User's Manual

Appendix H

WEST FLORIDA SHELF CIRCULATION MODEL USER'S MANUAL

Introduction

A total of eight programs are described in this manual. All are written in FORTRAN IV and have been compiled and executed on an IBM VM 370 Operating system using both the G and H (with optimization) compiler. The circulation model is composed of five main programs: VISCOUS, DENSITY, CIRC, PRTVEL, and PLOTVEL. These programs are collectively known as GAL. Two programs, WIND and SPAT, have been provided to calculate the wind field for GAL. Figure H.1 summarizes the relationship between the seven programs. The eighth program, DENSTAT, is a useful utility program.

The CPU time needed to execute varies from one program to another. In general all the programs in GAL except CIRC require less than five seconds of CPU time on the IBM 4341 at the University of Maine. CIRC takes approximately two seconds of CPU time per hour of modeled time. WIND and SPAT generally execute in less than five seconds. DENSTAT can take a considerable amount of time, depending on the amount of data to be read from tape.

The notation used in this manual is consistent with that in Chapter 3 and Appendix E. The reader should be familiar with this notation before proceeding.

Each program has the following function:

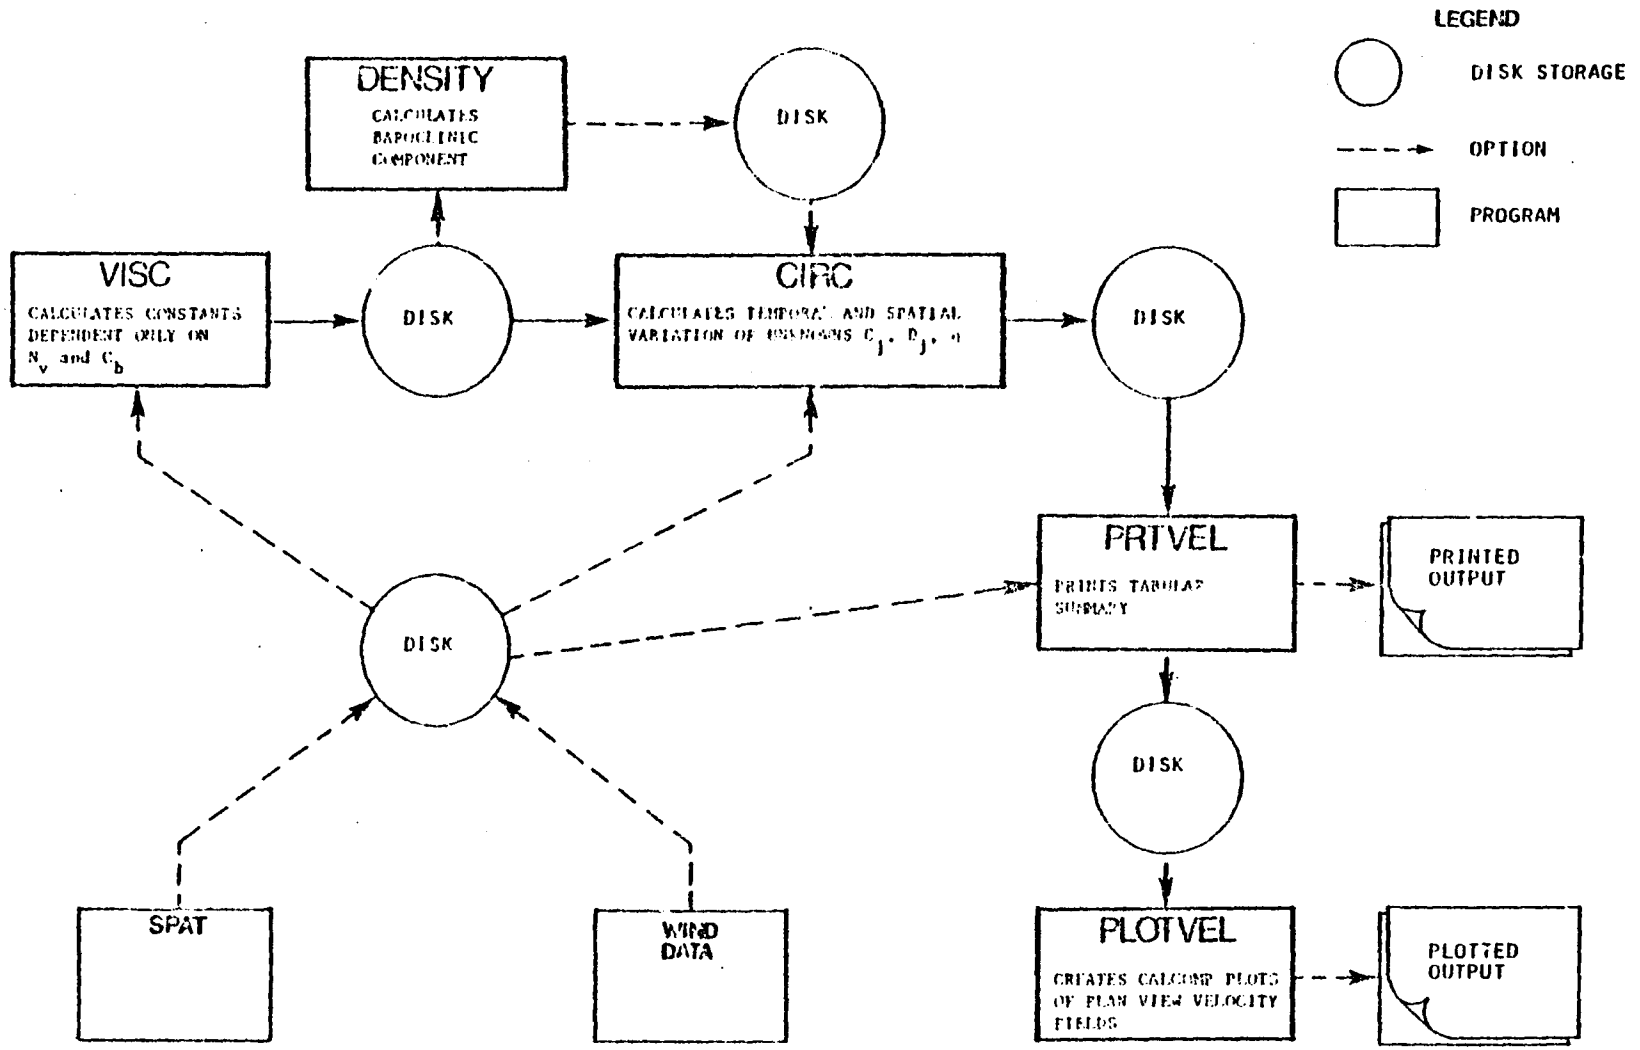

Figure H.1: Flow chart of GAL.

