## **ACKNOWLEDGEMENTS**

We would like to acknowledge the accomplishments and hard work that was put forth in the creation of this specifications manual. We would especially like to thank **Lynda Wayne** from LSU's Coastal Studies Institute, for all the hard work and many thankless hours spent in pulling together and creating this first draft. **RPI** and **ESRI** were essential in maintaining consistency and were an integral part of determining elements within data coverages and metadata standards. For all of your hard work, we sincerely thank you.

# 1.0 Introduction

## 1.1 Project Background

The Gulf-wide Information System (G-WIS) is designed to provide an authoritative database for oil spill contingency planning and environmental analysis. The U.S. Minerals Management Service (MMS) supports the G-WIS program through the Coastal Marine Institute program within the Center for Coastal, Energy, and Environmental Resources (CCEER) at Louisiana State University (LSU).

The Oil Pollution Act of 1990 (OPA 90) and Executive Order 12777 have mandated a greater role for the MMS in oil spill contingency planning and environmental analysis. G-WIS is designed to support the requirements of government and industry. By using geographic information system (GIS) technology, the GWIS Program provides a substantial environmental database that can be accessed by MMS, other government agencies, and industry for various analyses and products that may be used for contingency planning, environmental assessments, leasing activities, regulatory decision making, and other general management purposes.

The current practice of using disparate data sources for oil spill planning and response fosters inconsistent interpretations and contention among the involved parties. To encourage consensus, G-WIS has established a steering committee with members from industry, federal agencies, and each Gulf state to provide guidance throughout the project. The steering committee is involved in all major decisions concerning the design and composition of the database. The steering committee members of the G-WIS program are listed in **Table 1-1**.

Minerals Management Service (MMS)	Environmental Protection Agency (EPA)
Louisiana State University (LSU)	Clean Gulf Associates (CGA)
Texas General Land Office (TGLO)	Marine Industry Response Group (MIRG)
LA Oil Spill Coordinator's Office (LOSCO)	Marine Spill Response Corporation (MSRC)
MS Dept. of Environmental Quality (MSDEQ)	National Oceanic and Atmospheric Administration
AL Dept. of Environmental Management (ADEM)	Exxon
FL Dept. of Environmental Protection (FDEP)	Chevron
U.S. Coast Guard (USCG)	Amoco

The Gulf of Mexico coastal states and federal agencies are providing much of the data for the project. MMS and LSU are compiling and augmenting the data using NOAA's environmental sensitivity index (ESI) mapping framework. The GWIS database also includes additional coverages, tables, and items that are part traditional ESI databases. The geographic scope of GWIS also extends seaward to

the natural boundary of a resource that than to the seaward limit of USGS topographic quadrangle. These features of the GWIS database have been added to assure regional consistency, and completeness from local data sources, and to extend the equipability of ESI data to the offshore environment.

While the primary purpose of G-WIS is to develop a database to support oil spill contingency planning, another important objective is to compile a database that can be used for other environmental and planning applications. To ensure this capability, the project, to the extent that resources permit, emphasizes the robustness of the data itself, not the specific application for which the data will be used. The objective is to have G-WIS serve as a model and a first step toward developing a flexible and complete Gulf of Mexico database based on primary data. The G-WIS geographic area of coverage is the coastal regions of Texas, Louisiana, Mississippi, Alabama, and Florida. This specifications manual is intended to be used as a guide as to the coverages with specific information and format.

**Table 1-2** lists the database of the Gulf-wide Information into four prioritized data levels determined by the steering committee. This table was the basis to create the data layer specifications listed in Appendix A.

**Table 1-2**  
**G-WIS Priority Data Layers for Oil Spill Contingency Planning**  
**Identified by Interagency and Industry Consensus**

1. Level One Priority layers
  - A. Basemaps
    - 1:2,000,000
    - 1:100,000
    - Texas 1:24,000
    - Louisiana 1:24,000
    - Mississippi 1:24,000
    - Alabama 1:24,000
    - Florida 1:40,000
    - GWIS Basemap 1:24,000
  - B. Shoreline Habitat Type
    - Exposed vertical rock shoreline/seawall
    - Sheltered/Rock platform
    - Exposed Rock platform
    - Exposed riprap
    - Sheltered riprap
    - Gravel beaches
    - Mixed sand and gravel beaches
    - Shell beaches

- Coarse sand beaches
- Fine sand beaches
- Exposed mud flats
- Sheltered mud flats
- Mangroves
- Salt-brackish marsh
- Fresh floatant marsh
- Fresh marsh
- Swamps
- Developed/Upland

C. Aquatic Habitat Type

- Seagrass beds
- Oyster reefs
- Coral reefs
- Artificial reefs

D. Terrestrial Biological Resources

- Mammals
- Birds
- Reptiles

E. Aquatic Biological Resources

- Mammals
- Fish
- Mollusk
- Crustaceans
- Reptiles

F. Regulated Endangered and Threatened Species

- Type and distribution

G. Recreational Areas

- Beaches
- Marinas
- Boat ramps
- Diving areas
- Boating/Fishing

II. Level Two Priority Data Layers

A. Location of Protected Areas

- Special management areas
- State parks
- State preserves

- State wildlife refuges
- Federal preserves
- Federal wildlife refuges

**B. Coastal Marine Processes**

- Wave data
- Currents
- Hydrography
- Water temperature
- Meteorology data
- Climatic data

**C. Transportation Infrastructure**

- Roads
- Airports
- Helipads

**D. USCG Area Contingency Plans**

- MSO boundaries
- MSO Protection Priorities
- MSO Response Strategies

**E. Access and Staging Areas**

- Ramps
- Hoists

**F. Modern, Historical, and Prehistorical Cultural Resources**

**G. Bathymetry**

**III. Level Three Priority Data Layers**

**A. Sources of Public/Commercial Water Supplies**

- Water intakes

**B. Oil and Gas Infrastructure**

- Platforms
- Wells
- Pipelines
- Facilities
- Service bases
- Terminals
- Refineries
- Ports

C. Political and Administrative Boundaries and Locations

- Federal
- State
- Municipal
- Federal lease block
- State lease block

D. Preapproved Zones

- Dispersant
- In situ burning zones
- Exclusion areas

E. Navigable Shipping Routes/Channels

- Navigable shipping routes/channels
- Navigation markers
- Anchorage
- Lightering zones

F. Response Equipment Location

- Sources
- Inventory

G. Topography

- Minimum 5-foot contours

H. Place Names

- Names from USGS quads (GNIS)

I. Permitted Waste Disposal Sites

- Incinerators
- Landfills

IV. Level Four Priority Data Layers

A. Land Use

- USGS land use/land cover

B. Database of Historical Spills

- Risk analysis
- Location of spill source
- Spiller

C. Utilities

- Lines
- Generation stations

- Power plants
- Phone
- Power cable crossings

D. Population Data

- Census data
- Residences
- Camps

## 1.2 Purpose of the Specifications Manual

This Specifications Manual is intended to provide project participants specifications for the development of data for the G-WIS project. The manual outlines specific nomenclature, features, and formats for data development. The primary purpose of the manual is to standardize data development to ensure regional consistency. Some data types, such as the ESI data layers, are highly structured to mirror the NOAA national model for ESI mapping. Other data types, such as Coastal Marine Processes, are less structured because there are no regional/national models and the type of information available regionally will vary. Participants are encouraged to inform the G-WIS project team of pertinent data standards and suggest methods for incorporating these standards. **All project participants are required to observe these specifications, therefore it is imperative that they review and understand all information contained in this manual.** If you have any questions or comments regarding the Specifications Manual, you should contact the Project Manager for clarification.

It should also be noted that the Specifications Manual is an evolving document. As the project continues, new standards and data development issues will emerge. It is the intention of the G-WIS project team to progress with new information and experiences and to utilize the Specifications Manual as a means of documenting these changes. These changes may be in the form of data definitions, data types, or added sections. Each new version of the manual will include a synopsis of revisions. Participants are responsible for observing the specifications as written at the time of contracting, however, they are encourage to incorporate updates as possible.

## 1.3 Organization of the Manual

The manual is organized into four basic sections. Chapter One provides an overview of the G-WIS project. Chapter Two provides logistical information about contacts, formats, and procedures for the exchange of project data. Chapter Three provides detailed descriptions of each data layers. Appendix A includes examples of metadata and other supporting information.

## **2.0 Data Exchange Information**

### **2.1 Project Contacts**

G-WIS is a cooperative effort of the US Minerals Management Service (MMS) and the Louisiana State University's (LSU) Center for Coastal, Energy, and Environmental Resources (CCEER). Project support is provided by the five Gulf of Mexico states, Florida, Alabama, Mississippi, Louisiana, and Texas and industry co-ops including the Clean Gulf Associates (CGA) and the Marine Industry Group (MIRG). Individual contacts are listed below

#### US MMS - Gulf of Mexico OCS Region - Office of Leasing and Environment

Name: Dr. Norman Froome  
Title: Contract Officer / Senior Environmental Scientist  
Role: MMS Project Administration/State Contract Liason  
Phone: 504.736.2782  
Fax: 504.736.2631  
Email: norman\_froome@smtp,mms.gov  
Address: 1201 Elmwood Park Boulevard  
New Orleans, LA 70123-2394

#### LSU - CCEER

Name: Dr. Shea Penland  
Title: Project Director / Associate Research Professor  
Role: LSU Project Administration  
Phone: 504.388.8670  
Fax: 504.388.5328  
Address: Coastal Studies Institute  
331 Howe-Russel  
Louisiana State University  
Baton Rouge, LA 70803

Name: Ms. Karen Ramsey  
Title: Project Coordinator / Research Associate  
Role: Coordination of interagency and industry participation  
Phone: 504.388.3476  
Fax: 504.388.5328  
Address: CCEER  
E302 Howe-Russel  
Louisiana State University  
Baton Rouge, LA 70803

Name: Mr. Ed Vigil  
Title: Data Manager  
Role: Dataset development and management  
Phone: 504.388.8585  
Fax: 504.388.5328  
Email: [evigil@flotant.csi.lsu.edu](mailto:evigil@flotant.csi.lsu.edu)  
Address: CCEER  
E302 Howe-Russel  
Louisiana State University  
Baton Rouge, LA 70803

## **2.2 Data Format and Media Preferences**

### **Software Format**

G-WIS data base development utilizes the capabilities of several GIS and database software system. All data should be provided to G-WIS in the following software specific formats.

