3/30/49.

100 mosaics of H168' on lactose streak-dextrin on Lac EMB. If possible, one + and one - obtained from each and tested on other sugars.

Almost all were Xyl - Mtl - and Gal = Lac. Exceptions noted.

		Lac	Gal	
1-20.	A	20-	20-	} 2 - unpaired ≈ A
	B	18+	18+	

#15A is Xyl +/- ; Mtl +/- . Streaks out to purify.
≈ Mtl +/-

21-40.	A	20-	20-	1 unpaired ≈ A
	B	19+	19+	

2A is Xyl +/- Mtl +/- ? Mtl +!

9A ; 9B are Xyl + Mtl + (Conclusion?)

41-60	A pair	14-	14-	All X -
	B pair	14+	14+	M -
	A	3-	3-	
	B	3+	3+	

61-80		~~16~~		4 unpaired.
	A	20-	20-	
	B	16+	16+	All X - M -

81-100	A	20-	20-	All X -
	B	20+	20+	1A Mtl + Xyl - . TS^R

Hold all indicated exceptions.

All above tested on TS, but all appeared resistant. (probably n.s. ?).

81-100 Retested on TS (on Ara EMB).

	A. (Lac-)	15 R	5 S ↓ 86, 89, 90, 92, 94	(Lac+)

B: All 20 showed an S reaction (V_{ic}^R type)

#84 and 85 appeared to be mixed. Streaked these out.

[parentals in excess]

~~Plate 414 c 0881.~~

M168 Xyl selections.

5/2/49.

Mosaics picked from Lac selection plates. Streaked out on Xyl EMB. 100 streaked. Separable Xyl+/- in 27 tested first. 17 appeared pure - (replaced c additional mosaics). 56 required to separate a + and -. 49 separated; ∃ 1 came pure + (pair c - corresponding to it). 6 still too crowded.

	Xyl- selection: Xyl	lac	Gal	Mtl	Xyl+ selection: X	L	B	Mtl.

2 mixed Mtl#,- : Mtl+ : Xyl+
Mtl - : Xyl -

83 Xyl#Mtl-

No clear Xyl# could be found. Xyl- 20 Mtl-.

The streaked sectors from which these colonies were taken were reexamined to determine the prevalence of these unusual types, and the possible occurrence of the reciprocals.

a. Reciprocals were not found at all.
b. Recurrence of rare types was noted. (Total of 2/15 possibilities for Xyl-Mtl#).
Therefore each mosaic colony does represent a limited sample. Size??

single

streaks out on EMB Xyl, Lac.
X-18, 19, 19.5, 20.
X-24, 25, 26.

2-159-60-61-62.
-199-200-201-202

Regrow out on EMB to verify mosaicism.

~~Both~~ all are + and – on both media.
No mosaics noted.
X26 is pure Xyl– Lac– (does not grow HZ?)
others are mixture; no mosaics noted.

160 is stated to be pure – ? probably het? but contains a few Xyl+ papillae.
199 is pure Xyl– Lac–; others are mixed.

Disinfection of λ.

4/6/49.

Inoculate Y87 stable "UV 7" (for Esther's mutability program).

A. Pick 100 cols. and test for λ-:

Retest:

5, 6, 7, 15, 18, 19
23, 24, 28, 32, 34
45, 52, 55, 60
61, 78, 79, [illegible], 100

} and renumber 1-20.

4/9: All but 4 were either stable or λ+ on retest from cell suspensions.

Retest 1-4: all 4 λ+, ρ20^R λ^R

B. 4/8. Inoculate W588 10"-20" on EMB Lac.

20 colonies on 25" plate tested for sensitivity to ρ20.

All appeared more or less sensitive to ρ20. When tested on W518, 10 were λ+. This is not, therefore, a reliable criterion for λ-

Check other colonies directly on W518.

20" series: 37 tested none ρ20^s.

15" " 40 " " "

10" " 40 " " " (1 or 2 doubtful. Rechecks: λ+)

Apparent sensitivity may be partly an attenuation phenomenon.

p20: selection as λ+, λ−.

4/8/49.

1+2: Dilute 518 and 811 10^{-7}. Plate .1 ml ea + .1 ml p20 stock.
Control = p20.
Titrate p20 stock on 518.
Plate p20 on W811
Add .5 ml λ 10^9 to .5 ml W518 10^{-7}. Hold 10 mins. Then plate .2 ml
ea p20 to ascertain λ+.

	−P20	+P20	+λ
W518: 10^{-8}	24	0	0.
W811: 10^{-8}	19	31	

Titer p20: 10^{-7}: 253.

Selection for P20l: 10^{-1} ea W811: 173 plaques noted. Occur with a frequency ca. 10^{-6}

∴ P20 can be used to select for λ+. But 10 mins. contact of 518 ea λ does not protect it.

Also, cross-streak λ, p20 ea:

1-4 purified 518/20 isolates

		λ	p20
		1 S	R
5.	K-12	2 S	R
6.	W811	3 S	R
7	W518	4 S	R
8.	B.	5 K12 R	R
		6 811 R	R
		7 518 S	S
		8 R	S

Note: B is resistant to P20. Of B/ types.

P20l. 6 plaques picked from above plated ea W811: heavy plaquing from each, which therefore represent bonafide mutants (cf. p19). Replate single plaques. 3x on W811, once on B. Grow out on B. Loopful from last plaque gave ca. same counts on W811, W518 + B. Essentially same plating efficiency is indicated.

P20l = p21.

p20 mutants; ϕ specificities

4/9/49.

p21 = p20L described above as acting on λ+. [Not excluded that it may be a contaminant].

During titration of p20 on W518, a large plaque with translucent halo was noted. This bred true when picked + plated. Replate on W518; W811, to check identity and grow out on W518 p20 "r" finds true and is inactive on W811.
Material here for × (p20r × p21).

p20 tested ≡ B/ series.

B	S
B/1	S
B/1,5	S
B/2	S
B/3,4,7	S
B/6	R
B/69	S

Cross-reaction ≡ T6 noted.

T6 tested ≡ 518/20 4/test all T_6^R
W518 T_6^S.

V_6^R is therefore related to resistance to p20, but not to λ.

∴ p21 does not override genetic resistance

B/6	S	R
B/19B	R	S[P]

Lac = reversion.

4/9/49.

96 papillae of H190 kept a week on EMS Lac tested as before.
None were Lac⁻. None contained Xyl+.

Run unsuccessful

Displacement of λ by other φ.

4/12/45.

Test 811/x for maintenance of λ, after purification.

1. 811/~~T6~~ 28 tests all λ+
2. 811/21 8 tests all λ+
3. 811/p9 24 tests all λ+
4. 811/T7 26 tests all λ+.

∴ these phages do not displace λ.

[p14 should be tried as it appears to be lysogenic.]

4/11/49.

494-1 was Lac+ ... T_5^R // Lac- ... T_5^S +R

-2 " " " +R

-4 was indicated as pure S ! (probably +S) but checks.

Anfuist checks of 3, 4, 9, 10 all R was indicated. Recheck.

N12: Streaked out EMS colonies from 4, 5, 6, 7, 8, 12, 13 for further examination.

494:3 Lac+ : 10^R Lac- 9S 1^R

494:8 Lac+ : 10^R Lac- 10^S +R

:9 Lac+ : 10^R Lac- 10^S +R

:10 Lac+ : 10^S Lac- 4^R 6^S +S !

Most are entirely segregated, e.g. Xyl brush tests :

4	abc- d ±
5	abcd-
6	abc-
7	abcd-
8	acd- b ±
12	abc-
13	abc- d+.

4d and 8b are only hopeful.

restreak these.

4.9. 8 recoverable, but throw out.

Partial analysis of 502X. 8 % in each group.

a)	Xyl −	Lac +	36	43%
		Gal +	35	42%
		Mtl +	2	2.5%
	Xyl +	Lac +	1	1
		Gal +	0	0
		Mtl −	1	1

∴ Lac segregation is ca 40%.

Possible intype.

1C:	30 -	29 -	1 +
	13 +	10 -	3 +
2C	19 +	13 -	6 +
	20 -	20 -	0 +

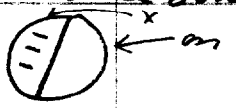
Gal + is simply infrequent and may not necessarily be linked directly to Lac; may be corresponding to Mal.

Mal difficult to score May retread ε B, -

Checks on λ- and λ^R

4/12/49.

Test each of the following for λ on W518 and sensitivity to λ, p20, p21



1. 482-1 carries R grossly.
2. 451-1 "λ^R"
3. 451-6 "λ^R" ✓
4. 449-D1 "λ- prototroph"
5. W877 carries p14

1. ~~s~~ sensitive to λ. Strongly lysogenic. ~~p~~ $p20^s$ $p21^s$
2. resistant to λ, $p20^s$ $p21^s$ not lysogenic Lac+
3. ? resistant to λ, $p20^s$ $p21^s$ not lysogenic. Lac+
   resistance should be rechecked λ^R. λ-
4. λ^s $p20^s$ $p21^s$ λ- Confirmed as λ- product of a cross.
5. λ^R $p20^s$ $p21^s$ (gross colony.). Not tested for λ+ as it carries p14.

Check single colonies: 8 all λ^R $p20^s$. Cf. 2 and 3., but these selected ☆ p14.

Check ~~4~~ 451-1 for antiphetic agent resistant to λ.

Search for λ mutants

4/12/49.

1. Mix 451-6 as λ^R & W518 as λ^S. After 2½ hr. of growth in K2, streak out to separate, & look for effect of λ-mutant possibly carried by 451-6. After first purification, test K12/21 isolates as T6 (20) and mix & W518 (50) for transmission, & as 20 Lac- (W518 λ-) recovered from mixed culture. Each one was λ^S. ∴ resistance is not transmitted extracellularly & is probably genetic. Keep 451-6 as W887

2. Displacement of λ: plate p14 & K-12; W518. No lysis noted. ~~Streak out K12~~ occasional pap. conc. noted. K12 did not show this.

Streak out p14 & K-12. No evident reactions.

p21-resistants. On the selection plate it was noticed that some of the colonies seemed to be somewhat weak fermenters. Some of these appeared to be $T6^S$. All K/21 noted were λ+. Touch of colony directly from picking needle may be a suitable method of testing λ on a large scale. Recover λ+ Lac- from lytic margins, and test for resistance to λ, p21.

Tests on ~~—~~ from 43 ~~colonies~~ gradients tested. As many as could be conveniently picked ~~from~~ cleanly were pooled for each test to ensure a thorough sample. None were $p21^R$; 3 showed signs of a λ^S component.

Conclusion Resistance to p21 is not infective; only bacterial mutations were found; no λ mutants.

~~Titrate p20s and p21.~~

4/13/49.

100 colonies of Y70 10" UV picked and dept tested for λ on W518.
1 apparent λ-. Pick, streak out, and retest.
λ+ λ^R $p20^S$. [Check on this].

	p20	λ
520-1	partial clearing	R
Y70	R	R
W518	S	S
W811	R.	R

520-1 thus shows some deviation from Y70 from which it came. (partial attenuation of λ?)

4/21/49. 219 additional tested. All were λ+.

W-1: Gal- mutants and λ disinfection attempts.

4/21/49.

20 plates W-1 on EMB Gal for - mutants. Ca 300/plate = 6000.

4 Gal- mutants noted. Unequal sizes. Purify and check Lac instability

		Glu	Ara	Gal		Lac	
1	W494	+++	+++	—		—	stable!
2	495	+++	+++	—		—	
3	496	+++	+++	—	1 papilla noted	—	
4	497	+++	+++	—		—	

A few doubtful Lac papillae noted in (1) ~~Lac+~~ ~~found~~. Isolate W502. Gal-Lac+

Disinfection. Test individual colonies by picking & needle and leaving on a ribbon of W518. (24) tested from 7 and 20 see treatments.

2 uncertain λ- Streak out on Mal EMB to verify W-1 origin and recheck.

#1 Mal+, undoubtedly W518, pushed out by stiff bunch

#2 Pure Mal-. On check was λ-. Recheck individual colonies for λ^s: All λ^R λ- ρ20^s

518

A23: 420 tested from 7 second runs: 22 possible λ- noted. Recover and recheck. Number 3-24

A24. 110 additional tests. 2 possible λ-. Streak out as 25-26.

4/24/49

R23: Test Isolates 3-24 and subculture responses.

no lysis observed.

Note culture which was used as W518 4/25 is apparently unmixed as it tests $p20^R$ λ^R on suitably controlled plates. All cpts. which this might affect have been streaked and present minds are correct

2 Telemas W898.
18 W900
19 W901
4 W899

c. Streak out conjunction of W900 and W901, & W518 above, on Mal EMB to determine whether resistance to p20 is transmissible.

Disinfection of λ.

4/21/49.

A) Prepare T(m) Glu. Add 1:5 deoxypyridoxine (Dopy) 25 mg/ml to make final level of 5 mg/ml. Inoculate lightly ~W677

1. P21 A23: no growth. 10/10 λ+
2. P24 faint turbidity. Transfer to second tube and streak out on Lac EMB.
3. A25. turbid — 3d transfer.
4. A26: Streaks out P26. 15 tests all λ+ very thick growth in thick streak. Isolated colo. OK.

B) Grow W677 at 44-45° in # Y2 Glu, repeated transfer.

1. A22
2. P22
3. A23
4. P23
5. Late P23
6. A24
7. P24
8. A25
9. P25
10. A26

P26. Streak out B10 for examination of single colonies

15 tests all λ+!

Neither deoxypyridoxine nor high temp. succeeded in desinfecting λ.

Diffuntial phages.

4/22/49

Test plaques from Chi. sewage for diffuntial on 518, 811 +887

	λ−	λ+	λ^R

These were scored on bac EMB; as W887 is bac+, they scored very poorly.
These tests are for λ+/− diffuntial only:

A22: No λ+/− diffuntials noted in (100) tests

A23 Test plaques on λ−, λ+ and λ^R (on W3A) (160) tests. No diffuntials
1 appeared lysogenic (filled center). Streaks out as 527−1.

A24. As above. (60) tests No diffuntials.

→ Bacteria isolated not lysogenic; ~~dk~~ clear & plaques sem.
Probably resistant bacteria were picked along ~~i~~ phage from initial plaque.

A25	(67) tests.	No diff.
P26	65 tests	No diff.
P27	(28) "	" " .

420 tests No diff.

Map Mal.

4/23/49.

#s 1, 2, 3, 4, 5, 8, 9, 12 (8 in all) are likely heterozygotes. All are Mal−. Some may be suitable for further outcrossing. = (9, 12)

Check on Mal+ component in #4.

June 9, 1949.

Second batch picked from A. 100 tests (Lac).
6 possibilities tested. #13-18.

		Lac	Mtl	Xyl	Mal	Gal
1	13	V	V	V	—	V
2	14	V	+	+	+	V
3	15	V	V	V	—	V
4	16	V	V	V	—	V
5	17	V	+	V	—	V
6	18.	V	+	+,- v?	+(-)	V
7	19.	V	V+	+	—	V-

Second batch (200) from MalEMS: Ca'h missed and are Mal+
8 possible Mal v, "v" colonies picked for retest. 1, 2 looked definitely variegated, 3-8 only somewhat irregular.
Only #1 is Mal v. W 2 13.

New and sp. heterozygotes

June 7, 1949.

(B) W45 × W677 on Lac EMS. No. 4. No yield, even ē biotin + thiamin

(A) W478 × W677 on ~~Xyl~~ Xyl EMS. (unlabelled) – high yield 125–/40+

(C) W478 × W595 on Lac EMS, Xyl EMS. v. poor yield diff. to score

(D) W~~+~~677 × W826 on Mal EMS. unl. – high yield 133–/31+

A. Xylose. 80 tests. Miscored –'s : ~~HH~~ III

72 tests. 2 possible Xyl v. #1 Xyl v Lac v
#2 Xyl slow Lac – not Lac v

C. Xylose 40 tests Mostly –'s. 1 ? No v.
Lac 7 " No v.

D. Maltose 100 tests. 2 unlikely Lac v. Not v.

6/12/49

A Xyl. 100 addnl. tests.
3 possible Xyl v.

	Xyl	Gal	Mal	Mtl	Ara	Lac
1 ~~Xyl~~	v	v	—	v	+ ?	v
2	+, slow	v	+	+	+	v
3	v	v	—	v	v ?	v

#2 is apparently Xyl + but it has a mottled appearance which may be related to Gal v.

5393 tests of heterozygosity

W478 x W945

6/9/49

	Lac	Mal	Gal	Xyl	Mtl	Ara	
1.	V	—	—	—	—[redacted]	V	
2.	V +faded	—	—	+	V++	V=	
3.	V ok	—	—	V	V	V	= H210
4.	V faded+	—	—	V	—	V	
5.	V+	—	+pure?	+	V	V+	
6.	faded V?	—	—	V	V	+	
7.	V+	—	+	+	V	V+	
8.	V-	—	+	V	V	V-	= H209

For general segregation studies, #8 is apparently best suited, as it shows stubborn variegation on four sugars. The Gal factor here resembles that of W583. #3 might also be useful as a Gal - heterozygote.

Mg on recombination

6/14/49

58-161 x Y10 ca 8x from Y2. Mix 1 ml c

		Colonies:	
A	1 ml H_2O	13, 12, 6, 2	8 = av.
B	1 ml M/1 $MgSO_4$	3, 4, 7, 0	3.5 = av.

Incubate 2:30 PM — 10:20 PM. Dilute 1:10 and plate .1 ml on T(B,)

$MgSO_4$ alone did not augment recombination.

Gal, Mal reversions of H209-210

6/11/49.

Pick single colonies from EMSLac to EMBLac, EMS Mal ± EMS Gal for reversion study.

209 is Gal+Mal- Each of 4 isolates gave ca 95%+ Lac v.

210 is Gal-Mal- " " " " " ".

Hold on EMS for reversions.

A few papillae which appeared were not reversions, nor Lac v! [H210 presumed + 3/21/50].

6/17 ff. Mal+ and Gal+ isolated respectively.

A. Single Mal+ purified on Mal EMS. Each of 6 s.c.i. tested on EMB Mal, EMB Lac: Each of 6 isolates is Lac v. Mal+ Many colonies on Mal EMB, however, show extreme mottling as if segregating at least for a modifier of Mal (2n vs. n ??) No Mal- colonies seen, but this might be due to close linkage of Mal+ to lethal. Retests on 6 suspicious colonies: all Mal++ pure, Gal-

B. Gal+. Two papillae isolated. Not yet purified

6/20 but predominantly Lac v, almost pure Gal+ ± no signs of Gal segregation.

6/21. 8 s.c.i. from Gal EMS. All preponderantly Lac v. No Gal- or marked Gal v seen. Some colonies mottled on Gal EMB, like Mal above. Restreak the most suspicious for a Gal- component. None of 24 colonies tested yielded a Gal-. ∴ Gal also hemizyg

Conclusion: Mal and Gal both hemizygous.

B5, B7 reverted for T, L. test on

	BM	B, M	BB,	BB, M
5, 7	++	++	–	++

Both are only M-astases demonstrable.

Mal Segregation of H215

568

6-23-48

H215 was a Lac+ prototroph from W67 x W677 on Lac EMS. This prototroph was streaked out initially on EMS Lac, and on other EMB sugars, where it was scored as Mal v, Lac v etc. The EMS plate & the initial streaking was preserved as 568-1.

16 single colonies from 568-1 picked and streaked on EMB Lac, EMB Mal and punched on EMS Lac.

	Lac	Mal		Lac	Mal
1	v	−

— — —
— — —

P2 Streak out all tubes at lowest inhibitor concentrations to find a possible λ−. Bactericidal − or + ?

Aureomycin and Chloromycetin are bacteriostatic at 1 γ/ml or below

Bacitracin and the acridines are bactericidal at these conc.

Test +++ cultures (isolates) for presence of λ.

8 each, chloromycetin and aureomycin survivors (not resistant) all λ+

Reisolation of M168 from Zello.

7/8/49

16 cultures tested, streaked on Xyl EMB.
All streaks are Xyl +, − mixtures. Occasional ± seen. Pick for propagation on Lac EMB.

Xyl ± recovered. Streak out on MH EMB for material to test Xyl loss.

(320) MH ± colonies touched on Xyl EMB; Lac EMS.

3 Xyl − colonies noted. Grew very poorly on EMS lac, probably segregated, but streak out on MH EMB.

7/17/41

Does buffer activation increase enzyme?

cells harvested from 100 cm Y2 Lac (36h.) to 5 ml water.

A) 2.5 ml cells + 2.5 ml water

B) " " NaP M/5. Incubate 12 20 PM — 215.

Assay ___ samples. Wash treated cells with water, save supernatants, and dry sediments over P_2O_5.

		Di		
Super .5 ml	A		016 (20 mins.)	No activity is extracted by water. Ca 8-10 fold activation by buffer, and ca. 1/3 activity is extracted!
	B		420 (5 mins.)	
cells .05 ml	A	080	111 271 (20 mins)	
	B	056	490 (5 mins)	

∴ Total sediment of B) should have activity of $4.5 \times \frac{1}{.05} \times \frac{450}{100} \times \frac{20}{5}$

= 1,160,000 u.

and A) should have $4.5 \times \frac{1}{.05} \times \frac{200}{100}$ = 180,000 u

Recover dry cells.

A 7.5 mg.
B. 11.0 mg.

B formed a much more compact pellet than A, of which ca 1/3 was estimated lost in preparing for drying and scraping from slide.

Calculate on predicted basis of 12 mg. cells in each.

Triturate each in 5 ml H_2O to prepare for assay.

Predicted activity, ca. 15000 u/mg for A and 13,000 u/mg for B.

Note / These Lac cells also gave brown purple color ± iodine.

Lysogenicity: conclusions.

Two kinds of phage apparent:

φ_A carried by 7, 13, 15, 18, 24, 32, 34, 36. type: W1029.

φ_B 17, 19, 23, 31

	φA^+	φB^+	φO^+
A^s	—	—	6, (14), 27, 29,
B^s	7, 15, 18, (24), 32, 34, 36	—	(10), 16, 21
O^s	(13),	(17), 19, 23, 31.	++

Of 40 cultures, 8 carried A, 4 B = 12/40 = 30%

Hence A^s; 7, B^s = 11/40.

The strongest phage action was that of #17.

#24 responded moderately to λ—

11/29/30: Throw out all except 10, 13, 14, 17, 24

Lysogenicity tests on Shapiro's E. coli cultures. 580

7/16/49.

Test by seeding E each strain as indicated, then spotting each strain on surface. Active combinations indicated:

1030	no lysis	
518	no lysis	(even λ did not show up).

7/15,17/49.

C) 1. W478 × W1022. 635 Lac+ : 1 / 14 Lac −.
200 Lac+ tested for Lac v. None found.
100 additional tested. Select those that appear weakest Lac+
5 suspicious colonies reincubated. 3 are Lac v.
Picks 1) Lac' Lac v and 2) Broad streak to LacEMS, LacEMB, MalEMB.

what are data?

A) (2)(1) W67 × W1022 1 Lac+ / 3000 prototrophs.
Lac v Mal+ Xyl+ Mtl v?

B) 8. Y40/6 × W1022. 10 plates LacEMS. To determine whether the prototrophs from this cross were diploid. Test 20 Lac+, 12 Lac− as T(o) with T6.

Lac+ :	19 R	1 S	
Lac− :	6 S	4 mucoid, unscoreable.	2 too dilute.

Indicates that Lac+ are not Lac+ U_6^R/U_6^S, and therefore that they are haploid.

A)

W1033, 1034 received from Cavalli 7/21/49.
Both are ~~F+~~ Lac+. 1033 is (B)M 1034 is BMB, ? as labelled.
Cross ♀ W677, cf. 58-161
Harvest and concentrate ca 5:1 as usual. Call concentrated cells 1ml = .1, and plate various dilutions of 1033 on EMS Lac or T(0) plate smeared with 677 (= 1ml).

Count: 10^{-6} ml 1033 on EMB Lac gave 580 colonies.
Count = 5.8×10^8.

No prototrophs appeared at 10^{-7} or 10^{-6}.
10^{-5} (on T(0)) gave 1 10^{-4} gave 30.
Talac rate ca $\frac{30 \times 10^{-4}}{580 \times 10^{-6}}$ = ca .05% = 5/10,000.

but 58-161 at this dilution gave 34 colonies !! (mixup?)
on EMS, No colonies were seen at 10^{-4} from 1033 x 677.
10^{-3} gave 18 (5+ 13-)
However streak of 1033 on 677 background on EMS Lac B, gave very much higher yield than did 58-161. The effect must be largely based upon microcolony formation. Efficacy of 58-161 should be checked!

7/24/49

Inoculate 677 and 1033 heavily together in Y2 broth (1:5 ea.) After 24h. streak out on lac EMB and test single +, − colonies on Xyl.

21 Lac− were Xyl−
of 8 Lac+, 6 were Xyl+, 2 were Xyl−.

Rechecked these 2 (583B1, B2) on lac, xyl, and mutation.

B1 and B2 are both Lac+ Xyl− Mal− LB1−. Stock as W1048, 1049

Additional tests of same plating:

13 Xyl− :→ 10 Lac−, 2 Lac+, 1 mixed.
36 Xyl− :→ 29 Lac− 5 Lac+, 2 mixed

49 Xyl−	:	39 Lac− 7 Lac+	3 mixed.
5 Xyl+	:	5 Lac+	
14 Lac−	:	14 Xyl−	
24 Lac+	:	18 Xyl+. 5 Xyl−	1 mixed.

There are exceptional Lac+ Xyl− present. 1033 is pure, but 677 needs re-verification. Streak out on lac EMB to check! OK!

7/25.

Cross check plated mixture of supra. Xyl and Mal.

1051
1052

A series of 8 "mutants" were isolated from a K-12 exp. All proved to be rather reversible tyrosineless. Exp # Sh 11 as W1053

"Coso" single mutants from W1045. 586

JUL 25 1949

W1050 = A

1051 = B

1052 = C.

Plate separately and in combination on T(0) plates.

Also inoculate into Y2.

At 36 hours, A-C were blank., AB and AC had numerous prototrophs. BC had a few.

A27.(48h.) A revertants noted. Not so numerous as in AB and AC. ?? Reversions or recombinants ??

Check 1050 with various 4 strokes. Cf. 1033. In Vegas.

↑
N.G.

Need double mutants for conclusive result

New penicillin mixes gave low yields of double mutants

#1 from 1050 = W1069
lys + methionine tryptophane

#3 from 1051 W1070

Cystine. Gave growth responses to A12 also on Vits.

16 hrs: +++ on methionine or lysine

Also give smaller responses on:

Vitamin mix
B_1
Pant
Inositol
K
B_{12}

} Probably reversions or tube contamination

24 hours – growth as T10. Just a "slow" mutant.

Hfr : Lac- mutation sus.

Crosses of Lac- mutants.

7/24/49

Irradiate 1033 on 18 Lac EMB plates. Survival high (N_y^{R}!)
6 mutants recovered. Ca 6000 colonies.

W466 Mal −

60.ia

September 15 ff. 1949.

as 604. W466. 20 Mal EMB plates; 200/ = 4000.

1-8 are slow or nearly − fermenters of maltose. Test on Glu

#9, 10 are Mal −. Streak out. (Glu+); W1208-1209

#11 as streaked from 1st isolation had mostly Mal−(slow) colonies, but 3 colonies sectoring in maltose. [These may be suggested to be $\frac{\text{Mal+}}{\text{Mal−}}$ $\frac{\text{Lethal}}{=}$]. No Mal+ were seen. Streak out on Mal EMB.

N18 When streaked out, Mal$\underline{v}$ colonies above gave mixtures of pure + and − and no apparent Mal$\underline{v}$. One possible Mal$\underline{v}$ (more bluish conglomerated) was noted. Streak out: These colonies are very difficult to interpret, mainly because there were no pure + colonies on the original plate. Conceivably, there had been induced an unstable intermediate allele which usually shifted to Mal− but rarely (i.e., with ~3 colonies) reverted to Mal+.

Test cross for Mal$_1$ –

September 17, 1949

D. W1189 × W1195 [Val$^{A\cdot C}$ Arg^{1} Mal− × Leu Thr Lac^{2}−]

E. W1189 × W1205 [Val^{AA} Arg^{1} Mal− × Thr His^{3} Lac−]

F. W1195 × W1191 [Leu^{CC} Thr^{2} Lac− × Thr His^{4} Mal−].

Wash cultures from 42. Conc. 5x. Use .1 ml/plate

Controls:

1 (W1189) 4 colonies / 4 plates Lac+ Mal−

2 (W1195) 0 " / " "

3 (W1205) 0 " / " " Lac− Mal+

4 (W1191) 8, 12, 16, 11 / 4 plates ca. 12/plate !

D. 2 colonies / 9 T(0) plates 2 Lac+ / 4 EMS Lac plates

E. 7 colonies / 9 T(0) plates 1 Lac+ / 2 "

F. 10, 6, 2 / T(0) plates

W1189 and W1191 appear to be exceptionally unstable. Their nutrition should be carefully checked.

Tests on "cross" prototrophs

P19

	Mal	Lac
D: 1-4	+	+
E 1, 6	+	−
2-5, 7	+	+
F 1-16	+	+

These prototrophs are clearly either contaminants or recombinants, probably former. Parents had been checked on EMB and found pure −.

Tests on "inversion" prototrophs

A20

1	Mal+ Lac+	} must be contaminated !!
4	Mal+ Lac+

Mal$_1$ - x-ses of W466 mutants

Sept. 23, 1945.

W466 Mal$_x$ - x W677.

A) W1208 x W677.
2 Mal+ / 600 Mal -.

B) W1209 x W677
5 Mal+ / 1600 Mal -

Streaks out + protoplasts:

A) Pure Mal+

B) 3 Mal $\underline{v}$, 4 Mal ++.

4 plates Mal E MS

In view of rarity of Mal+ in W^{Mal+}466 x W677, these low frequencies do not necessarily speak for close linkage.

Resolate [to use for Lac reversion studies].

Coli new crosses.

September 28, 1949.

Mixtures grown together 48 hours. Plate ca. .5 ml = 0 / plate T(0). Inc. 48 hours.

A	W1189	0	0	0		Lac+M- Val Leu Sh 3
D	W1191	0	0	0	0	0 Lac+M- Th His Sh 1
E	W1195	0	(1)	0	(1)	Const? L-M+ Leu Try Sh 1
F	W1205	(5)	(1)	(5)	0	L-M+ Th His Sh 3
G	W1189-1195	2	3	5	4	
H	W1189-1205	3	1	2	0	
I	W1195-1191	0	0	0	0	

Prototrophs grew more poorly on T(0) agar than those below.

Pick, dilute and test on Lac; Mal:

E	2	Lac- Mal+	
F	10	All Lac- Mal+	
G	12	All Mal+; 8 Lac- 4 Lac+.	
H	6	Lac+ Mal+	IIII
		Lac- Mal+	II

These results strongly suggest recombination between W1189 and either W1195 or W1205. However, there is a remarkable instability of the individual parents. The Lac+ Mal+ prototrophs are, however, unique.

Repurify and retest parents!

October 7, 1949.

A) Reversions of parents. Plate ca 10^9/plate ± or without single components.

Purified cultures

Some tests not recorded owing to subsequent contamination.

Wednesday
Dec 14

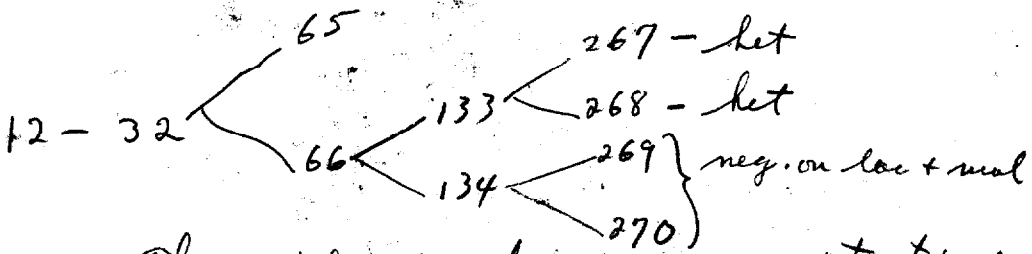
Dear Josh.

I have 4 series, 10, 11, 12 & 13 with H206-1., a strain I have maintained from the original culture you sent.

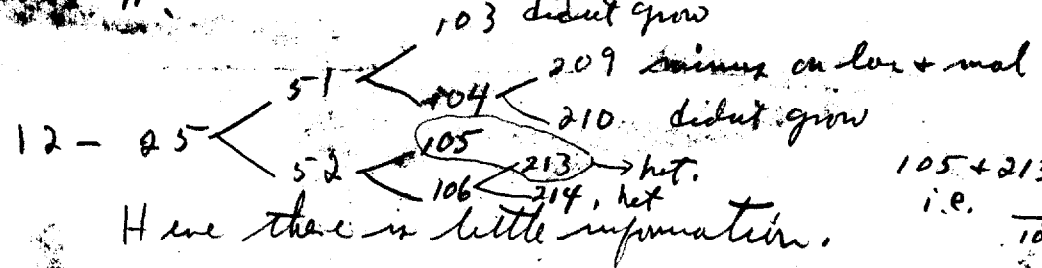
I have not had time to give the complete story but results so far are somewhat disappointing. I am sending a few cultures and the portions of the pedigrees pertinent.

Series 10 + 11, with about 100 cultures in each gave no segregants. I thought I had a couple of + segregants (have used + 113 lactose mainly, maltose to a certain extent) but in every case could isolate a het colony.

In series 12, the only true segregants so far occurred. These are; 12-269, 12-270 and 12-209.



This indicates the same type of situation as before, i.e. no complementary types.



105 + 213 could not be separated
i.e. 105 213 214

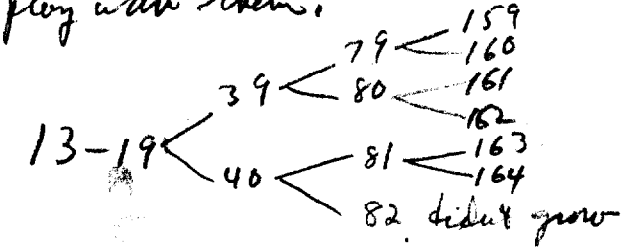
Here there is little information.

12-27 was a filamentous seed & could not further separate. It was largely minus lac, plus mal but there were a few hets also.

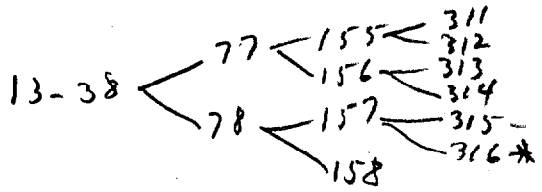
In addition 12-198 and 12-196 looked to be all positive on lactose but again I could find some small het colonies. These were in every case smaller colonies with a positive center & were not clearly mosaics. But on streaking they proved to be 13-316 and 13-163 behaved similarly, i.e. < 1% hets, and negative on 30 other items not positives

NEW YORK STATE COLLEGE OF AGRICULTURE
CORNELL UNIVERSITY

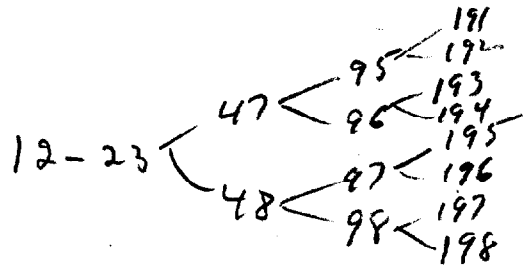
on lactose. It strikes me as curious that so many cells could be hets, segregate to + positives very early and end up with a microcolony composed a few het cells and almost no negatives. I wonder if all the positive cells are alike in other segregating characteristics. On replating 12-196 showed a few negatives but 12-198 showed no negatives among some 3 or 4 thousand colonies. Similarly 13-316 and 13-163 showed a few negatives on replating. Probably in all these cases, a segregation occurred in the first division of the cell but the very unequal + to − ratio probably indicates also that complementary types are not formed at the time of segregation. I'm sending some of these in case you want to play with them.



159, 160, 161, 162, 164 were typical het cultures
163 as above indicates.



158, 311, 312, 314 were typical hets
313 mostly + 's few means + negatives.
316 mostly +, <1% hets + negatives.



all typical hets but 196 + 198

I have observed some unusual forms of cells in these cultures. Haven't yet worked your latest H206, will do so next week. Sorry to be so shabby but must leave for Washington

Sincerely
Max

NEW YORK STATE COLLEGE OF AGRICULTURE
CORNELL UNIVERSITY

Dear Jack. 4 Jan 1950

Sorry to be so hurried in getting this off but at the moment life is a rat race. So I'll try to give the pertinent information & get this off.

1- Source for the 1231-pedigree was your new culture of H206. This culture behaves differently in the moist chamber. Fewer filaments, fewer cells not growing, no Y forms & mentioned.

2- The number duplicate earlier pedigrees. I started from 1 when I started on H206 + there are #5, 6 & 7. This is not good but not fatal. I renumbered the H206 pet dont know all my records here so will leave as is.

3- Some of the cultures gave blank plates. I think they are indicated on the pedigrees. They were inoculated & sent along for you to check.

4- I picked 6 + colonies from the plate of 5-223 since they were nearly half the total colonies observed + on the chance they might be all alike and complementary to 5-223. You can do what you wish with them.

5- Cultures were tested on lactose.

6- I have seen the NIH people and have permission to do some of this down here. I'm going to borrow the weekend to get my equipment. Initially, I think it best to send the cultures to you for classification. I'm going to send them in both in the vials at present. If they are too old to be easily classified I think I could do it down here but I don't want to kill the goose laying the golden eggs by moving in here too fast.

So in a couple of weeks I hope to have some more cultures for you. Is it necessary to send them airmail? I inoculate into 4 ml of broth. They can't grow too much to make classification difficult I don't believe. Probably you'll have to send each lot overnight - they are amazingly expensive.

Very truly yours Allen

#1 — definitely Lac V. Attempt reisolation on EMS Lac. However, many Lac− pototrophs noted, and Lac V colonies on EMS virtually preclude selective isolation.

Jan 6-7, 1950.

In cross of W677 × W1258, heavy plaquing of background was noted. In view of this, tests for λ sensitivity were made in soft agar plates.

	λ	W518	W677	W1258	T1	T6
W1258	L	–	L	–	L	L
W677	–	–	–	–	–	L

To obtain resistant mutants, plate W1258 with λ at various dilutions. Plates in).

1/10/50. Inoculate Nutr Br + 4% extr. (NB4) with 5 ml young culture W1258 + ca 10^8 λ. Aerate 5-6 hours. Cool overnight and filter, just streaking out the turbid supernatant. Control was much denser.

① titrate filtered λ stock

② Test 1258/λ for resistance; lysogenicity

Map stk - 657

	15 secs.	18	1 sect
		52	1?

Pick and streak ~~out~~ 20+ colonies in each category (and all −).
For 1st test. Compare cross streaks vs. T1 on EMS Lac; EMB Lac. Haploids and stable diploids will be same on both media (PaR; S); segregating diploids will be distinct. Save suspensions. 20 from each tested.
All were T_1^P except B10, T_1^R on both media. All were also clearly mixed ± on EMB Lac. Restreak a few impossible exceptions

Recessive lethals can account for only a part of the killing.

H225 segregants

1/18/50

Streak out individual lac V segregants on EMB Lac. Pick 1 Lac- and 1 Lac+ each for further classification.

	10	V	16

Irradiation of H-168.

January 20, 1950.

All previous irradiations have been done with Hanovia high pressure Hg lamp. To prepare for further experiments, calibrate killing with G.E. sunlamp.

P20. Suspend H168 from EMS bac. to ca 10^9. Dilute in saline to 10^{-5}.
~~Spread~~ Irradiate 5 ml in Petri dish (10 ml) under lamp and spread on EMS bac.
Suspension apparently viable: no colonies from controls!

P23. Repeat with H225.
By mistake, plated 10^{-6} and 10^{-7} ml with 0 irradiation and 10^{-7} only with various U.V. doses.

UV	Dil.	Count		V	+	−	
0	10^{-6}	~~~					
0	10^{-6}	~~~					
0	10^{-7}	35	45	~~V~~	1	5	79 : 10
0	10^{-7}	54			1	3	
5 s.	10^{-7}	18	15		5	5	3 : 26
5 s.	10^{-7}	11			7	9	
10 s	"	0					
10 s.	"	0					
20		0					

↓

For future work, increase distance of lamp to 20 cm and multiply dosages by 4x.

Irradiation of H-225.

January 23, 1950.

BE UV lamp at 20 cms. Diluted coli shaken 0, 20, 30 secs.

	UV	Dil.
A.	0	10^{-7}
B.	0	10^{-6}
C.	20	10^{-6}
D.	30	10^{-6}

Survival = ca 11/411 = ca 2½ %.

	V	+	−	Σ

C.			1	
			0	
		1	4	
		3	2	
	0	4	7	11.

D. Blank.

Initial TS and TI scores are thoroughly unsatisfactory!

Recheck ~ control stories + mimes before repeating

Jan 20, 1950.

"A"

"B" W1155 × W1258 } Backgrounds rather heavy. A few + colonies observed.
"C" W1268 × W1262 }

D W1268 × W1178.
L+M+V_1^S L-M-V_1^R

B. Pick + colonies which stand out slightly over background. Spot suspensions on T(0) agar to purify. Streak these out on EMB Sucr. All Sucr – V_1^S V_6^S but grow well on EMB Sucr with W1258!

C. Pick colonies (rather small) from T(0) directly to EMS Lac. V.G.!

D. (Colonies rather larger than C). Background very noticeable on EMS; OK on T(0).

Pick ~~#~~ colonies from T(0) and streak out on EMS

100 tests: 5 lac – [may contain Lac+] 95 lac+.

Pick purified colonies and test on Mal EMB vs. T1.

95 Lac+: All V_1^S. 94 Mal+ 1 Mal–

5 lac– 5 Mal+ : $3V_1^S$ $2V_1^R$

∴ All lac+ are V_1^S; Some lac– are V_1^S; some V_1^R.

January 24, 1950.

Prepare suspensions from EMS Lac. Prepare rather dilute susp.

	UV	Dil.
A.	0	10^{-7}
B.	0	10^{-6}
C.	5	10^{-6}
D.	10	10^{-6}

All plates too dense for accurate count (over compensation for "dilute" suspensions.

Segregation of M226

January 26, 1950.

Streaked out 8 Lac v of M226, on EMB Mal, Lac.

a) test reduced Mal (+ or −) on Lac

b) " " Lac v on Mal. [No Lac+ noted].

A number of peculiar variegated colonies were noted on Mal EMB. Picks and number & description. Streaks out on Mal, Lac.

c) 1.  2.  3.  4. 

A27. a) Mal−. 72 tested on Lac All apparently pure Lac−.

a Mal+ 84 tested. 80 definitely mixed. 4 possibly Lac v or containing Lac+. (These may have been Mal v miscounted as +). Streak these out as a [1-4].

a Mal v 24; tested 22 Lac v 2 apparently pure Lac−; a [5-6].

~~c [1-4].~~

Also, a considerable number of "pure" Mal+ and− colonies unpooled, and streaked out on EMB Lac. Among several hundred Lac− colonies there were two identifiable Lac v or+, in addition to numerous papillae in the thick streak. Attempt recisolation of Lac v. a [7-8].

b]. 52 Lac v tested on Mal: all + or contain +.

c].

All these tests were made by picking media directly from colony to agar. ∴ + cannot be distinguished from v.

January 27, 1950.

C]. 1. Lac — virtually all −, rare ⊽, papillate.
Mal — only + and − seen.

2. Lac — rare-occ. ⊽, heavily papillate
Mal — Mostly or all pure +, some −.

3. Lac — all − colonies, but papillate
Mal — only +, −

4. Lac — occ. ⊽ colonies.
Mal — only +, − noted.

Pick Lac ⊽ and pool as far as possible. Streak out on lactose for resolution of Lac ⊻

January 30, 1950

a) 1. Mal+ with occ. Mal−, and simple sectors. lac− with occasional lac v.

2. Do.

3. Mixed Mal+, v, − } ~~Mal v, M~~

4. Mal v, Mal+. } lac v; lac−.

5 Pure lac− } largely segregated (Mal+, −) → +, − only.

6 Pure Lac− } maybe some Mal v. [Attempt reisolation].

7 Mal−, some +, v?

8. Mal+, some −; v? } lac v, −. Reisolate lac v and test for Mal purity.

c) 1–4 Lac−, Lac v. Test isolated lac v for Mal. purity.

---

a) Pick lac v from 1, 2 and 7, 8 above. Streak on Mal.

1–3 = a1
4–9 = a2

Segregation of H226

1/31/50.

EMS Lac

1. Lac$\underline{v}$; Lac− (Mal−) H227.

2. Lac$\underline{v}$; Lac− mostly Mal+, occ. Mal−, simple Mal$\underline{v}$
Repeats 4 Lac$\underline{v}$; all some Mal+; Mal$\underline{v}$.

---

pool H227 on EMS Lac, EMS Mal.

---

131. Picks 200 Lac$\underline{v}$ from 671 A2 Bursts very sparse on EMS Mal.
1-100 No Mal−. Mostly Mal+, −. 2 maybe pure Mal+ : retitrate as 668 d: 3-4. 3: No Lac$\underline{v}$ (exc. papilla); 4: Mal+/− ; Lac$\underline{v}$
101-200 No Mal−. Mostly Mal+ & detectable −.
201-240 All Mal+/−

Irradiation of H225 and H226

668+

N.G. Too dilute

January 25, 1950.

Resuspend H-225 from EMS lac in H_2O, 10 ml, to get. Lens. ca 120
Dilute 1/100 for irradiation. 5 ml sample in Petri dish (10 cm).
Remove 1 ml to 10 ml for each interval. 20 cm. distance.
0, 5, 10, 20 sec. This leaves suspension at 10^{-3}, or as estimated 5×10^5
A, B, C, D. before irradiation.

Dilutions:

	1	.1 ml
	2	.03
	3	.01
	4	.003
E only	5	.001
	6	.0003
F 10^{-6}	7	.0001

H226 O.D. 090
E 0
F 20

A. 4	5, 4	∴ Initial count (00 = 120)
5	1, 0	
6	0, 0	was 3×10^{-6} ml = 5 colonies = ca 10^6/ml. (viable)
7	0, 0	
B. 6	0, 1	
C 3	12	∴ count = 12/10^5 = ca 10^6/ml.
4	7, 5	
5	0, 1	no killing detected.
6	0	
01	0	
D. 3	0	

E	10^{-6}	4, 4, 3
	10^{-7}	0, 1, 1
F	10^{-4}	0, 0, 0

Test lac+ [Lac$_1$ x Lac$_4$] as diploid
Irradiate Seligmann's lac+.

January 27, 1950.

Suspend "pure" colony of 652-2 in H_2O. Spread drops on EMBlac.
Expose to high pressure UV 6, 7, 8, 9 secs.
Ca 1000 survivors in total. No Lac- or Lac$^{\pm}$ noted

Conclude that 652-2 is probably not a stable diploid; but a typical recombination of lac$_1$- with lac$_4$-.

