INTRODUCTION

This volume contains plots and listings of hydrographic data obtained between September 1979 and July 1981 during five cruises to the East and West Flower Garden Banks. These data are vertical profiles of temperature, salinity, transmissivity, and horizontal currents taken mainly over and nearby the principal study site, the East and West Flower Garden Banks. Data were also taken over the continental slope which is located south of the study site, and on transects between Galveston and the principal study site. The Flower Garden Banks lie north of the Texas-Louisiana shelf break, or about 184 km SSE of Galveston, Texas. The banks are diapiric salt structures which rise above the edge of the Continental Shelf near the 100 m isobath. A map of the study area is given in Figure 1.

Table 1 gives a synopsis of the types and amount of hydrographic data obtained during each of the five cruises. Also included in this table is a list of the dye emission experiments which were performed to study the currents and turbulence in the bottom boundary layer. Preliminary results of the dye experiments are discussed in Chapter IV of the final report.

The method of data acquisition and the types of instrumentation changed from cruise to cruise as the field study progressed. On the BLACK SEAL and ROSS SEAL cruises, each station consisted of a sequence of separate vertical profiles. Temperature profiles were from XBT's; transmissivity was measured with a hand-lowered Martek (model XMS) transmissometer which had a one-metre folded path length and a white light source; and current speeds and directions were measured with a

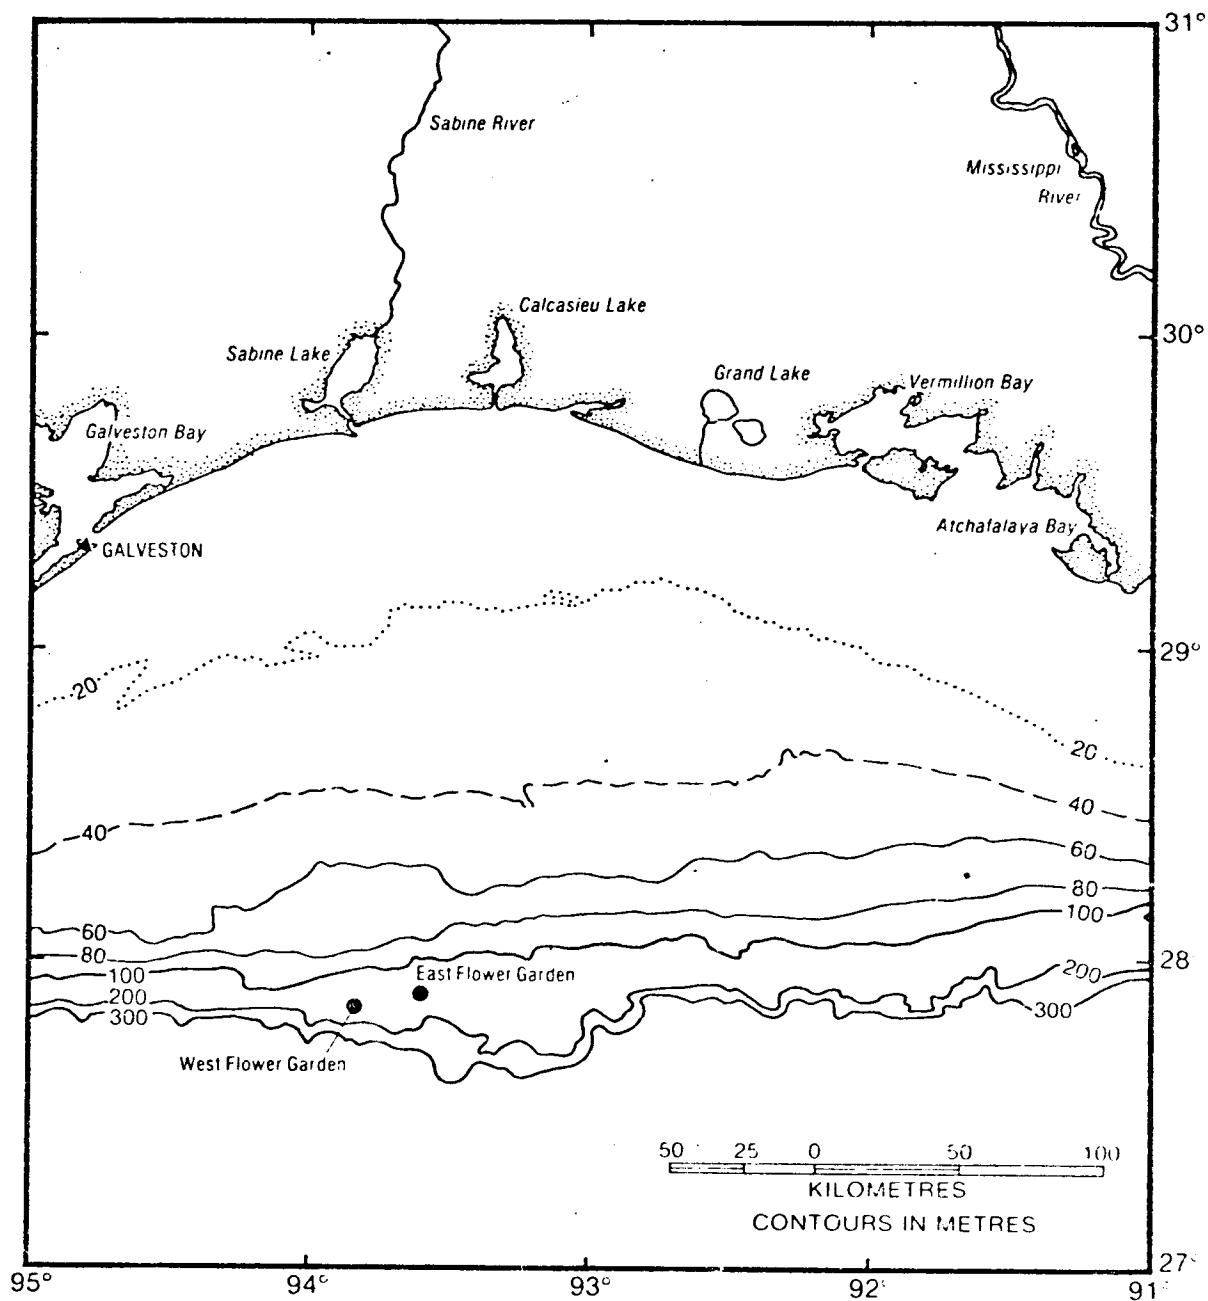

Figure 1. Map of study site, showing shelf area and East and West Flower Garden Banks.

* (a) 5 transmissivity and temperature profiles
 (b) 1 profile, transmissivity only
 (c) table of water temperature and salinity data

** (a) vertical profiles of transmissivity, 22 stations (EFG/WFG)
 (b) vertical profile time series of temperature, transmissivity,
 and currents near mooring 2, EFG.

HydroProducts profiling current meter by lowering it to given depths
 where measurements were taken.

Simultaneous profiles of temperature, salinity, transmissivity,
 and velocity were made on the last three cruises, using the PHISH
 (Profiling Hardwired Instrumented Sensor for Hydrography). The
 characteristics of this sensor package are discussed in detail in
 Chapter IV of the final report. The advantages of this system are: 1)
 station time is greatly reduced so that a more synoptic picture of the
 hydrography over a small area may be obtained; 2) by profiling with all
 sensors simultaneously, any variation due to position changes caused by
 ship drift or due to short term fluctuations in the water column will
 have the same effect on each quantity measured; and 3) data storage

through the PHISH onboard microcomputer system onto diskettes greatly simplifies data management and analysis.

The design of the PHISH transmissometer (Seatech) is different from that of the Martek transmissometer used on the BLACK SEAL and ROSS SEAL cruises, and the relationship between measurements made by the two instruments is presently being determined in laboratory tank measurements. The technique being employed for intercalibration is to immerse the two transmissometers into a tank filled with seawater. Preweighed portions of mud from the Flower Gardens region are disaggregated, suspended, and then added to the tank. Transmissivity is then simultaneously recorded on each instrument, and a water sample is taken. The SPM concentration is determined for the water sample. These data are combined from a number of trials using different SPM concentrations to derive an absolute calibration for each instrument and therefore intercalibration between the two. The PHISH transmissometer has a 25 cm path length, compared to 100 cm on the older Martek transmissometer, and the light source is also different. All transmissivity profiles from the PHISH which are reported in this volume have been transformed as follows. Units of %/25 cm (the measured attenuation with the Seatech transmissometer) were transformed to %/m (the mode of measurement with the Martek) using the equation

$$Tr(\%/\text{m}) = Tr^4(\%/25 \text{ cm})/10^6.$$

However, even after the application of this transformation to correct for pathlength difference, the profiles from the two transmissometers are still not comparable to each other, due mainly to the differences in their light source. Application of further corrections derived from the tank intercalibrations of the two instruments will be necessary.