#### Digital Maps

Preferred: ESRI ArcInfo export format  
Other: Intergraph MGE, ERDAS, and Autocad

#### Database Files

Preferred: ArcInfo (Info) or Oracle  
Other: FoxPro

#### Spreadsheets

Preferred: Excell  
Other: Lotus, Quattro Pro

#### Wordprocessor

Preferred: Wordperfect  
Other: Word

#### Other Data Products

Data providers should consult with the LSU Data Manager to determine preferred/acceptable formats for other data products.

### **Media**

Preferred: 4 mm tape, CDRom, 3.25 floppies, and internet transfer via ftp  
Other: 8 mil tape

### **Documentation**

The media must be clearly labelled as to:

- data provider organization
- media title/subject (e.g. MS ESI, Southeast TX Transportation)
- date data compile onto media
- data software format

A Readme file must be provided within the media that includes, at a minimum:

- data provider organization
- data provider contact, address, phone, fax, email
- media title/subject (e.g. MS ESI, Southeast TX Transportation)
- listing of all directories and files contained within the media
- date data compiled onto media
- data software format
- comments that will aid in data identification and application

FGDC compliant metadata must also be provided.

The metadata file must be clearly labelled and may be created for the entire media content or for individual files. Data providers are strongly encouraged to document individual data files when feasible in order to preserve the integrity and viability of their data. A set of minimum data fields is currently under development by the FGDC and will be adopted by the G-WIS program when finalized. Until that time, users are asked to provide as much content information as possible. An example metadata record is included as Appendix A. Additional information about the Metadata Content Standard and a metadata workbook are available from the FGDC at the NSDI home page (<http://fgdc.er.usgs.gov>). Metadata files generated in Arc/Info using *document.aml* are acceptable. Metadata generated using other automated tools should be reviewed with the Project Manager prior to submission.

### Geographic Projection

Preferred: Latitude/Longitude

Other: UTM (clearly indicate zone and units).

Datum: NAD27 or NAD 83

## 2.2 Data Management and Processing Procedures

As data are collected, LSU is responsible for integrating the data into the G-WIS program. Upon receipt, the data are logged in and information recorded as to the date, media, format, and data provider. The data are copied into the G-WIS project directory and the original is archived. The copied versions of the data are then subjected to necessary data translation routines and processed for review within the ArcInfo/ArcView environment.

Once formatted for G-WIS use, the data are reviewed and **quality checked (QC)** using three primary criteria: compliance, completeness, and spatial correlation. Compliance is an assessment of how well the data satisfy the data definition, data

base structure, and metadata requirements of *The Gulf-Wide Information Systems Database Specifications Manual*. Completeness is evaluated based upon the attribute information provided and the geographic extent of the data. Spatial correlation is an assessment of geospatial alignment relative existing base maps and related data layers. LSU is responsible for:

- documenting data inadequacies,
- reviewing all data quality problems with the data provider,
- correcting minor errors when feasible, and
- providing specific guidance to contributing agencies with regard to data enhancement/adaptation.

Once QC approval is achieved, these data are then subjected to a series of processes to incorporate them into the G-WIS project. More specifically, LSU will:

- integrate the data file into the G-WIS project directory structure
- select out those elements and attributes pertinent to the project
- compile the data into thematic views (e.g. ESI biology, shoreline type, infrastructure)
- cartographically enhance/coordinate the data with regard to color assignments, placement of text, line widths, etc.
- integrate multimedia reference data such as images, CAD files, text files, and, potentially, video clips.

## 3.0 Data Descriptions

This section includes a brief description of each coverage that will be included in the Gulf-wide Information System (G-WIS) database. The individual specifications for each coverage were based on the G-WIS Steering Committee recommendations and were documented during a one-week meeting in which project managers from Louisiana State University (LSU), United States Mineral Management Service (USMMS), Research Planning, Inc. (RPI), and Environmental Systems Research Institute, Inc. (ESRI), participated.

**Appendix A** gives a detailed breakdown of all G-WIS tables and the structure required for each coverage/table.

### 3.1 Environmental Sensitivity Index (ESI) Data

#### *Responsibility: States*

The process of mapping environmental sensitivities in potential oil spill impact areas has become an integral part of oil spill response and contingency planning. ESI mapping employs a qualitative ranking system that identifies and characterizes the sensitivity of the shore and associated biota to oiling and cleanup activities. The ESI ranking typically ranges from 1 to 10 with low numbers indicating short persistence of stranded oil and minor susceptibility to environmental degradation and high numbers indicating long-term oil persistence, difficulty of oil cleanup and a high sensitivity to damage. Certain Gulf Coast shorelines, especially in Louisiana and Texas, are dynamic environments that constantly change position and sometimes character due to erosion and deposition. In some places these processes along with human activities cause changes in physical attributes such as sediment composition, sediment textures, and nearshore slopes. The lengths and type of shores also determine their economic and recreational value, their ability to support certain plant and animal communities, and their value as productive nesting and nursery grounds for certain threatened and endangered species. Knowing shoreline characteristics also provide a fundamental basis for oil spill response, cleanup and contingency planning for post-spill damage assessments. NOAA has used environmental sensitivity maps during spill response for many years. By using the NOAA concept, ESI mapping can become an invaluable management tool for the oil spill community.

#### 3.1.1 ESI Biology Data—Coverages

The biological data consists of coverages and tables. This structure makes it redundant to address each coverage separately. The following paragraphs will give a general description of the organization of the biological data, with only the unique details given for the individual coverages. The coverages include CORAL, T\_MAMMAL, M\_MAMMAL, BIRD, NEST, SHELFISH, REPTILE, and PLANT. All of

the coverages have polygon topology, with the exception of NEST, and use ARC/INFO software's region data model to describe the spatial extent of biological resources. The region data model allows multiple polygons to be grouped as a single entity and assigned a RARNUM value that is a unique combination of species, concentration, and seasonality. These coverages represent the spatial distribution of the species of concern. The item RARNUM must be identified for each coverage (except CORAL) and used to link the coverages to the table BIORES.DAT. The RARNUM is the only item past user-ID# that is in these coverage.

The states are expected to create the completed coverages for delivery to LSU as outlined in the National Oceanographic and Atmospheric Administration (NOAA) Technical Memorandum NOS ORCA 92 "Environmental Sensitivity Index Guidelines. **Appendix A** gives an outline of the data structure that is to be used.

Most of the information is available through various state agencies. The state will be responsible for identifying the sources of data and collecting this information.

Metadata will be maintained for each coverage. However, individual biological species will have source data associated that documents the type and quality of the data used to document the species.

#### **3.1.1.1 CORAL**

The coral reef coverage has polygon topology with regions representing the location of coral reefs. Where available, the species of coral should be identified and entered into the linked tables.

#### **3.1.1.2 T\_MAMMAL**

The T\_MAMMAL coverage has polygon topology representing the location of terrestrial mammals within the biological region coverage.

#### **3.1.1.3 M\_MAMMAL**

The marine M\_MAMMAL coverage has polygon topology representing the location of marine mammals within the biological region coverage.

#### **3.1.1.4 BIRD**

The bird coverage has polygon topology representing the location of birds within the biological region coverage.

### **3.1.1.5 NEST**

The nest coverage is a point coverage. The data structure is the same but a point is used to represent the location of nesting colonies. The point is typically placed near the center of the nesting colony.

### **3.1.1.6 SHELFISH**

The shellfish coverage has polygon topology representing the location of shellfish within the biological region coverage.

### **3.1.1.7 REPTILE**

The reptile coverage has polygon topology representing the location of reptiles within the biological region coverage.

### **3.1.1.8 HABITAT**

The habitat coverage has polygon topology representing the location of plants within the biological region coverage. The plant coverage includes terrestrial plants and seagrasses as well as any other submerged aquatic vegetation.

## **3.1.2 ESI Biology Reference Information**

The biology reference information consists of data reference tables which provide attribute information in support of the biological coverages.

### **3.1.2.1 BIORES.DAT—Biological Resource Table**

The BIORES.DAT table is linked to all of the biology coverages listed above by the RARNUM. The data in BIORES.DAT are used to identify what species are present in the region, as well as when they are present and their abundance. It is important that the information contained in BIORES.DAT be recorded at the same time as information is being collected for the biology data polygons. The structure of the table is defined so that there is one species per row in the table. This relationship is shown in **Appendix A**. This table is linked to the tables: SPECIES.DAT by the fields SPECIES\_ID and ELEMENT; SEASON.DAT by the fields SPECIES\_ID,

ELEMENT, and SEASON\_ID; and SOURCE.DAT by the field SOURCE\_ID. There may be multiple rows for each RARNUM. The source of the information for this table is the same as the sources for the biological coverages. The field SOURCE\_ID is the link to the feature-level metadata for the polygon and the species.

### **3.1.2.2 SEASON.DAT—Seasonality Table**

SEASON.DAT is the table that specifies exactly when the individual species are present and the breeding times for the species. This table is to be completed at the same time as the coverages and the BIORES.DAT table. The state is responsible for collecting and compiling this information. The table is structured so there is one field for each month that a species is present. The field SEASON\_ID has no significance other than as a link to the table BIORES. The field BREEDNUM is a link from the season table to the table BREED.DAT.

### **3.1.2.3 BREED.DAT—Breed Table**

BREED.DAT tracks the breeding times for the species. One row of data is entered for each month that the animal is breeding. BREED.DAT is not contained in the traditional ESI data model which maintains information on breeding times as a range of months in SEASON.DAT. Maintaining breeding time data for each month in BREED.DAT enhances the quering and analytical capabilities of the database.

### **3.1.2.4 SPECIES.DAT Species Table**

The species table is compiled from a master list, that is used in the NOAA environmental sensitivity maps. This species master list is linked to SPECIES\_ID in the BIORES.DAT table. The species master list provides information used to track species identifications within and across Environmental Sensitivity Index (ESI) atlases. This list is particularly useful where there are several common names used for the same species. This list is also useful when a species is used in the ESI process for the first time. If any species are added to the list the final numbers must be assigned by NOAA.

### **3.1.2.5 SOURCE.DAT—Source Information Table**

The source (metadata) master list is used to provide detailed information on the sources used to compile biological and human-use data. For the biological data, sources for spatial, concentration, seasonality, and life history information need to be documented. The source information is needed for metadata documentation and

the references section of the ESI atlas. The state is responsible for completing the tables when the biological data are collected.

#### **3.1.2.6 SURVEY.DAT —Survey Information Table**

This table is linked to the SOURCE.DAT table on the field SOURCE\_ID. The SURVEY.DAT table is used to document the study methods used by a particular source (sampling method, spatial referencing and accuracy, and sampling dates and frequency). This information is necessary so that geographic completeness and temporal consistency can be monitored while merging different data sets from many different sources. A separate form should be completed for each source. The data used for this table are extensions of the data used to complete the SOURCE.DAT table. The table is not part of traditional ESI data boxes.

