# Hurricanes

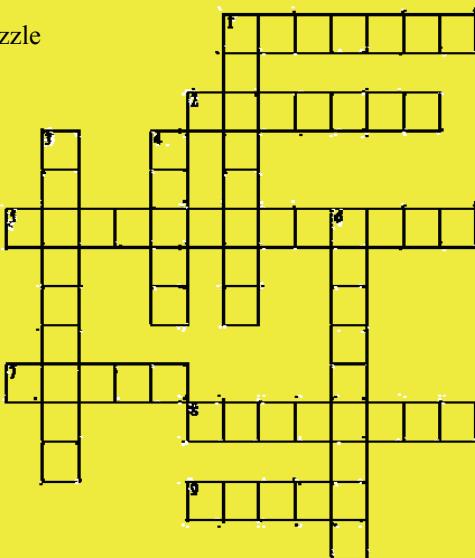

Hurricanes are severe tropical storms that form in the southern Atlantic Ocean, Caribbean Sea, Gulf of Mexico and in the eastern Pacific Ocean. Hurricanes gather heat and energy through contact with warm ocean waters. Evaporation from the seawater increases their power.

Hurricanes rotate in a counter-clockwise direction around an "eye." Hurricanes have winds at least 74 miles per hour. When they come onto land, the heavy rain, strong winds and huge waves can damage buildings, trees and cars. The huge waves are called a storm surge. Storm surges are very dangerous and a major reason why you must stay away from the ocean during a hurricane warning or hurricane.

After a hurricane makes landfall on a coastline it can cause severe weather inland including rain, high winds and tornadoes. This means being prepared for an emergency no matter where you live is very important!

warning

evacuate  
storm surge  
watch

eyewall  
tornado  
water

hurricane  
tropical storm  
wind

### Across

- 1 Where are hurricane winds most intense?
- 2 A Hurricane \_\_\_\_\_ is issued when hurricane conditions are EXPECTED within 24 hours.
- 5 A tropical disturbance with sustained winds of 39 to 73 mph is known as a \_\_\_\_\_.
- 7 A Hurricane \_\_\_\_\_ is issued when hurricane conditions are POSSIBLE within 36 hours.
- 8 "Inland \_\_\_\_\_" is responsible for the greatest number of fatalities over the past 30 years.
- 9 A dome of water that is pushed toward shore by the force of the hurricane winds is known as "Storm \_\_\_\_\_".

### Down

- 1 If you live in a mobile home or along the immediate coast, you should do this if asked to do so.
- 3 A tropical disturbance with sustained winds greater than 73 mph is known as a \_\_\_\_\_.
- 4 NOAA Weather Radio is the \_\_\_\_\_ of the National Weather Service.
- 6 These most often occur in rain bands well away from the center of the hurricane.

## HURRICANE PREPAREDNESS WEEK IN ALABAMA

Hurricane season officially runs from June 1st through the end of November. Governor Bob Riley has proclaimed the week of **May 25-31, 2008**, as Hurricane Preparedness Week in Alabama. The National Weather Service, in cooperation with the Alabama Emergency Management Agency, participates in this week to draw attention to the threat of hurricanes this summer and fall. The media in Alabama, Northwest Florida and Southeast Mississippi are encouraged to use information contained in this packet to increase hurricane awareness and readiness. This pamphlet highlights the primary hazards associated with tropical storms and hurricanes, and will help you be prepared when a hurricane threatens.

During Hurricane Preparedness Week residents both near the coast, as well as those in interior locations, should review preparedness plans and be ready for the next Gulf coast hurricane. Because we had a quiet hurricane season last year, some people may think that it will be quiet again this year. This mind-set places people at risk of being unprepared and can easily result in the loss of life. Everyone is urged to use Hurricane Awareness Week to formulate and review hurricane preparedness plans. Even inland communities need to make plans for hurricanes, such as assisting coastal evacuees, dealing with flooding, tornadoes and high winds.

Personal hurricane plans should be designed so you can take quick action when a hurricane threatens. The most important thing you need to do is **have a plan** based on your level of vulnerability. If you live near the coast in an evacuation zone, in a flood prone area, or in a mobile home, you need to evacuate. If you live inland away from the coast in a well built home, you would probably be better off boarding up your home and staying put. Whatever you decide, with a plan you should more easily be able to make quick decisions regarding questions like: Where will I go when I evacuate? How will I get there? When will I leave? What do I need to take with me? How can I prepare my home for the storm? When should I pick up outside objects, which could become missiles during a storm? Remember, as we have seen numerous times since 1995, it can happen here.

Although our local area was not affected by a hurricane last year, we remain in a cycle of increased hurricane activity. Remember, only one major hurricane hitting the United States coast could cause billions of dollars in property damage and many fatalities. Let's prepare ... because it's not a matter of "**if**", but "**when**". *The Weatherman says "Run from the water – Hide from the wind".*

### COVER GRAPHICS:

**Front cover:** "The First 72 are on you!", a Public Awareness Program developed by Escambia County Florida, encouraging residents to have enough supplies to sustain their families for three days (72 hours) after a hurricane makes landfall. **Inside front cover:** Crossword puzzles and word search games. For other fun Hurricane projects for kids from FEMA, go to the following web site (<http://www.fema.gov/kids/>). **Inside back cover:** Easy to read Saffir - Simpson Hurricane Scale designed by RL Shepherd and the answer key to the crossword puzzle and word search from inside front cover. **Back cover:** Past hurricane season photos from the local area.

### ALABAMA HURRICANE PREPAREDNESS, 2008

Mobile National Weather Service Office  
8400 Airport Blvd., Bldg 11, Mobile, AL 36608

## **A Message from the Governor of Alabama**

Time after time, Alabamians have shown their remarkable courage as hurricanes have ravaged our state. Even in times of horrible tragedy and need, Alabamians have banded together to provide relief and comfort to those affected by the devastation caused by severe weather.

That's why I'm pleased to join with the Federal Emergency Management Agency, the National Weather Service, and the Alabama Emergency Management Agency and all hurricane prone states in declaring May 25-31, 2008 as "Hurricane Preparedness Week."

