To All Interested Parties:

SUBJECT: 2002 Groundwater Contamination Maps for the
State of Hawai`i

The Department of Health has been periodically updating the Groundwater Contamination Maps for the State of Hawai`i since August 1989. These maps identify locations where certain groundwater contaminants have been detected and confirmed.

Accompanying the 2002 Groundwater Contamination Maps is information about the basic health effects related to the contaminants. We emphasize that the detected levels reported in the maps are below existing Federal and State drinking water standards established for the protection of public health. Before contaminant levels reach these standards, appropriate public health protection measures are implemented.

The data presented in the maps and tables were collected between January 1999 and December 2002. Positive results are considered confirmed when verified by a follow-up test or by comparison with historical data.

If you have any questions or would like to obtain additional information related to groundwater contamination, please contact the Groundwater Protection Program, Safe Drinking Water Branch, at (808) 586-4258.

Sincerely,

A handwritten signature in black ink, appearing to read "Chiyo Fukino".

CHIYOME L. FUKINO, M.D.
Director of Health

Enclosures

**State of Hawai`i
Department of Health
Groundwater Contamination Maps
2002**

Attached are the 2002 Groundwater Contamination Maps for the State of Hawai`i. This is the seventh edition of the Maps since they were first published in August of 1989. The previous edition of the Maps was developed in 1998 and issued in May of 1999. The Maps were not prepared between 1999 and 2001 due to resource limitations.

Where do these Maps come from?

The 2002 Groundwater Contamination Maps for the State of Hawai`i were prepared by the Groundwater Protection Program, Safe Drinking Water Branch of the Hawai`i Department of Health (DOH). The Maps represent the most current information available to the DOH up through December 31, 2002, and are based on monitoring data for public drinking water wells and other testing data available to the DOH.

What do these Maps represent?

The 2002 Maps identify **organic chemical contaminants that have been detected and confirmed in wells used for drinking water** throughout the state. Groundwater can become contaminated through natural processes, but anthropogenic, or human-induced, contamination poses more serious problems. Contaminants may come from herbicides, pesticides, industrial solvents, and other sources which are applied, spilled, or leaked into the ground. Groundwater contamination is a significant concern because nearly all of Hawai`i's drinking water comes from groundwater sources.

The intent of the Maps is to identify only those wells with detectable levels of groundwater contamination. Some contaminated wells may not be reported because of lack of confirmed data, or the wells have not been tested. The contamination levels in this document refer to reported levels of contamination on a specific sampling date. Levels of groundwater contamination may fluctuate for a number of reasons, including actual diminishing or increasing levels of contamination, chemical breakdown of contaminants, variability in sampling and analytical methods, the effects of pumping rates, and other factors.

What do these Maps tell us?

The 2002 Maps show that groundwater contamination continues to occur in Hawai`i. In most cases, once a groundwater source has been contaminated, it remains

contaminated for many years. The Maps show that a few wells that were previously not contaminated by a particular chemical have now shown positive detections of chemicals known to be present in nearby wells. The chemical dieldrin, a termite pesticide, has been detected in three additional sources since 1998. No chemical contaminants have been detected in the drinking water wells on Moloka`i and Lana`i since the Maps were first prepared in 1989.

Is the water safe?

The 2002 Maps indicate that the contaminant concentrations detected in Hawai`i's groundwater are generally below state and federal drinking water standards. As long as concentrations are below these standards and advisory levels, the water is considered safe and does not pose a serious health risk. If contamination levels approach state and federal drinking water limits, the well owner is required to take steps to reduce the contaminant concentration to a safe level. This could involve the installation of a treatment system, blending of the water with higher quality water, or removing the well from service.

How are the Maps organized?