#### **3.1.2.7 INFERRED.DAT—Nonsurvey Information Table**

This table is linked to the SOURCE.DAT table on the field SOURCE\_CODE. The INFERRED.DAT tables are used to document the method used by a particular source when the information provided is not based on a particular survey. This table is used when the data are derived from habitat models, an expert's personal knowledge, general knowledge, or extrapolated information. The data used for this table are extensions of the data used to complete the SOURCE.DAT table. The table is not part of traditional ESI data structure.

#### **3.1.2.8 SURVEY—Survey Area Coverage**

The SURVEY coverage is linked to the SOURCE.DAT and BIORRES.DAT tables. This coverage is a polygon coverage that delineates the boundaries of the field surveys used to compile the ESI biology data. The only items present in the INFO table (SURVEY.PAT) are SOURCE\_CODE and SURVEY\_ID. The table is not part of traditional ESI data boxes.

### **3.1.3 ESI Non-Biology Data—Coverages**

The ESI non-biology data coverages include physical and administrative data pertinent to special environments. Metadata is recorded for each coverage.

---

### **3.1.3.1 ESI—Shoreline**

The ESI shoreline classification is topologically stored as arcs (shorelines) and polygons (marshes and flats). Therefore, the arc attribute table (ESI.AAT) and the polygon attribute table (ESI.PAT) are defined in **Appendix A**. The item ESI contains values according to the ESI ranking of the shorelines and polygons. The metadata report for the atlas contains the specific ESI rankings used as well as the primary and secondary sources for the shoreline and ESI classifications. There is a feature-level attribute (SOURCE\_DES) to indicate any features that came from a source other than the primary source.

### **3.1.3.2 REC\_PT—Special Recreation Points**

The REC\_PT coverage is a point coverage that shows the location of important recreational features that are best represented by a point such as boating, fishing, and diving areas; boat ramps; and marinas.

### **3.1.3.3 REC\_PLY—Special Recreation Areas**

This coverage is based on ARC/INFO software's region data model, and has polygon topology. The information contained in this coverage is the location of all managed recreational and preservation areas including public recreational beaches, state parks, national parks, artificial reef permit areas, marine sanctuaries, national wildlife refuges, Nature Conservancy preserves, and MMS protected areas. The information included with this coverage is to facilitate contacting the appropriate people (NAME, AGENCY CONTACT, PHONE) as well as to further information on the feature (COMMENTS).

### **3.1.3.4 INTAKES—Surface Water Intake Locations**

The intake coverage includes information on location and type of surface water intakes. These are to include industrial, municipal, and private intakes. The field TYPE indicates what type of intake is indicated such as municipal, power plant, industrial, aquaculture, and so forth. In addition to contact information, fields for the depth of the intake, and the volume of water pumped is also included, but are not required information

### **3.1.3.5 REEF—Artificial Reef Locations**

The artificial reefs coverage consists of point locations for artificial reefs in both state and federal waters. States will be responsible for the data within territorial waters

and USMMS will provide data for federal waters. The reef points will be coded for the responsible agency (U.S., FL, AL, etc.) abbreviation and for the material used in each reef.

### **3.1.3.6 AQUA—Aquaculture Points**

#### **3.1.3.7**

The AQUA coverage includes the location of all the known aquaculture sites, with the exception of oyster and clam lease beds that are included under the biological coverages. The location of the facility is represented by a point. The information associated with the point is the type of facility (catfish farm, crawfish, etc.) and the necessary contact information

### **3.1.3.7 CLT\_PTS—Cultural Resource Location**

The CLT\_PTS coverage shows the location of archeological, historic, and shipwreck sites. This information is collected and displayed in accordance with the requirements of the State Historical Preservation Office or appropriate agency. The location of the points can be generalized to mask the exact location. In addition, the only sites to be included are those that would be directly impacted by an oil spill or by the cleanup operations. The state is responsible for collecting and processing state cultural resource information including generalization, if necessary. USMMS will provide an OCS shipwreck database.

## 3.2 State (Non-ESI) Data *Responsibility: States*

Participating state agencies are asked to provide their best available information for the following data sets. When possible, specific elements have been included in the data descriptions. However, LSU/MMS will work with states to adapt and incorporate available state data sets which do not provide information in the specific organizational format presented below. These descriptions are presented in an effort to standardized data representation across the Gulf of Mexico region. The data descriptions will evolve as data are collected and regional trends in data format and definitions emerge.

### 3.2.1 ROADS—Transportation - Ground

The ground transportation network database is intended to provide best available information regarding primary and secondary roads within the state. The data are represented as an arc coverage. The data will often be derived from USGS DLG data and should, at a minimum, include the following elements:

DLG codes shown next to item, Road Type

Primary route - Class 1, No centerline (201)

Primary route - Class 1, centerline (202)

Primary route - Class 1, divided lanes (203)

Primary route - Class 1, one way (204)

Secondary route - Class 2, no centerline (205)

Secondary route - Class 2, centerline (206)

Secondary route - Class 2, divided lanes (207)

Secondary route - Class 2, one way (208)

Road - Class 3, centerline (209)

Road - Class 4, centerline (210)

Number of lanes

Interstate Route Number

U.S. Route Number

State Route Number

County Route Number

Restriction - toll (609), private (610), under construction (604), proposed (611)

Special - in tunnel (601), bridge overpass (602), underpassing (603), double decked (612), elevated (614), on drawbridge (619), ferry crossing (214), covered bridge (406).

If more current information is available from the State transportation/highway department, the State data set is preferred.

### **3.2.2 AIR—Transportation - Air**

The air transportation data set is intended to capture information about general aviation (GA) and commercial airfields and heliports in the state. The data will be represented as a point coverage with points located at the estimated center of the airfield. At a minimum, the data set includes information about the name, location: city, state (Atlanta, GA) and type (Commercial, Agricultural) of airfield, services, size, as well as contact information (name, phone, fax). This data set is available from USGS as Digital Line Graphs (DLGs).

### **3.2.3 LEAS\_ST—State Leasing Areas**

This coverage is based on the oil and gas lease boundaries in state waters. The data are represented as a polygon coverage and information is to be provided as to the lease block number, leasee, lease\_stat (active/inactive)

### **3.2.4 WELL\_ST—State Platforms and Wells**

This coverage includes oil and gas production well locations within the state. The data are represented as a point coverage and information is to be provided as to the location, type (platform, well, caisson), product (oil, gas, other), owner, and contact (name and phone).

### **3.2.5 PROC\_FAC—Processing Facilities**

The process facility coverage identifies the location of various petroleum processing facilities. The data are represented as a point coverage. Points are to be located at the estimated center of the facility. Each facility is coded for name/owner, type, product transportation methods (pipeline, barge), and contact (name and phone). Facility layout plans (digital) should also be provided when available. This information will be referenced via "hotlink" so that users can view the facility layout.

### **3.2.6 ADMN\_ST—State Administrative Boundaries**

This coverage identifies the boundaries of state, county, and municipal governments and organizations pertinent to spill contingency planning (e.g. levee districts, natural resource agency districts, regional response groups). The data are represented as

a polygon coverage and includes, at a minimum, the name of the administrative unit, the type of organization (city, county, state agency, etc.), the primary point of contact in case of a spill event (name and phone).

### **3.2.7 TOPO—Topography**

The topography coverage provides best available information about topographic elevations within the state. The data are represented as an arc coverage with isolines generated a minimum of every five feet. This information is available from USGS DLG's. If more current/detailed information is available from State sources, the State data set is preferred.

### **3.2.8 PLAC\_NAM—Place Names**

The place name coverage provides an annotated point coverage of all place names included on USGS 7.5 series quadrangle maps. This information is available from the USGS and as the Geographic Names Index System (GNIS). Other available state developed name databases are acceptable if basic information about the location, name, and type of place (city, county, hydrologic feature, population [if known]) are included.

### **3.2.9 DISP\_FAC—Disposal Facilities**

The disposal facility locations coverage is a point coverage that identifies the location of disposal sites permitted to receive oil waste. Each facility will be coded for name, type, EPA classification, access, and size

### **3.2.10 LAND\_USE—Land Use**

The land use coverage is a polygon coverage that identifies the location and distribution of land use/land cover conditions. Data are compiled using the Anderson Classification System and should be provided at the most detailed level available. This information is available from the USGS LULC map series, but more current/detailed state data sets are preferred when available.

### **3.2.11 SPILLS—Historical Spills**

The historical spills coverage is undefined at this time. Those states able to provide information regarding the location and nature of past spills are encouraged to provide this data in any format and work with the G-WIS project team to standardized data representation.

### **3.2.12 UTILITY—Utilities**

The utility coverage is an arc coverage intended to capture information about the distribution of utility infrastructure including but not limited to: gas lines, sewer systems, and electrical conduits. This data are highly detailed and therefore out of scale relative to current G-WIS data development. However, states with highly aggregated information are encouraged to contribute and work with the G-WIS project team to determine the best data representation.

### **3.2.13 DEMOGRAP—Demographic Data**

The demographic coverage is intended to represent basic census data regarding the distribution and nature of human populations. The data coverage is not well defined at this time and states with demographic data sets specific to their oil spill contingency planning programs are encouraged to contribute and work with the G-WIS project team to standardize data representation in the Gulf.

### **3.3 Gulf-wide Data**

#### ***Responsibility: LSU***

#### **3.3.1 BASE\_GULF—Gulf-wide Basemap**

USGS 1:2,000,000 DLG's have been compiled and edited into a single arc coverage for the entire US Gulf of Mexico. The primary element is a land/water interface, that serves as a backdrop for other gulf-wide transportation network and administrative boundary data.

#### **3.3.2 BASE\_REG—Region-wide Basemap**

USGS 1:100,000 DLG's have been compiled and edited into a single polygon coverage for the entire US Gulf of Mexico. The primary element is a land/water interface, that serves as a backdrop for other region-wide coverages such as transportation and administrative boundary data.

#### **3.3.3 IMAGERY—Gulf-wide Imagery**

Imagery coverages will be generated to provide digital image backdrops. Accessible images such as scanned USGS quadrangles (an ESI by-product) will be incorporated early, and more resource intensive products including USGS Digital Orthophoto Quads (DOQ's) and multispectral satellite imagery (TM and SPOT) incorporated as resources permit. Separate raster coverages will be generated for each image source.

