Preface

Scope and purpose of the HIV molecular immunology database

HIV Molecular Immunology is a companion volume to *HIV Sequence Compendium*. This publication, the 2006/2007 edition, is the printed version of the web-based HIV Immunology Database (<http://www.hiv.lanl.gov/content/immunology/>). The web interface for this relational database has many search options, as well as interactive tools to help immunologists design reagents and interpret their results.

In the HIV Immunology Database, HIV-specific B-cell and T-cell responses are summarized and annotated. Immunological responses are divided into three parts, CTL, T helper, and antibody. Within these parts, defined epitopes are organized by protein and binding sites within each protein, moving from left to right through the coding regions spanning the HIV genome. We include human responses to natural HIV infections, as well as vaccine studies in a range of animal models and human trials. Responses that are not specifically defined, such as responses to whole proteins or monoclonal antibody responses to discontinuous epitopes, are summarized at the end of each protein section. Studies describing general HIV responses to the virus, but not to any specific protein, are included at the end of each part.

The annotation includes information such as cross-reactivity, escape mutations, antibody sequence, TCR usage, functional domains that overlap with an epitope, immune response associations with rates of progression and therapy, and how specific epitopes were experimentally defined. Basic information such as HLA specificities for T-cell epitopes, isotypes of monoclonal antibodies, and epitope sequences are included whenever possible. All studies that we can find that incorporate the use of a specific monoclonal antibody are included in the entry for that antibody. A single T-cell epitope can have multiple entries, generally one entry per study.

Finally, maps of all defined linear epitopes relative to the HXB2 reference proteins are provided. Alignments of CTL, helper T-cell, and antibody epitopes are available through the search interface on our web site at <http://www.hiv.lanl.gov/content/immunology>.

Only responses to HIV-1 and HIV-2 are included in the database. CTL responses to SIVs are periodically summarized in our review section by Dr. David Watkins and colleagues. (A review is included in this edition). Dr. Christian Brander and colleagues annually provide a concise listing of optimal CTL epitopes. Additional

reviews that our editorial board deems of general interest to the HIV research immunology community are solicited each year. This year's reviews are printed in the first part of this database; reviews from previous years can be found at <http://www.hiv.lanl.gov/content/hiv-db/REVIEWS/reviews.html>.

Comments on the database or requests for the hard copy can be sent via email to immuno@lanl.gov.

Citing the database

This publication may be cited as

HIV Molecular Immunology 2006/2007. Bette T. M. Korber, Christian Brander, Barton F. Haynes, Richard Koup, John P. Moore, Bruce D. Walker, and David I. Watkins, editors. Publisher: Los Alamos National Laboratory, Theoretical Biology and Biophysics, Los Alamos, New Mexico.

About the cover

This year's cover illustrates the number of defined epitopes included in the database that span each position in the HIV proteome. The data are also plotted in Figure 1, which is shown on the next page. For T-cell epitopes, this density reflects the density of defined epitopes in the database, which in turn roughly reflects the density of responses detected against the whole genome by Elispots in natural infection. Both CD8+ T-cell (or cytotoxic T lymphocyte, maroon) and CD4+ T-cell (or Helper T cell, green) responses are most commonly detected in Gag and Nef, and we also have the highest density of database epitopes captured from the literature in these regions. In contrast, the antibody epitope database density in different locations (blue) is less meaningfully captured in this graph, because only continuous epitopes are included. Many antibody responses defined in the database are to discontinuous epitopes, or are defined regionally or by competition experiments, and other database entries are polyclonal responses with multiple antibodies binding to multiple regions; these not included in this map. The database entries have other biases in frequency. For example, the database is based on retrieval of information from the literature, and so a region like the V3 loop of HIV-1, which is of particular interest to many investigators, has been studied with great intensity, and this high level of interest accounts for the large spike of nearly 120 different antibody entries in gp120.

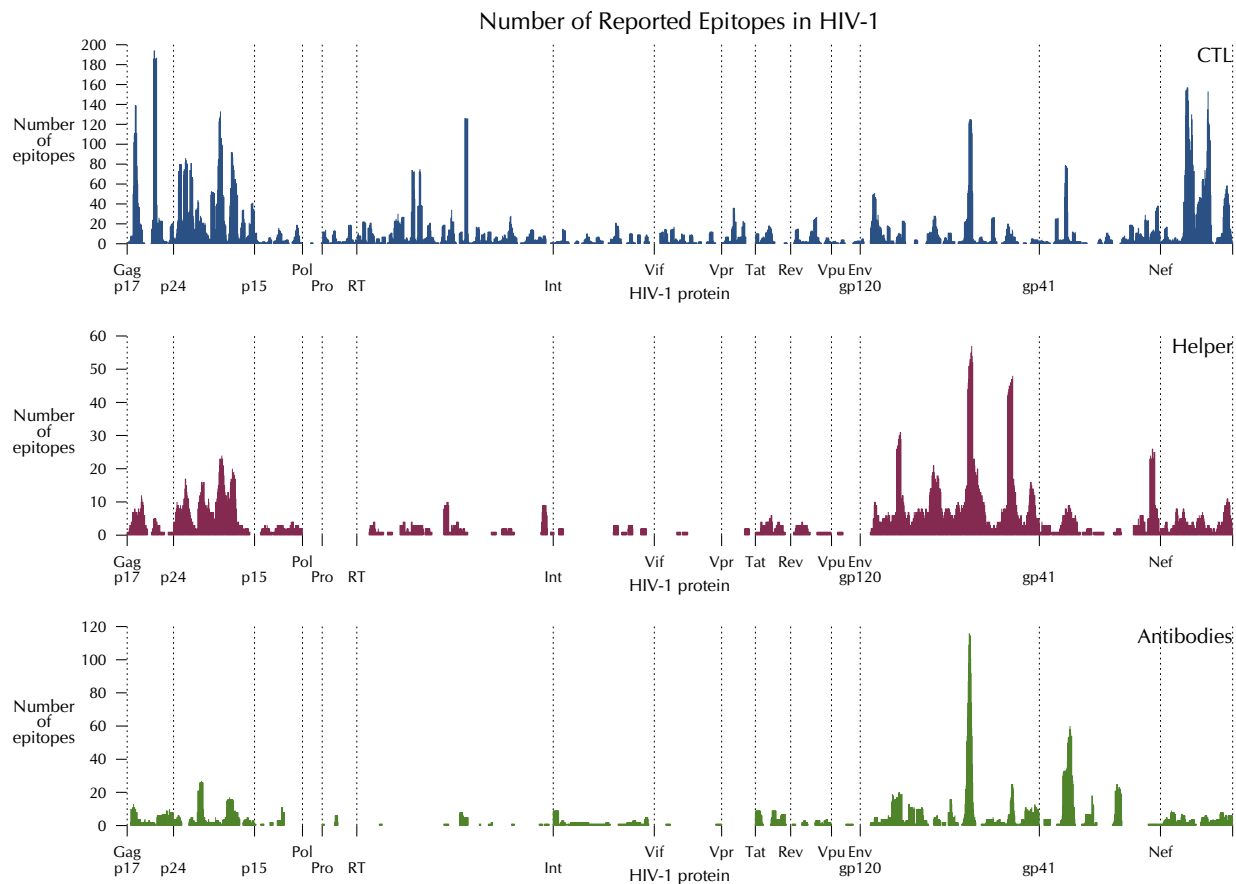

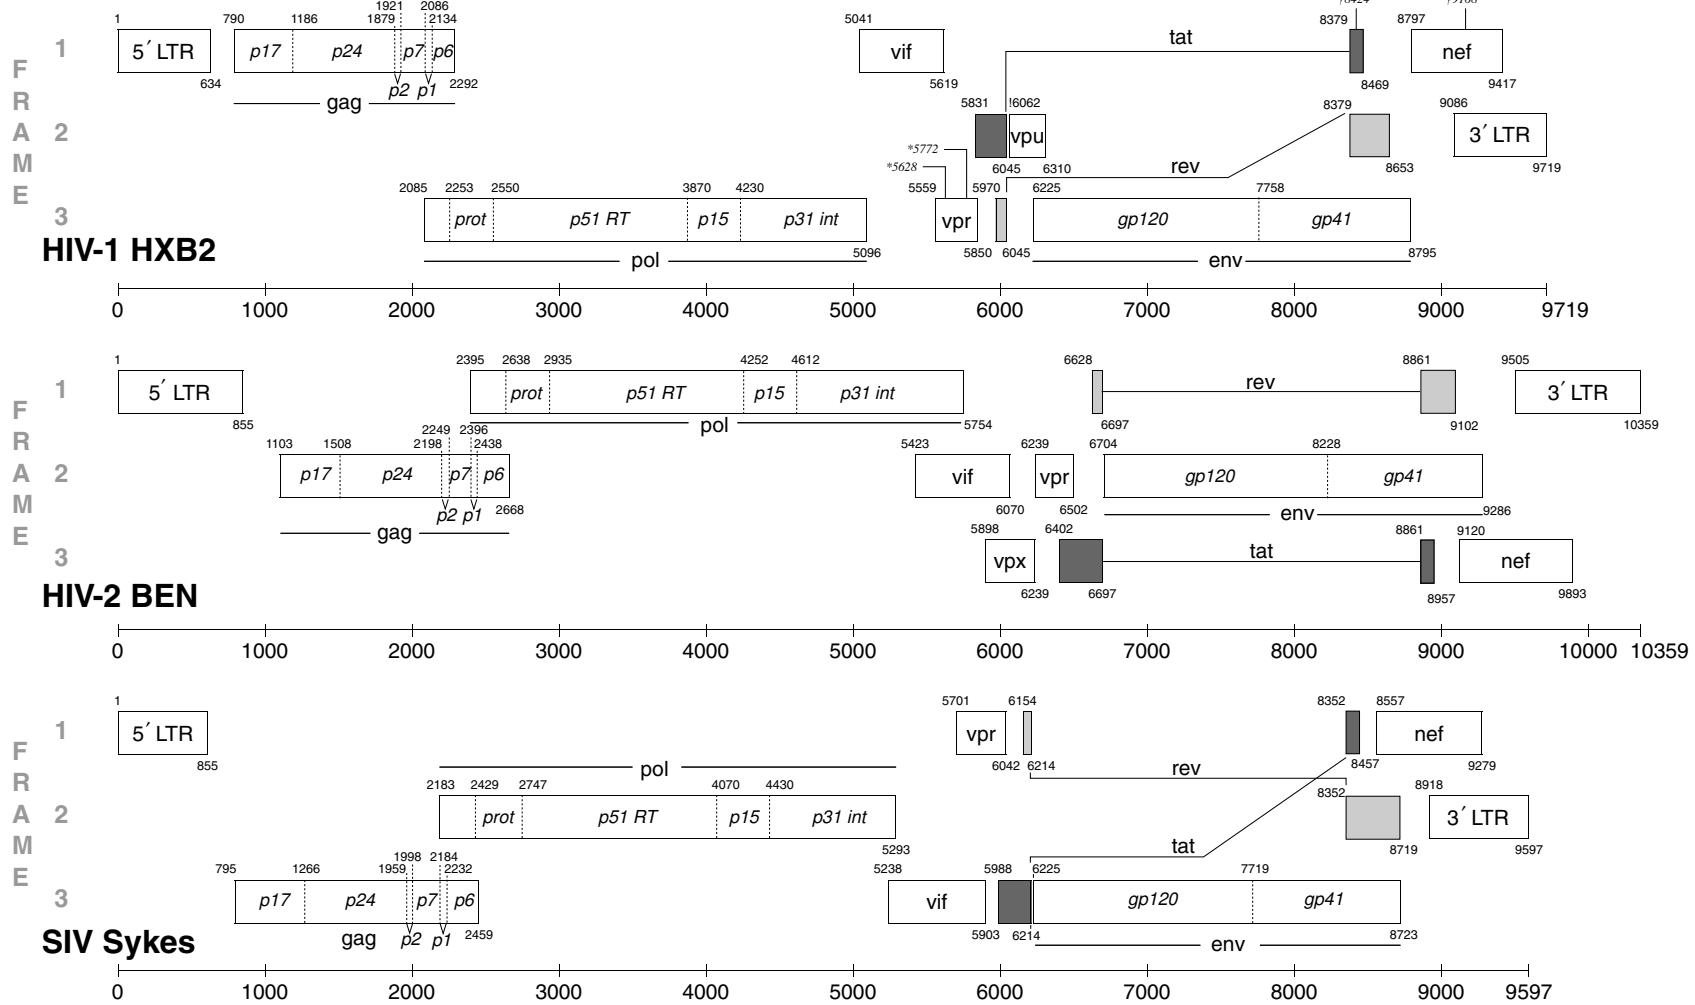

Figure 1: The number of defined epitopes included in the database that span each position in the HIV proteome.

About the PDF

The complete *HIV Molecular Immunology 2006/2007* is available in Adobe Portable Document Format (PDF) from our website, <http://www.hiv.lanl.gov/content/immunology>. The PDF version is hypertext enabled and features 'clickable' table-of-contents, indexes, references and links to external web sites.

This volume is typeset using \LaTeX . The immunology data tables and epitope maps are produced automatically from the SQL database by a series of Perl programs.

Genome maps

Landmarks of the HIV-1, HIV-2, and SIV genomes. The gene start, indicated by the small number in the upper left corner of each rectangle, normally records the position of the a in the atg start codon for that gene while the number in the lower right records the last position of the stop codon. For *pol*, the start is taken to be the first t in the sequence ttttttag which forms part of the stem loop that potentiates ribosomal slippage on the RNA and a resulting -1 frameshift and the translation of the Gag-Pol polyprotein. The *tat* and *rev* spliced exons are shown as shaded rectangles. In HXB2, *5628 and *5772 mark positions of frameshifts in the *vpr* gene; !6062 indicates a defective acg start codon in *vpu*; †8424 and †9168 mark premature stop codons in *tat* and *nef*. See Korber *et al.*, Numbering Positions in HIV Relative to HXB2CG, in *Human Retroviruses and AIDS*, 1998, p. 102. Available from <http://www.hiv.lanl.gov/content/hiv-db/REVIEWS/HXB2.html>

HIV/SIV proteins

Name	Size	Function	Localization
Gag MA	p17	membrane anchoring; env interaction; nuclear transport of viral core (myristylated protein)	virion
CA	p24	core capsid	virion
NC	p7	nucleocapsid, binds RNA	virion
	p6	binds Vpr	virion
Protease (PR)	p15	gag/pol cleavage and maturation	virion
Reverse Transcriptase (RT)	p66, p51	reverse transcription	virion
RNase H	(heterodimer)	RNase H activity	virion
Integrase (IN)		DNA provirus integration	virion
Env	gp120/gp41	external viral glycoproteins bind to CD4 and chemokine co-receptors	plasma membrane, virion envelope
Tat	p16/p14	viral transcriptional transactivator	primarily in nucleolus/nucleus
Rev	p19	RNA transport, stability and utilization factor (phosphoprotein)	primarily in nucleolus/nucleus shuttling between nucleolus and cytoplasm
Vif	p23	viral infectivity factor, inhibits minus-strand viral DNA hypermutation	cytoplasm (cytosol, membranes), virion
Vpr	p10-15	promotes nuclear localization of preintegration complex, inhibits cell division, arrests infected cells at G2/M	virion nucleus (nuclear membrane?)
Vpu	p16	promotes extracellular release of viral particles; degrades CD4 in the ER; (phosphoprotein only in HIV-1 and SIVcpz)	integral membrane protein
Nef	p27-p25	CD4 and class I downregulation (myristylated protein)	plasma membrane, cytoplasm, (virion?)
Vpx	p12-16	Vpr homolog present in HIV-2 and some SIVs, absent in HIV-1	virion (nucleus?)
Tev	p28	tripartite tat-env-rev protein (also named Tnv)	primarily in nucleolus/nucleus

Abbreviations

Common abbreviations and acronyms used in this database.

Abbrev.	Meaning
AA	amino acid
AAV	adeno-associated virus
Ab	antibody
ACTG	AIDS clinical trial group
ADC	AIDS dementia complex
ADCC	antibody-dependent cell-mediated cytotoxicity
ADE	antibody-dependent enhancement
ADRA	Antiviral Drug Resistance Analysis: a program that analyzes your sequences for mutations known to confer drug resistance and links to the records in the database
AIDS	acquired immunodeficiency syndrome
ANN	artificial neural networks
anti MHC	anti major histocompatibility complex
APC	antigen presenting cell
ARC	AIDS related complex
ART	anti-retroviral therapy
AZT	azidothymidine
BIMAS	BioInformatics and Molecular Analysis Section
BIV	bovine immunodeficiency virus
BLAST	Basic Local Alignment Search Tool
CAEV	caprine arthritis/encephalitis virus
CD4BS	CD4 binding site
CD4i	antibody that has enhanced binding to gp120 in the presence of SCD4 (CD4 induced)
CDC	Centers for Disease Control and Prevention
CDR	complementary determining regions
CFA	complete Freund's adjuvant
CHI	Center for HIV Information
CMI	cell-mediated immunity
CMV	cytomegaliovirus
CNS	central nervous system
CP	canary pox
CRF	circulating recombinant form
CsA	cyclosporine A
CSF	cerebrospinal fluid
CTL	cytotoxic T lymphocyte
CTL _e	CTL effector
CTL _p	CTL precursor
CyPA	cyclophilin A
DC	dendritic cell
DDDP	DNA-dependent DNA polymerase
DHH	U. S. Department of Health and Human Services
dMM	deopymannojirimycin
dpc	days post challenge
DTT	dithiothrietol
EIA	enzyme immuno assay
EIAV	equine infectious anemia virus
ELF	Epitope Location Finder
ELISA	Enzyme Linked ImmunoSorbent Assay
ER	endoplasmic reticulum
Fabs	fragment antigen binding-univalent antibody fragment
FATT-CTL	Fluorescent antigen-transfected target cell-CTL
FIV	feline immunodeficiency virus
FP	fowl pox
FSW	female sex worker
GALT	gut-associated lymphoid tissues
GDE format	Genetic Data Environment
gp	glycoprotein
GRIV	genetic resistance to HIV
HAART	highly-active anti-retroviral therapy
HCV	hepatitis C virus
HEPS	HIV-exposed persistently seronegative
HIV	human immunodeficiency virus
HIVD	HIV-1 dementia
HLA	human leukocyte antigens
HLA-MHC	human leukocyte antigens-major histocompatibility complex
HMM	hidden Markov models
IAVI	International AIDS Vaccine Initiative
IDE	immunodominant epitope
IE genes	immediate early genes
IFA	incomplete Freund's adjuvant
IFN	interferon
IG format	IntelliGenetics format
Ig	immunoglobulin
IL	interleukin
INHI	immunologically normal HIV-infected
iscom	immunostimulating complex
KLH	keyhole limpet hemocyanin
LANL	Los Alamos National Laboratory
LDA	limiting dilution assay
LN	lymph node
LPR	lymphoproliferative response
LT	labile enterotoxin
LTNP	long-term non-progressor
LTR	long terminal repeat
LTS	long term survivor
mAb	monoclonal antibody
MBL	mannose-binding lectin
MCMC	Markov chain Monte Carlo
MDP	muramyl dipeptide
MEI	multiple epitope immunogen
MHC	major histocompatibility complex
MHR	major homology region
ML	maximum likelihood
MLV	murine leukemia virus

Abbrev.	Meaning
MP	maximum parsimony
mpc	months post challenge
MPER	membrane-proximal external region
MRC	Medical Research Council, UK
MSF	multiple sequence alignment format of the GCG sequence analysis package
MV	measles vector
MVA vector	modified vaccinia virus Ankara
Nab	neutralizing antibody
NCBI	National Center for Biotechnology Information
NIAID	National Institute of Allergies and Infectious Diseases
NIBSC	National Institute for Biological Standards and Control, UK
NIH	National Institutes of Health
NIST	National Institute of Standards and Technology
NJ	neighbor joining
NLS	nuclear localization signal
NRP	non-rapid progressor
NSI	non-synctium-inducing protein
p	protein
PB	peripheral blood
PBL	peripheral blood lymphocyte
PBMC	peripheral blood mononuclear cell
PCOORD	principal coordinate analysis
PCR	polymerase chain reaction
PERV	porcine endogenous retrovirus
PHYLP	Phylogeny Inference Package
PL	proteoliposome
RAC	ricin A chain
RDDP	RNA-dependent DNA polymerase
rec/r	recombinant
RIP	Recombinant Identification Program: a program for detecting evidence of inter-subtype recombination
RIPA	Radio Immuno Precipitation Assay
RP	rapid progressor
RRE	Rev-responsive element
rsgp160	recombinant soluble gp160
RSV	Rous sarcoma virus
SAM	Sequence Alignment and Modeling program
SAP	sequential antigen panning
sCD4	soluble CD4
scFv	single-chain variable fragment
SDS	sodium dodecyl sulfate
SFV	Semliki Forest virus
SI	synctium inducing
SIV	simian immunodeficiency virus

Abbrev.	Meaning
SIVE	SIV encephalitis
SLE	systemic lupus erythematosis
SNAP	synonymous-nonsynonymous analysis program
STI	supervised treatment interruption (also seen as structured treatment interruption and standard treatment interruption)
TCLA	T cell line adapted
TCR	T-cell receptor
Th	T-helper cell
TNF	tumor necrosis factor
VEE	Venezuelan equine encephalitis
VESPA	Viral Epidemiology Signature Pattern Analysis
VIP	vasoactive intestinal peptide
VL	viral load
VLP	virus like particle, assembled from p55 gag
VSV	vesicular stomatitis virus
VV	vaccinia virus
WB	Western Blot

Amino Acid Codes

A	Alanine
B	Aspartic Acid or Asparagine
C	Cysteine
D	Aspartic Acid
E	Glutamic Acid
F	Phenylalanine
G	Glycine
H	Histidine
I	Isoleucine
K	Lysine
L	Leucine
M	Methionine
N	Asparagine
P	Proline
Q	Glutamine
R	Arginine
S	Serine
T	Threonine
V	Valine
W	Tryptophan
X	unknown or "other" amino acid
Y	Tyrosine
Z	Glutamic Acid or Glutamine
.	gap
-	identity
\$	stop codon
#	frameshift

Review Articles

I-A

Identification of HIV-Derived, HLA Class I Restricted CTL Epitopes: Insights into TCR Repertoire, CTL Escape and Viral Fitness

Nicole Frahm^a, Caitlyn Linde^a, Christian Brander^a

studies that focus on less well studied human populations with diverse HLA backgrounds [Kiepiela *et al.*, 2004].

I-A-1 The importance of well-defined T cell epitopes in understanding host immunity to HIV

A detailed understanding of T cell immunity to HIV infection will be required for the design and development of an effective HIV vaccine. Over the last few years, it has become clear that the mere breadth and magnitude of T cell responses directed against the entire viral proteome are not associated with immune control and that a more in-depth look at T cell specificity, effector functions and viral diversity will be needed to define true correlates of immune protection [Zuñiga *et al.*, 2006; Frahm *et al.*, 2004; Kiepiela *et al.*, 2004; Betts *et al.*, 2006; Masemola *et al.*, 2004a]. In particular, the relationship between targeting specific regions of the viral genome, T cell escape and, as a consequence, changes in viral replicative fitness has become a focus of much debate [Zuñiga *et al.*, 2006; Masemola *et al.*, 2004a; Martinez-Picado *et al.*, 2006; Bailey *et al.*, 2006; Li *et al.*, 2007; Liu *et al.*, 2006; Yeh *et al.*, 2006; Ganusov & De Boer, 2006]. In addition, studies on both the transmission and reversion of CTL escape variants, the induction of T cell specificities against effective viral escape variants as well as work addressing the role of subdominant T cell responses in the control of HIV have provided a better understanding of the complex dynamics between host immune response and viral adaptation to immune pressure [Leslie *et al.*, 2004, 2005; Friedrich *et al.*, 2004; Allen *et al.*, 2005b,a; Frahm *et al.*, 2006a]. For most of these studies, the identification of precisely defined HLA class I-restricted CTL epitopes has been key and will continue to be a central prerequisite, especially in

I-A-2 Escape pathways of dominant CTL epitopes

Despite the increasing appreciation for the role of subdominant CTL responses in viral control, much of the current knowledge on immune driven viral evolution and CTL escape is based on the study of a few, well defined, dominant T cell targets [Bailey *et al.*, 2006; Leslie *et al.*, 2004, 2005; Frahm *et al.*, 2006a; Brander *et al.*, 1998; Iversen *et al.*, 2006; Migueles *et al.*, 2003; Yu *et al.*, 2006]. In some of these cases, for instance the dominant HLA-B27-restricted epitope KK10 in HIV Gag p24 (KRWIIIGLNK), CTL escape from a single epitope can result in elevated viral loads and accelerated disease progression [Goulder *et al.*, 1997c; Feeney *et al.*, 2004]. However, for other epitopes and alleles, the relationship between CTL escape and disease progression may be more complex. For instance, in the case of the HLA-B57-restricted KF11 epitope (KAFSPEV-IPMF), a number of studies have found intact viral epitope sequences and significant epitope-specific responses even in individuals with seemingly uncontrolled viral replication [Migueles *et al.*, 2003]. On the other hand, others have reported “escape” mutations in the KF11 epitope in individuals with elite control of viral replication [Bailey *et al.*, 2006], indicating that additional factors are likely crucially involved in shaping an effective T cell response to this virus. Indeed, recent data generated by multi-color flow cytometric analyses highlight the importance of poly-functional effector cells in the control of HIV. These poly-functional T cells may be impaired in some individuals with progressive disease, although these subjects may have conserved epitope sequences and strong, epitope-specific T cell responses as assessed by interferon- γ secretion [Betts *et al.*, 2006].

A number of reports have now also begun to address the kinetics of compensatory mutations that are either required for effective T cell escape or for the maintenance of viral replicative fitness [Yeh *et al.*, 2006; Iversen *et al.*, 2006; Kelleher *et al.*, 2001; Peyerl *et al.*, 2004]. Recent

analyses by Iversen *et al.* [2006] have addressed viral escape pathways in the context of the dominant HLA-A2 restricted epitope SLYNTVATL in HIV Gag p17, showing that effective viral escape was only achieved after serial mutations in three positions within the optimal epitope. These changes were required for escape from TCR recognition, indicating that simple reduction of epitope binding affinity to the presenting HLA class I molecule does not necessarily allow the virus to evade immune control. Rather, effective escape may occur only when there is a profoundly diminished interaction between TCR and the HLA/peptide complex, to which the epitope binding affinity will only partially contribute. This highlights the need to expand the analyses of HIV-specific immune responses to include detailed assessments of functional avidity of these responses as well as to consider the impact that the T cell receptor repertoire diversity may have on the emergence of CTL escape variants. Thus, a number of studies have started to shed some light on the factors that define a broadly cross-reactive and highly avid T cell response, which may be especially well suited to prevent viral escape. Of note, a number of recent analyses have indicated that a more narrow T cell receptor repertoire, mediating T cell responses of high functional avidity, may be particularly effective in controlling viral replication [Yu *et al.*, 2006; Price *et al.*, 2004; Frahm *et al.*, 2006b; Ahlers *et al.*, 2001; Alexander-Miller *et al.*, 1996a]. Although one might expect a broader epitope-specific TCR repertoire to provide more possible candidate TCR to effectively recognize emerging escape variants, our own data and studies from other laboratories indicate that an increased breadth of the TCR repertoire may be associated with reduced functional avidity of the total epitope-specific T cell population [Yu *et al.*, 2006; Price *et al.*, 2004; Frahm *et al.*, 2006b; Mes-saoudi *et al.*, 2002]. This is highlighted in a recent analysis of the TCR usage in T cells directed against the dominant HIV Gag KF11 (KAFSPEVIPMF) epitope, which can be restricted by the two closely related alleles HLA-B*5701 and B*5703. In the context of HLA-B*5701, the KF11 specific response is characterized by a TCR repertoire that is highly conserved among HLA-B*5701-expressing individuals and that efficiently cross-reacts with viral epitope variants [Yu *et al.*, 2006]. In contrast, in the context of HLA-B*5703, the KF11 epitope induces an entirely different, more heterogeneous TCR repertoire that fails to recognize the most frequently occurring epitope variants, indicating that extensive TCR diversity may not effectively prevent the emergence of epitope escape variants. How the immune system may control the emergence of highly avid rather than broad TCR repertoires may at least partly depend on antigen availability and competition of expanding T cell populations [Kim *et al.*, 2006; Price *et al.*, 2005]. Studies that address these factors in HIV and other viral infections will have obviously important implications for vaccine design, which may need to consider different lev-

els of antigen availability during the induction phase of responses and aim to specifically drive the expansion of high avidity T cell responses of limited TCR diversity and (thus) superior ability to recognize epitope variants.

I-A-3 Inclusion of epitopes in the optimal list

As every year, the present listing is based on the inclusion of epitopes that fulfill a number of stringent criteria intended to ensure reliable description of the optimal length epitope and correct assignment of the restricting HLA class I allele(s) [Hunziker *et al.*, 1998; Brander & Walker, 1995]. Nevertheless, there may still be occasions where the data reported here conflict with data in other laboratories and we to encourage any investigators who observe discrepancies in their own data and what is reported here to bring this to our attention. The selection of inclusion criteria itself is obviously subject to potential disagreement, too. In particular, a number of epitopes have been described over the last year where binding motif algorithms have been used to predict the optimal epitope length, or for which the restricting HLA class I alleles have been inferred by statistical associations or binding assays [Kawashima *et al.*, 2005; Satoh *et al.*, 2005]. Although in some large cohort analyses, a number of associations have reached statistically highly significant associations, the optimal epitope was often inferred based on previously published motif data [Kiepiela *et al.*, 2004; Honeyborne *et al.*, 2006]. We have thus opted not include these epitopes even though a number of them are likely to be accurately described. However, as binding motif predictions are only as good as the quality of the described epitopes for a given allele, care must be taken to not further “confirm” existing binding motifs by data that were generated based on the original training set defining the motifs in the first place. Thus, at least some of the inferred optimal epitope lengths should ideally be confirmed experimentally to ensure that sometimes only loosely defined allele-specific binding motifs are indeed correct. Thus, while newly identified epitopes may violate known HLA binding motifs, these extensively mapped epitopes may help to refine currently incompletely defined allele-specific binding motifs. The expansion of binding motifs to include less frequently used amino acids will not only facilitate work in the HIV field, but also in other viral infections, cancer and autoimmunity.

I-A-5 Map of optimal HIV-1 CTL epitopes

The location and HLA restriction elements of CTL epitopes are indicated on protein sequences of HXB2. These maps are meant to provide the relative location of defined epitopes on a given protein, but the HXB2 sequence may not actually carry the epitope of interest, as it may vary relative to the sequence for which the epitope was defined.

I-A-6 Acknowledgments

We would like to express our gratitude to those researchers in the field who continuously contribute to this database. The mostly unpublished data added to this year's update stemming from the AIDS Research Center at Mass. General Hospital were largely funded by two NIH contracts (NO1-A1-15442, NO1-A1-30024) supporting HLA typing and HIV CTL epitope definition in non-Caucasian populations and non-clade-B HIV infection as well as R01-A1-067077 assessing the promiscuous presentation of HLA class I restricted epitopes.

We very much welcome any criticism, comments and additions to this list since we are sure that some epitopes will unintentionally escape our attention, despite close monitoring of the literature. Please write or call us with any comments you may have.

I-B

Beyond *Mamu-A*01* + Indian Rhesus Macaques: Continued Discovery of New MHC Class I Molecules that Bind Epitopes from the Simian AIDS Viruses

John T. Loffredo^a, Laura E. Valentine^a, David I. Watkins^{a,b}

I-B-1 Introduction

Developing an effective vaccine against HIV is a global public health priority. Nonhuman primate research will play a critical role in such development as simian immunodeficiency virus (SIV) infection of nonhuman primates is the best animal model available for AIDS, and nonhuman primates are used for testing of vaccination strategies. In the past decade, substantial progress has been made in defining and characterizing T cell responses for this animal model.

Accumulating evidence suggests that cellular immune responses play a major role in controlling HIV and SIV replication, directing recent efforts to vaccine regimens that elicit CD8+ T lymphocyte responses [McMichael & Rowland-Jones, 2001]. A variety of studies have shown associations between certain MHC class I alleles in both slow and rapid HIV/SIV disease progression [Carrington & O'Brien, 2003; Bontrop & Watkins, 2005]. Of particular interest are "elite controllers" (ECs), rare individuals who spontaneously control HIV/SIV viremia to very low levels (<50 vRNA copies/ml of plasma for HIV-infected humans [Pereyra *et al.*, 2007], <1,000 vRNA copies/ml of plasma for SIV-infected macaques [Yant *et al.*, 2006; Loffredo *et al.*, 2007b]). Understanding this natural control may aid in the development of an effective HIV vaccine.

There are, unfortunately, many difficulties inherent to studying HIV-infected humans. Viral control appears to be mediated during resolution of acute phase viremia, with the

appearance of CD8+ T cell responses in both HIV-infected humans and SIV-infected macaques [Borrow *et al.*, 1994; Koup *et al.*, 1994; Reimann *et al.*, 1994; Yasutomi *et al.*, 1993; Kuroda *et al.*, 1999]. HIV is rarely diagnosed during acute infection however [Weintrob *et al.*, 2003; Kuo *et al.*, 2005; Mayben *et al.*, 2007], making the study of immune responses involved in initial control of HIV replication extremely difficult. This is further complicated by the diversity of HIV isolates with which individuals might be infected.

AIDS research with nonhuman primates provides an animal model to complement human studies. Nonhuman primates can provide examples of successful immune containment of pathogenic immunodeficiency virus replication, and researchers have direct control over key variables such as virus strain, host genotype, and route of infection. Perhaps most importantly, the immunology and pathogenesis of acute infection can easily be studied in macaques. Overall, studying immune responses to SIV in macaques is simpler than studying immune responses to HIV in humans. All macaques can be infected with a known, often clonal, viral stock. Infection with a defined viral stock enables complete and accurate immunological tracking of early immune responses by the use of corresponding peptides in *ex vivo* immunological assays. Moreover, the timing of immune responses after infection, the associated viral sequence evolution, and plasma virus concentrations may be closely monitored.

Most published studies of CD8+ T cell responses in Indian rhesus macaques have used animals which express the common MHC class I allele *Mamu-A*01*. This allele was found to be associated with lower set-point viremia in vaccinated and non-vaccinated macaques in several studies [Mao *et al.*, 2005; Mühl *et al.*, 2002; Pal *et al.*, 2002; Zhang *et al.*, 2002]. Such animals have been used largely because their CD8+ T cell responses were the first to be exhaustively identified, and *Mamu-A*01* can be readily identified using sequence-specific PCR primers [Knapp *et al.*, 1997]. The *Mamu-A*01* peptide binding motif has been defined, and a comprehensive scan of the SIVmac239

^aWisconsin National Primate Research Center, University of Wisconsin-Madison, Madison, Wis., USA

In *HIV Molecular Immunology 2006/2007*. Bette T. M. Korber, Christian Brander, Barton F. Haynes, Richard Koup, John P. Moore, Bruce D. Walker, and David I. Watkins, editors. Publisher: Los Alamos National Laboratory, Theoretical Biology and Biophysics, Los Alamos, New Mexico. p. 29–51.

proteome yielded fourteen epitopes restricted by this MHC class I molecule [Allen *et al.*, 1998, 2001]. Tetramers are available for several of these epitopes, facilitating detailed vaccine and pathogenesis studies [Kuroda *et al.*, 1998; Allen *et al.*, 2001; Mothé *et al.*, 2002a; Egan *et al.*, 1999; Allen *et al.*, 2000].

As described in the previous compendium update and elsewhere, this focus on *Mamu-A*01+* macaques has created a bottleneck in AIDS vaccine research due to a shortage of animals expressing this allele [O'Connor *et al.*, 2002b; Cohen, 2000]. Compared to the human system, only a small fraction of macaque MHC class I alleles have been characterized at this time [Bontrop & Watkins, 2005]. Since the publication of the last SIV compendium review in 2001 [O'Connor *et al.*, 2002b], significant advances have been made in understanding nonhuman primate immunogenetics. Two MHC class I alleles, *Mamu-B*17* and *Mamu-B*08*, were found to be enriched in EC cohorts and associated with reduced SIV replication in the chronic phase of infection [Yant *et al.*, 2006; Loffredo *et al.*, 2007b]. The binding motifs of four additional Indian rhesus macaque MHC class I alleles have been defined, and the SIVmac239 epitopes presented by these alleles identified [Mothé *et al.*, 2002b; Loffredo *et al.*, 2004; Sette *et al.*, 2005; Loffredo *et al.*, 2005]. Knowledge of the minimal-optimal epitopes restricted by these alleles should allow the use of many more Indian rhesus macaques in studies of CD8+ T cell dynamics following SIV infection, as well as a fuller understanding of the immune responses generated against SIV. Additionally, several other species of macaques are now being used in AIDS research, and their cellular immune responses are beginning to be defined.

This review highlights recent advances in AIDS research using nonhuman primate models and provides a comprehensive list of the published MHC class I and class II epitopes (Table I-B.1 and Table I-B.2). A summary of the peptide-binding motifs of several macaque MHC alleles is also presented (Table I-B.3).

I-B-2 Indian rhesus macaques: MHC class I molecules and CD8+ T cell epitopes

The Indian rhesus macaque (*Macaca mulatta*) remains the best characterized and most commonly studied nonhuman primate AIDS model. At this time, the peptide binding motifs of five MHC class I molecules (*Mamu-A*01*, *-A*02*, *-A*11*, *-B*01*, and *-B*17*) have been fully defined in the SIV-infected rhesus macaque model (Table I-B.3), enabling the identification of 43 of the 66 known SIV-specific CD8+ T cell epitopes (Table I-B.1) [Allen *et al.*, 1998, 2001; Mothé *et al.*, 2002b; Loffredo *et al.*, 2004; Sette *et al.*, 2005; Loffredo *et al.*, 2005]. As described

above, *Mamu-A*01* has been intensely investigated, as it was the first MHC class I molecule studied in detail [Allen *et al.*, 1998; Furchner *et al.*, 1999; Allen *et al.*, 2001, 2000; Egan *et al.*, 1999; Barouch *et al.*, 2002; Mothé *et al.*, 2002a; O'Connor *et al.*, 2002a; Zhang *et al.*, 2002; Pal *et al.*, 2002; Mühl *et al.*, 2002; O'Connor *et al.*, 2004; Friedrich *et al.*, 2004b; Knapp *et al.*, 1997; Peyerl *et al.*, 2003; Kuroda *et al.*, 1998; Loffredo *et al.*, 2007a]. The addition of four well-characterized MHC class I molecules significantly broadens the repertoire of immune responses that researchers may effectively monitor in animal studies. *Mamu-A*02* and *Mamu-B*17* are particularly helpful with twenty [Vogel *et al.*, 2002a; Loffredo *et al.*, 2004; Robinson *et al.*, 2001; Watanabe *et al.*, 1994] and twelve [Evans *et al.*, 1999, 2000; Dzuris *et al.*, 2000; Mothé *et al.*, 2002b; Horton *et al.*, 2001] epitopes, respectively, known to be restricted by these two alleles. In addition, each is present at a high frequency (>10%), in most captive rhesus macaque colonies [Kaizu *et al.*, 2007].

*Mamu-B*01*, another high frequency allele, is unusual in that it does not appear to be involved in the immune response directed against SIVmac239 [Loffredo *et al.*, 2005], although previous published reports had described six *Mamu-B*01*-restricted CD8+ T cell epitopes [Yasutomi *et al.*, 1995; Su *et al.*, 2005]. However, the MHC restriction of these six putative *Mamu-B*01*-restricted epitopes was not verified with MHC class I transfection of 721.221 cells [Yasutomi *et al.*, 1995; Su *et al.*, 2005]. In a subsequent study, it was found that the putative epitopes did not bind to *Mamu-B*01* with biologically relevant affinities [Loffredo *et al.*, 2005], nor were CD8+ responses to these peptides detected in eight *Mamu-B*01+* SIV-infected Indian rhesus macaques. Hence, vaccine immunogenicity studies in *Mamu-B*01+* macaques may not yield useful results.

I-B-3 Indian rhesus macaques: web-based immunogenetics resources

Based on the identified SIV-specific CD8+ T cell epitopes and the peptide binding profiles of their corresponding Indian rhesus macaque MHC class I alleles, a computational algorithm was developed to predict the peptide binding and potential T cell epitopes restricted by the MHC class I molecules *Mamu-A*01*, *-A*02*, *-A*11*, *-B*01*, and *-B*17* [Peters *et al.*, 2005a]. This can be accessed at the website <http://www.mamu.liai.org/>. Previous studies defined detailed peptide binding motifs, aiding discovery of the majority of identified SIVmac239 epitopes [Allen *et al.*, 1998, 2001; Mothé *et al.*, 2002b; Loffredo *et al.*, 2004; Sette *et al.*, 2005; Loffredo *et al.*, 2005]. However, it is possible that epitope screens done in chronically infected macaques failed to detect some subdominant responses restricted by these alleles. Identification and characterization

of additional subdominant responses may be aided by using the website's search engine to find the predictive binding values of peptides within regions of novel responses of unknown restriction. In addition, this resource may be of use to researchers studying other viral pathogens in the Indian rhesus macaque, expediting CD8+ T cell epitope identification. The Immune Epitope Database and Analysis Resource (IEDB) [Peters *et al.*, 2005b], located at <http://www.immuneepitope.org/>, is another useful resource recently made available. The IEDB project is hosted at the La Jolla Institute for Allergy and Immunology (LIAI), and one of its foci is the compilation of known immune (antibody and T cell) epitopes and MHC binding data. These two resources provide useful information regarding the epitopes and alleles discussed in this review, in addition to covering humans, rodents, and various other animal species.

I-B-4 Indian rhesus macaques: viral evolution and epitope cross-reactivity

As more epitopes restricted by different Indian rhesus macaque alleles have been identified and followed over the course of SIV infection, sequencing of viral RNA has revealed selection of variation by CD8+ T cells. Escape mutations are detected in many epitopes targeted by CD8+ T cells, and variation is found in epitopes restricted by each of the alleles discussed previously in the review [Evans *et al.*, 1999; Allen *et al.*, 2000; O'Connor *et al.*, 2002a, 2004; Barouch *et al.*, 2002, 2003; Peyerl *et al.*, 2003; Friedrich *et al.*, 2004b; Loffredo *et al.*, 2004; Vogel *et al.*, 2002a]. This variation is selected for with varying kinetics following infection, though for a given epitope the same escape mutation is often found in multiple animals. Recent studies have also shown that viral escape from CD8+ T cell pressures can exact a fitness cost to the virus via fitness assays and reversion experiments [Friedrich *et al.*, 2004a; Peyerl *et al.*, 2003; Friedrich *et al.*, 2004b; Barouch *et al.*, 2005].

Reactivity to escape variant peptides is frequently detectable in enzyme-linked immunospot or intracellular cytokine staining assays. However, this putative "cross-reactivity" may be an artifact of the non-physiological antigen presentation that occurs when high concentrations of exogenous antigen are used to stimulate T cells. For at least two SIVmac239 epitopes, Mamu-A*01-restricted Gag₁₈₁₋₁₈₉CM9 and Tat₂₈₋₃₅SL8, consistent reactivity to escape variant peptides has been observed, albeit with reduced functional avidity. By contrast, cells infected with corresponding escape variant viruses were not recognized by CD8+ T cell lines specific for the wild-type epitope [Loffredo *et al.*, 2007a; Valentine *et al.*, 2007]. Whether *de novo* responses specific for escape variant sequences

are generated has not been rigorously studied.

I-B-5 Indian rhesus macaques: natural containment of pathogenic SIV replication

The most interesting, recent studies of Indian rhesus macaque immunogenetics involved the characterization of two MHC class I alleles associated with slow disease progression in SIV-infected macaques. Both *Mamu-B*17* and *Mamu-B*08*, unlike *Mamu-A*01*, are MHC class I alleles significantly enriched in elite controller (EC) cohorts [Yant *et al.*, 2006; Loffredo *et al.*, 2007b]. Fourteen of the sixteen (88%) EC macaques identified from a cohort of 196 SIVmac239-infected macaques expressed either *Mamu-B*17* or *Mamu-B*08*. This percentage is similar to a previous study that demonstrated the overrepresentation of *HLA-B*5701* (11 of 13, 85%) in a cohort of long term nonprogressors / ECs with normal CD4+ T cells counts and HIV replication less than 50 vRNA copies/ml [Migueles *et al.*, 2000]. *Mamu-B*17+* and *Mamu-B*08+* macaques also exhibit a greater reduction in SIV viremia compared to *Mamu-A*01+* macaques in a cohort of 196 SIVmac239-infected macaques [Yant *et al.*, 2006; Loffredo *et al.*, 2007b].

Intriguingly, the peptide binding motif of *Mamu-B*17* is broadly similar to that of *HLA-B57*, while the *Mamu-B*08* motif resembles that of *HLA-B27*. *HLA-B57* and *-B27* are associated with lower plasma virus concentrations in HIV-infected individuals [Carrington & O'Brien, 2003]. Although *Mamu-B*17* seems to tolerate a wider array of residues at position two than *HLA-B57*, both molecules require W, F, or Y at the C-terminal anchor position [Mothé *et al.*, 2002b; Rammensee *et al.*, 1999; Marsh *et al.*, 2000]. A previous study demonstrated that another macaque MHC class I molecule, *Mamu-B*03*, binds peptides conforming to the *HLA-B27* binding motif [Dzuris *et al.*, 2000]. This allele was also associated with slow SIV disease progression [Evans *et al.*, 1999], but additional studies were hindered by the low frequency of this allele in captive rhesus macaques (overall < 1%; Kaizu *et al.* [2007]). *Mamu-B*03* and *Mamu-B*08* are almost identical in amino acid sequence [Boyson *et al.*, 1996], with only two amino acid differences between *Mamu-B*03* and *Mamu-B*08* in regions that influence peptide binding and antigen recognition [Bjorkman *et al.*, 1987; Garrett *et al.*, 1989]. Both differences reside in the alpha-1 domain (exon two). Therefore, it is likely that *Mamu-B*08* also shares this *HLA-B27* binding profile. This hypothesis is supported by the fact that all seven *Mamu-B*08*-restricted CD8+ T cell epitopes currently described (Table I-B.1) fit the peptide-binding motif for *HLA-B27* of an R at position two and an L at the C-terminus [Loffredo *et al.*, 2007c]. Studies to completely define the *Mamu-B*08* peptide bind-

ing motif are ongoing, and should help to identify the complete repertoire of SIVmac239-specific CD8+ T cell epitopes restricted by Mamu-B*08.

The discovery of Mamu-B*17 and Mamu-B*08 now provide us with a unique opportunity not previously available due to technological and assay limitations. Currently, we have found that about 20–25% of Mamu-B*17+ and about 50% of Mamu-B*08+ SIV-infected Indian rhesus macaques are elite controllers [Yant *et al.*, 2006; Loffredo *et al.*, 2007b]. With peptide binding motifs similar to the analogous human EC alleles *HLA-B57* and *HLA-B27*, respectively, and definition of at least seven SIV epitopes for each macaque allele (Table I-B.1), investigators now have the resources to study successful immune responses against AIDS viruses in the SIV-infected macaque model.

I-B-6 Indian rhesus macaques: MHC class II molecules and CD4+ T cell epitopes

As with HIV, mapping of CD4+ T cell epitopes in SIV has lagged behind studies of CD8+ T cell epitopes. This is due in part to the difficulty in maintaining such responses in the face of ongoing viral replication, as HIV-specific CD4+ T cells are preferentially infected [Douek *et al.*, 2002]. Initially, studies focused on identifying Env-specific CD4+ T cell responses in SHIV-infected macaques [Lekutis & Letvin, 1997; Dzuris *et al.*, 2001; Lekutis *et al.*, 1997]. Two MHC class II molecules, Mamu-DRB1*0406 and Mamu-DRB*w201, presented three Env-specific CD4+ T cell responses, enabling an Env-specific MHC class II tetramer to be constructed [Kuroda *et al.*, 2000]. Later, peptide binding motifs for these two alleles were generated, and used to identify other SIV-derived peptides that Mamu-DRB1*0406 and Mamu-DRB*w201 might present [Dzuris *et al.*, 2001]. This investigation also discussed two new novel CD4+ T cell responses against Gag and Rev that were restricted by Mamu-DRB*w201. Unpublished data from Giraldo Vela *et al.* describe five additional MHC class II alleles that restrict CD4+ T cell responses in Gag, Rev, Nef, and Vpx, thereby doubling the number of known SIV/SHIV epitopes (Table I-B.2). Numerous other regions of SIV have been documented to contain CD4+ T cell epitopes [Mills *et al.*, 1991; Sarkar *et al.*, 2002; Vogel *et al.*, 2002b]. However, the MHC class II restriction of the majority of these responses remains undefined.

I-B-7 Alternatives to the SIV-infected Indian rhesus macaque animal model

The demand for Indian rhesus macaques has lessened somewhat with a growing interest in alternative nonhuman

primate models for AIDS. Currently, pigtail macaques (*Macaca nemestrina*) are being used in epitope identification and vaccine/pathogenesis studies. In addition, vaccine-induced immune responses have been effective at controlling SIVmac239 replication in Burmese macaques (*Macaca mulatta*), while the simple MHC genetics of Mauritian cynomolgus macaques (*Macaca fascicularis*) may offer unique opportunities for future SIV studies. There are, however, some key differences between these groups of animals, which are pertinent to SIV research.

All of these macaques, of the genus *Macaca*, are native to Asia and are non-natural hosts for SIV. Burmese-origin rhesus macaques, while the same species as Indian-origin rhesus macaques, are from a geographically separate population and possess divergent MHC class I alleles. Different subpopulations of rhesus macaques (Indian, Burmese, and Chinese origin) can be readily distinguished by mitochondrial DNA sequencing [Smith & McDonough, 2005], and by single nucleotide polymorphism analysis [Ferguson *et al.*, 2007; Malhi *et al.*, 2007], tools that may be useful for determining ancestry of animals with unknown origin. The most recent common ancestor of the rhesus macaque species is estimated to have lived about 1.9 million years ago, around the time rhesus macaques diverged from cynomolgus macaques [Hernandez *et al.*, 2007]. Pig-tailed macaques are somewhat more distantly related, having separated from the rhesus macaque lineage about 3.5 million years ago [Morales & Melnick, 1998].

These different groups of macaques experience varying degrees of pathogenicity following infection with commonly used SIV isolates. A comparative study by Reimann *et al.* [2005] found no significant difference in the acute-phase peak of viremia in SIVmac251-infected Indian rhesus, Chinese rhesus, and cynomolgus macaques, while a separate study of SIVmac251-infected pigtail macaques measured a very similar acute-phase viral peak [Batten *et al.*, 2006]. Differences in plasma virus concentrations emerge after acute infection, the timing of which suggests a determinative role for the adaptive immune response, rather than an inherent difference in the replicative capacity of SIV in these animals. Overall, rhesus macaques of Indian descent consistently have the highest viral set-points. In comparison, it appears that the chronic-phase plasma viremia of SIVmac239 in Burmese rhesus macaques (geometric mean of 65,000 vRNA copies/ml in one small study [Yamamoto *et al.*, 2007]) is similar, or perhaps slightly lower than that observed in a large cohort of Indian rhesus macaques (geometric mean 223,800 vRNA copies/ml, [Loffredo *et al.*, 2007b]). However, a direct comparison of these animals has not been published. Meanwhile, cynomolgus macaques have significantly reduced plasma virus concentrations (approximately two-logs) compared to Indian-origin rhesus macaques, with a large proportion of these cynomolgus macaques becoming ECs after SIVmac251 challenge [Reimann *et al.*, 2005].

Pigtail macaques are also productively infected with SIVmac251, with substantial variability in their viral set-point having been documented [Batten *et al.*, 2006].

Why different macaque species/subspecies have different disease courses following infection with the same virus has not been defined, but it is notable that SIV isolates used in the majority of studies (SIVmac239, SIVmac251, and SHIV-89.6P) have been passaged in rhesus macaques of Indian origin. One study has shown that passaging SIV in rhesus macaques of Chinese origin resulted in increased viral loads in subsequently infected Chinese macaques [Burdo *et al.*, 2005]. While the mutations acquired were not characterized, this study suggests that species-specific adaptations might play a role in determining viral set-point for different groups of animals.

I-B-8 Burmese rhesus macaques

Several interesting vaccine experiments have utilized SIV-infected Burmese rhesus macaques. A Gag-expressing DNA-prime/Sendai virus vector boost vaccination led to control of SIVmac239 replication in five of eight vaccinated Burmese macaques [Matano *et al.*, 2004]. By week five, the successful vaccinees had undetectable plasma virus concentrations. Interestingly, viruses from these five animals had escape mutations in Gag that appeared to have occurred at a high fitness cost to the virus [Matano *et al.*, 2004; Kobayashi *et al.*, 2005]. The escape analysis demonstrated that three vaccinees shared an MHC class I haplotype (90-120-Ia), which restricted some of the Gag-specific CD8+ T cell responses (Table I-B.1). Follow-up studies in these animals have shown that multiple Gag-specific CD8+ T lymphocyte responses were involved in the vaccine-induced control [Kawada *et al.*, 2006], and additional viral mutations associated with this MHC class I haplotype (90-120-Ia) accumulated. At this time, responses have not been mapped to specific MHC class I alleles.

Additionally, SIV-specific CD4 responses in the Burmese macaques are being investigated and appear to be associated with viral control [Lun *et al.*, 2004]. SIV-specific CD8+ T cells that are not directed against Gag also appear to be important in Burmese macaques, although responses have not yet been mapped [Kawada *et al.*, 2007].

I-B-9 Pigtail macaques

Until recently, research with pigtail macaques had been hampered by a lack of defined viral epitopes and limited characterization of pigtail macaque MHC class I alleles. However, over the past several years considerable effort has been directed toward understanding the immunogenetics of pigtail macaques, widening the resources available to researchers. Importantly, many *Macaca nemestrina* MHC

class I alleles (*Mane*) have now been characterized from more than 100 pigtail macaques [Lafont *et al.*, 2003; Pratt *et al.*, 2006; Smith *et al.*, 2005a].

Immunogenetic analyses of these animals have identified several defined minimal-optimal epitopes in Gag (Table I-B.1). Of particular interest is an immunodominant response, Gag₁₆₄₋₁₇₂KP9, restricted by the high frequency allele, Mane-A*10 (and later Mane-A*16, an MHC class I allele of similar sequence) [Smith *et al.*, 2005a,b]. This SIV epitope Gag₁₆₄₋₁₇₂KP9 has been studied extensively and parallels can be drawn to the Mamu-A*01-restricted CD8+ T cell epitope Gag₁₈₁₋₁₈₉CM9. Viral escape at position two of this epitope leads to loss of epitope recognition [Fernandez *et al.*, 2005]. Viral fitness was also impaired by this mutation, as evidenced by sequence reversion when the selective pressure of the Gag₁₆₄₋₁₇₂KP9-specific immune responses was removed [Fernandez *et al.*, 2005; Loh *et al.*, 2007; Fernandez *et al.*, 2007]. In addition, unvaccinated pigtail macaques infected with SIVmac251 that directed a response against Gag₁₆₄₋₁₇₂KP9 have significantly reduced plasma viremia compared to Gag₁₆₄₋₁₇₂KP9 non-responders [Smith *et al.*, 2005a].

Additional research has also identified three subdominant Gag responses in pigtail macaques restricted by various other MHC class I alleles (Table I-B.1) [Smith *et al.*, 2005a; Fernandez *et al.*, 2005; Pratt *et al.*, 2006]. Furthermore, several other Gag-specific CD8 and CD4 responses are currently being mapped, and their restriction elements determined [Fernandez *et al.*, 2005]. Finally, another study provided a comparative virological and immunological analysis of a variety of primate lentiviruses showing the variable pathogenicity of a variety of SIV/SHIVs that are available for use in pigtail macaques [Batten *et al.*, 2006].

I-B-10 Mauritian cynomolgus macaques

Research with cynomolgus macaques has not been as common as research with rhesus macaques because many SIV and SHIV strains are less pathogenic in the cynomolgus species [Reimann *et al.*, 2005]. However, lately there has been renewed interest in studying the SIV-specific immune responses in these animals, largely due to the unique immunogenetics of cynomolgus macaques from the Indian Ocean island of Mauritius. During the definition of 66 MHC class I alleles in cynomolgus macaques of Chinese, Vietnamese, and Mauritian origin, it was discovered that most MHC class I alleles could be divided by geographic origin, with few alleles shared by animals descended from geographically distinct populations [Krebs *et al.*, 2005]. This is similar to findings in Chinese and Indian rhesus macaques, which do not express the same MHC class I alleles [Ling *et al.*, 2002; Trichel *et al.*, 2002]. These data highlight the point that macaques from different origins are not interchangeable in studies of cellular immunity.

However, also of great interest was the finding that more than 50% of Mauritian cynomolgus macaques shared a combination of three MHC class I alleles. In contrast, the most frequent Indian rhesus macaque alleles are present at a frequency of only 25-30% in any given population [Kaizu *et al.*, 2007].

Follow-up analysis using microsatellite markers revealed that the Mauritian cynomolgus macaques have extremely simple MHC genetics, with six distinct chromosomal haplotypes accounting for almost all of the MHC class I and class II diversity in this population, likely due to these animals being recently descended from a small founder population [Lawler *et al.*, 1995]. Remarkably, 39% of Mauritian cynomolgus macaques carry at least one copy of the most frequent MHC haplotype, with 8% being homozygous for this haplotype [Wiseman *et al.*, 2007]. This extensive sharing of MHC haplotypes is unprecedented among macaques [Otting *et al.*, 2005; Penedo *et al.*, 2005; Krebs *et al.*, 2005; Wiseman *et al.*, 2007] and could expand the scope of SIV studies undertaken in non-human primates by allowing greater control over genetic variability. Studies are now possible in which entire MHC class I haplotypes are matched, rather than a single MHC class I molecule, as is typical in Indian rhesus macaque studies. This may simplify studying cellular immune responses by eliminating unknown influences of unmatched MHC class I alleles. In addition, adoptive lymphocyte transfers that are possible in inbred mouse strains might now be technically feasible with MHC-identical macaques. Recently, the MHC class II alleles for the six common haplotypes were characterized in these animals, enabling researchers to generate useful molecular reagents for CD4+ T cell studies [O'Connor *et al.*, 2007].

At this point, SIV epitopes restricted by these high frequency MHC class I alleles have not been mapped in Mauritian cynomolgus macaques. However, a recent study defined a single Gag minimal-optimal epitope of unknown MHC class I restriction [Negri *et al.*, 2006]. In addition, a similar breadth of cellular immune responses in Gag, Pol, Tat, Env, Rev, and Nef was identified in two MHC class I-identical SIVmac239-infected macaques. Corresponding viral variation was seen in Tat, Rev, and Nef that may prove to be escape from CD8+ T cell pressures [Wiseman *et al.*, 2007].

I-B-11 Advances in MHC genotyping methods

To support efficient utilization of limited nonhuman primate resources and maximize the understanding of SIV-specific immune responses in vaccine and viral pathogenesis studies, accurate and efficient MHC genotyping technologies are needed.

PCR amplification with sequence specific primers (PCR-

SSP) is currently the preferred method for MHC genotyping at allelic-level resolution in many human clinical laboratories [Olerup & Zetterquist, 1991, 1992] because this technique is specific, robust, and straightforward. The PCR-SSP platform enables rapid, high throughput analysis, yet it is cost effective and requires inexpensive equipment. These benefits have made it a productive choice for MHC class I genotyping of Indian rhesus macaques. Initial investigations designed PCR-SSP primers for a single MHC class I allele of interest, with unique PCR amplification conditions [Knapp *et al.*, 1997; Vogel *et al.*, 2002a; Horton *et al.*, 2001; Loffredo *et al.*, 2005; Robinson *et al.*, 2001; Schramm *et al.*, 2001; Su *et al.*, 2005]. However, recent technological improvements have allowed the use of unified PCR conditions, allowing simultaneous PCR amplification of eight Indian rhesus macaque MHC class I alleles [Kaizu *et al.*, 2007]. These alleles were selected since they have been implicated in the restriction of SIV-specific CD8+ T cell epitopes. Molecular genotyping of *Mamu-A*01*, *-A*02*, *-A*08*, *-A*11*, *-B*01*, *-B*03*, *-B*04*, and *-B*17* can now be conducted in a high throughput fashion, using genomic DNA as a template.

Although the importance of defining the complete MHC class I repertoire of a given macaque is well recognized, development of a simple, comprehensive molecular genotyping method for rhesus macaque MHC class I alleles has been difficult. During the evolution of this species, the *Mamu-A* and *Mamu-B* loci were duplicated [Bontrop & Watkins, 2005; Otting *et al.*, 2005; Daza-Vamenta *et al.*, 2004; Boyson *et al.*, 1996; Kulski *et al.*, 2004]. Therefore, macaques express a variable number of MHC class I alleles per haplotype.

The complexity of the nonhuman primate MHC is problematic for PCR-SSP-based genotyping since this technique can only detect known MHC alleles. Moreover, it is difficult to develop allele-specific primers in the absence of a reasonably complete allele database. The established methods to identify all of the alleles in a given macaque involve PCR cloning and sequencing, or generating macaque-derived cDNA libraries. While cDNA libraries are the gold standard in identifying MHC alleles, the process is very time consuming and expensive. PCR cloning and sequencing is a less time consuming alternative and requires less starting material. However, this technique may introduce PCR artifacts or provide incomplete MHC coverage due to primer mismatches. Therefore, alternative genotyping methods for rapid identification of all of the alleles in a given animal are being investigated.

The most developed of these techniques is reference strand-mediated conformational analysis, or RSCA. RSCA is a modified heteroduplex assay capable of characterizing complex gene families [Argüello & Madrigal, 1999; Argüello *et al.*, 2003; Kennedy *et al.*, 2005; Krebs *et al.*, 2005]. Heteroduplexes are created by hybridization between fluorescently labeled reference strands and individ-

ual MHC alleles. RSCA can resolve individual MHC alleles because each MHC/reference strand heteroduplex produces a characteristic and reproducible mobility profile when electrophoresed in a nondenaturing polyacrylamide gel. The mobility profile of each MHC allele can be further resolved for higher degrees of sensitivity with the addition of alternative reference strands. RSCA, unlike conventional genotyping techniques (i.e. PCR-SSP), can detect multiple known and unknown MHC alleles in a single reaction, enabling the researcher to define the full complement of expressed class I alleles in a given animal.

RSCA has been used in several nonhuman primate studies, including the SIV models summarized in this review. These applications include MHC genotyping, allele discovery, epitope restriction determination, and identifying haplotype inheritance patterns [Krebs *et al.*, 2005; Smith *et al.*, 2005a,b; Pratt *et al.*, 2006; Baquero *et al.*, 2006; Wiseman *et al.*, 2007; Tanaka-Takahashi *et al.*, 2007]. Current RSCA platforms can be easily expanded to incorporate newly discovered alleles once a mobility profile is established. However, RSCA is best utilized in tandem with other MHC genotyping techniques due to limited sensitivity in some circumstances [Pratt *et al.*, 2006; Tanaka-Takahashi *et al.*, 2007]. In addition, this technique is still technically demanding [Krebs *et al.*, 2005; Pratt *et al.*, 2006; Smith *et al.*, 2005a,b], so genotyping via capillary electrophoresis is currently being explored for higher throughput and increased sensitivity.

Another alternative for rapid MHC genotyping is microsatellite analysis, also known as short tandem repeat (STR) genotyping. For years, microsatellite genotyping has been applied for tissue matching and donor screening in human transplantation [Carrington & Wade, 1996; Foisac *et al.*, 2001]. MHC genotyping using microsatellite markers has become more common because the method is sensitive, accurate, and cost effective. With the recent publication of the genomic sequence of the entire rhesus macaque MHC [Daza-Vamenta *et al.*, 2004], and more recently the complete genome of an Indian-origin rhesus macaque [Gibbs *et al.*, 2007], additional microsatellite sites have been identified for use in nonhuman primate studies. Microsatellite maps of the macaque MHC were recently published [Wojcechowskyj *et al.*, 2007; Wiseman *et al.*, 2007] in addition to a core marker set of four multiplex PCR panels comprising fifteen autosomal STR loci for genetic managements of rhesus macaque colonies [Kanthaswamy *et al.*, 2006].

Microsatellite genotyping has already been utilized in rhesus macaque breeding groups to help define MHC haplotypes, track descent, and to differentiate chromosome configurations that would appear identical based on more limited allele-specific genotyping [Penedo *et al.*, 2005]. More recently, microsatellite analysis was instrumental in characterizing the simple genetics of Mauritian cynomolgus macaques [Wiseman *et al.*, 2007]. In order to define

MHC haplotypes in these animals, a panel of eighteen microsatellite markers, spanning the entire 5-Mb MHC region was utilized. The majority of the primers used to amplify these microsatellite markers were adapted from rhesus genomic sequences [Daza-Vamenta *et al.*, 2004; Gourraud *et al.*, 2004; Penedo *et al.*, 2005]. In a cohort of more than 100 feral Mauritian cynomolgus macaques, this analysis was applied to identify the six common haplotypes that account for two-thirds of the MHC haplotypes in these animals, as described above [Wiseman *et al.*, 2007]. Microsatellite genotyping can also be used for direct genotyping for a specific MHC class allele if a tightly linked microsatellite marker is identified. For example, the H11-9268 microsatellite marker has shown exceptional linkage to *Mamu-B*17* in a cohort of 75 Indian rhesus macaques [Wojcechowskyj *et al.*, 2007]. In the future, this technology may assist in selective breeding of nonhuman primates by identifying homozygous animals, something that is not possible with current PCR-SSP strategies.

Identification of single nucleotide polymorphisms (SNPs) has also been aided by the completion of the rhesus macaque genome. Recently, 23,000 candidate SNPs were identified throughout the rhesus macaque genome and compiled into a web resource called *MamuSNP* that is housed at <http://mamusnp.ucdavis.edu> [Malhi *et al.*, 2007]. Two other studies identified and applied SNPs to population genetic analyses between Indian-origin and Chinese-origin rhesus macaques to understand the demographic history and genetic divergence of these two groups [Ferguson *et al.*, 2007; Hernandez *et al.*, 2007]. Like microsatellite analysis, genetic studies using SNPs will play an important role in establishing ancestry, directing macaque breeding programs, and helping to map and identify genes involved in complex diseases in the future.

I-B-12 Concluding remarks

Nonhuman primate AIDS research is critical to HIV vaccine development and pathogenesis studies. A great deal of progress has been made in improving the nonhuman primate model in the last decade. The cellular immune responses of Indian rhesus macaques are far better defined, and additional macaque models, Burmese rhesus, pigtail, and cynomolgus, which are useful for AIDS research have been identified. However, despite this progress, our understanding of macaque immunogenetics is still rudimentary. Much work remains to be done in identifying MHC class I and class II alleles in these macaques, in mapping immune responses, and in characterizing which responses are effective against immunodeficiency viruses. Understanding these basic issues may then facilitate pathogenesis studies, and the rational design and testing of T cell-based vaccination strategies.

I-B-13 Table of SIV epitopes

Table I-B.1: Known MHC class I epitopes and restricting molecules

Virus	Species ^a	Protein	Amino acid positions ^b	Short name	Sequence	Restricting molecule ^c	GenBank Acc. No. ^d	Reference
SIV _{mac239}	Rhesus	Gag	149-157	LW9	LSPRTLNAW	Mamu-A*01 ^e	U50836	Allen <i>et al.</i> , 2001
SIV _{mac239} , SIV _{smE660} , SIV _{smH4}	Rhesus	Gag	181-189	CM9	CTPYDINQM	Mamu-A*01 ^e	U50836	Allen <i>et al.</i> , 2001, 1998; Furchner <i>et al.</i> , 1999
SIV _{mac239}	Rhesus	Gag	254-262	QI9	QNPIPVGNI	Mamu-A*01 ^e	U50836	Allen <i>et al.</i> , 2001
SIV _{mac239}	Rhesus	Gag	372-379	LF8	LAPVPIPF	Mamu-A*01 ^e	U50836	Allen <i>et al.</i> , 2001

Notes:

^a Unless specified, rhesus designation implies rhesus macaques of Indian descent.

^b Positions indicated for SIVmac239 or first virus listed for each epitope unless otherwise specified. Epitopes in Pol are numbered from the open reading frame.

^c MHC class I molecule designations: rhesus macaque (*Macaca mulatta*; *Mamu*); cynomolgus macaque (*Macaca fascicularis*; *Mafa*); pigtail macaque (*Macaca nemestrina*; *Mane*).

^d The GenBank Acc. No. listed for each MHC class I restricting allele contains the most complete nucleotide sequence for that corresponding allele. Multiple entries were marked if several full length sequences were available.

^e The following GenBank Acc. No. are also listed for Mamu-A*01: AJ539307 and NM 001048246.

^f This CD8+ T cell epitope, with an amino acid substitution at position 5, has been identified in both SIVmac239- and SIVmac251-infected macaques.

^g This CD8+ T cell epitope, with amino acid substitutions at position 7 and 8, has been identified in both SIVmac239- and SIVsmE660-infected macaques.

^h This CD8+ T cell epitope, with an amino acid substitution at position 1, has been identified in both SIVmac239- and SIVmac251-infected macaques.

- ⁱ The following GenBank Acc. No. is also listed for Mamu-A*02: AJ539308.
- ^j Epitopes may also be restricted by Mamu-A*01 in addition to Mamu-A*02.
- ^k SIVppm is a heterogenous virus stock that contained both sequences of this Nef epitope.
- ^l This CD8+ T cell epitope, with an amino acid substitution at position 3, has been identified in both SIVmac239- and SIVppm-infected macaques.
- ^m MHC class I restriction unknown but mapped to a single MHC class I haplotype, 90-120-Ia. This haplotype consists of three *Mamu-A* alleles, (*Mamu-A120-1*, *Mamu-A120-4*, and *Mamu-A120-5*) and four *Mamu-B* alleles (*Mamu-B120-1*, *Mamu-B120-6*, *Mamu-B120-8*, and *Mamu-B120-9*).
- ⁿ The following GenBank Acc. No. is also listed for Mamu-A*10: EF010518.

Part II

HIV CTL/CD8 + Epitopes

CTL CD8+

II-A

Summary

This part includes tables, maps, and associated references of HIV-specific CTL epitopes arranged sequentially according to the location of the proteins in the HIV-1 genome. We attempted to make this part as comprehensive as possible, requiring that the epitope be contained within a defined region of a maximum of 30 amino acids, but not that the optimal boundaries be defined. Studies that were based on the analysis of whole proteins are described at the end of each protein section. The same epitope can have multiple entries, as each entry represents a single publication in this part of the database. For more recent updates, epitope sequence alignments, and useful search capabilities, please see our web site: <http://www.hiv.lanl.gov/content/immunology>. For a concise listing of the best defined CTL epitopes, see the summary by Nicole Frahm, Caitlyn Linde and Christian Brander on page 3 in Part I of this compendium. CTL responses to proteins with no defined epitopes are listed at the end of each protein section.

Recent studies utilize multiple functions attributed to T cells to define responses, and the simple distinctions of cytotoxic T-cell and helper T-cells have become blurred as more is learned about the range of responses triggered in CD4 and CD8 positive T-cells responding to antigenic stimulus. When adding the most recent studies to the database, we have tried to place T cell responses in a reasonable manner into our traditional helper T cell and CTL parts, and to specify the assay used to measure the response in each study.

