## NASA STI Program ... in Profile

Since its founding, NASA has been dedicated to the advancement of aeronautics and space science. The NASA scientific and technical information (STI) program plays a key part in helping NASA maintain this important role.

The NASA STI program operates under the auspices of the Agency Chief Information Officer. It collects, organizes, provides for archiving, and disseminates NASA's STI. The NASA STI program provides access to the NASA Aeronautics and Space Database and its public interface, the NASA Technical Report Server, thus providing one of the largest collections of aeronautical and space science STI in the world. Results are published in both non-NASA channels and by NASA in the NASA STI Report Series, which includes the following report types:

- **TECHNICAL PUBLICATION.** Reports of completed research or a major significant phase of research that present the results of NASA Programs and include extensive data or theoretical analysis. Includes compilations of significant scientific and technical data and information deemed to be of continuing reference value. NASA counterpart of peer-reviewed formal professional papers but has less stringent limitations on manuscript length and extent of graphic presentations.
- **TECHNICAL MEMORANDUM.** Scientific and technical findings that are preliminary or of specialized interest, e.g., quick release reports, working papers, and bibliographies that contain minimal annotation. Does not contain extensive analysis.
- **CONTRACTOR REPORT.** Scientific and technical findings by NASA-sponsored contractors and grantees.

- **CONFERENCE PUBLICATION.** Collected papers from scientific and technical conferences, symposia, seminars, or other meetings sponsored or co-sponsored by NASA.
- **SPECIAL PUBLICATION.** Scientific, technical, or historical information from NASA programs, projects, and missions, often concerned with subjects having substantial public interest.
- **TECHNICAL TRANSLATION.** English-language translations of foreign scientific and technical material pertinent to NASA's mission.

Specialized services also include creating custom thesauri, building customized databases, and organizing and publishing research results.

For more information about the NASA STI program, see the following:

# Introduction

*Scientific and Technical Aerospace Reports (STAR)* is an online information resource listing citations and abstracts of NASA and worldwide aerospace-related scientific and technical information (STI). Updated biweekly, *STAR* highlights the most recent additions to the NASA Aeronautics and Space Database. Through this resource, the NASA STI Program provides timely access to the most current aerospace-related research and development (R&D) results.

*STAR* subject coverage includes all aspects of aeronautics and space research and development, supporting basic and applied research, and application, as well as aerospace aspects of Earth resources, energy development, conservation, oceanography, environmental protection, urban transportation and other topics of high national priority. The listing is arranged first by 11 broad subject divisions, then within these divisions by 76 subject categories and includes two indexes: subject and author.

*STAR* includes citations to R&D results reported in:

- NASA, NASA contractor, and NASA grantee reports
- Reports issued by other U.S. Government agencies, domestic and foreign institution, universities, and private firms
- Translations
- NASA-owned patents and patent applications
- Other U.S. Government agency and foreign patents and patent applications
- Domestic and foreign dissertations and theses

## The NASA STI Program

The NASA STI Program was established to support the objectives of NASA's missions and research to advance aeronautics and space science. By sharing information, the NASA STI Program ensures that the U.S. maintains its preeminence in aerospace-related industries and education, minimizes duplication of research, and increases research productivity.

Through the NASA Center for AeroSpace Information (CASI), the NASA STI Program acquires, processes, archives, announces, and disseminates both NASA's internal STI and world-wide STI. The results of 20th and 21st century aeronautics and aerospace research and development, a worldwide investment totaling billions of dollars, have been captured, organized, and stored in the NASA Aeronautics and Space Database. New information is continually announced and made available as it is acquired, making this a dynamic and historical collection of value to business, industry, academia, federal institutions, and the general public.

The STI Program offers products and tools that allow efficient access to the wealth of information derived from global R&D efforts. In addition, customized services are available to help tailor this valuable resource to meet your specific needs.

For more information on the most up-to-date NASA STI, visit the STI Program's Web site at <http://www.sti.nasa.gov>.

# NASA STI Availability Information

## NASA Center for AeroSpace Information (CASI)

Through NASA CASI, the NASA STI Program offers many information products and services to the aerospace community and to the public, including access to a selection of full text of the NASA STI. Free registration with the program is available to NASA, U.S. Government agencies and contractors. To register, contact CASI at [help@sti.nasa.gov](mailto:help@sti.nasa.gov). Others should visit the program at [www.sti.nasa.gov](http://www.sti.nasa.gov). The 'search selected databases' button provides access to the NASA Technical Reports Server (NTRS) – the publicly available contents of the NASA Aeronautics and Space Database.

Each citation in *STAR* indicates a 'Source of Availability.' When CASI is indicated, the user can order this information directly from CASI using the [STI Online Order Form](#), e-mail to [help@sti.nasa.gov](mailto:help@sti.nasa.gov), or telephone the STI Help Desk at 301-621-0390. Before ordering you may access [price code tables](#) for STI documents and videos. When information is not available from CASI, the source of the information is indicated when known.

NASA STI is also available to the public through Federal information organizations. NASA CASI disseminates publicly available NASA STI to the National Technical Information Service (NTIS) and to the Federal Depository Library Program (FDLP) through the Government Printing Office (GPO). In addition, NASA patents are available online from the U.S. Patent and Trademark Office.

## National Technical Information Service (NTIS)

The National Technical Information Service serves the American public as a central resource for unlimited, unclassified U.S. Government scientific, technical, engineering, and business related information. For more than 50 years NTIS has provided businesses, universities, and the public timely access to well over 2 million publications covering over 350 subject areas. Visit NTIS at <http://www.ntis.gov>.

## The Federal Depository Library Program (FDLP)

The U.S. Congress established the **Federal Depository Library Program** to ensure access for the American public to U.S. Government information. The program acquires and disseminates information products from all three branches of the U.S. Government to nearly 1,300 Federal depository libraries nationwide. The libraries maintain these information products as part of their existing collections and are responsible for assuring that the public has free access to the information. Locate the Federal depository libraries at <http://www.gpoaccess.gov/index.html>.

## The U.S. Patent and Trademark Office (USPTO)

The U.S. Patent and Trademark Office provides online access to full text patents and patent applications. The database includes patents back to 1976 plus some pre-1975 patents. Visit the USPTO at <http://www.uspto.gov/patft/>.

# SCIENTIFIC AND TECHNICAL AEROSPACE REPORTS

*A Biweekly Publication of the National Aeronautics and Space Administration*

---

VOLUME 45, NUMBER 19

OCTOBER 1, 2007

## 01 AERONAUTICS (GENERAL)

Includes general research topics related to manned and unmanned aircraft and the problems of flight within the Earth's atmosphere. Also includes manufacturing, maintenance, and repair of aircraft. For specific topics in aeronautics, see categories 02 through 09. For information related to space vehicles see 12 Astronautics.

**20070028738** Illinois Univ. at Urbana-Champaign, Urbana, IL, USA

### **Characteristics of Runback Ice Accretions and Their Aerodynamic Effects**

Whalen, E. A.; Broeren, A. P.; Bragg, M. B.; Apr. 2007; 92 pp.; In English  
Report No.(s): PB2007-109830; No Copyright; Avail.: CASI: [A05](#), Hardcopy

The results of a research program to investigate runback ice accretions due to hot-air ice protection systems, scaling of external flow parameters for testing thermal systems, and the resulting aerodynamic effects are presented. Ice accretion testing was conducted at the National Aeronautics and Space Administration Glenn Icing Research Tunnel to evaluate thermal scaling methods and produce representative runback ice accretions using a business jet wing section equipped with a hot-air, anti-icing system. Test conditions simulated an airplane holding in both at ambient static air temperatures near freezing (warm hold) and well below freezing (cold hold), as well as descending through (descent) Title 14 Code of Federal Regulations Part 25 Appendix C icing conditions. Warm-hold ice accretions were characterized on the suction surface by dense frozen rivulets that formed a ridge while the pressure surface accretion was composed of nodules and chunks that formed a ridge. In all cases, a clean airfoil region of varying chordwise extent was located upstream of the runback ice accretions. The runback ridge formations were shown to be very sensitive to total air temperature in both height and chordwise location. Increased hot-air temperature and mass flow rate were found, in general, to correspond to shorter ridges located farther aft on the model. The cold-hold accretions had the character of rime ice and exhibited more spanwise variation due to the proximity of the ridge to the hot-air jet impingement zones. Descent accretions also exhibited spanwise variation in chordwise position, but were more uniform in height than the cold-hold accretion. Results of the scaling analysis showed that a useful and qualitatively accurate scaling method was developed for scaling thermal anti-icing systems for ground testing, but further development and investigation of the methods and governing equations are required.

### **Boundary Layer Transition Experiments in Support of the Hypersonics Program**

Berry, Scott A.; Chen, Fang-Jenq; Wilder, Michael C.; Reda, Daniel C.; June 25, 2007; 14 pp.; In English; 39th AIAA Thermophysics Conference, 25-28 Jun. 2007, Miami, FL, USA; Original contains color and black and white illustrations

Contract(s)/Grant(s): WBS 732759.07.05

Report No.(s): AIAA Paper 2007-4266; No Copyright; Avail.: CASI: [A03](#), Hardcopy

ONLINE: <http://hdl.handle.net/2060/20070028872>

Two experimental boundary layer transition studies in support of fundamental hypersonics research are reviewed. The two studies are the HyBoLT flight experiment and a new ballistic range effort. Details are provided of the objectives and approach associated with each experimental program. The establishment of experimental databases from ground and flight are to provide better understanding of high-speed flows and data to validate and guide the development of simulation tools.

**Low Cost Parachute**

Bonaceto, B., Inventor; 12 Feb 04; 7 pp.; In English

Patent Info.: Filed 12 Feb 04; US-Patent-Appl-SN-10-779 484

Report No.(s): PB2007-104648; No Copyright; Avail.: CASI: [A02](#), Hardcopy

A parachute includes first strips of fabric configurable to define a pattern wherein the first strips are separated from each other and extend parallel to each other, and second strips of fabric configurable to further define the pattern wherein the second strips are separated from each other and extend parallel to each other and normal to the first strips, the number of first strips being equal to the number of second strips. The first and second strips cross each other to define vent holes. The ends of the strips are connected to suspension lines which are extendible to a confluence area for support of an article of cargo.

**02  
AERODYNAMICS**

Includes aerodynamics of flight vehicles, test bodies, airframe components and combinations, wings, and control surfaces. Also includes aerodynamics of rotors, stators, fans, and other elements of turbomachinery. For related information see also 34 Fluid Mechanics and Thermodynamics.

**20070026475** Naval Research Lab., Washington, DC USA

**Application of the Simplified Phase Plane to the Analysis and Design of Missile Jet-Relay Control Systems**

Hieatt, J L; Sep 30, 1958; 35 pp.; In English

Report No.(s): AD-A466220; 34; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA466220>

The application of phase plane analysis to a missile jet relay control system is reviewed, explained, and illustrated. Only a single lead network is considered under conditions in which aerodynamic damping is negligible. The assumption that all forces occur as step inputs is used to simplify analysis techniques and does not constitute a significant limitation on the application of this method for design purposes. To aid in system design, an analytic method for the solution of phase plane plots is developed. The analytic technique reduces the time necessary to evaluate a system design by minimizing the necessity for construction of phase plane diagrams. In conclusion a summary of general principles which may be used to optimize a missile jet relay control system is presented.

Report No.(s): AD-A468387; DSTO-TN-0747; No Copyright; Avail.: Defense Technical Information Center (DTIC)

This document has been prepared for presentation to the 30th Conference of the International Committee on Aeronautical Fatigue scheduled to be held in Naples, Italy, 14th and 15th May 2007. Brief summaries and references are provided on the aircraft fatigue research and associated activities of research laboratories, universities, and aerospace companies in Australia

and New Zealand during the period April 2005 to March 2007. The review covers fatigue-related research programs as well as fatigue investigations on specific military and civil aircraft.

**Finite Element Solution: Nonlinear Flapping Beams for Use with Micro Air Vehicle Design**

Walker, Robert L; Mar 2007; 122 pp.; In English; Original contains color illustrations

Report No.(s): AD-A468442; AFIT/GAE/ENY/07-M26; No Copyright; Avail.: Defense Technical Information Center (DTIC)

The development and use of Micro Air Vehicles is becoming more and more important to the military. Size, weight, maneuverability, stealth, and fuel consumption are just some of the constraints on a future Micro Air Vehicle. Perfect blueprints for a small scale flying machine are both insects and humming birds. Medium sized hummingbirds are found to have wings-beats at a frequency of 18-28 Hz. There is a vast amount of complexity to just how these creatures can create lift; however, this study looks at different beams made of common materials with 1st natural bending frequencies in this range. This study documents and evaluates the use of analytical tools to solve for nonlinear characteristics of a system. A function called the backbone curve is incorporated into a MATLAB program. The Hilbert transform characterized by the nonlinear decrement approach captures all of the necessary coefficients for this function. ABAQUS/CAE is relied upon. The numerical finite element results are compared to experiments. This work gives a better understanding of how materials and geometry perform when used in Micro Air Vehicle design considering large displacements.

**Aviation Security: Efforts to Strengthen International Passenger Prescreening are Under Way, but Planning and Implementation Issues Remain**

May 2007; 54 pp.; In English

Report No.(s): PB2007-108779; GAO-07-346; No Copyright; Avail.: CASI: [A04](#), Hardcopy

Passenger prescreening--a process that includes matching passengers' identifying information against records extracted from the U.S. government terrorist watch list--is one of several security measures in place to help ensure the safety of commercial flights traveling to or from the USA. DHS has several efforts underway to strengthen international aviation passenger prescreening. This report focuses on certain elements of the passenger prescreening process as well as some of the actions that DHS is taking or has planned to strengthen prescreening procedures. This report is a limited version of the original November 2006 report as various agencies that we reviewed deemed some of the information in the original report to be security sensitive. GAO's work included interviewing officials and assessing relevant documentation from federal agencies, U.S. and foreign air carriers, industry groups, and several foreign countries.

**Development of Aeroservoelastic Analytical Models and Gust Load Alleviation Control Laws of a SensorCraft Wind-Tunnel Model Using Measured Data**

Silva, Walter A.; Vartio, Eric; Shimko, Anthony; Kvaternik, Raymond G.; Eure, Kenneth W.; Scott, Robert C.; June 18, 2007; 17 pp.; In English; IFASD 2007: International Forum on Aeroelasticity and Structural Dynamics, 18-20 Jun. 2007, Stockholm, Sweden; Original contains color and black and white illustrations

Contract(s)/Grant(s): WBS 984754.02.07.07; Copyright; Avail.: CASI: [A03](#), Hardcopy

Aeroservoelastic (ASE) analytical models of a SensorCraft wind-tunnel model are generated using measured data. The data was acquired during the ASE wind-tunnel test of the HiLDA (High Lift-to-Drag Active) Wing model, tested in the NASA Langley Transonic Dynamics Tunnel (TDT) in late 2004. Two time-domain system identification techniques are applied to the development of the ASE analytical models: impulse response (IR) method and the Generalized Predictive Control (GPC) method. Using measured control surface inputs (frequency sweeps) and associated sensor responses, the IR method is used to extract corresponding input/output impulse response pairs. These impulse responses are then transformed into state-space models for use in ASE analyses. Similarly, the GPC method transforms measured random control surface inputs and associated

sensor responses into an AutoRegressive with eXogenous input (ARX) model. The ARX model is then used to develop the gust load alleviation (GLA) control law. For the IR method, comparison of measured with simulated responses are presented to investigate the accuracy of the ASE analytical models developed. For the GPC method, comparison of simulated open-loop and closed-loop (GLA) time histories are presented.

**Effects of Nose Bluntness on Stability of Hypersonic Boundary Layers over Blunt Cone**

Kara, K.; Balakumar, P.; Kandil, O. A.; June 27, 2007; 20 pp.; In English; 37th AIAA Fluid Dynamics Conference and Exhibit, 25-28 Jun. 2007, Miami, FL, USA; Original contains color and black and white illustrations

Contract(s)/Grant(s): WBS 984754; Copyright; Avail.: CASI: [A03](#), Hardcopy

Receptivity and stability of hypersonic boundary layers are numerically investigated for boundary layer flows over a 5-degree straight cone at a free-stream Mach number of 6.0. To compute the shock and the interaction of shock with the instability waves, we solve the Navier-Stokes equations in axisymmetric coordinates. The governing equations are solved using the 5th-order accurate weighted essentially non-oscillatory (WENO) scheme for space discretization and using third-order total-variation-diminishing (TVD) Runge-Kutta scheme for time integration. After the mean flow field is computed, disturbances are introduced at the upstream end of the computational domain. Generation of instability waves from leading edge region and receptivity of boundary layer to slow acoustic waves are investigated. Computations are performed for a cone with nose radii of 0.001, 0.05 and 0.10 inches that give Reynolds numbers based on the nose radii ranging from 650 to 130,000. The linear stability results showed that the bluntness has a strong stabilizing effect on the stability of axisymmetric boundary layers. The transition Reynolds number for a cone with the nose Reynolds number of 65,000 is increased by a factor of 1.82 compared to that for a sharp cone. The receptivity coefficient for a sharp cone is about 4.23 and it is very small, approx.  $10(\exp -3)$ , for large bluntness.

Contract(s)/Grant(s): WBS 732759.07.03

Report No.(s): AIAA Paper 2007-4424; Copyright; Avail.: CASI: [A03](#), Hardcopy

The NASA Energy Efficient Transport (EET) airfoil was tested at NASA Langley's Low-Turbulence Pressure Tunnel (LTPT) to assess the effectiveness of distributed Active Flow Control (AFC) concepts on a high-lift system at flight scale Reynolds numbers for a medium-sized transport. The test results indicate presence of strong Reynolds number effects on the high-lift system with the AFC operational, implying the importance of flight-scale testing for implementation of such systems during design of future flight vehicles with AFC. This paper describes the wind tunnel test results obtained at the LTPT for the EET high-lift system for various AFC concepts examined on this airfoil.

Report No.(s): AD-A469082; ARL-TR-4095; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA469082>

The U.S. Army Aviation and Missile Research Development and Engineering Command (AMRDEC), Aviation Engineering Division in Huntsville, AL requested that the U.S. Army Research Laboratory, Weapons and Materials Research Directorate at Aberdeen Proving Ground, MD develop and execute a program aimed at evaluating the shot-peening sensitivity of several aerospace materials. The materials represent the four most common metals utilized on U.S. Army aviation shot-peened components. The study had three main thrusts: to assess the variation in shot-peening intensity expected from variation shot-peening parameters, to assess the fatigue strength yielded at prescribed shot-peening intensities, and to correlate surface roughness and x-ray diffraction residual stress analysis data to those prescribed stress intensities. Once the shot-peening parameters' effect on shot-peening intensity was characterized, specific intensities and parameters were selected over an intensity range (dictated by AMRDEC) for each material to assess the sensitivity on fatigue strength.

**Achieving AFRL Universal FADEC Vision With Open Architecture Addressing Capability and Obsolescence for Military and Commercial Applications (Preprint)**

Behbahani, Alireza R; Nov 2006; 49 pp.; In English

Contract(s)/Grant(s): Proj-3066

Report No.(s): AD-A466151; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA466151>

The USA Air Force (USAF) has over 24,000 aircraft which include over 47,000 turbine engines. The aircraft systems are expensive and must be routinely modernized or upgraded to keep pace with threats, missions, and advancing technology. Each modern turbine engine includes controls and accessories which cost about 1/5 of the total cost of an engine. The main component of controls and accessories are the Full Authority Digital Engine Controls (FADECs). Currently, legacy FADEC systems are both unique and dedicated to their specific weapon system. Engine FADECs are built for three primary

applications, military aviation, commercial aviation, and ground based power turbines. Today, each FADEC design is unique within its application class. Future goals are to establish a universal or common standard for engine controls and accessories which includes FADECs. This will significantly reduce the costs of both development and support across DOD platforms, costs which are currently extremely high.

ONLINE: <http://hdl.handle.net/100.2/ADA466221>

Modern airborne weapons systems face increasingly stringent demands for improved performance and lower cost of ownership. The key to attaining the first of these demands is increased sub-systems integration, which leverages improved component performance to make even greater improvements in overall weapons system capability. Research is essential to gaining a fundamental understanding of the behavior and control of these highly integrated systems. Progress towards meeting the affordability demands for these systems is also being closely scrutinized. Recognition and control of ownership costs has become increasingly difficult in the face of increasing systems complexity. It may be possible to reduce the amount of physical engine test required in a typical gas turbine engine development program through the use of simulation and modeling techniques in a virtual engine test cell. However, in order to establish the credibility of a simulation and modeling approach to virtual engine test, carefully documented verification and validation (V & V) activities must be undertaken during model development.

ONLINE: <http://hdl.handle.net/100.2/ADA466568>

This report provides a review and analysis of the published literature on head-mounted displays (HMDs). In particular, we discuss several key perceptual issues that are relevant to the use of HMDs. The issues discussed are: (1) brightness and contrast; (2) accommodationvergence synergy; (3) field of view; (4) binocular input; and (5) head movements. This review of the literature is intended to anticipate and solve perceptual issues associated with two particular HMD applications: (1) simulation of off-bore sight (OBS) targeting and (2) full fieldof- view out-the-window (OTW) simulation for deployable flight training. Additionally, several technology issues important to the continued development of HMDs are discussed. This report concludes with a set of recommendations for the design and use of HMDs for OBS and OTW flight training applications.

**Development of Multisensory Orientation Technology for Reducing Spatial Disorientation Mishaps**

Albery, William B; Jul 2006; 22 pp.; In English

Contract(s)/Grant(s): Proj-7184

Report No.(s): AD-A467411; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA467411>

The Air Force regards Spatial Disorientation (SD) and loss of situational awareness (SA) as contributing factors in operational Class A (\$1 M in aircraft loss and/or pilot fatality) aircraft mishaps. Multisensory systems have been developed

to enhance the aircraft altitude information to the pilot. The systems incorporate multisensory aids including helmet-mounted symbology and tactile and audio cues. Two systems have been prototyped and demonstrated in the Air Force Research Laboratory. The technology could have application in the rotary-wing brownout program. This paper discusses the development of two systems and a potential application including an augmented cognition application. Unlike automatic ground collision avoidance systems, these systems do not take over the aircraft if a pre-set altitude is breached by the pilot; rather, these multisensory systems provide complementary attitude cues to the pilot via the tactile, audio, and visual systems that allow the pilot to continue flying through disorienting conditions.

**Weapons Director Intelligent-Agent-Assist Task: Procedure and Findings for a Validation Study**

Chaiken, Scott; Elliott, Linda R; Dalrymple, Mathieu; Covert, Michael D; Riddle, Dawn; Gordon, Thomas R; Hoffman, Kimberly A; Miles, Donald E; King, Thomas V; Schifflett, Samuel G; Jun 2001; 16 pp.; In English  
Report No.(s): AD-A468181; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA468181>

The Airborne Warning and Control System (AWACS) is a core command and control (C2) function in which sensors, shooters, and refuelers are managed by 'Weapons Directors' (WDs) in an airborne radar and communications command post. Improving the quality of WD training can have profound effects on mission outcome. A basic technology capable of doing this is 'intelligent-agent' technology, which allows more frequent practice, via simulated players, and embedded decision aids that display reasonable task options online. We report initial empirical work with an embedded-agent simulation based on the AWACS, namely the 21st Century Systems, Inc. Weapon's Director Intelligent-Agent Assist platform. Using this platform, we observed how 38 WDs performed during two high-workload missions. One mission was played with a decision aid that recommended target pairings and refuelings, while the other was not. Our sample benefited from the decision aid, but the more experienced WDs benefited the most (counter to our expectations). We discuss the results in terms of interface challenges decision aids will face in high workload environments. This report extends the initial report for this system (Elliott, Chaiken, Dalrymple, Petrov, Stoyen, 2000).

**Forecasting the KC-135 Cost Per Flying Hour: A Panel Data Analysis**

Bryant, Michael T; Mar 2007; 89 pp.; In English; Original contains color illustrations

Report No.(s): AD-A467354; AFIT/GCA/ENV/07-M2; No Copyright; Avail.: Defense Technical Information Center (DTIC)

This thesis developed models to forecast the KC-135R monthly Consumables (CONS) and Depot Level Repairable (DLR) Cost per Flying Hour (CPFH) for each U.S. Air Force service component. Using data for each operating location from FY1998 to FY2004, the models were constructed using panel data analysis, a form of regression that adds a cross-sectional and time-series dimension. In addition to including factors previously identified as prime contributors to CPFH, the models added new elements that may influence maintenance costs and be of interest to policymakers. These elements included mission capable rates, airframe operating hours, and climatology factors. An interaction variable for utilization rate and combat flying hours is also included. The results reveal that utilization rate can be a major factor to determine if the CPFH increases or decreases when a wing is flying combat hours. Furthermore, mission capable rates have an inverse relationship on the KC-135R CPFH while average airframe hours have a positive relationship. Average airframe hours is an alternative measure to aircraft age, although this measure is better suited for quarterly or yearly models. Overall, this research extends knowledge of the KC-135R CPFH program and provides a tool for planners, programmers, and decision makers at all levels.

**Multi-Sensor Information Fusion Technology Applied to the Development of Smart Aircraft**

Jeun, Buddy H; Whittaker, Allan; Sep 2002; 11 pp.; In English; Original contains color illustrations

Report No.(s): AD-A467469; No Copyright; Avail.: Defense Technical Information Center (DTIC)

This paper explores the possibility of applying multi-sensor information fusion technology to the development of smart aircraft. This technology integrates information from multiple sensors and extracts tactical information to detect, track and identify time critical targets at any time, in any place and under all weather conditions. Such target information will help the war fighter avoid fratricide and deploy weapon systems for surgical strike. Finally, the smart aircraft helps the war fighter establish air superiority in the air, on the land and at sea. The architecture of a smart aircraft includes the pilot and flight crew, vehicle interface unit, multi-sensor correlation processor, multi-sensor image fusion model, multi-sensor track fusion model, multiple target identification fusion model and multiple sensors such as: Radar, CNI, EW, IFF Visual, Electro Optic and IR. The multi-sensor track fusion model computes a fused track from the sensor trackers. A Multiple Target Identification Fusion model creates integrated target identifications from identification of multiple targets. Similarly, a Multi-Sensor Image Fusion model creates an integrated target image from multiple sensor images. In traditional aircraft, the pilot and crew extract tactical information from a huge amount of multi-sensor information. This processing is time consuming and subject to human error. A future smart aircraft with Multi-Sensor Information Fusion technology will have access to accurately correlated fused information. Fused information assists the pilot and crew to detect, track and identify targets more rapidly and accurately. Such platforms are truly smart aircraft.

**The Effectiveness of a PC-Based C-130 Crew Resource Management Aircrew Training Device**

Nullmeyer, Robert T; Spiker, V A; Golas, Katharine C; Logan, Ryan C; Clemons, Larry; Dec 2006; 19 pp.; In English

Contract(s)/Grant(s): Proj-1123

Report No.(s): AD-A467700; AFRL-HE-AZ-TP-2007-0002; No Copyright; Avail.: Defense Technical Information Center (DTIC)

Inadequate crew resource management (CRM) behaviors are still cited as causal factors in most military and commercial aircraft mishaps despite mandatory CRM training in virtually all aviator training programs, suggesting a need to explore alternative approaches. A low-cost, PC-based simulator was designed to elicit the communication and crew coordination behaviors associated with instrument and visual airdrop missions. These targeted behaviors were frequently addressed in instructor comments from earlier C-130 student training records, especially for navigators and copilots. The effectiveness of instruction using this device was evaluated. Treatment group students received a four hour training profile before their first airdrop flight while control group students did not. Multiple measures of effectiveness were tracked. Instructors and students rated training effectiveness using 5-point Likert scales. Ratings from both groups were significantly greater than '3' (neutral)

for task management, communication, and crew coordination. In addition, instructors reported that the experience was a good use of instructor and student time. Detailed CRM proficiency data were collected during the first subsequent airdrop flight. Positive transfer of training was substantiated by a multivariate analysis of variance. CRM performance ratings during this flight were significantly higher for treatment group students than for their control group peers. Higher performance grades in training records were also observed for treatment group students in all CRM skill areas through subsequent flights, with fewer sorties to criterion for communication, crew coordination, task management, and decision making for both navigators and copilots.

**Navy-Marine Corps Tactical Air Integration Plan: Background and Issues for Congress**

Bolkcom, Christopher; O'Rourke, Ronald; Apr 10, 2003; 7 pp.; In English

Report No.(s): AD-A467733; CRS-RS21488; No Copyright; Avail.: Defense Technical Information Center (DTIC)

As part of its FY2004 budget submission, the Department of the Navy (DoN) has proposed implementing a Navy-Marine Corps Tactical Air Integration (TAI) plan that would manage the Navy's strike fighters and the Marine Corps' strike fighters more like a common pool of strike fighters. DoN officials say the TAI plan would permit DoN to perform its stated missions with a smaller total number of operational strike fighters, and thereby permit DoN to reduce its planned buy of F/A-18E/F and F-35 strike fighters by 497 aircraft. Not procuring these 497 aircraft, DoN officials say, would save DoN about \$35 billion in aircraft procurement costs and significantly reduce DoN's projected approaching procurement 'bow wave.' The TAI plan poses potential issues for Congress regarding its effect on total DoN strike fighter capability, its cost effectiveness, and its possible significance in terms of further integration of U.S. military aviation assets in the future.

**Capability Based Resourcing for DPEM**

Flory, John; Cushion, Jennifer; Blazer, Doug; Apr 19, 2007; 10 pp.; In English

Contract(s)/Grant(s): Proj-AFLMA-LY-2006-33300

Report No.(s): AD-A467819; AFLMA-LY-2006-33300; No Copyright; Avail.: Defense Technical Information Center (DTIC)

Historically, the AF Depot Purchased Equipment Maintenance (DPEM) requirements development and validation process projects the impacts of funding and shortfalls/deferrals for the DPEM budget. The funding impacts are stated in terms of deferrals with emphasis on the number of Programmed Depot Maintenance (PDM) and whole-engine deferrals. This detracts from the potential impacts of other DPEM commodities as well as aircraft that do not undergo PDMs and engines overhauled in modules. This study investigates why projected deferrals in budget years differ from actuals in execution years using both quantitative and anecdotal data.

**First-Generation H1 Antihistamines Found in Pilot Fatalities of Civil Aviation Accidents, 1990-2005**

Sen, Ahmet; Akin, Ahmet; Craft, Krisit J; Canfield, Dennis V; Chaturvedi, Arvind K; May 2007; 17 pp.; In English

Report No.(s): AD-A467870; DOT/FAA/AM-07/12; No Copyright; Avail.: Defense Technical Information Center (DTIC)

First-generation H1-receptor antagonists are popularly used for alleviating allergy and cold symptoms, but these antihistaminics cause drowsiness and sedation. Such side effects could impair performance and, thus, could be the cause or a factor in accidents. Therefore, the prevalence of these antagonists was evaluated in aviation accident pilot fatalities. During civil aircraft accident investigations, postmortem samples from pilots involved in fatal aviation accidents are submitted to the Civil Aerospace Medical Institute (CAMI) for toxicological analyses. These analytical findings are stored in a database. This CAMI Toxicology Database was examined for the presence of the first-generation antihistamines in pilot fatalities of civil aircraft accidents that occurred during a 16-year (1990-2005) period. Of 5383 fatal aviation accidents from which CAMI received specimens, there were 338 accidents wherein pilot fatalities (cases) were found to contain the antihistaminics brompheniramine, chlorpheniramine, diphenhydramine, doxylamine, pheniramine, phenyltoloxamine, promethazine, and

triprolidine. Of the 338 accidents, 304 were general aviation accidents; 175 of the 338 pilots held private pilot airman certificates. Antihistamines were detected alone in 103 fatalities (1 antihistamine in 94 fatalities and 2 antihistamines in 9), while other drug(s) and/or ethanol were also present in an additional 235 fatalities. Thirty-five of the 338 fatalities had more than 1 antihistamine. The antihistamines were found in approximately 4 and 11% of the fatalities/accidents in 1990 and in 2004, respectively.

**Assessment of Injury Potential in Aircraft Side-Facing Seats Using the ES-2 Anthropomorphic Test Dummy**

DeWeese, Richard; Moorcroft, David; Green, Tom; Philippens, M M; May 2007; 30 pp.; In English

Report No.(s): AD-A468006; DOT-FAA-AM-07-13; No Copyright; Avail.: Defense Technical Information Center (DTIC)

A project was conducted to assess the injury potential of current side facing aircraft seat configurations using the ES-2 Anthropomorphic Test Dummy proposed for use in Federal Motor Vehicle Safety Standards. The ability of inflatable restraint systems to mitigate injuries in these configurations was also assessed. Impact sled tests were conducted at the Federal Aviation Administration's Civil Aerospace Medical Institute using a side-facing sofa fixture with cushion construction representative of current business jets. The tests simulated three typical seating configurations: occupant in the middle seat, occupant seated next to a rigid wall, and occupant seated next to an armrest end closure. Two types of restraints were evaluated: a three-point body centered conventional restraint with inertia reel and a similar restraint incorporating a new inflatable shoulder restraint (airbag). The test conditions were the 16g, 44 ft/s, horizontal impact specified in 14 CFR 25.562 but without yaw. Test setup techniques were developed to ensure consistent occupant positioning. Test repeatability was assessed for some test conditions. The suitability of the ES-2 for use in aircraft seat testing was evaluated. Injury criteria were calculated from the data gathered during the tests, including criteria currently published in the Federal Aviation Regulations and Federal Motor Vehicle Safety Standards such as the Head Injury Criteria, upper torso restraint loads, Thoracic Trauma Index, and peak lateral pelvis acceleration. Other research criteria and those identified in proposed Federal Motor Vehicle Safety Standards were also calculated. These criteria included neck forces and moments, Preliminary Lateral Nij, Viscous Criteria, rib deflection, abdominal forces, pubic force, upper spine acceleration, and femur torsion. Results were analyzed to identify criteria relevant for avia

Dierdorf, Douglas S; Enlow, Mark A; Stern, Seymour; Carr, Virgil J; Apr 2007; 73 pp.; In English; Original contains color illustrations

Contract(s)/Grant(s): F08637-03-C-6006; Proj-4915

Report No.(s): AD-A468067; No Copyright; Avail.: Defense Technical Information Center (DTIC)

This project's objective is to replace current firefighting aqueous film forming foams, AFFF, with an agent that is twice as effective as fire extinguishment. By reducing the required foam/water solution, the deployed firefighting footprint will thereby be reduced. In order to do this, the mechanism of firefighting foams and surfactants must be determined. Such physical characteristics as equilibrium surface tension, dynamic interfacial tension, and surface pressure have been examined in order to determine agent/surfactant behavior during the extinguishment process. This data will be correlated with computer models that will then be used to predict new, more efficient firefighting agents.

**Detection of Explosives on Airline Passengers: Recommendation of the 9/11 Commission and Related Issues**

Shea, Dana A; Morgan, Daniel; Apr 26, 2007; 7 pp.; In English; Original contains color illustrations

Report No.(s): AD-A468087; CRS-RS21920; No Copyright; Avail.: Defense Technical Information Center (DTIC)

The National Commission on Terrorist Attacks Upon the USA, known as the 9/11 Commission, recommended that Congress and the Transportation Security Administration give priority attention to screening airline passengers for explosives.

The key issue for Congress is balancing the costs of mandating passenger explosives detection against other aviation security needs. Passenger explosives screening technologies have been under development for several years and are now being deployed in selected airports. Their technical capabilities are not fully established, and operational and policy issues have not yet been resolved. Critical factors for implementation in airports include reliability, passenger throughput, and passenger privacy concerns. Presuming the successful development and deployment of this technology, certification standards, operational policy, and screening procedures for federal use will need to be established. This topic continues to be of congressional interest, particularly as the 110th Congress reexamines implementation of the 9/11 Commission's recommendations via H.R. 1 and S. 4.

Contract(s)/Grant(s): Proj-2304

Report No.(s): AD-A468280; No Copyright; Avail.: Defense Technical Information Center (DTIC)

In considering the problem of small unmanned aerial vehicle (SUAV) surveillance mission in a target rich environment, it is desirable to follow a trajectory path that maximizes targets coverage and observation time, while minimizing airframe maneuvering. Motivated by this requirement, this paper investigates the merits of multiple vehicle trajectory path schemes. Genetic Algorithms (GAs) and local optimum techniques are compared to a more conventional defined-path approach. The authors also introduce a polygon boundary reflection algorithm (PBRA) and investigate its merits.

**Autonomous Unmanned Aerial Vehicle Rendezvous for Automated Aerial Refueling**

Burns, Brian S; Mar 2007; 94 pp.; In English; Original contains color illustrations

Report No.(s): AD-A468380; AFIT/GAE/ENY/07-M05; No Copyright; Avail.: Defense Technical Information Center (DTIC)

As unmanned aerial vehicles (UAVs) increase in capability, the ability to refuel them in the air is becoming more critical. Aerial refueling will extend the range, shorten the response times, and extend loiter time of UAVs. Executing aerial refueling autonomously will reduce the command and control, logistics, and training efforts associated with fielding UAV systems. Currently, the Air Force Research Lab is researching the various technologies required to conduct automated aerial refueling (AAR). One of the required technologies is the ability to autonomously rendezvous with the tanker. The goal of this research is to determine the control required to fly an optimum rendezvous using numerical optimization and to design a controller that will approximate that control. Two problems were examined. The first problem is for the receiver to rendezvous in minimum time, with a known tanker path. The second problem is for the receiver to rendezvous at a specified time with a known tanker path. For the first problem, the simulated controller results will be compared to the calculated optimal control.

**Simulation of the Dynamically Coupled KC-135 Tanker and Refueling Boom**

Smith, Jeremy J; Mar 2007; 126 pp.; In English; Original contains color illustrations

Report No.(s): AD-A468388; AFIT/GAE/ENY/07-M21; No Copyright; Avail.: Defense Technical Information Center (DTIC)

Future Air Force requirements for the use of unmanned aircraft will require Automated Aerial Refueling (AAR). Current AAR research requires a precision model to simulate the refueling process of a KC-135 tanker and a UAV. There are existing high fidelity models of the tanker aircraft, refueling boom and proposed receiver aircraft. However, none of the models are coupled. Since boom orientation and motion is known to change the trim of the tanker aircraft, which in turn influences all other aspects of the refueling process, a new model is needed. The new model was created by integrating an existing KC-135 tanker and refueling boom model. The tanker boom equations of motion were coupled using joint coordinates and the velocity

transformation. Assessment of the new model investigated boom and tanker motion in comparison with other established models. Ultimately, behavior of the new model was validated by a comparison of simulation results to flight test data.

**Evaluation of airborne Electromagnetic Systems for Detection and Characterization of unexploded ordnance (uXo)**

Doll, William; Millhouse, Scott; Gamey, T J; Beard, Les P; Jan 2007; 67 pp.; In English; Original contains color illustrations

Contract(s)/Grant(s): Proj-MM-0101

Report No.(s): AD-A468552; MM-0101; No Copyright; Avail.: Defense Technical Information Center (DTIC)

As a result of past military training and weapons-testing activities, an estimated 6 million hectares (approximately 15 million acres) of U.S. land is potentially contaminated with unexploded ordnance (UXO) and/or weapons testing- and training-related artifacts. Using current technologies, the costs associated with detection, identification, and mapping of this contamination has been estimated to be in the tens of billions of dollars. Current surface-based technologies are generally labor-intensive, slow, and expensive. The Oak Ridge Airborne Geophysical System time-domain electromagnetic (ORAGS-TEM) system is a boom-mounted EM induction system designed for mounting on rigid Kevlar and carbon fiber booms attached to the underside of a Bell 206L Long Ranger helicopter. Rigid booms allow the helicopter to fly closer to the ground, increasing system resolution and permitting precise control of receiver positions, thus allowing more accurate determination of UXO locations. The airborne system is based on a single transmitter coil and two receiver coils mounted on a rigid 12m x 3m rectangular boom structure. Ancillary equipment includes a laser altimeter and a real-time differentially corrected global positioning system (GPS) for navigation and data positioning. This configuration enables operation at a nominal flight altitude of 1 to 3 meters above ground level (AGL). The survey methodology used for this report consisted of parallel lines traversing the areas of interest so that data were collected for each flight line at nominal data spacing. The survey process concludes with data processing, analysis, interpretation, and mapping using commercial software to generate digital images depicting locations and magnitudes of anomalies that may represent UXO.

**Prediction and Classification of Operational Errors and Routine Operations Using Sector Characteristics Variables**

Pfeiderer, Elaine M.; Manning, Carol A.; July 2007; 17 pp.; In English

Contract(s)/Grant(s): AM-B07-HRR-522

Report No.(s): DOT/FAA/AM-07/18; No Copyright; Avail.: CASI: [A03](#), Hardcopy

This study examined prediction and classification of operational errors (OEs) and routine operations (ROs) using sector characteristics variables. Average Control Duration, Aircraft Mix Index, Average Lateral Distance, Average Vertical Distance, Number of Handoffs, Number of Point Outs, Number of Transitioning Aircraft, and Number of Heading Changes were used as predictors in two stepwise logistic regression analyses conducted for the high-altitude and low-altitude sectors. In the high-altitude sample, variables included in the final model (Number of Heading Changes, Number of Transitioning Aircraft, and Average Control Duration) accurately classified OE and RO samples for 80% of the cases. In the low-altitude sample, variables included in the final model (Number of Point Outs, the Number of Handoffs, and the Number of Heading Changes) accurately classified OE and RO samples for 79% of the cases. Although logistic regression cannot be used to determine causation, it effectively identified variables that predicted the occurrence of OEs.

**Aviation Security: Foreign Airport Assessments and Air Carrier Inspections Help Enhance Security, but Oversight of These Efforts Can Be Strengthened**

May 2007; 124 pp.; In English

Report No.(s): PB2007-108418; GAO-07-729; No Copyright; Avail.: CASI: [A06](#), Hardcopy

The Transportation Security Administration's (TSA) efforts to evaluate the security of foreign airports and air carriers that service the USA are of great importance, particularly considering that flights bound for the USA from foreign countries continue to be targets of coordinated terrorist activity, as demonstrated by the alleged August 2006 liquid explosives terrorist

plot. For this review, GAO evaluated the results of foreign airport and air carrier evaluations; actions taken and assistance provided by TSA when security deficiencies were identified; TSA's oversight of its foreign airport and air carrier evaluation programs; and TSA's efforts to address challenges in conducting foreign airport and air carrier evaluations. To conduct this work, GAO reviewed foreign airport and air carrier evaluation results and interviewed TSA officials, foreign aviation security officials, and air carrier representatives.

**Subgrade CBR Values for Alpha Factor Determination Using Data Collected at the National Airport Pavement Test Facility**

Hayhoe, G. F.; Apr. 2007; 25 pp.; In English

Report No.(s): PB2007-109835; No Copyright; Avail.: National Technical Information Service (NTIS)

Full-scale traffic test results from tests run at the Federal Aviation Administration National Airport Pavement Test Facility (NAPTF) in 2000, 2001, and 2002 with four-wheel and six-wheel landing gears have previously been combined with results from tests run by the U.S. Army Corps of Engineers in the early 1970s. The combined results were analyzed in a recent report, and updated alpha factor values were determined for four- and six-wheel gears at 10,000 coverages. The strength of the subgrades in the NAPTF test pavements was characterized by averages of CBR (California Bearing Ratio) measurements made at the surface of the subgrade before and after testing and CBR measurements made after testing at depths of one foot and two feet (30.48 cm and 60.96 cm) below the surface of the subgrade. A number of minor transcription and rounding errors were made in the original calculations of the average CBR values and, since publication of the previous report, results have become available from an additional trench opened in one of the test items. The average CBR values for the NAPTF tests are updated in this report, resulting in an increase in the computed four-wheel alpha factor of approximately 0.6 percent and a decrease in the computed six-wheel alpha factor of approximately 1.3 percent.

**Enhanced Aircraft Conspicuity to Reduce Runway Incursions**

Gallagher, D. W.; Apr. 2007; 29 pp.; In English

Report No.(s): PB2007-109831; No Copyright; Avail.: CASI: [A03](#), Hardcopy

A study, which was conducted for the Runway Safety and Operational Services Office concerning controller and pilot error in surface operations, recommended increasing aircraft conspicuity when the aircraft is on the runway through the use of existing aircraft lights, thus making the aircraft more conspicuous to controllers and pilots both on the ground and on approach. The objectives of this research effort using standard aircraft lighting were to (1) determine the best aircraft lighting configuration for making an aircraft on the active runway more conspicuous to an aircraft on final approach and (2) determine from an air traffic control (ATC) tower which aircraft lighting configuration is better for making an aircraft on a runway more conspicuous to air traffic controllers. This research examined aircraft conspicuity from the two perspectives mentioned above, using a representative selection of aircraft types to the extent available as a target aircraft. Two aircraft were used for the approaches, one of which was equipped with an eye-tracker device that the subjects wore during the approaches. Results of the flight test showed that, of the external aircraft lighting configurations studied (steady and pulsing landing lights), none provided enough of a visual cue for the needed conspicuity for an approaching aircraft. From the ATC tower, steady and pulsing landing lights were both effective in providing the needed conspicuity.

**Strategic Airlift Modernization: Background, Issues and Options**

Bolkcom, Christopher; Mar 25, 2005; 7 pp.; In English

Report No.(s): AD-A467729; CRS-RS20915; No Copyright; Avail.: Defense Technical Information Center (DTIC)

There is a growing consensus that the U.S. strategic airlift fleet provides an increasingly important military capability, and is increasingly stressed. The Department of Defense's (DOD) latest mobility study points to a shortfall in current and projected airlift capability. Several options have been suggested to address this reported shortfall.

**Military Airpower: A Revised Digest of Airpower Opinions and Thoughts**

Westenhoff, Charles M; Mar 2007; 277 pp.; In English; Original contains color illustrations

Report No.(s): AD-A467598; No Copyright; Avail.: Defense Technical Information Center (DTIC)

This book is about what Airmen have in common - our heritage, capacity, and future potential. It also illustrates that while we're on the leading edge, we're also part of the sweep of military history. Understanding the way that our predecessors handled their challenges can equip us to better serve our nation. The number one aim of this book is to supply Airmen with useful thoughts that might help them meet their known responsibilities and the unknown challenges their service will bring. We can learn from both the failures and the successes of soldiers, sailors, marines, and Airmen; the ancient past; and yesterday's headlines. This book is a revision of one published in 1990. Just as in the 1990 edition, the quotations are arranged by subject matter to present multiple views of each topic.

**Flexible Precision: Air Force's Answer to Army Transformation and Intratheater Airlift on the 21st Century Battlefield**

Hering, Mark A; Jun 1, 2007; 73 pp.; In English; Original contains color illustrations

Report No.(s): AD-A468595; JFSC-25789; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA468595>

The changing operational environment has motivated the Army to undergo its largest transformation since WW II. The Army decision to procure the Joint Cargo Aircraft (JCA) has rekindled the 'roles and missions' debate that first surfaced soon after the Air Force stood up as a separate service. Both the Army and Air Force have a legitimate requirement to recapitalize the average age of Army cargo aircraft is over twenty years old and the average age of active duty Air Force C-130s are almost thirty-five years old. The significant increase in capability of the JCA, however, compared to current Army cargo aircraft (twice the range and three and a half times the payload capacity) is the source of the current 'roles and mission' debate. The purpose of this paper is to offer a solution to meeting intratheater airlift requirements that supports the Army's recent transformation. History is full of examples where the intratheater airlift community has embraced new technologies or modified operational procedures in order to overcome evolving threats and resupply troops in the field. The situation today is no different. Two examples of how the Air Force can adapt to support this Army transformation will be proposed. The first example involves using Joint Precision Air Drop System (JPADS) technology to resupply ground forces. The second involves On-Call Airdrop, a time-sensitive employment capability for airlift that adopts procedures currently used by the Close Air Support (CAS) community. Both JPADS and on-call airdrop represent a new distinctive capability-Flexible Precision-that the airlift community offers a joint force commander (JFC). The thesis of this paper is to add the concept of Flexible Precision as a USAF fixed-wing distinctive capability to enhance the JFC's ability to meet war-fighter logistical needs and allow the Air Force to continue as the intratheater airlift provider for the Army.

**Interim Heavy Airlift: Sea Base Logistics Glider Concept**

Thoms, Keith H; Jan 2007; 110 pp.; In English; Original contains color illustrations

Report No.(s): AD-A468743; NSWCDD/TR-06/52; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA468743>

This technical report proposes an interim heavy airlift (iHL) concept to connect the littoral Sea base to warfighters ashore.

Ships capable of selective offload use the iHL system to provide materiel over the horizon by distributed air means to Ship-to-Objective Maneuver (STOM) forces moving rapidly to operational objectives without stopping to seize, defend, and build up beachheads or landing zones. iHL purposely does not alter planned Navy Sea base constructions. iHL scales to sustain any force ashore from small units and Distributed Operations up to Marine Expeditionary Brigade (MEB) operations. iHL can reduce the number of rotorcraft or tilt-rotorcraft it would otherwise take to daily resupply by air, and uses ship cargo space for storage.

**Automated Aerial Refueling Presentation to 2007 ARSAG Conference (Preprint)**

Hinchman, Jacob; Schreiter, Daniel; Apr 2007; 21 pp.; In English; Original contains color illustrations

Contract(s)/Grant(s): Proj-A00T

Report No.(s): AD-A468985; AFRL-VA-WP-TP-2007-314; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA468985>

This presentation was prepared for the 2007 Aerial Refueling Systems Advisory Group (ARSAG) conference to update the status of the Automated Aerial Refueling (AAR) program at the Air Force Research Laboratory. The AAR technology suite has application to both manned and unmanned vehicles. For unmanned vehicles, AAR allows eliminates the tyranny of fuel, allowing unmanned vehicles to be based, deployed, and employed like manned systems. Furthermore as manned mission durations increase, aerial refueling becomes more and more strenuous on the pilot. AAR seeks to reduce the workload in cockpit and provide a in-weather refueling capability. Also, this technology allows manned or unmanned platforms to fly formation in IFR conditions.

**Demonstration of Clean Particle Seeding for Particle Image Velocimetry in a Closed Circuit Supersonic Wind Tunnel**

McNiel, Charles M; Mar 2007; 111 pp.; In English; Original contains color illustrations

Report No.(s): AD-A469163; AFIT/GAE/ENY/07-M19; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA469163>

The purpose of this research was to determine whether solid carbon dioxide (CO<sub>2</sub>) particles might provide a satisfactory, and cleaner, alternative to traditional seed material for Particle Image Velocimetry (PIV) for use in a closed circuit supersonic wind tunnel. The Air Force Institute of Technology (AFIT) closed circuit pressure-vacuum supersonic wind tunnel was utilized, which achieves a nominal Mach number of Mach 2.9 in a 2.5 inch by 2.5 inch square test section. CO<sub>2</sub> was dispensed into the flow as a liquid from a standard compressed gas liquid tank through two different injector styles at two injection sites using various injector attitudes. Upon exiting the injector in either the stagnation chamber or converging-diverging nozzle, the liquid CO<sub>2</sub> rapidly formed solid particles which became entrained in the wind tunnel flow and began the sublimation process from a solid to a gaseous state. The particles traveled through the test section, in which they were illuminated by a laser, and the light scattered by the particles was imaged with a camera. The resulting images were processed using the Dantec Dynamics FlowManager PIV processing software to generate vector maps representing the flow field in the test section. The particles fully sublimated after traveling through the test section, making the injection process self cleaning and hazard free. Vector maps that matched the nominal 606 m/s velocity in the empty test section were generated utilizing both multi-port tube and shroud tube style injectors. Realistic vector maps were also generated for the flow with a 10° half-angle cone model placed inside the test section. Overall this research successfully demonstrated the use of CO<sub>2</sub> as a seed material for PIV processing.

#### **Developing the Federal Aviation Administration's Requirements for Color Use in Air Traffic Control Displays**

Xing, Jing; May 2007; 19 pp.; In English

Report No.(s): AD-A467708; DOT/FAA/AM-07/10; No Copyright; Avail.: Defense Technical Information Center (DTIC)

This report describes the materials we developed for the Federal Aviation Administration's requirements for color use in Air Traffic Control (ATC) displays. While many color use guidelines and the Federal Aviation Administration's Human Factors Design Standard (HF-STD-001) provide general information about how to choose color schemes in visual displays, the purpose of this document is for developers of ATC technologies and human factors practitioners to evaluate the use of color from the perspective of ATC operations. This document provides two checklists. The first is a 'To-do' checklist to assess whether the use of a color is effective for its intended purpose of assisting ATC task performance. The second is a 'Do-not do' checklist to assess whether the use of color introduces potential negative effects on performance. While the two checklists may not cover all color use issues, they are pertinent to performance and can serve as a baseline to qualify/disqualify color schemes in ATC displays. Developers and human factors practitioners are encouraged to reference these checklists for interface design and acquisition evaluation of ATC technologies.

#### **Tip Clearance Control Using Plasma Actuators**

Morris, Scott C; Corke, Thomas C; Mar 2007; 73 pp.; In English

Contract(s)/Grant(s): FA9550-04-1-0198

Report No.(s): AD-A466059; UND-SM07-0328; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA466059>

This report documents experimental results from a series of experiments using active flow control to improve the performance and efficiency of turbine tip clearance flows. The flow control was based on plasma actuators. Two experimental facilities were used as part of this research project. The first was a low-speed, large-scale turbine cascade using Pak-B turbine blades. The second was a smaller scale, high-speed cascade with low aspect ratio. The active flow control was designed to act as a plasma squealer. Specifically, the plasma force was oriented perpendicular to the camber line in order to resist the leakage flow through the tip gap. Both steady and unsteady forcing was used as a method for manipulating natural jet-like instabilities that existed as the leakage flow separated in the tip gap. The results have indicated that the unsteady plasma forcing was as effective as the passive squealer geometry in reducing the losses that occurred in the wake of the blade tip.

ONLINE: <http://hdl.handle.net/100.2/ADA466106>

Incorporation of nanoparticles into engineered composites represents one of the largest volume applications for

nanocomposites currently envisioned. Of the wide variety of structural applications, fiber-reinforced composites for aerospace structures have some of the most demanding applications with extreme requirements in physical, chemical, electrical, thermal, and mechanical properties. Nanocomposites offer tremendous potential to improve these properties for advanced engineered composites with modest additional weight and easy integration into current processing schemes. Significant progress has been made in fulfilling this vision. Within this paper, we review the relative status of nanocomposites incorporation into aerospace composite structures and the need for continued development. In particular, nanocomposites have been applied at specific and multiple locations within the hierarchical composites to improve specific properties and to offer yet another method and level to optimize multiple properties of the overall structural composite.

**Aircraft Battery Design Concept for Improved Ultra Low Temperature Performance (Postprint)**

Erbacher, John K; Loeber, Gary J; Owens, Sarah M; Riepenhoff, Cameron A; Nov 2006; 6 pp.; In English

Contract(s)/Grant(s): Proj-3145

Report No.(s): AD-A466109; AFRL-PR-WP-TP-2007-215; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA466109>

The AFRL, Electrochemistry and Thermal Sciences Branch has evaluated numerous aircraft battery designs and chemistries since the 1960s. Recent experiments on advanced battery chemistries have shown poor performance at ultra low temperatures below -20 deg C. Aircraft battery designs stress low weight and volume and maximum capacity. One design concept uses lower capacity cells in a series parallel configuration to reduce overall battery resistance and should also improve ultra low temperature performance. Our organization has begun experiments with series-parallel cell designs to evaluate the concept and to solve low temperature performance issues. Progress, observations on the effect of different chemistries, and the impact on aircraft battery characteristics are discussed.

**V-22 Osprey Tilt-Rotor Aircraft**

Bolkcom, Christopher; Mar 13, 2007; 19 pp.; In English; Original contains color illustrations

Report No.(s): AD-A466335; CRS-RL31384; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA466335>

The V-22 Osprey is a tilt-rotor aircraft, capable of vertical or short take off and landing, with forward flight like a conventional fixed-wing aircraft. The MV-22 is the Marine Corps top aviation priority. Marine Corps leaders believe that the Osprey will provide them an unprecedented capability to quickly and decisively project power from well over the horizon. The Air Force's CV-22 version will be used for special operations. Army officials have testified that the service has no requirement for the V-22, but the Navy has expressed interest in purchasing MV-22s for a variety of missions. The V-22 program has been under development for over 25 years. Safety and maintenance concerns have arisen during this period (due in large part to three fatal accidents). The commander of the V-22 maintenance squadron admitted to falsifying maintenance records to make the aircraft appear more maintainable than it was, and three Marines were found guilty of misconduct. The program has maintained support from many in Congress despite these deficiencies. The program has undergone restructuring to accommodate congressional direction, budget constraints, and recommendations from outside experts, and DOD managers. After a 17 month hiatus, the Osprey embarked on its second set of flight tests in May of 2002. Tests were completed in June 2005 to the satisfaction of Navy testers, who believe that the V-22 has resolved all technical and engineering problems identified in internal and external reviews. On September 28, 2005 the V-22 program passed a major milestone when the Defense Acquisition Board approved it for military use and full rate production. Supporters tout the V-22's potential operational capabilities relative to the helicopters it will replace. It will fly faster, farther and with more payload than the CH-46 Sea Knight the Marine Corps currently operate.

ONLINE: <http://hdl.handle.net/100.2/ADA466359>

This report was developed under a SBIR contract. Active flow control experiments were conducted on a two-dimensional, single-element NACA 4312 airfoil to assess the performance of vortex generators and gurney flaps as lift-enhancing devices for the control of longitudinal dynamics of an air vehicle. The vortex-generators are shown to delay boundary layer separation and provide an increase in the lift coefficient for angles of attack above 12 deg, and the gurney flaps yield a constant shift in the lift curve for all angles of attack up to stall angle. The vortex-generators are most effective when used between 2 to 5% chord, and the gurney flap is most effective when used at the trailing-edge. Experiments from actuators distributed spanwise along the wing reveal that there is minimal interaction between individual gurney flaps at low-to-moderate angles of attack, while, the interactions between the individual vortex-generators are slightly more pronounced at high angles of attack. The effects of these individual actuators can be combined linearly to produce a desired net effect.

ONLINE: <http://hdl.handle.net/100.2/ADA466566>

As an alternative to the finite-difference time-domain (FDTD), the finite-element method (FEM), and the Method of Moments (MoM) based on the surface integral equation (SIE), a volume-integral equation (VIE) approach using MoM and conjugate-gradient methods is presented to address a wide variety of complex problems in computational electromagnetics. A formulation of the volume integral method is presented to efficiently address inhomogeneous regions in multilayered media. Since volume element discretization is limited to local inhomogeneous regions, numerical solutions for many complex problems can be achieved more efficiently than FDTD, FEM, and MoM/SIE. A challenge-problem in the field of nondestructive evaluation is the inspection of fastener sites for fatigue cracks in multilayer structures, ferromagnetic fastener sites, gaps between materials interfaces, and the presence of fatigue cracks are accurately modeled. Simulated studies are presented with VIC-3D, a proprietary volume-integral code, and comparisons are made with FEM highlighting performance advantages of the VIE approach.

**Tour Planning for an Unmanned Air Vehicle Under Wind Conditions (Preprint)**

McNeely, Rachelle L; Iyer, Ram V; Chandler, Phillip R; Feb 2007; 36 pp.; In English

Contract(s)/Grant(s): Proj-A03D

Report No.(s): AD-A466570; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA466570>

A very important sub-problem in the task assignment problem for unmanned air vehicles (UAVs) is the evaluation of costs for the state transitions of a directed graph. Usually a Dubins vehicle flying in the absence of wind is considered in the computation of costs. However, when a prevailing wind vector field is considered, the costs take on very different values and the task assignment problem can have very different solutions. In this paper, we consider the problem of constructing minimum time trajectories for a Dubins vehicle in the presence of a time varying wind vector field. We present results on the existence and uniqueness of minimum-time solutions for a Dubins vehicle flying in a general time-varying wind vector field under some technical conditions. These results extend the conclusions of the well-known Dubins theorem. We also propose an algorithm for obtaining the minimum-time solution for an UAV and prove its convergence. We also present the results of numerical experiments that show that the importance of considering wind vector fields while planning the tour for an UAV.

**A Value-Focused Thinking Model for the Selection of the Best Rigid Pavement, Partial-Depth Spall Repair Material**

Speer, Benjamin G; Mar 2007; 106 pp.; In English; Original contains color illustrations

Report No.(s): AD-A466573; AFIT/GEM/ENS/07-04; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA466573>

Concrete spalls on airfield pavements generate foreign object debris (FOD) that is damaging to aircraft engines, and may damage landing gear by roughening of the pavement surface. Repairing spalled concrete on aging and deteriorating airfields is essential for its safe operational use. Picking the best repair material from many products on the commercial market is difficult. There is wide variation on material properties, and good performance on certain criteria is critical to constructing long lasting repairs. Since there is currently no procedure for Air Force decision-makers to select the best rigid-pavement repair material, a model was created using Value-Focused Thinking (VFT) to evaluate repair material alternatives. Fourteen products

were compared against each other. Each was scored using fourteen evaluation measures that were identified as important to the repair material selection process. Pavemend EX-H was found to be the best choice for repairs conducted during conventional, steady-state operations. VFT was shown to be an effective methodology for objectively ranking repair products, while providing a systematic process that can be tailored for future circumstances.

**A Review and Assessment of Current Airframe Lifting Methodologies and Tools in Air Vehicles Division**

Hu, W; Tong, Y C; Walker, K F; Mongru, D; Amaratunga, R; Jackson, P; Dec 2006; 165 pp.; In English; Original contains color illustrations

Report No.(s): AD-A466578; DSTO-RR-0321; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA466578>

The Air Vehicles Division of Defence Science and Technology Organisation (DSTO) owns and/or uses a large number of software tools for crack-initiation and crack-growth analyses of aircraft structures. These tools represent a substantial body of knowledge of fatigue and fracture of engineering materials and structures that has been created and accumulated over the years. This report presents a review and assessment of the methods underpinning the more commonly-used software tools and approaches in Air Vehicles Division. The key points of the principle of each method are discussed, and different implementation considerations are highlighted, to demonstrate the similarity and difference between the models. A start is made on the compilation of a compendium of benchmark problems and challenging problems in order to assist the evaluation and consistent validation of existing and newly-developed tools. The objectives of the review are to help to increase the responsiveness and robustness of the advice DSTO provides to its clients by identifying the strengths and limitations of the commonly-used methods and tools; identifying and recommending software platforms for future improvement, and horizon-scanning the field of fatigue and fracture for new and emerging methodologies for aircraft structural life prediction. It is expected that the recommendations presented in this review will be addressed in follow-on work.

ONLINE: <http://hdl.handle.net/100.2/ADA466627>

In an urban environment, multiple small unmanned aerial vehicles (UAVs) may be utilized to locate, surveil, or attack various targets. Whatever the task, the air vehicles must cooperate by efficiently communicating with each other and optimally assigning each UAV to the appropriate task at the appropriate target and at the appropriate time. In this paper, a vehicle assignment algorithm is developed using a mixed integer linear program (MILP) to find the global optimal scheduling solution. The MILP can accommodate both binary and continuous decision variables as well as a variety of constraints and objective functions; however, the NP-hard nature of the problem implies a dramatic increase in the computing complexity as the number of variables and constraints increase. This formulation accounts for an assortment of scenarios focused on the military necessity for precise intelligence, surveillance, and reconnaissance (ISR) by modifying the vehicle routing problem with time windows (VRPTW) formulation. The VRPTW is a type of capacitated vehicle routing problem which optimally assigns a designated number of delivery vehicles originating at a single depot to a known number of customers. Specifically, the VRPTW and network flow techniques account for various scenarios as well as operator imposed timing constraints such as precedence constraints. For example, certain targets may take precedence or require simultaneous arrival times where the targets are first hierarchically clustered according to their proximity to each other. Thus, this paper also focuses on methods of clustering targets and implements this information into the MILP to optimally assign UAVs to targets. Clustering targets that are near enough to alert each other of an attack will allow UAVs to recognize this potential and hence surveil these targets simultaneously to avoid early detection. This techn

ONLINE: <http://hdl.handle.net/100.2/ADA466629>

As the Air Force transforms from a garrisoned force into a light expeditionary force, one area for restructuring is the manner in which mobility readiness spares packages (MRSPs) are managed and stocked. For a war tasking, thirty days supply is typically deployed in a MRSP as it is assumed that there will be no re-supply for thirty days. Studies of combat operations from the past decade suggest that thirty days without re-supply is an outdated assumption. The objective of this thesis is to economically build a robust MRSP that is flexible enough to provide adequate support for a variety of squadron sizes at least through day 20 of a war. Faster establishment of a reliable re-supply pipeline is the key to successfully implementing such a MRSP. This research focused on three different weapon-systems; the A-10, F-15E, and F-16C. Through use of the Aircraft Sustainability Model, smaller MRSPs are constructed which have the ability to adequately support squadron sizes of 12, 18, and 24 aircraft based on their ability to maintain aircraft availability goals without generating excessive amounts of expected backorders.

**Nonlinear Robust/Adaptive Controller Design for an Air-Breathing Hypersonic Vehicle Model (Preprint)**

Fiorentini, Lisa; Serrani, Andrea; Bolender, Michael A; Doman, David B; Dec 2006; 19 pp.; In English

Contract(s)/Grant(s): F33615-01-2-3154; Proj-A02D

Report No.(s): AD-A466631; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA466631>

This paper describes the design of a nonlinear controller for an air-breathing hypersonic vehicle. To overcome the analytical intractability of this model, a nominal control-oriented model is used to derive the control law. The nominal model has unstable zero dynamics with respect to the output to be controlled, namely flight path angle and velocity, and presents intricate couplings between the engine dynamics and flight dynamics. The flexible effects have not been included in the analysis yet. Adaptive control techniques and robust control techniques are applied to achieve tracking of velocity and altitude trajectories. Simulation results are provided to show that the derived control law allows to achieves excellent tracking performance on the nominal model.

**Enhancing Army S&T Lessons from 'Project Hindsight Revisited'**

Chait, Richard; Lyons, John W; Long, Duncan; Sciarretta, Albert A; Jan 2007; 161 pp.; In English; Original contains color illustrations

Report No.(s): AD-A466795; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA466795>

This book draws on a series of studies known as Project Hindsight Revisited conducted by the authors at the National Defense University from 2004-2006. The Hindsight Revisited studies examined, in three reports, the development of four current U.S. Army weapons systems: the Abrams main battle tank, the Apache attack helicopter, the Stinger anti-aircraft missile, and the Javelin anti-tank missile. In exploring how these weapons systems were taken from conceptual design to full-scale production, the studies brought to light crucial factors in their successful development. This book pursues significant implications of the studies' findings, with the intention that this analysis and commentary will help the Army's science and technology (S&T) leadership manage the Army S&T portfolio today and tomorrow. The Hindsight Revisited studies addressed the development of the weapons systems in question in terms of Critical Technology Events (CTEs). CTEs, as further explained in Chapters I and II, were those actions and advances that were vital to the capabilities with which a system was ultimately endowed. As such, they provided a way to focus on those factors that were crucial to success, including who performed the development work, who financed it, and what management practices were employed. These CTEs were established after many hours of discussion and extensive correspondence with scientists, engineers, technicians, and managers who were directly involved with the systems' developments. All told, the Hindsight Revisited studies found 135 CTEs for the four systems. Despite the obvious differences in the development stories of such disparate systems as a tank, a helicopter, and

two missiles, the research showed some common ingredients of success. Success depended both on having the S&T resources available to conduct the work and on the ability of the parties, principally the Army laboratories and industry, to team and work together.

Report No.(s): AD-A466848; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA466848>

Multiple tools exist to aid in the design and evaluation of high-speed weapons. This paper documents efforts to integrate several existing tools, including the Integrated Hypersonic Aeromechanics Tool (IHAT)1-7. Two major integration efforts are covered. The first is the combination of IHAT optimized vehicle output with a generic 6-degree-of-freedom (6-DOF) simulation capable of being run in a virtual environment. The second effort involves the addition of realistic campaign level target sets into the IHAT lethality module. M II. IHAT System Background The IHAT system is a multidisciplinary analysis system for the design, analysis, and systems level optimization of high-speed air vehicles. Traditional approaches use separate efforts for each of the major design disciplines (e.g. aerodynamics, propulsion, thermal, structures). The design of high-speed or hypersonic air vehicles involves a limited design space that poses problems for designing with separated discipline teams. For hypersonic vehicles, an integrated design approach lends itself to an efficient exploration of the design space. The IHAT system was developed in an effort to integrate the preliminary design and analysis procedure. It is intended to be run by a small team of engineers, with representatives from the involved disciplines.

ONLINE: <http://hdl.handle.net/100.2/ADA467401>

This booklet is a digest of material appearing in MIL-STD-1472, and is complemented with material from MIL-HDBK-759 and the Federal Aviation Administration (FAA) Human Factors Design Guide. The user is therefore referred to those documents and its references for required supplementary information. This digest provides basic, quantitative human engineering design data in pictorial, tabular, and graphical formats for use during system, equipment, or facility design and assessment. Its purpose is to furnish a convenient portable reference of human engineering design criteria and guidelines. The principles, explanations, limitations, and application techniques associated with the data have been intentionally omitted. This abbreviated presentation presupposes that the user is familiar with the bases and limitations of the given data or will consult applicable references to ensure appropriate application of the data. This digest was prepared by the Human Factors Standardization SubTAG of the Department of Defense Human Factors Engineering Technical Advisory Group (DoD HFE TAG).

**The Effects of Wind Turbine Farms on Air Defence Radars**

Jan 6, 2005; 33 pp.; In English; Original contains color illustrations

Report No.(s): AD-A467441; AWC/WAD/72/652/TRIALS; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA467441>

The UK Government supports the introduction of wind turbine farms as part of its alternative energy strategy but existing Ministry of Defense (MoD) Guidelines restrict planning consent for wind turbine farms within 60% of maximum instrumented range (interpreted as 74 km) and line of sight from primary surveillance radars. However, wind farm developers are

increasingly questioning the validity of current Guidelines. Consequently, a Trial was conducted by the Air Command and Control Operational Evaluation Unit (Air C2 OEU) in response to a tasking from the Directorate of Counter Terrorism and UK Operations (D CT&UK Ops) to determine the effects of wind turbine farms on Air Defense (AD) radars. The aim of the Trial was to determine the effects of wind turbine farms on AD radars by considering the effects of wind turbine farms on radar performance with regard to probability of detection, tracking and displayed effects, the effects on low-level coverage due to the wind turbine farms and system set-up and observed displayed effects. It was confirmed that on the T101 radar, primary radar returns from aircraft having a low Radar Cross Section (Hawk T Mk 1a and Tucano T Mk 1) are lost when flying over wind turbines, regardless of the aircraft's height. The cause of this effect is believed to be as a result of excessive returns from the wind turbines being received in the elevation sidelobes of the radar. As a result of this Trial, the MoD has provisionally ceased automatic approval of wind turbine developments beyond 74 km but within Line of Sight from an AD radar.

ONLINE: <http://hdl.handle.net/100.2/ADA467613>

This paper discusses recent results and proposed work in the application of emerging artificial intelligence technologies for flexible mission management, especially for unmanned (combat) airborne vehicles. Military user needs are discussed for planning, monitoring and control tasks, along with relevant emerging technologies. A story board is described that depicts these military needs in the context of a scenario for countering mobile target threats. The paper concludes with a brief discussion of technical and non-technical barriers to integrating these emerging technologies within fielded systems, and an outline for the next steps.

**Investigation of the Effect of Fuselage Dents on Compressive Failure Load**

Lang, Nann C; Mar 2007; 73 pp.; In English

Report No.(s): AD-A467083; No Copyright; Avail.: Defense Technical Information Center (DTIC)

The main motivation for this thesis study is that significant workload for aging transport aircrafts is related to dent removal from fuselages. This thesis is a preliminary investigation of aircraft fuselage dents using the Finite Element Method (FEM) via FEA ABAQUS software. We investigated single impact dent on fuselage panel at various locations and impact speeds. The material used for our finite element models is Aluminum Alloy 2024-T3, a typical material used for fuselages of older transport aircrafts. Our finite element model consisted of impact analysis, buckling prediction analysis, and post buckling analysis successively. These analyses were performed on both stiffened and unstiffened aluminum panels. We found that, depending on dent status in aluminum panel, the dent may increase or decrease buckling load of the panel compared to that of the virgin panel (undented). The buckling load of panel with low velocity impact is generally lower than that of the virgin plate. As the impact velocity is increased, buckling load of dented panel increases exceeding buckling load of virgin plate. In addition, we also noticed an existence of critical impact velocity at which the buckling load of the dented panel reached maximum and after which will start to decrease.

**Need for Robust Sensors for Inherently Fail-Safe Gas Turbine Engine Controls, Monitoring, and Prognostics (Postprint)**

Behbahani, Alireza R; Sep 2006; 37 pp.; In English; Original contains color illustrations

Contract(s)/Grant(s): Proj-3066

Report No.(s): AD-A467099; No Copyright; Avail.: Defense Technical Information Center (DTIC)

Sensor reliability is critical to turbine engine control. Today's aircraft engines demand more sophisticated sensors in the control systems, requiring advanced engine testing for component performance demonstration. Expertise in the gas turbine

instrumentation community is located across the gas turbine industry itself, within several specialized university departments serving to supplement the more general research programs in gas turbine research. Sensor technology has advanced in many fields; however, implementation has been slower in aerospace's push for engine health management through adaptive control systems demands more robust instrumentation with inherently fail safe sensors. The future needs of the USAF require innovative reliable control architectures. These needs require new ideas for turbine engine controls, employing the next generation computing, communication hardware and advanced sensors. Turbine engine control research includes: implementation, control theory, algorithms, sensors and transducers.

**Optimal UAV Task Assignment and Scheduling (Preprint)**

Weinstein, Amanda; Schumacher, Corey; Jan 2007; 23 pp.; In English

Contract(s)/Grant(s): Proj-A03D

Report No.(s): AD-A467104; No Copyright; Avail.: Defense Technical Information Center (DTIC)

This paper addresses the issue of task assignment and scheduling for teams of cooperative Unmanned Aerial Vehicles (UAVs) operating in a semi-autonomous manner with a single operator controlling the multiple-vehicle team. Mixed-Integer Linear Programming (MILP) is a highly effective technique for expressing this type of complex optimization problem because it allows for binary decision variables, continuous timing variables, and an extensive, flexible constraint set. A general MILP formulation is proposed, allowing a wide variety of vehicle capabilities and mission requirements to be incorporated. Possible task coupling constraints include precedence constraints, time windows, simultaneous tasks, joint tasks, and more. A variety of scenarios, with heterogeneous vehicles, and a wide range of mission constraints can be addressed.

**A Bold 21st Century Strategy for U.S. Airborne ISR**

Kimberly, Jack L; Mar 13, 2007; 23 pp.; In English

Report No.(s): AD-A467241; No Copyright; Avail.: Defense Technical Information Center (DTIC)

The airborne Intelligence, Surveillance, and Reconnaissance (ISR) capabilities of the U.S. Army could provide the Joint Commands their essential tools to support battlefield interdiction in the 21st Century. Various sensor packages are available today to provide the intelligence and/or information needed to project multiple modes of firepower on target. The U.S. Army has been adding to its existing ISR fleet by fielding unique sensor-integrated Quick Reaction Capabilities (QRC) to answer the short term ISR needs of the Global War on Terrorism (GWOT). These ISR QRC assets have helped increase the density of ISR capabilities across the battlefield, but they have been operationally integrated without meeting the persistent unblinking eye requirement. These assets were procured using un-forecasted supplemental funding, and more importantly, they were acquired without a guiding strategy to help identify the requirements and develop an integrated master plan to sustain the U.S. Army's ISR capabilities into the future. The purpose of this paper is to review and discuss the past and present issues that have impacted development of today's combat ISR capabilities within the U.S. Army, and to recommend an affordable ISR strategy to support the long term ISR needs of the GWOT.

**Effects of Using NATEC Services within E-2C and FA-18 Operational Squadrons**

Sanford, Allen E; Mar 2007; 149 pp.; In English

Report No.(s): AD-A467284; No Copyright; Avail.: Defense Technical Information Center (DTIC)

The thesis identifies Navy E-2C and FA-18 squadron metrics that are affected by Technical Representative (Tech Rep) Usage from Naval Air Technical and Engineering Service Command (NATEC). Six different databases are identified that contain the following types of metrics: Readiness, Standards and Policy (RS&P), Maintenance and Supply Chain Management (M&SCM); Fleet Readiness Training Plan (FRTTP); Financial; Manpower; and Tech Rep Usage. From the databases, twenty-four months of data is collected for 11 E-2C Squadrons and 37 FA-18 Squadrons. Exploratory Data Analysis is

conducted to visually identify trends within the metrics as well as relationships amongst Tech Rep usage and the other metrics. At the completion of the Exploratory Analysis an overdispersed Poisson Regression Model is then developed, with a subset of metrics, to predict the number of Tech Rep assists per month. Relationships between the predicted Tech Rep Usage and the predictors in the model are then explored.

**Homeland Security: Protecting Airspace in the National Capital Region**

Elias, Bart; Sep 1, 2005; 7 pp.; In English

Report No.(s): AD-A467333; CRS-RS22234; No Copyright; Avail.: Defense Technical Information Center (DTIC)

Since September 11 2001, several actions have been taken to monitor and protect the airspace around Washington, DC. However, many general aviation (GA) interests have protested that extensive airspace restrictions and complex procedures exceed what is necessary to protect critical assets from possible terrorist attacks using aircraft. Policymakers have struggled to address airspace protection needs without unduly impeding air commerce or compromising safety. While the administration is currently seeking to make the airspace restrictions in the National Capital Region permanent, Congress has pushed for an easing of restrictions on GA aircraft at Ronald Reagan Washington National Airport (DCA) and nearby GA airports through legislation and oversight. However, a few high profile airspace breaches have prompted some in Congress to seek stiffer penalties for violators and mandatory training for pilots (see H.R. 3465). Better pilot training and technologies to improve pilot situational awareness may help curtail inadvertent airspace violations that complicate surveillance and protection efforts. Further assessment of airspace design and special flight procedures around Washington, DC, may be undertaken to determine whether an appropriate balance exists between homeland security and defense requirements and air commerce and safety. This report will be updated as needed.

**Price vs. Performance: The Value of Next Generation Fighter Aircraft**

Stelly, John M; Mar 2007; 48 pp.; In English; Original contains color illustrations

Report No.(s): AD-A467340; AFIT/GCA/ENV/07-M10; No Copyright; Avail.: Defense Technical Information Center (DTIC)

The USA Department of Defense (DoD) is currently recapitalizing its aging fighter aircraft inventory with the F-22A and F-35. While the DoD may consider cost and performance issues, it does not use a quantitative model that effectively measures the tradeoffs between the two. This thesis constructs a hedonic model of the fighter aircraft market to measure the implicit price on fighter performance characteristics and specifically applies it to next-generation aircraft. Data from 50 aircraft from 1949-present were used to construct two models ? one based on procurement costs and one based on research, design, test, and evaluation (RDT&E) costs. The models, based on a linear Box-Cox transformation, demonstrated that the unique F-22 trait, the ability to super-cruise, has the highest per-unit implicit price (\$68.5M), followed by the stealth technology (\$58.7M) and large-scale integrated circuitry (\$55.3M). The high marginal value for the super-cruise trait implies that, depending on how super-cruise is used operationally, the F-35A may be a more effective purchase in terms of resource allocation than the F-22A.

**Civil Reserve Air Fleet (CRAF)**

Bolkcom, Christopher; Oct 18, 2006; 14 pp.; In English

Report No.(s): AD-A467423; CRS-RL33692; No Copyright; Avail.: Defense Technical Information Center (DTIC)

The Civil Reserve Air Fleet (CRAF) supports Department of Defense (DoD) airlift requirements in emergencies when the need for airlift exceeds the capability of the military aircraft fleet. All CRAF participants must be U.S. carriers fully certified by the Federal Aviation Administration, and they must meet the stringent standards of Federal Aviation Regulations pertaining to commercial airlines (Part 121). The CRAF has three main segments: international, national, and aeromedical evacuation. The international segment is further divided into the long-range and short-range sections and the national segment is divided into the domestic and Alaskan sections. Assignment of aircraft to a segment depends on the nature of the requirement and the

performance characteristics needed. The commercial airlines contractually pledge aircraft to the various segments of CRAF, ready for activation when needed. To provide incentives for civil carriers to commit aircraft to the CRAF program and to assure the USA of adequate airlift reserves, the government makes peacetime airlift business available to civilian airlines that obligate aircraft to the CRAF. DoD offers business through the International Airlift Services. CRAF presents benefits and opportunities for both DoD and U.S. airlines. By all accounts it appears to be a symbiotic relationship. Yet, as circumstances change, pressures and diverging interests may emerge that could bring changes to CRAF. A number of factors may be considered when examining the future size, character, and role of CRAF. These factors include cost, other potential government/commercial arrangements, potential change in DoD requirement for CRAF, and industrial base or financial assistance to U.S. air carriers. This report will be updated as events warrant.

**Probability Modeling of Multi-Type Autonomous Unmanned Combat Aerial Vehicles Engaging Non-Homogeneous Targets Under Imperfect Information**

Papadopoulos, Themistoklis; Mar 2007; 98 pp.; In English

Report No.(s): AD-A467498; No Copyright; Avail.: Defense Technical Information Center (DTIC)

UCAVs are advanced weapon systems that can loiter autonomously in a pack over a target area, detect and acquire the targets, and then attack them. Modeling these capabilities in a specific hostile operational setting is necessary for addressing weapons design and operational issues. While much attention has been given to the engineering and technological aspects of UCAV developments, there are very few studies on operational concepts for these weapon systems and their effectiveness and efficiency. This thesis builds probability models (Markov Chains) that describe UCAV operations, defines Measures of Effectiveness (MOEs) for the engagement performance, maps the functional relations between the parameters and the MOEs, and obtains insights regarding the design of the UCAVs and their tactical employment. The models are used to conduct extensive numerical analysis, based on experimental design concepts and traditional sensitivity analysis. The main focus of the analysis is to investigate optimal and robust mixes of UCAVs of different types, with respect to the MOEs. While in most cases, extreme-point solutions are optimal, there are cases where a balanced UCAV mix is better.

**A Review of Recent Algorithms and a New and Improved Cooperative Control Design for Generating a Phantom Track (Preprint)**

Purvis, Keith B; Chandler, Phillip R; Feb 2007; 11 pp.; In English

Contract(s)/Grant(s): Proj-A03D

Report No.(s): AD-A467506; No Copyright; Avail.: Defense Technical Information Center (DTIC)

For a team of unmanned aerial vehicles (UAVs) to deceive a radar network by generating a phantom track requires a high degree of cooperation due to: 1) dynamic constraints imposed mainly by the UAVs and 2) strong coupling caused by the phantom. We first review three works that have addressed this problem, namely two one-step look-ahead algorithms and an optimal solution with full time horizon; original simulations of each are included. Second, since the one-step algorithms do not satisfy the UAV and/or phantom constraints in many cases, we design a new algorithm that does, as shown by simulation. Finally, we add a multi-step look-ahead for the UAV constraints and modify the algorithm so that an operator can dynamically add objective waypoints for the phantom.

**Sustaining Air Force Space Systems: A Model for the Global Positioning System**

Snyder, Don; Mills, Patrick; Comanor, Katherine; Roll, Jr, Charles R; Jan 2007; 63 pp.; In English

Contract(s)/Grant(s): F49642-01-C-0003; FA7014-06-C-0001

Report No.(s): AD-A467528; No Copyright; Avail.: Defense Technical Information Center (DTIC)

Aging systems and systems operating longer than their anticipated life span, sometimes because of program slips in

follow-on systems, have intensified the need for understanding how maintenance and sustainment affect the performance of space systems. In this monograph, we develop a pilot framework for analyzing these and related questions in the ground segment of the Global Positioning System and recommend steps for implementing this framework. In doing so, we address the issue of modeling approach and how to define appropriate metrics of performance. We develop the guidelines for metrics and analytic methods as generally as possible so that they will be useful for other space systems. Much of the spirit of the current metrics used to monitor the maintenance of the ground segments of space systems follows that of metrics used for aircraft. But, space systems have some attributes that differ significantly from those of aircraft systems, and these attributes suggest that the metrics for maintenance and sustainment for space systems be reconsidered. From a modeling perspective, the central difference is that space systems are highly integrated systems in near constant operation, not fleets of aircraft, any one of which can perform the specified mission. This difference leads to three challenges for the analyst. First, the logical metric used in the aircraft realm the fraction of the fleet that can perform the stated mission is not applicable in the space realm. Space command systems function as an integrated whole, and the whole must meet operational mission goals at all times. What is needed for space systems is either a measure or measures that reflect the overall system performance, even when the system is operating nominally. The metric should also be sensitive to sustainment perturbations.

**Forecasting Demand for Civilian Pilots: A Cost Savings Approach to Managing Air Force Pilot Resources**

Collup, Justin W; Mar 2007; 46 pp.; In English; Original contains color illustrations

Report No.(s): AD-A467529; AFIT/GCA/ENV/07-M4; No Copyright; Avail.: Defense Technical Information Center (DTIC)

The purpose of this research was to create a model that could potentially predict demand for military trained pilots in the airline industry. Specifically, this thesis sought to answer the research question addressing whether or not military trained pilots are currently more in demand or less in demand. The research questions were answered through a comprehensive literature review, collection of data relevant to airline industry growth, and regression analysis. The Aviation Continuation Pay Bonus, offered to all eligible Air Force aviators, has risen from \$12,000/year to its current value of \$25,000/year. With shrinking budgets, and ever increasing costs of war, it remains important to implement cost savings measures wherever possible. Airline hiring is one of the most significant factors in an Air Force pilot's decision to leave the service. By monitoring airline industry, pilot growth and military pilot retention rates, it is possible to determine the amount of military trained pilots needed in civilian industry. Armed with this information, Air Force official could potentially revise bonus offerings and pilot production rates, ultimately saving the service money. Results of this research show that variables such as the unemployment rate and September 11, 2001 terrorist attacks are significant in predicting airline industry growth. Also, despite current high pilot retention rates in the Air Force, the research model shows a slight increase in demand for military trained pilots from the years 2005 to 2006.

**RF Design for Tactical Ultra-Light Unmanned Aerial Vehicle Radar System**

Alatishe, Jimmy O; Mokole, Eric L; Talapatra, Sukomal; Leibowitz, Lawrence M; Mar 29, 2007; 31 pp.; In English; Original contains color illustrations

Report No.(s): AD-A467595; NRL/FR/5340--07-10147; XB-NRL/MR/5340; No Copyright; Avail.: Defense Technical Information Center (DTIC)

The Radar Division of the Naval Research Laboratory (NRL) has developed the radio frequency (RF) section of an unmanned aerial vehicle (UAV) radar system in support of the Navy's Tactical Ultra-Light (TUL) UAV program. This RF section consists of a local oscillator (LO) and timing-circuitry module, transmit and receive modules, and a calibration network. The objective of the UAV Radar project was to develop and demonstrate the feasibility of a target detection concept for the TUL UAV system. This concept includes hardware and digital signal processing (DSP) algorithms for target detection in high clutter and foilage with low false-track rates. The hardware effort described represents a significant contribution to the Navy's ability to field a TUL UAV system with an effective radar capability.

**Military Helicopter Modernization: Background and Issues for Congress**

Liles, Christian F; Bolkcom, Christopher; Jun 24, 2004; 55 pp.; In English

Report No.(s): AD-A467680; CRS-RL32447; No Copyright; Avail.: Defense Technical Information Center (DTIC)

Recent military operations, particularly those in Afghanistan and Iraq, have brought to the fore a number of outstanding questions concerning helicopters in the U.S. armed forces, including deployability, safety, survivability, affordability, and operational effectiveness. These concerns are especially relevant, and made more complicated, in an age of military transformation, the global war on terrorism, and increasing pressure to rein in funding for the military, all of which provide contradictory pressures with regard to DOD's large, and often complicated, military helicopter modernization efforts. Despite these questions, the military use of helicopters is likely to hold even, if not grow. This report includes a discussion of the evolving role of helicopters in military transformation. The Department of Defense (DOD) fields 10 different types of helicopters, which are largely of 1960s and 1970s design. This inventory numbers approximately 5,500 rotary-wing aircraft, not including an additional 144 belonging to the Coast Guard, and ranges from simple utility platforms such as the ubiquitous UH-1 Huey to highly-advanced, multi-mission platforms such as the Air Force's MH-53J Pave Low special operations helicopter and the still-developmental MV-22B Osprey tilt-rotor aircraft. Three general approaches can be taken to modernize DOD's helicopter forces: upgrading current platforms, rebuilding current helicopter models (often called recapitalization), or procuring new models. These approaches can be pursued alone, or concurrently, and the attractiveness or feasibility of any approach or combination of approaches depends largely on budgetary constraints and operational needs. In some cases, observers argue that upgrades to helicopter sub-systems, especially radar, communications, and targeting systems, are the most cost effective way to satisfy current helicopter requirements.

**Potential Military Use of Airships and Aerostats**

Bolkcom, Christopher; May 9, 2005; 7 pp.; In English

Report No.(s): AD-A467685; CRS-RS21886; No Copyright; Avail.: Defense Technical Information Center (DTIC)

The Department of Defense (DOD) has a history of using lighter-than-air (LTA) platforms. Aerostats have recently been fielded to protect U.S. troops in the field. Contemporary interest is growing in using airships for numerous missions. This report examines the various concepts being considered and describes the issues for Congress.

**Pictorial Display Design to Enhance Spatial Awareness of Operators in Unmanned Aviation**

Zirkelbach, Thomas; Mar 2007; 140 pp.; In English

Report No.(s): AD-A467707; No Copyright; Avail.: Defense Technical Information Center (DTIC)

In aviation, spatial awareness and spatial orientation are essential for performing the task of recovering from an unusual attitude. Degraded spatial awareness, particularly in extreme flight situations, may lead to lower operational effectiveness and to loss of equipment and, in manned aviation, loss of life. Therefore, improvements in spatial awareness are important in complex 3D environments, including both manned and unmanned aviation. The main goal of this thesis was to determine whether a new prototype display design, called WEBER-Box, is a useful alternative or supplement to traditional flight instruments for unmanned aviation. In addition we combined the traditional flight instrument as well as the WEBER-Box with a colored-coded indication when the aircraft entered an unusual attitude. In this experiment, the participants executed typical tasks of a UAV-operator. We investigated the influence of the WEBER-Box on UAV operator's orientation performance. The important results can be summarized as follows: 1. significant improvement in correctly solving the orientation tasks 2. significant reduction in time to solve orientation tasks 3. color coded indication of unusual attitude significantly decreased the response time and reduced the error 4. the proposed display design was accepted, interpreted, and used to solve 3D-orientation tasks efficiently

**Platform Camera Aircraft Detection for Approach Evaluation and Training**

Yusko, Ryan S; Mar 2007; 82 pp.; In English

Report No.(s): AD-A467710; No Copyright; Avail.: Defense Technical Information Center (DTIC)

Approach training currently relies solely on manual observation and verbal feedback to the pilot. This project aims to provide pilots and landing signal officers (LSOs) with valuable information about individual approaches in the carrier landing environment. The author investigated fully automatic flight path acquisition by means of computer vision-based analysis of platform camera video. The obtained data supports enhanced LSO training, real-time approach analysis, and pilot self-improvement through advanced review capabilities.

**FEM Modeling of Guided Wave Behavior in Integrally Stiffened Plate Structures**

Martin, Steve A; Jata, Kumar V; Apr 2007; 12 pp.; In English

Contract(s)/Grant(s): F33615-03-C-5220; Proj-4349

Report No.(s): AD-A467720; No Copyright; Avail.: Defense Technical Information Center (DTIC)

Structural health monitoring (SHM) technologies, which use integrated sensing for damage detection, are expected to improve system reliability, availability, and operational cost. Guided waves can propagate great distances while experiencing low attenuation. They have been successfully used for damage detection in structures of relatively low geometric complexity such as plates and cylindrical pipes. The use of guided waves for this purpose becomes increasingly difficult as the geometric complexity of the structure increases. Aerospace structural components such as fuel tanks, wings, etc. often are comprised of substructures that consist of plates with integral stiffeners. This work reports on finite element simulations of guided waves in integrally stiffened plate structures. In these studies, the guided waves are generated by PZT wafer-type transducers mounted on the structure. Transient dynamic finite element simulations using PZFlex, in 2D and in 3D, were used to model both the structure and transducers. The interaction of the guided waves with cracks, simulated by notches of varying dimensions, is also modeled. This allows appraisal of the sensitivity of various modes for crack detection by providing insight into mode conversion and scattering resulting from the guided wave and crack interaction.

**V-22 Osprey Tilt-Rotor Aircraft**

Bolkcom, Christopher; Jan 7, 2005; 22 pp.; In English

Report No.(s): AD-A467730; CRS-RL31384; No Copyright; Avail.: Defense Technical Information Center (DTIC)

The V-22 Osprey is a tilt-rotor aircraft that takes off and lands vertically like a helicopter and flies like a plane by tilting its wing-mounted rotors to function as propellers. Begun in FY1982 by the Army and now funded in part by the Air Force, the V-22 has been primarily a Marine Corps program funded by the Navy Department. The aircraft is produced by Bell Helicopter Textron and Boeing Helicopters, with engines produced by Rolls-Royce/Allison. Flight testing and operational evaluation of pre-production V-22s began in early 1997, with procurement of production aircraft approved in April 1997. Congress has supported the V-22 as a new technology with multi-service military applications as well as various civilian uses (if derivatives of this tilt-rotor aircraft are developed for civil aviation) with potential commercial and foreign sales

implications. Critics of the V-22 have questioned its affordability and argued that its performance would not justify the cost of procuring this new aircraft in the quantity projected. Also, in light of several accidents, and a reported cover-up, critics argue that the tilt-rotor technology is too risky, while supporters contend that risks are being adequately addressed under a revamped program. This report will be updated.

**Preliminary Assessment of Stroboscopic Shutter Glasses on Motion Sickness in Helicopter Passengers**

Estrada, Arthur; May 2007; 28 pp.; In English

Report No.(s): AD-A467760; USAARL-2007-11; No Copyright; Avail.: Defense Technical Information Center (DTIC)

This report presents the results of preliminary tests conducted by the USAARL of two sets of stroboscopic shutter glasses (at 4Hz and 8 Hz) proposed as a countermeasure for motion sickness. The purpose was to examine the mission applicability and product potential of the glasses and to gain support for their inclusion in future USAARL motion sickness studies. Six participants experienced two flights in the cabin of a Black Hawk helicopter: the first flight with shutter glasses and the second without them. Following each flight, each participant filled out a motion sickness questionnaire and provided subjective feedback. This preliminary testing of the shutter glasses was conducted to determine their worthiness of further study. The testing was deliberately limited with no intentions of drawing firm conclusions as to the shutter glasses' efficacy. Although the effectiveness of the shutter glasses as a countermeasure for motion sickness is not implied by this test, the results did indicate that shutter glasses, particularly the 8 Hz device demonstrated promise and should be explored as a non-pharmacological motion sickness prevention strategy.

**Comanche Helicopter Program - A Strategic Failure**

Werthman, Robert W; Mar 1, 2007; 21 pp.; In English

Report No.(s): AD-A467794; No Copyright; Avail.: Defense Technical Information Center (DTIC)

The Army initiated the RAH-66 Comanche Helicopter as the Light Helicopter Family (LHX) in 1983 with early cost estimates of five million dollars per helicopter. In March 2004, after 22 years, 6 program restructurings, and 6.9 billion dollars, the Army Chief of Staff terminated the Comanche with the intent to reallocate 14.6 billion dollars programmed through 2011 to restructure Army Aviation. This paper explores the possibility that shortsighted threat analysis coupled with flawed group consensus within the Army allowed the Comanche Helicopter Program to continue through two decades despite intense Congressional scrutiny. Army senior level leadership safeguarded a helicopter program that did not adequately explore alternatives to transformation even when the threat environment called for a change in strategy. The Army's failure to adequately foster critical thinking about aviation threats resulted in a current helicopter force that was not adequately postured for the Global War on Terror.

**Unmanned Aerial Vehicles: Background and Issues for Congress**

Bone, Elizabeth; Bolkcom, Christopher; Apr 25, 2003; 53 pp.; In English

Report No.(s): AD-A467807; CRS-RL31872; No Copyright; Avail.: Defense Technical Information Center (DTIC)

Unmanned Aerial Vehicles (UAVs) have been referred to in many ways: RPV (remotely piloted vehicle), drone, robot plane, and pilotless aircraft. Most often called UAVs, they are defined by the Department of Defense (DoD) as powered, aerial vehicles that do not carry a human operator, use aerodynamic forces to provide vehicle lift, can fly autonomously or be piloted remotely, can be expendable or recoverable, and can carry a lethal or nonlethal payload. UAVs range from the size of an insect to that of a commercial airliner. DoD currently possesses five major UAVs: the Air Force's Predator and Global Hawk, the Navy and Marine Corps's Pioneer, and the Army's Hunter and Shadow. Other key UAV developmental efforts include the Air Force and Navy's unmanned combat air vehicle (UCAV), Navy's vertical takeoff and landing UAV (VTUAV) and the Broad Area Maritime Surveillance UAV (BAMS), and the Marine Corps's Dragon Eye and Dragon Warrior. The services continue to be innovative in their use of UAVs. Recent examples include arming UAVs (Predator, Hunter), using UAVs to extend the

eyes of submarines, and teaming UAVs with strike aircraft and armed helicopters to improve targeting. In the past, tension has existed between the services' efforts to acquire UAVs and congressional initiatives to encourage a consolidated DoD approach. Some observers argue that the result has been a less than stellar track record for the UAV. However, reflecting the growing awareness and support in Congress and the DoD for UAVs, investments in unmanned aerial vehicles have been increasing every year. Congressional considerations include the proper pace, scope, and management of DoD UAV procurement; appropriate investment priorities for UAVs vs manned aircraft; future roles and applications; and aerospace industrial base considerations. Summaries of UAVs now in operation include system characteristics, mission, payload, program status, inventory, cost, recent uses, losses, and recent actions.

**Crack Growth and Stress Intensity Prediction Techniques. Delivery Order 0004: Implementing Models and Libraries**

Brooks, Craig; Honeycutt, Kyle; Domasky, Scott P; Mar 2006; 65 pp.; In English

Contract(s)/Grant(s): FA8650-04-D-3446-0004; Proj-A02P

Report No.(s): AD-A467841; No Copyright; Avail.: Defense Technical Information Center (DTIC)

The challenges of designing modern aircraft continue to drive the development of more advanced analytical tools; often these more advanced analytical tools themselves require development of other enabling technologies such as powerful computers and associated software. The primary historical objective of this project was to develop the infrastructure and to demonstrate that key enabling technologies such as faster and bigger personal computers, as well as database and programming software, have evolved to the point that more advanced analytical tools for analyzing the damage tolerance of aircraft structures are now possible.

Contract(s)/Grant(s): W911SR-04-C-0074

Report No.(s): AD-A468145; ECBC-TR-510; No Copyright; Avail.: Defense Technical Information Center (DTIC)

The chemical and biological weapons decontamination of a C-141B aircraft carried out during Oct-Nov 2004 is part of a Congressionally funded joint venture between U.S. Army Edgewood Chemical Biological Center and Strategic Technology Enterprises (STE)/STERIS Corporation, Inc., (Mentor, OH) to develop and demonstrate the suitability of vaporous hydrogen

peroxide/modified vaporous hydrogen peroxide (VHP/mVHP) technology. The purpose of this exercise was to ensure that the vapor could be evenly distributed within the aircraft's cargo hold and its concentration sustained during four runs of 5-24 hr. For the biological decontamination tests, commercial *Geobacillus stearothermophilus* biological indicator (BI) strips and coupons of three aircraft related surface materials contaminated with the same type of spores were strategically placed within the aircraft prior to exposure to the VHP/mVHP fumigant. Coupons of two surface materials contaminated with distilled mustard were used in the chemical warfare (CW) decontamination tests. Over 99.5% kill (3 of 600), of all commercial BIs was achieved for the four decontamination runs. The three positive BIs are exclusively associated with the 5-hr VHP run. In the 5- and 10.5-hr fumigant exposures, residual chemical and biological warfare (CBW) agent simulant levels were below the worker's threshold limits set by the Joint Portable Interior Decontamination System's Operational Requirements Document draft for the corresponding agents. The resulting data has clearly established the suitability of the VHP/mVHP technology for the decontamination of aircraft interiors contaminated with CBW threat materials.

**Experimental Methods to Characterize Nonlinear Vibration of Flapping Wing Micro Air Vehicles**

Tobias, Adam P; Mar 2007; 170 pp.; In English; Original contains color illustrations

Report No.(s): AD-A468317; AFIT/GAE/ENY/07-M23; No Copyright; Avail.: Defense Technical Information Center (DTIC)

For urban combat reconnaissance, the flapping wing micro air vehicle concept is ideal because of its low speed and miniature size, which are both conducive to indoor operations. The focus of this research is the development of experimental methods best suited for the vibration testing of the wing structure of a flapping wing micro air vehicle. This study utilizes the similarity of a beam resonating at its first bending mode to actual wing flapping motion. While computational finite element analysis based on linear vibration theory is employed for preliminary beam sizing, an emphasis is placed on experimental measurement of the nonlinear vibration characteristics introduced as a result of large movement. Beam specimens fabricated from 2024-T3 aluminum alloy and IM7/5250-4 carbon-epoxy were examined using a high speed optical system and a scanning laser vibrometer configured in both three and one dimensions, respectively.

**Wide Area Search and Engagement Simulation Validation**

Marlin, Michael J; Mar 2007; 87 pp.; In English; Original contains color illustrations

Report No.(s): AD-A468378; AFIT/GAE/ENY/07-M17; No Copyright; Avail.: Defense Technical Information Center (DTIC)

The use of computer simulation in the development of autonomously controlled unmanned combat aerial vehicles (UCAV) for wide area search and engagement applications is addressed. Computer simulation is an essential tool to analyze control algorithms designed to optimally employ multiple UCAVs in wide area search and engagement. To be representative of real world mission conditions a simulation must be able to accurately duplicate the performance of the automatic target recognition (ATR) methods that will be used to discriminate between targets and non-targets in actual combat. The objective of this research is to demonstrate a method to validate a simulation's ATR model for use in research of wide area search and engagement control schemes. This objective is accomplished by comparing results of multiple simulations of academically contrived wide area search and engagement scenarios to closed form analytic solutions derived for the same scenarios.

**Mathematical Programming Model for Fighter Training Squadron Pilot Scheduling**

Newlon, Thomas M; Mar 2007; 113 pp.; In English; Original contains color illustrations

Report No.(s): AD-A468450; AFIT/GOR/ENS/07-17; No Copyright; Avail.: Defense Technical Information Center (DTIC)

The USA Air Force fighter training squadrons build weekly schedules using a long and tedious process. Very little of this process is automated and optimality of any kind is nearly impossible. Schedules are built to a feasible condition only to be changed with consideration of Wing level requirements. Weekly flying schedules are restricted by requirements for crew rest,

days since a pilot's last sortie, sorties in the last 30 days, and sorties in the last 90 days. By providing a scheduling model to the pilot charged with creating the schedule, valuable pilot hours could be spent in the cockpit, simulator, or other required duty. This research effort presents a mathematical programming (MP) approach to the fighter squadron pilot training scheduling problem. The methodology presented is based on binary variables that will provide integer solutions to every feasible set of inputs. A simulator heuristic developed specifically for this problem assigns pilots to simulator sorties based on the feasible solutions obtained from two different formulation and solving approaches. One approach assigns training mission sorties and duties for the entire week, while the other approach breaks the week into ten successive sub-problems. The model constructs two feasible schedules in approximately 2.5 minutes.

**Programmed Depot Maintenance Capacity Assessment Tool: Workloads, Capacity, and Availability**

Loredo, Elvira N; Pyles, Raymond A; Snyder, Don; Jan 2007; 120 pp.; In English

Contract(s)/Grant(s): F49642-01-C-0003; FA7014-06-C-0001

Report No.(s): AD-A468524; No Copyright; Avail.: Defense Technical Information Center (DTIC)

This monograph describes a model for evaluating the combined capacity of organic (U.S. Air Force owned and operated) and contractor maintenance assets to meet aircraft programmed depot maintenance (PDM) workloads. The PDM Capacity Assessment Tool (PDMCAT) forecasts the average number of aircraft that will be in PDM status each year over several decades, based on the initial number of aircraft in PDM status, the physical capacity of the facility or facilities (number of docks available for conducting PDM work), the PDM induction policy (the period allowed between the completion of one PDM and the start of the next), and the minimum hands-on flow time (the minimum time it would take a facility to complete a PDM if only one aircraft were in PDM status). While not directly part of the model, the derived induction data can be used to estimate both near- and long-term obligation authority requirements for different induction policies, labor rates, and workload forecasts. To illustrate the model's operations and capabilities, we applied the model to evaluate the U.S. Air Force's current capacity for supporting KC-135 PDM and examined several options for improving both near- and long-term availability. In the process, we discovered that, while future annual fleet costs increase and availability decreases with age and workload, they do so rather less rapidly because the aircraft induction rates (the number of aircraft inducted each year) decrease as the PDM flow time increases. This leads to a less-drastring cost and availability forecast than usual.

**A Review of the History of Fire Suppression on U.S. DoD Aircraft**

Bein, Donald P; Jul 13, 2006; 38 pp.; In English

Report No.(s): AD-A467847; No Copyright; Avail.: Defense Technical Information Center (DTIC)

As the Department of Defense's (DoD) Next Generation Fire Suppression Technology Program (NGP) culminates its research efforts, it is prudent to capture the history of fire suppression on DoD aircraft. This paper provides a synopsis of the history of fire suppression on DoD aircraft to provide a context against which the findings of the NGP can be assessed. The following aircraft fire suppression applications are reviewed: (1) power plant compartments, which include engine nacelles and auxiliary power unit (APU) compartments; (2) dry bay compartments; and (3) fuel tank ullage (wet bays). The following topics are discussed: the evolution of engine nacelle fire suppression system designs, from 'conventional' systems design to

current high-rate discharge systems; nacelle/APU fire occurrence and suppression discharge relative to altitude and outside air temperature; pilot response and system effectiveness; the evolution of active dry bay fire suppression; and technologies and methods for fuel tank ullage fire suppression.

**Aircraft Downwind Hazard Distance After a Chemical Attack**

McNally, Richard E; SPita, Claudia; May 8, 2007; 104 pp.; In English; Original contains color illustrations

Contract(s)/Grant(s): FA7014-06-A-2003

Report No.(s): AD-A468458; No Copyright; Avail.: Defense Technical Information Center (DTIC)

This report describes the development of a rule for the standoff distance from a chemical warfare contaminated aircraft for the Air Force counter-chemical warfare concept of operations (C-CW CONOPS). The 10-foot rule that was originally developed in the C-CW CONOPS described the precautionary procedures used to safely approach a painted, chemically-contaminated vehicle surface at varied times after the chemical warfare agent (CWA) attack. In order to make the 10-foot rule applicable to areas larger than a vehicle surface area, the 10-foot rule needed to be revised. The revision of the 10-foot rule focused on the impact of approaching chemically contaminated painted metal surfaces that were larger than the original vehicle surface area covered in the 10-foot rule, to include rules for safely approaching the contaminated item at different times after the attack. As part of the 10-foot rule revision process, a range of aircraft in the Air Force inventory were examined to generate the spatial extent and geometry to be used in modeling the downwind hazard areas around the aircraft. Further, a parametric study was conducted that used representative contamination densities and patterns, as well as representative aircraft paint combined with wind speed, relative wind direction, and the Pasquill Stability Category (PSC) over the range of anticipated conditions. The results of the parametric study identified the relative risk associated with operations for one-hour at various times (after the attack) and distances from the simulated contaminated aircraft. This report provides time-phased rules of thumb for operations in proximity to contaminated aircraft (and other large contaminated painted metal surfaces larger than 10m<sup>2</sup>).

Report No.(s): PB2007-104296; No Copyright; Avail.: CASI: [A03](#), Hardcopy

Methods and apparatus for end effectors for performing surface lapping using a robotic system are provided. In one embodiment, a lapping system includes a robotic arm and a pneumatic end effector unit. The pneumatic end effector unit includes a first base attached to the robotic arm, a second base, a lapping pad attachable to the second base, and a pneumatic piston system coupled between the first and second bases. An abrasive pad is attached to the lapping pad with a layer of pitch. The pneumatic piston system includes a piston chamber, a piston being slideably received within the piston chamber, and a component for controlling air pressure within the piston chamber. A slurry system introduces a slurry compound into one of the second base or the lapping pad.

**Prognostic Fusion for Uncertainty Reduction**

Goebel, Kai; Eklund, Neil; Bonanni, Pierino; Feb 2007; 12 pp.; In English

Contract(s)/Grant(s): Proj-4347

Report No.(s): AD-A467544; AFRL-ML-WP-TP-2007-430; No Copyright; Avail.: Defense Technical Information Center (DTIC)

This paper describes how the fusion of two different prognostic approaches produces a result that is more accurate and has more narrow uncertainty bounds than either approach alone. The fused prognostic estimate can be calculated by using both a physics-based as well as a data-driven approach. The individual approaches can have a plurality of input sources such as component properties (e.g., material properties and usage properties), history of the component (current damage state and history of accumulated usage), future anticipated usage, damage propagation rates established during experiments, etc. Damage estimates are arrived at using sensor information such as oil debris monitoring data as well as vibration data. The method detects the onset of damage and triggers the prognostic estimator that projects the remaining life. Uncertainty, stemming from the variability observed during experiments, as well as modeling inaccuracies, are propagated to provide a distribution around the projected remaining life. It is desirable to keep the uncertainty interval as narrow as possible while truthfully considering their spread. In this paper, we introduce an approach to fuse competing prediction algorithms for prognostics. Results presented are derived from rig test data wherein multiple bearings were first seeded with small defects, then exposed to a variety of speed and load conditions similar to those encountered in aircraft engines, and run until the ensuing material liberation accumulated to a predetermined damage threshold or cage failure, whichever occurred first.

System identification or mathematical modelling is utilised in the aerospace community for the development of simulation models for robust control law design. These models are often described as linear, time-invariant processes and assumed to be uniform throughout the flight envelope. Nevertheless, it is well known that the underlying process is inherently nonlinear. The reason for utilising a linear approach has been due to the lack of a proper set of tools for the identification of nonlinear systems. Over the past several decades the controls and biomedical communities have made great advances in developing tools for the identification of nonlinear systems. These approaches are robust and readily applicable to aerospace systems. In this paper, we

show the application of one such nonlinear system identification technique, structure detection, for the analysis of F-15B QuietSpike(TradeMark) aeroservoelastic flight test data. Structure detection is concerned with the selection of a subset of candidate terms that best describe the observed output. This is a necessary procedure to compute an efficient system description which may afford greater insight into the functionality of the system or a simpler controller design. Structure computation as a tool for black-box modelling may be of critical importance for the development of robust, parsimonious models for the flight-test community. Moreover, this approach may lead to efficient strategies for rapid envelope expansion which may save significant development time and costs. The objectives of this study are to demonstrate via analysis of F-15B QuietSpike(TradeMark) aeroservoelastic flight test data for several flight conditions (Mach number) that (i) linear models are inefficient for modelling aeroservoelastic data, (ii) nonlinear identification provides a parsimonious model description whilst providing a high percent fit for cross-validated data and (iii) the model structure and parameters vary as the flight condition is altered.

**Innovative Concept for a Heavy-Load Aircraft Utilizing a Two-Dimensional Wing**

Spearman, M. Leroy; June 25, 2007; 3 pp.; In English; 25th AIAA Applied Aerodynamics Conference, 25-28 Jun. 2007, Miami, FL, USA

Contract(s)/Grant(s): WBS 584772

Report No.(s): AIAA Paper 2007-4439; No Copyright; Avail.: CASI: A01, Hardcopy

ONLINE: <http://hdl.handle.net/2060/20070028871>

Heavy-load aircraft of conventional wing-body-tail design have become very large. Excessive size of such aircraft may present problems in the manufacturing process. In addition, large wing spans may cause some difficulties in ground handling. Increasing lift loads on large span cantilever wings will also increase the strength of the wing tip vortex. The concept presented herein proposes a means for substantially increasing the lift load capability of an aircraft without increasing the overall length and span of the configuration. The concept has a rectangular wing with a relatively low span and a large chord to provide the area required for high lift. Large fuselages are attached at each wing tip to provide the volume required for heavy loading. The fuselages serve as endplates for the wing and should preclude tip flow so that two-dimensional flow might be established on the wing. Elimination of the wing tip flow should prevent the formation of a tip vortex and eliminate the tip vortex hazard to trailing aircraft. Exploratory wind tunnel tests of such an aircraft concept have been conducted. Lessons learned from these tests are discussed herein in an effort to determine the validity of the concept.

**Persistent Monitoring Platforms**

Bennett, C. L.; Feb. 26, 2007; 49 pp.; In English

Report No.(s): DE2007-902249; UCRL-TR-228327; No Copyright; Avail.: National Technical Information Service (NTIS)

This project was inspired and motivated by the need to provide better platforms for persistent surveillance. In the years since the inception of this work, the need for persistence of surveillance platforms has become even more widely appreciated, both within the defense community and the intelligence community. One of the most demanding technical requirements for such a platform involves the power plant and energy storage system, and this project concentrated almost exclusively on the technology associated with this system for a solar powered, high altitude, unmanned aircraft. An important realization for the feasibility of such solar powered aircraft, made at the outset of this project, was that thermal energy may be stored with higher specific energy density than for any other known practical form of rechargeable energy storage. This approach has proved to be extraordinarily fruitful, and a large number of spin-off applications of this technology were developed in the course of this project.

Flight in fast fighter aircraft often results in physiological decrements caused by high accelerations due to gravity (Gz). Of principal importance during combat is the pilot's ability to track a moving target during high Gz maneuvers. A mathematical model of this task could become useful when planning air combat missions. Eight subjects performed a 2-D manual pursuit tracking task during four different Gz conditions in a human centrifuge simulator. The conditions included a 3-Gz, 5-Gz, and 7-Gz profile with one 15-sec peak. The final profile was a 7Gz peak simulated aerial combat maneuver (SACM). Time, Gz, and root mean square error (RMSE) were recorded. A modeling program was then created that accepted the time history of a Gz profile as input and used the values to calculate changes in the tracking RMSE values. The Gz profiles were then examined for agreement. The correlation coefficient, linear best-fit slope, and mean percent error were calculated for each Gz condition. Results: Correlation coefficients, linear best fit slope, and mean % error were as follows: 3Gz (0.91, 1.04, 6%), 5Gz (0.96, 0.99, 7%), and 7Gz SACM (0.82, 0.78, 8%). The 3 Gz predicted and measured output was a relatively constant RMSE value of 72. Conclusions: The model is a reasonable predictor of average RMSE values during a pursuit tracking task for Gz levels between 3 and 7 in a human centrifuge.

This ATC report presents guidance material for the use of the 'Ground-Initiated Comm. B' (GICB) register set contained in a Mode S transponder. The guidance material is intended to provide assistance for implementers of Mode S avionics installations. A common summary of the requirements and specifications for Mode S GICB transponder register data link applications is developed. While this ATC report focuses primarily on the 'Elementary Surveillance' (ELS), 'Enhanced Surveillance' (EHS), and 'Automatic Dependent Surveillance-Broadcast' (ADS-B) applications, guidance information is also provided for general transponder configuration and architecture of other Mode S functions employing the GICB register set. Although the information contained in this ATC report is drawn from a number of approved national and international standards, it is not intended to replace or supersede those standards documents. In the event of a conflict or contradiction between this ATC report and any approved standards, the approved standard takes precedence and the reader is encouraged to contact the authors of this document.

**Experimental and Detailed Numerical Studies of Fundamental Flame Properties of Gaseous and Liquid Fuels**

Egolfopoulos, Fokion N; Dec 2006; 120 pp.; In English; Original contains color illustrations

Contract(s)/Grant(s): FA9550-04-1-0006; FA9550-04-1-0003; Proj-2308

Report No.(s): AD-A468904; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA468904>

The dynamic behavior of laminar flames was studied for a wide range of conditions. The parameters considered included the fuel type, reactant composition, flame temperature, and combustion mode. Both gaseous and liquid fuels, including jet fuels and their surrogates, were considered. Flame ignition and extinction limits were determined experimentally and numerically for fuels and reaction conditions that have not been considered previously. For both low and high molecular weight fuels, it was determined that diffusion and kinetics can have similar effects on flames. Furthermore, it was found that kinetic mechanisms that predict laminar flame speeds, do not necessarily predict extinction limits, even though both

propagation and extinction are high temperature phenomena. Finally, it was determined that the chain mechanisms that control near-limit flames may change notably as the reactant temperature and pressure increase well above their standard values. These results enhance current understanding of the combustion behavior of fuels that are of relevance to air-breathing propulsion. Furthermore, the derived experimental data constitute a basis for partially validating combustion kinetics as well as proposed surrogates of jet fuels.

**Performance Evaluation of Ad Hoc Routing Protocols in a Swarm of Autonomous Unmanned Aerial Vehicles**

Hyland, Matthew T; Mar 2007; 119 pp.; In English; Original contains color illustrations

Report No.(s): AD-A469161; AFIT/GCS/ENG/07-07; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA469161>

This thesis investigates the performance of three mobile ad hoc routing protocols in the context of a swarm of autonomous unmanned aerial vehicles (UAVs). It is proposed that a wireless network of nodes having an average of  $5.1774 \log n$  neighbors, where  $n$  is the total number of nodes in the network, has a high probability of having no partitions. By decreasing transmission range while ensuring network connectivity, and implementing multi-hop routing between nodes, spatial multiplexing is exploited whereby multiple pairs of nodes simultaneously transmit on the same channel. The proposal is evaluated using the Greedy Perimeter Stateless Routing (GPSR), Optimized Link State Routing (OLSR), and Ad hoc On-demand Distance Vector (AODV) routing protocols in the context of a swarm of UAVs using the OPNET network simulation tool. The first-known implementation of GPSR in OPNET is constructed, and routing performance is observed when routing protocol, number of nodes, transmission range, and traffic workload are varied. Performance is evaluated based on proportion of packets successfully delivered, average packet hop count, and average end-to-end delay of packets received. Results indicate that the routing protocol choice has a significant impact on routing performance. While GPSR successfully delivers 50% more packets than OLSR, and experiences a 53% smaller end-to-end delay than AODV when routing packets in a swarm of UAVs, increasing transmission range and using direct transmission to destination nodes with no routing results in a level of performance not achieved using any of the routing protocols evaluated.

With the USA's push towards using unmanned aerial vehicles (UAVs) for more military missions, wide area search theory is being researched to determine the viability of multiple vehicle autonomous searches over the battle area. Previous work includes theoretical development of detection and attack probabilities while taking into account known enemy presence within the search environment. Simulations have been able to transform these theories into code to predict the UAV performance

against known numbers of true and false targets. The next step to transitioning these autonomous search algorithms to an operational environment is the experimental testing of these theories through the use of surrogate vehicles, to determine if the guidance and control laws developed can guide the vehicles when operating in search areas with true and false targets. In addition to the challenge of experimental implementation, dynamic scaling must also be considered so that these smaller surrogate vehicles will scale to full size UAVs performing searches in real world scenarios. This research demonstrates the ability of a given sensor to use a basic ATR algorithm to identify targets in a search area based on its size and color. With this ability, the system's target thresholds can also be altered to mimic real world UAV sensor performance.

A gas turbine engine combustor includes a plurality of main fuel injector assemblies, and a plurality of pilot fuel injector assemblies, that are arranged and configured to reduce exhaust gas emissions during engine operation. The plurality of main fuel injector assemblies are arranged in a substantially circular pattern of a first radius, and each includes an outlet port having a first divergence angle. The plurality of pilot fuel injector assemblies are arranged in a substantially circular pattern of a second radius. Each pilot fuel injector assembly is disposed between at least two main fuel injector assemblies, and each includes an outlet port having a second divergence angle.

#### **Toward a Real-Time Measurement-Based System for Estimation of Helicopter Engine Degradation Due to Compressor Erosion**

Litt, Jonathan S.; Simo, Donald L.; June 25, 2007; 22 pp.; In English; Forum 63, 1-3 May 2007, Virginia Beach, VA, USA; Original contains color illustrations

Contract(s)/Grant(s): FY06-VTD-02; WBS 561581.02.07.03.05

Report No.(s): NASA/TM-2007-214843; ARL-TR-4087; E-16059; Copyright; Avail.: CASI: [A03](#), Hardcopy

This paper presents a preliminary demonstration of an automated health assessment tool, capable of real-time on-board operation using existing engine control hardware. The tool allows operators to discern how rapidly individual turboshaft engines are degrading. As the compressor erodes, performance is lost, and with it the ability to generate power. Thus, such a tool would provide an instant assessment of the engine's fitness to perform a mission, and would help to pinpoint any abnormal wear or performance anomalies before they became serious, thereby decreasing uncertainty and enabling improved maintenance scheduling. The research described in the paper utilized test stand data from a T700-GE-401 turboshaft engine that underwent sand-ingestion testing to scale a model-based compressor efficiency degradation estimation algorithm. This algorithm was then applied to real-time Health Usage and Monitoring System (HUMS) data from a T700-GE-701C to track compressor efficiency on-line. The approach uses an optimal estimator called a Kalman filter. The filter is designed to estimate the compressor efficiency using only data from the engine's sensors as input.

This paper represents an overview of the activities carried out in the framework of RTO/AVT Working Group 10, Subgroup 1, dedicated to plug nozzle aerothermodynamics and performance. The subgroup worked out two main objectives: i) thorough understanding of the flow physics of plug nozzles through literature review and recent experiments conducted in Europe and USA; ii) definition of CFD test cases, conduction of CFD calculations and comparison with experimental data. This paper summarizes the findings of the flow physics based on literature review and recent experiments. It is the result of the many interesting discussions promoted by all members participating to the subgroup, whose contribution is acknowledged by the authors. In particular, the following key topics are discussed in depth in the paper: a) Survey on Past AGARD Activities. b) The Fundamental Aspects of Plug Nozzle Flowfields. c) The Wake Structure Transition from Open to Closed. d) The Influence of the External Flow. e) Plug Nozzle Base Pressure versus Flight Altitude. f) Altitude Adaptive Character of Plug Nozzles with Regard to Performance. g) Contour Design Methods. h) Aerospike: Thrust Vector Control.

While problem areas still exist in Supersonic Combustion Ramjets (SCRJ), its technology is nevertheless progressing towards military application. This Final Report contains discussions and calculations relevant to the SCRJ problem areas identified at the beginning of the activities by this Subgroup. ITAR, sensitivity and proprietary issues have prevented a full analysis of certain topics: some were explored only at the qualitative level, while others should be carried out later. The military implications of SCRJ technology is such that this is to be considered unavoidable if not acceptable. Participants in this Subgroup agreed that SCRJ technology, filled as it is with challenges, is ready to be tested for certain applications. With the understanding that Chapters 1-9 of this report are representative of only what is already available and understood in the open literature, the Conclusions and Recommendations sections at the end of each chapter indicate that (with the usual caveat from scientists) critical areas such as mixing, supersonic combustion, scaling and ground testing are approaching the maturity level enabling stepping up to flight testing of SCRJ-powered vehicles. It is important also to realize that problem areas outlined in these chapters are amenable to technological solutions either being tested now or that can be tested in the short term. This conclusion is supported by recent information from US supersonic combustion tests and by the successful Australian flight test of a scramjet engine. The general consensus was that SCRJ engines are likely to be viable for tactical missiles, e.g., for future Air Guided Missiles and also, possibly, for reconnaissance vehicles and cruise missiles. In this context, ground testing may be very effective to reduce the uncertainties (and therefore the cost) of flight tests; this is made possible by appropriately accounting for the differences in chemistry (and thus for the effect of air vitiation) as detailed in Chapter 4. This report identifies many key areas in need of further work. However, recent supersonic combustor experiments in the US are very encouraging in that they indicate that kerosene-based fuels pose fewer problems than anticipated in the past, thus paving the way to tactical applications. Hydrogen may remain the fuel for long range (strategic) SCRJ-powered vehicles, and (likely) that for part of trajectory of accelerators. Experiments mentioned, and others planned or in progress in France, indicate

regenerative cooling and flame anchoring is not only possible, but also feasible within the range of materials and flight conditions to be expected either now or in the near future.

The RTO AVT Working Group 10 was aimed to address selected critical issues related to propelled hypersonic flight, to review the associated state of the art for analysis and design, as well as to recommend activities for further developments. The three volumes cover mainly 3 parts corresponding to the output of three subgroups. Subgroup 1 dealt with reviewing fundamental aspects on plug nozzles such as altitude adaptation aspects, influence of external flow on thrust and addressing design methods. Subgroup 2 addressed the physical modelling aspects associated with scram combustion including fuels, turbulence mixing, ignition and flame holding prediction capabilities. Subgroup 3 screened and repeated a large number of test cases for CFD validation for areas where CFD validation was deemed essential, such as transition, real gas flows, laminar and turbulent shock-boundary layer interaction, as well as base flows with and without plumes. High standards for the selection and evaluation of test cases for CFD validation were applied, resulting in an unprecedented effort to improve technologies for hypersonic flight.

ONLINE: <http://hdl.handle.net/100.2/ADA469135>

The current focus on utilizing detonations for air-breathing propulsion has shifted from long-term studies of the possibility of fuel energy transformation in stabilized oblique detonation waves to investigations and practical development of propulsion engines operating on propagating detonations in a pulse mode. Contrary to the oblique-detonation concept that is applicable to hypersonic flight at velocities comparable or higher than the Chapman-Jouguet detonation velocity of the fuel-air mixture, the concept of a pulse detonation engine (PDE) is attractive for both subsonic and supersonic flight with the PDE as a main propulsion unit or as an afterburner in turbojet or turbofan propulsion system. In particular, PDE-based propulsion is attractive for flight Mach number up to about 4. Within this range of Mach number, solid rocket motors are known to be very efficient in terms of simplicity and high-speed capability, but they have a limited powered range. Turbojet and turbofan engines, due to their high specific impulse, provide longer range and heavier payloads, but at flight Mach number exceeding 2-3, they get too expensive. Ramjets and ducted rockets designed for flight Mach number up to 4 require solid rocket boosters to accelerate them to the ramjet take over speed, which increase the complexity and volume of a propulsion system. Combined-cycle engines, such as turbo-rockets or turboramjets, are also very complex and expensive for similar applications.

**A Multiservice Switch for Advanced Avionics Data Networks**

Rosen, W A; Phipps, W A; George, A D; Turner, D D; Gershman, V; Birmingham, M P; Jan 1996; 7 pp.; In English; Original contains color illustrations

Report No.(s): AD-A466320; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA466320>

With knowledge of persistent data communication traffic patterns offered to an avionics data network, modifications to the routing through the network can be made to improve total throughput and bound the latency of packets. The Multiservice Switch (MSS) is such a route-optimizing switch for streaming sensor data. The MSS has two switching fabrics: packet switching and circuit switching. The packet-switching fabric routes small control and data packets between switch ports. The circuit-switching fabric uses a crossbar to physically connect ringlets, which reduces the workload on the packet-switching fabric for long data streams between the ports. An implementation of the MSS is described which uses commercial-off-the-

shelf (COTS) components. A simulation model was developed to show the benefits of the MSS under standard avionics workloads. The results of the MSS indicate distinct advantages in terms of performance, price, and power consumption over other conventional switch and network topology designs.

**QoS Negotiation in Real-Time Systems and its Application to Automated Flight Control**

Abdelzaher, Tarek F; Atkins, Ella M; Shin, Kang G; Nov 2000; 15 pp.; In English

Contract(s)/Grant(s): N00014-94-1-0229; IRI-9209031

Report No.(s): AD-A466414; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA466414>

Real-time middleware services must guarantee predictable performance under specified load and failure conditions, and ensure graceful degradation when these conditions are violated. Guaranteed predictable performance typically entails reservation of resources and use of admission control. Graceful degradation, on the other hand, requires dynamic reallocation of resources to maximize the application-perceived system utility while coping with unanticipated overload and failures. We propose a model for quality-of-service (QoS) negotiation in building real-time services to meet both of the above requirements. QoS negotiation is shown to 1) outperform 'binary admission control schemes (either guaranteeing the required QoS or rejecting the service request), 2) achieve higher application-perceived system utility, and 3) deal with violations of the load and failure hypotheses. We incorporated the proposed QoS-negotiation model into an example real-time middleware service, called RTPOOL, which manages a distributed pool of shared computing resources (processors) to guarantee timeliness QoS for real-time applications. In order to guarantee timeliness QoS, the resource pool is encapsulated with its own schedulability analysis, admission control, and load-sharing support. This support differs from others in that it adheres to the proposed QoS-negotiation model. The efficacy and power of QoS negotiation are demonstrated for an automated flight control system implemented on a network of PCs running RTPOOL. This system is used to fly an F-16 fighter aircraft modeled using the Aerial Combat (ACM) F-16 Flight Simulator. Experimental results indicate that QoS negotiation, while maintaining real-time guarantees, enables graceful QoS degradation under conditions in which traditional schedulability analysis and admission control schemes fail.

**Analysis of Crossflow Transition Flight Experiment aboard the Pegasus Launch Vehicle**

Malik, Mujeeb R.; Li, Fei; Choudhan, Meelan; June 25, 2007; 34 pp.; In English; 37th AIAA Fluid Dynamics Conference and Exhibit, 25-28 Jun. 2007, Miami, FL, USA; Original contains color and black and white illustrations

Contract(s)/Grant(s): WBS 305311.43

Report No.(s): AIAA Paper-2007-4487; Copyright; Avail.: CASI: [A03](#), Hardcopy

The Pegasus wing-glove flight experiment was designed to provide crossflow transition data at high Mach numbers, specifically to help validate stability based predictions for transition onset in a flight environment. This paper provides an analysis of the flight experiment, with emphasis on computational results for crossflow disturbances and the correlation of disturbance growth factors with in-flight transition locations via the  $e(\sup N)$  method. Implications of the flight data for attachment line stability are also examined. Analysis of the thermocouple data reveals that transition (from turbulent to laminar flow) was first detected during the ascending flight of the rocket when the free stream Mach number exceeded about 4. Therefore, computations have been performed for flight Mach numbers of 4.13, 4.35, 4.56 and 4.99. Due to continually decreasing unit Reynolds number at higher altitudes, the entire wing-glove boundary layer became laminar at the highest flight Mach number computed above. In contrast, the boundary layer flow over the inboard tile region remained transitional up to and somewhat beyond the time of laminarization over the instrumented glove region. Linear stability predictions confirmed that the tile boundary layer is indeed more unstable to crossflow disturbances than the much colder stainless steel glove boundary layer. The transition locations based on thermocouple data from both the glove and the tile regions are found to correlate with stationary-crossflow N-factors within the range of 7 to 12.4 and with traveling mode N-factors between 7.6 and 14.1. Data from the thermocouples and hot film sensors indicates that transition from turbulent to laminar flow (i.e., laminarization) at a fixed point over the glove is generally completed within a flight time interval of 3 seconds. However, the

times at which transition begins and ends as inferred from the hot film sensors are found to differ by about 2 seconds from the corresponding estimates based on the thermocouple data.

**Fretting Wear-Resistant, Micro-Arc Oxidation Coatings for Aluminum and Titanium Alloy Bearings (Preprint)**

Choppy, K J; Kovar, R F; Cushman, B M; Mar 2007; 23 pp.; In English; Original contains color illustrations

Contract(s)/Grant(s): FA8650-06-M-5033; Proj-3005

Report No.(s): AD-A469003; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA469003>

This report was developed under a SBIR contract, and has been released to the public by Infoscitex. Aluminum and titanium alloys are used as replacements for steel in gear boxes of aircraft and helicopters in both military and commercial air vehicles, due to their low density, mechanical strength and thermal conductivity. However, these alloys are susceptible to fretting wear when matched to harder steel surfaces under high loads at elevated temperatures. Anodized coatings are too thin and porous to protect these metals. Infoscitex applied a proprietary micro-arc oxidation process to produce hard, thick, and adherent oxide coatings on aluminum and titanium alloys that rendered the coated metal components resistant to fretting type wear. Selected aluminum and titanium alloy test specimens were micro-arc treated then measured for surface hardness, roughness, and adhesion to metal substrate. Block-on-Ring fretting wear tests on polished test specimens against M-50 steel were conducted in the presence of lubricant, under high loading, at ambient and 400 degrees F temperatures. Coefficient of friction and wear volume were measured versus number of test cycles. The results of efforts to improve the fretting wear resistance of aluminum and titanium alloy bearings for use in aircraft gear box applications will be discussed.

**Environmental Impacts of Airport Operations: Maintenance, and Expansion**

Luther, Linda; Apr 5, 2007; 20 pp.; In English; Original contains color illustrations

Report No.(s): AD-A466859; CRS-RL33949; No Copyright; Avail.: Defense Technical Information Center (DTIC)

Funding authorization for Federal Aviation Administration (FAA) programs set forth in the Vision 100 Century of Aviation Reauthorization Act (P.L. 108-176, hereafter referred to as Vision 100) are set to expire at the end of FY2007. During the current reauthorization process, methods to address the environmental impacts associated with airport operations and expansion are likely to be debated. This issue is important to various stakeholders, particularly those whose health, property values, and quality of life may be affected by such impacts. The concerns of community members and local, state, and tribal agencies regarding environmental impacts have led to the delay and cancellation of some airport expansion projects. To address these concerns, airports may be required to implement projects that would minimize the environmental impacts of their operations. Some of these projects qualify for federal funding. For example, in its FY2008 budget, the FAA requested \$354 million to meet its Environmental Stewardship goals. Projects funded under this category address the environmental impacts of airports, primarily to abate airport noise (e.g., soundproofing homes, purchasing noise barriers and monitors, and relocating persons or businesses). Among other uses, funds may be spent on projects to minimize water quality impacts (e.g., funding projects that would control the discharge of deicing chemicals) and to reduce airport-controllable air emissions (e.g., purchasing alternative fuel vehicles to replace the airport's ground services equipment). Funds also are authorized for researching new aircraft technology that would reduce noise and air emissions.

**Rapid Runway Repair (RRR): An Optimization for Minimum Operating Strip (MOS) Selection**

Duncan, David; Mar 2007; 125 pp.; In English; Original contains color illustrations

Report No.(s): AD-A467547; AFIT/GEM/ENV/07-M4; No Copyright; Avail.: Defense Technical Information Center (DTIC)

Minimum Operating Strip (MOS) selection determines the exact placement of the MOS on the damaged runway, and therefore, the amount of munitions that need to be neutralized and the amount of damage that will need to be repaired. MOS selection, in essence, is the key determinant of the time required to attain an operational takeoff and recovery surface. Since the MOS selection stage determines the events and scope of work for all of the Rapid Runway Repair (RRR) stages that follow, it could be argued that this is the most important stage in the entire RRR process. The primary purpose of this research was to evaluate the application of a decision analysis methodology for the selection of a MOS during the RRR process. The secondary purpose was to determine the effect of additional considerations on both the MOS selected and the repair time. MOSs selected utilizing the outlined methodology were compared to a MOS selected using the current USAF method. Results showed that additional considerations have an impact on both MOS selection and time to repair. Results also showed that the outlined methodology selected a MOS with a shorter repair time, despite additional damage, than the MOS selected using the current USAF method.

**Grout Impregnation of Pre-Placed Recycled Concrete Pavement (RCP) for Rapid Repair of Deteriorated Portland Cement Concrete Airfield Pavement**

Mann, Travis A; Freeman, Reed B; Anderton, Gary L; Apr 2007; 132 pp.; In English; Original contains color illustrations  
Report No.(s): AD-A467797; ERDC/GSL-TR-07-9; No Copyright; Avail.: Defense Technical Information Center (DTIC)

The U.S. military must have the ability to rapidly deploy troops and equipment anywhere in the world as part of a contingency operation. Recent military operations have highlighted the critical need for rapid repair procedures and materials for military use on substandard, in-theater airfields. The U.S. Army Engineer Research and Development Center is currently addressing these problems through a 6-year demonstration-based research and development program called JRAC (Joint Rapid Airfield Construction). This study involves the development of a method using rapid setting grouts and recycled concrete pavement (RCP) to repair portland cement concrete pavements. A laboratory study was conducted to evaluate material properties in order to gain an understanding of expected field performance. Eight full scale repairs were constructed using two rapid setting grouts, two types of equipment, and two concrete slabs. The repairs were successfully trafficked with simulated C-17 aircraft wheel loads to verify the structural capacity and, ultimately, the procedures.

Report No.(s): AD-A468966; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA468966>

Since the 1960s the Air Force has employed an aluminum matting system, AM-2, for rapid aircraft parking ramp expansion (RPRE) in austere environments. While functional and durable, AM-2 is heavy and cumbersome to install. The restrictive weight of AM-2 and its tedious installation complicate the process of deploying aircraft. The Air Force Research laboratory (AFRL) is developing an AM-2 alternative made from composite materials. This next generation matting system, AM-X, consists of a lightweight foam core sandwiched between composite face sheets. The critical key performance parameters (KPP) for AM-X are a unit weight between 154.7 N/m<sup>2</sup> (3.23 lbs/ft<sup>2</sup>) and 232.7 N/m<sup>2</sup> (4.86 lbs/ft<sup>2</sup>), and a useful life requirement between 1500 and 1000 passes by a tire carrying a 133,733N (30,000 lb) load creating a surface pressure of

241.9N/cm<sup>2</sup> (350 psi) over a soil with a California Bearing Ration (CBR) value of 6 with no more than 3.81cm (1.5 in) deflection in the panel. In addition, the panel size is also critical for transportability requirements enabling the use of the standard 463L pallet. Successful proof-of-concept tests were completed in June 2003 demonstrating that the panel deflection requirement can be met. Design iterations focusing on optimizing the panel properties and geometries with respect to deflection are complete. Further mat tests took place in August 2005, June 2006 and September 2006. Results of the design iterations, full scale field testing, and a comparison of design vs. actual deflection of the panels will be reported.

#### **Fully Reusable Access to Space Technology (FAST) Methane Rocket**

Doupe, Cole; Sponable, Jess; Zweber, Jeffrey; Cohn, Richard; Mar 16, 2007; 42 pp.; In English

Contract(s)/Grant(s): Proj-5026

Report No.(s): AD-A467945; No Copyright; Avail.: Defense Technical Information Center (DTIC)

This paper provides an overview of the Fully Reusable Access to Space Technology (FAST) program. The program is an Air Force Research Laboratory initiative to methodically mature the technologies required for next generation operationally responsive space access - an Air Force Space Command mission. Program goals and requirements are delineated as well as technology approaches. The acquisition strategy matures key technologies in ground experiments through 2011, and then integrates the experiments into a subscale X-aircraft for ground or potentially flight test by 2013. The airframe experiment includes propellant tanks, structure and thermal protection systems fabricated and tested at the X-aircraft scale. In addition, subsystems experiments shall be accomplished such as a Flight Operations Control Center, avionics, adaptive GN&C, Integrated Systems Health Management, etc. An approach is also identified for either using an off-the-shelf propulsion system or a low cost, high ops tempo propulsion experiment. Key program goals include ensuring component demonstrations are scaleable to larger future operational systems, and that the technology demonstrations directly transition to fabrication and flight test of the experimental flight test vehicle. Potential future applications of the technologies are also briefly reviewed.

#### **Prioritizing Satellite Payload Selection via Optimization**

Kallemyn, Benjamin S; Mar 2007; 128 pp.; In English; Original contains color illustrations

Report No.(s): AD-A468455; AFIT/GOR/ENS/07-14; No Copyright; Avail.: Defense Technical Information Center (DTIC)

This thesis develops optimization models for prioritizing payloads for inclusion on satellite buses with volume, power, weight and budget constraints. The first model considers a single satellite launch for which the budget is uncertain and constellation requirements are not considered. Subsequently, we include constellation requirements and provide a more enhanced model. Both single-launch models provide a prioritized list of payloads to include on the launch before the budget is realized. The single-launch models are subsequently extended to a sequence of multiple launches in two cases, both of which incorporate an explicit dependence on the constellation composition at each launch epoch. The first case ignores future launches and solves a series of independent single-launch problems. The second case considers all launches simultaneously. The optimization models for single- and multiple-launch cases are evaluated through a computational study. It was found that, when the budget distribution is skewed, the prioritization model outperforms a greedy payload selection heuristic in the single-launch model. For the multiple-launch models, it was found that the consideration of future launches can significantly improve the objective function values.

Report No.(s): PB2007-104647; No Copyright; Avail.: CASI: [A03](#), Hardcopy

Solar array assemblies and systems and methods for deploying solar cell arrays from a spacecraft are provided. A solar cell panel assembly comprises a first flexible solar panel and a rotational member. A first extension assembly is disposed proximate to a first end of the rotational member and a second extension assembly is disposed proximate to a second end of the rotational member. The solar cell panel assembly further comprises a first support member and a second support member. The first end of the first support member is coupled to the first end of the rotational member and the first end of the second support member is coupled to the second end of the rotational member. The second ends of the support members are coupled to the first flexible solar panel. A tether assembly couples the extension assemblies to the support members.

**Joint Space Forces in Theater: Coordination is No Longer Sufficient**

Livergood, Brian K; Apr 2007; 89 pp.; In English; Original contains color illustrations

Report No.(s): AD-A468768; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA468768>

The role of space operations in the USA military has matured significantly since the end of the Cold War. The transformation from strategic applications to tactical integration has increased the demands for effects achievable through joint space capabilities on and off the battlefield. The explosive growth of and demand for joint space capabilities have outstripped the joint community's ability to provide unifying doctrine and a command and control structure to meet the demands. Consequently, the military services have independently developed solutions and doctrine to meet the needs of their respective joint force component commander. The thesis of this research is the US military must create a jointly focused command and control organization to meet the Joint Force Commander's growing demand for synchronized joint space capabilities. Although joint doctrine addresses the need for a space coordinating authority (SCA) separate from a commander to achieve space superiority, it does not provide sufficient joint authority to effectively execute the SCA role. Consequently, the Joint Force Air Component Commander has attempted to combine the roles in the Joint Air Operations Center resulting in a less than optimum integration of space into US joint warfighting. To establish clear lines of authority and enable a joint forces wide perspective of space power, a Joint Space Synchronization Authority supported by a Joint Space Synchronization Officer, Theater Space Integration Cell, and Joint Space Superiority Cell is proposed. While these organizations could operate independently of each other at different locations, the greatest synergy is obtained by co-locating them in a Joint Space Integration Division in the JAOC. This construct allows for a jointly recognized and focused approach to space force synchronization and integration across all components.

**Application of the Community Radiative Transfer Model to Evaluate Satellite-Based Measurements Across the African Easterly Jet Over Western Africa**

Ernest, Richard D; Mar 2007; 90 pp.; In English

Report No.(s): AD-A467189; No Copyright; Avail.: Defense Technical Information Center (DTIC)

The Community Radiative Transfer Model (CRTM) has been used to determine which polar-orbiter satellite channels are best suited to remotely sense in a cloud-free environment the lower-tropospheric temperature and moisture gradients that determine the location and intensity of the African Easterly Jet over West Africa. This study evaluates the capability of five microwave sensors and three infrared sensors, including both conical- and cross-track scanning instruments. Atmospheric

profiles obtained during the JET2000 field experiment blended with the European Center for Medium-range Weather Forecasting model analyses are input in the CRTM to obtain brightness temperature outputs. To address separately the moisture (temperature) signature, the average of the northern and southern temperature (moisture) profiles were combined with the real moisture (temperature) profiles. The effects of land surface emissivity uncertainty of +/-3% for microwave and +/-1% for infrared were tested. From the total set of 423 channels evaluated, 11 microwave and 21 infrared channels were found appropriate for obtaining moisture gradient information, but after applying emissivity perturbations this list was reduced to two microwave and 20 infrared channels. Temperature gradient information was determined to be available from 35 microwave channels and 95 infrared channels, with no impacts noted due to emissivity perturbations.

### **Fault Tolerant Optimal Trajectory Generation for Reusable Launch Vehicles (Preprint)**

Shaffer, Patrick J; Ross, I M; Oppenheimer, Michael W; Doman, David B; Bollino, Kevin P; Dec 2006; 39 pp.; In English  
Contract(s)/Grant(s): Proj-A03G

Report No.(s): AD-A467516; No Copyright; Avail.: Defense Technical Information Center (DTIC)

Reconfigurable inner-loop control laws improve the fault tolerance of a vehicle to control effector failures; however, in order to preserve stability, the unfailed effectors may be deployed to off-nominal positions to compensate for undesirable perturbations caused by the failed effectors. The effectors acting under the influence of a reconfigurable control law can produce significant perturbations to the nominal forces produced by the wing and body and can also affect the range of flight conditions over which the vehicle can be controlled. Three degree-of-freedom (3 DOF) dynamical models used in trajectory optimization for aerospace vehicles typically include wing-body aerodynamic force effects but ignore the aerodynamic forces produced by the control surfaces. In this work, a method for including these trim effects as well as control induced trajectory constraints in a 3 DOF model is presented.

### **Video Enabling the Combatant Commander's Headquarters**

Lee, Justin; Nakagawa, Arthur; Jun 2004; 50 pp.; In English; Original contains color illustrations

Report No.(s): AD-A465993; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA465993>

A combatant commander's decisions are based on critical and timely information. Today the information is more and more graphical and video based. Video information may take many forms---imagery from intelligence satellites, weather satellites, tactical reconnaissance platforms, biographical information data bases; graphical information including common operational picture, 3D terrain modeling, signals analysis, trend analysis and are all used in formulating courses of action. This is complicated by the need for collaboration among staff, inter agency and through chain of command. The result is that the headquarters for a combatant commander needs to be video enabled to allow the high speed transfer of digital imagery and graphics and use of advanced collaborative technologies. This paper discusses the audio-visual (A-V) systems which have been designed for the headquarters for USA Pacific Command (HQ USPACOM) and installed in the Nimitz-MacArthur Pacific Command Center (NMPCC), USPACOM's new headquarters building. These systems are being employed through the design and implementation of an integrated A-V systems architecture that enables the proliferation and sharing of video information and promotes collaboration both internally within HQ USPACOM and with external organizations. The A-V systems architecture includes multimedia communications systems that enable advanced internal briefing capabilities, video

teleconferencing at multiple security levels, mass multimedia distribution capabilities and an advanced A-V control system that integrates control and access of multimedia information.

**On-Orbit Identification of Inertia Properties of Spacecraft using Robotics Technology**

Ma, Ou; Dec 2006; 52 pp.; In English

Contract(s)/Grant(s): FA9550-06-1-0284

Report No.(s): AD-A466116; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA466116>

This technical report describes the results of a 6-month research project conducted by Dr. Ou Ma and one of his graduate students at the New Mexico State University under the AFOSR grant number FA9550-06-1-0284 starting in May 2006. In the project, a methodology of on-orbit identification of spacecraft inertia properties (i.e., the mass, the location of the mass center, and the inertia tensor) using a robotic arm was investigated. The extension of the method to using a solar array (instead of a robot) was also preliminarily investigated. The investigation was done in theory and by simulation only because of the time and funding limitations. The ultimate goal of this research is to enhance the control and operation of spacecraft for more challenging autonomous on-orbit service missions in the future.

**Mission Support for the Communications/Navigation Outage Forecast Satellite**

Hysell, D L; Aug 30, 2006; 11 pp.; In English; Original contains color illustrations

Contract(s)/Grant(s): F19628-03-C-0067; Proj-1010

Report No.(s): AD-A466144; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA466144>

This is a project to provide mission support for the Communication/Navigation Outage Forecast System (C/NOFS) under BAA VS-O3-O1 during its first four years of operation. Cornell is required to support the mission with ground-based radar observations of background ionospheric parameters and of Equatorial Spread F (ESF) events from the Jicamarca Radio Observatory near Lima, Peru. In the pre-launch period for C/NOFS, Cornell and Jicamarca contributed to the project by measuring plasma density, drift, temperature, and composition profiles during eight campaign periods. Cornell's theoretical studies based on the radar observations of the postsunset bottomside F region have also identified a new plasma shear instability that acts as a seed for the observed large-scale density irregularities. In this report, the field-line averaged linear growth rate of the instability and its comparison with that of the generalized Rayleigh-Taylor instability are presented. The shear instability may be used as a tool for understanding and forecasting of ESF. The instability model and its forecasting capability will improve when C/NOFS measurements are available.

**System Level Architecture of Cooperative Satellite Control Using Hierarchical Hybrid Systems and Automata Theory**

Won, Chang-Hee; Mar 28, 2007; 31 pp.; In English

Contract(s)/Grant(s): FA9550-06-1-0293

Report No.(s): AD-A467129; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA467129>

We investigated a hierarchical hybrid system architecture to implement an autonomous multiple satellite control scheme for the low earth orbit remote sensing satellites. We networked multiple satellites and ground control station into a hierarchical hybrid system and applied hybrid automata theory onto the different tiers of the system. Compared with the traditional satellite control concept, the hierarchical hybrid system is more autonomous, effective, scalable, and robust for the space remote sensing applications. In this paper, we developed the mathematical model for the multiple satellite control model and simulated the model with Matlab, Simulink and Stateflow. The simulation results show that the hierarchical hybrid system theory is feasible for the autonomous control of multiple satellite.

**Air Force-Navy Team Achieves Important Flight Test Milestone for Responsive Space Lift**

Garvey, John; Oct 5, 2006; 11 pp.; In English

Contract(s)/Grant(s): FA0300-05-M-3010

Report No.(s): AD-A466871; No Copyright; Avail.: Defense Technical Information Center (DTIC)

A joint service team consisting of the Air Force Research Laboratory's Propulsion Directorate (AFRL/PR), the Space and Missile Systems Center (SMC) and the Naval Air Warfare Center (NAVAIR) achieved a significant milestone on 28 September 2006 with an initial demonstration of responsive launch operations from the Navy's San Nicolas Island. Using an early prototype of the first stage for a reusable launch vehicle (RLV), the test focused on programmatic processes and issues that are considered to be critical factors to enabling responsive space lift with future launch systems. San Nicolas Island, which is situated off the coast of southern California and is a key element of NAVAIR's Sea Range, was chosen to host this test because it shares many of the same features relative to geography, facilities and logistics as other candidate launch sites that SMC is assessing as part of its Generic Approach to Launch Transformation (GALT) initiative.

**Chamber Core Structures for Fairing Acoustic Mitigation**

Lane, Steven A; Henderson, Kyle; Williams, Andrew; Ardelean, Emil; Feb 2007; 9 pp.; In English

Contract(s)/Grant(s): Proj-2302

Report No.(s): AD-A467095; No Copyright; Avail.: Defense Technical Information Center (DTIC)

The U.S. Air Force Research Laboratory is pursuing an innovative composite structure design called chamber core for constructing launch vehicle payload fairings. A composite chamber core fairing consists of many axial tubes sandwiched between face sheets, tubes that can be used as acoustic dampers to reduce low-frequency interior noise with virtually no added mass. This paper presents the results of experimental studies of noise transmission through a 1.51 m diameter x 1.42 m tall chamber core cylinder. It was tested in a semireverberant acoustics laboratory using band-limited random noise at sound pressure levels up to 110 dB. The bare cylinder provided approximately 12.7 dB of attenuation over the 0-500 Hz bandwidth and 15.3 dB over 0-2000 Hz. The noise reduction increased to over 18 dB for both bandwidths with the axial tubes acting as acoustic dampers. Narrowband reductions in excess of 15 dB were measured around specific acoustic resonances. This was accomplished with virtually no added mass to the composite cylinder. Results were compared with the performance provided by a 2.5 cm acoustic blanket treatment. The acoustic dampers were as effective as the acoustic blanket at low frequency, but not at higher frequencies. The acoustic dampers were better able to couple with and damp the low-frequency acoustic modes. Together, the acoustic blanket and dampers provided over 10 dB more noise reduction over the 2000 Hz bandwidth than the bare cylinder.

**Fine Pointing of Military Spacecraft**

Sands, Timothy A; Mar 2007; 154 pp.; In English

Report No.(s): AD-A467186; No Copyright; Avail.: Defense Technical Information Center (DTIC)

In 1923, Herman Oberth, considered by some to be the father of it all for space flight, wrote a book called *Die Rakete zu den Planetenraeumen* (i.e., *Dreams of Planets*) inspiring today's modern space flight. Amongst his suggestions was placing a telescope in space, so astronomical observations may be made without atmospheric distortion. Nearly a century later, the Hubble Space telescope is imaging distant stars with high accuracy. If Hubble were placed on the ground of the West Coast of the USA, it would be able to target a small coin placed on the Lincoln memorial on the East Coast of the USA. This startling accuracy has become useful for military spacecraft missions as well even though the mission is much more challenging. Military spacecraft perform aggressive slew maneuvers to acquire targets, but the actuators are complicated by singularities that can often lead to loss of attitude control during aggressive maneuvers. After acquiring the target, the spacecraft must rapidly settle and track the target as the spacecraft races by overhead. This dissertation addresses these challenges by introducing a new optimized geometry for installation of the spacecraft actuators to minimize the impact of singularities. Methods are discussed to orient the direction of maximum slew capability in a desired direction. In addition to the optimal geometry, a new algorithm is presented that reduces those remaining singularities that could lead to loss of attitude control. A newly developed algorithm is proven to fly through the singularities without losing attitude control. The advancements introduced here increase aggressive maneuver performance aiding military spacecraft rapidly acquire earthly targets.

**Real Options as a Strategic Management Framework: A Case Study of the Operationally Responsive Space Initiative**

Mitchell, Jr, Robert H; Mar 2007; 102 pp.; In English; Original contains color illustrations

Report No.(s): AD-A467722; AFIT/GRD/ENV/07-M2; No Copyright; Avail.: Defense Technical Information Center (DTIC)

The purpose of this research was to examine the potential for applying the concept of real options to the DoD acquisition system. The key premise of real options is the application of strategic decision making and flexibility in the face of future uncertainties. This thesis sought to answer three research questions, how could real options be applied to the acquisition system, how could the acquisition system benefit, and what are the potential challenges to implementation within the acquisition system. These research questions were addressed through a comprehensive literature and a case study of the Operationally Responsive Space (ORS) initiative. The ORS initiative is a transformational activity sponsored by the DoD to develop a strategy for deploying a flexible and responsive satellite system architecture for meeting the direct needs of the Combatant Commanders. Transcripts from interviews with six members of the ORS initiative, representing senior decision makers and project leads, were reviewed to gain insight into the goals and strategies of ORS. This research identified several consistent themes in the execution of the ORS initiative that present opportunities for the implementation of a real options framework in the defense acquisition system: the need for a new business strategy; the need for flexibility in our systems and processes to respond to future threats; and the need to exploit emerging capabilities and technologies. The culmination of this research is recommendations for further study of the real options, in particular how it might be codified for the use within the defense acquisition system.

**Investigation of Advanced Propellants to Enable Single Stage to Orbit Launch Vehicles**

Mossman, Jason; Oct 30, 2006; 91 pp.; In English

Contract(s)/Grant(s): Proj-48470255

Report No.(s): AD-A467749; AFRL-PR-ED-TP-2006-267; No Copyright; Avail.: Defense Technical Information Center (DTIC)

Single-Stage-To-Orbit (SSTO) launch vehicles designs offer the promise of reduced complexity and cost compared to multi-stage vehicles, as only one stage need be developed, produced, and maintained. Despite well-funded development efforts, no SSTO vehicles have been fielded to date. Existing chemical rocket and vehicle technologies do not enable feasible SSTO designs. In the future, new propellants with advanced properties could enable SSTO launch vehicles. A parametric sizing study was conducted to determine the rocket propulsion performance required. Bulk density, specific impulse, and main

propulsion thrust-to-weight level were varied to determine the sensitivity of SSTO vehicle size to these parameters. Advanced propellants including strained-ring hydrocarbons and polynitrogen compounds are evaluated for their suitability in SSTO applications.