#### **3.3.4 TEMPERAT—Ocean Temperature**

This coverage identifies average temperature conditions in the Gulf of Mexico. The data are represented as an arc coverage of isotherms. Units of representation have not been determined and will be based upon the units of representation presented by pertinent available regional data sets. This coverage may later be converted to several separate coverages to represent seasonal variations in oceanographic temperature.

#### **3.3.5 SALINITY—Ocean Salinity**

This coverage identifies average salinity conditions in the Gulf of Mexico. The data are represented as an arc coverage of isohalines. Units of representation have not been determined and will be based upon the units of representation presented by

pertinent available regional data sets. This coverage may later be converted to several separate coverages to represent seasonal variations in oceanographic salinity.

### **3.3.6 TIDES—Tide Gauge Data**

This coverage identifies average tidal conditions in the Gulf of Mexico. The data are represented as a point coverage of water level measurements. This coverage may later be converted to several separate coverages to represent seasonal variations in tide levels.

### **3.3.7 CURRENTS—Ocean Currents**

This coverage identifies directional current conditions in the Gulf of Mexico. The data are represented as an arc coverage of directional vectors. This coverage may later be converted to several separate coverages to represent seasonal variations in ocean currents.

### **3.3.8 CG\_PLANS—USCG Contingency Planning Data**

The CG\_PLANS coverage will provide basic information regarding the oil spill planning response districts and contact information for the Gulf of Mexico. The data are represented as a polygon coverage. Additional information extracted from regional USCG plans will be added as available/necessary.

### **3.3.9 STAGING—Access and Staging Areas**

This coverage provides information about the location and capacity of potential staging areas for response equipment assemblage and deployment. This includes commercial-grade ramps and hoist suitable for use in response operations. The data are represented as a point coverage and include the following elements: size of potential area, road and boat access, type of structure (ramp, hoist), weight limitations, owner/operator, contact information (name and phone).

### **3.3.10 BATHYMET—Bathymetry**

The bathymetry coverage provides information about ocean floor surface conditions. The data are represented as an arc coverage of 100 meter contour lines. Additional resolutions may be generated in the future.

### **3.3.11 LEAS\_FED—Federal Leasing Areas**

This coverage is based on the oil and gas lease boundaries in federal waters. The data are represented as a polygon coverage and information is to be provided as to the lease block number, leasee, approval date, region code, proaction number ac\_lab.

### **3.3.12 WELL\_FED—Federal Platforms and Wells**

This coverage includes oil and gas production well locations within the federal waters. The data are represented as a point coverage and information is to be provided as to the location, type (platform - structure #, complex ID#, structure name; well; caisson), product (oil, gas, other), owner, and contact (name, phone, fax).

### **3.3.13 PIPELINE—Pipelines**

The pipelines coverage is an arc coverage that identifies the location of petroleum product pipeline. Each pipeline will be coded for date, company, diameter, and product.

### **3.3.14 ADMN\_REG—Regional Administrative Boundaries**

This coverage identifies the boundaries of federal agencies and industrial organizations pertinent to spill contingency planning (e.g. EPA districts, MIRG). The data are represented as a polygon coverage and includes, at a minimum, the name of the administrative unit, the type of organization (federal, industry), and the primary point of contact in case of a spill event (name and phone).

### **3.3.15 APP\_ZONE—Preapproved Zones**

This coverage will include dispersant zones, insitu burning zones, prohibited zones, and the responsible agency for each zone. The data are represented as a polygon coverage.

### **3.3.16 NAV\_AID—Aids to Navigation**

This coverage provides information about the location of various navigation aids including. The data are represented as point data with specific elements for type

(light house, channel marker, buoys). The primary source for this information is (Bureau of Standards CD)

### **3.3.17 NAV\_CHNL—Navigation Channels**

This coverage includes shipping channels, fairways/anchorage, and lightering zones. The data are represented as an arc coverage with specific elements such as name, state, mile point, length & depth. The primary source for this information is (Bureau of Transportation Statistics CD)

### **3.3.18 NAV\_PORT—Navigation Port Locations**

This coverage provides information about the location and capacity of navigation port facilities along the Gulf of Mexico. The data are represented as point data with specific elements for name, latitude and longitude. The primary source for this information is (Bureau of Standards CD)

### **3.3.19 EQUIPMENT—Response Equipment Locations**

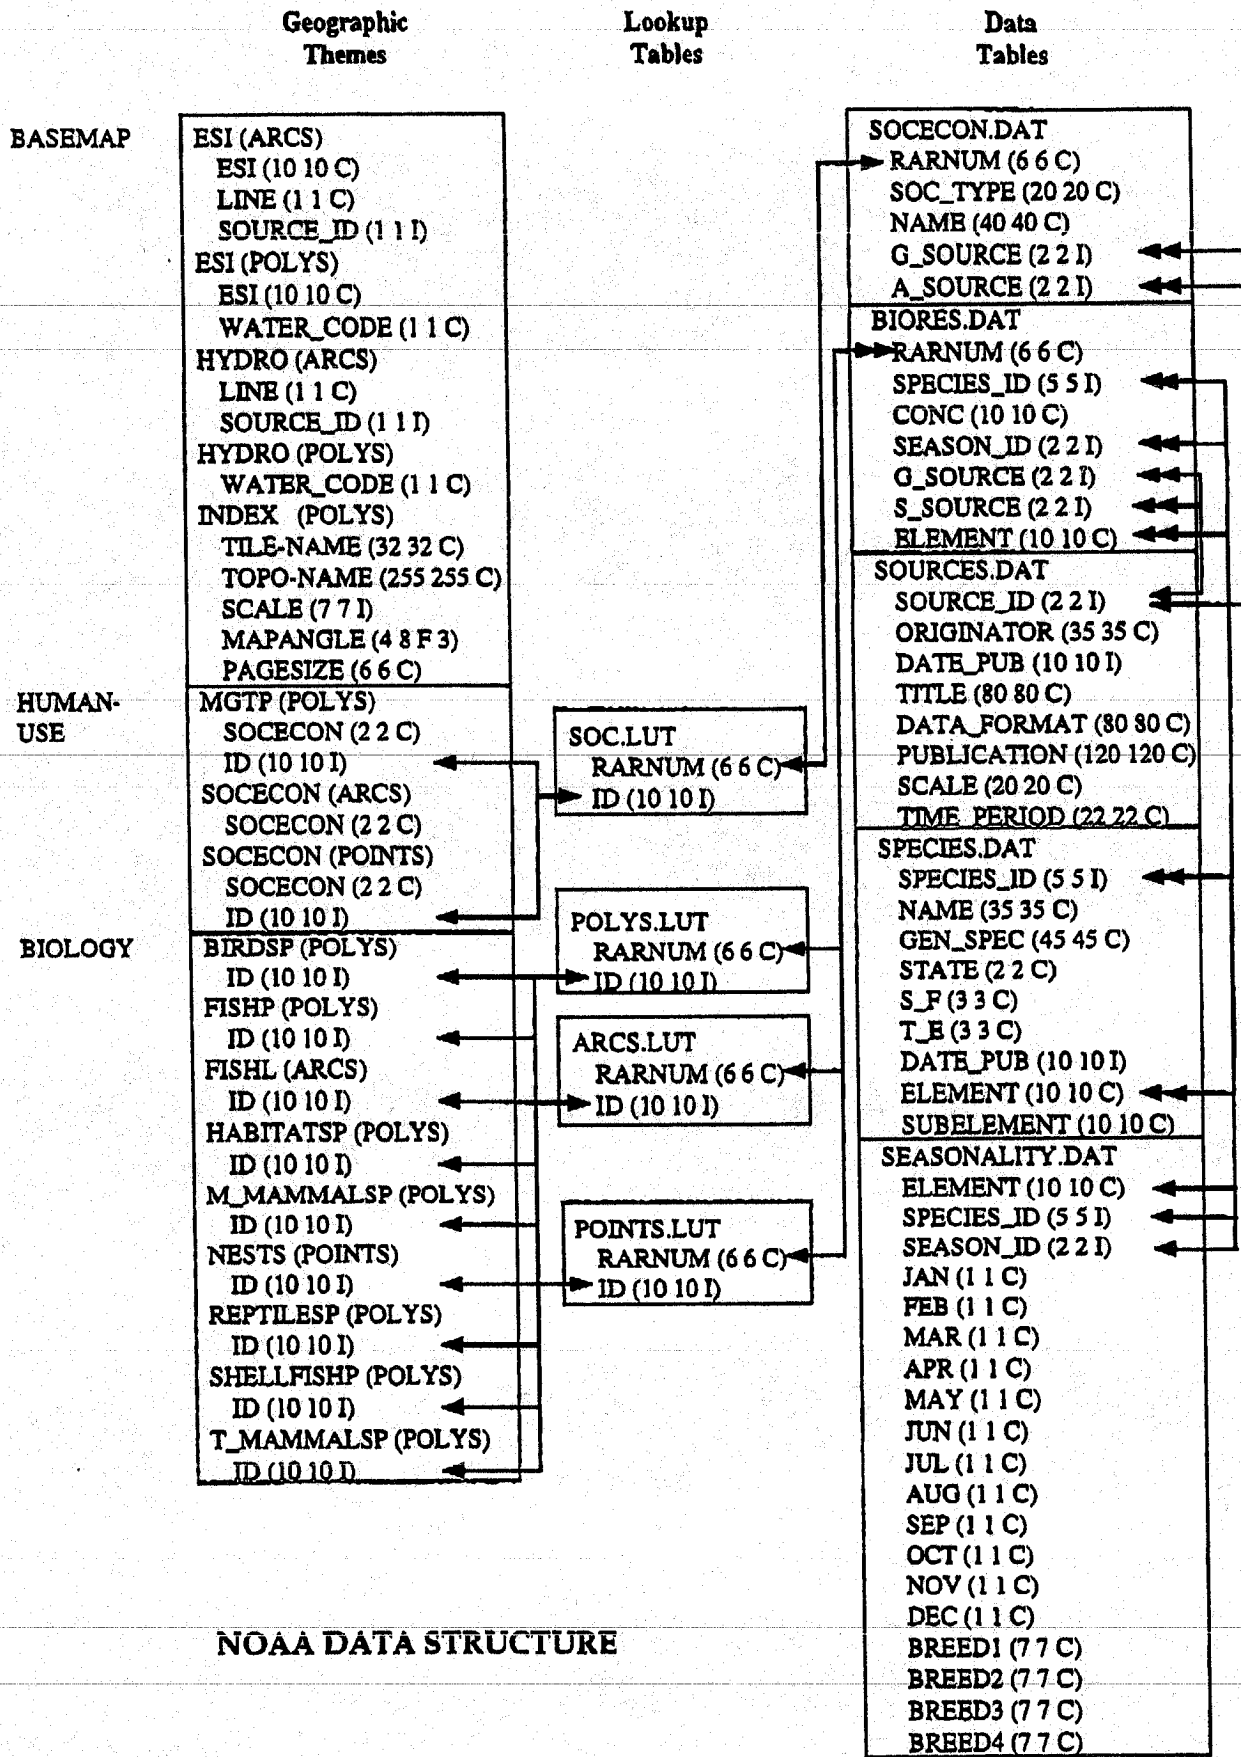

The EQUIPMENT coverage is intended to provide information about the location of oil spill response equipment (e.g. boom, skimmers). This information may be collected from contingency plans or purchased from oil spill data providers. The data are represented as a point coverage with specific elements for: type of equipment, number/ft stocked, cost, owner/operator, and contact (name and phone).

