**Concepts Associated with Transferring Temporal and Spatial Boundary Conditions Between Modules in the Framework for Risk Analysis in Multimedia Environmental Systems (FRAMES)**

Whelan, G.; Castleton, K. J.; Pelton, M. A.; Oct. 2006; 31 pp.; In English

Contract(s)/Grant(s): DE-AC05-76RL01830

Report No.(s): DE2007-901190; PNNL-16145; No Copyright; Avail.: National Technical Information Service (NTIS)

The Framework for Risk Assessments in Multimedia Environmental Systems (FRAMES) is a Windows-based software platform that provides an interactive user interface and, more importantly, specifications to allow a variety of Disk Operating System (DOS) and Windows-based codes to be integrated within a single framework. The major components of FRAMES include modules (module user interface, analysis code, and potentially pre- and/or post-processors), the Framework User Interface (FUI), a sensitivity/uncertainty module, and data visualization tools. Modules can accept data from the user or other modules and can calculate some portion of the risk assessment. The FUI allows the user to interact with the system. The sensitivity/uncertainty module allows the user to conduct a Monte Carlo analysis, and the visualization tools allow the user to review results from a particular stage in the process. FRAMES represents middleware for linking models so information can seamlessly pass between these components. A seamless linkage is best confirmed when the design is not parochial or inflexible but sets a standard through which communication can occur. Developing a standard is complicated when different models operate under different time and space constraints, or when dynamic feedback is desired.

**HPC-Colony: Services and Interfaces to Support Systems with Very Large Numbers of Processors. (2006 Annual Report, January-December 2006)**

Jones, T.; Kale, L.; Moreira, J.; January 2006; 10 pp.; In English

Report No.(s): DE2007-902273; UCRL-TR-227723; No Copyright; Avail.: National Technical Information Service (NTIS)

The primary objective of the Colony Project is to develop technologies that enable application scientists to easily scale applications to computing platforms comprised of tens of thousands to hundreds of thousands of compute cores. This will be accomplished by addressing several problem areas that are known to be key factors when scaling applications to tens of thousands of processors. First, by providing a smart runtime system to quickly and dynamically make cpu and memory and interconnect resource management adjustments, we remove the burden of achieving applications that are highly tuned and load-balanced for a particular execution instance (i.e. a particular input datasets and machine platform combination). Second, by providing a full complement of system services including the entire Linux system call set, we ease the challenge of developing portable applications since lightweight kernels frequently incorporate only a small subset of the POSIX calls prevalent in typical large scientific applications. Third, by providing fundamental changes to the Linux kernel that reduce variability in context switch times and provide for parallel-aware scheduling across the entire machine, we remove the negative impact of synchronizing collectives on bulk-synchronous applications. Fourth, by providing fault tolerance mechanisms that utilize our unique migration abilities in conjunction with in-memory techniques for minimal overhead, we

eliminate the necessity for costly frequent application-driven check-points. Our research utilizes full implementations of these technologies on systems consisting of tens of thousands of processors.

**Methods and Computer-Readable Medium for Navigating between a Plurality of Discrete Images**

Mostert, P. S., Inventor; 1 Mar 05; 22 pp.; In English

Contract(s)/Grant(s): DMI-0091510

Patent Info.: Filed Filed 1 Mar 05; US-Patent-Appl-SN-11-069 811

Report No.(s): PB2007-104660; No Copyright; Avail.: CASI: [A03](#), Hardcopy

In a computer system, methods and computer-readable medium are disclosed for tracking motion of a subject in an activity captured by camera. The camera supplies pluralities of discrete images of the subject to a computing system environment. An event window has at least two cells for receiving a user input pertaining to an action of the subject in the activity. In a first cell, the user indicates a specific image number corresponding to one of the plurality of discrete images and an estimate of a fractional percent thereof. In the second cell, the user indicates another specific image number and estimate of a fractional percentage thereof. Software calculates deltas between the cells. Pushbuttons are provided to aid users in navigating between pluralities of the discrete images. Example subjects include horses in horse race activities while actions include horse stride length.

**Intrusion and Misuse Deterrence System Employing a Virtual Network**

Roesch, M. F., Inventor; Gula, R. J., Inventor; 1 Nov 04; 15 pp.; In English

Contract(s)/Grant(s): DCA100-96-D-0048

Patent Info.: Filed Filed 1 Nov 04; US-Patent-Appl-SN-10-978 765

Report No.(s): PB2007-104659; No Copyright; Avail.: CASI: [A03](#), Hardcopy

A method and apparatus is disclosed for increasing the security of computer networks through the use of an Intrusion and Misuse Deterrence System (IMDS) operating on the network. The IMDS is a system that creates a synthetic network complete with synthetic hosts and routers. It is comprised of a network server with associated application software that appears to be a legitimate portion of a real network to a network intruder. The IMDS consequently invites inquiry and entices the intruder away from the real network. Simulated services are configured to appear to be running on virtual clients with globally unique, class 'C' IP addresses. Since there are no legitimate users of the virtual network simulated by the IMDS, all such activity must be inappropriate and can be treated as such. Consequently, the entire set of transactions by an intruder can be collected and identified rather than just those transactions that meet a predefined attack profile. Also, new exploits and attacks are handled just as effectively as known attacks, resulting in better identification of attack methodologies as well as the identification and analysis of new attack types. Since the IMDS only has to be concerned with the traffic going to its simulated hosts it additionally eliminates the bandwidth limitation that plagues a traditional intrusion detection system (IDS).

**Towards Multi Level Optimization. Space Mapping and Manifold Mapping**

Echeverria, D.; Tong, C.; Aug. 01, 2006; 16 pp.; In English

Report No.(s): DE2007-900107; UCRL-TR-223288; No Copyright; Avail.: National Technical Information Service (NTIS)

In this report we study space-mapping and manifold-mapping, two multi-level optimization techniques that aim at accelerating expensive optimization procedures with the aid of simple auxiliary models. Manifold-mapping improves in accuracy the solution given by space-mapping. In this report, the two mentioned techniques are basically described and then applied in the solving of two minimization problems. Several coarse models are tried, both from a two and a three level perspective. The results with these simple tests confirm the speed-up expected for the multi-level approach.

**Purple Computational Environment with Mappings to Ace Requirements for the General Availability User Environment Capabilities. Version 2.0**

Barney, B.; Shuler, J.; Dec. 05, 2006; 67 pp.; In English

Report No.(s): DE2007-900098; UCRL-TR-223888; No Copyright; Avail.: National Technical Information Service (NTIS)

Purple is an Advanced Simulation and Computing (ASC) funded massively parallel supercomputer located at Lawrence Livermore National Laboratory (LLNL). The Purple Computational Environment documents the capabilities and the environment provided for the FY06 LLNL Level 1 General Availability Milestone. This document describes specific capabilities, tools, and procedures to support both local and remote users. The model is focused on the needs of the ASC user working in the secure computing environments at Los Alamos National Laboratory, Lawrence Livermore National Laboratory, and Sandia National Laboratories, but also documents needs of the LLNL and Alliance users working in the unclassified environment. Additionally, the Purple Computational Environment maps the provided capabilities to the Trilab ASC Computing Environment (ACE) Version 8.0 requirements. The ACE requirements reflect the high performance computing requirements for the General Availability user environment capabilities of the ASC community. Appendix A lists these requirements and includes a description of ACE requirements met and those requirements that are not met for each section of this document. The Purple Computing Environment, along with the ACE mappings, has been issued and reviewed throughout the Tri-lab community.

**Report to the Institutional Computing Executive Group (ICEG) August 14, 2006**

Carnes, B.; Sep. 08, 2006; 27 pp.; In English

Report No.(s): DE2007-900083; UCRL-TR-224276; No Copyright; Avail.: National Technical Information Service (NTIS)

We have delayed this report from its normal distribution schedule for two reasons. First, due to the coverage provided in the White Paper on Institutional Capability Computing Requirements distributed in August 2005, we felt a separate 2005 ICEG report would not be value added. Second, we wished to provide some specific information about the Peloton procurement and we have just now reached a point in the process where we can make some definitive statements. The Peloton procurement will result in an almost complete replacement of current M&IC systems. We have plans to retire MCR, iLX, and GPS. We will replace them with new parallel and serial capacity systems based on the same node architecture in the new Peloton capability system named ATLAS. We are currently adding the first users to the Green Data Oasis, a large file system on the open network that will provide the institution with external collaboration data sharing. Only Thunder will remain from the current M&IC system list and it will be converted from Capability to Capacity. We are confident that we are entering a challenging yet rewarding new phase for the M&IC program.

**Implicit Solvers for Large Scale Nonlinear Problems**

Keyes, D. E.; Reynolds, D.; Woodward, C. S.; Jul. 14, 2006; 12 pp.; In English

Report No.(s): DE2007-900076; UCRL-CONF-222859; No Copyright; Avail.: National Technical Information Service (NTIS)

Computational scientists are grappling with increasingly complex, multi-rate applications that couple such physical

phenomena as DGuid dynamics, electromagnetics, radiation transport, chemical and nuclear reactions, and wave and material propagation in inhomogeneous media. Parallel computers with large storage capacities are paving the way for high-resolution simulations of coupled problems; however, hardware improvements alone will not prove enough to enable simulations based on brute-force algorithmic approaches. To accurately capture nonlinear couplings between dynamically relevant phenomena, often while stepping over rapid adjustments to quasi-equilibria, simulation scientists are increasingly turning to implicit formulations that require a discrete nonlinear system to be solved for each time step or steady state solution. Recent advances in iterative methods have made fully implicit formulations a viable option for solution of these large-scale problems. In this paper, we overview one of the most effective iterative methods, Newton-Krylov, for nonlinear systems and point to software packages with its implementation. We illustrate the method with an example from magnetically coned plasma fusion and briefly survey other areas in which implicit methods have bestowed important advantages, such as allowing high-order temporal integration and providing a pathway to sensitivity analyses and optimization. Lastly, we overview algorithm extensions under development motivated by current SciDAC applications.

### **Parallel Eigensolver for H (curl) Problems using H1 Auxiliary Space AMG Preconditioning**

Kolev, T. V.; Vassilevski, P. S.; Nov. 16, 2006; 13 pp.; In English

Report No.(s): DE2007-900179; UCRL-TR-226197; No Copyright; Avail.: National Technical Information Service (NTIS)

This report describes an application of the recently developed H1-auxiliary space preconditioner for H(curl) problems to the Maxwell eigenvalue problem. The auxiliary space method based on the new (HX) finite element space decomposition introduced in this document, was implemented in the hypre library under the name AMS. The eigensolver considered in the present paper, referred to as the AME, is an extension of the AMS. It is based on the locally optimal block eigensolver LOBPCG and the parallel AMG (algebraic multigrid) solver BoomerAMG from the hypre library. AME is designed to compute a block of few minimal nonzero eigenvalues and eigenvectors, for general unstructured finite element discretizations utilizing the lowest order Nedelec elements. The main goal of the current report is to document the usage of AME and to illustrate its parallel scalability.

**Regression Strategies for Parameter Space Exploration. A Case Study in Semicoarsening Multigrid and R**

Lee, B. C.; Schulz, M.; de Supinski, B. R.; Sep. 29, 2006; 25 pp.; In English

Report No.(s): DE2007-900144; UCRL-TR-224851; No Copyright; Avail.: National Technical Information Service (NTIS)

Increasing system and algorithmic complexity, combined with a growing number of tunable application parameters, pose significant challenges for analytical performance modeling. This report outlines a series of robust techniques that enable efficient parameter space exploration based on empirical statistical modeling. In particular, this report applies statistical techniques such as clustering, association, correlation analyses to understand the parameter space better. Results from these statistical techniques guide the construction of piecewise polynomial regression models. Residual and significance tests ensure the resulting model is unbiased and efficient. We demonstrate these techniques in R, a statistical computing environment, for predicting the performance of semicoarsening multigrid. 50 and 75 percent of predictions achieve error rates of 5.5 and 10.0 percent or less, respectively.

**Survey of Probabilistic Models for Relational Data**

Koutsourelakis, P. S.; Oct. 26, 2006; 29 pp.; In English

Report No.(s): DE2007-900137; UCRL-TR-225637; No Copyright; Avail.: National Technical Information Service (NTIS)

Traditional data mining methodologies have focused on DGat data i.e. a collection of identically structured entities, assumed to be independent and identically distributed. However, many real-world datasets are innately relational in that they consist of multi-modal entities and multi-relational links (where each entity- or link-type is characterized by a different set of attributes). Link structure is an important characteristic of a dataset and should not be ignored in modelling efforts, especially when statistical dependencies exist between related entities. These dependencies can in fact significantly improve the accuracy of inference and prediction results, if the relational structure is appropriately leveraged. The need for models that can incorporate relational structure has been accentuated by new technological developments which allow us to easily track, store, and make accessible large amounts of data. Recently, there has been a surge of interest in statistical models for dealing with richly interconnected, heterogeneous data, fuelled largely by information mining of web/hypertext data, social networks, bibliographic citation data, epidemiological data and communication networks.

Report No.(s): PB2007-104621; No Copyright; Avail.: CASI: [A04](#), Hardcopy

Data in a database describe an application domain such as a satisfiability problem. The data are represented in a manner that expresses the structure inherent in the data and one such representation uses group theory and represents the data as one

or more 'augmented clauses,' where each clause has a pair (c, G) including a database element c and a group G of group elements g acting on it. A query is encoded in a group theory representation and is executed on the group theory representation of the data to identify database elements and associated group elements satisfying the query. If desired, the satisfying database elements are converted from the group theory representation to the native representation of the data.

There is provided a ground sensor assembly adapted for deployment from air to a selected ground location. The ground sensor assembly comprises an aerially deployable sensor housing which has upper and lower housing ends defining a longitudinally elongated aperture therebetween. A plurality of connected sensor modules are longitudinally inserted into the aperture between the upper and lower housing ends. Furthermore, an aerodynamic module is connected to the sensor modules and is disposed adjacent the upper housing end outside the aperture. This aerodynamic module has a plurality of stabilizers which radially extend outward therefrom and form a generally parallel relationship with the upper housing end. Such stabilizers provide aerodynamic stability during the deployment of the ground sensor assembly from the air to the selected ground location.

Contract(s)/Grant(s): DARPA-NBCH30390004

Patent Info.: Filed Filed 22 Apr 05; US-Patent-Appl-SN-10-829 829

Report No.(s): PB2007-104100; No Copyright; Avail.: CASI: [A03](#), Hardcopy

A method and system for interactive modeling of high-level network performance with low-level link design provides a tool for optimizing networked computing systems and their link components simultaneously. The method models a fixed portion of a network and specifies operational performance levels and power constraints. A solution is chosen for a non-fixed network portion and the network is simulated to determine link requirements and synthesizes links in conformity with the link requirements. The links are analyzed to determine performance (e.g., bandwidth) and requirements (e.g., power) and network performance is recalculated. An iterative loop from the selection of the non-fixed topology through synthesis and recalculation of link performance can be implemented to optimize the link and network design. The links may be links that use an adaptive management policy that trades off power and bandwidth in multiple operating modes and the method may be used to optimize the operating modes and/or management rules.

Contract(s)/Grant(s): WBS 732759.07.05

Report No.(s): AIAA Paper 2007-4462; Copyright; Avail.: CASI: [A02](#), Hardcopy

Pure-tetrahedral unstructured grids have been shown to produce asymmetric heat transfer rates for symmetric problems. Meanwhile, two-dimensional structured grids produce symmetric solutions and as documented here, introducing a spanwise degree of freedom to these structured grids also yields symmetric solutions. The effects of grid skewness and other perturbations of structured-grids are investigated to uncover possible mechanisms behind the unstructured-grid solution asymmetries. By using controlled experiments around a known, good solution, the effects of particular grid pathologies are uncovered. These structured-grid experiments reveal that similar solution degradation occurs as for unstructured grids, especially for heat transfer rates. Non-smooth grids within the boundary layer is also shown to produce large local errors in heat flux but do not affect surface pressures.

Contract(s)/Grant(s): NCJRS-2000-RB-CX-0002

Report No.(s): PB2007-110358; No Copyright; Avail.: CASI: [A03](#), Hardcopy

The study described herein details investigations into the thermal behavior of forensically important maggots, the effect of internal maggot mass heat generation on maggot development time, and the sources and magnitudes of error affecting a phenological computer model that predicts the likely post-mortem interval (PMI) of human remains found long after the persons demise. Field studies were performed in north Florida and northwest Indiana with 88 domestic pigs (*Sus scrofa*) allowed to become colonized naturally in a wooded setting by blowflies (Insecta, Diptera: Calliphoridae) other carrion-feeding flies, and other insects, while being protected from larger scavengers. Adult flies found around the corpses were captured and identified, and samples from maggot masses were characterized by species and life stage. Each maggot mass was also measured for dimensions and temperature. Some pigs were further monitored with a linear probe that continuously measured the internal temperature of the pig and masses in 12 locations along the probe.

**Digital Evidence in the Courtroom: A Guide for Law Enforcement and Prosecutors**

Jan. 2007; 81 pp.; In English

Report No.(s): PB2007-110346; NCJ-211314; No Copyright; Avail.: CASI: [A05](#), Hardcopy

Law enforcement agencies, prosecutors, and judges are overwhelmed by the amount of information required to keep pace with the rapid changes involving the computer and its associated devices and features. Criminals continually alter, revise, or create hardware, software, viruses, and other attacks in an effort to disguise criminal activity and thwart detection. In addition to being familiar with these changes in technology, law enforcement officers and prosecutors also must stay abreast of the latest revisions of applicable laws. To assist prosecutorial offices and associated law enforcement agencies, the National Institute of

Justice (NIJ) has developed a series of guides dealing with digital evidence to address the complete investigation process. This process expands from the crime scene, through analysis, and finally into the courtroom. The guides summarize information from select groups of practitioners who are knowledgeable about the subject matter. These groups are more commonly known as technical working groups (TWGs).

**Time varying Reeb Graphs. A Topological Framework Supporting the Analysis of Continuous Time varying Data**

Mascarenhas, A.; Dec. 06, 2006; 140 pp.; In English

Report No.(s): DE2007-900445; UCRL-TH-226559; No Copyright; Avail.: National Technical Information Service (NTIS)

For static data, the Reeb graph encodes the evolution of topological features and compactly represents topological information of all level sets. The Reeb graph essentially contracts each level set component to a point. It can be computed efficiently, and it has several uses: as a succinct summary of the data, as an interface to select meaningful level sets, as a data structure to accelerate level set extraction, and as a guide to remove noise. The author extends these uses of Reeb graphs to time-varying data. He characterizes the changes to Reeb graphs over time, and develop an algorithm that can maintain a Reeb graph data structure by tracking these changes over time. He stores this sequence of Reeb graphs compactly, and call it a time-varying Reeb graph.

Report No.(s): PB2007-104131; No Copyright; Avail.: CASI: [A03](#), Hardcopy

The invention relates to improving the switching reliability of a magnetic memory cell in a magnetic random access memory (MRAM). Embodiments of the invention add an antiferromagnet to a magnetic memory cell. An antiferromagnetic layer can be formed adjacent to a soft layer in the MRAM on a side of the soft layer that is opposite to a hard layer of the MRAM. One embodiment further includes an additional interlayer of non-antiferromagnetic material between the antiferromagnetic layer and the soft layer.

A peer-to-peer (P2P) networking system is disclosed that provides a large, persistent object repository with the ability to easily scale to significant size. Data security is provided using a distributed object data access mechanism to grant access to data objects to authorized users. Data objects stored within the object repository are provided a plurality of security options including plain text data, objects, encrypted data objects, and secure, secret sharing data objects. A data object query processing component permits users to locate requested information within the P2P networking system.

**Pattern Analysis of Directed Graphs Using DEDICOM: An Application to Enroll Email**

Bader, B. W.; Harshman, R. A.; Kolda, T. G.; Dec. 2006; 34 pp.; In English

Report No.(s): DE2007-900402; SAND2006-7744; No Copyright; Avail.: National Technical Information Service (NTIS)

DEDICOM is a linear algebra model for analyzing intrinsically asymmetric relationships, such as trade among nations or the exchange of emails among individuals. DEDICOM decomposes a complex pattern of observed relations among objects into a sum of simpler patterns of inferred relations among latent components of the objects. Three-way DEDICOM is a higher-order extension of the model that incorporates a third mode of the data, such as time, giving it stronger uniqueness properties and consequently enhancing interpretability of solutions. In this paper, we present algorithms for computing these decompositions on large, sparse data as well as a variant for computing an asymmetric nonnegative factorization. When we apply these techniques to adjacency arrays arising from directed graphs with edges labeled by time, we obtain a smaller graph on latent semantic dimensions and gain additional information about their changing relationships over time. We demonstrate these techniques on the Enron email corpus to learn about the social networks and their transient behavior. The mixture of roles assigned to individuals by DEDICOM showed strong correspondence with known job classifications and revealed the patterns of communication between these roles. Changes in the communication pattern over time, e.g., between top executives and the legal department, were also apparent in the solutions.

**Cfengine. A General Purpose Tool for Anomaly Detection in Periodic Data**

Wachsmann, A.; Cassell, E.; Mar. 01, 2007; 6 pp.; In English

Contract(s)/Grant(s): DE-AC02-76SF00515

Report No.(s): DE2007-900590; SLAC-PUB-12379; No Copyright; Avail.: Department of Energy Information Bridge

Cfengine's environment daemon 'cfenv' has a limited and fixed set of metrics it measures on a computer. The data is assumed to be periodic in nature and cfenvd reports any data points that fall too far out of the pattern it has learned from past measurements. This is used to detect 'anomalies' on computers. We introduce a new standalone tool, 'cfetool', that allows arbitrary periodic data to be stored and evaluated. The user interface is modeled after rrdtool, another widely used tool to store measured data. Because a standalone tool can be used not only for computer related data, we have extended the built-in mathematics to apply to yearly data as well.

ONLINE: <http://hdl.handle.net/100.2/ADA466060>

Virtual ring is a preferable design for reliable and survivable group communication. Different implementations of virtual ring have different advantages and constraints. After studying two specific implementations of virtual ring, Virtual Ring on Embedded Tree and Virtual Ring of Traveling Salesman Tour, we propose a novel ring-based survivable architecture for group communication, called the Multi-Ring Virtual Ring (MVR). MVR is capable of tolerating one link or one node failure and is easy to implement and maintain. Performance is analyzed with respect to end-to-end hop-count delays and extra bandwidth

that is needed for backup. Results show that the MVR design is a desirable candidate to provide reliability and survivability for a group communication system.

Contract(s)/Grant(s): N00014-06-M-0105

Report No.(s): AD-A466524; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA466524>

We describe the design of a new oversampled analog-to-digital converter (ADC) based on phase modulation-demodulation (PMD) architecture. In a PMD ADC, the analog input signal modulates the phase of a periodic stream of fluxons applied to a modulator circuit for subsequent demodulation in a clocked synchronizer circuit to produce a digital code. The new modulator provides a way to quadruple the average fluxon transport rate, and hence the input dynamic range, by replacing the single junction interferometer with a high-speed symmetric divide-by-4 circuit. The divider acts as a 1:4 asynchronous demultiplexer which distributes incoming fluxons amongst its four quarter-rate outputs. This four-fold rate reduction, at the modulator output, allows one to increase the ADC maximum input slew rate to 2 fluxons per clock period, achieving 2 additional bits of resolution at the same sampling clock frequency. We have designed and fabricated a quarter-rate ADC front-end and present low frequency test results for the same. The ADC comprises a quarter-rate quantizer which has been successfully tested at an input frequency of 81.92 GHz.

**Using Cyclic Memory Allocation to Eliminate Memory Leaks**

Nguyen, Huu H; Rinard, Martin; Oct 26, 2005; 12 pp.; In English

Contract(s)/Grant(s): FA8750-04-2-0254; F33615-00-C-1692

Report No.(s): AD-A466771; MIT-CSAIL-TR-2005-069; MIT-LCS-TR-1008; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA466771>

We present and evaluate a new memory management technique for eliminating memory leaks in programs with dynamic memory allocation. This technique observes the execution of the program on a sequence of training inputs to find m-bounded allocation sites, which have the property that at any time during the execution of the program, the program accesses at most only the last m objects allocated at that site. The technique then transforms the program to use cyclic memory allocation at that site: it preallocates a buffer containing m objects of the type allocated at that site, with each allocation returning the next object in the buffer. At the end of the buffer the allocations wrap back around to the first object. Cyclic allocation eliminates any memory leak at the allocation site -- the total amount of memory required to hold all of the objects ever allocated at the site is simply m times the object size. We evaluate our technique by applying it to several widely-used open source programs. Our results show that it is able to successfully eliminate important memory leaks in these programs.

**Victim Migration: Dynamically Adapting Between Private and Shared CMP Caches**

Zhang, Michael; Asanovic, Krste; Oct 10, 2005; 19 pp.; In English; Original contains color illustrations

Report No.(s): AD-A466772; MIT-CSAIL-TR-2005-064; MIT-LCS-TR-1006; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA466772>

Future CMPs will have more cores and greater onchip cache capacity. The on-chip cache can either be divided into separate private L2 caches for each core, or treated as a large shared L2 cache. Private caches provide low hit latency but low capacity, while shared caches have higher hit latencies but greater capacity. Victim replication was previously introduced as a way of reducing the average hit latency of a shared cache by allowing a processor to make a replica of a primary cache victim in its local slice of the global L2 cache. Although victim replication performs well on multithreaded and single-threaded codes, it performs worse than the private scheme for multiprogrammed workloads where there is little sharing between the different programs running at the same time. In this paper, we propose victim migration, which improves on victim replication by adding an additional set of migration tags on each node which are used to implement an exclusive cache policy for replicas. When a replica has been created on a remote node, it is not also cached on the home node, but only recorded in the migration tags. This frees up space on the home node to store shared global lines or replicas for the local processor. We show that victim migration performs better than private, shared, and victim replication schemes across a range of single threaded, multithreaded, and multiprogrammed workloads, while using less area than a private cache design. Victim migration provides a reduction in average memory access latency of up to 10% over victim replication.

**Open Architecture in Naval Combat System Computing of the 21st Century: Network-Centric Applications**

Strei, Thomas J; Jun 2003; 11 pp.; In English; Original contains color illustrations

Report No.(s): AD-A467321; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA467321>

This paper describes the Navy's Open Architecture (OA) effort. At its most fundamental, OA is an integrated engineering discipline, a technical approach, and a business strategy for information systems that is based on mainstream commercial-off-the-shelf (COTS) information and computing technologies and systems. The OA initiatives seek to reduce multiple infrastructures that result from a myriad of competing architectures, and also to embrace a product-line approach that will generate true economic efficiencies. With this in mind, the Navy is developing a comprehensive strategy, plan, and program for an OA approach and strategy to address weapon system affordability, interoperability, and performance for today's fleet and the Navy after next. In the fall of 2002, the Navy stood up several new Program Executive Offices (PEOs), including the PEO for Integrated Warfare Systems (PEO IWS), which focuses on surface ship and submarine naval warfare technologies

and systems. PEO IWS will help select common standards and products in the areas of frameworks, middleware, resource management, and operating systems, using both established and evolving industry standards to avoid proprietary solutions that might constrain rather than enhance interoperability, operational effectiveness, and future technology insertion. Furthermore, the computer program architecture will enable the introduction of common functions across multiple systems and platforms.

**Emergency Preparedness and the Year 2000 Challenge**

Goss, Kay C; Oct 2000; 6 pp.; In English

Report No.(s): AD-A467868; No Copyright; Avail.: Defense Technical Information Center (DTIC)

The Year 2000 (Y2K) transition created one of the greatest emergency preparedness challenges ever faced by the Federal Emergency Management Agency (FEMA) and State and local emergency management organizations in the USA. This event was unique in the annals of emergency management because it had the potential to affect many different geographical areas and systems simultaneously. FEMA's normal mission of reducing loss of life and property and protecting America's critical infrastructure from all types of disasters made it a key Federal Agency involved in Y2K preparations. FEMA used an Executive Secretariat, including representatives from all major Agency components, to lead the Y2K program. FEMA approached the problem from three perspectives: information technology, emergency preparedness, and response. This structured management approach was effective, providing coordinated decisions allowing for quick actions on the Agency's part. FEMA also supported the President's Council on Year 2000 Conversion, chairing the Emergency Services Sector Working Group, and leading the Catastrophic Disaster Response Group Federal Departments and Agencies in preparing for potential responses to Y2K consequences. The Y2K transition resulted in few disruptions and was successful in large part because of extensive preparedness, technical assistance, and outreach activities on the part of FEMA and many other organizations.

**Challenges for Vertical Collaboration Among Warfighters for Missile Defense C2**

Lee, Laura A; Prouty, Ray C; Sepucha, David J; Jun 2004; 52 pp.; In English; Original contains color illustrations

Report No.(s): AD-A466039; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA466039>

Implementing an effective Missile Defense plan in a Network Centric environment requires a robust collaboration scheme compatible with multiple military models and simulations. Many technology breakthroughs have occurred allowing defense plans to be rapidly exchanged with C2 systems distributed around the Globe. However, the issue of interpreting the data properly within each C2 model or simulation component remains a stumbling block to effective planning. This paper describes a global collaboration approach using the eXtensible Mark-up Language (XML) to create and validate the plans. Experimentation performed using this approach, by allowing plans to be distributed using a Java Message Service (JMS) or provided by web services, is described to highlight the issues with netted sensors and weapons in military planning. An

approach to resolving this issue through a higher level NCW model of the architecture supported by tactical element web services is shown.

**The Critical Role of Intelligent Software Agents in Enabling Net-Centric Command and Control**

Lichtblau, Dale E; Jun 2004; 33 pp.; In English; Original contains color illustrations

Report No.(s): AD-A466040; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA466040>

The Net-Centric Operations and Warfare Reference Model (NCOW RM), Version 1.0, currently under development by the Office of the Assistant Secretary of Defense for Networks and Information Integration (OASD/NII), is the architectural touchstone for all Department of Defense information systems of the near- and long-term future. The reference model prescribes four sets of fundamental functionality: user/entity interaction services; intelligent assistance capabilities; net-centric services (encompassing communities of interest (COI) services, core enterprise services (discovery, mediation, collaboration, etc.), and environment control services); and resource provisioning services. The role and critical importance of the set of services that are to provide intelligent assistance to users of the Global Information Grid (GIG), and to its envisaged Net-centric Information Environment (NCIE), has yet to be fully delineated. We argue that the envisaged net-centricity in future warfare (command and control), business operations, and enterprise management is dependent upon a robust intelligent assistance capability based on the profuse use of intelligent agents throughout the GIG's NCIE.

Report No.(s): AD-A466042; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA466042>

The Extensible Modeling and Simulation Framework (XMSF) is defined as a modeling-&-simulation-tailored set of self-consistent standards, processes and practices employing a set of web based technologies and services to enable a new generation of Internet-distributed applications to emerge, develop and interoperate. One of the earliest XMSF uses web services to web enable the Defense Modeling & Simulation Office (DMSO)/SAIC High Level Architecture (HLA) Runtime Infrastructure (RTI) enabling communication between federates in an existing federation. As a result, existing federates and federations can be web enabled rapidly, in some cases just by relinking the federate with the Web Enabled RTI libraries instead of the standard RTI libraries. The resulting federate connects to a web server over the Internet, communicating with a federation that is unaware that the federate is not local. The Web Enabled RTI is an excellent example of the application of web technologies to the problem of making modeling and simulation capabilities available in a network centric environment, supporting the operational warfighter with network centric modeling and simulation tools.

**Operational Agility: Composing and Orchestrating Mission Capability Packages Through Business Process Execution Language (BPEL)**

Shaffer, Gary R; Jun 2004; 42 pp.; In English; Original contains color illustrations

Report No.(s): AD-A466044; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA466044>

One aspect of the Department of Defenses vision for Net-Centric Operations and Warfare is composing and orchestrating Mission Capability Packages from various disparate and geographically dispersed web services into mission-oriented application as required by the operational situation. This allows mission-oriented capabilities to be quickly composed in response to new challenges, requirements, or demands. In other words, Operational Agility. Today, web services can communicate with each other, advertise themselves, and be discovered and invoked using industry-wide specification.

However, until recently, orchestrating these fine grained services together into coherent course grained solutions required non-standard methods and procedures that were generally not interoperable with other organizations. Business Process Execution Language (BPEL) for Web Services (BPEL4WS) mitigates the issue of interoperability by providing a set of constructs, based on XML, that can be used to define the semantics of how process communicate and exchange data, control the flow of data from one services to another, and the order in which to invoke services. Furthermore, subject matter experts using graphical designer tools and not software developers writing software components can compose the processes. This will allow mission-oriented capabilities to be quickly composed in response to new challenges, requirements, or demands.

**Computational Experimentation with the Virtual Design Team: Bridging the Chasm between Laboratory and Field Research in C2**

Nissen, Mark E; Buettner, Raymond R; Jun 2004; 20 pp.; In English; Original contains color illustrations

Contract(s)/Grant(s): N0001401WR20304

Report No.(s): AD-A466047; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA466047>

A chasm exists between laboratory and field methods in C2 research. These methods are complementary but used rarely in combination. This expository article describes a research approach that bridges such chasm: computational experimentation. Computational experimentation mitigates the weakness of both laboratory and field research, yet it has its own limitations and appears suited best as a complement and not a replacement. To illustrate the power and potential of computational experimentation, we describe an implemented agent-based modeling environment called VDT. VDT benefits from accumulated research over two decades and extensive external validation. We employ this modeling environment to represent and emulate the behavior of a high-level C2 organization. Using a full-factorial experimental design, we illustrate computational experimentation through controlled manipulation of key factors associated with organizational and technological design (i.e., bureaucracy level, coordination load, knowledge inventory). This illustration includes discussion of rich operationalized constructs used to characterize a diversity of C2 organizations, task environments and performance measures. The experimental results highlight complex interactions between design factors, and they suggest fundamental tension and decision tradeoffs between important performance measures such as mission duration and risk. The article closes with key conclusions, implications for C2 in practice today, and suggestions for future research.

**New Navy Solutions: Developing Simulation Based C4I Applications**

Layman, Gene; Weatherly, Jim; Jun 2004; 42 pp.; In English; Original contains color illustrations

Report No.(s): AD-A466048; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA466048>

Simulation based Mission Applications are difficult to develop due to the conflicting nature of current Command, Control, Communications, Computer and Intelligence (C4I) systems and simulations. C4I systems process real world data to produce a common operational picture as accurate and as close to real time as possible. Simulations process simulated data, operate in variable time bases and present alternate courses of action, plans, analytical results, etc. C4I systems have made few provisions for these types of processes. The Navy's Embedded Simulation Infrastructure (ESI) Program was undertaken to provide Modeling and Simulation (M&S) software components to be used as building blocks for simulation based mission applications within C4I systems that are compliant with the Department of Defense's Common Operating Environment (COE). Standard software components have been developed to link simulations to internal COE and C4I functions and to manage simulated data and variable time bases in C4I systems. A variety of sharable M&S software components are available to generate planning and training scenarios, provide simulations links to internal C4I data bases and functions, manage the simulated data within the C4I system, manage variable time bases, display simulated data, integrate simulations with other applications and perform communication tasks.

**Issues and Requirements for Cybersecurity in Network Centric Warfare**

Stytz, Martin R; Banks, Sheila B; Jun 2004; 36 pp.; In English; Original contains color illustrations

Report No.(s): AD-A466069; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA466069>

The transition to network centric warfare brings with it great promise for the effectiveness of future military operations. This promise arises from the capability for network centric warfare to empower individuals at all levels with vast amounts of relevant information and thereby lift the fog of war. By achieving the promise, commanders will be able to effectively and efficiently employ their resources to achieve objectives; in addition, individuals can exploit information in real-time to increase their effectiveness in mission accomplishment and to capitalize upon transient opportunities in the battlespace. However, a central, but generally unspoken, tenet of network centric warfare is that the information received is actionable; i.e., that the information is timely and correct. However, the increasing sophistication of computer and network attack tools and technologies coupled with the increasing technical sophistication of potential adversaries calls this central tenet into question and raises the question of how to secure the network and software against the threat of attack and subversion. Clearly, network and application security, or cybersecurity, is a broad topic, but is of pressing importance if network centric warfare is to fulfill its potential and become a key component of the future battlespace.

System requirements are recognized as a critical step in the development of quality software (SW) systems and an important area of research. Being the first step in the process of software engineering, the effort has potential to shape the direction for all subsequent project activity. The main purpose of this research is to examine the impact of requirements uncertainty and task uncertainty on outcomes in software development projects, limiting the attention to process and product quality. Some of those examined projects are defense-related and aerospace-command and control systems. A cross-sectional survey of 123 participants work in software development in 34 U.S. organizations was employed to prove my research model. Analyzed data provided evidence of a significant negative association between requirements uncertainty and development quality factors: process and product. Moreover, the analyzed data showed that there is a significance positive association between requirements and task uncertainty. In addition, the data provided evidence of a negative significant association between task uncertainty and process and product quality. My study pointed to areas where there was negative impact on the developed system quality. In particular, my research focused on the uncertainty regarding user requirements, because I believed that this had the most influence. Findings from this research can provide the basis on which project managers and software practitioners can design concrete strategies that would enhance the performance of software development to high quality ends.

Understanding people's commonsense knowledge about the physical world is a fundamental problem in building intelligent systems. If this knowledge can be represented and used by computers, they can duplicate people's ability to understand and interact with the world. Qualitative physics is the attempt to capture and formalize this knowledge. An important aspect of qualitative reasoning is the ability to derive the possible behaviors of a given physical system from the structure of the system, using minimal initial information. This thesis investigates qualitative domain theories and reasoning techniques that will enable computers to analyze the qualitative behaviors of physical systems, including both mechanical mechanisms and fluids such as internal combustion engines and hydraulic lift pumps. The author has developed a domain

theory that integrates richer models of mechanics, fluids, and geometry than previous research in qualitative physics. These theories and inference techniques are embodied in QSA, a program that produces possible behaviors of physical systems.

ONLINE: <http://hdl.handle.net/100.2/ADA466238>

Wide-area parallel processing systems will soon be available to researchers to solve a range of problems. In these systems, it is certain that host failures and other faults will be a common occurrence. Unfortunately, most parallel processing systems have not been designed with fault-tolerance in mind. Mentat is a high-performance object-oriented parallel processing system that is based on an extension of the data-flow model. The functional nature of data-flow enables both parallelism and fault-tolerance. In this paper, we exploit the data-flow underpinning of Mentat to provide easy-to-use and transparent fault-tolerance. We present results on both a small-scale network and a wide-area heterogeneous environment that consists of three sites: the National Center for Super computing Applications, the University of Virginia and the NASA Langley Research Center.

ONLINE: <http://hdl.handle.net/100.2/ADA466288>

Many existing survivability mechanisms rely on software-based system monitoring and control. Some of the software resides on application hosts that are not necessarily trustworthy. The integrity of these software components is therefore essential to the reliability and trustworthiness of the survivability scheme. In this paper we address the problem of protecting trusted software on untrustworthy hosts by software transformations. Our techniques include a systematic introduction of aliases in combination with a break-down of the program control-flow; transforming high-level control transfers to indirect addressing through aliases pointers. In so doing, we transform programs to a form that yields data flow information very slowly and/or with little precision. We present a theoretical result which shows that a precise analysis of the transformed program, in the general case, is NP-hard and demonstrate the applicability of our techniques with empirical results.

ONLINE: <http://hdl.handle.net/100.2/ADA466301>

Chip-multiprocessor (CMP) architectures present a challenge for efficient simulation, combining the requirements of a detailed microprocessor simulator with that of a tightly-coupled parallel system. In this paper, a distributed simulator for target CMPs is presented based on the Message Passing Interface (MPI) designed to run on a host cluster of workstations. Microbenchmark-based evaluation is used to narrow the parallelization design space concerning the performance impact of distributed vs. centralized target L2 simulation, blocking vs. non-blocking remote cache accesses, null-message vs. barrier techniques for clock synchronization, and network interconnect selection. The best combination is shown to yield speedups of up to 16 on a 9-node cluster of dual-CPU workstations, partially due to cache effects.

ONLINE: <http://hdl.handle.net/100.2/ADA466314>

Military use of the intelligence process is vital both in and of itself and as a valuable input to Command and Control by enhancing military power through information superiority. The intelligence process begins when a need for information or intelligence is identified and encompasses how these information needs are met. As such, this process includes all of the satellites, aircraft, and communications systems used to gather and transmit data as well as the people, organizations, and resources involved in turning raw data into useful information. To support current and future Intelligence, Surveillance, and Reconnaissance (ISR) systems, more detailed analysis of the intelligence process becomes critical to determine what pieces may need to be improved or expanded. The authors' approach involves the construction of a modularized top-level computer simulation model of a generalized military intelligence process using the Arena process-oriented simulation software. The model provides the ability to perform quick-turn analysis for comparing structural modifications to the intelligence process using typical measures of performance (i.e., quality, quantity, timeliness, and information needs satisfaction). The Intelligence Process Model (IPM) consists of the following seven submodels: Planning and Direction, Collection, Processing and Exploitation, Analysis and Production, Dissemination and Integration, Mission Evaluation and Feedback, and Communications. The study also includes a statistical analysis of various configurations of this intelligence process.

ONLINE: <http://hdl.handle.net/100.2/ADA466404>

This paper presents an analytical performance characterization and topology comparison from a latency perspective for the Scalable Coherent Interface (SCI). Experimental methods are used to determine constituent latency components and to verify the results obtained by these analytical models as close approximations of reality. In contrast with simulative models, analytical SCI models are faster to solve, yielding accurate performance estimates very quickly, and thereby broadening the design space that can be explored. Ultimately, the results obtained here serve to identify optimum topology types for a range of system sizes based on the latency performance of common parallel application demands.

The distributed nature of routing and flow control in a register-insertion ring topology complicates priority enforcement for real-time systems. Two divergent approaches for priority enforcement for ring-based networks are reviewed: a node-oriented scheme called Preemptive Priority Queue and a ring-wide arbitration approach dubbed TRAIN. This paper introduces a hybrid protocol named Directed Flow Control that combines node- and ring-oriented flow control to yield greater performance. A functional comparison of the three protocols as implemented on the Scalable Coherent Interface (SCI) is presented, followed by performance results obtained through high-fidelity modeling and simulation.

Rapid increases in the complexity of algorithms for real-time signal processing applications have led to performance requirements exceeding the capabilities of conventional digital signal processor (DSP) architectures. Many applications, such as autonomous sonar arrays, are distributed in nature and amenable to parallel computing on embedded systems constructed from multiple DSPs networked together. However, to realize the full potential of such applications, a lightweight service for message-passing communication and parallel process coordination is needed that is able to provide high throughput and low latency while minimizing processor and memory utilization. This paper presents the design and analysis of such a service, based on the Message Passing Interface (MPI) specification, for unicast and collective communications.

ONLINE: <http://hdl.handle.net/100.2/ADA466421>

A key research priority for the next decade is the protection of critical, software-intensive infrastructures (e.g., electric power, banking, telecommunications, and transportation). The problem is complicated by the need to enhance existing systems. The authors describe one approach to survivability enhancement. In 1997, the Internet failed when corrupt data was disseminated at the top level of the Domain Name Service. The authors replicated this failure and developed a solution based on transparent insertion of mediators to enforce survivability policies. Their approach promises to ease survivability enhancement in two ways: (1) transparent insertion eases system architectural evolution, and (2) modularization of survivability policy implementations eases the evolution of both survivability policies and the systems into which their mediators are inserted.

ONLINE: <http://hdl.handle.net/100.2/ADA466430>

Dealing with damage that arises during the operation of networked information systems is essential if such systems are to provide the dependability required by modern critical applications. Extensive damage can arise from environmental factors, malicious actions, and so on, and in most cases it is impractical to mask the effects of such damage using typical redundancy techniques. Reconfiguration is required of both the application and the underlying computing and communications fabric. Such reconfiguration is difficult to achieve because it requires communication with a significant number of nodes both to determine the problem and to effect a repair. In this demonstration, the authors present an approach to the implementation of such a reconfiguration. The approach to reactive control includes a formal description of the error states, synthesis of the implementation, a novel new communications mechanism for communication between the error detection system and the application, and a system for coordinating the effects of independent actions.

Band gap structure is the most important information while studying electromagnetic propagation in photonic crystals. A collection of free software is used to set up an analysis tool system for simulation purpose. Because it is desired for application and has been a technique challenge to fabricate a photonic crystal possessing a complete photonic band gap operates at the optical wavelength regime, we study how to optimize the size and position of band gap from the standpoint of long range order, short range order, and material property. We show in this paper that , decreasing the variance of k points on the first Brillouin zone by choosing an appropriate lattice type and adjusting the lattice parameters is required to the formation of a larger complete photonic band gap, and for easy calculations we defined the variance quantity when the coordinates of high symmetry points are known; a local symmetry distorted along some specific directions always opens and extends the gaps, and the effects of structure inversion are considered from this viewpoint; dielectric contrast should have a optimum value to fulfill the requirements of position and size of gap simultaneously rather than an as-high-as-possible value, to prevent the wavelength shift of gap to a shorter range.

Report No.(s): AD-A466531; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA466531>

Sketching is a powerful means of communication between people. While many useful multimodal systems of communication have been created, current systems are far from achieving human-like participation in sketching. A computational model of sketching would help characterize these differences and help people better understand how to overcome them. This paper is a first step towards such a model. The authors start with an example of a sketching system (nuSketch COA Creator) designed to aid military planners to provide context and a source of examples. They then describe

four dimensions of sketching -- visual understanding, conceptual understanding, language understanding, and drawing -- that can be used to characterize the competence of existing systems and identify open problems. Three research challenges are posed to serve as milestones towards a computational model of sketching that can explain and replicate human abilities in this area.

ONLINE: <http://hdl.handle.net/100.2/ADA466633>

Worldwide, maritime trade accounts for approximately 80% of all trade by volume and is expected to double in the next twenty years. Prior to September 11, 2001, Ports, Waterways and Coastal Security (PWCS) was afforded only 1 percent of USA Coast Guard (USCG) resources. Today, it accounts for nearly 22 percent of dedicated USCG resources. Tactical assessment of resource requirements and operational limitations on the PWCS mission is necessary for more effective management of USCG assets to meet the broader range of competing missions. This research effort involves the development and validation of a discrete-event simulation model of the at-sea vessel interdiction process utilizing USCG deepwater assets. A discrete-event simulation model of the interdiction, control and boarding, and inspection processes has been developed and validated. Through a simulation optimization approach, our research utilizes the efficiency of a localized search algorithm interfaced with the simulation model to allocate USCG resources in the interception, boarding, and inspection processes with the objective of minimizing overall process time requirements. The model is tested with actual USCG data to gain insight on the development of efficient and effective interdiction operations.

ONLINE: <http://hdl.handle.net/100.2/ADA466685>

This research project investigated techniques to develop a High Performance Computing (HPC) grid infrastructure to operate as an interactive research and development tool. Current HPC grid architectures are designed for batch applications, where users submit their job requests, and then wait for notification of job completion. In the batch environment, the user lacks direct control over the execution of their application. To meet this need for accessing and processing data interactively in near real-time, the Air Force Research Laboratory/ Information Directorate developed an environment that stresses 'near real-time' user interaction with the application. This involved evaluating the various developing protocols for interactive grid computing, using the Globus Toolkit, and then selecting the one with the most growth potential. The grid architecture was evaluated by

assembling and demonstrating an in-house interactive demonstration grid using in-house cluster assets and existing code, to verify proper operation on a small scale.

ONLINE: <http://hdl.handle.net/100.2/ADA466716>

Intelligent agents can be quite useful as entities in combat simulations. Recently, there has been a great deal of research on developing enhanced methods for implementing intelligent agents in combat simulations, such as by introducing models of team work and collaborative behavior. However, modeling of command-and-control has lagged behind. Much is known about command-and-control in human tactical decision-making (TDM) teams from studies in cognitive science and organizational psychology. These studies suggest that human decision-makers tend to follow a Naturalistic Decision-Making process, in which situation awareness plays a key role. Hence command-and-control is heavily focused on information-gathering and information-fusion activities, oriented toward reducing uncertainty and identifying the situation, based on which an appropriate response can be applied (or adapted) from experience or training. In this paper, we provide a brief survey of multi-agent systems architectures, with a focus on combat simulations, and a survey of the cognitive literature on human situation awareness and tactical decision-making. Then we describe a new computational model for command-and-control in multi-agent systems. Primarily, the model focuses on a procedural representation of situation assessment and attempts to capture the decisions regarding information-gathering and information-management activities, though we also discuss how to integrate these activities with other on-going aspects of C2 (mission, threat-handling, etc.) using prioritization. We then discuss an approach to extending this procedure to a team task, which should automatically generate the interactions and information flow necessary to simulate distributed situation awareness.

ONLINE: <http://hdl.handle.net/100.2/ADA466787>

The CoAX demonstration was an international effort between the Defense Advanced Research Projects Agency (DARPA), Defense Science Technology Office (DSTO), Defense Scientific Technical Laboratory (DSTL), and The Technical Cooperation Program (TTCP). The CoAX participants included the Department of Defense (DoD) laboratories, industry and academia that were brought together with the purpose of showcasing the power of software agents to rapidly construct and maintain a coalition Command and Control Structure. The CoAX was conducted through numerous Technology Integration Experiments (TIEs). The purpose of the TIEs was to pair up participants in the demonstration in order to leverage the

synergistic effects of software agent technology being developed by each participant. The Naval Research Laboratory (NRL), University of Maryland (UMD) and University of Texas (UTEX) participated in a TIE which demonstrated the integration of the NRL Global Command and Control System Maritime (GCCSM) surrogate with the Interactive Maryland Platform for Agents Collaborating Together (IMPACT) system and UTEX's Adaptive Agent Organization and Information-Trust-Evaluation agents. This paper will describe the CoAX 30-month experiment and the TIE that was conducted between NRL, UMD, and UTEX to support the experiment. We will conclude with a brief summary and areas for future investigation.

**Distributed Simulation Run Automation Capability for the Navy PRA Testbed**

Trbovich, Sarah; Reading, Richard; Photinos, William; Malone, Shala; Jan 2007; 7 pp.; In English; Original contains color illustrations

Report No.(s): AD-A466815; 07S-SIW-076; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA466815>

The Navy Probability of Raid Annihilation (PRA) Testbed implements HLA federated simulations of ship combat system elements against independent, reactive threat raids in a common environment to formulate an overall combat system assessment. The PRA Testbed is a cornerstone of the U.S. Navy Ship Self Defense Test & Evaluation (T&E) Enterprise. The LPD 17 ship class is the first to implement a PRA Testbed baseline as a formal component of ship class OT&E. Products and lessons from the LPD 17 baseline are being transitioned to multiple ship classes including DDG 1000, LHA 6, LCS, and CVN 21. The PRA Testbed LPD 17 baseline is deployed as a secure, geographically distributed, time managed federation with three nodes: the U.S. Naval Research Laboratory (NRL) Washington, DC; Johns Hopkins University (JHU) Applied Physics Laboratory (APL) Laurel, MD; and Naval Air Warfare Center (NAWC) Weapons Division China Lake. Federation execution is controlled centrally from the NRL node. The PRA Testbed LPD 17 baseline federation is required to conduct nearly 2000 simulation test events during the course of LPD 17 PRA Assessment. Each scenario execution involves computation intensive calculations that progress much slower than real time. The development team is using Run Automation software, dubbed OneButtonStart to automate batch runs of the federation from a single control node. OneButtonStart is an important part of the LPD 17 testing program because it dramatically reduces manning requirements and takes advantage of all available computer time to minimize schedule. Yet, there are numerous challenges to implementing automated control of a classified, non-realtime federation that includes both legacy and new software. In this paper, we describe the Run Automation capability and how it will be used in the PRA Testbed LPD 17 baseline. We also share lessons learned in automating runs for a secure, geographically distributed, time-managed simulation with multiple nodes.

**Conceptual Modeling for the Probability of Raid Annihilation (Pra) Testbed**

Reading, Richard; Trbovich, Sarah; Malone, Shala; Jan 2007; 9 pp.; In English; Original contains color illustrations

Report No.(s): AD-A466816; 07S-SIW-074; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA466816>

A cornerstone of the Navy T&E Enterprise is the Probability of Raid Annihilation (PRA) Testbed. The Navy PRA Testbed implements HLA federated simulations of ship combat system elements against independent, reactive threat raids in a common environment to formulate an overall combat system assessment. The LPD 17 ship class is the first to implement a PRA Testbed baseline as a formal component of ship class OT&E. Products and lessons from the LPD 17 baseline are being transitioned to multiple ship classes. While the PRA Testbed LPD 17 baseline adheres to the Federation Development and Execution Process (FEDEP), conceptual modeling is a particularly distinctive feature. The Systems Engineering Concept Model (SECM) is an extension of the Conceptual Model product of FEDEP step 2 that broadens the impact of conceptual modeling in the SE process and specifically supports federation Verification, Validation, and Accreditation (VV&A). Accreditation of the PRA Testbed for LPD 17 operational testing is a challenging proposition. The purpose of the SECM is to provide a central documentation tool for stakeholders to view the Testbed capabilities and limitations from multiple perspectives. The SECM is divided into 3 views, which generally follow sequential stages in Testbed system engineering: System View, Model View, and Federate View. Each view is intended to reveal, address, and resolve a particular class of issues for PRA Testbed accreditation. Explanation of engineering judgments is inclusive to the documentation. The SECM creates a framework of deliberate intent for making decisions and accountability for limits in capability. The SECM also establishes a persistent

documentation product that feeds the corporate knowledge base. Many lessons have been learned about conceptual modeling. In this paper, we share those lessons and describe how we overcame the trials and tribulations of documenting engineering level details in the SECM for the PRA Testbed LPD 17 baseline.

ONLINE: <http://hdl.handle.net/100.2/ADA467022>

One of the bottlenecks in molecular simulations is to treat large systems involving electrostatic interactions. Computational time in conventional molecular simulation methods scales with  $O(N^2)$ , where  $N$  is the number of atoms. With the emergence of new simulation methodologies, such as the cell multipole method (CMM), and massively parallel supercomputers, simulations of 10-million atoms or more have been performed. In this work, the optimal hierarchical cell level and the algorithm for Taylor expansion were recommended for fast and efficient molecular dynamics simulations of three-dimensional (3D) systems. CMM was then extended to treat quasi-two-dimensional (2D) systems, which is very important for condensed matter physics problems. In addition, CMM was applied to grand canonical ensemble Monte Carlo simulations for both 3D and 2D systems. Under the optimal conditions, our results show that computational time is approximately linear with  $N$  for large systems, average error in total potential energy is about 0.05% for 3D and 0.32% for 2D systems, and the RMS force error is 0.27% for 3D and 0.43% for 2D systems when compared with the Ewald summation.

ONLINE: <http://hdl.handle.net/100.2/ADA467032>

We describe how a virtual node abstraction layer can be used to coordinate the motion of real mobile nodes in a region of 2-space. In particular, we consider how nodes in a mobile ad hoc network can arrange themselves along a predetermined curve in the plane, and can maintain themselves in such a configuration in the presence of changes in the underlying mobile ad hoc network, specifically, when nodes may join or leave the system or may fail. Our strategy is to allow the mobile nodes to implement a virtual layer consisting of mobile client nodes, stationary Virtual Nodes (VNs) for predetermined zones in the plane, and local broadcast communication. The VNs coordinate among themselves to distribute the client nodes between zones based on the length of the curve through those zones, while each VN directs its zone's local client nodes to move themselves to equally spaced locations on the local portion of the target curve.

**Shared Situational Awareness Environment for Tactical Level Humanitarian Emergency Operations**

Barge, Hezekiah; Davis, Mark S; Jun 2003; 50 pp.; In English; Original contains color illustrations

Report No.(s): AD-A467097; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA467097>

The Naval Postgraduate School (NPS) is exploring key factors that affect how teams, particularly distributed teams, develop shared situational awareness (SSA) in a Complex Humanitarian Emergency (CHE) environment. This research develops the foundation for deploying the following: Network-Centric Human-Agents in CHE habitats, an integrated environment of mobile operators, deployable wireless networks, sensors, collaborative tools, and multiagent systems. We experimentally explored how to integrate a deployable wireless network with peer-to-peer (P2P) collaborative tools and situational awareness agents. This was done to establish shared awareness of the events that were taking place during the CHE

operation. The major findings include the following: a better understanding of the critical role of peer-to-peer communication, network performance monitoring, and innovative agent-based architecture for maintaining seamless access to the remote data bases and expert sources.

Report No.(s): AD-A467170; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA467170>

The goal of this work is to explore techniques for making today's software, which is largely written in type-unsafe, low-level languages such as C, as reliable and trustworthy as code written in type-safe, high-level languages such as Java or ML. Type-safe languages automatically block or prevent common vulnerabilities such as buffer overruns, format string attacks, and overflow attacks which are all too common in today's critical software infrastructure. To this end, we have implemented a prototype compiler called Cyclone, which provides the benefits of type safety through a combination of static analysis, programmer annotations, and run-time checks. Particular emphasis has been placed on scalable, static analyses to ensure that programmers can retain good performance and high reliability.