2/4/50. #2922A received from E. Seligmann, Beth Israel Hospital, New York, N.Y.

streaked out on EMBlac: all +. Suspend + colonies in water, spread on EMBlac and subject to 8 secs UV (high pressure lamps).
4 plates; ca 500 colonies. All lac+.

Effect of medium on segregation.

January 27, 1950.

EMS BMTLB, apparently does not permit *lac v* colonies of H16B. Check effect of various supplements.

In this case, *lac v* was observed on BMTLB.

Irradiation of H225-226

January 29, 1950

a) H226 susp. in 10 ml O.D. 275 ca 2×10^6

b) H225 " " " O.D. 380. ca 3×10^6

Count in Petroff-Hausser. ca 3×10^7

Approved dilutions. dilute ~~H20~~ to estimated 10^5 each a) .5/10 b) .33/10

	"7"	9	11	2	22	
		33	55	7	95	
	"20"	2	1	1		
		1	2	0		

No absolute increase, as relative; actual count is one half that recorded

i.e., survival was $\frac{100}{312}$ = ca 32%

These counts seem more consistent than those of A–C: even shorter doses should be used (ca 3 seconds)

Analysis

2/3/50.

	A	B
a) Initial assays were	6×10^7	0×10^7
After 20 hours, refr. in water	2×10^7	5×10^6

Note drop in titer, especially with H226!

b) H225 data show uncomfortably high variance, but clearly indicate absolute increase of segregant types with 2 sec. irradiation.

c) H226 data not very useful owing to too low deletion

d.) 5 mems. at 60° already kills most cells. Use at high conc. and plate various deletions.

Irradiation of H226 - H225. 672 A

February 2, 1950.

a) P1. Assay suspns.

		O.D.^{4200}	Titer
A	H225	340	6×10^7
B	H226	290	6×10^7

Note error in calculation!!

For critical, low dose irradiations, dilute to 3×10^{-5} (estimated 1800/ml), irradiate, and plate .1 ml samples. Use 2 and 5 secs. UV. 20cm. 2 ml/10cm Petri dish

C. H226 Take 3 ml sample, undiluted, and give ~~~~ doses at 10 sec intervals. Plate .1 ml for each. Start at 40 sec. 27 survivors at 40 sec.

D. 60° exposure. (in oven) Use 3×10^{-4} dilution H226, 3 ml in small test tube. Sample at 5 min intervals (.1 ml).

PROVISIONAL

Keep on D(Lac) agar.

Evidence concerning diploid intermediate in segregation of M226.

2/3/50.

A Picked well isolated lac - colonies from pre-assay plates B5 - etc. of 672. Some should be Mal+/-. 40 tested by sparse brushes. Compare with material from 675.

39 +, apparently pure; 1 —.

B. Do. from c40 28 colonies brushed. 22 were pure Mal+
4 " " " Mal—
2 were predom. Mal-, ; Mal+. Picked and restreak → Mal EMB was badly contaminated.

Save 677 plates!

From 677 Ax and Bx, picks isolated ~~Mal~~ lac - colonies and brush on Mal EMB.

41 pure Mal-

18 "pure" Mal+

M mixed Mal+/-: ? Restreak on Mal EMB; lac EMS to isolate.

76 total.

Restreaked cultures:

	Mal	lac EMS	EMB
15	+ —	pr. — +	—
16	+ —	pr. +	
17	+ —	pr. +	

Mal+ - check lac EMS and transfer to lac EMB.

3 are lac +
2 are pure lac -

	Mal	lac EMS → EMB
1	++	
2	++ —	⊖
3	++	
4	+, —	○ ~
5	+ —	○ ~
6	++	
7	+ -	○ 4

	5	0	6	3

These ratios are comparable to C, which is consistent with the lack of killing.

---

streaks or apparent lac+.
1-3 from C
4-9 from D

all are clearly lac V. lac+ cumip to spreading habit.

Preparation of diploid inocula

February 4, 1950

D(@) liquid + 0.1% lactose

1-4 single colonies from old EMS stac

5,6 from broad streaks. Incubate 5 aeration on shaking.

Streak out initially and after growth. Estimate % lac⁻.

	Initial	20 h.
1	25	85
2	<10	90
3	40	90
4	80	>90
5	50	>90
6	40	>90

This appears to be a satisfactory method for preparing diploid inocula!

Use (4) for irradiation study in hopes that high proportion of lac⁻ is maintained

Irradiation of H226

~~676~~ 677

February 5, 1952.

Use liquid culture 676-4, ca 20 hours. O.D. 400

Assume titer of ~~[redacted]~~ 10^9, and work for 10^2 colonies/plate.

For safety, also plate at 10^{-6} and 10^{-5}.

Dilute to ~~[redacted]~~ 10^{-4}. Irradiate 3 ml 2 secs 20 cm low pressure uv.

A) Take .1 ml samples Crowded.

B) Dilute to ~~[redacted]~~ 10^{-5} .1 ml samples

C) 10^{-6} .1 ml samples.

D) Expose* 1 ml original sample to ~~[redacted]~~ 57°C. 10 mins.
(.7 ml) Dilute 1:10 in cold H_2O and plate out at various dilutions
~~All~~ plates sterile.

E) Plate original sample at all dilutions from 8 – 3.

EMB Mal counts. Most Mal plates were contaminated. Some, however, were on earlier clearer batch.

B: not readily scored; however, mostly Mal+ or Mal v.

B_x: Plates contaminated, but fairly numerous pectored colonies:

Mal+ (⁵⁄₇)	Mal−	Mal v
34	50	20

The frequency of Mal v seems higher than of lac v, suggesting some diploids. See 674.

InB, a fair proportion of crescentic colonies was seen (+) (−) etc.

(on E5) a single colony was noted that, by its appearance, might be a lac+ recombinant. Streak out for check. —

Lac+ pure, Mal+, Xyl+, Mtl+. Kept on agar & Cent.

2/10/50.

A number of colonies previously scored as lac −; lift out on desk top several days, now show central papillae. Pick and streak out as (plate photographed as 677-UV B). EMB lac.

V	−	central +
8	29	23

In general, they seem to give typical lac x!

To avoid any confusion, a special uv experiment is called for!

Treatment of H226 with Mustard (HN2)

Febr. 6, 1950.

H226, suspension 676-4 (24 h. in refrig.)

A) Control: Titrate out from buffer below.

B) Add 2 ml suspension to ~~1 ml D~~ 1 ml ~~KH buffer pH 7.0~~ 10 ml D(lac) [acetate buffer]. Add 10 mg HN2. After 5 mins., dilute 1:10 in Y2 plus to inactivate HN2. Titrate. (Initial 10^{-2}) Record in terms of initial ~~dilution~~ suspension.

STANDARD FORM NO. 64

Office Memorandum • UNITED STATES GOVERNMENT

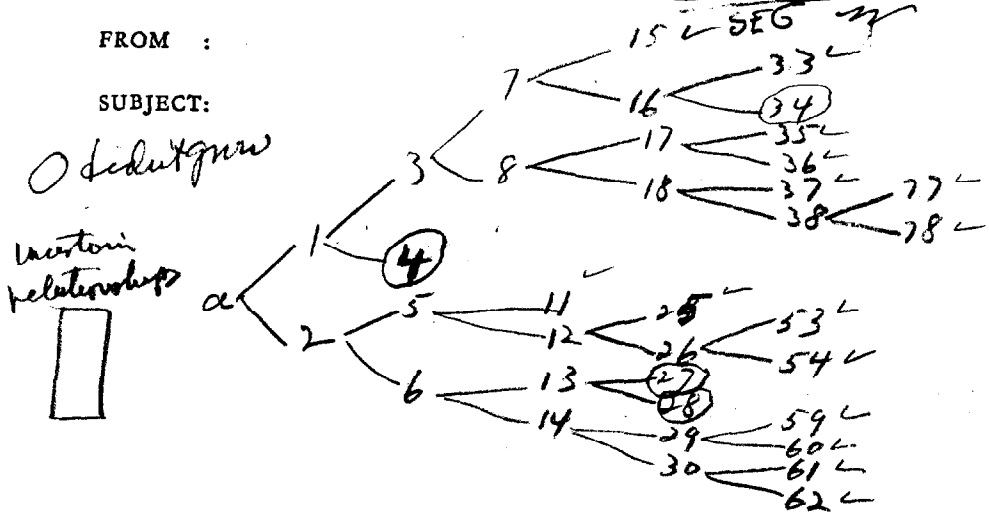
TO : # 226 DATE: 2-5-50

FROM :

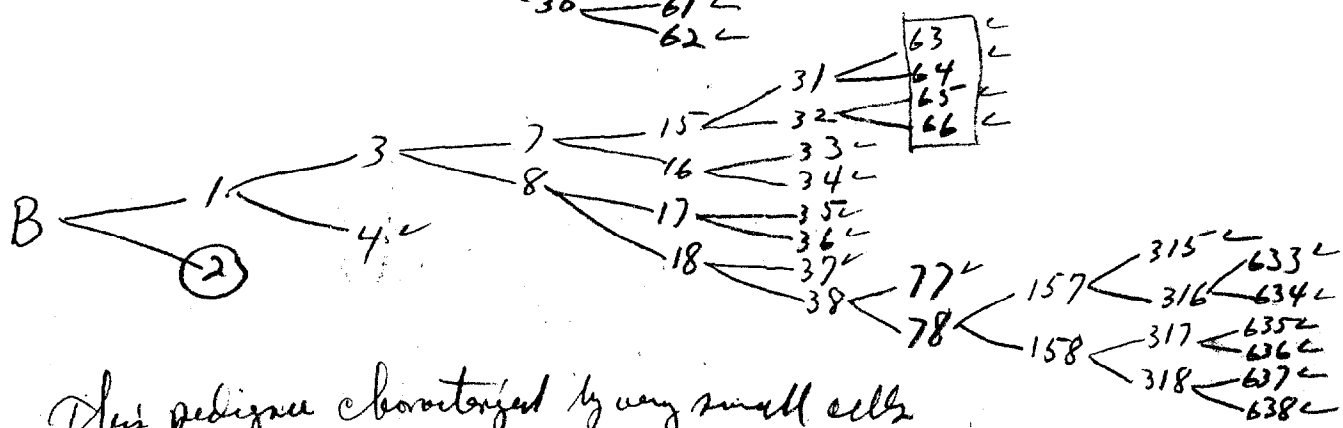
SUBJECT:

O dedutgrow

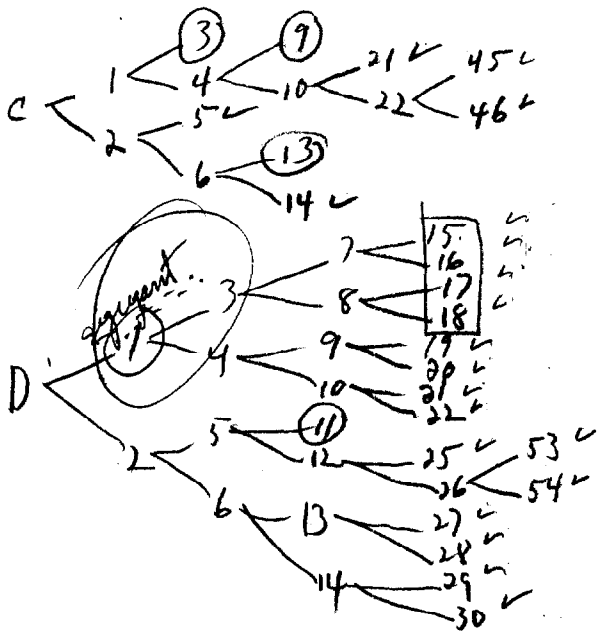
Ancestor relationships



a 35, 37, 36 mincolonies were longer, had "ramified" appearance,

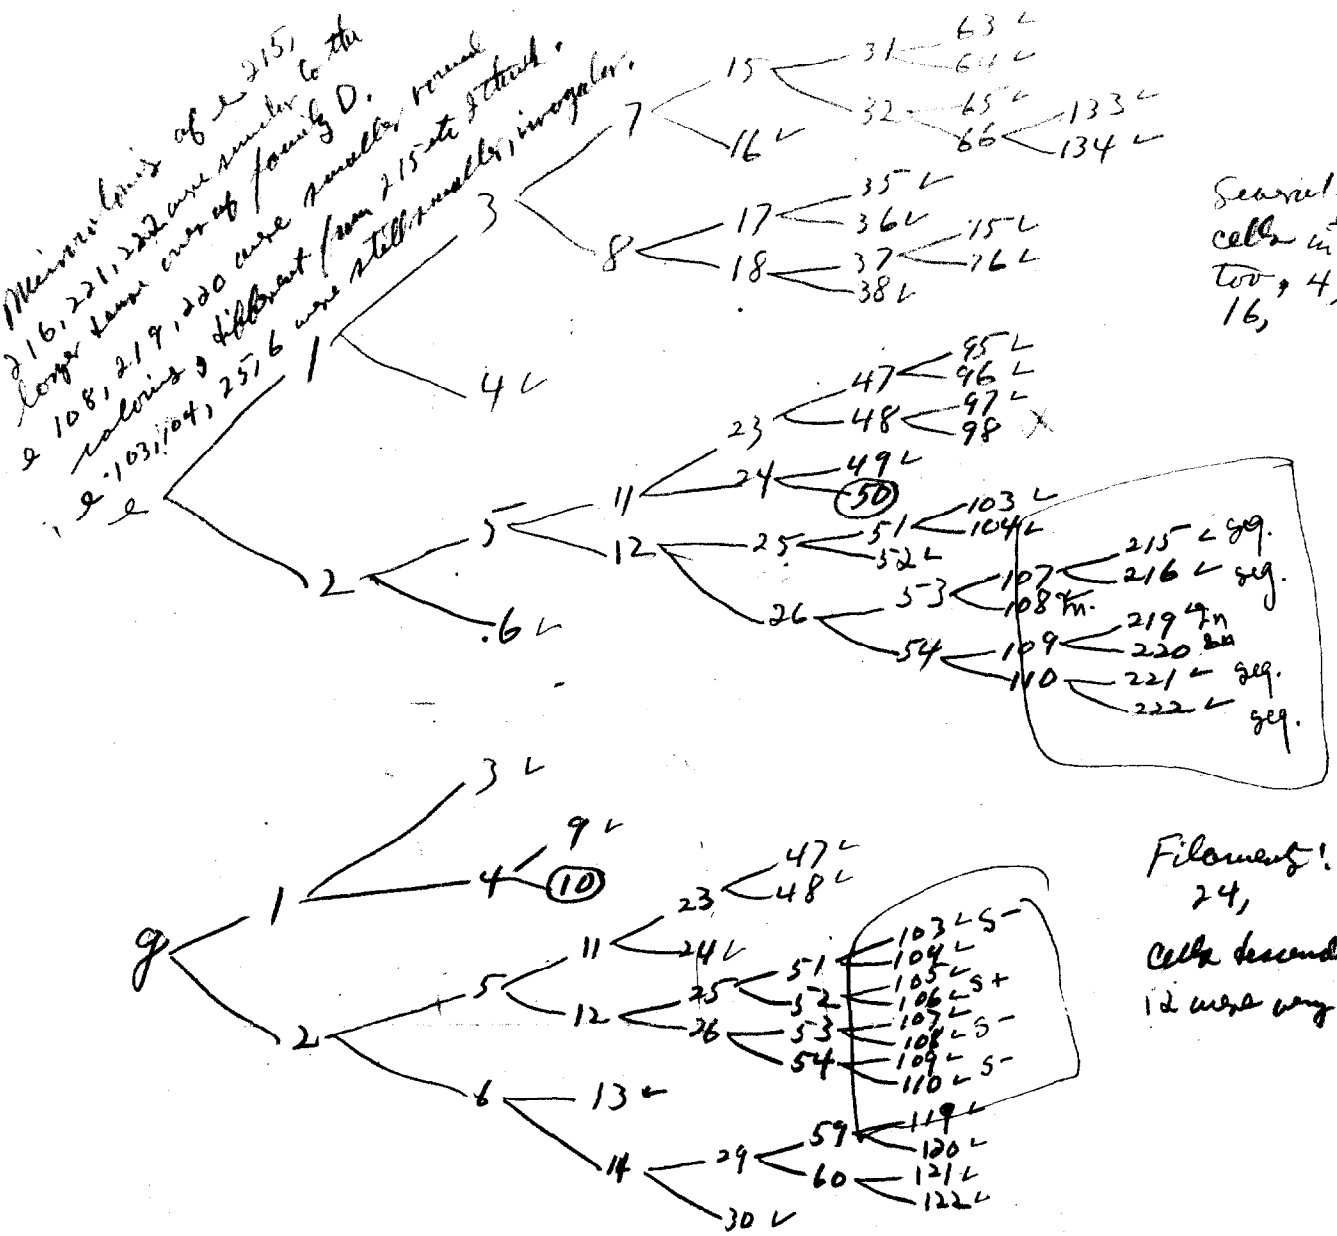


Des pedigree characterized by very small cells except #4 which was filamentous + later divided. #2 became a 8-10 μ filament—stopped there.



Most cells in this pedigree formed filaments, then divided somewhat irregularly.

Mincolonies of this family were rather faster growing, denser, harder to get into pipettes as if they were mucoid.



Microcolonies of 105 + 106 were found + smaller than 103, 104 and 107–110. 107–110 were the densest like the D family. 105 + 106 microcolonies were similar to ≥ 108, 219, 200.

Zille: single cell pedigrees on H226

February 5, 1950

Chemical treatments ~~with~~ of H226

Febr. 8, 1950.

Inoculum prepared from EMS colony into D(Lac); incub. 20h.

$O.D._{4200} = 830$

A. Assay

B. Dilute 1/10 in .01% Methyl Green in D(-) 2 ½ pm — 5 ½ 5

C. Dilute 1:5 in 6% Na deoxycholate. "

Add H_2O to 1/10 express dilutions as original.

		V	—
A7.		135	12
B6	325	37	Methyl green: v. little killing no haploidizations
C6	>>600	ca 10%	Not enough killing! no haploidizations.

Treatment of H226 with chemicals.

Febr. 9, 1950

Use same H226 resp. as 681.

A) Assay

B) Dilute 1:5 in 6% Na desoxycholate 11.45 } 37°
C) Dilute 1/10 in 0.1% Methyl Green/sal 11.45 }
D) " 1/10 in ~~H2~~ saline } I am probably in error 10x dil. ?

Express as orig. conc.

	v	—
B6	230	16
C2	114	6
D "7" (8) (2 plates)	13,6 (19)	(1,2) 3

Not appreciable killing in desoxycholate! pH of 6% solution : 8.9!
1:5 bacteria/doca : 7.1
bacteria + saline (ha) :

Methyl Green kills by non-nuclear mechanism.

Chemical Treatments of H226

Preliminary data

February 10, 1950.

Add stock of H226 (36h. in 50 ml DL Lac) 1:10 to medium D(-), plus supplement added. Incubate in tank unless indicated

		Supp. vol.	Total Vol.
A.	—	0	11.
* B.	Acriflavine .05% dark	0.5	11.5
* C	" " under 4W fluorescent lamp	0.5	11.5
* D.	Pyronin Y .01%	0.1	11.1
E	NaCNO 1%	(NaCNO 5%) 2.5	13.5
F	hydroquinone 1%	(Hq 5%) 2.5	13.5
G	Formaldehyde .04% (=.1% formalin)	1	12.0

6 30

D — in H_2O to prevent ppts which is heavy in A — alone.

* 6 30

B & C agglutinated heavy ppt in D.

9 30 1 standard loopful, spread on 1 plate serially.

All but A are sterile

Repeat 2/11/50 under less drastic conditions

M226 chem. treatment

February 10, 1950.

	Same stock as 683 (refrig.)	Supp %	vol.	Total
A	–	–		1 ml.
B	Acriflavine .005 %	1	.05	11.05
C	" " (light)	1	.05	11.05

i.e., ca 2-fold increase in proportion of K-12 over 4 decades of killing!

Dear Josh,

Here's another batch - I don't have too much hope for this run.

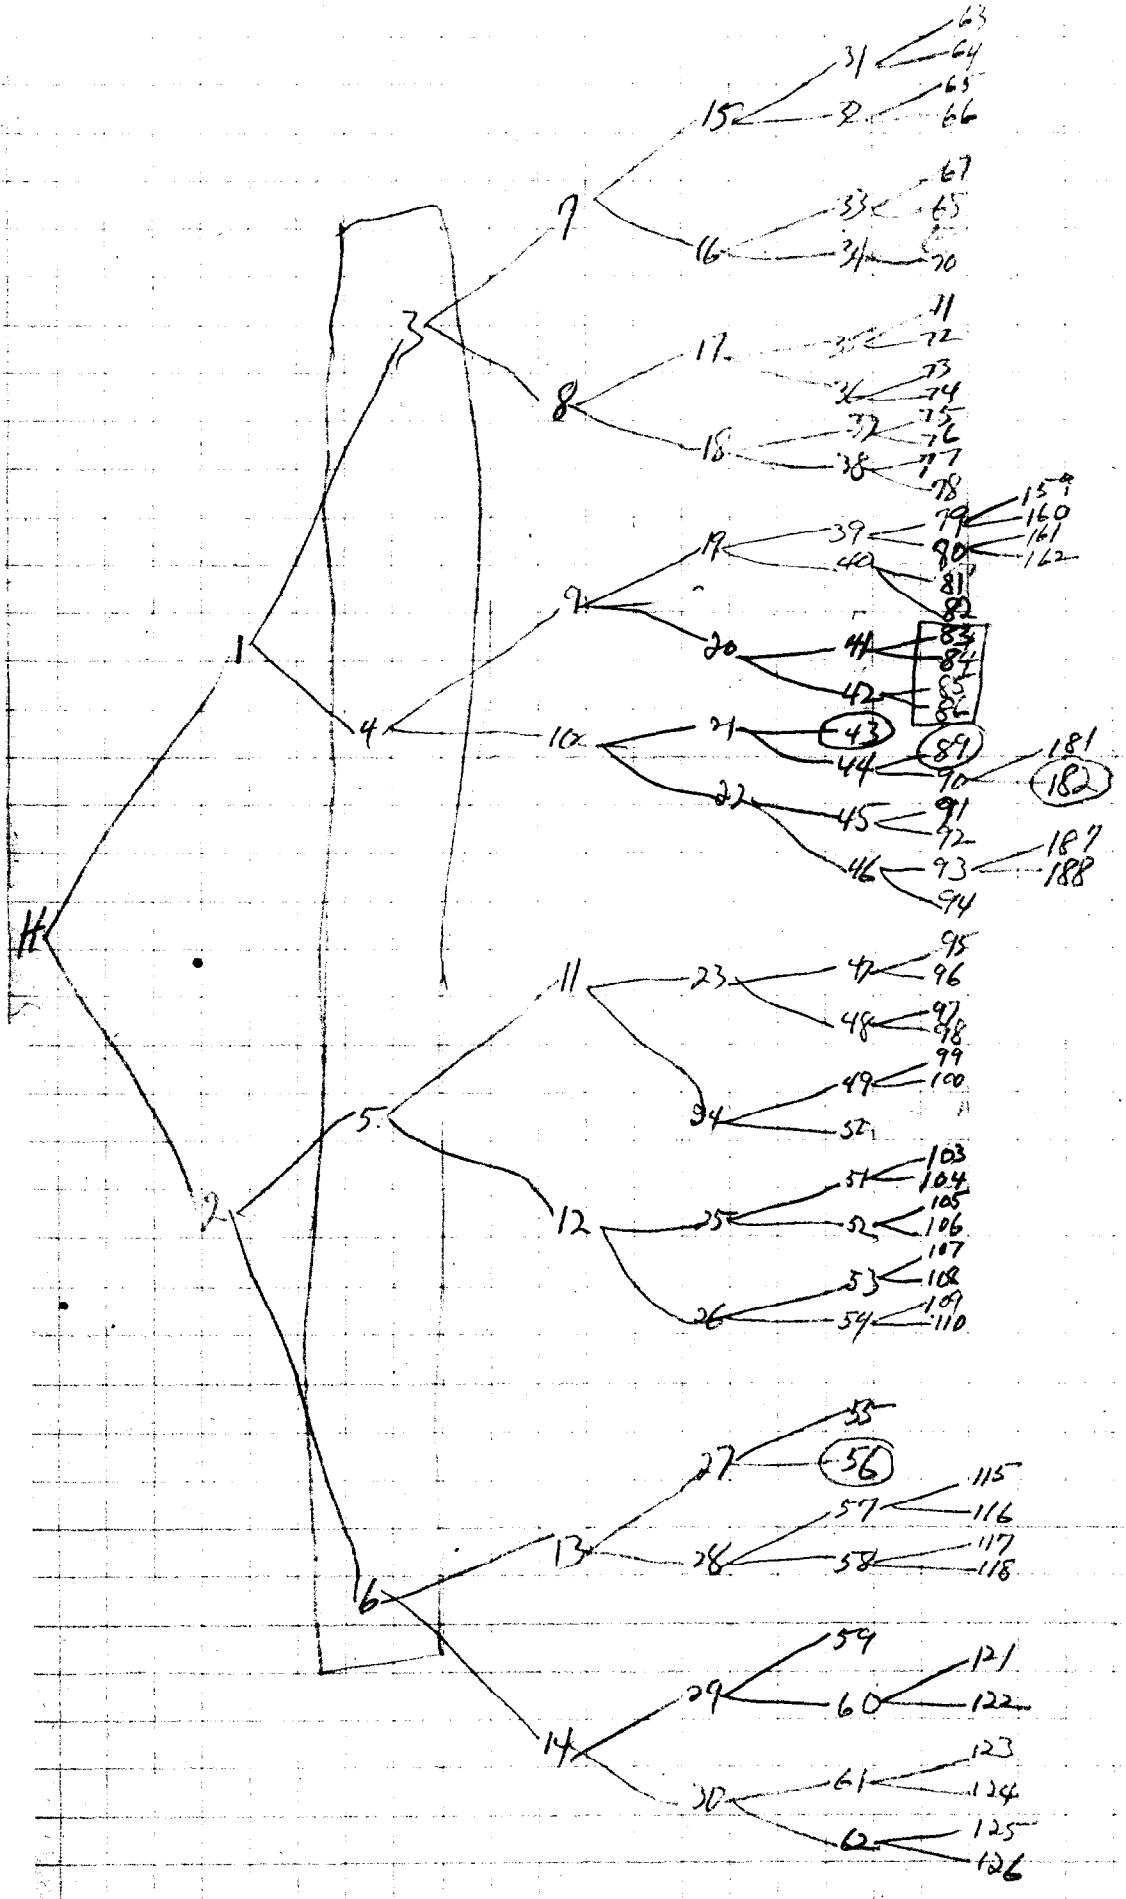
Ltr 8-5-50 pers was interesting - am anxious to hear the details.

Also anxious to learn your reaction to Oak Ridge. Please excuse me if I overstepped propriety in my last letter. Am not going to not send it but didn't get around to writing another one.

Am planning another session this Wednesday (Holiday for L. Work.) + another for the weekend. So be looking for a couple of more batches soon.

WWH

H 116 and H123 failed to grow in both tubes.

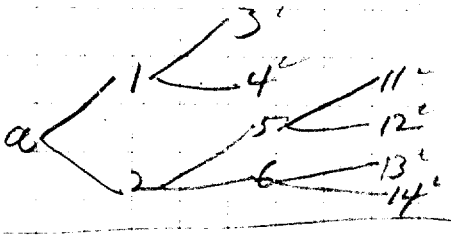


all var - Mab

2-18-50 H226 zygote

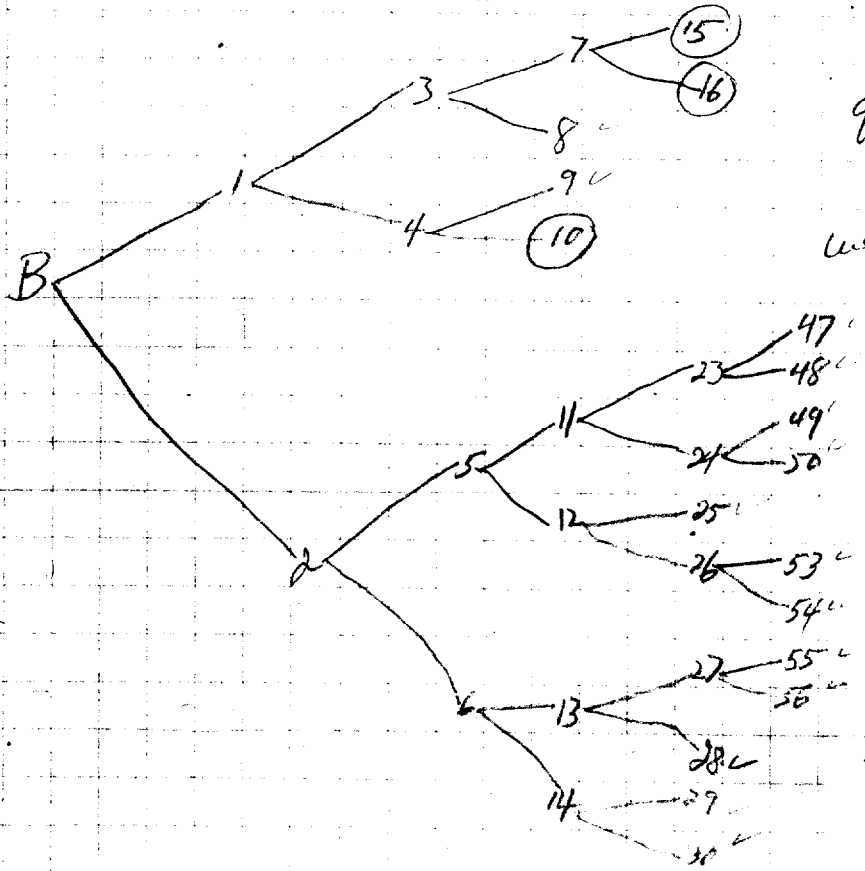
○ = dichorionic

⊓ = Unknown chorionicity



cells tended to become fibroblastic - stopped because of an engagement.

all het

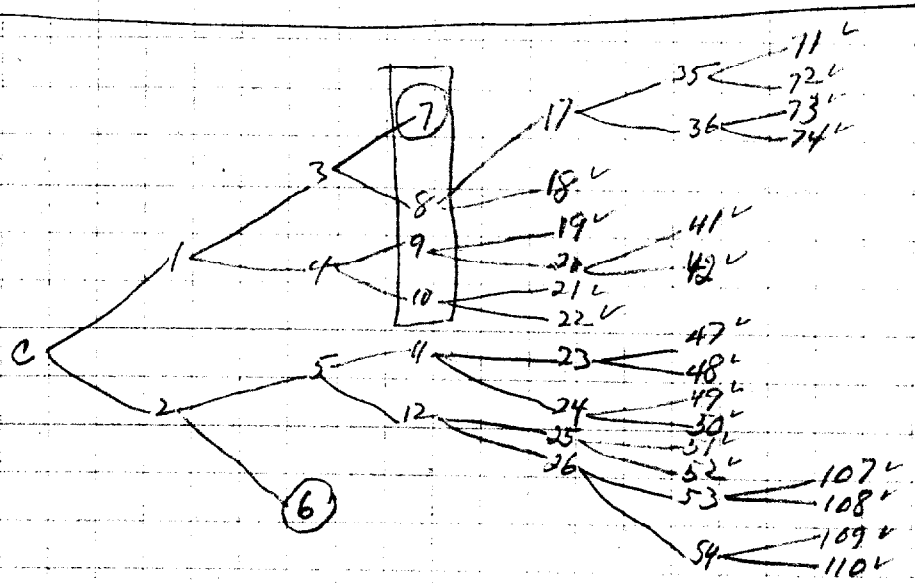


all 3 was a fetus cut, then split off small cell at each end

—— to 15, 8, 16

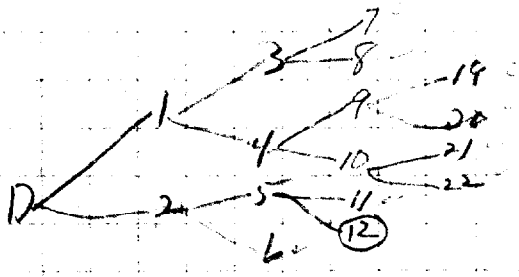
use arbitrary numbers as indicated

all het

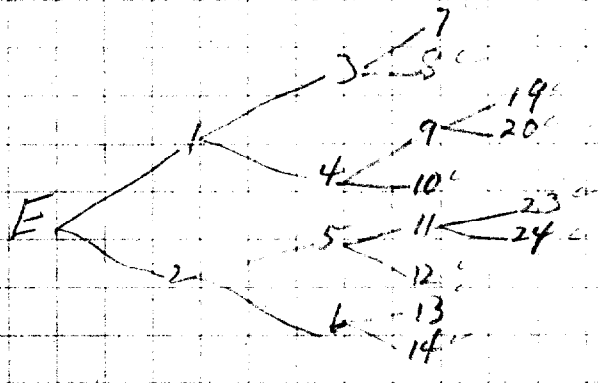


all these micromeres were [illegible] round, clear, "Lipoid" (i.e. hard to pick up in pipette) like those of clone 6 2-5-50

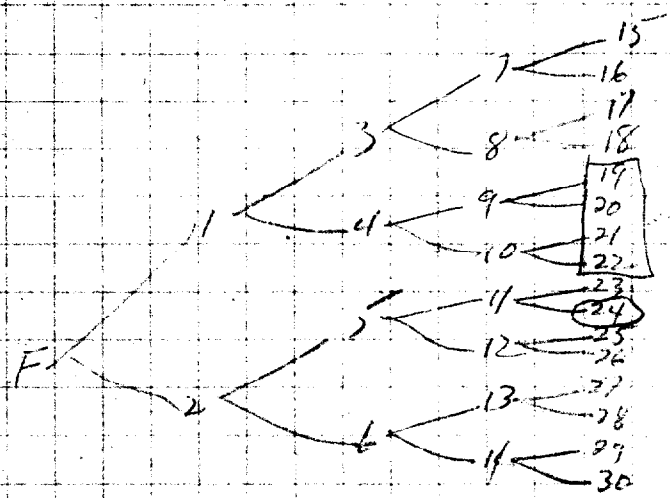
L-M



all Lac+



all Mal+



Cells in this clone were very sick from the start & would grow cells into a pregnant. Went along & took it for the Pellet set.

all Lac+ Mal+

F22 failed to grow in the broth tube due to breaking the tip off the micropipette.

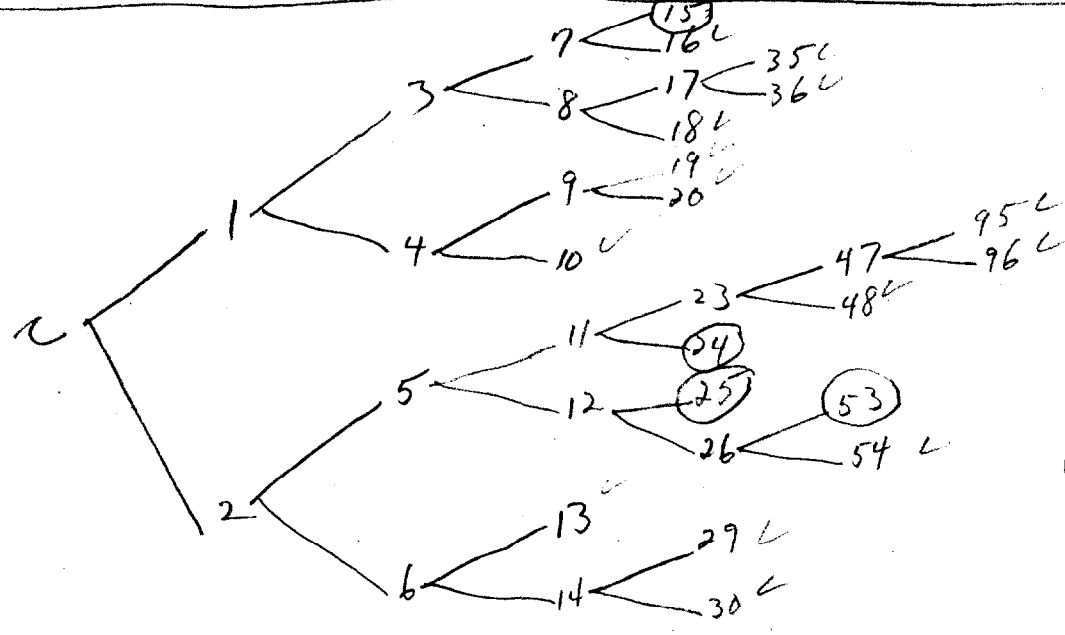
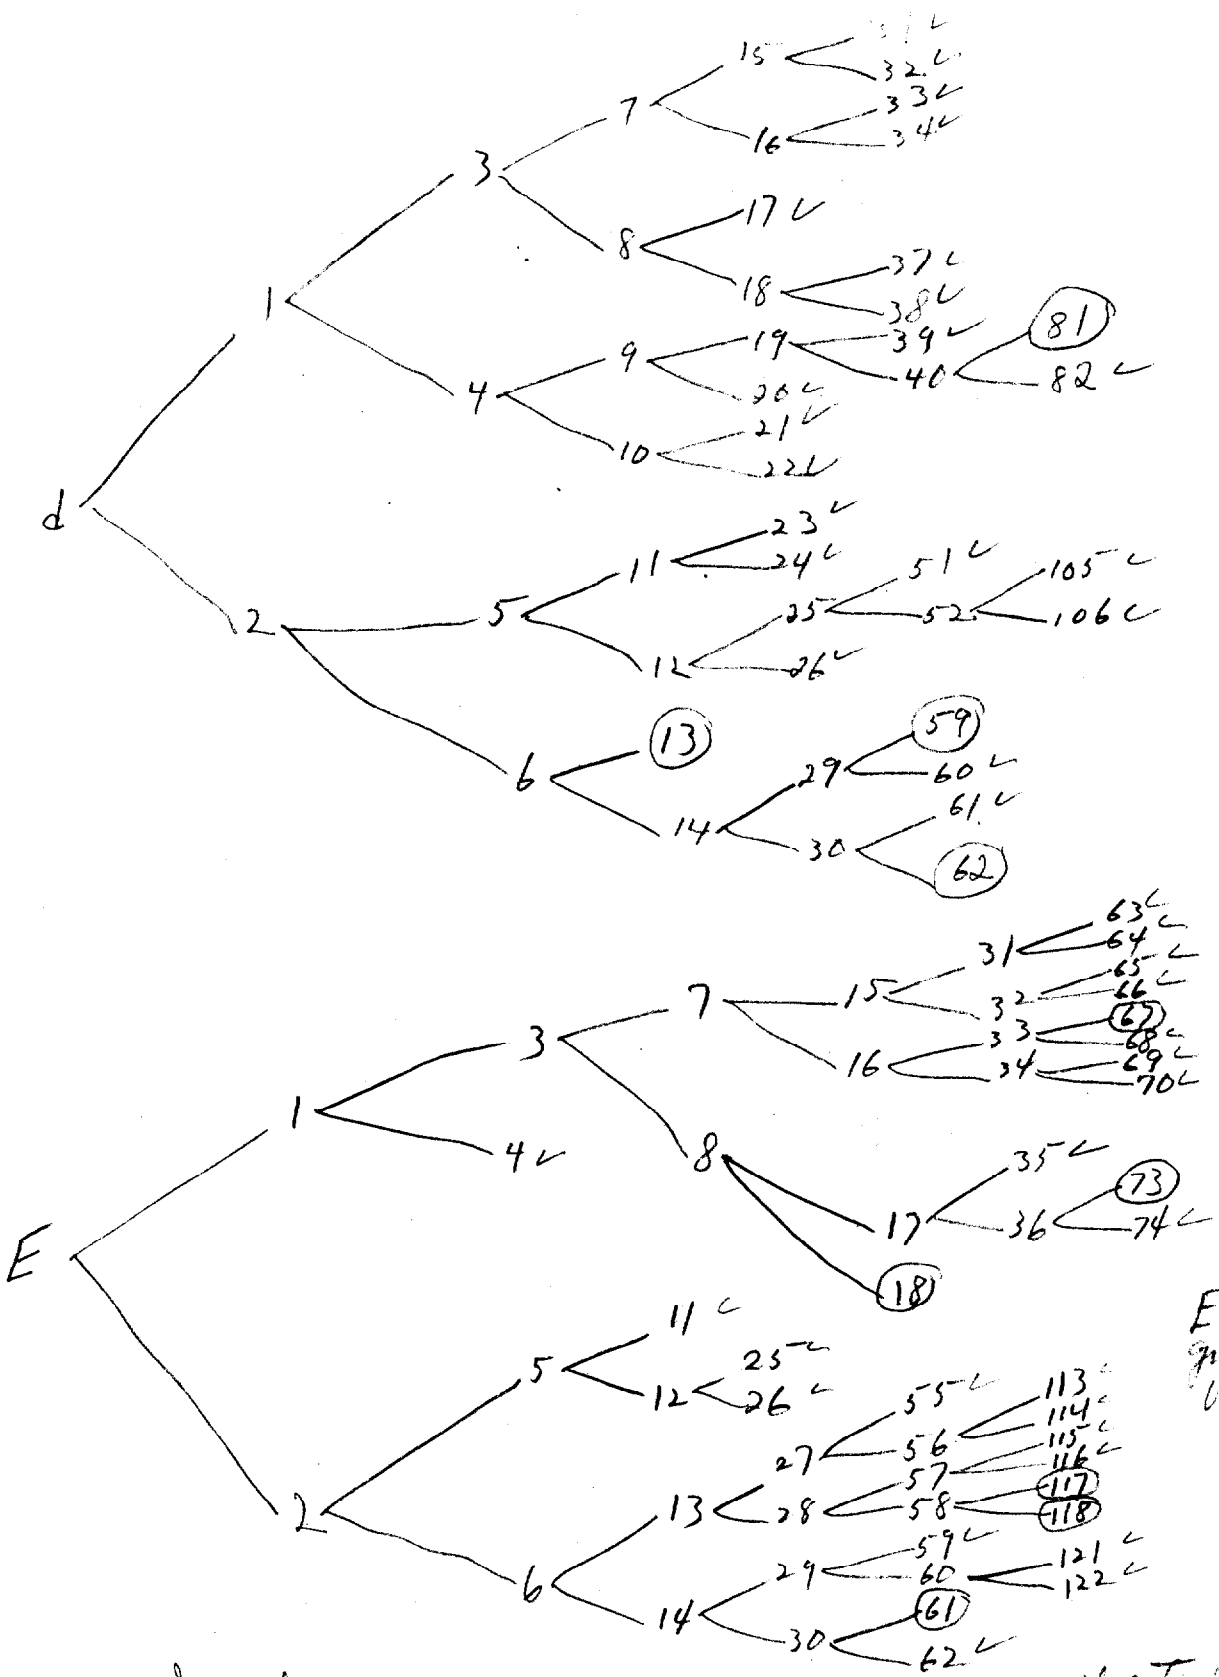
a 20 was a long filament, split off a cell at each end one of which divided. Quite arbitrarily numbered them as indicated above.



[redacted]



E65 did not grow in the broth vials.

I made an error in my records & had E2 dividing to give E4+E5 Luckily the actual E4 was not subdivided so I could correctly remember the vials with no possible doubt.

Josh,

I'm still planning another batch for Friday - I don't have too many hopes for the batch either.

The cultures tend to form filaments + then split off cells on the ends. I'm trying to keep records of all filamentous cells + sometimes rather arbitrarily number progeny of filamentous cells indicating how they were numbered.

This is one of the hardest cultures to work yet - has a somewhat longer log period and fewer cells from young EMS calluses actually grow.

(over)

Single colonies of H226 on EMB Lac. 4/pl.
Single-colony chosen from each, and tested on
the sugars indicated. Results indicate strongly
the preponderance of Val+ segregants (Lac_4 - ??)

Formaldehyde – prolonged exposure.

H_2O_2

2/19/50.

A Formaldehyde 8.01 → 8.37 as 690 G. Use suspension of H226 2/19. hold! Sterile!

B H_2O_2 Expose a 10^{-2} dilution of H226 to decimal stage conc. of H_2O_2 beginning with 30% 1:10. 10ml H_2O + .5ml D(-) + .1ml susp. After 15 m. take .1ml samples and spread on EMB lac.

C) Ac_2O H226 1ml + 1ml $CaCO_3$ 10% + 0.1ml 10% Ac_2O/ETOH.

At 10^{-4}, 198 lac – 0 lac v or +! $2 \times 10^6 = 10^{-3}$ survival.

10^{-3} → >1000 lac – 10^{-2} 7 colonies only!

D) assay

10^{-7}: lac v 146, lac – 12 / 156

		% H_2O_2	
	1	3	Sterile
	2	0.3	Sterile
B →	3	0.03	Sterile near center; crowded at periphery. (lac – around center.)
	4	0.003	Crowded!
	5	0.0003	Crowded!

Higher than .03% bacteriostatic on plate. [Should use catalase.]

A) P2 | 3 same plate

		lac v	lac –
6		3	51
A22		27	53
5		13	—
A22		>>13	

Survival = $\frac{5.4 \times 10^7}{1.6 \times 10^9} = 3 \times 10^{-2}$

~~Probably 6% diploid.~~

Suggestion! Do prolonged doses of chemicals differ from UV in permitting a much lower proportion of diploid survivors, conforming to nuclear elimination theory of killing.

Segregants of H226

Febr. 20, 1950.

B. 1:30 Incor. H226 1:10 in Penassay; aerate to 7:10 (6 hours). Plate out on EMB Mal. → But mostly still Lac v! (ca 80%).

A. Streak out single Lac± colonies of H226 (690C) on EMB Mal. Pick single Mal+, Mal− colonies to nmb and spot on EMB Lac, Mal, Xyl, MH.

2/21 (A) 57 Mal− : all Lac− MH− Xyl−

62 Mal+ : 52 Lac+(v), MH+ Xyl+ ... 52: Lac+ MH+ Xyl+

3 Lac− MH− Xyl−

5 Lac− MH− Xyl+

All above tested: V_1^R. [Do H226 V_1^R/V_1^S?]

But segregants are preponderantly parental combinations.

[Tests of phage resistance; mutations are ruled].

(B) Mal− picked (by M.O.) to Mal, Lac, MH, Xyl EMB:

	Lac	Mal	Xyl	MH	L	M	X	MH	L	M	X	MH	L	M	X	MH

3	±	±	−+	−	13 ±	±	±	±	±	−	+	+	±	±	−	±
4	±	±	±	±	14 ±	±	±	±	±	±	±	±	±	±	±	±
5	±	±	±	±	15 ✓	−	−	−	○ −	±	±	±	−✓	−	+	+
6	−	±	±	±	16 ✓	−	−	−	○ ± ✓	−	+	±	−+	±	−	−
7	−	±	±	±	17 ±	±	±	±	− ✓	−	−	−	±	−	±	+
8	−	−	−	−	18 ✓	−	−	−	−+	±	±	±	−✓	−	−	−
9	−	−	−	−	M ✓	−	−	−	−+	±	−+	●	○ −	±	−	−+
10					20 ✓	−	−	−	30 ±✓	−	+	+	40 −✓	−	−	−
					2 ✓	−	−	−	±	±	+	+	−✓	−	+	+
					6 ✓	−	+	+								

Most of these are poor selections. Investigate the Lac−Mal discrepancies!