MMS DATA STRUCTURE

ARCVIEW DATA STRUCTURE

FMRI DATA STRUCTURE

## Appendix A—G-WIS Second Year Item Source Summary

The coverage specifications that are included in this section were developed jointly by LSU, MMS, RPI, and ESRI staff during a one week meeting at the LSU and MMS offices in Baton Rouge and New Orleans. Each coverage and table was identified, discussed, and defined for both structure and content. The results of these discussions were then documented in the following table.

The following column descriptions document the content of each column in the table and how the column relates to the other columns in the table.

**Layer Description:** This column lists a general name for the layer that will be recognizable to the average user. The layer name will not necessarily be the same as the ARC/INFO coverage name. The layer description is repeated in the column for every row that is used to describe the coverage.

**ARC/INFO Cov/LUT Name:** This column lists the ARC/INFO coverage name that will be implemented for the G-WIS layers to be converted. The coverage name is repeated in the column for every row that is used to describe the coverage.

**ARC/INFO Coverage Type:** This column lists the ARC/INFO feature type of the coverage. The possible coverage types that will be listed are as follows:

LINE	Source layers will be converted with line topology (AAT)
POINT	Source layers will be converted with point topology (PAT)
LINK	Source layers will be converted with line and point topology (AAT and a point PAT)
NETWORK	Source layers will be converted with line and polygon topology (AAT and poly PAT), the point features from the source layers will become the polygon labels for the polygon topology

**INFO Table Name:** This column lists the INFO table names that will be used for the coverage. Coverages that contain LINK or NETWORK in the **ARC/INFO Coverage Type** will have both an AAT and a PAT INFO table name in this column. The INFO table name is repeated in the column for every row that is used to describe the coverage.

**Item Name:** This column lists the items names that will be present in the INFO table. The item name is repeated in this column to match the valid item values in the next column over.

**Item Def:** This column describes the INFO item definition that will be created.

**Valid Item Values:** This column lists the item values that have been identified at this time. These may change due to findings in the pilot study.

**Item Description:** This column lists the item descriptions that were identified during the G-WIS database specifications meeting. These may change due to findings in the pilot study.

**High Priority Attribute:** This column identifies high priority items. High priority items are defined as items that are necessary for oil spill contingency planning.

**Present in Pilot:** This column identifies which layers and items will be tested during the pilot study.

**Initial Database Source:** This column identifies the source for the initial database. This includes the compilation and automation of the data layer in question. The following describes the responsibilities for the source agency (STATE, MMS, LSU)

**State:** When state is listed as the initial database source, each state will be responsible for collecting and automation the data to match the specifications.

**LSU:** When LSU is listed as the initial database source, LSU will be responsible for collecting and automation the data to match the specifications.

**MMS:** When MMS is listed as the initial database source, MMS will be responsible for collecting and automation the data to match the specifications.

Any combination of the above entries indicates that the data layer in question crosses the normal state/federal boundaries and may be collected from more than one source (e.g., Leasing Boundaries).

**Final Format Source:** This column identifies the source for the final database. This includes formatting the data layer to match the final G-WIS database specifications for the data layer in question. The following describes the responsibilities for the source agency (STATE, LSU):

**State:** When state is listed as the final database source, each state will be responsible for providing the data to match the specifications. The data will be directly reviewed by LSU and loaded into the LSU ARC/INFO based data management system. The ESI data is a good example of this kind of data. It is expected that LSU will not be required to process any ESI data after delivery from the individual states.

**LSU:** When LSU is listed as the final database source, LSU will be responsible for processing data from a variety of sources (including state data). The data from the various sources will be reformatted and edgematched where necessary to create the final database. The administrative boundaries coverage is a good example of this type of situation.

G-WIS Second Year Item Source Summary

Layer Description	ARC/INFO Cov/LUT Name	A/I Coverage Type	INFO Table Name	Item Name	Item Def	Valid Item Values	Item Description	High Priority Attribute	Present in Pilot	Initial Database Source	Final Format Source
Coral Reefs	CORAL	POLY	CORAL.PATBIO	SPECIES	20,20,C	(text)	Text item for the various coral species.	*	*	State	State
Mammals	MAMMALS	POLY	MAMMALS.PATBIO	RARNUM	10,10,I	1 - n	Resource At Risk Number for the polygon. Unique through entire database. This item is the relate item from this PAT to BIORES.DAT.	*	*	State	State

NAME OF ATLAS  
ENVIRONMENTAL SENSITIVITY INDEX  
META DATA

*Prepared By:*  
Research Planning, Inc.  
1200 Park Street  
Columbia, South Carolina 29201 USA

FILE DESCRIBES: Digital data for NAME OF MAP Environmental Sensitivity Index. Data were compiled and digitized at NAME OF ORGANIZATION RESPONSIBLE FOR COMPILATION OF DATA

FILE CREATED BY: NAME, TITLE, STREET ADDRESS, EMAIL ADDRESS, AND TELEPHONE AND FAX NUMBERS OF PERSON RESPONSIBLE FOR CREATING THE METADATA FILE

FILE CREATED ON: 19950712 (DATE: MUST BE IN THIS FORMAT)

COMMENTS: GENERAL INFORMATION ABOUT THE METADATA, SUCH AS: Information was developed using the U.S. Federal Geographic Data Committee's Content Standards for Digital Geospatial Metadata, June 8, 1994. The numbering scheme matches the Meta Data Standard in order to facilitate referencing definitions of the elements. The items in **bold** are required elements and the others are optional elements. The Spatial Data Transfer Standard, ver. 03/92, was referenced to properly identify the geographic entities.

**LIST OF FIGURES**

1 Relationship between biology coverages and attribute files.....	8
---	---

**1.0. IDENTIFICATION INFORMATION**

**1.1. CITATION**

**1.1.1. ORIGINATOR:**

IDENTIFY WHO IS THE ORIGINATOR OF THE DATA SET.

EXAMPLE: National Oceanic and Atmospheric Administration (NOAA), Office of Ocean Resources Conservation and Assessment, Seattle, Washington 98115

**1.1.2. PUBLICATION DATE:**

DATE THE MATERIAL WAS PUBLISHED OR COMPLETED, IN THIS FORMAT:

19950809

**1.1.4. TITLE:**

TITLE OF THE PRODUCT.

EXAMPLE: Sensitivity of Coastal Environments and Wildlife to Spilled Oil: Southern Lake Michigan

**1.1.5. EDITION:**

WHAT EDITION OF THE PRODUCT IS THIS DATA. IN MOST CASES, THIS WILL BE FIRST, UNTIL THERE ARE UPDATES.

**1.1.6. GEOSPATIAL DATA PRESENTATION FORM:**

INDICATE IN WHAT FORM THE DATA IS PRESENTED.

EXAMPLE: Atlas

**1.1.7. SERIES INFORMATION**

**1.1.7.1. SERIES NAME:**

NAME OF THE SERIES. ESI ATLASES ARE NOT PUBLISHED AS A SERIES; THEREFORE, None

**1.1.7.2. ISSUE IDENTIFICATION:**

NAME OF THE ESI ATLAS

**1.1.8. PUBLICATION INFORMATION**

**1.1.8.1. PUBLICATION PLACE:**

WHERE THE INFORMATION IS PUBLISHED.

EXAMPLE: Seattle, Washington

**1.1.8.2. PUBLISHER:**

WHO PUBLISHED THE INFORMATION.

EXAMPLE: NOAA, Office of Ocean Resources Conservation and Assessment

**1.1.9. OTHER CITATION DETAILS:**

INCLUDE ANY OTHER CITATION INFORMATION HERE THAT WAS NOT ALREADY IDENTIFIED.

**1.1.10. ONLINE LINKAGE:**

IS THIS AVAILABLE ONLINE, AND IN WHAT FORMAT?

**1.1.11. LARGER WORK CITATION:**

IS THIS A SUBSET OF A LARGER PROJECT? IF YES, CITE THE LARGER PROJECT.

**1.2. DESCRIPTION**

**1.2.1. ABSTRACT:**

A BRIEF DESCRIPTION OF THE DATA SET SHOULD BE INCLUDED HERE.

EXAMPLE:

This data set comprises the Environmental Sensitivity Index (ESI) maps for the shoreline of Southern Lake Michigan. ESI data characterize coastal environments and wildlife by their sensitivity to spilled oil. The ESI data include information for three main components: shoreline habitats; sensitive biological resources; and human-use resources.

**1.2.2. PURPOSE:**

WHAT IS THE PURPOSE OF THE DATA SET. DEFINE BRIEFLY SO THE END USER CAN UNDERSTAND THE LIMITATIONS OF THE DATA.

EXAMPLE: The ESI data were collected, mapped, and digitized to provide environmental data for oil spill planning and response. The Clean Water Act with amendments by the Oil Pollution Act of 1990 requires response plans for immediate and effective protection of sensitive resources

**1.3. TIME PERIOD OF CONTENT**

**1.3.1. TIME PERIOD INFORMATION**

BRIEF DESCRIPTION OF WHEN THE INFORMATION WAS COLLECTED AND WHAT TIME FRAME IT ENCOMPASSES.

EXAMPLE: The intertidal habitats were mapped during aerial and ground surveys conducted from 18-21 April 1994. The biological and human use data were compiled by regional biologists. The dates for these data vary and are documented in Section 2.5.1.

**1.4. STATUS**

**1.4.1. PROGRESS:**

WHAT STAGE OF DEVELOPMENT IS THE DATA SET IN?

EXAMPLE: Complete, Only Habitat Completed, etc.