**Wave Front Sensor for Solar Concentrator Control**

Beasley, Joseph N; Aug 31, 2006; 64 pp.; In English

Contract(s)/Grant(s): Proj-10110062

Report No.(s): AD-A467765; AFRL-PR-ED-JA-2006-299; No Copyright; Avail.: Defense Technical Information Center (DTIC)

This article is the culmination of research directed into finding a system to control the position of the focal spot of paraboloid concentrators for use in terrestrial and space solar concentration applications. After a brief introduction into the area of study, the article describes how a normal Shack-Hartmann wavefront sensor is modified for use in detecting and tracking the focal spot. The first experiment describes how the wavefront sensor is to be utilized in a solar application and shows the adjustment from lenslets to cylindrical mirrors on a thruster. Next, the paper details the analysis and development of the algorithms used in locating the focal spot on a thruster absorber utilizing a correlation method and an area centroid method. The article concludes with a paragraph on suitable future work.

**Minimization of Thruster Plume Effects on Spacecraft Surfaces**

Rohl, Peter J; Velez, Juan; Koo, Justin W; Gorrilla, Michael; May 2007; 37 pp.; In English

Contract(s)/Grant(s): FA9300-06-D-0002; Proj-SBIR

Report No.(s): AD-A467840; No Copyright; Avail.: Defense Technical Information Center (DTIC)

For the past several years, Advatech Pacific has been maintaining and enhancing the COLISEUM plume simulation environment under the direction of AFRL/PRSS. COLISEUM is a software environment used to model the propagation of a plasma plume and its interactions with solid surfaces (including both sputtering and re-deposition). A recent addition to the capabilities of COLISEUM is its integration with ModelCenter, the optimization and integration framework developed by Phoenix Integration. With the help of ModelCenter, the thrust directions of four Hall Effect Thrusters (HETs) for a representative satellite geometry are optimized such that the overall sputtering on the solar panels is minimized, subject to performance constraints on the overall thrust and torque. The satellite is assumed to be in a geosynchronous orbit, with the solar panels always facing the sun. Different positions in the satellite's orbit are considered, as is a case where one thruster is disabled. All cases considered showed smooth convergence behavior, and sputtering on the solar panels could be reduced significantly while meeting all performance constraints.

**Synthesis and Characterization of Space-Survivable POSS-Kapton (Trademark) Polyimides (Preprint)**

Tomczak, Sandra J; Minton, Timothy K; Brunsvold, Amy L; Vij, Vandana; Wright, Michael E; Petteys, Brian J; Guenther, Andrew J; Svejda, Steven A; Mabry, Joseph M; Mar 6, 2007; 15 pp.; In English

Contract(s)/Grant(s): F49620-01-1-0276; F49620-01-1-0335

Report No.(s): AD-A467920; No Copyright; Avail.: Defense Technical Information Center (DTIC)

Kapton(Registered) is used extensively in spacecraft thermal blankets, solar arrays, and space inflatable structures. This material is chosen due to its thermal and physical properties, however it is degraded severely in low Earth orbit (LEO) by atomic oxygen (AO). SiO<sub>2</sub> coatings impart remarkable oxidation resistance to Kapton(Registered), yet imperfections in the SiO<sub>2</sub> application process and micrometeoroid debris impact in orbit may damage the SiO<sub>2</sub> coating and lead to Kapton(Registered) erosion. Polyhedral oligomeric silsesquioxane (POSS) is a silicon and oxygen cage-like structure surrounded by organic groups. POSS-diamine and the monomers of Kapton(Registered) were polymerized and cured to form POSS-polyimide (POSS-PI) films. These POSS-copolymers are self-passivating by the formation of a silica layer upon

exposure to AO. Evidence of a SiO<sub>2</sub> passivation layer has been shown by X-ray photoelectron spectroscopy studies on AO exposed 3.5, 7.0, and 8.75 weight % Si<sub>8</sub>O<sub>11</sub> main chain (MC)-POSS-PI samples with erosion yields of 3.7, 0.98, and 0.3 percent, respectively, of the erosion yield for Kapton H(Registered) at a fluence of 8.5 x 10<sup>20</sup> O atoms cm<sup>-2</sup>. The self-passivation of POSS-PIs has also been demonstrated by monitoring a 1 micron deep scratch in AO-exposed main-chain-POSS-PI (MC-POSS-PI) after a second exposure to AO. A study of the effect of temperature on the AO erosion of POSS-PI samples showed that although the erosion of MC-POSS-PIs increased with temperature, they erode significantly less than their no-POSS analogues at elevated temperatures. POSS-polyimides flown for 3.9 years in low Earth orbit on the Materials International Space Station Experiment (MISSE) showed dramatically increased survival relative to 0 % POSS-polyimide. These results and physical property characterization of POSS-PIs exposed to AO, evidence that POSS-PIs are a viable Kapton(Registered) replacement material.

#### **China's Anti-Satellite Weapon Test**

Kan, Shirley; Apr 23, 2007; 7 pp.; In English; Original contains color illustrations

Report No.(s): AD-A468025; CRS/DC-RS22652; No Copyright; Avail.: Defense Technical Information Center (DTIC)

On January 11, 2007, the People's Republic of China (PRC) conducted its first successful direct-ascent anti-satellite (ASAT) weapons test in destroying one of its own satellites in space. The test raised international concerns about more space debris. Longer-term, the test raised questions about China's capability and intention to attack U.S. satellites. The purpose of this CRS Report, based on open sources and interviews, is to discuss that ASAT test by China's military, the People's Liberation Army (PLA), and issues about U.S. assessments and policies. This report will not be updated.

#### **Study of Free-Free Beam Structural Dynamics Perturbations due to Mounted Cable Harnesses**

Gooding, James C; Babuska, Vit; Griffith, D T; Ingram, Brea R; Robertson, III, Lawrence M; Apr 2007; 14 pp.; In English; Original contains color illustrations

Report No.(s): AD-A468392; No Copyright; Avail.: Defense Technical Information Center (DTIC)

Signal and power harnesses on spacecraft buses and payloads can alter structural dynamics, as has been noted in previous flight programs. The community, however, has never undertaken a thorough study to understand the impact of harness dynamics on spacecraft structures. The Air Force Research Laboratory is leading a test and analysis program to develop fundamental knowledge of how spacecraft harnesses impact dynamics and develop tools that structural designers could use to achieve accurate predictions of cable-dressed structures. The work described in this paper involved a beam under simulated free boundary conditions that served as a validation test bed for model development.

#### **A 4-Mbit Non-Volatile Chalcogenide-Random Access Memory Designed for Space Applications (Preprint)**

Li, Bin; Bumgarner, Adam; Pirkel, Daniel; Stobie, James; Neiderer, Wayne; Granziano, Michael; Burcin, Laura; Storey, Thomas; Orlovsky, Brian; Hunt, Kenneth K; Jan 29, 2007; 9 pp.; In English

Contract(s)/Grant(s): FA9453-04-C-0052; Proj-2181

Report No.(s): AD-A468501; No Copyright; Avail.: Defense Technical Information Center (DTIC)

A 4Mbit non-volatile Chalcogenide-Random Access Memory (C-RAM)(tm) has been designed and fabricated in RH25, a radiation hardened CMOS technology. The top-down design focused on accommodating chalcogenide process variations and satisfying space system specifications. The optimized band-gap circuit supplies reference current and voltage that meet temperature and voltage requirements. The innovative write circuitry supplies appropriate currents (amplitude and shape) to the chalcogenide memory cells to allow them to be programmed either in amorphous state (write '0') or crystalline state (write '1'). The on-chip pulse generator circuit can provide multiple pulse widths for write '0' and write '1', as well as preconditioning pulse. The write circuits have a dedicated power supply, which can be removed to place the part in a read only mode. The read circuitry includes a voltage limiting circuitry, an adjustable current reference, an adjustable pre-charge circuitry,

and a sense amplifier to accurately sense the current difference between cells programmed as '0' or '1'. A localized redundant cell architecture is implemented with shared read/write circuits to improve yield without impacting access times. The redundant cells can be tested prior to laser fusing or used to monitor endurance. Considerations for testability such as direct chalcogenide cell access, margin test, analog monitors, and endurance acceleration have been implemented. Noise and power reduction techniques have also been used globally.

Report No.(s): AD-A468783; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA468783>

A spacecraft is subjected to very large dynamic forces from its launch vehicle during its ascent into orbit. These large forces place stringent design requirements on the spacecraft and its components to assure that the trip to orbit will be survived. The severe launch environment accounts for much of the expense of designing, qualifying, and testing satellite components. Reduction of launch loads would allow more sensitive equipment to be included in missions, reduce risk of equipment or component failure, and possibly allow the mass of the spacecraft bus to be reduced. These benefits apply to military as well as commercial satellites. This paper reports the design and testing of a prototype whole-spacecraft isolation system which will replace current payload attach fittings is passive-only in nature, and provides lateral isolation to a spacecraft which is mounted on it. This isolation system is being designed for a medium launch vehicle and a 6500 lb spacecraft but the isolation technology is applicable to practically all launch vehicles and spacecraft, small and large. The feasibility of such a system on a small launch vehicle has been demonstrated with a system-level analysis which shows great improvements. The isolator significantly reduces the launch loads seen by the spacecraft. Follow-on contracts will produce isolating payload attach fittings for commercial and government launches.

**Cooling Performance of a Partially-Confined FC-72 Spray: The Effect of Variable Gravity (Postprint)**

Michalak, Travis E; Yerkes, Kirk L; Puterbaugh, Rebekah; Jan 2007; 16 pp.; In English; Original contains color illustrations

Contract(s)/Grant(s): Proj-3145

Report No.(s): AD-A468416; AFRL-PR-WP-TP-2007-222; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA468416>

This paper discusses the effects of a variable-gravity environment on the performance of a subcooled partially-confined spray. An experiment was flown on the NASA KC-135, providing various gravity levels (-0.16, 0.35, 1.0, and 1.8 g). The experiment consists of a nozzle spraying on a Thick Film Resistor (TFR) heater which is mounted on an insulating glass pedestal. The working fluid is FC-72. Non-dimensional heat input varied over the range  $35 < (1-f)G\Delta < 190$ , with a heat flux of  $20 < (1-f)q' < 70$  W/cm<sup>2</sup>. The non-dimensional grouping  $(Fr/2Ga)^{1/2}$ , a ratio of inertia and acceleration forces to viscous forces, varied over the range  $35 < (Fr/2Ga)^{1/2} < 70$ . Subcooling temperature ranged from  $24 \text{ deg C} < T_{sc} < 30 \text{ deg C}$ . For this data, from one flight week of three flights,  $\Delta T = T_s - T_{sat}$  is found to decrease with decreasing values of  $(Fr/2Ga)^{1/2}$ . It appears that higher values for subcooling may enhance this acceleration effect. Changing the flow rate may affect how much the acceleration level affects the 2-phase heat transfer coefficient ( $h_{2-p}$ ), with the higher flow rate showing less of a change in  $h_{2-p}$  as the acceleration level changes.

**Cooling Performance of a Partially-Confined FC-72 Spray: The Effect of Dissolved Air (Postprint)**

Puterbaugh, Rebekah L; Yerkes, Kirk L; Michala, Travis E; Thomas, Scott K; Jan 2007; 14 pp.; In English

Report No.(s): AD-A468418; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA468418>

This paper discusses the heat transfer performance of a partially-confined FC-72 spray with varying dissolved air concentrations. An experimental test rig was used to obtain critical heat flux (CHF) data. A nozzle allowed the fluid to be sprayed onto a thick-film resistor heater, which was mounted onto a glass post, with a sump system to allow removal of excess fluid. Type-E thermocouples were imbedded in the post to obtain temperature data. The parametric ranges for testing were: volume-percent concentration of dissolved air,  $1 < C < 20\%$ , chamber saturation pressure,  $6.90E+4 < P_{sat} < 8.27E+4$  N/m<sup>2</sup>, subcooling,  $2 < \Delta T_{sc} < 12$  deg C, volumetric flow rate,  $6.31E-6 < V < 10.5E-6$  m<sup>3</sup>/s. Test data were obtained for comparison of CHF with varying C while controlling the spray chamber pressure. An empirical mathematical relationship allowing for determination of surface heat flux with varying flow rate was also developed. The model was obtained using test data at flow rates of  $V = 6.31E-6, 8.41E-6, \text{ and } 10.5E-6$  m<sup>3</sup>/s, and was validated using experimental data obtained for flow rates of  $V = 7.36E-6$  and  $9.46E-6$  m<sup>3</sup>/s.

### **Learning from Past Experiences**

Hulet, Michael W.; [2007]; 1 pp.; In English; NASA Project Management (PM) Challenge 2008, 5th Annual NASA Project Management Conference, 26-27 Feb, 2008, Daytona, FL, USA; No Copyright; Avail.: Other Sources; Abstract Only

Space flight is a risky business. This truism has been bandied about since the earliest days of the space program. When asked by the young daughter of a coworker, one of the Mercury astronauts likened launching into space to 'riding a Roman candle' -- it was both exciting and dangerous. Even in these more technologically advanced days, the solid rocket boosters and external tanks of the space shuttle provide a no less exciting, or dangerous, ride into space. However much the phrase 'risk mitigation' is bandied about within the U.S. space program, there is still the history of the Apollo 1 fire during a ground test at Cape Canaveral, Fla., the loss of the shuttle Challenger during liftoff, and the loss of the shuttle Columbia when returning to Earth to remind us that while we give lip-service to risk management, we have not learned to manage risk as well as we ought. Moreover, there are many more less dramatic, but equally critical, incidents that have occurred in association with the space program that also highlight our inability to accurately gauge and manage risk. Why do we seem caught in a senseless spiral in which we focus most on risk only after a tragedy? Why do we repeat serious mishaps and not learn from our mistakes? This paper reviews some possible explanations for our risk-taking behavior and provides examples of interest to the NASA centers, while also discussing inter center and intra-center opportunities for sharing information to mitigate risk.

Contract(s)/Grant(s): NNL06AA23A; WBS 732759.07.05

Report No.(s): AIAA Paper 2007-4267; Copyright; Avail.: CASI: **A03**, Hardcopy

During the Columbia Accident Investigation, imaging teams supporting debris shedding analysis were hampered by poor entry image quality and the general lack of information on optical signatures associated with a nominal Shuttle entry. After the accident, recommendations were made to NASA management to develop and maintain a state-of-the-art imagery database for Shuttle engineering performance assessments and to improve entry imaging capability to support anomaly and contingency analysis during a mission. As a result, the Space Shuttle Program sponsored an observation campaign to qualitatively characterize a nominal Shuttle entry over the widest possible Mach number range. The initial objectives focused on an assessment of capability to identify/resolve debris liberated from the Shuttle during entry, characterization of potential anomalous events associated with RCS jet firings and unusual phenomenon associated with the plasma trail. The aeroheating technical community viewed the Space Shuttle Program sponsored activity as an opportunity to influence the observation objectives and incrementally demonstrate key elements of a quantitative spatially resolved temperature measurement capability over a series of flights. One long-term desire of the Shuttle engineering community is to calibrate boundary layer transition prediction methodologies that are presently part of the Shuttle damage assessment process using flight data provided by a controlled Shuttle flight experiment. Quantitative global imaging may offer a complementary method of data collection to more traditional methods such as surface thermocouples. This paper reviews the process used by the engineering community to influence data collection methods and analysis of global infrared images of the Shuttle obtained during hypersonic entry. Emphasis is placed upon airborne imaging assets sponsored by the Shuttle program during Return to Flight. Visual and IR entry imagery were obtained with available airborne imaging platforms used within DoD along with agency assets developed and optimized for use during Shuttle ascent to demonstrate capability (i.e., tracking, acquisition of multispectral data, spatial resolution) and identify system limitations (i.e., radiance modeling, saturation) using state-of-the-art imaging instrumentation and communication systems. Global infrared intensity data have been transformed to temperature by comparison to Shuttle flight thermocouple data. Reasonable agreement is found between the flight thermography images and numerical prediction. A discussion of lessons learned and potential application to a potential Shuttle boundary layer transition flight test is presented.

ONLINE: <http://hdl.handle.net/100.2/ADA466653>

Successful space-based technologies like satellite imagery and GPS have increased military demand for a rapid-response launch capability. AF Space Command's Operationally Responsive Spacelift program was developed to ensure that the AF has the capability to launch a payload into orbit within hours of a tasking notification, and requires development of a new space launch vehicle. The Reusable Military Launch Vehicle (RMLV) is currently in the design phase. The AF Research Laboratory sponsored development of the MILEPOST simulation model in order to assess the turnaround time, and thus responsiveness, of various design alternatives. The focus of this thesis is to improve the fidelity of the MILEPOST model by assessing the logistics manpower required to support the modeled turnaround activities. The research determined the appropriate AF organizational structure and manpower requirements for RMLV ground support agencies based on the activities modeled in

MILEPOST. This information will be incorporated into the model in future research efforts, resulting in the capability to evaluate RMLV design alternatives based on both turnaround time and workforce requirements.

On Feb 1, 2003, the Shuttle Columbia was lost during its return to Earth. As a result of the conclusion that debris impact caused the damage to the left wing of the Columbia Space Shuttle Vehicle (SSV) during ascent, the Columbia Accident Investigation Board recommended that an assessment be performed of the debris environment experienced by the SSV during ascent. A flight rationale based on probabilistic assessment is used for the SSV return-to-flight. The assessment entails identifying all potential debris sources, their probable geometric and aerodynamic characteristics, and their potential for impacting and damaging critical Shuttle components. A probabilistic analysis tool, based on the SwRI-developed NESSUS probabilistic analysis software, predicts the probability of impact and damage to the space shuttle wing leading edge and thermal protection system components. Among other parameters, the likelihood of unacceptable damage depends on the time of release (Mach number of the orbiter) and the divot mass as well as the impact velocity and impact angle. A typical result is visualized in the figures below. Probability of impact and damage, as well as the sensitivities thereof with respect to the distribution assumptions, can be computed and visualized at each point on the orbiter or summarized per wing panel or tile zone.

#### **Re-Entry Aeroheating Analysis of Tile-Repair Augers for the Shuttle Orbiter**

Mazaheri, Ali R.; Wood, William A.; June 25, 2007; 12 pp.; In English; 37th AIAA Fluid Dynamics Conference and Exhibit, 25-28 Jun. 2007, Miami, FL, USA; Original contains color and black and white illustrations

Contract(s)/Grant(s): NNL06AC49T; WBS 732759.07.05

Report No.(s): AIAA Paper 2007-4148; Copyright; Avail.: CASI: [A03](#), Hardcopy

Computational re-entry aerothermodynamic analysis of the Space Shuttle Orbiter's tile overlay repair (TOR) sub-assembly is presented. Entry aeroheating analyses are conducted to characterize the aerothermodynamic environment of the TOR and to provide necessary inputs for future TOR thermal and structural analyses. The TOR sub-assembly consists of a thin plate and several augers and spacers that serve as the TOR fasteners. For the computational analysis, the Langley Aerothermodynamic Upwind Relaxation Algorithm (LAURA) is used. A 5-species non-equilibrium chemistry model with a finite rate catalytic recombination model and a radiation equilibrium wall condition are used. It is assumed that wall properties are the same as reaction cured glass (RCG) properties with a surface emissivity of  $\epsilon = 0.89$ . Surface heat transfer rates for the TOR and tile repair augers (TRA) are computed at a STS-107 trajectory point corresponding to Mach 18 free stream conditions. Computational results show that the average heating bump factor (BF), which is a ratio of local heat transfer rate to a design reference point located at the damage site, for the auger head alone is about 1.9. It is also shown that the average BF for the combined auger and washer heads is about 2.0.

The Mars Reconnaissance Orbiter (MRO) launched on August 12, 2005 and started aerobraking at Mars in March 2006. During the spacecraft's design phase, thermal models of the solar panels and instruments were developed to determine which components would be the most limiting thermally during aerobraking. Having determined the most limiting components, thermal limits in terms of heat rate were established. Advanced thermal modeling techniques were developed utilizing Thermal Desktop and Patran Thermal. Heat transfer coefficients were calculated using a Direct Simulation Monte Carlo technique. Analysis established that the solar panels were the most limiting components during the aerobraking phase of the mission.

**Thermal Testing of Prototype General Purpose Fissile Packages Using a Furnace**

Smith, A. C.; Blanton, P. S.; Gelder, L. F.; Lutz, R. N.; January 2007; 7 pp.; In English

Report No.(s): DE2007-899960; WSRC-STI-2007-00018; No Copyright; Avail.: National Technical Information Service (NTIS)

The 9977 / 9978 General Purpose Fissile Package (GFPF) was designed by SRNL to replace the DOT 6M Specification Package and ship Plutonium and Uranium metals and oxides. Urethane foam was used for the overpack to ensure the package would withstand the 10CFR71.73(c)(2) crush test, which is a severe test for drum-type packages. In addition, it was necessary to confirm that the urethane foam configuration provided adequate thermal protection for the containment vessel during the subsequent 10CFR71.73(c)(4) thermal test. Development tests were performed on early prototype test specimens of different diameter overpacks and a range of urethane foam densities. The thermal test was performed using an industrial furnace. Test results were used to optimize the selection of package diameter and foam density, and provided the basis for design enhancements incorporated into the final package design.

Report No.(s): AD-A466071; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA466071>

The next generation of thermal barriers coating (TBC) systems used on turbine engines must be able to endure higher operating temperatures. The thermally protective top coat layers of these TBC systems must therefore exhibit lower thermal conductivity and improved thermochemical stability. The underlying bond coat layers should have substantially improved oxidation resistance and increased high temperature strength. These properties strongly depend upon coating composition. However, as these layers become increasingly complex the relationship between composition and properties becomes difficult to predict and thus, the development of advanced materials systems is slowed. To accelerate the design and manufacture of advanced coatings we have developed a combinatorial synthesis approach. A library of compositions is created and their properties are measured using parallel measurement techniques to allow rapid investigation of a wide range of compositions. Compositionally graded libraries are directly deposited using multi-source electron beam evaporation in conjunction with an inert, transonic gas jet. The properties of the gas jet control the degree of intermixing between co-evaporated melt pools and thus, the compositional gradient of the library. Direct Simulation Monte Carlo simulations along with binary collision theory has been used to investigate the origin of the lateral compositional variation. Deposition conditions which lead to sharp, lateral composition gradients across a substrate have been identified.

**Literature Review of Biodegradation in Soil of Selected Rocky Mountain Arsenal Contaminants: Isodrin, Dieldrin, Diisopropylmethyl-Phosphonate, 1,2-Dibromo-3-Chloropropane, and p-Chloro-Phenylmethylsulfoxide**

Apr 1987; 24 pp.; In English

Report No.(s): AD-A467011; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA467011>

Soils and groundwater at the Rocky Mountain Arsenal (RMA), Colorado have been contaminated with a variety of organic chemicals. Among these chemicals are 1,2-dibromo-3-chloro- propane (DBCP), diisopropylmethylphosphonate (DIMP), p-chloro- phenylmethylsulfoxide (PCPMSO), isodrin, and dieldrin. The U.S. Army Toxic and Hazardous Materials Agency (USATHAMA) is investigating the possibility that microorganisms in soil may transform these five compounds to intermediates or innocuous end products. WESTON is conducting a laboratory study to evaluate the biodegradability of these compounds in soil under RMA relevant conditions. As part of this study, WESTON is conducting a literature review to determine the current state of knowledge regarding these subject areas.

Contract(s)/Grant(s): DAAA15-88-D-0008

Report No.(s): AD-A467331; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA467331>

The first quarter sampling activities included a reconnaissance survey to locate and inspect the wells at the landfill and to select those to be included in the Monitoring Program. As a result of the survey, two wells (MW-8 and WES-3), which were vandalized or otherwise damaged, were excluded from the Monitoring Program. The selected wells and some related data are listed in Table 1. The locations of the wells are shown in Figure 1. The wells were purged and sampled in accordance with procedures specified in the Draft Sampling and Analysis Plan (SAP), Fort Dix Follow-on Remedial Investigation/Feasibility Study, prepared by Dames & Moore. The sample containers were labeled, packed on ice in coolers, and shipped overnight with completed chain-of-custody forms to ESE for chemical analysis. The samples were analyzed for VOCs as well as for total and dissolved priority pollutant metals and iron. The analytical results are presented in Tables 2 and 3. Table 2 shows only the results for analyte concentrations above detection limits while Table 3 presents all analytical data.

**No Further Action Decision Under CERCLA, Study Area 43P Historic Gas Station Sites, Fort Devens, Massachusetts**

Jan 1995; 38 pp.; In English

Contract(s)/Grant(s): DAAA15-91-D-0008

Report No.(s): AD-A467459; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA467459>

Investigations of Study Area 43P (Historic Gas Station Site) at Fort Devens, Massachusetts have resulted in the decision that no further hazardous waste studies or remediation are required at this site. Study Area 43P was identified in the Federal Facilities Agreement between the U.S. Environmental Protection Agency and the U.S. Department of Defense as a potential site of contamination. Field investigation of Study Area 43P was initiated in 1992 in conjunction with the other 12 Groups 2, 7, and Historic Gas Stations Study Areas at Fort Devens. The Study Area 43P site investigation consisted of collecting subsurface soil samples, field analysis of those samples, and one soil boring. Eleven TerraProbe points were advanced to refusal at each location and up to three subsurface soil samples per point (21 total) were collected for field analysis. The samples were analyzed for benzene, toluene, ethylbenzene, and xylenes and total petroleum hydrocarbons. Benzene, toluene, ethylbenzene, and xylenes were not detected in any of the samples, and total petroleum hydrocarbon compounds were detected in only one sample at 220 parts per million. On the basis of findings at Study Area 43P and the Preliminary Risk Evaluation, there is no evidence or reason to conclude that petroleum contamination due to the former underground storage tank has caused significant environmental contamination or poses a threat to human health. The decision has been made to remove Study Area 43P from further consideration in the Installation Restoration Program.

**No Further Action Decision Under CERCLA Study Area 43E Historic Gas Station Sites Fort Devens, Massachusetts**

Jan 1995; 34 pp.; In English

Contract(s)/Grant(s): DAAA15-91-D-0008; Proj-7053-12

Report No.(s): AD-A467970; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA467970>

Investigations of Study Area 43E (Historic Gas Station Site) at Fort Devens, Massachusetts have resulted in the decision that no further hazardous waste studies or remediation are required at this site. Study Area 43E was identified in the Federal Facilities Agreement between the U.S. Environmental Protection Agency and the U.S. Department of Defense as a potential site of contamination. Fort Devens was placed on the National Priorities List under the Comprehensive Environmental Response, Compensation and Liability Act as amended by the Superfund Amendments and Reauthorization Act on December 21, 1989. In addition, under Public Law 101-510, the Defense Base Realignment and Closure Act of 1990, Fort Devens was selected for cessation of operations and closure. In accordance with these acts, numerous studies, including a Master Environmental Plan, an Enhanced Preliminary Assessment, and a Site Investigation, have been conducted which address Study Area 43E. Field investigation of Study Area 43E was initiated in 1992 in conjunction with the other 12 Groups 2, 7, and Historic Gas Stations Study Areas at Fort Devens. The Study Area 43E site investigation consisted of surficial geophysical surveys, which included a metal detector and ground penetrating radar survey. The geophysical surveys indicated that one abandoned underground storage tank was present on the northern side of Building 2020. This tank was removed by ATEC Environmental Consultants on September 3, 1992. No visually contaminated soil was observed in the excavation, and

groundwater was not encountered. ATEC Environmental Consultants performed field screening for volatile organic compounds and total petroleum hydrocarbons on 10 soil samples collected from the walls of the excavation. The photoionization detector headspace screening showed volatile organic compound concentrations ranging from 0.2 to 0.5 parts per million.

**A Possible Solution for the U.S. Navy's Addiction to Petroleum: A Business Case Analysis for Transitioning the U.S. Navy From Petroleum to Synthetic Fuel Resources**

Benedetto, Michael; Mar 2007; 130 pp.; In English

Report No.(s): AD-A467107; No Copyright; Avail.: Defense Technical Information Center (DTIC)

Considering the variable cost of petroleum, it is fiscally prudent for the Department of the Navy (DON) to consider alternative energy sources for propulsion. The cost of petroleum fuels for the DON have increased fifty-five percent from 2004 to 2005 and the increase is equivalent to the annual cost of over seven thousand personnel or three littoral combat ships. For the near-term and mid-term futures (five to thirty years), these alternative energy sources must be compatible with current power systems. The Chief of Naval Operations Strategic Studies Group XXV (SSG) proposed a Navy Synthetic Fuels Program (NSFP) which recommended embarking on a public-private venture to make synthetic fuels to satisfy the U.S. Navy's needs. This thesis examines one aspect of SSG's NSFP by specifically investigating the construction and operating costs of a coal to liquid synthetic fuel plant using domestic coal resources. The purpose of this study is to show the conditions where domestic coal to liquid (CTL) fuel production facility investment is financially practical, as well as those where it is financially impractical. This analysis develops cost estimates, provides business case analysis and reviews global estimates for developing a coal to liquid synthetic fuel production facility. It identifies and qualifies risks and sensitivities. It also examines various projected coal and crude oil markets and how each case influences the decision to pursue a synthetic fuel program. It concludes with a decision matrix comparing the pursuit of a synthetic fuel program with maintaining the status quo of the use of fuel from petroleum.

**Biofiltration as a Viable Alternative for Air Pollution Control at Department of Defense Surface Coating Facilities**

Hudock, David M; Mar 2007; 132 pp.; In English; Original contains color illustrations

Report No.(s): AD-A467551; AFIT/GES/ENV/07-M3; No Copyright; Avail.: Defense Technical Information Center (DTIC)

Surface coating operations at aircraft depot facilities are common throughout the Department of Defense (DoD). During paint application processes at Navy and Marine Corps Fleet Readiness Centers (FRCs), spray paints emit volatile organic compounds (VOCs) known to have harmful effects on human health and the environment. FRC East at Marine Corps Air Station Cherry Point, does not control the emissions of VOCs from any of its paint booths. The purpose of this research is to determine if FRC East and its surrounding area can benefit both economically and environmentally from a biofiltration system for air pollution control (APC) rather than the current conventional method of dry filtration. Dry filtration reduces only particulate matter in waste air streams and though there was no regulatory requirement to control VOC emissions at FRC East, the possibility exists that such legislation may be enacted in the future, affecting this facility and other similar DoD facilities. Three biofilters were designed for this study. The cost of each was analyzed using a net present value calculation and compared to potential monetary savings amongst the local population should VOC emissions from FRC East be controlled. Results show that FRC East and similar DoD facilities can benefit environmentally and economically from VOC control using biofiltration technologies.

**Development of ASTM Precision Bearing Grease Guide**

Rhee, In-Sik; Mar 30, 2007; 14 pp.; In English

Report No.(s): AD-A467746; TARDEC-17017; No Copyright; Avail.: Defense Technical Information Center (DTIC)

Lubricating grease is one of important operational parameter in the rolling bearing applications. Specially, the selection of the lubricating grease for the precision bearing applications is very risky due to many other factors unique to any specific precision bearing environments. For this reason, ASTM F-34 Tribology Subcommittee did a study to develop a Precision Bearing Grease Selection Guide in joint effort with the Department of Defense (DoD). The purpose of this study was to take a broad spectrum of lubricating greases used in precision bearings, including instrument bearings, and do a comprehensive series of tests so their properties could be compared. This study is also meant to be a design guide for choosing lubricating greases for future precision bearing applications. As a part of this study, thirty-eight lubricating greases, currently used in the precision bearings, were evaluated in comprehensive series of laboratory tests. Vital recommendations were then made based on a collective effort by members of this community, who span the spectrum from bearing manufacturers, original equipment manufactures (OEMs), grease manufacturers and suppliers, procurement specialists, quality assurance representatives (QARs) from DoD, and end users both inside and outside DoD. This study has been completed within ASTM F-34 Tribology Subcommittee and published as a new ASTM Standard Guide, F-2489. This paper presents the results of the grease testing program, grease selection guide, and recommendations.

**Supported Metal Catalyst with Improved Thermal Stability**

Carter, E. A., Inventor; Jarvis, E. A., Inventor; 12 Jun 03; 7 pp.; In English

Contract(s)/Grant(s): AFOSR-F49620-00-1-0054

Patent Info.: Filed Filed 12 Jun 03; US-Patent-Appl-SN-10-518-129

Report No.(s): PB2007-104193; No Copyright; Avail.: CASI: [A02](#), Hardcopy

Catalytic systems are provided that include a metallic catalyst attached to a ceramic support that has alumina as a principal ingredient. The ceramic support is doped with an adhesive agent so that the surface of the support includes the adhesive agent. The adhesive agent is designed to form an open-shell electronic structure at the interface between the metallic catalyst and

the support. The open-shell structure promotes extended useful catalyst lifetimes. The adhesive agents are early transition metals that include titanium, zirconium, scandium, hafnium, lanthanum and yttrium. Doping of the ceramic support surface with the adhesive agent also increases the adhesion between the ceramic support and metallic monoliths to which the ceramic support may be attached.

Ceramic compositions comprising a main ceramic component comprising from about 63 to about 99 mole % zirconia and from about 1 to about 37 mole % hafnia. These compositions further comprise at least about 4 mole % of a stabilizer metal oxide selected from the group consisting of yttria, calcia, ceria, scandia, magnesia, india, lanthana, gadolinia, neodymia, samaria, dysprosia, erbia, ytterbia, europia, praseodymia, and mixtures thereof. These ceramic compositions are useful in preparing thermal barrier coatings having reduced thermal conductivity for the substrate of articles that operate at, or are exposed to, high temperatures, as well as good producibility and impact/erosion resistance. Inclusion of hafnia also maintains the reduced conductivity of the thermal barrier coating after thermal exposure due to better sintering resistance.

Patent Info.: Filed Filed 27 Sep 04; US-Patent-Appl-SN-10-951-035

Report No.(s): PB2007-104585; No Copyright; Avail.: CASI: [A03](#), Hardcopy

The central metal interlayer can be used in sensors to enhance an optical response and detect surface plasmon resonances from the deflected membranes as will be discussed hereinbelow. Uniform nanoscale films that have a thickness in the range from 20 to 70 nm, depending on the numbers of layers, can be constructed using with a spin-assisted layer-by-layer LbL (SA-LbL) assembly method. The films can be fabricated within several minutes unlike usual methods requiring several hours. The films of the invention can sustain significant, multiple elastic deformations with a life time of at least ten million cycles. The parameters achieved here (the elastic modulus of about 10-50 GPa, e.g., about 30-40 GPa, the ultimate strain of 2%, and the ultimate tensile strength of 130 MPa) surpass those known for much thicker (microns) nanoparticle-containing free standing LbL films. The membrane of the present invention can be prepared by a process comprising depositing layers of the cationic polymer, the anionic polymer, and the inert nanoparticles layer-by-layer using spin-assisted deposition, onto the surface of a substrate.

ONLINE: <http://hdl.handle.net/100.2/ADA466203>

*Escherichia coli* W3110 was successfully modified to produce D-1,2,4-butanetriol (D-BT) in concentrations exceeding 10 g/L by conversion of D-xylose. The modified strain, *E. coli* WN13, was scaled from 1 L (bench scale) to 100 L (pilot scale) fermentor working volumes at MBI International. D-BT was isolated from fermentation broth by a succession of downstream unit operations, including: filtration, ion exchange, evaporation and distillation. Five-hundred milliliters of D-BT was collected and delivered to the Indian Head Division of the Naval Surface Warfare Center for nitration and testing. 'Green' D-BT was nitrated to D-1,2,4-butanetriol trinitrate (D-BTTN) and formulations including this D-BTTN had comparable performance metrics as synthetic D-BTTN. An economic model was constructed to determine the efficacy of the current process and to provide direction for the green production of D-BT.

**Development and Testing of Flame Retardant Additives and Polymers**

Jurs, J. L.; Apr. 2007; 303 pp.; In English

Report No.(s): PB2007-109832; No Copyright; Avail.: CASI: [A14](#), Hardcopy

Novel flame-retardant chemical additives and polymers were synthesized and their flammability measured in the Underwriters Laboratory test for flammability of plastics (UL94). Self-extinguishing (V-0) compositions were obtained for poly (acrylonitrile-butadiene-styrene) and high-impact polystyrene by adding as little as 10 weight percent of boronic acid derivatives or halogen-containing bisphenylethenes (BPH). Self-extinguishing (V-2) compositions were obtained for polyethylene by adding as little as 10 weight percent BPH. The efficacy of BPH additives as flame-retardants suggested incorporating these moieties directly into the polymer to further reduce flammability. Polymers and copolymers were synthesized having BPH backbone and pendant groups, including backbone copolymers containing acetylene and phosphineoxide. The thermal combustion properties of polymers containing a BPH backbone or pendant groups were measured by microscale combustion calorimetry and found to be among the lowest values ever recorded, suggesting that aircraft cabin materials made from these polymers would be ultra-fire-resistant.

Chinn, S. C.; Herberg, J. L.; Gjersing, E. L.; Cook, A.; Sawvel, A. M.; Oct. 03, 2006; 7 pp.; In English

Report No.(s): DE2007-896607; UCRL-CONF-224975; No Copyright; Avail.: National Technical Information Service (NTIS)

In an effort to develop a magnetic resonance based diagnostic tool to be used for polymer production and surveillance, we have investigated the use of magnetic resonance imaging (MRI) and unilateral relaxometry. MRI provides a spatial map of the polymer, which can be correlated to the structure heterogeneity. Though highly detailed information can be obtained with MRI, the high equipment cost and expertise required to operate the system makes it a poor choice for a production setting. Unilateral relaxometry via the NMR MOUSE provides rapid, inexpensive polymer screening, useful in the development in new polymer parts or to identify potentially defective components. The NMR ProFiler (originally called the NMR MOUSE) was procured by Kansas City originally for production support of the W80 LEP with future applications as a surveillance diagnostic. A robotic autosampler has been designed allowing the detection of several components without the need for any human interaction. A summary of the qualification experiments and results to date from the ProFiler and the robotic unit will be presented.

In this project, we performed experiments and simulations to establish constitutive models for plastic behavior and to

determine the deformation mechanism of nanocrystalline materials at different grain sizes (<100 nm) and high strain rates (>10<sup>6</sup>/s). The experiments used both laser-induced shocks and isentropic compression to investigate, for the first time, the high-strain-rate deformation of nanocrystalline Ni. Samples were characterized using transmission electron microscopy, nanoindentation, profilometry, and x-ray diffraction before and after loading. We validated constitutive models using both atomistic molecular dynamics and continuum simulations performed at the boundary of their current computational possibilities to match experimental scales.

Bergstroem, T.; Oestin, A.; Nilsson, C.; Dec. 2005; 36 pp.; In Swedish

Report No.(s): PB2007-106438; FOI-R-1778-SE; No Copyright; Avail.: National Technical Information Service (NTIS)

When analyzing complex protein mixtures, two-dimensional gel electrophoresis is often used. This technique is time-consuming, demands special instrumentation and includes many manual steps. By using capillary based methods in a two-dimensional combination, smaller sample amounts can be used, the total time of analysis is shortened and the manual steps are reduced. The first dimension is capillaryisoelectric focusing, where proteins are separated according to the pI. The separated and focused proteins are then transformed to the second dimension via an enzymatic column where they are digested into peptides. In the second dimension, these peptides are separated by liquid chromatography coupled to mass spectrometry. In the mass spectrometer, these individual peptides are identified and thereby the original proteins. This two-dimensional combination can both be used for analyzing complex protein mixtures and as a tool to get detailed information about the ricin toxin.

Liu, P. K. T.; Jan. 12, 2007; 21 pp.; In English

Report No.(s): DE2007-900971; No Copyright; Avail.: National Technical Information Service (NTIS)

In the last report, we covered the experimental verification of the mathematical model we developed for WGS-MR, specifically in the aspect of CO conversion ratio, and the effect of the permeate sweep. Bench-top experimental study has been continuing in this period to verify the remaining aspects of the reactor performance, including hydrogen recovery ratio, hydrogen purity and CO contaminant level. Based upon the comparison of experimental vs simulated results in this period along with the results reported in the last period, we conclude that our mathematical model can predict reliably all aspects of the membrane reactor performance for WGS using typical coal gasifier off-gas as feed under the proposed operating condition. In addition to 250DGC, the experimental study at 225DGC was performed. As obtained at 250DGC, the predicted values match well with the experimental results at this lower temperature.

**Corrosion Resistances of Iron Based Amorphous Metals with Yttrium and Tungsten Additions in Hot Calcium Chloride Brine & Natural Seawater. Fe48Mo14Cr15Y2C15B6 and W-Containing Variants**

Farmer, J. C.; Haslam, J.; Day, S.; Lian, T.; Saw, C.; Oct. 20, 2006; 14 pp.; In English

Report No.(s): DE2007-900167; UCRL-PROC-225429; No Copyright; Avail.: National Technical Information Service (NTIS)

Yttrium-containing SAM1651 (Fe48.0Cr15.0Mo14.0B6.0C15.0Y2.0), has a critical cooling rate (CCR) of approximately 80 Kelvin per second, while SAM2X5 (Fe49.7Cr17.7Mn1.9Mo7.4W1.6B15.2C3.8Si2.4) with no yttrium has a higher critical cooling rate of approximately 600 Kelvin per second. SAM1651s low CCR enables it to be rendered as a completely amorphous material in practical materials processes. Chromium (Cr), molybdenum (Mo) and tungsten (W) provide corrosion resistance; boron (B) enables glass formation; and rare earths such as yttrium (Y) lower critical cooling rate (CCR). The passive film stability of these Fe-based amorphous metal formulations have been found to be superior to that of conventional stainless steels, and comparable to that of Ni-based alloys, based on electrochemical measurements of the passive film breakdown potential and general corrosion rates.

**X ray Diffraction Techniques for Structural Determination of Amorphous Materials**

Saw, C. K.; Lian, T.; Day, S. D.; Farmer, J. C.; Oct. 18, 2006; 30 pp.; In English

Report No.(s): DE2007-900132; UCRL-TR-225388; No Copyright; Avail.: Department of Energy Information Bridge

Prevention of corrosion is a vital goal for the Department of Defense when billions of dollars are spent every year. Corrosion resistant materials have applications in all sort of military vehicles, and more importantly in naval vessels and submarines which come in contact with the seawater. An important application of the corrosion resistant material is in the

radioactive waste disposable field where the vessels or containers are expected to hold the radioactive toxic materials for thousands of years to surpass the half life of the radiation. It has been known that corrosion resistance can be improved by the used of structurally designed materials in the amorphous state where the atoms are arranged in a non-periodic conditions, even though, some local chemical short range ordering may occur in the amorphous arrangement. On the other hand, the final material can also be elementally tailored to specific application. This work documents in details the characterization effort for the amorphous materials using x-ray diffraction technique as part of the High Performance Corrosion-Resistant Material Structural Amorphous Metal (HPCRM-SAM) program here at LLNL. The samples are in the form of powders, ribbons and coatings deposited onto parts. Some brief theoretical background is given in order to interpret the results, instrumentation will also be described. The results suggest that the formation of amorphous phase in the metal alloys powders greatly depends on the processing conditions. In most of the powders, especially lot number 06, the result indicates that the materials are amorphous with a very small amount of iron boron alloy. In the ribbon samples, all the samples and of different compositions as well are observed to be amorphous. In most cases, starting from an amorphous powder sample, the coatings are also observed to be amorphous with a small amount of iron oxide, probably due to exposure to air during the thermal spraying process.

**Sinodal Decomposition and Order Disorder Transformation in a Water Quenched U-6wt%Nb Alloy**

Hsiung, L.; Zhou, J.; Sep. 14, 2006; 30 pp.; In English

Report No.(s): DE2007-900131; UCRL-TR-224432; No Copyright; Avail.: National Technical Information Service (NTIS)

A combinative approach of microhardness testing, tensile testing, and TEM microstructural analysis has been employed to study phase stability and aging mechanisms of a water-quenched U-6wt%Nb (WQU6Nb) alloy subjected to different aging schedules that include artificial aging of WQ-U6Nb at 200 degrees C, natural aging of WQ-U6Nb at ambient temperatures for 15 to 18 years, and accelerative aging of the naturally aged (NA) alloy at 200 degrees C. During the early stages of artificial aging at 200 degrees C, the microhardness values continuously increase as a result of the development of a fine-scale compositional modulation (wavelength: 3 nm) caused by spinodal decomposition. Coarsening of the modulated structure occurs after prolonged aging of WQ-U6Nb at 200 degrees C for 16 hours, which leads to a decrease of microhardness. Phase instability has also been found to occur in the NA alloy, in which the formation of partially ordered phase domains resulting from an atomic-scale spinodal modulation (wavelength: 0.5 nm) renders the appearance of antiphase domain boundaries (APBs) in TEM images. Although 18-year natural aging does not cause a significant change in hardness, it affects dramatically the aging mechanism of WQ-U6Nb subjected to the accelerative aging at 200 degrees C. The result of microhardness measurement shows that the hardness values continuously increase until after aging for 239 hours, and the total hardness increment is twice in magnitude than that in the case of the artificial aging of water-quenched alloy at 200 degrees C. The anomalous increment of hardness for the accelerative aging of NA alloy can be attributed to the precipitation of an ordered U3Nb phase. It is accordingly concluded that the long-term natural aging at ambient temperatures can detour the transformation pathway of WQ U(sub 3)6Nb alloy; it leads to the order-disorder transformation and precipitation of ordered phase in the alloy.

Report No.(s): PB2007-104652; No Copyright; Avail.: CASI: [A04](#), Hardcopy

High throughput screening of crystallization of a target material is accomplished by simultaneously introducing a solution of the target material into a plurality of chambers of a microfabricated fluidic device. The microfabricated fluidic device is then manipulated to vary the solution condition in the chambers, thereby simultaneously providing a large number of crystallization environments. Control over changed solution conditions may result from a variety of techniques, including but not limited to metering volumes of crystallizing agent into the chamber by volume exclusion, by entrapment of volumes of crystallizing agent determined by the dimensions of the microfabricated structure, or by cross-channel injection of sample and crystallizing agent into an array of junctions defined by intersecting orthogonal flow channels.

Contract(s)/Grant(s): NSF-DMR-0079992

Patent Info.: Filed Filed 3 Sep 04; US-Patent-Appl-SN-10-934 894

Report No.(s): PB2007-104614; No Copyright; Avail.: CASI: [A03](#), Hardcopy

The present invention relates to methods of reacting a receptor and a target. A reaction liquid having one or more receptors and one or more targets is provided. A confining fluid that is immiscible with the reaction liquid is positioned adjacent a first surface of the reaction liquid. The confining fluid is stirred, thereby allowing the one or more receptors and one or more targets to react with each other. Alternatively, a coverplate is positioned adjacent a first surface of the reaction liquid and reaction between the receptors and targets occurs upon rotating the coverplate. Also disclosed is a system for reacting a receptor and a target. The system involves a holding device having a reaction liquid, a confining fluid adjacent a first surface of the reaction liquid, and a mixing device positioned within the confining fluid. Alternatively, the system can be a substrate, a rotating coverplate, and a reaction liquid between the substrate and the coverplate.

Report No.(s): PB2007-104649; No Copyright; Avail.: CASI: [A02](#), Hardcopy

A microsystem enclosure for hermetically sealing and thereby protecting a microsystem located on a substrate from the potentially damaging effects of exposure to moisture, dust, and other external environmental or operating conditions. The enclosure broadly comprises a single-piece hermetic cover structure and a single solder preform. The preform facilitates sealing the cover to the substrate in high-temperature, single-step process so as to create a hermetic cavity wherein the microsystem resides.

Patent Info.: Filed Filed 4 Feb 05; US-Patent-Appl-SN-11-051 092

Report No.(s): PB2007-104645; No Copyright; Avail.: CASI: [A03](#), Hardcopy

A high resolution Fourier Transform Ion Cyclotron Resonance (FT-ICR) mass spectrometry system includes excitation circuitry including an excitation amplifier for generating an electrical excitation signal and excitation electrodes for applying an oscillating electric field to excite ions in the system. Detection circuitry including detection electrodes measures a detection signal which includes a plurality of signal values including signal values induced by the ions. Structure is provided for reducing or canceling coupling of the excitation signal into the detection signal, wherein simultaneous excitation and detection is used. A computing structure generates a Fourier transformed frequency domain representation of the detection signal and deconvolves the frequency domain representation using complex division to separate a dispersion spectrum portion and an absorption spectrum portion.

Report No.(s): PB2007-104129; No Copyright; Avail.: CASI: [A03](#), Hardcopy

Polymer-based biomaterials are popular due to ease of fabrication and low costs. However, many polymer substrates have undesirable surface properties. The invention provides a procedure to covalently apply a graft polymer to the surface of a polymer substrate by ultraviolet graft polymerization. The graft polymer is formed from monomers such as PEG, AA, monomethoxy acrylate PEG, HEMA, or DMA. Also, mixed monomers may be used to create the graft and the surface properties of the graft may be tailored for different properties, including hydrophobicity, friction coefficient, electroosmotic mobilities and electrophoretic separations. The invention has particular utility in tailoring surface chemistries in ocular lenses and polymer microdevices.

A bioproduct may be selectively separated from one or more impurities by means of a displacement chromatography system that includes a solvent, a chromatographic resin and a chemically selective displacer. The method includes: dissolving the bioproduct and the one or more impurities in a solvent; loading the bioproduct and the one or more impurities, in the solvent, on a chromatographic resin; displacing the bioproduct from the chromatographic resin with chemically selective displacer; and retaining the one or more impurities on the chromatographic resin. For this method, the bioproduct and the impurities have similar binding affinity for the chromatographic resin in the absence of the displacer.

**Theory for the RF Surface Field for Various Metals at the Destructive Breakdown Limit**

Wilson, P. B.; Feb. 2007; 15 pp.; In English

Report No.(s): DE2007-900599; SLAC-PUB-12354; No Copyright; Avail.: Department of Energy Information Bridge

This is a slightly revised version of the paper that will be published in the AAC06 proceedings. A number of minor changes have been made in the interest of clarity. A significant revision, however, has been made in the treatment of backscattering of incident electrons from a metal surface. In the conference publication it was assumed that incident electrons were backscattered without energy loss. In this publication the energy spectrum of the backscattered electrons is taken into account. This revision does not significantly change the conclusions concerning the relative resistance of various metals to breakdown.

Report No.(s): PB2007-109909; EPA/822/R-06-010; No Copyright; Avail.: CASI: [A04](#), Hardcopy

The U.S. Environmental Protection Agency (EPA) has prepared this Health Effects Support Document for Terbacil to support a determination regarding whether to regulate terbacil with a National Primary Drinking Water Regulation (NPDWR). The available data on occurrence, exposure, and other risk considerations suggest that, because terbacil does not occur in public water systems at frequencies and levels of public health concern, regulating terbacil will not present a meaningful opportunity to reduce health risk. EPA will present a determination and further analysis in the Federal Register Notice covering the CCL proposals.

**In-Track Demonstration of Laser-Treated Rail to Reduce Friction and Wear**

Reiff, R.; May 2007; 76 pp.; In English

Contract(s)/Grant(s): DTFR-53-00-C-00012

Report No.(s): PB2007-110334; No Copyright; Avail.: National Technical Information Service (NTIS)

In-track evaluations of a laser-treated rail intended to provide a permanent reduction of the friction level and increased wear life were conducted at the Transportation Technology Centers Facility for Accelerated Service Testing, Heavy Axle Load track in Pueblo, CO. These evaluations were conducted during the October 2005 operating period. Results suggest that the cracks formed during the laser treatment process led to early spalling and chipping of the gage corner, requiring removal of the test rail from the track. Limited data suggests that the treatment process did not significantly reduce gage face rolling friction.

**Application of Surface Energy Measurements to Evaluate Moisture Susceptibility of Asphalt and Aggregates**

Lytton, R.; Arambula, E.; Bhasin, A.; Branco, V. C.; Howson, J.; Aug. 2006; 2 pp.; In English

Report No.(s): PB2007-110223; REPT-0-4524-S; No Copyright; Avail.: CASI: [A01](#), Hardcopy

Moisture damage in asphalt mixtures can occur within the asphalt mastic (cohesive fracture) or at the aggregate-mastic interface (adhesive fracture or failure). Whether or not a cohesive or adhesive failure occurs depends on the nature of the mastic and the relative thickness of the mastic. The majority of previous studies on this subject focused on the development of mixture tests and empirical parameters to quantify moisture sensitivity of asphalt mixtures. This project was conducted to attain fundamental understanding of the moisture damage process by carefully considering the mechanisms that influence durability of the adhesive interface between aggregate and asphalt and the cohesive strength and durability of the mastic.

Report No.(s): PB2007-110219; REPT-0-4524-1; No Copyright; Avail.: National Technical Information Service (NTIS)

Moisture damage in asphalt mixtures can occur within the mastic (cohesive fracture) or at the aggregate-mastic interface (adhesive fracture or failure). Whether or not a cohesive or adhesive failure occurs depends on the nature of the mastic and the relative thickness of the mastic. This report is part of a project that focused on fundamental understanding of the moisture damage process by carefully considering the micro-mechanisms that influence the adhesive interface between aggregate and asphalt and the cohesive strength and durability of the mastic. The first phase of the project focused on the validation of the surface energy measurements and the dynamic mechanical analysis (DMA) of mastics through the evaluation of the moisture susceptibility of materials with known field performance. The results of the first phase of this project were documented in TxDOT report 0-4524-2. The second phase of the project, which is documented in this report, focused on the evaluation of the surface energy and moisture susceptibility of wide combinations of aggregates and asphalts.

Report No.(s): PB2007-104137; No Copyright; Avail.: CASI: [A03](#), Hardcopy

A method of synthesizing and controlling the internal diameters, conical angles, and morphology of tubular carbon nano/micro structures. Different morphologies can be synthesized included but not limited to cones, straight tubes, nozzles, cone-on-tube (funnels), tube-on-cone, cone-tube-cone, n-staged structures, multijunctioned tubes, Y-junctions, dumbbell (pinched morphology) and capsules. The process is based on changing the wetting behavior of a low melting metals such as

gallium, indium, and aluminum with carbon using a growth environment of different gas phase chemistries. The described carbon tubular morphologies can be synthesized using any kind of gas phase excitation such as, but not limited to, microwave excitation, hot filament excitation, thermal excitation and Radio Frequency (RF) excitations. The deposition area is only limited by the substrate area in the equipment used and not limited by the process. The internal diameters of the carbon tubular structures can be varied from a few nm to as high as about 20 microns. The wall thickness is about 10-20 nm. The carbon tubular structures can be formed open on both ends are directly applicable to micro-fluidics. Gallium required for the growth of the carbon tubes can be supplied either as a thin film on the substrate or could be supplied through the gas phase with different precursors such as Tri-methyl gallium. Seamless Y-junctions with no internal obstructions can be synthesized without the need of templates. Multi-channeled junctions can also be synthesized without any internal obstructions. Gallium that partially fills the carbon structures can be removed from the tubes by simple heating in vacuum at temperature above 600 degree.

Report No.(s): PB2007-108627; No Copyright; Avail.: CASI: [A03](#), Hardcopy

An electro-optically active polymer gel material comprising a high molecular weight alignment polymer adapted to be homogeneously dispersed throughout a liquid crystal to control the alignment of the liquid crystal molecules and/or confer mechanical stability is provided. The electro-optically active polymer gel comprises a homogenous gel in which the polymer strands of the gel are provided in low concentration and are well solvated by the small molecule liquid crystal without producing unacceptable slowing of its electrooptic response. During formation of the gel, a desired orientation is locked into

the gel by physical or chemical cross-linking of the polymer chains. The electro-optically active polymer is then utilized to direct the orientation in the liquid crystal gel in the 'field off' state of a liquid crystal display. The electro-optically active polymer also provides a memory of the mesostructural arrangement of the liquid crystal and acts to suppress the formation of large scale deviations, such as, for example, fan-type defects in a FLC when subjected to a mechanical shock. A method of making an electro-optically active polymer gel material and an electrooptic device utilizing the electro-optically active polymer gel of the present invention is also provided.

**A Method for the Analysis of Tabun in Multisol Using Gas Chromatographic Flame Photometric Detection**

Logan, Thomas P; Allen, Edward D; Way, Mark R; Swift, Austin T; Soni, Sunil-Datta; Koplovitz, Irwin; Jan 2006; 6 pp.; In English; Original contains color illustrations

Report No.(s): AD-A468903; USAMRICD-P05-022; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA468903>

Preparation and analysis of tabun (GA) solutions are necessary for the continued development of countermeasures to this nerve agent. GA solutions must be stable and compatible for use in the test systems chosen for study; however, GA is very unstable in saline solutions. In the past we have found GA in saline at 2 micrograms/mL to be stable for a month or less at -70 degrees C, whereas saline solutions of sarin (GB), soman (GD), and cyclosarin (GF) were stable for many months. Previous studies have shown that Multisol (48.5% H<sub>2</sub>O, 40% propylene glycol, 10% ethanol, and 1.5% benzyl alcohol) provides stable solutions of GA. We confirmed the stability of GA in Multisol with phosphorus nuclear magnetic resonance (P-NMR) and developed a method for the analysis of GA in Multisol using gas chromatographic flame photometric detection (GCFPD) in the phosphorus mode. The GC method used acetonitrile (CH<sub>3</sub>CN) for a dilution solvent because of its miscibility with GA in chloroform (CHCl<sub>3</sub>) standards and GA in Multisol samples at 1% (v/v). Furthermore, the dilutions with CH<sub>3</sub>CN made the phosphorus mode interference peak present in CHCl<sub>3</sub> analytically manageable, reduced the interferences of Multisol in the GC separation, and contributed to a safe and reliable analysis of GA at 20 microgram/mL. We demonstrated the stability of GA in Multisol stored for more than a year at 70 degrees C. This method contributes a suitable technique for the preparation and analysis of reliable solutions of GA in nerve agent medical research and demonstrates the extended stability of GA in Multisol.

**In Vivo Cholinesterase Inhibitory Specificity of Organophosphorus Nerve Agents**

Shih, Tsung-Ming; Kan, Robert K; McDonough, John H; Oct 26, 2005; 12 pp.; In English; Original contains color illustrations

Report No.(s): AD-A468835; USAMRICD-P05-006; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA468835>

The purpose of this project was to determine and compare the time-related changes in blood, brain, and tissue

acetylcholinesterase (AChE) activity during the first hour after exposure to six organophosphorus nerve agents (GA, GB, GD, GF, VR, and VX) in Hartley guinea pigs. Animals were pretreated with atropine methyl nitrate (1% .0 mg/kg, i.m.) to minimize peripheral toxic effects 15 min before they were given a 1.0 x LD50 subcutaneous dose of a nerve agent. At 0,5, 10, 15,30, and 60min after nerve agent, animals were humanely euthanized. Blood was collected and brain regions (brainstem, cortex, hippocampus, midbrain, cerebellum, striatum, and spinal cord) and peripheral tissues (diaphragm, skeletal muscle, and heart) were dissected and processed for AChE activity. All six nerve agents produced maximum inhibition of AChE in red blood cells between 5 and 10% of the control within 10min after exposure. In whole blood, differential effects were observed among the agents: GB, GD, and GF produced more rapid and greater inhibition than did GA, VR, and Vx. GF was the most rapid, producing a maximum inhibition to 5% of the control in 5 min. while VR and VX were slower reaching maximum inhibition to 30% of the control at 15 min. The enzyme activity in the majority of the brain regions was more markedly inhibited by the G-agents than by the V-agents. The G-agents caused rapid AChE inhibition, reaching maximum levels (20-30% of control) at 15 min and GA produced the most rapid effects. V-agents produced much slower and less AChE inhibition, reaching maximum (35-60% of control) at 30 min. In the diaphragm, VR, VX, and GD produced more rapid and greater AChE inhibition than other G-agents; GA produced the slowest and least inhibition. In the skeletal muscle, VX induced the most rapid and severe inhibition, while GA the least inhibition. In the heart, all agents produced very rapid inhibition, and GD produced the most severe inhibition of AChE activity.

**Micro and Nano-structure Development and Multiscale Physics at Sliding Metal Interfaces. Final Report May 2006**

Rigney, D. A.; Feb. 28, 2006; 28 pp.; In English

Contract(s)/Grant(s): DE-FG03-03NA00069

Report No.(s): DE2007-882935; DOE/NA/00069-FINAL; No Copyright; Avail.: National Technical Information Service (NTIS)

This final report describes research on the response of ductile materials to extreme loading conditions and high strain rates during impact combined with sliding friction. The work has involved a collaboration among two groups at Los Alamos National Laboratory and a tribology research group at The Ohio State University. The project involved experimental work and computer simulations at both laboratories and continuum mechanics analysis at OSU, supplemented by testing at AWE, Harwell, UK. Results demonstrated the importance of vorticity and mechanical mixing near the sliding interface in the development of nanocrystalline tribomaterial that is far from equilibrium. The work also revealed that strain rate sensitivity is an important materials property for determining the development of the velocity profile during sliding. As such, it is a property that is key to understanding the evolution of sliding behavior.

Studies suggest that metal-PAH interactions may be common among benthic copepods and that strong nonadditive effects observed in binary mixtures may be moderated in more diverse contaminant mixtures. Acute and sublethal mixture toxicology of the contaminants cadmium (Cd), mercury (Hg), lead (Pb), fluoranthene, and phenanthrene was investigated by using two species of meiobenthic harpacticoid copepod, *Schizopera knabeni* and *Amphiascoides atopus*. Contaminant effects were delineated using toxic unit methodology and factorial experiments. Adult *S. knabeni* were tolerant of exposures to the individual contaminants. When *S. knabeni* were exposed to the metals mixture, Cd-induced lethality was reduced, suggesting an antagonism among the metals. When exposed to a mixture of Cd, Hg, Pb, and phenanthrene, a greater than additive response was demonstrated. A Cd-phenanthrene synergism was observed in both sediment and aqueous exposures. Grazing-rate bioassays suggest a response-additive sublethal toxicology between metals and phenanthrene. Experiments with *A. atopus* revealed that phenanthrene and fluoranthene are synergistic with Cd.

Bactericidal compositions are disclosed that comprise a polymeric compound immobilized on a material. Medical devices are also disclosed which comprise such a bactericidal composition. Methods are disclosed for covalently derivatizing the surfaces of common materials with an antibacterial polycation, e.g., poly(vinyl-N-pyridinium bromide); the first step of the methods involves coating the surface with a nanolayer of silica. Various commercial synthetic polymers derivatized in this manner are bactericidal, i.e., they kill on contact up to 99% of deposited Gram-positive and Gram-negative bacteria, whether deposited through air or water.

The formation of hierarchically ordered arrays of spherical cavities on polymer films is of interest due to potential applications in the reparation of photonic bandgaps materials, environmental sensors, and patterned light-emitting diodes. While many methods are known for the preparation of these porous materials, the breath figure approach has received significant scrutiny because of the simple and robust mechanism of pattern formation. Breath figures are patterned arrays of micrometer-sized defects in a polymer film, formed when water droplets condense onto a polymer solution surface during film drying. By control variables such as relative humidity and solvent, the feature size and uniformity of the resultant pattern can be control The breath figure approach is valuable because it is versatile, inexpensive, and provides the advantages of large area ordering in the nano and micrometer regime. The self assembly of regular arrays of nano and microscale pores in polymer matrices generated using the breath figure technique is being explored. Experimental parameters are modified to vary the size, spacing, organization, and long-range order of these self-organizing surfaces. Utilizing these regular arrays of pores as templates, we have patterned analogous arrays of pillars (inverse pores) from a polymer film cast onto the patterned surface. These micro/nano-textured surfaces have enhanced the hydrophobicity of the textured polymer when measured by contact angle. This method of producing ultrahydrophobic textured surfaces should be amenable to high-throughput, low-cost manufacturing of myriad polymeric surfaces.

Contract(s)/Grant(s): FA5209-04-P-0397

Report No.(s): AD-A466507; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA466507>

In present investigation, analyses for the damage evolution behavior of particulate composite materials by using the finite element method (FEM) and the s-version finite element method (s-FEM) were carried out. The analyses were carried out in particular interest in the phenomenon of crack propagation. Prior to crack propagation, material damage develops in the material. The material damage may be in the forms of microvoid and/or microcracks in the binder (matrix) and in the form

of binder (matrix)/particle separation that is known to be dewetting. In a macroscopic sense, the reinforcing particles distribute evenly in matrix. However, at microscopic level, the density of the distributed particles varies. This means that the stiffness and strength of the material also have some spatial variations. Material damages initiate at the weak material locations and then propagate the surroundings. When cracks are present in the material, the cracks interact with the surroundings and the material. To simulate such scenarios, we adopted two kinds of damage constitutive models. One is isotropic damage model and the other is "separate dilatational/deviatoric damage constitutive model" in which the contributions of hydrostatic and of deviatoric stresses are accounted for independently. A parameter in the separate dilatational/ deviatoric damage model can characterize which, hydrostatic or deviatoric stress component, has dominant influence to the damage behavior of the material. A series of analyses on uncracked and cracked specimen with statistically varying material stiffness at a microscopic level were carried out. The results revealed that the damage behavior is highly influenced by the damage mode.

ONLINE: <http://hdl.handle.net/100.2/ADA466556>

Polymer matrix composite mechanical properties have been shown to decrease significantly with the presence of thermal damage. For aerospace applications, this type of damage typically occurs as a result of exposure to elevated temperatures from localized heating, such as lightning strikes, exhaust wash, or improper maintenance/repair procedures. Mechanical testing has shown that this type of damage, known as incipient damage, is present even when no visible damage is observable and can cause significant reduction in mechanical properties. Incipient damage is not currently readily detected with conventional nondestructive evaluation (NDE) tools. This presentation describes a NDE method that combines mechanical excitation with thermal imaging to detect the presence of surface and through-the-thickness incipient thermal damage without direct contact to the part being tested. It compares the results from samples with and without known damage using the thermo-elastic technique with similar inspection results from conventional NDE techniques, such as ultrasonic C-scan and thermography. These results indicate the thermo-elastic method identifies incipient damage that the other techniques fail to detect. In addition, an approach to analyze the thermo-elastic data to potentially determine the severity of the thermal damage is reviewed.

**Elevated-Temperature Life Limiting Behavior of Hi-Nicalon SiC/SiC Ceramic Matrix Composite in Interlaminar Shear**

Choi, Sung R; Kowalik, Robert W; Alexander, Donald J; Bansal, Narottam P; Mar 2, 2007; 38 pp.; In English; Original contains color illustrations

Report No.(s): AD-A467438; NAWCADPAX/TR-2007/5; No Copyright; Avail.: Defense Technical Information Center (DTIC)

Assessments of life limiting behavior of a gas-turbine grade, melt-infiltrated Hi-Nicalon SiC continuous fiber-reinforced SiC ceramic matrix composite (CMC) were made in interlaminar shear using both stress rupture and constant stress-rate testing at 1316°C in air. The composite exhibited appreciable life limiting behavior with a life susceptibility parameter of  $n \approx 22-24$ , estimated based on a proposed phenomenological life prediction model together with the experimental data. The phenomenological life model was in good agreement in prediction between the stress rupture and the constant stress-rate data, validating its appropriateness in describing the life limiting phenomenon of the CMC coupons subjected to interlaminar shear. Despite some limitations in material availability, time to failure and shear strength data exhibited a statistical relation, typically observed in Mode I loading for many isotropic brittle solids. The results of this work also indicated that the governing mechanism(s) associated with failure in interlaminar shear remained almost unchanged, regardless of the type of loading configurations, either in stress rupture or in constant stress rate. This additionally indicates that simplistic constant shear stress-rate testing can be used as a possible means of life prediction test methodology for CMCs even in interlaminar shear at elevated temperatures when relatively short lifetimes are expected.

**Nano Enabled Thermo-Mechanical Materials in Adhesive Joints: A New Paradigm to Materials Functionality (Preprint)**

Roy, Ajit K; Ganguli, Sabyasachi; Sihn, Sangwook; Qu, Liangti; Dai, Liming; Dec 2006; 8 pp.; In English

Contract(s)/Grant(s): Proj-4347

Report No.(s): AD-A467527; AFRL-ML-WP-TP-2007-447; No Copyright; Avail.: Defense Technical Information Center (DTIC)

One of the barriers in achieving adequate through-thickness thermal conductivity in composite materials and also in composite joints is the extremely low thermal conductivity of resins (polymer) or adhesives (typically 0.3 W/mK). In this paper, a material configuration aligning Multi-wall Nanotube (MWNT) in the thickness direction in adhesive joint is studied to enhance through-thickness thermal conductivity. Initial numerical study indicated that the thermal contact of the conductive phase (in this case is the MWNT) with the adherent surfaces is essential to achieve the desirable through-thickness thermal conductivity in joints. To demonstrate the concept, conductive graphite face sheets were used along with aligned MWNT aligned along the joint thickness. Aligned MWNT infused with resin (adhesive) is processed in joints with plasma etching the surfaces ensuring the ends of the MWNT make thermal contact with the adherent surfaces. The MWNT modified adhesive joint through-thickness thermal conductivity measure to be over 250 W/mK, which exceeded the thermal conductivity of adhesive by several orders of magnitude. Thus, the study demonstrates a new approach as well as opportunities of much needed thermal property tailoring in structural joints.

**Rheological Behavior of Entangled Polystyrene-Polyhedral Oligosilsesquioxane (POSS) Copolymer**

Wu, Jian; Mather, Patrick T; Haddad, Timothy S; Kim, Gyeong-Man; Aug 24, 2006; 33 pp.; In English

Contract(s)/Grant(s): Proj-23080521

Report No.(s): AD-A467764; No Copyright; Avail.: Defense Technical Information Center (DTIC)

We report on the linear viscoelastic properties of a family of entangled linear thermoplastic non-polar hybrid inorganic-organic polymers: random copolymers of polystyrene (PS) and styryl-based polyhedral oligosilsesquioxane (POSS),  $R_7(\text{Si}_8\text{O}_{12})(\text{C}_6\text{H}_4\text{CH}=\text{CH}_2)$ , with R = isobutyl (iBu). A series of styrene-styryl POSS random copolymers with 0, 6, 15, 30, 50 wt% iBuPOSS were investigated. WAXS and TEM demonstrate that the iBuPOSS disperses in the polymeric matrix at a molecular level. It is observed that the iBuPOSS plays a plasticizer-like effect, yielding a monotonic decrease of the glass transition temperature with increasing iBuPOSS content. Rheological measurements revealed that linear viscoelastic behavior of the copolymers is also profoundly influenced by the presence of iBuPOSS. The incorporation of iBuPOSS dramatically decreases the rubbery plateau modulus, suggesting a strong dilation effect of isobutyl-POSS on entanglement density. Additionally, the apparent flow activation energy, obtained by fitting the Vogel-Fulcher-Tamman-Hesse equation, monotonically increases with increasing iBuPOSS content, indicating a lower sensitivity of POSS copolymers to changes of temperature. We attribute observations of the microscopic topology of constituent polymer chains to be altered by iBuPOSS comonomers that act as compact volumetric branches. Conversely, intermolecular interactions between iBuPOSS and PS segments do not play an essential role in determining the rheological behavior.

**Detection of Localized Heat Damage in a Polymer Matrix Composite by Thermo-Elastic Method (Preprint)**

Welter, John; Sathish, Shamachary; Ripberger, Erik; Lindgren, Eric; Feb 2007; 16 pp.; In English

Contract(s)/Grant(s): F33615-03-C-5219; Proj-4349

Report No.(s): AD-A467863; No Copyright; Avail.: Defense Technical Information Center (DTIC)

Reduction of strength of polymer matrix composites when exposed to high temperatures is a major concern in aerospace industry. Loss of mechanical strength can be measured only through established destructive techniques; there is a need for detection and evaluation of heat damage in PMC. This paper describes a thermo-elastic based non-contact nondestructive technique for detection and evaluation of heat damage in PMC. The efficiency of the material to convert acoustic energy into heat is used as a means to detect and evaluate the heat damage in the material. A panel subjected to local heat damage at several locations is tested using air coupled ultrasonic C-scan and thermo-elastic measurements. The results show that the ultrasonic C-scan detects only the major damage. On the other hand the thermo-elastic method detects both high and low level heat

damages in the panel. The efficiency of the conversion of acoustic energy into heat, in undamaged and damaged regions and its role in detecting damage are discussed.

**2-D Biaxial Testing and Failure Predictions of IM7/977-2 Carbon/Epoxy Quasi-Isotropic Laminates**

Welsh, Jeffery S; Mayes, J S; Biskner, Adam C; Jan 2006; 8 pp.; In English; Original contains color illustrations

Report No.(s): AD-A468444; No Copyright; Avail.: Defense Technical Information Center (DTIC)

In previous research, a series of a thickness-tapered cruciform specimen configurations have been used to determine the biaxial (two-dimensional, in-plane) and triaxial (three-dimensional) strength of several carbon/epoxy and glass/vinyl-ester laminate configurations. Refinements to the cruciform geometry have been shown capable of producing acceptable results for cross-ply laminate configurations. However, the presence of a biaxial strengthening effect in quasi-isotropic, laminates have brought into question whether the cruciform geometry could be used to successfully generate two-dimensional strength envelopes. In the present study, a two-dimensional failure envelope for a IM7/977-2 carbon/epoxy laminate was developed, using a triaxial test facility. Results are promising as they indicated that failure in the majority of the IM7/977-2 specimens occurred in the gage section. This leads the authors to believe that maximum biaxial stress states were correctly generated within the test specimen. In addition to the data presented, multi-continuum theory (MCT) was used to predict and analyze the onset of damage and ultimate failure of a biaxially loaded IM7/977-2 laminate. Damage in a composite material typically begins at the constituent level and may, in fact, be limited to only one constituent in some situations. An accurate prediction of constituent failure at sampling points throughout the laminate provides a genesis for progressively analyzing damage propagation in a composite specimen allowing identification of intermediate damage modes. A constituent-based, quadratic, stress-interactive, failure criterion was used to take advantage of the micro-scale information provided by MCT. There was reasonable correlation between analytically and experimentally developed IM7/977-2 2D failure envelope which leads us to believe that the thickness-tapered cruciform specimen can be used to determine the biaxial strength of quasi-isotropic laminates.

**Acoustic Identification of Filler Materials in Unexploded Ordnance**

Cobb, Wesley; Apr 2006; 70 pp.; In English; Original contains color illustrations

Contract(s)/Grant(s): W912HQ-04-C-0015; Proj-1382

Report No.(s): AD-A468491; No Copyright; Avail.: Defense Technical Information Center (DTIC)

The objective of this project is to utilize acoustic waves to identify the materials inside sealed unexploded ordnance (UXO). Acoustic waves are high frequency pressure fluctuations (sound) that travel through materials. Small sensors clamped to the outside of the ordnance send low-energy acoustic waves through the container walls and filler. The received signals are analyzed to determine the characteristic acoustic properties of the filler material. To identify the filler, these measured properties are compared to a database of properties for known explosive and inert filler materials. A device based on this acoustic technique would permit personnel to quickly identify common inert UXO items, and optimize subsequent verification. Significant cost savings can be achieved through more efficient and safer clean-up procedures and the reduction of blow in place remediation procedures. Currently, 75 % of the costs associated with cleanup of UXO contaminated sites are derived from remediating non-hazardous items.

The development of flexible, thermally conductive fabrics and plastic tubes for the Liquid Cooling and Ventilation Garment (LCVG) are needed to reduce weight and improve the mobility, comfort, and performance of future spacesuits. Such improvements would allow astronauts to operate more efficiently and safely for extended extravehicular activities. As a continuation of our work on the improvement of thermal conductivity (TC) of polymeric materials, nanocomposites were prepared from copoly(ethylene vinyl acetate), trade name Elvax 260TradeMark), metallized carbon nanofibers (CNFs), nickel (Ni) nanostrands, boron nitride both alone and as mixtures with aluminum powder. The nanocomposites were prepared by melt mixing at various loading levels and subsequently fabricated into several material forms (i.e., ribbons, tubes, and compression molded plaques) for analysis. Ribbons and tubes were extruded to form samples in which the nanoparticles were aligned in the direction of flow. The degree of dispersion and alignment of the nanoparticles were investigated using high-resolution scanning electron microscopy. Tensile properties of the aligned samples were determined at room temperature. TC measurements were performed using a laser flash (NanoflashTradeMark) technique. The TC of the samples was measured in both the direction of alignment as well as transverse. Tubing of comparable dimensions to that used in the LCVG was extruded from select compositions and the thermal conductivities of the tubes measured.

**Effect of Excess Carbon on the Crystallographic, Microstructural, and Mechanical Properties of CVD Silicon Carbide Fibers**

Marzik, J. V.; Croft, W. J.; Staples, R. J.; MoberlyChan, W. J.; Dec. 11, 2006; 8 pp.; In English

Report No.(s): DE2007-900880; UCRL-PROC-226742; No Copyright; Avail.: National Technical Information Service (NTIS)

Silicon carbide (SiC) fibers made by chemical vapor deposition (CVD) are of interest for organic, ceramic, and metal matrix composite materials due their high strength, high elastic modulus, and retention of mechanical properties at elevated

processing and operating temperatures. The properties of SCS-6 silicon carbide fibers, which are made by a commercial process and consist largely of stoichiometric SiC, were compared with an experimental carbon rich CVD SiC fiber, to which excess carbon was added during the CVD process. The concentration, homogeneity, and distribution of carbon were measured using energy dispersive x-ray spectroscopy (SEM/EDS). The effect of excess carbon on the tensile strength, elastic modulus, and the crystallographic and microstructural properties of CVD silicon carbide fibers was investigated using tensile testing, x-ray diffraction, scanning electron microscopy (SEM), and transmission electron microscopy (TEM).

**Stab Sensitivity of Energetic Nanolaminates**

Gash, A.; Barbee, T.; Cervantes, O.; May 24, 2006; 15 pp.; In English

Report No.(s): DE2007-900454; UCRL-PROC-221604; No Copyright; Avail.: National Technical Information Service (NTIS)

This work details the stab ignition, small-scale safety, and energy release characteristics of bimetallic Al/Ni(V) and Al/Monel energetic nanolaminate freestanding thin films. The influence of the engineered nanostructural features of the energetic multilayers is correlated with both stab initiation and small-scale energetic materials testing results. Structural parameters of the energetic thin films found to be important include the bi-layer period, total thickness of the film, and presence or absence of aluminum coating layers. In general the most sensitive nanolaminates were those that were relatively thick, possessed fine bi-layer periods, and were not coated. Energetic nanolaminates were tested for their stab sensitivity as freestanding continuous parts and as coarse powders. The stab sensitivity of mock M55 detonators loaded with energetic nanolaminate was found to depend strongly upon both the particle size of the material and the configuration of nanolaminate material, in the detonator cup. In these instances stab ignition was observed with input energies as low as 5 mJ for a coarse powder with an average particle dimension of 400  $\mu\text{m}$ . Selected experiments indicate that the reacting nanolaminate can be used to ignite other energetic materials such as sol-gel nanostructured thermite, and conventional thermite that was either coated onto the multilayer substrate or pressed on it.

To prevent dry spot formation in RTM, a control interface and four different adaptive control algorithms were developed and tested with numerical simulations. The interface is capable of controlling the flow pattern of resin as it fills a mold containing a preform. The mold is equipped with multiple inlet gates, a single vent and a spinal sensor system that continuously feeds the interface with the resin flow front location along the spine lines connecting the inlet gates to the vent. Four different adaptive control algorithms targeting on injection flow rate control, injection pressure control, linearly-corrected pressure control, and the combined flow rate and linearly-connected pressure control were developed. Placement of the gates-sensors in addition to the possibility of permeability disturbances (race-tracking) could affect the filling pattern and ultimately the controllability of the developed schemes. To overcome this a sue, the location of the gates-sensors was optimized based on the minimization of void formation and filling time. Particle Swarm Optimization (PSO) coupled with adaptive control was implemented on the aforementioned problem and results were compared to previous work using Selective Exhaustive Search (SES) and Genetic Algorithm (GA). Three journal papers and six conference papers have been published.

ONLINE: <http://hdl.handle.net/100.2/ADA469179>

New composite materials and processing methods are continually being developed for use in high performance aerospace systems. One of these new processing methods is the vacuum assisted resin transfer molding (VARTM) process, which shows promise in producing large structural components that have good properties at a lower cost than traditional manufacturing methods. Future widespread use of components manufactured using the VARTM process depends on understanding how these components perform under service conditions, specifically under impact and fatigue conditions. The tension compression fatigue behavior of a four-harness satin weave carbon fiber/epoxy (IM7/EPON 862) composite manufactured using the VARTM process is investigated in this research. The results are compared to previous research done to determine the tension-tension fatigue behavior of the same material. An anti-buckling fixture was used to allow a long, thin specimen to be used for the tests without causing a buckling failure when the specimen was under compression loading. The

tension-compression fatigue tests were carried out at a percentage of the ultimate compressive strength at room temperature. Failed specimens were examined using an optical microscope and a scanning electron microscope to investigate and document damage mechanisms and failure modes. Fatigue life curves were developed for stress range, maximum stress, and normalized stress. Specimens tested under tension-compression loading were shown to have lower fatigue life than those under tension loading.

**Uncertainty Quantification of Composite Laminate Damage with the Generalized Information Theory**

Lucero, J.; Hemez, F.; Ross, T.; Kline, K.; Hundhausen, J.; May 2006; 88 pp.; In English

Report No.(s): DE2007-884685; LA-14283; No Copyright; Avail.: National Technical Information Service (NTIS)

This work presents a survey of five theories to assess the uncertainty of projectile impact induced damage on multi-layered carbon-epoxy composite plates. Because the types of uncertainty dealt with in this application are multiple (variability, ambiguity, and conflict) and because the data sets collected are sparse, characterizing the amount of delamination damage with probability theory alone is possible but incomplete. This motivates the exploration of methods contained within a broad Generalized Information Theory (GIT) that rely on less restrictive assumptions than probability theory. Probability, fuzzy sets, possibility, and imprecise probability (probability boxes (p-boxes) and Dempster-Shafer) are used to assess the uncertainty in composite plate damage. Furthermore, this work highlights the usefulness of each theory. The purpose of the study is not to compare directly the different GIT methods but to show that they can be deployed on a practical application and to compare the assumptions upon which these theories are based. The data sets consist of experimental measurements and finite element predictions of the amount of delamination and fiber splitting damage as multilayered composite plates are impacted by a projectile at various velocities. The physical experiments consist of using a gas gun to impact suspended plates with a projectile accelerated to prescribed velocities, then, taking ultrasound images of the resulting delamination. The nonlinear, multiple length-scale numerical simulations couple local crack propagation implemented through cohesive zone modeling to global stress-displacement finite element analysis.

Grazing incidence x-ray reflectivity measurements are used to determine the density of sputter-deposited LaAlO and anodized LaAl films. Together with refractive index and dielectric constant measurements, it is demonstrated that a coherent picture emerges explaining the low dielectric constant of the amorphous films (~13) as compared to the single-crystal value (~26). The importance of molecular volume dependence of the electronic and vibrational molecular polarizabilities is underlined.

This Management Plan has been prepared in accordance with Data Item A008 for the U.S. Army Environmental Center (USAEC) by ABB Environmental Services, Inc. (ABB-ES) in response to Delivery Order 0010 of Contract DACA31-94-D-0061 for a Site Inspection (SI) at Fort Allen in Juana Diaz, Puerto Rico and Preliminary Assessments (PAs) at the San Juan Army Aviation Support Facility (AASF) Puerto Rico, and Blair Hangar AASF on the island of St. Croix, USVI. The objectives of this Delivery Order are to conduct SIs at several areas of contamination (AOCs) and study areas at Fort Allen and to document the findings of the investigations. An additional objective is the completion of two PAs, at San Juan AASF and Blair Hangar AASF. The purpose of this Management Plan is to describe ABB-ES' organization, assignment of functions, duties and responsibilities, management procedures and policies, and reporting requirements for the completion of the work effort presented in the Accident Prevention Safety Program Plan (APSPP) and Quality Assurance Project Plan (QAPjP) (Data Item A004 and A006) and the Technical Plan (Data Item A003). Sections 2.0 and 3.0 of this plan describe the project management structure and controls to be used for this Delivery Order. Section 4.0 contains data management requirements which are specific to the Fort Allen SI. Costs and schedules will be monitored through the use of a detailed schedule and a Resource Utilization Plan (RUP) for each element in the Work Breakdown Structure (WBS). The project schedule and RUPs are presented in Sections 5.0 and 6.0, respectively. Descriptions of the reports to be prepared and delivered to the USAEC throughout the course of this project are presented in Section 7.0.

ONLINE: <http://hdl.handle.net/100.2/ADA466101>

An accurate and efficient hybrid Density Functional Theory (DFT)/Multireference Configuration Interaction (MRCI) model for computing electronic excitation energies in heavy element atoms and molecules was developed. This model incorporated relativistic effects essential for accurate qualitative and quantitative spectroscopic predictions on heavy elements, while simultaneously removing spin-multiplicity limitations inherent in the original model on which it is based. This model was used to successfully compute ground and low-lying electronic states for atoms in the first two rows of the period table, which were used for calibration. Once calibrated, calculations on carbon monoxide, bromine fluoride, the bromine atom, uranium +4 and +5 ions and the uranyl (UO<sub>2</sub><sup>2+</sup>) ion showed the model achieved reductions in relative error with respect to Time Dependent Density Functional Theory (TDDFT) of 11-42%, with a corresponding reduction in computational effort in terms of MRCI expansion sizes of a factor of 25-64.

ONLINE: <http://hdl.handle.net/100.2/ADA466119>

We demonstrated an approach toward the design of starburst C<sub>60</sub>-keto-DPAF assembly by applying a combination of a starburst macromolecular configuration with C<sub>60</sub> as the core center, which is encapsulated by multiple bulky groups leading to the increase of intermolecular separation and aggregation barrier. Molecular compositions of the resulting triad and pentaads were clearly confirmed by MALDI-MS (positive ion) detection of protonated molecular mass ions. Both structural isomers,

3a and 3b exhibited nonlinear optical transmittance reduction responses in femtosecond (fs) region with a lower transmittance % value for the latter at the high laser power above 80 GW/sq cm. It was attributed to larger fs 2PA cross-section values of 3a and 3b than that of 2 in the same concentration and, apparently, correlated to a higher number of DPAF-C9 subunits in the structure of 3.

**First Principles and Multi-Scale Modeling of the Roles of Impurities and Dopants on Thermal Barrier Coating Failure**

Carter, Emily A; Mar 31, 2007; 12 pp.; In English

Contract(s)/Grant(s): FA9550-05-1-0119

Report No.(s): AD-A466193; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA466193>

Optimization of thermal barrier coating materials is the main objective of this research, in order to increase the service lifetimes of aircraft engines. To this end, it is critical to first understand mechanisms of failure, and then use those insights to design materials countermeasures. This grant supported the following research efforts in those directions: (1) Developments of ultrasoft spin-dependent pseudopotential theory and a solid state phase transition path search algorithm; (2) Applications of first principles density functional theory to: (i) monoclinic-to-tetragonal phase transformation pathway in zirconia; (ii) atomic scale fatigue in silicon and alumina; (iii) metal/ceramic interfaces (MoSi<sub>2</sub>/SiO<sub>2</sub> and NiAl/Al<sub>2</sub>O<sub>3</sub>); (iv) adsorption of dopants (Hf, Pt) and impurities (S) on NiAl and segregation of same to NiAl/Al<sub>2</sub>O<sub>3</sub> interface; (v) formation and segregation of impurities, dopants, defects, and majority species in NiAl and alumina dopants added to alumina/late transition metal interfaces, with implications for high temperature catalysis.

ONLINE: <http://hdl.handle.net/100.2/ADA466279>

Our work has been concentrated on both chemical attachments of functionalized carbon nanotubes (CNTs) and their alignments through chemical, electrical and optical manipulation on templates such as Si-wafer and gold, on which nanostructures can be formed by novellithographic techniques of atomic force microscope (AFM) anodic oxidation lithography or nanosphere lithography. As-grown CNTs were modified with functional groups like carboxylic acid, acid chloride and alkyl thiol groups to chemically bond CNTs to templates. The chemical bonding of functionalized CNTs on conducting templates was also performed by applying a direct current (DC) field to CNT suspension, resulting in the formation of uniform CNT films. Ultrasonic treatment allowed the electrodeposited CNTs to be aligned normal to the electrodes. In addition, the selective attachment of CNTs on templates was conducted by applying the lithographic techniques. A promising approach to manipulating CNTs was demonstrated using a linear polarized infrared optical trapping system. Various analytical methods such as AFM, TEM, SEM, Raman, FT-IR, and field emission measurement enabled the characterization of the CNTs.

Contract(s)/Grant(s): FA5209-05-P-0401

Report No.(s): AD-A466492; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA466492>

Liquid molding processes are becoming more popular among the composite manufacturing industries due to their versatility and economy among other merits. In analyzing the flow during the process, permeability is the most important parameter. Permeability has been regarded as a property of the porous medium. However, in many practical cases, the value may vary depending on the flow conditions such as the flow rate. It is speculated that this deviation is caused by inhomogeneous microstructure of the medium. In this study, numerical simulations as well as experimental measurements have been done to investigate the cause of deviation. Microstructure of porous medium was modeled as an array of porous cylinders. Resin flow through the array was simulated numerically. Simulations were performed for two different flow conditions, namely saturated flow and unsaturated flow. Based upon the results, permeabilities were estimated and compared for the two flow conditions. In addition, a model was proposed to predict the permeability for different flow conditions. Results showed that experimental data were in agreement with the prediction by the model.

ONLINE: <http://hdl.handle.net/100.2/ADA466510>

A method to mass-produce ZnO nanowire-based integrated devices has been investigated. The approach is to employ

self-assembled monolayer patterns on the substrates, directly assemble and align ZnO nanowires from the solution without relying on any external forces. As a proof of concepts ZnO nanowires were assembled and aligned on Au and SiO<sub>2</sub> surfaces. Furthermore, the large-scale fabrication of ZnO nanowire-based circuits were successfully demonstrated. It is understood that this is the first successful demonstration for large-scale fabrication of ZnO-based integrated devices. The developed method can contribute to ZnO-based device commercial applications in the future.

**Nano-Dots Enhanced White Organic Light-Emitting Diodes**

Jou, Jwo-huei; Nov 30, 2006; 44 pp.; In English

Report No.(s): AD-A466515; AOARD-054088; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA466515>

Significant improvement in electroluminescent performance was resulted by incorporating nano-dots in the small-molecule host composing and solution-processing emission layers for red, green, blue and white organic light-emitting devices (WOLEDs). The proper nano-dot was cadmium selenium (CdSe) prepared in organic solvent, which was miscible with the host solutions of 4,4'-bis (carba- zol-9-yl) biphenyl (CBP) doped with red dye of bis [2-(2'-benzothienyl)-pyridinato-N,C3'] (acetyl-acetonate) iri-dium (III), green dye of tris(2-phenylpyridine) iridium (III) and/or blue dye bis(3,5-difluoro-2-(2-pyridyl)-phenyl-(2-carboxypyridyl) iri- dium (III). The power efficiency of the red OLEDs increased from 1.7 to 2.5 lm/W on the addition of 0.006 wt% CdSe. For the green OLEDs, it increased from 7.8 to 9.9 lm/W by adding 0.006 wt% CdSe. For the blue OLEDs, it increased from 1.45 to 1.66 lm/W by adding 0.01 wt% CdSe. The incorporation effect of CdSe was the most marked on the red device and the least on the blue device; i.e. that the power efficiency increment was 47% for the red device and 14.5% for the blue device. For the WOLEDs, it changed from 3.9 to 4.5 lm/W with a 15.4% increase in power efficiency as 0.002 wt% CdSe was incorporated, accompanied by a 5.7% increase in the resulted maximum luminance.

Dilithium phthalocyanine (Li<sub>2</sub>Pc) possesses mixed electronic-ionic conductivity due to overlap of pi-pi orbitals (electronic) and mobility of Li<sup>+</sup> ion (ionic) in a channel formed due to stacking of the macromolecules. Electrochemical impedance measurements provide separation of electronic and ionic conductivities. The temperature dependence studies are employed for calculation of activation energies. The electronic conductivity shows a marked increase on applying DC bias voltage across a symmetrical cell of Li<sub>2</sub>Pc with blocking electrodes, whereas the ionic conductivity is marginally influenced.

First-principles calculations have been employed to study clusters or Zr embedded in SiO<sub>2</sub>. Stable complexes are round with four, six, and seven oxygens coordinated to the Zr atom. Consistent with experiment, the higher coordinated complexes are the most stable. These also have a higher density, and hence, smaller molar volume. This smaller molar volume provides an explanation of the increased dielectric constant Zr<sub>x</sub>Si<sub>1-x</sub>O<sub>2</sub> mixed oxide systems for small amounts of Zr (x<0.3). An unusual sevenfold coordinated structure is described.

Contract(s)/Grant(s): DE-AC05-84OR21400

Report No.(s): AD-A466647; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA466647>

The adsorption and solvent extraction of aqueous 2,4-dinitro-toluene (DNT) were evaluated with two commercial activated carbons. Both carbons proved to be excellent adsorbents for aqueous DNT. The solvents tested for extracting the adsorbed DNT were water, acetone, and methanol, both individually and in mixtures with each other. Acetone and methanol were both found to be much more effective extraction solvents than water. Analysis of the extracts revealed the presence of at least six other chemical species besides DNT. Four of these other species were tentatively identified as 2,4-dinitro-benzyl alcohol, 2,4-dinitro-benzaldehyde, 2,4-dinitro-benzoic acid, and 2,4-dinitro-methylbenzoate. The presence of these derivative compounds suggests that some of the DNT undergoes chemical reactions while attached to the carbon surface.

Contract(s)/Grant(s): FA8650-04-C-2415; Proj-0605

Report No.(s): AD-A466667; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA466667>

Capacitors are a pervasive technology in every military and commercial application. Increased performance and smaller size in capacitor devices have been the main focus of our research in the development of new dielectrics. A multilayer stacked rigid aluminum oxynitride (Ala<sub>x</sub>N) capacitor design concept has been developed to improve the energy density and high temperature capability of Ala<sub>x</sub>N capacitors. This method consists of depositing alternating layers of dielectric and metal on a rigid substrate. A rigid substrate can withstand the stresses of the dielectric being coated on only a single side which eliminates the wrinkling problem of depositing Ala<sub>x</sub>N on thin metal foil and metallized polymer substrates. The inherent surface roughness issue associated with commercially available polymers is no longer a concern as the surface finish of the substrate can be more easily controlled. Amorphous aluminum oxynitride films possess unique properties of high dielectric strength, high resistivity, low loss, high decomposition temperature, chemical inertness and good thermal conductivity. Dual DC pulsed magnetron reactive sputtering was employed to synthesize amorphous Ala<sub>x</sub>N films on various substrates. Dielectric properties were compared for films developed with different process conditions. The properties were optimized with respect to the following input parameters: DC power, pulse frequency, total pressure, substrate temperature and reactive gas ratio. The effects on the dielectric constant, frequency dependence of capacitance, dissipation factor, resistivity, and breakdown strength of these films were measured using simple parallel plate capacitor test structures. Temperature dependent dielectric properties were evaluated from -200 degrees C to 400 degrees C.

**Microstructure of Dense Thin Sheets of gamma-TiAl Fabricated by Hot Isostatic Pressing of Tape-Cast Monotapes (Preprint)**

Adams, A G; Rahaman, M N; Dutton, Rollie E; Feb 2007; 34 pp.; In English

Contract(s)/Grant(s): F33615-01-D-5801-0032; Proj-4349

Report No.(s): AD-A466702; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA466702>

A powder metallurgy route based on hot isostatic pressing (HIPing) of tape-cast monotapes was used for the direct fabrication of dense thin sheets of gamma titanium aluminide. Polarized light microscopy revealed a fine-grained microstructure but a few isolated larger grains were also present. The primarily metastable alpha2 microstructure of the rapidly solidified starting powder transformed to the equilibrium near-gamma microstructure during HIPing. Chemical analysis revealed that the dense sheet had a carbon content of 0.13 wt.%, which was only 0.04 wt.% higher than that of the starting powder, but the oxygen content was significantly higher, presumably introduced during the decanning step. The hardness measured using Vickers microindentation technique was 384 +/- 9 HV. Manipulation of the as-HIPed microstructure was performed by heating for up to 1 hour in flowing argon at temperatures below and above the alpha transus. Below 1250 deg C, limited grain growth and no discernable change in the as-HIPed (near-gamma) microstructure occurred.

ONLINE: <http://hdl.handle.net/100.2/ADA466794>

Patterned growth of free-standing carbon nanotubes on submicron nickel dots on silicon was achieved using plasma-enhanced-hot-filament-chemical-vapor deposition (PE-HF-CVD). A thin film nickel grid was fabricated on a silicon wafer by standard microlithographic techniques, and the PE-HF-CVD was done using acetylene (C2H2) gas as the carbon source and ammonia (NH3) as a catalyst and dilution gas. Well separated, single carbon nanotubes were observed to grow on the grid. The structures had rounded base diameters of approximately 150 nm, heights ranging from 0.1 to 5 micrometers, and sharp pointed tips. A transmission electron microscopy (TEM) cross-sectional image clearly showed that the structures are indeed hollow nanotubes. The diameter and height depend on the nickel dot size and growth time, respectively. This nanotube growth process is compatible with silicon integrated circuit processing. Using this method, devices requiring free-standing vertical carbon nanotubes, such as scanning probe microscopy, field emission flat panel displays, etc., can be fabricated without difficulty.

**Ligand Field Strengths of Carbon Monoxide and Cyanide in Octahedral Coordination**

Hummel, Patrick; Osgaard, Jonas; Goddard, III, William A; Gray, Harry B; Jan 10, 2005; 6 pp.; In English

Report No.(s): AD-A466847; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA466847>

Ligand field splittings were extracted from absorption spectra of metal hexacarbonyl and hexacyano complexes over 35 years ago by Gray and coworkers (J. Am. Chem. Soc., 85, 2922 (1963); *ibid.* 90, 4260, 5713 (1968)). Recent time-dependent density functional theory calculations by Baerends and coworkers (J. Am. Chem. Soc., 121, 10356 (1999)) on M(CO)6 with M=Cr, Mo, W raised questions about the magnitudes of these ligand field splittings. In order to reexamine such effects systematically, we report here the splittings for a series of 3d6 metal hexacarbonyl, hexaisocyno and hexacyano complexes: V(CO)6(-), Cr(CO)6, Mn(CO)6(+) and Fe(CO)6(2+); Co(CN)6(3) and Fe(CN)6(4); and V(CNH)(-6), Cr(CNH)6, Mn(CNH)6(+) and Fe(CNH)6(2+). This work demonstrates that the 3d splittings induced by the ligands in question generally fall in the order CO>CNH>CN-. We agree with Baerends and colleagues that CO exerts a much stronger ligand field than was originally thought.

**Lessons Learned in Solid Rocket Combustion Instability**

Blomshield, Fred S; Nov 14, 2006; 20 pp.; In English

Report No.(s): AD-A466858; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA466858>

Over the last 60 years, a considerable amount of time and money has been spent improving our understanding of combustion instability in solid rocket propulsion systems. Over this period, significant knowledge has been accumulated that can influence the acoustic stability of solid propulsive systems. Unfortunately, many of these lessons learned about combustion instability remain the knowledge of a select few in government and industry who work with combustion instability on a daily basis. This paper attempts to organize many of these rules of thumb that propellant formulators and motor designers need to be aware of in order to minimize the chances of combustion instability. In addition, several mathematical relationships are presented which can be used to predict the frequency of potential acoustic modes and determine resultant thrust oscillations produced by acoustic oscillations. Also included are some key fundamental equations which can be used to gain insight into combustion instability in rocket motor systems and there is a short section on motor instrumentation. This paper is not an attempt to be an exhaustive study into combustion instability, but rather, will attempt to list in a clear fashion some of the more important lessons learned and empirical observations of solid propellant combustion instability. This paper emphasizes composite propellants, but many observations apply to double base and composite modified double base propellants, as well.

**Review of Laboratory Program on Degradation Mechanisms in Soil of Wastewater From Nitroguanidine Manufacture**

Williams, Richard T; MacGillivray, A R; Mar 1987; 341 pp.; In English

Contract(s)/Grant(s): DAAK11-85-D-0007

Report No.(s): AD-A466980; AMXTH-TE-CR-87106; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA466980>

The degradation of nitroguanidine manufacture wastewater components was examined in order to predict the long-term feasibility of land farming. Continuous flow and soil perfusion columns, microbial enumeration, and batch mineralization studies were utilized for this investigation. After 271 days of operation for the continuous flow soil columns and 84 days of operation for the soil perfusion columns, only some components of nitroguanidine wastewater were completely or partially removed. Guanidine nitrate and sulfate were the most rapidly transformed. Nitroguanidine (NQ), however, was only partially removed.

ONLINE: <http://hdl.handle.net/100.2/ADA467014>

This document is the Standard Operating Procedure (SOP) for a radon screening of existing buildings at the Umatilla Depot Activity (UMDA), Hermiston, Oregon. The U.S. Army Toxic and Hazardous Materials Agency. (USATHAMA) has contracted with Dames & Moore--under Contract No. DAAA15-88-D-0008, Delivery Order No. 3--to conduct this survey in support of the U.S. Department of Defense (DOD) Base Realignment and Closure (BRAC) Program at UMDA. The Army wants to be aware of any potential or existing radon problems in buildings at UMDA that would be left in place at the time of base closure. It is noted that currently unoccupied or minimally occupied buildings may be heavily occupied under possible future use scenarios (such as use of the facility as an industrial park). The objective of the radon survey will be accomplished by conducting the following tasks. Note that a total of no more than 400 radon samples (including blank samples at a rate of 10 percent) is authorized. 1. Conduct of an initial building survey to collect information on and evaluate building characteristics for the determination of optimal locations for radon collector placement in each of the approximately 238 existing buildings at the installation. (Note that the 1,001 storage igloos are not included in this survey.) 2. Alpha track radon detector placement and retrieval and conduct of laboratory analyses for radon. 3. Conduct of a supplementary building survey--limited to buildings in which exceedance of the U.S. Environmental Protection Agency. (USEPA) 4-picocurie/liter (pCi/l) guideline for radon were noted-- which includes additional visual assessment and measurements, as appropriate, to provide information for the determination of additional surveys or remedial measures.

ONLINE: <http://hdl.handle.net/100.2/ADA467500>

This report reviews the development and applications of molecular and materials modeling in Europe and Japan in comparison to those in the USA. Topics covered include computational quantum chemistry, molecular simulations by molecular dynamics and Monte Carlo methods, mesoscale modeling of material domains, molecular-structure/mesoscale property correlations like QSARs and QSPRs, and related information technologies like informatics and special-purpose molecular-modeling computers. The panel's findings include the following: The USA leads this field in many scientific areas. However, Canada has particular strengths in DFT methods and homogeneous catalysis; Europe in heterogeneous catalysis, mesoscale, and materials modeling; and Japan in materials modeling and special-purpose computing. Major government-industry initiatives are underway in Europe and Japan, notably in multi-scale materials modeling and in development of chemistry-capable ab-initio molecular dynamics codes. In European and U.S. assessments of nanotechnology, it was also concluded that to advance the field most quickly and competitively the need is acute for applying new and existing methods of molecularly based modeling. Additional findings are outlined in the panel's executive summary.

**No Further Action Decision Under CERCLA Study Area 43F Historic Gas Station Sites Fort Devens, Massachusetts**

Jan 1995; 36 pp.; In English

Contract(s)/Grant(s): DAAA15-91-D-0008

Report No.(s): AD-A467777; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA467777>

This decision document has been prepared to support a no further action decision at Study Area 43F - Historic Gas Station Site (SA 43F) at Fort Devens, Massachusetts. The report was prepared as part of the U.S. Department of Defense (DoD) Base Realignment and Closure (BRAC) program to assess the nature and extent of contamination associated with site operations

at Fort Devens. In conjunction with the Army's Installation Restoration Program (IRP), Fort Devens and the U.S. Army Environmental Center (USAEC; formerly the U.S. Army Toxic and Hazardous Materials Agency) initiated a Master Environmental Plan (MEP) in 1988. The MEP consists of assessments of the environmental status of SAS, specifies necessary investigations, and provides recommendations for response actions with the objective of identifying priorities for environmental restoration at Fort Devens. The Historic Gas Station Sites were identified in the MEP as potential areas of contamination. On December 21, 1989, Fort Devens was placed on the National Priorities List under the Comprehensive Environmental Response, Compensation and Liability Act (CERCLA) as amended by the Superfund Amendments and Reauthorization Act. An Enhanced Preliminary Assessment (PA) was also performed at Fort Devens to address areas not normally included in the CERCLA process, but requiring review prior to closure. A final version of the PA report was completed in April 1992. In 1992, DoD, through USAEC, also initiated a Site Investigation (SI) for SA 43A through S along with the other 12 SAs in SA Groups 2 and 7 at Fort Devens. The SI was conducted by ABB Environmental Services, Inc. (ABB-ES). Under Public Law 101-510, the Defense Base Realignment and Closure Act of 1990, Fort Devens has been selected for cessation of operations and closure.

**Multi-Wall Carbon Nanotubes for Flow-Induced Voltage Generation (Preprint)**

Liu, Jianwei; Dai, Liming; Baur, Jeff W; Aug 2006; 19 pp.; In English; Original contains color illustrations

Report No.(s): AD-A466863; No Copyright; Avail.: Defense Technical Information Center (DTIC)

Recently it has been reported that voltage can be generated by passing fluids over single-walled carbon nanotube (SWCNT) arrays with potential application to flow sensors with a large dynamic range. The present work investigates voltage generation properties of multi-walled carbon nanotubes (MWCNT) as a function of the relative orientation of the nanotube array with respect to the flow direction, flow velocity, and solution ionic strength. It was found that the flow-induced voltage can be significantly enhanced by aligning the nanotubes along the flow direction, increasing the flow velocity and/or the ionic strength of the flowing liquid. A flow-induced voltage of ~30mV, which is 15 times higher than the highest voltage reported for single-wall carbon nanotubes, has been generated from our perpendicularly-aligned MWCNT in an aqueous solution of 1 M NaCl at a relatively low flow velocity of 0.0005 m/s. The results are generally consistent with the pulsating asymmetric ratcheting mechanism proposed for SWCNT arrays, in which an asymmetrical spatial distributed strain forms from interactions with the polar and ionic species at the tube surface and is driven along the tube by the fluid flow.

Report No.(s): AD-A466895; No Copyright; Avail.: Defense Technical Information Center (DTIC)

The linearity and efficiency performance was studied for large periphery AlGaIn/GaN HEMTs. Comparison was made between inherent linear device performance and device performance using Digital Pre-Distortion (DPD) correction. Additionally, both drain voltage and current were optimized to provide high efficiency for a specified linearity. Significant improvements in linear efficiency were achieved using the DPD correction with a best measured PAE of 43.5%, at a Vd of 28 V, using two carrier W-CDMA.

Gallium Nitride (GaN) amplifiers have demonstrated very high power density as well as wide band width in previous

research. This paper examines their use in supplying flat gain, power, and linearity across a large band width. It demonstrates two types of power amplifiers: a Ft Doubler (FT2) amplifier and a Cascode amplifier, both of which require a simple PCB tune. Both amplifiers show 0.2 to 4GHz bandwidth with 30 dBm P1dB output power. The 3GPP WCDMA output power is 20 dBm at -45 dBc ACLR.

**Electromigration Related Effects At Metal-Metal Interfaces: Application To Railguns**

Cleveland, Jr, William B; Mar 2007; 75 pp.; In English

Report No.(s): AD-A467073; No Copyright; Avail.: Defense Technical Information Center (DTIC)

This thesis had 2 objectives. The first purpose of this thesis was to develop an experimental procedure to study electric current induced flow of liquid metal, similar to that found at the armature-rail contact due to local melting, to determine the kinetics of liquid flow Ga under electric current conditions. For this, a model system comprising a bead of Ga on a Cu thin film track was devised in order to enable liquefaction and current induced movement of Ga to occur along the Cu track. Upon application of current, Ga underwent liquefaction due to Joule heating and once liquid, it rapidly migrated along the Cu track towards the negative terminal. The Ga liquid flow was attributed to electromigration of liquid Ga under the influence of direct electric field. The kinetics of Ga flow was determined. This method will be useful in calculating the kinetics of electromigration of molten Al along Cu rails in future railgun development. The second purpose of this thesis was to analyze debris left on Cu/24Ag rails following firing of 7075Al armatures, in order to understand the compositional evolution of the debris, and its role in creating surface damage to armature/rail interfacial surfaces. EDS analysis showed a majority of the debris was composed of oxidized aluminum with significant porosity. The analysis of the rail debris will benefit future studies on preventing rail debris from damaging railguns.

**Substrate/Oxide Interface Interaction in LaAlO<sub>3</sub>/Si Structures**

Busani, T; Devine, R A; Jan 2004; 7 pp.; In English

Contract(s)/Grant(s): F29601-01-C-0241; Proj-4846

Report No.(s): AD-A467664; No Copyright; Avail.: Defense Technical Information Center (DTIC)

Amorphous lanthanum aluminate films (LaAlO<sub>3</sub>) were deposited on Si substrates at room temperature using rf sputtering in pure Ar or an Ar/O<sub>2</sub> mixture with a stoichiometric target. The film composition was analyzed using XPS and EDX. The evolution of the material resulting from annealing at temperatures in excess of 900 degree C was studied using infrared spectroscopy, XPS profiling and AFM. We obtain clear evidence for in-diffusion of Si from the substrate into the dielectric film. FTIR analysis showed only one peak centered at 747 /cm with an FWHM of 185/cm for as-deposited samples indicating an amorphous structure. Annealed samples showed very narrow absorptions at 483-510, 607, 695-720 and 811 /cm. No evidence for SiO<sub>2</sub> peaks at ~1060 /cm was observed suggesting that the LaAlO<sub>3</sub> structure tends not to reduce into a mixture of SiO<sub>2</sub> and a silicide. Short time annealing at 1000 degrees C results in a broad band at 905 /cm which can be interpreted in terms of the formation of a layer rich in Si-O-La bonds. Nitridation of the substrate before oxide deposition and annealing slows the degradation process but does not suppress it. X-ray diffraction analysis of the annealed films indicates a very oriented crystalline structure, yet unidentified, whose direction depends upon the orientation of the Si substrate. The dielectric constant in both annealed and as-deposited films was measured to be less than 14 and the leakage current density was very low. Some mobile charge was detected. This dielectric constant is substantially less than the value ~25 anticipated from bulk, single crystal measurements.

**Hydrogen Pressurization of LOX: High Risk/High Reward (Preprint)**

Turner, Andrew E; Leichner, Aaron; Oct 24, 2006; 5 pp.; In English

Contract(s)/Grant(s): FA9300-04-C-0008

Report No.(s): AD-A467734; No Copyright; Avail.: Defense Technical Information Center (DTIC)

Hydrogen safety has been an oxymoron in many circles since the catastrophic loss of the Hindenburg on May 6, 1937 due to a sudden fire consuming the huge 800 foot long, 100 foot diameter dirigible filled with hydrogen gas. Airship commercial service, enabled by relatively low-cost hydrogen, died along with the longest vehicle ever to fly, even though thousands of passengers had been transported without incident prior to that time. Since 1937 hydrogen has had a bad reputation, though less prominent applications such as launch vehicles, fuel cells and batteries have been safe and successful. But the passing of three generations and the maturation of certain technologies has advanced things sufficiently so that a hydrogen fuel transportation infrastructure and other uses can be discussed constructively. One beneficial application of hydrogen is pressurization of launch vehicle propellants, in other words forcing the liquid propellants out of their storage tanks and into the combustion chamber, overcoming combustion back-pressure and other resistance along the way. Hydrogen is the most mass-efficient way to do this. However, helium is more often used as the safer and more reliable solution, though it weighs twice as much. While the use of helium is a sensible approach for high-cost, high-reliability systems, hydrogen is attractive for systems that do not require high reliability. An example is Aquarius, a new low-cost, reduced-reliability launch vehicle for low-cost consumables, for which an occasional failure will be tolerated. This article discusses pressurization of liquid oxygen (LOX) with gaseous hydrogen, something most rocket scientists would not attempt but that has now been shown to be worthy of development.

Report No.(s): AD-A467750; AFRL-PR-ED-JA-2006-300; No Copyright; Avail.: Defense Technical Information Center (DTIC)

The structures of protonated pentazole cations (RN5H+), oxygen-containing anions such as N(NO2)2-, NO3-, and ClO4-, and the corresponding ion pairs are investigated by ab initio quantum chemistry calculations. The stability of the pentazole cation is explored by examining the decomposition pathways of several monosubstituted cations (RN5H+) to yield N2 and the corresponding azidinium cation. The heats of formation of these cations, which are based onisodesmic (bond type conserving) reactions, are dependent on the nature of the substituents. The proton transfer reaction from the cation to the anion is investigated.

**Molecular Structure Analysis of Aminophenyl Silsesquioxane (Preprint)**

Lee, Andre; Haddad, Timothy S; Schwab, Joseph J; An, Yi Zhong; Oct 31, 2006; 22 pp.; In English

Contract(s)/Grant(s): FA9550-05-1-0084; FA9300-05-C-0022

Report No.(s): AD-A467753; No Copyright; Avail.: Defense Technical Information Center (DTIC)

The molecular structures of aminophenyl substituted silsesquioxanes, prepared by two different approaches, have been

investigated using  $^{29}\text{Si}$  NMR spectroscopy. Aminophenyl silsesquioxane prepared by nitration/reduction of octaphenyl POSS(Registered), exhibits broad resonances in the  $^{29}\text{Si}$  NMR spectrum, whereas aminophenyl silsesquioxanes prepared directly from aminophenyltrimethoxysilane exhibit very narrow line widths. Wide-angle X-ray diffraction of the products from the direct synthesis show a diffraction peak with a d-spacing value similar to the 101 hkl reflection peak of the rhombohedral lattice seen in several other crystalline POSS(Registered) octamers, whereas the products from the nitration/reduction exhibit no diffraction peaks. Our analysis suggests that aminophenyl silsesquioxane prepared by the nitration/reduction of octaphenyl POSS(Registered) no longer retains the Si-O structure of the starting octaphenyl POSS(Registered), while the aminophenyl silsesquioxanes prepared by the direct synthesis have significant Si-O cage structure. Thermogravimetric analysis on both products indicates that the aminophenyl silsesquioxanes from the direct synthesis have better thermal and thermo-oxidative stability (TOS). Furthermore, this improved thermal stability is extended to highly crosslinked resins prepared from the phenylethynyl phthalimide derivatives of the aminophenyl silsesquioxanes. The thermal analysis suggests that the discrete Si-O frameworks found in POSS(Registered) monomers play an important role in maximizing the thermal and thermal-oxidative stability of the materials in which they are incorporated.

**Solid State Synthesis Under Supramolecular Control of a 2D Heterotetrapotic Self-complementary Tecton Tailored to Halogen Bonding**

Marras, Giovanni; Metrangolo, Pierangelo; Meyer, Franck; Resnati, Giuseppe; Pilati, Tullio; Vij, Ashwani; Jul 31, 2006; 7 pp.; In English

Report No.(s): AD-A467786; No Copyright; Avail.: Defense Technical Information Center (DTIC)

We describe the synthesis and characterization, by single crystal X-ray analysis, of a 1D heteroditopic self-complementary tecton for halogen bonding. It was designed to also incorporate double bonds and to possess heteropolar pi-pi stacking groups in order to carefully control its supramolecular organization in the solid state. As a result of this supramolecular control, by UV irradiation in the solid state the compound dimerizes forming a 2D heterotetrapotic self-complementary tecton tailored to halogen bonding based self-assembly. This 2D tecton crystallizes clathrating chloroform molecules.

**Numerical Analysis of Chamber Wall Heat Transfer in a GH<sub>2</sub>/GO<sub>2</sub> Sub-Scale Combustor**

Park, Tae; Coy, Edward; Mar 29, 2007; 15 pp.; In English

Contract(s)/Grant(s): Proj-5026

Report No.(s): AD-A467844; AFRL-PR-ED-TP-2007-169; No Copyright; Avail.: Defense Technical Information Center (DTIC)

Chamber wall heat transfer is critical to lifetime and reliability goals in all engine cycles but design margins included to account for uncertainty of predictive methods and allow for system growth can have detrimental effects on performance. Ensuring that critical objectives will be achieved requires accurate predictive methods; however, in many cases, CFD tools used to predict chamber wall heat transfer have never been validated for rocket chamber conditions. AFRL has a program for assessing the current capability of CFD tools and as necessary, and where possible, making improvements. As a part of our ongoing efforts, a sensitivity analysis was performed to identify key parameters that dominate the overall uncertainty in hot-gas-side chamber wall heat transfer to guide decision making in the experimental effort. Numerical simulations of heat transfer in a sub-scale combustor were carried out using FLUENT over a range of boundary and initial conditions in order to determine sensitivity coefficients. These results were combined with estimates of the uncertainty in experimental measurements to determine an initial estimate for the uncertainty in heat flux prediction. The results indicate that the most critical parameters for chamber wall heat flux are surface roughness, turbulence intensity, and gas temperature.

**Mechanical and Microstructural Effects of Cold Spray Aluminum on Al 7075 Using Kinetic Metallization and Cold Spray Processes (Preprint)**

Barnes, John; Champagne, Victor; Ballard, Donna; Eden, Timothy J; Shoffner, Brent; Potter, John K; Wolfe, Douglas E; Jan 2007; 20 pp.; In English

Contract(s)/Grant(s): Proj-4347

Report No.(s): AD-A467871; AFRL-ML-WP-TP-2007-431; No Copyright; Avail.: Defense Technical Information Center (DTIC)

The objective of this study was to examine how the deposition of a thin layer of Commercially Pure (CP) Al on thin plates of Al-7075 T6 affects the tensile properties of the substrate. The CP Al was deposited using both Cold Spray and Kinetic Metallization. Cold Spray utilizes both He and N<sub>2</sub> as the carrier gas and a supersonic nozzle while Kinetic Metallization uses only He as the carrier gas and a sonic or friction compensated nozzle. A test matrix was established to evaluate the coatings applied by both methods. Characterization of the coatings included microstructural analysis, hardness measurements, and tensile, S-N fatigue and bend tests. Results of the characterization are presented.

**Laser Induced Breakdown Spectroscopy (LIBS) Applied to Reacting Gases for Mixture Ratio Measurement and Detection of Metallic Species**

Thomas, Matthew; Deaconu, Stelu; Lewis, James; Coy, Edward; Mar 29, 2007; 30 pp.; In English

Contract(s)/Grant(s): FA9300-06-C-1002; Proj-300506JN

Report No.(s): AD-A467879; No Copyright; Avail.: Defense Technical Information Center (DTIC)

Measurements of LIBS spectra in an atmospheric pressure laboratory burner and pressurized sub-scale rocket combustion chamber are reported. LIBS is being developed as diagnostic for near wall measurements in liquid rocket combustion chambers as part of an AFRL effort to experimentally determine relative concentrations of major combustion species in rocket chambers and reduce validation uncertainty of CFD heat transfer tools. The potential for simultaneous use as a health-monitoring diagnostic i.e. detection of wall and injector erosion is also discussed.

**Processing, Microstructure, and Tensile Properties of the Ti-6Al-4V-1.55B Eutectic Alloy (Preprint)**

Ivasishin, Orest; Teliovich, Roman V; Ivanchenko, Volodymyr G; Tamirisakandala, Seshacharyulu; Miracle, Daniel B; Feb 2007; 41 pp.; In English

Contract(s)/Grant(s): Proj-4347

Report No.(s): AD-A467919; No Copyright; Avail.: Defense Technical Information Center (DTIC)

Boron addition to conventional titanium (Ti) alloys instigates precipitation of intermetallic TiB whiskers that provide significant increases in strength and stiffness. The eutectic composition is the maximum boron concentration that provides these benefits via melt processing while maintaining reasonable ductility and damage tolerance. The eutectic point for the most widely used Ti alloy, Ti-6Al-4V (weight percent), modified by B addition, was determined to occur at 1.55+0.05B and 1545+5 °C. The microstructure, texture, and tensile properties of the eutectic alloy are sensitive to ingot solidification conditions and melt pool morphology. Several microstructural forms in the as-cast condition as well as their transformation during thermomechanical processing (TMP) were identified. Two types of eutectic structures, aligned and random, were obtained. Cast microstructures with random eutectic colony orientation had no marked crystallographic texture, while cast aligned microstructure had a strong [020] texture for the TiB phase and a <110> circular texture for the alpha-Ti phase.

**Investigation of Ignition Delay: Novel Beta-Substituted Ethylazide Derivatives as Potential New Liquid Propellant Fuels (Preprint)**

Richman, K W; Griffith, K N; Liotta, C L; Pollet, P; Apr 9, 2007; 11 pp.; In English

Contract(s)/Grant(s): FA9300-05-M-3013; Proj-300505KM

Report No.(s): AD-A467979; AFRL-PR-ED-TP-2007-212; No Copyright; Avail.: Defense Technical Information Center (DTIC)

Extensive research has been directed at replacing hydrazine and its simple derivatives in liquid propellant fuel applications. While no specific replacement has been discovered, much has been learned about what types of compounds will make good fuels. One compound that has been investigated is 2-dimethylaminoethylazide (DMAZ). DMAZ is simple to prepare, and from a handling perspective is less toxic than hydrazine. Though DMAZ is hypergolic with IRFNA, there is a significant ignition delay. The explanation, based on ab-initio calculations is that the onset of ignition involves proton transfer from the acid to the amine nitrogen, and in the lowest energy conformer of DMAZ the azide group inhibits this proton transfer. This offers some insight into how one might design a fuel that overcomes these deficiencies. Either the electron distribution could be altered to allow for an enhanced interaction between the proton and the amine nitrogen, or the molecule could be altered to move the azide group away from the amine group. In either case, the chemistry would have to be done so that the advantages found with the DMAZ molecule (i.e. toxicity and energy) are not lost. While several molecules using either one approach or the other have been identified, this paper focuses on, a molecule that takes advantage of both approaches. The replacement of the tertiary amine nitrogen in DMAZ with 1,1-dimethyl hydrazine results in a molecule, 1,1-dimethyl-2-[2-azidoethyl]hydrazine (DMAEH) with a (calculated) lowest energy conformation in which the tertiary amine nitrogen is free to interact with the acidic proton at ignition. In addition to obvious steric improvements, a group with adjacent unshared electron pairs results in an enhancement of this group's nucleophilicity. Attempts at synthesizing DMAEH have ultimately failed.

**Role of Thermochemical Decomposition in Energetic Material Initiation Sensitivity and Explosive Performance**

Shackelford, Scott A; Feb 5, 2007; 31 pp.; In English

Contract(s)/Grant(s): Proj-2303

Report No.(s): AD-A468050; No Copyright; Avail.: Defense Technical Information Center (DTIC)

Catastrophic initiation of an energetic material consists of a complex, interactive, sequential train of mechanistic mechanical, physical, and chemical processes which occur over a finite time period and proceed from macroscopic into sub-microscopic composition levels (bulk > crystalline > molecular > atomic). Initiation results when these processes proceed at a rate which generates sufficient energy (heat) to reach a threshold stage within this finite time period. Thus, the rate at which these mechanistic processes occur defines initiation sensitivity and affects performance. Thermochemical decomposition processes regulate the rate at which heat energy is released at the molecular level, and therefore to some extent, control energetic material initiation sensitivity and performance characteristics. Kinetic deuterium isotope effect (KDIE) data, obtained during ambient pressure thermochemical decomposition process, identifies the mechanistic rate-controlling bond rupture which ultimately regulates the energy release rate of a given energetic material. This same rate-controlling bond rupture also appears as a significant rate-limiting feature in higher order deflagration, combustion, and explosion phenomena. The effect the KDIE-determined rate-controlling bond rupture exerts on initiation sensitivity, and its potential influence in combustion and explosion performance is delineated.

**Perchlorate Removal, Destruction, and Field Monitoring Demonstration**

Coppola, Edward N; Davis, Andrea; Oct 2, 2006; 151 pp.; In English; Original contains color illustrations

Contract(s)/Grant(s): Proj-CU-0312

Report No.(s): AD-A468528; No Copyright; Avail.: Defense Technical Information Center (DTIC)

The objectives of this demonstration were to evaluate and demonstrate a complete perchlorate ion exchange process for groundwater that included a unique, regenerable, perchlorate-selective ion exchange resin; an efficient regeneration technique that greatly minimized waste volume; methods for treating regeneration waste from this process that would reduce cost by enabling discharge or reuse; and to demonstrate a new perchlorate field monitor with ppb detection. In order to validate the performance and economics of the proposed processes compared to current perchlorate treatment processes, the following objectives were proposed: 1. Demonstrate perchlorate removal in groundwater from >50 ppb to < or = 5 ppb with a regenerable, perchlorate-selective ion exchange process. 2. Demonstrate an efficient regeneration technique of the perchlorate-selective ion exchange resin. Regenerant volume should be < 0.1% of treated groundwater stream. 3. Demonstrate removal or destruction of perchlorate (< or = 5 ppb) in the regenerant stream enabling discharge or reuse of the regenerant stream.

**Push-Pull Tests for Evaluating the Aerobic Cometabolism of Chlorinated Aliphatic Hydrocarbons**

Semprini, Lew; Sep 2006; 46 pp.; In English; Original contains color illustrations

Report No.(s): AD-A468544; No Copyright; Avail.: Defense Technical Information Center (DTIC)

Aerobic cometabolism is a promising technology for in situ remediation of chlorinated aliphatic hydrocarbons (CAH) at Department of Defense (DoD) sites. Low-cost methods are needed for generating the data required to design field-scale systems. This report describes a newly developed single-well technology for evaluating the feasibility of using in situ aerobic cometabolic processes to treat groundwater contaminated with chlorinated solvent mixtures. The Environmental Security Technology Certification Program (ESTCP) supported a 3-year field study to investigate single-well tests to evaluate the potential for aerobic cometabolism of CAHs. Tests were performed at McClellan Air Force Base (McAFB), California, using propane as the cometabolic substrate, and at Fort Lewis Logistics Center, Washington, using toluene as the cometabolic substrate. McAFB was selected as the demonstration site since it has significant CAH groundwater contamination, and it was the site of the ESTCP demonstration of cometabolic air sparging (CAS) with propane as a growth substrate. In the Fort Lewis demonstration, toluene was evaluated as a cometabolic growth substrate, and different surrogates and inhibitors were evaluated. The single-well test methods were developed and demonstrated to determine (1) the transport characteristics of nutrients, substrates, and CAHs and their transformation products; (2) the capability of indigenous microorganisms to utilize

selected substrates and transform targeted contaminants and surrogate compounds; (3) the rates of substrate utilization and contaminant transformation; and (4) the combinations of injected nutrients and substrates that maximize rates of contaminant transformation.

**Radon-222 as a Natural Tracer for Monitoring the Remediation of NAPL Contamination in the Subsurface**

Semprini, Lew; Istok, Jonathan; Nov 6, 2006; 98 pp.; In English; Original contains color illustrations

Contract(s)/Grant(s): Proj-ER-9916

Report No.(s): AD-A468545; No Copyright; Avail.: Defense Technical Information Center (DTIC)

Nonaqueous phase liquids (NAPL), including chlorinated solvents, aromatic hydrocarbons, and other volatile organic chemicals (VOC), are common contaminants at Department of Defense (DoD) and other federal and non-federal sites. Residual or pooled NAPL contamination provides a long-term source of contamination as it slowly dissolves into groundwater. A major obstacle preventing cost-effective soil and groundwater cleanup at many DoD sites is the current inability to accurately and inexpensively locate and quantify NAPL contamination. This final report describes the use of naturally occurring radon-222 (Rn) as a partitioning tracer for locating and quantifying NAPL contamination in the subsurface and for monitoring changes in NAPL quantities resulting from remediation activities. Radon-222 possesses unique physical properties that make it a useful natural partitioning tracer for detecting and quantifying NAPL. Rn is produced in the subsurface by the continuous decay of naturally occurring radium-226. In the absence of NAPL contamination, the aqueous Rn concentration quickly reaches a site-specific equilibrium value determined by the mineralogy and porosity of the geologic formation. In the presence of NAPL, however, the Rn concentration is substantially reduced due to partitioning of Rn into the organic NAPL phase. Moreover, the reduction in Rn concentration of groundwater in contact with a NAPL phase is quantitatively correlated with the quantity of NAPL present, as described by simple equilibrium models. Thus, the method is based on measuring Rn in groundwater samples from existing monitoring wells.

**Detonation Nanodiamonds and Related Materials. Bibliography Index, Issue 1**

Vul', Alexander; Dolmatov, Valerii; Shenderova, Olga; Jan 2003; 100 pp.; In English

Contract(s)/Grant(s): N00014-03-1-1070

Report No.(s): AD-A468237; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA468237>

The Bibliography Index 'Nanodiamonds and Related Materials' was prepared for the First International Symposium on 'Detonation Nanodiamonds: Technology, Properties and Applications'. It seemed important to us to introduce the Symposium participants to most of the recent publications, since the studies in the area of nanotechnologies - nanoelectronics, nanobioengineering and nanomaterials - are gaining greater importance in the modern world. A key position among nanomaterials belongs to nanocarbon clusters, such as fullerenes, nanotubes and carbon onions discovered at the end of the 20th century. Most of the papers included in the Bibliography are on detonation nanodiamonds. Two papers published in the Russian journal 'Reports of the Academy of Sciences' and in 'Nature' in 1988 are the most widely cited ones, so they are

chosen as a zero point for the selection of publications. But we also included a short list of papers published before that date for the sake of historical reference. The publications on each topic are presented in a chronological sequence and in the alphabetic order within each year. The Index is concluded with a list of organizations and research groups involved in nanodiamond technologies, which may promote international cooperation within this community.

**Effects of Temperature and Environment on Creep Behavior of an Oxide-Oxide Ceramic Matrix Composite**

Braun, Jason C; Mar 2007; 267 pp.; In English; Original contains color illustrations

Report No.(s): AD-A468294; AFIT/GAE/ENY/07-M04; No Copyright; Avail.: Defense Technical Information Center (DTIC)

This research investigated the creep behavior of an N720/Al2O3 composite. The composite consists of a porous alumina matrix reinforced with laminated, woven mullite/alumina fibers (Nextel™ 720). This ceramic matrix composite (CMC) has no fiber coating and relies on the porous matrix for flaw tolerance. The tensile stress-strain behavior was investigated and the tensile properties measured in the 800-1100 °C temperature range. Tensile creep behavior was examined at 1000 and 1100 °C in laboratory air and in steam environment. In air creep stress was 150 MPa. In steam creep stresses ranged from 100 to 160 MPa. Primary and secondary creep, but no tertiary creep, were observed in all tests. Minimum creep rate was reached in all tests. Creep rates accelerated with increasing temperature and creep stress. The presence of steam further increased creep rates. At 1000 °C creep run-out, defined as 100 hours at creep stress, was achieved in all tests. At 1100 °C run-out was achieved at 150 MPa in laboratory air, but only at 100 MPa in steam. The residual strength and modulus of all specimens that achieved run-out were characterized. At 1100 °C in the presence of steam, creep performance deteriorated rapidly with increasing creep stress. Composite microstructure, as well as damage and failure mechanisms, were explored.

**Microbial Dynamics during Barley Tempeh Fermentation**

Feng, X. M.; January 2006; 52 pp.; In English

Report No.(s): PB2007-109954; Copyright; Avail.: National Technical Information Service (NTIS)

Tempeh is a traditional staple food in Indonesia mainly made from soybeans. Barley tempeh has been developed by adapting the soybean tempeh process. During soybean tempeh fermentation, the filamentous fungus *Rhizopus oligosporus* is dominant. However, other fungi and bacteria also occur, which may influence tempeh quality or even constitute a health risk. Introduction of food-grade lactic acid bacteria (LAB) and yeasts to tempeh fermentation may enhance tempeh nutritional and hygienic quality. The abilities of LAB and yeasts to grow together with *R. oligosporus* during barley tempeh fermentation and their possible effects on tempeh quality were studied.

**Degradation of Polycyclic Aromatic Hydrocarbons by Actinomycetes**

Pizzul, L.; January 2006; 39 pp.; In English

Report No.(s): PB2007-109951; Copyright; Avail.: National Technical Information Service (NTIS)

The potential of some actinomycetes to degrade polycyclic aromatic hydrocarbons (PAH) and the effect of co-substrates, plants and other additives on their degradation and bioavailability was studied. A glass bead system for growth of PAH-degrading actinomycetes in liquid culture was developed and used for the screening of strains for biosurfactant activity and phenanthrene degradation in the presence of different co-substrates. Indication of biosurfactant production by all tested strains was obtained with hexadecane and rapeseed oil as co-substrates but not with glucose. *Rhodococcus* sp. DSM 44126 was identified as *R. wratislaviensis* and found to be able to degrade phenanthrene and anthracene. An actinomycete with a high capacity to degrade phenanthrene and pyrene was isolated from an agricultural soil and identified as *Mycobacterium* LP1. The catabolic activity of both strains was studied in liquid cultures and in soil. Several additives were also tested for their effect on PAH degradation in soils.

**Single Cell Chromatography, LDRD, Feasibility Study**

Knize, M. G.; Bailey, C. G.; Feb. 27, 2007; 8 pp.; In English

Report No.(s): DE2007-902253; UCRL-TR-228365; No Copyright; Avail.: Department of Energy Information Bridge

A limitation in the mass spectrometry of biological materials is the reduced ion formation caused by sample complexity. We proposed to develop an enabling technology, single cell planar chromatography, which will greatly increase the amount of chemical information that can be obtained from single biological cells when using imaging mass spectrometry or other surface analysis methods. The sample preparation methods were developed for the time-of-flight secondary mass spectrometer (ToF-SIMS) at LLNL. This instrument has a measured zeptomole (10<sup>-21</sup> mole, 600 atoms) limit-of-detection for a molecule with a mass to charge ratio of 225(1). Our goal was to use planar chromatographic separation to approach similar low limits of detection even with the chemically complex contents of a single cell. The process was proposed to reduce ion suppression and at the same time expose more of the cell contents to the ion beam. The method of work was to deposit biological cells on a silicon chip with suitable chromatographic and electrical properties, dissolve the cell with a droplet of solvent, allow the solvent to evaporate, and then allow the movement of cell contents laterally by immersing an edge of the chip in to a chromatographic solvent, that then moves through the chromatographic matrix allowing the components to interact with, and be separated by, the chromatographic substrate.

**Atomic-Scale Design of Iron Fischer-Tropsch Catalysts: A Combined Computational Chemistry, Experimental, and Microkinetic Modeling Approach. (3rd Annual Report)**

Mavrikakis, M.; Dumesic, J. A.; Nabar, R. P.; Zou, H.; Paul, U.; Feb. 02, 2007; 41 pp.; In English

Report No.(s): DE2007-901151; No Copyright; Avail.: National Technical Information Service (NTIS)

Work continued on the development of a microkinetic model of Fischer-Tropsch synthesis (FTS) on supported and unsupported Fe catalysts. The following aspects of the FT mechanism on unsupported iron catalysts were investigated on during this third year: (1) the collection of rate data in a Berty CSTR reactor based on sequential design of experiments; (2) CO adsorption and CO-TPD for obtaining the heat of adsorption of CO on polycrystalline iron; and (3) isothermal hydrogenation (IH) after Fischer Tropsch reaction to identify and quantify surface carbonaceous species. Rates of C<sub>2</sub>+ formation on unsupported iron catalysts at 220oC and 20 atm correlated well to a Langmuir-Hinshelwood type expression, derived assuming carbon hydrogenation to CH and OH recombination to water to be rate-determining steps. From desorption of molecularly adsorbed CO at different temperatures the heat of adsorption of CO on polycrystalline iron was determined to be 100 kJ/mol. Amounts and types of carbonaceous species formed after FT reaction for 5-10 minutes at 150, 175, 200 and 285oC vary significantly with temperature.

**Controls of Fluid Chemistry on Fracture Growth**

Bruton, C. J.; Knauss, K. G.; Viani, B. E.; Bonner, B. P.; Feb. 27, 2007; 6 pp.; In English

Report No.(s): DE2007-902283; UCRL-TR-228397; No Copyright; Avail.: National Technical Information Service (NTIS)

During this two year project (the original proposal requested 3 years funding) we developed and tested a new design for a mini-bending jig for the hydrothermal atomic force microscope (HAFM) and a modified design for the HAFM itself. These new capabilities now permit study of the connection between stress and mineral dissolution and growth, as well as sub-critical crack growth (SCG). We demonstrated the successful design by imaging SCG of glass in situ, in real time in the HAFM, as a function of changing solution pH. We generated a movie of the SCG process. We successfully accomplished our project objectives through year 2. The role of water and its dissolved content in fracturing and rock deformation is poorly understood. However, new models describing the controls of surface chemistry on fracturing, and the relation between fracturing and the

breakage of bonds during mineral dissolution suggest new ways to quantify the impact of fluid chemistry on fracturing using the HAFM.

AFCI Storage and Disposal participants at LLNL, ANL and INL provide assessment of how AFCI technology can optimize the future evolution of the fuel cycle, including optimization of waste management. Evaluation of material storage and repository disposal technical issues provides feedback on criteria and metrics for AFCI, and evaluation of AFCI waste streams provides technical alternatives for future repository optimization. LLNL coordinates this effort that includes repository analysis at ANL and incorporation of repository impacts into AFCI criteria at INL. Cooperative evaluation with YMP staff is pursued to provide a mutually agreed technical base. Cooperation with select international programs is supported.

**Neutron Induced Cross Sections for Radiochemistry Isotopes of Nickel, Copper and Zinc**

Kelley, K.; Hoffman, R. D.; Dietrich, F. S.; Mustafa, M.; Jun. 01, 2006; 42 pp.; In English

Report No.(s): DE2007-900873; UCRL-TR-221759; No Copyright; Avail.: National Technical Information Service (NTIS)

The authors have developed a set of modeled neutron induced cross sections for use in radiochemical diagnostics. Local systematics for the input parameters required by the Hauser-Feshbach statistical model were developed and used to calculate neutron induced nuclear reaction cross sections for target isotopes of nickel, copper, and zinc (28 less than or equal to Z less than or equal to 30) for neutron numbers 30 less than or equal to N less than or equal to 40.

**Final Project Report for Terahertz Spectroscopy of Complex Matter**

January 2006; 15 pp.; In English

Contract(s)/Grant(s): DE-FG02-02ER45960

Report No.(s): DE2007-899163; DOE/FG-45960-4; No Copyright; Avail.: National Technical Information Service (NTIS)

This project designed characterization techniques for thin films of complex matter and other materials in the terahertz spectral region extending from approximately 100 GHz to 4000 GHz (4 THz) midway between radio waves and light. THz has traditionally been a difficult region of the spectrum in which to conduct spectroscopic measurements. The THz gap arises from the nature of the sources and detectors used in spectroscopy both at the optical (high frequency) side and electronic (low frequency) side of the gap. To deal with the extremely rapid oscillations of the electric field in this frequency region this research project adapted techniques from both the electronics and optics technologies by fabricating microscopic antennas and driving them with short optical pulses. This research technique creates nearly single cycle pulses with extremely broad spectral bandwidth that are able to cover the THz spectral range with a single measurement. The technique of THz time domain spectroscopy (THz-TDS) has seen increasing use and acceptance in laboratories over the past fifteen years. However significant technical challenges remain in order to allow THz-TDS to be applied to measurement of solid materials, particularly thin films and complex matter. This project focused on the development and adaptation of time domain THz measurement techniques to investigate the electronic properties of complex matter in the terahertz frequency region from 25 GHz to beyond 5 THz (<1 inv. cm to >165 inv. cm). This project pursued multiple tracks in adapting THz Time Domain Spectroscopy (THz-TDS) to measurement of complex matter.

**Conversion of Hydrogen Sulfide in Coal Gases to Liquid Elemental Sulfur with Monolithic Catalysts. (Annual Report, October 1, 2005-September 30, 2006)**

Kwon, K. C.; Dec. 1, 2006; 31 pp.; In English

Contract(s)/Grant(s): DE-FG26-04NT42129

Report No.(s): DE2007-901077; No Copyright; Avail.: Department of Energy Information Bridge

Removal of hydrogen sulfide (H<sub>2</sub>S) from coal gasifier gas and sulfur recovery are key steps in the development of Department of Energys (DOEs) advanced power plants that produce electric power and clean transportation fuels with coal and natural gas. These plants will require highly clean coal gas with H<sub>2</sub>S below 1 ppmv and negligible amounts of trace contaminants such as hydrogen chloride, ammonia, alkali, heavy metals, and particulate. The conventional method of sulfur removal and recovery employing amine, Claus, and tail-gas treatment is very expensive. A second generation approach developed under DOEs sponsorship employs hot-gas desulfurization (HGD) using regenerable metal oxide sorbents followed by Direct Sulfur Recovery Process (DSRP). However, this process sequence does not remove trace contaminants and is targeted primarily towards the development of advanced integrated gasification combined cycle (IGCC) plants that produce electricity (not both electricity and transportation fuels).

**Single-Cell Level Investigation of Cytoskeletal/Cellular Response to External Stimuli**

Hiddessen, A. L.; Bearinger, J. P.; Feb. 26, 2007; 11 pp.; In English

Report No.(s): DE2007-902301; UCRL-TR-228478; No Copyright; Avail.: National Technical Information Service (NTIS)

A detailed understanding of the molecular mechanisms by which chemical signals control cell behavior is needed if the complex biological processes of embryogenesis, development, health and disease are to be completely understood. Yet, if we are to fully understand the molecular mechanisms controlling cell behavior, measurements at the single cell level are needed to supplement information gained from population level studies. One of the major challenges to accomplishing studies at the single cell level has been a lack of physical tools to complement the powerful molecular biological assays which have provided

much of what we currently know about cell behavior. The goal of this exploratory project is the development of an experimental platform that facilitates integrated observation, tracking and analysis of the responses of many individual cells to controlled environmental factors. Toward this goal, we developed chemically-patterned microarrays of both adherent and suspension mammalian cell types. A novel chemical patterning methodology, based on photocatalytic lithography, was developed to construct biomolecule and cell arrays that facilitate analysis of biological function. Our patterning techniques rely on inexpensive stamp materials and visible light, and do not necessitate mass transport or specified substrates. Patterned silicon and glass substrates are modified such that there is a non-biofouling polymer matrix surrounding the adhesive regions that target biomolecules and cells. Fluorescence and reflectance microscopy reveal successful patterning of proteins and single to small clusters of mammalian cells. In vitro assays conducted upon cells on the patterned arrays demonstrate the viability of cells interfacing with this synthetic system. Hence, we have successfully established a versatile cell measurement platform which can be used to characterize the molecular regulators of cellular behavior in a variety of important biological processes. The achievements realized in this project have enabled presentations and publication within the international scientific community, new collaborations with researchers at the University of California, and successful competition for three additional, separate research grants on studies of stem cell fate commitment and pathogen-host cell interactions.

Report No.(s): PB2007-104631; No Copyright; Avail.: CASI: [A03](#), Hardcopy

A new class of releasable corrosion inhibiting materials for protective coatings, methods of making the same, methods of using the same, and coatings containing the same are provided. The materials comprise one or more corrosion inhibitors that are chemically anchored to the surface of a particle having an aluminum oxyhydroxide surface through a carboxylate bond. The carboxylate/aluminum- oxyhydroxide-surface bond breaks under corrosion-causing conditions (for example the presence of high levels of hydroxide ions generated by the cathodic oxygen reduction reaction on metals such as iron and aluminum) thereby allowing the corrosion inhibitors to detach from the particle surface when corrosion is present.

**Comparison of Isoconversional and Model Fitting Approaches to Kinetic Parameter Estimation and Application Predictions**

Burnham, A. K.; May 30, 2006; 12 pp.; In English

Report No.(s): DE2007-900446; UCRL-CONF-221685; No Copyright; Avail.: National Technical Information Service

(NTIS)

Chemical kinetic modeling has been used for many years in process optimization, estimating real-time material performance, and lifetime prediction. Chemists have tended towards developing detailed mechanistic models, while engineers have tended towards global or lumped models. Many, if not most, applications use global models by necessity, since it is impractical or impossible to develop a rigorous mechanistic model. Model fitting acquired a bad name in the thermal analysis community after that community realized a decade after other disciplines that deriving kinetic parameters for an assumed model from a single heating rate produced unreliable and sometimes nonsensical results. In its place, advanced isoconversional methods (1), which have their roots in the Friedman (2) and Ozawa-Flynn-Wall (3) methods of the 1960s, have become increasingly popular. In fact, as pointed out by the ICTAC kinetics project in 2000 (4), valid kinetic parameters can be derived by both isoconversional and model fitting methods as long as a diverse set of thermal histories are used to derive the kinetic parameters. The current paper extends the understanding from that project to give a better appreciation of the strengths and weaknesses of isoconversional and model-fitting approaches. Examples are given from a variety of sources, including the former and current ICTAC round-robin exercises, data sets for materials of interest, and simulated data sets.

**Development of a Recovery System for Metals and Acids from Pickling Baths Using Nanofiltration and Crystallisation**

Tjus, K.; Bergstrom, R.; Fortkamp, U.; Forsberg, K.; Rasmuson, A.; Oct. 2006; 56 pp.; In English

Report No.(s): PB2007-110375; IVL-B-1692; No Copyright; Avail.: National Technical Information Service (NTIS)

Within the project a possible combination of techniques for recovery of metals and acids from stainless steel pickling has been investigated, as there is a lack of cost and energy efficient methods that allow recycling of both metals and acids today. Crystallisation and nanofiltration were combined in order to separate the metals as metal fluorides and recycle nitric and hydrofluoric acid to the pickling bath. A total treatment concept will also include the thermal treatment of the crystals, in order to gain metal oxides that can be reused. The fluorides will be recovered as HF from the exhaust gas. This thermal treatment has not been investigated in this project, but it should be possible to adapt existing techniques for that. Experiments in laboratory scale were performed in order to increase understanding of the processes and for design of a pilot plant. A Pilot plant was built within the project. Process liquids from two stainless steel companies in Sweden were investigated with the pilot plant. The experiments were used for recommendations on full-scale solutions as well as rough estimations on energy and cost savings. Tests for a longer period of time would be needed in order to be able to assess the life-time of the equipment and performance stability better, but the results show that the techniques could be used for metal separation to allow recycling of acids and prepare for metal recovery. The results also indicate possible energy savings when installing the system. Investigations from a parallel project show promising results regarding the on-line measurement of concentrations, which will allow a more efficient control of the process.

Report No.(s): DE2007-900334; WSRC-TR-2006-00363; No Copyright; Avail.: National Technical Information Service (NTIS)

The purpose of these studies was to determine the feasibility of using edible oils for remediation of the low but persistent chlorinated solvent (cVOC) groundwater contamination at the SRS T-Area. This paper provides a summary and overview of the studies completed for the remediation of the T-Area groundwater plume using edible oils. This report begins with a summary of the results and a brief description of the preliminary oil deployment design followed by brief descriptions of T-Area and current groundwater conditions as related to edible oil deployment. This is followed by a review of the remediation processes using edible oils and specific results from modeling, field and laboratory studies. Finally, a description of the preliminary design for full scale oil deployment is presented.

The Savannah River National Laboratory (SRNL) is a U.S. Department of Energy research and development laboratory located at the Savannah River Site (SRS) near Aiken, South Carolina. SRNL has over 50 years of experience in developing and applying hydrogen technology, both through its national defense activities as well as through its recent activities with the DOE Hydrogen Programs. The hydrogen technical staff at SRNL comprises over 90 scientists, engineers and technologists, and it is believed to be the largest such staff in the U.S. SRNL has ongoing R&D initiatives in a variety of hydrogen storage areas, including metal hydrides, complex hydrides, chemical hydrides and carbon nanotubes. SRNL has over 25 years of experience in metal hydrides and solid-state hydrogen storage research, development and demonstration. As part of its defense mission at SRS, SRNL developed, designed, demonstrated and provides ongoing technical support for the largest hydrogen processing facility in the world based on the integrated use of metal hydrides for hydrogen storage, separation and compression.

Report No.(s): AD-A468614; USAMRICD-P05-013; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA468614>

Methods of directly evaluating cyanide levels are limited by the volatility of cyanide and by the difficulty of establishing steady-state cyanide levels with time. We investigated the measurement of a stable, toxic metabolite, 2-aminothiazoline-4-carboxylic acid (ATCA), in an attempt to circumvent the challenge of directly determining cyanide concentrations in aqueous media. This study was focused on the spectrophotometric ATCA determination in the presence of cyanide, thiocyanate (SCN<sup>-</sup>), cysteine, rhodanese, thiosulfate, and other sulfur donors. The method involves a thiazolidine ring opening in the presence of p.(hydroxy.mercuri)- benzoate, followed by the reaction with diphenylthiocarbazone (dithizone). The product is spectrophotometrically analyzed at 625 nm in carbon tetrachloride. The calibration curve was linear with a regression line of  $Y = 0.0022x$  (R squared = 0.9971). Interference of cyanide antidotes with the method was determined. Cyanide, thiosulfate, butanethiosulfonate (BTS), and rhodanese did not appreciably interfere with the analysis, but SCN<sup>-</sup> and cysteine significantly shifted the standard curve. This sensitive spectrophotometric method has shown promise as a substitute for the measurement of the less stable cyanide.

**Sulfur Mustard-induced Neutropenia: Treatment with Granulocyte Colony-stimulating Factor**

Anderson, Dana R; Holmes, Wesley W; Lee, Robyn B; Dalal, Stephen J; Hurst, Charles G; Maliner, Beverly I; Newmark, Jonathan; Smith, William J; Jan 2006; 7 pp.; In English; Original contains color illustrations

Report No.(s): AD-A468624; USAMRICD-P04-030; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA468624>

Although best known as a blistering agent, sulfur mustard (HD) can also induce neutropenia in exposed individuals, increasing their susceptibility to infection. Granulocyte colony-stimulating factor (G-CSF) and pegylated G-CSF (peg-G-CSF) have been approved by the U.S. Food and Drug Administration as hematopoietic growth factors to treat chemotherapy-induced neutropenia. The goal of this study was to determine the effectiveness of G-CSF and peg-G-CSF in ameliorating HD-induced neutropenia. African green monkeys (*Chlorocebus aethiops*) were challenged with HD and, at 1, 3, 5, or 7 days after exposure, G-CSF therapy (10 microgram/kg per day for 21 days) was initiated. Peg-G-CSF (300 microgram/kg, single treatment) was similarly tested, with treatment given at 3 days after exposure. Untreated HD-exposed animals recovered from neutropenia 28 days after exposure, whereas G-CSF- or peg-G-CSF-treated animals recovered 8 to 19 days after exposure ( $p < 0.05$ ). These results indicate that G-CSF or peg-G-CSF may provide Food and Drug Administration-approved treatments that will reduce the duration of HD-induced neutropenia.

Schmitt, David R; May 2007; 144 pp.; In English; Original contains color illustrations

Report No.(s): AD-A468644; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA468644>

One of the most intriguing and perplexing problems in fluid mechanics today, as it was 50 years ago, is that of turbulence. The behavior of a fluid in turbulent regions around an object consists of chaotic flow phenomena made of unsteady vortices on many scales that can critically affect the ability of that object to pass through the fluid. Indeed, turbulent convective heat and mass transfer is one of the frequently encountered problems at all levels of applied engineering. While countless research efforts are devoted to understanding turbulent phenomena, this chaotic motion which also consists of random fluctuations in temperature, velocity, pressure, and fluid properties as well as advanced mixing (among other things), has yet to be solved analytically. As a result, understanding this flow requires the use of numerical methods. While turbulent behavior can be resolved through Direct Numerical Simulation (DNS) of the Navier-Stokes Equations, this method is extremely computationally intensive and cannot be practically implemented with today's computing power in flows with Reynolds numbers above approximately 10<sup>4</sup> or 10<sup>5</sup>. As a result, other methods must be used that can approximate turbulent behavior with flow modeling.

Contract(s)/Grant(s): FA9550-04-1-0107; Proj-2308

Report No.(s): AD-A468806; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA468806>

The project has conducted basic studies of flame ignition collaborative studies of pulse detonation ignition, and preliminary studies of fundamental issues relevant to the application of transient plasma as an ignition source for Air Force high-speed aircraft applications. Preliminary basic science experiments have been conducted at the Air Force Research Laboratory (AFRL) using planar laser-induced fluorescence (PLIF) for investigation of radical production and ignition delay. Very strong enhancement of radical species throughout the combustor volume using transient plasma for ignition (TPI) was demonstrated using PLIF, and the production of electronically excited species was well coordinated with TPI. In another study at AFRL systems were interfaced successfully with a pulse detonation engine (PDE), and data were taken for a variety of electrode lengths while burning aviation gasoline and ethylene. The project work also included development of appropriate ignition systems for these studies, comprised of pulse sources, transmission lines (cabling appropriate for nanosecond power pulses), and electrodes, and extending the work from laboratory pulse generation capabilities to considerable reduction in size and weight of the ignition pulse generation. This reduction is a critical issue in the application of this technology. The electrical engineering issues inherent in the application of the short pulses to fuel-air mixtures at various pressures and in a variety of geometries were addressed successfully in the project.

**Novel Continuous Carbon Nanofibers for the Next Generation Lightweight Structural Nanocomposites**

Dzenis, Y A; May 2007; 50 pp.; In English; Original contains color illustrations

Contract(s)/Grant(s): F49620-03-1-0142

Report No.(s): AD-A468823; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA468823>

The goal of this research was to establish applicability and effectiveness of novel continuous carbon nanofibers as nanoreinforcement in advanced organic matrix composites. The specific objectives were: (1) demonstrate applicability of continuous carbon nanofibers for delamination suppression in advanced PMC laminates; (2) explore manufacturing and characterize mechanical behavior of carbon nanofiber reinforced epoxy matrix nanocomposites. Continuous carbon nanofibers were successfully manufactured and used to reinforce interfaces in specially designed aerospace grade carbon-epoxy laminates. Static and fatigue Mode I and II fracture mechanics and edge delamination testing were performed. Substantial improvements in delamination toughness, mechanical strength, and fatigue life were observed for the first time. Pioneering multilayered carbon nanofiber reinforced nanocomposites were manufactured and evaluated. It was demonstrated that continuous carbon nanofibers may provide unique advantages for structural nanocomposite applications.

**A Fully-Integrated MEMS Preconcentrator for Rapid Gas Sampling (Preprint)**

Bae, Byunghoon; Yeom, Junghoon; Radadia, Adarsh D; Masel, Richard I; Shannon, Mark A; Nov 2006; 6 pp.; In English

Contract(s)/Grant(s): FA8650-04-01-7121; Proj-4H20

Report No.(s): AD-A468430; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA468430>

A new type of fully integrated MEMS preconcentrator has been fabricated and tested as a front end for a flame ionization detector (FID). A 1 microliter preconcentrator filled with PEI-coated microposts is integrated with fast microvalves (response time < 50 microseconds) and a resistive microheater (ramping to 200C in 0.5 second). The integrated preconcentrator can sample a cubic centimeter of gas in 0.2 second at 50 kPa, adsorb targeted species, heat and desorb in 0.5 second, and inject concentrated gaseous species in as small as 50  $\mu$ s pulses into separation columns in a microscale gas chromatograph (GC), or directly into a detector. The unprecedented speed of this preconcentrator (< 1 second) is enabled by MEMS sizing and

fabrication, allowing sniffing of chemical warfare agents, toxic industrial compounds (TICs), and other volatile compounds in seconds, rather than tens of minutes with conventional systems.