Salinity profiles obtained on the BALTIC SEAL and GYRE cruises exhibit rather large fluctuations or spikes, particularly where vertical temperature gradients are large. These spikes are not real, but are due to the time-mismatch between the conductivity and temperature sensors. This mismatch was caused mainly by the slow flushing rate of the conductivity cell. These spikes were reduced somewhat during the data processing operations by time-lagging the temperature measurements relative to the conductivity measurements before computing salinity (salinity is computed as a function of temperature, conductivity, and pressure). Further reduction in the spikes was accomplished by performing a running average over 1 m intervals for the entire downcast; there are typically three complete measurements of temperature, conductivity, and pressure taken over each 1 m depth interval. Between the GYRE cruise and the NORTH SEAL cruise, a pump was installed to increase the flow rate through the conductivity cell. The result is a dramatic improvement in the quality of the NORTH SEAL salinity profiles.

The PHISH package is equipped with an alarm system triggered when the PHISH is within 2 m of the bottom. Upon receipt of the alarm, the winch operator stops the cast and begins hauling the instrument package up. Thus, we are assured that for the last three cruises, all vertical profiles taken by the PHISH extend down to within 2 m of the bottom.

This report is divided by cruise into five sections. Each section begins with a table of contents, and each of these tables is referenced at the beginning of this volume in the master table of contents. Each

section is divided into two parts, XBT data and non-XBT data. The non-XBT data are either from PHISH profiles, as in the last three cruises, or they are the transmissivity and profiling current meter data from the first two cruises.* These data are presented in basic form as both vertical profile plots and listings versus depth. The tables list the appropriate variable, e.g., temperature, transmissivity, salinity, density (σ_t), or u-velocity and v-velocity, versus depth at 1 m depth increments. The u-velocity component is along the east-west direction and is positive toward the east; the v-velocity component is along the north-south direction and is positive toward the north.

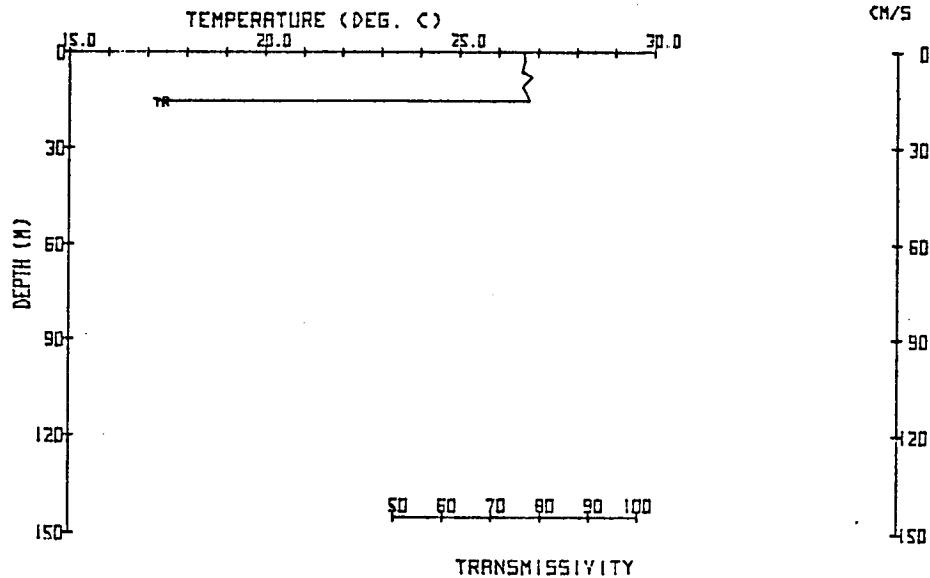

A number of different types of map plots display the horizontal distribution of hydrographic variables, such as temperature and salinity. The maps display the magnitude of these variables at either a given depth from the surface, at the depth where a given magnitude occurs, or at a given distance from the bottom. The distance from the bottom, when labeled on these plots, is actually the distance from the bottom of the vertical profile, which is about 2 m above the real bottom. This is the depth where the bottom sensing mechanism is tripped and the cast stopped. Thus, for instance, plots labeled "0 m from the bottom" actually show the values at 2 m from the bottom.

*During the BLACK SEAL and ROSS SEAL cruises, the STD did not function.