**1.4.2. MAINTENANCE AND UPDATE FREQUENCY:**

DESCRIBE THE MAINTENANCE AND UPDATE FREQUENCY PLANNED FOR THE DATA SET.

EXAMPLE: None planned, etc.

**1.5. SPATIAL DOMAIN**

ALL COORDINATES IN DECIMAL DEGREES

**1.5.1. BOUNDING COORDINATES**

**1.5.1.1. WEST BOUNDING COORDINATE:**

EXAMPLE: 87.88

**1.5.1.2. EAST BOUNDING COORDINATE:**

EXAMPLE: 87.125

**1.5.1.3. NORTH BOUNDING COORDINATE:**

EXAMPLE: 42.5

**1.5.1.4. SOUTH BOUNDING COORDINATE:**

EXAMPLE: 41.5

**1.6. KEYWORDS**

**1.6.1. THEME**

**1.6.1.1. THEME KEYWORD THESAURUS:**

GIVE THE FORMAL THESAURUS NAME, OR: None

**1.6.1.2. THEME KEYWORD:**

KEYWORDS THAT CAN BE USED IN A KEYWORD SEARCH BASED ON SUBJECT.

EXAMPLE: Sensitivity maps; ESI; coastal resources; oil spill planning; and coastal zone management

**1.6.2. PLACE**

**1.6.2.1. THESAURUS:**

GIVE THE FORMAL THESAURUS NAME, OR: None

**1.6.2.2. PLACE KEYWORD:**

KEYWORDS THAT CAN BE USED IN A KEYWORD SEARCH BASED ON LOCATION.

EXAMPLE: Shoreline of Southern Lake Michigan, to encompass the coastal areas of Menominee, Delta, Schoolcraft, Mackinac, Emmet, Charlevoix, Antrim, Grand Traverse, and Leelanau counties

**1.7. ACCESS CONSTRAINTS:**

STATE IF THERE ARE ANY LIMITATIONS ON ACCESS TO THE DATA.

EXAMPLE: None

**1.8. USE CONSTRAINTS:**

IDENTIFY ANY RESTRICTIONS IN HOW THE DATA MAY BE USED.

EXAMPLE: DO NOT USE ESI MAPS FOR NAVIGATIONAL PURPOSES.

Besides the above warning, there are no use constraints on this data.

Acknowledgment of NOAA and other contributing sources would be appreciated in products derived from these data

**1.11. DATA SET CREDIT:**

IDENTIFY WHO WAS RESPONSIBLE AND INVOLVED IN THE PROJECT AND WHAT THEIR CONTRIBUTIONS WERE.

**1.13. NATIVE DATA SET ENVIRONMENT:**

IDENTIFY THE FORMAT/SOFTWARE USED TO CREATE AND STORE THE DATA AND ALL FILE NAMES IN THE DATASET.

EXAMPLE: The software packages used to develop the atlas are Environmental Systems Research Institute's Arc/Info (version 7.0.3) and Oracle RDBMS (version 6.0.36.1.1). The hardware configuration is Hewlett Packard workstations (models 715/50 and 712/80 with 4 X-terminals) with unix operating system (HP-UX Release A.09.01). The following files are included in the data set: biores.dat.e00, seasonality.dat.e00, socecon.dat.e00, species.dat.e00, points.lut, polys.lut, soc.lut, birds.e00, esi.e00, fish.e00, hydro.e00, index.e00, nests.e00, plants.e00, and socecon.e00. The entire data set is approximately 60 megabytes.

**1.14. CROSS REFERENCE:**

IDENTIFY OTHER SIMILAR MATERIALS FOR THIS TYPE OF INFORMATION.

## 2.0. DATA QUALITY INFORMATION

### 2.1. ATTRIBUTE ACCURACY

#### 2.1.1. ATTRIBUTE ACCURACY REPORT:

DESCRIPTION OF THE ATTRIBUTE ACCURACY. THIS INFORMATION IS FURTHER DETAILED IN THE FEATURE LEVEL DATA, WHERE APPROPRIATE.

#### 2.1.2. QUANTITATIVE ATTRIBUTE ACCURACY ASSESSMENT

QUANTITATIVE ASSESSMENT OF THE ACCURACY OF THE ATTRIBUTES, NO THE SPATIAL DATA.

### 2.2. LOGICAL CONSISTENCY REPORT:

DESCRIBE WHAT TESTS WERE CONDUCTED TO ENSURE THAT THE DATA WAS LOGICALLY CORRECT AND CONSISTENT.

#### EXAMPLE:

The digitization of shoreline types, biological resources, and human-use resources is a complex and highly quality-controlled process. In order to facilitate digitizing, the entire study area is split into individual quadrangles using the INDEX coverage. The first layer of information digitized is the ESI shoreline. Upon completion of digitization the data are checked for completeness and topological and logical consistency and then plotted and checked by the mapping geologists. Any errors in the shoreline classification are updated prior to digitization of the biological and socio-economic layers. All layers use the shoreline as the geographic reference so that there are no slivers in the geographic coordinates. The hardcopy biological information is compiled onto 1:24,000 USGS topographic quadrangles by a biological expert using data from regional specialists in the form of maps, tables, charts, and written descriptions of wildlife distributions. The data are digitized, checked using both digital and on-screen procedures, plotted, and sent out for review by the regional specialists. The edited maps are updated, checked once again, and the final product plotted (at approximately 1:50,000 scale). A team of specialists review the entire series of maps, check all data, and make final edits. The data are then merged to form the study-wide layers. The data merging includes a final quality control check where labels, chains, and polygons are checked for attribute accuracy.

### 2.3. COMPLETENESS REPORT:

DESCRIBE THE INFORMATION THAT IS INCLUDED IN THE DATASET. EXAMPLE:

#### Shoreline Habitat Mapping:

The shoreline habitats of Southern Lake Michigan were mapped during overflights conducted from 7 May 1993. The surveys were conducted at elevations of 300-500 feet and slow air speed, using a H-65 helicopter provided by the U.S. Coast Guard. An experienced coastal geologist delineated the coastal types directly onto 1:24,000 scale USGS topographic maps, using a standardized classification scheme. Where appropriate, multiple habitats were delineated for each shoreline segment. For complicated areas or where the shoreline had changed significantly from that shown on the base maps, color infrared aerial photographs provided by the Department of Natural Resources were used to update the maps.

Prediction of the behavior and persistence of oil on intertidal habitats is based on an understanding of the dynamics of the coastal environments, not just the substrate type and grain size. The vulnerability of a particular intertidal habitat is an integration of the following factors:

- 1) Shoreline type (substrate, grain size, tidal elevation, origin)
- 2) Exposure to wave and tidal energy
- 3) Biological productivity and sensitivity
- 4) Ease of cleanup

All of these factors are used to determine the relative sensitivity of intertidal habitats. Key to the sensitivity ranking is an understanding of the relationships between: physical processes; substrate; shoreline type; product type; fate and effect; and sediment transport patterns. The intensity of energy expended upon a shoreline by wave action, tidal currents, and river currents directly affects the persistence of stranded oil. The need for shoreline cleanup activities is determined, in part, by the slowness of natural processes in removal of oil stranded on the shoreline.

These concepts have been used in the development of the Environmental Sensitivity Index (ESI), which ranks shoreline environments as to their relative sensitivity to oil spills, potential biological injury, and ease of cleanup. Generally speaking, areas exposed to high levels of physical energy, such as wave action and tidal currents, and low biological activity rank low

on the scale, whereas sheltered areas with associated high biological activity have the highest ranking.

Sensitive Biological Resources:

Regional biologists compiled the biological data. These data denote the key biological resources that are most likely at risk in the event of an oil spill. Three major categories, or elements, of biological resources were considered during data compilation: birds, fish, and plants.

Each ELEMENT corresponds to a coverage or geographic theme. There are three attribute tables, BIORES.DAT, SEASONALITY.DAT, and SPECIES.DAT, that are used to store the complex biological data (Fig. 1). Each biological coverage (BIRDS, FISH, and PLANTS) is linked to the Biological Resources table (BIORES.DAT) using the item ID and the associated look up tables. The look up tables contain ID and RARNUM. RARNUM is the resources at risk number and is determined for each unique combination of SPECIES\_ID, SEASON\_ID, and CONC. The items in BIORES.DAT are: RARNUM, SPECIES\_ID, CONC, SEASON\_ID, SOURCE\_ID, and ELEMENT. SPECIES\_ID is the numeric identifier of each species and is unique within each ELEMENT. CONC is the concentration of the species and can be LOW, MEDIUM or HIGH or an actual count of the numbers of species present in the polygon. SEASON\_ID contains a numeric value according to the monthly presence of the species. Usually, there is one seasonality per species, but occasionally the same species has different monthly presence or breeding activity. When this occurs, a new record with a different seasonality is referenced.

The SEASONALITY.DAT table stores the monthly presence of each species and the characteristics of the presence (life history information). The BIORES.DAT table is linked to the SEASONALITY.DAT table using the SPECIES\_ID, ELEMENT, and SEASON\_ID items. The categories of the variables BREED1 through BREED4 for each ELEMENT are:

ELEMENT	BREED 1	BREED 2	BREED 3	BREED 4
BIRD	nesting	laying	hatching	fledging
FISH	spawning	juvenile	outmigration	
MAMMAL	calving	pupping	molting	
REPTILE	nesting	hatching		
SHELLFISH	spawning	juvenile		