ONLINE: <http://hdl.handle.net/100.2/ADA467190>

In this paper we describe a software system called Tracker being developed under the DARPA Active Templates research program. Tracker allows users to define and use templates to support problem solving, e.g., crisis action mission planning. Our premise is that templates simplify problem solving by (a) providing flexible ways to make and record decisions, (b) reminding you to perform certain tasks, (c) encapsulating experience and domain knowledge, and (d) constraining task specification and language. In our vision, templates, when filled in and linked, can represent entire plans. In other words, the overall plan context may be embodied in a pre-existing template model that specifies how other more detailed templates are associated with each other. For example, the IRS tax forms are a collection of templates. The detailed templates that make up the IRS tax forms describe tasks or decision points and their alternatives. There is the main 1040 form, and then many schedules (detail templates) that are filled in as needed. The tax templates that make up the IRS tax forms work since each tax form is designed to collect data relative to some aspect of taxation as defined in a model that embodies the laws governing tax collection.

Report No.(s): AD-A467439; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA467439>

A 1995 vision statement for Air Force Modeling and Simulation highlighted the need for a Joint Synthetic Battlespace

(JSB); an environment in which warfighters can train using real-world equipment, while ‘virtually’ immersed in a realistic contingency or wartime environment. The Scientific Advisory Board has recommended the need for military information processes to be more predictive, thus enabling commanders at the strategic, operational and tactical levels to anticipate rather than react: this is referred to as ‘Predictive Battlespace Awareness (PBA).’ This ‘predictive’ capability must link national and military ISR platforms and bring a warfighting focus to the entire C2 enterprise. Although the term PBA is widely used, the pervasive cultural change required has not taken root. The problems faced by our decision makers have not changed much over time, namely: inability to accurately predict the course of action of an adversary or the inability to adequately ‘visualize’ the battlespace in order to make better informed decisions. This paper provides a top level view of PBA and explores the utility of a Joint Synthetic Battlespace that would provide the ‘core’ functionality of the PBA. The required information technologies to fully realize a JSB within the total PBA construct will also be discussed.

ONLINE: <http://hdl.handle.net/100.2/ADA467518>

The concept of Network-centric Warfare is powerful in terms of emphasizing the importance of accessing information by the warfighters, but just accessing information is not sufficient for future warfare. To achieve information superiority, a Warfighter-centric approach is required in addition to the Network-centric concept. In a Warfighter-centric approach, we focus on both the individual warfighter’s informational needs and the needs of decision support information flow across all echelons and services for effective achievement of decisive operations. The architecture and mechanism of Intelligent Nodes allows both the Network centric and Warfighter-centric paradigms to merge. This paper describes a multidisciplinary methodology for developing intelligent software assistants. Such assistants will continue to evolve during the military training, exercises and combat, to learn the informational needs of the individual warfighter and combat groups. This symbiotic aggregate of man and computer we call Intelligent Nodes [Dawidowicz E., et. al. 2002, and Dawidowicz E., 2001]. Such devices will communicate with humans using a Natural Language such as English and possess faculties capable of comprehending ; the commander’s intent, doctrine, mission execution process; assist in course of action development and analysis, planning and collaboration. These faculties are critical in developing the Common Operational Picture (COP), Common Relevant Operational Picture (CROP) and aiding commander’s Situational Understanding (SU). User biometric identification for system access authorization, network security, spoofed information identification and filtering are additional benefits of Intelligent Nodes.

**Use of Modeling and Simulation (M&S) in Support of the Quantitative Assessment of FORCENet Systems and Concepts**

Stevens, William K; Jun 2003; 43 pp.; In English; Original contains color illustrations

Contract(s)/Grant(s): N00039-01-D-2202

Report No.(s): AD-A467591; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA467591>

The work to be described in this paper addresses recent advances in the application of modeling and simulation (M&S) techniques to the problem of quantifying the force-level warfighting value-added of FORCENet and related doctrine and systems in the context of realistic scenarios including Operational War Plans (OPLANs). The M&S activities discussed in this paper have been conducted in support of operational experiments and wargames, as part of analyses in support of CINC-level commands, and as a part of analyses in support of certain specific acquisition programs having the requirement to demonstrate synergy with ongoing U.S. Department of Defense (DoD) and U.S. Navy FORCENet and Network Centric Warfare (NCW) improvement programs. Lessons-learned concerning the challenges associated with representing information technology (IT) infrastructure improvements along with required FORCENet/NCW warfare process re-engineering (WPR) initiatives will be presented. An iterative cycle of WPR initiative formulation and evaluation is often a required part of an assessment of the force-level warfighting value-added of specific FORCENet/NCW improvements. This paper will also describe the extent to which the M&S approaches employed in the analyses alluded to above are consistent with the OSD (C3I) Network Centric

Warfare Conceptual Framework. This framework provides a basis for making quantitative assessments of the degree to which specific Mission Capabilities Packages (MCPs), IT infrastructure improvement initiatives, and associated warfighting process improvements yield operational value-added in the manner envisioned by the tenants of NCW.

**Suitability of Agent Technology for Military Command and Control in the Future Combat System Environment**

Potok, Thomas; Phillips, Laurence; Pollock, Robert; Loebel, Andy; Jun 2003; 41 pp.; In English; Original contains color illustrations

Report No.(s): AD-A467592; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA467592>

The U.S. Army is faced with the challenge of dramatically improving its war fighting capability through advanced technologies. The focus of this paper is to assess the novelty and maturity of agent technology for use in the Future Combat System (FCS). FCS will rely on networked command and control (C2) to transform from the historically centralized C2 function. Achieving a networked C2 capability will require breakthroughs in current software technology. We have developed a set of software requirements for FCS based on military requirements for this system. We have then evaluated these software requirements against current computer science technology. From this analysis we find that existing technologies will not likely be sufficient to meet the networked C2 requirements of FCS due to limitations in scalability, mobility, and security. However, agent technology provides a number of advantages in these areas, mainly through much stronger messaging and coordination models. These advantages have the potential for significant improvements in scalability, mobility, and security. We believe that agent technology has the capability to support most of the networked C2 requirements of FCS. However, we would recommend proof of principle experiments to verify the theoretical advantages of this technology in an FCS environment.

Report No.(s): AD-A467620; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA467620>

Seeking advances in infrastructure for e-activities over networks requires the projection of the utility (either profit or satisfaction) of such activities for organizations and individuals. Studies of defense-information systems that manage spatial- and time-dependent data for which we have assumed a decision process applied by cybernetic models with a bi-dimensional function for effector's effectiveness revealed emergent properties that must be considered in defining future e-activities over dedicated networks, intranets and the Internet. We address two aspects of improving the value of shared information for spatial- and time-dependent data for synchronized actions: (1) architecture changes, and (2) strategy adaptation to dynamic data for geographically distributed fix or mobile participants.

Report No.(s): AD-A467706; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA467706>

This paper reports on the methodologies used and the findings of the research conducted by the Enterprise Social Learning Architecture (ESLA) Task into learning processes occurring in a strategic headquarters within the Australian Defence Organisation (ADO). The research focused on identifying processes and strategies that enable social learning in view of the socio-technical environment within which people work and learn. It is recognised that people are indeed essential components of the ADO s capability; this people capability is dependent on effective force structure and the forces' level of preparedness.

Similarly, effective social learning capability is also dependent on satisfactory force structure and in itself is a form of 'people' preparedness. Therefore, the identified social learning enablers have been assigned to three categories: Force Structure, Capability and Preparedness. In particular, the paper focuses on teambuilding strategies that facilitate knowledge generation and sharing. The enabling processes and strategies discussed are: team leadership, communication climate, impact of recognition and reward on team building as well as team socialising, and finally, goal alignment. The findings strongly suggest that there is a closely coupled relationship between effectiveness of these enablers and knowledge sharing and generation.

**An Experimental 3-D Framework to Support C2**

Callihan, Hubert D; Balash, John A; Jun 2002; 15 pp.; In English; Original contains color illustrations

Report No.(s): AD-A467718; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA467718>

Applications that are hosted in a web framework realize many advantages: familiarity to the user, captive environments, rapid development, mature toolsets, and reduced development time and cost. More recently, applications based on web 3-D technologies are showing considerable promise in C2. Because C2 applications tend to be very complex, casting them in a 3-D framework simplifies them considerably due to unlimited rapid drill down, visual realism, and the capacity to support C2 decision-making. We present an experimental scenario using a 3-D web-based framework to show the broad capabilities of interactive 3-D to support C2. This scenario addresses communication network infrastructure categories such as dynamic discovery and configuration, device connectivity, network performance, and device performance in a live demonstration. Although the domain of interest in this experiment targets network management in particular, we will demonstrate the ease with which this framework can be extended to many other domains of interest relevant to C2. The overall benefits realized will be shown as (1) improved understandability through a variety of visual contexts, (2) improved decision-making through manageable interfaces, (3) rapid application development using COTS tools integrated into the framework, and (4) potential for multiple collaborators to cooperate in a shared 3-D workspace.

**Course of Action Analysis for Coalition Operations**

Wagenhals, Lee W; Reid, Tom; Smillie, Robert J; Levis, Alexander H; Jun 2001; 16 pp.; In English

Contract(s)/Grant(s): N66001-00-M-0724; N66001-99-D-0050

Report No.(s): AD-A468175; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA468175>

A prototype Decision Support System for Coalition Operations (DSSCO) is being developed by SPAWAR Systems Center San Diego to support the Operations Planning Team (OPT) of the Commander in Chief, USA Pacific Command. The goal of DSSCO is to apply and integrate organizational design concepts and decision support technologies in planning and executing multi-national coalition operations. Within DSSCO, there is a module based on CAESAR II focused on the analysis of alternative Courses of Action (COAs). The capabilities of DSSCO and the CAESAR II / COA module were demonstrated in November 2000 at USCINCPAC. Subject matter experts (SMEs) collaborated in a distributed manner in developing the structure (the relationships between causes and effects) and the data of an Influence Net model representing a key outcome in a hypothetical military operation other than war (MOOTW) in a South Pacific scenario. The influence net was implemented in the CAESAR II / COA module, and sensitivity analysis was used to determine which actions could contribute substantially in achieving the desired effects. Those selected actions formed the basis for the construction of COAs, namely, time-phased sequences of these events. The CAESAR II / COA module was used to illustrate the impact of time-coordinated actions of the coalition partners to the decision-makers.

Report No.(s): AD-A468176; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA468176>

Software agents can be viewed as semi-autonomous entities which help people cope with the complexities of working collaboratively in a distributed information environment. This paper describes the research that DERA is carrying out into Software Agents for use in Command Systems and the collaborative work with the 16 partners of an international Coalition Agents Experiment. Specifically, the paper aims to show that using software agent-based C2 frameworks is a useful way of dealing with the complexity of real-world problems such as supporting agile and robust Coalition operations and enabling interoperability between legacy or previously incompatible systems. In addition, Agent-enabled 'grids' can be used to rapidly integrate a wide variety of agents and infrastructures, with domain management services structuring agent relationships, limiting their behaviors and enforcing Coalition policies.

**An Enterprise Identifier Strategy for Global Naming Across Arbitrary C4I Systems**

Chamberlain, Sam; Jun 2001; 16 pp.; In English; Original contains color illustrations

Report No.(s): AD-A468177; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA468177>

In any information system, a critical feature is the ability to link together disparate pieces of data and information via relationships. One way to greatly facilitate this task is to provide a common identification technique that allows data and information items be conveniently and uniformly referenced. This can be accomplished by standardizing one field across disparate data sources. Perhaps no simpler enhancement can produce such a huge benefit with as little intrusion into legacy systems. This is the objective of enterprise identifiers. If data can be globally identified using a common scheme, then one can spontaneously reference, and ultimately, plug and play disparate, arbitrary pieces of information without prior coordination.

**Classifying C2 Decision Making Jobs Using Cognitive Task Analyses and Verbal Protocol Analysis**

Gordon, Thomas R; Covert, Michael D; Riddle, Dawn L; Miles, Donald E; Hoffman, Kimberly A; King, V , Thomas S; Elliot, Linda R; Schifflett, Samuel G; Chaiken, Scott; Jun 2001; 22 pp.; In English

Report No.(s): AD-A468188; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA468188>

Weapons Directors (WDs) are cognitively complex, decision making jobs involving air traffic control of friendly assets and tracking hostiles from an airborne platform. Three cognitive task analyses (CTAs) were reviewed for WD jobs on the Airborne Warning and Control System aircraft. 230 tasks were derived from this 'meta-CTA.' Nine performance categories emerged, representing a cognitive-behavioral model of the WD job domain. To test the model, 38 WDs were observed participating in a computer simulation exercise during which they verbalized aloud their thoughts. These verbal protocols were recorded, transcribed, and reduced to task statements. Using a checklist derived from the meta-CTA, subject matter experts classified each of the statements as either primarily cognitive in nature, behavioral in nature, or a combination of the two. Classifications were analyzed to determine job performance differences between experienced and inexperienced WDs. Verbal protocol analysis presents the opportunity to integrate cognitive task analyses into a job model, yielding a new classification system based on a cognitive-behavior approach. This typology for describing jobs transcends traditional job analysis and has applicability to other complex management jobs involving decision-making, problem-solving, and resource management. More research is needed to validate further the process and identify potential boundary conditions for application.

ONLINE: <http://hdl.handle.net/100.2/ADA468213>

Targeting can be more complicated than just locating a facility or military column. If the target is suspected of having chemical weapons, weather forecasters and armament experts need to work cooperatively to decide how to disable the target without creating chemical fallout that endangers non-combatants or friendly forces. However, this collaboration is complicated by the fact that Air Operation Center's (AOC) functional units are often spatially distributed and have 'hard-wired' communication lines. Additionally, previous combat situations have shown that missions may change during the conflict. This condition may necessitate a change in information dissemination patterns to route information to new users that previously did not require it. The Joint Battlespace Infosphere (JBI) provides the flexible conduit to dynamically handle these changes in information needs.

**Enablers of Self-Synchronization for Network-Centric Operations: Design of a Complex Command and Control Experiment**

Hutchins, Susan G; Kleinman, David L; Hocevar, Susan P; Kemple, William G; Porter, Gary R; Jun 2001; 16 pp.; In English; Original contains color illustrations

Report No.(s): AD-A468216; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA468216>

Modified human decision-making processes are required in addition to new tactics and technology that are also currently under development to enable Joint military forces to operate in a time span that is shorter than an adversary's. Self synchronization is viewed as an essential process within military organizations that can increase speed of command and thus accelerate execution of the mission. This process of self-synchronization is described as the ability of a well-informed force to organize and synchronize complex warfare activities from the bottom up. The organizing principles are unity of effort, clearly articulated commander's intent, and carefully crafted rules of engagement. Self-synchronization is viewed as a mechanism to overcome the loss of combat power inherent in top-down, command-directed coordination that is characteristic of conventional command and control doctrine. The planning that took place to prepare for a complex, command and control, team-in-the-loop experiment, examining self synchronization, is the focus for this paper. The objective of the experiment was to determine the conditions under which self-synchronization can most effectively be achieved. In particular, we discuss the activities that led to formulating the hypotheses for the experiment, and the efforts that were needed to actually run the experiment. These efforts included conducting a pre-experiment seminar game, crafting the scenario, experimental design development, independent variable manipulation, data collection methods and instruments, and simulator software modification. Some initial results and lessons learned will also be discussed.

**Knowledge Based Systems as a Means of Managing Aspects of Datalink Within a Decision Support System for Naval Airborne Early Warning**

Thomas, Michael; Howells, Howard; Oct 2000; 19 pp.; In English

Report No.(s): AD-A468224; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA468224>

The future airborne early warning aircraft to be operated by the Royal Navy will consist of an advanced radar driven mission system that will include a datalink: this Datalink, as well as advanced sensors and an expanded role, will impose additional work on the aircrew that operate in the rear of the airborne early warning (AEW) aircraft. Operating the existing mission system is, under certain conditions, considered by AEW aircrew to be at the upper limits of tolerable workload. The deluge of information from these advanced sensor systems and datalink is likely to impact on the aircrew performance and hence overall system performance. The KBS group of the Defense, Evaluation and Research Agency (DERA) in Farnborough, UK, has been developing Knowledge Based Systems for Decision Support for over a decade. This experience has been applied

to the AEW domain with a high degree of success as demonstrated in a laboratory based concept demonstrator. However, previous work had not accounted for the impacts of the AEW aircraft operating within a digitized battlespace. This paper describes part of a project that was aimed at examining the implications of digitization on the future AEW aircraft and how that would impact the Knowledge Based Decision aids currently being developed. Specifically, the project assessed how datalink would be used and how the information conveyed over datalink could help the aircrew's decisions through greater situation awareness.

Much emphasis has been placed on over-actuated systems for air vehicles. Over-actuating an air vehicle provides a certain amount of redundancy for the flight control system, thus potentially allowing for recovery from off-nominal conditions. Due to this redundancy, control allocation algorithms are typically utilized to compute a unique solution to the over-actuated problem. As the number of control effectors placed on a vehicle increases, the likelihood of the occurrence of control effector interactions increases. For example, deflection of an aerodynamic surface that is upstream of another aerodynamic surface may cause the forces and moments produced by the downstream effector to differ from those produced when the upstream effector is not deployed. Another example can be found on launch vehicles that can use a combination of differential throttles and gimbaled nozzles for attitude control. The effectiveness of gimbaled nozzles are clearly influenced by the engine thrust. The above are examples of the control effector interaction problem. In this work, a method is devised, which utilizes linear programming methods in an iterative framework, to take into account control effector interactions. While nonlinear programming techniques could be directly applied to such problems, the lack of convergence guarantees precludes their use in flight critical systems. The use of linear programming methods is appealing because an optimal solution to each linear programming sub-problem can be determined in a finite amount of time.

**Modeling and Simulation to Support C4ISR Acquisition and Transformation**

Dahmann, Judith; Furness, Zach; Kissin, Sidney; Starr, Stuart; Sep 2002; 14 pp.; In English; Original contains color illustrations

Report No.(s): AD-A467066; No Copyright; Avail.: Defense Technical Information Center (DTIC)

Recently, a C4ISR Information Superiority Modeling & Simulation Master Plan (IS M&S MP) was issued by the Office of the Secretary of Defense (OSD) addressing the application of M&S to all functional areas associated with C4ISR. In the area of acquisition, the C4ISR IS M&S MP called for the following actions: recommend and outline methods for providing improved M&S support to C4ISR acquisition, and provide recommendations of desirable policy changes and initiatives along with metrics. To implement these actions, a workshop was convened on 2-4 April 2002 under the sponsorship of the Office of the Assistant Secretary of Defense (C3I); the Director, Interoperability, Undersecretary of Defense (Acquisition, Technology, & Logistics); and the Director, Defense Modeling and Simulation Office (DMSO). Forty-four subject matter experts from government, industry, and academia were assembled to address the subject. The participants were organized into breakout groups to address C4ISR acquisition by system type (i.e., sensors, communications, C2/information processing) and systems-of-systems. A synthesis panel was convened to identify and summarize the similarities and differences in the findings and recommendations of the other breakout groups. To initiate the deliberations, the breakout groups were provided with a strawman list of M&S capability objectives to support C4ISR acquisition. For each of the major phases in the DoD Directive 5000 on the acquisition of systems, the breakout groups used the strawman list to identify and prioritize key M&S needs (i.e., the cases where critical M&S capability objectives could not be satisfied by the year 2007). This paper summarizes the highest priority M&S needs that were identified by the groups to support the acquisition and transformation of C4ISR systems over

the next 5 years. The findings and recommendations from this workshop will drive DoD's investment in M&S to support the acquisition and transformation of C4ISR systems.

**PCA RAW FABRIC: Architectural Prototyping, Demonstration and Evaluation**

Amarasinghe, Saman; Agarwal, Anant; Feb 15, 2007; 42 pp.; In English

Contract(s)/Grant(s): F29601-03-2-0065; Proj-DARP

Report No.(s): AD-A467085; No Copyright; Avail.: Defense Technical Information Center (DTIC)

This report is the final technical report for the project 'PCA RAW Fabric: Architectural Prototyping, Demonstration, and Evaluation.' This project successfully built and demonstrated a Raw fabric system containing 4 Raw chips, with 3 streaming fabric boards. In addition to the Raw fabric hardware, the project also developed and demonstrated StreamIt: a language and compiler specifically designed for embedded, high performance stream computing on PCA architectures such as Raw. The project also implemented, analyzed and distributed a new PCA benchmark suite called Versabench and a PCA performance metric called Versatility.

**Automating the Shadow Method for Aerosol Optical Depth Retrieval**

Dombrock, Ryan M; Mar 2007; 59 pp.; In English

Report No.(s): AD-A467088; No Copyright; Avail.: Defense Technical Information Center (DTIC)

A new method for remote sensing retrieval of Aerosol Optical Depth was proposed and investigated by Vincent (2006). This shadow-based method uses the radiance difference between shadow and non-shadow regions in QuickBird high resolution commercial satellite imagery to estimate Aerosol Optical Depth. Though the process is initially time-consuming, requiring a high level of user knowledge to accomplish the procedure, great potential exists for further development into a stand-alone operational method for overland retrievals at any location and time. It is the automation of this process in order to make it more operational in nature that is the purpose of this investigation. Knowledge is gained in the realm of predicting shadow location for future times. Specific process automation is applied through computer programming to decrease the computational complexity of the method. Also the physical variations of shadow regions are investigated in terms of their brightness change across various spatial profiles. This study of shadow region variation is termed shadow morphology and seeks to provide a user with optimum radiance sampling regions within an observed shadow region. Through the integration of these automation techniques, a more unified and operationally focused iteration of the shadow method is derived.

**Intrusion Deception in Defense of Computer Systems**

Goh, Han C; Mar 2007; 59 pp.; In English

Report No.(s): AD-A467120; No Copyright; Avail.: Defense Technical Information Center (DTIC)

We investigate deception in response to cyber-intrusion or trespassing on computer systems. We present a Response Framework that categorizes the types of response we can employ against intruders and show how intrusion deception has its place in this framework. To experiment, we put together tools and technologies such as Snort, VMware, and honeynets in a testbed open to attacks from the Internet. We wrote some Snort rules and ran Snort in inline mode to deceptively manipulate packets of attackers. Our results showed that attackers did react to our deceptions in some interesting ways, suggesting that intrusion deception is a viable response to intrusion.

**Velocity Estimation Using Forward Looking Sonar**

Dolbec, Michael R; Mar 2007; 134 pp.; In English

Report No.(s): AD-A467123; No Copyright; Avail.: Defense Technical Information Center (DTIC)

The thesis investigates a method to estimate the forward velocity and heading rate of an autonomous underwater vehicle (AUV). Through relatively new technologies small AUVs are now able to mount a Forward Looking Sonar (FLS) on the vehicle's nose. This can be used for obstacle avoidance and feature based navigation. The sensor can also be used to estimate motion of the AUV, which can be useful for undersea navigation. The thesis focuses on a template matching technique used in computer vision. Two sequential sonar images are compared with the goal of finding the rotation and translation that best correlates the first to the second sonar image. The transformation which maximizes the correlation coefficient is then converted to forward velocity and heading rate through motion analysis. Experimentation shows that the method provides accurate estimates for both the forward velocity and heading rate of the AUV. Accuracy of the estimates for forward velocity was at the limitation of the resolution of the sonar. Using velocities estimated through image processing applied to FLS images entirely with software, the weight and energy resources currently required by standard measurement techniques could be used to increase the vehicles endurance or for additional payload capacity. Another benefit would be the reduction in acoustic and electrical interference with the FLS and side scan sonar, which would improve the vehicle's obstacle avoidance and mine-hunting capability. The vehicle could become more flexible in its capability to support additional roles vice specific missions. This method holds the promise for permitting smaller AUVs with a FLS to navigate undersea more accurately.

**Software Communications Architecture (SCA) Compliant Software Defined Radio Design for Interim Standard 95B (IS-95B) Transceiver**

Ramdat, Upendra; Mar 2007; 165 pp.; In English

Report No.(s): AD-A467134; No Copyright; Avail.: Defense Technical Information Center (DTIC)

The increasing demand for wireless services in both the military and civilian sectors results in the emergence of new communication standards and protocols to support these wireless services. There is a need for modern radio receivers to have the ability to receive and recover multiple wireless signals without the added complexity of additional hardware components. Fortunately, a single radio can accomplish these tasks by using software radio architectures where the radio has the ability to reconfigure itself based on the system it will be interfacing with and the functionalities it will be supporting. These radios are more commonly referred to as software defined radios (SDRs). This thesis focuses on using software radio techniques to design and implement software components for an IS-95B wireless transceiver. Furthermore, these software components were built to comply with regulations specified by the Software Communications Architecture (SCA). The open source core framework tool Open Source SCA Implementation::Embedded (OSSIE) was used to design and build the software components necessary to implement functions of an IS-95B transceiver.

**Boot Camp for Cognitive Systems: A Model for Preparing Systems with Machine Learning for Deployment**

Lange, Douglas S; Mar 2007; 419 pp.; In English

Report No.(s): AD-A467187; No Copyright; Avail.: Defense Technical Information Center (DTIC)

The vision for command and control and information technology capabilities for the future includes the use of machine learning to enable systems to respond to an adapting environment. Currently, our systems and software engineering processes hinder employment of machine learning, because the adaptation it provides runs counter to our notions of stability. Similarly, systems must demonstrate satisfaction of requirements before deployment, rather than learn tasks while on the job. This dissertation introduces new problems for the field of software engineering and discusses an approach for preparing cognitive systems for deployment. The model for cognitive systems being used is from the Personalized Assistant that Learns (PAL) program from the Defense Advanced Research Projects Agency (DARPA). A model for a boot camp for cognitive systems is presented along with a simulated boot camp capability. The simulation was used to experiment with the types of preparation that must be provided in order for a PAL style assistant to succeed in an operational environment. The results, providing thresholds and patterns for knowledge and observability, and the requirement for specific patterns of human use of PAL

assistants, are then used to infer requirements for a boot camp and measures for the prediction of successful employment of the assistant.

Contract(s)/Grant(s): MIPR-N6600106WR00101

Report No.(s): AD-A467197; No Copyright; Avail.: Defense Technical Information Center (DTIC)

On today's battlefield whether in Afghanistan or Iraq, ground combat forces are dealing with an adversary that has embraced the use of computers and electronic devices. Until now, there was no package of consolidated forensic tools available to the ground combat forces with the capability of conducting a quick interrogation of these devices. After a unit has captured a target that possesses electronic devices that require immediate exploitation, the devices are transferred to higher authority. Valuable time is lost locating and capturing associates of the target as the information is sent away to higher authority for analysis. The product of this thesis, Interrogator, was designed to prevent or reduce the time lost by allowing anyone to quickly retrieve data that is stored on a computer. This capability will positively aid a small unit commander's ability to exploit critical vulnerabilities of the enemy in a timely manner and improve the survivability of the unit and the ability to complete their mission.

**Simulating Candidate Missions for a Novel Glider Unmanned Underwater Vehicle**

Seguin, John M; Mar 2007; 140 pp.; In English

Report No.(s): AD-A467375; No Copyright; Avail.: Defense Technical Information Center (DTIC)

Unmanned Underwater Vehicles (UUVs) are becoming ubiquitous in the framework of U.S. Navy operations. According to the U.S. Navy's UUV Master Plan (2004), research and development will expand UUV capabilities that enable diverse roles from Intelligence, Surveillance, and Reconnaissance (ISR) and Mine Countermeasures to Anti-Submarine Warfare (ASW) and Information Operations (IO). However, typical UUVs are severely limited in operational characteristics such as endurance and range which prevents their use conducting certain missions. A novel UUV is currently being designed that is projected to support significantly greater endurance and range characteristics. This UUV is called Seadiver and is being designed by Institute of Engineering Science of Toulon, France with support from Naval Postgraduate School. It is a low-cost glider UUV which generates propulsion not with propellers or jet pumps, but rather by controlling its buoyancy. This method of propulsion is quite efficient and maybe capable of autonomous operation up to 30 days with a range of around 700 nautical miles. A UUV with such endurance and range exposes military missions previously impractical for UUVs especially when used in concert as an array of many UUVs. This thesis creates a simulation using NPS-produced software simulation tools Simkit, Viskit and AUV Workbench that analyzes the capabilities and effectiveness of Seadiver UUVs conducting missions of tactical interest.

**AFRL/IF Technology Transition to the Warfighter via the CAOC-X**

Phister, Jr , Paul W; Patrick, Scott; Humiston, Todd; Plonisch, Igor G; Sep 2002; 7 pp.; In English; Original contains color illustrations

Report No.(s): AD-A467569; No Copyright; Avail.: Defense Technical Information Center (DTIC)

The role of information technologies has played a significant role in conducting military operations since Operation Desert Storm. Over the past ten years, the Air Force Research Laboratory's Information Directorate (AFRL/IF) located in Rome NY has directly supported the warfighter by transitioning critical technologies through the Air Force Command and Control Intelligence, Reconnaissance and Surveillance Center's (AFC2ISRC) Combined Air Operations Center Experimental (CAOC-X). The CAOC-X is part of AFC2ISRC's efforts to rapidly develop and field capabilities critical to the warfighter utilizing the spiral development model of system acquisition. These technologies are designed to support the warfighter through all phases of conflict as well as providing support to various Homeland Defense initiatives. This paper provides a short

summary of each of the various technologies that have been transitioned since the CAOC-X's inception in 2000 as well as some near term candidates for transition in the future. The technologies discussed are: Broadsword, Adaptive Sensor Fusion, Cognitive Desktop Manager, Web-enabled Timeline Analysis System (WebTAS), Information Support Server Environment (ISSE) Guard, Trusted Transfer Agent (TTA), Master Caution Panel (MCP), and lastly, the Joint Targeting Toolbox (JTT) efforts that AFRL/IF has successfully transferred to the warfighter through the CAOC-X at Langley AFB, VA.

**Conditions for Achieving Network-Centric Operations in Systems of Systems**

Fisher, David A; Meyers, B C; Place, Pat; Jan 2007; 40 pp.; In English; Original contains color illustrations

Contract(s)/Grant(s): FA8721-05-C-0003

Report No.(s): AD-A467575; CMU/SEI-2007-TN-003; No Copyright; Avail.: Defense Technical Information Center (DTIC)

The advantages of systems of systems -- such as the ability to adapt to unanticipated and unforeseen situations, eliminate single points of failure, and remain continuously operational while being dynamically updated -- guarantee their increasing importance to military and commercial environments. The advent of network-centric systems has served only to accelerate the already prevalent move toward systems of systems. At the same time, network-centric systems and systems of systems are proving difficult to acquire, develop, test, and operate. Many of them are abandoned before they can be fielded, and fielded systems often fail to satisfy their objectives -- demonstrating cost and schedule overruns in their development and sometimes catastrophic failures in operation. The increasing disparity between the normative (but nonfactual) assumptions that underlie current practices and tools used in the acquisition, development, evolution, and operation of systems and the realities of actual systems of systems contributes to those problems. Effective practices and tools for the acquisition, development, and operation of systems of systems have not yet been developed. Suggesting a context in which those practices and tools can be developed, this technical note proposes necessary conditions -- statements of what the desired future state should be -- in six areas that influence the effectiveness of network-centric systems and systems of systems: (1) social and cultural environment, (2) legal and regulatory framework, (3) management practices, (4) governance procedures, (5) engineering practices, and (6) technology base.

**Topics in Interoperability: Structural Programmatics in a System of Systems**

Smith, II, James D; Oct 2006; 29 pp.; In English; Original contains color illustrations

Contract(s)/Grant(s): FA8721-05-C-0003

Report No.(s): AD-A467576; CMU/SEI-2006-TN-037; No Copyright; Avail.: Defense Technical Information Center (DTIC)

This technical note presents a case study on how choices of structural programmatics (e.g., hierarchical or peer-to-peer organization, centralized or decentralized execution) affect the ability to achieve programmatic interoperability in the context of large, complex systems of systems. Key systems-of-systems concepts and definitions are introduced and explored through the case study. In addition, this report illustrates the pitfalls of focusing on only one aspect of a problem and discusses the need to balance management's desires for control with the realities of systems-of-systems programmatics. The report also introduces an alternative to conventional program management practice that addresses the pitfalls previously identified.

**System-of-Systems Governance: New Patterns of Thought**

Morris, Ed; Place, Pat; Smith, Dennis; Oct 2006; 25 pp.; In English; Original contains color illustrations

Contract(s)/Grant(s): FA8721-05-C-0003

Report No.(s): AD-A467577; CMU/SEI-2006-TN-036; No Copyright; Avail.: Defense Technical Information Center (DTIC)

Systems of systems introduce complications for information technology (IT) governance because their individual system

components exhibit considerable autonomy. This technical note examines the ways in which six key characteristics of good IT governance are affected by the autonomy of individual systems in a system of systems. The characteristics discussed are as follows: (1) collaboration and authority, (2) motivation and accountability, (3) multiple models, (4) expectation of evolution, (5) highly fluid processes, and (6) minimal centrality. This report examines each characteristic in detail and, where possible, provides guidance for the practitioner.

**A Distributed Parallel Processing System for Command and Control Imagery**

Spetka, Scott E; Ramseyer, George O; Fitzgerald, Dennis; Linderman, Richard E; Sep 2002; 8 pp.; In English  
Report No.(s): AD-A467654; No Copyright; Avail.: Defense Technical Information Center (DTIC)

Many modern command and control applications are driven by imagery, and imagery, in general, may originate from diverse geographically distributed sources. A rapid increase in image sizes and processing capabilities has resulted from improved hardware for collection and display. Moreover, techniques for parallel processing are keeping pace with military requirements by harnessing powerful parallel processors to facilitate the analysis of images. In addition, tools for distributed processing are under development that can be used to coordinate the processing effort across a network of parallel processing systems. This paper describes a system that can be used to request image analysis over distributed parallel processing facilities, and integrate the results into command and control systems.

**Distributed Computing and Collaboration Framework (DCCF)**

Putnam, Cheryl D; Duffy, LorRaine; Sep 2002; 12 pp.; In English; Original contains color illustrations  
Report No.(s): AD-A467657; No Copyright; Avail.: Defense Technical Information Center (DTIC)

The Distributed Computing and Collaboration Framework has been developed by the Space and Naval Warfare Systems Center, San Diego (a Naval research and development facility), under the sponsorship of the Office of Naval Research. The focus of the effort is to provide superior performance in 'low bandwidth-high latency network conditions,' a hallmark of Naval operational environments. The software development includes a variety of mechanisms to manage and reduce latencies, with emphasis on ensuring effective, real-time collaboration at the operational user level and efficient use of limited bandwidth channels at the network level. This paper will describe an initial software development package of the peer-to-peer architecture design requirements, exploiting a transport layer (TCP/IP) protocol. This package will support information distribution and search across multiple enclaves using peer-to-peer data models, as well as models of redundancy for robustness across networks composed of a mix of wired and wireless channels. The software was tested in a ship-to-shore, ship-to-ship, and ship-to-submarine paradigm to verify that the initial design met documented Navy bandwidth standards. Results of the analysis showed this initial software to be within standards constraints. The authors provide a detailed presentation of their Collaboration Evaluation Laboratory (and methodology) that they have used to manage their development and transition efforts.

**Experiments with the Sun Java Real-Time System -- Part 2**

Auguston, Mikhail; Cook, Thomas S; Drusinsky, Doron; Michael, James B; Otani, Thomas W; Shing, Man-Tak; May 11, 2007; 24 pp.; In English

Contract(s)/Grant(s): MD7080101P0630

Report No.(s): AD-A467836; NPS-CS-07-005; No Copyright; Avail.: Defense Technical Information Center (DTIC)

In the authors' first report on the Sun Java Real-Time System (RTS), they concluded that it is preferable to use real-time Java threads that use heap memory rather than no-heap real-time threads (NHRTTs) for the Global Integrated Fire Control

System (GIFC) due to the difficulty of writing correct Java programs using NHRTTs. However, they also found that such an architecture could not be implemented using RTS 1.0. Experiments with the RTS 2.0 alpha release (August 2006) showed that it supports the real-time garbage collector (RTGC), and they used it to explore viable software architectures for the GIFC software. Although the alpha version of RTS 2.0 incorporated a number of improvements over RTS 1.0, its RTGC fell short of their expectations and needs. In this second report, they describe the results of their study of the RTS 2.0 beta release (December 2006), which includes a new RTGC. They performed a number of experiments to determine whether the improved RTGC would result in better software architecture for the GIFC -- a component of the C2BMC element of the Ballistic Missile Defense System (BMDS). Their experiments showed that the new RTGC performed in a satisfactory manner and has met their expectations. They also found that it is possible to use only the real-time Java threads that use heap memory for the GIFC software. SUN RTJ 2.0 gives programmers more control over the priority of the garbage collection. The authors developed a real-time monitor design pattern to support the implementation of time-constrained computations that use heap memory, and a methodology to determine the RTS run-time parameters (thread priorities, memory usage, process load, and task deadlines) necessary for the timely execution of these time-constrained computations.

**Automatic Generation of Best Emergency Routes and Procedures on a Brazilian Frigate**

Sicuro, David L; Rowe, Neil C; Jun 2000; 9 pp.; In English

Report No.(s): AD-A467862; No Copyright; Avail.: Defense Technical Information Center (DTIC)

We describe prototype software we have written that addresses the serious problem of management of damage control on naval vessels. Human reasoning and judgment may be strongly affected by stress and panic when several simultaneous events occur in a damaged-ship environment. Thus it would be helpful in times of emergency to dispassionately calculate the best courses of action to follow and suggest them to personnel. We describe two tested modules for the decision-aid system of the new Niteroi-Class Frigate Damage Control System project: an emergency-route generator for people and casualties, and a smoke-extraction-procedure generator. Our modules gather and organize sensor data and reports about rooms, gateways and equipment. They reason automatically to determine the best routes and procedures, and can present the damage-related information in a concise manner to users both in the command center and throughout the ship. This system is implemented as an expert system using the CLIPS shell. The ship is represented as a graph where the compartments are nodes and the doors and hatches are the edges between them; costs reflect the difficulty in passing from a compartment to another. For finding emergency routes for people, a cost-minimizing search is done using the current ship data. A different search is done for smoke extraction to determine routes for ventilation of the smoke, with processing that checks conditions and fills in details.

**Dataflow Integration and Simulation Techniques for DSP System Design Tools**

Hsu, Chia-Jui; Jan 2007; 224 pp.; In English; Original contains color illustrations

Contract(s)/Grant(s): DAAH01-03-C-R236

Report No.(s): AD-A468090; No Copyright; Avail.: Defense Technical Information Center (DTIC)

System-level modeling, simulation, and synthesis using dataflow models of computation are widespread in electronic design automation (EDA) tools for digital signal processing (DSP) systems. Over the past few decades, various dataflow models and techniques have been developed for different DSP application domains; and many system design tools incorporate

dataflow semantics for different objectives in the design process. In addition, a variety of digital signal processors and other types of embedded processors have been evolving continuously; and many off-the-shelf DSP libraries are optimized for specific processor architectures. To explore their heterogeneous capabilities, we develop a novel framework that centers around the dataflow interchange format (DIF) for helping DSP system designers to integrate the diversity of dataflow models, techniques, design tools, DSP libraries, and embedded processing platforms. The dataflow interchange format is designed as a standard language for specifying DSP-oriented dataflow graphs, and the DIF framework is developed to achieve the following unique combination of objectives: (1) developing dataflow models and techniques to explore the complex design space for embedded DSP system; (2) porting DSP designs across various tools, libraries, and embedded processing platforms; and (3) synthesizing software implementations from high-level dataflow-based program specifications.

**C4I-Simulation Interoperability Using the DII COE and HLA**

Layman, Gene; Daly, John; Furness, Zach; Womble, Jennie; Jun 2001; 9 pp.; In English

Report No.(s): AD-A468266; No Copyright; Avail.: Defense Technical Information Center (DTIC)

Technologies and methods have been developed within C4I systems that permit them to function as federates using the High Level Architecture (HLA). The HLA Runtime Infrastructure (RTI) has been shown to run successfully on C4I system hardware that is based on the Defense Information Infrastructure Common Operational Environment (DII COE). The most prominent example to date has been the operation of the RTI with the Global Command and Control System (GCCS) and GCCS/Maritime that both utilize the DII COE. The GCCS HLA interface has been used successfully with simulations such as the Joint Theater Level Simulation (JTLS), the Navy Simulation System (NSS), and the Pegasus Federation. These federations span the range of potential military applications from training, to experimentation, planning, and course of action (COA) analysis. This paper provides an overview of the various federation applications in which GCCS has been used to date, and also discusses the benefits of using HLA and the DII COE to improve C4I-Simulation interoperability.

**Development and Assessment of a Complete ATR Algorithm Based on ISAR Euler Imagery**

Baird, R G; Nixon, W E; May 2007; 13 pp.; In English

Report No.(s): AD-A468361; No Copyright; Avail.: Defense Technical Information Center (DTIC)

The Euler decomposition, when applied to the polarization scattering matrix, attempts to extract phenomenological information about the scattering target. Because the Euler parameters constitute a more physically relevant set of parameters than the traditional HH-VV ISAR representations, they have potential to improve ATR performance. The Euler parameter's usefulness in target recognition, however, is effected by several layers of signature variability. Unfortunately, many of the variability layers are often omitted in a typical ATR study. A complete ATR algorithm was therefore developed that allows for all layers of variability and requires no previous knowledge of the target's position, orientation, or average reflectivity. The complete ATR algorithm was then used to assess the effectiveness of Euler ISAR imagery in target recognition when all layers of variability are considered. The general approach and sub-methods used to construct the complete ATR system will be presented, including the methods to determine the targets orientation, registration, and to compare it to a library of pre-rendered target images. Finally, the performance of the Euler parameters in target recognition using the complete ATR algorithm will be presented.

**A Methodology for End-to-End Evaluation of Arabic Document Image Processing Software**

Herceg, Paul M; Ball, Catherine N; Jun 2006; 7 pp.; In English; Original contains color illustrations

Contract(s)/Grant(s): W15P7T-07-C-F600; Proj-0707G01Z

Report No.(s): AD-A468394; MP-06W0000108; No Copyright; Avail.: Defense Technical Information Center (DTIC)

This paper describes a methodology for end-to-end evaluation of Arabic document image processing software. Various software solutions have been proposed for digitization and understanding of noisy, complex Arabic document images.

Optical-character-recognition-based (OCR-based) solutions have been available for decades; however this technology is often tailored to the most common document image type: clean, monolingual documents. Real-world documents often involve multiple languages, handwriting, logos, signatures, pictures, stylized text, and other document aspects. Real-world documents involve noise introduced by document aging, reproduction, or exposure to environment factors. Document image processing solutions are maturing to deal with such complexities. Such systems include image clean-up algorithms and page segmentation, followed by various recognition or digitization algorithms: OCR, handwritten word recognition (HWR), logo identification, signature identification, sub-image or picture identification. Indexing digitized document renditions into a search engine enables ad hoc querying of the collection. Some researchers have proposed semi-automation, a process in which human readers interpret complex documents and record a spoken rendition; the audio recordings are then processed by a spoken document retrieval (SDR) system, employing automatic speech recognition (ASR) for digitization and an information retrieval solution to enable ad hoc queries. To handle foreign language, machine translation may be included in any of the aforementioned document image processing systems. This array of approaches results in widely varying performance. This paper discusses a methodology for evaluating the end-to-end retrieval performance of these systems: the ad-hoc use case. The methodology can be easily tailored to other languages, and to other document formats (e.g., audio and video).

**Use of Information Technology to Develop a Collaborative Decision Support System for Command and Control**

Hutchins, Susan G; Kemple, William G; Poirier, John; Hocevar, Susan P; Kleinman, David L; Sovereign, Michael G; Jun 2001; 19 pp.; In English; Original contains color illustrations

Report No.(s): AD-A468438; No Copyright; Avail.: Defense Technical Information Center (DTIC)

The need for rapid access to current, relevant, and accurate information is at an all-time premium -- especially for military operations. Many new Information Technology (IT) Tools were introduced to facilitate these information-related interactions in the Global Wargame 2000, held at the Naval War College, in Newport, RI. A web-based architecture, called the Wargame Information Grid System (WIGS), and a collaborative planning and operational environment, the Information Work Space (IWS), provided an alternative means to communicate, collaborate, and share information among decision makers than is seen in today's current operational environments. In addition to WIGS and IWS, the following tools were provided to participants: Text Documents, the Knowledge Wall, Email, Text Chat, Voice, and Video Teleconferencing. Developing an understanding of the implications and effects of distributed gaming was a key goal of Global 2000 with one objective being to provide insight into future operations for a distributed, network-centric joint force. A sub-objective was to obtain empirical data as to the effectiveness of these new tools, and to identify user defined enhancements that would better meet the decision makers' requirements. In order to collect the data with which to assess user perceptions of the utility of IT Tools, an IT Tool Functionality Questionnaire was developed. This paper presents the results of analysis of data from 112 respondents' replies to the questionnaire designed to assess the utility of the IT Tools with respect to supporting the users accessing and sharing of information, decision-making, collaboration, and how they might be improved in future versions.

The U.S. Army Engineer Research and Development Center Construction Engineering Research Laboratory has developed software that interfaces with an array of Larson-Davis Model 870 (LD-870) Environmental Noise Monitors for Aberdeen Test Center. This document provides step-by-step instructions for operating the software program used to setup and download data from these noise monitors. It provides a troubleshooting guide for resolving known issues with the monitoring system and contains information regarding modem communications between an LD-870 and the central computer.

**WABED Model in the SMS: Part 2. Graphical Interface**

Demirbilek, Zeki; Lin, Lihwa; Zundel, Alan; May 2007; 16 pp.; In English; Original contains color illustrations  
Report No.(s): AD-A468499; ERDC/CHL-CHETN-I-74; No Copyright; Avail.: Defense Technical Information Center (DTIC)

This Coastal and Hydraulics Engineering Technical Note (CHETN) describes the graphical interface for the Wave-Action Balance Equation Diffraction (WABED) model that has been added to the U.S. Army Corps of Engineers (USACE) Surface-water Modeling System (SMS). WABED is intended for applications in calculating wave transformation at coastal inlets and is part of the Coastal Modeling System (CMS) developed under the Coastal Inlets Research Program (CIRP) for simulating combined waves, currents, sediment transport, and morphology change. This CHETN describes the graphical interface of WABED available in SMS Version 9.2, which is similar to that of the half-plane STWAVE Version 3.0 (Smith et al. 2001). The SMS (Zundel 2006) is a graphically interactive computer program designed to facilitate the preparation and application of USACE numerical models. This package currently supports several circulation, wave, and sediment transport models and has recently been modified to generate input files for and visualize computed results of WABED. Various features, tools, and analysis capabilities outlined in this document are designed to enhance the ability of engineers to efficiently utilize WABED in the CMS. The model and its interface are expected to evolve with additional applications, and the current interface will continue to undergo revision. The theoretical background and user's manual for WABED are given by Lin et al. (2006) [see ADA452387, Wave-action balance diffraction model tests of wave diffraction and reflection at inlets, ERDC/CHL CHETN-III-73] and Demirbilek et al. (In preparation. WABED: A nearshore spectral wave processes model for coastal inlets and navigation projects).

**Infra-Gravity Wave Input Toolbox (IGWT): User's Guide**

Demirbilek, Zeki; Nwogu, Okey G; Zundel, Alan K; May 2007; 12 pp.; In English; Original contains color illustrations  
Report No.(s): AD-A468500; ERDC/CHL-CHETN-I-73; No Copyright; Avail.: Defense Technical Information Center (DTIC)

Most harbor structures and harbor layouts are designed for protection against wind-generated (short-period) waves with periods of order 3-20 sec. However, Infra-Gravity (IG) waves, also referred to in this note as low-frequency or long-period waves, with periods on order of 30-600 sec, are generated by groups of short-period waves through nonlinear wave-wave interactions. These long-period waves can cause oscillations and resonance problems in harbors. Such low-frequency waves are responsible for harbor downtime, causing oscillation problems to ships that could significantly degrade on-loading and off-loading operations inside ports. IG waves can also damage mooring lines because the natural periods for the horizontal motion of large moored vessels are typically the same order of magnitude. Predicted IG wave input is required in modeling of long-waves affecting harbors. IG waves may also influence navigation, coastal inlets, and coastal structural design projects; IG waves contribute to the prediction of bedload transport, wave setup and setdown, and wave runup and overtopping in a variety of coastal engineering applications. This Coastal and Hydraulic Engineering Technical Note (CHETN) is a user's guide for the Infra-Gravity Wave Toolbox (IGWT) developed as an activity of the Coastal Inlets Research Program (CIRP) of the U.S. Army Engineer Research and Development Center, Coastal and Hydraulics Laboratory. The IGWT is a calculator inside the CGWAVE interface in SMS. Users can access the toolbox through the CGWAVE Model Control dialog. This calculator allows users to input wave conditions from a deepwater buoy location or user-defined site, and then accesses several utilities including BOUSS-1D to estimate the generation of long-wave energies affecting nearshore projects. The IGWT thereby generates input wave conditions at the offshore boundary of the CGWAVE domain.

**Counter-Trafficking Integrated Display System (CIDS): A GIS-Based Command & Control Environment for Coalition Nations**

D'Andrea, Elizabeth R; Bogue, Charles R; Sep 2004; 33 pp.; In English; Original contains color illustrations  
Report No.(s): AD-A466529; No Copyright; Avail.: Defense Technical Information Center (DTIC)  
ONLINE: <http://hdl.handle.net/100.2/ADA466529>

Coalition nations involved in the global war on narco-terrorism may rely on an inadequate foundation upon which to base command and control activities. The inability to exploit multiple levels of information overlaid on a geospatial background

and the lack of a robust communication system to share inherently large datasets all contribute to reducing the quality and quantity of decision making among front-line forces. As the fidelity of data sources continues to improve, users continue to search for an effective ability to fuse sensor, infrastructure, map and intelligence feeds in a near-real time environment. While several robust solutions are available to US agencies, many coalition countries do not have access to these applications due to issues of reliability. As part of the U.S. Government's strategy to equip selected coalition forces with better tools to improve their ability to analyze, formulate, prosecute and evaluate activities which support counter-trafficking missions, the U.S. Department of Defense Counter-Narcoterrorism Technology Program Office has developed a customized command & control tool built upon COTS-based software. By using an industry standard GIS application, the value of public domain mapping data is leveraged and interoperability between the US and coalition nations is enhanced.

**Collaboration Tool Suites Developed to Support Joint Command and Control Planning and Decisionmaking**

Hutchins, Susan G; Kemple, William G; Adamo, Ron; Boger, Dan; Nelson, Brian W; Penta, Heather L; May 1, 2002; 16 pp.; In English; Original contains color illustrations

Report No.(s): AD-A467671; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA467671>

Military forces, operating as a networked force, can plan, decide, and act collaboratively and concurrently to accomplish many tasks simultaneously. Operating in a collaborative information environment will enable the joint force to transition from the use of a hierarchical, serial planning process to the use of a parallel, collaborative planning process to produce reduced decision times and an increased tempo of operations. Collaboration tool suites were introduced during two recent events to support operational planning and decision making processes by providing an alternative means to communicate, collaborate, and share information among warfighters that extends what is available in today's current operational environments. One goal for these events was to develop an understanding of the implications and effects of distributed planning. A second goal was to obtain feedback on the effectiveness of these new tools for supporting future military operations in a distributed, network-centric joint force and to identify user-defined enhancements that would better meet future joint operational requirements. New information technology tools, to be used as part of a networked, web-based collaborative system were also introduced. This paper discusses the strengths and weaknesses of the tool suites and describes additional capabilities needed for future collaborative information environments.

**Formal Methods for Developing High Assurance Computer Systems: Working Group Report**

Heimdahl, Mats P; Heitmeyer, Constance L; Jan 1998; 6 pp.; In English

Report No.(s): AD-A464973; XB-NRL/MR/5540; No Copyright; Avail.: Defense Technical Information Center (DTIC)

The Second International Workshop on Industrial- Strength Formal Techniques (WIFT'98) was held in October, 1998, in Boca Raton, Florida. At the workshop, four different discussion groups investigated various topics. This report summarizes the discussions conducted on the topic 'Formal Methods for Developing High Assurance Systems.' High assurance computer systems are computer systems where convincing evidence is required that the system satisfies a collection of critical properties. To operate correctly, these systems must satisfy properties such as safety and security. Examples of high assurance systems include flight control systems, medical systems, and control systems for nuclear plants. In addition, increased reliance on communications is moving many communications systems, such as telephone networks and cellular and satellite communications systems, into the domain of high assurance systems. The aim of the 1998 discussion was to revisit and continue a discussion began in the working group with the same name at the first WIFT in 1995. A report describing the discussions at WIFT'95 is available at the web site: <http://www.cse.msu.edu/WIFT98/>

**Using Formal Methods to Reason about Architectural Standards**

Sullivan, Kevin J; Socha, John; Marchukov, Mark; Jan 1997; 13 pp.; In English

Contract(s)/Grant(s): CCR-9502029; CCR-9506779

Report No.(s): AD-A466375; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA466375>

We present a study in which we used formal methods to reason precisely about aspects of a widely used software architectural standard, namely Microsoft's Component Object Model (COM). We developed a formal theory of COM to help us reason about a proposed compositional architectural style based on COM, intended for use in a novel commercial multimedia authoring system. The style combined COM objects, integration mediators, and the COM reuse mechanism of aggregation. Our use of formal methods averted an architectural disaster by revealing essential but subtle and counterintuitive properties of COM. We partially validated our theory by subjecting it to review by the designers of COM and by testing it against other available data. The theory has good evidential support.

Automatic user authentication is becoming a necessity to counter (physical and information) security threats. There is no optimal biometric. Performance claims by vendors are overly optimistic. Popular misconception that biometric authentication is a solved problem; fundamental research is needed for deployment of biometrics in large database (millions of users) applications. No security system, including biometric system, is foolproof. Multibiometrics improves population coverage and performance. We demonstrated that a multimodal biometric system using state-of-the-art (COTS) fingerprint and face biometrics has better performance than unimodal systems on a database of approx.1000 users. Performance improvement depends on normalization and fusion methods used.

Many biometric vendors have claimed its impossible or infeasible to recreate the enrolled image from a template. Reasons: a) templates record features (such as fingerprint minutiae) and not image primitives; b) templates are typically calculated using only a small portion of the image; c) templates are much smaller than the image; and d) proprietary nature of the storage format makes templates infeasible to 'hack'. Tests were performed against three commercial face recognition algorithms. Two of the vendors participated in the 2002 face recognition vendor test. Regenerated image always compared at over 99.9% Prob. Correct Verification.

The increase in security measures due to the complex international situation is forcing the realization of physical access control systems equipped with biometric identifiers. The identification based on physical or behavioural characteristics

represents one of the most sophisticated ways to protect buildings or sensible sites but, unfortunately, at the same time, requires the resolution of many different problems. While the technical difficulties may be considered ‘internationally transversal’, and therefore reasonably ‘known’ into the scientific community, non-technical issues may differ from country to country, thus involving often the lack of reference cases. Aspects such as labour legislation or privacy protection reflect national guidelines and may result in significant constraints on the implementation of biometrics. The present document highlights some of the constraints and problems encountered in the project of a biometric access control system for a large compound of the Italian Ministry of the Defence (MoD), attended by a reasonably high number of employees and characterized by a strong personnel degree of dishomogeneity. In addition, the present contribution intends to highlight the role played by societal and psychological issues in the implementation of a biometric project.

Biometrics have had a bad press: a) Unreasonable expectations; b) Inequitable comparisons; c) They re not perfect ergo they re no good! Biometrics have strengths and limitations (just like other technologies) a) Understand the strengths and weaknesses; b) Use the strengths to your advantage; c) Address the weaknesses. Look on Biometrics as another tool in the security toolbox Use the best tools for the job; Use biometrics where they solve a problem; Don t criticise them or use them for what they are not good for. Security is a holistic subject: a) Assess the threats and risks realistically; b) Don t depend on technology alone; c) Create a balanced technical, procedural and environmental security approach. Focus on the whole picture: a) Don t assume or expect perfection, nothing is perfect!; b) Be sceptical, but be reasonable; c) Determine what performance and security you actually need d) Apply balanced security measures across the board.

**The Effects of Social Network Centrality on Group Satisfaction**

Choi, Peter M; Mar 2007; 74 pp.; In English; Original contains color illustrations

Report No.(s): AD-A467555; AFIT/GEM/ENV/07-M2; No Copyright; Avail.: Defense Technical Information Center (DTIC)

The purpose of this research was to identify how various social network centralities affect a person's satisfaction level. Simple degree centrality has been utilized to specify an individual's location in a network by measuring the number of direct links with other members in the organization (Brass & Burkhardt, 1992, 1993). This study examines how location in friendship, task, and avoidance networks affect an individual's satisfaction with the group. To determine the relationship between social network centrality and work group satisfaction, a longitudinal field study was conducted on 440 active duty enlisted military members in a leadership development training course. While most research has indicated a positive

relationship between task or friendship network centrality and satisfaction (Kilduff, Krachardt, 1993), other research suggests otherwise (Brass, 1981). The results of this study are similarly inconclusive. Task centrality only predicted work group satisfaction in one of six time periods, however the relationship was negative. Similarly, friendship network centrality predicted satisfaction in two time period, with a negative relationship. Avoidance network centrality negatively predicted work group satisfaction in two periods. These inconsistent results suggest that the relationship between network position and attitudes such as satisfaction are dynamic. This paper proposes that researchers must not neglect the dynamic nature of social networks as well as the dynamic nature of attitudes, and how they interact to influence individuals within social networks.