As a state that has been hit hard by hurricanes over the past several years, it is extremely important for all of our citizens to be prepared for this kind of emergency. Hurricane Preparedness Week will focus on many hurricane-related subjects, and this information can prove invaluable to Alabama's citizens and our visitors in preparing a family disaster plan. I encourage you to take advantage of the information provided to protect your families and your property.

Bob Riley  
Governor, State of Alabama

## **A Message from the National Weather Service**

Hopefully, last years' quiet hurricane season gave everyone living near the Gulf Coast a chance to evaluate their vulnerability to hurricanes. Do you live in an area where evacuation might be necessary due to a hurricane strike, or do you live in an area where you would be better off riding out the storm in your home? Do you know what items should be included in your hurricane survival kit? **Hurricane Preparedness Week** is conducted each year in Alabama, prior to hurricane season, to encourage coastal residents to ask themselves these questions, and to help them to come up with the right answers. The National Weather Service, with our partners within the Alabama Emergency Management Agency, will work with you to make sure that you have the answers to questions like the ones above. The key is to make sure that you have your answers and have prepared **BEFORE** a hurricane threatens...if you wait until the last minute to find your answers, it may be too late.

David McShane, Meteorologist-in-Charge  
National Weather Service, Mobile

## **A Message from the Alabama Emergency Management Agency**

For the last two hurricane seasons, the state of Alabama has been fortunate a hurricane has not impacted our state. That has given Alabama Emergency Management Agency more time to prepare and look at ways to continue improving our response and recovery efforts. It's our hope that residents of Alabama have also taken this time to make sure their emergency plans and kits are in place. This year's theme, "The first 72 are on You" encourages residents to have enough supplies to sustain their families for that time period. Past hurricanes have shown us it's not only a danger for coastal counties, but the entire state. These dangers include storm surge, high winds, tornadoes and inland flooding. The Alabama Emergency Management Agency is pleased to support Governor Bob Riley, the Federal Emergency Management Agency and the National Weather Service for Hurricane Preparedness Week.

Brock Long  
Director

## ALABAMA HURRICANE PREPAREDNESS, 2008

Mobile National Weather Service Office  
 8400 Airport Blvd., Bldg 11, Mobile, AL 36608

# HURRICANE HISTORY and CLIMATOLOGY

Since 1953 tropical storms and hurricanes in the Atlantic, Caribbean Sea, and Gulf of Mexico have been given names to reduce confusion when exchanging information about the storm, especially when two storms occur during the same time period. Initially, only female names were used, but male names were included in the list of storm names in 1979. If a hurricane becomes especially strong and/or causes significant damage, the name is retired from the list and will not be used again. Camille, Frederic, Opal, Charley, Frances, Ivan, Dennis and Katrina are examples of names that have been retired.

During hurricane season, on average, there are four tropical storms and six hurricanes in the Atlantic, Caribbean and Gulf of Mexico each year. Even so, many coastal locations will likely not experience a hurricane for many years. A Hurricane Return Period is the frequency at which a hurricane of certain intensity can be expected within 75 miles of a given location along the coast (based on the tracks of past storms). For example, a return period of 20 years for a Category 3 hurricane at a certain location means that, on average, a Category 3 hurricane will pass within 75 miles of that location about once every 20 years. The return periods for the Alabama Gulf Coast are listed below.

Category 1	10 years	Category 2	21 years	Category 3	33 years
Category 4	62 years	Category 5	140 years		

As one can see from the return period statistics listed above, since 1995, the Alabama coastline is experiencing hurricanes at a frequency well above what would normally be expected for that time period. Dennis and Katrina (2005), Ivan (2004) and Frederic (1979) all struck the coastline within 75 miles of the Mobile Bay area as strong Category 3 hurricanes. This is well above the normal frequency of Category 3 hurricanes that one would expect to affect Alabama during that time period. While there have been some close calls with Category 4 and 5 hurricanes in recent years, records indicate that the Alabama coastline has not sustained a direct hit by a Category 4 or 5 hurricane in more than 100 years. Therefore, from the return period statistics listed above, one can clearly see that the Alabama coastline is very much overdue for such an extreme storm.

Tracks of the more significant tropical systems that have impacted the area since 1995.

On the next two pages the storms that have impacted our area since 1559 are listed. Clearly, tropical storms and hurricanes are frequent visitors to the Alabama Gulf Coast. With each storm, lessons are learned that have a positive influence in the preparation for the next big hurricane that will inevitably hit the region. *The Weatherman says, "History can be a great teacher but those who do not remember and learn from the past are condemned to relive it."*

## TROPICAL SYSTEMS THAT HAVE AFFECTED THE MOBILE-PENSACOLA AREAS

<u>Year</u>	<u>Date</u>	<u>Class.</u>	<u>Remarks</u>
1559	Sept. 19	---	Coast near present-day Mobile and Pensacola. Damaged de Luna's fleet.
1732	----	---	Mobile.
1736	----	---	Pensacola. Village destroyed.
1740	Sept. 12	---	SE Mississippi to NW Florida.
1766	Oct. 22	---	Pensacola.
1772	Sept. 4	---	SE Louisiana to SW Alabama.
1813	Aug. 19	—	Gulf coast.
1819	Aug. 27-28	---	Mississippi and Alabama.
1822	July 11	---	Mobile.
1852	Aug. 23	—	"Great Mobile Hurricane".
1856	Aug. 30	—	Mobile.
1860	Aug. 11	—	Landfall W of Mobile.
1860	Sept. 15	---	Landfall W of Mobile.
1870	July 30	---	Mobile.
1880	Aug. 31	—	SW Alabama, NW Florida.
1882	Sept. 9	---	SW Alabama, NW Florida.
1885	Sept. 27-28	---	Alabama, NW Florida coasts.
1889	Sept. 23	H	SE Mississippi to NW Florida.
1893	Oct. 2	H	Mississippi and Alabama coasts. Extensive Damage. Close to 2000 people killed from SE Louisiana to S Alabama
1894	Aug. 7	TS	Pensacola, NW Florida.
1895	Aug. 16	TS	SE Mississippi and SW Alabama.
1898	Aug. 2-3	H	NW Florida, SW Alabama.
1900	Sept. 13	TS	Weak tropical storm SE Mississippi.
1901	June 14	TS	Mobile.
1901	Aug. 15	H	SE Mississippi.
1901	Sept. 17	TS	E of Pensacola.
1902	Oct. 10	TS	Mobile.
1906	Sept. 27	H	Major hurricane. Pensacola, Mobile. Strongest hurricane to strike Pensacola Since 1736 storm.
1911	Aug. 11	H	Alabama, NW Florida coasts. Major damage.
1912	Sept. 14	H	Landfall just W of Mobile.
1916	July 5	H	Extensive damage from SE Mississippi to NW Florida. Landfall just west of Mobile. Pressure At Fort Morgan 28.38 inches.
1916	Oct. 18	H	Eye passed over Pensacola with winds of 114 mph.
1917	Sept. 28	H	Landfall E of Pensacola with winds 103 mph.
1919	July 4	TS	Tropical Storm, landfall E of Pensacola.
1922	Oct. 17	TS	Weak tropical storm, landfall between Mobile and Pensacola.
1926	Sept. 20	H	Major Hurricane. Extensive damage along Coast. Pressure at Perdido Beach 28.20".
1932	Aug. 31	H	Mobile.