1. VISCOUS calculates parameters dependent on the: vertical eddy viscosity (N_v), the bottom friction coefficient (c_b), and the grid configuration. If these do not change there is no need to rerun VISCOUS. The program writes one disk file which is read by DENSITY, CIRC, and PRTVEL.

2. DENSITY calculates all parameters associated with the density-driven component of flow. It is an optional program that need be run only if hydrographic data indicate density-driven flows to be important. The user must specify either the density field or the salinity and temperature field. These values are specified for each horizontal grid element as well as for vertical layers. The number of layers is specified by the user and density is assumed constant over a layer. The program reads the disk file generated by VISC and creates a disk file which is read by CIRC and PRTVEL.

3. CIRC is the main computational program which calculates the unknowns c(j,l,m), d(j,l,m), and eta(l,m). The program reads disk files created by VISCOUS, DENSITY (if specified) and wind data. The program writes a disk file containing the temporal change of various parameters specified by the user such as c(j,l,m), d(j,l,m), ub(l,m), etc.

4. PRTVEL is the main ouput program. It reads disk files created by VISCOUS, DENSITY (if specified), wind data, and CIRC, and it writes a disk file read by PLOTVEL. PRTVEL creates summary tables of input parameters such as water depth, bottom friction coefficients, surface density, N_v, etc. PRTVEL also prints results such as vertical velocity profiles at specified locations, plan velocity views at specified depths, surface levels, and mass fluxes.

5. PLOTVEL creates a series of CALCOMP plots. Each plot consists of a plan view of current vectors at a specified depth. The program reads from a disk file created by PRTVEL.

6. WIND calculates and writes a disk file containing the wind friction velocity squared at each grid element. The program specifies a spatially constant wind field but allows an initial temporal change using a ramp function. This program is useful for sensitivity studies and production runs.

7. SPAT generates a spatially and temporally varying wind field for the model grid system by linearly interpolating concurrent wind measurements from specified observation points. The program is useful for making hindcasts of real time currents.

8. DENSTAT calculates first order statistics for the density field. Density data is read from a tape in NODC format. The program generates a summary table listing the statistics for one-half degree squares at four levels in the water column. The user specifies the months which are to be searched and summarized. Unlike the seven other programs listed above, DENSTAT is a utility program which is not intended to interface directly to GAL or the wind field programs.

All programs make use of the FORTRAN command NAMELIST for most data input. Users unfamiliar with this command are urged to consult a FORTRAN Reference before proceeding.

Most of the programs read and write to disk files. This requires that the user include in his Job Control Language (JCL) the appropriate commands to access and link the disk. On the IBM VM 370 OS the commands are:

```
CP LINK username device1 device2 WR password
ACCESS device2 mode
```

where the lowercase denotes items which are installation dependent. The user should consult his local computer support staff to determine the appropriate

items.

The following sections give a more detailed description on usage of the eight programs.

H.1 VISCOUS

Inputs

First Record

The first record should contain the title. This can be any sequence of up to 80 alphanumeric characters.

Namelist &MISC

JP	the number of cosine terms used in the trial functions; j'. Default: JP=3.
KP	the number of linear segments +1 used for N_v; k'. Default: KP=2.
LP	the number of elements in the x direction; l'. Default: LP=12.
MP	the number of elements in the y direction; m'. Default: MP=24.
NS	the number of trapezoids used in the numerical integration. Default: NS=20.
CONNV	logical variable which indicates the status of N_v where: CONNV=.TRUE. indicates N_v is to be taken as constants in the vertical. In this case KP should be set equal to 2. CONNV=.FALSE. indicates N_v is not constant in the vertical

and that KP will be greater than two. Default: CONNV=.FALSE.

NUCHG — the number of times during the model run that N_v will change. Note that if NUCHG.GT.1 more than one Namelist &EDYVIS should appear in the input file. Also, if EDDYT=.TRUE. (see below), N_v will automatically be updated each time the wind changes so NUCHG will be ignored. Default: NUCHG=1

Namelist &DEPTH

H — the still water depths in meters. If tides at the ocean boundaries are to be specified then H should be referenced to MLW (mean low water). Must be LP*MP values specified (Note the use of FORTRAN convention which uses a * to signify multiplication. This notation will be used consistently in this text). Entering sequence should be first row of grid (i.e. +x direction), followed by second row, etc. Default: H(1,m)=0.

Namelist &FRICT

CB — the friction coefficient in m s^{-1}. Must be LP*MP values specified. Entering sequence is same as for H. Default: CB=0.00025.

Namelist &EDDYL

CK — the layer depth of the eddy viscosity (meters). Must be KP*LP*MP values. the entering sequence is:

```
CK=k(1,1,1),k(2,1,1),. . .k(KP,1,1),k(1,2,1)
    . . . . .k(KP,2,1), . .k(KP,LP, MP),&END
```

where k(k,l,m) is the depth of N_v(k,l,m).

NODIM — logical variable indicating whether the units of CK are to be input as meters or as a fraction of the total depth. NODIM=.TRUE. indicates units of CK are dimensionless; in other words CK will assume values 0.LE.CK.LE.1.0. NODIM=.FALSE. indicates units of CK are in meters; in other words CK will assume values 0.LE.CK(k,l,m).LE.H(l,m). Default: NODIM=.FALSE.

Namelist &EDYVIS

Note that if NUCHG has been set .GT.1 in &MISC then one &EDYVIS statement should appear NUCHG times.

EDDYT — logical variable indicating whether N_v is to be varied in time and space. If EDDYT=.TRUE. then N_v will be calculated each time the wind changes and for each element according to the formula by Townsend (1976):

$$N_v = H(1,m) * WA2(1,m,t) / REYNO$$

where WA2 is the surface friction velocity. WA2 is specified by a wind model (i.e. WIND or SPAT). Caution: N_v will be updated whenever the wind changes so this option may take a great deal of computer time if the wind changes frequently. Default: EDDYT=.FALSE.

EDDYS — Logical variable indicating whether N_v is to be varied in space using the Townsend expression. TRUE indicates the Townsend expression will be used to calculate N_v. FALSE indicates values of N_v will be specified by user (see EDDYV below). Default: EDDYS=.TRUE.

REYNO — the value of the flow Reynolds Number to be used to calculate N_v in the Townsend expression. Value of REYNO normally varies between 12 to 32. Default: REYNO=16.

WA2 — the value in m s^{-1} of the surface friction velocity to be used in the Townsend expression. Normally WA2 is based on a wind condition which represents an average for the period of the simulation. WA2 can be found by first assuming an average wind speed for the simulation period and then converting wind speed to WA2 using an expression such as Wu(1980). Default: = 0.005.