But probable pure ✓ shows 6 ## L−M−X+MH+ ; #14 L−M−X−MH− This is a high proportion of M−X+ compared to 693A, but may be due to previous prototroph selection.

Investigate ○. Pick from Mal or Lac

Partial segregations

March 4, 1950.

In older cultures of H226, a number of "partial segregants" have been isolated. See also 687: 9 Mal$\underline{v}$ Lac− were picked up following irradiation. Later, the same was found in ~~2/22~~ control cultures.

693 (2/22) 4 Lac$\underline{v}$ Mal− and 1 possible Lac−Mal$\underline{v}$ isolated from EMB.

3/1

c. See 700. Plating of H226 after growth on EMB Mal.
10 Mal$\underline{v}$ (?) picked. Streak on EMB Mal, Lac.
all were Lac$\underline{v}$ Mal$\underline{v}$.

D. See 700 A1. On EMS Lac, Mal. ≪1% −. Repick and purify on same medium for subsequent testing.
Mal− : 8 ; 3 Lac$\underline{v}$. #2, 3, 8. = ~~700 11, 12, 13~~ 699: 17, 18, 19
Lac− : 14 2 Mal− ; 12 Mal+ No Mal$\underline{v}$.

Segregation of H226
Partial segregation?

2/22/50.

See 693 (B).

1-4 from Lac (693B: 11, 23, 26, 37); 5-9 from Mal (693B: 6, 7, 21, 25, 35).
Streak out on EMB Mal, Lac; EMS Mal, Lac.

	Lac EMB	Mal EMB	EMS Lac	EMS Mal
1	Lac v; Lac −	Pure Mal −	+	−
2	Lac v; Lac −	Pure Mal −	+	−
3	Lac v; Lac −	Pure Mal −	+	−
4	Lac v; Lac −	Pure Mal −	+	−
5	Lac −	Mal +; Mal − v?	n.g.	n.g.
6	Lac −; Lac + (v?)	"	+	+
7	Lac −	"	n.g.	n.g.
8	Lac −	Mal + − v?	n.g.	n.g.
9	Lac −	Mal − v.?	+	n.g.

These isolations leave no doubt as to the occurrence of Lac v; Mal − types. How do they arise? They would represent a persistence of the 2 stage retention noticed by Zelle. A Mal v Lac − has also been picked up.

H226 partial segregation.

6936

2/24

Grow H226 1:100 to saturation in Penassay (aerated)

2/27 Plate at 10^{-5} on EMS, EMB Mal and Lac.

EMS: ca 100 prototrophs ++, +, and −

EMB: Turbid!

2/28 Plate at 10^{-7}(?) on EMB.

Lac EMB: ca 10% deploid; remainder all Lac −

Mal EMB: mostly Mal+; a few Mal−, Mal ⩒.

A. Pick − from Mal EMS. Brush on Mal EMS, streak on Lac, Mal EMB

B. − Lac " Mal EMS " " "

C. Pick Lac ⩒ from Lac EMB. Streak on Mal EMB; save suspensions.

D Pick Mal ⩒ from Mal EMB. ~~Streak~~ Brush on Lac EMB. ≡ only 2 scorable at this time! both Lac ⩒.

Sept 68

Tests for balanced lethals

2/21/50 ff.

Picks lac+ colonies from a variety of treatments to examine for balanced lethals. Streak out on EMB lac, and examine Lewis + for + lability. If any are more or less unstable, restreak. Emphasize isolate lac+ (so this frequency is exaggerated)

690D+ : was lac+.

690D: 28 colonies. 10 Rechecks

E. 17 cols. 10 Rechecks. 1 v- = 695-3

F. 12 cols. 4 (1a,b) Rechecks. 1 v- = 695-2

G. 4 cols. 0 checks.

692A 12 cols. 1 pure lac++ transferred to check. as 695-92A1. others lac+.

689B

Repick from first streaking if any colony not obviously sectoring is seen.

Retests for possible partial segregants

March 6-7, 1950.

Despite 3 decades of killing, no alteration of haploid-diploid ratio is found. The effects of peroxide sections may be ascribed to acetic and citric acids respectively ($pK_{(1)}$ = 4.76; 3.06

But pK (phthalic) is 2.89, 5.41, so at pH 4 there would be as much free phthalic as citric!

April 20, 1950.

H. W1311 × W67 ("A")
I W1311 × W1304 ("B") } on EMS Lac. → no yield Note 1/5/51 both are TUB.

H 100 Lac+ picked and streaked on EMB Lac
Hold possible ++ in refrigerator.

Pick purified lac+'s to DN2 Glu for spot test of constitutive lactase.

28 Lac+ 26 mpg+ 2 possible mpg− . (11, 18)
Replate these on DN2 Glu for recheck.

Recheck −1 for ~~at~~ prototrophic ~~constitutive~~ lac+.

12 Lac slow 1 possible

Hemizygosity tests: lac - partial segs.

April 3, 1950.

Entrained from 699 - .

Type 1 (Lac - Mal V) : on EMS lac, may eventually assume + appearance.
Select "papillae" from D(o) agar - lactose.

699-1 No papillae found. Colonies remain very small.

A 699-2#. 2 papillae: #1 gave - and Lac V colonies on EMB lac
#2 gave only lac - ! Recheck.

B 699-20. 8 papillae: #1-7 Lac V. #8 Lac -.
more appeared later!
But all of these cultures are Lac - on EMS lactose !!
See below - eventually gives + centre colonies.

These cultures grew slowly to rather large colonies on D(Lac) & obviously account for the poor selection!

C 4/3: Pick single prototrophs from EMS lac A1.

D " 4 " Lac V colonies from EMB lac A1

E From EMB lac B1-7, 1 each.

But after 3 days, colonies with dark centres appear on EMS lac, probably representing "lac +". This appearance develops very slowly.

723C #1 and #3 are weak Lac V on EMB lac and show comparable appearance on EMB lac. Restreak #1 on EMB lac. Transfer to D(lac) slant as 723 A1 ✓: ✓ mostly weak Lac V.

723D More or less typical lac + on EMS; Lac V on EMB. Streak out to compare with 723 A1. A1 and D1 both quite weak lac + on EMB

F 4 new colonies from 699-20 on D(Lac), to EMS lac
after 72 hours, Lac + centres.

Lac heterozygosity tests

April 7, 1950.

723: A + C compound:

Both are Lac- after 24 hours; but give Lac V mosaics apparent in 48 hours on EMB Lac. On EMS Lac, colonies taken at 48-72 hours. This holds for all of this series! How many Lac V may be missed? Or, are these not true reversions?

See 722: no comparable Lac V failed isolated from ~~[illegible]~~ W1303 x W1304

Heterozygosity tests
Mal- partial segs.

724

4/2/50 ff.

From 699:

A. 699-11:

2 papillae: Lac v Mal v Save single Mal EMS+ colony from each as 724A1, A2 OK ✓ Cf. 699-11R1.

an additional 2 papillae to EMS Mal. Reisolate from second. Check(1) as A3. Mal v Lac v ✓

1 gave Mal+; the other only papillae (2d) - Restreak on EMS Mal v/c check as A4: 15 M− X− ∴ ++/−− i.e. "E15" 13 M+ X+

D Grow 699-11 in D(Lac) aer., overnight. Spread on several EMS Mal and D(Mal) plates to obtain additional Mal+ revertants. N10 About 50 cols on 7 plates. 30 picked and streaked out on EMS Mal. Repick single colonies and streak on EMB Mal, D Lac ~~EMS Mal~~; EMB Lac −

#20 = Mal+ Lac− ~~Lac+~~

#25/#26 = Mal+ Lac? each was Lac −

Others are all Lac v Mal v.

Held on D Lac plate

B 699-9. 3 papillae from EMS Mal to EMS Mal for purification. Reisolate pure +, check, and to slants as B1-3 4/6

#2 Lac v Mal v Keep as #1, 3 Lac − Mal+ .724B1 Reject others

C 699-12. 2 Mal+, both give Mal v. 724C1, 2 purified and rechecked. To slants 4/6 Lac v Mal v ✓

Linkage phases of 699-11 M+ recombs. 724a

4/8/50

Streak out A0 – A4 on EMB Mal.

P7. Restreak Mal V. Pick isolated Mal+, – on the same plates and brush on EMB MH:

	MH+	Mal+ MH–	MH+	Mal– MH–	
A0	0	6	17	2	+–/–+
A1	1	5	5	1 (v?)	+–/–+
A2	1	2	5	1 (v?)	+–/–+ ??
A3	0	0	0	1	++/–– ??

P8 8 Mal V from each of above streaked out on EMB Mal to obtain distinct segregants. Pick app. pure+ and – from each quadrant to ~~A0~~. Xgl EMB. one + one –

A0.	Mal+	Mal–	A1	M+	M–	A2.	M+	M–
1	8X–	15X+		X–	X+		–	+
2	1X–	6X– 1X+		X–	X+		–	+
3	5X–	5X+		X–	X+		–	+
4	2X–	5X+		X–	X+		–	+
5	3X–	6X+		X–	X+		–	+
6	3X–	6X+		X–	X+		–	+
7	8X–	8X+		X–	X+		–	+
8	8X–	6X+		X–	X+		–	+

Each of these is +–/–+

A3.	M+	M–
1	4+	4–
2	3+ 1–	4–
3		4–
4	5+	4–
5	2+ 2–	4–
6	4–	4–
7	3+	4–
8	8–	1–

This is very likely in the ++/–– phase. Are the segregations accurately complimentary ??

724 F1 (Lac - Mal v) 724c

May 10, 1950.

Apparently, a partial segregation occurred after mutation from ~~Xyl~~ Mal = to Mal ±, resulting in a Lac - strain. The Lac + and - components present in the finally isolated Mal + prototroph (a direct from EMS Mal) were separated. Each was Mal v. The Lac + was Lac v. The Lac + component must be ancestral; scored for Mal-Xyl linkage phase with remainder of series. Rep Lac - as a partial segregant. F1 + : 7 Mal + : Xyl + 8 Mal + : Xyl - also trans

F1 - ~~gave~~ apparently gives somewhat mosaic colonies on EMB Lac after 48 hours, resembling ~~the "Lac +" colonies of~~ H239. (Lac + trans 699-20 Lac -)

Repick single colonies from EMS Lac (4 colonies)

24h. Each is Lac - Mal v.

60-72 hours. On Lac, definite mosaics ~~colonies~~ with dark centers shown by most colonies. On EMS Lac, some colonies are much darker than others. ~ these.

The "dark" type gives colonies on EMB Lac mosaic at 24-30 hours

The "light" requires 48-72 hours for Lac v.

5/22/50 Streaks of "light" on EMS Lac acquire "dark" papillae: restreak these:

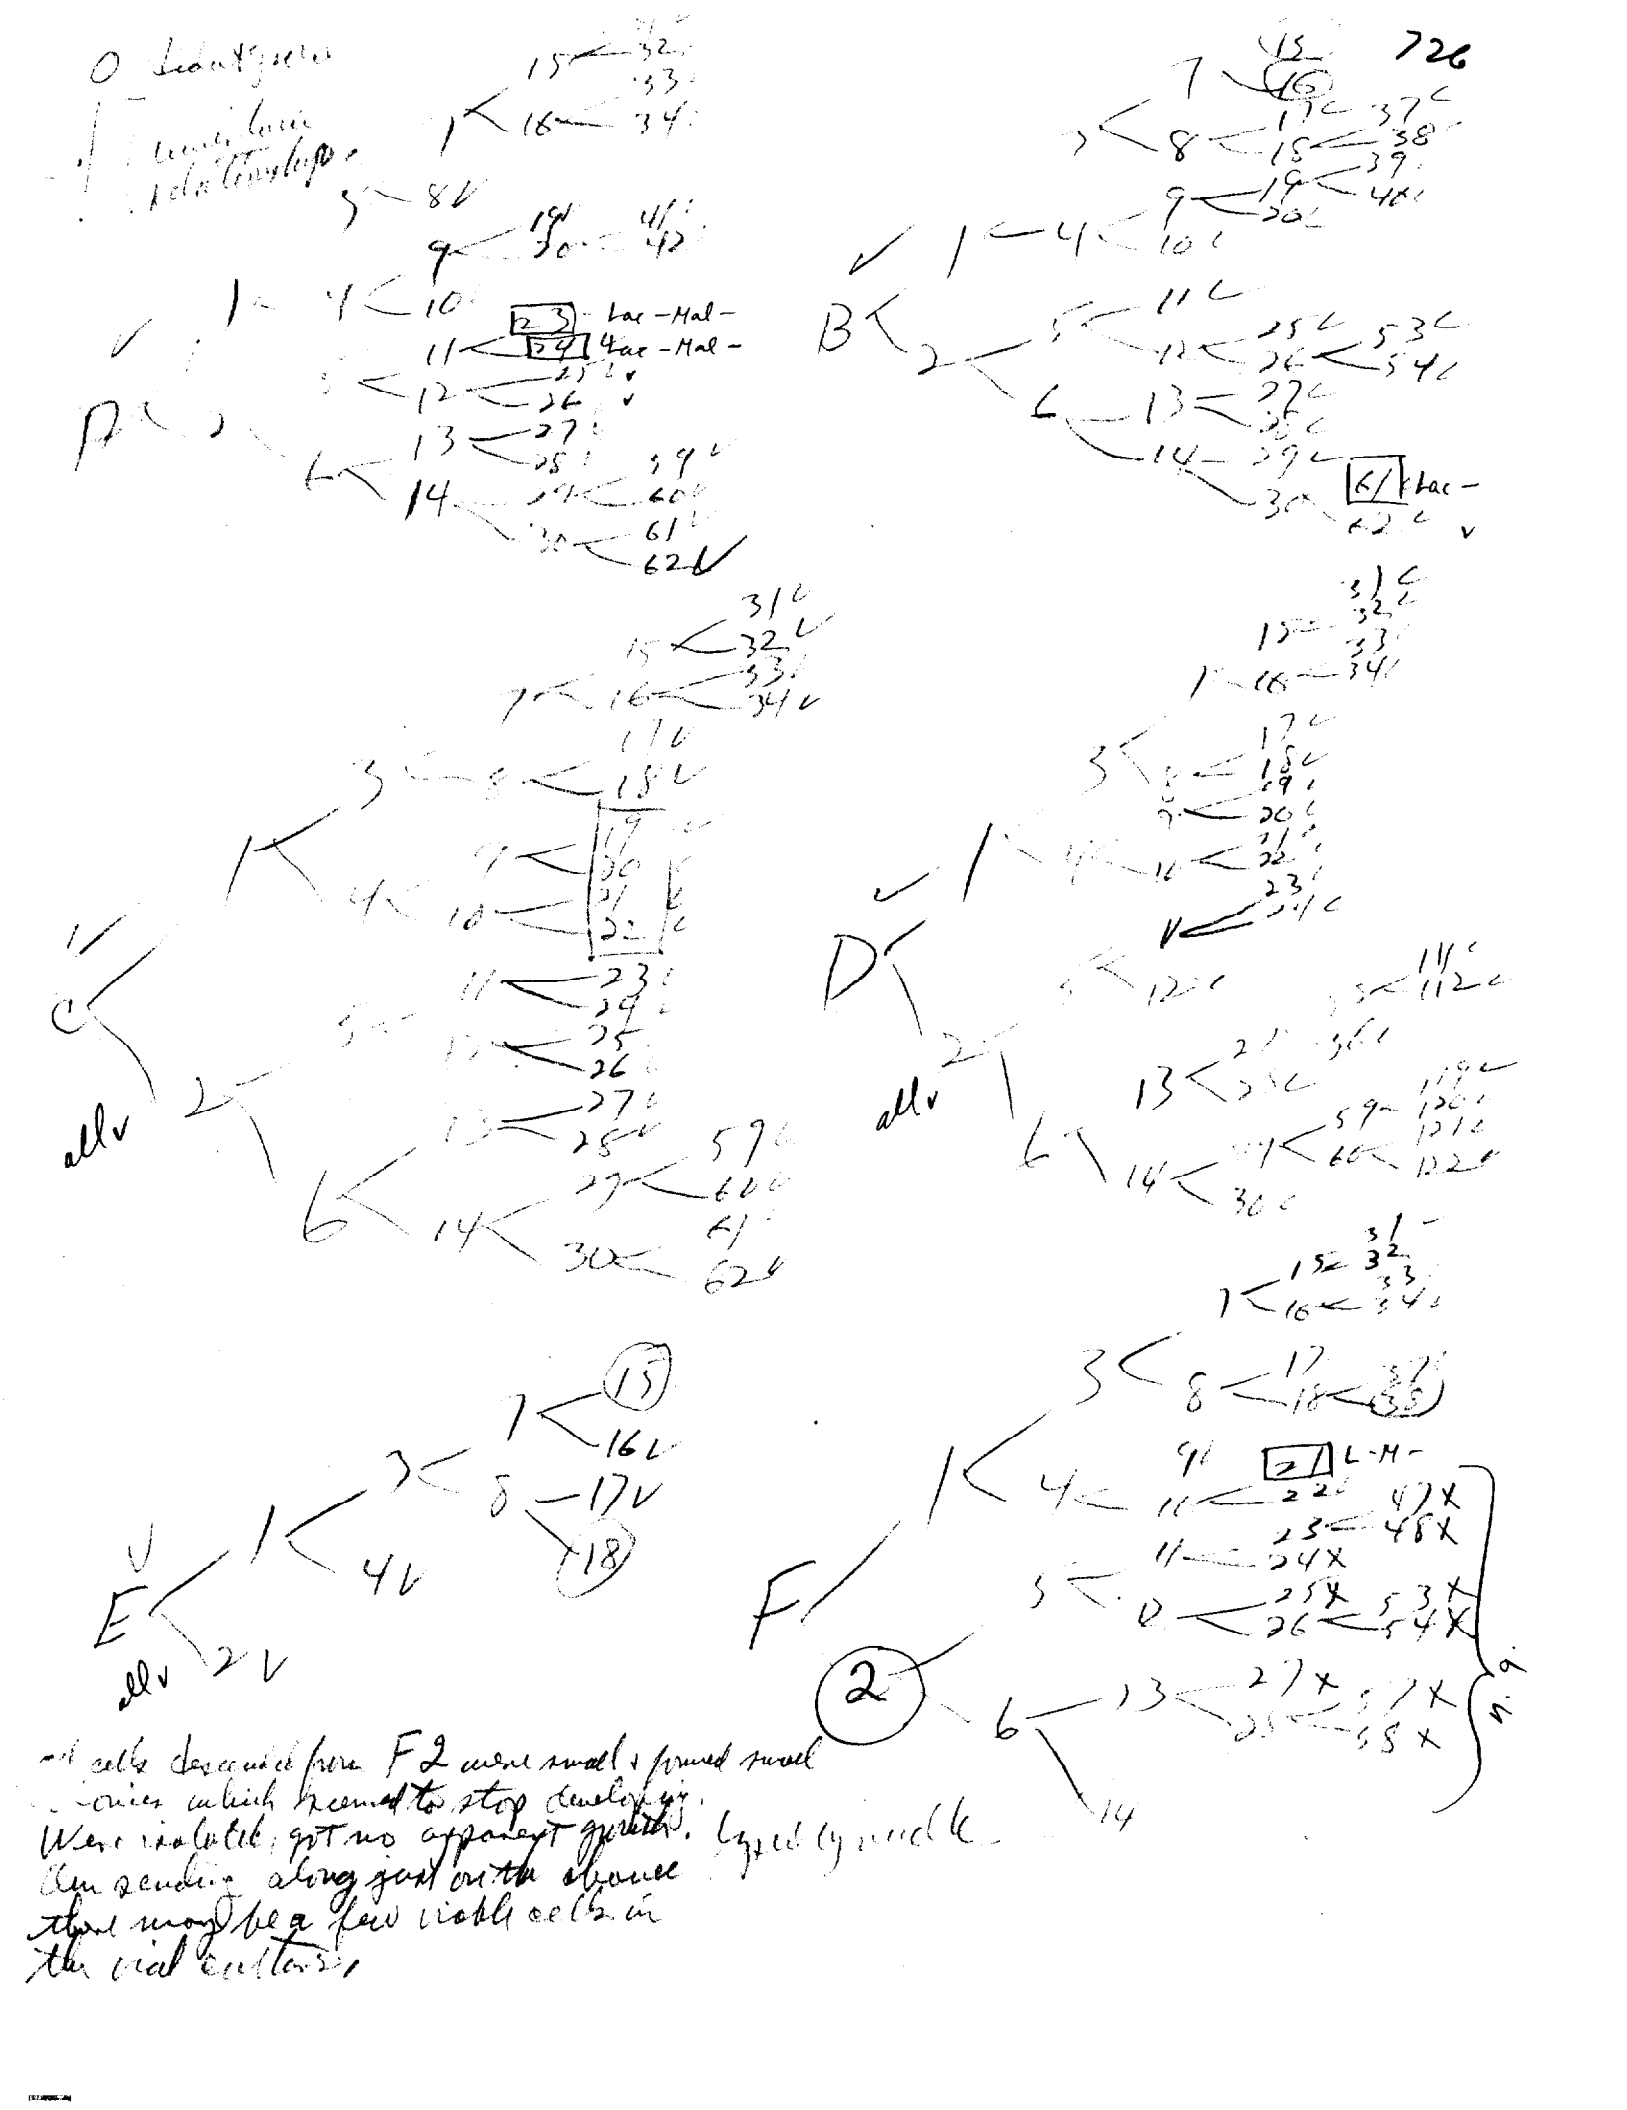
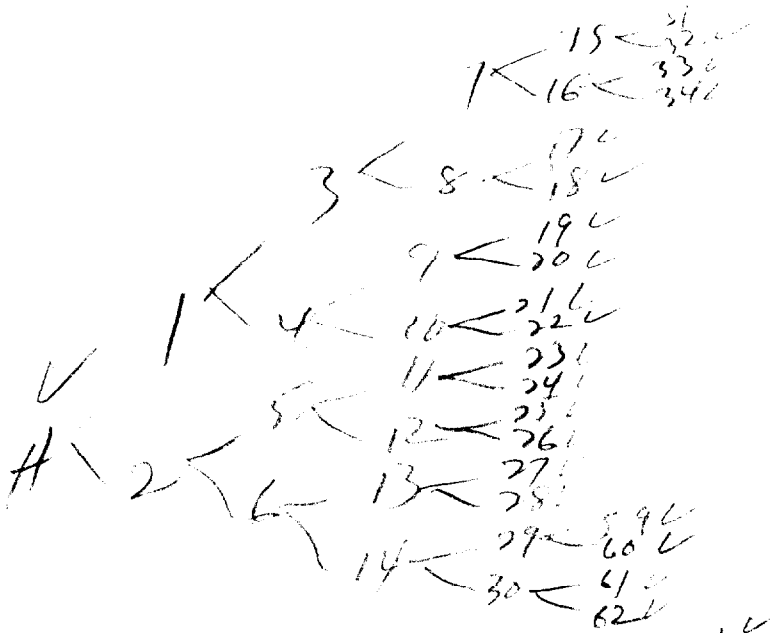
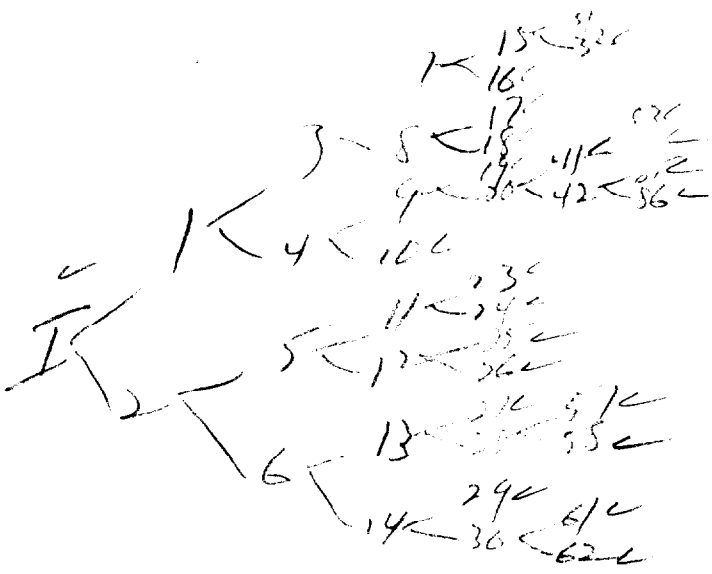
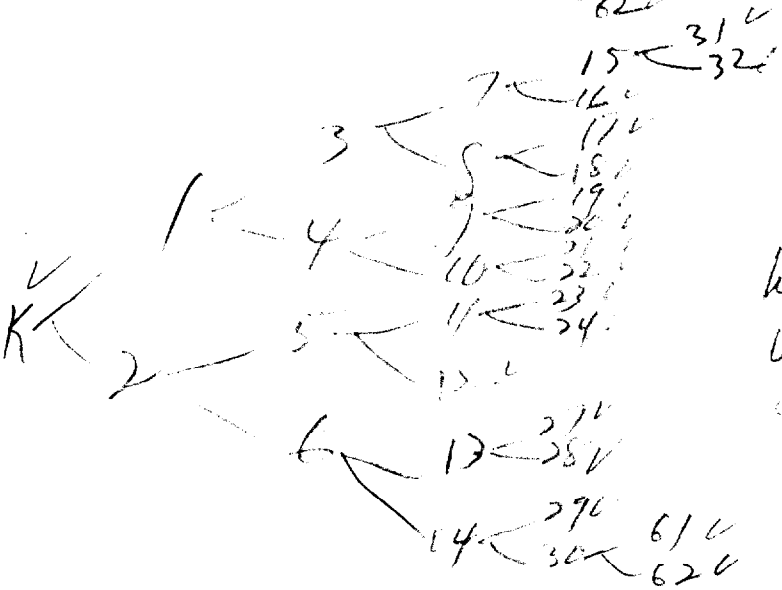
288 ~~screw~~ screw cap vials returned to Zelle.



All cells descended from F2 were small + pinned small colonies which seemed to stop developing. Were viable, got no apparent growth. Can see dividing along just on the chance that may be a few viable cells in the mid section.







Individuals most of these are hospital rats, they grow too well. Initial inoculum was p. cen 18, from Dairy minimal culture. (Inoculated with an EMS tree colony)

I can put the cloth in the incubator OK. Have two outside waiting for bugs to grow. Will have another clone till next week — transferring again.

5	6A	D	—
6	10A	D	glucose 10mg
7	11A	D	lactose "
8	14A	D	neolac "
T	1		

This experiment was designed to determine whether lactose-adapted cells could utilize neolactose.

Since 58-161, fully lactose-adapted, ferments neolactose ¼ as rapidly as it does lactose, the non-fermentability may be due to a block of adaptation comparable to lac: Bugal on lac. —: However, the falling off of the fermentation may speak for inhibition by allolactose, or a relatively high K_s for neolactose.

Outcross "stable diploid" 731
see 727

April 10, 1950.

Cross 727-1 and -3 as follows., on EMS lac

A	1-	x	Y10	Streaks of 727-1 and -3 streaked out. 99%+.
B			W677	
C	3		Y10	
D			W677.	

A and C gave good yields, almost all lac+. B, D gave ~~poor~~ ~~yields~~ moderate yields, lac-:lac+ ca 3:1

Pick + and streak out on EMB lac.

A: 100+. No distinctive lac v but some colonies have lighter, possibly mottled ~~ed~~ centers. Mark these for further purification. Repick all to EMB Mal, MH, Xyl.

B

C. 7~~8~~+ As A.

D 2 tested: Hold in cold

A. Spot-tests of purified lac+ [1-6 excl. 3. all Xyl+ Mtl+
20, 21, 22, 40, 53, 54, 55, 56, 93 Mal –
others Mal+.

2. All Mtl ++. All Xyl+ #~~8~~5, 87 Mal – 87 Mal-+?
others Mal+
+Hold Mal plates in refrigerator.

Treg 727-3 x W588

A. 6 restreaked on lac EMB as possible from lac V.

Each of these threw off carriedable lac - and has appearance suggesting a rather stable lac V.

C. Ditto. C3 destinctly variegated. } Each is pure Mal +.

B. 12 EMS lac + picked and streaked on EMB Lac Colonies resemble those of A + D. #1, 2 are like C3

D. like B.

Kept on EMS Lac

Pick single "4" colonies and restreak on EMB....

Constitutive galactosidase of W1301

April 18 ca., 1950.

A 58-161 Glu — 2 plates each D(x2) + glucose 0.1%
B " —
C W1301 Glu — growth in 10 ml H_2O. .1 ml in 10 ml
D " — Residue in spotplate for dying.

A	383	403 (20m)	5.8	Add benzene to each tube and refrigerate
B	209	236 "	3.1	
C	388	++++	180	
D	262	++++	144	
—	001	014		

C and D are too active to assay at this dilution. Use .01 ml/10

1u = Δ=100 in 20m.

				Units/ml
C'	048	150 (10m)		180
D'	027	113 "		144

E, F are suspensions from 4/15. Dilute benzene treated suspensions 1:100, use .2/10 E = 58-161 F = 1301 /no sugar

	Di	Donpg (10m.)	
E	003	017	?
F	004	222	>2000

ca 150 before activation. See Manometric Protocols 4/12.

4/15 See manometric protocols 4/12 called.

∴ The "constitutive" lactase differences persist through "activation".

4/20. Qualitative test (spotplate) for galactosidase in W1301 grown in D (BMTLB,) — various sugars.

Glu	+++
Lac	+++
Mal	+++++
Gal	+++
Ara	— ?
Mtl	++++
Stl	++++
K. Dna.	+ -?

April 18, 1950.

W1301

A. DN2 — 6 plates Use ca 1/5 in 20 ml

B. DN2/Glu 7 plates. Use ca 2/5 in 20 ml

Hold 24 hours. Run manometry 4/19. See Protocols.

Bottle's experiment, the cells (B) were tested on a variety of substrates glucose, galactose, maltose, lactose, (but not arabinose.) were rapidly utilized by B. Later that PM, with same suspensions, xylose, sorbitol, mannitol and gluconate were tested, and were not utilized:

+ A	— B
glucose	arabinose
galactose	xylose
lactose	mannitol
maltose	sorbitol
	gluconate

This was taken to mean that W1301 is preadapted to sugars A, because previous work had indicated that K-12 was not preadapted under these conditions. But see 4/20.

Cells (A) also utilized lactose and maltose, but rather more slowly in relation to glucose.

Cell density of suspensions used. Dilute: .1/10 ml

	Di	D_{onpg}^{10}	Δ	Δ/Di
A	128	370	236	1.84
B	160	560	397	2.48
Δ_{onpg}		019		

W1301 : Synthetic medium.

April 18, 1950.

~~Synthetic~~ Grow 20h. aer. 37°. D (Lac or Glu) + BM 1/10

R.A.

			Di	Dorpg	$\lambda^{corr.}$	Di 1:10	Δ/Di
1	58-161	Glu	016	033	1	208	—
2	"	Lac	034	190	142	321	~~4.3~~ 4.43
3	W1301	Glu	020	620	585	228	25.6
4	"	Lac	036	434	385	332	11.6
	—		~~4~~	017			
5	58-161	Glu	208	200 (20m.)	—		—

Thus W1301 produces a "constitutive" lactase on very simple medium.

Selection against W1301 is anticipated in non-lactose medium. Transfer successively in D(BMTiB.) glucose, lactose, and maltose. Streak out on EMBLac. 1st transfer from W1301/Glu above. 0th: pure lac+

0th: colonies from EMBLac picked to DN2 Glu. Spot test for constitutive lactase:
12 colonies: all onpg+

1: 12 from Mal to DN2 Glu } all onpg+ 58-161 4 colonies
4 Lac
4 Glu
onpg−.

2: EMBLac − all lac+.

3: " " . Test from DN2 Glu to onpg. 4 each: onpg ++

Galactosidase in W1301: Synthetic medium with various carbon sources.

W1301 x W945

April 20, 1950.

"C" W1301 x W945 on EMB Lac

+, slow, – colonies seen.

Purify.

28 Lac+ — 2 possible npg – — no! Both are npg+
Replate on DN2 glu

12 Lac slow — 1 possible npg – — But very slow
Replate and streak out EMB Lac

Store purified cultures on NSA slants

Restreak purified Lac – prototrophs and hold on EMB Lac.

5/6. Pick separated – and Lac+ revertants (corresponding) to T(0), for test for constitutive lactase

"W1312" is not a prototroph! Repeat cross! (W1301 x W1177
W1301 x W1178)

---

ca 50 Lac – allowed to revert and Lac+^{R} tested from D(0) glu for constitutive lactase. None were Const+.

Conclusion: Const locus is closely linked to Lac, or Const+ is epistatic to Lac–.

TRY: Lac,– on EMB Neolactose

Preadaptation of 58-161; W1301

737

A- 58161
B= 1301 April 21, 1952.

	Cells		Flask.	0	↓ 340	350	400	410	435 +

Reisolate type H226 from slants.

Kinetics and stability of cellular lactase

April 25th. 1950

Harvest X-12 from aerated Y2 Lac (1%?) after ca 18 hours. Wash 2x and concentrate from 100 to ca 10 ml. Remove ca 2-3 ml and toluene with benzene at room temp. for autolysis overnight. (B). Assay remainder with orpg M/2000 in Na P buffer M/50 pH 7.5 [Stored overnight in refrigerator]

On basis of preliminary assay, dilute A 2/50 and B 1/500 to give convenient ranges of activity in 20 minutes.

Assay system: 5 ml H_2O 3 ml M/15 Na P buffer 7.5 1 ml cells. 1 ml substrate (or H_2O). Add 1 ml Na_2CO_3 M/1 to stop reaction. Use dum scale of spectrophotometer. Time with stop watch, with 30 sec. interval between additions. Run in 38° "Precision" water bath with motor stirrer. Preliminary turbidity gives variance of tubes. Use volumetric pipettes. Remove from bath to room temperature when Na_2CO_3 is added.

Check, time sequence with A.

(1)

	Time	D:		D_{orpg}	Na_2CO_3 ①	+1 hr	$A^{corr.}$	A^{corr}_{D}

		Th Bac.		146'	156	151	151	154	152	155	157	4

Thus K12 from .1% glucose ferments maltose ca 1/5 - 1/4 the rate of glucose; from 1% glucose, at only a negligible rate! Galactose is not used significantly by either, previous discrepancy presumably due to impure galactose.

W1301 - Preadaptation to galactose

May 1, 1950

-W1301 and 58-161, each harvested from 3 plates DN2 Glu. 1 Wash and resuspend in ~~25~~ 30 ml. 1/20 $NaHCO_3$. Flasks 2 ml cells, .1 ml 10% ~~substrate~~ in sidearm.

			0	5	10	15	25	30	35	45
1A	—	161	55	57'	59'	57'	61	64	62'	61
2A	Glu .2 ml	161	48'	50	61	93	153	183	209	262
3A	Gal	161	13	10	10	17	20	20	23	21'
4A	Lac	161	51	52'	51'	55'	59	58'	61	60
6A	~~Lac~~	1301	60'	65	63	70	71	71'	72	70
5A	Glu	1301	62	64	77'	119	181'	206	236'	290

	Th Bar		133	135	132	138	139	136	140	139

W1301 is preadapted to lactose but not to galactose (galactose should be accumulating!) Hr uses lactose as fast as glucose.

1/10	Di	Donpg		Δ
A	252	260 (10 min)		—
B	249	473 (6 min)	ca 220	∴ B shows an activity of $\frac{4 \times 2.2}{1} = 88$ u/ml.

(Test by B exposed to conditions of Warburg vessel.)

Judging from efficiency of B in mixture with A, B contains approximately 7x the amount of lactase needed to keep pace with glycolysis, assuming equal potency within and outside the cell.

Inadequate lactase!

May 5, 1950.

200 ml DN2 Lac 1% K-12 harvested. Wash; suspend sediment in 10 ml. Dry 9 ml (D) aliquot; Dilute 1 ml to 10 (A). Treat ca 2 ml of A with Benzene (B). 40M —

Preliminary assays (see 744.)

A: 30 u/ml. Dilute 1:15
B: 50 × 4 × 3 units/ml, ca. = 600 u/ml. Dilute 1:200

D: 430 mg dry cells (two stage drying).
∴ Calculate 1 BDU = $\frac{430 \text{ mg}}{9 \times 192}$ = .248 mg (Cf. 744 .217

Assume about .23 mg. eg.

D) Prepare a 2% suspension of dry cells. Remove aliquot for use, and dilute 1:10 (2 mg/ml) (D) (2× in anti.)

X_1 Extract remainder 3 hours and spin sediment. (Re-extract = X_2)
Yellow, viscid, opalescent supernatant

Cells

Kinetics of ~~[redacted]~~ un-treated cells. Dilute ~~[redacted]~~ 1/15

	Final conc		Corr A	Corr B	Σ Corr	Δ = V (392)	1/V	1/S

7	M/1000 No cells	021						

Terminate with Na_2CO_3. Read within a few minutes.

~~10 r~~ 20 minutes 37° Cells fresh (a few hours in H_2O)

NaP M/50. 10 ml volume + 1 ml Na_2CO_3.

Volumetric Quant Technique

K_s (cells) = 6.3×10^{-4}

V_{max} ≐ 1/25.5 ≐ 392 (3.92 units / ml suspension.)

The cell suspension ~~extracted~~ was 1/15 × 1/10 × 1/9 × 430 mg/ml $= \frac{430}{1350} = 318$ r/ml

(Calculated density unitage : $\frac{2}{3} \times 192 = 128$
≐ 318 r
in perfect agreement, as demanded!)
Lower o.d. due to alkali).

Therefore V_{max} was 3.92/.318 = 12.3 u/mg.

Kinetics: Benzene treated cells.

May 5, 1[illegible].

B) Dilute ~~1:100~~ 1:200 to place in convenient range for assay.

	.01 ml.	011		437	4370 u/ml.	

LACTOSE ASSAY SYSTEM:

1 ml stock suspensions + 2 ml 10% lactose + 1 ml M/5 Na P buffer + 5 ml 10% $CaCO_3$ + 2 ml H_2O. Incubate 20 mins. Boil 2 minutes. Sediment and assay supernatants (1 ml)

	"Cells"		Assay
1.	A	no lactose	0
2.	A		4.84
3.	B	no lactose	0
4.	B		17.45
5	Novello lac		5.91
6		Glucose 1 mg.	2.18

The boiling with $CaCO_3$ appears to cause appreciable lactose hydrolysis, but the increased hydrolysis of benzene-treated cells is quite apparent

←

Lactase activity measured on lactose

Preliminary

Substrate = 2% lactose. All experiments in M/100 NaP buffer. 7.5

a). 1 ml 744 extract (= 880 units/ml) + .6 ml 10% lactose + .15 ml NaP M/5 + 2.55 ml H_2O @ 37° 3 38 – 8 45

---

744 extract 880 u/ml

1 ml extract + .6 ml 10% lac + .2 ml NaP M/5 + 1.2 ml H_2O.

Ca. 5 hours incubation.

Add 4 ml Benford's Cu reagent to 1 and to .1 ml.

	N/100 ml KMnO4
Glucose 1 mg	2.47
lactose 10 mg	<< 1 drop
Assay .1 ml	5.67
Assay 1 ml	36.0

This is the equivalent of complete hydrolysis. Repeat with lower unitage; shorter time.

5/18/50. System as above: .1 ml extract .6 ml 10% lactose .2 ml NaP 2.1 ml H_2O to 3 ml volume.

Sample .1 ml from time to time into 5 ml Cu reagent.

9 25 0

1 15 .5 ml sample 3.65

Glucose 1 mg 2.43 Take 2.4 as standard.

" " (1 ml boost H_2O) 2.13

∴ sample contained $2 \times \frac{3.65}{2.4}$ mg "glucose"/ml = 3.04 mg/ml.

∴ 88 units enzyme · 230 minutes split $3 \times 3.04 \times 10^3 / 360$ μ moles lactose

1 unit = $\frac{9{,}120}{88 \times 230 \times 360}$ μM/min. = 1.25×10^{-9} moles/minute.

= .45 γ/minute

Trial Run.

Calibration of method.

(1)	1 mg glucose	3.35 − .63	2.72
(2)	10 mg glucose	23½ × 20.10	33.3
(3)	10 mg lactose	2.5 − 1.86	1.86
(4)	100 mg lactose	13.5	11.86

later: titrate with Setaphonic C, no phosphoric acid

2, 6 Mal+ (EMS) may be segregating Mal− prototrophs (Lac v?)
Verify from single Mal+ colonies (EMS).

3 may illustrate a segregation from Mal v into Mal+ and Mal− lac v.
Verify from EMS Lac.

4 seems to suggest another type of separation. Lac Mal v ⇄ lac v Mal− / Lac− Mal v

5 may be confused: Mal− presumably was streaked on EMS Mal, for Mal+.
Verify from EMS Lac. ✓

6/3/50 ✓ 3 → Mal+ lac v and Mal− lac v

4 → Mal v Lac− and Mal− lac v

6/4/50 5 → pure Mal+

6 → each of 4 tests pure Mal+ prototrophs

2 → 1-10% Mal− prototrophs in each of 8 tests. Restreak; slant as 754g2; test Mal− on EMB Lac 4/10 were lac v.

A. Lac v ≒ ~~total~~ population ≒ prototrophs.

Auxotrophs = 1%

Mal- lac v = 2%

Mal- prototrophs = 2% (all lac v)

B. Lac v = 35.5% Prototrophs = ca 2/3? p Kill = ca 88/180 = 50%

	/Total	/ lac v	/prototrophs	/original total //	
Auxotroph lac v	7.4	21		3.7	
Mal- lac v	3.5	10		1.8	
Mal-	15.5			8	3.5
lac -	64.5			33	10
Mal- prot. lac v			12.7		

The predominant effect is to make haploids pure for Mal, lac. The residual lac v have a high proportion of perturbations. (should be checked on other characters).

754

B UV. Mal- (EMB) 81/522 = 15.5%

Lac- (EMB) 340/527 = 64.5% Lac v = 35.5%

Mal- (EMS) 73/259 = 28.2%

a) Mal- (EMB): 2/56 = 3.57% Mal- Lac v.

Total fraction = 3.57 x .155 = .55% intact Mal- Lac v.

b Lac v. 25/120 are auxotrophic: $\frac{25}{120} \times 35.5 = 7.4\%$ auxotroph

12/120 are Mal- Lac v = 3.5% Mal- Lac v.

c. Mal- (EMS). 19/42 are Mal- Lac v = $\frac{19}{42} \times 28.2 = 12.7\%$ of prototrophs are Mal- Lac v.

754

A. Control: Mal− = 11/315 = 3.5% EMB Mal

Lac − = 37/369 = 10.0% EMB Lac

EMS: Mal − = 3/157 = 1.9%

d 7 Mal− from EMB Mal : 1 Mal− Lac v.

∴ H226 suspension is ca .5% Mal− Lac v.

e. Lac v from EMB Lac /89 : 2 Mal− Lac v / Mal v Lac v non prototroph

This gives estimate of 2/89 = 2.2% Mal− Lac v.

1/89 = 1% auxotroph Lac v.

f. Mal− prototroph 3/3 is Mal− lac v. This gives estimate of ≅ 1.9% Mal− Lac v (prototroph).

Summary: controls. Take 2% as Mal− Lac v (prototroph)
1% as Lac v (auxotroph)

$$3080\ u/ml = V_{max}\ of\ \frac{1.25 \times 3080}{27} / mg.$$

Lactose activation in Lacto-12

K-12 harvested from 6 x 40 ml DN2 .3% lactose agar. Wash and resuspend in + 10 ml H_2O. (A). 3 ml aliquot of (A) shaken with benzene 2 hours. Stored overnight in refrigerator.

A: 215 mm/hour k = 1.84 (glucose) 37°

B: 190 mm/hour. k = 1.78 (lactose) 37°

∴ A ≐ 17.7 μM CO_2/hr ≐ 1.27 mg glucose/hr.

B ≐ 15.1 μM CO_2/hr. ≐ 1.09 mg glucose/hr.

(Assuming 1 μM glucose ≐ 2.5 μM CO_2 - Stokes - J. Bact. Feb. 1949)

$Q_{Glu}^{CO_2}$ = .128

$Q_{Lac}^{CO_2}$ = .110

original suspension A) 33 ~~x 1 mg~~ 1γ/ml

33 x .3 = 9.9 mg / Warburg flask.

27 mg/ml original suspension

c) Lactose hydrolysis. System: 37° 10 minutes.

2% lactose 2.5 ml
Cells 1.0 ml
NaP 4/5 7.5 .5 ml.

Terminate Reaction by adding .5 ml 5% $ZnSO_4$. Clarify with .5 ml .15N $Ba(OH)_2$. Sediment and decant clear supernatant. Dilute 1:10 in water, and take 1 ml for assay, after Caputto, Leloir and Trucco, Enzymologia, 12:350 (1948). To read optical density, read the reduced Ho reagent at 1:10 dilution at 520 mμ in spectrophotometer. All readings of same single cuvette.

6.6 mg/ml

		Density
1.	A. No lactose	004
2.	B. No lactose	000
3.	A. lactose	002
4.	B. lactose	110
5.	— lactose	003 ~~110~~
6.	Glucose (1 ml 2% = 4 mg/ml).	107
7	Blank. + reagents.	003

Thus, 1 ml B in 5 ml liberated 4 mg glucose / ml in 10 minutes.

∴ 1 unit ≐ 20 / 3080 × 10 mg / min.
= .65 γ / min.

No accumulation of monose by A could be detected. It can be assumed to have hydrolyzed ~~at the rate of 1.09/6 × 10/1.5 × 1/2 →~~ 121 γ / ml ($\frac{33\ \gamma}{5\ ml} \times \frac{10}{60} \times 110\ \gamma/\text{mg max}$), ignoring temperature coefficients. Activation of 4/.12 = 33 × re lactose. Activation re enzyme was 3080/90 = 34 ×

Manometric assay

Cut

Dear Josh:

Just to prove I haven't entirely forgotten about the staff, I'm sending the above cuttings. Other will be all for another two weeks as I'm off on another rover mission. I haven't had any time to think out a new route but I'll try to get at it when I get back to town.

If I haven't already given you it, my new home address is;

30 Decatur St
Kensington, Maryland.

I hope the cuttings don't all turn out to be hopeless. I'm sorry about so many uncertain groups of 4 cells but they grew too fast for me, probably due to the humidly warm humid weather we've been having.

As ever

Mary

Cultures of 6-5-50.

$\chi^2 =$

Conclusion: (11/12/50): $S^R X^+$ selection is a reliable method for detecting recombinations.

Pseudomonas fluorescens

Preliminary and penicillin rxn.

Sept. 21, 1950.