### ALABAMA HURRICANE PREPAREDNESS, 2008

Mobile National Weather Service Office  
8400 Airport Blvd., Bldg 11, Mobile, AL 36608

1934	Oct. 5	TS	Weak tropical storm, SW Alabama.
1936	July 31	H	Landfall at Choctawhatchee Bay, FL.
1939	June 16	TS	Mobile Bay.
1944	Sept. 10	TS	SE Mississippi and SW Alabama.
1947	Sept. 8	TS	Weak tropical storm W of Mobile.
1950	Aug. 30	H	Hurricane Baker made landfall between Mobile and Pensacola.
1956	Sept. 24	H	Hurricane Flossy, NW Florida.
1959	Oct. 8	TS	Tropical Storm Irene, Pensacola.
1960	Sept. 15	H	Hurricane Ethel, SE Mississippi.
1960	Sept. 26	TS	Tropical Storm Florence, NW Florida. Weakened to T. D. at landfall.
1969	Aug. 17	H	Camille (Cat 5 storm) moved inland near Bay St. Louis. Moderate damage Across SW Alabama.
1975	Sept. 23	H	Hurricane Eloise, NW Florida.
1979	Sept. 12	H	Hurricane Frederic, NW Florida, SW Alabama, and SE Mississippi. Incredible damage to Mobile.
1985	Sept. 2	H	Hurricane Elena, SE Mississippi.
1985	Oct. 31	H	Hurricane Juan, SW Alabama and NW Florida. Weakened at landfall.
1994	July 3	TS	Tropical Storm Alberto, NW Florida and S Alabama.
1995	Aug. 3	H	Hurricane Erin. NW Florida.
1995	Oct. 4	H	Hurricane Opal. NW Florida.
1997	Jul. 19	H	Hurricane Danny. SW Alabama.
1998	Sep 28	H	Hurricane Georges. SW Alabama, NW Florida and SE Mississippi
2002	Sep 14	TS	Hanna, SW Alabama
2002	Sep 26	TS	Isidore, SW Alabama and NW Florida
2004	Sep 16	H	Ivan, SW Alabama and NW Florida Strongest hurricane from Baldwin to Santa Rosa counties in more than 100 years
2005	June 11	TS	Arlene, SW Alabama. Minimal damage.
2005	July 6	H	Cindy, MS. Moderate damage in AL. Several tornadoes.
2005	July 10	H	Dennis, Major Hurricane. Small eye. Major Damage in NW Florida.
2005	Aug 29	H	Katrina. MS. Major Hurricane. One of the Highest Storm Surges ever in Mobile Bay at 11.5'. Estimated 13.5' in Bayou La Batre. Extensive damage to AL Coast.

(H is a Hurricane and TS is a Tropical Storm)

8400 Airport Blvd., Bldg 11, Mobile, AL 36608

# STORM SURGE AND MARINE SAFETY

The greatest threat to life and property related to a landfalling hurricane is from the **Storm Surge**, which historically claims nine out of ten victims. The deadliest natural disaster in the history of this country occurred during a hurricane in 1900, when a storm surge killed almost 8,000 people in Galveston, Texas. In 2005, Hurricane Katrina claimed approximately 1300 lives, with a large portion of that number being lost, either directly or indirectly, to storm surge and resultant flooding.

**Storm Surge** is a dome of water, 50 to 100 miles wide, that is pushed toward the shore by the force of the winds swirling around the storm. This dome of water is also enhanced slightly by contributions associated with the extreme low pressure within the storm itself. The advancing surge combines with the normal tides to create the hurricane storm tide, which can increase the mean water level 15 feet or more. In addition, wind driven waves are superimposed on top of the storm tide. This rise in water level can cause severe flooding along our coastline and bays, particularly when the storm tide coincides with normal high tides. Because much of our low lying coastline has become densely populated, the danger from storm tides is tremendous. During hurricane Georges in 1998, Water Street in downtown Mobile was covered with bay water when the storm tide reached almost 9 feet. In 2002, Tropical Storm Isidore brought very high tides to the area, with Water Street and the Causeway being flooded by several feet of water. In 2004, Hurricane Ivan brought a 10-15 foot surge that caused extensive damage along coastal Alabama and northwest Florida. This surge also heavily damaged the I-10 bridge across Escambia Bay in Florida. In 2005, near record storm surge levels were observed in and around the Mobile Bay area as Hurricane Katrina affected the region. Residents in Mobile and Baldwin counties can go to the following web site to see if they are in a storm surge area.

