IEC TC100 TV Power Measurement Project Overview and Status

Jon Fairhurst, Project Leader 2006-07-20

TV Trends - Demand

Demands Forecast of FPD TVs in 2006-2010 (million units)								
2003	2004	2005	2006	2007	2008	2009	2010	CAGR
156.3	159.2	152.1	138.2	119.5	109	99.7	93.3	-9.3%
3.9	8	20.7	40.2	59.5	72.8	83.4	92.8	35.0%

Demand Forecast of TVs by Technology

Displaybank, 2006 Forecast

TV Trends - Size

Global LCD Forecast by Size

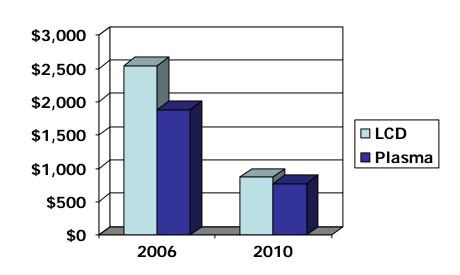

Nearly all of the growth in the LCTV market will be in at 30" and above segment.

The 40" and above segment will have steep growth.

TV Trends – Falling Prices

 Peter Kwon, president and chief executive of Korea-based Displaybank, projects retail prices of 42 in. LCD TVs to fall from an average of \$2,546 in 2006 to \$870 by 2010. Similar-size plasma TVs will drop from \$1,880 to \$775 over the same period, he added.

Average 42" TV Retail Price Forecast

Source: EE Times, 5-Jun-2006

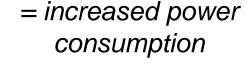

TV Trends - Applications

<u>Typical daily use:</u> US: 5 hours; Japan: 4.5 hours; Europe: 4 hours (varies by country)

The need for a TV Power Measurement Standard

- **IF** two TVs have the same brightness (cd/cm2)
 - And <u>IF</u> they have the same efficacy (lumens/watt)
 - The larger TV will draw more power, proportional to screen size
- The flat panel market will grow
- Set sizes will grow
- People want bright TVs
- People use their TVs more

- The key is improved efficiency (watts/in²)
 - It's easy to measure in²
 - We need a measurement standard for TV power consumption including "On Mode"

TV Power Measurement Standards

- Existing procedures
 - DOE method: developed for B&W TVs!
 - JEITA Draft Report: Developed for LCD-TVs & PDP-TVs; Japan centric (uses Japan broadcasting formats and metrics)
 - IEC 62087: Includes a variety of tests, but does not integrate them.
 Does not consider power saving features. Can be improved.
- IEC 100/1081/NP (new project proposal)
 - Initial draft based on best practices of JEITA and IEC 62087
 - We have strong industry, agency and IEC support
 - Working draft marked-up in Helsinki, June, 2006
- IEC 62487 (approved project)
 - First meeting in Washington, DC, July 2006
 - Key decisions made; Working draft updated

What is the IEC?

- IEC is the International Electrotechnical Commission
- An international standards body
- First meeting: 26 June, 1906
- www.iec.ch
- IEC is a matrix of technical committees (TCs)/subcomittees (SCs) and national committees (NCs)
 - Technical committees organize and administer the projects
 - Voting is done by the national committees
 - Nations potentially have Technical Advisory Groups (TAGs) for the Technical committees. They advise the national committees on voting.
 - You may join a TAG, and could become a delegate at TC meetings

IEC TC100 TV Power Measurement Project (62487)

- IEC TC100 (Technical Committee 100) has taken the lead role through the NP (new project, or new work item proposal) process
- The project has been approved
- TC100's scope covers "Audio, video and multimedia systems and equipment"; we are one of the most prolific TCs
- TC108 (Safety) has joined the effort
- TC110 (Displays) is actively involved in the project
- Participants include industry, government agencies, non-profit organizations, academia and independent contributors
- Anybody may join

Project Goals

- The project includes the following goals:
 - To be technology and size neutral
 - To consider dual function products, such as TVs with computer monitor capabilities
 - To allow for fair and consistent comparison of products
 - To have international scope and application
 - To focus on out-of-the-wall power consumption (i.e., consumption from the power mains)
 - To include a rich range of content for the test image
 - To be an easy to use measurement technique
 - To have an intuitive set up (e.g., out of the box/default settings) and run in a reasonable amount of time (i.e., a few hours with the ability to extrapolate results).
 - Timely publication and promulgation: 2007.

Timeline

- June 2005: NRDC hosted a TV Energy workshop in San Francisco
- September 2005: The topic was proposed at the TC100 meeting in San Jose
- December 2005: Jon Fairhurst of Sharp volunteers as project leader
- January 2006: Developed the NP
- February 2005: NP proposed to the US TAG
- March 2005: NP passed 30 day TAG vote; Comments resolved
- April 2006: NP ballot issued in TC100; Initial draft delivered to TC100
- May 2006: Ad-hoc meeting held in Helsinki; Working draft revised.
- June 2006: Working draft presented to London TV Power Consumption workshop
- July 2006: Two day meeting held (18th & 19th) in Washington; Project approved.
- September 2006: Meeting planned in Berlin (27th & 28th). Goal: Working draft completed.
- IEC TC100 procedures move forward (comment periods and ballots)
- Formal publication

The Washington Meetings

- 28 attendees registered
- Our members presented ten detailed proposals on various topics related to the standard under development
- We reviewed the working draft item by item and created a marked-up draft in real time
- We focused our scope on "On Mode"
- We decided to develop two parts: one with fixed test signals, the other with moving content
- The moving content part will have three test loops
 - Low Average Signal Level (movies & dramas)
 - Mid Average Signal Level (sports & animations)
 - High Average Signal Level (web & video games)
- The weighting of low, medium and high test results will be decided locally
- We have an action plan (17 action items) to complete the work in Berlin, September 27/28