**Ohmic Contacts for Technology for Frequency Agile Digitally Synthesized Transmitters**

Mohney, Suzanne E; May 21, 2007; 6 pp.; In English; Original contains color illustrations

Contract(s)/Grant(s): N00014-05-1-0194

Report No.(s): AD-A468888; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA468888>

Ohmic contacts to InAs and InGaAs have been investigated with the objective of providing low contact resistance, good thermal stability, and process compatibility for scaling InP-based heterojunction bipolar transistors to smaller sizes. For p-type InAs, the combination of modest contact resistance and good thermal stability at 250 °C was achieved with metallizations that had thin Pd layers deposited first, followed by W or Ti/Pt barrier layers, then Au. For n-type InAs, however, Pd as a first metal layer provided a higher resistance than conventional Ti/Pt/Au contacts. Ohmic contacts to p-type InGaAs were also investigated. An electron-beam evaporated Pd/Ru/Au contact developed at Penn State provided the minimum resistance of all contacts tested as well as good thermal stability at 250 °C, as demonstrated using contact resistances and cross-sectional transmission electron microscopy. However, Pt/Ti/Pt/Au contacts provided better thermal stability at 350 °C. Due to the possibility of electrochemically preparing Pd/Ru/Au contacts, they were selected for further study, and electroless deposition of successive Pd, Ru and Au layers on InGaAs was investigated.

ONLINE: <http://hdl.handle.net/100.2/ADA468958>

In this study, a high-intensity ultrasonic liquid processor was used to obtain a homogeneous mixture of epoxy resin and multi-walled carbon nanotubes (CNTs). The CNTs were infused into epon 862 epoxy resin through sonic cavitation and then mixed with a curing agent using a high-speed mechanical agitator. The trapped air and reaction volatiles were removed from the mixture using a high vacuum. Flexural tests and fracture toughness tests were performed on unfilled and CNT-filled epoxy to identify the effect of adding CNTs on the mechanical properties of epoxy. The highest improvement in strength and fracture toughness was obtained with 0.3 wt% CNT loading. The nanophased matrix filled with 0.3 wt% CNT was then used with weave carbon fabric in a vacuum-assisted resin transfer molding (VARTM) set up to fabricate composite panels. Flexural tests, Thermogravimetric Analysis (TGA), and Dynamic Mechanical Analysis (DMA) were performed to evaluate the effectiveness of adding CNTs on the mechanical and thermal properties of the composite. The glass transition temperature, decomposition temperature, and flexural strengths were improved by infusing CNTs.

**Microbial Degradation of Fuel Oxygenates under Aerobic Conditions**

Dietz, John M; Mar 2007; 102 pp.; In English; Original contains color illustrations

Report No.(s): AD-A469001; AFIT/GES/ENV/07-M1; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA469001>

This research determined the rate and extent of aerobic degradation of fuel oxygenates ethyl tert butyl ether (ETBE), tert amyl methyl ether (TAME) and ethyl alcohol (ethanol). Biodegradation was measured using gas chromatography (GC), respirometry, and biochemical oxygen demand (BOD) tests. Additionally, the research determined the effects of toluene on

degradation rates. This microcosm study used a microbial consortium obtained from a petroleum refinery wastewater treatment facility. Respirometry data were collected from chambers containing pure oxygenates, or oxygenate/toluene mixtures. Samples were withdrawn periodically for GC analysis. Aerobic conditions were maintained in the chambers at all times. Degradation of oxygenates was compared to degradation of toluene, assuming first order decay. Across all experiments TAME degraded at 8.65 % the rate of toluene, ETBE at 8.17% the rate of toluene and ethanol at 156.79 % the rate of toluene. GC and respirometry data were the most suitable methods for measuring degradation. BOD provided acceptable results for toluene and ethanol but not for the slower degrading oxygenates. Finally, the presence of toluene slowed the degradation of both ETBE and TAME.

The study of the individual components comprising a physical system is a necessary first step for understanding the behavior of the system. However, when the individual components are brought together, unexpected consequences have a way of taking place that were not anticipated by the studies on the individual components. This is usually the consequence of the union of components that comprise a non-linear system. The term 'non-linear' is understood within the usual analytical definition: [4] (1)  $f(a+b)=f(a)+f(b)$  and (2)  $cf(b)= f(cb)$  or present purposes, it is equation (1) that is of interest. In it lies a fundamental facet of human thinking. Simply put, equation (1) states that if a problem is divided into its parts and the parts are studied independently, then the parts can be reassembled and the response of the union can be predicted. This sometimes works. One name that characterizes this kind of behavior is the Principle of Superposition which is found in the analysis of electrical circuits. The nice thing about linearity is that the problems tend to have computable solutions. Another nice thing is that the systems being described can be easily categorized into discrete and unique parts and the mathematics is simpler and solutions exist. Non-linearity requires terms not included in equation (1) that suggest the existence of interactions between the components. The feedback between the components has a way of making the cause and effect presumption to become fuzzy. This is what characterizes a complex process.

Recently, there has been tremendous interest in the size-dependent mechanical properties of materials, in particular, using various applications of the micrometer-scale uniaxial compression technique. In this technique, site-specific focused ion beam (FIB) milling is employed to fabricate micrometer sized compression specimens (micro-posts) from otherwise bulk material. These micro-posts are then tested in uniaxial compression using a flat punch indenter in a conventional nanoindenter. We apply this technique to examine the mechanical properties of bulk metallic glass (BMG) systems from two perspectives; micro-electro-mechanical systems, and tungsten (W)-BMG composite kinetic energy penetrators (KEP). The mechanical properties of Pd40Ni40P20 are found to be relatively free from scale effects approaching the micron size scale. There are, however, moderate increases in strength for micrometer sized, likely resulting from extrinsic factors such as local heterogeneities, pores, and/or other defects are able to act as points of stress concentrations. While the mechanical properties of monolithic amorphous alloys are well understood, local heterogeneities in W-BMG composites may affect the response of

the composite. With this motivation, the micro-posts of the BMG are machined from the composite material using site-specific FIB milling. The mechanical properties of the BMG matrix are examined, and thus microcompression is used as a tool to relate local mechanical properties to the expected bulk response in these composites.

Patent Info.: Filed 8 Nov 04; US-Patent-Appl-SN-10-982 956

Report No.(s): PB2007-108656; No Copyright; Avail.: CASI: [A03](#), Hardcopy

The invention relates to compositions and kits for homogeneous fluorescence polarization (anisotropy) assays for detecting and quantifying metal ions in solution. Metal-dependent binding of a fluorescent ligand to an unlabeled macromolecule effects a measurable change in anisotropy as will the binding of metal ions to a fluorescent labeled macromolecule. Binding of the fluorescent ligand to the unlabeled macromolecule is metal dependent with the change in anisotropy being proportional to the concentration of bound metal ions. Conversely, if the fluorescent label is first conjugated to a macromolecule and the macromolecule is subsequently stripped of metal ion, it may then be used to signal binding of metal ions. The covalently bound fluorescent label exhibits changes in anisotropy proportional to the concentration of bound metal ions. Kits comprise a fluorescent molecule and a macromolecule.

**Probabilistic Analysis for the Mechanical Properties of Cross-Ply Fiber-Reinforced Composite Laminate (Postprint)**

Chuang, Shui-Nan; Mar 2006; 15 pp.; In English

Contract(s)/Grant(s): Proj-4347

Report No.(s): AD-A466114; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA466114>

A probabilistic micromechanics model has been developed for the unidirectional fiber-reinforced composite material design screening. This model provides a design-screening tool to help material producers eliminate the unnecessary time-consuming and costly material fabrications and to reduce the numbers of testing to a minimum, but enough to verify the model prediction. Consequently, it provides a means to accelerate the insertion of materials into AF productions. To include the material design in the structural design process, we extended the probabilistic analysis to predict the probability density functions for the off-axis transformed reduced stiffness, Young's modulus, transverse Young's modulus, shear modulus and Poisson's ratio. In this report we will focus on the probabilistic analysis of symmetric and anti-symmetric regular cross-ply laminates of IM-7/520-4 fiber-reinforced composite with odd-number plies parallel to and even-number plies perpendicular to the laminate principal axes.

**The Effect of Inhomogeneous Plastic Deformation on the Ductility and Fracture Behavior of Age Hardenable Aluminum Alloys**

Csontos, Aladar A; Starke, Edgar A; Jan 5, 2005; 23 pp.; In English; Original contains color illustrations

Contract(s)/Grant(s): F49620-97-1-1034

Report No.(s): AD-A466374; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA466374>

The role of alloy composition, grain structure, precipitate microstructure, and precipitate dislocation interactions on the

plastic deformation characteristics and the resulting fracture behavior of two isotropic Al Li Cu X alloys designated AF/C-458 (1.8 w/o Li) and AF/C- 489 (2.1 w/o Li) was examined. Inhomogeneous deformation due to strain localization from the shearing of the delta (Al<sub>3</sub>Li), theta (Al<sub>2</sub>Cu), and Tau (sub 1) (Al<sub>2</sub>CuLi) precipitates lead to fine and coarse planar slip for the AF/C-458 and AF/C-489 alloys, respectively. The intensity of this planar slip was predicted through slip intensity calculations using precipitate density measurements, dislocation particle interactions, and grain boundary misorientation-slip continuity statistics. The slip intensity predictions were corroborated through atomic force microscopy (AFM) measured slip height offsets on the polished surface of single aged and 2% plastically strained tensile samples. Our results suggest that the low ductility of AF/C-489 in comparison to AF/C-458 is primarily due to the much larger slip lengths, i.e. grain size, which increased the strain localization and stress concentrations on grain boundaries, thus promoting low-energy intergranular fracture.

ONLINE: <http://hdl.handle.net/100.2/ADA466501>

Atomic Cluster Configurations in Metallic Glasses: In connection with the model for metallic glasses proposed by D. B..Miracle [A structural model for metallic glasses. Nature Materials 3 (2004) 697-702], the structures consisting of a single solute atom surrounded by a coordination shell of solvent atoms has been examined. The possible coordination number (CN) depends, of course, on the ratio of radii of the two kinds of atom. Atomic Size Factor Criterion in Designing Bulk Metallic Glasses: In the heuristic formulations for glass forming ability by Inoue, atomic size, negative enthalpy of mixing and multicomponent criteria are used. A study of related crystalline and quasicrystalline intermetallics lends weight to the atomic size being the dominant factor. The largest size atom plays a key role in all topologically close-packed phases, even when it happens to be a minority constituent. The supertetrahedron: The various structures that can arise from supertetrahedral clusters serve to illustrate the interplay between the different approaches to visualising the geometry underlying complex material structures - sphere packing models, clusters describable as sets of nested polyhedra, network structures, and network-type configurations of polyhedra. A concise description and visualization of atomic structures is fundamental to a clear understanding of a broad range of phenomena in the expansive class of intermetallic alloys. Geometrical models based on polytetrahedral units have been adopted in order to rationalize a number of important intermetallic structures: the family of gamma-phases, the Laves phases and the so-called 'anti-Laves' phases. An icosahedral cluster consisting of a 13 equal-sized spheres is a simple polytetrahedral unit of relevance in many crystalline, quasicrystalline and amorphous structures. A more complicated polytetrahedral unit has been emphasized; the supertetrahedron, consisting of four interpenetrating icosahedra.

**Microstructural Evolution of Commercial-Purity Ti and Superplasticity of Ti-6Al-4V Alloy Processed by Equal Channel Angular Extrusion**

Shin, Dong H; Dec 8, 2006; 3 pp.; In English

Contract(s)/Grant(s): FA5209-05-P-0175

Report No.(s): AD-A466503; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA466503>

This project focused on deformation processing, microstructural development, and mechanical properties of Ti and Ti-6Al-4V alloys. Specific tasks included: (1) Study superplastic deformation of a Ti-6Al-4V alloy that have been processed by equal channel angular extrusion and relate the deformation mechanism to the enhancement of superplasticity, and (2) Examine the effect of strain path for Ti fabricated by equal channel angular extrusion and uniaxial compression, with a special focus on the improved mechanical properties of the deformed Ti. As a part of the report, two papers were published in Materials Science and Engineering A (vol.A410-411, 2005, 156-159) and Metallurgical and Materials Transactions A (vol.37, 2006, 381-391). The work was begun under AOARD 034023, 'Microstructure development of ultrafine grained Ti and superplasticity of Ti-6Al-4V alloy.' Most of that effort was devoted to Ti-6Al-4V alloy. Much progress has been made over the more than two years of effort. We propose to complete our studies by studying, in detail, deformation mechanisms for the

enhanced superplasticity in the ultrafine grained Ti-6Al-4V alloy with a special focus on the role of non-equilibrium grain boundaries.

**The Effect of As-Large-As (ALA) Grains on the High-Temperature Fatigue Life of Waspaloy**

Brogdon, Mandy L; Dec 2006; 120 pp.; In English

Contract(s)/Grant(s): FA8650-04-C-5200; Proj-4347

Report No.(s): AD-A466607; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA466607>

Waspaloy is a nickel superalloy that, when processed, may contain as-large-as (ALA) grains in the outer surface of the billet. Many components were manufactured containing this ALA region. The common practice now is to remove the ALA-affected region; however, the effect of these ALA grains in Waspaloy has not directly been studied. To characterize the material and determine the effects of the ALA grains, tensile tests and fatigue tests were performed at 538 degrees C to emulate the operating conditions of Waspaloy aerospace components. Half of the specimens tested were ALA containing specimens and the other half of the specimens were from the mid radius of the billet and did not contain ALA grains. Replicas were taken of several of each group to track crack initiation and growth. The fracture surfaces were also examined in a scanning electron microscope (SEM) where stereo pair photographs were taken so the surface geography could be viewed in a program called MeX by creating digital elevation maps (DEM). The tensile tests revealed yield strength variability in the ALA material. The fatigue data showed three types of behavior in the ALA material and two types in the non-ALA material. Based on the average material in both groups, the ALA material had a shorter average life. The short life specimens in each group, however, had almost the same number of cycles to failure, implying that the ALA grains had no specific bearing on the minimum bound of specimen life.

**Elastic-Viscoplastic an Isotropic Modeling of Textured Metals and Validation using the Taylor Cylinder Impact Text**

Plunkett, B; Cazacu, O; Lebensohn, R A; Barlat, F; Nov 21, 2006; 23 pp.; In English

Contract(s)/Grant(s): FA8651-05-1-0005; Proj-2502

Report No.(s): AD-A467081; No Copyright; Avail.: Defense Technical Information Center (DTIC)

An elastic-viscoplastic model for describing the anisotropic high-strain rate behavior of both low-symmetry and high symmetry textured materials is proposed. Yielding is described using a recently developed criterion which can capture simultaneously anisotropy and compression-tension asymmetry associated with deformation twinning. The anisotropy coefficients as well as the size of the elastic domain are considered to be functions of the accumulated plastic strain. The specific expressions for the evolution laws are determined using a multi-scale methodology, i.e. experimental measurements

of crystallographic texture and uniaxial stress/strain curves, poly-crystalline calculations, and macroscopic scale interpolation techniques. An over stress approach is used to incorporate rate effects in the formulation. Applications of the model to the description of the high strain-rate response of low-symmetry (hexagonal-close-packed zirconium) and high-symmetry (body-centered-cubic tantalum) pre-textured metals are presented. The very good agreement between the simulated and experimental post-test geometries of the Taylor impact specimens in terms of major and minor side profiles and impact interface foot prints shows the ability of the model to describe with fidelity the differences in the evolution of an isotropy between zirconium and tantalum.

**Recrystallization and Grain-Growth Behavior of a Nickel-Base Superalloy During Multi-Hit Deformation (Preprint)**

Weaver, D S; Semiatin, S L; Feb 2007; 20 pp.; In English

Contract(s)/Grant(s): Proj-4347

Report No.(s): AD-A467780; AFRL-ML-WP-TP-2007-432; No Copyright; Avail.: Defense Technical Information Center (DTIC)

The initial breakdown behavior of Waspaloy-ingot material with coarse, columnar grain structure was established via isothermal hot compression of double-cone samples. Temperature (1177 degrees C), strain rate (0.1 s<sup>-1</sup>), dwell time between increments of deformation (30 or 60 seconds), and forging direction relative to the columnar structure were typical of industrial practice. Recrystallization kinetics were more rapid during multi-hit testing than monotonic testing. The recrystallization and grain-growth behavior showed a complex dependence on imposed strain, test orientation, and dwell time.

**Determination of the Misorientation Dependence of the Relative Grain-Boundary Energy of Commercial-Purity Nickel (Preprint)**

Mahaffey, D W; Semiatin, S L; Schaab, A E; Rollett, A D; Feb 2007; 8 pp.; In English

Contract(s)/Grant(s): Proj-4347

Report No.(s): AD-A467784; AFRL-ML-WP-TP-2007-433; No Copyright; Avail.: Defense Technical Information Center (DTIC)

Columnar-grained samples of commercial-purity nickel were analyzed to establish the relative energy of <001> tilt boundaries as a function of misorientation. For this purpose, an electron-backscatter-diffraction (EBSD) technique was used to determine the grain-boundary geometry and misorientations across grain boundaries at triple-junction locations in two-dimensional sections perpendicular to the sample fiber texture. Analysis of the triple-junction dihedral angles and misorientations revealed that the relative boundary energy followed a classical Read-Shockley dependence.

**Infrared Damage Detection System (IDDS) for Real-Time, Small-Scale Damage Monitoring**

Hartman, George A; Jan 2007; 9 pp.; In English

Contract(s)/Grant(s): FA8650-04-C-5200; Proj-4347

Report No.(s): AD-A467885; No Copyright; Avail.: Defense Technical Information Center (DTIC)

Macroscopic damage and final failure of components subjected to repeated loading is preceded by microscopic damage accumulation in localized areas of the component material. The microscopic damage accumulation phase often comprises the majority of the life of the component. Thus, a detailed understanding of the processes involved would be invaluable for material design and life prediction. In metals, these localized damage accumulation areas are usually on the scale of the microstructure and the damage is not readily apparent. An infrared camera system has been developed to detect the radiant energy associated with local damage accumulation. This system pinpoints the location of the damage accumulation site and allows the loading to be stopped early in the damage accumulation process. The first goal is to use the system to stop mechanical testing as soon as a local damage area can be detected. This goal has been achieved and the IDDS has been used to support a number of research programs studying crack initiation. The second goal is to develop an understanding of the

various phenomena that produce infrared radiation signatures and correlate them with damage accumulation mechanisms. This work is just beginning and this paper discusses our plan to meet this goal.

**Modeling the Effects of Crevice Former, Particulates, and the Evolving Surface Profile In Crevice Corrosion**

Agarwal, A. S.; Landau, U.; Shan, X.; Payer, J. H.; January 2006; 13 pp.; In English

Report No.(s): DE2007-899321; No Copyright; Avail.: National Technical Information Service (NTIS)

Crevice corrosion may initiate in confined regions due to transport limitations, followed by an accumulation of a highly corrosive chemistry, capable of dissolving the metal. The metal and the crevice former surface roughness, the presence of particulates under the crevice former and the accumulation of solid corrosion products at the corroding site would significantly affect the current and potential distribution at the anode by increasing the ohmic potential drop. Most crevice corrosion models focus on a smooth walled crevice of uniform gap and do not account for the changing profile after crevice corrosion has been initiated. In this work we analyze the crevice (anodic) region and apply current and potential distribution models to examine the effects of the perturbed surface topography. The analysis focuses on three related issues: (i) the effects of surface roughness of the metal and the crevice former, (ii) the effects of particulates under the crevice former, and (iii) the evolution of the crevice profile with corrosion product accumulation at the active, anodic region.

**Crevice Repassivation Potentials for Alloy 22 in Simulated Concentrated Ground Waters**

Rebak, R. B.; Evans, K. J.; Ilevbare, G. O.; 13 Nov. 2006; 19 pp.; In English

Report No.(s): DE2007-902250; UCRL-CONF-226066; No Copyright; Avail.: Department of Energy Information Bridge

The resistance of Alloy 22 (N06022) to localized corrosion, mainly crevice corrosion, has been extensively investigated in the last few years. However, the behavior of Alloy 22 in concentrated aqueous solutions that may simulate concentrated ground waters was not fully understood. Systematic electrochemical tests using cyclic potentiodynamic polarization as well as the Tsujikawa-Hisamatsu electrochemical method were performed to determine the crevice corrosion susceptibility of Alloy 22 in simulated concentrated water (SCW), simulated acidified water (SAW) and basic saturated water (BSW). Results show that Alloy 22 is immune to crevice corrosion in SCW and SAW but may suffer crevice corrosion initiation in BSW. Results also show that in a naturally aerated environment, the corrosion potential would never reach the critical potential for crevice corrosion initiation.

**Changes in Delta-Plutonium Due to Self-Irradiation Aging Observed by Continuous In-Situ X-ray Scattering**

Saw, C. K.; Chung, B. W.; Wall, M. A.; Jan. 08, 2007; 8 pp.; In English

Report No.(s): DE2007-902280; UCRL-CONF-227115; No Copyright; Avail.: Department of Energy Information Bridge

The aging in plutonium is predominantly caused by its internal self-irradiation. The self-irradiation in Pu-239 is by the decay process of transmuted the Pu atom into uranium atom and emitting an  $\alpha$ -particle. Most of the lattice damage comes from the uranium recoil resulting in Frenkel-type defects consisting of vacancies and self-interstitial atoms, helium in-growth and defect clusters and possibly even though it is not yet observed, the generation of voids. As part of the stockpile stewardship, it is important to understand the changes in the structure and microstructures and their correlations to the physical properties. Changes in the physical properties have a direct relationship to the quality of the structure, in terms of formation of defects and defect clustering, accumulation of voids, grain boundaries, phase changes and etc. which can adversely affect the stability of the material. These changes are very difficult to monitor because of the high activity of the sample, high atomic number making x-ray and synchrotron probe into the bulk very difficult (neutron probe is not feasible) and the long life time which normally requires decades to measure. In this paper we describe the development of an in-situ in-house transmission x-ray diffraction (XRD) experimental technique used to monitor the structural changes in these materials. This technique calls for a very thin sample of less than 2 mm and to accelerate the aging process due to self-irradiation, spiked alloy of 7.5 weight percent of Pu-238 is used. This is equivalent to roughly 17 times the normal rate of aging.

Titanium is a candidate as a structural material for all new tactical and armored ground vehicles, because of its high strength-to-weight ratio, excellent corrosion resistance, and inherent ballistic resistance. However, titanium as a structural material is much less mature than both steel and aluminum alloys, especially in the area of joining. While welding is the typical joining method for titanium, vacuum brazing is an option in areas that are difficult to access for welding as well as areas near other nonmetallic materials, such as ceramics. This work focuses on vacuum brazing of titanium (both Ti-6Al-4V and commercially pure titanium) and the effect of processing changes (alloy, temperature, pressure), including post-braze hot isostatic pressing, on mechanical properties and microstructure. This study will examine the joining of both plate materials as well as lightweight, periodic pyramidal core structures. Shear and tensile testing is performed to determine the strength/ductility relationship to the various processing routes. Microscopy (optical and SEM) is employed to quantify the degree of bonding and to examine the microstructural changes, both within the base materials and at the bond line, associated with the process variations.

Report No.(s): AD-A466031; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA466031>

High-performance polymer matrix composites (PMCs) are an appealing choice for materials in aerospace applications due to their high strength-to-weight ratio and stability over a broad temperature range for thousands of service hours. The use of PMCs in propulsion applications is currently limited only by insufficient resistance to erosion by abrasive media. Erosion-resistant coatings may provide the necessary protection, however their application is not straightforward, as surface preparation is a challenge. Specifically, it is because of the resin-rich outer plies, mold release agents, and fluorinated high-temperature polymer matrices that treatment prior to deposition is required. A low pressure oxygen plasma treatment process was developed to improve adhesion of CN<sub>x</sub> coatings to a polymer matrix composite. CN<sub>x</sub> was selected as a protective coating for its high hardness-to-elastic ratio, coupled with elastic resilience. In situ x-ray photoelectron spectroscopy was used to evaluate the effect of the plasma treatment on surface chemistry, and electron microscopy was used to identify changes in the surface morphology of the PMC substrate after plasma exposure. CN<sub>x</sub> coatings were then deposited on treated PMC substrates. The effect of the plasma predeposition treatment on coating adhesion and erosion resistance was evaluated. The combination of PMC pretreatment and coating with CN<sub>x</sub> reduced the erosion rate by an order of magnitude.

Recent publications have reported a synergy between rubber and silica in modified epoxy resins that results in significantly improved fracture toughness without reductions in other material properties. In this work, we seek to achieve the same type of synergy in commercial vacuum-assisted resin transfer molding (VARTM) epoxy resins, SC15 and SC79, produced by Applied Polymeric, Inc. Nanopox F400 (Hanse Chemie) containing 40 weight-percent epoxy-functional silica in a diglycidyl bisphenol-F (DGEBF) epoxy was blended with the VARTM resins to add various silica loadings in the systems.

It was found that the presence of DGEGBF influenced resin properties more than silica. This monomer impacted crosslink density and other material properties. The crosslink density of SC15 was increased and resulted in reductions in resin fracture toughness, mode II composite fracture toughness, and increased damage area in impact performance. The crosslink density of SC79 was reduced upon the addition of DGEGBF contained in the Nanopox. At 10 weight-percent silica, resin fracture toughness, mode II composite toughness, and impact properties were improved due to decreased matrix crosslink density and the presence of silica. Finally, morphological studies showed that silica influences the rubber phase separation in a model epoxy system and VARTM epoxies. Further research will investigate the effects of epoxy-functional silica addition to phase separation mechanisms in rubber-toughened epoxies.

**Modeling Damage and Fragmentation in Concrete**

Clayton, John D; Apr 2007; 22 pp.; In English; Original contains color illustrations

Contract(s)/Grant(s): Proj-WHPR01E

Report No.(s): AD-A466490; ARL-RP-169; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA466490>

A theory combining nonlinear continuum elasticity, inelasticity, thermodynamics, damage mechanics, and fragmentation is formulated. The model is applied to study concrete subjected to high rate loading as occurs during ballistic impact. Two thermodynamically motivated methods are postulated within this theoretical framework for quantitatively characterizing the mass and velocity distributions of the post-impact debris field, one based upon a local energy balance and a second following global entropy maximization. Here the concrete, a composite mixture of mortar and granite aggregate, is regarded as a homogeneous continuum prior to fragmentation. However, the composite nature of the microstructure directly influences model parameters dictating the mean fragment dimension, here specifically related to the coarse aggregate size. Standard continuum elements represent the intact solid and particles describe eroded material in numerical implementation of the model. The impact of a metal sphere on a thin concrete target, and the subsequent motion of the resulting cloud of concrete fragment debris, are simulated. Fragment size, speed, and kinetic energy statistics predicted by the two methods are compared.

Report No.(s): AD-A466675; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA466675>

With the increased interest in using high performance ceramic matrix composites for advanced applications, long-term property behavior is of interest. In this work, time-dependent response of MI SiC/SiC composites (01/01 material) was experimentally evaluated under creep and dwell fatigue loading. A series of standard samples were tested at 815 degrees Celsius and 1204 degrees Celsius at various stress levels and multiple durations. All specimens showed primary and steady state creep responses. There were also some samples that showed tertiary creep response. Environmental degradation was empirically related to material response at different stress levels. Micrographic images of failed specimens revealed the existence of cavitations that were possibly caused by the creep strain at high stress areas.

Report No.(s): AD-A466791; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA466791>

Oxide/Oxide Ceramic Matrix Composites (CMC) are currently being demonstrated in high-temperature aerospace

applications where their oxidation resistance is critical to a successful design. Many applications are engine components that are axisymmetric in shape and subject to axisymmetric thermal and mechanical loadings. Traditionally woven CMC materials used in these components are typically made from 0 deg/90 deg fiber architectures. In many cases the highest stresses are not always coincident with the orientation of the reinforcing fibers. Therefore, these components may experience stress states that approach the off-axis tensile and creep strengths of the material. The oxide/oxide CMC investigated in this study was Nextel(trademark)720/AS. Nextel(trademark)720/AS is composed of an Alumina-Silica matrix reinforced with an eight-harness stain weave (8HSW) of Nextel(trademark)720 fibers. Tensile and creeps tests at 1100 C on +/- 45 deg Nextel(trademark)720/AS were performed to characterize the off-axis material behavior. The +/- 45 deg orientation has approximately two thirds the ultimate tensile strength of the 0 deg/90 deg orientation. However, the tensile toughness of the + or - 45 deg orientation was higher than the 0 deg /90 deg orientation by a factor of 2X. The creep rupture strength at 100 hrs for the + or - 45 deg orientation was approximately one third that of the 0 deg/90 deg orientation.

The Combat Rations Network (COPANET) is a Defense Logistic Agency (DLA) sponsored manufacturing technology program to improve the quality, reduce the cost, and increase the productivity of operational rations while increasing DLA's surge capability in the area of military rations. This report summarizes activity under Short Term Project 2007. The ultimate goal of this project was to develop a material to improve the performance and cost effectiveness of polymeric trays used for retorting Polytray rations. Initially, many candidate materials were gathered based on recommendation and research. Materials selection was limited to Polypropylene-based systems due to cost constraints and their prior proven performance during CORANET I and STP 1016.

**Polymers Used as Fuel for Laser Plasma Thrusters in Small Satellites**

Lippert, Thomas K; Urech, Lukas; Sep 12, 2006; 96 pp.; In English; Original contains color illustrations

Contract(s)/Grant(s): FA8655-03-1-03058

Report No.(s): AD-A467554; No Copyright; Avail.: Defense Technical Information Center (DTIC)

This report results from a contract tasking Paul Scherrer Institut as follows: Three different polymers (GAP, PVN and PVC) with two different absorbers (carbon nanoparticles and an IR-dye (Epolite 2057)) have been investigated as fuel for the micro laser plasma thruster. GAP and PVN are energetic polymers with a high decomposition enthalpy of -3829 J/g (PVN) and -2053 J/g (GAP). PVC was used as a less energetic (the decomposition enthalpy of -418 J/g is much lower than for the

other two polymers) commercially available reference. The best overall performance was observed for GAP. In the ms thrust measurements a efficiency of 370% was obtained for GAP+C, which means that chemically stored energy was transferred into thrust. In the fs measurements, higher thrust values were obtained for GAP+IR than for GAP+C. This is also in good correlation with the fs plasma emission measurements. The IR-dye lead to a higher fragmentation in the shadowgraphy measurements, which were performed at low fluences. The metal- and metal-oxidenanoparticles had no positive influence on the plasma and shockwave properties of GAP+IR. In the ns mass spectrometry measurements, GAP showed the highest fragmentation and the fastest C<sup>+</sup> ions. The highest energetic polymer PVN, showed the worst performance in all experiments at high fluences, and only a efficiency of 21% was obtained in the thrust measurements. In the mass spectrometry measurements, strong signals could be assigned to the solvent, which was used to produce the PVN film. Also strong thermal effects, like the formation of fibers and melting were observed. In the shadowgraphy measurements, which were performed in air and at low fluences, the fastest shockwave was observed for PVN+IR. Additional doping with CuO slowed down the shockwave, but also reduced the thermal features. For PVC a efficiency of 50% was determined in the thrust measurements. At high laser fluences, PVC performed worse than GAP, but better than PVN.

Report No.(s): AD-A467748; AFRL-PR-ED-TP-2006-039; No Copyright; Avail.: Defense Technical Information Center (DTIC)

Improvements in thermal and physical properties of epoxy resin systems have been demonstrated in the past through the influence of fillers. However, these improvements often come with a significant cost to processability. This paper examines the influence of nanofillers on a multifunctional epoxy resin system in terms of processability and thermal properties. The nanocomposites explored included nanosilica, linear calcium silicate (wollastonite), and polyhedral oligomeric silsesquioxane (POSS) in CYCOM(Registered) 977-3 resin. Composites with three to five weight percent of nanofillers were produced using IKA high shear mixers. The thermal and flow properties of the composites were evaluated using Dynamic Mechanical Thermal Analysis (DMTA) and parallel plate rheology. The microstructure of the composite was explored using Transmission Electron Microscopy (TEM) and Scanning Electron Microscopy (SEM). Each of the nanofillers used in this study showed a small improvement in T<sub>g</sub> over the neat epoxy. However, the addition of nanosilica dramatically increased the viscosity of the neat resin in contrast to the addition of wollastonite or POSS. The wollastonite showed no degradation in clarity and did not significantly increase the viscosity of the resin.

**High Strain Rate Mechanical Properties of Epoxy and Epoxy-Based Particulate Composites (Preprint)**

Jordan, Jennifer L; Richards, Wayne; White, Brad; Spowart, Jonathan E; May 2007; 13 pp.; In English

Contract(s)/Grant(s): Proj-2306

Report No.(s): AD-A468014; AFRL-MN-EG-TP-2007-7403; No Copyright; Avail.: Defense Technical Information Center (DTIC)

Polymers and polymer-based particulate composites are becoming increasingly used in aerospace structural applications, where they experience complex, non-static loads. Correspondingly, the high strain rate mechanical properties are of increasing importance. This paper investigates the properties of epoxy - bisphenol-A/diethanolamine epoxy (Epon 826/DEA) - and epoxy-based particulate composites across strain rates from  $10(\text{exp } -3)$  to  $10(\text{exp } 5)$  /s. The samples were tested using Instron, traditional split Hopkinson pressure bars (SHPBs) and a miniaturized SHPB for ultra-high strain rates. Additionally, the epoxy samples are tested with dynamic mechanical analysis to look at the effects of time-temperature superposition on the strain rate effects in the samples. The results of the testing are compared to the Hasan-Boyce model for polymers, which has shown good agreement with other epoxy studies, to develop constitutive equations for these materials.

**A New Silicon-Containing Bis(Cyanate) Ester Resin with Improved Thermal Oxidation and Moisture Resistance**

Guenther, Andrew J; Yandek, Gregory R; Wright, Michael E; Petteys, Brian J; Quintana, Roxanne; Connor, Dan; Gilardi, Richard D; Marchant, Darrell; May 23, 2006; 35 pp.; In English

Contract(s)/Grant(s): Proj-2303

Report No.(s): AD-A468069; No Copyright; Avail.: Defense Technical Information Center (DTIC)

A new cyanate ester monomer was prepared from bis(4-cyanatophenyl)-dimethylsilane (SiMCy) and fully characterized by analytical and spectroscopic techniques. The monomer was found to have a melting point about 20 deg C lower than that of the commercial bis(4-cyanatophenyl)dimethylmethane (BADCy) with similar melt viscosity, curing kinetics, and post-cure glass transition temperature. Analysis of the single-crystal molecular structure by x-ray diffraction showed that intermolecular packing was dominated by weak hydrogen-bonding attractions between the aromatic rings and the -OCN nitrogen atoms. In contrast, the packing interactions found in BADCy are dominated by dipole-dipole interactions of the OCN groups. These differences may explain the 50% reduction in moisture uptake observed in SiMCy as compared to BADCy during exposure to boiling water. In addition, thermogravimetric analysis revealed that SiMCy exhibited a significantly higher char yield in air than BADCy, presumably due to the formation of silicates at high temperature. The combination of improved thermo-oxidative stability and reduced moisture absorption without significant loss in ease of processing or mechanical properties makes SiMCy an important potential 'drop in' replacement for BADCy, and demonstrates the power of the molecular level approach to designing new high-temperature polymer materials.

**A Test Method to Assess the Foldability of Flexible Structural Materials**

Murphey, Thomas W; Sanford, Gregory E; Apr 2007; 14 pp.; In English; Original contains color illustrations

Report No.(s): AD-A468441; No Copyright; Avail.: Defense Technical Information Center (DTIC)

A coupon level comparative test method was developed to assess the foldability of thin flexible materials used in deployable structures. The subject materials support tensile and compressive loads; they are not cloth-like. The non-destructive method consists of a tensile stiffness test and a compressive buckling test and reveals changes in coupon properties that could result from locally extreme strains incurred during folding. The test is intended to provide a standardized means to compare changes in material systems or fabrication processes as flexible material development efforts continue. The method was applied to nine identical rigidizable composite coupons folded ten times. Five of the coupons were folded to a 4 mm radius and four were folded to a 2 mm radius. The results did not reveal a measurable change in coupon behavior from the pre-folded state.

Pressure Differential Scanning Calorimeter (PDSC) is a thermal analytical technique for evaluating oxidation-thermal stability of polymer materials including lubricating greases using the differential heat flow between sample reference thermocouples under various temperatures and pressures. The ASTM D 5483 test method is one of acceptable PDSC techniques to evaluate the grease oxidation stability. In a research effort, a decomposition kinetic model was developed to predict grease high temperature life using ASTM D 5483 PDSC technique. This kinetic model can predict grease oxidation life at the various temperatures and the degree of oxidation using their activation energy. Also, it was found that this kinetic model has a limited correlation to the results from ASTM D 3527 grease life test. This kinetic model can therefore be used to predict the high temperature grease life within certain constraints.

ONLINE: <http://hdl.handle.net/100.2/ADA469000>

Oxides are inherently stable in air at elevated temperatures and may serve as wear resistant matrices for solid lubricants. Aluminum oxide is a particularly good candidate for a matrix because it has good diffusion barrier properties and modest hardness. Most thin film deposition techniques that are used to grow alumina require high temperatures to impart crystallinity. Crystalline films are about twice as hard as amorphous ones. Unfortunately, the mechanical properties of most engineering steels are degraded at temperatures above 250-350 degrees C. This work is focused on using energetic reactive ion bombardment during simultaneous pulsed laser deposition to enhance film crystallization at low temperature. Alumina films were grown at several background gas pressures and temperatures, with and without Ar ion bombardment. The films were nearly stoichiometric except for depositions in vacuum. Using nitrogen ion bombardment, nitrogen was incorporated into the films and formed the Al-O-N matrix. Nitrogen concentration could be controlled through selection of gas pressure and ion energy. Crystalline Al-O-N films were grown at 330 degrees C with a negative bias voltage to the substrate, and showed improved hardness in comparison to amorphous films. Film deposition methodology and characterization of chemical and mechanical properties are reported in detail.

Contract(s)/Grant(s): FA8650-05-D-5052; Proj-4347

Report No.(s): AD-A469066; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA469066>

Innovative weaving and braiding processes open up a new opportunity for making 3-D textile composites that give significantly damage-tolerant structural response with design flexibility for durable joints, near-net shape processing, etc. To

fully understand the mechanical behavior of 3-D textile composites, it is essential to perform analyses to predict effective material properties and damage initiation and growth. In this paper we present a new approach to generating 3-D textile composite geometric models based on image processing techniques. The main objectives are to visualize, manipulate, and reconstruct textile internal structures based on multidimensional image data for the purpose of further mechanics analysis. A software code called the ImageScan is developed to generate geometry models from a set of image slices of a textile composite based on image reconstruction technology. The images from an optical microscope or other source can be segmented into objective constituents and reconstructed into 3-D geometry, which can be input into an appropriate mechanics model to predict the material properties and mechanical deformation under a specific boundary condition and loadings.

ONLINE: <http://hdl.handle.net/100.2/ADA466729>

Researchers at the Energy Institute of Pennsylvania State University (Penn State) are conducting research on producing jet fuel by coprocessing coal or coal-derived products with low-value liquid intermediates produced during petroleum refining. To date, most of this research effort has focused on a coal-tar blending process. Penn State currently plans to build a one-barrel per-day pilot plant and produce 100 barrels of product to be delivered to and tested by the Air Force Research Laboratory. Recognizing the limited availability of the coal-tar derived liquids used in the coal-tar blending process, the Penn State research team has recently shifted its attention to a co-coking process, in which a mixture of solid coal and a refinery intermediate, decant oil, is used to produce a combination of liquid fuels and coke.

This decision document has been prepared to support a no further action decision at Study Area 58 - Buildings 2648 and 2650 Fuel Oil Spills (SA 58) at Fort Devens, Massachusetts. The report was prepared as part of the U.S. Department of Defense (DOD) Base Realignment and Closure (BRAC) program to assess the nature and extent of contamination associated with site operations at Fort Devens. In conjunction with the Army's Installation Restoration Program (IRP), Fort Devens and the U.S. Army Environmental Center (USAEC; formerly the U.S. Army Toxic and Hazardous Materials Agency) initiated a Master Environmental Plan (MEP) in 1988. The MEP consists of assessments of the environmental status of SAS, specifies necessary investigations, and provides recommendations for response actions with the objective of identifying priorities for environmental restoration at Fort Devens. SA 58 was identified in the MEP as a potential source of contamination. On December 21, 1989, Fort Devens was placed on the National Priorities List under the Comprehensive Environmental Response, Compensation and Liability Act (CERCLA) as amended by the Superfund Amendments and Reauthorization Act.

**Liquefied Natural Gas (LNG) Import Terminals: Siting, Safety and Regulation**

Parfomak, Paul W; Flynn, Aaron M; May 27, 2004; 33 pp.; In English; Original contains color illustrations

Report No.(s): AD-A468225; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA468225>

Liquefied natural gas (LNG) is a hazardous fuel frequently shipped in large tankers to U.S. ports from overseas. While LNG has historically made up a small part of U.S. natural gas supplies, rising gas prices, current price volatility and the possibility of domestic shortages are sharply increasing LNG demand. To meet this demand energy companies have proposed building dozens of new LNG import terminals throughout the coastal USA. But many of these terminals would be built onshore near populated areas, so local communities fear the terminals would expose them to unacceptable safety and security hazards. Potentially catastrophic pool fires or vapor cloud fires could arise from a serious accident or attack on LNG infrastructure. Faced with the widely perceived need for greater LNG imports, and persistent public concerns about LNG safety, Congress is examining the adequacy of safety provisions in federal LNG siting regulation.

**America's Energy Security Policy: Goals for 2025**

Chesley, Gary; Feb 1, 2007; 23 pp.; In English

Report No.(s): AD-A467292; No Copyright; Avail.: Defense Technical Information Center (DTIC)

President Bush declared in his 2006 State of the Union address that America is addicted to oil, which is often imported from unstable parts of the world. He set a goal to replace more than 75 percent of the oil imported from the Middle East by 2025. However, nearly every recent president since the Nixon administration has had energy goals; few have been achieved. This paper assesses the failure to meet past energy goals, analyzes energy trends, and recommends actions to meet the goal of replacing 75 percent of Middle East imported oil by 2025.

**Improving the Resiliency of the Natural Gas Supply and Distribution Network**

Nadeau, John; Mar 2007; 88 pp.; In English

Report No.(s): AD-A467387; No Copyright; Avail.: Defense Technical Information Center (DTIC)

To accommodate the nation's escalating demand for natural gas, which is expected to increase 700% by 2030, the natural gas industry will likely build several new liquefied natural gas (LNG) import terminals. The location of these new terminals

is an important strategic decision that significantly impacts the resiliency of the nation's natural gas supply and distribution network. Due to public opposition in many communities and shortcomings in the current licensing process, any additional LNG import terminals are apt to be concentrated along the Gulf Coast. Unfortunately, this impending concentration will increase the vulnerability and diminish the resiliency of this critical infrastructure. This thesis uses network theory to forecast how the location of new terminals will impact the risk, vulnerability, and resiliency of the natural gas supply and distribution network. To enhance the resiliency and reduce the vulnerability of this critical infrastructure, we argue network analysis methodology should be applied during the terminal siting process. The Federal government must act quickly to facilitate siting of terminals in locations that reduce the vulnerability and improve the resiliency of the natural gas network. Failure to act will squander an unprecedented opportunity to shape and intelligently design this portion of the nation's critical infrastructure.

**Heat Flux and Infrared Spectral Measurements of Burning SRM Propellant (Postprint)**

Venner, Marty; Parker, James; McKeon, William; Jun 16, 2006; 11 pp.; In English

Report No.(s): AD-A467721; No Copyright; Avail.: Defense Technical Information Center (DTIC)

On 23 August 2005 the Air Force Research Laboratory (AFRL) Propulsion Directorate at Edwards AFB conducted an open air burn of over 2000 kg of Titan IV solid rocket motor propellant. Multiple remote sensors were deployed to measure the heat flux and spectral emissions during the burn. The heat flux data was utilized to help determine the hazard classification for the propellant. An average normalized irradiance of 1.62 kW/m<sup>2</sup> was obtained during a nominal portion of the burn and supports a classification of 1.4. A Fourier Transform Infrared (FTIR) spectrometer collected data over a spectral range of 1.4 - 14  $\mu$ m. Those data show strong gaseous emissions from carbon dioxide, water, and hydrogen chloride as well as a continuum emission component due to the aluminum oxide particulates.

Report No.(s): AD-A467838; AFRL-PR-ED-TP-2007-150; No Copyright; Avail.: Defense Technical Information Center (DTIC)

Interest in developing reusable, long-life, liquid hydrocarbon fueled rocket engines has continued to grow in recent years. Of critical importance in designing and developing an engine with these characteristics is of course the fuel and its impact on potential cooling schemes. For several years now, the Air Force Research Laboratory Propulsion Directorate has been developing the capability to examine the thermal performance of newly emerging petroleum distillate fuels such as RP-2, an advanced grade of ultra-low sulfur rocket kerosene. This paper reports recent experiments and numerical simulations of RP-2 cooled thermal stability tests conducted in the AFRL High Heat Flux Facility located at Edwards AFB, CA. Heat transfer measurements and simulations of those experiments using Metacomp's CFD++ conjugate heat transfer capability were conducted over heat fluxes ranging from 2-10 BTU/in<sup>2</sup>/s, channel velocities from 26-165 ft/s, and wall temperatures from 840-1135 deg F. A Nusselt number correlation comparison of experimental results to well-known Dittus-Boelter and Sieder-Tate correlations and the NASA/GRC correlation of Stiegemeier et. al is presented for Reynolds numbers between 5,000-35,000. Computational comparisons with experimental measurements are made and represent the first steps in producing a validated predictive computational capability.

**Application of Neutron-Absorbing Structural-Amorphous Metal (SAM) Coatings for Spent Nuclear Fuel (SNF) Container to Enhance Criticality Safety Controls**

Choi, J.; Lee, C.; Day, D.; Wall, M.; Saw, C.; Nov. 15, 2006; 25 pp.; In English

Report No.(s): DE2007-900175; UCRL-CONF-226122; No Copyright; Avail.: National Technical Information Service (NTIS)

Spent nuclear fuel contains fissionable materials (235U, 239Pu, 241Pu, etc.). Neutron multiplication and the potential for

criticality are enhanced by the presence of a moderator during cask loading in water, water incursion in accidents conditions during spent fuel storage or transport. To prevent nuclear criticality in spent fuel storage, transportation, and during disposal, neutron-absorbing materials (or neutron poisons, such as borated stainless steel, Boral™, Metamic™, Ni-Gd, and others) would have to be applied. The success in demonstrating that the High-Performance Corrosion-Resistant material (HPCRM) can be thermally applied as coating onto base metal to provide for corrosion resistance for many naval applications raises the interest in applying the HPCRM to USDOE/OCRWM spent fuel management program. The fact that the HPCRM relies on the high content of boron to make the material amorphous an essential property for corrosion resistance and that the boron has to be homogeneously distributed in the HPCRM qualify the material to be a neutron poison.

**Improving Thermal Performance of Radioactive Material Drum Type Packages by Using Heat Pipes**

Gupta, N. K.; Mar. 06, 2007; 7 pp.; In English

Report No.(s): DE2007-900560; WSRC-STI-2007-00101; No Copyright; Avail.: National Technical Information Service (NTIS)

This paper presents a feasibility study to improve thermal loading of existing radioactive material packages by using heat pipes. The concept could be used to channel heat in certain directions and dissipate to the environment. The concept is applied to a drum type package because the drum type packages are stored and transported in an upright position. This orientation is suitable for heat pipe operation that could facilitate the heat pipe implementation in the existing well proven package designs or in new designs where thermal loading is high. In this position, heat pipes utilize gravity very effectively to enhance heat flow in the upward direction. Heat pipes have extremely high effective thermal conductivity that is several magnitudes higher than the most heat conducting metals. In addition, heat pipes are highly unidirectional so that the effective conductivity for heat transfer in the reverse direction is greatly reduced. The concept is applied to the 9977 package that is currently going through the DOE certification review. The paper presents computer simulations using typical of-the-shelf heat pipe available configurations and performance data for the 9977 package.

**Nuclear Safety: DOE's Investigation of Phosgene Gas Contamination was Inadequate, but Experts Conclude that Worker Safety and Facilities Are Not Threatened**

May 2007; 41 pp.; In English

Report No.(s): PB2007-110246; GAO-07-712; No Copyright; Avail.: CASI: [A03](#), Hardcopy

More than 700,000 tons of uranium are stored at two Department of Energy (DOE) sites where uranium enrichment took place and where two facilities are being constructed to treat depleted uranium. Some of the storage cylinders for uranium came from the Army more than 50 years ago and may originally have contained phosgene, a toxic gas used as a chemical weapon in World War I. In September 2005, DOE's Inspector General issued an alert warning that residual phosgene, if present, could threaten the safety of people and the treatment facilities. GAO was directed to review DOE's investigation of possible

phosgene contamination of uranium storage cylinders. GAO consulted a panel of experts to assess the adequacy of DOE's investigation and whether possible phosgene contamination could threaten the new treatment facilities under construction. According to members of GAO's expert panel, although DOE adequately demonstrated that the public would not be harmed if small amounts of phosgene escaped from the storage cylinders, it neglected to explicitly document its analysis of worker safety in its investigation of possible phosgene contamination.

**Fuel Property Effects on T700 Exhaust Particulates**

Moses, Clifford A; Jun 2004; 43 pp.; In English; Original contains color illustrations

Contract(s)/Grant(s): DAAE07-99-C-L053

Report No.(s): AD-A468740; TFLRF-373; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA468740>

T700 engine and combustor-rig tests were conducted to evaluate fuel and additive effects on exhaust particulates. Six base fuels were used ranging from a zero-aromatics synthetic fuel to diesel fuel. The effect of copper contamination on particulates was evaluated as was the effect of the additive Spec\*Aid 8Q462, which has been shown to reduce particulates in some other testing. Particulates were characterized by both mass and size distribution. Particulate mass correlated equally well with the fuel aromatic content, hydrogen content, and smoke point. More importantly, in the engine tests, an excellent correlation was found between the particulate mass on the filters and the integrated particulate volume calculated from the particulate-size distribution. The presence of copper contamination did not affect the concentration or size of particulates. Limited results on two fuels without replication showed a 10 to 15% reduction in particulates at the cruise condition with the 8Q462 additive. The results indicate that a zero-aromatics fuel will reduce particulate mass about 25% compared to an average JP-5. Alternately, F-76 diesel fuel would be expected to double the particulate mass.

**Quantitative Analysis of Situational Awareness (QUASA): Applying Signal Detection Theory to True/False Probes and Self-Ratings**

McGuinness, Barry; Jun 2004; 86 pp.; In English; Original contains color illustrations

Report No.(s): AD-A465817; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA465817>

This paper describes a technique for assessing the situational awareness of individuals such as warfighters participating

in C2 experiments and exercises. Known as QUASA (quantitative analysis of situational awareness), the technique combines both objective queries (true/false probes) and subjective self-ratings of confidence for each probe response. The data so obtained are then analyzed and interpreted using the mathematical framework of Signal Detection Theory (SDT). The rationale behind the technique is described, followed by an example of its implementation and the results obtained. Further refinements of the technique based on recent research in experimental psychology are also considered.

Investigation of achieving direct imaging of fluid hydrodynamics in the microfluidic devices using a newly developed X-ray phase contrast radiology technique. The capability of direct imaging in real time of this new technique allows us to study the internal dynamics of the formation of the bubbles in respond to the localized heat or vibration in a microfluidic device. With such information, one can tie the images of the internal bubble formation with the external formation of the sprays to support the numerical simulation, which can be used to improve the functionality of ink-jet printer head. Apart from the ink flow study, one can also study mechanism of nano-particle flow in micro-scaled fluidic channels, which may eventually lead to the better understanding of the mechanism of drug delivery.

ONLINE: <http://hdl.handle.net/100.2/ADA466235>

This paper and associated presentation describes an approach for test and evaluation in a net-centric environment. A short term effort is planned in February to September 2004 to develop and apply appropriate measures of effectiveness (MOEs), metrics, and methods of data collection, analysis and evaluation for a representative test item's performance within a networked system of systems environment. A net-centric T&E approach is prepared for the Rosetta STONE Single Integrated Picture Enabling Technology Demonstration (ETD). The Department of Defense has issued guidance and criteria in the form of joint concepts, net-centric checklists, and interoperability and supportability instructions for use in program assessments, capability analyses, and experimentation. The finding of this research so far are that these criteria, comprised of attributes derived largely from network-centric warfare concepts and commercial standards, are not yet in a form suitable for immediate and widespread use for test and evaluation (T&E). However, progress is being made. Status of the effort will be reported at the Symposium to include lessons learned for planning future net-centric T&E.

Contract(s)/Grant(s): F4962-97-1-0507

Report No.(s): AD-A466321; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA466321>

A detailed characterization is presented of a silicon-micromachined thermal shear-stress sensor employing a thin-film platinum-sensing element on top of a silicon-nitride membrane that is stretched over a vacuum cavity. The sensor was operated in a constant current mode and characterized using a four-point probe configuration to isolate the sensor response from the effects of external compensation circuitry. The characterization results consist of static sensitivity data at multiple overheat

ratios (maximum of 11 mV/Pa at an overheat of 1.0), pressure sensitivity spectra (<1 microvolt/Pa), noise floor spectra (100 nV/square root of Hz), and direct dynamic calibration data (up to 7 kHz). Noise floor measurements reveal a minimum detectable shear stress of 9 microPa/Hz, thus resulting in a sensor dynamic range of over 100 dB (9 microPa 1.7 Pa).

**Shakedown & Determination of Tunnel Control Settings for Refurbished Trisonic Gasdynamic Facility (TGF)**

Saladin, Julie E; Sep 2006; 95 pp.; In English; Original contains color illustrations

Contract(s)/Grant(s): Proj-A01B

Report No.(s): AD-A466325; AFRL-VA-WP-TR-2007-3015; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA466325>

The Trisonic Gasdynamic Facility (TGF) had refurbishment completed in 2005 after being put into mothball status ten years prior. Upgrades during refurbishment to the tunnel and the loss of the old operations staff required the need for an initial set of tunnels runs to determine how to operate the facility, rediscover the limitations of the facility, and determine the correlation between the old documented control settings and the new systems. This control calibration also served as the initial shakedown of the refurbished tunnel, allowing technicians and engineers to cycle the systems and discover the best practices for operation and unresolved or unknown problems with the system. The shakedown initiated the reliable and successful operation of the TGF for future ground testing experiments.

ONLINE: <http://hdl.handle.net/100.2/ADA466350>

The UK Government supports the introduction of wind turbine farms as part of its alternative energy strategy. However, Ministry of Defense (MoD) guidelines restrict planning consent for wind turbine farms within line of sight (LoS) from Primary Surveillance Radars and in close proximity to Royal Air Force (RAF) Airfields. The validity of these guidelines has been the subject of close scrutiny by the wind farm developers. Consequently, a trial was conducted by the Air Command and Control Operational Evaluation Unit (Air C2 OEU) in response to a tasking from Headquarters No 3 Group (HQ 3 Gp), to determine the effects of wind turbine farms on Air Traffic Control (ATC) Primary Surveillance Radars. Stage 1 of the Trial was a scoping exercise over the period 3-4 Nov 04, utilizing the Watchman radar at RAF Valley and the Trysglwyn and Rhyd-y-Groes wind turbine farms. Stage 2, the start of the main trial, was conducted in the period 23-25 Nov 04 utilizing the Llandinam (P&L) wind turbine farm in South Wales. A Watchman Radar was deployed to a privately owned site in Shropshire, slightly south of the National Air Traffic Services (NATS) Radar Site at Clee Hill. This deployment provided medium-range data from within the main beam of the radar. Stage 3 was conducted during the period 13-14 Dec 04, again utilizing the P&L wind turbine farm but with the Watchman Radar on a soft-field site at Llanbister. This provided short-range data from within the auxiliary beam of the radar.

ONLINE: <http://hdl.handle.net/100.2/ADA466874>

A propane-fueled combustor was built to support the development of an alternate to the external fire test currently required for final Hazards Classification (HC). The device has the capability to provide a controlled heat flux environment of 40-400

kW/sq m (12,600- 126,000 Btu/hr/sq ft). This results in a repeatable and quantifiable environment for the evaluation of the fast cook-off response of an ordnance item.

This report covers the UXO sampling and clearance activities conducted on site in Panama on the Empire, Balboa West and Pina Ranges. The data collected was used to refine and/or confirm the initial UXO Assessment Report published in 1997 entitled 'Unexploded Ordnance Assessment of U.S. Military Ranges in Panama: Empire, Balboa West and Pina Ranges'. This report provides a snapshot of the conditions of the ranges and training areas with respect to UXO concentrations.

**Case Study of a Prototype Set of Behaviorally Anchored Rating Scales (BARS) for C2 Assessment**

Murphy, Jim; Grynovicki, Jock O; Kysor, Kragg P; Jun 2003; 53 pp.; In English; Original contains color illustrations

Report No.(s): AD-A467406; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA467406>

The Command and Control Research Program's (CCRP) recent publication of the 'Code of Best Practice for Experimentation' highlights once again the potential of behaviorally anchored rating scales (BARS) as an assessment tool for command-staff team performance in the execution of battle command. Interest in BARS as a performance appraisal technique has grown steadily since first proposed in 1963 (Smith and Kendall). The BARS methodology was originally proposed as an appraisal instrument for individuals but has since been applied to team environments. In 1991, the U.S. Army funded research for the development of BARS to support aircrew training (Grubb et al.). In 1999, a comprehensive framework was developed for assessing C4ISR performance in which commander and staff proficiencies would be observed and assessed using carefully developed BARS (Leedom). The intention was to link the assessments to other force effectiveness measures to determine the overall effectiveness of the human-technical system. That proposal led to an ARL funded effort and the development of a prototype set of BARS designed to assess the team proficiencies of a commander and staff in the execution of 'battle command.' This paper describes the use of the prototype BARS in a recent battle lab experiment, and sheds light on future efforts to develop BARS within the context of Joint services experimentation.

**Parametric Dynamic Load Prediction of a Narrow Gauge Rocket Sled**

Furlow, John S; Dec 2006; 261 pp.; In English

Report No.(s): AD-A466902; No Copyright; Avail.: Defense Technical Information Center (DTIC)

Dynamic load prediction of rocket sleds has been of interest to sled designers and analysts since the inception of the Holloman High Speed Test Track, (HHSTT). Dynamic loading along with thrust and aerodynamic loading is a primary contributor to sled design load cases. Dynamic loading comes directly from the rocket sled traversing the gap between the slipper and rail and the resulting sliding impacts. The current study investigates the prediction of narrow gauge sled dynamic loads by applying a systematic process of modeling validation, design parameter variation and dynamic load correlation.

**Integrating the Department of Defense Military Services' Technology Development Programs to Improve Time, Cost, and Technical Quality Parameters**

Adams, Barry D; Mar 2007; 109 pp.; In English

Report No.(s): AD-A467122; No Copyright; Avail.: Defense Technical Information Center (DTIC)

Currently, the Air Force is developing the Space Radar (SR) system, the Navy the DD(X) 21st Century Destroyer, and

the Army the Future Combat Systems (FCS). While technologies developed by the Research, Development, Test, and Evaluation (RDT&E) organizations affiliated with each military service often have pervasive utility among the services, the structures of these RDT&E organizations currently do not provide for or permit any substantial degree of synergistic teaming, integration, or technology leveraging. As a result, technology development for each of the SR, DD(X), and FCS programs has failed to achieve schedule efficiency, cost effectiveness, and technical proficiency. To enable a successful development of these systems in particular and to prevent DoD system acquisition programs from failing to achieve the aforementioned parameters, a leveraged technology development strategy is needed. This thesis examined the potential for inter-service technology development and identified opportunities to leverage the development of common, critical technologies across the three services within the DoD in general and across the SR, DD(X), and FCS programs in particular. The findings of this study show that through careful planning and coordinated technology transition, DoD acquisition programs can indeed leverage the technology development efforts of the three services within the DoD. The identified technology leveraging opportunities will enable significant cost savings and schedule efficiency to the Space Radar, DD(X), and Future Combat Systems programs and help ensure deployment of these critical defense capabilities.

**Corporate Entrepreneurship Assessment Instrument (CEAI): Refinement and Validation of a Survey Measure**

Cates, Michael S; Mar 2007; 79 pp.; In English; Original contains color illustrations

Report No.(s): AD-A467545; AFIT/GIR/ENV/07-M7; No Copyright; Avail.: Defense Technical Information Center (DTIC)

The study of corporate entrepreneurship has established itself as a valuable area of research for both public and private-sector organizations. The measurement instrument known as the Corporate Entrepreneurship Assessment Index (CEAI) has been designed to tap the climate-related organizational factors that represent and potentially encourage corporate entrepreneurship. This study is an attempt to refine the CEAI. The core constructs of the CEAI are redefined, the items are tested for content validity, the factor structure is analyzed, and the CEAI is correlated to other known measures to validate the CEAI. Through this testing, the CEAI was refined and found to be a useful measure for predicting an innovative, entrepreneurial environment.

**Joint Essential Tasks and a Framework for Evaluation**

Kingston, Gina; Johns, Kevin; Sep 2002; 11 pp.; In English

Report No.(s): AD-A467653; No Copyright; Avail.: Defense Technical Information Center (DTIC)

In Jan 2000, DSTO embarked on a task to develop a list of Australian Joint Essential Tasks (ASJETs) to support the planning and evaluation of exercises. This process has been very successful and has seen ASJETs incorporated into the planning for the next major Australian-led exercise -- Crocodile 03. Evaluation may be used for a variety of purposes: to monitor progress; to determine whether or not objectives can be achieved; to assess the suitability of new processes, systems, or structures; and to identify deficiencies or dependencies. Each of these purposes has different evaluation requirements. Also, evaluation may be limited to determining which activities have been conducted, or be based on subjective opinions, repeatable subjective measures, or objective measures. While rigorous objective evaluation is often considered the most desirable and reliable method, it may prove to be impractical or too expensive. A risk-managed approach may be a good alternative. The evaluation approach selected needs to take into account a number of factors, such as the purpose of the evaluation and the time and results of the last evaluation, to determine which measures should be used. With experience, it should be possible to identify a suite of reliable measures, both subjective and objective. This evaluation approach is discussed in the context of planned evaluations for future military exercises.

**American Competitiveness Initiative: Leading the World in Innovation**

Feb 2006; 28 pp.; In English; Original contains color illustrations

Report No.(s): AD-A468019; No Copyright; Avail.: Defense Technical Information Center (DTIC)

Keeping our competitive edge in the world economy requires focused policies that lay the groundwork for continued

leadership in innovation, exploration, and ingenuity. America's economic strength and global leadership depend in large measure on our Nation's ability to generate and harness the latest in scientific and technological developments and to apply these developments to real world applications. These applications are fueled by: scientific research, which produces new ideas and new tools that can become the foundation for tomorrow's products, services, and ways of doing business; a strong education system that equips our workforce with the skills necessary to transform those ideas into goods and services that improve our lives and provide our Nation with the researchers of the future; and an environment that encourages entrepreneurship, risk taking, and innovative thinking. By giving citizens the tools necessary to realize their greatest potential, the American Competitiveness Initiative (ACI) will help ensure future generations have an even brighter future.

**X-Ray Dose in Microfocus Radiographic Inspections**

Stupian, G W; Mar 15, 2007; 34 pp.; In English; Original contains color illustrations

Contract(s)/Grant(s): FA8802-04-C-0001

Report No.(s): AD-A468142; TR-2007(8555)-3; No Copyright; Avail.: Defense Technical Information Center (DTIC)

The radiation dose accumulated by specimens during real-time microfocus radiographic examination is of interest to program office customers and their contractors because of possible damage to certain sensitive types of electronic components. The real-time X-ray facility in The Aerospace Corporation's Laboratory Operations has two microfocus radiography systems. This report characterizes the radiation levels in both our Feinfocus model 160.52 system and our Phoenix X-ray 'PCBA/Analyzer.' These instruments are representative of the state-of-the-art in X-ray inspection. The variables involved in the determination of total dose include the voltage and current of the X-ray tube; the amount and type of shielding material (incidental and deliberate) between the sample and the X-ray source; the distance from the source to the sample; and the time spent looking at the sample. Some general principles of X-ray dosimetry are discussed along with strategies for dose minimization when required. Most of the considerable body of published work on the characterization of kilovolt X-ray sources has been done by the medical physics community. This report aims at ensuring that similar information is brought to the attention of people in the aerospace industry.

**Experimentation with Evolving C2 Operation Centers - Implications for the Human Element**

Goodman, Michael; Garrabone, Michael; Rolek, Evan; McCormick, Ed; Jun 2001; 26 pp.; In English; Original contains color illustrations

Report No.(s): AD-A468354; No Copyright; Avail.: Defense Technical Information Center (DTIC)

In spite of the surge in new technologies, complex operational processes, and high operations tempos, the selection, education, training, and team functions of the modern C2 operators has not been given comparable attention. In order to properly staff future C2 operations centers with capable individuals and operational teams, attention needs to be directed to the analysis of the evolving C2 operator training requirements and team dynamics that are being driven by modern technology and changing concepts of operations. This paper will describe the assessment approach and methodology employed by the Air Force Research Laboratory's Warfighter Training Research Division, Information Systems Training Branch, Brooks AFB, TX (AFRL/HEAI) researchers as they observed the C2 operators in the Time Critical Targeting Cell (TCTC) during Joint Expeditionary Force eXperiment 2000 (JEFX 00). The AFRL/HEAI researchers followed a human factors oriented approach in developing a data collection methodology to gain insight into the scope of issues confronting personnel in modern C2 operation centers. This approach stressed the importance of C2 functions and processes related to time critical targeting that depended on the interactions among individuals and teams of C2 operators. These insights may ultimately assist in the specification of C2 operator training requirements and help characterize the individual and team desired performance capabilities.

**Field Demonstration and Validation of a New Device for Measuring Water and Solute Fluxes NASA LC-34 SITE**

Hatfield, Kirk; Annable, Michael D; Rao, P S; Feb 2006; 173 pp.; In English; Original contains color illustrations

Contract(s)/Grant(s): Proj-ER-0114

Report No.(s): AD-A468559; No Copyright; Avail.: Defense Technical Information Center (DTIC)

The use of contaminant flux and contaminant mass discharge as robust metrics for assessment of risks at contaminated sites and for evaluating the performance of site remediation efforts has gained increasing acceptance within the scientific, regulatory and user communities. The Passive Flux Meter (PFM) is a new technology that directly addresses the DoD need for cost-effective long-term monitoring, because flux measurements can be used for process control, for remedial action performance assessments, and for compliance purposes. However, the use of innovative technologies such as the PFM can be slow to gain acceptance in the environmental community. Thus, to gain acceptance it must be shown that the PFM technology possesses a sound theoretical basis accepted widely in the technical circles and that it be field-scale demonstrated at diverse sites. Under ESTCP project No ER-0114, the PFM is demonstrated and validated at several locations including Hill AFB in Layton, Utah; NASA Launch Complex 34 in Cape Canaveral, Florida; a Canadian Forces Base in Ontario, Canada; Naval Base Construction Base in Port Hueneme, California; and the Naval Surface Warfare Center at Indian head, Maryland. The projects at Hill, NASA, and Borden include the objectives of evaluating the flux meter as an innovative technology for direct in situ measurement of cumulative water and contaminant flux for DNAPLs and compiling field data to transition the technology from the innovative testing phase to regulatory/end user acceptance and stimulated commercialization. The Port Hueneme project evaluated MTBE flux with similar objectives while the Indian Head project demonstrated the borehole flux meter to measure water and perchlorate contaminant flux.

**Design, Construction, and Validation of the AFIT Small Scale Combustion Facility and Sectional Model of the Ultra-Compact Combustor**

Anderson, Wesley S; Mar 2007; 114 pp.; In English; Original contains color illustrations

Report No.(s): AD-A468367; AFIT/GAE/ENY/07-M01; No Copyright; Avail.: Defense Technical Information Center

(DTIC)

The AFIT small-scale combustion facility is complete and its first experiment designed and built. Beginning with the partially built facility, detailed designs have been developed to complete the laboratory in order to run small-scale combustion experiments at atmospheric pressure. A sectional model of the Ultra-Compact Combustor has also been designed and built. Although the lab's specific design intent was to study the UCC's cavity-vane interaction, facility flexibility has also been maintained for future work. The design enabled the completion of liquid fuel and air delivery systems, power and control systems, and test equipment. The design includes failsafe operation, remote control, and adherence to SAE ARP 1256 testing standards. Construction of the laboratory has forced design changes as new obstacles arose. As system construction has been completed validation and troubleshooting have been undertaken. The AFIT facility can now deliver air in two separately controlled air lines at up to 530 K (500 deg F), at delivery rates of 0.12 kg/s (200 SCFM) for the main line and 0.03 kg/s (60 SCFM) for the secondary. A continuous dual syringe pump can deliver liquid fuel at up to 5.67 mL/s for JP-8 equivalence ratios up to 4. Safe, remote ignition and shutdown are in place and all test equipment fundamental to combustion is installed. The addition of an advanced laser combustion diagnostics system adds more unique capability to the laboratory. The laser system will provide instantaneous Raman and Raman spectroscopy, Coherent Anti-Stokes Raman Scattering, Planar Laser-Induced Fluorescence, Laser-Induced Incandescence and Planar Imaging Velocimetry diagnostic techniques.

**Test and Evaluation of Value Engineering Proposal: Removal of Rubber PAD in 120 MM PA 153 Ammunition Fiber Container**

Lam, Y H; Granuzzo, J; Kirshteyn, D; Yang, X M; Oct 2006; 10 pp.; In English; Original contains color illustrations  
Report No.(s): AD-A467928; ARASI-TR-06002; No Copyright; Avail.: Defense Technical Information Center (DTIC)

Rubber pad expanded neoprene is currently positioned in the container body assembly. It is fastened with adhesive to the metal end, which is crimped to the outer body portion of the fiber container. Extensive testing was performed on the cartridge support during design, pre-production, and FAT testing on past and current contracts by U.S. Army Armament Research, Development and Engineering Center personnel. The cartridge support has shown excellent strength at both elevated and negative temperatures. The container itself is designed and manufactured in a way as to add additional strength to the support. The fiber container, by forming an exterior barrier around the cartridge support also helps in controlling the amount of expansion the cartridge support can achieve. By removing the rubber pad, an initial cost savings of \$0.32 per container would be achieved.

ONLINE: <http://hdl.handle.net/100.2/ADA466436>

A gyroscope with a measured noise floor of 0.02 degrees /s/Hz<sup>1/2</sup> at 5 Hz is fabricated by post-CMOS micromachining that uses interconnect metal layers to mask the structural etch steps. The 1x1 mm lateral-axis angular rate sensor employs in-plane vibration and out-of-plane Coriolis acceleration detection with on-chip CMOS circuitry. The resultant device incorporates a combination of 1.8- micrometers-thick thin-film structures for springs with out-of-plane compliance and 60-micrometers-thick bulk silicon structures defined by deep reactive-ion etching for the proof mass and springs with out-of-plane stiffness. The microstructure is flat and avoids excessive curling, which exists in prior thin-film CMOS-microelectromechanical systems gyroscopes. Complete etch removal of selective silicon regions provides electrical isolation of bulk silicon to obtain individually controllable comb fingers. Direct motion coupling is observed and analyzed.

**When Do Organizations Need to Change (Part II)? Incongruence in Action**

Entin, Elliot E; Diedrich, Frederick J; Kleinman, David L; Kemple, William G; Hocevar, Susan P; Rubineau, Brian; Serfaty, Daniel; Apr 25, 2003; 27 pp.; In English; Original contains color illustrations

Contract(s)/Grant(s): N00014-02-C-0233

Report No.(s): AD-A467094; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA467094>

Organizations that adapt to changes in their environment have a much better chance at achieving their mission and performing well. When organizations do adapt they usually alter their strategies, but rarely do they change their organizational structure even when that structure no longer fits the mission. To identify the conditions that will be salient enough to cause organizations to alter not only their strategies, but also their current structures, we used a model-based design process to create mission scenarios that were either matched (congruent) or mismatched (incongruent) with two organizational structures

(functional, divisional). We then examined measures over time to identify ones that discriminated between congruent and incongruent conditions early in the mission scenarios. Several measures of communications, performance and workload appeared to be good candidates for leading indicators of the need for organizational change.

Contract(s)/Grant(s): N00014-02-C-0233

Report No.(s): AD-A467093; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA467093>

Different organizational structures are better matched to certain mission types than others (organizational congruence). Consequently, one way to achieve superior mission effectiveness is to switch between organizational structures when circumstances dictate. However, little is known about the variables that signal the need for such structural adaptation. To explore this issue, we used a model-based design process to create mission scenarios that were either matched (congruent) or mismatched (incongruent) with two organizational structures (Functional, Divisional). Results indicated that, as predicted on the basis of the coordination requirements imposed by the model-based design process, performance in the incongruent cases was characterized by increased communication, increased perceived workload, and degraded performance. Given these overall results, we explored these data further by analyzing communication patterns to identify how the organizations attempted to cope with the congruence problem. Our results indicated that the communication strategies employed in the face of incongruence depended on organizational structure/mission scenario pairings, suggesting that the specific signals of the need for structural adaptation will likely depend on context.

**Non-Thermal, On-Site Decontamination and Destruction of Practice Bombs**

Heaton, Harley L; Jun 12, 2006; 204 pp.; In English; Original contains color illustrations

Contract(s)/Grant(s): Proj-DACA87-02-C-0014

Report No.(s): AD-A468687; MM-0211; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA468687>

The U. S. Armed Forces have been exploring alternative methods of dealing with unexploded ordnance (UXO) practice bombs (such as the BDU-33) that contain spotting charges (such as the CXU-5, MK-4, or KC-4). There are hundreds of thousands of these bombs at bombing ranges throughout the U.S. The explosive ordnance disposal (EOD) community estimates the dud rate of these bombs to be upwards of 20%. This means that when removing these items from a range, every bomb has to be examined. If it has not functioned, the item must be rendered inert. UXBase, a new process under development by UXB International, Inc. (UXB), uses base hydrolysis (a non-thermal, environmentally safe, cost effective alternative to the 3X and thermal 5X methods) to treat and destroy propellant and explosive residues on range-derived scrap and other materials. UXB feels this technology can also be applied to practice bombs. The process was evaluated to determine required process variables. Following treatment the clean scrap was evaluated to determine its value. After neutralization, the liquid by-products were analyzed for explosive content, metals, and pH. During operations, gasses evolved were analyzed for hydrogen, carbon monoxide, carbon dioxide, and phosphine. Overall the process failed to achieve its objectives. The failure was due to the inability of the caustic fluid to penetrate certain blockages of some dropped, but still live, BDU's so that the propellant was not always destroyed. The fact that propellant does remain in some cases means that inspection would be required to verify that the process has worked as intended for each and every BDU treated, which largely negates the projected cost savings from the process, and does not decrease the hazards associated with recycling BDU's over the present practice.

During the last year the major activity of the 'Communicating Science and Engineering' project involved the third workshop (Catalyst Workshop) planned through the American Film Institute with the participation of colleagues in the industry, and with assistance from media experts at the National Academy. This workshop had the goals of 1) providing scientists and engineers with an opportunity to learn about the film industry and to enhance their science-oriented script writing skills (in order to involve more scientists and engineers in the creative process), and 2) providing data and learning for the project about approaches to professional activities in this area of research (the unique nature of the project presents planning difficulties because of the lack of a knowledge base or established research community to draw from). The Catalyst Workshop was held in August. Studies of the educational aspects of the project, in terms of impact, are reported.

ONLINE: <http://hdl.handle.net/100.2/ADA469174>

The Holloman High Speed Test Track (HHSTT) is a rocket-powered sled track facility used for testing a variety of hypervelocity aerospace applications. The current speed record is 6,453 miles per hour. While this seems fast there are customers at the track that have requirements demanding even faster speeds. Significant research has been conducted in the area of rail gouging as it relates to the test track, and efforts are under way to reduce and even eliminate this phenomenon. Any steps taken in this effort may eliminate catastrophic sled failures caused by gouging, however wear is another damaging issue that needs to be understood. This research evaluates wear in two fashions. First, data from the Dynamic Analysis and Design System (DADS) software, used by the HHSTT to model sled loading and vibration, is evaluated in a theoretical model originating from 'high-speed' pin-on-disk experimentation. The second method evaluates wear by conducting a series of simulations in which temperature, rail geometry in the form of an asperity, speed and rail coating are varied. These short duration simulations are performed with CTH, a hydrocode designed for analyzing hypervelocity impact problems. A validated CTH model, used in previous gouging research, was used to estimate wear by examining local areas of failure and melting. DADS provides forces related to frictional heating and vertical velocity information that will be incorporated as input into CTH.

Situation awareness is an essential cognitive-domain object of the command and control decision process. This paper places an organization's SA in the context of OODA (Observe, Orient, Decide, Act) interaction between opposing teams. In addition, a hierarchical SA structure is used to organize SA generated from the physical entities in the corresponding physical

domain. A rich Modal Logic-based language (SALMA) is proposed to represent and also to communicate awareness within an organization to form the Organizational Situation Awareness. An example of increase of knowledge due to Organizational SA is given. An additional example of strategic maneuver based on Organization SA is also given. The paper concludes with an assessment of technology-led innovation and the significance of measurement in situation awareness.

We are in the age of Knowledge Centricity (we will call it Knowledge in short). The age of Knowledge is an age of revolutionary change for businesses and military alike brought about by advancements in networking. These advancements are founded on rapid advancements in Telecommunications and Information Technology. Command Control and Information Systems (C2IS) is a medium by which military organizations exercise command and control. In the Knowledge era, C2IS design must also undergo a revolution to help the information users harness the right information, help them make a deeper appreciation of the situation, and enable them to make better and faster responses. This paper articulates an architecture for a C2IS build for the Knowledge Age, called Command Control Knowledge System (C2KS). The approach moves away from the traditional approach for C2IS design, which is based on C2 processes, to one centered on the human's knowledge creation, and sharing processes. This paper will also present a system currently under development at the SAF Center of Military Experimentation called Mission Mate, which is SAF's prototype of a C2KS.

**Experimenting with C2 Applications and Federated Infrastructures for Integrated Full-Spectrum Operational Environments in Support of Collaborative Planning and Interoperable Execution**

Mayk, Israel; Klose, Dirk; Jun 2004; 33 pp.; In English; Original contains color illustrations

Report No.(s): AD-A466094; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA466094>

In this paper, we describe the design, implementation, and execution of and the results obtained from the SINCE

experiment 1a (SINCEx1a). The goals of this experiment were (a) to test and verify the information exchange among all of the US and German systems connected in the experimentation environment, and (b) to demonstrate and validate with military user participation that the C2 functionality implemented was adequate to support future planned operational experiment, SINCEx1b. SINCEx1a implementation followed, adopted and adapted a code of best practice approach for experimentation. Both adopted features and adapted elements are summarized herein. Clearly, many compromises had to be made considering the limited resources and budget available. Many trade-offs were made in establishing a balance between (a) developing the infrastructure not only for SINCEx1a but for the planned follow-on experiments and (b) developing the SINCEx1a experimental configuration that was finally used in the conduct of the actual experiment.

**Framework for Measuring the Impact of C4ISR Technologies and Concepts on Warfighter Effectiveness Using High Resolution Simulation**

Porche, Isaac; Jamison, Lewis; Herbert, Tom; Jun 2004; 80 pp.; In English; Original contains color illustrations

Report No.(s): AD-A466098; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA466098>

A C4ISR architecture for future forces is a major concern to the Army. This report describes progress of an on-going project to develop a framework for assessing individual communication technologies and concepts by accounting for technological and operational detail. Assessments of communication performance (e.g., message delay and message completion rate) factor terrain, mobility, and other scenario specific details via high-resolution simulations. For such measurements, excessive run-times can be a problem. This is usually the case for high-resolution simulation of communication networks. However, in this paper, it is shown that high-resolution communication network simulation runs (using Qualnet(copyrighted), although time consuming, can be used to capture the dynamics of communication performance in closed form expressions or meta-models. The meta-models can then be embedded into force-on-force simulation (JANUS) to get perhaps the most important performance measure, e.g., warfighter effectiveness. This forms a framework that supports detailed, scenario specific examination of the impact of C4ISR on warfighter effectiveness.

This paper provides an overview of network enabled operations (NEOps) issues and initiatives within the Department of National Defense/Canadian Forces and how it has or will facilitate transformation. This includes discussion on the results of efforts to decompose NEOps to identify areas of fruitful research and development, and the status of efforts to address such areas. Moreover, this paper seeks to map the impact of NEOps to the department's PRICIE construct (equivalent to the US DOTMLP framework) and discuss concept development and experimentation related to this theory. Moreover, information is provided on departmental efforts in relation to C4ISR developments and their implications for NEOps within the context of the 2002 Exercise Robust Ram and the Pacific Littoral ISR Experiment (PLIX) conducted during the summer of 2003. The paper also describes the planning and expectations for an Atlantic Littoral ISR Experiment (ALIX) during August 2004, which will integrate and exploit multiple sensors in an integrated intelligence, surveillance and reconnaissance architecture (IISRA), including the employment of an uninhabited airborne vehicle (UAV), and concludes with discussion on future intentions in this area.

Battle Command on the Move (BCOTM) is a revolutionary capability that provides current and future combined arms commanders all of the information resident in their command posts, and the required communications necessary to command and control their combined arms team on the move, or at a short halt, from any vantage point on the joint battlefield. The purpose of the BCOTM effort was to convert five M-7 Bradley Fire Support Team (BFIST) vehicles into BCOTM systems. Three operator workstations and an extensive Mission Equipment Package (MEP) were integrated into the five BFIST platforms to provide a common operational picture and enable Situational Understanding (SU) while on the move. The integration team consisted of three groups who worked together for 2 months to complete the system from the concept until the final hand off to the 4th Infantry Division (ID), Fort Hood, TX. The program was extremely successful and has led to further advancements in battle command on the move.

The object of the Damage Control (DC) Triad program was to develop a Damage Control Communications system, which would be damage tolerant and remain operable in casualty situations where DC communications are vital. The current state of the art in communications technologies (WLAN, enhanced VoIP Power Line Communications, and Sound-Powered Phone implementations) should allow the implementation of the system without a costly R&D program. This report details the communications technologies and their application and testing in a shipboard environment to implement and demonstrate a true uninterrupted and survivable DC Communications system.

**Using Wargames for Command and Control Experimentation**

Rubel, Robert C; Jun 2003; 11 pp.; In English

Report No.(s): AD-A466408; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA466408>

Wargames are a staple technique of military research, but various inherent characteristics have prevented their use as rigorous analytic tools. Traditional gaming has long employed C2 among players, however, C2 has been generally regarded as a necessary adjunct to generating player moves, not as an element of independent scrutiny or play. Games that explore network-centric warfare necessarily focus precisely on player C2. Beyond their traditional exploratory function, wargames can constitute the basis for valid C2 experimentation. Harnessing wargames for C2 experimentation is possible if we conceptually divide them into two layers: the simulation layer and the command and control layer. Traditional wargames have consisted solely of the simulation layer, whose limitations with respect to experimentation are well documented. By separating out player C2 we have a different situation. C2 in a wargame can be real, not simulated, because it is what players actually do to each other and therefore is subject to valid experimental treatments. Such conceptual separation also allows the C2 experiment to ride on a relatively simple game that can be iterated more easily than traditional wargames. An example of a recent joint Naval War College / Center for Naval Analyses C2 experiment using a wargame is provided.

**Evaluation of Organisational Interoperability in a Network Centric Warfare Environment**

Fewell, Suzanne; Richer, Warren; Clark, Thea; Warne, Leoni; Kingston, Gina; Sep 2004; 35 pp.; In English; Original contains color illustrations

Report No.(s): AD-A466532; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA466532>

Recent trends and developments in operations mean that military organizations are increasingly being required to interoperate with a larger number, and wider range, of non-traditional partners. These include military, government and non-government agencies both national and international. At the same time, some military organizations are examining how they might best use the recent advances in information communications technology including the adoption of different approaches to warfare such as network centric warfare (NCW). The Organizational Interoperability Model (OIM) was developed for the evaluation of interoperability at the human-activity or organizational level. The opportunity has been taken to re-examine the model in light of the changes outlined above. In particular, this paper examines the suitability of the OIM for conducting evaluations in this wider context, and introduces a new version of the model. This paper also discusses the analysis of interoperability in individual organizations, starts to identify some potential stand-alone indicators and foreshadows the development of additional models based on the OIM.

**C3X: Correlation, Causation and Controlled Experimentation for C2**

Hiniker, Paul J; Sep 2004; 26 pp.; In English; Original contains color illustrations

Report No.(s): AD-A466544; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA466544>

This paper examines the key role of controlled experimentation in testing causal hypotheses on the warfighting effectiveness of C2 technologies and procedures. Through the years many hypotheses have been advanced regarding the factors making for effective warfighting. More troops, more firepower, higher speed of maneuver, superior doctrine, better training and superior C4I (Command, Control, Communications and Intelligence) are all factors hypothesized to make for more effective warfighting. Warfighting, itself is adjudged more effective when enemy combat losses appreciably exceed own force losses. How does one go about testing the many hypotheses on the causes of warfighting effectiveness against observational evidence? For example, what difference does it make to warfighting effectiveness if we put in a particular new C2 technology? We don't need to know simply what's the difference between military units with and without the new C2 technology; we need to know what actually happens with the new C2 technology compared with what would have happened without it. We shall prove that controlled experiments provide the only unequivocal tests of such causal hypotheses; otherwise the observed results are open to rival explanation in terms of causation by some of the uncontrolled factors. We introduce causal hypothesis testing with observations on a single group and then move to the method of using simple correlational data for two groups. This forces us to confront the open ended issue of control groups and control variables in testing causal hypotheses which in turn leads us to consider the most conclusive method, controlled experimentation.

**Operational Trust: A New Look at the Human Requirement in Network Centric Warfare**

Blatt, Nicole; May 21, 2004; 34 pp.; In English; Original contains color illustrations

Report No.(s): AD-A466612; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA466612>

Everyone agrees that the new information technology systems affect the way we fight wars. Advocates from the President of the USA to NATO leaders even recognize the information revolution in military affairs (RMA) and prescribe the need for major operational changes. However, the opinions of how the command and control operations should change are often diametrically opposed. Leading civilian authorities in network centric warfare profess a decentralized control system called self-synchronization. Meanwhile, the U.S. military leadership sponsors new technology experiments that often centralize control and increase micromanagement. Could these differences stem from a different assessment of operational trust? An enduring principle for increasing efficiency and effectiveness of command and control has always been centralized command, decentralized execution. In network centric warfare, this can be optimized through an approach called self-synchronization.

However, certain necessary conditions must first be met for self-synchronization to succeed. The authors of the book, *Power To The Edge*, state that these conditions include ‘Trust in the information, subordinates, superiors, peers, and equipment’ Can this condition be met? This paper tackles the requirement to trust in network centric warfare.

Report No.(s): AD-A466661; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA466661>

When organizations operate in an environment that is dynamic, complex and unpredictable they need to develop more flexible structures if they are to increase their chances of surviving. Organizational complexity increases when the constituent elements involved belong to different nationalities. Advances in information and communication technology (ICT) implemented with the appropriate process and structural changes offer the prospect of improving the flexibility of organizations. It is proposed that future Multinational Force (MNF) military headquarters (HQ) can achieve this flexibility through a modular organizational structure enabled by networked information management and communication technologies. This paper provides a critical examination of the human factors issues that would be involved in the future implementation of a modular structure to a MNF HQ.

ONLINE: <http://hdl.handle.net/100.2/ADA466751>

Recent research into command modeling has allowed us to build theoretical utility-based representations of the three layers: physical, information and cognitive (see Figure 1) to give models that transform observable data through interpretive indicators and onto course of action assessment. The key transfer function is driven by (a minimum of) two parameters and the function changes its shape (and influence) as the decision-maker’s context changes (for example, as local decisions become more global in their potential impact) [1]. The paper explores the applicability of the theory using results of a recent BG command decision-making experiment. The experimental results show that splitting factors can be derived from the subjective nature of the situation assessment, and the personality, training experience and history of the decision-maker need to be taken into account. The paper recommends that in order to capture these deeper aspects of the human decision-making process, there is a need to: Define a landscape whose contours are defined by the subjective context; Evaluate costs of moving over the landscape; and Overlay opponents current positions and intents. The landscapes are wholly subjective and will change as the decision-maker’s world changes over time. The example will illustrate these points showing that the move towards complex, less prescriptive C2 models will increase the need for more subjective C2 experimentation. The challenge then is how to capture this deeper representation of human decision making in a way that is useful for quantitative modeling.

Report No.(s): AD-A466759; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA466759>

The C4ISR Architecture Framework Products can be developed using mapping between Structured Analysis products and the Framework products and also based on mapping between Object Orientation and Framework products [Levis and Wagenhals, Bienvenue, Shin and Levis, 2000]. Both of these methodologies for architecture design are adequate to obtain essential and supporting C4ISR products. However, sometimes the architect has to add new capabilities into the existing architecture that contains the products developed using either of the two approaches. If he uses the same approach (either Structured or Object Orientation) to develop the new set of products as was used for the original architecture, then the task of model concordance is not difficult, otherwise it is not easy. This paper discusses the reuse of the components of an Integrated Dictionary developed for the C4ISR products to add new products into the existing architecture. The C4ISR Architecture Framework products are developed using two approaches for a single operational concept, and then the contents of the two integrated dictionaries are compared to find out the similarities and differences.

ONLINE: <http://hdl.handle.net/100.2/ADA466768>

Command and Control (C2) organizations must operate decisively and synchronously, and do so in highly uncertain and dynamic settings. Individuals succeed in these settings in part by thinking critically about their assessments and plans. We argue that individual team members collaborate in their application of critical thinking in a process called collaborative critical thinking. We are developing this concept of Collaborative Critical Thinking (CCT) within C2 teams from three research threads concerning 1) individual critical thinking, 2) team process and architecture, and 3) human performance in information age warfare. This paper describes our CCT framework and the tools and training we are developing to improve CCT among team members.

**Constructible Assessment for Situation Awareness in a Distributed C2 Environment**

Seet, Alfred W; Teh, Cheryl A; Soo, John K; Teo, Leonghwee; Sep 2004; 37 pp.; In English; Original contains color illustrations

Report No.(s): AD-A466920; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA466920>

A method for assessing situation awareness (SA) in field command and control exercises is described in this paper. This

method is an adaptation of the Situation Awareness Global Assessment Technique (SAGAT) by M. R. Endsley (1995) that takes into account specific constraints for use in a field exercise, such as minimizing the level of intrusiveness. Endsley's model of SA separates SA into three levels: Level 1, perception of elements in the environment within a volume of time and space; Level 2, the comprehension of their meaning and integration of multiple pieces of information; and Level 3, the projection of the elements' future status and ability to forecast future situation dynamics. This constructible assessment for SA (CASA) requires that military subject matter experts observe exercise events, construct specific and relevant questions to probe the situational knowledge of the exercise participants, and decide upon the suitable timings for administration of these questions. CASA was tested in a division-level army C2 exercise. An objective of the exercise was to investigate issues related to distributed command teams using situation awareness as one of the measures. Having applied CASA in this exercise, the strengths and limitations of CASA were identified. To analyze the findings, several methods of computing situation awareness of teams were utilized. It was found that CASA yielded results consistent with expectations stemming from exercise roles and events. Further validation and refinement of CASA would improve its utility and efficacy as a tool to measure objective SA in a field exercise. Twenty-three briefing charts summarize the presentation.

**Transforming Coalition Warfare with Network Centric Capabilities**

Admire, John H; Sep 2004; 23 pp.; In English

Report No.(s): AD-A466921; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA466921>

The challenges of preserving peace and prosecuting war are historically and inherently complicated. In today's changing international security environment, however, the traditional challenges of yesterday are becoming even more complex. The old challenges are contributing to the emergence of new concepts and new technologies as nations and coalitions transform to confront and resolve the timeless challenges of peace and war. This paper identifies and summarizes various transformation initiatives that today's nations and coalitions are pursuing to meet the demands of tomorrow's strategic environment. The initiatives include such concepts as Network-Centric Warfare (NCW), Effects-Based Operations (EBO), Collaborative Information Environment (CIE), and many others. A central theme throughout is that the often diverse, unpredictable, and asymmetric nature of evolving threats will require conscious and concerted efforts by nations to cooperate and collaborate. New thinking and new technologies are dominating these initiatives. Coalitions and multinational partnerships will become more important than ever to successfully defeat worldwide and full-spectrum threats. Threats that range from transnational actors to ideological terrorist organizations, from renegade states to emerging nationalism, will present new and dangerous challenges to peace and stability. This new era will require new thoughts and new capabilities. The challenges are immense and the threats imminent. Therefore, coalition warfare must transform, as individual nations transform, to attempt to set the pace and control the course of future actions in peace and war. This paper is about coalitions and the evolving concepts and technologies that will contribute to their future effectiveness. Ten briefing charts summarize the presentation.

**Joint and Allied Logistics Opportunities and Tools Supporting 21st Century War Fighter Rapid Decisive Operations**

Flynn, John E; Bryant, Russell E; Jun 2002; 32 pp.; In English; Original contains color illustrations

Report No.(s): AD-A467472; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA467472>

As the current review of DOD structures, capabilities, and plans are coming to completion and moving into implementation phases, a focus to maintain is the delivery of mission capabilities for the front line war fighters. The mission capabilities packages are supported by the material, and also by the materiel support process, which includes not only the hardware, but more importantly the people, training, maintenance and support, and the doctrine, concepts of operations, tactics, techniques, and procedures for the material. Following an updated discussion on Operational Engineering, this paper expands the authors concept of Operational Engineering, to several applied logistics options and discussions in support of rapid decisive operations. It finishes with an introduction discussion of a Logistics Commander Operational Planning Tool,

which potentially can support and enable generation of rapid decisive operations. This tool could assist Combatant Commanders and their war fighters to operate inside the decision cycle of opponents on the front lines.

**C4I Tactical Applications Utilizing Embedded Simulations**

Layman, Gene; Daly, John; Jun 2002; 16 pp.; In English; Original contains color illustrations

Report No.(s): AD-A467508; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA467508>

Embedded simulation technologies have matured suitably to allow C4I systems to incorporate simulations within their design. Simulation based mission applications such as a course of action analysis application, or visual representations of complicated operational assessment models, can significantly improve the quality and timeliness of tactical decisions for military operations. Simulation based applications have the ability to process C4I data beyond human cognition, and display it in an intuitive and meaningful way for key tactical decision makers. This paper reports progress on the Navy's Embedded Simulation Infrastructure (ESI) Program implementation and management of embedded models and simulations for C4I systems that are compliant with the Defense Information Infrastructure Common Operating Environment (DII COE). The ESI Program provides a robust set of common reusable DII COE simulation services and object-oriented links between simulations and DII COE services and data bases. The development of two Global Command and Control System (Maritime) Mission Applications utilizing this technology are discussed: the Planning Mission Editor and the Weapons of Mass Destruction Analysis Application.

Report No.(s): AD-A467513; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA467513>

Distributed simulation-based training is a challenging and resource intensive effort that the services must perform on a day-to-day basis--within services, joint service, and in joint coalition forces. Research gains have been made that demonstrate advanced training assessment and diagnosis, however, there remains a need for research and development of automated capabilities for assessing team performance, diagnosing root causes of team failure, and debriefing the results across distributed platforms in exercises. A major thrust of this research needs to be the development of measurement technologies for distributed team training that advances the efficiency and speed of delivery to the war fighter in training. In this paper we draw from the recent research on adaptive team architectures for command and control, team decision-making and training, and examples of team measurement tools to derive assessment requirements that support the instructional processes required for distributed team training debrief and after action review.

**A Cultural Framework for the Interoperability of C2 Systems**

Slay, Jill; Jun 2002; 13 pp.; In English; Original contains color illustrations

Report No.(s): AD-A467586; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA467586>

In considering some of the difficulties experienced in coalition operations, it becomes apparent that attention is needed, is in establishing a cultural framework for the interoperability of personnel (the human agents) and the IT/IS infrastructure that they share. This paper extends the argument proposed in previous work (Burke 2000a; Burke 2000b; Slay 2001, Slay & Burke 2001)] that culture is an important system variable within any complex socio-technical system, such as a C2 system. The IFIP-IFAC (1999) Task Force has developed the Generalized Enterprise Reference Framework and Architecture (GERAM). GERAM allows the merger of change process methods from different disciplines and examines both the products of a system and the business processes by which they are produced. However, while recognizing the role of human agents within the

system, the GERAM framework does not cater for any cultural differences within the processes of decision making, monitoring, commanding and controlling or bringing about change. This paper extends the GERAM framework with theoretical anthropological and organizational frameworks discussed in previous work (Slay 2001, Slay & Burke 2001) and creates a specific cultural framework that is applied to the interoperability of C2 systems in coalition operations.

**Using the Command and Control Framework to Analyse Command Challenges**

McCann, Carol; Pigeau, Ross; English, Allan; Sep 2002; 15 pp.; In English; Original contains color illustrations

Report No.(s): AD-A467623; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA467623>

This paper describes a study addressing the validation of the Pigeau-McCann framework for command and control. The framework is a re-conceptualization of command, control and C2 that is intended to provide a comprehensive and consistent base both for the scientific investigation of C2 and for the development of military C2 policy and doctrine. The validation approach involved the assessment of the explanatory power of the framework in the context of actual situations in which military personnel confronted operational challenges. The results endorse the value of the framework as a tool for categorizing and quantifying aspects of command, of control and of C2. Furthermore, with refinement, the tool could also be used by the military to analyze and understand challenging C2 situations.

**Managing Responsibility and Information Flow in Dynamic Team Decision-Making**

Hubbard, Paul; Kott, Alexander; Martin, Michael; Sep 2002; 12 pp.; In English; Original contains color illustrations

Report No.(s): AD-A467635; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA467635>

We propose a method to allocate decision responsibility and arrange information flow dynamically within a team of decision-makers for command and control. A model of decision making which relates the decision load to decision accuracy is proposed and employed as an atomic building block to create predictive models of team decision making. An optimization problem is then proposed for a given set of forecast decision requirements in which the information flow between the atomic decision-making models is varied so as to maximize an aggregate measure of decision accuracy. A small-scale MATLAB Simulink implementation is presented as well as the outline of current work in which a genetic algorithm is employed to perform the optimization. Preliminary results indicate the technique improves the decision-making performance measure. We conclude with a discussion of implementation issues in a larger C2 context.

**A Model of Command and Control Processes for JWARS: Test Results from Controlled Experiments and Simulation Runs**

Hiniker, Paul J; Sep 2002; 17 pp.; In English; Original contains color illustrations

Report No.(s): AD-A467636; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA467636>

The purpose of this paper is to provide a basic model to aid assessment of the effects of changes in C2 on combat outcomes in JWARS. We lay out essential elements of a general Complex Adaptive System (CAS) model of C2 processes, develop measures of C2 performance and combat behavior, and derive some hypotheses on C2 effects on combat outcomes. C2 processes have a multiplicative effect with weaponry on combat outcome; combat decision loop speed and information superiority over the adversary increase combat performance; increased information load on decision makers and narrowed communications channels limit combat performance. Net Centric Warfare practices lift these limits and permit aggregated teams to fight in speedy synchronicity increasing combat performance. These hypotheses are tested against evidence from four

controlled experiments, three military exercises, and hundreds of simulation runs of stochastic combat models.

**Optimising the Design of Land Force C2 Architectures**

Kirby, Brendan; Yen, Leong; Judd, Greg; Cropley, David; Jun 13, 2002; 16 pp.; In English; Original contains color illustrations

Report No.(s): AD-A467642; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA467642>

Two different configurations of the Australian Army Brigade HQ have been investigated using a Systems Engineering simulation tool known as CORE. A Military Appreciation Process (MAP) has been utilized as a common operational planning procedure for both configurations. The two configurations analyzed were a Future Land Force (FLF) where the Brigade HQ is divided into two different locations with separate functions, and the other is a Current Land Force (CLF) structure. The model included the Battlegroup (BG) planning process for both the FLF and CLF architectures. It has been shown that on average, the FLF design achieves the total Brigade-BG planning cycle 30% more quickly than the CLF configuration. This provides more time either to carry out further operational planning (and therefore achieve a higher quality plan within the allotted time), or to accelerate the Brigade commander's OODA loop to move within the enemy commander's decision action cycle.

**The Outlook Y-JBI: An E-Mail Based Approach to Prototyping the Joint Battlespace Infosphere**

Marmelstein, Robert E; Jun 2001; 14 pp.; In English; Original contains color illustrations

Report No.(s): AD-A468222; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA468222>

One approach for rapidly implementing a prototype Joint Battlespace Infosphere (YJBI) publish and subscribe (P&S) system is to leverage the existing e-mail transport infrastructure. E-mail has the advantage of being standardized, pervasive, robust, and scalable. This Y-JBI is implemented though the peer-to-peer interaction of publisher and subscriber agents. These agent pass subscription requests, acknowledgements, and information objects to each other using Extensible Markup

Language (XML) e-mail messages. Under this approach, Microsoft Exchange(Registered) is employed as the enterprise mail server with Microsoft Outlook(Registered) as the primary e-mail application servicing the JBI user. This system enables a direct flow of information from the publisher to subscriber-side fuselets that interface to Microsoft Office(Registered) planning tools.

**C4ISR Architectural Frameworks in Coalition Environments**

Myer, Charles R; Oct 2000; 14 pp.; In English; Original contains color illustrations

Report No.(s): AD-A468240; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA468240>

The break-up of the Soviet Union unleashed a flood of nationalism throughout Southeastern Europe (SEE). Freed from the yoke of suppression, the nations of the region sought economic stability and security in a dramatically changing global environment. These nations are anxious to display Western leanings and to ensure national security through multinational regional coalitions. These coalitions, in turn, are being supported by a variety of national, NATO, and U.S. sponsored initiatives with the common goal of regional stability. Within the regions of the Pacific Rim, similar coalitions may emerge with similar goals to which the principles set forth in this paper will equally apply. The common thread through these SEE initiatives is the use of Information Technology (IT) to improve Command, Control, and Communications (C3) in a combined military/peace support domain. This paper proposes an IT-driven Command, Control, Communications, Computers, Intelligence, Surveillance, and Reconnaissance (C4ISR) Architectural Framework approach to the integration of combat and peace support forces in regional coalition initiatives. Although the framework is applicable across the total C4ISR domain, only Command, Control, and Communications are relevant to the subject addressed in this paper and will be the term used throughout. Computers are assumed as a logical part of C3. This paper also proposes that this type of architectural approach is applicable to regional coalitions on a global basis.

**A Model for Predicting Intelligibility of Binaurally Perceived Speech**

Scharine, Angeline A; Henry, Paula P; Rao, Mohan D; Dreyer, Jason T; Apr 2007; 36 pp.; In English; Original contains color illustrations

Report No.(s): AD-A466840; ARL-TR-4075; No Copyright; Avail.: Defense Technical Information Center (DTIC)

Predicting and modeling intelligibility of monaurally or binaurally presented speech is difficult because it depends primarily on the accuracy and interdependency of frequency, time, and spatial information arriving at the listener. Despite these complex relationships, a new pragmatic model is suggested for speech mixed with broadband noise. A form of the logistic regression function is used to characterize human performance data. The regression of these signal properties onto empirical speech recognition performance data estimates the relationship of these properties to speech recognition. This concept is illustrated by the modeling of human performance on Central Institute for the Deaf W-22 speech items presented monaurally and binaurally in both reverberant and non-reverberant conditions at different signal-to-noise ratios. Although the implementation of the present model is limited to the data considered, it is expected that other data can be modeled after the procedure outlined in this report. The model described is the first step in developing an objective binaural measure for predicting speech perception in noisy environments.

**Effects of Multimodal Displays About Threat Location on Target Acquisition and Attention to Visual and Auditory Communications**

Glumm, Monica M; Kehring, Kathy L; White, Timothy L; Apr 2007; 56 pp.; In English; Original contains color illustrations

Contract(s)/Grant(s): Proj-62716AH70

Report No.(s): AD-A466869; ARL-TR-4074; No Copyright; Avail.: Defense Technical Information Center (DTIC)

This laboratory experiment examined the effects of paired sensory cues that indicate the location of targets on target

acquisition performance, the recall of information presented in concurrent visual and auditory communications, and perceived workload. The multimodal cueing techniques assessed in this study were Visual+Spatial Language, Visual+3-D Audio, Visual+Tactile, and Spatial Language+Tactile. A unimodal visual only cue was included as a baseline. Except for reaction times to cues, no significant differences were found between the multimodal cue conditions and the Visual Only mode in primary and secondary task performance or subjective workload. Reaction times were faster in the Visual+3-D Audio and the Visual+Tactile conditions than in modes that included a spatial language cue. Reaction times to the visual+spatial language cue were faster than the spatial language+tactile cue, but no significant differences were found between the Visual+Spatial Language and the Visual Only modes. Adding the 3-D audio cue to the visual cue significantly improved reaction time beyond that of the Visual Only condition, but no significant difference was found between the Visual Only and the Visual+Tactile modes. Reaction times to cues were slower when communications were presented visually, but no interaction was found between communications modality and cue condition on this measure. Communications modality, however, did have a different effect on subjective ratings of effort in the Visual+Tactile mode than in the other cue conditions. In the Visual+Tactile mode, ratings of effort were significantly lower when communications were presented auditorily than when they were presented visually, but communications modality did not appear to affect ratings of effort in the other cue conditions.

**Monitoring the Command and Control Weapon System. A Master Caution Panel for C2 System Monitoring**

Brown, Jr, Martin J; Sep 2002; 17 pp.; In English; Original contains color illustrations

Report No.(s): AD-A467029; No Copyright; Avail.: Defense Technical Information Center (DTIC)

This paper will highlight the Air Force Research Laboratory (AFRL) sponsored research being carried out by a team led by BBN Technologies to develop a Master Caution Panel (MCP) for modern, distributed command and control systems. The primary purpose of MCP is to provide military decision makers with situational awareness of the command and control weapon system. MCP accomplishes this by taking information technology (IT) resource data in the form of IT events and transforming them into operationally significant information. MCP bridges the gap between operational personnel and systems support personnel by providing each group with an independent views of the same set of IT related events. The operator can easily understand the impact of IT resource problems on mission accomplishment and can provide the systems support personnel with clear prioritization concerning where emphasis on fixing problems will have the most impact.

**Concept of C4I Data Fusion Command Center for Urban Operations**

Pigeon, Luc; Sep 2002; 16 pp.; In English; Original contains color illustrations

Report No.(s): AD-A467040; No Copyright; Avail.: Defense Technical Information Center (DTIC)

Within the last decade, military research on urban operations (UO) have become a critical challenge. Beirut, Mogadishu, and Grozny, are few examples of urban operations that highlight our actual doctrinal and/or material gaps. From a command and control perspective, the proposal for an urban data fusion command center (UDFCC) is already qualified as a key for urban operations success. The UDFCC main objective is to provide a robust understanding of an urban battlefield. This paper presents a summary of urban operations lessons learned in order to define the UDFCC sub-objectives and components. They are associated with the phases of the intelligence cycle: direction, collection, processing and dissemination. They are categorized into four themes: mission planning and rehearsal; synthetic urban battlefield up to date reproduction and formalization; urban battlefield data exploitation; and synthetic urban battlefield visualization.

**Developing and Evolving a Joint Australian Task List**

Kingston, Gina; McCarthy, Anna; Sep 2002; 8 pp.; In English

Report No.(s): AD-A467065; No Copyright; Avail.: Defense Technical Information Center (DTIC)

This paper describes the development of the Australian Joint Essential Tasks (AS JETs) list. These tasks were developed to support the planning for, and evaluation of, Joint Exercises. This approach is consistent with that of Australia's allies, who have been operating with such lists for a number of years. The USA's Universal Joint Task List (UJTL) was developed with an emphasis on training. In contrast, the UK and Canada have taken an enterprise-wide approach, capturing all core Defence tasks. While this approach has the benefit of encompassing the activities of the entire organization, it was believed that a more focused task list was required for Australian joint operations. The AS JETs were developed in line with current Australian doctrine, standard operating procedures, and emerging doctrinal concepts. They consist of a three-level hierarchy that is consistent with current command structures and represents the essential activities to be completed when conducting an operation. Also, the AS JETs were developed through close consultation with representatives from all levels of the Australian Defence Force (ADF). To remain consistent with the ADF's standard practice the AS JETs were designed to be a robust list capturing the tasks that need to be done, rather than specifying how to complete the tasks. It is, however, acknowledged that it is possible to change the AS JETs in both an evolutionary and revolutionary manner. This paper looks at two possible changes that may impact on the AS JETs. The concept of the Strategic Corporal suggests that the focus of the tasks may need to change to accommodate the fact that operations by low-level tactical units can have strategic consequences. With Ubiquitous C2 the scope of the AS JETs at an operational level may decrease, or disappear entirely.

**A Comparable Market Study of RFID for Manual Item-Level Accountability Inventory and Tracking Systems**

Courtney, Valencia V; Mar 2007; 111 pp.; In English

Report No.(s): AD-A467185; No Copyright; Avail.: Defense Technical Information Center (DTIC)

This thesis focuses on a return on investment (ROI) strategy for radio frequency identification (RFID) item-level tagging of assets by organizations that maintain manual inventory and tracking systems. The basis of strategy exists in leveraging benefits offered in repeated use of automated identify data and capture technology, RFID. The business model used for this thesis focuses on organizations that provide reference material management services (RMMS) (e.g. library reference material, employee privacy information records, laptops, etc) to internal and external customers. Although technology has created a means to digitized reference material, many organizations are required to maintain manual record systems for various reasons. In addition, a digitized capability does not address the issue of accounting for other pilferable items such as laptops, personal

digital assistants, etc. Therefore, evaluating capabilities available in RFID technology could lead to strategic options for eliminating the challenges posed by the lack of item visibility that exist in a manual RMMS business processes. Strategy development will derive from lessons learned in documented RMMS case studies that implemented an RFID solution. This thesis discusses and analyzes companies in private sector industry that have reported positive ROI with tangible benefits by implementing RFID for the purpose of asset control/management.

**Mobile Sensor Networks: A Discrete Event Simulation of WMD Threat Detection in Urban Traffic Schemes**

Hyink, Jeffrey F; Mar 2007; 73 pp.; In English

Report No.(s): AD-A467188; No Copyright; Avail.: Defense Technical Information Center (DTIC)

The rise of the threat of WMD attack on American soil necessitates new and innovative approaches to homeland security. A layered security model has been proposed in which an attacker must successfully penetrate multiple defensive constructs in order to complete an attack. As part of a layered defensive approach, a network of sensor equipped vehicles operating in urban traffic is considered. To-date, sensor packages have been developed for vehicles without detailed, area-specific analysis of their aggregate performance measures. The possible effectiveness of this network of sensors in detecting vehicle based WMD attacks is explored in this thesis. A Discrete Event Simulation using actual roadmap data was developed and analyzed to explore various configurations for searcher employment and in particular to generate a potential return on investment curve in the form of probability of detection generated as a function of the number of sensor equipped vehicles. The baseline scenario centers on an attacker utilizing a vehicle mounted WMD device. The attacker attempts a shortest-path route from a randomly selected starting point to a downtown target node. Patrol vehicles are equipped with sensors that can identify potential attacker vehicles in the adjacent lane of oncoming traffic. These vehicles patrol the roadway network, and are assumed to foil an attack when they detect an attack vehicle. The simulation model outputs data such as the proportion of foiled attacks and the distance from target, given a detection.

**Privacy: An Abbreviated Outline of Federal Statutes Governing Wiretapping and Electronic Eavesdropping**

Stevens, Gina M; Doyle, Charles; May 5, 2006; 6 pp.; In English

Report No.(s): AD-A467198; CRS/DC-98-327; No Copyright; Avail.: Defense Technical Information Center (DTIC)

It is a federal crime to intentionally wiretap or electronically eavesdrop on the conversation of another without a court order or the consent of one of the parties to the conversation. Moreover, in eleven states, it is a state crime for anyone other than the police to intentionally wiretap and/or electronically eavesdrop on the conversation of another without the consent of all of the parties to the conversation. The federal crimes are punishable by imprisonment for up to five years and expose offenders to civil liability for damages, attorneys' fees, and possibly punitive damages. State crimes carry similar consequences. Even in states where one party consent interceptions are legal, they may well be contrary to the professional obligations of members of the bar. The proscriptions often include a ban on using or disclosing the fruits of an illegal interception. Statutory exceptions to these general prohibitions permit judicially supervised wiretapping or electronic eavesdropping conducted for law enforcement or foreign intelligence gathering purposes. Similar regimes proscriptions with exceptions for government access under limited circumstances exist for telephone records, e-mail and other forms of electronic communications.

**Partnerships: The Path to Improving Crisis Communication**

Fitzpatrick, Helen M; Mar 2007; 82 pp.; In English

Report No.(s): AD-A467218; No Copyright; Avail.: Defense Technical Information Center (DTIC)

The global availability of 24-hour broadcast news establishes the media as a critical link to communicating with the public in times of crisis. As a result, the broadcast news media play a significant role in shaping how the public reacts in a crisis. Since fire and police departments will likely be the media's primary source for information in the initial stages of a disaster,

preventing the loss of lives depends on how quickly information is delivered to the public. However, positive working relationships between public safety and the media are often hampered by differences in police and fire culture, distrust and the lack of a clear understanding of each other's roles and responsibilities. The safety messages delivered by public safety officials and the media in an emergency have the power to influence the way the public behaves and the protective actions they take. This report examines how forming nontraditional partnerships between public safety agencies and the media can be used effectively to give direction to the public before, during and after a crisis. This report proposes a set of recommendations to help public safety agencies avoid costly communication mistakes through best practices and lessons learned from recent high profile incidents.

**Army and Air Force Transformation - Are They Synchronized?**

Forster, Richard A; Mar 30, 2007; 23 pp.; In English

Report No.(s): AD-A467300; No Copyright; Avail.: Defense Technical Information Center (DTIC)

The future global security environment will be one of great uncertainty and complexity. USA military forces will be called upon to conduct operations in any number of environments. The ability to operate and succeed in this environment is dependent upon the Services abilities to work effectively as members of joint and coalition teams. The Army and Air Force are working toward that vision of joint forces that provide unrivaled capabilities to the nation's leaders. It is critical that the two Services ensure their transformation processes are linked. Ensuring unity of effort throughout the transformation processes ensures that the Services will be far more effective and have greater combined capabilities for the Combatant Commanders. While both Services are moving toward greater effectiveness in executing assigned roles and missions, there may be disconnects in the two processes that could have strategic impacts. Finally, it is critical that the Services move toward fully joint cultures that enable unity of effort and thus increase the effectiveness of the American military as a whole.

**A Model for Effective Organization and Communication of Homeland Security Activity at the State Level**

Smith, Johnnie L; Mar 2007; 95 pp.; In English

Report No.(s): AD-A467395; No Copyright; Avail.: Defense Technical Information Center (DTIC)

This thesis is concerned with the optimal state organizational structure to achieve homeland security missions, particular in the state of Wisconsin. It will therefore first review the relevant literature in order to identify a core set of critical homeland security functions germane to states. Four organizational models, as represented by four case states, will be examined to determine which meet those critical functions, to what degree and with what demonstrable success. Wisconsin's current organizational structure for homeland security is evaluated in a gap analysis in that state's capabilities, and finally a set of policy and organizational recommendations are provided for Wisconsin and indeed other states attempting to meet these core critical functions to achieve an effective design for organizing and communicating state homeland security activities within a structure that provides a comprehensive response and a stable and unambiguous communications flow pattern.

**The Contribution of Command and Control to Unity of Effort**

Sproles, Noel; Sep 2002; 20 pp.; In English

Report No.(s): AD-A467488; No Copyright; Avail.: Defense Technical Information Center (DTIC)

While joint and multi-national operations are not a new phenomenon, achieving unity of effort in their conduct has generally proved elusive. Through much of history, whatever unity that had been achieved was the result of mutual cooperation between the commanders involved. Towards the end of the Great War it was becoming apparent that mutual cooperation alone was not sufficient and that a unified command system was needed. The Western Allies during World War II achieved levels of unified command that have probably not been exceeded since. This paper examines the function that command and control performs, through the medium of command arrangements, in achieving unity of command so as to attain unity of effort. By studying historical examples of joint and multi-national military operations, the importance of command

arrangements as a means to achieving unity of effort will be established. This leads to an approach not only for establishing the effectiveness of command arrangements, but of establishing the effectiveness of the other entities that are embraced by the umbrella term of 'Command and Control.'

**Defense Science Board 2006 Summer Study on Information Management for Net-Centric Operations. Volume 1: Main Report**

Schneider, Jr, William; Apr 2007; 120 pp.; In English

Report No.(s): AD-A467538; No Copyright; Avail.: Defense Technical Information Center (DTIC)

The task force addressed combat operations, information management, information assurance, and architecture requirements, as well as the architecture framework currently being pursued by the department. The task force examined the overall conceptual strategy for the system and the operational value of the proposed information network. Additionally, the task force assessed cost/risk trades and technical network issues such as bandwidth, quality of service, availability, security, integrity for all missions and users, and knowledge management -- all of which support the distribution of knowledge that will ultimately support the missions and users in making effective decisions. These considerations converged on the simple question of how to provide robust, useful information at all levels from decision-makers to tactical users. The task force focused on support of combat operations, as it was felt to be the most stressing application of the system, as opposed to, for example, business processes and administration. However, it was recognized that all these applications are intertwined and must be operated as a whole. The task force did not examine the protection of the nation's total information network. Although critically important, it was deemed outside the scope of this study. To set the context of the study, the task force addressed four operational scenarios: 1. Prevent and protect the USA against catastrophic attack. 2. Conduct large-scale counter-insurgency operations, including stabilization and reconstruction. 3. Conduct global distributed, small-scale operations, including counter-terrorism and humanitarian relief (such as Hurricane Katrina). 4. Enable large-scale operations against near-peer adversaries.

McCarthy, Jim; Kellog, Keith; Apr 2007; 81 pp.; In English

Report No.(s): AD-A467543; No Copyright; Avail.: Defense Technical Information Center (DTIC)

This report of the operations panel of the Information Management summer study served as the basis for the full summer study report sections that included warfighter assessments of needs and suggested improvements to enhance combat capabilities. The panel examined the operational value enabled by information networks. Particular attention was paid to emerging missions, counterinsurgency, counterterrorism, stabilization and reconstruction, and response to catastrophic disasters. The panel assessed the state of knowledge management for information networks. Additionally the panel focused on information discovery, sharing, collaboration, visualization, and storage for all missions and users. In addition, the elements of a Combat Information Capability (CIC) were developed and described. The panel's principal focus was on warfighter's needs as viewed through the eyes of those who experienced combat operations in both Iraq and Afghanistan. This perspective helped the study members appreciate the value of a CIC both as kludged in today's combat environment and desired for the future.

Report No.(s): AD-A467562; No Copyright; Avail.: Defense Technical Information Center (DTIC)

Command and Control (C2) is a commander's guidance of his/her forces (command) to accomplish a goal or mission while monitoring the directed movements (control). The U.S. Army Research Laboratory's (ARL) Battlespace Decision

Support Team (BDST) is exploring methods of evaluating the effectiveness of a commander's plan or course of action (COA). Part of our research involves the task of identifying metrics to rate a COA. We have modified the One Semi-Automated Forces (OneSAF) simulation to track direct fire hits and vehicle damage throughout simulated battles. One completed experiment ran a OneSAF scenario over 200 iterations and captured data. BDST will analyze the collected data to determine its utility in measuring COA effectiveness. Future applications of tools and techniques developed through this and other experiments will assist the commander as real-world battles unfold.

**Different Approaches for the Creation and Exploitation of 3D Urban Models**

Letourneau, Francois; Sep 2002; 16 pp.; In English; Original contains color illustrations

Report No.(s): AD-A467639; No Copyright; Avail.: Defense Technical Information Center (DTIC)

In this new defense era, military urban operations represent an important context of operation for defense agencies. Considering the complexity of urban environments, new tools and capabilities are required into command and control systems to address the complexity of conducting urban operations. Integrating a high fidelity 3D model of an urban scene into command and control systems is certainly of high interest for a better conduction of urban operations. The creation of 3D urban models represents a real challenge, considering that short time for the creation of the models and relative unavailability of detailed geospatial data are both important constraints. As each operations are unique, there is no one-unique-solution that can be applied. This is why RDDC Valcartier investigated different approaches during the last two years in order to define different 3D model creation work flows that apply to a broad range of requirements and situations. This paper is focusing mainly on the results we obtained during our project. Two experiences on the ground helped us to validate the utility of various models for different situations. Finally some technical and operational considerations will be presented for the optimal usage of 3D models within command and control systems.

**A System Design Archetype for C4ISR Systems of the 21st Century**

Reid, Darryn; Johnson, Wayne; Sep 2002; 17 pp.; In English; Original contains color illustrations

Report No.(s): AD-A467670; No Copyright; Avail.: Defense Technical Information Center (DTIC)

In this paper we discuss the difficult issue of how to reliably design and build systems that are fundamentally suited to interoperate with one another. Ideally, all these systems would be constructed using the proposed design principles, but the requirement to interoperate with legacy systems is also recognized. It is not a traditional systems engineering or technology based approach. Rather, a set of key design principles is enumerated. They are, (i) interoperability and system integration, (ii) decoupling of architecture layers, (iii) decoupling of system components. There is also an emphasis placed on a design methodology embodying these design principles, which allows a flexible system design that changes infrequently, and a system implementation that changes constantly. Together with other invariants, these principles are embodied in a highly abstract and widely applicable system design archetype. Populating this archetype further with application frameworks and specifications of components and their behaviors progressively produces more detailed designs. In particular, the archetype identifies core components for storing and conveying arbitrary information between application components, as well as components for managing the dissemination of information around the wide-area network. Using this approach, a system concept demonstrator has been developed that embodies a new approach to building C4ISR support systems, in particular with the aim of addressing the challenges of tactical land environment. This concept demonstrator is an aspect of a broader integrated programme in which advanced technology solutions are developed in conjunction with new tactics, training, procedures, and organizational structures, within particular environmental and operational contexts.

**Analysis and Classification of Traffic in Wireless Sensor Network**

Beng, Wang W; Mar 2007; 87 pp.; In English

Report No.(s): AD-A467755; No Copyright; Avail.: Defense Technical Information Center (DTIC)

Wireless sensor networks have been widely researched for use in both military and commercial applications. They are

especially of interest to the military planners as they can be deployed in hostile environments to collect vital information safely and cheaply. In view of this interest, there is a need to capture and categorize the data effectively under different operational conditions. This thesis captured traffic and data from sensor nodes to analyze and present characteristics of the traffic in a meaningful manner. Specifically, this thesis studied the traffic generated by wireless sensor networks by setting up two different commonly used network topologies, namely a direct connection to the base and a daisy-chain connection to base. A total of six runs of experiments were conducted, three for each topology. The data traffic between the nodes was captured over an extended duration of time. Using the captured information, analysis was performed to categorize and identify the information through anomalies and variations of traffic patterns. Data were also analyzed to study self-similarity and statistical distribution. The experimental results have shown that it is possible to differentiate the two different topologies by monitoring the traffic distribution or by analyzing the types of messages sent. The status of the nodes can also be determined with the traffic collected. Examples include new nodes joining the network and operational status of the nodes. Statistical analysis has also been done and found that wireless sensor network traffic is not self-similar except for the interarrival time of the direct connection mode.

**The Combined Aerospace Operations Center (CAOC) of the Future**

Phister, Paul; Plonisch, Igor; Humiston, Todd; Jun 2001; 11 pp.; In English; Original contains color illustrations  
Report No.(s): AD-A467820; No Copyright; Avail.: Defense Technical Information Center (DTIC)

The 'art of commanding aerospace power lies in integrating systems to produce the exact effects the nation needs.' Currently, information overload prevents C2 warriors from making operational decisions with precision and effect. The objective is to correct this and dominate the battlespace by making smarter decisions faster. Intelligent decision making will be enabled by awareness when and where it is needed, via an operationally superior information enterprise. This paper discusses a new Air Force Research Laboratory's Information Directorate initiative that combines prior work in areas such as Effects Based Operations, information fusion, decision support, mission training and enterprise defense. These efforts lay the groundwork so a Commander will receive the right information at the right time. This information will be displayed in a way to allow the Commander to do the right things, at the right time and in the right way. This paper discusses five applications built on JBI services that will fuse collected information to drive an 'effects based' operational solution along with the research and development efforts required to transform today's AOC into tomorrow's CAOC. Ultimately, the objective being to develop and field a capability using the Command and Control (C2) framework of Monitor, Assess, Plan and Execute.

**Global Broadcast Service Security Classification/Declassification Guide (SCG)**

Apr 29, 2007; 43 pp.; In English; Original contains color illustrations

Report No.(s): AD-A467825; No Copyright; Avail.: Defense Technical Information Center (DTIC)

The Global Broadcast Service (GBS) is an extension of the Global Information Grid (GIG) that provides worldwide, high capacity, one-way transmission of video, imagery, and other high-bandwidth information, via Transmit Suites (including Theater Injection Points (TIP's)) to Receive Suites, supporting the nation's command centers and joint combat forces in garrison, in transit, and deployed within global combat zones. It employs readily available satellite-based broadcast commercial technologies, which are relatively inexpensive and easily integrated into existing systems and processes. To this end, GBS currently uses broadcast payloads on three Ultra-High Frequency Follow-On (UFO) satellites and leased commercial satellite transponders as required. This SCG provides guidance for uniform security classification, declassification, management and protection of classified information for the Global Broadcast Service (GBS) Program and activities associated with its systems, plans, programs, projects and user information.

**Channel Hopping Multiple Access with Packet Trains for Ad Hoc Networks**

Tzamaloukas, Asimakis; Garcia-Luna-Aceves, J J; Jan 2000; 7 pp.; In English; Original contains color illustrations

Contract(s)/Grant(s): F30602-97-2-0338

Report No.(s): AD-A467852; No Copyright; Avail.: Defense Technical Information Center (DTIC)

We present a new medium-access control protocol for ad hoc networks that does not require carrier sensing or the preassignment of unique codes to nodes to ensure that intended receivers receive unicast, or multicast, or broadcast data packets without interference from hidden sources. We call this new protocol channel hopping access with trains (CHAT). CHAT combines the notion of packet trains with synchronous channel hopping to improve channel utilization. We compare CHAT against two of the most efficient protocols proposed to date based on the preassignment of codes (MACA-CT), or channel hopping with no predefined code assignment (CHMA) via simulations. The results show that CHAT provides considerable improvement in the throughput of an ad hoc network for unicast traffic, broadcast traffic and mixed traffic consisting of both unicast and broadcast transmissions. CHAT is applicable to ad hoc networks based on commercial off-the-shelf spread spectrum radios operating in unlicensed frequency bands.

**Making the Mix Work: Coalition C2 Interoperability during Recent Operations**

Ballard, John R; Jun 2001; 12 pp.; In English

Report No.(s): AD-A467855; No Copyright; Avail.: Defense Technical Information Center (DTIC)

This paper analyzes multinational command and control (C2) arrangements since the Second World War with an eye to understanding how such arrangements have been successful. In particular, it considers the development of command relations from developments in the European Theater during the Second World War to modern day crises. Operations DESERT SHIELD/STORM were clearly a watershed. Since 1990 operations in Somalia, and Haiti, and subsequent operations in Southwest Asia and Eastern Europe have taught us much about multinational C2. In some ways we have now rediscovered the tools that worked so well in 1944 and learned to apply them to a wider range of operations and participating nations.

**Command and Control Automation - MIP and MSC2 FOSC**

Bryant, Thomas E; Hartel, Robert; Jun 2001; 15 pp.; In English

Report No.(s): AD-A467878; No Copyright; Avail.: Defense Technical Information Center (DTIC)

The Multilateral Interoperability Program's work has been the a great leap forward in the coalition arena just as the Multi-Service Command And Control Flag Officer Steering Committee's work has been instrumental in bringing the Services together to discuss tactical interoperability and work to solve the hard problems. One of the most interesting aspects of these two undertakings has been the method of defining C2 requirements. The service tradition of working Service requirements first, then joint requirements, and finally multinational requirements is a long-standing sequential process that mimics the implementation process. Through these two efforts it is clear that this long practiced sequence is a questionable method for producing true interoperability.

**Finishing Together: Coalition End-State Development Since 1990**

Ballard, John R; Jun 2001; 14 pp.; In English

Report No.(s): AD-A467954; No Copyright; Avail.: Defense Technical Information Center (DTIC)

Since the end of the Cold War multinational structures have dominated operational level command and control during crisis response. A key factor in the effective execution of these operations was the development of consensus among the national desired end states for each contributing nation. Lessons learned from the attempts to find end state consensus for operations in Haiti, Somalia, Iraq, Bosnia, Kosovo and East Timor can aide significantly in the development of coming C2 arrangements, transition operations, future training opportunities and developing C2 doctrine. This paper also looks at the

strategic interoperability issues and policy dilemmas among different nations participating in recent operations and the methods those nations have used to cope with such C2 challenges. It offers an assessment of the level of consensus attained by multinational force commanders in their search for military end states. Several useful techniques provide a clear foundation for future improvement in this vital arena.

Report No.(s): AD-A468035; No Copyright; Avail.: Defense Technical Information Center (DTIC)

Simulation interfaces to Command, Control, Communications, Computers, Intelligence, Security, and Reconnaissance (C4ISR) systems are essential to support: Simulation Based Acquisition (SBA); the development of Doctrine, Tactics, Techniques, and Procedures (DTTP); Train as you fight; Embedded Training (both individual and collective); Course of Action Development and Analysis; Mission Planning and Rehearsal; and Execution Monitoring. Modeling and Simulation (M&S) systems have standardized on certain protocols and architectures for interoperability, such as the High Level Architecture (HLA). Within the Department of Defense (DoD), the C4ISR community is also moving to standardize on the Joint Technical Architecture (JTA) and the Defense Information Infrastructure Common Operating Environment (DII COE). These interoperability efforts, as well as efforts within the DoD and the international community to standardize message formats and develop common M&S and C4I data models may if the appropriate standards are identified and developed significantly enhance efforts to link M&S and C4ISR systems. However, a robust two-way dialog is required.

**Observation Uncertainty in Gaussian Sensor Networks**

Sarwate, Anand D; Jan 23, 2006; 87 pp.; In English

Report No.(s): AD-A468140; UCB/EECS-2006-3; No Copyright; Avail.: Defense Technical Information Center (DTIC)

The term 'sensor network' encompasses a wide range of engineering systems with dramatically different characteristics. We consider a specific class of sensor networks whose objective is to reconstruct a source at a central terminal. Our objective in this thesis is to quantify the asymptotic error in reconstructing the source as the number of data sources, sensors, and model complexity increases. We consider three types of estimation systems - unconstrained estimators for vector Gaussian sources that are allowed direct access to the sensor observations, estimators for discrete sources that receive information via rate constrained links from the sensors, and estimators for scalar Gaussians whose input is the output of a multiple-access channel. We first establish bounds on the optimal estimator performance of these networks using a centralized estimator with access to all of the sensor observations. We assume the observations are noisy linear functions of the source and are thus specified by a matrix. Because the asymptotic error depends only on the spectral properties of this matrix, we can use tools from matrix analysis to give bounds on the spectrum and error in terms of the entries of the matrix for a number of different scenarios. Finally, we look at the case where the matrix is partially unknown. In some cases we can estimate the matrix directly from the data and in others we must minimize the worst mismatch distortion.

**Digital C4I Interoperability: The EM Protection Issue**

Pfeffer, Robert; Oct 2000; 12 pp.; In English

Report No.(s): AD-A468325; No Copyright; Avail.: Defense Technical Information Center (DTIC)

In this paper, a unified protection methodology is applied to a digital mobile C4I platform subjected to several human-generated and nature-generated EM environments and effects. The unclassified values for self-induced electromagnetic interference (EMI), EM radiation (EMR), electrostatic discharge (ESD), near-strike lightning, and high-altitude EM pulse (HEMP) came from MIL-STD-464 and several commercial standards. By applying this methodology the EM protection requirements were estimated to be 70 dB enclosure port protection for frequencies between 100 MHz and 5 GHz, and 80 dB penetration port protection on the phone line for frequencies dependent upon the length of the phone line used. This EM protection strategy is both useful and cost effective to coalition forces, since validation testing and maintenance/surveillance testing to meet international standards reduce to simple, low-cost shield and penetration protection tests that can be conducted anywhere, even with the system operating. The application of this protection approach in the original system circuit design significantly reduces the number of breadboard and brassboard tests. Such protection also allows component replacement within the barrier, once the new component immunity level has been measured.

**Bone Conduction: Anatomy, Physiology, and Communication**

Henry, Paula; Letowski, Tomasz R; May 2007; 206 pp.; In English; Original contains color illustrations

Contract(s)/Grant(s): Proj-62716AH70

Report No.(s): AD-A468459; ARL-TR-4138; No Copyright; Avail.: Defense Technical Information Center (DTIC)

Humans hear through air and bone conduction pathways. Both pathways can be used to transmit sound to a listener and from a talker although traditionally, the air conduction pathway has been used. Communication through bone conduction is a feasible alternative to air conduction reception and transmission and provides benefits to the user that an air conduction system cannot provide. This report combines results of an extensive literature review of the anatomy and physiology of human hearing, theories behind the mechanisms of bone conduction transmission, devices for use in bone conduction transmission, and the use of the bone conduction pathway for communication. Bone conduction for the transmission of communication is effective and feasible for Soldiers because it provides a means of providing radio communication in combination with hearing protection devices.

**Hurricane Katrina: Lessons for Army Planning and Operations**

Davis, Lynn E; Rough, Jill; Cecchine, Gary; Gereben Schaefer, Agnes; Zeman, Laurinda L; Jan 2007; 104 pp.; In English

Contract(s)/Grant(s): W74V8H-06-C-0001

Report No.(s): AD-A468479; No Copyright; Avail.: Defense Technical Information Center (DTIC)

Hurricane Katrina was a catastrophic domestic emergency that, in its deaths and destruction, had many of the possible characteristics of future terrorist attacks, especially those that could occur simultaneously in different parts of the USA or

involve the use of weapons of mass destruction. It thus provides a case study that helps further our understanding of the problems that can arise during the nation's response to such an event. Such a case study will also help to determine how the USA might better prepare to respond to future catastrophic domestic emergencies. The efforts undertaken by civilian and military organizations in response to Hurricane Katrina were historically unprecedented. But, as the many 'lessons-learned' reports generated to date have documented, the response was tragically inadequate. Having researched what happened, the authors focused their analysis on the problems that affected the outcome of the response to Hurricane Katrina in a major way. The single most important problem was the speed with which the nation's local, state, and federal civilian organizations were overwhelmed. However, problems also were evident with the military response in the critical first few days of the disaster, problems that contributed to delays in evacuation and in accomplishing search and rescue operations throughout the storm-ravaged areas of Louisiana and Mississippi. The lessons-learned reports focus on the time it took for both the National Guard and active land forces to arrive in the region. Another problem in the military's response to Hurricane Katrina highlighted in the reports is the lack of a unified command and control (C2) structure, specifically the separation of the command structures for operations involving both National Guard and active-duty forces. The authors present recommendations for improving the Army's response to future catastrophic domestic emergencies.

**Time Synchronization in Wireless Sensor Networks**

Elson, Jeremy E; Jan 2003; 203 pp.; In English; Original contains color illustrations

Contract(s)/Grant(s): DABT63-99-1-0011; F33615-01-C-1906

Report No.(s): AD-A468557; No Copyright; Avail.: Defense Technical Information Center (DTIC)

Recent advances in miniaturization and low-cost, low-power design have led to active research in large-scale networks of small, wireless, low-power sensors and actuators. Time synchronization is a critical piece of infrastructure in any distributed system, but wireless sensor networks make particularly extensive use of synchronized time. Almost any form of sensor data fusion or coordinated actuation requires synchronized physical time for reasoning about events in the physical world. However, while the clock accuracy and precision requirements are often stricter in sensor networks than in traditional distributed systems, energy and channel constraints limit the resources available to meet these goals.

**Network Aware Tactical Collaborative Environments**

Bordetsky, Alex; Hutchins, Susan G; Bourakov, Eugene; Kemple, William G; Sep 2004; 61 pp.; In English; Original contains color illustrations

Report No.(s): AD-A466748; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA466748>

The implications of using mobile wireless communications are significant for emerging peer-to-peer (P2P) collaborative environments. From a networking perspective, the use of wireless technologies to support collaboration may impact bandwidth and spectrum utilization. This paper explores these network effects and describes an agent-based solution for providing feedback to system users regarding wireless P2P network behavior on the performance of collaboration support applications. We refer to this operational feedback as 'network awareness.' The underlying premise is that providing feedback on the status of the network will enable users to self-organize their behavior to maintain quality of data sharing. Results achieved during experiments conducted at the Naval Postgraduate School demonstrate significant effects of network behavior on application sharing performance and integration with client-server applications. A solution for improving network aware P2P collaboration, identified during the experiment, is discussed.

**Network Centric Warfare for Coalition Integrated Defense Against Terrorism**

Firkin, Eric C; McMahon, Margaret M; Sep 2004; 36 pp.; In English; Original contains color illustrations

Report No.(s): AD-A466526; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA466526>

The tragic events of 9-11, terrorist actions in Russia and the Philippines, along with cancellations of several international civilian air flights, have brought the world closer in forming an alliance pitting industrialized nations against less technically advanced, but extremely dedicated, international terrorists. The ability to operate as independent nations in this fight against loosely defined organizations requires a tightly netted collaboration of military and inter-governmental organizations working as a single entity, while maintaining some level of national independence. Through the use of a demonstrated Network-Centric Warfare (NCW) solution, called Tactical Component Network (TCN), countries exchange information among designated mission-centric groups with the distribution of data and its fidelity determined by the data's owner. TCN can use a local environment for small real-time operations or a global hub network that will integrate coalition partners in a shared network of sensors and intelligence information. TCN allows individual nations stove-piped systems to share data, common pictures, and intelligence information for any region of interest. The TCN architecture has successfully been demonstrated by the USA military in a variety of stressing applications. To facilitate the detection and neutralization of terrorists, this same infrastructure can support multi-national applications.

**Space Surveillance and Early Warning Radars: Buried Treasure for the Information Grid**

Satterthwaite, Charles P; Jun 2000; 13 pp.; In English; Original contains color illustrations

Report No.(s): AD-A468199; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA468199>

A major emphasis of the modern Air Force is to drastically improve the capability of the Global Information Grid, also called the Global Grid. It is believed that the realization of this capability will greatly enhance the Dynamic Aerospace Command's desire to be able to be Globally Aware, be able to Globally Engage its forces, and also be able to make Dynamic Decisions. The expectation of the Global Grid is that it will be able to provide accurate, secure, and timely information to our commanders anywhere, anytime, and in their specific information application requirement. A strong emphasis has been placed on the new technologies needed to achieve this capability. Many of the Defense Advanced Research Project Agency's (DARPA) new research priorities have been focused at improving interoperability, information assurance, information accessibility, and new space based information platforms to accommodate the evolving Global Grid. There is a resource for the Global Grid that should not be forgotten. That is the Nation's investment in Space Surveillance and Early Warning Ground

Based Radar Systems. These systems were originally built to keep a constant watch for the real threat of nuclear missile attack throughout the world. The strong requirements for these systems provided an enormous capability to monitor air and deep space activities.

**Quality of Service Behavioral Model From Event Trace Analysis**

Drummond, John; Berzins, Valdis; Kemple, William; Mikhail, Auguston; Chaki, Nabendu; Sep 2002; 17 pp.; In English Report No.(s): AD-A467762; No Copyright; Avail.: Defense Technical Information Center (DTIC)

The distributed command and control environment includes limited computer resources and numerous mission critical applications competing for these scarce resources. Additionally the stringent constraints and considerable complexity of distributed command & control systems can create a condition that places extreme demands upon the allocated resources and invites a potential for program errors. Consistent quality of service distribution can be a critical element in ensuring effective overall program completion while avoiding potential errors and process failures. The potential for errors and process failures can be understood and addressed by performing a practical analysis of the resource deployment procedures utilized within this environment. However, analyzing resource-based quality of service within a distributed command and control environment is a demanding endeavor. This difficult task can be simplified by directly examining specific quality of service actions that take place during program execution. Therefore, to pragmatically isolate these actions and develop a practical quality of service behavioral model, the research discussed in this paper has implemented an event trace approach to examine the exact quality of service execution path during program operation.

**Investigation of Complex Command, Control and Communications Decisionmaking under Sustained Operations**

Elliott, Linda R; Barnes, Christopher; Brown, Leroy; Fischer, Joe; Miller, James C; Dalrymple, Mathieu; Whitmore, Jeff; Cardenas, Rebecca; Sep 2002; 14 pp.; In English; Original contains color illustrations

Report No.(s): AD-A467659; No Copyright; Avail.: Defense Technical Information Center (DTIC)

In this paper we describe plans and initial progress in baseline investigations of fatigue on team performance in complex and operationally relevant task environments. Preliminary data collection used a PC-based analogue of command and control simulations. The platform was developed based on cognitive and functional analysis of C3 mission, tactics, team member roles, and role interdependencies. Tactical scenarios were developed to capture core team coordination, decision-making and problem-solving task demands. Issues regarding measures and scenario development are identified and discussed. Preliminary findings, indicating increased resistance to fatigue effects over time, are presented. Lessons learned are noted, along with plans for subsequent research.

**Critiquing: A Methodology to Extract C2 Expertise**

Miller, Janet E; Jun 2003; 35 pp.; In English; Original contains color illustrations

Report No.(s): AD-A467484; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA467484>

The higher a military person goes in the ranks, the sooner the transfer, meaning the commanders who make the highest level decisions have been in a particular assignment the shortest amount of time. To acquire and maintain the maximum level of efficiency and productivity as quickly as possible, the expertise of commanders must be understood so that appropriate decision support can be developed. Cognitive task analysis methods, including knowledge elicitation, can be applied to uncover the information about how a domain practitioner works. Such information on practitioner behavior provides valuable insight and data for incorporation into models used for training and development of automated support. However, knowledge elicitation methods face a number of challenges such as grounding in context, limited accessibility to experts and tasks, being labor intensive and time consuming, and difficulties with repeatability. In this study, a critiquing methodology was investigated in its ability to address these challenges. This baseline study involved a novice intelligence analyst performing a basic analysis

task. Then, six experts with various backgrounds critiqued the novice's process. The results suggest that the critiquing method addresses the challenges of knowledge elicitation methods and can be applied to understanding command and control.

**A Computer Tool for Modeling C4I Applications**

Guan, Luqi; Guan, Jennifer Z; Jun 2003; 34 pp.; In English; Original contains color illustrations

Contract(s)/Grant(s): 40473-MA-SP

Report No.(s): AD-A467483; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA467483>

The large-scale nature of C4I applications makes it difficult to formulate accessible requirements before putting lots of effort into development. Rapid modeling/prototyping has been proved to be efficient for requirement validation and verification by providing a mini scale software product. The latest updated software modeling/prototyping tool is an advanced tool for software prototyping and modeling via a unified graphical environment. To support complex requirement specification and elicitation, this tool is designed as a user centered modeling environment that represents requirements in multiple levels, supports project management, reduces modeling/prototyping effort, maintains model consistency and helps error prevention and elimination. This tool is demonstrated to be useful for modeling C4I applications.

**Pager Phones: Installation**

Apr. 1975; 15 pp.; In English

Contract(s)/Grant(s): SO144082

Report No.(s): PB2007-108769; No Copyright; Avail.: CASI: [A03](#), Hardcopy

The pager phones used in many underground coal mines are battery operated, party-line telephones with provisions for loudspeaker paging. The system is two-wire, non-polarized, and is operated by self-contained batteries. Many of the individual units are certified as permissible. Requirements for installation are specified in state and federal regulations, such as in the Code of Federal Regulations, Title 30, Mineral Resources, Part 75. The major federal regulations that affect communication in coal mines are noted below, with a brief description of the subject matter in each of the relevant paragraphs. Refer to the cited paragraphs of Title 30 for explicit details of these regulations. (This brief description is for reference purposes only.) (1) Minimum Requirements: (paragraphs 75.1600, 75.17 13-2, and 75.1003-1) Approved telephone or two-way communication will be provided between the surface and each main shaft landing and each working section; to the nearest medical assistance; and shall be protected from contact with trolley wires or trolley feeder wires. (2) Installation Requirements (paragraphs 75.5 16-2, 75.52 1, and 77.508-1 ) Communication wires will be supported on insulated hangers, attached to messenger cables, or buried, to protect against mechanical damage; installed opposite trolley wires; and insulated near power conductors... each cable will have lightning arresters within 100 feet of going below ground... and arresters will be provided wherever telephone wires enter a building. (3) Wire and Cable Requirements (paragraphs 75.5 16-2, 75.5 17, and 75.52 1) Communication cable means two or more insulated conductors, covered by an additional abrasion-resistant covering; power wires and cables shall

be adequately insulated and fully protected; and lightning arresters shall be connected to low-resistance grounds, more than 25 feet from neutral grounds. Arthur I3 Little Inc This technical bulletin is based on: the requirements of Title 30; installation practice recommended by equipment manufacturers; the experience of repair personnel; industrial telephone communication experience; and Rural Electrification Authority (REA) practices. A description of the many telephones available is included in the bulletin Introduction; the types of wire and cable to be used in these installations are described in the bulletin Cable Selection; and proper care and procedures for connecting and splicing the interconnecting cable are described in the bulletin Splices and Connections. The following text includes excerpts from those bulletins, to supplement the installation recommendations. Detailed information on each subject should be obtained from the individual technical bulletins.

**Pager Phones: Circuit Protection**

Jan. 1975; 9 pp.; In English

Contract(s)/Grant(s): SO144082

Report No.(s): PB2007-108768; No Copyright; Avail.: CASI: [A02](#), Hardcopy

Wires leading to or from underground facilities can develop hazardous voltages because of lightning exposure. The locations of many mine portals are particularly susceptible to lightning effects. The application of protective devices to limit this potential danger is necessary. Requirement: The Code of Federal Regulations, Title 30, Mineral Resources, Part 75, paragraph 75.52 1 identifies the requirement for lightning arrestors to be used on ungrounded, exposed power conductors and telephone wires. 'Each ungrounded, exposed power conductor and telephone wire that leads underground shall be equipped with suitable lightning arrestors of approved type within 100 feet of the point where the circuit enters the mine.' For telephone circuits, a wide range of protective devices are available. The public service telephone companies and Rural Electrification Authority have considerable experience with the problem. The current recommendation by these organizations for such installations is to use gas-tube protectors, operating with a well-designed and constructed grounding circuit. Although pager phones are d-c systems, with signals in the audio range, many installations have coupled RF (Radio Frequency) signals on the same cable that is used for the pager system. The telephones themselves are constructed with isolating circuits, so as not to disturb RF transmission. Lightning arrestors and protective circuits must also provide this same isolation and circuit integrity for the RF signals. Capacitive protective elements cannot be used for lightning protection of such circuits, as they would short out the RF signals. Lightning strokes, either cloud-to-cloud or cloud-to-ground, release tremendous energy. The voltage associated with cloud-to-earth lightning strokes is about 5 to 20 million Volts, but the danger is in the large amounts of energy developed by the fields induced in exterior cabling. Arrestor Connection: In early telephone installations, carbon blocks of 3 mil (0.003 inch) carbon were used as a protective breakdown device for phone circuits, but in the past ten years gas-tube devices have become more acceptable. When sufficient energy is developed between two circuits, such as a telephone line and ground reference, the protective device ionizes and provides a low-impedance path to ground, thus Arthur I3 Little, Inc keeping the hazardous voltage from reaching the remainder of the system.

**Technology Review of Smart Sensors with Wireless Networks for Applications in Hazardous Work Environments**

Sammarco, J. J.; Paddock, R.; Fries, E. F.; Karra, V. K.; Apr. 2007; 59 pp.; In English

Report No.(s): PB2007-108766; NIOSH-2007-114; NIOSH-IC-9496; No Copyright; Avail.: CASI: [A04](#), Hardcopy

Workers in hazardous environments such as mining are constantly exposed to the health and safety hazards of dynamic and unpredictable conditions. One approach to enable them to manage these hazards is to provide them with situational awareness: real-time data (environmental, physiological, and physical location data) obtained from wireless, wearable, smart sensor technologies deployed at the work area. The scope of this approach is limited to managing the hazards of the immediate work area for prevention purposes; it does not include technologies needed after a disaster. Three critical technologies emerge and converge to support this technical approach: smart-wearable sensors, wireless sensor networks, and low-power embedded computing. The major focus of this report is on smart sensors and wireless sensor networks. Wireless networks form the infrastructure to support the realization of situational awareness; therefore, there is a significant focus on wireless networks. Lastly, the 'Future Research' section pulls together the three critical technologies by proposing applications that are relevant to mining. The applications are injured miner (person-down) detection; a wireless, wearable remote viewer; and an ultrawide

band smart environment that enables localization and tracking of humans and resources. The smart environment could provide location data, physiological data, and communications (video, photos, graphical images, audio, and text messages).

**A Systematic Approach to Optimize Organizations Operating in Uncertain Environments: Design Methodology and Applications**

Levchuk, Yuri N; Levchuk, Georgiy M; Pattipati, Krishna R; Sep 2002; 23 pp.; In English; Original contains color illustrations

Contract(s)/Grant(s): N00014-00-1-0101

Report No.(s): AD-A467668; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA467668>

This paper presents a comprehensive methodology for solving diverse problems arising in performance optimization of organizations operating in uncertain environments. We introduce a technique to decompose a multi-dimensional organizational design problem into a series of coupled sub-problems whose iterative solution produces a near-optimal organizational structure, and decision processes. We illustrate our approach via an example to provide a step-by-step visualization of the modeling of complex and uncertain missions, and of synthesizing the concomitant organizations to optimize different sets of design objectives, while satisfying organizational constraints. Our methodology incorporates algorithms for optimizing the expected outcomes, collaborative organizational strategies, distributed resource utilization, mission processing schedule, and information management in an organization. The methodology serves as a valuable tool to address many practical problems arising in organizational design.

Report No.(s): AD-A467573; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA467573>

It is widely believed that whether we are talking about command and control teams, joint task forces or coalition forces, the 'organization' must be adaptive. Unanticipated changes in mission, rapidly evolving technologies, intelligent and changing opponents, and so forth have created a need to create forces that can respond rapidly, accurately and can readily adapt to new situations. Over the past decade, progress has been made in understanding the set of factors that enable adaptation. If the opposing force can be made less adaptive, more predictable, more consistent then it will be easier to contain or constrain their activity. Consequently, it may be important to mitigate the adaptivity of the opposing force in order to minimize the need for both adaptability and high performance. Thus, we turn the question on its head and ask, 'How can we inhibit adaptation?' This paper reviews the findings on what makes organization's adaptive and provides suggestions for how to inhibit adaptation. A number of lessons learned about how to inhibit adaptiveness are presented.

**Metrics for Command in an NEC Era: Operational Analysis of Way of Command in the Era of Network Enabled Capability**

Montgomery, John; Sep 2004; 33 pp.; In English; Original contains color illustrations

Report No.(s): AD-A466660; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA466660>

This paper considers the need for methods and metrics for analyzing the Command-related factors involved in delivering military operational benefits through better exploitation of information. It does this by considering where Command fits within the UK Network Enabled Capability (NEC) concept and where NEC impacts upon the Way (or style) of Command. There are a number of interdependent aspects of Command which have been discussed in various treatments of network-enabled military capability. This paper considers the key characteristics of, and relationships between, these factors and proposes a causal map which brings them together. The Command-related factors which have been considered are: decentralization, organizational culture, the impact of digitization and agility. Metrics and analysis methods have been identified to support analysis of the various entities and relationships which make up the 'Way of Command' causal map. The result is an analysis framework which can support methodical consideration of Way of Command in the era of NEC and which highlights a number of fundamental issues for study. This provides a starting point for an experimental campaign which weaves Command issues into the medium and long-term NEC roadmap.

**A Model of Tactical Battle Rhythm**

Duffy, LorRaine; Bordetsky, Alex; Bach, Eric; Blazeovich, Ryan; Oros, Carl; Jun 2004; 23 pp.; In English; Original contains color illustrations

Report No.(s): AD-A466128; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA466128>

The purpose of battle rhythm management is the maintenance of synchronized activity and process among distributed

warfighters. It is most critical in rapidly evolving situations or in highly distributed operations. Successful battle rhythm implies the synergism of procedures, processes, technologies, individual activities and collective actions at warfighter, staff level, command node, and unit levels in order to facilitate military operations. The concept is ubiquitous in daily military operations (particularly at the operational level of command), but little exists to define it at the tactical level or substantiate its existence in the experimental or analytical literature. There is a need to establish a common referent, a model of tactical battle rhythm, in order to discover the methods best suited to command and control it. If the battlefield has turned electronic, then so too must our methods for synchronizing the actions of thousands of warfighters. We propose that the judicious employment of collaborative technologies among distributed warfighters is one strategy for managing tactical battle rhythm. We assert that the increasing reliance on collaborative technologies will lead to successful management of tactical battle rhythm. However, we need a way to model the tactical battle rhythm in order to predict the most effective times to use collaborative tools. We propose a conceptual framework of tactical battle rhythm (TBR) and present a model of real world TBR in the context of a notional humanitarian assistance operation. The focus of our model is at the battalion/squadron/ combat/service support group level, in an attempt to explore the execution phase of warfighter activities, the activities that define the tactical level.

**Framework for Information Age Assessment Metrics**

Augustine, Thomas H; Broyles, James W; Jun 2004; 16 pp.; In English; Original contains color illustrations

Report No.(s): AD-A466046; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA466046>

This paper presents the insights of John Zachman, the father of Enterprise Architecture, as they have been applied to the development and assessment of C4ISR systems. All technologies that are relevant at the enterprise level are fundamentally rooted in the six primitive interrogatories and therefore can be evaluated by some or all of these metrics. Specifically this paper discusses an Information Age Framework for Assessment Metrics and relates its elements to the fundamental facets of a C4ISR enterprise architecture. In a spiral development process design and assessment are adjacent phases and both profit from this powerful intellectual construct. Both the strengths and weaknesses of a particular technology can be the stimulus for a successful integration that provides the capabilities that will satisfy the needs and goals of the users.

**Information Age Architectures Must Be Enterprise Architecture**

Augustine, Thomas H; Jun 2004; 18 pp.; In English; Original contains color illustrations

Report No.(s): AD-A466045; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA466045>

C2 will continue to be plagued by projects that overrun budgets, dissatisfy users, return poor performance, or result in

project termination until a critical mass of acquisition professionals understand what John Zachman calls Enterprise Physics. From his investigation of how other professions build complex things he was able to generalize the interaction of all these people into a simple schema. The people fit into a few common roles (planner, owner, designer, builder, and subcontractor). The columns are based on the six primitive interrogatories (who, what, when, where, why, and how). The framework is a powerful mechanism for resolving conflicts during project conception because each cell (role, interrogative pair) is unique. Uniqueness is very important precondition to successful requirements definition and requirements management. Uniqueness allows changes to be made without introducing conflicts that would otherwise arise from the same data variable's data value appearing in multiple locations and possibly holding multiple conflicting values. Uniqueness also allows efficient consistency checks which aid developing a complete set of requirements. These are fundamental relationships between the essential elements of an enterprise and the different organizational roles that are responsible for them. These relationships are not sufficient to guarantee success but if violated the chance for success is dramatically reduced. This paper what characterizes an Information Age architecture and why that architecture must be consistent with John Zachman's Enterprise Architecture Framework.