ROSS SEAL 1979 STATION NAMES

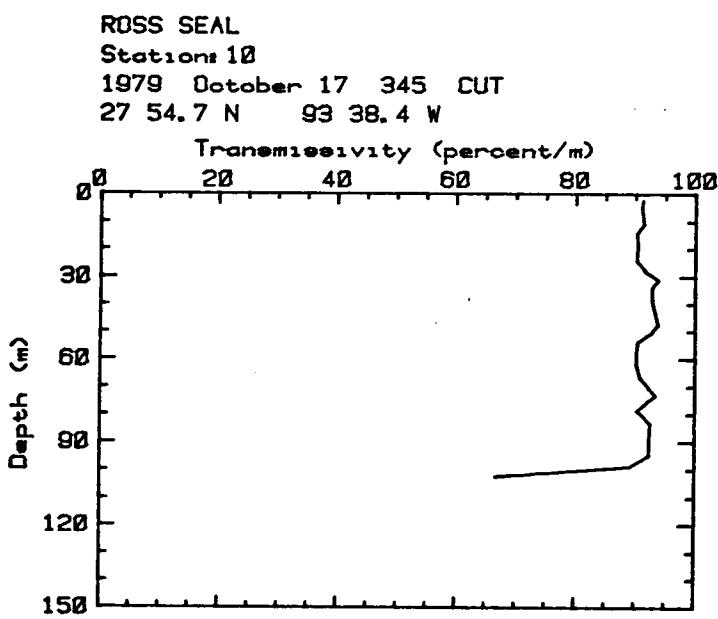

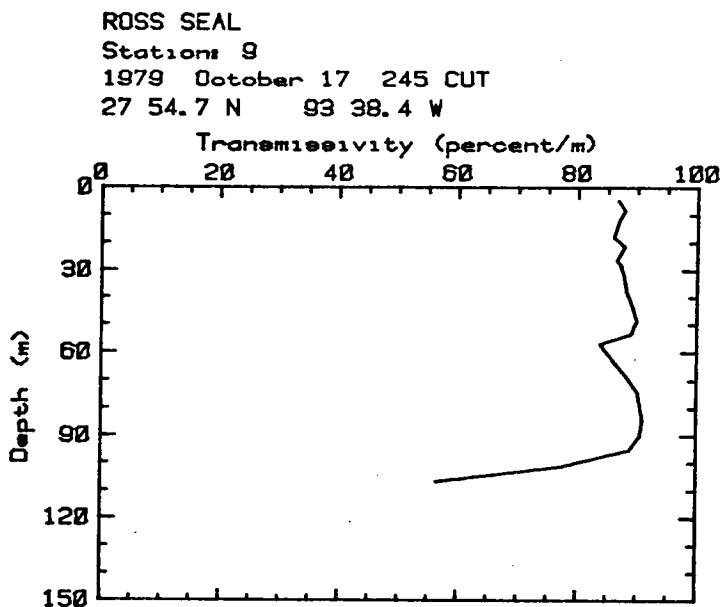

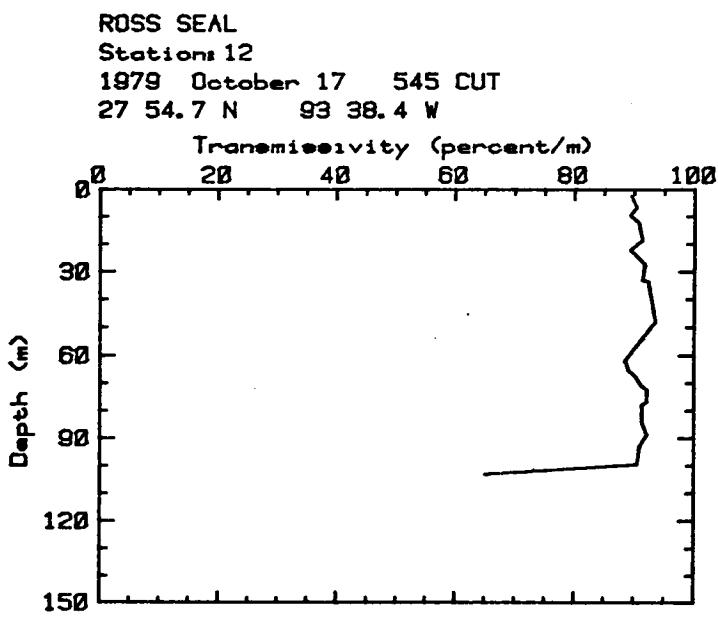

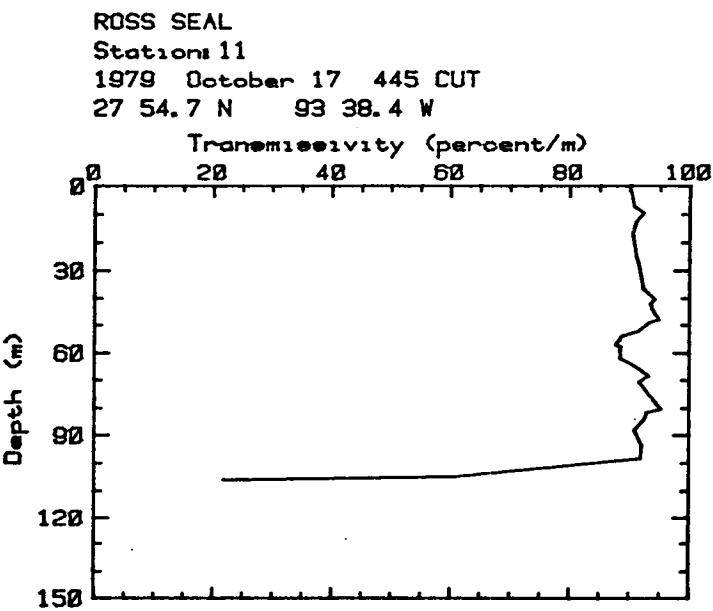

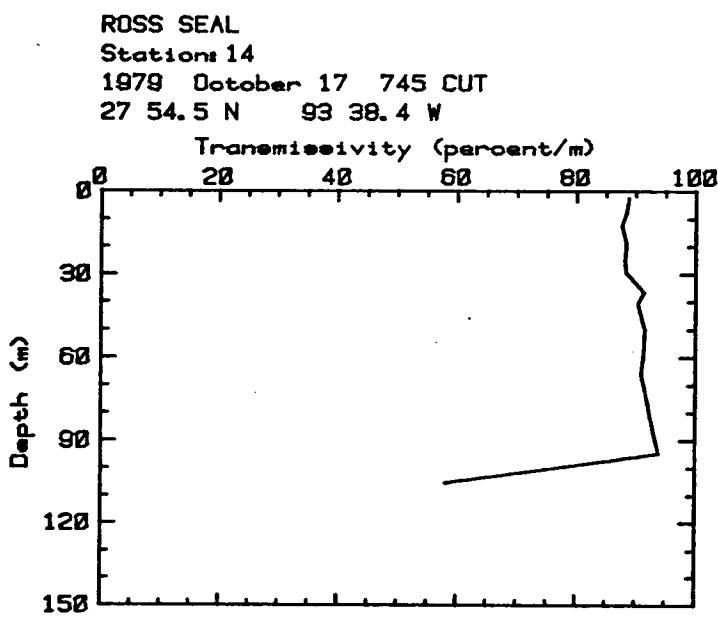

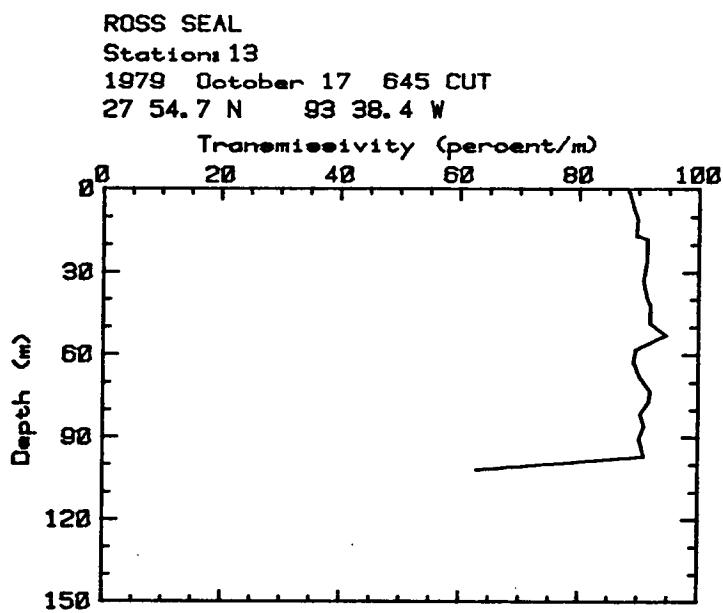

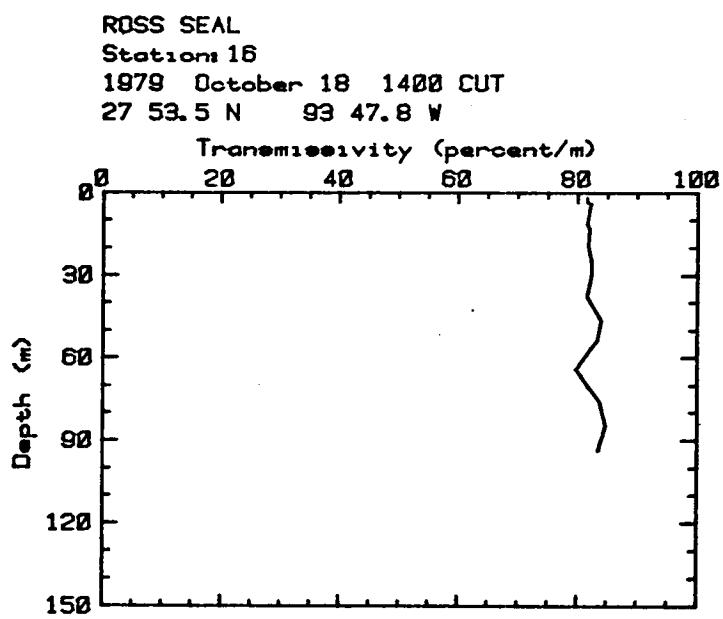

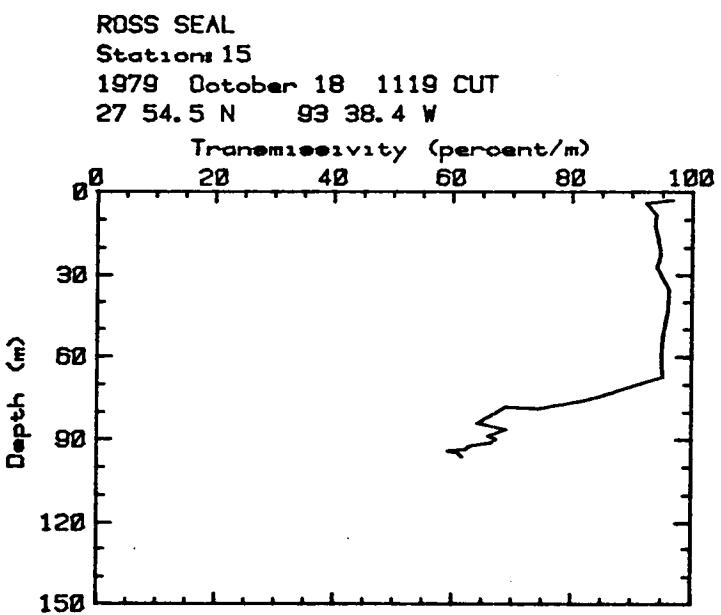

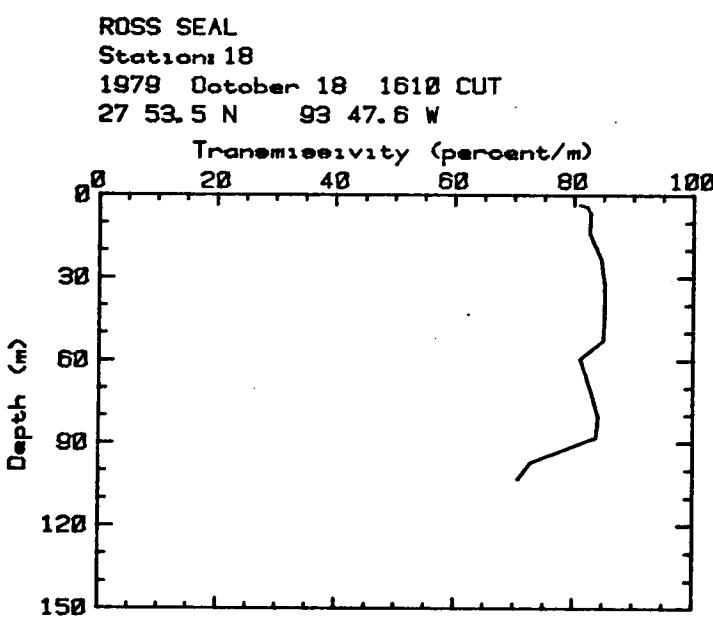

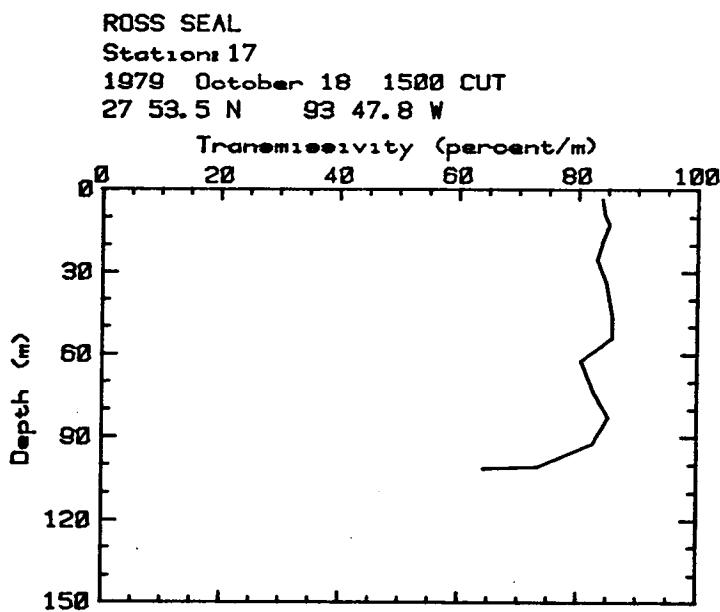

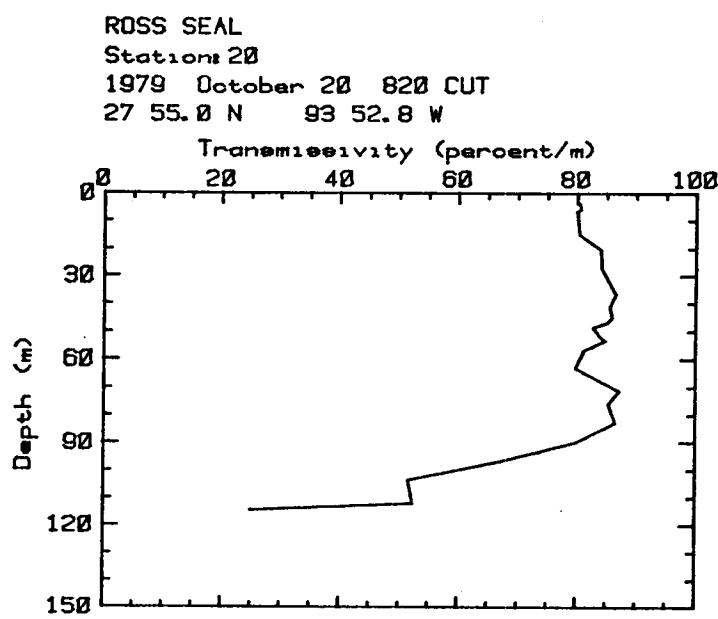

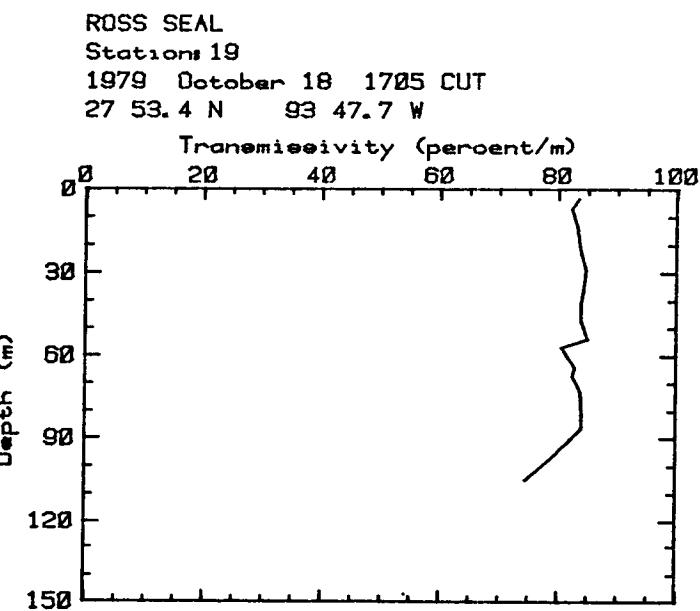

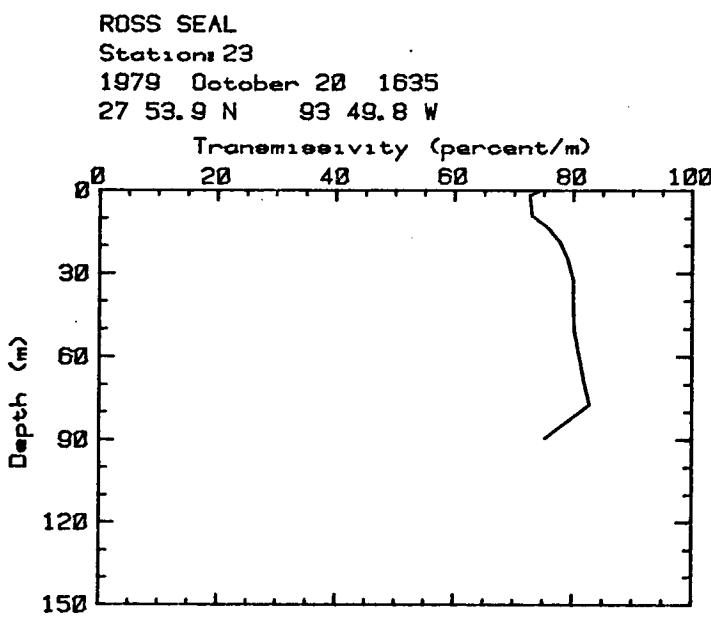