EDDYV — the eddy viscosity in $m^2 s^{-1}$ at each layer for each grid. Must be specified if EDDYS=.FALSE. and EDDYT=.FALSE. Must be KP*LP*MP values specified. Entering sequence is:

EDDYV=N_v(1,1,1),N_v(2,1,1), . . N_v(KP,1,1),
N_v(1,2,1), ...
N_v(KP,2,1), . . . N_v(KP,LP, MP),&END

where: $N_v(k,l,m)$ is the numerical value of N_v for grid location l,m and layer k.

ETIME — the time (in seconds) up until which EDDYV, or REYNO and WA2 will apply. If NUCHG=1 than ETIME should be set large. Default: ETIME=1×10^{32}

Dimensioning

```
 COMMON/AA/CK(KP*LP*MP),DELSIG(xx),SS(JP*LP*MP),H(LP*MP),FMASS(LP*MP),
&    B(JP*LP*MP),E(JP*LP*MP),D1(JP*LP*MP),ALPHA((KP-1)*LP*MP),
&    BETA((KP-1)*LP*MP),NB(LP*MP),Q(JP*LP*MP),
&    A(JP*LP*MP),CB(LP*MP),EDDYV(KP*LP*MP),JP,KP,LP,MP,LPMP,LM,KPM1,
&    JLMP,KLMP,G,NBP,REYNO,WA2,NS,IS,KT,DL,
&    ETIME,NUCHG,UA2(LP*MP),VA2(LP*MP),VERSIN(14),TITLE(20),
&    CONSTE,EDDYT,EDDYS,CONNV,LAND(LP*MP),FXY,PHI,THETA,F(LP*MP)
```

where xx=JP*LP*MP when CONNV=.TRUE. and xx=JP*JP*LP*MP when CONNV=.FALSE.

Disk Files

The program writes a disk file on device #10 in an unformated, variable spanned format, and reads from disk file #4. The file definitions on the IBM VM 370 are:

```
FIDEF 4  DISK WIND DISK mode(LRECL 795 BLOCK 800 RECFM VS PERM
FIDEF 10 DISK VISC DISK mode(LRECL 795 BLOCK 800 RECFM VS PERM
```

Were 'mode' is as defined in the ACCESS command described in the INTRODUCTION.

Errors

ERROR 1 — the nondimensional value of CK(k,l,m) exceeds unity or is negative. Most probable cause: CK has been specified greater than the local water depth or has been specified

as negative. Check Namelist EDDYL.

ERROR 2 — the value of CK(1,1,m) is not equal to zero or CK(KP,1,m) is not equal to H(1,m) (or unity if NODIM=.TRUE.). Check Namelist EDDYL

ERROR 3 — KP has been specified greater than 2 and CONNV=.TRUE. This is inconsistent and the user should change either KP or CONNV so that they are consistent.

ERROR 4 — KP has been specified as 2 but CONNV=.FALSE. This is inconsistent and the user should change either KP or CONNV so that they are consistent.

ERROR 5 — KP has been specified as 1. KP must be two or greater.

ERROR 6 — N_v has been specified as zero which is physically unrealistic. Check Namelist EDYVIS.

H.2 DENSITY

This program implements horizontal density-driven currents as described in Appendix E.3. Notation shown below is taken from that appendix.

Inputs

First Record

The first record should contain the title. This can be any sequence of up to 80 alphanumeric characters.

Namelist &MISC

NUCHG — the number of times during the model run the density is expected to change. Used in conjunction with DTIME (see below). Default: NUCHG=1.

CALDEN — logical variable specifying whether density data will be directly specified (CALDEN=.FALSE.) or salinity and temperature data will be specified (CALDEN=.TRUE.), hence requiring calculation of density within DENSITY. Default: CALDEN= .FALSE.

Namelist &LAYER

IPP — the number of density layers in the vertical, i'. Not necessarily the same as KP used in Program VISCOUS. Default: IPP=2.

HP — the depth in meters referenced to SWL (still water level) of the bottom of each layer. Must be IPP values. Not necessarily the same as CK used in Program VISCOUS. Default: HP(1)=10, HP(2)=300.

DTIME — the time in seconds up until which the density data applies. Default: $=1 \times 10^{32}$.

Namelist &SALIN This namelist is optional and need be specified only if CALDEN=.TRUE.

SAL — the salinity in ppt (parts per thousand) for each layer of each element. Specified in horizontal layers or:

```
SAL=sal(1,1,1),sal(1,2,1),. . . .
sal(1,LP,1),sal(1,LP,2),. . . . sal(1,LP,MP),sal(2,1,1),. . .
sal(2,LP,1),sal(2,LP,2),. . . . . .
sal(IPP,LP,MP),&END
```

where for example sal(1,LP,2) would be the salinity in ppt at the upper level, i.e. HP(1).GT.z.LE.HP(2) at grid l=LP, m=2.

Namelist &TEMP

This namelist is optional and need be specified only if CALDEN=.TRUE.

T — the temperature in C^{o} for each layer and each element. Same entering sequence as SAL.

Namelist &RHO

This namelist is optional and need be specified only if CALDEN=.FALSE.
RHOWP the density in g cm^{-3}. Same entering sequence as SAL.

Dimensioning

```
 COMMON/AA/*DELHP(IPP),PHI(IPP),S(IPP),HP(IPP),H(LP*MP),T(IPP*LP*MP),
&          SAL(IPP*LP*MP),RHOWP(IPP*LP*MP),RHOW(IPP*LP*MP),
&          ROWX(IPP*LP*MP),ROWY(IPP*LP*MP),A(IPP*LP*MP),C(IPP*LP*MP),
&          CALDEN,LP,MP,JP,IPP,IPLP,LPM1,MPM1,JPLPMP,LPMP,IPLPMP,
&          KP,KPLPMP,CONNV,VERSIN(14),TITLE1(20),TITLE2(20),DTIME,
&          ASTER,ETIME,LAND(LP*MP),BOTT(IPP*LP*MP)
```

Disk Files

The program reads from the disk file created by VISCOUS on file #10. The program writes disk file #11. The appropriate file definitions for the IBM VM 370 are:

```
FIDEF 10 DISK VISC DISK mode(LRECL 795 BLOCK 800 RECFM VS PERM
FIDEF 11 DISK DENSE DISK mode(LRECL 795 BLOCK 800 RECFM VS PERM
```

Errors

No execution time errors are written by the program.

H.3 CIRC

Inputs

First Record

The first record should contain the title. This can be any sequence of up to 80 alphanumeric characters.

Namelist &MISC

EDDYH	value of the lateral eddy viscosity in $m^2 s^{-1}$. Default: EDDYH=10^5.
DENSE	logical variable indicating whether the density driven term will be included in the computations. If TRUE then Program DENSITY should have been previously executed. Default: DENSE=.FALSE.

