MEETING

+ + + + +

WEDNESDAY,

MARCH 7, 2001

+ + + + +

The meeting was held at 9:30 a.m. in the Versailles Room of the Bethesda Holiday Inn, 8120 Wisconsin Avenue, Bethesda, Maryland, DR. ROBERT DAUM, Acting Chair, presiding.

PRESENT:

- STEVE KOHL, M.D.
- KWANG SIK KIM, M.D.
- ROBERT S. DAUM, M.D.
- DAVID STEPHENS, M.D.
- PAMELA DIAZ, M.D.
- BARBARA LOE FISHER
- JUDITH D. GOLDBERG, D., S.c.D
- WALTER L. FAGGETT, M.D.
- DIANE GRIFFIN, M.D.
- NANCY CHERRY
- Executive Secretary

OPEN

(9:36 a.m.)

CHAIRMAN DAUM: Good morning and welcome to the VRBPAC meeting. We will begin with asking the Committee members, and those seated at the table, to introduce themselves. Please, Dr. Ball, we will start with you, and we will go right around the table.

MS. LIBERA: Leslie Ball, FDA, CBER.

DR. TAFFS: Rolf Taffs, FDA CBER.

DR. KOHL: Steve Kohl, Oregon Health Science University.

DR. STEPHENS: I'm David Stephens, Emory University.

DR. GRIFFIN: Diane Griffin, Johns Hopkins.

DR. DIAZ: Pamela Diaz, Chicago Department of Health.

DR. GOLDBERG: Judith Goldberg, New York University.

MS. LOE FISHER: Barbara Loe Fisher, National Vaccine Information Center.

CHAIRMAN DAUM: Dr. Fleming?

DR. FLEMING: Thomas Fleming, University of Washington, Seattle.

DR. WHARTON: Melinda Wharton, Centers for

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1 Disease Control.

2 DR. BROOME: Claire Broome, Centers for
3 Disease Control.

4 DR. GERBER: Michael Gerber, Children's
5 Medical Center, Cincinnati.

6 MS. LIBERA: Dolores Libera, Allergy and
7 Asthma Network, Mothers of Asthmatics.

8 DR. MCINNES: Pamela McInnes, National
9 Institute of Allergy and Infectious Diseases, NIH.

10 CHAIRMAN DAUM: And I'm Robert Daum from
11 the University of Chicago. Thank you, we will now
12 turn the floor over to Ms. Cherry for the conflict of
13 interest statement.

14 MS. CHERRY: Before I say that, could I
15 ask any of you who are carrying cell phones, and I
16 know that that probably applies to everybody in the
17 room, to please turn them off during the meeting.

18 We have, the room seems pretty crowded
19 today, and that would be very disruptive.

20 Now I will read the statement. The
21 following statement addresses conflict of interest
22 issues associated with the open session of the
23 Vaccines and Related Biological Products Advisory
24 Committee meeting on March 7th, 2001.

25 The topic before the Committee today is a

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 discussion of the safety and immunogenicity data
2 pertaining to a combination DTPa-HepB-IPV vaccine.
3 Committee members Dr. Snyder and Manley will be unable
4 to attend this meeting. Dr. Katz is expected to join
5 us tomorrow.

6 The Director of the Center for Biologics
7 Evaluation and Research has appointed Dr. Britt, who
8 will be here later this morning, and Drs. Broome,
9 Fleming, and Wharton, as temporary voting members for
10 this discussion.

11 To determine if any conflict of interest
12 existed the Agency reviewed the submitted data, and
13 all financial interests reported by the meeting
14 participants. As a result of this review the
15 following disclosures are made regarding today's
16 discussions.

17 Drs. Goldberg and Fleming have been
18 granted waivers in accordance with 18 USC 208b3, so
19 that they can participate fully in the discussions.

20 In addition, in accordance with the Food
21 and Drug Administration Modernization Act of 1997,
22 Section 505, Drs. Goldberg, Kohl, Stephens and
23 Fleming, have been granted waivers which permit them
24 to participate fully in the Committee discussions.

25 Drs. Broome, Daum, Goldberg, Griffin,

1 Kohl, Snyder, Stephens, and Ms. Libera, have
2 associations with firms that could be, or appear to
3 be, affected by the Committee discussions.

4 However, in accordance with 18 USC 208 in
5 section 2365.502 of the Standards of Conduct, it has
6 been determined that none of these associations is
7 sufficient to warrant the need for a waiver, a written
8 appearance determination, or an exclusion.

9 In the event that the discussions involve
10 specific products or firms not on the agenda, and for
11 which FDA's participants have a financial interest,
12 participants are reminded of the need to exclude
13 themselves from the discussions. Their recusals will
14 be noted for the public record.

15 In the interest of fairness we ask that
16 any other individuals who may wish to participate in
17 this meeting state their name and affiliations, and
18 any current or previous financial involvements with
19 any firm whose products they wish to comment on.

20 Copies of all waivers addressed in this
21 announcement are available by written request through
22 the Freedom of Information Act.

23 CHAIRMAN DAUM: Thank you very much,
24 Nancy. Ladies and gentlemen, we are reminded of our
25 frailty in our short existence on this planet, by

1 events, sad events that have occurred since we met
2 last.

3 One of our Committee members, Ms. Barbara
4 Loe Fisher has had the untimely and unfortunate
5 passing of her spouse. Ms. Fisher, I wish to tell
6 you, on behalf of myself, and on behalf of the
7 Committee, that your loss is in our thoughts. To the
8 extent that we can, we share your pain, and we hope
9 that you heal in peace and in reflection.

10 MS. LOE FISHER: Thank you, Dr. Daum. I
11 want to thank the Committee and you, and Dr.
12 Greenberg, and the FDA staff for extending your
13 condolences to me personally and as a Committee in the
14 past few weeks. It meant a lot to me.

15 And I would also like to thank anyone in
16 this room who gives blood, especially platelet. My
17 husband died of a sever autoimmune blood disorder, and
18 the giving of blood meant that it extended the period
19 of time that he had to spend with us, and in many
20 cases it saves people's lives.

21 CHAIRMAN DAUM: It would be remiss if I
22 didn't point out that there is also joy in this human
23 existence of ours. Dr. Snyder is not with us during
24 this meeting because he is off to attend to the birth
25 of a grandchild. So that, as always, we mix the

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

1 sorrow with the joy.

2 And now to the business of the Committee
3 this morning. We are going to begin an open session
4 to consider some issues related to Infanrix HepB-IPV
5 from SmithKline Beecham Biologics.

6 We are going to begin, please, by calling
7 on Dr. Rolf Taffs from the FDA, to introduce the topic
8 to us.

9 While you are setting up, Dr. Taffs, I'm
10 just going to take a second here. I'm remiss, I did
11 not announce the open public Hearing that we are going
12 to have.

13 There will be another opportunity later,
14 and there are several individuals who have declared a
15 possible interest to speak later. But does anyone
16 want to speak now?

17 (No response.)

18 CHAIRMAN DAUM: Good. In that case, Dr.
19 Taffs, I apologize to you, and turn the floor over to
20 you.

21 DR. TAFFS: Thank you. It is my
22 responsibility and my pleasure this morning to welcome
23 the members of this Advisory Committee and all others
24 present to the important topic of consideration of
25 this combination vaccine, Infanrix DTPa-HepB-IPV. I

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 promise to keep my introductory comments brief.

2 If I could have the next slide, please?
3 The DTPa-HepB-IPV combination vaccine that is the
4 subject of today's meeting, is comprised of the
5 following components.

6 DTPa as in Infanrix-DTPa, a licensed
7 vaccine, incorporating diphtheria and tetanus antigens
8 produced under license by Chiron Behring. The
9 hepatitis B surface antigen, as in Engerix-B, also a
10 licensed vaccine, and IPV, that has not been
11 previously licensed in the United States.

12 Next slide, please. I would like to
13 update those present on certain matters, that during
14 the last 11 months, a number of significant updates
15 have taken place regarding recommendations for the
16 sourcing of materials of bovine origin that are used
17 in the manufacture of vaccines.

18 These include a letter to manufacturers of
19 biological products on recommendations regarding
20 bovine spongiform encephalopathy from April 19, 2000,
21 as well as a joint meeting of the Transmissible
22 Spongiform Encephalopathies Advisory Committee, and
23 the Vaccines and Related Biological Products Advisory
24 Committee that met on July 27th of 2000.

25 The letter to manufacturers reiterated

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 recommendations that were made in letters issued in
2 1993 and 1996 from CBER, and appraised manufacturers
3 of the need to be informed of the listing of countries
4 potentially affected by BSE in cattle that is
5 maintained by the USDA.

6 Next slide, please. These documents were
7 followed by a publication from the Public Health
8 Service on recommendations for the use of vaccines
9 manufactured with bovine-derived materials in
10 morbidity and mortality weekly reports in December
11 22nd of the year 2000.

12 And the posting of a webpage by CBER
13 titled Current List of Vaccines Using Bovine-Derived
14 Materials From Countries on the USDA's BSE List, or
15 from unknown countries. And the web address is given
16 in this slide.

17 Included on the web site, in the section
18 of vaccines that use bovine-derived materials from
19 countries on the USDA's list, is a SmithKline Beecham
20 Biologicals DTP vaccine, Infanrix.

21 The manufacturer has committed to
22 implementing changes that when completed may lead to
23 the removal of this vaccine from the listing.

24 Now, based on the proposed initial
25 marketing of the Infanrix DTPa-HepB-IPV because it

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 contains the same components as Infanrix DTPa, it will
2 also be placed on the list, until the changes
3 indicated by the manufacturer have been completed.

4 Next slide, please. So proceeding with
5 the purpose of this meeting this morning, CBER is
6 requesting that the Committee assembled here today
7 consider a series of questions and discussions points,
8 and make their recommendations regarding this vaccine.

9 The following questions pertain to
10 efficacy. The FDA is asking for the Committee's vote
11 on this question. Are the available data adequate to
12 support the efficacy of DTPa-HepB-IPV vaccine, when
13 given to infants in a primary series at 2, 4, and 6
14 months of age?

15 If the data are not adequate to address
16 efficacy, what additional information should be
17 requested?

18 Next slide, please. Discussion point
19 number 2. Please discuss whether available clinical
20 data are adequate to demonstrate the safety of the
21 DTPa-HepB-IPV combination vaccine, when given to
22 infants in a primary series at 2, 4, 6 months of age.
23 Please comment on the increased rates of fever.

24 If the data are not adequate to
25 demonstrate safety what additional information should

1 be requested?

2 Next slide, please. Discussion point 3.
3 Please discuss the data submitted in support of the
4 concurrent administration of other routinely
5 recommended childhood immunizations with the DTPa-
6 HepB-IPV vaccine in infants, that is, haemophilus
7 influenza type b vaccine, and 7-valent pneumococcal
8 conjugate vaccine, Prevnar.

9 Next please. The final discussion point,
10 number 4, please identify any issues that should be
11 addressed in post-licensure studies, specifically,
12 please include a discussion of the safety and
13 immunogenicity of concurrent administration of other
14 routinely recommended vaccines, for example, Prevnar,
15 the safety and immunogenicity of fourth and fifth dose
16 of Infanrix DTPa, following a primary series of DTPa-
17 HepB-IPV.

18 The safety and immunogenicity of DTPa-
19 HepB-IPV following a complete or partial primary
20 series of Infanrix or other DTPa vaccine. And,
21 finally, the safety of a primary series of DTPa-HepB-
22 IPV following a birth dose of Hepatitis B vaccine.

23 I think very much, and I now turn the
24 floor back to the Chair.

25 CHAIRMAN DAUM: Thank you, Dr. Taffs. It

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 is now time to hear from the sponsor of this proposed
2 product. And I've been given to believe that there
3 are three speakers, Drs. Kahn, Howe, and Kaufhold, and
4 that to remind you, before you start, that there are
5 50 minutes allotted for this part of the presentation.

6 I see Dr. Kahn up there, so I think we
7 have the right information.

8 DR. KAHN: Good morning. If everyone can
9 hear me?

10 Good morning, members of the Committee,
11 FDA, ladies and gentleman. GlaxoSmith Kline is
12 pleased to be here today to present the candidate
13 infant vaccine, Infanrix DTPa-HepB-IPV.

14 The agenda, my name is Clare Kahn, I
15 should say at the outset, and I'm vice president for
16 U.S. regulatory affairs, responsible for vaccines. So
17 following my introduction Dr. Barbara Howe, who is
18 vice president and director of clinical R&D, North
19 America, responsible for vaccines, will provide an
20 overview of the clinical data with an emphasis on
21 immunogenicity, and following that, Dr. Achim
22 Kaufhold, head of pediatrics vaccine development unit
23 at SB Biologicals in Rixensart, Belgium, will provide
24 a corresponding overview of this clinical safety, and
25 then I will make final conclusions.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 The product is a liquid combination of
2 diphtheria and tetanus toxoids, three acellular
3 pertussis antigens, that is PT, SHA, and potactin,
4 Hepatitis B recombinant, and inactivated poliovirus
5 vaccine types 1, 2, and 3.