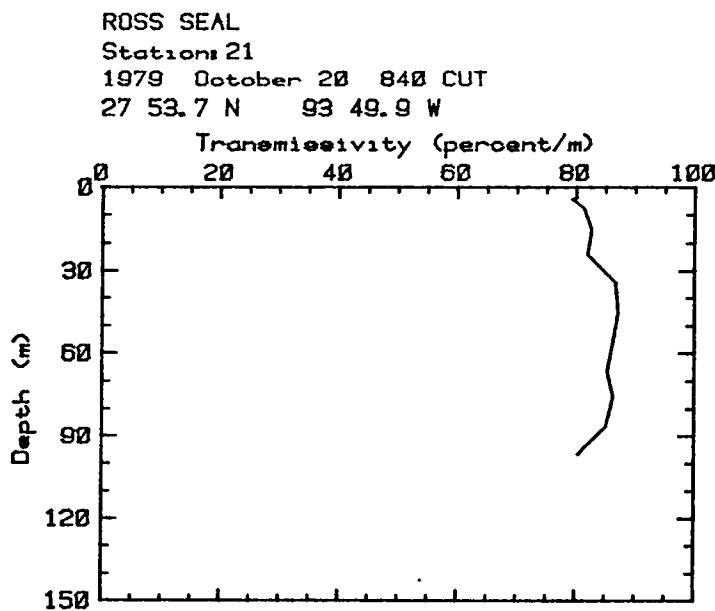

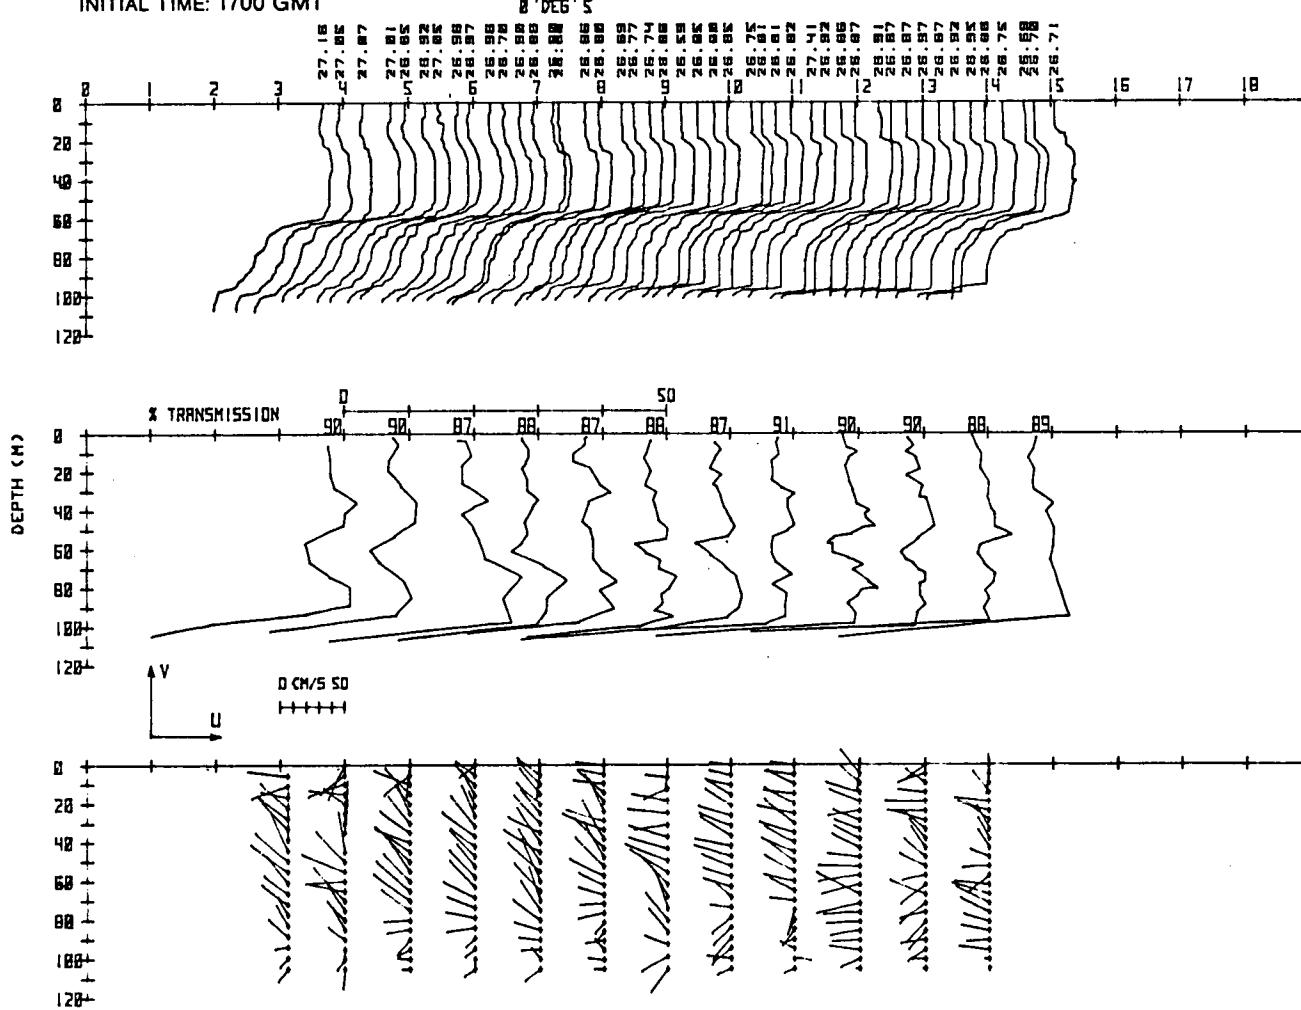

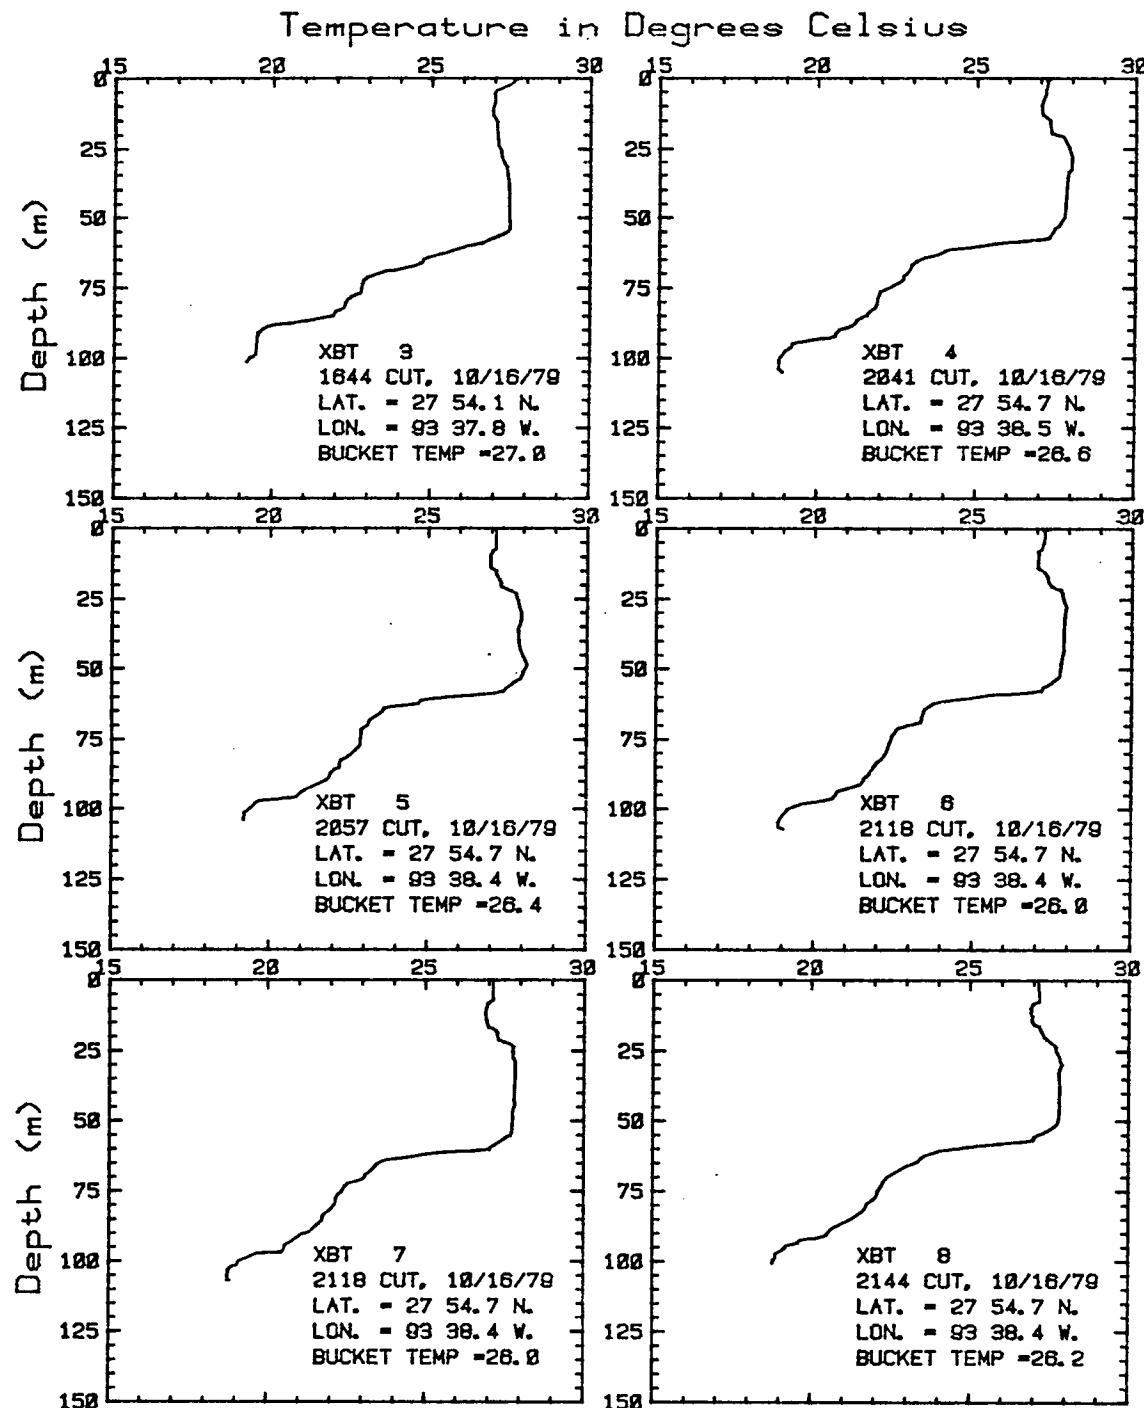

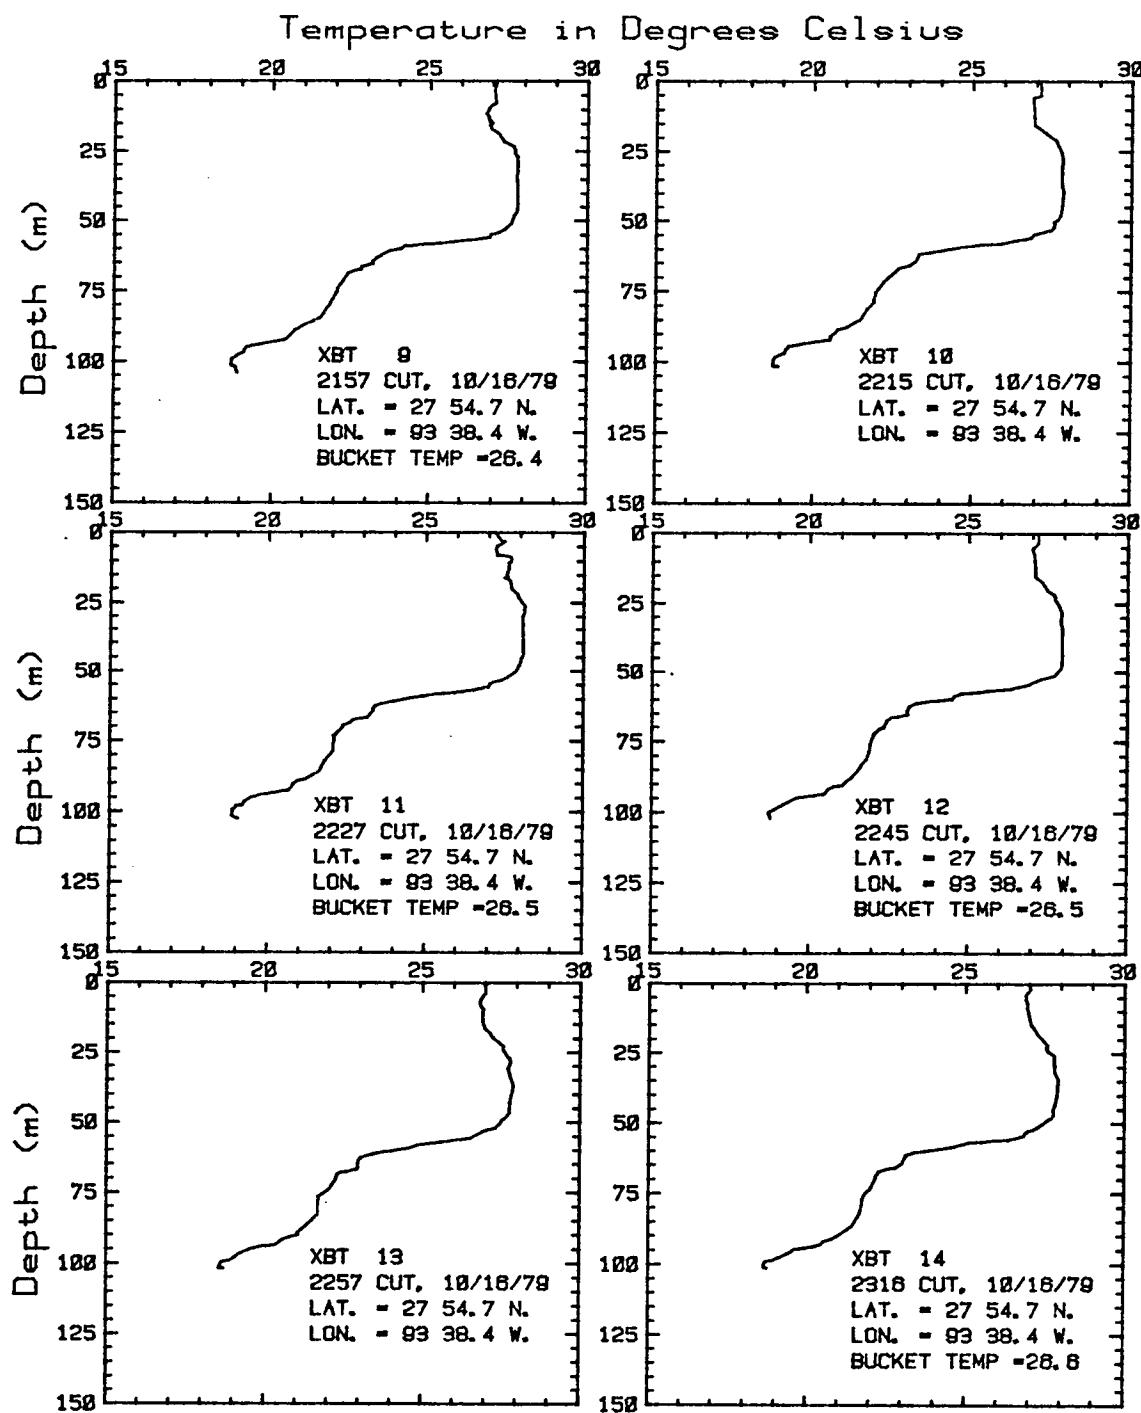

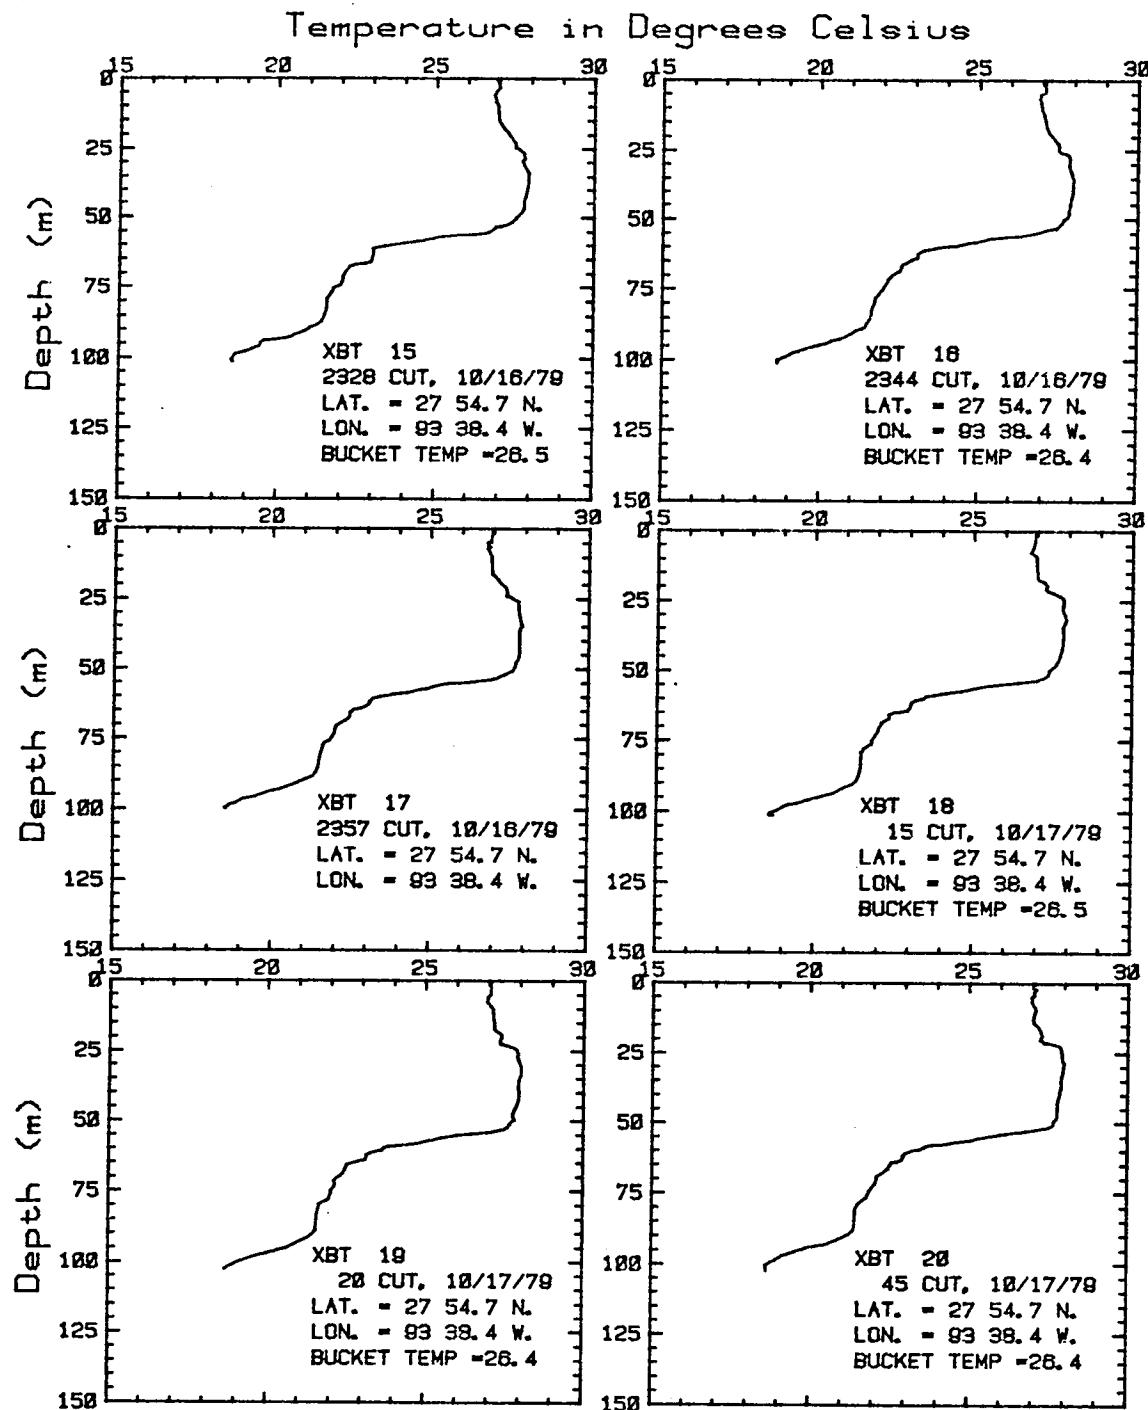

CRUISE: RS-10-79
FIRST XBT TAKEN AT 2041 GMT, 10/16/79
INITIAL TIME: 1700 GMT

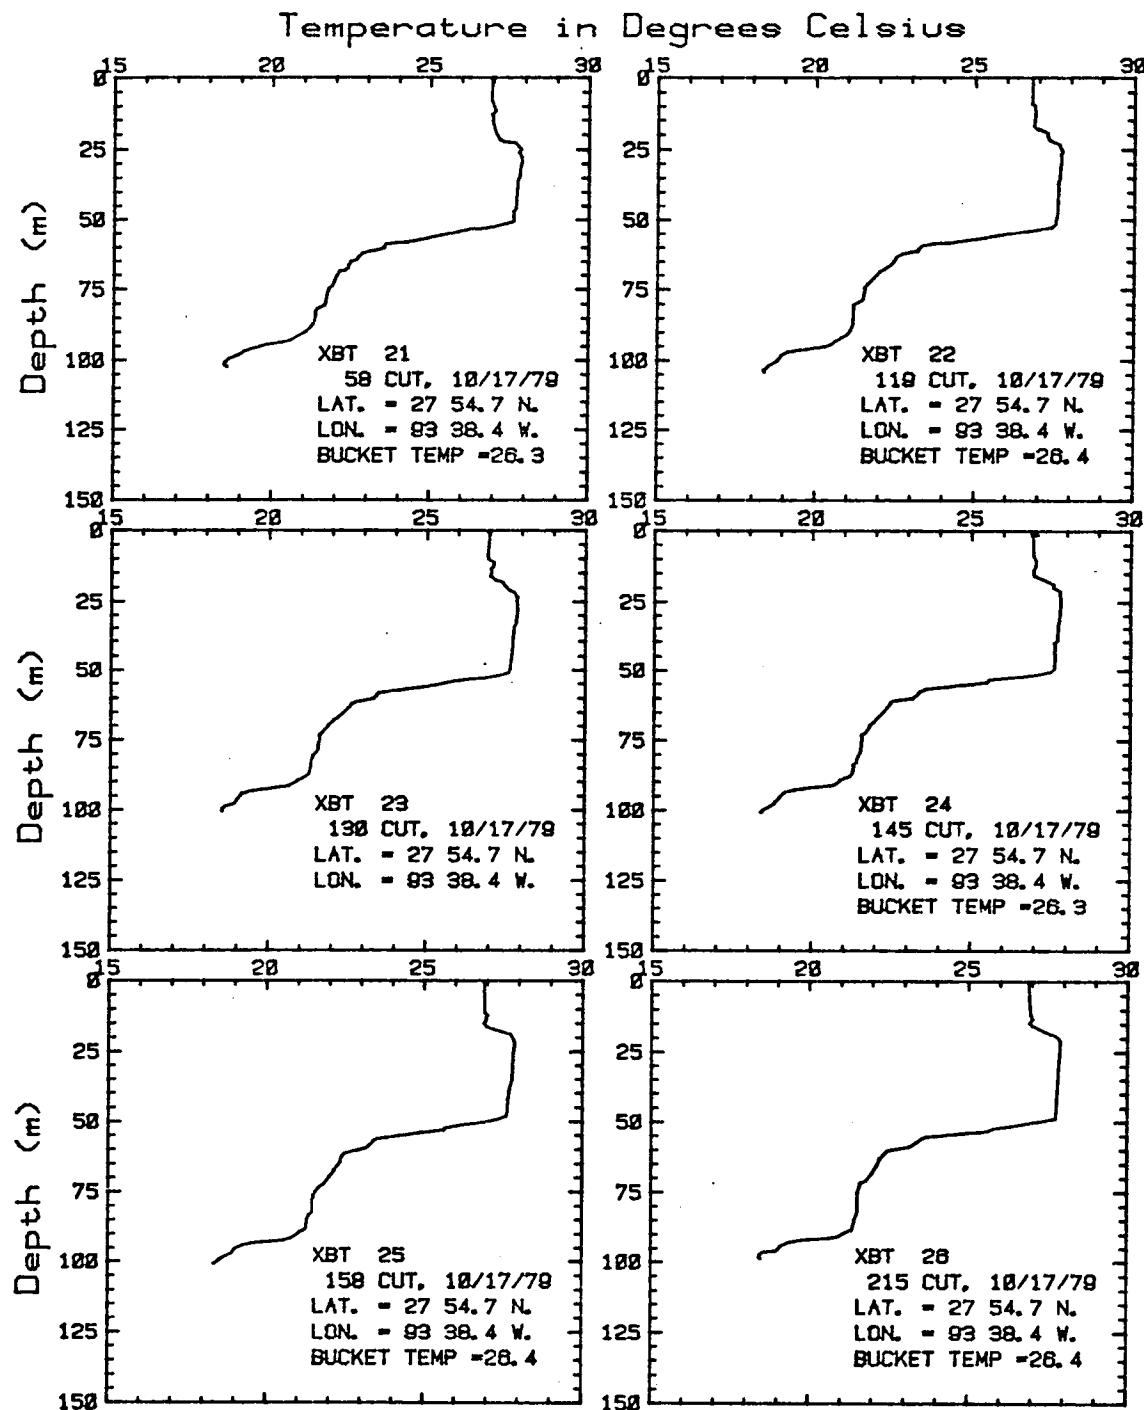

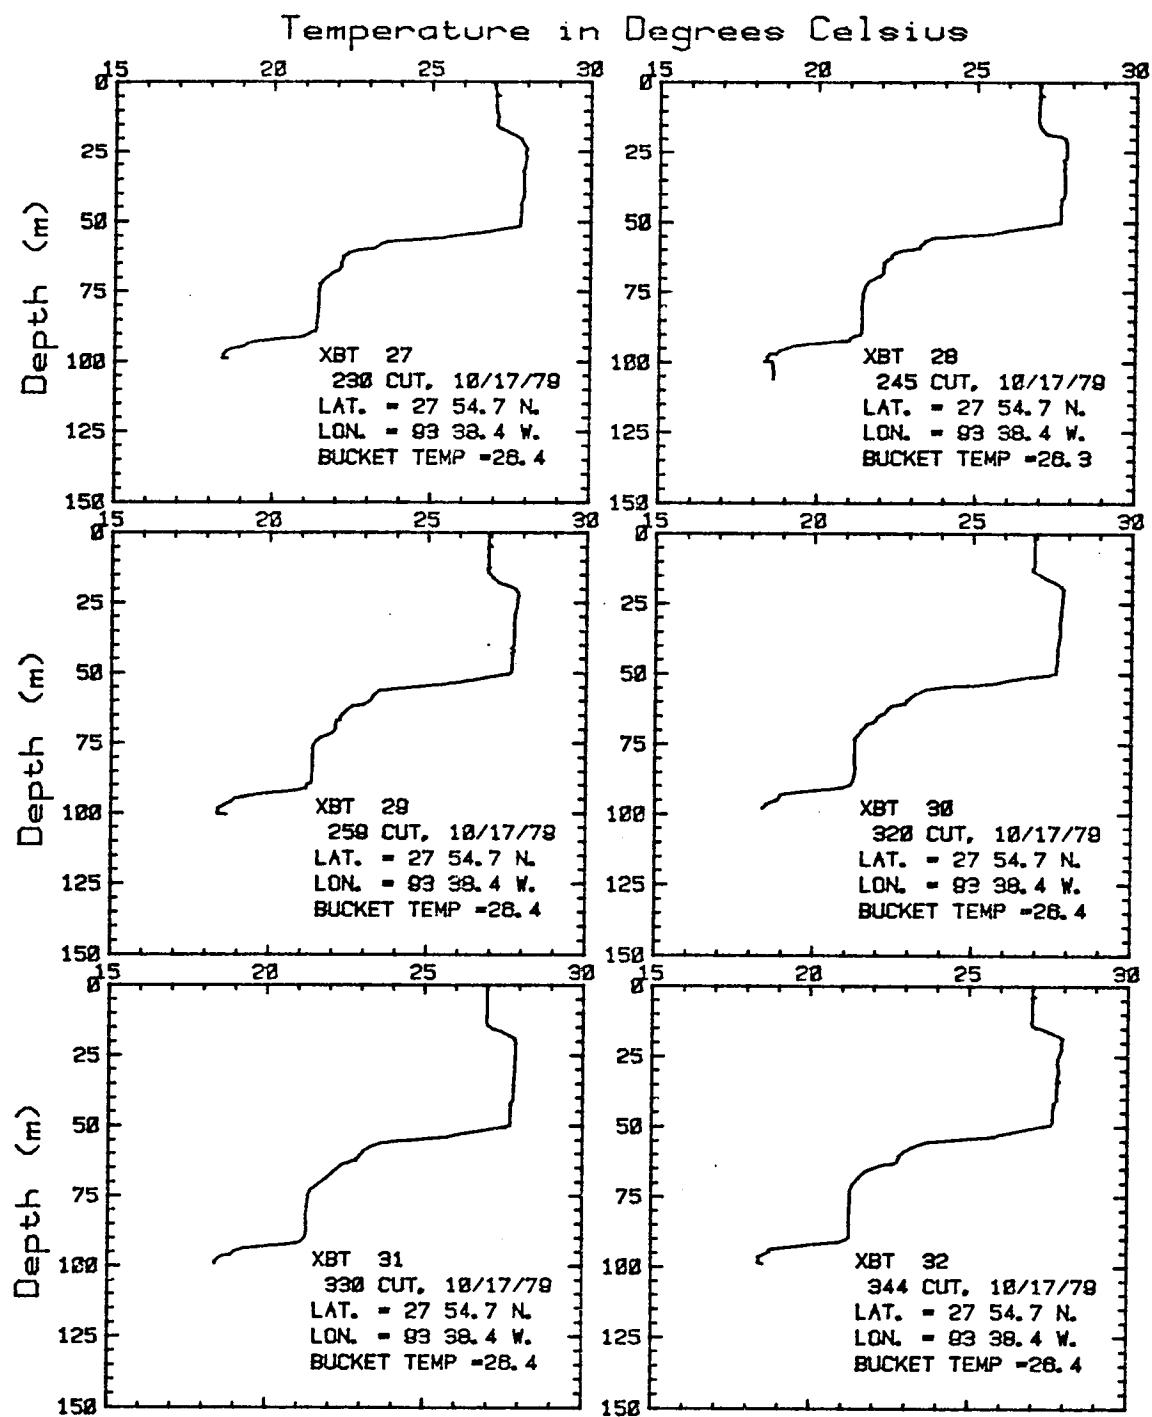

VERTICAL PROFILE TIME SERIES (ONE SET OF PROFILES PER HOUR) OF TEMPERATURE,
TRANSMISSIVITY, AND CURRENTS NEAR CURRENT METER MOORING 2, EAST FLOWER