<http://chps.sam.usace.army.mil/USHESdata/Alabama/ALcountyselect.htm>

*The Weatherman says, “Storm surge has the greatest potential for loss of lives. If instructed to evacuate, do so.”*

## ALABAMA HURRICANE PREPAREDNESS, 2008

Mobile National Weather Service Office  
8400 Airport Blvd., Bldg 11, Mobile, AL 36608

# HIGH WINDS AND TORNADOES

Hurricane winds are a force to be reckoned with by communities along and near the coast, especially when deciding how strong their homes and businesses should be built. As winds increase against an object, pressure increases at a disproportionate rate. Pressure against a wall mounts with the square of the wind speed so that a threefold increase in wind speed results in a ninefold increase in pressure. Therefore, a 25 mph wind causes about 1.6 pounds of pressure per square foot. A four by eight sheet of plywood will be pushed by a force of 50 pounds. In 75 mph winds, the speed associated with a minimal Category 1 hurricane, that force becomes 450 pounds, and in 125 mph winds, a mid Category 3 hurricane, the force becomes 1250 pounds. For many structures, this force is enough to cause failure or significant damage. Hurricane-force winds, 74 mph or more, can destroy poorly constructed buildings and mobile homes and down trees and power lines. Debris, such as signs, roofing material, siding, and small items left outside, become flying missiles in hurricanes.

Hurricanes are large storm systems that can measure as much as 300 to 500 miles across. In a hurricane, the winds rapidly increase in strength from the weakest on the outer fringes of the storm to the strongest near the eye. Hurricane winds are most intense around the perimeter of the eye, or within the area of the storm called the **eyewall**. This area is generally from 15 to 20 miles wide and also contains the most intense rainfall. As a hurricane moves inland, away from the coastline, winds begin to rapidly decrease, but may remain above hurricane strength well inland. *A general rule-of-thumb is wind speeds will decrease by 50% within the first twelve hours of landfall.* Therefore, the faster the storm is moving, the further inland the hurricane force winds will be experienced.

Wind damage patterns are often very different from storm to storm. In 2004, Ivan, a strong Category 3 at landfall, moved into interior sections of northwest Florida and southwest Alabama, cutting a path of destruction well

inland. Tree and power line damage alone had a cost estimate of nearly 1 billion dollars. In 2005, hurricane Katrina produced similar damage over parts of interior southeast Mississippi. In 1992, Hurricane Andrew slammed into south Florida as a Category 5 hurricane with sustained winds estimated at more than 155 mph, with higher gusts. This compact, intense hurricane caused major wind damage over a small, but highly populated and developed area. Damage was estimated at \$25 billion with reportedly 25,524 homes destroyed and 101,241 others damaged. It is also important to note that at least 95% of all mobile homes in or near the path of the eye of Andrew were totally destroyed.

Hurricanes also produce tornadoes, which can add to the hurricane's destructive power. These tornadoes most often occur in thunderstorms embedded in rain bands well away from the center of the hurricane. However, they can also occur near the eyewall. During Opal, in 1995, the area experienced eight tornadoes, primarily in the outer rain bands. One of these tornadoes killed a person near Crestview, Florida several hours before the center of the hurricane moved ashore. In 2004, we had six tornadoes as the outer rain bands of hurricane Ivan moved across the area, with the strongest tornado occurring near Panama City, Florida, killing two people.

*The Weatherman says, “**High winds sound like a “freight train”.** If you live in a manufactured home, evacuate.”*

## ALABAMA HURRICANE PREPAREDNESS, 2008

Mobile National Weather Service Office  
8400 Airport Blvd., Bldg 11, Mobile, AL 36608

# Hurricanes versus Tornadoes

## The Saffir-Simpson Hurricane Scale

### Tropical Storm

Winds 39-73 mph

### Category 1 Hurricane

Winds 74-95 mph

No real damage to buildings.

Damage to unanchored Mobile homes.

Some damage to poorly constructed signs.

### Category 2 Hurricane

Winds 96-110 mph

Some damage to roofs, doors and windows. Mobile homes demolished. Some trees blown down.

### Category 3 Hurricane

Winds 111-130 mph

Some structural damage to small residences and utility buildings. Large trees blown down. Mobile homes and poorly built signs destroyed

### Category 4 Hurricane

Winds 131—155 mph

Wall failures in homes and complete roof structure failure on small homes. Total destruction of mobile homes. Trees, shrubs and signs all blown down.

### Category 5 Hurricane

Winds 156 mph and higher

Complete roof failure on homes and industrial buildings. Some complete building failures. Severe and extensive window and door damage.

## The Enhanced Fujita Tornado Scale

### EF0 Gale Tornado

Winds 65-85 mph

Some damage to chimneys. Tree branches broken off. Shallow rooted trees uprooted.

### EF1 Moderate Tornado

Winds 86-110 mph

Peels surface off roofs. Mobile homes overturned. Moving autos pushed off roads.

### EF2 Significant Tornado

Winds 111-135 mph

Considerable damage. Roofs torn off frame houses. Large trees snapped or uprooted. Light-object missiles generated.

### EF3 Severe Tornado

Winds 136-165 mph

Severe damage. Roofs and some walls torn off well constructed homes. Trains overturned. Most trees in forests uprooted. Heavy cars lifted off ground and thrown.

### EF4 Devastating Tornado

Winds 166-200 mph

Well-constructed houses leveled. Structures with weak foundations blown off some distance. Cars thrown and large missiles generated.

### EF5 Incredible Tornado

Winds >200 mph

Strong frame houses lifted off foundations and disintegrated. Automobile-sized missiles fly through the air in excess of 100 mph. Trees debarked.