**Development of a Battlefield Management System: How to Use the User**

Vertegaal, Merel; Jun 2001; 15 pp.; In English; Original contains color illustrations

Report No.(s): AD-A467956; No Copyright; Avail.: Defense Technical Information Center (DTIC)

The Royal Netherlands Army (RNLA) is currently developing a demonstrator Battlefield Management System (BMS), which will support soldiers by displaying and distributing the available C2 information. Throughout the entire development of the BMS, the future military users play a very important role. There is frequent contact between users and developers and new versions of the BMS are presented to and evaluated by users every few months. The development consists of several cycles, while users are involved in nearly every step in each cycle. This leads to commitment of the user, because he notices that his comments are taken seriously and are usually implemented in the next version of the BMS. This user-centered approach has worked very well so far for both developers and military users. Several evaluations, in different settings and environments, have been conducted over the past two and a half years. This paper describes two of them in more detail, and also covers the user-centered approach that was taken in the development of the BMS. The paper explains the approach that was chosen by the RNLA, and discusses the advantages of this approach, as opposed to situations where users are not involved in the development of C2 systems.

**NDIA FORCEnet Study - Overview of the Human Element Group's Findings: Implications for C2 and other Aspects of NCW**

MacNulty, Christine A; Poirier, John A; Jun 2003; 32 pp.; In English; Original contains color illustrations

Report No.(s): AD-A467326; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA467326>

The National Defense Industrial Association, in a study sponsored by the Deputy Chief of Naval Operations for War fighting Requirements & Programs and the Commanding General of the Marine Corps Combat Development Command, spent a year investigating the critical technical, programmatic, organizational, and acquisition aspects of FORCEnet in order to develop a road map. One of the five study groups was focused on the Human Element. This paper provides an overview of that subgroup's findings covering everything from recruitment, selection, education, training and development of future warriors to changing ways of developing and assessing operational concepts, changing business processes and organizational structures, systems design and experimentation. This paper discusses the transformational aspects of FORCEnet and its contribution to Sea Power 21's enabling concepts, especially Sea Warrior, Sea Trial and Sea Enterprise, all from the Human Element perspective. Three key themes resulted from this investigation: 1. Equip the man, don't man the equipment 2. Humans decide, machines calculate, 3. We are moving from the human-in-the-loop to the human-as-the-loop.

The focus of the paper is required interaction of Command and Control (C2) applications and the tactical network on which they effectively operate. Command and control applications will always require communications capabilities. There are numerous examples of command and control applications that have been developed without adequate attention to the realities of tactical networks. The results of various tests and experimental efforts where tactical networks were characterized in operationally realistic environments are provided within the discussion. Connectivity, latency, and throughput related data is presented to make a case that tactical communications cannot now, and will never likely, achieve wired communications capabilities. In fact, these environments perform significantly below the levels achievable on a wired network. As such, C2 applications must accommodate the anticipated performance characteristics associated with tactical networks in order to meet the required C2 capabilities, current and emerging, of the war fighters. Since these applications are dependant on the tactical communications, the development process must address the integration of these applications into the total operational architecture. Integration implies not only the sharing of common resources but also the resolution of compatibility issues, such as those discussed in this paper. Integration is not easily or inexpensively achieved after the fact, therefore must be addressed early in the application design process. Performance characteristics for the networks tested in the referenced efforts are provided as extrapolations to the anticipated tactical networks of the future. The relevant C2 test bed configurations are also discussed enabling C2 application development in wired environments, while simulating reasonable tactical network connectivity.

**'How Much is a Pound of C4ISR Worth?' An Assessment methodology to Evolve Network Centric Measures and Metrics for Application to FORCENet**

Poirier, John A; Bates, Edgar; Tempestilli, Mark; Jun 2003; 52 pp.; In English; Original contains color illustrations

Report No.(s): AD-A467289; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA467289>

This paper offers a foundation for an assessment framework involving C4ISR processes in FORCENet. It collects and expands upon work done by a number of organizations engaged in efforts to structure a process that links traditional and evolved C4ISR attributes, measures, and metrics to network centric outcomes including work being done in support of the Office of Force Transformation and the office of the Assistant Secretary of Defense for Networks, and Information Integration (ASD (NI2)). Using a capabilities based approach to analysis, metrics are recommended and developed to measure organizational performance. Performance improvements such as increased responsiveness and efficiency are measured in the context of Situation Awareness (SA), in a form consistent with the framework of a Capability Maturity Model. This paper offers five levels of Shared Situational Awareness that can provide the basis for assessing an organization in a specific domain relevant to FORCENet. These resources are intended to guide an organization in implementing a series of increasingly sophisticated practices and activities that can have a significant impact on individual, team, unit, and organizational performance.

**Methodology for Rapid Development of C2 Planning Systems**

Kelsey, Sheena; Snell, Simon; Jun 2003; 28 pp.; In English; Original contains color illustrations

Report No.(s): AD-A466925; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA466925>

This paper proposes a methodology for rapid development of computer systems that offers benefits for the rapid and accurate elicitation and definition of user and system requirements. It also aids user acceptance and can reduce procurement time scales. The development of a successful planning system depends on a user-developer link where final user requirements can be developed through an adaptive process of learning and evolution. The methodology QinetiQ have developed is based on iterative and interactive 2 way links between User and System, User and Designer and between System and Designer. This

middle-out approach relies on the quick delivery of an initial system to which users can respond and thus clarify what they really need. This is known as rapid prototyping or Rapid Application Development (RAD). The refined method called Parallel Rapid Application Development has been developed in response to Urgent Operational Requirements (UOR). This involves designing and building an initial system using the methods detailed above but in a very short and concentrated time scale. This system is then fielded and further requirements are developed in response to information from the field. The system is updated and a new version sent to fielded system via secure email.

This paper formalizes evolution of C4I systems via a relational hypergraph model with primary- input- driven and secondary-input-driven dependencies. The evolution of C4I system is modeled by a multidimensional architecture containing successive software evolution steps and related software evolution components. We analyze a domain-specific software development architecture and give a standard software evolution process in developing a prototype system as well as a production software system. This model is applied in several real-time prototyping systems especially for Command and Control applications.

#### **The Synergic Integrated Concepts of C2S**

Lukas, Ludek; Tomecek, Petr; Hruza, Petr; Sep 2004; 20 pp.; In English; Original contains color illustrations

Report No.(s): AD-A466868; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA466868>

One of the features determining the strength of troops is command and control. The quality of command and control is determined by the quality of the command and control systems (C2S). To improve a C2S, it is necessary to define its basic concept a synergic integrated concept of C2S. The synergic integrated concept (SIC) of C2S defines its basic idea, rules and principles. By its employment we considerably improve C2S functionality. The synergic integrated concept is defined for a certain part or layer of C2S. To apply this SIC we improve the functions and order of this part, we improve its systemisation level. The C2 information support is improved as well. The basic synergic integrated concepts of C2S are battlefield digitalization and Network Centric Warfare.

Radar is an important sensor characterized by day/night all-weather operation capability. A key-feature of radar is the ability of reconnaissance, surveillance of a wide area with target acquisition (RSTA). In addition it offers the potential of moving target detection via Doppler discrimination, and target classification via imaging (SAR or ISAR) or polarimetric and other techniques. New developments on radar technology has improved the performance on several fields, e.g. on electronic countermeasures (ECM). This terrain has been addressed with adaptive processing, low sidelobe antennas, and mainlobe cancellation techniques. The increasing capabilities of coherent, programmable sources, digital signal processing, and computing have allowed implementation of hardware and algorithms for improving the overall performance. Low frequency foliage penetration (FOPEN) systems take advantage of programmable sources to reduce interference to other electronic equipment in the VHF and UHF bands. Advanced signal processing and capable computers are key in FOPEN SAR, UWB target detection and recognition, bistatic systems for counter-stealth, and STAP for MTI in moving radar platforms. Advances

in target recognition remain key for reduction of fratricide. This improvement has been provided by increased microwave and digital-processing components.

**Very High Resolution SAR and Multichannel SAR/MTI**

Berens, Patrick; Advanced Radar Signal and Data Processing; September 2006, pp. 8-1 - 8-14; In English; See also [20070028853](#); Original contains color and black and white illustrations; Copyright; Avail.: CASI: [A03](#), Hardcopy; Available from CASI on CD-ROM only as part of the entire parent document

SAR is widely used today in earth observation and is a potential means for military surveillance. However, systems only operating in the basic SAR mode will be superseded by new developments which fulfill much more user demands. Highest resolution in flight direction combined with a far range operation cannot be reached in stripmap mode. The spotlight mode has to be implemented demanding for special capabilities of the hardware and the data processing chain. To achieve a fine resolution in range direction, transmit signals with very large bandwidth have to be used. Technological imitations force the developers to implement new strategies to acquire the necessary bandwidth. Multichannel SAR systems offer great advantages compared to the conventional ones. Depending on the antenna configuration such systems allow to measure the height of image pixels or to detect moving objects in the illuminated scene.

In many engineering applications, including surveillance, guidance, or navigation, single stand-alone sensors or sensor networks are used for collecting information on time varying quantities of interest, such as kinematical characteristics and measured attributes of moving or stationary objects of interest (e.g. maneuvering air targets, ground moving vehicles, or stationary movers such as a rotating antennas). More strictly speaking, in these applications the state vectors of stochastically moving objects are to be estimated from a series of sensor data sets, also called scans or data frames. The individual measurements are produced by the sensors at discrete instants of time, being referred to as scan or frame time, target revisit time, or data innovation time. These output data (sensor reports, observations, returns, hits, plots) typically result from complex estimation procedures themselves characterizing particular waveform parameters of the received sensor signals (signal processing). In case of moving point-source objects or small extended objects, i.e. typical radar targets, often relatively simple statistical models can be derived from basic physical laws describing their temporal behavior and thus defining the underlying dynamical system. In addition, appropriate sensor models are available or can be constructed, which characterize the statistical properties of the produced sensor data sufficiently correct. As an introduction to target tracking and data fusion applications characteristic problems occurring in typical radar applications are presented; key ideas relevant for their solution are discussed.

**Introduction to Synthetic Aperture Radar (SAR)**

Berens, Patrick; Advanced Radar Signal and Data Processing; September 2006, pp. 3-1 - 3-14; In English; See also [20070028853](#); Copyright; Avail.: CASI: [A03](#), Hardcopy; Available from CASI on CD-ROM only as part of the entire parent document

The synthetic aperture radar principle has been discovered in the early 50th. Since then, a rapid development took place all over the world and a couple of air- and space-borne systems are operational today. Progress made in technology and digital signal processing lead to very flexible systems useful for military and civilian applications. Radar has proved to be valuable before, because of its day-and-night capability and the possibility to penetrate clouds and rain. Optical instruments however

had great advantages in the interpretation of depicted objects. The great wavelength of radar signals limits the achievable resolution in cross range direction of real aperture radar systems. Thus, imaging cannot be realized using static radar systems. The idea of SAR was to transmit pulses and store the scene echoes along a synthetic aperture (i.e. the path of the SAR sensor) and to combine the echoes afterwards by the application of an appropriate focussing algorithm. The combination is carried out coherently. As we will see, it is quite easy to understand the basic idea of SAR. We will show also the hardware concept of a SAR system and give an idea for a processing algorithm.

### **Bi- and Multistatic Radar**

Johnsen, Terje; Olsen, Karl Erik; Advanced Radar Signal and Data Processing; September 2006, pp. 4-1 - 4-34; In English; See also [20070028853](#); Original contains color illustrations; Copyright; Avail.: CASI: [A03](#), Hardcopy; Available from CASI on CD-ROM only as part of the entire parent document

Bi- and multistatic radar are expected to benefit from their separation of transmitter and receiver that denies receiver recognition by ARM, favours covered operation by their silent receivers, has higher detection possibilities of stealthy objects and is less vulnerable to jamming. The requirements of synchronisation in a separated transmitter-receiver system are discussed. The processing in bistatic radar must include the knowledge of geometry dependencies that exist for bistatic radar in range, Doppler and S/N ratio. Different track profiles relative to bistatic radar orientation and their range-Doppler relationships are presented together with examples from the processing in different types of bi- and multistatic radar. The extraction of target parameters, such as position, velocity and heading could require the combination of data as a function of time and/or contribution from several systems. A discussion of tracking in bi- and multistatic radar is included to the end that uses simulated input to estimate parameters with comparison of different methods of estimating measurement uncertainty and the use of bistatic or multistatic radar input data.

**Design and Evaluation of a Virtual Quadrant Receiver for 4-ary Pulse Position Modulation/Optical Code Division Multiple Access (4-ary PPM/O-CDMA)**

Mendez, A. J.; Hernandez, V. J.; Gagliardi, R. M.; Bennett, C. V.; Jan. 03, 2007; 8 pp.; In English  
Report No.(s): DE2007-902287; UCRL-CONF-227043; No Copyright; Avail.: National Technical Information Service (NTIS)

M-ary pulse position modulation (M-ary PPM) is an alternative to on-off-keying (OOK) that transmits multiple bits as a single symbol occupying a frame of M slots. PPM does not require thresholding as in OOK signaling, instead performing a comparison test among all slots in a frame to make the slot decision. Combining PPM with optical code division multiple

access (PPM/O-CDMA) adds the benefit of supporting multiple concurrent, asynchronous bursty PPM users. While the advantages of PPM/O-CDMA are well known, implementing a receiver that performs the comparison test can be difficult. This paper describes the design of a novel array receiver for M-ary PPM/O-CDMA ( $M = 4$ ) where the received signal is mapped onto an xy-plane whose quadrants define the PPM slot decision by means of an associated control law. The receiver does not require buffering or nonlinear operations. In this paper we describe a planar lightwave circuit (PLCs) implementation of the receiver. We give detailed numerical simulations that test the concept and investigate the effects of multi-access interference (MAI) and optical beat interference (OBI) on the slot decisions. These simulations provide guidelines for subsequent experimental measurements that will be described.

**Cost-Effective Strategies for Communicating with Remote Surveillance Stations: A Summary**

Chiu, Y. C.; Haas, C.; Logman, H.; Chiu, M. N.; Sunkara, A.; Oct. 2003; 4 pp.; In English

Report No.(s): PB2007-110186; CTR-0-4449-S; No Copyright; Avail.: CASI: [A01](#), Hardcopy

The researchers accomplished the following research activities during the 2003-2004 research period: (1) Documented the state-of-the-practice and past experience in deploying wireless communication system configurations, identified deficiency of current practice, and surveyed commonly encountered issues in technology acquisition by TxDOT engineers. Surveyed traffic operation applications involving wireless communication technologies include ITS applications, highway surveillance and traffic monitoring, portable traffic management systems, rural work zone management, etc. Engineers also expressed the need for an institutional effort to establish a knowledge management system that helps accumulate and share information, as well as advances in technological expertise. (2) Surveyed prevalent and emerging wireline and wireless technologies and investigated future impacts of wireless technology to traffic operation and ITS applications. The reviewed technologies include 802.11, 802.16, General Radio Packet Service, Multi-Code Direct Sequence Spectrum, Wide-Band Orthogonal Frequency Division Multiplexing, Multi-Hopping Technology, etc. The survey also included national service providers and regional service providers in Texas. Vendors and contractors who expressed interest in providing services to TxDOT were also interviewed and are listed. (3) Developed a life-cycle cost-and-risk analysis approach to characterize available communication technology choices and configurations, and analyze how they can be applied to various traffic operations applications. A particular methodology was developed to assist in the choosing cost-effective and minimal-risk communication technologies and configurations given the operational requirements and decision objectives. (4) Designed and implemented a web-based knowledge management system (WBKMS) not only to compile and document all the research findings, but also to facilitate the formation, accumulation, and advancement of institutional knowledge in wireless technologies among TxDOT engineers.

**Method for Constructing Antennas from Textile Fabrics and Components**

Deaett, M. A., Inventor; Weedon, W. H., Inventor; 28 Mar. 05; 10 pp.; In English

Contract(s)/Grant(s): DAAH01-02-C-R128; DMH01-03-C-R200

Patent Info.: Filed 28 Mar. 05; US-Patent-Appl-SN-11-090 598

Report No.(s): PB2007-108624; No Copyright; Avail.: CASI: [A02](#), Hardcopy

Antennas are fabricated using fabric substrates, and, in some embodiments, known stitching techniques to fabricate the conductive members required, including connecting wiring and radiating and/or receiving elements. In one embodiment, one or more 'patch antennas', that is, planar radiating and/or receiving elements, are connected to transmitting and/or receiving electronics by means of a connector and feed line structure. The antenna structure comprises multiple layers of fabric, some of which may contain patch antenna and/or feedline patterns made of conductive fabric, made by embroidery using conductive thread or yarn, or onto which patch antennas may be bonded. A ground plane layer may be fabricated similarly. Between the fabric layers containing the conductive patterns, there are one or more layers of insulating fabrics that separate the conductive fabric layers by a dielectric layer. Additional sheets of adhesive between the fabric layers may be used to attach the fabric layers. Alternatively, stitching of insulating thread can be used to attach the multiple fabric layers together. Conductive thread may be used where a connection is desired, that is, the microwave antenna may include a 'via' (an interlayer electrical connection) of conductive thread sewn through insulating fabric layers to connect one or more conductive components, typically of conductive fabric. The antenna may be flexible, so as to be used on clothing and the like, or may be impregnated with a curable resin, for forming a rigid structure for incorporation into a larger structure.

**Pilot Study: Parasitic and Passive Radar**

Ulander, L. M.; Andersson, B.; Bjoerklund, S.; Follo, P.; Froelind, P. O.; Sep. 2006; 52 pp.; In Swedish

Report No.(s): PB2007-106493; FOI-R-2015-SE; No Copyright; Avail.: National Technical Information Service (NTIS)

The report describes principles and potential applications of PPR (parasitic and passive radar) PPR is a passive technology which-in contrast to traditional radar-is based on using non-cooperative transmitters (e.g. radar-, TV-, or radio transmitters) as illuminators, wideband receivers, and advanced signal processing methods in order to extract target information. PPR may be combined with electronic support measures (ESM) in an integrated passive sensor system. ESM would contribute several critical functions such as detection, classification and positioning of transmitters. Advantages of PPR include generating all-weather target maps without revealing its presence, without needing a transmission license, and with a lower cost per unit. Disadvantages are that the technology is more complex than traditional radar and uncertainties regarding the availability of suitable transmitters. Important potential applications of PPR include air surveillance for anti-aircraft units, sea surveillance for submarines and surface vessels, and ground situation picture for army units. Civilian applications are also possible (e.g. traffic monitoring and covert police surveillance). Examples of suitable transmitters are given in the report and important research questions are identified, e.g. suppression of the direct path signal, positioning of transmitters, and clutter suppression using PPR in combination with SAR ('synthetic aperture radar') and GMTI ('ground moving target indication'). There are only a few operational PPR-systems today and the technology is often classified. A literature search has been performed which indicates that PPR-related research has increased during recent years.

**US/UK Sensor-To-Shooter Multinational C4 Interoperability Study Force-On-Force Effectiveness Methodology**

Bailey, Timothy J; Oct 2000; 29 pp.; In English; Original contains color illustrations

Report No.(s): AD-A468602; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA468602>

This paper documents the simulation-based methodology currently being used by the US Army TRADOC Analysis Center

(TRAC) to measure the effects on overall combat effectiveness of command and control, communications, computers, intelligence, surveillance, and reconnaissance (C4ISR) systems and architectures and their interoperability among joint and multinational forces. This methodology has been successfully applied to Army, joint, and multinational studies. The latest of these studies, the US/UK Sensor-To-Shooter Multinational C4 Interoperability Study Force-On-Force Analysis, was an effort to measure the value (in terms of force-on-force combat effectiveness) of enhancing the interoperability between US and UK forces. This paper presents the results of this US/UK study, as a case study, to illustrate the capabilities of this methodology. The overall objective of the US/UK study was to develop a multinational US/UK system and operational architecture that applies to fixed-wing (FW) and call-for-fire (CFF) precision engagements and to decisive maneuver operations. The purpose of the TRAC portion of the study was to provide a force-on-force analysis to the US Joint Staff, so they could make multinational interoperability recommendations to the US Joint Requirements Oversight Council and the UK Ministry of Defense. This paper focuses on the operational-level, force-on-force analysis of the alternative US/UK interoperability architectures for the FW/CFF portion of the study.

**A Conceptual Operational Model for Command and Control of International Missions in the Canadian Forces**

Cochran, Larry; Wheaton, Kendall; Sep 2002; 19 pp.; In English; Original contains color illustrations

Report No.(s): AD-A468699; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA468699>

Defence Research and Development Canada-Valcartier has sponsored the development of a Conceptual Operational Model of the strategic planning process within the Canadian Forces Joint Staff. This model is intended to convey an understanding of the processes within the headquarters for planning and monitoring international missions. As such, it captures the command and control processes at the strategic level of the Department of National Defence. The objective was to construct an IDEF process model. An IDEF model is, however, a rather abstract representation and is not easily interpreted by itself. Therefore, the process adopted was to apply the information from surveying the Joint Staff in constructing three different views that contribute to the construction of an IDEF model. The first step was a simple context model that shows a single process (Plan development) and the primary interfaces with that process. The context diagram was supplemented with an activity diagram that breaks the process down into discrete activities and allocates those activities to the organizational elements. The third view constructed was a hierarchical view of the activities that provides a structured and more detailed breakdown of the activities. The three views of the planning process provide most of the information, in an easily understood form, that can be applied to the construction of an IDEF model. The model describes the process activities, objects, and attributes necessary to enable an evaluation of the headquarters process. The model enables the identification of target organizational cells for which new tools may be offered to improve the effectiveness of specific activities, such as mission planning, or to improve the quality of the products of those activities. The Conceptual Operational Model is the first step in the development of new support tools specifically in the domain of situation awareness and strategic planning.

**Foreign Policy Effects on Strategic Communications and the Ability to Influence**

Roth, Robert M; May 17, 2007; 67 pp.; In English; Original contains color illustrations

Report No.(s): AD-A468761; JFSC-25789; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA468761>

This paper provides an analytical analysis of how the USA Government conducted strategic communications from post World War II until the end of the Cold War with the former Soviet Union. In the post Cold War environment, the paper continues to analyze how the U.S. Government conducted strategic communications into the 21st Century without an executive agency to lead this very important form of national power. The discussion leads to an understanding of how deeds and words are inseparable when communicating with the global community, and how policymakers must understand the perceptions of the global community in order to develop effective policies that serve the mutual interests of the U.S. and the region for which the policy is intended. Regardless of the message we try to send, our deeds must match our words in order to communicate and ultimately influence the global community through dialogue. However, with the deactivation of the U.S. Information Agency the leaders in the United States have all but lost their ability to communicate with the international public. As a result, the U.S. fails to lead the global community as the champion of human rights in the struggle against militant

religious extremism. This has resulted in the loss of a critical vulnerability within the U.S. Government at a time when the U.S. is attempting to fight an enemy whose base of support is primarily ideological. The paper concludes with a discussion and recommendation on how better to organize and use Informational Power within the U.S. Government.

ONLINE: <http://hdl.handle.net/100.2/ADA468842>

This paper focuses on the USA's need to adapt its strategic communication strategy (themes, goals, and organization) in fighting the Global War on Terrorism - GWOT. While addressing the USA Army War College on 27 March 2006, former Defense Secretary Donald Rumsfeld said the country is faring poorly in its effort to counter ideological support for terrorism, in part because the government does not communicate effectively. 'If I were grading I would say we probably deserve a 'D' or a 'D-plus' as a country as to how well we're doing in the battle of ideas that's taking place in the world today.' To support this position, this paper first examines the radical ideology of our enemy plus the means and effectiveness with which that ideology is communicated. It then evaluates the strategic communication strategies employed by the Bush administration from September 11, 2001 through the end of 2006. Because we can learn from the past, it presents successful communication themes and strategies focusing on World War II and the early years of the Cold War. This paper concludes by offering recommended strategies our leaders should consider in order to win the battle of ideas.

**Solving Wireless Communications Interoperability Problems among Emergency First Responders Depends on Greater National Guard Involvement**

McFarland, Blair J; May 17, 2007; 70 pp.; In English; Original contains color illustrations

Report No.(s): AD-A468867; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA468867>

Interoperable first responder wireless communications are a key strategic requirement for effectively and efficiently responding to and recovering from man-made and natural disasters. 'Communications -- particularly wireless communications -- are the critical enabler of all other functions in any disaster relief operation.' Recent major events provide terrible examples of the unnecessary loss of lives and severe confusion in which lack of interoperability played a significant role. These events resulted in renewed efforts from all levels of national government to fix the interoperability problem. The breadth and complexity of the problem resulted in numerous recommendations to improve interoperability for first responders. The most successful of these initiatives are not top-down federal approaches. Rather, they result from local and state personnel driving the solutions that work in local incidents as well as in larger emergencies. An effective national strategy for improving first responder wireless communications interoperability depends on greater involvement of the National Guard. This requires greater emphasis on the National Guard's role in proactively interfacing with local first responders to better understand the current state of the dynamic communications environment. A National Guard situation awareness cell at each JFHQ-State that is focused on first responder wireless communications interoperability within the state is key to improving emergency response during the next national crisis.

The development of Network Centric Warfare and the rapid infusion of emergent technologies create enormous potential

for the USA Army along with some tremendous challenges. Rapid fielding and integration of technological advancements in communication and information platforms provide strategic leaders with a plethora of information in near real time. The synchronization of these platforms with other battlefield systems produces a lethal capability on the battlefield. However, the rapid production and abundance of information places a tremendous demand on the strategic leader's decision cycle and soldier execution of mission. This paper will describe these systems and analyze the challenges of employing information technology and network centric warfare for strategic leaders.

ONLINE: <http://hdl.handle.net/100.2/ADA469028>

Hurricane Katrina response operations revealed that command, control, coordination, and cooperation (C4) between Title 10 and Title 32 forces needed improvement. The lack of effective C4 between Title 10 and Title 32 resulted in duplicate effort and less than optimal use of critical resources. Through the use of the Emergency Management Assistance Compact (EMAC), more than 456,000 National Guard soldiers, airmen, and their equipment from all states are available to support emergency operations. However, large scale and sustained operations that would be required in the response to an Incidence of National Significance (INS) or catastrophic event require a more systematic approach. This paper will define an appropriate C4 relationship between, USNORTHCOM, The National Guard Bureau (NGB), and The States Governors/State Adjutants General in time of INC or Catastrophic event.

Report No.(s): AD-A469151; AFIT/GE/ENG/07-15; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA469151>

This thesis presents a distributed fault-tolerant routing protocol (EFDCB) for QoS supporting hybrid mobile ad hoc networks with the aim of mitigating QoS disruption time when network failures occur. The experimental design presented in this thesis describes 22 experiments aimed at illustrating EFDCB's ability to handle fault-tolerance. The interpreted results show that EFDCB excels over a global rerouting protocol at this challenge which is the goal of this work.

Report No.(s): AD-A469171; AFIT/GCS/ENG/07-09; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA469171>

Military communications has always been an important factor in military victory and will surely play an important part in future combat. In modern warfare, military units are usually deployed without existing network infrastructure. The IP routing protocol, designed for hierarchical networks cannot easily be applied in military networks due to the dynamic topology expected in military environments. Mobile ad-hoc networks (MANETs) represent an appropriate network for small military networks. But, most ad-hoc routing protocols suffer from the problem of scalability for large networks. Hierarchical routing schemes based on the IP address structure are more scalable than ad-hoc routing but are not flexible for a network with very dynamic topology. This research seeks a compromise between the two; a hybrid routing structure which combines mobile ad-hoc network routing with hierarchical network routing using pre-planned knowledge about where the various military units will be located and probable connections available. This research evaluates the performance of the hybrid routing and compares that routing with a flat ad-hoc routing protocol, namely the Ad-hoc On-demand Distance Vector (AODV) routing protocol with respect to goodput ratio, packet end-to-end delay, and routing packet overhead. It shows that hybrid routing

generates lower routing control overhead, better goodput ratio, and lower end-to-end packet delay than AODV routing protocol in situations where some a-priori knowledge is available.

**Guidebook for Selecting Cost-Effective Wireless Communication Technologies for Intelligent Transportation Systems**

Chiu, Y. C.; Logman, H.; Chiu, M. N.; Sunkara, A.; Haas, C.; Mar. 2005; 108 pp.; In English

Report No.(s): PB2007-110193; No Copyright; Avail.: National Technical Information Service (NTIS)

The advances of modern communication technologies have changed the way the roadway information is collected. Innovative surveillance systems powered by various communication technologies have been installed to support various transportation operations. The abundance of available communication technologies and multiple available communication system configurations presents overwhelming challenges for traffic engineers in selecting proper communication technologies for users of various traffic operation and ITS applications. The objective of this research is to propose an effective approach to characterize available communication technology choices, and analyze how they can be applied to various traffic operations. Of particular interest is the development of a guidebook to facilitate the decision-making in choosing appropriate communication technology given the operational requirements and decision objectives. Because of the fast-paced developments in communication technologies, a web-based Knowledge Management System that enables on-line learning of applications vs. communication technology choices, as well as continual updates of the technology choice set, has been developed to ensure the continual usability of this research product.

**Coalition Information Sharing: Lessons from Kosovo**

Wentz, Larry K; Oct 2000; 26 pp.; In English; Original contains color illustrations

Report No.(s): AD-A468900; XD-OASD/C3I; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA468900>

Increased civil-military involvement in peacekeeping and humanitarian operations around the world is matched in part by the rise in the number and complexity of these situations. There are many more actors on today's peace operations battlefield with competing as well as common interests and expectations. The need to improve coordination and more open information sharing is on the rise. Efforts to improve and facilitate more open information sharing among the disparate participants must overcome a continuing lack of trust among the civil-military actors and outdated organization cultural traditions and behavior patterns. All actors need to better understand each other and the roles they can and should play in an increasingly complex operational environment. In order to obtain closure and improve information sharing in the future, the actors must develop relationships based on mutual trust and there must be a clear understanding that information sharing operates on a two-way, transparent basis. Since no two operations are really the same, one should be careful not to generalize too much on experiences and lessons learned. Each experience is different but lessons from previous operations can place the community on a higher level of awareness and facilitate the tailoring of actions to meet the needs of the new operation. The Balkans is certainly an example of this. Kosovo was not Bosnia for a number of reasons and therefore, although many things have been learned in the Bosnia operation not all lessons are directly applicable to the challenges of Kosovo. For example, despite extensive Bosnia experience, civil-military information sharing in the Kosovo operation was problematic. Although some progress has been made through local collaborative initiatives, there is still a ways to go to meet expectations. Experiences such as the Balkans are highlighting the urgency to improve and this coupled with the information technology revolution offers a means to an end.

ONLINE: <http://hdl.handle.net/100.2/ADA466111>

This report was developed under a SBIR contract. This paper presents an approach to predictive control and prognostication intended to increase the confidence levels for power converters in aerospace applications. One goal of this work is to accelerate the adoption of new technologies, such as advanced power semiconductor devices. While the devices are immature the technology provides significant overall performance advantages. Using prognostication it is hoped to significantly increase the confidence levels for successful mission completion and so overcome reservations about adopting these new technologies. The methodology uses predictive modeling and simple, robust, sensing, attempting to avoid excessive sensing requirements in the prognostics of complex converters. This approach requires detailed knowledge of the dominant aging and failure mechanisms, the physical driving forces behind these mechanisms and the observable precursors of failure. The precise history of the power converter system, combined with measurement and modeling, can then predict whether the system can operate successfully for a given time duration, with a high degree of confidence.

Report No.(s): AD-A466113; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA466113>

High temperature characteristics of 4H-SiC power JFETs and DMOSFETs are presented in this paper. Both devices are based on pn junctions in 4H-SiC, and are capable of 300 degrees C operation. The 4H-SiC JFET showed very predictable, well understood temperature dependent characteristics, because current conduction depends on the drift of electrons in the bulk region, which is not restricted by traps in the MOS interface or pn junctions. However, in a 4H-SiC DMOSFET, electrons must flow through the MOS inversion layer with very high interface state density. At high temperatures, transconductance of the device improves and threshold voltage shifts negative because less electrons are trapped in the interface states, resulting in a much lower MOS channel resistance. This cancels out the increase in drift layer resistance, and as a result, a temperature insensitive on-resistance can be demonstrated. Performances of the two devices are compared, and a discussion of issues for high temperature applications is presented.

ONLINE: <http://hdl.handle.net/100.2/ADA466115>

Supercritical fluid carbon dioxide provides an attractive medium for depositing materials in small structures with high aspect ratios and poorly wettable substrates due to the fact that it is able to dissolve solutes like a liquid and transport dissolved

materials like a gas. Metal and metal sulfide nanoparticles of controllable size can be synthesized in supercritical fluid carbon dioxide using water-in-CO<sub>2</sub> microemulsion as template. Continuous tuning the size of metallic nanoparticles and metal sulfide nanoparticles with diameters from less than 2 nm to over 10 nm can be achieved by varying the density of the fluid phase in the synthetic process. The synthesized nanoparticles are stabilized in the fluid phase using an alkylthiol compound. Deposition of the stabilized metal nanoparticles in the fluid phase forming self-assembled arrays has been demonstrated. Supercritical fluid deposition of metals on surfaces of carbon nanotubes has also been studied. Metal nanoparticles of narrow size distributions can be uniformly attached to carbon nanotube surfaces using this method. The carbon nanotube-supported platinum group metal nanoparticles show remarkably high activities for catalyzing chemical and electrochemical reactions. Examples of utilizing the carbon nanotube-nanoparticle composite materials as catalysts for chemical reactions, fuel cells and sensor applications are given.

Rosen, Warren A; George, Alan D; Jan 1999; 15 pp.; In English

Contract(s)/Grant(s): N00014-96-1-0569; N00014-97-1-0117

Report No.(s): AD-A466164; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA466164>

The problem of fault tolerance in autonomous disposable fiber-optic based acoustic arrays is considered. The principal source of failures over relatively short mission times is node outage due to battery run-down resulting in possible network failure, degradation in the beam power pattern, and possible loss of critical processing elements[ Network integrity in the presence of node failures requires an optical bypass capable of bypassing several adjacent failed nodes. The effect of node failure on the beam power pattern is principally in the side lobes rather than in the main beam, and is amenable to relatively simple solutions for the case of failures near the ends of the array, but failures near the center are more intractable. The loss of critical processing elements can be dealt with by distributing the processing load over processing elements located in each telemetry node of the network, thereby turning the array into a distributed parallel computer.

ONLINE: <http://hdl.handle.net/100.2/ADA466214>

Recently, three-dimensionally laterally confined semiconductor quantum wells ('quantum dots') were realized. These structures are analogous to semiconductor atoms. They have an energy level separation of order 25meV and are tunable by means of the confining potentials. A systematic study reveals a (radius)<sup>-1</sup> dependence on the energy separation. In this paper, electron transport through quantum dots is presented and analyzed. The spectra correspond to resonant tunneling from laterally

confined emitter contact subbands through the discrete three-dimensionally confined quantum dot states. The effects of two dots in series, and Fermi-level effects, are presented.

Contract(s)/Grant(s): 9770400.1304

Report No.(s): AD-A466364; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA466364>

A bipolar tunneling transistor has been fabricated in which ohmic contact is made to the strained p<sup>+</sup> InGaAs quantum well of a double-barrier resonant-tunneling structure. The heterojunction transistor consists of an n-GaAs emitter and collector, undoped AlAs tunnel barriers, and a pseudomorphic p<sup>+</sup> InGaAs quantum-well base. By making ohmic contact to the p-type quantum well, the hole density in the quantum-well base is used to modulate the base potential relative to the emitter and collector terminals. With control of the quantum-well potential, the tunneling current can be modulated by application of a base-to-emitter potential. This paper details the physical and electrical characteristics of the device. It is found that the base-emitter voltages required to bias the transistor into resonance are well predicted by a self-consistent calculation of the electrostatic potential.

ONLINE: <http://hdl.handle.net/100.2/ADA466432>

The authors present a detailed description of the microfabrication and operation at room temperature of a novel type of tunnel displacement transducer. Instead of a feedback system, it relies on a large reduction factor, assuring an inherently stable device. Stability measurements in the tunnel regime infer an electrode stability within 3 pm in a 1 kHz bandwidth. In the contact regime, the conductance takes on a discrete number of values when the constriction is reduced atom by atom. This reflects the conduction through discrete channels.

Report No.(s): AD-A466487; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA466487>

A mathematical continuum theory is developed to describe the electromechanical behavior of dielectric and piezoelectric solids containing imperfections. The macroscopic distortion field consists of recoverable elasticity, deviatoric plasticity arising from dislocation glide, and volumetric deformation from vacancies. A connection on the spatial manifold of deformed lattice vectors describes gradients of stretch and rotation at the microscale caused by various lattice defects. It is shown that parallel transport of a lattice director vector with respect to this connection about a closed loop yields a discontinuity with contributions from the torsion of the connection (physically, from dislocations) and curvature (physically, from domain walls and vacancy gradients). Classical balance laws of electrostatics and mass and momentum conservation are implemented. A free energy function dependent upon lattice distortion, polarization, temperature, and defect densities is suggested. Thermodynamically consistent kinetics relations for dislocation glide and vacancy diffusion are then derived, with the chemical potential for the latter depending upon defect density, electric potential, hydrostatic pressure, and elastic energy density. Vacancy migration and mass rearrangement at the free surface of the substance are also considered explicitly.

ONLINE: <http://hdl.handle.net/100.2/ADA466493>

Strained silicon is becoming a new technology in silicon industry where the novel strain-induced features are utilized. In this report we present a molecular dynamic prediction for the elastic stiffnesses C11, C12, and C44 in strained silicon as functions of the volumetric strain level. Our approach combines basic continuum mechanics with the classical molecular dynamic approach, supplemented with the Stillinger Weber potential. Using our approach, the bulk modulus, effective elastic stiffnesses C11, C12, and C44 of the strained silicon, including also the effective Young's modulus and Poisson's ratio, are all calculated and presented in terms of figures and formulae. In general, our simulation indicates that the bulk moduli, C11 and C12, increase with increasing volumetric strain whilst C44 is almost independent of the volumetric strain. The difference between strained moduli and those at zero strain can be very large, and therefore use of standard free-strained moduli should be cautious.

ONLINE: <http://hdl.handle.net/100.2/ADA466533>

Semiconductor self assembled quantum dots (QDs) have emerged as one of the simplest subjects for exploring and exploiting the physics and device applications of charge carriers and excitons in the three dimensional confinement regime. Nanoscale-sized surface in the form of mesa or ridges on patterned substrates offer opportunities not only for creating large densities of QDs with great homogeneity but also for novel growth-control engineering. This project aims at a fundamental understanding of the size-dependent crystal growth phenomena during the formation of QDs on the surfaces of Si stripe and mesa structures. Employing variable-temperature scanning probe microscope (VT-SPM) on the patterned substrates, we plan to observe in situ the atomistic chemical vapor deposition (CVD) growth mechanism of the QDs on the top terraces as well as on the sidewalls of pre-patterned structures. The key objective in this proposed research is to fabricate patterned structures with well-defined side walls. Specifically, we plan to fabricate patterned mesa and stripe structure with the flat (111) sidewalls on the Si(100) substrates by means of lithography and anisotropic wet chemical etch. When the patterned surface consists only of low-index surfaces with well-characterized structures, its growth behavior become more predictable and tunable. We will then perform epitaxy on the patterned surfaces and observe their evolution in atomic structure and in surface morphology on both the (100) top terraces and (111) sidewalls and QD formation in situ, in real time and in real space using VT-SPM. The fundamental understanding of the results could provide useful physical guidelines in preparing QDs for many researchers and contribute to device application development in a long-term base.

The study of novel materials produces many challenges in the areas of synthesis, modeling and characterization. For the latter, one would like to be able to determine mechanical, electrical and dynamical properties, and correlate them with structure. In the following chapter, we describe work performed at the University of North Carolina-Chapel Hill (UNC) in the development of microscopy instrument systems, including a natural interface for scanned probe microscopy we call the nanoManipulator. We describe the principle design features of the instrument system including the visual display of data, the haptic (force-feedback) control and display capabilities. Second, we describe the combination of microscopy and manipulation in a joint Scanning Electron Microscopy/Scanning Probe Microscopy system. These systems have been used for studies of nanotube mechanical dynamical and electrical properties,<sup>8</sup> and for the study of biological macromolecular structures such as viruses, fibers (pili, fibrin, microtubules, etc.) and molecules (DNA). We describe examples of these studies drawn from our work on nanotubes and viruses.

In this thesis we present LaSLAT, a sensor network algorithm that uses range measurements between sensors and a moving target to simultaneously localize the sensors, calibrate sensing hardware, and recover the target's trajectory. LaSLAT is based on a Bayesian filter that updates a probability distribution over the parameters of interest as measurements arrive. The algorithm is distributable and requires a fixed amount of storage space with respect to the number of measurements it has incorporated. LaSLAT is easy to adapt to new types of hardware and new physical environments due to its use of intuitive probability distributions: one adaptation demonstrated in this thesis uses a mixture measurement model to detect and compensate for bad acoustic range measurements due to echoes. We present results from a centralized implementation of

LaSLAT using a network of Cricket sensors. In both 2D and 3D networks, LaSLAT is able to localize sensors to within several centimeters of their ground truth positions while recovering a range measurement bias for each sensor and the complete trajectory of the mobile.

ONLINE: <http://hdl.handle.net/100.2/ADA467012>

This report is a comparative review of spin electronics ( spintronics ) research and development activities in the USA, Japan, and Western Europe conducted by a panel of leading U.S. experts in the field. It covers materials, fabrication and characterization of magnetic nanostructures, magnetism and spin control in magnetic nanostructures, magneto-optical properties of semiconductors, and magnetoelectronics and devices. The panel s conclusions are based on a literature review and a series of site visits to leading spin electronics research centers in Japan and Western Europe. The panel found that Japan is clearly the world leader in new material synthesis and characterization; it is also a leader in magneto-optical properties of semiconductor devices. Europe is strong in theory pertaining to spin electronics, including injection device structures such as tunneling devices, and band structure predictions of materials properties, and in development of magnetic semiconductors and semiconductor heterostructures. The USA is a leader in optoelectronics including optical detection and injection, as well as novel instrumentation e.g., ballistic electron magnetic microscopy (BEEM). The USA is also the international leader in applications including read heads, magnetic random access memory (MRAM), sensors, and magnetic device production. Additional details are included in an executive summary conveying the panel's overall conclusions.

ONLINE: <http://hdl.handle.net/100.2/ADA467427>

We discovered a grand homologous series which may help in the future to systematically identify thermoelectric materials with high performance. Namely, the series  $Am[M1+1Se2+1]2m[M21+nSe2+31+n]$  (A = alkali metal, M = Pb, Bi) has structure-predicting properties. The modular construction of these structures from evolving building blocks permits many of the criteria necessary for good thermoelectrics to be met.  $K2Bi8Se13$  is a member of this series and was found to be a promising thermoelectric. The charge transport properties were studied under pressure, where a significant increase in the power factor was observed. Several other promising materials were also discovered. In another part of this project we prepared nanocrystals of thermoelectric semiconductors and studied their properties. We investigated the assembly of nanocrystal components into well-organized arrays. The goal was to utilize quantum dot building blocks of desired thermal and electronic properties to design composite materials with improved power generation, thermoelectric characteristics. We devised new ways to prepare nanocrystals of PbTe, AgSbTe<sub>2</sub> and AgPb<sub>2</sub>SbTe<sub>4</sub>.

ONLINE: <http://hdl.handle.net/100.2/ADA467467>

There is strong interest within DoD to utilize high-gain. directional antennas at both the transmitting and receiving end

of the link in a dynamic, ad hoc network environment. However, the application of directional antennas (e.g., phased-array or sectorized antennas) in a dynamic network of mobile nodes requires coordination of antenna steering at both the receiver and transmitter ends of the link. Our solution is to apply adaptive, link-state routing (be performed by the OLSR ad hoc routing protocol) supported by a distributed, adaptive Time Division Multiple Access (TDMA) scheduler, which determines schedules based on cooperative decisions between each pair of neighbor nodes. The architecture that has been developed contains a high rate mission data channel with an adaptive TDMA link scheduling protocol designed to take advantage of high-gain directional antennas. Time slots on this channel are adaptively scheduled to meet dynamic traffic demand requirements and to avoid interference from adjacent transmitting nodes. In addition, the link scheduling protocol must adapt to changes in node neighborhood topology caused by node mobility and link obstructions. This architecture will be tested and evaluated in two ways: by OPNET simulations and by field demonstrations.

Localized operators, like Gabor wavelets and difference-of-Gaussian filters, are considered to be useful tools for image representation. This is due to their ability to form a sparse code that can serve as a basis set for high-fidelity reconstruction of natural images. However, for many visual tasks, the more appropriate criterion of representational efficacy is recognition, rather than reconstruction. It is unclear whether simple local features provide the stability necessary to subserve robust recognition of complex objects. In this paper, we search the space of two-lobed differential operators for those that constitute a good representational code under recognition/discrimination criteria. We find that a novel operator, which we call the dissociated dipole displays useful properties in this regard. We describe simple computational experiments to assess the merits of such dipoles relative to the more traditional local operators. The results suggest that non-local operators constitute a vocabulary that is stable across a range of image transformations. This paper reports the techniques for improving the characteristics of integrated antennas fabricated on silicon substrates

for communications over air. Using these, the pair gain (Ga) of antennas on 20-Omega-cm substrates has been improved by ~10x over the previously reported result. Lastly, the possibility of realizing single chip radios with integrated antennas for communication over air is suggested by picking up, amplifying, and frequency dividing a 15-GHz sine wave transmitted from a 2-mm long on-chip antenna located 40 cm away using a packaged clock receiver with a 2-mm long on-chip zigzag antenna.

This report reviews Japan's research and development activities and strategies in the field of microsystems and microelectromechanical systems (MEMS). Topics covered include the future outlook of national initiatives, interactions between industry and universities, technology and manufacturing infrastructure, and emerging applications research. The panel's findings include the following: non-silicon microsystem technologies, together with parallel assembly technologies for low-cost mass manufacturing, merit increased attention. Incorporating non-silicon technologies into the MEMS Exchange should be considered, in order to identify, support, and standardize U.S. capabilities. Opportunities should be identified for exploiting early applications of synthetic nanostructures in microsystems. Metrology, process control, and device standardization should be pursued, in collaboration with Asia and Europe. Additional findings are outlined in the panel's executive summary.

**A Rationale for Establishing Survivability Requirements for Objective Force Unmanned Army Platforms and Systems**

Pfeffer, Robert A; Jun 2003; 20 pp.; In English; Original contains color illustrations

Report No.(s): AD-A468167; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA468167>

The introduction of high-tech equipment into the Army inventory has substantially increased battle effectiveness, reduced personnel requirements, and in some cases allowed the replacement of several manned operational platforms and systems with unmanned equivalents. The continued trend toward digital robotics in the battlespace has become extremely attractive to military planners, so much so that future warfighters are expected to employ a considerable number of unmanned platforms and systems. Up to this point in time, however, nuclear hardening criteria have been applied principally to manned systems and have been balanced to the nuclear survivability of the operating crew. This paper provides the rationale for establishing reasonable nuclear hardening criteria for objective force unmanned mission critical equipment. It starts with the survivability requirement and then identifies the process used to establish criteria for five unmanned equipment classes. Also included are the factors to be considered and the steps to be taken to establish hardening criteria for all nuclear weapons effects (NWE) and for all weapon yields of interest. The paper concludes with an application of the process to a hypothetical system. Details given in this paper form the basis for proposed Quadripartite Standardization Agreement (QSTAG) 2041, a standard for the Armies of the USA, the UK, Canada, and Australia.

Report No.(s): AD-A466873; TARDEC-16963; No Copyright; Avail.: Defense Technical Information Center (DTIC)

In a previous paper, we discussed our techniques for measuring the thermal shielding of materials. Two heated panels served as surrogates for heated vehicle components, such as armor heated by the engine. The outer surface of each panel was thermostatically controlled to the same temperature. The camouflage material covered one of the panels, while the other,

uncovered, panel acted as the baseline. Periodically, we collected calibrated infrared images of the two panels at 3 to 5 and 8 to 12 microns. In this paper, we present techniques to analyze further data from these measurements. The goal of the analysis is to quantify the relative capability of materials to shield from view warm vehicle components. We also present results of a simple experiment to measure the effect of air movement on the shielding properties of the materials.

Report No.(s): AD-A466899; 16947-RC; No Copyright; Avail.: Defense Technical Information Center (DTIC)

These three briefing charts present a summary of the electrical systems used in the M1114 Golden High Mobility Multipurpose Wheeled Vehicle (HMMWV). Chart 1 pictures a number of the M1114's electrical systems, including the Common Remotely Operated Weapons Station (CROWS), the Improved Target Acquisition Sight (ITAS), the Battery Powered Motorized Turret Unit (BPMTU), the CREW 2 (DUKE) jammer, the Long-Range Acoustic Device (LRAD (trademark)), the Blue Force Tracker (FBCB2), Drivers Vision Enhancement (DVE), the DAGR/PLGR GPS System, and the SINCGARS and VIC-3 system. Chart 2 presents 2 tables. One table shows power draws for 12 M1114 electrical systems under steady state and surge on the Golden's 200A alternator, which can provide between 110-180 Amps of usable power. The second table shows steady state and surge Amp draws for 12 future and optional systems. Chart 3 presents 14 acronyms for M1114 electrical systems and their spelled-out versions.

**Solid State Capacitor Discharge Pulsed Power Supply Design for Railguns**

Black, Jesse H; Mar 2007; 74 pp.; In English

Report No.(s): AD-A467108; No Copyright; Avail.: Defense Technical Information Center (DTIC)

This thesis presents a solid state thyristor switched power supply capable of providing 50 kJ from a high voltage capacitor to a railgun. The efficiency with which energy is transferred from a power supply to a projectile depends strongly on power supply characteristics. This design will provide a better impedance match to the railgun than power supplies utilizing spark gap switches. This supply will cost less and take up less volume than a similar supply using spark gap switches; it will also produce a smaller electromagnetic pulse. Voltage limitations on the thyristors require two in series acting as a single switch. Railgun, snubber circuit and gate control systems were modeled for a 50 kJ railgun supply. These simulations yielded component values necessary to protect and control the thyristors for voltages up to 10 kV, currents up to 180 kA, and changes in current with respect to time up to  $10(\exp 9)$  A/s.

Contract(s)/Grant(s): F33615-03-D-5204-0001; Proj-4349

Report No.(s): AD-A467119; No Copyright; Avail.: Defense Technical Information Center (DTIC)

This report describes the exploitation of the attractive performance of magnetoresistive (MR) sensors for NDE of metallic aircraft structure, into an imaging array for rapid scanning, and the demonstration of the performance of that array. There were a number of issues requiring resolution for this development. These included array geometry, excitation geometry, signal processing, software, calibration, and operation. The geometry chosen was a linear array with sensitivity axis normal to the surface being scanned, and the excitation geometry is that of a uniform current 'sheet'. The array has been initially demonstrated on several test samples, and shown to be able to detect small flaws/cracks at depths of upwards of one-half inch. In many cases, cracks with length only a fraction of the covering metal are easily seen with no additional data manipulation. The array has been integrated and demonstrated with the MAUS scanning platform. Because of the chosen geometry, dependence on circular symmetry is obviated, and therefore rapid scanning along a row of fasteners is possible, with real time imaging. In the future, the bounding of applicability of the array for Air Force inspection scenarios must be determined, as well as flaw signature enhancement through additional processing.

**Investigation of Lattice and Thermal Stress in GaN/AlGaIn Field-Effect Transistors**  
Boutros, Karim; May 15, 2007; 7 pp.; In English  
Contract(s)/Grant(s): N00014-05-C-0120  
Report No.(s): AD-A467566; No Copyright; Avail.: Defense Technical Information Center (DTIC)

This report describes work performed in support of the program 'Investigation of Lattice and Thermal Stress in GaN/AlGaIn Field-Effect Transistors' (Contract No N00014-05-C-0120) for the period 10/1/06 - 4/30/07. Our overall goal is to understand the role and contribution of residual stress and junction temperature on the degradation of AlGaIn/GaN HEMT electrical device characteristics. To execute this goal, electrical stress measurements will be performed on devices with varying residual stress, and under varying conditions. We plan to use the micro-Raman technique to monitor the evolution of residual stress in the active region of the device over time and under quiescent electrical bias. The question of whether a stress relaxation, potentially inducing dislocations, or simply changing the piezoelectric contribution to the 2DEG charge, contributes to device degradation will be investigated. We will seek to understand the influence of junction temperature on the magnitude of the stress at the active junction. The effect of physical, thermal, and electrical stress on device reliability will be investigated.

**Venturing Through the Forbidden Band**  
Dec 2004; 44 pp.; In English; Original contains color illustrations  
Report No.(s): AD-A467568; No Copyright; Avail.: Defense Technical Information Center (DTIC)

Over the past three decades, industry and the U.S. Government have invested hundreds of millions of dollars in an emerging area called wide-bandgap materials. The technical significance of these materials is that they can be made into semiconductor devices capable of handling much higher voltages than silicon, while withstanding and operating at much higher temperatures. Such materials also have unique optoelectronic capabilities that allow them to emit blue and UV light. Thus, many aspects of our lives can be touched by transistors and diodes made from a new class of materials. What makes a semiconductor wide bandgap? The answer remains at the atomic level of the material. A range of energies called the forbidden band separates the valence band and the conduction band of a solid-state material. The valence and conduction bands hold electrons; however, no electrons may reside in the forbidden band. When the forbidden band is wider, more energy is required to promote an electron from the valence band into the conduction band. If a material has no forbidden band (i.e., the conduction band is the valence band), it behaves as metal. If it has a very wide band, it is a good insulator. Semiconductors lie somewhere in the middle. When we speak of wide-bandgap materials, we are referring to gallium nitride (GaN), silicon carbide (SiC), and other compound semiconductors that have a relatively wide forbidden band (on the order of between 1.7 and 7 electron volts) compared with silicon and gallium arsenide. More work is still needed for this technology to be available for many of the applications mentioned in this publication. Issues such as gate leakage and defect densities (which affect wafer size) need to be addressed.

**Atomtronics: Ultracold Atom Analogs of Electronic Devices**  
Seaman, B T; Kraemer, M; Anderson, D Z; Holland, M J; Jun 23, 2006; 13 pp.; In English  
Contract(s)/Grant(s): FA9550-04-1-0460; Proj-T139/00  
Report No.(s): AD-A467798; No Copyright; Avail.: Defense Technical Information Center (DTIC)

Atomtronics focuses on atom analogs of electronic materials, devices and circuits. A strongly interacting ultracold Bose gas in a lattice potential is analogous to electrons in solid-state crystalline media. As a consequence of the band structure, cold atoms in a lattice can exhibit insulator or conductor properties. P-type and N-type material analogs can be created by introducing impurity sites into the lattice. Current through an atomtronic wire is generated by connecting the wire to an atomtronic battery which maintains the two contacts at different chemical potentials. The design of an atomtronic diode with a strongly asymmetric current-voltage curve exploits the existence of superfluid and insulating regimes in the phase diagram analog of a bipolar junction transistor. Our results provide the building blocks for more advanced atomtronic devices and circuits such as amplifiers, oscillators and fundamental logic gates.

**Polarimeter in a Pixel**

Krishna, Sanjay; Mar 13, 2007; 6 pp.; In English

Contract(s)/Grant(s): FA9550-04-1-0396

Report No.(s): AD-A467805; 1; No Copyright; Avail.: Defense Technical Information Center (DTIC)

An imaging polarimeter captures an image with both the intensity and the average polarization state recorded for each pixel. A polarimetric image has more information than a simple intensity image and improves remote sensing and automatic target recognition. The current technology of imaging polarimeters cannot reliably measure high-spatiotemporal polarization or high-spectral-resolution polarization of a moving scene; the camera reports huge errors at the boundaries of objects in the scene or trades-off spatial and spectral resolution to achieve faster measurements. The aim of the proposed project is to realize a new optoelectronic device that completely and instantaneously measures the incident light's polarization for a narrow wavelength band in a single physical pixel. We have undertaken theoretical modeling of the Polarimeter in a Pixel and undertook one round of fabrication of the device. Although the device exhibited good mid infrared absorption, the electrical characteristics were poor due to residual Silicon Nitride. We are requesting follow on funding to undertake experimental studies on this project in collaboration with AFRL/VSSS.

**Spread Spectrum Signal Characteristic Estimation Using Exponential Averaging and an AD-HOC Chip rate Estimator**

Weber, John B; Mar 2007; 155 pp.; In English

Report No.(s): AD-A467872; No Copyright; Avail.: Defense Technical Information Center (DTIC)

This dissertation investigates two methods of spread spectrum (SS) signal characteristic estimation for the two principle types of SS systems, frequency-hopped (FH) and direct sequence SS. The exponential averaging detector is used to detect and estimate the hopped frequencies of a SS-FH signal in the presence of interference signals as well as additive-white-Gaussian-noise (AWGN). The detection method provides an estimate of the AWGN plus interference spectrum using exponential averaging and then generates an estimate of the desired signal spectrum by combining the estimated AWGN plus interference spectrum with the composite (desired signal plus interference plus AWGN) spectrum. Finally, this dissertation evaluates the detector's performance as a function of the exponential coefficient, the combining method, the probability of false alarm, signal-to-AWGN ratio, and signal-to-interference ratio. The second method of SS signal characteristic estimation uses a digital ad-hoc chip rate estimator (ACRE). The ACRE is used to estimate the chip rate of a half-sine pulse shaped SS direct-sequence signal. The ACRE is explained in relation to its similarities and contrasts to the chip rate detector. The components and performance of the ACRE are presented for standard-ACRE, ACRE with additional filtering, and ACRE with incrementing. The additional filtering results in a reduced chip rate search range but yields improved estimation performance and incrementing has the potential for parallel processing, resulting in dramatically decreased computational time, without loss of performance.

**Analysis and Design of Ultra Wide-Band and High-Power Microwave Pulse Interactions With Electronic Circuits and Systems**

Uslenghi, Piergiorgio L; Erricolo, Danilo; Yang, Hung-Yu D; Feb 28, 2007; 55 pp.; In English

Contract(s)/Grant(s): F49620-01-1-0436

Report No.(s): AD-A467894; No Copyright; Avail.: Defense Technical Information Center (DTIC)

This research is directed to understanding and modeling the effects of electromagnetic pulse interactions with electronic circuits and systems, and is focused on four major tasks. (1) Characterization of coupling mechanisms responsible for guiding electromagnetic energy from the source to the electronic components, via topology schemes based on a generalized scattering matrix. Frequency-domain and time-domain solvers are developed for large-scale systems. The results are validated via measurements and via comparison with new canonical solutions to scattering and penetration problems. (2) Characterization of the spurious waveforms at the input ports of the electronic systems. A full-wave three-dimensional analysis of linear passive systems is developed to convert the radiating and conducting EMI into sets of noise sources at the ports of nonlinear active circuits. A network-oriented nonlinear transient simulator is developed for small-signal and large-signal analysis of nonlinear electronics, including the distributed nature of the coupling path and EMI sources. (3) Determination of conditions for induced change-of-logic states and alterations of logic functions for digital circuits and computer systems. A fault-tolerance analysis

is developed to determine, classify, monitor and control various system program errors under EM threat. (4) Experiments to validate EM penetration and coupling predictions, and circuit and system fault models.

Perina, Jan; Haderka, Ondrej; Scalora, Michael; Apr 2007; 24 pp.; In English; Original contains color illustrations

Contract(s)/Grant(s): N62558-05-P-0421

Report No.(s): AD-A468027; No Copyright; Avail.: Defense Technical Information Center (DTIC)

A waveguide made of LiNbO<sub>3</sub> with a periodic linear corrugation on its surface is analyzed from the point of view of squeezed-light generation. It is shown that scattering of nonlinearly interacting optical fields caused by the corrugation improves efficiency of the nonlinear process under certain conditions. These conditions are found approximately analytically and confirmed numerically. The linear corrugation can be tuned both into the pump as well as second-subharmonic field in order to improve efficiency of the nonlinear process. The analysis provides a detailed understanding of the role of all parameters of the waveguide and this enables to specify optimum values of parameters to achieve the best values of squeezing. In pulsed regime the right choice of spectral modes is important to observe squeezing. These modes are found using the Bloch-Messiah reduction of the appropriate Green functions.

**Feasibility Study on Magnetic Content Addressable Memory**

Wang, Weizhong; May 10, 2007; 4 pp.; In English; Original contains color illustrations

Contract(s)/Grant(s): N00014-06-1-0942

Report No.(s): AD-A468138; No Copyright; Avail.: Defense Technical Information Center (DTIC)

The objective of this project is to investigate the feasibility of the novel magnetic content addressable memory (MCAM) design. The proposed MCAM is to integrate the data storage function and logic function together by using the Magnetic Tunneling Junction (MTJ). The major challenge is to individually program the two ferromagnets in MTJ which are separated by 2 nm. Our approach is to use layer thickness difference and magnetic field confinement within the ferromagnetic materials for programming. We used LLO micro-magnetic simulator to investigate the feasibility of the proposed MCAM operation. The feasibility studies covers both Cobalt and Permalloy based devices. The simulated structures included ideal 'picture frame' structure' as well as structures with non-ideal parts which can be introduced during fabrication. In all cases, the simulation results indicate that the MCAM can operate as expected. There are some vortex states introduced in non-ideal structures. However, the read currents are orders of magnitude below threshold current for domain wall movement. The MCAM is expected to work with those non-ideal structures.

**Study on Wide-gap Gallium-nitride Based Films and Their Quantum-dots Devices**

Hwang, Huey-Liang; Hwang, Jung-Min; Yei, Brian; Lee, Kuan-Feng; Sep 5, 2006; 95 pp.; In English

Report No.(s): AD-A468270; No Copyright; Avail.: Defense Technical Information Center (DTIC)

Wide-gap III-Nitride based white light emission had been proven to yield luminescence efficiency (20-30 Lumen/W) and the III-Nitride devices proved long lifetime (>10khr). It is expected that high efficiency III-Nitride based white light emission will be the major lighting source for daily illumination in the coming decades. In 1998, the world energy consumption of energy is 69,000 TWh. There had been 2300 TWh consumption in illumination with rather inefficiently way. To further largely improve the luminescence efficiency beyond 100 Lumen/W and to increase thermal stability of the III-Nitride based LED, devices in the quantum structure is the viable way to pursuit.

**Novel Organic Field Effect Transistors via Nano-Modification**

Wen, Ten-Chin; Chou, Wei-Yang; Guo, Tzung-Fang; Wang, Yeong-Her; Jul 2005; 52 pp.; In English

Contract(s)/Grant(s): FA5209-04-P-0518

Report No.(s): AD-A468286; No Copyright; Avail.: Defense Technical Information Center (DTIC)

In recent years, organic/polymer field-effect transistors (FETs) provide inherent advantages of low cost, large area fabrication, simple packing, and compatibility with flexible substrates. The performance of organic FETs is determined primarily by the field effect mobility of the carriers in the organic semiconductor layers and by the efficiency of injecting and extracting carriers at source and drain currents. For virtually all classes of organic semiconductors, the intrinsic carrier mobility depends on the degree of molecular ordering critically and the extent of the stacking in the material. Under these conditions, we propose to enhance carrier mobility by using two kinds of nano-scale films. One is to apply the photoalignment method on a nano-scale film to control the orientation of pentacene molecules as an active layer in the thin-film transistors with conspicuously anisotropic electrical characteristics. Another is to employ also a nano-scale film (polymer electrolyte) to control moving of ions in/out an active semiconductor, pentacene or conducting polymer, for improving carrier mobility. In this project, pentacene or a series of conducting polymers, such as the derivatives of PANI and P3HT will be patterned and manufactured in FETs. Nano-scale films including polyimide for photoalignment/ion beam treatment and polymer electrolyte for ion doped/doped modification are to achieve the high mobility.

**New Column Designs for MicroGC (Preprint)**

Radadia, Adarsh D; Masel, Richard I; Shannon, Mark A; Nov 2006; 6 pp.; In English

Contract(s)/Grant(s): FA8650-04-1-7121; Proj-4H20

Report No.(s): AD-A468403; No Copyright; Avail.: Defense Technical Information Center (DTIC)

New column designs that give lower dispersion than column designs presented previously are presented. All of the work so far has concentrated on columns that are arranged with a spiral geometry. Spiral columns show lower dispersion than serpentine in chip scale electrophoresis and the assumption has been that spirals would also give lower dispersion than serpentine for microGC. We also test various turn geometries to see which gives the lowest dispersion. We have examined spiral and serpentine columns. We have also considered several turn geometries.

**Symposium Q: Magnetic Thin Films, Heterostructures, and Device Materials**

Bailey, William; May 22, 2007; 25 pp.; In English

Contract(s)/Grant(s): N00014-06-1-0281

Report No.(s): AD-A468427; No Copyright; Avail.: Defense Technical Information Center (DTIC)

In Symposium Q on Magnetic Thin Films, Heterostructures, and Device Materials, spin-dependent tunneling junctions were presented, with a particular focus on Fe/MgO/Fe junctions. Tunneling magnetoresistance values in this system have recently attained up to 350% at room temperature, several times higher than those seen in any other materials system. High magnetoresistance values were presented experimentally, treated through ab initio models, and correlated with MgO barrier structure by in situ STM and XPs characterization. Prospects for incorporation into nonvolatile magnetic RAM devices were also reviewed. Among other highlights were possibilities for novel interactions of ferromagnetic layers with other functional material types; novel rectifying possibilities, predicted theoretically, for the integration of ferroelectric such as SrTiO<sub>3</sub>, in the tunnel barrier between metallic Co electrodes; unambiguous proof of electrical injection and detection of spin-polarized electrons from metallic ferromagnets through GaAs, through the Hanle effect; and all-oxide magnetic tunneling junctions based on NiMn<sub>2</sub>O<sub>4</sub> barriers. Materials approaches to increasing subnanosecond switching speeds, critical for high-data-rate (>10 GHz) information storage, were presented. It was shown that the damping constant for high-speed motion can be predicted from first principles only in layered structures; controlled in epitaxial Fe alloys, potentially reduced below the intrinsic value of pure Fe; correlated with the femtosecond demagnetization process; and understood microscopically through picosecond-scale time-resolved x-ray spectroscopy. Composition spread approaches for the discovery of high-frequency magnetic materials were also reviewed.

**Handheld Broadband Electromagnetic UXO Sensor**

Won, I J; SanFilipo, Bill; Oren, Alex; Dec 2006; 38 pp.; In English; Original contains color illustrations

Contract(s)/Grant(s): Proj-MM-0036

Report No.(s): AD-A468547; No Copyright; Avail.: Defense Technical Information Center (DTIC)

Detection of unexploded ordnance (UXO) and discrimination between UXO and metallic clutter pose challenges to cost-effective remediation of UXO-contaminated land in order to reclaim it for civilian use. The need to develop sensors that can be deployed in a realistic setting and accomplish these goals motivated this project. The broadband electromagnetic sensor improvement and demonstration undertaken in this project took the prototype GEM-3 and evolved it into an operational sensor with increased bandwidth and dynamic range, and enough memory and processing power to allow efficient data acquisition while decreasing the weight for ease of operation. Specifically, the frequency range was doubled from 24 kHz to 48 kHz; the 24-bit analog-to-digital converter (ADC) replaced the 16-bit ADC, providing 48 dB increased dynamic range; the digital signal processor (DSP) was upgraded to be fast enough to allow continuous operation at more than 10 frequencies simultaneously; and compact-flash memory was added, accommodating internal storage of a day's surveying. In addition to the original handheld configuration specified at the outset, a cart-mounted, large-coil configuration has also been developed for surveying large open areas. A more detailed description is provided in Section 2.0, Technology Description.

**Electronically Induced Redox Barriers for Treatment of Groundwater**

Sale, Tom; Gilbert, David; Oct 2006; 44 pp.; In English; Original contains color illustrations

Contract(s)/Grant(s): Proj-ER-0112

Report No.(s): AD-A468551; ER-0112; No Copyright; Avail.: Defense Technical Information Center (DTIC)

This report summarizes results from a 3-year collaboration between the Environmental Security Technology Certification Program (ESTCP) and Colorado State University (CSU). The focus is an innovative electrolytic approach for managing redox-sensitive contaminants in groundwater, referred to as electrically induced redox barrier (e-barriers). The overarching objective of the work is to demonstrate/validate a new technology for managing contaminated groundwater at the Department of Defense (DoD) facilities that holds promise in terms of efficacy and cost. The premise underlying the technology is that closely spaced permeable electrodes can be installed through a groundwater contaminant plume in the format of a permeable reactive barrier. Application of low voltage direct current (DC) drives sequential oxidation and/or reduction of contaminants with the net benefit of reducing contaminant flux. The site selected for the demonstration is a shallow alluvial plume containing approximately 300 micrograms/L of trichloroethene (TCE). The e-barrier was designed and fabricated at CSU in May through July 2002 and was installed at F.E. Warren Air Force Base (AFB) in August 2002. Following installation, the e-barrier was allowed to equilibrate with the contaminant in the plume for 5 months. Power was applied to the e-barrier in January 2003, and as of August 2004, the e-barrier has been operating continuously (approximately 19 months). As implemented, the e-barrier met the functional objective of the demonstration, and experience gained through the demonstration provides insight into avenues for optimization. Electrical cost and performance is monitored continuously using a remote data acquisition system. Eighteen months of operation indicates that the electrical components are reliable and power costs low (an average of \$0.013/m<sup>2</sup>/day).

Report No.(s): AD-A468563; No Copyright; Avail.: Defense Technical Information Center (DTIC)

The goal of the conference was to establish mutually beneficial scientific interactions between researchers in Taiwan and AFRL scientists. It was to foster basic research innovation and interactions between scientists and enhance future USAF capabilities through support of Air Force fundamental nanoscience research efforts. The definition of USAF Nanoscience is to work at the atomic, molecular and supramolecular levels, in the length scale of approximately 1-100 nm in range; understand

novel phenomena, properties and functions that occur on nm length scales; manipulate matter at the nanoscale to control those properties and functions; and achieve macroscale functionality based on properties at the nonoscale.

Report No.(s): AD-A466431; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA466431>

A new technique, named SHARP, is presented for the partitioning of Very-Large-Scale Integration (VLSI) integrated circuits. SHARP is a hill-climbing heuristic that is designed to be incorporated into a partitioning-based placement algorithm. The method is more strongly influenced by the geometry of the layout surface than other partitioning methods, such as min-cut partitioning and the quadrisection approach. It is tuned for intra-package connections rather than inter-package connections. The method is named SHARP because the layout circuit surface is decomposed geometrically into nine regions in a manner that resembles a musical ‘#’, or sharp sign. Its other important features include a multi-objective function that more accurately represents wire usage than the standard min-cut criterion, and extensive use of Steiner trees. A series of experiments demonstrates that the SHARP technique produces very high quality partitions.

ONLINE: <http://hdl.handle.net/100.2/ADA466178>

The project investigates the formation of micro-scale structures using capillary force-driven self-assembly. Two main activities were undertaken during the course of the project: determination of the proper self-assembly environment and scaling of the metal contacts, and development of microfabrication processes that can generate micron-scale single crystal silicon parts that can participate in a self-assembly process. The effect of the alloy composition, chemical composition of the self-assembly environment, and contact metallization were extensively studied and an optimum condition for scaling the metal contacts was determined. Microfabrication processes on SOI wafers were developed to form parts that can participate in 2D and 3D self-assembly processes.

Report No.(s): PB2007-104053; No Copyright; Avail.: CASI: [A03](#), Hardcopy

A buffer/driver having large output devices for driving multiple loads is configured with three parallel paths. The first logic path is made of small devices and is configured to provide the logic function of the buffer without the ability to drive large loads. Second and third logic paths have the logic function of the first logic path up to the last inverting stage. The last inverting stage in each path is a single device for driving the logic states of the buffer output. The second and third logic paths have power-gating that allows the input to the pull-up and pull-down devices to float removing gate-leakage voltage stress. When the second and third logic paths are power-gated, the first logic path provides a keeper function to hold the logic state of the buffer output. The buffer may be an inverter, non-inverter, or provide a multiple input logic function.

Patent Info.: Filed Filed 31 Mar 05; US-Patent-Appl-SN-11-096-014

Report No.(s): PB2007-104595; No Copyright; Avail.: CASI: [A03](#), Hardcopy

A silicon-on-insulator (SOI) device structure 100 formed using a self-aligned body tie (SABT) process. The SABT process connects the silicon body of a partially depleted (PD) structure to a bias terminal. In addition, the SABT process creates a self-aligned area of silicon around the edge of the active areas, as defined by the standard transistor active area mask, providing an area efficient device layout. By reducing the overall gate area, the speed and yield of the device may be increased. In addition, the process flow minimizes the sensitivity of critical device parameters due to misalignment and critical dimension control. The SABT process also suppresses the parasitic gate capacitance created with standard body tie techniques.

Report No.(s): PB2007-104589; No Copyright; Avail.: CASI: [A02](#), Hardcopy

A micromechanical resonate device having an extensional wine-glass mode shape is described herein. Different embodiments of the device may employ vibrating polysilicon micromechanical ring resonators, utilizing a unique extensional wine-glass mode shape to achieve lower impedance than previous UHF resonators at frequencies as high as 1.2-GHz with a Q of 3,700, and 1.47-GHz (highest to date for polysilicon micromechanical resonators) with a Q of 2,300. The 1.2-GHz resonator exhibits a measured motional resistance of 560 k(OMEGA) with a dc-bias voltage of 20V, which is 6(times) lower than measured on radial contour mode disk counterparts at the same frequency, and which can be driven down as low as 2 k(OMEGA) when a dc-bias voltage of 100V and electrode-to-resonator gap spacing of 460 (ANG) are used. The above high Q and low impedance advantages, together with the multiple frequency, on-chip integration advantages afforded by electrostatically-transduced (mu)mechanical resonators, may be utilized in the front-end RF filtering and oscillator functions needed by wireless communication devices.

Report No.(s): AD-A466484; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA466484>

A 4.5-MJ capacitor-based pulsed power system (PPS), previously owned and operated by General Dynamics Land Systems in the early 1990s, was acquired by the U.S. Army Research Laboratory. The system was placed in storage in the late 1990s. It was recently modified and, in 2001, was placed back in operation at barricade C to operate with an electromagnetic (EM) railgun load. On 9 February 2006, a capacitor in module 4 developed an internal short while charged to 7.2 kV. Further inspection revealed arc damage at the center post terminal on 20 capacitors in nearby modules and some amount of rust on every capacitor case. After the incident, all modules were charged individually to 3.2 kV and discharged into a short. The data indicates that the damaged center posts likely occurred quite some time ago. New hardware was required to restore relevant capability to barricade C. The capacitors from the primary and essential basis for the system. The PPS must be capable of reliably delivering higher energy pulses. New capacitors using modern manufacturing techniques and improved dielectrics were purchased. New center posts were designed and replaced concomitant with the installation of new capacitors. Lastly, the bus work that connects the pulse-forming inductor to the pulse-forming-network output cable was replaced in order to decrease the number of bolted joints and increase reliability at high-energy operation. Upon completing the upgrade in hardware, each module was discharged into a short at the breech of the railgun at initial charge voltages of 3, 5, and 7 kV. Additionally, all 18 modules were sequentially discharged into the shorted breech. Lastly, firings using a railgun were completed without incident. All simulation models were updated as necessary throughout the commissioning process. The stored energy at the maximum charge voltage of 11 kV is now 5.2 MJ.

**A Pareto Approach to Lossy Matching**

Allen, J C; Arceo, D; Sep 2006; 62 pp.; In English; Original contains color illustrations

Report No.(s): AD-A467597; SSC-TR-1942; No Copyright; Avail.: Defense Technical Information Center (DTIC)

This report originated in the In-House Laboratory Independent Research Program of SPAWAR Systems Center San Diego and continues the migration of H(infinity) Engineering into fleet applications. As more communication systems are installed and radar cross-section requirements become stricter, shipboard space has become extremely limited and new antenna designs must be considered. As antenna size is reduced, a tradeoff between efficiency and bandwidth is forced. This report offers a multiobjective solution where transducer power gain is traded to reduce the large reflection at the feed of the antenna. Although lossy matching is an anathema for standard antenna matching, trading gain against reflection is rational design objective for a small antenna provided the corresponding Pareto front can be computed. This report offers several techniques to compute the Pareto front for a given lossy topology random sampling, orbit techniques based on lossless matching, and the adaptation of the H(infinity) techniques. These Pareto front computations readily adapt to other lossy matching tradeoffs and offer a general approach to lossy matching.

**Understanding and Improving High Voltage Vacuum Insulators for Microsecond Pulses**

Javedani, J. B.; Goerz, D. A.; Houck, T. L.; Lauer, E. J.; Speer, R. D.; Mar. 06, 2007; 64 pp.; In English

Report No.(s): DE2007-902244; UCRL-TR-228713; No Copyright; Avail.: National Technical Information Service (NTIS)

In this report we summarize our modeling and simulation efforts, theoretical studies, and experimental investigations. The computational work began by exploring the limits of commercially available codes and demonstrating methods to examine field enhancements and defect mechanisms at microscopic levels. Plasma simulations with particle codes used in conjunction with circuit models of the experimental apparatus enabled comparisons with experimental measurements. The large scale plasma (LSP) particle-in-cell (PIC) code was run on multiprocessor platforms and used to simulate expanding plasma conditions in vacuum gap regions. Algorithms were incorporated into LSP to handle secondary electron emission from dielectric materials to enable detailed simulations of flashover phenomenon. Theoretical studies were focused on explaining a possible mechanism for anode initiated surface flashover that involves an electron avalanche process starting near the anode, not a mechanism involving bulk dielectric breakdown. Experiments were performed in Engineering's Pulsed Power Lab using an available 100-kV, 10-ns pulse generator and vacuum chamber. The initial experiments were done with polyethylene insulator material in the shape of a truncated cone cut at +45DG angle between flat electrodes with a gap of 1.0 cm. The insulator was sized so there were no flashovers or breakdowns under nominal operating conditions. Insulator flashover or gap closure was induced by introducing a plasma source, a tuft of velvet, in proximity to the insulator or electrode.

**Structural Investigations of Surface and Orientation-Specific Phenomena in Nanocrystals and Their Assemblies**

Aruguete, D. M.; 1 Jan. 2006; 175 pp.; In English

Report No.(s): DE2007-901229; No Copyright; Avail.: Department of Energy Information Bridge

Studies of colloidal nanocrystals and their assemblies are presented. Two of these studies concern the atomic-level structural characterization of the surfaces, interfaces, and interiors present in II-VI semiconductor nanorods. The third study investigates the crystallographic arrangement of cobalt nanocrystals in self-assembled aggregates. Crystallographically-aligned assemblies of colloidal CdSe nanorods are examined with linearly-polarized Se-EXAFS spectroscopy, which probes bonding along different directions in the nanorod. This orientation-specific probe is used, because it is expected that the presence of specific surfaces in a nanorod might cause bond relaxations specific to different crystallographic directions. Se-Se distances are found to be contracted along the long axis of the nanorod, while Cd-Se distances display no angular dependence, which is different from the bulk. Ab-initio density functional theory calculations upon CdSe nanowires indicate that relaxations on the rod surfaces cause these changes.

**Defect-Related Internal Dissipation in Mechanical Resonators and the Study of Coupled Mechanical Systems**

Sullivan, J. P.; Modine, N. A.; Czaplewski, D. A.; Friedmann, T. A.; Wendt, J. R.; Jan. 2007; 58 pp.; In English

Contract(s)/Grant(s): DE-AC04-94AL85000

Report No.(s): DE2007-900851; SAND2006-7937; No Copyright; Avail.: National Technical Information Service (NTIS)

Understanding internal dissipation in resonant mechanical systems at the micro- and nanoscale is of great technological and fundamental interest. Resonant mechanical systems are central to many sensor technologies, and microscale resonators form the basis of a variety of scanning probe microscopies. Furthermore, coupled resonant mechanical systems are of great utility for the study of complex dynamics in systems ranging from biology to electronics to photonics. In this work, we report the detailed experimental study of internal dissipation in micro- and nano-mechanical oscillators fabricated from amorphous and crystalline diamond materials, atomistic modeling of dissipation in amorphous, defect-free, and defect-containing crystalline silicon, and experimental work on the properties of one-dimensional and two-dimensional coupled mechanical oscillator arrays. We have identified that internal dissipation in most micro- and nano-scale oscillators is limited by defect relaxation processes, with large differences in the nature of the defects as the local order of the material ranges from amorphous to crystalline. Atomistic simulations also showed a dominant role of defect relaxation processes in controlling internal dissipation. Our studies of one-dimensional and two-dimensional coupled oscillator arrays revealed that it is possible to create mechanical systems that should be ideal for the study of non-linear dynamics and localization.

**Biomimetic Energy Transduction: Artificial Photosynthesis in a Stabilized Lipid Membrane Coupled to a Semiconductor**

Saavedra, S. S.; Armstrong, N. R.; Feb. 20, 2007; 11 pp.; In English

Report No.(s): DE2007-899970; No Copyright; Avail.: National Technical Information Service (NTIS)

This research program explored development of artificial, biomimetic photosynthetic assemblies that perform the initial steps of bacterial photosynthesis, visible light absorption, charge separation, and vectorial proton pumping, in a planar supported lipid bilayer (PSLB), coupled to a semiconductor electrode. The creation of a light-driven, transmembrane proton pump interfaced to an electrically active support is significant because at the most basic level, the development of a proton motive force (pmf) across a biological membrane is one of the essential elements of biological energy conversion.

Paeaejaervi, L.; Andersson, P.; Dec. 2005; 36 pp.; In Swedish

Report No.(s): PB2007-106437; FOI-R-1823-SE; No Copyright; Avail.: National Technical Information Service (NTIS)

In the project Electronic Warfare on GNSS, sponsored by the Armed Forces, jamming and anti-jam techniques for GNSS receivers are studied. Antenna arrays and beam-forming is used as an anti-jam technique, and jamming of such systems is also considered. This report gives up-to-date overview of the demonstrator development within this project. The demonstrator is general and intended to be used for several tasks. One example is development, and selection, of beam-forming algorithms, later to be implemented on a more advanced platform. Measurements of the different parts of the demonstrator have been made. Antenna array measurements showed that the antenna array performs well, and that it should be possible to use it to direct beams towards the satellites. Measurements of the 4-channel front end established high levels of cross-talk between the printed circuit cards and the front end must hence be shielded.

**Electrostatic Modeling of Vacuum Insulator Triple Junctions**

Tully, L. K.; Goerz, D. A.; Houck, T. L.; Javedani, J. B.; Oct. 25, 2006; 7 pp.; In English

Report No.(s): DE2007-900151; UCRL-TR-227505; No Copyright; Avail.: National Technical Information Service (NTIS)

Triple junctions are often initiation points for insulator flashover in pulsed power devices. The twodimensional finite-element TriComp (1) modeling software suite was utilized for its electrostatic field modeling package to investigate electric field behavior in the anode and cathode triple junctions of a high voltage vacuum-insulator interface. TriComp enables simple extraction of values from a macroscopic solution for use as boundary conditions in a subset solution. Electric fields computed with this zoom capability correlate with theoretical analysis of the anode and cathode triple junctions within submicron distances for nominal electrode spacing of 1.0 cm. This paper will discuss the iterative zoom process with TriComp finite-element software and the corresponding theoretical verification of the results.

Organic semiconductors based on molecular and polymeric materials have become a major part of the electronics industry in the last 25 years as a complement to the shortcomings of inorganic semiconductors. Most notably, organic semiconductors offer, with respect to current inorganic-based technology, greater ease in substrate compatibility, device processability, flexibility, large area coverage, and reduced cost; as well as facile tuning of the frontier molecular orbital energies by molecular design. A key device used in the electronic industry is the field-effect transistor (FET) based on inorganic electrodes, insulators, and semiconductors. FETs based on organic semiconductors (OFET) may find niche applications in low-performance memory elements as well as integrated optoelectronic devices, such as pixel drive and switching elements in active-matrix organic light-emitting diode (LED) displays.

**Studies on Electrical Safety, When Using ESD Protective Equipment, Especially ESD Protective Garments**

Fast, L.; Franzon, J.; Mannikoff, A.; Boerjesson, A.; Jan. 2005; 60 pp.; In English

Report No.(s): PB2007-103412; SP-RAPP-2005:09; No Copyright; Avail.: National Technical Information Service (NTIS)

Electrical safety is top priority issue for most companies in the world today, both regarding the electrical safety of their customers, but also concerning their own employees during the manufacturing phase. Laws and regulations are very strict on the producers'/employers' responsibility on these issues. By introducing Electro Static Discharge (ESD) protection in a production facility, i.e. creating an ESD Protected Area (EPA), one can jeopardize the electrical safety for the personal; therefore it is highly advisable to always have authorized personal inspecting the EPA, with respect to electrical safety, after any alterations/installations have been performed.

An electrospray ionization device incorporates a shaped thin film with a microfluidic channel. The device may be interfaced to a time-of-flight mass spectrometer (TFOMS). In one embodiment, the shaped thin film has a polygonal-shaped or triangle-shaped thin polymer tip formed by lithography and etching. The microfluidic channel is approximately 20 micrometer wide and 10 micrometers deep, and embossed in a substrate using a silicon master. The shaped thin film is aligned with the channel and bonded between the channel substrate and a flat plate to create a microfluidic channel with a wicking tip protruding from the end of the channel. Application of a high voltage at one end of the channel creates an electrospray from the tip, which is provided to the TFOMS.

A method of forming a highly doped layer of AlGa<sub>N</sub>, is practiced by first removing contaminants from a MBE machine. Wafers are then outgassed in the machine at very low pressures. A nitride is then formed on the wafer and an AlN layer is grown. The highly doped GaAlN layer is then formed having electron densities beyond  $1 \times 10^{20}$  cm<sup>-3</sup> at Al mole fractions up to 65% are obtained. These levels of doping application of n-type bulk, and n/p tunnel injection to short wavelength UV emitters. Some applications include light emitting diodes having wavelengths between approximately 254 and 290 nm for use in fluorescent light bulbs, hazardous materials detection, water purification and other decontamination environments. Lasers formed using the highly doped layers are useful in high-density storage applications or telecommunications applications. In yet a further embodiment, a transistor is formed utilizing the highly doped layer as a channel.

Diegert, C.; Dec. 01, 2006; 37 pp.; In English

Contract(s)/Grant(s): DE-AC04-97AL85000

Report No.(s): DE2007-900418; SAND2006-7894; No Copyright; Avail.: National Technical Information Service (NTIS)

The author defines a new diagnostic method where computationally-intensive numerical solutions are used as an integral part of making difficult, non-contact, nanometerscale measurements. The limited scope of this report comprises most of a due diligence investigation into implementing the new diagnostic for measuring dynamic operation of Sandia's RF Ohmic Switch. Our results are all positive, providing insight into how this switch deforms during normal operation. Future work should contribute important measurements on a variety of operating MEMS devices, with insights that are complimentary to those from measurements made using interferometry and laser Doppler methods. More generally, the work opens up a broad front of possibility where exploiting massive high-performance computers enable new measurements.

Report No.(s): PB2007-108663; No Copyright; Avail.: CASI: [A03](#), Hardcopy

Fabrication of metallic or non-metallic wires with nanometer widths and nanometer separation distances without the use of lithography. Wires are created in a two-step process involving forming the wires at the desired dimensions and transferring them to a planar substrate. The dimensions and separation of the wires are determined by the thicknesses of alternating layers of different materials that are in the form of a superlattice. Wires are created by evaporating the desired material onto the superlattice that has been selectively etched to provide height contrast between layers. The wires thus formed upon one set of superlattice layers are then transferred to a substrate.

Report No.(s): PB2007-104136; No Copyright; Avail.: CASI: [A03](#), Hardcopy

The present invention discloses a relatively simple CVD method for forming branched carbon nanotubes. In general, the method includes adding a dopant to the precursor materials. The dopant can be a material that has a thermodynamically more favorable carbide-forming reaction at the reactor conditions than does the catalyst that is provided to the reactor by a second precursor material. The doped nanoparticles formed in the reactor can adhere to the walls of the developing nanotubes and provide a nucleation site for the development of one or more branches on the nanotube. The nanotubes formed according to the invention can be recognized as such due to the presence of the doped nanoparticles adhered along the walls of the branched nanotubes.

Contract(s)/Grant(s): NSF-CCR-0073469

Patent Info.: Filed 23 Apr 05; US-Patent-Appl-SN-10-830 766

Report No.(s): PB2007-104096; No Copyright; Avail.: CASI: [A03](#), Hardcopy

A dynamically or run-time reconfigurable matrix multiplier architecture with a reconfiguration mechanism for computing

the product of matrices  $X_p \times r$  and  $Y_r \times q$  for any integers  $p, q, r$  and any item precision  $b$ , i.e., bitwidth, ranging from 4 to 64 bits is described. The reconfigurable matrix multiplier uses borrow parallel counters with new circuits, 6 sub--0, and 6 sub--1 and the improved small multiplier library. The reconfigurable matrix multiplier architecture is based on a novel scheme of trading data bitwidth for processing array or matrix size. The matrix multiplier achieves an extra compact, low power, high speed design through the use of a borrow parallel counters and a library of small borrow parallel multiplier circuits. The matrix multiplying processor using area comparable with a single 64 times 64-b multiplier constructed of very large-scale integrated (VLSI) circuits, can be reconfigured to produce the product of two matrices  $X(4 \text{ times } 4)$  and  $Y(4 \text{ times } 4)$  of 8, 16, and 32-bit data items in every 1, 4, and 16 pipeline cycles, respectively, or the product of two 64-b numbers in every pipeline cycle.

A monolithic device for photonically coupling a first optical waveguide to a second optical waveguide, including: an input being optically coupled to the first waveguide; a first portion being optically coupled to the input; a second portion being optically coupled to the first portion; and, an output being optically coupled to the second portion and the second waveguide; wherein, when an optical signal is provided on the first waveguide, a given part of the signal is provided to the second waveguide dependently upon an angle between the first and second portions. At least one of the waveguides may have an amorphous silicon material coating.

ONLINE: <http://hdl.handle.net/100.2/ADA468670>

The increasingly complex battlefield environment drives the requirement for the presentation and interactive control of the endless stream of information arriving from a diverse collection of sensors deployed on a variety of platforms. At best, the situational awareness picture is fragmented without the benefit of data fusion and correlation to present a true picture of the battlespace from all information sources. Collaboration and interaction is also needed for operators within a control center and among remote geographic locations. The need to display and manipulate real-time multimedia data in a battlefield operations control center is critical to the Joint Commander directing air, land, naval and space assets. The Interactive DataWall being developed by the Advanced Displays and Intelligent Interfaces (ADII) technology team of the Information Directorate of the Air Force Research Laboratory (AFRL/IF) in Rome, New York is a strong contender for solving the information management problems facing the 21st century military commander. It provides an ultra high-resolution large screen display with wireless interaction. Commercial off-the-shelf technology has been combined with specialized hardware and software developed in-house to provide a unique capability for multimedia data display and control.

Our scientific objective is to advance our fundamental understanding of how the brain plans and executes arm movements.

Our technical objective is to design and build high-performance neural prostheses. Jointly, these objectives should provide a deeper understanding of the neural control of natural movement, and a better design of neural prostheses to restore movement to the disabled, including the disabled warfighter.

Significant research achievements have been accomplished in development of multi-photon active materials and applications as well as of novel nanocomposites materials for opt-electronic technology. The specific research progress achieved by this grant support can be summarized as follows. (I) Nonlinear optical limiting and stabilization of 1064-nm laser pulses using a novel two-photon absorbing liquid dye salt system. The major advantage of using a neat liquid dye salt as the two-photon absorbing medium is that the effective molar concentration can be increased by two orders of magnitude and it can withstand much higher input laser energy and intensity. (II) A new-type stimulated Rayleigh-Bragg scattering generated in a novel two-photon absorbing dye solution. It is a two-photon excitation enhanced backward stimulated Rayleigh scattering in a non linearly absorbing dye solution. This stimulated scattering shows no frequency shift and therefore is different from most of other known stimulated scattering processes. The principle of this effect can be highly useful for optical phase-conjugation technique and optical power limiting applications. (III) Synthesis, two- and three photon absorption, and optical limiting properties of fluorene containing ferrocene derivatives and novel dendritic structures. These newly designed and synthesized systems have provided a considerably improved two- and three photon absorption cross-section values, and demonstrated good optical power limiting behavior in fs-regime for both 775-nm and 1300-nm wavelengths.

Under the major support from AFOSR (FA9550-04-1-0215) during the years of 2004, 2005 and 2006, we have done significant achievement on scientific research and invented very promising electronic and optoelectronic devices including (1) nano-composite polymer memory devices based on metal-nanoparticles and nano-structured virus biomaterials, (2) vertical organic transistors, (3) efficient polymer solar cells, and (4) high efficient polymer light emitting diodes. We totally published 32 papers in the first rated referee journals and filed 8 patents. Some of the developed technologies have been transferred to industry for commercialization (see the attached table).

Our SPRING III activities concentrated this year on mass spectrometry, a new MALDI system and an ESI-TOF system. We can now perform high resolution nanoparticle analysis along with protein analysis. We consolidated and rehabilitated the Rice X-ray facilities, spending \$140K to upgrade the computer controls, software, and adding attachments for temperature

control on powder and single crystal systems. An investment toward accessories to the JEOL 200KV FEG Model 2100F include a scanning attachment, coupled with energy filtering (GIF) and energy dispersive X-ray spectrometer to convert our high-resolution TEM to a fully analytical scanning transmission electron microscope.

ONLINE: <http://hdl.handle.net/100.2/ADA468932>

Radio frequency (RF) communication systems are particularly vulnerable because the antenna provides a direct port of entry for electromagnetic radiation. This report describes a new type of RF receiver front-end that features a complete absence of electronic circuitry and metal interconnects the traditional soft spots of a conventional RF receiver. The device consists of a dielectric resonator antenna that concentrates and feeds the signal onto a resonant electro-optic field sensor. The absence of metallic interconnects and the charge isolation provided by the optics removes the soft spots in a traditional receiver. In the proof-of concept experiment, detection of C band electromagnetic signals at 7.38 GHz with a sensitivity of  $4.3 \times 10^{-3}$  V/m.Hz(exp 1/2) is demonstrated. The dielectric approach has an added benefit: it reduces physical size of the front end an important benefit in mobile applications. **Quantification of Impact Damage in CMC Thermal Protection Systems Using Thin-Film Piezoelectric Sensors (Preprint)**

Kuhr, Samuel J; Blackshire, James L; Mar 2007; 12 pp.; In English

Report No.(s): AD-A469019; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA469019>

Thermal protection systems (TPS) are frequently subjected to impacts from micrometeoroids and ground handling during refurbishment. The damage resulting from such impacts can greatly reduce the vehicle's overall ability to resist extreme temperatures. Therefore, it is essential to have a reliable method to detect and quantify the damage resulting from impacts. In this effort, the effectiveness of lightweight thin film piezoelectric sensors was evaluated for impact detection and quantification in CMC wrapped TPS. The sensors, which were adhered to the bottom of the TPS tile, were used to sense impact events occurring on the top of the tile, with the ultimate goal of quantifying the level of impact level and damage state based on the sensed signals. A reasonable correlation between impact load levels and sensed response were observed for load levels between 0.07-1.00 Joules. An increase in signal frequency content was also observed as impact levels were increased, with specific frequency bands occurring in the 2-16 kHz range. A preliminary nondestructive evaluation of the impact damage sites

was also accomplished, where a reasonable correlation between the gross damage features (i.e. impact crater dimensions) and signal response was observed.

The Department of Defense (DoD) has a long history of successfully supporting innovative research and development efforts for the future advancement of war fighter and battle systems capabilities. Since the 1980s, DoD including the Defense Advanced Research Projects Agency (DARPA), Office of Naval Research (ONR), Army Research Office (ARO) and the Air Force Office of Scientific Research (AFOSR) initiated numerous research and development programs focusing on advancing science and technology below one micron in size. Scientific breakthroughs and advances in the last ten years demonstrate the potential for nanotechnology to impact a tremendous number of key capabilities for future war fighting: chemical and biological warfare defense; high performance materials for platforms and weapons; unprecedented information technology; revolutionary energy and energetic materials; and uninhabited vehicles and miniature satellites. In support of the National Nanotechnology Initiative, DoD is a member of the Nanoscale Science and Engineering Technology (NSET) subcommittee of the National Science and Technology Council's Committee on Technology. Twenty three federal departments and agencies are members of the NSET, including the Intelligence Community. The NSET meets bimonthly to coordinate the federal government's nanotechnology programs.

This study analyzes how to efficiently create a storage circuit to charge a capacitor with a radioisotope power converter. Variables analyzed include capacitance and frequency of pulse/discharge. Virtual Test Bed was used to display the transient effects of the charging circuit. MATLAB was used to explore the efficiency of circuits. Results indicate efficient circuits need a capacitance that correlates to the number of times the capacitor is discharged in a day.

**The Costs of Not Using Green Design in the USAF: Would Using Green Building Design Have Resulted in Life Cycle Cost**

Osborne, J K; Mar 2007; 61 pp.; In English; Original contains color illustrations

Report No.(s): AD-A469170; AFIT/GCA/ENV/07-M8; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA469170>

This study's purpose is to determine if using green building design would have resulted in life cycle costs savings for the USA Air Force. Green designs are those that employ steps to mitigate the impacts facilities have on the environment by using resources more efficiently than conventional design. The prevailing ranking system for green design in the USA is the Leadership in Energy and Environmental Design (LEED) which evaluates facilities on certain characteristics, assigning certain point values that translate to non-certified, certified, silver, gold, or platinum ratings. The author attempts here to show how previous studies indicated the presence of construction cost premiums, savings in operating costs and environmental benefits from green design. The literature review also shows the extent the Air Force and Department of Defense have incorporated green building standards into current policy. After performing an analysis of Air Force building data, this study

suggests that deciding to build green would not pay for itself based off of energy and environmental benefits alone.

Report No.(s): PB2007-108631; No Copyright; Avail.: CASI: [A03](#), Hardcopy

A grating coupled surface plasmon resonance optical modulator is disclosed. A electro-optic polymer dielectric is deposited on the metallic surface of a diffraction grating to provide a metal/dielectric interface. A surface plasmon will propagate at the metal/dielectric interface in a resonant condition, e.g., when the metal surface is illuminated by transverse magnetic (TM) polarized light of the appropriate wavelength, angle of incidence and phase velocity. In the present invention, phase velocity is controlled by the diffraction grating. A transparent electrode deposited on the electro-optic layer allows an electrical potential to be applied across the electro-optic polymer. The applied electrical potential (voltage) changes the index of refraction of the electro-optic polymer, thereby disrupting the resonant condition to produce an optically detectable change in reflectance of incident light from the metal layer. The disclosed grating coupled surface plasmon resonance optical modulator may be configured as an electronically or optically addressable array.

Contract(s)/Grant(s): ARMY-W31P4Q-04-C-R074

Patent Info.: Filed 14 Apr 05; US-Patent-Appl-SN-11-106 875

Report No.(s): PB2007-108638; No Copyright; Avail.: CASI: [A03](#), Hardcopy

A coolerless photonic integrated circuit (PIC), such as a semiconductor electro-absorption modulator/laser (EML) or a coolerless optical transmitter photonic integrated circuit (TxPIC), may be operated over a wide temperature range at temperatures higher than room temperature without the need for ambient cooling or hermetic packaging. Since there is large scale integration of N optical transmission signal WDM channels on a TxPIC chip, a new DWDM system approach with novel sensing schemes and adaptive algorithms provides intelligent control of the PIC to optimize its performance and to allow optical transmitter and receiver modules in DWDM systems to operate uncooled. Moreover, the wavelength grid of the on-chip channel laser sources may thermally float within a WDM wavelength band where the individual emission wavelengths of the laser sources are not fixed to wavelength peaks along a standardized wavelength grid but rather may move about with changes in ambient temperature. However, control is maintained such that the channel spectral spacing between channels across multiple signal channels, whether such spacing is periodic or aperiodic, between adjacent laser sources in the thermally floating wavelength grid are maintained in a fixed relationship. Means are then provided at an optical receiver to discover and lock onto floating wavelength grid of transmitted WDM signals and thereafter demultiplex the transmitted WDM signals for OE conversion.

Contract(s)/Grant(s): F49620-03-1-0135; F49620-01-1-0146

Report No.(s): AD-A466385; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA466385>

The flow field generated by a zero-net mass-flux (ZNMf) actuator is investigated via both numerical simulations and experiments to augment the current understanding of the flow physics of the orifice. The results aid in improving the accuracy of low dimensional lumped element ZNMf models suitable for design. Dimensional analysis yields a number of key parameters that govern the characteristics of this flow. Among them, for a sharp rectangular slot or circular orifice, are the Reynolds number, the dimensionless stroke length, and the orifice height-to-diameter ratio. Variation of these parameters shows that the flow field differs appreciably from the exact linear solution of pipe flow driven by an oscillatory pressure gradient. In particular, depending on the stroke length and the orifice geometry, the pressure drop in the orifice may be dominated by nonlinear minor losses due to entrance/exit effects, or linear major losses associated with the presence of a nominally fully-developed region in the central region of the orifice/slot.

Contract(s)/Grant(s): F49620-00-1-0284

Report No.(s): AD-A466403; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA466403>

Fluid-dynamic systems are inherently nonlinear and are subject to a combination of coherent and random unsteady disturbances. As a result, accurate low-order dynamic models are difficult to obtain for real-time control of such systems. Therefore, controllers implementing adaptive on-line system identification are ideally suited to flow control problems. Adaptive linear and nonlinear filters for real-time system identification are presented in this paper. The linear models studied are traditional FIR and IIR filters, and the nonlinear models include a 2nd-order Volterra filter and the Bilinear filter. The coefficients of the adaptive filter models are calculated and updated using two of the most popular recursive methods, the normalized LMS and RLS algorithms. The adaptive filters are tested offline in software and then implemented on real-time DSP hardware. The focus of this study is on model accuracy and viability in real-time applications. The real-time performance is measured in terms of achievable sampling frequency. Specific applications to relevant nonlinear systems, a spring-mass damper model and a drag-law problem, are also considered in detail.

ONLINE: <http://hdl.handle.net/100.2/ADA466814>

Gas turbine engines have long used fuel on its way to the combustor as a coolant for engine components. Advanced aircraft and engine technologies are demanding more cooling capacity than conventional fuel delivery systems can offer. To meet these new cooling requirements, technologies are being pursued to allow fuel to reach significantly higher temperatures without the traditional limitations associated with coking. A compact fuel/air heat exchanger is a critical component in these new high-temperature fuel systems. Both tubular metal foam and hollow-truss cellular metal heat exchangers were examined for performance, size, and weight benefits as compared to conventional shell-tube technology. The tubular metal foam heat exchanger behavior was characterized with scaled laboratory and full-scale rig experiments. The data were used to calibrate an analytical model based on data in the open literature. The results indicate that sintered metal foam can provide as much as twice the heat transfer as a plain bank of staggered tubes. However, the corresponding 4X increase in pressure drop almost neutralizes the heat transfer benefit. Furthermore, it was determined that metal foam manufacturing constraints combined with

the small high pressure fuel tubes would result in a design which has no size/weight or performance benefit. However a 40 % reduction in the number of tubes may provide improved reliability. A preliminary investigation of a hollow-tube cellular metal heat exchanger found that when elliptical non-flowing rods are used to augment the tube-bank they can increase the heat transfer by as much as 1.5X over a plain staggered tube-bank without a significant increase in pressure drop. It is projected that 10 % weight and 30 % size reductions can be achieved with hollow-truss cellular metal as compared to shell-tube heat exchanger. However, realization of hollow-tub cellular metal may require a costly manufacturing process.

**Atomization Performance Predictions of Gas-Centered Swirl-Coaxial Injectors**

Lightfoot, Malissa D; Danczyk, Stephen A; Talley, Douglas G; Mar 16, 2007; 10 pp.; In English

Contract(s)/Grant(s): Proj-5026

Report No.(s): AD-A468183; AFRL-PR-ED-TP-2007-121; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA468183>

The ability to predict injector performance can reduce the cost of rocket engine development. This paper details a new theory to predict the atomization efficiency and droplet diameter from the atomization of wall-bounded films with strong gas-phase influences. In this theory atomization occurs when a disturbance is created on the film surface then breaks down into droplets via stripping. The theory relates the mass of film lost via atomization to the mass of liquid introduced into the atomizer to predict atomization efficiency and offers some estimations of primary droplet diameter. A specific example involving a gas-centered swirl coaxial injector is discussed. The results of experiments and simulations are used to support assumptions and are successfully compared to some simple predictions from the theory. Despite the application to a specific injector efforts are made to keep the theory as general as possible so that it applies to many types of injectors and a wide range of operating conditions.

Contract(s)/Grant(s): FA9550-04-1-0177

Report No.(s): AD-A466943; CCD-2007-1; No Copyright; Avail.: Defense Technical Information Center (DTIC)

Achievement of the future US Air Force mission requires development of new high speed air vehicles. The aerodynamic performance of high speed air vehicles is sensitive to local flow phenomena which may adversely affect vehicle operation and possibly result in vehicle loss. An example is the Edney W shock-shock interaction which causes intense local surface heat transfer. New concepts in local flow control for high speed flows are needed to alleviate or eliminate adverse local flow phenomena. \* Recently, a promising new research field in local flow control for high speed flows has emerged - Electromagnetic Local Flow Control (ELFC). Examples include beamed energy addition (e.g, laser and/or microwave energy deposition) and DC discharge, with or without external magnetic fields. Recent conferences and workshops have emphasized the importance of ELFC and identified many promising opportunities. This report describes the research accomplishments of Rutgers - The State University of New Jersey, the University of Illinois Urbana-Champaign and the University of Minnesota in understanding the fundamental physics and practical applications of Electromagnetic Local Flow Control in high speed flows.

Contract(s)/Grant(s): Proj-622618.H80

Report No.(s): AD-A467745; ARL-TR-3866; No Copyright; Avail.: Defense Technical Information Center (DTIC)

A mission program named Extended Area Protection and Survivability was initiated at the U.S. Army Research

Laboratory to demonstrate guided ammunition technologies to defend the battle space against any presented targets, such as mortars, rockets, and artillery. This report introduces the first step in the development of the guided ammunition system. It presents high-level physics-based simulations of a 60-mm projectile system. The topology of the initial projectile was developed on the basis of gun barrel specifications and certain aerodynamics characteristics. A three-dimensional finite element model was created to present the projectile system. Three different projectile configurations were analyzed with the LS-DYNA program and the results were compared. An acceptable design demonstrated that the muzzle velocity reached only 85% of target value mainly because the launch package exceeded the desired mass by 25%. In addition, a characteristic centerline variation of a gun barrel was taken into account in this report. The outcome of the in-bore vertical displacements and accelerations attributable to the variation was found to be significant. Note that the structural configuration of the initial projectile is not optimal. Rigorous optimization efforts will be made on the system, particularly on the sabot component, in order to meet performance requirements.

**Code Validation of CFD Heat Transfer Models for Liquid Rocket Engine Combustion Devices**

Coy, E B; Mar 23, 2007; 44 pp.; In English

Contract(s)/Grant(s): Proj-5026

Report No.(s): AD-A467839; AFRL-PR-ED-TP-2007-157; No Copyright; Avail.: Defense Technical Information Center (DTIC)

This paper reports on the development of a new heat transfer test rig for exploratory testing of new technologies for controlling chamber wall heat transfer. The design of the rig and its capabilities are described. A second objective of the test rig is to provide CFD validation data under conditions relevant to liquid rocket engine thrust chambers. The approach to validation that was adopted was to establish the minimum level of validation uncertainty that can be achieved for a fully-reacted, uniform flow. A method for characterizing the surface temperature and heat flux to the wall is described based on sensors embedded within the wall of the chamber.

**Swirl-Stabilized Injector Flow and Combustion Dynamics for Liquid Propellants at Supercritical Conditions**

Yang, Vigor; Feb 8, 2007; 84 pp.; In English

Contract(s)/Grant(s): FA9550-04-1-0014

Report No.(s): AD-A467900; No Copyright; Avail.: Defense Technical Information Center (DTIC)

An integrated modeling and simulation program has been conducted to substantially improve the fundamental knowledge of supercritical combustion of liquid propellants under conditions representative of contemporary rocket engines. Both shear and swirl co-axial injectors were considered. The formulation was based on the complete conservation equations in three dimensions. In addition, general-fluid thermodynamics and transport theories were incorporated to allow for a unified treatment of fluid properties over the entire range of thermodynamic states. Turbulence closure was achieved by means of the large-eddy-simulation (LES) technique. Special attention was given to the fluid behavior in the two-phase and transcritical regimes in which rapid property variations occur. Various underlying physiochemical mechanisms associated with co-axial injector dynamics were studied in detail. These included flow evolution, flame stabilization and spreading, heat transfer, and acoustic response. The effects of design attributes and operating conditions on injector characteristics were assessed. Results have not only enhanced the basic understanding of the subject problem, but also provided a quantitative basis for identifying and prioritizing the key design parameters and flow variables that exert dominant influences on the injector behavior in different environments.

**A Rocket-Like Coaxial Injector in an Acoustic Field Under Sub- and Supercritical Conditions (POSTPRINT)**

Davis, D W; Chehroudi, B; Talley, D G; May 3, 2006; 9 pp.; In English

Contract(s)/Grant(s): Proj-2308

Report No.(s): AD-A468072; AFRL-PR-ED-TP-2006-123; No Copyright; Avail.: Defense Technical Information Center (DTIC)

An experimental investigation was undertaken under non-reacting condition to gain a physical understanding of the interaction of acoustic waves and a coaxial-jet injector similar to those used in cryogenic liquid rockets. Liquid nitrogen (the round inner jet) and gaseous nitrogen (the annular outer jet) were used under subcritical, near critical, and supercritical chamber pressures, with and without presence of an external acoustic field. High-speed imaging provided information on the dynamic behavior of the jet under a variety of conditions. It is found that when the jet is at the pressure node, an externally-imposed acoustic field excites the dark-core of the jet to a wavy-shaped structure consistent with the field's characteristics. Mean and root mean square (RMS) values of the dark-core length fluctuations were measured from images. It is found that when the outer-to-inner-jet velocity ratio increases, the RMS of the dark-core length fluctuations decreases both with and without the existence of the acoustic field. A connection to the rocket instability may be established from these data through examination of the RMS values. It is possible that decreases in the fluctuation levels, observed at higher velocity ratios, could weaken a key feedback mechanism for the self-excitation process that could be driving combustion instability in rocket engines. This can offer a possible explanation of the combustion stability improvements experienced in engines when a transition to higher values of the outer-to-inner-jet velocity ratio is made. Finally, after a careful review of relevant data taken here and elsewhere, there appears to be a good correlation between the dark-core length and the momentum flux ratio.

**A Method to Predict Atomization Performance in Gas-Centered Swirl-Coaxial Injectors**

Lightfoot, M D; Danczyk, S A; Talley, D G; Mar 27, 2007; 11 pp.; In English

Contract(s)/Grant(s): Proj-5026

Report No.(s): AD-A468129; AFRL-PR-ED-TP-2007-125; No Copyright; Avail.: Defense Technical Information Center (DTIC)

The ability to predict atomizer performance can reduce the cost of system development in many areas. This paper investigates the atomization efficiency and droplet distribution from films with strong gas-phase influences. A prediction of atomization efficiency based on a general theory of the droplet creation process is given. In this process a disturbance is created on the film surface then broken down into droplets via stripping. The theory relates the mass of film lost via atomization to the mass of liquid introduced into the atomizer to predict atomization efficiency and offers some estimations of primary droplet diameter. A specific example involving a gas-centered swirl coaxial injector is given to illustrate how the theory would be applied; however, efforts are made to keep the model as general as possible so that it applies to many types of atomizers and a wide range of operating conditions.

**Comparison of Thermodynamic Equilibrium and Non-Equilibrium Representation of Materials**

Vanderhyde, Michael J; Mar 22, 2007; 135 pp.; In English; Original contains color illustrations

Report No.(s): AD-A468308; AFIT/GAE/ENY/07-M25; No Copyright; Avail.: Defense Technical Information Center (DTIC)

Hydrocodes are valuable tools in the modeling of shock wave propagation through solids due to high speed impact phenomena. CTH is a hydrocode built with the ability to use multiple EOSs, including the semi-empirical Mie-Gruneisen EOS and tabular Sesame EOS. Modeling high speed impacts necessitates modeling the non-equilibrium thermodynamic states caused by these impacts. A discussion of the non-equilibrium thermodynamics that may be applied to the region directly behind a shock wave is presented, including details of recent attempts to model non-equilibrium impact phenomena in solids. Also, in order to better determine the applicability of the Mie-Gruneisen EOS and the two state PTRAN EOS and the Sesame EOS in situations that include non-equilibrium thermodynamics, the high speed, uniaxial impacts between two iron bars are modeled in CTH. The differences between the Mie-Gruneisen EOS and the Sesame EOS are established. A finite volume

uniaxial hydrocode is validated. Finally, CTH is shown to be able to model some irreversibilities occurring in impact phenomena.

**Quantifying Non-Equilibrium in Hypersonic Flows Using Entropy Generation**

Carr, Ryan W; Mar 2007; 127 pp.; In English; Original contains color illustrations

Report No.(s): AD-A468381; AFIT/GAE/ENY/07-M07; No Copyright; Avail.: Defense Technical Information Center (DTIC)

The constitutive relations traditionally used for finding shear stress and heat flux in a fluid become invalid in non-equilibrium flow. Their derivation from kinetic theory only demonstrates they are valid only for small deviations from equilibrium. Because it is fundamentally linked to non-equilibrium, entropy generation is used to investigate the limits of the continuum constitutive relations. However, the continuum equations are inherently limited to near equilibrium conditions due to the constitutive relations; thus kinetic theory must be used as a basis for comparison. Direct Simulation Monte Carlo (DSMC), a particle method alternative to continuum methods, is based on kinetic theory and is used to develop a flow solution free from equilibrium assumptions. Solutions were obtained for hypersonic flow over two axisymmetric geometries using both a continuum solver and DSMC. Formulations for entropy generation are presented for each method, and the two solutions are compared. The continuum solver fails to capture regions of non-equilibrium as evidenced by thicker shocks in the DSMC solution. To extend the useful range of the continuum constitutive relations, the Lennard-Jones model is offered as an alternative to Sutherland's Law for calculating viscosity and thermal conductivity. The two are compared, and parameters offering a good fit for these flows are suggested for the Lennard-Jones model.

**Experimental Characterization of Turbulent Flow Around Cylinder Arrays**

Harder, Adam D; Mar 2007; 74 pp.; In English; Original contains color illustrations

Report No.(s): AD-A468435; AFIT/GAE/ENY/07-M12; XC-46TW; No Copyright; Avail.: Defense Technical Information Center (DTIC)

This research was done as part of an effort to develop alternative fire suppressant technologies for aircraft engine nacelles. A circular cylinder array was designed, built, and placed in the AFIT roll-around low speed wind tunnel to model generic clutter inside an engine nacelle. A turbulence grid was fabricated to enable measurements of the effects of turbulence level, independent of airspeed, on the flow over different model configurations. The wind tunnel test section was 12 inches wide x 12 inches high x 24 inches long. Pressure differential measurements were taken on various cylinder configurations. The configurations included one cylinder as well as one, two, and three arrays of cylinders. Half diameter spacing was used for two and three cylinder cases, as well as an additional case at a two-diameter spacing with the three array configuration. All conditions were tested with and without the turbulence grid placed at the front of the test section. Pressure differential measurements were taken at 15-degree increments from 0 degrees - 180 degrees on the circumference of an upstream cylinder, centered vertically on the array. Hot-wire measurements were taken with and without the turbulence grid to determine airspeed and the effect of turbulence intensity generated by the grid on the wake profile. Also, vertical traverse data was taken with the hot-wire to determine airflow characteristics behind two configurations, both with and without a turbulence grid. The first had only one cylinder installed while the second was done with three arrays spaced at a half-diameter length. Pressure and velocity measurements were used to investigate the effects caused by the upstream turbulence grid.

**Correcting the Response of an Albedo Neutron Dosimeter for Energy**

Riel, Gordon K; Winters, Patrick J; Cassata, James R; St John, Ted; Benevides, Luis A; Jan 2007; 27 pp.; In English; Original contains color illustrations

Report No.(s): AD-A468456; NSWCCD-63-TR-2006/36; No Copyright; Avail.: Defense Technical Information Center (DTIC)

The neutron response of an albedo neutron dosimeter varies greatly with energy. For example, the dosimeter, calibrated

with moderated Californium fission neutrons, will read more than 30 times the dose from thermal neutrons and less than 3% of the dose from 14 MeV neutrons. To report a correct result, the measured dose equivalent is multiplied by a neutron energy correction factor (NECF). Two techniques for finding the NECF were developed through a cooperative effort among the Naval Research Laboratory, the Naval Surface Warfare Center, and the Naval Dosimetry Center. Data for the DT-702 (measured in 5 different neutron spectra) matched data for the DT-648 dosimeter from 15 spectra that included an SSBN and the NATO standard battlefield spectrum. NECFs calculated from count rate ratios of the AN/PDR-70 neutron remmeter (rem) to its internal parts (guts) or from the ratio of the inner to the outer neutron dosimeters in the DETECTOR RADIAC SS-20/S (NAM-5) make the DT-702 dosimeter about as accurate as the AN/PDR-70 neutron remmeter.

### **Broken Symmetries and Magnetic Dynamos**

Shebalin, John V.; [2007]; 18 pp.; In English; Original contains black and white illustrations; No Copyright; Avail.:

CASI: A03, Hardcopy

ONLINE: <http://hdl.handle.net/2060/20070028911>

Phase space symmetries inherent in the statistical theory of ideal magnetohydrodynamic (MHD) turbulence are known to be broken dynamically to produce large-scale coherent magnetic structure. Here, results of a numerical study of decaying MHD turbulence are presented that show large-scale coherent structure also arises and persists in the presence of dissipation. Dynamically broken symmetries in MHD turbulence may thus play a fundamental role in the dynamo process.

### **Large-eddy Simulation of Round Turbulent Jets Using the Inertial LES Method with Multifractal Subgrid-Scale Modeling**

Burton, G.; Jan. 10, 2007; 8 pp.; In English

Report No.(s): DE2007-902263; UCRL-CONF-227154; No Copyright; Avail.: National Technical Information Service (NTIS)

The free round turbulent jet is perhaps the most extensively studied of the canonical free turbulent shear flows. Turbulent jets are important in a variety of industrial applications, such as fuel injectors, furnaces and rocket engines, as well as in high energy-density phenomena such as astrophysical jets and inertial confinement fusion. The enormous range of length and time scales generated by such flows, however, makes high-resolution laboratory or field study of most of them difficult or impossible. The multiplicity of scales also prevents direct numerical studies (DNS) of such flows, since fully resolving all dynamically-significant scales would require computational power well beyond present-day capabilities. Currently, therefore, the most promising method to study such flows on the computer is through large-eddy simulation (LES), in which only the larger turbulent scales are calculated explicitly, while the smaller, unresolved scales are modeled. However, most presently available modeling techniques lack the fidelity necessary for LES to become a more widely-accepted tool for scientific and engineering work.

### **Nonequilibrium Stagnation-Line Radiative Heating for Fire II**

Johnston, Christopher O.; Hollis, Brian R.; Sutton, Kenneth; June 25, 2007; 17 pp.; In English; 39th AIAA Thermophysics Conference, 25-28 Jun. 2007, Miami, FL, USA; Original contains color illustrations

Contract(s)/Grant(s): WBS 732759.07.05; No Copyright; Avail.: CASI: A03, Hardcopy

ONLINE: <http://hdl.handle.net/2060/20070029232>

This paper presents a detailed analysis of the shock-layer radiative heating to the Fire II vehicle using a new air radiation model and a viscous shock-layer flowfield model. This new air radiation model contains the most up-to-date properties for modeling the atomic-line, atomic photoionization, molecular band, and non-Boltzmann processes. The applied viscous shock-layer flowfield analysis contains the same thermophysical properties and nonequilibrium models as the LAURA Navier-Stokes code. Radiation-flowfield coupling, or radiation cooling, is accounted for in detail in this study. It is shown to

reduce the radiative heating by about 30% for the peak radiative heating points, while reducing the convective heating only slightly. A detailed review of past Fire II radiative heating studies is presented. It is observed that the scatter in the radiation predicted by these past studies is mostly a result of the different flowfield chemistry models and the treatment of the electronic state populations. The present predictions provide, on average throughout the trajectory, a better comparison with Fire II flight data than any previous study. The magnitude of the vacuum ultraviolet (VUV) contribution to the radiative flux is estimated from the calorimeter measurements. This is achieved using the radiometer measurements and the predicted convective heating. The VUV radiation predicted by the present model agrees well with the VUV contribution inferred from the Fire II calorimeter measurement, although only when radiation-flowfield coupling is accounted for. This agreement provides evidence that the present model accurately models the VUV radiation, which is shown to contribute significantly to the Fire II radiative heating.

**Hypersonic Magneto-Fluid-Dynamic Compression in Cylindrical Inlet**

Shang, Joseph S.; Chang, Chau-Lyan; June 25, 2007; 11 pp.; In English; 37th AIAA Fluid Dynamics Conference and Exhibit, 25-28 Jun. 2007, Miami, FL, USA; Original contains color illustrations

Contract(s)/Grant(s): WBS 599489; Copyright; Avail.: CASI: [A03](#), Hardcopy

Hypersonic magneto-fluid-dynamic interaction has been successfully performed as a virtual leading-edge strake and a virtual cowl of a cylindrical inlet. In a side-by-side experimental and computational study, the magnitude of the induced compression was found to be depended on configuration and electrode placement. To better understand the interacting phenomenon the present investigation is focused on a direct current discharge at the leading edge of a cylindrical inlet for which validating experimental data is available. The present computational result is obtained by solving the magneto-fluid-dynamics equations at the low magnetic Reynolds number limit and using a nonequilibrium weakly ionized gas model based on the drift-diffusion theory. The numerical simulation provides a detailed description of the intriguing physics. After validation with experimental measurements, the computed results further quantify the effectiveness of a magnet-fluid-dynamic compression for a hypersonic cylindrical inlet. At a minuscule power input to a direct current surface discharge of 8.14 watts per square centimeter of electrode area produces an additional compression of 6.7 percent for a constant cross-section cylindrical inlet.

As part of the Kunsan Focused Effort (KFE), which was a project that sought to develop counter-biological warfare (C-BW) strategies and procedures designed to mitigate the impacts of BW attacks on Air Force operations, this technical report describes a project that examined both historic and contemporary studies related to background aerosol materials and biological weapon (BW) detection systems. The goal was to summarize how current BW detection systems are expected to behave in a non-laboratory environment. This report describes past monitoring programs and their key results. The programs described were selected because their data results were directly applicable to the background problems being analyzed, namely, the nature of background concentrations and fluctuations of aerosol materials that are known to adversely affect BW detection systems. This technical report illustrates the modeling effort that was undertaken to determine if it was possible to analytically reproduce aerosol concentrations observed by aerosol particle counter devices.

ONLINE: <http://hdl.handle.net/100.2/ADA466118>

A framing camera incorporating an ultra high resolution CCD detector array comprised of 9,216 x 9,216 pixels is discussed. The detector array measures 8 x 8 centimeters and has been scaled to be fabricated in one piece on a 5inch diameter

silicon wafer. Pixel size is 8.75 x 8.75 microns which gives 57 lp/mm resolution. The detector array features a two frame per second readout capability which allows collection of stereo imagery from very high V/H platforms. Image Motion Compensation is achieved by operating the frame readout clocks during the exposure interval in typical TDI fashion. The high geometric accuracy of pixel placement on the array yields a camera suitable for mapping, reconnaissance, space and astronomy applications. In this paper, measured detector array performance, detector array yield and overall camera performance are presented.

#### **Alternatives for Military Space Radar**

Jan 2007; 88 pp.; In English; Original contains color illustrations

Report No.(s): AD-A466170; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA466170>

The U.S. Air Force, National Reconnaissance Office, and National Geospatial-Intelligence Agency are developing a new radar reconnaissance satellite known as Space Radar to produce images of the Earth's surface using synthetic aperture radar (SAR) techniques and to detect moving targets on the ground, among other missions. The first launch of what would eventually be a constellation of Space Radar satellites is now planned for about 2015. Since the late 1970s, various nations have operated SAR imaging satellites for national security or scientific purposes. However, as currently envisioned, Space Radar would be more capable than existing systems or those likely to be launched in the next few years. In particular, the ability to identify moving targets from space would constitute a major improvement in capability. Fully realizing that and other advances, however, would require designers to meet numerous technical challenges.

#### **Outlier Detection in Hyperspectral Imaging Using Closest Distance to Center with Ellipsoidal Multivariate Trimming**

Caulk, Ryan F; Mar 2007; 103 pp.; In English; Original contains color illustrations

Report No.(s): AD-A466861; AFIT/GOR/ENS/07-02; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA466861>

Many multivariate techniques are available to find outliers in a hyperspectral image. Among the algorithms one may utilize is a global anomaly detector called Ellipsoidal Multivariate Trimming (MVT). In this paper we tested the efficacy of using the Closest Distance to Center (CDC) algorithm in conjunction with MVT to find outliers among a hyperspectral image. Since MVT is a global anomaly detector the images were first clustered using a variety of techniques. Among the hyperspectral images used for evaluation in this study, only one of the images contained more than 5% outliers in any given cluster set. Based upon the assumption that this is normally the case for most images, the standard use of 50% retention within MVT does not perform as well as using a higher value such as 95% for retention in MVT. This use of a higher number of observations for the estimate of the mean and covariance is shown to decrease the effect of swamping seen when using 50% retention. Furthermore, the use of CDC to initialize the MVT iteration process did not have any effect on outlier determination, but did increase the time to compute significantly.

ONLINE: <http://hdl.handle.net/100.2/ADA467353>

This report presents the development of a multiple frequency continuous wave radar for target detection and classification. The radar design incorporates specifications germane to both basic research and personnel detection applications. An extensive

database of radar signatures is collected, processed, and analyzed. The radar signature database contains data from human, vehicle and animal subjects. The subjects undergo significant variation in velocity, range, approach angle, and posture to represent potential operational conditions. The radar's detection and ranging performance is predicted and Tested. Classification performance is experimentally quantified using the acquired database. wave

ONLINE: <http://hdl.handle.net/100.2/ADA467998>

The research efforts proceeded on different fronts leading to advances in target detection, tracking, and characterization for over the Over-the-Horizon radar applications as well as for urban sensing and through-the-wall radar imaging applications. Improved characterizations of the targets are achieved using multiple OTHRs operating simultaneously as compared to a single OTHR operating alone. We have introduced the spatial polarimetric time-frequency distributions (SPTFDs) as a platform for processing polarized nonstationary signals incident on multiple dual-polarized double-feed antennas. For urban sensing applications two different techniques to provide high imaging quality of scenes behind walls when wall characteristic are unknown were proposed. When considering chirp radar signals or complex Doppler target signatures we have improved blind separation of signals with time-varying spectra using Multiple Hypothesis Testing. Further, we have enhanced the estimation of the phase parameters of mono- or multi-component frequency modulated signals from noisy observations using the Time-Frequency Hough Transform.

**Characteristics and Use of a Parametric End-Fired Array for Acoustics in Air**

Akar, Ali O; Mar 2007; 81 pp.; In English

Report No.(s): AD-A467126; No Copyright; Avail.: Defense Technical Information Center (DTIC)

The parametric array exploits two highly collimated ultrasound beams interacting in a given volume producing a single beam with very high directivity and almost no side lobes. The high directivity of the difference frequency signal of the parametric array is due to the interaction of the waves in the volume effectively producing a virtual end fired array boosting pressure levels along the interaction region which is limited by the absorption coefficient. This thesis focuses on experiments conducted in an anechoic room using AS-18-B Audio Spotlight system from Holosonic(TradeMark). Furthermore, nonlinear theory was modeled by a linear discrete array. The beam pattern of the parametric loudspeaker, range dependence of primary and secondary signals and total harmonic distortion (THD) were measured and then compared to theory. Experimental data for the beam pattern of the parametric loudspeaker agreed with the theory. It was all shown that the parametric array had a very narrow beam width and almost no side lobes as opposed to conventional loudspeakers. Both primary waves and difference wave frequency signals were examined for their range dependence. Due to the complicated interference of the primary waves, it was impossible to compare experimental results with theoretical predictions. For the difference wave signals,

experimental data was verified by theory, which was modified in order to accommodate both wave generation and spreading region. Finally, THD of the parametric loudspeaker was measured for different amplitude modulation depths. Experimental results showed that preprocessing should be applied in order to decrease THD and achieve clean audio signal reproduction.

**A Verification of Optical Depth Retrievals From High Resolution Satellite Imagery**

Evans, Jack R; Mar 2007; 94 pp.; In English

Report No.(s): AD-A467213; No Copyright; Avail.: Defense Technical Information Center (DTIC)

A new technique has been developed using high resolution satellite imagery to derive aerosol optical depths by measuring the difference of the radiances inside and outside of shaded regions Vincent (2006). This approach has shown promise as a new means of providing aerosol optical depth in regions that have proven difficult using more traditional means. Initial studies have been done primarily over desert/arid environments with some limited work over urban regions. This thesis takes the next step by focusing on the challenges that come along with using this technique in an urban environment and by exploring the relationship of how this technique is affected by different surface types. Four different surface types were examined, dirt, grass, pavement, and other which includes a random sampling of surfaces that are commonly found in urban environments. Three of these surface types act remarkably similar while grass surfaces deviate from the results seen with the other surfaces. Results from all the surfaces show a low bias which was not seen in the earlier study. This low bias can possibly be attributed to the aerosol model used when running the Shadow Method program, urban effects.

The Human Research and Engineering Directorate of the U.S. Army Research Laboratory conducted an experiment to determine what size breaching hole is necessary for a soldier with a fighting load to enter a building in a tactical and timely manner. The results from this experiment were used to determine requirements for wall breaching technology. The experiment was conducted at McKenna Military Operations in Urban Terrain (MOUT) site Ft. Benning, Georgia. Soldiers from the Ranger Training Brigade and Headquarters Company 3/11th Infantry participated in the experiment. The soldiers were divided into infantry squads and participated in an exercise that involved crossing a danger area, entering a building through the three different size holes, and clearing the initial room. After participating in each mission, the soldiers were given a questionnaire to solicit information about their capabilities and limitations to enter the building. Each event was also timed to determine a mean time for entry with each hole.

**A Centripetal Acceleration Statistic for Tracking Maneuvering Targets with Radar**

Bizup, David; Sep 2002; 12 pp.; In English; Original contains color illustrations

Report No.(s): AD-A467466; No Copyright; Avail.: Defense Technical Information Center (DTIC)

Maneuver tracking is complicated because radar cannot directly measure target acceleration. Radar measures a target's range and bearing, and its radial velocity with respect to radar position. Tracking algorithms use radial velocity to associate radar reports to tracks, but not to update track state estimates. In this paper, a new statistic of centripetal acceleration based on the radial velocity measurement is developed. A tracker using this statistic is developed and tested via simulation against three other tracking algorithms. Simulation results show that the new tracker outperforms trackers with switched noise levels and a two mode interacting multiple model.

Elias, J H; Carr, J S; Richter, M J; Najita, J; Chun, M R; Tokunaga, A T; Liu, M; Lacy, J; Strom, S; Liang, M; Jan 2006; 13 pp.; In English; Original contains color illustrations

Report No.(s): AD-A468071; No Copyright; Avail.: Defense Technical Information Center (DTIC)

We present a discussion of the science drivers and design approach for a high-resolution, mid-infrared spectrograph for the Thirty-Meter Telescope. The instrument will be integrated with an adaptive optics system optimized for the mid-infrared; as a consequence it is not significantly larger or more complex than similar instruments designed for use on smaller telescopes. The high spatial and spectral resolution possible with such a design provides a unique scientific capability. The design provides spectral resolution of up to 120,000 for the 4.5-25 m region in a cross-dispersed format that provides continuous spectral coverage of up to 2% to 14 micrometers. The basic concept is derived from the successful TEXES mid-infrared spectrograph. To facilitate operation, there are separate imaging channels for the near-infrared and the mid-infrared; both can be used for acquisition and the mid-infrared imaging mode can be used for science imaging and for guiding. Because the spectrograph is matched to the diffraction limit of a 30-m telescope, gains in sensitivity are roughly proportional to the square of the telescope diameter, opening up a volume within the Galaxy a thousand times greater than existing instruments.

**CFD Investigation of Flow Past Idealized Engine Nacelle Clutter**

Casper, Matthew S; Mar 2007; 83 pp.; In English; Original contains color illustrations

Report No.(s): AD-A468376; AFIT/GAE/ENY/07-M08; XC-46OG/OGM/OL; No Copyright; Avail.: Defense Technical Information Center (DTIC)

This research modeled low-speed flow past idealized engine nacelle clutter in support of aircraft re suppression research. The idealized clutter was comprised of three vertical rows of staggered circular cylinders approximating typical nacelle obstructions such as fuel lines and wire bundles. Single-phase, Detached-Eddy Simulations (DES) were conducted using the commercial CFD solver, Fluent(TradeMark), to resolve the flow-field dynamics inside the clutter element and determine mechanisms accounting for the failure of suppressant spray droplets from traversing the array under low-speed, free-stream conditions ( $Re_D = 1,575$ ). The numerical models provided no evidence that span-wise vorticity or non-uniform shedding was responsible for transporting dispersed-phase particles towards the tunnel walls for deposition. However, the simulations demonstrated that suppressant droplets would likely follow a path governed by the vector sum of the local carrier fluid velocity and the velocity imposed by gravity. Additionally, the Stokes number was computed from time-accurate data to determine the ability of dispersed particles to negotiate the clutter element without impinging on a cylinder. For slower free-stream velocities,  $U(\infty) = 1$  m/s, suppressant droplets ( $D = 90$  m) will likely be entrained in vortices shed from the intermediate row of cylinders and subsequently deposited on the last row of cylinders as the Karman vortex directly collides with the clutter. At free-stream velocities,  $U(\infty) = 5$  m/s, the droplet particles will likely fail to track the carrier fluid streamlines in the cylinder wake and remain free of any shed vortices. Thus, the suppressant will conceivably transit the cylinder array

without impact. These findings imply that a bluff-body turbulent diffusion flame in a cylinder wake could be nearly impossible to extinguish under high-speed, co-flow conditions.

**Scenario-Based Assessment of Sensors for the Canadian Recognized Maritime Picture**

Dore, Steve; Helleur, Chris; Van Fong, C W; Sep 2002; 14 pp.; In English; Original contains color illustrations

Report No.(s): AD-A467068; No Copyright; Avail.: Defense Technical Information Center (DTIC)

In the area of command and control projects in which a surveillance sensor is being evaluated, project sponsors ask scientists to measure the operational utility and value of the sensor to assist in the decision making process. This paper puts forward a formal and consistent methodology of relating trial results to operational value-added by employing the Canadian Forces Force Planning Scenarios. The approach was applied within an Operational Evaluation (OPVAL) of a High Frequency Surface Wave Radar (HFSWR) system that is used for over-the-horizon coastal surveillance. The methodology was applied to data obtained during trials of the HFSWR system located off the east coast Newfoundland, Canada. For this OPVAL, four Vice Chief of the Defence Staff scenarios were selected that require significant Intelligence, Surveillance, and Reconnaissance (ISR) capability: (Search and Rescue (SAR), Surveillance, National Sovereignty, and Defence of North America). As these scenarios were too general in nature to provide a straightforward evaluation of the sensor system, maritime vignettes were produced for each of the four ISR scenarios and a set of ISR objectives was established for each vignette. The results of this OPVAL were assessed to determine HFSWR's contribution to surveillance-based Force Planning Scenarios. The primary contribution of this paper is to demonstrate the feasibility of relating OPVAL results directly to the scenarios in a quantifiable fashion. The main conclusion of the paper is that the approach presents the capabilities of the sensor system to the decision makers in a logical and intuitive way, and it provides a context to the results of the analysis that is easy to communicate to a larger audience.

Report No.(s): AD-A466345; ATC-9360; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA466345>

The U.S. Army Environmental Command (USAEC), through the Environmental Quality Technology (EQT) Program, requested Aberdeen Test Center's (ATC) Military Environmental Technology Demonstration Center (METDC) to develop and execute a plan to determine and document, if it exists, a level of influence that operators may have on unexploded ordnance (UXO) detection technology results. The primary objective of the test was to determine this level of influence and to perform an analysis of operator detection activities to identify factors that produce variations in operator performance. ATC tested a

total of ten operators (five novices and five experts), using a Schonstedt magnetometer. The experts had more experience with the geophysical detection than the novices. Overall, the results showed that the position and speed of the detector head impacted performance measurements. In addition, the data indicated that perhaps periodic refresher training would be beneficial to expert operators to improve their results in the field.

**Fusion of Imaging and Inertial Sensors for Navigation**

Veth, Michael J; Sep 2006; 207 pp.; In English; Original contains color illustrations

Report No.(s): AD-A468382; AFIT/DS/ENG/06-09; No Copyright; Avail.: Defense Technical Information Center (DTIC)

The motivation of this research is to address the limitations of satellite-based navigation by fusing imaging and inertial systems. The research begins by rigorously describing the imaging and navigation problem and developing practical models of the sensors, then presenting a transformation technique to detect features within an image. Given a set of features, a statistical feature projection technique is developed which utilizes inertial measurements to predict vectors in the feature space between images. This coupling of the imaging and inertial sensors at a deep level is then used to aid the statistical feature matching function. The feature matches and inertial measurements are then used to estimate the navigation trajectory using an extended Kalman filter. After accomplishing a proper calibration, the image-aided inertial navigation algorithm is then tested using a combination of simulation and ground tests using both tactical and consumer-grade inertial sensors. While limitations of the Kalman filter are identified, the experimental results demonstrate a navigation performance improvement of at least two orders of magnitude over the respective inertial-only solutions.

Report No.(s): AD-A468804; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA468804>

Operations and intelligence organizations continue to struggle with how to best plan and employ assets with a video capability. Many heated debates have occurred concerning manned and unmanned, as well as, armed and unarmed assets. This friction caused the less than optimum utilization of these assets. In today's Global War on Terrorism, timely, detailed intelligence is ever more critical to mission success. In many cases, operational commanders do not conduct their operations unless they are assured the availability of airborne full motion video (FMV) assets. The thesis of this paper argues the Department of Defense must adopt changes in joint doctrine, terms, organizations, and processes concerning armed, FMV capable platforms in order to employ FMV capabilities with greater operational effectiveness and efficiency.

ONLINE: <http://hdl.handle.net/100.2/ADA468805>

The C.S. Draper Laboratory, with 30 years of experience in instrument and sensor research and development, and the University of Massachusetts Terahertz Laboratory, with 15 years of research in the development terahertz receivers and focal plane arrays, propose to develop and characterize a fundamentally new method for generating terahertz radiation. Our approach will enable the development of a class of high power ( $\geq 100$  mW), portable, coherent, terahertz radiation source devices not realizable using either conventional RF approaches such as Schottky Diodes, Transferred Electron Guns, or Resonant Tunneling Diodes or optical transition approaches such as cryogenically cooled Quantum Cascade Lasers. Consequently, our concept for a Terahertz Fiber Laser will enable a US Navy Advanced Explosives Detection system with significantly improved sensitivity, selectivity, and  $>20$ m stand-off operating range in a compact (shoebox size), man-portable package.

The main goal of this project was to develop new lithographic and nanofabrication approaches for the assembly of novel nanoelectronic and nanomagnetic device structures. Our team's interests, expertise and facilities spanned materials synthesis, nanoscale characterization, nanoscale lithography and processing, and involved three institutions (University of Virginia, Notre Dame University, Lund University). To fabricate annular structures of giant magnetoresistive material for proposed vertical magnetic random access memory structures, we explored use of a novel negative inorganic resist, HSQ. Using electron and ion beam exposure of the resist (as well as direct focused ion beam sputtering of the GMR material) we were able to create structures at or close to the project goal of 75/225 nm internal/external annular diameter. It was found that electron beam exposure offered slightly higher resolution but substantially lower throughput than ion beam exposure of the resist. The

resultant exposed HSQ patterns offered good etch masks for physical sputtering of the underlying GMR material, an important consideration given the known challenges in reactive ion etching of these materials. Other studies focused on ultra rapid sputtering of PMMA using focused ion beams and exploring fabrication of inexpensive masks for electron projection lithography. We also explored nanoscale processing and contacting of nanowire structures with our collaborators at Lund University, with application to proposed quantum dot architectures such as quantum cellular automata.

**Deep Ultraviolet Laser Diode for UV-Resonance Enhanced Raman Identification of Biological Agents**

Hug, William F; Moustakas, T; Treece, R; Smith, J; Bhattacharyya, A; Reid, R; Pankove, J; Brown, C; Nelson, W; Mar 31, 2007; 215 pp.; In English; Original contains color illustrations

Contract(s)/Grant(s): W31P4Q-04-C-R039

Report No.(s): AD-A468910; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA468910>

This proposal addresses the need for deep UV semiconductor lasers for use in UV resonance enhanced Raman spectroscopic identification of biological agents. The proposed approach avoids the problems of p-doping and ohmic contacts by using subminiature direct electron injection excitation of an InAlGaN heterostructure. We have demonstrated strong stimulated emission at 274nm using this approach with measured linewidth reduction from 16nm to 4nm and five orders of magnitude non-linear increase in intensity. High levels of chemical specificity can be obtained using Raman spectroscopy without sample preparation, contact, or destruction. When Raman excitation occurs within the electronic resonance band of a material the scatter cross-sections can improve as much as eight orders of magnitude. For biochemical molecules such as nucleic and amino acids these absorption bands are very strong in the deep UV between about 220nm and 280nm. When Raman excitation is below about 250nm, there is a fluorescence-free region extending over 4000 wave numbers above the excitation wavelength providing very high detection sensitivities and low background noise. It is the goal of this proposed program to demonstrate deep UV emission from a semiconductor laser and the ability to obtain deep UV resonance Raman spectra of analogs of hazardous biological agents.

**Point Spread Function Characterization of a Radially Displaced Scatterer Using Circular Synthetic Aperture Radar**

Majunder, Uttam K; Mar 2007; 74 pp.; In English; Original contains color illustrations

Report No.(s): AD-A469162; AFIT/GE/ENG/07-26; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA469162>

This research effort investigated characterizing the point spread function (PSF) behavior of radially displaced point scatterers using circular synthetic aperture radar (CSAR). Thus far, research has been conducted to understand PSF of a scatterer located at the imaging scene center. An analytic closed-form solution has been derived assuming the scatterer is located at the origin of the CSAR imaging geometry. However, it is difficult to derive an analytic PSF solution for a scatterer that is radially displaced from the imaging scene center. Using the back projection image formation algorithm, PSF responses are generated at various point target locations. Consistent with previous studies, the three dimensional PSF for a point target located at the image center is cone shaped and serves as the basis for comparing and characterizing the PSFs of radially displaced scatterers. Simulated results show the impulse response of a radially displaced point scatterer is asymmetric and tends to exhibit increased ellipticity as it moves further from the scene center.

**Microfabricated Electrochemical Sensor for Chemical Warfare Agents: Smaller is Better (Preprint)**

Oh, Ilwhan; Monty, Chelsea; Masel, Richard I; Shannon, Mark A; Nov 2006; 6 pp.; In English

Contract(s)/Grant(s): FA8650-04-01-7121; Proj-4H20

Report No.(s): AD-A468716; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA468716>

For the last decade, interest in the organophosphate (OP) chemical warfare agents (CWA) sensor has multiplied, especially

after the tragic terrorist attack with sarin in Tokyo in 1995. The requirements for OP CWA sensors include: portability - small and light enough to be carried by a person; vapor detection - sample is gas phase, rather than liquid or solid phase; sensitivity - the vapor concentration of the target molecule is in the ppb or below; selectivity (reliability) - minimum false positives. Conventional methods for the detection of gas-phase OP CWA are gas chromatography/mass spectroscopy (GC/MS) and ion mobility spectrometry (IMS). GC/MS is in most cases not suitable for portable applications. IMS has a lower selectivity because the intrinsic detection mechanism of IMS is not based on the chemical nature of the target molecule. The objectives of this work are 1) to study the oxime-based electrochemical sensor in a beaker cell and 2) to fabricate a micro-scale gas-liquid interface so that the oxime-based sensor can be miniaturized into a small-sized device.

### **GISMO**

Benford, Dominic; March 21, 2007; 1 pp.; In English; International Space Terahertz Symposium, 21-23 Mar. 2007, Pasadena, CA, USA; No Copyright; Avail.: Other Sources; Abstract Only

The 2 mm (150 GHz) atmospheric window enables unparalleled ground-based observations of the earliest active dusty galaxies in the universe. We have undertaken the development of a bolometer camera, GISMO (the Goddard-IRAM Superconducting 2-Millimeter Observer), which will obtain large and sensitive sky maps at this wavelength. The instrument will be used at the IRAM 30 m telescope, where we hope to have a trial observing run in Spring of 2007. The innovative element in this camera is its 8x16 fully sampled planar array of multiplexed superconducting transition edge sensor bolometers. This array is based on our recently demonstrated Backshort Under Grid architecture, designed to be scaled to kilopixel arrays with high sensitivity (of around  $4 \times 10^{-17}$  W<sup>2</sup>/sqrt(Hz) at T(sub c) approximates 450mK). A compact cryogenic optical system provides a wide field of view, (almost 2'x4') enabling GISMO to be very efficient at detecting sources serendipitously in large sky surveys, while retaining diffraction-limited imaging performance. GISMO will provide significantly greater imaging sensitivity and mapping speed at this wavelength than has previously been possible. The major scientific driver for the instrument is to detect dust emission from high-z Ultraluminous Infrared Galaxies (ULIRGs) and quasars. The instrument provides an important portion of the spectrum of high redshift galaxies at the Rayleigh-Jeans part of the dust emission spectrum, even at the highest redshifts. Models of galaxy evolution predict that GISMO will serendipitously detect one galaxy in every four hours of observing blank sky, and that one quarter of these galaxies will be at a redshift of  $z > 6.5$ .

Report No.(s): AD-A466096; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA466096>

The major thrust of our research program has been to start the development of multiple laser beacon systems for wavefront sensing, and to tie this new technology to the unique development of deformable secondary mirrors pioneered at the University of Arizona's Center for Astronomical Adaptive Optics (CAAO). The technology development funded by this award has resulted in the first practical solution for a multi-beacon laser system, enabling progress in tomographic wavefront sensing and altitude conjugated adaptive correction, and is a critical step forward for adaptive optics for future large telescopes proposed for very high resolution space situational awareness. This has been demonstrated by the first high resolution images

of geostationary satellites, captured at the 6.5 m MMT telescope, using the deformable secondary adaptive optics system.

**Novel Two- and Three-Photon Pumped Lasing Dyes: Design, Synthesis, and Characterization**

Lin, Tzu-Chau; Sep 1, 2006; 13 pp.; In English

Report No.(s): AD-A466361; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA466361>

In this proposed research project, efforts have been focused on the synthesis and optical properties characterization of some multi-photon absorbing chromophores especially with frequency up-converted stimulated emission behavior. This research project was originally aimed to study some structural parameters that may affect the multi-photon pumped stimulated emission properties in dye molecules. The structural parameters that was attempted to investigate include the substituent effects (types and/or positions) and chromophoric unit number density effect. Significant amount of time and man-power was spent to accomplish the synthesis and characterization of some of the designed model compounds. Most of these compounds possess strong two- and three-photon absorption (2PA & 3PA) induced up-converted emission covering various spectral regions. One of the synthesized stilbazolium-type chromophore also shows strong 2PA-induced stimulated emission when pumped by femtosecond laser pulses at ~775 nm. Specifically, four stilbazolium chromophores have been stabilized for 2PP stimulated emission property studies. Only one of the synthesized compounds possesses 2PP-induced up-converted cavityless lasing when pumped by femtosecond laser pulses. To the best of author's knowledge, this compound is so far the only stilbazolium salt with symmetrical di-substitution in its molecular structure that exhibits 2PP-induced stimulated emission in femtosecond regime. Although the currently collected data could not provide any clear picture of the relationship between molecular structure and stimulated emission property, using thiophene unit(s) as part of pi-bridge in designing symmetrically di-substituted two-photon lasing dyes might be a direction that worthy to explore. On the other hand, the blueshifted forward lasing is an interesting phenomenon that worth to put more efforts on studying its origin.

This report results from a contract tasking Crystal Fibre A/S as follows: Crystal Fibre will conduct research and development of large mode area, dual clad multi-core Yb-doped photonic crystal fiber. The fiber may be polarization maintaining (PM). Nominal fiber designs will include six and seven core fibers with nominal specifications of 400 micron 0.6 NA pump core, and 30-35 micron signal cores. Crystal Fibre shall fabricate 1 preform worth but not less than 50 meters of passive and active versions of each fiber designed under this task. Crystal Fibre shall provide characteristics of the fiber fabricated to include core and cladding diameters, core and cladding numerical apertures, Yb doping concentration, and pump absorption at 976nm. Passive multicore fiber versions without airclad will be available approximately 1-1/2 month after fiber design agreement. Active multicore airclad fiber versions will be available approximately 3 months after fiber design agreement. Within this project we will deliver a passive and active version of multicore fiber iteration 1 and a passive version of multicore fiber iteration 2.

**A Hybrid Nano-Imprinting Lithography Method for Nano-Patterning Based on Infrared Pulsed Laser Heating**

Lee, Yung-Chun; Sep 5, 2006; 14 pp.; In English

Report No.(s): AD-A466513; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA466513>

In this research project we present a novel method of nano-imprinting which adopts important features of conventional

nano-imprinting lithography (NIL) and the newly developed laser-assisted direct imprinting (LADI) method. It utilizes an Nd-YAG pulsed laser of wavelength 1064 nm which can easily penetrate and also heat up a silicon mold which is pressed against a resist layer deposited on a substrate. The fast rising temperature in the silicon mold can momentarily melt the resist layer so that the mold is imprinting into the resist layer. After the pattern is transformed, standard nano-imprinting lithography processes can be applied to the substrate for nano-fabrication. This new method has several advantages over existing nano-imprinting methods mostly due to the fast heating-up of silicon mold by high intensity IR laser pulse and therefore has no thermal drifting problem. Both the theoretical modeling and experimental results of this novel IR-laser assisted imprinting method will be investigated.

ONLINE: <http://hdl.handle.net/100.2/ADA466560>

Despite the proven safety and efficacy of laser refractive surgery in improving uncorrected vision, several important issues require further analysis in the armed forces. Visual performance under low light illumination, cockpit performance in military aviators, ability to meet accession and retention standards, and resistance to trauma are among some of the unique considerations of the active duty military. The current study comprises a comprehensive evaluation of safety, efficacy and visual performance after laser refractive surgery. Initial studies cover surgical procedures and pre- and post-operative assessment of visual performance, refractive error and stability, and ocular integrity. Subsequent phases address military operational factors, including occupation-specific visual requirements and effects of various operational environments. Additional militarily relevant investigations will address emerging technologies, both military and medical, as they apply to refractive surgery in the US service men and women. To date, we have enrolled and treated over 500 subjects in one of 16 approved protocols (9 ongoing and 7 completed). We have published 15 peer-reviewed papers, and presented 8 papers and 22 abstracts at national or international meetings. We have research collaborations with a number of DoD and civilian academic institutions including the US Army Night Vision Laboratory and Electronic Sensor Directorate, the US Army Aviation Research Laboratory, the Naval Medical Center San Diego, Stanford Research Institute, the US Army Center for Health Promotion and Preventative Medicine, the Schepens Eye Research Institute, Harvard Medical School, University of Virginia, James Madison University, and Eastern Virginia Medical School. This report will cover the accomplishments of the program to date and outline future directions and goals for the program.

**Increasing the Laser Induced Damage Threshold of Single Crystal ZnGeP<sub>2</sub>**

Zawilski, Kevin T; Setzler, Scott D; Schunemann, Peter G; Pollak, Thomas M; Mar 2006; 21 pp.; In English

Report No.(s): AD-A466914; AFRL-ML-WP-TP-2007-418; No Copyright; Avail.: Defense Technical Information Center (DTIC)

The laser induced damage threshold (LIDT) of single crystal zinc germanium phosphide (ZGP), ZnGeP<sub>2</sub>, was increased to 2 J/cm<sup>2</sup> at 2.05 microns and 10 kHz pulse rate frequency (double the previously measured value of 1 J/cm<sup>2</sup>). This increased LIDT was achieved by improving the polishing of ZGP OPO crystals. The surface preparation of ZGP samples was determined to be of great importance because laser-induced damage has been observed to always initiate at the surface rather than in the bulk of the material. Two different polishing techniques were evaluated by comparing the surfaces of ZGP samples fabricated in the same manner apart from the polishing stage. Surfaces were characterized using scanning white light interferometry (SWLI) in order to determine RMS surface roughness and sample flatness. The photon backscatter technique (PBS) was used to determine the degree of surface and subsurface damage in the sample induced through the fabrication process. Both uncoated and anti-reflection coated samples were damage tested. The effect of subsurface damage in the samples was studied by removing different amounts of material during polishing for otherwise identical samples. The amount of material removed was correlated to the observed LIDT. Statistical LIDT was measured using a high-average-power, repetitively Q-switched

Tm,Ho:YLF 2.05-micron pump laser. On average, lower surface roughness and photon backscatter measurements was a good indicator of ZGP samples exhibiting higher LIDT. The removal of more material during polishing significantly improved the LIDT of otherwise identical samples, indicating the importance of subsurface damage defects in the LIDT of ZGP.

**Improving COIL Efficiency By Iodine Pre-Dissociation Via Corona Discharge In The Transonic Section Of The Secondary Flow**

Rosenwaks, Zamik; Barmashenko, Boris; Aug 1, 2006; 18 pp.; In English; Original contains color illustrations

Contract(s)/Grant(s): FA8655-05-1-3041

Report No.(s): AD-A467600; No Copyright; Avail.: Defense Technical Information Center (DTIC)

This report results from a contract tasking Ben-Gurion University of the Negev as follows: We intend to carry out a comprehensive experimental study of I<sub>2</sub> pre-dissociation, based on applying corona discharge in the transonic section of the secondary flow in the COIL supersonic nozzle. The main issues to be addressed are the following: 1. Determination of conditions for maximum dissociation fraction F of I<sub>2</sub> caused by the corona discharge. 2. Experimental measurements of the lasing power and small signal gain with and without the iodine predissociation caused by the corona discharge and determination of the power enhancement factor. There will be two stages in the proposed experimental study of I<sub>2</sub> pre-dissociation. Facilities: The equipment available at BGU includes a supersonic COIL setup with different mixing nozzles and three diode laser based diagnostic systems for H<sub>2</sub>O, O<sub>2</sub> and I atoms for probing the COIL active medium. Also available are a variety of optical, electronic and computing equipment, including He-Ne lasers, lock-in amplifiers, optical fibers, power supplies, optical windows, halogen lamps and an on-line laboratory computer. Schedule: Report will be delivered at the end of the contract.

Report No.(s): AD-A469169; AFIT/GEO/ENP/07-01; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA469169>

Airborne Laser testing and evaluation can be aided by developing a spectrally-based infrared camera simulation to explore how the target surface's specular and diffuse reflectivities affect the observed signal-to-noise ratio (SNR) and how the target's temperature in the laser spot can be estimated. This simulation provides for the observed irradiance, scaled by atmospheric absorption, to consist of the target's self-emission, reflected background emission, and the path emission from the observer to the target. The observed irradiance is scaled and distributed onto a focal plane array by way of a simulated optical system, whose effects are described by modulation transfer functions. The modeled detector response converts the observed irradiance to a current signal from which detector noise quantities are computed. Analyzing the simulated data shows that the observed SNR is dependent upon the target's reflectivity, and leads to a conclusion that the mid-wave infrared band is the best choice for observing the thermal emission. For estimating temperature, a least-squares optimization will not work because of the effects of the point spread function.