II-A-1 Epitope tables

Each CTL reference has a multi-part basic entry:

HXB2 location: The viral strain HXB2 (GenBank Accession Number K03455) is used as a reference strain throughout this publication. The position of the defined epitope location relative to the sequence of the HXB2 protein is indicated. The numbering in this table corresponds to the protein maps. Because of HIV-1 variation the epitope may not actually be present in HXB2; rather, the position in HXB2 indicates the position aligned to the epitope. HXB2 was selected as the reference strain because so many studies use HXB2, and because crystal structures for HXB2-related proteins are often available. The precise positions of an epitope on the HXB2 reference strain can be readily

obtained using the interactive position locator at our web site: <http://www.hiv.lanl.gov/content/hiv-db/LOCATE/locate.html>.

Author location: The amino acid positions of the epitope boundaries and the reference sequence are listed as given in the primary publication. Frequently, these positions as published are imprecise, and do not truly correspond to the numbering of the sequence, but they provide a reasonable guide to the peptide's approximate location in the protein. Also, in many cases the reference sequence identification was not provided, and in such cases it is not possible to use these numbers to specify precise locations.

Epitope: The amino acid sequence of the epitope of interest as defined in the reference, based on the reference strain used in the study defining the epitope. On occasions when only the position numbers and not the actual peptide sequence were specified in the original publication, we tried to fill in the peptide sequence based on the position numbers and reference strain. If the sequences were numbered inaccurately by the primary authors, or if we made a mistake in this process, we may have misrepresented the binding site's amino acid sequence. Because of this uncertainty, epitopes that were not explicitly written in the primary publication, that we determined by looking up the reference strain and the numbered location, are followed by a question mark in the table.

Epitope name: If the epitope has a name attributed by the publication, it is recorded here, e.g. "SL9".

Subtype: The subtype under study, generally not specified for B subtype.

Immunogen: The antigenic stimulus of the CTL response. Often this is an HIV-1 infection. If a vaccine was used as the original antigenic stimulation, not a natural infection, this is noted separately, and additional information about the vaccine antigen is provided as available.

Species (MHC): The species responding and MHC or HLA specificity of the epitope.

Donor MHC: The HLA genotype of the individual that responded to the epitope.

Country: The country where the samples were obtained—generally not specified if the study was conducted in the United States.

Assay type: Assay used to characterize the response.

Keywords: Keywords are a searchable field for the web interface that is included in the T-cell sections of the

printed version to help identify entries of particular interest.

Reference: The primary reference (sometimes two or more directly related studies are included). Details for some of the earlier references are in Part V.

Following the entry for a given CTL epitope brief comments explain the context in which the epitope was studied and what was learned about the epitope in a given study.

II-A-2 HIV protein epitope maps

All HIV CTL epitopes mapped to within a region of 14 amino acids or less are indicated on the HIV protein epitope maps. The location and HLA restriction elements of CTL epitopes are indicated on protein sequences of HXB2. These maps are meant to provide the relative location of defined epitopes on a given protein, but the HXB2 sequence may not actually carry the epitope of interest, as it may vary relative to the sequence for which the epitope was defined. Epitopes with identical boundaries and HLA fields are included in the maps only once. If one laboratory determines HLA presenting molecules at the serotype level (example: A2) and another at the genotype level (example: A*0201) both will be included in the map. MHC specificities are indicative of the host species; when no MHC presenting molecule is defined, the host species is noted.

II-A-3 Alignments

To conserve space, no epitope alignments are provided in this book, but they can be generated using the CTL epitope search tool at <http://www.hiv.lanl.gov/content/immunology>. The master alignment files from which the epitope alignments were created are available at our web site at http://www.hiv.lanl.gov/content/hiv-db/ALIGN_CURRENT/ALIGN-INDEX.html.

II-B

HIV CTL/CD8+ Epitope Tables

All HIV CTL epitopes are arranged by protein position. The table entries are sorted in a nested way—first by protein, then by HXB2 start location, and finally by HLA presenting molecule. CTL reactions against proteins with undefined epitopes are listed at the end of the protein that stimulated the response.

II-B-1 Gag p17 CTL/CD8+ epitopes

HXB2 Location p17 (5–13)
Author Location Gag (5–13 SUMA)
Epitope ASVLSGGEL
Epitope name Gag AL9
Subtype B
Immunogen HIV-1 infection
Species (MHC) human
Donor MHC A*1103, A*2402, B*1402, B*1501, Cw*0802
Country United States.
Assay type CD8 T-cell Elispot - IFN γ , Chromium-release assay
Keywords dynamics, acute/early infection, characterizing CD8+ T cells
References Jones *et al.* 2004

- Primary CD8+ T-cell response to Env, Tat and Gag and the extent, kinetics and mechanisms of viral escape were examined in three patients. Rapid escape, within weeks from infection, from HIV specific CTL responses was observed in all three patients, but the kinetics and extent of the escape differed depending on the breadth and co-dominant distribution of CTL-mediated pressure. The two patients that rapidly declined had more focused immunodominant responses, while the single patient that had low viral load and stable CD4 counts for seven years had a broad co-dominant response and less escape.
- The patient SUMA maintained low viral loads and stable CD4 T-cell counts through 7 years of followup. In contrast to more rapid progressors WEAU and BORI, SUMA had a broad response to 24 epitopes, with little immunodominance. Two peptides were somewhat more intensely recognized in acute infection, but this response leveled out early on.
- Only 4 epitopes acquired escape mutations in SUMA over time, and this was 1 of the 20 that remained invariant. A low level response was detected at acute infection that persisted through early infection.

HXB2 Location p17 (8–18)
Author Location Gag (8–18)
Epitope LSGGELDRWEK
Epitope name Gag I.2
Immunogen vaccine

Vector/Type: DNA prime with modified vaccinia Ankara (MVA) boost **Strain:** B clade
HIV component: Env, Gag, Protease, Rev, RT, Tat, Vpu

Species (MHC) macaque

Assay type T-cell Elispot, Intracellular cytokine staining

Keywords subtype comparisons, variant cross-recognition or cross-neutralization, memory cells

References Amara *et al.* 2005

- A clade B DNA/MVA HIV vaccine was shown to raise a broad cross-reactive cellular immune response for peptides based on the CRF02_AG consensus Gag in macaques. The activity was better conserved for CD8 than CD4 T cells.
- All 5 CD8 and 4/8 of the CD4 epitopes that were recognized in vaccinated macaques have also been reported for human infections, indicating cross-species conservation. The similar reported human epitope in this case is GELDRWEKI. HLA restriction: B*4002, B62
- Conservation across other clades: none. The form that is most common in CRF02, LSGGkLDaWEK, does not cross-react with the B clade elicited response.

HXB2 Location p17 (11–19)

Author Location

Epitope GELDRWEKI

Epitope name Gag-GI9

Subtype B

Immunogen HIV-1 infection

Species (MHC) human (B*4002)

Donor MHC 01RCH46: A*0201, A*0217, B*0801, B*4002, Cw*0303, Cw*0701

Keywords HAART, ART

References Sabbaj *et al.* 2003

- This study monitored epitope responses in HIV-1 infected minority women living in the United States.
- 24 epitopes were described – 8 were novel, 8 used new restricting elements but were previously defined epitopes, and 8 were previously described.
- Serial peptide truncations were used to define optimal epitopes for CTL cell lines isolated from 12 individuals, assayed by a Cr-release.
- This epitope was newly defined in this study.
- Patient 01RCH46 was Hispanic, on HAART, and had a viral load of 21000 and CD4 count of 623 – she also recognized KETINEEAA p24(70-78), HLA B*4002, and TAFTIPSI, RT(128-135), HLA A*0217.
- Among HIV+ individuals who carried HLA B40, 2/5 (40%) recognized this epitope.

HXB2 Location p17 (11–19)

Author Location p17 (11–19)
Epitope GELDRWEKI
Immunogen HIV-1 infection
Species (MHC) human (B*4002)
Keywords optimal epitope
References Frahm *et al.* 2007

HXB2 Location p17 (11–19)

Author Location p17 (11–19)
Epitope GELDRWEKI
Epitope name GI9
Subtype B
Immunogen HIV-1 infection
Species (MHC) human (B40)
Donor MHC A*30, B*18, B*40, Cw*02, Cw*05
Country United States.
Assay type CD8 T-cell Elispot - IFN γ
Keywords responses in children, mother-to-infant transmission, escape, acute/early infection, reversion, viral fitness
References Sanchez-Merino *et al.* 2005

- CD8 T-cell responses were examined in mother-infant pairs. Escape variants were commonly detected in maternal plasma. Early infant plasma viruses showed heterogeneity of gag and nef gene sequences as well as mother-to-child transmission of CD8 T-cell escape variants. The stability of escape mutants in the infant over time was determined by infant HLA haplotype and viral fitness. Sequential plasma specimens from infants showed changes in CD8 T-cell epitope sequences, suggesting that infants are capable of generating virus-specific CD8 T-cell responses.
- The escape variant geldrWkKi was detected in 10/10 maternal clones from a B40-positive mother, but was absent in all sequences from her B40-negative infant, sampled at months 2, 4, and 11, suggesting either transmission of a minority wild-type variant, or rapid reversion in the absence of continued CTL pressure.
- geldrWkKi elicited lower responder cell frequencies than GELDRWEKI.

HXB2 Location p17 (11–30)

Author Location Gag (11–30)
Epitope GELDRWEKIRLRPGGKKKYK
Subtype B
Immunogen HIV-1 infection
Species (MHC) human (B62)
Donor MHC A2, A32, B27, B62
Assay type Chromium-release assay
Keywords genital and mucosal immunity
References Musey *et al.* 2003

- CTL clones from blood, semen, cervix and rectum samples from 12 individuals were compared. CTL clones derived from blood and mucosal samples had similar high lysis efficiency, primarily perforin dependent, and TCRbeta VDJ region sequencing revealed cases of expansion of the same clone in different compartments.
- CD8+ T cell clones directed at this epitope were derived from blood and semen.

HXB2 Location p17 (12–21)

Author Location p17
Epitope ELDRWEKIRL
Subtype B, C
Immunogen HIV-1 infection
Species (MHC) human (B63)
Assay type CD8 T-cell Elispot - IFN γ
Keywords rate of progression
References Frahm *et al.* 2005

- HLA-B63-positive subjects were shown to be able to generate CTL responses early in acute HIV infection and to control HIV replication in the absence of antiretroviral treatment. Since HLA-B63 shares the epitope binding motif of HLA-B57 and -B58, it was shown that HLA-B63-positive individuals mounted CTL responses to previously identified B57-restricted epitopes, as well as novel, B63-restricted epitopes. Moreover, these novel B63-restricted epitopes can also be presented by HLA-B57 and -B58.
- This is a putative HLA B63 epitope containing the B58 super-type binding motif embedded in a reactive peptide. There is no evidence for B57/B58 cross-presentation of this epitope.

HXB2 Location p17 (16–30)

Author Location p17 (16–30 HXB2)
Epitope WEKIRLRPGGKKKYK
Subtype B
Immunogen HIV-1 infection
Species (MHC) human
Assay type T-cell Elispot
Keywords immunodominance, early treatment
References Addo *et al.* 2003

- Comprehensive Elispot screening of 504 overlapping peptides that spanned all HIV-1 proteins in 57 HIV-1 infected individuals. Four groups of patients were compared: 23 were untreated; 12 patients were chronically infected and treated; 22 started treatment during acute infection, 11 continuously treated and 11 with STI.
- 63% of the peptides were recognized - the most frequent responses were directed against Nef (95%) and p24-Gag (88%). p17 was the most frequently recognized protein after correction for protein length. A median of 18 peptides (range 2–42) were recognized per person. The most frequently (>20%) recognized peptides were located in conserved regions within clade B sequences. Vpu was rarely recognized.
- Responses to this peptide were detected in 19% of the study subjects, and it was one of the 25 most frequently recognized peptides.

HXB2 Location p17 (18–26)

Author Location p17 (18–26 IIIB)
Epitope KIRLRPGGK
Immunogen
Species (MHC) human (A*0301)
Keywords optimal epitope
References Frahm *et al.* 2007

- C. Brander notes that this is an A*0301 epitope.

HXB2 Location p17 (18–26)

Author Location
Epitope KIRLRPGGK
Immunogen HIV-1 infection

Species (MHC) human (A*0301)

Keywords acute/early infection

References Wilson *et al.* 2000a

- Three individuals with highly focused HIV-specific CTL responses were studied during acute infection using tetramers – high frequencies of HIV-1-specific CD8+ T cells were found prior to seroconversion, and there was a close temporal relationship between the number of circulating HIV-specific T cells and viral load was also found.
- All three patients were B*2705, with HLA alleles: A1, A30/31, B*2705, B35; A1, A*0301, B7, B2705; and A*0201, A*0301, B2705, B39.
- ELISPOT was used to test a panel of CTL epitopes that had been defined earlier and were appropriate for the HLA haplotypes of the study subjects – 3/3 subjects showed a dominant response to the B*2705 epitope KRWILGGLNK.
- The subject with A*0201 had a moderately strong response to SLYNTVATL.
- Weak responses were observed to A*301-RLRPGGKKK, A*301-QVPLRPMYK, and B7-TPGPGVRYPL in the subject who has HLA A1, A*0301, B7, B*2705.
- No acute response was detected to the following epitopes: A*201-ILKEPVHGV, A*301-KIRLRPGGK, A*301-AIFQSSMTK, A*301-TVYYGVPVWK, B35-EPIVGAETF, B35-HPDIVIYQY, B35-PIPVGEIY, B35-NSSKVSQNY, B35-VPLRPMY, B35-DPNPQEVVL.

Immunogen HIV-1 infection

Species (MHC) human (A*0301)

Donor MHC A*0101, A*0301, B*0801; A*0201, A*3101, B*3501, B*3905

Country United Kingdom.

Assay type CD8 T-cell Elispot - IFN γ , HLA binding

Keywords escape, acute/early infection, variant cross-recognition or cross-neutralization

References Milicic *et al.* 2005

- CTL responses and escape were analyzed in 4 homosexual couples where blood samples were available within weeks of estimated transmission. CTL escape variants were often transmitted. When the recipient had the same HLA type as the donor, CTL escape variants prevented a CTL response to those epitopes in the recipient. Even when the HLA alleles were different in the transmitting couple, a single escape mutation in one epitope can abolish CTL recognition of an overlapping epitope of distinct restriction in the recipient.
- A*0301 epitopes RLRPGGKKK and KIRLRPGGK, and B*0801 epitope GGKKKYRL, overlap. In 1 donor, the transmitted virus carried the escape form for 2 of these epitopes. The double substitution kirlrpggR results in escape from response in the donor. Similarly, the double substitution ggRkkyKl results in escape for this epitope.
- The escape mutation kirlrpggR in this epitope resulted in 74% reduction in HLA binding affinity. The other variant tested, kirlrQggR, resulted in 90% reduction.

HXB2 Location p17 (18–26)

Author Location p17 (18–26 IIIB)

Epitope KIRLRPGGK

Immunogen HIV-1 infection

Species (MHC) human (A3)

Keywords responses in children, mother-to-infant transmission, escape

References Wilson *et al.* 1996

- Epitope defined in the context of the Pediatric AIDS Foundation ARIEL Project, a mother-infant HIV transmission study.
- KIRLRPGGR and RIRLRPGGR, naturally occurring variants, were found in mother and are escape mutants.

HXB2 Location p17 (18–26)

Author Location p17 (18–26)

Epitope KIRLRPGGK

Immunogen in vitro stimulation or selection

Species (MHC) human (A3)

Keywords dendritic cells

References Zarling *et al.* 1999

- This study compares the ability of macrophages and dendritic cells to stimulate primary responses in CD8+ lymphocytes isolated from HLA-appropriate HIV-uninfected donors using peptide-pulsed APC – the dendritic cells performed better as APC for the stimulation of primary responses.

- Strong CTL responses were elicited by the epitopes DRFYK-TLRA and GEIYKRWII when presented by either immature or mature dendritic cells – macrophages were not able to prime a CTL response against DRFYKTLRA.
- A weak response to KLTPLCVSL was stimulated using macrophages as the APC.
- No detectable response was observed for the following previously-defined HIV epitopes: KIRLRPGGK, ILKEPVHGV, IRLRPGGK, GPKVKQWPL.

Epitope KIRLRPGGK

Immunogen HIV-1 infection, HIV-1 exposed seronegative

Species (MHC) human (A3)

Keywords HIV exposed persistently seronegative (HEPS)

References Kaul *et al.* 2001a

- KIRLRPGGK is cross-reactive for A, B, and D clades.
- ELISPOT was used to study CTL responses to a panel of 54 predefined HIV-1 epitopes in 91 HIV-1-exposed, persistently seronegative (HEPS) and 87 HIV-1-infected female Nairobi sex workers.

HXB2 Location p17 (18–26)

Author Location p17 (JRCSF)

Epitope KIRLRPGGK

Subtype B

Immunogen HIV-1 infection

Species (MHC) human (A3)

References Severino *et al.* 2000

- Primary HLA-A3+ CD4+ and HLA-mismatched lymphocytes from uninfected donors were infected with JRCSF after isolation then cocultured with the A3-restricted CTL clone 11504/A7 specific for KIRLRPGGK, and viral inhibition was MHC-restricted.

- Primary monocytes and monocyte-derived DC were generated from the same donors, replication of HIV-1 in these cell types was less efficient than in lymphocytes and could also be inhibited by MHC-restricted CTL.
- DC-lymphocyte cluster cultures allowed vigorous viral replication and MHC-restricted CTL viral inhibition was blunted or lost depending on the ratio of DC to CD4+ lymphocyte in the culture.

Epitope KIRLRPGGK

Epitope name A3-KK9

Subtype B

Immunogen HIV-1 infection

Species (MHC) human (A3)

Donor MHC A3, B7, Cw7

Keywords dynamics, supervised treatment interruptions (STI), immunodominance, acute/early infection

References Yu *et al.* 2002a

- CTL responses in 18 acutely HIV-infected HLA-A3 (n=7) or -B7 (n=4) or both -A3 and B7 (n=7) positive individuals were studied.
- One individual, AC-06, was homozygous at all three class I alleles (A3, B7, Cw7), was treated during acute infection and had supervised treatment interruptions (STI). He had only two detectable CTL responses during acute infection, but after STI this broadened to 27 distinct epitopes including 15 restricted by HLA-A3, 11 by HLA-B7, and 1 by HLA-Cw7.
- 8/14 HLA-A3 positive individuals had detectable A3-restricted responses during acute infection. Only 5/15 of HLA-A3 epitopes tested were targeted during acute infection. 7/8 individuals with acute responses had specific responses for this epitope.
- KIRLRPGGK and RLRPGGKKK were the most commonly recognized HLA-A3 epitopes during acute infection, after 1 year of treatment, and after STI. RLRPGGKKK was immunodominant.

Country Netherlands.

Assay type CD8 T-cell Elispot - IFN γ , Flow cytometric T-cell cytokine assay

Keywords rate of progression, escape

References Geels *et al.* 2003

- Both stable potential epitopes and epitopes with escape mutations were found in a patient with increasing viral load over a time period of 4 years. Fixation of escape mutations occurred sequentially and correlated with the rise in viral load and with the increased number of productively infected cells.
- This is one of 17 potential epitopes from this individual, defined based on previously identified epitopes presented by appropriate HLA molecules. Full length genome sequence did not reveal changes in time in any of these epitopes over a four year period. Peptide pools initially revealed very little response to these epitopes, but this increased over time.

Assay type CD8 T-cell Elispot - IFN γ , Flow cytometric T-cell cytokine assay

Keywords epitope processing, immunodominance, escape, acute/early infection, characterizing CD8+ T cells, reversion, viral fitness

References Allen *et al.* 2004

- KK9 and RK9 overlap, are presented by HLA-A3, and are frequently immunodominant and involved in acute-phase primary responses. A mutation in the C-terminal flanking residue of KK9 (K to Q) (kirlrpkkq-Q) inhibits processing of the immunodominant gag KK9 epitope, resulting in rapid decline in the KK9 specific CD8+ T-cell response. At the same time it abrogates the response to RK9 through the embedded mutation rlrpggkQk. Transmission of this mutation to patients expressing HLA-A3 prevents acute-phase response to these epitopes, although the mutation can eventually revert to wild-type allowing a delayed response to the epitope.

Assay type CD8 T-cell Elispot - IFN γ

Keywords responses in children, mother-to-infant transmission, escape, acute/early infection, reversion, viral fitness

References Sanchez-Merino *et al.* 2005

- CD8 T-cell responses were examined in mother-infant pairs. Escape variants were commonly detected in maternal plasma. Early infant plasma viruses showed heterogeneity of gag and nef gene sequences as well as mother-to-child transmission of CD8 T-cell escape variants. The stability of escape mutants in the infant over time was determined by infant HLA haplotype and viral fitness. Sequential plasma specimens from infants showed changes in CD8 T-cell epitope sequences, suggesting that infants are capable of generating virus-specific CD8 T-cell responses.
- The escape variant kirlrpggR was present in 10/10 clones from an A3+ mother, was transmitted to her infant, and present in 10/10 clones at months 2 and 4, but decreased to 0/10 clones by 15 months of age in her A3- child.

Epitope KIRLRPGGKK

Subtype C

Immunogen HIV-1 infection

Species (MHC) human (A*0301)

Country South Africa.

Assay type CD8 T-cell Elispot - IFN γ

Keywords characterizing CD8+ T cells

References Kiepiela *et al.* 2004

- HLA class I restricted CD8+ T-cell responses against HIV-1 were analyzed in African patients. Significantly more responses were shown to be HLA-B restricted. Viral load, CD4 count, and thus rate of disease progression were also associated with HLA-B alleles. In addition, the selection pressure imposed on HIV-1 by HLA-B alleles was shown to be substantially greater than by other alleles.
- This epitope was suggested to be the epitope within a longer reactive peptide based on correspondence with a known epitope in the HIV database. Also, a significantly higher frequency of people in the Durban cohort who reacted with the peptide had this HLA type.

- Three distinct HLA alleles known to alter the rate of AIDS progression were studied. B*57-mediated protection occurs early in infection and the protective effect of this allele subsides after CD4 cell count drops. In contrast, B*27 shows no protection against progression to CD4<200, but rather delays progression to an AIDS-defining illness after the CD4 counts have dropped. B*35-mediated rapid progression to AIDS is probably a function of early decline in CD4 counts.
- KK10 escape occurs late and was shown to precede a sharp increase in viral load. The authors hypothesize the B27 benefit may arise due to enduring HLA restriction after escape from many other allotype responses has occurred.

Keywords mother-to-infant transmission

References Sabbaj *et al.* 2002

- IFN γ T-cell responses in breast milk of 5 HIV-1 infected women from the US and 6 from Zambia were tested using Elispot. 11/11 women responded to Gag, 8/11 responded to Pol, 7/11 women to Nef, and 2/5 women to Env peptide pools. These responses were shown to be primarily due to CD8+ T-cells in one woman, and another woman had cytolytic responses measured by Cr-release.
- Tetramer analysis of breast milk and peripheral blood samples of one volunteer showed responses to RLRPGGKKK in both compartments, 0.65% of CD3+/CD8+ cells in breast milk, and 0.22% of CD3+/CD8+ cells in peripheral blood cells.
- The frequencies of responses in the two compartments differed, and 2/4 women who responded to epitopes in Nef 101-205 and Pol 601-710 showed responses in breast milk but no detectable responses in peripheral blood cells.

Country United States.

Assay type CD8 T-cell Elispot - IFN γ , Intracellular cytokine staining, Chromium-release assay

Keywords escape, acute/early infection, characterizing CD8+ T cells

References Bansal *et al.* 2005

- Patients with acute or early infection were shown to preferentially target variable peptides with higher entropy while those with chronic infection showed responses towards more conserved peptides with lower entropy. In longitudinally followed subjects, responses to variable proteins declined over time while responses to conserved proteins increased. The decline is suggested to be due to CTL escape.
- rlrpggkkQ escape mutant showed drastically reduced avidity. The response to this peptide was not apparent until month 20, by month 32 the escape variant was present.

Assay type CD8 T-cell Elispot - IFN γ , HLA binding

Keywords escape, acute/early infection, variant cross-recognition or cross-neutralization

References Milicic *et al.* 2005

- CTL responses and escape were analyzed in 4 homosexual couples where blood samples were available within weeks of estimated transmission. CTL escape variants were often transmitted. When the recipient had the same HLA type as the donor, CTL escape variants prevented a CTL response to those epitopes in the recipient. Even when the HLA alleles were different in the transmitting couple, a single escape mutation in one epitope can abolish CTL recognition of an overlapping epitope of distinct restriction in the recipient.
- Certain escape mutations in RLRPGGKKK, rlrpggkkQ, rlrpggkkR and rlrpggkkT, resulted in nearly complete reduction in binding affinity for A*0301. The form that was transmitted in one of the donor pairs was rlrpggRkk, and it binds to A*0301 with comparable affinity to RLRPGGKKK. However, an escape variant was on the rise in the donor near the time of transmission, rlrpggRkT, which eventually came to fixation in the donor, illustrating the importance of the timing of transmission regarding which variant is transmitted.
- A*0301 epitopes RLRPGGKKK and KIRLRPGGK, and B*0801 epitope GGKKKYRL, overlap. In 1 donor, the transmitted virus carried the escape form for 2 of these epitopes. The double substitution kirlrpggR results in escape from response in the donor. Similarly, the double substitution ggRkkyKl results in escape for this epitope.

- CTL responses in 18 acutely HIV-infected HLA-A3 (n=7) or -B7 (n=4) or both -A3 and B7 (n=7) positive individuals were studied.
- One individual, AC-06 was homozygous at all three class I alleles (A3, B7, Cw7), was treated during acute infection and had supervised treatment interruptions (STI). He had only two detectable CTL responses during acute infection, but after STI this broadened to 27 distinct epitopes including 15 restricted by HLA-A3, 11 by HLA-B7, and 1 by HLA-Cw7.
- 8/14 HLA-A3 positive individuals had detectable A3-restricted responses during acute infection. Only 5/15 of HLA-A3 epitopes tested were targeted during acute infection. 7/8 individuals with acute responses had specific responses for this epitope.
- KIRLRPGGK and RLRPGGKKK were the most commonly recognized HLA-A3 epitopes during acute infection, after 1 year of treatment, and after STI. RLRPGGKKK was immunodominant during acute infection and throughout the study period in the 5/6 individuals who targeted it.

Epitope RLRPGGKKK

Subtype B

Immunogen HIV-1 infection

Species (MHC) human (A3)

Keywords class I down-regulation by Nef

References Lewinsohn *et al.* 2002

- CTL kill targets through releasing perforin, that forms pores in the plasma membrane, and granzymes, that induce apoptosis.
- Vpr is capable of arresting infected cells in the G2 phase, and it was hypothesized that Vpr may inhibit CTL-mediated apoptosis because it interacts with the granzyme B molecular complex.
- Vpr expression in the target cell did not inhibit epitope specific lysis – neither perforin or granzyme mediated events were inhibited, as measured by a Chromium release assay and a TUNEL assay.
- In contrast, deletion of Nef, which is thought to protect primary HIV infected cells by down-regulating cell-surface expression of MHC class I complexes, increased the susceptibility of HIV-1 infected cells to CTL mediated killing 2-fold using the TUNEL assay.

Assay type CD8 T-cell Elispot - IFN γ

Keywords acute/early infection, early-expressed proteins

References Cao *et al.* 2003

- All proteins were scanned and optimal epitopes were mapped in a study of CD8+ gamma IFN T-cell responses in 21 men within 15-92 days post-HIV-1 infection. Subjects initially showed narrow immune responses with a mean of 2.3 epitopes recognized per patient. The immune response broadened later in infection. No correlation between the plasma viral load and the number of recognized epitopes or the frequency of IFN- γ secreting cells was observed, and there was no correlation between the functional avidity of responses and the abundance of IFN-secreting cells that recognized the epitope. The first epitopes to be recognized did not tend to be the most avid, and earliest responses tended to be directed against Nef, Tat, Vpr, and Env.
- This epitope was recognized in four individuals during early infection, each time presented by A3.
- All HIV-1 proteins except Vpu were recognized, and responses to a total of 41 optimal epitopes were characterized; 24 had been identified previously. 48% of the total T-cell responses were directed against Nef and 43% were directed against Gag.
- More common HLA alleles were less frequently used in primary infection than less common alleles, for example A3, B35, B57, and B62 were more frequently utilized than A1, A2, A30, and A44.

Epitope name RK9

Subtype B

Immunogen HIV-1 infection

Species (MHC) human (A3)

Country United States.

Assay type CD8 T-cell Elispot - IFN γ , Flow cytometric T-cell cytokine assay

Keywords immunodominance, escape, acute/early infection, characterizing CD8+ T cells, reversion, viral fitness

References Allen *et al.* 2004

- KK9 and RK9 overlap, are presented by HLA-A3, and are frequently immunodominant and involved in acute-phase primary responses. A mutation in the C-terminal flanking residue of KK9 (K to Q) (kirlpkkg-Q) inhibits processing of the immunodominant gag KK9 epitope, resulting in rapid decline in the KK9 specific CD8+ T-cell response. At the same time it abrogates the response to RK9 through the embedded mutation rlrpggkQk. Transmission of this mutation to patients expressing HLA-A3 prevents acute-phase response to these epitopes, although the mutation can eventually revert to wild-type allowing a delayed response to the epitope.

Keywords responses in children, mother-to-infant transmission, escape, acute/early infection, reversion, viral fitness
References Sanchez-Merino *et al.* 2005

- CD8 T-cell responses were examined in mother-infant pairs. Escape variants were commonly detected in maternal plasma. Early infant plasma viruses showed heterogeneity of gag and nef gene sequences as well as mother-to-child transmission of CD8 T-cell escape variants. The stability of escape mutants in the infant over time was determined by infant HLA haplotype and viral fitness. Sequential plasma specimens from infants showed changes in CD8 T-cell epitope sequences, suggesting that infants are capable of generating virus-specific CD8 T-cell responses.
- RLRPGGKKKY was recognized in 2 mothers, and is an A*30 epitope. The variant RLRPGGKKqY was found in 9/10 of 1 mother's sequences. This form was transmitted to her child, and 10/10 clones were this variant at months 2 and 6 in the infant; by month 12, 9/10 were RLRPGGKKqY. RLRPGGKKrY was the form found in the other mother. The variant gradually diminished in frequency in her child, 10/10 sequences at 2 months, 9/10 at 4 months, and 6/10 at 12 months.

References Liu *et al.* 2006

- T-cell immunity and the impact of selection were longitudinally studied in a patient from the time of transmission. New epitopes were detected at sites that were shown to be under positive selection. Env was found to be the major target of CTLs and most of the new epitopes were found here. One third of the sites examined were associated with epitope escape mutations from CTL. Acquisition of mutations found at high frequency in the database was suggested to be a result of reversion of CTL epitopes in the absence of immune targeting.
- GGKKKYKf presumed escape variant was transmitted to an HLA-B8 negative recipient from an HLA-B8 positive donor. Reversions were found later, with loss of CTL pressure and hypothesized gain of replicative fitness.

- CTL responses in seronegative highly HIV-exposed African female sex workers in Gambia and Nairobi were studied – these women had no delta 32 deletion in CCR5.
- In Gambia there is exposure to both HIV-1 and HIV-2, CTL responses to B35 epitopes in exposed, uninfected women are cross-reactive, and the B35 allele seems to be protective.

- HIV-2 sequence: GGKKKYKMK – no cross-reactivity Phillips *et al.* [1991].

HXB2 Location p17 (24–32)

Author Location p17 (24–32)

Epitope GGKKKYKLLK

Epitope name GGK

Immunogen HIV-1 infection

Species (MHC) human (B8)

Keywords HAART, ART, supervised treatment interruptions (STI), immunodominance, acute/early infection

References Oxenius *et al.* 2000

- Patients who started therapy at acute HIV-1 infection (three with sustained therapy, two with limited therapy upon early infection) had strong HIV specific CD4 proliferative responses and were able to maintain a CTL response even with undetectable viral load – three patients that had delayed initiation of HAART had no HIV specific CD4 proliferative responses and lost their CTL responses when HAART was eventually given and their viral loads became undetectable.
- This epitope was recognized by 1/7 study subjects that were HLA-B8+.
- Patient SC12(HLA A1, B8/39, Cw0701/0702, DR2/3, DR51/52, DQ2/6) had sustained therapy started during acute infection and maintained an immunodominant response to FLKEKGGL throughout and minor responses to GEIYKR-WII, DCKTILKAL, GGKKKYKLLK – GEIYKRWII and GGKKKYKLLK responses were stimulated by a brief period off therapy.

Keywords HLA associated polymorphism
References Boutwell & Essex 2007

- All HIV-1 subtype C protein sequences were analysed, and 94 HLA-associated amino acid polymorphisms were found that were well distributed throughout the proteome. These sequences were compiled from publicly available databases and originated in South Africa and Botswana. Many polymorphisms were associated with multiple HLA allele classes. 12% of negative associations were found as well, where there was an association of virus expression of the consensus amino acid with a specific HLA allele. HLA-B alleles were involved in most of the associations. 19 HLA-associated polymorphisms were embedded in previously defined epitopes presented by an appropriate HLA restricting molecule.
- HYMLKHLVW was a previously defined A*2402 presented epitope that encompassed an A*24 associated polymorphism, HYmLKHLVW, in the third position.

Keywords supervised treatment interruptions (STI), acute/early infection
References Montefiori *et al.* 2003

- HIV-1 + patient AC10 underwent early HAART treatment, which was discontinued 1.5 years later. At this timepoint potent NAb responses against autologous virus were detected. Treatment interruption initially induced weak CD8+ responses directed against 5 epitopes. By days 873d and 923d the CTL response had broadened to target 22 epitopes; of these six were fully characterized. Eventually the virus escaped the NAb response, but escape was not accompanied by a rise in viral load, and the authors suggest the virus was contained by the CTL response.

Assay type CD8 T-cell Elispot - IFN γ
Keywords responses in children, mother-to-infant transmission, escape, acute/early infection, reversion, viral fitness
References Sanchez-Merino *et al.* 2005

- CD8 T-cell responses were examined in mother-infant pairs. Escape variants were commonly detected in maternal plasma. Early infant plasma viruses showed heterogeneity of gag and nef gene sequences as well as mother-to-child transmission of CD8 T-cell escape variants. The stability of escape mutants in the infant over time was determined by infant HLA haplotype and viral fitness. Sequential plasma specimens from infants showed changes in CD8 T-cell epitope sequences, suggesting that infants are capable of generating virus-specific CD8 T-cell responses.
- qYKLLKHIVW is an escape variant of the A*24 epitope KYLKLHIVW, found in 9/10 clones from the mother. It was transmitted to her infant, and persisted for 15 months. Both the mother and child are A*24+.
- qYKLLKHIVW elicited lower responder cell frequencies than KYLKLHIVW.

Subtype A
Immunogen HIV-1 infection, HIV-1 exposed seronegative
Species (MHC) human (Cw4)
Keywords HIV exposed persistently seronegative (HEPS), immunodominance
References Kaul *et al.* 2001a

- ELISPOT was used to study CTL responses to a panel of 54 predefined HIV-1 epitopes in 91 HIV-1-exposed, persistently seronegative (HEPS) and 87 HIV-1-infected female Nairobi sex workers.
- Responses in HEPS women tended to be lower, and focused on different epitopes with HLA presenting molecules that have previously been associated with reduced risk of infection, and there was a shift in the response in the HEPS women upon late seroconversion to epitopes recognized by the HIV-1 infected women.
- 43/91 HEPS women had CD8+ responses and detection of HIV-1-specific CTL in HEPS women increased with the duration of viral exposure.
- Among HLA-Cw4 women, 2/2 HEPS and 7/11 HIV-1 infected women recognized this epitope.
- The dominant response to this HLA allele was to this epitope in both of the 2/2 HEPS cases and in 3 of the 7/11 HIV-1 infected women.

HXB2 Location p17 (28–36)

Author Location p17 (28–36)
Epitope KYRLKHLVW
Immunogen HIV-1 infection
Species (MHC) human (Cw4)
References Appay *et al.* 2000

- This epitope is newly defined in this study.
- Combined tetramer and intracellular cytokine staining was used to study the function of circulating CD8+ T cells specific for HIV and CMV.
- HIV-specific CD8+ T cells expressed lower levels of perforin than CMV-specific CD8+ T cells from the same donor, and this was associated with persistent CD27 expression on HIV-specific cells, suggesting impaired maturation.
- In most donors, between 50% and 95% of the activated virus-specific CD8+ T cells produced IFN- γ and MIP-1 β with a distinct subset that failed to produce TNF- α .

- HLA-B63-positive subjects were shown to be able to generate CTL responses early in acute HIV infection and to control HIV replication in the absence of antiretroviral treatment. Since HLA-B63 shares the epitope binding motif of HLA-B57 and -B58, it was shown that HLA-B63-positive individuals mounted CTL responses to previously identified B57-restricted epitopes, as well as novel, B63-restricted epitopes. Moreover, these novel B63-restricted epitopes can also be presented by HLA-B57 and -B58.
- This is a putative HLA-B63 epitope is contained within a reactive peptide containing the B58 supertype binding motif. There is no evidence for B57/B58 cross-presentation of this epitope.

HXB2 Location p17 (69–93)**Author Location** p17 (69–93 BH10)**Epitope** QTGSEELRSLYNTVATLYCVHQRIE**Immunogen** HIV-1 infection**Species (MHC)** human (A2)**References** Johnson *et al.* 1991

- CTL responses and escape were analyzed in 4 homosexual couples where blood samples were available within weeks of estimated transmission. When the recipient had the same HLA type as the donor, CTL escape variants prevented a CTL response to those epitopes in the recipient. Even when the HLA alleles were different in the transmitting couple, a single escape mutation in one epitope can abolish CTL recognition of an overlapping epitope of distinct restriction in the recipient. In an early acute infection of the donor, the precise timing of transmission determines the viral variants transmitted.
- Escape mutation gteelrslf in this epitope resulted in 98% reduction in HLA binding affinity, and was the transmitted variant.

HXB2 Location p17 (71–79)**Author Location** p17**Epitope** GSEELRSLY**Subtype** B**Immunogen** HIV-1 infection**Species (MHC)** human (A*0101)**Donor MHC** A*0101, A*0301, B*0801, B*5101; A*0101, B*0801**Country** United Kingdom.**Assay type** CD8 T-cell Elispot - IFN γ , HLA binding**Keywords** escape, acute/early infection, characterizing CD8+ T cells**References** Milicic *et al.* 2005

- CTL responses and escape were analyzed in 4 homosexual couples where blood samples were available within weeks of estimated transmission. CTL escape variants were often transmitted. When the recipient had the same HLA type as the donor, CTL escape variants prevented a CTL response to those epitopes in the recipient. Even when the HLA alleles were different in the transmitting couple, a single escape mutation in one epitope can abolish CTL recognition of an overlapping epitope of distinct restriction in the recipient.
- The second donor in the study shares A*0101 and B*0801 with his partner. Escape mutations gseeIKsly in GSEELRSLY resulted in 44% reduction in HLA binding affinity and no response in an Elispot assay, and gseeIKsly was the transmitted form.

Epitope GSEELRSLY
Immunogen HIV-1 infection, HIV-1 exposed seronegative
Species (MHC) human (A1)
Keywords HIV exposed persistently seronegative (HEPS)
References Kaul *et al.* 2001a
 - ELISPOT was used to study CTL responses to a panel of 54 predefined HIV-1 epitopes in 91 HIV-1-exposed, persistently seronegative (HEPS) and 87 HIV-1-infected female Nairobi sex workers.
 - Responses in HEPS women tended to be lower, and focused on different epitopes with HLA presenting molecules that have previously been associated with reduced risk of infection, and there was a shift in the response in the HEPS women upon late seroconversion to epitopes recognized by the HIV-1 infected women.
 - 43/91 HEPS women had CD8+ responses and detection of HIV-1-specific CTL in HEPS women increased with the duration of viral exposure.
 - Among HLA-A1 women, 1/1 HEPS and 3/3 HIV-1 infected women recognized this epitope, and the response was the dominant HLA-A1 response in all cases.

References Geels *et al.* 2005

- Cross-clade CTL responses in 10 non-B HIV-1 infected individuals were evaluated. T-cell reactivity was tested against peptide pools of clade B Gag, Pol, Nef, Rev and Tat. Nine individuals demonstrated cross-reactive T-cell responses to clade A, B, and C Gag pools; 6/7 patients that responded to Nef-B also reacted to clade A and C Nef pools. An inverse correlation was observed between the sequence divergence of the HLA class I restricted epitopes and the height of the T-cell responses, which in Gag could be explained through variations in the HLA-anchor residues. 42% of the responses were directed to regions containing new epitopes.
- This previously described epitope was embedded in a B clade peptide that was recognized by T-cells from an infected person carrying subtype D Gag. The autologous epitope sequence had dramatic changes, the epitope GSEELRSLY peptide was GtegikSLh, and so likely not the actual reactive epitope in the larger peptide.

References Addo *et al.* 2003

- Comprehensive Elispot screening of 504 overlapping peptides that spanned all HIV-1 proteins in 57 HIV-1 infected individuals. Four groups of patients were compared: 23 were untreated; 12 were chronically infected and treated; 22 started treatment during acute infection; 11 continuously treated and 11 with STI.
- 63% of the peptides were recognized - the most frequent responses were directed against Nef (95%) and p24-Gag (88%). p17 was the most frequently recognized protein after correction for protein length. A median of 18 peptides (range 2–42) were recognized per person. The most frequently (>20%) recognized peptides were located in conserved regions within clade B sequences. Vpu was rarely recognized.
- A decrease in the total magnitude and in the breadth of CTL responses was detected in patients with treated acute infection in comparison to chronically infected treated or untreated individuals. No correlation between plasma viral load and HIV-1 specific T-cell responses was observed.
- Responses to this peptide were detected in 16% of the study subjects, and it was one of the 25 most frequently recognized peptides.

References Chitnis *et al.* 2003

- 17 perinatally HIV-1 infected children (0.08–16 years) were evaluated for HLA-A2-restricted IFN-gamma CD8+ CTL responses against 4 immunodominant peptides that carry HLA-A2 epitopes. Two peptides were from gp120 (one at position 112, one from the V3 loop), and one each was from gp41 and Gag. 15/17 patients responded to the Gag peptide, 13/17 to the gp41 and the non-V3 gp120 peptides, and 11/17 responded to the V3 loop. 4 children recognized all 4 peptides.
- In 10/14 children, addition of exogenous IL-15 induced increased frequencies of SFCs to the Gag peptide. IL-2 and IL-7 did not increase SFCs, however IL-2, IL-7 and IL 15 could all increase the intensity of the spots in some patients. In 4 children, IL-15 addition brought the SFC response up to the level of detection.

Keywords characterizing CD8+ T cells

References Kiepiela *et al.* 2004

- HLA class I restricted CD8+ T-cell responses against HIV-1 were analyzed in African patients. Significantly more responses were shown to be HLA-B restricted. Viral load, CD4 count, and thus rate of disease progression were also associated with HLA-B alleles. In addition, the selection pressure imposed on HIV-1 by HLA-B alleles was shown to be substantially greater than by other alleles.
- This epitope was suggested to be the epitope within a longer reactive peptide based on correspondence with a known epitope in the HIV database. Also, a significantly higher frequency of people in the Durban cohort who reacted with the peptide had this HLA type.

Keywords HAART, ART, supervised treatment interruptions (STI)

References Altfeld *et al.* 2002b

- Peripheral blood (PB) and lymph node (LN) CD8+ T-cell responses were compared in 15 asymptomatic HIV-1 infected patients using all known optimal CTL epitopes (<http://hiv-web.lanl.gov/content/hiv-db/REVIEWS/brander2001.html>) for each person's class I HLA alleles.
- 60 epitope responses were detected in both PB and LN samples of the 15 patients, and an additional 8 responses were detected only in LN. The total magnitude of the response was similar in LN and PB, but the percentage of CD8+ T cells in the LN is lower so the number of HIV-specific cells per million CD8+ T-cells is higher in the LN.
- 1 year post-HAART treatment in five patients studied, the magnitude of the CD8+ T-cell response was decreased in both LN and PB, but more dramatically in PB, and 13/25 epitope responses in the PB became undetectable, in contrast to 5/26 in the LN.
- Treatment interruption following HAART resulted in increased viremia accompanied by the restoration of the detection of 13 epitopes that had become undetectable in the PB, and the addition of 9 novel epitope responses.
- Breakdowns of epitope responses were shown for 4 individuals. Patient D displayed the greatest response to B27-KK10 (p24), and also responded to A30-RY11(p17), A32-PW10(RT), A30-KY11(RT), A32-RW10(gp120), and B18-YY9(Nef).

Keywords HIV exposed persistently seronegative (HEPS)

References Missale *et al.* 2004

- HIV-specific T-cell response was tested in patients exposed to blood from a patient with highly replicating HIV; these patients were nosocomially infected with HBV, but uninfected with HIV. HIV-specific T-cell responses were directed to structural and non-structural HIV proteins in 2 patients, suggesting that the virus replicated in these patients sufficiently to prime a cell-mediated immune response that protected them from HIV infection.
- This patient responded to 4/8 HIV epitopes tested in an IFN γ Elispot assay or tetramer assay. Responses were detected 8 and 28 weeks after exposure, this particular epitope was only tested with Elispot.

Subtype B, C

Immunogen HIV-1 infection

Species (MHC) human (B63, B57, B58)

Donor MHC A*02, A*24, B*1517, B*58, Cw*03, Cw*07

Assay type CD8 T-cell Elispot - IFN γ

Keywords rate of progression, cross-presentation by different HLA, optimal epitope

References Frahm *et al.* 2005

- HLA-B63-positive subjects were shown to be able to generate CTL responses early in acute HIV infection and to control HIV replication in the absence of antiretroviral treatment. Since HLA-B63 shares the epitope binding motif of HLA-B57 and -B58, it was shown that HLA-B63-positive individuals mounted CTL responses to previously identified B57-restricted epitopes, as well as novel, B63-restricted epitopes. Moreover, these novel B63-restricted epitopes can also be presented by HLA-B57 and -B58.
- This is a putative HLA-B63/57/58 epitope containing the B58 supertype binding motif. Peptide reactivity was enriched for those that carry B63, with a trend for those that carry B57/B58. Optimal epitope was defined in an individual that was B*1517(B63)/B58 positive.

Epitope SLYNTVATL

Epitope name SL9

Immunogen HIV-1 infection

Species (MHC) human (A*02)

Keywords HAART, ART, immunodominance

References Scott-Algara *et al.* 2001

- This study examined with CTL response in HLA A*02+ children by tetramer staining for HLA-A2 immunodominant epitopes SLYNTVATL and ILKEPVHGV.
- 71% of the 28 HIV-1 infected HLA-A*02 positive children recognized both epitopes, with cells from 26 children stained positive by the gag tetramer (SLYNTVATL) and 21 children by the pol tetramer (ILKEPVHGV)
- There were no differences observed in children that had therapy versus those that did not.
- Tetramer-binding cells were memory activated CD28-, CD45RO+, CD45RA- HLADR+, CD69-, CD8+ T-cells.

HXB2 Location p17 (77–85)**Author Location** p17**Epitope** SLYNTVATL**Epitope name** GAG**Immunogen** HIV-1 infection**Species (MHC)** human (A*02)**Country** France.**Assay type** Cytokine production, Tetramer binding, Intracellular cytokine staining, Flow cytometric T-cell cytokine assay**Keywords** responses in children, characterizing CD8+ T cells**References** Scott-Algara *et al.* 2005

- Only a fraction of HIV-1-specific CD8 T-cells detected in the PBMC of 17 infected children (ages 2-18) were able to produce cytokines (IFN-gamma, TNF-alpha) or chemokines (CCL4, CCL5) after stimulation with the cognate peptide. A negative correlation was found between the plasma viral load and the percentage of CD8+ Gag-specific T-cells secreting IFN-gamma. Tetramers used in this study were SLYNTVATL-HLA-A*02 and ILKEPVHGV-HLA-A*02.

HXB2 Location p17 (77–85)**Author Location** p17 (77–85 HXB2)**Epitope** SLYNTVATL**Epitope name** SL9**Subtype** B**Immunogen** HIV-1 infection**Species (MHC)** human (A*0201)**Keywords** epitope processing, immunodominance, escape**References** Brander *et al.* 1999

- Multiple natural variations in the SL9 flanking regions of the immunodominant epitope SLYNTVATL were tested and found not to adversely affect CTL recognition or prevent epitope processing, suggesting that viral escape from the HLA-A*0201-restricted CTL response against SLYNTVATL is probably not linked to variations in the flanking regions of this epitope.
- The substitution Y79F was an escape mutation in that it interfered with CTL recognition by one CTL clone from an A*0201 infected individual, clone 13010.B17, but it was still recognized by another CTL clone, 115.D4.

HXB2 Location p17 (77–85)**Author Location** p17**Epitope** SLYNTVATL**Immunogen** HIV-1 infection**Species (MHC)** human (A*0201)**Keywords** acute/early infection**References** Wilson *et al.* 2000a

- Three individuals with highly focused HIV-specific CTL responses were studied during acute infection using tetramers – high frequencies of HIV-1-specific CD8+ T cells were found prior to seroconversion, and there was a close temporal relationship between the number of circulating HIV-specific T-cells and viral load was also found.
- All three patients were B*2705, with HLA alleles: A1, A30/31, B*2705, B35; A1, A*0301, B7, B2705; and A*0201, A*0301, B2705, B39.
- ELISPOT was used to test a panel of CTL epitopes that had been defined earlier and were appropriate for the HLA haplotypes of the study subjects – 3/3 subjects showed a dominant response to the B*2705 epitope KRWILGGLNK.
- The subject with A*0201 had a moderately strong response to SLYNTVATL.
- Weak responses were observed to A*301-RLRPGGKKK, A*301-QVPLRPMTYK, and B7-TPGPGVRYPL in the subject who was HLA A1, A*0301, B7, B*2705.
- No acute response was detected to the following epitopes: A*201-ILKEPVHGV, A*301-KIRLRPGGK, A*301-AIFQSSMTK, A*301-TVYYGVPVWK, B35-EPIVGAETF, B35-HPDIVIYQY, B35-PPIPVGEIY, B35-NSSKVSQNY, B35-VPLRPMTY, B35-DPNPQEVVL.

HXB2 Location p17 (77–85)**Author Location** Gag**Epitope** SLYNTVATL**Immunogen** HIV-1 infection**Species (MHC)** human (A*0201)**References** Tan *et al.* 1999

- Adoptive transfer of two autologous *in vitro*-expanded CTL clones against the A*0201 restricted epitopes SLYNTVATL and VIYQYMDDL were infused into a patient – they were well tolerated, but the SLYNTVATL clone was shown by tetramer staining to be rapidly eliminated through apoptosis, and the treatment had no impact upon viral load and CD4 and CD8 cell counts.

HXB2 Location p17 (77–85)**Author Location** p17 (77–85)**Epitope** SLYNTVATL**Immunogen** HIV-1 infection**Species (MHC)** human (A*0201)**Keywords** immunodominance**References** Betts *et al.* 2000

- Only 4/11 HLA-A2+ HIV+ individuals had CTL that reacted to SLYNTVATL, calling into question whether it is immunodominant.
- 95 optimally-defined peptides from this database were used to screen for INF γ responses to other epitopes.
- Individuals who did not respond to SLYNTVATL recognized other HIV epitopes, and 2/4 SLYNTVATL responders had stronger responses to epitopes restricted by other class I alleles.
- SLYNTVATL was the only response detected in a one individual that was HLA A*0201, B44, B70.

References Mollet *et al.* 2000

- A panel of 16 epitopes covering 15 class I alleles was tested in 14 HIV+ patients from an unselected Caucasian population treated with HAART, using tetramer staining or CD8+ cell IFN-gamma production to measure responses.
- In general, during the first month of treatment viral load decreased and frequencies of HIV-specific CTL tripled and broadened – eight new HIV specificities that were not previously detectable were newly detected, as were CMV specific CD8+ PBL – but with continued viral suppression, HIV-specific responses diminished.
- Viral rebounds gave different patterns of response: increases or decreases in pre-existing response, new specificities, or no change.

Epitope SLYNTVATL

Immunogen HIV-1 infection

Species (MHC) human (A*0201)

Keywords supertype, rate of progression

References Propato *et al.* 2001

- Long-term nonprogressors (LTNPs) had strong memory resting CD8+ T-cell responses against the majority of epitopes tested, (18 for the A2 supertype, 16 for the A3 supertype) while the effector cells of long-term nonprogressors recognized far fewer epitopes.
- Progressors had memory resting CD8+ T-cells that recognized far fewer epitopes than LTNPs.
- A positive correlation between effector CD8+ T-cells and plasma viremia and a negative correlation between CD8+ effector T-cells and CD4+ T-cells was observed, which may contribute to the inability of LTNPs to clear virus.
- Tetramer staining with A2, beta2microglobulin, and either SLYNTVATL, KLVGKLNWA, or LTFGWCFKL revealed that tetramers detected more HIV-specific cells in LTNP than in progressors, activated effector cells were the minority population, and ELISPOT correlated better with the effector cell subpopulation than the total tetramer stained population.

Species (MHC) mouse (A*0201)
Keywords binding affinity, vaccine-specific epitope characteristics, immunodominance

References Peter *et al.* 2001

- The stability of peptide binding to HLA-A2.1 was determined for six HLA-A2.1 peptides included in this vaccine study – ILKEPVHGV (RT), SLYNTVATL (p17), SLLNATDIAV (gp41) and LLWKGEGAV (RT) all bound with high affinity comparable to a influenza epitope reference (GILGFVFTL), while RGPGRAFTI and VIYQYMDDL bound with a lower affinity (relative binding activity = 0.01).
- The four high-affinity peptides formed stable complexes with half-lives ranging between 8 and 32 hours, while the low affinity peptides had half lives of less than an hour.
- HLA-A2.1 transgenic mice were immunized with the six HIV-1 peptides and P30, as a universal T-helper epitope, with IFA or Montanide or microspheres as adjuvants.
- All peptides except VIYQYMDDL induced a strong CTL response in Cr-release assays - stronger responses were observed when peptides were delivered alone, indicating immunodominance when the combination was used.

Epitope SLYNTVATL
Immunogen computer prediction
Species (MHC) (A*0201)

Keywords subtype comparisons, computational epitope prediction, vaccine-specific epitope characteristics, escape

References Schönbach *et al.* 2002

- Computational methods (artificial neural networks [ANN], hidden Markov models [HMM], binding matrices based on HLA association rates BIMAS) were used to identify HLA-A*0201 and HLA-B*3501 HIV T-cell epitope candidates from 533 Gag, Env and Pol sequences of which 374 were derived from HIV-1, 97 were derived from HIV-2 and 62 from SIV. Comparisons to known epitopes and between clades were made.
- The SLYNTVATL epitope received focused discussion. SLYNTVATL, sIFntvatl, slyntvaVI, and slyntIaVI are all recognized variants, ANN predicts all four variants would be recognized, while BIMAS only predicts SLYNTVATL and sIFntvatl would be recognized. However, Sewell *et al.* [1997] suggested certain substitutions may be antagonistic, including sIFntvatl, and vaccines do not stimulate SLYNTVATL responses as well as natural infections. The authors note these kinds of issues complicate the application of computational predictions of epitopes to vaccine design.

References Imami *et al.* 2002b

- 70 patients with chronic disease progression, 10 clinical non-progressors, and 3 immunologically discordant progressors (individuals who controlled viremia but had progressive CD4+ T-cell decline) were analyzed for their T-helper cell responses to p24 and cytokine profile. Long term non-progressors had much stronger Th responses, particularly to p24 peptides, and they tended to be balanced between Th1, IL-2 producing and Th2, IL-4 producing responses.
- One of the immunologically discordant progressors became symptomatic during the course of the study, and he had a rapid drop in proliferative response to all antigens and also a shift from a Th1 to a Th2 response. To find out if the CD8 response also shifted in cytokine production, the CD8+ T-cell response to SLYNTVATL in this patient was also tested. It too was found to shift, from IFNgamma to IL-4 producing in Elispot, and using a bioassay of indicator lines, from IL-2 to IL-4 production.

References Cao *et al.* 2003

- CTL epitope responses were mapped in 21 men within 15-92 days post-HIV-1 infection. Subjects initially showed narrow immune responses with a mean of 2.3 epitopes recognized per patient. The immune response broadened later in infection. No correlation between the plasma viral load and the number of recognized epitopes or the frequency of IFN-gamma secreting cells was observed, and there was no correlation between the functional avidity of responses and the abundance of IFN-secreting cells that recognized the epitope. The first epitopes to be recognized tended not to be the most avid, and earliest responses tended to be directed against Nef, Tat, Vpr, and Env.
- Only 1/10 HLA A*02 carrying individuals in this study recognized SLYNTVATL.
- All HIV-1 proteins except Vpu were recognized, and responses to a total of 41 optimal epitopes were characterized; 24 had been identified previously. 48% of the total T-cell responses were directed against Nef and 43% were directed against Gag.
- More common HLA alleles were less frequently used in primary infection than less common alleles, for example A3, B35, B57, and B62 were more frequently recognized than A1, A2, A30, and A44.

References Dagarag *et al.* 2003

- Telomere length is short in the CD8+ T-cell compartment of HIV-1 infected people, indicating excessive CTL activation and premature senescence. Here human telomerase RT (hTERT) transduction of HIV-1-specific CTL was used to study the functional impact of telomerase. Telomerase expression enhanced proliferative capacity, as well as cytolytic and antiviral capabilities; cytokine production was unchanged. hTERT transduced CTLs were 10-fold more efficient in controlling HIV-1 replication in culture. Thus telomerase transduction can restore CTL mediated cytotoxicity, and may have therapeutic potential.
- Three polyclonal CD8+ T-cell lines derived from an HIV-1, HLA A*0201 positive patient were used in this study, including one specific for this epitope.

Keywords genital and mucosal immunity
References Shacklett *et al.* 2003

- Lymphocytes from rectal biopsies were used to characterize the CD8+ T cell response to HIV in GALT, Gut-associated lymphoid tissues. Patients were selected on the basis of being HLA-A2+ and having detectable SLYNTVATL and ILKEPVHGV tetramer responses in PBMC. SLYNTVATL frequency was increased in GALT relative to PBMC in 6/7 patients studied, while a control response to a CMV-peptide was diminished in GALT. Only two patients had ILKEPVHGV CD8+ T cell responses, and both had slightly higher frequencies in GALT than PBMC.
- HIV may perturb lymphocyte retention in GALT, suggested by an overall reduction of GALT CD8+ cells expressing alphaE-beta7. GALT HIV-specific CD8+ T cells expressed alphaE-beta7, suggesting mucosal priming.

- Epitope escape mutations in chronically infected individuals developed over several years indicating selective advantage of escape mutants. The maturation state of CTLs appear to affect the rate of epitope mutation and CTL decay.
- In two patients, SL9-specific CTL peaked at 2–4 years post-infection; at that point the escape mutations began to dominate followed by CTL decline with a 6 month lag, suggesting CTL decline resulted as a consequence of escape. In a third patient, the initial response was 1/2 as strong and mutations did not arise until 6–7 years post-infection; in that case the decline in SL9 CTL preceded epitope mutation.
- Two patients HLA-A*0201 started out with a non-consensus sequence, sLFntvatl. In one of the patients, a transient reversion to the consensus was observed after 4 years, that did not reappear until the 11th year, suggesting the possibility that a reversion to the consensus form occurred, but a CTL response may have limited it so that this more fit form could not re-assert itself until the patient had a more severely compromised immune response.

- SL9-specific CTLs were shown to be primed by immature DCs and independent of help from CD4+ or exogenous IL2, and sensitive to paracrine IL-2 induced apoptosis. The authors suggest that the reason SL9 responses are not seen during acute infection is the high level of innate immune responses resulting in cytokine-induced apoptosis, but that these CD8+ T-cells would come to dominate later infection when CD4 help is diminished.

Epitope SLYNTVATL
Subtype A
Immunogen HIV-1 exposed seronegative
Species (MHC) human (A*0214, A*0201)
References Kaul *et al.* 2000

- 11/16 heavily HIV exposed but persistently seronegative sex-workers in Nairobi had HIV-specific CD8⁺ gamma-IFN responses in the cervix – systemic CD8⁺ T cell responses tended to be to the same epitopes but at generally lower levels than cervical CD8⁺ T cell responses.
- Low risk individuals did not have such CD8⁺ cells.
- CD8⁺ T cell epitopes: DTVLEDINL (3 individuals), SLYNTVATL (4 individuals), LSPRTLNAW (3 individuals) and YPLTFGWCF (4 individuals) were most commonly recognized by the HIV-resistant women.
- The epitope variants SLYNTVATL and SLFNTVATL were both recognized.

HXB2 Location p17 (77–85)
Author Location Gag (77–85)
Epitope SLYNTVATL
Immunogen vaccinia
Vector/Type: vaccinia
Species (MHC) human (A2)
References Woodberry *et al.* 1999

- A polyepitope vaccine was generated in a vaccinia construct that contiguously encoded seven epitopes, all presented by HLA A-2.
- HHD mice have a transgene of HLA A2 linked to the transmembrane and cytotoxic domains of H-2D^d – this transgene is the only MHC molecule expressed in the mice.
- CTL responses to Gag (77-85) SLYNTVATL, Pol (476-484) ILKEPVHGV, gp120 (120-128) KLTPLCVTL, and Nef (190-198) AFHHVAREL were observed in HIV polytope HHD-vaccinated mice, and these responses were enhanced with vaccinia boost.
- No CTL immune responses were generated against HLA A2-restricted HIV epitopes Nef 157-166 (PLTFGWICYKL), Pol 346-354 (VIYQYMDDL), and Nef 180-189 (VLEWRFD-SRL).

- Sixteen HLA A2+ patients were tested for their ability to make CTL responses by peptide restimulation in culture with the epitopes selected for inclusion in the polytope – one individual recognized all seven of these epitopes; 7 patients had CTL cultures able to recognize at least one of the epitopes, and 6 of those 7 recognized more than one epitope, but they were not able to test all peptides for all patients; many patients only had three peptides tested.
- SLYNTVATL was recognized by 5/16 HLA-A2 patients.

Author Location p17 (77–85)
Epitope SLYNTVATL
Immunogen vaccine
Vector/Type: canarypox *Strain:* B clade LAI, B clade MN *HIV component:* Gag, gp120, gp41, Protease
Species (MHC) human (A2)
Keywords immunodominance
References Carruth *et al.* 1999

- The vaccine used was a live recombinant canarypox (CP) virus vaccine containing multiple HIV-1 genes (HIV-1 MN gp120, HIV-1 LAI gp41, HIV-1 LAI Gag, HIV-1 LAI protease).
- CD4⁺ and CD8⁺ Gag and Env specific CTL responses were detected in only 1/5 vaccinated volunteers, and were not detectable 1 year after vaccination.
- CTL responses to epitopes SLYNTVATL and TVYYGVPVWK from HIV+ control patients were used as positive controls.
- The study explored why vaccinees were non-responsive – non-response was not due to inherent defects or differences in the ability of these individuals to process and present antigen.
- Lack of response to SLYNTVATL led the authors to speculate that the immunodominance of this epitope in natural infections may not be recapitulated by vaccine antigen.

Author Location p17 (77–85)
Epitope SLYNTVATL
Epitope name SL9
Immunogen HIV-1 infection
Species (MHC) human (A2)
Keywords subtype comparisons
References Durali *et al.* 1998
 - Cross-clade CTL response was studied by determining the CTL activity in seven patients from Bangui, (6 A subtype, and 1 AG recombinant infections) and one A subtype infection from a person living in France originally from Togo, to different antigens expressed in vaccinia.
 - Pol reactivity: 8/8 had CTL to A subtype, and 7/8 to B subtype, and HIV-2 Pol was not tested.
 - Gag reactivity: 7/8 reacted with A or B subtype gag, 3/8 with HIV-2 Gag.
 - Nef reactivity: 7/8 reacted with A subtype, and 5/8 with B subtype, none with HIV-2 Nef.
 - Env reactivity: 3/8 reacted with A subtype, 1/8 with B subtype, none with HIV-2 Env.
 - Patient B18 had the greatest breadth and diversity of response, and recognized Gag SLYNTVATL and Nef PLTFGWCFKL.

HXB2 Location p17 (77–85)
Author Location p17 (77–85)
Epitope SLYNTVATL
Epitope name SL9
Immunogen HIV-1 infection
Species (MHC) human (A2)
Keywords dendritic cells
References Kundu *et al.* 1998b
 - Allogeneic dendritic cells (DCs) were obtained from HLA-identical siblings, pulsed with rgp160 MN or A2-restricted HIV-1 epitope peptides, and infused monthly into six HIV-infected patients.

- 1/6 showed increased env-specific CTL and increased lympho-proliferative responses, 2/6 showed increase only in proliferative responses, and 3/6 showed no change – pulsed DCs were well tolerated.
- SLYNTVATL is a conserved HLA-A2 epitope included in this study – 3/6 patients had this sequence as their HIV direct sequence, one had the form SLYNTVAVL and all four of these had a detectable CTL response – the other two had either the sequence SLFSAVAVL or SLFSAVAAL and no detectable CTL response.

Epitope SLFNTVATL

Immunogen HIV-1 infection, HIV-1 exposed seronegative

Species (MHC) human (A2)

Keywords subtype comparisons, HIV exposed persistently seronegative (HEPS), immunodominance

References Kaul *et al.* 2001a

- Variants SL(F/Y)NTVATL are A/B clade specific.
- ELISPOT was used to study CTL responses to a panel of 54 predefined HIV-1 epitopes in 91 HIV-1-exposed, persistently seronegative (HEPS) and 87 HIV-1-infected female Nairobi sex workers.
- Responses in HEPS women tended to be lower, and focused on different epitopes with HLA presenting molecules that have previously been associated with reduced risk of infection, and there was a shift in the response in the HEPS women upon late seroconversion to epitopes recognized by the HIV-1 infected women.
- 43/91 HEPS women had CD8+ responses and detection of HIV-1-specific CTL in HEPS women increased with the duration of viral exposure.
- Among HLA-A2 women, 1/10 HEPS and 22/26 HIV-1 infected women recognized this epitope, likelihood ratio 18.3, p value < 0.003, and ILK(D/E)PVHGV tended to be more reactive in HEPS women, SL(F/Y)NTVATL in infected women.
- The dominant response to this HLA allele was to this epitope in the 1/10 HEPS case and in 18 of the 22/26 HIV-1 infected women that responded.
- Differences in epitope specificity were only seen for responses restricted by class I HLA alleles A2, A24, A*6802, B14, and B18, previously shown to be associated with resistance to HIV-1 in this cohort.
- Subject ML 1250 had an A2 response to ILK(D/E)PVHGV prior to seroconversion, which switched to SL(F/Y)NTVATL post-seroconversion.
- Subjects ML 1575 and ML 1592 had no response to SL(F/Y)NTVATL prior to seroconversion, but made responses post-seroconversion.
- Subject ML 1760 had an A2 response to ILK(D/E)PVHGV prior to seroconversion, and gained responses to epitopes A2 SL(F/Y)NTVATL and B27 KRWII(L/M)GLNK post-seroconversion.

Species (MHC) human (A2)
Keywords HAART, ART, epitope processing, immunodominance
References Kelleher *et al.* 2001a
- Ritonavir (RTV) inhibits chymotryptic activity in the 20S proteasome *in vitro*, as does Saquinavir (SQV) to a lesser extent; Indinavir (IDV) does not. Thus there is concern protease inhibitors may adversely effect CTL epitope processing, but this paper indicates that processing is not inhibited at therapeutically relevant concentrations of RTV when the proteasome is functioning in an intracellular context.
 - RTV did not reduce antigen presentation and concentration of the two immunodominant Gag CTL epitopes (KRWIIMGLNK (B27) and SLYNTVATL (A2)).
 - RTV did not inhibit the processing and assembly of HLA-B35 or -A2, which are assembled with a rapid and moderate time course, respectively, or of HLA-A3, -B27 and -B39.

Epitope SLYNTVATL

Immunogen HIV-1 infection

Species (MHC) human (A2)

Keywords epitope processing

References Cohen *et al.* 2002

- The antigen presentation of two A2-restricted epitopes was compared, SLYNTVATL (p17) and ILKEPVHGV (RT). HIV-1 infected cells were more sensitive to lysis by SLYNTVATL-specific CTL than by ILKEPVHGV-specific CTL, because of a higher density of SLYNTVATL-A2 resulting from differences in processing.
- Incubation with a T1-cell proteolytic extract showed that by four hours, 25% of a p17 peptide had a C-term Leu-85 and were SLYNTVATL-precursors, while ILKEPVHGV-precursors were far less frequent (6.8%) even with four times more proteolytic extract after 30 hours.
- p17 was preferentially cleaved between Leu85 and Tyr86, while appropriate Val484 and Tyr485 cleavage was minor for RT.
- In a competition experiment, RSLYNTVATL bound TAP 3.7-fold more efficiently than RT peptides.
- No difference in CTL avidity was detected in six patients with HLA-A2-restricted responses to these epitopes.
- No significant difference in HLA-A2 binding to p17 or RT epitopes was observed.

Epitope SLYNTVATL

Epitope name SL9

Immunogen HIV-1 infection

Species (MHC) human (A2)

Assay type Chromium-release assay, Flow cytometric T-cell cytokine assay

Keywords class I down-regulation by Nef

References Bobbitt *et al.* 2003

- Nef, through Nef-mediated MHC-I down-regulation, is not the only viral protein to influence levels of HIV-specific CTL recognition. The Rev L60F mutation, a common natural variant, can decrease CTL recognition of late gene products. The Rev mutation impacts the early to late gene switch, reducing late gene product production (Gag, Pol, Env, Vpu, Vpr and Vif), while increasing Nef production, both of which reduce the impact CTL recognition of late gene products. As expected,

Rev L60F rendered HIV infected cells more resistant to CTL that recognized epitopes from the late proteins Env and Gag. Gag expression is reduced more than Env, and Gag-specific CTL were more profoundly affected. Conversely CTL against an epitope in an early gene product, Tat, were more efficiently recognized when infected with viruses carrying the Rev L60F mutation.

- Patients in the asymptomatic phase with active immune responses had more CTL resistant viruses, with lower Rev activity, lower Gag expression and greater resistance to Gag-specific CTL killing, while viruses isolated from people with AIDS were more sensitive to CTL killing.

Assay type CD8 T-cell Elispot - IFN γ , Tetramer binding, Flow cytometric T-cell cytokine assay

Keywords responses in children

References Sandberg *et al.* 2003

- 65 vertically HIV-1 infected children, ages 1-16, the majority undergoing ART, were analyzed in regard to their plasma viremia and CD4+ and CD8+ T-cell counts, and CD8+ T-cell responses.
- Using vaccina expressed Gag, Pol, Env, Rev, Nef in target cells in an Elispot assay, 85% of the children recognized at least one HIV antigen. Strong CD8+ T-cell responses were directed against Pol, followed by Gag and Nef. Children younger than 4 had significantly weaker responses (7/14 had no response) than older children (only 1/32 had no response, and responses were greater in magnitude).
- SLYNTVATL and ILKEPVHGV tetramers were used to quantify specific responses. 49 children in an expanded cohort carried HLA-A2. 1/11 children under 3 years of age had detectable CD8+ T-cell responses to SLYNTVATL, 2/11 to ILKEPVHGV. Among children over 3, 11/38 recognized SLYNTVATL and 9/38 recognized ILKEPVHGV.
- Older children that maintained a CD4 count greater than 400 cells/ul tended to have stronger CTL responses.