6 All component antigens are produced by
7 SmithKline Beecham Biologicals in Rixensart, Belgium,
8 with the exception of DT adsorbed, this is
9 manufactured by Chiron Vaccines in Germany, and
10 shipped for further manufacturer to SB Biologicals,
11 and included in the combination.

12 The generic name, spelled it all out, is
13 diphtheria and tetanus toxoids acellular pertussis
14 hepatitis B recombinant inactivated polio virus
15 vaccine. And the trade names provides good clarity
16 for the physician in that it not only spells out the
17 component antigens in the vaccine, but its
18 relationship to our DTPa vaccine, which is currently
19 marketed, which is Infanrix.

20 The vaccine is indicated for immunization
21 against diphtheria, tetanus, pertussis, all known sub-
22 types of hepatitis B virus, and poliomyelitis caused
23 by polio virus types 1, 2, and 3.

24 As a three dose vaccination series in
25 infants and children, from 6 weeks to 7 years of age,

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 prior to the 7th birthday. And just to clarify this,
2 we are talking about immunization prior to the 7th
3 birthday, intended to allow for catch-up for the
4 primary series.

5 An indication for a fourth dose, following
6 the primary series not being sought at this time, and
7 so booster doses are still required according to the
8 recommended immunization schedule.

9 The basis for licensure, the components of
10 the vaccine, as I shall review shortly, are included
11 individually, or in combination, in products licensed
12 in the U.S. and/or in many world-wide markets.

13 And the development of the candidate was
14 based on CBER's guidance for industry for evaluation
15 of combination vaccines for preventable diseases,
16 which was published in April of '97, in which one
17 would show the combination vaccine is not inferior to
18 separately administered U.S.-licensed vaccines, with
19 respect to immunogenicity, as a surrogate for
20 efficacy, and in regards to safety.

21 And a word about the components, now. The
22 DTPa components are identical in terms of
23 manufacturing composition to those in our currently
24 licensed DTPa vaccine, which is Infanrix.

25 And just to remind you that Infanrix is

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 licensed in the USA in January of '97, licensed in 69
2 countries, with over 31 million doses distributed
3 world-wide. In fact that is more than 50 million
4 doses if one counts DTPa in combination.

5 The hepatitis B component is similar to
6 our licensed engerix-B, that was licensed nearly 12
7 years ago in 1989, apparently licensed in 145
8 countries, with more than 500 million doses of that
9 vaccine distributed as a monovalent vaccine.

10 So now the IPV component, and GSK does
11 not have a U.S. licensed IPV vaccine, but this
12 component is an enhanced potency IPV inactivated
13 trivalent polio vaccine similar to the Aventis Pasteur
14 vaccine, IPOL, similar in that the manufacturing
15 process is similar, it is CFR and WHO compliant. And
16 the same cell line were used for the manufacturing
17 process in that very cells.

18 It also contains the same three strains,
19 types 1, 2, 3, and the same antigen content as IPOL,
20 so that would be Mahoney strain, 40 antigen units.
21 And if you want, it is ADU and the Saukett strain, 32
22 DU.

23 Now, our IPV vaccine has been in clinical
24 development since 1989, with 78 trials conducted in
25 more than 26,000 infants and children, either as IPV

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 alone, or in combinations.

2 It was first licensed in France in '96,
3 and licensed outside the U.S. in quite a variety of
4 combinations shown here, DTPa-IPV in six countries,
5 DTP-IPV, and mixed with Hib before administration in
6 36 countries.

7 And shown in yellow here is our candidate
8 combination licensed as such in 17 countries, and
9 licensed with mixing with Hib before administration in
10 19 countries.

11 And for this combination, for the IPV,
12 over 8 million doses of IPV equivalents have been
13 distributed to date.

14 So this is the vaccine composition. As I
15 mentioned, the DTPa, the hepatitis B and the polio
16 components are the same, and in the same content as in
17 the separately licensed vaccines of the U.S.

18 We point out that there is an aluminum
19 adjuvant, .7 migs of aluminum, as an aluminum source,
20 this is lower than one would have if one would have
21 the separate vaccines. And there is phenoxyethanol as
22 a preservative in common with Infanrix. And there is
23 no detectable thimerosal in the final product.

24 So manufacturing changes have been made
25 during the process of clinical development. There are

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealgross.com

1 in fact three lots, first, second, and third lot
2 series. Third lot series actually being the launch
3 material that we propose.

4 For the pertussis component there have
5 been 2 successive purification scale-ups, all of which
6 have been approved and in use for the currently
7 licensed Infanrix.

8 In going from the first to the second lot
9 during development we added one additional
10 purification step for hepatitis B, which triggered the
11 clinical bridging trial in addition to the usual
12 technical bridging.

13 So for the launch material we have this
14 final PA scale-up a minor volume increase in the
15 hepatitis B purification, and the introduction of new
16 working seeds for the IPV. The technical bridge was
17 sufficient to bridge to the launch material.

18 So with that let me just say that
19 regarding the status of the BLA review, all the BLA
20 questions, including the complete response letter,
21 have been responded to, and we are now in active
22 discussion on those responses with the Agency.

23 And a pre-approval inspection has also
24 been satisfactorily completed. So it is now time to
25 move onto the clinical presentation, and may I

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 introduce Dr. Barbara Howe, to talk about the clinical
2 immunogenicity. Thank you.

3 DR. HOWE: Good morning everyone. Can I
4 be heard okay?

5 So in the next few minutes what I would
6 like to do is to, first of all, overview the contents
7 of the file in support of the Infanrix HepB-IPV and
8 then this will be followed by a review of the pivotal
9 and major supportive studies which had immunogenicity
10 as their primary objective.

11 A total of 12 clinical trials, in which
12 infants received one or more doses of Infanrix HepB-
13 IPV were conducted in ten countries. Three in North
14 America, 2 in the U.S.

15 And these evaluated five different primary
16 immunization schedules, and involved 11 different
17 production lots of vaccine. In total more than 7,000
18 infants received more than 20,000 of Infanrix HepB-IPV
19 in these 12 trials.

20 Now, the three studies that are
21 highlighted in yellow on this slide, studies 011, 15,
22 and 44, are the pivotal trials, which will be the
23 focus of the presentations which follow.

24 There are two additional U.S. studies
25 which employed related combination vaccines, and these

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 provided supportive data for the file.

2 In study DTPa-HepB-030, a combination DTPa
3 vaccine, which is similar to Infanrix HepB-IPV, with
4 the exception of the IPV component, provided support
5 for a schedule change in the hepatitis B component
6 from the license 016 to 246 as part of the
7 combination.

8 Then we have study 003, another U.S.
9 study. And in this study Infanrix HepB-IPV was used
10 to reconstitute GlaxoSmith Kline's Hib vaccine, and
11 which was administered a three dose primary series,
12 following a birth dose of HepB, and this provided
13 supportive safety data for use of Infanrix HepB-IPV in
14 this manner.

15 If we focus now on the six trials from
16 which the most important data for the U.S. file are
17 derived, in accordance with the FDA guidance for
18 industry, for the evaluation of combination vaccines,
19 and in support of the proposed indication, the
20 following critical objectives were included.

21 First of all from an immunogenicity point
22 of view, comparison to U.S. licensed separate
23 administration vaccines was provided in study 015, a
24 U.S. study. And this study also had as an objective
25 an evaluation of the immunogenicity and safety of

1 Infanrix HepB-IPV, co-administered with U.S.-licensed
2 Hib vaccine.

3 For lot consistency study 044 provided
4 data on three production lots of vaccine, and from the
5 point of view of the schedule change for HepB, DTPa-
6 HepB-030, again, provided immunogenicity data from
7 246, the hepatitis B component in the combination
8 given at 246, the licensed 0, 1, 6 months of age.

9 From the point of view of safety an
10 evaluation of common, that is solicited adverse
11 events, following Infanrix HepB-IPV as compared to
12 U.S.-licensed separate administration products was
13 provided in two studies, study 015 in the U.S., and
14 study 011 in Germany.

15 And the latter study, which involved more
16 than 5,000 infants, and had safety as its primary
17 objective, also provided an evaluation of less common
18 events, that is, those that occurred at about a rate
19 of 1 in 100.

20 And then, finally, study 003 provided
21 safety data following a birth dose of HepB. It is
22 important to state up front that all of the pivotal
23 studies in the file were analyzed as equivalents, or
24 non-inferiority trials.

25 And the objective of equivalence trials

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 are to show that two treatments are similar, not
2 necessarily identical, to rule out superiority of the
3 separate components by a pre-specified amount, which
4 is felt to be clinically important.

5 As such the difference must be felt to be
6 important clinically in order to justify use of the
7 combination vaccine.

8 Practically speaking, then, what one does
9 is to first of all pre-specify a clinically relevant
10 difference, here shown as delta, and this sets the
11 limit for non-inferiority.

12 The difference between treatment groups is
13 then calculated and in this example, we have the
14 separate minus the combined vaccine, and 90 percent
15 confidence intervals are built around the absolute
16 difference.

17 If the upper limit of the confidence
18 interval exceeds the pre-specified limit then we
19 consider that non-inferiority is not shown. However
20 if the upper limit of the 90 percent confidence level
21 is within this limit, then non-inferiority is
22 demonstrated.

23 Now, in the case of equivalence trials,
24 both upper and lower limits are pre-specified, and if
25 the upper or the lower limit of the 90 percent

1 confidence interval on the treatment exceeds the pre-
2 specified limits and equivalence is not shown, if both
3 upper and lower limits are within the pre-specified
4 limits equivalence is considered to be demonstrated.

5 A few words about the end points in the
6 immunogenicity trials, so serum samples were --
7 measurement of the humoral antibody were generally
8 obtained prior to vaccination, and one month after the
9 third dose of vaccine.

10 For those products, for the antigens and
11 combinations that are already part of U.S.-licensed
12 products, such as DTPa and hepatitis B, the assays
13 that were employed were similar to those used and
14 approved by FDA under the existing license
15 application.

16 This slide first summarizes the parameters
17 for which a correlate of protection has been
18 established, all of these were considered to be co-
19 primary endpoints in the trial.

20 So seroprotection rates for anti-
21 diphtheria and anti-tetanus were assessed via an ELISA
22 with seroprotection defined as a titer greater to .1
23 international units per ML, anti-HBS was assessed via
24 commercial RIA, with seroprotect cutoff of ten million
25 international units per ML, and polio was assayed

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 using a cell culture neutralization assay WHO
2 protocol, and seroprotection was defined as any
3 detectable neutralizing antibody.

4 The clinical limit defining non-
5 inferiority for all of these parameters -- if you
6 would go back, please -- was ten percent. Next slide.

7 Now, for the response for pertussis, for
8 which a serologic correlate has not been established,
9 the co-primary endpoints took into account both
10 because response rates to the pertussis, as well as
11 the geometric mean antibody titers.

12 And here vaccine response was defined as
13 appearance of antibody in initially seronegative
14 subjects and at least maintenance of antibody in
15 initially seropositive subjects.

16 Again, the clinical limits defining non-
17 inferiority for vaccine response were set at ten
18 percent, and for the geometric mean titers a maximum
19 of 1.5.

20 Okay. So if we move now to review of the
21 primary immunogenicity studies, and we start with
22 study 015, this study was conducted in order to rule
23 out important differences between the immune response
24 to each antigen in the combined vaccine, as compared
25 to separately administered U.S.-licensed products, and

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 also had co-administration with U.S.-licensed Hib
2 vaccine.

3 This was an open study in which 400
4 subjects were enrolled, and randomized equally into
5 one of four groups. Group one received three doses of
6 Infanrix HepB-IPV, co-administered with U.S.-licensed
7 Hib, this is Adventis' Hib, given at 2, 4, and 6
8 months of age.

9 Group two received two doses of Infanrix
10 HepB-IPV co-administered with Hib, at 2 and 4 months
11 of age. And then at six months of age they received
12 a combination DTPa-HepB co-administered with Hib, and
13 oral polio. So this was our sequential IPV OPV arm.

14 Group 3 received three separate
15 injections. That is the combination DTPa-HepB, co-
16 administered with Hib, and this is U.S.-licensed IPV
17 manufactured by Adventis, and this was at 2, 4, and 6
18 months of age. So this is our separate injection
19 U.S.-licensed IPV arm.

20 And group 4 received standard of care,
21 separate administrations, this is GlaxoSmith Kline's
22 DTPa Infanrix, our hepatitis B, Engerix-B, Hib, and
23 Lederle's oral polio.

24 I just want to emphasize that at the time
25 that the trial was performed, actually, this was the

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 standard of care, that is oral polio was the standard
2 of care.

3 For the purposes of the remainder of the
4 presentation I'm going to primarily focus on the
5 comparison of group 1, three doses of the Infanrix
6 HepB-IPV, to separate administrations in group 4.

7 This slide then summarizes the immune
8 response to diphtheria, tetanus and Hep-B, with
9 seroprotection rates shown as the height of the bars,
10 and geometric mean titers listed at the top.