**Discrete Data Transfer Technique for Fluid-Structure Interaction**

Samareh, Jamshid A.; June 25, 2007; 12 pp.; In English; 18th AIAA Computational Fluid Dynamics Conference, 25-28 Jun. 2007, Miami, FL, USA; Original contains color and black and white illustrations

Contract(s)/Grant(s): WBS 389018.02.13.01.46

Report No.(s): AIAA Paper-2007-4309; No Copyright; Avail.: CASI: A03, Hardcopy

ONLINE: <http://hdl.handle.net/2060/20070028833>

This paper presents a general three-dimensional algorithm for data transfer between dissimilar meshes. The algorithm is suitable for applications of fluid-structure interaction and other high-fidelity multidisciplinary analysis and optimization. Because the algorithm is independent of the mesh topology, we can treat structured and unstructured meshes in the same manner. The algorithm is fast and accurate for transfer of scalar or vector fields between dissimilar surface meshes. The algorithm is also applicable for the integration of a scalar field (e.g., coefficients of pressure) on one mesh and injection of the resulting vectors (e.g., force vectors) onto another mesh. The author has implemented the algorithm in a C++ computer code. This paper contains a complete formulation of the algorithm with a few selected results.

ONLINE: <http://hdl.handle.net/100.2/ADA468594>

Because the development of large-scale scientific/engineering application codes is an often difficult, complicated, and sometimes uncertain process, success depends on identifying and managing risk. One of the drivers of the evolution of software engineering, as a discipline, has been the desire to identify reliable, quantifiable ways to manage software development risks. The taxonomy that follows represents an attempt to organize the sources of software development risk for scientific/engineering applications around three principal aspects of the software development activity: the software development cycle, the development environment, and the programmatic environment. These taxonomic classes are divided into elements and each element is further characterized by its attributes.

ONLINE: <http://hdl.handle.net/100.2/ADA468600>

Ongoing field work centered at the Information Technology Process Institute (ITPI) makes clear that processes that

control change and access within information technology (IT) management and operations simultaneously reduce security risk and increase efficiency and effectiveness. The CERT Coordination Center is building on this work. This technical note describes a system dynamics model that embodies CERT's current hypothesis of why and how these controls reduce the problematic behavior of the low-performing IT operation. CERT has also started to extend the model in ways that reflect the improved performance seen by high performers. In the longer term the hope is that this model will help to specify, explain and justify a prescriptive process for integrating change and access controls into organizations business processes in a way that most effectively reduces security risk and increases IT operational effectiveness and efficiency.

**Quality-Attribute-Based Economic Valuation of Architectural Patterns**

Ozkaya, Ipek; Kazman, Rick; Klein, Mark; May 2007; 51 pp.; In English; Original contains color illustrations

Contract(s)/Grant(s): FA8721-05-C-0003

Report No.(s): AD-A468620; CMU/SEI-2007-TR-003; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA468620>

Quality attribute requirements are a driving force for software and system architecture design. Architectural patterns can be used to achieve quality attribute requirements. Consequently, architectural patterns generate value based on the present and future utility of the quality attributes they achieve. This report makes the case that architectural patterns carry economic value, in part in the form of real options, providing software architects the right, but not the obligation, to take subsequent design actions. The report shows, via a simple example, how an analysis of the options embodied within architectural patterns allows an architect or manager to make reasoned choices about the future value of design decisions, considering this value along multiple quality attribute dimensions.

**Building the Readiness Data Warehouse**

Tysor, Sue; Jun 2000; 19 pp.; In English; Original contains color illustrations

Report No.(s): AD-A468682; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA468682>

Organizations must manage information assets. To meet the requirement, corporate data must be analyzed, comprehended, transformed and delivered. This is the role of the data warehouse. The data warehouse will deliver business intelligence based on operational data, decision support data and external data to all business units in the organization. The program managers and resource managers at Command-in-Chief, U.S. Atlantic Fleet (CINCLANFLT) need consistent and reconciled business intelligence to manage the level of readiness of active and reserve forces. As a component command and force provider, readiness information is used by the fleet commands (FLTCINCs) to make business management decisions about which assets should be used for assigned missions. Our goal is to build a readiness data warehouse that will enable information management to change the way organizations leverage and value their information assets. With the ability to easily access information, mission delivery, resource management and data dissemination can be raised to levels previously unimagined. This paper will identify the many issues associated with the process of building our readiness data warehouse. Specifically, it addresses the need to manage complexity and presents the development methodology, data architecture and technical architecture for the readiness data warehouse.

**Ocean Wave Energy Harvesting Devices**

Cheung, Jeffrey T; Childress, III, Earl F; Apr 2007; 34 pp.; In English; Original contains color illustrations

Contract(s)/Grant(s): HR001-06-C-0030

Report No.(s): AD-A468837; RC71273.FR; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA468837>

Development of an ocean wave energy-harvesting device that can be used as a renewable energy source for ocean

monitoring systems. The core technology is a mass-spring based high efficiency, low frequency linear generator that was integrated to a spar buoy to form a robust unit. Its dynamic sensitivity is improved by the use of a near zero friction liquid bearing. Through extensive theoretical modeling and wave tank testing, we studied the effect of enhanced heave motion due to resonance with waves and applied it to improve the energy harvesting efficiency. We also developed a computer simulation model that can accurately predict the device performance driven by a single frequency, sinusoidal forcing function. Full-scale models were fabricated and field tested in non-random waves. Power output was measure from 1.6 W to more than 6 W, depending on the device size, oscillator characteristic and wave conditions. Finally, we carried out extensive studies to build and characterize several small underwater motion energy harvesters of different designs. A complete performance metrics was established.

**Path Planning Software and Graphics Interface for an Autonomous Vehicle, Accounting for Terrain Features**

Hurezeanu, Vlad; Dec 2000; 135 pp.; In English; Original contains color illustrations

Report No.(s): AD-A469030; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA469030>

A Navigation Test Vehicle (NTV) is being developed at the Center for Intelligent Machines and Robots at the University of Florida under the sponsorship of the Air Force Research Laboratory at Tyndall Air Force Base. This vehicle performs tasks to include surveying fields, laying mines, and teleoperation. The capability of the vehicle will be increased if its supporting software plans paths that take into account the terrain features. The objective of this work is to plan a survey path for a specified region taking terrain elevation data into account. A survey path is defined as a path that provides complete coverage of a defined polygonal region. This work is an extension of previous work that assumed that the region to be surveyed was flat. Now the characteristics of the vehicle, specifically the maximum allowable pitch and roll, will be accounted for when planning the path. Data that contains elevation points are available from government databases. Using three different programs the data are transformed from the vector format in which it is found to a Virtual Reality Modeling Language format in order to be viewed with a common web browser. Data are stored into a grid of m x n elements and the user selects the coordinates of the region that will be surveyed. The previous 2D algorithm is then executed in which the primary direction of the survey varies from zero to 180 degrees. For each path a cost is computed in which the cost is based on pitch and roll knowing the maximum that the vehicle can withstand. For the NTV the maximum roll and pitch angle is 15 degrees. If the pitch or roll is larger than 15 degrees a very high cost is associated with that part of the path. After each path is processed, the path with overall minimum cost is written to a file. If the minimum path contains any slopes that are inaccessible they are recorded as obstacles. The last step is an obstacle avoidance algorithm, which generates small sub-paths around the inaccessible regions.

**The Federal Networking and Information Technology Research and Development Program: Funding Issues and Activities**

Figliola, Patricia M; Jul 1, 2004; 16 pp.; In English; Original contains color illustrations

Report No.(s): AD-A469096; CRS-IB10130; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA469096>

In the early 1990s, Congress recognized that several federal agencies had ongoing high-performance computing programs, but no central coordinating body existed to ensure long-term coordination and planning. To provide such a framework, Congress passed the High-Performance Computing and Communications Program Act of 1991 (P.L. 102-194) to enhance the effectiveness of the various programs. In conjunction with the passage of the act, the White House Office of Science and Technology Policy (OSTP) released Grand Challenges: High-Performance Computing and Communications. That document outlined a research and development (R&D) strategy for high-performance computing and a framework for a multiagency program, the High-Performance Computing and Communications (HPCC) Program. The HPCC Program has evolved over time and is now called the Networking and Information Technology Research and Development (NITRD) Program, to better reflect its expanded mission. The NITRD Program is composed of 12 agencies; its members work in collaboration to increase the overall effectiveness and productivity of federal information technology (IT) R&D. A National

Coordinating Office coordinates the activities of the NITRD Program and reports to OSTP and the National Science and Technology Council.

**CASE Planning and the Software Process**

Humphrey, Watts S; May 1989; 33 pp.; In English

Report No.(s): AD-A469159; CMU/SEI-89-TR-026; ESD-TR-89-034; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA469159>

Automating a software process both magnifies its strengths and accentuates its weaknesses. Automation can make an effective process more effective, but it can make a chaotic process even worse and at considerable expense. Anyone who buys expensive tools to solve an ill-defined problem is likely to be disappointed. Unless procuring such tools is part of a thoughtful software process improvement plan, the purchase could be an expensive mistake. This report discusses software process maturity and its relationship to planning and installing computer-aided software engineering (CASE) systems. While process is not a magic answer (there isn't one), the key issues are discussed from a process perspective, and guidelines are given for avoiding the most common pitfalls. Since CASE systems can involve significant investment, an economic justification may be necessary. The relevant financial considerations are therefore discussed, and some basic steps for producing such justifications are outlined. Finally, some key considerations for introducing and using CASE systems are discussed.

**Case Study: Accelerating Process Improvement by Integrating the TSP and CMMI**

Wall, Daniel S; McHale, James; Pomeroy-Huff, Marsha; Jun 2007; 35 pp.; In English

Contract(s)/Grant(s): FA8721-05-C-0003

Report No.(s): AD-A469180; CMU/SEI-2007-TR-013; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA469180>

This report describes how two U.S. Naval Air Systems Command (NAVAIR) organizations integrated the use of the Software Engineering Institute's (SEI) Team Software Process (SM) methodology and the Capability Maturity Modeling (trademark) framework to progress from Maturity Level 1 to Maturity Level 4 in 30 months. This is less than half of the average time it has taken other organizations to accomplish the same maturity level progression. This case study describes the process improvement efforts of both NAVAIR groups and how they integrated the two SEI technologies to accelerate process improvement within their organizations. Finally, the report presents the key factors that allowed NAVAIR to achieve these rapid results.

**Assessment of Two Desk-Top Computer Simulations Used to Train Tactical Decision Making (TDM) of Small Unit Infantry Leaders**

Beal, Scott A; Apr 2007; 105 pp.; In English; Original contains color illustrations

Contract(s)/Grant(s): Proj-A790

Report No.(s): AD-A468772; ARI-RR-1869; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA468772>

Fifty-two leaders in the Basic Non-Commissioned Officer Course (BNCOC) at Fort Benning, Georgia, participated in an assessment of two desk-top computer simulations used to train tactical decision making. Thirteen leaders trained with the Soldier Visualization Station (SVS) simulation, while 39 others trained with Simulation Field Exercise, or SimFX. Pre-simulation exercise measures included military and simulation experience, decision-making style, and tactical situation judgment. A questionnaire administered to leaders following simulation exercises documented their sense of personal

involvement during mission execution and their perceptions of the training value of the simulations. Leaders in both groups were assessed individually for their ability to recognize and implement sound tactical decisions while serving as a squad leader of a light Infantry squad during patrol and defense missions in an urban environment. Results suggest that, in general, the use of desk-top simulations have potential value for training the tactical decisions leaders make during exercises that require greater expenditures of resources. However, the methods used to train with simulations impacted leaders' tactical decision making, their perceptions of the training value of simulations, and their ideas about what they learned from the experience.

**Incident Management Capability Metrics Version 0.1**

Dorofee, Audrey; Killcrece, Georgia; Ruefle, Robin; Zajicek, Mark; Apr 2007; 229 pp.; In English; Original contains color illustrations

Contract(s)/Grant(s): FA8721-05-C-0003

Report No.(s): AD-A468688; CMU/SEI-2007-TR-008; ESC-TR-2007-008; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA468688>

Successful management of incidents that threaten an organization's cyber security is a complex endeavor. Frequently an organization's primary focus on the response aspects of security incidents results in its failure to manage incidents beyond simply reacting to threatening events. The metrics presented in this document are intended to provide a baseline or benchmark of incident management practices. The incident management functions provided in a series of questions and indicators define the actual benchmark. The questions explore different aspects of incident management activities for protecting, defending, and sustaining an organization's computing environment in addition to conducting appropriate response actions. This benchmark can be used by an organization to assess how its current incident management capability is defined, managed, measured, and improved. This will help assure the system owners, data owners, and operators that their incident management services are being delivered with a high standard of quality and success, and within acceptable levels of risk.

**Applying Executable Architectures to Support Dynamic Analysis of C2 Systems**

Pawlowski, Tom; Barr, Paul C; Ring, Steven J; Jun 2004; 39 pp.; In English; Original contains color illustrations

Report No.(s): AD-A466014; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA466014>

This paper describes the development of a methodology to import key products of the DoD Architecture Framework into an executable form to conduct a dynamic analysis of the Command and Control (C2) system or capability represented by the architecture. Dynamic analysis of these models enables a user to assess the impact of change and determine measures of performance and effectiveness. The research team successfully implemented the methodology in a demonstration that made a three-way link among a business process model, a communications network model, and a combat simulation representing the system's operational environment. We linked these models together via the Runtime Infrastructure (RTI) of the High Level Architecture (HLA). Basic HLA interactions that we established allowed key events in the combat simulation to initiate one or more business processes in the process model. As a business process proceeded in time, the process model requested from the communications model a delay time that represented the time required to pass information through the network from one node to another. We extracted measures of performance and effectiveness from the simulation runs to conduct the dynamic analysis of the system in question.

This paper discusses the continued development and operation of coalition networks in support of U.S. Pacific Command's initiative to provide classified, permanent network service for bilateral and multilateral communities of interest for combined and coalition operations. The Combined Operations Wide Area Networks (COWAN) project, headed by SSC San Diego personnel, continued to grow and has recently been consolidated with the Combined Enterprise Regional Information Exchange System (CENTRIXS) program, originally designed to support U.S. Central Command requirements. The consolidation of these efforts has created a dynamic team of personnel working to meet the increasing need for secure global connectivity. Challenges continue to confront the team, primarily in getting approved and accredited technical solutions for connecting multiple classified domains to facilitate the Global War on Terrorism.

**Secure Enterprise Access Control (SEAC) Role Based Access Control (RBAC)**

Fernandez, Richard; Jun 2004; 85 pp.; In English; Original contains color illustrations

Report No.(s): AD-A466126; SSC-TD-3182; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA466126>

Access to resources such as applications and web services are becoming increasingly difficult to manage via access control lists (ACLs). ACLs usually consist of a client's name or unique identifier. However, resource access is usually based on client characteristics such as command assignments, clearances, and/or pay grade. If a user is reassigned, changes clearance, or is promoted, access to resources should also change. Instead, with ACLs, resource managers constantly have to evaluate personnel records to determine resource access. Such a task can become overwhelming as the number of personnel within an organization grows. Limited access to personnel records by resource managers could compound the problem. This paper discusses a government off-the-shelf-solution (GOTS) for Secured Enterprise Access Control (SEAC) Role-Based Access Control (RBAC) proposed by Richard Fernandez, Space and Naval Warfare Systems Center, San Diego (SSC San Diego) for Commander, U.S. Pacific Fleet (COMPACFLT). In an RBAC solution, a resource manager does not have to constantly query personnel records to determine resource access. The resource manager establishes conditions based on a user's characteristics (command assignments, clearances, and/or pay grade) versus their name or unique identifier. The SEAC RBAC design surpasses the NIST RBAC standard requirements and can be used by any U.S. Government organization. Chapter 1 provides the reader with a general background on RBAC and other access

This report describes a Wireless Intrusion Detection (WIND) system that utilized physical layer features, derived from

individual radio frequency packets, to identify network intrusions. The features considered include those intrinsic to the packet source, as well as those related to the propagation path between the source and a network access point. It is shown that the statistics of a set of packet features can be used to fingerprint each packet source in the network, thereby providing a mechanism for identifying rogue node activity, such as a spoofing attack. Empirical results are presented for IEEE 802.11b networks. Initial test results suggest WIND can achieve a 99% probability of detection with a 10% false alarm rate.

Traditional key pre-distribution schemes in sensor and ad hoc networks rely on the existence of a trusted third party to generate and distribute a key pool. The assumption of a single TTP however can be very strong in practice, especially when nodes belong to different domains and they come together in an ad hoc manner. Other important motivations to omit a TTP include preservation of privacy in a network as well as reducing the required knowledge base for the usage of sensor networks. In this work we show the shortcomings of the previous approaches [3, 13] in terms of both efficiency and security. By incorporating a heterogeneous network we show that we can dramatically reduce the load on resource constrained while also increasing their security. We also propose a new strengthened security model for self-organized ad hoc networks and evaluate the security of our protocol in this model. We evaluate the correctness of the protocol and show that we can achieve network connectivity with very high probability.

ONLINE: <http://hdl.handle.net/100.2/ADA466348>

Information Technology is the core capability required to align our resources and increase our effectiveness on the battlefield by integrating and coordinating our preventative measures and responses along with the tools used to perform them. To win the War on Terrorism, the US defense strategy requires information superiority to secure our advantage over adversaries. This focus on technology is identical to Joint Vision 2020's goal of information dominance, and the Joint Services' focus on network-centric warfare. As learned through the RestOps and CASPOD ACTDs, systems must be built to shift, grow, and shrink as the context of their use changes. As stated in Joint Vision 2020, this capability will allow commanders to bring together the correct mix of assets at the place and time most favorable to success. Systems providing these characteristics are largely unavailable and a high priority need for battle management. This report discusses the requirements of an integrated management system and progress on the effort.

**Multicast Performance Analysis for High-Speed Torus Networks**

Oral, S; George, A; Jan 2002; 11 pp.; In English; Original contains color illustrations

Report No.(s): AD-A466383; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA466383>

Overall efficiency of high-performance computing clusters not only relies on the computing power of the individual nodes, but also on the performance that the underlying network can provide to the computational application. Although modern high-performance networks, especially System Area Networks (SANs), have high unicast performance, they do not support multicast communication in hardware. This research experimentally evaluates the performance of various protocols

for unicast-based and path-based multicast communication on high-speed torus networks. Software-based multicast performance results of selected algorithms on a 16-node Scalable Coherent Interface (SCI) torus are given. The strengths and weaknesses of the various protocols are illustrated in terms of startup and completion latency, CPU utilization, and link utilization and concurrency.

Report No.(s): AD-A466387; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA466387>

High-performance networks require sophisticated management systems to identify sources of bottlenecks and detect faults. At the same time, the impact of network queries on the latency and bandwidth available to the applications must be minimized. Adaptive techniques can be used to control and reduce the rate of sampling of network information, reducing the amount of processed data and lessening the overhead on the network. Two adaptive sampling methods are proposed in this paper based on linear prediction and fuzzy logic. The performance of these techniques is compared with conventional sampling methods by conducting simulative experiments using Internet and video conference traffic patterns. The adaptive techniques are significantly more flexible in their ability to dynamically adjust with fluctuations in network behavior, and in some cases they are able to reduce the sample count by as much as a factor of two while maintaining the same accuracy as the best conventional sampling interval. The results illustrate that adaptive sampling provides the potential for better monitoring, control, and management of high-performance networks with higher accuracy, lower overhead, or both.

Report No.(s): AD-A466410; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA466410>

The management of modern distributed systems is complicated by scale and dynamics. Scalable, decoupled communication establishes flexible, loosely coupled component relationships, and these relationships help meet the present demands on management. However, traditional decoupled addressing mechanisms tend to focus the addressing on only one of the parties involved in communication while, in general, a communication relationship involves a sender, communicated content, and receivers. The state of all three are simultaneously relevant to correctness of a management relationship and its communications. We introduce Selective Notification, a scalable, decoupled event dissemination architecture supporting simultaneous and combined addressing of senders, receivers, and events. We demonstrate its application to programming dynamic, scalable management relationships. We then discuss its implementation, and present measurements of its effective capabilities.

**User-Level QoS-Adaptive Resource Management in Server End-Systems**

Abdelzaher, Tarek F; Shin, Kang G; Bhatti, Nina; May 2003; 9 pp.; In English

Contract(s)/Grant(s): N00014-01-1-0576; EIA-980620

Report No.(s): AD-A466422; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA466422>

Proliferation of QoS-sensitive client-server Internet applications such as high-quality audio, video-on-demand, e-commerce, and commercial web hosting has generated an impetus to provide performance guarantees. These applications require a guaranteed minimum amount of resources to operate acceptably to the users, thus calling for QoS-provisioning

mechanisms. One good place to locate such mechanisms is in server communication subsystems. Server-side communication subsystems manage an increasing number of connection end-points, thus readily controlling important bottleneck resources. We propose, implement, and evaluate a novel communication server architecture that maximizes the aggregate utility of QoS-sensitive connections for a community of clients even in the case of overload. A contribution of this architecture is that it manages QoS from the user space and is transparent to the application. It does not require modifications to the OS kernel, which improves portability and reduces development cost. Results from an experimental evaluation on a microkernel indicate that it achieves end-system overload protection and traffic prioritization, improves insulation between independent clients, adapts to offered load, and enhances aggregate service utility.

**Combined Enterprise Regional Information Exchange System (CENTRIXS): Supporting Coalition Warfare World-Wide**

Boardman, Jill L; Shuey, Donald W; Apr 2004; 31 pp.; In English; Original contains color illustrations

Report No.(s): AD-A466528; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA466528>

The joint Combatant Commanders require responsive information exchange between combined forces and the joint combatant commands region-to-region for global operations. CENTRIXS (Combined Enterprise Regional Information Exchange System) is the premier network for coalition interoperability in support of military operations. Ongoing coalition operations continue to test and prove the viability of the CENTRIXS enterprise. Information flow to coalition partners via the multiple versions of CENTRIXS networks achieved unprecedented volume and continues to expand. CENTRIXS dissemination capabilities must become even more robust as the trend to move more command and control operations to the coalition networks continues. CENTRIXS is designed to one day form a single, common, global, multinational data network. To achieve this goal, a certified security technology solution to allow confidential, multi-level information sharing over a single network is desperately needed. The only option today is proliferation of multiple separate networks to support the various coalition operations and bilateral exchanges. Security technology to allow separate, simultaneous communities of interest across common network transport is key to future coalition networking.

**Network Centric Operations: Background and Oversight Issues for Congress**

Wilson, Clay; Mar 15, 2007; 56 pp.; In English; Original contains color illustrations

Report No.(s): AD-A466624; CRS-RL32411; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA466624>

Network Centric Operations (also known as Network Centric Warfare) is a key component of DOD planning for transformation of the military. Network Centric Operations (NCO) relies on computer equipment and networked communications technology to provide a shared awareness of the battle space for U.S. forces. Proponents say that a shared awareness increases synergy for command and control, resulting in superior decision-making, and the ability to coordinate complex military operations over long distances for an overwhelming war-fighting advantage. NCO technology saw limited deployment in Afghanistan and, more recently, increased deployment in Operation Iraqi Freedom (OIF). This report describes technologies that support NCO, and includes (1) questions about possible vulnerabilities associated with NCO; (2) a description of electronic weapons, and other technologies that could be used as asymmetric countermeasures against NCO systems; (3) descriptions of several key military programs for implementing NCO; (4) a list of other nations with NCO capabilities; and, (5) a description of experiences using NCO systems in recent operations involving joint and coalition forces. The final section raises policy issues for NCO that involve planning, network interoperability, acquisition strategies, offshore outsourcing, technology transfer, asymmetric threats, coalition operations, and U.S. military doctrine. Appendices to this report give more information about the global network conversion to Internet Protocol version 6 (IPv6), views on Metcalfe's Law of Networks, and possible perverse consequences of data-dependent systems. This report will be updated to accommodate significant changes.

**Potential System Vulnerabilities of a Network Enabled Force**

Houghton, Peter; Sep 2004; 50 pp.; In English; Original contains color illustrations

Report No.(s): AD-A466659; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA466659>

The intent of the UK Network Enabled Capability (NEC) initiative is to gain military advantage through greater inter-working of organizations, people and equipment. It aims to achieve this by exploiting commercial sector information technology, and associated organizational concepts, and adapting them to the defense environment. However, the technology and associated concepts do not only confer benefits, they also bring with them penalties, risks and system vulnerabilities. Such penalties, risks and system vulnerabilities could potentially be very harmful, particularly if they occur at operationally critical times. It is thus imperative that the military and research communities remain vigilant, do not seek to emphasize only the positive and consider how such penalties and vulnerabilities might occur and how they might be mitigated. This paper provides a brief review of some of the potential negative consequences of moving to a Network-Enabled future that have appeared in the open literature. As a consequence, this paper will not expose genuinely new or novel issues, particularly as the ground of vulnerabilities has previously been relatively well-trodden. However, it does attempt to aid those engaged in NCW endeavors in understanding the potential scale and extent of the problems they face, by bringing a number of the different sources and sets of issues together in a single place.

ONLINE: <http://hdl.handle.net/100.2/ADA466773>

Atomicity (or linearizability) is a commonly used consistency criterion for distributed services and objects. Although atomic object implementations are abundant, proving that algorithms achieve atomicity has turned out to be a challenging problem. In this paper, we initiate the study of systematic ways of verifying distributed implementations of atomic objects, beginning with read/write objects (registers). Our general approach is to replace the existing operational reasoning about events and partial orders with assertional reasoning about invariants and simulation relations. To this end, we define an abstract state machine that captures the atomicity property and prove correctness of the object implementations by establishing a simulation mapping between the implementation and the specification automata. We demonstrate the generality of our specification by showing that it is implemented by three different read/write register constructions: the message-passing register emulation of Attiya, Bar-Noy and Dolev, its optimized version based on real time, and the shared memory register construction of Vitanyi and Awerbuch. In addition, we show that a simplified version of our specification is implemented by a general atomic object construction based on the Lamport's replicated state machine algorithm.

ONLINE: <http://hdl.handle.net/100.2/ADA467450>

The Mission Information Management (MIM) Communications Architecture provides a framework to develop an integrated space, air, and terrestrial communications network that supports all national security users (DoD, Intelligence Community, and civil), all information domains, and all levels of classification. The architecture provides a basis for developing a communications investment strategy to satisfy Joint Vision 2020 imperatives. The architecture framework consists of an integrated, internetted high capacity space backbone, high capacity terrestrial gateways, fiber entry points, airborne communications nodes, and software programmable tactical terminals that are handheld or embedded on weapons platforms. Dynamic routing, prioritization, and bandwidth allocation in space, air, and terrestrial layers ties the architecture together, eliminates stovepipes. An NSSA led Architecture Development Team comprised of thirty stakeholder organizations developed the architecture and a set of proposed recommendations for presentation to the NSSA Senior Steering Group.

Report No.(s): AD-A467451; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA467451>

As information systems technology continues to evolve, new opportunities arise to more fully harness its power to enhance user and organizational performance. Concepts such as Network Centric Warfare envision unprecedented access to types and amounts of information and data. User interface technologies and system design methodologies must also evolve in order to fulfill the Network Centric Warfare vision and allow us to build human-centered systems which leverage these advances without overloading or confusing the end user -- systems that work together with the user to enable efficient work. We are developing Work-Centered Support System technology, which focuses on supporting all user work activities, including decisions, through a single interface client designed to capitalize on universally available data as afforded by the Network Centric Warfare and similar concepts. The WCSS technology is an analysis and design methodology for building interface clients which enable a tight coupling of the human and computer with a goal of maximizing work effectiveness and efficiency. This paper describes a demonstration prototype of the WCSS technology called the Work-Centered Support System for Global Weather Management. The WCSS-GWM uses intelligent agent technology, cognitive analysis and new user interface design techniques to enable command and control users in an airlift services firm to proactively manage and mitigate mission impacts due to changing weather events. It has also begun to provide insight into ways interface agents can be efficiently incorporated into user interface clients.

ONLINE: <http://hdl.handle.net/100.2/ADA467593>

Timely, accurate, and secure information is essential to the Air Force Research Laboratory (AFRL), Information Directorate (IF), Rome, New York, whose mission is to provide superior information systems in support of the war fighter. With such information, improved decisions can be made regarding financial, acquisition, and personnel matters. In this paper the authors describe an automated Program Management capability newly deployed for use by all scientists, engineers,

contracting, financial and management personnel working at the Air Force Research Laboratory, Information Directorate. It is important to recognize, the application currently has over 66% of its users logging into a .mil network from a .com or .edu world. Security is a significant factor that must be considered when allowing users outside of a .mil environment to access this Program Management System. Moreover, current Department of Defense (DoD) and Air Force (AF) regulations do not adequately address this new environment. This paper will describe the Program Management System and the local procedures implemented to ensure the system remains secure and the challenges associated with the effort. Additionally, this paper will include a description of user's roles and responsibility, how access is granted, the traceability aspect of the system, and finally sustainment issues.

**Use of a Novel Organizational Structure to Support Complex Decisionmaking During Global Wargame 2000**

Hutchins, Susan G; Kemple, William G; Poirier, John A; Hocevar, Susan P; Jun 2001; 15 pp.; In English; Original contains color illustrations

Report No.(s): AD-A468208; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA468208>

Global Wargame 2000 addressed the theme of Network Centric Operations (NCO) with the objective of providing insight into future operations for a distributed, network-centric Joint Force. Network-centric operations are postulated to offer information advantages that include significantly improved capabilities for accessing and sharing information. These improved capabilities will be dependent on emergent technologies, new processes, and novel ways of organizing to enable operators to leverage the anticipated information advantage and reap the full benefits afforded by a distributed, networked organization. New variables and metrics to assess these benefits are currently under development. One variable, described as the information domain is influenced by several factors, including the performance of operators, the performance of sensors, and the characteristics and performance of the relevant information infrastructure, or infostructure, that links battlespace entities. Global Wargame 2000 was an attempt to gain insight into how to implement these new organizational forms and processes, with the information infrastructure provided by a networked set of well-informed but geographically dispersed forces. This paper will address some of the issues that contributed to developing an effective infostructure for an interoperable command and control organization during global Wargame 2000.

**Route Optimization for Mobile IPV6 Using the Return Routability Procedure: Test Bed Implementation and Security Analysis**

Kandirakis, Ioannis; Mar 2007; 121 pp.; In English

Report No.(s): AD-A467151; No Copyright; Avail.: Defense Technical Information Center (DTIC)

Mobile IPv6 is an IP-layer mobility protocol that is designed to provide mobility support, allowing an IPv6 node to arbitrarily change its location on the IPv6 Internet and still maintain existing connections by handling the change of addresses at the Internet layer using Mobile IPv6 messages, options, and processes that ensure the correct delivery of data regardless of the mobile node's location. Return Routability is an infrastructureless, lightweight procedure that enables a mobile IPv6 node to request another IPv6 node (maybe unaware of mobility) to test the ownership of its permanent IPv6 address in both its home network and its temporary address in the current IPv6 network; and authorizes a binding procedure by the use of a cryptographic token ezohange The main objective of this research effort is to build a test bed for investigating the vulnerabilities of the Mobile IPv6 OR procedure. The test bed shall facilitate the enactment and analysis of the effects of specific threats on the hosts and the network. While this thesis is not about discovering new vulnerabilities or evaluating countermeasures, the resulting test bed and software shall lay the necessary groundwork for future research in those directions.

**Static Reachability Analysis and Validation Regarding Security Policies Implemented via Packet Filters**

Kantz, Stephen M; Mar 2007; 69 pp.; In English

Report No.(s): AD-A467157; No Copyright; Avail.: Defense Technical Information Center (DTIC)

The ability to statically determine what kinds of packets can be exchanged between two hosts on a network is desirable

to those who design and operate networks but this is a difficult and complex problem. Factors affecting reachability analysis are packet filters routing policies and packet transformations. The number of variables within and among networks is intractable for manual computation. A proposed solution to this mess is a tractable framework for which to map networks into thus creating a single unified model for analysis. It depends heavily on the use of transforming the problem into a classical graph problem that can be solved with polynomial time algorithms such as transitive closure. This research develops an automated validation process to test the reachability upper bound calculated from a recent implementation of the framework which focuses specifically on the packet filter aspect namely access control lists. Real-world network configuration files and network packet flow data from a Tier-i Internet Service Provider is supplied as the data set. A significant contribution of this thesis is the application of real-world data to the proposed method for static reachability analysis as it pertains to the static testing of security policies applied via packet filters.

**Extending Simple Network Management Protocol (SNMP) Beyond Network Management: A MIB Architecture for Network-Centric Services**

Gateau, James; Mar 2007; 183 pp.; In English

Report No.(s): AD-A467271; No Copyright; Avail.: Defense Technical Information Center (DTIC)

The promise of the Global Information Grid (GIG) includes connecting sensors, shooters and decision-makers who may not be physically co-located in a manner efficient for combat employment, decision-making and information sharing. Current information architecture strategies, such as Network-Centric Enterprise Services have started down one path, requiring the implementation of a Service Oriented Architecture (SOA) and all the requisite underpinnings thereof. These are, for an organization the size of the DoD, a very large problem set in and of themselves. An additional unfortunate side effect of choosing a conventional SOA as the backdrop for the GIG is that only those devices capable of running an entire web server/database stack are able to participate in the architecture, effectively excluding computationally constrained devices. Additionally, the connectivity requirements in a conventional SOA restrict participation by bandwidth-constrained and

intermittently connected entities. This thesis investigates one possible solution, utilizing SNMP as the language and mechanism for sharing data between disparate systems. Specific decision-support MIBs will be developed to allow transmission of decision-specific information in both push (TRAP/SET) and pull (GET) directions.

**Analysis of USA' Broadband Policy**

Uzarski, Joel S; Mar 2007; 163 pp.; In English

Report No.(s): AD-A467327; No Copyright; Avail.: Defense Technical Information Center (DTIC)

Broadband Internet access has become an important service that affects the economic and social makeup of a country. Broadband penetration is becoming extremely important as globalization starts to interweave the economies and policies of nations around the world. With every month that passes, the USA fails to close the gap in the digital divide both inside its borders as well as among the other countries that lead the world in broadband penetration. The lack of strong market competition among broadband providers and failing governmental policies is partly to blame. A brief overview of broadband technologies as well as an analysis of the USA broadband market is undertaken and compared with some other countries in order to establish a baseline comparison. The USA has long been known as a leading innovator in technology and services. However, the lack of competition to bring higher speeds, lower costs, and universal access has pushed the USA out of the top ten world-wide in broadband Internet penetration. This Thesis explores how the USA could close the digital divide and become a world leader in broadband penetration and innovation.

**Risk of Cyberterrorism to Naval Ships Inport Naval Station Everett: A Model Based Project Utilizing SIAM**

Tester, Rodrick A; Mar 2007; 95 pp.; In English

Report No.(s): AD-A467365; No Copyright; Avail.: Defense Technical Information Center (DTIC)

Based on numerous high level concerns that the cyber threat is expected to increase, as well as the already documented uses of cyber warfare, it is necessary to ensure our naval ships are hardened against such attacks. In doing so, an influence net model was designed to discover the likelihood of a successful cyber attack. However, first it was necessary to establish what the best mitigation tools are in defense of cyber attack methods. In order to do so, an expert opinion survey was designed and completed by individuals currently working in the field of network security. In combination with the expert opinion surveys and in looking at research and established security techniques it should become apparent whether or not ships are taking all the required steps to best secure themselves against an attack. Though the initial model was designed around a theoretical Naval Station Everett ship, with modification the model can be utilized for any naval asset throughout the USA and the risk for each particular U.S. asset can be evaluated. Additionally, this tool can also facilitate security funding as well as establishing a means of prioritizing the tools for protection if the network needs to be hastily re-established after an attack. Ultimately, the protection of a ship's computer networks against cyber terrorist threats is fundamental in ensuring continued effective command and control and ultimately the security of this nation.

**Hacking Social Networks: Examining the Viability of Using Computer Network Attack Against Social Networks**

Schuhart, II, Russell G; Mar 2007; 73 pp.; In English

Report No.(s): AD-A467374; No Copyright; Avail.: Defense Technical Information Center (DTIC)

Social Network Analysis (SNA) has been proposed as a tool to defeat transnational terrorist groups such as Al Qaeda. However, SNA is a descriptive tool that is a product of sociology and not an offensive tool used to attack a social network. SNA was not designed to destabilize covert networks that are difficult to observe and penetrate. This work presents a possible way to improve SNA's performance against a covert social network by employing the Computer Network Attack (CNA) model. The CNA model is used by computer network security to represent the traditional approach to hacking a computer network. Although not tested in this paper, it is argued that the CNA model should be able to improve the accuracy of SNA when applied to a covert social network by standardizing the destabilization process and allowing for frequent challenges of

operating assumptions. A history and overview of both computer networks and social networks is covered to allow for a comparison of the two networks. The networks have enough similarities to allow the application of the CNA model without major modification from its original form. Assumptions about the security of computer and social networks are examined to clarify how the CNA model can attack a social network. The model is examined for validity and the conclusion is that the CNA model can incorporate SNA into a more methodical approach to achieve better results than using SNA alone. The final portion of the paper details a possible implementation of the CNA model and how it can be used as part of an offensive effort to destabilize a covert social network.

**A Limited Objective Experiment on Wireless Peer-To-Peer Collaborative Networking**

Bordetsky, Alex; Cook, Glenn R; Kemple, Bill; Thate, Timothy; Sep 2002; 10 pp.; In English; Original contains color illustrations

Report No.(s): AD-A467581; No Copyright; Avail.: Defense Technical Information Center (DTIC)

The implications of using peer-to-peer communications within an urban environment are significant for military applications. From a networking perspective, the use of wireless technologies to support collaborative communications may have impacts on bandwidth and spectrum utilization. This paper explores the effects of wireless peer-to-peer (P2P) network behavior on the performance of collaboration support applications. The results achieved during the limited objective experiment conducted by the Naval Postgraduate School demonstrate significant effects of roaming on application-sharing performance and integration with client-server applications. The authors discuss the wireless network operation challenges leading to the solutions for scaling up application-sharing and improving collaborators' self-organizing behavior.

**Defense Acquisitions. Improved Management and Oversight Needed to Better Control DOD's Acquisition of Services**

May 10, 2007; 22 pp.; In English

Report No.(s): AD-A467693; GAO-07-832T; No Copyright; Avail.: Defense Technical Information Center (DTIC)

Numerous persistent problems have resulted in reduced effectiveness and have exposed DOD to unnecessary risks when acquiring services. The growth in obligations on service contracts from \$85.1 billion in fiscal year 1996 to more than \$151 billion in fiscal year 2006 reflects a growing reliance on contractors to provide a range of mission-critical services. At the same time, DOD's civilian workforce was downsized without sufficient attention to requisite skills and competencies. Within this environment, our work, as well as that of some agency Inspectors General, have identified numerous instances of weak business practices poorly defined requirements, inadequate competition, insufficient guidance and leadership, inadequate monitoring of contractor performance, and inappropriate uses of other agencies contracts and contracting services. Collectively, these problems expose DOD to unnecessary risk, complicate efforts to hold DOD and contractors accountable for poor acquisition outcomes, and increase the potential for fraud, waste, or abuse of taxpayer dollars. DOD's structure and processes for managing services do not position the department to make service acquisitions a managed outcome. DOD has taken some actions to improve its management of services, including developing a competency model for its contracting workforce; issuing policies and guidance to improve DOD's management of contractors supporting deployed forces and its use of interagency contracts; and developing an integrated assessment of how best to acquire services. DOD leadership will be critical for translating this assessment and other actions into effective frontline practices. At this point, however, DOD does not know how well its services acquisition processes are working and whether it is obtaining the services it needs while protecting DOD's and the taxpayer's interests.

**Bridging the Gap in Port Security; Network Centric Theory Applied to Public/Private Collaboration**

Wright, Candice L; Mar 2007; 80 pp.; In English

Report No.(s): AD-A467714; No Copyright; Avail.: Defense Technical Information Center (DTIC)

'Achieving awareness in the maritime domain, including intelligence and information sharing at all levels of government

is a key to our maritime security. Better awareness of what is out there leads to better unity of effort in maritime planning and operations. We need to have a common operating picture. We also need to integrate our operational capabilities and efforts with our private sector partners to better prepare for, respond to, and recover from incidents.' Admiral Thad Allen, 2007 The application of Network Centric Warfare theory enables all port stakeholders to better prepare for a disaster through increased information sharing and collaboration. Currently, a significant gap in connectivity exists among the many entities responsible for securing the intermodal supply chain throughout the port complex. The research conducted in this thesis creates an architecture using the theory of Network Centric Warfare to perpetuate a cycle of preparedness in a seaport, thus enhancing situational awareness for improved security. As a result of the research conducted in this thesis, the architecture is being applied in the Port of Los Angeles/ Long Beach in the form of a public/private 'virtual maritime fusion center' to fill the gap between stakeholders thus improving overall maritime domain awareness.

### **Homeland Security -- Reducing the Vulnerability of Public and Private Information Infrastructures to Terrorism: An Overview**

Seifert, Jeffrey W; Dec 12, 2002; 27 pp.; In English

Report No.(s): AD-A467827; CRS-RL31542; No Copyright; Avail.: Defense Technical Information Center (DTIC)

This report assesses the impact of the September 11, 2001 attacks on public and private information infrastructures in the context of critical infrastructure protection, continuity of operations (COOP) planning, and homeland security. Analysis of the effects of the terrorist attacks suggests various lessons learned. These lessons support three general principles. The first principle emphasizes the establishment and practice of comprehensive continuity and recovery plans. One lesson learned in this area is to augment disaster recovery plans. Businesses and agencies, who now must consider the possibility of complete destruction and loss of a building, may need to augment their disaster recovery plans to include the movement of people, the rapid acquisition of equipment and furniture, network connectivity, adequate workspace, and more. A corollary to this lesson learned is the need to assure that recovery procedures are well-documented and safeguarded so that they can be fully utilized when necessary. A second lesson is the need to back up data and applications. Without a comprehensive backup system that captures more than just an organization's data files, a significant amount of time can be lost trying to recreate applications, organize data, and reestablish user access. A corollary to this lesson learned is the need to fully and regularly test backup sites and media to ensure their reliability and functionality. The second principle focuses on the decentralization of operations and the effectiveness of distributed communications. Industry experts suggest recovery sites be located at least 20-50 miles away from the primary work site. Another lesson in this area is to ensure the ability to communicate with internal and external constituencies. The third principle involves the institutionalization of system redundancies to eliminate single points of weakness. The lesson of employing redundant service providers is applied primarily to telecommunications services.

### **Bilateral Interoperability through Enterprise Architecture**

Catania, Glen A; Hamilton, Jr , John A; Rosen, J D; Melear, John; Oct 2000; 10 pp.; In English; Original contains color illustrations

Report No.(s): AD-A468341; No Copyright; Avail.: Defense Technical Information Center (DTIC)

This paper addresses the important role of architecture planning for ensuring system interoperability in a network-centric coalition environment. As U.S. forces become more dependent upon coalition partners to support crises around the globe, systems interoperability becomes a major concern. This problem is more acute in the Pacific theater, where the USA has numerous bilateral agreements with allied nations and the degree of interoperability varies from country to country. A key to understanding interoperability shortfalls is documenting the 'as is' architecture for each allied nation to identify key information exchange requirements for critical C2 nodes. Enterprise architecture planning considers both the tactical and strategic need for information exchange in supporting the organization's mission. This is especially true with the plethora of C4ISR systems scattered throughout the U.S. Pacific Command (USPACOM) theater of operations where access to secure, quality data is vital to ongoing operations. HQ USPACOM recognized the need for documenting baseline architectures with the publication of USCINCPAC Instruction 2010-4. This instruction provided guidance to component commands on how to describe and construct systems and operational architectures. The Joint Forces Program Office was asked to assist with this effort at U.S. Alaskan Command (USALCOM) in the fall of 1999. The USALCOM architecture study, using a prototype

version of the Joint C4I Architecture Planning System (JCAPS), illustrated the utility of having a clearer picture of the enterprise architecture described in common lexicon, and the need to consolidate the numerous architectures that had been developed in recent years. In this paper, the authors outline a practical strategy for consolidating existing C4ISR architectures. Using their practical architectural success at USALCOM, they suggest that this methodology can be applied across large, combined, theaters of operation.

**Approximate Analysis of an Unreliable M/M/2 Retrial Queue**

Crawford, Brian P; Mar 2007; 84 pp.; In English; Original contains color illustrations

Report No.(s): AD-A468454; AFIT/GOR/ENS/07-05; No Copyright; Avail.: Defense Technical Information Center (DTIC)

This thesis considers the performance evaluation of an M/M/2 retrial queue for which both servers are subject to active and idle breakdowns. Customers may abandon service requests if they are blocked from service upon arrival, or if their service is interrupted by a server failure. Customers choosing to remain in the system enter a retrial orbit for a random amount of time before attempting to re-access an available server. We assume that each server has its own dedicated repair person, and repairs begin immediately following a failure. Interfailure times, repair times and times between retrials are exponentially distributed, and all processes are assumed to be mutually independent. Modeling the number of customers in the orbit and status of the servers as a continuous-time Markov chain, we employ a phase-merging algorithm to approximately analyze the limiting behavior. Subsequently, we derive approximate expressions for several congestion and delay measures. Using a benchmark simulation model, we assess the accuracy of the approximations and show that, when the algorithm assumptions are met, the approximation procedure yields favorable results. However, as the rate of abandonment for blocked arrivals decreases, the performance declines while the results are insensitive to the rate of abandonment of customers preempted by a server failure.

**Applying the Concept of Minimal Essential to Maintain Operational Continuity and Attain Mission Assurance During Internal and External Attacks on the Information Environment**

McCallam, Dennis H; Luzwick, Perry; Jun 2002; 18 pp.; In English; Original contains color illustrations

Report No.(s): AD-A467520; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA467520>

Operational continuity while under sustained physical and cyber attack is possible using the concept of operational continuity. To achieve operational continuity, in addition to a synchronized and coherent defense of the information environment, data resiliency must also be used. What takes data resiliency from theory to practice is the use of minimum essential data sets on critical information. Through frequent updating of critical information and its dispersion throughout a network, robust sets of essential data can be maintained. Because network centric warfare and information superiority are important in achieving military successes, data resiliency for operational continuity is essential for achieving mission assurance. Data resiliency and operational continuity are important features within Coherent Knowledge-based Operations(trademark). Continued research and operational testing is needed to mature the concept of operational continuity, such as integrated physical and cyber continuity of operations.

Contract(s)/Grant(s): F33615-02-C-3262; Proj-A013

Report No.(s): AD-A467371; No Copyright; Avail.: Defense Technical Information Center (DTIC)

The coordination of a team of distributed air vehicles requires a complex optimization, balancing limited communication bandwidths, non-instantaneous planning times and network delays, while at the same time trying to allocate limited resources to spatially diverse locations in a near-optimal fashion in a dynamic and uncertain environment. Given that, in this environment, the optimality of a given plan will not last very long when the information state is constantly changing and being updated, a new approach is proposed in this paper. Global-scope plans for the team are generated and distributed using the principle of emergent leadership to provide efficient plan generation and execution with minimal performance degradation compared to a centralized controller under delayed communications. This type of protocol is labeled the Decentralized Control Global Optimization (DCGO) protocol, and is discussed in this paper, along with some simulation results showing that this premise can produce good results in a realistic environment.

**Cooperative Multi-Agent Systems in Mobile Ad Hoc Networks**

Macker, Joseph P; Chao, William; Abramson, Myriam; Downard, Ian; Jan 2006; 8 pp.; In English; Original contains color illustrations

Report No.(s): AD-A466587; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA466587>

Two important enabling but evolving technologies supporting future DoD network-centric systems at the tactical edge are

mobile ad hoc networking (MANET) and Multi-Agent Systems (MAS). Despite their value in enabling more autonomous network system operation scenarios, open research and engineering questions remain regarding robust interoperability, standardization, and design of these two technologies. We describe recent research and development that is helping to better understand cross-layer design issues within both MAS and MANET. We describe the problem area and the open software components developed to support our research. We summarize recent modeling and simulation advances in a mixed MAS and MANET scenario environment. MANET multicast approaches for interagent communications are discussed and described. Some early analysis of MAS performance is presented using a variety of inter-agent MANET communication models. The behavior of MAS autonomous cooperative teamwork and role allocation within disruptive and dynamic MANET environments is examined. We conclude by outlining open issues and areas of further work.

ONLINE: <http://hdl.handle.net/100.2/ADA467386>

The continuous transformation of the US military into an integrated and a dominant 'full spectrum' capability requires a comprehensive and evolutionary system model (the objective) and a prescribed set of transformation processes (the means) whose incremental results are measurable against operational requirements. Given its sheer size and complexity, this military system must be partitioned into logical and semi-independent elements. The individual and ensemble performance of system elements must be objectively measured, and characterized by specific and reusable metrics. Taken together, the system model and the classes of metrics define a performance measurement framework (PMF). This paper outlines the design of a generalized and scalable performance measurement framework for the Navy's FORCENet environment.

**Critical Infrastructure: Control Systems and the Terrorist Threat**

Shea, Dana A; Jan 20, 2004; 23 pp.; In English

Report No.(s): AD-A467307; No Copyright; Avail.: Defense Technical Information Center (DTIC)

Much of the U.S. critical infrastructure is potentially vulnerable to cyber-attack. Industrial control computer systems involved in this infrastructure are specific points of vulnerability, as cyber-security for these systems has not been previously perceived as a high priority. Industry sectors potentially affected by a cyber-attack on process control systems include the electrical, telephone, water, chemical, and energy sectors. The federal government has issued warnings regarding increases in terrorist interest in the cyber-security of industrial control systems, citing international terrorist organization interest in critical infrastructure and increases in cyber-attacks on critical infrastructure computer systems. The potential consequences of a successful cyber-attack on critical infrastructure industrial control systems range from a temporary loss of service to catastrophic infrastructure failure affecting multiple states for an extended duration.

Contract(s)/Grant(s): FA8721-05-C-0003

Report No.(s): AD-A468801; CMU/SEI-2006-TN-041; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA468801>

The Insider Threat Study, conducted by the U.S. Secret Service and Carnegie Mellon University's Software Engineering Institute CERT Program, analyzed insider cyber crimes across U.S. critical infrastructure sectors. The study indicates that management decisions related to organizational and employee performance sometimes yield unintended consequences that increase risk of insider attack. The problem is exacerbated by a lack of tools for understanding insider threat, analyzing risk mitigation alternatives, and communicating results. The goal of Carnegie Mellon University's Management and Education of the Risk of Insider Threat (MERIT) project is to develop such tools. MERIT uses system dynamics to model and analyze insider threats and produce interactive learning environments. These tools can be used by policy makers, security officers, information technology and human resource personnel, and management. The tools help these users to understand the problem and assess risk from insiders based on simulations of policies, and on cultural, technical, and procedural factors. This technical note describes the MERIT insider threat model and simulation results.

**Internet: An Overview of Key Technology Policy Issues Affecting Its Use and Growth**

Smith, Marcia S; Moteff, John D; Kruger, Lennard G; McLoughlin, Glenn J; Seifert, Jeffrey W; Moloney Figliola, Patricia; Dec 29, 2004; 48 pp.; In English

Report No.(s): AD-A469049; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA469049>

The growth of the Internet may be affected by a number of issues being debated by Congress. This report summarizes several key technology policy issues. 1. Internet privacy issues encompass concerns about information collected by website operators and by spyware, and about the extent to which law enforcement officials are allowed to monitor an individual's Internet activities. Congress has passed several laws already, but continues to debate what other legislation may be needed. 2. Concerns about computer and Internet security are prevalent in both the government and private sectors. Issues have also been raised about the vulnerability of the nation's critical infrastructures (e.g. electrical power supply) to cyber attacks. Issues for Congress include oversight and improvement of the protection of federal computer systems and cooperation with and between the private sectors. 3. Broadband Internet access gives users the ability to send and receive data at speeds far greater than current Internet access over traditional telephone lines. With deployment of broadband technologies beginning to accelerate, Congress is seeking to ensure fair competition and timely broadband deployment to all sectors and geographical locations of American society. 4. Since the mid-1990s, commercial transactions on the Internet called electronic commerce (e-commerce) have grown substantially. Among the issues facing Congress are encryption procedures to protect e-commerce transactions, extension of the three-year tax moratorium on domestic e-commerce taxation, the impact of the USA PATRIOT Act, and how the policies of the European Union and the World Trade Organization (WTO) may affect U.S. e-commerce activities.

Report No.(s): AD-A466108; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA466108>

Prognostic techniques are intricately tied to the physics of incipient-fault-to-failure progression, and hence most prognostic research has focused on developing techniques for a range of components such as rotating machinery parts. The research and development of such techniques has relied on the theories of material science, structural mechanics, domain expertise, as well as empirical studies such as accelerated run-to-failure testing. Even after prognostic models have been developed and operationally validated for various components of a system, the challenge remains how prognostic assessments from individual components of a system (such as the aircraft engine) should be used to make maintenance and inventory management decisions. In this paper, we describe our research where the primary focus is to bridge the gap between the individual component prognostics and the system-level reasoning required to support maintenance and inventory management decisions. The research involves integration of component health assessment and an information fusion mechanism that operates in conjunction with a higher-level reasoning engine which utilizes system level structural and functional dependencies to generate a system availability analysis that leads directly actionable decision-making tasks for the inventory and maintenance management systems. The inventory management decision systems involve predicting spares requirements and when integrated with remote health monitoring and intelligent diagnostics and prognostics, can assess different spares allocation schemes and optimize inventory management by maximizing system availability within budget constraints.

### **An Expose of Autonomous Agents in Command and Control Planning**

Matthews, Christopher; Jun 2004; 44 pp.; In English; Original contains color illustrations

Report No.(s): AD-A466145; XA-CERDEC/C2/NJ; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA466145>

Autonomous agents are a value-added technology to facilitate integrating logistics into the in-theater maneuver planning processes. Conventionally, logistics impacts that can affect the successful prosecution of a maneuver plan are only analyzed or discovered after the maneuver course of action (COA) has been finalized. Logistic oversights, assumptions, or faulty assessments can lead to an unsupportable maneuver plan that must be re-planned or thrown away; a situation that may require unafforded time. We implemented autonomous agents to provide a near-real-time, logistics feedback loop to augment the on-going, dynamic battle planning processes. As the battle plan is progressing, a logistics plan, too, is being formulated

whereby logistic assets are being tasked to support the tentative maneuver plan, dynamically. This logistics plan that maps to the current battle plan is the mechanism whereby resource management and allocation impacts are discovered and, thus, can alert the command and control (C2) planners of logistics issues. The coupling of logistics and C2 planning saves time, effort, and better utilizes resources and personnel. But, the major benefit is the adaptation of this model when applied to the execution-monitoring and real-time prosecution of a maneuver plan using unfolding battlefield events as re-planning inputs to the current, executing plan.

**Information Fusion for Hypothesis Generation under Uncertain and Partial Information Access Situation**

Kitano, Hiroaki; Jul 21, 2006; 83 pp.; In English

Contract(s)/Grant(s): FA5209-04-C-0003

Report No.(s): AD-A466198; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA466198>

The challenge for most artificial systems that operate autonomously in the real world environment is how to cope with dynamic environment with limited, uncertain, and noisy information. Artificial intelligence and intelligent robotics research has been trying to solve such a problem by either improving accuracy of recognition systems or by integrating multiple source of information. In addition, architectural issues has been discussed on whether classical Sense-Model-Plan-Act architecture or the subsumption architecture better suits for autonomous agents. Information fusion issue is tightly coupled with behavioural control as overall performance of the autonomous system is the ultimate concern. The work performed focused on identifying possible system architecture for realistic information fusion and corresponding reactions under uncertain environments. Our research starts from analysing issues in existing paradigm of autonomous agent and AI architectures, redefine needs, and propose a suitable architecture. In this research, it was essential to learn from biological systems where various species has evolved to adapt to uncertain and dynamic environment for survival.

**Introducing Actions into Qualitative Simulation**

Forbus, Kenneth D; Aug 1988; 14 pp.; In English

Contract(s)/Grant(s): N00014-85-K-0225

Report No.(s): AD-A466199; UIUCDCS-R-88-1452; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA466199>

Many potential uses of qualitative physics, such as robot planning and intelligent computer-aided engineering, require integrating physics with actions taken by agents. This paper proposes to augment qualitative simulation to include the effects of actions to form action-augmented envisionments. The action-augmented envisionment incorporates both the effects of an agent's actions and what will happen in the physical world whether or not the agent does something. Consequently, it should provide a richer basis for planning and procedure generation than any previous representation. This paper defines action augmented envisionments and an algorithm for directly computing them, along with an analysis of its complexity and suitability for different kinds of problems. We describe our initial implementation and discuss potential extensions, including incremental algorithms.