Assay type Cytokine production, CD8 T-cell Elispot - IFN γ , Tetramer binding, Intracellular cytokine staining

Keywords assay standardization/improvement, memory cells

References Sun *et al.* 2003

- This study compares assay methods for testing CTL responses using samples from 20 HIV+ patients. The study compares ELISpot, tetramer-binding, and intracellular IFN γ . Tetramer-binding analysis was performed with Gag (SLYNTVATL) or Pol (ILKEPVHGV) tetramers. Antigen presentation using recombinant vaccinia viruses (rVVs) encoding HIV-LAI Gag, Pol, Env, Nef, Tat and Vif proteins was compared to peptide panels. HIV antigen recognition in memory CTLs was measured by chromium release assay and compared to effector/memory CD8+ T-cells in an IFN- γ ELISpot assay.
- Results: IFN γ Elispot and flow cytometry gave similar frequencies of HIV specific CD8+ T-cells. Tetramer-binding analysis was most sensitive. Pools of peptides and the sum of frequencies of individual peptides were comparable. Elispot assays using peptides were more sensitive than assays using vaccinia expressed proteins. Cr release and Elispot against rVVs gave comparable memory cell responses 2/3s of the time.
- 3/7 HLA-A2+ patients recognized this epitope.

Epitope SLYNTVATL

Epitope name SL9

Subtype B

Immunogen HIV-1 infection

Species (MHC) human (A2)

Assay type Chromium-release assay, CTL suppression of replication

Keywords escape, TCR usage

References Yang *et al.* 2003a

- Virus was cultured in the presence of CTL lines specific for 5 different epitopes (SLYNTVATL, ILKEPVHGV, IEIKDTKEAL, SEGATPQDL, and KEKGGLEGL) to study the emergence of escape mutations. Escape varied between clones for the same epitope, and between different epitopes. Gag and RT epitope escape, if it occurred at all, tended to be monoclonal and within the epitope, indicating strong fitness constraints, while the Nef epitope escape was rapid, polyclonal, and sometimes the result of upstream frameshifts.
- Three CTL clones were studied that recognized SLYNTVATL, 161JxA14, 18030D23, and 115DEC4. The different TCR usage on the CTL clones resulted in different patterns of recognition and escape. 161JxA14 suppressed the variant sIFntvatl, 18030D23 did not; conversely the variants sIFntIaVI and sIFntIatl were suppressed by 18030D23, but not 161JxA14.
- After two weeks of passage the predominant escape mutant from 161JxA14 was slyntlatl. Amino acid residues flanking SL9 were unchanged. Escape mutations did not occur within two weeks for the two additional SL9-specific CTL clones 18030D23 and 115DEC4.

Assay type CD8 T-cell Elispot - IFN γ

Keywords variant cross-recognition or cross-neutralization

References Draenert *et al.* 2004c

- CD8+ T-cell responses that persisted in individuals with advanced disease were studied; most of the optimal epitopes defined were recognized with intermediate to high avidity. On average 13 (range, 2–39) epitopic regions were targeted in an average of 6 proteins (range, 1–8). HAART resulted in decrease in antigen and reduction in gamma IFN EliSpot responses, suggesting active responses to autologous virus. The lack of mutations within most viral epitopes suggest that persistent CTL through late disease do not exert strong immune selection pressure, yet the Elispot assays show robust responses, suggesting to the authors that gamma IFN-based screening methods may not reveal functional CD8+ T-cell impairment in patients with AIDS.
- 3 subjects recognized this epitope with high functional avidity. Relative to consensus, 2 individuals that had the SLYNTVATL epitope carried a R -> K mutation proximal to but outside the epitope; possible processing implications were not studied here.

- Killing efficiency of CTLs and their ability to suppress viral replication is shown to depend more on epitope specificity than to antigenic avidity. Different clones recognizing the same epitope had similar killing efficiency despite their variation in avidity. Nef specific CTL clones tended to be most inhibitory, followed by Gag, then by RT specific clones, regardless of avidity.
- 3/14 CTL T-cell clones tested were specific for Gag/p17-SL9. Under conditions of excess peptide (100 μ g/ml), there was no difference in their lytic potential; all possessed similar effector capacity. Avidity was measured as the sensitizing dose of peptide required for 50% of maximal killing (SD50), which varied from 20 pg/ml to 100 ng/ml, over four orders of magnitude for all 14 epitopes. The SD50 range for Gag/p17-SL9 was 1,000 - 20,000 pg/ml.

Country United States.

Assay type proliferation, Tetramer binding, T-cell Elispot

Keywords acute/early infection, characterizing CD8+ T cells, immune dysfunction

References Lichterfeld *et al.* 2004a

- HIV-1 specific CD8+ T-cells in acute and long-term nonprogressive HIV-1 infection show strong ex-vivo proliferative capacities which are rapidly lost in chronic HIV-1 infection. The loss of CD8+ T-cell function is closely linked with the loss of HIV-1 specific, IL2 secreting CD4+ T-cells. The function can be rescued in vitro and in vivo by restoring the specific CD4+ T-cell help.
- Despite being detectable at high frequencies, CD8+ T-cells specific for SL9 epitope were shown to entirely lose their proliferative capacity in chronic HIV-1 infection. This activity could be restored by co-stimulation with CD4+ T cells isolated from acute infection in an IL-2 dependent manner.

Assay type Tetramer binding, Intracellular cytokine staining

Keywords escape, TCR usage, variant cross-recognition or cross-neutralization, characterizing CD8+ T cells

References Lopes *et al.* 2003

- CD8+ T cells from HIV-2 infected patients had more polyclonal TCR responses than HIV-1 infected patients, who tended to have oligoclonal responses. This results in limited plasticity of T cell responses to amino acid substitutions within epitopes in HIV-1 infections. HIV-2-specific CD8+ T-cells showed a more diverse TCR usage associated with enhanced CD8 expansion

and IFN-gamma production on cross-recognition of variant epitopes.

- Responses to this epitope were characterized in detail. One patient's response to SL9 A2-SLYNTVATL tetramers was shown to have only Vbeta5.1 clonotypes. The naturally occurring HIV-2 variant: sIFntvCVI, was not recognized well by this response or by the SLYNTVATL reactive CD8+ T cells in four additional A2+ HIV infected asymptomatic individuals. The subtype A variant, sIFntvatl was also poorly recognized, and 4/5 Ala substitutions abrogated responses. All variants bound to HLA-A2 with higher affinity than the index peptide except slyntAatl, which was slightly reduced, so the lack of cross-reactivity must have been due to the TCR.

Keywords rate of progression, immunodominance, escape

References Oxenius *et al.* 2004b

- The increase in plasma viral load in a patient that progressed rapidly was preceded by positive selection of viral escape mutations in epitopes targeted by dominant HIV-1-specific CD8+ T-cell responses, and a decrease in HIV-1-specific CD4+ and CD8+ T-cell frequencies. Overall, escape variant epitopes were recognized 0-80% as efficiently as the index peptide, and the relatively efficiency of the variant epitopes increased using PBLs collected after their appearance. No changes were found in viral tropism, replication kinetics and neutralizing antibody titers, so the rapid decline of the patient was attributed to loss of HIV containment due to CTL escape.
- This epitope was one of six epitopes found to be under positive selection for escape mutations and was completely replaced by escape variants between days 327 and 635 (sLYntvatl and sLYnAvatl).

Keywords vaccine-specific epitope characteristics, vaccine antigen design
References Bolesta *et al.* 2005

- Immunization of transgenic mice with a codon-optimized hGagp17p24-Polp51 DNA plasmid, consisting of clusters of highly conserved CTL epitopes presented by multiple MHC class I alleles, induced 2- to 5-fold higher CD8+ T-cell responses than the corresponding full-length proteins. The modified proteins had the ribosomal frameshift deleted, as well as the potentially immunosuppressive p15, and protease and integrase. This correlated with higher protection against challenge with Gag and Pol expressing recombinant vaccinia virus. Mice immunized with the hGagp17p24-Polp51 also showed an elevated level of type 1 cytokine production as well as an increased titer of p24- and RT-specific IgG2 antibody responses.
- This was 1 of 4 A2 gag/pol epitopes tested. Transgenic mice immunized with the deleted construct induced more potent EliSpot reactions to this epitope than those immunized with full length Gag/Pol.

Assay type CD8 T-cell Elispot - IFN γ
Keywords rate of progression, escape, variant cross-recognition or cross-neutralization, optimal epitope
References Harrer *et al.* 2005

- An HLA-B13-restricted optimal epitope was defined in Nef, RI9. The frequency of CTLs specific for this epitope in B13-positive patients exceeded the number of CTLs against other epitopes, indicating that this is a dominant epitope in B13-positive subjects. Three B13-positive patients who had an immunodominant response to this epitope were good controllers of their infection, with low viral loads over long periods.
- Five A2+ B13+ patients were found to make an immunodominant response to the B13 epitope RI9. 0/5 recognized ILKEPVHGV, and only 1/5 recognized SLYNTAVTL, with a much lower frequency than the B13 response.

Assay type Tetramer binding, Flow cytometric T-cell cytokine assay

Keywords binding affinity, rate of progression, escape, characterizing CD8+ T cells

References Jansen *et al.* 2005

- HLA-B57 has been associated with long term non-progression in HIV+ people. The number and responsiveness of CD8 T-cells directed to different Gag peptides presented by HLA-A2, -B8 and B57 were compared. T cells specific for the HLA-B57 epitope KAFSPEVIPMF responded to a higher extent and more readily to antigenic stimulation than those specific for the A2 epitope SLYNTVATL and the B8 epitope EIYKRWII.
- In 3/4 A2 subjects that were sequenced, epitope variants dominated: 2 subjects carried sIFntvatl, and the other slyntlatl.
- Tetramer decay experiments indicate that the HLA-B57 peptide has a higher half-life than the A2 and B8 peptides. The authors point out that CD8+ T cells with high binding affinity may require less help.

Assay type CD8 T-cell ELISPOT - IFN γ , Chromium-release assay, Flow cytometric T-cell cytokine assay

Keywords escape, optimal epitope

References Koibuchi *et al.* 2005

- HIV-1-specific CD8 T-cell responses were shown to be persistent in the chronic phase of HIV-1 infection, although the responses to some of the epitopes were declining despite the persistence of the targeted sequences in vivo. Only 4/14 epitopes were potential CTL escape variants, although strong responses to these epitopes persisted for 6 years. This indicates limited viral evolution within targeted CD8 T-cell epitopes during the chronic phase of infection.
- ELISPOT responses to the consensus form of this epitope, SLYNTVATL, were much more intense than to the most common variants of the epitope found over time in this individual, SLfN-TiATL and SLfNTVAvL; these may be escape variants. The strong response to the consensus form persisted, despite the fact it was not observed among the autologous sequences during 6 years of chronic infection.

Immunogen HIV-1 infection, HIV-1 exposed seronegative

Species (MHC) human (A2)

Country Canada.

Assay type CD8 T-cell ELISPOT - IFN γ

Keywords HIV exposed persistently seronegative (HEPS), immunodominance, genital and mucosal immunity, characterizing CD8+ T cells

References Makedonas *et al.* 2005

- CD8 T-cell responses were studied in individuals who remained seronegative in spite of being mucosally (group 1) or intravenously (group 2) exposed to HIV-1. A similar proportion of subjects from each group recognized at least 1 HIV peptide, and they recognized peptides with similar cumulative intensity. The proportion of responding individuals in both groups was significantly greater than in a low-risk, negative control group. One exposed uninfected subject recognized 7 epitopes.
- HLA-A*0201 epitopes that are immunodominant in chronically infected individuals were rarely stimulatory in exposed uninfected individuals. SLYNTVATL was recognized by one HLA A2+ individual in each group (1/11 vs 1/5), while none of the exposed uninfected individuals tested responded to ILKEPVHGV. In contrast, chronically infected subjects recognized these epitopes at a frequency of 69% and 31%, respectively.

Epitope name SL9

Immunogen HIV-1 exposed seronegative

Species (MHC) human (A2, A*0202)

Keywords subtype comparisons

References Rowland-Jones *et al.* 1998b

- HIV-specific CTL were found in exposed seronegative prostitutes from Nairobi – these CTL may confer protection.
- Seroprevalence in this cohort is 90-95% and their HIV-1 exposure is among the highest in the world.
- Most isolated HIV strains are clade A in Nairobi, although clades C and D are also found – B clade epitopes are often cross-reactive, however stronger responses are frequently observed using A or D clade versions of epitopes.
- This epitope is conserved among B and D clade viruses.

- The Clade A version of the epitope, SLFNTVATL, was preferentially recognized by CTL.
- This epitope was recognized by two different exposed seronegative prostitutes.

Epitope SLYNTVATL

Epitope name SL9

Subtype B

Immunogen HIV-1 infection

Species (MHC)

Keywords rate of progression, escape

References Douek *et al.* 2002

- Seven HIV-positive subjects tended to make their strongest CD8+ T-cell response against Gag; these responses had varying breadth and magnitude that were unrelated to disease progression.
- Patient TX7 primarily recognized SL9 during a three year study period and used six T-cell clonotypes for this recognition.
- SLYNTVATL was the only form of the epitope found initially, but three alternate forms eventually appeared: SLYNTVAVL, SLYNTIATL, and most commonly SLYNTIAVL. These distinct forms bind A2, but have distinct abilities to stimulate different T-cell clonotypes.
- In subject TX7, the observed mutations of SL9 failed to escape overall CTL recognition, presumably because the six T-cell clonotypes allowed a more flexible response.
- The BV17 T-cell clone recognized SL9 but not SLYNTIAVL, and BV17 became undetectable at week 20 when SLYNTIAVL predominated. Subsequently BV17 became the second most common clone. Thus the relative frequency of the T-cell clonotypes varied with respect to each other and to epitope variation.

Epitope TLYCVHQR

Subtype B

Immunogen HIV-1 infection

Species (MHC) human (A*1101)

Keywords subtype comparisons, TCR usage

References Fukada *et al.* 2002

- Counterparts for eight known clade B HLA A*1101 epitopes were generated for clade E (CRF01). Three epitopes, identical among clade A-E, were cross-reactive and recognized by clade E infected individuals. The clade E and B analogs to three more HLA A*1101 epitopes was recognized in a clade specific manner. Two other HLA A*1101 clade B defined epitopes were found not to have stimulated a response in clade E infected individuals.
- TLYCVHQQR was found to elicit clade-specific responses in clade B (TLYCVHQQR is most common, and is also common in clade A – the variant tlycvhqK is common in clade B) and clade E (tlWcvhqr is most common). TLYCVHQQR was not recognized by any CTL, tlycvhqK was recognized by CTL from 1/5 B clade infected Japanese subjects, and tlWcvhqr was not recognized by CTL from infected Thai subjects, so this seems to be a B clade exclusive epitope.
- The binding of the variant peptides to HLA A*1101 was comparable, but CTL that recognized tlycvhqK did not cross-recognize the other forms, implicating TCR interaction differences.

HXB2 Location p17 (84–91)

Assay type CD8 T-cell Elispot - IFN γ , Chromium-release assay

Keywords dynamics, acute/early infection, characterizing CD8+ T cells

References Jones *et al.* 2004

- Primary CD8+ T-cell response to Env, Tat and Gag and the extent, kinetics and mechanisms of viral escape were examined in three patients. Rapid escape, within weeks from infection, from HIV specific CTL responses was observed in all three patients, but the kinetics and extent of the escape differed depending on the breadth and co-dominant distribution of CTL-mediated pressure. The two patients that rapidly declined had more focused immunodominant responses, while the single patient that had low viral load and stable CD4 counts for seven years had a broad co-dominant response and less escape.
- The patient SUMA maintained low viral loads and stable CD4 T-cell counts through seven years of follow up. In contrast to more rapid progressors, WEAU and BORI, SUMA a broad response to 24 epitopes, with little immunodominance. Two peptides were somewhat more intensely recognized in acute infection, but this response leveled out early on.
- Only four epitopes were found to acquire escape mutations in SUMA over time, and this was one of the 20 that remained invariant. A low level response was detected at acute infection that persisted through early infection.

- Cross-clade CTL responses in 10 non-B HIV-1 infected individuals were evaluated. T-cell reactivity was tested against peptide pools of clade B Gag, Pol, Nef, Rev and Tat. Nine individuals demonstrated cross-reactive T-cell responses to clade A, B, and C Gag pools; 6/7 patients that responded to Nef-B also reacted to clade A and C Nef pools. An inverse correlation was observed between the sequence divergence of the HLA class I restricted epitopes and the height of the T-cell responses, which in Gag could be explained through variations in the HLA-anchor residues. 42% of the responses were directed to regions containing new epitopes.

Epitope IEIKDTKEAL

Epitope name IL10

Subtype B

Immunogen HIV-1 infection

Species (MHC) human (B60)

Assay type Chromium-release assay, CTL suppression of replication

Keywords escape

References Yang *et al.* 2003a

- Virus was cultured in the presence of CTL lines specific for 5 different epitopes (SLYNTVATL, ILKEPVHGV, IEIKDTKEAL, SEGATPQDL, and KEKGGLEGL) to study the emergence of escape mutations. Escape varied between clones for the same epitope, and between different epitopes.

Gag and RT epitope escape, if it occurred at all, tended to be monoclonal and within the epitope, indicating strong fitness constraints, while the Nef epitope escape was rapid, polyclonal, and sometimes the result of upstream frameshifts.

- There was one cloned cell line that recognized IEIKDTKEAL, 161JD27. After 2 weeks of passaging HIV-1 in the presence of 161JD27, no mutations were observed within the epitope in 10 sequences; one of the 10 had a single E → K substitution 6 amino acids beyond the C-terminal end of the epitope.

HXB2 Location p17 (92–101)

Epitope IEIKDTKEAL

Epitope name IL10

Subtype B

Immunogen vaccine

Vector/Type: adeno-associated virus (AAV)

HIV component: gp120

Species (MHC) human (B60)

Assay type Chromium-release assay, Flow cytometric T-cell cytokine assay

Keywords dynamics, immune evasion

References Brainard *et al.* 2004

- HIV-1 gp120 is shown to suppress the ability of antigen-specific CTLs to migrate or remain at sites of high viral replication by concentration-dependent chemotaxis and fugetaxis. Directional T-cell movement is shown to depend on the interaction of the V2 and V3 loops with the CXCR4 receptor. X4 HIV-1 gp120 causes the migration of T-cells, including HIV-1 specific CTL, away from infected target cells, another potential mechanism for immune evasion.

HXB2 Location p17 (92–101)

Author Location p17 (92–101)

Epitope IEIKDTKEAL

Epitope name Gag/p17-IL10

Subtype B

Immunogen HIV-1 infection

Species (MHC) human (B60)

Assay type Chromium-release assay

Keywords binding affinity, epitope processing, TCR usage, characterizing CD8+ T cells

References Yang *et al.* 2003b

- Killing efficiency of CTLs and their ability to suppress viral replication is shown to depend more on epitope specificity than to antigenic avidity. Different clones recognizing the same epitope had similar killing efficiency despite their variation in avidity. Nef specific CTL clones tended to be most inhibitory, followed by Gag, then by RT specific clones, regardless of avidity.
- 1/14 CTL T-cell clones tested were specific for Gag/p17-IL10. Under conditions of excess peptide (100ug/ml), there was no difference in their lytic potential; all possessed similar effector capacity. Avidity was measured as the sensitizing dose of peptide required for 50% of maximal killing (SD50), which varied from 20 pg/ml to 100 ng/ml, over four orders of magnitude for all 14 epitopes. The SD50 value for the Gag/p17-IL10 clone was 8,000 pg/ml.

Assay type CD8 T-cell Elispot - IFN γ , Chromium-release assay

Keywords dynamics, immunodominance, acute/early infection, kinetics, characterizing CD8+ T cells, reversion, viral fitness

References Jones *et al.* 2004

- Primary CD8+ T-cell response to Env, Tat and Gag and the extent, kinetics and mechanisms of viral escape were examined in three patients. Rapid escape, within weeks from infection, from HIV specific CTL responses was observed in all three patients, but the kinetics and extent of the escape differed depending on the breadth and co-dominant distribution of CTL-mediated pressure. The two patients that rapidly declined had more focused immunodominant responses, while the single patient that had low viral load and stable CD4 counts for seven years had a broad co-dominant response and less escape.
- The patient WEAU had high viral loads and rapid CD4 decline. WEAU mounted 14 detected CTL responses, with distinct patterns of immunodominance. WEAU did not control viral replication well, and escape mutations occurred early and 4/14 had changes that could have resulted in escape, and two were confirmed as escape.
- There was a weak response to this epitope during acute and early infection, and the epitope sequence did not vary during the first year of the infection.

Assay type CD8 T-cell Elispot - IFN γ , HLA binding

Keywords escape, acute/early infection, variant cross-recognition or cross-neutralization

References Milicic *et al.* 2005

- CTL responses and escape were analyzed in 4 homosexual couples where blood samples were available within weeks of estimated transmission. When the recipient had the same HLA type as the donor, CTL escape variants prevented a CTL response to those epitopes in the recipient. Even when the HLA alleles were different in the transmitting couple, a single escape mutation in one epitope can abolish CTL recognition of an overlapping epitope of distinct restriction in the recipient. In an early acute infection of the donor, the precise timing of transmission determines the viral variants transmitted.
- The second donor in the study shares A*0101 and B*0801 with his partner. The epitope EVKDTKEAL has an escape variant in the donor that does not react in an Elispot assay, DvkGtkeal, but the Dvkdtkeal form was the transmitted variant. The transmitted form and EVKDTKEAL bind with equal affinity to B*0801.
- The recipient mounted a response to the Dvkdtkeal form of the epitope. The variant DvRdtkeal was detected by 32 weeks post infection.

HXB2 Location p17 (124–132)**Author Location** p17**Epitope** NSSQVSQNY**Immunogen** HIV-1 infection**Species (MHC)** human (B*3501)**Keywords** binding affinity**References** Dorrell *et al.* 2001

- The crystal structure of this epitope bound to HLA-B*3501 shows that a serine can fit into the B pocket, which is shared between B35 and B53, with the hydroxyl group of the P2 serine occupying a position almost identical to the P2 proline that was previously considered the anchor motif.

- Novel B53 epitopes (DTINEEAAEW and QATQEVKNNM) were defined in this study that showed that A and T can also serve as P2 anchor residues for the B pocket of HLA-B35 and B53 – while S, T, and P could all fit into the B pocket and form a hydrogen bond, A would not form a bond, so the authors propose compensatory interactions account for the high affinity of QATQEVKNNM for B53.

References Plana *et al.* 2004

- Structured treatment interruption (STI) alone is not able to control viral replication in chronically infected patients, probably due to lack of strong, maintained T-helper cell responses. HIV-1 specific CD8+ T-cell responses were shown to increase significantly until the end of the follow up, but were not correlated with viral load.
- Less than 2/9 patients recognized this epitope.

II-B-2 Gag p17-p24 CTL/CD8+ epitopes

HXB2 Location p17-p24 (124–1)

Author Location Gag (124–133 BORI)

Epitope NSSQVSQNYP

Epitope name Gag NP10

Subtype B

Immunogen HIV-1 infection

Species (MHC) human

Donor MHC A*2902, B*1402, Cw*0802

- Country** United States.
Assay type CD8 T-cell Elispot - IFN γ , Chromium-release assay
Keywords dynamics, immunodominance, escape, acute/early infection, characterizing CD8+ T cells, reversion, viral fitness
References Jones *et al.* 2004
- Primary CD8+ T-cell response to Env, Tat and Gag and the extent, kinetics and mechanisms of viral escape were examined in three patients. Rapid escape, within weeks from infection, from HIV specific CTL responses was observed in all three patients, but the kinetics and extent of the escape differed depending on the breadth and co-dominant distribution of CTL-mediated pressure. The two patients that rapidly declined had more focused immunodominant responses, while the single patient that had low viral load and stable CD4 counts for seven years had a broad co-dominant response and less escape.
 - The patient BORI had high viral loads and rapid CD4 decline. BORI mounted 8 detected responses. BORI did not control viral replication well, and escape mutations occurred early and in most epitopes, 6/7 that were precisely identified.
 - 10 variants in the NSSQVSNYP epitope were found in the patient BORI, the first appearing at day 35, NgSQVSNYP, with new variants continuing to arise through day 556. This is an extremely variable epitope, and changed not only by base substitution but by insertion and deletion. All variants tested conferred some degree of escape by diminishing the CTL response.

Epitope SQNYPIVQNIQ
Epitope name Gag 7.3
Immunogen vaccine

Vector/Type: DNA prime with modified vaccinia Ankara (MVA) boost **Strain:** B clade
HIV component: Env, Gag, Protease, Rev, RT, Tat, Vpu

- Species (MHC)** macaque
Assay type T-cell Elispot, Intracellular cytokine staining
Keywords subtype comparisons, variant cross-recognition or cross-neutralization, memory cells
References Amara *et al.* 2005
- A clade B DNA/MVA HIV vaccine was shown to raise a broad cross-reactive cellular immune response for peptides based on the CRF02_AG consensus Gag in macaques. The activity was better conserved for CD8 than CD4 T cells.
 - All 5 CD8 and 4/8 of the CD4 epitopes that were recognized in vaccinated macaques have also been reported for human infections, indicating cross-species conservation of a CD8 T cell epitope previously reported for humans as NYPIVQNL. HLA restriction: A*2402.
 - The response elicited to the B clade epitope SQNYPIVQNIQ does not cross-react with the CRF02 form SQNYPIVQNaQ. Other clades either most commonly carry an A or L in this position, SQNYPIVQN[a/l]Q.

- HXB2 Location** p17-p24 (131–6)
Author Location p17-p24 (132–140 SF2)
Epitope NYPIVQNL
Immunogen HIV-1 infection
Species (MHC) human (A*2402)
References Ikeda-Moore *et al.* 1997
- The epitope starts in p17 and ends in p24.
 - Defined using reverse immunogenetics – 59 HLA-A*2402 binding peptides were predicted by searching for A*2402 anchors in HIV proteins (Tyr at 2, and Phe, Leu or Ile at the C term) – 53 of the 59 peptides bound A*2402.
 - This peptide induced CTL in 1/4 HIV-1 + people tested.
 - NYPIVQNL bound to A*2402 with medium strength, and the epitope can be processed in a vaccinia construct and presented – no CTL clone was obtained.

Assay type CD8 T-cell Elispot - IFN γ

Keywords characterizing CD8+ T cells

References Kiepiela *et al.* 2004

- HLA class I restricted CD8+ T-cell responses against HIV-1 were analyzed in African patients. Significantly more responses were shown to be HLA-B restricted. Viral load, CD4 count, and thus rate of disease progression were also associated with HLA-B alleles. In addition, the selection pressure imposed on HIV-1 by HLA-B alleles was shown to be substantially greater than by other alleles.
- This epitope was suggested to be the epitope within a longer reactive peptide based on correspondence with a known epitope in the HIV database. Also, a significantly higher frequency of people in the Durban cohort who reacted with the peptide had this HLA type.

Subtype B

Immunogen HIV-1 infection

Species (MHC) human

Assay type T-cell Elispot

Keywords supervised treatment interruptions (STI), immunodominance, early treatment

References Addo *et al.* 2003

- Comprehensive Elispot screening of 504 overlapping peptides that spanned all HIV-1 proteins in 57 HIV-1 infected individuals. Four groups of patients were compared: 23 were untreated; 12 patients were chronically infected and treated; 22 started treatment during acute infection, 11 continuously treated and 11 with STI.
- 63% of the peptides were recognized - the most frequent responses were directed against Nef (95%) and p24-Gag (88%). p17 was the most frequently recognized protein after correction for protein length. A median of 18 peptides (range 2–42) were recognized per person. The most frequently (>20%) recognized peptides were located in conserved regions within clade B sequences. Vpu was rarely recognized.
- A decrease in the total magnitude and in the breadth of CTL responses was detected in patients with treated acute infection in comparison to chronically infected treated or untreated individuals. No correlation between plasma viral load and HIV-1 specific T-cell responses was observed.
- The authors did not note the reference strain, but based on the peptide sequences provided it appears to be HXB2.
- Responses to this peptide were detected in 29% of the study subjects, and it was the third most frequently recognized peptide.

Keywords immunodominance

References Betts *et al.* 2000

- Only 4/11 HLA-A2+ HIV+ individuals had CTL that reacted to SLYNTVATL, calling into question whether it is immunodominant.
- 95 optimally-defined peptides from this database were used to screen for INF γ responses to other epitopes.
- 1/11 of the A2+ individuals was HLA A*0201, A1, B57 and responded to four B57 epitopes and two others, but not SLYNTVATL.

HXB2 Location p24 (15–23)

Author Location Gag (SF2)

Epitope ISPRTLNAW

Epitope name IW9

Immunogen HIV-1 infection

Species (MHC) human (B57)

Keywords acute/early infection

References Goulder *et al.* 2001a

- This epitope elicited the second strongest CTL response in patient PI004 during acute infection, and maintained the response.
- Three CTL responses, to epitopes TSTLQEIQGW, ISPRTLNAW, and KAFSPEVIPMF, were evident early after infection; CTL responses to SLYNTVATL, QASQEVKNW, ELYKRWII, and FLKEKGGL were detectable at 5 months post-infection and beyond.

HXB2 Location p24 (15–23)

Author Location p24 (147–155)

Epitope ISPRTLNAW

Epitope name ISP

Immunogen HIV-1 infection

Species (MHC) human (B57)

Keywords HAART, ART, acute/early infection

References Oxenius *et al.* 2000

- Patients who started therapy at acute HIV-1 infection (three with sustained therapy, two with limited therapy upon early infection) had strong HIV specific CD4 proliferative responses and were able to maintain a CTL response even with undetectable viral load – three patients that had delayed initiation of HAART had no HIV specific CD4 proliferative responses and lost their CTL responses when HAART was eventually given and their viral loads became undetectable.
- None of the 8 study subjects recognized this epitope but none were HLA B57+.

- Assay type** CD8 T-cell Elispot - IFN γ
- Keywords** epitope processing, responses in children, mother-to-infant transmission, escape, acute/early infection
- References** Pillay *et al.* 2005
- HIV-specific CTLs in infants were shown to be able to select for viral escape variants early in life, despite a lack of escape with the same CTL specificity in the mother. Infant CTL responses may be compromised by transmission of escape variants that arose in the mother and also those that arose in the father, if the father was the source of the mother's infection.
 - ISPRTLNAW is the C consensus form of the epitope and was the autologous form in the mother, and was transmitted to her infant. By 33 weeks a new dominant form of the epitope had emerged in the infant, mSPRTLNAW, and two additional variants had arisen, one with a substitution proximal to the epitope, pISPRTLNAW, and ISPRTLNAW.

- Species (MHC)** human (B57, B*5801)
- Assay type** CD8 T-cell Elispot - IFN γ , Chromium-release assay
- Keywords** epitope processing, responses in children, mother-to-infant transmission, escape
- References** Feeney *et al.* 2005
- Escape mutations in TW10 and other B57-restricted epitopes were shown to arise early in infants following perinatal infection. Some escape variants were likely to have been transmitted vertically, from HLA-B57/5801 positive HIV-1 infected mothers, while others arose during infancy in cases where the children inherited the B57/5801 allele paternally. In contrast to adults, the majority of children showed a robust response to the escape variants, suggesting that infants are able to mount functional immune responses and drive immune escape and that a developing immune system may exhibit greater plasticity in recognizing viral variants.
 - ISPRTLNAW was recognized more often in children than in adults, and was the most frequently recognized B57 epitope in children. Escape variants of this epitope arose in 2 children: an A->P change proximal to the epitope, pISPRTLNAW, and and IIL change, ISPRTLNAW. In both cases the mother carried AISPRTLNAW.

References Geels *et al.* 2005

- Cross-clade CTL responses in 10 non-B HIV-1 infected individuals were evaluated. T-cell reactivity was tested against peptide pools of clade B Gag, Pol, Nef, Rev and Tat. Nine individuals demonstrated cross-reactive T-cell responses to clade A, B, and C Gag pools; 6/7 patients that responded to Nef-B also reacted to clade A and C Nef pools. An inverse correlation was observed between the sequence divergence of the HLA class I restricted epitopes and the height of the T-cell responses, which in Gag could be explained through variations in the HLA-anchor residues. 42% of the responses were directed to regions containing new epitopes.
- This previously described epitope was embedded in a B clade peptide that was recognized by T-cells from an infected person carrying subtype D Gag. The autologous epitope sequence had an ILL change, ISPRTLNAW.

Keywords subtype comparisons

References Rowland-Jones *et al.* 1998b

- HIV-specific CTL were found in exposed seronegative prostitutes from Nairobi – these CTL may confer protection.
- Seroprevalence in this cohort is 90-95% and their HIV-1 exposure is among the highest in the world.
- Most isolated HIV strains are clade A in Nairobi, although clades C and D are also found – B clade epitopes are often cross-reactive, however stronger responses are frequently observed using A or D clade versions of epitopes.
- This epitope is conserved among A, B, and D clade viruses.

Epitope QIRSLSGWIL

Epitope name QL10

Subtype B

Immunogen HIV-1 infection

Species (MHC) human

Donor MHC A2, B7, B44, Cw5, Cw7

Country United States.

Assay type CD8 T-cell Elispot - IFN γ

Keywords subtype comparisons, escape, characterizing CD8+ T cells, reversion, viral fitness

References Allen *et al.* 2005a

- Two-thirds of all mutations arising in nonenvelope proteins during the transition from acute to chronic infection were found to be due to either CD8 T-cell-associated selective pressures or reversion of HLA-I-associated mutations selected in a previous host. The predominance of escape mutations at highly polymorphic sites was observed across different HIV-1 clades.
- One escape mutation, at position 7, QIRSLSeWIL was found not to correspond to the most polymorphic residue in the epitope. This is a novel unmapped epitope.

Epitope RTLNAWVKV

Epitope name Gag150

Immunogen HIV-1 infection, vaccine

Vector/Type: peptide *HIV component:* p24 Gag *Adjuvant:* Incomplete Freund's Adjuvant (IFA)

Species (MHC) human, transgenic mouse (A2)

Assay type CD8 T-cell Elispot - IFN γ , Chromium-release assay, Flow cytometric T-cell cytokine assay

Keywords binding affinity, subtype comparisons, computational epitope prediction

References Corbet *et al.* 2003

- HLA-A2-restricted HIV-1 CTL epitopes were computationally predicted. Binding affinities for HLA-A*0204, immunogenicity in HLA-A*0201 transgenic mice, and responses to the peptides in 17 HIV-1 infected patients were tested. 31 novel conserved A2 epitopes were detected. An average of 4 epitopes were recognized per patient.

- This peptide was an intermediate A2 binder, and induced CTL responses in mice. Responses were detected in 1/17 HIV+ HLA-A2 subjects.

Author Location Gag

Epitope TLNAWVKW

Epitope name T9V

Immunogen vaccine

Vector/Type: measles virus (MV) *Strain:* multiple epitope immunogen *HIV component:* gp140, gp140ΔV3

Species (MHC) transgenic mouse (A*0201)

Assay type Chromium-release assay, Flow cytometric T-cell cytokine assay

Keywords memory cells, vaccine antigen design, antibody generation, characterizing CD8+ T cells

References Lorin *et al.* 2005

- A recombinant measles MVSchw virus expressing an HIV-1-derived polyepitope effectively primed HLA-A*0201-restricted CTL responses against multiple conserved HIV-1 epitopes in HLA-A*0201 transgenic mice. Also, a recombinant MVSchw virus expressing gp140 with deleted V1, V2, and V3 loops successfully induces neutralizing antibodies against HIV-1. A live attenuated measles vaccine could provide a safe and efficient pediatric vaccination vector for simultaneous vaccination against HIV and measles.

Epitope TLNAWVKVI

Epitope name 24D

Subtype B**Immunogen** vaccine*Vector/Type:* DNA *Strain:* multiple epitope immunogen *HIV component:* p17/p24 Gag, Pol *Adjuvant:* IL-12**Species (MHC)** transgenic mouse (A2)**Assay type** Cytokine production, CD8 T-cell Elispot - IFN γ , Chromium-release assay**Keywords** vaccine-specific epitope characteristics, vaccine antigen design**References** Bolesta *et al.* 2005

- Immunization of transgenic mice with a codon-optimized hGagp17p24-Polp51 DNA plasmid, consisting of clusters of highly conserved CTL epitopes presented by multiple MHC class I alleles, induced 2- to 5-fold higher CD8+ T-cell responses than the corresponding full-length proteins. The modified proteins had the ribosomal frameshift deleted, as well as the potentially immunosuppressive p15, and protease and integrase. This correlated with higher protection against challenge with Gag and Pol expressing recombinant vaccinia virus. Mice immunized with the hGagp17p24-Polp51 also showed an elevated level of type I cytokine production as well as an increased titer of p24- and RT-specific IgG2 antibody responses.
- This was 1 of 4 A2 gag/pol epitopes tested. Transgenic mice immunized with the deleted construct induced more potent EliSpot reactions to this epitope than those immunized with full length Gag/Pol.

HXB2 Location p24 (21–30)**Author Location** Gag (153–162 WEAU)**Epitope** NAWVKIEEK**Epitope name** Gag NK9**Subtype B****Immunogen** HIV-1 infection**Species (MHC)** human**Donor MHC** A*2902, B*4403, B*0801**Country** United States.**Assay type** CD8 T-cell Elispot - IFN γ , Chromium-release assay**Keywords** dynamics, immunodominance, acute/early infection, kinetics, characterizing CD8+ T cells, reversion, viral fitness**References** Jones *et al.* 2004

- Primary CD8+ T-cell response to Env, Tat and Gag and the extent, kinetics and mechanisms of viral escape were examined in three patients. Rapid escape, within weeks from infection, from HIV specific CTL responses was observed in all three patients, but the kinetics and extent of the escape differed depending on the breadth and co-dominant distribution of CTL-mediated pressure. The two patients that rapidly declined had more focused immunodominant responses, while the single patient that had low viral load and stable CD4 counts for seven years had a broad co-dominant response and less escape.
- The patient WEAU had high viral loads and rapid CD4 decline. WEAU mounted 14 detected CTL responses, with distinct patterns of immunodominance. WEAU did not control viral replication well, and escape mutations occurred early and 4/14 had changes that could have resulted in escape, and two were confirmed as escape.
- There was a weak response to this epitope during acute and early infection, and the epitope sequence did not vary during the first year of the infection.

HXB2 Location p24 (21–31)**Author Location** Gag (129–139)**Epitope** NAWVKVVEEKA**Epitope name** Gag 8.4**Immunogen** vaccine*Vector/Type:* DNA prime with modified vaccinia Ankara (MVA) boost *Strain:* B clade *HIV component:* Env, Gag, Protease, Rev, RT, Tat, Vpu**Species (MHC)** macaque**Assay type** T-cell Elispot, Intracellular cytokine staining**Keywords** subtype comparisons, memory cells**References** Amara *et al.* 2005

- A clade B DNA/MVA HIV vaccine was shown to raise a broad cross-reactive cellular immune response for peptides based on the CRF02_AG consensus Gag in macaques. The activity was better conserved for CD8 than CD4 T cells.
- All 5 CD8 and 4/8 of the CD4 epitopes that were recognized in vaccinated macaques have also been reported for human infections, indicating cross-species conservation. The similar reported human epitope in this case is NAWVKVVEEKAF-SPEVIPMF, HLA restriction: A2, B21, B57.
- The B clade immune response to NAWVKVVEEKA gives a diminished response to the CRF02 variant NAWVKViEEKA, but does cross-react. The M group clades are about evenly split between the 2 variants.

- C. Brander notes this is a B*5701 epitope.

HXB2 Location p24 (30–40)**Author Location****Epitope** KAFSPEVIPMF**Subtype** B**Immunogen** HIV-1 infection**Species (MHC)** human (B*5701)**Keywords** rate of progression, immunodominance**References** Migueles & Connors 2001

- HLA B*5701 was found in a very high frequency in HIV-1 infected non-progressors, 11/13 (85%) versus 19/200 (9.5%) of progressors. Non-progressors tended to have an immune response that was highly focused on four p24 epitopes that were presented by B*5701, ISPRTLNAW, KAFSPEVIPMF, TSTLQEQIGW, and QASQEVKNW.
- Attempts to make all for HLA B*5701-epitope tetramers were made, but only the HLA B*5701-KAFSPEVIPMF tetramer folded properly. The percentage of CD8+ T cells staining with this HLA B*57 gag tetramer and the fraction of CD69+IFN- γ cells responding to autologous B cells pulsed with KAFSPEVIPMF was highly correlated ($r = 0.84$; $P = 0.005$). The percent of CD8+ T cells that stain with the A*2 gag SLYNTVATL tetramer was low (0–0.31%) in a A2+ B57+ LTNP, emphasizing the focus of the immune response on the B*5701 epitopes.

HXB2 Location p24 (30–40)**Author Location****Epitope** KAFSPEVIPMF**Subtype** B**Immunogen** HIV-1 infection**Species (MHC)** human (B*5701)**Keywords** rate of progression, immunodominance**References** Migueles & Connors 2001

- CTL activity was monitored in 27 individuals, including 10 LTNP with an over-expression of HLA B*5701 – these individuals have viral loads below the threshold of infection without therapy, and their immune response tends to be focused on peptides that contain B*5701 epitopes ISPRTLNAW, KAFSPEVIPMF, TSTLQEQIGW, and QASQEVKNW.

- CTL responses are broader in B*5701+ individuals with progressive viremia than those that control viremia.
- The HLA-A*0201 SLYNTVATL epitope response was not as strong in individuals that carried both A2 and B57.

HXB2 Location p24 (30–40)**Author Location** Gag (162–172)**Epitope** KAFSPEVIPMF**Epitope name** KAF11**Subtype** B**Immunogen** HIV-1 infection**Species (MHC)** human (B*5701)**Assay type** Intracellular cytokine staining, Flow cytometric T-cell cytokine assay**Keywords** rate of progression, escape**References** Migueles *et al.* 2003

- cDNA Gag sequences from a set of 17 HLA-B*5701+ progressors and 10 LTNPs were obtained, and the variation in four p24 B*5701 epitopes examined. Sequence variants were more common ($p < 0.01$) in the epitopes in the progressors (median 3, range 1–7) than LTNPs (median 2, range 0–4).
- In general, use of the autologous protein in a target cell did not diminish the overall CD8+ T-cell responses.
- This epitope tends to be quantitatively immunodominant in B57+ people, including in some of the individuals in this study. It was extremely well conserved in the sequences obtained here, despite strong immune pressure, suggesting fitness constraints.

HXB2 Location p24 (30–40)**Author Location** p24 (30–40)**Epitope** KAFSPEVIPMF**Epitope name** KAFS**Subtype** A, B**Immunogen** HIV-1 infection**Species (MHC)** human (B*5701, B*5703)**Keywords** subtype comparisons, rate of progression**References** Gillespie *et al.* 2002

- CTL responses of eight HIV+ slow progressors from Nairobi Kenya or Oxford, UK who were B*5701 or B*5703 were studied, as B*57 is associated with slow progression.
- This epitope is located between the structurally conserved alpha-helix 1 and alpha-helix 2 (H1–H2) region of the p24 capsid protein, and tends to elicit strong reactions in B*57 individuals.
- Broad heterogeneous cross-clade reactivity to 6 clade variants of the KAFS peptide sequence were observed in one B*5701 and 5 B*5703 HLA-restricted patients, measured by IFN γ production Elispot assays as well as tetramer binding. The clade variants were: KAFSPEVIPMF (clades A and B), kGfNpevipmf (clades A/AC); kaLspevipmf (clade A); kafspevipVf (clade A); kafNpeIipmf (group O); kafspeIipmf (A/C); kafsQevipmf (A/C); and kaLspevipmf KNFSPEVIPMF A/G). Not all variants were well recognized in all patients, for example kafsQevipmf was not able to induce IFN gamma production in 3/6 tested, and had a diminished capacity to sensitize target cells for lysis.

- This study monitored epitope responses in HIV-1 infected minority women living in the United States.
- 24 epitopes were described – 8 were novel, 8 used new restricting elements but were previously defined epitopes, and 8 were previously described.
- Serial peptide truncations were used to define optimal epitopes for CTL cell lines isolated from 12 individuals, assayed by a Cr-release.
- Subject 00RCH59 was African American, on HAART, viral load 170, CD4 count 477.
- Among HIV+ individuals who carried HLA-B57, 6/6 (100%) recognized this epitope.

HXB2 Location p24 (30–40)**Author Location** p24 (162–172)**Epitope** KAFSPEVIPMF**Epitope name** KF11**Subtype** C**Immunogen** HIV-1 infection**Species (MHC)** human (B*5703)**Country** Ethiopia.**Assay type** CD8 T-cell Elispot - IFN γ **Keywords** rate of progression, immunodominance, escape, variant cross-recognition or cross-neutralization**References** Currier *et al.* 2005

- HLA-B57 is associated with slow progression. Epitope sequence variation and CD8 T-cell responses were analyzed in HLA-B*5703-positive individuals from Ethiopia. KF11 epitope and its variants were found to be immunodominant in these subjects. Two HLA-B*5702 subjects did not respond to the KF11 epitope or its variants.
- 5 variants of the epitope were observed: KAFSPEVIPMF, KnFSPEVIPMF, rAFSPEVIPMF, KgFnPEVIPMF, and KAFSPEVIPMI. Depending on the subject, different versions of these variants were more or less susceptible to their CD8+ T cells, i.e., one person's escape form was another person's susceptible form.

HXB2 Location p24 (30–40)**Author Location** (C consensus)**Epitope** KAFSPEVIPMF**Subtype C****Immunogen** HIV-1 infection**Species (MHC)** human (B*5703)**Country** South Africa.**Assay type** CD8 T-cell Elispot - IFN γ **Keywords** rate of progression, optimal epitope**References** Kiepiela *et al.* 2007

- A comprehensive analysis of 160 class I T cell responses in 578 individuals from KwaZulu-Natal, South Africa was performed. Gag-specific responses were associated with lowering viremia, while Env, accessory and regulatory protein-specific responses were associated with higher viremia.
- Mutational patterns in the A2 and S4 residues of KAFSPEVIPMF are associated with the presence of the HLA presenting molecule in the host.

HXB2 Location p24 (30–40)**Author Location** p24 (30–40)**Epitope** KAFSPEVIPMF**Immunogen** HIV-1 infection**Species (MHC)** human (B57)**References** Goulder *et al.* 2000c

- Two strong clonal CTL responses were generated in donor 026-BMC (HLA A3/-, B42/B57, Cw7/17) against different optimal versions of this epitope, one 8 amino acids long, one 11.
- Improved stabilization of the B57-peptide complex was demonstrated by the 11mer which fits the B57 binding motif, relative to the 8 mer, which does not.
- B57 tolerates marked difference in optimal peptide length – and B57 is associated with non-progressive infection.

HXB2 Location p24 (30–40)**Author Location** p24 (162–172)**Epitope** KAFSPEVIPMF**Immunogen** HIV-1 infection**Species (MHC)** human (B57)**Keywords** immunodominance**References** Betts *et al.* 2000

- Only 4/11 HLA-A2+ HIV+ individuals had CTL that reacted to SLYNTVATL, calling into question whether it is immunodominant.
- 95 optimally-defined peptides from this database were used to screen for INF γ responses to other epitopes.
- 1/11 of the A2+ individuals was HLA A*0201, A1, B57 and responded to four B57 epitopes and two others.

Assay type CD8 T-cell Elispot - IFN γ
Keywords acute/early infection, early-expressed proteins
References Cao *et al.* 2003

- All proteins were scanned and optimal epitopes were mapped in a study of CD8+ gamma IFN T-cell responses in 21 men within 15–92 days post-HIV-1 infection. Subjects initially showed narrow immune responses with a mean of 2.3 epitopes recognized per patient. The immune response broadened later in infection. No correlation between the plasma viral load and the number of recognized epitopes or the frequency of IFN-gamma secreting cells was observed, and there was no correlation between the functional avidity of responses and the abundance of IFN-secreting cells that recognized the epitope. The first epitopes to be recognized did not tend to be the most avid, and earliest responses tended to be directed against Nef, Tat, Vpr, and Env.
- All HIV-1 proteins except Vpu were recognized, and responses to a total of 41 optimal epitopes were characterized; 24 had been identified previously. 48% of the total T-cell responses were directed against Nef and 43% were directed against Gag.
- Alleles A3, B35, B57, and B62 were more frequently recognized than alleles A1, A2, A30, and A44 e.g., during primary infection. 2/10 patients, 1372 and 1397, recognized A2-restricted epitopes. The common A2-restricted epitopes Gag SL9 and Pol IV9 were not recognized in peptide tetramer-binding assays.

Assay type CD8 T-cell Elispot - IFN γ
Keywords variant cross-recognition or cross-neutralization
References Draenert *et al.* 2004c

- CD8+ T-cell responses that persisted in individuals with advanced disease were studied; most of the optimal epitopes defined were recognized with intermediate to high avidity. On average 13 (range, 2–39) epitopic regions were targeted in an average of 6 proteins (range, 1–8). HAART resulted in decrease in antigen and reduction in gamma IFN Elispot responses, suggesting active responses to autologous virus. The lack of mutations within most viral epitopes suggest that persistent CTL through late disease do not exert strong immune selection

pressure, yet the Elispot assays show robust responses, suggesting to the authors that gamma IFN-based screening methods may not reveal functional CD8+ T-cell impairment in patients with AIDS.

- 2 subjects recognized this epitope, 1 with high functional avidity, 1 with intermediate. Autologous sequence revealed no substitutions in this epitope compared to the B consensus.

Epitope KAFSPEVIPMF
Immunogen HIV-1 infection
Species (MHC) human (B57, B*5801)
Assay type CD8 T-cell Elispot - IFN γ , Chromium-release assay
Keywords responses in children, mother-to-infant transmission, escape, characterizing CD8+ T cells
References Feeney *et al.* 2005

- Escape mutations in TW10 and other B57-restricted epitopes were shown to arise early in infants following perinatal infection. Some escape variants were likely to have been transmitted vertically, from HLA-B57/5801 positive HIV-1 infected mothers, while others arose during infancy in cases where the children inherited the B57/5801 allele paternally. In contrast to adults, the majority of children showed a robust response to the escape variants, suggesting that infants are able to mount functional immune responses and drive immune escape and that a developing immune system may exhibit greater plasticity in recognizing viral variants.
- KAFSPEVIPMF was frequently recognized in children and in adults.

Epitope KAFSPEVIPMF
Immunogen HIV-1 infection, HIV-1 exposed seronegative
Species (MHC) human (B57, B58)
Keywords HIV exposed persistently seronegative (HEPS), immunodominance
References Kaul *et al.* 2001a

- ELISPOT was used to study CTL responses to a panel of 54 predefined HIV-1 epitopes in 91 HIV-1-exposed, persistently seronegative (HEPS) and 87 HIV-1-infected female Nairobi sex workers.

- Responses in HEPS women tended to be lower, and focused on different epitopes with HLA presenting molecules that have previously been associated with reduced risk of infection, and there was a shift in the response in the HEPS women upon late seroconversion to epitopes recognized by the HIV-1 infected women.
- 43/91 HEPS women had CD8+ responses and detection of HIV-1-specific CTL in HEPS women increased with the duration of viral exposure.
- Among HLA-B57/B58 women, 4/6 HEPS and 12/17 HIV-1 infected women recognized this epitope.
- The dominant response to this HLA allele was to this epitope in 2 of the 4/6 HEPS cases and in 7 of the 12/17 HIV-1 infected women.

Immunogen HIV-1 infection

Species (MHC) human (B57, B63)

Assay type CD8 T-cell Elispot - IFN γ

Keywords rate of progression, cross-presentation by different HLA, optimal epitope

References Frahm *et al.* 2005

- HLA-B63-positive subjects were shown to be able to generate CTL responses early in acute HIV infection and to control HIV replication in the absence of antiretroviral treatment. Since HLA-B63 shares the epitope binding motif of HLA-B57 and -B58, it was shown that HLA-B63-positive individuals mounted CTL responses to previously identified B57-restricted epitopes, as well as novel, B63-restricted epitopes. Moreover, these novel B63-restricted epitopes can also be presented by HLA-B57 and -B58.
- This epitope was recognized by 60% of B63-positive subjects and 33% of B57/58-positive subjects.

Assay type CD8 T-cell Elispot - IFN γ

Keywords subtype comparisons

References Geels *et al.* 2005

- Cross-clade CTL responses in 10 non-B HIV-1 infected individuals were evaluated. T-cell reactivity was tested against peptide pools of clade B Gag, Pol, Nef, Rev and Tat. Nine individuals demonstrated cross-reactive T-cell responses to clade A, B, and C Gag pools; 6/7 patients that responded to Nef-B also reacted to clade A and C Nef pools. An inverse correlation was observed between the sequence divergence of the HLA class I restricted epitopes and the height of the T-cell responses, which in Gag could be explained through variations in the HLA-anchor residues. 42% of the responses were directed to regions containing new epitopes.
- This previously described epitope was embedded in a B clade peptide that was recognized by T-cells from an infected person carrying subtype G Gag. The autologous epitope sequence in this person matched the known epitope.

References Addo *et al.* 2003

- Comprehensive Elispot screening of 504 overlapping peptides that spanned all HIV-1 proteins in 57 HIV-1 infected individuals. Four groups of patients were compared: 23 were untreated; 12 patients were chronically infected and treated; 22 started treatment during acute infection, 11 continuously treated and 11 with STI.
- 63% of the peptides were recognized - the most frequent responses were directed against Nef (95%) and p24-Gag (88%). p17 was the most frequently recognized protein after correction for protein length. A median of 18 peptides (range 2-42) were recognized per person. The most frequently (>20%) recognized peptides were located in conserved regions within clade B sequences. Vpu was rarely recognized.
- A decrease in the total magnitude and in the breadth of CTL responses was detected in patients with treated acute infection in comparison to chronically infected treated or untreated individuals. No correlation between plasma viral load and HIV-1 specific T-cell responses was observed.
- The authors did not note the reference strain, but based on the peptide sequences provided, it appears to be HXB2.
- Responses to this peptide were detected in 22% of the study subjects, and it was one of the 25 most frequently recognized peptides.

References Liu *et al.* 2006

- T-cell immunity and the impact of selection were longitudinally studied in a patient from the time of transmission. New epitopes were detected at sites that were shown to be under positive selection. Env was found to be the major target of CTLs and most of the new epitopes were found here. One third of the sites examined were associated with epitope escape mutations from CTL. Acquisition of mutations found at high frequency in the database was suggested to be a result of reversion of CTL epitopes in the absence of immune targeting.

Assay type CD8 T-cell Elispot - IFN γ , Chromium-release assay

Keywords dynamics, immunodominance, escape, kinetics, characterizing CD8+ T cells, reversion, viral fitness

References Jones *et al.* 2004

- Primary CD8+ T-cell response to Env, Tat and Gag and the extent, kinetics and mechanisms of viral escape were examined in three patients. Rapid escape, within weeks from infection, from HIV specific CTL responses was observed in all three patients, but the kinetics and extent of the escape differed depending on the breadth and co-dominant distribution of CTL-mediated pressure. The two patients that rapidly declined had more focused immunodominant responses, while the single patient that had low viral load and stable CD4 counts for seven years had a broad co-dominant response and less escape.

- The patient WEAU had high viral loads and rapid CD4 decline. WEAU mounted 14 detected CTL responses, with distinct patterns of immunodominance. WEAU did not control viral replication well, and escape mutations occurred early and 4/14 had changes that could have resulted in escape, and two were confirmed as escape.

- There was a weak response to this epitope during acute and early infection, and the epitope sequence did not vary during the first year of the infection.

HXB2 Location p24 (43–52)

Immunogen HIV-1 infection

Species (MHC) human (B44)

Country Cote D'Ivoire.

Assay type CD8 T-cell Elispot - IFN γ

Keywords subtype comparisons

References Inwoley *et al.* 2005

- CD8+ T-cells from HIV-1 CRF02_AG-infected Ivorians could recognize clade B epitopes. No difference was observed in the number of recognized peptide pools between nine French subtype B infected study subjects, and nine CRF02_AG infected Ivorian subjects.

- This epitope was recognized by 1/9 CRF02_AG-infected Ivorians, and 1/9 B-infected French subjects.

HXB2 Location p24 (44–52)
Author Location p24 (SF2)
Epitope SEGATPQDL
Immunogen HIV-1 infection
Species (MHC) human (B60)
References Altfeld *et al.* 2000

- This epitope was mapped by ELISPOT in a study identifying new HLA-B60 epitopes.
- B60 is present in 10–20% of the Caucasoid and very common in Asian populations.

HXB2 Location p24 (44–52)
Author Location p24
Epitope SEGATPQDL
Epitope name SL9
Immunogen HIV-1 infection
Species (MHC) human (B60)
Donor MHC A2, A24, B38, B60, Cw2, Cw12
Assay type CD8 T-cell Elispot - IFN γ
Keywords HAART, ART, supervised treatment interruptions (STI), acute/early infection, early treatment
References Montefiori *et al.* 2003

- HIV-1 + patient AC10 underwent early HAART treatment, which was discontinued 1.5 years later. At this timepoint potent NAb responses against autologous virus were detected. Treatment interruption initially induced weak CD8+ responses directed against 5 epitopes. By days 873d and 923d the CTL response had broadened to target 22 epitopes; of these six were fully characterized. Eventually the virus escaped the NAb response, but escape was not accompanied by a rise in viral load, and the authors suggest the virus was contained by the CTL response.

HXB2 Location p24 (44–52)
Author Location p24 (44–52 NL43)
Epitope SEGATPQDL
Subtype B
Immunogen HIV-1 infection
Species (MHC) human (B60)
Assay type Chromium-release assay, CTL suppression of replication
Keywords escape
References Yang *et al.* 2003a

- Virus was cultured in the presence of CTL lines specific for 5 different epitopes (SLYNTVATL, ILKEPVHGV, IEIKDTKEAL, SEGATPQDL, and KEKGGLEGL) to study the emergence of escape mutations. Escape varied between clones for the same epitope, and between different epitopes. Gag and RT epitope escape, if it occurred at all, tended to be monoclonal and within the epitope, indicating strong fitness constraints, while the Nef epitope escape was rapid, polyclonal, and sometimes the result of upstream frameshifts.
- One CTL clone, 161Jx12, recognized this epitope, and apparently no resistance mutations were selected by this clone, although the data was not shown in the paper.

HXB2 Location p24 (44–52)
Author Location p24 (176–184)
Epitope SEGATPQDL

Epitope name Gag/p24-SL9
Subtype B
Immunogen HIV-1 infection
Species (MHC) human (B60)
Assay type Chromium-release assay
Keywords binding affinity, TCR usage, characterizing CD8+ T cells
References Yang *et al.* 2003b

- Killing efficiency of CTLs and their ability to suppress viral replication is shown to depend more on epitope specificity than to antigenic avidity. Different clones recognizing the same epitope had similar killing efficiency despite their variation in avidity. Nef specific CTL clones tended to be most inhibitory, followed by Gag, then by RT specific clones, regardless of avidity.
- 1/14 CTL T-cell clones tested were specific for Gag/p24-SL9. Under conditions of excess peptide (100ug/ml), there was no difference in their lytic potential; all possessed similar effector capacity. Avidity was measured as the sensitizing dose of peptide required for 50% of maximal killing (SD50), which varied from 20 pg/ml to 100 ng/ml, over four orders of magnitude for all 14 epitopes. The SD50 value for Gag/p24-SL9 was 30 pg/ml, it was among the peptides with the highest avidity.

HXB2 Location p24 (44–52)
Author Location p24 (HXB2)
Epitope SEGATPQDL
Subtype B
Immunogen in vitro stimulation or selection
Species (MHC) human (B60)
Assay type CD8 T-cell Elispot - IFN γ , Chromium-release assay
Keywords epitope processing, vaccine antigen design, characterizing CD8+ T cells
References SenGupta *et al.* 2004

- Multiple HLA class I-restricted and class II-restricted T-cell epitopes were shown to be processed and presented from an exogenously added HIV-1 gag-p24 peptide complexed to a heat shock protein. T-cell recognition of the complex was shown to be inhibited by brefeldin A indicating an endoplasmic reticulum-dependent pathway.

HXB2 Location p24 (44–52)
Author Location p24 (44–52)
Epitope SEGATPQDL
Immunogen HIV-1 infection
Species (MHC) human (B60, B61)
Keywords immunodominance
References Day *et al.* 2001

- No immunodominant responses were detected to five B61-restricted epitopes tested.
- All five B60-restricted epitopes were reactive in another subject, the strongest CTL response directed against the B60-epitope p24 SEGATPQDL, and the B60-restricted responses together contributed over one-third of the total CTL response.

HXB2 Location p24 (46–59)
Author Location p24 (SF2)
Epitope GATPQDLNMLNTV
Immunogen HIV-1 infection

Species (MHC) human

Keywords subtype comparisons, immunodominance

References Goulder *et al.* 2000a

- The CTL-dominant response was focused on this epitope in a HIV+ African American living in Boston with HLA A*3002/68 B14/*5802 Cw6/8 – this epitope fell within the most recognized peptides in the study.
- Three peptides GSEELRSLYNTVATL (p17 residues 71-85), SALSEGATPQDLNMLNTVG (p24 41-60), and WEKIRL-RPGGKKKYKLG (p17 16-30) contained the dominant Gag-specific epitope in 31/44 B-clade infected individuals from Boston who showed Gag-CTL responses.
- Five peptides RLRPGGKKHYMIKHLVW (p17 20-36), ELRSLYNTVATLYCV (p17Gag 74-88), SALSEGATPQDLNMLNTVG (p24 41-60), FRDYVDRFFKTLRAEQA (p24 161-177), and SILDIKQGKEPFRDY (p24 149-164) contained dominant Gag-specific epitopes in 32/37 C-clade infected subjects from South Africa.

Epitope ATPQDLNMLNT

Subtype B, D

Immunogen HIV-1 infection

Species (MHC) human (B58)

Donor MHC A23, A24, B35, B58, Cw4, Cw7

Country Democratic Republic of the Congo.

Assay type CD8 T-cell Elispot - IFN γ

Keywords subtype comparisons

References Geels *et al.* 2005

- Cross-clade CTL responses in 10 non-B HIV-1 infected individuals were evaluated. T-cell reactivity was tested against peptide pools of clade B Gag, Pol, Nef, Rev and Tat. Nine individuals demonstrated cross-reactive T-cell responses to clade A, B, and C Gag pools; 6/7 patients that responded to Nef-B also reacted to clade A and C Nef pools. An inverse correlation was observed between the sequence divergence of the HLA class I restricted epitopes and the height of the T-cell responses, which in Gag could be explained through variations in the HLA-anchor residues. 42% of the responses were directed to regions containing new epitopes.
- This previously described epitope was embedded in a B clade peptide that was recognized by T-cells from an infected person carrying subtype D Gag. The autologous epitope sequence in this person matched the known epitope.

HXB2 Location p24 (48–55)

Author Location p24 (48–55)

Epitope TPQDLNTM

Immunogen HIV-1 infection

Species (MHC) human (B7)

Country Spain.

Assay type proliferation, CD8 T-cell Elispot - IFN γ , Flow cytometric T-cell cytokine assay

Keywords HAART, ART, supervised treatment interruptions (STI), immune dysfunction

References Plana *et al.* 2004

- Structured treatment interruption (STI) alone is not able to control viral replication in chronically infected patients, probably due to lack of strong, maintained T-helper cell responses. HIV-1 specific CD8+ T-cell responses were shown to increase significantly until the end of the follow up, but were not correlated with viral load.
- Less than 2 of 7 patients recognized this epitope.

- All HIV-1 subtype C protein sequences were analysed, and 94 HLA-associated amino acid polymorphisms were found that were well distributed throughout the proteome. These sequences were compiled from publicly available databases and originated in South Africa and Botswana. Many polymorphisms were associated with multiple HLA allele classes. 12% of negative associations were found as well, where there was an association of virus expression of the consensus amino acid with a specific HLA allele. HLA-B alleles were involved in most of the associations. 19 HLA-associated polymorphisms were embedded in previously defined epitopes presented by an appropriate HLA restricting molecule.
- TPQDLNTML was a previously defined B*81 presented epitope that encompassed associated polymorphisms, SeGAI/TPQDLNtML, in the seventh position of as well in the third position before the known epitope.

Keywords cross-presentation by different HLA, characterizing CD8+ T cells

References Kiepiela *et al.* 2004

- HLA class I restricted CD8+ T-cell responses against HIV-1 were analyzed in African patients. Significantly more responses were shown to be HLA-B restricted. Viral load, CD4 count, and thus rate of disease progression were also associated with HLA-B alleles. In addition, the selection pressure imposed on HIV-1 by HLA-B alleles was shown to be substantially greater than by other alleles.
- This epitope was suggested to be the epitope within a longer reactive peptide based on correspondence with a known epitope in the HIV database. Also, a significantly higher frequency of people in the Durban cohort who reacted with the peptide had this HLA type.

References Dorrell *et al.* 2001

- In clade A infected Gambians, three HLA-B53 epitopes were defined in Gag p24 using ELISPOT, tetramer, and cytotoxicity assays.
- This optimal epitope was identified within the 20 mer reactive peptide that carried it by homology with a B53 epitope from HIV-2, a B subtype B7 peptide that corresponds to it, as B53 is part of the B7 superfamily, and by the proline in the anchor at position 2.
- TPQDLNMML was recognized in 6/7 HLA-B53 subjects and was immunodominant in most subjects.
- TPQDLNMML was A subtype-specific with no cross-recognition of the subtype B, C, and D variant, TPQDLNNTML, although the B/C/D variant bound more efficiently to B53 – position 7 show great positional variation in crystal structures of two HLA-B53 complexes, suggesting variation here might significantly alter the position of the peptide in the binding groove and thus affect TCR interactions.
- Only one subject might have had a cross-reactive response with the HIV-2 and Mamu-A*01 variant CTPYDINQML, and this subject might have been dual infected with HIV-2.

- Recognized by patient 9354 during chronic infection, used as a positive control in a study of the SLYNTVATL epitope.

HXB2 Location p24 (48–56)
Author Location p24 (48–56)
Epitope TPQDLNTML
Immunogen HIV-1 infection
Species (MHC) human (B7)
Keywords rate of progression, acute/early infection
References Day *et al.* 2001

- The CTL response to optimally defined CTL epitopes restricted by HLA class I A and B alleles in individuals who coexpressed HLA A2, A3, and B7 was studied in eight HIV-1-infected subjects, two with acute infection, five with chronic, and one long-term non-progressor (LTNP)
- 2 to 17 epitopes were recognized in a given individual, A2-restricted CTL response tended to be narrow and never dominated the response, and 25/27 epitopes were targeted by at least one person.
- Subjects with chronic HIV-1 infection recognized between 2–8 out of 11 B7-restricted epitopes.
- An acute seroconverter homozygous for the B7 allele recognized five B7-restricted epitopes.
- The other acute seroconverter failed to recognize any of the 11 B7-restricted epitopes tested.
- The B7-restricted CTL response was highly variable and there was no clearly dominant epitope.

HXB2 Location p24 (48–56)

Epitope TPQDLNTML
Epitope name B7-TL9
Subtype B
Immunogen HIV-1 infection
Species (MHC) human (B7)
Donor MHC A3, B7, Cw7
Keywords dynamics, supervised treatment interruptions (STI), acute/early infection
References Yu *et al.* 2002a
- CTL responses in 18 acutely HIV-infected HLA-A3 (n=7) or -B7 (n=4) or both -A3 and B7 (n=7) positive individuals were studied.
 - One individual, AC-06, was homozygous at all three class I alleles (A3, B7, Cw7), was treated during acute infection and had supervised treatment interruptions (STI). He had only two detectable CTL responses during acute infection, but after STI this broadened to 27 distinct epitopes including 15 restricted by HLA-A3, 11 by HLA-B7, and 1 by HLA-Cw7.
 - 1/11 HLA-B7 individuals had detectable B7-restricted responses to this epitope during acute infection – 10/15 of HLA-B7 epitopes tested were targeted by at least one person during acute infection. 1/4 individuals had detectable responses to this epitope after STI.

Author Location p24
Epitope TPQDLNTML
Epitope name B7-TL9(p24)
Subtype B
Immunogen HIV-1 infection
Species (MHC) human (B7)
Donor MHC A32, B7, B14
Keywords HAART, ART, supervised treatment interruptions (STI)
References Altfeld *et al.* 2002b
- Peripheral blood (PB) and lymph node (LN) CD8+ T-cell responses were compared in 15 asymptomatic HIV-1 infected patients using all known optimal CTL epitopes (<http://hiv-web.lanl.gov/content/hiv-db/REVIEWS/brander2001.html>) for each person's class I HLA alleles.
 - 60 epitope responses were detected in both PB and LN samples of the 15 patients, and an additional 8 responses were detected only in LN. The total magnitude of the response was similar in LN and PB, but the percentage of CD8+ T cells in the LN is lower so the number of HIV-specific cells per million CD8+ T-cells is higher in the LN.
 - 1 year post-HAART treatment in five patients studied, the magnitude of the CD8+ T-cell response was decreased in both LN and PB, but more dramatically in PB, and 13/25 epitope responses in the PB became undetectable, in contrast to 5/26 in the LN.
 - Treatment interruption following HAART induced resulted in increased viremia accompanied by the restoration of the detection of 13 epitopes that had become undetectable in the PB, and the addition of 9 novel epitope responses.
 - Breakdowns of epitope responses were shown for 4 individuals. Patient A displayed the greatest response to epitope B14-EL9(gp41), a strong response to B7-TL9(p24), and responses to B7-TM9(Nef) and A32-PW10(RT).

Epitope TPQDLNTML
Immunogen HIV-1 infection
Species (MHC) human
Assay type CD8 T-cell Elispot - IFN γ
Keywords assay standardization/improvement, epitope processing, characterizing CD8+ T cells
References Beattie *et al.* 2004

- This study compared CD8+ T-cell EliSpot responses to 58 Gag peptides that were optimal epitopes, with responses to overlapping 15 mers that spanned Gag. When screening for HIV-1-specific CD8+ T-cell responses from 49 HIV+ people, overlapping 15-mer peptide pools revealed several novel responses that would have been missed using predefined CD8 epitopes. However, the 15-mer pools often missed low-level responses to predefined epitopes, especially when the epitope was located centrally in the 15-mer peptide, and the overall level of response to the 15 mers was generally lower (mean 1.4 five fold dilutions lower, range 0-3).
- The response to TPQDLNTML was used as an example of a titration curve. When comparing the peptide TPQDLNTML to the 15 mer EGATPQDLNTMLNTV, the 15 mer had a diminished response to the same amount of peptide.

Country Nigeria.
Assay type CD8 T-cell Elispot - IFN γ
Keywords subtype comparisons, variant cross-recognition or cross-neutralization
References Geels *et al.* 2005

- Cross-clade CTL responses in 10 non-B HIV-1 infected individuals were evaluated. T-cell reactivity was tested against peptide pools of clade B Gag, Pol, Nef, Rev and Tat. Nine individuals demonstrated cross-reactive T-cell responses to clade A, B, and C Gag pools; 6/7 patients that responded to Nef-B also reacted to clade A and C Nef pools. An inverse correlation was observed between the sequence divergence of the HLA class I restricted epitopes and the height of the T-cell responses, which in Gag could be explained through variations in the HLA-anchor residues. 42% of the responses were directed to regions containing new epitopes.
- This previously described epitope was embedded in a B clade peptide that was recognized by T-cells from an infected person carrying subtype G Gag. The autologous epitope sequence in this person differed from the known epitope in one position, Q7T, TPQDLNtMLNTV

Keywords HIV exposed persistently seronegative (HEPS)

References Kaul *et al.* 2001c

- This study examines CTL responses in HIV exposed, persistently seronegative individuals, HEPS, who eventually seroconverted – 11/114 HEPS Nairobi sex workers eventually seroconverted, and for six of these HIV CTL reactive epitopes had been defined while seronegative.
- The epidemiological factor associated with seroconversion was stopping sex work. HIV-specific CTL activity declined when HEPS sex workers stopped working for a period or retired.
- This epitope was recognized in 1/22 HEPS sex worker controls, ML1792.