ONLINE: <http://hdl.handle.net/100.2/ADA466100>

Effective manipulation of a flow field can lead to a number of significant benefits to aerospace vehicle systems, including enhanced performance, maneuverability, payload and range, as well as lowered overall cost. These macro benefits are directly achievable through the application of flow-control technology on the micro scale. Practical application of active flow control is dependent upon the development of robust actuators that are reliable, low cost, and responsive. An example of promising actuator technology for supersonic flow applications is the SparkJet actuator under development at The Johns Hopkins University Applied Physics Laboratory. The SparkJet has demonstrated the ability to produce a synthetic jet with high exhaust velocities, and hence holds the promise of manipulating high-speed flows without moving aerodynamic structures. Practical application of the SparkJet technology will require the development and demonstration of distributed actuator arrays.

Report No.(s): AD-A466310; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA466310>

This paper describes the optimization of a piezoelectric-driven synthetic jet actuator based on a Lumped Element Modeling (LEM). To simplify the problem, this paper splits the optimization problem into two parts. First, a constrained optimization of the cavity volume and orifice dimensions of two baseline synthetic jets, each with a given piezoelectric diaphragm, is conducted using two different objective functions. One seeks to improve the centerline output velocity over a broad frequency range, and the other maximizes the centerline velocity at a prescribed resonant frequency of the device. Significant improvements are achieved using both objective functions for both synthetic jets. Second, the two baseline piezoelectric diaphragms have been optimized using two configurations. One uses the standard inner-disc piezoceramic patch bonded to a metal shim, while the other employs an outer piezoceramic ring. In each case, the objective is to maximize the achievable volume displacement of the diaphragm at the coercive electric field strength of the piezoceramic, while the natural frequency of the piezoelectric diaphragm is constrained to be greater than or equal to the baseline designs. Both configurations yield modest (~5%) improvements for one diaphragm and significant improvements for the other diaphragm (>50%).

**Simulation and Analysis of Dart Dispense Events with Collisions**

Dietz, William E; Baltar, James Y; Losser, Kevin; Morell, Morris; Jan 2006; 24 pp.; In English; Original contains color illustrations

Contract(s)/Grant(s): N00014-06-C-0011

Report No.(s): AD-A466347; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA466347>

Current approaches to beach and surf zone mine clearance depend on the dispensing of large numbers of darts from a parent missile or projectile. The mine clearance mission requires a uniform distribution of darts over the target area. The dispersal pattern is affected by many factors, including the angle of attack, velocity, and rotational rate of the parent vehicle,

the aerodynamic design of the darts, dart collision, and the different aerodynamic regimes that exist in the vicinity of the dispenser. In the overall effort, computational modeling and simulation is used to provide insight and understanding of the dispense event. The primary long-term goal of the present effort is to understand and characterize, through simulation, analysis, and comparisons to wind tunnel and flight tests, the most important physical processes underlying the behavior of dispense events.

**Thermally Compensated Fiber Bragg Grating Mount**

Ames, Gregory H, Inventor; Jan 25, 2007; 17 pp.; In English

Report No.(s): AD-D020286; No Copyright; Avail.: Other Sources

ONLINE: <http://hdl.handle.net/100.2/ADD020286>

A thermally compensated fiber Bragg grating package is used with a fiber optic sensor. The package includes a Bragg grating mount connected at each end of a sensor mandrel. An optical fiber is wound around the sensor mandrel and a fiber portion having a Bragg grating therein is wound onto the mount. The mount is made of a rigid material having a negative coefficient of thermal expansion to minimize thermally induced spectral shifts. One example of the material includes zirconium tungstate. A coating material can be used to further adhere the optical fiber to the sensor mandrel and/or to the mount. The mount preferably includes a ramped groove to provide for a smooth transition from the sensor mandrel to the mount.

**Evaluation of Portable Emissions Measurement Systems (PEMS) for Inventory Purposes and the Not-to-Exceed Heavy-Duty Diesel Engine Regulation**

Maldonado, H.; Miller, J. W.; Jun. 2006; 136 pp.; In English

Report No.(s): PB2007-109675; No Copyright; Avail.: National Technical Information Service (NTIS)

Diesel engines are significant contributors of emissions in air basins and diesel emissions have become increasingly scrutinized. This scrutiny has resulted in more regulation of diesel emissions and a desire to learn more about the actual in-use emissions from these engines rather than values measured with engine and chassis dynamometers. However, measuring on-board, in-use emissions is problematic, especially if current EPA reference methods must be used. This project was launched with a goal of measuring the performance of alternatives to EPA reference methods. Toward that end, the practical alternative to fixed laboratory measurements with EPA reference methods is the use of portable emissions measurement systems (PEMS) which became the focus of this research. The intent of this project was to test the PEMS over a wide range of engine operating conditions so the results would provide insight for PEMS use for emission inventories and for regulatory applications, especially compliance with the Not-To-Exceed (NTE) regulations. The specific project deliverables included quantifying both the accuracy and precision of commercially available PEMS relative to the federal reference methods (FRM) in the University of California, Riversides (UCRs) mobile emissions laboratory (MEL).

**Southern Nevada Air Quality Study**

Watson, J. G.; Barber, P. W.; Chang, M. C. O.; Chow, J. C.; Etyemezian, V. R.; Feb. 2007; 54 pp.; In English

Contract(s)/Grant(s): FTA-26-7003; FTA-26-7003-01

Report No.(s): PB2007-109059; FTA-NV-26-7003-2006.01; No Copyright; Avail.: National Technical Information Service (NTIS)

The Southern Nevada Air Quality Study (SNAQS) created cross-plume and in-plume measurement systems to quantify emissions distributions and source profiles from transportation emissions, specifically gasoline and diesel powered vehicles. The cross-plume system measures backscattered ultraviolet radiation to estimate particulate emissions and infrared and ultraviolet absorption to measure gas concentrations in exhaust plumes. The in-plume system draws a portion of air from the plume and directs it to continuous monitors and filter samples that are analyzed in the laboratory. Both systems were applied

to on-road measurements in Las Vegas, Nevada. Results from both methods found that most of the particulate and gas pollutant emissions came from a small fraction of the vehicles. High carbon monoxide emitters were not always high particulate matter and oxide of nitrogen emitters, implying that smog checks must measure all of these pollutants to be effective. Receptor models were applied to ambient particulate samples taken in Las Vegas using source profiles obtained with the in-plume system. Gasoline engine exhaust was the largest contributor to the carbon component at all sites, and diesel exhaust was only a large contributor at commercial sites near major highways. Residential wood combustion was also an important contributor in residential areas, but not in the commercial areas.

**Characterization and Evaluation of a Mass Efficient Heat Storage Device.**

Splinter, Scott C.; Blosser, Max L.; Gifford, Andrew R.; June 21, 2007; 11 pp.; In English; 29th International Thermal Conductivity Conference (ITCC), 24-27 Jun. 2007, Birmingham, AL, USA; Original contains color and black and white illustrations

Contract(s)/Grant(s): WBS 599489.02.07.07.02.02; Copyright; Avail.: CASI: [A03](#), Hardcopy

The heat sponge is a device for mass-efficient storage of heat. It was developed to be incorporated in the substructure of a reentry or hypersonic vehicle to reduce thermal protection system requirements. The heat sponge consists of a liquid-vapor mixture contained within a number of miniature pressure vessels that can be embedded within a variety of different types of structures. As temperature is increased, pressure in the miniature pressure vessels also increases so that heat absorbed through vaporization of the liquid is spread over a relatively large temperature range. Using water as a working fluid, the heat storage capacity of the liquid-vapor mixture is many times higher than that of typical structural materials and is well above that of common phase change materials over the temperature range of 660oR to 1160oR. Prototype heat sponges were fabricated and characterized. These heat sponges consisted of 1.0 inch diameter hollow stainless steel spheres with a wall thickness of 0.020 inches which had varying percentages of their interior volumes filled with water. An apparatus to measure the heat stored in these prototype heat sponges was designed, fabricated, and verified. The heat storage capacity calculated from measured temperature histories is compared to numerical predictions.

**Report 17: Cost-Effective Reciprocating Engine Emissions Control and Monitoring for E&P Field and Gathering Engines. (Technical Report, October 1, 2006-December 31, 2006)**

Chapman, K. S.; Nuss-Warren, S. R.; Jan. 2007; 12 pp.; In English

Report No.(s): DE2007-901194; No Copyright; Avail.: National Technical Information Service (NTIS)

This report highlights work done on a project intended to lower the cost of environmental compliance and expedite project permitting for Exploration and Production (E&P) operators by identifying, developing, testing, and commercializing emissions control and monitoring technologies. Promising technologies have already been identified and developed. Current work focuses on testing these promising technologies. Specifically, several technologies are being tested in the laboratory for application to lean-burn engines or fully characterized on-site for use with rich-burn engines. Upon completion of these tests, the most cost-effective and robust technologies will be tested in the field and commercialization will ensue.

Khalek, I. A.; Jun. 12, 2007; 64 pp.; In English

Contract(s)/Grant(s): CRC-E-66; E-66-3

Report No.(s): PB2007-110019; CRC-E-66-3; No Copyright; Avail.: National Technical Information Service (NTIS)

Phase 3 of Project E-66 was conducted using the same engine and aftertreatment system used in Phase 1 and Phase 2, namely a 1998 DDC Series 60 heavy-duty diesel engine (HDDE) equipped with a continuously regenerative technology diesel particulate filter (CRT-DPF). Overall, Phase 3 of Project E-66 verified the greatly improved and now acceptable response time of the PFSS units tested in this program. It also showed that at a PM emission level below 10 percent of the 2007 standard, both the CVS as well as the PFSS units could be used interchangeably to produce similar results under steady-state and transient engine operation. Phase 3 of Project E-66 also highlighted the usefulness of using real time particle instruments to measure PM at near or well below the 2007 PM standard. The ease of use, high sensitivity, and fast response time (less than one second) of these instruments make them good candidates for particle measurement instead of using the filter collection technique. However, more work is needed to establish a standard protocol to calibrate and demonstrate the accuracy of these systems in measuring PM mass.

**Truck Driver Occupational Safety and Health. 2003 Conference Report and Selective Literature Review**

Saltzman, G. M.; Belzer, M. H.; Feb. 2007; 138 pp.; In English

Report No.(s): PB2007-110282; No Copyright; Avail.: CASI: [A07](#), Hardcopy

In 2003, NIOSH co-sponsored a conference that brought together researchers from around the world to discuss the safety and health of commercial truck drivers. NIOSH recognizes that these workers merit attention due to the difficult and dangerous nature of their trade. Truck drivers have an unusually high rate of occupational injury, and one of the highest rates of on-the-job fatality. NIOSH is actively working to improve the safety and health of truck drivers. Current Institute projects will increase our understanding of cause-specific mortality among owner-operator truck drivers, the health effects of diesel exhaust particles, and the influence of work organization on truck driver fatigue. Reducing occupational injury and illness among truck drivers is assisted by a coordinated effort, and this conference was an important step towards establishing a national research agenda. The following report and accompanying CD-ROM share the information, insight, and research of the professionals who participated in the conference. Together they provide an overview of the trucking industry, summarize the current state of knowledge regarding truck driver safety and health, and document the topics for future research suggested by the conference participants. NIOSH hopes that these proceedings will be valuable to researchers, industry representatives, policymakers, and the public.

### QUALITY ASSURANCE AND RELIABILITY

Includes approaches to, and methods for reliability analysis and control, quality control, inspection, maintainability, and standardization.

**20070028661** Westinghouse Savannah River Co., Aiken, SC, USA

**Type B Radioactive Material Package Failure Modes and Contents Compliance**

Hensel, S. J.; Watkins, R. W.; Smith, A. C.; January 2007; 5 pp.; In English

Report No.(s): DE2007-899959; WSRC-STI-2007-00090; No Copyright; Avail.: Department of Energy Information Bridge

Type B radioactive material package failures can occur due to any one of the following: inadequate design, manufacture, and maintenance of packages, load conditions beyond those anticipated in the regulations, and improper package loading and

operation. The rigorous package design evaluations performed in the certification process, robust package manufacture quality assurance programs, and demanding load conditions prescribed in the regulations are all well established. This paper focuses on the operational aspects of Type B package loading with respect to an overbatch which may cause a package failure.

#### **Survey of Underground Storage Tanks and Other Subsurface Structures at the Umatilla Depot Activity, Hermiston, Oregon**

Jul 1990; 36 pp.; In English

Contract(s)/Grant(s): DAAA15-88-D-0008

Report No.(s): AD-A467010; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA467010>

This document is the Standard Operating Procedure (SOP) for the performance of a survey of underground storage tanks (UST) and other subsurface structures at the Umatilla Depot Activity (UMDA), Hermiston, Oregon This plan has been prepared under Contract No. DAAA15-88-D-0008, Delivery Order No. 3, for the U.S. Army Toxic and Hazardous Materials Agency (USATHAMA) in support of the U.S. Department of Defense (DOD) Base Realignment and Closure (BRAC) Program at UMDA. This project is being performed in conjunction with, though not as part of, the Remedial Investigation/Feasibility Study (RI/FS) of UMDA. The Army needs to determine--prior to base closure and property excessing--if any USTs are leaking or have leaked, thereby releasing contaminants to surrounding soils and possibly groundwater, and if other subsurface structures exist that may be potential contamination sources or potentially providing conduits for contaminant migration. This SOP presents the technical approach for performance of the UST/subsurface structure survey at UMD. It includes the methodologies and procedures that will be followed in identifying and locating USTs and other subsurface structures, performing leak testing of the tanks, and performing sampling investigations, as necessary. #### **Seismic Response of a Half-Scale Masonry Building with Flexible Diaphragms**

Sweeney, Steven C; Horney, Matthew A; Orton, Sarah L; Sep 2005; 127 pp.; In English; Original contains color illustrations

Contract(s)/Grant(s): Proj-AT41-CFM-A001

Report No.(s): AD-A468395; ERDC/CERL-TR-05-25; No Copyright; Avail.: Defense Technical Information Center (DTIC)

Unreinforced masonry (URM) buildings constructed on Army installations before the development of modern seismic codes may be susceptible to earthquake damage and therefore could benefit from seismic mitigation measures. Improved understanding of URM structural response under multidirectional loads is required to develop the most effective seismic structural retrofit strategies. This research used a half-scale structural model to investigate the seismic response of URM buildings with flexible diaphragms. The objectives were to determine failure mechanisms and deformation behaviors; examine amplification of ground motion acceleration by walls and diaphragms; approximate any strength effects that flange portions of out-of-plane walls may have on in-plane walls; investigate vertical distribution of lateral forces; and identify any combinational effects of multidirectional base motions. An unexpected level of out-of-plane wall flange contribution to in-plane wall strength indicates the need for experimental quantification using different pier layouts, URM wall combinations, and wall connection methods. Results also indicate the need to investigate the effect of overturning forces on the in-plane strength of piers and to determine critical ground motion characteristics that lead to the direct combination of response quantities due to orthogonal earthquake components. **Composite Action during Construction of Steel Trapezoidal Box Girder Bridges**

Topkaya, C.; Yura, J. A.; Williamson, E. B.; Frank, K. H.; Aug. 2005; 54 pp.; In English

Report No.(s): PB2007-110168; CTR-0-1898-2; No Copyright; Avail.: National Technical Information Service (NTIS)

In steel trapezoidal box girder bridge systems, the U-shaped steel girder is designed to act compositely with the concrete deck to form a closed box for live loading. During the construction stage, however, the behavior is not well understood. The usual practice of assuming the system to be non-composite during construction requires substantial top flange bracing to form a quasi-closed box section. Field studies have Composite box girders with live loading, and girders during construction, have to be evaluated during the design of curved steel trapezoidal box girder bridges. Considering both cases, the design for construction loading is the least understood and is the most important. Stresses due to construction loading can reach up to 60-70 percent of the total design stress for a given cross section. A three-phase study was undertaken to investigate the behavior of curved trapezoidal box girders during construction. In the first phase, laboratory tests were performed to investigate the shear transfer between the concrete deck and steel girder at early concrete ages (hours, not weeks). In the second phase, an easy-to-use finite element program, UTrAp, was developed for the analysis of these systems under construction loads and is documented in CTR Report 1898-3 (October 2002). The program has the capability of modeling the effects of semi-cured concrete. The third phase focused on the monitoring of two curved trapezoidal box bridges during construction. The measured forces and stresses in the field were compared with the analyses using the developed software. Findings from laboratory and field tests revealed that composite action develops at very early concrete ages. The developed software provides good correlation between measured field data and computed results.

**Evaluation of Serviceability Requirements for Load Rating Prestressed Concrete Bridges**

Wood, S. L.; Hagenberger, M. J.; Heller, B. E.; Wagener, P. J.; Jan. 2007; 200 pp.; In English

Report No.(s): PB2007-110167; CTR-0-1895-1; No Copyright; Avail.: National Technical Information Service (NTIS):

A09, Hardcopy

Within Texas, the procedures in the AASHTO Manual for Condition Evaluation of Bridges (MCEB) are used to determine the load rating of existing structures. A large number of prestressed concrete bridges that were constructed in the 1950s and 1960s have load ratings that fall below the minimum design vehicle specified in the MCEB. The load ratings for this group of are typically controlled by the serviceability limit state criterion related to the tensile stress in the concrete. A low load rating implies that these bridges have experienced damage under service loads. However, observations made by TxDOT personnel during routine inspections indicate that the condition of these bridges is very good, and that there are generally no signs of deterioration. Based on the results of the diagnostic load tests and laboratory fatigue tests, it was concluded that the tensile stress criterion in the MCEB should not be used to evaluate existing prestressed concrete bridges. The calculated tensile stress in the concrete is not a reliable indicator of the stresses induced in the strand due to live load. Conservative guidelines for considering the fatigue limit state explicitly in the load rating process were developed.

**Analysis of ICESat Data Using Kalman Filter and Kriging to Study Height Changes in East Antarctica**

Herring, Thomas A.; November 24, 2005; 5 pp.; In English; Original contains black and white illustrations

Contract(s)/Grant(s): NAS5-99007; Copyright; Avail.: Other Sources

ONLINE: <http://dx.doi.org/10.1029/2005GL024272>

We analyze ICESat derived heights collected between Feb. 03-Nov. 04 using a kriging/Kalman filtering approach to investigate height changes in East Antarctica. The model's parameters are height change to an a priori static digital height model, seasonal signal expressed as an amplitude Beta and phase Theta, and height-change rate  $dh/dt$  for each (100 km)(exp

2) block. From the Kalman filter results, dh/dt has a mean of -0.06 m/yr in the flat interior of East Antarctica. Spatially correlated pointing errors in the current data releases give uncertainties in the range 0.06 m/yr, making height change detection unreliable at this time. Our test shows that when using all available data with pointing knowledge equivalent to that of Laser 2a, height change detection with an accuracy level 0.02 m/yr can be achieved over flat terrains in East Antarctica.

R. L. Stollar and Associates, Inc. (RLSA) conducted an asbestos survey and bulk sampling of materials at the Fort Point U.S. Coast Guard Station (FPUSCGS) buildings to delineate the location and extent of asbestos-containing materials (ACM) at the facility. The U.S. Coast Guard Station is located on Presidio of San Francisco property along the San Francisco Bay. The facility consists of nine buildings ranging in size from 108 square feet (sq ft) to 8,852 sq ft, totalling 20,905 square feet. The survey was conducted in accordance with procedures outlined in TM5-612, Asbestos Control. Assessment of friable ACM was made using the worksheets included in the Guide for Asbestos Hazard Assessment in U.S. Army Facilities. From damage/risk and exposure values obtained from these worksheets, recommended management corrective actions were determined.

**Oil Vulnerabilities and USA Strategy**

Walsh, Shawn P; Feb 8, 2007; 23 pp.; In English

Report No.(s): AD-A468533; No Copyright; Avail.: Defense Technical Information Center (DTIC)

The USA, its industries, livelihood, and economy depend on oil. The USA is the world's largest consumer of oil, with daily usage of approximately 20 million barrels. Approximately 12.6 million barrels of oil per day is imported from foreign sources. Dependence on foreign oil leaves the American lifestyle, its freedoms, and its economy extremely vulnerable to risk, and exposed to factors outside the USA's immediate control. Foreign political or military action, acts of terrorism abroad, and the world's growing and competing demands for limited oil supplies are factors that could affect America's energy security.

Additionally, acts of terrorism on American soil directed at its vast petroleum distribution infrastructure could have a devastating impact on transportation and industry, bringing the nation and economy to a virtual stand still. These factors place the USA in a precarious position. As a new world order continues to take shape, oil remains a strategic commodity, critical to national strategies and international politics. Is the U.S. government promoting technology advances to find effective, efficient, and affordable solutions to fossil fuels? The author intends to explore vulnerabilities associated with the USA's dependence on foreign oil and reveal if the nation has an effective strategy to reduce its dependence on foreign oil.

**European Security in the Wider Black Sea Area**

Stinga, Aurelian; Mar 12, 2007; 22 pp.; In English

Report No.(s): AD-A469122; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA469122>

At the beginning the third millennium, the world balance of power changed. The events of 9/11 necessitated a reorientation of U.S. foreign policy and a new approach to the wider Black Sea security environment. After a decade of decline due to its energy policies, the Russian Federation has recovered and is trying to regain its position as the World's second greatest power. To accomplish this goal, communist Russia uses dirty politics, blackmail, and sabotage to frighten its neighbors; these tactics are jeopardizing the international security environment. This project examines geopolitical, geo-economical, and geostrategic tendencies, vulnerabilities, risks, and threats in the wider Black Sea area. The research reveals the existence of a 'Soft War' that has set the USA and the European Union on one side against the Russian Federation and its allies in the Shanghai Cooperation Organization on the other. This Soft War could easily become the Second Cold War. This war involves access to energy resources and distribution; Russian efforts to maintain and extend its hegemony using regional instability, secessionist enclaves, sabotage, paramilitary violence, terrorism, and heavy criminality. The project also examines Western interests in the area and U.S. and European Union recommendations meant to improve regional security and to counteract Russian offensive actions.

**A Decision Model for Selecting Energy Efficient Technologies for Low-Sloping Roof Tops Using Value-Focused Thinking**

McCourt, Michael J; Mar 2007; 112 pp.; In English; Original contains color illustrations

Report No.(s): AD-A466681; AFIT/GEM/ENS/07-03; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA466681>

The Air Force has a large inventory of low-sloping built up roofs (BURs) and millions of dollars are spent each year

retrofitting these systems. The DOD has been directed to reduce non-renewable energy consumption by using energy-efficient technologies. These two details present a great opportunity to use the open roof space to install energy-efficient roofing technologies. The purpose of this research is to provide Air Force decision makers with a tool to assist them in deciding what roofing technologies should be installed on facilities. Value Focused-Thinking is the methodology used to construct the model, in which values were used, instead of alternatives, to create the model. Data was collected from three different Air Force bases and values from three different Air Force Base Civil Engineers were used to evaluate the alternatives. The results show that based on current technologies these decision makers would be best served to retrofit BURs with standing seam metal roofs with some energy-efficient technologies added.

**Transforming the Way DOD Looks at Energy. An Approach to Establishing an Energy Strategy**

Crowley, Thomas D; Corrie, Tanya D; Diamond, David B; Funk, Stuart D; Hansen, Wilhelm A; Stenhoff, Andrea D; Swift, Daniel C; Apr 2007; 138 pp.; In English; Original contains color illustrations

Report No.(s): AD-A467003; FT602T1; No Copyright; Avail.: Defense Technical Information Center (DTIC)

In an environment of uncertainty about the price and availability of traditional energy sources, DoD is facing increasing energy demand and support requirements that it must meet if it is to achieve its broader strategic goals notably, establishment of a more mobile and agile force. However, recent technological advances in energy efficiency and alternative energy technologies offer a unique opportunity for DoD to make progress toward reconciling its strategic goals with its energy requirements through reduced consumption of fuel especially foreign fuel. To capitalize on this opportunity, DoD needs to implement an energy strategy that encompasses the development of innovative new concepts and capabilities to reduce energy dependence while maintaining or increasing overall warfighting effectiveness. Recognizing that DoD must change how it views, values, and uses energy a transformation that will challenge some of the department's most deeply held assumptions, interests, and processes the Office of Force Transformation and Resources, within the Office of the Under Secretary of Defense for Policy, asked LMI to develop an approach to establishing a DoD energy strategy.

**Defending Electrical Power Grids**

Rose, Robert W; Mar 2007; 70 pp.; In English

Report No.(s): AD-A467137; No Copyright; Avail.: Defense Technical Information Center (DTIC)

This thesis considers the problem of protecting an electrical power grid against a potential attack on its physical infrastructure. We develop a mathematical model, called Defense of Known Interdictions (DKI), that identifies the optimal set of components to defend in an electrical power grid given limited defensive resources. For a small test network, we show that defending fewer than 10% of the buses reduces the possible disruption from an attack by over 20%. Previous research has developed optimization models, called I-DCOPF, to find optimal or near optimal interdiction plans for electrical power grids. DKI solution time is determined by I-DCOPF solution time. We develop a model, called the Network Dual Relaxation (NDR), to replace I-DCOPF and reduce solution times. NDR approximates electrical power grid behavior as a minimum cost network flow and uses this approximation to quickly estimate a lower bound for the exact interdiction model. We test NDR on a portion of the North American power grid with a computational limit of 6000 seconds. Results with ten buses defended show that NDR finds solutions that are, on average, 40% better than those of the exact I-DCOPF model with a significant reduction in computational time.

**Army Facility Energy Demand and the Impact on National Security**

Clapp, Isabella; Mar 30, 2007; 25 pp.; In English

Report No.(s): AD-A467293; No Copyright; Avail.: Defense Technical Information Center (DTIC)

Sustaining the Army base ensures soldiers and their families have adequate resources to live and work. The focus of this paper is current and future energy demand for Army facilities and how demand will be met in the face of global resource

shortages. Utility services for facilities on Army installations include: purchased electricity, steam, hot water and other utilities, and operation of electrical, heating, air conditioning, refrigeration, water distribution, and wastewater collection and treatment systems worldwide. In recent years, facility energy costs have escalated and demand has increased due to higher wartime operating tempo. This paper examines the impact this trend has on national security and the Army budget. This includes a survey of the Energy Policy Act of 2005 (EPACT 2005) and other defense relevant directives and an assessment of their impact on resulting Army energy strategy (e.g., Army Energy Strategy for Installations, Army Energy and Water Campaign Plan for Installations, etc.). This paper also addresses what the Army has accomplished to meet energy goals. Lastly, it considers the effect of energy efficiencies and employment of alternative sources of energy as well as the implications of failing to invest sufficient resources today to meet future energy demand.

**Navy Ship Propulsion Technologies: Options for Reducing Oil Use - Background for Congress**

O'Rourke, Ronald; Dec 11, 2006; 42 pp.; In English; Original contains color illustrations

Report No.(s): AD-A467382; No Copyright; Avail.: Defense Technical Information Center (DTIC)

General strategies for reducing the Navy's dependence on oil for its ships include reducing energy use on Navy ships; shifting to alternative hydrocarbon fuels; shifting to more reliance on nuclear propulsion; and using sail and solar power. Reducing energy use on Navy ships. A 2001 study concluded that fitting a Navy cruiser with more energy-efficient electrical equipment could reduce the ship's fuel use by 10% to 25%. The Navy has installed fuel-saving bulbous bows and stern flaps on many of its ships. Ship fuel use could be reduced by shifting to advanced turbine designs such as an intercooled recuperated (ICR) turbine. Shifting to integrated electric-drive propulsion can reduce a ship's fuel use by 10% to 25%; some Navy ships are to use integrated electric drive. Fuel cell technology, if successfully developed, could reduce Navy ship fuel use substantially. Alternative hydrocarbon fuels. Potential alternative hydrocarbon fuels for Navy ships include biodiesel and liquid hydrocarbon fuels made from coal using the Fischer-Tropsch (FT) process. A 2005 Naval Research Advisory Committee (NRAC) study and a 2006 Air Force Scientific Advisory Board both discussed FT fuels. Nuclear propulsion. Oil-fueled ship types that might be shifted to nuclear propulsion include large-deck amphibious assault ships and large surface combatants (i.e., cruisers and destroyers). A 2005 'quick look' analysis by the Naval Nuclear Propulsion Program concluded that total life-cycle costs for nuclear-powered versions of these ships would equal those of oil-fueled versions when oil reaches about \$70 and \$ 178 per barrel, respectively. Sail and solar propulsion. Kite-assisted propulsion might be an option for reducing fuels use on Navy auxiliaries and DOD sea lift ships. Two firms are now offering kite-assist systems to commercial ship operators.

**Emerging Energy Requirements for Future C4ISR**

Pfeffer, R A; Macon, Jr , W A; Sep 2002; 14 pp.; In English; Original contains color illustrations

Report No.(s): AD-A467640; No Copyright; Avail.: Defense Technical Information Center (DTIC)

Command, control, communication, computers, intelligence, surveillance, and reconnaissance (C4ISR) systems already play a fundamental role in today's military operations. Modern C4ISR nodes now process enormous quantities of digital data in real time, allowing all levels of Command to better control the battle space. In future C4ISR, even more sophisticated electronics will be used to acquire, process and distribute information in manned and unmanned platforms and systems. In every case, from the more fixed sites at higher echelons to the very mobile battle space sensors and nodes, C4ISR will have to depend upon an energy source that is safe, reliable, and readily available/transported worldwide. Desert Storm and the low intensity war in Afghanistan clearly illustrate the enormous logistics costs required to provide readily available hydrocarbon-based fuel to military C4ISR and front line shooters. It would be preferable for the military to carry with them the capability to create all their fuel requirements. Even better, the new energy source should be based upon an inexhaustible natural resource and it should be compatible with current, oil-driven internal combustion engine technology, thus making the transition to the new fuel evolutionary, not revolutionary. The purpose of this article is to identify future military energy requirements, describe how they are driven by fundamental changes in the nation's energy policy, and show how the next generation of mobile nuclear power reactors could be used to generate the future energy transfer medium, hydrogen (H<sub>2</sub>), from seawater.

**Proceedings of the 1st Army Installation Energy Security and Independence Conference**

Hartranft, Thomas J; Yeboah, Frank; Grady, Dennis; Ducey, Roch; Mar 2007; 33 pp.; In English; Original contains color illustrations

Report No.(s): AD-A467999; ERDC/CERL-TR-07-9; No Copyright; Avail.: Defense Technical Information Center (DTIC)

This report is about energy security and for mission accomplishment. Is energy security assured by backup generator sets dedicated to individual buildings that are pre-identified as critical assets with fuel for 3-5 days? Suppose a utility power grid outage occurs. Today it is impossible to locally wheel power from dispersed individual on site fossil-fueled or renewable power sources to facilities or other power loads & anywhere at any time. Each power source is stranded; powering only one load. Relocating generator sets and engineering their electrical connections to other power loads are not speedy or trivial tasks. There are many mission aspects that go unpowered in a blackout because Army cannot afford backup generator sets for every building, training range, sewer treatment plant, warehouse, motor pool, etc. Even if everything has dedicated backup generators, experience shows that 50 percent will not operate right anyway & and they will run out of gas after 3-5 days. Mission priorities are dynamic; power outages are unpredictable. Commanders must have the ability to wheel dispersed and finite on-installation power anywhere at anytime and to allocate stored fuels for extended outages. A new vision of energy security is needed for the asymmetrical threats and dynamics of the GWOT era.

**Experience Scaling-Up Manufacturing and Emerging Photovoltaic Technologies**

Braun, G. W.; Skinner, D. E.; Jan. 2007; 59 pp.; In English

Report No.(s): DE2007-899800; NREL/SR-640-39165; No Copyright; Avail.: National Technical Information Service (NTIS)

This report examines two important generic photovoltaic technologies at particularly revealing stages of development, i.e., the stages between R&D and stable commercial production and profitable sales. Based on two historical cases, it attempts to shed light on the difference between: (1) costs and schedules validated by actual manufacturing and market experience, and (2) estimated costs and schedules that rely on technology forecasts and engineering estimates. The amorphous Silicon case also identifies some of the costs that are incurred in meeting specific market requirements, while the Cadmium Telluride case identifies many of the operational challenges involved in transferring R&D results to production. The transition between R&D and commercial success takes a great deal of time and money for emerging energy conversion technologies in general. The experience reported here can be instructive to those managing comparable efforts, and to their investors. It can also be instructive to R&D managers responsible for positioning such new technologies for commercial success.

**National Solar Radiation Data Base 1991-2005 Update: User's Manual**

Wilcox, S.; Apr. 2007; 472 pp.; In English

Contract(s)/Grant(s): DE-AC36-99-GO-10337

Report No.(s): PB2007-109060; NREL/TP-581-41364; No Copyright; Avail.: National Technical Information Service (NTIS)

This manual describes how to obtain and interpret the data products from the updated 1991-2005 National Solar Radiation Database (NSRDB). This is an update of the original 19611990 NSRDB released in 1992. In 2003, the National Renewable Energy Laboratory (NREL) investigated the feasibility of updating the NSRDB and began collaborative work with several agencies, including the National Aeronautics and Space Administration (NASA), the National Climatic Data Center (NCDC), the Northeast Regional Climate Center, the State University of New York at Albany (SUNY), the University of Oregon, the University of Wisconsin, and the private firm Solar Consulting Services. The original NSRDB held a serially complete data set for all sun-up hours for 239 stations. Because of expected changes in the roster of National Weather Service (NWS) sites, as well as the potential for adding NSRDB sites, the updated list of stations was not restricted to those same 239. Instead, it included as many stations and as much data as possible to increase the usefulness of the data set. This update therefore provides data for 1,454 stations. Users are encouraged to carefully consider the sections on modeled data and data uncertainty to better understand the applicability of the NSRDB for specific work.

A lithium battery for use in a vehicle includes a container, a plurality of positive terminals extending from a first end of the lithium battery, and a plurality of negative terminals extending from a second end of the lithium battery. The plurality of positive terminals are provided in a first configuration and the plurality of negative terminals are provided in a second configuration, the first configuration differing from the second configuration. A battery system for use in a vehicle may include a plurality of electrically connected lithium cells or batteries.

Report No.(s): PB2007-104584; No Copyright; Avail.: CASI: [A03](#), Hardcopy

Solid battery components are provided. A block copolymeric electrolyte is non-crosslinked and non-glassy through the entire range of typical battery service temperatures, that is, through the entire range of at least from about 0 degrees C to about 70 degrees C. The chains of which the copolymer is made each include at least one ionically-conductive block and at least one second block immiscible with the ionically-conductive block. The chains form an amorphous association and are arranged in an ordered nanostructure including a continuous matrix of amorphous ionically-conductive domains and amorphous second domains that are immiscible with the ionically-conductive domains. A compound is provided that has a formula of  $\text{Li}(\text{sub } x)\text{M}(\text{sub } y)\text{N}(\text{sub } z)\text{O}(\text{sub } 2)\text{M}$  and N are each metal atoms or a main group elements, and x, y and z are each numbers from about 0 to about 1. y and z are chosen such that a formal charge on the  $\text{M}(\text{sub } y)\text{N}(\text{sub } z)$  portion of the compound is (4-x). In certain embodiments, these compounds are used in the cathodes of rechargeable batteries. The present invention also includes methods of predicting the potential utility of metal dichalcogenide compounds for use in lithium intercalation compounds. It also provides methods for processing lithium intercalation oxides with the structure and compositional homogeneity necessary to realize the increased formation energies of said compounds. An article is made of a dimensionally-stable, interpenetrating microstructure of a first phase including a first component and a second phase, immiscible with the first phase, including a second component.

**Studies of Basic Electronic Properties of CdTe-Based Solar Cells and Their Evolution During Processing and Stress. Final Technical Report October 16, 2001-August 31, 2005**

Kaydanov, V. I.; Ohno, T. R.; Feb. 2007; 132 pp.; In English

Report No.(s): DE2007-899988; NREL/SR-520-41129; No Copyright; Avail.: National Technical Information Service (NTIS)

This report describes basic issues behind CdTe/CdS cell performance and stability, such as the nature and electronic properties of impurities and defects that control the majority carrier concentration, mechanisms of dopant compensation, recombination processes, their nature and properties, migration and transformation of defects under various processing, stress, and operating conditions. We believe that a better basic understanding of the specific influence of grain boundaries, especially for fine-grain materials such as those making up CdTe-based cells, is now one of the most important issues we must address. We need to clarify the role of grain boundaries in forming the film electronic properties, as well as those of the p-n junction.

**Impedance Analysis of Electrochemical NO<sub>x</sub> Sensor Using a Au/Yttria-Stabilized Zirconia (YSZ) Au Cell**

Woo, L. Y.; Martin, L. P.; Glass, R. S.; Grote, R. J.; Nov. 21, 2006; 8 pp.; In English

Report No.(s): DE2007-900174; UCRL-PROC-226274; No Copyright; Avail.: Department of Energy Information Bridge

An electrochemical cell employing a YSZ electrolyte and two Au electrodes was utilized as a model system for investigating the mechanisms responsible for impedancemetric NO<sub>x</sub> (NO and NO<sub>2</sub>) sensing. The cell consists of two dense Au electrodes on top of a porous/dense YSZ bilayer structure (with the additional porous layer present only under the Au electrodes). Both electrodes were co-located on the same side of the cell, resulting in an in-plane geometry for the current path. The porous YSZ appears to extend the triple phase boundary and allows for enhanced NO<sub>x</sub> sensing performance, although the exact role of the porous layer is not completely understood. Impedance data were obtained over the frequency range of 0.1 Hz to 1 MHz, and over a range of oxygen (2 to 18.9%) and NO<sub>x</sub> (10 to 100 ppm) concentrations, and temperatures (600 to 700 degrees C). Data were fit with an equivalent circuit, and the values of the circuit elements were obtained for different concentrations and temperatures. Changes in a single low-frequency arc were found to correlate with concentration changes, and to be temperature dependent. In the absence of NO<sub>x</sub>, the effect of O<sub>2</sub> on the low-frequency resistance could be described by a power law, and the temperature dependence described by a single apparent activation energy at all O<sub>2</sub> concentrations. When both O<sub>2</sub> and NO<sub>x</sub> were present, however, the power law exponent varied as a function of both temperature and concentration, and the apparent activation energy also showed dual dependence. Adsorption mechanisms are discussed as possibilities for the rate-limiting steps.

Report No.(s): AD-A468619; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA468619>

This Final Report compiles all the work carried out at the Center for Power Electronics Systems (CPES), corresponding to the 'Standard-Cell, Open-Architecture Power Conversion Systems' project sponsored by the Office of Naval Research (ONR). This project was purposefully aimed to develop a standardized hierarchical design and analysis methodology for modular power electronics conversion systems using as basis the ISO/OSI seven-layer reference model. The foundational ideas of this engineering vision came from the Power Electronics Building Block (PEBB), seeking to expand the usage of this concept while exploiting the numerous advantages offered by it, namely modularity, scalability, reconfiguration and reduced design cycles. The means to the end chosen was the actual embracing of the hierarchical nature of PEBB-based converters by applying it to the modeling approach, control software, and energy processing characterization of power electronics systems. The resultant two-dimensional hierarchical reference model pursues the complete analysis and design of power electronics systems, covering not only the electromagnetic, thermal and mechanical interactions from semiconductors up to complete power systems, but also their associated controls, modeling and communications at every hierarchy level. In order to achieve these objectives several tasks were identified and undertaken in this project. Specifically, several studies were conducted in order to fully characterize the energy processing functions observed in shipboard power systems, individually addressing the PEBB, power converter and power system levels. The PEBB level -- using a CPES built 33 kW PEBB -- was subjected to a complete study describing it across all defined hierarchies, i.e., energy processing, controls and modeling.

Further, the complete design and evaluation of its digital controller (Hardware Manager) is also presented, thus fully characterizing the controls hierarchy at this level.

Report No.(s): AD-A468854; JFSC-25789; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA468854>

This report examines China's increasing demand for energy and how that demand has the potential to threaten the stability of China's Communist Party regime. It illustrates that China's demand for energy will continue to grow and that China will become increasingly reliant on oil imports to meet its energy needs. This reliance on oil imports has forced China, in the short term to adopt an energy security strategy that seeks to protect its access to oil by adopting a non-threatening military posture complemented by use of its economic bargaining power. At the same, China has adopted a long range strategy, that runs side-by-side with the short-term strategy, of 'Bide our time and build up our capabilities.' This long-term strategy consists of a 'String of Pearls' approach to gain the necessary forward bases to secure its energy lifeline and the development of asymmetric military capabilities. The ultimate goal of this long-term strategy is to develop sufficient military capability to challenge the West and achieve great power status.

**Heat Generation during Overcharge in Sealed Cells**

Catherino, Henry A; Aug 9, 2006; 16 pp.; In English

Report No.(s): AD-A469043; TACOM-16088; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA469043>

A popular explanation for the heat generated when a sealed cell is overcharged is that the oxygen recombination taking place at the negative electrode is an exothermic process. Although it is a fact that this recombination reaction is exothermic, the first law of thermodynamics mandates that the net enthalpy of the closed cycle oxygen recombination process is exactly zero (also known as Hess's Law). Since the closed oxygen cycle cannot produce any enthalpic heat, the heat generated must be entirely of Joule origin. The alternative mechanism discussed in this paper is that the gas evolution process displaces the electrolyte in the intercell gap and by doing that, causes a substantial increase in the internal resistance of the cell. The consequence of this resistance increase in the presence of current passing through the cell is a significant contributor to the observed heat generation. This paper presents data and discussions that support this interpretation. This mechanistic interpretation has some notable implications. That is, the heat generation process is largely chemistry independent (i.e., it is common to all sealed cell designs), is the consequence of the ability of the separator to manage the electrolyte distribution within the cell and can thermally accelerate thermodynamically spontaneous processes that have slow kinetics under normal ambient conditions.

Report No.(s): AD-A469121; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA469121>

The world faces a significant energy problem with global demand rising and reserves declining. As both the largest consumer of energy and a major promoter of global economic stability, the USA is obviously affected by these developments. Beyond their direct economic consequences, high energy prices and potential shortages provide a pretext for unstable regimes to develop nuclear power (and potentially weapons), foster terrorism, impede global economic growth, and endanger stability. Concurrently, the U.S. faces a range of strategic challenges in Latin America including poor economic environments which promote problems including illegal immigration, drug trafficking, and instability. This project examines a concept to help mitigate both challenges - strengthening partnerships between the U.S. and its Latin American neighbors so they can become viable sources of alternative energy. This initiative would simultaneously help mitigate both America's energy concerns and improve relations with our Latin American neighbors.

In response to the growing need for lightweight - high energy density power sources on the battlefield, the US Army Communications Electronic Research Development Engineering Center (CERDEC) Fuel Cell Technology Team initiated several development contracts to address multiple areas where fuel cell technologies have the potential to offer increased capability to the Warfighter. Two of those areas are Soldier and Man Portable Power. Soldier Power fuel cell technology focuses specifically on Soldier worn power equipment, mainly from the sub to 100 Watt range. Man Portable Power fuel cell technology focuses on larger up to 500 Watt systems that could be carried by one or multiple Soldiers and provide power in remote locations. These two focus areas will serve as the basis of this paper discussing development status as well as testing results.

Report No.(s): AD-A469072; APPT-TR-06-01; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA469072>

The SFC C20-MP now utilizes fourth-generation conductive membrane technology in order to both increase system power density and mitigate the effects of methanol crossover across the DMFC membranes. Upon delivery of the upgraded units, CERDEC performed a series of test regimes to determine the operational capabilities of the C20-MP including fuel efficiency and power energy density. These tests confirmed that the C20-MP units are capable of achieving net system efficiencies as high as 21% based on the LHV of methanol. Testing also showed that the SFC systems were capable of providing upwards of 20 Watts of net continuous power at a power density of 10.25 Watts/kg. The calculated system energy density is 420W hrs/kg for a 72 hour, 20 Watt mission. The rest of this paper will discuss the results and findings in greater detail.

ONLINE: <http://hdl.handle.net/100.2/ADA466185>

The Gopher tortoise (*Gopherus polyhemus*) and the Indiana Bat (*Myotis sodalists*) are species found on many military installations. The Indiana bat is endangered throughout its range, and the Gopher tortoise is threatened in its westernmost distributions and at risk everywhere else. On installations where troop readiness training is conducted, an important component of realistic troop readiness training is the generation of obscurant material and the conduct of maneuvers under obscurant cover. Fog oil (FO) has long been deployed for visual obscurant training, and the effects of such obscurants on these species are unknown. As a preliminary step prior to instituting toxicological studies, a laboratory simulation was performed on the capability of FO to penetrate the living space of these species: the tortoise burrow and the hollow-tree location of a bat maternity colony. The FO smoke did not enter the simulated tortoise burrow in significant concentrations, but the smoke concentrations in the simulated tree cavity approached ambient levels under some test conditions. This suggests that tortoise burrows do not need to be studied in-situ, and that the tortoise may be considered protected while in the burrow. Bat maternal colony sites, however, should not be considered protected from smoke entry to any significant degree.

**Terrorist 'Dirty Bombs': A Brief Primer**

Medalia, Jonathan; Apr 1, 2004; 7 pp.; In English

Report No.(s): AD-A467145; CRS-RS21528; No Copyright; Avail.: Defense Technical Information Center (DTIC)

Many fear a terrorist attack with a radiological dispersal device (RDD). RDDs may scatter radioactive material with an explosive (a 'dirty bomb') or other means. Radioactive atoms are unstable; as they decay, they emit electromagnetic radiation or subatomic particles that can damage cells. Many legitimate activities worldwide use radioactive materials. This congressional report examines the following aspects of RDDs: differences between RDDs and nuclear weapons; the process by which RDDs decay and release their radioactivity; the meaning of the term 'half-life'; biological effects of radiation;

sources of radioactive materials, including medical equipment, oil well gauges, research labs, etc.; the effectiveness of RDDs; preventing an RDD attack by securing and controlling radioactive sources; detection of RDDs; advance steps the government can take to minimize the effects of an RDD attack; and how the government would respond to an RDD attack. This report will be updated. 'Nuclear and Radiological Terrorism,' in the CRS electronic briefing book on terrorism, tracks developments. This report does not address nuclear power-related issues. For information on that subject, see CRS Report RS21131, 'Nuclear Powerplants: Vulnerability to Terrorist Attack.'

Von Stackleberg, Katherine; Amos, Craig; Butler, C; Smith, Thomas; Famely, J; McArdle, M; Southworth, B; Steevens, Jeffrey; Oct 2006; 255 pp.; In English; Original contains color illustrations

Report No.(s): AD-A467991; ERDC-TR-06-11; No Copyright; Avail.: Defense Technical Information Center (DTIC)

Preparation for anticipated, unknown, and invariably adverse battlefield conditions requires military training activities involving military smokes and obscurants (S&Os) and related chemical compounds, and can result in the release of other chemical agents and military unique compounds (MUCs) associated with munitions. This study evaluates the potential long-term impacts on selected threatened and endangered species resulting from dispersion and deposition of vapors and particles found in the fog oils, hexachloroethane smoke, colored smokes, white phosphorus, and obscurants such as brass flakes and graphite flakes used during training. Residue from these constituents can deposit directly on plants and prey species favored by higher vertebrates and other species or can be taken up by plants and prey species from the soil. From the literature and installation use reports, the authors develop estimates of toxicity and exposure to calculate installation-specific screening-level risk for selected threatened and endangered species.

**NIOSH Health Hazard Evaluation Report: HETA No. 2007-0068-3042, Noise Exposures and Hearing Loss Assessments among Animal Shelter Workers, Louisiana Society for the Prevention of Cruelty to Animals, Algiers, Louisiana, May 2007**

May 2007; 20 pp.; In English

Report No.(s): PB2007-108765; HETA-2007-0068-3042; No Copyright; Avail.: CASI: [A03](#), Hardcopy

On December 1, 2006, NIOSH received a management request for an HHE from the LA/SPCA in Algiers, Louisiana. The HHE request asked NIOSH to assess the noise levels experienced by workers in the kennel area from barking dogs. On December 16-17, 2006, a NIOSH investigator measured noise exposure levels for workers in the kennel area. NIOSH investigators returned to the facility on February 6-8, 2007, to conduct hearing tests on all LA/SPCA employees. Thirteen kennel workers, two veterinary staff, and three client care workers provided 22 personal noise dosimetry measures over the 2- day evaluation. One of the measures collected on a kennel worker was invalid because of equipment malfunction. Sixteen of the 21 measures exceeded the daily allowable noise dose of 100% as calculated by the NIOSH criterion. Five measures also exceeded the OSHA AL. The OSHA PEL was not exceeded. Hearing tests were performed on 33 employees. Three employees showed some degree of hearing loss (> 25 decibel hearing loss) at one or more test frequencies in one or both ears on the NIOSH-administered audiogram. Twenty-one employees with normal hearing showed notches (hearing levels worsen over test frequencies before improving in the highest frequencies, forming a 'notch' configuration) in one or both ears between 3000-6000 Hz, indicating early signs of hearing loss. In addition to noise, the NIOSH investigator observed other hazards. Kennel workers without gloves and without proper eye protection (safety goggles) were cleaning cages. A constituent of one of the disinfectants used to clean the cages is a known eye irritant. In addition, kennel workers were required to wear back braces in case there was a need to lift heavy animals; NIOSH has determined back braces to be ineffective in preventing back injury.

**Guidelines for Oxygenated Gasoline Credit Programs under Section 211(m) of the Clean Air Act as Amended**

January 1992; 94 pp.; In English

Report No.(s): PB2007-109823; EPA/420/B-92/002; No Copyright; Avail.: CASI: [A05](#), Hardcopy

Section 221(m) of the Clean Air Act as Amended by the Clean Air Act Amendments of 1990 ('the Act') requires that various states submit revisions to their State Implementation Plans (SIPs), and implement oxygenated gasoline programs. The requirements applies to all states with carbon monoxide (CO) nonattainment areas with design values of 9.5 parts per million or more based generally on 1988 and 1989 data. The oxygenated gasoline program must require gasoline in the specified control areas to contain at least 2.7% oxygen by weight during that portion of the year in which the areas are prone to high ambient concentrations of carbon monoxide. Section 211(m)(5) of the Act requires that EPA promulgate guidelines for state credit programs, allowing the use of marketable oxygen credits for baselines with a higher oxygen content than required to offset the sale or use of gasolines with a lower oxygen content than required.

Report No.(s): DE2007-901189; PNNL-16321; No Copyright; Avail.: National Technical Information Service (NTIS)

Smokes and obscurants (S&O) are important screening agents used during military training exercises on many military installations. Although the use of S&O is subject to environmental laws, the fate and effects of S&O on natural habitats are not well documented. One particular concern is the impact S&O may have on local insect populations, which can be important components of terrestrial food chains of endangered species. Fog-oil (FO) is an S&O that is of particular concern. An important part of assessing potential ecosystem impacts is the ability to predict downwind FO concentrations. This report documents the use of the comprehensive atmospheric dispersion modeling system DUST TRANsport (DUSTRAN) to simulate the downwind transport and diffusion of a hypothetical FO release on the U.S. Army installation at Ft. Hood, TX.

This project's scientific goal was to achieve better understanding of where land cover change may mitigate climate change, accounting for both direct climate effects as well as the impacts on the global carbon cycle. As tools for investigating this problem, several models of different complexities were used: an offline land model, a standard coupled climate model, and a model in which coupled carbon-climate interactions were explicitly represented. Results from all model simulations were qualitatively similar: climate mitigation projects involving large-scale re-growth of forests are predicted to be beneficial in mitigating future CO<sub>2</sub>-induced global warming if these are carried out in the tropical latitudes, to be largely ineffectual if conducted in temperate latitudes, and to be counterproductive if implemented at high latitudes. Details of the quantitative differences in these predictions which are exhibited by the chosen climate models also are discussed.

The focus of this DOE-funded project has been the study of volatile components in magmas and the atmosphere. Over the twenty-one year period of this project, we have used experimental petrology and stable isotope geochemistry to study the behavior and properties of volatile components dissolved in silicate minerals and melts and glasses. More recently, we have also studied the concentration and isotopic composition of CO<sub>2</sub> in the atmosphere, especially in relation to air quality issues in the Los Angeles basin.

**Optical Fiber Chemical Sensor with Sol-Gel Derived Refractive Material as Transducer for High Temperature Gas Sensing in Clean Coal Technology (Final Report, October 1, 2004-December 31, 2006)**

Tao, S.; Feb. 01, 2007; 96 pp.; In English

Contract(s)/Grant(s): DE-FC26-04NT42230

Report No.(s): DE2007-901089; No Copyright; Avail.: National Technical Information Service (NTIS)

The chemistry of sol-gel derived silica and refractive metal oxide has been systematically studied. Sol-gel processes have been developed for preparing porous silica and semiconductor metal oxide materials. Micelle/reversed micelle techniques have been developed for preparing nanometer sized semiconductor metal oxides and noble metal particles. Techniques for doping metal ions, metal oxides and nanosized metal particles into porous sol-gel material have also been developed. Optical properties of sol-gel derived materials in ambient and high temperature gases have been studied by using fiber optic spectroscopic techniques, such as fiber optic ultraviolet/visible absorption spectrometry, fiber optic near infrared absorption spectrometry and fiber optic fluorescence spectrometry. Fiber optic spectrometric techniques have been developed for investigating the optical properties of these sol-gel derived materials prepared as porous optical fibers or as coatings on the surface of silica optical fibers. Optical and electron microscopic techniques have been used to observe the microstructure, such as pore size, pore shape, sensing agent distribution, of sol-gel derived material, as well as the size and morphology of nanometer metal particle doped in sol-gel derived porous silica, the nature of coating of sol-gel derived materials on silica optical fiber surface.

**Development and Implementation of Noise Analysis Standards for ACSA Airports**

Baldwin, T.; Hass, A.; Breen, T.; Alverson, S.; Reindal, E.; Apr. 2003; 288 pp.; In English

Report No.(s): PB2004-104577; HMMH-298610; No Copyright; Avail.: National Technical Information Service (NTIS)

The national government of South Africa has published, or is in the processing of developing several policy statements related to the measurement, analysis, reporting, and abatement of aircraft noise. In recognition of this national initiative, the Airports Company South Africa ('ACSA') is developing noise analysis standards for the air carrier airports that it operates. ACSA retained the acoustical consulting firm of Harris Miller Miller & Hanson Inc. (HMMH) to provide technical assistance in the following areas: development of standards for noise measurement, modeling, analysis, reporting, and related functions; performance of noise analyses and impact assessments, and recommendations of mitigation options for Johannesburg International Airport and Cape Town International Airport; Development of an investment plan for noise and flight track monitoring systems for ACSA's airports, including a comparative cost assessment of centralized and decentralized monitoring approaches, and recommendation of a preferred configuration to serve South African airports; preparation of tender specifications for a non-airport-specific noise and flight track monitoring system; preparation of tender specifications for noise and flight track monitoring system for Johannesburg International Airport; and Recommendation of appropriate permanent noise monitoring locations in the environs of Johannesburg International Airport and Cape Town International Airport.

**Area Factor Determinations for an Industrial Worker Exposed to a Concrete Slab End State**

Jannik, G. T.; Lee, P. L.; Farfan, E. B.; Roach, J. L.; Feb. 08, 2007; 8 pp.; In English

Report No.(s): DE2007-900559; WSRC-STI-2001-00074; No Copyright; Avail.: Department of Energy Information Bridge

The U.S. Department of Energy's (DOE) Savannah River Site (SRS) is decommissioning many of its excess facilities through removal of the facility structures leaving only the concrete slab foundations in place. Site-specific, risk-based derived concentration guideline levels (DCGLs) for radionuclides have been determined for a future industrial worker potentially exposed to residual contamination on these concrete slabs as described in Jannik. These risk-based DCGLs were estimated for an exposure area of 100 m<sup>2</sup>. During deactivation and decommissioning (D&D) operations at SRS, the need for area factors for larger and smaller contaminated areas arose. This paper compares the area factors determined for an industrial worker exposed to a concrete slab end-state for several radionuclides of concern at SRS with (1) the illustrative area factors provided in MARSSIM, (2) the area correction factors provided in the U.S. Environmental Protection Agency's (EPA) Soil Screening Guidance, and (3) the hot spot criterion for field application provided in the RESRAD User's Manual.

**Evaluation of Emission Control Strategies for the 8-Hour Ozone Standard in the Houston and Dallas Areas and A Pilot-Scale Study of In-Use Emissions from Heavy-Duty Diesel Dump Trucks using a Portable Emissions Monitoring System (PEMS)**

Webb, A.; Spinhirne, J.; Kimura, Y.; Gonzalez, L.; Durrenberger, D.; Oct. 2006; 141 pp.; In English

Report No.(s): PB2007-110174; CTR-0-5191-1; No Copyright; Avail.: National Technical Information Service (NTIS)

Emissions that lead to the formation of ozone have distinctive temporal patterns, and the chemistry of ozone formation is non-linear and introduces time lags between emissions and ozone formation. As the transition is made between the 1-hour ozone National Ambient Air Quality Standard (NAAQS) and the 8-hour NAAQS, critical questions arise about the effectiveness of potential new mobile source control strategies for reducing 8-hour averaged ozone concentrations in Texas non-attainment areas. This project had two primary objectives. The first objective was to examine the relative effectiveness of potential new emission control measures, primarily from mobile sources, on 1-hour and 8-hour ozone concentrations and population exposure metrics in the Houston and Dallas areas. The second objective was to conduct a pilot-scale study to

examine how portable emissions monitoring system (PEMS) technology can be used to characterize exhaust emissions from heavy-duty diesel vehicles and equipment during real-world driving conditions. The overall goal of the research was to provide a foundation for effective transportation and air quality policy decisions in eastern Texas. A total of thirty-eight modeling simulations were conducted to examine a range of emission control strategies. This modeling indicated that even with reductions in on-road and non-road mobile source emissions greater than 40 percent, at least one monitor in each area is still predicted to remain in non-attainment. Given these challenges, it is recommended that TxDOT continue to investigate eligibility for Texas Emission Reduction Program (TERP) funding to reduce NO<sub>x</sub> emissions from on-road heavy-duty diesel vehicles and non-road equipment (particularly diesel construction equipment) and continue to pursue effective emission control strategies that can be adopted both locally and statewide to assist in obtaining regional NO<sub>x</sub> reductions. The pilot-scale PEMS study demonstrated the successful deployment of the Sensors, Inc. SEMTECH-D PEMS on single-axle and tandem-axle dump trucks during typical TXDOT operations. Idling accounted for the most significant fraction (20 percent) of the duty cycle and had the highest average and median fuel-specific emission factors for all pollutants.

**Review of the Ambient Air Quality Standards for Ozone: Policy Assessment of Scientific and Technical Information. OAQPS Staff Paper**

Jan. 2007; 603 pp.; In English

Report No.(s): PB2007-110162; EPA/452/R-07-003; No Copyright; Avail.: National Technical Information Service (NTIS)

This Staff Paper, prepared by staff in the U.S. Environmental Protection Agency's (EPA) Office of Air Quality Planning and Standards (OAQPS), evaluates the policy implications of the key studies and scientific information contained in the document, Air Quality Criteria for Ozone and Related Photochemical Oxidants (USEPA, 2006; henceforth referred to as the CD), prepared by EPA's National Center for Environmental Assessment (NCEA). This document also presents and interprets results from several quantitative analyses (e.g., air quality analyses, human exposure analyses, human health risk assessments, and an environmental assessment of vegetation-related impacts) that we believe should also be considered in EPA's current review of the national ambient air quality standards (NAAQS) for ozone (O<sub>3</sub>), and presents factors relevant to the evaluation of current primary and secondary O<sub>3</sub> standards. Finally, this document presents staff conclusions and recommendations on a range of policy options that we believe are appropriate for the Administrator to consider concerning whether, and if so how, to revise the primary (health-based) and secondary (welfare-based) O<sub>3</sub> NAAQS. The policy assessment presented in this Staff Paper is intended to help 'bridge the gap' between the scientific assessment contained in the CD and the judgments required of the EPA Administrator in determining whether it is appropriate to retain or revise the NAAQS for O<sub>3</sub>. This policy assessment considers the available scientific evidence and quantitative risk-based analyses, together with related limitations and uncertainties, and focuses on the basic elements of air quality standards: indicator, averaging times, forms, and levels. These elements, which serve to define each standard, must be considered collectively in evaluating the health and welfare protection afforded by the O<sub>3</sub> standards. Our conclusions and policy recommendations on whether, and if so how, to revise these standard elements are based on the assessment and integrative synthesis of information presented in the CD and on staff analyses and evaluations presented in this document, and are further informed by comments and advice received from an independent scientific review committee, the Clean Air Scientific Advisory Committee (CASAC), in their review of earlier drafts of this document, as well as comments on earlier drafts submitted by public commenters.

**Priority of Chemicals for Detection in Air at International Missions for Reducing Threats to Personnel at Acute Toxic Releases to Air**

Edlund, C.; Eriksson, H.; Leffler, P.; Liljedahl, B.; Waesterby, P.; Jun. 2006; 18 pp.; In Swedish

Report No.(s): PB2007-106485; FOI-R-1995-SE; No Copyright; Avail.: National Technical Information Service (NTIS)

The variety of chemicals posing a threat for personnel on international missions is very wide and looks different depending on mission. Based on what level the industrial development has reached in an area, the threat will vary considerably. In this report a prioritizing of chemicals posing a threat has been made. Focus is set on air dispersion of chemicals transported on roads and stored or handled in industrial context. A list of chemicals is presented based on identification of relevant chemicals performed by different authorities and organizations (e.g. USACHPPM and SRV). In order to illustrate the

differences between mission areas, two examples are given in the report. One from Kosovo, where NBC-personnel made an inventory of used industrial chemicals in the province. The other example is a region where the industrial production has not yet reached the large scale of production, seen on the Balkans, like Africa or Afghanistan.

**Guidance for Estimating VOC and NO<sub>x</sub> Emission Changes from MACT Rules**

May 2007; 58 pp.; In English

Report No.(s): PB2007-109920; EPA/457/B-07-001; No Copyright; Avail.: CASI: [A04](#), Hardcopy

This document is intended to help States prepare their emission projections by providing the information needed to determine the level of VOC and NO<sub>x</sub> reductions expected with the implementation of post-2002 MACT standards where source-specific estimates are not practical for a source category in an 8-hour ozone nonattainment area. The States can assume the national average percent reduction provided in this document to estimate emission reductions for a given MACT standard. Although the MACT standards address hazardous air pollutants (HAPs), and indirectly affect criteria pollutants such as particulate matter (PM), this document only addresses the ozone precursor pollutants VOC and NO<sub>x</sub>.

**What's in a Name. Examination of Light and Intermittent Smokers. Helping to Set the Tobacco Control Research Agenda.**

Aug. 2005; 15 pp.; In English

Report No.(s): PB2007-110293; No Copyright; Avail.: National Technical Information Service (NTIS)

What defines a smoker. On national surveys, a smoker used to be defined as someone who smoked every day. In 1992,

the Centers for Disease Control and Prevention changed the definition of a smoker on the National Health Interview Survey to include those who indicated that they smoke some days. The meaning of smoker now encompasses a variety of smoking patterns, including the notion of light and occasional smoking. However, research and public health efforts aimed at reducing light smoking have been obscured by the broad perception among researchers and the public that smoking a few cigarettes per day is less harmful than smoking many cigarettes per day. Smoking at any level is harmful. Light and intermittent tobacco smokers (LITS) comprise a significant proportion of the smoking population, and several studies show that they are at increased risk for heart disease and cancer. The majority of African Americans and Hispanics who smoke often fall into the category of light smokers, and the prevalence of intermittent smokers is increasing in both the USA and Finland. To reduce smoking and create a smoke-free society, it is important that we create an open dialogue and begin to raise the appropriate research questions to address smoking behavior among light and intermittent smokers.

**Removal of Elemental Mercury from a Gas Stream Facilitated by a Non-Thermal Plasma Device. Final Report**

Mones, C.; Dec. 2006; 37 pp.; In English

Contract(s)/Grant(s): DE-FC26-98FT40323

Report No.(s): DE2007-900188; WRI-06-R016R; No Copyright; Avail.: National Technical Information Service (NTIS)

Mercury generated from anthropogenic sources presents a difficult environmental problem. In comparison to other toxic metals, mercury has a low vaporization temperature. Mercury and mercury compounds are highly toxic, and organic forms such as methyl mercury can be bio-accumulated. Exposure pathways include inhalation and transport to surface waters. Mercury poisoning can result in both acute and chronic effects. Most commonly, chronic exposure to mercury vapor affects the central nervous system and brain, resulting in neurological damage. The CRE technology employs a series of non-thermal, plasma-jet devices to provide a method for elemental mercury removal from a gas phase by targeting relevant chemical reactions. The technology couples the known chemistry of converting elemental mercury to ionic compounds by mercury-chlorine-oxygen reactions with the generation of highly reactive species in a non-thermal, atmospheric, plasma device. The generation of highly reactive metastable species in a non-thermal plasma device is well known. The introduction of plasma using a jet-injection device provides a means to contact highly reactive species with elemental mercury in a manner to overcome the kinetic and mass-transfer limitations encountered by previous researchers. To demonstrate this technology, WRI has constructed a plasma test facility that includes plasma reactors capable of using up to four plasma jets, flow control instrumentation, an integrated control panel to operate the facility, a mercury generation system that employs a temperature controlled oven and permeation tube, combustible and mercury gas analyzers, and a ductless fume hood designed to capture fugitive mercury emissions. Continental Research and Engineering (CR&E) and Western Research Institute (WRI) successfully demonstrated that non-thermal plasma containing oxygen and chlorine-oxygen reagents could completely convert elemental mercury to an ionic form. These results demonstrate potential the application of this technology for removing elemental mercury from flue gas streams generated by utility boilers. On an absolute basis, the quantity of reagent required to accomplish the oxidation was small.

**Inventory of U.S. Greenhouse Gas Emissions and Sinks: 1990-2005**

Apr. 15, 2007; 458 pp.; In English

Report No.(s): PB2007-110344; EPA/430/R-07/002; No Copyright; Avail.: CASI: [A20](#), Hardcopy

An emissions inventory that identifies and quantifies a country's primary anthropogenic sources and sinks of greenhouse gases is essential for addressing climate change. This inventory adheres to both (1) a comprehensive and detailed set of methodologies for estimating sources and sinks of anthropogenic greenhouse gases, and (2) a common and consistent mechanism that enables Parties to the United Nations Framework Convention on Climate Change (UNFCCC) to compare the relative contribution of different emission sources and greenhouse gases to climate changes. This chapter summarizes the latest information on U.S. anthropogenic greenhouse gas emission trends from 1990 through 2005. To ensure that the U.S. emissions inventory is comparable to those of other UNFCCC Parties, the estimates presented here were calculated using methodologies consistent with those recommended in the Revised 1996 IPCC Guidelines for National Greenhouse Gas Inventories (IPCC/UNEP/OECD/IEA 1997), the IPCC Good Practice Guidance and Uncertainty Management in National Greenhouse Gas Inventories (IPCC 2000), and the IPCC Good Practice Guidance for Land Use, Land-Use Change, and Forestry (IPCC 2003). Additionally, the U.S. emission inventory has begun to incorporate new methodologies and data from the 2006 IPCC Guidelines for National Greenhouse Gas Inventories (IPCC 2006). The structure of this report is consistent with the UNFCCC guidelines for inventory reporting. For most source categories, the Intergovernmental Panel on Climate Change (IPCC) methodologies were expanded, resulting in a more comprehensive and detailed estimate of emissions.

**IAQ Tools for Schools. Managing Asthma in the School Environment**

Aug. 2005; 23 pp.; In English

Report No.(s): PB2007-110294; EPA 402-K-05-002; No Copyright; Avail.: CASI: [A03](#), Hardcopy

Asthma has reached epidemic proportions in the USA affecting millions of people of all ages and races. An average of

one out of every 13 school-age children has asthma, and the percentage of children with asthma is rising more rapidly in preschool-age children than in any other age group. Asthma is the leading cause of school absenteeism due to a chronic condition, accounting for more than 14.7 million missed school days per year. Asthma also accounts for many nights of interrupted sleep, limitation of activity, and disruption of family and care-giver routines. Asthma symptoms that are not severe enough to require a visit to an emergency room or to a physician can still be serious enough to prevent a child with asthma from living a fully active life.

**Preliminary Findings from Noise Testing on PFC Pavements in Texas**

Trevino-Frias, M.; Dossey, T.; Apr. 2007; 121 pp.; In English

Report No.(s): PB2007-110190; CTR-0-5185-2; No Copyright; Avail.: National Technical Information Service (NTIS)

This report documents noise testing performed on Texas pavements in the summer and fall of 2006. Test methods include roadside noise measurement with SPL meters and on-vehicle sound intensity measurement of noise at the pavement tire interface. Comparisons are made between the levels of vehicular noise at the roadside and directly on the source vehicle. The FHWA Traffic Noise Model (TNM) computer program was then used to predict the noise levels at roadside based on the observed traffic and geometry of the roadway, and subsequently compared to the noise as actually measured with precision test equipment. The pavements tested were primarily of the New Generation Open Graded Friction Course type, a permeable asphalt design with air voids in the area of 17 percent, also known as Permeable Friction Course (PFC) in Texas. Preliminary findings indicate that roadside noise levels experienced along PFC pavements are significantly lower than predicted by TNM using either the 'Average' or 'Open Graded' pavement models included in the program. This suggests that further study is warranted to determine whether these pavements retain their acoustic properties over time and wear and, thus, can be reliably used for noise impact avoidance and abatement.

ONLINE: <http://hdl.handle.net/100.2/ADA466358>

The possibility of strong diffusion by driving intense Alfvénic turbulence in the radiation belts is examined. Intense Alfvénic turbulence is artificially induced by the release of neutral gas in the equatorial plane perpendicular to the ambient magnetic field. The free energy associated with the orbital motion of the released neutral atoms is the energy source of the Alfvénic turbulence. Ions resulting from the photo-ionized neutrals form a ring-type distribution in velocity that is highly unstable to shear Alfvén waves near the ion cyclotron harmonics of the released species. The nonlinear evolution of the primary waves leads to redistribution of the wave energy in k-space and to excitation of secondary waves with characteristics appropriate for electron cyclotron resonance with the energetic electrons in the radiation belts that can induce intense pitch angle scattering of the trapped electrons. Release types and requirements to achieve the strong scattering limit are presented.

**Grid-Search Techniques for Seismic Event Location and Phase Association**

Toksoz, Nafi; Rodi, William; Sarkar, Sudipta; Mar 2007; 49 pp.; In English; Original contains color illustrations

Contract(s)/Grant(s): DTRA01-00-C-0102; Proj-463D

Report No.(s): AD-A466474; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA466474>

The objectives of this project are to develop improved methods for locating seismic events and to develop new approaches to analyzing the seismic event location uncertainty. Our efforts are focused on the problems of both single and multiple event location. For a single event, we have formulated a statistical approach based on maximum-likelihood estimation and implemented it with grid-search and Monte Carlo techniques to yield an algorithm called 'Grid-Search Single Event Location' (GSEL), which computes non-elliptical confidence regions on event locations for a wide class of assumed probability distributions (Gaussian and non-Gaussian) and for data picking errors. We have applied GSEL to regional arrival data from the 1991 Racha earthquake sequence and from the 1998 Adana (Turkey) earthquake sequence. Our multiple-event grid-search location algorithm (called GMEL) is also based on a maximum likelihood formulation of the location problem and it solves jointly for the location parameters (hypocenters and origin times) of seismic events in a cluster and travel-time corrections at the stations recording the events, GMEL accommodates non-Gaussian as well as Gaussian models of picking errors. We test this GMEL with clusters of 1999 Izmit/Duzce (Turkey) earthquake sequence. The approach we developed is based on the maximum-likelihood framework determines confidence regions on event locations under a general class of picking error models (Gaussian and non-Gaussian).

**Collaborative Research: Ground Truth of African and Eastern Mediterranean Shallow Seismicity Using SAR Interferometry and Gibbs Sampling Inversion**

Brooks, Benjamin A; Gomez, Francisco; Sandvol, Eric; Frazer, L N; Oct 5, 2006; 80 pp.; In English

Contract(s)/Grant(s): F19628-03-C-0107; Proj-1010

Report No.(s): AD-A466900; No Copyright; Avail.: Defense Technical Information Center (DTIC)

We evaluate the use of Synthetic Aperture Radar Interferometry (InSAR) to provide GT5 or better locations for shallow earthquakes of moderate size (Mw 5 - 6.5) in primarily Africa and the Middle East, although we also included some events

from Asia. We find that InSAR is capable of routine detection of surface displacements associated with small (<Mw 5.5) seismic events. Additionally, we find that, in some cases, inversion of the surface displacement field alone can meet GT5 criteria. In many cases, however, although CIT location criteria appear to be met by The inversion, the overall solution (including strike, rake, and dip of the fault plane) is not consistent with additional information such as focal mechanism and so there may be some question to its overall accuracy. This suggests that in order to start to properly create an InSAR/CIT catalog, the next level inversion should incorporate prior information (properly propagating errors) such as the focal mechanism. We provide 2 new GT5 events for the existing catalog. We were successful in collecting seismic data from which we were able to measure origin times for all sixteen events. Collected waveforms for the Sultan Dagi, Turkey event help us identify the likely existence of a small foreshock.

**Observation of Tidal Effects on LWIR Radiance Above the Mesopause**

Wintersteiner, Peter; Mar 7, 2007; 18 pp.; In English

Contract(s)/Grant(s): FA8718-04-C-0031; Proj-2301

Report No.(s): AD-A466901; No Copyright; Avail.: Defense Technical Information Center (DTIC)

An examination of CO<sub>2</sub> infrared limb radiance, directly measured by the SABER instrument aboard the TIMED satellite, reveals unusual structure in the region just above the mesopause, at tangent heights of -95-110 km. Global coverage afforded by SABER makes it possible to investigate this behavior, which includes prominent regions with positive radiance gradients, as a function of latitude, local time, and season. The local-time dependence, in particular, suggests a role for atmospheric tides. Using a tidal model, Global Scale Wave Model, and our non-LTE ARC code, we modeled the 15 micrometers radiance. These calculations reproduced the main features of the global radiance structure, including the heights where positive gradients occur, and its variation with local time for different latitudes and seasons. The conclusion is that tidal perturbation of the temperature field in the lower thermosphere is directly responsible for the observed variability of the long-wave infrared limb radiance.

**Regionalization of Crustal and Upper Mantle Q Structure in Eastern Eurasia Using Multiple Regional Waves**

Gaherty, James; Lerner-Lam, Arthur; Feb 5, 2007; 62 pp.; In English

Contract(s)/Grant(s): F19628-03-C-0122; Proj-1010

Report No.(s): AD-A466910; No Copyright; Avail.: Defense Technical Information Center (DTIC)

We have mapped lateral variations in seismic Q in eastern Eurasia, including continental China, central Asia, Mongolia and Siberia, using high-frequency regional phases L<sub>g</sub> and P<sub>n</sub>, as well as long-period Rayleigh waves. We measured Q of crustal L<sub>g</sub> waves in eastern Eurasia using two-station methods. Over 5,000 spectral ratios from 594 interstation paths were used to estimate L<sub>g</sub> Q Omicron and Eta(Q at 1 Hz and its frequency dependence). These path averages were used to derive tomographic models of Q Omicron and Eta with resolutions between 4 and 10 degrees. The Q Omicron model contains values that vary between 100 and 900. Q Omicron are the lowest in the Tibetan plateau, increase to moderate levels towards the east and north, and reach maxima in the Siberian and eastern Europe Cratons. Q Omicron values correlate well with regional tectonics. Most Eta values are between 0.14 and 0.50, with a mean of 0.18. These values are lower than those obtained previously. P<sub>n</sub> spectra were collected from three seismic experiments in the Tibetan Plateau (TP) over four path groups to study P<sub>n</sub> attenuation. A comparison of P<sub>n</sub> spectra from these events reveal that mantle lid under north central TP attenuates P<sub>n</sub> more severely than under central Asia. Over paths that sample either a mixture of northern and southern Tibet or eastern Tibet, Q Omicron and Eta are between about 250-270 and 0.0-0.1, respectively. Over the path group that samples easternmost TP the respective estimates are 374 +/- 51 and 0.3 +/- 0.1. Lateral variation of P<sub>n</sub> attenuation inversely correlates with that of the P<sub>n</sub> velocity. Possible causes of this variation include (1) a thermally driven mantle Q Rho, and (2) region-specific velocity structures. We utilized Rayleigh waves with periods longer than -15 s, derived from regional and near-telesismic earthquakes, to map lateral variations in crustal and upper mantle shear velocity and attenuation across eastern Eurasia.

**On Recent Interannual Variability of the Arctic Winter Mesosphere: Implications for Tracer Descent**

Siskind, David E; Eckermann, Stephen D; Coy, Lawrence; McCormack, John P; Randall, Cora E; Jan 2007; 6 pp.; In English; Original contains color illustrations

Report No.(s): AD-A467553; No Copyright; Avail.: Defense Technical Information Center (DTIC)

Observations from the Sounding of the Atmosphere with Broadband Emission Radiometry (SABER) experiment on the NASA/Thermosphere Ionosphere Mesosphere Energetics and Dynamics (TIMED) satellite show an unusual vertical displacement of the winter Arctic stratopause in 2006 with zonal mean temperatures at 0.01 hPa (~78 km) exceeding 250 K. By contrast, at the conventional stratopause location near 0.7 hPa (~50 km), temperatures were unusually cold. Simulations with the NOGAPS-ALPHA model suggest that these are coupled to an unusually warm and disturbed lower stratosphere that filtered out many of the gravity waves that normally break at and above 50 km. The model also shows that downward transport in the 2006 Arctic vortex was enhanced relative to 2005. These results might explain observations of enhanced upper atmospheric NO descending to the upper stratosphere in 2006 and highlights the importance of gravity waves in modulating the coupling of the upper atmosphere with the stratosphere.

**The Supreme Court's Climate Change Decision: Massachusetts v. EPA**

Meltz, Robert; May 18, 2007; 7 pp.; In English; Original contains color illustrations

Report No.(s): AD-A468114; CRS-RS22665; No Copyright; Avail.: Defense Technical Information Center (DTIC)

On April 2, 2007, the Supreme Court handed down 'Massachusetts v. EPA,' its first pronouncement on climate change. By 5-4, the Court held the following: (1) Massachusetts had standing to sue, (2) Section 202 of the Clean Air Act authorizes the Environmental Protection Agency (EPA) to regulate emissions from new motor vehicles on the basis of their possible climate change impacts, and (3) Section 202 does not authorize EPA to inject policy considerations into its decision whether to so regulate. The Court's decision leaves EPA with three options under Section 202: find that motor vehicle greenhouse gas emissions may 'endanger public health or welfare' and issue emission standards, find that they do not satisfy that prerequisite, or decide that climate change science is so uncertain as to preclude making a finding either way. The decision also has implications for other climate-change-related litigation, particularly a pending suit seeking to compel EPA regulation of greenhouse gas emissions from stationary sources of emissions.

**On the Relationship of SAPS to Storm-Enhanced Density**

Foster, J C; Rideout, W; Sandel, B; Forrester, W T; Rich, F J; Jan 2007; 12 pp.; In English; Original contains color illustrations  
Contract(s)/Grant(s): F19628-00-C-0002; NAS5-96020; Proj-2311

Report No.(s): AD-A468139; No Copyright; Avail.: Defense Technical Information Center (DTIC)

We use magnetic field-aligned mapping between the ionosphere and the magnetosphere to intercompare ground-based observations of storm enhanced density (SED), and plasmasphere drainage plumes imaged from space by the IMAGE EUV imager, with the enhanced inner-magnetosphere/ionosphere SAPS electric field which develops during large storms. We find that the inner edge of the SAPS electric field overlaps the erosion plume and that plume material is carried sunward in the SAPS overlap region. The two phenomena, SED in the ionosphere and the erosion plume at magnetospheric heights, define a common trajectory for upward-propagating cold plasma fluxes in the midnight-desk-post noon sector. The SAPS channel at ionospheric heights and its projection into the equatorial plane serve to define the sharp outer boundary of the erosion plume. The SAPS electric field abuts and overlaps both the plasmasphere boundary layer and the plasmasphere erosion plume from pre-midnight through post-noon local times.

**Gravity-Wave Dynamics in the Atmosphere**

Akylas, Triantaphyllos R; May 1, 2007; 35 pp.; In English

Contract(s)/Grant(s): FA9950-04-1-0125

Report No.(s): AD-A468407; No Copyright; Avail.: Defense Technical Information Center (DTIC)

The flow of wind over mountain ranges is believed to be one of the primary generation mechanisms of atmospheric gravity waves. Mountain gravity waves contribute to the production of stratospheric turbulence, a potential cause of accidents in high-altitude aircraft flights. In an effort to advance the current capabilities of forecasting stratospheric turbulence, theoretical models have been developed for the generation and breakdown of mountain gravity waves under realistic conditions, including effects not captured by existing forecasting tools. Specifically, short-scale oscillations in the background buoyancy-frequency profile, often seen in balloon measurements, but normally ignored in theoretical models, are found to cause significantly increased gravity-wave activity, resulting in wave breaking above and upstream of the mountain. The effect of temporal variations in the wind velocity is also studied for a range of amplitudes and periods typical of those encountered in the field. Transient gravity waves resulting from such variations can be significant, and steady flow states predicted on the assumption of uniform wind may not be attainable. Finally, a study is made of the nonlinear evolution of a gravity-wave packet as it propagates upwards in the atmosphere, generating low-frequency inertial-gravity waves of the type seen in recent field observations.

**Tsunami Risk Reduction for the USA: A Framework for Action**

Dec 2005; 31 pp.; In English; Original contains color illustrations

Report No.(s): AD-A467981; No Copyright; Avail.: Defense Technical Information Center (DTIC)

Following the Indian Ocean tsunami on December 26, 2004, the President moved to protect lives and property by launching an initiative to improve domestic tsunami warning capabilities. This plan, developed under the auspices of the National Science and Technology Council, places the President's initiative in the context of a broad national effort of tsunami risk reduction and USA participation in international efforts to reduce tsunami risk worldwide. Although the frequency of damaging tsunami in the USA is low compared to many other natural hazards, the Indian Ocean event was a reminder that the impacts can be extremely high. Recognizing the potential geographic links to other hazards such as hurricanes, volcanoes, and earthquakes, the framework for tsunami risk reduction incorporates an all-hazards approach and builds upon existing hazard programs.

**Review of the Stability Analysis for the LANL BSL-3 Building Foundation**

Heuze, F. E.; Wagoner, J. L.; Nov. 02, 2006; 18 pp.; In English

Report No.(s): DE2007-900444; UCRL-TR-226737; No Copyright; Avail.: National Technical Information Service (NTIS)

This work was performed upon request from Dr. Richard Thorpe from NNSA after his review of the LANL report on BSL-3 seismic stability. The authors also reviewed report (1) and concluded, as did Dr. Thorpe, that the stability analysis was inappropriate. There are several reasons for that conclusion: the assumption of a circular failure surface through the combined fill-and-rock foundation does not recognize the geologic structure involved; the assumption of an equivalent static force to an earthquake loading does not represent the multiple cycles of shear loads created by a seismic event that can engender a substantial degradation of shear modulus and shear strength of the soil under the building (2); and there was no credible in-situ strength of the foundation materials (fill and rock mass) available for input into the stability analysis. Following that review, on September 26 the authors made a site visit and held discussions with LANL personnel connected to the BSL-3 building project.

**Rotational Response of Toe-Restrained Retaining Walls to Earthquake Ground Motions**

Ebeling, Robert M; White, Barry C; Dec 2006; 343 pp.; In English; Original contains color illustrations

Report No.(s): AD-A468663; ERDC/ITL-TR-06-2; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA468663>

This research report describes the engineering formulation and corresponding software developed for the rotational response of rock-founded, toe-restrained Corps retaining walls to earthquake ground motions. The PC software CorpsWallRotate (sometimes referred to as CWRotate) was developed to perform an analysis of permanent wall rotation for each proposed retaining wall section to a user-specified earthquake acceleration time-history. A particular formulation of the permanent sliding (i.e., translational) displacement response of retaining walls is also described. The resulting engineering methodology and corresponding software are applicable to a variety of retaining walls that are buttressed at their toes by a structural feature (e.g., navigation walls retaining earth, spillway chute walls, spillway discharge channel walls, approach channel walls to outlet works structures, highway and railway relocation retaining walls, and floodwall channels). CorpsWallRotate is particularly applicable to L-walls and T-walls (cantilever retaining walls) and may also be used to predict permanent, seismically induced displacements on retaining walls with or without a toe restraint.

**Continent-Wide Maps of 5-50 S Rayleigh-Wave Attenuation for Eurasia Inferred from Maps of 1-Hz Lg Coda Q and its Frequency Dependence**

Cong, Lianli; Mitchell, Brian J; Sep 2006; 6 pp.; In English; Original contains color illustrations

Contract(s)/Grant(s): FA8718-04-C-0021; Proj-1010

Report No.(s): AD-A468833; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA468833>

The crust of southern Eurasia is characterised by low Q values (200-450) for 1-Hz Lg coda everywhere from Spain to China. The north-south extent of that low-Q zone varies from being relatively narrow in western Europe to being very broad from the Middle East to China. Those variations in both magnitude and width first became apparent with the development of continent-wide tomographic maps of Lg coda Q. The most recent mappings of Lg coda Q values at 1 Hz, completed over the past year, show that the four regions of lowest Q values occur in regions marked by high levels of seismicity. Q instable regions of Eurasia varies between about 450 and 900 with the highest values occurring in the Indian shield, the East European Craton, the Siberian Craton, and the Khasakh Platform. The maps reveal relatively, and unexpectedly, low values of Q in the Siberian Trap region of Siberia.

**Detection of Atmospheric Explosions at IMS Monitoring Stations using Infrasonic Techniques**

Christie, Douglas R; Kennett, Brian L; Tarlowski, Chris; Sep 2006; 12 pp.; In English; Original contains color illustrations

Contract(s)/Grant(s): FA8718-04-C-0032; Proj-1010

Report No.(s): AD-A468834; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA468834>

Work is continuing on the development of infrasonic techniques that can be used to improve detection, location and discrimination capability for atmospheric nuclear explosions at International Monitoring System (IMS) infrasonic monitoring stations. In particular, we are continuing to focus on the detection of atmospheric explosions in the distance range from about 500 to 4500 km. We note that good detection capability in this distance range is essential to ensure that the global IMS infrasonic network has acceptable monitoring capability, including good capability for the detection of explosions that occur over the vast open ocean areas in the Pacific, Indian and Southern Oceans. This investigation has therefore been primarily concerned with a detailed study of the properties of infrasonic generated by regional and distant atmospheric explosions and the development of techniques that can improve detection capability for regional and distant sources at infrasonic monitoring stations.

**Computational Nonlinear Optics: Femtosecond Atmospheric Light String Applications**

Moloney, Jerome V; Wright, E M; Diels, J C; Brio, M; Kolesik, M; Sep 20, 2006; 18 pp.; In English; Original contains color illustrations

Contract(s)/Grant(s): F49620-03-1-0194

Report No.(s): AD-A468911; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA468911>

The main technical achievement of the project was the development of a comprehensive vector Maxwell unidirectional laser pulse propagator to accurately simulate intense ultra-short atmospheric light strings, white-light super-continuum generation across a broad landscape of applications, short range THz emission from plasma channels left in the wake of critically-collapsing light strings, nonlinear X- and O-wave generation in air, water and condensed matter and super-continuum shaping in sub-micron diameter fiber cores and photonic crystal fibers. The propagator model is broadly inclusive, allowing for the first time the capability to propagate optical carrier resolved, 3D space and time laser pulses over many meter distances. Furthermore it allows seamless transition to all know prior ultra-short pulse propagators in the literature thereby clearly identifying the physical limitations of each. Funding from the project also enabled the initial development of a full 3D FDTD vector Maxwell space and time grid refinement algorithm. It is anticipated that the propagator developed in this project will need to be fully interfaced to a Maxwell solver in anticipation of future extreme nonlinear optics applications.

**Global Climate Change: National Security Implications**

Johnson, II, Douglas V; Jan 2007; 5 pp.; In English; Original contains color illustrations

Report No.(s): AD-A466551; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA466551>

Climate change is underway. The effects will vary according to a broad variety of circumstances and interactions, some of which are not well-understood. Likewise, mitigation is not wellunderstood, and will not take place quickly. The national security implications of climate change are proportional both to the speed of change and the extent. Public awareness should follow a coordinated strategic communication plan that focuses on maintaining credibility. Threats to national survival stemming from catastrophic change must be anticipated, evaluated, and neutralized to the greatest degree possible. The entire range of plausible threats needs to be delineated, then analyzed and early warning criteria established. The alternative approaches and cost-benefit analyses must be run to establish what can be done, when, and at what cost. While military forces have roles in disaster relief, the broader impact of serious climate change will require multinational, multi-agency cooperation on a scale heretofore unimaginable and could provide no-fault ground for global cooperation. ' Effective interagency action may require new legislation and better definition of Department of Homeland Security authority. Should global cooperative measures fail, the first impact will likely come from large numbers of displaced people who, by the very nature of their

displacement, will become subject to malnutrition and disease; agricultural dislocation could aggravate or spark displacement and border security issues could arise as well.

**The Chaos of Katrina**

Morris, Jr, Gerald W; Mar 2007; 104 pp.; In English; Original contains color illustrations

Report No.(s): AD-A466576; AFIT/GLM/ENS/07-10; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA466576>

This thesis presents a case study of federal logistics support during Hurricane Katrina disaster relief operations. Data from federal contracts covering the first 10 weeks of Katrina are used to measure federal logistics activity. The study investigates whether chaos theory, part of complexity science, can extract information from Katrina contracting data to help managers make better logistics decisions during disaster relief operations. The study uses three analytical techniques: embedding, fitting the data to a logistic equation, and plotting the limit-cycle. Embedding and fitting a logistic equation to the data were used to test for deterministic chaos. The logistic equation and two versions of the limit-cycle model developed by Priesmeyer, Baik, and Cole were also tested as potential management tools. The study found that deterministic chaos was present during the first week of disaster relief, but that results for subsequent weeks were inconclusive, possibly due to internal changes to the relief dynamics. The thesis concludes that initial conditions and early actions will have a significant affect on disaster relief outcomes. Furthermore, many events that appear to be uncontrollable and random may actually be controllable. Therefore, managers play a critical role in preparing for and providing guidance in the early stages of disaster relief.

**Downstream Impacts Due to the Extratropical Transition of Tropical Cyclones Over the Western North Pacific**

Dea, Jonathan M; Mar 2007; 119 pp.; In English

Report No.(s): AD-A467082; No Copyright; Avail.: Defense Technical Information Center (DTIC)

Analysis of the eddy kinetic energy budget for four cases of extratropical transition (ET) with North Pacific tropical cyclones (TCs) is conducted. The cases compare varying ET and midlatitude flow characteristics. Each case was examined to determine the impacts of eddy kinetic energy generation and/or transfer on downstream development in the midlatitude circulation. Typhoon Tokage (October 2004) was a large TC that moved into a high-amplitude midlatitude circulation. Energetics analysis revealed that the ET of Tokage influenced the development of a deep trough over the central North Pacific before Tokage moved poleward and weakened transfer. Typhoon Banyan (July 2005) was a mid-summer case that influenced downstream development ultimately over the Aleutian Islands. Typhoon Guchol (August 2005) was a small TC that was dominated by midlatitude flow. However, the merger of Guchol with a midlatitude trough enabled development downstream of a separate trough. Typhoon Nabi was an intense TC that injected significant EKE into the midlatitude circulation during ET. Through downstream development, Nabi changed a zonal pattern over the North Pacific into an amplified pattern. These cases indicate that the ET process over the western North Pacific impacts the midlatitude circulation across the entire North Pacific basin.

**Severe Weather Forecasting for Laughlin AFB, TX**

Cercone, Eric J; Mar 2007; 99 pp.; In English

Report No.(s): AD-A467110; No Copyright; Avail.: Defense Technical Information Center (DTIC)

A sounding climatology of a variety of parameters commonly used to forecast deep, moist convection using upper-air observations is developed. The data set includes 0000 and 1200 UTC rawinsonde data (approximately 3629 soundings) from Laughlin AFB, TX from April September 1995 2004. Cloud-to-ground lightning data, surface observations, and severe weather reports from the Storm Prediction Center (SPC) SeverePlot2 Program were used to categorize soundings as representative of conditions for no convection, light convection, convection within vicinity, moderate severe convection, or severe convection. Indices, including convective available potential energy (CAPE) and mean layer CAPE (MLCAPE), along

with sounding parameters and combinations of such as 0-2 and 0-6 km bulk shear, 700-500 mb lapse rate, lifted condensation level (LCL) and mean layer LCL (MLLCL) heights, are examined in an attempt to distinguish between moderate and severe convection. The results show that the 0-6 km bulk shear along with the MLCAPE and LCL height indicate some discrimination between the moderate and severe categories. The best discrimination comes from the significant severe parameter, calculated by taking the product of the 0-6 km bulk shear and MLCAPE, and the 0-6 km bulk shear versus MLCAPE, and the 700-500 mb lapse rate.

**A Detailed Study of Advection Sea Fog Formation to Reduce the Operational Impacts Along the Northern Gulf of Mexico**

King, Jason M; Mar 2007; 112 pp.; In English

Report No.(s): AD-A467125; No Copyright; Avail.: Defense Technical Information Center (DTIC)

This study creates rules of thumb for forecasting advection sea fog development and dissipation along the northern Gulf of Mexico for the months of December through March. Surface observations from Tyndall AFB, Destin- Fort Walton Beach Airport, Eglin AFB, Hurlburt Field and Keesler AFB were used in conjunction with the National Data Buoy Center's marine sensors to determine the low-level atmospheric state and the sea surface temperatures during advection sea fog events at the five locations listed above. Forecasting rules of thumb were created and then modified to maximize forecasting effectiveness. The criteria examined include: sea surface temperature, wind speed and direction, air temperature and dewpoint spread, dewpoint and sea surface temperature spread. Data from December 1999 to March 2004 and from December 2005 to March 2006 was used for the Keesler AFB analysis. Data from February 2005 to March 2006 was used for the Tyndall AFB, Eglin AFB, Hurlburt Field and Destin-Fort Walton Beach analysis. Missing sea surface temperatures limited the amount of winter time advection sea fog seasons that could be examined.

**Evaluation of High Density Surface Observations in Complex Terrain and Their Contribution to the MM5 Model**

Homan, Paul B; Mar 2007; 95 pp.; In English

Report No.(s): AD-A467164; No Copyright; Avail.: Defense Technical Information Center (DTIC)

This study evaluates the data assimilation capabilities of Three Dimensional Multiquadric Interpolation (3DMQ) and the MM5 model when incorporating mesoscale observations from the USA Air Force Academy (USAFA) High Wind Alert system (HWAS). These mesoscale observations are incorporated into a triple nested (12, 4, and 1.33 km) high resolution model simulation and evaluated for their impact upon analyzed and forecasted wind values at USAFA during a severe down slope wind event that occurred on 6 March 2004. This evaluation is the first step in developing future forecasting and analysis tools for use by the military in various operations in complex terrain. The development of deployable automated tactical weather sensors in forward deployed locations requires an evaluation of the impact and usefulness these sensors would have on analysis forecast tools and mesoscale Numerical Weather Prediction (NWP) models. The juxtaposition of the HWAS network in complex terrain and the aviation training operations at USAFA provides an ideal set of data, mission and location for testing and evaluating a high resolution nested grid mesoscale NWP model. This study shows that incorporating HWAS observations into the 3DMQ data assimilation process has a significant impact upon verification of analyzed wind fields with the biggest impact occurring at the 1.33 km grid scale. Using these analyzed fields as initial conditions for MM5 model simulations, this study shows the ability of the 1.33 km model forecast wind fields to verify significantly better than either the 4 or 12 km through 18, 24, and 30 hour forecasts. Additionally, this study shows the limited, yet discernable impact HWAS observations have upon forecasted winds in the first several hours of MM5 model runs during a severe down slope wind event at USAFA.

**A Weighted Consensus Approach to Tropical Cyclone 96-H and 120-H Track Forecasting**

Hughes, James R; Mar 2007; 107 pp.; In English

Report No.(s): AD-A467166; No Copyright; Avail.: Defense Technical Information Center (DTIC)

A long-range (96 h-120 h) weighted position consensus for tropical cyclone tracks is evaluated for 24 western North

Pacific storms in 2006. The first weighted position technique simply weights the 96-h, 108-h, and 120-h dynamical model positions inversely to their distances from the 60-h, 66-h, and 72-h consensus positions. The second weighted consensus technique uses the same weighting factors but is applied to the forecast motion vectors to assess 96 h-120 h track errors. The weighted position consensus yields modest reductions in error relative to an unweighted position consensus at 96 h 120 h and produces smoother track forecasts. Weighted position consensus errors are reduced when the COAMPS model and the Air Force Weather Agency MM5 model are removed from the unweighted consensus used to form the weighting factors. Including the Japan and ECMWF model tracks also improves the weighted position consensus performance. The weighted motion vector consensus achieves dramatic improvements over an unweighted position consensus (9.9% at 96 h and 5.6% at 120 h). Most of the improvement over an unweighted position consensus is from using a motion vector consensus rather than a position consensus since large improvements are also achieved with an unweighted motion vector consensus.

**Study of the Utility of NWP Forecast Guidance and Simple Ocean Modeling as a Tool for Planning During Reactive Situations**

Jones, Robert D; Mar 2007; 137 pp.; In English

Report No.(s): AD-A467191; No Copyright; Avail.: Defense Technical Information Center (DTIC)

The utility of using a numerical weather prediction (NWP) forecast model as an input to a simple ocean model for planning during reactive situations is studied. An oceanographic experiment called the Maud Rise Nonlinear Equation of State Study (MaudNESS) was conducted from June to September of 2005 over the Maud Rise in the eastern Weddell Sea. Archived Antarctic Mesoscale Prediction System (AMPS) Polar MM5 forecast fields from MaudNESS were compared to observed conditions during MaudNESS. AMPS was found to have problems with cloud and moisture parameters, but represented the overall synoptic situation. AMPS forecast and observed forcing fields (as well as increased values for both) were input into a simple one dimensional ocean model at three locations in the Maud Rise area of differing stability. The ocean model was found to have good utility as a planning tool for short term reactive situations where a high degree of accuracy is not needed.

**Long-Range Operational Military Forecasts for Iraq**

Hanson, Christopher M; Mar 2007; 77 pp.; In English

Report No.(s): AD-A467246; No Copyright; Avail.: Defense Technical Information Center (DTIC)

The military weather community is mandated by the Department of Defense (DoD) to provide accurate, timely, and reliable meteorological information necessary for commanders to exploit the best windows of opportunity for operations. In order to meet this mandate, the military must apply state-of-the-art longrange forecasting techniques. This study was motivated by the need for long-range forecasts for mission planning in Iraq. To develop these forecasts, we tested and adapted composite analysis and forecasting techniques used by the National Oceanographic and Atmospheric Association (NOAA) for forecasts in the continental U.S. Using these techniques, we conducted seasonal composite analyses for Iraq surface temperature and precipitation rate, with the compositing based on the observed occurrence of the North Atlantic Oscillation (NAO) and El Nino La Nina (ENLN) climate variations. We then used composite analysis results to produce long range forecasts of Iraq surface temperature and precipitation rate based on the predicted occurrence of the NAO and ENLN. These forecasts outperformed forecasts based on long-term means (LTMs). Forecasts based on LTMs are currently the best available long range forecasts available from DoD. Thus, the composite analysis forecasts developed and tested in this study are a clear improvement over presently available DoD long range guidance products. The outcome of this study is a vector for the DoD weather community to expand out from the almost exclusive use of LTM based climatological products, and to invest in modern state-of-the-art methods for to supporting the global mission of the DoD.

**Freezing Fog Formation in a Supercooled Boundary Layer: Solving the Winter Fog Forecasting Challenge for Elmendorf Air Force Base, Alaska**

Harbaugh, Bradley J; Mar 2007; 105 pp.; In English

Report No.(s): AD-A467247; No Copyright; Avail.: Defense Technical Information Center (DTIC)

We have examined four complex freezing fog events at Elmendorf Air Force Base, Alaska, to determine the root cause of the fog. These events have drastically impacted operations in the region for years, and are still a mystery to forecasters. The primary goal was to provide a detailed analysis of conditions within the boundary layer that contributed to freezing fog formation within the supercooled liquid water boundary layer. The data sets used to accomplish this goal were surface observations, upper air soundings, satellite images and water level data. In the end, the fog was identified to be the result moisture flux at the surface during high tide, which interacts with cold air from valleys northeast of the base. The interaction causes spontaneous condensation, and fog drains towards the base due to thermal gradients established from differential cooling from diurnal radiative properties. A correlation exists between water levels and moisture flux, which is strong enough that forecasters should focus on water level data and wind speed and direction. Armed with this knowledge, the Air Force and the Department of Defense will reap the benefits of much more timely and accurate fog forecasts.

**The Forcing of 25-Knot Winds at Hickam and Andersen AFB**

Smith, Scott G; Mar 2007; 83 pp.; In English

Report No.(s): AD-A467286; No Copyright; Avail.: Defense Technical Information Center (DTIC)

This study investigates synoptic scale regimes in the forcing of 25 knot winds at Hickam and Andersen AFB. Ten years of data from January 1996 through December 2005, as well as case studies from June, July and August of 2006 were considered for this study. Days were grouped together to isolate the events of trade wind flow only and to alleviate days where trade wind flow was interrupted by synoptic scale weather events or local weather phenomena. Of the approximately 3,650 days of observations, Hickam AFB had 258 days in which the winds gusted to or above 25 knots and 1,077 days in which the winds remained between 15 and 24 knots. Similarly, Andersen AFB had 99 days where the winds gusted to or above 25 knots and 448 days where the winds remained between 15 and 25 knots. These days were then combined in their respective lists and were compiled to create composite sea level pressure surface analyses, winds, temperature, dew point, and geopotential height for each list of days. Upon examination of the compiled charts, identifiable climatological regimes became evident for days in which the winds gust to or above 25 knots and when the winds remained between 15 and 24 knots. The climatological average for Hickam AFB for winds gusting to or above 25 knots consisted of the subtropical high located 894 miles almost due north of Hawaii and the strength of the high at 1024 mb. The subsequent gradient across Hawaii produced an average geostrophic flow of 15 m s<sup>-1</sup> across. North to South cross sections of potential temperature and winds across Hawaii indicated low static stability and analyzed winds of 7-9 m s<sup>-1</sup>. The climatological average when the winds remained between 15 and 24 knots consisted of the subtropical high located much further east and with a strength of 1022 mb. This reduced the gradient across Hawaii and produced an average geostrophic flow of 11 m s<sup>-1</sup>. North to South cross sections indicated stronger static stability and analyzed winds of 5-7 m s<sup>-1</sup>.

**Meteorological Factors That Lead to Separation of the California Coastal Jet from the Central Coast**

Mason, Jonathan D; Mar 2007; 89 pp.; In English

Report No.(s): AD-A467287; No Copyright; Avail.: Defense Technical Information Center (DTIC)

This study investigates the impact of off-shore cross-coast winds on the coastal-jet along the Central California Coast specifically Vandenberg AFB. Events that resulted in synoptic-scale offshore flow over most of the Central Californian coast were identified and considered for this study throughout the late spring through early fall 2006 season. A total of 18 events were found along the central coast during this time frame. Two case were selected from the 18 events for detailed analyses by examining the cross-coast offshore winds, length of duration, the degree of marine boundary layer compression, and westward migration of coastal jet. Results indicate changes in the California Coastal Jet are dominantly influenced by two major processes: subsidence due to increase of low to mid-level thickness above the boundary layer and downsloping winds directly above the marine boundary layer from flow over Coastal Mountain Ranges. Both processes lead to compression of

the marine boundary layer near coast, increasing the east-west thermal gradient in the inversion above the marine boundary layer causing the coastal jet to tightest temperature and pressure gradient.

**Theoretical Characterization of the Radiative Properties of Dust Aerosol for the Air Force Combat Climatology Center Point Analysis Intelligence System**

McMillen, John D; Mar 2007; 145 pp.; In English

Report No.(s): AD-A467299; No Copyright; Avail.: Defense Technical Information Center (DTIC)

The Air Force Combat Climatology Center produces an analysis of meteorological conditions in a column over any point on the globe. Currently this analysis does not include aerosol impact on radiative transfer. Instead, the meteorological parameters are used to choose an aerosol representation native to MODTRAN radiative transfer software. This research investigates the impact of dust aerosol on radiative transfer in the 1-5  $\mu$ m wavelength band. Theoretical radiative transfer properties are calculated for various dust aerosols. The aerosols vary in size distribution and index of refraction. The aerosols also vary in phase functions, extinction coefficients, absorption coefficients, and asymmetry parameters. MODTRAN is used to simulate radiative transfer in the 1-5  $\mu$ m wavelength band incorporating the various dust aerosols in the bottom 1-2 km of the atmosphere. Radiance values from MODTRAN are converted into brightness temperatures, allowing interpretation of the impact dust aerosol has on remote sensing in this wavelength band. Dust aerosol does impact radiative transfer in the 1-5  $\mu$ m wavelength band. Brightness temperatures vary by as much as 50 K between no aerosol simulations and certain dust simulations below 3 m, and can vary by 1 K above 3 m.

**Long-Range Operational Military Forecasts for Afghanistan**

Moss, Sarah M; Mar 2007; 99 pp.; In English

Report No.(s): AD-A467305; No Copyright; Avail.: Defense Technical Information Center (DTIC)

We have investigated statistically significant signals in Afghanistan associated with two global scale climate variations, El Niño-La Niña (ENLN) and the North Atlantic Oscillation (NAO). The results of primary interest were in seasonal 850hPa temperatures and precipitation rates (PR), as these variables affect many military operations. Our primary data sets were National Centers for Environmental Prediction (NCEP) reanalysis fields and indices of ENLN and NAO activity. Our methods involved a two-step process. We first performed composite analyses of past events in an effort to identify statistically significant (SS) relationships between climate variations and 850hPa temperatures and PRs for Afghanistan. If SS was identified, we then used a forecast of ENLN or NAO conditions to produce a probabilistic forecast of potential occurrence of the particular variable, with a two-week lead time. We identified statistically significant results in all four seasons for both ENLN and NAO. The NAO has a larger impact on 850hPa temperatures while ENLN has a larger impact on PRs. The ENLN impacts on PRs are associated with anomalous advection of moisture out of the Arabian Sea or out of central Asia. The NAO impacts on 850hPa temperatures are associated with variations in storm tracks over southwest Asia. We generated initial probabilistic forecasts of PRs and 850hPa temperatures for Afghanistan for all four seasons. These serve as first steps in providing in-depth climatological planning products to military commanders and bridging the gap between civilian and military climatological products.

**Vertical Variation of Dust and Its Impact on the Top of the Atmosphere Brightness Temperature in the Midwave Infrared**

Luckyk, Paul W; Mar 2007; 89 pp.; In English

Report No.(s): AD-A467392; No Copyright; Avail.: Defense Technical Information Center (DTIC)

The objective of this thesis is to investigate the vertical distribution of dust and its impact on the top of the atmosphere radiance and associated remotely sensed thermal variability in the midwave infrared wavelengths. Due to the inconsistent

availability and coincidence of in-situ data with dust events, model data was used to identify the vertical dust regions. The Navy Aerosol Analysis and Prediction System global aerosol model was used to determine mass concentration and vertical extent of dust. Mass concentration was converted to extinction and individual dust events were analyzed to characterize the vertical distribution, extinction, and optical depth. The average height was defined for specific dust regions of Iraq and Korea. This value was used to determine the impact of the dust layer on the top of the atmosphere radiance and brightness temperature in the wavelengths of interest. Radiative transfer software was used to determine the top of the atmosphere radiance of the modeled dust atmosphere. Resultant brightness temperature was calculated to obtain the thermal characteristics of the dust layer and associated atmosphere. The vertical distribution of the dust layer was varied with fixed atmospheric components to gain insight into the resultant variation of radiance and subsequent brightness temperature to provide a set of possible values for a regionally specific dust event.

Report No.(s): AD-A468076; No Copyright; Avail.: Defense Technical Information Center (DTIC)

This report describes the work done for the Starfire Optical Range, Kirtland Air Force Base under Contract N00014-01-D-043 DO #4, between 25 May 01 and 31 September 06. This work relates to the Air Force's need to characterize the cloud distribution during day and night, for a variety of applications, including support of satellite tracking, and support of research into impact of clouds on laser communication. This contract followed Contract N00014-97-D-0350 DO #6, which will be discussed in Section 2, and is documented in Shields et al 2004b, Technical Note 265. The primary goals of Delivery Order #4 discussed in this current report included further development of day and night cloud algorithms and support of the fielded Whole Sky Imager instruments. Much of the work done under DO #4 was completed by the end of 2004. Some additional work was done in 2005 and 2006 under the DO #4 funding, but most of the SOR work during this interval was done under a follow-on contract, ONR N00014-01-D-0043 DO #11, funded September 04. The work under DO #11 will be reported under a separate report.

**Skin Temperature Feedback Optimizes Microclimate Cooling**

Stephenson, L A; Vernieuw, C R; Leammukda, W; Kolka, M A; Jan 2007; 7 pp.; In English

Report No.(s): AD-A468452; M06-22; No Copyright; Avail.: Defense Technical Information Center (DTIC)

A novel pulsed cooling paradigm (PC<sub>skin</sub>) integrating mean skin temperature (T<sub>sk</sub>) feedback was compared with constant cooling (CC) or time-activated pulsed cooling (PC). Methods: Eight males exercised while wearing personal protective equipment (PPE) in a warm, dry environment (dry bulb temperature: 30°C; dew-point temperature: 11°C in each of the tests. Treadmill exercise was performed (~225 w 1 m<sup>-2</sup>) for 80 min. A liquid cooling garment (LCG) covered 72% of the body surface area. Core temperature (T<sub>c</sub>), local skin temperatures, heart rate, inlet and outlet LCG perfusate temperatures, flow, and electrical power to the LCG and metabolic rate were measured during exercise. At 75 min of exercise T<sub>sk</sub> was higher (33.9 ± 0.5 °C) or CC(32.0 ± 0.6 °C) and PC > CC. The changes in T<sub>c</sub> and heart rate during the tests were not different. T<sub>c</sub> at 75 min was not different among the cooling paradigms (37.6 ± 0.3°C in PC<sub>skin</sub>, 37.6 ± 0.2 °C in PC and 37.6 ± 0.2 °C in CC). Heart rate averaged 124 ± 10 bpm in PC<sub>skin</sub>, 120 ± 9 bpm in PC and 117 ± 9 bpm in CC. Total body insulation (C · W<sup>-1</sup> · m<sup>-2</sup>) was significantly reduced in PC<sub>skin</sub> (0.020 ± 0.003) and PC (0.024 ± 0.004) from CC (0.029 ± 0.004). Electrical power in PC<sub>skin</sub> was reduced by 46 % from CC and by 28% from PC. Real-time T<sub>sk</sub> feedback to control cooling optimized LCG efficacy and reduced electrical power for cooling without significantly changing cardiovascular strain in exercising men wearing PPE.

**Leveraging Command and Control Technology to Provide Advanced Environmental Effects Decision Aids on the Battlefield**

Sauter, David; Torres, Mario; McGee, Steve; Okrasinski, Richard; Oct 2000; 8 pp.; In English; Original contains color illustrations

Report No.(s): AD-A467962; No Copyright; Avail.: Defense Technical Information Center (DTIC)

Computer and communication technology has been advancing within military command and control (C2) systems since the advent of the modern computer. These C2 systems have progressed noticeably from the first systems that were primarily stove pipe workstations that did not share information among the various battlefield functional areas (BFAs), much less among the services. Realizing this shortcoming and leveraging the advances in computer and communication technology, the 1990s saw a proliferation of networked C2 systems that automate the sharing of battlefield information. The ABCS connects numerous workstations (via a local area network) that cover the BFAs of maneuver, intelligence, field artillery, logistics, and air and missile defense. The Integrated Meteorological System (IMETS) is the Army's tactical system for weather and resides as a subordinate system of the intelligence BFA. IMETS provides weather data and weather effects to the various other BFAs as well as to the IMETS operator. The Army Research Laboratory (ARL) has developed an Integrated Weather Effects Decision Aid (IWEDA) that is being transitioned to the fielded Army via integration with all BFAs. IWEDA processes high-resolution mesoscale model output into weather effects information for graphic and text display and allows the user to display as much or as little information about impacts as required. Figure 1 shows a weather effects matrix (WEM) over a 72-hour forecast period for several of the available weapon systems or operations. Emerging technology will allow for even more advances, including autonomous intelligent agents, more fully integrated software modules, cross service common applications, and the development of common displays and databases both within and across the services. This paper examines in more detail the current status of this environmental effects software, and discusses new applications that will leverage ongoing advances in computer and communication technology.

**Micrometeorological and Soil Data for Calculating Evapotranspiration for Rainier Mesa, Nevada Test Site, Nevada, 2002-05**

DeMeo, G. A.; Flint, A. L.; Lacznia, R. J.; Nylund, W. E.; January 2006; 20 pp.; In English

Report No.(s): DE2007-896768; USGS/OFR-2006-1312; No Copyright; Avail.: Department of Energy Information Bridge

Micrometeorological and soil-moisture data were collected at two instrumented sites on Rainier Mesa at the Nevada Test Site, January 1, 2002 August 23, 2005. Data collected at each site include net radiation, air temperature, and relative humidity at two heights; wind speed and direction; subsurface soil heat flux; subsurface soil temperature; volumetric soil water; and matric water potential. These data were used to estimate 20-minute average and daily average evapotranspiration values. The data presented in this report are collected and calculated evapotranspiration rates.

**Bringing Climate Change Into Natural Resource Management. Proceedings of a Workshop**

Mar. 2007; 155 pp.; In English

Report No.(s): PB2007-109942; FSGTR-PNW-706; No Copyright; Avail.: National Technical Information Service (NTIS)

These are the proceedings of the 2005 workshop titled implications of bringing climate into natural resource management in the Western USA. This workshop was an attempt to further the dialogue among scientists, land managers, landowners, interested stakeholders and the public about how individuals are addressing climate change in natural resource management. Discussions illustrated the complexity of global climate change and the need for managers to consider how the impacts of climate change will unfold across regional and local landscapes. The workshop offered examples of how managers are already responding to those aspects of the global climate change that they can see or perceive. While no comprehensive solutions emerged, there was an appreciation that policy complexity may exceed the science complexity but that eventually the accumulation of local actions will shape the future.

**Optimizing the Prioritization of Natural Disaster Recovery Projects**

Aftanas, Jason M; Mar 2007; 269 pp.; In English; Original contains color illustrations

Report No.(s): AD-A467368; AFIT/GEM/ENS/07-01; No Copyright; Avail.: Defense Technical Information Center (DTIC)

Prioritizing reconstruction projects to recover a base from a natural disaster is a complicated and arduous process that involves all levels of leadership. The project prioritization phase of base recovery has a direct affect on the allocation of funding, the utilization of human resources, the obligation of projects, and the overall speed and efficiency of the recovery process. The focus of this research is the development of an objective and repeatable process for optimizing the project prioritization phase of the recovery effort. This work will focus on promoting objectivity in the project prioritizing process, improving the communication of the overall base recovery requirement, increasing efficiency in utilizing human and monetary resources, and the creation of a usable and repeatable decision-making tool based on Value-Focused Thinking and integer programming methods.

Report No.(s): AD-A466972; No Copyright; Avail.: Defense Technical Information Center (DTIC)

The objectives are to achieve a better understanding of the physics of the surface temperature structure and near-surface temperature gradients; specifically how they respond to different flux and wind regimes. An extensive set of measurements were taken in the Air-Sea Interaction Saltwater Tank (ASIST) at RSMAS under controlled conditions of wind speed and air-sea temperature difference to examine the behavior of the thermal skin layer. Air-water fluxes were controlled by changing the water temperature in the tank. Throughout the course of the experiment, air-water temperature differences were varied from 15 K to + 15 K in increments of 5 K, and the wind speed was varied from 0 to 10 ms-i in increments of 1 ms-i. Analysis has been undertaken in terms of the surface geometry, the subsurface temperature vertical microstructure, and the two-dimensional temperature variability at the water surface.

**Meteorological Integration for the Biological Warning and Incident Characterization (BWIC) System: General Guidance for BWIC Cities**

Shaw, W. J.; Wang, W.; Rutz, F. C.; Rishel, J. P.; Xie, Y.; Feb. 2007; 51 pp.; In English

Contract(s)/Grant(s): DE-AC05-76RL01830

Report No.(s): DE2007-901186; PNNL-16422; No Copyright; Avail.: National Technical Information Service (NTIS)

The U.S. Department of Homeland Security (DHS) is responsible for developing systems to detect the release of aerosolized bioagents in urban environments. The system that accomplishes this, known as BioWatch, is a robust first-generation monitoring system. In conjunction with the BioWatch detection network, DHS has also developed a software tool for cities to use to assist in their response when a bioagent is detected. This tool, the Biological Warning and Incident Characterization (BWIC) System, will eventually be deployed to all BioWatch cities to aid in the interpretation of the public health significance of indicators from the BioWatch networks. BWIC consists of a set of integrated modules, including meteorological models, that estimate the effect of a biological agent on a city's population once it has been detected. For the meteorological models in BWIC to successfully calculate the distribution of biological material, they must have as input accurate meteorological data, and wind fields in particular. The purpose of this document is to provide guidance for cities to use in identifying sources of good-quality local meteorological data that BWIC needs to function properly. This process of finding sources of local meteorological data, evaluating the data quality and gaps in coverage, and getting the data into BWIC, referred to as meteorological integration, is described. The good news for many cities is that meteorological measurement networks are becoming increasingly common. Most of these networks allow their data to be distributed in real time via the internet. Thus, cities will often only need to evaluate the quality of available measurements and perhaps add a modest number of stations where coverage is poor.

**Implementation of the Immersed Boundary Method in the Weather Research and Forecasting Model**

Lundquist, K. A.; Dec. 08, 2006; 61 pp.; In English

Report No.(s): DE2007-900883; UCRL-TH-226657; No Copyright; Avail.: National Technical Information Service (NTIS)

Accurate simulations of atmospheric boundary layer flow are vital for predicting dispersion of contaminant releases, particularly in densely populated urban regions where first responders must react within minutes and the consequences of forecast errors are potentially disastrous. Current mesoscale models do not account for urban effects, and conversely urban scale models do not account for mesoscale weather features or atmospheric physics. The ultimate goal of this research is to develop and implement an immersed boundary method (IBM) along with a surface roughness parameterization into the mesoscale Weather Research and Forecasting (WRF) model. IBM will be used in WRF to represent the complex boundary conditions imposed by urban landscapes, while still including forcing from regional weather patterns and atmospheric physics. This document details preliminary results of this research, including the details of three distinct implementations of the immersed boundary method. Results for the three methods are presented for the case of a rotation influenced neutral atmospheric boundary layer over flat terrain.

**Stratospheric Relaxation in IMPACTs Radiation Code**

Edis, T.; Grant, K.; Smith, P. C.; Nov. 15, 2006; 20 pp.; In English

Report No.(s): DE2007-900173; UCRL-TR-226128; No Copyright; Avail.: National Technical Information Service (NTIS)

While Impact incorporates diagnostic radiation routines from our work in previous years, it has not previously included the stratospheric relaxation required for forcing calculations. We have now implemented the necessary changes for stratospheric relaxation, tested its stability, and compared the results with stratosphere temperatures obtained from CAM3 met data. The relaxation results in stable temperature profiles in the stratosphere, which is encouraging for use in forcing calculations. It does, however, produce a cooling bias when compared to CAM3, which appears to be due to differences in radiation calculations rather than the interactive treatment of ozone. The cause of this bias is unclear as yet, but seems to be systematic and hence cancels out when differences are taken relative to a control simulation.

**1958-2006 Precipitation Climatology for Lawrence Livermore National Laboratory, Livermore Site and Site 300**

Brown, B. M.; January 2006; 37 pp.; In English

Report No.(s): DE2007-902306; UCRL-TR-228582; No Copyright; Avail.: National Technical Information Service (NTIS)

This report was written and is intended for a wide audience of readers, from scientists, engineers, and technologists who can use the data directly, to individuals who want to know rainfall patterns at Lawrence Livermore National Laboratory's (LLNL) Livermore site and Site 300. For this reason, and because the English units of inches continue to be the standard in National Oceanic and Atmospheric Administration (NOAA) reporting and publications as well as many engineering documents, the familiar unit of inches is used primarily in this report. The metric unit of centimeters (cm) is also displayed on second ordinates of most graphs. In keeping with meteorological convention, the mention of wind direction refers to the direction from which the wind blows. This report complements a previously published LLNL climatology report (Gouveia and Chapman, 1989) that contains primarily wind and turbulence coefficients, temperature, and humidity analyses. A climatology report is planned for 2011 that will include analyses of updated 30-year temperature and rainfall normals, wind, temperature, and humidity measurements at the Livermore site and Site 300. This comprehensive report will include data from the 170-foot (52-m) towers recently installed at the Livermore site (2005) and Site 300 (2006) and include additional measurements such as vertical turbulence coefficients, evaporation, soil temperature, moisture and heat flux, solar and infrared radiation, and atmospheric pressure.

**Summary of Dimensionless Texas Hyetographs and Distribution of Storm Depth Developed for Texas Department of Transportation Research Project 0-4194**

Asquith, W. H.; Rouseel, M. C.; Thompson, D. B.; Cleveland, T. G.; Fang, X.; Jan. 2005; 78 pp.; In English  
Report No.(s): PB2007-110184; No Copyright; Avail.: CASI: [A05](#), Hardcopy

Hyetographs and storm depth distributions are important elements of hydraulic design by Texas Department of Transportation engineers. Design hyetographs are used in conjunction with unit hydrographs to obtain peak discharge and hydrograph shape for hydraulic design. Storm-depth distributions can be used to assess the probability of a total rainfall depth for a storm. A research project from 20002004 has been conducted to (1) determine if existing Natural Resources Conservation Service (NRCS) dimensionless hyetographs are representative of storms in Texas, (2) provide new procedures for dimensionless hyetograph estimation if the NRCS hyetographs are not representative, and (3) provide a procedure to estimate the distribution of storm depth for Texas. This report summarizes the research activities and results of the research project. The report documents several functional models of dimensionless hyetographs and provides curves and tabulated ordinates of empirical (nonfunctional) dimensionless hyetographs for a database of runoff-producing storms in Texas. The dimensionless hyetographs are compared to the NRCS dimensionless hyetographs. The distribution of storm depth is documented for seven values of minimum interevent time through dimensionless frequency curves and tables of mean storm depth for each county in Texas. Conclusions regarding application of the research results are included in the report.

**CLMT2 User's Guide: A Coupled Model for Simulation of Hydraulic Processes from Canopy to Aquifer**

Pan, L.; Jul. 26, 2006; 24 pp.; In English

Report No.(s): DE2007-900656; LBNL-60857; No Copyright; Avail.: National Technical Information Service (NTIS)

CLMT2 is designed to simulate the land-surface and subsurface hydrologic response to meteorological forcing. This model combines a state-of-the-art land-surface model, the NCAR Community Land Model version 3 (CLM3), with a variably saturated groundwater model, the TOUGH2, through an internal interface that includes flux and state variables shared by the two submodels. Specifically, TOUGH2, in its simulation, uses infiltration, evaporation, and root-uptake rates, calculated by CLM3, as source/sink terms; CLM3, in its simulation, uses saturation and capillary pressure profiles, calculated by TOUGH2, as state variables. This new model, CLMT2, preserves the best aspects of both submodels: the state-of-the-art modeling capability of surface energy and hydrologic processes from CLM3 (including snow, runoff, freezing/melting, evapotranspiration, radiation, and biophysiological processes) and the more realistic physical-process-based modeling capability of subsurface hydrologic processes from TOUGH2 (including heterogeneity, three-dimensional flow, seamless combining of unsaturated and saturated zone, and water table). The preliminary simulation results show that the coupled model greatly improved the predictions of the water table, evapotranspiration, and surface temperature at a real watershed, as evaluated using 18 years of observed data.

**Analysis of Operational Alternatives to the Terminal Doppler Weather Radar (TDWR)**

Weber, M. E.; Cho, J. Y.; Robinson, M.; Evans, J. E.; Feb. 26, 2007; 68 pp.; In English

Contract(s)/Grant(s): FA8721-05-C-002

Report No.(s): PB2007-106512; ATC-332; No Copyright; Avail.: National Technical Information Service (NTIS)

Possible alternatives to the Terminal Doppler Weather Radar (TDWR) are assessed. We consider both the low altitude wind shear detection service provided by TDWR and its role in reducing weather-related airport delays through its input to the Integrated Terminal Weather System (ITWS). Airborne predictive wind shear (PWS) radars do not provide an acceptable alternative because many commercial aircraft and practically all general aviation and business aircraft are not equipped. Further, the PWS radars have limited range and scan-angle capability and cannot provide the broad area situational awareness needed to proactively reroute aircraft away from the affected runways. We considered in detail the alternatives of using the ASR-9 Weather Systems Processor (WSP) and NEXRAD in lieu of TDWR. An objective metric for wind shear detection capability was calculated for each of these radars at all TDWR equipped airports. TDWR was uniformly superior by this metric, and at a number of the airports, the AS-9/NEXRAD alternative scored so low as to raise questions whether it would be operationally acceptable. To assess airport weather delay reduction impact, we compared the accuracy of the high-benefit

ITWS 'Terminal Winds' product with and without TDWR input. Removal of the TDWR data would have increased the mean estimate error by a factor of 3 near the surface.

**USA Meteorological Data: Daily and Hourly Files to Support Predictive Exposure Modeling**

Burns, L. A.; Suarez, L. A.; Prieto, L. M.; May 2007; 397 pp.; In English

Report No.(s): PB2007-110161; EPA/600/R-07/053; No Copyright; Avail.: CASI: [A17](#), Hardcopy

ORD numerical models for pesticide exposure include a model of spray drift (AgDisp), a cropland pesticide persistence model (PRZM), a surfacewater exposure model (EXAMS), and a model of fish bioaccumulation (BASS). A unified climatological database for these models has been assembled from several National Weather Service (NWS) datasets, including Solar and Meteorological Surface Observation Network (SAMSON) data for 1961-1990 (versions 1.0 and 1.1), combined with NWS precipitation and evaporation data. Together these NWS products provide coordinated access to solar radiation, sky cover, temperature, relative humidity, station atmospheric pressure, wind direction and speed, and precipitation. The resulting hourly and daily weather parameters provide a unified dataset for use in coordinated exposure modeling. The data files, which include some derived data of use to exposure modeling (e.g., short-grass crop standard evapotranspiration ET(sub 0)) are publicly available (gratis) on EPA's Center for Exposure Assessment Modeling (CEAM) web site at <http://www.epa.gov/ceampubl/tools/metdata/index.htm>. By using observational data for models, trace-matching Monte Carlo simulation studies can transmit the effects of environmental variability directly to exposure metrics, by-passing issues of correlation (covariance) among external driving forces. This report covers a period from May 2, 2001 to December 27, 2004 and work was completed as of December 27, 2004.

Report No.(s): PB2007-110359; No Copyright; Avail.: CASI: [A03](#), Hardcopy

This study evaluated the climate change impacts on the productivity, health, and value of a forest for a specific region in California the Sierran mixed conifer timberbelt. The research team adapted an industry standard planning tool to forecast 30-year tree growth and timber yields for forest stands in El Dorado County under a changing climate. The model projections were constrained by structural and demographic data from the Blodgett Forest Research Station in El Dorado County in order to represent a realistic range of legal management regimes employed on private and governmental forests in the region.

### **Achievements in Stratospheric Ozone Protection**

Apr. 2007; 40 pp.; In English

Report No.(s): PB2007-110370; EPA/430/R-07/001; No Copyright; Avail.: National Technical Information Service (NTIS)

Countries around the world are phasing out the production and use of chemicals that destroy ozone in the Earth's upper atmosphere. The USA has already phased out production of those substances having the greatest potential to deplete the ozone layer. At the same time, we have ensured that businesses and consumers have alternatives that are safer for the ozone layer than the chemicals they replace. These vital measures are helping to protect human health and the global environment. With our many partners, the U.S. Environmental Protection Agency (EPA) is proud to have been part of a broad coalition that developed and implemented flexible, innovative, and effective approaches to ensure stratospheric ozone layer protection. These partnerships have fundamentally changed the way we do business, spurring the development of new technologies that not only protect the ozone layer but, in many cases, also save energy and reduce emissions of greenhouse gases. Together, we continue to look for alternatives and technologies that are as ozone- and climate-friendly as possible. This report covers the important and substantial achievements of the people, programs, and organizations that are working to protect the Earth's ozone layer. As impressive as these accomplishments are, our work is not done. Even though we have reduced or eliminated the use of many ozone-depleting substances, some still remain. Additionally, since ozone-depleting substances persist in the air for long periods of time, the past use of these substances continues to affect the ozone layer today. We must also continue to ensure that the alternatives being brought to the market support the country's long-term environmental goals in a cost-effective manner.

### **Ecosystems and Climate Change: Research Priorities for the U.S. Climate Change Science Program. Recommendations from the Scientific Community**

Lucier, A.; Palmer, M.; Mooney, H.; Nadelhoffer, K.; Ojima, D.; January 2006; 56 pp.; In English

Report No.(s): PB2007-110368; UMCES-CBL-06-038; No Copyright; Avail.: National Technical Information Service (NTIS)

In 2003, the Ecosystems Interagency Working Group (EIWG) of the U.S. Climate Change Science Program (CCSP) convened a small group of scientists to plan a workshop and encourage participation by leading ecologists and resource managers in the public and private sectors. The goal of the workshop was to identify critical research needs that address the complex linkages and feedbacks between climate and ecological systems. The Ecosystems and Climate Change workshop was held in 2004 in Silver Spring, MD, and was attended by over 100 participants. Here we summarize and interpret the workshop discussions and outcomes with a focus on the key research needs that were identified within each of three areas: 1. Feedbacks between ecological systems and global change 2. Consequences of global change for ecological systems 3. Sustaining and improving ecological systems in the face of global change. By self-selection, workshop participants divided into three groups for each of the three research areas. Each group was asked to: (a) identify priority research questions related to its area; and (b) describe approaches to addressing the research questions. For each of the three groups, volunteers moderated the discussions and captured the essential points that came from the group discussions. They also contributed to the development of this document. Every attempt was made to represent the consensus views of the participants.

**Climate Change Impacts and Adaptation in California. Staff Paper**

Franco, G.; Jun. 2005; 43 pp.; In English

Report No.(s): PB2007-110363; CEC-500-2005-103-SD; No Copyright; Avail.: National Technical Information Service (NTIS)

This paper presents a short review of the existing literature on climate change impacts and adaptation options for California. At the global scale, there is a scientific consensus that climate is changing and that the increased concentration of greenhouse gases in the atmosphere are responsible for these changes. California will get warmer in the future, but the level of warming is not known. With respect to precipitation, there is no consensus on how California would be affected, but it is clear that the warming would result in increased runoff in the winter season and decreased runoff in the spring and summer. Human adaptation to climate change in the state may be costly. Ecosystems, one of the most precious state resources, could be severely affected not only by climate change, but also by other stressors such as increased urbanization. Because of the thermal inertia of the Earth, our climate will continue to warm and, for this reason, the identification of adaptation options should be a state priority. Finally, this paper suggests that scientific research should be an integral part of the state overall strategy for how to deal with climate change.

**National Security and the Threat of Climate Change**

Jan 2007; 36 pp.; In English; Original contains color illustrations

Report No.(s): AD-A469156; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA469156>

The purpose of this study is to examine the national security consequences of climate change. A dozen of the nation's most respected retired admirals and generals have served as a Military Advisory Board to study how climate change could affect our nation's security over the next 30 to 40 years the time fram for developing new military capabilities. The specific questions addressed in this report are: 1. What conditions are climate changes likely to produce around the world that would represent security risks to the USA. 2. What are the ways in which these conditions may affect America's national security interests? 3. What actions should the nation take to address the national security consequences of the climate change? The Military Advisory Board hopes these findings will contribute to the call President Bush made in his 2007 State of the Union address to 'help us to confront the serious challenge of global climate change' by contributing a new voice and perspective to the issue.

#### **The Role of CRELD1 Isoform 9B in the Pathogenesis of Breast Cancer**

Maslen, Cheryl L; Corless, Christopher; Oct 2005; 8 pp.; In English

Contract(s)/Grant(s): W81XWH-04-1-0634

Report No.(s): AD-A466056; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA466056>

The goal is to develop a mouse model that expresses isoform 9b in mammary tissues, and to determine if CRELD1-9b causes or predisposes the mice to develop breast tumors, or participates in cancer progression. Scope: This study will determine if expression of CRELD1-9b contributes to the cause and/or progression of breast cancer. Information from this study will be used to better understand the relationship of CRELD1-9b to breast cancer tumor biology, and to develop it as a new marker for early detection of breast cancer or breast cancer progression. Since utilization of exon 9b appears to be unique to cancer cells it is thought to participate in the malignant process and hence would be a potentially viable target for therapeutic intervention. Major findings: We have tested two different mammalian expression vectors for expression of the CRELD1-9b under the control of the mouse mammary tumor virus (MMTV) promoter. The promoter is inducible, giving us control over mammary tissue-specific expression. One of the vectors exhibited superior performance in expressing CRELD1-9b, with verified protein expression.

#### **Knockout AR in Prostate**

Chang, Chawnsang; Oct 2005; 7 pp.; In English; Original contains color illustrations

Contract(s)/Grant(s): W81XWH-04-1-0199

Report No.(s): AD-A466057; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA466057>

Prostate cancer progresses from androgen-dependent to androgen-independent state. The androgen receptor (AR) is expressed throughout progression. We would like to understand the AR role in this progression. Using lox-Cre methodology, we have generated mice in which AR function is abolished in the entire animal (ARKO) or tissue specific manner. We will generate mice with ARKO in prostate only or in different stages to be used to study prostate cancer progresses. Our Aims follow. 1: Generate mice lacking functional AR in prostate epithelium. 2: Generate inducible ARKO mouse line to be used to determine potential effect of androgen in absence of AR on prostate growth/maintenance. 3: Determine AR role in prostate cancer development/progression by crossing ARKO mice with TRAMP mice to examine AR role in TRAMP induced

prostatecancer and permit determination of points in prostate cancer requiring AR function. 4: Determine AR role in tumorigenicity of androgen-dependent and androgen-independent ARKO prostate cancer cell lines. The effect of AR loss in these cells will be examined for ability to generate/promote tumors in mice. This year we generated mice with ARKO in the prostate epithelium and will be able to continue the other aims in the proposal in the coming years.

**The Role of TSC Proteins in Regulating Cell Adhesion and Motility**

Krymskaya, Vera P; Sep 2006; 49 pp.; In English

Contract(s)/Grant(s): W81XWH-04-1-0819

Report No.(s): AD-A466058; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA466058>

The goal of this project was to define the molecular signaling mechanisms by which TSC1 and TSC2 proteins regulate cell adhesion and motility as it relates to the genetic disorder tuberous sclerosis complex (TSC). The pathogenesis of TSC that develops due to the loss-of-function of tumor suppressors TSC1 and TSC2 proteins represents an extremely complex and not fully understood interplay of deregulated cell functions. The neurological manifestations of TSC are related to brain lesions named tubers that have been defined as a neuronal migration disorder and occur due to aberrant neuronal motility during brain development. As a result of aberrant neuronal motility affected individuals may suffer from seizures mental retardation and autism. Thus TSC represents a major cause of developmental disorders and epilepsy in the pediatric population. The central hypothesis of this proposal was: TSC proteins regulate cell adhesion and motility and loss of either TSC1 or TSC2 function alters cell adhesion and induces aberrant motility promoting the pathological conditions associated with TSC PI3K and small GTPases RhoA and Rac1 respectively serve as the upstream modulator and downstream effectors of TSC1 and TSC2 proteins. The significance of this work relates to better understanding of the molecular and cellular mechanisms of the pathobiology of TSC such that new therapeutic targets can be identified to treat this devastating disease.

**Enhancement of Tumor Immunotherapy by Blockade of a Prostate Tumor Derived Immunosuppressive Factor**

Hui, Xu; Feb 2005; 9 pp.; In English; Original contains color illustrations

Contract(s)/Grant(s): W81XWH-04-1-0185

Report No.(s): AD-A466091; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA466091>

Slit2 is a soluble protein that has been demonstrated to regulate cell migration and inhibit inflammatory reactions. Recent studies suggest that Slit2 may play a role in tumor development. However conflict results have been reported about the expression level of Slit2 in normal and tumor tissues and the effect of Slit2 on development. The current studies in this report have for the first time demonstrated that forced expression of Slit2 in tumors suppresses the growth of human prostate tumor Du145 fibrosarcoma HT1080 and epidermoid tumor A431 cells in an anchorage independent way. Further experiments indicate that Slit2 inhibits tumor growth and reduces metastasis of HT1080 tumors in lungs of nude mice. Additionally in situ detection of transcriptional level indicates that Slit2 is down regulated in human tumor samples compared to normal tissues that mostly express Slit2 mRNA. Since all three tumor cell lines in the current studies express Robo4 a receptor for Slit2, the suppressive effect of Slit2 on tumors is likely mediated by the interaction of Slit2 with the receptor. These data imply that Slit2 is a tumor suppressor which is down regulated during tumor development. The effect of Slit2 on tumorigenesis is largely unexplored and further studies are required to define the mechanism for Slit2 mediated suppression of tumors.

**Expression and Genomic Profiling of Minute Breast Cancer Samples**

Makrigiorgos, G M; Jul 2006; 70 pp.; In English; Original contains color illustrations

Contract(s)/Grant(s): DAMD17-03-1-0240

Report No.(s): AD-A466110; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA466110>

To be able to apply the newest genetic analysis technologies in breast cancer research, enough DNA material must be

available to perform this analysis. Often this is impossible with the minute amounts of tissue obtained via fine needle aspiration or laser capture microdissection currently the best methods available for removal of small amounts of tissue. Therefore whole genome-based DNA amplification techniques (e.g. PCR) are essential. The aim of this proposal was to evaluate a newly developed method, balanced PCR, which overcomes the difficulty of non-linear PCR-amplification of complex genomes and faithfully retains the difference among corresponding genes or gene fragments. In the three years of work we demonstrated the application of balanced PCR in performing genomic profiling of breast CA cell lines and samples (part of Tasks 2 and 3). In the second year we demonstrated the application of the method for gene expression profiling of breast CA cell lines (Task 1). This report describes the work conducted over the three years.

**Pim Protein Kinase-Levels Correlate with Prostate Tumor Growth and Chemo- Resistance - Potential Mechanism of PIM Action**

Kraft, Andrew S; Dec 2006; 39 pp.; In English

Contract(s)/Grant(s): W81XWH-05-1-0126

Report No.(s): AD-A466143; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA466143>

Pim is a protein kinase that has been implicated to play a role in prostate cancer. Kaplan-Meier analysis demonstrated that those patients with high Pim-1 expression are at a significantly greater risk for developing metastatic cancer. In transgenic animal models, the levels of Pim-1 protein kinase are elevated in prostate tumors caused by over expression of the c-myc oncogene, a gene overexpressed in human prostate cancer. In this proposal, we will examine whether Pim mimics Akt and TOR or modulates additional biochemical pathways and use knockout mice to dissect how myc and Pim collaborate to induce transformation and growth of prostate cancers. Pim inhibitors alone or in combination with TOR inhibitors will make a powerful chemotherapeutic strategy.

**Identifying Molecular Factors in Androgen Receptor Nuclear Export**

Weng, Yujuan; Jan 2007; 11 pp.; In English; Original contains color illustrations

Contract(s)/Grant(s): W81XWH-06-1-0193

Report No.(s): AD-A466147; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA466147>

Androgen receptor (AR) plays a central role in prostate cancer and the regulation of its nuclear/cytoplasmic transport represents another level control of its activity. However how AR is transported into and out of the nucleus remains largely a mystery. Yeast (*S. cerevisiae*) provides a powerful system to study fundamental cellular mechanisms. Thus we use yeast as a model system to identify factors that are involved in the AR nuclear export. A mutagenesis screen was performed and thus far 6000 individual clones (about 1 yeast genome) have been examined. Seven mutants that displayed a defect in nuclear export

were isolated. Preliminary results suggest that one mutant yeast clone 27.7D is a recessive gene that may play a role in the nuclear localization of AR. In addition the mutant clone 27.7D also exhibit retarded growth. The export and growth defects observed in clone 27.7D appear to be caused by the same mutation or two separate but very closely linked mutations. Complementation experiments show that 27.7D is distinct from two other mutants clones I .3E and 72.5E which are actively being characterized. Initial results also suggest that the combination of the mutation in 27.7D and the mutation of another mutant clone I 02.5D results in lethality. This suggests the possibility that these two genes may belong to two parallel pathways.

ONLINE: <http://hdl.handle.net/100.2/ADA466148>

The ARF tumor suppressor protein plays an important role in the tumor surveillance of human cancer. In the search for novel ARF binding proteins, we uncovered NPM. Despite the important role ARF plays in the regulation of tumorigenesis, alterations selectively affecting its ability to negate NPM function have not been studied. In our proposed study, we aimed to determine the impact of ARF-NPM interactions in the pathogenesis of breast cancer. To this end, we have found that overexpression of NPM in the absence of ARF is a powerful transforming event. NPM promotes tumorigenesis without affecting genomic stability, implying that the subsequent tumors should remain diploid, a hallmark of ARF-null breast cancers. Indeed, when we analyzed sixty breast carcinomas, NPM was highly overexpressed in 50% of cases. We have begun further analyses of how NPM promotes tumor formation and have discovered that it does so through ribosome dysregulation, opening up the door to new therapeutic targets in breast cancer: protein synthesis.

ONLINE: <http://hdl.handle.net/100.2/ADA466149>

In the proposal, we hypothesized that HDAC inhibitors will sensitize the effects of ionizing radiation (IR) through inhibition of pro-survival events with simultaneous up-regulation of pro-apoptotic events. The following three specific aims were proposed: Aim 1. To determine the combined effects of HDAC inhibitors and ionizing radiation on prostate cancer cell lines (PC-3, LN-3, LnCAP, DU-145 and 22Rv1). Aim 2. To understand the signaling pathways induced by combined exposures to HDAC inhibitors and ionizing radiation in both androgen dependent and independent prostate cancer cell lines. Aim 3. To determine the combined effects of HDAC inhibitors plus ionizing radiation on the regression of (i) prostate cancer xenografts (PC-3) in nude mice and (ii) insitu prostate tumor in TRAMP mice. The following tasks were achieved: Aim 1: The radiosensitizing effects of VAD-18 and VAD-20 were studied in PC-3 cells. Further, due to change in the inhibitors for the remaining part of the grant, effects of SAHA and (S)-HDAC-42 were investigated in PC-3, LN-3 and DU-145 cells. (S)-HDAC-42 and SAHA could sensitize PC-3 and DU-145 cells to radiation. Aim 2: Effects of VAD-18 and VAD-20 were mediated through cell cycle arrest, down-regulation of anti-apoptotic proteins, upregulation of pro-apoptotic proteins and abrogation of radiation-induced nuclear translocation of p65, thereby, enhancing cell death. Further, a novel transcription factor, USF-1 was identified which may be responsible for the radiosensitizing effects of these inhibitors. Aim 3: The breeding of TRAMP mice is in progress. We are currently increasing the population of true TRAMP mice for further experiments. Ultrasound Imaging protocol will be used for assessing in situ regression of tumors.

Hypothesis: The overall objective is to provide for routine clinical use a simple and reliable method for identifying patients with prostate cancer so that transrectal ultrasound guided biopsies can be restricted to men harboring PCa. Our broad strategy will involve the use of selected markers for sensitive detection of cancer cells in ejaculate. Objectives: (1) To recruit patients for a prospective clinical trial in a screening assay of patient ejaculate and urine samples from which PCa cells will be isolated by (2) immunocapture using antibodies to specific cell-surface markers and (3) detected by real-time PCR with a combination of genes upregulated in PCa. These methods will be refined for application for routine laboratory use. Logistic regression analysis will be used with the above combination of PS MA DD3 and Hepsin to determine each patient's probability of harboring PCa. This data will be correlated with clinical data obtained by conventional diagnostic methods. Relevance: It is our strong expectation that this research will lead to provision of a simple and reliable approach for diagnosing PCa in the longer term reducing the need for the invasive imprecise and unpleasant procedure of TRUS-guided prostatic biopsies. In addition we expect that the earlier detection will be associated with and even greater proportion of cancer localised to the prostate at time of diagnosis.

**Human Leukocyte Antigen (HLA) Genotype as a Contributor to Racial/Ethnic Differences in Breast Cancer: A Population-Based Molecular Epidemiologic Study**

Glaser, Sally L; John, Esther M; Clarke, Christina A; Erlich, Henry A; May 2006; 86 pp.; In English; Original contains color illustrations

Contract(s)/Grant(s): DAMD17-03-1-0430

Report No.(s): AD-A466157; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA466157>

As both breast cancer incidence and the highly polymorphic genes for the human leukocyte antigen (HLA) component of the immune system differ across racial/ethnic groups, HLA may be a biologically based risk factor for breast cancer and explain some of its racial/ethnic variation. In a population-based series of 915 post-menopausal white, black and Hispanic breast cancer cases and controls, we determined HLA class I (A, B) and class II (DR, DO) genotypes through DNA methodology and calculated age- and risk factor-adjusted odds ratios to estimate allele-specific risks. We found moderate associations of HLA alleles with breast cancer overall but varying with race/ethnicity. Overall, breast cancer risk was suggestively increased for allele A-33, suggestively decreased for alleles B-13 and B-39, and doubled for the DR-DO haplotype 0803. In whites, A-23 increased risk. In blacks, A-32, A-33 and DOB-5 increased risk, while DRB-9 reduced risk. In Hispanics, B-40 increased risk, while A-01, B-07, and B-45 decreased risk. Some associations were modified by disease stage at diagnosis, ER status of tumors, and breast cancer family history. Associations noted for A-01, A-23, A-32, B-07, DRB1-01, DOB1-02 and DOB1-05 were consistent with observed racial/ethnic incidence differentials, but other associations were in contradictory directions. Our findings, limited by sample size and multiple comparisons, support a possible but complex role of HLA or linked loci in breast cancer occurrence and perhaps the racial/ethnic variation in its incidence.

Report No.(s): AD-A466158; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA466158>

Angiogenesis, or the formation of new blood vessels from existing vasculature is an important event in tumor progression. It results from a complex, multistep biochemical cascade that is initiated by the activation of endothelial cells in response to angiogenic factors. In prostate cancers, angiogenic factors are produced by epithelial and stromal cells, and are believed critical to prostate cancer growth and progression. One of the most important of these factors is basic fibroblast growth factor (bFGF), which plays an important role in angiogenesis through the stimulation of endothelial cell proliferation, migration, and protease production in vitro phenomenon. A number of studies both in vitro and in patient specimens suggest that enhanced expression of bFGF contributes to more aggressive prostate cancer. Clearly, a better understanding of the pathways regulating angiogenesis in the prostate and how these pathways change during malignant transformation and prostate cancer progression will assist in developing more effective therapies for patients with prostate cancer. Cell-surface peptidases are the guardians of the cell against small stimulatory peptides, functioning to control growth and differentiation in normal cells by regulating peptide access to their cell-surface receptors. They are integral membrane proteins with their enzymatic site exposed to the external cell surface, Neutral endopeptidase (NEP) is a cell-surface peptidase normally expressed by prostatic epithelial cells, whose expression is lost in over half of prostate cancers. NEP substrates include small peptides that have been implicated in prostate cancer progression, including endothelin-1, bombesin and neurotensin. We have now reported that bFGF is also a substrate for NEP. The goals of this application focus on deciphering the interaction between NEP and bFGF.

Using a homology-based bioinformatics approach a new structural model of the vaccinia virus (VV) I7L proteinase active

site has been generated. This model was used to perform Virtual Ligand Screening of a comprehensive library of approximately 3.5 million available compounds including about 208,000 available ketones and aldehydes. Compounds with a docking score of <-32 were ordered and screened using our newly developed fluorescence quench biochemical assay for those compounds able to inhibit the activity of the I7L enzyme. Compounds have been identified that inhibit I7L more than 50% at 200 pM which validate the 3D ligand binding model and provide initial leads for further rational optimization of poxvirus I7L proteinase inhibitors.

ONLINE: <http://hdl.handle.net/100.2/ADA466160>

While adoptive immunotherapy holds promise as a treatment for cancer and infectious diseases, development has been impeded by the lack of reproducible methods for generating therapeutic numbers of antigen-specific CD8+ CTL. As a result, there are only limited reports of expansion of antigen-specific CTL to levels required for clinical therapy. Therefore, our groups has previously developed artificial Antigen-Presenting Cells (aAPC), made by coupling soluble HLA-Ig and anti-CD28 to beads. These aAPC have successfully been used to induce and expand CTL specific for CMV or melanoma. For the current study we have proposed to used and further developed those aAPC for the generation of prostate cancer specific CTL. Our preliminary data demonstrate that aAPC loaded with the prostate cancer specific antigen EpHA2 have been used to generate functional active prostate cancer-specific CTL from peripheral blood healthy donors.

**Automated Patient Positioning Guided by Cone-Beam CT for Prostate Radiotherapy**

Li, Tianfang; Jan 2007; 37 pp.; In English; Original contains color illustrations

Contract(s)/Grant(s): W81XWH-06-1-0235

Report No.(s): AD-A466162; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA466162>

Modern radiotherapy equipment is capable of delivering high precision conformal dose distributions to the target. However, the target localization especially for soft-tissue target such as prostate is an issue, because of its possible non-rigid internal motion relative to bony structures or external landmarks. Recently, a new technology of kilo-voltage cone-beam CT (CBCT) has been integrated with the linear accelerator treatment machine. Superior to the common approach based on the two orthogonal images provided by the mega-voltage EPID, CBCT can provide high-resolution three-dimensional (3D) information of the patient in the treatment position. Thus the target localization could be potentially done more accurately

without using any implanted fiducials. In practice, however, there is currently still a general lack of efficient method to utilize the 3D CBCT images. In this work, we have developed a clinically practical technique for automatic patient positioning based on the newly emerged CBCT, accounting for the non-rigid motions of the prostate and surrounding structures. A novel deformable registration method has also been developed to improve the positioning accuracy. Furthermore, a low-dose CBCT acquisition protocol is being developed so that a daily use of CBCT becomes possible for prostate patients.

**Do Capacity Coupled Electric Fields Accelerate Tibial Stress Fracture Healing**

Hoffman, Andrew R; Beck, Belinda; Matheson, Gordon; Bergman, Gabrielle; Dec 2006; 41 pp.; In English

Contract(s)/Grant(s): DAMD17-98-1-8519

Report No.(s): AD-A466165; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA466165>

To determine the effect of capacitively coupled electric field stimulation on tibial stress fracture healing in men and women. Methods: A convenience sample of 20 men and 24 women with posteromedial tibial stress fractures was recruited. Subjects were randomly assigned an active or placebo OrthoPak(Registered) Bone Growth Stimulator (sinusoidal wave, 3-6 V, 60 kHz, 5-10 mA), to be used for 15 hours per day until healed. Subjects were given supplemental calcium and instructed to rest from training. Healing was confirmed when hopping 10 cm off the ground for 30 seconds was pain free. Data was analyzed using 2-way ANOVA for effects of treatment and sex on healing time. Compliance and other between-group differences and relationships were examined via ANOVA, t-tests and correlation analyses. The influence of anthropometric and behavioral characteristics on time to healing was evaluated by multiple regression analysis. No difference in time to healing was detected between treatment and placebo groups. Treatment compliance was positively associated with reduced time to healing ( $p = 0.003$ ). Rest non-compliance was associated with increased time to healing ( $p = 0.05$ ). Female subjects healed more slowly than men ( $p = 0.05$ ). Capacitively coupled electric fields did not accelerate tibial stress fracture healing in comparison with placebo treatment (modified rest), but women took longer to recover than men. Daily device use and weight bearing loading during treatment appeared to positively and negatively (respectively) influence the efficacy of the active device.

**Mechanism of Telomerase Inhibition Using Small Inhibitory RNAs and Induction of Breast Tumor Cell Sensitivity**

Poynter, Kennon R; Holt, Shawn; Mar 1, 2007; 21 pp.; In English

Contract(s)/Grant(s): W81XWH-04-1-0421

Report No.(s): AD-A466166; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA466166>

Telomerase, a ribonucleoprotein enzyme composed of an RNA template (hTR) and a catalytically active protein subunit (hTERT), synthesizes telomeres after cell divisions and is obligatory for continuous tumor cell proliferation as well as malignant progression of breast cancer cells. Telomerase is an attractive anti-cancer therapeutic agent because telomerase activity is present in over 90% of human breast cancers but is undetectable in most normal somatic cells. Traditional therapies (surgery, chemotherapy, radiotherapy, etc.) lack the ability to effectively control and cure breast cancer, primarily because residual cells are or become resistant to DNA damaging modalities including standard chemo- and radio-therapies. Since telomerase requires its associated hTR for repeat synthesis, we have chosen to use RNA interference as a method to inactivate hTR and hence telomerase. RNA interference (RNAi) has become a powerful tool for the analysis of gene function in that RNAi allows sequence specific inhibition of gene expression. Another protein we targeted is p21, which has long been established as a requirement for senescence. We wanted to further examine its relationship to senescence and apoptosis, in an attempt to sensitize breast tumor cells more effectively.

**A Novel Mechanism of Androgen Receptor Action**

Roberts, Jr, Charles T; Jan 2007; 6 pp.; In English; Original contains color illustrations

Contract(s)/Grant(s): W81XWH-05-1-0152

Report No.(s): AD-A466168; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA466168>

This revised project has as its goal the characterization of a novel alternative product of the Her-2/neu/erbB2 proto-oncogene derived from intron retention. The product of this splicing mechanism, termed herstatin, is a secreted protein comprised of the N terminus of the Her-2 receptor tyrosine kinase and a unique, intron-encoded C terminus that allows binding to the other members of the EGFR/erbB family. This binding down-regulates erbB expression and inhibits EGF family signaling and cell proliferation. We have found that herstatin also binds to and down-regulates the IGF-I receptor (IGF-IR) and modulates IGF signal transduction. Herstatin is, therefore, a novel bifunctional inhibitor of erbB and IGF-IR signaling. Herstatin is expressed in prostate tissue and may represent a promising therapeutic target and biomarker in CaP. The work proposed in this project will assess the effect of herstatin on CaP cell phenotype, the expression of herstatin in CaP samples, and potential mechanisms of regulation of herstatin expression.

**Hot Flashes and Quality of Life Among Breast Cancer Patients**

Jacobs, Linda A; Aug 2006; 19 pp.; In English

Contract(s)/Grant(s): DAMD17-03-1-0264

Report No.(s): AD-A466169; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA466169>

This prospective study examined hot flashes and quality of life (QOL) in BC patients undergoing initial treatment. The medical and complementary and alternative medicine (CAM) interventions used by patients were also examined. One hundred and ninety-six women were recruited to the study and data for several time-points continues to be collected on women who were recruited to the study 12 months ago in order to complete their 15 and 18 month questionnaires. A limited analysis of data gathered to date is available. Women were assessed for hot flash intensity/frequency, use of medical and CAM interventions, emotional distress, physical and social functioning, and QOL at diagnosis and 6, 9, 12, 15, and 18 months. Data were analyzed for each timepoint and results will be discussed in this report in relation to each specific aim. The sample is primarily middle-aged (M = 52 years; R = 27-83 years), European American (72.6%), has at least some college education (76.5%), and is married (64.2%). Approximately one-half (51.5%) of the sample reported that they were post-menopausal at diagnosis with 48.5% pre-menopausal. Of the women who were pre-menopausal prior to diagnosis, approximately (10%) reported that they were experiencing hot flashes at the 12 month time-point and these younger women reported higher levels of distress related to hot flashes than those women who were postmenopausal and already experiencing hot flashes. Of women currently experiencing hot flashes, 40.7% report at baseline, having used HRT and 26.8% used exercise to control hot flashes. The 12-month data indicates that 26.5% of the entire sample who are experiencing hot flashes, tried or are using some form of HRT to control hot flashes with exercise still the most frequently used approach to manage hot flashes with 44.2% of sample currently exercising.