11 You can see that for all three antigens,
12 diphtheria, tetanus and Hep-B, high seroprotection
13 rates, 99 to 100 percent were achieved in both groups,
14 with geometric mean titers that were higher following
15 the combination, than following separate
16 administration.

17 Here, then, the response rates for the
18 three pertussis antigens. Again we see high vaccine
19 response rates that is greater or equal to 91 percent
20 correlates of the group. This is a combined vaccine
21 versus separate administration, with GMTs to PT and
22 Pertactin, which were higher following the
23 combination, than following separate administration,
24 and GMT to FHA was somewhat higher following the
25 separate administration, than following the

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 combination.

2 Here are the results for polio. You see
3 high seroprotection rates to all three polio
4 serotypes. Of course there was a further relevant
5 control group for polio in this study, namely the
6 U.S.-licensed IPV.

7 And so this slide compares three doses of,
8 or one month after the third dose of the combination,
9 as compared to U.S.-licensed IPV.

10 If we look, then, at the comparison of the
11 geometric mean titers, first looking at that,
12 comparing the combination versus oral polio, what you
13 see is that the GMTs to polio 1 and 2 are higher
14 following oral polio, as compared to the combination.

15 But the GMT to polio 3 is higher following
16 the combination than following oral polio. However if
17 we look at a comparison of geometric mean titers
18 comparing the combination to U.S.-licensed separate
19 injection IPV, you see that for all three polio
20 serotypes the GMTs were higher following the
21 combination, than following separate injections.

22 That was the descriptive analysis. But
23 what is important, of course, is the non-inferiority
24 testing. So this slide shows non-inferiority testing
25 for seroprotection and vaccine response rates to each

1 of the contained antigens.

2 And the absolute difference is taking the
3 rates for the separate injection, or separate
4 administration, minus that for the combined vaccine
5 are shown above the horizontal bars.

6 And then we have the 90 percent intervals
7 plotted horizontally. What you can see is that for
8 all parameters, other than FHA, the upper limit of the
9 90 percent confidence interval is within the pre-
10 specified limit at 10 percent. For FHA the upper
11 limit of the confidence interval marginally exceeded
12 this limit.

13 You will recall that I said that for --
14 since there is no correlate protection for pertussis,
15 that geometric mean titers for the three pertussis
16 antigens were also taken into account as co-primary
17 endpoints, and this slide shows the non-inferiority
18 testing for the ratio of GMTs.

19 Here we take the ratio of GMTs, they have
20 calculated in the 90 percent confidence intervals
21 built around the ratio. You can see that for all
22 three pertussis antigens the upper limit of the 90
23 percent confidence interval was within the pre-
24 specified limit of 1.5.

25 What I would like to do is sort of quickly

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 walk you through the reverse cumulative distribution
2 curves, because they are important to look at as well.
3 And what you are going to see is a series of slides
4 that shows the combined vaccine, the results following
5 the combined vaccine in black, and that following
6 separate administration in red.

7 And what you are going to see is a similar
8 pattern, that is, a similar shape for the curves
9 themselves. But generally with that, the curve for
10 the combined vaccine to the right of that is separate
11 administration indicative of the higher titers.

12 So these are the curves for anti-
13 diphtheria, anti-tetanus, anti-PT, FHA, pertactin, and
14 anti-HBS.

15 Now, on the polio slides we have the curve
16 for the combination vaccine in black. Still that oral
17 polio in red, and also we have the curve for IPV. And
18 what you can see for polio 1 is that the curve
19 following the combined vaccine falls largely between
20 that of oral polio, and an activated IPV separate
21 injection.

22 The same pattern is seen for polio 2. And
23 for polio 3 the curve following three doses of the
24 combined vaccine is to the right for both OPV and IPV.

25 Now, study 015, as I had mentioned, also

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 afforded the opportunity to evaluate the response to
2 co-administered U.S.-licensed Hib. And here are the
3 results for anti-PRP, one month after the third dose.

4 You can see that the proportion who
5 achieved a titer greater than .15, as well as greater
6 than equal to 1, as well as the GMC, were comparable
7 between the two groups. This is the combined vaccine
8 co-administered with Hib, and this is Hib given as a
9 separate injection with other routine administered
10 separate vaccines.

11 So from study 015 we can conclude that
12 Infanrix HepB-IPV is at least as immunogenic as U.S.-
13 licensed separately administered vaccines, including
14 oral polio, with respect to the response rates to all
15 of the antigens.

16 It is also at least as immunogenic as
17 U.S.-licensed IPV with respect to the response rates
18 to polio 1, 2, and 3. And there does not appear to be
19 any negative impact on the immunogenicity to the co-
20 administered Hib vaccine.

21 We move to the next study, study 044,
22 which studied clinical consistency with regard to
23 immunogenicity of the three production lots of
24 Infanrix HepB-IPV.

25 And this was a U.S. study in which a total

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 of 484 subjects were enrolled in randomized equally
2 into one of four groups. Groups 1 through 3 received
3 one of three production lots of Infanrix HepB-IPV,
4 lots A, B, and C, co-administered, again, with U.S.-
5 licensed Hib vaccine.

6 Group 4 received Infanrix HepB-IPV from
7 another lot series co-administered with Hib vaccine,
8 and this was done in order to asses a manufacturing
9 change.

10 For the purpose of this presentation I'm
11 going to focus now on the lot consistency data. This
12 slide shows the immunogenicity results for diphtheria,
13 tetanus and hep-B. You can see that high rates of
14 seroprotection were achieved in all three lot groups,
15 for all three antigens.

16 Here are the results for the pertussis.
17 Vaccine response rates were high, greater than equal
18 to 91 percent for each pertussis antigen, regardless
19 of the lot used.

20 This was with the exception to the
21 response to Pertactin, for which one lot achieved a
22 somewhat lower response, that is 84 percent.

23 Here are the results for the three polio
24 serotypes, essentially one hundred percent of all
25 subjects in all three lots achieved detectable

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 neutralizing antibody to polio.

2 Again, that was the descriptive results,
3 here are now the equivalence testing results. The
4 lots were shown to be statistically equivalent with
5 respect to diphtheria, tetanus, and Hepatitis B. You
6 can see that the upper and lower limits of the 90
7 percent confidence intervals were within the pre-
8 specified limits.

9 Similarly the three lots were shown to be
10 statistically equivalent for all three polio
11 serotypes. However, although the absolute difference
12 between the lots did not exceed the limit, the 90
13 percent confidence interval on the difference between
14 lots exceeded the limit for FHA and for Pertactin, for
15 two of the three lot comparisons.

16 This slide then shows the equivalence
17 testing for geometric mean titers in this study. And
18 what you can see is that the 90 percent confidence
19 interval in the GMT ratios was within the pre-
20 specified limits for all three pertussis antigens,
21 with the exception of a marginal exceeding of the
22 lower limit for one of the three lot comparisons for
23 Pertactin.

24 I'm just going to show you the reverse
25 cumulative curves for the pertussis antigens from this

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 study, then. And what you will see is that the
2 distribution of titers in all three lots is remarkably
3 similar for anti-PT, anti-FHA, and here is anti-PRN.

4 Now, importantly, the same three lots were
5 evaluated for lot consistency when extemporaneously
6 mixed with GlaxoSmith Kline's Hib vaccine, and these
7 were studied in two additional studies, study 027,
8 which is a U.S. study.

9 The vaccine was administered on a 2, 4, 6
10 month schedule, and study 048, which was done in
11 Germany, on a 3, 4, 5 month schedule. And data from
12 both of these studies were provided to you in your
13 pre-read materials.

14 I'm just going to show the results from
15 study 027. This is the design of study 027. Again,
16 these are the identical three lots, lots A, C, and B,
17 from the study 044 of Infanrix HepB-IPV,
18 extemporaneously mixed with Hib vaccine, and given to
19 approximately 360 infants per group, 2, 4, and 6
20 months of age.

21 The identical criteria for equivalents
22 were applied in this study. And what you see is that
23 for all three pertussis antigens, the 90 percent
24 confidence interval on the lot comparisons for vaccine
25 response rate for all three pertussis antigens were

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 met, they fell within the pre-specified criteria.

2 And consistency was also demonstrated with
3 respect to the geometric mean antibody titers in this
4 study.

5 So from study 044 the pre-specified limits
6 for equivalence were exceeded for two out of the nine
7 valencies. And both of these were pertussis antigens.

8 One possible explanation for the lack of
9 consistency in this study was the observation that
10 there was an imbalance in the twin groups in the pre-
11 existing, that is maternal antibody, across the lot
12 groups.

13 It has previously been recognized that
14 infants with high pre-existing titers are more likely
15 to have a lower response to pertussis antigens,
16 particularly FHA, and Pertactin.

17 Importantly, though, the same three lots
18 were evaluated into additional studies mixed with Hib,
19 and in these two additional studies they were shown to
20 be statistically equivalent for all nine antigens,
21 including FHA and Pertactin.

22 So from these studies we conclude that
23 equivalence has been demonstrated for all parameters.

24 The last study I would like to review is
25 study DTPa-HepB-030, this was conducted in support of

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 the schedule change for the hepatitis B component. As
2 I mentioned previously, the combination of the vaccine
3 is similar to Infanrix HepB-IPV with the exception of
4 the IPV.

5 So this was an open randomized study
6 conducted in the U.S. Group 1 received the
7 combination DTPa-HepB co-administered with Hib, and
8 oral polio, at 2, 4, and 6 months of age.

9 And group 2 received co-administered
10 Infanrix, Hib, oral polio, at 2, 4, 6. And then our
11 Hep-B and Engerix-B was given at birth, 1, and 6
12 months of age.

13 Here are the results. It shows the
14 seroprotection rates, 99 and 100 percent. This is for
15 the combined vaccine given at 2, 4, 6. This is for
16 Engerix monovalent 016, with a GMT of 1,000 in those
17 who received the combination on a 2, 4, 6 month
18 schedule, as compared to 3,700 in those who received
19 the monovalent vaccine.

20 If we look at the non-inferiority testing
21 on the seroprotection rates, you can see that the
22 upper limit of the 90 percent confidence interval was
23 below the specified limit of ten percent, and the
24 primary objective of the trial was, therefore, met.

25 Now, in order to put the GMT result into

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 perspective, we reviewed data in the published
2 literature in the two U.S.-licensed monovalent Hep-B
3 vaccines, Engerix and Recombivax.

4 And you can see results plotted from the
5 literature. This is Engerix-B in red, Recombivax two
6 and a half and five in yellow. And these data have
7 been plotted, then, against the results from the study
8 I just showed you, DTPa-HepB-030 in green, and
9 multiple studies involving Infanrix HepB-IPV given
10 according to a 2, 4, 6 month schedule.

11 And what you can see is that the results
12 achieved with these combinations on a 2, 4, 6 month
13 schedule, are in line with that published in the
14 literature for the monovalent Hep-B vaccines.

15 So from this study we conclude that the
16 combination given at 2, 4, and 6 months of age is at
17 least as immunogenic as monovalent Hep-B given at 0,
18 1, and 6 months of age, with respect to the
19 seroprotection rate to Hep-B.

20 The GMT on a 2, 4, 6 month schedule was
21 lower as compared to 0, 1, 6, as one would expect,
22 given the fact that the interval between the second
23 and the third dose was shorter. This is a schedule
24 effect.

25 The lower GMT is not thought to be

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 clinically relevant. However, given the fact that the
2 GMT is in line with that previously reported following
3 the administration of the two U.S.-licensed monovalent
4 vaccines, which have been shown to provide long-term
5 protection against disease.

6 Additionally the GMT was more than 100
7 times greater than the seroprotective cutoff. And
8 individuals with titers greater than equal to ten
9 should continue to be protected from both symptomatic
10 and chronic infection on the basis of immunologic
11 memory, given the absence of detectable antibody.

12 So the overall conclusions on
13 immunogenicity are that Infanrix HepB-IPV is at least
14 as immunogenic as separately administered vaccines in
15 head to head trials involving Infanrix, Engerix-B,
16 oral polio, and IPV.

17 And although I didn't show data, I think
18 it is important to mention that we also looked at a
19 comparison of antibody titers following Infanrix HepB-
20 IPV to historical data following the immunogenicity
21 achieved in two efficacy trials for Infanrix that were
22 provided the basis for licensure for Infanrix, and the
23 titers were comparable.

24 Additionally, Infanrix HepB-IPV has
25 demonstrated lot to lot consistency. There is no

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 negative impact on the co-administered Hib, and
2 hepatitis B, as part of the combination given on a 2,
3 4, 6 month schedule is at least as immunogenic as
4 monovalent 0, 1, 6, in terms of seroprotection for
5 hepatitis B.

6 I would like to turn the podium over now
7 to my colleague Dr. Achim Kaufhold, who is in charge
8 of the pediatric vaccine development unit in our
9 central headquarters in Belgium, and he is going to
10 provide you with an overview of the clinical safety
11 for this product.

12 DR. KAUFHOLD: Good morning, everybody.
13 Before I come to the summary of key data obtained in
14 the clinical trial program, I would like to emphasize
15 that we can build on a large experience with
16 individual components of the DTPa-HepB-IPV vaccine.