HXB2 Location p24 (51–59)**Author Location** p24 (183–191 LAI)**Epitope** DLNTMLNTV**Epitope name** G5**Subtype** B**Immunogen** HIV-1 infection**Species (MHC)** human (B14)**Keywords** HAART, ART**References** Mollet *et al.* 2000

- A panel of 16 epitopes covering 15 class I alleles was tested in 14 HIV+ patients from an unselected Caucasian population treated with HAART, using CD8+ cell IFN γ production to measure responses.
- In general, during the first month of treatment viral load decreased and frequencies of HIV-specific CTL tripled and broadened – eight new HIV specificities that were not previously detectable were newly detected, as were CMV specific CD8+ PBL – but with continued viral suppression, HIV-specific responses diminished.
- Viral rebounds gave different patterns of response: increases or decreases in pre-existing response, new specificities, or no change.

HXB2 Location p24 (51–59)**Author Location** p24 (183–191)**Epitope** DLNMMLNIV**Immunogen** HIV-1 infection, HIV-1 exposed seronegative**Species (MHC)** human (B14)**Keywords** HIV exposed persistently seronegative (HEPS), immunodominance**References** Kaul *et al.* 2001a

- Variants DLNMMLNIV/DLNTMLNVV are specific for clades A/B.
- ELISPOT was used to study CTL responses to a panel of 54 predefined HIV-1 epitopes in 91 HIV-1-exposed, persistently seronegative (HEPS) and 87 HIV-1-infected female Nairobi sex workers.
- Responses in HEPS women tended to be lower, and focused on different epitopes with HLA presenting molecules that have previously been associated with reduced risk of infection, and there was a shift in the response in the HEPS women upon late seroconversion to epitopes recognized by the HIV-1 infected women.
- 43/91 HEPS women had CD8+ responses and detection of HIV-1-specific CTL in HEPS women increased with the duration of viral exposure.

- Among HLA-B14 women, 4/4 HEPS and 3/7 HIV-1 infected women recognized this epitope, likelihood ratio 4.8, p value 0.1, and HEPS women tended to respond to DLNMMLNIV/DLNTMLNVV, while infected women tended to respond to DRF(F/W)KTLRA.
- The dominant response to this HLA allele was to this epitope for all 4/4 HEPS cases and in only one of the 3/7 HIV-1 infected women.
- Differences in epitope specificity were only seen for responses restricted by class I HLA alleles A2, A24, A*6802, B14, and B18, previously shown to be associated with resistance to HIV-1 in this cohort.
- Four epitopes were considered to be “resistant epitopes”, as they were preferentially reactive in HEPS women and so may confer resistance, and these were found in three different proteins: A2 ILK(D/E)PVHGV in RT, A*6802 DTVLEDINL in Protease, B14 DLN(M/T)LN(I/V)V in p24 and B18 FRDYV-DRF(Y/F)K also in p24.

Keywords characterizing CD8+ T cells
References Kiepiela *et al.* 2004

- HLA class I restricted CD8+ T-cell responses against HIV-1 were analyzed in African patients. Significantly more responses were shown to be HLA-B restricted. Viral load, CD4 count, and thus rate of disease progression were also associated with HLA-B alleles. In addition, the selection pressure imposed on HIV-1 by HLA-B alleles was shown to be substantially greater than by other alleles.
- This epitope was suggested to be the epitope within a longer reactive peptide based on correspondence with a known epitope in the HIV database. Also, a significantly higher frequency of people in the Durban cohort who reacted with the peptide had this HLA type.

Assay type T-cell Elispot
Keywords supervised treatment interruptions (STI), immunodominance, early treatment
References Addo *et al.* 2003

- Comprehensive Elispot screening of 504 overlapping peptides that spanned all HIV-1 proteins in 57 HIV-1 infected individuals. Four groups of patients were compared: 23 were untreated; 12 patients were chronically infected and treated; 22 started treatment during acute infection, 11 continuously treated and 11 with STI.
- 63% of the peptides were recognized - the most frequent responses were directed against Nef (95%) and p24-Gag (88%). p17 was the most frequently recognized protein after correction for protein length. A median of 18 peptides (range 2–42) were recognized per person. The most frequently (>20%) recognized peptides were located in conserved regions within clade B sequences. Vpu was rarely recognized.
- A decrease in the total magnitude and in the breadth of CTL responses was detected in patients with treated acute infection in comparison to chronically infected treated or untreated individuals. No correlation between plasma viral load and HIV-1 specific T-cell responses was observed.
- The authors did not note the reference strain, but based on the peptide sequences provided it appears to be HXB2.
- Responses to this peptide were detected in 22% of the study subjects, and it was one of the 25 most frequently recognized peptides.

Author Location Gag (HXB2)

Epitope AMQMLKETI

Subtype B

Immunogen vaccine

Vector/Type: vaccinia, vesicular stomatitis virus (VSV) *Strain:* B clade HXB2, B clade IIIB *HIV component:* Env, Gag

Species (MHC) mouse (H-2K^d)

Keywords immunodominance

References Haglund *et al.* 2002a

- Different HIV strains were used for different regions: Env IIIIB, Gag HXB2.
- BALB/c mice were vaccinated with rec vesicular stomatitis virus (rVSV) expressing either HIV-1 Gag, Env, or both, and compared to using rec Env and Gag in vaccinia virus (rVVs). The primary response was determined by cell lysis, cytokine production and tetramer staining.

- Primary CTL responses to the immunodominant Gag (AMQMLKETI) epitope peaked in 7 days for GAG-rVSV, 3% of the cells were tetramer positive, and this response was 8-fold higher than for Gag-rVV.
- Vaccinating with GagEnv-rVSV carrying both Gag and Env allowed recognition of both HIV-1 proteins, but at reduced levels compared to either Gag-rVSV or Env-rVSV alone.
- Intranasal immunization with Env-rVSV yielded CTL responses that were strong but reduced compared to an intraperitoneal route.

HXB2 Location p24 (65–73)

Author Location Gag (HXB2)

Epitope AMQMLKETI

Subtype B

Immunogen vaccine

Vector/Type: vaccinia, vesicular stomatitis virus (VSV) *Strain:* B clade HXB2, B clade IIIIB *HIV component:* Env, Gag

Species (MHC) mouse (H-2K^d)

Keywords immunodominance

References Haglund *et al.* 2002b

- Different HIV strains were used for different regions: Env IIIIB, Gag HXB2.
- BALB/c mice were vaccinated with rec vesicular stomatitis virus (rVSV) expressing either HIV-1 Gag or Env, or both, and retention of memory responses and recall responses were studied by tetramer staining and IFN- γ production.
- Seven months after vaccination with Env-rVSV, 6% of the CD8+ cells were tetramer positive for the immunodominant Env epitope; these cells had a memory phenotype, CD44-Hi positive.
- Env in rec vaccinia virus (Env-rVV) elicited a strong recall response, with up to 45% to the CD8+ T-cell population tetramer positive and activated (expressing CD62L-Lo), and capable of IFN- γ production.
- A prime with Env-rVSV and heterologous boost of Env-rVV gave remarkably high levels of memory cells, with approximately 1/3 of the CD8+ splenocytes being Env specific memory cells 150 days after the boost.
- A Gag-rVSV or EnvGag-rVSV prime and with a heterologous Gag-rVV or EnvGag-rVV boost combination gave 40% tetramer positive CD8+ cells, but the fraction of IFN- γ producing cells was only about 25%. Still the heterologous vector prime-boost combination showed a profound benefit.
- A HIV-1 protein rVSV prime, rVV boost was a more potent combination than a vector reversal of a rVV prime and rVSV boost.

Epitope AMQMLKETI

Epitope name A9I

Immunogen vaccine

Vector/Type: DNA, virus-like particle (VLP), polyepitope *HIV component:* Gag, p24 Gag, V3

Species (MHC) mouse (H-2K^d)

Assay type Cytokine production, Chromium-release assay

Keywords epitope processing, vaccine-specific epitope characteristics, immunodominance, vaccine antigen design

References Wild *et al.* 2004

- A codon optimized gag DNA vaccine was compared to a myristylation defective gag and p24 alone, both of which lack signals for secretion from transfected cells. Gag-derived immunogens that were secreted as VLPs and those that remained intracellular (p24) each produced strong CTL responses, and neither the size of antigen nor cellular trafficking and localization significantly influenced the strength of humoral and cellular immune activation. The formation and release of VLPs was not essential for eliciting strong CTL. BALB/c mice were

given the DNA vaccine by i.m. administration of plasmid DNA for the prime and boost.

- Linking the region encoding the V3 immunodominant epitope to the gag gene did not diminish the response to the Gag p24 epitope A9I, but did enable a response to the V3 epitope.
- Minigenes were made incorporating just 1 epitope, minitopes, carrying 1 of 3 murine class I epitopes linked to the Ad2-E3 protein-derived signal peptide to allow access of the epitope to the ER. Weak induction of cellular immune responses was observed, in contrast to the complex polyprotein.

- Therapy provided during acute infection resulted in a narrower CTL response, stronger T help response, and a less diverse viral population than was seen in individuals treated during chronic infection.
- The breadth and specificity of the response was determined using ELISPOT by studying 19 individuals with pre-seroconversion therapy (Group 1), 11 individuals with primary infection but post-seroconversion therapy (Group 2), and 10 individuals who responded to HAART given during chronic infection (Group 3), using 259 overlapping peptides spanning p17, p24, RT, gp41, gp120 and Nef.
- Previously described and newly defined optimal epitopes were tested for CTL response.
- Number of HLA-A25+ individuals that had a CTL response to this epitope broken down by group: 0/0 group 1, 0/2 group 2, and 1/3 group 3.

Epitope ETINEEAAEW
Subtype B
Immunogen HIV-1 infection
Species (MHC) human (A25)
Country United States.
Assay type CD8 T-cell Elispot - IFN γ , CD8 T-cell Elispot granzyme B
Keywords Th1, characterizing CD8+ T cells
References Kleen *et al.* 2004

- Only 20% of CD8+ T-cells produce IFN-gamma and granzyme B simultaneously (Tc1a). Two additional subpopulations of HIV specific CD8+ cells are found, each one constituting 30–40% of the CD8+ cell pool. One of these (Tc1b) secretes IFN-gamma only, and the other one (Tc1c) secretes GzB only.
- 1/3 patients responded to this peptide with GzB producing cells, and the other two responded with IFN-gamma producing cells.

Subtype C
Immunogen HIV-1 infection
Species (MHC) human (B*5801)
Country India.
Assay type CD8 T-cell Elispot - IFN γ
Keywords subtype comparisons, computational epitope prediction, immunodominance
References Thakar *et al.* 2005

- This epitope is highly conserved across clades.
- PBMCs from HIV-1 infected Indian subjects were tested for HIV-1 Gag (with C clade peptides), Nef (with B clade peptides), and Env (clade unspecified) specific T-cell responses. 5 immunodominant regions conserved across clades were identified in Gag and Nef. 3 antigenic regions were found to be recognized by CTLs in the Indian subjects; these regions were not identified as immunodominant in studies from Africa. 26 epitopes were predicted within reactive peptides, of which 90% were clustered in the conserved immunodominant regions of Gag and Nef. 3 of the epitopes were highly conserved across clades, and 7 novel epitopes were found.

HXB2 Location p24 (71–80)
Author Location p24 (203–212)
Epitope DTINEEAAEW
Immunogen HIV-1 infection, HIV-1 exposed seronegative
Species (MHC) human (B53)
Keywords HIV exposed persistently seronegative (HEPS)
References Kaul *et al.* 2001a

- ELISPOT was used to study CTL responses to a panel of 54 predefined HIV-1 epitopes in 91 HIV-1-exposed, persistently seronegative (HEPS) and 87 HIV-1-infected female Nairobi sex workers.
- Responses in HEPS women tended to be lower, and focused on different epitopes with HLA presenting molecules that have previously been associated with reduced risk of infection, and there was a shift in the response in the HEPS women upon late seroconversion to epitopes recognized by the HIV-1 infected women.
- 43/91 HEPS women had CD8+ responses and detection of HIV-1-specific CTL in HEPS women increased with the duration of viral exposure.
- Among HLA-B53 women, 0/2 HEPS and 7/9 HIV-1 infected women recognized this epitope.
- The dominant response to this HLA allele was to this epitope in 4 of the 7/9 responsive HIV-1 infected women.

HXB2 Location p24 (71–80)
Author Location p24 (203–212 subtype A consensus)
Epitope DTINEEAAEW
Subtype A
Immunogen HIV-1 infection
Species (MHC) human (B53)
Keywords binding affinity, subtype comparisons, epitope processing
References Dorrell *et al.* 2001

- In clade A infected Gambians, three HLA-B53 epitopes were defined in Gag p24 using ELISPOT, tetramer, and cytotoxicity assays.
- Two of the new epitopes lacked the predicted P2 anchors, DTINEEAAEW and QATQEVKNM, and bound to B53 with high affinity, thus extending the anchor residue motif for B53 and the related B35.
- Two overlapping 20 mer peptides carry this complete epitope, but only one stimulates recognition, which could be due to different peptide processing.
- DTINEEAAEW was recognized in only 2/7 HLA-B53 subjects.
- DTINEEAAEW was not A subtype specific and there was cross-recognition although diminished, of the subtype B, C, and D variant, ETINEEAAEW.
- In one of the two subjects there was cross-recognition of the HIV-2 version of the epitope, EIINEEAADW.

Country Democratic Republic of the Congo.
Assay type CD8 T-cell Elispot - IFN γ
Keywords subtype comparisons, variant cross-recognition or cross-neutralization
References Geels *et al.* 2005

- Cross-clade CTL responses in 10 non-B HIV-1 infected individuals were evaluated. T-cell reactivity was tested against peptide pools of clade B Gag, Pol, Nef, Rev and Tat. Nine individuals demonstrated cross-reactive T-cell responses to clade A, B, and C Gag pools; 6/7 patients that responded to Nef-B also reacted to clade A and C Nef pools. An inverse correlation was observed between the sequence divergence of the HLA class I restricted epitopes and the height of the T-cell responses, which in Gag could be explained through variations in the HLA-anchor residues. 42% of the responses were directed to regions containing new epitopes.
- This previously described B53 epitope was embedded in a B clade peptide that was recognized by T-cells from an infected person carrying subtype A Gag. The autologous epitope sequence in this person differed from the known epitope by one amino acid, E1D, dTINEEAAEW. It was also recognized in a person carrying a subtype D gag, and in this case the autologous sequence matched the epitope. This was also predicted to possibly be a B58 cross-presented epitope in another subtype

D Gag infected person based on peptide reactivity and a known B58 motif.

Epitope EEAAEWDRV
Subtype B
Immunogen HIV-1 infection
Species (MHC) human (B*40)
Donor MHC A*03, A*24, B*35, B*40
Country United States.
Assay type CD8 T-cell Elispot - IFN γ
Keywords acute/early infection, variant cross-recognition or cross-neutralization, superinfection
References Yang *et al.* 2005b
- An individual infected with a drug-resistant strain of HIV-1 subtype B with controlled viremia became superinfected with another subtype B strain. The second strain outgrew the first despite lower replication capacity and the same viral phenotype. The strains showed differences in their epitope sequences. The CTL responses to the first strain declined after superinfection, followed by some adaptation of targeting to the new epitopes of the second strain. Differences in the recognized epitopes were suggested to have contributed to the poor immune containment of the second strain.
 - The response to the epitope EEAAEWDRV was found in the patient before superinfection and diminished afterwards; the initial infecting and superinfecting strain carried EEAAEWDR1.

Assay type CD8 T-cell Elispot - IFN γ , CD4 T-cell Elispot - IFN γ
Keywords rate of progression, escape
References Oxenius *et al.* 2004b

- The increase in plasma viral load in a patient that progressed rapidly was preceded by positive selection of viral escape mutations in epitopes targeted by dominant HIV-1-specific CD8+ T-cell responses, and a decrease in HIV-1-specific CD4+ and CD8+ T-cell frequencies. Overall, escape variant epitopes were recognized 0–80% as efficiently as the index peptide, and the relative efficiency of the variant epitopes increased using PBLs collected after their appearance. No changes were found in viral tropism, replication kinetics and neutralizing antibody titers, so the rapid decline of the patient was attributed to loss of HIV containment due to CTL escape.
- This was one of 8 reactive epitopes found not to vary over time.

- A comprehensive analysis of 160 class I T cell responses in 578 individuals from KwaZulu-Natal, South Africa was performed. Gag-specific responses were associated with lowering viremia, while Env, accessory and regulatory protein-specific responses were associated with higher viremia.
- HPVHAGPIA is an optimal epitope.

HXB2 Location p24 (84–92)**Author Location** (C consensus)**Epitope** HPVHAGPIA**Subtype** C**Immunogen** HIV-1 infection**Species (MHC)** human (B35)**Country** South Africa.**Assay type** CD8 T-cell Elispot - IFN γ **Keywords** characterizing CD8+ T cells**References** Kiepiela *et al.* 2004

- HLA class I restricted CD8+ T-cell responses against HIV-1 were analyzed in African patients. Significantly more responses were shown to be HLA-B restricted. Viral load, CD4 count, and thus rate of disease progression were also associated with HLA-B alleles. In addition, the selection pressure imposed on HIV-1 by HLA-B alleles was shown to be substantially greater than by other alleles.

- This epitope was suggested to be the epitope within a longer reactive peptide based on correspondence with a known epitope in the HIV database. Also, a significantly higher frequency of people in the Durban cohort who reacted with the peptide had this HLA type.

Donor MHC A*03, A*24, B*35, B*40
Country United States.
Assay type CD8 T-cell Elispot - IFN γ
Keywords acute/early infection, superinfection, characterizing CD8+ T cells
References Yang *et al.* 2005b

- An individual infected with a drug-resistant strain of HIV-1 subtype B with controlled viremia became superinfected with another subtype B strain. The second strain outgrew the first despite lower replication capacity and the same viral phenotype. The strains showed differences in their epitope sequences. The CTL responses to the first strain declined after superinfection, followed by some adaptation of targeting to the new epitopes of the second strain. Differences in the recognized epitopes were suggested to have contributed to the poor immune containment of the second strain.
- An early response to this peptide was detected that waned prior to superinfection. The embedded epitope and HLA presenting molecule were not resolved. The initial and superinfecting strains carried a perfect match to the peptide sequence.

Epitope TTSTLQEIQI**Immunogen** vaccine*Vector/Type:* Listeria monocytogenes*Strain:* B clade HXB2 *HIV component:* Gag**Species (MHC)** mouse (H-2K^d)**References** Mata *et al.* 1998

- BALB/c mice were immunized with recombinant Listeria monocytogenes (Lm-Gag) expressing HIV-1 HXB2 Gag.
- L. monocytogenes is a gram-positive bacteria that enters the macrophage on phagocytosis and lives in the cytoplasm – secreted L. monocytogenes antigens are processed and presented by both class I and class II pathways.

HXB2 Location p24 (108–117)**Author Location****Epitope** TSTLQEIQIGW**Subtype** B**Immunogen** HIV-1 infection**Species (MHC)** human (B*5701)**Keywords** rate of progression, immunodominance**References** Migueles & Connors 2001

- HLA B*5701 was found in a very high frequency in HIV-1 infected non-progressors, 11/13 (85%) versus 19/200 (9.5%) of progressors. Non-progressors tended to have an immune response that was highly focused on four p24 epitopes that were presented by B*5701, ISPRTLNAW, KAFSPEVIPMF, TSTLQEIQIGW, and QASQEVKNW.

HXB2 Location p24 (108–117)**Author Location****Epitope** TSTLQEIQIGW**Subtype** B**Immunogen** HIV-1 infection**Species (MHC)** human (B*5701)**Keywords** rate of progression, immunodominance**References** Migueles & Connors 2001

- CTL activity was monitored in 27 individuals, including 10 LTNP with an over-expression of HLA B*5701 – these individuals have viral loads below the threshold of infection without therapy, and their immune response tends to be focused on peptides that contain B*5701 epitopes ISPRTLNAW, KAFSPEVIPMF, TSTLQEIQIGW, and QASQEVKNW.
- CTL responses are broader in B*5701+ individuals with progressive viremia than those that control viremia.
- The HLA-A*0201 SLYNTVATL epitope response was not as strong in individuals that carried both A2, B57.

HXB2 Location p24 (108–117)**Author Location****Epitope** TSTLQEIQIGN**Subtype** B**Immunogen** HIV-1 infection**Species (MHC)** human (B*5701)**Assay type** Intracellular cytokine staining, Flow cytometric T-cell cytokine assay**Keywords** rate of progression, escape**References** Migueles *et al.* 2003

- cDNA Gag sequences from a set of 17 HLA-B*5701+ progressors and 10 LTNPs were obtained, and the variation in four p24 B*5701 epitopes examined. Sequence variants were more common ($p < 0.01$) in the epitopes in the progressors (median 3, range 1-7) than LTNPs (median 2, range 0-4).
- In general, use of the autologous protein in a target cell did not diminish the overall CD8+ T-cell responses.

HXB2 Location p24 (108–117)**Author Location** (108–117)**Epitope** TSTLQEIQIAW**Subtype** C**Immunogen** HIV-1 infection**Species (MHC)** human (B*5701, B*5801)**Assay type** Other**Keywords** HLA associated polymorphism**References** Boutwell & Essex 2007

- HIV-1 subtype C proteins were analysed and 94 HLA-associated amino acid polymorphisms were found. Many polymorphisms were associated with multiple HLA allele classes. 12% of negative associations were found as well, where there was an association of virus expression of the consensus amino acid with a specific HLA allele. HLA-B alleles were involved in most of the associations. 88% of CTL immunodominant regions had same HLA-associations as found polymorphisms. In 19 studied CTL epitopes, the epitope-restricting allele was same as the polymorphism-restricting allele for 7, and in 12 the alleles differed by specificity.
- TSTLQEIQIAW was a previously defined B*5701/B*5801 presented epitope that encompassed a B*57/B*5801 associated polymorphism, TStLQEIQIAW, in the third position.

Immunogen HIV-1 infection, HIV-2 infection
Species (MHC) human (B*5801)
Country Gambia.
Assay type CD8 T-cell Elispot - IFN γ , Tetramer binding, Flow cytometric T-cell cytokine assay
Keywords characterizing CD8+ T cells
References Gillespie *et al.* 2005
- CD8 T-cell responses were evaluated and compared in HIV-1 and HIV-2 infected individuals. A significantly greater magnitude and breadth of Gag-specific responses were found in HIV-1 infected individuals, possibly because of undetectable viral load in HIV-2 infected individuals. This finding suggests that responses in HIV-2 infection reflect antigen load in plasma, as is the case in HIV-1 infection. No correlation was found between immune control of HIV-2 and the frequency of perforin-expressing virus-specific CD8 T-cells.

- The HIV-2 epitope TSTVEEQIQW was evaluated in HIV-2 infected individuals, and 4/5 HIV-2-infected B*5801-positive subjects recognized the TSTV epitope.
- 0/4 HIV-1-infected B*5801-positive subjects responded to the equivalent TSTLQEQIGW, TSTL epitope.

Epitope name TW10

Subtype B, C

- Immunogen** HIV-1 infection
Species (MHC) human (B57)
Keywords escape, reversion, viral fitness
References Leslie *et al.* 2004
- TSTLQEIQAW (the consensus form in the C clade) responses dominate the immune response in HLA-B57 individuals, and this epitope is also recognized in HLA-B5801 individuals. TSnlQEIQAW is shown to be an escape mutant correlated with HLA-B57 and HLA-B5801 alleles. The variant can be transmitted to HLA-B57/B5801 negative individuals, but reverts to wild-type in those. A second escape mutation within the epitope is, however, maintained after transmission; TSNLQEIQIGW is the most common form of the epitope in the B clade, and a G substitution to some other amino acid, often A, was frequently noted in B57+ individuals; transmission of these variants persist in the new host.

- Epitope sequence variation and CD8 T-cell responses were analyzed in C subtype infected HLA-B57-positive individuals from Ethiopia. KF11 was the immunodominant response.
 - 9/10 B57 subjects had the T3N TSnlQEIQIAW substitution relative to the C consensus, while this form was found in only 2/9 B57- subjects, so it appears to be selected and an immune escape form ($p=0.001$). Both forms of the TW10 epitope (TSTLQEIQIAW and TSnlQEIQIAW) were tested in 2 B57-positive subjects; neither responded. The authors suggest this may be due to the dominance of the TW10 response in acute infection, as the response may have been lost by the time of sampling.
- HXB2 Location** p24 (108–117)
Author Location Gag
Epitope TSTLQEIQIGW
Epitope name TW10
Immunogen HIV-1 infection
Species (MHC) human (B57)
Assay type Other
Keywords rate of progression, escape
References Gao *et al.* 2005

- Three distinct HLA alleles known to alter the rate of AIDS progression were studied. B*57-mediated protection occurs early in infection and the protective effect of this allele subsides after CD4 cell count drops. In contrast, B*27 shows no protection against progression to CD4<200, but rather delays progression to an AIDS-defining illness after the CD4 counts have dropped. B*35-mediated rapid progression to AIDS is probably a function of early decline in CD4 counts.
- TW10 is typically the immunodominant B57 epitope. TW10 responses are rapid, and escape occurs but presumably with a fitness cost, because reversion occurs after the escape variant is transmitted to a B57- person. High CD4 counts may be maintained in individuals because of immune selection for a less fit form of the virus.

Assay type CD8 T-cell Elispot - IFN γ
Keywords responses in children, mother-to-infant transmission, escape, acute/early infection
References Pillay *et al.* 2005

- HIV-specific CTLs in infants were shown to be able to select for viral escape variants early in life, despite a lack of escape with the same CTL specificity in the mother. Infant CTL responses may be compromised by transmission of escape variants that arose in the mother and also those that arose in the father, if the father was the source of the mother's infection.
- TSTLQEIQIAW is the C consensus form of the epitope and the autologous form in the mother was TSTLQEIQItW, and this was the form transmitted to her infant. The mother does not carry B57, and the B57 escape footprint was inherited paternally. By 33 weeks a new dominant form of the epitope had emerged in the infant, TSnLQEIQIAW, and the consensus form was also present in the infant.

Species (MHC) human (B57, B*5801)
Keywords review, rate of progression, immunodominance, escape, acute/early infection, reversion, viral fitness
References Goulder & Watkins 2004

- This paper is a review of the role of CTL in HIV infection, and it uses the TW10 epitope as an example. HLA B*57 and B*5801 both can present this epitope, and are associated with successful containment of HIV infection. The early response to TW10 is immunodominant, and often followed by rapid escape due to the T->N substitution, tsNlqeqigw. Some long term survivors do not carry the escape form, possibly because

the CTL response to this epitope is able to suppress viremia. Others do carry the N escape form, and presumably control viremia due to viral attenuation; in support of this the N rapidly back mutates to T in a new host, so there is likely to be a high fitness cost. In contrast, the epitope sometimes contains a G->A substitution at position 9, and the A can persist in a new host after transmission.

Keywords responses in children, mother-to-infant transmission, escape
References Feeney *et al.* 2005

- Escape mutations in TW10 and other B57-restricted epitopes were shown to arise early in infants following perinatal infection. Some escape variants were likely to have been transmitted vertically, from HLA-B57/5801 positive HIV-1 infected mothers, while others arose during infancy in cases where the children inherited the B57/5801 allele paternally. In contrast to adults, the majority of children did not respond to TSTLQEIQIGW but showed a robust response to the escape variants, suggesting that infants are able to mount functional immune responses and drive immune escape and that a developing immune system may exhibit greater plasticity in recognizing viral variants.
- TW10 was found to be more frequently recognized by adults than by children. Among B57-positive subjects, TW10 was recognized by 10 out of 12 acutely infected adults, 11/22 chronically infected adults, and only 1/14 infected children. All 14 children carried mutations of this epitope, commonly T3N and G9A (TSnLQEIQIAW), but the children were able to recognize the autologous variant. These mutations were rare in adults. One child carried T3N, Q5A, and G9A, and also recognized the autologous variant, TSnLaEQIAW.

- All proteins were scanned and optimal epitopes were mapped in a study of CD8+ gamma IFN T-cell responses in 21 men within 15-92 days post-HIV-1 infection. Subjects initially showed narrow immune responses with a mean of 2.3 epitopes recognized per patient. The immune response broadened later in infection. No correlation between the plasma viral load and the number of recognized epitopes or the frequency of IFN-gamma secreting cells was observed, and there was no correlation between the functional avidity of a responses and the abundance of IFN-secreting cells that recognized the epitope. The first epitopes to be recognized did not tend to be the most avid, and earliest responses tended to be directed against Nef, Tat, Vpr, and Env.
- This epitope was recognized in three of the acutely infected individuals and was presented by both HLA-B57 and B58.
- More common HLA alleles were less frequently used in primary infection than less common alleles, for example A3, B35, B57, and B62 were more frequently utilized than A1, A2, A30, and A44.
- All HIV-1 proteins except Vpu were recognized, and a responses to a total of 41 optimal epitopes were characterized; 24 had been identified previously. 48% of the total T-cell responses were directed against Nef and 43% were directed against Gag.

HXB2 Location p24 (108–117)**Author Location** Gag (240–249)**Epitope** TSTLQEQIGW**Epitope name** gag 240-9**Immunogen** HIV-1 infection, HIV-2 infection**Species (MHC)** human (B57, B58)**Country** Gambia.**Assay type** Intracellular cytokine staining**Keywords** escape, TCR usage, variant cross-recognition or cross-neutralization, characterizing CD8+ T cells**References** Lopes *et al.* 2003

- CD8+ T cells from HIV-2 infected patients had more polyclonal TCR responses than HIV-1 infected patients, who tended to have oligoclonal responses. This results in limited plasticity of T cell responses to amino acid substitutions within epitopes in HIV-1 infections. HIV-2-specific CD8+ T-cells showed a more diverse TCR usage associated with enhanced CD8 expansion and IFN-gamma production on cross-recognition of variant epitopes.
- This peptide was recognized by a CD8+ T-cell clonotype with Vbeta5.1 usage in one HIV-1 infected patient, and all HIV-1 patients had narrow TCR usage, while HIV-2 patients used multiple TCR Vbeta chains. The HIV-2 variant of this peptide is: tstVEeqiQw. 5/6 HIV-2 infected individuals could recognize both the HIV-1 and HIV-2 peptides, while 0/5 HIV-1 infected patients that could react with the HIV-1 peptide could also react with the HIV-2 peptide.

HXB2 Location p24 (108–117)**Author Location** p24**Epitope** TSTLQEQIGW**Subtype** B, C**Immunogen** HIV-1 infection**Species (MHC)** human (B57, B58, B63)**Assay type** CD8 T-cell Elispot - IFN γ **Keywords** rate of progression, cross-presentation by different HLA, optimal epitope**References** Frahm *et al.* 2005

- HLA-B63-positive subjects were shown to be able to generate CTL responses early in acute HIV infection and to control HIV replication in the absence of antiretroviral treatment. Since HLA-B63 shares the epitope binding motif of HLA-B57 and -B58, it was shown that HLA-B63-positive individuals mounted CTL responses to previously identified B57-restricted epitopes, as well as novel, B63-restricted epitopes. Moreover, these novel B63-restricted epitopes can also be presented by HLA-B57 and -B58.
- This epitope was recognized by 30% of B63-positive subjects and 22% of B57/58-positive subjects.

Assay type CD8 T-cell Elispot - IFN γ
Keywords subtype comparisons, variant cross-recognition or cross-neutralization

References Geels *et al.* 2005

- Cross-clade CTL responses in 10 non-B HIV-1 infected individuals were evaluated. T-cell reactivity was tested against peptide pools of clade B Gag, Pol, Nef, Rev and Tat. Nine individuals demonstrated cross-reactive T-cell responses to clade A, B, and C Gag pools; 6/7 patients that responded to Nef-B also reacted to clade A and C Nef pools. An inverse correlation was observed between the sequence divergence of the HLA class I restricted epitopes and the height of the T-cell responses, which in Gag could be explained through variations in the HLA-anchor residues. 42% of the responses were directed to regions containing new epitopes.
- This previously described epitope was embedded in a B clade peptide that was recognized by T-cells from an infected person carrying subtype D Gag. The epitope sequence in this person had a single G8A change, STLQEQIaW.

Assay type CD8 T-cell Elispot - IFN γ

Keywords responses in children, mother-to-infant transmission, escape, acute/early infection, reversion, viral fitness

References Sanchez-Merino *et al.* 2005

- CD8 T-cell responses were examined in mother-infant pairs. Escape variants were commonly detected in maternal plasma. Early infant plasma viruses showed heterogeneity of gag and nef gene sequences as well as mother-to-child transmission of CD8 T-cell escape variants. The stability of escape mutants in the infant over time was determined by infant HLA haplotype and viral fitness. Sequential plasma specimens from infants showed changes in CD8 T-cell epitope sequences, suggesting that infants are capable of generating virus-specific CD8 T-cell responses.
- The mother was A02- and carried a variant form of the epitope, MThNPPIPV, which she passed to her A02+ child. This form persisted in her child for 12 months.

HXB2 Location p24 (118–126)

Assay type T-cell Elispot

Keywords supervised treatment interruptions (STI), immunodominance, early treatment

References Addo *et al.* 2003

- Comprehensive Elispot screening of 504 overlapping peptides that spanned all HIV-1 proteins in 57 HIV-1 infected individuals. Four groups of patients were compared: 23 were untreated; 12 patients were chronically infected and treated; 22 started treatment during acute infection, 11 continuously treated and 11 with STI.

- 63% of the peptides were recognized - the most frequent responses were directed against Nef (95%) and p24-Gag (88%). p17 was the most frequently recognized protein after correction for protein length. A median of 18 peptides (range 2-42) were recognized per person. The most frequently (>20%) recognized peptides were located in conserved regions within clade B sequences. Vpu was rarely recognized.
- A decrease in the total magnitude and in the breadth of CTL responses was detected in patients with treated acute infection in comparison to chronically infected treated or untreated individuals. No correlation between plasma viral load and HIV-1 specific T-cell responses was observed.
- The authors did not note the reference strain, but based on the peptide sequences provided it appears to be HXB2.
- Responses to this peptide were detected in 19% of the study subjects, and it was one of the 25 most frequently recognized peptides.

Epitope PPIPVGDIY

Immunogen HIV-1 infection, HIV-1 exposed seronegative

Species (MHC) human (B35)

Keywords HIV exposed persistently seronegative (HEPS), immunodominance

References Kaul *et al.* 2001a

- ELISPOT was used to study CTL responses to a panel of 54 predefined HIV-1 epitopes in 91 HIV-1-exposed, persistently seronegative (HEPS) and 87 HIV-1-infected female Nairobi sex workers.
- Responses in HEPS women tended to be lower, and focused on different epitopes with HLA presenting molecules that have previously been associated with reduced risk of infection, and there was a shift in the response in the HEPS women upon late seroconversion to epitopes recognized by the HIV-1 infected women.
- 43/91 HEPS women had CD8+ responses and detection of HIV-1-specific CTL in HEPS women increased with the duration of viral exposure.

- Among HLA-B35 women, 1/3 HEPS and 3/4 HIV-1 infected women recognized this epitope.
- The dominant response to this HLA allele was to this epitope in the 1/3 HEPS case and in the all 3/4 responsive HIV-1 infected women.
- Subject ML 857 shifted from a A*6802 DTVLEDINL and B35 (H/N)PDIVYQY response prior to seroconversion to a B35 PPIPVGDIY and B35 VPLRPMTY response post-seroconversion.

Epitope PPIPVGIEY

Subtype A, B, C, D

Immunogen HIV-1 infection, vaccine

Vector/Type: DNA prime with modified vaccinia Ankara (MVA) boost *Strain:* A clade HIV component: p17 Gag, p24 Gag

Species (MHC) human (B35)

Keywords subtype comparisons, epitope processing, vaccine-specific epitope characteristics, immunodominance

References Hanke & McMichael 2000; Wee *et al.* 2002

- The HIV-1 subtype A focused vaccine HIVA contains p24 and p17, in a reversed order relative to the Gag polyprotein to prevent myristylation of p17, which could direct the protein to the cell membrane and inhibit efficient peptide processing and class I presentation, as well as a polyepitope string of conserved, often immunodominant epitopes that were selected to have particularly good cross-reactive potential for the A-clade epidemic in Nairobi, Kenya. A DNA and MVA prime-boost vaccination protocol using the HIVA antigen will be used in a phase III clinical trial in Kenya. This epitope is included in the polyepitope string Hanke & McMichael [2000].
- Multiple CD4+ or CD8+ T-cell vaccine-induced responses to peptide pools were detected using intracellular cytokine staining and IFN γ Elispot assays after vaccination of 5 macaques. The response to the Mamu A*01 SIV p27 epitope p11C (CTPYDINQM), included in the polyepitope region, was not immunodominant in the Mamu A*01 vaccinated macaques, possibly because of processing limitations in context of the artificial polyepitope string Wee *et al.* [2002].

Country South Africa.
Assay type CD8 T-cell Elispot - IFN γ
Keywords characterizing CD8+ T cells
References Kiepiela *et al.* 2004
- HLA class I restricted CD8+ T-cell responses against HIV-1 were analyzed in African patients. Significantly more responses were shown to be HLA-B restricted. Viral load, CD4 count, and thus rate of disease progression were also associated with HLA-B alleles. In addition, the selection pressure imposed on HIV-1 by HLA-B alleles was shown to be substantially greater than by other alleles.
 - This epitope was suggested to be the epitope within a longer reactive peptide based on correspondence with a known epitope in the HIV database. Also, a significantly higher frequency of people in the Durban cohort who reacted with the peptide had this HLA type.

Assay type CD8 T-cell Elispot - IFN γ
Keywords subtype comparisons
References Geels *et al.* 2005
- Cross-clade CTL responses in 10 non-B HIV-1 infected individuals were evaluated. T-cell reactivity was tested against peptide pools of clade B Gag, Pol, Nef, Rev and Tat. Nine individuals demonstrated cross-reactive T-cell responses to clade A, B, and C Gag pools; 6/7 patients that responded to Nef-B also reacted to clade A and C Nef pools. An inverse correlation was observed between the sequence divergence of the HLA class I restricted epitopes and the height of the T-cell responses, which in Gag could be explained through variations in the HLA-anchor residues. 42% of the responses were directed to regions containing new epitopes.
 - This previously described epitope was embedded in a B clade peptide that was recognized by T-cells from an infected person carrying subtype D Gag. The autologous epitope sequence in this person matched the known epitope. In another D subtype infected individual, it was predicted to be a B53 epitope based on HLA typing of the individual and motifs within the reactive peptide.

Subtype B**Immunogen** HIV-1 infection**Species (MHC)** human**Assay type** T-cell Elispot**Keywords** supervised treatment interruptions (STI), immunodominance, early treatment**References** Addo *et al.* 2003

- Comprehensive Elispot screening of 504 overlapping peptides that spanned all HIV-1 proteins in 57 HIV-1 infected individuals. Four groups of patients were compared: 23 were untreated; 12 patients were chronically infected and treated; 22 started treatment during acute infection, 11 continuously treated and 11 with STI.
- 63% of the peptides were recognized - the most frequent responses were directed against Nef (95%) and p24-Gag (88%). p17 was the most frequently recognized protein after correction for protein length. A median of 18 peptides (range 2-42) were recognized per person. The most frequently (>20%) recognized peptides were located in conserved regions within clade B sequences. Vpu was rarely recognized.
- A decrease in the total magnitude and in the breadth of CTL responses was detected in patients with treated acute infection in comparison to chronically infected treated or untreated individuals. No correlation between plasma viral load and HIV-1 specific T-cell responses was observed.
- The authors did not note the reference strain, but based on the peptide sequences provided it appears to be HXB2.
- Responses to this peptide were detected in 19% of the study subjects, and it was one of the 25 most frequently recognized peptides.

Keywords HAART, ART

References Sabbaj *et al.* 2003

- This study monitored epitope responses in HIV-1 infected minority women living in the United States.
- 24 epitopes were described – 8 were novel, 8 used new restricting elements but were previously defined epitopes, and 8 were previously described.
- Serial peptide truncations were used to define optimal epitopes for CTL cell lines isolated from 12 individuals, assayed by a Cr-release.
- Among HIV+ individuals who carried HLA B08, 3/6 (50%) recognized this epitope.

Keywords characterizing CD8+ T cells
References Kiepiela *et al.* 2004

- HLA class I restricted CD8+ T-cell responses against HIV-1 were analyzed in African patients. Significantly more responses were shown to be HLA-B restricted. Viral load, CD4 count, and thus rate of disease progression were also associated with HLA-B alleles. In addition, the selection pressure imposed on HIV-1 by HLA-B alleles was shown to be substantially greater than by other alleles.
- This epitope was suggested to be the epitope within a longer reactive peptide based on correspondence with a known epitope in the HIV database. Also, a significantly higher frequency of people in the Durban cohort who reacted with the peptide had this HLA type.

- CD8+ T-cell responses that persisted in individuals with advanced disease were studied; most of the optimal epitopes defined were recognized with intermediate to high avidity. On average 13 (range, 2-39) epitopic regions were targeted in an average of 6 proteins (range, 1-8). HAART resulted in decrease in antigen and reduction in gamma IFN EliSpot responses, suggesting active responses to autologous virus. The lack of mutations within most viral epitopes suggest that persistent CTL through late disease do not exert strong immune selection

pressure, yet the Elispot assays show robust responses, suggesting to the authors that gamma IFN-based screening methods may not reveal functional CD8+ T-cell impairment in patients with AIDS.

- 3 subjects recognized this epitope with intermediate functional avidity. Autologous sequence revealed one substitution, Diyrkwil, in 1 of the 3; this version of the epitope also had intermediate functional avidity with the donor's cells.

Country Netherlands.

Assay type Tetramer binding, Flow cytometric T-cell cytokine assay

Keywords binding affinity, rate of progression, escape, characterizing CD8+ T cells

References Jansen *et al.* 2005

- Number and responsiveness of CD8 T-cells directed to different Gag peptides presented by HLA-A2, -B8 and B57 were compared. It was shown that T-cells specific for an HLA-B57 peptide responded to a higher extent and more readily to antigenic stimulation than those specific for HLA-A2 and -B8 peptides did. Moreover, it was shown that the higher functionality of B57-restricted T-cells was not correlated to higher number of epitope escape mutations in A2- and B8-restricted T-cells.

- Tetramer decay experiments indicate that the HLA-B57 peptide has a higher half-life than the A2 and B8 peptides. The authors point out that CD8+ T cells with high binding affinity may require less help.
- In 1/2 B8+ individuals that were sequenced, 2 epitope variants were present: EfYRKWII and rIYRKWII, but the form EIYRKWII was found most often.

Keywords dynamics, acute/early infection, characterizing CD8+ T cells
References Jones *et al.* 2004

- Primary CD8+ T-cell response to Env, Tat and Gag and the extent, kinetics and mechanisms of viral escape were examined in three patients. Rapid escape, within weeks from infection, from HIV specific CTL responses was observed in all three patients, but the kinetics and extent of the escape differed depending on the breadth and co-dominant distribution of CTL-mediated pressure. The two patients that rapidly declined had more focused immunodominant responses, while the single patient that had low viral load and stable CD4 counts for seven years had a broad co-dominant response and less escape.

- The patient SUMA maintained low viral loads and stable CD4 T cell counts through seven years of follow up. In contrast to more rapid progressors, WEAU and BORI, SUMA a broad response to 24 epitopes, with little immunodominance. Two peptides were somewhat more intensely recognized in acute infection, but this response leveled out early on.
- Only four epitopes were found to acquire escape mutations in SUMA over time, and this was one of the 20 that remained invariant. A low level response was detected at acute infection that persisted through early infection.

Epitope KRWIILGLNK
Immunogen HIV-1 infection
Species (MHC) human (B*2705)
Keywords dynamics, acute/early infection
References Wilson *et al.* 2000a

• Three individuals with highly focused HIV-specific CTL responses were studied during acute infection using tetramers – high frequencies of HIV-1-specific CD8+ T cells were found prior to seroconversion, and there was a close temporal relationship between the number of circulating HIV-specific T cells and viral load was also found.
 • All three patients were B*2705, with HLA alleles: A1, A30/31, B*2705, B35; A1, A*0301, B7, B2705; and A*0201, A*0301, B2705, B39.
 • Tetramers with peptide variants KRWIILGGLNK and KRWIIMGGLNK were used – CTL from most B27 donors recognize both variants, although one of the three subjects recognized only KRWIILGGLNK.
 • ELISPOT was used to test a panel of CTL epitopes that had been defined earlier and were appropriate for the HLA haplotypes of the study subjects – 3/3 subjects showed a dominant response to the B*2705 epitope KRWIILGGLNK.
 • The subject with A*0201 had a moderately strong response to SLYNTVATL.
 • Weak responses were observed to A*301-RLRPGGKKK, A*301-QVPLRPMTYK, and B7-TPGPGVRYPL in the subject who was HLA A1, A*0301, B7, B*2705.
 • No acute response was detected to the following epitopes: A*201-ILKEPVHGV, A*301-KIRLRPGGK, A*301-AIFQSSMTK, A*301-TVYYGVPVWK, B35-EPIVGAETF, B35-HPDIVIYQY, B35-PPIVGGEIY, B35-NSSKVSQNY, B35-VPLRPMTY, B35-DPNPQEVVL.

Epitope KRWIILGLNK
Immunogen HIV-1 infection
Species (MHC) human (B*2705)
Keywords escape
References Kelleher *et al.* 2001b
 • A mutation in 4/5 B*2705 patients had substitution to lysine (K) at HIV-1 gag residue 264 (R264K), in three the change occurred late in infection – in one patient a substitution of glycine at HIV-1 gag residue 264 (R264G) was detected – these substitutions reduce binding to B27.
 • The R264K mutations were associated with a L268M mutation that may be compensatory, and R264G occurred in conjunction with E260D.

- Positions 260, 264, and 268 all lie along one aspect of helix seven of the capsid protein, a region that is important for capsid self-association and assembly.
- R264G and R264K escape mutation outgrowth occurred in conjunction with high viral loads.

Keywords subtype comparisons, epitope processing, vaccine-specific epitope characteristics, immunodominance

References Hanke & McMichael 2000; Wee *et al.* 2002

- The HIV-1 subtype A focused vaccine HIVA contains p24 and p17, in a reversed order relative to the Gag polyprotein to prevent myristylation of p17, which could direct the protein to the cell membrane and inhibit efficient peptide processing and class I presentation, as well as a polyepitope string of conserved, often immunodominant epitopes that were selected to have particularly good cross-reactive potential for the A-clade epidemic in Nairobi, Kenya. A DNA and MVA prime-boost vaccination protocol using the HIVA antigen will be used in a phase III clinical trial in Kenya. This epitope is included in the polyepitope string Hanke & McMichael [2000].
- Multiple CD4+ or CD8+ T-cell vaccine-induced responses to peptide pools were detected using intracellular cytokine staining and IFN γ ELISPOT assays after vaccination of 5 macaques. The response to the Mamu A*01 SIV p27 epitope p11C (CTPYDINQM), included in the polyepitope region, was not immunodominant in the Mamu A*01 vaccinated macaques, possibly because of processing limitations in context of the artificial polyepitope string Wee *et al.* [2002].

Assay type CD8 T-cell ELISPOT - IFN γ , Tetramer binding, Intracellular cytokine staining, Chromium-release assay, Flow cytometric T-cell cytokine assay, Degranulation, CD107a and b cell surface mobilization

Keywords vaccine-specific epitope characteristics, vaccine-induced epitopes, immunodominance, escape, TCR usage, characterizing CD8+ T cells

References Betts *et al.* 2005

- A vaccinated HIV-negative individual exhibited features predicted to be necessary for vaccine-induced protection: killing ability, cytokine production, multifunctionality, proliferative capacity, polyclonality, memory phenotype, and a CD8 T-cell response directed against a highly immunodominant epitope correlated with long-term nonprogression. In spite of this, the subject became infected with HIV through homosexual contact. The subject progressed more rapidly than expected for an HLA-B27-positive individual.
- After infection, CD4+ and CD8+ T cells acquired functional characteristics typical of chronic HIV infection. The infecting virus escaped the vaccine-induced T-cell response with an R264G substitution, KgWIILGLNK, which diminishes binding to B27, between the second and third year of infection.

Keywords responses in children, mother-to-infant transmission, immunodominance, escape, acute/early infection

References Goulder *et al.* 2001b

- 85% of B27+ adults have CTL that recognize this epitope, but only 2/6 children did.
- Responses to this dominant B27-restricted Gag epitope are present during the time of decreasing viral load in acute infection.
- Three children who shared B27 with their mothers did not respond to this epitope and inherited escape mutations from their mothers.
- A transmitted R132T anchor residue mutation abrogated binding to B27.
- In the three children infected with the non-binding KK10 variants, the dominant CTL specificity was still HLA-B27-restricted, but it was directed against an epitope in p17, IRL-RPGGKK, only rarely recognized in adults when KRWIILGLNK is the dominant response.
- Mutations in this epitope were observed in autologous clones of subjects who were B27-positive with a higher frequency than those who were B27-negative (P = 0.0005)
- These mutations are being sexually transmitted in adult infections.

Keywords HAART, ART, supervised treatment interruptions (STI)

References Altfeld *et al.* 2002b

- Peripheral blood (PB) and lymph node (LN) CD8+ T-cell responses were compared in 15 asymptomatic HIV-1 infected patients using all known optimal CTL epitopes (<http://hiv-web.lanl.gov/content/hiv-db/REVIEWS/brander2001.html>) for each person's class I HLA alleles.
- 60 epitope responses were detected in both PB and LN samples of the 15 patients, and an additional 8 responses were detected only in LN. The total magnitude of the response was similar in LN and PB, but the percentage of CD8+ T cells in the LN is lower so the number of HIV-specific cells per million CD8+ T-cells is higher in the LN.
- 1 year post-HAART treatment in five patients studied, the magnitude of the CD8 T-cell response was decreased in both LN and PB, but more dramatically in PB, and 13/25 epitope responses in the PB became undetectable, in contrast to 5/26 in the LN.
- Treatment interruption following HAART induced resulted in increased viremia accompanied by the restoration of the detection of 13 epitopes that had become undetectable in the PB, and the addition of 9 novel epitope responses.
- Breakdowns of epitope responses were shown for 4 individuals. Patient C displayed the greatest response to B27-KK10(p24), and in decreasing order also responded to A24-RW8(Nef), B7-IL9(gp41), A24-RL9(gp41), A24-YL8(gp41), and B7-TM9(Nef). Patient D also displayed the greatest response to B27-KK10(p24), and also responded to A30-RY11(p17), A32-PW10(RT), A30-KY11(RT), A32-RW10(gp120), and B18-YY9(Nef).

Keywords responses in children, rate of progression, immunodominance, escape

References Feeney *et al.* 2004

- Viral load in a perinatally infected child remained low until emergence of an escape variant (kTwilglnk) in the immunodominant CTL epitope KRWIILGLNK when the child was 7.4 years old. The emergence of this escape mutation was followed by an increase in viremia and an increase in the number of targeted CTL epitopes, measured again when the child was 9.2 years old. The timing suggests that the loss of recognition of this epitope may have resulted in the subsequent loss of immune control.
- The mutation krwillMglnk has been suggested to be compensatory and required for the emergence of the previously described escape mutation kKwillMglnk (Kelleher 2001). The L136M mutation does appear in this child, but not in conjunction with the R132T escape mutation.

Epitope KRWIIMGLNK

Epitope name KK10

Immunogen HIV-1 infection

Species (MHC) human (B27)

Keywords review, responses in children, vaccine-specific epitope characteristics, rate of progression, escape

References Goulder & Watkins 2004

- This paper is a review of the role of CTL in HIV infection, and it uses KK10 as an example of an epitope that has late escape mutations associated with loss of immune control of the virus and decline to AIDS.
- A study where a vaccine response to KK10 was stimulated in a individual who subsequently got infected and had rapid escape from the KK10 response and an unexpectedly high steady state viral load for a B27+ person is recounted as a cautionary note regarding the delicate balance of effects that might contribute to CTL mediated immune control.

Epitope KRWIIILGLNK

Epitope name KK10

Subtype B

Immunogen HIV-1 infection

Species (MHC) human (B27)

Assay type CD8 T-cell Elispot - IFN γ

Keywords subtype comparisons, escape, characterizing CD8+ T cells, reversion, viral fitness

References Allen *et al.* 2005a

- Two-thirds of all mutations arising in nonenvelope proteins during the transition from acute to chronic infection were found to be due to either CD8 T-cell-associated selective pressures or reversion of HLA-I-associated mutations selected in a previous host. The predominance of escape mutations at highly polymorphic sites was observed across different HIV-1 clades.
- One escape mutation, at position 6, krwiiMglnk, was found in the most polymorphic residue in the epitope. This was shared between clades B and C. One escape mutation, at position 2, kTwiilglnk, was found not to correspond to the most polymorphic residue in the epitope.

Epitope KRWIIILGLNK

Epitope name KK10

Immunogen

Species (MHC) (B27)

Keywords review, immunodominance, escape, acute/early infection, early-expressed proteins, kinetics, reversion, viral fitness

References Lichterfeld *et al.* 2005

- This review discusses the importance of 3 factors that impact the selection of immunodominant epitopes in acute HIV infection: i) the kinetics of viral protein expression, ii) the HLA class I background of the infected individual, and iii) the autologous sequence of the infecting virus. This is 1 of 12 peptides listed as immunodominant in acute HIV-1 infection.

HXB2 Location p24 (131–140)

Author Location Gag (263–272)

Epitope KRWIIILGLNK

Subtype B

Immunogen HIV-1 infection

Species (MHC) human (B27)

Country Barbados.

Assay type CD8 T-cell Elispot - IFN γ

Keywords responses in children, mother-to-infant transmission, escape, acute/early infection

References Pillay *et al.* 2005

- HIV-specific CTLs in infants were shown to be able to select for viral escape variants early in life, despite a lack of escape with the same CTL specificity in the mother. Infant CTL responses may be compromised by transmission of escape variants that arose in the mother and also those that arose in the father, if the father was the source of the mother's infection.
- A B27 escape footprint was passed from a B27+ father to his partner, who then passed the variant to their child. KRWIIILGLNK is the B consensus form of this epitope, the paternal form was KqWIIiGLNK, the maternal form, KqWvImGLNK, and this was the form passed on to the child.

Assay type CD8 T-cell Elispot - IFN γ , Chromium-release assay

Keywords dynamics, acute/early infection, characterizing CD8+ T cells

References Jones *et al.* 2004

- Primary CD8+ T-cell response to Env, Tat and Gag and the extent, kinetics and mechanisms of viral escape were examined in three patients. Rapid escape, within weeks from infection, from HIV specific CTL responses was observed in all three patients, but the kinetics and extent of the escape differed depending on the breadth and co-dominant distribution of CTL-mediated pressure. The two patients that rapidly declined had more focused immunodominant responses, while the single patient that had low viral load and stable CD4 counts for seven years had a broad co-dominant response and less escape.
- The patient SUMA maintained low viral loads and stable CD4 T cell counts through seven years of follow up. In contrast to more rapid progressors, WEAU and BORI, SUMA a broad response to 24 epitopes, with little immunodominance. Two peptides were somewhat more intensely recognized in acute infection, but this response leveled out early on.
- Only four epitopes were found to acquire escape mutations in SUMA over time, and this was one of the 20 that remained invariant. A low level response was detected at acute infection that persisted through early infection.

Assay type CD8 T-cell Elispot - IFN γ

Keywords variant cross-recognition or cross-neutralization

References Draenert *et al.* 2004c

- CD8+ T-cell responses that persisted in individuals with advanced disease were studied; most of the optimal epitopes defined were recognized with intermediate to high avidity. On average 13 (range, 2–39) epitopic regions were targeted in an average of 6 proteins (range, 1–8). HAART resulted in decrease in antigen and reduction in gamma IFN EliSpot responses, suggesting active responses to autologous virus. The lack of mutations within most viral epitopes suggest that persistent CTL through late disease do not exert strong immune selection pressure, yet the Elispot assays show robust responses, suggesting to the authors that gamma IFN-based screening methods may not reveal functional CD8+ T-cell impairment in patients with AIDS.
- 1 subject recognized this epitope with intermediate functional avidity. The autologous sequence matched the B consensus.

Author Location p24 (267–277 SF2)

Epitope GLNKIVRMY

Immunogen HIV-1 infection

Species (MHC) human (B62)

Keywords HAART, ART, acute/early infection

References Altfeld *et al.* 2001b

- Therapy provided during acute infection resulted in a narrower CTL response, stronger T help response, and a less diverse viral population than was seen in individuals treated during chronic infection.
- The breadth and specificity of the response was determined using ELISPOT by studying 19 individuals with pre-seroconversion therapy (Group 1), 11 individuals with primary infection but post-seroconversion therapy (Group 2), and 10 individuals who responded to HAART given during chronic infection (Group 3), using 259 overlapping peptides spanning p17, p24, RT, gp41, gp120 and Nef.
- Previously described and newly defined optimal epitopes were tested for CTL response.
- Number of HLA-B62+ individuals that had a CTL response to this epitope broken down by group: 0/1 group 1, 0/1 group 2, and 1/1 group 3.

- CTL epitope responses were mapped in 21 men within 15-92 days post-HIV-1 infection. Subjects initially showed narrow immune responses with a mean of 2.3 epitopes recognized per patient. The immune response broadened later in infection. No correlation between the plasma viral load and the number of recognized epitopes or the frequency of IFN-gamma secreting cells was observed, and there was no correlation between the functional avidity of a response and the abundance of IFN-secreting cells that recognized the epitope. The first epitopes to be recognized tended not to be the most avid, and earliest responses tended to be directed against Nef, Tat, Vpr, and Env.
- More common HLA alleles were less frequently used in primary infection than less common alleles, for example A3, B35, B57, and B62 were more frequently recognized than A1, A2, A30, and A44.
- All HIV-1 proteins except Vpu were recognized, and a response to a total of 41 optimal epitopes were characterized; 24 had been identified previously. 48% of the total T-cell responses were directed against Nef and 43% were directed against Gag.
- More common HLA alleles were less frequently used in primary infection than less common alleles, for example A3, B35, B57, and B62 were more frequently recognized than A1, A2, A30, and A44.

HXB2 Location p24 (137–145)**Author Location** Gag (269–277)**Epitope** GLNKIVRMY**Subtype** B**Immunogen** HIV-1 infection**Species (MHC)** human (B62)**Donor MHC** A2, A24, B27, B62**Assay type** Chromium-release assay**Keywords** TCR usage, genital and mucosal immunity**References** Musey *et al.* 2003

- CTL clones from blood, semen, cervix and rectum samples from 12 individuals were compared. CTL clones derived from blood and mucosal samples had similar high lysis efficiency, primarily perforin dependent, and TCRbeta VDJ region sequencing revealed cases of expansion of the same clone in different compartments.

- CD8+ T cell clones directed at this epitope were derived from blood, rectum and semen.
- The TCRbeta VDJ rearrangement of the CTL clones was V β 22S1DJ1.2, demonstrating expansion of CTL clones in all three compartments from the same progenitor cell.

HXB2 Location p24 (137–145)**Author Location** Gag (269–277)**Epitope** GLNKIVRMY**Epitope name** GY9**Subtype** B**Immunogen** HIV-1 infection**Species (MHC)** human (B62)**Donor MHC** A*01, A*11, B*08, B*15, Cw*04, Cw*07**Country** United States.**Assay type** CD8 T-cell Elispot - IFN γ , Chromium-release assay, Flow cytometric T-cell cytokine assay**Keywords** escape, optimal epitope**References** Koibuchi *et al.* 2005

- HIV-1-specific CD8 T-cell responses were shown to be persistent in the chronic phase of HIV-1 infection, although the responses to some of the epitopes were declining despite the persistence of the targeted sequences in vivo. Only 4/14 epitopes were potential CTL escape variants, although strong responses to these epitopes persisted for 6 years. This indicates limited viral evolution within targeted CD8 T-cell epitopes during the chronic phase of infection.
- The autologous form of the GY9 matched the B clade consensus form of the epitope, GLNKIVRMY, throughout the 5 years of study.

HXB2 Location p24 (137–145)**Author Location** Gag (269–277 HXB2)**Epitope** GLNKVRMY**Subtype** B, CRF01_AE**Immunogen** HIV-1 infection**Species (MHC)** human (B62)**Country** Viet Nam.**Assay type** HLA binding**Keywords** subtype comparisons, computational epitope prediction, vaccine antigen design**References** Lazaro *et al.* 2005

- The most common HLA-alleles in the Vietnamese population were found to be HLA-A11, A02, A33, B75, B46, and B62. Several epitopes cluster in short regions in Gag and Nef that are presented by these HLA molecules; these epitopes may be useful targets for vaccine antigens. In a comparison of CRF01_AE sequences to HXB2, 14 mutations were found in epitopes in these Gag and Nef pluriepitopic regions; 7 did not affect the HLA binding score, 3 increased it, and 4 reduced it.
- GLNKVRMY is the epitope in the HXB2 reference strain sequence, and is also the most common form in CRF01.

- Multiple natural variations in the SL9 flanking regions of the immunodominant epitope SLYNTVATL were tested and found not to adversely affect CTL recognition or prevent epitope processing, suggesting that viral escape from the HLA-A*0201-restricted CTL response against SLYNTVATL is probably not linked to variations in the flanking regions of this epitope.
- The CTL response to RMYSPTSI was used as a control.

HXB2 Location p24 (143–150)**Author Location** p24 (273–283 IIIB)**Epitope** RMYSPTSI**Immunogen** HIV-1 infection**Species (MHC)** human (B52)**Keywords** responses in children, mother-to-infant transmission, escape**References** Wilson *et al.* 1999a

- This study describes maternal CTL responses in the context of mother-to-infant transmission.
- Detection of CTL escape mutants in the mother was associated with transmission, but the CTL-susceptible forms of the virus tended to be found in infected infants.
- No variants of this epitope were found in a non-transmitting mother that had a CTL response to this epitope.

HXB2 Location p24 (143–150)**Author Location** p24 (143–150)**Epitope** RMYSPTSI**Immunogen** HIV-1 infection**Species (MHC)** human (B52)**References** Ferrari *et al.* 2000

- One of the 51 HIV-1 epitopes selected by Ferrari *et al.* as good candidate CTL epitopes for vaccines by virtue of being conserved and presented by common HLA alleles.

HXB2 Location p24 (143–150)**Author Location** Gag (275–282)**Epitope** RMYSPTSI**Epitope name** RI8**Subtype** B**Immunogen** HIV-1 infection**Species (MHC)** human (B52)**Donor MHC** A*02, A*68, B*14, B*52, Cw*08, Cw*12**Country** United States.**Assay type** CD8 T-cell Elispot - IFN γ , Chromium-release assay, Flow cytometric T-cell cytokine assay**Keywords** escape, optimal epitope**References** Koibuchi *et al.* 2005

- HIV-1-specific CD8 T-cell responses were shown to be persistent in the chronic phase of HIV-1 infection, although the responses to some of the epitopes were declining despite the persistence of the targeted sequences *in vivo*. Only 4/14 epitopes were potential CTL escape variants, although strong responses to these epitopes persisted for 6 years. This indicates limited viral evolution within targeted CD8 T-cell epitopes during the chronic phase of infection.

- A form of this epitope that elicited a diminished Elispot response, RMYSPvSI, dominated the viral sequence for several years, and then reverted back to the B consensus form, RMYSPvTSI.

HXB2 Location p24 (143–151)

Author Location p24 (143–151)

Epitope RMYSPVSIIL

Subtype C

Immunogen HIV-1 infection

Species (MHC) human (A*0201)

Country India.

Assay type CD8 T-cell Elispot - IFN γ

Keywords subtype comparisons, computational epitope prediction, immunodominance

References Thakar *et al.* 2005

- PBMCs from HIV-1 infected Indian subjects were tested for HIV-1 Gag (with C clade peptides), Nef (with B clade peptides), and Env (clade unspecified) specific T-cell responses. 5 immunodominant regions conserved across clades were identified in Gag and Nef. 3 antigenic regions were found to be recognized by CTLs in the Indian subjects; these regions were not identified as immunodominant in studies from Africa. 26 epitopes were predicted within reactive peptides, of which 90% were clustered in the conserved immunodominant regions of Gag and Nef. 3 of the epitopes were highly conserved across clades, and 7 novel epitopes were found.
- This epitope is highly conserved across clades.

- Codon-optimized gag gene DNA vaccines were compared to wild type by vaccination of BALB/c mice. Codon optimized DNA gave a Th1 polarized Th response, a strong antibody response that persisted from more than 20 weeks, and CTL responses, while wild-type DNA induced weak and inconsistent immune responses.

HXB2 Location p24 (159–168)**Author Location****Epitope** EPFRDYVDRF**Epitope name** E10F**Immunogen** vaccine*Vector/Type:* DNA, virus-like particle (VLP), polyepitope *HIV component:* Gag, p24 Gag, V3**Species (MHC)** mouse (H-2L^d)**Assay type** Cytokine production, Chromium-release assay**Keywords** epitope processing, vaccine-specific epitope characteristics, immunodominance**References** Wild *et al.* 2004

- A codon optimized gag DNA vaccine was compared to a myristylation defective gag and p24 alone, both of which lack signals for secretion from transfected cells. Gag-derived immunogens that were secreted as VLPs and those that remained intracellular (p24) each produced strong CTL responses, and neither the size of antigen nor cellular trafficking and localization significantly influenced the strength of humoral and cellular immune activation. The formation and release of VLPs was not essential for eliciting strong CTL. BALB/c mice were given the DNA vaccine by i.m. administration of plasmid DNA for the prime and boost.
- Minigenes were made incorporating just 1 epitope, minitopes, carrying 1 of 3 murine class I epitopes linked to the Ad2-E3 protein-derived signal peptide to allow access of the epitope to the ER. Weak induction of cellular immune responses was

observed, in contrast to the complex polyprotein. The E10F minigene did not produce a detectable CTL response.

Keywords characterizing CD8+ T cells

References Kiepiela *et al.* 2004

- HLA class I restricted CD8+ T-cell responses against HIV-1 were analyzed in African patients. Significantly more responses were shown to be HLA-B restricted. Viral load, CD4 count, and thus rate of disease progression were also associated with HLA-B alleles. In addition, the selection pressure imposed on HIV-1 by HLA-B alleles was shown to be substantially greater than by other alleles.
- This epitope was suggested to be the epitope within a longer reactive peptide based on correspondence with a known epitope in the HIV database. Also, a significantly higher frequency of people in the Durban cohort who reacted with the peptide had this HLA type.

References Liu *et al.* 2006

- T-cell immunity and the impact of selection were longitudinally studied in a patient from the time of transmission. New epitopes were detected at sites that were shown to be under positive selection. Env was found to be the major target of CTLs and most of the new epitopes were found here. One third of the sites examined were associated with epitope escape mutations from CTL. Acquisition of mutations found at high frequency in the database was suggested to be a result of reversion of CTL epitopes in the absence of immune targeting.

Epitope FRDYVDRFYK
Immunogen HIV-1 infection, HIV-1 exposed seronegative
Species (MHC) human (B18)
Keywords HIV exposed persistently seronegative (HEPS)
References Kaul *et al.* 2001a

- Variants FRDYVDRF(Y/F)K are specific for the B,D/A,C clades.
- ELISPOT was used to study CTL responses to a panel of 54 predefined HIV-1 epitopes in 91 HIV-1-exposed, persistently seronegative (HEPS) and 87 HIV-1-infected female Nairobi sex workers.

- Responses in HEPS women tended to be lower, and focused on different epitopes with HLA presenting molecules that have previously been associated with reduced risk of infection, and there was a shift in the response in the HEPS women upon late seroconversion to epitopes recognized by the HIV-1 infected women.
- 43/91 HEPS women had CD8+ responses and detection of HIV-1-specific CTL in HEPS women increased with the duration of viral exposure.
- Among HLA-B18 women, 3/4 HEPS and 1/9 HIV-1 infected women recognized this epitope, likelihood ratio 5.3, p value 0.04, and HEPS women tended to respond to FRDYVDRFY/FK, while infected women tended to respond to YPLT-FGWCY/F.
- The dominant response to this HLA allele was to this epitope for all 3/4 HEPS cases and for the single HIV-1 infected women that responded to this epitope.
- Four epitopes were considered to be “resistant epitopes”, as they were preferentially reactive in HEPS women and so may confer resistance, and these were found in three different proteins: A2 ILK(D/E)PVHGV in RT, A*6802 DTVLEDINL in Protease, B14 DLNM/TLN(I/V)V in p24 and B18 FRDYVDRF(Y/F)K also in p24.
- Differences in epitope specificity were only seen for responses restricted by class I HLA alleles A2, A24, A*6802, B14, and B18, previously shown to be associated with resistance to HIV-1 in this cohort.

Epitope FRDYVDRFYK
Subtype B, D

Immunogen HIV-1 infection, vaccine

Vector/Type: DNA prime with modified vaccinia Ankara (MVA) boost *Strain:* A clade
HIV component: p17 Gag, p24 Gag

Species (MHC) human, macaque (B18)

Keywords subtype comparisons, epitope processing, vaccine-specific epitope characteristics, immunodominance

References Hanke & McMichael 2000; Wee *et al.* 2002

- The HIV-1 subtype A focused vaccine HIVA contains p24 and p17, in a reversed order relative to the Gag polyprotein to prevent myristylation of p17, which could direct the protein to the cell membrane and inhibit efficient peptide processing and class I presentation, as well as a polyepitope string of conserved, often immunodominant epitopes that were selected to have particularly good cross-reactive potential for the A-clade epidemic in Nairobi, Kenya. A DNA and MVA prime-boost vaccination protocol using the HIVA antigen will be used in a phase III clinical trial in Kenya. This epitope is included in the polyepitope string Hanke & McMichael [2000].
- Multiple CD4+ or CD8+ T-cell vaccine-induced responses to peptide pools were detected using intracellular cytokine staining and IFN γ Elispot assays after vaccination of 5 macaques. The response to the Mamu A*01 SIV p27 epitope p11C (CTPYDINQM), included in the polyepitope region, was not immunodominant in the Mamu A*01 vaccinated macaques, possibly because of processing limitations in context of the artificial polyepitope string Wee *et al.* [2002].

HXB2 Location p24 (161–170)**Author Location****Epitope** FRDYVDRFFK**Immunogen** HIV-1 infection**Species (MHC)** human**Keywords** HIV exposed persistently seronegative (HEPS)**References** Kaul *et al.* 2001c

- This study examines CTL responses in HIV exposed, persistently seronegative individuals, HEPS, who eventually seroconverted – 11/114 HEPS Nairobi sex workers eventually seroconverted, and for six of these HIV CTL reactive epitopes had been defined while seronegative.
- The epidemiological factor associated with seroconversion was stopping sex work. HIV-specific CTL activity declined when HEPS sex workers stopped working for a period or retired.
- This epitope was recognized in 1/22 HEPS sex worker controls, ML1732.