Namelist &TIME

DTT	the time step in seconds, delta t. Selection of DTT is critical for model stability. Consult Chapter 3 for the criteria which must be meet by DTT. Default: DTT=450.
TLAST	the last time step in seconds. Default: TLAST=360000.
ISTPR	the time step in seconds at which printed output (in CIRC and PRTVEL) and plots (in PLOTVEL) will begin. Default: ISTPR=90000.
IDTPR	the time increment in seconds between printed output (in CIRC and PRTVEL) and plots (in PLOTVEL). Default: IDTPR=45000.

Namelist &BCS

IAMP(l,m) indicates the type of boundary condition which is to be assumed at grid l,m. IAMP can assume the following values:

0 indicates a land element.

1 indicates the surface slope will be assumed zero in a direction normal to the boundary.

2 indicates an open ocean element where the tidal amplitude and period must be specified (see description of 'AMP' and PERIOD below).

3 not applicable in version 7-A.

4 indicates internal water element.

5 indicates c(j,l,m) and d(j,l,m) will be specified at the element. This condition is used to model the shear invoked by a current along the western boundary. Note that the c's and d's can be specified directly by the user or calculated internally by the program to provide a sinusoidal forcing at the boundary analogous to the eddy-wave field suggested by Niiler (1976). To excercise this latter option the characteristics of the eddy wave must be specified via WPEROD, WLNGTH, and WAMP (see below).

6 indicates the mass fluxes, UB and VB, will be specified at the element. This condition is used to model river inflow and outflow.

Note that IAMP is defaulted to '0' for all land elements, '1' for all non-land boundary elements, and '4' for all non-land, non-boundary elements.

PERIOD the period of the tidal oscillation in seconds. Default: PERIOD=44,500.

AMP — the amplitude of the tidal oscillation in decimeters at the western boundary. AMP is a two dimensional array of the form AMP(1,m) where 1 and m specify the grid element location. AMP should be specified as an integer and again note that the units are in decimeters. Default: AMP(1,m)=0.

UB,VB — Sources/sinks such as rivers can be modeled by specifying the mass fluxes, UB and/or VB. Units of UB and VB are $m^2 s^{-1}$. Note that IAMP must = 6. Entering sequence is same as for IAMP. Default: UB=VB=0.0

RLID — logical variable which specifies whether a rigid lid assumption is to be made. In other words, whether the surface elevation, eta, is to be set to zero throughout the grid. Default: RLID=.FALSE.

CBC,DBC — the value of the unknown coefficients, c(j,1,m) and d(j,1,m) respectively, in $m\ s^{-1}$ at the boundary. Note that IAMP(1,m) must = 5 and that j.LE.JP. Default: CBC=DBC=0.0

WPEROD — the period (seconds) of a sinusoid oscillation imposed at the western boundary. Can be used to model a Niiler eddy wave. Note that IAMP(1,m) must equal 5. If a temporally constant lateral shear is to be applied on the western boundary, WPEROD should be set to zero. Default: WPEROD=0.

WLNGTH — the length (meters) of the sinusoidal oscillation. Used in conjunction with WPEROD and WAMP. Default: WLNGTH=0.

WAMP — the wave amplitude ($m\ s^{-1}$) of the sinusoidal oscillation. Used in conjunction with WLNGTH and WPEROD. Default: WAMP=0.

Again note that if IAMP is set to 5 on the western boundary the user must either specify: (1) DBC and/or CBC in which case WLNGTH, WAMP and WPEROD should all be set to zero or (2) WAMP, WLNGTH, and WPEROD. The second option is used to simulate the Niiler eddy wave.

Namelist &INOUT

HOTSTR — logical variable indicating whether a "hot start" is to be made. If TRUE than CIRC will initialize the unknowns c(j,l,m), d(j,l,m) and eta(l,m) by accessing existing values on disk file #12 which should have be established by a prior run of CIRC. If HOTSTR=FALSE then these variables will initially be set to zero. Default: HOTSTR=.FALSE.

HOTIME — the time in seconds at which the "hot start" begins. Must be specified if HOTSTR=.TRUE. and must be .LE. the last time step executed by the prior run of the model.

PRTFLO — logical variable which indicates whether a printed summary of the flows in the x and y direction are desired in Program PRTVEL. Default: PRTFLO=.FALSE.

Dimensioning

```
 COMMON/EDDE/DELSIG(xx),SS(JP*LP*MP),H(LP*MP),FMASS(LP*MP),
&    B(JP*LP*MP),E(JP*LP*MP),D1(JP*LP*MP),CONNV,LAND(LP*MP)
 COMMON/UNKNOW/C(JP*LP*MP),D(JP*LP*MP),ETA(LP*MP),
&    UB(LP+1,MP+1),VB(LP+1,MP+1)
 COMMON/CON/JP,KP,LP,MP,KPM1,EDDYH,C2,C3,C4,C5,VERSIN(14),
&    AMP(LP,MP),IAMP(LP,MP),TIT1(20),JPLPMP,LPMP,JPLP,PRTFLO
&    MPM1,LPM1,CBC(JP,LP+1,MP+1),DBC(JP,LP+1,MP+1),HOTIME,HOTSTR
 COMMON/WINDY/UA2(LP*MP),VA2(LP*MP),HO(LP*MP),
&    FX(LP*MP),FY(LP*MP),TAUX(JP*LP*MP),TAUY(JP*LP*MP),DPDXJ(JP*LP*MP),
     DPDYJ(JP*LP*MP)
 COMMON/DEN/ROWX(JP*LP*MP),ROWY(JP*LP*MP),RHOW(LP*MP),IPP,DENSE,DTIME
```

where: xx=JP*LP*MP when CONNV=.TRUE. and xx=JP*JP*LP*MP when CONNV=.FALSE.

Disk Files

The program writes one disk file on device #12. It is an unformated, variable spanned file containing various parameters intended for Program PRTVEL. CIRC reads at least two files - file #4 which is the wind data and file #10 which are the parameters written by VISCOUS. If the variable DENSITY=.TRUE. in the CIRC input then CIRC will also access disk file #11, written by Program

DENSITY. The file definitions needed to run CIRC on the IBM 370 are:

```
FIDEF  4 DISK WIND  DISK mode(LRECL 795 BLOCK 800 RECFM VS PERM
FIDEF 10 DISK VISC  DISK mode(LRECL 795 BLOCK 800 RECFM VS PERM
FIDEF 11 DISK DENSE DISK mode(LRECL 795 BLOCK 800 RECFM VS PERM
FIDEF 12 DISK CIRC  DISK mode(LRECL 795 BLOCK 800 RECFM VS PERM
```

Errors

No error statements are generated by CIRC in this version.

H.4 PROGRAM PRTVEL

Inputs

Namelist &OUTOPS

PRTWND — logical variable which specifies whether a printed table of the x & y components of the wind friction velocity squared is to be created. Caution: a great deal of output can result with this option since a table will be generated each time the wind changes. Default: PRTWND=.FALSE.