**Self-Organized Air Tasking: Examining a Non-Hierarchical Model for Joint Air Operations**

Bordeaux, John; Jun 2004; 89 pp.; In English

Report No.(s): AD-A466243; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA466243>

The hypothesis of this paper proposes that it is possible to structure a non-hierarchical approach to air tasking in the conduct of Joint air operations. For the private sector, advances in information and communication technologies have led to innovations in organizational structures in order to know more across the enterprise. However, the application of these 'value

network' principles has not been fully applied to the processes upon which the U.S. organizes for Joint force operations. A non-hierarchical model is constructed for the tasking of air assets in order to test an agent-based approach to the servicing of targets in an air campaign, using agent-based simulation techniques and models established by Epstein & Axtell (SugarScape) within the Santa Fe Institute's Swarm agent modeling environment.

ONLINE: <http://hdl.handle.net/100.2/ADA466418>

A general problem in qualitative physics is determining the consequences of assumptions about the behavior of a system. If the space of behaviors is represented by an envisionment, many such consequences can be represented by pruning states from the envisionment. This paper provides a formal logic of occurrence which justifies the algorithms involved and provides a language for relating specific histories to envisionments. The concepts and axioms are general enough to be applicable to any system of qualitative physics. We further propose the concept of transverse quantities as a general solution to qualitative versions of Zeno's paradox. The utility of these ideas is illustrated by a rational reconstruction of the pruning algorithms used in FROB, a working AI program.

An important aspect of qualitative spatial reasoning is understanding mechanisms. This paper presents a qualitative analysis of motion for mechanical linkages. In particular, we describe how to analyze the behavior of a mechanism which has a movable axis. The basic idea of our approach is to represent relative motions of the link in terms of quadrants (qualitatively representing the direction relative to a global reference frame) and relative inclinations relative to the x-axis. Using this representation ; we can derive all the possible motions of a system of linkages. This idea has been implemented and tested on several examples.

Report No.(s): AD-A466425; UIUCDCS-R-90-1572; UILU-ENG-90-1710; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA466425>

Incrementally maintaining a qualitative understanding of physical system behavior based on observations is crucial to real-time process monitoring, control, and diagnosis . This paper describes the DATMI theory for dynamically maintaining a pinterp-space, a concise representation of local and global interpretations consistent with the observations over time. Each interpretation signifies alternative paths of states in a qualitative envisionment . Representing a space of interpretations, instead of just a 'current best' one, avoids the need for extensive backtracking to handle incomplete or faulty data. Domain-specific knowledge about state and transition probabilities can be used to maintain the best working interpretation as well.

Domain-specific knowledge about durations of states and paths of states can also be used to further constrain the interpretation space. When all these constraints lead to inconsistencies, faulty-data hypotheses are generated and then tested by adjusting the interpretation space. The time and space complexity of maintaining the interpretation space is polynomial in the number of measurements and environment states.

**A Qualitative Approach to Rigid Body Mechanics**

Nielson, Paul E; Nov 1988; 157 pp.; In English

Contract(s)/Grant(s): N00014-85-K-0225

Report No.(s): AD-A466441; UIUCDCS-R-88-1469; UILU-ENG-88-1775; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA466441>

In order for a program to interact with the world as well as people do, we must provide it with a great deal of commonsense about the way things work. Reasoning about the geometric interactions and motions of objects is an important part of that commonsense. Some of the most complex problems we solve involve reasoning about mechanical devices, such as gears, cams, and docks. Qualitative mechanics is the symbolic analysis of the motions and the geometric interactions of physical objects. This thesis describes a theory for analysis of rigid body mechanisms, an important subset of qualitative mechanics problems. This theory has been implemented and tested on several mechanisms including a mechanical clock. Beginning with drawings of the parts involved we compute a discrete symbolic description showing changes in position and motion of the parts of the mechanism as well as its global behavior.

ONLINE: <http://hdl.handle.net/100.2/ADA466516>

The US Army Battle Command Battle Lab conducted an experiment with the Integrated Course of Action Critiquing and Elaboration System (ICCES) -- an integrated decision aid for performing several critical steps of a US Army Brigade Military Decision Making Process: from capturing a high-level Course of Action to producing a detailed analysis and plan of tasks. The system integrated several available technologies based largely on AI techniques, ranging from qualitative spatial interpretation of course-of-action diagrams to interleaved adversarial planning and scheduling. The experiment dispelled concerns about potential negative impacts of such tools on the creative aspects of the art of war, showed a potential for dramatic time savings in the MDMP process, and confirmed the maturity and suitability of the technologies for near-future deployment.

Understanding the complex brain computations leading to object recognition requires quantitatively characterizing the information represented in inferior temporal cortex (IT), the highest stage of the primate visual stream. A read-out technique based on a trainable classifier is used to characterize the neural coding of selectivity and invariance at the population level. The activity of very small populations of independently recorded IT neurons (~100 randomly selected cells) over very short

time intervals (as small as 12.5 ms) contains surprisingly accurate and robust information about both object identity and category, which is furthermore highly invariant to object position and scale. Significantly, selectivity and invariance are present even for novel objects, indicating that these properties arise from the intrinsic circuitry and do not require object-specific learning. Within the limits of the technique, there is no detectable difference in the latency or temporal resolution of the IT information supporting so-called categorization (a.k. basic level) and identification (a.k. subordinate level) tasks. Furthermore, where information, in particular information about stimulus location and scale, can also be readout from the same small population of IT neurons. These results show how it is possible to decode invariant object information rapidly, accurately and robustly from a small population in IT and provide insights into the nature of the neural code for different kinds of object-related information.

**Link Analysis for Dynamic Planning and Scheduling**

Marcus, Sherry E; Frantz, Albert G; Beyerle, John A; Jun 2002; 16 pp.; In English; Original contains color illustrations  
Report No.(s): AD-A467521; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA467521>

This paper discusses an innovative approach to military campaign planning and resource allocation, and scheduling based on link analysis and mixed integer programming. Link analysis explores relations among large numbers of similar or different types of objects. Mixed integer programming solves problems containing both integer variable constraints, like aircraft numbers, as well as linear (real) variable constraints like probability of destruction or risk to aircraft. ATO Link (Air Tasking Order Link Analysis) combines these software technologies to more optimally use resources throughout all phases of the air campaign planning and execution process. These two mature, matrix-based and computationally well behaved technologies (link analysis and mixed integer programming) have the potential to scale to very large plans, while more optimally allocating and scheduling limited resources. The ATO Link prototype is implementing an effects-based operations (EBO) concept for the air campaign-planning domain. This effort has the potential to significantly accelerate the military campaign planning and execution replanning process. The planner will be able to rapidly explore more courses of action, resulting in more dynamic planning and execution to achieve full spectrum dominance in military operations more responsive to the strategic goals of the NCA (National Command Authority).

ONLINE: <http://hdl.handle.net/100.2/ADA467522>

In the highly dynamic and information rich environment of military submarine operations, the Commanding Officer must make split second decisions that could ultimately result in the destruction or survival of Ownship or the accomplishment of its designated mission. Despite extensive training and expertise, the fog of war often shadows real world encounters. Pieces of the tactical puzzle may be scattered, broken, and/or even missing. It is the Commanding Officer's job to meld the fog into a clear tactical picture and intuitively decide upon the optimal course of action to obtain his mission goals and objectives. A mathematically derived optimal solution could be used as a decision making aid for the Commanding Officer to enhance Ownship's performance. A highly innovative hybrid Bayesian/differential game modeling approach is being developed utilizing 21CSI's Agent Enhanced Decision Guide Environment (AEDGE(TradeMark)), a COTS based agent architecture, to tackle this problem. The resulting decision aid will facilitate submarine operations by addressing such practical problems as tradeoff evaluation for course of action and maintaining tactical advantage while avoiding counter detection.

**Automatic Author Profiling of Online Chat Logs**

Lin, Jane; Mar 2007; 289 pp.; In English

Report No.(s): AD-A467087; No Copyright; Avail.: Defense Technical Information Center (DTIC)

Now that the Internet has become easily accessible and more affordable, a larger number of people spend more time in front of a computer. Some spend so much time on the Internet that they develop virtual friendships and relationships with people with whom they have regular contact via a computer screen and the Internet. While most of the dialogue exchanged online is not harmful or illegal, there are those with dishonest intentions lurking online. These people can be breaking the law by seducing a minor virtually or even going as far as meeting a minor in person. Terrorists can also use the Internet to facilitate communication and plan attacks. Since e-mail is one of the original means of communication on the Internet, methods for determining the author of an e-mail have already been studied. So far, however, no significant experimentation with online chat logs exists. The first part of this study is comprised of generating an unbiased, random, and broad corpus of online chat logs. Having a general corpus with a wide-range of topics allows the results of this research to be applied in the most general case. Because developing a complete solution to the authorship attribution problem for chat logs is difficult, we limit our scope to predicting gender and age. The ultimate goal of this work, then, is to facilitate the jobs of law enforcers in tracking down criminals who attempt to use the Internet as a hiding place.

**Capacity Building and Sustainment: Focusing on the End-State for Homeland Security**

Burch, James A; Mar 2007; 143 pp.; In English

Report No.(s): AD-A467089; No Copyright; Avail.: Defense Technical Information Center (DTIC)

Since 9/11, the U.S. has developed policies to counter the terrorist threat. Integral to those policies is preparedness. Homeland Security Presidential Directive 8 states that preparedness will include, 'capacity building prevention activities such as information gathering, detection, deterrence, and collaboration related to terrorist attacks.' Despite the criticality of capacity building in relation to preparedness, the term is not defined. There has been no discussion on what capacity building means. The term is often equated to federal assistance or used interchangeably with capabilities and capability based planning. Capacity building strategies, however, are distinct and link into wider economic, political, and societal issues. Despite capacity building's criticality to preparedness and sustainment, various or ambiguous interpretations will translate to differences in strategic priorities. This thesis will examine the existing strategies to determine the linkage between capacity building, preparedness, sustainment, capability, capability based planning, and the envisioned end-state. It will also address sustainment issues and homeland security costs based on differing capacity building interpretations. The end product is a capacity building definition that captures the costs and variables with building and sustaining capabilities. This thesis will also demonstrate how capacity building measures serve as the foundational premise for a sound homeland security strategic plan.

**Issues Related to Experience & Automated Agent Technology in Synthetic Task Performance**

Covert, Michael D; Riddle, Dawn L; Gordon, Thomas; Miles, Donald; Hoffman, Kimberly; King, Thomas; Elliott, Linda; Dalrymple, Mathieu; Schiflett, Samuel; Chaiken, Scott; Jun 2001; 14 pp.; In English; Original contains color illustrations

Report No.(s): AD-A467735; No Copyright; Avail.: Defense Technical Information Center (DTIC)

The U.S. Air Force's E-3 AWACS is a highly mobile early warning platform providing both surveillance and command and control functions for tactical and air defense forces. The weapons suite within the AWACS is occupied by multiple weapons directors (WD) and a Senior Director (SD), is critical to mission success. The cognitive demand placed on these team members is extremely high. Elliott, Stoyen and Chaiken (2000) note the limits of human cognitive processing relative to this demand and suggest agent technology has the potential to offer effective information and decision support the human operator. This paper examines relationships among experience, performance and the use of agent technology in a decision support role within a synthetic task. We first examine experience related factors leading to utilization of the agent, and subsequently explore the relationship between experience and performance, and how the presence of an automated agent might impact that relationship. Two interesting findings are presented: 1) differences in qualitative experience impact the degree to which

weapons directors utilize agent assistance, and 2) the nature of the experience performance relationship changes when agent assistance is available.

**Lethality and Autonomous Robots: An Ethical Stance**

Arkin, Ronald C; Moshkina, Lilia; Jan 2007; 4 pp.; In English

Contract(s)/Grant(s): W911NF-06-1-0252

Report No.(s): AD-A468122; No Copyright; Avail.: Defense Technical Information Center (DTIC)

This paper addresses a difficult issue confronting the designers of intelligent robotic systems: their potential use of lethality in warfare. To fully understand the consequences of the deployment of autonomous machines capable of taking human life under military doctrine and tactics, a systematic ethical evaluation needs to be conducted to guide users (e.g., warfighters), system designers, policy makers, and commanders regarding the intended future use of this technology. This study needs to be conducted prior to the deployment of these systems, not as an afterthought. Toward that end, a 3-year research effort on this topic is being conducted at the Georgia Institute of Technology for the Army Research Office, of which the authors are currently in the first year. Two topics are being investigated: What is acceptable?, and What can be done? A survey is being conducted on the use of lethality by autonomous systems. The survey investigates the points of view of various demographic groups on this issue, including the public, robotics researchers, policy makers, and military personnel. The authors also are designing a computational implementation of an ethical code within an existing autonomous robotic system (i.e., an artificial conscience) that will be able to govern an autonomous system's behavior in a manner consistent with the rules and laws of war. This paper describes the survey's design and administration. The independent variables used for the survey are as follows: (1) community type; (2) level of authority; (3) demographic variables, such as age, gender, level of education, etc.; and (4) the extent of participants' knowledge of robots and their capabilities. In addition to finding out what the terms of acceptance are for using lethal robots in warfare, the authors would like to see if, and how, the level of acceptance varies among the different community types, according to certain demographics factors, and for the three levels of autonomy.

**Signals Intelligence Support to the Cockpit**

Van Nederveen, Gilles; Jun 2001; 16 pp.; In English

Report No.(s): AD-A468296; No Copyright; Avail.: Defense Technical Information Center (DTIC)

A continuing challenge for the operational and intelligence communities, is the quest to get relevant cryptological products to warfighters engaged in combat operations. During World War II both 8th and 9th Air Forces used specialized signals intelligence squadrons (low-grade ciphers or open transmissions) to defeat the Luftwaffe in the air and on air fields. After the surprise of the MiG-15 in Korea the USAFSS established intercept sites to monitor controller to pilot radio links in MiG alley. Data collected was passed to radar sites that helped to place USAF F-86 in optimal intercept position. The Air Force established Teaball at NKP AB, in Thailand which incorporated EC-121 data, highly classified voice intercept data and IFF data to develop a composite air picture. The three case studies examine the balance between operational immediacy and the intelligence communities desire to protect intelligence sources and develop analysis prior to passing intelligence. Linguistic challenges and need to protect operational security are factors in the study.

**Making Network Intrusion Detection Work With IPsec**

McLain, C D; Studer, A; Lippmann, R P; May 11, 2007; 31 pp.; In English; Original contains color illustrations

Contract(s)/Grant(s): FA8721-05-C-0002

Report No.(s): AD-A468587; TR-1121; No Copyright; Avail.: Defense Technical Information Center (DTIC)

Network-based intrusion detection systems (NIDSs) are one component of a comprehensive network security solution. The use of IPsec, which encrypts network traffic, renders network intrusion detection virtually useless unless traffic is decrypted at network gateways. One alternative to NIDSs, host-based intrusion detection systems (HIDSs), provides some of the functionality of NIDSs but with limitations. HIDSs cannot perform a network-wide analysis and can be subverted if a host is compromised. We propose an approach to intrusion detection that combines HIDS, NIDS, and a version of IPsec that encrypts the header and the body of IP packets separately. We refer to the latter generically as TwoKey IPsec. We show that all of the network events currently detectable by the Snort NIDS on un-encrypted network traffic are also detectable on encrypted network traffic using this approach. The NIDS detects network-level events that HIDSs have trouble detecting and HIDSs detect application-level events that can't be detected by the NIDS.

**Implementing a Low-Cost Long-Range Unmanned Underwater Vehicle: The SeaDiver Glider**

Gassier, David; Rebollo, Jerome; Dumonteil, Romain; Jan 9, 2007; 79 pp.; In English; Original contains color illustrations

Report No.(s): AD-A468591; NPS-MV-07-001; No Copyright; Avail.: Defense Technical Information Center (DTIC)

The SeaDiver Glider is an UUV (Unmanned Underwater Vehicle) used for underwater prospecting at a low cost with a long distances coverage (approx = 1400 miles). It moves without propellers by changing its buoyancy with the help of ballast and its hydrodynamics profile reminiscent of a wing (model NACA0022). Ballast inflation makes it raise the surface, ballast deflated make it submerge the bottom. Ballast is positioned in front of its structure in an optimal position to use the lift of its shape. This up-and-down movement is converted into horizontal displacement by the wing-shape of the SeaDiver Glider. It mimics sinusoidal movements from the sea surface down to 300 feet underwater. This vehicle is able to traverse from one point to another without human intervention.

Report No.(s): AD-A466726; MIT-CSAIL-TR-2005-079; AIM-2005-034; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA466726>

We describe a state-space tracking approach based on a Conditional Random Field (CRF) model, where the observation potentials are learned from data. We find functions that embed both state and observation into a space where similarity corresponds to L1 distance, and define an observation potential based on distance in this space. This potential is extremely fast to compute and in conjunction with a grid-filtering framework can be used to reduce a continuous state estimation problem to a discrete one. We show how a state temporal prior in the grid-filter can be computed in a manner similar to a sparse HMM, resulting in real-time system performance. The resulting system is used for human pose tracking in video sequences.

Contract(s)/Grant(s): W81XWH-06-1-0291

Report No.(s): AD-A468685; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA468685>

It is widely recognized that the diagnosis of early lung cancer should entail a multimodal approach taking age clinical history radiology and cytology/histopathology into consideration. Most radiological assessments should be combined with microscopic analysis of tissue samples to reach a diagnosis. Our proposed new universal computer-aided diagnosis (UCAD) system combining anatomical knowledge based CAD (AK-CAD) and computer-aided pathological diagnosis (CAPD) which provides combined and correlated radiological and cytopathological features in diagnosis of early lung cancers will give radiologists and pathologists an efficient and automatic tool for their diagnosis. The development of a novel automatic quantitative assessment of radiological-pathological combined and correlated features is proposed here for diagnosis of early lung cancer. The integrated AK-CAD and CAPD system will provide radiologists and pathologists an efficient and automatic tool for their detection and diagnosis of early lung cancers.

**Finding Stable Causal Interpretations of Equations**

Skorstad, Gordon; Jan 9, 1991; 15 pp.; In English

Contract(s)/Grant(s): N00014-85-K-0225

Report No.(s): AD-A468852; UIUCDCS-R-91-1654; UILU-ENG-91-1701; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA468852>

The causal ordering procedure of Iwasaki and Simon [5,6] provides a means for uncovering causal dependencies among variables constrained by a set of mathematical equations. This paper examines the procedure from a qualitative modeling viewpoint and addresses one of its limitations: context sensitivity. Causal dependencies predicted by the procedure may change depending on the context or scenario in which the underlying physical system operates. This prevents the qualitative modeler from using causal ordering to determine, a priori, a single causal interpretation of equations describing some phenomenon. We show that in some cases it is possible to find clusters of equations that possess causal stability. That is, their causal dependencies are the same in all scenarios consistent with the equations' modeling viewpoint. These unidirectional equations help the qualitative modeler by providing a stable, unambiguous causal interpretation. To identify such equations we define conditions sufficient to guarantee causal stability. In addition, we show that unidirectional equation sets are causally independent of equations outside their set. Thus, they add compositionality to the causal modeling task. Lastly, we demonstrate our ideas by uncovering the causal dependencies of Hooke's law, Gauss's law for electricity, and Bernoulli's equation.

**Vector Pursuit Path Tracking for Autonomous Ground Vehicles**

Wit, Jeffrey S; Aug 2000; 315 pp.; In English; Original contains color illustrations

Report No.(s): AD-A468928; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA468928>

The Air Force Research Laboratory at Tyndall Air Force Base, Florida, has contracted the University of Florida to develop autonomous navigation for various ground vehicles. Autonomous vehicle navigation can be broken down into four tasks. These tasks include perceiving and modeling the environment, localizing the vehicle within the environment, planning and deciding the vehicle's desired motion, and finally, executing the vehicle's desired motion. The work presented here focuses on tasks of deciding the vehicle's desired motion and executing the vehicle's desired motion. The third task above involves planning the vehicle's desired motion as well as deciding the vehicle's desired motion. In this work it is assumed that a planned path already exists and therefore only a technique to decide the vehicle's desired motion is required. Screw theory can be used to describe the instantaneous motion of a rigid body, i.e., the vehicle, relative to a given coordinate system. The concept of vector pursuit is to calculate an instantaneous screw that describes the motion of the vehicle from its current position and orientation to a position and orientation on the planned path. Once the desired motion is determined, a controller is required to track this desired motion. The fourth task for autonomous navigation is to execute the desired motion. In order to accomplish this task, two fuzzy reference model learning controllers (FRMLCs) are implemented to execute the vehicle's desired turning rate and speed. The controllers are designed to be dependent on certain vehicle characteristics such as the maximum vehicle speed maximum turning rate. This is done to facilitate the transfer of these controllers to different vehicles. The vector pursuit path-tracking method and the FRMLCs were first tested in simulation by modeling the Navigation Test Vehicle (NTV) developed by the Center for Intelligent Machines and Robotics (CIMAR) at the University of Florida.

**Compliant Formation Control of an Autonomous Multiple Vehicle System**

MacArthur, Erica Z; Dec 2006; 99 pp.; In English; Original contains color illustrations

Report No.(s): AD-A468947; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA468947>

This research identifies a new strategy called 'compliant formation control' which may be used to coordinate the navigational structure of a team of autonomous vehicles. This technique controls the team's motion based on a given, desired formation shape and a given, desired set of neighboring separation distances, wherein the formation shape is considered general two-dimensional. The strategy establishes how to select, place, and use virtual springs and dampers that conceptually 'force' proper interspacing between neighboring team members. The objective is to continuously maintain, in the most optimal way, the desired formation as team motion proceeds. Research in multiple vehicle systems has addressed follow-the-leader techniques, cooperative mapping, reconnaissance and communication, and learning and adaptation techniques. Each of these areas is interested in multiple vehicle coordination techniques... This research provides a strategy for formation control that is based on a desired formation shape. In practice, actual robot separation distances will be measured relative to smarter, leader robots that have known position and orientation information at all times (e.g., GPS or INS). The control strategy subsequently commands, in an optimal way, each vehicle by providing a heading and velocity necessary to maintain the desired formation. Such requisite commands result from modeling the compliant displacements of team members as they travel in a network of virtual springs and dampers. One of the primary contributions of this work is the development of a methodology to determine the internal behaviors for the individual mobile robots in order to achieve a desired global formation for the entire system. One of the motivations here is to reduce the cost and increase the navigational effectiveness of a team of mobile robots, since only a select few team members (leaders) are required to be equipped with expensive GPS or INS equipment.

ONLINE: <http://hdl.handle.net/100.2/ADA468987>

Motion planning and control for autonomous vehicles are complex tasks that must be done in order for a ground robot

to operate in a cluttered environment. This dissertation presents the theory, implementation, and test results for some new and novel Receding Horizon Control (RHC) techniques that allow these tasks to be unified into one. The first new method is called Heuristic Receding Horizon Control (HRHC), and uses a modified A\* search to fulfill the online optimization required by RHC. The second is called Dual-Frequency Receding Horizon Control (DFRHC), and is used to simplify the trajectory planning process during the RHC optimization. Both methods are combined together to form a practical implementation, which is discussed in detail. The autonomous ground vehicle, the NaviGator, developed at the Center for Intelligent Machines and Robotics, serves as a platform for the implementation and testing discussed.

This paper presents an overview of the newly formed Joint Center for Unmanned Ground Vehicles (JC-UGV) located at the Army's Detroit Arsenal in Warren, Michigan. The center will provide a focus to ground vehicle robotics by bringing together research and development as well as acquisition and sustainment to manage the life cycle of defense robotic systems. The central mechanism the center will use to bring together all of these aspect is a system integration laboratory (SIL) environment. The robotics SIL will include both hardware and simulation and be based upon a distributed simulation environment. This will allow researchers, industry and Government partners all over the country to work on very complex problem. By bringing together university, industry and Government to advance defense robotics our customer, the war fighter, will be ultimately well served in the end.

**A Weighted Essentially Non-Oscillatory Numerical Scheme for a Multi-Class LWR Model**

Zhang, Mengping; Shu, Chi-Wang; Wong, George C; Wong, S C; Jan 2002; 45 pp.; In English

Contract(s)/Grant(s): DAAD19-00-1-0405; DMS-9804985

Report No.(s): AD-A466239; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA466239>

In this paper we present a high order weighted essentially non-oscillatory (WENO) scheme for solving a multi-class extension of the Lighthill-Whitham-Richards (LWR) model. We first review the multi-class LWR model and present some of its analytical properties. We then present the WENO schemes, which were originally designed for computational fluid dynamics problems and for solving hyperbolic conservation laws in general, and demonstrate how to apply these to the present model. We found through numerical experiments that the WENO method is vastly more efficient than the low order Lax-Friedrichs scheme, yet both methods converge to the same solution of the physical model. It is especially interesting to observe the small staircases in the solution which are completely missed out, because of the numerical viscosity, if a lower

order method is used without a sufficiently refined mesh. To demonstrate the applicability of this new, efficient numerical tool, we study the multi-class model under different parameter regimes and traffic stream models. We consider also the convergence of the multi-class LWR model when the number of classes goes to infinity. We show that the solution converges to a smooth profile without staircases when the number of classes increases.

**Phase-Shift-Based Time-Delay Estimators for Proximity Acoustic Sensors**

Li, Xi; Larsson, Erik G; Sheplak, Mark; Li, Jian; Jan 2002; 11 pp.; In English

Contract(s)/Grant(s): N00014-00-1-0105

Report No.(s): AD-A466266; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA466266>

Time-delay estimation is important in a wide range of applications in oceanic engineering. In this paper, we present a novel time-delay estimation algorithm based on maximum likelihood theory for the case that the measurements are corrupted by colored or nonuniform zero-mean Gaussian noise. It turns out that the likelihood function associated with the problem is highly oscillatory, and we propose a computationally efficient technique to maximize this function. Our algorithm first obtains an initial estimate based on a smooth approximate cost function, and then refines this estimate based on the true cost function. Simulation results show that our estimator outperforms a traditional phaseshift based estimator, and that the estimation error approaches the Cramer-Rao bound (CRB) when the signal-to-noise ratio (SNR) increases without bound.

**Fault-Tolerant Parallel Algorithms for Adaptive Matched-Field Processing on Distributed Array Systems**

Cho, Kilseok; George, Alan D; Subramaniyan, Raj; Sep 24, 2004; 19 pp.; In English; Original contains color illustrations

Contract(s)/Grant(s): N00014-99-1-0278

Report No.(s): AD-A466282; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA466282>

Continuous innovations in adaptive matched-field processing (MFP) algorithms have presented significant increases in computational complexity and resource requirements that make development and use of advanced parallel processing techniques imperative. In real-time sonar systems operating in severe underwater environments, there is a high likelihood of some part of systems exhibiting defective behavior, resulting in loss of critical network, processor, and sensor elements, and degradation in beam power pattern. Such real-time sonar systems require high reliability to overcome these challenging problems. In this paper, efficient fault-tolerant parallel algorithms based on coarse-grained domain decomposition methods are developed in order to meet real-time and reliability requirements on distributed array systems in the presence of processor and sensor element failures. The performance of the fault-tolerant parallel algorithms is experimentally analyzed in terms of beamforming performance, computation time, speedup, and parallel efficiency on a distributed testbed. The performance results demonstrate that these fault-tolerant parallel algorithms can provide real-time, scalable, lightweight, and fault-tolerant implementations for adaptive MFP algorithms on distributed array systems.

ONLINE: <http://hdl.handle.net/100.2/ADA466330>

Statistical machine translation (SMT) treats the translation of natural language as a machine learning problem. By examining many samples of human-produced translation, SMT algorithms automatically learn how to translate. SMT has made tremendous strides in less than two decades, and many popular techniques have only emerged within the last few years. This survey presents a tutorial overview of state-of-the-art SMT at the beginning of 2007. We begin with the context of the

current research, and then move to a formal problem description and an overview of the four main subproblems: translational equivalence modeling, mathematical modeling, parameter estimation, and decoding. Along the way, we present a taxonomy of some different approaches within these areas. We conclude with an overview of evaluation and notes on future directions.

**A Multivariate Magnitude Robust Control Chart for Mean Shift Detection and Change Point Estimation**

Harrell, Ryan M; Mar 2007; 114 pp.; In English; Original contains color illustrations

Report No.(s): AD-A466635; AFIT/GOR/ENS/07-09; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA466635>

Statistical control charts are often used to detect a change in an otherwise stable process. This process may contain several variables affecting process stability. The goal of any control chart is to detect an out-of-control state quickly and provide insight on when the process actually changed. This reduces the off-line time the quality engineer spends assigning causality. In this research, a multivariate magnitude robust chart (MMRC) was developed using a change point model and a likelihood-ratio approach. Here the process is considered in-control until one or more normally distributed process variables permanently and suddenly shifts to out-of-control, stable value. Using average run length (ARL) performance and the relative mean index (RMI), the MMRC is compared to the multivariate cumulative sum (MC1) and the multivariate exponentially weighted moving average (MEWMA). These results show the MMRC performs favorably to the MC1 and MEWMA when the process is initially in-control before shifting out-of-control. Additionally, the MMRC provides an estimate for the change point and out-of-control mean vector. This change point estimator is shown effective for medium to large sudden mean shifts.

**Automatic Target Recognition User Interface Tool**

Kerns, David A; Mar 2007; 150 pp.; In English; Original contains color illustrations

Report No.(s): AD-A466682; AFIT/GOR/ENS/07-15; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA466682>

A computer tool to aid in selecting the best Automatic Target Recognition (ATR) algorithm is developed. The program considers many quantifiers, accepts user-defined parameters, allows for changes in the operational environment and presents results in a meaningful way. It is written for Microsoft Excel. An ATR algorithm assigns a class label to a recognized target. General designations can include 'Friend' and 'Foe.' The error of designating 'Friend' as 'Foe' as well as 'Foe' as 'Friend' comes with a high cost. Studying each algorithm's error can minimize this cost. Receiver Operating Characteristic (ROC) curves provide only information on the probabilities given a system state of declaring up to three class labels: 'True,' 'False' or 'Unknown.' Other quantifiers, including an alternate ROC curve, are developed in this study to provide information on the probability of a system state given any of multiple declarations, which is more useful to the user. Sensitivity to prior probabilities, suggestions for user-defined parameters and areas for future research are identified as the User Interface Tool is described in detail in this thesis.

**A New Multi-Sensor Track Fusion Architecture for Multi-Sensor Information Integration**

Jean, Buddy H; Younker, John; Hung, Chih-Cheng; Sep 2004; 13 pp.; In English; Original contains color illustrations

Report No.(s): AD-A466744; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA466744>

This paper proposes a new multi-sensor track fusion model. The widely used multisensor track fusion model is based on the Extended Kalman Tracker whereas the new fusion model is based on the alpha beta gamma tracker. This new technology will integrate multi-sensor information and extract integrated multi-sensor information to detect, track and identify multiple targets at any time, in any place under all weather conditions. This technology can be applied to the development of fighter aircraft and also to the development of aircraft for Command, Control, Communication and Computer and Information, Surveillance and Reconnaissance (C4ISR). This technology will help to protect our Homeland and finally control and destroy

any enemy who dares to challenge us from the air, land or the sea. The advantage of this new Multi-Sensor Track Fusion Model over the currently used Multi-Sensor Track Fusion Model is that it is mathematically simpler. The algorithm needs no matrix inversion and no matrix element divide-by-zero. This means it is easier to implement and there will be no mid-air computer shut down or system crash. The architecture of the new Multi-Sensor Track Fusion Model includes Multi-Sensors such as radar, electronic warfare, the digital signal processor, the alpha beta gamma tracker, the multi-sensor correlation processor, the vehicle interface unit, and the flight crew. The ultimate goal of this new Multi-Sensor Track Fusion Model is to generate fused tracks from all sensor trackers, and integrate all sensor information to provide the pilot and the C4ISR headquarters with time critical target information. Finally this new integration will help establish the air, land and sea superiority on the battlefield.

**Self-Stabilizing Mobile Node Location Management and Message**

Dolev, Shlomi; Lahiani, Limor; Lynch, Nancy; Nolte, Tina; Aug 11, 2005; 22 pp.; In English

Contract(s)/Grant(s): F33615-01-C-1896; CCR-0121277

Report No.(s): AD-A466747; MIT-CSAIL-TR-2005-052; MIT-LCS-TR-999; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA466747>

We present simple algorithms for achieving self-stabilizing location management and routing in mobile ad-hoc networks. While mobile clients may be susceptible to corruption and stopping failures, mobile networks are often deployed with a reliable GPS oracle, supplying frequent updates of accurate real time and location information to mobile nodes. Information from a GPS oracle provides an external, shared source of consistency for mobile nodes, allowing them to label and timestamp messages, and hence aiding in identification of, and eventual recovery from, corruption and failures. Our algorithms use a GPS oracle. Our algorithms also take advantage of the Virtual Stationary Automata programming abstraction, consisting of mobile clients, virtual timed machines called virtual stationary automata (VSAs), and a local broadcast service connecting VSAs and mobile clients. VSAs are distributed at known locations over the plane, and emulated in a self-stabilizing manner by the mobile nodes in the system. They serve as fault-tolerant building blocks that can interact with mobile clients and each other, and can simplify implementations of services in mobile networks. We implement three self-stabilizing, fault-tolerant services, each built on the prior services: (1) VSA-to-VSA geographic routing, (2) mobile client location management, and (3) mobile client end-to-end routing. We use a greedy version of the classical depth-first search algorithm to route messages between VSAs in different regions. The mobile client location management service is based on home locations. Each client identifier hashes to a set of home locations, regions whose VSAs are periodically updated with the client's location. VSAs maintain this information and answer queries for client locations. Finally, the VSA-to-VSA routing and location management services are used to implement mobile client end-to-end routing.

**Evaluation of a Particle Swarm Algorithm for Biomechanical Optimization**

Schutte, Jaco F; Koh, Byung-Il; Reinbolt, Jeffrey A; Fregly, Benjamin J; Haftka, Raphael T; George, Alan D; Sep 23, 2004; 41 pp.; In English

Contract(s)/Grant(s): F49620-09-1-0070

Report No.(s): AD-A466833; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA466833>

Optimization is frequently employed in biomechanics research to solve system identification problems, predict human movement, or estimate muscle or other internal forces that cannot be measured directly. Unfortunately, biomechanical optimization problems often possess multiple local minima, making it difficult to find the best solution. Furthermore, convergence in gradient based algorithms can be affected by scaling to account for design variables with different length scales or units. This study evaluates a recently developed version of the particle swarm optimization (PSO) algorithm to address these problems. The algorithm's global search capabilities were investigated using a suite of difficult analytical test problems, while its scale independent nature was proven mathematically and verified using a biomechanical test problem. For comparison, all test problems were also solved with three off-the-shelf optimization algorithms a global genetic algorithm (GA) and multi-start gradient-based sequential quadratic programming (SQP) and quasi-Newton (BFGS) algorithms. For the analytical test

problems, only the PSO algorithm was successful on the majority of the problems. When compared to previously published results for the same problems, PSO was more robust than a global simulated annealing algorithm but less robust than a different, more complex genetic algorithm. For the biomechanical test problem, only the PSO algorithm was insensitive to design variable scaling, with the GA algorithm being mildly sensitive and the SQP and BFGS algorithms being highly sensitive. The proposed PSO algorithm (freely available with this article) provides a new off-the-shelf global optimization option for difficult biomechanical problems, especially those utilizing design variables with different length scales or units.

**Direct Numerical Simulation and Experimental Validation of Hypersonic Boundary-Layer Receptivity and Instability**

Zhong, Xiaolin; Mar 28, 2007; 46 pp.; In English

Contract(s)/Grant(s): FA9550-04-1-0029

Report No.(s): AD-A467163; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA467163>

The objective of this research project is to compare our numerical simulation solutions with available experimental or theoretical results on hypersonic boundary layer receptivity and stability; and to conduct extensive DNS studies on the flow mechanisms of hypersonic boundary layer receptivity and stability. During the three-year period, we have conducted extensive DNS studies on the receptivity of hypersonic boundary layer flows over a sharp wedge, a flat plate, a blunt cone, and the FRESH aeroshell. DNS studies are compared with Stetson's 1984 stability experiment on Mach 7.99 flow over a blunt cone, and Maslov's leading-edge receptivity experiment on Mach 5.92 flow over a flat plate. Our numerical studies have been validated to be of high accuracy and led to further understanding of hypersonic boundary layer receptivity mechanism. Such understanding can lead to better tools for the prediction and control of high-speed boundary layer transition.

**Parameter Space: The Final Frontier. Certified Reduced Basis Methods for Real-Time Reliable Solution of Parametrized Partial Differential Equations**

Patera, Anthony T; Mar 12, 2007; 13 pp.; In English

Contract(s)/Grant(s): FA9550-05-1-0114

Report No.(s): AD-A467167; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA467167>

This project is focused on reduced basis approximation methods, associated rigorous and sharp a posteriori error bounds, and offline-online computational strategies for the rapid and reliable solution of parametrized elliptic, parabolic, and more recently hyperbolic partial differential equations relevant to mechanics from the quantum through the meso-scale to the macro-scale. Typical equations and applications of interest include Density Functional Theory for solid state property calculations, the Boltzmann equation for microscale gas flows, the Navier-Stokes equations for natural convection calculations, elasticity for stress intensity factors/brittle failure, and Helmholtz and the wave equation for acoustic waveguide applications. Of particular interest is real-time and robust parameter estimation with application to detection, nondestructive evaluation, adaptive design/optimization, and control. In the online/deployed stage, we can provide results for key engineering outputs in real-time without loss of accuracy or reliability: the outputs provided - in milliseconds (online) - by our approach are provably indistinguishable from the outputs provided - typically in many minutes or even hours - by classical methods.

**Military Information Networks as Complex Adaptive Systems**

Miller, L D; Jun 2001; 16 pp.; In English

Report No.(s): AD-A468189; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA468189>

New information technology now permits a vastly increased degree of connectivity in military communication networks. This more connected architecture should result in faster response times and greater efficiencies in military operations. A

potential downside, however, is that highly connected network architectures are more prone to chaotic behaviors. Unfortunately, these behaviors are: nonlinear, frequently counter intuitive, usually manifested only under severe stress, and difficult to discern under the 'artificial' conditions of training exercises. This paper introduces a methodology and a set of tools for the simulation of nonlinear network behaviors. The approach taken is to consider military information networks to be complex adaptive systems made up of autonomous decision nodes (of variable capacity and responsiveness) coupled by information flows (of variable urgencies and multiplicities). A coupled map- lattice approach to the simulation of network dynamic behavior (greatly facilitated via the recursive functions of the Mathematica(TradeMark) software package) is employed. Although simplistic, this approach may possess the appropriate degree of 'essential nonlinearity' for use by network designers seeking to hone their nonlinear intuition. If destructive chaotic behaviors can be thereby anticipated and ameliorated prior to their occurrence in military operations, then the promises of information age technology may be fully realized by our nation's military forces.

### **Implementation of a High-Speed Numeric Function Generator on a COTS Reconfigurable Computer**

Mack, Thomas J; Mar 2007; 143 pp.; In English

Report No.(s): AD-A467274; No Copyright; Avail.: Defense Technical Information Center (DTIC)

Certain methods of realizing numeric functions, such as  $\sin(x)$  or square root of  $x$ , in hardware involve a Taylor Series expansion or the CORDIC algorithm. These methods, while precise, are iterative and slow and may take on the order of hundreds to thousands of CPU clock cycles. A faster method involves a piecewise approximation to the function. The function value is computed by reading pre-calculated coefficients (slope and intercept for first order approximations). And then, by multiplying the function argument by the proper slope and adding the proper intercept, a close approximation to the function solution is produced. This thesis shows how this first order approximation technique was implemented on an FPGA-based COTS reconfigurable computer. MATLAB routines were developed to approximate the function as a set of consecutive, linear equations. The MATLAB approximation is combined with other modules designed in VHDL to construct an overall circuit. A pipelined circuit was created on the SRC-6E computer that reduces the latency of the  $\sin(x)$  function by over 88% and produces a result on each clock cycle. The circuit easily implements other functions by simply exchanging the approximation and coefficients. Thus, a user-friendly environment was created for calculating functions at higher speeds than the more popular current methods.

### **Hamiltonian Analysis of Charged Particle Gyromotion in Cylindrical Coordinates**

Amatucci, William E; Schuck, Peter W; Ganguli, Gurudas; Walker, David N; Apr 27, 2007; 24 pp.; In English; Original contains color illustrations

Contract(s)/Grant(s): Proj-67-3419-17

Report No.(s): AD-A467594; NRL/MR/6750--07-9030; XB-NRL/MR/6750; No Copyright; Avail.: Defense Technical Information Center (DTIC)

A Hamiltonian approach in cylindrical coordinates is applied to the motion of charged particles in a uniform axial magnetic field. The method is compared to the traditional approaches of uniform circular motion and Newtonian mechanics. Cylindrical coordinates are preferred in many practical situations such as application to laboratory experiments. The advantage cylindrical coordinates offer is the ability to form a one-dimensional effective potential, which can be used to determine a number of spatial and temporal characteristics of the resulting cyclotron motion without an explicit solution of the equations of motion. This approach provides a different perspective into the dynamics of Larmor motion to complement the traditional approaches.

### **Relationship of Complexity Factor Ratings With Operational Errors**

Pfleiderer, Elaine M; Manning, Carol A; Goldman, Scott M; May 2007; 18 pp.; In English

Report No.(s): AD-A467731; DOT/FAA/AM-07/11; No Copyright; Avail.: Defense Technical Information Center (DTIC)

This study is an examination of the extent to which objective static sector characteristics and controller ratings of static

and dynamic sector complexity factors contributed to the occurrence of operational errors (OEs) at the Indianapolis air route traffic control center (ZID). A multiple regression model of the relationship between a combination of static sector characteristics (sector altitude strata and sector size) resulted in a modest prediction of the variance in OE incidence ( $R = .70$ ,  $R^2 = .49$ ). Sector size was negatively related to OEs, indicating that smaller sectors were associated with more OEs. Sector strata were positively related to OEs, indicating that higher altitude sectors were associated with more OEs. Principal Components Analysis (PCA) of the complexity ratings produced four components with eigenvalues  $>1.00$ , accounting for 62% of the variance in the data. Components were used as predictors in a multiple regression analysis of the number of OEs in the ZID sectors. Only Component 1 (climbing and descending aircraft in the vicinity of major airports) and Component 2 (services provided to non-towered airports) contributed significantly to the total proportion of variance explained by the model ( $R = .78$ ,  $R^2 = .61$ ). Component 2 shared an inverse relationship with the number of OEs, indicating that the complexity related to providing services to non-towered airports is associated with fewer OEs. These results will be used to guide the choice of objective measures for further analysis of the influence of static and dynamic sector characteristics in the occurrence of OEs.

Report No.(s): AD-A467952; NPS-PH-07-001; No Copyright; Avail.: Defense Technical Information Center (DTIC)

The purpose of this report is to notify those in the community who have used, or are using, the Monterey-Miami Parabolic Equation (MMPE) Model of an error in previous implementations that affects the computation of volume loss. The error has been corrected and an updated version is now available. Thorough analysis of the results are provided here, including comparison with exact modal attenuation factors for bottom loss parameters, which indicate the model is now performing properly.

**The Role of Continuity in Residual-Based Variational Multiscale Modeling of Turbulence**

Akkerman, I; Bazilevs, Y; Calo, V M; Hughes, T J; Hulshoff, S; May 2007; 19 pp.; In English; Original contains color illustrations

Contract(s)/Grant(s): N00014-03-C-0263

Report No.(s): AD-A468018; ICES-07-16; No Copyright; Avail.: Defense Technical Information Center (DTIC)

This paper examines the role of continuity of the basis in the computation of turbulent flows. We compare standard finite elements and NURBS (non-uniform rational B-splines) discretizations that are employed in Isogeometric Analysis. We make use of quadratic discretizations that are  $C_0$ -continuous across element boundaries in standard finite elements, and  $C_1$ -continuous in the case of NURBS. The variational multiscale residual-based method is employed as a turbulence modeling technique. We find that  $C_1$ -continuous discretizations outperform their  $C_0$ -continuous counterparts on a per-degree-of-freedom basis. We also find that the effect of continuity is greater for higher Reynolds number flows.

**Convergence of High Order Finite Volume Weighted Essentially Non-Oscillatory Scheme and Discontinuous Galerkin Method for Nonconvex Conservation Laws**

Qiu, Jing-Mei; Shu, Chi-Wang; Jan 2007; 41 pp.; In English

Contract(s)/Grant(s): FA9550-05-1-0123

Report No.(s): AD-A468107; No Copyright; Avail.: Defense Technical Information Center (DTIC)

In this paper, we consider the issue of convergence toward entropy solutions for high order finite volume weighted essentially non-oscillatory (WENO) scheme and discontinuous Galerkin (DG) finite element method approximating scalar nonconvex conservation laws. Although such high order nonlinearly stable schemes can usually converge to entropy solutions of convex conservation laws, convergence may fail for certain nonconvex conservation laws. We perform a detailed study to demonstrate such convergence issues for a few representative examples, and suggest a modification of the high order schemes based either on first order monotone schemes or a second order entropic projection to achieve convergence toward entropy solutions while maintaining high order accuracy in smooth regions.

**The Entropy Solutions for the Lighthill-Whitham-Richards Traffic Flow Model with a Discontinuous Flow-Density Relationship**

Lu, Yadong; Wong, S C; Zhang, Mengping; Shu, Chi-Wang; Jan 2007; 43 pp.; In English; Original contains color illustrations

Contract(s)/Grant(s): W911NF-04-1-0291

Report No.(s): AD-A468108; No Copyright; Avail.: Defense Technical Information Center (DTIC)

In this paper we explicitly construct the entropy solutions for the Lighthill-Whitham-Richards (LWR) traffic flow model with a flow-density relationship which is piecewise quadratic, concave, but not continuous at the junction points where two quadratic polynomials meet, and with piecewise linear initial condition and piecewise constant boundary conditions. The existence and uniqueness of entropy solutions for such conservation laws with discontinuous fluxes are not known mathematically. We have used the approach of explicitly constructing the entropy solutions to a sequence of approximate problems in which the flow-density relationship is continuous but tends to the discontinuous flux when a small parameter in this sequence tends to zero. The limit of the entropy solutions for this sequence is explicitly constructed and is considered to be the entropy solution associated with the discontinuous flux. We apply this entropy solution construction procedure to solve three representative traffic flow cases, compare them with numerical solutions obtained by a high order weighted essentially non-oscillatory (WENO) scheme, and discuss the results from traffic flow perspectives.

**A Novel Approach to Calibrating Wavemakers and Generating Wavemaker Transfer Functions**

Fu, Thomas C; Fullerton, Anne M; Fu, Thomas K; Rice, James R; Hess, David E; Apr 2007; 24 pp.; In English; Original contains color illustrations

Report No.(s): AD-A468141; NSWCCD-50-TR-2007/028; No Copyright; Avail.: Defense Technical Information Center (DTIC)

Limitations in our current knowledge of a ship in extreme wave conditions have been illuminated by the work being done by the US Navy on advanced hull-forms. Stochastic approaches to these phenomena are insufficient, and deterministic testing of these events must be performed if the physics is to be understood. Although modern computer controlled wavemakers provide the ability to generate regular sine waves, long crested multi-spectral waves, mixed seas of almost any sea spectra, and even freak' waves, all of these systems require the wavemakers be tuned to the specific facility and that transfer functions between wavemaker settings and the generated wave be calculated. This tuning is performed to compensate for the facility's

geometry, wave absorbers (beaches), etc, as well as to aid the researcher in using the wavemaker system.

**Digital Watermarking Using Syndrome Codes**

Cox, Ingemar J; Apr 4, 2005; 11 pp.; In English

Contract(s)/Grant(s): FA8655-03-1-3045

Report No.(s): AD-A468319; No Copyright; Avail.: Defense Technical Information Center (DTIC)

The Grantee will conduct research on informed watermarking. Recent analyses proved that the theoretical limit to digital watermarking is much higher than previously believed, however no practical means for accomplishing the theoretical rates are available. As detailed in the technical proposal, the PI will investigate means to achieve increased embedding rates. Specifically, he will: 1. refine the trellis-based coding techniques including (1) studying how variations in the trellis architecture (i.e. number of states and arcs) affect performance and (2) investigating the performance of syndrome coding as a function of the underlying error correction code. 2. investigate approximations to the informed embedding optimizations, including (1) studying how such optimizations can be efficiently computed and (2) examining the choice of symbol alphabet (binary versus n-symbol alphabets) and their corresponding modulation codes. Pending satisfactory results of the initial work and availability of funding, additional research would be performed to: 3. Improve the perceptual modeling required to hide a high data rate embedded signal in a video 4. conduct tests to measure and subsequently model the distortions that occur during the broadcasting of television 5. conduct tests to determine the robustness of our watermarking algorithms to commercial broadcasting.

Contract(s)/Grant(s): FA9550-04-1-0187

Report No.(s): AD-A468426; No Copyright; Avail.: Defense Technical Information Center (DTIC)

This document constitutes the final project report for Contract # FA9550-04-1-0187 titled Theory and Applications of Computational Time-reversal Imaging. The report summarizes the theoretical development and implementation of time-reversal based imaging and target detection algorithms for locating targets from multistatic data collected from unstructured phased antenna arrays. The report summarizes the main theoretical results obtained in the program and includes both computer simulated examples as well as results from experimental data collected by a research team from Carnegie Mellon University illustrating the use of the algorithms developed in the project. The final section of the report outlines goals for follow-on research in these general areas.

**Cooperative Solutions in Multi-Person Quadratic Decision Problems: Finite-Horizon and State-Feedback Cost-Cumulant Control Paradigm**

Pham, Khanh D; Jan 2007; 9 pp.; In English

Report No.(s): AD-A468463; AFRL-VS-PS-TP-2007-1019; No Copyright; Avail.: Defense Technical Information Center (DTIC)

In the cooperative cost-cumulant control regime for the class of multi-person single-objective decision problems characterized by quadratic random costs and state-feedback information structures, individual decision makers share state information with their neighbors and then autonomously determine decision strategies to achieve the desired goal of the group which is a minimization of a finite linear combination of the first k cost cumulants of a finite-horizon integral quadratic cost associated with a linear stochastic system. Since this problem formation is parameterized by the number of cost cumulants, the scalar coefficients in the linear combination and the group of decision makers, it may be viewed both as a generalization of linear-quadratic Gaussian control, when the first cost cumulant is minimized by a single decision maker and of the problem class of linear-quadratic identical-goal stochastic games when the first cost cumulant is minimized by multiple decision

makers. Using a more direct dynamic programming approach to the resultant cost-cumulant initial-cost problem, it is shown that the decision laws associated with multiple persons are linear and are found as the unique solutions of the set of coupled differential matrix Riccati equations, whose solvability guarantees the existence of the closed-loop feedback decision laws for the corresponding multi-person single-objective decision problem.

**Background Modeling and Algorithm Fusion for Airborne Landmine Detection**

Ramachandran, Hariharan; Dec 2005; 104 pp.; In English; Original contains color illustrations

Contract(s)/Grant(s): DAAB07-01-D-G601; W15P7T-05-R-B497

Report No.(s): AD-A466482; AMSRD-CER-NV-TR-245; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA466482>

Airborne mine and minefield detection has been an active topic of research in recent times. The detection process looks for local anomalies in the acquired mid-wave infrared imagery. An anomaly is any mine size image feature that is different from its immediate surrounds. The so called RX algorithm by Reed and Yu has been used extensively in airborne mine detection systems as the anomaly detector. The RX detector measures the local signal to clutter ratio assuming a zero mean uncorrelated Gaussian background. The airborne minefield detection system is expected to detect possible mines and minefields over various types of terrains, different soil conditions and at different times of the day. For most terrains conditions, the background is often correlated and inhomogeneous. This raises the question as to whether the performance can be made invariant to terrain characteristics. The primary aim behind this thesis is to model the distributions for RX statistics of false alarms under more realistic background conditions. This modeling is expected to facilitate the study of the detectability of mines and minefields in various backgrounds. By modeling various backgrounds, guidelines can be obtained for likely false alarms rates for different backgrounds. Algorithmic fusion is simple but often effective tool to derive optimum performance from multiple detection algorithms. The parameters obtained from background modeling can be use as a catalyst for algorithm fusion and thereby improve detection performance for a given set of detector algorithms.

**Application of the Unscented Transformation to Obtain Target Range, Bearing, Elevation, Range Rate, Speed and Course Estimates and Errors From Tracks Given in Cartesian Coordinates**

Ong, Hwa-Tung; Mar 2007; 19 pp.; In English; Original contains color illustrations

Report No.(s): AD-A467801; DSTO-TN-0745; No Copyright; Avail.: Defense Technical Information Center (DTIC)

The unscented transformation is applied to tracks given in Cartesian coordinates to obtain target range, bearing, elevation, range rate, speed and course estimates, and their associated errors. This approach is attractive because it does not require tedious closed-form mathematical derivations, is not computationally expensive, and does not require a pseudo-random number generator. Example code and results are given to demonstrate the applicability of the approach.

The ultimate goal of our research is to find a procedure that would enable us to generate, for a class of systems, nominal finite state machine models with guaranteed error bounds that are usable for robust controller synthesis. We consider three notions of stability, input/output stability, external stability and incremental input/output stability, as they apply to deterministic finite state machine systems. We propose LP based algorithms for verifying stability of a system, or lack thereof,

in the input/output and the external sense. We show that for a class of systems, incremental I/O stability and external stability are equivalent notions, stronger than the notion of I/O stability.

ONLINE: <http://hdl.handle.net/100.2/ADA466830>

We introduce and develop models for a physical goods storage system based on the 15-puzzle, a classic children's game in which 15 numbered tiles slide within a 4 x 4 grid. The objective of the game is to arrange the tiles in numerical sequence, starting from a random arrangement. For our purposes, the tiles represent totes, pallets, or even containers that must be stored very densely, and the objective is to maneuver items to an input-output point for retrieval or processing. We develop analytical results for storage configurations having a single empty location (as in the game) and experimental results for configurations with multiple empty locations. Designs with many empty locations can be made to form aisles, allowing us to compare puzzle-based designs with traditional aisle-based designs found in warehousing systems.

**Retort Racks for Polymeric Trays in 1400 Style Spray Retorts**

Bruins, Henderikus B; May 2003; 12 pp.; In English

Contract(s)/Grant(s): SP0103-02-D-0024-0005

Report No.(s): AD-A468626; RUTGERS-FTR 202; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA468626>

The objective of this project was to design a retort rack that would maximize the retort capacity of a 1400 style spray retort and to select a material that would withstand the harsh retort spray environment. The contract consisted of three phases: 1.) mold design, 2.) mold fabrication, 3.) rack production. Test rack samples were produced at the end of phase II using three different materials. A blend of Polyphenylene (PPE) and Polypropylene (PP) with 15% short glass fiber filling was selected as the preferred material for the production of the final set of racks. Two retort producers were supplied with 100 retort racks each, for testing in a production environment. The racks increased the capacity of the retort with 29-33% and the rack material has withstood the retort environment without any problems after exposure to three-month of production environment.

**Mathematical Fluid Dynamic Modeling of Plasma Stall-Spin Departure Control**

Malmuth, Norman D; Fedorov, Alexander V; Soloviev, Victor; Apr 2007; 36 pp.; In English; Original contains color illustrations

Contract(s)/Grant(s): FA9550-04-C-0028

Report No.(s): AD-A468863; SC71234.RFRFTV; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA468863>

This report summarizes theoretical and CFD studies related to surface discharge to quench stall-slip departure due to asymmetric vortex shedding on aircraft nose tips, augment directional control/authority agility, and develop tailless capability. This approach offers adaptability in rapidly changing flight and mission conditions, constructional simplicity, massless operation, no changes in aerodynamic shape, no influence on aircraft characteristics when the system is not in use, and low weight and power penalties, and closed loop feedback control. In the first phase of the effort, lower-order theoretical modeling showed that vortex symmetry breakdown strongly depends on the boundary-layer separation locus. The latter can be effectively controlled by a surface discharge located upstream from the separation line. Using spark discharges of relatively

small power (less than 1 kW) it is feasible to shift the separation line toward the windward surface and suppress vortex asymmetry.

A practical and efficient way to use the power of quantum mechanics (quantum parallelism due to the superposition and entanglement of states) could enormously speed up numerical simulations of interest to computational physicists. The diffusion equation the nonlinear Burgers equations, the turbulent Navier-Stokes equations, and the many-body Schroedinger equation could all be solved much more rapidly if efficient quantum algorithms could be implemented for their solution. The presentations at the conference that are published here review the progress toward these goals.