HXB2 Location p24 (161–174)**Author Location** p24 (161–174 HXB2)**Epitope** FRDYVDRFYKTLRA**Subtype** B**Immunogen** HIV-1 infection**Species (MHC)** human**Assay type** T-cell Elispot**Keywords** supervised treatment interruptions (STI), immunodominance, early treatment**References** Addo *et al.* 2003

- Comprehensive Elispot screening of 504 overlapping peptides that spanned all HIV-1 proteins in 57 HIV-1 infected individuals. Four groups of patients were compared: 23 were untreated; 12 patients were chronically infected and treated; 22 started treatment during acute infection, 11 continuously treated and 11 with STI.
- 63% of the peptides were recognized - the most frequent responses were directed against Nef (95%) and p24-Gag (88%). p17 was the most frequently recognized protein after correction for protein length. A median of 18 peptides (range 2-42) were recognized per person. The most frequently (>20%) recognized peptides were located in conserved regions within clade B sequences. Vpu was rarely recognized.
- A decrease in the total magnitude and in the breadth of CTL responses was detected in patients with treated acute infection in comparison to chronically infected treated or untreated individuals. No correlation between plasma viral load and HIV-1 specific T-cell responses was observed.
- Responses to this peptide were detected in 16% of the study subjects, and it was one of the 25 most frequently recognized peptides.

Assay type CD8 T-cell Elispot - IFN γ

Keywords variant cross-recognition or cross-neutralization

References Draenert *et al.* 2004c

- CD8+ T-cell responses that persisted in individuals with advanced disease were studied; most of the optimal epitopes defined were recognized with intermediate to high avidity. On average 13 (range, 2-39) epitopic regions were targeted in an average of 6 proteins (range, 1-8). HAART resulted in decrease in antigen and reduction in gamma IFN EliSpot responses, suggesting active responses to autologous virus. The lack of mutations within most viral epitopes suggest that persistent CTL through late disease do not exert strong immune selection pressure, yet the Elispot assays show robust responses, suggesting to the authors that gamma IFN-based screening methods may not reveal functional CD8+ T-cell impairment in patients with AIDS.
- 1 subject recognized this epitope with low functional avidity. The autologous sequence matched the B consensus.

Assay type CD8 T-cell Elispot - IFN γ , Chromium-release assay

Keywords dynamics, acute/early infection, characterizing CD8+ T cells

References Jones *et al.* 2004

- Primary CD8+ T-cell response to Env, Tat and Gag and the extent, kinetics and mechanisms of viral escape were examined in three patients. Rapid escape, within weeks from infection, from HIV specific CTL responses was observed in all three patients, but the kinetics and extent of the escape differed depending on the breadth and co-dominant distribution of CTL-mediated pressure. The two patients that rapidly declined had more focused immunodominant responses, while the single patient that had low viral load and stable CD4 counts for seven years had a broad co-dominant response and less escape.
- The patient SUMA maintained low viral loads and stable CD4 T cell counts through seven years of follow up. In contrast to more rapid progressors, WEAU and BORI, SUMA a broad response to 24 epitopes, with little immunodominance. Two peptides were somewhat more intensely recognized in acute infection, but this response leveled out early on.

- Only four epitopes were found to acquire escape mutations in SUMA over time, and this was one of the 20 that remained invariant. A low level response was detected at acute infection that persisted through early infection.

- All HIV-1 subtype C protein sequences were analysed, and 94 HLA-associated amino acid polymorphisms were found that were well distributed throughout the proteome. These sequences were compiled from publicly available databases and originated in South Africa and Botswana. Many polymorphisms were associated with multiple HLA allele classes. 12%

of negative associations were found as well, where there was an association of virus expression of the consensus amino acid with a specific HLA allele. HLA-B alleles were involved in most of the associations. 19 HLA-associated polymorphisms were embedded in previously defined epitopes presented by an appropriate HLA restricting molecule.

- DRFFKTLRA was a previously defined B*1402 presented epitope that encompassed a B*14/B*1401 associated polymorphism, DRFFkTLRA, in the fifth position. This epitope is embedded in a previously determined CTL immunodominant region.

Epitope DRFFKTLRA

Immunogen HIV-1 infection, HIV-1 exposed seronegative

Species (MHC) human (B14)

Keywords HIV exposed persistently seronegative (HEPS)

References Kaul *et al.* 2001a

- Variants DRF(F/W)KTLRA are specific for clades A/B.
- ELISPOT was used to study CTL responses to a panel of 54 predefined HIV-1 epitopes in 91 HIV-1-exposed, persistently seronegative (HEPS) and 87 HIV-1-infected female Nairobi sex workers.
- Responses in HEPS women tended to be lower, and focused on different epitopes with HLA presenting molecules that have previously been associated with reduced risk of infection, and there was a shift in the response in the HEPS women upon late seroconversion to epitopes recognized by the HIV-1 infected women.
- 43/91 HEPS women had CD8+ responses and detection of HIV-1-specific CTL in HEPS women increased with the duration of viral exposure.
- Among HLA-B14 women, 0/4 HEPS and 6/7 HIV-1 infected women recognized this epitope, likelihood ratio 14.4, p value 0.004 and HEPS women tended to respond to DLNMMML-NIV/DLNTMLNVV, while infected women tended to respond to DRF(F/W)KTLRA.
- The dominant response to this HLA allele was to this epitope for all of the 6/7 HIV-1 infected women.
- Differences in epitope specificity were only seen for responses restricted by class I HLA alleles A2, A24, A*6802, B14, and B18, previously shown to be associated with resistance to HIV-1 in this cohort.

Epitope DRFYKTLRA

Subtype B, D

Immunogen HIV-1 infection, vaccine

Vector/Type: DNA prime with modified vaccinia Ankara (MVA) boost *Strain:* A clade
HIV component: p17 Gag, p24 Gag

Species (MHC) human (B14)

Keywords subtype comparisons, epitope processing, vaccine-specific epitope characteristics, immunodominance

References Hanke & McMichael 2000; Wee *et al.* 2002

- The HIV-1 subtype A focused vaccine HIVA contains p24 and p17, in a reversed order relative to the Gag polyprotein to prevent myristylation of p17, which could direct the protein to the cell membrane and inhibit efficient peptide processing and class I presentation, as well as a polyepitope string of conserved, often immunodominant epitopes that were selected to have particularly good cross-reactive potential for the A-clade epidemic in Nairobi, Kenya. A DNA and MVA prime-boost vaccination protocol using the HIVA antigen will be used

in a phase III clinical trial in Kenya. This epitope is included in the polyepitope string Hanke & McMichael [2000].

- Multiple CD4+ or CD8+ T-cell vaccine-induced responses to peptide pools were detected using intracellular cytokine staining and IFN γ Elispot assays after vaccination of 5 macaques. The response to the Mamu A*01 SIV p27 epitope p11C (CTPYDINQM), included in the polyepitope region, was not immunodominant in the Mamu A*01 vaccinated macaques, possibly because of processing limitations in context of the artificial polyepitope string Wee *et al.* [2002].

Assay type CD8 T-cell Elispot - IFN γ

Keywords acute/early infection, early-expressed proteins

References Cao *et al.* 2003

- All proteins were scanned and optimal epitopes were mapped in a study of CD8+ gamma IFN T-cell responses in 21 men within 15-92 days post-HIV-1 infection. Subjects initially showed narrow immune responses with a mean of 2.3 epitopes recognized per patient. The immune response broadened later in infection. No correlation between the plasma viral load and the number of recognized epitopes or the frequency of IFN-gamma secreting cells was observed, and there was no correlation between the functional avidity of a responses and the abundance of IFN-secreting cells that recognized the epitope. The first epitopes to be recognized did not tend to be the most avid, and earliest responses tended to be directed against Nef, Tat, Vpr, and Env.
- This epitope was recognized in two subjects early in infection, presented by B14 in each case.
- All HIV-1 proteins except Vpu were recognized, and a responses to a total of 41 optimal epitopes were characterized; 24 had been identified previously. 48% of the total T-cell responses were directed against Nef and 43% were directed against Gag.
- More common HLA alleles were less frequently used in primary infection than less common alleles, for example A3, B35, B57, and B62 were more frequently utilized than A1, A2, A30, and A44.

HXB2 Location p24 (166–174)

Epitope DRFYKTLRA

Epitope name Gag/p24-DA9

Subtype B

Immunogen HIV-1 infection

Species (MHC) human (B14)

Assay type Chromium-release assay

Keywords binding affinity, TCR usage, characterizing CD8+ T cells

References Yang *et al.* 2003b

- Killing efficiency of CTLs and their ability to suppress viral replication is shown to depend more on epitope specificity than to antigenic avidity. Different clones recognizing the same epitope had similar killing efficiency despite their variation in avidity. Nef specific CTL clones tended to be most inhibitory, followed by Gag, then by RT specific clones, regardless of avidity.

- 1/14 CTL T-cell clones tested were specific for Gag/p24-DA9. Under conditions of excess peptide (100ug/ml), there was no difference in their lytic potential; all possessed similar effector capacity. Avidity was measured as the sensitizing dose of peptide required for 50% of maximal killing (SD50), which varied from 20 pg/ml to 100 ng/ml, over four orders of magnitude for all 14 epitopes. The SD50 value for Gag/p24-DA9 was 100,000 pg/ml, it had the lowest avidity of the 14 tested.

Assay type CD8 T-cell Elispot - IFN γ , Chromium-release assay

Keywords dynamics, immunodominance, acute/early infection, characterizing CD8+ T cells, reversion, viral fitness

References Jones *et al.* 2004

- Primary CD8+ T-cell response to Env, Tat and Gag and the extent, kinetics and mechanisms of viral escape were examined in three patients. Rapid escape, within weeks from infection, from HIV specific CTL responses was observed in all three patients, but the kinetics and extent of the escape differed depending on the breadth and co-dominant distribution of CTL-mediated pressure. The two patients that rapidly declined had more focused immunodominant responses, while the single patient that had low viral load and stable CD4 counts for seven years had a broad co-dominant response and less escape.
- The patient BORI had high viral loads and rapid CD4 decline. BORI mounted 8 detected responses. BORI did not control viral replication well, and escape mutations occurred early and in most epitopes, 6/7 that were precisely identified.
- DRFYKTLRAEQ didn't vary. There was no response in acute infection to this epitope, but the response was detectable by early infection.

References Masemola *et al.* 2004b

- Highly targeted regions in Gag for CD8+ T-cells were defined for individuals with C clade infections in South Africa. 9 specific epitopes within the most reactive regions were characterized. This is 1 of 5 novel epitopes that were found among subtype C HIV-1 from African patients who hadn't previously been identified in B clade infections. Some epitopes were shown to be promiscuous, presented by multiple class I restricting alleles.
- TLRAEQATQD was presented by Cw*03 and newly identified in this study; Cw*03 is more common in Zulus than Caucasians (0.157 versus 0.101).

Assay type CD8 T-cell Elispot - IFN γ , Chromium-release assay

Keywords dynamics, acute/early infection, characterizing CD8+ T cells

References Jones *et al.* 2004

- Primary CD8+ T-cell response to Env, Tat and Gag and the extent, kinetics and mechanisms of viral escape were examined in three patients. Rapid escape, within weeks from infection, from HIV specific CTL responses was observed in all three patients, but the kinetics and extent of the escape differed depending on the breadth and co-dominant distribution of CTL-mediated pressure. The two patients that rapidly declined had more focused immunodominant responses, while the single patient that had low viral load and stable CD4 counts for seven years had a broad co-dominant response and less escape.
- The patient SUMA maintained low viral loads and stable CD4 T cell counts through seven years of follow up. In contrast to more rapid progressors, WEAU and BORI, SUMA a broad response to 24 epitopes, with little immunodominance. Two peptides were somewhat more intensely recognized in acute infection, but this response leveled out early on.
- Only four epitopes were found to acquire escape mutations in SUMA over time, and this was one of the 20 that remained invariant. A low level response was detected at acute infection that persisted through early infection.

Keywords escape, optimal epitope
References Koibuchi *et al.* 2005
- HIV-1-specific CD8 T-cell responses were shown to be persistent in the chronic phase of HIV-1 infection, although the responses to some of the epitopes were declining despite the persistence of the targeted sequences *in vivo*. Only 4/14 epitopes were potential CTL escape variants, although strong responses to these epitopes persisted for 6 years. This indicates limited viral evolution within targeted CD8 T-cell epitopes during the chronic phase of infection.
 - Elispot responses to the consensus form of this epitope, RAEQASQEV, were much more intense than to the most common variants of the epitope found over time in this individual, RAEQASStEV and RAEQASQdV. There was a diminished response to RAEQASStEV and no response to RAEQASQdV, so these appear to be escape variants. The strong response to the consensus form persisted, despite the fact it was not observed among the autologous sequences until it surfaced as a minor variant (5/13 sequences) after 6 years of chronic infection.

Keywords HAART, ART
References Mollet *et al.* 2000
- A panel of 16 epitopes covering 15 class I alleles was tested in 14 HIV+ patients from an unselected Caucasian population treated with HAART, using CD8+ cell IFN γ production to measure responses.

- In general, during the first month of treatment viral load decreased and frequencies of HIV-specific CTL tripled and broadened – eight new HIV specificities that were not previously detectable were newly detected, as were CMV specific CD8+ PBL – but with continued viral suppression, HIV-specific responses diminished.
- Viral rebounds gave different patterns of response: increases or decreases in pre-existing response, new specificities, or no change.

Keywords HAART, ART, supervised treatment interruptions (STI)

References Altfeld *et al.* 2002b

- Peripheral blood (PB) and lymph node (LN) CD8+ T-cell responses were compared in 15 asymptomatic HIV-1 infected patients using all known optimal CTL epitopes (<http://hiv-web.lanl.gov/content/hiv-db/REVIEWS/brander2001.html>) for each person's class I HLA alleles.
- 60 epitope responses were detected in both PB and LN samples of the 15 patients, and an additional 8 responses were detected only in LN. The total magnitude of the response was similar in LN and PB, but the percentage of CD8+ T cells in the LN is lower so the number of HIV-specific cells per million CD8+ T-cells is higher in the LN.
- 1 year post-HAART treatment in five patients studied, the magnitude of the CD8 T-cell response was decreased in both LN and PB, but more dramatically in PB, and 13/25 epitope responses in the PB became undetectable, in contrast to 5/26 in the LN.
- Treatment interruption following HAART induced resulted in increased viremia accompanied by the restoration of the detection of 13 epitopes that had become undetectable in the PB, and the addition of 9 novel epitope responses.
- Breakdowns of epitope responses were shown for 4 individuals. Patient B displayed the greatest response to epitope B44-AW11(p24) and also responded to A32-PW10(RT) in both PB and LN samples, while a third response against epitope A32-RW10(gp120) was only detected in the LN sample.

References Draenert *et al.* 2004c

- CD8+ T-cell responses that persisted in individuals with advanced disease were studied; most of the optimal epitopes defined were recognized with intermediate to high avidity. On average 13 (range, 2-39) epitopic regions were targeted in an average of 6 proteins (range, 1-8). HAART resulted in decrease in antigen and reduction in gamma IFN EliSpot responses, suggesting active responses to autologous virus. The lack of mutations within most viral epitopes suggest that persistent CTL through late disease do not exert strong immune selection pressure, yet the Elispot assays show robust responses, suggesting to the authors that gamma IFN-based screening methods may not reveal functional CD8+ T-cell impairment in patients with AIDS.
- 1 subject recognized this epitope with low functional avidity. The autologous sequence matched the B consensus.

Keywords subtype comparisons, variant cross-recognition or cross-neutralization

References Geels *et al.* 2005

- Cross-clade CTL responses in 10 non-B HIV-1 infected individuals were evaluated. T-cell reactivity was tested against peptide pools of clade B Gag, Pol, Nef, Rev and Tat. Nine individuals demonstrated cross-reactive T-cell responses to clade A, B, and C Gag pools; 6/7 patients that responded to Nef-B also reacted to clade A and C Nef pools. An inverse correlation was observed between the sequence divergence of the HLA class I restricted epitopes and the height of the T-cell responses, which in Gag could be explained through variations in the HLA-anchor residues. 42% of the responses were directed to regions containing new epitopes.
- This previously described epitope was embedded in a B clade peptide that was recognized by T-cells from an infected person carrying subtype D Gag. The autologous epitope sequence had an D7E change, AEQASQeVKNW.

Assay type Intracellular cytokine staining, Flow cytometric T-cell cytokine assay

Keywords rate of progression, escape

References Migueles *et al.* 2003

- cDNA Gag sequences from a set of 17 HLA-B*5701+ progressors and 10 LTNPs were obtained, and the variation in four p24 B*5701 epitopes examined. Sequence variants were more common ($p < 0.01$) in the epitopes in the progressors (median 3, range 1-7) than LTNPs (median 2, range 0-4).
- In general use of the autologous protein in a target cell did not diminish the overall CD8+ T-cell responses.
- The substitution E312D (qasqDvknw) was common in progressors (8/17) and rare in LTNP (1/8) ($p = 0.06$). qasqDvknw and qasqEvknw peptides were made; this mutation does not affect binding to B*57. 2/4 progressors that carried only the D variant could not recognize the D variant peptide, but could recognize the E variant peptide, demonstrating immune escape.

HXB2 Location p24 (176–184)**Author Location** (C consensus)**Epitope** QATQDVKNW**Subtype** C**Immunogen** HIV-1 infection**Species (MHC)** human (B*5801)**Country** South Africa.**Assay type** CD8 T-cell Elispot - IFN γ **Keywords** characterizing CD8+ T cells**References** Kiepiela *et al.* 2004

- HLA class I restricted CD8+ T-cell responses against HIV-1 were analyzed in African patients. Significantly more responses were shown to be HLA-B restricted. Viral load, CD4 count, and thus rate of disease progression were also associated with HLA-B alleles. In addition, the selection pressure imposed on HIV-1 by HLA-B alleles was shown to be substantially greater than by other alleles.
- This epitope was suggested to be the epitope within a longer reactive peptide based on correspondence with a known epitope in the HIV database. Also, a significantly higher frequency of people in the Durban cohort who reacted with the peptide had this HLA type.

HXB2 Location p24 (176–184)**Author Location** Gag (308–316)**Epitope** QASQEVKNW**Epitope name** QAS**Immunogen** HIV-1 infection, HIV-2 infection**Species (MHC)** human (B*5801, B53)**Country** Gambia.**Assay type** CD8 T-cell Elispot - IFN γ , Flow cytometric T-cell cytokine assay**Keywords** cross-presentation by different HLA, characterizing CD8+ T cells**References** Gillespie *et al.* 2005

- CD8 T-cell responses were evaluated and compared in HIV-1 and HIV-2 infected individuals. A significantly greater magnitude and breadth of Gag-specific responses were found in HIV-1 infected individuals, possibly because undetectable viral load in HIV-2 infected individuals. This study suggests that responses in HIV-2 infection reflect antigen load in plasma, as is the case in HIV-1 infection. No correlation was found between immune control of HIV-2 and the frequency of perforin-expressing virus-specific CD8 T-cells.
- QASQEVKNW is cross-presented by B53 and B*5801. It was recognized in 4/4 B*5801+ HIV-1 infected individuals, and 7/7 B53+ HIV-1 infected individuals. HIV-2 infected individuals preferentially recognized the B58 HIV-2 epitope TSTVEE-QIQW, and B53 epitope TPYDINQML.

- Exogenous presentation or cross-presentation of epitopes by antigen presenting cells (APC) without protein synthesis is an alternative pathway for CTL epitope processing that may be important in the initial generation of viral specific CTL.
- Dendritic cells treated with AZT to inhibit protein synthesis were able to elicit a strong specific CTL response in QASQEVKNW specific CTL clone 141 without protein synthesis, while macrophages demonstrated a decreased presentation efficiency.
- Exogenous Gag epitope presentation was Env-dependent and required receptor-dependent fusion.

HXB2 Location p24 (176–184)**Author Location** p24 (308–316)**Epitope** QATQEVKNW**Immunogen** HIV-1 infection, HIV-1 exposed seronegative**Species (MHC)** human (B53)**Keywords** HIV exposed persistently seronegative (HEPS)**References** Kaul *et al.* 2001a

- ELISPOT was used to study CTL responses to a panel of 54 predefined HIV-1 epitopes in 91 HIV-1-exposed, persistently seronegative (HEPS) and 87 HIV-1-infected female Nairobi sex workers.
- Responses in HEPS women tended to be lower, and focused on different epitopes with HLA presenting molecules that have previously been associated with reduced risk of infection, and there was a shift in the response in the HEPS women upon late seroconversion to epitopes recognized by the HIV-1 infected women.
- 43/91 HEPS women had CD8+ responses and detection of HIV-1-specific CTL in HEPS women increased with the duration of viral exposure.
- Among HLA-B53 women, 1/2 HEPS and 7/9 HIV-1 infected women recognized this epitope.

HXB2 Location p24 (176–184)**Author Location** p24 (308–316 subtype A consensus)**Epitope** QATQEVKNM**Subtype** A**Immunogen** HIV-1 infection**Species (MHC)** human (B53)

Keywords binding affinity, subtype comparisons

References Dorrell *et al.* 2001

- In clade A infected Gambians, three HLA-B53 epitopes were defined in Gag p24 using ELISPOT, tetramer, and cytotoxicity assays.
- Two of the new epitopes lacked the predicted P2 anchors, DTI-NEEAAEW and QATQEVKNNM, and bound to B53 with high affinity, thus extending the anchor residue motif for B53 and the related B35.
- While S, T, and P could all fit into the HLA-B35 or HLA-B53 B pocket and form a hydrogen bond, A would not form a bond, so the authors propose compensatory interactions account for the high affinity of QATQEVKNNM for B53.
- QATQEVKNNM was recognized in 6/7 HLA-B53 subjects.
- Cross-recognition of QATQEVKNNM was not studied here, but it was noted that both the A, QATQEVKNNM, and B, QASQDVKNW, subtype version of this epitope, are also presented by HLA-B57 and B58, common HLA alleles in Africans.

Country United States.

Assay type CD8 T-cell Elispot - IFN γ

Keywords variant cross-recognition or cross-neutralization

References Draenert *et al.* 2004c

- CD8+ T-cell responses that persisted in individuals with advanced disease were studied; most of the optimal epitopes defined were recognized with intermediate to high avidity. On average 13 (range, 2–39) epitopic regions were targeted in an average of 6 proteins (range, 1–8). HAART resulted in decrease in antigen and reduction in gamma IFN Elispot responses, suggesting active responses to autologous virus. The lack of mutations within most viral epitopes suggest that persistent CTL through late disease do not exert strong immune selection pressure, yet the Elispot assays show robust responses, suggesting to the authors that gamma IFN-based screening methods may not reveal functional CD8+ T-cell impairment in patients with AIDS.
- 2 subjects recognized this epitope with high functional avidity. Autologous sequence revealed no substitutions in this epitope compared to the B consensus.

Country Spain.

Assay type proliferation, CD8 T-cell Elispot - IFN γ , Flow cytometric T-cell cytokine assay

Keywords HAART, ART, supervised treatment interruptions (STI), immune dysfunction

References Plana *et al.* 2004

- Structured treatment interruption (STI) alone is not able to control viral replication in chronically infected patients, probably due to lack of strong, maintained T-helper cell responses. HIV-1 specific CD8+ T-cell responses were shown to increase significantly until the end of the follow up, but were not correlated with viral load.
- 6/7 patients recognized this epitope.

HXB2 Location p24 (176–184)

Author Location Gag

Epitope QASQEVKNNW

Epitope name QW9

Subtype B

Immunogen HIV-1 infection

Species (MHC) human (B57)

Assay type CD8 T-cell Elispot - IFN γ

Keywords subtype comparisons, escape, characterizing CD8+ T cells, reversion, viral fitness

References Allen *et al.* 2005a

- Two-thirds of all mutations arising in nonenvelope proteins during the transition from acute to chronic infection were found to be due to either CD8 T-cell-associated selective pressures or reversion of HLA-I-associated mutations selected in a previous host. The predominance of escape mutations at highly polymorphic sites was observed across different HIV-1 clades.
- One escape mutation, at position 5, qasqDvknw, was found in the most polymorphic residue in the epitope. This was shared between clades B and C. The most common substitution in people carrying B57 was in position 3, qaTqevknw.

Species (MHC) human (B57, B*5801)

Assay type CD8 T-cell Elispot - IFN γ , Chromium-release assay

Keywords responses in children, mother-to-infant transmission

References Feeney *et al.* 2005

- Escape mutations in TW10 and other B57-restricted epitopes were shown to arise early in infants following perinatal infection. Some escape variants were likely to have been transmitted vertically, from HLA-B57/5801 positive HIV-1 infected mothers, while others arose during infancy in cases where the children inherited the B57/5801 allele paternally. In contrast to adults, the majority of children showed a robust response to the escape variants, suggesting that infants are able to mount functional immune responses and drive immune escape and that a developing immune system may exhibit greater plasticity in recognizing viral variants.

Assay type CD8 T-cell Elispot - IFN γ

Keywords subtype comparisons, variant cross-recognition or cross-neutralization

References Geels *et al.* 2005

- Cross-clade CTL responses in 10 non-B HIV-1 infected individuals were evaluated. T-cell reactivity was tested against peptide pools of clade B Gag, Pol, Nef, Rev and Tat. Nine individuals demonstrated cross-reactive T-cell responses to clade A, B, and C Gag pools; 6/7 patients that responded to Nef-B also reacted to clade A and C Nef pools. An inverse correlation was observed between the sequence divergence of the HLA class I restricted epitopes and the height of the T-cell responses, which in Gag could be explained through variations in the HLA-anchor residues. 42% of the responses were directed to regions containing new epitopes.
- This previously described epitope was embedded in a B clade peptide that was recognized by T-cells from two infected people carrying subtype D Gag. The epitope sequence in one person matched the peptide, in the other had an E5D change, QASQdVKNW.

Assay type CD8 T-cell Elispot - IFN γ

Keywords assay standardization/improvement, epitope processing, characterizing CD8+ T cells

References Beattie *et al.* 2004

- This study compared CD8+ T cell EliSpot responses to 58 Gag peptides that were optimal epitopes, with responses to overlapping 15 mers that spanned Gag. When screening for HIV-1-specific CD8 T-cell responses from 49 HIV+ people, overlapping 15-mer peptide pools revealed several novel responses that would have been missed using predefined CD8 epitopes. However, the 15-mer pools often missed low-level responses to predefined epitopes, especially when the epitope was located centrally in the 15-mer peptide, and the overall level of response to the 15 mers was generally lower (mean 1.4 five fold dilutions lower, range 0-3).
- In one individual, a response to QASQEVKNW could be detected at a concentration of 0.2 ug/ml, while a response to RAEQASQEVKNWMTE required 25 ug/ml for detection.

References Arnedo-Valero *et al.* 2004
- T cell immune responses following STI were monitored in two chronically HIV-1 infected partners (A and B) who had contracted HIV-1 during 1992. STI induced strong transitory CD4+ and CD8+ T cell responses in both patients. The viruses remained very closely related over 10 years, despite the two individuals having different HLA types; the authors suggest the maintained similarity does not support a strong role for

HLA driven HIV diversity as has been claimed in Moore *et al.* (Science 2002).

- During the second treatment stop, patient A developed a strong proliferative response to p24, and multiple strong CD8+ T cell responses to Env, Pol, Gag and Nef. This patient was able to control viral load for two years follow up without therapy. Patient B developed a very weak CD4+ T cell response against p24 during breaks in therapy, and had CD8+ responses to two epitopes. Patient A: A01, A32, B*1410, B15; Patient B: A*3101, A68, B*4403, B51.

Keywords rate of progression, escape
References Oxenius *et al.* 2004b

- The increase in plasma viral load in a patient that progressed rapidly was preceded by positive selection of viral escape mutations in epitopes targeted by dominant HIV-1-specific CD8+ T-cell responses, and a decrease in HIV-1-specific CD4+ and CD8+ T-cell frequencies. Overall, escape variant epitopes were recognized 0-80% as efficiently as the index peptide, and the relatively efficiency of the variant epitopes increased using PBLs collected after their appearance. No changes were found in viral tropism, replication kinetics and neutralizing antibody titers, so the rapid decline of the patient was attributed to loss of HIV containment due to CTL escape.
- This was one of 8 reactive epitopes found not to vary over time.

Epitope NPDCCKTILRAL

Subtype C

Immunogen HIV-1 infection

Species (MHC) human (B*3910)

Country South Africa.

Assay type CD8 T-cell Elispot - IFN γ

Keywords rate of progression, optimal epitope

References Kiepiela *et al.* 2007

- A comprehensive analysis of 160 class I T cell responses in 578 individuals from KwaZulu-Natal, South Africa was performed. Gag-specific responses were associated with lowering viremia, while Env, accessory and regulatory protein-specific responses were associated with higher viremia.
- NPDCCKTILRAL is an optimal epitope.

HXB2 Location p24 (197–205)

Author Location p24 (329–337 LAI)

Epitope DCKTILKAL

Subtype B

Immunogen

Species (MHC) human (B*0801)

Keywords optimal epitope

References Frahm *et al.* 2007

- C. Brander notes this is a B*0801 epitope.

HXB2 Location p24 (197–205)

Author Location p24 (329–337 LAI)

Epitope DCKTILKAL

Subtype B

Immunogen

Species (MHC) human (B8)

References Sutton *et al.* 1993

- Predicted epitope based on B8-binding motifs, from larger peptide VQNANPDCKTILKAL.

HXB2 Location p24 (197–205)

Author Location p24 (329–337)

Epitope DCKTILKAL

Immunogen HIV-1 infection

Species (MHC) human (B8)

Keywords escape

References Nowak *et al.* 1995

- In a longitudinal study of CTL response and immune escape – the variant DCRTILKAL was also found, binds to B8, but is not recognized.

HXB2 Location p24 (197–205)

Author Location p24 (329–337)

Epitope DCKTILKAL

Immunogen

Species (MHC) human (B8)

References McAdam *et al.* 1995

- Defined as minimal epitope by titration and binding studies.

HXB2 Location p24 (197–205)

Author Location p24 (197–205)

Epitope DCKTILKAL

Immunogen

Species (MHC) human (B8)

References Goulder *et al.* 1997g

- Included in a study of the B8 binding motif.

HXB2 Location p24 (197–205)

Author Location p24 (329–337)

Epitope DCKTILKAL

Epitope name DCK

Immunogen HIV-1 infection

Species (MHC) human (B8)

Keywords HAART, ART, supervised treatment interruptions (STI), immunodominance, acute/early infection

References Oxenius *et al.* 2000

- Patients who started therapy at acute HIV-1 infection (three with sustained therapy, two with limited therapy upon early infection) had strong HIV specific CD4 proliferative responses and were able to maintain a CTL response even with undetectable viral load – three patients that had delayed initiation of HAART had no HIV specific CD4 proliferative responses and lost their CTL responses when HAART was eventually given and their viral loads became undetectable.

- This epitope was recognized at a low level by only 1 of the 7/8 study subjects that were HLA B8.
- Patient SC12(HLA A1, B8/39, Cw0701/0702, DR2/3, DR51/52, DQ2/6) had sustained therapy started during acute infection and maintained an immunodominant response to FLKEKGGGL throughout and minor responses to GEIYKRWII, DCKTILKAL, GGKKKYKLLK – GEIYKRWII and GGKKKYKLLK responses were stimulated by a brief period off therapy.

HXB2 Location p24 (197–205)

Author Location p24 (197–205)

Epitope DCKTILKAL

Immunogen HIV-1 infection

Species (MHC) human (B8)

References Ferrari *et al.* 2000

- One of the 51 HIV-1 epitopes selected by Ferrari *et al.* as good candidate CTL epitopes for vaccines by virtue of being conserved and presented by common HLA alleles.

HXB2 Location p24 (197–205)

Author Location p24 (197–205)

Epitope DCKTILKAL

Immunogen HIV-1 infection

Species (MHC) human (B8)

References Day *et al.* 2001

- B8-restricted CTL accounted for about 1/3 of the total CTL response in one individual.

HXB2 Location p24 (197–205)

Author Location p24

Epitope DCKTILKAL

Epitope name DCK

Immunogen HIV-1 infection

Species (MHC) human (B8)

Keywords HAART, ART, supervised treatment interruptions (STI)

References Oxenius *et al.* 2002b

- Using previously defined epitopes Oxenius *et al.* [2000, 2001a] in an IFN γ Elispot assay, 13 chronically HIV-1 infected patients were studied over a period including therapy with standard treatment interruptions (STI).
- STIs induced increased recognition of CTL epitopes, but there was no correlation between CTL responses with viral rebound rates, plateau viral loads, or clearance rates.

HXB2 Location p24 (197–205)

Author Location Gag (329–337)

Epitope DCKTILKAL

Immunogen HIV-1 infection

Species (MHC) humanized rabbit (B8)

Donor MHC A03, A28, B07, B08

Country Canada.

Assay type proliferation, Chromium-release assay, Flow cytometric T-cell cytokine assay

Keywords HAART, ART, memory cells, immune dysfunction

References Gamberg *et al.* 2004a

- HAART restores HIV specific immunity after advanced infection by increase of CD4+ and CD8+ T cell numbers after suppression of viral replication. However, HIV specific CTLs emerged only with detectable viral replication breakthroughs and were short-lived while CD4+ T-cell responses remained compromised, suggesting failure of generating stable CD8+ memory T-cells in the absence of HIV-specific T-helper responses.

HXB2 Location p24 (197–205)

Author Location (B consensus)

Epitope DCKTILKAL

Epitope name DL9

Subtype B

Immunogen HIV-1 infection

Species (MHC) human (B8)

Donor MHC A01, A03, B08, B14, Cw7, Cw8

Country United States.

Assay type Cytokine production, Intracellular cytokine staining, Chromium-release assay, Flow cytometric T-cell cytokine assay

Keywords assay standardization/improvement, memory cells, characterizing CD8+ T cells

References Lichterfeld *et al.* 2004c

- Using a flow-cytometric cytotoxicity assay based on caspase-3 activation in dying target cells, it was shown that the subset of HIV-1-specific CD8+ T cells secreting both IFN- γ and TNF- α exhibit stronger cytotoxic activity than those secreting only IFN- γ . These cells also exhibited stronger intracellular perforin expression. No association between HIV-1-specific CD8+ T-cell maturation phenotypes and intracellular perforin expression was found.
- 1/9 individuals recognized this epitope.

HXB2 Location p24 (199–218)

Author Location Gag (331–350)

Epitope KTIILRALGPGATLEEMMTAC

Subtype C

Immunogen HIV-1 infection

Species (MHC) human

Keywords subtype comparisons

References Novitsky *et al.* 2002

- HLA, viral sequence, and Elispot data was obtained from 105 HIV-1 positive Botswanans; Elispot data was obtained from between 55 and 64 subjects for each HIV protein.
- Nef and p24 had the highest percentage of reactive peptides, and p24 had the highest magnitude of HIV-1 responses.
- This peptide was among the 28 most reactive C clade peptides from among over 350 tested spanning all HIV proteins.

HXB2 Location p24 (203–211)

Author Location Gag (335–343 SUMA)

Epitope KALGPAATL

Epitope name Gag KL9

Subtype B

Immunogen HIV-1 infection

Species (MHC) human

Donor MHC A*1103, A*2402, B*1402, B*1501, Cw*0802

Country United States.

Assay type CD8 T-cell Elispot - IFN γ , Chromium-release assay

Keywords dynamics, acute/early infection, characterizing CD8+ T cells

References Jones *et al.* 2004

- Primary CD8+ T-cell response to Env, Tat and Gag and the extent, kinetics and mechanisms of viral escape were examined in three patients. Rapid escape, within weeks from infection, from HIV specific CTL responses was observed in all three patients, but the kinetics and extent of the escape differed depending on the breadth and co-dominant distribution of CTL-mediated pressure. The two patients that rapidly declined had more focused immunodominant responses, while the single patient that had low viral load and stable CD4 counts for seven years had a broad co-dominant response and less escape.
- The patient SUMA maintained low viral loads and stable CD4 T cell counts through seven years of follow up. In contrast to more rapid progressors, WEAU and BORI, SUMA a broad response to 24 epitopes, with little immunodominance. Two peptides were somewhat more intensely recognized in acute infection, but this response leveled out early on.
- Only four epitopes were found to acquire escape mutations in SUMA over time, and this was one of the 20 that remained invariant. A low level response was detected at acute infection that persisted through early infection.

HXB2 Location p24 (209–217)

Author Location Gag (341–)

Epitope ATLEEMMTA

Epitope name Gag341

Immunogen HIV-1 infection, vaccine

Vector/Type: peptide *HIV component:* p24 Gag *Adjuvant:* Incomplete Freund's Adjuvant (IFA)

Species (MHC) human, transgenic mouse (A2)

Assay type CD8 T-cell Elispot - IFN γ , Chromium-release assay, Flow cytometric T-cell cytokine assay

Keywords binding affinity, subtype comparisons, computational epitope prediction

References Corbet *et al.* 2003

- HLA-A2-restricted HIV-1 CTL epitopes were computationally predicted. Binding affinities for HLA-A*0204, immunogenicity in HLA-A*0201 transgenic mice, and responses to the peptides in 17 HIV-1 infected patients were tested. 31 novel conserved A2 epitopes were detected. An average of 4 epitopes were recognized per patient.
- This peptide was a good A2 binder that did not induce CTL and CD8+ T-cell IFN gamma responses in mice, although responses were detected in 2/17 HIV+ HLA-A2 subjects.

Epitope ACQGVGGPGHK

Subtype B, CRF01_AE

Immunogen HIV-1 infection

Species (MHC) human (A*1101)

Keywords subtype comparisons, TCR usage

References Fukada *et al.* 2002

- Counterparts for eight known clade B HLA A*1101 epitopes were generated for clade E (CRF01). Three epitopes, identical among clade A-E, were cross-reactive and recognized by clade E infected individuals. The clade E and B analogs to three more HLA A*1101 epitopes was recognized in a clade specific manner. Two other HLA A*1101 clade B defined epitopes were found not to have stimulated a response in clade E infected individuals.
- ACQGVGGPGHK was found to elicit clade-specific responses in clade B (ACQGVGGPGHK is most common in clades A and B) and clade E (acqvggpShk is most common and is also common in clades C and D). ACQGVGGPGHK was recognized by CTL from 4/5 B clade infected Japanese subjects, and acqvggpShk from 3/7 E clade infected Thai subjects.
- The binding of the two variants to HLA A*1101 was almost identical, but bulk CTL generated from individuals did not cross-react with the cross-clade peptides, indicating the lack of cross-reactivity was due to TCR specificity.

Epitope GPSHKARVL

Subtype C

Immunogen HIV-1 infection

Species (MHC) human (B*0702)

Country South Africa.

Assay type CD8 T-cell Elispot - IFN γ

Keywords characterizing CD8+ T cells

References Kiepiela *et al.* 2004

- HLA class I restricted CD8+ T-cell responses against HIV-1 were analyzed in African patients. Significantly more responses were shown to be HLA-B restricted. Viral load, CD4 count, and thus rate of disease progression were also associated with HLA-B alleles. In addition, the selection pressure imposed on HIV-1 by HLA-B alleles was shown to be substantially greater than by other alleles.
- This epitope was suggested to be the epitope within a longer reactive peptide based on correspondence with a known epitope in the HIV database. Also, a significantly higher frequency of people in the Durban cohort who reacted with the peptide had this HLA type.

HXB2 Location p24 (223–231)

- A comprehensive analysis of 160 class I T cell responses in 578 individuals from KwaZulu-Natal, South Africa was performed. Gag-specific responses were associated with lowering viremia, while Env, accessory and regulatory protein-specific responses were associated with higher viremia.
- GPSHKARVL is an optimal epitope.

HXB2 Location p24 (223–231)

Author Location (224–232)

Epitope GPSHKARVL

Subtype C

Immunogen HIV-1 infection

Species (MHC) human (B*0702)

Assay type Other

Keywords HLA associated polymorphism

References Boutwell & Essex 2007

- All HIV-1 subtype C protein sequences were analysed, and 94 HLA-associated amino acid polymorphisms were found that were well distributed throughout the proteome. These sequences were compiled from publicly available databases and originated in South Africa and Botswana. Many polymorphisms were associated with multiple HLA allele classes. 12% of negative associations were found as well, where there was an association of virus expression of the consensus amino acid with a specific HLA allele. HLA-B alleles were involved in most of the associations. 19 HLA-associated polymorphisms were embedded in previously defined epitopes presented by an appropriate HLA restricting molecule.
- GPSHKARVL was a previously defined B*0702 presented epitope that encompassed a B*07- associated polymorphism, GPshKARVL, in the third position.

Epitope GPGHKARVL

Subtype D

Immunogen HIV-1 infection

Species (MHC) human (B35)

Donor MHC A23, A24, B35, B58, Cw4, Cw7

Country Democratic Republic of the Congo.

Assay type CD8 T-cell Elispot - IFN γ

Keywords subtype comparisons, computational epitope prediction

References Geels *et al.* 2005

- Cross-clade CTL responses in 10 non-B HIV-1 infected individuals were evaluated. T-cell reactivity was tested against peptide pools of clade B Gag, Pol, Nef, Rev and Tat. Nine individuals demonstrated cross-reactive T-cell responses to clade A, B, and C Gag pools; 6/7 patients that responded to Nef-B also reacted to clade A and C Nef pools. An inverse correlation was observed between the sequence divergence of the HLA class I restricted epitopes and the height of the T-cell responses, which in Gag could be explained through variations in the HLA-anchor residues. 42% of the responses were directed to regions containing new epitopes.
- Predicted epitope based on an HLA motif embedded in a reactive peptide from a person carrying a D clade Gag.

HXB2 Location p24 (223–231)**Author Location** p24 (223–231 SF2)**Epitope** GPGHKARVL**Immunogen** HIV-1 infection**Species (MHC)** human (B7)**Keywords** HAART, ART, acute/early infection**References** Altfield *et al.* 2001b

- Therapy provided during acute infection resulted in a narrower CTL response, stronger T help response, and a less diverse viral population than was seen in individuals treated during chronic infection.
- The breadth and specificity of the response was determined using ELISPOT by studying 19 individuals with pre-seroconversion therapy (Group 1), 11 individuals with primary infection but post-seroconversion therapy (Group 2), and 10 individuals who responded to HAART given during chronic infection (Group 3), using 259 overlapping peptides spanning p17, p24, RT, gp41, gp120 and Nef.
- Previously described and newly defined optimal epitopes were tested for CTL response.
- Number of HLA-B7+ individuals that had a CTL response to this epitope broken down by group: 1/4 group 1, 2/3 group 2, and 0/1 group 3.

HXB2 Location p24 (223–231)**Author Location** p24 (223–231)**Epitope** GPGHKARVL**Immunogen** HIV-1 infection**Species (MHC)** human (B7)**Keywords** rate of progression, acute/early infection**References** Day *et al.* 2001

- The CTL response to optimally defined CTL epitopes restricted by HLA class I A and B alleles in individuals who coexpressed HLA A2, A3, and B7 was studied in eight HIV-1-infected subjects, two with acute infection, five with chronic, and one long-term non-progressor (LTNP)
- 2 to 17 epitopes were recognized in a given individual, A2-restricted CTL response tended to be narrow and never dominated the response, and 25/27 epitopes were targeted by at least one person.
- Subjects with chronic HIV-1 infection recognized between 2-8 out of 11 B7-restricted epitopes.
- An acute seroconverter homozygous for the B7 allele recognized five B7-restricted epitopes.

- The other acute seroconverter failed to recognize any of the 11 B7-restricted epitopes tested.
- The B7-restricted CTL response was highly variable and there was no clearly dominant epitope.

HXB2 Location p24 (223–231)**Author Location** p24 (223–231)**Epitope** GPGHKARVL**Epitope name** B7-GL9**Subtype** B**Immunogen** HIV-1 infection**Species (MHC)** human (B7)**Donor MHC** A3, B7, Cw7**Keywords** dynamics, supervised treatment interruptions (STI), immunodominance, acute/early infection**References** Yu *et al.* 2002a

- CTL responses in 18 acutely HIV-infected HLA-A3 (n=7) or -B7 (n=4) or both -A3 and B7 (n=7) positive individuals were studied.
- One individual, AC-06, was homozygous at all three class I alleles (A3, B7, Cw7), was treated during acute infection and had supervised treatment interruptions (STI). He had only two detectable CTL responses during acute infection, but after STI this broadened to 27 distinct epitopes including 15 restricted by HLA-A3, 11 by HLA-B7, and 1 by HLA-Cw7.
- Only two epitopes were detected during acute infection in patient AC-06, B7 restricted gp41 epitope IPRRIRQGL and Gag GPGHKARVL. GPGHKARVL was the first targeted peptide, and remained immunodominant through the 34 month study period.
- 3/11 HLA-B7 individuals had detectable B7-restricted responses to this epitope during acute infection – 10/15 of HLA-B7 epitopes tested were targeted by at least one person during acute infection. 1/4 individuals had detectable responses to this epitope after STI.

HXB2 Location p24 (223–231)**Author Location** p24 (223–231)**Epitope** GPGHKARVL**Epitope name** B7-GL9 Gag**Subtype** B**Immunogen** HIV-1 infection**Species (MHC)** human (B7)**Assay type** CD8 T-cell Elispot - IFN γ **Keywords** supervised treatment interruptions (STI), escape, early treatment, superinfection**References** Altfield *et al.* 2002a

- An HIV+ individual given acute ARV and undergoing STI developed a strong CTL immune response, but despite this was shown to be superinfected with second B clade virus. Some epitope variants of the second infecting virus were resistant to the initial CTL response.
- In the earliest sample at day18 the sequence for this epitope was gpShkarvl. gpgkharvl dominated at day 606; both were equally well recognized.
- This was an immunodominant epitope, and was present in both viruses, the original strain and the superinfecting strain.

HXB2 Location p24 (223–231)

Author Location p24 (223–231)**Epitope** GPGHKARVL**Immunogen** HIV-1 infection**Species (MHC)** human (B7)**Country** Spain.**Assay type** proliferation, CD8 T-cell Elispot - IFN γ , Flow cytometric T-cell cytokine assay**Keywords** HAART, ART, supervised treatment interruptions (STI), immune dysfunction**References** Plana *et al.* 2004

- Structured treatment interruption (STI) alone is not able to control viral replication in chronically infected patients, probably due to lack of strong, maintained T-helper cell responses. HIV-1 specific CD8+ T-cell responses were shown to increase significantly until the end of the follow up, but were not correlated with viral load.
- 4/7 patients recognized this epitope.

HXB2 Location p24 (223–231)**Author Location** (B consensus)**Epitope** GPGHKARVL**Epitope name** GL9**Subtype** B**Immunogen** HIV-1 infection**Species (MHC)** human (B7)**Donor MHC** A03, B07, Cw7**Country** United States.**Assay type** Cytokine production, Intracellular cytokine staining, Chromium-release assay, Flow cytometric T-cell cytokine assay**Keywords** assay standardization/improvement, memory cells, characterizing CD8+ T cells**References** Lichterfeld *et al.* 2004c

- Using a flow-cytometric cytotoxicity assay based on caspase-3 activation in dying target cells, it was shown that the subset of HIV-1-specific CD8+ T cells secreting both IFN-gamma and TNF-alpha exhibit stronger cytotoxic activity than those secreting only IFN-gamma. These cells also exhibited stronger intracellular perforin expression. No association between HIV-1-specific CD8+ T-cell maturation phenotypes and intracellular perforin expression was found.
- 1/9 individuals recognized this epitope.

HXB2 Location p24 (223–231)**Author Location** Gag (355–363)**Epitope** GPGHKARVL**Subtype** B**Immunogen** HIV-1 infection**Species (MHC)** human (B7)**Donor MHC** A1, A3, B7, B57, Cw6, Cw7**Country** United States.**Assay type** CD8 T-cell Elispot - IFN γ **References** Allen *et al.* 2005a

- Two-thirds of all mutations arising in nonenvelope proteins during the transition from acute to chronic infection were found to be due to either CD8 T-cell-associated selective pressures or reversion of HLA-I-associated mutations selected in a previous host. The predominance of escape mutations at highly polymorphic sites was observed across different HIV-1 clades.

- This epitope was reactive, but escape mutations did not accrue in it over time.

II-B-4 Gag p24-p2p7p1p6 CTL/CD8+ epitopes

HXB2 Location p24-p2p7p1p6 (223–1)**Author Location** Gag**Epitope** GPGHKARVLA**Immunogen****Species (MHC)** human (B7)**References** De Groot *et al.* 2001

- The program Epimatrix was used in conjunction with the program Conservatrix to identify conserved regions of HIV that might serve as epitopes.
- A subset of the potential epitopes was identified that could bind to the appropriate HLA-allele, and 15 predicted B7 superfamily (HLA B7, B8, and B58) epitopes were identified that could stimulate IFN γ production in an ELISPOT assay.
- GPGHKARVLA was confirmed as an HLA-B7 epitope in this study, and had been previously published.

HXB2 Location p24-p2p7p1p6 (223–1)**Author Location** Gag**Epitope** GPGHKARVLA**Epitope name** I291**Subtype** multiple**Immunogen** HIV-1 infection**Species (MHC)** human (B7)**Donor MHC** A03, A24, B07, B38, Cw07, Cw12/13; A01, A03, B07, B08, Cw03, Cw07**Country** United States.**Assay type** T-cell Elispot**Keywords** binding affinity, computational epitope prediction**References** De Groot *et al.* 2003

- Epitopes defined using sequence parsing and matching algorithm Conservatrix, and epitope prediction tool EpiMatrix, were shown to be conserved in a broad range of HIV-1 sequences derived from different parts of the world. 31 novel highly conserved HIV-1 epitopes were found, among which four were recognized as promiscuous epitopes and five as MHC supertypes.
- Estimated binding probability for GPGHKARVLA: 28%

HXB2 Location p24-p2p7p1p6 (225–8)**Author Location** Gag (357–372 LAI)**Epitope** GHKARVLAEATLSQVN**Subtype** B**Immunogen** HIV-1 infection**Species (MHC)** human**References** Buseyne *et al.* 1993a

- Vertical transmission of HIV ranges from 13% to 39%.
- Primary assays showed that cytotoxic activity against at least one HIV protein was detected in 70% of infected children.
- Epitopes recognized in five children were mapped using synthetic peptides and secondary cultures.

- Patient EM28 (CDC P2A) had a CTL response to four epitopes in Gag.

HXB2 Location p24-p2p7p1p6 (230–7)

Author Location Gag (386–)

Epitope VLAEAMSQV

Epitope name Gag-386

Immunogen

Species (MHC) human (A*0201)

Keywords binding affinity, subtype comparisons, super-type, computational epitope prediction, immunodominance

References Altfeld *et al.* 2001c

- HIV was scanned for all peptides which carried the A2-supermotif pattern conserved in more than 50% of B clade sequences – 233 peptides met this criteria, and 30 of these bound to HLA-A*0201 – 20/30 bound to at least 3/5 of HLA-A2 supertype alleles tested.
- Three additional previously described HLA-A2 epitopes were added to the set of 20, and 18/22 chronically infected HLA-A2 individuals had CTL that recognized at least one of the 23 peptides (median of 2 and maximum of 6), while 6/12 acute infected individuals recognized at least 1 (median of 1 and maximum of 2)
- VLAEAMSQV binds to all five HLA-A2 supertype alleles tested: A*0201, A*0202, A*0203, A*0206 and A*6802 (highest affinity)
- 4/22 individuals with chronic HIV-1 infection recognized this epitope, and it was immunodominant in 3/4 by ELISPOT.
- 0/12 acutely infected individuals recognized this epitope.

HXB2 Location p24-p2p7p1p6 (230–7)

Epitope VLAEAMSQV

Epitope name Gag 386

Subtype M

Immunogen vaccine, in vitro stimulation or selection, computer prediction

Vector/Type: DNA, peptide *Adjuvant:* Incomplete Freund's Adjuvant (IFA)

Species (MHC) human, mouse, humanized mouse (A*0201)

Assay type Cytokine production, T-cell Elispot

Keywords subtype comparisons, computational epitope prediction, escape, TCR usage, variant cross-recognition or cross-neutralization

References McKinney *et al.* 2004

- This study examined variant recognition of epitopes presented by A*0201 and A*1101. Numerous amino acid substitutions can be introduced into epitopes without disrupting their recognition by CTLs, although epitopes with multiple substitutions were less recognized. An algorithm was constructed for prediction of epitopes capable of inducing responses to a great number of variant epitopes.
- A total of 20 variant forms of Gag 386 were identified. More than 95% of the variant epitopes were recognized by CTLs from mice immunized with the parental form.
- Gag 386 epitope (parent or variant form) was present in 97% of HIV sequences of many M group subtypes.

Assay type CD8 T-cell Elispot - IFN γ

Keywords responses in children, mother-to-infant transmission, escape, acute/early infection, reversion, viral fitness

References Sanchez-Merino *et al.* 2005

- CD8 T-cell responses were examined in mother-infant pairs. Escape variants were commonly detected in maternal plasma. Early infant plasma viruses showed heterogeneity of gag and nef gene sequences as well as mother-to-child transmission of CD8 T-cell escape variants. The stability of escape mutants in the infant over time was determined by infant HLA haplotype and viral fitness. Sequential plasma specimens from infants showed changes in CD8 T-cell epitope sequences, suggesting that infants are capable of generating virus-specific CD8 T-cell responses.
- The mother was A02+ and carried a variant form of the epitope, VLAEAMShV, which she passed to her A02- child. This form persisted in her child for 15 months.

HXB2 Location p24-p2p7p1p6 (230–7)

Author Location Gag (397–405)

Epitope VLAEAMSQV

Immunogen HIV-1 infection

Species (MHC) human (A2 supertype)

Keywords supertype, rate of progression

References Propato *et al.* 2001

- Long-term nonprogressors (LTNPs) had strong memory resting CD8+ T-cell responses against the majority of epitopes tested, (18 for the A2 supertype, 16 for the A3 supertype) while the effector cells of long-term nonprogressors recognized far fewer epitopes.
- Progressors had memory resting CD8+ T-cells that recognized far fewer epitopes than LTNPs.
- A positive correlation between effector CD8+ T-cells and plasma viremia and a negative correlation between CD8+ effector T-cells and CD4+ T-cells was observed, which may contribute to the inability of LTNPs to clear virus.
- This epitope can bind all five HLA-A2 supertypes alleles (A*0201, A*0202, A*0203, A*0206 and A*6802)

Assay type CD8 T-cell Elispot - IFN γ

Keywords escape, immune evasion, optimal epitope, HIV-1

References Liu *et al.* 2006

- T-cell immunity and the impact of selection were longitudinally studied in a patient from the time of transmission. New epitopes were detected at sites that were shown to be under positive selection. Env was found to be the major target of CTLs and most of the new epitopes were found here. One third of the sites examined were associated with epitope escape mutations from CTL. Acquisition of mutations found at high frequency in the database was suggested to be a result of reversion of CTL epitopes in the absence of immune targeting.
- Position4 in the epitope had potentially experienced positive selection. NspTRREL and tSPTRREL escape variants were found.

Assay type CD8 T-cell Elispot - IFN γ
References Allen *et al.* 2005a

- Two-thirds of all mutations arising in nonenvelope proteins during the transition from acute to chronic infection were found to be due to either CD8 T-cell-associated selective pressures or reversion of HLA-I-associated mutations selected in a previous host. The predominance of escape mutations at highly polymorphic sites was observed across different HIV-1 clades.
- This epitope was reactive, but escape mutations did not accrue in it over time.

Donor MHC A2, A36, B45, B58, Cw3, Cw6

Country Nigeria.

Assay type CD8 T-cell Elispot - IFN γ

Keywords subtype comparisons, computational epitope prediction

References Geels *et al.* 2005

- Cross-clade CTL responses in 10 non-B HIV-1 infected individuals were evaluated. T-cell reactivity was tested against peptide pools of clade B Gag, Pol, Nef, Rev and Tat. Nine individuals demonstrated cross-reactive T-cell responses to clade A, B, and C Gag pools; 6/7 patients that responded to Nef-B also reacted to clade A and C Nef pools. An inverse correlation was observed between the sequence divergence of the HLA class I restricted epitopes and the height of the T-cell responses, which in Gag could be explained through variations in the HLA-anchor residues. 42% of the responses were directed to regions containing new epitopes.
- This previously described epitope was embedded in a B clade peptide that was recognized by T-cells from an infected person carrying subtype G Gag. The autologous epitope sequence had 2 changes, an E8T substitution and a two amino acid insertion, QG at position 10, that could impact the anchor: HQMKDCNtRqgQAN.

Assay type CD8 T-cell Elispot - IFN γ

Keywords binding affinity, acute/early infection, early-expressed proteins

References Cao *et al.* 2003

- CTL epitope responses were mapped in 21 men within 15–92 days post-HIV-1 infection. Subjects initially showed narrow immune responses with a mean of 2.3 epitopes recognized per patient. The immune response broadened later in infection. No correlation between the plasma viral load and the number of recognized epitopes or the frequency of IFN-gamma secreting cells was observed, and there was no correlation between the functional avidity of a response and the abundance of IFN-secreting cells that recognized the epitope. The first epitopes to be recognized tended not to be the most avid, and earliest responses tended to be directed against Nef, Tat, Vpr, and Env.
- All HIV-1 proteins except Vpu were recognized, and a response to a total of 41 optimal epitopes was characterized; 24 had been identified previously. 48% of the total T-cell responses were directed against Nef and 43% were directed against Gag.
- More common HLA alleles were less frequently used in primary infection than less common alleles, for example A3, B35, B57, and B62 were more frequently recognized than A1, A2, A30, and A44.

Subtype B
Immunogen HIV-1 infection
Species (MHC) human
Assay type T-cell Elispot
Keywords supervised treatment interruptions (STI), immunodominance, early treatment
References Addo *et al.* 2003
- Comprehensive Elispot screening of 504 overlapping peptides that spanned all HIV-1 proteins in 57 HIV-1 infected individuals. Four groups of patients were compared: 23 were untreated; 12 patients were chronically infected and treated; 22 started treatment during acute infection, 11 continuously treated and 11 with STI.
 - 63% of the peptides were recognized - the most frequent responses were directed against Nef (95%) and p24-Gag (88%). p17 was the most frequently recognized protein after correction for protein length. A median of 18 peptides (range 2-42) were recognized per person. The most frequently (>20%) recognized peptides were located in conserved regions within clade B sequences. Vpu was rarely recognized.
 - A decrease in the total magnitude and in the breadth of CTL responses was detected in patients with treated acute infection in comparison to chronically infected treated or untreated individuals. No correlation between plasma viral load and HIV-1 specific T-cell responses was observed.
 - Responses to this peptide were detected in 16% of the study subjects, and it was one of the 25 most frequently recognized peptides.

Species (MHC) human (A*0201)
Country South Africa.
Assay type CD8 T-cell Elispot - IFN γ
Keywords characterizing CD8+ T cells
References Kiepiela *et al.* 2004

- HLA class I restricted CD8+ T-cell responses against HIV-1 were analyzed in African patients. Significantly more responses were shown to be HLA-B restricted. Viral load, CD4 count, and thus rate of disease progression were also associated with HLA-B alleles. In addition, the selection pressure imposed on HIV-1 by HLA-B alleles was shown to be substantially greater than by other alleles.
- This epitope was suggested to be the epitope within a longer reactive peptide based on correspondence with a known epitope in the HIV database. Also, a significantly higher frequency of people in the Durban cohort who reacted with the peptide had this HLA type.

Keywords acute/early infection, variant cross-recognition or cross-neutralization, superinfection

References Yang *et al.* 2005b

- An individual infected with a drug-resistant strain of HIV-1 subtype B with controlled viremia became superinfected with another subtype B strain. The second strain outgrew the first despite lower replication capacity and the same viral phenotype. The strains showed differences in their epitope sequences. The CTL responses to the first strain declined after superinfection, followed by some adaptation of targeting to the new epitopes of the second strain. Differences in the recognized epitopes were suggested to have contributed to the poor immune containment of the second strain.
- A response to this epitope was detected before superinfection but diminished afterward. The epitope in the infecting and superinfecting strain had the sequence: kelyplAsl. The second infecting strain had a 4-amino acid insertion proximal to the epitope, RGIDkelyplAsl.

Assay type CD8 T-cell Elispot - IFN γ

Keywords responses in children, mother-to-infant transmission, escape, acute/early infection, reversion, viral fitness

References Sanchez-Merino *et al.* 2005

- CD8 T-cell responses were examined in mother-infant pairs. Escape variants were commonly detected in maternal plasma. Early infant plasma viruses showed heterogeneity of gag and nef gene sequences as well as mother-to-child transmission of CD8 T-cell escape variants. The stability of escape mutants in the infant over time was determined by infant HLA haplotype

and viral fitness. Sequential plasma specimens from infants showed changes in CD8 T-cell epitope sequences, suggesting that infants are capable of generating virus-specific CD8 T-cell responses.

- A B40+ mother carried the KEmYPLaSL variant of the epitope and transmitted it to her B40- infant. The variant form continued to dominate the infant's sequences at months 3 and 15.

Keywords subtype comparisons, computational epitope prediction

References Geels *et al.* 2005

- Cross-clade CTL responses in 10 non-B HIV-1 infected individuals were evaluated. T-cell reactivity was tested against peptide pools of clade B Gag, Pol, Nef, Rev and Tat. Nine individuals demonstrated cross-reactive T-cell responses to clade A, B, and C Gag pools; 6/7 patients that responded to Nef-B also reacted to clade A and C Nef pools. An inverse correlation was observed between the sequence divergence of the HLA class I restricted epitopes and the height of the T-cell responses, which in Gag could be explained through variations in the HLA-anchor residues. 42% of the responses were directed to regions containing new epitopes.
- Predicted epitope based on an HLA motif embedded in a reactive peptide from a person carrying a D clade Gag.

II-B-6 Gag CTL/CD8+ epitopes**HXB2 Location** Gag**Author Location****Epitope****Immunogen** computer prediction**Species (MHC)** (A*0201, B*3501)**Keywords** subtype comparisons, computational epitope prediction**References** Schönbach *et al.* 2002

- Computational methods (artificial neural networks, hidden Markov models, binding matrices based on HLA association rates) were used to identify HLA-A*0201 and HLA-B*3501 HIV T-cell epitope candidates from 533 Gag, Env and Pol sequences of which 374 were derived from HIV-1, 97 were derived from HIV-2 and 62 from SIV. Comparisons to known epitopes and between clades were made.

HXB2 Location Gag**Author Location** Gag

- Epitope**
Immunogen HIV-1 infection
Species (MHC) human (A*0201, Cw*08)
References Shacklett *et al.* 2000
- HIV-1 specific, MHC class I-restricted CTL killing was detected in duodenal and rectal gut associated lymphoid tissue (GALT) sites from three infected individuals – the distribution of class I restricted CTL was different in the peripheral blood samples and GALT samples.
- HXB2 Location** Gag
Author Location Gag
Epitope
Immunogen HIV-1 infection
Species (MHC) human (A2)
Assay type Tetramer binding, Flow cytometric T-cell cytokine assay
Keywords assay standardization/improvement
References Wu *et al.* 2005
- A flow cytometric assay for validation of HIV-1 gag- or pol-specific- CD8/HLA-A2 T-cells was shown to be sensitive and specific, being able to detect HIV-1 CTL at the single T-cell level. An inverse correlation between HIV plasma viremia and gag- and pol-specific-CD8/HLA-A2 T-cells was observed.
- HXB2 Location** Gag
Author Location Gag
Epitope
Subtype B
Immunogen HIV-1 infection
Species (MHC) human (B*35)
Keywords rate of progression
References Jin *et al.* 2002
- Patients with HLA-B*35 variants B*3502, B*3503, B*3504, and B*5301 tend to proceed to AIDS more quickly than those with B*3501.
 - Of 32 patients with HLA-B*35 alleles CD8+ CTL responses were quantified using an intracellular cytokine staining assay – 75% had responses to Pol, 69% to Gag, 50% to Nef, and 41% to Env.
 - The overall magnitude of CTL responses did not differ between those bearing B*3501 and the others. A higher percentage of Gag responses was observed in those that had lower RNA levels that carried B*3501, and there was a negative association with viral load and CTL activity. The data is consistent with higher levels of CTL responses contributing to protection in B*3501 individuals, but not in B*3502, B*3503, B*3504, and B*5301 individuals.
- HXB2 Location** Gag
Author Location Gag
Epitope
Subtype A, B, C
Immunogen vaccine
Vector/Type: canarypox prime with gp120 boost, canarypox prime with gp160 boost
Strain: B clade LAI, B clade MN, B clade SF2 *HIV component:* Gag, gp120, gp41, Nef, Pol
Species (MHC) human (B60)

- Keywords** subtype comparisons, vaccine-specific epitope characteristics
References Ferrari *et al.* 2001
- Different HIV strains were used for different regions: gp41 LAI, Gag LAI, gp120 MN, gp120 SF2
 - HLA-B60 responses dominated the responses against an Gag vaccine in an individual (022G0Z) who was HLA A1, A11, B8, B60. The strongest response was against the MN peptide 107-136. Low level Gag responses were observed against B8 and A11 epitopes, no response was observed against A1 epitopes.
 - Vaccinee 202T7 (HLA A2, B27, C25) made the strongest response to an epitope at positions 131-140 of Gag. The response was highly cross-reactive with D clade Gag expressed from vaccinia, less so with C, and only minimally cross-reactive with A and CRF01.
- HXB2 Location** Gag
Author Location p24
Epitope
Immunogen vaccine
Vector/Type: DNA *HIV component:* p17/p24 Gag
Species (MHC) mouse (H-2^b, H-2^d, H-2^k)
References Iroegbu *et al.* 2000
- The p24 sequence is more conserved than is p17 within patient, and nonsynonymous substitutions are spread evenly throughout its coding regions, not concentrated in CTL epitopes.
 - Minor changes in p24 did not alter the immunogenicity in H-2b,d, or k mice, while changes in p17 (92% similarity) did alter immunogenicity.
- HXB2 Location** Gag
Author Location Gag (SF2)
Epitope
Immunogen vaccine
Vector/Type: DNA, vaccinia *Strain:* B clade SF2 *HIV component:* Gag, Pol
Species (MHC) mouse (H-2^{bx/d})
References Otten *et al.* 2000
- CB6F1 were primed with gag DNA by im injection and challenged with vaccinia expressing Gag/Pol (rVVgag-pol)
 - Gag-specific CTL responses were detected by IFN γ secretion in the spleen, independent of the route (intraperitoneal, intranasal or intrarectal) of rVV gag-pol challenge.
 - The gag DNA vaccine induced CTL responses in 4/4 monkeys 2 weeks post immunization, but antibody responses were detected in only 1/4 monkeys after 3 immunizations.
 - CTL cross-reactivity against Gag sequences 1-80, 254-323, and 421-496 was observed, suggesting multiple CTL epitope recognition.
- HXB2 Location** Gag
Author Location p24
Epitope
Immunogen vaccine
Vector/Type: DNA *HIV component:* Gag
Species (MHC) mouse (H-2^d)
References Qiu *et al.* 2000

- Mice were injected with plasmid DNA at 0, 2 and 4 weeks and lymphocyte proliferation was measured after 6 weeks with recombinant p24 protein.
- Secreted HIV-1 Gag expression vectors generated a stronger response than standard Gag or cytoplasmic Gag expression vectors.
- IFN-gamma levels were increased compared to an undetectable IL-4 response.
- CTL levels were also increased in secreted Gag expression vaccination studies.

HXB2 Location Gag

Author Location Gag (SF2)

Epitope

Immunogen vaccine

Vector/Type: vaccinia *Strain:* B clade SF2

HIV component: Gag, Protease

Species (MHC) macaque, mouse (H-2^d)

References zur Megede *et al.* 2000

- Sequence-modified Rev-independent gag and gag-protease gene constructs lead to increased expression levels and elevated CTL and antibody immunogenicity in BALB/c and CB6F1 mice.
- A CTL response in mice could be detected after a single immunization with codon-optimized gag, using 2 ng of plasmid; wild type gag required 200 ng to detect a response.
- Recognition of 3 different Gag peptide pools was observed, indicating a polyclonal CTL response.
- Significant gag-specific CTL responses were detected in 4/4 rhesus monkeys, in contrast to 1/4 using wildtype gag.

Author Location Gag (IIIB)

Epitope

Immunogen vaccine

Vector/Type: virus-like particle (VLP) *HIV component:* Gag

component: Gag

Species (MHC) macaque

References Paliard *et al.* 2000

- CTLs primed by HIV-1 p55 gag virus-like particle (VLP) vaccination recognized epitopes in four different 20 amino acid peptides p17/4, p17/8, p24/13 and p14/9.
- Cytotoxic T cell response lasted greater than 8.5 months.

HXB2 Location Gag**Author Location** Gag (IIIB)**Epitope****Immunogen** HIV-1 infection**Species (MHC)** human**Keywords** rate of progression, Th1**References** Wasik *et al.* 2000

- HIV+ infants that progressed rapidly to AIDS had lower Th1 responses and decreased production of beta-chemokines and IL-2 relative to other HIV+ infants.
- HIV+ infants had no demonstrable CTL at birth, but Th1 responses accompanied by CTL responses developed in children with slowly progressive disease, and not in rapid progressors.
- CTLp frequencies were determined by limiting dilution using autologous B cells infected with vaccina/HIV constructs.

HXB2 Location Gag**Author Location** Gag (LAI)**Epitope****Subtype** B**Immunogen** vaccine*Vector/Type:* canarypox *Strain:* B clade LAI, B clade MN *HIV component:* Gag, gp41, Protease, V3**Species (MHC)** human**References** Salmon-Ceron *et al.* 1999

- The vaccine used was a rec canarypox with HIV-1 gp120 MN, tm/gag/protease LAI (vCP205), alone or with p24E-V3 MN synthetic peptide (CLTB-36)
- Twenty HIV negative subjects were vaccinated in phase I trial with combinations of vCP205 and CLTB-36.
- Immunization with vCP205 induced HIV-1-specific ABs to gp120, V3, and p24 antigens, and CTL immune responses against vCP205 were detected after the fourth immunization in 33% of the subjects against Env, Gag and Pol, but the CLTB-36 peptide did not produce AB or CTL immune responses against p24 or gp160.

HXB2 Location Gag**Author Location** p24**Epitope****Immunogen** vaccine*Vector/Type:* virus-like particle (VLP) *HIV component:* p17 Gag, p24 Gag**Species (MHC)** human**References** Klein *et al.* 1997

- Immunization of HIV+ people with an HIV-1 p17/p24 Ty virus-like particle (p24-VLP) resulted in a marginal, short-lived increased proliferative response to p24 and p17 and a transient elevation in viral load.
- Two of four subjects that received 500 or 1000 μ g of p24-VLP had an increase in gag-specific CTL.

HXB2 Location Gag**Author Location** p24 (SF2)**Epitope****Immunogen** vaccine*Vector/Type:* DNA *Strain:* B clade SF2 *HIV component:* gp120, p24 Gag *Adjuvant:* MF59, PLG**Species (MHC)** mouse, baboon**References** O'Hagan *et al.* 2000

- PLG (Polylactide co-glycolide polymer) microparticles administered in MF59 emulsion induced gp120 Ab responses and CTL immune responses against p24 gag.