### **Relationships in Wind Speed and Effects on Structures**

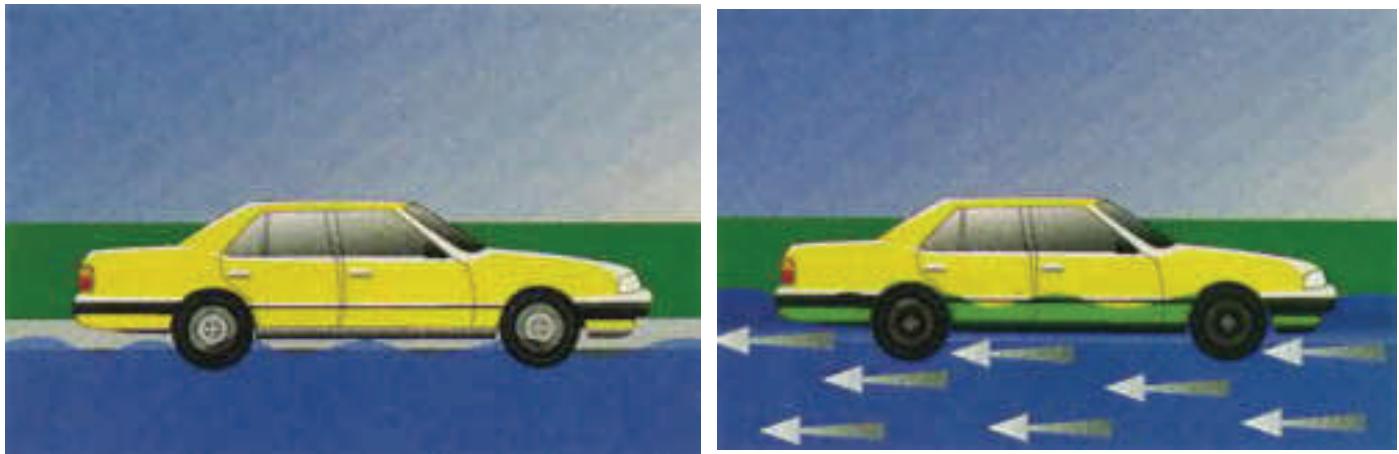

Tropical Storm & Weak Category 1 Hurricane = EF0 Tornado

Strong Category 1 & 2 Hurricane = EF1 Tornado

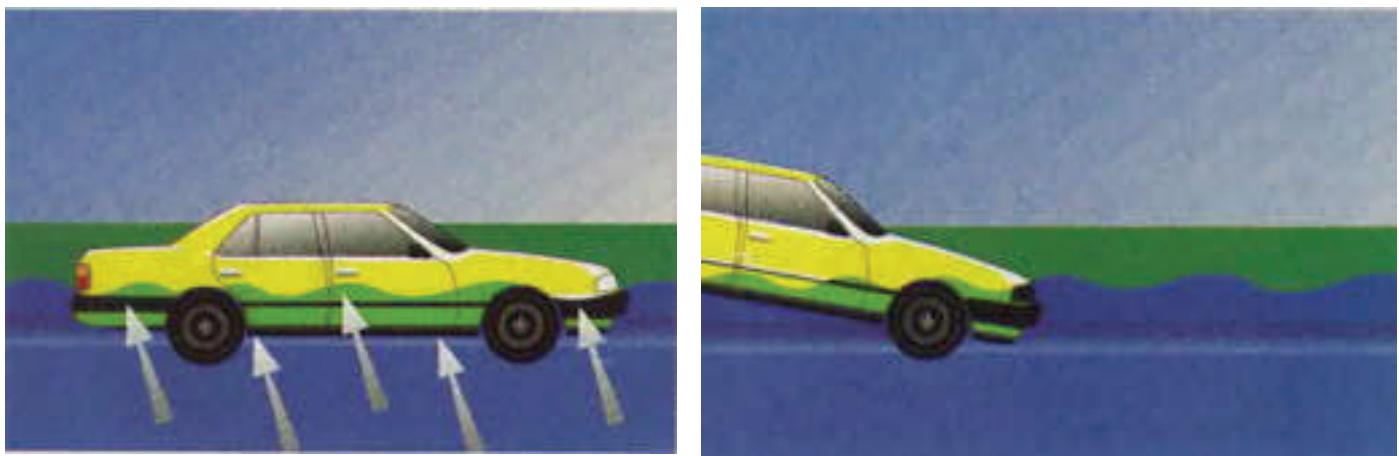

Category 3 Hurricane = EF2 Tornado, Category 4 & Weak 5 Hurricane = EF3 Tornado

Category 5 Hurricane = EF4 Tornado

EF5 Tornadoes have no corresponding hurricane relationships

Water weighs 62.4 lbs. per cubic foot and typically flows downstream at 6 to 12 mph. When a vehicle stalls in the water, the water's momentum is transferred to the car. For each foot the water rises, 500 lbs. of lateral force is applied to the automobile

But the biggest factor is buoyancy. For each foot the water rises up the side of the car, the car displaces 1500 lbs. of water. In effect, the automobile weighs 1500 lbs. less for each foot the water rises. Two feet of water will carry away most automobiles!!!

# INLAND FLOODING

When it comes to hurricanes, wind speeds do not tell the whole story. Hurricanes produce not only storm surges, high winds and tornadoes, but also produce deadly **inland flooding**.

Although storm surge has the greatest potential for loss of life as the storm is making landfall, recent research indicates that inland flooding has been responsible for the greatest number of fatalities over the last 30 years. Studies show that 59 percent of the tropical cyclone deaths in the United States have resulted from freshwater flooding. Intense rainfall is not related to the strength of a tropical cyclone. In fact, some of the greatest rainfall amounts often occur from weaker storms that drift slowly or stall over an area.

In 1997, Hurricane Danny, a Category 1 storm, produced widespread 48 hour rainfall totals ranging from 10 to 20 inches across most of Mobile and Baldwin counties of southwest Alabama, with maximum totals in excess of 30 inches over southeastern portions of Mobile County. The official 48 hour rainfall reported at the Dauphin Island Sea Lab was 36.71 inches. Several rivers in both Mobile and Baldwin counties experienced record flooding. Heavy rainfall can also occur well removed from the center of a tropical system. In 1998, Hurricane Georges made landfall along the Mississippi Gulf Coast and the center of the storm never moved very far inland as it drifted eastward across the coastal counties of Alabama and Florida, but the storm's heavy rains still produced significant flooding to the north over parts of interior southwest Alabama.

Statistics clearly point out the high risk of driving an automobile in and around flooded roads and low spots. Often, individuals will attempt to drive through flooded roads only to be whisked away by rushing waters. Though the water may not look very deep, it may hide severe road damage. Unsuspecting drivers have entered what they thought was a minor overflow of the road, only to find themselves sinking rapidly into a

collapsed roadbed. The rule is simple: if you cannot see the road or its line markings, do not drive through the water.