ONLINE: <http://hdl.handle.net/100.2/ADA469119>

The U.S. Army Research Laboratory at the Aberdeen Proving Ground, MD is interested in developing a thin-walled munition capable of perforating an urban structure and delivering a payload intact to the interior of the structure. One of the most critical design aspects of this munition is the shell casing. Its shape, thickness, and material composition must be selected such that it has sufficient structural integrity to perforate a double-reinforced concrete wall as a rigid body and to deliver a payload to the interior of the structure. A combined experimental-computational approach is being used to evaluate candidate munition configurations. The goal of maximizing the payload mass delivered, with a thin-walled and lightweight casing, must be balanced against the need to retain sufficient structural integrity to survive the breaching of the wall intact. In this study, various casing-wall thicknesses and nose shapes and their effects on the payload volume were considered.

ONLINE: <http://hdl.handle.net/100.2/ADA469164>

Plug-and-play (PnP) satellite construction is a key component of the US Air Force Operational Responsive Space (ORS) effort. The goal of ORS is to provide mission specific satellite support by configuring and launching a satellite to a selected orbit within days of the request. One major challenge during the time limited process is to accurately predict the response of the satellite to harmonic loads that occur during launch and satellite operation. Given the time limitations, constructing finite element (FE) models by traditional methods is not currently a viable option for the ORS timeline. By implementing an approach for rapid FE model creation, we can significantly reduce the timeline from weeks to hours. The advantages to our approach include simplification of model creation, ease of design modifications, and significant reduction in the FE model creation timeline; all lending this approach for utilization within the ORS acquisition cycle.

Effects-based design of robust organizations seeks to synthesize an organizational structure and its strategies (resource allocation, task scheduling and coordination), to achieve the desired effect(s) in a dynamically changing mission environment. In this paper, we model the dynamic system associated with the mission environment (e.g., environment faced by a joint task force with a military objective or the competitive environment confronted by a consumer electronic company striving to increase its market share) as a finite-state Markov Decision Process (MDP). Using this model, we determine a near-optimal action strategy that specifies which action to take in each state of the MDP model by Monte Carlo control method. The action strategy determines a range of possible missions the organization may face. The range of missions and platform utilization measures, in turn, are used to synthesize a robust organizational structure.

**An Approximation Technique for Belief Revision in Timed Influence Nets**

Haider, Sajjad; Levis, Alexander; Jun 2004; 28 pp.; In English; Original contains color illustrations

Contract(s)/Grant(s): N00014-03-1-0033; F30602-01-C-0065

Report No.(s): AD-A466041; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA466041>

The paper presents an approach for belief updating in Timed Influence Nets. Influence Nets provide graphical representation of causal or influencing relationships in complex situations. They are used to model and evaluate courses of actions in certain domains and to compare the performance of actions based on the desired outcome. In Timed Influence Nets, the impact or effect of these actions on target variables is not instantaneous. This is modeled by adding communication and processing delays in the model. The paper provides a technique for updating the beliefs of variables in the model over time once new evidence is received about some of the variables in the model. The objective is to assess the behavior of the variables

of interest as a function of both the timing of actions and the receipt of evidence on indicators, thus providing aid to decision makers in the revision of the planned courses of actions.

Report No.(s): AD-A466398; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA466398>

A dependable middleware should be able to adaptively share the distributed resources it manages in order to meet diverse application requirements, even when the quality of service (QoS) is degraded due to uncertain variations in load and unanticipated failures. In this paper, we have addressed this issue in the context of a dependable middleware that adaptively manages replicated servers to deliver a timely and consistent response to time-sensitive client applications. These applications have specific temporal and consistency requirements, and can tolerate a certain degree of relaxed consistency in exchange for better response time. We propose a flexible QoS model that allows clients to specify their timeliness and consistency constraints. We also propose an adaptive framework that dynamically selects replicas to service a client's request based on the prediction made by probabilistic models. These models use the feedback from online performance monitoring of the replicas to provide probabilistic guarantees for meeting a client's QoS specification. The experimental results we have obtained demonstrate the role of feedback and the efficacy of simple analytical models for adaptively sharing the available replicas among the users under different workload scenarios.

ONLINE: <http://hdl.handle.net/100.2/ADA466411>

In this paper, the authors present a scale-independent method of optimization with a stochastic global optimization approach introduced by Kennedy and Eberhart: the Particle Swarm Optimizer (PSO). They apply this method to the biomechanical system identification problem of finding positions and orientations of joint axes in body segments through the processing of experimental movement data. They compare its performance to the BFGS optimizer, which falls under a class of optimizers more commonly used for this application. Traditionally, gradient-based methods such as the BFGS algorithm have been used to solve joint parameter identification problems, but major drawbacks to these methods are their sensitivity to problem scaling and algorithm parameter selection. These drawbacks require costly and time-consuming parameter

sensitivity studies to be carried out for a problem before consistently acceptable results can be obtained. In addition, the presence of noise in the data will often cause premature convergence to an incorrect solution. The PSO method has some very desirable qualities that can be exploited in these types of problems. First, because it requires no gradient evaluations and because of the way it is formulated, the algorithm is insensitive to scaling of the design variables. Second, because of the algorithm's simplicity, there are very few parameters to tune, and even these have been shown to be relatively problem independent. Finally, the concurrent nature of the swarm algorithm lends it to parallelization, enabling the solution of problems that are too computationally challenging for single-processor machines. The need for greater computational power is common in the search for more realistic and accurate engineering models that currently can only be addressed by the use of parallel algorithms.

**Change-Point Methods for Overdispersed Count Data**

Wilken, Brian A; Mar 2007; 111 pp.; In English; Original contains color illustrations

Report No.(s): AD-A466621; AFIT/GOR/ENS/07-26; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA466621>

A control chart is often used to detect a change in a process. Following a control chart signal, knowledge of the time and magnitude of the change would simplify the search for and identification of the assignable cause. In this research, emphasis is placed on count processes where overdispersion has occurred. Overdispersion is common in practice and occurs when the observed variance is larger than the theoretical variance of the assumed model. Although the Poisson model is often used to model count data, the two-parameter gamma-Poisson mixture parameterization of the negative binomial distribution is often a more adequate model for overdispersed count data. In this research effort, maximum likelihood estimators for the time of a step change in each of the parameters of the gamma-Poisson mixture model are derived. Monte Carlo simulation is used to evaluate the root mean square error performance of these estimators to determine their utility in estimating the change point, following a control chart signal. Results show that the estimators provide process engineers with accurate and useful estimates for the time of step change. In addition, an approach for estimating a confidence set for the process change point will be presented.

**Hyperspectral Imagery Target Detection Using Principal Component Analysis**

Reyes, Kevin B; Mar 2007; 100 pp.; In English; Original contains color illustrations

Report No.(s): AD-A466634; AFIT/GOR/ENS/07-22; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA466634>

The purpose of this research was to improve on the outlier detection methods used in hyperspectral imagery analysis. An algorithm was developed based on Principal Component Analysis (PCA), a classical multivariate technique usually used for data reduction. Using PCA, a score is computed and a test statistic is then used to make outlier declarations. First, four separate PCA test statistics were compared in the algorithm. It was found that Mahalanobis distance performed the best. This test statistic was then compared using the entire data set and a clustered data set. Since it has been shown in the literature that even one outlier can distort the covariance matrix, an iterative approach to the clustered based algorithm was developed. After each iteration, if an outlier(s) is identified, the observation(s) is removed and the algorithm is reapplied. Once no new outliers are identified or one of the stopping conditions is met, the algorithm is reapplied a final time with the new covariance matrix applied to the original data set. Experiments were designed and analyzed using analysis of variance to identify the significant factors and optimal settings to maximize each algorithm's performance.

**Feasibility Study of Variance Reduction in the Logistics Composite Model**

Cole, III, George P; Mar 2007; 111 pp.; In English; Original contains color illustrations

Report No.(s): AD-A466637; AFIT/GLM/ENS/07-04; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA466637>

The Logistics Composite Model (LCOM) is a stochastic, discrete-event simulation that relies on probabilities and random

number generators to model scenarios in a maintenance unit and estimate optimal manpower levels through an iterative process. Models such as LCOM involving pseudo-random numbers inevitably have a variance associated with the output of the model for each run, and the output is actually a range of estimates. The reduction of the variance in the results of the model can be costly in the form of time for multiple replications. The alternative is a range of estimates that is too wide to realistically apply to real-world maintenance units. This research explores the application of three different methods for reducing the variance of the output in the Logistics Composite Model. The methods include Common Random Numbers, Control Variates, and Antithetic Variates. The differences in the 95% confidence intervals were compared between the variance reduction techniques and the original model to determine the degree of variance reduction. The result is a successful variance reduction in the primary output statistics of interest using the application of the Control Variates technique, as well as a methodology for the implementation of Control Variates in LCOM.

**Examining Clandestine Social Networks for the Presence of Non-Random Structure**

Seder, Joshua S; Mar 2007; 101 pp.; In English; Original contains color illustrations

Report No.(s): AD-A466683; AFIT/GOR/ENS/07-24; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA466683>

This thesis develops a tractable, statistically sound hypothesis testing framework for the detection, characterization, and estimation of non-random structure in clandestine social networks. Network structure is studied via an observed adjacency matrix, which is assumed to be subject to sampling variability. The vertex set of the network is partitioned into  $k$  mutually exclusive and collectively exhaustive subsets, based on available exogenous nodal attribute information. The proposed hypothesis testing framework is employed to statistically quantify a given partition's relativity in explaining the variability in the observed adjacency matrix relative to what can be explained by chance. As a result, valuable insight into the true structure of the network can be obtained. Those partitions that are found to be statistically significant are then used as a basis for estimating the probability that a relationship tie exists between any two vertices in the complete vertex set of the network. The proposed methodology aids in the reduction of the amount of data required for a given network, focusing analyses on those attributes that are most promising. Ample effort is given to both model demonstration and application, including an example using open-source data, illustrating the potential use for the defense community and others.

ONLINE: <http://hdl.handle.net/100.2/ADA466737>

Partially observable Markov decision processes (POMDPs) are a well studied paradigm for programming autonomous

robots, where the robot sequentially chooses actions to achieve long term goals efficiently. Unfortunately, for real world robots and other similar domains, the uncertain outcomes of the actions and the fact that the true world state may not be completely observable make learning of models of the world extremely difficult, and using them algorithmically infeasible. In this paper we show that learning POMDP models and planning with them can become significantly easier when we incorporate into our algorithms the notions of spatial and temporal abstraction. We demonstrate the superiority of our algorithms by comparing them with previous flat approaches for large scale robot navigation.

**Empirical Effective Dimension and Optimal Rates for Regularized Least Squares Algorithm**

Caponnetto, Andrea; Rosasco, Lorenzo; De Vito, Ernesto; Verri, Alessandro; May 27, 2005; 16 pp.; In English

Contract(s)/Grant(s): N00014-02-1-0915

Report No.(s): AD-A466778; MIT-CSAIL-TR-2005-036; AIM-2005-019; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA466778>

This paper presents an approach to model selection for regularized least-squares on reproducing kernel Hilbert spaces in the semi-supervised setting. The role of effective dimension was recently shown to be crucial in the definition of a rule for the choice of the regularization parameter, attaining asymptotic optimal performances in a minimax sense. The main goal of the present paper is showing how the effective dimension can be replaced by an empirical counterpart while conserving optimality. The empirical effective dimension can be computed from independent unlabelled samples. This makes the approach particularly appealing in the semi-supervised setting.

ONLINE: <http://hdl.handle.net/100.2/ADA467464>

For vehicle designers, the main goal of experiments on the observability of combat vehicles is a comparison of the probability of detection for two vehicles as a function of range. This paper addresses the statistical techniques to analyze such data to compare the probability of detection of the two vehicles as a function of range. Two techniques are compared: 1. Fitting logistic curves to the data of the vehicles, and 2. Using the Fisher Exact Test to compare the probability of detection of the two vehicles at each range. The paper discusses the issues of background variability and confidence levels for hypothesis testing. Finally, a recommendation is made on how to write a specification for the detectability of a vehicle.

**The Potential Impact of an Auction Based Retention Bonus and Other Factors on Continuation Rates of General Dentists Completing Their Initial Obligation**

Anderson, Robert L; Mar 2007; 83 pp.; In English

Report No.(s): AD-A467131; No Copyright; Avail.: Defense Technical Information Center (DTIC)

This thesis seeks to determine the impact of an auction based retention bonus on continuation rates for general dentists

completing their initial obligation. An auction based retention bonus has the potential to improve retention rates. In lieu of actual bids from Navy general dentists, the difference between average civilian dentist salaries and Navy general dentist pay is used to represent theoretical opportunity costs. Inputting opportunity costs into a break-even formula allows approximation of the retention bonus amount needed for a one-year and/or five-year employment agreement with the Navy. A logistic regression retention model is also estimated using data for 516 Navy general dentists commissioned between 1998 and 2001. Model results indicate that accession source significantly affects the decision to continue military service. Officers commissioned as direct accessions and participants in the Dental Student Program are more likely to stay in the navy than participants in the Health Sciences Collegiate Program. Dentists commissioned in 2000-2001 are less likely to stay than those commissioned in 1998-1999. Those commissioned between the ages of 30 and 39 are more likely to continue service beyond their initial obligation than younger dentists. Race and gender do not significantly affect retention.

**The Effect of Graduate Education on the Performance of Air Force Officers**

Pearson, Jeffrey P; Mar 2007; 114 pp.; In English

Report No.(s): AD-A467144; No Copyright; Avail.: Defense Technical Information Center (DTIC)

This thesis investigates the effects of graduate education on the retention and promotion of Line of the Air Force (LAF) officers at the rank of Captain and Major. Logistic regression models are estimated to examine the effects of graduate education on the retention of Captains and Majors and on promotion to Major using data from the Active Duty Military Master File for fiscal years 1992 through 2006. A difference-in-difference estimator is incorporated into the promotion model to evaluate the effects of an Air Force policy change intended to eliminate any bias towards advanced education at promotion boards. Besides graduate education, explanatory variables include basic demographic traits and professional characteristics. Results indicate that graduate education has a positive effect on retention of LAF officers at the rank of Captain and Major. Findings from the promotion model indicate that graduate education also has a positive effect on promotion but results for the change in policy (masking education information for promotion) are inconclusive. In addition, race and career field are shown to influence both retention behavior and promotion while gender significantly affects retention but not promotion.

**Reducing the 'Gap of Pain': A Strategy for Optimizing Federal Resource Availability in Response to Major Incidents**

Heidtke, Curtis L; Mar 2007; 105 pp.; In English

Report No.(s): AD-A467162; No Copyright; Avail.: Defense Technical Information Center (DTIC)

In large-scale domestic disasters, a temporal gap frequently develops between the exhaustion of state and local resources and the arrival of federal resources. To date, strategies for reducing this so-called gap of pain have not been based upon scientific methodology. This thesis reviews four alternatives for ensuring continuous availability of critical commodities: pre-positioning, pre-emptive federal action, time-phased deployment, and surge transportation. For a given scenario, the optimum approach is likely to be some combination of these alternatives. Stochastic modeling using optimization techniques holds great promise for producing efficient and effective strategic solutions. This thesis evaluates one such model using two notional scenarios affecting the Washington, D.C. metropolitan area: a Category 4 hurricane and a one-kiloton nuclear explosion near the city center. The results reinforce the validity of using this method to generate viable strategic alternatives for consideration by senior decision-makers. With additional development and testing, the model may be productively applied to a range of natural and man-made incidents, in disparate locations.

**A Strong Zero-One Law for Connectivity in One-Dimensional Geometric Random Graphs With Non-Vanishing Densities**

Han, Guang; Makowski, Armand M; Apr 30, 2007; 22 pp.; In English

Contract(s)/Grant(s): DAAD19-01-2-0011

Report No.(s): AD-A468079; ISR-TR-2007-8; No Copyright; Avail.: Defense Technical Information Center (DTIC)

We consider the geometric random graph where  $n$  points are distributed independently on the unit interval  $[0, 1]$  according to some probability distribution function  $F$ . Two nodes communicate with each other if their distance is less than some transmission range. When  $F$  admits a continuous density  $f$  which is strictly positive on  $[0, 1]$ , we show that the property of graph connectivity exhibits a strong critical threshold and we identify it. This is achieved by generalizing a limit result on maximal spacings due to Levy for the uniform distribution.

**Design of Experiments Study of the Initial Extended Area Protection and Survivability (EAPS) Projectile System**

Chen, Michael M; May 2007; 38 pp.; In English

Contract(s)/Grant(s): Proj-622618.H80

Report No.(s): AD-A468505; ARL-TR-4109; No Copyright; Avail.: Defense Technical Information Center (DTIC)

A novel approach is proposed for assessing the effects of gun barrel centerline variations on Extended Area Protection and Survivability (EAPS) projectile launch dynamics. The technique of experiment design was adopted to simulate an array of deformed gun tubes representing reasonable manufacturing tolerance. Subsequently, in-bore structural analysis of the EAPS projectile system subject to the simulated gun barrels was performed. The projectile responses, including transitional and rotational velocities at the muzzle, were obtained. The analysis of variance method was then used to identify the sources of variability and to determine the significance of each gun shape. Based on the response statistics, no erratic launch conditions should be expected for the EAPS projectile because of normal barrel centerline variations.

**Patterns of War Termination: A Statistical Approach**

Robinson, II, Paul D; Mar 2007; 151 pp.; In English; Original contains color illustrations

Report No.(s): AD-A466619; AFIT/GOR/ENS/07-23; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA466619>

This research uses an advanced statistical technique to expand upon the current understanding of war termination. Specifically, this thesis addressed questions concerning the most relevant factors toward predicting both the outcomes of interstate wars and the winners of intrastate and extra-systemic wars, within the limitations of the available data. Open-source war data from the Correlates of War Project was analyzed using both binary and multinomial logistic regression techniques. While the Correlates of War Project did not necessarily focus its data collection efforts on those variables historically associated with war termination, it did provide a sufficient number of variables with which to demonstrate the applicability of logistic regression techniques to war termination analyses. As a consequence, every significant logistic regression model contains a single relevant variable. For both intrastate and extra-systemic wars, the duration of the conflict was found to be most relevant to predicting the winner. In contrast, the proportion of total casualties borne by a nation in an interstate war was most relevant to predicting the manner in which an interstate war ends. Conclusions drawn from this research and suggestions for future statistical applications to war termination studies were also discussed.

**Classifying Failing States**

Nysether, Nathan E; Mar. 2007; 150 pp.; In English; Original contains color illustrations

Report No.(s): AD-A466620; AFIT/GOR/ENS/07-19; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA466620>

The US is heavily involved in the first major war of the 21st Century -- The Global War on Terror (GWOT). As with any militant group, the foundation of the enemy's force is their people. There are two primary strategies for defeating the terrorists and achieving victory in the GWOT. First, we must root out terrorists where they live, train, plan, and recruit and attack them militarily. Second, we must suffocate them by cutting off the supply of new soldiers willing to choose aggression or even death over their current life. This thesis helps to achieve these objectives by applying Multivariate Analysis techniques to identify the states most likely to provide asylum for terrorists. Weak and Failed States are attractive to terrorist groups looking for safe haven and recruits. Governments in these states are often unable to prevent illegal activity, and are vulnerable to corruption or takeover. Citizens of failing states often experience poverty, disease, and unemployment, and may see little hope for improvement. Terrorists can meet these disenfranchised people's basic needs and promise brighter futures for families of those willing to fight and perhaps die for the cause. Current published efforts to identify failing states primarily use Ordinary Least Squares Regression, which requires the analyst to predefine the degree to which a state is likely to fail. This thesis uses a Factor Analysis approach to identify the key indicators of state failure, and Discriminant Analysis to classify states as Stable, Borderline, or Failing based on these indicators. Furthermore, each nation's discriminant function scores are used to determine their degree of instability. The methodology is applied to 200 countries for which open source data was available on 167 variables. Results of the classification are compared with subject matter experts in the field of state failure.

The scalar bidirectional reflectance distribution function (BRDF) due to a perfectly conducting surface with roughness and autocorrelation width comparable with the illumination wavelength is derived from coherence theory on the assumption of a random reflective phase screen and an expansion valid for large effective roughness. A general quadratic expansion of the two-dimensional isotropic surface autocorrelation function near the origin yields representative Cauchy and Gaussian BRDF solutions and an intermediate general solution as the sum of an incoherent component and a nonspecular coherent component proportional to an integral of the plasma dispersion function in the complex plane. Plots illustrate agreement of the derived

general solution with original bistatic BRDF data due to a machined aluminum surface, and comparisons are drawn with previously published data in the examination of variations with incident angle, roughness, illumination wavelength, and autocorrelation coefficients in the bistatic and monostatic geometries. The general quadratic autocorrelation expansion provides a BRDF solution that smoothly interpolates between the well-known results of the linear and parabolic approximations.

**Analysis of Network-Enabled ASW Concepts of Operation**

Klingbeil, Ralph; Shannon, John; Galdorisi, George; Jun 2004; 61 pp.; In English; Original contains color illustrations Report No.(s): AD-A466050; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA466050>

This report describes an analysis of two selected concepts for improving Anti-Submarine Warfare (ASW) performance and effectiveness by means of network-enabled sharing of information during ASW operations. These concepts are identified as Shared Situational Awareness (SSA) and Collaborative Information Environment (CIE). It is shown that the application of queueing theory models provide useful tools for quantitatively estimating the value-added of implementing these concepts. In addition, queueing theory can be used to examine the tradeoffs between information systems and shooters. In general, queueing theory can support analysis whenever military operations, such as ASW, can be characterized as demand for service processes. For the SSA and CIE concepts, an ASW tactical situation (TACSIT) is described and then metrics are defined and quantified by means of queueing models. Insights, conclusions and recommendations are then developed from the parametric quantitative results about the potential improvements to ASW performance and effectiveness achievable through implementation of these network-enabled concepts.

**The Hybrid Tree: An Index Structure for High Dimensional Feature Spaces (Preprint)**

Chakrabarti, Kaushik; Mehrotra, Sharad; Jan 1999; 9 pp.; In English

Contract(s)/Grant(s): DAAL01-96-2-0003

Report No.(s): AD-A466131; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA466131>

Feature based similarity search is emerging as an important search paradigm in database systems. The technique used is to map the data items as points into a high dimensional feature space which is indexed using a multidimensional data structure. Similarity search then corresponds to a range search over the data structure. Although several data structures have been proposed for feature indexing, none of them is known to scale beyond 10-15 dimensional spaces. This paper introduces the

hybrid tree a multidimensional data structure for indexing high dimensional feature spaces. Unlike other multidimensional data structures, the hybrid tree cannot be classified as either a pure data partitioning (DP) index structure (e.g., R-tree, SS-tree, SRtree) or a pure space partitioning (SP) one (e.g., KDB-tree, hBtree); rather, it combines positive aspects of the two types of index structures a single data structure to achieve search performance more scalable to high dimensionalities than either of the above techniques (hence, the name hybrid ). Furthermore, unlike many data structures (e.g., distance based index structures like SS-tree, SR-tree), the hybrid tree can support queries based on arbitrary distance functions. Our experiments on real high dimensional large size feature databases demonstrate that the hybrid tree scales well to high dimensionality and large database sizes. It significantly outperforms both purely DP-based and SP-based index mechanisms as well as linear scan at all dimensionalities for large sized databases.

ONLINE: <http://hdl.handle.net/100.2/ADA466133>

This paper reports on the integration of the SpAtio-Temporal Uncertainty ReasoNing (SATURN) system being developed in our group with the Virtual GIS (VGIS) system in order to improve its performance and scalability to complex dynamic environments as well as to enhance its functionality as a collaborative planning tool. To achieve this we added three new components to VGIS: a spatiotemporal object manager, a performance monitor, and a task database. The spatio-temporal object manager uses SATURN techniques for indexing dynamic multidimensional (spatio-temporal) objects to support effective and efficient object traversal during visualization. The performance monitor adjusts the resource allocation between VGIS components and adaptively adjusts image quality to guarantee bounded visualization performance. The task database extends VGIS as a tool for collaborative planning. Performance results illustrate that the SATURN techniques for object management and the performance monitor significantly improve VGIS performance allowing it to scale to complex scenarios with a large number of dynamic objects.

### **An Approach to Integrating Query Refinement in SQL**

Ortega-Binderberger, Michael; Chakrabarti, Kaushik; Mehrotra, Sharad; Jan 2002; 19 pp.; In English

Contract(s)/Grant(s): DAAL01-96-2-0003

Report No.(s): AD-A466134; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA466134>

With the emergence of applications that require content based similarity retrieval, techniques to support such a retrieval paradigm over database systems have emerged as a critical area of research. User subjectivity is an important aspect of such queries, i.e., which objects are relevant to the user and which are not depends on the perception of the user. Query refinement is used to handle user subjectivity in similarity search systems. This paper explores how to enhance database systems with query refinement for content-based (similarity) searches in object-relational databases. Query refinement is achieved through relevance feedback where the user judges individual result tuples and the system adapts and restructures the query to better reflect the users information need. We present a query refinement framework and an array of strategies for refinement that address different aspects of the problem. Our experiments demonstrate the effectiveness of the query refinement techniques proposed in this paper.

ONLINE: <http://hdl.handle.net/100.2/ADA466136>

Intelligent tutoring systems seek to optimize instruction and training by adapting and individualizing the learning experience on the basis of a student model (Shute, 1995). This model represents the system's estimate of the student's current knowledge or skill level, established from a performance history. Knowledge tracing (Alevan & Koedinger, 2002; Anderson, Conrad, & Corbett, 1989) is a dynamic, Bayesian approach to updating the estimates of probability of skill mastery in the student model. A fundamental shortcoming of this approach is that it does not include a representation of memory decay during periods of non-practice. As a result, traditional student modeling approaches are unable to make predictions regarding knowledge and skill changes under various future training schedules or to prescribe how much training will be required to achieve specific levels of readiness at a specific future time. In this paper, we propose a new knowledge tracing equation, computationally inspired by the learning and forgetting equations in the ACT-R cognitive architecture (Anderson et al., 2004), which uses performance history to baseline student model parameters and then extrapolates knowledge state transformation to predict future performance. We explore practical issues concerning predictive models of future trainee performance and the prescription of frequency and timing of optimal learning with training systems. For instance, we investigate how much data from the training history are necessary to achieve reasonable predictive validity, and we describe the impact of data granularity through a quantitative assessment of how adequately the model can fit and predict human performance curves across aggregate-level, team-level, and individual-level resolutions. The paper ends with a discussion of the implications of this research for the future of training and education

**Optimizing the Allocation of Sensor Assets for the Unit of Action**

Tutton, Stephanie J; Sep 2004; 26 pp.; In English; Original contains color illustrations

Report No.(s): AD-A466312; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA466312>

The U.S. Army's Objective (Future) Force is being developed as a faster, lighter, more rapidly deployable alternative to the current force structure. The development of a strategy for the allocation of the Unit of Action's organic sensing assets is necessary to achieve the maximum situational awareness and information dominance required for successful combat operations on the future battlefield. This paper presents a methodology for finding an appropriate mix and allocation strategy for organic Unit of Action sensors in a given scenario. Specifically, the author developed a mathematical programming model to analyze the mix and allocation of organic sensor assets using an optimization-based approach. The model requires the following inputs: an inventory of sensors and platforms, a list of asset configurations known as packages, and an intelligence-based clustering of targets. The model then creates operationally feasible assignments of packages to target clusters, maximizing the weighted number of targets detected. Stochastic optimization and mixed integer linear programming were used to accomplish this goal. Two optimization models were developed: (1) a Sensor Mix Model that, given a fixed mix or inventory, allocates assets to target areas on the battlefield; and (2) a Sensor Mix Model that suggests an organic mix of sensors for consideration in developing the Objective Force structure. These models have the potential to be used as operational decision support tools for the unit commander. The notional data set used for model development included 10 platform types, 10 target clusters, 10 target categories, 4 enemy orders of battle, and 4 outcomes. However, these inputs could be easily modified based on the requirements of the user or analyst.

**Risk Advised Course of Action (COA) Analysis**

Courand, Gregg; Liu, Wanderley; Mar 2007; 46 pp.; In English; Original contains color illustrations

Contract(s)/Grant(s): FA8750-06-C-0196; Proj-459S

Report No.(s): AD-A466339; AFRL-IF-RS-TR-2007-84; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA466339>

The purpose of this project is to demonstrate the feasibility and value of Synergia's experimental 'Risk-Advised Planning' (RAP) technology. This technology embodies an analytical tool called 'Value of Informed Control over Events' (VOICE). VOICE manages simulation-based analysis for COA development and assessment. RAP integrates human systems modeling tools to develop causal conditions and trajectories for projected COA execution, with VOICE decision-theoretic tools to assess and comparatively evaluate candidate COAs. The results of VOICE guide COA design/redesign, and circumscribe whatever information gathering and human systems modeling may be required. The value of the experimental VOICE technology was successfully demonstrated as a formal mechanism for managing the potentially unbounded combinatory complexity of simulation-based planning. VOICE clearly identifies the most important causal variables in a COA. It sharply circumscribes the simulation studies that are required to establish the kinds and frequency of outcomes pertinent to COA evaluation and redesign. The authors illustrate RAP's operation on a simulation scenario -- the Jakarta scenario -- that was developed under the Joint Semi-Automated Forces (JSAF) environment. The Jakarta scenario consists of a series of events following the assassination of the Indonesian president and key government leaders that ultimately leads to a military intervention of the Australian forces (blue forces) on Indonesia (red forces.) First, they describe their revised version of the Jakarta scenario and use it as background to illustrate the complexities associated with the development of plans and the design of simulation studies. Then, they summarize the technology and methods employed in this demonstration, including the VOICE technology and the H-RAP method. Next, they present the demonstration itself; they describe each step of their hierarchical planning approach as they apply it to the Jakarta scenario.

**Further Evidence of the Effects of Wind Turbine Farms on AD Radar**

Aug 12, 2005; 57 pp.; In English; Original contains color illustrations

Report No.(s): AD-A466373; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA466373>

The Government is supporting the introduction of wind turbine farms within the UK as part of its renewable energy strategy. As a result of the Government's policy, there has been a rapid increase in the number of planning applications for wind turbine farms, including offshore developments. Prior to conducting live flight trials in 2004, the MoD scrutinised planning applications for wind turbine farm developments within 74 km and Line of Sight (LoS) of a primary Air Defence (AD) surveillance radar. However, following those trials, the resultant Trial Report recommended that the MoD scrutinise wind turbine farm planning applications within LoS of AD radars, regardless of range. As a result of this recommendation, the MoD temporarily removed the 74 km range limit. There remains a requirement for MoD to provide more robust and substantiated evidence in support of this policy change. Consequently, the Directorate of Counter Terrorism and UK Operations (D CT&UK Ops) tasked the Air Warfare Centre (AWC) (Air Command and Control Operational Evaluation Unit (Air C2 OEU)) with gathering further evidence on the effects of wind turbines on AD radar performance. This task was conducted as a live flight trial during the period 29 Mar 8 Apr 05.

Contract(s)/Grant(s): F49620-09-1-0070; R03-LM07332-01

Report No.(s): AD-A466417; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA466417>

Time requirements for the solving of complex large-scale engineering problems can be substantially reduced by using parallel computation. Motivated by a computationally demanding biomechanical system identification problem, we introduce a parallel implementation of a stochastic population based global optimizer, the Particle Swarm Algorithm, as a means of obtaining increased computational throughput. The Particle Swarm requires very few algorithmic parameters to define convergence behavior due to its simplicity, and, as a population based optimization method it is a natural candidate for concurrent computation. The parallelization of the Particle Swarm Optimization (PSO) algorithm is detailed and its performance and characteristics demonstrated for the biomechanical system identification problem as example.

**Parallel Global Optimization with the Particle Swarm Algorithm (Preprint)**

Schutte, J F; Reinbolt, J A; Fregly, B J; Haftka, R T; George, A D; Dec 2004; 34 pp.; In English

Contract(s)/Grant(s): F49620-09-1-0070

Report No.(s): AD-A466447; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA466447>

Present day engineering optimization problems often impose large computational demands, resulting in long solution times even on a modern high-end processor. To obtain enhanced computational throughput and global search capability, we detail the coarse-grained parallelization of an increasingly popular global search method, the Particle Swarm Optimization (PSO) algorithm. Parallel PSO performance was evaluated using two categories of optimization problems possessing multiple local minima - large-scale analytical test problems with computationally cheap function evaluations and medium-scale biomechanical system identification problems with computationally expensive function evaluations. For load-balanced analytical test problems formulated using 128 design variables, speedup was close to ideal and parallel efficiency above 95% for up to 32 nodes on a Beowulf cluster. In contrast, for load-imbalanced biomechanical system identification problems with 12 design variables, speedup plateaued and parallel efficiency decreased almost linearly with increasing number of nodes. The primary factor affecting parallel performance was the synchronization requirement of the parallel algorithm, which dictated that each iteration must wait for completion of the slowest fitness evaluation. When the analytical problems were solved using a fixed number of swarm iterations, a single population of 128 particles produced a better convergence rate than did multiple independent runs performed using sub-populations (8 runs with 16 particles, 4 runs with 32 particles, or 2 runs with 64 particles). These results suggest that 1) parallel PSO exhibits excellent parallel performance under load-balanced conditions, 2) an asynchronous implementation would be valuable for real-life problems subject to load imbalance, and 3) larger population sizes should be considered when multiple processors are available.

Stankovic, John A; Abdelzaher, Tarek F; Lu, Chenyang; Sha, Lui; Hou, Jennifer C; Jul 2003; 22 pp.; In English

Contract(s)/Grant(s): N00014-01-1-0576

Report No.(s): AD-A466459; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA466459>

Sensor networks can be considered distributed computing platforms with many severe constraints, including limited CPU

speed, memory size, power, and bandwidth. Individual nodes in sensor networks are typically unreliable and the network topology dynamically changes, possibly frequently. Sensor networks also differ because of their tight interaction with the physical environment via sensors and actuators. Because of this interaction, we find that sensor networks are very data-centric. Due to all of these differences, many solutions developed for general distributed computing platforms and for ad-hoc networks cannot be applied to sensor networks. After discussing several motivating applications, this paper first discusses the state of the art with respect to general research challenges, then focuses on more specific research challenges that appear in the networking, operating system, and middleware layers. For some of the research challenges, initial solutions or approaches are identified.

**Updating Optimal Decisions Using Game Theory and Exploring Risk Behavior Through Response Surface Methodology**

Jordan, Jeremy D; Mar 2007; 157 pp.; In English; Original contains color illustrations

Report No.(s): AD-A466605; AFIT/GOR/ENS/07-13; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA466605>

This thesis utilizes game theory within a framework for updating optimal decisions based on new information as it becomes available. Methodology is developed that allows a decision maker to change his perceived optimal policy based on available knowledge of the opponents strategy, where the opponent is a rational decision maker or a random component nature. Utility theory is applied to account for the different risk preferences of the decision makers. Furthermore, response surface methodology is used to explore good risk strategies for the decision maker to approach each situation with. The techniques are applied to a combat scenario, a football game, and a terrorist resource allocation problem, providing a decision maker with the best possible strategy given the information available to him. The results are intuitive and exemplify the benefits of using the methods.

**Reduced Magnetic Vector Potential and Electric Scalar Potential Formulation for Eddy Current Modeling (Postprint)**

Zeng, Zhiwei; Liu, Xin; Deng, Yiming; Udpa, Lalita; Knopp, Jeremy S; Steffes, Gary; Mar 2007; 7 pp.; In English; Original contains color illustrations

Contract(s)/Grant(s): Proj-4349

Report No.(s): AD-A466615; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA466615>

A new formulation using the reduced magnetic vector potential and the electric scalar potential is proposed for modeling of eddy current (EC) problems using finite element analysis. The major advantage of the proposed formulation is that it eliminates the need for meshing the current source. In EC nondestructive testing the probe coil scans across the sample which involves motion of the coil. Simulation of EC scans in conventional finite element models requires considerable re-meshing. In the proposed formulation, the mesh and system matrix remain unchanged with different coil positions. The incomplete factorization of the system matrix as pre-conditioner is performed only once during the entire scan, which results in a significant reduction of computation time.

ONLINE: <http://hdl.handle.net/100.2/ADA466693>

In some rapidly approaching future, on a battlefield, deep-space or planetary mission, teams of agents will be confronted with a problem beyond their computational capability, putting missions at risk. This risk arises from a lack of social theory based on first principles for decision-making in the face of ill-defined problems (IDPs). Also, no first principles exist to address

the downside of cooperation (e.g., terrorist cells, corruption, and, regarding agents, reductions in computational power from communication costs when an increasing number of agents cooperates interactively). These problems make traditional social models impractical for a multiple-agent system to solve IDPs. In contrast to logical positivist models, such as command or consensus decision models, quantizing the pro-con positions in decision-making may produce a robust model that increases in computational power with 'N.' Previously, optimum solutions of IDPs were found to occur when incommensurable beliefs interacting before neutral decision makers generated sufficient emotion to process information, 'I,' but insufficient to impair the interaction, producing more trust compared to cooperation. This model has been extended to the first quantum information density functional theory of groups, especially mergers between organizations. The author now begins to integrate his model with Markovian models. Twenty-nine briefing charts summarize the presentation.

ONLINE: <http://hdl.handle.net/100.2/ADA466728>

When groups of individuals make choices among several alternatives, the most compelling social outcome is the Condorcet winner, namely the alternative beating all others in a pair-wise contest. Obviously the Condorcet winner cannot be overturned if one sub-group proposes another alternative it happens to favor. However, in some cases, and especially with haphazard voting, there will be no clear unique winner, with the outcome consisting of a triple of pair-wise winners that each beat different subsets of the alternatives (i.e. a 'top-cycle'.) We explore the sensitivity of Condorcet winners to various perturbations in the voting process that lead to top-cycles. Surprisingly, variations in the number of votes for each alternative is much less important than consistency in a voter's view of how alternatives are related. As more and more voter's preference orderings on alternatives depart from a shared model of the domain, then unique Condorcet outcomes become increasingly unlikely.

ONLINE: <http://hdl.handle.net/100.2/ADA466762>

This paper presents a new abstraction for virtual infrastructure in mobile ad hoc networks. An Autonomous Virtual Mobile Node (AVMN) is a robust and reliable entity that is designed to cope with the inherent difficulties caused by processors arriving, leaving, and moving according to their own agendas, as well as with failures and energy limitations. There are many types of applications that may make use of the AVMN infrastructure: tracking, supporting mobile users, or searching for energy sources. The AVMN extends the focal point abstraction in and the virtual mobile node abstraction in. The new abstraction is that of a virtual general-purpose computing entity, an automaton that can make autonomous on-line decisions concerning its own movement. We describe a self-stabilizing implementation of this new abstraction that is resilient to the chaotic behavior of the physical processors and provides automatic recovery from any corrupted state of the system.

**Supporting Effects-Based Operations with Information Technology Tools: Examining Underlying Assumptions of EBO Tool Development Practices**

Wales, William J; Triscari, Thomas; Sep 2004; 26 pp.; In English; Original contains color illustrations

Report No.(s): AD-A466810; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA466810>

Throughout the course of history, great leaps in progress and understanding have been facilitated through the questioning of basic assumptions. In an effort to uncover critical opportunities and vulnerabilities within effect-based operations (EBO), similar questions must be posed to our current assumptions underlying EBO tool development practices. Required for these assumptions to be examined is a shared understanding of strategy formulation as an intensely human process. The breadth of approaches used in recent years to help commanders formulate effects-based courses of action (CoA) is quite diverse including expert systems, Bayesian networks, and scenario analysis. All of these approaches represent best guess assumptions of how to codify aspects of the strategy development process, often with out regard for the principles of automation. The adverse unintended consequences made possible from this neglect are wide ranging, including the potential to inadvertently foster convergent vs. divergent thinking, conditioning commanders and policy makers to accept a dangerously limited view as an accurate model of real world threats. Imperative to avoiding this conceivable eventuality is a strategic perspective on EBO tool development practices. Identified in this paper are four major paradigms or schools of thought of strategic decision support: autonomous, directive, predictive, and emergent. The proposed paradigms are offered to illustrate how recent EBO tool development approaches may be classified and subsequently characterized based upon their inherent gravitation to a particular decision support paradigm.

ONLINE: <http://hdl.handle.net/100.2/ADA467098>

We define a programming abstraction for mobile networks called the Virtual Stationary Automata programming layer, consisting of real mobile clients, virtual timed I/O automata called virtual stationary automata (VSAs), and a communication service connecting VSAs and client nodes. The VSAs are located at pre-specified regions that tile the plane, defining a static virtual infrastructure. We present a self-stabilizing algorithm to emulate a VSA using the real mobile nodes that are currently residing in the VSA's region. We also describe several examples of applications whose implementations benefit from the simplicity obtained through use of the VSA abstraction.

ONLINE: <http://hdl.handle.net/100.2/ADA467100>

We introduce Simultaneous Localization and Tracking (SLAT), the problem of tracking a target in a sensor network while simultaneously localizing and calibrating the nodes of the network. Our proposed solution, LaSLAT, is a Bayesian filter providing on-line probabilistic estimates of sensor locations and target tracks. It does not require globally accessible beacon signals or accurate ranging between the nodes. When applied to a network of 27 sensor nodes, our algorithm can localize the nodes to within one or two centimeters.

Traditional command and control research occurs at two extremes of the cost and fidelity spectrums. At one end, low cost seminar games and simple abstractions, like chess, offer insights, but lack rigorous scientific techniques for analysis. On the other hand, highly detailed simulations, like those conducted for the US Navy's Global War Game, cost time and money, and offer little in support of developing scientific proofs. This paper details the methodology of employing two complementary concepts to the field of C2 research: game-based experimentation using distillation games, and agentbased methods. These approaches fall midway on the cost and fidelity spectrums. The game distillation, SCUDHunt, has proven to be successful in providing a rigorous scientific and statistical approach for experimentation. The results of SCUDHunt experiments offer insights into team behavior, shared situational awareness, and team performance. To complement this human-player environment, we created SCUDHunt computer agents. This agent-based approach provides an exploratory environment complementary to the human-based game. This paper provides an overview of the work we, and others, have done in these areas to date, and proposes some future directions to develop the promise of this approach.

As military environments increase in the complexity, fidelity, scope, and number of participants, the reliance of the military upon information superiority to facilitate successful operations increases. In conjunction with this increase upon accurate and timely information the vulnerability of military forces to information attack also increases. Additionally, information management capability improvements inevitably increase the value of the information management networks and software; thereby, directly increasing the incentive for attacking or pirating the network and software capabilities. Therefore, as the information management capabilities of military forces increase, there is a corresponding need for improved security for the software and network systems and this need for improved security will increase as the value of the software and network systems increases. This improvement in information management capabilities must be accompanied by a corresponding increase in the ability to manage the protection of military information systems, which is a topic that has received scant attention.

Agent-based modeling (ABM) is a recent simulation modeling technique that consists of modeling a system from the bottom up, capturing the interactions taking place between the system's constituent units. Such a bottom up approach enables

users to describe and predict emergent phenomena. These include aggregate, system-level behaviors that can be counter-intuitive. Because decentralized command and control (DC2) paradigms can sometimes lead to counter-intuitive phenomena, ABM is the tool of choice to test DC2 and can provide significant insight into the design of DC2 approaches.

Report No.(s): AD-A467431; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA467431>

Twelve years after Desert Storm, conduct of Time Critical Target (TCT) operations remains one of the most difficult challenges facing US military forces. While a variety of DoD and DARPA programs are addressing technologies to locate and identify TCTs, finding the target candidate is only one part of the problem. Success will only occur when we shorten the entire 'kill chain', and operate within the enemy's maneuver timeline. The automated exchange and processing of battlefield information is critical to achieving viable decision timelines in this arena. The situation demands a secure, robust network backbone supporting automated decision aids designed to execute commander's guidance. Critical decision aids include the ability to monitor and exchange critical tactical information, to evaluate real-time intelligence and generate actionable Target Evidence Files and to re-assign en-route tactical and support assets to higher value tasks. The Air Force Research Laboratory (AFRL), with support of The Boeing Company, is executing several research initiatives targeted at these information exchange shortfalls. AFRL is developing the Joint Battlespace Infosphere (JBI) as a means to realize information dominance. In effect, the JBI can be viewed as a tactical Internet that provides unprecedented access to data sources. Through this wide-area network connectivity, the JBI can be accessed, searched, and manipulated to create new products. This paper will discuss the Insertion of Embedded Infosphere Support Technology (IEIST) research in which the Guardian Agent (GA) will be embedded within the Force Template (FT) and transmitted to the appropriate C2 node(s) over Link 16. The demonstration C2 node is planned to be the Advanced AWACS Prototype Software, which will host the transmitted GAs as well as the TCT Evidence File Generation Agents, and the Real-time Battle Management system that will match tactical assets to selected TCTs.

A WOVEN WEB of GUESSES -- Canto One: Network Centric Warfare and the Myth of the New Economy. -- Canto Two: Network Centric Warfare and the Myth of Inductivism. -- Canto Three: Network Centric Warfare and the Virtuous Revolution. INTRODUCTION -- Canto One: The NCW business analogy is highly problematic. Important and often adverse insight have been ignored. -- Canto Two: The NCW thesis perpetuates a discredited theory of knowledge and knowledge development, known as naive inductivism, that has long exerted powerful influence over the military. -- Canto Three: Exciting opportunities exist if we replace inductivism with critical rationalism. Unlike inductivism, critical rationalism is consistent with profound insights into the nature of logic, information, knowledge and reasoning. In short, the prerequisite to a revolution in military affairs is a revolution in the way we think about thinking.

Human interactions of all kinds, both friendly and unfriendly, are increasingly structured by networks of transportation

and communication spatial technologies. Yet our tools to model, understand, and predict dynamic human interactions and behavior on spatial networks and geographic landscapes have lagged far behind. Even recent progress in social network modeling has not yet offered us any capability to model dynamic processes among mobile agents who interact at all scales on small-world and scale-free geographic networks. Computational laboratory modeling of dynamic human interactions on richly structured landscapes is important for understanding the sometimes counter-intuitive dynamics of such loosely coupled systems of non-linear interactions. Deeper understanding is more important than ever not only because the stakes are so much higher, but because we now have greater strategic control over the structural design and therefore the effects of our networks of organizational and spatial technologies.

**Time-Base Tree Graphs for Stabilized Force Structure Representations**

Chamberlain, Sam; Leeds, Chris; Jun 2003; 40 pp.; In English; Original contains color illustrations

Report No.(s): AD-A467517; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA467517>

A basic, and often key, component of any battlefield representation is the forces involved. Obtaining high-resolution force structure data has always been a major task. This is true whether the representation is for simulated or actual operations. However, the problem extends far beyond simply obtaining a single force structure snapshot. The real challenge is maintaining the data, especially when numerous other programs are creating and linking their data to the force structure. This paper describes an approach for maintaining consistency in a high-resolution database of Army units that is undergoing continual change due to force modification. The use of time-based tree graphs is proposed as a technique for providing stability and maximizing the retention of existing entities to minimize the effect to systems that use the data. In a network-centric context, an easily accessible repository called the Army Organization Server (AOS) is under development that will contain the evolving, default force structure of the Army.

**Workforce Configuration of a Canadian Forces Geomatics Division**

Ng, Kevin Y; Ghanmi, Ahmed; Mitchell, Roy; Lam, M N; Sep 2002; 16 pp.; In English; Original contains color illustrations

Report No.(s): AD-A467627; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA467627>

This paper addresses some of the pertinent issues related to the workforce configuration of a C2 organization within the Canadian Forces. The mission of the latter is to produce Geomatics Information supporting US National Imaging and Mapping Agency's (NIMA) Foundation Based Operations (FBO). Initially, the open queueing network representation of the Geomatics division (where each node or station is governed by a GI/G/s queue) is examined and its complexity analyzed. The Geomatics network belongs to the class of queueing network with signals. An alternate network architecture is proposed and the intent of which is to provide a simplified network whereby the theory of product-form solutions can be employed to evaluate the workforce configuration. The equivalence of the L norm on the waiting times between the original and the revised network is demonstrated. A nonlinear integer programming model to minimize the L norm on the waiting times for the revised network is formulated. The solution procedure involves transforming the nonlinear problem into a linear problem using approximation techniques. Fictitious data are used to illustrate the methodology.

**Assessing C3I in Support of Dismounted Operations in Complex Terrain**

Brady, Edward; Starr, Stuart; Jun 2002; 16 pp.; In English; Original contains color illustrations

Report No.(s): AD-A467715; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA467715>

The assessment of dismounted operations in complex terrain remains one of the most challenging problems for the military analysis community. Recently, a study was performed by the US Army Science Board to identify the operational

capabilities that were needed to enhance the effectiveness of these operations, with emphasis on C3I. To establish a context for the study, an extensive data mining activity was undertaken to identify the key issues and to formulate preliminary insights. This activity focused on 'lessons learned' reports from actual operations and after action reports from recent experiments. In the former category, C3I lessons recorded (if not learned) were identified in the Handbook for Joint Urban Operations (reference 1). As an illustration, based on an assessment of the Russian experience in Chechnya, it was concluded that 'The command and control structure needs to be able to adapt to the urban environment where communication may be difficult.' Similarly, in the area of experimentation, the USMC's experiences in Project Metropolis (reference 2) revealed shortfalls in communications at the lowest tactical levels (e.g., platoon commander and squad leader). Based on the results of this data mining, several vignettes were selected that spanned an interesting set of levels of conflict and environmental conditions. Three of these vignettes were selected to illuminate selected C3I issues: a reverse slope, treeline attack against a well-protected squad in rugged terrain; floor clearing operations in a building; and humanitarian assistance in a small village.

### **Simulation of Coherent Signals with Forward Error Correction Coding**

Kong, Der-Hung; Mar 2007; 67 pp.; In English

Report No.(s): AD-A467078; No Copyright; Avail.: Defense Technical Information Center (DTIC)

This thesis focuses on the modeling and simulation of the performance of M-ary modulation techniques. In addition to the most popular used coherent modulation schemes, forward error correction (FEC) coded signals, and fading channels are also considered. The channel is modeled for the two cases of fading and no fading, both with additive white Gaussian noise (AWGN). The effect of barrage noise interference is also considered. Binary phase-shift keying (BPSK), 16-PSK, and 16-QAM (quadrature amplitude modulation) communication systems are simulated and analyzed. For BPSK, both hard decision decoding (HDD) and soft decision decoding (SDD) are considered. For 16-PSK and 16-QAM, only HDD is examined. Simulation results and analytical results are compared. The results show that the modeling and simulation in SystemView, are in excellent agreement with the analytical results.

### **Polarimetric Thermal Imaging**

Loo, Fook L; Mar 2007; 121 pp.; In English

Report No.(s): AD-A467102; No Copyright; Avail.: Defense Technical Information Center (DTIC)

Passive infrared (IR) imagers, using intensity contrast for target detection, are often limited by low target-background contrast. Detecting stationary targets against cluttered backgrounds presents an even bigger challenge. Polarized signatures can be used as an additional discriminator, to improve target detection probability and reduce false alarm rate. In this research, a polarimetric thermal imager, operating in the mid wave infrared (3-5  $\mu$ m), was set up using the Merlin InSb camera with three internal wire grid polarizers. Non uniformity correction and radiometric calibration were performed to compensate for differences in detector response and polarizer's transmittance. The scene consisted of a heated aluminum plate in front of a large area blackbody as background. The viewing angle, defined as the angle between surface normal and camera line of sight, was varied by rotating the plate about its vertical axis. Stokes parameters were computed from the irradiance images. Images of intensity, degree of polarization and polarization angle were derived from the Stokes parameters. The dependence of these polarization characteristics on viewing angle was investigated. While intensity increased slightly with viewing angle, degree of polarization increased rapidly when the viewing angle was increased from 20c to 80c. The polarization angle increased with viewing angle and became constant at 150c for viewing angle greater than 60c. Target to background contrast based on degree of polarization increased with viewing angle and was higher than intensity contrast for viewing angle greater than 20c. Image processing algorithms were developed to segment the target plate from its background. The target similarity metric used was the texture-based Fisher distance, which enabled the fusion of one or more data type.

**Particle Filter Based Tracking in a Detection Sparse Discrete Event Simulation Environment**

Borovies, Drew A; Mar 2007; 135 pp.; In English

Report No.(s): AD-A467179; No Copyright; Avail.: Defense Technical Information Center (DTIC)

One of the key abilities of agents in military simulations is to react to both detections of and counter-detections by other agents in the environment. While methods have been developed to model these detections and counter-detections, the majority of these methods model detection and counter-detection as an all or nothing prospect in which an un-detected entity at some point crosses an arbitrary threshold of observability and becomes fully detected. In actuality, even extremely uncertain or incomplete detections and counter-detections of opposing entities can provide enough data for entities to make reasonably intelligent decisions on the virtual battlefield. Recent developments in commercial gaming artificial intelligence suggest that particle-based tracking techniques can provide accurate and computationally efficient state estimation of opposing agents within virtual environments. In this work several particle-based methods for obtaining and tracking contacts are explored to determine the feasibility of their use as a general purpose tracking technique in military simulations.

**An Analysis of Small Navy Tactics Using a Modified Hughes' Salvo Model**

Tiah, Yao M; Mar 2007; 112 pp.; In English

Report No.(s): AD-A467282; No Copyright; Avail.: Defense Technical Information Center (DTIC)

This thesis develops a modified version of Hughes' Salvo Model and employs it to analyze the tactical disposition (concentration or dispersion) of a small, but modern, navy whose adversary is numerically superior but technologically inferior. It also identifies tactical factors and develops insights that are critical to the success of small navies when fighting outnumbered. Quantitative results indicate that the smaller navy must fight dispersed and win by outscouting the enemy and attacking him effectively first. This requires a superior scouting capability, effective command, control, and communications (C3), and the ability to deliver sufficient striking power. To ensure the delivery of sufficient striking power, a small navy must put greater emphasis on offensive firepower to compensate for small force size. To be successful in battle, small navies must show initiative, and be willing to implement bold tactics. These attributes have been demonstrated by small, but successful, naval forces in the history of naval warfare. In addition, innovative tactical thinking can allow small navies to take advantage of useful tactical phenomenon like the 'missile- sump effect' and to design the most appropriate type of combat craft for their respective operating environments.

**A System of Systems Interface Hazard Analysis Technique**

Redmond, Patrick; Mar 2007; 151 pp.; In English

Report No.(s): AD-A467343; No Copyright; Avail.: Defense Technical Information Center (DTIC)

The next generation of military capabilities will hinge on systems of systems technologies, entailing the integration of numerous large scale systems into a complex system of systems whose capability exceeds the capabilities of the individual systems. The increase in capability is due to the emergent properties of the system of systems. However, these emergent properties also introduce hazards that must be adequately dealt with before the system of systems can be employed. The current state of hazard analysis processes is insufficient to deal with the complexity and size of a system of systems. This thesis aims to define the nature and types of hazards associated with systems of systems and to define a technique for identifying specific hazards within a system of systems. In addition to developing a theoretical process, this thesis applies it to a real world case study, the Ballistic Missile Defense System. A software application was developed to prove the concept of the hazard analysis technique. The technique has been designed from the top down to be compatible with current system safety processes and as such, is directly compatible with systems of systems currently in development and familiar to practicing system safety engineers.

**A Heuristic Design Information Sharing Framework for Hard Discrete Optimization Problems**

Jacobson, Sheldon H; Mar 1, 2007; 48 pp.; In English

Contract(s)/Grant(s): FA9550-04-1-0110; 6RNM25; Proj-FQ867100400698

Report No.(s): AD-A467897; No Copyright; Avail.: Defense Technical Information Center (DTIC)

This project studied and developed simultaneous generalized hill climbing (SGHC) algorithms as an algorithmic framework for information sharing in discrete optimization problems. This framework has been used to gain new insights into neighborhood structure designs that allow different neighborhood functions to share information when using the same heuristic applied to the same problem. The results reported from this project introduce the SGHC algorithm framework for information sharing across sets of related discrete optimization problems, provide guidelines on how to use and to design neighborhood functions that results in effective performance of local search algorithms, and describe how tabu search can be effectively used to improve the performance of generalized hill climbing algorithms. Extensive computationally results are reported on a large variety of test bed, large-scale, real-world discrete optimization problems. The primary application for this research were a military combat search and rescue problems, where several possible search and rescue strategies must be considered to determine the optimal strategy, and a homeland security aviation security baggage screening problems, where several different baggage screening strategies at a set of airports must be considered to determine the optimal strategy for the entire system. Both these problems are intractable due, in part, to the exponentially large number of possible solutions that exist and must be evaluated to identify those that are optimal.

**Problem representation and variation in the forecasts of 'political experts'**

Purkitt, Helen E; Jun 2001; 21 pp.; In English

Report No.(s): AD-A468436; No Copyright; Avail.: Defense Technical Information Center (DTIC)

Forecasts often involve judgments about 'ill-structured' problems that lack an optimal solution or agreement about boundary conditions. This paper describes how the degree of structure of the problem and the forecasting time frame can be used to form a classification scheme of different types of forecasting problems. This scheme can be used as a guide for choosing the most appropriate approach and methods to use in analyses and predictions. The paper next describes a method for summarizing how individuals or groups of problem solvers analyze 'ill-structured' social and political problems. Examples of this method, based on the construction of free-hand causal diagrams of novice and expert political forecasters, are presented. Experience to date using these schematic summaries indicate that such summaries are useful for understanding the reasoning processes of clients and to check the reasoning process used by experts from different backgrounds and experiences in making forecasts.