**Efficacy of Calcium and Vitamin D Supplementation for the Prevention of Stress Fractures in Female Naval Recruits**

Lappe, Joan M; Oct 2006; 6 pp.; In English

Contract(s)/Grant(s): DAMD17-01-1-0807

Report No.(s): AD-A466171; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA466171>

The goal is to determine if calcium and vitamin D supplementation can reduce the incidence of stress fracture by at least 50% in female Naval recruits during basic training. The secondary goal is to examine the potential mechanisms for increasing bone adaptation to intense mechanical loading. The Command Officers at the Great Lakes Naval Station stopped the study on xxx because we had recruited our originally targeted sample size. We recruited 5201 females who were randomly assigned to calcium 2000 mg and vitamin D 800 I.U. per day or a control placebo group. The intervention and stress fracture monitoring

continued through 8 weeks of basic training. We were not able to recruit the targeted number of subjects for the sub-study designed to determine changes in moment of inertia using peripheral quantitative computed tomography (pOCT). We enrolled 148 (out of a target 560) in the 3703 participants who completed the main study we found that calcium D supplementation decreased the incidence of stress fracture by 27% ( $p=0.02$ ). Furthermore supplementation suggests that supplementation can compensate for a history of low physical activity.

The epidermal growth factor receptor (EGFR) plays an important role in receptor transactivation events initiated by G protein-coupled receptors (GPCRs), integrins and cytokine receptors. In these signaling pathway, the EGFR frequently is responsible for activating Ras and MAP kinase/extracellular signal-regulated kinase (ERK). EGFR transactivation may be ligand-dependent, in which case EGF or TGF $\alpha$  bind to the receptor, cause its dimerization and activation, or ligand-independent, due to the activity of intracellular kinases, such as c-Src, which induce tyrosine phosphorylation of the EGFR. EGFR and c-Src are coexpressed in a wide range of human tumors including the brain, lung, breast and prostate. Much evidence suggests that overexpression of TGF $\alpha$  and its cognate receptor EGFR is involved in the later stages of human breast cancer and may play a role in growth and metastatic processes. Results from recent studies using cultured fibroblasts and human breast cancer cell lines have indicated that c-Src and EGFR synergistically interact to promote tumor formation in nude mice xenografts. To check whether this synergism occurs in the more physiological setting of the mammary gland, I am testing the interaction of these tyrosine kinases in transgenic mouse models, where MMTV EGFR, c-Src and TGF $\alpha$  transgenic mice generated. MMTV EGFR transgenic mice will be cross-bred with MMTV-c-Src and/or TGF $\alpha$  transgenic mice to form bigenic or trigenic mice, then examined for tumor formation in the mammary gland tissue. If the synergism hypothesis is correct, bigenic mice should develop large tumors more rapidly than single transgenic mice, and trigenic more rapidly than bigenic mice thus validating the synergism between c-Src, EGFR and TGF $\alpha$  as targets for future therapies.

ONLINE: <http://hdl.handle.net/100.2/ADA466173>

Cancer is a highly heterogeneous disease, both morphologically and genetically. A current shortcoming in cancer prognosis and treatment is a lack of methods that adequately address the complexity and diversity of the disease. Genome wide studies can provide molecular characterization or fingerprints of cancer phenotypes linked to clinical information. The aim of this research is to 1a: identify an informative set of specific genetic alterations that underlie the pathogenesis of disease progression to serve as targets for management of disease at the earliest stages and 1b: refine stage-specific disease phenotypes by integration of molecular profiles with known risk factors of breast cancer such as reproductive characteristics, medical history, and histologic parameters of breast carcinomas. We will examine 100 cases in each disease stage category of 0, 1, 2, 3, 4 and unknown to evaluate 120 breast cancer associated gene markers distributed throughout the human genome. Molecular fingerprints identified from genome wide studies should delineate patterns of genomic imbalances at the level of stage-specific gene loci, providing a novel index to estimate the extent of genomic abnormality with disease progression. This knowledge should allow the integration of stage-specific therapeutic targets as treatment intervention strategies in the management of breast cancer.

The CDK4/6 kinase has elevated activity in spontaneous breast cancer, making it an excellent candidate for targeted inhibition for the treatment of breast cancer. We proposed to prepare a CDK4/6-specific kinase inhibitor that is based on the naturally occurring CDK4/6 specific inhibitory proteins of the INK4 family. Since the INK4 proteins are notoriously unstable, we have been working towards the preparation and structural characterization of INK4 proteins with improved thermostability that could be used as a scaffold to prepare peptide sub-fragments that may serve as a scaffold to prepare small molecule CDK4/6- specific inhibitors. During the funding period, we successfully prepared p18INK4c proteins with increased thermostability and have characterized the structure of a subset of the more thermostable p18INK4c proteins. This structure-function analysis revealed the chemical basis for the increased stability properties of the more thermostable p18INK4c proteins. Significantly, a thermostable F71N mutant protein also showed enhanced CDK6 interaction and cell cycle inhibitory activity in vivo, as measured using co-immunoprecipitation and transient transfection assays, respectively. Together, our studies show that a structure-based approach to increase the thermodynamic stability of INK4 proteins can be exploited to prepare more biologically active molecules with potential applications for the development of molecules to treat INK4-mediated cancers.

**Chemokine Blockade in Combination with Cytoablative Conditioning in Metastatic Breast Cancer**

Murphy, William J; Aug 2006; 12 pp.; In English

Contract(s)/Grant(s): DAMD17-03-1-0525

Report No.(s): AD-A466180; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA466180>

Chemokines have been shown to provide angiogenic effects. Blocking chemokines can reduce metastatic breast cancer cell growth. We proposed that cytoablative conditioning will force the tumor to rely on angiogenesis as a survival mechanism and thus make the tumor more susceptible to chemokine blockade. We demonstrate that tumor cells increase production of IL-8 and MCP-1 transcripts in vivo in response to IL-8 neutralization and/or gamma irradiation and cytoxan administration. We have also demonstrated that IL-8 but not MCP-1 can function as autocrine growth or survival factor for MDA-231 cells in vitro but neutralization requires high concentrations of antibody. This observation is consistent with the more significant anti-tumor effect observed with anti-IL-8 as a single agent and suggest that IL-8 promotes tumor cell growth through multiple mechanisms. We also showed that administration of anti-IL-8 and anti-MCP-1 can inhibit the formation of human breast cancer lung metastasis in a xenograft model.

**HOXC5 as a Biomarker of Disease Presence in Tumor-Associated Normal Prostate**

Nordeen, Steven K; Dec 2005; 7 pp.; In English; Original contains color illustrations

Contract(s)/Grant(s): W81XWH-04-1-0918

Report No.(s): AD-A466187; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA466187>

Our preliminary data had suggested that HOXC5 gene expression was increased in prostate tumor and in tumor-associated normal epithelium compared to epithelium from normal prostate, raising hopes that HOXC5 could be a biomarker that could guide whether a patient with a negative biopsy should undergo a rebiopsy. We compared methods for preparation of RNA from formalin-fixed, paraffin embedded tissue and used the best method to prepare RNA from normal prostate tissue and from dissected tumor and tumor-associated normal tissue. While there was a trend toward increased frequency of HOXC5 expression in tumor and tumor-associated normal tissue compared to normal prostate, the trend fell slightly short of statistical significance. Moreover, there was only a small difference between the frequency of detection of HOXC5 expression in normal

and tumor-associated normal. These results do not support the efficacy of HOXC5 as a biomarker for the presence of tumor elsewhere in the gland.

ONLINE: <http://hdl.handle.net/100.2/ADA466217>

*Burkholderia pseudomallei* causes melioidosis, a fatal septicemic infection following either soil or water exposure. The organism is endemic in Asia, where it is able to survive in either desiccated environments or distilled water for several years. The goal of this work was to evaluate available data and to assess the biological hazard posed by *B. pseudomallei* in environmental water, soil, or on inanimate surfaces. We reviewed the historical impact of melioidosis on the military, clinical aspects of the disease, its laboratory diagnosis, and the molecular and phenotypic characteristics of *B. pseudomallei*. We then evaluated the effect of geographic environments and habitats (water, soil, climate), as well as physical (ultraviolet radiation, temperature) and chemical (pH, chlorine) factors on the survival of *B. pseudomallei*. In addition, we analyzed a variety of biological properties that enhance the survival of *B. pseudomallei*, including metabolic adaptation, biofilm formation, and intracellular survival in protozoa, fungi, and specific parts of legume roots. We identified critical data needed for accurate risk prediction and effective threat reduction of the risk posed by *B. pseudomallei*. The lack of a vaccine, together with its unusual resistance in the environment, makes *B. pseudomallei* a concern for public health and bio-defense.

ONLINE: <http://hdl.handle.net/100.2/ADA466522>

Conventional breast radiotherapy utilizes two opposed tangential fields (OTF) can result in high radiation dose to lung and heart and inhomogeneous dose distribution in the target for large-size breast. Modern advances in radiation therapy such as the intensity-modulated radiotherapy (IMRT) may be used to achieve dose distribution with superior tumor conformality and normal tissue spare. However, the increased complexity of the treatment planning and delivery procedures is a problem in a busy clinical environment. In this USAMRMC-supported project, we have developed a multiple-aperture radiation therapy (MART) procedure dedicated to breast irradiation, which combines the planning simplicity of the conventional OTF with the superior dose distribution of IMRT methods. The MART has been implemented in a clinic environment and systematically assessed. The improvement of dose distribution over traditional OTF has been clearly demonstrated. Furthermore, techniques related to breathing motion control have also been extensively investigated and included in this report.

Optical and photochromic properties of spiropyran-intercalated DNA-surfactant complex films were studied for optical switching. The switching speed was observed as 200-300 ms. They depended on the type of spiropyran as well as the type of surfactant. Spiropyrans containing the oxazine ring and intercalated into DNA showed a very rapid photochromic response. It also showed that photochromic response times became much faster when intensity of the excitation light increased. Various DNA-cationic lipid complexes and their bulk films were also prepared and their physical properties were measured.

ONLINE: <http://hdl.handle.net/100.2/ADA466555>

Aging is the single largest risk factor for developing breast cancer and is thought to be due the convergence of the accumulation of mutations together with the accumulation of senescent cells. Our working hypothesis is that senescent epithelial cells can cause preneoplastic or neoplastic changes in its neighbors, and that these changes will be manifest when cells are cultured in three dimensions, which more closely mimics the natural tissue environment than conventional two dimensional cultures. To test this hypothesis, we have successfully established two and three dimensional culture models of normal human mammary epithelial cells (HMECs) with and without a functional 16-tumor suppressor pathway. We have also created preneoplastic HMECs by introducing defined genes with oncogenic potential, particularly genes that selectively inactivate the p53 or pRB tumor suppressor pathways. We have used these, and frankly neoplastic human mammary epithelial cells, in the two and three dimensional co-culture assays in which presenescent HMECs are mixed with senescent HMECs and stromal breast fibroblasts. We have devised ways to analyze factors secreted by senescent cells and compared human mammary epithelial cells with their stromal counterparts.

The goal of this program is to develop and recommend a model of care that enhances the of life for DOD children with life-threatening conditions and their families. Our strategy is to maximize current benefits and coordinate medical care with existing community resources and services, tailored to support the family's specified needs and requirements. The first year of work focused on a feasibility study to gather data on the intent, interpretation and implementation of the benefit; status of service delivery; available resources through the Military Health System, contract providers, community and other government agencies; and to conduct an assessment of needs of families. A distinct research protocol was designed to use individual interviews and focus groups to determine family and provider needs. The benefits likely to be used by military families and their children were analyzed. A data assessment collection tool has been designed to capture descriptors regarding community resources. The plan is to web enable the database in order to provide maximum availability and accessibility to the various potential users. An existing education curriculum for providers, Initiative for Pediatric Palliative Care, developed by the CHI PACC model.

ONLINE: <http://hdl.handle.net/100.2/ADA466558>

Apoptosis, or programmed cell death, is frequently triggered through the release of cytochrome c from mitochondria. Cytosolic cytochrome c then binds to a cytosolic protein known as Apaf-1, which binds to and activates the cell death protease, caspase 9. Many cancers are resistant to apoptosis induced by chemotherapies. During the course of this work we demonstrated that breast cancer cells, while resistant to release of mitochondrial cytochrome c are actually hypersensitive to cytochrome c, once it is released. Our work provides a unique point of sensitivity that might be exploited for the successful treatment of breast cancers.

**Biological Impact of Senescence Induction in Prostate Cancer Therapy**

Jarrard, David F; Jan 2007; 13 pp.; In English; Original contains color illustrations

Contract(s)/Grant(s): W81XWH-08-1-0207

Report No.(s): AD-A466559; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA466559>

Recently, it has been recognized that a distinct mechanism of terminal proliferation arrest after chemotherapy involves the reactivation of senescence. However, whether this phenotype occurs in vivo is unclear, as is the biological impact of senescence induction. We have previously identified pathways and genes involved in human senescence that may serve as senescence markers, and have demonstrated that senescence occurs in prostate cancer cell lines after chemotherapy. In this proposal, we will: a) determine whether senescent tumor cells alter the proliferation and invasion of surrounding prostate cancer cells in vitro and in vivo, b) assess for and augment senescence in prostate cancer xenograft models and human tumors, and c) identify novel small molecules that induce senescence in prostate cancer cells. Both in vitro and in vivo approaches using human prostate cancer cells will be utilized to identify and determine the mechanisms underlying senescence. With this data, our understanding of cellular senescence will undergo a quantum leap and permit the translation of this entity both as a marker of response and for directing therapy.

**Long-Term Outcomes of Alternative Brachytherapy Techniques for Early Prostate Cancer**

Talcott, James A; Jan 2007; 18 pp.; In English

Contract(s)/Grant(s): W81XWH-05-1-0093

Report No.(s): AD-A466561; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA466561>

All active, potentially curative treatments for clinically localized prostate cancer damage quality of life. Brachytherapy, or radioactive seed implants, theoretically may increase the target radiation dose and thus improve control of cancer. has been rapidly adopted in the U.S. despite limited long-term published outcomes, in part because of its convenience apparently attractive toxicity profile. However, our recent survey of brachytherapy patients after longer follow-up surprisingly frequent urinary incontinence and erectile dysfunction. Retrospective evidence suggests that reducing the radiation dose to the urethra may prevent later urinary incontinence. A recent refinement of conventional brachytherapy technique targets only the peripheral zone of the prostate, sharply reducing the dose to the urethra, and attempts to reduce radiation cold spots by using intraoperative feedback from real-time magnetic resonance imaging(MRI). Using our validated cancer-specific scales, our pilot data suggested that the altered brachytherapy technique had the intended benefit but also unexpected outcomes. We have extended our cohort study of 276 brachytherapy patients and now compare 3- and 24-month outcomes of this technique to standard ultrasounded-guided brachytherapy.

**Effect of COX-2 (PGE2) and IL-6 on Prostate Cancer Bone Mets**

Levine, Alice C; Feb 2007; 9 pp.; In English; Original contains color illustrations

Contract(s)/Grant(s): W81XWH-05-1-0166

Report No.(s): AD-A466562; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA466562>

We hypothesize that (1) prostate cancer cells that express cyclooxygenase-2 (COX-2), prostaglandin E2(PGE2) and interleukin-6 (IL-6) display enhanced bone targeting and (2) the level of expression of COX-2, PGE2 and IL-6 in established bone metastases determines the overall bone response, with lower vs. higher cytokine levels inducing osteoblastic vs. osteolytic responses, respectively. We utilize two human prostate cancer cell lines (MDA-PCa-2B that expresses low levels of COX-2 and PGE2 and produces osteoblastic lesions vs. PC-3 that expresses high levels COX-2/PGE2 and induces osteolytic mets). Over the past year, we demonstrated that (1) low levels of PGE2 stimulate preosteoblast cell growth, differentiation and Wnt signaling (2) Forced overexpression of COX-2 in MDA-PCa-2b cells induces the Wnt antagonist DKK-1 (3) PGE2 addition to PC-3 cells stimulates Dkk-1 (4) Forced overexpression of COX-2 in MDA-PCa-2B cells inhibits preosteoblastic cell growth in co-culture. Over the next and final year of the grant proposal we will determine the effects of COX-2/PGE2 expression in the two PCa cell lines on in vivo bone targeting and bone reaction

**PCBs Alter Dopamine Mediated Function in Aging Workers**

Seegal, Richard F; Jan 2007; 18 pp.; In English; Original contains color illustrations

Contract(s)/Grant(s): DAMD17-02-1-0173

Report No.(s): AD-A466563; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA466563>

The major hypotheses to be tested in this project are that high-level occupational exposure of former capacitor workers to polychlorinated biphenyls (PCBs) will result in reductions in: (i) performance on neuropsychological and neurological tests that reflect the historic PCB body burden of the individual and (ii) the number of dopamine (DA) terminals in the basal ganglia. Aging former capacitor workers, previously employed at capacitor manufacturing facilities located approximately fifty miles north of Albany, NY, have undergone neuropsychological and neurological exams, completed a comprehensive occupational, residential and dietary questionnaire, had blood drawn to measure serum thyroid hormone and PCB concentrations, and undergone a non-invasive test to determine bone lead concentrations in Albany, NY. This latter measure will reduce the likelihood of confounding the neurological effects of prior PCB exposure with the neurological effects of prior lead exposure. Finally, approximately 40% of the subjects have participated in a second portion of the study that uses brain

-CIT SPECT imaging to determine whether prior occupational exposure to PCBs reduces the number of basal ganglia DA terminals. Imaging took place at the Institute for Neurodegenerative Disorders in New Haven, CT under the supervision of Dr. Kenneth Marek. In order to test the above hypotheses we have gathered a team of internationally recognized experts in the epidemiology of environmental and occupational exposure to PCBs, the neurology of movement disorders and Parkinson's Disease, the assessment of toxicant-induced deficits in neuropsychological function, measurement of serum PCB concentrations, non-invasive determination of bone lead concentrations, and brain imaging of central DA neurons and their relationship to movement disorders, including Parkinson's Disease.

Contract(s)/Grant(s): W81XWH-06-1-0060

Report No.(s): AD-A466565; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA466565>

We will determine the mechanism by which Shh signaling accelerates prostate tumor growth, identify Shh targets in prostate tumor stroma, and test the effect of individual target genes on tumor growth. The purpose of the report is to evaluate the first year of research. Sonic hedgehog induces tumor growth by a paracrine mechanism using tumor stroma. Shh signaling independent of Shh ligand in tumor stroma accelerates tumor growth. We have identified potential stromal Shh target genes in xenograft tumors and have begun to evaluate the genes in human prostate cancer. Noggin was identified as a Shh-induced paracrine factors that may drive tumor growth by interfering with BMP signaling. Noggin was overexpressed in tumor stroma. Stromal-derived Noggin does not accelerate tumor growth in the presence or absence of Shh. Future research will continue to identify and evaluate Shh-induced paracrine factors that accelerate prostate tumor growth.

**Leg Muscle Usage Effects on Tibial Elasticity during Running**

Antich, Peter P; Jan 2007; 8 pp.; In English

Contract(s)/Grant(s): DAMD17-02-1-0219

Report No.(s): AD-A466571; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA466571>

Tibial stress fractures (TSFs) are a substantial problem in military training, but a means of predicting their occurrence

remains elusive. Bone strength is key to the resistance of TSF, but bone density, a determinant of strength, is known not to predict TSF. Elasticity is nearly as important as density in determining bone strength but has not been tested in TSF, or even studied in runners. However, clinical studies of osteoporotic patients given bisphosphonates have shown significant correlations between low elasticity and fracture incidence. These basic validation studies will determine if modulators of tibial stress, such as strike mechanics and surface incline, also modulate bone elasticity during running. Because these modulators may operate on the tibia via muscles, we have combined ultrasound characterization of tibial elasticity with MRI monitoring of muscle recruitment during a running protocol in healthy volunteers.

Contract(s)/Grant(s): DAMD17-01-1-0259

Report No.(s): AD-A466577; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA466577>

AKT/PKB represents potentially a promising molecular target for the design of new anticancer therapies for the treatment of human breast cancer and other types of cancer. In this DOD Idea Award grant, using computational approach, we have discovered a class of potent small-molecule inhibitor of AKT/PKB (API-59). API-59 selectively inhibits AKT activity and has little effect on other upstream protein kinases or MAP kinases. API-59 is highly potent and effective in inhibition of cell growth and induces apoptosis in human breast cancer cell lines with high levels of AKT and has selectivity over cancer cells with low levels of AKT. Importantly, API-59 has little toxicity to normal cells. Our present study provides a solid proof-of-the-concept that targeting AKT or AKT pathway in human breast cancer is a promising strategy for the design and development of a class of anticancer therapy, and API-59 represents a promising lead compound for further evaluation and optimization.

ONLINE: <http://hdl.handle.net/100.2/ADA466579>

In this partnership training program, experts from Georgetown and Howard Universities participated in training through seminars, specialized tutorials and workshops. Further, we developed a large digitized mammography database of African-American patients. The database was made accessible through the web to support breast cancer research. We have accomplished the objectives of this 4-year project and have reached our goal. As a result, a large number of Howard faculty investigators and students, both undergraduate and graduate, have been trained for breast cancer research. Under this program, one Ph.D. student and three Masters students have successfully completed their theses and obtained their degrees from Howard University; four graduate students have entered the Ph.D. degree program of the ECE Department; and half a dozen of undergraduate students have successfully completed their degree work. More than a dozen academic papers have been published in both international journals and at international conferences based on the research activities of this partnership program. We have also developed a large-scale mammography database featuring Africa-American patients and a mammography research website, among other major achievements listed in this final report.

**Association between Microtubule Associated Protein -2 and the EGRF Signaling in Breast Cancer**

Adhami, Vaqar M; Sep 2006; 14 pp.; In English; Original contains color illustrations

Contract(s)/Grant(s): W81XWH-04-1-0741

Report No.(s): AD-A466580; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA466580>

Microtubule associated proteins (MAP)-2 a component of the MAP family is a marker for neurons and its

immuno-reactivity has been demonstrated in several neoplasms. We hypothesized that MAP-2 expression is deregulated in EGFR over-expressing breast cancers thus rendering them resistant to conventional therapy. Here we show that loss of MAP-2 expression in breast cancer cells during sustained activation of the EGFR results in resistance to chemotherapeutic drugs. We observed higher expression of MAP-2 in EGFR over-expressing cells than in non-EGFR over-expressing cells both at protein and mRNA levels. MCF-7 and MCF-10A cells were challenged with increasing doses of EGF (25-150 ng/ml) and examined for the expression of phosphorylated EGFR. We observed that expression of MAP-2 in cell lines challenged with EGF increased with increasing doses of EGF however its expression was almost completely lost at concentrations >100 ng/ml of EGF treatment. This observation suggested a possible mechanism of resistance in breast cancer patients with EGFR over-expression. We also found increasing resistance to growth inhibition by docetaxel in cells that were challenged with higher concentrations of EGFR (>50 ng/ml). This suggested that over expression of EGFR signaling in breast cancers could in fact be responsible for resistance to therapeutic agents. The loss of MAP-2 expression could have implications in treatment of breast cancers over-expressing the EGFR and exhibiting resistance to conventional therapy.

ONLINE: <http://hdl.handle.net/100.2/ADA466592>

This report summarizes the first year of a 5-year program to develop physiologically and biomechanically based mathematical models that will allow the estimation of physical and cognitive performance decrements from blunt trauma and inhalation insult. The main objectives of this research effort are as follows: (1) to develop advanced lung models that include multi-scale mechanical, anatomical, functional, and patho-physiological components to predict the acute trauma and performance decrement due to blunt impacts and blasts; (2) validate the models against animal test data; (3) integrate and release models into an application software that can be used for all blunt pulmonary hazards evaluation purposes; and (4) couple the blunt models with the toxic gas models to provide injury and performance decrement assessment from all pulmonary hazards. Progress is captured in this report as brief summaries of individual projects that have lead to a variety of knowledge, software, and hardware products. The work from Year 1 has produced 14 products in a wide range of applications. These products are the result of the on-going, collaborative research between the Military Operational Medicine Research Program (MOMRP) and other military (e.g., U.S. Army Center for Health Promotion and Preventive Medicine, U.S. Army Research Laboratory, U.S. Army Natick Soldier Center) and civilian research agencies (e.g., U.S. Environmental Protection Agency, Department of Justice, National Highway Traffic Safety Administration). The projects include Human FEM Validation Against Blast Data (No Armor), Sheep FEM Development, Blast Health Hazard Assessment for Joint Strike Fighter, Blast Protection Concepts Using Human FEM Coupled with Armor, Behind Armor Blunt Trauma Assessment Program, TGAS 2.0P, Generalized Skull Fracture Criterion, Biofidelity of Motorcycle Helmet Criteria, Effect of Blast Overpressure on the Human Head, THOR GUI, and Thorax FEM Validation Against Seat Belt Test.

**A Phase II Immunotherapeutic Trial: Combination Androgen Ablative Therapy and CTLA-4 Blockade as a Treatment for Advanced Prostate Cancer**

Kwon, Eugene D; Dec 2006; 7 pp.; In English

Contract(s)/Grant(s): DAMD17-02-1-0245

Report No.(s): AD-A466628; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA466628>

The objectives of this study are to generally test whether the addition of CTLA-4 blockade can enhance clinical treatment responses in advanced prostate cancer patients compared with treatment with AA therapy alone. Patients will be randomized to 3 months of concurrent AA therapy + MDX-01 0 or 3 months of initial AA therapy alone. Of 25 enrolled patients approximately 10 have received sufficient follow-up to assess whether any treatment effects may be occurring: 10 patients

have received AA therapy alone; 11 patients have received AA therapy + MDX-01 0. Those 11 patients who have received AA therapy alone. Specifically the 11 test subjects have experienced faster declines in PSA suggesting that MDX-01 causes hormone therapy to work more effectively than using hormone therapy alone. We have observed that some of the test subjects experienced a more prolonged response (diminished PSA) relative to those that received hormone therapy alone. Based on these preliminary observations our strong hunch is that patients who received AA therapy + MDX-01 0 treatment may be deriving a benefit from the experimental form of therapy beyond that which occurs using standard treatment (which is hormone therapy alone).

Contract(s)/Grant(s): W81XWH-04-1-0771

Report No.(s): AD-A466640; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA466640>

Pre-clinical testing has shown that subcutaneous injection of an Ad-sig-TAA/ecdCD40L adenoviral vaccine strategy overcomes anergy to tumor associated antigens (TAA) in mice which are genetically engineered to be tolerant of these antigens. Two injections of the vector confer up to a year's immunity and induce regressions of TAA positive tumor even in old (18mo. Old) mice which are known to be poorly responsive to vaccination. This is important since diminished response to vaccine has been seen clinically in human subjects in the age range of peak prevalence of prostate cancer. We have chosen to use hMUC-1, an antigen which is a marker of poor prognosis in prostate cancer, for the clinical development of this vaccine. We have completed the development of a phase I clinical protocol of the ad-sig-hMUC-1/ecdCD40L adenoviral vector vaccine for individuals diagnosed with localized prostate cancer who have evidence of recurrence of their prostate cancer (rising PSA) following radiation therapy for clinically localized disease. We are in the midst of completing the pharmacology, toxicology, and biodistribution assays, GMP production of the Ad-sig-hMUC-1/ecdCD40L and the quality control testing of the GMP production, all of which are needed for FDA approval of the phase I trial is arranged.

**Molecular Mechanisms of Soft Tissue Regeneration and Bone Formation in Mice: Implications in Fracture Repair and Wound Healing in Humans**

Mohan, Subburaman; Apr 2007; 119 pp.; In English

Contract(s)/Grant(s): DAMD17-99-1-9571

Report No.(s): AD-A466642; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA466642>

The primary goal of the proposed work is to identify genes which play an anabolic role in bone and soft tissue function and to clarify the function of these genes. Three hypotheses have been proposed: 1) The high bone density gene in chromosome 1 in our CAST/B6 congenic mice can be cloned; 2) Genes that regulate soft- and hard-tissue regeneration can be identified by using appropriate mouse strains that exhibit differences in regeneration; and 3) ENU mutagenesis, applied to our mouse model, will lead to the identity of genes that regulate soft and hard tissue function. During the last funding period, we have proposed several specific objectives for each of the above-mentioned hypotheses. As disclosed in the progress report, we have successfully accomplished all of the specific objectives. Our work during the first year of the funding period has resulted in two manuscripts in press, two published manuscripts, and three abstracts. We believe that the successful accomplishment of the proposed studies will provide a better understanding of the molecular mechanisms involved in hard- and soft-tissue regeneration and will provide a framework for future development of therapies for hard and soft tissue injuries.

**Origin and Properties of Prostatic Stem Cells**

Wilson, E L; Gupta, Rashmi; Feb 2007; 32 pp.; In English

Contract(s)/Grant(s): W81XWH-04-1-0255

Report No.(s): AD-A466643; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA466643>

The aims of this proposal were to isolate and characterize prostatic epithelial stem cells and also to determine if bone marrow (BM) cells can differentiate into prostatic tissue. We show that the murine prostate contains a small population of cells (<1%) capable of effluxing the Hoechst dye by an active process (the side population, SP), indicating the presence of cells with features of stem cells. As SP cells expressed Sca-1, a protein expressed by stem cells of other origins, we isolated Sca-1 expressing cells and determined their proliferative ability in an in vivo prostate reconstitution assay. We show that prostate stem cells reside in the proximal region of ducts within the population that expresses high levels of Sca-1. We also show that BM stem cells can differentiate into prostatic epithelial and stromal cells. Low numbers of basal epithelial cells (-1%) are of BM origin but significant numbers of stromal cells (-15%) are derived from BM. These findings may have considerable implications for prostatic diseases such as cancer as gastric cancer has been shown to originate in BM-derived cells.

ONLINE: <http://hdl.handle.net/100.2/ADA466655>

The long-term objective of this research is to develop a device for treating spinal cord injury. The specific aims of the proposed study are to test new types of collagen tubes and porous collagen scaffolds. Moreover we will be investigating the effects of incorporating genes from nerve growth factors into the collagen scaffolds and seeding the scaffolds with marrow-derived mesenchymal stem cells. The standardized defect site is a 5-mm gap in the rat thoracic spinal cord. Our principal method of evaluation is histomorphometry. During the past project year the following were accomplished toward achieving the objectives determining the effects of selected design variables on the reparative processes in spinal cord defects: 1) produce oriented pore in the porous collagen scaffold 2) non-virally transfect undifferentiated marrow-derived mesenchymal stem cells (MSCs) in monolayer with plasmid DNA encoding a neurotrophic factor 3) supplement the collagen scaffold with plasmid DNA and 4) transfect MSCs grown in the gene-supplemented collagen scaffold with plasmid DNA for a neurotrophic factor.

**Discovery of Therapeutics for Ricin Toxicosis**

Sanda, Arthur T; Jan 2006; 7 pp.; In English; Original contains color illustrations

Contract(s)/Grant(s): W81XWH-05-1-0048

Report No.(s): AD-A466665; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA466665>

Ricin a type II ribosome inactivating protein (a heterodimeric glycoprotein containing two subunits joined together by a disulfide bond) is a biological toxin with a history of use as a weapon of war and bioterrorism. Biological toxins act in concert with various (mostly unknown) host proteins; specific host proteins are essential for toxin action. In an effort to identify possible targets for pharmaceutical intervention that may lead to an effective treatment for ricin toxicosis this study investigates the effects of inactivating specific host proteins and cellular response when exposed to ricin. Specifically 278 genes were selected for challenge based on the criteria developed by Lexicon Genetics to identify genes that might encode pharmaceutically tractable proteins. A full phenotypic analysis of all knockout mouse lines (278) was performed and fibroblast cell cultures were established for all 278 KO lines. A kill curve was established for the mouse fibroblast cells and the fibroblast cell cultures were challenged in triplicate (3 separate homozygous knockout mice for each KO line) with ricin at different points in the curve. Through a cooperative research and development agreement (CRDA) with investigators at USAMRIID

specific whole animal gene knockout models will also be made available for testing of modified responses to ricin toxin; this task awaits approval from the USAMRMC Animal Care and Use Review Office (ACURO). A 12-month extension of the performance period (to December 14 2006) was granted in December 2005 to allow time for breeding and shipping mouse lines to USAMRIID.

**An Analysis of Robust Workforce Scheduling Models for a Nurse Rostering Problem**

Tower, Paul K; Mar 2007; 77 pp.; In English; Original contains color illustrations

Report No.(s): AD-A466671; AFIT/GLM/ENS/07-12; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA466671>

Disruptions impacting workforce schedules can be costly. A 1999 study of the UK's National Health Service estimated that as much as 4% of the total resources spent on staffing were lost to schedule disruptions like absenteeism. Although disruptions can not be eliminated, workforce schedules can be improved to be more responsive to disruptions. One key area of study that has expanded over the past few years is the application of traditional scheduling techniques to re-rostering problems. These efforts have provided methods for responding to schedule disruptions, but typically require deviations to the disrupted schedule. This thesis examines five workforce scheduling models designed for a nurse rostering problem. Each model is designed to produce a robust workforce schedule that remains valid in the midst of disruptions and requires no schedule deviations. Each model is evaluated based on the number of disruptions it can receive before becoming invalid. Nonparametric statistical analysis is used to analyze the disruption data for each model and determine which workforce scheduling model produces the most robust schedule. The results of this research indicate that additional manpower must be applied to the correct skill sets in order to produce robust workforce schedules. Furthermore, workforce managers can consider leaving a portion of the workforce unscheduled (or in reserve) to accommodate schedule disruptions.

**The Distribution, Levels, and Relevance of the Interleukin-1 Family of Cytokines and Receptors in Human Breast Carcinoma-Induced Osteolysis**

Pantschenko, Alexander G; Oct 2005; 32 pp.; In English; Original contains color illustrations

Contract(s)/Grant(s): DAMD17-03-1-0608

Report No.(s): AD-A466672; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA466672>

Bone metastasis in human breast carcinoma (HBC) occurs in 83% of patients with advanced disease HBC bone metastasis causes degeneration of the bone matrix (osteolysis) hypercalcemia pathologic fracture and nerve-compression syndrome The pathophysiology of human breast carcinoma-induced osteolysis (HBC-IO) involves an increase in the number and activity of osteoclasts within the HBC metastatic lesion We examined the expression of the IL-1 family of cytokines and receptors and IL-8 in HBC-IO using archival human samples (mean age 52 yrs; age range 34-83 yrs; no prior radiation to site) and immunohistochemistry We observed IL-1 and IL-8 expression by HBC cells and IL-1 Receptor I expression on osteoclasts. These data suggest that HBC-derived IL-1 is an important mediator of human breast cancer-induced osteolysis and supports our hypothesis: 1) IL-1 can activate osteoclastogenesis promote osteoclast (OC) activation and osteolysis via paracrine induction of IL-1 Receptors on osteoclasts. 2) IL-1 can promote tumor progression by autocrine induction and subsequent activation of IL-8. 3) IL-8 expressed by HBC cells can support tumor growth and progression by stimulating angiogenesis through IL-8 Receptors expressed on vascular endothelial cells. This study suggests that IL-1 may be an important mediator of HBC pathophysiology and therefore a potential target for therapeutic intervention.

Report No.(s): AD-A466673; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA466673>

We demonstrated that a DNA-based vaccine encoding fibroblast activation protein (FAP), overexpressed on tumor-associated fibroblasts (TAFs), induces a CD8+ T cell response killing TAFs. This effectively suppressed or eradicated primary tumors or their pulmonary metastases in a murine breast carcinoma model. Moreover, eradication of TAFs decreased the interstitial fluid pressure of the tumor since it markedly diminished collagen type I produced by TAFs. This resulted in increased tumor uptake (70%) of doxorubicin which made the combination of the pFAP vaccine with chemotherapy highly effective as it completely eradicated primary breast tumor growth in a mouse tumor model.

**The Role of RB in the Therapeutic Response of Breast Cancer**

Bosco, Emily E; Mar 2007; 22 pp.; In English; Original contains color illustrations

Contract(s)/Grant(s): W81XWH-04-1-0329

Report No.(s): AD-A466676; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA466676>

The retinoblastoma tumor suppressor protein (RB) is functionally inactivated in the majority of human cancers, and lost in one third of all breast cancers. RB regulates G1/S phase cell cycle progression and is a critical mediator of anti-proliferative signaling. Here the specific impact of RB loss on E2F-regulated gene expression, tumorigenic proliferation, and the response to distinct lines of therapy was interrogated in breast cancer cells. RB loss resulted in RB/E2F target gene deregulation and accelerated tumorigenic proliferation, thereby demonstrating that even in the context of a complex tumor cell genome, RB status exerts significant control over proliferation. Furthermore, the loss of RB compromised the short-term cell cycle inhibition following DNA damage and anti-estrogen therapies. In the context of DNA damaging agents this bypass resulted in increased sensitivity to these agents in cell culture and xenograft models. In contrast, the bypass of anti-estrogen signaling resulted in continued proliferation and xenograft tumor growth in the presence of tamoxifen. These effects of RB loss were recapitulated by ectopic E2F expression, indicating that control of downstream target genes was an important determinant of the observed responses. Specific analyses of the RB/E2F gene expression signature in 60 human patients indicated that deregulation of this pathway was associated with early recurrence following tamoxifen monotherapy. Thus, because the RB-pathway is a critical determinant of tumorigenic proliferation and differential therapeutic response, it may represent a critical basis for directing therapy in the treatment of breast cancer.

ONLINE: <http://hdl.handle.net/100.2/ADA466677>

In this proposal, we will identify and clone a protein that can be used to generate infection-specific gene therapy vector. We expect that using this protein to modify various gene therapy vectors, we can specifically deliver cytotoxic genes into prostate cancer cells using systemic treatment, and eventually eradicate metastatic prostate cancer cells in patients. During the third year, we inserted the sequences that encode these two peptides to modify lentiviral vector envelope gene and used one of the modified membrane proteins to target prostate cells. The viral vector that have peptide YDSVLALSAALQATR (P2) modified gp41 envelope protein was used to infect LNCaP cells in 24-well plates. The control vector that does not have gp41-P2 envelope protein on viral surface was also used to infect LNCaP cells as the control. Our results demonstrated that with the gp41-P2 envelope protein on the surface of the viral vector, lentiviral vectors increase infectivity by 30% to 70%.

**Cord Blood Stem Cell Procurement in Minority Donors**

Ratanatharathorn, Voravit; Mar 2007; 10 pp.; In English; Original contains color illustrations

Contract(s)/Grant(s): W81XWH-05-1-0266

Report No.(s): AD-A466680; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA466680>

This progress report summarizes the clinical activity of cord blood procurement and the preliminary analysis of the yield of cord blood cells for the purpose of clinical transplantation. The purpose of collection and procurement of cord blood is for public use and will be accessible to all stem cell transplantation centers worldwide. Cord blood is a readily available source of hematopoietic stem cells. It is more accessible than other sources such as live donors since the cryopreserved cord blood units (CBU) have already been extensively characterized in terms of tissue typing and screening for infectious disease markers. The CBU from minority donors especially African/American is particularly valuable because of the difficulty with finding a matched donor. The CBU allows for less stringent matching; thus CBU is a rapid solution to patients who are in urgent need of stem cell transplantation and have no living donor available. We will now summarize the findings of our efforts to expand the cord blood collection program in an outreach setting with a comprehensive educational program to recruit African/American donors. We are able to demonstrate a significant increase of the CBUs collected with time indicating improvement of access to the African/American donor. This activity may compensate for the poor individual yield of the total nucleated cells in the African/American donor CBU and therefore prove to be a more effective method to build the CBU inventory.

Report No.(s): AD-A466688; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA466688>

Targeting the anti-apoptotic Bcl-2 members using non-peptide small-molecule inhibitors is a new and exciting therapeutic strategy. Our work has led to the discovery of potent non-peptide small-molecule inhibitor apogossypolone that not only binds to Bcl-2 and Bcl-xL proteins but also Mcl-1. Consistent with its strong binding affinity to Bcl-2 members apogossypolone potently and effectively inhibits cancer cell growth in androgen-independent human prostate cancer PC-3 and DU-145 cell lines. Apogossypolone is well-tolerated in animals and has an excellent oral bioavailability. Extensive in vivo studies are being carried out to determine its antitumor activity in animal models of human prostate cancer. Apogossypolone may have a great therapeutic potential to be developed as an effective and non-toxic new therapy for the treatment of advanced androgen-independent human prostate cancer.

**PSA-Based Screening Outcomes, Dietary Heterocyclic Amine Exposure, and Prostate Cancer Risk in African Americans**

Bogen, Kenneth T; Jan 2007; 28 pp.; In English; Original contains color illustrations

Contract(s)/Grant(s): W81XWH-05-1-0153

Report No.(s): AD-A466696; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA466696>

Prostate cancer (PC) is the second leading cause of male U.S. cancer deaths, with African-Americans having the highest rate of PC mortality worldwide. A 5- year prospective NIH-funded clinic-based study investigated whether prostate-specific antigen (PSA) and digital rectal exam (DRE) screening indicators of PC risk in 500 African-American men 50 to 70 years of age who underwent PC screening in Oakland, CA (East Bay San Francisco area), were associated with estimated dietary exposures to 2-amino-1-methyl-6-phenylimidazo[4,5-b]pyridine (PhIP), which forms when meat is overcooked. The DOD-funded study expands that NIH-funded work by adding a new %-free-PSA test for 312 (108 from the NIH-funded study, plus 200 additional) men, results of which will be compared with PSA/ DRE results and PhIP exposures estimated by dietary

interviews. For 392 men studied under the NIH protocol, an odds ratio (95% CL) of 32 (3.2, 720) for highly elevated PSA ( $\geq 20$  ng/mL) was observed in the highest 15% vs. the lower 50% of estimated daily PhIP intakes. As of 31-12-06, a total of 220 additional men completed participation using the expanded protocol, for a combined total of 612 men. For 562 of these men studied to date, the corresponding OR was found to be 24 (2.20, 533). This study will help define the potential value of improved screening and dietary/behavioral intervention to reduce PC risk.

Report No.(s): AD-A466697; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA466697>

The proteasome inhibitor bortezomib (PS-341 Velcade) synergizes with tumor necrosis factor-related apoptosis-inducing ligand (TRAIL) acts via a p21-dependent mechanism to induce high levels of apoptosis in prostate cancer cells. Our further investigation into the molecular mechanisms underlying the effects of bortezomib implicated endoplasmic reticular (ER) stress in its anti-tumoral effects. These effects also provide us with a molecular mechanism to explain the observed anti-angiogenic effects of bortezomib in prostate cancer cells. We have generated luciferase-transduced variants of our human prostate cancer cell lines in order to use them to generate orthotopic tumors in nude mice that can be imaged non-invasively. We plan to use these models in the coming 6-12 months to test the toxicity and anti-tumoral efficacy of combination therapy with bortezomib plus TRAIL in vivo. Preliminary toxicity studies confirmed that mice tolerate daily therapy with recombinant TRAIL plus biweekly therapy with bortezomib (at its MTD) very well.

**Selective Androgen Receptor Downregulators (SARDs): A New Prostate Cancer Therapy**

Bhattacharyya, Rumi S; Oct 2006; 27 pp.; In English

Contract(s)/Grant(s): W81XWH-05-1-0582

Report No.(s): AD-A466698; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA466698>

The androgen receptor (AR) plays a key role in the development and progression of prostate cancer. Targeting the AR for down-regulation would be a useful strategy for treating prostate cancer especially hormone-refractory or androgen independent prostate cancer (AIPO). In the present study we showed that the antiestrogen Fulvestrant (ICI 182,780, ICI) effectively suppressed AR expression in several human prostate cancer cells including androgen-independent cells. In LNCaP cells 101(10 microM) treatment decreased AR mRNA expression by 43% after 24 hours and AR protein expression by approximately 50% after 48 hours. We further examined the mechanism of AR down-regulation by ICI in LNCaP cells. ICI did not bind to the T877A mutant AR present in the LNCaP cells nor did it promote proteasomal degradation of the AR. ICI did not affect AR mRNA or protein half-life. However ICI decreased the activity of an AR promoter-luciferase reporter plasmid transfected into LNCaP cells suggesting a direct repression of AR gene transcription. As a result of AR down-regulation by ICI androgen induction of PSA mRNA and protein expression were substantially attenuated. Importantly LNCaP cell proliferation was significantly inhibited by ICI treatment. Following 6 days of 101 treatment a 70% growth inhibition was seen in androgen stimulated LNCaP cells. These data demonstrate that the antiestrogen ICI is a potent AR down-regulator that causes significant inhibition of prostate cancer cell growth. Our study suggests that AR down-regulation by ICI would be an effective strategy for the treatment of all prostate cancer especially AR-dependent AIPC.

**Structural Studies on Intact Clostridium Botulinum Neurotoxins Complexed with Inhibitors Leading to Drug Design**

Swaminathan, Subramanyam; Feb 2006; 54 pp.; In English; Original contains color illustrations

Contract(s)/Grant(s): DAMD17-02-2-0011

Report No.(s): AD-A466700; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA466700>

In this fourth annual report we present our progress on several fronts. We have identified a number of inactive mutants of BoNT/E-LC which may be potentially used as vaccine candidates. Crystal structures of several catalytic domains of clostridial neurotoxins have been determined and it has been shown that there is a commonality of the architecture of the active site. Accordingly it must be possible to design a common drug for all of them. We have determined the structure of the C fragment of botulinum neurotoxin type B and found that the N-terminal helix reorients. Virtual screening with small molecule library has been successfully carried out with BoNT/E-LC. The C fragment of BoNT/A has been successfully cloned and expressed.

**Medical Risk in the Future Force Unit of Employment. Results of the Army Medical Department Transformation Workshop V**

Johnson, David E; Cecchine, Gary; Jan 2006; 101 pp.; In English

Contract(s)/Grant(s): DASW01-01-C-0003

Report No.(s): AD-A466724; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA466724>

This report documents the Army Medical Department's continuing process of identifying medical issues in the Army's transformation to the Future Force. It contains an assessment of the AMEDD Transformation Workshop (ATW) V; describes the workshop's organization, objectives, scenario, and analysis methodology; and provides observations and conclusions. The purpose of this workshop was to continue the assessment, begun in ATWs I-IV, of the medical risks associated with emerging Army operational concepts and the capacity of the AMEDD to mitigate these risks. ATWs I-III focused on medical risk in a Unit of Action (UA) within a theater that had a defined echelons-above-UA Health Service Support (HSS) system (a 44-bed Combat Support Hospital [CSH]). Based in part on these initial workshops, the AMEDD determined that a 44-bed CSH would likely be insufficient, and it set out to determine what HSS system would be required at echelons above UA. ATW IV assessed the medical risk and demand on an echelons-above-UA HSS system that 76 casualties from a single UA would create during a simulated 12-hour battle. The principal focus of ATW V was to continue the process of establishing the casualty demand data that must be addressed by the echelons-above-UA HSS system. It involved four UAs (and supporting units of employment [UE]) with 429 casualties over a 100-hour simulated battle. Thus, the principal purpose of ATW V was to provide analytical support to the AMEDD to assist it in designing the HSS system above the UA level.

**Biodegradation of DIMP, Dieldrin, Isodrin, DBCP, and PCPMSO in Rocky Mountain Arsenal Soils. Installation Restoration Program, Environmental Technology Development**

Williams, Richard T; Ziegenfuss, P S; Marks, Peter J; Jan 1989; 92 pp.; In English

Contract(s)/Grant(s): DAAK11-85-D-007

Report No.(s): AD-A467061; CETHA-TE-CR-89006; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA467061>

The role of biodegradation in the environmental fate of DIMP, dieldrin, isodrin, DBCP, and PCPMSO in Rocky Mountain Arsenal soils was evaluated. Surface soil borings were collected from contaminated and uncontaminated regions at RMA. The extent of heterotrophic microbial activity in the soil samples was determined by monitoring <sup>14</sup>C-CO<sub>2</sub> production from soils spiked with a mixture of <sup>14</sup>C-glucose, <sup>14</sup>C-acetate, and <sup>14</sup>C-amino acids. Soil extracts were plated on nutrient agar to enumerate total heterotrophs. Two of six soil samples exhibited little or no heterotrophic activity. The lack of metabolic activity in these two samples was attributed to microbially inhibitive soil contaminants. Inactive soils were not utilized in subsequent mineralization studies. The mineralization of radiolabeled DIMP, dieldrin, isodrin, DBCP, and PCPMSO in contaminated and uncontaminated RMA soils was determined. Soil samples were spiked with test compound and incubated at 22 deg C. Headspace in the test flasks was periodically sampled and analyzed for <sup>14</sup>C-organics and <sup>14</sup>C-CO<sub>2</sub>. Mineralization studies were conducted for a period of 26 weeks. All five test compounds were poorly degraded under aerobic conditions. Low, but statistically significant (compared to sterile controls) levels of <sup>14</sup>C-CO<sub>2</sub> were produced from <sup>14</sup>C-isodrin and <sup>14</sup>C-dieldrin. Previous research by other investigators indicated that the five test compounds are resistant to aerobic degradation. Data from the present study support these findings. The mineralization of <sup>14</sup>C-isodrin was also evaluated in a laboratory-scale composting system maintained at 55 deg C. Less than 0.1 percent of <sup>14</sup>C-isodrin was evolved as <sup>14</sup>C-CO<sub>2</sub> during a 39 day test period.

Report No.(s): AD-A467404; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA467404>

The degradation of the Chemical Warfare Agent sulfur mustard, bis(2-chloroethyl) sulfide, and the half-mustard simulant, 2-chloroethyl phenyl sulfide was studied on ambient and moist concrete using <sup>13</sup>C solid-state magic-angle-spinning nuclear magnetic resonance (SSMAS NMR). Two samples of concrete made by the same formulation, but differing in age and surface alkalinity, were used. The 2-chloroethyl phenyl sulfide hydrolyzed to form the 2-hydroxyethyl phenyl sulfide, which then formed the ether on all of the concrete samples. The sulfur mustard formed minor amounts of vinyl species on the newer, more alkaline concrete samples. The sulfur mustard eventually degraded to thiodiglycol and 1,4-oxathiane via the intermediate sulfonium ions H-2TG and O(CH<sub>2</sub>CH<sub>2</sub>)<sub>2</sub>S(+)<sub>2</sub>CH<sub>2</sub>CH<sub>2</sub>OH on all of the concrete samples.

ONLINE: <http://hdl.handle.net/100.2/ADA467449>

The Army has identified the need for early and robust screening of Soldiers for a variety of health risk behaviors. Behavioral health factors are a key component of this. This report presents mental health screening data for 2,882 Soldiers seeking services at a military facility outpatient behavioral health clinic and 3,451 Soldiers screened 90 days following return from OIF deployment. The screening was completed via scanning software and has more recently been updated to a completed automated kiosk system. PTSD and depression were the most commonly identified disorders, followed by alcohol abuse. Screening positive for multiple symptom domains was common, with over 60% of the clinical sample screening positive for more than one clinical symptom domain. Clinical implications include the development of treatment approaches that address multiple diagnoses. Future research efforts in outpatient screening will assist in the design of clinical interventions. Comprehensive screening that leverages technology in a military setting is useful in case identification and in guiding clinician assessment and treatment efforts. Such a standardized approach enhances efficiency and ensures that all critical domains are addressed. Technology could potentially be leveraged even further in the form of online screening, psychoeducational tools, CBT modules, and virtual reality tools for assessment and treatment of combat-related symptoms.

**Apoptosis-Dependent and Apoptosis-Independent Functions of Bim in Prostate Cancer Cells**

Tang, Dean; Liu, Junwei; Mar 2005; 21 pp.; In English; Original contains color illustrations

Contract(s)/Grant(s): DAMD17-03-1-0146

Report No.(s): AD-A467615; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA467615>

Attenuated apoptotic response and extended cell survival have been implicated in prostate cancer (PCa) development and progression. We recently found that Bim, a BH3-only pro-apoptotic protein, is upregulated in PCa cells in vitro and in vivo. The main objective of this postdoctoral fellowship is to elucidate why PCa cells upregulate Bim and what is the role of the upregulated Bim proteins in modulating PCa cell behavior (death, survival, proliferation/division, etc.). Our hypothesis is that, under normal, unstimulated conditions, with its apoptotic function blocked, the upregulated Bim in PCa cells plays an apoptosis-independent function(s). Under apoptosis-stimulated conditions, however, Bim can still participate in triggering a robust apoptotic response, thus guaranteeing that weaker or more susceptible PCa cells be eliminated from the population. Two Specific Aims were proposed to determine: 1) apoptosis-independent functions of the upregulated Bim in PCa cells under unstimulated conditions, and 2) apoptosis-dependent functions of the upregulated Bim in PCa cells under stimulated conditions. The PI of the grant, Dr. Junwei Liu, had to leave the lab Oct. of 2004. Before he left, he had completed all experiments in Specific Aim 2 with one manuscript published (Append. I). After he left, with the small amounts of funds left over from the Fellowship, we have just accomplished all of the experiments proposed in Specific Aim 1 and are in the process of preparing a manuscript, which will be supplied to DOD when it is ready.

This report is a comparative review of tissue engineering research and development activities in the USA, Japan, and Western Europe conducted by a panel of leading U.S. experts in the field. It covers biomaterials, cells, biomolecules, non-medical applications, engineering design, informatics, and legal and regulatory issues associated with tissue engineering research and applications. The panel's conclusions are based on a literature review, a U.S. review workshop held at NIH in June of 2000, and a series of site visits to leading tissue engineering research centers in Japan and Western Europe. A summary of the June 2000 workshop is included as an appendix, as are site reports from each of the panel's overseas visits. An executive summary is included conveying the panel's overall conclusions.

The U.S. Environmental Protection Agency (EPA) requires that all environmental monitoring and measurement efforts mandated or supported by EPA participate in a centrally managed Quality Assurance (QA) program. Any party generating data under the centrally managed QA program described in this plan has the responsibility to implement minimum procedures to ensure that the precision, accuracy, representativeness, completeness, and comparability of its data are known and documented. To ensure that responsibility is met uniformly, each party must prepare a written QA Project Plan (QAPjP) covering each project the party is to perform. This QAPjP presents the organization, objectives, functional activities, and specific QA activities and quality control (QC) performance criteria associated with the Resource Conservation and Recovery Act (RCRA) Facility Investigation (RFI) for Fort Benjamin Harrison (FBH), Marion County, Indiana. This QAPjP also describes the specific protocols that will be followed for sampling, sample handling and storage, chain of custody, and field and laboratory analysis. QA/QC procedures presented in this QAPjP are in accordance with applicable professional technical standards, EPA requirements, government regulations and guidelines, and specific project goals and requirements. This QAPjP is prepared by HLA to fulfill the requirements of the USAEC under the Total Environmental Program Support (TEPS) Contract DAA15-91-D-0013 in accordance with EPA QAPjP guidance documents, Interim Guidelines and Specifications for Preparing Quality Assurance Project Plans (QAMS-005/80) (EPA, 1986), and the Region V Model QAPjP (EPA, 1991c).

ONLINE: <http://hdl.handle.net/100.2/ADA468164>

Mass spectrometric profiles of peptides and proteins obtained by current technologies are characterized by complex spectra, high dimensionality, and substantial noise. These characteristics generate challenges in discovery of proteins and protein-profiles that distinguish disease states, e.g. cancer patients from healthy individuals. A challenging aspect of biomarker discovery in serum is the interference of abundant proteins with identification of disease-related proteins and peptides. We present data processing methods and computational intelligence that combines support vector machines (SVM) with particle

swarm optimization (PSO) for biomarker selection from MALDI-TOF spectra of enriched serum. SVM classifiers were built for various combinations of m/z windows guided by the PSO algorithm. The method identified mass points that achieved high classification accuracy in distinguishing cancer patients from non-cancer controls. Based on their frequency of occurrence in multiple runs, six m/z windows were selected as candidate biomarkers. These biomarkers yielded 100% sensitivity and 91% specificity in distinguishing liver cancer patients from healthy individuals in an independent dataset.

Report No.(s): AD-A468174; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA468174>

Although considerable progress in the understanding of prostate cancer has been made in the last few years, the basic knowledge of the biology of this disease remains elusive. The development of this cancer is related to the male sexual hormone (testosterone) but the actual mechanisms by which testosterone affects the development of this cancer is not known. The prostate gland has at least three different types of cells that contribute to the physiology of the gland: basal, luminal and neuroendocrine cells. It is not totally clear what the relationship is between these different cell types, how testosterone affects them and which one is the target cell in prostate cancer development. We will use new transgenic technology that allows tagging of a particular cell population and following its behavior over the life of the animal. These experiments will be performed in mice because this technology is well developed in these animals and there is a basic knowledge of the rodent prostate. The studies proposed here will clarify some of the basic aspects of the biology of the prostate gland and the process of carcinogenesis in this organ.

Work on this award continues to focus on three primary areas: Operating Room Informatics, Simulation, and Smart Image. In the area of Informatics, a meta-analysis of commercially available positioning technologies has been completed. A sampling of these technologies was installed in a lab environment and extensive testing was completed. The Simulation effort continues to build The Virtual Human, having developed a working model of normal esophageal function. The Smart Image research has demonstrated the ability to fuse multi-source images, creating a real-time 3-dimensional view for the laparoscopic surgeon. Work continues on refining these images.

**A Device for the In-Situ Measurement of Acoustically Stimulated Bioluminescence**

Savoie, Matthew J, Inventor; Aug 22, 2005; 11 pp.; In English

Report No.(s): AD-D020285; No Copyright; Avail.: Other Sources

ONLINE: <http://hdl.handle.net/100.2/ADD020285>

A device and method of use for measurement of in-situ bioluminescence generally comprising an acoustical pulse generator, a detector chamber, a lens assembly and a photomultiplier tube. The generator comprises transducers which can generate acoustical energy in the object field of the device. The acoustical energy provides a stimulus of aquatic organisms within the object field (typically an aqueous volume) to produce the bioluminescence. The generator is positioned outside of the detector chamber and the photomultiplier tube and lens assembly are mounted within the chamber. The lens assembly restricts light to the photomultiplier tube of that bioluminescence light originating only from the volume. The photomultiplier

tube detects the bioluminescence generated by any aquatic organisms in a captured volume or if a changing measurement occurs by water flow in the volume. The output of the photomultiplier tube is provided to a controller to be analyzed.

**Modeling Phenotypes of Tuberous Sclerosis in the Mouse**

Shipley, James M; Feb 2007; 8 pp.; In English

Contract(s)/Grant(s): W81XWH-05-1-0205

Report No.(s): AD-A466831; No Copyright; Avail.: Defense Technical Information Center (DTIC)

The overall goal of this project is to generate a mouse model of the smooth muscle-related facets of tuberous sclerosis, specifically in an attempt to model the lung phenotype seen in a subset of TS patients and patients with LAM. We have conditionally targeted the TSC1 gene in smooth muscle, which results in mortality at approximately 10 weeks of age. This mouse now provides a useful model in which to investigate the function of individual MMPs or other proteins in this pathological progression, and to evaluate relevant therapeutic interventions such as rapamycin.

**Evaluation of Daphnia Magna Neonate Viability under Low Temperature Exposure Conditions**

Burton, Dennis T; Turley, Steven D; Jan 25, 2007; 46 pp.; In English

Report No.(s): AD-A466881; No Copyright; Avail.: Defense Technical Information Center (DTIC)

The U.S. Army Center for Environmental Health Research (USACEHR) expressed interest in the possibility of maintaining Daphnia magna neonates under prolonged cold conditions (4-6 degrees C). As a result, Science Applications International Corporation (SAIC) issued a Statement of Work (SOW) on July 19, 2006, which described the tasks that USACEHR wanted covered to address the maintenance of Daphnia magna under cold conditions (SAIC, 2006). The University of Maryland (UMD) submitted a proposal to SAIC on July 21, 2006, to conduct the tasks described in SAIC's SOW. This report describes the result of the tasks.

**Integration of Soluble and Adhesive Gradient Signals in Directed Cell Migration**

Haugh, Jason M; Nov 2006; 5 pp.; In English

Contract(s)/Grant(s): N00014-03-1-0594

Report No.(s): AD-A467054; No Copyright; Avail.: Defense Technical Information Center (DTIC)

Our research has led to a comprehensive model of fibroblasts' responsiveness to PDGF gradient stimulation at the level of PI 3-kinase signaling, and we have analyzed the implications of this mechanism for dermal wound invasion. In this research, we have utilized and in some cases developed advanced tools for live-cell microscopy and quantitative analysis including mathematical modeling. Thus, our research has contributed to the fundamental understanding of directed fibroblast migration, a critical process in wound healing.

**Effects of the Global War on Terror on Medical Service Corps Retention Rates**

Dietrich, Erich J; Mar 2007; 77 pp.; In English

Report No.(s): AD-A467118; No Copyright; Avail.: Defense Technical Information Center (DTIC)

This thesis analyzes the retention behavior of first term Medical Service Corps officers and examines the effect of the Global War on Terror (GWOT) on all communities within the Navy Medical Service Corps including Healthcare Administration (HCA), Healthcare Science (HCS) and Clinical Care Provider (CCS). Data were collected from the Defense Manpower Data Center for MSC officers in entering cohort years 1998, 1999 and 2001. Four logistic regression models were estimated to capture the effects of different types of deployments on the retention of first term MSC officers. The models included both demographic and military experience explanatory variables. A difference-indifference estimator was incorporated into each model to measure the effects of the deployment variables across the pre and post- GWOT periods. The post-GWOT period is defined as following the initiation of major combat operations in Iraq (March 2003). Factors having positive effects on retention included age, having greater than two dependents, entering through the In-Service Procurement Program, and deployments including at least one hostile deployment during the first term. Negative influences on retention included serving in HCS or CCS when compared to HCA, entering through the Health Services Collegiate Program and commissioning in the 2001 cohort year. While serving a first term in the post-GWOT period has a negative effect on retention, the post-GWOT deployment indicators were inconclusive in this study.

**Integrating Local Public Health Agencies into the Homeland Security Community**

Reed, Patricia D; Mar 2007; 60 pp.; In English

Report No.(s): AD-A467136; No Copyright; Avail.: Defense Technical Information Center (DTIC)

After more than seven years of funding through The Centers for Disease Control and Prevention, local public health agencies have made inconsistent progress in fulfilling their Homeland Security objectives. Most progress has been made in those areas in which Public Health has previous experience. However, in those activities requiring integration with other responder agencies Public Health has lagged in developing effective capabilities in prevention, preparedness, response, mitigation and recovery. This thesis argues that several factors contribute to this lack of success, including funding structures and guidelines, the reluctance on the part of other responder agencies to include Public Health in emergency planning and response activities, and the organizational isolation in which Public Health has existed. In order for local public health agencies to meet their Homeland Security objectives, funding structures and guidelines must support local Public Health and public health agencies must be better integrated with their Homeland Security partners. Public health agencies at all levels and their leadership have the opportunity to effect organizational changes designed to accelerate the transformational process, enhancing their Homeland Security partnerships. Public Health agencies can be more effectively integrate into the larger Homeland Security community by demonstrating commitment to making these changes.

**Steps Towards Determining the Right Number of Dental Recruits the Navy Should Access to Meet the Projected Targets for Navy Dental Corps Officers**

Gilliard, Jr, Richard; Mar 2007; 69 pp.; In English

Report No.(s): AD-A467230; No Copyright; Avail.: Defense Technical Information Center (DTIC)

This thesis took steps towards determining the right number of dentists the Navy should recruit to meet projected targets. Dental Corps data were provided from the Dental Corps Manpower office covering fiscal years 1984 through 2005. The accession sources for Dental Corps officers were a concern at the onset of this study. One goal of the research was to determine whether or not certain behaviors were associated with particular accession programs. The results showed that no particular accession source dominated any of the five specialties that were selected. To develop the loss rates, data from two Excel files, DC Total Inventory and DC Losses were merged. After merging the files, only one record per dentist remained from fiscal years 1988 through 2005. This evolution produced 3,643 records that portray each dentist's career. The loss rate results suggest that once Dental Corps officers reach their tenth year they are less likely to leave the military than in earlier years. This would

suggest that retention incentives should be focused during the fourth through sixth years of the Dental officer's career. Oral Surgeons, however, are more likely than the other specialties to leave the military after their tenth year.

**Medical Reserve Corps Volunteers' Ability and Willingness to Report to Work for the Department of Health During Catastrophic Disasters**

Schechter, Shelly; Mar 1, 2007; 97 pp.; In English

Report No.(s): AD-A467359; No Copyright; Avail.: Defense Technical Information Center (DTIC)

Local public health systems must have the capacity to meet the surge requirements of a health emergency that requires an extraordinary increase in activity including the rapid prophylaxis of an effected community. According to recent studies of paid healthcare professionals, approximately forty percent may be unable or unwilling to report to work during catastrophic disasters, but these questions have not yet been asked in the volunteer community. The Medical Reserve Corps (MRC) is a group of medical volunteers with a primary mission of support to the public health system during periods of surge. This thesis surveyed the members of a county health department MRC to determine their ability and willingness to volunteer in a public health emergency. The survey also elicited information on barriers and enablers to response and perceptions of community preparedness. Both significant differences in the responses of paid versus volunteer health professionals regarding their ability and willingness and striking similarities in their responses regarding barriers and enablers to report to work were identified. Volunteer motivation, cognitive dissonance and the nature of self selected volunteers are examined as they relate to these findings and strategies to strengthen the ability and willingness of MRC units to respond with the public health system are suggested.

**Strategies for the Integration of Medical and Health Representation within Law Enforcement Intelligence Fusion Centers**

Morrissey, James F; Mar 2007; 92 pp.; In English

Report No.(s): AD-A467383; No Copyright; Avail.: Defense Technical Information Center (DTIC)

Terrorism-related intelligence gathering, analysis and information dissemination would be improved and enhanced by including a medical and health element in law enforcement intelligence fusion centers. The lack of medical representation and participation in intelligence analysis and information dissemination has been an obstacle to effective terrorism prevention, preparedness and response. Terrorist acts, including weapons of mass destruction, would have a significant and profound impact on the medical and health community. The medical and health community should work more closely with the intelligence community and be privy to terrorism-related information and alerts. The three areas of implementation to be examined include the FBI's Joint Terrorism Task Force, state level fusion centers and local (city, county, regional) terrorism early-warning groups. The Terrorism Liaison Officer Program will be examined as an option for medical personnel to become involved in anti-terrorism efforts. Literature on the subject shows overwhelming support for the involvement of non-law enforcement public safety representation, including the medical and health communities, in intelligence fusion centers.

**Activation and Protection of Dendritic Cells in the Prostate Cancer Environment**

Guruli, Georgi; Jordan, Mark L; Feb 2007; 26 pp.; In English; Original contains color illustrations

Contract(s)/Grant(s): W81XWH-05-1-0181

Report No.(s): AD-A467561; No Copyright; Avail.: Defense Technical Information Center (DTIC)

First annual report for this award. Experiments were conducted as was scheduled in the Statement of Work. So far studies have demonstrated for the first time the presence of endothelin receptors on murine DC and the fact of endothelin-I production by murine DC upon stimulation with TNF(dot). Phenotyping of dendritic cells stimulated with TNF(dot) and treated with endothelin receptor inhibitors demonstrated decreased expression of pro-inflammatory co-stimulatory molecules (CD40 VD80 CD86 CD205 MHC class II) with the blockade of ETA receptors and no change or mild increase in the expression of

co-stimulatory molecules with the blockade of ETB receptors. In vivo administration of endothelin A receptor inhibitor abolished the effect of infectious stimulus to mobilize dendritic cells to draining lymph nodes. Functional studies are under way to further characterize the role of endothelin receptors in the biology of dendritic cells as well as to study the interaction of dendritic cells and prostate cancer cells and develop the means of active cell therapy for murine prostate cancer model.

**Differential Mechanisms of Androgen Resistance**

O'Mahony, Orla A; Dec 2006; 11 pp.; In English; Original contains color illustrations

Contract(s)/Grant(s): W81XWH-05-1-0105

Report No.(s): AD-A467564; No Copyright; Avail.: Defense Technical Information Center (DTIC)

We proposed to study the mechanisms of androgen resistance by focusing on androgen receptor mutations and may arise due to selective pressures of antiandrogen treatment. We have utilized xenograft and a humanized mouse model of prostate cancer. To date we have identified mutations throughout the androgen receptor coding region and are in the process of carrying out functional analysis. It is proposed that these mutations may lead to greater androgen receptor activity under particular conditions and potentially highlight sites of interaction with critical coactors that might themselves serve as novel therapeutic targets to complement androgen ablation. During this study analysis of tumor progression in the h/mAR X TRAMP mice have highlighted differences in disease course between antiandrogen treated and hormone deplete (castrated) mice. We are in the process of determining mechanisms underlying these differences by characterizing AR levels and subcellular localization in these tumors

**Pilot Comparison of Stromal Gene Expression among Normal Prostate Tissues and Primary Prostate Cancer Tissues in White and Black Men**

Bova, G S; Sep 2006; 6 pp.; In English; Original contains color illustrations

Contract(s)/Grant(s): W81XWH-04-1-0817

Report No.(s): AD-A467565; No Copyright; Avail.: Defense Technical Information Center (DTIC)

Recent advances in prostate biology suggest that stromal cells surrounding prostate epithelia may play a key role in permitting or stimulating epithelial cells to lose control and form precancerous and cancerous lesions. The goal and purpose of this Hypothesis Development project is to obtain preliminary data sufficient to begin to explore the role of prostate stromal cells in prostate carcinogenesis under conditions as rigorously controlled as current technology allows. This hypothesis development project tests the feasibility of identification, laser capture microdissection, and expression analysis of prostate-stroma specific cells in normal and cancerous prostates, and aims to develop preliminary data sufficient to identify potential differences in stromal RNA expression in normal and cancerous prostate tissue. The studies found that it is difficult but not impossible to histologically identify prostate zones with an acceptable degree of confidence in frozen tissues, thus eliminating the need to attempt expression studies in fixed tissues with their attendant biases. Laser capture microdissection of stromal tissue was completed for 5 normal prostates from men across the age range and from two racial groups (African Americans and Caucasians), and for prostates from men of similar ages with adenocarcinoma identified distant from the area of dissection. High Quality RNA was isolated, and duplicate Affymetrix Plus 2.0 chip analysis was recently completed. RNA expression data analysis has just begun. Selective validation testing of these analyzed data is planned and will be the final step of this painstaking hypothesis development project. The key research accomplishments during this period were as follows: identification of appropriate normal tissues for study, determination of frozen tissues as the best foundation for study, completion of tedious laser capture microdissections, and completion of Affymetrix Gene Chip hybridizations.

**Disruption of the Circadian Rhythms of Gene Expression and the Development of Breast Cancer**

Kennaway, David J; Feb 2007; 8 pp.; In English; Original contains color illustrations

Contract(s)/Grant(s): W81XWH-06-1-0265

Report No.(s): AD-A467567; No Copyright; Avail.: Defense Technical Information Center (DTIC)

This project uses a mouse model to examine the effects of shiftwork on the expression of genes that are directly involved

in the genesis and progression of breast cancer. Task 1: Shift work simulation experiments in mice have been accomplished. High variability has made it advisable to increase the number of animals from n=5 per group to n=10. Results show that shift work produces a shift in the rhythm of core clock genes and the attenuation of expression of genes involved in cell cycle. A manuscript with these results is currently in preparation. Task 2: Two preliminary experiments have been carried out to assess the grafting success of MCF-7 and MDA-MB-231 tumour cells. We expect to run the full experiment within 8 weeks. Task 4: We have successfully crossed the Clock mutation on to a BALB/c-Foxn1nu background. The pups from this cross were not viable due to the inability of the mothers to lactate their offspring. This, in itself, is a very interesting finding. We have been able to maintain this colony by cross fostering the mutant pups to a lactating heterozygote mother. As a backup we have started to cross the Clock mutation on to a Severe combined immuno-deficient (SCID) mouse background with the expectation that these will not manifest the same problems.

**The Effect of Hypotensive Resuscitation and Fluid Type on Mortality, Bleeding, Coagulation, & Dysfunctional Inflammation in a Swine Grade V Liver Injury Model**

Schreiber, Martin A; Muller, Patrick; Kiraly, Laszlo; Englehart, Michael; Tieu, Brandon; Underwood, Samantha; Phillips, Charles; Watters, Jennifer; Jan 2007; 17 pp.; In English; Original contains color illustrations

Contract(s)/Grant(s): W81XWH-04-1-0104

Report No.(s): AD-A467570; No Copyright; Avail.: Defense Technical Information Center (DTIC)

Objectives: To determine the optimal fluid resuscitation and anesthetic regimen for swine undergoing uncontrolled hemorrhage. To develop a severe multi-system trauma model resulting in the lethal triad. Methods: 1. 20 swine underwent Grade V liver injury followed by 30 minutes of hemorrhagic shock without resuscitation. Hemodynamics were measured using PICCO 2. Systemic and local lung inflammation was measured in animals undergoing TIVA and isoflurane anesthetic. 3. Femur fracture controlled hemorrhage hypothermia and liver injury were combined to create a reproducible model replicating the lethal triad. Results: 1. Resuscitation with NS results in decreased SVR and increased CO as well as increased extravascular lung water. This suggests that NS is more likely to predispose trauma patients to ARDS. 2. A systemic pro-inflammatory response can be measured within 2 hours of injury and shock. Anesthesia with TIVA produces suppression of TNF-alpha mRNA in the lung compared to anesthesia with isoflurane. 3. A severe reproducible multi-system injury can be created in swine with good short term survivability. This injury model can be reliably reproduced at multiple distant centers.

**Contrast Enhancement for Thermal Acoustic Breast Cancer Imaging via Resonant Stimulation**

Li, Jian; Sheplak, Mark; Cattafesta, Lou; Zmuda, Henry; Jiang, Huabei; Arreola, Manuel; Mar 2007; 40 pp.; In English; Original contains color illustrations

Contract(s)/Grant(s): W81XWH-06-1-0389

Report No.(s): AD-A467571; No Copyright; Avail.: Defense Technical Information Center (DTIC)

This research plans to develop enhanced contrast thermal acoustic imaging (TAI) technology for the detection of breast cancer by combining amplitude-modulated (AM) electromagnetic (EM) field excitation resonant acoustic scattering and advanced signal processing techniques. While EM-induced TAI possesses great promise the thermal acoustic signals tend to be weak. However when the tumor is excited into resonance via EM stimulation the effective acoustic scattering cross-section may increase by a factor in excess of 100 based on predictions for microsphere-based ultrasound contrast agents. Such an increase would truly be revolutionary making the EM-induced TAI technology a very promising candidate for routine breast screening. The image formation methods in the existing TAI systems are data-independent and have poor resolution and high sidelobe problems. We will devise adaptive image formation algorithms to achieve high resolution and excellent interference and noise suppression capability.

**Analysis of p21-Activated Kinase Function in Neurofibromatosis Type 2**

Chernoff, Jonathan; Jan 2007; 7 pp.; In English

Contract(s)/Grant(s): W81XWH-06-1-0213

Report No.(s): AD-A467572; No Copyright; Avail.: Defense Technical Information Center (DTIC)

The goal of this project is to determine if group A p21-activated kinases (Paks) are important elements in signaling in neurofibromatosis type II (NF2). Our hypothesis is that activation of the NF2 gene disrupts a signaling pathway emanating from the small GTPase Rac and its effector, p21-activated kinase (Pak). We propose that stimulation of the Rac/Pak signaling axis in cells lacking Merlin leads to changes in transcriptional activity and cytoskeletal dynamics, ultimately resulting in enhanced cell proliferation and motility, which are hallmarks of tumorigenesis.

**Protein Transduction Based Therapies for Breast Cancer**

Robbins, Paul D; Jul 2006; 12 pp.; In English; Original contains color illustrations

Contract(s)/Grant(s): DAMD17-03-1-0489

Report No.(s): AD-A467574; No Copyright; Avail.: Defense Technical Information Center (DTIC)

We have demonstrated that certain transduction peptides such as 12 lysines and 12 arginines can facilitate internalization into breast tumor lines with higher efficiency than smaller polymers of cationic amino acids. In addition we have demonstrated that PTD-Sma34 worked in conjunction with Ad=TRAIL gene transfer to induce breast tumor apoptosis. We also have demonstrated that membrane bound TRAIL worked more effectively than soluble (secreted) TRAIL to induce breast cancer apoptosis. Moreover we have demonstrated that coadministration of Ad=TRAIL with PTD-Smac34 resulted in not only enhanced adenoviral transduction of the tumors but resulted in a stronger apoptotic effect. Finally we have initiated studies to identify breast cancer specific tumor lines by screening a peptide phage display library both in cell culture as well as in nude mice bearing xenografts. Initial results in prostate tumors have demonstrated the feasibility of this approach and suggests breast tumor specific internalization peptides can be identified.

**Neurofibromatosis and the Painful Neuroma**

Belzberg, Allan J; Jan 2007; 24 pp.; In English; Original contains color illustrations

Contract(s)/Grant(s): W81XWH-06-1-0176

Report No.(s): AD-A467583; No Copyright; Avail.: Defense Technical Information Center (DTIC)

Pain is a common and distressing symptom that impacts the quality of life of many patients with neurofibromatosis. The pain is often due to the formation of a neuroma. To understand better how neuromas cause pain and what treatments may be provided, we have attempted to develop an animal model of a painful neuroma. We have completed the first of the three specific aims in this research project. The tibial neuroma transposition (TNT) model has been confirmed as a model of neuropathic pain. The TNT model has been established as reliable and valid. In the TNT model, the neuroma test-site mechanosensitivity is dependent on neural input from the tibial neuroma. In the TNT model, hindpaw mechanical hyperalgesia is independent of input from the tibial neuroma. We will now move on with work related to developing methods to prevent painful neuroma formation.

**DRF3 as a Cholesterol-Dependent Regulator of Src in Prostate Cancer**

Freeman, Michael R; Jan 2007; 9 pp.; In English

Contract(s)/Grant(s): W81XWH-06-1-0197

Report No.(s): AD-A467584; No Copyright; Avail.: Defense Technical Information Center (DTIC)

This project focuses on the novel finding from our group that the formin protein, Drf3, is a signaling molecule positioned downstream from the EGF receptor that intersects with the tyrosine kinase Src in prostate cancer cells. Formins bind small

GTPases and have been implicated in actin cytoskeletal remodeling. Evidence was presented in the original proposal that the EGFR Drf3 Src signaling circuit appears to traverse cholesterol-rich lipid raft membranes in prostate cancer cells. Lipid rafts are cholesterol-and sphingolipid-enriched membrane microdomains that serve as signal transduction platforms by sequestering and excluding signaling proteins and by harboring pre-formed multi-protein complexes. We have hypothesized in this project, and in our published work in this area, that cholesterol accumulation in prostate cancer cells may promote oncogenesis by altering the nature of and/or the types of signals that flow through lipid raft microdomains. Several new lines of evidence consistent with our hypothesis have been produced in year 1 of the project and are described and summarized in this progress report.

**Intra-Prostate Cancer Vaccine Inducer**

Humphreys, Robert; Xu, Minzhen; von Hofe, Eric; Lu, Xueqing; Hillman, Gilda; Jul 2006; 61 pp.; In English; Original contains color illustrations

Contract(s)/Grant(s): W81XWH-04-1-0279

Report No.(s): AD-A467585; No Copyright; Avail.: Defense Technical Information Center (DTIC)

Antigen Express has generated potent human Ii-RNAi constructs for use in prostate cancer therapy. We identified active Ii- RNAi sequences, selected the most active promoter (CMV) and demonstrated good suppression of Ii. The constructs also were used to enhance a gp120 DNA vaccine model, confirming that Ii suppression increases the potency of a tumor cell and DNA vaccine. We have shown that an anti-tumor immune response can be strongly induced by intratumoral induction of the MHC class I+II+II- phenotype and effectively and specifically protects mice from re-challenge by the same tumor cells. The frequency and dose of plasmid injections have been optimized as well as the dose of IL-2 to induce a potent immune response following generation of the MHC class I+II+II- phenotype. The duration of plasmid in cells in vitro and the in vivo have been evaluated and indicate that this immunotherapy should be safe. Finally, we have found that DU-145, PC-3, and LNCap prostate cell lines are heterogeneous for MHC class II and II expression and that PC-3 and LNCap cells are MHC class II-/II+. Overall, our results suggest that Ii suppression has the potential to be an elegant method for prostate cancer immunotherapy.

**Stromal Mesenchyme Cell Genes in Prostate Cancer Development: Epigenetic Markers for Cancer and Potential Targets for Therapy**

Goo, Young A; Dec 2006; 14 pp.; In English; Original contains color illustrations

Contract(s)/Grant(s): W81XWH-06-1-0108

Report No.(s): AD-A467588; No Copyright; Avail.: Defense Technical Information Center (DTIC)

Functional development of the prostate is governed by stromal induction and epithelial response. Stromal/epithelial signaling can be mediated through direct cell-cell contact and diffusible factors with their cell surface receptors. One approach to gain a molecular understanding of epithelial/stromal interaction is to identify the organ-specific stromal signaling factors. We proposed to do this through a comparative analysis between prostate stromal and bladder stromal cells. For the prostate/bladder transcriptome analysis, we isolated stromal cell populations by the use of specific CD markers: CD49a for prostate and CD13 for bladder with magnetic cell sorting (MACS) and laser-capture microdissection (LCM). The Affymetrix microarray platform was used to determine the cell type-specific transcriptomes. The glycopeptide-capture method was used to profile protein expression differences because most secreted proteins are glycosylated. We have identified an increased expression in prostate stromal cells of signal transducers like AXL receptor tyrosine kinase, and protein tyrosine kinase 7, which have been implicated in tumor progression. Western blot analysis was performed to validate their expression. Our comparative stable isotope-free proteomic analysis using a modification of the N-linked glycopeptide-capture method allowed facile measurement of changes in protein expression. A number of secreted proteins which may be involved in stromal/epithelial signaling and organ-specific differentiation were identified.

**Brain's DNA Repair Response to Neurotoxicants**

Sanchez-Ramos, Juan; Jan 2007; 117 pp.; In English; Original contains color illustrations

Contract(s)/Grant(s): DAMD17-03-1-0501

Report No.(s): AD-A467590; No Copyright; Avail.: Defense Technical Information Center (DTIC)

Parkinson's Disease (PD) is associated with death of dopaminergic (DA) neurons in the substantia nigra (SN) of the brain. Military personnel abroad are at a greater risk of exposure to pesticides and toxins which may selectively damage DA neurons in the SN and increase the probability of development of Parkinson's disease (PD) later in life. The toxins of interest are mitochondrial poisons that create a bioenergetic crisis and generate toxic oxyradicals which damage macromolecules, including DNA. We hypothesized that regulation of the DNA repair response within certain neurons of the SN (the pars compacta) may be a critical determinant for their vulnerability to these neurotoxicants. We have measured regional differences in the brain's capacity to increase repair of oxidized DNA (indicated by oxyguanosine glycosylase (OGG1) activity) to three distinct chemical classes of neurotoxins (MPTP, two mycotoxins, and an organochlorine pesticide). We have found that the temporal and spatial profile of OGG1 activity across brain regions elicited by each class of neurotoxicant is distinct and unique. Even though all 3 toxicants caused various degrees of depletion of striatal dopamine, the temporal profile of DA depletion and OGG1 activity in striatum was distinct for each toxicant. DNA repair gene expression in response to OTA and dieldrin revealed differences in VTA and SN compartments that may relate to differential vulnerability to oxidative stressors.

**Role of Reactive Stroma in Prostate Cancer Progression**

Rowley, David R; Feb 2007; 46 pp.; In English; Original contains color illustrations

Contract(s)/Grant(s): W81XWH-04-1-0189

Report No.(s): AD-A467602; No Copyright; Avail.: Defense Technical Information Center (DTIC)

The purpose of this project is to determine the role of FGF receptor 1 in reactive stroma during prostate tumorigenesis. We are using a novel approach to target transgene expression specifically to the reactive stroma of experimental prostate cancer. Using a modified approach, we are placing an inducible Cre recombinase behind the FAP gene promoter to target expression to reactive stroma. We will cross this mouse with Fgfr1flox mice (LoxP sites flanking FGF receptor 1 alleles). These mice will be crossed with TRAMP mice (prostate cancer model). Induced expression of Cre at sites of reactive stroma generated in the cancer foci will function to excise the FGF receptor 1 alleles and create a conditional knockout mouse. Progression of tumorigenesis in this line of knockout mice will be compared to heterozygous and wild type controls. Progress has been made in each Task. We have completed all cloning steps and acquired all reagents. We have rederived the Fgfr1flox and have crossed it into the appropriate backgrounds. We have completed crossing the TRAMP mice with the Fgfr1flox mice. This study will pinpoint the role of FGF receptor 1 in reactive stroma promotion of prostate.

**IDO Inhibitors for Combination Therapy of Prostate Cancer**

Prendergast, George C; Nov 2005; 12 pp.; In English

Contract(s)/Grant(s): W81XWH-05-1-0010

Report No.(s): AD-A467603; No Copyright; Avail.: Defense Technical Information Center (DTIC)

Cancer cells evade immunity during malignant progression. Thus strategies to reverse this process could offer new therapeutic options. Over expression of indoleamine 2,3-dioxygenase (IDO) in cancer cells inhibits T cell activation by tumor antigens. Notably combining an IDO inhibitor with cytotoxic drugs such as paclitaxel strongly and safely enhances antitumor efficacy in animal models of breast cancer. In this project we proposed to test whether combining an IDO inhibitor with paclitaxel could safely enhance efficacy against prostate tumors. The suggested model system was a variant of the TRAMP mouse engineered with a prostate-specific luciferase transgene. Briefly our objectives were to assign tumor-bearing mice to control and drug treatment groups and to compare tumor response after control or experimental therapies by bioluminescence imaging. Unfortunately a fatal pitfall prevented the use of the model (nonselective luciferase expression). Two alternate models explored - each based on engraftment of luciferase-expressing cells into the prostate or under the skin - also exhibited fatal pitfalls (arising tumors tended to spontaneously regress). Our findings raised serious concerns about the utility of

luciferase-expressing prostate tumor cells for bioluminescence-based studies of prostate cancer pathophysiology and therapeutic response.

**Involvement and Regulation of Heparanase in Prostate Cancer Progression**

Elkin, Michael; Feb 2007; 43 pp.; In English; Original contains color illustrations

Contract(s)/Grant(s): W81XWH-04-1-0235

Report No.(s): AD-A467604; No Copyright; Avail.: Defense Technical Information Center (DTIC)

Improvement in prostate cancer patient survival requires the identification of new therapeutic targets, based on a detailed understanding of the biologic mechanisms involved in metastatic dissemination and growth in bone and other target organs. Heparanase (HPSE) is a predominant mammalian enzyme that cleaves heparan sulfate, the main polysaccharide component of the extracellular matrix (ECM). The role of HPSE in sustaining the pathology of malignant tumors is being extensively studied during the last decade. The link between HPSE and prostate carcinoma progression remains less investigated and was disputed in recent publications, favoring or opposing involvement of the enzyme. Here we report that HPSE directly contributes to the prostate tumor take and growth in bone, as well as to its ability to metastasize to distant organs. Inhibitory strategies designed in the course of the research are hoped to develop into effective anti-cancer therapeutic modalities. Knowledge gained on the regulatory machinery of heparanase promoter is of high significance, as a part of general effort to define the exact molecular mechanisms of heparanase-driven prostate tumorigenesis. In summary, our results suggest that in prostate tumorigenesis HPSE may become important molecular marker in clinical decision-making process for prostate tumor patients, as well as a target for intervention.

**Mechanisms of Disease Persistence in Chronic Myelogenous Leukemia (CML)**

Druker, Brian J; Oct 1, 2006; 39 pp.; In English; Original contains color illustrations

Contract(s)/Grant(s): W81XWH-05-1-0606

Report No.(s): AD-A467605; No Copyright; Avail.: Defense Technical Information Center (DTIC)

Disease persistence is the main issue faced by CML patients on therapy with imatinib and eradication of persistent malignant cells will be critical for the longterm success of kinase inhibitor therapy. Mechanisms underlying acquired resistance to imatinib have been extensively studied and the manner by which mutations of the Bcr-Abl kinase domain can reduce or eliminate sensitivity of CML cells to imatinib has been well characterized. Disease persistence in responding patients, in contrast, is still poorly understood. We sought to identify and extensively characterize hematopoietic stem cells responsible for disease persistence and explore their mechanisms of imatinib resistance. Using in vitro culture of primary CML progenitor cells, we identified both quiescent and cycling cells capable of surviving in the presence of imatinib. We observed inhibition of tyrosine phosphorylation by imatinib in surviving cells, suggesting a Bcr-Abl independent mechanism of survival. To apply information gained from in vitro culture to persistent cell populations in treated CML patients, we attempted to isolate Bcr-Abl positive cells from patients in cytogenetic remission. Although persistent CML cells may reside within the stem cell compartment, techniques of stem cell enrichment did not lead to enrichment of CML cells. We are therefore developing techniques for Bcr-Abl-specific detection to facilitate these studies, including creation of a Bcr-Abl junction-specific antibody, development of a Bcr-Abl mRNA junction-specific molecular beacon and analysis of potential markers of CML cells. Evaluation of the utility of these techniques in primary cells is ongoing. The detailed analysis of primary samples is technically challenging, but is essential for an understanding of disease persistence and may allow identification of novel drug targets or methods to sensitize resistant cells to imatinib or alternative Bcr-Abl kinase inhibitors.

**Mechanism of Tumor Metastasis Suppression by the KA11 Gene**

Watabe, Kounosuke; Feb 2007; 13 pp.; In English; Original contains color illustrations

Contract(s)/Grant(s): W81XWH-04-01-0193

Report No.(s): AD-A467606; No Copyright; Avail.: Defense Technical Information Center (DTIC)

KA11 is a tumor metastases suppressor gene which is capable of blocking the metastatic process without affecting the

primary tumorigenesis. Based on our preliminary data, we hypothesize that the KAI1 protein on tumor cells interacts with gp-Fy on the endothelial cells, which activates a signal pathway of the KAI1 molecule, and that this activation eventually leads to cell growth arrest of tumor cells. To test this hypothesis, we will examine whether the interaction of KAI1 and gp-Fy leads to suppression of tumor metastasis in vivo (Task 1), and identify specific peptide sequences that activate KAI1 and to assess the efficacy of the peptides on tumor growth in an animal model (Task 2). We have successfully completed Task 1 and published the results during this cycle. Task 2 is currently underway and one year non-cost extension was requested. Our long-term goal is to elucidate the molecular mechanism of tumor suppression by the KAI1 gene and to develop an effective therapeutic method which restores the function of the KAI1 gene in the metastatic tumor cells.

**Evaluation of DNA Methylation as a Target for Intraductal Therapy for Ductal Carcinoma in Situ of the Breast**

SKinner, Kristin A; Aug 2006; 8 pp.; In English

Contract(s)/Grant(s): DAMD17-02-1-0569

Report No.(s): AD-A467607; No Copyright; Avail.: Defense Technical Information Center (DTIC)

In ductal carcinoma in situ(DCIS), the malignant cells are confined within the basement membrane, and so an ideal candidate for local therapies. Because DNA methylation is a potentially reversible mechanism for tumor suppressor gene inactivation, it is an intriguing target for molecular therapeutics. In this study we have documented significant methylation in eight tumor suppressor genes in DCIS. We have successfully performed ductal lavage in 24/27 patients undergoing surgery for DCIS without any complications. Unfortunately, we were able to successfully identify and lavage the malignant duct in only 25% of cases, half of which were identified because the patient presented with discharge. In the absence of nipple discharge, only 14% of the lavaged ducts were the malignant duct. While these data do not rule out the potential of targeting DNA methylation for intraductal therapy for DCIS, we need better methods for identifying the malignant ductal orifices before proceeding to clinical trials of intraductal therapy.

**Humanin: A Novel Therapeutic Target in Prostate Cancer**

Cohen, Pinchas; Jan 2007; 14 pp.; In English; Original contains color illustrations

Contract(s)/Grant(s): W81XWH-06-1-0211

Report No.(s): AD-A467610; No Copyright; Avail.: Defense Technical Information Center (DTIC)

Humanin is a recently discovered potent survival peptide encoded by the 16S mitochondrial RNA. We cloned humanin as an insulin-like growth factor binding protein-3 (IGFBP-3) antagonist, and others identified it as a Bax antagonist. We hypothesize that humanin is an important prostate cancer regulator and that it may have a role as a diagnostic or prognostic marker in this disease. We proposed to characterize the role of humanin as a regulator of cell survival, growth, and signalling in prostate cancer in vitro, to define its interactions with IGF related molecules including IGFBP-3. We also proposed to identify alterations in humanin levels in sera and tissues of men with prostate cancer using a serum bank and a CaP tissue array. Our data so far indicates that humanin is present in prostate and seminal plasma, and is increased in prostate cancer specimens and its presence is a poor prognostic factor for disease free survival. As findings indicate that humanin levels are related to outcome in CaP, using humanin assays as a potential prognostic tool in patients with prostate cancer could improve treatment decisions in the future.

**Monitoring and Counteracting Functional Deterioration in Parkinson's Disease: A Multilevel Integrative Approach in a Primate Model System**

Philippens, Ingrid H; Sep 2006; 21 pp.; In English; Original contains color illustrations

Contract(s)/Grant(s): W81XWH-05-1-0517

Report No.(s): AD-A467621; No Copyright; Avail.: Defense Technical Information Center (DTIC)

It is still largely unknown what the general course is in the progression of Parkinson's disease (PD). Presumably more

than one factor is responsible. There is evidence suggesting that metabolic compromise, excitotoxicity and oxidative stress are involved in the neurodegenerative process causing PD. To investigate the connection of excitotoxicity and oxidative stress with metabolic compromise in the development of the disease, anti-excitotoxic treatment with riluzole and anti-oxidant treatment with EGCG will be compared to untreated controls and to a standard treatment with L-DOPA in a MPTP induced Parkinson model. We hypothesize that critical changes indicating the nature of the gradual patho-physiological changes leading to PD will be revealed if anti-oxidants or anti-excitatory treatments are given in a situation where the brain is susceptible to develop PD. The comparison, of the results on the different levels of research, between the neuroprotective regimes and the symptom control drug L-DOPA will give insight in the relative role of the different markers for neuroprotection and behavioral output. In particular relatively new technologies such as differential proteomics and sleep research will yield novel insights. In this report period new test methods were developed, the use of brain imaging or neurophysiology was validated and the dose range finding of the test compounds was performed. The highest sign-free dose will be used in the neuroprotective experiments.

**Feasibility of Biomonitoring of Exposure to Permethrin Through Analysis of Long-Lived (Metabolite) Adducts to Proteins**

Noort, Daan; Sep 2006; 37 pp.; In English; Original contains color illustrations

Contract(s)/Grant(s): W81XWH-05-1-0516

Report No.(s): AD-A467622; No Copyright; Avail.: Defense Technical Information Center (DTIC)

Biomonitoring of exposure to the insecticide permethrin is usually performed by analysis of its urinary metabolite 3-phenoxybenzoic acid (3- PBA). However, chronic low-level exposures and cumulative exposures cannot be assessed by analyzing urinary biomarkers. We are engaged in the development of a methodology to assess the cumulative internal dose of exposure to permethrin, which is based on the assumption that (reactive) glucuronide conjugates of the major permethrin metabolites 3-PBA and cis/trans-3-(2,2-dichlorovinyl)-2,2-dimethylcyclopropane-1-carboxylic acid (cis/trans-CI2CA) will form persistent adducts to proteins, in analogy with the glucuronide conjugates of structurally related drugs. In the first year of the project the 3-PBA and CI2CA glucuronide metabolites of permethrin have been successfully chemically synthesized. Their identities have been assessed by means of 1H- NMR spectroscopy and LC tandem mass spectrometry. The reactivity of these metabolites with various amino acids, peptides and albumin has been studied; various distinct adducts could be identified by LC tandem mass spectrometry. It is envisaged that the obtained results will form a firm basis for development of an adduct-based methodology for biomonitoring exposure to permethrin.

**Cannabinoid Receptors: A Novel Target for Therapy of Prostate Cancer**

Mukhtar, Hasan; Afaq, Farrukh; Sarfaraz, Sami; Feb 2007; 55 pp.; In English

Contract(s)/Grant(s): W81XWH-04-1-0217

Report No.(s): AD-A467641; No Copyright; Avail.: Defense Technical Information Center (DTIC)

In recent years, cannabinoids, the active components of Cannabis sativa linnaeus (marijuana) and their derivatives are drawing renewed attention because of their diverse pharmacological activities such as cell growth inhibition and tumor regression. We have shown that the expression levels of both cannabinoid receptors CB1 and CB2 are higher in human prostate cancer cells than in normal prostate epithelial cells and treatment of LNCaP cells with WIN-55,212-2 (WIN) resulted in inhibition of cell growth and induction of apoptosis. Next study was conducted to understand the mechanistic basis of these effects. Treatment of LNCaP cells with WIN resulted in (1) an arrest of the cells in the G0/G1 phase of the cell cycle; (2) an induction of p53 & p27/KIP1; (3) down-regulation of cyclins D1, D2, E, decrease in the expression of cdk -2, -4, and -6; (4) decrease in protein expression of pRb; (5) down-regulation of E2F (1-4); and (6) decrease in the protein expression of DP1 and DP2. Similar effects were also observed when androgen-independent PC3 cells were treated with WIN(5-30 micrometers). We further observed sustained up regulation of ERK1/2, and inhibition of PI3k/Akt pathways in WIN-55,212-2 treated cells. Inhibition of ERK1/2 abrogated WIN induced cell death suggesting that sustained activation of ERK1/2 leads to cell-cycle dysregulation and arrest of cells in G0/G1 phase subsequently leading to an induction of apoptosis. Further, WIN treatment of cells resulted in a dose-dependent increase in Bax/Bcl-2 ratio in such a way that favors apoptosis. The induction of apoptosis

proceeded through down regulation of caspases 3, 6, 7, and 9 and cleavage of PARP. Based on these data we suggest that cannabinoid receptor agonists should be considered as novel agents for the management of prostate cancer.

**Defense Health Care: Activities Related to Past Drinking Water Contamination at Marine Corps Base Camp Lejeune**

Crosse, Marcia; Anderson, Bonnie; Doran, Karen; Bogart, George; Desaulniers, Helen; Hamann, Cathleen; Organeck, Danielle; Price, Roseanne; Ritchie, Christina; Ryba, Stuart; May 2007; 82 pp.; In English; Original contains color illustrations

Report No.(s): AD-A467704; GAO-07-276; No Copyright; Avail.: Defense Technical Information Center (DTIC)

In the early 1980s, volatile organic compounds (VOCs) were discovered in some of the water systems serving housing areas on Marine Corps Base Camp Lejeune. Exposure to certain VOCs may cause adverse health effects, including cancer. In 1999, the Department of Health and Human Services' (HHS) Agency for Toxic Substances and Disease Registry (ATSDR) began a study to examine whether individuals who were exposed in utero to the contaminated drinking water are more likely to have developed certain childhood cancers or birth defects. ATSDR has projected a December 2007 completion date for the study. The National Defense Authorization Act of Fiscal Year 2005 required GAO to report on past drinking water contamination and related health effects at Camp Lejeune. In this report, GAO describes the following: (1) efforts to identify and address the past contamination; (2) activities resulting from concerns about possible adverse health effects and government actions related to the past contamination; and (3) the design of the current ATSDR study, including the study's population, time frame, selected health effects, and the reasonableness of the projected completion date. GAO reviewed documents, interviewed officials and former residents, and contracted with the National Academy of Sciences to convene an expert panel to assess the design of the current ATSDR study.

**Genetic and Molecular Analysis of the Mechanisms by Which TSC Regulates Neuronal Differentiation**

McNeill, Helen; Feb 2007; 20 pp.; In English; Original contains color illustrations

Contract(s)/Grant(s): W81XWH-06-1-0154

Report No.(s): AD-A467744; No Copyright; Avail.: Defense Technical Information Center (DTIC)

We have previously shown that loss of TSC pathway components alters the timing of neuronal differentiation in the Drosophila eye and wing imaginal disc. To determine the mechanisms underlying this regulation of neuronal differentiation, we have 1) further defined the subtypes of photoreceptors that respond to loss of TSC, 2) tested in silico candidates for the regulation of differentiation in the eye, and 3) optimized conditions for an RNAi screen. Our preliminary data indicate that loss of TSC does not control neural differentiation through 5' TOP elements contained in the mRNA of proneural genes examined (CG11799, echinoid, moleskin, src). Consistent with this conclusion, our genetic analysis of the Drosophilahomolog of polypyrimidine tract binding protein, Hephaestus, indicates that loss of Hephaestus does not alter the timing of differentiation of photoreceptors in the eye. We conclude therefore that alternate mechanisms control this process. Our preliminary epistasisanalysis indicates that S6K is essential for the precocious differentiation seen in TSC clones, while loss of eIF4E does not affect the timing of differentiation.

**Development of a Mouse Model for Prostate Cancer Imaging and Study of Disease Progression**

Garraway, Isla; Jan 2007; 9 pp.; In English; Original contains color illustrations

Contract(s)/Grant(s): W81XWH-06-1-0230

Report No.(s): AD-A467758; No Copyright; Avail.: Defense Technical Information Center (DTIC)

Prostate carcinogenesis is a multi-step process resulting in the transformation of prostatic epithelial cells into invasive carcinoma and metastasis. In recent years, mouse models have emerged that recapitulate salient features of prostate carcinogenesis found in human disease. These models illuminate the molecular events that result in transformation and disease progression. In addition, mouse models can be used to identify molecular targets and to test chemotherapeutic agents that may alter the course of a disease. The authors have generated a new mouse model to further delineate molecular targets that may

halt cancer progression and/or lead to regression of metastatic disease. To rapidly evaluate a variety of select target genes in the long-term, the authors have created a new transgenic mouse. Crossing the TRAMP mouse with the PSCA-TVA transgenic mouse has resulted in the TRAMP-TVA mouse, which allows for efficient and specific gene transfer of imaging genes into prostate epithelial cells that are destined to form cancer, and that expresses the avian viral receptor, TVA, on prostate cancer cells. This new transgenic mouse should enable specific gene transfer of imaging genes and small hairpin nuclear RNAs (shRNAs) resulting in knockdown of specific targets. TRAMP-TVA mice demonstrate prostatic cellular neoplasia (PIN) lesions at 8 weeks and develop adenocarcinoma at 6-15 months. The authors have been able to demonstrate PSCA-driven expression of the TVA viral receptor in these lesions. Intraperitoneal injection of virus containing the luciferase gene results in luminescence signal in the prostate. Further development of this model will enable the effect of target gene knockdown via RNA.

**The Role of Oncogene/Tumor Suppressor Interaction with the Centrosome Protein Pericentrin in Prostate Tumorigenesis**

Chen, Chun-Ting; Dec 2006; 8 pp.; In English; Original contains color illustrations

Contract(s)/Grant(s): W81XWH-06-1-0140

Report No.(s): AD-A467759; No Copyright; Avail.: Defense Technical Information Center (DTIC)

Prostate carcinoma is the most common form of cancer in American men. The etiology of prostate cancer is currently unknown. It is known that during progression from low to high-grade carcinoma, the spectrum of cytologic, biological, and genetic features changes. We believe that these changes may be a result of defects in the centrosome, an essential organelle that organizes spindle poles during mitosis and has important roles in cell proliferation, cell polarity, and genetic stability. We have shown that centrosomes are defective in prostate carcinoma and pre-invasive lesions. We also showed that the essential centrosomal protein pericentrin is elevated in both pre-invasive prostate lesions and invasive prostate tumors, induces cancer like lesions when overexpressed and binds AKT, PKA and PKC. In this proposal we will follow up on these observations by: examining pericentrin's oncogenic potential after disrupting its interactions with the kinases AKT, PKA and PKC and determine whether other oncogenes or tumor suppressors act synergistically or antagonistically with pericentrin in prostate cancer.

**Proteomic Analysis to Identify Novel Circulating Breast Cancer Markers**

Esteve, Francisco J; Jun 2006; 14 pp.; In English; Original contains color illustrations

Contract(s)/Grant(s): DAMD17-03-1-0429

Report No.(s): AD-A467768; No Copyright; Avail.: Defense Technical Information Center (DTIC)

Serum protein profiling using mass spectrometry is a promising approach to identify novel circulating breast cancer markers. In this study, serum was fractionated to deplete highly abundant proteins. After protein digestion, we used liquid chromatography mass spectrometry (LC-MS) to develop diagnostic fingerprints using bioinformatic techniques. Samples were randomized prior to fractionation and mass spectrometry testing. Each fraction was digested with trypsin and subsequently analyzed by LC-MS. Peptides were targeted based on the disease to control peak intensity ratios measured in the averages of all mass spectra in each group and t-tests of the intensity of each individual peak. A series of preprocessing steps (spectral alignment, baseline subtraction, normalization) were employed to produce an expansive list of peptides for further investigation and sequencing. The antibody columns removed 12 of the most abundant proteins in serum. Using LC-MS and bioinformatic analysis we found 17-36 differentially expressed peaks in the Cancer vs. Healthy groups. Efforts are ongoing to identify targeted peptide ion signals using tandem matrix-assisted laser desorption/ionization mass spectrometry (MALDI-MS/MS). Serum fractionation using specific antibody columns followed by LC-MS and bioinformatic analysis is a feasible approach to peptide profiling in healthy women and breast cancer patients.

**The Demise of Russian Health Capital: The Continuity of Ineffective Government Policy**

Van Wagoner, Jarad L; Mar 2007; 111 pp.; In English

Report No.(s): AD-A467769; No Copyright; Avail.: Defense Technical Information Center (DTIC)

Health capital in Russia is in steep decline. Today the Russian population is decreasing by more than 700,000 per annum. Life expectancy has decreased significantly since it peaked in the mid-1960s. Infectious diseases, including an emerging HIV/AIDS epidemic, are threatening to worsen Russia's health crisis and further overwhelm a dilapidated health care system. Both Soviet and Russian government policies aimed at preserving health capital have consistently failed. Government policies and intervention have contributed to the crisis. The purpose of this research is to find a possible explanation for the continuity in ineffective government policy regarding health care. The analysis indicates that a paternalistic political culture permeates the political process. As a result, the government is free to pursue its own agenda without a significant degree of accountability to the population. Issues affecting health capital are not a priority of the Russian government, which has resulted in short-sighted and uncoordinated government policy and programs that are under-funded. Long-term improvements to Russia's health capital will require a shift in the Russian political culture. State-society relations must evolve to allow and encourage greater interaction between state officials and the general population. Without government accountability or individual responsibility, health capital in Russia will continue to decline.

Contract(s)/Grant(s): W81XWH-04-1-0250

Report No.(s): AD-A467775; No Copyright; Avail.: Defense Technical Information Center (DTIC)

Acoustic wave sensors have been widely used for detection of various chemical and biological species in liquid media. An improved binding of Protein A and IgG molecules on QCM biosensors by modifying the gold surface of the quartz crystal with a 35nm polystyrene film followed by an acidic treatment was accomplished. Also, the increase in the sensitivity of the QCM biosensor with CNT as the chemical interface was studied. Immobilization of the PSA at different concentrations on gold surface was achieved and corresponding sensor responses were registered. Using ELISA technique it was verified that PSA was bound to both the crystals and the 96 well plates. Following this, SH-SAW devices have been designed in a differential configuration to be used as biosensors with high selectivity. These SH-SAW devices were fabricated at the Microfabrication facility at University of Michigan, Ann Arbor. The frequency response of these SH-SAW devices and their performance when used in the oscillator configuration has also been recorded. A complete physical structure which can house the sensor along with the associated analog circuitry has been designed and developed. This structure provides electromagnetic shielding as well as reducing the effects of vibration and motion to the entire sensing system.

**Molecular Analysis of Neurotoxin-Induced Apoptosis**

D'Mello, Santosh R; Mar 2006; 67 pp.; In English; Original contains color illustrations

Contract(s)/Grant(s): DAMD17-99-1-9566

Report No.(s): AD-A467776; No Copyright; Avail.: Defense Technical Information Center (DTIC)

Apoptosis is a cell-suicide process that is required for the normal development of the nervous system, but that can be aberrantly activated in neurodegenerative diseases and following exposure to neurotoxins. The intracellular pathways by which these different physiological and pathophysiological stimuli cause neuronal death has not been characterized. In our original application we proposed the hypothesis that certain components of the signaling pathways activated by different apoptotic stimuli might be shared. Four of these molecules had been implicated in the regulation of neuronal survival. In a request for supplemental funding that was submitted in 2001, we had proposed to extend our investigation to another well studied apoptosis-regulatory molecule - the serine-threonine kinase, Akt. In 2002, we submitted a statement of modification of work as part of our annual report. In 2003, we submitted another request for supplemental funding. The funds were to be used to study a novel and exciting chemical compound called GW6074, which we found had neuroprotective properties. Finally, in 2004 we were provided with yet another supplement to study the mechanism of action of GW5074 and examine

whether this compound could prevent neurodegeneration and improve behavioral outcome in an animal model of Parkinson's disease.

Contract(s)/Grant(s): DAMD17-02-1-0632

Report No.(s): AD-A467787; No Copyright; Avail.: Defense Technical Information Center (DTIC)

We have isolated a holoenzyme complex termed BRCC containing BRCA1, BRCA2, and RAD51. BRCC not only displays increased association with p53 following DNA damage but also ubiquitinates p53 in vitro. BRCC36 and BRCC45 are novel components of the complex with sequence homology to a subunit of the signalosome and proteasome complexes. Reconstitution of a recombinant foursubunit complex containing BRCA1/BARD1/BRCC45/BRCC36 revealed an enhanced E3 ligase activity compared to that of BRCA1/BARD1 heterodimer. In vivo, depletion of BRCC36 and BRCC45 by the small interfering RNAs (siRNAs) resulted in increased sensitivity to ionizing radiation and defects in G2/M checkpoint. BRCC36 shows aberrant expression in sporadic breast tumors. These findings identify BRCC as a ubiquitin E3 ligase complex that enhances cellular survival following DNA damage.

**Modulation of Postmenopausal Steroid Hormone Levels by Phytoestrogens and Correlation with Breast Proliferative Activity and Menopausal Symptoms**

Gralow, Julie R; Jul 2004; 21 pp.; In English

Contract(s)/Grant(s): DAMD17-01-1-0449

Report No.(s): AD-A467791; No Copyright; Avail.: Defense Technical Information Center (DTIC)

Overall 5-year survival from breast cancer is now 85% and most surviving women are postmenopausal. Nearly half of postmenopausal American women take estrogen replacement to relieve hot flashes and other symptoms of menopause but this is contraindicated in women with breast cancer. Phytoestrogen supplements can be used as an alternative, but their effect on the risk of cancer recurrence is unknown. Given the mixed results of phytoestrogen studies regarding breast cell stimulation and inhibition in the medical literature the effect of phytoestrogen on postmenopausal breast cancer survivors is unclear. To evaluate the effect of a phytoestrogen supplement on steroid hormones and breast epithelial proliferation 23 disease-free post-therapy postmenopausal women with in-situ or early invasive (Stage 0-11) breast cancer were randomized to either 100mg/d isoflavone tablets or placebo for one year. Hormone levels were measured at baseline 5 months and one year. Changes in menopausal symptoms and vaginal maturation were also measured.

Weaver, Valerie M; Mar 2006; 41 pp.; In English; Original contains color illustrations

Contract(s)/Grant(s): W81XWH-05-1-0330

Report No.(s): AD-A467799; No Copyright; Avail.: Defense Technical Information Center (DTIC)

Apoptosis regulates the pathogenesis and treatment responsiveness of breast tumors yet the molecular mechanisms whereby breast cancer cells resist apoptosis remains unknown. We found that coincident with malignant transformation and in association with an increase in collagen deposition, cross-linking and reorganization, the mammary gland becomes incrementally stiffer and that the elastic modulus of the tissues to which breast tumor cells characteristically metastasize varies widely. We used natural collagen and basement membrane (BM) hydrogels as well as synthetic laminin and BM-cross linked polyacrylamide gels with precisely calibrated compliances, and could show that elevated matrix stiffness independently induce mammary cell proliferation, perturb cell-cell integrity, disrupt tissue polarity, and inhibit apoptosis-dependent lumen formation to disrupt mammary tissue morphogenesis. When we varied matrix force within the range we measured for the various metastatic and transformed tissues, we could modify the activity of several key stress response pathways previously linked to

apoptosis regulation% Matrix mediated stress pathway regulation profoundly influenced the apoptosis responsiveness of mammary tissue to a diverse array of exogenous death stimuli including chemotherapeutics such as taxol, immune receptor activators including trail and gamma irradiation Towards delineating a molecular mechanism we were able to demonstrate that matrix stiffness increases the expression and activation of integrins, drives the assembly of mature focal adhesions, and increases Rho GTPase-dependent intracellular contractility. Experiments are now in progress to further explore these findings using novel biomaterials and imaging modalities and organotypic culture manipulations.

**Functional Genomic Analysis of Breast Cancer Cell Tumorigenicity Using a Novel Gene Silencing Resource**

Conklin, Douglas S; Apr 2006; 16 pp.; In English; Original contains color illustrations

Contract(s)/Grant(s): W81XWH-04-1-0474

Report No.(s): AD-A467802; No Copyright; Avail.: Defense Technical Information Center (DTIC)

The year 1 aims were primarily concerned with collecting shRNA constructs so that a small number that have inhibitory effects on breast cancer progression in vivo models could be identified. We have collated a set of encoded hairpins targeting genes overexpressed in ErbB-2 positive breast tumors. We have also spent considerable effort testing the compatibility of several assays for cellular correlates of tumorigenicity with high throughput gene transfer. To date we have retrieved 65 shRNA constructs targeting 51 of the genes overexpressed ErbB2-positive breast cancer cells and tested them for effects on cell proliferation in a screen in BT474 cells. Year 2 of funding resulted in tests of the specificity of the shRNAs' negative impact on the growth of ErbB-2 positive breast cancer cells. Effects of these shRNAs on normal cells and other breast cancer cell lines identified approximately 20 shRNAs that specifically inhibit ErbB-2 positive breast cancer cells target genes. Several of these gene targets are known to be important to a variety of cancers. Two novel genes are interesting because they give new insight into a pathway that can be exploited as a potential therapeutic target.

**Radiation-Induced Immune Modulation in Prostate Cancer**

McBride, William H; Jan 2007; 43 pp.; In English

Contract(s)/Grant(s): W81XWH-04-1-0126

Report No.(s): AD-A467803; No Copyright; Avail.: Defense Technical Information Center (DTIC)

This effort is to determine if radiation affects presentation of prostate specific antigen (PSA) through endogenous and exogenous pathways by dendritic cells (DCs) and to devise novel strategies to translate radiation-induced cell death into the generation of tumor-specific immunity. The goal is to improve the therapeutic outcome from radiation therapy. Radiotherapy is normally thought of as being immune suppressive because it kills radiosensitive lymphocytes. Our hypothesis, in contrast, is that it also affects immune cell function and this has profound effects on the immune system and the development of anti-tumor immunity. We chose PSA as antigen for this study. However, because of the high risk nature of the experiments and the high PSA expression levels in prostate cancer patients that might interfere with its efficacy, we have also develop a back-up system using survivin as an antigen, since it also is overexpressed in prostate cancer. One aim of this proposal is to devise strategies to avoid radiation-induced immunosuppression and to translate radiation tumor cytotoxicity into beneficial tumor immunity with combination treatments of IL-3 and/or GM-CSF. Our studies on combined treatments of radiotherapy and IL-3, and on the effects of radiation on PSA presentation by DCs are presented, along with other milestones that have been attained.

The overall objective of the proposed research is to develop positron emitter labeled bombesin (BBN) analogs with high

affinity for the GRP receptor GRPR for microPET imaging of both androgen dependent and androgen independent prostate cancer xenografted mice. Specific Aims: (1) Design synthesize and characterize positron emitting bombesin analogs labeled with copper-64 or fluorine-18; (2) Conduct in vitro studies of copper-64 and fluorine-18 labeled bombesin analogs to evaluate the effect of modification and radiolabeling on the receptor binding affinity and specificity; (3) Evaluate in vivo efficacy of these novel radiopharmaceuticals in the murine PC-3 and CWR22 human prostate cancer xenograft models. Major Findings: In year 1 we coupled Lys3-BBN with DOTA and labeled the DOTA-Lys3-BBN conjugate with <sup>64</sup>Cu for imaging both subcutaneous PC-3 (GRPR+) and CWR22 (GRPR-) tumors. In year 2 we further tested a series of BBN analogs and fully characterized <sup>64</sup>Cu-DOTA-Aca-BBN(7-14). Studies on metabolic stability for both tracers on organ homogenates showed that <sup>64</sup>Cu-DOTA-[Lys3]BBN is relatively stable. This study demonstrated that both tracers are suitable for targeted PET imaging to detect the expression of GRPR in prostate cancer while <sup>64</sup>Cu-DOTA-[Lys3]BBN may have a better potential for clinical translation.

**Proof of Concept for Systematic Collection of Optimal Molecular Quality Anatomically Oriented Normal Prostate from Diverse Age and Race Transplant Donors**

Bova, G S; Dec 2006; 8 pp.; In English

Contract(s)/Grant(s): W81XWH-05-1-0084

Report No.(s): AD-A467813; No Copyright; Avail.: Defense Technical Information Center (DTIC)

The bulk of valuable molecular research published in prostate cancer to date is based on radical prostatectomy specimens from men with prostate cancer, or on metastatic prostate cancer tissues collected at surgery or autopsy. The majority of normal control tissues for such studies come from the same radical prostatectomy specimens, and less commonly from TURP (transurethral resection of the prostate) samples from men with benign prostatic hyperplasia, cystoprostatectomy specimens in men with bladder cancer, or rarely from autopsy samples collected no sooner than 12-24 hours after death, although documentation is usually absent or scant<sup>2-5</sup>. Using noncancerous areas of radical prostatectomy specimens or samples from men with other GU diseases as normal control tissue has critical drawbacks. Prostate cancer is often multifocal when it arises<sup>6-11</sup>, and there is strong evidence that precancerous changes occur gradually over a period of years in men predisposed to the disease<sup>5,12-14</sup>. Based on these observations, the noncancerous areas of prostates of men with prostate cancer are probably in a state more prone to the development of cancer than men of the same age and race without prostate cancer. Therefore, having a population-based sample of prostates from men of various ages and races is essential for us to understand whether this critical difference exists.

Report No.(s): AD-A467814; No Copyright; Avail.: Defense Technical Information Center (DTIC)

Nipple aspiration ductal lavage and ductography are methods of obtaining breast fluids from women who are neither pregnant or lactating. Breast cells in these fluids can be classified as either normal or as showing various abnormalities including hyperplasia atypical hyperplasia and cancer. In previous follow-up studies of women who participated in breast fluid and tissue studies it was shown that women with proliferative cytology (hyperplasia or atypical hyperplasia) were significantly more likely to develop breast cancer than women with normal cytologic findings in breast fluids or than women from whom fluid could not be obtained. (Fabian et al. 2000; Wrensch et al. 2001) This study followed an additional cohort of women from Santa Barbara CA that had fluids drawn between 1970-1990. Statistical methods of association were used to determine if women with abnormal cytologic findings developed breast cancer at a higher rate than women with normal cytologic findings or women from whom fluid could not be obtained. Overall 10% (93) of the 946 women developed breast cancer during the follow-up period.

Report No.(s): AD-A467821; No Copyright; Avail.: Defense Technical Information Center (DTIC)

We offer a novel methodology for rapidly identifying superior-performance DNA probes/primers for use in detecting emerging or engineered pathogens. Our approach will deliver DNA probes and PCR primers that have an unprecedentedly low probability of false positives or confusion by environmental background, and which resist evasion by threat agent engineering. Any detection method that utilizes DNA or RNA probes or primers will benefit greatly by using probes/primers designed with our methodologies. This technology is made possible by novel insights into statistical properties of useful probes, primer pairs, and targets. Such findings have become possible because of dramatic advances in the computational analysis of genomic sequence data. Using our novel approach, background sequences are rigorously (not heuristically, e.g., BLAST) discriminated against. Thus, probes and primers developed using these tools can be known to be at least three mismatches away from the nearest other sequence in an entire set of DNA sequences employed in the calculations. The Phase I studies will demonstrate the advantages of our design technology. In this phase we will (1) perform extensive analysis of several Category A and B pathogens and produce(deliver) the database of all human and/or 'background' 1, 2, 3, and 4 mismatches blind 16-22-mers present in their genomes; (2) transform in house scientific software into a Windows-based application that allows users to perform similar calculations for any custom sequence for 16-19-mers with up to 3 mismatches blind; and (3) perform intensive experimental validation in order to verify candidate sequences and experimentally estimate false discovery rate.

Report No.(s): AD-A467822; USAMRIID-TR-06-110; No Copyright; Avail.: Defense Technical Information Center (DTIC)

Pneumonic plague is a severe, rapidly progressing disease for which there is no effective vaccine. As the efficacy of new vaccines cannot be tested in humans, it is essential to develop in vitro surrogate assays that are valid predictors of immunity. The F1 capsule antigen stimulates a protective immune response to most strains of *Y. pestis*. However, strains of *Y. pestis* that are F1(-) but still virulent have been isolated, and an in vitro assay, the results which can predict protection against both F1(+) and F1(-) strains, is needed. The virulence antigen (V) is an essential virulence factor of *Y. pestis* and stimulates protective antibodies. We investigated potential correlates of plague immunity that are based on anti-V Ab-mediated neutralization of *Yersinia*-induced macrophage cytotoxicity. The neutralizing activity of sera from mice vaccinated with an F1-V fusion candidate vaccine was determined. The decrease in the level of the apoptosis-specific enzyme caspase-3 significantly predicted survival in one- and two-dose vaccination experiments. Sera from F1-V vaccinated nonhuman primates were evaluated with MPhis assays based on caspase-3 and on other markers manifested at the different stages in cell death. Using murine- and human-derived MPhis in microscopic and fluorescence activated cell sorting-based live/dead staining assays of terminal necrosis, we demonstrated a strong association between in vitro neutralization of macrophage cytotoxicity induced by sera-treated *Yersinia* and in vivo protection against lethal infection. These results provide a strong base for the development of reliable in vitro correlate bioassays which are predictive of protective immunity to plague.

**Novel Molecular Interactions and Biological Functions of the Neurofibromatosis 2 Tumor Suppressor Protein, Merlin**

Carpen, Olli; Aug 2006; 59 pp.; In English; Original contains color illustrations

Contract(s)/Grant(s): W81XWH-05-1-0469

Report No.(s): AD-A467823; No Copyright; Avail.: Defense Technical Information Center (DTIC)

The project studies molecular functions of neurofibromatosis 2 tumor suppressor protein merlin and compares the role of phosphorylation in regulation of merlin and structurally related ezrin. The role of different importin subunits in nuclear targeting of merlin was tested. Merlin bound several importin subunits in a non-selective manner. Merlin was shown to bind tubulin via two different regions one located in the FERM-domain and one at the C-terminus. Intramolecular association and phosphorylation of S518 residue regulated tubulin binding. Merlin promoted microtubule polymerization in vitro and in vivo.

Loss of merlin caused marked changes in microtubule organization and dynamics. Studies on merlin and HEI10 a cell cycle regulator clarified the interaction mechanism and showed a role for merlin in regulation of the integrity of HEI10. Phosphorylation studies identified a second protein kinase A binding site in merlin. Finally studies assessing the role of Src-induced tyrosine phosphorylation of ezrin were initiated.

Report No.(s): AD-A467837; No Copyright; Avail.: Defense Technical Information Center (DTIC)

After OVA sensitization and aerosol challenge, SR-AI/II and MARCO-deficient mice exhibited greater eosinophilic airway inflammation and airway hyper responsiveness compared to wild-type mice. A role for simple SRA-mediated antigen clearance (scavenging) by lung macrophages was excluded by observation of comparable uptake of fluorescent OVA by wild-type and SRA-deficient lung M(phi)s and DCs. In contrast, airway instillation of fluorescent antigen revealed significantly higher traffic of labelled DCs to thoracic lymph nodes in SRA-deficient mice than in controls. The increased migration of SRA-deficient DCs was accompanied by enhanced proliferation in thoracic lymph nodes of adoptively transferred OVA-specific T cells after airway OVA challenge. The data identify a novel role for SRAs expressed on lung DCs in down-regulation of specific immune responses to aero-allergens by reduction of DC migration from the site of antigen uptake to the draining lymph nodes.

Sellers, William R; Feb 2006; 22 pp.; In English

Contract(s)/Grant(s): W81XWH-04-1-0169

Report No.(s): AD-A467846; No Copyright; Avail.: Defense Technical Information Center (DTIC)

The PTEN tumor suppressor gene is localized to the 10q23 interval and biallelic inactivation of PTEN has been demonstrated in prostate cancer cell lines, and in human primary and metastatic prostate cancers. In mice, inactivation of PTEN leads to prostate hyperplasia, PIN, and microinvasive cancers. Thus, PTEN is a bona fide tumor suppressor with special relevance to prostate cancer. We previously demonstrate that loss of PTEN protein was strongly associated with high-grade Gleason tumors and Suzuki et. al. showed that 56% of metastatic prostate cancer samples were PTEN null. Thus, loss of PTEN appears to correlate with clinical parameters known to be associated with poor outcome. These data suggest that small molecule inhibitors that act to reverse the transformed phenotype induced by loss of PTEN may find significant efficacy in lethal forms of prostate cancer. Loss of PTEN function leads to activation of the PI3K pathway, phosphorylation and activation of Akt and the subsequent aberrant phosphorylation and hence constitutive localization of the FOXO transcription factors to the cytoplasm of PTEN null cells. Based on these findings, we developed a novel, high-throughput cell-based screen using FKHR localization in PTEN null cells as a read-out. This screen has been conducted and numerous new lead compounds were identified. This grant focused on the evaluation of these lead molecules, their activity in in vitro and in vivo models, as well as their possible cooperation with other therapeutics targeting the same pathway.

**Characterization of the Role of Breast Tumor Kinase (BRK) in Breast Cancer Cells Non-responsive to EGFR-targeted Agents**

Nimnual, Anjaruwee; Jul 2006; 11 pp.; In English

Contract(s)/Grant(s): W81XWH-05-1-0448

Report No.(s): AD-A467849; No Copyright; Avail.: Defense Technical Information Center (DTIC)

Epidermal growth factor (EGF) receptor tyrosine kinases (erbB family) EGFR (erbB1) and HER2 are highly expressed in breast cancer and are associated with poor prognosis. A number of EGFR and/or HER2-targeted agents are being investigated for breast cancer treatment. Brk (Breast Tumor Kinase) is a nonreceptor tyrosine kinase that has been shown to enhance the mitogenic signaling of EGF induce phosphorylation of erbB 3 and interact with AKT. In this study we aim to investigate whether Brk can promote cells to become refractory to EGFR-targeted drugs. PI-3 kinase/AKT pathway mediates EGF-induced cell growth and survival and is involved in cellular resistance to anti-cancer drugs/AKT pathway is regulated by multiple activators downregulation of the EGFR alone may not lead to its inhibition. We will investigate whether Brk promotes growth and survival as well as PI3K/AKT activity in cells treated with EGFR-targeted agents.

**Gene Expression Analysis of Circulating Hormone Refractory Prostate Cancer Micrometastases**

Rosenberg, Jonathan; Jan 2007; 13 pp.; In English; Original contains color illustrations

Contract(s)/Grant(s): W81XWH-05-1-0175

Report No.(s): AD-A467851; No Copyright; Avail.: Defense Technical Information Center (DTIC)

This annual report for the Physician Research Training Award focuses on progress in the genetic analysis of circulating hormone refractory prostate cancer micrometastases. As metastatic tissue is often inaccessible in advanced prostate cancer patients, analysis of circulating tumor cells may provide understanding of the biology of hormone refractory prostate cancer as well as chemotherapy resistance. Oligonucleotide array comparative genomic hybridization allows the assessment of genetic changes that may occur in the process of metastasis and chemotherapy resistance. Genomic profiling using this technology will go beyond cell counting, and circumvent technical complexities related to working with RNA. Work performed over the last year has perfected techniques to deal with small amounts of DNA isolated using the Vitatex cell isolation system. Preliminary data suggests that reproducible genomic alterations are observed in the circulating tumor cells isolated from patients with metastatic hormone refractory prostate cancer. During year 3, having ironed out the methodology of pursuing this work, we will ramp up collection of peripheral blood on patients with chemotherapy-na(ve and

chemotherapy-refractory hormone refractory prostate cancer to isolate circulating tumor cells and perform genetic analyses.

**Postexposure Protection of Guinea Pigs against a Lethal Ebola Virus Challenge is Conferred by RNA Interference**

Geisbert, Thomas W; Hensley, Lisa E; Kagan, Elliott; Yu, Erik Z; Geisbert, Joan B; Daddario-DiCaprio, Kathleen; Fritz, Elizabeth A; Jahrling, Peter B; McClintock, Kevin; Phelps, Janet R; Jun 15, 2006; 11 pp.; In English; Original contains color illustrations

Report No.(s): AD-A467854; USAMRIID-RPP-05-449; No Copyright; Avail.: Defense Technical Information Center (DTIC)

Background. Ebola virus (EBOV) infection causes a frequently fatal hemorrhagic fever (HF) that is refractory to treatment with currently available antiviral therapeutics. RNA interference represents a powerful, naturally occurring biological strategy for the inhibition of gene expression and has demonstrated utility in the inhibition of viral replication. Here, we describe the development of a potential therapy for EBOV infection that is based on small interfering RNAs (siRNAs). Methods. Four siRNAs targeting the polymerase (L) gene of the Zaire species of EBOV (ZEBOV) were either complexed with polyethylenimine (PEI) or formulated in stable nucleic acid-lipid particles (SNALPs). Guinea pigs were treated with these siRNAs either before or after lethal ZEBOV challenge. Results. Treatment of guinea pigs with a pool of the L gene-specific siRNAs delivered by PEI polyplexes reduced plasma viremia levels and partially protected the animals from death when administered shortly before the ZEBOV challenge. Evaluation of the same pool of siRNAs delivered using SNALPs proved that this system was more efficacious, as it completely protected guinea pigs against viremia and death when administered shortly after the ZEBOV challenge. Additional experiments showed that 1 of the 4 siRNAs alone could completely protect guinea pigs from a lethal ZEBOV challenge. Conclusions. Further development of this technology has the potential to yield effective treatments for EBOV HF as well as for diseases caused by other agents that are considered to be biological threats.

**Mechanisms of Alpha-synuclein Aggregation and Toxicity**

Wolozin, Benjamin; Sep 2004; 126 pp.; In English; Original contains color illustrations

Contract(s)/Grant(s): DAMD17-01-1-0781

Report No.(s): AD-A467856; No Copyright; Avail.: Defense Technical Information Center (DTIC)

Alpha-synuclein is a protein implicated in the pathophysiology of Parkinson's disease. The purpose of this proposal is to study the regulation of synuclein aggregation by metals, the interaction of synuclein with other proteins associated with its pathophysiology and the effects of aggregated alpha-synuclein on the function of neuronal mitochondria. During the current year, we have identified several novel interactions of Alpha-synuclein, including binding to the proteasome and selective inhibition of Mitochondrial complex 1. We have also identified a number of novel pathological changes associated with alpha-synuclein aggregation, including phosphorylation of tau protein and up-regulation of DJ-1 protein. Finally, our studies identify novel chemical and molecular strategies for inhibiting toxicity induced by aggregated alpha-synuclein.

**An All-Atom Model of the Pore-Like Structure of Hexameric VP40 from Ebola: Structural Insights into the Monomer-Hexamer Transition**

Nguyen, Tam L; Schoehn, Guy; Weissenhorn, Winfried; Hermone, Ann R; Burnett, James C; Panchal, Rekha G; McGrath, Connor; Zaharevitz, Dan W; Aman, M J; Gussio, Rick; Bavari, Sina; Apr 30, 2005; 12 pp.; In English; Original contains color illustrations

Contract(s)/Grant(s): 02-4-3U-057; Y3-CM-1005-05

Report No.(s): AD-A467875; No Copyright; Avail.: Defense Technical Information Center (DTIC)

The matrix protein VP40 is an indispensable component of viral assembly and budding by the Ebola virus. VP40 is a monomer in solution, but can fold into hexameric and octameric states, two oligomeric conformations that play central roles

in the Ebola viral life cycle. While the X-ray structures of monomeric and octameric VP40 have been determined, the structure of hexameric VP40 has only been solved by three-dimensional electron microscopy (EM) to a resolution of approximately 30Å. In this paper, we present the refinement of the EM reconstruction of truncated hexameric VP40 to approximately 20Å and the construction of an all-atom model (residues 44-212) using the EM model at approximately 20Å and the X-ray structure of monomeric VP40 as templates. The hexamer model suggests that the monomer-hexamer transition involves a conformational change in the N-terminal domain that is not evident during octamerization and therefore, may provide the basis for elucidating the biological function of VP40.

**Detection of Staphylococcus Aureus Enterotoxin A and B Genes with PCR-EIA and a Hand-Held Electrochemical Sensor**

Aitichou, Mohamed; Henkins, Robert; Sultana, Afroz M; Ulrich, Robert G; Ibrahim, M S; Jun 11, 2004; 6 pp.; In English Report No.(s): AD-A467877; RPP-03-147; No Copyright; Avail.: Defense Technical Information Center (DTIC)

Two electrochemical assays for detecting Staphylococcus aureus enterotoxin A and B genes were developed. The assays are based on PCR amplification with biotinylated primers, hybridization to a fluorescein-labeled probe, and detection with horseradish peroxidase (HRP)-conjugated anti-fluorescein antibody using a hand-held electrochemical detector. The limit of detection (LOD) for both assays was approximately 16 copies of the sea and seb genes. The assays were evaluated in blinded studies, each with 81 samples that included genomic and cloned S. aureus DNA, and genomic DNA from Alcaligenes, Bacillus, Bacteroides, Bordetella, Burkholderia, Clostridium, Comamonas, Enterobacter, Enterococcus, Escherichia, Francisella, Haemophilus, Klebsiella, Listeria, Moraxella, Neisseria, Proteus, Pseudomonas, Salmonella, Serratia, Shigella, Streptococcus, Vibrio and Yersinia species. Both assays showed 100% sensitivity. The specificity was 96% for the SEA assay and 98% for the SEB assay. These results demonstrate the feasibility of performing probe-based detection of PCR products with a low-cost, hand-held, electrochemical detection device as a viable alternative to colorimetric enzyme-linked assays of PCR products.

**Cross-Protection against Marburg Virus Strains by Using a Live, Attenuated Recombinant Vaccine**

Daddario-DiCaprio, Kathleen M; Geisbert, Thomas W; Geisbert, Joan B; Stroehner, Ute; Hensley, Lisa E; Grolla, Allen; Fritz, Elizabeth A; Feldmann, Friederike; Feldmann, Heinz; Jones, Steven M; Oct 2006; 11 pp.; In English Contract(s)/Grant(s): Proj-04-4-7J-012

Report No.(s): AD-A467883; No Copyright; Avail.: Defense Technical Information Center (DTIC)

Marburg virus (MARV) has been associated with sporadic episodes of hemorrhagic fever, including a recent highly publicized outbreak in Angola that produced severe disease and significant mortality in infected patients. MARV is also considered to have potential as a biological weapon. Recently, we reported the development of a promising attenuated, replication-competent vaccine against MARV based on recombinant vesicular stomatitis virus (VSV) expressing the glycoprotein of the Musoke strain of MARV (VSVDeltaG/MARVGP-Musoke). We used this vaccine to demonstrate complete protection of cynomolgus monkeys against a homologous MARV challenge. While these results are highly encouraging, an effective vaccine would need to confer protection against all relevant strains of MARV. Here, we evaluated the protective efficacy of the VSVDeltaG/MARVGP-Musoke vaccine against two heterologous MARV strains, the seemingly more pathogenic Angola strain and the more distantly related Ravn strain. In this study, seven cynomolgus monkeys were vaccinated with the VSVDeltaG/MARVGP-Musoke vector. Three of these animals were challenged with the Angola strain, three with the Ravn strain, and a single animal with the Musoke strain of MARV. Two animals served as controls and were each injected with a nonspecific VSV vector; these controls were challenged with the Angola and Ravn strains, respectively. Both controls succumbed to challenge by day 8. However, none of the specifically vaccinated animals showed any evidence of illness either from the vaccination or from the MARV challenges and all of these animals survived. These data suggest that the VSVDeltaG/MARVGP-Musoke vaccine should be sufficient to protect against all known MARV strains.

**Transcriptome Analysis of Human Immune Responses Following Live Vaccine Strain (LVS) Francisella Tularensis Vaccination**

Fuller, Claudette L; Brittingham, Katherine C; Porter, Mark W; Hepburn, Matthew J; Pettitt, Patricia L; Pittman, Phillip R; Bavari, Sina; Mar 8, 2007; 13 pp.; In English; Original contains color illustrations

Report No.(s): AD-A467884; USAMRIID-TR-06-082; No Copyright; Avail.: Defense Technical Information Center (DTIC)

The live vaccine strain (LVS) of *Francisella tularensis* is the only vaccine against tularemia available for humans, yet its mechanism of protection remains unclear. We probed human immunological responses to LVS vaccination with transcriptome analysis using PBMC samples from volunteers at time points pre- and post-vaccination. Gene modulation was highly uniform across all time points, implying commonality of vaccine responses. Principal components analysis revealed three highly distinct principal groupings: pre-vaccination (-144h), early (+18 and +48h), and late post-vaccination (+192 and +336h). The most significant changes in gene expression occurred at early post-vaccination time points ( $\leq$ 48h), specifically in the induction of pro-inflammatory and innate immunity-related genes. Evidence supporting modulation of innate effector function, specifically antigen processing and presentation by dendritic cells, was especially apparent. Our data indicate that the LVS strain of *F. tularensis* invokes a strong early response upon vaccination. This pattern of gene regulation may provide insightful information regarding both vaccine efficacy and immunopathogenesis that may provide insight into infection with virulent strains of *F. tularensis*. Additionally, we obtained valuable information that should prove useful in evaluation of vaccine lots as well as efficacy testing of new anti-*F. tularensis* vaccines.

**Endothelial Progenitors as Vectors for Systemic Gene Therapy of Breast Cancer**

Blackwell, Jerry L; Aug 2004; 70 pp.; In English; Original contains color illustrations

Contract(s)/Grant(s): DAMD17-00-1-0116

Report No.(s): AD-A467888; No Copyright; Avail.: Defense Technical Information Center (DTIC)

14. ABSTRACT Gene therapy offers a potentially important treatment for breast cancer, however a noted problem with current vector systems is the lack of efficient and targeted systemic delivery to the primary tumor and disseminated metastases. To address this issue we proposed the use of endothelial progenitor cells (EPCs), which have the propensity of homing to sites of neovascularization characteristic of growing tumors. The success of this approach requires efficient isolation of EPCs and subsequent loading of the EPCs with therapeutic modalities. We hypothesized that EPCs can, after intravascular injection, localize into sites of tumor neovascularization and deliver therapeutic payloads. In this regard, the key findings of this research project are that (1) EPCs can be isolated and enriched from fresh human blood, (2) blood-isolated EPCs can be efficiently loaded with therapeutic adenovirus (Ad) vectors, (4) the oncolytic Ad vectors are able to amplify their therapeutic payloads within the EPCs, (5) loading EPCs with Ad vectors does not inhibit their intrinsic homing activity, and (6) loaded EPCs deliver the oncolytic Ad vectors that exert an effective anti-tumor activity. Overall, the findings of this project support the application of therapeutic EPCs as cellular vehicles for gene therapy of both local and disseminated breast cancer.

**A Randomized Trial of Musculoskeletal Pain Treatment in a Military Population**

Gatchel, Robert; Peterson, Alan; Hunter, Christine; Hunter, Christopher; Goodie, Jeffrey; Oordt, Mark; Feb 2007; 24 pp.; In English; Original contains color illustrations

Contract(s)/Grant(s): DAMD17-03-1-0055

Report No.(s): AD-A467893; No Copyright; Avail.: Defense Technical Information Center (DTIC)

Musculoskeletal system conditions are the leading cause of hospitalization and disability for the U.S. Armed Forces. The department of Defense pays over \$1.5 billion per year to disabled service members, and musculoskeletal conditions account for 40-50% of this amount. This study investigates the effectiveness of an interdisciplinary functional restoration approach to the treatment of Active Duty military from all 4 branches suffering from chronic musculoskeletal pain (CMP). The primary aims of this Functional and Occupational Rehabilitation Treatment (FORT) program include restoring physical function, retaining soldiers on active duty, and increasing the participants abilities to effectively manage their pain. These outcomes, as

well as socioeconomic variables, are evaluated immediately following treatment, and at 6, 12 and 18 months follow-up.

Report No.(s): AD-A467895; No Copyright; Avail.: Defense Technical Information Center (DTIC)

The three major research targets of this study are (a) OR informatics (b) simulation research, and (c) smart image. The purpose of the OR informatics program is to develop, test, and deploy technologies to collect real-time data about key tasks and process elements in clinical operating rooms. The objective of Simulation research is to create a system where a user can interact with a virtual human model in cognitive simulation and have the virtual human respond appropriately to user queries and interventions in clinical situations, with a focus on cognitive decision making and judgment. The objective of smart image is to use real-time 3D ultrasonography and 40- slice high-frame-rate computed tomography (CT) for intraoperative imaging to volume rendered anatomy from the perspective of the endoscope. The overall project reported here was modified to add and additional task related to the DARPA-sponsored, TraumaPod project. The period of this contract was extended to February 28, 2008. This extension was due to the delay in obtaining IRB approval and other administrative matters. Based on the extended period of performance, this project is on time, on schedule, and within performance parameters.

**Prenatal Exposure to Nicotine and Childhood Asthma: Role of Nicotine Acetylcholine Receptors, Neuropeptides and Fibronectin Expression in Lung**

Roman, Jesse; Dec 2006; 8 pp.; In English; Original contains color illustrations

Contract(s)/Grant(s): W81XWH-05-1-0114

Report No.(s): AD-A467902; No Copyright; Avail.: Defense Technical Information Center (DTIC)

Asthma is a chronic lung disease characterized by airway dysfunction. Of the many factors implicated in the pathogenesis of asthma, a strong association exists between prenatal and postnatal exposure to environmental tobacco smoke (ETS). This is particularly true in infancy and in childhood where ETS exposure is associated with a higher incidence or prevalence of asthma, and with measures of decreased flow in the airways, bronchial hyperresponsiveness, and increased respiratory infections. It has been speculated that the relationship between ETS and asthma is secondary to reduced airway flow caused by tobacco-induced prenatal alterations in airway architecture and/or bronchial reactivity. However, the exact mechanisms by which prenatal ETS promotes airway dysfunction in children remain unelucidated. The authors hypothesize that prenatal exposure to nicotine, a major component of tobacco that transverses the placenta, is largely responsible for the development of asthma in children born of mothers who smoke. Specifically, they hypothesize that nicotine is recognized by specific cellular proteins called nicotinic acetylcholine receptors (nAChRs) that are expressed by lung cells termed fibroblasts and pulmonary neuroendocrine cells (PNEC). In fibroblasts, this interaction triggers the exaggerated expression of a connective tissue protein called fibronectin. In PNECs, nicotine stimulates cell growth and the excessive secretion of neuropeptides that affect airway formation and lung growth, and that stimulate smooth muscle cells to contract. In this fashion, nicotine can affect airway development and promote disease during childhood. This proposal will test the hypothesis in animal models of lung development and hyperreactive airways.

Contract(s)/Grant(s): W81XWH-04-1-0169

Report No.(s): AD-A467904; No Copyright; Avail.: Defense Technical Information Center (DTIC)

The PTEN/MMAC/TEP-1 tumor suppressor gene (hereafter referred to as PTEN) is a target of somatic mutation in

prostate cancer as well as in endometrial cancer, glioblastoma and melanoma (reviewed in (Sansal and Sellers, 2004)) Biallelic loss of PTEN has been demonstrated in both primary and metastatic prostate tumors (reviewed in (Sansal and Sellers, 2004)). In metastatic disease, PTEN loss approaches 50%-60% (Suzuki et al., 1998). Together, these data suggest that loss of PTEN is an important step for those prostate tumors associated with a lethal outcome. Moreover, the loss of PTEN has been intimately linked to deregulation of the PI3K pathway connecting growth and survival signals both to the regulation of the mTOR kinase as well as to the regulation of the FOXO transcription factors. A significant effort is now being expended in the pharmaceutical industry in trying to develop regulators of the PI3K pathway (or more specifically inhibitors) that can reverse the molecular consequences of PTEN loss.

**Program Project on the Pathogenesis and Treatment of Parkinson's Disease**

Przedborski, Serge; Dec 2006; 211 pp.; In English

Contract(s)/Grant(s): DAMD17-03-1-0002

Report No.(s): AD-A467905; No Copyright; Avail.: Defense Technical Information Center (DTIC)

This proposal represents the authors' continuing efforts to investigate the molecular mechanisms of Parkinson's disease (PD), a progressive neurodegenerative disorder that affects about 1 million people in the USA alone. Recent evidence suggests that inflammation plays a major role in the progressive nature of this disease. Thus, they are investigating the contributions of several pro-inflammatory enzymes that they found up-regulated in microglia following the use of 1-methyl-4-phenyl-1,2,3,6-tetrahydropyridine (MPTP), the neurotoxin that is the cornerstone of PD research. They found that the number of substantia nigra pars compacta (SNpc) dopaminergic neurons (DA) in MPTP-treated IL-1 beta and IL-1R1 knockout mice did not differ from their nonknockout litter mates. This suggests that IL-1 beta and IL-1R1 may not be involved in the inflammatory response related to the necrotic form of neuronal death characteristic of the acute MPTP dosing schedule. However, they did note that cyclooxygenase-2 (COX-2) and cPLA2 are both up-regulated in SNpc DA neurons following acute MPTP. Because the acute MPTP dosing schedule is quite harsh, Core B characterized a subacute MPTP model of PD and found that this model exhibits at least 3 forms of neuronal death in the SNpc that are time-dependent: necrosis, apoptosis, and autophagy. This subacute model is closer to human PD in that it does not present an immediate end-stage situation characteristic of many neurotoxin-based PD models. The authors also have found in this subacute model that the number of SNpc DA neurons in MPTP-treated IL-1 beta and IL-1R1 knockout mice did not differ from their nonknockout litter mates during the inflammatory process, which is somewhat confusing. Thus, they are now using their neuronal/glial cultures and their neuronal- and glial-conditioned media to sort out the mechanisms involved in the initiation of the inflammatory response related to SNpc DA neuronal death.

**Unique Approaches to Androgen Effects on Prostate Cancer**

Rosner, W; Kahn, S M; Feb 2007; 41 pp.; In English; Original contains color illustrations

Contract(s)/Grant(s): W81XWH-04-1-0228

Report No.(s): AD-A467907; No Copyright; Avail.: Defense Technical Information Center (DTIC)

Sex hormone-binding globulin (SHBG) is a plasma protein that binds androgens and it acts as a transducer of androgen signaling at the plasma membrane of prostate cancer cells. The human prostate cancer cell line LNCaP in addition to having a receptor for SHBG (RSHBG) produces its own SHBG. We devised an inducible system to study SHBG protein expression in LNCaP cells and expressed tagged versions of SHBG in LNCaP cells that will also be useful for future studies on its biologic function. We present a complex and novel picture of extrahepatic human SHBG gene expression including 21 different SHBG gene transcripts generated by alternative splicing 17 of which are newly described and the use of three independent SHBG gene promoters including a novel promoter PN. We used microarray technology to investigate the effect of SHBG on the DHT response of LNCaP cells and found evidence for RSHBG signaling and SHBG modulation of AR activity. Further extended studies of the role of SHBG in prostate signaling and the modulation of SHBG expression in prostate cancer are warranted.

**Proteomic Analysis of Bronchoalveolar Lavage Fluid: Effect of Acute Exposure to Diesel Exhaust Particles in Rats**

Lewis, John A; Rao, K M; Castranova, Vince; Vallyathan, Val; Dennis, William E; Knechtges, Paul L; Feb 5, 2007; 39 pp.; In English

Contract(s)/Grant(s): IAG0307NIOH00; Proj-FH2

Report No.(s): AD-A467914; No Copyright; Avail.: Defense Technical Information Center (DTIC)

Inhalation of diesel exhaust particles (DEP) is characterized by lung injury and inflammation with significant increases in the numbers of polymorphonuclear leukocytes and alveolar macrophages. This influx of cellular infiltrates is associated with the activation of multiple genes, including cytokines and chemokines, and the production of reactive oxygen species. The pathogenesis of the lung injury is not fully understood, but alterations in the presence or abundance of a number of proteins in the lung have been observed. The present study investigates global alterations in the proteome of bronchoalveolar lavage fluid taken from rats 1, 7 or 30 days after exposure to 5, 35, or 50 mg/kg of animal weight of DEP. Analysis by surface-enhanced laser desorption/ionization-time of flight mass spectrometry (SELDI-TOF) identified two distinct peaks that appeared as an acute response post-exposure at all doses in all animals. These two peaks, with mass to charge ratios (m/z) of 9,000 and 10,100 were identified as anaphylatoxin C3a and calgranulin A by additional mass spectral investigation using liquid chromatography coupled to mass spectrometry (LC/MS).

**Determination of Antibiotic Efficacy Against Bacillus Anthracis in a Mouse Aerosol Challenge Model**

Heine, Henry S; Bassett, Jennifer; Miller, Lynda; Hartings, Justin M; Ivins, Bruce E; Pitt, M L; Fritz, David; Norris, Sarah L; Byrne, W R; Apr 2007; 9 pp.; In English; Original contains color illustrations

Report No.(s): AD-A467918; TR-06-100; No Copyright; Avail.: Defense Technical Information Center (DTIC)

An anthrax-spore aerosol infection mouse model was developed as a first test of in vivo efficacy of antibiotics identified as active against Bacillus anthracis. Whole-body, LD50 aerosol challenge doses in a range of  $1.9 \times 10^3$  to  $3.4 \times 10^4$  with spores of the fully virulent Ames strain were established for three inbred and one outbred mouse strain (A/J, BALB/c, C57BL and Swiss Webster). The BALB/c strain was further developed as a model for antibiotic efficacy. Time-course microbiological examination of tissue burdens in mice after challenge showed that spores could remain dormant in the lungs while vegetative cells disseminated to the mediastinal lymph nodes and then to the spleen accompanied with bacteremia. For antibiotic efficacy studies, BALB/c mice were challenged with 50-100 LD50 of spores followed by intraperitoneal (i.p.) injection of either ciprofloxacin 30 mg/kg (q12h), or doxycycline 40 mg/kg (q6h). A control group was treated with PBS q6h. Treatment was begun 24 h after challenge in groups of 10 mice for 14 or 21 days. The PBS-treated control mice all succumbed (10/10) to inhalation anthrax infection within 72 h. Sixty-day survival rates for ciprofloxacin and doxycycline-treated groups were 8/10, 9/10 for 14-day treatment and 10/10, 7/10 for 21-day treatment. Delayed treatment with ciprofloxacin initiated 36- and 48-h postexposure resulted in 80% survival and was statistically no different than early postexposure (24 h) treatment. This mouse model correlates closely with clinical observations of inhalational anthrax in humans and with earlier antibiotic studies in the non-human primate inhalational-anthrax model.

**DNA Damage and Genomic Instability Induced by Inappropriate DNA Re-replication**

Green, Brian M; Li, Joachim J; Apr 2007; 80 pp.; In English; Original contains color illustrations

Contract(s)/Grant(s): W81XWH-04-1-0409

Report No.(s): AD-A467931; No Copyright; Avail.: Defense Technical Information Center (DTIC)

Chromosomal rearrangements and changes in copy number at various genomic loci are hallmarks of cancer cells and may be very early steps in tumorigenesis. The origins of genomic insults are poorly understood and this proposal aims to characterize one potential source of genomic instability inappropriate DNA re-replication. In a normal eukaryotic cell cycle the chromosomal DNA of a cell is replicated once and only once during S phase to ensure that each daughter cell receives exactly one complement of genomic material. By perturbing the regulation of several proteins involved in replication initiation our laboratory has been able to conditionally induce varying amounts of re-replication in yeast cells. We have demonstrated that re-replication induces a rapid and significant decrease in cell viability and a cellular DNA damage response. We elected to focus our studies of genome instability on gene amplification because of its clinical importance in breast cancer. We have shown that re-replication is a potent inducer of gene amplification that generates structures similar to amplicons seen but poorly understood in tumors. The high frequency at which these amplification structures are generated is specific to re-replication as similar structures are not observed when S phase DNA replication is impaired or DNA is directly damaged. We thus propose that re-replication arising from loss of replication control is a potential source of the genomic instability important for tumorigenesis.

**Role of Obesity in Prostate Cancer Development**

Cleary, Margot P; Mar 2007; 12 pp.; In English; Original contains color illustrations

Contract(s)/Grant(s): W81XWH-06-1-0292

Report No.(s): AD-A467932; No Copyright; Avail.: Defense Technical Information Center (DTIC)

Prospective epidemiological studies indicate that obesity increases the risk for prostate cancer. Also, mortality from prostate cancer is increased with elevated body weights and obesity recently was reported to be associated with higher prostate cancer grade at diagnosis and with higher recurrence rates. However, it is difficult in human studies to adequately assess effects of body weight or the effect of body weight change at specific ages on prostate cancer. Recent introduction of the TRAMP (transgenic adenocarcinoma mouse prostate) mouse provides a model that shares many characteristics with human prostate cancer. In the present study we are assessing the effect of obesity induced at different ages on the development of prostate cancer in TRAMP mice. Obesity is induced in TRAMP mice by injections with gold-thioglucose (GTG) at either 6, 16 or 26 weeks of age. Body weight is monitored and longitudinal blood samples are obtained to monitor serum leptin levels. Mice are followed until 46 weeks of age. The 26-week cohort study is complete and preliminary analyses of the data indicate no effect of body weight on prostate tumor development although pathology results have not been obtained. Mice in the 6- and 16- week cohorts are currently being followed.

**Antioxidant Prophylaxis in the Prevention of Prostatic Epithelial Neoplasia**

Kumar, A P; Ghosh, Rita; Arevalo, Nicole; Gardner, Lori; Feb 2006; 7 pp.; In English; Original contains color illustrations

Contract(s)/Grant(s): W81XWH-04-1-0275

Report No.(s): AD-A467933; No Copyright; Avail.: Defense Technical Information Center (DTIC)

The PI's laboratory has relocated to the University of Texas Health Science Center San Antonio TX. This is a report of the work that was conducted at AMC Cancer Research Center Denver CO between March 1 and June 30, 2005. We have submitted a report describing the work performed in Y1 of the project in Feb 2005. This 4 month (February 26th 2005 to June 30th 2005) report describes the research accomplishments primarily associated with the Task I as outlined in the approved statement of work. As mentioned in the Y1 report we terminated the experiment involving feeding antioxidant supplemented diet in May 2005 (as described in our Y1 report). At the termination of the study (16 weeks) serum, prostate and other organs were collected from all the animals. The efficacy of the combination of antioxidants was assessed by histological evaluation of the prostate and modulation of antioxidant enzymes. Data indicate that 90% of the animals in the control group developed high grade PIN while only 10% of the animals in the experimental group developed high grade PIN. In contrast 90% of the

animals on the experimental diet developed low grade PIN. This suggests that a combination of antioxidants can reduce or delay the appearance of high grade PIN in Noble rats. Detailed studies to understand the mechanism of action of these antioxidants as proposed are currently in progress.