HXB2 Location Gag**Author Location** Gag**Epitope****Immunogen** HIV-1 infection**Species (MHC)** human**References** Lubaki *et al.* 1999

- Three strategies were used to analyze CTL activity: area under the net HIV-specific lysis curve (ACU), linear regression (LR) of net specific lysis, and the standard method, lytic units (LU20)
- A correlation between low HIV plasma viral load and increased levels of HIV-specific Gag and Nef CTL activity was observed using ACU and LR, but not LU20.

HXB2 Location Gag**Author Location** Gag**Epitope****Immunogen** HIV-1 infection**Species (MHC)** human**References** Kalams *et al.* 1999a

- The presence of HIV-1 p24-specific proliferative responses was positively correlated with Gag-specific memory CTL and negatively correlated with viral load in untreated subjects.
- Gag proliferative responses were the most readily detected – Gag CTL responses were the only responses with a significant correlation with Gag stimulated help, although there was a positive trend with Nef, Env and RT.

HXB2 Location Gag**Author Location** p55 (IIIB)**Epitope****Immunogen** HIV-1 infection**Species (MHC)** human**References** Greenough *et al.* 1999

- 7/128 HIV-1 infected hemophiliac were identified as long-term non-progressors (LTNPs) and were monitored for viral and host immune parameters over 15 years – LTNPs maintained a low viral load, high frequencies of CTL precursors directed against Gag antigen and low levels of HIV-specific effector CTL activity – effector cell activity suggests low level ongoing viral replication.

HXB2 Location Gag**Author Location** Gag**Epitope****Immunogen** HIV-1 infection**Species (MHC)** human**References** Trickett *et al.* 1998

- Twelve HIV-1 infected patients were re-infused with their own lymphocytes, cryopreserved from an earlier time point in the infection.
- Improvement in CD4+ and CD8+ T cells was seen in 7/12, and an increase in the CTL response to Gag was seen in one patient.

HXB2 Location Gag

Immunogen HIV-1 exposed seronegative

Species (MHC) human

Keywords review, HIV exposed persistently seronegative (HEPS)

References Rowland-Jones *et al.* 2001

- This is a review that summarizes observations about HIV-specific CTL found in the HIV-1 exposed persistently seronegative (HEPS) population.
- The CTL responses assayed by ELISPOT and by CTL precursor frequencies by limiting dilution analysis indicate that CTL in HEPS individuals tend to be of a lower magnitude than in chronic HIV-1 infections – the responses in HEPS cases are below the level of detection by tetramer assays.
- CD8+ CTL responses tend to be detectable in HEPS subjects only if they are recently exposed, and the response diminishes if exposure is reduced – it is not clear if there is a stable memory population in HEPS cases.
- CD8+ CTL responses in the HEPS population are associated with HIV-1 specific CD4+ T cell responses, assayed by proliferation assays, IL-2 secretion, and ELISPOT, and the authors consider the possibility that HIV-1-specific T-help responses improve the "quality" of the CD8+ response in HEPS individuals relative to HIV-1 infected individuals, who tend to have a poor HIV-1-specific T-help response.
- HIV-1 specific CD8+ CTL responses in HIV-1 infected individuals show reduced levels of perforin, and the T cells may not mature properly, and although similar studies have not been conducted in HEPS individuals this is considered as a possible difference in the CTL immune response in HEPS and HIV-1 infected people.

HXB2 Location Gag

Author Location

Epitope

Subtype B

Immunogen vaccine

Vector/Type: DNA *HIV component:* Env, Gag, Pol

Species (MHC) mouse

Keywords review, vaccine-specific epitope characteristics

References Nabel 2002

- Using DNA that had humanized codon usage, CTL responses to DNA vaccines containing either Gag, Pol, Gag-Pol fusion protein, or Gag-Pol pseudoparticles suggested that the greatest breadth and most potent response was to the Gag-Pol fusion protein. The Gag-Pol fusion lacks the Gag precursor protein required for viral assembly, so does not form releaseable particles; the author speculates that longer retention of the Gag-Pol protein within the cell may enhance antigen presentation.

Author Location Gag

Epitope

Immunogen vaccine

Vector/Type: vaccinia *HIV component:* Gag
Adjuvant: block copolymer CRL8623

Species (MHC) macaque

Assay type CD8 T-cell Elispot - IFN γ

Keywords vaccine-induced epitopes

References Caulfield *et al.* 2002

- Codon-optimized HIV Gag DNA vaccines were given i.m. with or without a nonionic block copolymer(CRL8623) as adjuvant. DNA-CRL8623 formulations induced 2-fold higher Elispot responses, shifting the response towards CD8+ T-cells.
- 23 monkeys recognized 25 different epitopes with an average of 2.7 epitopes per monkey, and a minimum of 1 and a maximum of 5 peptides per monkey.
- Responses were detected up to 18 months after vaccination.

HXB2 Location Gag

Author Location Gag

Epitope

Subtype multiple

Immunogen

Species (MHC) human

Assay type Flow cytometric T-cell cytokine assay

Keywords subtype comparisons

References Currier *et al.* 2003

- CD8-cellular immune responses from 21 HIV-1 infected patients from Kenya infected with subtype A, C, D, and unique recombinants were studied for cross-recognition of Gag, Env, and Nef vaccinia-expressed proteins representing subtypes A-H, including CRF01.
- Both subtype-specific and cross-reactive CTL were observed, with a skewing of responses towards the infecting subtype in the nine subjects with full length sequence available. The magnitude of the responses to Gag were the highest, less to Nef, and still less to Env.
- For Gag, 8/21 subjects responded to at least 7/8 different subtype proteins, 7 had a mixed response, recognizing some subtypes but not others, and 6 responded to only one or none of the different subtype proteins. For Env, 4/19 subjects responded to

at least 7/8 subtypes, 8 had a mixed response, and 7 responded to one or none. For Nef, 5/19 subjects responded to at least 7/8 subtypes, 8 had a mixed response, and 6 responded to one or none.

HXB2 Location Gag

Author Location Gag (SF2)

Epitope

Subtype B

Immunogen vaccine

Vector/Type: DNA, protein, virus-like particle (VLP), PLG microparticle *Strain:* B clade SF2 *HIV component:* Gag *Adjuvant:* E. coli mutant heat labile enterotoxin (LT-R72), LTK63

Species (MHC) macaque

Assay type proliferation, Chromium-release assay

References Otten *et al.* 2003

- Immunization strategies for Gag (p55) in macaques were compared. GAG DNA prime with a boost of Gag adsorbed onto PLG (polyactide coglycolide) microparticles with LTK63 as adjuvant gave the strongest CD4+ T cell proliferative, CTL, and antibody responses, compared with Gag protein, or Gag virus-like particles (VLP). GAG DNA was best for inducing CTL responses, Gag-PLG for T-help and antibody; the prime-boost combination gave strong responses for all three.

HXB2 Location Gag

Subtype C

Immunogen HIV-1 infection

Species (MHC) human

Country South Africa.

Assay type Flow cytometric T-cell cytokine assay

Keywords characterizing CD8+ T cells

References Ramduth *et al.* 2005

- The magnitude of HIV-specific CD8 responses in HIV-1 infected individuals from South Africa correlated with the CD4 responses. CD4 responses were much more narrowly focused, with Gag as dominant target, while CD8 responses were equally distributed among Gag, Pol and the regulatory and accessory proteins. An association between the preferential targeting of Gag by CD8 T-cells and viral control was found.

HXB2 Location Gag

Author Location Gag (Consensus B, DU422)

Epitope

Subtype B, C

Immunogen HIV-1 infection

Species (MHC) human

Country United States.

Assay type CD8 T-cell Elispot - IFN γ

Keywords assay standardization/improvement, subtype comparisons, variant cross-recognition or cross-neutralization

References Sabado *et al.* 2005

- CD8 T-cell responses were tested in HIV-1 clade B infected individuals using Gag peptides based on clade B consensus sequence and clade C primary isolate DU422. Peptides from both clades were shown to be of equal sensitivity, with equal numbers of discordantly detected responses. The majority of discordant detection was due to sequence differences between clades. Thus, clade B consensus peptides were not superior in detecting CD8 T-cell responses in clade B-infected individuals.

II-B-7 Gag/Pol CTL/CD8+ epitopes

HXB2 Location Gag/Pol

Author Location Gag/Pol (ARV-2 SF2)

Epitope

Immunogen vaccine

Vector/Type: fowlpoxvirus *Strain:* B clade ARV-2, B clade SF2 *HIV component:* Gag, Pol *Adjuvant:* IFN γ

Species (MHC) macaque

References Kent *et al.* 2000

- Vaccination with FPV Gag/Pol-IFN-gamma increased HIV-1 specific CTL and T cell proliferative responses to Gag/Pol antigens, respectively, in infected *Macaca nemestrina*.
- HIV-1 viral loads remained low and unchanged following vaccinations.

HXB2 Location Gag/Pol

Author Location RT

Epitope

Immunogen vaccine

Vector/Type: DNA *HIV component:* Env,
Gag, Pol, Vif *Adjuvant:* B7, IL-12

Species (MHC) mouse

References Kim *et al.* 1997d

- A Gag/Pol or Env DNA vaccine, when delivered in conjunction with the plasmid encoding the co-stimulatory molecules CD86, gave a dramatic increase in both the cytotoxic and proliferative responses in mice.
- When CD86 was present, CTL response could be detected even without *in vitro* stimulation.

HXB2 Location Gag/Pol

Author Location RT

Epitope

Immunogen HIV-1 infection

Species (MHC) human

Keywords TCR usage

References Gamberg *et al.* 1999

- 13/13 subjects with advanced HIV infections showed CD8 T cell proliferation and differentiation of CTL *in vitro*, and six individuals showed HIV-specific responses to Gag, Pol, Env or Nef antigens.
- Data suggests that the functional and genetic integrity of the CD8 T cell repertoire (TCR V β gene intrafamily genetic diversity) remains intact through advanced HIV infection, although HIV-specific CTL activity decreases.

HXB2 Location Gag/Pol

Author Location

Epitope

Immunogen vaccine

Vector/Type: adenovirus *HIV component:*
Gag-Pol, Nef, Vpr

Species (MHC) mouse

References Muthumani *et al.* 2002

- Vpr can cause cells to go into G2 arrest, and it suppresses immune cell activation and inflammatory cytokine production, so co-immunization of BALB/c mice with recombinant adenovirus expressing Vpr and HIV-1 antigens Nef or Gag/Pol was tested to see if Vpr reduced the immune response to the other HIV antigens.
- Vpr compromised CD8+ T-cell lytic responses and T-helper proliferative responses in mice co-immunized with Vpr and Nef or Gag/Pol.
- *In vitro*, Vpr reduced T-cell cytokine production of IL-12 and TNF α , indicative of Vpr-mediated immune suppression.

Epitope ITLWQRPLV

Subtype A, B, C, D

- Immunogen** HIV-1 infection, vaccine
Vector/Type: DNA prime with modified vaccinia Ankara (MVA) boost *Strain:* A clade
HIV component: p17 Gag, p24 Gag
- Species (MHC)** human (A*6802)
- Keywords** subtype comparisons, epitope processing, vaccine-specific epitope characteristics, immunodominance
- References** Hanke & McMichael 2000; Wee *et al.* 2002
- The HIV-1 subtype A focused vaccine HIVA contains p24 and p17, in a reversed order relative to the Gag polyprotein to prevent myristylation of p17, which could direct the protein to the cell membrane and inhibit efficient peptide processing and class I presentation, as well as a polyepitope string of conserved, often immunodominant epitopes that were selected to have particularly good cross-reactive potential for the A-clade epidemic in Nairobi, Kenya. A DNA and MVA prime-boost vaccination protocol using the HIVA antigen will be used in a phase III clinical trial in Kenya. This epitope is included in the polyepitope string Hanke & McMichael [2000].
 - Multiple CD4+ or CD8+ T-cell vaccine-induced responses to peptide pools were detected using intracellular cytokine staining and IFN γ Elispot assays after vaccination of 5 macaques. The response to the Mamu A*01 SIV p27 epitope p11C (CTPYDINQM), included in the polyepitope region, was not immunodominant in the Mamu A*01 vaccinated macaques, possibly because of processing limitations in context of the artificial polyepitope string Wee *et al.* [2002].

Country United States.
Assay type CD8 T-cell Elispot - IFN γ
References Allen *et al.* 2005a
- Two-thirds of all mutations arising in nonenvelope proteins during the transition from acute to chronic infection were found to be due to either CD8 T-cell-associated selective pressures or reversion of HLA-I-associated mutations selected in a previous host. The predominance of escape mutations at highly polymorphic sites was observed across different HIV-1 clades.
 - This epitope was reactive, but escape mutations did not accrue in it over time.
- HXB2 Location** Protease (3–11)
Author Location RT (71–79 LAI)
Epitope ITLWQRPLV
Epitope name P2
Subtype B
Immunogen HIV-1 infection
Species (MHC) human (A28 supertype)
Keywords HAART, ART, supertype
References Mollet *et al.* 2000
- A panel of 16 epitopes covering 15 class I alleles was tested in 14 HIV+ patients from an unselected Caucasian population treated with HAART, using CD8+ cell IFN γ production to measure responses.
 - In general, during the first month of treatment viral load decreased and frequencies of HIV-specific CTL tripled and broadened – eight new HIV specificities that were not previously detectable were newly detected, as were CMV specific CD8+

PBL – but with continued viral suppression, HIV-specific responses diminished.

- Viral rebounds gave different patterns of response: increases or decreases in pre-existing response, new specificities, or no change.

Country Australia.

Assay type Intracellular cytokine staining

Keywords HAART, ART, immunotherapy, variant cross-recognition or cross-neutralization, optimal epitope

References Stratov *et al.* 2005

- CD8 T-cells targeting epitopes spanning drug resistance induced mutations were detected in 3/25 individuals harboring multidrug-resistant HIV-1. Novel CD8 T-cell responses were detected against epitopes with common protease inhibitor fitness mutations. T-cell immunity to drug-resistant variants was confirmed in SHIV-infected macaques, where CD8 and CD4

immune responses to RT and protease resistance mutations were elicited using peptide-based immunotherapy.

- QRPLVTIKI carries the the L10I protease inhibition mutation and was recognized in a multidrug resistant individual. Response against wild-type epitope qrpIvtiki was detected.
- The 3 people that responded to the drug resistant forms of the virus were among those that had the highest levels of CD4 and CD8 T-cell responses, indicating that they were among the most immunocompetent.

Immunogen HIV-1 infection

Species (MHC) human (A*6802)

Keywords HIV exposed persistently seronegative (HEPS), escape

References Kaul *et al.* 2001c

- This study examines CTL responses in HIV exposed, persistently seronegative individuals, HEPS, who eventually seroconverted – 11/114 HEPS Nairobi sex workers eventually seroconverted, and for six of these HIV CTL reactive epitopes had been defined while seronegative.
- DTVLEDINL was recognized in 3 of the 6 women (ML857, ML1203, and ML1707), and the response was present in the last available sample prior to seroconversion, 3–7 months.
- In each of the three women, 20/20 sequences of the infecting strain had no substitutions in this epitope, all were DTVLEDINL, so there was no evidence for escape.
- The epidemiological factor associated with seroconversion was stopping sex work. HIV-specific CTL activity declined when HEPS sex workers stopped working for a period or retired.

- This epitope was recognized in 3/22 HEPS sex worker controls, ML851, ML1432, and ML1601.

HXB2 Location Protease (30–38)

Epitope DTVLEDINL

Immunogen HIV-1 infection, HIV-1 exposed seronegative
Species (MHC) human (A*6802)

Keywords HIV exposed persistently seronegative (HEPS), immunodominance

References Kaul *et al.* 2001a

- ELISPOT was used to study CTL responses to a panel of 54 predefined HIV-1 epitopes in 91 HIV-1-exposed, persistently seronegative (HEPS) and 87 HIV-1-infected female Nairobi sex workers.
- Responses in HEPS women tended to be lower, and focused on different epitopes with HLA presenting molecules that have previously been associated with reduced risk of infection, and there was a shift in the response in the HEPS women upon late seroconversion to epitopes recognized by the HIV-1 infected women.
- 43/91 HEPS women had CD8+ responses and detection of HIV-1-specific CTL in HEPS women increased with the duration of viral exposure.
- Among HLA-A*6802 women, 11/12 HEPS and 6/11 HIV-1 infected women recognized this epitope likelihood ratio 4.4, p value 0.08, and HEPS women tended to respond to DTVLEDINL, infected women tended to ETAYFILKL.
- The dominant response to this HLA allele was to this epitope in 10 of the 11/12 HEPS cases, but in only 4 of the 6/11 HIV-1 infected women.
- Differences in epitope specificity were only seen for responses restricted by class I HLA alleles A2, A24, A*6802, B14, and B18, previously shown to be associated with resistance to HIV-1 in this cohort.
- Four epitopes were considered to be “resistant epitopes”, as they were preferentially reactive in HEPS women and so may confer resistance, and these were found in three different proteins: A2 ILK(D/E)PVHGV in RT, A*6802 DTVLEDINL in Protease, B14 DLN(M/T)LN(I/V)V in p24 and B18 FRDYV-DRF(Y/F)K also in p24.
- Subject ML 857 shifted from a A*6802 DTVLEDINL and B35 (H/N)PDIVIQY response prior to seroconversion to a B35 PPIPVGDIY and B35 VPLRPMTY response post-seroconversion, and the loss of the pre-seroconversion response was not due to sequence variation within these epitopes.
- Subject ML 1203 started with CTL responses to A*6802 DTVLEDINL and B7 FVPTQVPLR prior to seroconversion, and upon seroconversion acquired additional responses to A*6802 ETAYFILKL which became dominant, B7 TPGPGV/IRYPL, B7 IPRRIRQGL, and B7 SPRTLNAWV.
- Subject ML 1707 started with a CTL response to A*6802 DTVLEDINL prior to seroconversion, and switched to A*6802 ETAYFILKL and A24 RDYVDRFFKTL post-seroconversion, and the loss of the pre-seroconversion response was not due to sequence variation within the epitope.
- Subject ML 1830 made no detectable response prior to seroconversion, but responded to A*6802 DTVLEDINL and A*6802 ETAYFILKL post-seroconversion.

- CTL responses were evaluated in identical twins infected with HIV-1 from the same blood source. Targeting of the CTL was similar in the 2 patients, while their TCR profiles were highly dissimilar. It is suggested that CTL targeting is predominately genetically determined, while T-cell generation is a stochastic process; the responding CTLs differ at the TCR molecular level, leaving the viral escape and CTL efficacy unpredictable.
- HKAIGTVLVGPTPVN was the immunodominant epitope in each twin, but was recognized by T cells with distinctly different TCRs. The epitope was not defined within the epitope. The twins had very different patterns of HIV evolution in this region, with one carrying HKveGsVLIgPTPVN and the other HKAIGaVLIgPTPVN.

HXB2 Location Protease (70–77)**Author Location****Epitope** KAIGTVLV**Immunogen****Species (MHC)** human (B57)**Keywords** optimal epitope**References** Frahm *et al.* 2007

- HLA-B63-positive subjects were shown to be able to generate CTL responses early in acute HIV infection and to control HIV replication in the absence of antiretroviral treatment. Since HLA-B63 shares the epitope binding motif of HLA-B57 and -B58, it was shown that HLA-B63-positive individuals mounted CTL responses to previously identified B57-restricted epitopes, as well as novel, B63-restricted epitopes. Moreover, these novel B63-restricted epitopes can also be presented by HLA-B57 and -B58.

- HLA-B63/57/58 epitope containing the B58 supertype binding motif. Significantly more often recognized by B63-positive subjects than by negative subjects. Optimal epitope was defined in a person who was B57+.

HXB2 Location Protease (75–84)

Author Location Protease (175–184 MN)

Epitope VLVGPTPVNI

Subtype B

Immunogen vaccine

Vector/Type: DNA, polyepitope *Strain:* B clade MN *HIV component:* gp120, Protease, RT *Adjuvant:* Incomplete Freund's Adjuvant (IFA)

Species (MHC) humanized mouse (A*0201)

Assay type CD8 T-cell Elispot - IFN γ

Keywords epitope processing, vaccine-specific epitope characteristics, immunodominance, immunotherapy

References Isagulians *et al.* 2004

- Immunization of HLA-A*0201-transgenic mice with synthetic genes encoding clusters of human A*0201 CTL epitopes located at the sites of drug resistance mutations, induced RT-specific cellular responses indicating the immunogenicity of these constructs. This vaccine strategy may be a first step towards a therapeutic vaccine against drug-resistant strains.
- This was one of five HLA-A*0201 epitopes from the RT or protease proteins that was included in the polyepitope vaccine. When the transgenic HLA A*0202 mice were vaccinated with the polyepitope construct or with a mixture of RT peptides, a sustained low level CD8+ T-cell gamma IFN response was observed, in contrast to when an intact RT gene was used for vaccination.

HXB2 Location Protease (75–84)

Subtype B

Immunogen vaccine

Vector/Type: DNA *Strain:* B clade IIIB

HIV component: Gag-Pol

Species (MHC) humanized mouse (A*0201)

Assay type Intracellular cytokine staining

Keywords epitope processing, vaccine-specific epitope characteristics, immunodominance, variant cross-recognition or cross-neutralization, vaccine antigen design

References Singh & Barry 2004

- When A*0201-C3H/J transgenic mice were immunized with plasmids encoding wild-type gag-pol, codon-optimized (CO) gag-pol, and an expression library vaccine expressing 16 fragments of gag-pol fused with ubiquitin for proteasome targeting (ELI), the ELI vaccine produced up to 10-fold higher CD8 T-cell responses than the other two vaccines. In contrast to the wt and CO vaccines, which tended to augment only immunodominant responses, boosting with the ELI vaccine resulted in many CD8 responses against variant epitopes from different HIV-1 clades, and against drug-resistant variants.
- The drug resistant variant of this epitope, vlvgptpTnV, was tested. WT and CO vaccines produced low level CD8+ T-cell responses against the B clade form as well as against drug resistant variant, but the ELI vaccine produced much more intense responses against both the WT and the variant, including after boosting.

HXB2 Location Protease (76–84)

Author Location Pol (163–)

Epitope LVGPTPVNI

Epitope name Pol-163

Immunogen HIV-1 infection

Species (MHC) human (A*0201)

Keywords binding affinity, subtype comparisons, super-type, computational epitope prediction

References Altfeld *et al.* 2001c

- HIV was scanned for all peptides which carried the A2-supermotif pattern conserved in more than 50% of B clade sequences – 233 peptides met this criteria, and 30 of these bound to HLA-A*0201 – 20/30 bound to at least 3/5 of HLA-A2 supertype alleles tested.
- Three additional previously described HLA-A2 epitopes were added to the set of 20, and 18/22 chronically infected HLA-A2 individuals had CTL that recognized at least one of the 23 peptides (median of 2 and maximum of 6), while 6/12 acute infected individuals recognized at least 1 (median of 1 and maximum of 2)
- LVGPTPVNI binds to 4/5 HLA-A2 supertype alleles: A*0201, A*0202, A*0206 (highest affinity) and A*6802, but not A*0203.
- 1/22 individuals with chronic HIV-1 infection recognized this epitope by ELISPOT.
- 0/12 acutely infected individuals recognized this epitope.

HXB2 Location Protease (76–84)**Author Location** Protease**Epitope** LVGPTPANI**Immunogen** HIV-1 infection**Species (MHC)** human, macaque (A*0205)**Donor MHC** A*0101, A*0205, B*0702, B*0801, Cw*0701, Cw*0702**Country** Australia.**Assay type** Intracellular cytokine staining**Keywords** HAART, ART, immunotherapy, variant cross-recognition or cross-neutralization**References** Stratov *et al.* 2005

- CD8 T-cells targeting epitopes spanning drug resistance induced mutations were detected in 3/25 individuals harboring multidrug-resistant HIV-1. Novel CD8 T-cell responses were detected against epitopes with common protease inhibitor fitness mutations. T-cell immunity to drug-resistant variants was confirmed in SHIV-infected macaques, where CD8 and CD4 immune responses to RT and protease resistance mutations were elicited using peptide-based immunotherapy.
- A response against the peptide harboring the protease drug resistance mutation V82A, LVGPTPANI, was detected in one individual, but the wildtype epitope was not recognized, lvgptpVni. This epitope response was not fine-mapped, and is based on analogy to a previously described A2 epitope.
- Other drug resistant variants were not recognized: V82T and I84V.
- The 3 people that responded to the drug resistant forms of the virus were among those that had the highest levels of CD4 and CD8 T-cell responses, indicating that they were among the most immunocompetent.

HXB2 Location Protease (76–84)**Author Location** Protease (76–84 HXB2)**Epitope** LVGPTPVNI**Epitope name** PR82V**Immunogen** HIV-1 infection**Species (MHC)** human (A2)**Assay type** Intracellular cytokine staining, Chromium-release assay**Keywords** HAART, ART, escape**References** Karlsson *et al.* 2003

- This epitope contains two positions that are commonly associated with protease inhibitor escape, lvgptpAni (V82A) and lvgptpvnV (I84V). 29 HIV-1 infected patients (15 were HLA-A2+) with a history of protease inhibitor failure were screened for mutations within the protease gene and CD8+ T cells recognition of the wt and V82A variant peptides. CTL pressure alone, despite high functional avidity, did not drive the V82A substitution. Surprisingly V82A was found more frequently among HLA-A2- individuals (10/14) than HLA-A2+ (7/15), despite the mutation conferring not only drug resistance but CTL escape.
- 8/15 HLA-A2+ patients carried had a Val at position 82; 7/8 of these recognized the WT peptide, but only 3/8 could also recognize V82A.

- 7/15 had the V82A substitution; 2/7 recognized the wt and the V82A mutation, 1/7 recognized only the peptide with the V82A substitution.

HXB2 Location Protease (76–84)**Author Location** Protease (76–84)**Epitope** LVGPTPVNI**Subtype** B**Immunogen** HIV-1 infection**Species (MHC)** human (A2)**Country** Canada.**Assay type** CD8 T-cell Elispot - IFN γ , Chromium-release assay**Keywords** HAART, ART, escape, immunotherapy, variant cross-recognition or cross-neutralization**References** Mason *et al.* 2004

- Accumulation of specific antiretroviral drug-resistance mutations in Pol gene was shown to sustain and even enhance the antigenicity and immunogenicity of HIV-1 CTL epitopes in this region. Several different patterns of cross-reactivity and selective recognition of wild-type and variant epitopes were found.
- LVGPTPVNI variant is detected due to appearance of I84V resistance mutation. Three patients receiving PIs had viral sequences obtained, and two had the I84V mutation. EliSpot reactivity to this epitope in either form was evident in these patients, showing drug resistance can persist coincident with an active CTL response.

HXB2 Location Protease (76–84)**Author Location** Protease (76–84)**Epitope** LVGPTPVNI**Subtype** B**Immunogen** HIV-1 infection**Species (MHC)** human (A2)**Country** United States.**Assay type** CD8 T-cell Elispot - IFN γ , HLA binding**Keywords** acute/early infection, optimal epitope**References** Altfeld *et al.* 2005

- The most frequently targeted HLA-A2-restricted CD8+ T-cell epitopes in chronic infection were significantly less frequently recognized during primary infection. This epitope was only recognized during chronic infection.

HXB2 Location Protease (76–84)**Author Location** Protease (76–84)**Epitope** LVGPTPVNI**Immunogen** HIV-1 infection**Species (MHC)** human (A2)**Country** Canada.**Assay type** CD8 T-cell Elispot - IFN γ , Chromium-release assay, Flow cytometric T-cell cytokine assay**Keywords** variant cross-recognition or cross-neutralization, characterizing CD8+ T cells, mimics**References** Mason *et al.* 2005

- CTL responses against the human IP-30 signal peptide sequence LLDVPTAAV were shown to be elicited by stimulation of PBMCs from HIV-1 infected individuals with HIV protease peptide 76-84, LVGPTPVNI. In vitro stimulation with HIV PR 76-84 or the IP-30 signal peptide was shown to activate a comparable population of cross-reactive effector cells. None of the peptides activated CTL in non-HIV-infected individuals. IP-30 signal peptide was shown to have lower avidity T-cell interactions than the HIV peptide.
- As a control, responses to A2-restricted HIV epitopes ALVEICTEM, EELRQHLLRW, and LSPRTLNAW were shown not to give IP-30 responses.

HXB2 Location Protease (76–84)

Author Location Pol (156–164)

Epitope LVGPTPVNI

Immunogen HIV-1 infection

Species (MHC) human (A2 supertype)

Keywords supertype, rate of progression

References Propato *et al.* 2001

- Long-term nonprogressors (LTNPs) had strong memory resting CD8+ T-cell responses against the majority of epitopes tested, (18 for the A2 supertype, 16 for the A3 supertype) while the effector cells of long-term nonprogressors recognized far fewer epitopes.
- Progressors had memory resting CD8+ T-cells that recognized far fewer epitopes than LTNPs.
- A positive correlation between effector CD8+ T-cells and plasma viremia and a negative correlation between CD8+ effector T-cells and CD4+ T-cells was observed, which may contribute to the inability of LTNPs to clear virus.
- This epitope can bind three of the five HLA-A2 supertypes alleles (A*0201, A*0202, A*0203, A*0206 and A*6802).

Keywords HAART, ART
References Seth *et al.* 2001

- CTL responses were studied by tetramer staining in 41 patients with combination therapy – activated CD8+ T-cells decline as the viral load drops in response to therapy, but the overall level of antigen-specific cells capable of differentiating into effectors stays constant and new epitopes may be recognized.

HXB2 Location RT (18–26)
Author Location RT (185–193 SF2)
Epitope GPKVKQWPL
Immunogen HIV-1 infection
Species (MHC) human (B8)
Keywords HAART, ART, acute/early infection
References Altfeld *et al.* 2001b

- Therapy provided during acute infection resulted in a narrower CTL response, stronger T help response, and a less diverse viral population than was seen in individuals treated during chronic infection.
- The breadth and specificity of the response was determined using ELISPOT by studying 19 individuals with pre-seroconversion therapy (Group 1), 11 individuals with primary infection but post-seroconversion therapy (Group 2), and 10 individuals who responded to HAART given during chronic infection (Group 3), using 259 overlapping peptides spanning p17, p24, RT, gp41, gp120 and Nef.
- Previously described and newly defined optimal epitopes were tested for CTL response.
- Number of HLA-B8+ individuals that had a CTL response to this epitope broken down by group: 0/3 group 1, 0/3 group 2, and 2/2 group 3.

Assay type CD8 T-cell Elispot - IFN γ , Chromium-release assay, Flow cytometric T-cell cytokine assay

Keywords escape, variant cross-recognition or cross-neutralization, optimal epitope

References Koibuchi *et al.* 2005

- HIV-1-specific CD8 T-cell responses were shown to be persistent in the chronic phase of HIV-1 infection, although the responses to some of the epitopes were declining despite the persistence of the targeted sequences in vivo. Only 4/14 epitopes were potential CTL escape variants, although strong responses to these epitopes persisted for 6 years. This indicates limited viral evolution within targeted CD8 T-cell epitopes during the chronic phase of infection.
- The GL9 variant GPrVKQWPL was essentially the only form of the epitope detected over a 5-year period in this person. Elispot reactions were roughly equivalent between the autologous form and the B clade consensus form, GPKVKQWPL. A single variant was observed in 1/8 clones at the 5-year time point, GPrVKQgPL.

HXB2 Location RT (18–27)

Author Location Pol

Epitope GPKVKQWPLT

Immunogen

Species (MHC) human (B7, B8)

References De Groot *et al.* 2001

- The program Epimatrix was used in conjunction with the program Conservatrix to identify conserved regions of HIV that might serve as epitopes.
- A subset of the potential epitopes was identified that could bind to the appropriate HLA-allele, and 15 predicted B7 superfamily (HLA B7, B8, and B58) epitopes were identified that could stimulate IFN γ production in an ELISPOT assay.
- GPKVKQWPLT was confirmed as a previously identified HLA-B8 epitope, and newly identified as an HLA-B7 epitope in this study.

Immunogen vaccine

Vector/Type: DNA, polyepitope *Strain:* B clade MN *HIV component:* gp120, Protease, RT *Adjuvant:* Incomplete Freund's Adjuvant (IFA)

Species (MHC) humanized mouse (A*0201)

Assay type CD8 T-cell Elispot - IFN γ

Keywords epitope processing, vaccine-specific epitope characteristics, immunodominance, immunotherapy

References Isagulians *et al.* 2004

- Immunization of HLA-A*0201-transgenic mice with synthetic genes encoding clusters of human A*0201 CTL epitopes located at the sites of drug resistance mutations, induced RT-specific cellular responses indicating the immunogenicity of these constructs. This vaccine strategy may be a first step towards a therapeutic vaccine against drug-resistant strains.
- This was one of five HLA-A*0201 epitopes from the RT or protease proteins that was included in the polyepitope vaccine. When the transgenic HLA A*0202 mice were vaccinated with the polyepitope construct or with a mixture of RT peptides, a sustained low level CD8+ T-cell gamma IFN response was observed, in contrast to when an intact RT gene was used for vaccination.

HXB2 Location RT (33–41)

Author Location Pol (132–140 IIIB)

Epitope ALVEICTEM

Epitope name pol132-140

Subtype B

Immunogen vaccine

Vector/Type: DNA *Strain:* B clade IIIB *HIV component:* Gag-Pol

Species (MHC) humanized mouse (A*0201)

Assay type Intracellular cytokine staining

Keywords subtype comparisons, vaccine-specific epitope characteristics, immunodominance, variant cross-recognition or cross-neutralization, vaccine antigen design

References Singh & Barry 2004

- When A*0201-C3H/J transgenic mice were immunized with plasmids encoding wild-type gag-pol, codon-optimized (CO) gag-pol, and an expression library vaccine expressing 16 fragments of gag-pol fused with ubiquitin for proteasome targeting (ELI), the ELI vaccine produced up to 10-fold higher CD8 T-cell responses than the other two vaccines. In contrast to the wt and CO vaccines, which tended to augment only immunodominant responses, boosting with the ELI vaccine resulted in many CD8 responses against variant epitopes from different HIV-1 clades, and against drug-resistant variants.
- Different variants of this epitope from different clades were tested. WT and CO vaccines produced low level CD8+ T-cell responses against the B clade form as well as against variants from other clades, but the ELI vaccine produced much more intense responses against the B clade and all variants tested, including after boosting. The variants were: clade A, alTDictem; clade C, atTAicEem; and clade D, alleicSem.

Epitope NTPVFAIKK

Immunogen HIV-1 infection, vaccine

Species (MHC) human (A*6801, A3 superfamily)

Country Australia.

Assay type Intracellular cytokine staining

Keywords HAART, ART, immunotherapy, variant cross-recognition or cross-neutralization, optimal epitope

References Stratov *et al.* 2005

- CD8 T-cells targeting epitopes spanning drug resistance induced mutations were detected in 3/25 individuals harboring multidrug-resistant HIV-1. Novel CD8 T-cell responses were detected against epitopes with common protease inhibitor fitness mutations. T-cell immunity to drug-resistant variants was confirmed in SHIV-infected macaques, where CD8 and CD4 immune responses to RT and protease resistance mutations were elicited using peptide-based immunotherapy.
- The immune response to this peptide was cross-reactive for both the wild type and RT drug resistance mutation K65R, and NTPVFAIKK and ntpvfaikR stimulated CD8 T-cell responses with equal efficiency. The C-terminal R or K is required for a full response; NTPVFAIK stimulated a much weaker response.
- The 3 people that responded to the drug resistant forms of the virus were among those that had the highest levels of CD4 and CD8 T-cell responses, indicating that they were among the most immunocompetent.

HXB2 Location RT (57–65)

Author Location Pol (236–244)

Epitope NTPVFAIKK

Immunogen HIV-1 infection

Species (MHC) human (A3 supertype)

Keywords supertype, rate of progression

References Propato *et al.* 2001

- Long-term nonprogressors (LTNPs) had strong memory resting CD8+ T-cell responses against the majority of epitopes tested, (18 for the A2 supertype, 16 for the A3 supertype) while the effector cells of long-term nonprogressors recognized far fewer epitopes.
- Progressors had memory resting CD8+ T-cells that recognized far fewer epitopes than LTNPs.
- A positive correlation between effector CD8+ T-cells and plasma viremia and a negative correlation between CD8+ effector T-cells and CD4+ T-cells was observed, which may contribute to the inability of LTNPs to clear virus.
- This epitope can bind 3/5 HLA-A3 supertype alleles (A*0301, A*1101, A*3101, A*3301 and A*6801).

Epitope KLVDFRELNK

Epitope name A3-KK10

Subtype B

Immunogen HIV-1 infection

Species (MHC) human (A3)

Donor MHC A3, B7, Cw7

Keywords dynamics, supervised treatment interruptions (STI), acute/early infection

References Yu *et al.* 2002a

- CTL responses in 18 acutely HIV-infected HLA-A3 (n=7) or -B7 (n=4) or both -A3 and B7 (n=7) positive individuals were studied.

- One individual, AC-06, was homozygous at all three class I alleles (A3, B7, Cw7), was treated during acute infection and had supervised treatment interruptions (STI). He had only two detectable CTL responses during acute infection, but after STI this broadened to 27 distinct epitopes including 15 restricted by HLA-A3, 11 by HLA-B7, and 1 by HLA-Cw7.
- 0/14 HLA-A3 positive individuals had detectable A3-restricted responses to this epitope during acute infection, but only 5/15 of HLA-A3 epitopes tested were targeted during acute infection. 3/7 individuals began to have detectable responses to this epitope after STI.

Epitope GIPHPAGLKK

Subtype CRF01_AE

Immunogen HIV-1 infection

Species (MHC) human (A11)

Keywords subtype comparisons

References Bond *et al.* 2001

- HLA-A11 CRF01 (called subtype E in Bond *et al.*) epitopes were identified that stimulated CTL from HIV+ female sex workers (FSW) from Northern Thailand, of whom more than half were HLA-A11 positive.
- 77 possible HLA-A11 epitopes were first defined using EpiMatrix, these were screened for binding to A11 finding and 26 bound, and 12 of these were epitopes for CTL responses from 8 HLA-A11 positive FSWs, six were novel, six were previously identified.
- This is one of the new A11 epitopes identified through the streamlined EpiMatrix method, and 2/8 tested FSWs recognized it.

- This epitope was highly conserved in other subtypes, and exact matches were common.

Epitope SVPLDESFRK
Epitope name P272-281
Subtype CRF01_AE
Immunogen HIV-1 exposed seronegative
Species (MHC) human (A11)
Keywords HIV exposed persistently seronegative (HEPS)
References Sriwanthana *et al.* 2001

- This was a study of HIV-1 exposed persistently seronegative (HEPS) female sex workers in Chiang Mai, northern Thailand.
- HLA-A11 is very common in this population, and was enriched among the HEPS sexworkers – weak CTL responses were detected in 4/7 HEPS women, and CTL responses were found in 8/8 HIV+ controls, and 0/9 HIV- women that were not exposed.

- This epitope after a second stimulation *in vitro* gave a strong response in HEPS study subject 128 who was HLA A11/A33.

HXB2 Location RT (117–126)

Epitope SVPLDESRFK
Subtype CRF01_AE
Immunogen HIV-1 infection
Species (MHC) human (A11)
Keywords subtype comparisons
References Bond *et al.* 2001

- HLA-A11 CRF01 (called subtype E in Bond *et al.*) epitopes were identified that stimulated CTL from HIV+ female sex workers (FSW) from Northern Thailand, of whom more than half were HLA-A11 positive.
- 77 possible HLA-A11 epitopes were first defined using EpiMatrix, these were screened for binding to A11 finding and 26 bound, and 12 of these were epitopes for CTL responses from 8 HLA-A11 positive FSWs, six were novel, six were previously identified.
- This is one of the new A11 epitopes identified through the streamlined EpiMatrix method, and 3/8 tested FSWs recognized it.
- This epitope was only conserved in CRF01, and subtype A and B, and exact matches were uncommon.

HXB2 Location RT (118–127)
Author Location (C consensus)
Epitope VPLDEDFRKY
Subtype C
Immunogen HIV-1 infection
Species (MHC) human (B*35)
Country South Africa.
Assay type CD8 T-cell Elispot - IFN γ
Keywords characterizing CD8+ T cells
References Kiepiela *et al.* 2004

- HLA class I restricted CD8+ T-cell responses against HIV-1 were analyzed in African patients. Significantly more responses were shown to be HLA-B restricted. Viral load, CD4 count, and thus rate of disease progression were also associated with HLA-B alleles. In addition, the selection pressure imposed on HIV-1 by HLA-B alleles was shown to be substantially greater than by other alleles.
- This epitope was suggested to be the epitope within a longer reactive peptide based on correspondence with a known epitope in the HIV database. Also, a significantly higher frequency of people in the Durban cohort who reacted with the peptide had this HLA type.

- A novel CTL clone was defined with a panel of recombinant vaccinia-RT-infected B-LCL target cells using PBMCs donated by a patient who was HIV-seropositive for 6 years and had not received any antiretroviral therapy.
- There is evidence that some CTL epitopes are poorly presented on the surface of infected cells, but this RT epitope was recognized as effectively on HIV-infected cells as on peptide-pulsed targets.

HXB2 Location RT (127–135)**Author Location** (C consensus)**Epitope** YTAFTIPSI**Subtype** C**Immunogen** HIV-1 infection**Species (MHC)** human (A*0205)**Country** South Africa.**Assay type** CD8 T-cell Elispot - IFN γ **Keywords** rate of progression, optimal epitope**References** Kiepiela *et al.* 2007

- A comprehensive analysis of 160 class I T cell responses in 578 individuals from KwaZulu-Natal, South Africa was performed. Gag-specific responses were associated with lowering viremia, while Env, accessory and regulatory protein-specific responses were associated with higher viremia.
- YTAFTIPSI is an optimal epitope.

HXB2 Location RT (127–135)**Author Location** Pol (316–)**Epitope** YTAFTIPSI**Epitope name** Pol-316**Immunogen** HIV-1 infection**Species (MHC)** human (A2)**Keywords** binding affinity, subtype comparisons, supertype, computational epitope prediction**References** Altfeld *et al.* 2001c

- HIV was scanned for all peptides which carried the A2-supermotif pattern conserved in more than 50% of B clade sequences – 233 peptides met this criteria, and 30 of these bound to HLA-A*0201 – 20/30 bound to at least 3/5 of HLA-A2 supertype alleles tested.
- Three additional previously described HLA-A2 epitopes were added to the set of 20, and 18/22 chronically infected HLA-A2 individuals had CTL that recognized at least one of the 23 peptides (median of 2 and maximum of 6), while 6/12 acute infected individuals recognized at least 1 (median of 1 and maximum of 2)
- 2/22 individuals with chronic HIV-1 infection recognized this epitope in ELISPOT.
- 0/12 acutely infected individuals recognized this epitope.
- YTAFTIPSI binds to five HLA-A2 supertype alleles: A*0201, A*0202, A*0203, A*0206 and A*6802 (highest affinity)

HXB2 Location RT (127–135)**Author Location** RT (127–135)**Epitope** YTAFTIPSV**Immunogen** HIV-1 infection**Species (MHC)** human (A2)**Keywords** optimal epitope**References** Frahm *et al.* 2007**HXB2 Location** RT (127–135)**Author Location** RT (127–135)**Epitope** YTAFTIPSI**Subtype** B**Immunogen** HIV-1 infection**Species (MHC)** human (A2)**Country** United States.**Assay type** CD8 T-cell Elispot - IFN γ , Chromium-release assay, HLA binding**Keywords** acute/early infection, optimal epitope**References** Altfeld *et al.* 2005

- The most frequently targeted HLA-A2-restricted CD8+ T-cell epitopes in chronic infection were significantly less frequently recognized during primary infection. This epitope was only recognized during chronic infection.

HXB2 Location RT (127–135)**Author Location** Pol (306–314)**Epitope** YTAFTIPSI**Immunogen** HIV-1 infection**Species (MHC)** human (A2 supertype)**Keywords** supertype, rate of progression**References** Propato *et al.* 2001

- Long-term nonprogressors (LTNPs) had strong memory resting CD8+ T-cell responses against the majority of epitopes tested, (18 for the A2 supertype, 16 for the A3 supertype) while the effector cells of long-term nonprogressors recognized far fewer epitopes.
- Progressors had memory resting CD8+ T-cells that recognized far fewer epitopes than LTNPs.
- A positive correlation between effector CD8+ T-cells and plasma viremia and a negative correlation between CD8+ effector T-cells and CD4+ T-cells was observed, which may contribute to the inability of LTNPs to clear virus.
- This epitope can bind all five HLA-A2 supertypes alleles (A*0201, A*0202, A*0203, A*0206 and A*6802)

Keywords epitope processing, escape

References Moore *et al.* 2002b

- HIV polymorphisms in the RT protein were examined relation to HLA alleles found in a population of 473 participants in the Western Australian HIV Cohort Study. 64 significant associations between polymorphisms at particular positions and HLA alleles were detected, for HLA-B7, -B12, -B35 and -B15. Fifteen of these were in positions with known epitopes, 4 in anchor residues, 11 in other positions. Six additional polymorphic sites associated with particular HLA molecules flanked known epitopes and may relate to processing.
- TAFTIPSI was one of two epitopes characterized in detail. C-terminal I135x substitutions were associated with people who carried HLA-B5 – 39/40 (98%) of HLA-B*5101 individuals had substitutions in this position, while only 127/431 (29%) who did not have HLA-B*5101 did. The predominant substitution was kytaftipsT, and this mutation is predicted to abrogate binding to HLA-B*5101.

Keywords rate of progression, escape

References Geels *et al.* 2003

- Both stable potential epitopes and epitopes with escape mutations were found in a patient with increasing viral load over a time period of 4 years. Fixation of escape mutations occurred sequentially and correlated with the rise in viral load and with the increased number of productively infected cells.
- This is one of 5 epitopes from this individual that varied over time where the internal mutations became fixed; a dramatic decrease in CTL activity against the wild type epitope was observed as the mutation arose. The taftipsT variant residue found at 47 months postseroconversion.

Epitope TAFTIPSI

Subtype B

Immunogen HIV-1 infection

Species (MHC) human (B51)

Donor MHC A2, A31, B51, B58w4

Country United States.

Assay type Intracellular cytokine staining, Flow cytometric T-cell cytokine assay

Keywords HAART, ART, escape, variant cross-recognition or cross-neutralization, characterizing CD8+ T cells

References Casazza *et al.* 2005

- Evidence of continued viral evolution during HAART therapy despite low viral load was found in 1/5 patients studied. This epitope provided the best evidence for apparent immune escape during HAART.
- Prior to the initiation of therapy, taftipsT variant was found in 24/24 clones. At week 14 of therapy, this variant was completely replaced with taftipsI. By week 19, a complete replacement occurred again, this time to taftipsM. The change at nucleotide level suggests a stepwise progression from ACA to ATA to ATG.
- The taftipsT and taftipsM variants had lower avidity than the taftipsI variant, but this wasn't evident at saturating conditions; only careful titrations revealed the difference. HLA-B51 stabilization studies revealed the increased stabilization with the taftipsI form. Also, CD3 down-regulation was larger in response to taftipsI.
- The viral shift to the taftipsM variant during HAART was predicted to have minimal or undetectable effect on drug sensitivity.

Epitope name NY9

Subtype B

Immunogen HIV-1 infection

Species (MHC) human (B*1801)

Donor MHC A*0201, A*2501, B*1801, B*5101, Cw*0102, Cw*1203

Assay type CD8 T-cell Elispot - IFN γ

Keywords escape, immune evasion, optimal epitope, HIV-1

References Liu *et al.* 2006

- T-cell immunity and the impact of selection were longitudinally studied in a patient from the time of transmission. New epitopes were detected at sites that were shown to be under positive selection. Env was found to be the major target of CTLs and most of the new epitopes were found here. One third of the sites examined were associated with epitope escape mutations from CTL. Acquisition of mutations found at high frequency in the database was suggested to be a result of reversion of CTL epitopes in the absence of immune targeting.
- NNETPGiRY, NsETPGVRY, NNEiPGVRY, NNEiPGiRY, NNgTPGVRY and NNEvPGiRY escape variants were found.

Epitope QGWKGSPAIFQSSMTKIL

Subtype B

Immunogen HIV-1 infection

Species (MHC) human

Assay type T-cell Elispot

Keywords supervised treatment interruptions (STI), immunodominance, early treatment

References Addo *et al.* 2003

- Comprehensive Elispot screening of 504 overlapping peptides that spanned all HIV-1 proteins in 57 HIV-1 infected individuals. Four groups of patients were compared: 23 were untreated; 12 patients were chronically infected and treated; 22 started treatment during acute infection, 11 continuously treated and 11 with STI.
- 63% of the peptides were recognized - the most frequent responses were directed against Nef (95%) and p24-Gag (88%). p17 was the most frequently recognized protein after correction for protein length. A median of 18 peptides (range 2-42) were recognized per person. The most frequently (>20%) recognized peptides were located in conserved regions within clade B sequences. Vpu was rarely recognized.
- A decrease in the total magnitude and in the breadth of CTL responses was detected in patients with treated acute infection in comparison to chronically infected treated or untreated individuals. No correlation between plasma viral load and HIV-1 specific T-cell responses was observed.
- The authors did not note the reference strain, but based on the peptide sequences provided it appears to be HXB2.

- Responses to this peptide were detected in 19% of the study subjects, and it was one of the 25 most frequently recognized peptides.

Epitope SPAIFQSSM

Subtype C

Immunogen HIV-1 infection

Species (MHC) human (B*07)

Assay type Other

Keywords HLA associated polymorphism

References Boutwell & Essex 2007

- All HIV-1 subtype C protein sequences were analysed, and 94 HLA-associated amino acid polymorphisms were found that were well distributed throughout the proteome. These sequences were compiled from publicly available databases and originated in South Africa and Botswana. Many polymorphisms were associated with multiple HLA allele classes. 12% of negative associations were found as well, where there was an association of virus expression of the consensus amino acid with a specific HLA allele. HLA-B alleles were involved in most of the associations. 19 HLA-associated polymorphisms were embedded in previously defined epitopes presented by an appropriate HLA restricting molecule.

- SPAIFQSSM was a previously defined B*07 presented epitope that encompassed a B*0702-associated polymorphism, SPAIFQsSM, in the seventh position.

Assay type CD8 T-cell Elispot - IFN γ

Keywords cross-presentation by different HLA, characterizing CD8+ T cells

References Kiepiela *et al.* 2004

- HLA class I restricted CD8+ T-cell responses against HIV-1 were analyzed in African patients. Significantly more responses were shown to be HLA-B restricted. Viral load, CD4 count, and thus rate of disease progression were also associated with HLA-B alleles. In addition, the selection pressure imposed on HIV-1 by HLA-B alleles was shown to be substantially greater than by other alleles.
- This epitope was suggested to be the epitope within a longer reactive peptide based on correspondence with a known epitope in the HIV database. Also, a significantly higher frequency of people in the Durban cohort who reacted with the peptide had this HLA type.

Country Spain.

Assay type proliferation, CD8 T-cell Elispot - IFN γ , Flow cytometric T-cell cytokine assay

Keywords HAART, ART, supervised treatment interruptions (STI), immune dysfunction

References Plana *et al.* 2004

- Structured treatment interruption (STI) alone is not able to control viral replication in chronically infected patients, probably due to lack of strong, maintained T-helper cell responses. HIV-1 specific CD8+ T-cell responses were shown to increase significantly until the end of the follow up, but were not correlated with viral load.
- 5/9 patients recognized this epitope.

HXB2 Location RT (156–164)

Author Location Pol (156–164 HXB2)

Epitope SPAIFQSSM

Subtype B

Immunogen HIV-1 infection

Species (MHC) human (B7)

Keywords rate of progression, immunodominance

References Hay *et al.* 1999

- CTL response to IPRRIRQGL was the immunodominant response in a rapid progressor – there was a subdominant response to SPAIFQSSM in Pol, and interestingly, no response to commonly immunodominant HLA A*0201 epitope SLYNT-VATL, although this individual was HLA A*0201.
- The individual showed a strong initial CTL response at the time of the initial drop in viremia, but it was quickly lost, although memory cells persisted.
- Despite the initial narrow response to two epitopes, no other CTL responses developed.
- No HIV-specific lymphoproliferative responses were detected in this patient, and neutralizing antibody response was weak.

- Variants of this epitopes were observed *in vivo* (spaiFqCsm, spSifqssm), but the binding motifs for B7 were preserved (P2, and C-term aromatic or hydrophobic)

HXB2 Location RT (156–164)

Author Location Pol

Epitope SPAIFQSSM

Immunogen HIV-1 infection

Species (MHC) human (B7)

Keywords rate of progression, acute/early infection

References Islam *et al.* 2001

- Subject 053i was followed longitudinally from acute infection through death, and had rapid progression to AIDS.
- This individual had a dominant response to IPRRIRQGL with strong *in vivo* activated responses and *in vitro* stimulated memory responses and a subdominant response to SPAIFQSSM – during the course of disease progression (4 Years), the functional CTL responses were lost and no sequence variation occurred with in both epitopes, but CTL clones specific for IPRRIRQGL persisted throughout.

Assay type CD8 T-cell Elispot - IFN γ

Keywords assay standardization/improvement, epitope processing

References Draenert *et al.* 2004a

- 96% of optimally defined epitopes have one of only nine amino acids serving as the C-terminal anchor position. Seven amino acids are never found in this position and four are only present in 4% of cases. CD8 T-cell response to an epitope is shown to be best detected when the epitope is situated at the C-terminal end of a longer peptide, and authors suggest that Elispot reagents would be better designed if peptides ended on known C-terminal anchors.
- SPAIFQSSM is suggested to be the optimal epitope instead of SPAIFQSSMT.

HXB2 Location RT (158–166)**Author Location****Epitope** AIFQSSMTK**Immunogen** HIV-1 infection**Species (MHC)** human (A*0301)**Keywords** acute/early infection**References** Wilson *et al.* 2000a

- Three individuals with highly focused HIV-specific CTL responses were studied during acute infection using tetramers – high frequencies of HIV-1-specific CD8+ T cells were found prior to seroconversion, and there was a close temporal relationship between the number of circulating HIV-specific T cells and viral load was also found.
- All three patients were B*2705, with HLA alleles: A1, A30/31, B*2705, B35; A1, A*0301, B7, B2705; and A*0201, A*0301, B2705, B39.
- ELISPOT was used to test a panel of CTL epitopes that had been defined earlier and were appropriate for the HLA haplotypes of the study subjects – 3/3 subjects showed a dominant response to the B*2705 epitope KRWIIIGGLNK.
- The subject with A*0201 had a moderately strong response to SLYNTVATL.
- Weak responses were observed to A*301-RLRPGGKKK, A*301-QVPLRPMTYK, and B7-TPGPGVRYPL in the subject who was HLA A1, A*0301, B7, B*2705.

- No acute response was detected to the following epitopes: A*201-ILKEPVHGV, A*301-KIRLRPGGK, A*301-AIFQSSMTK, A*301-TVYYGVPVWK, B35-EPIVGAETF, B35-HPDIVIYQY, B35-PIIPVGEIY, B35-NSSKVSQNY, B35-VPLRPMTY, B35-DPNPQEVVL.

Epitope AIFQSSMTK

Subtype A, B, C, D

Immunogen HIV-1 infection, vaccine

Vector/Type: DNA prime with modified vaccinia Ankara (MVA) boost *Strain:* A clade HIV component: p17 Gag, p24 Gag

Species (MHC) human, macaque (A*0301, A11, A33)

Keywords subtype comparisons, epitope processing, vaccine-specific epitope characteristics, immunodominance

References Hanke & McMichael 2000; Wee *et al.* 2002

- The HIV-1 subtype A focused vaccine HIVA contains p24 and p17, in a reversed order relative to the Gag polyprotein to prevent myristylation of p17, which could direct the protein to the cell membrane and inhibit efficient peptide processing and class I presentation, as well as a polyepitope string of conserved, often immunodominant epitopes that were selected to have particularly good cross-reactive potential for the A-clade epidemic in Nairobi, Kenya. A DNA and MVA prime-boost vaccination protocol using the HIVA antigen will be used in a phase III clinical trial in Kenya. This epitope is included in the polyepitope string Hanke & McMichael [2000].
- Multiple CD4+ or CD8+ T-cell vaccine-induced responses to peptide pools were detected using intracellular cytokine staining and IFN γ Elispot assays after vaccination of 5 macaques. The response to the Mamu A*01 SIV p27 epitope p11C (CTPYDINQM), included in the polyepitope region, was not immunodominant in the Mamu A*01 vaccinated macaques, possibly because of processing limitations in context of the artificial polyepitope string Wee *et al.* [2002].

Immunogen

Species (MHC) human (A*1101)

Country Thailand.

Keywords HIV exposed persistently seronegative (HEPS), structure

References Li & Bouvier 2004

- HLA-A*1101 has been associated with resistance to acquisition of HIV-1 infection in female sex-workers in Thailand. Its crystal structure has been determined in association with two immunodominant A*1101 HIV-1 CTL epitopes. Its anchor residues are confirmed as P2(Ile/Val) and C-term (Lys). The backbone conformation of the peptides is defined as two bulges separated by a secondary anchor residue (P6 Ser or Met) that may offer various advantages in the selection and presentation of CTL epitopes by HLA-A*1101.

Epitope AIFQSSMTK

Immunogen HIV-1 infection

Species (MHC) human (A*1101, A3, A*0301, A*6801)

References Menendez-Arias *et al.* 1998; Threlkeld *et al.* 1997

- Study of the fine specificity of an A3-like super-type epitope (the A3 super-type includes A*0301, A*1101, A*3101, A*3301, and A*6801)
- A3 super-type is characterized by a hydrophobic or hydroxyl containing anchor residue at position 2, and a positive charge in the C-term position.

- While most lines were specific, promiscuous cloned CTL lines were also derived from HIV+ donors that could recognize epitope presented by either A3 or A11 or A*6801.
- Alanine substitutions throughout the epitope and natural variants indicate that the same amino acid positions are critical for presentation by either MHC molecule, A3 or A11.
- AIFQSSMTK is presented by three members of the A3 superfamily: A*0301, A*1101, and A*6801, and the naturally occurring variants A1S and K9R are recognized with similar efficiency to wild type epitope – AIFQSSMTR can also bind to two additional members of the A3 superfamily, A*3101 and A*3301.

Keywords subtype comparisons

References Bond *et al.* 2001

- HLA-A11 CRF01 (called subtype E in Bond *et al.*) epitopes were identified that stimulated CTL from HIV+ female sex workers (FSW) from Northern Thailand, of whom more than half were HLA-A11 positive.
- 77 possible HLA-A11 epitopes were first defined using EpiMatrix, these were screened for binding to A11 finding and 26 bound, and 12 of these were epitopes for CTL responses from 8 HLA-A11 positive FSWs, six were novel, six were previously identified.
- This epitope was predicted by the EpiMatrix method to be likely to bind to A11, and it served as an epitope in the FSWs, it was one of the six A11 epitopes that had been previously defined.
- 6/8 tested FSWs recognized this epitope.
- An HLA-A11 tetramer was made for this epitope, which was recognized by two subjects – and both subjects had expanded tetramer staining T-cell populations after *in vitro* stimulation.
- This epitope was highly conserved in other subtypes, and exact matches were common.

Keywords epitope processing, escape

References Moore *et al.* 2002b

- HIV polymorphisms in the RT protein were examined relation to HLA alleles found in a population of 473 participants in the Western Australian HIV Cohort Study. 64 significant associations between polymorphisms at particular positions and HLA alleles were detected, for HLA-B7, -B12, -B35 and -B15. Fifteen of these were in positions with known epitopes, 4 in anchor residues, 11 in other positions. Six additional polymorphic sites associated with particular HLA molecules flanked known epitopes and may relate to processing.
- HLA-A11+ individuals with a K166x (4/19) substitution had higher viral loads than those that did not, suggesting escape was associated with diminished immune control of viremia.

- 4/14 optimal HIV-1 T-cell epitopes in a subject underwent mutation associated with dramatic loss of the original CD8 response. For one of the escape variants, a novel CD8 T-cell response equal in magnitude to the wild type, was generated. CD8 T-cell recognizing the variant epitope utilized a distinct T-cell receptor and did not exhibit any cross-reactivity against the wild type.
- This epitope did not vary.

HXB2 Location RT (158–166)**Author Location** Pol (314–322)**Epitope** AIFQSSMTK**Subtype** B**Immunogen** HIV-1 infection**Species (MHC)** human (A11)**Donor MHC** A2, A11, B18, B44, Cw5, Cw12**Country** United States.**Assay type** CD8 T-cell Elispot - IFN γ **References** Allen *et al.* 2005a

- Two-thirds of all mutations arising in nonenvelope proteins during the transition from acute to chronic infection were found to be due to either CD8 T-cell-associated selective pressures or reversion of HLA-I-associated mutations selected in a previous host. The predominance of escape mutations at highly polymorphic sites was observed across different HIV-1 clades.
- This epitope was reactive, but escape mutations did not accrue in it over time.

HXB2 Location RT (158–166)**Author Location** Pol (313–321)**Epitope** AIFQSSMTK**Epitope name** AK9**Subtype** B**Immunogen** HIV-1 infection**Species (MHC)** human (A11)**Donor MHC** A*01, A*11, B*08, B*15, Cw*04, Cw*07**Country** United States.**Assay type** CD8 T-cell Elispot - IFN γ , Chromium-release assay, Flow cytometric T-cell cytokine assay**Keywords** escape, optimal epitope**References** Koibuchi *et al.* 2005

- HIV-1-specific CD8 T-cell responses were shown to be persistent in the chronic phase of HIV-1 infection, although the responses to some of the epitopes were declining despite the persistence of the targeted sequences in vivo. Only 4/14 epitopes were potential CTL escape variants, although strong responses to these epitopes persisted for 6 years. This indicates limited viral evolution within targeted CD8 T-cell epitopes during the chronic phase of infection.
- The AK9 variant AIFQSSMT_r was essentially the only form of the epitope detected over a 5-year period in this person. Elispot reactions indicated the T-cell clones only recognized the autologous form, not the B clade consensus, AIFQSSMTK. Two rare variants were observed at the 5-year time point, tIFQSSMT_r and AIFQSSMar.

- Variants (S/A)IFQSSMTK are specific for the A/B clades.
- ELISPOT was used to study CTL responses to a panel of 54 predefined HIV-1 epitopes in 91 HIV-1-exposed, persistently seronegative (HEPS) and 87 HIV-1-infected female Nairobi sex workers.
- Responses in HEPS women tended to be lower, and focused on different epitopes with HLA presenting molecules that have previously been associated with reduced risk of infection, and there was a shift in the response in the HEPS women upon late seroconversion to epitopes recognized by the HIV-1 infected women.
- 43/91 HEPS women had CD8+ responses and detection of HIV-1-specific CTL in HEPS women increased with the duration of viral exposure.
- Among HLA-A3 women, 2/2 HEPS and 3/3 HIV-1 infected women recognized this epitope.
- The dominant response to this HLA allele was to this epitope in one of the 2/2 HEPS cases and in one of the 3/3 HIV-1 infected women.

Immunogen HIV-1 infection
Species (MHC) human (A3 supertype)
Keywords supertype, rate of progression
References Propato *et al.* 2001
- Long-term nonprogressors (LTNPs) had strong memory resting CD8+ T-cell responses against the majority of epitopes tested, (18 for the A2 supertype, 16 for the A3 supertype) while the effector cells of long-term nonprogressors recognized far fewer epitopes.
 - Progressors had memory resting CD8+ T-cells that recognized far fewer epitopes than LTNPs.
 - A positive correlation between effector CD8+ T-cells and plasma viremia and a negative correlation between CD8+ effector T-cells and CD4+ T-cells was observed, which may contribute to the inability of LTNPs to clear virus.
 - This epitope can bind 4/5 HLA-A3 supertype alleles (A*0301, A*1101, A*3101, A*3301 and A*6801).

Epitope name KY9 (RT-53)
Immunogen HIV-1 infection
Species (MHC) human (A*3002)
References Goulder *et al.* 2001a
- HLA-A*3002 is very common in African populations, 50% of Zimbabweans express HLA-A30, 44% in African Zulu, so five new HIV epitopes were characterized that are presented by this HLA molecule.
 - A rapid method was developed combining ELISPOT with intracellular IFN- γ staining of PBMCs to map optimal epitopes, then HLA presenting molecules were defined – this method was completed within 48 to 72 hours of receipt of blood.
 - Two individuals were studied: Subject 199 (HLA A*0201/*3002 B*4402/51 Cw2/5), a Caucasian, and Subject 6007 (HLA A*3002/ B53/*5801 Cw4/7) an African-Caribbean.
 - In both HLA-A*3002 individuals the response to RSLYNT-VATLY was dominant.

- In subject 199 four additional A*3002 epitopes were identified.
- Three quantitative assays, ELISPOT, precursor frequency and chromium release, confirmed a hierarchy of response: RY11 (p17) > KY9 (gp41) > KY9 (RT-53) > IY9 (gp41)

Keywords characterizing CD8+ T cells
References Kiepiela *et al.* 2004
- HLA class I restricted CD8+ T-cell responses against HIV-1 were analyzed in African patients. Significantly more responses were shown to be HLA-B restricted. Viral load, CD4 count, and thus rate of disease progression were also associated with HLA-B alleles. In addition, the selection pressure imposed on HIV-1 by HLA-B alleles was shown to be substantially greater than by other alleles.
 - This epitope was suggested to be the epitope within a longer reactive peptide based on correspondence with a known epitope in the HIV database. Also, a significantly higher frequency of people in the Durban cohort who reacted with the peptide had this HLA type.

References Moore *et al.* 2002b

- HIV polymorphisms in the RT protein were examined relation to HLA alleles found in a population of 473 participants in the Western Australian HIV Cohort Study. 64 significant associations between polymorphisms at particular positions and HLA alleles were detected, for HLA-B7, -B12, -B35 and -B15. Fifteen of these were in positions with known epitopes, 4 in anchor residues, 11 in other positions. Six additional polymorphic sites associated with particular HLA molecules flanked known epitopes and may relate to processing.
- NPDIVYQY was one of two epitopes characterized in detail. D177x substitutions are known to specifically abrogate binding to HLA-B*3501, and not other B*35 subtypes. D177x substitutions were associated with people who carried HLA-B*3501 and not other B*35 subtypes; considering high resolution typing generally strengthened the B*35 associations.

Keywords binding affinity, acute/early infection, early-expressed proteins

References Cao *et al.* 2003

- All proteins were scanned and optimal epitopes were mapped in a study of CD8+ INF γ T-cell responses in 21 men within 15-92days post-HIV-1 infection. Subjects initially showed narrow immune responses with a mean of 2.3 epitopes recognized per patient. The immune response broadened later in infection. No correlation between the plasma viral load and the number of recognized epitopes or the frequency of INF γ secreting cells was observed, and there was no correlation between the functional avidity of a response and the abundance of INF-secreting cells that recognized the epitope. The first epitopes to be recognized did not tend to be the most avid, and earliest responses tended to be directed against Nef, Tat, Vpr, and Env.

- All HIV-1 proteins except Vpu were recognized, and a responses to a total of 41 optimal epitopes were characterized; 24 had been identified previously. 48% of the total T-cell responses were directed against Nef and 43% were directed against Gag.
- More common HLA alleles were less frequently used in primary infection than less common alleles, for example A3, B35, B57, and B62 were more frequently recognized than A1, A2, A30, and A44.

- Patients with acute or early infection were shown to preferentially target variable peptides with higher entropy while those with chronic infection showed responses towards more conserved peptides with lower entropy. In longitudinally followed subjects, responses to variable proteins declined over time while responses to conserved proteins increased. The decline is suggested to be due to CTL escape.
- The response to this epitope was not detected until month 25.

- IFN γ T-cell responses in breast milk of 5 HIV-1 infected women from the US and 6 from Zambia were tested with using Elispot. 11/11 women responded to Gag, 8/11 responded to Pol, 7/11 women to Nef, and 2/5 women to Env peptide pools. These responses were shown to be primarily due to CD8+ T-cells in one woman, and another woman had cytolytic responses measured by Cr-release.
- T-cells in breast milk from a volunteer who was HLA A3, A11, B35, B51 induced IFN γ after stimulation with a peptide that carries known B35 epitope NPDIIVYQY.
- The frequencies of responses in the two compartments differed, and 2/4 women that responded to epitopes in Nef 101-205 and Pol 601-710 showed responses in breast milk but no detectable responses in peripheral blood cells.

Author Location Pol

Epitope HPDIIVYQY

Subtype A

Immunogen HIV-1 infection, vaccine

Vector/Type: DNA prime with modified vac-

cinia Ankara (MVA) boost *Strain:* A clade

HIV component: p17 Gag, p24 Gag

Species (MHC) human, macaque (B35)

Keywords subtype comparisons, epitope processing, vaccine-specific epitope characteristics, immunodominance

References Hanke & McMichael 2000; Wee *et al.* 2002

- The HIV-1 subtype A focused vaccine HIVA contains p24 and p17, in a reversed order relative to the Gag polyprotein to prevent myristylation of p17, which could direct the protein to the cell membrane and inhibit efficient peptide processing and class I presentation, as well as a polyepitope string of conserved, often immunodominant epitopes that were selected to have particularly good cross-reactive potential for the A-clade epidemic in Nairobi, Kenya. A DNA and MVA prime-boost vaccination protocol using the HIVA antigen will be used in a phase III clinical trial in Kenya. This epitope is included in the polyepitope string Hanke & McMichael [2000].
- Multiple CD4+ or CD8+ T-cell vaccine-induced responses to peptide pools were detected using intracellular cytokine staining and IFN γ Elispot assays after vaccination of 5 macaques. The response to the Mamu A*01 SIV p27 epitope p11C (CTPYDINQM), included in the polyepitope region, was not immunodominant in the Mamu A*01 vaccinated macaques, possibly because of processing limitations in context of the artificial polyepitope string Wee *et al.* [2002].

Epitope VIYQYMDDL

Immunogen HIV-1 infection

Species (MHC) human (A*0201)

Keywords epitope processing, immunodominance, escape

References Sewell *et al.* 1999

- Proteasome regulation influences epitope processing and could influence patterns of immunodominance.
- The proteasome is inhibited by lactacystin treatment, and gamma IFN induces expression of proteasome subunits, LMP2 and LMP7, which combine with the proteasome to create an immunoproteasome.
- IFN-gamma induction of the immunoproteasome and lactacystin inhibition increases the presentation of the A*0201 VIYQYMDDL epitope, but decreases the presentation of the A*0201 ILKEPVHGV epitope, which is immunodominant within pol proteins, showing the two epitopes are processed by different pathways.
- ILKEPVHGV seems to be processed by the classical proteasome pathway, while VIYQYMDDL appears to be destroyed by this pathway.
- This epitope contains the catalytic site (YMDD) of RT, a conserved sequence in HIV-1 which restricts escape mutants.

HXB2 Location RT (179–187)

Epitope VIYQYMDDL

Immunogen HIV-1 infection

Species (MHC) human (A*0201)

Keywords review, escape

References Brander *et al.* 1998a; Menendez-Arias *et al.* 1998

- Of 17 infected HLA A*0201 subjects, 13 had CTL responses against the p17 SLYNTVATL epitope, six recognized ILKEPVHGV and five recognized VIYQYMDDL, and there was no correlation between viral load and recognition of a specific epitope or evidence of immune escape.
- Only one subject had CTL against all three epitopes.

- Subjects were part of the San Francisco City Clinic Cohort, the ARIEL project and from the Boston area.
- In the review Menendez-Arias *et al.* [1998] the authors note that substitution of three residues in this epitope can confer resistance to RT inhibitors (1, 3, and 6) – substitutions V1E and M6V abolish CTL activity, and M6V confers resistance to 3TC – substitution Y3C reduces CTL activity and is associated with resistance to non-nucleoside RT inhibitors.