Moving water exerts a pressure on an object such as a car or person. As water depth increases or a greater area is exposed to moving water, a greater force will be exerted. Also, as a surface becomes slippery, friction is reduced. Water, sand, or mud tends to replace the frictional forces that hold a car in place.

Even though the weight of Sport Utility Vehicles (SUVs) may appear to offer a greater protection in crossing flooded roads, their size and larger tires can actually make them more buoyant and more prone to being swept away. Bottom Line: It is just as dangerous to drive a SUV through flooded waters as a regular vehicle.

Some statistics to remember if you are ever faced with the decision of crossing a flooded roadway.

- *As little as one foot of water can move most cars off the road.*
- *Just six inches of fast-moving flood water can sweep a person off his or her feet.*
- *Most flood-related deaths occur at night and are vehicular.*
- *Tropical cyclones pose significant risk well inland due to fresh water flooding.*

When rivers rise, water tends to spread out far from riverbanks. During Hurricane Danny in 1997 and Georges in 1998, rising rivers and repeated periods of heavy rainfall combined to pool water over inland areas miles away from rivers. Though not swift moving, such pooling water can also pose a significant risk, mainly due to the inability to judge water depth. Relatively "safe" water only inches deep can be next to more dangerous water that is several feet deep. So, the next time you hear hurricane, think **inland freshwater flooding**. Drive Smart – *The Weatherman says, "TURN AROUND DON'T DROWN!"*

# THE FORECAST PROCESS

Part of the mission of the National Weather Service (NWS) and the Tropical Prediction Center (TPC) is to save lives and protect property by issuing watches, warnings, forecasts, and statements which inform the public of hazardous weather conditions. This section provides information about the roles of those responsible for providing hurricane and tropical storm information to emergency managers and local decision makers, as well as to the general public.

The Tropical Prediction Center (TPC) is comprised of the National Hurricane Center (NHC), the Tropical Analysis and Forecast Branch (TAFB), and the Technical Support Branch (TSB). During hurricane season (June 1<sup>st</sup>-Nov 30<sup>th</sup>), the latter two provide support to NHC. NHC is responsible for forecasting the movements and intensities of tropical disturbances in the Atlantic, Caribbean and the Gulf of Mexico. NHC will provide a five day forecast giving decision makers adequate time to make a decision on when and if to evacuate or shut down a business

NHC uses a wide variety of tools and techniques to monitor the tropical Atlantic and to forecast the development and movement of any tropical weather systems. These include the use of weather satellite imagery, ship reports, marine buoy data, high detailed computer forecast models, and once a storm develops, hurricane reconnaissance aircraft.

NHC closely coordinates with the local NWS Weather Forecast Offices (WFO's) in hurricane-prone areas. As a tropical storm or hurricane approaches the coast, NHC coordinates with local WFO's with regard to the appropriate tropical storm or hurricane watch/warning information. The Storm Prediction Center (SPC) provides guidance and watch information to the WFO with regard to the severe thunderstorm and tornado potential that is often associated with land falling hurricanes.

The role of the WFO in the forecast process is to provide warnings for their local area as it is affected by a land falling tropical system. These include, but are not limited to, severe thunderstorm, tornado, flash flood, and wind warnings. Statements and forecasts of expected conditions with regard to the hurricane are also provided by the WFO. The forecast process of the local WFO uses a wide variety of observations, analysis tools and techniques in conjunction with guidance and information supplied by the NHC. This includes a network of surface weather observing systems, upper air observations, Doppler radar analysis, and information provided by local officials and storm spotters. In addition, computer model guidance and satellite imagery is also used at the local level.

While the broadcast media does a great job of relaying National Weather Service products to the public, the **All Hazards National Oceanic and Atmospheric Administration (NOAA) Weather Radio**, the official "voice of the National Weather Service", is the NWS's most direct link to the public. Getting reliable, up-to-date weather information during threatening, critical situations is essential to any hurricane preparedness plan. The **All Hazards NOAA Weather Radio (NWR)** system in place across the country provides the public with a convenient and rapid means of receiving weather forecasts, weather warnings, and other weather information. This information is broadcast on NWR 24 hours a day, seven days a week. Along the immediate Gulf Coast area of Alabama and the western Florida Panhandle, weather radio transmitters are located in Gulfport, MS, Mobile, AL, and Milton, FL. Other transmitting locations can be found throughout Alabama, Florida, Georgia and Mississippi.

Weather radios can be purchased at many stores at affordable prices, and some AM/FM radios have "weather bands" to receive NWR

## ALABAMA HURRICANE PREPAREDNESS, 2008

Mobile National Weather Service Office  
8400 Airport Blvd., Bldg 11, Mobile, AL 36608

broadcasts. Look for a radio with an alert mode, one that has backup battery power, and one that has the capability of receiving all seven NWR broadcast frequencies. Most weather radios sold today have a feature known as Specific Area Message Encoder (SAME). The SAME feature will allow you to have the radio alarm warnings for only those counties that you specify. NWR broadcasts will include the latest information prepared on tropical storms and hurricanes by the NHC. NWS offices will also broadcast local information on the weather, its impact on the local area, and any information from local emergency management officials.

The following are some of the products that are issued by the NWS and the NHC during hurricane season, and what they mean:

**Tropical Storm Watch...** Tropical Storm conditions (winds 39 to 73 mph) are **possible** in the specified area of the Watch, usually within 36 hours.

#### **Tropical Storm Warning...**

Tropical Storm conditions are **expected** in the specified area of the Warning, usually within 24 hours.

**Hurricane Watch...** Hurricane conditions (winds 74 mph or higher) are **possible** in the specified area of the Watch, usually within 36 hours. During a Hurricane Watch, prepare to take immediate action to protect your family and property in case a Hurricane Warning is issued.

**Hurricane Warning...** Hurricane conditions are **expected** in the specified area of the Warning within 24 hours or less. Complete all storm preparations and evacuate if directed by local officials.