This report contains maps and tables for the islands of O`ahu, Hawai`i, Maui and Kaua`i. The Maps identify the locations of current and historic contaminated wells and well fields (an area where many wells in proximity share the same groundwater source). The tables relate information about the contaminated well, such as the use of the well (e.g. drinking water, irrigation, industrial or inactive), the contaminant(s) detected, the concentration of the contaminant (e.g. detected level), the sampling date when the contamination was detected, and the drinking water standards and health risks associated with each contaminant.

A contaminant which has been identified in prior editions will be removed from the report if subsequent monitoring no longer shows detection. A well will be removed from the map if it does not show any detectable concentrations of contamination. But a well and associated contaminant(s) will remain on the map until new information confirms that concentrations have decreased to non-detectable levels. This is the case with several non-drinking water wells in this report that have not been monitored regularly.

Where can I get more information about groundwater contamination and protection?

More information about the Maps and groundwater protection is available from the Department of Health's Groundwater Protection Program. If you need more information, please call the Groundwater Protection Program using the following telephone numbers:

From:	O`ahu	586-4258
	Hawai`i (toll free)	974-4000 ext. 64258
	Kaua`i (toll free)	274-3141 ext. 64258
	Maui (toll free)	984-2400 ext. 64258
	Moloka`i and Lana`i (toll free)	1-800-468-4644, ext. 64258

Definitions

The following are general definitions of the terms and abbreviations used in this report.

Before: water samples taken “before treatment”. Drinking water that contains a chemical contaminant above drinking water standards is treated to reduce the contaminant concentration to a safe level. All “after treatment” readings meet Federal and State drinking water standards.

Contaminant: organic chemical contaminants that have been detected and confirmed in wells used for drinking water, irrigation and industrial purposes.

The State Department of Health defines a contaminant as “...any physical, chemical, biological, or radiological substance or matter in water. An additive contaminant under this definition may have beneficial or detrimental effect on the potability of the water,” per Hawaii Administrative Rules, Title 11, Department of Health, Chapter 20, Rules Relating to Potable Water Systems.

Current: drinking water wells where new chemical contaminants have been detected since 1998 when the last Groundwater Contamination Maps were prepared.

DOA: Department of Agriculture.

DW: drinking water well.

Date: the date when the water sample was taken.

Detected level: the amount of a contaminant found in a sample. The numerical values are presented in “parts per billion” (ppb).

Detection Limit: the lowest concentration of a contaminant that can be detected by a laboratory through its testing equipment, analytical methods and personnel.

Historic: a well or well field where chemical contaminants have previously been detected.

IND: industrial well.

IRR: irrigation well.

Inactive: a well that is no longer in service.

Montgomery composite: water samples usually taken from two wells that are combined and tested for chemical contaminants by Montgomery Watson Laboratories in California.

ND: “non-detectable,” no presence of a contaminant at, or below the detection limit used by laboratory.

Indications below the detection limit are considered to be negative findings and are reported as: ND<0.05. “ND” identifies this as a “not detectable” result. The “<” is a “less than” sign, and “0.05” is the detection limit for the contaminant. Detection limits vary for different chemicals and analytical methods.

NQ: “non-quantifiable,” the lowest concentration of a contaminant to which a numerical value can be assigned. The level is also determined by the analytical method.

Indications below the quantification limit are reported as: NQ<0.10, where the “<” is a “less than” sign, and “0.10” is the quantification limit for the contaminant. As with detection limits, quantification limits differ for different chemicals and analytical methods. An “NQ” result means that the chemical concentration is between the quantification limit and the detection limit. Chemical concentrations above the quantification limit are given numerical values.