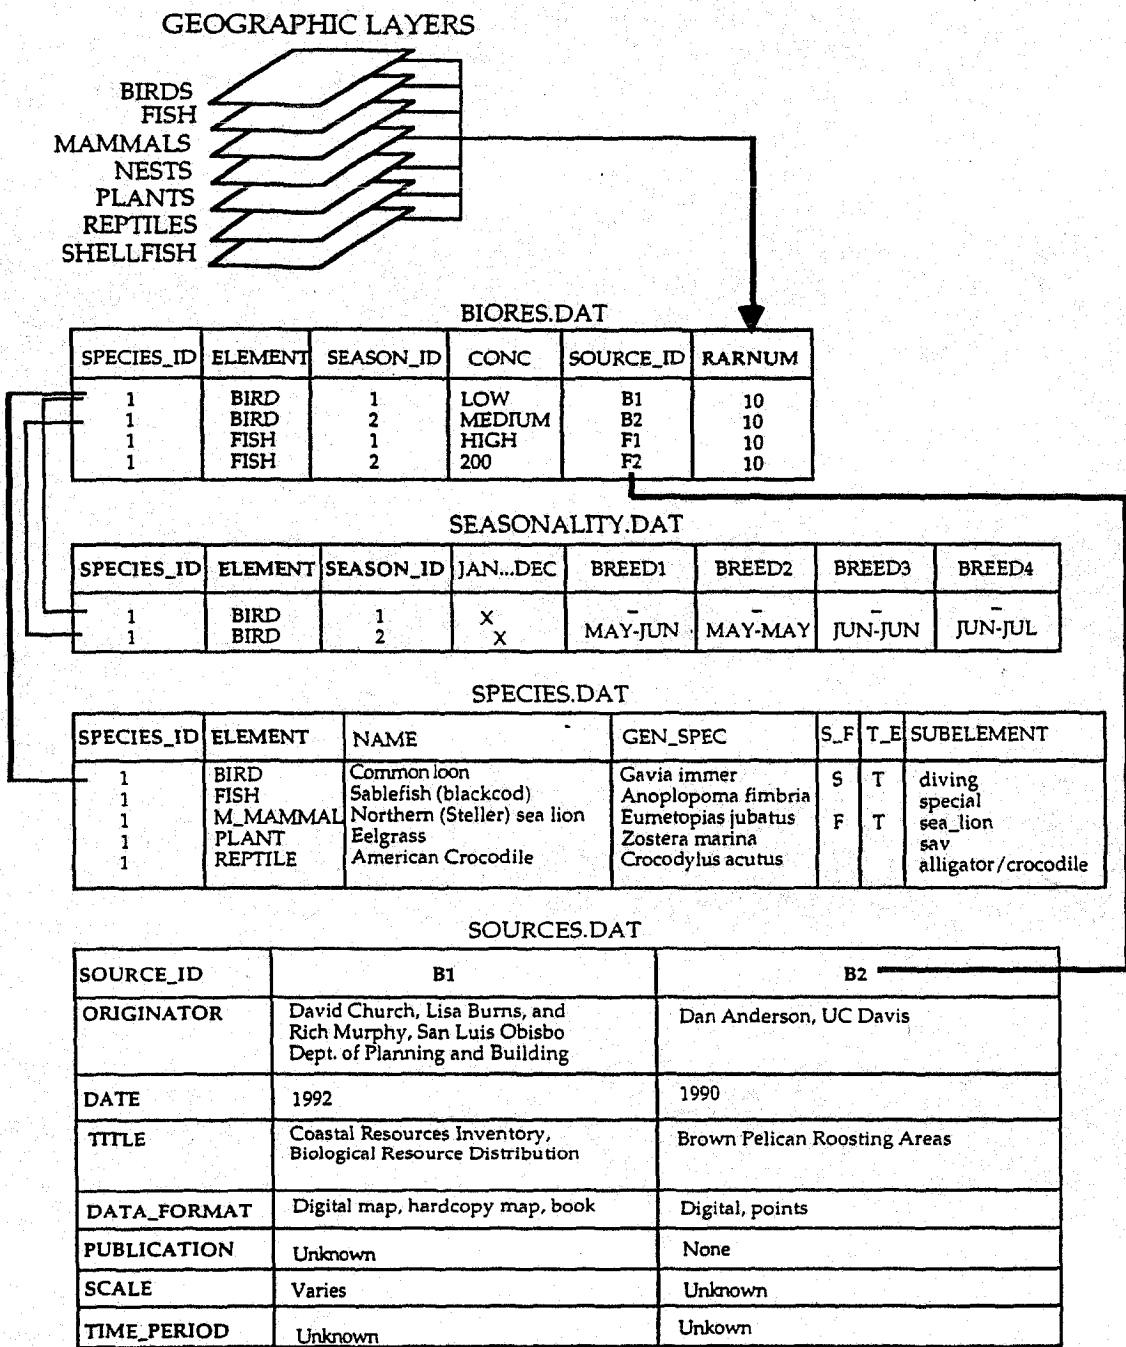

FIGURE 1. Relationships between biology coverages and attribute files.

NOTE: There are no BREED variables for PLANTS.

The SPECIES.DAT table contains the common name (NAME), the scientific name (GEN\_SPEC), the state and federal status (S\_F), and the threatened or endangered status (T\_E). The item SUBELEMENT refers to the grouping of the species. The SUBELEMENTS, by ELEMENT, are:

ELEMENT	SUBELEMENT
Bird	Alcid
	Diving Coastal Bird
	Gull/Tern
	Passerine
	Pelagic
	Raptor
	Shorebird
	Wading Bird
	Waterfowl
Fish	Anadromous
	Beach Spawner
	Kelp Spawner
	Reef Fish
	Special Concentration
Marine Mammal	Dolphin
	Manatee
	Sea Lion
	Sea Otter
	Seal
	Whale
Plant	Marsh
	Submerged aquatic vegetation
	Shrub
Reptile	Alligator/Crocodile
	Sea Turtle
Shellfish	Abalone
	Cephalopod
	Clam
	Conch/Whelk
	Echinoderm
	Gastropod
	Mussel
	Oyster
	Scallop
	Squid/Octopus

NAME OF ESI ATLAS METADATA

	Crab
	Lobster
	Shrimp
Terrestrial Mammal	Bear
	Deer
	Mustelid
	Rodent

Human Use Resources:

Several human use, or socio-economic, features are included in ESI atlases. Entity points and complete chains are digitized into the coverage SOCECON. The data set is linked to the database SOCECON.DAT using the item ID found in the SOC.LUT.

ENTITY POINTS (.PAT)		COMPLETE CHAINS (.AAT)	
Item	Type	Item	Type
SOCECON	C	SOCECON	C
ID	C		

The SOCECON item may contain the following values:

Entity Points		Complete Chains	
Feature	SOCECON	Feature	SOCECON
Access	A2	Indian Reservation	IR
Airport	A	International Border	IB
Aquaculture	AQ	Marine Sanctuary	MS
Archaeological Sites	AS	National Park	NP
Beach	B	Park	P
Boat Ramp	BR	Pipeline	PL
Campground	CP	Regional or State Park	SP
Coast Guard	CG	State Border	SB
Commercial Fishing	FA	State Beach	B/RB
Factory	F2	Wildlife Refuge	WR
Ferry	F		
Fishery Area	FA		
Historical Site	HS		
Hoist	H		
Log Storage	LS		
Marina	M		
Marine Sanctuary	MS		
Mining	M2		
National Park	NP		
Native American Lands	NAL		
Oil Facilities	OF		
Platforms	PF		
Public Fishing	PF		
Recreational Beach	RB		
Recreational Fishing	RF/PF		
State Park	SP		
Subsistence	S		
Village	V		
Water Intake	WI		
Wildlife Refuge	WR		

The table SOCECON.DAT contains the feature type, contact person, the owner of the facility, and any comments regarding the site. The RARNUM value is

distinguished from the biology RARNUM values by an "H" preceding the unique number.

## **2.4. POSITIONAL ACCURACY**

### **2.4.1. HORIZONTAL POSITIONAL ACCURACY**

#### **2.4.1.1. HORIZONTAL POSITIONAL ACCURACY REPORT:**

DESCRIBE THE HORIZONTAL ACCURACY OF THE DATA, AND THE BASIS FOR THAT ACCURACY MEASUREMENT.

EXAMPLE:

The ESI data uses USGS 1:24,000 topographic quadrangles as the base map. It is estimated that the ESI has a minimum mapping unit of 50 feet. The biological data sets are developed primarily using regional experts who estimate concentration areas. Unlike shorelines, which maintain relative spatial stability through time, the biological data by nature migrate across the landscape. Therefore, the 1:24,000 USGS quadrangles are used as a base map in gathering the data but the data have "fuzzy" boundaries which must be understood when utilizing this information.

#### **2.4.1.2. QUANTITATIVE HORIZONTAL POSITIONAL ACCURACY ASSESSMENT**

DESCRIBE THE ASSESSMENT DONE ON THE HORIZONTAL POSITIONAL ACCURACY.

EXAMPLE: None

### **2.4.2. VERTICAL POSITIONAL ACCURACY**

#### **2.4.2.1. VERTICAL POSITIONAL ACCURACY REPORT:**

DESCRIBE THE ACCURACY OF THE DATA, AND THE BASIS FOR THAT ACCURACY MEASUREMENT.

EXAMPLE: None

**2.5. LINEAGE**

LIST ALL SOURCES FOR EACH DATA ELEMENT.

**2.5.1. SOURCE INFORMATION:**

Coverage or theme name: BIRDS

**2.5.1.1. SOURCE CITATION**

INCLUDE THE SOURCE INFORMATION FOR THE DATA IN THIS SECTION. THIS IS THE SAME INFORMATION THAT IS IN THE TABLE SOURCE.DAT. BELOW ARE EXAMPLE TABLES.

**2.5.2. PROCESS STEP****2.5.2.1. PROCESS DESCRIPTION:**

DESCRIBE THE PROCESSES USED TO CREATE THE COVERAGES AND DATA.

**EXAMPLE:**

The digitization of ESI, biological resources, and human-use resources is a complex and highly quality controlled process. In order to facilitate digitizing, the entire study area was split into individual quadrangles using a map index coverage. The first layer of information digitized is the ESI. Upon completion of digitization the data is checked for completeness, topological and logical consistency and then plotted and checked by the over-flight/field specialists. Any errors in the shoreline classification are updated prior to digitization of the biological and socio-economic layers. All data use the shoreline as the geographic reference so that there are no slivers in the geographic layers. The biological information is compiled onto 1:24,000 USGS topographic quadrangles by an in-house biological and GIS expert using the data from regional specialists in the form of maps, tables, charts, and written descriptions of wildlife distributions. The data are digitized, checked using both digital and on-screen procedures, plotted, and sent out for review by the regional specialists. The edited maps are updated on the computer, checked once again, and plotted at final map scale. A team of specialists review the entire series of maps, check all data, and make final edits. The data are merged to form the study-wide layers which are described in this document. The data merging includes a final quality control check where topological consistency, rules for geography, and database to geography are checked and reported to the GIS manager.

THE FOLLOWING SECTION PROVIDES A GUIDELINE AND EXAMPLE FOR THE ATTRIBUTE SECTION OF THE METADATA FORM. APPENDIX A HAS MOST OF THE INFORMATION NEEDED TO COMPLETE THIS SECTION.

**5.1. DETAILED DESCRIPTION: BIRDS**

The coverage BIRD contains the polygons with bird species.