**Using a Shortest Path Algorithm for Identifying Areas of Interest in An Area of Operations**

Charbonneau, Steven; Stein, Michael; Jun 2003; 53 pp.; In English; Original contains color illustrations

Report No.(s): AD-A466746; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA466746>

Sensor coverage of a unit's area of operations will be critical to maintaining situational awareness for interim and objective force ground units. As such, sensor deployment plans that offer a high probability of covering lines of communication (LOC's) and avenues of approach (AA) while limiting the number of sensors employed will become an important part of the Intelligence Preparation of the Battlefield. Manual methods for determining these LOC's and AA's can be time consuming when applied over large areas of terrain. We propose a method that combines mathematical morphology and a greedy heuristic (single source shortest path algorithm) in order to identify channeling terrain along likely routes of enemy movement. The results of the analysis can then be graphically reviewed for quality and used as necessary in the Intelligence Preparation of the Battlefield (IPB) process.

**Filtered Rayleigh Scattering Measurements in a Buoyant Flowfield**

McGaha, Christopher C; Mar 2007; 81 pp.; In English; Original contains color illustrations

Report No.(s): AD-A468305; AFIT/GAE/ENY/07-M18; No Copyright; Avail.: Defense Technical Information Center (DTIC)

Filtered Rayleigh Scattering (FRS) is a non-intrusive technique for studying flowfields. Molecular scattering provides the signal to the camera, and the difference in molecular cross section can be used to discriminate between unmixed gaseous components. The focus of this research is to document the behavior of a horizontal buoyant jet using FRS. A helium jet of precisely controlled mass flow rate is injected into a standard room temperature environment, and FRS provides the means to measure its core trajectory and mixing rate. Trajectory analysis, conducted with consideration of the Reynolds number and Grashof number, can be used to compare these results to the literature. A significant portion of the study was dedicated to measuring the rate at which FRS data can be acquired with a continuous wave laser. Additionally, mixing patterns for the buoyant jet were collected and indicate that core low-density fluid is expelled into the ambient region in a striking manner under certain conditions. Although such an expulsion of core low-density fluid has been noted in the literature, it has generally been associated only with an upward direction. This was observed at a Reynolds number of 238. However, at a Reynolds number of 667, the jet appears to take on features of jets subjected to an exaggerated form of helical mode excitation. The physics behind this phenomena requires additional study.

**Multi-Cumulant and Non-Inferior Strategies for Multi-Player Pursuit-Evasion (PREPRINT)**

Pham, Khan D; Lacy, Seth; Robertson, Lawrence; Jan 2007; 9 pp.; In English

Contract(s)/Grant(s): LRI; 00VS17C0R

Report No.(s): AD-A468453; AFRL-VS-PS-TP-2007-1018; No Copyright; Avail.: Defense Technical Information Center (DTIC)

The paper presents an extension of cost-cumulant control theory over a finite horizon for a class of two-team pursuit-evasion games wherein the evolution of the states of the game in response to decision strategies selected by pursuit and evasion teams from non-inferior sets of admissible controls is described by stochastic linear differential equations and integral quadratic cost. Since the sum of the aggregate cost functions of two teams is equal to zero, the amount that one team gains is equal to the amount of the other team loses. Both cooperation within each team and competition between the teams presumably exist. A direct dynamic programming approach for the Mayer optimization problem is used to solve for a multi-cumulant non-inferior based solution when the members in each team measure the states and minimize the first  $k$  cumulants of the standard integral-quadratic cost associated with this special class of multi-player pursuit-evasion games.

ONLINE: <http://hdl.handle.net/100.2/ADA468603>

The integration of demand dynamics into a structural model is a key conceptual shift for software engineering. This report

examines the utility and transition characteristics of a structural dynamic analysis modeling technique called Protective ANalysis (PAN) that was used on an interoperability technical probe of a North Atlantic Treaty Organization (NATO) modernization program. The report focuses on the process rather than the findings of the probe. Organizational entities are referred to generically and in some instances aggregated. The probe involved workshops and interviews conducted over a two-week period with more than 25 people followed by analysis of the data gathered. PAN was used to model the NATO program as a system of systems. The model is a rapid assessment based on the subjective understanding of the interviewed subject matter experts. It is a snapshot in time; while dynamic stocks and feedback loops are represented their temporal characteristics are not. From the model five perspectives were analyzed for different forms of interoperability- risk. These analyses produced three-dimensional projections that depict clusters of shared interfaces. The separation between these clusters identifies the interoperability risks. The report notes that the PAN technique starts from a client-driven context and builds visual representations that are easily understood by and bring immediate value to the client. Further the report observes that the modeler is critical to this technique and must possess expert skills in the Microsoft Visio application as well as an ability to quickly grasp and characterize the constructs and objects revealed through dialog-based inquiry. The report concludes that PAN appears to offer a fresh approach new insights and appropriate mechanisms to study complexity in systems of systems. The potential for applying and amplifying this technique appears to be significant.

**A Practical Example of Applying Application-Driven Design (ADD), Version 2.0**

Wood, William G; Feb 2007; 59 pp.; In English; Original contains color illustrations

Contract(s)/Grant(s): FA8721-05-C-0003

Report No.(s): AD-A468604; CMU/SEI-2007-TR-005; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA468604>

This report describes an example application of the Attribute-Driven Design (ADD) method developed by the Carnegie Mellon Software Engineering Institute. The ADD method is an approach to defining a software architecture in which the design process is based on the quality attribute requirements the software must fulfill. ADD follows a recursive process that decomposes a system or system element by applying architectural tactics and patterns that satisfy its driving quality attribute requirements. The example in this report shows a practical application of the ADD method to a client-server system. In particular this example focuses on selecting patterns to satisfy typical availability requirements for fault tolerance. The design concerns and patterns presented in this report-as well as the models used to determine whether the architecture satisfies the architectural drivers-can be applied in general to include fault tolerance in a system. Most of the reasoning used throughout the design process is pragmatic and models how an experienced architect works.

ONLINE: <http://hdl.handle.net/100.2/ADA468631>

In today's business environment, multiple organizations routinely work collaboratively in pursuit of a single mission. These separate efforts result in process and programmatic complexity that is difficult to manage effectively. Mission success in these complex settings demands a collaborative management approach that effectively coordinates task execution and decision-making activities among all participating groups. Managing for mission success requires establishing and maintaining a reasonable degree of confidence that a mission's objectives will be successfully achieved. Confidence at the mission level requires establishing and maintaining a corresponding level of confidence in the people, processes, and technologies used to achieve a mission. The Software Engineering Institute (SEI) is currently developing the Mission-Oriented Success Analysis and Improvement Criteria (MOSAIC) a suite of advanced, risk-based analysis methods for assessing

complex, distributed programs, processes, and information-technology systems. With SEI MOSAIC methods, management can establish and maintain confidence in success throughout the life cycle and help provide assurance at the mission, system, and program levels. This technical note provides an executive overview of the concepts and foundations of SEI MOSAIC.

Contract(s)/Grant(s): DASW01-02-D-0016

Report No.(s): AD-A468757; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA468757>

Operations research (OR) emerged during World War II as an important means of assisting civilian and military leaders in making scientifically sound improvements in the design and performance of weapons and equipment. OR techniques were soon extended to address questions of tactics and strategy during the war and, after the war, to matters of high-level political and economic policy. Until now, the story of why and how the U.S. Army used OR has remained relatively obscure, surviving only in a few scattered official documents, in the memories of those who participated, and in a number of notes and articles that have been published about selected topics on military operations research. However, none of those materials amounts to a comprehensive, coherent history. In this, the first of three planned volumes, Dr. Charles R. Shrader has for the first time drawn together the scattered threads and woven them into a well-focused historical narrative that describes the evolution of OR in the U.S. Army, from its origins in World War II to the early 1960s. He has done an admirable job of ferreting out the surviving evidence, shaping it into an understandable narrative, and placing it within the context of the overall development of American military institutions. Often working with only sparse and incomplete materials, he has managed to provide a comprehensive history of OR in the U.S. Army that offers important insights into the natural tension between military leaders and civilian scientists, the establishment and growth of Army OR organizations, the use (and abuse) of OR techniques, and, of course, the many important contributions that OR managers and analysts have made to the growth and improvement of the Army since 1942.

**Design and Implementation of a Modular Manipulator Architecture**

Sosa, Ognjen; Dec 2004; 226 pp.; In English; Original contains color illustrations

Contract(s)/Grant(s): F08637-00-C6008

Report No.(s): AD-A469060; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA469060>

The Joint Architecture for Unmanned Systems (JAUS) has successfully established a well-defined component interface for unmanned mobile systems, but has yet to address the implications of such systems requiring an on-board robot manipulator. This configuration is seen in many applications including planetary exploration, hazardous materials removal, and marine research and is frequently referred to as the vehicle-manipulator system. The purpose of our study was to develop and implement a set of JAUS components that will allow for tele-operational (teleop) and autonomous control of a vehicle-manipulator platform. Teleop control is the control of a system by the direct input of a human or a computer. Autonomous control is a cooperative mode between the vehicle and the manipulator. Testing and implementation of these components was performed on a 6-degree-of-freedom (6-DOF) Puma 762 robot manipulator (Unimation Westinghouse, Danbury, Connecticut) outfitted with a commercially available Galil motion controller (Galil Motion Control, Inc, Rocklin, California). Successful completion and adequate compatibility to the outlined JAUS performance specifications would ensure the inception of the above mentioned components to the latest version of the document's Reference Architecture. Even though this modular manipulator architecture is suitable for both autonomous and teleop control, testing and results were based solely on the input provided using a graphical user interface on a computer.

**A Modular, Scalable, Architecture for Unmanned Vehicles**

Armstrong, David G; Crane, Carl D; Novick, David; Wit, Jeffrey; English, Ralph; Adsit, Phillip; Shahady, David; Jul 2000; 16 pp.; In English; Original contains color illustrations

Report No.(s): AD-A469064; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA469064>

A modular, scalable architecture for use on unmanned vehicles has been developed at the Center for Intelligent Machines and Robotics under the direction of the Air Force Research Laboratory at Tyndall Air Force Base, FL. This state of the art architecture isolates five functionally cohesive sub-tasks into self-contained modules with well defined interfaces. The architecture consists of a Mobility Control Unit (MCU), Path Planner (PLN), Position System (POS), Detection and Mapping System (DMS), and a Primitive Driver (PD). The design considerations for the development of this architecture included sub-system modularity, implementation independent software interfaces, ability to expand system functionality through continued addition of modules (scale), and the goal of moving toward a standard architecture for autonomous systems. The focus of this paper is to present a modular architecture that addresses the above design considerations.

**Knowledge Management in an Information Age Army**

Fountain, Darrell D; Mar 30, 2007; 21 pp.; In English

Report No.(s): AD-A469106; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA469106>

The widespread application of advanced information technologies has dramatically affected USA fighting forces. Senior leaders at all levels that came of age as principals before the technological revolution of the 90's have struggled to take full advantage of modern information technology. Information technology exploitation strategies have been further complicated by the now omnipresent Joint and Combined nature of our operations. Key leaders need to more fully embrace the comprehensive strategy already available to take full advantage of this explosion in capability. This work examines the Army's current knowledge management strategy and suggests that a consistent construct is required at the CORPS and Division level to fully exploit current information technology capabilities in a joint and combined environment. This construct is required to move our fighting forces beyond the simplistic incorporation of the latest information technology hardware and software to a more deliberate knowledge management strategy: the logical extension of the information age technology and network-centric operations to effective Knowledge Management. This organizational construct should be disciplined enough to resist the latest hardware/software solution of the day and agile enough to readily adopt innovative information technology solutions addressing critical organizational information sharing and knowledge management challenges.

**Quantum Algorithms and Initialization**

Chi, Dong-Pyo; Aug 31, 2006; 21 pp.; In English

Contract(s)/Grant(s): FA5209-04-P-0228

Report No.(s): AD-A466534; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA466534>

We are going to show that whether or not a function is evenly distributed can be determined in quantum polynomial time without initialization. We will also show that the functional evaluation oracle and the functional phase transform are equivalent. To solve the first conjecture, we will construct a quantum algorithm to solve the reduced problem to determine whether or not a function is evenly balanced and then extend this result by employing our initialization-free quantum functional evaluation oracle. For the second conjecture, we will construct the quantum functional evaluation oracle from the quantum functional phase transform. For this purpose, we will localize the both operators on the auxiliary register and then

build a quantum circuit that can transform both localized operators to each other. We will extend the domain of the functional phase transform to the Hilbert space, which is the domain of a function evaluation oracle, so that the relative phase changes in the functional phase transform can be encoded into the control register. The limitation on the size of quantum computers makes it important to reuse qubits for auxiliary registers. Our initialization-free algorithm will greatly reduce the size of quantum computers since independent computational processes can share auxiliary registers. Furthermore, our algorithm can be useful in symmetric cryptography, because to design secure block ciphers it is essential to find evenly distributed functions. Moreover, until now it is not known how to implement functional evaluation on a quantum computer. Also which one is easy or possible to implement on a quantum computer among the functional phase transform and the functional evaluation oracle has not been answered yet. Thus our result can give a flexibility to the realization of functional evaluation on quantum computers.

**Ukraine's Search for its Place in Europe: The East or the West?**

Yakovenko, Andriy; Mar 2007; 96 pp.; In English

Report No.(s): AD-A467712; No Copyright; Avail.: Defense Technical Information Center (DTIC)

The pace of democratic political and economic reforms in Ukraine has been slower than that of some other democracies of post-communist Eastern and Central Europe. Ukraine is still uncertain of its future development orientation. The reasons for this uncertainty involve internal factors such as the historically diverse political, cultural and ethnic affiliations of Ukraine's population. At the same time, the impact of external factors, especially Russian and Western geo-strategic interests relating to the future of Ukraine, also contribute to the current crisis. The thesis examines the historically-based geopolitical and cultural attachments of the Ukrainian people in relation to the nation-formation process in independent Ukraine. The absence of a common national identity in Ukraine is one of the obstacles to successful national development. In the case of Ukraine, a sense of national identity cannot be based purely on ethno-cultural and regional bonds. On the contrary, the emphasis on the rise of civic consciousness among all strata of Ukrainian society seems crucial. The successful integration of major democratic values might afford a clear direction for the country's future development, and help define its place in Europe in a way that would be acceptable to a majority of the Ukrainian people.

**A High Order WENO Scheme for a Hierarchical Size-Structured Model**

Shen, Jun; Shu, Chi-Wang; Zhang, Mengping; Jan 2007; 18 pp.; In English; Original contains color illustrations

Contract(s)/Grant(s): W911NF-04-1-0291

Report No.(s): AD-A468112; No Copyright; Avail.: Defense Technical Information Center (DTIC)

In this paper we develop a high order explicit finite difference weighted essentially non-oscillatory (WENO) scheme for solving a hierarchical size-structured population model with nonlinear growth, mortality and reproduction rates. The main technical complication is the existence of global terms in the coefficient and boundary condition for this model. We carefully design approximations to these global terms and boundary conditions to ensure high order accuracy. Comparing with the first order monotone and second order total variation bounded schemes for the same model, the high WENO scheme is more efficient and can produce accurate results with far fewer grid points. Numerical examples including one in computational biology for the evolution of the population of *Gambusia affinis*, are presented to illustrate the good performance of the high order WENO scheme.

**Towards Dominant Battlespace Comprehension in Network Centric Warfare**

Yufik, Y M; Cunningham, W B; Jun 2001; 16 pp.; In English; Original contains color illustrations

Contract(s)/Grant(s): DASG60-97-C-0019; N00014-99-1-0999

Report No.(s): AD-A468373; No Copyright; Avail.: Defense Technical Information Center (DTIC)

Wars in the XXIst century will place unprecedented demands on the commander's ability to make critical decisions under volatile conditions and extreme time pressure. Advances in information technology and cognitive science have made possible new types of decision aids that can help commanders to meet those demands. Design of commander decision aids for Network Centric Warfare is in the focus of this paper. The first section treats command and control in terms of dynamic asset allocation and considers the cognitive complexity of allocation decisions under shifting constraints and priorities. The next section compares two decision strategies: 1) template-matching and 2) creative utilization of past experiences under conditions that are rapidly changing and have no exact precedents. We argue that creative and efficient application of rules and past experiences requires battle space comprehension and suggest that current decision technologies do not recognize the role of comprehension and thus overlook a fundamental prerequisite for efficient command and control. The third section outlines a model of expert commander decision processes, and defines a new approach to the design of decision aids that facilitate commander's comprehension of the battle space and help to increase the speed of control and self-synchronization in highly mobile and geographically dispersed forces.

Report No.(s): AD-A469052; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA469052>

An Intelligent Primitive Driver (IPD) was designed to supplement the control of a Primitive Driver component that is defined in the Department of Defense Joint Architecture for Unmanned Systems (JAUS). Whereas the Primitive Driver component accepts and blindly executes wrench commands, the IPD uses various subsystems to provide it with the necessary information to make low-level decisions concerning vehicle control. The IPD is accessible by either an onboard autonomous control system; or by a tele-operational control system. Tele-operational control (teleop) is characterized by the direct control of a platform by a human operator. For the case of an autonomous control system, the IPD reduces high-level control responsibilities; and therefore reduces processor demands. In the case of teleop control, the IPD serves to ease operator burden by automating intensive operator-controlled processes. The test platform for the functionality of the Intelligent Primitive Driver was a Remotec ANDROS robot. In the case of the ANDROS robot, the IPD automates the process of maneuvering up or down a flight of stairs.

Report No.(s): AD-A469153; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA469153>

Part I: The researchers developed a comprehensive transitional P-system Membrane Computing model. Membrane computing consists of cell-like membranes placed inside a unique skin membrane. In regions delimited by a membrane structure, cells are placed in multisets of objects which evolve according to evolution rules associated with the regions. The researchers considered multi-sets of objects, usually multi-sets of symbols, objects and a set of evolution rules, which are placed inside regions delimited by membranes. The evolution between system configurations is completed non-deterministically by applying rules synchronously in a maximum parallel manner. Part II: The researchers applied the P system constructs described in Part I to provide end-to-end secure mobile ad hoc networks as Distributed P systems consisting of migrating membrane agents. Membrane networks were modeled, with migration components and a guardian membrane that regulates interactions between the processing component and the external environment. Membranes act as filters that control access to the associated site and rely on the established notion of trust between sites. The researchers developed steps necessary to control the actions of incoming agents and encompass complex policies, wherein the number of actions a membrane agent is allowed to perform and the order of actions are prioritized.

**A Feasibility Study of Life-Extending Controls for Aircraft Turbine Engines Using a Generic Air Force Model (Preprint)**

Behbahani, Al; Jordan, Eric A; Millar, Richard; Dec 2006; 9 pp.; In English

Contract(s)/Grant(s): Proj-3066

Report No.(s): AD-A466102; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA466102>

Turbine engine controllers are typically designed and operated to meet required or desired performance criterion within

stability margins, while maximizing fuel efficiency. The U.S. Air Force turbine engine research program is seeking to incorporate sustainable cost reduction into this approach, by considering a life-cycle design objective if the life of the engine is considered as an objective during the design of the engine controller. Specifically during aircraft takeoff, the turbine engines are subject to high temperature variations that aggravate the stress of the material used in their construction and thus a negative effect in their life spans. Therefore, the control strategy needs to be re-evaluated to include operating cost, and extending the life of the engine is one way to reduce that. Life-Extending Control (LEC) is an area that deals with control action, engine component life usage, and designing an intelligent control algorithm embedded in the FADEC. This paper evaluates the LEC, based on critical components research, to demonstrate how an intelligent engine control algorithm can drastically reduce the engine life usage, with minimum sacrifice in performance. Finally, a generic turbine engine is extensively simulated using a sophisticated non-linear model of the turbine engine. The paper concludes that LEC is worth consideration and further research should include development of the damage models for turbine engines, and experimental research that could correlate the damage models to actual damage for turbine engines. This could lead to implementation of online damage models in real-time that will allow for more robust damage prevention.

ONLINE: <http://hdl.handle.net/100.2/ADA466367>

A new method of determining probe/antenna plasma sheath parameters has been developed. For low neutral pressure environments in the absence of a magnetic field, the method provides these quantities from a probe/antenna surface through the sheath, pre-sheath, and into the bulk plasma. For high pressure environments, where conventional resonances are strongly damped, it can determine bulk plasma density. The paper cites commonly used methods of finding electron density/temperature and points out the inadequacy of each to make sheath measurements in the general case. The primary advantage of the method lies in the fact that a non-perturbative rf signal is applied to the probe/antenna for the determination and this makes the measurement independent of complicating influences such as secondary electron emission, surface conditions, and ion mass. Because of this, the ac impedance depends on frequency but not on the dc voltage unlike a typical Langmuir probe. In this paper, we concentrate on the low pressure regime.

**Lumped Element Modeling of Piezoelectric-Driven Synthetic Jet Actuators**

Gallas, Quentin; Mathew, Jose; Kasyap, Anurag; Holman, Ryan; Nishida, Toshikazu; Carroll, Bruce; Sheplak, Mark; Cattafesta, Louis; Jan 2002; 11 pp.; In English

Report No.(s): AD-A466402; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA466402>

This paper presents a lumped element model of a piezoelectric-driven synthetic jet actuator. A synthetic jet, also known as a zero net mass-flux device, uses a vibrating diaphragm to generate an oscillatory flow through a small orifice or slot. In lumped element modeling (LEM), the individual components of a synthetic jet are modeled as elements of an equivalent electrical circuit using conjugate power variables. The frequency response function of the circuit is derived to obtain an expression for  $Q(\text{sub out})/V(\text{sub AC})$ , the volume flow rate per applied voltage. The circuit is analyzed to provide physical insight into the dependence of the device behavior on geometry and material properties. Methods to estimate the model parameters are discussed, and experimental verification is presented. In addition, the model is used to estimate the performance of two prototypical synthetic jets, and the results are compared with experiment.

**On the Correlation Between the Self-Organized Island Pattern and Substrate Elastic Anisotropy**

Pan, Ernian; Zhu, Richard; Chung, Peter W.; Apr 2007; 12 pp.; In English; Original contains color illustrations  
Report No.(s): AD-A466483; ARL-RP-168; No Copyright; Avail.: Defense Technical Information Center (DTIC)  
ONLINE: <http://hdl.handle.net/100.2/ADA466483>

Self-organized quantum dots pattern depends strongly on the elastic strain energy of the substrate. It is well-known experimentally that for the elastic substrate with a high degree of anisotropy, the epitaxially grown island patterns are different for different growth orientations. In this report, by incorporating the anisotropic strain energy field into a kinetic Monte Carlo algorithm for adatom diffusion, we show that the self-organized island pattern on the surface of an anisotropic substrate is closely correlated to the elastic energy distribution on the surface. The anisotropic substrates studied are GaAs with different growth orientations (001), (111), and (113). An isotropic substrate Iso (001), reduced from GaAs, is also investigated for the purpose of comparison. The island patterns on these substrates with and without elastic strain energy are presented. Besides the effect of substrate anisotropy, different growth parameters, including temperature, coverage, and interruption time, are further investigated to identify the optimal growth values. It is observed that the strain energy field in the substrate is the key factor that controls the island pattern, and that the latter is closely correlated to the substrate orientation (anisotropy). Our simulated patterns are also in qualitative agreement with recent experimental growth results.

Report No.(s): AD-A466491; TARDEC-TR-16996; No Copyright; Avail.: Defense Technical Information Center (DTIC)  
ONLINE: <http://hdl.handle.net/100.2/ADA466491>

This report documents a method to estimate runflat stiffness using the bulk modulus of the runflat material. For the example dimensions and material properties given, the runflat stiffness is estimated to be approximately 6,000 pounds per inch and will be contacted after 4.53 inches of tire deflection. The report describes example runflat technology and dimensions, discusses bulk modulus and appropriate values for it, details the calculation for determining compression of the runflat, describes the method used to estimate the runflat force upon impact and its stiffness rate at various tire deflections, determines the amount of tire deflection at which runflat contact begins, and summarizes the results.

ONLINE: <http://hdl.handle.net/100.2/ADA466509>

This work showed that a high aspect ratio nano-scale hollow tube can be produced in a Y-Ba-Cu-O surface by focused ion beam (FIB) etching methods. However, production of matrices of deep hollow tubes on an individual basis would require long FIB operating times and would be costly. Cost and time limitations prevented the measuring of the superconducting properties of these materials.

Report No.(s): AD-A466818; No Copyright; Avail.: Defense Technical Information Center (DTIC)  
ONLINE: <http://hdl.handle.net/100.2/ADA466818>

Several missiles and projectiles have periods during their flight where the body is spinning and must be controlled. It has been stated that a roll stabilized autopilot may be more appropriate during this phase of the flight. This paper first examines

the full nonlinear equations of motion in both the roll stabilized frame and the body axis system assuming a rigid axially symmetric body. Two and three loop autopilots are developed using an optimal control approach for a non-rolling airframe. These autopilots are examined to determine how well they are able to follow inertial commands. An extremely simplified example is presented so that the basic characteristics of the closed loop system can be examined. The results are presented and conclusions drawn. Effects of different acceleration levels, including the axial moment of inertia and very high roll rates are examined.

Report No.(s): AD-A466915; AFRL-VS-PS-TN-2007-1001; No Copyright; Avail.: Defense Technical Information Center (DTIC)

The role of the network structure in determining the dielectric constant of binary and ternary oxide insulators is outlined. Seemingly anomalous behavior observed in rare-earth sesquioxides, Ta<sub>2</sub>O<sub>5</sub>-TiO<sub>2</sub> mixed oxides, lanthanum aluminate and dilute Zr(x)Si(y)O<sub>2</sub> is discussed in terms of the atomic structure. Physical examination of the relevant properties of these materials should lead to an understanding of how to engineer the dielectric constant.

**Designing of Bulk Nano-Structures With Enhanced Thermoelectric Properties**

Kanatzidis, Mercouri G; Apr 23, 2007; 20 pp.; In English; Original contains color illustrations

Contract(s)/Grant(s): N00014-02-1-0867

Report No.(s): AD-A466951; 4; No Copyright; Avail.: Defense Technical Information Center (DTIC)

We discovered a grand homologous series which may help in the future to systematically identify thermoelectric materials with high performance. Namely, the series  $A_m[Ml+1Se2+1]2m[M21+nSe2+31+n]$  ( $A$  = alkali metal,  $M$  = Pb, Bi) has structure-predicting properties. The modular construction of these structures from evolving building blocks permits many of the criteria necessary for good thermoelectrics to be met. K<sub>2</sub>Bi<sub>8</sub>Se<sub>13</sub> is a member of this series and was found to be a promising thermoelectric. The charge transport properties were studied under pressure, where a significant increase in the power factor was observed. Several other promising materials were also discovered. In another part of this project we prepared nanocrystals of thermoelectric semiconductors and studied their properties. We investigated the assembly of nanocrystal components into well-organized arrays. The goal was to utilize quantum dot building blocks of desired thermal and electronic properties to design composite materials with improved power generation, thermoelectric characteristics. We devised new ways to prepare nanocrystals of PbTe, AgSbTe<sub>2</sub> and AgPb<sub>2</sub>SbTe<sub>4</sub>.

**Through-the-Wall Imaging from Electromagnetic Scattered Field Measurements**

Kim, Jerry; Mar 1, 2007; 125 pp.; In English

Report No.(s): AD-A467076; No Copyright; Avail.: Defense Technical Information Center (DTIC)

We investigate an inverse imaging problem for TWI (Through-the-wall Imaging) using frequencies between 500 GHz and 1 THz. Starting from first principles, this thesis uses Maxwells equations to develop a model for the transmission Greens function. This simplified model is then used in a Lippman-Schwinger integral equation to predict the scattered field associated with interrogating THz waves. We investigate the effects of wave propagation through isotropic media, and present methods for creating images from the scattered field. These methods are examined using simulated data.

**Simulation of Radiowave Propagation in a Dense Urban Environment**

Chung, Chris V; Mar 2007; 65 pp.; In English

Report No.(s): AD-A467130; No Copyright; Avail.: Defense Technical Information Center (DTIC)

One objective of this thesis was to investigate the effect of details, such as the windows of high-rise buildings, on the radio wave propagation in the dense urban environment through modeling and simulations. If adding windows does not significantly change the signal distribution on average, it may not be necessary to build such a detailed model. Simulations are performed using several levels of detail and the results compared to estimate the impact of the fine details on the signal level. A second issue is base station antenna coverage. The antenna gain, half power beamwidth (HPBW), location, and pointing angle should be chosen to give the maximum coverage over a specified sector. Simulations can be used to select the optimum set of base station properties. Specifically this research looks at the coverage from the two sectored antennas versus a single one over a quadrant.

**Optical and Radio Frequency Refractivity Fluctuations from High Resolution Point Sensors: Sea Breezes and Other Observations**

MacPherson, Douglas A; Mar 2007; 55 pp.; In English

Report No.(s): AD-A467200; No Copyright; Avail.: Defense Technical Information Center (DTIC)

High bandwidth communications and optical/RF weapons systems are being developed that are limited by atmospheric absorption and accumulated phase distortions. The need and ability to mitigate these effects depends on their magnitudes. It is difficult to numerically model the magnitudes of Cn2 numerically and results are frequently off by an order of magnitude or more. To refine models or conduct climatologically studies for Cn2 requires direct measurements to identify the underlying factors and provide a clear understanding of the phenomena. In situ measurements of Cn2 are extremely sparse at RF wavelengths. This thesis utilized high speed measurements of the humidity, temperature and wind speed collected on a 10 m tower at a coastal location to simultaneously examine the optical and RF Cn2. The humidity data were collected with a high-speed infrared humidity sensor. A three axis sonic anemometer provided wind data and a fine wire temperature sensor as well as the sonic anemometer provided temperature data. All the data were sampled at 20 Hz. This study examined a subset of 251 days of data collected at Marina, California to investigate the relative variations of optical and RF magnitudes of Cn2 and the underlying atmospheric phenomena.

**High Altitude Electromagnetic Pulse (HEMP) and High Power Microwave (HPM) Devices: Threat Assessments**

Wilson, Clay; Aug 20, 2004; 18 pp.; In English

Report No.(s): AD-A467679; No Copyright; Avail.: Defense Technical Information Center (DTIC)

Electromagnetic Pulse (EMP) is an intense energy field that can instantly overload or disrupt numerous electrical circuits at a distance. Modern high technology microcircuits are especially sensitive to power surges, and the possible vulnerability of U.S. civilian computer systems to the effects of EMP has been discussed in the media. EMP can be produced on a large scale using a single nuclear explosion, and on a smaller, non-nuclear scale using a device with batteries or chemical explosives. Several nations, including reported sponsors of terrorism, may currently have a capability to use EMP as a weapon for cyber warfare or cyber terrorism, to disrupt computers, communications systems, or parts of the U.S. critical infrastructure. The threat of an attack against the USA involving EMP is hard to assess, but some observers indicate that it is growing along with worldwide access to newer technologies and the proliferation of nuclear weapons. In the past, the threat of mutually assured destruction provided a lasting deterrent against the exchange of multiple high-yield nuclear warheads. However, now a single, specially-designed low-yield nuclear explosion high above the USA, or over a battlefield, can produce an EMP effect that results in a widespread loss of electronics, but no direct fatalities, and may not necessarily evoke a large nuclear retaliatory strike by the U.S. military. This, coupled with the possible vulnerability of U.S. commercial electronics and U.S. military battlefield equipment to the effects of EMP, may create a new incentive for other countries to develop or acquire a nuclear capability.

Report No.(s): AD-A467782; No Copyright; Avail.: Defense Technical Information Center (DTIC)

Coordinated, multi-institutional research (University of Wisconsin, Stanford University, the University of Kansas, the University of California-Davis, and Florida State University) is addressing key underlying scientific and engineering issues of Generation II Coated Conductors, and is fabricating and acquiring through collaborations forefront CC samples, developing new tools for their understanding and characterizing them so as to resolve key performance issues. Areas of concentration include substrates, buffer layers, the superconducting overlayer, their complex interactions, and the underlying physical mechanisms that determine conductor performance. Our thrusts have covered study of grain boundaries, electromagnetic characterization, fabrication of model samples relevant to coated conductors, nanoscale characterization by scanning probe and scanning transmission electron microscopies, and the formulation of detailed models of how and why low angle grain boundaries and other macroscopic obstacles become barriers to current flow. We consider the way in which epitaxy develops through from an IBC or deformation-textured substrate, the choice of oxide buffer layer and the influence of the buffer layer formation method. Strong interactions with leading companies, the DOE laboratories and AFRL and other universities are in place.

**3-Dimensional Crack Growth Behavior of Turbine Engine Materials (Preprint)**

Esperanza, Christine; Jan 31, 2007; 13 pp.; In English

Contract(s)/Grant(s): F33615-02-2-5800; Proj-4349

Report No.(s): AD-A468074; WSU-MME-138; No Copyright; Avail.: Defense Technical Information Center (DTIC)

The objective of '3-Dimensional Crack Growth Behavior of Turbine Engine Materials' is to evaluate 2-dimensional and 3-dimensional crack growth and material mechanics in turbine engine components and its corresponding lab specimens under thermomechanical loading configurations. In particular, experiments are conducted on titanium and nickel-base super alloys under simulated engine loading conditions. The resulting residual stresses, the deformation and displacement of the geometry, and the initiation and growth of cracks are analyzed. Such experiments are simulated in finite element analysis (FEA) computer programs. Previous geometries analyzed in this project include turbine disk blades, horseshoe-shaped beams, and dog bone specimens.

Bell, Tom; Mar 2006; 20 pp.; In English; Original contains color illustrations

Contract(s)/Grant(s): W912HQ-04-C-0017; Proj-MM-0415

Report No.(s): AD-A468558; VA-118-001-06-TR; No Copyright; Avail.: Defense Technical Information Center (DTIC)

A primary goal of the UXO research community is to develop technologies that detect and localize buried UXO, and that discriminate them from clutter. Electromagnetic sensors such as EMI systems operate by detecting the presence of an anomalous electromagnetic field that could be caused by buried UXO. Physics-based modeling and analysis procedures, developed under previous SERDP and ESTCP funding for electromagnetic induction and magnetometer sensor data of isolated targets, have been shown to discriminate UXO from clutter based on the derived source parameters for spatially discrete target signatures. However, many real world UXO remediation sites contain highly-contaminated regions with high density of anomalies, both UXO and clutter. In these cases, where the signatures from multiple targets overlap, whether or not they are UXO, the standard procedures do not work well. The primary problem with overlapping signatures is that conventional inversion procedures assume a single source whose signature is spatially separated from other signatures. Currently, analysts attempt to isolate anomalies by carefully selecting the data to be inverted (usually by manually inspecting a two dimensional plot of the anomaly and carving out two separate regions of data) and assuming that the selected data reflect the signature caused by a single source. The goal of this project was to develop advanced iterative techniques for inverting magnetic and electromagnetic data for situations in which the signatures from two targets overlap. After developing the methodology, the algorithm(s) would be tested first on synthetic data without any added noise. The synthetic data would be used to

systematically vary the parameters of the two targets by changing their depths, the distance between them and their relative orientations. Later, controlled test data would be used to further validate and test the algorithms in real-life situations.

Report No.(s): DE2007-899839; LBL-32435-FINAL; SLAC-R-855; No Copyright; Avail.: Department of Energy Information Bridge

We study the applicability of beam-beam deflection techniques as a tuning tool for the SLAC/LBL/LLNL B factory, PEP-II. Assuming that the closed orbits of the two beams are separated vertically at the interaction point by a local orbit bump that is nominally closed, we calculate the residual beam orbit distortions due to the beam-beam interaction. Difference orbit measurements, performed at points conveniently distant from the IP, provide distinct coordinate- or frequency-space signatures that can be used to maintain the beams in collision and perform detailed optical diagnostics at the IP. A proposal to test this method experimentally at the TRISTAN ring is briefly discussed.

Report No.(s): PB2007-104590; No Copyright; Avail.: CASI: [A03](#), Hardcopy

A scanning probe detects phase changes of a cantilevered tip proximate to a sample, the oscillations of the cantilevered tip are induced by a lateral bias applied to the sample to quantify the local impedance of the interface normal to the surface of the sample. An ac voltage having a frequency is applied to the sample. The sample is placed at a fixed distance from the cantilevered tip and a phase angle of the cantilevered tip is measured. The position of the cantilevered tip is changed relative to the sample and another phase angle is measured. A phase shift of the deflection of the cantilevered tip is determined based on the phase angles. The impedance of the grain boundary, specifically interface capacitance and resistance, is calculated based on the phase shift and the frequency of the ac voltage. Magnetic properties are measured by applying a dc bias to the tip that cancels electrostatic forces, thereby providing direct measurement of magnetic forces.

From the very beginning of their existence, human beings have tried to understand and explore the things surrounding them. This is the unique feature of human beings which makes them an altogether completely different and superior species. In order to understand any natural phenomenon, a systematic study is needed. As an example, If we are trying to understand the cause of a certain problem in the human body then a systematic study of the human body is required. Similarly if we are trying to understand the nature and surroundings around us then we need to explore it right at its roots. This is what we do at a high energy physics lab like Fermilab. Aided with big machines and state of the art technology we try to understand fundamental questions: How did the Universe came to its present form. What happened at the time of Big Bang. Where has all the anti-matter has gone.

Report No.(s): DE2007-899992; FERMILAB-CONF-06-441-E; No Copyright; Avail.: National Technical Information Service (NTIS)

The DO experiment was upgraded in spring 2006 to harvest the full physics potential of the Tevatron accelerator at Fermi National Accelerator Laboratory, Batavia, Illinois, USA. It is expected that the peak luminosity delivered by the accelerator will increase to over 3000E1030 cm-2s-1. One of the upgraded systems is the Central Track Trigger (CTT). The CTT uses the Central Fiber Tracker (CFT) and Preshower detectors to identify central tracks with  $p_T > 1.5\text{GeV}$  at the first trigger level. Track candidates are formed by comparing fiber hits to predefined track equations. In order to minimize latency, this operation is performed in parallel using combinatorial logic implemented in FPGAs. Limited hardware resources prevented the use of the full granularity of the CFT. This leads to a high fake track rate as the occupancy increases. In order to mitigate the problem, new trackfinding hardware was designed and commissioned. We report on the upgrade and the improved performance of the CTT system.

**Characteristics of Round and Extracted Strands of Nb(3)Al Rutherford Cable**

Kikuchi, A.; Yamada, R.; Ambrosio, G.; Andreev, N.; Barazi, E.; January 2007; 5 pp.; In English

Report No.(s): DE2007-899983; FERMILAB-CONF-06-295-TD; No Copyright; Avail.: Department of Energy Information Bridge

Long Nb3Al strands with copper stabilizer are promising for future high field accelerator magnets. A 1.2 kilometer Nb3Al strand with Cu stabilizer was fabricated at the National Institute for Materials Science in Japan. Using this strand a 30 meter Cu stabilized Nb3Al Rutherford cable was made for the first time by a collaboration of NIMS and Fermilab. The Nb3Al strands extracted from cable with a relatively low packing factor showed almost no Jc degradation. But the extracted strands from the highly compacted cable showed some degradation in both Jc and n value, which may be caused by local separation of the copper stabilizer. Still, its Jc degradation is lower than that of typical Nb3Sn strands. The current limit due to magnetic instability in low field is about 500 A at 4.2 K. The magnetization of the strands, which was measured with balanced coils at 4.2 K, showed large flux jumps, usually around 1.5 T. This value is much larger than the Bc2 (4.2 K) of the Nb matrix, which is around 0.4 Tesla. The magnetic instability of the Nb3Al strand at low field is not completely understood, but it might be explained by the superconducting coupling current through the Nb matrix.

**Results on QCD Physics from the CDF-II Experiment**

January 2006; 10 pp.; In English

Report No.(s): DE2007-899351; No Copyright; Avail.: National Technical Information Service (NTIS)

The Quantum Chromo Dynamics (QCD) processes provide signals to test theoretical calculations and models and contribute major backgrounds to many other searches or measurements. Thus, their detailed understanding and modelling is of crucial importance. In particular, the current QCD physics program, at Tevatron, includes studies of jets with the goal of performing precision measurements to test and further constrain the validity of the Standard Model (SM). Jets can be defined as collimated sprays of particles originating, all in one point, from the fragmentation of a parton. The ability in reconstructing the jets allows to characterize and measure the energy of the parent partons. As jet calculations, at leading order and at higher orders, can vary the definition of a jet it is therefore important in order to compute the jet energy beyond the leading order.

**HEND: A Database for High Energy Nuclear Data**

Brown, D.; Vogt, R.; Nov. 2006; 7 pp.; In English

Report No.(s): DE2007-902246; UCRL-PROC-228275; No Copyright; Avail.: Department of Energy Information Bridge

We propose to develop a high-energy heavy-ion experimental database and make it accessible to the scientific community through an on-line interface. The database will be searchable and cross-indexed with relevant publications, including published detector descriptions. It should eventually contain all published data from older heavy-ion programs such as the Bevalac, AGS, SPS and FNAL fixed-target programs, as well as published data from current programs at RHIC and new facilities at GSI (FAIR), KEK/Tsukuba and the LHC collider. This data includes all proton-proton, proton-nucleus to nucleus-nucleus collisions as well as other relevant systems and all measured observables. Such a database would have tremendous scientific payoff as it makes systematic studies easier and allows simpler benchmarking of theoretical models to a broad range of experiments. To enhance the utility of the database, we propose periodic data evaluations and topical reviews. These reviews would provide an alternative and impartial mechanism to resolve discrepancies between published data from rival experiments and between theory and experiment. Since this database will be a community resource, it requires the high-energy nuclear physics community's financial and manpower support.

**Overview of Theory and Simulations in the Heavy Ion Fusion Science Virtual National Laboratory**

Friedman, A.; January 2006; 16 pp.; In English

Report No.(s): DE2007-901241; No Copyright; Avail.: National Technical Information Service (NTIS)

The Heavy Ion Fusion Science Virtual National Laboratory (HIFS-VNL) is a collaboration of Lawrence Berkeley National Laboratory, Lawrence Livermore National Laboratory, and Princeton Plasma Physics Laboratory. These laboratories, in cooperation with researchers at other institutions, are carrying out a coordinated effort to apply intense ion beams as drivers for studies of the physics of matter at extreme conditions, and ultimately for inertial fusion energy. Progress on this endeavor depends upon coordinated application of experiments, theory, and simulations. This paper describes the state of the art, with

an emphasis on the coordination of modeling and experiment; developments in the simulation tools, and in the methods that underly them, are also treated.

**Potential Applications of Microtesla Resonance Imaging Detected Using a Superconducting Quantum Interference Device**

Myers, W. R.; January 2006; 205 pp.; In English

Report No.(s): DE2007-901227; No Copyright; Avail.: National Technical Information Service (NTIS)

This dissertation describes magnetic resonance imaging (MRI) of protons performed in a precession field of 132 iT. In order to increase the signal-to-noise ratio (SNR), a pulsed 40-300 mT magnetic field prepolarizes the sample spins and an untuned second-order superconducting gradiometer coupled to a low transition temperature superconducting quantum interference device (SQUID) detects the subsequent 5.6-kHz spin precession. Imaging sequences including multiple echoes and partial Fourier reconstruction are developed. Calculating the SNR of prepolarized SQUID-detected MRI shows that threedimensional Fourier imaging yields higher SNR than slice-selection imaging. An experimentally demonstrated field-cycling pulse sequence and post-processing algorithm mitigate image artifacts caused by concomitant gradients in low-field MRI. The magnetic field noise of SQUID untuned detection is compared to the noise of SQUID tuned detection, conventional Faraday detection, and the Nyquist noise generated by conducting biological samples.

**Inclusive high-p(T)b anti-b Cross Section Measurement at  $s^{**} (1/2)$  Equals 1.96 TeV**

Galyaev, E.; Nov. 2006; 220 pp.; In English

Report No.(s): DE2007-901121; No Copyright; Avail.: National Technical Information Service (NTIS)

The Run II physics program at the Tevatron started in the spring of 2001 with protons and antiprotons colliding at an energy of  $(\text{square root } s) = 1.96 \text{ TeV}$ , and is continuing with about 1.2 fb(-1) of data currently collected by the CDF and DA experiments. A measurement of the b-jet cross section as function of jet transverse momentum p has been performed using 312 pb(-1) of DA data. The results for this measurement were obtained and are presented herein. A neural network algorithm was used to identify b jets.

Report No.(s): DE2007-901119; FERMILAB-CONF-06-410-E; No Copyright; Avail.: National Technical Information Service (NTIS)

The search for physics beyond the Standard Model is one of the primary motivations of the Run II at the Tevatron. The CDF collaboration has been very active in this field by searching in a variety of final states for signals of new physics processes. The observation of no significant deviation from the Standard Model has led to limits on the cross-sections of the considered processes, which, in turn, have been used to constrain several models that predict such new physics scenarios.

**BlueGene/L Supercomputer and Quantum Chromodynamics**

Vranas, P.; Soltz, R.; Oct. 20, 2006; 5 pp.; In English

Report No.(s): DE2007-902256; UCRL-TR-225442; No Copyright; Avail.: National Technical Information Service (NTIS)

In summary our update contains: (1) Perfect speedup sustaining 19.3% of peak for the Wilson D-slash Dirac operator. (2) Measurements of the full Conjugate Gradient (CG) inverter that inverts the Dirac operator. The CG inverter contains two

global sums over the entire machine. Nevertheless, our measurements retain perfect speedup scaling demonstrating the robustness of our methods. (3) We ran on the largest BG/L system, the LLNL 64 rack BG/L supercomputer, and obtained a sustained speed of 59.1 TFlops. Furthermore, the speedup scaling of the Dirac operator and of the CG inverter are perfect all the way up to the full size of the machine, 131,072 cores. The local lattice is rather small (4x4x4x16) while the total lattice has been a lattice QCD vision for thermodynamic studies (a total of 128x128x256x32 lattice sites). This speed is about five times larger compared to the speed we quoted in our submission. As we have pointed out in our paper QCD is notoriously sensitive to network and memory latencies, has a relatively high communication to computation ratio which can not be overlapped in BGL in virtual node mode, and as an application is in a class of its own. The above results are thrilling to us and a 30 year long dream for lattice QCD.

**Thermal Diffusivity and Conductivity Measurements in Diamond Anvil Cells**

Antonangeli, D.; Farber, D. L.; Feb. 26, 2007; 7 pp.; In English

Report No.(s): DE2007-902295; UCRL-TR-228329; No Copyright; Avail.: Department of Energy Information Bridge

We have undertaken a study of the feasibility of an innovative method for the determination of thermal properties of materials at extreme conditions. Our approach is essentially an extension of the flash method to the geometry of the diamond-anvil cell and our ultimate goal is to greatly enlarge the pressure and temperature range over which thermal properties can be investigated. More specifically, we have performed test experiments to establish a technique for probing thermal diffusivity on samples of dimensions compatible with the physical constraints of the diamond anvil cell.

**Final Task Report on NRF Measurements of Photon Scattering Resonances in Plutonium at the High Voltage Research Laboratory of MIT**

Johnson, M. S.; McNabb, D. P.; Norman, E. B.; Feb. 27, 2007; 8 pp.; In English

Report No.(s): DE2007-902291; UCRL-TR-228387; No Copyright; Avail.: National Technical Information Service (NTIS)

The bremsstrahlung experiments were conducted at the 3-MV Van de Graaff electron accelerator at the High Voltage Research Laboratory (HVRL) at the Massachusetts Institute of Technology (MIT). Bremsstrahlung photons were produced by impinging an electron beam onto a 'radiator' with 102-micron Au backed by 1-cm Cu (used for cooling and electron cleanup). The radiator was electrically isolated and the average current was recorded for analysis. The bremsstrahlung photons then pass through a 20-cm long collimator with a 2.5 degrees half-angle, conic opening. The photon beam was aligned by steering the electron beam on the radiator and observing the tune of the beam with an x-ray imager downstream of the target.

Report No.(s): DE2007-902288; UCRL-CONF-226129; No Copyright; Avail.: National Technical Information Service (NTIS)

The National Ignition Facility (NIF) at the Lawrence Livermore National Laboratory is scheduled for completion in 2009. Thereafter, experiments will commence in which capsules of DT will be imploded, generating neutrons, gammas, x-rays, and other reaction products that will interact in the facility's structure. In order to understand and minimize the exposure of workers within the facility to prompt and delayed (activation) dose, we have developed a model for the facility using the three-dimensional Monte Carlo particle transport code, TART. To obtain acceptable statistics in a reasonable amount of time, biasing techniques are employed. In an effort to improve efficiency, we are studying the optimization of particle splitting using geometrically similar, but much simpler models. We are discussing our techniques and results.

**Radiation Damage Effects on the Magnetic Properties of Pu(1-x)Am(x) (x=0.224)**

McCall, S. K.; Fluss, M. J.; Chung, B. W.; Elfresh, M. W.; Haire, R. G.; Dec. 19, 2006; 7 pp.; In English

Report No.(s): DE2007-902266; UCRL-PROC-226893; No Copyright; Avail.: National Technical Information Service (NTIS)

Plutonium-ameridium alloys present an interesting material for the study of 5f electron systems, as the two metals form a single stable fcc phase over a wide range of compositions, with the lattice parameter increasing with Am concentration, showing a positive deviation from Vegard's law. Previous work on radiation damage in PuAm alloys has investigated the consequence of damage accumulation on magnetic susceptibility where the damage was accumulated near room temperature. Recent work on isochronal annealing of PuAm alloys accumulated damage at low temperature with the total number of decays per atom approximately 20 times smaller than the room temperature work but the accumulated damage (surviving atomic displacements) was much greater. The isochronal annealing study finds that room temperature is very close to the annealing stage where small vacancy clusters are unstable, removing the last magnetically observable indication of radiation damage. Therefore, damage accumulated for extended periods of time at room temperature is not simply the very dilute remnant evolution of the vacancy and interstitial displacements and their diffusion history, but likely reflects also the presence of the helium and daughter products of the nuclear decay itself.

**Proposal to Upgrade the MIPP Experiment**

Peterson, R. J.; Gutbrod, H.; Peters, K.; Feldman, G.; January 2006; 93 pp.; In English

Report No.(s): DE2007-900842; FERMILAB-P-960; No Copyright; Avail.: National Technical Information Service (NTIS)

The upgraded MIPP physics results are needed for the support of NuMI projects, atmospheric cosmic ray and neutrino programs worldwide and will permit a systematic study of non-perturbative QCD interactions. The MIPP TPC is the largest contributor to the MIPP event size by far. Its readout system and electronics were designed in the 1990s and limit it to a readout rate of 60 Hz in simple events and 20 Hz in complicated events. With the readout chips designed for the ALICE collaboration at the LHC, we propose a low cost scheme of upgrading the MIPP data acquisition speed to 3000 Hz. This will also enable

us to measure the medium energy nuclei target to be used for the NO.A/MINER.A experiments. We outline the capabilities of the upgraded MIPP detector to obtain high statistics particle production data on a number of nuclei that will help towards the understanding and simulation of hadronic showers in matter. Measurements of nitrogen cross sections will permit a better understanding of cosmic ray shower systematics in the atmosphere. In addition, we explore the possibilities of providing tagged neutral beams using the MIPP spectrometer that may be crucial for validating the Particle Flow Algorithm proposed for calorimeters for the International Linear Collider detectors. Lastly, we outline the physics potential of such a detector in understanding non-perturbative QCD processes.

**Superconducting High Resolution Fast-Neutron Spectrometers**

Hau, I. D.; May 26, 2006; 157 pp.; In English

Report No.(s): DE2007-900877; UCRL-TH-221650; No Copyright; Avail.: National Technical Information Service (NTIS)

Superconducting high resolution fast-neutron calorimetric spectrometers based on (sup 6) LiF and TiB2 absorbers have

been developed. These novel cryogenic spectrometers measure the temperature rise produced in exothermal reactions with fast neutrons in (sup 6) Li and (sup 10) B-loaded materials with heat capacity C operating at temperatures T close to 0.1 K. Temperature variations on the order of 0.5 mK are measured with a Mo/Cu thin film multilayer operated in the transition region between its superconducting and its normal state. The advantage of calorimetry for high resolution spectroscopy is due to the small phonon excitation energies  $kBT$  on the order of microeV that serve as signal carriers, resulting in an energy resolution, which can be well below 10 keV. An energy resolution of 5.5 keV has been obtained with a Mo/Cu superconducting sensor and a TiB<sub>2</sub> absorber using thermal neutrons from a <sup>252</sup>Cf neutron source. This resolution is sufficient to observe the effect of recoil nuclei broadening in neutron spectra, which has been related to the lifetime of the first excited state in <sup>7</sup>Li. Fast-neutron spectra obtained with a <sup>6</sup>Li-enriched LiF absorber show an energy resolution of 16 keV FWHM, and a response in agreement with the <sup>6</sup>Li <sup>3</sup>H reaction cross section and Monte Carlo simulations for energies up to several MeV. The energy resolution of order of a few keV makes this novel instrument applicable to fast-neutron transmission spectroscopy based on the unique elemental signature provided by the neutron absorption and scattering resonances. The optimization of the energy resolution based on analytical and numerical models of the detector response is discussed in the context of these applications.

**Eddy Current Scanning of Niobium for SRF Cavities at Fermilab**

Borro, C.; Bauer, P.; Foley, M.; Antoine, C.; Cooper, C.; January 2006; 4 pp.; In English

Report No.(s): DE2007-901116; FERMILAB-CONF-06-286-TD; No Copyright; Avail.: National Technical Information Service (NTIS)

In the framework of SRF cavity development, Fermilab is creating the infrastructure needed for the characterization of the material used in the cavity fabrication. An important step in the characterization of as received niobium sheets is eddy current scanning. Eddy current scanning is a nondestructive technique first adopted and further developed by DESY with the purpose of checking the cavity material for subsurface defects and inclusions. Fermilab has received and further upgraded a commercial eddy current scanner previously used for the SNS project. This scanner is now used daily to scan the niobium sheets for the Fermilab third harmonic, the ILC, and the Proton Driver cavities. After optical inspection, more than 400 squares and disks have been scanned and when necessary checked at the optical and electron microscopes, anodized, or measured with profilometers looking for surface imperfections that might limit the performance of the cavities. This paper gives a status report on the scanning results obtained so far, including a discussion of the classification of signals being detected.

**Studies of a Gas-Filled Helical Muon Beam Cooling Channel**

Yonehara, K.; Derbenev, Y.; Johnson, R. P.; January 2006; 3 pp.; In English

Contract(s)/Grant(s): DE-FG02-02ER86145

Report No.(s): DE2007-901112; FERMILAB-CONF-06-197-TD; No Copyright; Avail.: National Technical Information Service (NTIS)

A helical cooling channel (HCC) can quickly reduce the six dimensional phase space of muon beams for muon colliders, neutrino factories, and intense muon sources. The HCC is composed of solenoidal, helical dipole, and helical quadrupole magnetic fields to provide the focusing and dispersion needed for emittance exchange as the beam follows an equilibrium helical orbit through a continuous homogeneous absorber. The beam dynamics of a gas-filled helical muon beam cooling channel is studied by using Monte Carlo simulations. The results verify the cooling theory (1) of the helical magnet. The cooling performance has been improved by correcting chromatic aberration and the non-linear effects caused by the ionization energy loss process. With these improvements, a simulated cooling channel of 160 meters length has achieved a reduction of 6-dimensional (6D) phase space by a factor of 50,000.

**Preliminary Study of Using 'Pipetron'-Type Magnets for a Pre-Accelerator for the LHC**

de Rijk, G.; Rossi, L.; Piekarz, H.; January 2006; 3 pp.; In English

Report No.(s): DE2007-901111; FERMILAB-CONF-06-192-TD; No Copyright; Avail.: National Technical Information Service (NTIS)

One of the luminosity limitations of the LHC is the rather low injection energy (0.45 TeV) with respect to the collision energy (7 TeV). The magnetic multipoles in the main dipoles at low field and their dynamic behaviour are considered to limit the achievable bunch intensity and emittance. We report on a preliminary study to increase the injection energy to 1.5 TeV using a two-beam pre-accelerator (LER) in the LHC tunnel. The LER is based on Pipetron magnets as originally proposed for the VLHC. The aim of the study is to assess the feasibility and to identify the critical processes or systems that need to be investigated and developed to render such a machine possible.