17 First, individual components have been
18 studied extensively. Second, individual components
19 administered simultaneously in separate injections are
20 in wide use. And third, individual components
21 contained in similar combinations are currently in
22 wide use.

23 Indeed, GlaxoSmith Kline has licensed, and
24 is currently marketing a variety of DTPa combination
25 vaccines in many countries around the world. A DTPa

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 vaccine, Infanrix, a DTPa-HepB combination, a DTPa-
2 IPV-Hib combination, DTPa-IPV vaccine.

3 The DTPa-HepB-IPV combination we are
4 discussing today, as well as hexavalent DTPa-HepB-Hib
5 vaccine were simultaneously licensed in October 2000
6 in all 15 European member states, and in a few other
7 countries.

8 In most European countries the larger
9 hexavalent combination is preferred over the DTPa-
10 HepB-IPV combination vaccine, and has been launched
11 thus far in two countries, in Germany and in
12 Switzerland.

13 Today almost 50 million doses of these
14 DTPa based combination vaccines have been commercially
15 distributed, and all of these combinations are well
16 tolerated in clinical practice.

17 The extensive clinical trial experience,
18 and the post-marketing surveillance have not raised
19 any signal of concern with regards to safety.

20 In the next 20 minutes I would like to
21 give an overview of the safety and reactogenicity of
22 DTPa-HepB-IPV when co-administered with commercially
23 available Hib vaccines.

24 My presentation will focus on the
25 comparison to separately U.S.-licensed vaccines. I

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 will share with you data of common AEs that were
2 obtained in the pivotal studies 011 and 012.

3 The occurrence of less common AEs was
4 specifically addressed in the last safety study, 011.
5 Safety following a birth dose of hepatitis B was
6 evaluated in study 003. And finally, I will briefly
7 comment on the serious adverse events and death that
8 contained in the clinical trials contained in the BLA.

9 A few words regarding the methodology
10 applied that in general were standardized across all
11 trials for solicited local and general AEs all infants
12 were followed for four days after each dose. That
13 means on the day of vaccination and the subsequent
14 three days.

15 The parents were asked to complete diary
16 cards. In the two U.S. study, 011 and 044, additional
17 telephone calls were made between day 1 and day 3
18 post-vaccination, in order to encourage parents to
19 complete the diary cards, and to check on the status
20 of the child.

21 This active surveillance allowed an
22 unbiased assessment of the frequency, severity, and
23 duration of local symptoms, pain, redness and
24 swelling, and general signs and symptoms.

25 Next. In addition all other AEs, whether

1 or not considered related to the candidate, or the
2 comparator vaccine, were recorded as unsolicited AEs.
3 The follow-up period for 30 days following each dose.

4 Prior to analysis all unsolicited symptoms
5 were classified according to the WHO body system and
6 preferred term. Special attention was paid to
7 promptly gather all information of serious AEs.

8 The follow up period for throughout the
9 vaccination course, up to 30 days after the last dose
10 was administered. Overall, in the 12 clinical trials
11 contained in the BLA, a total of 7,028 subjects
12 received at least one dose of vaccine, so that all
13 together almost 21,000 doses of DTPa-HepB-IPV were
14 administered.

15 As you can see here, compliance for
16 reactogenicity reporting was very high in all studies.
17 Symptom sheets were completed for more than 99 percent
18 of subjects enrolled in the trials.

19 All data that I will present are based on
20 the analysis of the according to protocol cohort. But
21 I would like to point out that the results obtained
22 from the ATP analysis are virtually identical with the
23 conclusions drawn from the ITT analysis.

24 You are already familiar with the design
25 of the U.S. 015. This was an open randomized trial

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 with four groups of 100 subjects each.

2 I will limit this presentation to the
3 comparison of group one, the combined group, three
4 doses of DTPa-HepB-IPV co-administered with Hib, to
5 group four, that received -- in which infants received
6 separate injections of U.S.-licensed vaccines, DTPa,
7 Infanrix, HepB, Generix-B, Hib from Aventis Pasteur,
8 and Lederle's oral polio vaccine.

9 And this was the standard of care at the
10 time the trial was conducted in the U.S.

11 Infants of group one received two
12 injections that were given intramuscularly into
13 opposite limbs. While infants of group four received
14 three injections, along with oral polio vaccine.

15 In the following I will compare the local
16 symptoms only for the DTPa-HepB-IPV group one, and the
17 DTPa injection sites. At the DTPa based injection was
18 generally thought to be more reactogenicity than the
19 reactogenicity elicited by the other vaccines.

20 But please keep in mind that the
21 additional HepB and Hib injections would also
22 contribute to the overall reactogenicity profile.

23 Having said this, you will appreciate that
24 the incidence of pain was very similar for dose 1,
25 dose 2 and dose 3, for both the DTPa-HepB-IPV and the

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 DTPa injection site.

2 This is true for any pain, as well as for
3 pain that was judged to be graded 3 in intensity. So
4 clinically more relevant pain.

5 For redness at the injection site the
6 incidence appears a little bit higher for the DTPa-
7 HepB-IPV as compared to the DTPa injection site.
8 There was no increase by dose, and the incidence of
9 redness above 20 millimeters was very low in both
10 groups.

11 For swelling we see a very similar
12 picture. A slightly higher incidence for the DTPa-
13 HepB-IPV, as compared to the DTPa injection site, a
14 slight increase from dose 1 to dose 2, but no further
15 increase after dose 3.

16 If you compare the incidence of solicited
17 general symptoms between the combined group, and the
18 separate injection control group, over the four day
19 follow-up period, over the full three dose vaccination
20 course, you can see that the figures are virtually
21 identical for all symptoms other than fever, greater
22 or equal than 100.4 degree fahrenheit.

23 Fever was 41 percent in the combined
24 group, versus 29.6 percent in the separate
25 administration control group, although as you can see

1 here, the 95 percent confidence intervals overlapped.

2 Importantly there was no difference in the
3 incidence of clinically more relevant symptoms rated
4 3, and this includes a low rate of fever above 103.2
5 degree fahrenheit.

6 Now I come to the large German safety
7 study 011 that was initially designed as an
8 uncontrolled safety study, in which infants were
9 randomized to receive the candidate vaccine, along
10 with one of four different Hib vaccines at 3, 4, and
11 5 months of age.

12 After enrollment of almost 1,600 children,
13 the study protocol was amended. The amended design
14 allowed for the introduction of a control group, group
15 5, of U.S.-licensed vaccines, namely DTPa Infanrix,
16 Hib from Aventis Pasteur, and Wyeth-Lederle's OPV.

17 This design was implemented upon
18 consultation with the FDA, and was in line with the
19 guidelines for the evaluation of the combination
20 vaccines that were published in April '97.

21 There was an imbalance between group in
22 the sense that the control group did not receive the
23 hepatitis B vaccine. This was necessary, as German
24 physicians and parents do not accept more than two
25 injections at the same visit. And this illustrates,

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 very practically, the need for pediatric combination
2 vaccines.

3 Regarding the comparison between groups
4 for systemic reactogenicity, however, the design
5 implied the bias in favor of the separate
6 administration control group.

7 The study was analyzed as a non-
8 inferiority trial. The primary endpoint was the
9 proportion of subjects reporting at least solicited
10 symptom graded 3, a clinically relevant symptom.

11 And non-inferiority was demonstrated if
12 the upper limit of the 90 percent confidence interval
13 for the difference between the pool that had the IPV
14 group, and the control group was below the up priority
15 clinical limit of 7.5 percent.

16 The percentage of subjects with any grade
17 3 solicited symptom was 16.2 percent for the pooled
18 candidate vaccine group, and numerically higher, 20.3
19 percent, for the control group.

20 The absolute difference was 4.1 percent,
21 and the upper limit of the 90 percent confidence
22 interval for the difference between groups, was below
23 the pre-specified clinical limit, 7.5 percent, for
24 non-inferiority.

25 Thus the primary objective of this trial

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 was met.

2 Let's now look again at the incidence of
3 local symptoms by dose. Again, as seen for study 015,
4 also in this large comparative trial the incidence of
5 pain was similar between both DTPa-HepB-IPV and DTPa
6 injection sites.

7 Any redness appears to occur slightly more
8 frequent at the DTPa-HepB-IPV injection site, as
9 compared to the DTPa injection site. There was a
10 slight increase from dose 1 to dose 2, but no further
11 increase after dose 3. And redness greater than 20
12 millimeters was, again, equally low in both groups.

13 For swelling the picture looks very
14 similar. And, importantly, the incidence of more
15 pronounced local reaction, injection site reactions,
16 were equally low for both vaccines.

17 When looking at general symptoms please
18 keep in mind that the separate injection control group
19 received one systemic antigen less, the hepatitis B
20 antigen. Thus, as already mentioned, the comparison
21 is biased in favor of the control group.

22 For the percentage of subjects for the
23 solicited general symptoms there were two differences
24 between groups, unusual crying was observed more
25 frequently in infants receiving separate

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 administration of vaccines, while the infants in the
2 candidate vaccine group had a higher rate of low grade
3 fever, 40.6 percent versus 27 percent.

4 Again, as already observed in study 015,
5 the incidence of clinically more relevant grade 3
6 symptoms was low in both groups for all symptoms,
7 including high fever. Restlessness and unusual crying
8 occurred more frequently in the separate
9 administration control group, and these differences
10 were statistically significant.

11 Regarding unsolicited symptoms, an
12 important secondary objective of this large safety
13 trial, the rates were similar between DTPa-HepB-IPV
14 plus Hib, versus DTPa plus Hib plus OPV recipients,
15 for all unsolicited AEs, for unsolicited AEs
16 considered related, or possibly related, and for less
17 common AEs. There were no unexpected AEs.

18 And you can find a comparison of the rates
19 of unsolicited symptoms occurring at a frequency above
20 one percent in your briefing document.

21 Let me summarize, now, the key findings of
22 study 011. The candidate vaccine was at least as safe
23 as separately administered U.S.-licensed vaccines,
24 with respect to the percentage of subjects with any
25 grade 3 solicited symptoms.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 There were similar rates of solicited
2 symptoms with the exception of unusual crying,
3 restlessness, that occurred more frequently in the
4 separate versus the combined group, and low grade
5 fever that occurred more frequently in the combined
6 group versus the separate administration control
7 group. And there were similar rates of unsolicited
8 symptoms.

9 Now, one of the questions, question number
10 2A, that is to be addressed by the panel is the
11 following. There were higher rates of fever above
12 100.4 degree fahrenheit in DTPa-HepB-IPV plus Hib
13 recipients in studies 011 and 015, as compared to the
14 control vaccine recipients. What is the clinical
15 relevance of this finding?

16 We have looked into this very carefully
17 and did a variety of comparative analysis between
18 groups. Indeed, there was no difference between
19 groups in the duration of fever. In the vast majority
20 of infants fever lasted for one or two days.

21 In more than 98.5 percent of children the
22 fever episode resolved during the four day follow-up
23 periods. There was no difference in the use of anti-
24 pyretics across groups in both studies.

25 There was no difference between groups in

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 the number of sepsis work-ups within seven days post-
2 vaccination. There was no difference between groups
3 in the incidence of febrile seizures occurring within
4 seven days post-vaccination.

5 Indeed there was only one case, in study
6 011, that occurred after dose 1, in the DTPa-HepB-IPV
7 plus Hib vaccine recipient. A diagnosis of an
8 underlying convulsive disorder was made, and the
9 investigator stated that the event was not related to
10 vaccination.

11 If you look at hospitalizations with any
12 fever within seven days post-vaccination, there were
13 11 cases among 4,695 equals .23 percent DTPa-HepB-IPV
14 recipients, and 3 cases among 776 equals .39 percent
15 control vaccine recipients.

16 Thus there is strong evidence that the
17 higher incidence of low grade fever did not result in
18 clinically relevant consequences.

19 The safety of the candidate vaccine
20 following the administration of a birth dose of
21 hepatitis B is of practical relevance. This question
22 -- next slide, please -- was addressed in a randomized
23 trial conducted in the U.S.

24 In study 003 one group of infants received
25 a dose of hepatitis B at or shortly after birth, while

1 the comparator group did not receive a hepatitis B
2 dose at birth. And then three doses of the
3 combination vaccine were given at 2, 4, and 6 months
4 of age.

5 The combination vaccine was the identical
6 liquid DTPa-HepB-IPV combination under consideration
7 today, but it was used to reconstitute revitalized POP
8 tetanus conjugate prior to injection.

9 The primary end point was the percentage
10 of subjects reporting any grade 3 solicited symptom
11 during the eight day follow-up period after any of the
12 three doses of the combination vaccine.

13 This occurred in 23.2 percent of subjects
14 that had not received a hepatitis B dose at birth, and
15 in 20.2 percent, 20.6 percent of subjects that had
16 received hepatitis B at birth.

17 Non-inferiority was shown as the upper
18 limit of the 90 percent confidence interval for the
19 difference between groups was below the priority find
20 clinical image for non-inferiority.