Contract(s)/Grant(s): W81XWH-04-1-0275

Report No.(s): AD-A467934; No Copyright; Avail.: Defense Technical Information Center (DTIC)

Clinically significant prostate cancer usually occurs in men who are 65 and older although precursor lesions are known to exist many years prior to cancer diagnosis. Histopathological changes referred to as Prostatic Intraepithelial Neoplasia (PIN) are considered to be the most likely precursor of prostate cancer. The mechanism(s) involved in progression of indolent to active disease remains elusive although a role for age-related increase in oxidative stress has been proposed. There are a variety of reactive oxygen species (ROS) that ultimately cause oxidative stress and any particular oxidant has not been identified as being primarily involved. We rationalized that a combination of antioxidants may be necessary to neutralize the different classes of ROS to prevent the progression of latent precursor foci to active cancer. Therefore we devised a combination of antioxidants with varied antioxidant properties to determine whether such supplementation could prevent the progression of PIN in Noble rats that are stimulated to develop PIN with hormones. Results from this study show for the first time that dietary intervention with a combination of antioxidants caused a highly significant decrease ( $p < 0.0004$ ) in high grade PIN formation compared to animals on control diet possibly through modulation of proliferation/apoptosis induction. These data provide evidence regarding the involvement of oxidants in the progression of precursor lesions and the need to evaluate combinations of antioxidants as prostate cancer preventive agents.

**Facilitating Smoking Cessation and Preventing Relapse in Primary Care: Minimizing Weight Gain by Reducing Alcohol Consumption**

Sobell, Mark B; Peterson, Alan; Sobell, Linda C; Hunter, Christopher; Hunter, Christine; Jan 2007; 132 pp.; In English; Original contains color illustrations

Contract(s)/Grant(s): W81XWH-05-2-0015

Report No.(s): AD-A467935; No Copyright; Avail.: Defense Technical Information Center (DTIC)

This project evaluates a brief smoking cessation intervention for use in primary care settings. The Brief Counselor Assisted Program (BCAP) combines motivational interviewing, behavioral counseling and nicotine replacement therapy with an emphasis on reducing alcohol consumption as a strategy for minimizing weight gain related to smoking cessation. Participants are randomly assigned to either BCAP or to a Self-Guided Program (SGP) where they receive a pamphlet discussing the most effective behavioral change strategies for tobacco cessation, how to minimize weight gain, and how to plan for and deal with possible relapses. The nicotine patch and bupropion (Zyban) are available to all participants. Participants in the BCAP attend two 30-minute clinic appointments and have two counseling sessions by phone over a period of 8-10 weeks, where tobacco cessation skills are integrated with weight and alcohol reduction strategies. Current smokers at 3-month follow-up, blocked by original group assignment, are randomized either to receive no further counseling or to attend one clinic booster session focusing on dealing with their individual obstacles to change. All participants will be followed up for 12 months. At the end of the second project year, all project materials had been developed and approved and recruitment was ongoing.

**Biomarkers for Amyotrophic Lateral Sclerosis in Active Duty Military**

Millhorn, David E; Schlager, John J; Feb 2007; 14 pp.; In English; Original contains color illustrations

Contract(s)/Grant(s): W81XWH-06-2-0016

Report No.(s): AD-A467938; No Copyright; Avail.: Defense Technical Information Center (DTIC)

Following their service in the first Gulf War, veterans were faced with an increased incidence of amyotrophic lateral sclerosis (ALS). Most recently, concern has been raised that military service per se could result in an elevated risk for ALS. ALS is a rapidly progressing, invariably fatal neurodegenerative disease, and despite exhaustive studies, the possible genetic or environmental causes remain largely unknown. Early symptoms of the disease are often similar to those of other, less severe neurodegenerative diseases, which can complicate and delay the diagnosis. No validated clinically relevant biomarkers exist to assist the physician in a more precise diagnosis of the disease. No therapies exist to cure the disease, and the mean time of survival after diagnosis of ALS is 4-5 years. In light of this problem, there is a pressing need for the identification of new ALS biomarkers that allow an early, specific diagnosis and that have the potential for the development of future therapies. This study compares serum samples from individuals diagnosed with (ALS) to serum samples from matched individuals who did not develop ALS. The authors aim to identify candidate serum biomarkers that are unique for ALS and a subset of diagnostic serum biomarkers for early detection of ALS prior to the appearance of overt symptoms. The significance of a positive identification of protein biomarkers for ALS is indisputably great. However, to date no validated clinically relevant biomarkers have been found to allow a more specific diagnosis of ALS at an earlier stage. Previous efforts to identify ALS associated biomarkers have often focused on the identification of genes and proteins characteristic for familial ALS, yet validated biomarkers for sporadic ALS, which accounts for as much as 90-95% of all ALS cases, have yet to be identified. Subjects will be identified through the National Registry of Veterans with ALS; serum samples will be obtained from the DoD Serum Registry.

In the period covered by this application we have standardized an efficient methodologies for isolating cells from primary tumors expressing RFP by fluorescence activated cell sorting (FACS) and by laser capture micro-dissection (LCM). We have completed a comprehensive micro-array based bioinformatics effort to identify genes whose expression is modulated by Casodex to characterize the molecular events underlying the effects of Casodex on AR+ cell lines (LNCaP and PC-346C cells). The changes in gene expression detected by micro-array were validated by QT-PCR using SYBR green. The results of these experiments are also being compared to the changes in gene expression seen in the PC-346RFP primary tumors (and metastases) from animals chronically treated with Casodex. We have also demonstrated that there is a threshold dose response to Casodex in these cell lines. Results of the dose response revealed considerable differences in expression changes of target genes between Casodex treatments of 50 or 100 M in comparison to control. One of these genes, the cell cycle inhibitor p21 which has been recently shown to have multiple transcript variants also demonstrates differential regulation of the transcripts at the two concentrations. One of the variants, p21B, has been implicated in apoptosis and displays upregulation at concentrations of Casodex that induce cell death. Ingenuity pathway analysis suggest that this gene may be dually regulated by p53 and AR at the higher dose of Casodex.

**Methylselenium and Prostate Cancer Apoptosis**

Lu, Junxuan; Feb 2007; 35 pp.; In English; Original contains color illustrations

Contract(s)/Grant(s): DAMD17-02-1-0007

Report No.(s): AD-A467941; No Copyright; Avail.: Defense Technical Information Center (DTIC)

The purpose of this research is to gain a better understanding of the biochemical pathways and molecular targets for the selective induction of apoptosis signaling and execution of prostate cancer (PCa) cells by methyl selenium. We hypothesized that methyl selenium inhibits PI3K-AKT survival pathway leading to the activation of caspase-dependent apoptosis execution in PCa cells. Data generated support PI3K-AKT pathway activity as a determinant of the apoptosis sensitivity of PCa cells to a prototype methyl Se MSeA which can be further modulated by ERK1/2. AKT and ERK1/2 differentially modulated cytochrome c involvement in MSeA-induced extrinsic (major) and intrinsic caspase cascades. We have pursued a novel lead for using selenium as a chemosensitizer for cancer therapeutic drug-induced apoptosis in androgen independent PCa cells. We have also discovered a synergistic enhancement of apoptosis effect of TRAIL (an anti-cancer biological) by the genotoxic selenium through p53-mediated actions. The chemosensitizer activity of selenium is expected to improve quality of life of prostate cancer patients because of increased efficacy and reduced dosage needed. Seven publications are credited to the support by this grant award. Validation of these findings in animal models is currently in progress.

**Selenium and Breast Cancer Chemoprevention**

Thompson, Henry J; Dec 2006; 12 pp.; In English; Original contains color illustrations

Contract(s)/Grant(s): DAMD17-01-1-0124

Report No.(s): AD-A467942; No Copyright; Avail.: Defense Technical Information Center (DTIC)

The primary objective of this project was to determine whether selenium supplementation affected candidate markers of breast cancer risk in a cohort of women at elevated risk for breast cancer. The intermediate biomarkers being studied were: indicators of oxidative damage to cellular macromolecules such as DNA and lipid indicators of IGF metabolic status and cellular indicators of breast cancer risk. We conducted a randomized, placebo-controlled double-blind chemoprevention trial with 150 participants (75 subjects per arm) using a placebo tablet or a tablet containing 200 microg high-selenium brewer's yeast per day, given for a duration of one year. The form and dose of selenium that was being used has been reported to reduce cancer incidence and mortality in lung, prostate and colon. Blood and urine were collected at baseline and after 6 and 12 months of intervention. The feasibility of obtaining breast epithelial cells via nipple aspiration at baseline and the end of the intervention was assessed. Plasma selenium and glutathione peroxidase activity were evaluated in addition to pill counts and self report as markers of compliance.

**A Chemoprevention Trial to Study the Effects of High Tea Consumption on Smoking-Related Oxidative Stress**

Hakim, Iman A; Chow, H-H; Harris, R B; Garland, L; Rodney, S; Tobar, M; Cordova, C; Strebing, A; Goodman, L; Mikhael, D; Feb 2007; 13 pp.; In English; Original contains color illustrations

Contract(s)/Grant(s): DAMD17-03-1-0053

Report No.(s): AD-A467944; No Copyright; Avail.: Defense Technical Information Center (DTIC)

The authors' overall goal is to develop a safe and feasible model for the chemoprevention of a wide range of tobacco-related diseases. Their immediate goal, addressed over a 4-year study period, is to determine the effects of high tea consumption on the biological markers of oxidative stress that mediate lung cancer risk. They are conducting a 6-month randomized, controlled, double-blinded chemopreventive trial with subjects who have chronic obstructive pulmonary disease (COPD) and who were, or are, chronic smokers. The subjects are being randomized to green or black tea preparations or a control intervention (matching placebo). Levels of 8-hydroxydeoxyguanosine and 8-F2-isoprostanes are being used to measure DNA damage and lipid damage, respectively. Changes in biomarkers of oxidative damage are being measured in urine, blood, and exhaled breath condensate. The study protocol was approved by all parties in September 2003. Recruitment and screening of participants for eligibility started in October 2003. By the end of December 2006, 275 participants had signed the consent form and were screened for confirmation of COPD eligibility (i.e., spirometry for lung function). Thirteen subjects were not eligible and 262 subjects were enrolled in the study. Ninety-six of the participants dropped out of the study in the

first week. The main reported causes of drop-out were as follows: could not stop drinking coffee, did not like the taste of the tea, and caffeine intolerance. A total of 158 subjects completed the 1-month run-in and were randomized to one of the study arms: green tea, black tea, or placebo. All randomized subjects provided blood and urine samples, exhaled breath condensate, and buccal cell samples during the 6-month intervention period. To date, 114 subjects have completed the study and 19 subjects are actively enrolled in it. The authors expect that adherence to a regular pattern of tea is feasible and quantifiable in this high-risk population.

**Dietary Fat, Fat Metabolizing Genes, and Prostate Cancer Risk in African-Americans and Whites**

Ingles, Sue Ann; Dec 1, 2006; 8 pp.; In English; Original contains color illustrations

Contract(s)/Grant(s): W81XWH-04-1-0111

Report No.(s): AD-A467946; No Copyright; Avail.: Defense Technical Information Center (DTIC)

Dietary fat has been implicated as a potential promotional factor leading to progression of small, latent, non-metastatic prostate tumors to invasive, metastatic lesions. One possible mechanism is conversion of n-6 polyunsaturated fatty acids to inflammatory compounds produced by the lipoxygenase (LOX) family of enzymes. The authors are examining whether genetic variants in the n-6 fatty acid LOX pathways are associated with the risk of prostate cancer in a population-based, case-control study of advanced prostate cancer among African-Americans and whites in Los Angeles County. In the first two years of the study, they genotyped five LOX gene polymorphisms, including 12-LOX Gln261Arg and Ser322Asn, 15-LOX-2 Gln656Arg, 5-LOX Lys254Glu, and the 5-LOX promoter Sp1 motif polymorphism. Preliminary analyses indicate that the 12-LOX gene Gln261Arg polymorphism may be related to prostate cancer risk in both African-Americans and whites. In the third year, they will investigate whether genetic variation in specific LOX pathways, in combination with diet, contributes to prostate cancer risk. The findings could provide a scientific foundation upon which to design dietary intervention trials and may allow them to design strategies for reducing the disparity in prostate cancer burden between African-Americans and other ethnic groups.

**Short-Course Postexposure Antibiotic Prophylaxis Combined with Vaccination Protects Against Experimental Inhalational Anthrax**

Vietri, Nicholas J; Purcell, Bret K; Lawler, James V; Leffel, Elizabeth K; Rico, Pedro; Gamble, Christopher S; Twenhafel, Nancy A; Ivins, Bruce E; Heine, Henry S; Sheeler, Ryan; May 16, 2006; 7 pp.; In English; Original contains color illustrations

Report No.(s): AD-A467948; USAMRIID-RPP-05-451; No Copyright; Avail.: Defense Technical Information Center (DTIC)

Prevention of inhalational anthrax after *Bacillus anthracis* spore exposure requires a prolonged course of antibiotic prophylaxis. In response to the 2001 anthrax attack in the USA, approximately 10,000 people were offered 60 days of antibiotic prophylaxis to prevent inhalational anthrax, but adherence to this regimen was poor. We sought to determine whether a short course of antibiotic prophylaxis after exposure could protect non-human primates from a high-dose spore challenge if vaccination was combined with antibiotics. Two groups of 10 rhesus macaques were exposed to approximately 1,600 LD<sub>50</sub> of spores by aerosol. Both groups were given ciprofloxacin by orogastric tube twice daily for 14 days, beginning 1-2 h after exposure. One group also received three doses of the licensed human anthrax vaccine (anthrax vaccine adsorbed) after exposure. In the ciprofloxacin-only group, four of nine monkeys (44%) survived the challenge. In contrast, all 10 monkeys that received 14 days of antibiotic plus anthrax vaccine adsorbed survived ( $P = 0.011$ ). Thus postexposure vaccination enhanced the protection afforded by 14 days of antibiotic prophylaxis alone and completely protected animals against inhalational anthrax. These data provide evidence that postexposure vaccination can shorten the duration of antibiotic prophylaxis required to protect against inhalational anthrax and may impact public health management of a bioterrorism event.

**Midkine Promoter-Driven Adenovirus as Potential Therapy for NF1**

Ding, Vivanne; Dec 1, 2006; 8 pp.; In English; Original contains color illustrations

Contract(s)/Grant(s): W81XWH-06-1-0153

Report No.(s): AD-A467964; No Copyright; Avail.: Defense Technical Information Center (DTIC)

We proposed to test the possibility of using midkine promoter driven adenovirus (AdMk) to selectively kill neurofibroma cells. It is suggested from the literature that midkine is expressed at higher levels in cells and sera of NF1 patients. We initially obtained a version of the AdMk and tested its cytopathic effect on a neurofibroma cell line ST88. However a more recent publication indicated that this virus would be too toxic for normal cells as well. We then obtained from our new collaborator several different modified adenovirus and tested their cytopathic effects. Promoter activities of the midkine and Cox2 are also assayed in several cell lines.

**Platelet Activating Factor: A Growth Factor for Breast Cancer**

Daniel, Larry W; Sep 1, 2006; 14 pp.; In English; Original contains color illustrations

Contract(s)/Grant(s): W81XWH-04-1-0682

Report No.(s): AD-A467966; No Copyright; Avail.: Defense Technical Information Center (DTIC)

Women with a diet rich in fish oils are less likely to develop breast cancer. Recent studies have shown that the ratio of two families of essential fatty acids is important in regulating many cellular processes. Nutrition is extremely important in determining this ratio since both the separate families are obtained only from the diet. The omega 3 family is enriched in fish and grains and the omega 6 family is enriched in the meats and oils typical in modern diets. The strategy of this proposal was to study the molecular mechanisms that control this effect. We focused on the synthesis of platelet activating factor (PAF). We have shown that PAF can increase the growth of breast cancer in cell cultures. Our hypothesis is that the ratio of omega 3 and omega 6 fatty acids influences the synthesis of PAF. This idea came from the fact that these fatty acids must be removed from the precursor of PAF for PAF synthesis to occur. The goal of this proposal was to test this idea and provide the knowledge that would stimulate further clinical trials using fatty acid supplementation to prevent recurrent disease.

**Functional Characterization of Two Novel Human Prostate Cancer Metastasis Related Genes**

Abbel-Mageed, Asim B; Agrawal, Krishna C; Crawford, Jr, Byron; Feb 1, 2007; 12 pp.; In English; Original contains color illustrations

Contract(s)/Grant(s): W81XWH-04-1-0210

Report No.(s): AD-A467967; No Copyright; Avail.: Defense Technical Information Center (DTIC)

We propose to identify the functional characterization of two novel cancer-specific, metastasis-related genes whose constitutive expression may be pivotal for prostate cancer progression. Due to hurricane Katrina, we were able to gain access to research laboratories in end of April, 2006. Due to prolonged power outages in our building (approximately 7 months), we have lost all of DNA constructs, cell lines, frozen tissue sections, cell lines, research supplies. In addition, all of our laboratory personnel were relocated to other cities following hurricane Katrina. Accordingly, we spent considerable amount of time (June, 2006 through January, 2007) cleaning up labs, replacing laboratory supplies and equipments, and hiring lab personnel. Over the past three months we were able to re-generate Seq1 and Seq 2 DNA construct using approaches shown above. We have characterized the full-length cDNAs of the Seq1 and Seq2 genes using at least three 5 and 3 rapid amplification of cDNA ends (RACE) commercial kits (Invitrogen Carlsbad, CA, BD Bioscience (Clontech Inc), and Seegene, Rockville, MD). We have also subcloned cDNAs in expression plasmids and were sequence verified for orientation and recombinant protein expression, in vitro translation, and antibody production. However, our research plans of development of antibodies and validation of expression in tissue sections were disrupted by hurricane Katrina and destruction of all of our laboratory materials and supplies and experimental animals. To accomplish this, we have requested a one year extension to complete the remaining tasks.

**Development of Methodology to Maintain Primary Cultures of Normal and Malignant Human Prostatic Epithelial Cells in Vivo**

Peehl, Donna M; Feb 1, 2007; 11 pp.; In English; Original contains color illustrations

Contract(s)/Grant(s): W81XWH-04-1-0188

Report No.(s): AD-A467968; No Copyright; Avail.: Defense Technical Information Center (DTIC)

Our objective is to develop a realistic preclinical model of prostate cancer by developing methodology that supports the survival, growth and differentiation of primary cultures of prostate cells in mice. During Year 1, we focused on the method of implantation and the implantation site as the most critical elements in achieving this goal. In Year 2, we took into consideration growing evidence that stem cells are the only cells capable of regenerative growth in vivo, and started developing methodology to isolate stem cells and grow them in primary cultures. We continued these efforts in Year 3, but were not able to accomplish our goal of growing these stem cell primary cultures in vivo because of staffing problems. Staff is now in place and we will resume our in vivo studies under a No Cost Extension in Year 4.

**Evaluating an Interactive, Multimedia Education and Decision Program for Early-Stage Prostate Cancer Patients in a Randomized Controlled Trial**

Diefenbach, Michael A; Feb 1, 2007; 8 pp.; In English; Original contains color illustrations

Contract(s)/Grant(s): W81XWH-04-1-0179

Report No.(s): AD-A467969; No Copyright; Avail.: Defense Technical Information Center (DTIC)

This 3-arm randomized controlled trial evaluates the efficacy of a CD-ROM based multimedia prostate cancer education system (PIES). PIES is an educational software that provides patients with information about prostate cancer and its treatment through an intuitive interface, using video, animation, text, and voice-over text. All text is tailored to a person's information seeking preference. Participants (N = 312) are patients diagnosed with localized prostate cancer who will be randomized into three experimental conditions: a) Standard care, involving the provision of standard NCI print material about prostate cancer, Group 1; b) PIES software without tailoring component, Group 2; c) and PIES software with tailoring component, Group 3. Assessments will be taken prior to exploring the software/brochures, immediately after completing the software/brochure, and 6-weeks post baseline. The study design allows for the evaluation of the efficacy of the multimedia intervention against traditional care; the influence of tailoring versus not tailoring information within a multimedia context; and for an evaluation of the moderating effect of monitoring on the efficacy of the groups.

**Role of Growth Hormone in Prostate Cancer**

Swanson, Steven M; Feb 2007; 28 pp.; In English; Original contains color illustrations

Contract(s)/Grant(s): W81XWH-04-1-0201

Report No.(s): AD-A467973; No Copyright; Avail.: Defense Technical Information Center (DTIC)

We have established a GH-deficient prostate cancer model (Tag/Ghdr/dr rat) indicating that a reduction in GH and/or IGF-I can significantly inhibit prostate carcinogenesis in this model in contrast to GH wild-type controls (Probasin/Tag, Tag/Gh+/+). Tag/Gh+/+ Tag/Ghdr/dr and age-matched non-Tag controls were sacrificed at 10, 25 and 52 weeks of age. While real-time RT PCR and immunohistochemical analysis revealed the significantly increased levels of prostate GHR and the dramatically reduced levels of prostate IGF-1R (P<0.0001) in Tag/Gh+/+ during prostate cancer progression the loss of prostate GHR and the increase of IGF-1R were observed in Tag/Ghdr/dr. However there was no significant change in either serum or prostate IGF-1 level that can be correlated with prostate cancer progression or the resistance of Tag/Ghdr/dr to prostate carcinogenesis. These findings are consistent with the hypothesis that GH signaling plays a significant role in prostate carcinogenesis and suggest that GH antagonists may be effective agent against prostate cancer.

Contract(s)/Grant(s): W81XWH-04-1-0366

Report No.(s): AD-A467975; No Copyright; Avail.: Defense Technical Information Center (DTIC)

Our own results suggest that a risk of teratoma formation inversely correlates with the duration of the in vitro differentiation protocol (Brederlau & Correia et al., 2006). While the yield of hESC-derived DA neurons is not a limiting factor of transplantation success anymore, the major problems associated with the actual application of hESC-based therapies for PD are associated with 1) poor survival of mature DA neurons and 2) risk of teratoma and tumor formation in the site of transplantation. The former is caused by the presence of residual undifferentiated/mitotic cells amongst the transplanted cells. We have refined the in vitro differentiation protocol resulting in a balance of proliferation and differentiation in the cultures and yielding 3-D structures (Transplantable Units, TUs) suitable for transplantation without further dissociation. We have also refined the technique allowing rapid handling and reliable intracerebral delivery of TUs in model animals; resulting in an improved cell survival. Finally we have identified the substantia nigra pars compacta-specific factor Fibroblast growth factor 20 (FGF20) as a factor affecting both differentiation and proliferation of hESC-derived DA progenitors in a dose-dependant manner.

**Maintenance of Glucose Homeostasis through Acetylation of the Metabolic Transcriptional Coactivator PGC-1alpha**

Puigserver, Pere; Feb 2007; 10 pp.; In English; Original contains color illustrations

Contract(s)/Grant(s): W81XWH-06-1-0214

Report No.(s): AD-A467976; No Copyright; Avail.: Defense Technical Information Center (DTIC)

The purpose of this proposal is to test the hypothesis that acetylation of PGC-1alpha by the Acetyl Transferase GCN5 associated proteins, Pc3 and WDR18, is a key regulatory modification that controls hepatic glucose production. This investigation has a define scope to specifically test how these proteins control the acetylation status of PGC-1alpha and what is the functional effect in blood glucose levels. The major findings of this Research Technical Report are that we have generated specific siRNAs that specifically knock-down Pc3 and WDR18 and control PGC-1alpha transcriptional function. Moreover, we have generated PGC-1alpha acetylation mutants, surprisingly GCN5 still repress these mutant indicating that other sites are also involved. The significance of these results are that we have identified two proteins, Pc3 and WDR18, that control PGC-1alpha activity and that previous acetylation sites identified in PGC-1alpha are no responsible for GCN5-mediated repression of PGC-1alpha. This leads to further effort to identify the specific sites on PGC-1alpha that are mediating the effects of GCN5 to control hepatic glucose production.

**Incorporating New Technology to Create a Comprehensive Realistic Training Environment for the 91W**

Miller, Joseph P; Sep 2005; 15 pp.; In English; Original contains color illustrations

Contract(s)/Grant(s): MIPR-05M5047

Report No.(s): AD-A467977; No Copyright; Avail.: Defense Technical Information Center (DTIC)

The level of competence of the combat medic (91W) is varied and below the standard of civilian paramedics and Special Forces medics. These soldiers often have minimal clinical experience when assigned directly out of Advanced Individual Training (AIT). When training does occur, it is often on individual subsets of knowledge and does not allow practice of these multiple skills together, in sequence or in a combined scenario with the medic's entire unit in tactical maneuvers. Our proposal is to incorporate medical simulation into a clinically and tactically relevant program for training combat medics. Our goal is to incorporate short didactic sessions, immediate skills stations, case-based experiential learning in both simulation and live tissue models into a hybrid course for combat medics and all brigade medical providers from the combat life-saver to the FST surgeon. It consists of four major parts; didactics, task/skills stations, case-based scenarios from actual wartime environments and an FTX. The FTX portion is unique in that it can be performed by a group of battalion medics only, be incorporated into a brigade sized FTX to include FST and rotary winged evacuation or be a combination of any of the brigade medical assets. We developed a course curriculum covering the critical principles of combat casualty care. Although good and constantly improving, today's simulators are not the same as live patients. Using an IRB/IACUC approved protocol, procedural skills will

be trained on live animals in a controlled environment during the FTX portion of the training. This FTX will attempt to bring in all the variables the 91W will encounter in a tactical environment.

**ATM Heterozygosity and the Development of Radiation-Induced Erectile Dysfunction and Urinary Morbidity Following Radiotherapy for Prostate Cancer**

Cesaretti, Jamie A; Feb 2007; 43 pp.; In English; Original contains color illustrations

Contract(s)/Grant(s): W81XWH-04-1-0172

Report No.(s): AD-A467978; No Copyright; Avail.: Defense Technical Information Center (DTIC)

The goal of this training grant project is to determine whether the prevalence of ATM carriers among prostate cancer patients treated with radiotherapy that develop erectile dysfunction and urinary morbidity is greater than the prevalence of ATM heterozygosity among patients that do not develop this complication. Regardless of the scientific outcome of the proposal the PI will be left with a vast experience in translational research from which to form new hypotheses and research strategies as he begins his career as an independent physician scientist. To assure a well-rounded experience, the school of medicine will insure that the PI will participate for the first two years of the funded period in Mount Sinai's rigorous clinical research training program. The NIH sponsored program will give the PI formal instruction in Clinical Research and Policy Evaluation, Epidemiology and Biostatistics, Basic Science for the Clinical Investigator, Cultural, Illness, and Community Health Outcomes, Behavioral Medicine, and Ethical Issues in Clinical Research. Also the PI, while at Mount Sinai, will make significant progress in establishing collaborative relationships with well-established prostate cancer researchers and will continue this approach in order to expand the scope of the outlined proposal throughout the funding period of this grant.

**Hepatocyte Growth Factor and Interleukin-6 in Prostate Cancer Bone Metastasis**

Knudsen, Beatrice S; Jun 2006; 51 pp.; In English; Original contains color illustrations

Contract(s)/Grant(s): DAMD17-02-1-0159

Report No.(s): AD-A467982; No Copyright; Avail.: Defense Technical Information Center (DTIC)

The hypothesis of this grant proposal is that androgen-ablative therapy paradoxically increases growth factor secretion from bone stromal cells and that this may stimulate the growth of prostate cancer metastases. Based on the presence of androgen receptor regulatory elements in the promoter regions of the Interleukin-6 (IL-6) and hepatocyte growth factor/scatter factor (HGF/SF) genes and the presence of nuclear factor IL-6 binding sites in the promoter of the HGF gene, it is the premise of this project that IL-6 and HGF genes may serve as paradigms of genes that are increased in expression under androgen-suppressed conditions. However, initial experiments failed to reveal regulation of HGF and IL-6 by androgen suppression. An analysis of global gene regulation in castrated mice demonstrated that 159 genes were regulated and that Insulin growth Factor Binding Protein-5 demonstrated the most consistent increase in expression. The support provided by the grant fostered the PI's career development to an independent investigator in the field of prostate cancer metastasis to bone. There were several publications supported by the funds from this grant.

Contract(s)/Grant(s): W81XWH-06-1-0229

Report No.(s): AD-A468005; No Copyright; Avail.: Defense Technical Information Center (DTIC)

It is fundamentally important to understand the underlying mechanisms regulating prostate cancer (PCa) metastasis. Despite the increased PSMA expression found in more advanced stage of PCa, little is known about the functional role of PSMA in PCa progression. Work accomplished for the period of the report has (1) generated the fluorescently labeled anti-PSMA antibodies for monitoring PSMA expressions in live PCa cells, (2) established the cell model systems with reduced

PSMA expression for studying PSMA functions, (3) identified fibronectin as a specific extracellular matrix for enhanced LNCaP attachment and (4) performed 2-D wound healing assays to examine the role of PSMA in PCa cell migration. Results from these studies demonstrated and further supported the idea that PSMA is involved in PCa cell adhesion and migration, therefore will enhance our understanding of molecular regulatory mechanisms of PCa. Knowledge about the action of PSMA in cell adhesion and migration during PCa metastasis will have a direct impact on the improvement for design better-targeted approaches for treating patients suffering from metastatic prostate cancer.

Contract(s)/Grant(s): W81XWH-04-1-0124

Report No.(s): AD-A468010; No Copyright; Avail.: Defense Technical Information Center (DTIC)

Centrosomes are tiny structures critical for organizing mitotic spindles and segregating chromosomes during mitosis. We (and another group) were the first to discover that centrosomes were abnormal in nearly all malignant human tumors. Our recent observations show that centrosome defects and genomic instability can be artificially induced by elevating the levels of the centrosome protein pericentrin and that pericentrin was elevated in prostate carcinomas. Based on these observations, we proposed that centrosome dysfunction may be a critical factor in prostate cancer progression that could explain most phenotypic changes that occur during progression of prostate carcinomas. The specific aims of the original proposal were designed to test several features of this model. 1. Are centrosome defects present in early prostate cancer and can they predict aggressive disease? 2. Do pericentrin's oncogenic features result from the interaction with PKA, PKB/Akt and/or PKC? 3. Can prostate tumor cells be arrested in the cell by overexpression of a pericentrin domain that blocks the cell cycle? We anticipate

that this work will lead to new prognostic markers and novel cancer-specific therapeutic targets for aggressive prostate cancer, the form that is most critical in terms of diagnosis, treatment and health care expenditure.

The purpose was to investigate whether activation of 5-HT1B receptors within the ventral tegmental area (VTA) facilitated dopamine (DA) transmission in the ipsilateral nucleus accumbens (NAcc) and potentiated ethanol-induced increases in NAcc DA by 5-HT1B receptor-mediated GABA mechanisms. The data derived from microdialysis studies performed in rats and 5-HT1B receptor knockout mice, and those obtained from superfusion experiments consistently showed that activation of VTA 5-HT1B receptors facilitated mesolimbic DA transmission and enhanced the stimulatory effects of ethanol on mesolimbic DA neurons. These enhancements may be a consequence of additive effects resulting from indirect disinhibition of VTA DA neurons due to the receptor activation-induced inhibition of VTA GABA release. Moreover, the results showed that blockade of VTA 5-HT1B receptors attenuated ethanol-induced increases in mesolimbic DA transmission, suggesting the involvement of the receptor activation in mediating ethanol's DA activating effects. However, VTA GABA may not be involved in this 5-HT1B receptor-mediated effect since the data from in vivo and in vitro experiments showed that ethanol did not affect VTA GABA transmission. The data also showed that ethanol, when directly applied to VTA slices, increased somato-dendritic DA release, suggesting that the stimulatory effects of ethanol on VTA DA neurons observed in vivo may be associated, at least in part, with its direct actions within the VTA. Our data may explain in part why 5-HT1B receptors have been reported to be associated with alcohol abuse in both human genetics and in animal models, and to play a role in regulating alcohol voluntary intakes.

**Prevalence and Outcomes of Restless Legs Syndrome Among Veterans**

Bourguet, Claire C; Feb 2007; 95 pp.; In English; Original contains color illustrations

Contract(s)/Grant(s): DAMD17-03-1-0082

Report No.(s): AD-A468016; No Copyright; Avail.: Defense Technical Information Center (DTIC)

Restless Legs Syndrome (RLS) is a commonly under diagnosed organ cause of insomnia. There is evidence that insomnia leads to psychic distress which impacts health care utilization. Purpose: To examine a proposed model which links RLS to insomnia, and insomnia to reduced mental health and increased utilization. Scope: To estimate the prevalence of RLS, insomnia, mood disorders, and substance abuse; quantify the proportion of mood disorders and substance abuse which are attributable to RLS and insomnia; document the diagnosis of RLS and insomnia; and estimate the association of RLS and insomnia to health care utilization and health related quality of life. Methods: A cross-sectional survey of a representative sample of Ohio VA clients using telephone interviews and data extracted from medical records. One year follow-up of health care utilization using postal questionnaire and medical records. Results: The prevalence of RSL and insomnia are high (22% and 16% respectively) as are mental health disorders (major depression, 20%; anxiety disorder, 12%; phobias, 14%; panic attack, 6%; alcohol dependence, 3%). Less than 5 % of RLS was documented in the medical record. RLS is associated with insomnia (PR = 1.5, p<.001) and 20% of the insomnia may be attributed (PAR) to RLS. As RLS is untreated in this population, the burden of insomnia might be reduced by 20% with effective treatment of RLS.

A key part of our research plan has been the development and use of retroviral vectors expressing RNA interference RNAs

to identify human genes involved in causing or restraining cancer. In our first progress report we described our efforts to develop shRNA libraries and showed they could be used to identify tumor suppressors. Ultimately our goal is to screen of complex pools of shRNA expressing retroviruses each marked with a bar code that allows the results of the screen to be read out by microarray hybridization. We demonstrated this could be accomplished in enrichment screens for shRNAs that caused cellular transformation and growth in soft agar. However, a key goal has been to identify shRNAs that debilitate or kill cancer cells. In order for this to be possible in complex pools, it is imperative that each vector knock down its target with high penetrance. We have successfully achieved this level of knockdown and can now see particular shRNA expressing viruses drop out of complex pools. We are also developing bar code hybridization methods that allow us to detect over 80% of the viruses in pool. We hope to push this to over 90% using double bar codes. Together the high knockdown vectors together with the bar code hybridization has allowed us to achieve the central goal of this Award. We have taken advantage of our improvements to perform a variety of screens relevant to cancer. These include lethality screens to identify genes that cancer cell lines rely upon to proliferate and survive. We also are performing screens that are identifying genes whose loss gives rise to resistance to tyrosine kinase inhibitors. Finally we are continuing our efforts to identify tumor suppressors in human mammary epithelial cells. We have expanded this to identify oncogenes in the same system. In parallel we are attempting to generate a system through which we can explore the autoimmune phenotype of breast cancer patients. We have generated the peptide display libraries required fo

**The Effect of COX-2 Inhibitors on the Aromatase Gene (CYP19) Expression in Human Breast Cancer**

Shapiro, Charles L; Dec 2006; 28 pp.; In English; Original contains color illustrations

Contract(s)/Grant(s): DAMD17-01-1-0589

Report No.(s): AD-A468021; No Copyright; Avail.: Defense Technical Information Center (DTIC)

Aromatase (CYP19) is responsible for estrogen biosynthesis, and CYP-19 and cyclooxygenase-2 (COX-2) are both overexpressed in human breast cancers. Prostaglandin activates the CYP19 promotor and increases gene expression therefore we hypothesized that celecoxib, a selective COX-2 inhibitor, will decrease PG and decrease the expression of CYP19. To test this hypothesis, celecoxib was administered to breast cancer patients after the initial core biopsy tumor tissue and then tumor tissue was collected at the definitive surgery on OSU protocol 0125. A total of 8 breast cancer patients were enrolled until December 20, 2004 when the cardiovascular risks associated with celecoxib were made public. Accrual was suspended and the restarted in July 2005 with a revised protocol and consent form describing the cardiovascular risks. The trial was closed November 13, 2006 due to lack of accrual. There were no adverse events recorded during celecoxib administration. With only 8/34 (23%) of patients enrolled, there have no analysis of gene expression of CYP19. This trial failed to accrue, in part, over concerns about the cardiovascular risks.

Wemmer, David E; Jan 2007; 7 pp.; In English; Original contains color illustrations

Contract(s)/Grant(s): DAMD17-03-1-0476

Report No.(s): AD-A468023; No Copyright; Avail.: Defense Technical Information Center (DTIC)

The mouse prion protein peptide (residues 89-143 with the substitution of Leu for Pro at residue 101) induces prion disease in sensitized mice. Samples of this peptide isotopelabeled with  $^15\text{N}$  were prepared by expression of a fusion in *E. coli* cleaved to yield an unmodified peptide and then fibrillized. Hydrogen exchange was allowed to occur in the fibrils for periods from 1 hour to 6 weeks repeating initial experiments to verify the exchange behavior. The extent of exchange was monitored using peak intensities in  $^15\text{N}$ - $^1\text{H}$  HSQC nuclear magnetic resonance spectra in DMSO/D $_2\text{O}$ /TFA solutions. The results are consistent with previous measurements that we did. Analogous experiments were also done with unlabeled peptide in fibrils with the analysis done by mass spectroscopy. Fragmentation was improved relative to previous experiments by using a combination of two proteases. With the improved coverage it was possible to show that the same protected regions as determined by NMR could be identified.

**Domain Specific Effects of Herstatin, an Alternative HER-2 (erbB-2) Product, on erbB Positive Breast Cancer**

Shamieh, Lara S; May 2006; 33 pp.; In English; Original contains color illustrations

Contract(s)/Grant(s): W81XWH-04-1-0412

Report No.(s): AD-A468024; No Copyright; Avail.: Defense Technical Information Center (DTIC)

Herstatin an autoinhibitor of ErbB receptors is produced from an alternatively spliced HER-2 mRNA. Retention and read-through of intron 8 leads to the production of the inhibitory secreted ligand which contains a novel receptor binding domain (RBD) encoded by the intron. Both herstatin and its intron-encoded RBD bind to all four members of the ErbB receptor family. Herstatin also binds to both the IGF-IR and the Insulin Receptor (IR) albeit with approximately 10- fold reduced affinity compared to EGFR and HER-2. Examination of signaling and growth in parental MCF7 breast carcinoma cells and MCF7 cells stably transfected with herstatin revealed that herstatin expression resulted in altered signaling and reduced IGF-I- or Insulin-stimulated proliferation in vitro. These studies demonstrate that in addition to binding to and blocking activation of the EGF receptor family herstatin binds to the IGF-IR and IR and modulates IGF-I- stimulated proliferation and survival signaling either through direct interaction with the IGF-IR or indirectly by modulating crosstalk with the EGF family of receptors. In summary herstatin is a unique ligand of both the EGF and IGF-I receptor families that functions to modulate the action of these receptors and may be critical in controlling the progression of ErbB positive breast cancer.

**Developing Models to Facilitate the Appropriate Selection and Effective Targeting of Candidate Antigens for Specific Cellular Immunotherapy of Prostate Cancer**

Greenberg, Philip D; Dec 2006; 7 pp.; In English; Original contains color illustrations

Contract(s)/Grant(s): W81XWH-06-1-0152

Report No.(s): AD-A468034; No Copyright; Avail.: Defense Technical Information Center (DTIC)

Immunologically targeting prostate cancer has received increasing attention, [1- 3], in part because collateral normal tissue injury is an acceptable toxicity. However, many questions must be resolved, including the nature of antigens that can be effectively targeted, the requisite T cell response, and the relationship between tumor development and progression and the immune system. Many candidate human prostate cancer antigens have been identified, including PSA, PSMA, PAP, PSCA, and TARP [2, 4-11]. These targets, and others suggested by analysis of differential gene expression [6, 12-15], include cytosolic, transmembrane, and secreted proteins, which interface differently with the immune system. Predicting which one or class of antigens might be most effectively targeted is difficult to resolve in human trials, and thus the use of relevant mouse tumor models might provide essential insights into prostate cancer immunobiology that can then be translated to human clinical trials. The Transgenic Adenocarcinoma of the Mouse Prostate (TRAMP) model, developed by our collaborator Norm Greenberg, appears particularly useful as a foundation for addressing these questions. The TRAMP model is focused on a mouse strain genetically engineered to express from a minimal rat probasin promoter the pro-oncogenic SV40 early genes in prostatic epithelium in a developmentally and hormonally regulated fashion [16]. Transgene expression, associated with puberty and increased androgen levels, can be detected in prostate tissue as early as 4 weeks of age [17]. Disease begins as prostatic intraepithelial hyperplasia (PIN), and progresses to well-differentiated adenocarcinoma as early as 12 weeks [17, 18], to moderately differentiated over the next 6-weeks, and to poorly differentiated carcinoma by 24-30 weeks. Distant metastases, by both hematogenous and lymphatic spread, have been detected as early as 12 weeks, and approach 100% by 24-30 weeks of age [18].

**MR Imaging Based Treatment Planning for Radiotherapy of Prostate Cancer**

Chen, Lili; Feb 2007; 61 pp.; In English; Original contains color illustrations

Contract(s)/Grant(s): W81XWH-04-1-0023

Report No.(s): AD-A468037; No Copyright; Avail.: Defense Technical Information Center (DTIC)

This work is aimed at MRI-based treatment planning for radiation therapy. The tasks for the third year include (a) develop practical procedures for clinical implementation of MRI simulation; (b) develop guidelines for MRI-based treatment planning dose calculation, and (c) develop quality assurance programs for MRI simulation for prostate cancer treatment. We have developed a technique to create MR-based digitally reconstructed radiographs (DRR) for patient initial setup for clinical applications of MR-based treatment planning for prostate IMRT. The CT and MR images of twenty prostate patients were used for the study. The pelvic bony structures that are relevant for routine clinical patient setup were manually contoured on MRI. The contoured bony structures were assigned a bulk density of 2.0 g/cm<sup>3</sup>. The MRI based DRRs were generated. The accuracy of the MR based DRRs was quantitatively evaluated by comparing MR-based DRRs with CT-based DRRs for these patients. Our results showed that MR-based DRRs utilizing the outlines of relevant bony structures have an accuracy of about 3 mm, which is adequate for initial patient setup. This technique has been used, in combination with the BAT/in-room CT daily target localization techniques, for the clinical implementation of MRI-based treatment planning for prostate IMRT at FCCC.

**Interactions between Dietary Factors and Inflammation in Prostate Carcinogenesis**

DeMarzo, Angelo M; Dec 2006; 15 pp.; In English; Original contains color illustrations

Contract(s)/Grant(s): W81XWH-06-1-0138

Report No.(s): AD-A468039; No Copyright; Avail.: Defense Technical Information Center (DTIC)

We are investigating whether inflammation can enhance prostate carcinogenesis in a rat model of dietary charred meat carcinogen induced cancers, and, whether antioxidant and other chemopreventative compounds can reduce prostate cancer in this model. We published a manuscript of some of the key data used for preliminary data in the original grant proposal. We completed part of aim 1 by treating PhIP treated Fisher rats with broccoli tea extract and celecoxib and discovered that both

broccoli tea extract and the non-steroidal anti-inflammatory agent celecoxib prevents mutations in all lobes of the prostate in response to PhIP treatment. We also discovered that PhIP treatment causes widespread epithelial atrophy in the rat ventral prostate that precedes the development of PIN. We completed a long term study related to task 3 in which we will defined the baseline number and extent of PIN and intraductal cancer lesions in the 52 week model to be used for the remainder of the studies in task 3.

**Neuropsychological Functioning in Gulf War Veterans Exposed to Pesticides and Pyridostigmine Bromide**

Krengel, Maxine; Sullivan, Kimberly; Feb 2007; 57 pp.; In English; Original contains color illustrations

Contract(s)/Grant(s): W81XWH-04-1-0118

Report No.(s): AD-A468046; No Copyright; Avail.: Defense Technical Information Center (DTIC)

GulfWar (GW) veterans continue to complain of short term memory and mood problems many years following their return from the Persian Gulf. Suspected causes for these health complaints continue to be investigated and include additive and/or synergistic effects of the varying combinations of exposures to pesticides, pyridostigminebromide(PB), low-level nerve agents, and psychological trauma. Many pesticides are neurotoxicants as are PB and nerve agents. Two subsets of these chemicals, organophosphates(OP) and carbamates, are known to produce chronic neurological symptoms at sufficient exposure levels. It is the goal of this study to further evaluate the role of pesticides in the development of symptoms reported by GW veterans. This will be accomplished by performing neuropsychological assessments with a group of military pesticide applicators. It is hypothesized that pesticide applicators with high exposures will perform significantly worse on cognitive and neurological measures than a group of GW military personnel with very little pesticide exposure. It is also hypothesized that multiple chemical exposures (PB, pesticides) will prove to be synergistic and/or additive in terms of decreased cognitive and neurological functioning and increased physical symptoms.

**Mechanisms of p53-Mediated Apoptosis**

Harms, Kelly L; Mar 2007; 64 pp.; In English; Original contains color illustrations

Contract(s)/Grant(s): W81XWH-04-1-0349

Report No.(s): AD-A468053; No Copyright; Avail.: Defense Technical Information Center (DTIC)

The p53 tumor suppressor is the most commonly mutated gene in human breast cancer. Upon genotoxic stress, p53, a sequence-specific transcription factor, induces target genes that mediate many cellular activities such as cell cycle arrest and apoptosis. While the mechanism by which p53 induces apoptosis is unclear, this pathway has rich potential as a target for cancer therapies. Thus, the purpose of this proposal is to characterize the molecular basis of p53-mediated apoptosis. Throughout this funding period, I have found that the N-terminal transcriptional activation domain 1 (AD1) and the C-terminal basic domain (BD) of p53 is inhibitory, while activation domain 2 (AD2) is required for transactivation of IGFBP3 by p53. Interestingly, lack of AD1 and the BD is paralleled in nature, and the naturally occurring p53 isoforms activate the IGFBP3 promoter. Importantly, p53 containing the inhibitory functional domains can be activated to induce IGFBP3 when histone deacetylases (HDACs) are inhibited by HDAC inhibitors. Furthermore, I found that HDAC2 specifically inhibits p53 activity by inhibiting p53-DNA binding activity. Since histone deacetylase (HDAC) inhibitors are in clinical trials for cancer therapies, my results shed insight into how HDAC inhibitors may be used as breast cancer therapies.

**High Resolution Anatomic and Elastographic Transrectal Ultrasound for Improved Diagnosis of Prostate Cancer**

Hossack, John A; Feb 2007; 38 pp.; In English; Original contains color illustrations

Contract(s)/Grant(s): W81XWH-04-1-0240

Report No.(s): AD-A468054; No Copyright; Avail.: Defense Technical Information Center (DTIC)

In this work we improve upon conventional Digital Rectal Examination (DRE) and PSA blood test by using ultrasound elasticity imaging. A latex sheath over the transrectal ultrasound probe is slightly inflated with water to provide a source of

moderate pressure. The elasticity image is generated by cross-correlating successive raw radio frequency image data sets for incrementally increasing pressure. Strain, and consequently elasticity, can be calculated from the displacement image. Our second objective is to use a new freehand 3D acquisition approach to obtain 3D image data sets. This approach uses a slightly modified transducer and an image motion tracking technique. Preliminary phantom based results are presented in this report. Excellent progress has been made with respect to the Statement of Work and first three of four total Specific Aims. A transducer has been specified and is on order. As promised, this transducer is designed to possess unsurpassed prostate scanning resolution by virtue of its exceptionally high frequency up to 14 MHz. Prototype phantoms and complete ultrasound test instrumentation has been assembled. Preliminary ultrasound image speckle reduction work has been performed. Preliminary, dimensionally accurate, 3D prostate phantom images have been produced.

**Mechanism of Action of Prostate Stem Cell Antigen Targeted Antibody Therapy and Its Relevance to Clinical Application in Prostate Cancer**

Reiter, Robert; Tran, Chau; Jan 2007; 7 pp.; In English; Original contains color illustrations

Contract(s)/Grant(s): W81XWH-06-1-0202

Report No.(s): AD-A468055; No Copyright; Avail.: Defense Technical Information Center (DTIC)

We have recently demonstrated that a monoclonal antibody against prostate stem cell antigen (PSCA) can exert anti-tumor activity in a xenograft animal model, suggesting oncogenic activity of PSCA in prostate cancer. Therefore our goal is to elucidate the role of PSCA in the development of prostate cancer. A better understanding of PSCA function and its antibody activity will enable rational patient selection and trial design, all of which are particularly relevant to subsequent clinical trials of PSCA antibody. There were difficulties in using the LAPC9 xenograft cells to study the effect of suppressing PSCA, but we have since established conditions for infecting LAPC9 xenograft tumor cells in vitro, and confirmed knockdown ability of siPSCA lentivirus. We have examined PSCA<sup>-/-</sup>/Nkx3.1<sup>-/-</sup> double knockout mice at early time point and find no difference in the lagged time to PIN formation compared to control group. We have also recognized the difficulty in generating the PSCA<sup>-/-</sup> /conditional PTEN<sup>-/-</sup> compound mice, and have engaged in an alternative approach by using the tissue recombination assay.

**A BCR-ABL Kinase Activity-Independent Signaling Pathway in Chronic Myelogenous Leukemia**

Li, Shaoguang; Feb 2007; 14 pp.; In English; Original contains color illustrations

Contract(s)/Grant(s): W81XWH-06-1-0239

Report No.(s): AD-A468056; No Copyright; Avail.: Defense Technical Information Center (DTIC)

The BCR-ABL tyrosine kinase inhibitor imatinib mesylate (Gleevec) is the preferred treatment for human chronic myeloid leukemia (CML), but does not cure mice with BCR-ABL-induced acute lymphoblastic leukemia (ALL), similar to CML lymphoid blast crisis. The inability of imatinib to cure CML in mice leads us to hypothesize that a BCR-ABL kinase activity-independent pathway also plays a critical role in the development of this disease. We identified Src kinases as key molecules in this BCR-ABL kinase activity-independent pathway, and they are essential for leukemic cells to survive imatinib treatment and for CML transition to lymphoid blast crisis. Inhibition of both SRC and BCR-ABL kinase activities affords complete B-ALL remission. However, leukemic stem cell pathways must be targeted for curative therapy of Ph<sup>+</sup> leukemia. We have identified CML stem cells in mice, and found that these cells are insensitive to imatinib therapy. Our study suggests that Src kinases may be effective in inhibiting leukemic stem cells, and combination therapy using a BCR-ABL/Src inhibitor and an anti-stem cells agent would be beneficial to CML patients. Our work will provide a new therapeutic strategy for CML.

Wemmer, David E; Jul 2006; 19 pp.; In English; Original contains color illustrations

Contract(s)/Grant(s): DAMD17-03-1-0476

Report No.(s): AD-A468058; No Copyright; Avail.: Defense Technical Information Center (DTIC)

The mouse prion protein peptide (residues 89-143 with the substitution of Leu for Pro at residue 101) induces prion disease in sensitized mice. Samples of this peptide, isotope labeled with <sup>15</sup>N, have been prepared by expression of a fusion in E.coli, cleaved to yield unmodified peptide, and then fibrillized. Hydrogen exchange was allowed to occur in the fibrils for periods from 1 hour to 6 weeks. The extent of exchange was monitored using peak intensities in <sup>15</sup>N-1H HSQC nuclear magnetic resonance spectra in DMSO/D<sub>2</sub>O/TFA solutions that had previously been assigned. The exchange data show a high fraction of amides are protected, with a core set (residues 104-109 and 117-135) exchanging very slowly (<10% exchange in 6 weeks). Some biphasic exchange was observed for residues between 110 and 116 suggesting a conformationally heterogeneous region, possibly relating to strain behavior. Samples of unlabeled, uniformly <sup>13</sup>C/<sup>15</sup>N labeled and selectively <sup>13</sup>C labeled peptide were prepared for solid state NMR experiments.

**Prostate Cancer Cell Growth: Stimulatory Role of Neurotensin And Mechanism of Inhibition by Flavonoids as Related to Protein Kinase C**

Carraway, Robert E; Dobner, Paul; Hassan, Sazzad; Jan 2007; 65 pp.; In English; Original contains color illustrations

Contract(s)/Grant(s): W81XWH-06-1-0242

Report No.(s): AD-A468073; No Copyright; Avail.: Defense Technical Information Center (DTIC)

The purpose is to define the relationships between neurotensin (NT) and protein kinase C (PKC) isotypes and to investigate the mechanism by which flavonoids (FLAV) inhibit NT-induced signaling in PC3 cells. The long-range scope is to determine the significance of NT as a participant in the negative effects of high fat intake on PC incidence and growth, and the positive effects of diets containing large amounts of FLAV. Our results show that NT-induced growth signaling in PC3 cells involves and requires the activation of several PKC isotypes, that arachidonic acid release and lipoxygenase activity participate in the signaling process, that cellular metabolism and ATP levels are important inputs to NT receptor function, and that activated PKC feeds back to regulate the ability of NT receptor to bind and to initiate signaling. These findings have implications regarding general mechanisms of G protein-linked receptor function and the design of new agents to block NT-induced growth signaling in PC.

**Locating a Prostate Cancer Susceptibility Gene on the X Chromosome by Linkage Disequilibrium Mapping Using Three Founder Populations in Quebec and Switzerland**

Foulkes, William; Sep 2006; 83 pp.; In English; Original contains color illustrations

Contract(s)/Grant(s): DAMD17-00-1-0033

Report No.(s): AD-A468077; No Copyright; Avail.: Defense Technical Information Center (DTIC)

At the Montreal site, 240 participants (195 cases) have consented to participate and 230 participants (185 cases) had their

blood drawn. The pedigrees for cases and some controls have been drawn. Ishihara charts were shown to all cases and controls and the results were recorded. At the Switzerland site, case ascertainment is complete and 250 patients have been contacted; 185 have had a consultation with a DNA sampling. As the X chromosome gene has proved to be elusive, we have focused our attention on candidate genes and have studied CHEK2, PALB2, BRCA1, BRCA2 as well as other candidate genes in this series of cases. We have identified several novel mutations in CHEK2 and PALB2, but none of these mutations appear to be thus far associated with prostate cancer risk. Other known mutations, such as BRCA1: 187delAG and BRCA2: 6174delT do not appear to be more frequent in men with prostate cancer. Our work did not support the initial suggestion that some Ashkenazi Jewish men with prostate cancer carried a prostate cancer-associated allele on chromosome 7q. Prostate cancer genetics remains a difficult area of research; our work has mainly eliminated various candidate genes rather than identify causative mutations in prostate cancer susceptibility genes.

**Improved Formulation of a Recombinant Ricin A-chain Vaccine Increases its Stability and Effective Antigenicity**

Carra, John H; Wannemacher, Robert W; Tammariello, Ralph F; Lindsey, Changhong Y; Dinterman, Richard E; Schokman, Rowena D; Smith, Leonard A; Mar 26, 2007; 11 pp.; In English; Original contains color illustrations

Report No.(s): AD-A468099; TR-07-003; No Copyright; Avail.: Defense Technical Information Center (DTIC)

Ricin is a potent toxin associated with bioterrorism for which no vaccine or specific countermeasures are currently available. A stable, non-toxic and immunogenic recombinant ricin A-chain vaccine (RTA 1-33/44-198) has been developed by protein engineering. We identified optimal formulation conditions for this vaccine under which it remained stable and potent in storage for up to 18 months, and resisted multiple rounds of freeze-thawing without stabilizing co-solvents. Reformulation from phosphate buffer to succinate buffer increased adherence of the protein to aluminum hydroxide adjuvant from 15 to 91%, with a concomitant increase of nearly threefold in effective antigenicity in a mouse model. Using Fourier-transform infrared spectroscopy, we examined the secondary structure of the protein while it was adhered to aluminum hydroxide. Adjuvant adsorption produced only a small apparent change in secondary structure, while significantly stabilizing the protein to thermal denaturation. The vaccine therefore may be safely stored in the presence of adjuvant. Our results suggest that optimization of adherence of a protein antigen to aluminum adjuvant can be a useful route to increasing both stability and effectiveness, and support a role for a 'depot effect' of adjuvant.

**Assessment of Detection and Refinement Strategies for de novo Protein Structures using Force Field and Statistical Potentials**

Lee, Michael S; Olson, Mark A; Jan 2007; 14 pp.; In English

Contract(s)/Grant(s): Proj-RIID-02-4-1R-069

Report No.(s): AD-A468130; ARL-TR-06-078; No Copyright; Avail.: Defense Technical Information Center (DTIC)

De novo predictions of protein structures at high resolution are challenged by the problem of detecting the native conformation from false energy minima. In this work, we provide an assessment of various detection and refinement protocols on a small subset of the second-generation all-atom Rosetta decoy set (Tsai, et al. *Proteins* 2003, 53, 76-87) by using an all-atom force field and a heavy-atom statistical potential. Detection schemes include minimization followed by conformational scoring and short-time molecular dynamics simulations. Refinement methods include temperature-based replica exchange molecular dynamics and a new computational unfold/refold procedure. Our results indicate that simple detection without any refinement is the best protocol for finding most native-like structures in the decoy set. The refinement techniques that we tested were generally unsuccessful in improving detection; however, they provided marginal improvements to some of the decoy structures.

**Continuous Pre-hospital Data as a Predictor of Outcome Following Major Trauma: A Study Using Improved and Expanded Data**

Kinkler, E S; Convertino, Victor A; Gordon, Donald J; Holcomb, John B; Salinas, Jose; Jun 2007; 23 pp.; In English; Original contains color illustrations

Contract(s)/Grant(s): W81XWH-04-2-0015

Report No.(s): AD-A468131; SWRI-10.10433; No Copyright; Avail.: Defense Technical Information Center (DTIC)

This study is designed to acquire near continuous physiologic measurements, beginning at the earliest practical time after injury, on large numbers of injured patients with severe trauma. The study will utilize commercially available FDA-certified monitoring equipment, operating in a fleet of ground EMS ambulances currently serving a large metropolitan area with multiple trauma centers. First Responders may represent the earliest opportunity to acquire meaningful medical data in injury cases. This data will be correlated with significant clinical outcomes within the first 24 hours of admission and entered into a research database. This is the second annual report for the subject project. During the reporting period, upgrade of five project ambulances was completed and pre-hospital patient data was acquired and processed for 29 cases. Analysis supports the hypothesis that ground EMS systems can provide earlier inception of data recording than helicopter services. A new physiological monitor device was deployed in an expanded fleet of ambulances and research to facilitate data collection and interpretation using the new device was initiated. Phase 2 of the subject project was initiated and planned work was re-directed based on results of early investigations. Work is underway to accelerate and expand data collection operations and to enhance data collection and analysis processes.

**Intra-Prostate Cancer Vaccine Inducer**

Humphreys, Robert E; Feb 2005; 36 pp.; In English

Contract(s)/Grant(s): 281XWH-04-1-0279

Report No.(s): AD-A468160; No Copyright; Avail.: Defense Technical Information Center (DTIC)

Substantial progress has been made in creating a simple, feasible method to induce an anti-cancer immune response in prostate cancers or metastases by manipulating the regulation of the immune response. Cancer cells are transformed into antigen presenting cells by inducing of the MHC class II molecules and suppressing the co-induced immunoregulatory Ii protein with antisense or siRNA methods. The resulting anticancer immune response is profound, curing up to 80% of mice with established prostate tumors, transplanted into their normal prostates. The important achievement of this past year has been to design, synthesize and validate two second generation reagents, for mice and humans, that are more potent, simpler to use, and set the stage for definite preclinical validation in mice, and with human tumors in tissue culture. Substantial improvement on the reagent of the original grant proposal was achieved by a) tripling the expression of the reverse gene construct which suppresses Ii protein expression, and b) by both chemical and plasmid genetic forms of small inhibitory RNA, which achieve the same end, but with surprising potency. These substantial technical advances (under Task 1 and 2) set the stage for advancement toward clinical trails (when justified by data from next year's effort).

Contract(s)/Grant(s): FA9550-04-1-0164

Report No.(s): AD-A468406; No Copyright; Avail.: Defense Technical Information Center (DTIC)

Overall this project has been successful having reached most of the goals originally proposed for the funding period. Screening of light producing organisms (Research Area 1) has been completed in diverse environments, including the Caribbean that was added on a later date. The screening has led to describing the general change with geographical latitude of pigmentation, chemiluminescence and fluorescence in organisms. This has led to documentation of organisms producing light of different color, which could stimulate future research of specific interest for the AFOSR. Also, as a result from this screening, a new Green Fluorescent Protein (GFP) and also been identified from the higher invertebrate (Protochordate) Amphioxus, the most developed invertebrate closest to vertebrate. The discovery of this new GFP (named amphigFP) raised

questions on extent of occurrence of this protein in the Animal Kingdom, considering that GFP had so far been described only from lower invertebrates like jellyfish, corals and some crustaceans.

**Intensity Modulated Radiation Treatment of Prostate Cancer Guided by High Field MR Spectroscopic Imaging**

Xing, Lei; May 2006; 229 pp.; In English

Contract(s)/Grant(s): DAMD17-03-1-0023

Report No.(s): AD-A468461; No Copyright; Avail.: Defense Technical Information Center (DTIC)

This Idea Award (DAMD17-03-1-0023, entitled 'Intensity Modulated Radiation Treatment of Prostate Cancer Guided by High Field MR Spectroscopic Imaging') was awarded to the principal investigator (PI) for the period of May 1, 2003 - April 30, 2006. This is the final report for the grant. The goal of this project is to establish biologically conformal -- as opposed to anatomically conformal -- IMRT as a viable modality through integration with 3T magnetic resonance spectroscopic imaging (MRSI) to more effectively kill prostate tumor cells. The underlying hypothesis driving this work is that the MRSI-guided IMRT will provide substantially improved dose distributions required to achieve greater local tumor control while maintaining, or reducing, complications to sensitive structures. The specific aims of the project are: (1) To establish a robust procedure for registering and mapping of MR spectroscopic data to CT/MRI images for prostate irradiation. (2) To develop an inverse planning system for MRSI-guided IMRT prostate treatment and demonstrate the feasibility of concurrent dose escalation to intraprostatic lesion(s) through a set of phantom studies and at least two previously treated prostate cases who had undergone CT/MRSI scans. Under the generous support from the U.S. Army Medical Research and Materiel Command (AMRMC), the PI has contributed significantly to prostate cancer research by applying physics and engineering knowledge to prostate cancer research. A number of significant conference abstracts and refereed papers have resulted from the support. The preliminary data obtained under the support of the grant has also enabled the PI to start new research initiatives, in particular, in adaptive prostate radiation therapy. The past year's research activities of the PI are highlighted in the following.

**Novel and Efficient Synthesis of the Promising Drug Candidate Discodermolide**

Parker, Kathyln A; Feb 2007; 7 pp.; In English; Original contains color illustrations

Contract(s)/Grant(s): W81XWH-06-1-0300

Report No.(s): AD-A468483; No Copyright; Avail.: Defense Technical Information Center (DTIC)

During the first year of this grant, we have demonstrated proof of principle for both of the premises on which the project is built. We have shown that a macrolide that is available in large quantities can be degraded to provide a building block for a value-added polyketide, specifically discodermolide. Because of difficulties with the original scheme, we applied Corey's cis diene synthesis in this preparation; this proved to be a superior method. We have also shown that chiral, syn anti stereotriad building blocks may be efficiently accessed from a chiral allylic alcohol that was prepared by asymmetric catalysis. This is a practical new approach to these useful intermediates that should have many applications.

**p63 in Development and Maintenance of the Prostate Epithelium**

Signoretti, Sabina; Mar 2007; 13 pp.; In English; Original contains color illustrations

Contract(s)/Grant(s): W81XWH-06-1-0365

Report No.(s): AD-A468492; No Copyright; Avail.: Defense Technical Information Center (DTIC)

The purpose of this project is to define the role of p63 in the development and maintenance of the prostate epithelium by utilizing both in vivo and in vitro models. In our first year of work, we have successfully constructed the targeting vector for the generation of the p63-Cre-ERT2 knock-in mice to be used for genetic lineage tracing. The p63-Cre-ERT2 vector has been transferred to the DFCI Gene Targeting Core Facility and electroporation in the ES cells will be performed shortly. The strategy for screening of ES cells for homologous recombination has been already designed and probes for Southern Blot analysis have been generated and successfully tested. In addition, we have made progress in exploring the molecular

mechanisms through which p63 regulates development of the prostate epithelium. Specifically, the use of siRNA against p63 has been optimized in various cell lines and, most importantly, p63 shRNA inducible cell lines (including iPrEC) have been generated. Preliminary results obtained utilizing these reagents show that down regulation of p63 in iPrEC cells consistently causes a decrease in cell viability.

**Cadmium, Zinc, and Selenium Levels in Carcinoma of the Human Prostate**

Sarafanov, Andrey; Centeno, Jose A; Apr 2007; 29 pp.; In English; Original contains color illustrations

Contract(s)/Grant(s): W81XWH-06-1-0407

Report No.(s): AD-A468497; No Copyright; Avail.: Defense Technical Information Center (DTIC)

The purpose of this study is to examine associations between zinc (Zn), selenium (Se) and cadmium (Cd), on development of prostate cancer. The objectives of this project are: 1) to establish the reliability of using formalin-fixed paraffin embedded (FFPE) prostate tissue by comparing levels of Zn, Se and Cd between FFPE and fresh-frozen unfixed prostate tissues; 2) to enhance our knowledge of prostate cancer environmental etiology by examining the association of Cd, Zn, Se with the development and progression of cancer using FFPE tissues; 3) to enhance the use of the AFIP National Tissue Repository of archival tissues. First objective has been successfully accomplished based on the development of a method which uses high-resolution inductively-coupled mass-spectrometry (ICP-MS) for the analysis of Zn, Cd, Se including arsenic (As) and iron (Fe) in FFPE prostate tissue. Our results have demonstrated that in comparison with fresh tissue, Fe, Se and As do not show much difference in the FFPE tissue. On the other hand, Zn and Cd resulted in ~40% and ~60% loss, respectively, requiring using the correction factors to assess their content in the original tissue. The technique can be useful in various studies for analysis of archival FFPE tissue, and provides a basis for fulfilling the next aim of the project, the

**cSrc and Her2 Signaling Pathways Cooperate with Estrogen to Promote ER Phosphorylation, Ubiquitination and Proteolysis in ER Negative Breast Cancers**

Chu, Isabel; Mar 2007; 68 pp.; In English; Original contains color illustrations

Contract(s)/Grant(s): W81XWH-04-1-0392

Report No.(s): AD-A468502; No Copyright; Avail.: Defense Technical Information Center (DTIC)

Breast cancer is the most frequent cancer in women. One third of new breast cancers do not express estrogen receptor (ER) protein and these have a worse prognosis than ER positive breast cancers. The ER is a ligand activated transcription factor. Estrogen:ER binding stimulates rapid Src activation that feeds back to phosphorylate the ER and increases its transcriptional activity. Estrogen binding to the ER rapidly activates ubiquitin-dependent ER proteolysis which in turn regulates ER activity. The data that I present here suggest that Src activates ER proteolysis. Src inhibition impaired estrogen stimulated ER ubiquitylation and proteolysis. The weakly ER positive, MDA-MB-361 and ER negative, BT-20 breast cancer lines both have high Src activity. ER was increased by estrogen deprivation, proteasome inhibition. Src inhibitors impaired ER ubiquitylation and degradation both in vivo and in vitro. Src levels or activity were increased in primary ER negative breast cancers compared to ER positive. We proposed that Src, when recruited by ligand dependent or independent ER activation, leads to ER or co-activator phosphorylation to regulate ubiquitin-dependent ER degradation. Some ER negative breast cancers are estrogen responsive: they express ER mRNA but ER protein levels are undetectable due to accelerated Src mediated ER proteolysis. Oncogenic RTK and Src activation may alter phosphorylation of the ER or of key co-regulators to activate both ER proteolysis and ER target gene transcription. The elucidation of mechanisms underlying ER loss in ER negative breast cancer may indicate why these cancers are so clinically aggressive. Pathways identified may yield new targets for molecular based therapies for this treatment-resistant form of breast cancer.

**Adipose Estrogen and Increased Breast Cancer Risk in Obesity: Regulation by Leptin and Insulin**

Samad, Fahumiya; Sep 2006; 8 pp.; In English; Original contains color illustrations

Contract(s)/Grant(s): W81XWH-05-1-0497

Report No.(s): AD-A468503; No Copyright; Avail.: Defense Technical Information Center (DTIC)

Clinical studies suggest that obesity increases the risk for breast cancer and there is convincing evidence that post-menopausal breast cancer risk is highly correlated with serum estrogen levels. One potential link between obesity and breast cancer risk is increased estrogen production by the adipose tissue itself. The adipose tissue produces the enzyme aromatase which catalyses the biosynthesis of estrogen from androgen and also 17-beta-hydroxysteroid dehydrogenase (17-beta HSD) important for the conversion of estrone to estradiol. Our studies have identified two key molecules (insulin and leptin) in obesity that regulates aromatase and 17-beta HSD synthesis in adipose tissues and in adipocytes. The identification of these target molecules that may ultimately induce estrogen production in the setting of obesity may provide a unique therapeutic preventive strategy to reduce systemic estrogen levels and thereby reduce post-menopausal breast cancer risk associated with obesity.

**Eliciting Autoimmunity to Ovarian Tumors in Mice by Genetic Disruption of T Cell Tolerance Mechanisms. Addendum**

Nelson, Brad H; Jan 2007; 18 pp.; In English; Original contains color illustrations

Contract(s)/Grant(s): DAMD17-01-1-0733

Report No.(s): AD-A468504; No Copyright; Avail.: Defense Technical Information Center (DTIC)

We have developed a mouse model for ovarian cancer that allows monitoring of tumor-specific T cell clones as they encounter ovarian tumors in vivo. We 'tagged' the neu oncogene with two defined T cell epitopes so as to confer recognition by available T cell receptor (TCR) transgenic T cells. When expressed in the murine ovarian tumor cell line ID8, epitope-tagged neu (designated neuOT1/OT2) induces the formation of aggressive ovarian adenocarcinomas that express the epitope tags and hence are recognizable by adoptively transferred TCR transgenic T cells. We successfully made the neuOT1/OT2 expression construct and stably expressed it in an aggressive subclone of the ID8 cell line, designated ID8-G7, which was derived by serial in vivo passage of the original ID8 line. When injected intraperitoneally into syngenic mice, ID8-G7 cells expressing neuOT1/OT-II give rise within one month to disseminated ovarian cancer with extensive ascites (Aim 1). CD8+ (OT-I) T cells specific for neuOT1/OT-II proliferate extensively after adoptive transfer into tumor-bearing hosts and, remarkably, induce complete tumour regression within 10 days in a dose-dependent manner (Aim 2). We also showed that the dose-dependency of this response can be mitigated by use of autoimmune-prone Cbl-b-deficient CD8+ T cells (Aim 3). Finally, we demonstrated that ascites from these tumours contains a soluble factor that enhances the proliferation of primary and cultured T cells, which may explain the striking proliferative responses seen in Aim2. Future studies will attempt to identify this soluble factor.

**Development of an Automated Modality-Independent Elastographic Image Analysis System for Tumor Screening**

Ou, Jao J; Miga, Michael I; Feb 2007; 76 pp.; In English; Original contains color illustrations

Contract(s)/Grant(s): W81XWH-05-1-0221

Report No.(s): AD-A468508; No Copyright; Avail.: Defense Technical Information Center (DTIC)

The objective of this project is to further develop modality-independent elastography as a system that is able to reproducibly detect regions of increased stiffness within the breast based on pre- and post- compression input images of the anatomy. As stated in the proposal, the original specific aims are concerned with enhancement of the method, investigation of texture and statistical analyses for evaluating the success of the method, and engineering of a device that can generate proper forces on mock setups within current available clinical imaging systems. To date, progress on each of these aims has been made in handling increased computational complexity, developing and testing metrics for the evaluation of reconstructions, and the fabrication of a compression chamber tested on a tissue-like polymer phantom.

**A MicroRNA Cluster as a Potential Breast Cancer Oncogene**

Hannon, Gregory J; Mar 2007; 8 pp.; In English; Original contains color illustrations

Contract(s)/Grant(s): W81XWH-06-1-0270

Report No.(s): AD-A468511; No Copyright; Avail.: Defense Technical Information Center (DTIC)

microRNAs (miRNAs) are small, regulatory RNAs that silence target genes by repressing translation and destabilizing mRNAs (1). Recent studies have demonstrated the importance of miRNAs in molecular mechanisms for the oncogenic and tumor suppressor pathways (2) (3) (4). We have identified a novel oncogenic miRNA polycistron, mir17-92, as a potential human oncogene in B-cell lymphomas (5). Since mir17-92 is overexpressed in a subset of breast tumor samples, we explored the role of mir17-92 in the tumorigenesis of breast tumor. Mir-17-92 is able to collaborate with c-myc to accelerate breast tumor formation, and we are further characterizing the molecular mechanisms for this oncogenic collaboration. In addition, we have recently identified a miRNA component of the p53 pathway. mir-34 family microRNAs are direct transcriptional target of p53, and are able to induce growth arrest in both primary cells and tumor cell lines. Since p53 pathway is an important tumor suppressor mechanism in breast cancer development, we will further look into the roles of mir-34 miRNAs in preventing tumorigenesis in breast epithelia.

**Mechanisms and Chemoprevention of Ovarian Carcinogenesis**

Patriotis, Christos; Feb 2007; 10 pp.; In English; Original contains color illustrations

Contract(s)/Grant(s): W81XWH-04-1-0064

Report No.(s): AD-A468512; No Copyright; Avail.: Defense Technical Information Center (DTIC)

Due to its asymptomatic development and frequent diagnosis at advanced stages ovarian cancer is the most deadly among the gynecological cancers. A better understanding of the early molecular events leading to the disease is of utmost importance for the development of strategies for its efficient early diagnosis and prevention which could improve patient survival and quality of life. We have shown that DMBA-induced mutagenesis in the rat ovary combined with gonadotropin hormone-mediated enhanced mitogenesis of the ovarian surface epithelium gives rise to lesion 5 ranging from preneoplastic to early neoplastic and advanced ovarian tumors which resemble the human disease. The goal of the study is to use this animal model to study the molecular mechanisms behind ovarian oncogenesis and to conduct a preclinical trial for its chemoprevention. The aims of the study are: 1) Determine the molecular genetic mechanisms behind ovarian oncogenesis in the DMBA/gonadotropin-animal model; 2) Determine the efficacy of the COX-1 inhibitor SC-560 to prevent the appearance and/or progression of DMBA-induced ovarian lesions; and 3) Study the in vivo mechanisms of the putative chemopreventive effect of COX-2 inhibition. Genomic and mutation analyses as well as other molecular biology assay 5 will be employed to accomplish the objectives of the study.

**Targeting Breast Cancers Featuring Activating Mutations in PIK3CA by Generating a Lethal Dose of PIP3**

Zhao, Jean J; Feb 2007; 7 pp.; In English; Original contains color illustrations

Contract(s)/Grant(s): W81XWH-06-1-0341

Report No.(s): AD-A468513; No Copyright; Avail.: Defense Technical Information Center (DTIC)

Our research described here is relevant to the pathogenesis and a potential novel therapy for breast cancers. The PIK3CA is the most commonly mutated oncogene in breast cancer and loss of the tumor suppressor PTEN occurs frequently in patients suffering from this disease. The most significant accomplishment during the first year of funding is the generation of the oncogenic PIK3CA transgenic animal model which will allow us to determine the oncogenic role of PIK3CA in tumor initiation progression maintenance and metastasis etc. It should also significantly facilitate preclinical testing for the development of PI3K inhibitors for targeted therapy. Our final goal of simultaneous inactivation of PTEN and activation of PIK3CA will not only provide a new perspective on the relationship of the two key oncogene and tumor suppressor PIK3CA and PTEN and the signaling pathway under their control in cell regulation and oncogenic transformation but also a potential novel therapy to all patients plagued with the common tumorigenic mutations.

**PARK2, a Large Common Fragile Site Gene, is Part of a Stress Response Network in Normal Cells That is Disrupted During the Development of Ovarian Cancer**

Smith, David I; Zhu, Yu; Jan 2007; 20 pp.; In English; Original contains color illustrations

Contract(s)/Grant(s): W81XWH-04-0082

Report No.(s): AD-A468514; No Copyright; Avail.: Defense Technical Information Center (DTIC)

PARK2 (Parkin) is an extremely large gene that spans greater than 1.3 megabases of genomic sequence within chromosomal band 6q26. This gene is derived from within the distal end of the highly unstable FRA6E (6q26) common fragile site (CFS). CFSs are large chromosomal regions that are highly unstable, found in all individuals, and prone to deletions and other aberrations, especially in developing cancer cells. The central two questions that we want to address with this work are what role does inactivation of Parkin and other large CFS genes play in the development of ovarian cancer and whether these genes function as part of a stress response network. In order to address these two questions, we have analyzed the effect of re-introducing Parkin (and several other large CFS genes) into ovarian cancer cell lines that do not express it. We have now shown that the re-introduction of Parkin, and several other CFS genes, is associated with greater sensitivity to the induction of apoptosis. This is consistent with our hypothesis that the inactivation of these genes contributes to ovarian cancer development. We have now identified 20 extremely large genes like Parkin that reside within CFS regions. To determine if these genes are randomly inactivated during cancer development, we have utilized realtime RT-PCR analysis to measure the expression of a number of these genes including Parkin in panels of cancer cell lines and primary tumors for cancers of the prostate, ovary, breast, brain and liver. This analysis reveals a decidedly non-random inactivation of the expression of these genes in different cancers. In addition, we've found that there is a greater inactivation of expression of the large CFS genes (and greater numbers of these genes inactivated) in cancers that are generally more aggressive and have a poorer overall clinical prognosis.

**20070027776** Duke Univ., Durham, NC USA

**Biological Basis for Chemoprevention of Ovarian Cancer**

Berchuck, Andrew; Oct 2006; 60 pp.; In English; Original contains color illustrations

Contract(s)/Grant(s): DAMD17-02-1-0666

Report No.(s): AD-A468515; No Copyright; Avail.: Defense Technical Information Center (DTIC)

To achieve a better understanding of the etiology of ovarian cancer we have initiated a case-control study that considers genetic susceptibility epidemiologic risk factors and acquired genetic alterations. Subjects are interviewed in their homes and about 950 cases and 950 controls have been accrued thus far. Blood and cancer samples have been collected and molecular analyses of polymorphisms in single genes including most recently the androgen receptor have been performed. We also have performed an Illumina array experiment with 1 536 haplotype tagging single nucleotide polymorphisms in about 150 candidate genes. This data presently is being analyzed. We also have played a leadership role in establishing an international consortium in which groups are working together to validate initial positive associations. An initial ovarian cancer chemoprevention trial with levoneoresterel in chickens demonstrated a protective effect and we have shown that progestin mediated apoptosis in the ovarian epithelium is mediated by transforming growth factor-beta. In vitro data has suggested that vitamin D analogues may also represent appealing chemopreventives. A chemoprevention trial in chickens that incorporates both progestins and vitamin D analogues is near completion. These studies have the potential to increase our ability to identify high-risk women and to lead to the development of chemoprevention strategies that might decrease mortality from this disease.

**Short-Term Exercise and Prostate Cancer Prevention in African American Men**

Taylor, Teletia R; Apr 2007; 7 pp.; In English; Original contains color illustrations

Contract(s)/Grant(s): W81XWH-05-1-0366

Report No.(s): AD-A468516; No Copyright; Avail.: Defense Technical Information Center (DTIC)

This study seeks to examine the impact of exercise on serum factors related to prostate cancer in African-American men. Aims and Objectives: 1. To recruit 40 African-American men between the ages of 40 and 70 who are at increased risk for developing prostate cancer and randomize them into an exercise intervention or control group. 2. To examine the effect of 12 days of aerobic exercise over 4 weeks on PSA levels in African-American men who have PSA levels under 4.0 ng/ml. 3. To

examine the effect of 12 days of aerobic exercise on free and total testosterone insulin IGFI and SHBG levels in African-American men. A total of 40 African-American men between the ages of 40 - 70 yrs from the Howard University Cancer Center prostate screening program that have a PSA under 4.0 ng/ml a BMI > 25 and <35 kg/m2 <375 pounds and have been sedentary for at least 6 months (not exercising for more than 20 minutes 2 days a week). The men will be randomized into 2 groups 12 days of aerobic exercise (20 participants) or a control group (20 participants). The 12 days of exercise will consist of 30 minutes of walking on a treadmill at 50 - 60% of maximal heart rate reserve (HRR). Free testosterone lipids glucose insulin SHBG psychosocial measures body weight BMI and body fat anthropometric measurements height and weight will be measured before and after the study.

Lee, Peter P; Mar 2007; 18 pp.; In English; Original contains color illustrations

Contract(s)/Grant(s): W81XWH-06-1-0417

Report No.(s): AD-A468517; No Copyright; Avail.: Defense Technical Information Center (DTIC)

This first year of this award has been one of intense infrastructure building. This included recruitment and training of two excellent research associates, two PhD postdoctoral fellows, and one part-time student. I spent several months working closely with Dr. Donna Ferrandino on a human subjects protocol which was approved in August by both the Stanford IRB (protocol ID 4408) and DoD HSRRB (A-13776.2). This enabled us to work closely with our surgery and pathology colleagues to develop an efficient system of identifying, recruiting, and consenting subjects, and to obtain samples from the operating room to pathology and eventually to my laboratory. We tested multiple protocols to maximize recovery of immune cells from tumor and lymph node specimens. We also optimized methods for analysis of fresh and archive samples by flow cytometry, immunohistology, immunofluorescence, function assays, and DNA microarray analysis. The attached annual report is a summary of our progress in relation to my proposed SOW.

**Telemedicine Based Ultrasound for Detecting Neonatal Heart Disease in Babies at Remote Military or Native American Health Care Facilities**

Sahn, David J; Kinney, James; Puntel, Robert; Mar 2007; 14 pp.; In English; Original contains color illustrations

Contract(s)/Grant(s): DAMD17-03-1-0109

Report No.(s): AD-A468518; No Copyright; Avail.: Defense Technical Information Center (DTIC)

Our partnership of investigators from Madigan Army Medical Center at Fort Lewis Washington and Oregon Health & Science University in Portland will test the hypothesis that trained primary care practitioners or nurses can with telemedicine supervision perform cardiac ultrasound exams on neonates at risk for heart disease and thereby impact time to diagnosis and outcomes. This study is targeted at Military Medical Facilities within TRICARE West and Western Regional Medical Command. It will also include two large Alaska Native Health Care Centers. Echocardiography has had major impact in the management of neonates suspected of having congenital heart disease. The expensive specialized equipment and significant expertise to adequately perform and interpret these studies usually is present only in tertiary level medical centers with a pediatric cardiologist on staff. Initial results of a National Multicenter Neonatal Telemedicine Echo Outcomes Study developed by the Principal Investigator suggest that telemedicine-implemented diagnosis positively affects outcomes in infants suspected of having congenital heart disease. Our partnership has trained 33 non cardiologists to perform neonatal echo and has installed a high bandwidth telecommunications link using the military version of Internet2 NIPRNET. By spring of 2007 we will be overseeing neonatal echo exams from 3 military installations in the NW and in Alaska as well as a large Alaska Native Health Center in Anchorage. We have also arranged to upgrade the scanners used in our network to the latest architecture from Sonosite: the fully digital phased array handheld ultrasound scanner the MicroMaxx.

**Prevention of Prostate Cancer by Inositol Hexaphosphate**

Banerjee, Partha P; Feb 2007; 19 pp.; In English; Original contains color illustrations

Contract(s)/Grant(s): DAMD17-03-1-0080

Report No.(s): AD-A468519; No Copyright; Avail.: Defense Technical Information Center (DTIC)

Prostate cancer (PCa) is the most common invasive malignancy and second leading cause of cancer death in men in the USA. Up till now, hormone ablation therapy is the major way to treat PCa. Such therapy only causes a temporary regression and tumor growth resumes within 6-18 months. Therefore, better androgen blockade is not the answer for treating PCa. Rather, research efforts should focus on the therapeutic agents that will inhibit growth factor signaling pathways and thereby inhibit growth. A large number of studies have pointed out that inositol hexaphosphate (IP6) could have beneficial effect on variety of cancers. The specific aims of this proposal are to determine (1) the in vivo effects of IP6 on the growth of PCa (2) the efficacy of IP6 in inhibiting growth factor-induced DNA synthesis of the PCa cells in vitro, and (3) the molecular mechanisms by which IP6 inhibits growth of PCa cells. The information we obtain from these experiments will provide a better understanding of the potential role of IP6 in the prevention of growth of PCa cells. This information will lead to more effective PCa prevention and treatment strategies in human that might prolong the longevity of men with prostate cancer.

**GKLF as a Novel Target in Selenium Chemoprevention of Prostate Cancer**

Dong, Yan; Feb 2007; 23 pp.; In English; Original contains color illustrations

Contract(s)/Grant(s): W81XWH-04-1-0009

Report No.(s): AD-A468520; No Copyright; Avail.: Defense Technical Information Center (DTIC)

The present study investigated the functional significance of the zinc finger transcription factor gut-enriched kruppel-like factor (GKLF) in mediating selenium action in the androgen receptor (AR)-null PC-3 human prostate cancer cells. We found that overexpression of GKLF enhances selenium inhibition of DNA synthesis and induction of apoptosis. Furthermore knocking down the expression of GKLF greatly attenuates the growth suppressive and apoptosis inducing activities of selenium. Therefore our data support an important role of GKLF induction in selenium action in the AR-null prostate cancer cells. However we found that in cells expressing a functional AR the disruption of AR signaling is most likely more important than the induction of GKLF signaling for selenium action. Selenium treatment significantly decreases the expression of AR and AR-regulated genes implicated in prostate carcinogenesis (PSA KLK2 ABCC4 DHCR24 and GUCYIA3) in five human prostate cancer cell lines irrespective of their AR genotype (wild-type vs. mutant) or sensitivity to androgen-stimulated growth. Transfection of AR in the androgen-dependent LNCaP cells weakens significantly the inhibitory effect of selenium on cell proliferation and AR target gene expression. Since the vast majority of prostate cancers including those refractory to hormone therapy express a functional AR the disruption of AR signaling is probably more important for selenium action and more relevant to selenium chemoprevention of prostate cancer than the induction of GKLF.

**The Use of a Cognitive Protectant to Help Maintain Quality of Life and Cognition in Premenopausal Women with Breast Cancer Undergoing Adjuvant Chemotherapy**

Klemp, Jennifer R; Oct 2006; 18 pp.; In English; Original contains color illustrations

Report No.(s): AD-A468521; DAMD17-03-1-0670; No Copyright; Avail.: Defense Technical Information Center (DTIC)

Significant reductions in quality of life and cognitive function are experienced by women with breast cancer receiving adjuvant chemotherapy. These decrements can be identified in some women even several years following treatment. The majority of relevant research has been based on retrospective data in women with breast cancer. Moreover, current estimates suggest that 25% of breast cancers will be diagnosed in women under age 50, and very little data are available regarding younger women's cognitive function and quality of life during chemotherapy. The goal of the proposed study is to examine change in cognitive function and quality of life in 30 pre-menopausal women with breast cancer receiving chemotherapy. To determine if accelerated menopause is associated with change in cognition and quality of life, serum hormone levels, measures of cognitive function, quality of life variables, and symptoms of depression will be assessed. Measures will be collected at baseline before the initiation of chemotherapy, prior to the third cycle of chemotherapy, and following completion of chemotherapy, but prior to any additional treatment. A better understanding of the association between chemotherapy and

quality of life is essential to provide appropriate preventive approaches and interventions aimed at maximizing the quality of life and health of young women diagnosed with breast cancer.

Six academically qualified students 3 each from Delaware St. University (DSU) and Lincoln University were offered slots in the PCR program. Five accepted: 3 from Lincoln and 2 from DSU. Students did 10-week research rotations in addition to attending research seminars and roundtable discussions on the basis of health disparities. This latter topic was not in the initial grant but was received favorably. Students presented research posters in a joint undergraduate research symposium at the end of the summer with almost 200 other students from several summer student research programs. In a poster session at Lincoln University our DoD students swept the prizes for biology I group competition. Students also took their posters to other national meetings. Graduating students from Lincoln University and Del. St. University are applying to Graduate Schools for post-baccalaureate education. One still intends to apply to Medical School. The PI Co-PI and a mentor (Cooper) gave prostate and health disparity lectures at Lincoln University and Delaware State University in 2006. This will continue in 2007. In addition outside speakers of prominence are being recruited to speak in the program.

**Effects of Herstatin, an Alternative HER-2 (erbB-2) Product, on Hormonal Responsiveness of Breast Cancer**

Clinton, Gail M; Jun 2006; 9 pp.; In English; Original contains color illustrations

Contract(s)/Grant(s): DAMD17-03-1-0336

Report No.(s): AD-A468526; No Copyright; Avail.: Defense Technical Information Center (DTIC)

The HER-2 receptor tyrosine kinase (erbB-2) and the estrogen receptor (ER) participate in the establishment and progression of breast cancer. While the anti-estrogen tamoxifen is used as a therapeutic resistance is a clinical problem. Over expression of HER-2 confers resistance to the antiestrogen tamoxifen. The objective was to evaluate the effects of Herstatin a naturally occurring inhibitor of the HER-2 receptor on hormonal responsiveness of breast cancer cells. scope. The effects of Herstatin were tested on MCF-7 and McF-7/HER-2 breast carcinoma cells by stable transfection or treatment with Herstatin in the presence or absence of estrogen. There was no effect of Herstatin on hormonal response of MCF-7 cells with low levels of HER-2 in vivo or in vitro. In McF-7/HER-2 cells, Herstatin enhanced response to estrogen and depressed levels of HER-3. These studies suggest that Herstatin has no effect on hormonal response of MCF7 cells with low levels of HER-2 but may restore hormonal response to breast cancer cells that overexpressHER-2.

**Effects of Extracellular Matrix on DNA Repair in Vivo**

Rizki, Aylin; Sep 2006; 9 pp.; In English; Original contains color illustrations

Contract(s)/Grant(s): W81XWH-05-1-0526

Report No.(s): AD-A468527; No Copyright; Avail.: Defense Technical Information Center (DTIC)

DNA damage in the form of double-strand breaks is caused by exposure to endogenous factors as well as in response to radiation therapy in breast cancer patients. Double-strand breaks can be repaired by homologous recombination or nonhomologous end joining pathways, both of which can lead to error-prone repair. Errors in repair lead to accumulation of mutations that may accelerate the process of tumorigenesis and malignant transformation. Apart from cell cycle effects, little is known about which factors contribute to the determination of double-strand break efficiency or pathway choices in mammalian cells. We previously showed that extracellular matrix signaling can regulate double-strand break repair pathway choice in a human breast epithelial cell line. Furthermore, we find that the kinetics of foci formation by a DNA damage signaling protein after ionizing radiation is altered by extracellular matrix signaling. Here we found that in primary mouse mammary epithelial cells extracellular matrix signaling regulates double-strand repair, as well as the kinetics of damage signaling after ionizing radiation. Having shown that the effects of ECM on DNA damage signaling and repair are generalizable, we will use mouse models with altered extracellular matrix signaling or DNA repair components to genetically dissect this pathway in vivo.

**Non-Invasive Markers of Tumor Growth, Metastases, and Sensitivity to Anti-Neoplastic Therapy**

Koutcher, Jason A; Jan 2007; 13 pp.; In English; Original contains color illustrations

Contract(s)/Grant(s): W81XWH-05-1-0108

Report No.(s): AD-A468529; No Copyright; Avail.: Defense Technical Information Center (DTIC)

The goals of this application are to develop methods to non-invasively differentiate fast and slow growing prostate tumors and also develop methods to evaluate response to anti-angiogenic agents. Validation of the results will be based on tumor growth metastases and microvessel density measurement (anti-angiogenic studies). To date we have focused on optimizing the pulse sequences necessary for lactate detection synthesizing a macromolecular contrast agent and optimizing its use. These goals have been more difficult to achieve but we are now able to localize lactate within a voxel of the tumor with quantitation and have finished synthesizing the macromolecular contrast agent and been using it in studies.

**Three-Dimensional near Infrared Imaging of Pathophysiological Changes within the Breast**

Yalavarthy, Phaneendra K; Mar 2007; 98 pp.; In English; Original contains color illustrations

Contract(s)/Grant(s): W81XWH-06-1-0328

Report No.(s): AD-A468530; No Copyright; Avail.: Defense Technical Information Center (DTIC)

Diffuse Optical tomography is a non-invasive and non-ionizing medical imaging technique that can image functional properties of biological tissue using Near Infrared (NIR) light. Image reconstruction methods play an important role in characterizing the breast tissue optical properties. New reconstruction methods/algorithms which improve the quantitative and qualitative accuracy of NIR images are developed. At same time, existing methods/algorithms are optimized for the current clinical set up. Algorithms which will take an account of noise characteristics of the instruments were also developed to get an optimal estimate of breast tissue optical properties. Moreover, new methods for effectively using Magnetic resonance image information in NIR image reconstruction procedure were also developed to improve the total outcome of NIR functional images of breast.

Erdman, Susan E; Feb 2007; 21 pp.; In English; Original contains color illustrations

Contract(s)/Grant(s): W81XWH-05-1-0460

Report No.(s): AD-A468531; No Copyright; Avail.: Defense Technical Information Center (DTIC)

Recent studies suggest that inflammation is a key contributor to development of breast cancer in women. Increasing scientific and medical data point to immune cells in particular pro-inflammatory CD4+ effector (TE) cells and anti-inflammatory CD4+regulatory (TR) cells as pivotal mediators in human health and disease. We have previously demonstrated that anti-inflammatory TR cells prevent colorectal cancer (CRC) in mice by suppressing inflammatory growth factors. We show here that transfer of pro-inflammatory TE cells or infection with pro-inflammatory intestinal bacteria *Helicobacter hepaticus* rapidly promotes mammary tumor development in the *ApcMin/+* mouse model and that adoptive transfer of TR cells inhibits development of inflammation-associated mammary tumors induced by either pro-inflammatory cells or intestinal bacteria in those mice. Targeting deleterious host inflammatory responses may be more effective and less toxic than traditional chemotherapeutic approaches to neoplasia. Ability to understand and harness the potency of TR cells to suppress inflammatory carcinogenic processes may prevent and ultimately abolish breast malignancies in women.

Ben-Jonathan, Nira; Mar 2007; 13 pp.; In English

Contract(s)/Grant(s): W81XWH-06-1-0359

Report No.(s): AD-A468538; No Copyright; Avail.: Defense Technical Information Center (DTIC)

The objective of this investigation is to examine the protective effects of prolactin (PRL) against anti-cancer drugs. Three specific aims were formulated: 1) To characterize the protective effects of PRL against several anticancer drugs 2) To determine anti-apoptotic mechanism(s) and 3) To examine the protective effects of PRL in vivo. Good progress has been made in all objectives as follows. First we have shown the protective effects of PRL against taxol cisplatin and vinblastine in more than one breast cancer cell line. Two we defined the window of time for the action of PRL. Three we have established qualitative and quantitative assays for apoptosis. Due to taxol cytotoxicity initial in vivo studies were unsuccessful. Future research will be redirected to an emphasis on anti-cancer drugs other than taxol and the use of SCID rather than PRL4- mice.

**Detection of Genes Modifying Sensitivity to Proteasome Inhibitors Using a shRNA Library in Breast Cancer**

Hannon, Gregory J; Mar 2007; 9 pp.; In English

Contract(s)/Grant(s): W81XWH-06-1-0249

Report No.(s): AD-A468539; No Copyright; Avail.: Defense Technical Information Center (DTIC)

The application of RNAi has transformed the way we approach mammalian cell genetics. Over the past year we have made significant progress in several areas that have enhanced the use of shRNAs as a tool for genetic screens. Our second-generation shRNA retroviral library now covers 32,202 genes (86,128 clones) for human and 30,629 genes (76,896

clones) for mouse genomes. These shRNA can be delivered into cells both in vitro and in vivo using our optimized viral expression vectors. More importantly with these tools we have successfully demonstrated the feasibility of performing genetic screens in mouse and human cells through our pilot efforts. Using the 'synthetic-lethal genetic approach we can now perform drug-induced synthetic-lethal screens by using cancer drugs that are currently in clinical trials. This is important as cancer cells can often become resistant to the toxic effects of chemotherapeutics. Bortezomib (Velcade) is the first targeted therapeutic to the proteasome approved by the FDA for treatment against multiple myeloma and is currently in phase II clinical trials for breast and lung cancers. Our goal is to identify genes that mediate resistance against Velcade that could serve as potential drug targets. RNAi technology is a powerful tool that could potentially be used to study and treat other human diseases through its application to mammalian cell genetics.

**Development of Novel Bifunctional Compounds that Induce Apoptosis in Prostate Cancer Cells**

Essigmann, John M; Mar 2007; 8 pp.; In English; Original contains color illustrations

Contract(s)/Grant(s): W81XWH-06-1-0183

Report No.(s): AD-A468546; No Copyright; Avail.: Defense Technical Information Center (DTIC)

We have designed and synthesized a novel compound (11beta) that efficiently triggers apoptosis in prostate cancer cells such as LNCaP. This bifunctional compound was designed to form DNA adducts that are camouflaged by the androgen receptor making them less readily repaired in AR+ prostate cancer cells. The aims of our studies are to investigate the mechanisms by which 11 is able to trigger apoptosis in target cells. Methods have been developed that permit us to determine the fates of 11 -DNA adducts in treated cells in culture as well as in tumors growing in animal models. Another objective is to identify the signaling events that lead from DNA adducts to activation of the apoptotic program. Finally we have obtained encouraging results from animal experiments that indicate that molecules such as 11 may have clinical potential for the treatment of human tumors.

**Detection and Evaluation of Early Breast Cancer via Magnetic Resonance Imaging: Studies of Mouse Models and Clinical Implementation**

Arkani-Hamed, Sanaz; Mar 2007; 133 pp.; In English; Original contains color illustrations

Contract(s)/Grant(s): W81XWH-06-1-0329

Report No.(s): AD-A468562; No Copyright; Avail.: Defense Technical Information Center (DTIC)

Mice are widely used in the study of breast cancer to increase understanding of cancer development and to evaluate new therapies. Noninvasive imaging methods are a crucial component of the effective use of mouse models of breast cancer. However prior imaging studies of mammary cancer in mice have focused on large palpable tumors at an advanced stage of invasion that are rarely orthotopic and are poor models for the human cancers commonly seen clinically. Here high resolution MR was used to image spontaneous early and nonpalpable cancers transgenic mouse model of breast cancer. After correlation with histology MRI was able to clearly detect large 5mm tumors small nonpalpable 0.5-1.5mm tumors and even smaller ducts distended with preinvasive ductal carcinoma in situ 300500 microns in diameter with very high sensitivity and specificity. This is the first report of in vivo imaging of early spontaneous mouse mammary cancer. Because of its similarity to human breast cancer in vivo MRI of early orthotopic murine mammary cancer will be an important tool for real time study of the development and progression of breast cancer in vivo. These techniques can be used to develop new therapies that target early breast cancer and to find new ways of detecting early breast cancer.

**Restoration of Wild-Type Activity to Mutant p53 in Prostate Cancer: A Novel Therapeutic Approach**

Manfredi, James J; Jan 2007; 8 pp.; In English

Contract(s)/Grant(s): W81XWH-05-1-0109

Report No.(s): AD-A468564; No Copyright; Avail.: Defense Technical Information Center (DTIC)

A summary is presented of research performed during the second year of a project to explore approaches to restore

wild-type function on mutant p53 proteins found in human prostate tumors. p53 mutant proteins derived from prostate tumors are being characterized to determine their suitability. Three specific aims are being pursued. The first is characterizing the interaction of p53 with two distinct classes of its response elements. The second aim is determining the role of mutant p53 proteins in prostate cancer cell proliferation. The final aim is to explore approaches to restore wild-type function to mutant p53 proteins found in prostate cancer. This is a chemical biological approach with the goal of restoring wild-type function to prostate tumor- derived mutant p53 proteins. This research is geared towards preclinical development of a highly targeted therapy for human prostate cancer.

**Preventing Epilepsy after Traumatic Brain Injury**

Dichter, Marc A; Feb 2007; 8 pp.; In English

Contract(s)/Grant(s): W81XWH-05-1-0020

Report No.(s): AD-A468565; No Copyright; Avail.: Defense Technical Information Center (DTIC)

The purpose of this study is to determine the safety and tolerability of topiramate (TPM) in the treatment of early seizures following traumatic brain injury (TBI) and to compare the efficacy of TPM to prevent early seizures to the standard of care (phenytoin). A secondary objective is to obtain the data necessary to design a randomized clinical trial to determine if TPM can prevent epilepsy and improve neurological outcome after TBI. In the first two years of the study we formulated the protocol and all documents required by regulatory bodies. These were approved by the IRB at the University of Pennsylvania HSRRB at the US Army and the FDA. The infrastructure for the study was established relevant personnel were hired and the patient recruitment methods interactions with the trauma center neurosurgical services EEG laboratory pharmacy etc. were organized in order to conduct the research. Patient recruitment was begun but after screening more than 100 prospective patients with TBI no patients were able to be admitted to the study as it was constituted for several unforeseen technical reasons. The protocol has been revised to eliminate these obstacles. In addition a NINDS-sponsored workshop on Biomarkers for Epileptogenesis was held and a program of new potential biomarkers was incorporated into the study.

**Military Nutrition Research: Four Tasks to Address Personnel Readiness and Warfighter Performance**

Ryan, Donna; Mar 2007; 53 pp.; In English; Original contains color illustrations

Contract(s)/Grant(s): W81XWH-05-2-0081

Report No.(s): AD-A468579; No Copyright; Avail.: Defense Technical Information Center (DTIC)

Background: Pennington Biomedical Research Center (PBRC) continues a 19 year collaborative effort with the Department of Defense (DOD) in this research effort. Objectives: To assess and evaluate novel ways to sustain warfighter performance during high intensity missions at home and abroad, under special funded cooperative agreements between the US

Army Medical Research and Materiel Command (USAMRMC) and PBRC, PBRC provides high quality analytical laboratory, nutrition database and metabolic unit support for military nutrition clinical research protocols. Specific Aims: PBRC performed four research tasks as follows: Task 1: Clinical Laboratory for Human Samples; Task 2: Stable Isotope Laboratory; Task 3: Nutrient Database Laboratory; Task Metabolic Unit Project. During the year of this report, the four tasks supported eight projects directed by USARIEM investigators. Study Design: In consultation with the Project Officer at US Army Research Institute of Environmental Medicine (USARIEM), PBRC Task Leaders for Tasks 1 and 2 determine the number, timing, type of sample and type of analysis. Analysis of relevant endpoints in the PBRC Clinical Laboratory and Stable Isotope Laboratory provides information useful for determination of energy expenditure, water turnover, body composition, clinical biochemistry and metabolism. In consultation with the Project Officer, the Task Leader for Task 3 provides assistance with food intake analysis and nutrient composition. In consultation with the Project Officer, the Task Leader for Task 4 provides access to the PBRC Metabolic Unit, where capabilities exist for clinical studies of relevance to energy metabolism using state of the art facilities for metabolic chambers and magnetic resonance spectroscopy.

**The Use of Cognitive Task Analysis and Simulators for After Action Review of Medical Events in Iraq**

Clark, Richard E; Dec 2006; 24 pp.; In English; Original contains color illustrations

Contract(s)/Grant(s): W81XWH-04-C-0093

Report No.(s): AD-A468582; No Copyright; Avail.: Defense Technical Information Center (DTIC)

Prior attempts to use standard 'self report' or interview protocols to extract After Action Review (AAR) descriptions of emergency event decision making and problem solving strategies generated by participants are problematical. Cognitive psychological studies suggest that the resulting information often contains significant errors and omissions (Glaser et al., 1985; Besnard, 2000). These errors are not often recognized by participants who solved important problems in emergency situations and wish to give accurate reports on their solutions because the knowledge they are describing is largely automated and unconscious (Wheatley & Wegner, 2001). The problem is further complicated by the fact that experienced medical personnel mistakenly believe that their reports are complete and accurate and that they solved the problems they are describing in a conscious, willful, deliberate manner (Wegner, 2002). These reporting errors most likely increase in number and severity under time-pressure battlefield situations (Hunt & Joslyn, 2000). This research attempts to improve medical AAR with a novel combination of Cognitive Task Analysis conducted while interviewees moulage simulators (Clark and Estes, 2002; Clark & Estes, 1996; Velmahos et al, 2002). Nine trauma surgeons who have used Argyle-type shunts to repair femoral artery damage have been interviewed separately and together. Data from these interviews are being analyzed for a report that will be written by 12/31/2006. It is hypothesized that our protocol which employed a novel combination of medical Cognitive Task Analysis combined with the moulage of instruments and depictions of the femoral artery will more accurately capture the mix of automated and conscious decisions used to solve critical medical problems faced in battlefield situations.. Each surgeon was interviewed separately and after reviewing the results, each surgeon was asked to correct and improve on the information gathered from the 'other' surgeons.

**The Use of Cognitive Task Analysis and Simulators for After Action Review of Medical Events in Iraq**

Clark, Richard E; Mar 2007; 41 pp.; In English; Original contains color illustrations

Contract(s)/Grant(s): W81XWH-04-C-0093

Report No.(s): AD-A468583; No Copyright; Avail.: Defense Technical Information Center (DTIC)

Prior attempts to use standard 'self report' or interview protocols to extract After Action Review (AAR) descriptions of emergency event decision making and problem solving strategies generated by participants are problematical. Cognitive psychological studies suggest that the resulting information often contains significant errors and omissions (Glaser et al., 1985; Besnard, 2000). These errors are not often recognized by participants who solved important problems in emergency situations and wish to give accurate reports on their solutions because the knowledge they are describing is largely automated and unconscious (Wheatley & Wegner, 2001). The problem is further complicated by the fact that experienced medical personnel mistakenly believe that their reports are complete and accurate and that they solved the problems they are describing in a conscious, willful, deliberate manner (Wegner, 2002). These reporting errors most likely increase in number and severity under time-pressure battlefield situations (Hunt & Joslyn, 2000). This research attempts to improve medical AAR with a novel

combination of Cognitive Task Analysis (CTA) conducted while interviewees moulage simulators (Clark and Estes, 2002; Clark & Estes, 1996; Velmahos et al, 2002). Nine trauma surgeons, who have used Argyle-type shunts to repair femoral artery damage, were interviewed, in which they simply described (no CTA) the procedure. A full CTA was conducted with a tenth trauma surgeon with similar experience in the procedure. The interviews were coded and compared with a gold standard protocol. It was hypothesized that our protocol which employed a novel combination of medical Cognitive Task Analysis combined with the moulage of instruments and depictions of the femoral artery will more accurately capture the mix of automated and conscious decisions used to solve critical medical problems faced in battlefield situations.

**COHORT: An Integrated Information Approach to Decision Support for Military Subpopulation Health Care**

Reichard, G D; Demitry, Peter; Catalino, Joseph; Sep 2004; 31 pp.; In English; Original contains color illustrations  
Report No.(s): AD-A466937; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA466937>

Delayed recognition and response to health syndromes in the past have highlighted the critical need for real-time surveillance of the health status of forces as an enabling capability for decision makers. Real-time surveillance serves to alert health authorities and make possible rapid, appropriate, and effective responses to limit the adverse impact of occupational and operational threats to health. In support of Force Health Protection, the USAF Surgeon General has recognized a need for early detection of syndromes and epidemics in specific cohorts (subpopulations) over time. Cohort surveillance and monitoring require analytical tools and access to pertinent, timely, and consolidated medical data. The Composite Occupational Health and Operational Risk Tracking system (COHORT) addresses the USAF Surgeon General's need by providing real-time surveillance of the medical care and treatment of specified groups of military personnel across multiple medical health facilities throughout the world. The medical encounter data aggregated by COHORT provide input for timely detection and monitoring of occupational health concerns and disease trends, syndromes, and outbreaks. The early detection made possible by COHORT avails key decision makers the opportunity to formulate appropriate responses in time to make a difference in the outcome.

**Weathering the Storm. Leading Your Organization Through a Pandemic**

Prior, Stephen; Armstrong, Robert; Rowan, Ford; Hill-Harmon, Mary B; Nov 2006; 78 pp.; In English; Original contains color illustrations

Report No.(s): AD-A466801; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA466801>

A storm is coming. None of us have ever experienced a storm like this. It could arrive very soon. But, as anyone who makes a living as a forecaster will quickly say, On the other hand . . . The storm is, of course, an influenza pandemic. Much has been written in the past few years about the virus known as H5N1 and its potential to develop into a pandemic. Some in the scientific community are questioning whether that will ever happen. If H5N1 does become pandemic, we have no basis for predicting whether it will be this year or 10 years from now. After all, H5N1 was first identified in birds in 1961; the first human cases did not appear until 1997. There is little doubt, though, that eventually something most likely a virus will mutate into a pandemic form. The SARS outbreak in February 2003 is a good example of how a lethal virus can emerge suddenly. We were fortunate that SARS, while contagious, did not become pandemic. The SARS outbreak and the emergence of H5N1 avian influenza provide us with a forewarning of the problems a larger outbreak will pose. It is prudent to use this time before the storm to plan for the societal disruption a pandemic will cause. A pandemic poses problems that most disasters even ordinary public health disasters do not present. First, the time period of the disaster is extended; the 1918 pandemic lasted about 18 months, with three distinct peaks of infection and illness. Another issue with a pandemic is its geographic spread; modern air travel can deliver any pathogen worldwide in a very short time frame. Thus, our planning has to take into account the necessity to change our social behaviors and possibly restrict our movements to limit the pathogen's spread.

**Protection with Recombinant Clostridium botulinum C1 and D Binding Domain Subunit (Hc) Vaccines Against C and D Neurotoxins**

Webb, Robert P; Smith, Theresa J; Wright, Patrick M; Montgomery, Vicki A; Meagher, Michael M; Smith, Leonard A; Mar 16, 2007; 11 pp.; In English; Original contains color illustrations

Contract(s)/Grant(s): Proj-USAMRIID-02-4-3U-064

Report No.(s): AD-A468185; ARL-TR-06-114; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA468185>

Recombinant botulinum Hc (rBoNT Hc) vaccines for serotypes C1 and D were produced in the yeast *Pichia pastoris* and used to determine protection against four distinct BoNT C and D toxin subtypes. Mice were vaccinated with rBoNT/C1 Hc, rBoNT/D Hc, or with a combination of both vaccines and challenged with BoNT C1, D, C/D, or D/C toxin. Mice receiving monovalent vaccinations were partially or completely protected against homologous toxin and not protected against heterologous toxin. Bivalent vaccine candidates completely survived challenges from all toxins except D/C toxin. These results indicate the recombinant C1 and D Hc vaccines are not only effective in a monovalent formula but offer protection against both parental and mosaic toxins when delivered as a bivalent vaccine.

**fRMSDPred: Predicting Local RMSD Between Structural Fragments Using Sequence Information**

Rangwala, Huzefa; Karypis, George; Apr 4, 2007; 14 pp.; In English; Original contains color illustrations

Contract(s)/Grant(s): DAAD19-01-2-0014; NSF-EIA-9986042

Report No.(s): AD-A467651; TR-07-011; No Copyright; Avail.: Defense Technical Information Center (DTIC)

The effectiveness of comparative modeling approaches for protein structure prediction can be substantially improved by incorporating predicted structural information in the initial sequence-structure alignment. Motivated by the approaches used to align protein structures, this paper focuses on developing machine learning approaches for estimating the RMSD value of a pair of protein fragments. These estimated fragment-level RMSD values can be used to construct the alignment, assess the quality of an alignment, and identify high-quality alignment segments. We present algorithms to solve this fragment-level RMSD prediction problem using a supervised learning framework based on support vector regression and classification that incorporates protein profiles, predicted secondary structure, effective information encoding schemes, and novel second-order pairwise exponential kernel functions. Our comprehensive empirical study shows superior results compared to the profile-to-profile scoring schemes.

**Post Traumatic Stress Disorder: The Facts**

Murray, Mark A; Feb 22, 2007; 18 pp.; In English

Report No.(s): AD-A467315; No Copyright; Avail.: Defense Technical Information Center (DTIC)

Following the attacks on the Twin Towers of the World Trade Center and the Pentagon on 11 September 2001, the USA began the Global War on Terror (GWOT) on 07 October 2001 in Afghanistan and expanded the war to include Iraq in March of 2003. As a result of GWOT hundreds of thousands of service men and women have been deployed to Iraq and Afghanistan with 3,410 killed and another 24,795 physically wounded as of 22 February 2007. Likewise, thousands of other service men and women of all ranks have been psychologically wounded and subsequently diagnosed with Post Traumatic Stress Disorder (PTSD) or symptoms of PTSD. With the apparent increased awareness and diagnosis among service members, little is actually known and understood about PTSD among aspiring strategic leaders. This strategic research project will examine and hopefully dispel the myths about PTSD for strategic leaders by answering the following basic questions. What is PTSD, historical understanding of PTSD, how does PTSD develop, what are the symptoms of PTSD, how common is PTSD, who is most likely to develop PTSD, what are the consequences of PTSD, what are scientists learning from the research, and how is PTSD treated?

**Role of Merlin in the Growth and Transformation of Arachnoidal Cells**

Lal, Anita; Jan 1, 2007; 23 pp.; In English; Original contains color illustrations

Contract(s)/Grant(s): W81XWH-06-1-0221

Report No.(s): AD-A467980; No Copyright; Avail.: Defense Technical Information Center (DTIC)

This proposal is concerned with the functional role of merlin in arachnoidal and meningioma cells. The focus of year 1 was to characterize and develop meningioma-specific NF2 model systems. We have successfully generated three additional meningioma cell lines. The expression of merlin was quantitated at the transcript and protein level in these and arachnoidal cells. The KT21MG1 cell line is merlin-deficient and contains a novel splice site mutation between exon 14 and 15. This alternative splicing results in a 79 bp insertion that encodes for truncated merlin. We have used a tetracycline inducible system, to express wild type merlin and the L64P, S518A and S518D mutant forms of merlin in KT21MG1. Additionally, we have tested the ability of three NF2-specific short interfering RNA (siRNA) to silence merlin. Two siRNAs significantly reduced transcript and protein levels of merlin in arachnoidal cells and the SF6717 meningioma cell line. Stable suppression of merlin in these cell lines has been achieved using the pSUPER retroviral RNAi system. In summary, we have successfully developed three meningioma-specific NF2 model systems. In the subsequent 2 years, we will use these systems to understand the mechanistic role of merlin and to investigate meningioma cell type specific functions.

**State of the Science Meeting: Burn Care: Goals for Treatment and Research**

Palmieri, Tina L; Nov 2006; 158 pp.; In English

Contract(s)/Grant(s): W81XWH-07-1-0008

Report No.(s): AD-A467898; No Copyright; Avail.: Defense Technical Information Center (DTIC)

The Burn State of the Science Research Conference achieved its stated purpose: the identification and prioritization of burn research goals for the next decade and the delineation of the resources needed to achieve those goals. Issues ranging from acute burn care through the rehabilitative period were addressed in a single forum and published in the Journal of Burn Care and Research. Although much progress has been made in burn management, much remains to be learned. Universal definitions, endpoints of care, and grading systems which can be applied for both clinical and basic science research are lacking. Consensus in these areas is vital to conducting meaningful research, but these conclusions need to be validated via basic science, pilot clinical studies, and multicenter randomized trials to define the 'best' burn care. The greatest achievement of the conference was the open interaction it fostered between researchers, clinicians, burn survivors, funding organizations, journal editors, military personnel, and international burn researchers. The findings of this conference will be the basis for the burn research of the future.

**Inter- and Intra-Chromosomal Aberrations in Human Cells Exposed in vitro to Space-like Radiations**

Hada, Megumi; Cucinotta, F. A.; Gonda, S. R.; Wu, H.; November 16, 2005; 1 pp.; In English; The 1st Asian Congress of Radiation Research, 16-17 Nov. 2005, Hiroshima, Japan; No Copyright; Avail.: Other Sources; Abstract Only

Energetic heavy ions pose a great health risk to astronauts in extended ISS and future exploration missions. High-LET heavy ions are particularly effective in causing various biological effects, including cell inactivation, genetic mutations and cancer induction. Most of these biological endpoints are closely related to chromosomal damage, which can be utilized as a biomarker for radiation insults. Previously, we had studied chromosome aberrations in human lymphocytes and fibroblasts induced by both low- and high-LET radiation using FISH and multicolor fluorescence in situ hybridization (mFISH) techniques. In this study, we exposed human cells in vitro to gamma rays and energetic particles of varying types and energies and dose rates, and analyzed chromosomal damages using the multicolor banding in situ hybridization (mBAND) procedure. Confluent human epithelial cells and lymphocytes were exposed to energetic heavy ions at NASA Space Radiation Laboratory (NSRL) at the Brookhaven National Laboratory (Upton, NY) or Cs-137 gamma radiation source at the Baylor College (Houston, TX). After colcemid and Calyculin A treatment, cells were fixed and painted with XCyte3 mBAND kit (MetaSystems) and chromosome aberrations were analyzed with mBAND analysis system (MetaSystems). With this technique, individually painted chromosomal bands on one chromosome allowed the identification of interchromosomal aberrations (translocation to unpainted chromosomes) and intrachromosomal aberrations (inversions and deletions within a

single painted chromosome). The possible relationship between the frequency of inter- and intra-chromosomal exchanges and the track structure of radiation is discussed. The work was supported by the NASA Space Radiation Health Program.

**Three-Dimensional Cell Culture Models for Infectious Disease and Drug Development**

Nickerson, Cheryl A.; Honer zu Bentrup, Kerstin; Ott, C. Mark; [2005]; 11 pp.; In English; Original contains color and black and white illustrations; Copyright; Avail.: CASI: [A03](#), Hardcopy

Three-dimensional (3-D) cell cultures hold enormous potential to advance our understanding of infectious disease and to effectively translate basic cellular research into clinical applications. Using novel NASA bioreactor technology, the rotating wall vessel (RWV), we have engineered physiologically relevant 3-D human tissue culture models for infectious disease studies. The design of the RWV is based on the understanding that organs and tissues function in a 3-D environment, and that this 3-D architecture is critical for the differentiated form and function of tissues in vivo. The RWV provides large numbers of cells which are amenable to a wide variety of experimental manipulations and provides an easy, reproducible, and cost-effective approach to enhance differentiated features of cell culture models.

**Prostate Cancer Gene Discovery Using ROMA**

Isaacs, William B; Dec 2006; 7 pp.; In English; Original contains color illustrations

Contract(s)/Grant(s): W81XWH-06-1-0189

Report No.(s): AD-A468543; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA468543>

The authors hypothesize that a subset of men who develop prostate cancer do so as a result of an inherited chromosomal deletion or amplification, affecting the function of one or more critical prostate cancer susceptibility genes. These chromosomal abnormalities, and the affected gene(s) can be identified using the novel technique, ROMA. Together with their collaborators at Cold Spring Harbor, they have now performed ROMA analysis of 90 prostate cancer patients, each with a strong family history of prostate cancer (having at least two affected first-degree relatives). The majority of these men had either early onset prostate cancer (diagnosis before age 60) or evidence of advanced disease (non-organ confined disease). Over 1,100 copy number polymorphisms (CNPs), including many recurring CNPs, have been observed in these 90 patients. These CNPs include 33 novel CNPs that have never (or rarely) been seen in control samples. Of these 33 novel CNPs, one can rule out a causal role for at least 5 based on lack of cosegregation with disease in families in which multiple affected members have been subjected to ROMA analysis. An additional 15 novel CNPs do not affect the coding sequences of any known genes. Currently, the authors are examining both common and rare CNPs in additional cases and controls for evidence of an association with prostate cancer risk.

**NMR Analysis of Thiodiglycol Oxidation by Mammalian Alcohol Dehydrogenases**

Novak, Mark J; Brimfield, Alan A; Jan 2006; 15 pp.; In English; Original contains color illustrations

Report No.(s): AD-A468601; USAMRICD-P06-010; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA468601>

This unit describes a proton nuclear magnetic resonance (<sup>1</sup>H NMR)-based methodology for investigation of thiodiglycol (TDG; Fig. 4.20.1A) transformation by human and equine alcohol dehydrogenases (ADH). An ultraviolet/visible (UV/vis) spectrophotometric method is also described in support of the NMR protocol. Its purpose is to initially indicate if TDG is actually a substrate for the various ADH isozymes before the more complicated NMR protocol is undertaken. Once verified spectrophotometrically that TDG is a substrate for a particular ADH isozyme, <sup>1</sup>H NMR is used to obtain structural and kinetic data on the products as they form. Although interest was established for the study of TDG metabolism with regard to how the hydrolysis of sulfur mustard (Fig. 4.20.1A) may contribute to its toxicity, the protocols in this unit can be applied as general methods for the metabolic study of different water-soluble xenobiotics using ADMs. Access to NMR depends upon the facility

in which an individual researcher works. Most large institutions have a centralized NMR facility where samples are submitted to an appointed scientist or technician. Because the personnel of the NMR facility have control of the instrumentation, they are responsible for acquiring data. This takes the operational aspects of running the NMR out of the hands of the researcher. Smaller research institutions usually have NMR as standard equipment, but they rely on the individual principal investigators and/or students to personally carry out their experiments as operators of the instrument. As such, this unit is being written in context of aiding an investigator who has to personally acquire and interpret the data. There are also multiple manufacturers of NMR spectrometers, each having a unique operational protocol. Therefore, this unit is also written from the standpoint that the specific operational steps in acquiring a spectrum are omitted.

**Acetylcholinesterase Inhibition: Does it Explain the Toxicity of Organophosphorus Compounds?**

Maxwell, Donald M; Brecht, Karen M; Koplovitz, Irwin; Sweeney, Richard E; Jan 2006; 6 pp.; In English; Original contains color illustrations

Report No.(s): AD-A468608; USAMRICD-P06-012; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA468608>

The hypothesis that acetylcholinesterase (AChE) inhibition is the mechanism of toxicity of organophosphorus (OP) compounds was examined by mathematically modeling the in vivo lethal effects of OP compounds and determining the amount of variation in OP toxicity that is explained by AChE inhibition. Mortality dose-response curves for several OP compounds (i.e., VX, soman, cyclosarin, sarin, tabun, diisopropylfluorophosphate and paraoxon) exhibited steep probit slopes (> 9.6) in guinea pigs. Steep probit slopes were also observed when the mortality dose-response curves for soman were examined in mice, rats, rabbits and non-human primates. The consistently steep probit slopes of the dose-response curves for highly toxic OP compounds suggested that these compounds have a single specific mechanism of toxicity regardless of the OP compound or the species in which it was tested. Regression analysis indicated that 93% of the 3,280-fold variation in the median lethal doses (i.e., LD50) of OP compounds in rats was explained by the variation in their in vitro rate constants for inhibition of AChE. Conversely, 91% of the 23-fold variation in the ability of the oximes pralidoxime and obidoxime to protect against the toxicity of OP compounds in guinea pigs was explained by the variation in the in vitro ability of oximes to reactivate OP-inhibited AChE. The best explanation for this variety of observations was that the primary mechanism of in vivo toxicity for highly toxic OP compounds is the inhibition of AChE, and the residual unexplained variation in OP toxicity that might be explained by other mechanisms represents < 10% of the total variation in OP toxicity.

McDonough, John H; Shih, Tsung-Ming; Jan 2007; 18 pp.; In English; Original contains color illustrations

Report No.(s): AD-A468611; USAMRICD-P05-032; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA468611>

The nerve agents are highly toxic organophosphorous (OP) compounds. The agents of greatest concern, along with their chemical names and two-letter military designations, are tabun (o-ethyl N,N-dimethyl phosphoramidocyanidate; GA), sarin (isopropyl methylphosphonofluoridate; GB), soman (pinacolyl methylphosphonofluoridate; GD), cyclosarin (cyclohexyl methylphosphonofluoridate, GF), VX (o-ethyl S- 2-N,N- diisopropylaminoethyl methyl phosphonofluoridate) and a Russian V-type agent designated VR (0-isobutyl S-(2-diethylamino)ethyl methylphosphonothioate). The nerve agents inhibit the cholinesterase (ChE) family of enzymes that includes acetylcholinesterase (AChE) and butyrylcholinesterase (BChE). It is the inhibition of AChE, the enzyme that hydrolyzes the cholinergic neurotransmitter acetylcholine (ACh), that produces the toxic action of nerve agents. Inhibition of BChE activity by itself is not known to produce any toxic effect. Nerve agents bind to the active site of the AChE enzyme, thus preventing it from hydrolyzing ACh. The enzyme is inhibited irreversibly, and the return of esterase activity depends on the synthesis of new enzyme molecules ( 1% per day in humans). All nerve agents penetrate the central nervous system (CNS), with the G-type agents acting more rapidly centrally than the V-type.

**Growth Factor Dependent Cholinergic Function and Survival in Primary Mouse Spinal Cord Cultures**  
Sheridan, Robert E; Adler, Michael; Jan 2006; 6 pp.; In English; Original contains color illustrations  
Report No.(s): AD-A468612; USAMRICD-P05-004; No Copyright; Avail.: Defense Technical Information Center (DTIC)  
ONLINE: <http://hdl.handle.net/100.2/ADA468612>

In primary embryonic spinal cord cultures, synaptic transmission can be conveniently studied by monitoring radiolabeled neurotransmitter release or by recording of electrophysiological responses. However, while the mature spinal cord contains an appreciable number of cholinergic motoneurons, cultures of embryonic spinal cord have a paucity of these neurons and release little or no acetylcholine upon stimulation. To determine whether the proportion of cholinergic neurons in primary mouse spinal cord cultures can be augmented, the effects of several classes of growth factors were examined on depolarization- and Ca<sup>2+</sup>-evoked release of choline/acetylcholine (Ch/ACh). In the absence of growth factors, little or no evoked release of radiolabeled Ch/ACh could be demonstrated. Media supplemented with brain-derived neurotrophic factor (BDNF), ciliary neurotrophic factor (CNTF) or basic fibroblast growth factor (bFGF) were examined for their ability to preserve the population of neurons in culture. CNTF was found to increase the number of surviving neurons and to enhance the release of radiolabeled Ch/ACh; the other factors were without effect. The action of CNTF was transient, and the neuronal population decreased to levels observed in cultures lacking growth factor after 20 days in vitro. The correlation between enhanced neuron survival and increased Ch/ACh release suggests that CNTF protected cholinergic neurons, albeit transiently, from cell death.

**Noninvasive Methods for Determining Lesion Depth from Vesicant Exposure**  
Braue Jr, Ernest H; Graham, John S; Doxzon, Bryce F; Hanssen, Kelly A; Lumpkin, Horace L; Stevenson, Robert S; Deckert, Robin R; Dalal, Stephen J; Mitcheltree, Larry W; Jan 2007; 12 pp.; In English; Original contains color illustrations  
Report No.(s): AD-A468615; USAMRICD-P06-009; No Copyright; Avail.: Defense Technical Information Center (DTIC)  
ONLINE: <http://hdl.handle.net/100.2/ADA468615>

Before sulfur mustard (HD) injuries can be effectively treated, assessment of lesion depth must occur. Accurate depth assessment is important because it dictates how aggressive treatment needs to be to minimize or prevent cosmetic and functional deficits. Depth of injury typically is assessed by physical examination. Diagnosing very superficial and very deep lesions is relatively easy for the experienced burn surgeon. Lesions of intermediate depth, however, are often problematic in determining the need for grafting. This study was a preliminary evaluation of two noninvasive bioengineering methodologies, laser Doppler perfusion imaging (LDPI) and indocyanine green fluorescence imaging (ICGH), to determine their ability to accurately diagnose depth of sulfur mustard lesions in a weanling swine model. Histological evaluation was used to assess the accuracy of the imaging techniques in determining burn depth. Six female weaning swine (8-12 kg) were exposed to 400 microliters of neat sulfur mustard on six ventral sites for 2, 8, 30, or 60 minutes. This exposure regimen produced lesions of varying depths from superficial to deep dermal. Evaluations of lesion depth using the bioengineering techniques were conducted at 24, 48, and 72 hours after exposure. After euthanasia at 72 hours after exposure, skin biopsies were taken from each site and processed for routine hematoxylin and eosin histological evaluation to determine the true depth of the lesion. Results demonstrated that LDPI and ICGH were useful tools to characterize skin perfusion and provided a good estimate of HD lesion depth. Traditional LDPI and the novel prototype ICGFI instrumentation used in this study produced images of blood flow through skin lesions, which provided a useful assessment of burn depth. LDPI and ICGH accurately predicted the need for aggressive treatment (30- and 60-minute HD lesions) and nonaggressive treatment (2- and 8-minute HD lesions) for the lesions generated in this study.

Most of the proposed studies have cleared local and HSRRB approvals and are in various stages of implementation at

participating sites. Those that have yet to be approved are through the planning phase. For completed studies, results have been analyzed and manuscripts are being prepared for submission to academic conferences and peer reviewed journals. The JVN application has been integrated to include both eye care and diabetes care in readiness for integration into AHLTA. Technologically, we have incorporated a new digital video camera for the eye care component of the JVN program; this is currently undergoing clinical validation for diagnostic accuracy for diabetic retinopathy assessment. CDMP development for new modules is being accomplished and we have expanded the patient portal to encompass many more home monitoring devices. CDMP development has also addressed the results of the completed Human Factors Study (Usability Lab).

**Direct Detection of Stereospecific Soman Hydrolysis by Wild-Type Human Serum Paraoxonase**

Yeung, D T; Smith, J R; Sweeney, R E; Lenz, D E; Cerasoli, D M; Jan 2007; 10 pp.; In English; Original contains color illustrations

Report No.(s): AD-A468634; USAMRICD-P05-028; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA468634>

Human serum paraoxonase 1 (HuPONI; EC 3.1.8.1) is a calcium-dependent six-fold Beta-propeller enzyme that has been shown to hydrolyze an array of substrates, including organophosphorus (OP) chemical warfare nerve agents. Although recent efforts utilizing site-directed mutagenesis have demonstrated specific residues (such as Phe222 and His15) to be important in determining the specificity of OP substrate binding and hydrolysis, little effort has focused on the substrate stereospecificity of the enzyme; different stereoisomers of OPs can differ in their toxicity by several orders of magnitude. For example, the C +/- P- isomers of the chemical warfare agent soman (GD) are known to be more toxic by three orders of magnitude. In this study, the catalytic activity of HuPONI towards each of the four chiral isomers of GD was measured simultaneously via chiral GC/MS. The catalytic efficiency (kcat/Km) of the wild-type enzyme for the various stereoisomers was determined by a simultaneous solution of hydrolysis kinetics for each isomer. Derived kcat/Km values ranged from 625 to 4130 mM(exp-1) min(exp-1), with isomers being hydrolyzed in the order of preference C + P + > C-P + > C + P- > C-P-. The results indicate that HuPONI hydrolysis of GD is stereoselective; substrate stereospecificity should be considered in future efforts to enhance the OPase activity of this and other candidate bioscavenger enzymes.

**A Physiologically Based Pharmacokinetic (PB/PK) Model for Multiple Exposure Routes of Soman in Multiple Species**

Sweeney, Richard E; Langenberg, Jan P; Maxwell, Donald M; Jan 2006; 15 pp.; In English; Original contains color illustrations

Contract(s)/Grant(s): DAA019-02-0-0001

Report No.(s): AD-A468638; USAMRICD-P06-005; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA468638>

A physiologically based pharmacokinetic (PB/PK) model has been developed in advanced computer simulation language (ACSL) to describe blood and tissue concentration-time profiles of the C(plus or minus)P(minus)stereoisomers of soman after inhalation, subcutaneous and intravenous exposures at low (0.8-1.0 x LD50), medium (-3 x LD50) and high (6 x LD50) levels of soman challenge in three species (rat, guinea pig, marmoset). Allometric formulae were used to compute the compartment volumes, blood flow rates, tidal volume and respiratory rate based upon total animal weight. Blood/tissue partition coefficients for soman, initial carboxylesterase and acetylcholinesterase levels and the rate constants for interactions between soman and these enzymes were species-dependent and were obtained from in vitro measurements reported in the literature. The model incorporated arterial and venous blood, lung, kidney, liver, richly perfused, poorly perfused and fat tissue compartments as well as subcutaneous and nasal exposure site compartments. First-order absorption from linearly filled soman deposits into metabolizing exposure site compartments was employed to model subcutaneous and inhalation exposures. The model was validated by comparing the predicted and observed values for c(plus or minus)P(minus)-soman in arterial blood at various times following exposure and by regression analysis. Sensitivity analysis was used to determine the effects of perturbations in the model parameters on the time-course of arterial C(-)P(-)-soman concentrations for different exposure routes. In our evaluation of 28 datasets, predicted values were generally within 95% confidence limits of the observed values, and regression

coefficients comparing predicted and observed data were greater than 0.85 for 95% of the intravenous and subcutaneous datasets and 25% of the inhalation datasets.

ONLINE: <http://hdl.handle.net/100.2/ADA468659>

In the fall of 2001, approximately 15,000 U.S. military personnel participated in a military exercise in the northwestern Egyptian desert. To assess the prevalence and impact of diarrhea and enteropathogen distribution, we conducted a post-deployment survey and a case series study. A departure convenience sampling (n = 3725) was used in the post-deployment survey. Overall, 9.3% reported diarrhea, 2.6% sought medical care, and 2.8% stopped or decreased their work for at least a day. Among those reporting diarrhea, 41.7% had symptoms for less than 2 days, 43.5% had symptoms from 2-5 days, and 14.8% had symptoms for more than 5 days. In the case series study, pathogens were identified in 53.6% of the 129 cases enrolled. Pathogens identified included enterotoxigenic E. coli (n = 53), enteroaggregative E. coli (n = 13), Cryptosporidium (n = 9), Campylobacter jejuni (n = 7), noroviruses (n = 7), Shigella flexneri (n = 2), rotavirus (n = 2), and Entamoeba histolytica (n = 2). Among those seeking care for diarrhea, two thirds reported a decreased ability or inability to perform their jobs for at least one day, but overall, diarrhea was much less prevalent than in past surveys in this region, with minimal impact on the mission.

**Knowledge, Attitudes, and Practices Regarding Epidemiology and Management of Travelers' Diarrhea: A Survey of Front-Line Providers in Iraq and Afghanistan**

Sanders, John W; Jun 2005; 5 pp.; In English

Report No.(s): AD-A468660; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA468660>

To evaluate the relationship between medical knowledge and clinical practice, a survey on travelers' diarrhea was administered to military health care providers attending a professional development and trauma management conference. The survey was administered at the beginning of the conference and 58 of the 76 attendees participated by completing a questionnaire. Respondents were aware of the standard definition of travelers' diarrhea; however, their knowledge about the epidemiology and management of travelers' diarrhea was low. Less than one-third correctly answered questions on etiology and more than two-thirds made incorrect management choices in treatment of mild to moderate watery diarrhea and dysentery. Important knowledge gaps about gastroenteritis were identified and should serve as a basis to develop military-specific clinical guidelines and training programs.

We have made excellent progress in the preliminary stages of our project to examine the role of FGFR4 G388R in altering cell adhesion in prostate cancer. This includes acquiring expertise in the passage and transfection for gene expression studies using prostate cancer cell lines. A key accomplishment is the demonstration of feasibility of ponasterone; A inducibility of FGFR4 expression in PC3 cells. We hope to successfully create these inducible cells to use in our studies of FGFR4 G388R and its role in prostate cancer progression.

Fluorescence molecular tomography is an emerging technology to image the spatial distribution of fluorescence activity in tissue volumes with the potential to reduce false positive readings and eliminate the need for stressful biopsy procedures for many women. However the spatial resolution and quantification capabilities of FMT must be improved before realizing this potential. The funded research aims to improve the imaging capabilities of FMT by incorporating the optical imaging system directly into a clinical MRI for simultaneous image acquisition. Tissue structural information from the MR image is then used to guide the FMT image reconstruction algorithm. This approach is shown to dramatically improve image quality and fluorescence yield quantification in realistic simulated domains and provide noticeable improvements for simple domains in preliminary phantom experiments. Additionally a newly developed algorithm to quantify exogenous absorption is developed and validated.

**Effects of Modifications in the Laminin-10 Basal Laminina on Prostate Cancer Invasion**

Pawar, Sangita C; Bair, Elisabeth L; Oct 2006; 14 pp.; In English; Original contains color illustrations

Contract(s)/Grant(s): W81XWH-05-1-0611

Report No.(s): AD-A468686; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA468686>

In order for prostate cancer to metastasize it must invade through a laminin-511 rich barrier. We have previously shown that the matrix metalloprotease MT1-MMP, which is expressed in prostate cancer but not in normal prostate tissue cleaves the laminin alpha-5 chain into four distinct fragments. This cleavage allows for increased prostate cancer cell migration in vitro. Laminin-511 cleavage also occurs in vivo in human prostate tissue. Cleavage of laminin-511 and release of laminin-511 fragments leads to altered cell function leading to increased cell migration and invasion in in vitro assays. We have demonstrated that prostate cancer cells treated with laminin-511 that has been cleaved by MT1-MMP have increased EGFR phosphorylation compared with cells grown on tissue culture plastic or intact laminin-511 in a Western blot. We have purified a recombinant 45kDa laminin-511 N-terminal cleavage fragment which contains laminin EGF-like domains. Treatment of prostate cancer cells with soluble recombinant fragment demonstrates that the cleaved laminin fragment acts as a matrikine, activating the EGFR on prostate cancer cells in a Western blot. This work demonstrates that increased MT1-MMP expression in prostate cancer not only cleaves the major laminin surrounding prostate cancer to clear a path for migration but also releases active fragments from the laminin-511 that signal for increased migration.

ONLINE: <http://hdl.handle.net/100.2/ADA468690>

The unpredictable nature of bio-terrorism compels us to develop medical countermeasures that will enable authorities to treat individuals exposed to agents such as anthrax. We report the feasibility of producing a protective, human-derived, monoclonal antibody directed against the protective antigen (PA) of *Bacillus anthracis* in plants. This was achieved by transient expression using agroinfiltration of *Nicotiana benthamiana* plants. The resulting antibody was able to neutralize toxin activity in vitro and in vivo at a comparable level to that seen for its hybridoma-produced counterpart.

ONLINE: <http://hdl.handle.net/100.2/ADA468692>

In this funding period (first of three years) we have fulfilled the scheduled tasks of (1) standardizing the condition for engineering the 3D vasculature network that can consistently produce lumen; (2) generating various viral constructs that can deliver the FRET sensors to 100% of the endothelial cells used in vasculature formation; (3) determining the fluid exchange rate within the 3D collagen matrix that will be critical for any subsequent drug treatment of the endothelial cells in the assay system; (4) co-developing with Improvisation a FRET module that is capable of performing 3D ratio-imaging. We presented here to the best of our knowledge the first ever three dimensional FRET microscopy data. We have also established that the endothelial cells undergo polarization similar to those under physiological condition during in vitro vasculogenesis. Taken together these developments meet and exceed the scheduled tasks outlined in the statement of work and complete the establishment of the 3D FRET assay system needed to study the transient modulation of endothelial signaling events by breast cancer cells during transendothelial migration.

**Skeletal Complications in Neurofibromatosis Type 1: The Role of Neurofibromin Haploinsufficiency in Defective Skeletal Remodeling and Bone Healing in NF1**

McHugh, Kevin P; Jan 2007; 13 pp.; In English; Original contains color illustrations

Contract(s)/Grant(s): W81XWH-06-1-0219

Report No.(s): AD-A468693; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA468693>

A large proportion of patients with Neurofibromatosis Type 1 display skeletal abnormalities including scoliosis and pseudoarthrosis which are compounded by osteoporosis and poor bone healing. Corrective orthopaedic intervention often fails necessitating multiple revision surgeries followed by prolonged recovery periods. The cell types and pathway by which neurofibromin haploinsufficiency (Nf1 +/-) leads to dysregulation of bone remodeling and healing are unknown. The aim of this study is to identify the cell types expressing Nf1 in normal bone cell physiology and fracture healing. We demonstrate that in normal mouse bones neurofibromin is primarily expressed by cells of the osteoblast lineage. Neurofibromin expression was also induced during osteoblastic differentiation of MC3T3 cells. We found that during fracture repair neurofibromin expression increased in the early stage and was seen at sites of primary bone formation. Taken together these observations indicate that neurofibromin expression is primarily associated with bone-adherent osteoblast lineage cells with minimal expression in other cell types. In addition neurofibromin expression is induced during the formation of the mineralized callus in the endochondral-like formation stage of bone fracture healing. Neurofibromin haploinsufficiency may keep osteoblasts in an immature state. Immature osteoblasts produce large quantities of the osteoclastogenic cytokine RANKL. A high RANKL

environment would shift the balance of bone metabolism in favor of bone resorption and may result in the bone-healing defect seen in NF1 patients.

**Far Forward Treatment of Hemorrhagic Shock**

Alam, Hasan B; Feb 2007; 18 pp.; In English; Original contains color illustrations

Contract(s)/Grant(s): N00014-05-MP-2-0006; N00014-06-1-0192

Report No.(s): AD-A468694; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA468694>

Hemorrhagic shock is the leading cause of death in civilian and combat trauma. Even when the injured survive long enough to be transported to a medical facility, hemorrhage still remains the leading cause of preventable late death and complications. Effective hemorrhage control and better resuscitation strategies have the potential of saving lives. However, resuscitation can exacerbate cellular injury caused by hemorrhagic shock. Utilizing the funding provided by the ONR, we have clearly established that resuscitation fluids play a critical role in this injury pattern. Furthermore, we have demonstrated that these adverse effects can be avoided through simple modifications. We have also designed novel strategies for cellular protection. In parallel, advanced hemostatic battlefield dressings have been developed and validated. The goal of this research has been to improve the care of the critically injured, and a number of our findings have already been incorporated into new military doctrine (e.g. use of new hemostatic dressings, limited volume resuscitation), saving numerous lives.

ONLINE: <http://hdl.handle.net/100.2/ADA468732>

In August 2002, two cases of hantavirus pulmonary syndrome (HPS) were confirmed in Minereros and Concepci n, within the Santa Cruz Department of Bolivia. Extensive alteration of the native ecosystem, from dense forest to pasture or sugarcane, had occurred in both regions. An ecologic assessment of reservoir species associated with the human disease identified a single hantavirus antibody-positive *Oligoryzomys microtis* from Minereros and three hantavirus antibody-positive *Calomys callosus* from Concepci n. In Minereros, the virus from the *O. microtis* was 90% similar to sequences published for Rio Mamor virus. Viral nucleotide sequences from two *C. callosus* were 87-88% similar to the sequence of Laguna Negra virus. The viral sequence from the *C. callosus* was 99% identical to viral sequences obtained from the HPS patient in this area, implicating *C. callosus* as the host and Laguna Negra virus as the agent responsible for the HPS case near Concepci n.

Contract(s)/Grant(s): DAMD17-02-0005

Report No.(s): AD-A468733; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA468733>

Dendritic cells (DCs) play a central role as major targets of dengue virus (DV) infections and initiators of antiviral immune responses. Previous observations showed that DCs are activated by infection, presumably acquiring the capacity to promote cell-mediated immunity. However, separate evaluations of the maturation profiles of infected and uninfected bystander cells show that infection impairs the ability of DCs to upregulate cell surface expression of costimulatory, maturation, and major histocompatibility complex molecules, resulting in reduced T-cell stimulatory capacity. Infected DCs

failed to respond to tumor necrosis factor alpha as an additional maturation stimulus and were apoptotic. Interleukin 10 (IL-10) was detected in supernatants from cultures of DV-infected DCs and cocultures of DCs and T cells. Taken together, these results constitute an immune evasion strategy used by DV that directly impairs antigen-presenting cell function by maturation blockade and induction of apoptosis.

ONLINE: <http://hdl.handle.net/100.2/ADA468734>

Bis-(2-chloroethyl) sulfide (sulfur mustard, SM) is a carcinogenic alkylating agent that has been utilized as a chemical warfare agent. To understand the mechanism of SM-induced lung injury, we analyzed global changes in gene expression in a rat lung SM exposure model. Rats were injected in the femoral vein with liquid SM, which circulates directly to the pulmonary vein and then to the lung. Rats were exposed to 1, 3, or 6 mg/kg of SM, and lungs were harvested at 0.5, 1, 3, 6, and 24 h postinjection. Three biological replicates were used for each time point and dose tested. RNA was extracted from the lungs and used as the starting material for the probing replicate oligonucleotide microarrays. The gene expression data were analyzed using principal component analysis and two-way analysis of variance to identify the genes most significantly changed across time and dose. These genes were ranked by p value and categorized based on molecular function and biological process. Computer-based data mining algorithms revealed several biological processes affected by SM exposure, including protein catabolism, apoptosis, and glycolysis. Several genes that are significantly upregulated in a dose-dependent fashion have been reported as p53 responsive genes, suggesting that cell cycle regulation and p53 activation are involved in the response to SM exposure in the lung. Thus, SM exposure induces transcriptional changes that reveal the cellular response to this potent alkylating agent.

**Mode of Action of Invasion-Inhibitory Antibodies Directed against Apical Membrane Antigen 1 of Plasmodium falciparum**

Dutta, Sheetij; Haynes, J D; Barbossa, Arnaldo; Ware, Lisa A; Snavely, Jeffrey D; Moch, J K; Thomas, Alan W; Lanar, David E; Apr 2005; 8 pp.; In English

Report No.(s): AD-A468748; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA468748>

Antibodies against apical membrane antigen 1 (AMA-1) of Plasmodium falciparum inhibit merozoite invasion into erythrocytes. Invasion-inhibitory polyclonal AMA-1 antibodies inhibit secondary proteolytic processing and surface redistribution of AMA-1 on merozoites. We present evidence supporting inhibition of processing and redistribution as probable causes of inhibition of invasion by polyclonal antibodies. Polyclonal anti-AMA-1 was much more inhibitory than monoclonal antibody (MAb) 4G2dc1 in an invasion assay. Although both polyclonal and monoclonal immunoglobulin G

(IgG) inhibited secondary processing of the 66-kDa form of AMA-1, only polyclonal IgG caused its anomalous processing, inhibited its redistribution, and cross-linked soluble forms of AMA-1 on merozoites. Moreover, Fab fragments of polyclonal IgG that fail to cross-link did not show the enhancement of inhibitory effect over intact IgG, as observed in the case of Fab fragments of MAb 4G2dc1. We propose that although blocking of biologically important sites is a common direct mode of action of anti-AMA-1 antibodies, blocking of AMA-1 secondary processing and redistribution are additional indirect inhibitory mechanisms by which polyclonal IgG inhibits invasion. We also report a processing inhibition assay that uses a C-terminal AMA-1-specific MAb, 28G2dc1, to detect merozoite-bound remnants of processing (20 kDa from normal processing to 48 and 44 kDa and 10 kDa from anomalous processing to a 52-kDa soluble form of AMA-1). The ratio of intensity of 10-kDa bands to the sum of 10- and 20-kDa bands was positively correlated with inhibition of invasion by polyclonal antibodies. This assay may serve as an important immunochemical correlate for inhibition of invasion.

**Role of Superoxide in the Germination of Bacillus Anthracis Endospores**

Baillie, Les; Hibbs, Stephen; Tsai, Pei; Cao, Guan-Liang; Rosen, Gerald M; Jan 2005; 7 pp.; In English

Contract(s)/Grant(s): EB-2034

Report No.(s): AD-A468749; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA468749>

The spore forming Gram-positive bacterium *Bacillus anthracis*, the causative agent of anthrax, has achieved notoriety due to its use as a bioterror agent. In the environment, *B. anthracis* exists as a dormant endospore. Germination of endospores during their internalization within the myeloid phagocyte, and the ability of those endospores to survive exposure to antibacterial killing mechanisms such as superoxide, (O<sub>2</sub><sup>-</sup>), is a key initial event in the infective process. We report herein that endospores exposed to fluxes of O<sub>2</sub><sup>-</sup> typically found in stimulated phagocytes had no effect on viability. Further endospores of the Sterne Strain of *B. anthracis* were found to scavenge O<sub>2</sub><sup>-</sup>, which may enhance the ability of the bacterium to survive within the hostile environment of the phagolysosome. Most intriguing was the observation that endospore germination was stimulated by a flux of O<sub>2</sub><sup>-</sup> as low as 1 micrometer/min. Data presented herein suggest that *B. anthracis* may co-opt O<sub>2</sub><sup>-</sup> which is produced by stimulated myeloid phagocytes and is an essential element of host immunity, as a necessary step in productive infection of the host.

ONLINE: <http://hdl.handle.net/100.2/ADA468752>

**Abstract.** To assist the Peruvian Ministry of Health in modifying the malaria treatment policy for their north Pacific coastal region, we conducted an in vivo efficacy trial of sulfadoxine-pyrimethamine (SP) and SP plus artesunate (SP-AS) for the treatment of uncomplicated *Plasmodium falciparum* infections. A total of 197 patients were randomized to therapy with either SP (25 mg/kg of the sulfadoxine component in a single dose on day 0) or a combination of SP plus AS (4 mg/kg on days 0, 1, and 2) and were followed for 28 days for symptoms and recurrence of parasitemia. No statistically significant differences between the two groups were observed on enrollment with respect to age, sex, history of malaria, or geometric mean parasite density. A total of 185 subjects completed the 28-day follow-up. Of the 91 subjects treated with SP alone, two had recurrences of parasitemia on day 7 and one on day 21. Of the 94 subjects treated with SP-AS, one had a recurrence of parasitemia on day 21. Fever and asexual parasite density decreased significantly more rapidly and the proportion of patients with gametocytemia on days 3-28 was significantly lower in subjects treated with combination therapy than in those who received SP alone. No severe adverse drug reactions were observed; however, self-limited rash and pruritis were significantly more common and an exacerbation of nausea, vomiting, and abdominal pain were observed significantly more frequently among patients who had received SP-AS. These results have contributed to a National Malaria Control Program decision to change

to SP-AS combination therapy as the first-line treatment for uncomplicated *P. falciparum* malaria in northern coastal Peru in November 2001, making Peru the first country in the Americas to recommend this combination therapy.

**Genomic Characterization of KIR2DL4 in Families and Unrelated Individuals Reveals Extensive Diversity in Exon and Intron Sequences Including a Common Frameshift Variation Occurring in Several Alleles**

Gedil, M A; Steiner, N K; Hurley, C K; Jan 18, 2005; 18 pp.; In English

Contract(s)/Grant(s): N00014-00-1-0898

Report No.(s): AD-A468754; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA468754>

Abstract: The KIR2DL4 gene including a portion of exon 1 through exon 9 was sequenced from two families and eight cell lines from the International Histocompatibility Workshop (IHWS). Two known alleles and eight variants were detected. Overall, there were five synonymous and three nonsynonymous changes when the variants were compared to the coding sequences of the most closely related known alleles plus a common frameshift change in five of the variant alleles. Alignment of the new variants with all known alleles showed that the regions encoding the extracellular region and the cytoplasmic tail were the most polymorphic. Two non-synonymous changes, P146H and L161V, occurred in an extracellular immunoglobulin-like domain. Five of the eight variants had a single adenine deletion in the exon encoding the transmembrane region, potentially resulting in a truncated protein lacking the cytoplasmic tail. The distribution of the deletion variant among many KIR2DL4 alleles may explain the high frequency of this variation in the population. Four of the eight consanguineous IHWS cell lines were found to be heterozygous for KIR2DL4 carrying two alleles that differed from one another by a few nucleotide substitutions. Analysis of intron sequences in the families revealed the nature and distribution of interspersed repeat elements which comprise 46% of the KIR2DL4 nucleotide sequence and consist of 12 elements including six SINEs (13.73% of the total length), one LINE (12.41%), and five LTR elements (19.51%). The results revealed the presence of extensive diversity in the KIR2DL4 gene. This is the first extensive report providing both exon and intron data in related individuals.

**Dynamic Tissue Culture from Prostate Biopsy Specimens as a Model for Predicting Tumor Radiosensitivity to Ionizing Radiation Treatment**

Nyman, David W; Apr 2004; 26 pp.; In English

Contract(s)/Grant(s): DAMD17-02-1-0223

Report No.(s): AD-A468755; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA468755>

Prostate cancer is the most common non-cutaneous malignancy in men. Radiation therapy is a common treatment for this disease however, most patients receive a similar dose of radiation (70-76 Gy) regardless of individual clinical, pathological, or molecular characteristics of the tumor. The hypothesis of this project is that all prostate carcinomas are unique and that by identifying specific tumor markers or other molecular characteristics using our dynamic tissue culture system (Parrish et al, 2002), we can identify those tumors most sensitive to radiation therapy. The specific aims for the first year were to use prostate biopsy tissue, obtained retrospectively, and adapt our organ culture technique to the requirements of prostate biopsy specimens. We have been able to determine the optimal biopsy core size and tissue culture media conditions. We have also demonstrated that basal cells present in the prostate glandular tissue proliferated over the 72 hour time period of organ culture. We have maximized the length of time that tissue remains viable in our dynamic tissue culture system. We are now ready to begin Aim II of the proposal determining the baseline radiosensitivity of prostate tissue and assessing the roles of p53, bcl-2, and NFkB in the intrinsic radiosensitivity of prostate tissue. We hope to further profile these biomarkers and using them to predict prostate tissue radiosensitivity will aid in the diagnosis and prognosis of this significant cancer. We have received approval by the IRB at the University of Arizona to enroll up to 30 new patients. Dr. Shona Dougherty, Assoc. professor of Rad. Oncology has agreed to be the new Co-PI. We anticipate enrolling as many as 3-5 patients in the following 6 months. We will be processing these tissues for bio-markers as noted above. We expect to complete the project by April 30, 2005.

ONLINE: <http://hdl.handle.net/100.2/ADA468769>

The lungs are a major organ system of entry into the body and a target for the toxic effects of organophosphorus (OP) compounds, potent inhibitors of the enzyme acetylcholinesterase (AChE). In general, AChE inhibitors (AChEIs) were developed for a variety of indications, including military, medical, and insecticide applications. Nerve agents, OP chemicals with remarkable toxic activity, were first developed by Germany prior to World War II. Whereas nerve agents were produced primarily for military deployment, other cholinesterase inhibitors were used for treating conditions such as myasthenia gravis and as pretreatments for nerve agent exposure. As powerful inhibitors of AChE, these compounds exhibit profound toxicity on multiple organ systems. This chapter discusses respiratory and pulmonary toxicity through direct inhalation of AChEIs and indirect effects on all aspects of respiration through systemic toxicity. OP nerve agents can be disseminated as liquids or aerosols and are toxic by oral, dermal, or inhalational exposure. The lungs are one of the first organs affected following contact with aerosols and vapors. Lung toxicity by AChEIs is due to the following: (1) parasympathetic muscarinic effects leading to increased glandular secretion throughout the respiratory tract and alveoli, (2) bronchoconstriction from contraction of airway smooth muscle, (3) nicotinic effects on respiratory muscles in the thorax and accessory muscles of the neck causing labored breathing and eventually flaccid paralysis, and (4) central effects resulting in a decrease in respiratory drive.