**Neutron Generators Developed at LBNL for Homeland Security and Imaging Applications**

Reigonen, J.; January 2006; 4 pp.; In English

Contract(s)/Grant(s): DE-AC02-05CH11231

Report No.(s): DE2007-900949; No Copyright; Avail.: Department of Energy Information Bridge

The Plasma and Ion Source Technology Group at Lawrence Berkeley National Laboratory has developed various types of advanced D-D (neutron energy 2.5 MeV), D-T (14 MeV) and T-T (09 MeV) neutron generators for wide range of applications. These applications include medical (Boron Neutron Capture Therapy), homeland security (Prompt Gamma Activation Analysis, Fast Neutron Activation Analysis and Pulsed Fast Neutron Transmission Spectroscopy) and planetary exploration with a sub-surface material characterization on Mars. These neutron generators utilize RF induction discharge to ionize the deuterium/tritium gas. This discharge method provides high plasma density for high output current, high atomic species from molecular gases, long life operation and versatility for various discharge chamber geometries. Four main neutron generator developments are discussed here: high neutron output co-axial neutron generator for BNCT applications, point neutron generator for security applications, compact and sub-compact axial neutron generator for elemental analysis applications. Current status of the neutron generator development with experimental data will be presented.

**Searching for Double Beta Decay with the Enriched Xenon Observatory**

Hall, C.; Mar. 2007; 4 pp.; In English

Report No.(s): DE2007-900996; SLAC-PUB-12399; No Copyright; Avail.: Department of Energy Information Bridge

The Enriched Xenon Observatory (EXO) Collaboration is building a series of experiments to search for the neutrinoless double beta decay of  $^{136}\text{Xe}$ . The first experiment, known as EXO-200, will utilize 200 kg of xenon enriched to 80% in the isotope of interest, making it the largest double beta decay experiment to date by one order of magnitude. This experiment is rapidly being constructed, and will begin data taking in 2007. The EXO collaboration is also developing a technique to identify on an event-by-event basis the daughter barium ion of the double beta decay. If successful, this method would eliminate all conventional radioactive backgrounds to the decay, resulting in an ideal experiment. We summarize here the current status of EXO-200 construction and the barium tag R&D program.

**Injector Test Facility for the LCLS. Executive Summary**

Mar. 2007; 34 pp.; In English

Contract(s)/Grant(s): DE-AC02-76SF00515

Report No.(s): DE2007-900991; SLAC-TN-07-005; No Copyright; Avail.: National Technical Information Service (NTIS)

SLAC is in the privileged position of being the site for the worlds first 4th generation light source as well as having a premier accelerator research staff and facilities. Operation of the worlds first x-ray free electron laser (FEL) facility will require

innovations in electron injectors to provide electron beams of unprecedented quality. Upgrades to provide ever shorter wavelength x-ray beams of increasing intensity will require significant advances in the state-of-the-art. The BESAC 20-Year Facilities Roadmap identifies the electron gun as the critical enabling technology to advance linac-based light sources and recognizes that the sources for next-generation light sources are the highest-leveraged technology, and that BES should strongly support and coordinate research and development in this unique and critical technology. This white paper presents an R&D plan and a description of a facility for developing the knowledge and technology required to successfully achieve these upgrades, and to coordinate efforts on short-pulse source development for linac-based light sources.

**High-Energy Neutron Imaging Development at LLNL**

Hall, J. M.; Rusnak, B.; Fitsos, P. J.; Dec. 06, 2006; 15 pp.; In English

Report No.(s): DE2007-900879; UCRL-TR-226786; No Copyright; Avail.: National Technical Information Service (NTIS)

We are proceeding with the development of a high-energy (10 MeV) neutron imaging system for use as an inspection tool in nuclear stockpile stewardship applications. Our goal is to develop and deploy an imaging system capable of detecting cubic-mm-scale voids, cracks or other significant structural defects in heavily-shielded low-Z materials within nuclear device components. The final production-line system will be relatively compact (suitable for use in existing or proposed facilities within the DOE complex) and capable of acquiring both radiographic and tomographic (CT) images. In this report, we will review our programmatic accomplishments to date, highlighting recent (FY06) progress on engineering and technology development issues related to the proposed imaging system. We will also discuss our preliminary project plan for FY07, including engineering initiatives, proposed radiation damage experiments (neutrons and x rays) and potential options for conducting classified neutron imaging experiments at LLNL.

**Systematic Procedure for Assigning Uncertainties to Data Evaluations**

Younes, W.; Feb. 23, 2007; 8 pp.; In English

Report No.(s): DE2007-902296; UCRL-TR-228283; No Copyright; Avail.: National Technical Information Service (NTIS)

In this report, an algorithm that automatically constructs an uncertainty band around any evaluation curve is described. Given an evaluation curve and a corresponding set of experimental data points with x and y error bars, the algorithm expands a symmetric region around the evaluation curve until 68.3% of a set of points, randomly sampled from the experimental data, fall within the region. For a given evaluation curve, the region expanded in this way represents, by definition, a

one-standard-deviation interval about the evaluation that accounts for the experimental data. The algorithm is tested against several benchmarks, and is shown to be well-behaved, even when there are large gaps in the available experimental data. The performance of the algorithm is assessed quantitatively using the tools of statistical-inference theory.

**Assessment of Gradient Diffusion Closures for Modeling Rayleigh Taylor and Richtmyer Meshkov Instability Induced Mixing**

Schilling, O.; Mueschke, N.; Latini, M.; Jan. 11, 2007; 8 pp.; In English

Report No.(s): DE2007-900103; UCRL-CONF-227196; No Copyright; Avail.: Department of Energy Information Bridge

The validity of gradient-diffusion closures for modeling turbulent transport in multi-mode Rayleigh Taylor and reshocked Richtmyer Meshkov instability-induced mixing is investigated using data from three dimensional spectral/tenth-order compact difference and ninth-order weighted essentially non-oscillatory simulations, respectively. Details on the numerical methods, initial and boundary conditions, and validation of the results are discussed elsewhere (2,3). First, mean and fluctuating fields are constructed using spatial averaging in the two periodic flow directions. Then, quantities entering eddy viscosity-type gradient-diffusion closures, such as the turbulent kinetic energy and its dissipation rate (or turbulent frequency), and the turbulent viscosity are constructed. The magnitudes of the terms in the turbulent kinetic energy transport equation are examined to identify the dominant processes. It is shown that the buoyancy (or shock) production term is the dominant term in the transport equation, and that the shear production term is relatively small for both the Rayleigh Taylor and Richtmyer Meshkov cases. Finally, a priori tests of gradient-diffusion closures of the unclosed terms in the turbulent kinetic energy transport equation are performed by comparing the terms constructed directly using the data to the modeled term. A simple method for estimating the turbulent Schmidt numbers appearing in the closures is proposed. Using these turbulent Schmidt numbers, it is shown that both the shape and magnitude of the profiles of the dominant terms in the turbulent kinetic energy transport equation across the mixing layer are generally well captured.

**Self-Consistent Simulations of High-Intensity Beams and E-Clouds with WARP POSINST**

Vay, J. L.; Friedman, A.; Grote, D. P.; January 2006; 7 pp.; In English

Report No.(s): DE2007-900710; No Copyright; Avail.: National Technical Information Service (NTIS)

We have developed a new, comprehensive set of simulation tools aimed at modeling the interaction of intense ion beams and electron clouds (e-clouds). The set contains the 3-D accelerator PIC code WARP and the 2-D slice ecloud code POSINST, as well as a merger of the two, augmented by new modules for impact ionization and neutral gas generation. The new capability runs on workstations or parallel supercomputers and contains advanced features such as mesh refinement, disparate adaptive time stepping, and a new drift-Lorentz particle mover for tracking charged particles in magnetic fields using large time steps. It is being applied to the modeling of ion beams (1 MeV, 180 mA, K+) for heavy ion inertial fusion and warm dense matter studies, as they interact with electron clouds in the High-Current Experiment (HCX). In earlier papers, we described the capabilities and presented recent simulation results with detailed comparisons against the HCX experiment, as well as their application (in a different regime) to the modeling of e-clouds in the Large Hadron Collider (LHC). We concentrate here on the description of the implementation of the quasi-static mode of operation, for comparison with other codes, and introduce a new consideration on the estimate of computing time between the quasi-static and the fully self-consistent modes.

**Improved Charged Particle Model in CALEICF**

Managan, R. A.; Jan. 18, 2007; 12 pp.; In English

Report No.(s): DE2007-900089; UCRL-CONF-227316; No Copyright; Avail.: National Technical Information Service (NTIS)

Modeling ICF capsules and test problems involving thermonuclear plasmas requires modeling the charged particles produced by the thermonuclear reactions. The charged particles escaping from an ICF capsule are one of the main diagnostics of capsule performance. Caleicf can locally deposit the charged particle energy into the electron and ion fields instantaneously or track them using a Monte Carlo algorithm. Test problems revealed that Caleicf's charged particle package needed improvement. The package has been enhanced to include the thermal energy of the reacting particles and to model the created particles energy distribution. The thermal energy of the reacting particles is accounted for as described in Ballabio, et al. (Ballabio et al., 1998) and Warshaw (Warshaw, 2001). This energy is removed from the background ion energy and distributed between the created particles. The particle energy distributions are modeled with an approximation used by Ballabio, et al. This distribution is a modified Gaussian (based on the square root of the energy) that has a functional form similar to the exact distribution (see Warshaw). The skewness of the distribution matches that of the exact distribution within 1-2%. The thermal energy and the parameters of the distribution can be calculated using  $\langle v \rangle$  and its first two derivatives with respect to temperature. The new model will be compared with the original one for several test problems and ICF calculations.

**Isochoric Implosions for Fast Ignition**

Clark, D. S.; Tabak, M.; Jun. 09, 2006; 18 pp.; In English

Report No.(s): DE2007-900086; UCRL-CONF-221925; No Copyright; Avail.: National Technical Information Service (NTIS)

Fast Ignition (FI) exploits the ignition of a dense, uniform fuel assembly by an external energy source to achieve high gain. In conventional ICF implosions, however, the fuel assembles as a dense shell surrounding a low density, high-pressure hotspot. Such configurations are far from optimal for FI. Here, it is shown that a self-similar spherical implosion of the type originally studied by Guderley (Luftfahrtforschung 19, 302 (1942).) may be employed to implode a dense, quasi-uniform fuel assembly with minimal energy wastage in forming a hotspot. A scheme for realizing these specialized implosions in a practical ICF target is also described.

**Rayleigh Taylor Instability induced Mixing. Initial Conditions Modeling, Three Dimensional Simulations and Comparisons with Experiment**

Mueschke, N.; Schilling, O.; Andrews, M.; Jan. 11, 2007; 6 pp.; In English

Report No.(s): DE2007-900080; UCRL-CONF-227192; No Copyright; Avail.: National Technical Information Service (NTIS)

A spectral/compact finite-difference method with a third-order Adams Bash forth Moulton time evolution scheme is used to perform a direct numerical simulation (DNS) of Rayleigh Taylor flow. The initial conditions are modeled by parameterizing the multi-mode velocity and density perturbations measured just off of the splitter plate in water channel experiments. Parameters in the DNS are chosen to match the experiment as closely as possible. The early-time transition from a weakly-nonlinear to a strongly-nonlinear state, as well as the onset of turbulence, is examined by comparing the DNS and experimental results. The mixing layer width, molecular mixing parameter, vertical velocity variance, and density variance spectrum obtained from the DNS are shown to be in good agreement with the corresponding experimental values.

**Active Detection of Small Quantities of Shielded Highly-Enriched Uranium Using Low-Dose 60-keV Neutron Interrogation**

Kerr, P.; Rowland, M.; Dietrich, D.; Stoeffl, W.; Wheeler, B.; Aug. 21, 2006; 13 pp.; In English

Report No.(s): DE2007-900071; UCRL-CONF-223845; No Copyright; Avail.: National Technical Information Service (NTIS)

Active interrogation with low-energy neutrons provides a search technique for shielded highly enriched uranium. We describe the technique and show initial results using a low-dose 60 keV neutron beam. This technique produces a clear induced fission signal in the presence of small quantities of <sup>235</sup>U. The technique has been validated with low-Z and high-Z shielding materials. The technique uses a forward-directed beam of 60 keV neutrons to induce fission in <sup>235</sup>U. The induced fission produces fast neutrons which are then detected as the signature for <sup>235</sup>U. The beam of neutrons is generated with a 1.93 MeV proton beam impinging on a natural lithium target. The proton beam is produced by a radio-frequency quadrupole (RFQ) LINAC. The 60 keV neutron beam is forward directed because the <sup>7</sup>Li(p,n) reaction is just at threshold for the proton energy of 1.93 MeV.

**Recent Physics Results from NSTX**

Menard, J. E.; Bell, M. G.; Bell, R. E.; Bialek, J. M.; Boedo, J. A.; Oct. 08, 2006; 14 pp.; In English

Report No.(s): DE2007-900160; UCRL-CONF-225102; No Copyright; Avail.: National Technical Information Service (NTIS)

The National Spherical Torus Experiment (NSTX) has made considerable progress in advancing the scientific understanding of high performance long-pulse plasmas needed for ITER and future low-aspect-ratio Spherical Torus (ST) devices. Plasma durations up to 1.6s (5 current redistribution times) have been achieved at plasma currents of 0.7 MA with non-inductive current fractions above 65% while achieving T and N values of 16% and 5.7 (%mT/MA), respectively. Newly available Motional Stark Effect data has allowed systematic study and validation of current drive sources and improved the understanding of hybrid-like scenarios. In MHD research, six mid-plane ex-vessel radial field coils have been utilized to infer and correct intrinsic error fields, provide rotation control, and actively stabilize the n=1 resistive wall mode at ITER-relevant low plasma rotation values. In transport and turbulence, the low aspect ratio and wide range of achievable in NSTX provide unique data for confinement scaling studies. A new high-k scattering diagnostic is investigating turbulent density fluctuations with wave numbers extending from ion to electron gyro-scales. In the area of energetic particle research, cyclic neutron rate drops have been associated with the destabilization of multiple large Toroidal Alfvén Eigenmodes (TAEs) similar to the sea-of-TAE modes predicted for ITER. Three wave coupling processes between energetic particle modes and TAEs have also been observed for the first time. In boundary physics, advanced shape control has been utilized to study the role of magnetic balance in H-mode access and ELM stability. Peak divertor heat flux has been reduced by a factor of 5 using an H-mode compatible radiative divertor, and Lithium conditioning has demonstrated particle pumping and improved thermal confinement. Finally, non-solenoidal plasma start-up research is particularly important for the ST, and Coaxial Helicity Injection has now produced 160kA plasma currents on closed magnetic flux surfaces.

**Global Local Dynamic Models**

Pfeffer, A.; Das, S.; Lawless, D.; Ng, B.; Oct. 12, 2006; 8 pp.; In English

Report No.(s): DE2007-900155; UCRL-CONF-225258; No Copyright; Avail.: Department of Energy Information Bridge

Many dynamic systems involve a number of entities that are largely independent of each other but interact with each other via a subset of state variables. We present global/local dynamic models (GLDMs) to capture these kinds of systems. In a GLDM, the state of an entity is decomposed into a globally influenced state that depends on other entities, and a locally influenced state that depends only on the entity itself. We present an inference algorithm for GLDMs called global/local particle filtering, that introduces the principle of reasoning globally about global dynamics and locally about local dynamics. We have applied GLDMs to an asymmetric urban warfare environment, in which enemy units form teams to attack important targets, and the task is to detect such teams as they form. Experimental results for this application show that global/local particle filtering outperforms ordinary particle filtering and factored particle filtering.

**Ultra Fast Coherent Diffraction Imaging of Single Particles, Clusters and Biomolecules**

Hajdu, J.; Chapman, H.; Oct. 07, 2006; 42 pp.; In English

Report No.(s): DE2007-900146; UCRL-TR-225072; No Copyright; Avail.: National Technical Information Service (NTIS)

Theoretical studies and simulations predict that with a very short and very intense coherent X-ray pulse a single diffraction pattern may be recorded from a large macromolecule, a virus, or a cell without the need for crystalline periodicity (Neutze et al., 2000; Jurek et al., 2004; Hau-Riege, 2004 et al.; Bergh et al., 2004). Measurement of the over-sampled X-ray diffraction pattern permits phase retrieval and hence structure determination (Bates, 1982; Fienup, 1982; Sayre et al., 1998; Miao et al., 1999; Robinson et al., 2001; Marchesini et al., 2003; Chapman, 2006). Although individual samples will be destroyed by the very intense X-ray pulse, a three-dimensional data set could be assembled when copies of a reproducible sample are exposed to the beam one by one (Huldt et al., 2003). The challenges in carrying out such an experiment requires an interdisciplinary approach, drawing upon structural biology, atomic and plasma physics, mathematics, statistics, and XFEL physics. The potential for breakthrough science in this area is great with impact not only in the biological areas but wherever structural information at or near atomic resolution on the nanoscale is valuable.

**AdS/CFT and QCD**

Brodsky, S. J.; de Teramond, G. F.; Feb. 2007; 9 pp.; In English

Contract(s)/Grant(s): DE-AC02-76SF00515

Report No.(s): DE2007-899840; SLAC-PUB-12361; No Copyright; Avail.: Department of Energy Information Bridge

The AdS/CFT correspondence between string theory in AdS space and conformal field theories in physical spacetime leads to an analytic, semi-classical model for strongly-coupled QCD which has scale invariance and dimensional counting at short distances and color confinement at large distances. Although QCD is not conformally invariant, one can nevertheless use the mathematical representation of the conformal group in five-dimensional anti-de Sitter space to construct a first approximation to the theory. The AdS/CFT correspondence also provides insights into the inherently non-perturbative aspects of QCD, such as the orbital and radial spectra of hadrons and the form of hadronic wavefunctions. In particular, we show that there is an exact correspondence between the fifth-dimensional coordinate of AdS space  $z$  and a specific impact variable  $a_e$  which measures the separation of the quark and gluonic constituents within the hadron in ordinary space-time. This connection allows one to compute the analytic form of the frame-independent light-front wavefunctions, the fundamental entities which encode hadron properties and allow the computation of decay constants, form factors, and other exclusive scattering amplitudes. New relativistic lightfront equations in ordinary space-time are found which reproduce the results obtained using the 5-dimensional theory. The effective light-front equations possess remarkable algebraic structures and integrability properties. Since they are complete and orthonormal, the AdS/CFT model wavefunctions can also be used as a basis for the diagonalization of the full light-front QCD Hamiltonian, thus systematically improving the AdS/CFT approximation.

**Summary of LLNL Russian Projects**

Schilling, O.; Jan. 22, 2007; 24 pp.; In English

Report No.(s): DE2007-902309; UCRL-TR-227384; No Copyright; Avail.: National Technical Information Service (NTIS)

The objective of this project is to develop and demonstrate more efficient methods for solving radiation transport equations using adaptivity in angle variables. Conventional angular discretization methods require that the angular finite-difference grid be fine enough in any region. If the grid is too coarse, the well-known ray effects appear. In addition, subdomains appear with a highly anisotropic particle flux distribution over directions (where a very fine angular difference grid must be used), as well as subdomains where the distribution is nearly isotropic. In view of this, a promising approach to multi-dimensional transport solution efficiency enhancement using finite-difference approximations is one employing adaptive grids. Such adaptive methods are expected to resolve the ray effect problem in a cost-efficient manner. The algorithm for solving the radiation transport equation using an angle-adaptive method with dynamic criteria for constructing the grid was evaluated using a set of benchmark test problems (pipe, slit, vacuum, and spherical).

**Feasibility of Measuring  $^3\text{He}$  Bubble Diameter Populations in Deuterium-Tritium Ice Layers Using Mie Scattering**

Izumi, N.; Feb. 01, 2007; 18 pp.; In English

Report No.(s): DE2007-902305; UCRL-TR-227651; No Copyright; Avail.: National Technical Information Service (NTIS)

In this report, the author assesses the feasibility of using Mie scattering to quantify the diameter distribution of  $^3\text{He}$  bubbles in DT ice layers. Mie scattering methods are often used for diameter measurements of particulates in emulsions like pigments and ink products. This suggests that similar techniques could be used to measure the distribution of  $^3\text{He}$  bubbles in DT ice layers, which is important for NIF ICF capsules. To investigate the achievable performance of bubble diameter measurements using Mie scattering, he performed numerical modeling using exact analytical expressions. Mie scattering is light scattering by spherical particulates which have different refractive indices than their surrounding medium. Mie's theoretical model of this problem applies to diffraction by any number of spheres that are all of the same diameter and composition, provided they are randomly distributed and separated from each other by distances that are large compared to the light scattering wavelength.

**Ultrafast, In Situ Probing of Shocked Solids at the Mesoscale and Beyond: a New Paradigm for Materials Dynamics**

Lorenzana, H.; Belak, J.; Campbell, G.; King, W.; Nikkel, D.; Feb. 22, 2007; 10 pp.; In English

Report No.(s): DE2007-902303; UCRL-TR-228191; No Copyright; Avail.: National Technical Information Service (NTIS)

Understanding material response under dynamic conditions and extreme pressures at the lattice level is important for being able to generate predictive models of material response. Despite many decades of study, material behavior is primarily inferred from bulk measurements on dynamically loaded samples or the microstructure from recovery experiments and not determined from lattice level measurements made in-situ at the relevant length scale of the governing physics. In the work described here, we report on progress made in advancing this frontier with research conducted under LDRD 04-ERD-071. Specifically, we present advances in, and applications of, dynamic x-ray diffraction, Extended X-ray Absorption Fine Structure and dynamic transmission electron microscopy.

Contract(s)/Grant(s): N00014-99-1-0857

Patent Info.: Filed Filed 11 Mar 04; US-Patent-Appl-SN-10-799 530

Report No.(s): PB2007-104641; No Copyright; Avail.: CASI: [A03](#), Hardcopy

A system and method for containing plasma and forming a Field Reversed Configuration (FRC) magnetic topology are described in which plasma ions are contained magnetically in stable, non-adiabatic orbits in the FRC. Further, the electrons are contained electrostatically in a deep energy well, created by tuning an externally applied magnetic field. The simultaneous electrostatic confinement of electrons and magnetic confinement of ions avoids anomalous transport and facilitates classical containment of both electrons and ions. In this configuration, ions and electrons may have adequate density and temperature so that upon collisions they are fused together by nuclear force, thus releasing fusion energy. Moreover, the fusion fuel plasmas that can be used with the present confinement system and method are not limited to neutronic fuels only, but also advantageously include advanced fuels.

**Conformal Template and New Perspectives for Quantum Chromodynamics**

Brodsky, S. J.; Mar. 01, 2007; 19 pp.; In English

Report No.(s): DE2007-900589; SLAC-PUB-12381; No Copyright; Avail.: Department of Energy Information Bridge

Conformal symmetry provides a systematic approximation to QCD in both its perturbative and nonperturbative domains. One can use the AdS/CFT correspondence between Anti-de Sitter space and conformal gauge theories to obtain an analytically tractable approximation to QCD in the regime where the QCD coupling is large and constant. For example, there is an exact correspondence between the fifth-dimensional coordinate of AdS space and a specific impact variable which measures the separation of the quark constituents within the hadron in ordinary space-time. This connection allows one to compute the analytic form of the frame-independent light-front wave functions of mesons and baryons, the fundamental entities which encode hadron properties and allow the computation of exclusive scattering amplitudes. One can also use conformal symmetry as a template for perturbative QCD predictions where the effects of the nonzero beta function can be systematically included in the scale of the QCD coupling. This leads to fixing of the renormalization scale and commensurate scale relations which relate observables without scale or scheme ambiguity. The results are consistent with the renormalization group and the analytic connection of QCD to Abelian theory at  $N(c) \rightarrow 0$ .

**Test Suite for Nuclear Data I. Deterministic Calculations for Critical Assemblies and Replacement Coefficients**

Pruet, J.; Brown, D. A.; Descalle, M. A.; May 23, 2006; 90 pp.; In English

Report No.(s): DE2007-900468; UCRL-TR-221568; No Copyright; Avail.: National Technical Information Service (NTIS)

The authors describe tools developed by the Computational Nuclear Physics group for testing the quality of internally developed nuclear data and the fidelity of translations from ENDF formatted data to ENDL formatted data used by Livermore. These tests include S(n) calculations for the effective k value characterizing critical assemblies and for replacement coefficients of different materials embedded in the Godiva and Jezebel critical assemblies. For those assemblies and replacement materials for which reliable experimental information is available, these calculations provide an integral check on the quality of data. Because members of the ENDF and reactor communities use calculations for these same assemblies in their validation process, a comparison between their results with ENDF formatted data and our results with data translated into the ENDL format provides a strong check on the accuracy of translations. As a first application of the test suite we present

a study comparing ENDL 99 and ENDF/B-V. They also consider the quality of the ENDF/B-V translation previously done by the Computational Nuclear Physics group. No significant errors are found.

**Materials and Fabrication Issues for Large Machined Germanium Immersion Gratings**

Kuzmenko, P. J.; Davis, P. J.; Little, S. L.; Hale, L. C.; May 23, 2006; 16 pp.; In English

Report No.(s): DE2007-900461; UCRL-CONF-221559; No Copyright; Avail.: National Technical Information Service (NTIS)

LLNL has successfully fabricated small (1.5 cm<sup>2</sup> area) germanium immersion gratings. We studied the feasibility of producing a large germanium immersion grating by means of single point diamond flycutting. Our baseline design is a 63.4(sup o) blaze echelle with a 6 cm beam diameter. Birefringence and refractive index inhomogeneity due to stresses produced by the crystal growth process are of concern. Careful selection of the grating blank and possibly additional annealing to relieve stress will be required. The Large Optics Diamond Turning Machine (LODTM) at LLNL is a good choice for the fabrication. It can handle parts up to 1.5 meter in diameter and 0.5 meter in length and is capable of a surface figure accuracy of better than 28 nm rms. We will describe the machine modifications and the machining process for a large grating. A next generation machine, the Precision Optical Grinder and Lathe (POGAL), currently under development has tighter specifications and could produce large gratings with higher precision.

Six parties (EU, Japan, Russia, US, Korea, China) will build International Thermonuclear Experimental Reactor (ITER). The U.S. proposed to deliver at least 4 out of 7 modules of the Central Solenoid. Phillip Michael (MIT) and the author were tasked by DoE to assist ITER in development of the ITER CS and other magnet systems. They work to help Magnets and Structure division headed by Neil Mitchell. During this visit the author worked on the selected items of the CS design and carried out other small tasks, like PF temperature margin assessment.

**Flash X-ray (FXR) Linear Induction Accelerator(LIA) Optimization Upgrade of the OTR Emittance Diagnostic**

Houck, T. L.; Wargo, P. E.; Dec. 21, 2006; 17 pp.; In English

Report No.(s): DE2007-900448; UCRL-TR-226954; No Copyright; Avail.: National Technical Information Service (NTIS)

Knowing the electron beam parameters at the exit of an accelerator is critical for several reasons. Foremost is to optimize the application of the beam, which is flash radiography in the case of the FXR accelerator. The beam parameters not only determine the theoretical dose, x-ray spectrum, and radiograph resolution (spot size), they are required to calculate the final

transport magnetic fields that focus the beam on the bremsstrahlung converter to achieve the theoretical limits. Equally important is the comparison of beam parameters to the design specifications. This comparison indicates the health of the accelerator, warning the operator when systems are deteriorating or failing. For an accelerator of the size and complexity of FXR, a large suite of diagnostics is normally employed to measure and/or infer beam parameters. These diagnostics are distributed throughout the accelerator and can require a large number of shots (measurements) to calculate a specific beam parameter. The OTR Emittance Diagnostic, however, has the potential to measure all but one of the beam parameters simultaneous at a specific location. Using measurements from a scan of a few shots, this final parameter can also be determined. Since first deployment, the OTR Emittance Diagnostic has been limited to measuring only one of the seven desired parameters, the beam's divergence. This report describes recent upgrades to the diagnostic that permit full realization of its potential.

Report No.(s): DE2007-900831; FERMILAB-CONF-07-041-E; No Copyright; Avail.: National Technical Information Service (NTIS)

One of the most striking signature of supersymmetric models with electroweak symmetry breaking is the presence of multilepton event topologies in the decay products. In this paper searches are presented for physics beyond the Standard Model (SM) in final states containing charged leptons from proton-antiproton collision data at a center-of-mass energy of 1.96 TeV, collected with Run II CDF and DO Detectors in 2002-2006, and corresponding to integrated luminosities of up to 1.1 fb<sup>-1</sup>. In any of the searches no excess of candidates was observed with respect to the SM predictions and limits on masses and production cross-sections are set at the 95% CL.

**Search for Chargino and Neutralino at Run II of the Tevatron Collider**

Canepa, A.; Aug. 2006; 186 pp.; In English

Report No.(s): DE2007-900820; No Copyright; Avail.: National Technical Information Service (NTIS)

In this dissertation we present a search for the associated production of charginos and neutralinos, the supersymmetric partners of the Standard Model bosons. We analyze a data sample representing 745 pb<sup>-1</sup> of integrated luminosity collected by the CDF experiment at the pp Tevatron collider. We compare the Standard Model predictions with the observed data selecting events with three leptons and missing transverse energy. Finding no excess, we combine the results of our search with similar analyses carried out at CDF and set an upper limit on the chargino mass in SUSY scenarios.

**New Strategic Plan Takes the ALS into the Future**

Kirz, J.; Chemla, D. S.; Feinberg, B.; Hussain, Z.; Krebs, G. F.; January 2007; 4 pp.; In English

Report No.(s): DE2007-900657; No Copyright; Avail.: Department of Energy Information Bridge

A new strategic plan is in place to upgrade the ALS so it can continue to address fundamental questions, such as

size-dependent and dimensional-confinement phenomena at the nanoscale; correlation and complexity in physical, biological, and environmental systems; and temporal evolution, assembly, dynamics and ultrafast phenomena. Moreover, the growing number of ALS users (now exceeding 2,000 per year) requires increased attention. Accordingly, our plan concentrates on projects that will continue to make it possible for ALS users to address grand scientific and technological challenges with incisive world-class tools and quality user support. Our highest priority is to begin top-off operation, in which electrons are injected into the storage ring at intervals of approximately 1 minute. The combination of top-off and concurrent development of small-gap in-vacuum undulators and superconducting undulators will allow an increase in brightness from eight to more than 100 times, depending on the specific undulators and photon energy range. As part of our core mission in the VUV and soft x-ray regions, we plan to exploit these accelerator developments to extend our capabilities for high spatial and temporal resolution and utilize the remarkable coherence properties of the ALS in a new generation of beamlines. Ranked by priority, several proposed beamlines will follow completion of five new beamlines already under construction or funded. The intellectual excitement of the ALS has been a powerful tool in the recruitment and retention of outstanding staff, but additional sustained efforts are required to increase diversity both in gender and in underrepresented groups. To this end, we intend to expand the ALS Doctoral Fellowship Program by giving special emphasis to underrepresented groups.

#### **Charmless B Decays**

Gratl, W.; Jan. 2007; 11 pp.; In English

Report No.(s): DE2007-900602; SLAC-PUB-12300; No Copyright; Avail.: Department of Energy Information Bridge

Rare charmless hadronic B decays are a good testing ground for the standard model. The dominant amplitudes contributing to this class of B decays are CKM suppressed tree diagrams and  $b \rightarrow s$  or  $b \rightarrow d$  loop diagrams (penguins). These decays can be used to study interfering standard model (SM) amplitudes and CP violation. They are sensitive to the presence of new particles in the loops, and they provide valuable information to constrain theoretical models of B decays.

#### **Overview of the Pulse Line Ion Accelerator**

Briggs, R. J.; Bieniosek, F. M.; Coleman, J. E.; Eylon, S.; Henestroza, E.; Jun. 2006; 4 pp.; In English

Report No.(s): DE2007-900655; No Copyright; Avail.: National Technical Information Service (NTIS)

An overview of the Pulse Line Ion Accelerator (PLIA) concept and its development is presented. In the PLIA concept a pulse power driver applied to one end of a helical pulse line creates a traveling wave pulse that accelerates and axially confines a heavy ion beam pulse. The motivation for its development at the IFE-VNL is the acceleration of intense, short pulse, heavy ion beams to regimes of interest for studies of High Energy Density Physics and Warm Dense Matter. Acceleration scenarios with constant parameter helical lines are described which result in output energies of a single stage much larger than the several hundred kilovolt peak voltages on the line, with a goal of 3-5 MeV/meter acceleration gradients. The main attraction of the concept is the very low cost it promises. It might be described crudely as an air core induction linac where the pulse-forming network is integrated into the beam line so the accelerating voltage pulse can move along with the ions to get voltage multiplication.

#### **X-Ray Absorption Edge Detector for High-Resolution Measurement of Undulator Effective K-Parameter**

Yang, B.; Galayda, J. N.; January 2006; 9 pp.; In English

Report No.(s): DE2007-900613; SLAC-PUB-12352; No Copyright; Avail.: National Technical Information Service (NTIS)

The spectrum of angle-integrated undulator radiation displays a sharp edge at every harmonic photon energy. A technique utilizing this feature to measure minute changes in K-parameters of an undulator in a free-electron laser has been proposed. To date, this technique requires the use of crystal monochromators as bandpass filters whose energy centroid depends on the incident angle of the x-ray beam. In this work we propose to use the absorption edge of an appropriate element as an energy-selective detector whose response is truly independent of the angle of the x-ray beam, and hence independent of

electron beam direction and emittance. We will discuss the basic design concept of the detection system and illustrate its projected performance with computer simulations.

Report No.(s): DE2007-900837; FERMILAB-CONF-06-465; No Copyright; Avail.: National Technical Information Service (NTIS)

Long baseline neutrino oscillation physics in the U.S. is centered at the Fermi National Accelerator Laboratory (FNAL), in particular at the Neutrinos at the Main Injector (NuMI) beamline commissioned in 2004-2005. Already, the MINOS experiment has published its first results confirming the disappearance of neutrinos across a 735 km baseline. The forthcoming NO $\nu$ A experiment will search for the transition and use this transition to understand the mass hierarchy of neutrinos. These, as well as other conceptual ideas for future experiments using the NuMI beam, will be discussed. The turn-on of the NuMI facility has been positive, with over 310 kW beam power achieved. Plans for increasing the beam intensity once the Main Injector accelerator is fully-dedicated to the neutrino program will be presented.

**e-/e+ Accelerating Structure with Cyclic Variation of Azimuth Asymmetry**

Krasnykh, A.; Jan. 2007; 3 pp.; In English

Report No.(s): DE2007-900611; SLAC-PUB-12275; No Copyright; Avail.: National Technical Information Service (NTIS)

A classical electron/positron accelerating structure is a disk-loaded cylindrical waveguide. The accelerator structure here has azimuth symmetry. The proposed structure contains a disk-loaded cylindrical waveguide where there is a periodical change of RF-field vs. azimuth. The modulation deforms the rf-field in such a manner that the accelerated particles undergo transverse focusing forces. The new class of accelerator structures covers the initial part of e+/e- linacs where a bunch is not rigid and additional transverse focusing fields are necessary. We discuss a bunch formation with a high transverse aspect ratio in the proposed structure and particularly in the photoinjector part of a linac.

**Coreless Approaches for On/Off Marx Type Modulators**

Krasnykh, A.; Jan. 2007; 3 pp.; In English

Report No.(s): DE2007-900609; SLAC/PUB-12278; No Copyright; Avail.: National Technical Information Service (NTIS)

SLAC was first to report using ON/OFF switches in Marx type modulator. The development of Marx type modulator was bounded with the NLC need. The high energy physics runs based on the ILC concept where longer modulator pulse width is required. The SLAC idea of coreless modulators was useful for other applications (medicine, military, home security, etc.). The discussed conception is presented as a continuation of the earlier published articles. Several types of the Marx ON/OFF type modulators are under consideration. This article describes the new coreless approach, based on the solid state ON/OFF Marx's topology. An AC high voltage network feeds individual Marx's cells through the inductive and diode assemblies. Further integration of the ON/OFF Marx type modulator and its power supply is proposed. Two topologies are under consideration. The first scheme is an integration of DC/DC converters with ON/OFF Marx. The second topology is based on the usage of AC network directly with ON/OFF Marx scheme.

**Topology of On/Off Marx Modulator with Protection of Load and Solid State Switches**

Krasnykh, A.; Jan. 2007; 3 pp.; In English

Contract(s)/Grant(s): DE-AC02-76SF00515

Report No.(s): DE2007-900608; SLAC-PUB-12279; No Copyright; Avail.: National Technical Information Service (NTIS)

This article discusses a proposal for an ultra fast feedback response that will protect the load and solid state switches of the ON/OFF Marx type modulators. The feedback guards main elements of a modulator against possible arcs in the load, particularly arcs inside of the electron guns. The chief concept behind the proposed response system is an employment of a fraction of the output modulator power as a controlling and guarding pulse during the delivery time. The time constant of the proposed feedback loop lies in the nanosecond range. Peculiarities of proposed topology are discussed.

**Constraints on Meta-Stable de Sitter Flux Vacua**

Soroush, M.; Feb. 2007; 22 pp.; In English

Report No.(s): DE2007-900605; SLAC-PUB-12367; No Copyright; Avail.: Department of Energy Information Bridge

We consider flux compactification of type IIB string theory as the orientifold limit of an F-theory on a Calabi-Yau fourfold. We show that when supersymmetry is dominantly broken by the axion-dilaton and the contributions of the F-terms associated with complex structure moduli are small, the Hessian of the flux potential always has tachyonic modes for de Sitter vacua. This implies that there exist no meta-stable de Sitter vacua in this limit. Moreover, we find that the stability requirement imposes a relation between the values of cosmological constant and the scale of supersymmetry breaking for non-supersymmetric anti de Sitter vacua in this limit. The proof is general and does not rely on the details of the geometry of the compact Calabi-Yau internal space. We finally analyze the consequences of these constraints on the statistics of meta-stable de Sitter vacua and address some other related issues.

**Description of ALARMA. The Alarm Algorithm Developed for the Nuclear Car Wash**

Luu, T.; Bilotto, P.; Church, J.; Descalle, M. A.; Hall, J.; Jan. 26, 2007; 61 pp.; In English

Report No.(s): DE2007-900435; UCRL-TR-227515; No Copyright; Avail.: National Technical Information Service (NTIS)

The goal of any alarm algorithm should be that it provide the necessary tools to derive confidence limits on whether the existence of fissile materials is present in cargo containers. It should be able to extract these limits from (usually) noisy and/or weak data while maintaining a false alarm rate (FAR) that is economically suitable for port operations. It should also be able to perform its analysis within a reasonably short amount of time (i.e. seconds). To achieve this, it is essential that the algorithm be able to identify and subtract any interference signature that might otherwise be confused with a fissile signature. Lastly, the algorithm itself should be user-intuitive and user-friendly so that port operators with little or no experience with detection algorithms may use it with relative ease. In support of the Nuclear Car Wash project at Lawrence Livermore Laboratory, we have developed an alarm algorithm that satisfies the above requirements. The description of the this alarm algorithm, dubbed ALARMA, is the purpose of this technical report.

**Chiral Multichromic Single Crystals for Optical Devices**

Kemp, R. A.; Fleix, A. M.; Dec. 01, 2006; 22 pp.; In English

Contract(s)/Grant(s): DE-AC04-94AL85000

Report No.(s): DE2007-900406; SAND2006-7904; No Copyright; Avail.: National Technical Information Service (NTIS)

This report summarizes our findings during the study of a novel system that yields multicolored materials as products. This system is quite unusual as it leads to multi-chromic behavior in single crystals, where one would expect that only a single color would exist. We have speculated that these novel solids might play a role in materials applications such as non-linear optics, liquid crystal displays, piezoelectric devices, and other similar applications. The system examined consisted of a main-group alkyl compound (a p block element such as gallium or aluminum) complexed with various organic di-imines. The di-imines had substituents of two types either alkyl or aromatic groups attached to the nitrogen atoms. We observed that single crystals, characterized by X-ray crystallography, were obtained in most cases. Our research during January-July, 2006, was geared towards understanding the factors leading to the multichromic nature of the complexes. The main possibilities put forth initially considered (a) the chiral nature of the main group metal, (b) possible reduction of the metal to a lower-valent, radical state, (c) the nature of the ligand(s) attached to the main group metal, and (d) possible degradation products of the ligand leading to highly-colored products.

**Modeling and Simulation of Longitudinal Dynamics for LEH-HER PEP II Rings**

Rivetta, C.; Mastorides, T.; Fox, J. D.; Teytelman, D.; Van Winkle, D.; Feb. 2007; 4 pp.; In English

Report No.(s): DE2007-900593; SLAC-PUB-12375; No Copyright; Avail.: National Technical Information Service (NTIS)

A time domain modeling and simulation tool for beam-cavity interactions in LER and HER rings at PEP II are presented.

The motivation for this tool is to explore the stability margins and performance limits of PEP II RF systems at higher currents and upgraded RF configurations. It also serves as test bed for new control algorithms and can define the ultimate limits of the architecture. The time domain program captures the dynamical behavior of the beam-cavity interaction based on a reduced model. The ring current is represented by macro-bunches. Multiple RF station in the ring are represented via one or two macro-cavities. Each macro-cavity captures the overall behavior of all the 2 or 4 cavity RF station. Station models include nonlinear elements in the klystron and signal processing. This allows modeling the principal longitudinal impedance control loops interacting with the longitudinal beam model. Validation of simulation tool is in progress by comparing the measured growth rates for both LER and HER rings with simulation results. The simulated behavior of both machines at high currents are presented comparing different control strategies and the effect of non-linear klystrons in the growth rates.

Quantitative gamma spectrometry measurements of uranium frequently require corrections for attenuation by an equipment or container layer and by the uranium bearing material itself. It is common to correct for attenuation using the far-field approximation. Under this approximation, the minimum thickness of equipment or material is used for the correction rather than an average thickness over the detector field-of-view. In reality this aspect of the far-field approximation is really a narrow field-of-view approximation. The price of this simplification is the introduction of a bias. This bias will be investigated in this paper. In addition, there is a distance dependence of the radial response of a detector. This dependence will also be investigated.

Quantum chromodynamics (QCD) is the widely accepted theory of the strong interactions of quarks and gluons. Only through large scale numerical simulation has it been possible to work out the predictions of this theory for a vast range of phenomena relevant to the US Department of Energy experimental program. Such simulations are essential to support the discovery of new phenomena and more fundamental interactions. With support from SciDAC the USQCD collaboration has developed software and prototyped custom computer hardware to carry out the required numerical simulations. We have developed a robust, portable data-parallel code suite. It provides a user-friendly basis for writing physics application codes for carrying out the calculations needed to predict the phenomenology of QCD. We are using this efficient and optimized code base to develop new physics application code, to improve the performance of legacy code, and to construct higher level tools,

such as QCD-specific sparse matrix solvers. We give a brief overview of the design of the data parallel API and its various components. We describe performance gains achieved in the past year. Finally, we present plans for further improvements under SciDAC-2.

We present the one-step theory of neutron-pickup transfer reactions with  $^3\text{He}$  projectiles on  $^{235}\text{U}$  and  $^{238}\text{U}$ . We find all the neutron eigenstates in a deformed potential, and use those in a given energy range for (( $^3\text{He}$ ,alpha) DWBA pickup calculations to find the spin and parity distributions of the residual target nuclei. A simple smoothing convolution is used to take into account the spreading width of the single-neutron hole states into the more complicated compound nuclear states. We assume that the initial target is an even-even rotor, but can take into account spectator neutrons outside such a rotor by recombining their spin and parity at the end of the calculations.

**Interaction of Intense Electron Beams with Plasma**

Andrews, M L; Fleischmann, H H; Ury, M; Levine, L S; Vitkovitsky, I M; Apr 15, 1969; 12 pp.; In English; Original contains color illustrations

Report No.(s): AD-A468756; NRL-MR-2017; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA468756>

An exploratory experiment has been performed on the propagation of intense relativistic electron beams through an ionized medium. The beam was produced on the Cornell facility and consisted of a 50 kAmp stream of 350 keV electrons. The initial plasma was produced by a conical theta pinch gun located 1.5 m downstream of the diode and it is estimated that the initial electron density at beam injection was about  $10^{13}$  cu cm. Beam propagation was observed photographically, on an X-ray diode at the end of the tube, and on magnetic loops along the tube. Results suggest that the bulk of the beam propagates down the tube at speeds of  $1.8 \times 10^8$  m/sec. The magnetic probe signals indicate that there is appreciable counter streaming current within the plasma volume.

**Turbulence and Complex Flow Phenomena in Multi-Stage Axial Turbomachines**

Katz, Joseph; Meneveau, Charles; May 10, 2007; 35 pp.; In English; Original contains color illustrations

Contract(s)/Grant(s): FA9550-04-1-0019

Report No.(s): AD-A468816; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA468816>

The objective of this project is to measure the flow within axial turbomachines and use the data to address turbulence

modeling issues. Measurements are performed in two-stage transparent machines located in an optically index matched facility, which allows unobstructed 2-D and Stereo PIV measurements. Data provide insight on blade-wake, wake- boundary layer and wake-wake interactions. This report examines and elucidates several phenomena: i. Variations in turbulence within a wake generated by an upstream IGV blade while being ingested by a rotor passage; ii. Non-uniform turbulence production and diffusion leading to formation of turbulent hot spots within a rotor wake due to flow non-uniformities generated by upstream wakes; iii. Unsteady flow caused by an upstream wake stabilizes the boundary layer on a rotor blade and reduces its momentum thickness; iv. Comparisons of data covering an entire stage to RANS predictions; and V. Measurements of subgrid-scale stresses and dissipation rate, and comparisons to model predictions as well as associated implications of spatial averaging in followed by ensemble averaging in sustially non-uniform flows.

**Durability Patch: Application of Passive Damping to High Cycle Fatigue Cracking on Aircraft**

Rogers, Lynn; Searle, I R; Ikegami, R; Gordon, R W; Conley, D; Mar 1997; 12 pp.; In English

Report No.(s): AD-A468821; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA468821>

Although high-cycle fatigue cracks in secondary structure are often termed 'nuisance cracks', they are costly to repair. Often the repairs do not last long because the repaired part still responds in a resonant fashion to the environment. Although the use of visco-elastic materials for passive damping applications is well understood there have been few applications to high-cycle fatigue problems because the design information: temperature resonant response frequency and strain levels are difficult to determine. The Damage Dosimeter and the Durability Patch are an effort to resolve these problems with the application of compact off-the-shelf electronics and a damped bonded repair patch.

**Position Analysis of Planar Tensegrity Structures**

Bayat, Jahan B; Aug 2006; 108 pp.; In English; Original contains color illustrations

Contract(s)/Grant(s): F49620-00-1-0021

Report No.(s): AD-A468992; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA468992>

Tensegrity is an abbreviation of tension and integrity. Tensegrity structures are spatial structures formed by a combination of rigid elements in compression (struts) and connecting elements that are in tension (ties). In three-dimensional tensegrity structures no pair of struts touches, and the end of each strut is connected to non-coplanar ties, which are in tension. In two-dimensional tensegrity structures, struts still do not touch. A tensegrity structure stands by itself in its equilibrium position and maintains its form solely because of the arrangement of its struts and ties. The potential energy of the system stored in the springs is at a minimum in the equilibrium position when no external force or torque is applied. A closed-form solution of a two-spring, three-spring, and fourspring planar tensegrity mechanism was developed to determine all possible equilibrium configurations when no external force or moment is applied. Here closed form means that all solution equilibrium poses will be determined, although for each case a high-degree polynomial will have to be solved numerically.

Contract(s)/Grant(s): DE-FG02-032ER45959

Report No.(s): DE2007-898823; No Copyright; Avail.: National Technical Information Service (NTIS)

The original goal of this proposal was to study frozen spin polarized targets (HD target and other technologies) and produce a conceptual design report for the implementation of such a target in the HALL B detector of the Thomas Jefferson National Accelerator Facility (JLab). During the first two years of the proposal, we came to the conclusion that the best suited

target for JLab was a frozen spin target and helped with the design of such a target. We have not only achieved our original goal but have exceeded it by being involved in the actual building and testing of parts the target.

**Design and Application of the Reconstruction Software for the BaBar Calorimeter**

Strother, P. D.; Jul. 2006; 131 pp.; In English

Contract(s)/Grant(s): DE-AC02-76SF00515

Report No.(s): DE2007-885541; SLAC-R-828; No Copyright; Avail.: Department of Energy Information Bridge

The BaBar high energy physics experiment will be in operation at the PEP-II asymmetric  $e(\text{sup } +)e(\text{sup } -)$  collider in Spring 1999. The primary purpose of the experiment is the investigation of CP violation in the neutral B meson system. The electromagnetic calorimeter forms a central part of the experiment and new techniques are employed in data acquisition and reconstruction software to maximize the capability of this device. The use of a matched digital filter in the feature extraction in the front end electronics is presented. The performance of the filter in the presence of the expected high levels of soft photon background from the machine is evaluated. The high luminosity of the PEP-II machine and the demands on the precision of the calorimeter require reliable software that allows for increased physics capability. BaBar has selected C++ as its primary programming language and object oriented analysis and design as its coding paradigm. The application of this technology to the reconstruction software for the calorimeter is presented. The design of the systems for clustering, cluster division, track matching, particle identification and global calibration is discussed with emphasis on the provisions in the design for increased physics capability as levels of understanding of the detector increase. The CP violating channel  $B(\text{sup } 0) \rightarrow J/\psi K(\text{sub } S)(\text{sup } 0)$  has been studied in the two lepton, two  $(\pi)(\text{sup } 0)$  final state. The contribution of this channel to the evaluation of the angle  $\sin 2(\beta)$  of the unitarity triangle is compared to that from the charged pion final state. An error of 0.34 on this quantity is expected after 1 year of running at design luminosity.

**Beam Dynamics in a Spectrometer for the Polarized Positron Production Experiment**

Batygin, Y. K.; January 2005; 19 pp.; In English

Report No.(s): DE2007-881535; SLAC-PUB-11827; No Copyright; Avail.: Department of Energy Information Bridge

The proposed experiment E-166 at SLAC is designed to demonstrate the possibility of producing longitudinally polarized positrons from circularly polarized photons to be used in future Linear Collider. The experimental set-up utilizes a low emittance 50 GeV electron beam passing through a helical undulator in the Final Focus Test Beam line of the SLAC accelerator. Circularly polarized photons generated by the electron beam in the undulator hit a target and produce electron-positron pairs. The purpose of the post-target spectrometer is to select the positron beam and to deliver it to a polarimeter whilst keeping the positron beam polarization as high as possible. This paper analyzes positron transmission and polarization in the E-166 spectrometer experiment. The positron transmission has a maximum value of 7% for a positron beam energy of 5.5 MeV, while positron polarization is approximately 60%.

**W + Jet Production at CDF**

Messina, A.; Oct. 01, 2006; 4 pp.; In English

Report No.(s): DE2007-900378; FERMILAB-CONF-06-377-E; No Copyright; Avail.: National Technical Information Service (NTIS)

The study of jets produced in events containing a W bosons provides a useful test of Quantum Chromo-Dynamics (QCD) at high momentum transfers. Recently a lot of work has been channeled to develop sophisticated Monte Carlo programs capable of handling more particle in the final state at the leading order (LO), or in some cases, next-to-leading order (NLO). Measurements of W + jet cross sections are an important test of QCD and may be used to validate these new approaches. A good understanding of W + jet production is vital to reduce the uncertainty on the background to top pair production and to increase the sensitivity to higgs and new physics searches at the Tevatron and the LHC.

Report No.(s): DE2007-900358; FERMILAB-CONF-06-522-E; No Copyright; Avail.: National Technical Information Service (NTIS)

The Fermilab Tevatron is currently the only collider capable of producing and studying top quarks. The dominant mechanism for top quark production at the Tevatron is tt production via the strong interaction. The precise measurement of the cross section of this process is a test of the QCD prediction. In Run II of the Tevatron it should be possible to achieve an experimental error on this cross section which is comparable or better than the current theoretical precision. This paper presents the basic event selection criteria for tt events at the Tevatron and the latest measurements of the tt cross section.

**Acoustic Thermometry of Ocean Climate: Marine Mammal Issues**

Buck, Eugene H; May 12, 1995; 19 pp.; In English; Original contains color illustrations

Report No.(s): AD-A466194; CRS-95-603; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA466194>

After global warming became a concern in the mid-1950s, researchers proposed measuring deep ocean temperatures to reveal any significant trends in core ocean warming. Acoustic thermometry can detect changes in ocean temperature by receiving low-frequency sounds transmitted across an ocean basin because the speed of sound is proportional to water temperature. Acoustic Thermometry of Ocean Climate (ATOC) is an international program involving 11 institutions in seven nations. It is designed as a 30-month 'proof-of-concept' project to provide data on possible global climate change, with funding provided by the U.S. Department of Defense. A Marine Mammal Research Program (MMRP) was established as part of ATOC to assess the effects of ATOC sound signals on marine mammals. The proposed ATOC sources will be located 15 kilometers off the coast of Kauai, Hawaii, and near the Pioneer Seamount in California. A debate has arisen over ATOC's impact on marine mammals versus the benefits of better global warming information derived from it. Among the concerns are questions regarding the effects of low-frequency sound on marine mammals, and the baseline data available on marine mammals near the proposed source locations. In response to concerns expressed by the public, environmentalists, scientists, and Congress, the National Marine Fisheries Service (NMFS) held a series of public hearings on the Marine Mammal Protection Act (MMPA) permit applications by Scripps Institution of Oceanography for ATOC. Consequently, ATOC was delayed until draft environmental impact statements could be prepared. The Office of Naval Research funded a National Research Council (NRC) investigation of current knowledge and research needs with respect to the effects of low-frequency sound on marine mammals. The NRC report, released in March 1994, concluded that the data were insufficient to determine the possible effects of low-frequency sound on marine mammals.

**Design and Validation of an Aeroacoustic Anechoic Test Facility**

Jansson, D; Mathew, J; Hubner, J P; Sheplak, M; Cattafesta, L; Jun 2002; 12 pp.; In English; Original contains color illustrations

Report No.(s): AD-A466386; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA466386>

This paper discusses the design and initial validation of a newly constructed aeroacoustic anechoic test facility at the

University of Florida. The facility will enable and assist research in the areas of aeroacoustics, structural acoustics, and industrial noise/vibration control. General facility features and characteristics are described and documented. Experimental results focus on the free-field characteristics of the chamber via the ISO 3745 standard and preliminary evaluations of the acoustic data quality for subsonic axisymmetric turbulent jet noise measurements. Initial free-field results comply with the tolerances set by the ISO standard except for a few bands close to the corner containing the chamber door. The preliminary jet noise measurements yield reasonable comparisons to the fine-scale turbulent jet noise similarity spectrum at 90 degrees. The results also reveal the need for acoustic treatment and vibration control of the chamber traverse and fan that supplies supplemental entrainment air.

**Acoustic Proximity Ranging in the Presence of Secondary Echoes**

Li, Xi; Wu, Renbiao; Rasmi, Srihari; Li, Jian; Cattafesta, III, Louis N; Sheplak, Mark; Oct 2003; 14 pp.; In English

Contract(s)/Grant(s): N00014-00-1-0105

Report No.(s): AD-A466444; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA466444>

Proximity ranging is very important in many applications. Ultrasonic sensors have proven to be very cost effective tools for this purpose. Most of the currently available time-of-flight based acoustic proximity ranging systems use the conventional matched filter based time delay estimation approaches to measure short distances between proximity objects. However, in the presence of strong and closely spaced secondary echoes, the aforementioned matched filter based algorithms tend to fail or suffer from severe performance degradations due to their poor resolutions. In this paper, a computationally efficient time delay estimation algorithm, referred to as multiecho parameter estimation for acoustic ranging systems, is described for the joint proximity range estimation and secondary echo mitigation. The effectiveness of the proposed algorithm is demonstrated by both numerical and experimental examples.

**A Geometric Investigation of Acoustical Wavefront Scattering and Healing Induced by Ocean Internal Waves**

Salazar, Maxsimo; Mar 2007; 56 pp.; In English

Report No.(s): AD-A467113; No Copyright; Avail.: Defense Technical Information Center (DTIC)

Observed ocean acoustic wavefronts show surprising stability in long range acoustic transmission experiments. This suggests that ocean scattering processes tend to re-distribute acoustic energy dominantly along the wavefront rather than across it. The purpose of this thesis is to elucidate the physical mechanism for this type of scattering by presenting a ray based physical model. Analytic formulae are presented that predict wavefront distortions caused by ocean internal waves and other processes. Applications of this study include wavefront healing near underwater obstacles, out of plane scattering and the vertical redistribution of energy of off axis sources.

Report No.(s): AD-A467413; No Copyright; Avail.: Defense Technical Information Center (DTIC)

Results of the ATOC project's AET experiment have shown that at 75 Hz Rytov theory may be used for predicting the phase variations. This paper is focused on establishing the regimes of validity for Rytov theory at 75-400 Hz acoustic frequency range and up to 200 km distance. Ray paths correspond to grazing angles of 0, 5, 10 and 14 are considered, thus spanning the range of possible ray geometry from surface reflection to axial propagation. We find that the Rytov and simulation spectra are in very good agreement in the frequency range from the buoyancy frequency up to a grazing angle dependent on the transition frequency between 1 and 0.2 cph. For frequencies less than the transition frequency the Rytov spectra are in fairly good agreement with the simulations for all ranges and grazing angles between 0 and 10. For the 14 beam the Rytov

theory dramatically under predicts the spectral energy at frequencies less than 1 cph. When there is significant variability in phase and log-amplitude, we also find that significant spectral energy can exist at frequencies greater than the buoyancy frequency. This energy is not predicted by the Rytov model and represents the effect of strong interference and scattering not treated in the weak fluctuation approach of the Rytov theory. This study will increase the interest in the weak fluctuation theory (WFT) as an acoustic prediction tool.

