# Session 5.1 Auditing Data Access

# Panel Members

**Moderator**

**Linda Fischetti, Department of Veterans Affairs**

**Panelists**

**Daniel Mellen, Accenture**

**Houtan Aghili, Technical Lead, NHIN Team, IBM**

**Greg Walton, CIO, Carillion Medical System, VA**

# Auditing Data Access

Even when there is broad availability of role based access controls, networked health information exchange will bring substantial needs for auditing access to patient data

There are needs to record
- incoming access to EHR and PHR data,
- outgoing requests for data
- inter-organizational exchanges of data

This session will focus on different approaches for auditing access to data in a complex networked care environment, including the data exchanges needed to support the various auditing models

# Specific Issues for the Panel

**To help frame the discussion we have asked the panel to address some specific architectural issues related to auditing data access including**

1. **Types of data that need to be included in messages in order to support the audit activities of entities involved in the data exchange process.**
2. **Needs to connect audit information to create a coordinated view across multiple settings**
3. **Alerting needs for auditable events**