21 The percentage -- next slide, please --
22 the percentage of subjects with solicited symptoms
23 observed over the 8 day follow-up period actually
24 tended to be higher for the group that had not
25 received hepatitis B at birth.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 There was no difference between groups
2 when we look, again, at the percentage of infants with
3 clinically more relevant symptoms graded 3 in
4 intensity.

5 Let me now summarize the findings
6 regarding serious AEs and death. In 12 clinical
7 trials 182 subjects reported 199 SAEs, and this
8 translates into 2.1 percent among DTPa-HepB-IPV
9 vaccinees, versus 1.8 percent among comparator vaccine
10 recipients. Eight SAEs were considered possibly, or
11 definitely related to study vaccines.

12 In brief there were three SAEs considered
13 by the investigator to be related to vaccination, all
14 occurred in study 011. Two of the three cases
15 involved symptoms that were related to the Hib
16 injection sites, while the third case was associated
17 with high fever.

18 There were five SAEs considered possibly
19 related to vaccination. Four of these cases involved
20 fever, and in three of these cases an alternative
21 cause of fever was diagnosed, possible influenza,
22 possible viral infection, and possible
23 gastroenteritis, or bronchitis.

24 In the 12 clinical trials contained in the
25 BLA, six unrelated deaths were reported. Five deaths

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 in 7,028 DTPa-HepB-IPV vaccinees, and one death in
2 1,764 comparator vaccine recipients.

3 Here the causes of and relationships to
4 vaccination are listed for the six deaths. All cases
5 were considered unrelated, or probably not related to
6 vaccination.

7 In study 011 there was one case of sudden
8 infant death syndrome in the candidate vaccine group,
9 and one case of SIDS occurred in the control group.
10 The overall incidence of SIDS was .2 per 1000 infants
11 in the German safety study 011, and this must be seen
12 against an expected backdrop rate in Germany of more
13 than 1 case per 1,000 live births. A rate that is
14 very similar in the U.S.

15 It is worth mentioning that in the 12
16 clinical trials with 7,000 DTPa-HepB-IPV vaccinees, no
17 cases were reported of hypotonic hyporesponsiveness
18 encephalopathy, or anaphylaxis.

19 Ladies and gentlemen, with respect to
20 safety and reactogenicity let me conclude. In 12
21 clinical trials, 7,028 subjects received almost 21,000
22 doses of DTPa-HepB-IPV that was an active follow-up
23 with standardized methods across all trials.

24 Rates of common solicited AEs, as well as
25 less common AEs were similar to separately

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

1 administered U.S.-licensed vaccines. Rates of low
2 grade fever were higher, but did not result in
3 clinically relevant consequences.

4 No unusual pattern or symptom complex were
5 identified for any of the SAEs reported in any of the
6 clinical trials. Three doses of DTPa-HepB-IPV when
7 mixed with Hib, following a dose of HepB were well
8 tolerated.

9 So the combination of antigens does not
10 place infants at an increased risk of clinically
11 relevant AEs.

12 Thank you very much, and at this point I
13 would like to hand over to Dr. Clare Kahn.

14 DR. KAHN: I have some overall conclusions
15 to make pertinent to the consideration of the
16 questions.

17 Concerning the adequacy of efficacy data
18 for all antigens we show that the combination was at
19 least as immunogenicity as separately administered
20 U.S.-licensed vaccines, and with special regard to
21 hepatitis B, the 2, 4 and 6 schedule in the
22 combination was at least as immunogenic as 016
23 schedule, in terms of seroprotection for hepatitis B.

24 Regarding the adequacy of the safety data,
25 GSK has extensive clinical and post-marketing

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 experience with individual antigens, alone or in
2 combination, the safety of the product has been
3 demonstrated in more than 7,000 infants, even as a
4 three dose primary series, and this safety profile was
5 generally similar to separately administered U.S.-
6 licensed vaccines.

7 Especial attention has been given to
8 fever, and the rates of low grade fever are higher
9 with this combination than the separate vaccines.
10 This is not so for grade 3 fever.

11 And, importantly, this difference did not
12 result in clinically relevant sequelae. Regarding
13 the co-administration with U.S.-licensed vaccines, the
14 data show that there is no interaction upon co-
15 administration of Infanrix HepB-IPV with U.S.-licensed
16 Hib vaccine.

17 And we are planning a co-administration
18 study of Prevnar as a post-approval commitment.

19 We saw safety data for three doses of the
20 combination product, in fact mixed with Hib, following
21 a birth dose of hepatitis B. And under these
22 circumstances the vaccine was well tolerated, and when
23 comparing those who received a birth dose of HepB to
24 those who did not, there was no increase in any grade
25 3 solicited symptoms, this was the primary endpoint of

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 this study, or for the solicited symptoms specific
2 rates of adverse events.

3 Regarding boosters after the combination,
4 we've experienced in hand with the administration of
5 fourth dose boosters following administration of
6 Infanrix HepB-IPV in the primary series.

7 But before I describe the scope of this
8 data, let me make the following clarifications. As
9 noted in my introduction, the focus of the current
10 BLA, and this current presentation, is the indication
11 for the use of the combination administered at 2, 4,
12 and 6 months of age, with the recommended schedule
13 thereafter.

14 But in addition to that we do have some
15 data, and these were submitted to the FDA at their
16 request, they are in the form of synopsis. And these
17 are three studies in which the fourth dose of the
18 series was administered as Infanrix, shown here in the
19 green box, following three doses of the combination.

20 And here we have safety data in 327
21 subjects, and immunogenicity in 152. And such data
22 would be from the future supplement to put this data
23 and describe them in the label.

24 And, furthermore, we have six studies in
25 which all four doses, 2, 4, 6, and 12 to 18 months of

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 age, the administration of the full combination. And
2 here we have safety in 816 and immuno in 303.

3 So these data are somewhat supportive,
4 perhaps, of the fourth dose of Infanrix.

5 Now, the data here for the three doses of
6 combo with the fourth dose of Infanrix were
7 highlighted in FDA's briefing document. And we are
8 happy to address questions on that, should you wish to
9 see that.

10 But, again, these were only submitted as
11 synopsis officially in the BLA.

12 Now, the safety and efficacy of Infanrix
13 HepB-IPV in infancy received one or more doses of the
14 DTPa vaccine in the primary series has not been
15 studied.

16 But in keeping with ACIP recommendations
17 that interchangeability of acellular DTB vaccines in
18 the primary series is not recommended, we suggest that
19 since DTPa in the combination is identical to
20 Infanrix, we suggest that Infanrix DTPa-HepB-IPV may
21 be used to complete the primary series in infants who
22 received one or two doses of Infanrix.

23 In final conclusion, then, here is the
24 current immunization schedule published in MMWR for
25 2001. And we've highlighted the three component

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 vaccines that form the combination.

2 This is hepatitis B vaccine here in the
3 first year of life in the yellow, and into the second
4 year. Three doses of the primary series of DTPa, and
5 the first doses of IPV.

6 And as you will see it is possible to have
7 as many as five injections in a single visit, or
8 perhaps elect to defer doses.

9 So here would be the proposed schedule,
10 looking at the inclusion of DTPa-HepB-IPV combination
11 at 2, 4, and 6 months of age, which is a lot less busy
12 looking.

13 And the advantages of such combinations
14 are clear. Here you are targeting five diseases with
15 one single injection, and in the primary course for
16 those antigens, for those five diseases, you are
17 reducing -- not yet for that one -- you are reducing
18 those injections from -- not from 9 to 3, so just 3.

19 And in the first year, for the overall
20 primary course, you are reducing injections from 15 to
21 9.

22 And, furthermore, for such a combination
23 vaccine there is the potential for
24 pharmacoepidemiologic or pharmaco-economic benefit.
25 And in fact outcomes modeling studies have been

1 conducted by Alan Meyerhoff and presented at meetings
2 last year.

3 And I know he is in the audience if there
4 is any interest in that aspect of these combinations.

5 So this formally concludes GSK's
6 presentation for the day, and thank you for your
7 attention.

8 CHAIRMAN DAUM: Thank you very much,
9 SmithKline presenters, Dr. Kahn, et al. We now will
10 entertain comments from the Committee regarding the
11 sponsor's presentation. Questions? Ms. Fisher.

12 MS. LOE FISHER: How long did you monitor
13 children for persistence of antibodies to all antigens
14 in the combination vaccine versus the separate
15 injection controls to confirm long-term immunity?

16 And how long did you monitor children
17 which had acute reactions, particularly the more
18 serious reactions, for development of autoimmune
19 neurological or behavioral disorders following the 30
20 day acute observation period?

21 DR. KAHN: Dr. Barbara Howe.

22 DR. HOWE: So with respect to persistence
23 of immunity we followed infants, after the three dose
24 primary series up until the time of the booster in a
25 number of the trials.

1 We have data with us in the context of
2 persistence and boosting data. In the U.S. studies
3 that included up to a mean age of 14 months, that is
4 in study 015, we followed the children out until mean
5 age of 14 months and administered a booster dose of,
6 actually, separate injection DTPa and Hib. So
7 Infanrix and U.S.-licensed Hib vaccine.

8 And in study 044, which was the
9 consistency study, we followed children out to a mean
10 age of 16 months, and administered booster doses
11 there. And I do have data to show that persistence
12 was comparable in those who received the combination
13 vaccine at 2, 4, 6, out to the mean age of 14 months
14 as to those who had received separate administration
15 of the U.S.-licensed products out to the mean age of
16 14 months.

17 MS. LOE FISHER: For hepatitis B too?

18 DR. HOWE: Yes.

19 MS. LOE FISHER: And then the reactions?

20 DR. HOWE: In terms of the reactogenicity
21 and the safety data children were followed up until 30
22 days after the last dose of vaccine.

23 Some of these children would have gone on
24 to be included in booster trials as well, but not all
25 of the children.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 MS. LOE FISHER: So you don't know what
2 happened to those children after 30 days?

3 DR. HOWE: Unless they were subsequently
4 in booster trials.

5 CHAIRMAN DAUM: Dr. Stephens, please.

6 DR. STEPHENS: Two questions. One relates
7 to the demographics in terms of race, ethnicity, sex
8 of the infants used in the study, and any differences
9 that you saw based on those parameters.

10 DR. HOWE: So your question was about
11 demographics. And for the majority of the studies in
12 the file more than 95 percent of the infants were
13 caucasian, with the exception of the two U.S. trials,
14 which provided much more heterogeneity in terms of
15 ethnicity.

16 I believe that demographics for study 015,
17 044 and 011 are all in the FDA briefing document. In
18 study 015 a little less than half of the children were
19 caucasian, 34 percent hispanic, and 10 percent afro-
20 american. And there were assorted other, I think
21 middle-eastern, Samoan.

22 And in study 044 about 85 percent of
23 children were caucasian.

24 DR. STEPHENS: The question was actually
25 different than that. It was about differences in

1 rates of reactions among ethnic groups --

2 DR. HOWE: I'm sorry, we do not have
3 reactogenicity analyzed by ethnicity.

4 DR. STEPHENS: Or immunogenicity?

5 DR. HOWE: Or immunogenicity, right.

6 CHAIRMAN DAUM: Dr. Gerber do you want to
7 clarify this? I will put you in line here, one
8 second. Dr. Goldberg, Dr. Kohl, then Dr. Gerber.

9 DR. GOLDBERG: Okay, I have two questions.
10 One relates to, it is in your briefing document, on
11 the lot to lot consistency trial, when you looked at
12 FHA and PRN, where you weren't able to show
13 equivalence crudely, you did an adjustment where you
14 removed the subjects with high baseline titers.

15 DR. HOWE: Yes.

16 DR. GOLDBERG: Did you do analysis within
17 strata by baseline titer, and do you have the
18 distribution of baseline titers, and what might the
19 overall impact of that removal be?

20 You brought the difference down, but not
21 completely. And I'm a little concerned about that.
22 Do you have any more information to bear on that?

23 DR. HOWE: Yes. I think if I could have
24 the maternal antibody folder? So to take this in a
25 couple of parts, first I will just answer what was the

1 distribution of the pre-existing antibody titer across
2 the various lot groups.

3 So this shows the distribution of
4 pertussis titers by antigen, first of all, anti-PT,
5 and what you see plotted here is the distribution of
6 titers. This is, I don't know if you can see it, but
7 10, 20, 40, and 80 for each of the three lots, with a
8 color coding similar to what you had seen when I
9 showed you the immunogenicity.

10 You can see the pre-existing antibody
11 titers for anti-PT were actually relatively low. This
12 is typical. And was equally distributed across the
13 three lot groups.

14 If we see, then, the results for anti-FHA,
15 anti- pre-existing antibody titers to anti-FHA were
16 higher, but again, they were relatively equally
17 distributed at these higher titers. Again, this is
18 greater than equal to 40, this is greater than equal
19 to 80.