**Short Term Watches and Warnings...** These provide detailed information on specific hurricane threats, such as tornadoes, floods, and high winds.

**Public Advisory...** Issued by the National Hurricane Center. Provides critical hurricane

warning and forecast information out through five days.

**Marine Advisory...** Issued by the National Hurricane Center. Provides detailed hurricane track and wind field information.

**Tropical Cyclone Update...** Issued by the National Hurricane Center. Highlights significant changes in a hurricane that occur between advisories.

**Wind Speed Probability Table...** Provides probabilistic information for decision makers, such as emergency management. The table shows the probability of the maximum wind speed at any given location in the storms path during the next 5 days.

**Hurricane Local Statements...** Issued by your local National Weather Service office and gives greater detail on how the storm will impact the local area.

**Tropical Storm/Hurricane Watch or Warning...** Issued by your local National Weather Service office when tropical storm or hurricane force winds are expected to occur beyond coastal areas and outside of the traditional hurricane warning area.

**Extreme Wind Warning...** Issued by your local National Weather Service office for destructive winds associated with the eyewall of a major hurricane as it moves inland.

## ALABAMA HURRICANE PREPAREDNESS, 2008

# BE PREPARED

If you were suddenly faced with a powerful land falling hurricane, would you know what to do? For residents along the central Gulf coast, the key to protecting yourself and your family is preparation. Main preparations before hurricane season include ensuring that your house (and boat) are in good condition, your insurance is up to date, and that you have adequate emergency supplies on hand. In fact, Emergency Management and other disaster preparedness officials suggest that residents have enough supplies on hand to sustain themselves and their families for a three day, or 72 hour period, after a hurricane makes landfall. As Hurricane Katrina showed in 2005, it may take that long for outside help to arrive if a hurricane is particularly strong. *The Weatherman says, "The First 72 Are on You!"*

You should also determine the main threat you face from a hurricane and whether you need to evacuate. Basically, if you live near the coast, in a flood prone area, or in a mobile home, you need to evacuate. However, if you live away from the coast in a well-built home, you would probably be better off boarding up your home and staying put. Remember, "**Run from the water - Hide from the wind**". Whether you decide to evacuate or not, from June through November, you should be ready to enact a family disaster plan in case a hurricane threatens. The plan should cover actions such as boarding up the house and securing the boat. In addition, special considerations should be taken for young children, the elderly, the disabled, and pets.

## Building a Safe Room Inside Your Home

Extreme winds can create stresses on houses that frequently cause connections between building components to fail. For example, the roof or siding material can be pulled off or the windows can be blown out. Once this type of wind damage occurs, additional and often more significant damage can follow. In addition, during extreme winds, damage can also be caused by flying debris. If winds become strong enough, flying debris can be thrown at a building with enough force to penetrate windows, walls, or the roof. In fact, most of the common materials used in building today can be penetrated by flying debris if winds become strong enough. For this reason, persons living in areas where extreme winds associated with hurricanes or tornadoes could occur, should consider having a shelter, or safe room, built into their home to provide a place to seek safe shelter and protect themselves and their families from injury or death caused by the dangerous forces of extreme winds. It can also relieve some of the anxiety created by the threat of an oncoming hurricane or tornado.

Over the past several years, extensive testing and design by several universities and wind engineering research facilities have resulted in the development of shelters constructed of building materials and combinations of building materials that will withstand the forces imposed on it by extreme winds without failing, and will also resist penetration by wind blown flying debris. These safe rooms are most easily built into new homes, but some shelter designs can be added to existing homes. For more detailed information about building a shelter, or safe room, inside your house, contact the Federal Emergency Management Agency.

# EMERGENCY SUPPLY KIT

- Flashlight(s) with extra batteries
- Portable radio with extra batteries
- Matches
- Sanitary Supplies
  - Toothbrush/toothpaste
  - Soap
  - Shampoo
  - Sponge
  - Cleanser
  - Bleach
  - Paper towels/towelettes
  - Plastic trash bags
  - Tissues
- Pencils
- Food (three day supply)
  - Canned and dried foods
  - Canned/boxed drinks
- Bottled water (1 gal per person per day)
- Cooking Utensils
  - Cooking pot
  - Camping stove and fuel
- Plastic dishes/eating utensils
  - Aluminum foil
  - Manual can opener
- Baby Supplies
  - Formula
  - Bottles
  - Powered milk
  - Diapers
  - Medications/lotions
  - Blankets/extr clothes
- Pet Supplies
  - Food
  - Leash and/or carrier
  - Vaccination records
  - Food and water containers
- Mosquito Repellant
- Documents
  - Important telephone numbers
  - Record of bank account numbers
  - Records (birth, marriage, wills)
  - Insurance policies
  - Contracts, deeds, titles
  - Credit card account numbers/companies
- Passports, social security cards
- Vaccination records
- Family Pictures
- Tools and repair supplies
  - Tarps (for temporary roof repair)
  - Hammer and nails
  - Ax
  - Pliers
  - Handsaw
  - Screwdrivers
  - Work gloves
  - Knife
- Extra clothes
- Foul weather gear
- Blankets and towels
- Sunglasses
- Sun screen
- Cash or traveler's checks
- First aid kit
  - Bandages
  - Gauze
  - Scissors
  - Petroleum Jelly
  - Antiseptic spray
  - Hydrogen Peroxide
  - Antacids
  - Aspirin
  - Thermometer
  - Rubbing Alcohol
  - Anti-diarrhea medication
  - First Aid Handbook
- Emergency Generator
- All Hazards NOAA Weather Radio

---

NOTE: This list is not intended to be all-inclusive. You must decide what supplies are best suited for you and your family's survival. This list contains suggestions for your consideration.

# TAKE ACTION

## TERMS AND DEFINITIONS TO IMPROVE THE UNDERSTANDING OF HURRICANES AND RELATED HAZARDS

**HURRICANE...** An intense tropical weather system with a well defined circulation and maximum sustained winds of 74 mph or higher.

**TROPICAL STORM...** An organized system of strong thunderstorms with a well defined circulation and maximum sustained winds of 39 to 73 mph.