P. fluorescens. A3.12 received from R. Stanier.

Grow at 30 ±. Aerated cultures gave heavy growth overnight in Penassay or in D(glucose). However D— also supported growth, presumably due to citrate utilization.

a) Test "PF" base: per liter with addn. of 0.1% substrates.

K_2HPO_4	4
KH_2PO_4	4
$MgSO_4$	.5
NH_4NO_3	2

n.g. with benzoate or glucose.

Throw out!

b Dilute cells from dense Penassay culture 1:20. Add varying units penicillin and aerate. 230 PM.

Pen.	4^{30}	6^{30}
0	++++	++++
50/ml	"	++++
100	"	+++
500	"(+++?)	++ lysed
1000	++ lysed? (granular deposit).	

∴ 500 – 1000 units/ml will lyse Pseudomonas fluorescens.

9/22/50. [20-40-60 sec. doses. Dilute in Penassay 1145]

Wash 48 hr. aerated D(Glu) culture and resuspend in $M/_{15}$.

UV at 50cm 10ml samples in Petri dish. Dil. ½ml 1/10 and dilute from this as 10^n for viable counts

UV sec.	Count
0	5.3×10^7; 4.8×10^7 – 5×10^7
20	5.6×10^6
40	5.5×10^6
60	10^7

See over for conclusions

Auxanograms – P. fluorescens

9	IV	✓		
10			TRYPT.	4
11	A4	TRY HIST.		
12			TRYPT.	

10/1 Throw out all but PF – x strains.

Notes:

PF-1. Growth on histidine is slow and limited compared to A4.

761-8. After 48 hours, growth on glutamate exceeded histidine. Try hist + glut and hist, glut + vits; + yna.

PF-2 Growth on A2 ~~slightly~~ considerably faster, than on isoleucine-valine. (balance?)

PF-3 and PF-4 probably preferred as mutants for further work

Pseudomonas – penicillinum

Sept. 23, 1950.

P.F. A3.12 irradiated 60 sec. Grown overnight in aerated Penassay. Remoculate into Penassay 9^00 AM for young growth.

2 PM wash and resuspend in D(Glu). Rm. temperature

2^20 aerate A) .5/10 dilution

B) .05 x .2 = .01/10 dilution

2^40 add 1000 u penicillin per tube. (1000 u/ml)

6^15. A strongly lysed cf. non glu – non pen. control

Plate A, B, in D(0); NSA.

9/24 1PM. Comparison of D(0) with NSA impractical owing to failure of subsurface colonies.

A2 → ca 30 surface colonies

B1 → ca 3-4.

Pick from each to water. Test on NSA; D(glu)0 agar.

A: 30 tests. 11 did not grow on D(0).

B: 20 tests 2 did not grow.

lower dilution into penicillin is not more effective. Possibly a longer interval should be used.

Pick presumed mutants to nutrient agar for ~~pass~~ preservation.

Further colonies tested

A 20/27 + 13/19 = 33/46 Store on NSA plate.

! Repeat. See 760

Re: K-12 [illegible]!

1045× very likely S^R mutants. W1115×, 1176× may be either recombinants or very peculiar types like 760-5 which demands explanation.

Inoculate Y2 with stock W-1177. Inoculate heavily into DSM.

H248 : 3 papillae on Mal EMS. (hemizyg. test)
all bac - segr. pure Malt pat in test.

E coli outcrosses

763c

10/8/50 + prev.

W1177 ~~plate~~ cultured with

1 W1176
2 W1115
3 W1258 in ½ broth 24 hours. Wash + plate very heavily (ca 10^9/plate DSM).

Controls: W1177, etc. alone: no colonies

1. ca 200/plate
2. ca 1000/plate
3. 0 colonies. (10 plates)

These colonies on test proved to resemble their prototroph parent: Lac+ Sucr± and Streptomycin-sensitive!!

10/~~10~~9/50. Repeat with fresh cultures:

Sh24x 5 plates ca ~~4~~/
Sh24c 2 plates ca ~~15~~/

W1045x 3 plates 1
c 2 plates 0

Brush ~~streak~~ on EMB Lac, Mal. Result very peculiar:
all slow on Mal. Sh24x; 1045x are Lac+, -
Sh24c Lac+.

Sh24c Lac+ Chief prototrophy! — none prototrophic!
Sh24x (1-8): Lac- S^R
W1045x Lac- S^R

probably S^D mutations.

W1177 x

1	Gaunt +	4.	W1113
2	W1281 (Coli Lisbonne - Cavier)	5	W1115
3.	ML (Monod - Lwoff mutable)	6	W1176

1.	5 ⊗ ; 2 control plates	0	
2.	5 ⊗ 2 " "	0.	
3.	5 ⊗	16	#1-16
	2 c	0	
4	2 ⊗	0	
5	2 ⊗	1	#17
6	2 ⊗	15	#18-32
	1 c	3	#32-34.

Pick all colonies to water. Spot on DSM for preservation.

Streak

1-16 (ML x 1177) : all Lac - mutable; Malt (~~numerous~~ 3^R mutations??)

Peculiar sectoring noted in ~~16~~ colonies on EMB Mal

17 mucoid mutation on EMB lac. mottling of fluid streak.

SD ? { 18-31 weak growth on EMB lac Lac -

32 mg. on EMB lac

DSM plate check.

#1-17 show peculiar mottling of colonies on EMB Mal.
Resemble (from #3), and ML itself. However, ML is definitely a weak MH+; 763-1-16 are all strong MH+. (Maybe effect of S^R mutation)

Clues:

#3 resembles ML in variegation on EMB Mal, from strong to weak Mal+. Not unique.

#1-16 also resemble ML in Lac^{-mut}; Mal+; Xyl+, (V_1^R) and must be regarded as S^R mutations in absence of evidence for recombination of any other nature.

763f- #17 appears to be Lac+ Xyl- MH- V_1^R. v. Poor growth on EMB xylose!
From W1115 x W1177.

Compare 1. W1115
2. W1177
3. #17
4. 1+2

on various media.

EMB:	Glu	Lac	Suc	Mal	MH
1	+	±	+	+	+
2	+	−	−	−	−
3	wk. +	wk+	+	wk+	+ wk
4	+	+, −	+, −	+ −	+, −

#17 is a weak fermenter, but may be merely an S^D or S^R type mutant from W1115. It does not provide evidence for recombination.

S^R/S^S heterozygotes

Sept. 26, 1950

9/29 W67 x W1177 heavily plated on EMS lac 7 plates x ca 200/. ~1400 2 (lac+) prototrophs. Restreak on EMB lac, EMS lac, EMB Mal, DSM.

#1. Mal−; gives a few papillae on D(SM). lac v. grows poorly on EMS lac.

#2. Mal−; grows well on EMS lac. large colonies on ~~D~~ DSM. Streak out several colonies of each on EMB lac for segregants for S^S/S^R test.

---

6 EMS Lac+ colonies to ~~EMS~~ EMS Lac (SM)

3 " lac ± . (noted on streak of 764-2)

all S^R

ca 30 Xyl− S^R (taken from EMB lac segregants).

This culture H248 is evidently pure S^R Mal− Xyl− (coupling of S^R to Mal− is not unexpected). It may be useful in physical comparisons with K-12.

B Repeat W67 x W1177, v. heavy parental inocula, on EMS lac. After 3 hrs., ca 1700 prototrophs. 10 possible lac+ picked for test: streak on EMB lac; spot on EMS lac; streak v. streptomycin on EMS Mal

	lac	EMS	Mal	S				
1	−			R				
2	~~+~~ ++			R				
3	−			S				
4	−			R				
* 5	v			R	1	Pure Mal+	Xyl+	S^R
6	−			R				
* 7	v			R	2	"	−	
8	++			R				
* 9	v			R	3	"	−	
* 10	v			R	4	Pure	−	Xyl− S^R

None of these is segregating S^R/S^S. Repeat cross again (to look for Mal v)

→

~~to~~ S^R dominance?

W67 x W1177

10/11/50.

Cross 67 x 1177, 10/9/50 EMS lac.

C Colonies examined A12. 14 plates ca 100/ = 1400.

3 colonies picked: (2) very doubtful). Test on EMB Mal
#1 + 2 Lac v Mal −; Mal + S^R EMS Lac (S14).
#3 Lac − Mal + S^S

D1 ① W67 + W1177 + 1 added volume ×2 9:30 — to

② Separate until washed.
concentrate each from 20ml combined volume to ca. 1.5.
(Spread .1ml each on EMS lac (± camphor))

Yields in 1 and 2 ca same. (① may be not more than 2 × ②).
2?? lac+ in 19 × 50 prototrophs

1 (Acenaphthene) Lac − Mal + S^S
2 (Camphor). Lac + (pure) Mal − S^R

2da → Neither is lac v.

3da. P15. 2 additional possible lac+

(1. − camphor ① Lac v Mal − Gal v Mtl − Xyl −. Gives many lac − proto
2. − acenaphth. ① Lac − Mal + trophs. (partial segregation?))

P17: P## (camphor; colchicine; controls)

E very poor yield.
20 plates × ca. 25/plate = 500. No lac −.

F 10/19 10 plates. Parental media derived from cultures exposed to camphor on EMBagar for 6 hours.] Ca 160/plate. 12 Lac + segs. (ca 1%!) (Reincubated more)
Is this due to character of parents?
4 additional lac + 10/22. (14-17)

No suitable S^R/S^S heterozygotes recovered.

10/22/50.

F's streaked out on EMBlac (poor batch!), EMSlac; EMSMal.

1	little.	−, V
2		V, −
3		V, −
4		−, V
5		V, −
6		V −
7		V −
8		V, −

This suggests a mutable Mal allel rather than segregation.

For 1327, Select a lac+ and streak out to allow lac analysis; Mal reversions.

B) 1329: Pick a Mal V from each and restreak on Lac; Mal.

C) Pick any possible lac V from reversion plates and restreak.

"W1328" No pure + obtained! Study other reversions of W1327

c1 1 possible lac ±. Restreak single colony → pure lac+.

B: #3, 5, 8 are pure Lac+, Mal V. Others happen to be Lac− Mal V
No pure Mal+ seen. Repropagated lac+ Mal V as W-

D. Papillae from W1327. Streak out individually: are there any Mal++?

W1327 revertants. 769D

8 Mal+ revertants from single Mal− colonies tested for purity. Some − components

	Mal
1	+ −
2	++
3	++
4	+ −
5	v
6	v
7	++
8	++

Restreak − and + components of 2, 3, 4, 7, 8.

Confirm: stable + ✓.

10/19 Repick associated − and + to determine whether a single − type gives both Mal+ and Mal+^{m}. Transfer + to slants as 7 & 8 etc.

D7 is distinctly more powerful Mal+ than the others.
D2− is most papillated

Reversions from 769 D:

2	almost all variegated.
3	occ. Mal v. Some Mal++, Mal+?
7	mostly Mal v " " " ?
8	occ. Mal v.

∴ all Mal− give Mal v revertants; some Mal+??

P 10/21 Restreak single Mal+ or v colonies from above.

2	varying degree of instability
3	2 stable +; 1 stable ± *; 1 variegated +
7	2 stable +; 1 unstable ++ *; 1 variegated + *
8	1 unstable very weak + * 3 variegated ++

Repick interesting types *

10/21. Cross D7+ with Y10 for "suppressor" to 11 1 possible − / ca 1000 proteolytics (& plates)

↳ streaks out: mucoid Mal+ (not Mal+)

∴ W1327 probably differs in only reverse from K12

10/7/50.

Irradiate PF0. (30 sec.) Incubate in D(0) glucose.

A 8: Inoc. into T(mand) to preadapt 3 - 4 hours (heavy inoculum 1:1)

Wash and reinoculate 1:10 into T(mand). After 5 mins add penicillin to 1000 u/ml. After 5 hrs & overnight spread on EMB Lac. Test on EMB Lac; T(mand)agar

P10 55 tests : no mutants

Addnl test

P11 (Polyflis Fuid). 50 tests " ". No mutants.

ca 50 addnl. tests : " "

Query: Are methods suitable for C-source : 1. Penicillin selection
2. Agargrowth tests.

Check 1 by reconstruction with Mand- strains
2. by T(m) agar (+ mandelate).

EMB lac used solely for convenience + for identification.

green diffuse

#1 gives an undoubted Acrif R reaction, but

redisperses very readily to resemble S or RS.

Morphological differentiation probably better on EMB.

M271 — 273.

W1435 x W112 on EMS MM.

Pick MM +, purify on EMS MM. Test for discordant V_6 reaction on EMB, EMS (MM).

Out of ca. 30 such tests, 3 likely cultures segregating V_6^R.

M271 – 273.

M271 is verified as segregating $V_6^{R/S}$. V_6^S predominate.

M272 – Lac ?

$V_6^S \rightarrow$ Lac – stable $V_6^R \rightarrow$ Lac – unstable on EMB Lac.

Streaks (MM)

of EML60 12/28/50. Nonallelism of lac, c – b.

12/23/50.

See 777B.

Ca 1/2 Mtl$^{\vee}$ isolates are ~~#~~ Lac − 1/2 Lac$^{\vee}$.

Some Lac − EMS may have come from duplex, whence Lac + might be isolated. All original 1-22 are on D(Mtl) or D(Lac) segs.

Lac+ isolated: 11, 12, 18. All appear to be stable Lac+.

11/23 In course of isolation 8, 13.

To be isolated 14, 17.

#8^{+} is ~~[redacted]~~ Lac+, apparently pure, but restreak.

By EMS Lac → both Lac+ and −. Restreak + to verify, and to provide Lac − for further testing.

#13 → both + and − colonies. Restreak Lac+.

#14 → pure + EMS Lac. (mislabeling ?). Isolate to slant. ✓ as EMS. cf. "14 −"

#17 + and −

Note: since Lac$^{\vee}$ components of #8, 13, and 17 have already been isolated, attend to Mtl$^{\vee}$ character of Lac − "segregants".

12/27. "14+" is pure Lac+ Mtl − 14− : pure Lac − Mtl + (? Rev).

~~#~~8+ Lac$^{\vee}$ OK.

17− : 3 Mtl + 1 Mtl − No$^{\vee}$.

8 − 4 Mtl + no$^{\vee}$.

13 − 4 Mtl − no$^{\vee}$.

Tentative conclusion: These cultures which give Lac − prototrophs from Lac$^{\vee}$ isolations are throwing prototroph segregants, not partial segregants. Restreak from original slants. This does not explain 11, 12, 18 which are apparently duplex.

Comparison of Lac$_1$ – homozygotes hybrids and parents

12/24.../50.

Lac (EMB) 364..

1	H271	Bright red centres (confluent papillae ?)	
2	H258	type – papillae in streak	
3	H268	type – no " "	
4	H273	as 1	
5	H261	as 2	
6	799-11	as 3	
7	W1435	–	pap.
8	466	–	pap.
9	112	–	stable
10	1177	–	stable!!!

H271 and 273 may show very slight + reaction; more likely frequent crossovers lead to lac+ segregants.

W-1177 appears to have become lac– stable. Therefore lac– types such as H268 are unsuitable for homozygosity analysis. Review strains for lac– mutability. Resuscitate W660 for new set of diploids carrying mutable Lac$_1$–.

see 803

Lwoff Effect.

January 1, 1951.

A = K12
B = 1485.

Young cultures from YZ. Irradiate 2 ml samples in 10cm plates.

1. Pre-irradiation control.
2. After 120 seconds uv.
3. After 80 minutes incubation in YZ.

Incub 1.10 in YZ
No lysis observed.

A	1	ca 2×10^9 cells.	10^{-7} λ. (1 plaque)	B1	ca 2×10^9 cells

C2. 100 picked: all Mal+ (no Mal ✓)

See 815'

2/26/51

W1177x on EMS Mal for Mal v.

A W960
B W965
C W966
D W972

① No special treatment ② Expose uni plates to UV 50cm. 10secs.

A. 1 2 × 200 3 Mal+ ?
2 6 × 300 15 "

B 1 3 × 200 6 "
2 4 × 300 12 "

} all Mal+ no Mal v ! scoring on EMS Mal very difficult

C 1 } 3 × 200 } 1200
C 2 4 × 150 }

No Mal+ seen.

D1 2 × 300 No Mal+ seen. Scoring ?

Picks to MalEMS: 60, all Mal −.

Contradictory results?

Repeat D1. Ca. 1% Mal+ formed. ∴ W972 is not allelic, but close. Scoring of these Mal+ arrangements because of Mal is not satisfactory. However, W1532 (from W966 Mal −) should serve the same purpose, if it is truly allelic to Mal).

Suppressor: Lac_3 Lac_1 8/6

February 12, 1951.

W1531 $\frac{A}{B}$ x W1490 on EMS Lac. Look for Lac − to verify persistence of Lac_1 −.

A ca 600 all Lac+.

B. ca. 700 prototrophs, all Lac+.

Do $SLac_3$+ are allele of Lac_1 ?
If so, it should be detectable among Lac_1 − revertants.
Check for a) x Lac_3 −
b) Constitutive release

10 recombinants from A seem to have constitutive lactase! (from DNP Glu plates; spot test)
Recheck from synthetic D(o).:

K-12 Prototrophs
1531 A + B
W1490
} are Cst −

W1301 Cst +.

∴ none of these lac+ suppressors are Cst + like SL_3 previously examined!

See 822

H281

828

3/19/57 H289 is MtlvXylv Lac+ Mal−,+ v?

Inoc D(Mal) 10 ml with mixed growth from original EMS Mtl streaking, incubate in air 24h. Plate out at 10^{-7} on EMS Mal, EMB Mal, Mtl.

EMB Mtl plating shows 90% Mtlv. On EMB Mal, no clear Mal v colonies are seen, but very numerous mottled Mal+, which might be Mal+/− ... v.

↪ ca 30: all Mal++ 20 all ++ Mostly Mtlv.

This "culture" is probably a duplex pair Mal+, − resp. Check Mal− for hemizygosity.

824-8
H288

3/17/44. /50.

H288 is Lac- MHv Xyl+ Mal- from $\overset{BMLac-}{W466} \times \overset{W660Lac+}{W1577}$
$T5^{s}(?)$ V_1^R.

Each of 16 Lac+ reversions on EMS Lac was found to be Lac$\underline{v}$ MH$\underline{v}$ but the latter character is difficult to score.

∴ Lac- derived from reverse cross is also homozygous.
From this one might argue that the corresponding Lac+ found in the cross W478 x W1490, etc., are also homozygous.
Compare 819 for similar data on Mal.

A W1490 x W1511 (W-1 Mtl) on EMS Lac.

B " x 1578 (W-1 Xyl -)

C " x 1519 (")

A 40 Lac "+" picked, streak on EMB Lac. Lac v : 1-4 1-6 (~~[illegible]~~).

B. 100 Lac "+" (light) picked (Miss Lem) and streaked on EMB Lac. Mostly Lac -!

C. 40 Lac + picked.

Segregation ratios : B among Lac - 13 + : 78 -
5 + : 15 -
9 Xyl+ : 51 Xyl -

C " " 14 + : 46 -

~~A~~ ..

Lac + : C : 7 + : 22 -

B : 3 + : 30 -

Some correlation with Mal+ recheck.

	Mal+ Mtl+	Mal+ Mtl-	Mal- Mtl-	Mal- Mtl+
A. Lac+	7	0	13	1
Lac -	3	0	18	0

very close linkage of Mtl to Mal. Also seen in heterozygote behavior.

March 26, 1951.

1, 2, 3 : Mal − Mal − lac v. Growing poorly on EMS Lac.

There heterozygotes give almost a − reaction on EMS Lac, requiring 48 hours to give a full + reaction. (Modifier or pleiotropic effect?)

Each gave a Mal+ Lac v reversion with stronger lac+ reaction.
∴ Mal− is hemizygous.

	Lac	Mal	Xyl	Isolated EMS lac +	
1	V	−	V	V+	Xyl V
2	V	−	V	V	H
3	V	−	−	V	✓
4	V	+	−	V	✓
5	V	−	−	V	?
6	V	−	V+	+	Xyl +

In B, C 1 EMS lac+ colony was picked as purified haploid stock.

3, 4, 5 each gave Xyl ± reversions after storage on EMS Xyl

∴ Xyl − here is Xyl =

	lac	Mal	Xyl		Isolated EMS+ lac	
1	?	−	−	.	v?	— mottled but not lac v. May be lac+/lac+
2	?	−	−	.	+	xyl-
3	v	−	v		v	
4	v	−	v		+	xyl v
5	v	−	v		v	
6	v	−	v		v	
7	v	−	v		v	
8	v	−	v		v	
9	v	−	v		v	
10	v	−	−	. .	v	—
11	v	+	+		v	
12	v	−	v		v	
13	v	−	v		v	
14	v	−	−	. .	~~+~~ v+/v	
15	v	+	+		v	
16	v	−	v		v	
17	v	+	+	(v?)	v	
18	v	+	+		v	
19	v ?	−	v		v+ (?)	
20	v	+	+	(v?)	v	

Note conclusion has also between xyl+ and Mal+. Would it be possible to arrange to have xyl marker screened to verify the homozygosity of xyl "+" in this case?

all S^S on EMB Hyl

TL Lac^r Mal^r x DM Lac$^-$ mal$^-$ S^R

These diploids resemble those of 833B and 833D.

Evidently, the BM parents do not contribute to the Mal-S factors of these heterozygotes. The possibility that these are 3n-2n aneuploids remains open. (cf. B or D).

when M245 is one parent.

Restreak +^{v} colonies from certain Mal plates. All but 10 and 23 showed apparently only Mal+, these also had rare Mal$^-$. It is possible that these are all Mal^v but that segregants occur rarely. Appropriate S^R markers would facilitate the characterization of these diploids.

Compare original and derived Lac v Mal v 833 Ca

April 21, 1951.

Compare original & derived (selected as Mal v) from 833:

1 A9 – σ Lac v
2 – d

Plaques noted in thick streak. Mostly lac –; + on background.

3 B3 – σ Lac v
4 – d Lac – only

Restreak 1 & 2 on EMS Lac to recover heterozygote. Source of λ^S?!

✓ Plaques may be unique phage, rather than λ^S

This is confirmed. The phage attacks all λ^+, λ^R types and resistant mutants are not attacked to λ (E.M.L.)

May be merely a contaminant see EML 163

Auxotroph Lepil par exp. 837

April 12, 1951

A. H257 suspension from D(lac) streaked out on EMB Lac, Mal on and possible S^R Lac v or Mal v epicked for tests auxotrophs. 2 apparent Lac v (from several hundred S^R) recovered; both auxotrophic 837A-1 and A-2. Check nutrition; S^R, etc. Both are Mal ~~v~~ -

1. eventually grows on D(0), but fertest on D(TLB,) or D(BM)
   b-? or prototrophic?

2. D(0) -
   D(BM,) -
   D(TLB,) -
   D(BMTLB,) +.

B. H261, through Penassay. Plated → ca 10% Lac v.
Test colonies from EMB to D(0).

30 Lac v.	# all prototrophic	#16 ?v Mal S Xyl MM Lac v
20 MM v		#16.
6 Mal v		# 3?

C. H257

35 Lac v.	#17 auxotr.	others x+	Lac v Mal v
31 Mal v	#7 ? "	" "	Lac - Mal +, -

B1 (L)T - Mal Xyl MM Lac 1/4 S^{R1} v. n.g. for crosses.
C1 Mal Lac M+ T+ L+ ... ~~Prototroph~~. not heterozygous

H257 - 267 partial segregants

April 20 ff. 1951.

Irradiate H257, 24, 30 secs. UV 50 cm. ca 20% survival.
Pick lac⁻ centers and streak with ~ 1/3 lac⁻.
Replica lac⁻ on + (?) and ~~streak~~ spot on D(o); ~ 1/3 lac⁻ (or back segregation).
Partial plating gave a 2% S^R lac⁻. Incidentally after UV, this number ~ 6%.
Some "lac+" gave very scarce-lac⁻ - S^R segregants! (Why is ??)

B Check for prototrophy:

H267.

	lac	Sm	D(o)		lac	Sm	D(o)

C }
D }

B. 6 clones. 19 V_1^R; 14 V_1^R

1 C 7 clones 30, 29.

D 1? clone. 12, 12

A29. Pool pickings ~~from~~ homologous sites and restreak on EMB Lac. save original cultures Transfer to plain, T1 agar.

2 A 15? clones; ca 25 mutants Restreak from 5 sites

B 13? " ca 40 " " " " (without pooling)

C 12 " all v thick streaks 18 muts.

D 1 21

A3-4. 14 clones; 37 mutants. Pool from 5 sites into ca. 1 ml.
Plate serially to further dilutions.
Suspend B, C experiment.
D transfer to plain; 2 T1. 7/3/51. Hold in refrig.

7/4/51. ~~Transfer D3~~
D3: 3-4 clones (?) ca 20 mutants.
Plate as #4:

A4. Transfer to series of T1 plates at 1, 3, 6" spreading

****

This procedure is obviously not working properly, presumably because of confusion between mutants within an inoculum to a plate, and those which occur during the growth of colonies on the plate. The samples from homologous sites are probably too small to have a reasonable probability of carrying an identified clone to the next inoculum.

The procedure should be modified as follows: A broth culture should be spread or streaked on plain agar, and permitted to grow for just a few generations. The thinly grown plate should then be printed to selective and plain agar, and the clones identified. The homologous site should then be inoculated to a small volume of broth, which is then restreaked in the same manner.

Lee Adelberg

Selected isolations

852
D

June 29, 1951.

Cross B EM5 Lac. Print 3 plates to (173 Lac-, 174, 174) for specific selections. #1, 2 rather smeared (use back support wipes)

#3 OK

Pick all Mal- (Lac-) and Mtl- from # 3 plates (including overlaps).

Comm. Lac: 10 - 163 + / 173

Mal ~~29~~ 30 } 7? overlaps

Mtl 21 }

Lac-Mtl 1? ov.
Lac-Mal 0?

S^R : 27 : 8 Mal+
19 Mal-

From the interaction of the - Lac, Mtl, Mal selections, in cross with unselected tester of B, we should note recombination linkage which is maybe interesting.

Linkage of Lac to M? Not supported by these data.

Lac- mutants in W1634

July 6, 1951.

W1634 (Cellobiose-fermenter). Irradiated 8 secs on EMB Lac
~~20~~ x 50 = ~~1000~~ colonies.
Some sectorials undoubtedly ignored. Many morphological sectorials.

Spot Lac- on EMB Glu for lac- tester pairing.
By ~~Lanston~~ Hotz:
13 lac- all are sucrose cellobiose xylose galactose maltose and glucose positive

Save 1. lac- 854 1

July 12, 1951.

20 x 50 = 1000 on EMB glucose No definite mutants
15 x ~~40~~ = 600 " " " " " "

7/16. Check Vaughn's cultures 776-835, 837, 839, 840, 841 1-5 s.o., EMB glu, cell, suc, lac

7/17. all are ++ or +. #1, 3 probably most generally suitable
= 835 (Vaughn 129) = W 1647
= 839 (Vaughn 168) = W 1648

7/17. a 1634
b 1647 — uv resistant
c 1648

854-(2-4)

a. ~~3 possible lac-~~ from 12 x 400 = ca 5000 ✓
c 1 " " " 8 x 100 = 800. ✓ (+ spread very well!)
= 854-5

All 4 mutants grow rather poorly. Are negative on galactose, glucose, xylose, mannitol, maltose, lactose, sucrose and cellobiose

see over

(1648??)

W1647. UV

1 Glu- mut on 5 plates, variably recorded

? Lac- or ±

(1). Glu- Cb- Suc + Mal-Lac-
Xyl+ Gal+

Designation of W1647 almost certainly correct, but conceivably was substituted for W1648. Designate 1647a for immediate source of Glu- mutant (W1677)

Penicillin effects on K12

July 8, 1951.

24 hr. K12 culture .5/10 ml fresh Penassay + penicillin as indicated.

1. No penicillin
2. 1 unit/ml
3. 5 units/ml

* P9. Fifth 1, then 2; 3 then W1177 (4) as control.

This experiment u.v.:
Sealing gasket on filter
used for 1 and 2

With 1–5 units, no morphological effects were noted.

Penicillin effects.

July 11, 1951.

P12. P12.

K12. 1 ml + A Penicillin in Penassay tubes ~~++++~~
B

1	A	0	++	
2	B	50	++	Normal size + motility.
3	C	50	++	many filaments. some minute granules
4.	D	120 u/ml	±	inhibited growth.

Filter 1, 2, 3 through separate 8-9 lb Mandler filters. Pass turbid (ca 10^8) W1177 broth culture each bulk sterility. Plate this filtrate on EMB Lac (= E) and inoculate 1 ml into Penassay (= F).

		1	2	3
A.	Inoculate filtrates 1 ml, Penassay	—	—	K12 only ++
B	" " " " + W1177. Plate after 24.	0	0	~~++~~ K12
C	Plate " .1 " EMB Lac	0	0	0
D	" " EMB Lac + W1177	0	0	0
E		0	0	0
F		—	K12 only ++	K12 only ++

A few particles per ml ~~survive~~ survive filtration, if penicillin has been added. No unique genetic activity is noted. However, higher titres of FA, and heat-inactivation are needed to parallel Salmonella findings. W1177 control satisfactory.

Also plate filtrates into serum agar (+ penicillin ?)

F: streak out on EMB lac + or − see to find W1177.

75u Penicillin K12 1% inoculum. 4½. 37°
" R.T.

A. Sediment and filter supernatant. 14 under 81b filter
B. Follow with untreated W1177 >1% (.01/ml) control.

---

1. Plate A on serum agar; 0.1ml
2 " " nutrient " "
3 " " EMBlac 0.1 "
4 Incr 1ml samples into Penassay.
5 " " " + .5ml W1177
6 Plate B on EMB Lac sen
7 Incr 1ml Penassay.

Conclusion: Filter not satisfactory. 6 showed ca 50 lac-
1,2,3 each showed ca 400 500 (lac+). 4 all turbid.

Refilter unirradiated suspension, 141b Mandler hypothesis all sterile. No protoplasts from 5, 7

Conclusion: Penicillin may result in slight augmentation of lethality of K-12, but no consistent effect noted. No genetic effects whatever noted.

5. showed minute colonies on EMS lac after 3-5 days

Pick and streak out on EMB ~~S~~ lac, D/O). – 3 days: no growth on both

[Probably T-L+ revertants growing on carryover]. not + on former.

8 hour W1649 + 855b Inc'd in Primary.

9 " W1632 " " " "

Wash + plate heavily EMS lac

No colonies

Conclusion: No evidence of genetic activity in penicillin treatments of K12.

TL- +-1 in linkage orientation

Lac+

Lac –

July 10, 1951

P10

1. Inoc. Isolate U-1 to Permassay., NSA slant

~~Spread~~ Spread .1 (a) and .01 (b) ml on E4B lac. Assay .1 ml i T1.
9:30 A12

~~4P~~ 4P Print to I T1 agar.

A 13: Read:

a. 46 clones; 31 singles; (1 plate); 2 1/2 singles (second plate).

b. 10 clones; 6 singles (on one plate only)

Pick from b sites to rush broth.
Spread .001 ml; streak. Incub 4 P11 - 10:30 AM
Print A 10:00 AM. 13.

~~AM~~ .001 ml: 15 clones 10 singles (1)
5 " (2)

(3) Pick 5 sites.

- Assays of successive isolates. 1×10^{-6} .1 ml 91,5 mic.
2.5×10^{-6} .1 ml ca 500.
3×10^{-6} .01 ml ca 1000.
4×10^{-6} 38/582

N15 Plate at various dilutions
Shows incubation:
Print to T1.

A streak: 1 clone is nearly confluent portion. Restreak quickly, also testing and compare cross-streak with T1, as against random isolated clones. Pick 1 clone = 1

B 10^{-5} Semi confluent. 9 clones; no singles.
Pick 3 clones = 2-4 streak out
pool to Permassay.

See over:

1. Random tests on streaked colonies. / T1.

1.	10 S.	0 R
2.	"	"
3.	25 S	5 R.
4.	8 S	2 R

∴ successful isolation of V_1^R by indirect selection

2. Dilute 858-4 10^{-6} plate. 1 ml. 3 plates.

#2 smeared - too wet

Permit to T1 after 9 hours (pinpoint colonies)

1.	12 V_1^R	301	total
3.	16	261	"
	38 /	562	

Pick best isolated homologous colonies. Test against T1 and streak to purify.

✓ each of 4 V_1^R

2 random V_1^S.

Store single colony as 858-5 ... grow + transfer broth to test stability

Note In final plating a few plaques of contaminant phage (identified as T1) were found. However, no evidence of T1 was found in the broth series, or in selection line. It seems unlikely that this could interfere with achieved result. However, see 859 for repetition of general expt.

Indirect Selection: W-112 / T1.

July 17, 1951.

Initiate single colony broth cultures 11 AM. = 859-1

P17 Plate EMB lac, Incubate ca 5 hours. Print to T1 plates .01 ml

5 clones; Total: 16; 12

N18. Picks clone sites to Penassay.

3-8 PM. $^{A}10^{-2}$, 10^{-3}, 10^{-4} ml plated on EMB lac

8 PM Print to T1 plates

A19. A. 23 clones, 1-3 singles.

B 1 clone 2 singles

C 1 clone 1 single.

Pool clones from B and C to Penassay. 859-3

N19. 2 hour tube probably ca 3×10^8) plated out on EMB lac

12 N19 — 10^{-3} A, 10^{-4} B, 10^{-5} C

q^{30} A20. C: (ca 600 cells) No V_1^R

B: 2 clones; 1, 0 singles

A: 16 clones; 2, 0 singles.

Pool 2 sites from B and 2 from A to Penassay 859-4.

10 A21. 10^{-6} dilution: 3 plates. After 4 hours, make replica transfer.

A

B 12 mutants; 793 Total

C

Streak out 4 of the V_1^R.

Test against T1. V_1^R ✓

Place associated V_1^R on slant.

Initiate serial transfers in broth, 5A, B, ...

858 and 859. Each transfused serially through 10 5ml tubes Penassay with loopful inocula.

8/3/51. Plate out on EMB glu. Replica to EMBLac. T1. all colonies are V_1^R. W1485 control lysed on T1 plates.

Total counts:

858	859.
290	131
277	150
269	166
836	447

Replica Efficiency

July 24, 1951.

A. Compare fresh and 4 day broth for clones.

1. Dilute 58-161 in EMB (4 ml) 9 AM.
2. Spread " " " " 315 PM.

325. Replica to T1 agar, pairs.

B. Dilute 58-161 10^{-5} Spread .1 ml, let dry.

① Replica to series of plain agar.

② Assay 10^{-7} ml for count.

③ As ①, but 10^{-5} ml originally

			(Replica removed) ↓				
(B) 2:	10^{-7}	0	1	2	3	[illegible]	
		99	91	7	1		
1	10^{-6}	(1000)	± 10^3	42	19	12	10	6
3	10^{-5}	(10,000)	± ca 10^4	331	171	108	109	87

∴ About 10-25% of initial cells are removed.

5-10% deposited on first replica, with indicated "decay" thereafter.

8/30/61 — see experiments with E. Klein on efficiency of colony transfer,,

Singlets and clones
Replica plating

July 25, 1951.

2¹⁵ P.M. W112 (859-1)

1a. 1 ml + T1 assay 190
b. 02 ml + T1 assay. 90 ~~78~~

2a ~~.02 ml~~ .1 ml Replica to 2 T1 plates immediately
b .02 " " " "

3a .1 " " after incubation 2¹⁵ -
b .02 " "

2a	15	4	0	) no sign of clones.

Mal v relatively infrequent in this cross.

Grow 866-1 on D(Lac) for mucoid patches on EMS Mal.

Diploid microcolony segregations

August 2, 1951.

See 862 .01 ml; $.3 \times 10^{-6}$ per plate $11\frac{30}{}$ -

assay .1 ml EMB Lac

V	-
14	6
9	3

Mal

+	-	V
1	0	23
9	1	26

11^{30} - 5PM.

ca 200/ml. About 2 clones / plate.
Agues with 2-3 ~~pla~~ strains not required.
On EMB Lac 6 plates. EMB Mal 3 plates

Clones:

—		EMB Mal
	1^1 V	1 V
1	1^4	1 V
		1 +
	1^{10}	1 V (+, - also!)
	no segregants	1 mixed V, +.

No useful data but method is substantiated.

8/5/51. H226 A) .01 ml 10^{-6} B) .01 ml 3×10^{-7}
D . Lac count; many —. (assay: 14 V, 17 —)

5 usable Lac V clones, ca 10/. 2 possible segregants, but crowded.
Streaks on EMB Mal. (Both Mal +) ✓

8/6/51. As above. Total 25 plates, mostly too crowded Mostly Lac V
E 47 possible useful clones (5-20) ~~a~~ altogether. (5½ h. mic.)
Pick Lac - to EMB Mal · 12 : all Mal +. (2 Mal V)

8/7/51 4½ h. mic. ~~Loop~~ standard loop method — Few clones
F should use 2 x. Many Lac - !
(over)

G, H. UV 20 secs. ca 50% surv.

Results inconclusive. Increase in Mal+ in both intact and resp'ed.

Method probably is unsound.

auxotroph diploids. 868

July 30, 1957 FA

A. H226, grown in D(Lac), no treatment. auxotrophy noted in replica platings. Nutrition, Mal, S tested in such platings.

H267, grown D(Lac). UV 30 secs. Grew heavily in D(Lac) +

B. BM

C. TLB$_1$.

Plate on EMB Lac, Replica tests for auxotrophies. B gave numerous auxotroph Lac$^-$; C very few.

Cross Attempts with E coli B
Phage T3

August 3, 1951.

Mix 1 drop culture or phage T3 (10^{-3} lysate) to 5 ml Penassay
Incubate overnight.

A 8/3

1	Y44		
2	Y51		
3	Y44 + Y51		
4	Y44 + T3	clear	
5	Y51 "	"	
6	Y44 + Y51 + "	"	

→ #1, 2, 3, 6 plated. all grew without plaques on EMB.
No protoplasts after 7 hours.

Sediment turbid cultures. Plate on D(o)

Repeat A, with heavier bacterial inoculum (ca. 4/ml)

1-3 turbid. 4-6 clear. Streak out 4-6. Also W1664/3 passages

B 8/4

4-6 remain clear!
No true 1664/3 formed as survivors (phage tests)

W1663/3 obtained from platings on EMB. = W1679.
Purify by 3 streakings on EMB and retube —.

C 8/12.

1	1679		Protoplasts? 1
2	" + T3	±	1
3	1679 + 1665		1
4	1665		2
5	1665 + T3	Clear.	
6	1679 + 1665 + T3.	± turbidity.	3

Sediment. Also inoculate 2 and 6 into Penassay.

a) The parents are not completely stable
b) No detectable effect. The crosses had numerous ● (L?) forms.

See Notes by E. Cohn

August 29 (ff.) 1957.

a) Diauxotrophes from PF9 (meth-) and PF12 (leuc SR).
UV 40 sec., resuspended cultures in saline from exh. Asolectin broth
Wash proc 1:100 in D(C) + meth + leuc + 1000 u/ml penicillin,
↑ aerate overnight. Plate on EMB bac after 10-12 h.,
replica to D(ML).
PF 9 ca 15% auxotrophes.
PF 12 ca 3% . to pack to EMB for Rechecks.
On Rechecks:
PF9. 7/8 and 31/40 = 44/48 OK as auxotroph
PF12 14/20 OK.

see 870a. for Random series.

b) Plate mixed suspensions from b) at ↑. PF 9, PF12 and PF9+12 (uv. grown together). The last showed high counts (prototrophs) (ca 5000/ml) but considerable counts 5/5 1000?/ml) these were in the separate cultures also.

Preservation of Bacterial Cultures on Silica Gel

This circular was written in response to a number of inquiries. Judging from these, present methods for preservation of bacterial cultures are not entirely satisfactory, and it would be a real contribution to laboratory technique to work out a better one. Unfortunately, I can only suggest a principle that seems very plausible, but that has not yet been empirically justified.

The working principles are (1) that suitably dried bacteria should survive just as well in a sealed tube under air as in vacuo, and (2) that if this is correct, chemically inert desiccants such as anhydrous silica gel could greatly facilitate the practice. The following arrangement has been tried: small vials or tubes are filled nearly full with silica gel (Davison Company, Baltimore; Grade 40, 6-16 mesh). About 1 to 1.5 gms. of silica fits well into the tubes used. The tubes are plugged, then baked in a sterilizing oven at 160-180 C., 2 hours, to dry and sterilize the tubes. These are stored in a desiccator. The bacteria to be preserved are suspended in 2% peptone. About .05 ml. is pipetted directly to the silica, and the end of the tube sealed off. The tubes were then stored in a refrigerator. The water disappears very quickly. To regenerate the cultures, the tubes were broken, and the silica poured into broth. Considerable gas is liberated. After about an hour to allow redispersion, viable counts were made on the broth. The 24-hour survival, in apparently dried condition, was quite high (about 10%), but this was more encouraging than long-term experiments. After four - five months, the survival has been low, of the order of 10^{-5}, and some tubes are inviable. In its present form, the method is not a success, and cannot be recommended for long-term preservation and storage. I think that it could be greatly improved, without complication, by experiments leading to a better suspending fluid, and possibly by drying the cells on a layer of glass bead over the silica. What is most needed is an improved theoretical understanding of the biology of suspended animation in successfully dried cultures.

Despite its shortcomings, the silica gel tubes provide an ideal method for mailing cultures. They are not affected by undue cold in the way agar slants are, and probably ought to be more resistant to high temperatures as well. The mechanical strength of small sealed tubes allows them to be sent with simple padding in an ordinary envelope, and the absence of any liquid minimizes possible hazards from breakage and leakage.

I hope that other workers with suitable facilities to study preservation problems, or with a potential interest in the biophysics of suspended animation may be able to make some use of this suggestion.

No Mal V noted in platings of pooled probings

November 22, 1951.

See correspondence ca. 11/51 with Umbreit & Ogrisley

Stanier recalled the report (J. Bact 1949) that S^R mutants of the Hussey + Gratia strains of E. coli were not improved in growth by aeration. RYS suggested that this might be a directive effect of sm on spontaneous S^R survivors (similar to Ephrussi's petite forms). Several S^R mutants of E. coli K-12 were tested, and did not differ from S^S in improved growth with aeration on Penassay, Minimal or Tryptone broth. (incl. W1177, & other K-12 S^R).

Ogrisley sent two cultures labelled S and R respectively (Hussey strain). These did not show NAI. effect, but Ogrisley later wrote that the early experiments were not readily reproducible.

The cultures when streaked out are highly heterogeneous, and show a majority of minute colonies that do not grow for ± 48 hours.

11/20 Test S1, R1 (sm. colo.). Both show AI on Penassay.

P21 Restreak S1 and R1 (as received). on EMB Lac, Nutr. Ag.

A22: large colony forms apparent on EMB Lac Practically no growth visible TSA. Incubate

12/16/51.

WAc 3 grown on nutrient agar bottle.

Susp. ca 2.5×10^8/ml. Dilute to 2×10^3/ml. UV 90 sec
plate on nutrient agar. n.g.: survival ca 500/plate!

12/28/51. Same suspension. Dilute from nominal 2.5×10^8
to 10^3/ml. 90 sec uv. Plate ,2 ,1 ,05 ml
ca 10×35 colonies. 4?? None mutants. Recheck.

Plate WAc 3 on TSA+sm100. (ca 10^8 plated; 10^2 colonies appeared)
Restreak on TSA+sm. Pick clean colony to Dtc slant as presumed sR
mutant

W1729 : Selection in Series on non-Maltose medium.

November 24, 1951.

Streaked from EMB Mal to nutrient agar A: Mal+v
B: Mal−

Note: A forms somewhat larger, rougher colonies

11/24. Picks 4 colonies from A, B. Restreak on EMB Mal and NA

11/25 A: Mal v (ca 94%) and Mal− in all 4 streaks
B: Mal − P " " " "

∴ Maltose is not immediately necessary for instability.
Inoculate from nutrient agar to Pomassay, EMB Mal and NA
Difference between Mal v and Mal− noted again in these streakings.
(Looks for mutational equilibrium)

	A	B
1	20+ 8− some+?	ca 1%+
2	84+ 34− some+ slower	100+: 17−
3	37+: 40−	[illegible]
	70+ 71−	[illegible] stable ??
	[illegible]	ca =

A3 shows no + stable
B3 + stable ?

A state approaching pseudoequilibrium is reached from either side.
Stable +, (− ? also) occur in B series.

Repeat with colony streaks. Streak Mal+v colony (A3) on EMB Mal; Nutrient Agar
= C1

6/24/52. Restreak slant of A1, B1. A1 → mostly Mal ±, and − v
B1 → all Mal − P
∴ no change in stability.

Stable + seems to accumulate in successive transfers, but so gradually that skeleton mutation process can't be excluded.

WAc 3 x 4. 885

December 7, 1951 et seq

see 880

12/2 Cross Bunch 3 x 4 on minimal agar. Prototrophic interaction seen
12/6 Restreak from X, also parents D(o) agar.
12/9. WAc 1 Heavy spor. growth
WAc 3 no "
WAc 4 faint colonial background.
WAc 3x4 Mostly like WAc 4. about 20 heavily spor. colonies on thick streak.

mycelium Ditto., especially around mycelial fragments.

12/9. Restreak (spores) from spores A., mycelium B. to minimal agar.

12/11 +++ growth, apparently pure in A, a few residual - colonies in B. Restreak spores on minimal medium.

12/14. A. 12 colonies on thick part of streak
B. Blanks.

Restreak from 12/11 plate., A, B and from 12/14 A. to minimal and complete. Also replica 12/9 to " " all prototrophs.

12/16. All streaks +++

Compare 886.

1/2/52.

Repeat cross brush. Heavy residual growth of WAc 4, but sporulation only of interests. Restreak 4 sporulating ~~sg~~ sations 1/5/52

1/10/52 Occasional sporulated colonies finally developed. (5 days!) Restreak

1/16/52 Residual growth crumbling WAc 4. WAc 4 shows too much residuum to be a satisfactory mutant New growth probably at coincidence of WAc 3 - WAc 4

WAc 3 x 5

886

December 8, 1951.

A 12/7/51. Crossed on minimal, but WAc5 app contam ⇒ shows spots of +.
B See 880 Reverse. Cross-Bush WAc3 x WAc5 on minimal agar. 12/8/51

A ∘ B after 3-4 days show prototrophic interaction, no signs of syntrophism.

A. 12/11 Restreak spores on minimal. 12/14. ~~Very few colonies A, none B. (good inoculum ?)~~

~~12/14 Restreak from 12/9 plate to minimal, complete; also replicate~~

12/20/51 Table photographed

No Table photographed

or

(12/12-12/14. at room temp.)).

B. 12/12/Restreak spores on minimal agar (separate areas). Isolated
12/16. prototroph areas; background mostly auxotrophic. Repeils to minimal medium.

12/20/51. 1: Scant large colonies, background smaller (new heterokaryons?); residue of background heavy — (auxotroph parent) Restreak from 12/16 plating
2: no prototrophs.