PRTNV — logical variable which specifies whether a table of the N_v and associated parameters will be printed each time N_v changes. Default: PRTNV=.FALSE.

PRTDEN — logical variable which specifies whether a table of the surface density will be printed. Meaningful only if variable DENSE in Program CIRC has been set to TRUE. Table will be created each time the density changes Default: PRTDEN=.FALSE..

PRTETA — logical variable which specifies whether a table of the surface elevation at each element will be printed. Default: PRTETA=.FALSE.

NOGRDS — the number of elements where a table of the velocity profile is desired. If NOGRDS.GT.0, a print out will begin at ISTPR seconds and repeat every IDTPR seconds thereafter. Default: NOGRDS=0

LOCATE(I) — the coordinates of the grid elements for which a table of the velocity profile is desired. The number of LOCATE must be equal to NOGRDS. This variable is of the form: LOCATE(I)=(l,m) where l and m are the grid coordinates in the x and y direction, respectively.

LAYERS — the number of layers for which an instantaneous plan view of the velocities for the entire grid will be printed. Default: LAYERS=0.

LEVELS — the number of layers for which an instantaneous plan view of the velocities are to be plotted. Default: LEVELS=0

If NOGRDS .GT. 0 the namelist &OUTOPS should be immediately followed by NOGRDS records, each containing up to 16 constants in F5.0 format. Each record should be of the following form:

```
z(1,1)  z(1,2)  z(1,3) . . . . . z(1,b')
z(2,1)  z(2,2)  z(2,3) . . . . . z(2,b')
   .
   .
z(a',1) z(a',2) z(a',3). . . . . z(a',b')
```

where: z(a,b) is the depth in meters at which the velocity will be calculated for the grid element specified by LOCATE(a). z should be specified in F5.0 format. restrictions: a' = NOGRDS, b' .LT. 17 , and z(a,b) .LT. z(a,b+1)

If LAYERS .GT. 0, variables described in the previous paragraph must be followed immediately by 1 record containing up to 16 variables in F5.0 format. The record should be in the following form:

z(1) z(2) z(3) . . . . . .z(i)

where i= the no. of plan views which will be printed (must be .LT. 17) and z is the percentage depth (e.g. z=50 indicates that velocities at each element will be calculated at 50% of the local water depth), and expressed in F5.0 format. Print-out will occur starting at ISTPR seconds and repeating every IDTPR seconds thereafter. Note ISTPR and IDTPR are specified by the user in Program CIRC.

If LEVELS.GT.0, variables described in the previous paragraphs must be followed immediately by 1 record containing up to 16 variables in F5.0 format. The record should be in the following form:

z(1) z(2) . . . . . .z(I)

where: I= no. of plan views to be plotted (must be .LT. 17) and z is the percentage depth of the plan view expressed in F5.0 format. Plotting will start at ISTPR and repeat every IDTPR seconds thereafter.

Dimensioning

```

```

Disk Files

One disk file is generated by PRTVEL on unit #13. This file contains

information for program PLOTVEL. PRTVEL reads at least three disk files: file #4 which is the wind data; file #10 written by Program VISCOUS; and file #12 written by Program CIRC. If the variable DENSITY=.TRUE. in Program CIRC than PRTVEL also accesses file #11, written by Program DENSITY. The file definitions on the IBM 370 are:

```
FIDEF  4 DISK WIND    DISK mode(LRECL 795 BLOCK 800 RECFM VS PERM
FIDEF 10 DISK VISC    DISK mode(LRECL 795 BLOCK 800 RECFM VS PERM
FIDEF 11 DISK DENSE   DISK mode(LRECL 795 BLOCK 800 RECFM VS PERM
FIDEF 12 DISK CIRC    DISK mode(LRECL 795 BLOCK 800 RECFM VS PERM
FIDEF 13 DISK PRTVEL  DISK mode(LRECL 795 BLOCK 800 RECFM VS PERM
```

Errors

No error statements can be generated by PRTVEL in this version.

H.5 PROGRAM PLOTVEL

Inputs

First Record

The first record should contain the title. This can be any sequence of up to 80 alphanumeric characters.

Namelist &MISC

FACT	a reduction factor. Plots will be generated with a grid size of FACT*GRDSZ. Default: FACT=.6
GRDSZ	the size of each grid element to be plotted in inches. Default: GRDSZ=0.5.

LP	the number of grid elements in the x direction. The axis is aligned with the width of CALCOMP paper. Default: LP=12.
MP	the number of grid elements in the y direction. The y axis is aligned with the length of the CALCOMP paper. Default: MP=24.
DL	the grid element size in meters. Default: DL=30000.
ISKIP	specifies how many of the plots are to be initially skipped. If first plot is to be drawn then ISKIP should be set to zero. Default: ISKIP=0.
INC	specifies the number of plots to be skipped between drawings. Default: INC=0.
VECTOR	logical variable. TRUE indicates velocity vectors will be drawn as vectors whose length will be proportional to the speed. FALSE indicates an arrow of constant length will be drawn with feathers on the tail. The speed is found by multiplying the number of feathers by SPDSCL, e.g. if 3 1/2 feathers appear then the speed at that grid is 3 1/2 times SPDSCL. Default: VECTOR=.FALSE.
SCALE	logical variable which indicates whether automatic scaling is to be used when VECTOR=.TRUE. If SCALE=.TRUE. each plot will be automatically scaled so that the largest velocity vector will be equal to GRDSZ. Note that the scale will not necessarily be constant for each plot. If SCALE=.FALSE. scaling will be based on the value of SPDMAX. Default: SCALE=.FALSE.
SPDMAX	only used if SCALE=.FALSE. SPDSCL is the length of one feather on the velocity arrow if VECTOR=FALSE. If VECTOR=TRUE, SPDMAX should be set to approximately the maximum velocity to be expected. Default: SPDMAX=0.1 m s^{-1}
ANGT	the angle from the x-axis to true north in degrees ccw from the x-axis.
NOPLTS	the number of plan views to be drawn. Default: NOPLTS=1.
PRT	print switch. TRUE indicates tables of the speed and direction arrays will be created. Default: PRT=.FALSE.
DIST	the distance in inches between two consecutive plan view

plots. Default: DIST=4.0.

DIMENSION SPEED(LP*MP),DIREC(LP*MP)

Disk Files The program reads one disk file from file #13. It is an unformated, variable spanned file containing various parameters written by program PRTVEL. The file definitions for the IBM 370 are:

FIDEF 13 DISK PRTVEL DISK mode(LRECL 795 BLOCK 800 RECFM VS PERM

Errors

No error statements are generated by PLOTVEL in this version.

H.6 PROGRAM WIND

The program calculates and writes a spatially constant wind field to a disk file. Wu's (1980) relationship is used to transform the user specified wind speed to wind friction velocity squared needed by GAL and written on the disk file.