**TROPICAL DEPRESSION...** An organized system of clouds and thunderstorms with a defined circulation and maximum sustained winds of 38 mph or less.

**STORM SURGE...** This large dome of water, often 50 to 100 miles wide, sweeps ashore near where a hurricane strikes land and typically accounts for nine of ten hurricane fatalities. A buildup of the water level up to 15 feet or more can cause severe flooding and damage along the coast, particularly when the storm surge coincides with normal high tides.

**RIP CURRENTS...** Nice weather along the coastal areas well in advance of an approaching hurricane or tropical storm can be deceiving. While the storm is still distant, large swells can propagate away from the storm and impact local beaches in the form of

very rough surf. This can result in the development of dangerous rip currents along local beaches. As winds and tides increase as the storm draws nearer, rip currents can become even more dangerous. Swimmers at local beaches should be aware of these dangers if a hurricane or tropical storm is present, even if it is hundreds of miles away.

**TORNADOES...** Even though a hurricane or tropical storm weakens as it moves inland, it can produce deadly and damaging tornadoes.

**FLOODING...** Typically, hurricanes bring heavy rains which can compound drainage problems in areas experiencing storm surge flooding. Rainfall totals of 10 inches are not uncommon when a tropical storm or hurricane moves across a coastal location. Over land, torrential rain may continue even after the wind has diminished. Rainfall totals of this magnitude could easily result in destructive flash flooding and river flooding. In the past few hurricane seasons, more people have died from fresh water flooding than from storm surge. Flooding also causes extensive property and agricultural losses.

### ALABAMA HURRICANE PREPAREDNESS, 2008

Mobile National Weather Service Office  
8400 Airport Blvd., Bldg 11, Mobile, AL 36608

## WHEN IN A WATCH AREA

- Frequently monitor radio, TV (local and cable), NOAA Weather Radio, and/or the Internet ([www.srh.noaa.gov/mob](http://www.srh.noaa.gov/mob)) for official bulletins of the storm's progress.
- Fuel and service family vehicles.
- Inspect and secure mobile home tie downs.
- Prepare to cover all window and door openings with shutters or other shielding materials.
- Check batteries and stock up on canned food, first aid supplies, drinking water, and medications.
- Prepare to secure or store lawn furniture and other loose, light-weight objects, such as garbage cans, garden tools, etc.
- Have on hand an extra supply of cash.

## WHEN IN A WARNING AREA

- Closely monitor radio, TV (local and cable), NOAA Weather Radio, and/or the Internet ([www.srh.noaa.gov/mob](http://www.srh.noaa.gov/mob)) for official bulletins.
- Complete preparation activities, such as putting up storm shutters, storing or securing loose objects, etc.
- Follow instructions issued by local officials. Leave immediately if told to do so!
- If evacuating, leave early (if possible, in daylight). Stay with friends or relatives, at a low-rise inland hotel/motel, or (as a last resort) go to a predesignated public shelter outside a flood zone. The shorter distance you travel, the better, as long as you move away from the coast.
- Leave mobile homes in any case.
- Notify neighbors and a family member outside of the warned area of your evacuation plans.
- Put food and water out for a pet if you cannot take it with you. Most public health regulations do not allow pets in public shelters, nor do most hotels/motels allow them.

### ALABAMA HURRICANE PREPAREDNESS, 2008

Mobile National Weather Service Office  
8400 Airport Blvd., Bldg 11, Mobile, AL 36608

## IF STAYING AT HOME

Only stay in a home if you have **NOT** been ordered to leave. Stay inside a well constructed building (mobile homes should be evacuated). In structures, such as a home, examine the building and plan in advance what you will do if winds become strong. Strong winds can produce deadly missiles and structural failure.

- Turn refrigerator to maximum cold and open only when necessary.
- Turn off propane tanks.
- Board up windows.
- Stock up on canned goods, flashlights, battery operated radio and plenty of extra batteries.
- Fill bathtub and large containers with water for sanitary purposes.
- Know how to turn off utilities if told to do so by authorities.
- Remove objects from around your home that could become dangerous wind-driven projectiles.

## IF WINDS BECOME STRONG

- Stay away from windows and doors even if they are covered. Take refuge in a small interior room, closet, or hallway.
- Close all interior doors. Secure and brace external doors.
- If you are in a two-story house, go to an interior first-floor room, such as bathroom or closet.
- If you are in a multiple-story building and away from the water, go to the first or second floors and take refuge in the halls or other interior rooms away from windows.
- Lie on the floor under a table or another sturdy object.

## PLAN TO EVACUATE IF YOU

- Live in a mobile home. They are unsafe in high winds, no matter how well fastened to the ground.
- Live on the coastline, an offshore island, or near a river or a flood plain.
- Live in a high-rise near the beach. Hurricane winds are stronger at higher elevations.

*The Weatherman says, “**If evacuating inland, it may be better to go northwest instead of due north.**”*

### ALABAMA HURRICANE PREPAREDNESS, 2008

Mobile National Weather Service Office  
8400 Airport Blvd., Bldg 11, Mobile, AL 36608

## AFTER THE STORM

- Keep monitoring radio, TV (local or cable), NOAA Weather Radio, and/or the Internet.
- Roads may be closed for your protection. If you come upon a barricade or a flooded road, turn around and go another way!
- Avoid weakened bridges and washed out roads. Do not drive into flooded areas.
- Stay on firm ground. Moving water only 6 inches deep can sweep you off your feet. Standing water may be electricity charged from underground or downed power lines.
- Check gas, water, and electrical lines and appliances for damage.
- Do not drink or prepare food with tap water until you are certain it is not contaminated.
- Avoid using candles and other open flames indoors. Use a flashlight to inspect for damage.
- Be especially cautious if using a chainsaw to cut fallen trees.
- Use the telephone to report life-threatening emergencies only.
- Wait until an area is declared safe before entering.
- If you are using an emergency generator, make sure the exhaust is vented to the outside.
- Most important, be a GOOD neighbor.

## ATLANTIC TROPICAL STORM AND HURRICANE NAMES FOR 2008