12/25/51. Over two prototrophs, mainly satellited. By late growth, diffuse prototrophy (= formation of heterokaryons?) Restreak 1, 2 (centers of prototroph growth).

→ complete. Replica to minimal +, - Incubate ca 37° 1 each.

gave sporadic prototrophs on minimal. (over)

Heterokaryosis only?

886

1/1/51. plate 12/16/51 [illegible]

Strain largest prototrophs in minimal.

1/6/51 1 sector largely prototrophic, about 50%

"prototrophic" colonies, may be partly sectored? Restreak some of these —

886A. 1-4. 1/10 flat growth not sporulated.

WAc 11 : Mutation mm.

WAc 19 x x.

12/29/51.

Harvest from 4 day bottle nutrient agar.
Yield: 3×10^8 (ca 15 ml.) cell count

Dilute to 1.5×10^3/ml. UV 90 sec. Plate on D(Ac)

1/1/52 Considerable variation in pigmentation. Moderate # sectored colonies (spore texture; pigment ?) on ur plates. 1 yellowish slow, wetted mass on plate: streak out + compare with col. from control plating (might be S. griseus). Methylest dark slight but measureable difference presented.

ca 14 x 100 colonies replicated. 11 poss mutants recovered by brushing spores on D(o); D(Ac). 3 are clearcut mutants with little or no residuum. Pick from D(Ac) to eg. spore suspensions:

WAc 18, 19, 20. Slant. Cross brush these with each other & with WAc 3 on minimal agar.

	WAc 18	WAc 19	WAc 20.
WAc 3	0	0	0
WAc 18		++ past intersection	
WAc 19	++ past intersection		
WAc 20	± " "		
	no residue	1 reversion ?, sl. residual	no residue

1/10/51. Restreak 1/16/52

A WAc 19 x 18 dark gum growth at intersections of smaller colonies.

B WAc 19 x 3 Numerous, moderate sized white colonies

C ~~WAc 18 x 20~~ occasional large dark colonies against mucoc. background.

1/16/52. (room temperature:) WAc 3 x WAc 19 very heavy dark gum growth at intersection. Background very light.

WAc 18 x 20 similar, no background.

WAc 19 on this plate shows considerable background (from intrusion ?)

Streptomyces from NRRL; mutation runs. 888

12/31/51.

Cultures received

a WAc 13 S. venezuelae
b 14 S. lavendulae
c 16 S. coelicolor

15 and 17 sporulate poorly on D(O), DAc yellow color

Scrape spores directly from slants to 1/2 ml H_2O. Estimate density by cytometer. (ca 10^8). Dilute to calculated 10^3/ml; Treat as 883.887.

1/3/52 c OK.

b, a. v.g. in uv set (too much killing?)
b sporulated poorly on D(Ac), OK on D(O). right uv killing
a. count on D(Ac) low, on D(O) o. low uv survival.

Retransfer single colonies to DAc bottles for spores
WAc 16 showed two (more?) types of colonies: dark red (on DAc) and UV light orange red. Repick + test mixture of/difference. Red colony was used for stock. Light colonies were less acid fast by asparagine. No mutants in production runs.

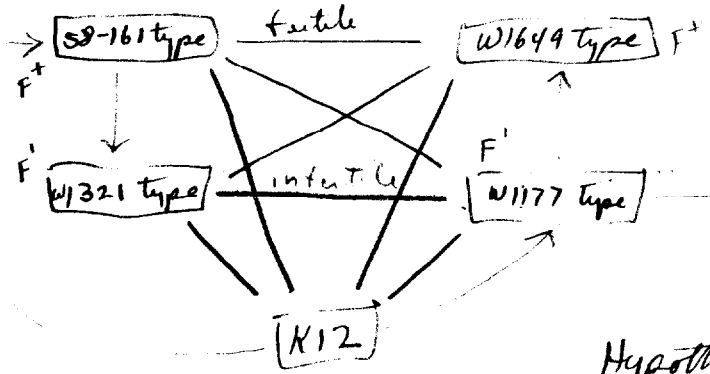
1/10/52. Re-start DAc) agar bottle for spores.

Rec 894

Incompatibility.

1/4/51.

EM+ noticed that W1321 (and subline W1578 from W518) was highly infertile with W1177. Her tests and those of this experiment give following relationships



Hypotheses: W1321, W1177 both carry the same mutant incompatibility allele F', all others are F+ and are freely self- and inter-fertile.

1/3/51. The following crosses were carried out on D10.

F' W1321 x

		Yield
F'	W1177	0
F+	W1267	+++
F+	W1649	+++
F+	W1678 (K12; mal; str-)	+++

(58-161 x W1177 controls should have been included)

λ is segregating

1/5/51. Initiate following crosses: 58-161 x W677

		Yield	SM	Lac
1.	Y10 x (W1607 + 58-161)	++		
2	Y10 x W1607 + 58 161	++	Mostly Lac+ S^S / Some Lac- S^R, Lac- S^S, Lac+ S^R / all lac+ S^S	
3	Y10 x W1607	—		
4	Y10 x 58-161	++	all lac+ S^S	
5	W1607 x (Y10 + W1649)	+++	Mostly Lac- S^R, some Lac+. Some S^S?	
6	" x Y10 + W1649	+++	all lac-	
7	" x Y10	-	+S^S	
8	" x W1649	+++	all Lac-	

(Note Sbac was mistakenly tried!)

Mating train D10 to EMS Lac, no plate-cal Sbac, D10

This is evidence that F' x F' crosses in presence of F+. F' is thus deficient in "donor" and "fertile" [illegible]

Conjugat	W1607 x	1304	++	1022	+++	W1014 x W1015	+
tester		674-680	—	1015	+++	x W1649	+
F' fertile		471	+++	K19TH	—		
Lac+		-11	—

1	+, −	wkyane
2	0	controls 2-4
3	0	n.j. ?
4	0	58-161 suspension ?
5	+, −	
6	−	
7	0	
8	−	

Fertility situation experiment [illegible] Stuehrer except pistol-pkt to test for ♂ to use for self-incompatibility expts.

Recombinations, additions of F's

1/7/52 W1810 × K12 (SRF) — (Mal+ and −)
" × 1177 } D(0) —
" × 1649 } —

1/9/52 Add Hairin to part of plate
1/11/52 Norfleet

1/10/52. Do there a connection between linkage modification and F+?

~~1 W1178 × W1607 : segregation of Mal, S.~~
2 W588 × W1607 " " " lac
~~3 W1178 × 58-161 Control, Seg. Mal, lac, S.~~ (cut. plate)
4 W677 × 58-161 " " " "
lac− → lac+ Mal− → Mal+

W1178 seems apparently contains segregation of F+

A.

do λ inherent to F+/F− ?

B.
1 W1321 × W1027 (F−) } no D(0). } infertile
2 F− × W1267 (F+) } very fertile

1 ~~58~~ × 1607 lac− → lac+
2 ~~677~~ × 58-161 lac− → lac+
3 W1800 × W1178. Mal+ >> Mal− (∴ BMF− × TLB, F+ f1 shows same ~~showed linkage as BMF+ × ...~~)
RU 896.
4 1178 × 58-161 Mal+ > Mal− lac+ > lac−
5 1178 × W1607 Mal+ > Mal−

Conclusions:
1. Status of W1810 Unsure, clouds situation
2. B shows that λ is not directly related to F
3. F+/F− not directly related to abnormal linkage of F. TLB1.
at least F+ × F− = F+ × F+

1/11/52 W1367 } × 679 SRP } Both fertile, segregating lac.
W1607 }
∴ 679 is F+

(see over)

W1813 x Y10 +++

W1303 x Y10 +++

679-183 x W1607 ++

Confirms that 679 = F^+

679-680 = F^-

W1033 xx
Hfr.

570

1/6/52

Harvest 10ml Fermasay tubes to bulk. Conc xx are 1/ml each parent pair. D(a) plate after 3rd generation, called Dil xx. Use 1% "this".

No counts before plating.

		Conc	Dil
A.	1 58-161 x W1177	40	3 (+1?)
	2 1033 x "	ca 70 (½ are small col)	12
	3 58-161 x W1649	50	0
	4 1033 x "	17	0
	5 58-161 x W1678	~~3~~ 12	~~3~~ 0
	6 1033 x "	~~3~~ 31	0
	7 ~~Mass [illegible]~~ W1811 x 1033	0	

These yields on the whole are very low. Repeat.

A 1/15/1. "Conc" as above. "Dil" = dilute only W1033, do not alter ~~W~~1177

	Conc	Dil
1 1033 x 1177	+++	
2 " 1649	+++	

No effect of Hfr noted in conc. 58-161 x W1033 x 677

Re-cover Hfr!)

B. Aerated cultures. Resuspend in 10ml for conc. 1:1/10 for dil. Inoculate D(a)

	Conc	Dil
11 W1033 x ~~58-161~~ W1177		
12 58-161 x W1177		
~~13~~		

No yield. Except for rather low yields sporadically in A, this confirms the sterility of aerated cultures. Try 58-161 x W1177 x 1649 aerated non aer — in various combinations — to see if it may not act via F+.

1/9/52

Following cultures grown in Penassay.

1. 58-161 + W1607 + Y10 (100ml) Sedimented cells and filtered supernatant.
2. 58-161 10 ml
3. Y10 10 ml.

Nofiltrate.
Add "normal" 1:1 Penassay. Incr. W1607 11:20 AM – 4:20PM
(Also incr Y10 in separate culture).

Plate 0 1 2 3 & Y10 on D(0) .2ml 1607; .1ml Y10

1/18/51 No prototrophs in any of the series 0, 1, 2, 3 or when filtrate of 58-161 was used. F+ substance may not be present in filtrates of grown cultures.

1/10/52 Sinterglass U tube, 15 ml Penassay each side.
58-161 + W1607 + Y10 (A) vs W1607 + Y10 (B). 11 AM - 5:30 PM

Plate 6PM on D(0), EMS bac

1/11/52. A ++ B – . 1/12/52. A +++ B — mostly bact, few –

stimulus is not filtrable!

Do stimulus inhibited?
Grow $F^- S^R + F^+ S^S$ together, then inoculate into one broth & select out S^S. Test $F^- S^R$ residue from time to time.

UV Activation of 58-161 for recombination (Hayes) 892

1/9/52

Harvest 58-161 from 10 mL Penassay. Irradiate (in 2 ml saline) for 100 secs. UV. Incor. Penassay YCx Broth 20 minutes. & dilute and incorp x W1177. (.1 ml each) prototrophs

Control: 6

UV : ca 200!

11:35 - 12:05.

This confirms Hayes' claim. Repeat with F⁻ x F⁻ and

1/11/52. Repeat similar experiment to "activate" λ⁻ 58-161, W1607, W1248 and W677.

58-161 F⁺ A, A'

W1607 F⁻ B etc.

15	E	F	+++	++
16	E	W1649	+	+
17	A	F	+++	++
18	B	F	++ small	++

In these experiments, inhibition by aeration was not absolute. There may be recovery on the plate themselves. The effect parallels the modification of F+ to F-, possibly excepting reaction with W1304 which should be checked in a controlled experiment. Again note possible greater futility of F+ x F- vs. F+ x F+

aging 36h. no effect
aeration 58-161 parallels W1816 +++ effect

1/15/52

1. Washed cells. Mix 58-161 and W-1607 in saline. Incubate 3 - 9 PM. a) Streak out on EMB Lac; b) Inoc. Penassay + sm 10ug/ml. c: λ^+ All XX x Y-10 unless indicated

2. Grow 58-161 + W1321 in Penassay. a&b as above. (a showed background of Lac+ and lambda plaques. 2c λ^S (Therefore λ has not been transmitted whereas F+ has). lysogenic

3. Transmission from lambda-sensitive to [redacted]. W-1655 + W-1607 in Pennassay. Then a&b c: λ^+

4. to sensitive. W-1655 + W-1321.... c: λ^S

5. F+ to W-1177. W-588 + W-1177 a & b. (b showed rare + pap. b culture was pure.)

In all cases, Lac- colonies from a) were pooled to make fresh inoculum. Cultures were restreaked to control success of resiolation of F- component. Growth from sm-Penassay in b) was used directly, in each case with only barely detectable Lac+ residuum.

6. Transfer via lambda? 58-161 streaked out on W-1321 on EMB Lac sm. Plaques restreaked. Individual colonies picked and tested for lysogenicity. #1 (out of ca 25) was lysogenic and restreaked, rechecked. Single verified lysogenic colony retained for test of F: (X y-10)

7. Single colonies of W-1816 from stock culture (itself reisolated) streaked on EMB Gal(-). o = stock.

	Tests (x Y-10 exc. 5, x W-1607)		
	a	b	c(= retest pooled Lac- colonies from test streaks of b)
1	−	7 cols. + ?	w1607cont: −

W1811 Stability: Summary & Expts.

Lysogenicity

1/28/52

In course of 902 - 14A, plaques were noted in W1177 that had been grown with W1811. The lysogenicity of W1811 / 1177 was confirmed. The plaques are readily seen on sm agar (suppressing W1811 bacterial growth.) Check other post-cultures from Maas! all of his strains proved to be lysogenic on W1177. Their history is given as K12 → * KIT (ts) → KI put aboard. Presumably phage entered (mutated?) at *. ↓ ↓ Since KIT series is futile, the phage is not related to W1811 stability.

D	58-161	x	W1177	+	3	Yields generally
3/19 E	"	x	W1876	++	—	low. Bears repeating.
C	W1802	x	W1876	+++	—	

		D(o)	→	D(sm)	D(sm)	
3/22 D		++		5^S / 49	20	Note instability of C
E		+++		56R / ca 200	—	on sm as reported.

Proportion of breakthrough / segregants s^R is evidently greater for D than E. F+ x F- S^R differs from F+ x F+ S^R.

This consistent with the concept of "relative potency" of BM and TL whereby BMF+ x TL is actually BMF-!

Equivalent of parents in F+ x F−

A. W1802 (BM F−) × W1876 (F+)

B ~~58~~ 58-161 (F+) × W1177 (F−) ± Sm (A+ ; B−)

C. 58-161 (F+) × W1876 (F+)

also see Smith, 1947.

915a was conducted by Mrs. D. C. Gosting. It appears to show that W1177 F+ behaves like filial W1177! Repeat and of other F+ strains.

~~Sa921~~ 921, 915d. 916a.

Hfr. 916

2/27/52

"Hfr" received again from Cavalli ca. 2/24/52, after retests on W1033 showed no Hfr activity. Store as W1895.

a) Platings of W1895 at 10^8 and 10^6 per plate, in comparison with 58-161 showed 100-1000 x as many prototrophs

b) Effect was same x W1177, x W1876. ∴ does not depend on F- Opposition;

c) In one experiment, aerated Hfr was still F+ (same yield vs. 1177, 1876) but not highly fertile as Hfr. Control showed macerated Hfr still +++ fertile.

d) 1895 dil. x W1611, 1678 ⇒ few prototrophs! Repeat

e) 1895 of. A. showed Hfr x W1177 ± aeration
also Hfr x 1876 does not accord with c).

3/10/52 f). 1895 - 1895A. x1678. Showed Hfr from dilute plating, but A +++ / ++
x 1177 A ++ - ++++

This may reflect a partial F- phenocopy effect of aeration.

g. Grow W1895 in broth with W1607, W1177, W1876. Streak out, recover, and test by replica plating

A. 1895/1607. 1895 12 cols. Hfr x W1177
1607 2 " F- or Hfr? = 916G-2

C. 1895/1177 → 11 cols
1876. → 11 " } Hfr x W1177.
∴ No back dissimulation

B. 1177/1876/1895. 1177: 8 cols. + Hfr? x 58-161
1876: 11 cols. No cols x 58-161
Both: No cols x W1607.

Is this W1177 F- Hfr? Recheck after isolation. = 916G-1

(These mixtures should be repeated)

W1607/1895 = 916G-2

3/12/52 M. Recetion: subcult.

	conc.	1177	1876	dil.	1177	1876
1895		++++	++++		all ++ - 2/3 Lac -	all ++ - ; 2/3 Lac -
1895A		+	+++		1	4

Repl. to EMS lac.

student out on NSA: By replica 20/20 all Hfr!

∴ again, there seems to be ① an incomplete effect of recetion on the F+ character and ② a depression of Hfr in compatible crosses.

Note absence of F+ effect of W1876 x 1895 cf. 58-161

3/12 i. Repeat, using "moderate dilution"; ca 3×10^8 cells 1895 or 1895A per plate

	1177		1876	
1895	1	+++	2	+++
1895A	3	++	4	+++

No marked effect.

Repl. to EMS lac.

lac - : lac + Estem.

1	3:1
2	2:1
3	2-3:1
4	3:1

∴ again, W1895 x F+ shows no modification of segr. ratio!

916 "gA" 1-2. 1607/1895 Both gave seemingly very high yields with W1876, — with W1177. Same questions arose with W1177/1895. See above. ?Hfr. gA1 = 916 & 2.

W1875 tester was day-old. Today's broke!

916 & 1	x 1607	—	
	x 58-161	++	
	x 1875	+++	
dil.	x 58-161	29	
1177"	x 58-161	10.	

Closer comparison required!

as half-plates:

916 & 1 } x W1875 { — !
W 1177 } { ++

916 & 2 } x W1876 { +++
W 1607 } { +++

Is close comparison they were very similar 3/21/52

Is 1895 x W1876 less fertile than 1607 x 1876?

M Repeat transfer of F+ from W1895: Grow with 1607, W1177 in hemizygy. Resistant as EMB sm agar. Pool 40+ colonies:

C W1607 / 1895 / x 1177 —
D W1177 / 1895 / x 1607 —

∴ again Hfr does not transfer F+!

① Is F+ found in Hfr? ② Is it absent? Test pooled prototrophs from 1895 x [redacted] 410

Summary

3/11/52. h. aeration of W1895 → ~~no~~ a partial effect on F+, Hfr.
Histidine plates, 1895A on nutrient agar gave 20/20 all Hfr!
1895 gave normal bac, Phal- ratios × 1177, or 1876

3/12. i Similar result.

j. W1607/1895 Neither were modified, either re F+ or Hfr.
W1177/1895

k. Similar result. → l. do. But 916b1 on half plate test was −. (presumably mor cf. k.)

m Retrial of j, via Sm agar, for F+ from W1895.
Both W1607, W1177 (pools of colonies) remained F−.

3/16 n Retrial of m. 1607, 1177 → Remain F−, with +++, ++ × F+ testers.

o 1876/1895. ✓ O/K. 1876 remains F+.

p. Retrial m:

		1607	1895
A	1177/1895	+++	++
B	1177 / 1033	++	+
C	1177 / 58-161.	++	+

Results: (1607) ! − + A presumably reisolated 1895 (fact) proved to be impure (fact) Repeat! — Do this correct?

q. Is 1895 more futile than 1607 × 1876? Genetic study may be required.
Hfr does seem more highly futile Test 2.
about =. Test 2

R. Repeat p

		× 1607	× 1895
A	1177/58-161	+++	++
B	1033	+++	++
C	1895	−	+++

∴, as before, Hfr does not reproduce F+!, but W1033 does.

Methyl-naphthaquinone effects.

3/8/52.

Cf. Colwell 1946 J. Bact. 52: 417.

D/O) + MNQ (from 1% solution in acetone). Strain K12.

		A 24h.	B 48h.
1	0		++
2	.0002 %		+
3	.0005		+
4	.001		+
5	.002		−

A. Streak out on nutrient agar. No "petites" observed.

B. Re-streak. No petites " . #5 was sterile.

Critical concentration may be between 4 and 5.

C.

		A) 24h	B) 48h	A	B
1.	0	+++	++++	A No petites	
2.	.001 %	+	++	" "	no petites.
3.	.0015	−	−	Few saw. pet?	Streak
4.	.002	−	−	"	"

3/19/52 Colwell's observations are not confirmed with K-12! Write him for details

3/27/52 Repeat with Colwell's #II strain = 776-1763 = W1939

		24h	colonies	48h.	colonies
1	0	++	++	+++	−
2	.0005	+	++	++	++
3	.001	−	++	−	mostly +, some dw? Restreak.
4	.002	−	some dw?	−	+ / dw? (practically sterile)

"dw" grew out to full size.

Repeat 4/21/52

		24	48h	colonies:
1	0	++	+++	
2	.001	−	++	
3	.0015	−	−	one small but gave +++ on re-streak.
4	.002	−	−	

Colwell specifies previous transfer on minimal. Try this with W1939 A (single col. isol.) No luck.

September 16, 1952.

9/13. Colwell sent strains again: #1 = original coli transferred on minimal medium. = W1939A
#2, 3, 4 = "SCV" selected with guinine.

9/14-15. Characterization of SCV verified. #1 grew promptly to give large colonies on NSA. #2-4 gave barely visible colonies in 24 hours. By 48 hours, ca .2 mm colonies.

9/15. Inoculate from plates to D(o); Penassay:

9/16: All cultures grew very well, #1 perhaps slightly denser
By D(o) #1 grew more poorly than others! for further work, use 1 and 2 only.

9/16. Inoculate 917-1 and -2 from Penassay to:

	1	2	2days
D(o) liq.	++	+	
Penassay	+++	++	+++
NSB	++	+	
NSB+glucose	+++ acid agglut	++	
D(o) Agar	++ 2days	±	
NS Agar	+++	±	
EMB Glu	+++	+	
EMB Lac	+++	+	

Also, mix 1 and 2 ca 1:5 and streak out no satellite effect observed.

Growth on D(o) comparable to NB, NA. ∴ not likely single tryptophane requirement. In her paper, Colwell refers to MacLeod's "synthetic medium" but does not specify whether HC was added.
In experiments with W1571 (HLB yeast) MNG .002% was lytic in standing tubes. Guinine was lytic only in aeration. Usefulness in place of penicillin still to be verified.

Waksman strains
= W1906

March 10, 1952.

A. W1177 + W1906 in Penassay; streaked on EMB Waksm. Waksman plaque not again
Pick single colonies for F+ test. x W1607. 5 singles — | 6 singles
3 +
3 −
Isolate single colonies pool x+ ++ | pool++
= 902 D35 +3

B. Crossing tests: auxotrophs.

W1907 = 1908 — 1909 control platings —.

1907 x 1909 —

1907 x 1607 —

1875 —

1909 x 1177 ~~+++~~ contaminant coli? Replic to EMS lac: poor growth. prob. contam.

1876 — Repeat

C. W1846 — —
" x 1177 —
A " x 1876 4? → all lac− prototrophs. Fertility supported.
B " x 1607 1 Mal+
" x 1875 —

D. Waksman. SRP x

1177, 1876, 1607, 1875 } rare Mal+ no − each! This would have been classified as doubtful futile to be retested.

E - F (W1852; W1909)

		E	F	
1	1607	—	1?	
2	~~1875~~ SD 161	—	++	ng
3	1177	— (1)	—, —	
4	1876	—		
5	1808	—	4	
6	1678	—	—	ng

E3 grew others did not

∴ part TS strains may be detectably futile, others not (yet)

1177 + 1909 : grown up and together : —, —

1875 x ... ?

WG-35 x

918a

March 28, 1952

1.	W1852 ×	W1177	37°	=	
2	"	"	+ pant.	=	
3	"	"	+ pant. 30°		ca 20 cols. eventually
4	" ×	W1895			
5	W1846 ×	"	+ phage-ridden		
6	W1907 ×	"	1 " "		heavy background lysis
7	W1908 ×	"	ca 1000		

∴ Hfr does allow crossing of wg35 × wg 1., but W1908, not W1907! (φ^R tester should be used)
EML is working on the extraction of Wollmans phage and transfer to wg-1.

---

ca. 4/10/52. EML noted Wallas. to be sucr + - ± on EMB sucr.
Comparison of W1906; W1811; W1852; K12 shows the first 3 to be alike, strengthening conclusion of origin from wg 35. Cf. Shaw for cross-reaction (H?) of wg-1 × wg-35.

4/15/52. Strains received from Maas: K1t-p A) K-1t h2 B).
Grow together in Penassay 3h. Plate ca. 3 ml per plate

W1177 · A	No prototrophs	
W1177 · B	"	
A · B	Minute colonies; background growth (cytotoxicin?)	
A ·	1-5 " "	.
B.	" "	.

?? Was K1t-p or -h2 ever properly crossed with # wg 1? as claimed by Maas? WG-35 behaves in my hands throughout as a nearly sterile wg×, but there is some likelihood of crossing with other wg's.

W1678 deriv. Het crosses.

March 10, 1952.

W1903 (= W1688 s^R) x EMS lac Picks

A W1325 40-50/plate ca 2-:1+ ca 30
B W1178. 5-10/plate. ca 5-:1+ ca 10

Picks lac+ and streak on EMB lac to look for Lac v.

A. 1 lac v → lac v Mal-

B. 5 lac v → lac v 4 Mal- 1 Mal+. No Mal v !

Presumably Mal- are hemizygous and Mal segmental diminuetans also occurs in these "outcrosses".

c. W478 x W1876 (for formal statement). EMS lac, Mal. + → -.
EMB poor - differ. inuetans 40 tests - 8? mixeds.

Test for transmission of F+ to W1177. Test exposed W1177 / W1607

921B should be tested for fertility × W1177, W1817

A)

1	A1 × A2	3	
2	A1 × 1177	2	
3	A1 × 1876	16	R → 14 S^s
4	A2 × 1607	++	R → Lac sm all - R
5	A2 × 1875	+	(40) " 1+R.

∴ A1 behaves like a weak F+

A2 ~~but~~ like a moderate F+. A1 × A2 not accted for (unless F ÷)

Replica A1 - 1876 ξ EMS lac
A2 × 5 sm

4 unfore
$F_{A2} > 1875$
$F_{A1} < 1876$

In these experiments, Hfr behaves like an F-, with F+ Hfr not hfr.

921B #1 = lac+
2-8 lac-

Need to keep for
SRP x 1876
1177

Prot. (W1895 x W677) F states by SRP test

921B

~~3/30/52~~ 4/3/52

#1 Lac+ 2-8 are Lac-. Use 1 ml Penassay to prepare SRP x 1177, 1876

no significant effect of light.

F+ Hormone from W 1895

March 26, 1952..

A Cross W1895 with W1607. Plate on D(o), D(sm), EMS lac. x Y10

B. Control septum, grown separately

C. " components. 1 1895 x ~~W~~ Y10

2 ~~W~~ 1607 x Y10

D streak out 1607/1895. ca ½ % lac+ 1 SR

A. D(o) +++ $\xrightarrow{R}$ EMS lac sm 4 SRP. later ca 20 addtl. SRP, some lac− !

D(sm) No SRP. 3 days. ca 100 !

EMS lac ① ca 1000 lac+ No lac−

B. D(o) +++ $\xrightarrow{R}$ EMS lac sm ② 500 + 1 ? 925A1 streak out + check

D(sm) ① 6 SRP, lac+, −

EMS lac all +

C1 D(o) +++ $\xrightarrow{R}$ EMS lac sm 0.

C2

In view of possibility of intercalary crossing of W1607 x W1895, these data provide no support for a hormonal control of F+ grade in a situation where F+ transduction does not occur. See 928

Delayed crossing probably occurs on EMS sm plates.

Streptomycin and streptothricin

March 27, 1952.

Test (cross-bunch) Sm^R and Sm^S strains vs. old streptothricin 10^4/ml. W1922, W1607, W1177, 58-161, W677 all Sth^S
Lack showed a more ~~greater~~ abrupt cutoff in streaks. Cf. previous observations of SM-STH cross-resistance ! ⇒ These concerned cross-resistance at low levels only! (5 u sm = 10 u sth).

3/29. Selections for Sth^R:
W1678, W1177 ca. 10^9 ea + 10,000 u STH. No survivors

4/20 ff. Add 10 ml grown culture 58-161 to 100 ml Penassay + 50 u/ml STH. After 4 days streak and test survivors.
all tested were STH^R SM^S. Picks 1 as W1969. When cross-bunched against loopful of 1000 u/ml, show slight inhibition, whereas 58-161 is completely inhibited. Sth^R may differ from S^R in step-resistance.

Trial run: λ adsorption assay with multiple filter

8/13 ± 152

λ (1439 / woffate) diluted to nominal 2×10^6 /ml.
W1655 young aer culture in NSB, nominally 2×10^9/ml.

Mix in equal volumes 5+5 $4^{50} - 5^{15}$ 37° / incub. (no aer.)

(A) Assay initial phage ~~(also dilute 1:100 and filter)~~ (uncorrected for 1:1 dilution) with W1655. (132, 181) $= 1.6 \times 10^6$

(B) Assay filtrate :1 543 :01 42 .53 ~~.543~~ $\times 10^4$

(C) Assay residue λ and bacteria (173 .1) (25 .01) Bacteria: $.143 \times 10^7 = \frac{14}{96}$: % λ : $.173 \times 10^4$

(D) Assay diluted mixture. .1 >1000

λ 165, 162 1.64×10^4 Expt completed 5:38

Bacteria $.96 \times 10^7$

Initial λ ≐ $1.6 \times 10^6 \times \frac{1}{2} \times \frac{1}{100} = .8 \times 10^4$

λ in mixture = 1.6×10^4

Residue λ = $.17 \times 10^4 \times \frac{96}{14} = 1.16 \times 10^4$

Filtrate λ $.54 \times 10^4$

Low e.o.p for λ, measured by incubating cells?

March 28, 1952.

~~Verification~~ Test of Mal- elimination in Hfr crosses.

Streak out cross-mixture on EMS lac. Scoring difficult — ? ca 10% Mal+ 30% Lac+

Pick small Lac+, Mal for Lac V

3/31/52. EMB Medium rather poor: characterization doubtful. 5? / 24. Restreak

A. Recheck from EMS Lac. #1-5

Repeat 40 addtl. test from cross plate 1? #6

		Lac	Mal
1		V	—
2		V	—
3		V	—
4		V?	—
5	X	—	—
6	X	+	+

~~Save + 4~~ T.O. 6/53.

Note 6/52. Unless these are homozygous, which is unlikely, elimination likewise occurs in Hfr x Het. The important point is not readily tested here, namely whether markers such as Xyl or Mtl = in W1177 would be heterozygous. Selection for prototrophy misleadingly search for TL, M heterozygosity which would be really as useful! Similar cross should be conducted on EMB Lac Sen.

Hfr crosses i limited selection

March 30, 1952

Lac+ S^R had been noted repeatedly in mixtures of W1895 and W1607, etc. There might represent recombinants.

Grow W1895, W1177, W1607 overnight in broth. Mix 1 ml each + 10 ml Penassay. Incubate 11 30 AM – 4 PM. Streak out on EMB lac sm.

are sm-inactivated Hfr cells participating?

1895	no colonies
1607	all –
1177	

1895 + W1177 Ca 1–2% lac+ S^R some apparently sectored, but lac+ very weak (Gal – ?)
1895 + W1607 " " R " lac+ Mal Xyl – S^R Aux.

3/31. 1:5 each 12 N.

14	SR	RR	
13	RR	RR	
12	SS	RR	Recomb?

See 928a

Exp. Tried segregations by deleting in both, right way of segregation of lac+ to lac+.

K: Lac+ and − ∴ all are Mal−, Xyl−.
(3 are V,R selectants)

Among Lac+, $10 V_1^S / 17 V_1^R$

Lac −, $1 V_1^S / 19 V_1^R$ (coupled with Lac+ V_1^S).

a) Keep this pair for test (#32)

b) Test all for pidotegraphy (B, agar).

\# 3/-8 Lac+ } grew on B, agar. Both are B_1 −.
\# 2-10 Lac+ }

∴ 2 B_1 − +++ of 47 recombinants (ca ½ Lac+ S^R).

3.2 Lac+ $V_1^S S^R$ Lac− $V_1^S S^R$ sci

both are T− B_1 − L+

In most tests, T− and L− are not distinguished (on replica plates), but only on reisolates in tubes. L+ V_1^S maybe associated.

4/2/52

C The pure lac+ S^R are especially significant as they exclude the possibility that residual Hfr cells fruiting W1177 microcolonies on the agars (after agglutination and clumping).

C2 - pure lac+ Restreak: 6 ✓ lac+ pure. Pick for Mal, V, test.
C3 - sectored lac+/-

C1. 5: Repl to EMB lac, lac+ for identif. lac/- mean.

4/4/52 C2-3. (lac+) all Mal-. C2: $3V_1^R$ $3V_1^S$

C3: $7V_1^R$ 5 S
+5 +5
12R 10S

C1 in each are, isolated lac+ S^R identified, few or no lac+ S^S! ∴ the small sectored colonies presumably are related to Hfr recombination.

928 A) Repeat 8 lac V? colonies:

1	−,	V,	+
2	+,	−,	V
3	+,	−	(V?)
4	−		
5	+	−	V

Observations on living cells.

April 6-10, 1952.

A. Use of tetrazolium as tag for parental type. Cells grown in .005% TZ / Penassay broth. W1177: over 95% of cells have 1, usually polar, TZ granule. This does not segregate (observ. on agar-coverglass mounts) PM 4/9. Several cell divisions were of the form:

This does not necessarily mean that the "mitochondrium" itself is genetically discontinuous.

B. In mixtures of W1895 + W1177 numerous pairs have been found  and  These were firmly attached, and in a few cases arose by conjugation, not fission.

C. Interesting cells  with small bud frequently noted.

In preliminary HV run, 1 colony 58-161/ca 60. plate was noticeably nibbled. This proved to be λ^{s}_{1} similar to W1655. Discard.

Summary.

A) Lac + I −
B) Lac + S^R I −
} Almost all TL− M+ S^R Mal− Xyl− MtlR. Segregating Lac − V_1 − V_6 in more or less linked pattern. (V_6 − Lac − TL−). Also upheld in C.

C) Prototrophs! → B_1 − > B_1 +. ca 10:1.

In Hfr x F− there appears to be a constraint favoring TL− ... as well as S^R Mal− M+ .... [Rothfels crossed S^R M− x S^S M+ ... Almost all recombinants in his experiments were also T− L− Lac− V_1^R just as here! This was concluded to be based on the M+ .. Lac− .... linkage. It can be reinterpreted as a Lac ... TL ... Y linkage, with Y a hidden selector. But, the order V_6 Lac V_1 TL Y would (if applicable to Rothfels) would give a different sets of auxotroph single crossovers! The conditions of mating do not preclude a limited degree of F+ − transduction.

It may be conclude that selection for TL+ essentially discounts the effect of Y over the Lac − TL region, but leaves this influence at the left end, so that all of this set of prototrophs are Mal−.

① Further Project: Compare Hfr x F+ crosses.

② Study T − L − V_1 more closely

Replicas of A to EMBlac sm; EMB Mtl.

1. of 31 Lac+, 5 were S^R
2. No Mtl+ Lac were seen in 5 plates (ca. 1000 Lac- Mtl- 31 Lac+ Mtl±)

Owing to distorted ratio of Lac+ : Lac-
and overall low number (5) of recombinants
this experiment is not conclusive

Bordgalsor flagellotypic phage 942

Summary.

4/29/52.

1. Two phages (A-B) (C-D) received from Bordgalsor.
2. AB is essentially a typhi (also paratyphi B) phage, but independent of somatic (842-1 Rough) or Vi antigen.
3. C-D Accords to description of flagellotypic phage. High (?) titre obtained from single plaques either on H901 (942-2 φ) or Sutic Rough (942-1φ) S. typhi. This acts on H- typhi, probably mutant on Vi+ (Ty 2V, SV79) It has given non-motile secondary growth and O-forms of various stability with S. typhi (Sutic R unstable; H901 "stable"), para B and Stanley. Although marked lysis is seen with typhi murium LT2 and SW519 (typhi; i —), secondary growth remained motile (Vi, V antigens ??)
4. Motile "mutants" from S. typhi became again sensitive to φC.
5. Saved for further work: NM typhi H901 (para B; Stanley. Should be subcloned. Also lysates from single plaques.
6. L-forms not of this motility agar. See 944

10/31 - which para B? Stock book records SW533 (=703) but no explicit notation here

4/28/52.

W1895 + W1958 TZ. Overn. Aerate 9³⁰ to 2⁴⁵. Hfr to 4⁴⁵

~~S. typhi H901~~ large bodies

942C.
944

4/27 Many colonies of ~~large~~ L-type growth noticed in course of motility tests in H901 controls.

H901 was inoculated from EMB plate (?) to semisolid agar incubated ca 24 hours. Room temperature 8 hours.
Inoculate to semi solid agar (5 ml ±) + 500 units penicillin.

4/28. – penicillin showed same interspersal of bacilli and spherules
+ " " no macroscopic growth; spherules were prominent.
These are very transparent, practically invisible except to phase microscopy possibly accounting for infrequency of reports on them.

Similar admixtures of spherules noted to varying extent in semisolid agar smears of S. Stanley, pearB, and 842-1 swollen cytolytes of H901!
(Test LT2, K12...).

4/29. — Similar observations without & with penicillin. However the L-colonies are much less prevalent than in H901.
W1895 and W1956 unequivocal in motility agar. Then transfer to meat agar + penicillin 500 u/ml. Occasional L-type, usually not colonial, seen with and without bacteria respectively. Small + very large spheres seen
5/1 Similar structures with B. subtilis and staph. aureus.
Further control examinations showed similar spherules singularly in uninoculated plates, also in freshly poured mediums! Doubtful connection with bacteria!

Hfr x F+ 945

May 3, 1952.

See 938

W1895 x W1876. Grow overnight Parasaay. Mix 12N 1ml 1/10 ml each. Incubate to 1 30.

H311 1922

956 ~~956~~ 956

June 26, 1952

H-311 = Het diploid: Lac- Mal- MtlV. prot. EMS lac. Picks 8 lac+ → lacV.
A) Prot. mostly lac-, occasional lac+. (Maybe revertants of H-311?)
8 picked: all are Mal- S^s MtlV (exc. #1, #8 Mtl-). Restreak these on EMB lac. (prot. not diploid) (Should select for Mal+ prototrophs)
✓ : these two are lac+ Mal- Mtl- not diploid.

? Are the lacV reversions of H311 or recombinants with W1895?

Restreak from EMS lac (ctg. lacV) to EMS Lac., Mal. B)
This streak is ca 30% lacV but very few if any Mal+ on EMB.

C) Reni EMS Mal.
~~Almost all Mal-. 2?? Mal+ prototrophs. Restreak to EMB Mal.~~
4/5 show a +V rx on EMB Mal. Possibly Mal+ lacV? Restreak on Lac, Mal: all 4 are lacV Mal+V, as surmised.
These must be results of H311 x W1922, and presumably hemizygous for Mal. Het diploids may not bypass elimination!

Test additional
Test #2A for Mal hemizygosity: 8 Mal EMS papilla → Mal+ on EMB. Restreak on EMB lac: all were lac- → lac-
~~Hlac+, Hlac-~~ 7/10: 3 add'l. ~~sequential prot. All were Mtl-!~~ See 956A.

D. 40 lac+ tested: 23 were clearly lacV.
Spot on EMS lac, EMB Mal: all 23 are Mal-. Do not save

7/15/52 Segregate (H320) A2. 4 Lac+, 4 Lac− (all MH− mfreist test) (Hfr × Het dyploid MH u)

	lac	D(o)	D(BM)	D(TLB)
1	+	—	—	+
2	+	—	—	+
3	+	—	—	+
4	+	—	—	+
5	—	—	+	—
6	—	—	+	—
7	—	—	±	+
8	—	—	—	+

Which are MH+ ?
Pick on EMB/MH.

Btypes: #1, #5, #8.
TL− M− TL−

All should be S^S Mal−.

[Test for Hfr by Lac S cross. (#5 and 8 are lac−)]

H320: Select for reversions on EMS/Mal. Pick ~~88~~ 48 papillae to EMB lac.

1 was still lac u → lac u Mal+ ∴ H320 is hemizygous Mal−.

λ / W1827

957

June July 1, 1952.

Seed plates of:

lysis = +

Spot	W1827B	W1485

1827B + K12	−	+ , +	+

* prob. used 1827B.

No evidence that 1827 (= 1827B) is lysogenic vs. 1485 or B.

Include B/λ ✓ B is λ^R.

7/2.

B/seed plate:

1 λ

2 (λ + 1827B plaques)

3 (λ) + (1827)

4 1827

Plate ca 100 particles of λ on

A) 1827 → 100 plaques, clear,

B) 1827 + B → no 100 turbid plaques

Pick plaques A, B To 1485, 518, B. None grew on B

all others equally + on 1485, 518.

No gross evidence of phage modification.

Use 1027?

EML now reports that W1055 was responsible for the modification.

H245 x W1922

958

July 2, 1952

7/3. 40 Mal+ colonies streaked EMB Mal. Mostly Mal+ or +v Sarelikely Malv. Restreak EMB Lac, Mal; EMS Mal.

#2 3 6 78 are Mal+/- v?

1 2 6 78 Lac+/- prob. Lacv. #3 are -+

1,6,7 certainly Lacv 6 certainly Malv. #4 pure -

Retest from EMS, single colonies: 1, 2, 3, (4), (5), 6.

1-5 are Malv Lacv #6 Malv Lac+

At first glance #2 appears Lac+/- , 1,3,4,5 Lac +-/-+

Repurify Lac+/-. H321

H295 secondary. ....
H324-325

June 26 ff. 1952.

Plate H295 from D(lac) on EMB Gal. Replica to Lac. Pick apparent Gal-lac$\underline{v}$ and test for λ...

1 Gal-lac$\underline{v}$ secondary isolated. It is apparently still Lp$^+$/Lp^s. = H317

Later proved to be Gal$\underline{v}$ still, although with slower expression of Gal+.

Difference between H295 - H317 obscure. May be primarily a shift from segregation ratio + > − to − > +. Lysid colonies (Gal-) are very prominent.

H324-325.
June 9, 1953. Plate out from D(lac) to EMB lac, Repl. to Lac, Mal, Gal. 3 plates each. >95% lacv(+). ca 150/plate

possible lacv Mal-

1. H325
2. H325

lacv Gal-

3. H324

See 1056

4. Galv lac- H324
5. Malv Gal-lac- H324

H316 x W1895

July 4, 1952.

EMS Mal.

v. high yields. ca 20% Mal+. Picks smallest colonies, restreak EMB Mal

16 tests: 3 likely Malv. Hold to pool with further tests.

+ 40 tests } . No Malv noted !

Some possibly Mal+v but no Mal- segregants seen in estimate.

F- via sonic disruption

7/7/52. A) B)

1 plateful W1895; W1678 in ca 15 ml. H_2O.
Subjected to Raytheon machine at full power, 15 min.
Then filter (14 lb Mandler).

4:30 brot 1 ml filtrate (+ 1 ml W1607) in 5 ml Penassay.

9A8: Controls clear. Plate Exp. with W1177 as D(0) or EMS tac.

	× W1956	as EMS Gal.
A = 1607 + 1895 fil.	· 0	· 15
B = 1607 + 1678 fil.	· 00	· 7
C = 1607	· 0	· 13
D = 1607 + 10^9 λ (K-12 UV)		· 315 (confirm ML/Rose).
E 58-161 × 1956	$+10^2$	

48h.

∴ Ultrasonates lacks both F+ and Gal+ transduction activity

Streak out papillae from C, D (8) (12) to confirm Gal segregation; test possibility of F transfer coincidentally.
"D1" was a very dark papillae. C papillae do not show such clear fermentation generally.
E (v) are areas between papillae for control use re F+ transduction?

In addition to streaking-out, cross-bucsh pushby pulled papillae from EMS Gal; all uniform spot on D(0) - all auxotr.
Broth pooled samples to Penassay to prepare pulsum. F+ test.

C 1-8 D 11-20
D 9-10

8C: all appear to give pure +

12 D: at least 9 show Gal v, ~~some~~ possibly all.

Repurify from single (selected) clones.

Pooled Gals (C, D) and Gal- (E) remained F- (× 1956)

7/14/52

Restr single colonies.

C (sport rev.) 8: all pure Gal+

D. (should be 19/20 Galduced). 12 tests:

1	+	−
2	+	−
3	+	−
4	+	−
5	+	−
6	+	−
7	+	−
8	+	only
9	+	only
10	+	only
11	+	−
12	+	−

4.5 | 3.5

∴ 8 | 0 8 is comparison. ~~No serious doubt of effect.~~

6.63 | 5.49 | 12

11 | 9 | 20

For further study, Restrials single colonies of # "1" for acquired stability, and 8, 9, 10 for persistent states.

7/15. In restrials, #8 showed 1 Gal− ? (Reduct). 9,10 were entirely +.
but restrials single colonies → all Gal+

7/15 #1 showed 3 +,− 1 "pure +". A. (but background has poss− ?) Restrials

7/16. All colonies were +,−. Restrials + and v → 7/17 all +, −, v colonies.

1590, 1485	Plaques	S	
1918 1956 1802	S	S	

Note: T3K ≠ T3H.
Plaques on 1485!

T3 strain is evidently mutant on K-12 ....

It shows a limited e.op. on W1485 full activity on W1918 (Y10.... acc'g Bouvier).

T3K was selected by growth (on K12?)

9/15... T3, T3K spotted on E coli B, 1918.

Repeated and tested:

	T3/B	T3/1918	T3K/B	T3K/1918
B	+++	+++	~~B~~ +++	+++
K	−	±	—	± (1pl.)
1918	+++	+++	++	+++

Question of possible host modification should be studied more explicitly. T3K originally gave +++ on K as well as B.

For testing WG series, use T3K initially; then T3 for T3K ˢ types.

Prepare Salmonella FA. 966

9/22/52.

(A) Stock "PLT22/LT2" 10¹⁰ 3/52 found quite moldy.

(B) 10AM. In 100 ml Erlenmeyer. Incubate in aeration

1	1 ml LT2	+	1 ml stock PLT22
2	"		.1 "
3	"		.01 "
4	"		1 ml SW435 (LA22)

2PM. Heat shock #2, #4 60° 1 hour. Sediment. Treat supernatant i CHCl₃.

Test .1 ml "4" / SW435 EMB Gal

(C) Gal+ transduction:

9/21 ca .1 ml SW435 ± .1 ml stock FA (A22/LT2.

9/23 SW435 — 1 papilla → Streak out 16
SW435 + FA — ca 30 Gal+ papillae → 1st plating: apparently clean Gal+, 2d "(+)": all apparently pure +. Repeat a few lightest (mid ? −): 3d plating: inoculable (Cover)
FA streile — 0

(D) Assay FA #2 on SW435/Gal: papillae [redacted] 5
.1 ml
D(0): colonies. 6

Throw out ~~#2~~ FA: streile

(E) 1 ml each SW603 (para B 0 ca 10¹⁰/ml); 966-4
→ trailes and swarms small loopful 9/26 (48+ hours)

(F) SW603 5 ml/petri dish UV { 0, 20, 40, 60, 120 } — [redacted]: isolate
No trailes / no swarms

(G) Assay 4: 800×10⁸ phage/LT2; Gal+ papillae/ml/SW435
∴ phage/FA = ca 10⁸! 61/.1 ml = 610

Note — SW552 "Group D Rough" — not fermentative by PLT22/2.

A SW541 5 EMB Gal 3 Xyl 8 sec UV (°K).