Inputs

First Record

The first record should contain the title. This can be any sequence of up to

80 alphanumeric characters.

Namelist &MISC

Figure H.2 shows a sample ramp function used to vary the wind in time.

ITO — the time in seconds at which the wind reaches its full magnitude, WTO. In Figure H.2 ITO=2*IDTT. Default: ITO=72000.

WTHETA — the angle of the wind referenced to the positive x axis. The wind vector is described in terms of a Cartesian vector with the angle measured as positive in a counter-clockwise direction and the origin of the vector at the axis origin. Default: WTHETA=0.

WTO — the full magnitude of the wind in m s^{-1}. In the sample shown below wind reaches full magnitude after 2*IDTT seconds. Default: WTO=10.

IDTT — the time increment between changes in the wind magnitude. Default: IDTT=7200.

MAXT — the last time step in seconds. Default: MAXT=72000.

LP — the number of grid elements in the x direction, l'. Default: LP=12.

MP — the number of grid elements in the y direction, m'. Default: MP=24.

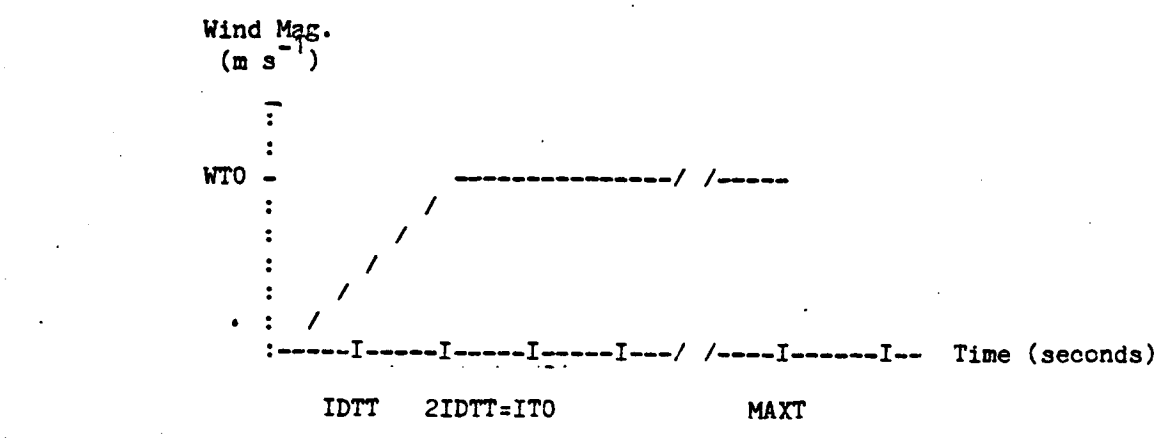

Figure H.2: Sample Wind Function

Dimensioning

DIMENSION UA2(LP*MP),VA2(LP*MP),TIT(20)

Disk Files

The program writes one disk file on device #4. It is an unformated, variable spanned file containing: the time in seconds, and the friction velocity squared in the x and y-direction. The file definition for the IBM 370 is:

FIDEF DISK WIND DISK mode(LRECL 796 BLOCK 800 RECFM VS PERM

Errors

One error can occur if the variable ITO is specified greater than MAXT, in which case an appropriate message is printed and execution immediately terminates.

H.7 SPAT

This program calculates the wind for each element of a grid system with LP by MP elements. The wind can change in time and space. A time series of concurrent measured winds are specified by the user at N stations. The program multiplies these measured winds by amplification factors (SYSW(I), I=1,N), thus giving the user a simple method to correct bias in the measurements. Amplification factors must be specified by the user. The program spatially interpolates between the concurrent wind measurements to

derive the wind field at each grid element. Measured winds are assumed to be at 1 hour intervals.

The interpolation scheme is a simple linear method which calculates the wind at a given grid point, (1,m), by taking the weighted contribution of each station. The weighting for a given station is based on the normalized distance from the station to (1,m). Stated mathematically, the wind component at grid (1,m) for time T is calculated as:

$$U(1,m) = W_1 U_1 + W_2 U_2 + \ldots . W_N U_N$$

where: U(1,m) is the wind component at grid (1,m) for time T, W_n is the weighting factor at station n for time T and U_n is the wind component at station n for time T. Note that U_n is the corrected component, that is $U_n = U'_n SYSW_n$ where U'_n is the observed wind component for time T at station n and $SYSW_n$ is the amplification factor for station n.

The weighting factor, W_n, is given by the expression:

$$W_n = W_1 R_1 / R_n$$

where R_n is the distance between (1,m) and station n. The weighting factor at station 1 is given by:

$$W_1 = 1/(1 + R_1/R_2 + R_1/R_3 + \ldots . R_1/R_N)$$

For illustration consider the following example. Let N=2, $SYSW_1$=1.1, $SYSW_2$=1.2, and assume the grid (1,m) lies a distance 3/8 R from station 1 and 5/8 R from station 2. It follows from the above equations that:

$$W_1 = 1.0/(1 + 3/5) = 5/8$$

$W_2 = 3/5 \times 5/8 = 3/8$

$U(1,m) = 5/8 \times 1.1 \times U_1 + 3/8 \times 1.2 \times U_2$

The program writes a disk file containing wind friction velocity squared at each grid point. The file is compatible with GAL. Wu's (1980) relationship is used to convert wind speed to friction velocity squared.

Inputs

LP	the number of grid elements in the x-direction.
MP	the number of grid elements in the y-direction.
N	the number of stations at which measurements will be specified. Restriction: N.LT.17.
IX(n)	the x grid coordinate of station n.
IY(n)	the y grid coordinate of station n.
SYSW(n)	the amplification factor at station n.

The namelist should be followed immediately by a record containing a title consisting of no more than 80 alpha characters describing the input wind data. The title record is immediately followed by records containing the observed winds at N stations organized in increasing time as follows:

$$U'_{1,T}, V'_{1,T}, U'_{2,T}, V'_{2,T}, \ldots V'_{N,T}$$
$$U'_{1,T+1}, \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots V'_{N,T+1}$$
$$\ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots$$

where all variables are as previously defined. The units of T are hours and the units of wind speed are in m s^{-1}. The program will continue reading and processing observed wind records until it runs out of data, at which time it will automatically stop. Input format for each record is 16I5.

Dimensioning

```
COMMON/ONE/LP,MP,LPMP,IX(N),IY(N),N,SYSW(N),INT
COMMON/TWO/IUM(N),IVM(N),UM(N),VM(N),W(N,LP*MP)
DIMENSION U(LP*MP),V(LP*MP)
DIMENSION WT(N)
DIMENSION R(N),WT(N)
DIMENSION U(LP*MP),V(LP*MP),USTAR(LP*MP),VSTAR(LP*MP)
```

Errors

The program checks to make sure that the friction velocity squared is less than 0.01 m^2 s^{-2} which corresponds to a wind speed of about 60 m s^{-1}. If the wind is greater than this than the program prints the grid element and time step and terminates execution.