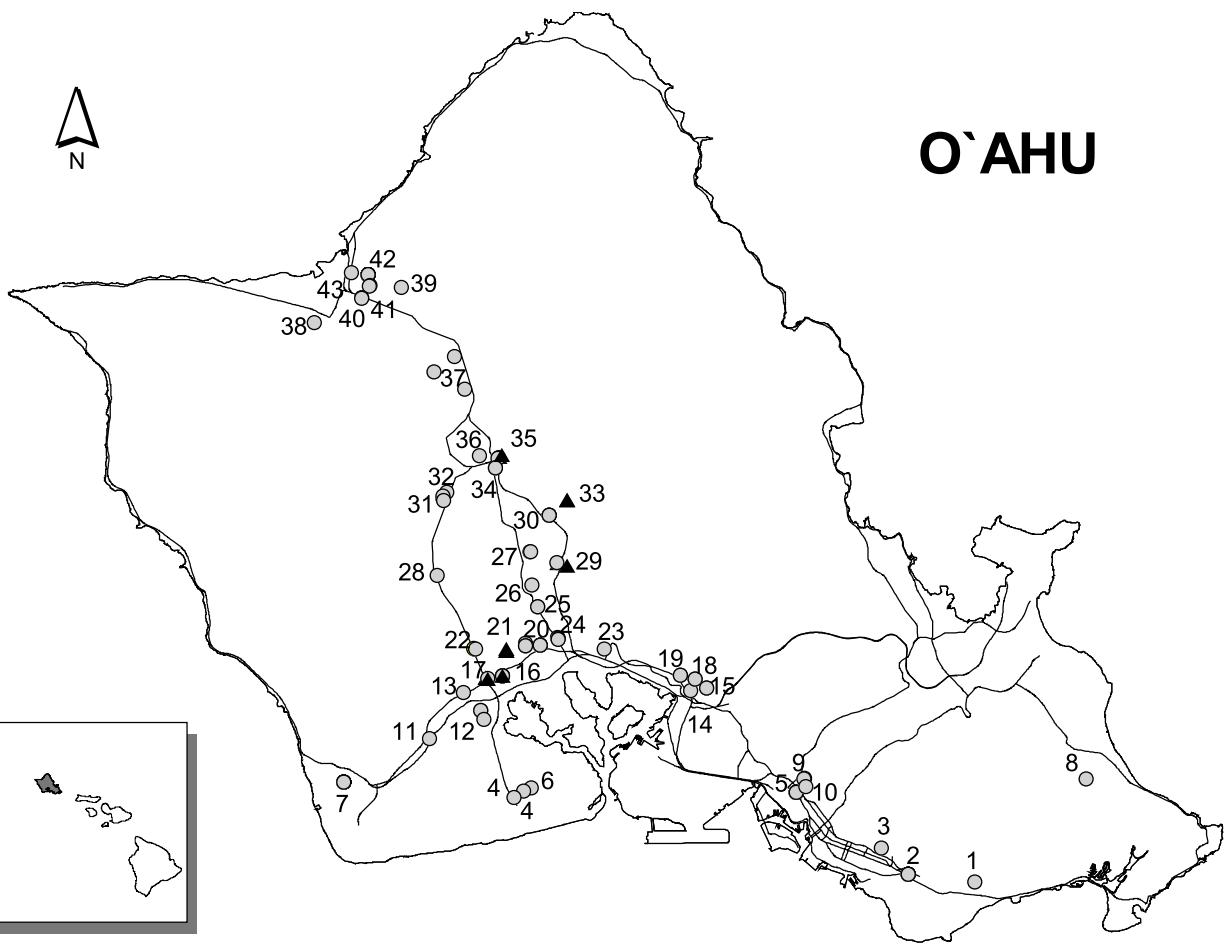

Old Hawaiian Datum: a geographic coordinate system used by the State Department of Land and Natural Resources (DLNR), Division of Water and Land Management of Hawai`i. The DLNR has assigned a six-digit number for each well, based on the latitude and longitude position of the well.

Parts per billion (ppb): a unit commonly used as an equivalent to “microgram per liter” (ug/L). One ug/L is approximately equivalent to a drop of contaminant in the volume of liquid contained in three Olympic-size swimming pools.

Quantification limit: the concentration level of a contaminant that can be confidently quantified by a laboratory’s testing equipment, analytical methods and personnel.