1 each?? — Gal n.g. Xyl — lookasok. SW665

excellent mutant: no transductions, papillae are clear in 48 hours.

Apparent rather high yield compared to SW435. (should be compared closely)

Plate c PLT22/2. Pick papillae + streak to test stability

12 papillae. Streak to give large but poorly terminating colonies!

Compare 541, 665 and papillae! (possible a Xyl+ weak allele, in this background).

In various tests, inconsistent scoring. Best result: incubate at 37, thermostat up. No signs of segregation — not many tests

B SW603 5 Gal → 1 sectored col. → good Gal — SW666 | 1 Xyl

considerable dimorphism on gal, especially after UV, not remedied by repicking large colony.

excellent mutant colour. Pick papillae & streak to test stability. +PLT22 → plaque ridden (e.o.p. ca 10^{-4})

8 papillae. 1 appears Gal v = 973 B1 Restreak several colonies.) All others appear stable.

10/9 Pick addnl. 16. (all large papillae only). All + appear stable on 1st streaking. Restreaks: no — segs, but + ≠ 2c shows some mottling. Review this as 973 B2: repicked + and + mottled (phage?). Repeat once again:

appears to throw stable, mosaic types. Repick B1A to look for new stable, "stable" ✓ 1 colony is stable.

Streaks of B1A mosaic Gal v → −, v, + . Check +, restreak v. → pure + → −+v

∴ This unstable transduction segregates pure + and −.

~~Can~~ (over) Isolate pure + and −

973C PLT22 + SW665

973D ϕ SW541 + SW665 Xyl.

973E PLT22 SW435 Gal. – 20 : all pure + !

D) SW541, transductions of SW665 behave very peculiarly on xylose. Sharp, Xyl+ colonies give – restreaking; SW541 itself gives inconsistent responses on EMS xylose, but not to cause a false negative reading. Only one restreaking gave a typical + reaction. 24 tests 22 – 1++ 1 weak + !

These colonies gave typical + reactions on original plating !

Possibility : interaction with SW655? Try mixture.

Save 1 plate which carries 1++, 1+, 2 –.

Efficiency of transduction and effect of serum.

973 B

FA is PLT22 966-4.

Mix .5ml ca 10^{10}+ cells/ml with .5ml FA (or dil. as ind). 966-4
Let stand 5-10 minutes · plate .1ml.

1 = ~~SW665~~ as EMBXyl Note self plaquing!

✓ Immotile as before on old (i, 12)

5 i i b b i b i i i i i i i b i i i i b

12 i
5 b

4

This experiment was recalled to be confused, and these results bear it out! From previous experience, 4 should give a mixture of b and i, 5 i only.

REPEAT 10/17.

this is actually mixed b, i

4 b+i?) pool was streaked out. Test colonies: 14/14 b
7/7 b pool rx b, not i
7/7 b test rx b agar

migrated on b agar

D1 separate T+S 7i 1b

D2 1 plate T+S pool - to both: reacts i ++ b + . Colony tests from strain: 4i : 2b

D3 No T or S need new PA

D5 ~~both~~ individual swarms: b and i ~~8~~ Total

	i agar	b agar
b	swarmed.	8 19
i	swarmed.	

previous difficulty not reproduced.

D2 affirms F-2 progeny test of limited transduction

10/21: Reisolate SW623 single colony (b) and prepare FA (FA9 + ...)
FA(SW623) + SW666 → many T+S. (very well defined on large agar plates)

5A Pick reasonably individ. swarms + retest b or i:
10: i 1: b (weak, maybe b + i) → purify and retest

5B. FA12B + SW666 on motility agar, well separated swarms and tracks.
Count: 14 lateral swarms (mostly i tracklets) 46 tracks. In many cases, the tracks flare out into swarms. Pick well isolated swarms for later selection test. Pick flares + streak out to reisolate presumed O component.

at least 2-3 mm from streak "FA" from SW686 (2 batches) – no T or S. (check sensitivity to PLT-22).
SW666 controls No T or S.

see over.

→ Spot on i (or b) agar to test purity. 5/5 i immotile.
6 add. tests spoiled by bad agar, but spike. Also single b stopped around and retest → all are immotile. i. Each swarm was pure.
To check, spot i on b plate and v.v. 11/16 swarms. 5/i grew spont. (plate dried out?)
Repeat test by serial inoculum.

6. FA18 (PLT22 2/2 b. / LT2 phase I + 1, 2) + SW666.
16/16 b.
Total 18/18 all b
no 1/2 ?!

Spot 16 on b agar: no swarms. typical slow spr. growth, some mutual inhibition.

Conclude: these are morphs b identical with SW618.

(over)

see 979

5B: 3 flares streaked out.
15 colonies tested from each: all i no O forms!
(45 tests!)

Perhaps the flares are not actually O microcolonies!

---

12 isolated buds tested: 11 → i
1 → b (#12)
inside from rear source

(as over) Spot on NSA, transfer to homologous serum agar.
all uniciliged. ∴ each swarm is pure

This agrees with 15/15 individual tests on each of 3 swarms.

Note 11/8. SW688 (Boyd "I rough) gives very coarse flares on motility agar, prior to later "smooth" swarm. Reisolate and compare morphology, swarms & original unselected.
This may be the basis of flares. see 978

progeny tests on SW666x — i, b

974E

FA21 → SW666 1st test: agar too sloppy 2d test activity?
Repeat preps: try FA9, LT7.
new FA9 prep. apparently lysed but activity still poor.

---

new PLT7 prep. inactive — v. few Trailers. 2? swarmers.
but might be carryover?

Test other hybrid i's for assoc. to PLT22. cf. 697 which is app. resistant
e.g. 974DD5b: 1–11 and SW697. All show no lysis on plate (but hybrid?)
with FA9 except #6. = SW904. However in broth 697 does seem to be inhibited by FA9!

FA21A (904) → SW666

27 swarms. 25 : i 2 : b → 1R / 1S

Note: in 974DD5b of 11 i, 10 are LP22R 1S / 4S
were of 25 28

31 R : 5 S

2 FA20 → activity? / a number of T+ swarms developed later. Maybe contaminants: grow poorly on NSA
as above. 1 swarm → b.
new prep (FA9) → T+ swarms fairly separable.
22 → all 6 (not i) ∴ 23 total
Test on FA9: 1S 21R. of 986

Serum effect on transmotilityation.

~~974~~ 975

October 4, 1952.

Many fewer swarms occur in antigen substitution experiments (e.g. typhi x typhimurium) than in "transmotilityations" (eg. SW543 x typhimur), and it seems unlikely that this is due to a lower frequency of occurrence. The SW543 transductions allow a comparison of the techniques.

10/3. Plant D22 (SW-666 + FA P4722/2) on motility agar ± b, i 1 2.

No serum: many tracks and swarms (ca. 60 tracks, diff. swarm)

i: 1 bud } A4: transplant — to ~~E~~ i

b no buds, no tracks. }

Could this effect be due to O-antibodies? Absorbed sera should be used.

Also of. 971D.

D3: 19 ~~buds~~ tracks. many swarms D3/b: no buds, swarms or tracks.

Repeat P4, D3/-, /b, /i (to test specificity of i effect)

A5: D3/- swarm; ca 15 tracks

D3/i 1 sw ca 12 tracks.

D3/b No tracks or swarms.

D3/d T+S as above.

In this case, b is specific of 974

$D3_0$/b 1 swarm. See D3. Agglutinable.

NOTE. Agglutinable phases might come either from FA or alternate phases in SW603. Occasional buds appear in each plate of SW(666)(HH)/b, e.g. SW673. → agglutinable by b, i, 1.2, enx ... Furthermore abony/b (occurs very readily) = enx shows very weak reaction with our enx serum!

Second phases.

10/5/52

Plant indicated steams on serum-motility agar

1. SW671 /i,12. (Insuff. antibody to prevent slow mass diff.) No buds or rapid swarms. Growth out not entirely even, but still i.

2. SW673 = para B/o sport b+ /b. See 975. After 24-48h., four buds/plate. Test: b, enx, 1, 2, i : 4/4 swagglutinable. Purify 1 as SW676 may show trace reaction with b. (pur? or phase ⇒ variation?) = z33

3. SW670 = typhi H901 x abony b enx /b. 3/4 buds. 3/4 still react strongly i b (=3-1) #4 swagg. streaksout, mesolate, and retest on b agar. (=3-2?)
#1 very weak b.
#2 swagglut.
10/22: /b slow spread. rough ← T.O. j ?= z33 slide test by 3/5/53
10/22 /b slow spread

4 SW672/b. (=typhimurium x abony) → 4 days: non b, i, 1,2, enx
SW435 itself is relatively poorly motile! (Auxotrophy? - 435. moves very slowly through kept transducers) i but 1,2 phase appears
623, 435/"I" - apparent buds still i.
LT2 & LT22 → swarm 1,2

5 SW703 - 4. 704/b (spice absorbed) → 1,2
703 k, r, a, gm ⇒ swagg. Repeat immediately on b agar
✓ 703/b swagg. b, i, 1,2, 1, T, enx. swarmed / [glu+ lac−]
see over ← 703 itself = b. Streakout: occasional more opaque colony, non-b = 976-5A
6. SW618. Swarmed /b → streak b! (Insufficient serum?)
→ slow spread /b → b

7. 623/i 12h. slow spr. LT22/i 3 isolated buds (subsequently to slower & main stock)
612/b " " " → b SW569/i no swr. → later heavy swarm.
623/i → slow spread → i
(over)
slow spread

Note: "b" serum inhibits SW546 (phase II) and thus contains 1,2
do. Seastone's "b" Absorbed SW546 Check SW435/I" OK! ∴ alt. phase of SW609... may be a third "j" phase

Check Spicer's sera

- 618 swarmed on i, not on b.

974D5 b - sw. i not b
i : sw. b not i

SW435 is relatively immotile compared to LT22. This may relate to behavior of SW672

703 (purif.) /b → 1, 2 (3 bands)

SW 672 /b (spun) ⟶ 1, 2 (very infrequently)

a) Rechecked single colonies: some seem to react both 1, 2 and ex Regrow: 1, 2 only

Second phases

~~976~~
976

1 SW671/i, 12 No.

2 SW673/b → agglut. SW676

3 SW670/b → " ; very weak b. save

4. SW672/b(1,2) → agglut. cf. SW435 - poorly motile as tested and gave no buds / i
/b → 1, 2

5. SW703 orig. → contaminant, isolated later s serum = 976-5A
SW703 pur → 1, 2 Separate phases
SW704 → 1, 2 " "

6. SW618 No

7. SW623 No ("sw" = i)

8. SW612/b "

9. SW569/i " → d (1/2)? ~~but may be migrant rough~~ Not distinguishable from typhi. How about Entam?

10. LT-22/i isolated buds 1, 2.

Unstable transductions

10/13/52.

SW 684 is Gal +/-. Transmotility ± PLT22: ca 50-100 tracks and streamers. Pick more or less well separated buds, streak on EMB Gal to look for a superimposed transduction. 15 streamers 0 = 1 trans & stationary

A. All streamers were substantially pure + or - 12 -, 2 + 1 mixed but no V.

B. SW666 + ~~FA 437~~ FA(SW684) only 7 papillae.

6 gave -, pure + 1 had +, (IV)? ? Restreak

(Cf. 986D - This one not saved) ⇒ this has phage - mottled appearance, not +/-

New transducing phages;
R forms.

10../52

1. R isolated from aged bottles of eastbourne, Boyd 110.4 typ. minimum . . .
SW688.
688 is sensitive to φ2715 (Dasroudreau) although this is described as an O phage!! 6885 original appears resistant
It is highly lytic on R but may pit transduce to S?

SW688 is resist. to PLT7, PLT22 S is sens. See over →

2. LT-10, LT-1 a) aged b) grown with Boyd 4. No phage activity is noted
seperate either on original parent or Boyd 4. LT-10 in penicillin ~ 1/unit,
no plaquing in ~~streak~~ streak-out.

3. Cross bunch LT-1 to 10 / SW688 LT10? on SW688. SW688 shows
O-10. discolored plaques, velocities with O 10 (spin)

4. O-10 / H901, Thompson, abony 1, gall, montevideo, heidelberg, stanley, altendorf
SW666, eastbourne.
No action – probably too dry.

LT-1 to 10 all R.

5. SW~~#~~665 self plq. Cultivate, ✓ broth.

6. Test mixed φ on SW435, 666. (Select for R?)

HP13		

Streak out survivors, pick to broth: none were clough!

SUMMARY

O-10 (Thompson φ) has a component v. weakly active on SW688 (rough).
wait for Spicer to build it up

Like PLT10 - need to find other hosts to build it up

"10" phages attack rough phages. O-10, PLT-10 inactive on Bovis monbifucans
strains here. Wait for Boyd's material.

	φ2715-43	942B
Boyd 1184	R	R
" SW688	S	S±
Typhi 1+90	S	S
~~SW540~~	~~S~~	
LT-1	S	S
thompson	R	R
montevideo	R	R

These are not strictly R or S phages.

SW-688 is motility agar - see 974DD
motile selection appears "smooth" - first i phage
still resistant to PLT22. (check somatic antigen.)

Phase variation.

of available material, abony^{B} (enx - b) and typhimurium^{B} (i - 1,2) seem the most appropriate to study phase variation, as FH and sera are available.

In previous experiments, SW672 was made by SW435 ↔ abony^{I}. ~~[redacted]~~

In preliminary tests, SW672 appeared monophasic b. SW435 however is itself suspicious in its motility behavior; in addition sera previously used may have acted as b-1,2.

(1) Test SW670, 672 in b agar.

(2) Repeat, but ~~[redacted]~~ LT2 ↔ abony^{I} and ^{II}. (Use LT2 to improve possibility of progeny tests).

A	LT-2	FA14	→ b ⇄ 1,2	SW699	
B	LT-2	FA15	→ enx ⇄ i	SW698	
C	LT-2^{II}	FA14			
D	LT-2^{II}	FA15			

partial

NOTE: i-enx is found only in group C (baienses) but i is often a rare bird in general.

(3) Try enteritidis as recipient for transductions.

(4) See 971D SW666+ FA15 (abony^{II}) 17 swarms: all b, not enx

✓ Gal-.

~~Purify and test vs. b.~~ Purify 4. Test all directly on b(1,2) agar.

4: b → 6: ✓ nonmotile of SW678 ~~[redacted]~~ small buds from #4, b. pick, 2d plate is nearly pure. Pick center (guess)

(5) Phases 1 and 2 of SW703.

979-5A = FA23 → SW666

979-5B = FA24 → SW666 (several thousand from several swarms)

test pooled from various spots / b.

15 spots (probably tests >100 swarms): none swarmed directly out on b agar

3 gave what may be buds. pick these: 5B1-3 : still b. Remember

Repeat 5A + B: number of swarms is phenomenal.
Test Cal+ transduction?

---

streak out pooled swarms on EMB Cal: all –

Also, test on b serum: no swarm from A or B

5B: 27 single colonies: all b, none 1, 2. (2: may show equivocal reaction in 1, 2)
+ 8 added. all b → Recheck all b. or maybe sl. rough
(sw981)

5A: ~~20~~/20 b.

10/26 Repeat ĉ deleted FA...
1/100 no trailers or swarms

10/27 FA 1/10

---

6 ~~FA~~(sw~~5~~88) → sw666 6 1, 2 FA streak: –
BADS 2 mixed
more or less all isolated swarmers 14 b
streak out on EMB Cal.
b, 1, 2 – both Cal – sw699, 901.

Note sw533 (= 703?) → 534 ~~588~~

But ~~533~~ 703 behaves differently from 588. Recover NZ culture of 533

Recap + summary — Phase variation

10/28/57

② mantis-i

A. LT-2^{I} × abony^{I} gave 1/swarm SW699 b → 1,2 (slow) → b

B. LT-2^{I} × abony^{II} gave " SW698 enx → i → enx

C and D not successful in initial trial (LT-2^{II} × —)

④ FA15 (abony^{II}) → × SW666 17/17 b.

⑤ A. FA23 (SW703') → × SW666 15/15 b on bagar. Very high rate!

In second gen, streak out pool (>>100 swarms) and test colonies.
20/20 ⑥. Pool does not migrate on b agar.

B. FA24 (SW703") → × SW666. spots of pool b on bagar
27/27 ⑥ Pool does not migrate on b agar. ~~b~~ at furthest.

⑥ FA (SW588 — B.A.D.S.) → × SW666 14 b pur. + save SW699
2 mixed
6 1,2 " " SW901

979DD 6: FA18 (LT-2^{II}) → × SW666 18/18 b no alt. phase could be selected

Consideration of ②, ④... leads to hypothesis of phase variation:

~~i*~~ i^{*}; 1,2 ↔ i ; 1,2* where * is a locus-fixed activation (or suppression).

$\dot{A}_1^i \; A_2^{1,2} \longleftrightarrow A_1^i \; \dot{A}_2^{1,2}$

④, ⑤B, 979DD-6, and previous expts also ~~typhi~~ lead to hypothesis that $\hat{A}^{1,2}$ can not be expressed in monophasic strains. Apparent paradox:

SW703 $\overset{?}{=}$ SW533 $\xrightarrow{K}$ 534 $\xrightarrow{sp.}$ 588

↓ → b only ↓ → 1,2 ; b

∴ SW534 / may have a unique $\hat{A}^{1,2}$. Also SW546 = SW867.

.. nothing 29A' = i (v. weak).
.. odd one.
#14 appears agglutinable. All others are i.
See over for /i..

Repurify 18A before further tests are made. 18B may be preserved contam. from abony. 18A' is enx, but also shows trace 1,2? /Lp^R 18A "as 18.

29B as 29

All 34 are Lp^R!

There's no clear cut 1,2 × from FA 22.

979-AA Note: phase variation in S. abony. Stock culture labelled abony II, isolated recently from single colony is about 20% b! Many individual colonies react both b, enx. ∴ the phase of FA 14-15 and cells abony' and 2 cannot be regarded as under control. This suggests enx → b. Not known whether b → enx likewise. In a parallel check on LT-2 II (from Salmi susp.) 6/10 were strong 1,2 4/10 were scarcely agglutinable (i?): regrow these 4 (see over).

Reisolate phase 2 cells for new FA pops

LT-2 II

4: These colonies when regrown give only trace agglutination in 12 (smi? i?)

In broth, #4 is very sluggish motility, again only trace 1, 2.

#5 (strong 1, 2) very mot.

most cells immobile; some quite active. Reselect on motility agar then gives a strong 1, 2.

Streak out present suspensions of LT-2, above. (H.L.B. tests)

b ⇔ enx frequent

above I: b: 7 enx: 3

above II: enx: 2 b, enx: 2 (see above)

HLB

LT-2 I: 16: i 1,2: 1 ? 5 (both or weak?)

→ 18 i 1: 1,2 other R. retest

LT-2 II: 0: i 1,2: 20 weak 1,2: 3.

Thus, FA22 - FA18 are fairly reliable, but

FA14 - 15 are not, but nearly equivalent.

9795 second phase: select on/i serum. Test swarms: (i blurry) all isolates swarming on i agar.

streak out pool of 9795, pick colonies test Lp(22)^s: undetermined proportion of Lp^s. Purify and test SW941 as Lp^s; i:

979K...

periphery pure + (perhaps slight increase −).

② In soft agar - gelatin tubes: Mix top and recover after 24 hours
− glucose ca. 10:1
+ glucose + ca 30 : 1 −

Should use fully non-nutrient medium.

③ In broth + b serum .02 ml/5
a. inoc from top of broth
b. sediment lightly − top of broth
perhaps allowed to grow too long.

Heavy agglutination.
ca 5:1 ?
ca 10:1
Repeat ē growth 11:35 − 3^{30} (recover)

E. Owing to its resistance, the SW543 line is commonly used for selection by χ phage. In pilot experiments, make up mixtures of SW666 and SW703, and determine what proportion of χ are the pre-introduced Gal− H−.

But SW703 showed virtually no response to χ! of SW533
Phage n.g? Repeat ē χ/SW592 : now all are susceptible (incl SW537)
∴ 942 − 1 has lost some activity
Repeat ē new χ

9803: short serum passage:

unsedimented: ca 6:1 +:−

briefly sedimented: ca 20:1 +:−

control: too dense to read, but very low-apparent.

∴ brief sedimentation appears to be harmful.

Repeat i second pass:

control is another tube from original 980 mix culture serum (ca 1:300) mix i pour into serum tube after light sedimentation. Compare no, light, strong sedimentation.

ca 20:1 heavy sed.

180:1 control

D4 ½% agar. ± glucose

	Val ratio +	−
Broz: washed cells, 980D sec. passage:		
+ glucose	100	<1
− glucose	100	<1

∴ this method is unfit for concentrating O forms.

Methods for concentrating O forms.

10/29/52

1. SW666 has a selective disadvantage in broth passage with SW618
2. Dilution by migration through agar (± gelatin ± glucose) does not conc. the O forms
3. Asher's method may be slightly efficacious — needs to be worked up.
4. χ phage not yet properly tested. Of 588 as H^+G^+ + H^-G^+ 666. start fresh inocula

---

F. SW603 (H^-G^+) and SW680 (H^+G^-). Wash, conc. to ca 10^{10}/ml.

~~Mix 100600 : 1680~~ 100680 : 1603 Add b serum to titer of 1/100.

~~let stop in ca 1½ % salt.~~ Put at room temper. 5:25 — N.G.

Repeat in original broth (mixed & dilutions in saline). (poor agglutination)

Initial	ca 100 - : 1 +
4½ hr. no aerate.	ca 100 : 1
" heavy aerate.	>> 100 : 1

Broth culture here labelled 603 agglutinates ~~ineffective selection.~~ in b. (Mixup?) Test slants

G. χ selection. Make up SW666 (H^-G^-) 1 : 100 SW588 (H^+G^+).

Cross-brush with χ SW592 on EMB Gal, Lac. Compare ratio before and after. Note: SW666 is lysogenic for SW588 : grows plaques on 588

		Gal+	Gal−
χ(Lac)	[dry agar, poor phage action]	~~H+~~	ca 1 : 1
		→ ca 8 : 1	
χ(Gal)	marked phage action	ca 1 : 1	
	Initial	> 100 : 1	
	Final & phage	100 : 1	

∴ χ phage probably is effective to extent of 100 : 1. But how can it be used to study flares?

* recover result may be influenced by lysogenicity. Should strain out from area of mixture arrays from phage action.

In some ~~con~~ control tests,

SW666 reacted weakly i b when grown from broth,

but not the saline suspensions from agar.

Retest both cultures viaz from → v + but very weakly b not i

	Broth	Water
A slant	±	–
B broth culture as above	–	–
C saline susp	–	–
D motility plate (negative)	++	++, not d, i, 1, 2

microscopically: nonmotile

Limit test from cells on D gave wk ± b – d, i

603 broth also v b.

This may be related to the "weak b" reaction seen in earlier experiments.

Restreak D, spot on motility agar.

SW905-6-7-8

As received from W. Hirsch

905	b (1,2)	Rapidly motile	} in first selection. Mailed slime wall, especially 908, also 905...
906	b	Non "	
907	b+1,2	" "	
908	0	" "	

Isolate "pure" b phases 905-906

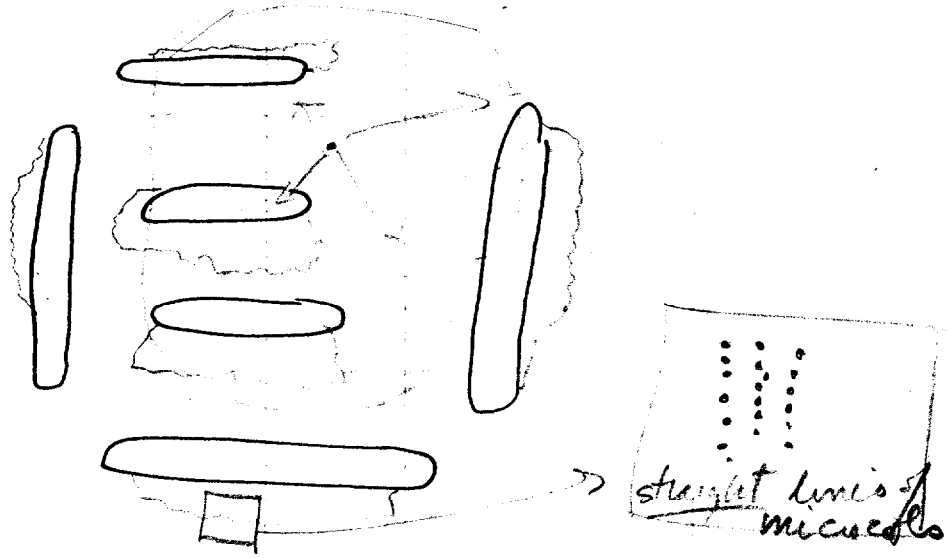
907: 3 single colonies: pred. 1,2, also b! Restreak

7/7 colonies mostly b as well as 1,2. Pick #4, least reaction to b as SW907 (1,2). Either very high mutation rate or b ↔ b,1,2

Note. Contaminant spread on 908 plate. As it did so, there was a filmy, limited spread from edges of non motile 908:

A).

One repetition,
SW 908 and SW 554 responded very strongly;
SW666 and 550 gave no appreciable spreading.
Swarming is confined to the surface.



Reisolate the contaminant for further study: inhibited on NA (gent. wilt) and EMB., but apparent pure culture in broth. It is a spore former, not actively motile. The outgrowths are not the spore terms but not actively motile.

B Phage tests: all 4: FA 26^R; faint sens. to FA 9.

908: gave a spont H^+, no plate / 3·4 (no flare).
+ FA 9 gave a good yield of offtarts and swarms, occ. flares in these

SW905: b → 1,2 → b ca 20% per streaking! Most colonies grossly mixed!

a) note very high rate of phase variation.

C b) FA21 → 908; numerous T+s. (tracks unusually long + prolific).

14: 6 & 1,2 mutants (ca ½ each predominate!)

2: 1,2 + 6? (or i?) Restrict these for further test: definite 0, no; mutants.

phage unprocessed to FA9 are indistinct. However, 10 (or more) appear to be still sensitive to FA9.

2 b !
3 cur
Does this mean heterozygosity for b in 546?
See H, supports latter.

Note 546 on motility agar shows no flare.

Resumé

A. SW534 ← FA22. 30 tracks: 2 swarms (no flares obvious)
534 maybe heterog. rough: necrotic smooth.

B. FA21 → SW666.

	Tracks	swarms
~~+5~~	13	4
	28	6

Pick free tracks. 5/7 are Lp+

C. Stick out from non-metabolized regions: 3/11 are Lp+.

11/20../52
See 989

test pleurisy 5 Lp 1 cave as SW...

F. FA22 → ×546 11/11 : all i 1-4 tested as anti i : i : —

11/24, repeat. very numerous swarms 16/16 all i. Purify and test /i ; Lp ~~=2~~ 9
In first few hours, none swarm. ~~8~~ 8/16 are sensitive to P22.
Overnight : no swarm. (#1,3,4,6, 13,14,15,16) Save F1 as SW-934

G. FA11 (SW618 b:-) → ×546 3/3 : b: — (all Lp^R)

T.O. 991G1A ~~eventually~~ isolated. Save for z33 test. ✓ prob. z33 by slide test
991G1 = SW939 Lp^R

H. FA15 (b:"enx") → ×546 1.-2. b: —
3. enx ⇔ 1,2 = SW926

H3 tested after several passages and 3 single colony purifications.
In first tests, enx phase also reacted with 1,2., but purified version was pure enx on slide agglutination.

H1 eventually gave "inagglutinable" H1A. Save for z33 test. ✓ z33 3/6/53 ~~Save~~

H1 ~~&~~ Lp^S, H2 Lp^R. Save H1 = SW937 H2 n.s.

pass SS 3/5/53 → both 1,2 T.O.

K. FA18 → ×546 (cf. F) K1 ~~&~~ pan agglut? reacts b, enx, ... ? ~~save~~.
K2, K4 still 1,2 K3, K5 "inagglutinable" but slow 1,2 ? 3/5 ~~save~~

C. 546/1,2 control 2 "buds" < 1. 1,2 2. inagglut. (cf. K3,5) save! C2 3/5/53 inagg. pass SS

M. 926/1,2-enx " . 1 "bud" - still 1,2. Not ~~saved~~. n.s ↓ still inagg. save

not Lp^S L. FA22 → ×SW926/1,2; enx → Many T+S. 8/8 i → enx
3/8 are Lp^S. Save #1 as SW933
n.s. others

N FA22 → ×937 numerous sw. Pick 12 : all i : —. ✓ Lp ~~#3.5~~ others: R. do not save

P FA18D → ×937 (rare). ~~Not plated~~. 14/4 plates inagglut! Reselect as b.enx (and control as SW937): 2 grew more than others, but inagg. Select /i motility agar. 6 added; also inagglut : inagg. (weak b?) cf. H1A!

Q = 937/b control: ~~lots of enx overnight~~ 1 sw/plate after 36 h. T.O.

(see over for conclusions).

a. N25 → 157 presumably a spontaneous mutation
(b) (1,2) see Edwards 1946. b → 1, 2.

b. #157 carries a allele at H_1, as shown both by ×546 and 546 × experiments

c. The H_2 allele is either null or the "j" phase that occasionally crops up.

N25 = SW942 should behave as $H_1^{\ b}\ H_2^{\ o}$

a) b: homologue of H_1

b) $H_2^{1,2}$ × 942 should → $H_1^{\ b}\ H_2^{\ 1,2}$

see 1000.

See 989E.

E. 546 → typhi H901 537 : 3 (1,2), (a²) Purify : single colonies pure 1,2.
On 1,2 again:
1 1,2 → — SW 930
2 1,2 → —
3 1,2 → —

A 546 FA25 → abony' 11/19 : 4 blues — all 1,2 1 1,2 → enx 5 12 → enx
2 " 6 "
3 " 7 "
4 "

B 546 FA25 → abony² 11/11 : 3 blues — all 1,2 1. 1,2 → enx → 1,2 [redacted]
2. 1,2 → enx
3. 1,2 → enx
4 "
5 "
6 "

3 s.r.

Study B1 in greater detail: ←.
1,2 phase does not agglutinate (shikes) in enx
enx phase shows same (1,2).

all are 4p except A7; same as SW 938

~~C. 546 1,2 control~~ (see 979 for abony' ≠ abony²)

~~D 18 → 546 1,2.~~

Host adaptation of PLT22 -...

b/i determinations

SW686 unfortunately is Lp+

A. FA31 (= FA9/LT-2^{I}) → × 666 Many T+S.
2i; 11b.
In cross-streak tests (~~no plaque count~~) this phage appears to have retained its specificity for ~~parental~~ strains. Ca. half the numbers are phage-plaqued. Phage character should not be determined s prior streaking out of the culture.
This result would indicate that host adaptation of the phage does not determine b/i ratio.

B. FA21 → × 928 Fairly distinct swarms: 4b: 16i

C. FA22 → × 928 Many T+S (confluent). Pick plaques. (Lytic area noted in swarm!
(Pick and test for Lp^{s} or Ph. mutant.) ⇒ no evidence of either; clear area may have been single stabbing infection.
Swarm Not true will separated. 14:b 1:i 2:b+i. Real total as 16b:3i

∴ lysogenicity of transducee does not influence b/i ratios.
SW686 is unfortunately not feasible for FA (Lp+). This remains the basis for a final test of mechanism of ratio. In addition, other i's from FA22 → × 666 should be examined. See 973C3

11/24

D1	FA 36	A	×	666	T+S	9i : 9b	sic!
2		B	×	666	T+S	7i : 7b	"
3		C	×	666	No	7i : 3b	
4		D	×	666	No.	6i : 2b	

(SW935 / SW936)

Test 36A → × 666, 36B → × 666 for Lp^{s} i — A 6/8 are Lp^{s} (one is " " n.s.)
(vague opportunity for verification during isolation) B 3/7 are Lp^{s}

E FA12 → × 666 Relat. few swarms, but 9/9 i

(over)

11/28. 628 → x 666 7i 4b 1b,i

8i : 5b

This appears to be quite distinct from 623

11/28 FA12 → x ✓ 5i : 0b

FA12B → x 12i : 2b

Using pools from
12 → x 15i 5b
12 → x 14i 6b
12B → x 16i 4b

poor agreement with other data -

625 → x 7i 3bi 3b (swarms must have been confused, from overlaft again)

680 → x 14i 6b 1bi

15i 7b.

note: ~~sup~~ suspicious sum of b's as I did up on Possibility that there are hidden cues for b/i on the swarm plate?

A. Goldstein strains

995

Received 11/2[illegible]/57.

W2148 = "MSFB"

very rough, apparently homogeneous on EMBLac; MH. grows well on D/0).

2149 = Harvard (Goldstein)

dimorphic, especially on EMB MH.

A: smaller, darker (lytic ?) ~~or gummy~~ colony

B: gummy, ~~[illegible]~~

poor growth when streaked on D/0).

11/24. Separate A and B for further test — character persists on EMB MH.

Replica plates: A: no growth on D (0) or EMS Lac in 48h. Eventual reversions ?

B: all colonies grow (ca 50 tested).

For further work, need to run down requirements of A.

In subsequent plating of B, ca 2/300 auxotrophs. Pick as 995B 1-2

4/14/53 EMP

Subtypes W2149 observed

homogeneity W2148

Both R to 2-2

Srp with W1926 (F-) and W-1177 (F+)

on $Smal_{sm}$ + $Slac_{sm}$.

Dienes' L forms

Acc 1319 8/56.

11/16. Bought tracts from Boston slants of "Proteus 52" and Salmonella typhimurium "3". In addition, a vial of L-growth of the Proteus (Dadey shaken in flight.

(A) Plated in Penassay ~~agar~~ broth; no growth here for two weeks. 11/30 – 12/1 surface films noted in 1 of 3 tubes.

12/1. Transfer to fresh tubes: Penassay; Penassay + horse serum 10%; Penassay + cotton; motility agar; motility agar + SW66: Good growth in 2–3 days, especially on penassay broth. Very poor growth on agar. Note a curious film of material in the course of L-form growth: fatty material? in phase microscope.

(B) ① Proteus 52 heavily inoculated in agar layer with ca 1000 u penicillin ca 11/18

ca 11/21 ② cut out block and smear over surface of fresh N.A. + penicillin plate.

Both show L-type colonies especially in depths of agar.

③ Transfer to broth / agar slant + horse serum + penicillin.

12/15: Dense growth on agar over lysis! No bacteria noted.

12/16 Remoculate to wet slant & horse serum + penicillin

12/17 a Broth; motility agar: typical motile bacteria

b Agar + serum: mostly bacteria; some granules + fragmentation; irregular hyphae in microcols.

c Penicillin serum agar: no marked growth.

12/19

(C) Transfer cultures of 12/3... to v. small inocula.

12/23 11 Streak out on ~~mot~~ motil. agar.

12/27: Motility agar, in tubes seems best
~~Emulsified~~ Emulsified inoculum, however, does not grow well. Heavy inoculum grows well in broth

Protues 52 pour goute vol in 0(0) ? impair ? mi ?

12/20 996 B: grew very well on motility + penicillin; no swarming.
Microscopic examination: large spheres + small granules.

D Salm sw 4/6: smaller sph + gran. ξ as Mother culture.
E Pr sw 4/7: like B

Test for recovery of bacteria; try to float Ba broth.

12/28 C, E all gave turbid growth. Carry on penicillin broth. Transplant D to second penicillin-mot agar.

E gives faint hazy turbidity in penicillin broth. Microscopically, only swollen forms were seen. Titrate on EMB lac and plain broth penicillin.
D gave clear broth. Plate out E → Broth ± 500 u/ml penicillin

E: 10^{-1}, 10^{-3} ml: crowded on EMB Lac 10^{-5} ca 100 (size v. variable)
10^{-7} 0 on EMB.

12/h.: Passage Turbid ± penicillin 10^{-1}, 10^{-3}, 10^{-5}.
10^{-9} clear 10^{-7} - penicillin turbid
+ penicillin turbid but settles granularly.

These are generally more turbid than above inoculum.

Microscopically
a. Inoculum spheres and granules
b. 10^{-7} - penic. motile bact
c 10^{-7} + penic " "
d. 10^{-1} + pen swollen bacteria and many spheres
e $^{-1}$ - pen. spheres and " "

note degree of granularity → different type of bacteria!
Subculture → normal bact!

try 1 ml inocula

(over)

c8, stood on motility agar in frig., and rewarmed back and forth to Chamblee gave a desposie growth in broth 3/10/53. Resembles paracoli ° °° under microscope. Presumably contaminant — fails to grow on EMB lactose

1/14/53 D - (Saline) has shown no turbidity or growth of any kind

E. ②. Had been turbid throughout medium; has now also developed a film on surface. Transplant to fresh penicillin broth + penicillin + colloidion = E3 a, b.

F. Centrifuge E③. Assay supernant and filtrate of same for bacteria on EMB lac. Resuspn sediment in 1 ml (ca 5×) H_2O — forms a gelatinous mass. Under scope, bye clumps of L-type 

Put on plain agar 1:15.

after ca 6-8 hours, small microcolonies of plump pictures appear in conjunction with clumps. Bacillaform could not have been present in comparable numbers but detailed origin was not determinable.

filtrate: sterile on fresh broth and on plate. ~~Unfiltered~~ Unfiltered supt had ca 10^4 colony formers/ml. (1000×10^1 but 0×10^{-3}!)

Osmotic Shocks

998

12/4/52 Osmotic Shocks.

A. add .25 ml PLT22 (961.4) in broth to .75 ml saturated NaCl.
Add 10 ml H_2O. Add 2 ml broth.

Est titer $\frac{1}{4 \times 12} \times 4 \times 10^{10}$
= ca 10^9

B. as A, but add NaCl last.

Assay plagues; .01 ml samples on sw666 / motility: too crowded.

B25 some minute colonies
& numerous ++.

Restreak these.
all normal size!

∴ these expts. fail to confirm Weed, Colwell mutation
of 2CV

As received from Colwell (1st and 2d time) W1939A is a mixture of Mal+ and Mal–. Both are highly stable, but Mal– after purif. did give after papillae → blue and +. (Mal+) + W2090 did not give normal Mal–.

Strains for phase control. 1005

S. Sendai SW 771 is being considered for ~~st~~ studies on determination of phase. However, it appears to be unduly rough. Attempt to isolate a smoother strain.

All isolates, incl. from lyophil, are at least partly coarse in habit on nutrient agar, making H-scoring difficult. Gradually H- is rapidly attenuated on solid medium. Ditto for SW 925.

∴ Not at other Salmonella diphasics

see 1024, 1035

Multiplicity reactivation

FA12: ca 10^9 299E3: "160/ml" Does this depend on multiplicity?

SW666 ~~[redacted]~~ 12/17. Estimated bacteria = 2×10^{10} FA12 ≐ 10^9

① Mix .1ml E3 + .1ml undiluted bacteria. Plate .1ml on EMBLac + ~~[redacted]~~

② " " bacteria 1:10 + ~~[redacted]~~

③ " " " 1:100 + ~~[redacted]~~

no light

After 10 mins RT. add .1ml saline to ①, .1ml undilbac to ②, ③ and plate .1ml samples on EMBLac., after that put also on

	EMBLac		Cal: plaques. Cal +
1	6,7	(.075ml)	2
2	2,8	(.05ml)	4
3	1,5	(.06ml)	1

Multiplicity reactivation probably does not account for the residual plaques.

"Lytic variant" 1006

12/22

See 1003: Streak out plaques 1-4 to isolate pure lines. An initial streak of #1 was mix. of clear and turbid plaques, both small; 2 + 3 also mixed, mostly larger clear plaques, 4 small and large clear plaques. For first purps. pick well isolated clear plaques, grow on LT-2

Imp'l tests, 927 and 928 was not lysed by any plaque. LT-2 was grossly lysed. 666 showed only few weak plaques on #4.

Grow plaque on LT-2/2 in broth. All but #3 gave v. clear lysates.

a) test vs LT-2, 927 etc.

b. Add ca 10^5 cells LT-2 to eq. vol [redacted] LT-22. Plate c .1 ml 22V4 (1/2 dil). at various intervals, incl. 0. Then there is a final plating = 1/4 × .1 ml of diluted cells. All platings equiv volumes

		ca. log survr.
1	No PA22, No 22V	10^3
2	No PA22, 22V	(1 or 2)
3	60M FA22	10^3
4	" + 22V	10^3
5	1M FA22 + 22V	10^3
6	~~25~~M FA22 + 22V	10^3
7	25 " , no 22V	10^3
8	45M FA22	10^3
9	45M " + 22V	10^3

of 5 & 2

1 mutate exp. to 22 protects against 22V! Because of very high multiplicity of 22, this may be adsorption - interference!

[redacted]

Titer of V4: 12×10^9, +++ $\times 10^7$ Confl. 10^5. All plaques clear!
(For more accurate titration, use 10^8.)

Qualitative tests:

	V:	1	2	3	4
LT2		S	S	S	S
927	λ+	R	R	R	R
666		odd plaques			
928	λ+	R	R	R	R
912		S	S	S	S
688	R	R	R	R	R

∴ can also be used to select mutants.

(over)

Some "smooth" streaks of 22V. + LT2.

Follow 4 through serial streaking:
gave self-nibbled streaks until isolated
as PLT-22, 22V-sensitive, non lysogenic.

On SW666 22V gave scattered plaques at 10^{-3}
(e.o.p. ca 10^{-5}). Plaques not very sharp, not lytic.

Restreak on SW666 to get 22B1V → retains lytic action on LT2,
gives turbid plaques on SW666.

However, attempt to reduce lysogenicity on SW666 gave 4/4 still sensitive

10^{-15} m. .2 ml ctg $10^3, 10^6, 10^8$ PLT22 + 10^9 LT2/ml (2 ml)
RT.

	PLT22				
A	10^8	count: 111×10^7	+V 3×10^7	288×10^5	
B	10^6	count: 120×10^7	+V: 0×10^7	22×10^5	(589×10^3) sic!
C	10^3	plaques: 23×10^1 (+ some mucoid).	with V: +++ $\times10^{1\frac{1}{2}}$		
D	0	count: 129×10^7,	with 22V: 6×10^5	1073×10^3	+++ $\times10^1$

Plate i 22V at various dilutions. also ⊕ titrates i C.
Stock PLT22 assumed 3×10^{10} ⊕ plaque titre and "protective titre".

Results. Phage added was 2.3×10^8 initial rather than 10^9.
Bacterial count was 1.2×10^9 containing 1.07×10^6 background resistant.

	Phage added	V22^R recovered.
A.	2.3×10^7	$+2.78\times10^5$
B	2.3×10^5	$10+12\times10^5$
C	230	—
D	0	6×10^5 10×10^5

$\therefore$ ~~$\frac{2}{100}$~~ $\frac{28}{23}$ = 1.2 resistant bacteria per plaque formed!

7 contaminated colonies appear at A ($\times10^{-7}$) dilutg. for all added virus!

dil in terms of original Bouill.

conditions of cells may affect the quantitative recovery of φ (as thioglycollate killed cells or other inhibitors

No effect of multiplicity or survival. The actual ratio φ/B was

~~13/78~~ in B and 130/

130/125 in B and 130/82 in C but amount actually adsorbed was not established.

Detail on B, C:

$r \doteq 10$ C$_1$ 85 plating 4 obviously contaminated. Many additional are vaguely mottled. Festuals these. Replicate to 22V.
central plaque general.

C$_2$ 88 Replicate to ~~LT-2~~ LT-2 4 contam.

B ($r \doteq 1$) Many colonies have a central cloud, difficult to tell whether definite plaque or not. Obvious plaques in 17/18; almost all others have a central plaque.

recover

Small central plaque are multiply infected?
Large plaque & lysed are single??

100901 Total 78 Test lysogenicity by replication

B# lysogenic

all non lys. were more or less lysed by 22V.

21 non-lysogenic
57 lys. of these, 17 showed obvious plaquing and are therefore contaminated.

On replication, 8 additional were ~~off-plaque~~ sector-plaqued

Streak out remaining lysogenic for purity (15 can be picked)

25 contam. or colony 27 not
21 non-lysogenic

15 picked, 12 not adequately tested on replica or not pickable.

$\frac{21}{78}$ non lysogenic = .269 = $e^{-1.3}$

actual ratio B:C = $\frac{130}{125}$ = 1.04

C: ~~B:C~~ C:B ca 10.

C2: 7/88 non lysogenic = .0795 = $e^{-2.5}$

Are these non-lysogenized? Test for sensitivity (all were 22V's)

also test "non-contaminated" lysogenics.

of remaining 81, only 4 were obviously contaminated

A: non-lysogenic on PLT22

B streak out "non-contaminated" lysogenics

In preliminary test of 21, 8 clones were picked (7 resist 22V)

All showed a few lysed colonies on streak. Conclude that all are actually contaminated.

UV'd FA22, protection vs. 22V ?

100 9

12/25-26

A dilute stock FA22 ca 1:30

B UV A 20 minutes (10ml) at 50 cm.

Add .1ml to .1ml LT2 (10 hour broth)
Plate out ± 22V. at 10^{-5}, [redacted]

O: LT2 & FA22 +22V, 10^{-5}: 5 survivors.

(A) ~~G~~. LT2 & FA22 ~ 10^3 plaques on LT2; ~ 10^3 survivors ± 22V at 10^{-5}

(B) H. plaques: 0×10^5, 0×10^3, 0×10^1

survivors ± 22V: 0×10^7 8×10^5. (check these for lysogenicity).

Note extreme killing (does dilution of the broth increase viricidal action?)

UV'd PLT22 seems to have lost its protective function, but the dose may have been excessive. Check transducing ability.

C (J) as above A, FA22 UV 10 min. 11 min rough No plaques at 1, 3, 5, 7.

K D. FA22 UV 0 1 min rough → rough. 10^{-6} 58×10^6 recovery ok!

E no FA22 16 min rough survr.

(F) 22V UV 10 min. assay. (titers of 1/30 diluted)

at 10^{-5}, C, D, E ~ 10^2-10^3 survivors with V. Expt n.g. owing to high survivors in the control. & D. indicating that this dose also removed protective power.

Diluted phage is killed by UV much faster than broth, as one should expect.

K: 10 plaqued colonies. See L-M for more thorough expt.

Any non-plaqued lysogenic? 2 lysogenic ones not obviously self-plaqued in original streaks these.

1009
B-B
(B)

B-B 8 "non-contam." colonies streaked out. 6/8 showed 1-5% plaqued colonies and are therefore contaminated. 2/8 showed no overt plaquing. Replicate for further test.

1 - colonies evidently not lysogenic. Restreak, first rub whole area, also an isol colony

2. " " " "

✓ sensitive! all sensitive. Initial account as lysogenic - non-contam was incorrect

Conclude that most or all colonies are initially "contaminated".

C-B 8 non-cont. colonies streaked out. 3 overtly clear.

Replicate

crude test, apparently pure lysogenic (might have been up to 2% of the 3 "clear" picks possible sens. for unknown. results.)

2 single colonies not sens. No self. lysis noted in controls.

Thus, multiple infection may give some uncontaminated lysogenic clones

B-A 15 tests 10/15 single LP22^S 5 are not 22^S (try 22V?)