**5.1.1. ENTITY TYPES:**

5.1.1.1. ENTITY TYPE LABEL:	5.1.1.2. ENTITY TYPE DEFINITION:
GT-Polygons	ID integer

**5.1.2. ATTRIBUTES:**

**5.1.2.1. ATTRIBUTE LABEL:**

ID

**5.1.2.2. ATTRIBUTE DEFINITION:**

A unique identifier which links to the POLYS.LUT table. The POLYS.LUT is a lookup table with two attributes: ID and RARNUM. The value of RARNUM is determined for each unique combination of SPECIES\_ID, SEASON\_ID, and CONC. The items in BIORES.DAT are: RARNUM, SPECIES\_ID, CONC, SEASON\_ID, SOURCE\_ID, and ELEMENT. SPECIES\_ID is the numeric identifier of each species and is unique within each ELEMENT. CONC is the concentration of the species and can be LOW, MEDIUM, or HIGH or an actual count of the numbers of species present in the polygon. SEASON\_ID contains a numeric value according to the monthly presence of the species. Usually, there is one seasonality per species, but occasionally the same species has different monthly presence or breeding activity. When this occurs, a new record with a different seasonality is referenced. SOURCE\_ID is a variable which holds meta data information. The information for this variable was unavailable during compilation of this atlas.

The following BIRD species are found in the Southern Lake Michigan ESI atlas.

SPECIES ID	NAME
1	Common loon
2	Arctic loon
4	Red-necked grebe
5	Horned grebe
7	Western grebe
8	Double-crested cormorant
12	Canada goose
13	Black brant
16	Mallard
17	Pintail
18	Green-winged teal
20	Northern shoveler
21	Canvasback
22	Greater scaup
23	Lesser scaup
24	Common goldeneye
26	Bufflehead
27	Oldsquaw
28	Harlequin duck
29	White-winged scoter
30	Surf scoter
32	Common merganser
33	Red-breasted merganser
34	American coot
38	Herring gull
40	Ring-billed gull
42	Bonaparte's gull
44	Thayer's (herring) gull
45	Common tern
54	Great blue heron
56	Spotted sandpiper
58	Greater yellowlegs
59	Lesser yellowlegs
60	Red knot
61	Pectoral sandpiper
62	Least sandpiper
63	Dunlin
64	Short-billed dowitcher
67	Sanderling
69	Semipalmated plover
70	Killdeer

**5.1. DETAILED DESCRIPTION: ESI**

The Coverage ESI contains arc (Complete Chains) features for the ESI shoreline classification. The classification of the features is based upon *Guidelines for Developing Digital Environmental Sensitivity Index Atlases and Data-bases* (Michel, J. and J. Dahlin, 1993, Hazardous Materials Response and Assessment Division, NOAA). The ESI classification was performed 18-21 April 1994.

**5.1.1. ENTITY TYPES:**

<u>Complete Chain</u>	ESI SOURCE_ID character integer

**5.1.2. ATTRIBUTES:****5.1.2.1. ATTRIBUTE LABEL:**

ESI

**5.1.2.2. ATTRIBUTE DEFINITION:**

The item ESI contains values according to the ESI ranking of the shorelines and polygons. The ESI rankings progress from low to high susceptibility to oil spills. In many cases, the shorelines are also ranked with multiple codes such as 10A/5. The first number is the most landward shoreline type, fringing wetlands, with mixed sand and gravel beaches being the shoreline type closest to the water. The Southern Lake Michigan shoreline types are listed below.

**5.1. DETAILED DESCRIPTION: SOCECON**

The coverage SOCECON contains the entity points and complete chains for the human use data.

**5.1.1. ENTITY TYPES:**

5.1.1.1. ENTITY TYPE LABEL:	5.1.1.2. ENTITY TYPE DEFINITION:	
<u>Complete Chain</u>	SOCECON	
<u>Entity Points</u>	SOCECON	character
	ID	character

**5.1.2. ATTRIBUTES:**

**5.1.2.1. ATTRIBUTE LABEL:**

ID

**5.1.2.2. ATTRIBUTE DEFINITION:**

A unique identifier which links to the POINTS.LUT table. POINTS.LUT is a lookup table with two attributes: ID and RARNUM. RARNUM is the link to the socio-economic data found in the SOCECON.DAT table. The table SOCECON.DAT contains feature type, contact person, owner of the facility, phone number, and any comments regarding the site. The RARNUM value is distinguished from the biology RARNUM values by an "H" preceding the unique number.

**5.1.2.3. ATTRIBUTE DEFINITION SOURCE:**

Research Planning, Inc.

**5.1.2.5. ATTRIBUTE UNITS OF MEASUREMENT:**

integer

**5.1.2.1. ATTRIBUTE LABEL:**

SOCECON

**5.1.2.2. ATTRIBUTE DEFINITION:**

Identifies a line or point with a socio-economic, or human-use, feature. This attribute allows direct access to the type of feature instead of linking to the more detailed SOCECON.DAT table.

**5.1.2.3. ATTRIBUTE DEFINITION SOURCE:**

Research Planning, Inc.

**5.1.2.4.1.3. ENUMERATED DOMAIN VALUE****DEFINITION SOURCE:**

Research Planning, Inc.

5.1.2.4.1.1. ENUMERATED DOMAIN VALUE:	5.1.2.4.1.2. ENUMERATED DOMAIN VALUE DEFINITION:
A	Airport - Points
BR	Boat Ramp - Points
CG	Coast Guard - Points
M	Marina - Points
NP	National Park - Points and Chains
SB	State Beach - Chains
SP	State Park - Chains
WI	Water Intake - Points
WR	Wildlife Refuge - Points and Chains

**5.1.2.5. ATTRIBUTE UNITS OF MEASUREMENT:**

nominal

## **6.0. DISTRIBUTION INFORMATION**

### **6.1. DISTRIBUTOR**

#### **6.1.1. CONTACT PERSON PRIMARY**

##### **6.1.1.1. CONTACT PERSON:**

PERSON RESPONSIBLE FOR DISTRIBUTION OF THE DATA

##### **6.1.1.2. CONTACT ORGANIZATION:**

PRIMARY CONTACT PERSON'S COMPANY AFFILIATION

#### **6.1.4. CONTACT ADDRESS**

##### **6.1.4.1. ADDRESS TYPE:**

PHYSICAL ADDRESS

##### **6.1.4.2. ADDRESS:**

PHYSICAL STREET ADDRESS

##### **6.1.4.3. CITY:**

CITY

##### **6.1.4.4. STATE OR PROVINCE:**

STATE

##### **6.1.4.5. POSTAL CODE:**

NUMERICAL ZIP CODE

#### **6.1.5. CONTACT VOICE TELEPHONE:**

PRIMARY CONTACT PERSON'S TELEPHONE NUMBER

#### **6.1.7. CONTACT FACSIMILE TELEPHONE:**

PRIMARY CONTACT PERSON'S FAX NUMBER

### **6.2. RESOURCE DESCRIPTION:**

THE NAME OF THE DATA SET (ESI ATLAS) TO BE DISTRIBUTED

### **6.3. DISTRIBUTION LIABILITY:**

INCLUDE ANY DISCLAIMER STATEMENTS NECESSARY ABOUT THE PRODUCT

### **6.5. CUSTOM ORDER PROCESS**

STATE THE PROCESS BY WHICH A COPY OF THE DATA CAN BE OBTAINED

**7.0. METADATA REFERENCE INFORMATION**

**7.1. METADATA DATE:**

DATE THE METADATA REPORT WAS CREATED (i.e., 19950710)

**7.2. METADATA REVIEW DATE:**

DATE THE METADATA REPORT WAS REVIEWED (i.e., 19941115)

**7.4. METADATA CONTACT**

**7.4.1. CONTACT PERSON PRIMARY**

**7.4.1.1. CONTACT PERSON:**

PRIMARY CONTACT PERSON'S NAME

**7.4.1.2. CONTACT ORGANIZATION:**

PRIMARY CONTACT PERSON'S COMPANY AFFILIATION

**7.4.3. CONTACT POSITION:**

PRIMARY CONTACT PERSON'S JOB TITLE

**7.4.4. CONTACT ADDRESS**

**7.4.4.1. ADDRESS TYPE: :**

PHYSICAL ADDRESS

**7.4.4.2. ADDRESS:**

PHYSICAL STREET ADDRESS

**7.4.4.3. CITY:**

CITY

**7.4.4.4. STATE OR PROVINCE:**

STATE

**7.4.4.5. POSTAL CODE:**

NUMERICAL ZIP CODE

**7.4.5. CONTACT VOICE TELEPHONE:**

PRIMARY CONTACT PERSON'S TELEPHONE NUMBER

**7.4.7. CONTACT FACSIMILE TELEPHONE:**

PRIMARY CONTACT PERSON'S FAX NUMBER

**7.4.8. CONTACT ELECTRONIC MAIL ADDRESS:**

PRIMARY CONTACT PERSON'S EMAIL ADDRESS

**7.5. METADATA STANDARD NAME:**

Content Standards for Digital Geospatial Metadata

**7.6. METADATA STANDARD VERSION:**

19940608

### The Department of the Interior Mission

As the Nation's principal conservation agency, the Department of the Interior has responsibility for most of our nationally owned public lands and natural resources. This includes fostering sound use of our land and water resources; protecting our fish, wildlife, and biological diversity; preserving the environmental and cultural values of our national parks and historical places; and providing for the enjoyment of life through outdoor recreation. The Department assesses our energy and mineral resources and works to ensure that their development is in the best interests of all our people by encouraging stewardship and citizen participation in their care. The Department also has a major responsibility for American Indian reservation communities and for people who live in island territories under U.S. administration.

### The Minerals Management Service Mission

As a bureau of the Department of the Interior, the Minerals Management Service's (MMS) primary responsibilities are to manage the mineral resources located on the Nation's Outer Continental Shelf (OCS), collect revenue from the Federal OCS and onshore Federal and Indian lands, and distribute those revenues.

Moreover, in working to meet its responsibilities, the **Offshore Minerals Management Program** administers the OCS competitive leasing program and oversees the safe and environmentally sound exploration and production of our Nation's offshore natural gas, oil and other mineral resources. The MMS **Minerals Revenue Management** meets its responsibilities by ensuring the efficient, timely and accurate collection and disbursement of revenue from mineral leasing and production due to Indian tribes and allottees, States and the U.S. Treasury.

The MMS strives to fulfill its responsibilities through the general guiding principles of: (1) being responsive to the public's concerns and interests by maintaining a dialogue with all potentially affected parties and (2) carrying out its programs with an emphasis on working to enhance the quality of life for all Americans by lending MMS assistance and expertise to economic development and environmental protection.