20 If we look at the results for anti-
21 pertactin, again, higher levels of pre-existing
22 antibody for pertactin similar to anti-FHA. If we
23 look at the higher titers, though, this is greater
24 than equal to 40. And then, particularly greater than
25 equal to 80, this is for lot A, B, and C.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 Here are the proportion who had the titer
2 greater than equal to 80 at baseline for lots A, B,
3 and C. And lot C was the one that had the lowest
4 response. So you can see the proportion who had a
5 titer greater than equal to 80, with lot C, was 7.1,
6 lot B 0.9, and lot A 2.8.

7 So this is what I'm talking about, an
8 imbalance in the pre-existing titers.

9 DR. GOLDBERG: And then did you look at
10 the response within those strata?

11 CHAIRMAN DAUM: You need to speak right
12 into the microphone, Dr. Goldberg, please.

13 DR. HOWE: We didn't look within the
14 strata. I can ask our biometrician to explain exactly
15 what the definition of high maternal antibody was, and
16 what was done in the reanalysis.

17 DR. GOLDBERG: Okay.

18 CHAIRMAN DAUM: Could you tell us who you
19 are, please?

20 DR. CHEUVART: Yes, my name is Brigitte
21 Cheuvart, I'm a statistician.

22 CHAIRMAN DAUM: Right into the microphone,
23 and you are all set. Thank you.

24 DR. CHEUVART: Thank you. So in terms of
25 vaccine response we had the issue that we were dealing

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE. N.W.

WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealrgross.com

1 with vaccine response rate which were quite high,
2 around -- very close to one hundred percent.

3 Therefore it was difficult to apply a
4 stratified analysis, because the stratified analysis
5 are really based on Asantotic methodology. And we
6 felt that in the context of grades very close to one
7 hundred percent, it would be preferable to do an
8 analysis where we would have excluded subject with
9 high pre-vaccination titer.

10 Can you show, maybe, the slides with
11 respect to the reanalysis? It is in the folder of all
12 statistics. It is, yes, the next one, please.

13 So this is illustrating the relationship
14 that we had between the post-vaccination titer, and
15 the pre-vaccination titer, for one of the pertussis
16 antigen. And we had the same pattern for the three
17 pertussis antigen.

18 So you see that there is really a strong
19 relationship between pre-vaccination titer, and post-
20 vaccination titer. Below you see here the slope with
21 respect to that -- with respect to a regression, for
22 the three pertussin antigen.

23 And you see that the confidence above 40
24 slope is excluding minus 1, as well as 1.

25 MS. LOE FISHER: I'm sorry, does that

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 exclude -- that excludes the patients, the subjects
2 with the high titers at baseline, or is that all the
3 patients?

4 DR. CHEUVART: This is fully including all
5 the subjects. With respect to the GMT analysis, what
6 we did, we applied an ANCOVA model to adjust for the
7 possible imbalance with respect to pre-vaccination
8 titer.

9 For vaccine response, since there were not
10 satisfactory method, exact method dealing with rates
11 very close to one hundred percent, we did supportive
12 analysis, which excluded subject with very high titer.

13 And how did we select the subject to be
14 excluded? We examined the relationship between the
15 post-vaccination titer over the pre-vaccination titer,
16 with respect to the pre-vaccination titer.

17 And what you see is subject with pre-
18 vaccination titer above specific value will have
19 little problem. It will be very difficult for those
20 subjects to have a vaccine response. The vaccine
21 response being defined by post-vaccination titer above
22 the pre-vaccination titer.

23 CHAIRMAN DAUM: Thank you very much. I
24 think we are really going to move on at this point.
25 It is such intense scrutiny on pertussis, it sure

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 would be nice to know what the protective correlate is
2 and what to interpret here, but I think we will move
3 on.

4 Dr. Kohl please, then Dr. Gerber, and Dr.
5 Faggett.

6 DR. KOHL: Before we get to the clinical
7 relevance of the results I would like to ask the
8 manufacturer to verify that, indeed, they set up a
9 priori definitions of non-equivalency.

10 And although it has been stated several
11 times that all the results were equivalent in terms of
12 serological results, my understanding of both the
13 reading and the presentation this morning was, in
14 looking at the GMT of both hepatitis B, given at a
15 different schedule, and it was done to test whether
16 they were equivalent at those schedules, and also
17 looking at the FHA results in the only data that I
18 think were presented, there was non-equivalency of the
19 GMTs.

20 DR. HOWE: So with respect to the co-
21 primary endpoints that were mentioned, seroprotection
22 rates to each of the contained antigens, as well as
23 vaccine response rates to the three pertussis
24 antigens, as well as geometric mean titers to the
25 three pertussis antigens, were a priori defined as

1 primary endpoints, co-primary endpoints.

2 For all of the other antigens, other than
3 pertussis, the geometric mean titers were secondary
4 antigens. And with the exception of hepatitis B in a
5 couple of the studies, actually, there were not pre-
6 defined criteria for non-inferiority for HepB.

7 When there was, there was still a
8 secondary endpoint. I just want to be clear that the
9 limits for non-inferiority, and for equivalence,
10 particularly for the pertussis antigens are the same
11 as was used in the context of licensure of Infanrix
12 itself, in order to bridge from efficacy trials, for
13 instance, to a U.S. population.

14 So, for instance, for immunogenicity
15 bridging for the pertussis antigens there is precedent
16 for those, for those pre-specified criteria.

17 Does that answer your question?

18 DR. KOHL: Thank you. Could you just say
19 yes or no? With the FHA levels and the hepatitis B
20 levels by schedule not equivalent?

21 DR. HOWE: Well, for HepB the endpoint
22 was, in the DTPa-HepB-030 studies, the primary
23 endpoint was seroprotection rates. So the non-
24 inferiority testing was on seroprotection rates to
25 HepB, not to the GMTs.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 DR. KOHL: So it wasn't tested there, and
2 it was non-equivalent for FHA.

3 DR. HOWE: And for FHA you are right. In
4 the 015 study the vaccine response rate marginally
5 exceeded, or the difference in vaccine response rates
6 marginally exceeded the pre-specified limit.

7 CHAIRMAN DAUM: Dr. Gerber please. Thank
8 you.

9 DR. GERBER: With respect to the
10 increased incidence of fever in the combination group,
11 I understand that you are talking about temperatures
12 of 100.4 or greater, but less than 103.2.

13 That is a fairly large range. And what
14 I'm wondering is, what is the distribution of those
15 temperatures, for most of these temperatures of 101,
16 102, 103, do you have that information?

17 DR. KAUFHOLD: In the two comparative
18 trials, 015 and 011, we have indeed made this
19 breakdown. In the upper part of the slide you see the
20 results, the breakdown for the study 015.

21 And in this trial any fever, as well as
22 fever above 38.6 degrees centigrade, and fever above
23 95 percent degrees centigrade, there was no
24 statistical difference between groups.

25 However, the trial was not designed to

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 detect such difference, the sample size was much too
2 small.

3 Now, if you look at study 011 you see in
4 green highlighted those temperature categories for
5 which there was a statistical difference. So for any
6 fever that is defined as fever greater than 38 degrees
7 centigrade, and fever greater equal than 38.5 degrees
8 centigrade, there was no statistical difference for
9 higher grade fever above 39.5 degrees centigrade.

10 And in this trial there were only two
11 cases of children who had fever above 40.5 degrees
12 centigrade. One was in the group that received the
13 candidate vaccine, whereas the other case was in the
14 group that received separate administrations of
15 licensed vaccines.

16 CHAIRMAN DAUM: Dr. Faggett, then Dr.
17 Fleming.

18 DR. FAGGETT: My question is adequacy of
19 safety data. You mentioned that safety was
20 demonstrated in 7,000 infants at three dose primary
21 series.

22 One of the earlier speakers mentioned
23 5,000 infants, 015 and 011 study, and 1,600 children
24 were mentioned in the German safety study. My
25 question is, what is the total number of children in

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 the safety studies, and is that ongoing, and what is
2 your endpoint in terms of how many you plan to study?

3 DR. KAUFHOLD: So the total, altogether
4 7,028 children received at least one dose of vaccine.
5 And as I showed in the main presentation there were
6 only very few subject excluded both from the ITT
7 analysis and from the ATP analysis.

8 DR. FAGGETT: So how many -- is this
9 ongoing, what is your endpoint, in terms of how many
10 children --

11 DR. KAUFHOLD: I'm not sure if I
12 understand the question.

13 CHAIRMAN DAUM: The question is, are there
14 ongoing trials conducting safety data that you are
15 conducting right now, right?

16 DR. KAUFHOLD: Yes.

17 DR. FAGGETT: Seven thousand sounds kind
18 of small to me, I mean it is --

19 CHAIRMAN DAUM: And the answer is?

20 DR. KAUFHOLD: There are no ongoing
21 trials.

22 DR. FAGGETT: Okay, thank you.

23 CHAIRMAN DAUM: Dr. Fleming is next, and
24 wanted to see the last slide that you showed, Dr.
25 Kaufhold. If you could put that back up, please?

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS

1323 RHODE ISLAND AVE., N.W.

WASHINGTON, D.C. 20005-3701

1 DR. FLEMING: Great, I have a number of
2 issues, and I would like to reserve my questions to
3 the end just to avoid overlap. And I did want to,
4 since this slide was put up, it does get at the heart
5 of the issues.

6 My interpretation of this data are that
7 there is much more strength of evidence here about an
8 increase in fever than your interpretation. I think
9 when you had presented the data on 015 you noted the
10 estimates for the fever greater than 38, that the --
11 relating to whether the confidence intervals are
12 overlapping. In fact confidence intervals can
13 overlap. That is not the way you assess whether there
14 is a statistically significant evidence of an
15 increase.

16 Your upper limit of the confidence
17 interval for the difference does, in fact, reflect
18 what is on the margin of statistical significance on
19 the 015 trial. You are estimating an 11 percent
20 higher rate.

21 The lower limit, which you would be using
22 in a non-inferiority sense clearly is not satisfying
23 in non-inferiority criteria, in fact, it is on the
24 edge of being statistically significantly greater.

25 You have in 011 clear cut evidence of a

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 statistically significant greater rate of fever. The
2 estimate is 13. -- the difference is 13.7. The lower
3 limit of the confidence interval is close to zero.

4 And in addition to that you have certain
5 trends that, granted, is under power for the fever
6 greater than 38.6, but you have consistent trends in
7 the two.

8 These data are improperly interpreted as
9 not providing statistically significant evidence of an
10 increase in fever. Clearly there is, and it is
11 consistently seen in these two studies, as it is seen
12 in the 044 trial.

13 CHAIRMAN DAUM: Thank you, Dr. Fleming.
14 Dr. Ball next, then Ms. Fisher.

15 DR. BALL: I wanted to comment that some
16 of the questions that you are addressing now, as well
17 as what Dr. Gerber addressed, which is with regard to
18 what degree of fever are found in my slides, and I
19 will be discussing that later.

20 And I don't know if you have the
21 information in front of you, but it may be easier for
22 people to see that slide, because I know I can't see
23 that slide.

24 But if you have my briefing, or my slides,
25 slide number 31 addresses the incidence of fever in

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 study 011, and it breaks it down to fever greater than
2 38.6 degrees, and 39.5 degrees.

3 And as you can see here with the asterisk
4 the difference is for the groups, for fever greater
5 than 38 degrees, and greater than 38.6 degrees, were
6 statistically significantly different.

7 Study 015 was addressed in slide 35, with
8 the same information, fever greater than 38 degrees,
9 fever greater than 38.6 degrees, and fever greater
10 than 39.5.

11 And as Dr. Fleming pointed out, fever with
12 greater than 38 degrees in this study was on the
13 margin of being statistically significant. But the
14 trends were the same in both studies.

15 CHAIRMAN DAUM: Thank you. I know that
16 you are planning to return to this topic in some
17 depth, and the Committee members will have a chance to
18 reflect on this issue further after the FDA
19 presentation, as well.

20 Ms. Fisher, please.

21 MS. LOE FISHER: I'm interested in the --
22 getting more information about the two seizure cases.
23 One was, I think, in the adverse event category of
24 febrile seizure, which was then determined to be
25 caused by an underlying seizure disorder, the other

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 was a death that had the cause of death listed as an
2 underlying seizure disorder.

3 Was this the same patient, and what
4 determination was made that the seizure, was this the
5 first time that the seizure had occurred following the
6 vaccination, had there been pre-existing seizures?

7 And what was the determination, how did
8 you determine that they were not connected to the
9 vaccine? And I have the same question on the deaths.
10 Because you had five deaths in the combination group
11 and only one death in the controls.

12 That seems pretty significant to me, and
13 what determination was made that those deaths were
14 not, indeed, in some way connected with the
15 combination vaccine?

16 DR. KAUFHOLD: You are right, there were
17 five deaths in the group that received the combination
18 vaccines. That includes all trials that are contained
19 in the BLA, and one death in the comparative vaccine.

20 If you now look at the denominator you
21 can, and the denominators between those two groups
22 are, obviously, very different. So if you compare the
23 percentages the figures are virtually identical.

24 Perhaps we can have another look at the
25 slide that lists all the deaths, perhaps that went too

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 fast.

2 Altogether there were three cases of
3 sudden infant death syndrome, the next one please,
4 three cases of sudden infant death syndrome. I
5 highlighted in my presentation, in the comparative
6 study 011 there was one case, in the group that has
7 received the candidate vaccine and one case in the
8 group that received separately administered licensed
9 vaccines.