1 self-plaqued. → all lysogenic (reduced?)

C-A 8 tests: 7 22^S 1 22^R → turns out lysogenic (reduced).

∴ There is too high an incidence of non-lysogenized once infected cells → pure sensitive clones? (over)

Save B4 and C1 as 1009BA and 1009CA

1009 BA, CA · seem pure on stretch.

Cf. lysogenicity i a typical "lysogenized colony

Transductions – lysogenizations – protection vs. 22V

1009 LT

also UV'd FA22

1/1/53

L. Added 10^8 FA22 to 10^9 LT-2. Absorb 10 min. Plate out to count incidence of lysogenization. (assume stock = 3×10^{10}/PLT22)
Also plate [redacted] & 22V for purity of these solutions.

M. No FA.

N. as L, UV 500 seconds.

L. 1ml SW414 + .2 ml FA22 (1/30) 9:45 –

M " + 1 ml "

N " + 1 ml FA22 (1/30) UV 500 sec.

A: Plate .2 ml on D(0) + M or H.

B. Plate 10^{-5} ml with 22V, EMB...

C. Plate .2 ml + 22V on D(0) + M or H

B): L ca ~~400~~ 878
M ca ~~800~~ (note 1:1 dilution)
N ca 7. Plate .1 ml directly: ca 100 plaques.
O ca 15

Stocks all right; UV'd phage PLT22 does not protect.

The design of this experiment is faulty for using 22V/LT2 rather than 22V/LT-14 in the last step.

(over)

medium useful?

0: (no FA)

		D(Hist)	D(Meth)	D(O)
	0	0	2	—
A	L	ca 50 v. small	ca 300	
	M	2	ca 300	
C	L	ca 10 v. small	ca 100	
	M			

O + 22V — 0 (pinpoints background) — 4

Important comparison:

LA - MA - LC

Note MA ≯ LA although 5× as much FA was used.
absolute counts seem rather high also, paramount of FA used!
Transduction by 22V may be ignored.

Survival of transductions = $\frac{LA}{LC} = \frac{248}{113}$

Survival of populations: $\frac{LB}{} = \frac{\cancel{400 \times 10^5}}{\cancel{10^9}} = \cancel{\frac{4}{100} = .04}$ $\frac{878 \times 10^5}{\text{"}10^9\text{"}}$

Expected surv = $^0/_B = \frac{10^8}{4 \times 10^7} = $ ca 2.5

New LT-2 mutants
UV FA22

ca 12/31

SW414: 9 sec UV (ca 400 cfu/plate).

Cal 13 plates
Xyl 5 "
Mal 10 "

1 clear Cal- (SW950) and Mal- (SW951)

SW950 also had some "fuzzy" colonies as well as clear ~~pluses~~ minuses: these → pure +.

∴ SW950 = SW414 (LT-2) Cal- .

SW951 is slow +, not suitable as selective marker although unequivocally scoreable

Response of SW950:

A Spont Rev: 1 + colony in one spread plate

B + FA22 .1 ml >10^2

C + FA22 (1:30) sec 1009 LM 23 papillae

D + PA22 UV (1009 N) 9 papillae + 59 plaques.

Thus FA22 behaves like PA10, 12 in response to UV. UV'd phage transduces, (thus hypersensitive). though it does not infect or protect

All Cal+ stable.

A: Lp^s

B: 20/20 Lp$^+$

D: 9/9 Lp^s

It can be inferred that FA22 can also be UVd so as to separate phage from transduction.

SW950 / EMS Cal. in a 15 plates, 1 sectorial → SW952.
This is slow +, like 951, and may be suitable only as an unselected marker.

Adsorption

1/14/53

A SW950
B 694
C
O – 948.

add (3x) 10^7 PLT22 (in 0.1 ml) to 1 ml heat-killed broth (10^9)

9:00 – 9:20. Plate 10^{-1}, 10^{-3}, 10^{-5} in SW950.

A: ca 20×10^5 discrete at 10^3, barely confluent at 10^1!

B: ca 100×10^5 at 10^1, ca 100 small sharp plaques.

C: ca $60 \cdot 80 \times 10^5$ (smeared) not discrete at 10^3

O: ca 100×10^5

694 lysogenic for LT-2?

Unfortunately, plates smeared.

Consistent with adsorpt: 950 > 948 > 694 > O. Rates seem unaccountably low.

Has antigen been destroyed? Perhaps should use live cells for adsorption, then kill. Each killed resp. aggl. (slide) in XII IX saline.

Adsorption of PLT-22 1011

2/2/53

SW66 + FA46	− 1	—
928 + "	− 1	—

Host adaptation

1/8/53 X Y

of ., on SW666; [redacted]950:

FA 21, 22, 41A, B, C. FA41 = FA21 plaque resolution on LT-2.

~~2244~~ 43, 46

		X	Cal X	Y	Cal Y
FA22	A	~~50~~ $\times 10^1$	7	~~$300^{++} \times 10^9$~~	10^2
FA21	B	100×10^7	0	~~50×10^5~~	1
41A	C	100×10^3	0	$> 100 \times 10^7$	60
41B	D	~~50×10^3~~		100×10^7	50
41C	E	20×10^3	0	100×10^7	
43	F	10×10^1 (turbid)	12	500×10^7	lysed 10^{-7}: 3
46	G	100×10^7 (turbid)	0	300×10^5 (clear)	0 lysed

log ratio, essay on Y / X.

	adapted to	
A	Y	7
B	X	- 1+
C	Y (X)	4
D	Y (X)	4+
E	Y (X)	4+
F	Y	7
G	X	- 1+

The adaptation of PLT22 to SW666 is therefore reversible, and is presumably a host-induced adaptation.

It also affects 22V, which gives ~~turbid~~ turbid plaques on SW666 when adapted but does not induce lysogenicity.

Note that FA22 has a differential of 7 while the readapted phages FA41 have a differential of 4. This suggests a dual effect, part reversible, part not (host-adaptation; mutation). This may also account for previous impression that host adaptation was not reversible.

Purify, test lysogenicity → pure Cal+: all show same lytic interaction with SW950! (suggesting that 950 is lytic for 666!).

Transduction by lytic variant

1014

1/3/53

FA46 (FA45/SW618) → X 666 Probable lysis. No Tor S.

A. 928: 4 (long) tracks in 3 plates; no swarms.

Isolate 3 of the tracks. Also pick empty nearby agar. Test on LT-2 #2 and 3 or. show typical PLT22 plaques. #1 did not.

1/9 Retest isolated colonies: all lysogenic (PLT22 type)

see 1017,

FA43 = 22V/LT2 FA44 = 43/SW950 FA45 = 43/666 FA46 = 45/618.

1017: FA43 × 953 → H+

And But see FA44 increase of H+ from 22 × 950.

1006 FA43 × 435 → Tr+ Gal+ but low yields.

Persistence of H_1^*

1/8/53 FA 18 × SW 666 See 971018.

4 are i, $4p^s$. a, 4, c, d.

Prepare FA48 = FA22/a – d. save cultures under these numbers.

1/19/53. Plating ca 300 PLT2 + SW954 ± FA53

+FA53 ca 300 plaques, all clean.

100N, 1/ml → confluent lysis on part of plate; clear plaques on remainder
+ FA53 2×10^{-7} → 0. ∴ same ~~per~~ inhibitive particles are working.

Prepare S3A = FA53/LT2. Plaques are very small, scarcely discernible. Titer 10 or 10^4? $\times 10^6$.

D) 1-2 resistants ⇒ SW954/FA53 + PLT22

954 + FA53 seems to show some spotty mucoid lysis. Restreak to separate possible components.

E) SW951, 956 ~ not lysogenic / 950.
Some very vague interaction of 950 → 948, 956?

F) 954 ~~+~~ Lp+ (PLT22) showed no lytic response to FA53A or 53A+ PLT22. (v.sl. inhibition of growth or spreading noted).

& Grow FA53A (53/LT2'). Titre (SW950) 64×10^8

Felix' Salmonella O phage

January 15, 1953.

Ampoules received (duplicate) 1/14/53 as #1, 2, 3 respectively. (described by Lilly and Spicer; [redacted] conversation as "cosmopolitan" Salmonella phages. Label FA 51-3 resp.

a) Test on mixed serotypes. All behaved alike except as indicated:

SW950	S	all lysed clear (exc. occ. rough ?)
666		
948		SW948 had background regrowth to all 3.
927		
927R1		SW688 and S. coli 3 showed no response to any.
H901	S	SW900 had considerable background for [redacted] #2.
SW688	R	
550	S	927Rough1 is morphologically very rough (ragged broth).
S. florida	S	
coli 3	R	
London	S	

b) Plate. Incl #3 as rec'd i SW666, 950. SW666, [redacted] 550; i #3 in mottle

no papillae. no swarms

c. Select resistants in streaks of both mixtures. Clones noted:

1. LT-2/51	Retests:	53 R	FA22, 44 S	!
2. 948/52		53 R	" R	
3 950/52.		53 S	" S	

c1 was noted to show full lysis where streaks from /53 adjoined /22 / Retest synergism of mixture of #A22, 53. Note also resistance to 53, resistant to FA 22!

Repeat ✓ C1 is [redacted] lysed by FA22 + FA53, not repeatedly!

a) obtain C1 lysogenic! C1=SW954

C1 and C2 remain serologically smooth (IV, XII); (I [redacted] XII resp.)

C2 is not susc. to PLT22 + FA 53.

FA22 – 950 relationships.

1017

1/13/52

A. Titrate FA22 (stock) on SW950, SW953 on EMB Gal, D(H), D(M)

Titrations recorded for further studies.

1009LB showed FA22 to have activity of inv. $\frac{1}{6} \times \frac{1}{30} \times \frac{1}{15} \times 500 \pm$

~~10,000/ml~~. ca 100,000/ml.

(also 22V. and WV 22 and check transductants for Gal, M–.

1012 GG showed $1/\frac{1}{30} \times \frac{1}{10} \times 15 = 50{,}000$/ml.

If ca. 3000 previously assayed in SW 435

	FA22	D(meth)	cells have to be washed for D(Hist)
SW 950	.001 ml	30	(count may be conc. higher – plate somewhat smeared). ≐ 30,000
	.005, .01, .002	>>100	
	0	6, 8	
	FA47.1ml	>30 smeared	sic!

SW953	.005	3

c) Transmission of Hfr to Mal+ progeny?

d) Transmission of Hfr in H316 × Hfr? etc.

959: H295 recombinants: H317 Lp^{+}/s. $Lp^{2}{}^{R}$ segregating? Obtain Gal+ recombinants for coupling/repulsion.

954: Lac+ S^{R} recomb from F+ × F−. Check mesc markers to compare pattern with 1895 × 1956

957. What peculiarities of λ/1827 can be demonstrated? On gross test, λ^{4} diff not recog.

phase variation of Bumgendorf

2/22/53

Bumgendorf. 6145-52 = A2. single colony picked and matched = A1. = SW961

List of serums:
k1 Bumgendorf
2 minnesota 240
3 berlin
4 new mexico 10
5 para A 228 new
6 morehead
7 para A 228 old

2/28. Inoculate A into serum tubes:
k1, k6.
after 48 hours, k1 showed rough blebs which spread very slowly; 2/28: spread through.
k6 grew out and filled the tube = A/k6. Repeats + test antigens.
On slides, unspecific A/k6 = B1 reacts c 1,5(k1) but not 1,5(k6) or 1,2 reactions are quite weak.
(over)

2/22 Inoculate A1 on plates of k1, k6 again.
A23: bulbs on k6, not on k1 — slow overspread. (surface spreading = E
P23 pick → D. spread may obscure blebs. matches plates less satisfactory than tubes for prolonged incubations).
A24: numerous B+S on all k6 plates
1 small rough bulb on k1. Reinoculate to try to pick later.
C = choleraesuis c: — #153

D = A1/k6 plates (4 swarms / 3 small plates).
4 mass cultures all react c: + k1: ± k6 — in slide tests. ~~Test~~ use D3 as strongest reaction and test single colonies.
Each of 4 colonies react c +, k1 ±, k6 - in slide (= D1)
Prepare broth culture for titration. Broth D1 in k1: k6: E:
grows promptly through k6 is slightly inhibited in k1, strongly inhibited in c but definite diffuse spread. 2/28 still not spread.
E: one plate showed two rough blebs. Pick to Pennessay. (May have undergone two steps of selection)
after 4 days

SW
D1 = 958

		c	k1	q6
B1 (cryptic.)	at 1:500	+	—	—
	A1	—	+f	+
B1.	1:100	++	+	—
	(overnight: same)			
	supernates fairly clear.			
	1:500 overnight	++	+	—

D: Mor in k1, k6 SS. transferred k6 overnight; k1 in 48 hours = D2

2/26 D3 Mor D2 in k1

Titrate D1, living cf. heated 58° 1 hour & formalized.

living	c: 1000 +++		k1:	50 +++	100 ++	200 +	500 −	
heated	c: 1000 ++		k1:	50 −	100 −			

Repeat

	living	k1 : 100	++	k6	:50	−		
	form	: 100	÷		:50	−		
	heated	: 100	−		:50	−		
D2	living	k1 : 50	÷	k6	:50	−	c: 1000 +	(poor suspn.)
E1	"	k1 : 100	+	k6	:100	−		++
E2	"	ditto						

~~Retest Kunzendorf for c: 1000 D2....~~

carfunic notein of kunzendorf = 1,5, x... : c, x.., with x-component absent in other 1,5 sera. (cf. berlin serum). Heat lability makes somatic antigen unlikely, but reactivity of living cells is much better than formalyzed. Same type is secured by deletion in kunzendorf serum.

Titrate berlin serum : D1 living

1:50	100	200	500	1000
+++	++	++	+	÷

∴ ~~beheim~~ berlin is even more satisfactory some (titer of 1:500)

10 20

2/23-4 B1 (not pur.) into tubes of k1, k6 SS.
A1

overnight:

	k1	k6
A1	—	2 v. small balls. +++ near end of tube
B1	slow diffuse spread	

2/25. Titrate D1, A, C: (1 hour 37°).

A. C: 100 — 500 — <100

k1 : 500 +++ 1.000 +++ 2. +++ 5. ++ 10. + 20. ± 1: 10,000

k6 : 500 ++ 1. +++ 2. +++ 5. ++ 10. ++ 20. ++ >20,000

C: c 1.000 +++ 10. ++ 100.000 — <100,000

k1 100 — k6 100 — <100

D c 1.000 ++ 2. ++ 10. + 10,000

k1 50 — 100 — 200 — 500 — 1000 — 2. — <50

k6 50 — 100 — 200 — 500 — 1. — 2. — ! <50

of B1 at 1:100, 1:500! 4 hours: ib. (±k1 1:50, 1:100)

Ax to c++ k1±. still shows in shide aggl. from colonies from streak of D1. Cf. heat killed cells (somatic O component?)

Kenyondorf - 958

1020

further titrations

2/27 4 live cells and heated in boiling water 10 mins.

	c 1:1000	berlin 1:500	berlin 1:100
SW958 liv.	++	+	++
heat.	−	−	−
cholerasuis 153 liv.	++	−	++
liv. D2	++	−	÷
liv. E1 purified	++	+	++
liv. E2	++	+	++

∴ factor is also present in 153, presumably selected by a non kenyondorf serum. It has been substantially eliminated in D2. The factor is presumably absent from diphasic cholerae suis which migrates readily in kenyondorf serum. It is heat-labile (presumably H.:.), but also formalin-labile!

Test serums at 1:50 with D1 living

berlin 1,5 (k3) and ⑤ (berlin absorbed c 157) ++++

all others negative: k2, k4, k6, k7, 1,2; kw, enx, d., 1,2,3 (colindale)

To select ≤ ~~4~~ or 4 phases from c: 1,5, presumably should use 1,2 serums. "phase stability" of javiana may be due to similar cross reactions of ~~kw~~ d – 1,5.

Effect of formalin. (Add .5% formalin to D1 cells)

	c 1:1000	berlin 1:100
liv.	+++	+++
form.	+++	−

	c 1:100	berlin 1:100	TVi 1:50	c 1:50.
SW 958 1/V.	+	+++	—	
SW 961 1/V.	—	++++	—	—
D3 (not pur.) (of Glidden ref. swis 153)	+++	—	—	

c' factor is evidently absent from Glendale c.

Further questions:

① Does this explain all anomalies (cf. 45-47).

② Recession of c

a) 958 appears to be stable in c (Glendale) SS. cf. D3.

b) does Glendale c inhibit migration of [redacted] 961 : tested 2/18 no.

③ Is c' present in Edwards' c serum? (not previously detected with 1,5,c'... owing to formalin-lability.) If so, c' reagent possibly best prepared by absorbing cc' with D3 ~~with heated cc' cells~~. Absorption of berlin serum with, e.g., para A 1,5 would be less safe.

Misc. tests:

3/1 E.153 is somewhat restrained in berlin serum. (verify c')

SW961 is not " " c (Glendale).

Titrate in c, berlin:

	c 1:1000	1,5,c' berlin 1:100
(mono. c-) 902	++	—
D3 pur a. 958 c	+++	—
SW 958 c (b.)	+++	—
958 2c (slide agg.)	—	++
961	++	

3/4/53. Stability of c phages:

F) Broc c: SS 3/4/53.

		3/7:	3/10:	3/13	3/15
1 SW958		no			
2 958C	motility whatever.	idem	idem	idem	no motility (well-purified stability)
3 #153					theirs.

Other serums: SW961 in SS:

G.

1. 1,2,3 bleeds — 24-48 hours screamed through
2. k5, k7 (para A 278) - 2-3 days " " (k5 slightly slower)
3. k3 — substantially immotile in 4 days: rough beads.

"1,2,3" serum probably pufunal (try Edwards 1,2. of Lw!)

However, k5 and 47 are "effective serums", may still have some residual components (agg. titer < 1:50)

4. 961 / 1,2E (157 serum): screams about equally prompt in k6, 12 Edwards, 1, 2, 3.

Stability of O-901

2/24/53.

Fresh stocks of 0901 received from A. Felix. Also test SW 542, an absent, and SW 586 resuscitated from lyophil. (0901 from Kauffmann and Edwards respectively).
In tubes, 0901 Felix 1-2 remained stable 4 days. On plates, (1 each) #1 stable; #2 gave 1 swarm 48h., 2d 72h.
Requisify for further test.

A: 0901-11 → both (d).
0 sw. 1st. 2d plate: 1 swarm: (d)

C SW 542 0 swarms 1st plate; 2d plate: 1 swarm: (d)

D SW 546 1 swarm : (d)

∴ All cultures are about equally stable (ca 1 swarm / 2 plates)

E 0901 #1 + FA 22: 8 swarms after 24 hours (control 0) } all d
v. numerous trails
48h. 1

F + FA 9 (SW 663) 3 swarms several trails
+ FA 12 (SW 628) 4 swarms several trails

0901 + Flg. −

needs to be checked.

2206 futilates 1876

2207-2208 are futilated by W1876.

F/ mot. recap. 1022

4/6/53. 6 cultures 58-161, 3 and 1, resp. 4 of W1678 sent through motility tubes (2 pass.) were altered.

58-161: W2207, 2208 : F^-, ~~non-infective~~, infectable
W2206 F^+ nearly Hfr. Infective. Not studied for mixture. (see TCN) (found no SR+) see also 1113

W1678 W2209 F^-, non-infective

3/ Prepare purified (5YA) from purified z_6 phage of 3 ggs.

3/13/53 P: 5YA – X LT2 ^{2} <24h → d: 1,2

~~(R) (S) (T) 5YA – X SW999~~

R 891 x–
(S) 959 x– | 5YA. swarms overnight. → d
T 960 x– → d

Dose these bottles, unpurified, into d+1,2 for possible z_6 phages.
3/18. No alt. phages.

Repeat 3/8/53 using restolyzed 891, 959., in d-1,2 serum.

3/19/53. Swarm in S (in d 1,2 tube). Other R, S (2 d: 1,2 each): no swarm overnight ~~~~ T.O. (T.O.) T.O. 3/28.

3/20/53. 1 235 swarmed. 3/21. z_6: – purified, no swarm in z_6 in 24h. Send to Edwards as SW999.

SW999 / z_6 = 999B: wants z_6 ++ 1,2 ++ 1,5 ++
2 – 5 ++.

∴ new phage is z_6, 1, 5 ... or mixture. Restricts

	z_6	1,2	1,5	2	5
cf. SW999	+++	–	– +	–	–
999B (not pur).	++	++	+++	–	+++
SW959	–	+++	÷	+++	–

↓ 5/5 single colonies behave same way. SW999 apparently wants fairly specifically a z_6 Still, worthwhile in 1,5 SS for further selection

SW999 and 999/1,5 serum still react a bit in 1,5 serum at 1:1000 but are not inhibited by it.

Misc: transductions

A. SW938 (1,2 : enx) ← FA40 (sendai a: 1,5) [2; enx serum SS]

3	i++ enx+++	→			
4	i+++ enx− a−	→			

SW986.

1026 e.

Recap. 4/13/53 From FA58(aborticus-equi) → SW950 following cultures were thus obtained, verified by single colony tests:

		s.c. Vx	alt. phase
2	SW986 (slant) Gal-or ±	: a, enx	
1	SW986 (stab) Gal-	: i, enx	
3	SW986B = 986(e1 or e2?)/enx	: i, enx	i
4	SW986C = 986e3/enx (thrice 2 passages)	: i	—

Save/each of these mesolations for further study. Also note.

5 = 1026e1/enx i.

From similar experiments, 1026G3 and 1026H1 had been isolated (both → TM2) These now react as pure enx, as SW986 was originally reported. (It could have been overlooked as a stray i)

Gal- character, even of #2 (which is the most puzzling) seems to rule out any possibility of confusion, e.g., a 1026G2 (= FA58 → SW726). Recheck gal character of SW726. Actually, 1026e2 shows some fermentation of EMB Gal! Disregarding 2, there may have been an increase in i-reaction since SW986 was first isolated. Cf. G3 and H1. Since above rx all come from single colony isolations, 3 and 4 are definitely different, presumably not mixtures or notability.

-2 is weak Gal+ as is 2652 and SW726.

4/14. Try SW986e1 in i., 986e4 in i; G3 and H1 again in enx.

			overnight	
e1	i	++	→ e1'	i- or ± enx + s.c. i → enx+++ i++ (delayed
e4	i	−	} no migr.	4/25 still many limited spread: i, no enx
G3	enx	−		" " " " : enx+++ i − (or i+ v. long delay)
H1	enx	dense bulb	48h: slow spread. →	4/25 : enx+ i −.

cf. 1039 SW950 is also anomalous (more or less i: i 1,2)

e1' indistinguishable from SW986

Thus enx → TM1 makes the latter monophasic vis-a-vis either i or enx.

Try → SW950 to restore diphasicity.

→ 950 shows the double reaction; → TM2 more typically —: enx

enx i : —
— : i

Cf. SW986 in i, enx seems vs. phases of SW924 or 941

10 Gal- : 10 enx

10 Gal+ : 10 b.

Thus if we regarded Gal- only (= 1, 2, in this case,) all would be homophenic, but 25 : 6 of the Gal+ (TM' !) are b. Swarms may have been too crowded still. TM has not, as a rule, given any difficulty in scoring i vs. 1, 2 but should be examined further.

Cumul. totals (discrete swarms only): • homophenic

		Gal+ b	Gal+ enx	Gal- b	Gal- enx
A, B	i- plus 1, 2 +			5 • 2	2
C, D	i+ plus 1, 2 -	3 • 36	8		4 •
E	1, 2 +		7		

See 1039 for further analysis of TM; SW950.

3/26/53.

see 1031

A. "7-119" from Cheny 2/53. "Peters Serum Co" Shipp Nov. 1942
S. paratyphi B & type 3b. Monoph. nonsp. tactiate +.
= SW 1006.

SS = sarcolid In my hands — rather rough. Rapid smoothest colony for stock.
1+ = agglutinable. Does not swarm through SS agar either 37° or 30°.
3/28 Microscopically: occasional cells (ca 10^{-4}) show definite motility, others stationary. Some diffusion in SS, but no progressive swarms or blebs. Cells about stationary under microscope. (nutr. req. for motility?) — Chalk with Cheny. On SS plates, numerous blebs appear, enlarging to swarms which are radially inhibited near margin — probably accounting for failure in SS tubes which are more restricted. [Antarctobacter system?] 2 swarms: 1, 2 ++, b ±. A smooth-looking colony (in SS subtilis) was actively motile. Note: self-plugged!

B N97 "A.M.S. Source unknown type 3b Monoph. sp. tactiate +"
agglutinable in b. ~~Treatment for single colonies & mass. b serum.~~
Stock: grew through b in 48 hours (after def. inhibition) = 36B1 = 1, 2 — = SW1009
Herrothers 3/29. N97 orig lost. Put mass 36B1 through
SW1007 (recovered from mass 1036B1) = b. for reversal 1, 2, 3 N97, if any.
Treatment and test single colonies in b serum.
4/5. 1036B1, s.c., also gave b after prolonged incub in 1, 2, 3
∴ N97 is reversible b: 1, 2. (and just as stable as parent N97)

stock tubes inadvertently discarded

C. "N97 (3) 1" java nsp. Grew very slowly in Pressey or nutrient. Test swarm through sarcolid — 1, 2.

NOTE.

SW1007 (= N97 or ?), and most other b phases react b++ z_{33} – .(including SW1027, 942,)

SW1009 = N97 ph.2 = 1,2, not z_{33}.

SW1009 → SW1009b (ph.1?) but this is bz_{33}.

In 1036 G, the b phases are all from a single ~~colo~~ selection of SW1009 1,1,2,3 and are evidently all bz_{33}.

For comparisons, F1–F5 should be compared. F1b is recorded as being b++ z_{33}–

SW 1009b (G1) does not revert to 1,2,3... but slowly gives z_{33}.
Other b's from SW1009 should be checked.

SW1026 is stated as FA12 (SW623) × SW1007 (and not × 1009b)
It was isolated in i phase, readily → b, but the b phase (4 colonies of 1 isolate) gives only z_{33}. The b phase has little or no z_{33}.

1036H

① SW945 | $\frac{1}{1}^{2\,3}$ inagglut though actively motile

② 1000-C1 | 1,2,3 often not → slow spread 1,2 ++ 1,5 – + all b phases

ph 1,2 $\rightarrow$: b: 26 1,2: 7

SW1031 $\rightarrow$ SW967
1053 $\rightarrow$ SW967
) note: very low yields + apparent lysis Why?

$1053_a \rightarrow$ SW666 a: — a: —

$1053_c \rightarrow$ " c: —

dontes-eggi and paratyphi A.

1052. Screening of Hoan strains leaves doubts on several of these concerning identity, as some are ent: b. E (1967 · relation to 1966) not yet tested.

Fix on 1052B (Edwards) as authentic strain.

1045. Several attempts → a:− unsuccessful.

However, SW1048 seems more transducible (for F/a+) by FA(PB)., though not by TM.

Note: F.K. records SW1048 as I−, 948 as I+.

(1045J1) SW1047 as I+ SW694 as I−.
Transduction?

Perhaps should check other transductions → 1048 for restoration of I.

Gal – Lac diploids.

105 v

6/3/53 (y EML)
W2281 x H245

40 colonies streaked out., ~~replicate to~~ pick 1 apparent Gal v. to EMS Gal. Replicate to EMB Gal, Lac, Mal, MH.

Pick 2 as most tentatively still Mal v., Lac v.

of original 40, all were Lac + (v) exc. 2, 8, ~~32~~, 40.

	Lac	Mal	MH	Gal	
4	v	+v	+v	+v	
7	v	v	v	+v	
14	v	–,v	+v	+,– ?	} not –. not Gal v.
23	–,v	v v	v	+v –?	
27	v (+/–)	+v,–?	+v	+v,–?	
28		v	v	+v	
29	v	v	v	+v	
39	–,v	+	+	+	

14, 23, 27 must be ~~redone~~ re-to verify whether Gal v or Gal +v (latter is assumed Gal +/. or +, modified by other segregations)

Estby later isolated H324 from this cross. T.O.
This material

6/6/53.

by PDS - W2284 from W1895 / motility passage.
In his hands, F⁻ and not re-inflated by W1817 or by W1895.
(However, controls not certain).

1. W2284, W1802 grown with W1305 3 hours. Mixture (F) then streaked out (→ F1) and plated directly with W677, W1896:

			D/O) 48h.	EMBLac	
1	W1802 ×	W677	—	—	
2	W1802	1896	++	++	+>-
3	1802F	677	2	3	-
4	"	1896	+		
5	2284 ×	677	—	—	
6	"	1876	++	++	+>-
7	2284F	677	+±		+± ->+
8	"	1896	+		
9	W-6	677	+	+	->+
10	"	1896	+		

Thus mixture of W2284 (or W1802) with W1305 is clearly F+

F1. Isolate Lac+ from initial mixtures with W1305. (ca 10-20 colonies from EMBLac pooled in broth + used after incubation overnight).

W1802'	×	677	+
W2284'	×	677	4

F2. Lac+ from mixture overnight. Pool incubated 4-6 hours.

$B = 2nF^+ \times Y10$

$C = 2nF^- \times W1918.$

H302 = H-Lacv MH – Mal-S^R.

References: 1. 2n parent functions as such whether F^+ or F^-. If $2nF^+ \times nF^-$ depended on polarity reversal, there would at least be some Mal$^-$ S^R. Split (B:C)(1:2) is certainly significant.

2. "No" Mal+ S^S in B, suggests that "none" of these diploids are hemizygous in this region. If elimination occurs from the F^+ side, it must involve only 1 of two strands, and the eliminated one may be discriminated against in zygote formation. It is possible that elimination does not occur at all from the F+ side of 2n. Note high incidence of Bd. (Mal/S) crossovers!

3. High incidence of C2 suggests usual elimination from $1nF^+$ side. ? are these homo- or hemi-zygous? Need tests on these random C5. Nearly half are S^V. Note: in B, only S^S and S^V; in C only S^R, S^V.

} → Mal v.

15: 2 plates vs Mal+ 7/10
2 plates: 3 Mal+ 7/18: → Mal v.

#17 initially a few Mal v. Reisolate Lac v Mal — and test
(mutants?)

None of this is inconsistent with pre-elimination, if it occurs. Would need a Mal/S crossover (Mal-S>) or a Mal-hemizygote in B to substantiate it. Presumption of elimination is based on polarity differential.

Immediate requirements: hemizygosity tests on C1, C5 classes.

Later: Look for Mal-diploids in B. (Should occur by crossover).

10.	−	−	−	−	−	−	−
(12) ~~11.~~	++ T.	−	−	++ T	−	++ T	−
17.	−	−	+	−	+	−	± lytic ++

From point of view of survivorship, #12 seems most likely.
Label on this vial reads: S. luciana #12. Cherry's letter refers to S. luciana #18 as v. specific for group XI. Presumably not these ϕ.

Grow #12 on TM2, SW887 to test heteroduteonic. Also grow
#1 /957; 9/SW730; #4/957; #17/666, 957.

Need to find better hosts for 3, 7: try smotopes strains (enterides, citrobacter and gallinarium).

#1 seems to differ from 01 in host range. Called para A phage!

Ch2 grown on TM. spot: OK. / TM
on SW887 " "
on 730 " "

Stocks 6/5.

(over)

Lysogenicity tests on 63A-B.

A:1-8 all are lysogenic on BAOR ; sensitive to FA10 ;
SW66 not " " " ; " ;
SW928 " " " " ; resistant ;

all are resistant to FA90.

no control, BAOR/FA90. By 90 → SW66 these have evidently became lysogenic for BAOR indicator. In transduction platings, only rare plaques were seen. Save A1, B1 for further study.

B: 1-20 15 lysogenic on BAOR. Suggests that BAOR might also be lysogenic on many of these.
5 may be sensitive. In initial streakings a few were noted as possibly mixed lysogens.

BAOR lysogenicity. 1063

7/18/53. Reciprocal lysogenic cR...

	BAOR	PB2	SW666	FA90.
1063 A1	++ ·	—	—	—
B1	++ ·	—	—	—
SW666	— ·	—	+—	— (shaded)
SW918	— ·	—	+	—
BAOR	—	—	—	+
PB2	— ·	—	—	+

note difference of 1063A1/PB2 and FA90/PB2. Suggests 63A1 may be lysogenic for a phage other than BAOR!!

· v. small plaques in A1, B1.

BAOR lysogenic for 4 caused by 1063A1 = 63C1.

Streak out BAOR/90, PB2/90; and 63A + BAOR.

BAOR may be lysogenic for another phage which attacks PB2, C66..., but this is probably distinct from the lysogenizing phage in 63A-B.

Lysogenicity of SW1060 (Cherry, 305-50): cross-str. on ETMB Lac

	SW1060	PB1
Taunton (Ch. strain)	—	—
Bucles (" ")	4 plaques	—
Dundee / Dundee	11 plaques	ca 30
Dundee / SW618	—	++

After 48 hours, SW1060 streaked in 1, 2, 3 zones → SW1060' (

Try to grow Dundee, Bucles on SW1060.

63C1 FA90 × 63B1 / not
63C2 FA10 × 63B1 / not — Hold 6 colonies for later lysogen. test

Tom's ?? Mal V.

7/1/53...
TCN 174-95 for further study. From W1325 × W1394
Streak out 2 colonies from EMS lac. 1 → pure lac+ Mal+; poor growth on Stac
2 → lac, Mal +, − and ? ↓
Restreak 4.? on Stac: many satellite pinpoint colonies
1,2,4: variable colony size on EMBlac; no −
3: Mostly lac−, Mal−. Occ. small +?

7/4. A. Restreak + colonies from 1,2,4 on EMB, EMS Mal /sen.
→ no overlap of sensitivity on EMB. of EMS; e.g. on EMS! edges of many colonies look lysed (or lac v?)
~~all pure lac+!~~
Test parents, intact +, − for sensitivity to "ϕ".

B. Restreak 6 clones from 3 (pres. + or v, not −).
all mottled + on EMB lac → pure lac+!
Replica of 1-2-3-4 above: 1, 2, 4 and lac+ 3 are S^R Mal+
lac− 3 = S^S Mal−

C. Tests for ϕ: using parents, 2+ 3− and 4+ as indicators, and parents, mottled + as donors: no signs of ϕ in cross-streak on EMB-O

maybe diploid or more likely, contaminated prototroph + pseudomonad satellites.
Try Mal + prototrophs on EMS Mal /sen.

Write p.v.?

11/19/53

The general conclusion is that the Hfr parent is frequently associated with the F- in recombinant containing colonies. Etched question still whether these are unicellular in origin — considered like from the colony appearance ~~of~~ and from EKL findings.

It is difficult to calculate exactly what proportion of lac+/- colonies have Sk+ recombinants.

Single cell isolations of
Spirochaetes.

1080

11/16/53.

ca. 11/10 ff. Preliminary trials.

A. Prep'n mercury droplets - overlooked Topsky description. Had altered pipet to vary needle diam by squeezing. Later found simple technique, and could pick droplet off glass plate by sliding needle + drop across the edge. Droplets ca 1/2 - 2/3 diameter of 43X field found adequate and could still permit study under phase contrast.

B. Quartz o/k - Plastic coverglass shutting opaque. #1 coverglass: no killing even for 5 mins! Kodak film base allows partial transmission — and 3-5X diurnal dose, but poor optical quality. Visiting doubts with too readily.

C. Troubles: with several blocks: growth along and up sides
Peril of moving completed work by accidentally touching edge of coverglass

B/B. Plastocel 10 mils showed partial transmission (killing at 1 min dose). May be too restricted?

D. 11/22/53. after various casual efforts, try the method using 5 cm squares of agar blocks & plastocel squares about same size. 6 tests: 2 controls, 4 droplets. On controls, found 2, 1 colonies. On others, total of 26 but only 1 even close to a droplet. Complete failure!! UV dose may have been inadequate.

wg 28 Lac- Screen for test crossing markers.

082. ? How many zygotes are mixed

a). Are there recombinants not detectable as $Lac^+ S^R$
b) Are there segregates other than Lac^+/Lac^-.

a. $234Y \times 234I = Lac^- S^R V_1^R \times Lac^+ Gal^- S^S V_1^R$
F^-

$Lac^+ S^R$ essentially all Gal+. 2 V_1^R 2 V_1^S.

S^R/V_1 recombinants = (A3) 20X showed { 33 Lac+ / 130 Lac-
1 X showed $8 V_1^R Lac^+$, $8 V_1^R Lac^-$

(A2) $S^R Lac^+$ (2X) numbered ca 21 purplate.

∴ One should have predicted that ½ these would be V_1^R = ca 11.

(A3) Found $S^R V_1^R$ lac^+ = 8 purplate.

1/12/54

Per 2X plate: S^R a Lac$^+$ < V_1^R 11
V_1^S 10

S^R a V_1^R < 8 lac$^+$
8 Lac$^-$.

These experiments suggest that here lac and V_1 are unlinked to each other and segregate independently one of the other. ∴ 3 groups indicated S – Gal (almost always prototypic) Lac; V_1. If parents are

Hfr S^S Gal$^-$ lac$^+$ V_1^R
× ——— ———
F$^-$ S^R Gal$^+$ lac$^-$ V_1^S

Then recombinants are generally S^R Gal$^+$ · $\frac{\text{lac}^+}{\text{Lac}^-}$ · $\frac{V_1^R}{V_1^S}$

but one should test the Gal S character of V_1/lac recombinants for final verification.

The missed recombinants are therefore probably lac$^-$ V_1^R S^R. Do these occur in association with either parent? Would be detected now with the lac$^+$ parent. P1/P2 combinations should be reviewed for other [illegible]

UNIVERSITY OF ILLINOIS
DEPARTMENT OF BACTERIOLOGY
362 NOYES LABORATORY OF CHEMISTRY
URBANA

Nov. 24, 1953

My dear Dr. Lederberg,

Did you really think I would remember? I'm afraid I can't tell any more about the experiments than what is recorded, which isn't much; is it? This is the best I can do by way of summary.

I do remember that in the filter paper transfer experiments, before I started using fz and selecting marked (Lac-) cells, I was plagued by a persistent excess of Lac + and/or S^s cells, those which started to grow under direct observation but failed to produce colonies on sm agar. Several times I assayed the parental mixture to affirm that this excess was greater than might be expected from a higher titer of W-1895. I also tried inoculating fresh broth from the mixture at the time the cells were deposited in the micro-chamber and reassaying at the time the microcolonies were plated, but something always happened to make these assays unreliable, and I don't know what happens to the proportion of the mixture in broth. Do you?

The single cell isolations, 7/15 -7/29/52, seem to have been plated on Lac without sm. I recorded that the Lac + colonies from the mixed plate, 7/24 were tested and found to be S^r. Probably those from the two mixed plates, 7/15, were also tested and found to be S^s. I don't know about the Lac-. It could have been the result you suggest, but I wouldn't base any conclusions on it. I think I saved the cultures, but if you can't find them I don't suppose I could. The Lac + plate in that (7/15) experiment probably arose from an unmarked cell that stuck to the needle and got pulled out by mistake (see drawing of isolation).

Good Luck & amd Happy Thanksgiving to you and Esther and Seymour.

E Helen

Conclusions (11/28/53) apparent morphology of zygotes (normal)

Ethelyn's experiments were directed at a different objective. A few cases of cells giving SR+ recombinants are recorded. Unfortunately most of the experiments involved plating directly to EMB Lac sm. Part of series III was plated on EMB Lac. There were two occasions of Lac+/- from 1-cells. But the two from 7/15 (presumably sisters) were not saved and there is no explicit record of tests for S. ERL thinks they were both Lac^+S^s/Lac^-S^r (bi-parentals). 7/24 were saved, presumably P1 + R1, are being checked now. Her work is therefore not too useful. [My recollection agrees with ERL on the 7/15 expt.]. Do I have any reference in any correspondence?

large cells recorded. same components.

E13 → P1, R1 No P2 seen. Same mixture and potential toxins.

12/15/53.

12/14. Received cultures from Pomper — lyophil tubes. Incubate in YEx medium.

WY-			
1	62	+++	Pound cells (occ. oval!)
2	63	++	"
3	62-10-19Y	— did not grow out.	(tryptophane, uracil)
4	67-1	++	" (meth, adenine)

12/17. WY-1 grew well and promptly on yeast-sucrose agar
WY 2, 4 grew very poorly initially, but some large colonies suggest incipient adaptation. (probably temper
Hand over to Rubbo for this (There do better at 30 than 37°
After 3 days, WY3 finally grew. Handle as above. ∑ Reversion?)
Transfer from these initial bottles to slants for "cultures as received

WY 6 = dipl S. cerevisiae WY 8, 9 — acriflavine-induced petites (Rubbo).
SOR reports that petites are defective in metabolism of various sugars (cellobiose, rhamnose, maltose, galactose) suggesting adaptive loss generally.

A. Check β-glucosidase in 6 vs 8 grown in glucose, cellobiose.

B. Most sugars, WY 8, 9... showed mighty very poor growth, occasional larger colonies. On EMB Cal, WY8 showed two types of large colonies (fermenters vs slow fermenters). I... and single colonies from EMB Cal of WY8. Also repeat SOR's stations on EMB...

Further tests, nutrition

RL medium base. add niacin 1mg/liter to mix

WY5 (S. fragilis) +++ (~~not~~ previous failure presumably nic requirement)

± metals ... No effect on WY1, WY5 in liquid & moderate medium.

WY1 +++ s/c metals

WY2 +++ confluent flor!

Lac – Gal + SR V

11 cols started → my Lac + V_1^S?

E 4 was murky. 5 [illegible] #5 n.g. But this was 150 minutes more.

1117B. Picks Lac+ from LMB Lac to classify proportions of types and to characterize Lac-V_1 segregations.

Columns 1, 2 6, 7 Brush 65 colonies on LMB Gal/TI (unpurs.) and indicate TI/Gal types Gal+V_1^S/Gal+V_1^R as easily typeable but some doubtful

Columns 3, 4, 8, 9 Lac types on streaks not to be reported

1117B: Initial (TC N.) 2×10^{-7} ml pumpkin.

LMB Lac	Lac+	40.6	Lac−	
$\bar{X}$:	Lac−	55.2		Lac− 48.8
	+/−	3.5	(SR+)	+/− 3.7
		99.3		

∴ SR+ = Lac+/−. Plates all showed Poisson of each type.

$$\% \text{ zygotes} = \frac{3.5}{99.3} = 3.5\%$$

$$= \frac{3.5}{58.7} \text{ of Pl}_{\text{Type}} = 5.96\%$$

...reported ca ~~[illegible]~~ 1.43 zygotes from 24 Pl- isolations.

Found 1 (see over): not different from chance!

Total χ^2 testing Poisson variance: $\chi^2 = 56.0$ d.f. = 50

Plate Jackalyne Newton Hetero 2-9 3-8

$\chi = 10.583 - 9.950 = .633$ $p = .6-.5$

$\bar{x}$	40.6	$\bar{x} = 55.2$	2					4	$\bar{x} = 48.8$
Σd^2	447	281	1					3	
χ^2_4	11.0	5.1	8					3	$\Sigma d^2 = 165$
p	.05-.02	.3-.2	3					2	$\chi^2 = 3.4$
			3					4	
			2					2	
			2					5	
			3					2	
			2					4	
			4					4	
			5						
			3						
			5						
			6						

Lac vs. Lac

$\chi^2 = \frac{32^2}{520} = 1.97$ $p = .2-.1$

Lac vs. Lac

$\chi^2 = \frac{73^2}{479} = 11.1$

$p < .01$

$\Sigma x = 78$

$\Sigma x^2 = 326$

$n = 22$

$\bar{x} = 3.545$

$\Sigma d^2 = 326 - 276.545 = 49.455$

$\chi^2 = \frac{49.455}{3.545} = 14$ $p = .4$

$\Sigma x = 67$

$\Sigma x^2 = 333$

$n = 18$

$\bar{x} = 3.722$

$\Sigma d^2 = 333 - 249.389 = 83.611$

$\chi^2 = 22.5$ $p = .2$

$F_{17,21} = \frac{4.918}{2.355} = 2.09$ $p > .05$

$s^2 = \frac{133.066}{38} = 3.502$

$\chi^2_{[17]} = \frac{9.9[.177]^2}{3.625} = .0856$ $p = .75$

$s^2 = \frac{145}{40} = 3.625$

∴ Het variance Poisson, means homogeneous.

	Col. 2,3	Col. 8, 7-8	
+	276	244	520
−	18	+ 24	42
	294	268	562

$\chi^2_{[1]} = \frac{(2232)^2 n}{\pi} = \frac{2.8 \times 10^9}{1.72 \times 10^9} = 1.6$ $p > .2$

∴ Frequency of het. homogeneous in the two tiny het: lac.

11173

C EMB lac T1. (for S-ratio)

D 10 = C ca 10X

C: ~~colonies~~ Lac–, Lac+ canp. (6 have only small papillae? multiple anything noted with stepton spot.)

19/165 tot.

11/122 } (patsquared)
5/170 }

35/357 +-/-. A: + ca = . Not acc. scorable for + vs ±, –.

B 30 +-/tot = 12/171
6/149
15/236
14/231
47/787

Satan (apparently) in B: 2+1?
C: 0

1/28. Pick B, C, D to EMBlac + other for later study.

This worsdoes pick up the also.

lateration of phage on or secondary crossing ?

Since virtually all of these colonies in B or in C are Lac+/Lac– sectored, no recombinants are here missed that are not otherwise picked up by only ca +/–.

Why discrepancy in rel. count? 10% in C
ca 6% in B

a) (contin) some 'papillate" V_1^R Lac+
b) on other hand, some S^R lac+ are V_1^S!

1119
B – C – D

DATE: 1/31/54. REF:

(B) Plates stored from 1/28 in frig.
Replica B to Lac, T1 to score the V_1 segr. ratio (cf. 1117B).
all colonies have Lac – V_1^R (P1 residue); score strokes for presence of Lac+ s/i T1.

2/1/54

	Lac/ch:	– T1	+ T1	Score type
1		+	(–) +	1
		+	+	1
		+	+	1
		+	+	1
		+ –	– +	1
		+	–	2
		+	–	2
		+	+	1
		+	+	1
10		+	–	2
		+	–	2
		+	–	2
		+	+ –	1
		+	–	2
		+	–	2

		+ –	– +	2
		+	–	2
30		+ –	+ –	1
		+ –	+ –	1
		+	– +	2
		+	+	1
		+	+	1

∴ 18 type 1 15 type 2.

Lac+	V_1^R	V_1^S
	(par)	(recomb.)

Totals now are ~~98~~ parental | ~~99~~
Lac / V_1 : ~~10~~ recomb. | 10^2
– among Lac+ S^R recombinants, neglecting V_1 reversal. $X_1^2 = \frac{12.5}{101.5} = .1$
$p = 0.8$

< 10 + all V_1^R

< 10 Lac+ Lac– all V_1^R ∴ type 1.

Restrict 1119 B ~~B~~ B 20 for components:
actual numbers Uniform type 1 : 19
2 : 14.
$X_1^2 = 0.7$

But p_{total} almost too high!