Disk Files

The program writes one variable spanned disk file on unit #4. Each block contains the x and y components of the wind friction velocity squared for LP*MP elements. The file definition on the IBM 370 is:

```
FIDEF 4 DISK WIND DISK mode(LRECL 795 BLOCK 800 RECFM VS PERM
```

H.8 DENSTAT

This is a utility program which reads density data from the standard NODC format for STD data. DENSTAT's primary use is in developing input for DENSITY. The user must specify the starting date and ending date in which he

is interested. The program will then calculate the first order statistics summarizing sigma-t at four water levels for one-half degree squares on the West Florida Shelf.

Input

Namelist &MISC

ISTIME — the starting time consisting of 4 digits. The first two represent the month and the last two, the day.

IETIME — the termination time consisting of 4 digits (same format as ISTIME).

Dimensioning

no dimension changes should be needed when program is applied for what it was designed.

Errors

The program checks to see that ISTIME-IETIME.GT.1 month. If not an error statement is written and execution is terminated.

Disk Files

The reads data from an NODC formated tape. The JCL needed to run the program on the IBM 370 are:

ERASE DLOG DATA G /MOUNT TAPE US0439 ON TAP1 PASS NECE RING OUT FI 13 TAP1 (LRECL 80 BLOCK 3200 RECFM FB ASCII PERM FI 23 DISK DLOG DATA G (LRECL 80 BLOCK 80 RECFM F PERM TAPE REW TAPE FSF 1

H.9 EXAMPLE

Sample input/output (I/O) are given for each of the eight programs. The I/O sequence for WIND, VISCOUS, DENSITY, CIRC and PRTVEL are for production Run 21-5 i.e. summer currents including wind, density and Loop Current forcing. I/O for DENSTAT are for summer conditions and output is summarized in Table 6.1.1. The sample run for SPAT generates the wind field for February-March 1978 (FSU data set).

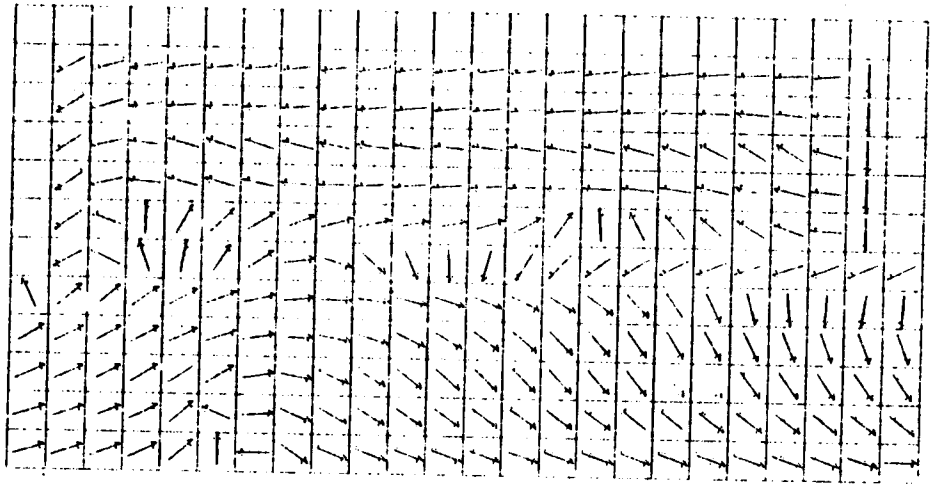
Sample PLOTVEL Input

WFSCM - NECE

Sample Output



Program SPAT

Sample Input

The input for SPAT generates a wind field for the FSU study, starting in 25 February 1978. Observations from five stations are used as the basis for extrapolation - the NDBO data buoy, Apalachicola, Tampa, Fort Myers, and Key West. Observations are provided at one hour increments. The wind field generated by the sample input is only five hours long, which is sufficient to illustrate the use of the program

00040 C                          PROGRAM VISCOUS(GAL)
00050 C
00060 C                   VERSION 7 - JULY 1982 - REVISION A
00070 C
00080 C                          BY CORTIS COOPER, NECE
00090 C
00100 C     THIS PROGRAM CALCULATES ALL CONSTANTS WHICH CHANGE ONLY WHEN THE
00110 C     EDDY VISCOSITY CHANGES.  THE CONSTANTS ARE WRITTEN ON DISK FILE
00120 C     AND LATER ACCESSED BY PROGRAM CIRC WHICH IS THE PROGRAM THAT
00130 C     ACTUALLY CALCULATES VELOCITIES.  FOR INFORMATION ON HOW TO USE
00140 C     THE PROGRAM AS WELL AS CIRC, SEE THE GAL USER'S MANUAL.  THIS
00150 C     MANUAL ALSO CONTAINS A LIST OF REVISIONS.
00160 C 6.A, 10/81, SPLIT COMMON /AA/ INTO TWO BLOCKS.  CHANGED 1.0E70'S
00170 C      TO 1.0E20'S.  INITIALIZED ALL COMMON VARIABLES IN
00180 C      BLOCK DATA. PUT NAMELIST READ'S INTO MAIN PROGRAM.
00190 C      REMOVED &'S FROM ALTERNATE RETURN CALLS.  PUT 'KPM1' IN
00200 C      COMMON /AA/.
00210 C 6.E, 2/82, ADDED SPATIAL VARIATION IN CORIOLIS PARAMETER.
00220 C 7.A, 7/82, MODIFIED TO RUN ON IBM. CHANGED FCN ASIN TO ARSIN.