10 Then there was one case of neuroblastoma,
11 and one case of congenital immunodeficiency. And if
12 you will read the narratives, we -- one can support
13 only the conclusion of the investigator that stated
14 that these cases are certainly unrelated to
15 vaccination.

16 With regard to your question regarding
17 convulsive disorder, yes, there were altogether two
18 febrile convulsive disorders in study 011. And one
19 occurred after four days post-vaccination, and the
20 other case occurred more than two weeks post-
21 vaccination.

22 The case with the febrile seizure is the
23 same, that was diagnosed to have an underlying
24 convulsive disorder, and this child died later on.

25 MS. LOE FISHER: So it was the same

1 patient?

2 DR. KAUFHOLD: It was the same patient.

3 CHAIRMAN DAUM: Dr. Diaz, then Dr. Broome,
4 and then I think we are going to take a break.

5 DR. DIAZ: Thank you. I have just a
6 couple of questions. The first in regards to
7 immunogenicity.

8 Do you have -- how did the anti-PRN data
9 vary lot-to-lot consistency for the original Infanrix?
10 Did you see the same kinds of differences in the
11 immunogenicity lot-to-lot?

12 DR. HOWE: I have to go back to look at
13 the exact definition of lot consistency at the time
14 that Infanrix was licensed, to be quite honest.

15 And I don't think that the same criteria
16 were applied. Maybe another way -- I mean, I can
17 certainly share with you how this data compare with
18 anti-PRN results, or other antigens, results for other
19 antigens.

20 With respect to the efficacy trials that
21 data I have with me. I don't know if that helps to
22 answer your question. But I can say that the criteria
23 for consistency were not -- those same criteria were
24 not applied to Infanrix in the context of that
25 licensure, because that was years ago. These were

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealgross.com

1 subsequently developed.

2 DR. DIAZ: And in the studies today, that
3 are being presented, were the same -- it may be
4 implied, but I don't recall seeing it in your data.
5 Were the same lots used to prepare the combination
6 vaccines that were used for the control lots in the
7 studies?

8 DR. HOWE: In terms of the -- no, these
9 were commercial lots of, for instance, it would be a
10 commercial lot of purchased Infanrix, or commercial
11 lot of Engerix-B.

12 In terms of, for instance, the Lederle OPV
13 could have been multiple lots.

14 DR. DIAZ: And how were those lots chosen?

15 DR. HOWE: They were just chosen as to
16 what was available commercially, on the market. In
17 terms of the Infanrix and the Engerix-B there was, in
18 general, a single lot used throughout the course of
19 the trial. That was true for the Hib vaccine, as
20 well.

21 But these were commercial products that we
22 would purchase.

23 DR. DIAZ: So from study site to study
24 site the lot may have varied in terms of the control
25 group?

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 DR. HOWE: No, no. The lot was the same
2 for Infanrix, for Engerix-B, and for Hib in the
3 trials. The lot would have been provided to the site,
4 but it was a commercial lot, I'm sorry.

5 And then for oral polio, in the trials we
6 did allow the sites to purchase their own. So that is
7 the only one for which we used various lots.

8 CHAIRMAN DAUM: Thank you, Dr. Howe. Dr.
9 Broome, please.

10 DR. DIAZ: Just one other question if I
11 could, please.

12 CHAIRMAN DAUM: If it is very brief.

13 DR. DIAZ: You've looked at children post-
14 vaccination up to four days, and then at 30 days,
15 correct? And I recognize that in the recommendations
16 from the FDA to the manufacturers they recommend
17 following children up to seven days, initially.

18 And I was just curious why you chose four
19 days as your cutoff.

20 DR. HOWE: So for the detailed
21 reactogenicity analysis the period of solicitation was
22 four days.

23 DR. DIAZ: For safety?

24 DR. HOWE: For safety, yes. And then for
25 -- but, however, for unsolicited symptoms the period

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 for follow-up was 30 days after each vaccine dose.
2 And then for serious adverse events they were followed
3 throughout the entire course of the trial, for up to
4 30 days after the last dose.

5 DR. DIAZ: I was just curious if there was
6 a reason.

7 DR. HOWE: Well, four days, I think, is
8 more typical of inactivated products. For instance,
9 in some later trials we may have had an eight day
10 period of solicitation, but these trials were all
11 designed for four days.

12 DR. DIAZ: I just noticed that the
13 industry guidelines recommended seven days.

14 CHAIRMAN DAUM: We are going to move on
15 now. Please, Dr. Broome?

16 DR. BROOME: I'm still interested in this
17 issue with the possible lack of lot consistency with
18 the pertussis antigens.

19 The reverse cumulative distributions you
20 are showing are all for post-vaccination, they do not
21 include pre-titers. And in the reverse cumulative
22 distribution, in study 44, there seems to be a slight
23 but consistent left shift for lot C.

24 So I wondered if you could show me the
25 reverse cumulative distribution for study 027, in

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 terms of whether that was seen in that, you know,
2 other larger study.

3 (Unmiked answer.)

4 DR. BROOME: It is a fairly slight left
5 shift, but I thought that was somewhat interesting for
6 the anti-PRN. And it wouldn't, you know, it is
7 independent of the high pre-existing titer. So it
8 looked like an observation worth noting.

9 CHAIRMAN DAUM: I don't suspect the person
10 trying to bring the slide up has too much anxiety at
11 this moment.

12 DR. BALL: Dr. Daum, can I just interject?
13 This was one issue that we looked at, and I think they
14 are having a difficult time finding the slide. But
15 the backup slide which unfortunately I didn't bring
16 today, shows that those lots were basically
17 superimposable.

18 There wasn't that difference in that
19 outlier, the lot, in study 027.

20 CHAIRMAN DAUM: Can we accept that?

21 DR. BROOME: Sure.

22 CHAIRMAN DAUM: Here we have the slide.
23 Take the anxiety off for a moment, distract it.

24 DR. HOWE: These are the three lots, then,
25 in red, yellow, and black, lots A, B, and C. And

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 these are for anti-PT. But if you could just go to
2 anti-FHA? And what we really want to see is the anti-
3 PRN.

4 Those are very superimposable, anti-FHA,
5 and here is anti-PRN.

6 CHAIRMAN DAUM: Thank you very much.
7 Thank you for the sponsor's presentation. We will
8 revisit some of these issues, I'm sure, when we hear
9 from the FDA, and have Committee discussion.

10 We will take a 15 minute break and
11 reassemble at 11:35.

12 (Whereupon, the above-entitled matter
13 went off the record at 11:24 a.m. and
14 went back on the record at 11:44 a.m.)

15 CHAIRMAN DAUM: I'd like to get started so
16 that those of us like lunch can get there.

17 Before we move on to the FDA's
18 presentation on this issue, I would like to ask a
19 favor, or make a request of our audience members
20 today. A number of people have complained to me that
21 there is sufficient amount of buzzing and talking
22 there that they have actually been distracted from
23 being able to hear what is going on in the meeting.

24 And I would like to request that people
25 minimize, or eliminate that kind of conversation, and

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 maybe step outside for a moment if they need to have
2 a conversation while the meeting is going on. Thank
3 you.

4 There is one more announcement, we will
5 turn the floor over to Nancy.

6 MS. CHERRY: Yes. I understand -- I know
7 that there is a binder with briefing materials that is
8 out on the table, or that was out on the table. I
9 understand that all of the sponsor's briefing
10 materials have all been given out.

11 And now the binder has disappeared. So if
12 you look around and you see your neighbor with that
13 binder, would you kind of -- since we asked you not to
14 talk, but at least jab that person in the elbow and
15 hint that they take it back to the table out there,
16 and give it to Dennise and Rosanna. Thank you. The
17 binder has a copy of the briefing materials.

18 CHAIRMAN DAUM: I think we will call on
19 Dr. Ball at this point.

20 DR. BALL: Good morning. I will be
21 presenting the FDA's clinical review of GlaxoSmith
22 Kline's DTPa-HepB-IPV combination vaccine.

23 My intent is not to present all the
24 material that was presented this morning, nor present
25 everything that was in the briefing document from the

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 FDA, but to highlight some issues for your
2 consideration.

3 First I will discuss the proposed
4 indication and provide an overview of this
5 combination, and the FDA's approach to combination
6 vaccines. Next I will discuss the clinical studies
7 submitted in the license application to support
8 efficacy and safety of this combination vaccine.

9 I will present the available data on
10 concomitant vaccines, and as was noted, this will
11 consist of data with concomitant Hib vaccine. Prevnar
12 was not licensed, nor was it commercially available at
13 the time the studies were conducted, and at the time
14 the BLA was filed.

15 In addition I will discuss some limited
16 data on the fourth dose of Infanrix following a
17 primary series of the DTPa-HepB-IPV vaccine. Finally
18 I will present the questions and discussion points for
19 the Committee.

20 The proposed indication, as was mentioned
21 earlier today, for this combination is a three dose
22 primary series, given at 4 to 8 week intervals, with
23 the customary age of administration, 2, 4, and 6
24 months of age.

25 This slide presents the current

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 recommended childhood immunization schedule to
2 illustrate how this combination would fit in the
3 existing schedule.

4 The combination under discussion today
5 contains the components that are in light yellow,
6 namely DTPa, HepB, and IPV. The proposed schedule, as
7 was mentioned, would fit under this time frame, 2, 4,
8 and 6 months of age.

9 So what would this vaccine mean in terms
10 of injections administered to infants during the
11 primary series? Under the current recommended
12 childhood immunization schedule an infant would
13 typically receive four to five injections per visit,
14 depending on the formulation used, as illustrated
15 here.

16 With this new combination vaccine, if it
17 is used in the primary series, and if it would receive
18 up to three injections per visit in the primary
19 series, namely that of the combination Hib and the
20 pneumococcal conjugate vaccine.

21 Next slide. As we heard, earlier today,
22 the hepatitis B vaccine consists of two vaccines that
23 are currently licensed in the U.S., namely Infanrix,
24 DTPa and hepatitis B, Engerix-B, as well as the IPV
25 component that is not currently licensed in the U.S.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 In the FDA approach to the licensure of
2 combination vaccines, there are two regulations that
3 I wanted to mention.

4 First a new license is required when
5 already licensed products are combined, or when
6 unlicensed components are added to a licensed vaccine.
7 Secondly, products may be combined if each component
8 makes a contribution to the claimed effects, and
9 combining does not decrease the purity, potency,
10 safety, or effectiveness of the individual components.

11 In addition the FDA's approach to
12 combination vaccines is outlined in the 1997 guidance
13 document for industry, which states: Clinical studies
14 of combination vaccines should be designed to rule out
15 clinically meaningful differences.

16 The approach taken for licensure of this
17 combination has been through the evaluation of
18 immunogenicity of each component in the combination,
19 rather than clinical end point efficacy studies.

20 In other words, efficacy is inferred from
21 immunogenicity. The objectives of the clinical
22 studies of the combination have been based in first
23 demonstrating non-inferiority of the combination,
24 compared with separately administered U.S.-licensed
25 vaccines, namely Infanrix, Engerix B, oral polio, and

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 in study 015, IPV.

2 Note that polio vaccine was the standard
3 of care at the time of studies to support licensure
4 were conducted.

5 In addition, for those components having
6 a generally accepted immune correlate of protection,
7 namely D and T, hepatitis B and IPV antigens, the
8 clinical studies have sought to demonstrate that the
9 immune response to the combination exceeds these
10 correlates.

11 The objectives of the clinical studies in
12 support of licensure have been to demonstrate the
13 immunogenicity and safety of DTPa-HepB-IPV, to
14 evaluate the immunogenicity when vaccine is given
15 concomitantly under the recommended schedule,
16 immunization schedule, and to demonstrate that the
17 vaccine can be manufactured consistently, and to
18 demonstrate that clinical bridging between the two
19 sequential lots following a manufacturing change.

20 You have heard, earlier today, about the
21 clinical studies submitted in support of licensure.
22 I will be concentrating on the three pivotal studies
23 that are in this slide namely study 011, which was the
24 large-scale safety trial conducted in Germany under a
25 3, 4, 5 month immunization schedule.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

(202) 234-4433

www.nealgross.com

1 Study 015 evaluated the immunogenicity as
2 safety on the schedule of 2, 4, and 6 months of age.
3 Study 044 examined DTPa-HepB-IPV for lot consistency
4 and manufacturing bridging from the first production
5 lot to the second lot series.

6 The total number of subjects receiving the
7 combination in the pivotal trials was over 5,000. In
8 addition to the pivotal trials Dr. Howe discussed data
9 from supportive studies not conducted under USIND that
10 were submitted to the license application.

11 These studies used the same procedure for
12 evaluating safety immunogenicity generally speaking,
13 as the pivotal trials, but utilized different
14 schedules at times and comparators that were not U.S.-
15 licensed vaccines.

16 The total data base of subjects receiving
17 the combination in the pivotal and supportive trials
18 was approximately 7,000, with 764 of these subjects
19 receiving the combination at the 2, 4, 6 month
20 schedule.