Scores: 1 : T1 no effect = + R / –.
2 Lac+ V_1^S / – R
[3 Lac+ V_1^S (+ V_1^R ?) / – R] probably ≐ 1, phage inadequate mixture possible but ignore here. They would not influence ratios ~~in some marked~~ 3. in any event.

DATE: REF:

Replace lac+V,R/−R to EMS lac + Sm.

2/1/54.

C1. 30. Lac+ equally prominent in EMS lac sm.

C2. ← C 10 / D 20. " " " " " "

D1. 23.

D2. 29.

Undetermined

112 all orthotype S^R among lac+V,R recombinants. Still possible that some S^S are present but obscured in mixture but no evidence for it. . . S behaves very differently from Lac, V_1. Other data show extreme rarity of Gal/S recombinants but this should be reviewed in multipoint tests.

Recheck in 1119 only to unify 13, 20.

2/5 See also 1076, just noted!!

Note also, in 928-94, W1895 × W1177 among lac+ S^R's, reported 4/S; 74R. (poss. of selection through linkage to TL?). Needs to be repeated.

4	– ✓	0	0	
5				
6	– ✓	0	1	

Best these Mal⁻ evidently all/almost (nearly totally) the S^R segregators; and maybe equivalent. Use 2384 for future studies.

what A5?

B. 3.20 W2057 × P1, 2:45 – 9:30 PM

Plate 10^{-6} EMB lac sm. Streak lac+ S^R to confirm orthotypy for M+l, Mal among these recombinants in lines 1×28A.

EMB lac sm:

2/2 ✓✓ (Some pure lac+) Pool and restreak → ca 2% M+l – but analysis pure Mal+/several hundred Hi all lac+. from EMB lac.

Mal sm: pure Mal+. (Some colonies mottled very likely lac+/–.)

EMB lac: some lac+/–, often too crowded. ~~Picks as likely to EMB lac block Test~~

From EMB lac sm 10 lac ✓: 9 pure V_1^S 1 V_1^R (all M+l+) (different from line 1×28A in V_1 segregation!)

(V_1 orthotypy).

C. P1 – P2 (W2338 × W2344) plate EMB Cal T1 } to test for lac +/– ratio among V_1R^SR recombinants (cf 1082.)

(plate as from 1121. 9:30 PM) EMB lac sm T1 }

did not exist (over)

Freehand, pick EMB lac lac++ (A) and lac +/– (B) for Mal test.

10 · Mal – SR+ 3 Mal +/– Spath, SR+ (over)

Control:

P1 clear: heavy colonial background and partial survivors. Phage titer evidently inadequate.

Microscopy:

EMB Lac sm T1: Lac+ probably >> Lac− but many of former also nibbled! Microcolonies platings of cross (same T1) Lac− → Lac+!

EMB Lac T1 Fewer T1R and: not reliable!
Repeat & better phage stock!

Conclusions:

A. Mal− have all effectively linked to S, show orthotypy

B. W2057 has same elimination patterns for Mal, S, MR as W1895, but note that the V1 ratio is quite different!! (look for V_1^S in × W2377?) Have these V_1^R been tested with T5? This is same V_1^R as W1177 (= W−1 V_1^R); may be different loci.
Also earlier data with W1895 × W1177 where V1 ratio was strongly orthotypic!

C. No information: need fresh T1 for selections.

2/7/54

See 1175

Cont. of W2393 (2390 - 2393) = MtL - W2384.
Test for suitability in mating line. All showed very few MtL + SR compared to SR lac+, but W2393 chosen as having highest (inx P2) (abt 10%).

V_1 segregation in Hfr crosses.

2/6/54.

Recap. 1. In Hfr W2344 $lac^+ S^S V_1^R$ × line 28 $lac^- S^R$..., almost precisely 50% of the $lac^+ S^R$ recombinants are V_1^R. (1117B).

2. In line 1, W1895 × W1177, data are rather heterogeneous, but sum is 41S:74R. Should be recapitulated!

3. In W2057 × W2338 (line 1 Hfr $lac^+ V_1^R S^S$...), in one experiment only, found 1S:9R.

4. 1123B ~~W2057 × W~~ W1177 × W2344: No V_1^S recombinants. [see 1122]

2/7. A. W2393 × W2344 11:35 AM — PM. Plate on EMB lac sm and EMB Mtl sm. Test SR+ for lac (Mtl) and V_1 segregation.

1:1:5

[B. W1895 × W1177 ". see 1122.]

A). Mtl+S^R picked at 24 hours. Cf. isolated Mtl+ and original mass

	Isol lac	Isol	Mass lac	Mass V_1	
1	−	S	✓		includes lac+ papillae
2	−	S	✓		" " "
3	+	S	✓		" lac− V_1^R
4	−	S	✓		" lac+ V_1^S papillae
5	−	S	✓		pure − S
6	+	R	✓		includes, lac? S
7	−	R	✓		pure: same background of S.

lac+ (4 colonies each) is:

1	~~lac~~ Mtl − V_1^S
2	Mtl − V_1^R
4	Mtl − V_1^S
10	Mtl − V_1^R

(over)

∴ lac V_1

−	S	8
−	R	3
+	S	1
+	R	3
		15

Lpores. that some of these are Mtl+ recessors should be studied?

Also isolate the lac+ components: are they also Mtl+?

see 1129

∴ $V_1^R = 6/15$

Lac+ = 4/15

Exp. +R = 24/225 ≐ 1.5/15

but actually +R > +S!

	2C1	–	R	±							

∴ all parentals SP1 SP2 NoR.

2/17 Improved media to avoid clumping. Test P2 x W2400 (3 hours) in ① Nutrient broth 1% Glucose 0.2% ② = ① + Gelatine 1% ③ Nutrient broth, no salt. Clumping (macro) is largely avoided. Streak out Lac ++:

① < 1% ② ditto ③ 2-3% O/K. Use NB for crosses if less macroscopic clumping than Penassay.

~~1129~~
1130

W2401-2 × P2. Pick from Ara sex; test: Lac TS
Infected components: Lac, V_1

% Lac+ among Ara+
17/19 :
21/29 :

(1).

	Lac+	Lac−	+	−
1	S	R	R	
2	R		S	
3	R		S	R
4		S	S	S
5		R	S	R
6	S		R	R
7	R	S	R	R
8	R	S ?	R	S
9	R	S	R	S
10	R	S	20	

Lac+ < R 12 // 12 / S 5 // 4 (R)

Lac− (when pure) < R 1 // 5 / S 1 // 3

(2)

	+		−	+	−	+	−	+	−
1			S	R		R		R	
2	R	S		R			R	S	
3			R		R		S	R	S
4	S		R	R	S		R	R	S
5	R			R	S		S	R	S
6	S		R	S	S	R		R	S
7	R			R		R		R	S
8	R				R	R	S	R	S
9	R			R		R	S	R	S
10	R					R	S	R	S

What are Ara's scores under this heading?

Ara almost certainly linked to Lac. Confusion by Ara ratio among Lac+ S R:

(Ara, TS): par = Ara − V_1 S, + R

		pooled
− R	7	− R
− S	18	− S
+ R	4	+ R
+ S		+ S
+ R, − S	8	+ R
− S, − R	3	− R
+ S, − S	1	+ S

∴ 14/37 have Ara+ (< ½).
definite linkage to V_1 is apparent.

	Ara+ V_1 S	Ara− V_1 R
	1	13
	18	5
	Ara− V_1 S	Ara− V_1 R

Not clear whether Ara/Lac linked. Use V_1/S crosses.

31

Pending:

complementing linkage tests

of Lac - V_1 - Ara.

The independence of Lac - V_1 - Ara

has not been settled, partly on account

of short supply of acridine (phage stocks).

Probably not substantiated

11305

2/15/54

~~W1422 x W1895 3-9PM. E 1915 Laz Sm. (for V_1^S/R)~~

3/8/54. W2407 x W1895. For Cal $^+V_1^R$ recomb.
possibly Hfr!

all 10± Cal+ isolated probable reversions (see DCC notes)

DATE: Apr 27, 1954 REF:

Control platings 2 and 3 parents.

A. W2324 + W1177 — young cultures 1 ml each per 10 ml/2 : 10 PM. Plate at 4:50 PM. EMB Lac

B. " Lac+Gal−S^B Mal+Hfr " Lac−Mal−S^R + W1394 Lac+Mal+S^R F−

(better to use 1895; 2324/Lac−Gal−!)

C. W2324 + W2401 (for Mal+S^R selection) — Incr moderately ± sm.

4/28/54.

D. W1895 × W1177 — Young cells. 1:30 PM —

E. " × " × W1394. X too smeared.

4/28: (3) Pick sectored colonies. Test Mal/S. Mal+S^R indicates F−/F−
14/11 plates × 150 colonies scoreable Mal+S^S " Hfr/F−
But Gal−Lp^S character of Hfr parent Mal−S^R = F− parent.
may prejudice results. However at this time,
the Hfr was probably not strictly distinct from W1394. (judging from plate + sm)
Est 3-4% recomb in A/sm

A29: 5 only had Mal+. 6 were pure Mal−. 3 clearly Mal+S^S/Mal−S^R.
of remaining 2, one may be pure Mal+S^R, other is Mal+S^R/Mal−S^R.
(4) (5)
Restreak to characterize components.

1152 B1-2 : checked by DCG next page

1152

DATE: REF:

	1	2	3	4	5	6	7	8	9	10

B1 and B2 streaked out from spots on B mal.
B1 → mal + and mal − ; six of each picked
B2 → 2 types mal +, one dark, one light

	ed. picked as	mal	gal	lac	mtl	S all resistant	Vs

	6	(+)	(+)	+	+		R

40 (+) = light +

Osmear 1152 B1-2-3

Try W895 lac⁻ + W1177 + ~~W1394~~ Y10
Hfr lac⁻ SR lac⁺ S^S

∴ B1 = pure S^R.
Mal⁻ : W1177 plus recomb!
Mal⁺ : W1394

B2 - pure S^R also but pure W1394, does not contain W1177. Might be 2344 x W1394.

∴ Either a 3-coincidence or Hfr parent potentiates crossing after!!

Lp^S exercises

4/27/54 ff Was given irradiated plates of W478 and Beal, E (M−) suspected sensitives marked.

(1) Picked possible sensitives, streaked one to O; spotted in order on complete → replicated to D(milk)

→ 31 Lp^S ; 2 auxotrophic; all salt+

(2) Several plates replicated directly to D(milk) to pick up non-Lp^S auxos (5 plates, ca 150 col/plate)

→ 3 possible distinct auxos.

478-4
Both sensitive & resistant on parents

5/6/54 ff Streaked E irradiated plates of W478 - before 16 Lp^S allowed; nutrition checked by E ML

5/11/54 ff 478 UV(8). Procedure as before. 29 Lp^S allowed; nutrition checked by E ML

Notes

1152A

DATE: May 8, 1954 REF: 1152

1152 B suggested W1177 × W1941 sibs/sons of Hfr (W2364) repeat design.

1. Y10 × W1177 × W1941
   F⁻ lac⁺ S^S F⁻ lac⁻ S^R Hfr lac⁻ S^S
   Grow together 1:1:10 in 1230 PM - 5 PM.
2. Y10 × W1177 (both F⁻)
3. W1941 × W1177 (both lac⁻) Then streak out on EMB lac sm. or plate
4. W1941 × Y10. (both S^S)

5/10:

1. 5 plates (> 200 each) all lac⁻
2. 1 all -
3. 1 all -
4. 1. N. G. -

parents checked for lac, S : o/k

Hfr x F⁻ (xF⁻) & motile 1153.

DATE: April 28, 1954. REF:

Desiderata for zygote isolations:
① 10x both parent motile
② 3 component mixtures as technical control.

10:30 – 3:30 Mix

A W2341 mot (TCN) x W1177 Hfr.
B " " x W1394
C " x 2401.

128 or ? 40s. cell isol.

8:30 A 30. Dilute ca 1:50 to prepare for isolations.
Defr. 10:30

~~D Fresh cultures W2401 x W2344 Mot (TCN) 12:30 – 4:30~~
M1 OK for plating (i.e. test of s.c. of 2344 mot,)

5/1/54 D. 9A1 Older cultures as inoculum. — N.1. Defr. [to 3:25. Delete due to setup: 4:10].
W2401 x W2344 Mot 1:1:20

[Should study rate of crossing at low cell density & motile and immotile parents, perhaps in viscous medium.]
Could be done in a competition experiment! Cf. W1895, W2334 mot + immot.
No – need some Lac-linked marker (V6, V1 ?)].

1153 B (128). Random single isolates. 40 placed. F1-G1-H1 flowed together. No Lac++ (as indicative of Lac+ Gal+ recombinants).
5 N.G. (A3,4; B2; D2; G5) agree with drops.
Described as actively motile at n=2⁵: C1, C5, D3A D5, These and G2, H4 appear to be v. slow Lac+, others Lac⁻. Have DC G streak out on EMB Lac, M+L; repl to Lac sus., Mal

B2, B5. — both non motile in direct test.
DC 0 also tested C1 D1 E4 F3 G5, non swarm
& C5 - swarm (as expected).

E4 } pure Gal+ by streak.
B5 }

E4: V_1^S

B2 originally showed weak lac+ reaction and some lac+ S^R.
It appears now pure Gal+ by first streak, but some lac+ S^R indicated.
Maybe simply lac+ S^R recombinants in low numbers with ♀ excess.

B5: shows lac (φ) S^R ; Lac+ S^R but also some late Mal^+ $(\sigma?)$. Not evident on early streaking.

E4 though from a pair is not obvious recombinant. (v arabinose).

Check single colonies:

			Mal	Xyl	
B2	lac+ ①	Gal,S	lac +	+	Xyl+ lac+ recombinant
	2		+	+	
	3		+	+	
	4	all+R	+	+	all Mtl−
	lac− 1		−	−	
	(2)		−	−	♀ parent
	3		−	−	
	4		−	−	
B5	Mal+ ①		+	+	Xyl+ lac+ Mal+ recombinant
	2		+	+	
	3		+	+

Total to date (W2344/11 × W2401): 13/16

Queries:

1. These are all fairly late pairs. Earlier should be studied to ensure that zygotes result from pairs, not conc[illegible], and to seek dikaryon cells such as 1156 B2. Notes should be consulted in event of doubt on purity of this cell. None indicated: 
2. Perhaps fuller pedigrees.

3. Review possibilities of line-1 crosses (of 1158. Mich Fla 1177 or 1895!

4. Cytology.

5. Find previous resumé!

6. Problem of undetected recombinants: why not more?

DATE: May 12 1954

REF:

A. Start to isolate numerous pairs, but this was interrupted. Rather late culture.
144 A1–D3 are isolatable. But only A1–5 were separated (65) quite late). B1–D3 give only viability data: from the untouched pairs, both ♂ and ♀ grew in 9; ♂ only in 3 and both died in ①. This suggests that inviability maybe connected with separation but other differences are possible.

In A1–4 ♀ ♂ copulation separated early (watch ALR!); A5 at 30+30 min. sequence in A1 is not clear from notes. (was it copulation?).

B. [143] Pick 5 pairs (rather clumsily) for pedigree analyses.

A1: 1-A, B, ♂ ♀ 1 cell — B 1 cell

2A: ♀ C — A2 ♀ B2 ♂ A2 D2 F2 C2 ! E2 — all grew.

3A: A ♀ ♂ BL BK ♂ C ♂ D ♀ ! E ♀ 1 cell — all but E grew

4A: 144 E1-4 A1-4 — B ♀ A ♂ C ♀ D ♀ ! E4 — B 1 cell only

5A: — A ♂ B ♀ — both grew.

chance to correlate growth delay & zygotes.

Note fair survival of these, too.

DATE: May 19, 1954. REF: 150.

(1) Hfr culture (W2346M1) seems sluggish. Resolute motile cells = A1-4. A1 n.g. (A3) probably best to be picked. From this serial #, use 6 x 8 coverglass mountings. Lettering in sequence A B C D E F G H.

(2) Set up parents in adjacent degs: ♂ ♀ ○ next to trap deg, noted that ♂ have to swim through ♀ to reach trap. May have worked moderately well, but setting of ♀ suggests better to allow intimate mixture before trapping. Many very early pairs seem to separate very readily indeed, precluding any isolation. But no systematic data!

(3) Conventional mixture 1:1:6 2¹⁰ - 3¹⁵ deobtained from ca. 3⁴⁰ - 4:40, assay trap deg

all exc.

at footground reading party 5/7

These C2 may be a dibranyon.

Streaked out on EMB lac, Gal. Both lac+ and − are present.

a) spot some of these on plate for 1164 tests

b) check motility!

(ROC)

S.S. = ss. + 1 post

s.i.d. = s.i.d. after pipette

record on C2 was:

3:54 f0

st. ca 5:15

6:25 $\frac{0^2}{3\ 1}$ presumably separated by slight manipulation.

No comment on behavior at isolation. No basis for question on the isolation - possibility of contamination at isolation is not inherently excluded.

In view of rarity of this event even now (and reduced incidence per zygote for fem pairs, the matter must be strenuously questioned.

No remark is noted of motile cells in the drop.

Why is proportion now so low if true? See next page →

Tests on C2: Streak out on EMB Gal. Gal+ > Gal− colonies.

Pick and stroke: 5 Gal+ 6 Gal−. all are Lac− Mtl− Mal− Xyl− S^R and are thus simply a Gal−/ prototype recombinant! Streaked on EMB Lac, no Lac+ are noted, but some colonies are pink (Lac− Gal− ?). Where crowded with some pink "+" reactions.

{ None motile in motility agar 10/54 }

a) Check Hfr, Lp, mutation. b) Might be Lac+ Gal− Xyl− .... (needed by Gal+ − x ?)

c) Presumably not Lac+ and Hfr would give Lac+ Gal+ recombinants. d) Check motility, Mal+?

1163
C2.

Competative pairing

W-2401, W-2344M1; W-1895M2
F- Hfr F-

DATE: May 22, 1954 REF: 153

Yesterday's observations suggest that motile F- (cf. also Salmonella) does not pair with W-2401. This can be properly confirmed only by a competitive pairing experiment. Suggest: menage a trois with Hfr mot; F- mot; F- ~~non~~ non-mot. Pick pairs and diagnose. For simple diagnosis, it should not be essential to seprate out the pairs, but would be useful if most of these, as expected, will be bisexual. Similar expt. possible with F+. also permitting "F-duction" test.

Cf. DCG notes and 1154. W-1895 used here is second passage motility, and second colony ~~reisolate~~ reisolate showing F- behavior (with peculiar segregation ratios). (before reisolation).

Ovenight cultures, to 10 ml. Penassay, 37° 9:25 AM

A. W-2344M1 (.1) + W-2401 (1)

B. do. + W-1895M2 (.1)

C. W-1895 M2 + W-2401.

Previously concerned about lyp's of W2401 but EML finds it pos. to λ. (possibly Mal-Lyp 2?).

W2338, W2384 being incubated.

11:40 - 12:40 Isolate pairs. Leave at R.T. Some probable motile - motile pairs seen also.

In controls, no pairing was seen in C as compared to A.
Control for B: streak out on EMB Lac, Test Lac+ on EMB Gal to verify ratios of Hfr / F⁻.

N23: A, B show SR+, not C. ca 1% on Lac sm.

EMB Gal: Lac.

A ca. = +, - (sic! indicates growth diff.?) + almost = -.

B + > - + = -

C all +. + almost = -.

Sample Lac+ to EMB Gal. (Pick very clear + available to avoid pairs on slight diffuseness of appearance.) : 23 Gal+ : 1 Gal-
(F-) (Hfr)

Competitive pairing.

why such less dying than 140? all inert.

DATE: May 28, 1954. REF: [155]

Y10M1 + W2502 .1 : 1 : 10 Per essay 37° 100 – 245 ...
(A B C 1 D E 1). 2:30 – 3:45 min NB (C 4 E 4 F G H).

Three 16 "pairs" isolated, but many proved inviable. On early inspection, 8 PM, record as mixed only:
A1, C1, H1 and these were separated & later proved correct.

However A1 B1 E1 may still have some wg28 type cells.

∴ Pick A1-2, C1-2, H1-3 and B1, E1. in this sequence.

W2502 though nonmotile is not morphologically quite so destructive from line 1 as is W2101. Should compare directly.

		dsps	Lac P30	same streak out
A 1, 2 (mixed cell)		1, 28? 28	+ –	→ Lac+, few – (and Lac-S^R).
C 1, 2		1 28	+ –	→ pure Lac+
H 1		1	+	→ pure +
2	(2.28)	1	+	→ pure +
3		28	–	
B1		1-28?	–+	→ Lac+, –
E1		1-28?	+–	→ "

evidently not!

B1, E1.

① Streak out A1, C1, H1-2 on EMB Lac for lac⁻ recomb. (Gal⁺ or S^S)

② Malto- ~~as Epistac~~ /mm.

A1 is presumably a mixture of parents only as lac⁻ = S^R. Others show no lac⁻ in single cell progeny of F⁻. ~~but table should in B1, E1~~ For more efficient tests see ff. ∴ Lac⁺/V, R.

Mal +/− prototrophs. 1171

DATE: May 30 1954 REF: 1163-64.

A) Estlin crossed W2574 x W2118 on EMS Mal. Picks Mal+ to EMS Mal) (mod. crowded), replica to EMS Mal, 1 sun. 45 Mal+. Of these, 9 also had Mal+ S^R. DC & is checking 8 of these for concurrence of other classes.

9 also had Mal− S^R thus Mal− S^R/Mal+ S^S. (presumably "twins"). check Lac concurrence.

1-8, by DCG: #3 also had Mal− S^R #6,8 also had Mal+ S^S. Not clear cut whether twins

B) Remainder, look for twins (non crossover) 11-21. Streaked on EMS Mal. (Number not clear) 10 had Mal+/−

Lac	Mal	
+	+	3
	−	2
−	+	2
	−	0
−(+,−)		4

No indication of significant twinning. Results altogether inconclusive.

of zygote data (not prototrophs)

DCG 1171.

1171 A

1171A 1-8 (known to contain mal + S^R) ; Streaked out on Smal; picked 10 col. from each streak. Spotted each on Sgal; replicated to Smal and Smal SM. Results:

1: all mal + S^R

2: " " "

3: 5 mal + S^R; 5 mal - S^R

4: all mal + S^R

5: " " "

6: 9 mal + S^R; 1 mal + S^S

7: all mal + S^R

8: 1 mal + S^R; 9 mal + S^S

1171A 11-21 Streaked out on Smal to isolate mal +. In most of these streaks no mal - appeared. Spotted mal + and mal - (mal - ? depicting Smal SM plate) on Slac.

	mal +	mal -		mal +	mal -
11	lac +	lac +	16	lac -	lac +
12	+	-	17	-	+
13	+	-	18	+	+
14	-	+ and -	19	+	+
15	-	+ and -	20	-	+ and -
			21	-	+ and -

(these two were different)

1171 B

Picked ~~single~~ mal + col. to Slac; replicated to Smal and Smal SM.

Only 3 contained SR components
#8 & #15 contained mal – SR
#14 mal + SR

8 & 15; Spotted mal + and mal – on Slac;

	mal +	mal –
8	lac –	lac –
15	lac –	lac + and –

14; Streaked ant on Smal (→ no mal –); picked 16 colonies to Slac; replicated to Smal and Smal SM. All 16 were mal + SR

Misc crossing tests 1172

5/31/54.

		D(o)	Lac:

Sept. 20, 1954

At my request for "the aerogenes strain used in the Baskett-Hinshelwood expts. (PRS 139:58-73, 1951) received a culture labelled simply "Aerogenes aerobacter" 19.7.54 This is stated to have a lag of about 5-6 days in synthetic-arabinose medium.

Initially it was streaked on EMB-L-arabinose and found positive.

Alack Bernstein received culture and stored it as W-2654. For first experiments, slant from single colony on L-arabinose was used. Subsequently, used slant directly from Hinshelwoods vial.

9/20. PM. Inoculate D(m) (citrate!) and D(0) for inocula. Latter grew well in 24h; former shows slight initial growth.

p21: From D(0) above, streak out EMB-Darabinose (Dar) and inoculate: (.1ml /10)

	A22	P22	A23	P24	P25
D(m)	±	✓	+	+	
D(0)	+++	✓	✓		
D(m,Dar)	±	± ··+ ?	+	+	
(to avoid citrate until D(A)= D(m) s/citrate mix is made up) T(m)	÷		±	±	
T(glu)	++				
T(Dar)	÷		±	+	

÷ is faint turbidity scarcely more than inoculum. Should try smaller.

A1. EMB-Dar plate all negative. (tamit pinks by afternoon)

A2. P22. Streak out from D(Dar) above which showed some growth previously? all negative. No papillae seen.

B1 Restreak original W2654 (Blac) for single colony for initiation. Prepare current slant and D(0) inoculum tube from this.

P24. Streak out ① from T(Dar) ② sole papilla on 1 colony of A2 ③

C: sole papilla on 1 colony of A1. to EMB Dar. In future expts., minimal medium D(Ar) is based on salts & citrate.

D. Incr fresh D(0) culture from B1 to D±Ar for mear selection.

DATE: REF:

N3. Since yesterday, 1 tube of D1 has begun to grow. (other D1 and D2 still negative).

C7A" seems now to be as rapid on glucose and arabinose. on EMB agar, still weak +.

Plan (1) Restreak D1A, C7A on EMB, DAr and inoc. 1 ml. D(Ar) for comparison.

P3-P4 (24 hours) — C7A" has formed colonies, often two are semi-, pinpoints., D1A' has scarcely begun.

P4: 48 hrs/hours, C7A" has grown optimally (lag = glucose)

Plate inoc 9/30, D(Ar). shows C7A' forming good sized colonies (two sizes). W2654 forms numerous pinpoints & definite stimulation from Ara+.

Conclusions (1). EMB probably not a good indicator for this problem. However papillae on EMB suggest a non-homogeneous response (contra Hinshelwood). (2) possibility of trying indirect selection on DAr.

Take C7A" single colony to NSA as 1181A.

P4: Note original 9/30 DAr plate shows no papillation yet for W2654 stock.

P7 picks + and - to D(o) for check.

P6: on D(Ar), D1A' shows about 1% dense colonies

P6: D2A is now ++.

P7: D2A ++
D1A (++)
D1B now +.3

P11: 1 all v.s.
2 mostly +, few v.s.

1. + and − colonies. ○ ○ about =
2. ++ and a few − ○ ○. any +?
3. " "

∴ heterogenity is still obvious.

None of these grows nearly as well as a D(blu). What was Dean's finding? Write H?

10/15/54 Conclusions.

① Initial strain, Ara⁻ grows v. slowly on gar, gives v. small flat colonies which appear to decay slowly as original.

Mutants not observed on O(Ar) (except possibly after 3-4 cycles) but heavy inocula have not been tested

② On O(Ar) liquid, Ara⁻ grows initially to ca 10^{6}-10^{7}/ml. Then stationary turbidity for 4-5 days, then slow growth.

③ Platings of these first cultures show mixture of Ara⁻ and Ara± (denser, faster colonies) on O(Ar) agar. Only trace for conversion of colonies with subsequent lag time.

④ These cultures still have long lags on Ara, but successive transfers are gradually shorter. After 4-5 transfers, fully adapted cultures are found.

⑤ No critical experiments on deadaptation except from 1st stage.

⑥ Platings on O(Ar) and EMB Ar at various stages suggest several mutational steps.

A. Cultures adapting in Ara liquid are not homogeneous.
B. Not proven whether induced or selected.
C: Needed: ① Platings of dense suspensions & hope of identifying

the first step mutants ⊘ lac$^+$/lac$^-$ markers for confirming heterogeneity of response.

Interactions on phenotypy "F⁻".

Pay Preliminaries.

1182 revertants

1) Recovery of aerated cells in Penassay.

2) Effect of 1 hour aeration on unaerated cells.

3) Effect of aerated ~~E~~ 1305$^-$ on ~~W~~ Waerated.

Comparisons

① E2: either aeration was ineffective in recovery in Penassay.

②. 4 series: a. W1305 reverted. W1305 aerated still reverted but qualified by ①

3 series: ~~W~~ W2207 aerated also reverted, less effectively ~~E~~ by aerated W1305.

③ 2 series: see ①. However B2/E2 suggests that 1305F$^+$ aer. inhibits recovery.

④ 1 series of A1/B1/E1: W1305 aerated may transmit mutagenic to W6 unaerated.

W1305F^a ~~/~~ × W6F$^+$?

among lac+ :

	Ara+	Ara−	
V_1^R	(12)	5	(17)
V_1^S	3	20	23
	(15)	25	40

Ara and V_1 are clearly linked to each other. Are they linked to lac? The parentals in coupling with lac+ are tricky. There is a definite excess of recombinants, possibly significant (no!) However, incidence of couplings may be exaggerated by admixture.

~~Data~~ Table above is uncorrected for a few sib zygotes. Note especially 1165 B6A, B (31, 32).

G14: pure lac- Gal+ Ara+

G15: pure Gal+. Reported rare lac- among many Lac+.

of 12 Ara+ all Lac+
12 Ara- all Lac+.

at least 1 lac- Ara+ identified. Reexamine for lac- Ara-. V_1 should also be scored: both V_1^R on Lac.

On retrials, G15 was pure Lac+. (Previous lac- colony probably came from G14.) Absence of lac- Ara- is notable but might be in other parts of pedigree, undetected. If segregant is lac- V_1- Ara, implies crossover of V_1-Ara. Ara- should be checked also. Some lac+ did come from late ~~ward~~ restrain! — These are all lac+ V_1^r Ara- are lac+ V_1^s. ∴ Types recovered are

lac+ Ara+ V_1^r lac+ Ara- V_1^s and lac- Ara+ V_1^r as if 3/4 strands from $\frac{+ \; +r}{- \; -s}$ hybrid with c.o. between Lac/Ara. Unfortunate that others were not recovered.

Note A5 and A6 showed mottled appearance on EMB Gal, but DCO failed to find any evidence of segregation.

Logical, if one c.o. is recovered, should other be also?

Luca - J. Indent selection 1193

presumably variability in lag.

Note adverse selection! Parent cultures had ca 125/.1 ml.

8(2) series: dilute 7-36 by 1:6250, incor. .5 ml into each of 20 tubes of saline. Found 1 tube (8(2)-3) to have cols. by loop assay. But 0.1 ml assays shows only 34, 20 colonies per 0.1 ml.

Remember: 8(1)-3 = 8-C 8(2)-3 = 8-D (Rom)

Is periodic selection coming in?

Recontinued by Luca

Stage 14-5

11/27 Picks 109 singles from EMB-0
also 8 ≠ clusters of 5., to EMBlacI ons.

None of singles, 2 of 5's showed S^R

Restreak these on EMBlac for final conf.

= total of 2/149. A, B.

10 colonies on EMBlac. Pick at random
3/10, 2/10 S^R

(02716)

Parallel platings at last stage showed S^R = Cal−
(if S^R suppresses Su^+_{Cal4}). This isolate has weak if any response to s/4.

Note ≠ Cal + and ± ? together noted as
Cal − − not on second head, probably matter of folding

C1 = S^R Cal−
C2 = S^S Cal?
C3 = repeat isol S^S.

Gal+ reversions of W2716 were noticed to be Gal$\underline{U}$!

---

passed through 20 passages (ca 10^{-3} ml/10 - 10^{-4} max.), i.e. for
1/10/55 about $\log_2 10^{80}$ = about 250 generations, then plated.
DCG examined ca 1000 colonies (5 plates); all were SR on replica. One isolated as W2716-20 for quantitative comparisons.
About 0.1% of colonies at this stage were weak Gal+. Proved stable SR and, as above, unstable +. Save ①.

T2 and crosses

1195 #44

DATE: OCT 27 1954 REF:

Some preliminaries (1,9c) not recorded.

Grow ♂, ♀ overnight.

8:55 add 1ml broth culture to .1ml .05% T2

10:05 – treatment 2: spin down + resuspend

" 3: use stained cells per se

ca 10^{25}

(1)	♀ + ♂ 3	1ml : .5	7ml Penassay	
(2)	♀ + ♂ 2	" "	"	
(3)	♀ 2 + ♂	1ml : .5	"	37°.
(4)	♀ 3 + ♂	" "	"	

Also note .2ml T2 went slightly faster.

addition of 1ml fresh broth at 8:55 delayed (.2ml T2) coloration about 1 hour

♂ reduced T2 > ♀.

Exp. n.g. – label (T2) insufficient for low power determination.

Conclusions – so far, T2 label has not been satisfactory. In growth overnight in T2, much of the label is extracellular. In buffer pools so far, there has generally been just too little label to be workable. Needed: some pulmin. expts on incorporating the label, especially in line 28. This should not be allowed to interfere with pedigree work and cytology

DATE: Nov. 2 1954 REF: 192

11/ Prepare ♂, ♀ TT for pect. study

General conclusion. ① TT label can be introduced in ca 2 hours (in old broth .005% TT)

② It interfers considerably with motility but some pairs may still be obtainable.

P1 prepare labelled cells. Let stand in frig.

#2 Most of TT had settled. Supernatant may contain the most active labelled ♂♂. Take off about ½ and mix with ♀ unlabelled + ca 1 ml broth 10:30 AM.

(also prepare freshly labelled ♀♀ and fists ♂♂

In general, only a few labelled ♀ proved satisfactory.

compare pairs.

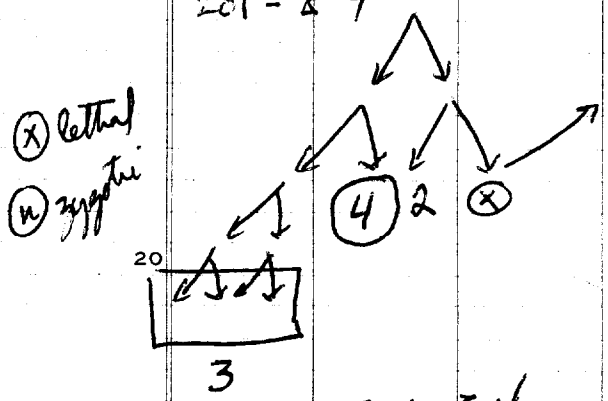
DATE: Dec 6, 1954 REF: /201-203/

This pair used in recent experiments as 1) pretested fertile sibs and 2) for possible selection of potentiality of Gal paratypes.

Protocols do ~~not~~ give timing of cultures, probably mixed early, about 10:15 AM by DCG during class. Isolations were begun at 11:10 AM, therefore quite fresh. Cultures also presumably overnight. Isolations completed 12N.

Yields low (0/3 complete; 2/6 incomplete) (3 illegitimate!) 2/9 total. See protocols for details. Successful (productive pairs) saved as:

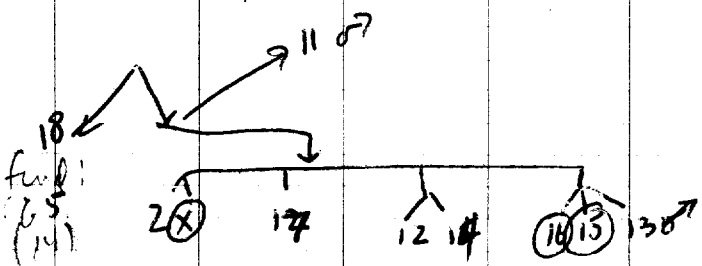
201-E4



all cultures parental
Lac +sm, Gal, M, X, M, Ara

(4) = Lac+/- Ara+/- V, R

201-C4



(15) = Lac+/- Ara- S

(16) appears mixture of ♂'s; not technically accounted for but this is a poor pedigree (R+/S-) unless otherwise confirmed

201-16 is a puzzle. Not fully analyzed but contains motile and non motile elements; Lac+/-; Gal+/- and seems surely a mixture. It is impossible to be certain whether this is an artifact; until a pedigree can be obtained from such an individual, it must be left in doubt, even though there have been no reasons for it.

Neg, V, : streaked out cultures but not analyzed in detail for the present.

Transmission of fragments.

Hfr (Val+ × –) × F – (Val–)
(W2730)

Dec. 21 ff. 1914

Objective: test for transmission of fragments

EML Val+( ) × W2344M1 (for Val⁺ fragm/Val₂⁻.)
p.800:1-7 Tsolates.

Plan: a) SR+ crossing tests b) progeny analysis of
(Val+ × ♂) × W2405 (Val4⁻).
+/Val₂⁻

A. On 1st pul um, 800-1 × W2405 (24-48 h. cultures) (10:1 ratio ca 3 hours incubation necessary)

12/21. cross
EMB Val, Lac + >> –
lac sm. No + in 18 hours. Probable slow + thereafter.
after 36 h. some probable Lac+

Point: 800-1 is mostly Val+ or Val⁰, ca 15% –.
.. presumably still Hfr. (an Aur). No lac++ or Val+ SR
implies no transmission of fragment. → of probably Lac+ "SR, {15 Aur+ / 13 Aur –}

b 12/23 as above, all 7 isolates, streak × on Calsm. tc screen.
× 4⁰⁵–5⁴⁵ PM
pul – all Val SR.
12/25 – dilute. #1 on lac sm again shows SR work +.
Conclude: at least #1 is certainly Hfr but is not transmitting the Val fragment with appreciable frequency. Should be repeated under conditions selecting Val+ prototrophs. Label 800-1 as W-2730

c). 4 papillae in thick streak of #1 above. (sm)

D. Should check Val character of recombinants above, but probably not best suited material if Hfr Lp_2^{R+}

c)

4 papillae streaked out, each gave Gal+ dn repurification, 3 apparently segregating occasional (1-3)

Gal−, ≠ 4 pure Gal+. None were Lac+ (nor were crude papillae) and ∴ unlikely to be related to recombinators. Might be direct transductants from sp. lysis of W2730 parent. Review of possible complications, abandon expt. (Save for test on Mal− Mal, Arg. (stab?). Might still be one c prototroph selection) and Lp^s ~~resist~~ F$^-$

Transmission of allotype fragment
Hfr × F⁻ prototrophs.

1208

DATE: 12/29/54 REF:

Design

Isolate Gal+ prototrophs and, if segregating, determine whether they are 2⁻ or 4⁻.

This will reveal conclation of segment when fragment is selected. Since the cross is so strongly orthotypic, recovery of 2⁻ segregants will indicate close association.

E, F W2405⁻ × W2730, W1895. (latter as control for parotype incidence). 1:1:7 ca 10AM – 5PM. Then plate 10^{-3} ml, 10^{-4}, 10^{-5} resp. on EMS Gal

A2: Fertility was very low – ca 1-2 prototr at 10^{-3}! probably low recombination of $M_1^- \times M_2^- H^-$.

A3 Use old susp. for mixing, recross as above 9:30 – 5:10 PM
Wash, plate 0.1 ml samples on S Gal.

A5-6. Count E: 8 plates 12+/722 F: 3 plates:
(about ½ + are sectored) 3+/204 (41, 75, 88)

↪ (81, 73, 112, 95, 99, 89, 108, 75⁻)

E1 both Gal V

	11	+		+	−	4⁻
	12	+		+	−	4⁻

(EML finds in a comparable situation)

2⁻	4⁻	?
10	III	I

; when fragment appears it is usually associated with parental locus (not always), i.e., fragment is "linked" to locus.

2⁻ 4 4⁻

should cross + Lp's to examine Lp situation of the fragment.

~~know~~ selected

It remains possible that some 4⁻ are transductants.

Stl - of W2401.

1209

DATE: ~~Nov.~~ Dec. 28, 1954. REF: see 1207

also prob. temp-sens.

In tests for Stl reaction (see p. 1207) exconjugant clones varied. On one plate, only 2 clones were negative, remaining 4 being variable.

P27 ♂ strain ♂, ♀, ~~Hfr~~ 206-11 and 206-12 on EMB Stl.

P28 ↙: ♂ is weak + ♀ is − (5) & occasional + or V (6) colonies.

206-12 appears to be − (1)

206-11 is mostly − (2), has ± (3) and + (4) colonies!

B. P28 Strain as indicated ♂ or ♀, ~~Hfr~~ F'lac.

P29 all Lac+. Though 1 and 5 are weaker.

On Stl 1 and 2 are pure −

3 is −, + (still segregating?)

4 is +, − (" " ?)

5 is pure − (some spotting in thick portion)

6 is +, − may still be segregating.

Held over weekend for further study: incl. small broths also.

~~A2~~ F

On replating from colonies, read by REW

#3 scaled as − #4 as +, − #6 as + and −.

P3 Conclusion is that W2401 is a mixture of unstable + and more stable −. Since stock culture is predominantly Stl − while most clones from pairs in that experiment were V three may be some selective difference with reanalyzing. For further analysis, replate B5 and B6 broths; discard the others.

DATE: Jan 4, 1955 = C1 = W2401 pur. stl⁻ REF:

P4: B5 now seems pure. save stock and replate (1? colony on plate)

C)

B6. 90+ % stl+ " , remainder —.

Replate these = C2 = C3 = stl⁻ "segregant"

= stlv ✓

D1

Selectivity? Streak out W2401 parent of cross this date, and also the cross on EMB lactose, stl. for later comparison of cross with D2 parent. D1 is ca 0.1% + D2 is mixed.

On testing SR+, 0/14 were stl+, ∴ no evidence of selectivity. How account for [206]? Note [206] spread all-, while [207] was mostly +. Without further data, must assume that ♀ parent of [206] had simply accumulated high incidence of stlv type. But why would this not reappear in [207] which was same susp. the next day?

A11 On replating 9C1 shows ca .1% +. Repeat, to test stability of C4 ✓ shows stlv on two restreakings.

Conclusion: W2401 carries an stl⁻ —ca 1/1000→ stlv —ca 20%→ stl-

8/53. S. bongendorf; and misc nonsp. & Jean Thomy 1068, 1063
para B phages : BAOR
TM2 monophasic SW1067. ~~SW 1067~~ 1067 1063 of 1026e (SW986)
Note: SW1067 → SW666 gave only H_1^b's.
TM2 → SW1061 gave no non-1,2.

UV, heat / phase variation: monophasic 1065

S. abortus-equi (anelbourn) 1042
1062, 1052

Somatic selection (monophasic) 1034 1062

Resume's at 1053:

SW1047 (N97...) H_1 H_1 1046 1038 1036992-991

Misc. on S. wien ek. mcard. (cf Aleuk; PRE)

→ SW1061 → still/mannopheric enx: —

but SW1057 → SW1061 (same?) did give c:1,2

S

1049: misc para B strains.

1045 S. para A.

1051 : H_1-H_1- Fla linkage

Used duplication status → . No clear result.

1048 Motility agar changes — mcard

1047 X phage

1044 H_1, H_2 transductions (TM: miami albany) + ; note of trailsome!

1041 - Phase variation: resume 1035 979

1037 S napoli

1033 Fla regulation in tracks tested. Somatic on T:S ratio. Serum effects (975)

SW967 Fla linkage. Ratios of gm: i ck.

1032 Calv? Looks for Hft (misguided). 977 973B1

1031 Resume

JAN 2 4 1955

1031 – Resume

Fla,-H,... linkage tests 1008. ; crossovers?
Monophasics (976)
abortus equi, javiana, pullorum
Z33, Z6

1030 "autoantibody" – inhibition of Fla$^+$ H,^{b} by Fla$^-$ H,^{b}?

1027 9–×967 "extensive teach" (This is probably the one saved)

"numerous T, no S" "numerous T, 1S".
heat-list of Fla$^-$ types. typing of SW970, 972...

Statement that 9–×967: numerous T, rare swarms } linkage?
10–×967: " and " . }

[Has there ever been adequate test for Fla,$^-$ in 9–×967?]

1024 S. cholerae suis, javalis ~~bebb~~ labile antigen; 1020
Misc & tests + stability tests

1019 1/53. Cetrimedium for inactivating phage n.g.

1018 "Evaporation of phage"; lysogenization 1009 994/ protection - transduction 1017, 1012 980 988

1016 Felix O phage. n.g.

1014 PLT22V. 1006

1013 host adaptation

1011 adsorption

1010 999 uv'd PLT22; TM2 Val-mutants;

1008 S. para A

1007 XRay PLT22

1003 Serum

1002 buffers 999

1001 b/i ratios: Fla⁻ linkage? Bais? 993, 992 986

0998 uv'd phage → Fla⁻. Val⁺/Fla⁺/unfeathered

990 Flaes + Trailes.

992 5/6 → × typhi H901 → 3/3 SW930 1,2: —

→ × abony 7/7 1,2: elix

1000 Eduardo N25 (SW942?)

and wi FA15 – × SW942b → 1,2 – gam!

1023M Misc on Manoptenco; ; 526 – × miami → 1,2; 1,5
SW973

1025 z_{33}

1[illegible]1 Expts on N97, N25 same xxx b: 1,2)

SW942 /b → 7/7 z_{33}: — only

do 959-960-961

1036 N97 = SW1007, /b → 1036B1 → 1,2 !
Mass stock 1,2 slowly ∴ reversible ! reputable mutation

1036E i → × SW1007 → i : b and cycled

1038 Immunology ~~tests~~ N97 → × miami → b: 1,5 $H_{\downarrow}^{b}$
→ × TM2 → b: 1,2 incl $H_2^b H_{\cdot}^{1,2}$

E TM2 → × SW1007 → 3/3 i : b

→ × 942 → c : —

10385 SW10B6x — sendai → a:b:a SW1031
:b

Check 1026i → x mating → 1/2 i:1,5

mei. shigushi
no b's reformed

see summary of 1044

1046 Fresh N97 = SW1043 → b → 1,2 1046A1

and check single colonies 6/6 → b → 1,2

1046B1=b → SW1043(1,2)
(SW1043b)

1,2's poorly viable.

---

c) TM2 → SW 1043 2/2 i:1,2:(i)

Schrödinger notes 1/61

Is thruway turnover?

H_2 protein as repressor of H_1 synthesis.

Levin found a strain which was permanently in the phase-1 state.

$$Ph_2^+ H_2^{1.2} Ah_2^- \quad \text{or} \quad Ph_2^- H_2^{1.2} Ah_2^- \quad \text{or} \quad Ph_2^- H_2$$

$$\updownarrow \qquad\qquad \neq Vh_2^- \qquad\qquad \text{or stable allele.}$$

$$Ph_2^- H_2^{1.2} Ah_2^-$$

? Can $Ph_2^+ Ah_2^-$ be obtained by recombination.

$$Ah_2^- Ph_2^- H_2^{1.2} \xleftarrow{\times} Ph_2^+ H_2^{enx} Ah_2^+$$

$$\downarrow$$

$$H_2^{enx} Ph_2^+ Ah_2^- \quad \text{i.e. stable phase } \underline{\underline{2}}.$$

how select ~~in presence of~~ $H_2^{enx} Ph_2^+ Ah_2^+$ unstable phase $\underline{\underline{2}}$.

? Is phase variation going on?

$$Ah_2^- Ph_2^+ H_2^{1.2}$$

$$\updownarrow \qquad \xleftarrow{\times} Ah_2^+ \underline{\underline{Ph}}^{del} H_2^{del} \longrightarrow \text{both phases.}$$

$$Ah_2^- Ph_2^- H_2^{1.2}$$