**Federal and State Drinking Water Standards
and
Health Advisories**

Contaminant	Contamination level in ppb (parts per billion)	Applicable Drinking Water Standard	Potential Health Effects from Ingestion of Water	Potential Contamination Sources
Alachlor	2	MCL	Eye, liver, kidney or spleen problems; anemia; increased risk of cancer.	Herbicide
Ametryn	60	LHA	Liver damage.	Herbicide
Atrazine Desethyl Atrazine Despropyl Atrazine Diamino Atrazine	3	MCL	Cardiovascular system or reproductive problems.	Herbicide
Bromacil	300	LHA	Possible human carcinogen.	Herbicide
Carbon tetrachloride (CTC)	5	MCL	Liver problems; increased risk of cancer.	Solvent, dry cleaning agent
Chlordane	2	MCL	Liver or nervous system problems; increased risk of cancer.	Pesticide (termiticide)
1,2 Dibromo 3-chloropropane (DBCP)	0.04	SMCL	Reproductive difficulties; increased risk of cancer.	Pesticide (soil fumigant)
1,2-Dichloropropane (DCP)	5	MCL	Increased risk of cancer.	Pesticide, solvent
Dieldrin	0.2	10 –4	Central nervous system; liver and kidney damage.	Pesticide
Diuron	10	LHA	Central nervous system depression; damaged red blood cells causing spleen damage; altered fetal development.	Herbicide
Ethylene dibromide (EDB)	0.04	SMCL	Problems with liver, stomach, reproductive system, or kidneys; increased risk of cancer.	Gas additive, soil fumigant, solvent
Hexazinoine	200	LHA	Reduced body weight or possibly reduced growth.	Herbicide
Isophorone	100	LHA	No studies on developmental or reproductive effects in humans.	Solvent, herbicide, pesticide
Lindane	0.2	MCL	Nerve damage and central nervous system seizures; liver and kidney damage; suppression of immune system.	Insecticide

Simazine	4	MCL	Liver, kidney and brain damage	Herbicide
Tetrachloroethylene (PCE)	5	MCL	Liver problems; increased risk of cancer.	Solvent, dry cleaning agent
Trichloroethylene (TCE)	5	MCL	Central nervous system depression; liver and kidney damage.	Solvent
1,2,3-Trichloropropane (TCP)	0.8	SMCL	Decreased red blood cells; liver and kidney damage.	Solvent, trace contaminant in certain pesticides
1,2,4-Trichlorobenzene	70	MCL	Changes in adrenal glands.	Herbicide, solvent, termiticide

Definitions of Applicable Drinking Water Standards

Lifetime Health Advisory (LHA) – This EPA advisory describes a non-regulatory concentration of a drinking water contaminant at which health effects would not be anticipated to occur over a lifetime exposure of 70 years duration. The advisories are based on data describing non-carcinogenic risk from exposure. This is a non-regulatory standard.

Maximum Contaminant Level (MCL) – The highest level of a contaminant that is allowed in drinking water. MCLs are set as close to the MCLGs as feasible using the best available treatment technology and taking cost into consideration. MCLs are enforceable standards.

Maximum Contaminant Level Goal (MCLG) – The level of a contaminant in drinking water below which there is no known or expected risk to health. MCLGs allow for a margin of safety and are non-enforceable public health goals.

State Maximum Contaminant Level (SMCL) – The State maximum contaminant level (SMCL) may be more stringent than the EPA's maximum contaminant level (MCL) of a contaminant in water as defined in Hawai'i Administrative Rules, Title 11, Department of Health, Chapter 20, Rules Relating to Potable Water Systems.

10-4 – This number refers to EPA's estimate of a "cancer risk level" of one-in-ten-thousand chance of developing cancer as a direct result of drinking water containing the contaminant over a lifetime of 70 years. This is a non-regulatory standard.