**Effects of Sarin on the Operant Behavior of Guinea Pigs**

Langston, Jeffrey L; Adkins, Angela L; Moran, Anita V; DeFord, Michelle S; Rockwood, Gary A; Jul 19, 2005; 14 pp.; In English; Original contains color illustrations

Report No.(s): AD-A468775; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA468775>

The present study evaluated the dose-response effects of subacute exposure to sublethal doses of the organophosphorus (OP) chemical warfare nerve agent (CWNA) sarin (GB) on the operant behavior of guinea pigs. Dietary restricted guinea pigs, trained to respond for food under a progressive ratio (PR) schedule of reinforcement, were injected five times per week (Monday-Friday) for 2 weeks with fractions (0.1, 0.2, and 0.4) of the established LD<sub>50</sub> of GB (42 %g/kg). Changes in body weight, whole blood (WB) acetylcholinesterase (AChE) levels, and operant performances were monitored over the 2 weeks of GB exposure and for an additional 2 weeks following the termination of exposures. There were dose-related changes in body weight and WB AChE levels throughout the exposure and post-exposure periods. Several parameters of PR performance were disrupted during exposure to 0.4 LD<sub>50</sub> GB, however, concurrent weight loss indicated the presence of overt toxicity. PR performance recovered following the termination of exposures. Lower doses (0.1 and 0.2 LD<sub>50</sub>) of GB failed to produce reliable effects on operant performance during the exposure period. Overall responding decreased during exposure to 0.4 LD<sub>50</sub> GB, resulting in reduced response rates and break points. The decrease in overall response rates was attributed to an increase in pausing since there was no decrease in running rate. Motor effects of 0.4 LD<sub>50</sub> GB were evident as an increase in the proportion of lever press durations > 1.0 s. In the present study, doses of GB lower than 0.4 LD<sub>50</sub> produced no marked alteration of operant performance in guinea pigs, although WB AChE levels were maximally inhibited to 20% of control. © 2005 Elsevier Inc. The Sleep and Performance Research Center (SPRC) at Washington State University will conduct laboratory and field studies of sleep loss and performance in normal humans. These studies will provide the scientific basis for the effective

management of sleep to sustain performance in the operational environment, including all 24x7 operations, extended work hours, and shiftwork. They will improve effectiveness, productivity, safety, health and well-being in military and civilian operations, reducing the likelihood of fatigue-related error, incident, accident or catastrophe.

The goal of this proposal is to develop the use of a nanoscale interface to protein translation machinery to control translation. External magnetic fields excite the nanoscale interface and thus switch on translation of a protein. This technique would enable time-specific control of protein expression, and would enable new techniques in disease diagnosis and therapy. These objectives are in line with the original proposal.

**Improved Wound Healing of Cutaneous Sulfur Mustard Injuries in a Weanling Pig Model**

Graham, John S; Stevenson, Robert S; Mitcheltree, Larry W; Simon, Marcia; Hamilton, Tracey A; Deckert, Robin R; Lee, Robyn B; Nov 8, 2006; 24 pp.; In English; Original contains color illustrations

Report No.(s): AD-A468865; USAMRICD-P06-008; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA468865>

**OBJECTIVE:** The objective was to examine the efficacy of several treatment regimens in improving wound healing of cutaneous sulfur mustard (HD) injuries. **METHODS:** Wound healing studies were conducted in weanling pigs. Superficial dermal HD injuries were debrided at 48 hours post-exposure using an erbium-doped yttrium aluminum garnet (Er:YAG) laser, followed by application of a treatment adjunct. A variety of noninvasive bioengineering methods were conducted during the post-surgical observation period to examine the various cosmetic and functional aspects of the skin. Histopathology was performed at the end of each study (14 or 21 days post-surgery). **RESULTS:** As noted clinically, re-epithelialization was nearly complete by 7 days post-surgery for many of the sites treated with petrolatum and scarlet red dressings. By 21 days, the skin elasticity of the petrolatum-dressed sites was not significantly different from that of sham-exposed skin. Upon dressing removal on post-surgery day 4, the neoepidermis of allograft- and thin film-dressed sites was partially removed, with resultant petechial hemorrhaging. Mean pathology scores for hydro-colloid-dressed sites were significantly lower than those of untreated HD-exposed sites on postsurgery day 14. **CONCLUSIONS:** Care must be taken during bandage changes, and a non-adherent dressing that could be left in place for a longer period of time (e.g., 7 days) would be beneficial. The use of cultured epithelial allograft material may have a potential role if grown on a completely non-adherent backing and left undisturbed for at least a week. Xeroform Petrolatum and Scarlet Red Ointment dressings are effective and inexpensive treatment adjuncts for HD injuries.

ONLINE: <http://hdl.handle.net/100.2/ADA468872>

DNA-dependent protein kinase (DNA-PK) phosphorylates several cellular proteins in vitro, but its cellular function and natural substrate(s) in vivo are not established. We reported activation of DNA ligase in cultured normal human epidermal keratinocytes (NHEK) on exposure to the DNA-damaging compound bis-(2-chloroethyl) sulfide. The activated enzyme was identified as DNA ligase I, and this activation was attributed to phosphorylation of the enzyme. Here, we show that the phosphorylation is mediated by DNA-PK and that DNA ligase I is one of its natural substrates in vivo. DNA ligase I

phosphorylation-cum-activation is a response specific to DNA double-strand breaks. We also demonstrate that affinity-purified inactive DNA ligase I is phosphorylated and activated in vitro by HeLa Cell DNA-PK confirming the in vivo observations. The findings specify the roles of DNA-PK and DNA ligase I in mammalian DNA double-strand break repair.

ONLINE: <http://hdl.handle.net/100.2/ADA468881>

Thiodiglycol (2,2'-bis-hydroxyethylsulfide, TDG), the hydrolysis product of the chemical warfare agent sulfur mustard, has been implicated in toxicity of sulfur mustard through the inhibition of protein phosphatases in mouse liver cytosol. The absence of any inhibitory activity when TDG was present in assays of pure enzymes, however, led us to investigate the possibility for metabolic activation of TDG to inhibitory compound(s) by cytosolic enzymes. We have successfully shown that mammalian alcohol dehydrogenases (ADH) rapidly oxidize TDG in vitro, but the classic spectrophotometric techniques for following this reaction provided no information on the identity of TDG intermediates and products. The use of proton NMR to monitor the oxidative reaction with structural confirmation by independent synthesis allowed us to establish the ultimate product, 2-hydroxyethylthioacetic acid, and to identify an intermediate equilibrium mixture consisting of 2-hydroxyethylthioacetaldehyde, 2-hydroxyethylthioacetaldehyde hydrate and the cyclic 1,4-oxathian-2ol. The intermediate nature of this mixture was determined spectro-photometrically when it was shown to drive the production NADH when added to ADH and NAD.

**Treatment of PTSD-Related Anger in Troops Returning from Hazardous Deployments**

Shea, M T; Mar 2007; 74 pp.; In English; Original contains color illustrations

Contract(s)/Grant(s): W81XWH-05-1-0171

Report No.(s): AD-A468883; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA468883>

The long-term goal of this research is to provide an effective intervention for the prevention of secondary and escalating effects of poor anger control associated with trauma-related anger problems. The specific objectives are to adapt an evidenced-based Cognitive-Behavioral Intervention (CBI) for the treatment of anger to the specific needs of military personnel returning from hazardous deployments, and to conduct a randomized pilot study providing preliminary data on the efficacy and acceptability of the adapted intervention in this population. The first phase of the study involves administering the current (adapted) version of CBI to n participants, and a clinically relevant comparison condition, Supportive Intervention (SI), to n participants. Based on their experiences treating participants in Phase I, the authors have made some changes in inclusion criteria to target individuals who they believe are most appropriate for the treatment. For Phase II, they will exclude subjects with severe PTSD (CAPS > 70) given their experience that too severe anxiety requires different treatment. They also now assess and require evidence that clinically significant anger problems have persisted for at least 3 months to avoid spontaneous improvement. Progress: Phase I of the study is nearing completion, with 14 participants (12 in CBI and 2 in SI) entering treatment. Anticipated treatment completion rate for CBI is 8 of 12 (66%). Based on Phase I experience, the CBI manual has been extensively modified, and less extensive changes have been made to the SI manual. Protocol changes have been approved by local IRBs and have been submitted to the Department of Defense. The randomized pilot study (Phase II) will begin in the near future.

HBOC-201, a bovine polymerized hemoglobin, has been proposed as a novel oxygen-carrying resuscitative fluid for patients with hemostatic effects of HBOC-201 in an animal model of HS. A 40% blood loss-controlled hemorrhage and soft tissue injury were performed in 24 invasively monitored Yucatan mini-pigs. Pigs were resuscitated with HBOC-201 (HBOC) or hydroxyethyl starch (HEX), or were not resuscitated (NON) based on cardiac parameters during a 4-h prehospital phase. Afterward, animals received simulated hospital care for 3 days with blood or saline transfusions. Hemostasis measurements included in vivo bleeding time (BT), thromboelastography (TEG), in vitro bleeding time (platelet function; PFA-CT), prothrombin time (PT), and partial thromboplastin time (PTT). Serum lactate was measured and lung sections were evaluated for microthrombi by electron microscopy. During the prehospital phase, BT remained unchanged in the HBOC group.

ONLINE: <http://hdl.handle.net/100.2/ADA468890>

Orientia tsutsugamushi infection causes scrub typhus, a common zoonosis of rural Asia. Orientia tsutsugamushi was recently detected by a real-time quantitative polymerase chain reaction (qPCR) assay in animal specimens. We evaluated the same qPCR assay in specimens obtained from patients with serologically proven scrub typhus infections. The 47-kDa qPCR assay was more sensitive than was mouse inoculation; it was reactive in whole blood specimens from all 10 isolate-positive patients and in 7 of 17 isolate-negative individuals ( $P=0.003$ , Fisher's two-tailed exact test). As few as 1,076 O. tsutsugamushi copies/microLiter were detected in whole blood. Four of 7 sera from isolate-proven scrub typhus infections were also reactive by qPCR. The assay was unreactive in all 12 individuals without scrub typhus infection. This is the first demonstration of a sensitive and specific real-time qPCR assay for human scrub typhus infection.

**Posttreatment Changes in Escherichia coli Antimicrobial Susceptibility Rates Among Diarrheic Patients Treated with Ciprofloxacin**

Putnam, Shannon D; Sanders, John W; Tribble, David R; Rockabrand, David R; Riddle, Mark S; Rozmajzl, Patrick J; Frenck, Robert W; Jun 2005; 3 pp.; In English

Report No.(s): AD-A468892; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA468892>

Changes in antimicrobial resistance of Escherichia coli among deployed U.S. military personnel being treated for diarrhea were evaluated. Stool samples were collected pretreatment and on days 7, 14, and 28 posttreatment. Resistance to ciprofloxacin was noted in 13.3% of baseline specimens, and rates of resistance against multiple antibiotics increased dramatically from baseline to day 7 and then tapered off to return to pretreatment levels by day 28, except for ciprofloxacin, suggesting that population accumulative usage of fluoroquinolones may result in an incremental increase in resistance rates.

Report No.(s): AD-A468896; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA468896>

Activated platelets participate in inflammatory and microbicidal processes by upregulation of surface selectins, shedding of CD40 ligand, and release of platelet microbicidal proteins and microparticles. Given their myeloid lineage, we hypothesized that platelets express functional N-formyl peptide receptors and respond to the bacterially derived chemotactic peptide N-formyl peptide with gradient-driven chemotaxis. Methods and Results. Here we show specific binding of N-formyl peptides to the surface of activated platelets. Platelet expression and function of the formyl peptide receptor, FPR, was verified by RT-PCR of the differentiated megakaryocyte MEG-01 cell line, immunoblotting of platelet proteins, and calcium mobilization in platelets with formyl peptide binding. Furthermore, we demonstrate gradient-driven chemotaxis of platelets by video microscopy and transwell migration toward formyl peptides. We also show that endogenous formyl peptides, released by eukaryotic mitochondria from necrotic cells, induce chemotaxis using formyl peptide receptors expressed by thrombin-activated platelets. Conversely, supernatants from cells undergoing apoptotic cell death do not induce platelet chemotaxis. Platelet chemotaxis to formyl peptides was blocked with FPR-specific antibody as well as by pertussis toxin inhibition of the formyl peptide G-coupled receptor. Conclusion. These data establish a new role for platelets in host defense and suggest reexamination of their active function in microbicidal and other host defense activities.

**Comparison of Meglumine Antimoniate and Pentamidine for Peruvian Cutaneous Leishmaniasis**

Andersen, Ellen M; Cruz-Saldarriaga, Maria; Llanos-Cuentas, Alejandro; Luz-Cjuno, Maria; Echevarria, Juan; Maranda-Verastegui, Cesar; Colina, Olga; Berman, Jonathan D; Jan 2005; 6 pp.; In English

Report No.(s): AD-A468919; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA468919>

Pentamidine was compared with meglumine antimoniate (Glucantime) for 80 patients with cutaneous leishmaniasis due

to *Leishmania braziliensis* in Peru. Of the 40 patients administered Glucantime (20 mg of antimony [Sb]/kg/day intravenously for 20 days), 31 cured (78%), 6 failed (15%), of which 5 were due to relapse, and 3 were lost to follow-up (7%). Of the 40 patients administered pentamidine (2 mg/kg every other day for seven injections), 14 were cured (35%), 23 failed (58%), and 3 were lost to follow-up (7%). Five pentamidine failures were due to relapse, and 14 failures were due to the presence of parasites two weeks after therapy. Both regimens were well tolerated. Gastrointestinal, musculoskeletal, and total adverse events were not statistically different in either group. Elevations in levels of liver enzymes and pancreatic enzymes were statistically higher in the Glucantime group, but no patient terminated therapy prematurely. In this study, Glucantime was more effective than pentamidine for treatment of *L. braziliensis* cutaneous leishmaniasis in Peru based on parasitologic as well as clinical criteria.

**Cross-Serotype Neutralization of Dengue Virus in *Aotus nancymae* Monkeys**

Kochel, Tadeusz J; Watts, Douglas M; Gozalo, Alfonso S; Ewing, Daniel F; Porter, Kevin R; Russell, Kevin L; Jan 31, 2005; 6 pp.; In English

Report No.(s): AD-A468920; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA468920>

Previously, we observed that serum from humans immune to dengue serotype 1 (dengue-1) neutralized the American genotype of dengue serotype 2 (American-2) to a greater extent than it neutralized the Asian genotype of dengue serotype 2 (Asian-2). To determine if this activity is protective, *Aotus nancymae* monkeys were infected with dengue-1 followed by either American-2 or Asian-2. Dengue-1 infected animals produced antibody with neutralizing titers of 2656 antibodies against dengue-1, 409 against American-2, and 120 against Asian-2. Infection with American-2 did not produce detectable viremia in either dengue-1 immune or dengue-1 naive animals. These findings support the hypothesis that dengue-1 immunity might have prevented disease or altered the severity of disease in individuals sequentially infected with dengue-1 and American-2. Dengue viruses are single-stranded, positive-sense RNA viruses that belong to the Flavivirus genus in the Flaviviridae family. There are 4 serotypes of dengue virus (dengue 1-4), and each serotype consists of many closely related (genotypic) viruses. Dengue viruses are transmitted primarily by *Aedes aegypti* mosquitoes, and all 4 serotypes cause human disease. It is estimated that 100 million dengue infections occur annually worldwide [1], and these can either be subclinical or cause diseases ranging from a flulike syndrome dengue fever to severe disease characterized by capillary leakage and thrombocytopenia dengue hemorrhagic fever (DHF) to hypovolemic shock dengue shock syndrome.

Report No.(s): AD-A468921; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA468921>

We conducted a randomized, double-blind, phase III yellow fever (YF) vaccine trial among 1,107 healthy children in Sullana in northern Peru. The safety and efficacy (by measurement of geometric mean neutralizing antibody titer responses) were determined for two YF vaccines, ARILVAX (exp Trademark)' (n 738) and YF-VAX (n 369). Seroconversion rates were higher (94.9%) in ARILVAX(EXP TRADEMARK)' than in YF-VAX (90.6%) recipients. The two-sided 95% confidence interval (YF-VAX ARILVAX(EXP TRADEMARK)') was (12.8% to 2.5%), indicating that the higher seroconversion rate for Arilvax' was significant. Post-vaccination (30-day) mean log<sub>10</sub> neutralization indices were found to be similar for both products: 1.32 for ARILVAX(EXP TRADEMARK)' and 1.26 for YF-VAX (P 0.1404, by analysis of variance). A similar number of subjects in each group reported at least one adverse event (AE); 441 (59.8%) for ARILVAX(EXP TRADEMARK)' versus 211 (59.9%) for YF-VAX. Most (591; 96.7%) of these were of a mild nature and resolved without treatment. There

were no treatment-related serious AEs. This is the first randomized, double-blind comparison of two YF vaccines in a pediatric population; both vaccines were shown to be highly immunogenic and well-tolerated.

**Bifunctional Alkylating Agent-Induced p53 and Nonclassical Nuclear Factor kB Responses and Cell Death are Altered by Caffeic Acid Phenethyl Ester: A Potential Role for Antioxidant/Electrophilic Response-Element Signaling**  
Minsavage, Gary D; Dillman III, James F; Jan 2007; 12 pp.; In English; Original contains color illustrations  
Report No.(s): AD-A468940; USAMRICD-P05-036; No Copyright; Avail.: Defense Technical Information Center (DTIC)  
ONLINE: <http://hdl.handle.net/100.2/ADA468940>

Bifunctional alkylating agents (BFA) such as mechlorethamine (nitrogen mustard) and bis-(2-chloroethyl) sulfide (sulfur mustard; SM) covalently modify DNA and protein. The roles of nuclear factor kappa B (NF-kB) and p53, transcription factors involved in inflammatory and cell death signaling, were examined in normal human epidermal keratinocytes (NHEK) and immortalized HaCaT keratinocytes, a p53-mutated cell line, to delineate molecular mechanisms of action of BFA. NHEK and HaCaT cells exhibited classical NF-kB signaling as degradation of inhibitor protein of NF-kappa B alpha (I kappa B alpha) occurred within 5 min after exposure to tumor necrosis factor-alpha. However, exposure to BFA induced nonclassical NF-kB signaling as loss of I kappa B alpha was not observed until 2 or 6 h in NHEK or HaCaT cells, respectively. Exposure of an NF-kB reporter gene-expressing HaCaT cell line to 12.5, 50, or 100 micrometers SM activated the reporter gene within 9 h. Pretreatment with caffeic acid phenethyl ester (CAPE), a known inhibitor of NF-kB signaling, significantly decreased BFA-induced reporter gene activity. A 1.5-h pretreatment or 30-min postexposure treatment with CAPE prevented BFA-induced loss of membrane integrity by 24 h in HaCaT cells but not in NHEK. CAPE disrupted BFA-induced phosphorylation of p53 and p90 ribosomal S6 kinase (p90RSK) in both cell lines. CAPE also increased nuclear factor E2-related factor 2 and decreased aryl hydrocarbon receptor protein expression, both of which are involved in antioxidant/electrophilic response element (ARE/EpRE) signaling. Thus, disruption of p53/p90RSK-mediated NF-kB signaling and activation of ARE/EpRE pathways may be effective strategies to delineate mechanisms of action of BFA-induced inflammation and cell death signaling in immortalized versus normal skin systems.

The clinical diagnosis of Q fever is difficult. Whole cell antigens are currently used in several serological methods, but antigens are limited due to the hazardous nature of *Coxiella burnetii* cultivation. In this report, we described the method of detecting immunodominant antigens of *C. burnetii* by using proteomic techniques with patient sera, and cloning and expressing the selected antigens using a novel vector known for its ease of expression, purification, and downstream application.

ONLINE: <http://hdl.handle.net/100.2/ADA468967>

*Plasmodium berghei* and *Plasmodium chabaudi* are widely used model malaria species. Comparison of their genomes, integrated with proteomic and microarray data, with the genomes of *Plasmodium falciparum* and *Plasmodium yoelii* revealed a conserved core of 4500 *Plasmodium* genes in the central regions of the 14 chromosomes and highlighted genes evolving

rapidly because of stage-specific selective pressures. Four strategies for gene expression are apparent during the parasites life cycle: (i) housekeeping; (ii) host-related; (iii) strategy-specific related to invasion, asexual replication, and sexual development; and (iv) stage-specific. We observed post transcriptional gene silencing through translational repression of messenger RNA during sexual development, and a 47-base 3 untranslated region motif is implicated in this process.

ONLINE: <http://hdl.handle.net/100.2/ADA468969>

A cohort study involving 60 human immunodeficiency virus (HIV) negative male transvestite commercial sex workers (CSWs) was conducted in Montevideo, Uruguay in 1999-2001. Serum samples were tested for HIV by an enzyme-linked immunosorbent assay screening with immunoblot confirmation. Six participants seroconverted for an incidence-density rate of 6.03 (95% confidence interval 2.21-13.12) per 100 person-years. Inconsistent condom use during client sex (adjusted hazard ratio [AHR] 6.7), during oral sex (AHR 5.6), and at the last sexual encounter (AHR 7.8), and use of marijuana (AHR 5.4) were marginally associated with HIV seroconversion. Five samples were genotyped in the protease and reverse transcriptase regions; three were subtypes B and two were BF recombinants. Full genome analysis of four samples confirmed all three subtype B samples and one of the two BF recombinants. Male transvestite CSWs sustained a high rate of HIV infection. Larger prospective studies are required to better define subtypes and associated sexual and drug-related risk factors.

**Identification, Cloning, Expression, and Characterization of the Gene for Plasmodium knowlesi Surface Protein Containing an Altered Thrombospondin Repeat Domain**

Mahajan, Babita; Jani, Dewal; Chattopadhyay, Rana; Nagarkatti, Rana; Zheng, Hong; Majam, Victoria; Weiss, Walter; Kumar, Sanjai; Rathore, Dharmendar; Apr 27, 2005; 9 pp.; In English

Report No.(s): AD-A468970; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA468970>

Proteins present on the surface of malaria parasites that participate in the process of invasion and adhesion to host cells are considered attractive vaccine targets. Aided by the availability of the partially completed genome sequence of the simian malaria parasite *Plasmodium knowlesi*, we have identified a 786-bp DNA sequence that encodes a 262-amino-acid-long protein, containing an altered version of the thrombospondin type I repeat domain (SPATR). Thrombospondin type 1 repeat domains participate in biologically diverse functions, such as cell attachment, mobility, proliferation, and extracellular protease activities. The SPATR from *P. knowlesi* (PkSPATR) shares 61% and 58% sequence identity with its *Plasmodium falciparum* and *Plasmodium yoelii* orthologs, respectively. By immunofluorescence analysis, we determined that PkSPATR is a multistage antigen that is expressed on the surface of *P. knowlesi* sporozoite and erythrocytic stage parasites. Recombinant PkSPATR produced in *Escherichia coli* binds to a human hepatoma cell line, HepG2, suggesting that PkSPATR is a parasite ligand that could be involved in sporozoite invasion of liver cells. Furthermore, recombinant PkSPATR reacted with pooled sera from *P. knowlesi*-infected rhesus monkeys, indicating that native PkSPATR is immunogenic during infection. Further efficacy evaluation studies in the *P. knowlesi*-rhesus monkey sporozoite challenge model will help to decide whether the SPATR molecule should be developed as a vaccine against human malaria.

**Can GWOT Primary Prevention Strategy More Effectively Impede Religious Extremism?**

Meyers, Michael A; Mar 23, 2007; 22 pp.; In English

Report No.(s): AD-A468975; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA468975>

Primary prevention, as a medical term, involves taking action to prevent problems from occurring before the onset of symptoms. This concept, when related to the Global War on Terrorism (GWOT) in the Middle East, provides insights on the current strategy's effort and effectiveness in staying ahead of religious extremism expansion. Current U.S. focus and expenditure of resources in Iraq and Afghanistan are very expensive and largely a treatment of religious extremism symptoms. To realize cost effective and enduring effects, Middle East primary prevention strategy requires increased emphasis, updated strategic objectives, and implementation analysis. Existing regimes, with their stability, influence, and control over the vast pool of undecided moderate Muslims, are the critical point of strength and vulnerability for both sides. The strategic objective of cauterization, strengthening the states surrounding the country facing an insurgency, is the most valid approach to achieve the end state of isolated pockets of extremism. Diplomacy through principled negotiation, unilateral hegemonic restraint, and a multi-lateral focus of execution will provide the U.S. legitimacy and leverage to realize the efficacy of primary prevention.

ONLINE: <http://hdl.handle.net/100.2/ADA468986>

The Medical Vanguard Diabetes Management Project was designed to deploy an Internet based diabetes management system, MyCare Team, into a number of existing diverse clinical environments and evaluate how such a stand-alone clinical information system can be integrated into diabetes management program. The diverse environments include the High-Risk Pregnancy Clinic at the National Naval Medical Center and Native American Communities throughout the USA. The GAO Report Executive Guide: Measuring Performance and Demonstrating Results of Information Technology Investments (GAO/AIMD-98-89) will be used as the basis for the evaluation of the technology implementations. Enrollment of patients is set to start in two Native Communities, and the IRB process almost complete in two others. The processes required to implement this technology into diverse communities will be studied. This project has two primary specific aims: clinical deployment and deployment evaluation.

**Prognostic Significance of Telomere Attrition in Ductal Carcinoma in Situ of the Breast**

Griffith, Jeffrey K; Feb 2007; 21 pp.; In English; Original contains color illustrations

Contract(s)/Grant(s): W81XWH-05-1-0226

Report No.(s): AD-A468993; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA468993>

We are using an innovative quantitative assay for telomere DNA content (TC) developed and characterized by the PI to test the hypothesis that TC predicts the likelihood of disease recurrence in women with DCIS. In Year One we collaborated to determine whether TC measured in bulk DCIS tumor tissue is comparable to that measured in tumor epithelial cells purified by laser-capture microscopy. In 7/10 instances TC in microdissected specimens was 72-112% of that in the undissected control (mean 85%). These results suggest that it will not be necessary to microdissect or otherwise fractionate DCIS specimens prior to TC analysis. We are currently confirming and extending these results in our own laboratory. In Years One and Two we measured TC in 46 specimens of normal breast tissue 126 specimens of DCIS and 657 specimens of breast tumor tissues. In Year Two we used a Kaplan-Meier plot and log-rank test to show that low TC predicts a shorter survival interval. TC was not associated with ethnicity menopausal status or the expression of several other markers including estrogen receptor progesterone receptor p53 Ki67 and Her2. We are working with the New Mexico Tumor Registry to identify additional specimens of DCIS from women with longer follow-up to confirm and extend these results. In summary during Years One and

Two we have shown that (i) meaningful TC measurements can be obtained with bulk DCIS issues (ii) TC is associated with tumor stage and (iii) TC in DCIS is associated with breast cancer-free survival.

**Characterization of Breast Masses Using a new Method of Ultrasound Contrast Agent Imaging in 3D Mapping of Vascular Anomalies**

LeCarpentier, Gerald L; Oct 2006; 64 pp.; In English; Original contains color illustrations

Contract(s)/Grant(s): DAMD17-01-1-0327

Report No.(s): AD-A468994; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA468994>

Doppler ultrasound and other imaging modalities have been used to assess characteristics of vasculature associated with malignant breast masses. 3D contrast refill imaging should help visualize slow-flow in small neo-vasculature associated with these masses. The dual-transducer method investigated is expected to provide vascular mapping while minimizing acquisition time, the major limitation of techniques such as interval-imaging (I-I) and real-time (RT) imaging. Phantom tube-flow studies confirmed the method as viable in a simple sense. Further experiments with an in vitro fixed porcine kidney provided the bulk of the data post Y2. Image volumes reconstructed using the dual-transducer method displayed remarkable spatial detail. A parametric method of visualizing mean transit times (MTTs) throughout a volume was developed, and a secondary scheme for extending the technique into clinical trials was developed. Simple MTT estimates were extended into actual perfusion estimates, using large vessel reference signals within each image plane. These signals were characterized and quantified by way of a variety of means presented in this report. There was significant consistency among methods. Results over the course of the study have been promising, and clinical trials are expected in the near future.

**Characterization of Breast Masses Using a New Method of Ultrasound Contrast Agent Imaging in 3D Mapping of Vascular Anomalies**

LeCarpentier, Gerald L; Oct 2005; 70 pp.; In English; Original contains color illustrations

Contract(s)/Grant(s): DAMD17-01-1-0327

Report No.(s): AD-A468996; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA468996>

Doppler ultrasound and other imaging modalities have been used to assess characteristics of vasculature associated with malignant breast masses. 3D contrast refill imaging should help visualize slow-flow in small neo-vasculature associated with these masses. The dual-transducer method proposed should provide vascular mapping while minimizing acquisition time, the major limitation of techniques such as interval-imaging (I-I) and real-time (RT) imaging. Previous phantom tube-flow studies and fixed porcine kidney studies were further analyzed and formalized in two separate papers submitted to Ultrasound in Medicine and Biology. While results were promising, follow-up verification of the latter displayed some unexplainable anomalies. It has become clear that comparisons of mean transit time alone are insufficient. It is also apparent that input contrast signal levels vary in time in less than ideal ways (i.e. as opposed to our earlier assumption of exponential decay). We have begun to evaluate a method for estimating the signal level in 100% blood from characteristics of cumulative histograms of each acquired image. This should allow us a method to both monitor fluctuations of input contrast signal level and calculate a real value for fractional blood volume (and subsequently, combined with mean transit time estimates, an actual measure of perfusion).

**Physiological Stress Reactivity and Breast Cancer**

Wadhwa, Pathik; Oct 2005; 10 pp.; In English

Contract(s)/Grant(s): DAMD17-99-1-9248

Report No.(s): AD-A468998; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA468998>

The objective of the present program of research is to study physiological processes that may mediate the links between

psychological states and cancer. Specifically, the present study is designed to conduct an investigation of the cross-sectional associations between indices of stress reactivity and psychological coping styles in women with breast cancer and matched healthy controls. The aims of the project are: (1) To quantify parameters of biological reactivity to a behavioral stress paradigm in women with and without breast cancer; (2) To examine effects of menopause and familial risk on biological stress reactivity and emotional expression; and (3) To develop the methodology and obtain preliminary data which could justify subsequent, prospective research with high-risk populations. Data collection ended May 2005. Results of data analyses indicated significant differences in several cardiovascular indicators of stress-reactivity, as well as significant differences in changes in cortisol levels between the breast cancer and control group. While specific coping styles were shown to relate differently to cardiovascular stress responses and negative emotional responses among participants, coping styles were not associated with changes in cortisol levels. This suggests that the HPA-stress hormone link may not be mediated by perception of stress. Among reproductive and familial risk factors assessed, oral contraceptive use and length of use were associated with a dysregulated biological stress response profile (i.e., respond quicker and not recover as quickly).

**A Rat Model for Human Ductal Carcinoma In Situ**

Nandi, Satyabrata; Sep 2006; 17 pp.; In English; Original contains color illustrations

Contract(s)/Grant(s): DAMD17-03-1-0551

Report No.(s): AD-A469002; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA469002>

Our objective was to develop a rodent model for human OCIS and LCIS in which lesions of diverse phenotypes could be induced and characterized and their malignant potential studied in a linear manner. We tested the effect of the infusion of EGF FGF or IGF1 on the proliferation of mammary glands in ovariectomized rats. Infusion of EGF, FGF or IGF1 resulted in end bud formation and lobuloalveolar development within 72 hours. Intraductal proliferation resulted only in rats treated with IGF1. These results indicate that infusion of growth factors into the mammary glands induces proliferation of different kinds of structures including end buds lobuloalveolar structures and intraductal proliferations and that the growth factors in ovariectomized rats can support neoplastic mammary transformation. EGF or IGF-1 were infused in ovariectomized rats using Alzet pumps and treated with the chemical carcinogen N-methyl-N nitrosourea (MNU). The cancers were varied in their estrogen and progesterone receptor expression as determined by immunocytochemistry. The objectives of the project were not achieved due to the low incidence of mammary cancers induced following treatment with growth factors and MNU making it difficult to transplant lesions of different phenotypes and characterize the malignant potential.

**Sources of Variability in Determining Malaria Parasite Density by Microscopy**

O'Meara, Wendy P; McKenzie, F E; Magill, Alan J; Forney, J R; Permpanich, Barnyen; Lucas, Carmen; Gasser, Jr , Robert A; Wongsrichanalai, Chansuda; Jan 2005; 7 pp.; In English

Report No.(s): AD-A469015; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA469015>

Enumeration of parasites by microscopic examination of blood smears is the only method available for quantifying parasitemia in infected blood. However, the sources and scale of error inherent in this technique have not been systematically investigated. Here we use data collected in outpatient clinics in Peru and Thailand to elucidate important sources of variation in parasite density measurements. We show that discrepancies between readings from two independent microscopists and multiple readings from a single microscopist are inversely related to the density of the infection. We present an example of how differences in reader technique, specifically the number of white blood cells counted, can contribute to the differences between readings. We discuss the implications of this analysis for field studies and clinical trials.

**Behavioral Responses to DDT and Pyrethroids Between Anopheles Minimus Species A and C Malaria Vectors in Thailand**

Potikasikorn, Jinnapa; Chareonviriyaphap, Theeraphap; Bangs, Michael J; Prabaripai, Atchariya; Jan 2005; 8 pp.; In English Report No.(s): AD-A469018; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA469018>

Behavioral responses of two field populations of *Anopheles minimus* complex species A and C for contact and non-contact actions of chemicals were compared during and after exposure to operational field concentrations of DDT (2 g/sq m), deltamethrin (0.02 g/sq m), and lambda-cyhalothrin (0.03 g/sq m) using an excito-repellency escape chamber. The two populations were collected from the Mae Sot District in Tak Province (species A) and the Tri Yok District in Kanchanaburi Province (species C) in western Thailand. Female mosquitoes of both populations rapidly escaped from chambers after direct contact with DDT, deltamethrin, and lambda-cyhalothrin. The non-contact repellency response to DDT and the two synthetic pyrethroids was pronounced with *An. minimus* species A; however, non-contact repellency was relatively weak with *An. minimus* species C, but remained significantly greater than the paired controls ( $P < 0.05$ ). We conclude that strong contact irritancy was present in both test populations, whereas non-contact repellency also played a significant role in the escape response of *An. minimus* species A.

**Prevalences, Genotypes, and Risk Factors for HIV Transmission in South America**

Montano, Silvia M; Sanchez, Jose L; Laguna-Torres, Alberto; Cuchi, Paloma; Avila, Maria M; Weissenbacher, Mercedes; Serra, Margarita; Russi, Jose Vinales; ose C; Aguayo, Nicolas; Feb 7, 2005; 8 pp.; In English

Report No.(s): AD-A469029; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA469029>

HIV cross-sectional studies were conducted among high-risk populations in 9 countries of South America. Enzyme-linked immunosorbent assay screening and Western blot confirmatory testing were performed, and env heteroduplex mobility assay genotyping and DNA sequencing were performed on a subset of HIV-positive subjects. HIV prevalences were highest among men who have sex with men (MSM; 2.0%-27.8%) and were found to be associated with multiple partners, noninjection drug use (non-IDU), and sexually transmitted infections (STIs). By comparison, much lower prevalences were noted among female commercial sex workers (FCSWs; 0%-6.3%) and were associated mainly with a prior IDU and STI history. Env subtype B predominated among MSM throughout the region (more than 90% of strains), whereas env subtype F predominated among FCSWs in Argentina and male commercial sex workers in Uruguay (more than 50% of strains). A renewed effort in controlling STIs, especially among MSM groups, could significantly lessen the impact of the HIV epidemic in South America.

**Mandatory Vaccinations: Precedent and Current Laws**

Welborn, Angie A; Jan 18, 2005; 6 pp.; In English

Report No.(s): AD-A469034; CRS-RS21414; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA469034>

This report discusses the history legal precedent for mandatory vaccination laws and provides a brief overview of state laws that require certain individuals or populations to be vaccinated against various communicable diseases. State laws include those requiring children to be vaccinated before they enroll in a public or private school and laws providing for mandatory vaccinations during a public health emergency or outbreak of a communicable disease. In addition to the current laws, many states are considering or have considered the provisions set forth in the Model State Emergency Health Powers Act. The Model Act addresses a number of issues likely to arise during a public health emergency and offers guidelines for states with respect to what powers may be necessary during such an emergency. Under the Model Act, during a public health emergency the public health authority would be authorized to 'vaccinate persons as protection against infectious disease and to prevent the spread of contagious or possibly contagious disease.' Under the Public Health Service Act, the Secretary of Health and Human Services has the authority to make and enforce regulations necessary 'to prevent the introduction, transmission, or spread of communicable diseases from foreign countries into the States or possessions, or from one State or possession into any other State or possession.' Generally, federal regulations authorizing the apprehension, detention, examination, or conditional

release of individuals are applicable only to individuals coming into a State or possession from a foreign country or a possession. This limitation on federal jurisdiction acknowledges that states have the primary responsibility for protecting the public health, but under certain circumstances, federal intervention may be necessary. This report will be updated as warranted.

**Early Detection of Dengue Infections using Cluster Sampling Around Index Cases**

Beckett, Charmagne G; Kosasih, Herman; Faisal, Indra; Nurhayati,.; Tan, Ratna; Widjaja, Susana; Aningsih, Erlin L; Ma'Roef, Chairin; Wuryadi, Suharyono; Bangs, Michael J; Jan 2005; 7 pp.; In English

Report No.(s): AD-A469042; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA469042>

A two-year study using a cluster investigation method was conducted in West Jakarta, Indonesia to demonstrate the detection of dengue cases prior to onset of clinical illness. The clusters consisted of family members and neighbors of 53 hospitalized dengue index cases. Among 785 adult and child volunteers enrolled, 17 (2.2%) post enrollment dengue (PED) infections were identified. Eight PED cases were asymptomatic and nine were symptomatic. Symptomatic cases included eight with dengue fever and one with dengue hemorrhagic fever (DHF) (grade II). Among the eight asymptomatic PED cases, viremia was detected in two. Eleven volunteers had acute dengue infections at the time of enrollment. Four of the 11 developed DHF, resulting in a total of five DHF cases detected during the investigation. This study design can serve as a benchmark for future investigations that seek to define early immunologic events following dengue infections that contribute to the development of DHF.

**Murine Macrophages Kill the Vegetative Form of Bacillus anthracis**

Kang, Tae J; Fenton, Matthew J; Weiner, Matthew A; Hibbs, Stephen; Basu, Subhendu; Baillie, Les; Cross, Alan S; Aug 18, 2005; 8 pp.; In English; Original contains color illustrations

Report No.(s): AD-A469048; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA469048>

Anti-protective antigen antibody was reported to enhance macrophage killing of ingested Bacillus anthracis spores, but

it was unclear whether the antibody-mediated macrophage killing mechanism was directed against the spore itself or the vegetative form emerging from the ingested and germinating spore. To address this question, we compared the killing of germination-proficient (gp) and germination-deficient (DeltagerH) Sterne 34F2 strain spores by murine peritoneal macrophages. While macrophages similarly ingested both spores, only gp Sterne was killed at 5 h (0.37 log kill). Pretreatment of macrophages with gamma interferon (IFN-gamma) or opsonization with immunoglobulin G (IgG) isolated from a subject immunized with an anthrax vaccine enhanced the killing of Sterne to 0.49 and 0.73 log, respectively, but the combination of IFN-gamma and IgG was no better than either treatment alone. Under no condition was there killing of DeltagerH spores. To examine the ability of the exosporium to protect spores from macrophages, we compared the macrophage-mediated killing of nonsonicated (exosporium+) and sonicated (exosporium-) Sterne 34F2 spores. More sonicated spores than nonsonicated spores were killed at 5 h (0.98 versus 0.37 log kill, respectively). Pretreatment with IFN-gamma increased the sonicated spore killing to 1.39 log. However, the opsonization with IgG was no better than no treatment or pretreatment with IFN-gamma. We conclude that macrophages appear unable to kill the spore form of *B. anthracis* and that the exosporium may play a role in the protection of spores from macrophages.

**A Hemoglobin-based Oxygen Carrier, Bovine Polymerized Hemoglobin (HBOC-201) Versus Hetastarch (HEX) in a Moderate Severity Hemorrhagic Shock Swine Model with Delayed Evacuation**

Philbin, Nora; Rice, Jennifer; Gurney, Jennifer; McGwin, Gerald; Arnaud, Francoise; Dong, Feng; Johnson, Todd; Flourncy, W S; Ahlers, Stephen; Pearce, L B; McCarron, Richard; Freilich, Daniel; Mar 23, 2005; 13 pp.; In English; Original contains color illustrations

Report No.(s): AD-A469050; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA469050>

Objective: To evaluate the efficacy of HBOC-201 for resuscitation of hemorrhagic shock in a swine model incorporating soft tissue injury and delayed evacuation. Methods: A muscle crush injury and 40% estimated blood volume controlled hemorrhage was completed in 24 Yucatan mini-pigs. Pigs were untreated or resuscitated with HBOC-201 or 6% hetastarch (HEX) at 20 min. Invasive hemodynamics and clinical variables were monitored for 4 h (pre-hospital phase) and subsequent fluid infusions were administered for severe hypotension or tachycardia. Animals were recovered from anesthesia and monitored non-invasively to 72 h (hospital phase). Results: 100% (8/8) of HBOC-201-, 88% (7/8) of HEX-, and 63% (5/8) of non-resuscitated pigs, survived to 72 h ( $p = 0.27$ ). Mean arterial pressure, mean pulmonary arterial pressure and systemic vascular resistance index were higher in HBOC-201 pigs. By 90 min, cardiac index was restored to baseline in the HBOC-201 group and was 1.4-fold greater than baseline in the HEX group. HBOC-201 pigs had lower fluid requirements than HEX pigs (18.8 1.8 and 29.9 1.1 ml/kg,  $p < 0.001$ ) in the pre-hospital phase and required fewer blood transfusions (1.3 1.3 and 9.4 0.6 ml/kg, respectively,  $p < 0.001$ ) in the hospital phase. Urine output and blood creatinine were comparable in HBOC-201 and HEX pigs. Tissue oxygenation levels were highest in the HBOC-201 group. Conclusions: As HBOC-201 restored hemodynamics and tissue oxygenation and decreased fluid requirements, in comparison with HEX, HBOC-201 was at least as efficacious and possibly a superior resuscitative fluid in a military-relevant delayed evacuation hemorrhagic shock swine model.

**Proteomic Analysis of *Rickettsia prowazekii***

Chao, C C; Chelius, D; Zhang, T; Mutumanje, E; Ching, W M; Jan 2005; 4 pp.; In English

Report No.(s): AD-A469065; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA469065>

*Rickettsia prowazekii* is an obligate intracellular gram-negative bacterium. Comparative proteomics study of a virulent strain (Breinl) versus an avirulent strain (Madrid E) was performed using an integrated liquid chromatography and mass spectrometer. About 30% of predicted proteins were detected and identified. Among the detected proteins, more than 30 proteins were of unknown function in both strains. Although several proteins were detected in only one strain, the overall distribution of detected proteins in different COGs (clusters of orthologs groups) was very similar between the two strains.

Functional analysis of differentially expressed proteins, either qualitatively or quantitatively, may lead to the discovery of pathogenesis-related factors.

**Impact of Illness and Non-Combat Injury During Operations Iraqi Freedom and Enduring Freedom (Afghanistan)**

Sanders, John W; Putnam, Shannon D; Frankart, Carla; Frenck, Robert W; Monteville, Marshall R; Riddle, Mark S; Rockabrand, David M; Sharp, Trueman W; Tribble, David R; May 25, 2005; 8 pp.; In English

Report No.(s): AD-A469067; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA469067>

Historically, non-combatant injuries and illnesses have had a significant impact on military missions. We conducted an anonymous cross-sectional survey to assess the prevalence and impact of common ailments among U.S. military personnel deployed to Iraq or Afghanistan during 2003-2004. Among 15,459 persons surveyed, diarrhea (76.8% in Iraq and 54.4% in Afghanistan), respiratory illness (69.1%), non-combat injuries (34.7%) and leishmaniasis (2.1%) were commonly reported. For all causes 25.2% reported that they required intravenous fluids, 10.4% required hospitalization and 5.2% required medical evacuation. Among ground units 12.7% reported that they missed a patrol because of illness and among air units, 11.7% were grounded because of illness. The incidence of diarrhea and respiratory infections doubled from the pre-combat to combat phases, and the perceived adverse impact of these illnesses on the unit increased significantly during the combat phase. Despite technologic advances in warfare and preventive medicine illness and non-combat injuries have been common during operations in Iraq and Afghanistan, resulting in frequent transient decreases in operational efficiency.

**Measuring 'Impossible' Intermolecular Cross-Peaks to Improve Selectivity and Sensitivity in Breast MRI**

Warren, Warren S; Oct 2002; 7 pp.; In English; Original contains color illustrations

Contract(s)/Grant(s): DAMD17-99-1-9357

Report No.(s): AD-A469069; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA469069>

This proposal focuses on development of a radically new method for breast magnetic resonance imaging (MRI), which could improve detection of small tumors and reduce the unnecessary biopsies generated by false positives in conventional breast MRI and mammography. This method is based on my groups recent discovery of a significant omission in the decades old theoretical framework of nuclear magnetic resonance (NMR, the spectroscopic precursor to MRI). We have shown that it is possible to detect strong signals from intermolecular resonances for example, simultaneously flipping up a water spin at one location while flipping down another water spin 100 um away even though such intermolecular zero-quantum coherences (iZQCs) would be predicted to be completely impossible to observe in the conventional formulation of NMR or MRI. This fundamentally new physics provides the basis for a potentially extremely useful contrast enhancement technique geared towards early detection and tumor grading. Our preliminary results demonstrated iZQC breast imaging on one healthy volunteer, with and without fat suppression. Unfortunately, the human approval process took the entire grant year, during which time the existing human machine was decommissioned. During this time, work progressed on phantom imaging and sequence improvement.

**Establishment of a Non-human Primate Campylobacter Disease Model for the Pre-clinical Evaluation of Campylobacter Vaccine Formulations**

Islam, Dilara; Lewis, Michael D; Srijan, Apichai; Bodhidatta, Ladaporn; Aksomboon, Ajchara; Gettayacamin, Montip; Baqar, Shahida; Scott, Daniel; Mason, Carl J; Jul 25, 2005; 11 pp.; In English

Report No.(s): AD-A469071; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA469071>

disease Campylobacter jejuni is a common cause of enteritis worldwide. The mechanisms by which C. jejuni causes

disease are unclear. Challenge studies in humans are currently considered unethical due to the possibility of severe complications, such as Guillain Barr e syndrome. Campylobacter infection in non-human primates closely mimics the disease and immune response, seen in humans. In this study, we attempted to determine the minimal dose of a pathogenic *C. jejuni* 81-176 strain required for clinical signs and symptoms of disease (e80% attack rate) in *Macaca mulatta* monkeys using an escalating dosage (three doses for three monkey groups: 107, 109 and 1011 cfu). Eighty percent of the monkeys challenged with highest dose (1011 cfu) had mild disease, but the 80% attack rate (moderate diarrhea in 80% of the monkeys) was not achieved. However, 100% of monkeys showed IgA seroconversions (three-fold over pre-challenge titers). The elicited immune response was challenge dose-dependent. Campylobacter antigen specific fecal s-IgA responses were observed in all challenged groups but the response was not dose-dependent. Only IgM antibody secreting cells response was observed against Campylobacter antigens. The elicited immune response in three groups of rhesus monkeys was dose-dependent, indicating this monkey model can be used for pre-clinical evaluation of Campylobacter candidate vaccines, however these adult rhesus monkeys are less prone to Campylobacter infection.

**National Institutes of Health Consensus Development Project on Criteria for Clinical Trials in Chronic Graft-versus-Host Disease: I. Diagnosis and Staging Working Group Report**

Filipovich, Alexandra H; Weisdorf, Daniel; Pavletic, Steven; Socie, Gerard; Wingard, John R; Lee, Stephanie J; Martin, Paul; Chien, Jason; Przepiorka, Donna; Couriel, Daniel; Sep 9, 2005; 13 pp.; In English

Report No.(s): AD-A469074; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA469074>

This consensus document is intended to serve 3 functions. First, it standardizes the criteria for diagnosis of chronic graft-versus-host disease (GVHD). Second, it proposes a new clinical scoring system (0-3) that describes the extent and severity of chronic GVHD for each organ or site at any given time, taking functional impact into account. Third, it proposes new guidelines for global assessment of chronic GVHD severity that are based on the number of organs or sites involved and the degree of involvement in affected organs (mild, moderate, or severe). Diagnosis of chronic GVHD requires the presence of at least 1 diagnostic clinical sign of chronic GVHD (e.g., poikiloderma or esophageal web) or the presence of at least 1 distinctive manifestation (e.g., keratoconjunctivitis sicca) confirmed by pertinent biopsy or other relevant tests (e.g., Schirmer test) in the same or another organ. Furthermore, other possible diagnoses for clinical symptoms must be excluded. No time limit is set for the diagnosis of chronic GVHD. The Working Group recognized 2 main categories of GVHD, each with 2 subcategories. The acute GVHD category is defined in the absence of diagnostic or distinctive features of chronic GVHD and includes (1) classic acute GVHD occurring within 100 days after transplantation and (2) persistent, recurrent, or late acute GVHD (features of acute GVHD occurring beyond 100 days, often during withdrawal of immune suppression). The broad category of chronic GVHD includes (1) classic chronic GVHD (without features or characteristics of acute GVHD) and (2) an overlap syndrome in which diagnostic or distinctive features of chronic GVHD and acute GVHD appear together. It is currently recommended that systemic therapy be considered for patients who meet criteria for chronic GVHD of moderate to severe global severity.

**HIV Gag Protein Conjugated to a Toll-like Receptor 7/8 Agonist Improves the Magnitude and Quality of Th1 and CD8+ T Cell Responses in Nonhuman Primates**

Mattapallil, Joseph J; Weiss, Walter R; Roederer, Mario; Seder, Robert A; Wille-Reece, Ulrike; Flynn, Barbara J; Lor, Karin; Koup, Richard A; Kedl, Ross M; Jun 23, 2005; 7 pp.; In English

Report No.(s): AD-A469077; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA469077>

Induction and maintenance of antibody and T cell responses will be critical for developing a successful vaccine against HIV. A rational approach for generating such responses is to design vaccines or adjuvants that have the capacity to activate specific antigenpresenting cells. In this regard, dendritic cells (DCs) are the most potent antigen-presenting cells for generating primary T cell responses. Here, we report that Toll-like receptor (TLR) agonists and ligands that activate DCs in vitro influence the magnitude and quality of the cellular immune response in nonhuman primates (NHPs) when administered with HIV Gag protein. NHPs immunized with HIV Gag protein and a TLR7 8 agonist or a TLR9 ligand [CpG oligodeoxynucleotides (CpG

ODN)] had significantly increased Gag-specific T helper 1 and antibody responses, compared with animals immunized with HIV Gag protein alone. Importantly, conjugating the HIV Gag protein to the TLR7/8 agonist (Gag-TLR7/8 conjugate) dramatically enhanced the magnitude and altered the quality of the T helper 1 response, compared with animals immunized with HIV Gag protein and the TLR7/8 agonist or CpG ODN. Furthermore, immunization with the Gag-TLR7/8 conjugate vaccine elicited Gag-specific CD8 T responses. Collectively, our results show that conjugating HIV Gag protein to a TLR7/8 agonist is an effective way to elicit broad-based adaptive immunity in NHPs. This type of vaccine formulation should have utility in preventive or therapeutic vaccines in which humoral and cellular immunity is required.

**Production of Recombinant Protein Pap31 and Its Application for the Diagnosis of Bartonella bacilliformis Infection**

Taye, A; Chen, H; Duncan, K; Zhang, Z; Hendrix, L; Gonzalez, J; Ching, W; Jan 2005; 7 pp.; In English

Report No.(s): AD-A469080; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA469080>

Tropical bartonellosis is a highly fatal epidemic and endemic infectious disease that occurs throughout the communities of the Andes Mountains in South America. The disease is caused by the facultative intracellular bacteria, Bartonella bacilliformis. The emergence of bartonellosis in new geographic areas and an increase in the number of reported cases suggest the need for a rapid test for epidemiologic study and investigation of the disease burden. The objective of this research is to develop a rapid serologic diagnostic test using recombinant antigens to overcome the limitations of the current standard IFA technique for laboratory diagnosis. Western blot analysis with patient sera of whole cell lysate separated on a 2D gel identified Pap31 as a dominant antigen. PCR primers were designed according to the sequence of ATCC strain 35685 to amplify the gene coding for Pap31 from a local isolate (HOSP 800-09, Peru). The amplicon was subsequently cloned into pET24a, adding the T7 tag, and expressed in E. coli. Patient sera with different IFA titers confirmed the diagnostic band of 31 kDa on a Western blot of SDS-PAGE. The performance of affinity-purified recombinant Pap31 (rPap31) was also evaluated in an ELISA format with 137 patient sera of known IFA titers. The range of ELISA reading from positive sera did not overlap with the range of those from negative sera, suggesting the potential application of rPap31 in both ELISA for high throughput regional hospital settings and in the construction of handheld rapid tests for rural clinical sites.

**Observation on the Joint Service Military Medical Facility What Does the Future Hold**

O'Connell, Cynthia A; Mar 30, 2007; 31 pp.; In English

Report No.(s): AD-A469087; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA469087>

There has been much discussion regarding the Unified Medical Command (MEDCOM), but not much written about what 'right might look like' for the Service medical organizations. Our Service Medical Centers (MEDCENs) are a strategic asset in the healthcare mission and will continue to be as they move into the realm of joint MEDCENs. To extend some recent speculation about joint MEDCENs, this paper describes the prototype organization of the joint MEDCEN model that has been

in joint operation for the past ten years: Landstuhl Regional Medical Center (LRMC) in Landstuhl, Germany. It further describes the historical transformation of LRMC into the joint organization that it is today, its evolution during peacetime, its integration of joint staffing during Operation Iraqi Freedom/Operation Enduring Freedom (OIF/OEF), its progress to achieve jointness, and efforts to make it part of the organizational culture. The paper concludes with recommendations on what still needs to be done to create a fully joint environment of a tertiary care MEDCEN.

**Protection Against Scrub Typhus by a Plasmid Vaccine Encoding the 56-KD Outer Membrane Protein Antigen Gene**

May 27, 2005; 7 pp.; In English

Report No.(s): AD-A469095; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA469095>

The 56-kD outer membrane protein of *Orientia tsutsugamushi* has previously been shown to be the immunodominant antigen in scrub typhus infections. Its gene was cloned into the DNA vaccine vector pVR1012 as a vaccine candidate (pKarp56). The in vitro expression of this 56-kD antigen by pKarp56 was confirmed in tissue culture by an indirect fluorescence assay and Western blot analysis. The initial antibody responses of mice immunized with varied doses of the pKarp56 were barely detected, but increases were observed after each of three subsequent booster immunizations. Although no protection was observed with a single immunization of pKarp56, after four immunizations, 60% of the mice survived a 1,000 50% lethal dose (LD50) challenge. These results specifically confirm the importance of the 56-kD protein antigen in protective immunity against *O. tsutsugamushi* and demonstrate the feasibility of DNA vaccines for the prevention of scrub typhus.

**Cloning and Sequence Analysis of the 22-kDa Antigen Genes of *Orientia tsutsugamushi* Strains Kato, TA763, AFSC 7, 18-032460, TH1814, and MAK 119**

Ge, Hong; Tong, Min; Li, Andrew; Mehta, Rajan; Ching, Wei-Mei; Jan 2005; 9 pp.; In English

Report No.(s): AD-A469100; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA469100>

The 22-kDa protein antigen is one of several antigens recognized by sera from scrub typhus patients infected with *Orientia tsutsugamushi*. The 22-kDa protein genes from six *O. tsutsugamushi* strains (Kato, TA763, AFSC 7, 18-032460, TH1814, MAK119) were cloned and their sequences were determined and compared to each other and to the Karp strain sequence listed in GenBank. The sequence alignment revealed that the promoter regions of these seven strains were highly conserved. However, the ORFs exhibited some variation. The phylogenetic analysis of the DNA sequences indicated that among the seven strains assessed, Kato and TA763 were the most closely related, while Karp and TH1814 were the most distantly related. The information gained from this analysis will facilitate our selection of *O. tsutsugamushi* strains from which antigens should be derived to be included in a multivalent vaccine candidate for scrub typhus.

**Federally Sponsored Health Care Research Gulf War Illnesses and Beyond**

Forster, Ellen E; Mar 22, 2007; 21 pp.; In English

Report No.(s): AD-A469103; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA469103>

The USA Congress has poured vast amounts of money into Gulf War illnesses research projects. From 1994 through 2005, the Department of Veterans Affairs, the Department of Defense, and the Department of Health and Human Services collectively spent \$284 million on Gulf War illnesses research. Some question whether there is sufficient oversight and collaboration directed at ensuring that the most appropriate and strategic priorities aimed to improve the health status of deployed soldiers and veterans are being addressed. Who is conducting what research where? Is this research resulting in America's sons and daughters getting the care they need and deserve? Gulf War illnesses are defined and the evolution of the interagency committees that coordinated and conducted federal Gulf War illnesses research from its inception are highlighted. Congressionally directed funding trends, where the funds are spent, and significant impacts and improvements resulting from research findings are explored. Regardless of partisan or political views, there is great interest in the federal response to health concerns of Gulf War and Global War on Terrorism veterans as well as a significant interest in aid provided to our service men and women who endure great sacrifice to protect our freedom.

**HLA-A2 Supertype-Restricted Cell-Mediated Immunity by Peripheral Blood Mononuclear Cells Derived from Malian Children with Severe or Uncomplicated Plasmodium falciparum Malaria and Healthy Controls**

Lyke, Kirsten E; Burges, Robin B; Cissoko, Yacouba; Sangare, Lansana; Kone, Abdoulaye; Dao, Modibo; Diarra, Issa; Fernandez-Vina, Marcelo A; Plowe, Christopher V; Doumbo, Ogobara K; Sztein, Marcelo B; Apr 25, 2005; 11 pp.; In English  
Report No.(s): AD-A469105; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA469105>

Understanding HLA-restricted adaptive host immunity to defined epitopes of malarial antigens may be required for the development of successful malaria vaccines. Fourteen epitopes of preerythrocytic malarial antigens known to mediate cytotoxic T-lymphocyte responses against target cells expressing HLA-A2-restricted epitopes were synthesized and pooled based on antigen: thrombospondin-related anonymous protein (TRAP), circumsporozoite protein (CSP), and export protein 1 (Exp-1) peptides. HLA-A2 supertype (\*0201, \*0202, \*0205, \*6802) peripheral blood mononuclear cells collected from 774 Malian children, aged 3 months to 14 years, with severe Plasmodium falciparum malaria matched to uncomplicated malaria or healthy controls were stimulated with the HLA-A2-restricted peptide pools. Significant gamma interferon production, determined by enzyme-linked immunospot assay to at least one of the three peptide pools, was observed in 24/58 (41%) of the severe malaria cases, 24/57 (42%) of the uncomplicated malaria cases, and 34/51 (67%) of the healthy controls. Significant lymphoproliferation to these peptides was observed in 12/44 (27%) of the severe malaria cases, 13/55 (24%) of the uncomplicated malaria cases, and 18/50 (36%) of the healthy controls. Responses to individual peptide pools were limited. These studies confirm the presence of adaptive cell-mediated immunity to preerythrocytic malaria antigens in volunteers from Mali and demonstrate that suballeles of the HLA-A2 supertype can effectively present antigenic epitopes. However, whether these immune responses to TRAP, CSP, and Exp-1 malarial proteins play a substantial role in protection remains a matter of controversy.

**White Blood Cell Counts and Malaria**

McKenzie, F E; Prudhomme, Wendy A; Magill, Alan J; Forney, J R; Permpnich, Barnyen; Lucas, Carmen; Gasser, Jr, Robert A; Wongsrichanalai, Chansuda; Jun 9, 2005; 9 pp.; In English

Report No.(s): AD-A469110; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA469110>

White blood cells (WBCs) were counted in 4697 individuals who presented to outpatient malaria clinics in Maesod, Tak

Province, Thailand, and Iquitos, Peru, between 28 May and 28 August 1998 and between 17 May and 9 July 1999. At each site and in each year, WBC counts in the *Plasmodium falciparum* infected patients were lower than those in the *Plasmodium vivax* infected patients, which, in turn, were lower than those in the uninfected patients. In Thailand, one-sixth of the *P. falciparum* infected patients had WBC counts of  $<4000$  cells/mL. Leukopenia may confound population studies that estimate parasite densities on the basis of an assumed WBC count of 8000 cells/mL. For instance, in the present study, use of this conventional approach would have overestimated average asexual parasite densities in the *P. falciparum* infected patients in Thailand by nearly one-third.

ONLINE: <http://hdl.handle.net/100.2/ADA469112>

Taccalonolides are plant-derived steroids which act as microtubule poisons on mammalian cells with a taxol-like mechanism. This makes them potentially useful lead compounds for the development of anti-cancer agents specifically breast cancer. Natural taccalonolide A was modified through selective chemical reactions at various sites in the molecule in preparation for biological tests that will compare the biological effects and potency of the derivatives with that of the starting material. These studies will allow the identification of those parts of the structure of taccalonolide A that are important for its biological activity. Work towards this goal is subject of this report.

**The *Plasmodium falciparum* Sexual Development Transcriptome: A Microarray Analysis using Ontology-Based Pattern Identification**

Young, Jason A; Fivelman, Quinton L; Blair, Peter L; de la Vega, Patricia; Le Roch, Karine G; Zhou, Yingyao; Carucci, Daniel J; Baker, David A; Winzeler, Elizabeth A; Jun 17, 2005; 14 pp.; In English

Report No.(s): AD-A469116; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA469116>

The sexual stages of malarial parasites are essential for the mosquito transmission of the disease and therefore are the focus of transmission blocking drug and vaccine development. In order to better understand genes important to the sexual development process, the transcriptomes of high-purity stage I V *Plasmodium falciparum* gametocytes were comprehensively profiled using a full-genome high-density oligonucleotide microarray. The interpretation of this transcriptional data was aided by applying a novel knowledge-based data-mining algorithm termed ontology-based pattern identification (OPI) using current information regarding known sexual stage genes as a guide. This analysis resulted in the identification of a sexual development cluster containing 246 genes, of which  $<75\%$  were hypothetical, exhibiting highly-correlated, gametocyte-specific expression patterns. Inspection of the upstream promoter regions of these 246 genes revealed putative cis-regulatory elements for sexual development transcriptional control mechanisms. Furthermore, OPI analysis was extended using current annotations provided by the Gene Ontology Consortium to identify 380 statistically significant clusters containing genes with expression patterns characteristic of various biological processes, cellular components, and molecular functions. Collectively, these results, available as part of a web-accessible OPI database (<http://carrier.gnf.org/publications/Gametocyte>), shed light on the components of molecular mechanisms underlying parasite sexual development and other areas of malarial parasite biology.

ONLINE: <http://hdl.handle.net/100.2/ADA469117>

*Campylobacter jejuni* infection is a main source of severe gastroenteritis-related illnesses in humans and there is also

evidence that it may be linked to neurological disorders. C. jejuni 81-176 is a virulent strain that has become the global model in the study of mechanisms and pathogenesis of C. jejuni infection. For this reason, we were engaged in studying the ne structures of cell-surface carbohydrate antigens of C. jejuni 81-176, namely, the capsule polysaccharide (CPS) and lipooligosaccharide (LOS). Serologically, C. jejuni 81-176 has been classified as belonging to serogroups HS23 and HS36, and indeed previous studies have shown that the LOS and CPS structures possess components similar to those expressed by serostrains HS23 and HS36. Here, we describe that in addition to the LOS and CPS, this strain also produced an independent cell-surface (1!4)-a-glucan capsule.

**The Use of a Low-Concentration Heparin Solution to Extend the Life of Central Venous Catheters in the African Green Monkeys (*Chlorocebus aethiops*)**

Gamble, Christopher S; Jacobsen, Kenneth O; Leffel, Elizabeth K; Pitt, M L; Nov 28, 2006; 4 pp.; In English  
Report No.(s): AD-A469118; USAMRMC-TR-06-037; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA469118>

Normal hematological values for African green monkeys have been reported, but these results are confounded by the effect of chemical restraint (ketamine), physical restraint, and capture stress. The dual-lumen central venous catheter, jacket, and tether combination described allows intravenous fluid administration and repeated blood sampling without using restraint or anesthesia. The use of a low-concentration heparin solution for catheter maintenance resulted in a significant increase in mean patency time compared to a saline-only catheter flush solution. Adding a low-concentration heparin solution creates a suitable system for long-term, serial blood collection in the African green monkey.

**Dental Considerations in a Unified Medical Command**

Tempel, Jr , Thomas R; Mar 23, 2007; 24 pp.; In English  
Report No.(s): AD-A469128; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA469128>

Volumes have been written touting the benefits of a Unified Medical Command, but none have discussed the Army, Navy, and Air Force Dental Corps' role in this command. The pace of military medicine's transformation is increasing, and in order to ensure eligible beneficiaries continue to get world class dental care, a study of dentistry's potential role must be conducted. Whether a Unified Medical Command is established or not, there are several joint dental initiatives that should be undertaken to achieve unity of effort between the services in both peacetime and war. To meaningfully contribute to a Joint Medical structure, the Dental Corps must start now to ensure young officers receive joint exposure to understand each service's dental capabilities and how to employ them.

Report No.(s): AD-A469138; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA469138>

A mixture of DNA plasmids expressing five Plasmodium falciparum pre-erythrocyte-stage antigens was administered with or without a DNA plasmid encoding human granulocyte-macrophage colony-stimulating factor (hGM-CSF) as an immune enhancer. After DNA immunization, antigen-specific gamma interferon (IFN-gamma) responses were detected by ELISPOT in 15/31 volunteers to multiple class I- and/or class II-restricted T-cell epitopes derived from all five antigens. Responses to multiple epitopes (less than or equal 7) were detected simultaneously in some volunteers. By 4 weeks after

challenge with *P. falciparum* parasites, 23/31 volunteers had positive IFN- responses and the magnitude of responses was increased from 2- to 143-fold. Nonetheless, none was protected against malaria. Volunteers who received hGM-CSF had a reduced frequency of IFN-gamma responses to class I peptides compared to those who only received plasmids expressing *P. falciparum* proteins before challenge (3/23 versus 3/8; P=0.15) or after parasite challenge (4/23 versus 5/8; P=0.015) but not to class II peptides before or after challenge. The responses to one antigen (*P. falciparum* circumsporozoite protein [PfCSP]) were similar among volunteers who received the five-gene mixture compared to volunteers who only received the PfCSP DNA plasmid in a previous study. In summary, DNA-primed IFN-gamma responses were boosted in humans by exposure to native antigen on parasites, coadministration of a plasmid expressing hGM-CSF had a negative effect on boosting of class I-restricted IFN-gamma responses, and there was no evidence that immunization with PfCSP DNA in the mixture reduced T-cell responses to PfCSP compared to when it was administered alone.

**Evaluation of Lateral-Flow Clostridium botulinum Neurotoxin Detection Kits for Food Analysis**

Sharma, Shashi K; Eblen, Brian S; Bull, Robert L; Burr, Donald H; Whiting, Richard C; Feb 8, 2005; 8 pp.; In English  
Report No.(s): AD-A469140; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA469140>

The suitability and sensitivity of two in vitro lateral-flow assays for detecting Clostridium botulinum neurotoxins (BoNTs) in an assortment of foods were evaluated. Toxin extraction and preparation methods for various liquid, solid, and high-fat-content foods were developed. The lateral-flow assays, one developed by the Naval Medical Research Center (Silver Spring, MD) and the other by Alexeter Technologies (Gaithersburg, MD), are based on the immunodetection of BoNT types A, B, and E. The assays were found to be rapid and easy to perform with minimum requirements for laboratory equipment or skills. They can readily detect 10 ng/ml of BoNT types A and B and 20 ng/ml of BoNT type E. Compared to other in vitro detection methods, these assays are less sensitive, and the assessment of a result is strictly qualitative. However, the assay was found to be simple to use and to require minimal training. The assays successfully detected BoNT types A, B, and E in a wide variety of foods, suggesting their potential usefulness as a preliminary screening system for triaging food samples with elevated BoNT levels in the event of a *C. botulinum* contamination event.

**Epidemiology of Transfusion-Transmitted Infections Among Multi-Transfused Patients in Seven Hospitals in Peru**

Laguna-Torres, V A; Perez-Bao, J; Chauca, G; Sovero, M; Blichtein, D; Chunga, A; Flores, W; Retamal, A; Mendoza, S; Cruz, M; Jan 2005; 9 pp.; In English

Contract(s)/Grant(s): NMRC-2002-0018

Report No.(s): AD-A469142; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA469142>

Transfusion-transmitted infections (TTIs) constitute a major health problem worldwide where routine screening of blood or blood products is temperately done, and where non-medical injecting medications and/or drug use are prevalent. Prevalence and risk factors vary by geographic location and by the specific TTI (including HIV-1, HBV, HCV and HTLV-I). Objective To determine the prevalence and risk factors associated with TTIs among a sample of multi-transfused adult patients in Peru. Study design: A cross-sectional multi-center study was conducted across seven major hospitals in Peru from February 2003 to September 2004. Self-reported behavior information (medical procedures, number of sexual partners, and drug use history) was analyzed, along with a review of exposure history from hospital medical records. Prevalences were calculated by TTI the different exposures, along with unadjusted and adjusted odds ratios for infection risk. Results: Overall, 192 (54.7%) of 351 multi-transfused patients were found infected with one or more TTIs. Number of transfusion units, years of transfusion history (6 or more), and number of treatment facilities (2 or more) were associated with HCV infection. Hemodialysis history was a common risk factor associated with HBV, HCV and HTLV-I infection. HIV infection was associated only with total number of transfusion units received. Conclusions: High prevalences of HBV and HCV infection were found among Peruvian multi-transfused patients and were associated with a past history and number of blood transfusions, as well as with past hemodialysis procedures. TTIs continue to represent a significant public health problem in Peru. Continued vigilant attention

to blood safety procedures, including universal screening and health care provider education, is recommended

**The Immune Status of Kupffer Cells Profoundly Influences their Responses to Infectious Plasmodium berghei sporozoites**

Steers, Nick; Schwenk, Robert; Bacon, David J; Berenzon, Dmitri; Williams, Jackie; Krzych, Urszula; May 18, 2005; 13 pp.; In English

Contract(s)/Grant(s): NIH-AI-46438

Report No.(s): AD-A469143; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA469143>

Multi-factorial immune mechanisms underlie protection induced with radiation-attenuated Plasmodia sporozoites (gamma-spz). Spz pass through Kupffer cells (KC) before invading hepatocytes but the involvement of KC in protection is poorly understood. In this study we investigated whether gamma-spz-immune KC respond to infectious spz in a manner that is distinct from the response of naive KC to infectious spz. KC were isolated from (1) naive, (2) spz-infected, (3) gamma-spz-immune, and (4) gamma-spz-immune-challenged C57BL/6 mice and examined for the expression of MHC class I and II, CD40 and CD80/CD86, IL-10 and IL-12 responses and antigen-presenting cell (APC) function. KC from gamma-spz-immune- challenged mice up-regulated class I and costimulatory molecules and produced elevated IL-12p40, relative to naive KC. In contrast, KC from naive mice exposed to infectious spz down-modulated class I and IL-12p40 was undetectable. Accordingly, KC from spz-infected mice had reduced APC function, while KC from gamma-spz-immune-challenged mice exhibited augmented APC activity. The nearly opposite responses are consistent with the fact that spz challenge of gamma-spz-immune mice results in long-lasting sterile protection, while infection of naive mice always results in malaria.

**Transcriptional Analysis of In vivo Plasmodium yoelii Liver Stage Gene Expression**

Sacci, Jr , John B; Ribeiro, Jose M; Huang, Fengying; Alama, Uzma; Russell, Joshua A; Blair, Peter L; Witney, Adam; Carucci, Daniel J; Azada, Abdu F; Aguiar, Joao C; Apr 26, 2005; 8 pp.; In English; Original contains color illustrations

Report No.(s): AD-A469146; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA469146>

The transcriptional repertoire of the in vivo liver stage of Plasmodium has remained largely unidentified and seemingly not amenable to traditional molecular analysis because of the small number of parasites and large number of uninfected hepatocytes. We have overcome this obstruction by utilizing laser capture microdissection to provide a high quality source of parasite mRNA for the construction of a liver stage cDNA library. Sequencing and annotation of this library demonstrated expression of 623 different Plasmodium yoelii genes during development in the hepatocyte. Of these genes, 25% appear to be unique to the liver stage. This is the first comprehensive analysis of in vivo gene expression undertaken for the liver stage of P. yoelii, and provides insights into the differential expression of P. yoelii genes during this critical stage of development.

**Phylogenetic Analysis of a Novel Molecular Isolate of Spotted Fever Group Rickettsiae from Northern Peru**

Jiang, Ju; Blair, Patrick J; Felices, Vidal; Moron, Cecilia; Cespedes, Manuel; Anaya, Elizabeth; Schoeler, George B; Sumner, John W; Olson, James G; Richards, Allen L; Jan 2005; 7 pp.; In English

Report No.(s): AD-A469149; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA469149>

Phylogenetic analysis of five rickettsial genes (17-kDa gene, gltA, ompB, ompA, and sca4) from two molecular isolates of Candidatus Rickettsia andeanae from two ticks (Amblyomma maculatum and Ixodes boliviensis) collected from two domestic horses living in two separate locations in northern Peru (Coletas and Naranjo) was conducted to more clearly

characterize this recently reported novel spotted fever group (SFG) rickettsia. Following nested polymerase chain reaction (PCR) amplification of the 17-kDa gene, *gltA*, *ompB*, *ompA*, and *sca4*, amplicons were purified, sequenced, and compared to those downloaded from GenBank. Phylogenetic analyses of the Candidatus *Rickettsia andeanae* sequences generated from 17-kDa gene (483 bp), *gltA* (1185 bp), *ompA* (1598 bp), *ompB* (4839 bp), and *sca4* (2634 bp) demonstrated that they aligned strongly with those of SFG rickettsiae. Moreover, the sequences of these five genes most closely aligned with the following rickettsiae: *ompA*: *Rickettsia* sp RpA4 (98.03%), *R. sp* DnS28 (97.90%), and *R. rhipicephali* and *R. massiliae* (97.11%); *ompB*: *R. aeschlimannii* (97.22%), *R. rhipicephali* (97.20%), and *R. sp* Bar 29 (97.10%); and *sca4*: *R. massiliae* (97.8%), *R. rhipicephali*, and *R. slovacica* (97.7%). These results from the additional phylogenetic analyses of Candidatus *Rickettsia andeanae* confirm its inclusion within, and distance and uniqueness from, other known SFG rickettsiae.

**Investigating the Mechanism of Action and the Identification of Breast Carcinogens by Computational Analysis of Female Rodent Carcinogens**

Cunningham, Albert R; Aug 2006; 120 pp.; In English; Original contains color illustrations

Contract(s)/Grant(s): DAMD17-01-1-0376

Report No.(s): AD-A469150; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA469150>

This project investigated the potential that environmental chemicals may be involved in the etiology of breast cancer. We hypothesized that specific features of chemicals can be identified that are significantly associated with female and breast carcinogens and that these features are related to mechanisms of chemical carcinogenesis. Our overall scientific objective was to investigate the hypothesized relationship between environmental chemicals, xenoestrogens, and the development of breast cancer. With the success of the project, we published several papers, have one accepted pending revision but temporarily withdrawn specific to our rat mammary carcinogen model, and we will be preparing others for later publication. We also developed a novel SAR approach that allowed us to address the question of 'why do some carcinogens cause cancer in the breast?' which is a very different question than that posed in older SAR studies of 'why do some chemicals cause cancer?' Two graduate students have been awarded MS degrees based (supported) on this project. We have also used this project to obtain an appointment at the University of Louisville's Brown Cancer Center, significant funding for an associated project in conjunction with its NIH-funded Molecular Targets Program, and another BCRP IDEA award studying a novel approach to discover highly specific breast cancer drugs.

Contract(s)/Grant(s): W81XWH-06-1-0120

Report No.(s): AD-A469155; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA469155>

The aim of this study is to investigate the field effect in prostate cancer, the relationship between tumor and nearby histologically normal tissues compared to truly disease free prostate tissue. Identification of changes within tumor adjacent tissues has two possible clinical implications: prognosis and diagnosis. Several tools are being used to investigate this effect, specifically the assessment of telomere length, allelic imbalance, and methylation status, all markers of genomic instability. Microarray studies will be used to aid in the identification of additional gene expression changes occurring between tumor and histologically normal tissues compared to truly disease free tissue. While telomere length and allelic imbalance have been shown to correlate with outcome, it is expected that, when compared with truly normal tissue from disease-free prostates, several progressive changes will be seen, as has been found in prostate cancer cell lines. The proposed study will allow for interaction with other scientists, exposure to new technologies, teaching and continued patient interaction, all of which are important to the physician scientist.

ONLINE: <http://hdl.handle.net/100.2/ADA469157>

The development of drug resistance represents a formidable barrier to the successful treatment of breast cancer. Although some cancers such as melanoma can be intrinsically resistant, many cancers acquire resistance through selection pressure in the face of adversity, e.g., chemotherapy. One of the most consistent features of drug resistance is overexpression of P-glycoprotein (P-gp). This protein functions as a pump to reduce the intracellular concentration of anticancer drugs. Clinical use of P-gp antagonists to inhibit drug efflux has been disappointing. Here we propose silencing the multidrug resistance (MDR1) phenotype by retarding glycolipid metabolism via inhibition of glucosylceramide synthase (GCS), a lipogenic enzyme associated with MDR1. We will determine whether inhibitors of GCS affect MDR1/P-gp expression and chemotherapy sensitivity in drug-resistant breast cancer cells and determine whether GCS inhibitors forestall acquired resistance to chemotherapy in wild-type breast cancer cells. This is the first study to attack drug resistance in breast cancer by manipulating GCS and glycolipids, and as such, it represents a major shift in the research paradigm for drug resistance. This is also the first study to propose an approach that might have prophylactic as well as therapeutic value.

**Molecular Effects of 13C/DIM in Prostate Cancer**  
Sarkar, Fazlul H; Apr 2007; 156 pp.; In English; Original contains color illustrations  
Contract(s)/Grant(s): DAMD17-03-1-0042  
Report No.(s): AD-A469160; No Copyright; Avail.: Defense Technical Information Center (DTIC)  
ONLINE: <http://hdl.handle.net/100.2/ADA469160>

To discover the mechanisms of 13C/DIM action on prostate cancer cells, we have investigated the molecular effects of 13C/DIM on Akt and NF- $\kappa$ B pathways and their downstream genes which play critical roles in the control of cell survival. We have found that 13C/DIM significantly inhibited the activation of Akt in PC-3 and LNCaP prostate cancer cells. Moreover, we found that 13C/DIM also significantly inhibited the activity of NF- $\kappa$ B. However, we did not observe such inhibitory effects of 13C/DIM on non-tumorigenic CRL-2221 prostate epithelial cells. Most importantly, we found that 13C/DIM could inhibit NF- $\kappa$ B activation and AR transactivation in prostate cancer cells transfected with activated Akt. These results demonstrate that there is a crosstalk between Akt, NF- $\kappa$ B, and AR signaling pathways and 13C/DIM could interrupt the crosstalk, leading to the induction of apoptosis. From transfection experiments, we found that 13C/DIM inhibited the expression of IKK $\beta$ , the subsequent phosphorylation of I $\kappa$ B $\alpha$ , and the nuclear localization and activation of NF- $\kappa$ B. By microarray analysis, we found that 13C/DIM could regulate the expression of genes which control cell cycle, apoptosis, and signal transduction. 13C/DIM also inhibited angiogenesis and invasion. These results suggest that 13C and DIM may be potent agents for the prevention and/or treatment of prostate cancers.

**BRCA1 in Gene-Specific Coordination of Transcription and DNA Damage Response**  
Sun, Jianlong; Li, Rong; Mar 2007; 10 pp.; In English; Original contains color illustrations  
Contract(s)/Grant(s): W81XWH-06-1-0302  
Report No.(s): AD-A469165; No Copyright; Avail.: Defense Technical Information Center (DTIC)  
ONLINE: <http://hdl.handle.net/100.2/ADA469165>

During the first year of current funding period, we have focused our study on the identification of BRCA1 regulated genes in human breast cancer cells. By combining the genome-wide microarray study and gene-specific approaches, we have discovered a group of genes that were significantly repressed or stimulated by BRCA1, and several genes in this group, such as TIMP-1, S100P, and GABBR1 have been implicated in the development of breast cancer. We have also found that transcriptional regulation by BRCA1 required gene-specific involvement of its cofactor, COBRA1. These findings will serve as the basis for us to explore the role of BRCA1 in transcriptional regulation in the presence of DNA damage. It also provides

targets for investigating the dynamic association of BRCA1, the transcriptional machinery, and DNA damage checkpoint protein complex with chromatin templates under the stress conditions.

**Mosaic Structure of a Multiple-Drug-Resistant, Conjugative Plasmid from *Campylobacter jejuni***

Nirdnoy, Warawadee; Mason, Carl J; Guerry, Patricia; Jan 30, 2005; 7 pp.; In English

Report No.(s): AD-A469168; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA469168>

Partial sequence analysis of a tet(O) plasmid from a multiple-drug-resistant clinical isolate of *Campylobacter jejuni* revealed 10 genes or pseudogenes encoding different aminoglycoside inactivating enzymes, transposaselike genes, and multiple unknown genes from a variety of pathogenic and commensal bacteria. The plasmid could be mobilized by a P incompatibility group plasmid into *Escherichia coli*, where it apparently integrated into the chromosome and expressed high-level resistance to multiple aminoglycoside antibiotics. This work provides new information about both the nature of drug resistance in *C. jejuni* and the ability of *C. jejuni* to exchange genes with other bacterial species.

ONLINE: <http://hdl.handle.net/100.2/ADA469172>

The results of analyses of hydrographic, nutrient, and biological data collected in coastal ocean waters off Central California in October 2006 aboard the R/V *Wecoma* (Hoke cruise) and R/V *Point Sur* (PaCOOS cruise) are presented in both tabular and graphical form. Along with all the data from the PaCOOS cruise, included in this report are also hydrographic data sampled over the last two days of the Hoke cruise at CalCOFI stations between Moss Landing, California, and Point Reyes, California, and along CalCOFI line 60. The PaCOOS cruise departed from Moss Landing and proceeded to Point Reyes following CalCOFI line 67 to station 90, thence to CalCOFI line 60/station 90, and finally along CalCOFI line 60. The cruise then returned to Moss Landing via the course from CalCOFI line 61.75/station 52.5 to CalCOFI Line 65.25/station 52.5, and thence to site H3. The Hoke cruise finished in Redwood City, California, after following a route from Moss Landing via the aforementioned H3/CalCOFI stations 52.5 and the inshore CalCOFI Line 60 stations from station 60. ADCP observations collected during both cruises, and marine mammal and biological observations taken during the PaCOOS cruise, are also included.

**Characterization of Neurofibromas of the Skin and Spinal Roots in a Mouse Model**

Zhu, Yuan; Feb 2007; 12 pp.; In English; Original contains color illustrations

Contract(s)/Grant(s): W81XWH-06-1-0293

Report No.(s): AD-A469173; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA469173>

Benign neurofibromas and malignant peripheral nerve sheath tumors (MPNSTs) contribute to the majority of morbidity and mortality associated with NF1. The proposed studies will provide significant insight into one of the fundamental questions in neurofibroma biology: whether bi-allelic NF1 inactivation is necessary for neurofibroma formation. The objectives of this proposal are to use a newly established mouse model to (1) identify and characterize neurofibromas that are exclusively or predominantly comprised of NF1+/- cells (designated NF1+/- neurofibromas hereafter) in the skin and spinal roots; and (2) determine whether in this model, neurofibromas in the skin are similar to human dermal neurofibromas and thus are fundamentally different from the plexiform neurofibromas found in spinal roots. Previous studies of human tumors suggest that dermal and plexiform neurofibromas have fundamental differences in their dependence on the NF1 heterozygous

environment and have different malignant transformation potentials. We have made substantial progress in the first year of the award. For Task 1, we have generated most of the mutant mice proposed for the study. Phenotypic analysis of these mutant mice will be undertaken in the second year as proposed. For Task 2, we have completed most of the proposed experiments. We are writing a manuscript and trying to publish these results this year. For Task 3, we have generated the half of the mutant mice proposed for the study. The preliminary data suggest that the NF1 heterozygous environment is not essential for malignant transformation. This year, we will finish characterizing tumor phenotypes of these mutant mice and generate more mutants for analysis.

ONLINE: <http://hdl.handle.net/100.2/ADA468897>

Diarrhea, a scourge upon humanity since preliterate times, has been the particular nemesis of military forces. The Armed Forces of the USA have been in the forefront in the diagnosis, treatment, and prevention of diarrheal illness. U.S. military scientists and physicians implemented the first mandatory typhoid inoculation program, contributed to advances in water chlorination, and pioneered the use of antibiotics for typhoid fever. U.S. Navy physicians refined the intravenous treatment of cholera, reducing the death rate from 20% to less than 1%. Their studies of electrolyte and fluid balance in cholera, and the subsequent development of oral rehydration therapy for cholera and other diarrheal illness, have saved millions of lives worldwide. U.S. Army researchers refuted the desquamation theory of cholera pathogenesis, isolated the cholera exotoxin, and developed improved cholera vaccines. U.S. Army and Navy researchers pioneered the use of antibiotics for the treatment of typhoid fever, made major contributions to the treatment of dysentery, developed algorithms for the treatment of traveler's diarrhea, and continue active development of traveler's diarrhea and dysentery vaccines. U.S. military diarrheal research has directly contributed to the welfare of hundreds of millions of people.

**Workload, Stress, and Situation Awareness of Soldiers Who are Controlling Unmanned Vehicles in Future Urban Operations**

Sterling, Bruce S; Perala, Chuck H; Apr 2007; 34 pp.; In English; Original contains color illustrations

Contract(s)/Grant(s): Proj-7MB25R

Report No.(s): AD-A466480; ARL-TR-4071; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA466480>

This research describes the workload, stress, and situation awareness of operators of robotic reconnaissance platforms who are conducting future full spectrum operations in an urban setting. The participants controlled unmanned aerial vehicles, unmanned ground vehicles, and unmanned ground sensors in a virtual reality simulation as part of a combined arms battalion using Future Combat Systems. Results suggested that robotic controllers supporting infantry units had higher workloads and stress than controllers supporting non-line-of-sight cannon units, mounted combat system units, or reconnaissance units, perhaps because infantry units are more vulnerable and require closer surveillance. Also, individuals controlling all three sensor types had higher workloads and stress than those controlling other combinations of assets. Human factors recommendations for the interface included an ability to automatically track a target, switch to teleoperation to make slight adjustments, an auto-scan function on the sensor, and the ability for the platform to automatically plot a route to a grid location. Some potential limitations of this study include the fact that the workload may have been affected by other factors such as

experience or training; the robotic platforms may have been operated simultaneously or sequentially; and the interface used in this study may or may not mirror the (to be determined) future interfaces.

ONLINE: <http://hdl.handle.net/100.2/ADA466547>

1. To avoid anesthesia confounders, free-ranging rats were exposed to cool water, warm water, or temperate air to induce hypothermia, or control for water or novel environment stress, respectively. 2. While WW and TA core temperature and the brown adipose tissue subdermal skin temperature relationship remained similar, CW hypothermia induction was variable and associated with tachycardia or TA with CW TBAT elevated CW TSDS. 3. Without anesthesia to blunt thermoregulatory countermeasures to hypothermia, variable resistance to Tc depression, tachycardia rather than bradycardia and BAT thermogenic responses were demonstrated.

**High-Throughput Analysis of Dynamic Gene Expression Associated with Sleep Deprivation and Recovery Sleep in the Mouse Brain**

Lein, Ed; Dec 2006; 33 pp.; In English; Original contains color illustrations  
Contract(s)/Grant(s): W81XWH-06-1-0131  
Report No.(s): AD-A467705; No Copyright; Avail.: Defense Technical Information Center (DTIC)

Sleep deprivation in mice causes changes in gene expression in discrete brain regions associated with sleep/wake control as well as higher cognitive functions. Laser capture microdissection was used to isolate a set of relevant brain regions, and these samples were amplified to allow genome-wide genetic profiling on DNA microarrays to search for altered gene expression correlated with sleeping, waking, sleep deprivation and recovery sleep following sleep deprivation. Candidate genes from this microarray approach have been comprehensively analyzed using a highthroughput in situ hybridization platform. The resulting data indicate that there is dynamic gene expression correlated with circadian time of day, sleeping vs. waking states, and sleep deprivation specifically. This dynamic gene expression is also highly brain region and cell type-specific within a given region. These genes help to provide an anatomical and genetic framework for understanding the consequences of sleep deprivation and potential new means for pharmacological intervention. A web-based viewer interface has been developed to provide access to this data for the entire sleep community.

**Cognitive, Psychomotor, and Physical Performance in Cold Air After Cooling by Exercise in Cold Water**

O'Brien, Catherine; Tharion, Ingrid V Sils, and John W Castellani, William J; Jun 2007; 7 pp.; In English  
Report No.(s): AD-A468440; USARIEM/TMMD-MO6-46; No Copyright; Avail.: Defense Technical Information Center (DTIC)

This study evaluated performance after lowering core temperature at different rates while local tissues were either cooled

(lower body) or not cooled (upper body). Methods: There were 10 men who volunteered to perform up to 8 cold water immersions (CWI) at combinations of 2 water temperatures (10 deg C and 15 deg C), 2 depths [waist (W), chest (C)], and 2 walking speeds (0.44 or 0.88 m/s<sup>-1</sup>) until their core temperature fell to 35.5 deg C, stabilized above that temperature, or they requested to stop. They also completed a control trial (120 min rest in 19 deg C air). Immediately following each CWI and control, cognitive and physical performance tests were performed in cold air (10 deg C; CAE). Results: Overall, the CWI protocol lowered rectal temperature by 0.3-1.0 deg C. Mean skin temperature was ~26 deg C and finger temperature was ~15 deg C during CAE. No statistical differences were observed across trials for any cognitive test. On the physical performance tests, step test performance was degraded ~12% on CWI trials compared with control, but there were no differences in manual dexterity, hand grip strength, marksmanship, or pull-ups. Conclusions: These results indicate that cognitive performance can be maintained despite mild hypothermia, and that physical performance is related to local tissue temperature, not a moderately reduced core temperature.

**Galvanic Skin Response as a Measure of Soldier Stress**

Perala, Chuck H; Sterling, Bruce S; May 2007; 37 pp.; In English

Report No.(s): AD-A468462; ARL-TR-4114; No Copyright; Avail.: Defense Technical Information Center (DTIC)

In the ever-increasing realm of 'high-tech' Soldier systems, one factor remains fairly constant: the human factor. The use of multiple high-tech and increasingly complex systems is intended to add capabilities to Soldiers and to reduce stress and workload. However, these systems may add increased levels of stress and workload onto Soldiers who are already at heightened levels of each because of the environments in which the systems are employed. To gauge what levels of stress and workload are being impinged upon these Soldiers, researchers have used a small number of tools at their disposal. The two primary tools used are self-report surveys and salivary amylase. Surveys are quick and cheap but subjective, while salivary amylase tests are objective but time-consuming, intrusive, and expensive. As requirements increase to incorporate larger numbers of high-tech and more complex systems with Soldier-in-the-loop (SIL) systems, researchers will need a method to gather stress data in an accurate, timely, and less intrusive manner. This report discusses the use of a third method to measure Soldier stress: galvanic skin response (GSR). The first step of this process compared the survey method with the GSR method to determine if GSR data are similar to survey stress data in terms of statistics and trends. The ultimate goal of the research (this phase and ensuing research) is to determine if the GSR method is a suitable 'middle ground' between the survey method and the salivary amylase method. GSR has the potential to provide researchers with a tool for objectively measuring Soldier stress that is quick, effective, and unobtrusive during research, training, and operational conditions. Stress levels were tested with soldiers using a head-tracked sensor suite (HTSS), aided target recognition technology, and a crew-aiding behavior interface. Results of the survey-GSR comparison and recommendations for ensuing research are presented.

**Pharmacological and Nonpharmacological Methods of Treatment for Fragile**

Perlmutter, David H; Feb 2007; 13 pp.; In English

Contract(s)/Grant(s): DAMD17-03-1-0057

Report No.(s): AD-A468498; No Copyright; Avail.: Defense Technical Information Center (DTIC)

Fragile X (FX) syndrome causes behavioral disturbances such as labile mood, anxiety, hyperactivity, and aberrant behavioral responses to stress. Affected males may suffer from learning disabilities, attention deficit disorders, mental retardation, or autism spectrum disorders. We seek to address the most effective methods of treatment (pharmacological and behavioral) for the symptoms and behavioral problems associated with FX syndrome. During the past year, we have established a comprehensive FX syndrome clinic and we continue to refine our treatment protocol. Collaborative relationships have been established with genetics, speech/language, psychiatry, ophthalmology and dental so that families can obtain these services from specific professionals with an interest in FX syndrome. School liaison services for school aged youth with FX syndrome have been established. Community education programs, in the form of a website, a parent advisory group, and announcements have been established. We continue to refine our database to track the frequency of the disease and specific symptoms with the goal of guiding future treatment through evidence based medicine.

**Modeling Performance in C4ISR Sustained Operations: A Multi-Level Approach (Briefing Charts)**

Barnes, Christopher; Miller, James C.; Elliott, Linda; Coovert, Michael; Jun 2003; 19 pp.; In English; Original contains color illustrations

Report No.(s): AD-A467397; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA467397>

This briefing discusses methodology and preliminary findings focused on the application of multi-level modeling techniques to distinguish effects of sleep loss and task demands on individual and team C4ISR decision making, coordination, and performance over time. We focus our efforts on measurement and modeling. First, we describe aspects of C4ISR scenario development, to ensure (a) psychological fidelity and operational relevance, (b) elicitation and assessment of performance constructs of interest, and (b) equivalence in scenario task demands and difficulty. Sustained operations research is challenged by the need for repeated-measures assessment, while minimizing effects of practice or experience. Second, we describe aspects of cognitive performance based on a standard cognitive test battery. Third, we describe other assessments (e.g. NEO PI personality assessment, mood-state inventory, Stanford Sleepiness Scale, physiological indices) that will be included in an overall approach to modeling fatigue effects, using multi-level hierarchical modeling analyses.

**Artificial Gravity: Will it Preserve Bone Health on Long-Duration Missions?**

Davis-Street, Janis; Paloski, William H.; June 23, 2005; 14 pp.; In English; Bone Loss During Space Flight, 23-24 Jun. 2005, Cleveland, OH, USA; Copyright; Avail.: CASI: **A03**, Hardcopy

Prolonged microgravity exposure disrupts bone, muscle, and cardiovascular homeostasis, sensory-motor coordination, immune function, and behavioral performance. Bone loss, in particular, remains a serious impediment to the success of exploration-class missions by increasing the risks of bone fracture and renal stone formation for crew members. Current countermeasures, consisting primarily of resistive and aerobic exercise, have not yet proven fully successful for preventing bone loss during long-duration spaceflight. While other bone-specific countermeasures, such as pharmacological therapy and dietary modifications, are under consideration, countermeasure approaches that simultaneously address multiple physiologic systems may be more desirable for exploration-class missions, particularly if they can provide effective protection at reduced mission resource requirements (up-mass, power, crew time, etc). The most robust of the multi-system approaches under consideration, artificial gravity (AG), could prevent all of the microgravity-related physiological changes from occurring. The potential methods for realizing an artificial gravity countermeasure are reviewed, as well as selected animal and human studies evaluating the effects of artificial gravity on bone function. Future plans for the study of the multi-system effects of artificial gravity include a joint, cooperative international effort that will systematically seek an optimal prescription for intermittent AG to preserve bone, muscle, and cardiovascular function in human subjects deconditioned by 6 degree head-down-tilt-bed rest. It is concluded that AG has great promise as a multi-system countermeasure, but that further research is required to determine the appropriate parameters for implementation of such a countermeasure for exploration-class missions.

**Simulated Microgravity Regulates Gene Transcript Profiles of 2T3 Preosteoblasts: Comparison of the Random Positioning Machine and the Rotating Wall Vessel Bioreactor**

Patel, Mamta J.; Liu, Wenbin; Sykes, Michelle C.; Ward, Nancy E.; Risin, Semyon A.; Risin, Diana; Hanjoong, Jo; [2007]; 29 pp.; In English; Copyright; Avail.: CASI: **A03**, Hardcopy

Microgravity of spaceflight induces bone loss due in part to decreased bone formation by osteoblasts. We have previously examined the microgravity-induced changes in gene expression profiles in 2T3 preosteoblasts using the Random Positioning Machine (RPM) to simulate microgravity conditions. Here, we hypothesized that exposure of preosteoblasts to an independent microgravity simulator, the Rotating Wall Vessel (RWV), induces similar changes in differentiation and gene transcript profiles, resulting in a more confined list of gravi-sensitive genes that may play a role in bone formation. In comparison to static 1g controls, exposure of 2T3 cells to RWV for 3 days inhibited alkaline phosphatase activity, a marker of differentiation, and downregulated 61 genes and upregulated 45 genes by more than two-fold as shown by microarray analysis. The microarray results were confirmed with real time PCR for downregulated genes osteomodulin, bone morphogenic protein 4

(BMP4), runx2, and parathyroid hormone receptor 1. Western blot analysis validated the expression of three downregulated genes, BMP4, peroxiredoxin IV, and osteoglycin, and one upregulated gene peroxiredoxin I. Comparison of the microarrays from the RPM and the RWV studies identified 14 gravi-sensitive genes that changed in the same direction in both systems. Further comparison of our results to a published database showing gene transcript profiles of mechanically loaded mouse tibiae revealed 16 genes upregulated by the loading that were shown to be downregulated by RWV and RPM. These mechanosensitive genes identified by the comparative studies may provide novel insights into understanding the mechanisms regulating bone formation and potential targets of countermeasure against decreased bone formation both in astronauts and in general patients with musculoskeletal disorders.

#### **Flight Attendant Fatigue**

Nesthus, T.; Schroeder, D.; Connors, M.; Rentmeister-Bryant, H.; DeRoshina, C.; July 2007; 67 pp.; In English; Original contains black and white illustrations

Report No.(s): DOT/FAA/AM-07/21; No Copyright; Avail.: CASI: [A04](#), Hardcopy

ONLINE: <http://hdl.handle.net/2060/20070028811>

The Departments of Transportation and Treasury and Independent Agencies Appropriations Bill (House Rpt. 108-671) included a directive to the Federal Aviation Administration to conduct a study of flight attendant fatigue. The NASA Ames Research Center Fatigue Countermeasures Group (FCG) was contracted by CAM1 to conduct the study. To meet the goals of the study, this report contains a literature review on fatigue as potentially experienced by flight attendants, an evaluation of currently used (actual vs. scheduled) flight attendant duty schedules, and a comparison of these schedules to the current CFRs. The report additionally reviews fatigue related incident/accident information from the Aviation Safety Reporting System (ASRS) and the NTSB database. One report section describes the application of three different performance and fatigue models to assess how flight attendant duty schedules contribute to increased levels of fatigue and predicted changes in performance. The report concludes with 6 recommendations concerning issues that require further evaluation, including (1) Survey of Field Operations. To assess the frequency with which fatigue is experienced, the situations in which it appears, and the consequences that follow; (2) Focused Study of Incident Reports. To better understand details of the incidents; (3) Field Research on the Effects of Fatigue. To explore physiological and neuropsychological effects of fatigue, sleepiness, circadian factors, and rest schedules on flight attendants; (4) Validation of Models for Assessing FA Fatigue. An important step to understanding whether and how models could be used in conjunction with field operations; (5) International Carrier Policies and Practices Review. To learn how other countries address these issues and with what results; and (6) Training. FAs could benefit from information on fatigue, its causes and consequences, its interaction with circadian disruption, and how and when to employ countermeasures (e.g., scheduled naps, physical activity, social activity and caffeine

#### **Fundamentals of Aerospace Medicine: Cosmic Radiation**

Bagshaw, Michael; Cucionotta, Francis A.; [2007]; 35 pp.; In English; Original contains color and black and white illustrations; Copyright; Avail.: CASI: [A03](#), Hardcopy

Cosmic rays were discovered in 1911 by the Austrian physicist, Victor Hess. The planet earth is continuously bathed in

high-energy galactic cosmic ionizing radiation (GCR), emanating from outside the solar system, and sporadically exposed to bursts of energetic particles from the sun referred to as solar particle events (SPEs). The main source of GCR is believed to be supernovae (exploding stars), while occasionally a disturbance in the sun's atmosphere (solar flare or coronal mass ejection) leads to a surge of radiation particles with sufficient energy to penetrate the earth's magnetic field and enter the atmosphere. The inhabitants of planet earth gain protection from the effects of cosmic radiation from the earth's magnetic field and the atmosphere, as well as from the sun's magnetic field and solar wind. These protective effects extend to the occupants of aircraft flying within the earth's atmosphere, although the effects can be complex for aircraft flying at high altitudes and high latitudes. Travellers in space do not have the benefit of this protection and are exposed to an ionizing radiation field very different in magnitude and quality from the exposure of individuals flying in commercial airliners. The higher amounts and distinct types of radiation qualities in space lead to a large need for understanding the biological effects of space radiation. It is recognized that although there are many overlaps between the aviation and the space environments, there are large differences in radiation dosimetry, risks and protection for airline crew members, passengers and astronauts. These differences impact the application of radiation protection principles of risk justification, limitation, and the principle of as low as reasonably achievable (ALARA). This chapter accordingly is divided into three major sections, the first dealing with the basic physics and health risks, the second with the commercial airline experience, and the third with the aspects of cosmic radiation appertaining to space travel including future considerations.

#### **Johnson Space Center Flight Medicine Clinic Experience**

Landry, Trela; [2006]; 1 pp.; In English; No Copyright; Avail.: Other Sources; Abstract Only

Being a member of the Flight Medicine Clinic (FMC) Staff is a great experience. I joined the FMC staff 2 years ago when I became part of the Kelsey-Seybold team. The FMC staff consists of Flight Surgeons, Family Clinic Physician, Nursing staff, Wellness Coordinator and Support staff. We serve as the Primary Care Physicians for the astronauts and their families and provide annual physicals for the retired astronauts. We have approximately 800 patients in the FMC. As the Family Clinic Physician, I care for the astronaut spouses and children and provide annual physicals for the retired astronauts. Since we have a small patient population, we have the opportunity to spend increased personal time with our patients, which I enjoy. We have a pretty healthy patient population, who are very interested in their overall health and preventive care. In preparation for a shuttle launch, our nursing staff assists the flight surgeons with the astronaut physical exams, which occur 10 days prior to launch and again 3 days after their return. We also provide Primary Contact physicals for the families and guests, who will be in close contact with shuttle crew members. During these physicals, we provide education, emphasizing the importance of preventing the spread of communicable diseases to shuttle crew members. Being a part of the Space Medicine Program is an honor. To know that you contribute in some way to our nation's Space Program is very special. (This article was prepared by Dr. Trela Landry, M.D. for inclusion in a Kelsey-Seybold newsletter on 25 OCT 2006.)

#### **The Effect of Increasing Mass on Locomotion**

DeWitt, John; Hagan, R. Donald; August 2007; 50 pp.; In English; Original contains color and black and white illustrations Report No.(s): NASA/TP-2007-214757; S-1007; Copyright; Avail.: CASI: [A03](#), Hardcopy

The purpose of this investigation was to determine if increasing body mass while maintaining bodyweight would affect

ground reaction forces and joint kinetics during walking and running. It was hypothesized that performing gait with increased mass while maintaining body weight would result in greater ground reaction forces, and would affect the net joint torques and work at the ankle, knee and hip when compared to gait with normal mass and bodyweight. Vertical ground reaction force was measured for ten subjects (5M/5F) during walking and running on a treadmill. Subjects completed one minute of locomotion at normal mass and bodyweight and at four added mass conditions (10%, 20%, 30% and 40% of body mass) in random order. Three-dimensional joint position data were collected via videography. The addition of mass resulted in several effects. Peak impact forces and loading rates increased during walking, but decreased during running. Peak propulsive forces decreased during walking and did not change during running. Stride time increased and hip extensor angular impulse and positive work increased as mass was added for both styles of locomotion. Work increased at a greater rate during running than walking. The adaptations to additional mass that occur during walking are different than during running. Increasing mass during exercise in microgravity may be beneficial to increasing ground reaction forces during walking and strengthening hip musculature during both walking and running.

### **A Comprehensive Characterization of Microorganisms and Allergens in Spacecraft Environment**

Ott, C. M.; John, J.; Castro, V. A.; Cruz, P.; Buttner, L. M.; Pierson, D. L.; February 12, 2007; 1 pp.; In English; NASA HRP Investigators' Workshop, 12-14 Feb. 2007, Houston, TX, USA; Copyright; Avail.: Other Sources; Abstract Only

The determination of risk from infectious disease during long-duration missions is composed of several factors including (1) the host's susceptibility, (2) the host's exposure to the infectious disease agent, and (3) the concentration of the infectious agent, and (4) the characteristics of the infectious agent. While stringent steps are taken to minimize the transfer of potential pathogens to spacecraft, several medically significant organisms have been isolated from both the Mir and International Space Station (ISS). Historically, the method for isolation and identification of microorganisms from spacecraft environmental samples depended upon their growth on culture media. Unfortunately, only a fraction of the organisms may grow on a culture medium, potentially omitting those microorganisms whose nutritional and physical requirements for growth are not met. Thus, several pathogens may not have been detected, such as *Legionella pneumophila*, the etiological agent of Legionnaire's disease. We hypothesize that environmental analysis using non-culture-based technologies will reveal microorganisms, allergens, and microbial toxins not previously reported in spacecraft, allowing for a more complete health assessment. The development of techniques for this flight experiment, operationally named SWAB, has already provided advances in NASA laboratory processes and beneficial information toward human health risk assessment. The first accomplishment of the SWAB experiment was the incorporation of 16S ribosomal DNA sequencing for the identification of bacteria. The use of this molecular technique has increased bacterial speciation of environmental isolates from previous flights three fold compared to conventional methodology. This increased efficiency in bacterial speciation provides a better understanding of the microbial ecology and the potential risk to the crew. Additional SWAB studies focused on the use of molecular-based DNA fingerprinting using repetitive sequence-based polymerase chain reaction (rep-PCR). This technology has allowed contamination tracking of microorganisms between crewmembers and their environment. This study not only demonstrated that ISS has a greater diversity of organisms than originally expected, but also provided insight into possible routes of infection to the crew. Additional ground-based studies used rep-PCR and protein based assays to determine the potential of methicillin resistant *Staphylococcus aureus* (MRSA) aboard ISS. MRSA has become increasingly common on Earth and pose a treatment problem for infections during flight. While no MRSA have been isolated from ISS to date, the *mecA* gene product that is responsible for methicillin resistance was isolated in other *Staphylococcus* species aboard ISS suggesting a potential of MRSA through gene transfer. Using improved sample collection technologies, flight sampling for SWAB was initiated in August 2006 and should continue through spring of 2007. The focus of these flight samples is the collection of DNA for evaluation by Denaturing Gradient Gel Electrophoresis (DGGE). Unlike other techniques, DGGE does not depend on any microbial growth on culture media allowing a more comprehensive assessment of the spacecraft interior. This study should provide insight into the true microbial ecology that is experienced by the crew during flight. This information will lead toward an accurate microbial risk assessment to help set flight requirements to protect the safety, health, and performance of the crew.

**An Evidence-based Approach to Developing a Management Strategy for Medical Contingencies on the Lunar Surface: The NASA/Haughton-Mars Project (HMP) 2006 Lunar Medical Contingency Simulation at Devon Island**

Scheuring, R. A.; Jones, J. A.; Lee, P.; Comtois, J. M.; Chappell, S.; Rafiq, A.; Braham, S.; Hodgson, E.; Sullivan, P.; Wilkinson, N.; Bach, D.; Torney, S.; May 20, 2007; 2 pp.; In English; Humans in Space: 2007, 20-24 May 2007, Beijing, China; Copyright; Avail.: Other Sources; Abstract Only

The lunar architecture for future sortie and outpost missions will require humans to serve on the lunar surface considerably longer than the Apollo moon missions. Although the Apollo crewmembers sustained few injuries during their brief lunar surface activity, injuries did occur and are a concern for the longer lunar stays. Interestingly, lunar medical contingency plans were not developed during Apollo. In order to develop an evidence-base for handling a medical contingency on the lunar surface, a simulation using the moon-Mars analog environment at Devon Island, Nunavut, high Canadian Arctic was conducted. Objectives of this study included developing an effective management strategy for dealing with an incapacitated crewmember on the lunar surface, establishing audio/visual and biomedical data connectivity to multiple centers, testing rescue/extraction hardware and procedures, and evaluating in suit increased oxygen consumption. Methods: A review of the Apollo lunar surface activities and personal communications with Apollo lunar crewmembers provided the knowledge base of plausible scenarios that could potentially injure an astronaut during a lunar extravehicular activity (EVA). Objectives were established to demonstrate stabilization and transfer of an injured crewmember and communication with ground controllers at multiple mission control centers. Results: The project objectives were successfully achieved during the simulation. Among these objectives were extraction from a sloped terrain by a two-member crew in a 1 g analog environment, establishing real-time communication to multiple centers, providing biomedical data to flight controllers and crewmembers, and establishing a medical diagnosis and treatment plan from a remote site. Discussion: The simulation provided evidence for the types of equipment and methods for performing extraction of an injured crewmember from a sloped terrain. Additionally, the necessary communications infrastructure to connect multiple centers worldwide was established from a remote site. The surface crewmembers were confronted with a number of unexpected scenarios including environmental, communications, EVA suit, and navigation challenges during the course of the simulation which provided insight into the challenges of carrying out a medical contingency in an austere environment. The knowledge gained from completing the objectives will be incorporated into the exploration medical requirements involving an incapacitated astronaut on the lunar surface.

This viewgraph presentation reviews the use of telemedicine in a simulated microgravity environment using a patient simulator. For decades, telemedicine techniques have been used in terrestrial environments by many cohorts with varied clinical experience. The success of these techniques has been recently expanded to include microgravity environments aboard the International Space Station (ISS). In order to investigate how an astronaut crew medical officer will execute medical tasks in a microgravity environment, while being remotely guided by a flight surgeon, the Medical Operation Support Team (MOST) used the simulated microgravity environment provided aboard DC-9 aircraft teams of crew medical officers, and remote flight surgeons performed several tasks on a patient simulator.

#### **Translational Research from an Informatics Perspective**

Bernstam, Elmer; Meric-Bernstam, Funda; Johnson-Throop, Kathy A.; Turley, James P.; Smith, Jack W.; August 20, 2007; 3 pp.; In English; MEDINFO 2007, 20-24 Aug. 2007, Brisbane, Australia; Copyright; Avail.: CASI: [A01](#), Hardcopy

Clinical and translational research (CTR) is an essential part of a sustainable global health system. Informatics is now recognized as an important en-abler of CTR and informaticians are increasingly called upon to help CTR efforts. The US National Institutes of Health mandated biomedical informatics activity as part of its new national CTR grant initiative, the Clinical and Translational Science Award (CTSA). Traditionally, translational re-search was defined as the translation of laboratory discoveries to patient care (bench to bedside). We argue, however, that there are many other kinds of translational research. Indeed, translational re-search requires the translation of knowledge discovered in one domain to another domain and is therefore an information-based activity. In this panel, we will expand upon this view of translational research and present three different examples of translation to illustrate the point: 1) bench to bedside, 2) Earth to space and 3) academia to community. We will conclude with a discussion of our local translational research efforts that draw on each of the three examples.

#### **Effects of Hind Limb Unloading on Pharmacokinetics of Procainamide in Mice**

Risin, Semyon A.; Dasgupta, Amitava; Ramesh, Govindarajan T.; Risin, Diana; [2007]; 2 pp.; In English; 79th Annual Scientific Meeting of the Aerospace Medical Association, 11-15 May 2008, Boston, MA, USA; Copyright; Avail.: Other Sources; Abstract Only

The pharmacokinetics (PK) of medications administered to astronauts could be altered by the conditions in space. It is prudent to expect that low gravity and free floating (and associated hemodynamic changes) could affect the absorption, distribution, metabolism and excretion of the drugs. Knowledge of these alterations is essential for adjusting the dosage and the regimen of drug administration. Among the medications of special interest are the cardiovascular drugs, especially the antiarrhythmic agents. In this study we used hind limb unloaded (HLU) mice as a model to investigate possible changes in the PK of a common antiarrhythmic drug procainamide (PA). Prior to drug administration the experimental animals were tail suspended for 24 hours and the control animals were kept free. PA (150-250 mg per kg) was given orally by a gavage procedure. After that the experimental mice were kept suspended for additional 1, 2, 3 and 6 hours. At these time points the serum concentration of PA and N-acetyl-procainamide (NAPA), an active metabolite which is formed by N-acetyltransferase in the liver, were measured by the fluorescence polarization immunoassay (FPIA) on the AxSYM autoanalyzer (Abbott Laboratories, Abbott Park, IL). The serum level of PA in HLU mice at 1 hour after administration was almost 40% lower than in controls. At 2-3 hours the difference still maintained, however, it was not statistically significant; at 6 hours no difference

was detected. The level of NAPA in HLU mice was slightly lower at 1 and 2 hours but the difference did not reach statistical significance. The estimated PA half-life time in HLU mice was almost 55% longer than in control animals. These results confirm that hind limb unloading and related hemodynamic changes significantly alter the PK of PA. The effects are most likely primarily associated with a decrease in the drug absorption, especially within the first two hours after administration. At the same time prolongation of the PA half-life time in the HLU mice points towards slower drug elimination from the circulation.

#### **Effects of Lunar Dust Simulant (JSC-1A-vf) on WI-38 Human Embryonic Lung Cells**

Currie, Stephen; Hammond, Dianne; Jeevarajan, Anthony; July 24, 2007; 1 pp.; In English; Summer Institute for Students, 24 Jul 2007, USA; No Copyright; Avail.: Other Sources; Abstract Only

In order to develop appropriate countermeasures for NASA's return mission to the moon, the potential toxicity of lunar dust needs to be examined. Due to its abrasiveness, reactivity, composition and small size, lunar dust may pose a serious health risk to astronauts who inhale it. This project focuses on the toxicity of lunar dust simulant (JSC-1A-vf) using WI-38 human embryonic lung cells. Past results show that the simulant has toxic effects on small animals using intratracheal instillation. Earlier studies in this lab suggest that the dust remaining in media after low speed centrifugation is toxic. In order to better assess its toxicity, the simulant has been diluted in media, filtered with a 5 micron filter before combining it with media. This filtered dust is compared with dust centrifuged in media. Whole dust toxicity is also tested. Toxicity is estimated using a 3-(4,5-Dimethylthiazol-2-yl)-2,5-diphenyltetrazolium bromide (MTT) toxicity test which measures the activity of reducing enzymes in the mitochondria of viable cells. Preliminary results suggest that simulant which is diluted in media at different concentrations is slightly toxic. Interestingly, the cells appear to sweep up and collect the simulant. Whether this contributes to its toxicity is unclear. This project provides possible toxicity testing protocols for lunar dust and contributes to the knowledge of nanosize particle toxicity.

**Toxicity and Radioprotective Effects of DF-1 and Carbon Nanotubes in Human Lung and Liver Cell Lines**

Burgoyne, Madeline; Holtorf, Heidi; Huff, Janice; Moore, Valerie; Jeevarajan, Antony; July 24, 2007; 1 pp.; In English; USRA CASS Summer Student Presentation, 24 Jul. 2007, Houston, TX, USA; Copyright; Avail.: Other Sources; Abstract Only

The DF-1 compound, a sixty carbon fullerene derivative, has been shown to have antioxidant effects and is thought to possibly help mediate the effects of radiation on cells. While this is potentially useful, it is important to first understand the effect that the DF-1 has on the cells and the growth rate of the cells to determine if the material itself has any innate toxicity. A growth curve was established for both HF-19 cells, human fibroblasts, and HepG2 cells, liver tissue cells in the presence of two different concentrations of DF-1 and for untreated controls. The cells were plated in triplicate in 60mm dishes and were lifted and counted with a hemocytometer daily for one week. The growth curve data for the HF-19 cells show that while the low concentration of DF-1 had no apparent effect on the growth rate, the high concentration of DF-1 appeared to severely inhibit the growth of the HF-19 cells. The growth curve data for the HepG2 cells shows that the DF-1 compound had no significant effect on the rate at which the cells grew. A second growth curve study was performed plain carbon nanotubes, but with only 24 hour exposure to a high and low concentration of material. The carbon nanotubes are another carbon compound similar to DF-1, but in the shape of a tube, rather than a ball. We hypothesize that nanotubes may also mediate the effect of radiation on cells. This time, nanotubes did not show any significant effect on the growth rate HF-19 or HepG2 cells. A third growth curve study is underway to further determine the effect of DF-1, nanotubes, and a derivatized nanotube (BHT-nanotubes). This derivatized nanotube has been modified with a compound that is known to be very effective at neutralizing free radicals. We expect that the high concentration of DF-1 and possibly the nanotubes and BHT-nanotubes may inhibit the growth of the HF-19 cells while the low concentration will resemble the growth of the control. We also hypothesize that there will be no significant effect on the growth of the HepG2 cells by the nanotubes, and BHT-nanotubes. In order to examine the usefulness of the DF-1, nanotubes, and BHT-nanotubes in mediating the effects of radiation a clonogenic assay is being performed. The HF-19 cells were plated in different concentrations of the various compounds and exposed to varying amounts of radiation. The cells are being allowed to grow in a small enough concentration so that the ability of each cell to divide can be seen by the development of cell clusters. By comparing the irradiated control to the un-irradiated control the effects of radiation alone can be seen. By comparing the compound treated irradiated cells to the irradiated control the usefulness of each compound can be seen. It is thought that Amifostine, the positive control, will have more regularly dividing cells than the irradiated control, as will DF-1 and hopefully both nanotube materials as well.

**Multi-System Effects of Daily Artificial Gravity Exposures in Humans Deconditioned by Bed Rest**

Paloski, William H.; September 13, 2007; 1 pp.; In English; Medicine and Mobility 2007, 13-16 Sept. 2007, Cologne, Germany; No Copyright; Avail.: Other Sources; Abstract Only

We have begun to explore the utility of intermittent artificial gravity (AG) as a multi-system countermeasure to the untoward health and performance effects of adaptation to decreased gravity during prolonged space flight. The first study in this exploration was jointly designed by an international, multi-disciplinary team of scientists interested in standardizing an approach so that comparable data could be obtained from follow-on studies performed in multiple international locations. Fifteen rigorously screened male volunteers participated in the study after providing written informed consent. All were subjected to 21 days of 6deg head-down-tilt (HDT) bed rest. Eight were treated with daily 1hr AG exposures (2.5g at the feet decreasing to 1.0g at the heart) aboard a short radius (3m) centrifuge, while the other seven served as controls. Multiple observations were made of dependent measures in the bone, muscle, cardiovascular, sensory-motor, immune, and behavioral systems during a 10 day acclimatization period prior to HDT bed rest and again during an 8 day recovery period after the bed rest period. Comparisons between the treatment and control subjects demonstrated salutary effects of the AG exposure on aspects of the muscle and cardiovascular systems, with no untoward effects on the vestibular system, the immune system, or cognitive function. Bone deconditioning was similar between the treatment and control groups, suggesting that the loading provided by this specific AG paradigm was insufficient to protect that system from deconditioning. Future work will be devoted to varying the loading duty cycle and/or coupling the AG loading with exercise to provide maximum physiological

protection across all systems. Testing will also be extended to female subjects. The results of this study suggest that intermittent AG could be an effective multi-system countermeasure.

**Selective Serotonin Reuptake Inhibitors: Medical History of Fatally Injured Aviation Accident Pilots**

Sen, Ahmet; Akin, Ahmet; Canfield, D. V.; Chaturvedi, A. K.; July 2007; 11 pp.; In English; Original contains black and white illustrations

Contract(s)/Grant(s): AM-B-07-TOX-202

Report No.(s): DOT/FAA/AM-07/19; Copyright; Avail.: CASI: [A03](#), Hardcopy

Selective serotonin reuptake inhibitors (SSRIs) are popularly prescribed for treating depression, but these antidepressants are not currently approved for use by U.S. civilian aviators. In a 2003 study, 4 SSRIs--citalopram, fluoxetine, paroxetine, and sertraline--were found in 61 pilot fatalities of civil aviation accidents that occurred during 1990-2001. However, it was not known whether these pilots had had disqualifying psychological conditions, including depression, and had properly reported the use of the antidepressants. The aeromedical history of the pilots was retrieved from the Federal Aviation Administration's (FAA's) Medical Certification Database; additional pilot medical information and the cause/factor of the accidents were obtained from the National Transportation Safety Board's (NTSB's) Aviation Accident Database. Fifty-nine pilots had medical records in the FAA's Certification Database. The database did not contain medical records of 2 pilots--1 had never received a medical certificate and another had a Canadian pilot and medical certificate. Although driving under the influence was self-reported by 22 of the 59 pilots during their past aeromedical examinations, disqualifying psychological conditions were self-reported in the past examinations of only 7 (12%) of the 59 pilots, and the use of an SSRI was reported by 3 of the 7 pilots. In later examinations, 6 of the 7 indicated that they were free from the conditions and not taking SSRIs; thus, they were reissued medical certificates. Such conditions and/or drug use were not self-reported in the aeromedical records of the 52 (88%) pilots. Nevertheless, the NTSB investigations revealed that 12 (20%) of the 61 pilots had a history of a psychological condition and/or an SSRI use, as suggested by their personal medical records. Psychological conditions and/or the use of drugs were determined to be the cause or a factor in 19 (31%) of the 61 accidents. These findings reconfirm that SSRIs were used by the aviators but were not reported in their last aeromedical examinations.

#### **Utility of DF-1 for Radioprotection in Lymphocytes**

Reynolds, Julia; Casey, Rachael; Wu, Honglu; Huff, Janice; Emami, Kamal; Moore, Valerie; Jeevarajan, Antony; July 24, 2007; 1 pp.; In English; USRA CASS, 24 Jul. 2007, Houston, TX, USA; Copyright; Avail.: Other Sources; Abstract Only

The development of degenerative changes in the vasculature, such as atherosclerosis, is a known consequence of exposure to ionizing radiation, and is thus a concern for astronaut health following long duration space flight. Cellular damage caused by radiation is due to free radical generation and DNA damage. The goal of this project was to assess the ability of a C60-derivative, DF-1, to mitigate cellular damage resulting from radiation exposure in primary human lymphocytes. DF-1 is a water-soluble C60 fullerene encapsulated in dendrimeric functional groups that is proposed to exhibit antioxidant properties. Human lymphocytes are radiosensitive and travel throughout the body potentially causing bystander effects in any tissues they contact. These cells were subjected to varying doses of gamma radiation in the presence or absence of DF-1. Cells were collected at 48 hours post-irradiation for chromosomal aberration studies and at 72 hours post-irradiation for micronuclei studies. These studies showed that the irradiated cells contained more chromosomal aberrations and micronuclei than the control cells. Addition of the DF-1 reduced the amount of observed DNA damage in the irradiated cells. Growth curves were measured for the lymphocytes exposed to 0 and 4 Gray gamma irradiations, and we observed less growth in the cells irradiated at 4 Gy. 2,7-dichlorofluorescein diacetate was used to detect reactive oxygen species production, and increased production of ROS was observed in the irradiated lymphocytes. Human lymphocytes were subjected to varying doses of gamma or photon radiation in the presence and absence of DF-1 and a known radioprotectant, amifostine. After irradiation, the production of reactive oxygen species, growth curves and cell viability were measured. These cells were also collected to quantify chromosomal aberrations and micronuclei formation. We predict that irradiated cells will show the most damage and that DF-1 will provide protective effects similar to those of amifostine, an established radioprotectant.

A comprehensive analysis of both the molecular genetic and phenotypic responses of any organism to the spaceflight environment has never been accomplished due to significant technological and logistical hurdles. Moreover, the effects of spaceflight on microbial pathogenicity and associated infectious disease risks have not been studied. The bacterial pathogen *Salmonella typhimurium* was grown aboard Space Shuttle mission STS-115 and compared to identical ground control cultures. Global microarray and proteomic analyses revealed 167 transcripts and 73 proteins changed expression with the conserved RNA-binding protein Hfq identified as a likely global regulator involved in the response to this environment. Hfq involvement was confirmed with a ground based microgravity culture model. Spaceflight samples exhibited enhanced virulence in a murine infection model and extracellular matrix accumulation consistent with a biofilm. Strategies to target Hfq and related regulators could potentially decrease infectious disease risks during spaceflight missions and provide novel therapeutic options on Earth.

Report No.(s): AD-A466093; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA466093>

Complex cognitive systems couple humans with machines for the purpose of accomplishing a specific goal. It is often the case that human factors practitioners focus their attention on the humans while designers tend to focus on the technological aspects of the system. The point of intersection between humans and technology has become a boundary with respect to evaluation. In addition, human factors practitioners have often studied the result of cognitive activity (e.g., a decision) rather than the processes that lead to the outcome. In this paper, the authors present a general model that combines the technological aspects of a system with the perceptual and cognitive processes of the humans embedded in the system. The model emphasizes that such systems are both process oriented and dynamic. The authors describe a process tracing methodology that can be used to investigate the flow of data and information through both the technological and human components of the system. The attack on the USS Stark is used as a case study to illustrate the model and the process tracing methodology. The results of the process tracing analysis have implications for the design of complex systems and the training received by those who operate such systems.

Report No.(s): AD-A466644; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA466644>

Trident Warrior 2003 (TW03) was a Navy initiative to demonstrate an initial baseline of potential FORCENet capabilities. FORCENet is the operational construct and architectural framework for Naval Network Centric Warfare in the information age that integrates warriors, sensors, networks, command and control, platforms, and weapons into a distributed combat force. TW03 provided an integrated prototype capability for fleet evaluation and refinement of a supportable incremental delivery of FORCENet capability. The Chat system was limited by the synchronous nature of the system that required constant attention to monitor communications, by the number of participants that could be accommodated and recognized, and by the time required for users to authorize, compose, and type messages. The connections between the fire control systems allowed users to share common situation awareness on tracks, targets, and fire schedules but were mediated by the GCCS-M position information, which could lag up to 15 minutes behind real-time. The utility of the links between the fire support systems were limited by the inability of one system to accommodate the same target designations from another system and by the lack of connection between systems. Situation awareness is a continuing process and the limitation of reliance on chat as a status indicator was highlighted when one shooter was not aware that he was supposed to be in position to provide fire support to shore. Chat technology was used extensively to transfer information among distributed teams. Confusions and missed messages were noted occasionally and were typically due to user interface design problems, ambiguous operating procedures, or technical incompatibilities between chat systems. Display configurations and workspace layouts were problematic and led to inefficiencies in the way that information was transferred within and between command centers. Consideration of the proper location of operator workstations, legibility of

**Assessing Human Factors in Command and Control: Workload and Situational Awareness Metrics**

McGuinness, Barry; Ebbage, Louise; May 2002; 12 pp.; In English; Original contains color illustrations

Report No.(s): AD-A467497; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA467497>

The effects of digitized command and control on commanders workload and situational awareness (SA) were experimentally investigated in a simulated battle group scenario. Military participants acted in pairs to lead the planning and execution of a land reconnaissance operation, controlling the deployment of various units and sensor assets to find and fix an enemy. The subjects performed two versions of the exercise: one in which all communications between the HQ and its battlefield units occurred using the standard voice radio net, and a second version in which most of the interactions were either augmented or replaced with digital technology such as data-link, text messaging and automatic location reporting. During the execution phase, the command teams responded to various measures of workload and SA, described in the paper. These data, backed up with subject debriefings, provided several key insights into the impact of digitization. For example, it appears that the automatic presentation of enemy positional data reduced the depth to which commanders mentally processed incoming sighting information, thus reducing their sense of confidence in understanding the enemy picture. The pros and cons of the measures used are discussed, along with lessons learned.

**Testing and Evaluation of Dynasig Biometric Pen in Support of Tactical Military and Law Enforcement Missions**

Odgers, Kenton M; Mar 2007; 91 pp.; In English

Report No.(s): AD-A467350; No Copyright; Avail.: Defense Technical Information Center (DTIC)

Existing access control methods depend on mechanisms that can either be copied or stolen. From passwords to identification cards, these forms of authentication and verification are unique only while they remain in possession of the owner. Signature-based authentication and verification however, while not implying the two-dimensional ink on paper, but rather the method with which a signature is made, is extremely unique and provides a method that cannot feasibly be duplicated or stolen. Thereby, this form of access control can be more beneficial to security issues and to the increasing awareness of identity management. The objective of this thesis is to test and evaluate the Bio-Pen(trademark) and its associated WebClient software leveraging the Cooperative Operations and Applied Science and Technology Studies (COASTS) field experimentation program as a vessel for equipment and idea testing, requirements and standards definition. This thesis will examine a new biometric technology in terms of access control as well as its associated software. The primary objective of this research is to develop a fundamental understanding of the doctrinal, technological, and operational considerations of how the Bio-Pen can be utilized within the Department of Defense and Homeland Defense. To accomplish this objective, the Bio-Pen(trademark) and WebClient software will be tested and evaluated for use in the field to determine feasibility for future applications.

**Fort Holabird Defense Investigative Service (DIS), Base Realignment and Closure (BRAC) Cleanup Plan (BCP), Version II**

Longe, Timothy; Chuang, R; Johnston, D; Brand, C; McKown, Gary; Dec 1998; 105 pp.; In English; Original contains color illustrations

Contract(s)/Grant(s): DACA31-94-D-0064

Report No.(s): AD-A467428; ESP506-13; No Copyright; Avail.: Defense Technical Information Center (DTIC)

This Base Realignment and Closure (BRAC) Cleanup Plan (BCP), Version II, summarizes the current status of the Fort Holabird DIS environmental restoration and associated environmental compliance programs, and presents a comprehensive strategy for implementing response actions necessary to protect human health and the environment. Fort Holabird DIS was situated on 7.92 acres within the corporate limits of Baltimore City and performed clearances for the Department of Defense and other federal government agencies. Fort Holabird DIS was approved for closure under the Base Closure and Realignment Act of 1995. The official closure date was October 1, 1998. Fort Holabird DIS relocated all operations to a new site in Linthicum, MD in July 1996. In addition to laying out the response action approach at the installation in support of base

closure, this BCP defines the status of efforts to resolve technical issues so that continued progress and implementation of scheduled activities can occur. This BCP, originally prepared as Version 1, Draft Document, in September 1996, has been updated regularly to incorporate newly obtained information. This Version II BCP was prepared with information available as of December 10, 1998.

**The Tactile Modality: A Review of Tactile Sensitivity and Human Tactile Interfaces**

Myles, Kimberly; Binseel, Mary S; May 2007; 27 pp.; In English; Original contains color illustrations

Report No.(s): AD-A468389; ARL-TR-4115; No Copyright; Avail.: Defense Technical Information Center (DTIC)

Even though vision is only one modality humans use to interact with their environment, most people consider it to be the most important. Hearing also is viewed as necessary for interpreting environmental stimuli. In contrast, touch, smell, and taste are largely ignored as being essential to humans' interaction with the environment. The brain seldom processes environmental information sequentially using successive sensory modalities; rather, it simultaneously processes stimuli from several or all of the sensory modalities. Because humans have a limited capacity to receive, hold in working memory, and cognitively process information taken from the environment, the use of one sensory modality to convey information within a system can overload that modality. Multimodal systems can help to alleviate overload for any one modality, and such systems have been favorable in showing that the touch or tactile modality can be used as an independent input modality to convey information to the user, or as a redundant modality to increase information prominence of the visual and auditory modalities. The purpose of this review, which reflects work that occurred before mid-2006, is to discuss the tactile modality, specifically measures of tactile sensitivity for the human body, capabilities and limitations of the tactile modality, and applications of human tactile interfaces. Compared to other areas of the body, tactile research for the head and interfaces for the head is sparse. Therefore, a secondary concern of this review is to highlight this gap in the tactile literature.

**Human Factors Evaluation of the XM30 Guided Multiple Launch Rocket System (GMLRS) in the Combined High Mobility Artillery Rocket System (HIMARS)-GMLRS Initial Operational Test**

Hernandez, Charles L; May 2007; 30 pp.; In English

Contract(s)/Grant(s): Proj-62716AH70

Report No.(s): AD-A468402; ARL-TR-4113; No Copyright; Avail.: Defense Technical Information Center (DTIC)

The primary purpose of this effort by the U.S. Army Research Laboratory (ARL) was to record Soldier-participant comments, impressions, and any recommendations for improving the guided multiple launch rocket system (GMLRS) in areas related to the design of the rocket itself and the training required to handle, maintain, and employ it with the use of the high mobility artillery rocket system (HIMARS) launcher and its associated support vehicles. The GMLRS was tested along with the HIMARS in a combined initial operational test (IOT) administered by the U.S. Army Test and Evaluation Command (ATEC). Three of the four multi-faceted questionnaires developed for the combined HIMARS-GMLRS IOT provided Soldiers with the opportunity to address GMLRS-related issues. These instruments were the military occupational specialties (MOS) 13M (MLRS crewman), 13P (Fire Direction Specialist), and 27M (MLRS Repairman). Results from this evaluation were used by ATEC (for the GMLRS system evaluation report) and ARL's Human Research and Engineering Directorate (for the human factors evaluation), in support of the Milestone C decision for full-rate production that occurred in June 2005.

**Human Factors Evaluation of the High Mobility Artillery Rocket System (HIMARS) in the Combined HIMARS-Guided Multiple Launch Rocket System (GMLRS) Initial Operational Test**

Hernandez, Charles L; May 2007; 73 pp.; In English

Contract(s)/Grant(s): Proj-62716AH70

Report No.(s): AD-A468506; ARL-TR-4112; No Copyright; Avail.: Defense Technical Information Center (DTIC)

The primary purpose of this effort by the U.S. Army Research Laboratory (ARL) was to collect data that could be used

to assess human factors issues related to mission performance, training, and safety. Using questionnaires specifically designed for this initial operational test (IOT), Soldier participant comments, we recorded impressions and recommendations for improving the HIMARS launcher and its associated support vehicles. Four multi-faceted questionnaires were developed to support the applicable measures of performance listed in the HIMARS test and evaluation master plan. The questionnaires were administered to military occupational specialties 13M (MLRS Crewman), 27M (MLRS Repairman), 13P (Fire Direction Specialist), and 63 series (Vehicle Maintenance) personnel. Selected leaders (i.e., support platoon leader and fire direction officer) were also given the opportunity to answer any of the questionnaires they felt qualified to answer, based on their having received HIMARS IOT training or having been closely involved in multiple aspects of the tactical IOT events or both. Results from this evaluation were used by the U.S. Army Test and Evaluation Command (for the HIMARS system evaluation report) and ARL (for the human factors evaluation) in support of the Milestone C decision for full-rate production that occurred in June 2005.

**Human Factors Engineering: An Enabler for Military Transformation Through Effective Integration of Technology and Personnel**

Osga, Glenn; Galdorisi, George; Jun 2003; 56 pp.; In English; Original contains color illustrations

Report No.(s): AD-A467381; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA467381>

Transformation of the USA military requires new ways of defining both design and mission processes to improve warfighting performance and reduce system costs. New technologies engendered through the discipline of human-factors engineering enable warfighters to make more effective decisions in a timelier manner with fewer personnel. While the tradeoffs between new technologies and numbers of operators needed are complex, strong anecdotal evidence suggests that these manpower savings can be significant and have the potential to accelerate military transformation. The human factors engineering community has documented and quantified the enhanced mission effectiveness of fewer warfighters operating enhanced combat systems. What is less well quantified due to a number of institutional factors - is the true life cycle cost of military operators. This paper discusses design factors that support reduced crew workload and factors that influence crew cost estimation and size. The conclusion is that although we have identified good candidate designs to support reduced crew workload, we cannot adequately trade off their cost with personnel costs until we can more accurately quantify personnel costs.

**Anthropometric Accommodation in Space Suit Design**

Rajulu, Sudhakar; Thaxton, Sherry; March 12, 2007; 1 pp.; In English; 10 Annual Applied Ergonomics Conference, 12-15 Mar. 2007, Dallas, TX, USA; Copyright; Avail.: CASI: [A01](#), Hardcopy

Design requirements for next generation hardware are in process at NASA. Anthropometry requirements are given in terms of minimum and maximum sizes for critical dimensions that hardware must accommodate. These dimensions drive vehicle design and suit design, and implicitly have an effect on crew selection and participation. At this stage in the process, stakeholders such as cockpit and suit designers were asked to provide lists of dimensions that will be critical for their design. In addition, they were asked to provide technically feasible minimum and maximum ranges for these dimensions. Using an adjusted 1988 Anthropometric Survey of U.S. Army (ANSUR) database to represent a future astronaut population, the accommodation ranges provided by the suit critical dimensions were calculated. This project involved participation from the Anthropometry and Biomechanics facility (ABF) as well as suit designers, with suit designers providing expertise about feasible hardware dimensions and the ABF providing accommodation analysis. The initial analysis provided the suit design team with the accommodation levels associated with the critical dimensions provided early in the study. Additional outcomes will include a comparison of principal components analysis as an alternate method for anthropometric analysis.

**Revitalization of Space-Related Human Factors, Environmental and Habitability Data**

Russo, Dane; Pickett, Lynn K.; Tillman, Barry; Foley, Tico; February 12, 2007; 1 pp.; In English; NASA Human Research Program Investigators Workshop, 12-14 Feb. 2007, League City, TX, USA

Contract(s)/Grant(s): NAS9-02078; No Copyright; Avail.: Other Sources; Abstract Only

The NASA Chief Health and Medical Officer (CHMO) recently directed that the agency establish crew health standards to aid in the development of requirements for future vehicles and habitats. Response to this direction includes development of a new NASA habitability and human factors standard and an accompanying design handbook. The new standard contains high-level, over-arching principles to assure its applicability and usability across all NASA development programs. The handbook will provide detailed design requirements and suggestions that will meet the standards. The information contained in NASA-STD-3000 will be updated and included in the new design handbook. In this approach, each new program will derive detailed program-specific requirements from the new standard using the handbook as a design guide and resource. With the completion of the standard, the focus of this year's effort is the development of the new handbook: Human Integration Design Handbook (HIDH). This is an opportunity for the space flight human factors and habitability community to consolidate up-to-date data for use by NASA programs and designers as well as outside researchers and policy makers looking for the next research focus. The goal of the handbook is to help NASA design and build human space flight systems which accommodate the capabilities and limitations of the crew so as to provide an environment where the crew can live and work effectively, safely, and comfortably. Handbook contents will address that primary goal, addressing unique aspects of space flight and habitation, including reduced gravity conditions, time lags, EVA systems and day/night cycles, not addressed in other standards or handbooks. The handbook will be divided into topics similar to NASA-STD-3000 (anthropometrics, architecture, workstations, etc.) and each topic area will contain elements for designers, human factors practitioners, program managers, operators, and researchers. The handbook will include the following elements: (1) Design considerations include a clear and concise summary of what is important to designers in space vehicle / habitat design, design information to translate Earth-base knowledge to the space environment, space issues and the data necessary to address those issues, and a consistent set of terminology. (2) Updates to Lessons Learned and example solutions from Shuttle and Station program experience will provide historical examples to help prevent repeating mistakes or reinvention of the wheel. (3) Requirements will aid in the translation of standards into program specific requirements. The scope of included requirements will define the pool that each program needs to consider and tailor for their specific program. (4) Requirements rationale will help understanding of the importance of these considerations. The HIDH development team at JSC is finalizing the format of the new handbook, prioritizing topic areas for expansion and update, and contacting subject matter experts within the scientific community to assist with this effort. Plans are also being made to continue handbook expansion and maintenance to assure it remains a valuable resource for human factors and human space flight programs.

**Extended Research on Detection of Deception Using Volatile Organic Compound (VOC) Emissions. Final Report**

Jan. 1, 2006; 74 pp.; In English

Report No.(s): DE2007-901096; ORISE-06-1690; No Copyright; Avail.: National Technical Information Service (NTIS)

A system that captures and analyzes volatile organic compound (VOC) emissions from skin surfaces may offer a viable alternative method to the polygraph instrument currently in use for detecting deception in U.S. government settings. Like the involuntary autonomic central nervous system response data gathered during polygraph testing, VOC emissions from the skin may provide data that can be used to detect stress caused by deception. Detecting VOCs, then, may present a noninvasive, non-intrusive method for observing, recording, and quantifying evidence of stress or emotional change.

**Defense Logistics: Army and Marine Corps' Body Armor Requirements, Controls, and Other Issues**

Solis, William M; Jun 6, 2007; 15 pp.; In English; Original contains color illustrations

Report No.(s): AD-A468964; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA468964>

In recent years, a number of reports and newspaper articles have cited concerns regarding the level of protection and the

available amounts of body armor to protect deployed service members. As part of GAO's efforts to monitor the Department of Defense's (DoD) and the services' action to protect ground forces, GAO reviewed the Army and Marine Corps' actions to address these concerns. On April 26, 2007, GAO issued a report regarding the Army and the Marine Corps' individual body armor systems. Today's testimony summarizes the report's findings regarding the extent to which the Army and Marine Corps have done the following: (1) have met the theater requirements for body armor, (2) have the controls in place to assure that the manufacturing and fielding of body armor meet requirements, and (3) have shared information regarding their efforts on body armor ballistic requirements and testing. The report also included additional information concerning whether contractors or non-DoD civilians obtain body armor in the same way as U.S. forces and DoD civilians given the number of contractors and non-DoD civilians in CENTCOM's area of operation. GAO did not make recommendations in the report. DoD officials did not provide written comments on the report but technical comments were incorporated as appropriate.

**Defense Acquisitions: Analysis of Processes Used to Evaluate Active Protection Systems**

Francis, Paul; Graveline, William R; Ahearn, Marie P; Breen, Beverly; Davis, Tana; Jenkins, Letisha; Patton, Kenneth E; Swierczek, Robert; Jun 2007; 33 pp.; In English

Report No.(s): AD-A468965; GAO-07-759; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA468965>

Active Protection Systems (APS) protect vehicles from attack by detecting and intercepting missiles or munitions. In 2005, the lead systems integrator for the Army's Future Combat Systems (FCS) program sought proposals for an APS developer and design and to deliver APS prototypes on vehicles by fiscal year 2009. Raytheon was chosen the APS developer. At the same time, the Department of Defense's (DoD) Office of Force Transformation (OFT) evaluated near-term APS for potential use in Iraq. GAO was asked to review the Army's actions on APS/FCS: (1) the process for selecting the subcontractor to develop an APS for FCS and if potential conflicts of interest were avoided; (2) the timing of the trade study and if it followed a consistent methodology to evaluate alternatives, and the results; (3) the role the Army and Boeing played in selecting the developer; and (4) the process followed to provide a near-term APS solution for current forces. GAO recommends that the Secretary of Defense support additional testing and demonstration of APS systems to help develop tactics, techniques, procedures, and concepts of operations for active protection systems and provide useful data on the use of APS. DoD did not agree to support such testing.

**Can a Self-Diagnostic Digitally Controlled Pacemaker/Defibrillator Device be Used for Alerting Military Personnel When a Soldier Health Condition Becomes Compromised Out in the Field**

Nedd, Steven; Jan 26, 2007; 9 pp.; In English; Original contains color illustrations

Report No.(s): AD-A469014; TARDEC-16774; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA469014>

The Self-Diagnostic Digitally Controlled Pacemaker/Defibrillator Device (SDDCPDD) has several features that I think may be very useful to the Armed Services. Even though this device is designed as a pacemaker/defibrillator device; its applications can be used as a sensory data retrieval device for Soldiers that have been captured in the field or in combat missions. This research investigates the use of Unified Modeling Language (UML) Diagrams, Object-Oriented Analysis and Design, and Structured Query Language (SQL) to develop the high level architecture of a system to store and retrieve digital/wireless communication information from a pacemaker/defibrillator, or other device to determine the whereabouts, and alert military personnel of the status of the Soldier. It presents the requirements and architectural design of the Self-Diagnostics Digitally Controlled Pacemaker/Defibrillator Device.

Contract(s)/Grant(s): Proj-622618.H80

Report No.(s): AD-A469177; ARL-TR-4140; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA469177>

Gun propulsion modeling has been undergoing development for many decades. Because of the great strides in recent development, one has been able to estimate in-bore pressure-time history at a fairly accurate level. However, some underlying assumptions among the models exhibit certain level of uncertainties, such as the time-varying friction between the obturator and bore surface, the granular shape variations of propelling charges, the packaging deviations of each propellant load, etc. These factors explain the fact that the recorded pressure levels differ from one gun shot to another with the same gun and projectile system in many experimental tests. Thus, this report considered the variations of the factors as a whole and investigated in-bore responses of the Extended Area Protection and Survivability projectile, subject to the inherent randomness of propulsion forces. The results provide a better understanding of the projectile behavior during proposed circumstances.

Report No.(s): AD-A468978; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA468978>

The 85% Biological Defense Project identifies those ideas that can significantly improve the defensive capabilities and facilitate military forces survival, operation, and sustainment in a biologically contaminated environment. The 100% biological warfare (BW) defense solution is difficult, if not impossible, to obtain. The purpose of the 85% Biological Defense Project, hereafter referred to as the 85% Project, is to determine if there are quick-to-implement ideas using available technologies or capabilities that have not yet been adequately addressed to enhance our military forces protection against biological weapons. While this project was focused on the military services as a whole (Army, Navy, Marines, and Air Force), several ongoing initiatives within the USA Air Force (USAF) are used as examples of the different services' initiatives to counter the biological warfare threat. Likewise, the 85% Project identifies areas being worked by other USAF programs under the USAF Counter- Chemical, Biological, Radiological, Nuclear, and high yield Explosives (CCBRNE) Council that require further attention and refinement. The ultimate goal is to reduce the biological weapons threat to U.S. and allied forces at fixed bases. This publication is the product of the authors' research, the 'Needed Now: The '85% Quick Fix' in Bio-Defense' publication (Appendix A), and a workshop held to address shortfalls in biological weapons defense. This report has been prepared by U.S. Air Force Counterproliferation Center (USAF CPC) senior researchers for the Defense Threat Reduction Agency/ Chemical and Biological Division (DTRA/CB). The report is targeted to be read by decision-makers, commanders, staff officers, and planners in all functional areas at the DoD, major command, and installation levels.

**Human Error Investigation Software Tool (HEIST)**

Reinach, S.; Viale, A.; Green, D.; May 2007; 41 pp.; In English

Contract(s)/Grant(s): DTFR53-01-D-00029

Report No.(s): PB2007-110306; DFRA-060053; No Copyright; Avail.: CASI: [A03](#), Hardcopy

Human factors are a leading cause of train accidents and incidents in the USA. Human factors go beyond the crewmembers who operate the on-track equipment. They include management support and oversight, operating practices and procedures, technologies and facilities, and the work culture in short, the socio-technical environment in which railroad employees work. The purpose of this project was to develop a software tool to help Federal Railroad Administration personnel, and the railroad industry in general, systematically consider human factors issues at all levels of the socio-technical environment (or system) when investigating the causes or contributing factors of train accidents, incidents, and close calls. This report describes the development and features of the Human Error Investigation Software Tool (HEIST). HEIST is a portable Tablet and Windows-based application that can be used in the field, a hotel room, or an office to support accident/incident investigations. HEIST data collection tools include a checklist of things to consider; operator, front-line

supervisor, and manager interview guides; a human factors taxonomy and definitions; an interactive data collection aid; and an online accident/incident/close call summary form. Data classification tools include an interactive aid and practice module. A HEIST user manual was also produced under separate cover. The report concludes with some recommendations for future enhancements to HEIST, including implementation of a centralized accident, incident, and close call database, and preparation of a field test.

Hospitals submit data in electronic form on a series of quality measures to the Centers for Medicare & Medicaid Services (CMS) and receive scores on their performance. Increasingly, the clinical information from which hospitals derive the quality data for CMS is stored in information technology (IT) systems. GAO was asked to examine (1) hospital processes to collect and submit quality data, (2) the extent to which IT facilitates hospitals' collection and submission of quality data, and (3) whether CMS has taken steps to promote the use of IT systems to facilitate the collection and submission of hospital quality data. GAO addressed these issues by conducting case studies of eight hospitals with varying levels of IT development and interviewing relevant officials at CMS and the Department of Health and Human Services (HHS).

#### **Testing for Compliance to NTCIP Standards**

De Roche, R.; Apr. 2007; 494 pp.; In English

Report No.(s): PB2007-108773; REPT-0-5003-2; No Copyright; Avail.: CASI: [A21](#), Hardcopy

The objectives of this two-year project are to define a framework for testing conformance to National Transportation Communications for ITS Protocol (NTCIP) standards, identify an approach to describe the extent to which testing is needed, and recommend the appropriate documentation for such testing activities. To meet the objectives, the first years report included a summary of past and current efforts by various groups and organizations, a description of available testing tools, and the results of a survey undertaken to understand Texas Department of Transportations (TxDOTs) testing process and needs. These topics were followed by discussions of the steps involved in conformance testing, how NTCIP requirements are specified, current TxDOT testing processes, reporting results, and the mapping of requirements to tests. The first years report concluded with an enumerated list of recommendations to establish a testing framework. This second year report looks at the details of testing documentation, provides estimates for developing test procedures for the various NTCIP-conformant field devices, discusses how to apply the procedures to the TxDOT testing processes, and presents an outline for training classes. The main portion of the report concludes with some additional recommendations to establish a testing framework. Appendices address modifications to TxDOT Closed Circuit Television (CCTV) specifications, a template for a TxDOT specification listing CCTV NTCIP requirements, a set of CCTV test procedures, test results reporting, miscellaneous communications test procedures, and a preliminary set of traffic signal controller procedures.

#### **Assessing Technology, Methods, and Information for Committing and Combating Cyber Crime**

Gordon, G. R.; Hosmer, C. D.; Siedsma, C.; Rebovich, D.; Jan. 2003; 114 pp.; In English

Contract(s)/Grant(s): NCJRS-2000-LT-BX-K002

Report No.(s): PB2007-109014; No Copyright; Avail.: CASI: [A06](#), Hardcopy

The goal of this report is to provide key insights to the law enforcement community on how to upgrade basic abilities to

effectively investigate computer crimes. This report is designed to reduce the skill distance between what computer criminals have learned to successfully commit their crimes and what law enforcers need to know to successfully bring these offenders to justice. By presenting this information in a clear, structured form, we believe great inroads can be made to gain a competitive edge over those who would misuse technology for criminal gain. The information contained in this report serves as a valuable guide to computer crime investigators. Properly implemented, the information should prove instrumental in controlling and preventing the highly damaging crimes committed against large portions of the general public and business community, crimes that, not long ago, would have been impossible to achieve with the ease with which it they can be achieved today.

**Automated STR Analysis for DNA Databases**

Perlin, M. W.; Jan. 2003; 21 pp.; In English

Contract(s)/Grant(s): NCJRS-2000-IJ-CX-K005

Report No.(s): PB2007-109011; Copyright; Avail.: National Technical Information Service (NTIS)

STR technology has enabled the rapid generation of highly informative DNA data for use in human identification. However, these data must be carefully analyzed. With database samples, there is now an acute shortage of skilled data reviewers. With casework samples (including mixtures), much information is not extracted from the data, despite considerable examiner effort. We are rapidly developing novel computational, mathematical and statistical methods that help overcome these limitations. This report focuses on the collaborative validation of these methods as applied to DNA databases. Convicted offender DNA databases must be accurate. To minimize error, the original STR data are carefully reviewed by two or more people. Moreover, in a troubleshooting capacity, this review helps to continuously maintain high quality lab data. But there are not enough skilled personnel for this arduous, repetitive task. To alleviate this critical labor shortage, we developed the TrueAllele expert system. The computer program automates virtually every human review function, and provides consistent quality assessment and allele designation. The TrueAllele validation began with the original data from 50,000 CODIS genotypes. System parameters were adapted to the instruments (ABV310, ABV3700; HitachVFMbio) and panels (ProfilerPlus, Cofiler, PowerPlex 1.2) used to generate the data. Computer processing was then done, with automated scoring of the high quality data, followed by limited human review. The computed expert system results were compared against manually scored results. We report here on the relative accuracy and efficiency of the automated approach. Our report describes novel computer-based methods for assuring data quality and automating DNA database review. We present here the objective results of our validation study, and demonstrate the feasibility of practical automated analysis. Our primary objective is the rapid introduction of validated intelligent data analysis systems for eliminating tedious human STR analysis. This contribution may help free up valuable DNA examiner time for serving justice through forensic science.

The purpose of this report is to document the development and current status of the Ada County Sheriff's office Internet site. On January 1, 1997, Boise State University and the Ada County Sheriff's Office entered into a partnership whose purpose was to advance community policing initiatives at the Sheriff's Office. The goals of the partnership were: Form a research-practitioner partnership to contribute to policy-relevant research and evaluation on behalf of the Ada County Sheriff's Office. Use the partnership to develop a pool of research ideas fruitful to the Sheriff's department. Solicit information on citizens perceptions of current police practices, community-based initiatives within the Sheriff's Office, and ways in which the Sheriff's Office can more effectively communicate information about its activities.

Report No.(s): PB2007-104586; No Copyright; Avail.: CASI: [A03](#), Hardcopy

A low-frequency, temporally asymmetric watermark carrier decreases in luminance in a substantially monotonic manner at a different rate than it increases in luminance in a substantially monotonic manner. This allows the carrier to be embedded, e.g., in a video work, in a manner that renders the resultant watermark virtually invisible to the human eye. Moreover, the resultant watermark is substantially resistant to common pirating techniques in which high-frequency visual content (e.g., including watermark data) tends to be filtered out by piracy processing.

**Appraising Policies to Reduce Freight Transport Time and Its Variability-A New Method**

Minken, H.; Samstad, H.; January 2006; 109 pp.; In Norwegian  
Report No.(s): PB2007-109949; TOI-825/2006; Copyright; Avail.: National Technical Information Service (NTIS)

Analytical formulas for freight values of time and the value of reliability have been developed, along with a toolbox to assess the impact of policies on the expectation and variance of delays. Some of the data required by the formulas are not available at present. Data for appraisal may be obtained from a survey. To assess impacts, more systematic registers on incidents causing delays are needed.

Software for automated test equipment can be tedious and monotonous making it just as error-prone as other software. Active defect prevention and detection are also important for test applications. Incomplete or unclear requirements, a cryptic syntax used for some test applications, especially script-based test sets, variability in syntax or structure, and changing requirements are among the problems encountered in one tester. Such problems are common to all software but can be particularly problematic in test equipment software intended to test another product. Each of these issues increases the probability of error injection during test application development. This report describes a test application development tool designed to address these issues and others for a particular piece of test equipment. By addressing these problems in the development environment, the tool has powerful built-in defect prevention and detection capabilities. Regular expressions are widely used in the development tool as a means of formally defining test equipment requirements for the test application and verifying conformance to those requirements. A novel means of using regular expressions to perform range checking was developed. A reduction in rework and increased productivity are the results. These capabilities are described along with lessons learned and their applicability to other test equipment software. The test application development tool, or application builder, is known as the PT3800 AM Creation, Revision and Archiving Tool (PACRAT).

Hypersonic flow simulations using the node based, unstructured grid code FUN3D are presented. Applications include

simple (cylinder) and complex (towed ballute) configurations. Emphasis throughout is on computation of stagnation region heating in hypersonic flow on tetrahedral grids. Hypersonic flow over a cylinder provides a simple test problem for exposing any flaws in a simulation algorithm with regard to its ability to compute accurate heating on such grids. Such flaws predominantly derive from the quality of the captured shock. The importance of pure tetrahedral formulations are discussed. Algorithm adjustments for the baseline Roe / Symmetric, Total-Variation-Diminishing (STVD) formulation to deal with simulation accuracy are presented. Formulations of surface normal gradients to compute heating and diffusion to the surface as needed for a radiative equilibrium wall boundary condition and finite catalytic wall boundary in the node-based unstructured environment are developed. A satisfactory resolution of the heating problem on tetrahedral grids is not realized here; however, a definition of a test problem, and discussion of observed algorithm behaviors to date are presented in order to promote further research on this important problem.