GARDEN BANK, 16 Oct 79, 2145 GMT, TO 17 Oct 79, 0745 GMT, BETWEEN SUBMER-
SIBLE DIVES 9 AND 10.

The Department of the Interior Mission

As the Nation's principal conservation agency, the Department of the Interior has responsibility for most of our nationally owned public lands and natural resources. This includes fostering sound use of our land and water resources; protecting our fish, wildlife, and biological diversity; preserving the environmental and cultural values of our national parks and historical places; and providing for the enjoyment of life through outdoor recreation. The Department assesses our energy and mineral resources and works to ensure that their development is in the best interests of all our people by encouraging stewardship and citizen participation in their care. The Department also has a major responsibility for American Indian reservation communities and for people who live in island territories under U.S. administration.

The Minerals Management Service Mission

As a bureau of the Department of the Interior, the Minerals Management Service's (MMS) primary responsibilities are to manage the mineral resources located on the Nation's Outer Continental Shelf (OCS), collect revenue from the Federal OCS and onshore Federal and Indian lands, and distribute those revenues.

Moreover, in working to meet its responsibilities, the **Offshore Minerals Management Program** administers the OCS competitive leasing program and oversees the safe and environmentally sound exploration and production of our Nation's offshore natural gas, oil and other mineral resources. The MMS **Minerals Revenue Management** meets its responsibilities by ensuring the efficient, timely and accurate collection and disbursement of revenue from mineral leasing and production due to Indian tribes and allottees, States and the U.S. Treasury.

The MMS strives to fulfill its responsibilities through the general guiding principles of: (1) being responsive to the public's concerns and interests by maintaining a dialogue with all potentially affected parties and (2) carrying out its programs with an emphasis on working to enhance the quality of life for all Americans by lending MMS assistance and expertise to economic development and environmental protection.