HXB2 Location RT (179–187)

Author Location RT

Epitope VIYQYMDDL

Epitope name RT VL9

Immunogen HIV-1 infection

Species (MHC) human (A*0201)

Keywords subtype comparisons, supertype, computational epitope prediction

References Altfeld *et al.* 2001c

- HIV was scanned for all peptides which carried the A2-supermotif pattern conserved in more than 50% of B clade sequences – 233 peptides met this criteria, and 30 of these bound to HLA-A*0201 – 20/30 bound to at least 3/5 of HLA-A2 supertype alleles tested.
- Three additional previously described HLA-A2 epitopes were added to the set of 20, including RT VL9, and 18/22 chronically infected HLA-A2 individuals had CTL that recognized at least one of the 23 peptides (median of 2 and maximum of 6), while 6/12 acute infected individuals recognized at least 1 (median of 1 and maximum of 2)
- RT VL9 was not recognized by any of the 22 HLA-A2 patients with chronic HIV-1 infection or the 13 HLA-A2 patients with acute HIV-1 infection included in this study.

HXB2 Location RT (179–187)

Author Location RT (346–354)

Epitope VIYQYMDDL

Epitope name VL9

Immunogen HIV-1 infection

Species (MHC) human (A*0201)

References Dela Cruz *et al.* 2000

- Integration of HIV RT CTL epitopes into the N-terminus of the HLA-A2 heavy chain, or tethering the epitopes to the target chain, resulted in epitope-specific lysis by CD8+ CTL.
- These antigens could also be used to stimulate primary responses *in vitro*.

HXB2 Location RT (179–187)

Author Location Pol (346–354)

Epitope VIYQYMDDL

Subtype B

Immunogen HIV-1 infection

Species (MHC) human (A*0201)

Keywords epitope processing, immunodominance

References Sewell *et al.* 2002

- Epitope processing of three different HLA-A*0201 HIV epitopes was shown to use different pathways, which might influence patterns of immunodominance. .174 cells were used that lack TAP1 and TAP2 genes, as well as the LMP2 and LMP7 genes that encode the beta-subunits of the immunoproteasome.

These genes could be added back through transfection to study processing.

- ILKEPVHGV was efficiently presented in TAP-1 and -2 transfected cells while VIYQYMDDL and SLYNTVATL were not. VIYQYMDDL was destroyed by the MB1 subunit of the protease, and could be expressed in the presence of the proteasome inhibitor lactacystin, but SLYNTVATL expression was not restored. SLYNTVATL expression was unaltered by lactacystin in a wild type cell line.

HXB2 Location RT (179–187)

Epitope VIYQYMDDL

Epitope name LR26

Subtype B

Immunogen vaccine

Vector/Type: peptide *Strain:* B clade LAI

Adjuvant: Incomplete Freund's Adjuvant (IFA), Montanide (ISA 720), P30, PLG

Species (MHC) mouse (A*0201)

Keywords binding affinity, vaccine-specific epitope characteristics, immunodominance

References Peter *et al.* 2001

- The stability of peptide binding to HLA-A2.1 was determined for six HLA-A2.1 peptides included in this vaccine study – ILKEPVHGV (RT), SLYNTVATL (p17), SLLNATDIAV (gp41) and LLWKGEGAV (RT) all bound with high affinity comparable to a influenza epitope reference (GILGFVFTL), while RGPGRAVFTI and VIYQYMDDL bound with a lower affinity (relative binding activity = 0.01).
- The four high-affinity peptides formed stable complexes with half-lives ranging between 8 and 32 hours, while the low affinity peptides had half lives of less than an hour.
- HLA-A2.1 transgenic mice were immunized with the six HIV-1 peptides and P30, as a universal T-helper epitope, with IFA or Montanide or microspheres as adjuvants.
- All peptides except VIYQYMDDL induced a strong CTL response in Cr-release assays - stronger responses were observed when peptides were delivered alone, indicating immunodominance when the combination was used.

Assay type proliferation, CD8 T-cell Elispot - IFN γ , Flow cytometric T-cell cytokine assay

Keywords HAART, ART, supervised treatment interruptions (STI), immune dysfunction

References Plana *et al.* 2004

- Structured treatment interruption (STI) alone is not able to control viral replication in chronically infected patients, probably due to lack of strong, maintained T-helper cell responses. HIV-1 specific CD8+ T-cell responses were shown to increase significantly until the end of the follow up, but were not correlated with viral load.

- 5/19 patients recognized this epitope.

HXB2 Location RT (179–187)

Author Location Pol

Epitope VIYQMDDL

Immunogen HIV-1 exposed seronegative

Species (MHC) human (A2)

Donor MHC A*02, A*30, B*4402, B*15

Assay type Tetramer binding, T-cell Elispot

Keywords HIV exposed persistently seronegative (HEPS)

References Missale *et al.* 2004

- HIV-specific T-cell response was tested in patients exposed to blood from a patient with highly replicating HIV; these patients were nosocomially infected with HBV, but uninfected with HIV. HIV-specific T-cell responses were directed to structural and non-structural HIV proteins in 2 patients, suggesting that the virus replicated in these patients sufficiently to prime a cell-mediated immune response that protected them from HIV infection.
- This patient responded to 4/8 HIV epitopes tested in an IFN γ EliSpot assay or tetramer assay. Responses were detected 8 and 28 weeks after exposure. No response to this epitope was detected by IFN γ EliSpot, but a response was detected by tetramer staining.

HXB2 Location RT (179–187)

Author Location RT (179–187)

Epitope VIYQYMDDL

Subtype B

Immunogen HIV-1 infection

Species (MHC) human (A2)

Country United States.

Assay type CD8 T-cell Elispot - IFN γ , Chromium-release assay, HLA binding

Keywords acute/early infection, optimal epitope

References Altfeld *et al.* 2005

- The most frequently targeted HLA-A2-restricted CD8+ T-cell epitopes in chronic infection were significantly less frequently recognized during primary infection. This epitope was only recognized in chronic infection.

Author Location RT (179–187 HXB2)

Epitope VIYQYMDDL

Epitope name 51F

Subtype B

Immunogen vaccine

Vector/Type: DNA *Strain:* multiple epitope immunogen *HIV component:* p17/p24 Gag, Pol *Adjuvant:* IL-12

Species (MHC) transgenic mouse (A2)

Assay type Cytokine production, CD8 T-cell Elispot - IFN γ , Chromium-release assay

Keywords vaccine-specific epitope characteristics, vaccine antigen design

References Bolesta *et al.* 2005

- Immunization of transgenic mice with a codon-optimized hGagp17p24-Polp51 DNA plasmid, consisting of clusters of highly conserved CTL epitopes presented by multiple MHC class I alleles, induced 2- to 5-fold higher CD8+ T-cell responses than the corresponding full-length proteins. The modified proteins had the ribosomal frameshift deleted, as well as the potentially immunosuppressive p15, and protease and integrase. This correlated with higher protection against challenge with Gag and Pol expressing recombinant vaccinia virus. Mice immunized with the hGagp17p24-Polp51 also showed an elevated level of type 1 cytokine production as well as an increased titer of p24- and RT-specific IgG2 antibody responses.
- This was 1 of 4 A2 gag/pol epitopes tested. Transgenic mice immunized with the deleted construct induced more potent EliSpot reactions to this epitope than those immunized with full length Gag/Pol.

Keywords HAART, ART, supervised treatment interruptions (STI), early treatment

References Montefiori *et al.* 2003

- HIV-1 + patient AC10 underwent early HAART treatment, which was discontinued 1.5 years later. At this timepoint potent NAb responses against autologous virus were detected. Treatment interruption initially induced weak CD8+ responses directed against 5 epitopes. By days 873d and 923d the CTL response had broadened to target 22 epitopes; of these six were fully characterized. Eventually the virus escaped the NAb response, but escape was not accompanied by a rise in viral load, and the authors suggest the virus was contained by the CTL response.

HXB2 Location RT (202–210)**Author Location** RT (202–210)**Epitope** IEELRQHLL**Immunogen** HIV-1 infection**Species (MHC)** human (B60, B61)**Keywords** immunodominance**References** Day *et al.* 2001

- No immunodominant responses were detected to five B61-restricted epitopes tested.
- All five B60-restricted epitopes were reactive in another subject, and the B60-restricted responses together contributed over one-third of the total CTL response.

HXB2 Location RT (203–211)**Author Location** RT**Epitope** EELRQHLLR**Immunogen** HIV-1 infection**Species (MHC)** human (B44)**Donor MHC** A*3101, A68, B*4403, B51**Keywords** HAART, ART, supervised treatment interruptions (STI)**References** Arnedo-Valero *et al.* 2004

- T cell immune responses following STI were monitored in two chronically HIV-1 infected partners (A and B) who had contracted HIV-1 during 1992. Both were heterozygous for the CCR5 delta32, and had different HLAs and treatment histories. STI induced strong transitory CD4+ and CD8+ T cell responses in both patients. Patient A displayed broad CD8+ T cell responses directed against Env, Pol, Gag, and Nef HIV-1 antigens. CTL responses in patient B were mainly directed against two epitopes: Gag(p24)NANPDSKTI and Pol(RT)EELRQHLLRW.
- Despite the host differences, both patients had similar dynamics of viral evolution and CD4+ T-cells, suggesting that good immune responses to STI may be more related to the virus than host characteristics in these cases.

HXB2 Location RT (203–212)**Author Location** RT (LAI)**Epitope** EELRQHLLRW**Subtype** B**Immunogen** HIV-1 infection**Species (MHC)** human (B44)**References** Menendez-Arias *et al.* 1998; van der Burg *et al.* 1997

Assay type CD8 T-cell Elispot - IFN γ

Keywords HAART, ART, supervised treatment interruptions (STI)

References Arnedo-Valero *et al.* 2004

- T cell immune responses following STI were monitored in two chronically HIV-1 infected partners (A and B) who had contracted HIV-1 during 1992. STI induced strong transitory CD4+ and CD8+ T cell responses in both patients. The viruses remained very closely related over 10 years, despite the two individuals having different HLA types; the authors suggest the maintained similarity does not support a strong role for HLA driven HIV diversity as has been claimed in Moore *et al.* (Science 2002).
- During the second treatment stop, patient A developed a strong proliferative response to p24, and multiple strong CD8+ T cell responses to Env, Pol, Gag and Nef. This patient was able to control viral load for two years follow up without therapy. Patient B developed a very weak CD4+ T cell response against p24 during breaks in therapy, and had CD8+ responses to two epitopes. Patient A: A01, A32, B*1410, B15; Patient B: A*3101, A68, B*4403, B51.

Keywords escape, immune evasion, optimal epitope, HIV-1

References Liu *et al.* 2006

- T-cell immunity and the impact of selection were longitudinally studied in a patient from the time of transmission. New epitopes were detected at sites that were shown to be under positive selection. Env was found to be the major target of CTLs and most of the new epitopes were found here. One third of the sites examined were associated with epitope escape mutations from CTL. Acquisition of mutations found at high frequency in the database was suggested to be a result of reversion of CTL epitopes in the absence of immune targeting.
- This is a newly defined epitope. Position 8 in the epitope had potentially experienced positive selection. ELRQHLLRW escape variant was found.

- Comprehensive Elispot screening of 504 overlapping peptides that spanned all HIV-1 proteins in 57 HIV-1 infected individuals. Four groups of patients were compared: 23 were untreated; 12 patients were chronically infected and treated; 22 started treatment during acute infection, 11 continuously treated and 11 with STI.
- 63% of the peptides were recognized - the most frequent responses were directed against Nef (95%) and p24-Gag (88%). p17 was the most frequently recognized protein after correction for protein length. A median of 18 peptides (range 2-42) were recognized per person. The most frequently (>20%) recognized peptides were located in conserved regions within clade B sequences. Vpu was rarely recognized.
- A decrease in the total magnitude and in the breadth of CTL responses was detected in patients with treated acute infection in comparison to chronically infected treated or untreated individuals. No correlation between plasma viral load and HIV-1 specific T-cell responses was observed.
- Responses to this peptide were detected in 16% of the study subjects, and it was one of the 25 most frequently recognized peptides.

Epitope PIVLPEKDSW

Epitope name PIV

Immunogen HIV-1 infection

Species (MHC) human (B57)

Keywords HAART, ART, acute/early infection

References Oxenius *et al.* 2000

- Patients who started therapy at acute HIV-1 infection (three with sustained therapy, two with limited therapy upon early infection) had strong HIV specific CD4 proliferative responses and were able to maintain a CTL response even with undetectable viral load – three patients that had delayed initiation of HAART had no HIV specific CD4 proliferative responses and lost their CTL responses when HAART was eventually given and their viral loads became undetectable.
- None of the 8 study subjects recognized this epitope but none were HLA B57+

Author Location RT Pol (398–407)

Epitope PIVLPEKDSW

Immunogen HIV-1 infection

Species (MHC) human (B57)

Country Spain.

Assay type proliferation, CD8 T-cell Elispot - IFN γ , Flow cytometric T-cell cytokine assay

Keywords HAART, ART, supervised treatment interruptions (STI), immune dysfunction

References Plana *et al.* 2004

- Structured treatment interruption (STI) alone is not able to control viral replication in chronically infected patients, probably due to lack of strong, maintained T-helper cell responses. HIV-1 specific CD8+ T-cell responses were shown to increase significantly until the end of the follow up, but were not correlated with viral load.
- 6/7 patients recognized this epitope.

Epitope IVLPEKDSW

Subtype B**Immunogen** HIV-1 infection**Species (MHC)** human (B*5701, B*5801)**Keywords** binding affinity, rate of progression, escape**References** Klein *et al.* 1998

- This peptide was defined as the optimal epitope.
- B57 has been associated with long-term non-progression in the Amsterdam cohort.
- The most pronounced CTL responses in HLA B*5701 LTS were to RT and Gag.
- B57 restricted CTL responses are targeted at multiple proteins, but one LTS had a response that was dominated by reactivity to the epitope – two variants were found in this LTS: ITLPEKESW, which bound to B*5701 with similar affinity as the index peptide but was an escape mutant that was not recognized by CTL, and IMLPEKDSW, which bound to B*5701 with reduced affinity but could still be recognized.
- In an additional HIV+ LTS, only the variant IELPEKDSW was found, and this epitope was recognized by CTL but had less affinity for B*5701 than the index peptide.
- This epitope was recognized in the context of both HLA-B*5701 and B*5801.

HXB2 Location RT (244–252)**Author Location** Pol (244–252)**Epitope** IVLPEKDSW**Immunogen** HIV-1 infection**Species (MHC)** human (B*5801)**References** Appay *et al.* 2000

- Combined tetramer and intracellular cytokine staining was used to study the function of circulating CD8+ T cells specific for HIV and CMV.
- HIV-specific CD8+ T cells expressed lower levels of perforin than CMV-specific CD8+ T cells from the same donor, and this was associated with persistent CD27 expression on HIV-specific cells, suggesting impaired maturation.
- In most donors, between 50% and 95% of the activated virus-specific CD8+ T cells produced IFN- γ and MIP-1 β with a distinct subset that failed to produce TNF- α

HXB2 Location RT (244–252)**Author Location** RT (399–407)**Epitope** IVLPEKDSW**Immunogen****Species (MHC)** human (B57)**References** van der Burg *et al.* 1997**HXB2 Location** RT (244–252)**Author Location** RT (244–252)**Epitope** IVLPEKDSW**Immunogen** HIV-1 infection**Species (MHC)** human (B57)**Keywords** early-expressed proteins, kinetics**References** Guillon *et al.* 2002b

- An early-expressed Nef protein was modified to contain Env and Pol epitopes to enable the study the effect of expression kinetics on CTL mediated suppression of replication. The "EpiNef" construct was inserted into a recombinant vaccinia virus which was used to infect a target cell line; the target cells

were lysed by CTL clones specific for the Env and Pol epitopes indicating that they were properly processed.

HXB2 Location RT (244–252)**Author Location** RT (244–252 ACH320.2A.2.1)**Epitope** IVLPEKDSW**Subtype** B**Immunogen** HIV-1 infection**Species (MHC)** (B57)**Keywords** acute/early infection, early-expressed proteins, kinetics**References** van Baalen *et al.* 2002

- Tat, Rev and Nef are the first HIV proteins expressed upon acute infection of T-cells (< 6 hours), and RT is not expressed until after 24 hours. The B14-restricted Rev-SAEPVPLQL specific CD8 T-cell clone TCC108, and the B57-restricted RT-IVLPEKDSW specific CD8 T-cell clone TCL1C11 were co-incubated with CD4+ cultures inoculated with HIV-1 at low MOI. Co-incubation with the Rev-specific CTL resulted in two logs less HIV-1 production in ten days of culture. When the RT epitope was cloned into the Nef gene of the infecting strain, another early expressed protein, it proved as effective as the Rev epitope at inhibiting viral production. A mathematical model of CTL-target interactions suggest early proteins are important for vaccine design.

HXB2 Location RT (244–252)**Author Location** Pol**Epitope** IVLPEKDSW**Epitope name** IW9**Subtype** B**Immunogen** HIV-1 infection**Species (MHC)** human (B57)**Assay type** CD8 T-cell Elispot - IFN γ **Keywords** subtype comparisons, escape, characterizing CD8+ T cells, reversion, viral fitness**References** Allen *et al.* 2005a

- Two-thirds of all mutations arising in nonenvelope proteins during the transition from acute to chronic infection were found to be due to either CD8 T-cell-associated selective pressures or reversion of HLA-I-associated mutations selected in a previous host. The predominance of escape mutations at highly polymorphic sites was observed across different HIV-1 clades.
- One escape mutation, at position 2, was found in the most polymorphic residue in the epitope. This was shared between clades B and C. The position 2 mutation was significantly more common among persons expressing HLA-B57.

HXB2 Location RT (244–252)**Author Location****Epitope** IVLPEKDSW**Immunogen** HIV-1 infection**Species (MHC)** human (B57, B*5801)**Assay type** CD8 T-cell Elispot - IFN γ , Chromium-release assay**Keywords** responses in children, mother-to-infant transmission, escape**References** Feeny *et al.* 2005

- Escape mutations in TW10 and other B57-restricted epitopes were shown to arise early in infants following perinatal infection. Some escape variants were likely to have been transmitted vertically, from HLA-B57/5801 positive HIV-1 infected mothers, while others arose during infancy in cases where the children inherited the B57/5801 allele paternally. In contrast to adults, the majority of children showed a robust response to the escape variants, suggesting that infants are able to mount functional immune responses and drive immune escape and that a developing immune system may exhibit greater plasticity in recognizing viral variants.

HXB2 Location RT (245–252)

Country South Africa.

Assay type CD8 T-cell Elispot - IFN γ

Keywords rate of progression

References Kiepiela *et al.* 2007

- A comprehensive analysis of 160 class I T cell responses in 578 individuals from KwaZulu-Natal, South Africa was performed. Gag-specific responses were associated with lowering viremia, while Env, accessory and regulatory protein-specific responses were associated with higher viremia.

HXB2 Location RT (259–267)

Author Location Pol

Epitope KLVGKLNWA

Immunogen HIV-1 infection

Species (MHC) human (A2 supertype)

Keywords supertype, rate of progression

References Propato *et al.* 2001

- Long-term nonprogressors (LTNPs) had strong memory resting CD8+ T-cell responses against the majority of epitopes tested, (18 for the A2 supertype, 16 for the A3 supertype) while the effector cells of long-term nonprogressors recognized far fewer epitopes.
- Progressors had memory resting CD8+ T-cells that recognized far fewer epitopes than LTNPs.

- A positive correlation between effector CD8+ T-cells and plasma viremia and a negative correlation between CD8+ effector T-cells and CD4+ T-cells was observed, which may contribute to the inability of LTNPs to clear virus.
- This epitope can bind four of the five HLA-A2 supertypes alleles (A*0201, A*0202, A*0203, A*0206 and A*6802).
- Tetramer staining with A2, beta2microglobulin, and either SLYNTVATL, KLVGKLNWA, or LTFGWCFKL revealed that tetramers detected more HIV-specific sells in LTNP than in progressors, activated effector cells were the minority population, and ELISPOT correlated better with the effector cell subpopulation than the total tetramer stained population.

Assay type CD8 T-cell Elispot - IFN γ
Keywords characterizing CD8+ T cells
References Kiepiela *et al.* 2004

- HLA class I restricted CD8+ T-cell responses against HIV-1 were analyzed in African patients. Significantly more responses were shown to be HLA-B restricted. Viral load, CD4 count, and thus rate of disease progression were also associated with HLA-B alleles. In addition, the selection pressure imposed on HIV-1 by HLA-B alleles was shown to be substantially greater than by other alleles.
- This epitope was suggested to be the epitope within a longer reactive peptide based on correspondence with a known epitope in the HIV database. Also, a significantly higher frequency of people in the Durban cohort who reacted with the peptide had this HLA type.

References Altfeld *et al.* 2002b

- Peripheral blood (PB) and lymph node (LN) CD8+ T-cell responses were compared in 15 asymptomatic HIV-1 infected patients using all known optimal CTL epitopes (<http://hiv-web.lanl.gov/content/hiv-db/REVIEWS/brander2001.html>) for each person's class I HLA alleles.
- 60 epitope responses were detected in both PB and LN samples of the 15 patients, and an additional 8 responses were detected only in LN. The total magnitude of the response was similar in LN and PB, but the percentage of CD8+ T cells in the LN is lower so the number of HIV-specific cells per million CD8+ T-cells is higher in the LN.
- 1 year post-HAART treatment in five patients studied, the magnitude of the CD8 T-cell response was decreased in both LN and PB, but more dramatically in PB, and 13/25 epitope responses in the PB became undetectable, in contrast to 5/26 in the LN.
- Treatment interruption following HAART resulted in increased viremia accompanied by the restoration of the detection of 13 epitopes that had become undetectable in the PB, and the addition of 9 novel epitope responses.
- Breakdowns of epitope responses were shown for 4 individuals. Patient D displayed the greatest response to B27-KK10 (p24), and also responded to A30-RY11(p17), A32-PW10(RT), A30-KY11(RT), A32-RW10(gp120), and B18-YY9(Nef).

Keywords HLA associated polymorphism
References Boutwell & Essex 2007

- All HIV-1 subtype C protein sequences were analysed, and 94 HLA-associated amino acid polymorphisms were found that were well distributed throughout the proteome. These sequences were compiled from publicly available databases and originated in South Africa and Botswana. Many polymorphisms were associated with multiple HLA allele classes. 12% of negative associations were found as well, where there was an association of virus expression of the consensus amino acid with a specific HLA allele. HLA-B alleles were involved in most of the associations. 19 HLA-associated polymorphisms were embedded in previously defined epitopes presented by an appropriate HLA restricting molecule.
- QIYPGIKVR was a previously defined A*0301 presented epitope that encompassed an A*03- associated polymorphism, QIYPGIKVrIQ, in the last position. This epitope was embedded in a previously determined CTL immunoreactive region.

Assay type CD8 T-cell Elispot - IFN γ
Keywords subtype comparisons, escape, characterizing CD8+ T cells, reversion, viral fitness
References Allen *et al.* 2005a

- Two-thirds of all mutations arising in nonenvelope proteins during the transition from acute to chronic infection were found to be due to either CD8 T-cell-associated selective pressures or reversion of HLA-I-associated mutations selected in a previous host. The predominance of escape mutations at highly polymorphic sites was observed across different HIV-1 clades.
- One escape mutation, at position 9, qiypgikvR, was found not to correspond to the most polymorphic residues in the epitope.

HXB2 Location RT (271–279)
Author Location (LAI)
Epitope YPGIKVRQL
Subtype B
Immunogen HIV-1 infection

Species (MHC) human (B*4201)
Keywords optimal epitope
References Frahm *et al.* 2007

- C. Brander notes this is a B*4201 epitope.

Immunogen HIV-1 infection
Species (MHC) human (B*4201)
Country South Africa.
Assay type CD8 T-cell Elispot - IFN γ
Keywords characterizing CD8+ T cells
References Kiepiela *et al.* 2004

- HLA class I restricted CD8+ T-cell responses against HIV-1 were analyzed in African patients. Significantly more responses were shown to be HLA-B restricted. Viral load, CD4 count, and thus rate of disease progression were also associated with HLA-B alleles. In addition, the selection pressure imposed on HIV-1 by HLA-B alleles was shown to be substantially greater than by other alleles.
- This epitope was suggested to be the epitope within a longer reactive peptide based on correspondence with a known epitope in the HIV database. Also, a significantly higher frequency of people in the Durban cohort who reacted with the peptide had this HLA type.

HXB2 Location RT (271–279)

Epitope YPIGKVRQL
Subtype C
Immunogen HIV-1 infection
Species (MHC) human (B*4201)
Country South Africa.
Assay type CD8 T-cell Elispot - IFN γ
Keywords rate of progression, optimal epitope
References Kiepiela *et al.* 2007

- A comprehensive analysis of 160 class I T cell responses in 578 individuals from KwaZulu-Natal, South Africa was performed. Gag-specific responses were associated with lowering viremia, while Env, accessory and regulatory protein-specific responses were associated with higher viremia.
- Mutational patterns in the L9 residue of YPIGKVRQL are associated with the presence of the HLA presenting molecule in the host.

HXB2 Location RT (271–279)
Author Location RT (271–279)
Epitope YPGIKVRQL
Subtype C
Immunogen HIV-1 infection
Species (MHC) human (B*4201)
Assay type Other
Keywords HLA associated polymorphism
References Boutwell & Essex 2007

- HIV-1 subtype C proteins were analysed and 94 HLA-associated amino acid polymorphisms were found. Many polymorphisms were associated with multiple HLA allele classes. 12% of negative associations were found as well, where there was an association of virus expression of the consensus amino acid with a specific HLA allele. HLA-B alleles were involved in most of the associations. 88% of CTL immunodominant regions had same HLA-associations as found polymorphisms. In 19 studied CTL epitopes, the epitope-restricting allele was same as the polymorphism-restricting allele for 7, and in 12 the alleles differed by specificity.

- YPGIKVRQL was a previously defined B*4201 presented epitope that encompassed an B*42 associated polymorphism, YpGIKVRQL, in the second position. This epitope was found embedded in a previously determined immunoreactive region.

Species (MHC) human (B*3501)

Donor MHC A*2402, A*2601, B*3501, B*5101

Country Japan.

Assay type Cytokine production, Tetramer binding, Chromium-release assay

Keywords binding affinity, kinetics, TCR usage, characterizing CD8+ T cells, immune dysfunction

References Ueno *et al.* 2004b

- Two different clonotypes of CD8+ T-cells with specificity for this epitope were isolated from a chronic HIV+ patient. The clonotype with the relatively high affinity TCR had no cytolytic activity, cytokine production or proliferation in response to HIV-infected cells, while the moderate affinity clonotype had strong reactions. More than 3-fold increased duration in tetramer 1/2 life was observed with the defective clonotype. The TCRs from the two clonotypes preserved the phenotype when transduced into primary CD8+ T cells, suggesting the TCR with higher affinity was directly associated with impaired T-cell reactivity of the cells.
- The high affinity impaired TCR was Valpha1.1/Vbeta13.3, the moderate affinity active TCR was Valpha12.1/Vbeta5.6.

Keywords rate of progression, immunodominance, escape

References Oxenius *et al.* 2004b

- The increase in plasma viral load in a patient that progressed rapidly was preceded by positive selection of viral escape mutations in epitopes targeted by dominant HIV-1-specific CD8+ T-cell responses, and a decrease in HIV-1-specific CD4+ and CD8+ T-cell frequencies. Overall, escape variant epitopes were recognized 0-80% as efficiently as the index peptide, and the relatively efficiency of the variant epitopes increased using PBLs collected after their appearance. No changes were found in viral tropism, replication kinetics and neutralizing antibody titers so the rapid decline of the patient was attributed to loss of HIV containment due to CTL escape.
- The IPL epitope was found to be under positive selection for escape mutations and it was replaced by first variant between days 297 and 369, ipltGaeel. This new variant was subsequently replaced by 2 further variants, that were even more resistant to CD8+ T cell recognition between days 369 and 635, ipltAeael and ipltVeael.

Author Location

Epitope ILKEPVHGV

Immunogen HIV-1 infection

Species (MHC) human (A*0201)

Keywords acute/early infection

References Wilson *et al.* 2000a

- Three individuals with highly focused HIV-specific CTL responses were studied during acute infection using tetramers – high frequencies of HIV-1-specific CD8+ T cells were found prior to seroconversion, and a close temporal relationship between the number of circulating HIV-specific T cells and viral load.
- All three patients were B*2705, with HLA alleles: A1, A30/31, B*2705, B35; A1, A*0301, B7, B2705; and A*0201, A*0301, B2705, B39.
- ELISPOT was used to test a panel of CTL epitopes that had been defined earlier and were appropriate for the HLA haplotypes of the study subjects – 3/3 subjects showed a dominant response to the B*2705 epitope KRWIILGGLNK.
- The subject with A*0201 had a moderately strong response to SLYNTVATL.

- Weak responses were observed to A*301-RLRPGGKKK, A*301-QVPLRPMTYK, and B7-TPGPGVRYPL in the subject who was HLA A1, A*0301, B7, B*2705.

- No acute response was detected to the following epitopes: A*201-ILKEPVHGV, A*301-KIRLRPGGK, A*301-AIFQSSMTK, A*301-TVYYGVPVWK, B35-EPIVGAETF, B35-HPDIVIYQY, B35-PPIPVGEIY, B35-NSSKVSQNY, B35-VPLRPMTY, B35-DPNPQEVVL.

Epitope ILKEPVHGV

Immunogen HIV-1 infection

Species (MHC) human (A*0201)

Keywords epitope processing, immunodominance

References Sewell *et al.* 1999

- Proteasome regulation influences epitope processing and could influence immunodominance.
- The proteasome is inhibited by lactacystin treatment, and gamma IFN induces expression of proteasome subunits, LMP2 and LMP7, which combine with the proteasome to create an immunoproteasome.
- IFN-gamma induction of the immunoproteasome and lactacystin inhibition increases the presentation of the A*0201 VIYQYMDDL epitope, but decreases the presentation of the A*0201 ILKEPVHGV epitope, which is immunodominant within pol proteins, showing the two epitopes are processed by different pathways.
- ILKEPVHGV seems to be processed by the classical proteasome pathway, while VIYQYMDDL appears to be destroyed by this pathway.
- This epitope contains the catalytic site (YMDD) of RT, a conserved sequence in HIV-1 which restricts escape mutants.

HXB2 Location RT (309–317)

Immunogen HIV-1 infection

Species (MHC) human (A*0201)

Keywords review, escape

References Goulder *et al.* 1997e; Goulder *et al.* 1997a; Menendez-Arias *et al.* 1998

- HLA-identical sibling hemophiliac brothers were both infected with the same batch of factor VIII.
- One had a response to gag A2 epitope SLYNTVATL, the other to pol A2 epitope ILKEPVHGV. They were tested 6-8 years after infection.
- Viral sequencing from the twin that had no response to SLYNTVATL indicated his virus had the substituted form SLH-NAVAVL.
- 71% of an additional set of 22 HIV-1 infected HLA-A*0201 positive donors preferentially responded to gag SLYNTVATL.
- Those individuals with a pol ILKEPVHGV response tended to have mutations in or around SLYNTVATL.
- Goulder *et al.* [1997a] is a review of immune escape that summarizes this study.

Epitope ILKEPVHGV

Immunogen HIV-1 infection

Species (MHC) human (A*0201)

References Altman *et al.* 1996

- This paper introduces the tetramer methodology which permits quantification of specific CTL based on expression of specific TCRs—HLA-A2 tetramers were prepared that can stain CTL lines specific for ILKEPVHGV and SLYNTVATL, and can quantify HIV-specific CD8+ cell lines in freshly isolated PBMCs.
- Three patients only stained the Gag epitope SLYNTVATL, one patient had the highest frequency of tetramer staining to the Pol epitope (0.77%), less to the Gag epitope (0.28%)
- The A2-Pol CD8+ clones were CD45RO positive and HLA-DR and CD38 negative, suggesting a memory rather than effector phenotype.

Epitope ILKEPVHGV

Subtype B

Immunogen HIV-1 infection

Species (MHC) human (A*0201)

Keywords epitope processing, immunodominance

References Sewell *et al.* 2002

- Epitope processing of three different HLA-A*0201 HIV epitopes was shown to use different pathways, which might influence patterns of immunodominance. .174 cells were used that lack TAP1 and TAP2 genes, as well as the LMP2 and LMP7 genes that encode the beta-subunits of the immunoproteasome. These genes could be added back through transfection to study processing.
- ILKEPVHGV was efficiently presented in TAP-1 and -2 transfected cells while VIYQYMDDL and SLYNTVATL were not. VIYQYMDDL was destroyed by the MB1 subunit of the protease, and could be expressed in the presence of the proteasome inhibitor lactacystin, but SLYNTVATL expression was not restored. SLYNTVATL expression was unaltered by lactacystin in a wild type cell line.

Epitope ILKEPVHGV

Epitope name LR22

Subtype B

Immunogen vaccine

Vector/Type: peptide *Strain:* B clade LAI

Adjuvant: Incomplete Freund's Adjuvant (IFA), IL-12, P30

Species (MHC) mouse (A*0201)

Keywords vaccine-specific epitope characteristics, immunodominance

References Peter *et al.* 2002

- When HIV-1 peptides were used to vaccinate HLA-A2.1 transgenic A2-Kb mice, strong responses to five peptides were observed when the peptides were given individually, but immunodominance limited the response to some of the peptides when they were given in combination Peter *et al.* [2001]. IL-12 can counteract immunodominance in BALB/c mice, so it was given with the multiple epitope vaccination, and was instead found to specifically eliminate the HLA-A2.1-epitope CTL responses, but not Kb CTL responses. This was possibly a consequence of transient depletion of T-cells, B cells and macrophages in the spleen.

Immunogen HIV-1 infection, vaccine

Vector/Type: DNA prime with modified vaccinia Ankara (MVA) boost *Strain:* A clade
HIV component: p17 Gag, p24 Gag

Species (MHC) human, macaque (A*0201)

Keywords subtype comparisons, epitope processing, vaccine-specific epitope characteristics, immunodominance

References Hanke & McMichael 2000; Wee *et al.* 2002

- The HIV-1 subtype A focused vaccine HIVA contains p24 and p17, in a reversed order relative to the Gag polyprotein to prevent myristylation of p17, which could direct the protein to the cell membrane and inhibit efficient peptide processing and class I presentation, as well as a polypeptide string of conserved, often immunodominant epitopes that were selected to have particularly good cross-reactive potential for the A-clade epidemic in Nairobi, Kenya. A DNA and MVA prime-boost vaccination protocol using the HIVA antigen will be used in a phase III clinical trial in Kenya. This epitope is included in the polypeptide string Hanke & McMichael [2000].
- Multiple CD4+ or CD8+ T-cell vaccine-induced responses to peptide pools were detected using intracellular cytokine staining and IFN-gamma Elispot assays after vaccination of 5 macaques. The response to the Mamu A*01 SIV p27 epitope p11C (CTPYDINQM), included in the polypeptide region, was not immunodominant in the Mamu A*01 vaccinated macaques, possibly because of processing limitations in context of the artificial polypeptide string Wee *et al.* [2002].

Epitope ILKEPVHGV

Subtype B

Immunogen in vitro stimulation or selection

Species (MHC) human (A*0201)

Keywords epitope processing, dendritic cells

References Andrieu *et al.* 2003

- This study demonstrates that lipopeptides carrying epitopes can be taken up by human dendritic cells, processed using different pathways, and recognized by epitope-specific CD8+ T-cells originally derived from HIV+ individuals. The RT ILKEPVHGV peptide was embedded in a longer peptide fragment in the lipopeptide, and was internalized by endocytosis and processed in the cytosol by proteasomal cleavage by following an endosome-to-cytosol pathway for processing and presentation. Administration of epoxomycin, a proteasome inhibitor, completely abrogated epitope presentation to a CD8+ T-cell line, while monensin, an inhibitor of acid-dependent endosomal enzyme activity did not.
- In contrast to the RT epitope, dendritic cell presentation of the Nef epitope QVPLRPMTYK embedded in a longer peptide in a lipopeptide was not inhibited by epoxomycin, but was inhibited by monensin, indicative of endocytotic epitope processing.

- Epitope name** IV9
Subtype B
Immunogen HIV-1 infection
Species (MHC) human (A*0201)
Assay type Cytokine production, proliferation, Tetramer binding, Intracellular cytokine staining, Chromium-release assay
References Dagarag *et al.* 2003
- Telomer length is short in the CD8+ T-cell compartment of HIV-1 infected people, indicating excessive CTL activation and premature senescence. Here human telomerase RT (hTERT) transduction of HIV-1-specific CTL was used to study the functional impact of telomerase. Telomerase expression enhanced proliferative capacity, as well as cytolytic and antiviral capabilities; cytokine production was unchanged. hTERT transduced CTLs were 10-fold more efficient in controlling HIV-1 replication in culture. Thus telomerase transduction can restore CTL mediated cytolysis, and may have therapeutic potential.
 - Three polyclonal CD8+ T-cell lines derived from an HIV-1, HLA A*0201 positive patient were used in this study, including one specific for this epitope. An IV9-specific monoclonal cell line, 68A62 was also generated.

Epitope ILKEPVHGV
Epitope name IV9
Immunogen HIV-1 infection
Species (MHC) human (A*0201)
Assay type Tetramer binding
Keywords genital and mucosal immunity
References Shacklett *et al.* 2003

- Lymphocytes from rectal biopsies were used to characterize the CD8+ T cell response to HIV in GALT, Gut-associated lymphoid tissues. Patients were selected on the basis of being HLA-A2+ and having detectable SLYNTVATL and ILKEPVHGV tetramer responses in PBMC. SLYNTVATL frequency was increased in GALT relative to PBMC in 6/7 patients studied, while a control response to a CMV-peptide was diminished in GALT. Only two patients had ILKEPVHGV CD8+ T cell responses, and both had slightly higher frequencies in GALT than PBMC.
- HIV may perturb lymphocyte retention in GALT, suggested by an overall reduction of GALT CD8+ cells expressing alphaE-beta7. GALT HIV-specific CD8+ T cells expressed alphaE-beta7, suggesting mucosal priming.

References Mollet *et al.* 2000

- A panel of 16 epitopes covering 15 class I alleles was tested in 14 HIV+ patients from an unselected Caucasian population treated with HAART, using tetramer staining or CD8+ cell IFN γ production to measure responses.
- In general, during the first month of treatment viral load decreased and frequencies of HIV-specific CTL tripled and broadened – eight new HIV specificities that were not previously detectable were newly detected, as were CMV specific CD8+

PBL – but with continued viral suppression, HIV-specific responses diminished.

- Viral rebounds gave different patterns of response: increases or decreases in pre-existing response, new specificities, or no change.

Author Location Pol (476–484)

Epitope ILKEPVHGV

Immunogen vaccine

Vector/Type: vaccinia

Species (MHC) human (A2)

References Woodberry *et al.* 1999

- A polypeptide vaccine was generated in a vaccinia construct that contiguously encoded seven epitopes, all presented by HLA A-2.
- HHD mice have a transgene of HLA A2 linked to the transmembrane and cytotoxic domains of H-2D^d – this transgene is the only MHC molecule expressed in the mice.
- CTL responses to Gag (77-85) SLYNTVATL, Pol (476-484) ILKEPVHGV, gp120 (120-128) KLTPLCVTL, and Nef (190-198) AFHHVAREL were observed in HIV polytope HHD-vaccinated mice, and these responses were enhanced with vaccinia boost.
- No CTL immune responses were generated against HLA A2-restricted HIV epitopes Nef 157-166 (PLTFGWYKYL), Pol 346-354 (VIYQYMDDL), and Nef 180-189 (VLEWRFDSSL).
- Sixteen HLA A2+ patients were tested for their ability to make CTL responses by peptide restimulation in culture with the epitopes selected for inclusion in the polytope – one individual recognized all seven of these epitopes; 7 patients had CTL cultures able to recognize at least one of the epitopes, and 6 of those 7 recognized more than one epitope, but they were not able to test all peptides for all patients; many patients only had three peptides tested.
- ILKEPVHGV was recognized by 2 of the patients.

Epitope ILKDPVHGV

Immunogen HIV-1 infection, HIV-1 exposed seronegative

Species (MHC) human (A2)

Keywords subtype comparisons, HIV exposed persistently seronegative (HEPS), immunodominance

References Kaul *et al.* 2001a

- Variants ILK(D/E)PVHGV are A/B clade specific.

- ELISPOT was used to study CTL responses to a panel of 54 predefined HIV-1 epitopes in 91 HIV-1-exposed, persistently seronegative (HEPS) and 87 HIV-1-infected female Nairobi sex workers.

- Responses in HEPS women tended to be lower, and focused on different epitopes with HLA presenting molecules that have previously been associated with reduced risk of infection, and there was a shift in the response in the HEPS women upon late seroconversion to epitopes recognized by the HIV-1 infected women.

- 43/91 HEPS women had CD8+ responses and detection of HIV-1-specific CTL in HEPS women increased with the duration of viral exposure.

- Among HLA-A2 women, 7/10 HEPS and 14/26 HIV-1 infected women recognized this epitope, and ILK(D/E)PVHGV tended to be more reactive in HEPS women, SL(F/Y)NTVATL in infected women.

- The dominant response to this HLA allele was to this epitope in all 7/10 HEPS cases but in only 5 of the 14/26 HIV-1 infected women.

- Four epitopes were considered to be “resistant epitopes”, as they were preferentially reactive in HEPS women and so may confer resistance, and these were found in three different proteins: A2 ILK(D/E)PVHGV in RT, A*6802 DTVLEDINL in Protease, B14 DLN(M/T)LN(I/V)V in p24 and B18 FRDYV-DRF(Y/F)K also in p24.

- Differences in epitope specificity were only seen for responses restricted by class I HLA alleles A2, A24, A*6802, B14, and B18, previously shown to be associated with resistance to HIV-1 in this cohort.

- Subject ML 1250 had an A2 response to ILK(D/E)PVHGV prior to seroconversion, which switched to SL(F/Y)NTVATL post-seroconversion.

- Subject ML 1760 had an A2 response to ILK(D/E)PVHGV prior to seroconversion, and gained responses to epitopes A2 SL(F/Y)NTVATL and B27 KRWII(L/M)GLNK post-seroconversion.

- Ritonavir (RTV) inhibits chymotryptic activity in the 20S proteasome *in vitro*, as does Saquinavir (SQV) to a lesser extent; Indinavir (IDV) does not. Thus there is concern protease inhibitors may adversely effect CTL epitope processing, but this paper indicates that processing is not inhibited at therapeutically relevant concentrations of RTV when the proteasome is functioning in an intracellular context.

- RTV did not alter the presentation two RT A2 epitopes processed by distinct pathways: ILKEPVHGV, generated by the constitutive proteasome containing the MB1 beta subunit, and VIYQYMDDL which is dependent on IFN γ induction of LMP7 which replaces MB1 in the immunoproteasome, and is destroyed by MB1 in the constitutive proteasome.
- RTV did not inhibit the processing and assembly of HLA-B35 or -A2, which are assembled with a rapid and moderate time course, respectively, or of HLA-A3, -B27 and -B39.

Donor MHC A2
Keywords epitope processing
References Cohen *et al.* 2002
- The antigen presentation of two A2-restricted epitopes was compared, SLYNTVATL (p17) and ILKEPVHGV (RT). HIV-1 infected cells were more sensitive to lysis by SLYNTVATL-specific CTL than by ILKEPVHGV-specific CTL, because of a higher density of SLYNTVATL-A2 resulting from differences in processing.

- Incubation with a T1-cell proteolytic extract showed that by four hours, 25% of a p17 peptide had a C-term Leu-85 and were SLYNTVATL-precursors, while ILKEPVHGV-precursors were far less frequent (6.8%) even with four times more proteolytic extract after 30 hours.
- p17 was preferentially cleaved between Leu85 and Tyr86, while appropriate Val484 and Tyr485 cleavage was minor for RT.
- In a competition experiment, RSLYNTVATL bound TAP 3.7-fold more efficiently than RT peptides.
- No difference in CTL avidity was detected in six patients with HLA-A2-restricted responses to these epitopes.
- No significant difference in HLA-A2 binding of to p17 or RT epitopes was observed.

Keywords class I down-regulation by Nef, escape

References Ali *et al.* 2003

- NL43 was passaged in the presence of Nef KEKGGLEGL-specific CTL clones STD11 and KM3, giving rise to rapid selection of escape mutations, including E93G, E93K, K94N+G99R, G95R+G99R, E98K, E98D, G99R, G99E, L100P, and L100I; insertions, deletions, frameshifts and an early stop codon. 34/36 (94%) of sequences carried mutations in the epitope by seven days, 36/36 (100%) by 14 days.
- Several mutations selected by KEKGGLEGL-specific CTL were shown to impair the down regulation of class I MHC by Nef, in particular E93G, E93K, and a truncation mutation at position 51.
- Nef deletion mutants increased 100-fold NL-43 susceptibility to inhibition by CTL specific for epitopes in other proteins, the A2 epitopes ILKEPVHGV in RT and SLYNTVATL in p17 Gag.

Epitope ILKEPVHGV

Epitope name Pol476

Immunogen HIV-1 infection

Species (MHC) human (A2)

Assay type CD8 T-cell Elispot - IFN γ , Chromium-release assay, Flow cytometric T-cell cytokine assay

Keywords binding affinity, subtype comparisons, computational epitope prediction

References Corbet *et al.* 2003

- HLA-A2-restricted HIV-1 CTL epitopes were computationally predicted. Binding affinities for HLA-A*0204, immunogenicity in HLA-A*0201 transgenic mice, and responses to the peptides in 17 HIV-1 infected patients were tested. 31 novel conserved A2 epitopes were detected. An average of 4 epitopes were recognized per patient.
- This epitope was one of the previously identified HLA-A2 epitopes studied.
- 9/17 HIV-infected HLA-A2+ people recognized this epitope.

Epitope ILKEPVHGV

Immunogen HIV-1 infection

Species (MHC) human (A2)

Assay type CD8 T-cell Elispot - IFN γ , Tetramer binding, Flow cytometric T-cell cytokine assay

Keywords responses in children

References Sandberg *et al.* 2003

- 65 vertically HIV-1 infected children, ages 1-16, the majority undergoing ART, were analyzed in regard to their plasma viremia and CD4+ and CD8+ T cell counts, and CD8+ T cell responses.
- Using vaccinia expressed Gag, Pol, Env, Rev, Nef in target cells in an Elispot assay, 85% of the children recognized at least one HIV antigen. The strong CD8+ T cell responses were directed against Pol, followed by Gag and Nef. Children younger than 4 had significantly weaker responses (7/14 had no response) than older children (only 1/32 had no response, and responses were greater in magnitude).
- SLYNTVATL and ILKEPVHGV tetramers were used to quantify specific responses. 49 children in an expanded cohort carried HLA-A2. 1/11 children under 3 years of age had detectable CD8+ T-cell responses to SLYNTVATL, 2/11 to ILKEPVHGV. Among children over 3, 11/38 recognized SLYNTVATL and 9/38 recognized ILKEPVHGV.
- Older children that maintained a CD4 count greater than 400 cells/ul tended to have stronger CTL responses.

Assay type Cytokine production, CD8 T-cell Elispot - IFN γ , Tetramer binding, Intracellular cytokine staining

Keywords assay standardization/improvement, memory cells

References Sun *et al.* 2003

- This study compares assay methods for testing CTL responses using samples from 20 HIV+ patients. The study compares ELISpot, tetramer-binding, and intracellular IFN γ . Tetramer-binding analysis was performed with Gag (SLYNTVATL) or Pol (ILKEPVHGV) tetramers. Antigen presentation using recombinant vaccinia viruses (rVVs) encoding HIV-LAI Gag, Pol, Env, Nef, Tat and Vif proteins was compared to peptide panels. HIV antigen recognition in memory CTLs was measured by chromium release assay and compared to effector/memory CD8+ T cells in an IFN- γ ELISpot assay.
- Results: IFN γ Elispot and flow cytometry gave similar frequencies of HIV specific CD8+ T cells. Tetramer-binding analysis was most sensitive. Pools of peptides and the sum of frequencies of individual peptides were comparable. Elispot assays using peptides were more sensitive than assays using vaccinia expressed proteins. Cr release and Elispot against rVVs gave comparable memory cell responses 2/3s of the time.
- 3/7 HLA-A2+ patients recognized this epitope.

Epitope ILKEPVHGV

Epitope name IV9

Subtype B

Immunogen HIV-1 infection

Species (MHC) human (A2)

Assay type Chromium-release assay, CTL suppression of replication

Keywords escape

References Yang *et al.* 2003a

- Virus was cultured in the presence of CTL lines specific for 4 different epitopes (SLYNTVATL, ILKEPVHGV, IEIKDTKEAL, and KEKGGLEGL) to study the emergence of escape mutations. Escape varied between clones for the same epitope, and between different epitopes. Gag and RT epitope escape, if it occurred at all, tended to be monoclonal and within the epitope, indicating strong fitness constraints, while the Nef epitope escape was rapid, polyclonal, and sometimes the result of upstream frameshifts.
- There was one cloned cell line that recognized ILKEPVHGV, 68A62. After 2 weeks of passaging HIV-1 in the presence of 68A62, the mutated epitope ilkeLvHgv was found in 6/12 sequences.

Epitope ILKEPVHGV

Immunogen HIV-1 infection

Species (MHC) human (A2)

Country Spain.

Assay type proliferation, CD8 T-cell Elispot - IFN γ , Flow cytometric T-cell cytokine assay

Keywords HAART, ART, supervised treatment interruptions (STI), immune dysfunction

References Plana *et al.* 2004

- Structured treatment interruption (STI) alone is not able to control viral replication in chronically infected patients, probably due to lack of strong, maintained T-helper cell responses. HIV-1 specific CD8+ T-cell responses were shown to increase significantly until the end of the follow up, but were not correlated with viral load.
- 9/19 patients recognized this epitope.

HXB2 Location RT (309–317)

Author Location RT (309–317)

Epitope ILKEPVHGV

Epitope name RT-IV9

Subtype B

Immunogen HIV-1 infection

Species (MHC) human (A2)

Assay type Chromium-release assay

Keywords binding affinity, TCR usage, characterizing CD8+ T cells

References Yang *et al.* 2003b

- Killing efficiency of CTLs and their ability to suppress viral replication is shown to depend more on epitope specificity than to antigenic avidity. Different clones recognizing the same epitope had similar killing efficiency despite their variation in avidity. Nef specific CTL clones tended to be most inhibitory, followed by Gag, then by RT specific clones, regardless of avidity.
- 2/14 CTL T-cell clones tested were specific for RT/IV9. Under conditions of excess peptide (100 μ g/ml), there was no difference in their lytic potential; all possessed similar effector capacity. Avidity was measured as the sensitizing dose of peptide required for 50% of maximal killing (SD50), which varied from 20 pg/ml to 100 ng/ml, over four orders of magnitude for all 14 epitopes. The SD50 values for the two RT/IV9 clones were very different, 50 and 20,000 pg/ml.

- CD8 T-cell responses were studied in individuals who remained seronegative in spite of being mucosally (group 1) or intravenously (group 2) exposed to HIV-1. A similar proportion of subjects from each group recognized at least 1 HIV peptide, and they recognized peptides with similar cumulative intensity. The proportion of responding individuals in both groups was significantly greater than in a low-risk, negative control group. One exposed uninfected subject recognized 7 epitopes.
- HLA-A*0201 epitopes that are immunodominant in chronically infected individuals were rarely stimulatory in exposed uninfected individuals. SLYNTVATL was recognized by one HLA A2+ individual in each group (1/11 vs 1/5), while none of the exposed uninfected individuals tested responded to ILKEPVHGV. In contrast, chronically infected subjects recognized these epitopes at a frequency of 69% and 31%, respectively.

HXB2 Location RT (309–317)**Author Location** RT (476–484)**Epitope** ILKEPVHGV**Epitope name** IV9**Immunogen** HIV-1 infection**Species (MHC)** human (A2)**Country** Germany.**Assay type** CD8 T-cell Elispot - IFN γ , Chromium-release assay**Keywords** HAART, ART, TCR usage, characterizing CD8+ T cells, optimal epitope**References** Schmitt-Haendle *et al.* 2005

- CTL responses to 3 HLA-A2-restricted epitopes were investigated in 51 HIV-1 infected HLA-A2+ individuals. The most prevalent response was seen for IV9, followed by SL9. The VL9 epitope was not recognized. There was a significant correlation of CTL activity to the CD8 counts in peripheral blood, but no correlation to CD4 counts, viral load, or antiviral therapy.
- 37.3% of the individuals recognized ILKEPVHGV.
- All analyzed mutations for RT-IV9 epitope could decrease or abrogate CTL recognition dependent on the CTL clones tested, but all were fully immunogenic for other CTL clones. The ilkDpvhgv, ilkEpvhEv, Rlkepvhgv and ilRepvhgv variants were tested.

HXB2 Location RT (309–317)**Author Location** Pol (476–484)**Epitope** ILKEPVHGV**Immunogen** HIV-1 infection**Species (MHC)** human (A2 supertype)**Keywords** supertype, rate of progression**References** Propato *et al.* 2001

- Long-term nonprogressors (LTNPs) had strong memory resting CD8+ T-cell responses against the majority of epitopes tested, (18 for the A2 supertype, 16 for the A3 supertype) while the effector cells of long-term nonprogressors recognized far fewer epitopes.
- Progressors had memory resting CD8+ T-cells that recognized far fewer epitopes than LTNPs.
- A positive correlation between effector CD8+ T-cells and plasma viremia and a negative correlation between CD8+ effector T-cells and CD4+ T-cells was observed, which may contribute to the inability of LTNPs to clear virus.
- This epitope can bind three of the five HLA-A2 supertypes alleles (A*0201, A*0202, A*0203, A*0206 and A*6802).

Species (MHC) human (B62)

Keywords subtype comparisons, epitope processing, vaccine-specific epitope characteristics, immunodominance

References Hanke & McMichael 2000; Wee *et al.* 2002

- The HIV-1 subtype A focused vaccine HIVA contains p24 and p17, in a reversed order relative to the Gag polyprotein to prevent myristylation of p17, which could direct the protein to the cell membrane and inhibit efficient peptide processing and class I presentation, as well as a polyepitope string of conserved, often immunodominant epitopes that were selected to have particularly good cross-reactive potential for the A-clade epidemic in Nairobi, Kenya. A DNA and MVA prime-boost vaccination protocol using the HIVA antigen will be used in a phase III clinical trial in Kenya. This epitope is included in the polyepitope string Hanke & McMichael [2000].
- Multiple CD4+ or CD8+ T-cell vaccine-induced responses to peptide pools were detected using intracellular cytokine staining and IFN γ Elispot assays after vaccination of 5 macaques. The response to the Mamu A*01 SIV p27 epitope p11C (CTPYDINQM), included in the polyepitope region, was not immunodominant in the Mamu A*01 vaccinated macaques, possibly because of processing limitations in context of the artificial polyepitope string Wee *et al.* [2002].

Author Location Pol (487–497 93TH253 subtype CRF01)
Epitope QIYQEPFKNLK
Epitope name P495-505
Subtype CRF01_AE
Immunogen HIV-1 infection, HIV-1 exposed seronegative
Species (MHC) human (A11)
Keywords HIV exposed persistently seronegative (HEPS)
References Sriwanthana *et al.* 2001

- This was a study of HIV-1 exposed persistently seronegative (HEPS) female sex workers in Chiang Mai, northern Thailand.
- HLA-A11 is very common in this population, and was enriched among the HEPS sexworkers – weak CTL responses were detected in 4/7 HEPS women, and CTL responses were found in 8/8 HIV+ controls, and 0/9 HIV- women that were not exposed.
- This epitope was weakly reactive in the HEPS study subject 128 who was HLA A11/A33.
- This epitope was reactive in HIV+ study subjects 053 and 184 who carried HLA-A11.

HXB2 Location RT (340–350)
Author Location Pol (487–497 93TH253 subtype CRF01)
Epitope QIYQEPFKNLK
Subtype CRF01_AE
Immunogen HIV-1 infection
Species (MHC) human (A11)
Keywords subtype comparisons
References Bond *et al.* 2001

- HLA-A11 CRF01 (called subtype E in Bond *et al.*) epitopes were identified that stimulated CTL from HIV+ female sex workers (FSW) from Northern Thailand, of whom more than half were HLA-A11 positive.
- 77 possible HLA-A11 epitopes were first defined using EpiMatrix, these were screened for binding to A11 finding and 26 bound, and 12 of these were epitopes for CTL responses from 8 HLA-A11 positive FSWs, six were novel, six were previously identified.
- This epitope was not predicted by the EpiMatrix method to be likely to bind to A11, though it served as an epitope in the FSWs, and it was one of the six A11 epitopes that had been previously defined.
- 5/8 tested FSWs recognized this epitope.
- This epitope was highly conserved in other subtypes, although exact matches were not very common.

Immunogen HIV-1 infection

Species (MHC) human (A11)

References Ferrari *et al.* 2000

- One of the 51 HIV-1 epitopes selected by Ferrari *et al.* as good candidate CTL epitopes for vaccines by virtue of being conserved and presented by common HLA alleles.

HXB2 Location RT (341–349)

Author Location (C consensus)

Epitope IYQEPFKNL

Subtype C

Immunogen HIV-1 infection

Species (MHC) human (A*2301)

Country South Africa.

Assay type CD8 T-cell Elispot - IFN γ

Keywords characterizing CD8+ T cells

References Kiepiela *et al.* 2004

- HLA class I restricted CD8+ T-cell responses against HIV-1 were analyzed in African patients. Significantly more responses were shown to be HLA-B restricted. Viral load, CD4 count, and thus rate of disease progression were also associated with HLA-B alleles. In addition, the selection pressure imposed on HIV-1 by HLA-B alleles was shown to be substantially greater than by other alleles.
- This epitope was suggested to be the epitope within a longer reactive peptide based on correspondence with a known epitope in the HIV database. Also, a significantly higher frequency of people in the Durban cohort who reacted with the peptide had this HLA type.

Epitope IYQEPFKNLK

Epitope name IK10

Subtype B

Immunogen HIV-1 infection

Species (MHC) human (A11)

Donor MHC A2, A11, B18, B44, Cw5, Cw12

Country United States.

Assay type CD8 T-cell Elispot - IFN γ , Intracellular cytokine staining, Flow cytometric T-cell cytokine assay

Keywords optimal epitope

References Allen *et al.* 2005b

- 4/14 optimal HIV-1 T-cell epitopes in a subject underwent mutation associated with dramatic loss of the original CD8 response. For 1 of the escape variants, a novel CD8 T-cell response equal in magnitude to the wildtype, was generated. CD8 T-cell recognizing the variant epitope utilized a distinct T-cell receptor and did not exhibit any cross-reactivity against the wildtype.
- This epitope did not vary.

HXB2 Location RT (341–350)

Author Location Pol (497–506)

Epitope IYQEPFKNLK

Subtype B

Immunogen HIV-1 infection

Species (MHC) human (A11)

Donor MHC A2, A11, B18, B44, Cw5, Cw12

Country United States.

Assay type CD8 T-cell Elispot - IFN γ

References Allen *et al.* 2005a

- Two-thirds of all mutations arising in nonenvelope proteins during the transition from acute to chronic infection were found to be due to either CD8 T-cell-associated selective pressures or reversion of HLA-I-associated mutations selected in a previous host. The predominance of escape mutations at highly polymorphic sites was observed across different HIV-1 clades.
- This epitope was reactive, but escape mutations did not accrue in it over time.

Epitope RMRGAHTNDVK
Epitope name A3-RK11
Subtype B

Immunogen HIV-1 infection
Species (MHC) human (A3)
Donor MHC A3, B7, Cw7
Keywords dynamics, supervised treatment interruptions (STI), acute/early infection
References Yu *et al.* 2002a

- CTL responses in 18 acutely HIV-infected HLA-A3 (n=7) or -B7 (n=4) or both -A3 and B7 (n=7) positive individuals were studied.
- One individual, AC-06, was homozygous at all three class I alleles (A3, B7, Cw7), was treated during acute infection and had supervised treatment interruptions (STI). He had only two detectable CTL responses during acute infection, but after STI this broadened to 27 distinct epitopes including 15 restricted by HLA-A3, 11 by HLA-B7, and 1 by HLA-Cw7.
- 0/14 HLA-A3 positive individuals had detectable A3-restricted responses to this epitope during acute infection, but only 5/15 of HLA-A3 epitopes tested were targeted during acute infection. 5/7 individuals began to have detectable responses to this epitope after STI.

Keywords supervised treatment interruptions (STI), immunodominance, early treatment

References Addo *et al.* 2003

- Comprehensive Elispot screening of 504 overlapping peptides that spanned all HIV-1 proteins in 57 HIV-1 infected individuals. Four groups of patients were compared: 23 were untreated; 12 patients were chronically infected and treated; 22 started treatment during acute infection, 11 continuously treated and 11 with STI.
- 63% of the peptides were recognized - the most frequent responses were directed against Nef (95%) and p24-Gag (88%). p17 was the most frequently recognized protein after correction for protein length. A median of 18 peptides (range 2-42) were recognized per person. The most frequently (>20%) recognized peptides were located in conserved regions within clade B sequences. Vpu was rarely recognized.
- A decrease in the total magnitude and in the breadth of CTL responses was detected in patients with treated acute infection in comparison to chronically infected treated or untreated individuals. No correlation between plasma viral load and HIV-1 specific T-cell responses was observed.
- The authors did not note the reference strain, but based on the peptide sequences provided it appears to be HXB2.
- Responses to this peptide were detected in 21% of the study subjects, and it was one of the 25 most frequently recognized peptides.

- Peripheral blood (PB) and lymph node (LN) CD8+ T-cell responses were compared in 15 asymptomatic HIV-1 infected patients using all known optimal CTL epitopes (<http://hiv-web.lanl.gov/content/hiv-db/REVIEWS/brander2001.html>) for each person's class I HLA alleles.
- 60 epitope responses were detected in both PB and LN samples of the 15 patients, and an additional 8 responses were detected only in LN. The total magnitude of the response was similar in LN and PB, but the percentage of CD8+ T cells in the LN is lower so the number of HIV-specific cells per million CD8+ T-cells is higher in the LN.
- 1 year post-HAART treatment in five patients studied, the magnitude of the CD8 T-cell response was decreased in both LN and PB, but more dramatically in PB, and 13/25 epitope responses in the PB became undetectable, in contrast to 5/26 in the LN.
- Treatment interruption following HAART induced resulted in increased viremia accompanied by the restoration of the detection of 13 epitopes that had become undetectable in the PB, and the addition of 9 novel epitope responses.
- Breakdowns of epitope responses were shown for 4 individuals. Patient A displayed the greatest response to epitope B14-EL9(gp41), a strong response to B7-TL9(p24), and responses to B7-TM9(Nef) and A32-PW10(RT). Patient B displayed the greatest response to epitope B44-AW11(p24) and also responded to A32-PW10(RT) in both PB and LN samples, while a third response against epitope A32-RW10(gp120) was only detected in the LN sample. Patient D displayed the greatest response to B27-KK10 (p24), and also responded to A30-RY11(p17), A32-PW10(RT), A30-KY11(RT), A32-RW10(gp120), and B18-YY9(Nef).

HXB2 Location RT (397–406)**Author Location** RT Pol (552–561)**Epitope** TWETWTEYW**Immunogen** HIV-1 infection**Species (MHC)** human (B44)**Country** Spain.**Assay type** proliferation, CD8 T-cell Elispot - IFN γ , Flow cytometric T-cell cytokine assay**Keywords** HAART, ART, supervised treatment interruptions (STI), immune dysfunction**References** Plana *et al.* 2004

- Structured treatment interruption (STI) alone is not able to control viral replication in chronically infected patients, probably due to lack of strong, maintained T-helper cell responses. HIV-1 specific CD8+ T-cell responses were shown to increase

significantly until the end of the follow up, but were not correlated with viral load.

- Less than 2 of 11 patients recognized this epitope.

Assay type CD8 T-cell Elispot - IFN γ

Keywords characterizing CD8+ T cells

References Kiepiela *et al.* 2004

- HLA class I restricted CD8+ T-cell responses against HIV-1 were analyzed in African patients. Significantly more responses were shown to be HLA-B restricted. Viral load, CD4 count, and thus rate of disease progression were also associated with HLA-B alleles. In addition, the selection pressure imposed on HIV-1 by HLA-B alleles was shown to be substantially greater than by other alleles.

- This epitope was suggested to be the epitope within a longer reactive peptide based on correspondence with a known epitope in the HIV database. Also, a significantly higher frequency of people in the Durban cohort who reacted with the peptide had this HLA type.

Author Location Pol (587–595)
Epitope EPIVGAETF
Immunogen HIV-1 infection
Species (MHC) human (B*3501)
References Tomiyama *et al.* 2000a

- CD8+ T-cells that bound one of six HIV-specific B*3501-epitope tetramers did not express CD28 or CD45A.
- A significant increase in CD28-CD45RA- cells and a decrease of CD28+CD45RA+ cells was observed in chronically HIV-1-infected individuals relative to healthy individuals.
- CD28-CD45RA- cells are likely to be effector cells and have high levels of perforin in their cytoplasm.
- The mean percentage of total CD28- CD8+ cells in chronically infected HIV-1-infected patients was 76.6% in comparison to HIV-1-uninfected individuals (40.6%)

HXB2 Location RT (432–440)
Author Location
Epitope EPIVGAETF
Immunogen HIV-1 infection
Species (MHC) human (B35)
Keywords acute/early infection
References Wilson *et al.* 2000a

- Three individuals with highly focused HIV-specific CTL responses were studied during acute infection using tetramers – high frequencies of HIV-1-specific CD8+ T cells were found prior to seroconversion, and there was a close temporal relationship between the number of circulating HIV-specific T cells and viral load was also found.
- All three patients were B*2705, with HLA alleles: A1, A30/31, B*2705, B35; A1, A*0301, B7, B2705; and A*0201, A*0301, B2705, B39.

- ELISPOT was used to test a panel of CTL epitopes that had been defined earlier and were appropriate for the HLA haplotypes of the study subjects – 3/3 subjects showed a dominant response to the B*2705 epitope KRWILGGLNK.
- The subject with A*0201 had a moderately strong response to SLYNTVATL.
- Weak responses were observed to A*301-RLRPGGKKK, A*301-QVPLRPMTYK, and B7-TPGPGVRYPL in the subject who was HLA A1, A*0301, B7, B*2705.
- No acute response was detected to the following epitopes: A*201-ILKEPVHGV, A*301-KIRLRPGGK, A*301-AIFQSSMTK, A*301-TVYYGVPVWV, B35-EPIVGAETF, B35-HPDIVIYQY, B35-PIIPVGEIY, B35-NSSKVSQNY, B35-VPLRPMTY, B35-DPNPQEVVL.

- HLA-A*3303 is a common HLA allele in east and southeast Asia. Pol, Gag and Nef SF2 proteins were scanned for potential A*3303 epitopes. 99 potential epitopes were synthesized, and 52/99 bound to A*3303. Six of these served as peptide-targets for lysis by PBMC from infected individual, and clones derived from 4 of these 6 could lyse HIV-vaccinia infected target cells, indicating proper processing.
- This epitope is one of the 4 that are properly processed.

Species (MHC) transgenic mouse (A2)

Assay type Cytokine production, CD8 T-cell Elispot - IFN γ , Chromium-release assay

Keywords vaccine-specific epitope characteristics, vaccine antigen design

References Bolesta *et al.* 2005

- Immunization of transgenic mice with a codon-optimized hGagp17p24-Polp51 DNA plasmid, consisting of clusters of highly conserved CTL epitopes presented by multiple MHC class I alleles, induced 2- to 5-fold higher CD8+ T-cell responses than the corresponding full-length proteins. The modified proteins had the ribosomal frameshift deleted, as well as the potentially immunosuppressive p15, and protease and integrase. This correlated with higher protection against challenge with Gag and Pol expressing recombinant vaccinia virus. Mice immunized with the hGagp17p24-Polp51 also showed an elevated level of type 1 cytokine production as well as an increased titer of p24- and RT-specific IgG2 antibody responses.
- This was 1 of 4 A2 gag/pol epitopes tested. Transgenic mice immunized with the deleted construct induced more potent EliSpot reactions to this epitope than those immunized with full length Gag/Pol.

Immunogen HIV-1 infection
Species (MHC) human (A*1101)
Keywords subtype comparisons, TCR usage
References Fukada *et al.* 2002

- Counterparts for eight known clade B HLA A*1101 epitopes were generated for clade E (CRF01). Three epitopes, identical among clade A–E, were cross-reactive and recognized by clade E infected individuals. The clade E and B analogs to three more HLA A*1101 epitopes was recognized in a clade specific manner. Two other HLA A*1101 clade B defined epitopes were found not to have stimulated a response in clade E infected individuals.
- QIIEQLIKK was found to elicit clade-specific responses in clade B (QIIEQLIKK is most common) and clade E (qiieEliKK is most common). QIIEQLIKK was strongly recognized by CTL from 1/5 B clade infected Japanese subjects, and qiieEliKK from 3/7 E clade infected Thai subjects. The variant qiieKliEk, common in the A subtype, was also recognized in 2/7 E clade infected Thai subjects.
- The binding of QIIEQLIKK, qiieEliKK and qiieKliEk to HLA A*1101 was similar, but CTL clones from individuals did not cross-react with the cross-clade peptides indicating that the substitutions inhibited TCR interaction.

Binding affinities for HLA-A*0204, immunogenicity in HLA-A*0201 transgenic mice, and responses to the peptides in 17 HIV-1 infected patients were tested. 31 novel conserved A2 epitopes were detected. An average of 4 epitopes were recognized per patient.
- This peptide was an intermediate A2 binder, and induced a CD8+ T-cell IFN gamma response in 1/6 mice. Responses were detected in 1/17 HIV+ HLA-A2 subjects.

HXB2 Location RT (532–540)

Author Location Pol (714–722)

Epitope YLAWVPAHK

Immunogen HIV-1 infection

Species (MHC) human (A3 supertype)

Keywords supertype, rate of progression

References Propato *et al.* 2001

- Long-term nonprogressors (LTNPs) had strong memory resting CD8+ T-cell responses against the majority of epitopes tested, (18 for the A2 supertype, 16 for the A3 supertype) while the effector cells of long-term nonprogressors recognized far fewer epitopes.
- Progressors had memory resting CD8+ T-cells that recognized far fewer epitopes than LTNPs.
- A positive correlation between effector CD8+ T-cells and plasma viremia and a negative correlation between CD8+ effector T-cells and CD4+ T-cells was observed, which may contribute to the inability of LTNPs to clear virus.
- This epitope can bind 5/5 HLA-A3 supertype alleles (A*0301, A*1101, A*3101, A*3301 and A*6801).

HXB2 Location RT (532–540)
Author Location RT (532–540)
Epitope YLAWVPAHK
Immunogen HIV-1 infection
Species (MHC) human (B7)
References Haas *et al.* 1998

- Of 98 patients in cross-sectional analysis, 78% had CTL against pol – RT was more immunogenic than Integrase and Protease (81%, 51%, and 24% of 37 patients, respectively)
- New clusters of epitopes were defined utilizing different HLA molecules.
- This epitope occurs in the p15 (RNAse) domain of Pol p66 RT.