00020 C
00030 C
00040 C  AUTHOR:  C.K. COOPER, NECE AND B. FIDLER, UMO.
00050 C  DATE:    ORIGINAL VERSION BY FIDLER IN JUNE 1979, MAJOR MODIFICATION
00060 C           APRIL 1982 BY COOPER.
00070 C PURPOSE:  PROGRAM PLOTS A PLAN VIEW OF THE VELOCITY FIELD ON A RECT.
00080 C           GRID SYSTEM OF LP BY MP ELEMENTS.  EACH ELEMENT IS A SQUARE
00090 C           OF ACTUAL LENGTH DL AND PLOTTED LENGTH GRDSZ.
00100 C
00110 C  * * * * * * * * * * * * * * * * * * * * * * * * * * * * * * * * *
00120 C
00130 C  HISTORY OF REVISIONS:
00140 C
00150 C   REV 1.2:  READS IN VELOCITY IN F4.0 FORMAT AND READS PLAN VEIW
00153 C            DEPTH AS A % OF LOCAL DEPTH, NOT METERS.
00155 C  REV 7.A:  SAME AS 1.2 EXCEPT READS IN VARIABLE SPANNED RECORD.
00160 C
00170 C * * * * * * * * * * * * * * * * * * * * * * * * * * * * * * * * *
00180 C
00190 C  DESCRIPTION OF INPUT:
00200 C
00210 C   TWO FILES ARE NECESSARY, ONE CONSISTING OF A FORTRAN NAMELIST
00220 C   AND THE OTHER OF SPEED AND DIRECTION DATA TO BE PLOTTED.
00230 C   THE SPEED/DIREC FILE FORMAT IS DEFINED IN ROUTINE RDSPD.  EACH
00240 C   ARRAY OF SPEED AND DIRECTION SHOULD BE PRECEEDED BY ONE RECORD
00250 C   CONTAINING THE TIME AND DEPTH (M) OF THE PLAN VIEW.
00260 C   THE NAMELIST FILE SHOULD CONTAIN THE FOLLOWING VARIABLES:
00270 C
00280 C    GRDSZ = THE INDIVICUAL ELEMENT SIZE OF THE GRID SYSTEM IN INCHES.
00290 C            ACTUAL SIZE PLOTTED WILL BE GRDSZ*FACT INCHES.
00300 C    LP    = THE NUMBER OF ELEMENTS IN THE X-DIRECTION, I.E. THE
00310 C            DIRECTION ALIGNED WITH THE WIDTH OF THE PLOTTING PAPER.
00320 C    MP    = THE NUMBER OF ELEMENTS IN THE Y-DIRECTION, I.E. THE
00330 C            THE DIRECTION ALIGNED WITH THE LENGTH OF THE PAPER.
00340 C    DL    = THE INDIVIDUAL ELEMENT SIZE IN METERS.
00350 C    ISKIP = THE NUMBER OF PLAN VIEWS TO BE INITIALLY SKIPPED BEFORE
00360 C            DRAWING BEGINS.  SHOULD BE 0 IF 1ST PLAN VIEW IS TO BE
00370 C            DRAWN.
00380 C    INC   = THE NUMBER OF PLAN VIEWS TO BE SKIPPED BETWEEN DRAWINGS.
00390 C            SHOULD BE 0 IF EACH SUCCESSIVE PLAN VIEW IS TO BE DRAWN.
00400 C    VECTOR = LOGICAL VARIABLE.  TRUE INDICATES VELOCITY VECTORS WILL
00410 C            BE DRAWN AS VECTORS WHOSE LENGTH WILL BE PROPORTIONAL
00420 C            TO THE SPEED.  FALSE INDICATES THE VELOCITY WILL BE SHOWN
00430 C            AND AN ARROW OF CONSTANT LENGTH WITH FEATHERS ON THE TAIL.
00440 C            EACH FEATHER WILL EQUAL SPDSCL (SEE BELOW).
```

```
00450 C    FACT  = THE FACTOR BY WHICH THE PLOTS WILL BE MODIFIED.  IF .LT.1
00460 C            THE PLOTS WILL BE REDUCED.  IF .GT.1 THE PLOTS WILL BE
00470 C            AMPLIFIED.
00480 C    SCALE = LOGICAL VARIABLE. TRUE INDICATES PLOTS WILL BE SCALED
00490 C            AUTOMATICALLY BASED ON THE MAXIMUM SPEED EQUAL GRDSZ.
00500 C            FALSE INDICATES THAT SPDSCL WILL BE USED TO SCALE.
00510 C   SPDSCL = ONLY USED IF SCALE EQUAL FALSE.  SPDSCL IS THE LENGTH OF
00520 C            ONE FEATHER ON THE VELOCITY ARROW IF VECTOR.EQ.FALSE.  IF
00530 C            VECTOR.EQ.TRUE SPDSCL SHOULD BE APPROXIMATELY EQUAL TO
00540 C            THE MAXIMUM SPEED TO OCCUR.
00550 C   ANGT   = THE ANGLE FROM THE X-AXIS TO TRUE NORTH IN DEGREES
00560 C            CCW FROM THE X-AXIS.
00570 C   NOPLTS = THE NUMBER OF PLAN VIEWS TO BE DRAWN.
00580 C   NWF1   = THE DEVICE NUMBER WHERE THE SPEED/DIREC DATA IS RESIDENT
00590 C   PRT    = PRINT SWITCH.  TRUE INDICATES TABLES OF THE SPEED AND
00600 C            DIRECTION ARRAYS WILL BE CREATED.  FALSE, NO TABLES.
00610 C   DIST   = THE DISTANCE IN INCHES BETWEEN TWO CONSECUTIVE PLAN VIEWS.
00620 C   SUNITS = TELLS PROGRAM WHAT UNITS THE SPEED WILL BE INPUT.  IF
00623 C            M/S THEN SUNITS=1., IF CM/S THEN .01, IF MM/S THEN .001, EC.
00625 C   DUNITS = TELLS PROGRAM WHAT UNITS THE DIRECTION WILL BE INPUT.
00627 C            IF IN TENS OF DEGREES, THEN DUNITS=10., IF TO THE
00628 C            NEAREST WHOLE DEGREE, THEN 1.

The Department of the Interior Mission

As the Nation's principal conservation agency, the Department of the Interior has responsibility for most of our nationally owned public lands and natural resources. This includes fostering sound use of our land and water resources; protecting our fish, wildlife, and biological diversity; preserving the environmental and cultural values of our national parks and historical places; and providing for the enjoyment of life through outdoor recreation. The Department assesses our energy and mineral resources and works to ensure that their development is in the best interests of all our people by encouraging stewardship and citizen participation in their care. The Department also has a major responsibility for American Indian reservation communities and for people who live in island territories under U.S. administration.

The Minerals Management Service Mission

As a bureau of the Department of the Interior, the Minerals Management Service's (MMS) primary responsibilities are to manage the mineral resources located on the Nation's Outer Continental Shelf (OCS), collect revenue from the Federal OCS and onshore Federal and Indian lands, and distribute those revenues.

Moreover, in working to meet its responsibilities, the **Offshore Minerals Management Program** administers the OCS competitive leasing program and oversees the safe and environmentally sound exploration and production of our Nation's offshore natural gas, oil and other mineral resources. The MMS **Minerals Revenue Management** meets its responsibilities by ensuring the efficient, timely and accurate collection and disbursement of revenue from mineral leasing and production due to Indian tribes and allottees, States and the U.S. Treasury.

The MMS strives to fulfill its responsibilities through the general guiding principles of: (1) being responsive to the public's concerns and interests by maintaining a dialogue with all potentially affected parties and (2) carrying out its programs with an emphasis on working to enhance the quality of life for all Americans by lending MMS assistance and expertise to economic development and environmental protection.