21 Additional data were provided through
22 studies of related DTPa Infanrix combination that were
23 not licensed in the U.S. These Infanrix-based
24 combinations were DTPa-HepB-IPV Infanrix with Hib, as
25 was mentioned earlier today and the combination DTPa-

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 HepB vaccines.

2 These studies provided additional data on
3 lot consistency, the safety of the primary series
4 following a birth dose of hepatitis B vaccine, and
5 data on the change and schedule of the administration
6 for hepatitis B combination for the hepatitis B
7 component in a combination.

8 This slide presents the demographics of
9 the clinical studies as DTPa-HepB-IPV that was
10 submitted in the license application, with specific
11 data on the pivotal trials, and total data for both
12 the pivotal and supportive studies.

13 As highlighted in blue the majority of
14 infants studied in the clinical studies were
15 caucasian. The population was diverse in a pivotal
16 study conducted in the U.S.

17 Now I will move on to examine the studies
18 evaluating the immunogenicity of the combination
19 vaccine. The primary immunogenicity endpoint included
20 the percent of subjects achieving immune response
21 correlated with protection for the D and T, Hib and
22 polio components.

23 For the pertussis components the
24 immunogenicity endpoints evaluated were the percent of
25 infants showing response to PT, FHA, and Pertactin.

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 In addition geometric mean titers were evaluated.

2 In assessing the immune response the
3 statistical approach used for evaluating the
4 combination vaccine compared with a separate
5 administration of U.S.-licensed vaccine, was for
6 testing for non-inferiority.

7 For non-inferiority testing a one sided
8 equivalence test was used with an alpha of five
9 percent. To evaluate manufacturing consistency a two-
10 sided equivalence test was used.

11 AS was mentioned earlier today, pre-
12 specified limits for defining non-inferiority were
13 maximum difference of ten percent for seroprotection
14 vaccine response rates to D and T, pertussis,
15 hepatitis B and polio antigens.

16 For GMTs the pre-specified limits for non-
17 inferiority were maximum ratio of 1.5 on the GMTs for
18 the pertussis components, and 2.0 for the hepatitis B
19 component. And hepatitis B GMTs -- I'm sorry, go back
20 for a second. Hepatitis B GMTs were considered a
21 secondary endpoint.

22 Now we will discuss the specific clinical
23 studies. The objective of study 015 was to evaluate
24 immunogenicity and safety of a primary series of the
25 combination compared with separately administered

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 U.S.-licensed vaccines.

2 The study was conducted in the U.S. on a
3 2, 4, 6 month schedule. This slide depicts the study
4 groups to which the infants were randomized. In the
5 study I will concentrate on group one which received
6 the combination with Hib vaccine, and group 4, which
7 received the -- I'm sorry, separately administered
8 Infanrix, Engerix-B, Hib, and OPV.

9 Group 2, as was mentioned earlier,
10 evaluated the combination vaccine given in a
11 sequential schedule, which is no longer the
12 recommended schedule in the U.S.

13 In addition group 3 examined the
14 combination DTPa, hepatitis B, which is no longer
15 licensed in the U.S., and is no longer under
16 consideration today.

17 This data presented, in terms of the
18 immune response for the two eligible groups, as I
19 mentioned, group 1 and group 4. And the difference of
20 immune response was seen with a 90 percent confidence
21 interval on the difference.

22 Note the statistical methodology was non-
23 inferiority, a one-sided equivalent testing, for sero
24 response and vaccine response. The upper bound of the
25 90 percent confidence interval should not exceed 10

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 percent.

2 Dr. Howe earlier presented the immune
3 response data for all the antigens contained in the
4 combination, and noted that all pre-specified
5 immunologic endpoints for demonstrating non-
6 inferiority of a combination, compared to the
7 separately administered vaccines were met, with the
8 exception of the percent responders to FHA.

9 This slide presents the vaccine response
10 to pertussis antigens, to each of the pertussis
11 antigens, and highlighted in blue is FHA, which
12 exceeded the pre-specified limit of ten percent.

13 I think it should be noted that
14 variability of immune response to FHA has been noted
15 previously, specifically in studies used to support
16 licensure for Infanrix DTPa.

17 In the German household contact study
18 multiple lots of Infanrix were used showing various
19 immune responses to FHA, but efficacy did not appear
20 to differ among these lots.

21 The second pivotal study of immunogenicity
22 was study 044, which evaluated lot consistency in
23 manufacturing bridge. This study was conducted in the
24 U.S. on a 2, 4, 6 month schedule.

25 This slide depicts the study groups in

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 study 044, which evaluated lot consistency in groups
2 1 through 3, which consisted of three lots of the
3 second lot series in the combination and mixed with
4 Hib.

5 It should be noted that as compared with
6 the previous presentation by the manufacturer, we've
7 labeled lot C, and lot C are different on the lot that
8 was labeled lot C by GSK we have labeled lot B.

9 The study also compared pooled lots from
10 the first lot series, I'm sorry, from the second lot
11 series to group four, which contained one lot of the
12 first lot series.

13 I think it is also important to note that
14 in this study there was no separate administration
15 control arm.

16 This slide depicts the immune response
17 data for lot consistency. We have the vaccine
18 response rates here, and the GMTs here. And in the
19 middle columns here are the groups 1 through 3, and
20 here are the maximum 90 percent confidence interval
21 limits on the pair wise differences between the three
22 groups.

23 And for the GMT the maximum 90 percent
24 confidence interval limit on the pair-wise ratio. As
25 was noted earlier today by Dr. Howe, all pre-specified

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 immune endpoints were demonstrating equivalence, that
2 is lot consistency of the second series of DTPa-HepB-
3 IPV were met with the exception of the percent
4 responders to FHA and pertactin, as well as the GMTs
5 to pertactin.

6 This slide presents the immune response
7 data for the manufacturing bridge from the first to
8 the second lot series. All pre-specified immunologic
9 endpoints were demonstrating non-inferiority were met,
10 with the exception of the percent responders to
11 pertactin.

12 Here are the upper limit of the 90 percent
13 confidence interval was 12.3 where pre-specified limit
14 was 10 percent.

15 Now I will present information on the
16 immune response to the hepatitis B component in the
17 combination vaccine. Engerix B, GlaxoSmith Kline's
18 hepatitis B monovalent vaccine is currently licensed
19 under 0, 1, and 6 months schedule.

20 For the proposed indication the schedule
21 is 2, 4, and 6 months. Several studies in the license
22 application evaluated the immune response of the
23 combination on a 2, 4, 6 month schedule. And these
24 data are presented here.

25 The observed hepatitis B immune response

1 in infants receiving the combination was significantly
2 greater than the 10 international units per mil, the
3 level considered protective against hepatitis B
4 disease.

5 In these studies 99 to 100 percent of
6 infants achieved levels considered seroprotective with
7 the GMTs ranging from about 1,400 to close to 1,700.

8 Note that none of the infants in these
9 studies received a birth dose of hepatitis B. So it
10 is important to note that no data were submitted as
11 part of the license application that directly compared
12 the hepatitis B immune response of the combination
13 vaccine given at 2, 4, and 6 months of age to the
14 immune response of Engerix-B administered at birth, 1,
15 month, and 6 months of age.

16 Supportive data for the change in schedule
17 for the hepatitis B were submitted from study DTPa-
18 HepB-030, which evaluated SmithKline Beecham's DTPa-
19 HepB combination that is not licensed in the U.S., and
20 the data were presented on the next slide.

21 So the DTPa-HepB-030 compared the
22 hepatitis B immune response to the hepatitis B DTPa
23 combination, given at 2, 4, 6 months of age, to
24 hepatitis B given at 0, 1, and 6 months of age.

25 The immunogenicity of the DTPa hepatitis

1 B combination on a 2, 4, 6 month schedule, compared
2 with the standard 0, 1, 6 month schedule, met the pre-
3 specified criteria for non-inferiority with respect to
4 seroprotection, with 99 percent of the subjects given
5 the vaccine on a 2, 4, 6 month schedule, having host
6 vaccination levels above the level considered
7 seroprotective.

8 The hepatitis immune response to GMTs were
9 lower when the hepatitis B antigen was given on a more
10 compressed schedule of 2, 4, and 6 months of age.
11 However, the hepatitis B immune response of the
12 combination was well above the level considered
13 protective.

14 Now I will move on to the studies
15 evaluating the safety of DTPa-HepB-IPV vaccine.

16 The objectives of these pivotal studies
17 was to compare the rates of adverse events following
18 administration of the combination with the separately
19 administered U.S.-licensed vaccines.

20 Study 011 was a large scale safety study
21 with the objective being to evaluate common and less
22 common adverse events. The study was amended after
23 initial enrollment as was mentioned earlier today, to
24 include a control arm that received a separately
25 administered U.S.-licensed vaccines. The study was

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 conducted in Germany on a 3, 4, 5 month schedule.

2 It should be noted here that there was no
3 sera drawn to evaluate immunogenicity in this study.

4 This slide depicts the study arms in study
5 011. Groups 1 through 4 received the combination
6 vaccine with Hib vaccine from various manufacturers.
7 And as was mentioned, the original intent was to
8 evaluate the safety with these four different Hib
9 vaccines.

10 Infants in group 5 received separately
11 administered vaccines, Infanrix, Hib, and OPV. As was
12 noted earlier today, group 5 did not receive hepatitis
13 B during the study period.

14 Also, as was mentioned earlier, the arms
15 of the groups receiving the combination was
16 significantly higher, 4,696 compared with the group
17 receiving separate injections, 776.

18 This slide depicts the incidence of local
19 reactions in the groups receiving the combinations,
20 compared with the separately administered vaccines, by
21 looking at the site of injection at the DTPa hepatitis
22 B IPV compared with the Infanrix given alone site.

23 And I'm -- with the vaccines but not in
24 combination. This was measured in three days,
25 following the vaccination for each dose, and for any

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 dose of vaccine. The two columns in the middle
2 present the data on the incidence of redness and
3 swelling in the pooled groups receiving the
4 combination, compared with the groups receiving
5 separate vaccines.

6 Instead of P-values the last column
7 presents the difference between the groups, and the
8 confidence interval on the difference. The difference
9 is statistically significant if the lower bound on the
10 90 percent confidence interval is greater than zero.

11 In this study increased incidence of
12 redness and swelling was observed for groups receiving
13 the combination, compared with the infants receiving
14 separately administered Infanrix.

15 Following doses 2, 3, and for any dose the
16 difference between the combination and Infanrix were
17 statistically significant. Of note grade 3 local
18 symptoms defined as swelling or redness greater than
19 20 millimeters did not appear increased in the
20 combination recipients.

21 This slide presents the incidence of fever
22 greater than 38 degrees after each dose, and after any
23 dose. An increased incidence of fever greater than 38
24 degrees centigrade was observed in the combination
25 with recipients with a difference between the

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701

1 combination in a separately administered vaccine,
2 statistically significant after each dose, and after
3 any dose of the vaccine when compared with the
4 separately administered vaccines.

5 For example, following dose one, 25
6 percent of infants receiving the combination
7 experienced fever greater than 38 degrees centigrade,
8 compared with 13 percent in the group receiving
9 separately administered vaccines.

10 And for any dose the incidence of fever
11 was 43 percent versus 26 percent in the separately
12 administered vaccines.

13 To determine whether this increased rate
14 of fever was for low grade fever or higher fever, we
15 further evaluated the incidence of fever in addition
16 to 38 degrees we looked at fever greater than 38.6
17 degrees or 101.5 degrees fahrenheit, and fever greater
18 than 39.5 centigrade, or 103.2 degrees fahrenheit.

19 The incidence of fever greater than 38.6
20 degrees also increased with a difference of 4.7
21 percent, reaching statistical significance. The
22 incidence of grade 3 fever, greater than 39.5 degrees
23 was not significantly different in the groups
24 receiving the combination, as compared with the
25 control.

1 I will move on now to study 015, which I
2 discussed earlier, with respect to immunogenicity.
3 This slide reviews the study groups and the data I
4 will present will concentrate, again, on groups one
5 and four.

6 Note that in the study groups one and two
7 received two injections, and group three and four
8 received three injections, generally, each visit.

9 This slide presents the incidence of local
10 swelling in the three days following vaccination,
11 similar to the pattern observed in study 011, where
12 the combination was associated with increased redness
13 and swelling, compared with a separate DTPa site.

14 The incidence of redness and swelling was
15 increased in the group receiving the combination,
16 compared with the group receiving separately
17 administered U.S.-licensed vaccines. Although this
18 difference did not reach statistical significance.

19 The incidence of redness and swelling
20 greater than 20 millimeters was higher in the group
21 receiving the combination. However, again, this
22 difference did not reach statistical significance.

23 I think it should be noted that this study
24 was not powered for safety but for immunogenicity, so
25 therefore the finding of no statistical significance

NEAL R. GROSS

COURT REPORTERS AND TRANSCRIBERS
1323 RHODE ISLAND AVE., N.W.
WASHINGTON, D.C. 20005-3701