Epitope YLAWVPAHK
Immunogen HIV-1 infection
Species (MHC) human (B7)
Country Spain.

Assay type proliferation, CD8 T-cell Elispot - IFN γ , Flow cytometric T-cell cytokine assay

Keywords HAART, ART, supervised treatment interruptions (STI), immune dysfunction

References Plana *et al.* 2004

- Structured treatment interruption (STI) alone is not able to control viral replication in chronically infected patients, probably due to lack of strong, maintained T-helper cell responses. HIV-1 specific CD8+ T-cell responses were shown to increase significantly until the end of the follow up, but were not correlated with viral load.
- 3/7 patients recognized this epitope.

- HLA class I restricted CD8+ T-cell responses against HIV-1 were analyzed in African patients. Significantly more responses were shown to be HLA-B restricted. Viral load, CD4 count, and thus rate of disease progression were also associated with HLA-B alleles. In addition, the selection pressure imposed on HIV-1 by HLA-B alleles was shown to be substantially greater than by other alleles.
- This epitope was suggested to be the epitope within a longer reactive peptide based on correspondence with a known epitope in the HIV database. Also, a significantly higher frequency of people in the Durban cohort who reacted with the peptide had this HLA type.

HXB2 Location Integrase (28–36)**Author Location** (C consensus)**Epitope** LPPIVAKEI**Subtype** C**Immunogen** HIV-1 infection**Species (MHC)** human (B*4201)**Country** South Africa.**Assay type** CD8 T-cell Elispot - IFN γ **Keywords** rate of progression, optimal epitope**References** Kiepiela *et al.* 2007

- T-cell immunity and the impact of selection were longitudinally studied in a patient from the time of transmission. New epitopes were detected at sites that were shown to be under positive selection. Env was found to be the major target of CTLs and most of the new epitopes were found here. One third of the sites examined were associated with epitope escape mutations from CTL. Acquisition of mutations found at high frequency in the database was suggested to be a result of reversion of CTL epitopes in the absence of immune targeting.

Epitope ETAYFILKL

Immunogen HIV-1 infection, HIV-1 exposed seronegative

Species (MHC) human (A*6802)

Keywords HIV exposed persistently seronegative (HEPS), immunodominance

References Kaul *et al.* 2001a

- ETAYFILKL cross-reacts with clades A, B and D.
- ELISPOT was used to study CTL responses to a panel of 54 predefined HIV-1 epitopes in 91 HIV-1-exposed, persistently seronegative (HEPS) and 87 HIV-1-infected female Nairobi sex workers.
- Responses in HEPS women tended to be lower, and focused on different epitopes with HLA presenting molecules that have previously been associated with reduced risk of infection, and there was a shift in the response in the HEPS women upon late seroconversion to epitopes recognized by the HIV-1 infected women.
- 43/91 HEPS women had CD8+ responses and detection of HIV-1-specific CTL in HEPS women increased with the duration of viral exposure.
- Among HLA-A*6802 women, 3/12 HEPS and 9/11 HIV-1 infected women recognized this epitope likelihood ratio 7.9, p value 0.01, and HEPS women tended to respond to DTVLEDINL, while infected women to ETAYFILKL.
- The dominant response to this HLA allele was to this epitope in 2 of the 3/12 HEPS cases and in all 9/11 HIV-1 infected women that responded to the epitope.
- Differences in epitope specificity were only seen for responses restricted by class I HLA alleles A2, A24, A*6802, B14, and B18, previously shown to be associated with resistance to HIV-1 in this cohort.
- Subject ML 1203 started with CTL responses to A*6802 DTVLEDINL and to B7 FPVTPQVPLR prior to seroconversion, and upon seroconversion acquired additional responses to A*6802 ETAYFILKL which became dominant, B7 TPGPG(V/I)RYPL, B7 IPRRIRQGL, and B7 SPRTLNAWV.
- Subject ML 1707 started with a CTL response to A*6802 DTVLEDINL prior to seroconversion, and switched to A*6802 ETAYFILKL and A24 RDYVDRFFKTL post-seroconversion.
- Subject ML 1830 made no detectable response prior to seroconversion, but responded to A*6802 DTVLEDINL and A*6802 ETAYFILKL post-seroconversion.

Keywords responses in children, mother-to-infant transmission, characterizing CD8+ T cells

References Feeney *et al.* 2005

- Escape mutations in TW10 and other B57-restricted epitopes were shown to arise early in infants following perinatal infection. Some escape variants were likely to have been transmitted vertically, from HLA-B57/5801 positive HIV-1 infected mothers, while others arose during infancy in cases where the children inherited the B57/5801 allele paternally. In contrast

to adults, the majority of children showed a robust response to the escape variants, suggesting that infants are able to mount functional immune responses and drive immune escape and that a developing immune system may exhibit greater plasticity in recognizing viral variants.

HXB2 Location Integrase (127–135)

Author Location Pol (869–877)

Epitope KAACWWAGI

Immunogen HIV-1 infection

Species (MHC) human (A2 supertype)

Keywords supertype, rate of progression

References Propato *et al.* 2001

- Long-term nonprogressors (LTNPs) had strong memory resting CD8+ T-cell responses against the majority of epitopes tested, (18 for the A2 supertype, 16 for the A3 supertype) while the effector cells of long-term nonprogressors recognized far fewer epitopes.
- Progressors had memory resting CD8+ T-cells that recognized far fewer epitopes than LTNPs.
- A positive correlation between effector CD8+ T-cells and plasma viremia and a negative correlation between CD8+ effector T-cells and CD4+ T-cells was observed, which may contribute to the inability of LTNPs to clear virus.
- This epitope can bind three of the five HLA-A2 supertypes alleles (A*0201, A*0202, A*0203, A*0206 and A*6802).

- Comprehensive Elispot screening of 504 overlapping peptides that spanned all HIV-1 proteins in 57 HIV-1 infected individuals. Four groups of patients were compared: 23 were untreated; 12 patients were chronically infected and treated; 22 started treatment during acute infection, 11 continuously treated and 11 with STI.
- 63% of the peptides were recognized - the most frequent responses were directed against Nef (95%) and p24-Gag (88%). p17 was the most frequently recognized protein after correction for protein length. A median of 18 peptides (range 2-42) were recognized per person. The most frequently (>20%) recognized peptides were located in conserved regions within clade B sequences. Vpu was rarely recognized.
- A decrease in the total magnitude and in the breadth of CTL responses was detected in patients with treated acute infection in comparison to chronically infected treated or untreated individuals. No correlation between plasma viral load and HIV-1 specific T-cell responses was observed.
- The authors did not note the reference strain, but based on the peptide sequences provided it appears to be HXB2.
- Responses to this peptide were detected in 21% of the study subjects, and it was one of the 25 most frequently recognized peptides.

In addition, the selection pressure imposed on HIV-1 by HLA-B alleles was shown to be substantially greater than by other alleles.
- This epitope was suggested to be the epitope within a longer reactive peptide based on correspondence with a known epitope in the HIV database. Also, a significantly higher frequency of people in the Durban cohort who reacted with the peptide had this HLA type.

HXB2 Location Integrase (219–227)**Author Location** Integrase**Epitope** KIQNFVYY**Epitope name** KY9**Immunogen** HIV-1 infection**Species (MHC)** human (A30)**Country** United States.**Assay type** CD8 T-cell Elispot - IFN γ , Intracellular cytokine staining, Chromium-release assay, Flow cytometric T-cell cytokine assay**Keywords** epitope processing, supervised treatment interruptions (STI), immunodominance**References** Rodriguez *et al.* 2004

- Protease and integrase are shown to be frequently targeted by CD8 T-cell responses (23% and 68% of 56 HIV+ patients, respectively). Responses tend to cluster in conserved regions of Int, although 1 high conserved region had no responses. CTL frequencies per unit protein length for Pro and Int were similar to other HIV non-structural proteins. Three novel HLA class I-restricted optimal epitopes were found and characterized with fine mapping.

Epitope KIQNFRVYYR

Subtype B

Immunogen HIV-1 infection, computer prediction

Species (MHC) human (A*3303)

Assay type Chromium-release assay

Keywords binding affinity, computational epitope prediction

References Hossain *et al.* 2003

- HLA-A*3303 is a common HLA allele in east and southeast Asia. Pol, Gag and Nef SF2 proteins were scanned for potential A*3303 epitopes. 99 potential epitopes were synthesized, and 52/99 bound to A*3303. Six of these served as peptide-targets for lysis by PBMC from infected individual, and clones derived from 4 of these 6 could lyse HIV-vaccinia infected target cells, indicating proper processing.
- This epitope is one of the 4 that are properly processed.

Species (MHC) mouse (A*0201)

Keywords binding affinity, vaccine-specific epitope characteristics, immunodominance

References Peter *et al.* 2001

- The stability of peptide binding to HLA-A2.1 was determined for six HLA-A2.1 peptides included in this vaccine study – ILKEPVHGV (RT), SLYNTVATL (p17), SLLNATDIAV (gp41) and LLWKGEAV (RT) all bound with high affinity comparable to a influenza epitope reference (GILGFVFTL), while RGPGRAFVTI and VIYQYMDDL bound with a lower affinity (relative binding activity = 0.01).
- The four high-affinity peptides formed stable complexes with half-lives ranging between 8 and 32 hours, while the low affinity peptides had half lives of less than an hour.
- HLA-A2.1 transgenic mice were immunized with the six HIV-1 peptides and P30, as a universal T-helper epitope, with IFA or Montanide or microspheres as adjuvants.
- All peptides except VIYQYMDDL induced a strong CTL response in Cr-release assays - stronger responses were observed when peptides were delivered alone, indicating immunodominance when the combination was used.

Species (MHC) mouse (A*0201)

Keywords vaccine-specific epitope characteristics, immunodominance

References Peter *et al.* 2002

- When HIV-1 peptides were used to vaccinate HLA-A2.1 transgenic A2-Kb mice, strong responses to five peptides were observed when the peptides were given individually, but immunodominance limited the response to some of the peptides when they were given in combination Peter *et al.* [2001]. IL-12 can counteract immunodominance in BALB/c mice, so it was given with the multiple epitope vaccination, and was instead found to specifically eliminate the HLA-A2.1-epitope CTL responses, but not Kb CTL responses. This was possibly a consequence of transient depletion of T-cells, B cells and macrophages in the spleen.

Keywords epitope processing, HLA associated polymorphism
References Boutwell & Essex 2007
- All HIV-1 subtype C protein sequences were analysed, and 94 HLA-associated amino acid polymorphisms were found that were well distributed throughout the proteome. These sequences were compiled from publicly available databases and originated in South Africa and Botswana. Many polymorphisms were associated with multiple HLA allele classes. 12% of negative associations were found as well, where there was an association of virus expression of the consensus amino acid with a specific HLA allele. HLA-B alleles were involved in most of the associations. 19 HLA-associated polymorphisms were embedded in previously defined epitopes presented by an appropriate HLA restricting molecule.
 - VPRRKVKII was a previously defined B*42 presented epitope that was associated with a polymorphism, VPRRKVKIIk seen just after the last position in that epitope.

Assay type CD8 T-cell Elispot - IFN γ
Keywords binding affinity, acute/early infection, early-expressed proteins
References Cao *et al.* 2003

- All proteins were scanned and optimal epitopes were mapped in a study of CD8+ gamma IFN T-cell responses in 21 men within 15-92 days post-HIV-1 infection. Subjects initially showed narrow immune responses with a mean of 2.3 epitopes recognized per patient. The immune response broadened later in infection. No correlation between the plasma viral load and the number of recognized epitopes or the frequency of IFN-gamma secreting cells was observed, and there was no correlation between the functional avidity of a response and the abundance of IFN-secreting cells that recognized the epitope. The first epitopes to be recognized did not tend to be the most avid, and earliest responses tended to be directed against Nef, Tat, Vpr, and Env.
- All HIV-1 proteins except Vpu were recognized, and a response to a total of 41 optimal epitopes were characterized; 24 had been identified previously. 48% of the total T-cell responses were directed against Nef and 43% were directed against Gag.
- More common HLA alleles were less frequently used in primary infection than less common alleles, for example A3, B35, B57, and B62 were more frequently utilized than A1, A2, A30, and A44.

Author Location RT (IIIB)
Epitope
Subtype B
Immunogen HIV-1 infection
Species (MHC) human (A2)
Keywords epitope processing, escape
References Moore *et al.* 2002b
- HIV polymorphisms in the RT protein were examined relation to HLA alleles found in a population of 473 participants in the Western Australian HIV Cohort Study. 64 significant associations between polymorphisms at particular positions and HLA alleles were detected, for HLA-B7, -B12, -B35 and -B15. Fifteen of these were in positions with known epitopes, 4 in anchor residues, 11 in other positions. Six additional polymorphic sites associated with particular HLA molecules flanked known epitopes and may relate to processing.
 - 25 negative associations were also found between polymorphism and HLA alleles. The authors propose this is due to escape mutations in epitopes presented by common HLA types dominating in the population, and give examples of five amino acids which are in the consensus and tend to be stable in those with the most common HLA allele, HLA-A2.

- The CTL precursor level (CTLp) was measured in long term non-progressors (LTNP) with low viral load using limiting dilution analysis and measuring CTL against Env Gag and Pol expressed in vaccinia in autologous targets.
- LTNPs have high memory CTL numbers and low viral load.

HXB2 Location Pol**Author Location** Pol**Epitope****Immunogen** HIV-1 exposed seronegative**Species (MHC)** human**Keywords** review, HIV exposed persistently seronegative (HEPS)**References** Rowland-Jones *et al.* 2001

- This is a review that summarizes observations about HIV-specific CTL found in the HIV-1 exposed persistently seronegative (HEPS) population.
- The CTL responses assayed by ELISPOT and by CTL precursor frequencies by limiting dilution analysis indicate that CTL in HEPS individuals tend to be of a lower magnitude than in chronic HIV-1 infections – the responses in HEPS cases are below the level of detection by tetramer assays.
- CD8+ CTL responses tend to be detectable in HEPS subjects only if they are recently exposed, and the response diminishes if exposure is reduced – it is not clear if there is a stable memory population in HEPS cases.

- CD8+ CTL responses in the HEPS population are associated with HIV-1 specific CD4+ T cell responses, assayed by proliferation assays, IL-2 secretion, and ELISPOT, and the authors consider the possibility that HIV-1-specific T-help responses improve the "quality" of the CD8+ response in HEPS individuals relative to HIV-1 infected individuals, who tend to have a poor HIV-1-specific T-help response.
- HIV-1 specific CD8+ CTL responses in HIV-1 infected individuals show reduced levels of perforin, and the T cells may not mature properly, and although similar studies have not been conducted in HEPS individuals this is considered as a possible difference in the CTL immune response in HEPS and HIV-1 infected people.

Epitope

Subtype B

Immunogen HIV-1 infection

Species (MHC) human

Keywords epitope processing, escape

References Yusim *et al.* 2002

- Epitopes that have been described in the literature and included in this database tend to cluster in conserved regions and be absent or rarely found in highly variable regions in Nef, Env, and p17.
- In the more conserved p24, and Pol proteins RT and Protease, epitopes are more evenly distributed; however, epitopes were not found that span the invariant, most highly conserved regions of RT and Protease. This might be due to the virus evolving conserved features that disallow the CTL responses in these most conserved regions, as functional constraints for enzyme function would not tolerate change, and normal capacity for immune escape by rapid evolution is lost in these domains.

Epitope

Subtype B

Immunogen HIV-1 and HCV co-infection

Species (MHC) human

Keywords rate of progression

References Lauer *et al.* 2002

- HIV-1 and HCV immune responses were studied in 22 individuals who were co-infected with HIV-1 and hepatitis C virus (HCV). IFN γ production was measured in an Elispot assay of CD8+ T-cells using targets expressing either Gag, RT, Env and Nef in a vaccinia construct, or one of seven HCV proteins.
- All 22 patients targeted at least one protein. 20/22 patients recognized RT, 17/22 patients recognized Gag, 13/22 subjects recognized Env and 11/22 patients recognized Nef. Robust CTL activity was independent of disease progression or viral load.
- Despite high HCV viral loads, very few HCV CD8+ T-cell Elispot responses were detected. In a control HCV infected person who did not have HIV-1, strong anti-HCV responses were mounted.
- HIV-specific CD4 proliferative responses were detected in 9/17 coinfecting patients, but no HCV responses were detected.

HXB2 Location Pol**Author Location****Epitope****Subtype** B**Immunogen** HIV-1 infection**Species (MHC)** human**Keywords** HAART, ART, responses in children**References** Scott *et al.* 2001

- CTL responses before and after initiation of ART were studied in 13 HIV-1 vertically infected infants <6 months of age, and 4 that were >6 months of age.
- Before ART 2/13 infants <6 months of age showed IFN γ Elispot CD8+ T-cell responses, one to Nef and one to Env and Nef, and these responses became undetectable after successful therapy— 3 infants were coinfecting with CMV and all 3 had CMV-specific CD8+ T-cell responses.
- One older infant, at 23 months, had CTL responses against all for proteins tested, Gag, Pol, Nef and Env, and had the lowest plasma viremia of the study group. 3/4 infants older than 6 months of age responded to either Nef or Pol.
- Administration of ART over 48 weeks broadened the HIV-1-specific CTL response in 2/4 of the older children that were incomplete responders.

HXB2 Location Pol**Author Location** (IIB, MN)**Epitope****Subtype** B**Immunogen** HIV-1 infection**Species (MHC)** human**Keywords** dendritic cells**References** Larsson *et al.* 2002a

- Dendritic cells acquire and present HIV-1 antigens derived from dead, apoptotic cells or from non-infectious, fusion-competent HIV-1 virions, and these DC cells could stimulate CD4+ and CD8+ T-cells resulting in IFN γ production in an Elispot assay. Both HLA Class I and class II molecules were used for presentation. This may be an important aspect of the initial immune response to HIV-1 infection of CD4+ cells in the mucosal subepithelia.

HXB2 Location Pol**Author Location** (IIB)**Epitope****Immunogen** HIV-1 infection**Species (MHC)** human**Keywords** HAART, ART, supervised treatment interruptions (STI)**References** Ortiz *et al.* 2001

- Immune responses in eight chronically HIV-1 infected patients undergoing HAART therapy structured treatment interruptions (STI) were studied. STI boosted HIV-1 specific CTL responses and elevated CTL responses were maintained up to 22 weeks after the last treatment interruption, but viral load rebound to pretreatment levels and CD4 T-cell count decline was observed. CD8 responses in PBMC were measured by cytokine flow cytometry with gp160, Gag p55, RT-Pol and Nef expressed in vaccinia.

- Two-thirds of all mutations arising in nonenvelope proteins during the transition from acute to chronic infection were found to be due to either CD8 T-cell-associated selective pressures or reversion of HLA-I-associated mutations selected in a previous host. The predominance of escape mutations at highly polymorphic sites was observed across different HIV-1 clades.
- One escape mutation, at position 6, rirtwNslvk, was found not to correspond to the most polymorphic residue in the epitope.

HXB2 Location Vif (17–26)**Author Location****Epitope** RIRTWKSLVK**Subtype** B**Immunogen** HIV-1 infection**Species (MHC)** human**Keywords** epitope processing, escape**References** Yusim *et al.* 2002

- Epitopes that have been described in the literature and included in this database tend to cluster in conserved regions and be absent or rarely found in highly variable regions in Nef, Env, and p17.
- While the uneven distribution of epitopes may be in part due to a limited cross-recognition of specific responses because of differences between peptides used to probe the immune response and autologous strains, regions with a paucity of defined epitopes also had higher frequencies of amino acids that tend to not be found in C-terminal positions of epitopes, and had lower cleavage prediction scores for epitope processing. This suggests that in the regions of the virus where variation is best tolerated traces of immune escape have left an imprint on the viral population. Epitopes also were concentrated in alpha-helix and turn regions in the proteins.
- In the more conserved p24, and Pol proteins RT and Protease, epitopes are more evenly distributed.
- What was learned from proteins where many epitopes have been defined (Gag, Pol, Env and Nef) was used to develop an algorithm to predict where epitopes would be localized in Rev, Tat, Vif, and Vpr. Predictions were made blinded, and then compared to the first 15 epitopes defined in these proteins; the epitopes were concentrated in the predicted regions.

Assay type CD8 T-cell Elispot - IFN γ

Keywords characterizing CD8+ T cells

References Kiepiela *et al.* 2004

- HLA class I restricted CD8+ T-cell responses against HIV-1 were analyzed in African patients. Significantly more responses were shown to be HLA-B restricted. Viral load, CD4 count, and thus rate of disease progression were also associated with HLA-B alleles. In addition, the selection pressure imposed on HIV-1 by HLA-B alleles was shown to be substantially greater than by other alleles.
- This epitope was suggested to be the epitope within a longer reactive peptide based on correspondence with a known epitope in the HIV database. Also, a significantly higher frequency of people in the Durban cohort who reacted with the peptide had this HLA type.

Epitope HPRVSSEVHI
Epitope name B7-HI10
Subtype B
Immunogen HIV-1 infection
Species (MHC) human (B7)
Donor MHC A3, B7, Cw7
Keywords dynamics, supervised treatment interruptions (STI), acute/early infection
References Yu *et al.* 2002a
- CTL responses in 18 acutely HIV-infected HLA-A3 (n=7) or -B7 (n=4) or both -A3 and B7 (n=7) positive individuals were studied.
 - One individual, AC-06, was homozygous at all three class I alleles (A3, B7, Cw7), was treated during acute infection and had supervised treatment interruptions (STI). He had only two detectable CTL responses during acute infection, but after STI this broadened to 27 distinct epitopes including 15 restricted by HLA-A3, 11 by HLA-B7, and 1 by HLA-Cw7.
 - 0/11 HLA-B7 individuals had detectable B7-restricted responses to this epitope during acute infection – 10/15 of HLA-B7 epitopes tested were targeted by at least one person during acute infection. 2/4 individuals had detectable responses to this epitope after STI.

Species (MHC) human

Keywords epitope processing, escape

References Yusim *et al.* 2002

- Epitopes that have been described in the literature and included in this database tend to cluster in conserved regions and be absent or rarely found in highly variable regions in Nef, Env, and p17.
- While the uneven distribution of epitopes may be in part due to a limited cross-recognition of specific responses because of differences between peptides used to probe the immune response and autologous strains, regions with a paucity of defined epitopes also had higher frequencies of amino acids that tend to not be found in C-terminal positions of epitopes, and had lower cleavage prediction scores for epitope processing. This suggests that in the regions of the virus where variation is best tolerated traces of immune escape have left an imprint on the viral population. Epitopes also were concentrated in alpha-helix and turn regions in the proteins.
- In the more conserved p24, and Pol proteins RT and Protease, epitopes are more evenly distributed.
- What was learned from proteins where many epitopes have been defined (Gag, Pol, Env and Nef) was used to develop an algorithm to predict where epitopes would be localized in Rev, Tat, Vif, and Vpr. Predictions were made blinded, and then compared to the first 15 epitopes defined in these proteins; the epitopes were concentrated in the predicted regions.

Keywords acute/early infection, variant cross-recognition or cross-neutralization, superinfection

References Yang *et al.* 2005b

- An individual infected with a drug-resistant strain of HIV-1 subtype B with controlled viremia became superinfected with another subtype B strain. The second strain outgrew the first despite lower replication capacity and the same viral phenotype. The strains showed differences in their epitope sequences. The CTL responses to the first strain declined after superinfection, followed by some adaptation of targeting to the new epitopes of the second strain. Differences in the recognized epitopes were suggested to have contributed to the poor immune containment of the second strain.
- The response to this epitope, HTGERDWHL, was present before superinfection but waned afterward. The epitope from the first strain had the substitution hPgerdwhl, while the second strain matched the test peptide.

Keywords epitope processing, HLA associated polymorphism

References Boutwell & Essex 2007

- All HIV-1 subtype C protein sequences were analysed, and 94 HLA-associated amino acid polymorphisms were found that were well distributed throughout the proteome. These sequences were compiled from publicly available databases and originated in South Africa and Botswana. Many polymorphisms were associated with multiple HLA allele classes. 12% of negative associations were found as well, where there was an association of virus expression of the consensus amino acid with a specific HLA allele. HLA-B alleles were involved in most of the associations. 19 HLA-associated polymorphisms were embedded in previously defined epitopes presented by an appropriate HLA restricting molecule.

- WHLGHGVS I was a previously defined B*1510 presented epitope that was associated with a polymorphism, dIWHLGHGVS I, in the first position before that epitope. This epitope was embedded in a previously identified CTL immunoreactive region.

Keywords binding affinity, acute/early infection, early-expressed proteins

References Cao *et al.* 2003

- CTL epitope responses were mapped in 21 men within 15–92 days post-HIV-1 infection. Subjects initially showed narrow immune responses with a mean of 2.3 epitopes recognized per patient. The immune response broadened later in infection. No correlation between the plasma viral load and the number of recognized epitopes or the frequency of IFN-gamma secreting cells was observed, and there was no correlation between the functional avidity of a response and the abundance of IFN-secreting cells that recognized the epitope. The first epitopes to be recognized tended not to be the most avid, and earliest responses tended to be directed against Nef, Tat, Vpr, and Env.
- All HIV-1 proteins except Vpu were recognized, and a response to a total of 41 optimal epitopes was characterized; 24 had been identified previously. 48% of the total T-cell responses were directed against Nef and 43% were directed against Gag.
- More common HLA alleles were less frequently used in primary infection than less common alleles, for example A3, B35, B57, and B62 were more frequently recognized than A1, A2, A30, and A44.

References Corbet *et al.* 2003

- HLA-A2-restricted HIV-1 CTL epitopes were computationally predicted. Binding affinities for HLA-A*0204, immunogenicity in HLA-A*0201 transgenic mice, and responses to the peptides in 17 HIV-1 infected patients were tested. 31 novel conserved A2 epitopes were detected. An average of 4 epitopes were recognized per patient.
- This peptide was a good A2 binder, and induced CTL and CD8+ T-cell IFN gamma responses in mice. Responses were detected in 1/17 HIV+ HLA-A2 subjects.

Keywords epitope processing, escape

References Yusim *et al.* 2002

- Epitopes that have been described in the literature and included in this database tend to cluster in conserved regions and be absent or rarely found in highly variable regions in Nef, Env, and p17.
- While the uneven distribution of epitopes may be in part due to a limited cross-recognition of specific responses because of differences between peptides used to probe the immune response and autologous strains, regions with a paucity of defined epitopes also had higher frequencies of amino acids that tend to not be found in C-terminal positions of epitopes, and had lower cleavage prediction scores for epitope processing. This suggests that in the regions of the virus where variation is best tolerated, traces of immune escape have left an imprint on the viral population. Epitopes also were concentrated in alpha-helix and turn regions in the proteins.
- In the more conserved p24, and Pol proteins RT and Protease, epitopes are more evenly distributed.
- What was learned from proteins where many epitopes have been defined (Gag, Pol, Env and Nef) was used to develop an algorithm to predict where epitopes would be localized in Rev, Tat, Vif, and Vpr. Predictions were made blinded, and then compared to the first 15 epitopes defined in these proteins; the epitopes were concentrated in the predicted regions.

References Addo *et al.* 2003

- Comprehensive Elispot screening of 504 overlapping peptides that spanned all HIV-1 proteins in 57 HIV-1 infected individuals. Four groups of patients were compared: 23 were untreated; 12 patients were chronically infected and treated; 22 started treatment during acute infection, 11 continuously treated and 11 with STI.
- 63% of the peptides were recognized - the most frequent responses were directed against Nef (95%) and p24-Gag (88%). p17 was the most frequently recognized protein after correction for protein length. A median of 18 peptides (range 2-42) were recognized per person. The most frequently (>20%) recognized peptides were located in conserved regions within clade B sequences. Vpu was rarely recognized.
- A decrease in the total magnitude and in the breadth of CTL responses was detected in patients with treated acute infection in comparison to chronically infected treated or untreated individuals. No correlation between plasma viral load and HIV-1 specific T-cell responses was observed.
- Responses to this peptide were detected in 17% of the study subjects, and it was one of the 25 most frequently recognized peptides.

Assay type CD8 T-cell Elispot - IFN γ
Keywords escape, immune evasion, optimal epitope, HIV-1
References Liu *et al.* 2006
- T-cell immunity and the impact of selection were longitudinally studied in a patient from the time of transmission. New epitopes were detected at sites that were shown to be under positive selection. Env was found to be the major target of CTLs and most of the new epitopes were found here. One third of the sites examined were associated with epitope escape mutations from CTL. Acquisition of mutations found at high frequency in the database was suggested to be a result of reversion of CTL epitopes in the absence of immune targeting.
 - Last position (9) in the epitope had potentially experienced positive selection. EAVRHFPRT and EAVRHFPRI escape variants were found.

References Cao *et al.* 2003
- CTL epitope responses were mapped in 21 men within 15–92 days post-HIV-1 infection. Subjects initially showed narrow immune responses with a mean of 2.3 epitopes recognized per patient. The immune response broadened later in infection. No correlation between the plasma viral load and the number of recognized epitopes or the frequency of IFN-gamma secreting cells was observed, and there was no correlation between the functional avidity of a response and the abundance of IFN-secreting cells that recognized the epitope. The first epitopes to be recognized tended not to be the most avid, and earliest responses tended to be directed against Nef, Tat, Vpr, and Env.
 - All HIV-1 proteins except Vpu were recognized, and a response to a total of 41 optimal epitopes were characterized; 24 had been identified previously. 48% of the total T-cell responses were directed against Nef and 43% were directed against Gag.
 - More common HLA alleles were less frequently used in primary infection than less common alleles, for example A3, B35, B57, and B62 were more frequently recognized than A1, A2, A30, and A44.

- Escape mutations in TW10 and other B57-restricted epitopes were shown to arise early in infants following perinatal infection. Some escape variants were likely to have been transmitted vertically, from HLA-B57/5801 positive HIV-1 infected mothers, while others arose during infancy in cases where the children inherited the B57/5801 allele paternally. In contrast to adults, the majority of children showed a robust response to the escape variants, suggesting that infants are able to mount functional immune responses and drive immune escape and that a developing immune system may exhibit greater plasticity in recognizing viral variants.

Epitope FPRPWLHGL

Epitope name Vpr34

Immunogen HIV-1 infection, vaccine

Vector/Type: peptide *HIV component:* Vpr

Adjuvant: Incomplete Freund's Adjuvant (IFA)

Species (MHC) human, transgenic mouse (A2)

Assay type CD8 T-cell Elispot - IFN γ , Chromium-release assay, Flow cytometric T-cell cytokine assay

Keywords binding affinity, subtype comparisons, computational epitope prediction

References Corbet *et al.* 2003

- HLA-A2-restricted HIV-1 CTL epitopes were computationally predicted. Binding affinities for HLA-A*0204, immunogenicity in HLA-A*0201 transgenic mice, and responses to the peptides in 17 HIV-1 infected patients were tested. 31 novel conserved A2 epitopes were detected. An average of 4 epitopes were recognized per patient.
- This peptide was a good A2 binder, and induced a CD8+ T-cell IFN gamma response in 1/6 mice. Responses were detected in 3/17 HIV+ HLA-A2 subjects.

HXB2 Location Vpr (34–42)

Author Location Vpr (34–42 SF2)

Epitope FPRIWLHGL

Epitope name FL9

Immunogen HIV-1 infection

Species (MHC) human (B*0702)

Keywords acute/early infection

References Altfeld *et al.* 2001a

- CTL responses against HIV-1 Vpr, Vpu, and Vif were analyzed in multiple HIV-1-infected individuals.
- This epitope was recognized by 2/2 individuals expressing B*8101 allele and 4/8 individuals expressing B*0702 allele.
- Individuals with long-term nonprogressive and treated chronic HIV-1 infection targeted Vpr more frequently than individuals with treated acute infection.
- Vpr is a frequent target of HIV-1 specific CD8+ T-cells – a response was detected in 45% of individuals tested and Vpr and p17 were the most preferentially targeted proteins per unit length by CD8+ T-cells.
- HIV+ individual AC-06 was tested for reactive overlapping peptides spanning all HIV-1 proteins in an ELISPOT and was found to react with 12 peptides from 7 proteins, suggesting that the breadth of CTL responses are underestimated if accessory proteins are not included in the study.

- FPRIWLHGL was the only epitope identified in Vpr for AC-06.

Keywords cross-presentation by different HLA, characterizing CD8+ T cells

References Kiepiela *et al.* 2004

- HLA class I restricted CD8+ T-cell responses against HIV-1 were analyzed in African patients. Significantly more responses were shown to be HLA-B restricted. Viral load, CD4 count, and thus rate of disease progression were also associated with HLA-B alleles. In addition, the selection pressure imposed on HIV-1 by HLA-B alleles was shown to be substantially greater than by other alleles.
- This epitope was suggested to be the epitope within a longer reactive peptide based on correspondence with a known epitope in the HIV database. Also, a significantly higher frequency of people in the Durban cohort who reacted with the peptide had this HLA type.

HXB2 Location Vpr (34–42)

Keywords epitope processing, escape

References Yusim *et al.* 2002

- Epitopes that have been described in the literature and included in this database tend to cluster in conserved regions and be absent or rarely found in highly variable regions in Nef, Env, and p17.
- While the uneven distribution of epitopes may be in part due to a limited cross-recognition of specific responses because of differences between peptides used to probe the immune response and autologous strains, regions with a paucity of defined epitopes also had higher frequencies of amino acids that tend to not be found in C-terminal positions of epitopes, and had lower cleavage prediction scores for epitope processing. This suggests that in the regions of the virus where variation is best tolerated, traces of immune escape have left an imprint on the viral population. Epitopes also were concentrated in alpha-helix and turn regions in the proteins.
- In the more conserved p24, and Pol proteins RT and Protease, epitopes are more evenly distributed.
- What was learned from proteins where many epitopes have been defined (Gag, Pol, Env and Nef) was used to develop an algorithm to predict where epitopes would be localized in Rev, Tat, Vif, and Vpr. Predictions were made blinded, and then compared to the first 15 epitopes defined in these proteins; the epitopes were concentrated in the predicted regions.

References Liu *et al.* 2006

- T-cell immunity and the impact of selection were longitudinally studied in a patient from the time of transmission. New epitopes were detected at sites that were shown to be under positive selection. Env was found to be the major target of CTLs and most of the new epitopes were found here. One third of the sites examined were associated with epitope escape mutations from CTL. Acquisition of mutations found at high frequency in the database was suggested to be a result of reversion of CTL epitopes in the absence of immune targeting.

Keywords HLA associated polymorphism

References Boutwell & Essex 2007

- All HIV-1 subtype C protein sequences were analysed, and 94 HLA-associated amino acid polymorphisms were found that were well distributed throughout the proteome. These sequences were compiled from publicly available databases and originated in South Africa and Botswana. Many polymorphisms were associated with multiple HLA allele classes. 12% of negative associations were found as well, where there was an association of virus expression of the consensus amino acid with a specific HLA allele. HLA-B alleles were involved in most of the associations. 19 HLA-associated polymorphisms were embedded in previously defined epitopes presented by an appropriate HLA restricting molecule.
- ETYGDTWTGV was a previously defined A*6802 presented epitope that encompassed a supertype A*2 associated polymorphism, YleTYGDTWTGV, in the first position of that epitope.
- The epitope YleTYGDTWTGV is partially embedded in a CTL immunodominant region.

References Cao *et al.* 2003

- All proteins were scanned and optimal epitopes were mapped in a study of CD8+ gamma IFN T-cell responses in 21 men within 15-92 days post-HIV-1 infection. Subjects initially showed narrow immune responses with a mean of 2.3 epitopes recognized per patient. The immune response broadened later in infection. No correlation between the plasma viral load and the number of recognized epitopes or the frequency of IFN-gamma secreting cells was observed, and there was no correlation between the functional avidity of a responses and the abundance of IFN-secreting cells that recognized the epitope. The first epitopes to be recognized did not tend to be the most avid, and earliest responses tended to be directed against Nef, Tat, Vpr, and Env.
- All HIV-1 proteins except Vpu were recognized, and a responses to a total of 41 optimal epitopes were characterized; 24 had been identified previously. 48% of the total T-cell responses were directed against Nef and 43% were directed against Gag.
- More common HLA alleles were less frequently used in primary infection than less common alleles, for example A3, B35, B57, and B62 were more frequently utilized than A1, A2, A30, and A44.

HXB2 Location Vpr (59–67)**Author Location** Vpr (59–67)**Epitope** ALIRILQQL**Epitope name** AL9**Subtype** B**Immunogen** HIV-1 infection**Species (MHC)** human (A2)**Donor MHC** A2, A11, B18, B44, Cw5, Cw12**Country** United States.**Assay type** CD8 T-cell Elispot - IFN γ , Intracellular cytokine staining, Flow cytometric T-cell cytokine assay**Keywords** escape, optimal epitope**References** Allen *et al.* 2005b

- 4/14 optimal HIV-1 T-cell epitopes in a subject underwent mutation associated with dramatic loss of the original CD8 response. For one of the escape variants, a novel CD8 T-cell response equal in magnitude to the wild type, was generated. CD8 T-cell recognizing the variant epitope utilized a distinct T-cell receptor and did not exhibit any cross-reactivity against the wild type.

- An escape mutation occurred at position 5 of this epitope, alirSlqql.

Country United States.

Assay type CD8 T-cell Elispot - IFN γ

Keywords subtype comparisons, escape, characterizing CD8+ T cells, reversion, viral fitness

References Allen *et al.* 2005a

- Two-thirds of all mutations arising in nonenvelope proteins during the transition from acute to chronic infection were found to be due to either CD8 T-cell-associated selective pressures or reversion of HLA-I-associated mutations selected in a previous host. The predominance of escape mutations at highly polymorphic sites was observed across different HIV-1 clades.
- One escape mutation, at position 5, ALIRsLQQL, was found in the most polymorphic residue in the epitope. One escape mutation, at position 3, ALiRILQQL was found not to correspond to the most polymorphic residue in the epitope.

Assay type CD8 T-cell Elispot - IFN γ , Chromium-release assay, HLA binding

Keywords escape, acute/early infection, variant cross-recognition or cross-neutralization, optimal epitope

References Altfeld *et al.* 2005

- The most frequently targeted HLA-A2-restricted CD8+ T-cell epitopes in chronic infection were significantly less frequently recognized during primary infection. This epitope was recognized both in acute and chronic infection, but slightly more frequently in chronic infection.
- A less common form of this epitope, with the I to L change in the second position, ALIRILQQL binds to HLA-A2 at lower concentrations and can serve as an HLA-A2 epitope during acute infection. It binds well to A*0201, A*0202, A*0203, and A*0206. This is an example of a less immunogenic form of the epitope, AiRILQQL becoming the most common circulating form.

Keywords epitope processing, escape

References Yusim *et al.* 2002

- Epitopes that have been described in the literature and included in this database tend to cluster in conserved regions and be absent or rarely found in highly variable regions in Nef, Env, and p17.
- While the uneven distribution of epitopes may be in part due to a limited cross-recognition of specific responses because of differences between peptides used to probe the immune response and autologous strains, regions with a paucity of defined epitopes also had higher frequencies of amino acids that tend to not be found in C-terminal positions of epitopes, and had lower cleavage prediction scores for epitope processing. This suggests that in the regions of the virus where variation is best tolerated, traces of immune escape have left an imprint on the viral population. Epitopes also were concentrated in alpha-helix and turn regions in the proteins.
- In the more conserved p24, and Pol proteins RT and Protease, epitopes are more evenly distributed.
- What was learned from proteins where many epitopes have been defined (Gag, Pol, Env and Nef) was used to develop an algorithm to predict where epitopes would be localized in Rev, Tat, Vif, and Vpr. Predictions were made blinded, and then compared to the first 15 epitopes defined in these proteins; the epitopes were concentrated in the predicted regions.

Epitope name EW10
Immunogen HIV-1 infection
Species (MHC) human (B53)
Assay type Chromium-release assay, Flow cytometric T-cell cytokine assay
Keywords class I down-regulation by Nef
References Bobbitt *et al.* 2003

- Nef, through Nef-mediated MHC-I down-regulation, is not the only viral protein to influence levels of HIV-specific CTL recognition. The Rev L60F mutation, a common natural variant, can decrease CTL recognition of late gene products. The Rev mutation impacts the early to late gene switch, reducing late gene product production (Gag, Pol, Env, Vpu, Vpr and Vif), while increasing Nef production, both of which reduce the impact CTL recognition of late gene products. As expected, Rev L60F rendered HIV infected cells more resistant to CTL that recognized epitopes from the late proteins Env and Gag. Gag expression is reduced more than Env, and Gag-specific CTL were more profoundly affected. Conversely CTL against an epitope in an early gene product, Tat, were more efficiently recognized when infected with viruses carrying the Rev L60F mutation.

- Patients in the asymptomatic phase with active immune responses had more CTL resistant viruses, with lower Rev activity, lower Gag expression and greater resistance to Gag-specific CTL killing, while viruses isolated from people with AIDS were more sensitive to CTL killing.

Keywords escape, immune evasion, optimal epitope, HIV-1

References Liu *et al.* 2006

- T-cell immunity and the impact of selection were longitudinally studied in a patient from the time of transmission. New epitopes were detected at sites that were shown to be under positive selection. Env was found to be the major target of CTLs and most of the new epitopes were found here. One third of the sites examined were associated with epitope escape mutations from CTL. Acquisition of mutations found at high frequency in the database was suggested to be a result of reversion of CTL epitopes in the absence of immune targeting.

- This is a newly defined epitope. Positions 5 and 7 in the epitope had potentially experienced positive selection. PVDPRLEPW, PVDPSLEPW and PVDPKLEPW escape variants were found.

Assay type CD8 T-cell Elispot - IFN γ

Keywords acute/early infection, variant cross-recognition or cross-neutralization, superinfection, characterizing CD8+ T cells

References Yang *et al.* 2005b

- An individual infected with a drug-resistant strain of HIV-1 subtype B with controlled viremia became superinfected with another subtype B strain. The second strain outgrew the first despite lower replication capacity and the same viral phenotype. The strains showed differences in their epitope sequences. The CTL responses to the first strain declined after superinfection, followed by some adaptation of targeting to the new epitopes of the second strain. Differences in the recognized epitopes were suggested to have contributed to the poor immune containment of the second strain.
- A early response to this peptide KCCFHCQVCFTTKGL was detected that waned prior to superinfection. The embedded epitope and HLA presenting molecule not resolved. The initial and superinfecting strains had different versions of the peptide, oCCFHCQVCFTTKGL and KCCIHCQVCFTTKGL respectively.

Assay type CD8 T-cell Elispot - IFN γ , Intracellular cytokine staining, Flow cytometric T-cell cytokine assay

Keywords escape, optimal epitope

References Allen *et al.* 2005b

- 4/14 optimal HIV-1 T-cell epitopes in a subject underwent mutation associated with dramatic loss of the original CD8 response. For 1 of the escape variants, a novel CD8 T-cell response equal in magnitude to the wildtype, was generated. CD8 T-cell recognizing the variant epitope utilized a distinct T-cell receptor and did not exhibit any cross-reactivity against the wildtype.
- A mutation occurred at position 3 of this epitope, ccMhcqvc, but significant cross-recognition was observed between the escape variant and the wildtype epitope.

- Two-thirds of all mutations arising in nonenvelope proteins during the transition from acute to chronic infection were found to be due to either CD8 T-cell-associated selective pressures or reversion of HLA-I-associated mutations selected in a previous host. The predominance of escape mutations at highly polymorphic sites was observed across different HIV-1 clades.
- One escape mutation, at position 3, CCIHCQVC, was found in the most polymorphic residue in the epitope.

- CTL epitope responses were mapped in 21 men within 15–92 days post-HIV-1 infection. Subjects initially showed narrow immune responses with a mean of 2.3 epitopes recognized per patient. The immune response broadened later in infection. No correlation between the plasma viral load and the number of recognized epitopes or the frequency of IFN-gamma secreting cells was observed, and there was no correlation between the functional avidity of a response and the abundance of IFN-secreting cells that recognized the epitope. The first epitopes to be recognized tended not to be the most avid, and earliest responses tended to be directed against Nef, Tat, Vpr, and Env.

- Two individuals recognized this epitope both presented by Cw*1203.
- More common HLA alleles were less frequently used in primary infection than less common alleles, for example A3, B35, B57, and B62 were more frequently recognized than A1, A2, A30, and A44.
- All HIV-1 proteins except Vpu were recognized, and a response to a total of 41 optimal epitopes were characterized; 24 had been identified previously. 48% of the total T-cell responses were directed against Nef and 43% were directed against Gag.

- T-cell immunity and the impact of selection were longitudinally studied in a patient from the time of transmission. New epitopes were detected at sites that were shown to be under positive selection. Env was found to be the major target of CTLs and most of the new epitopes were found here. One third of the sites examined were associated with epitope escape mutations from CTL. Acquisition of mutations found at high frequency in the database was suggested to be a result of reversion of CTL epitopes in the absence of immune targeting.
- Position 3 in the epitope had potentially experienced positive selection. CCIHCQVC and CCFHCQsC escape variants were found.

Assay type CD8 T-cell Elispot - IFN γ , Chromium-release assay

Keywords dynamics, epitope processing, immunodominance, escape, acute/early infection, kinetics, characterizing CD8+ T cells, reversion, viral fitness

References Jones *et al.* 2004

- Primary CD8+ T-cell response to Env, Tat and Gag and the extent, kinetics and mechanisms of viral escape were examined in three patients. Rapid escape, within weeks from infection, from HIV specific CTL responses was observed in all three patients, but the kinetics and extent of the escape differed depending on the breadth and co-dominant distribution of CTL-mediated pressure. The two patients that rapidly declined had more focused immunodominant responses, while the single patient that had low viral load and stable CD4 counts for seven years had a broad co-dominant response and less escape.
- The patient SUMA maintained low viral loads and stable CD4 T cell counts through seven years of follow up. In contrast to more rapid progressors, WEAU and BORI, SUMA a broad response to 24 epitopes, with little immunodominance. Two peptides were somewhat more intensely recognized in acute infection, but this response leveled out early on.
- Only four epitopes were found to acquire escape mutations in SUMA over time. Early in infection, three overlapping epitopes in Tat carried mutations: FHCQVCFMTK, VCFMTKGLGI, and MTKGLGISY. An M->T substitution was evident during acute infection in the first sample, at four days of the onset of symptoms, and a rare second variant was seen at day 20 that added a K->E substitution. The M->T substitution abrogated responses to FHCQVCFtTK, VCFtTKGLGI, but not in the third epitope tTKGLGISY. By day 69 a double mutation was evident that persisted through day 435, F->L and T->K. Variants IHCQVCFMkK, VCFMkKGLGI were not recognized, and impact processing of the MTKGLGISY epitope.

Keywords characterizing CD8+ T cells

References Kiepiela *et al.* 2004

- HLA class I restricted CD8+ T-cell responses against HIV-1 were analyzed in African patients. Significantly more responses were shown to be HLA-B restricted. Viral load, CD4 count, and thus rate of disease progression were also associated with HLA-B alleles. In addition, the selection pressure imposed on HIV-1 by HLA-B alleles was shown to be substantially greater than by other alleles.
- This epitope was suggested to be the epitope within a longer reactive peptide based on correspondence with a known epitope in the HIV database. Also, a significantly higher frequency of people in the Durban cohort who reacted with the peptide had this HLA type.

Keywords rate of progression, escape

References Oxenius *et al.* 2004b

- The increase in plasma viral load in a patient that progressed rapidly was preceded by positive selection of viral escape mutations in epitopes targeted by dominant HIV-1-specific CD8+ T-cell responses, and a decrease in HIV-1-specific CD4+ and CD8+ T-cell frequencies. Overall, escape variant epitopes were recognized 0-80% as efficiently as the index peptide, and the relatively efficiency of the variant epitopes increased using PBLs collected after their appearance. No changes were found in viral tropism, replication kinetics and neutralizing antibody titers, so the rapid decline of the patient was attributed to loss of HIV containment due to CTL escape.
- This was one of 8 reactive epitopes found not to vary over time.

Keywords epitope processing, escape

References Yusim *et al.* 2002

- Epitopes that have been described in the literature and included in this database tend to cluster in conserved regions and be absent or rarely found in highly variable regions in Nef, Env, and p17.
- While the uneven distribution of epitopes may be in part due to a limited cross-recognition of specific responses because of differences between peptides used to probe the immune response and autologous strains, regions with a paucity of defined epitopes also had higher frequencies of amino acids

that tend to not be found in C-terminal positions of epitopes, and had lower cleavage prediction scores for epitope processing. This suggests that in the regions of the virus where variation is best tolerated traces of immune escape have left an imprint on the viral population. Epitopes also were concentrated in alpha-helix and turn regions in the proteins.

- In the more conserved p24, and Pol proteins RT and Protease, epitopes are more evenly distributed.
- What was learned from proteins where many epitopes have been defined (Gag, Pol, Env and Nef) was used to develop an algorithm to predict where epitopes would be localized in Rev, Tat, Vif, and Vpr. Predictions were made blinded, and then compared to the first 15 epitopes defined in these proteins; the epitopes were concentrated in the predicted regions.

References Gruters *et al.* 2002

- This paper is a review that makes a case for using Tat and Rev as part of a vaccine strategy.
- CTL against Tat and Rev were found preferentially in long term non-progressors.
- Tat/Rev vaccinations of macaques provided protection or reduction in viremia, with high levels of CTL providing protection from challenge, lower levels of CTL having lower viremia, while Gag/Pol vaccinations with did not result in decreased viremia.

- Early expression of Tat/Rev may in part explain the enhanced benefit of a CTL response directed at these proteins, and CTL escape is more prominent in these proteins.

HXB2 Location Tat

Author Location Tat (BH10)

Epitope

Immunogen vaccine

Vector/Type: DNA *Strain:* B clade BH10

HIV component: Tat *Adjuvant:* cationic block copolymer K2

Species (MHC) mouse

Donor MHC H-2d

Assay type proliferation, Chromium-release assay

References Caputo *et al.* 2003

- Mice were immunized intramuscularly with a plasmid DNA vaccine (HIV-1 pCV-tat DNA) alone or complexed with a cationic block polymer K1, K2, or K5, which block digestion by DNAase I and enhance DNA delivery to APC.
- CTL responses to low dose Tat DNA vaccination with K2 were greatly enhanced relative to responses to DNA alone.

HXB2 Location Tat

Author Location Tat

Epitope

Immunogen vaccine

Vector/Type: DNA, protein *HIV component:*

Tat *Adjuvant:* aluminum hydroxide, Ribi adjuvant (MPL+TDM) (RIBI)

Species (MHC) macaque

Keywords review, early-expressed proteins

References Fanales-Belasio *et al.* 2002a

- HIV-1 Tat protein is efficiently taken up by monocyte-derived dendritic cells (MDDCs) and promotes Th1 immune responses. A Tat based vaccine can elicit an immune response that can control primary infection in monkeys that are in early stage of infection with SHIV89.6P.
- Tat-specific CTL activity was detected in four monkeys inoculated with i.m. with pCV-tat.

HXB2 Location Tat

Author Location

Epitope

Immunogen in vitro stimulation or selection

Species (MHC)

Assay type CD8 T-cell Elispot - IFN γ , Chromium-release assay

Keywords epitope processing, immunodominance, early-expressed proteins, Th1, adjuvant comparison

References Gavioli *et al.* 2004

- HIV-1 Tat protein modulates proteasome composition and activity in B and T cells that either express Tat or are treated with exogenous biologically active Tat protein. This results in modification of Ag processing where presentation of immunodominant EBV epitopes is decreased and presentation of subdominant epitopes is increased. The authors suggest that the immunomodulatory effects of endogenous and exogenous Tat may be beneficial in terms of expanding stimulation of responses to subdominant epitopes, and may be useful as an adjuvant.

Epitope KAVRLIKFLY

Immunogen HIV-1 infection

Species (MHC) human (B57, B*5801)

Assay type CD8 T-cell Elispot - IFN γ , Chromium-release assay

Keywords responses in children, mother-to-infant transmission

References Feeney *et al.* 2005

- Escape mutations in TW10 and other B57-restricted epitopes were shown to arise early in infants following perinatal infection. Some escape variants were likely to have been transmitted vertically, from HLA-B57/5801 positive HIV-1 infected mothers, while others arose during infancy in cases where the children inherited the B57/5801 allele paternally. In contrast to adults, the majority of children showed a robust response to the escape variants, suggesting that infants are able to mount functional immune responses and drive immune escape and that a developing immune system may exhibit greater plasticity in recognizing viral variants.
- This epitope was recognized less frequently in children than in adults.

Immunogen HIV-1 infection

Species (MHC) human

Keywords epitope processing, escape

References Yusim *et al.* 2002

- Epitopes that have been described in the literature and included in this database tend to cluster in conserved regions and be absent or rarely found in highly variable regions in Nef, Env, and p17.
- While the uneven distribution of epitopes may be in part due to a limited cross-recognition of specific responses because of differences between peptides used to probe the immune response and autologous strains, regions with a paucity of defined epitopes also had higher frequencies of amino acids that tend to not be found in C-terminal positions of epitopes, and had lower cleavage prediction scores for epitope processing. This suggests that in the regions of the virus where variation is best tolerated, traces of immune escape have left an imprint on the viral population. Epitopes also were concentrated in alpha-helix and turn regions in the proteins.
- In the more conserved p24, and Pol proteins RT and Protease, epitopes are more evenly distributed.
- What was learned from proteins where many epitopes have been defined (Gag, Pol, Env and Nef) was used to develop an algorithm to predict where epitopes would be localized in Rev, Tat, Vif, and Vpr. Predictions were made blinded, and then compared to the first 15 epitopes defined in these proteins; the epitopes were concentrated in the predicted regions.

Assay type CD8 T-cell Elispot - IFN γ

Keywords superinfection, characterizing CD8+ T cells

References Yang *et al.* 2005b

- An individual infected with a drug-resistant strain of HIV-1 subtype B with controlled viremia became superinfected with another subtype B strain. The second strain outgrew the first despite lower replication capacity and the same viral phenotype. The strains showed differences in their epitope sequences. The CTL responses to the first strain declined after superinfection, followed by some adaptation of targeting to the new epitopes of the second strain. Differences in the recognized epitopes were suggested to have contributed to the poor immune containment of the second strain.
- The response to this epitope, TVRLIKFLY, was present only after superinfection. The epitope from the first infecting strain had the substitutions tvKIikfly relative to the test peptide, while the second strain shared the sequence TVRLIKFLY.

Assay type CD8 T-cell Elispot - IFN γ , HLA binding
Keywords escape, acute/early infection, characterizing CD8+ T cells
References Milicic *et al.* 2005
 • CTL responses and escape were analyzed in 4 homosexual couples where blood samples were available within weeks of estimated transmission. When the recipient had the same HLA type as the donor, CTL escape variants prevented a CTL response to those epitopes in the recipient. Even when the HLA alleles were different in the transmitting couple, a single escape mutation in one epitope can abolish CTL recognition of an overlapping epitope of distinct restriction in the recipient. In an early acute infection of the donor, the precise timing of transmission determines the viral variants transmitted.
 • The second donor in the study shares A*0101 and B*0801 with his partner. The escape variant iserilstF was transmitted, and it abrogates binding to A*0101.

Epitope SAEPVPLQL

Immunogen HIV-1 infection

Species (MHC) human (B14, Cw8)

References van Baalen *et al.* 1998

- The Rev-specific CTL response studied here was from an individual infected with HIV-1 for more than 12 years without developing symptoms – Rev and Tat are expressed early and CTL activity against these proteins has been correlated with long-term survival.
- The CTL clone TCC108 specific for this epitope was studied *in vitro*.
- CTLs added immediately after infection suppressed viral production, indicative of CTL interference with viral production prior to lysis – CTL-mediated lysis occurred after the onset of progeny viral release, but prior to peak viral production.
- Rapid selection of a E69K mutation, which abolished CTL, recognition was observed.
- The epitope was originally listed as B14, but Cw8 and B14 are in linkage disequilibrium, and in this case were not distinguished (pers. comm., Christian Brander, 1999)

Epitope SAEPVPLQL

Immunogen HIV-1 infection

Species (MHC) human (Cw5)

Keywords HAART, ART, acute/early infection

References Altfeld *et al.* 2001b

- Therapy provided during acute infection resulted in a narrower CTL response, stronger T help response, and a less diverse viral population than was seen in individuals treated during chronic infection.
- The breadth and specificity of the response was determined using ELISPOT by studying 19 individuals with pre-seroconversion therapy (Group 1), 11 individuals with primary infection but post-seroconversion therapy (Group 2), and 10 individuals who responded to HAART given during chronic infection (Group 3), using 259 overlapping peptides spanning p17, p24, RT, gp41, gp120 and Nef.
- Previously described and newly defined optimal epitopes were tested for CTL response.
- Number of HLA-Cw5+ individuals that had a CTL response to this epitope broken down by group: 2/6 group 1, 0/1 group 2, and 0/2 group 3.

Epitope SAEPVPLQL

Immunogen HIV-1 infection

Species (MHC) human (Cw5)

Donor MHC A1, A*0201, B44, B57, Cw5, Cw6

Assay type CD8 T-cell Elispot - IFN γ

Keywords binding affinity, acute/early infection, early-expressed proteins

References Cao *et al.* 2003

- CTL epitope responses were mapped in 21 men within 15-92 days post-HIV-1 infection. Subjects initially showed narrow immune responses with a mean of 2.3 epitopes recognized per patient. The immune response broadened later in infection. No correlation between the plasma viral load and the number of recognized epitopes or the frequency of IFN-gamma secreting cells was observed, and there was no correlation between the functional avidity of a response and the abundance of IFN-secreting cells that recognized the epitope. The first epitopes to be recognized tended not to be the most avid, and earliest responses tended to be directed against Nef, Tat, Vpr, and Env.

- All HIV-1 proteins except Vpu were recognized, and a responses to a total of 41 optimal epitopes were characterized; 24 had been identified previously. 48% of the total T-cell responses were directed against Nef and 43% were directed against Gag.
- More common HLA alleles were less frequently used in primary infection than less common alleles, for example A3, B35, B57, and B62 were more frequently recognized than A1, A2, A30, and A44.

Immunogen HIV-1 infection

Species (MHC) human (Cw5, Cw8)

Keywords early-expressed proteins

References Addo *et al.* 2002b

- CTL responses against regulatory and accessory proteins in 70 HIV-1 infected patients were studied using overlapping peptides and Elispot.
- 28% targeted one or more overlapping Tat peptides; 36%, Rev peptides; 33%, Vif peptides; 40%, Vpr peptides; and 2%, Vpu peptides.
- All known optimally defined epitopes were summarized for the five proteins.

HXB2 Location Rev (67–75)

Author Location Rev (69–77 BRU)

Epitope SAEPVPLQL

Epitope name Rev SL9

Immunogen HIV-1 infection

Species (MHC) human (Cw8)

Keywords HAART, ART, supervised treatment interruptions (STI), acute/early infection

References Addo *et al.* 2001

- Rev and Tat are expressed early in the virus life cycle and thus may be important targets for CTL against HIV early in infection and for vaccines – therefore CTL responses against Tat and Rev were screened using overlapping peptides.
- 11/57 (19.3%) HIV-1 + individuals recognized at least 1 Tat peptide, and 21/57 (37%) responded to at least 1 Rev peptide.
- This epitope is the first HIV-specific CTL epitope restricted by HLA-Cw5.
- This epitope was recognized by 2/5 individuals expressing HLA-Cw8 and by 5/11 individuals expressing Cw5 allele, which differs from Cw8 by 4 amino acids, suggesting promiscuous presentation of the epitope between those HLA molecules.
- Longitudinal data was available for 6 Rev-SL9 responders, who were treated during acute infection, and the response was stable 2 and 12 months after initiation of HAART, measurements by ELISPOT and flow-based intracellular cytokine staining (ICS) were concordant – in two subjects the response was heightened by transient reexposure to antigen with treatment interruption at 12 to 14 months.

Epitope SAEPVPLQL

Subtype B

Immunogen HIV-1 infection

Species (MHC) human

Keywords epitope processing, escape

References Yusim *et al.* 2002

- Epitopes that have been described in the literature and included in this database tend to cluster in conserved regions and be absent or rarely found in highly variable regions in Nef, Env, and p17.
- While the uneven distribution of epitopes may be in part due to a limited cross-recognition of specific responses because of differences between peptides used to probe the immune response and autologous strains, regions with a paucity of defined epitopes also had higher frequencies of amino acids that tend to not be found in C-terminal positions of epitopes,

and had lower cleavage prediction scores for epitope processing. This suggests that in the regions of the virus where variation is best tolerated traces of immune escape have left an imprint on the viral population. Epitopes also were concentrated in alpha-helix and turn regions in the proteins.

- In the more conserved p24, and Pol proteins RT and Protease, epitopes are more evenly distributed.
- What was learned from proteins where many epitopes have been defined (Gag, Pol, Env and Nef) was used to develop an algorithm to predict where epitopes would be localized in Rev, Tat, Vif, and Vpr. Predictions were made blinded, and then compared to the first 15 epitopes defined in these proteins; the epitopes were concentrated in the predicted regions.

Immunogen vaccine
Vector/Type: DNA *HIV component:* Nef, Vif, Vpu

Species (MHC) mouse (H-2^d)
Keywords subtype comparisons, Th1
References Ayyavoo *et al.* 2000

- Splenocytes from BALB/c mice immunized with pVVN-P DNA were incubated with Vif, Vpu or Nef antigens for 3 days and assayed for IL-4 and IFN-gamma levels.
- Antigen stimulation increased IFN-gamma production in pVVN-P immunized mice, indicating a Th1 response.
- IL-4 production was not significantly changed after antigen stimulation compared to control levels.
- Cross-clade CTL activity was also observed: A, B clade, CRF01(AE) clade antigens could serve as targets for the B clade immunization-stimulated CTL – an HIV-1 AC recombinant, however, did not stimulate a CTL response, but was expressed at lower levels on the target cell.

II-B-21 gp160 CTL/CD8+ epitopes

HXB2 Location gp160 (2–10)
Author Location gp160 (2–10 IIIB)
Epitope RVKEKYQHL

Immunogen HIV-1 infection
Species (MHC) human (B*0801)
Keywords optimal epitope
References Frahm *et al.* 2007

- C. Brander notes this is a B*0801 epitope.

HXB2 Location gp160 (2–10)
Author Location gp160 (2–10 IIIB)
Epitope RVKEKYQHL

Immunogen HIV-1 infection
Species (MHC) human (B8)
Keywords subtype comparisons
References Sipsas *et al.* 1997

- HIV IIIB proteins were used to define the range of CTL epitopes recognized by 3 lab workers accidentally infected with HIV-1 IIIB.
- Type-specific epitope, unique to the LAI and IIIB because of a deletion of three amino acids that are present in all other subtype B HIV-1s.
- RVKGIRKQNYQHL, a variant found in JRCSF, was not recognized.
- This epitope is in the signal sequence of gp120.

HXB2 Location gp160 (2–10)
Author Location gp120 (2–10)

Epitope RVKEKYQHL

Immunogen HIV-1 infection

Species (MHC) human (B8)

References Day *et al.* 2001

- B8-restricted CTL accounted for about 1/3 of the total CTL response in one individual.

Subtype CRF01_AE

Immunogen HIV-1 exposed seronegative

Species (MHC) human (A11)

Keywords HIV exposed persistently seronegative (HEPS)

References Sriwanthana *et al.* 2001

- This was a study of HIV-1 exposed persistently seronegative (HEPS) female sex workers in Chiang Mai, northern Thailand.
- HLA-A11 is very common in this population, and was enriched among the HEPS sexworkers – weak CTL responses were detected in 4/7 HEPS women, and CTL responses were found in 8/8 HIV+ controls, and 0/9 HIV- women that were not exposed.
- This epitope after a second stimulation *in vitro* gave a weak response in HEPS study subject 186 who was HLA A2/A11.

HXB2 Location gp160 (6–12)

Author Location gp120 (6–15 CM243 subtype CRF01)

Epitope TQMNWPNLWK

Subtype CRF01_AE

Immunogen HIV-1 infection

Species (MHC) human (A11)

Keywords subtype comparisons

References Bond *et al.* 2001

- HLA-A11 CRF01 (called subtype E in Bond *et al.*) epitopes were identified that stimulated CTL from HIV+ female sex workers (FSW) from Northern Thailand, of whom more than half were HLA-A11 positive.
- 77 possible HLA-A11 epitopes were first defined using EpiMatrix, these were screened for binding to A11 finding and 26 bound, and 12 of these were epitopes for CTL responses from 8 HLA-A11 positive FSWs, six were novel, six were previously identified.
- This is one of the new A11 epitopes identified through the streamlined EpiMatrix method, and 2/8 tested FSWs recognized it.
- This epitope was not conserved in other subtypes, and exact matches were rare.

HXB2 Location gp160 (30–40)

Epitope AAENLWVTVYY

Immunogen HIV-1 infection

Species (MHC) human (B44)

Country Spain.

Assay type proliferation, CD8 T-cell Elispot - IFN γ , Flow cytometric T-cell cytokine assay

Keywords HAART, ART, supervised treatment interruptions (STI), immune dysfunction

References Plana *et al.* 2004

- Structured treatment interruption (STI) alone is not able to control viral replication in chronically infected patients, probably due to lack of strong, maintained T-helper cell responses. HIV-1 specific CD8+ T-cell responses were shown to increase significantly until the end of the follow up, but were not correlated with viral load..
- Less than 2 of 11 patients recognized this epitope.

Author Location gp120

Epitope AAEQLWVTVYYGVPVWKEAT

Immunogen HIV-1 infection

Species (MHC) human (A11)

Keywords TCR usage

References Weekes *et al.* 1999b

- Peptide 7035.1: Almost all CD8+ T cells are CD28+ at birth, and the proportion of CD28-CD8+ cells increases with age – this study examines the contribution of CD8+CD28- cells to CTL memory pools for CTL clones specific for two persistent human viruses, CMV and HIV – clones were found to be similarly distributed in the CD28 depleted cell population.
- HIV CTL responses to 3 Env and 2 Gag peptides were studied.
- The clonal composition of the TCR V β responses was studied and was found to be highly focused, with one TCR beta-chain sequence tending to dominate the peptide-specific response – clones to this epitope were V β 6.

Assay type CD8 T-cell Elispot - IFN γ , CD4 T-cell Elispot - IFN γ

Keywords rate of progression, escape

References Oxenius *et al.* 2004b

- The increase in plasma viral load in a patient that progressed rapidly was preceded by positive selection of viral escape mutations in epitopes targeted by dominant HIV-1-specific CD8+ T-cell responses, and a decrease in HIV-1-specific CD4+ and CD8+ T-cell frequencies. Overall, escape variant epitopes were recognized 0-80% as efficiently as the index peptide, and the relatively efficiency of the variant epitopes increased using PBLs collected after their appearance. No changes were found in viral tropism, replication kinetics and neutralizing antibody titers, so the rapid decline of the patient was attributed to loss of HIV containment due to CTL escape.
- This was one of 8 reactive peptides found not to vary over time. It was one of four epitopes that were not precisely defined.

Keywords escape, immune evasion, optimal epitope, HIV-1

References Liu *et al.* 2006

- T-cell immunity and the impact of selection were longitudinally studied in a patient from the time of transmission. New epitopes were detected at sites that were shown to be under positive selection. Env was found to be the major target of CTLs and most of the new epitopes were found here. One third of the sites examined were associated with epitope escape mutations from CTL. Acquisition of mutations found at high frequency in the database was suggested to be a result of reversion of CTL epitopes in the absence of immune targeting.
- This is a newly defined epitope. Position 1 in the epitope had potentially experienced positive selection. AdNLWVTYVY, tdNLWVTYVY, tEdLWVTYVY, eEdLWVTYVY and AEdsWVTYVY escape variants were found.

Assay type CD8 T-cell Elispot - IFN γ , Chromium-release assay

Keywords dynamics, immunodominance, escape, acute/early infection, kinetics, characterizing CD8+ T cells, reversion, viral fitness

References Jones *et al.* 2004

- Primary CD8+ T-cell response to Env, Tat and Gag and the extent, kinetics and mechanisms of viral escape were examined in three patients. Rapid escape, within weeks from infection, from HIV specific CTL responses was observed in all three patients, but the kinetics and extent of the escape differed depending on the breadth and co-dominant distribution of CTL-mediated pressure. The two patients that rapidly declined had more focused immunodominant responses, while the single patient that had low viral load and stable CD4 counts for seven years had a broad co-dominant response and less escape.

- The patient WEAU had high viral loads and rapid CD4 decline. WEAU mounted 14 detected CTL responses, with distinct patterns of immunodominance. WEAU did not control viral replication well, and escape mutations occurred early and 4/14 had changes that could have resulted in escape, and two were confirmed as escape.
- This was the immunodominant response in acute infection in WEAU, and there was rapid escape in the epitope AENLWVTYVY, with three variants observed by day 30 from the onset of symptoms. Additional mutations continued to develop, so that there were 9 different forms observed through the course of sampling. The variants all conferred different levels of reduction in CTL response, double mutations or anchor mutations tended to cause the greatest reduction: AaNLWV-TaY, tNkWVTYVY, AgNLWVTYVY, AkNLWVTYVY, although the double mutant tENLWVTiY elicited a very strong CTL response, suggesting it might not be an escape form.

HXB2 Location gp160 (31–39)

Author Location gp120 (30–38 SF2)

Epitope AENLWVTYVY

Immunogen HIV-1 infection

Species (MHC) human (B44)

Keywords HAART, ART, acute/early infection

References Altfeld *et al.* 2001b

- Therapy provided during acute infection resulted in a narrower CTL response, stronger T help response, and a less diverse viral population than was seen in individuals treated during chronic infection.
- The breadth and specificity of the response was determined using ELISPOT by studying 19 individuals with pre-seroconversion therapy (Group 1), 11 individuals with primary infection but post-seroconversion therapy (Group 2), and 10 individuals who responded to HAART given during chronic infection (Group 3), using 259 overlapping peptides spanning p17, p24, RT, gp41, gp120 and Nef.
- Previously described and newly defined optimal epitopes were tested for CTL response.
- Number of HLA-B44+ individuals that had a CTL response to this epitope broken down by group: 1/8 group 1, 2/3 group 2, and 3/4 group 3.

Epitope AENLWVTYVY

Immunogen HIV-1 infection

Species (MHC) human (B44)

Keywords epitope processing

References Cao *et al.* 2002

- AC2 is a B44 restricted CTL clone that recognizes AENLWVTYVY.

- CTL could be activated by a fusion protein of an HIV protein and anthrax lethal factor (LFn-HIV) that promotes antigen presenting cell uptake of exogenous protein and allows processing through the MHC class I pathway. This strategy for CTL detection could allow antigen presentation without generation of cells by the standard methods of using live viral vectors carrying a protein, or by loading the cells with peptides and by-passing processing.

Country United States.
Assay type Cytokine production, Intracellular cytokine staining, Chromium-release assay, Flow cytometric T-cell cytokine assay
Keywords assay standardization/improvement, memory cells, characterizing CD8+ T cells
References Lichterfeld *et al.* 2004c

- Using a flow-cytometric cytotoxicity assay based on caspase-3 activation in dying target cells, it was shown that the subset of HIV-1-specific CD8+ T cells secreting both IFN-gamma and TNF-alpha exhibit stronger cytotoxic activity than those secreting only IFN-gamma. These cells also exhibited stronger intracellular perforin expression. No association between HIV-1-specific CD8+ T-cell maturation phenotypes and intracellular perforin expression was found.
- 1/9 individuals recognized this epitope.
