

This matrix indicates the ground distance an individual pixel covers, with a micron scale micron / scale of photography combination.

DPI Formula: $20 \text{ microns} / 1,000,000 = .00002 * 39.37 = .00078$; $1 / .00078 = 1282 \text{ DPI}$

Ground Distance Formula: $\text{Scale of Photography} / \text{DPI} / \text{Feet}$
 Example: $60,000 / 2136 = 28.08 / 12 = 2.3'$