**Dark Core Analysis of Coaxial Injectors at Sub-, Near-, and Supercritical Conditions in a Transverse Acoustic Field**

Leyva, Ivett A; Chehroudi, Bruce; Talley, Douglas; May 2007; 12 pp.; In English

Contract(s)/Grant(s): Proj-2308

Report No.(s): AD-A467843; AFRL-PR-ED-TP-2007-164; No Copyright; Avail.: Defense Technical Information Center (DTIC)

An experimental study on the effects of an externally-imposed transverse acoustic field in sub-, near-, and supercritical N<sub>2</sub> coaxial jets is presented. Such fields and their interaction with the jets (i.e., breakup, mixing, etc.) is believed to play a critical role during combustion instabilities in liquid rocket engines. The shear coaxial injector used here is similar to those used in cryogenic liquid rockets. By using N<sub>2</sub> as the working fluid, the chemistry effects on combustion instability are separated from the effects of a transverse acoustic field on coaxial jets. Furthermore, through this choice, ambiguities associated with composition dependence on mixtures' critical properties are eliminated. The acoustic oscillations are generated by a piezo-siren and have a frequency of ~3kHz. The pressures in the chamber range from 215-716 psia to span sub-, near-, and supercritical conditions. The outer to inner jet velocity ratio varies from ~1.2 to 23 and the momentum flux ratio varies from ~0.2 to 23. These ratios are mainly varied by changing the temperature and flow rates of the outer jet. At least 2000 backlit images were taken at 41kHz for each run. The main metric investigated is the length of the dark, or inner jet, core length. Both the axial length of the jet and the total, or curved, length are studied. A functional relation of the form  $A/MR^n$  describes the behavior of the axial length with the exponent being 0.2 (A:20-25) for subcritical conditions and 0.5 (A:5-12) for near and supercritical conditions. These results agree with historical data. The standard deviation of the axial length, which due to the large number of data points is within 0.03% of the RMS of the jet lengths fluctuations, also decreases with velocity ratio, for sub-, near-, and supercritical conditions.

**The Matrix Pencil and its Applications to Speech Processing**

Haddad, Darren H; Noga, Andrew J; Mar 2007; 152 pp.; In English; Original contains color illustrations

Contract(s)/Grant(s): Proj-459E

Report No.(s): AD-A466668; AFRL-IF-RS-TR-2007-89; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA466668>

Matrix Pencils facilitate the study of differential equations resulting from oscillating systems. Certain problems in linear ordinary differential equations, such as speech processing, can be represented as the problem of finding a canonical pencil strictly equivalent to a given pencil. It was originally applied by the radar community to phased array radar for signal directional finding applications. The Matrix Pencil (MP) algorithm is a direct data approach, and is a nonstochastic method. This approach has many benefits over a statistical approach. One benefit allows the user to approximate the error of the reconstructed signal without reconstructing the signal. Second, it takes less time and less computational power to execute the algorithm. Third, the matrix pencil approach has a lower variance of the estimates of the parameters of interest than a statistical approach such as traditional Linear Prediction Coding (LPC). Speech processing has many applications which directly assist in the advancement of technology. These technologies utilize speech tools that include, but are not limited to speech compression, speech enhancement, speech recovery, pitch estimation, and cochannel interference reduction. However, the speech processing community has not grasped the power of the MP algorithm, which will likely make a significant leap forward in improving these speech processing tools.

**Utilizing Network-Enabled Command and Control Concepts to Enhance ASW Effectiveness**

Klingbeil, Ralph; Shannon, John; Galdorisi, George; Sep 2004; 63 pp.; In English; Original contains color illustrations

Report No.(s): AD-A468697; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA468697>

This report describes an analysis of two selected concepts for improving Anti-Submarine Warfare (ASW) performance and effectiveness by means of network-enabled sharing of information during ASW operations. These concepts are identified as Shared Situational Awareness (SSA) and Collaborative Information Environment (CIE). It is shown that the application of queueing theory models provide useful tools for quantitatively estimating the value-added of implementing these concepts. In addition, queueing theory can be used to examine the tradeoffs between 'information systems' and 'shooters.' In general, queueing theory can support analysis whenever military operations, such as ASW, can be characterized as 'demand for service' processes. For the SSA and CIE concepts, an ASW tactical situation (TACSIT) is described and metrics are defined and quantified by means of queueing models. Insights, conclusions, and recommendations are then developed from the parametric quantitative results about the potential improvements to ASW performance and effectiveness achievable through implementation of these network-enabled concepts. Thirty-two briefing charts summarize the presentation.

A soft impact location system and method which detects and processes wide-band acoustic signatures for testing long-range munitions. The system incorporates a real-time digital signal-processing algorithm that detects the impact signature, processes it, and calculates the time-of-arrival (TOA). The system comprises a polyphase filter bank, boxcar filter, a detection analyzer for detecting an impact, and time-tagging software for calculating the time of impact. The system splits the received hydrophone signal into evenly spaced energy bands, processes each band individually, and then recombines the data to provide a precise time of detection.

Van Parijs, S.; Southall, B.; Mar. 2007; 70 pp.; In English; Developing a Strategic Program Plan for NOAA's Passive Acoustics Ocean Observing System (PAOOS), 11-13 Apr. 2006, Woods Hole, MA, USA

Report No.(s): PB2007-110765; No Copyright; Avail.: CASI: [A04](#), Hardcopy

Sound is the primary means by which many marine organisms convey and sense information over any appreciable spatial scale. Acoustic sensing is an optimal means for detecting and characterizing physical and biological features of ocean areas. Heightened public attention on the effects of anthropogenic sound in the marine environment provides impetus for the expansion of passive acoustic observing capabilities in general and for NOAA's leadership efforts in particular, in passive acoustics deployment, data acquisition, and management. Passive acoustics is an exceedingly powerful means of achieving many NOAA missions. Expansion of U.S. marine acoustic sensing capabilities is supported by a large variety of scientific, legislative, and policy directives, as well as number of international resolutions. Various National Research Council (NRC) reports have highlighted the wide variety of information that can be obtained through passive acoustic deployments, and have recommended that increased investments be made to realize these opportunities (e.g., NRC, 2003). Passive acoustic deployments provide enhanced and unique scientific data on (a) living marine resources; (b) biotic and abiotic characteristics of marine ecosystems; and (c) the effects of anthropogenic sound on protected species and their ecosystems. The National Passive Acoustics Workshop held in April 2006 in Woods Hole, MA, the purpose of which was to develop a draft strategic program plan for NOAA's Passive Acoustics Oceans Observing System (PAOOS) and to identify critical data requirements. The workshop recommended that NOAA's PAOOS provide data on biological, geophysical, oceanographic, meteorological, and anthropogenic ocean events.

Report No.(s): AD-A466664; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA466664>

This program was a theory/experiment collaboration focusing on the fundamental need for scalability in the development of quantum information processing. Theory and experiment were connected and interleaved at several levels. The theory objectives were 1) to develop new theoretical tools to enable the implementation of reliable quantum information processing in scalable systems and 2) to characterize the relations between quantum algorithms and architectures, between fault tolerance and architectures, between quantum and classical complexity classes, and to develop secure primitives for quantum cryptography. The experimental objectives were to develop scalable quantum component technology based on gas phase systems using atoms and light fields. Specific experimental goals were scalable implementation of universal quantum logic in optical lattices and achievement of deterministic control in atom/cavity systems.

### **Ionic Liquid Lubrication of MEMS Devices: An AFM Based Analysis and Evaluation on Test Devices (Preprint)**

Naninaparampil, Jose; Eapen, Kalathil C; Voevodin, Andrey A; Sanders, Jeffrey H; Dec 2006; 33 pp.; In English

Contract(s)/Grant(s): Proj-4347

Report No.(s): AD-A467077; No Copyright; Avail.: Defense Technical Information Center (DTIC)

Lubrication of Micro Electro Mechanical Systems (MEMS) became very important as the devices became complex and more and more parts had interacting areas. In previous reports, self-assembled monolayers and long chains of fluocarbons were used to lubricate MEMS components with significant success. In this report, a method based on atomic force microscopy is described that measures and compares ionic liquid lubricity. Effect of ring structure is studied in the case of substituted pyridinium and imidazolium rings as cations in ethyl methyl pyridinium and ethyl methyl imidazolium ethyl sulfate. Effect of alkyl chain length on friction was studied for butyl methyl pyrrolidinium and hexyl methyl pyrrolidinium bis(trifluoro methyl sulfonyl) imide. Some of the ionic liquids that exhibited promising results from AFM study are tested on MEMS test devices. The friction and wear data obtained for these liquids applied on hydrogenated silicon showed ample correlation to the failure life span of hydrogenated MEMS test devices. This shows that AFM-liquid cell based tests of ionic liquid lubricity is a good characterization technique for screening lubricants for MEMS devices.

Fisher, S; Carr, J; Jan 2006; 13 pp.; In English; Original contains color illustrations  
Report No.(s): AD-A468011; No Copyright; Avail.: Defense Technical Information Center (DTIC)

A feasibility design study was undertaken to assess the requirements of a mid-infrared echelle spectrograph (MIREs) with a resolving power of 120,000 and its associated mid-infrared adaptive optics (MIRAO) system on the Thirty-Meter Telescope. Our baseline design incorporates a 2Kx2K Si:As array or array mosaic for the spectrograph and a 1Kx1K Si:As array for the slit viewer. Various tradeoffs were studied to minimize risk and to optimize the sensitivity of the instrument. Major challenges are to integrate the spectrograph to the MIRAO system and, later, to an adaptive secondary, the procurement of a suitable window and large KRS-5 lenses, and the acquisition of large format mid-IR detector arrays suitable for the range of background conditions. We conclude that the overall risk is relatively low and there is no technical reason that should prevent this instrument from being ready for use at first light on the Thirty-Meter Telescope.

This workshop focused on the development of prototype quantum information processors, quantum algorithms used for physical modeling applications, and efficient numerical simulations. The Air Force Research Laboratory hosted the Quantum Computation for Physical Modeling (QCPM) Workshop 2004 on 12-15 September 2004, our third bi-annual workshop on quantum computation for physical modeling held at The Harbor View Hotel on Martha's Vineyard. The workshop was hosted by our laboratory and sponsored by the Air Force Office of Scientific Research (AFOSR). The three day workshop comprised six sessions spanning the following research areas: (1) quantum algorithms; (2) quantum effects and devices; (3) superconductive quantum information processing; (4) nuclear magnetic resonance quantum information processing; (5) quantum information, quantum cryptography and quantum communication. We reviewed the research progress carried out by our extramural university research programs following our laboratory's in-house basic research mission and funded through confederated AFOSR grants. Our workshop focused on the development of prototype quantum information processors and quantum algorithms used for physical modeling applications and efficient numerical simulations. The workshop was an outstanding and unqualified success and represents a new milestone in our progress toward achieving a practical quantum computer using state-of-the-art nanotechnology.

**Hyperspectral Imagery Target Detection Using Improved Anomaly Detection and Signature Matching Methods**

Smetek, Timothy E; Jun 2007; 389 pp.; In English; Original contains color illustrations

Report No.(s): AD-A469195; AFIT/DS/ENS/07-07; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA469195>

This research extends the field of hyperspectral target detection by developing autonomous anomaly detection and signature matching methodologies that reduce false alarms relative to existing benchmark detectors. The proposed anomaly detection methodology adapts multivariate outlier detection algorithms for use with hyperspectral datasets containing thousands of high-dimensional spectral signatures. In so doing, the limitations of existing, non-robust anomaly detectors are identified, an autonomous clustering methodology is developed to divide an image into homogeneous background materials, and competing multivariate outlier detection methods are evaluated. To arrive at a final detection algorithm, robust parameter design methods are employed to determine parameter settings that achieve good detection performance over a range of hyperspectral images and targets. The final anomaly detection algorithm is tested against existing local and global anomaly detectors, and is shown to achieve superior detection accuracy when applied to a diverse set of hyperspectral images. The

proposed signature matching methodology employs image-based atmospheric correction techniques in an automated process to transform a target reflectance signature library into a set of image signatures. This set of signatures is combined with an existing linear filter to form a target detector that is shown to perform as well or better relative to detectors that rely on complicated, information-intensive atmospheric correction schemes. The performance of the proposed methodology is assessed using a range of target materials in both woodland and desert hyperspectral scenes.

Squassoni, Sharon; Feb 22, 2007; 7 pp.; In English; Original contains color illustrations

Report No.(s): AD-A468472; CRS-RS21592; No Copyright; Avail.: Defense Technical Information Center (DTIC)

International Atomic Energy Agency (IAEA) inspections since 2003 have revealed two decades' worth of undeclared nuclear activities in Iran, including uranium enrichment and plutonium separation efforts. Iran agreed in 2003 to suspend sensitive activities in negotiations with Germany, France, and the UK (European Union-3), which broke down in August 2005. On September 24, 2005, the IAEA Board of Governors found Iran to be in noncompliance with its Nuclear Nonproliferation Treaty (NPT) safeguards agreement and reported Iran's case to the U.N. Security Council in February 2006. The Security Council called upon Iran to resuspend enrichment and reprocessing, reconsider construction of its heavy water reactor, ratify and implement the Additional Protocol, and implement transparency measures. The Security Council passed UNSCR 1696 on July 31, 2006, and on December 23, 2006, the Security Council adopted limited sanctions under UNSCR 1737. Iran has continued its enrichment activities, failing to meet deadline after deadline, the most recent being February 21, 2007. This report will be updated as needed.

**Characterization Of Commonly Encountered Explosives Using Highfield Asymmetric Waveform Ion Mobility Spectrometry Coupled With Mass Spectrometry**

Boock, Jared J; May 2007; 97 pp.; In English; Original contains color illustrations

Report No.(s): AD-A468495; No Copyright; Avail.: Defense Technical Information Center (DTIC)

The goal of this research was to characterize explosive compounds using high-field asymmetric waveform ion mobility spectrometry (FAIMS) as an ion separation device interface to a mass spectrometer (MS). FAIMS is a relatively recently developed technology that is promising adding a dimension of separation. This method was employed in such a way as to be conducive to possible future development of field instruments (e.g., use of atmospheric pressure chemical ionization (APCI)). In addition, several experiments were conducted with the application of this method, mainly dealing with optimization of the instrument parameters. These experiments led to the development of a new method: high-resolution FAIMS. An ion mobility spectrometer was used as a desolvation and ion focusing device to drastically improve FAIMS resolution. This allowed for the separation of mixtures that otherwise could not have been separated. The resolution was high enough that isomers of the same explosive were successfully resolved. This can be beneficial to forensics studies.

**India's Nuclear Separation Plan: Issues and Views**

Squassoni, Sharon; Dec 22, 2006; 28 pp.; In English; Original contains color illustrations

Report No.(s): AD-A467312; CRS-RL33292; No Copyright; Avail.: Defense Technical Information Center (DTIC)

On July 18, 2005, President Bush and Indian Prime Minister Manmohan Singh announced the creation of a 'global partnership,' which would include 'full' civil nuclear cooperation between the USA and India. This is at odds with nearly three decades of U.S. nonproliferation policy and practice. President Bush promised India he would persuade Congress to amend the pertinent laws to approve the agreement, as well as persuade U.S. allies to create an exception to multilateral Nuclear Suppliers Group (NSG) guidelines for India. India committed to, among other things, separating its civilian nuclear facilities from its military nuclear facilities, declaring civilian facilities to the International Atomic Energy Agency (IAEA) and placing them under IAEA safeguards, and signing an Additional Protocol. See CRS Report RL33016, U.S. Nuclear Cooperation With India: Issues for Congress, by Sharon Squassoni, for further details on the agreement. The separation plan announced by Prime Minister Singh and President Bush on March 2, 2006, and further elaborated on May 11, 2006, would place 8 power reactors under inspection, bringing the total up to 14 out of a possible 22 under inspection. Several fuel fabrication and spent fuel storage facilities were declared, as well as 3 heavy water plants that were described as 'safeguards-irrelevant.' The plan excludes from international inspection 8 indigenous power reactors, enrichment and spent fuel reprocessing facilities (except as currently safeguarded), military production reactors and other military nuclear plants and 3 heavy water plants. Administration officials have defended the separation plan as credible and defensible because it covers more than just a token number of Indian facilities, provides for safeguards in perpetuity, and includes upstream and downstream facilities.

**Hot Leg Piping Materials Issues (U)**

Jul. 19, 2006; 8 pp.; In English

Report No.(s): DE2007-884668; B-MT(SPME)-24; No Copyright; Avail.: Department of Energy Information Bridge

With Naval Reactors (NR) approval of the Naval Reactors Prime Contractor Team (NRPCT) recommendation to develop a gas cooled reactor directly coupled to a Brayton power conversion system as the space nuclear power plant (SNPP) for Project Prometheus (References a and b) the reactor outlet piping was recognized to require a design that utilizes internal insulation (Reference c). The initial pipe design suggested ceramic fiber blanket as the insulation material based on requirements associated with service temperature capability within the expected range, very low thermal conductivity, and low density. Nevertheless, it was not considered to be well suited for internal insulation use because its very high surface area and proclivity for holding adsorbed gases, especially water, would make outgassing a source of contaminant gases in the He-Xe working fluid. Additionally, ceramic fiber blanket insulating materials become very friable after relatively short service periods at working temperatures and small pieces of fiber could be dislodged and contaminate the system. Consequently, alternative

insulation materials were sought that would have comparable thermal properties and density but superior structural integrity and greatly reduced outgassing.

Report No.(s): AD-A466112; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA466112>

The use of fiber optics is considered herein as a means to distribute Radio Frequency (RF) signals across Printed Circuit Boards (PCB). The use of fiber optics is studied with an emphasis on reducing inter-board Electromagnetic Interference (EMI). High performance RF circuits are especially sensitive to EMI and other Radio Frequency Interference (RFI), resulting in poor circuit to circuit isolation, spurious signals, additional filtering requirements, and increased shielding constraints. Fiber-optic cable has beneficial characteristics of extremely low cross coupling and is not conductive along its length; this equates to tremendous promise as a means for distributing RF signals with limited EM/RFI. The innovative concept is applicable to PCBs which have a level of RF signals traversing near multiple sensitive RF circuits.

ONLINE: <http://hdl.handle.net/100.2/ADA466124>

Rapid advancements in acoustical beamforming techniques for array signal processing are producing algorithms with increased levels of computational complexity. Concomitantly, autonomous arrays capable of performing most or all of the processing in situ have become a focus for mission-critical applications. To address these changes, future sonar systems will take advantage of parallel in-array processing by coupling transducer nodes with low-power processing devices to achieve higher performance and fault tolerance at lower cost. This paper explores parallel algorithms for conventional beamforming (CBF) designed for an in-array processing system. The parallel algorithms presented offer scaled speedup and provide the basis for adaptations in advanced beamforming algorithms.

ONLINE: <http://hdl.handle.net/100.2/ADA466498>

(A) We propose a basic system layout that combines with the microdisplay for contrast sensitivity function measurement. The optical components need to be modified to eliminate the aberrations. (B) We made the power and control electronics for this system that increase the capabilities to build the specific deformable pattern by our self. (C) We measured the interferences patterns for the deformable mirror and build the influences matrix (D) We did NOT complete the system due the limited

resources. It is believed that without appropriate financial management, it is not easy to complete the whole system in schedules. (E) We have measured the interferences patterns of the deformable mirror with our driving power system. Preliminary results indicate that there might be some problems for the driving issues in the deformable mirror that leads to the slower or breakdown of the elimination of the aberration. Also, the reason that the optical components in this layout can not work perfectly is due to the large aberrations near the camera lens of the CCD and also part of the relay system. A modified design is accomplished.

**Experiments, Computation, and Modeling for Temperature Dependence of Absorption, Scattering, Reflection, Transmission, and Index of Refraction of Optical Radiation in Biological Tissues**

Sardar, Dhiraj K; Yow, Raylon M; Thomas, Robert J; Dec 2006; 25 pp.; In English

Contract(s)/Grant(s): FA8650-05-1-6641; Proj-7757

Report No.(s): AD-A466743; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA466743>

The objective of this research was to systematically measure the temperature dependence of optical properties of various bovine eye tissues at elevated temperatures (above body temperature) using different experimental and computational techniques. The temperature dependence of absorption and scattering coefficients of bovine ocular tissue in the temperature range of 24 to 40 degrees C at 980nm was measured. After computing diffuse reflectance and total transmittance, it was determined that any temperature dependence of the diffuse reflectance and total transmittance could not be discerned with the current setup in the temperature range of interest. The average diffuse reflectance and total transmittance values over all measured temperatures were input into the inverse adding doubling computer program. The resulting absorption coefficients were comparable to those reported by Sardar et al., but the scattering coefficients were not, perhaps due to some specular reflection inadvertently measured in the previous work. The rate of change of the refractive index with respect to temperature was performed at 632.8nm for bovine aqueous and vitreous humor in the temperature range of 37 to 41 degrees C. using the Mach-Zehnder interferometer setup. The measured refractive index with respect to temperature for bovine aqueous humor was comparable to that of water, while the measured value for bovine vitreous humor was slightly less than the value for water. These values are necessary for accurately modeling thermal lensing and hence light propagation in the eye.

ONLINE: <http://hdl.handle.net/100.2/ADA467436>

The purpose of this preliminary set of measurements is to obtain a qualitative idea of the magnitude of visible and infrared emissions of the Black-Out (BO) lamps on a M1025 vehicle HMMWV. The question to be answered is the degree of infrared security that exists with the present BO drive and marker lamps. Also, what effect, if any, does an IR filter kit has on the infrared security of the vehicle.

**Wavefront Aberration Correction Using Zernike Polynomial Parameterizations of Optical Phased Arrays (PRE-PRINT)**

Butterworth, Jeffrey A; Hindman, Charles; Lacy, Seth; Jan 2007; 7 pp.; In English; Original contains color illustrations

Contract(s)/Grant(s): Proj-4846

Report No.(s): AD-A467283; AFRL-VS-PS-TP-2007-1022; No Copyright; Avail.: Defense Technical Information Center (DTIC)

High performance laser communication systems require adaptive optics based wavefront correction systems to correct

aberrations that result from imperfections in optical hardware and atmospheric conditions. Traditionally, deformable membrane mirrors are used for wavefront correction. These mirrors are bulky and require excessive amounts of power, both of which can be detrimental to a space application. Liquid crystal based optical phased arrays (OPAs) offer an attractive alternative to these traditional devices. This paper presents a method of correcting wavefront aberrations with an OPA device by utilizing phase reconstruction of point-source images and Zernike polynomial parameterizations of the OPA. Limitations of common OPA architectures that reduce the effectiveness of the proposed wavefront correction method will be discussed. A simulation will demonstrate the effectiveness of the proposed technique.

**Rapid C4I High Performance Computing for Hyperspectral Imaging Exploitation**

Ramseyer, George O; Spetka, Scott E; Linderman, Richard E; Romano, Brian C; Jun 2001; 8 pp.; In English

Report No.(s): AD-A468111; No Copyright; Avail.: Defense Technical Information Center (DTIC)

A multidisciplinary effort has been initiated which spans the C4I and signal/image processing computational technology areas to integrate diverse capabilities of existing hyperspectral image exploitation systems. The primary objective of the project is to develop and demonstrate support for the rapid, low latency exploitation of hyperspectral information. A flexible and open framework will service exploitation requests from C4I users by tapping into large, dynamic databases of previously processed and raw data to deliver products to the requester with minimal latency. A web-based interface is being developed so that any authorized user with a web browser can input requests. The user can select data sources, exploitation time intervals, and a parallelized exploitation method for execution. To maximize productivity and minimize the decision making cycle of the requestors, algorithm parallelization efforts seek to achieve a minimal latency before initial results begin to stream back to the requestor in typical web prioritized fashion.

Report No.(s): PB2007-104058; No Copyright; Avail.: CASI: [A03](#), Hardcopy

A variably-polarizing optical probe assembly. The assembly includes an optical probe having one or more optical light delivery channels that emit incident light from the sample end of the probe toward a sample being investigated, and one or more optical light-receiving channels that receive incident light from the sample. A variably-polarizing substrate assembly is coupled to the sample end of the probe. The substrate assembly includes an optically transmitting substrate and one or more discrete polarizer areas on a face of the substrate, each such polarizer area defining a polarization orientation, with the polarizer areas together defining one or more different polarization orientations. The substrate assembly is arranged relative to the probe such that one polarizer area covers at least one light delivery channel and one polarizer area covers at least one light-receiving channel.

**Visible and Infrared Optical Design for the ITER Upper Ports**

Lasnier, C. J.; Seppala, L. G.; Morris, K.; Groth, M.; Fenstermacher, M. E.; Mar. 04, 2007; 93 pp.; In English

Report No.(s): DE2007-902282; UCRL-TR-228629; No Copyright; Avail.: National Technical Information Service (NTIS)

This document contains the results of an optical design scoping study of visible-light and infrared optics for the ITER upper ports, performed by LLNL under contract for the US ITER Project Office. ITER is an international collaboration to build a large fusion energy tokamak with a goal of demonstrating net fusion power for pulses much longer than the energy confinement time. At the time of this report, six of the ITER upper ports are planned to each to contain a camera system for recording visible and infrared light, as well as other diagnostics. The performance specifications for the temporal and spatial resolution of this system are shown in the Section II, Functional Specifications. We acknowledge a debt to Y. Corre and co-authors of the CEA Cadarache report ITER wide-angle viewing and thermographic and visible system. Several of the concepts used in this design are derived from that CEA report. The infrared spatial resolution for optics of this design is diffraction-limited by the size of the entrance aperture, at lower resolution than listed in the ITER diagnostic specifications. The size of the entrance aperture is a trade-off between spatial resolution, optics size in the port, and the location of relay optics. The signal-to-noise ratio allows operation at the specified time resolutions.

**EUV Inspection of Reticle Defect Repair Sites**

Goldberg, K.; Barty, A.; Mar. 02, 2007; 9 pp.; In English

Report No.(s): DE2007-902264; UCRL-PROC-228584; No Copyright; Avail.: Department of Energy Information Bridge

We report the actinic (EUV wavelength) and non-actinic inspection of a multilayer-coated mask blank containing an array

of open-field defect repair sites, created in different ways. The comparison of actinic bright-field and dark-field measurements shows the importance of having both local reflectivity and scattering measurements. Although effective mask blank repair capabilities have not been adequately demonstrated, the data acquired in this experiment have been very instructive. Correlation with non-actinic inspection methods shows the difficulty of establishing a successful predictive model of the EUV response without EUV cross-comparison. The defect-repair sites were also evaluated with SEM, AFM, and 488-nm-wavelength confocal microscopy. The data raise important questions about mask quality specifications and the requirements of future commercial actinic inspection tools.

**Lithographic Characterization of Low-Order Aberrations in a 0.3-NA EUV Microfield Exposure Tool**

Naulleau, P.; Cain, J.; Dean, K.; Goldberg, K. A.; January 2006; 7 pp.; In English

Report No.(s): DE2007-901033; No Copyright; Avail.: National Technical Information Service (NTIS)

Although tremendous progress has been made in the crucial area of fabrication of extreme ultraviolet (EUV) projection optics, the realization diffraction-limited high numerical aperture (NA) optics (above 0.2 NA) remains a concern. The highest NA EUV optics available to date are the 0.3-NA Microfield Exposure Tool (MET) optics used in an experimental exposure station at Lawrence Berkeley National Laboratory (1) and commercial METs (2) at Intel and SEMATECH-North. Even though these optics have been interferometrically demonstrated to achieve diffraction-limited wavefront quality, the question remains as to whether or not such performance levels can be maintained after installation of the optics into the exposure tool. Printing-based quantitative aberration measurements provide a convenient mechanism for the characterization of the optic wavefront error in the actual lithography tool. We present the lithographic measurement of low-order aberrations in the Berkeley MET tool, including a quantitative measurement of astigmatism and spherical error and a qualitative measurement of coma. The lithographic results are directly compared to interferometry results obtained from the same optic. Measurements of the Berkeley MET indicate either an alignment drift or errors in the interferometry on the order of 0.5 to 1 nm.

**High Efficiency Grazing Incidence Pumped X ray Laser**

Dunn, J.; Keenan, R.; Price, D. F.; Patel, P. K.; Smith, R. F.; Sep. 29, 2006; 17 pp.; In English

Report No.(s): DE2007-900117; UCRL-TR-224880; No Copyright; Avail.: National Technical Information Service (NTIS)

The main objective of the project is to demonstrate a proof-of-principle, new type of high efficiency, short wavelength x-ray laser source that will operate at unprecedented high repetition rates (10Hz) that could be scaled to 1kHz or higher. The development of a high average power, tabletop x-ray laser would serve to complement the wavelength range of 3rd and future 4th generation light sources, e.g. the LCLS, being developed by DOE-Basic Energy Sciences. The latter are large, expensive, central, synchrotron-based facilities while the tabletop x-ray laser is compact, high-power laser-driven, and relatively inexpensive. The demonstration of such a unique, ultra-fast source would allow us to attract funding from DOE-BES, NSF and other agencies to pursue probing of diverse materials undergoing ultrafast changes. Secondly, this capability would have a profound impact on the semiconductor industry since a coherent x-ray laser source would be ideal for 'at wavelength' approximately 13 nm metrology and microscopy of optics and masks used in EUV lithography. The project has major technical challenges. We will perform grazing-incidence pumped laser-plasma experiments in flat or groove targets which are required to improve the pumping efficiency by ten times. Plasma density characterization using our existing unique picosecond x-ray laser interferometry of laser-irradiated targets is necessary. Simulations of optical laser propagation as well as x-ray laser production and propagation through freely expanding and confined plasma geometries are essential. The research would be conducted using the Physics Directorate Callisto and COMET high power lasers. At the end of the project, we expect to have a high-efficiency x-ray laser scheme operating below 20 nm at 10Hz with a pulse duration of approximately 2 ps. This will represent the state-of-the-art in x-ray lasers and would be a major step forward from our present picosecond laser-driven x-ray lasers. There is an added bonus of creating the shortest wavelength laboratory x-ray laser, below 4.5 nm and operating in the water window, by using the high-energy capability of the Titan laser.

**Second Preliminary Report on X-Ray Yields from OMEGA II Targets**

Fournier, K. B.; May, M. J.; MacLaren, S. A.; Coverdale, C. A.; Davis, J. F.; Aug. 30, 2006; 45 pp.; In English

Report No.(s): DE2007-900115; UCRL-TR-224095; No Copyright; Avail.: National Technical Information Service (NTIS)

We present details about X-ray yields measured with LLNL and SNL diagnostics in soft and moderately hard X-ray bands from laser-driven, doped-aerogel targets shot on 07/14/06 during the OMEGA II test series. Yields accurate to plus or minus 25% in the 5-15 keV band are measured with Livermores HENWAY spectrometer. Yields in the sub-keV to 3.2 keV band are measured with LLNLs DANTE diagnostic, the DANTE yields may be 35-40% too large. SNL ran a PCD-based diagnostic that also measured X-ray yields in the spectral region above 4 keV, and also down to the nearly sub-keV range. The PCD and HENWAY and DANTE numbers are compared. The time histories of the X-ray signals are measured with LLNLs H11 PCD, and from two SNL PCDs with comparable filtering. There is a persistent disagreement between the H11 PCD and SNL PCD measured FWHM, which is shown not to be due to analysis techniques. The recommended X-ray waveform is that from the SNL PCD p66k10, which was recorded on a fast, high-bandwidth TDS 6804 oscilloscope, and which are not plotted here.

**Laser Plasma Interactions in High Energy Density Plasmas**

Baldis, H.; Oct. 20, 2006; 14 pp.; In English

Report No.(s): DE2007-900158; UCRL-TR-225455; No Copyright; Avail.: National Technical Information Service (NTIS)

High temperature hohlraums (HTH) are designed to reach high radiation temperatures by coupling a maximum amount of laser energy into a small target in a short time. These 400-800 (micro)m diameter gold cylinders rapidly fill with hot plasma during irradiation with multiple beams in 1ns laser pulses. The high-Z plasmas are dense, (electron density,  $n(\text{sub } e)/n(\text{sub } c)$  approximately 0.1-0.4), hot (electron temperature,  $T(\text{sub } e)$  approximately 10keV) and are bathed in a high-temperature radiation field (radiation temperature,  $T(\text{sub } \text{rad})$  approximately 300eV). Here  $n(\text{sub } c)$ , the critical density, equals  $9 \times 10^{21}/\text{cm}^3$ . The laser beams heating this plasma are intense (approximately  $10^{15}$  -  $10^{17}$  W/cm<sup>2</sup>). The coupling of the laser to the plasma is a rich regime for Laser-Plasma Interaction (LPI) physics. The LPI mechanisms in this study include beam deflection and forward scattering. In order to understand the LPI mechanisms, the plasma parameters must be known. An L-band spectrometer is used to measure the electron temperature. A ride-along experiment is to develop the x-radiation emitted by the thin back wall of the half-hohlraum into a thermal radiation source.

**Coherence and Polarization Properties of Far Fields Generated by Quasi-Homogeneous Planar Electromagnetic Sources (Postprint)**

Korotkova, Olga; Hoover, Brian G; Gamiz, Victor L; Wolf, Emil; Feb 3, 2005; 12 pp.; In English

Contract(s)/Grant(s): FA9451-04-C-0353

Report No.(s): AD-A469044; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA469044>

In studies of radiation from partially coherent sources the so-called quasi-homogeneous (QH) model sources have been very useful, for instance in elucidating the behavior of fields produced by thermal sources. The analysis of the fields generated by such sources has, however, been largely carried out in the framework of scalar wave theory. In this paper we generalize the concept of the QH source to the domain of the electromagnetic theory, and we derive expressions for the elements of the cross-spectral density matrix, for the spectral density, the spectral degree of coherence, the degree of polarization, and the Stokes parameters of the far field generated by planar QH sources of uniform states of polarization. We then derive reciprocity relations analogous to those familiar in connection with the QH scalar sources. We illustrate the results by determining the properties of the far field produced by transmission of an electromagnetic beam through a system of spatial light modulators.

#### **Development and Application of a Predictive Computational Tool for Short-Pulse, High-Intensity Target Interactions**

Town, R. P. J.; Chung, H. K.; Langdon, A. B.; Lasinski, B. F.; Lund, S. M.; Feb. 06, 2007; 11 pp.; In English

Report No.(s): DE2007-900863; UCRL-TR-227795; No Copyright; Avail.: National Technical Information Service (NTIS)

The widely differing spatial, temporal, and density scales needed to accurately model the fast ignition process and other short-pulse laser-plasma interactions leads to a computationally challenging project that is difficult to solve using a single code. This report summarizes the work performed on a three year LDRD to couple together three independent codes using PYTHON to build a new integrated computational tool. An example calculation using this new model is described.

#### **Looking for Anomalous Dispersion in Weakly Ionized Plasmas Using X ray Laser Interferometry**

Nilsen, J.; Castor, J. I.; Iglesias, C. A.; Cheng, K. T.; Dunn, J.; Sep. 08, 2006; 12 pp.; In English

Report No.(s): DE2007-900119; UCRL-PROC-224273; No Copyright; Avail.: Department of Energy Information Bridge

For decades the electron density of plasmas has been measured using optical interferometers. With the availability of good X-ray laser sources in the last decade interferometers have been extended into the wavelength range 14-72 nm, which has enabled researchers to probe even higher density plasmas. The data analysis assumes that the index of refraction is less than one and is due only to the free electrons in the plasmas. Recent interferometer experiments using Al plasmas observed an index of refraction greater than one at 14 nm and showed how the anomalous dispersion from bound electrons can dominate the free electron contribution to the index of refraction in many plasmas. Using our average-atom and atomic physics codes together with experimental data we searched for other plasmas that would have an index of refraction greater than one in an X-ray laser interferometer operating at 47 nm. We identified several promising candidates. We present the calculations and the experimental confirmation that doubly ionized Ag, Sn, and C plasmas have an index of refraction greater than one at the 46.9 nm wavelength (26.44 eV) of the capillary discharge Ne-like Ar soft X-ray laser. These results show that bound electrons can dominate the index of refraction of numerous plasmas over a broad range of soft X-ray wavelengths.

#### **Characterizing Electron Temperature Gradient Turbulence Via Numerical Simulation**

Nevins, W. M.; Candy, J.; Cowley, S.; Dannert, T.; Dimits, A.; May 23, 2006; 67 pp.; In English

Report No.(s): DE2007-900467; UCRL-CONF-221590; No Copyright; Avail.: National Technical Information Service (NTIS)

Numerical simulations of electron temperature gradient (ETG) turbulence are presented which characterize the ETG fluctuation spectrum, establish limits to the validity of the adiabatic ion model often employed in studying ETG turbulence, and support the tentative conclusion that plasma-operating regimes exist in which ETG turbulence produces sufficient electron heat transport to be experimentally relevant. We resolve prior controversies regarding simulation techniques and convergence by benchmarking simulations of ETG turbulence from four microturbulence codes, demonstrating agreement on the electron heat flux, correlation functions, fluctuation intensity, and rms flow shear at fixed simulation cross section and resolution in the plane perpendicular to the magnetic field. Excellent convergence of both continuum and particle-in-cell codes with time step

and velocity-space resolution is demonstrated, while numerical issues relating to perpendicular (to the magnetic field) simulation dimensions and resolution are discussed. A parameter scan in the magnetic shear,  $s$ , demonstrates that the adiabatic ion model is valid at small values of  $s$  ( $s < 0.4$  for the parameters used in this scan) but breaks down at higher magnetic shear. A proper treatment employing gyrokinetic ions reveals a steady increase in the electron heat transport with increasing magnetic shear, reaching electron heat transport rates consistent with analyses of experimental tokamak discharges.

#### **Impact Location for a Multilayer Transversely Isotropic Plate**

Martin, Steven A; Jata, Kumar V; Kuhr, Samuel J; Medina, Enrique A; Oct 2006; 11 pp.; In English

Contract(s)/Grant(s): F33615-03-C-5220; Proj-4349

Report No.(s): AD-A466369; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA466369>

This paper will address analytical research work performed on impact location in an anisotropic multilayered thermal protection structure. The propagation of elastodynamic waves through the multilayer structure and the possibility that the layers are transversely isotropic are two complications that are addressed. The method used is an extension of classical triangulation based on the use of the fixed geometry of the multilayer plate structure, quasi-longitudinal modes, and the generalized Snell's law for transversely isotropic materials. The impact localization problem is recast as a minimization problem whose objective function is the sum of the distances between all combination pairs of constant time difference curves for the sensor pairs. An initial estimate is made for the parameter values for the collection of constant time difference curves. The Newton-Kantorovich algorithm is then used to generate a sequence of iterations which converge to the minimum of the objective function. This generates a point on each of the collection of curves. The centroid of this point set is calculated and used for the approximation for the impact point.

#### **Investigation of Low Temperature Metal Induced Crystallization and Doping of Silicon Using Various Excitation Sources for Solar Cells and other Microelectronic Applications.**

Naseem, H. A.; Abu-Safe, H. H.; January 2005; 32 pp.; In English

Contract(s)/Grant(s): DE-FG02-02ER45965

Report No.(s): DE2007-899164; DOE/ET-45965; No Copyright; Avail.: National Technical Information Service (NTIS)

The purpose of this project was to investigate metal-induced crystallization of amorphous silicon at low temperatures using excitation sources such as laser and rapid thermal annealing, as well as, electric field. Deposition of high quality crystalline silicon at low temperatures allows the use of low cost soda-lime glass and polymeric films for economically viable photovoltaic solar cells and low cost large area flat panel displays. In light of current and expected demands on Si supply due to expanding use of consumer electronic products throughout the world and the incessant demand for electric power the need for developing high grade Si thin films on low cost substrate becomes even more important. We used hydrogenated and un-hydrogenated amorphous silicon deposited by plasma enhanced chemical vapor deposition and sputtering techniques (both of which are extensively used in electronic and solar cell industries) to fabricate nano-crystalline, poly-crystalline (small as well as large grain), and single-crystalline (epitaxial) films at low temperatures. We demonstrated Si nanowires on flat surfaces that can be used for fabricating nanometer scale transistors. We also demonstrated lateral crystallization using Al with and without an applied electric field. These results are critical for high mobility thin film transistors (TFT) for large area display applications. Large grain silicon (30-50 nm grain size for  $< 0.5$   $\mu\text{m}$  thick films) was demonstrated on glass substrates at low temperatures. We also demonstrated epitaxial growth of silicon on (100) Si substrates at temperatures as low as 450°C. Thin film Si solar cells are being projected as the material of choice for low cost high efficiency solar cells when properly coupled with excellent light-trapping schemes. Ar ion laser (CW) was shown to produce dendritic nanowire structures at low power

whereas at higher powers yielded continuous polycrystalline films. The power density required for films in contact with Al was demonstrated to be at least two orders of magnitude lower than that reported in the literature before. Polysilicon was successfully achieved on polyimide (KaptonCO) films. Thin film Si solar cells on lightweight stable polymer offer great advantage for terrestrial and space power applications. In summary we have demonstrated through this research the viability of producing low cost nano-, poly-, and epitaxial Si material on substrates of choice for applications in economically viable environmentally friendly sustainable solar power systems. This truly enabling technology has widespread applications in multibillion dollar electronic industry and consumer products.

#### **AC Field Measurements of Fermilab Booster Correctors Using a Rotating Coil System**

Velev, G. V.; DiMarco, J.; Harding, D. J.; Kashikhin, V.; Lamm, M.; January 2006; 3 pp.; In English

Report No.(s): DE2007-901114; FERMILB-CONF-06-235-TD; No Copyright; Avail.: National Technical Information Service (NTIS)

The first prototype of a new corrector package for the Fermilab Booster Synchrotron is presently in production. This water-cooled package includes normal and skew dipole, quadrupole and sextupole elements to control orbit, tune and chromaticity of the beam over the full range of Booster energies (0.4-8 GeV). These correctors operate at the 15 Hz excitation cycle of the main synchrotron magnets, but must also make more rapid excursions, in some cases even switching polarity in approximately 1 ms at transition crossing. To measure the dynamic field changes during operation, a new method based on a relatively slow rotating coil system is proposed. The method pieces together the measured voltages from successive current cycles to reconstruct the field harmonics. This paper describes the method and presents initial field quality measurements from a Tevatron corrector.

#### **Variable Directional Coupler for an Alternate ILC High-Power RF Distribution Scheme**

Nantista, C. D.; Adolphsen, C.; Feb. 2007; 3 pp.; In English

Report No.(s): DE2007-900986; SLAC-PUB-12372; No Copyright; Avail.: National Technical Information Service (NTIS)

We describe the design and functionality of an RF directional coupler for which the power division between the output ports is mechanically variable. In an alternate power distribution scheme for the ILC, power is delivered to cavities in pairs, through hybrids. Four pairs, or eight cavities, are fed from one waveguide feed, from which one fourth, one third, and one half of the power is coupled out at consecutive directional couplers. Three such feeds are powered by a single 10 MW klystron. Experience suggests that cavities considered useable will display some variation in the operational accelerating gradient they can sustain. With fixed distribution, the klystron power must be kept below the level at which the weakest cavity out of 24 receives its power limit. This problem can be solved by installing variable attenuators, but that means wasting precious power. With adjustable coupling, distribution can be optimized for more efficient use both of available power and of the accelerating cavities. This novel device, feeding cavities paired by similar performance, can provide such benefit to the ILC.

#### **Fermi Timing and Synchronization System**

Wilcox, R.; Staples, J.; Doolittle, L.; Byrd, J.; Ratti, A.; January 2006; 41 pp.; In English

Report No.(s): DE2007-900945; No Copyright; Avail.: National Technical Information Service (NTIS)

The Fermi FEL will depend critically on precise timing of its RF, laser and diagnostic subsystems. The timing subsystem to coordinate these functions will need to reliably maintain sub-100fs synchronicity between distant points up to 300m apart in the Fermi facility. The technology to do this is not commercially available, and has not been experimentally demonstrated in a working facility. Therefore, new technology must be developed to meet these needs. Two approaches have been researched by different groups working with the Fermi staff. At MIT, a pulse transmission scheme has been developed for synchronization of RF and laser devices. And at LBL, a CW transmission scheme has been developed for RF and laser synchronization. These respective schemes have advantages and disadvantages that will become better understood in coming

years. This document presents the work done by both teams, and suggests a possible system design which integrates them both. The integrated system design provides an example of how choices can be made between the different approaches without significantly changing the basic infrastructure of the system. Overall system issues common to any synchronization scheme are also discussed.

**Quantitative Experiments with Electrons in a Positively Charged Beam**

Molvik, A. W.; Vay, J. L.; Covo, M. K.; Coehn, R.; Baca, D.; Dec. 07, 2006; 35 pp.; In English

Report No.(s): DE2007-900881; UCRL-PROC-226637; No Copyright; Avail.: National Technical Information Service (NTIS)

Intense ion beams are difficult to maintain as non-neutral plasmas. Experiments and simulations are used to study the complex interactions between beam ions and (unwanted) electrons. Such electron clouds limit the performance of many accelerators. To characterize electron clouds, a number of parameters are measured including: total and local electron production and loss for each of three major sources, beam potential versus time, electron line-charge density, and gas pressure within the beam. Electron control methods include surface treatments to reduce electron and gas emission, and techniques to remove electrons from the beam, or block their capture by the beam. Detailed, self-consistent simulations include beam-transport fields, and electron and gas generation and transport; these compute unexpectedly rich behavior, much of which is confirmed experimentally. For example, in a quadrupole magnetic field, ion and dense electron plasmas interact to produce multi-kV oscillations in the electron plasma and distortions of the beam velocity space distribution, without the system becoming homogenous or locally neutral.

### **Consequence Assessment Methods for Incidents Involving Releases From Liquefied Natural Gas Carriers**

May 13, 2004; 129 pp.; In English; Original contains color illustrations

Contract(s)/Grant(s): FERC04C40196

Report No.(s): AD-A468573; GEMS-1288209; 131-04; No Copyright; Avail.: Defense Technical Information Center (DTIC)

Liquefied natural gas (LNG) has been transported by sea since 1959 in specially designed LNG carriers. These vessels have a remarkable safety record and provide an essential link in the movement of LNG from production locations to consumer locations. However, stakeholders recognize that there are possibilities for some serious incidents involving LNG carriers, particularly in light of increased awareness and concern about potential terrorist actions. The Federal Energy Regulatory Commission (FERC) sponsored this study with the goal of identifying appropriate consequence analysis methods for estimating flammable vapor and thermal radiation hazard distances for potential LNG vessel cargo releases during transit and while at berth. This work considers the flammable vapor and thermal radiation hazards created by unconfined LNG spills on water resulting from an LNG cargo release. This includes review of literature on experimental LNG spills and on consequence assessment methodologies that are applicable to modeling of incidents involving LNG spills on water.

### **Characterization of a Hall Effect Thruster Using Thermal Imaging**

Tomaszewski, James W; Mar 2007; 86 pp.; In English; Original contains color illustrations

Report No.(s): AD-A469185; AFIT/GA/ENY/07-M18; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA469185>

A Hall thruster uses ionized xenon as a propellant for space propulsion applications. The heat produced by thruster components and the xenon plasma transfers to space and the spacecraft, impacting thruster and spacecraft design, as well as thruster efficiency and lifetime. Therefore, thermal information was gathered and analyzed in order to better understand the thermal characteristics of an operating thruster and to provide data applicable to improving the thruster efficiency and lifetime. This paper contains analysis of thruster temperatures obtained using a commercially available FLIR A40M thermographic imager in order to characterize a Busek Inc. 200W Hall Effect Thruster operating in Chamber 6 at the Air Force Research Laboratory at Edwards AFB, CA. This method is non-intrusive in that the thruster is viewed from outside the chamber through a zinc selenide window and provides temperature data on the entire visible area of the thruster for output to a computer for further processing. Maximum temperatures observed were above 773 K on the alumina plasma sprayed portion of the cathode, the anode, and on the thruster body near the exit plane. Magnet core winding temperature varied from 620 K near the exit plane to 475 K near the rear of the thruster. If these temperatures are near the magnet core temperature, it suggests they are not near the Curie temperature for iron of 1043 K or the Curie temperature of 858 K of iron alloyed with nickel. Initial heating rates

of up to 138 K/min and initial cooling rates of up to 218 K/min were observed. The steady state temperature images and the heating data indicated a possible interaction between xenon and the thruster components.

#### **Measuring the Value of High Level Fusion**

Moore, III, Louis R; Gonzales, Daniel; Jun 2004; 27 pp.; In English; Original contains color illustrations

Report No.(s): AD-A465987; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA465987>

In most current ground force combat simulations, the operational movements and command intent of forces follow prescribed, inflexible objectives and plans. Because of this limitation, the value of advanced intelligence, surveillance, and reconnaissance (ISR) and high-level fusion is reflected only in better targeting and not in improved operational-level command and control (C2). RAND has developed an agent interaction-based constructive simulation called the Ground C4-ISR Assessment Model (GCAM) to help examine the contributions of C4-ISR to ground forces. In GCAM simulated ground force commanders make decisions on the basis of shared awareness derived from information produced by Level 1 (Identify/Correlate), Level 2 (Aggregate/Resolve), and Level 3 (Interpret/Determine/Predict) fusion processes. In this way simulated ground commanders can adapt their plans in response to perceived changes in enemy capability, activity, or intent, or to

perceived changes to the battlefield environment. This paper details the representation of high-level fusion processes used in GCAM and developed with the support of the U.S. Army Model Improvement Program. Those processes are modeled using the Assistant Secretary of Defense for Networks and Information Integration (ASD-NII) Decision Support Center (DSC) Multi-INT fusion study Knowledge Matrix methodology. The information or knowledge added by high-level fusion and analysis of raw sensor data from multiple sources is represented in this methodology by increased information quality levels for activity, capability, and intent. This research will allow military analysts to demonstrate the utility and the relative importance of improved C2 and high-level fusion capabilities for Army and Joint forces.

**The Control of Multi-Agent Systems (MAS)**

Lawless, W F; Bergman, Margo; Feltovich, Nick; Jun 2004; 15 pp.; In English; Original contains color illustrations  
Report No.(s): AD-A466002; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA466002>

Doubt continues that current theories and practices can produce agent or multiagent system (MAS) autonomy (Pynadath et al., 2001), imperiling future MAS missions (Lawless & Grayson, 2004). One possible reason is that from the view of methodological individualism (Nowak & Sigmund, 2004), reality is a stable phenomenon meaning that a single best view of reality is mathematically possible, a thesis that Benardete (2002) rejects. Alternatively, social reality is bistable (bistability occurs when a phenomena exists in one of two interdependent states; e.g., bistable interpretations refer to two stable, incommensurable interpretations of one data set, illustration, or phenomenon), and is best modeled by the quantum relations (Bohr, 1955). Given multiple interpretations of the same context or situation, to control an MAS, a group or decision maker can choose to avoid multiple interpretations as advised by Nash (1950) in order to converge mathematically to a consensus which we conclude is optimal to enact solutions for well-defined problems (wdp's), or to exploit these multiple interpretations which we conclude is the only way to solve ill-defined problems (idp's) (Lawless & Grayson, 2004).

**A Roadmap for Developing Architectures in a Net-Centric World**

Tieso, John V; McDaniel, David; Jun 2004; 24 pp.; In English; Original contains color illustrations  
Report No.(s): AD-A466032; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA466032>

Architectures are beginning to impact on the process that should accompany data collection and dissemination, more needs to be done to ensure that valid, useful data reaches the right people at the right time, enabling them to take the right action in the emerging Net-Centric Environment. This paper discusses architectural approaches that will facilitate required levels of information transfer and utilization. Information transfer is the critical ingredient in Net-Centric Transformation. Interoperability, integration, and convergence all rely on the availability of valid, current, and confirmable data that can be intelligently pulled as required to satisfy some aspect of a Command, Control, Communications, Computers, Intelligence, Security or Reconnaissance (C4ISR) requirement. A roadmap defines how the architecture is used in creating new systems, systems-of-systems and applications that support net-centricity. The authors propose a method for creating a roadmap to facilitate and focus architecture creation efforts that will maximize their usefulness in development of the Net-Centric Environment. Underlying the paper is a discussion of how two established tools the authors had roles in creating, the DoD Architecture Framework, version 1.0, (DoDAF 1.0) and the Core Architecture Data Model (CADM), provide the structure needed for creating architectures under the roadmap.

**A New Perspective on Use of the Critical Decision Method with Intelligence Analysts**

Hutchins, Susan G; Pirolli, Peter L; Card, Stuart K; Jun 2004; 36 pp.; In English; Original contains color illustrations  
Report No.(s): AD-A466054; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA466054>

Intelligence analysts engage in information seeking, evaluation, prediction, and reporting behavior in an extremely

information-intensive work environment. A Cognitive Task Analysis (CTA) was conducted on intelligence analysts to capture data that will provide input to support development of a computational model of the analyst's processes and analytic strategies. A hybrid method was used to conduct the CTA, including a modified version of the critical decision method. Participants were asked to describe an example of a critical analysis assignment where they had to collect, analyze, and produce a report on intelligence of a strategic nature. Procedures used to conduct the CTA are described in this paper along with initial results. Several factors contribute to making the analyst's task challenging: (1) time pressure, (2) a high cognitive workload, and (3) difficult human judgments. Human judgments are involved in considering the plausibility of information, deciding what information to trust, and determining how much weight to place on specific pieces of data. Intelligence analysis involves a complex process of assessing the reliability of information from a wide variety of sources and combining seemingly unrelated events. This problem is challenging because it involves aspects of data mining, data correlation and human judgment.

Report No.(s): AD-A466065; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA466065>

New information technologies introduced into military operations provide the impetus to explore alternative operating procedures and command structures. New concepts such as network-centric operations and distributed, decentralized command and control, have been suggested as technologically enabled replacements for platform centric operations and centralized command and control. As attractive as these innovations may seem, it is important that responsible military planners test these concepts before their adoption. To do this it is necessary to build models and simulations and to conduct experiments and exercises. The authors assess the flow of information within three alternative Command and Control (C2) structures using a series of quantitative measures of performance of command and control effectiveness. In terms of the categorization developed by Alberts, these metrics bridge between the information domain and the cognitive domain. The quantitative assessment of information flows within alternative C2 structures is part of a larger programme of work considering the structure of future headquarters for UK armed forces. Outputs are being compared with high level combat models outputs in order to assess the quantitative linkage between our measures of C2 effectiveness and metrics of benefit at the campaign level, measures of force effectiveness.

ONLINE: <http://hdl.handle.net/100.2/ADA466067>

In the information age era, there never has been a better time to reflect upon the fact that information in itself is something that has to be engineered. Since command and control is a cognitive process by which the commander gains situation awareness and proceeds to deliberate and coordinated action, one has to ask himself how raw data turns into actual information, and eventually knowledge that will trigger human understanding. Furthermore, the question arises as to how C4ISR system of systems can support this transformation process. Of course, this is no magic. Information systems do the only thing they are good at: Working on large amounts of data at incredible speed. This is where the human fails. However, data must be aggregated in such a way that it results in information that conveys operational meaning to the commander. This is where information technologies alone fail, miserably. The resulting information must capture the semantics of the commander's domain of interest, and this must exist prior the automated data transformation process. The exercise of capturing the semantics of a certain business domain (the nouns, verbs, adjectives, etc.) along with its usage guidance (business rules) can be referred to as information engineering or ontology engineering. Conducting information engineering activities comes in support of the definition of ontologies. By definition, an ontology is an explicit formal specification of how to represent the objects, concepts and other entities that are assumed to exist in some area of interest and the relationships that hold among them.

**The Multidimensional Measurements of Geographic Information Systems (GIS) Effectiveness in Crisis Management**

Aldaijy, Emad Y; Jun 2004; 26 pp.; In English; Original contains color illustrations

Report No.(s): AD-A466121; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA466121>

Geographic information systems (GIS) provide timely and precise spatial information for command and control systems. GIS support decision makers in formulating plans and making critical decisions in preparedness, response, recovery, and mitigation phase of crisis management. The study developed a validated and prioritized reference decision making model by Panel of experts from Federal Emergency Management Agency (FEMA) that measures GIS effectiveness in crisis management. The model consists of seven factors and forty sub-factors. The seven GIS factors with respect to their importance in ascending order were system quality, information quality, user satisfaction, system use, decision performance, task complexity and feedback, and organizational impact. The data on measuring GIS effectiveness were obtained from a survey. Analyzed results from GIS directors, project managers, technical staff and users indicated that user satisfaction was assessed the lowest factor in the model. Additionally, the lowest assessments of the model sub-factors were: error recovery, documentation of system and procedures, ease of learning, currency of output, top management involvement, training provided to user, and GIS organizational position. The highest assessments in the model sub-factor were given to presentation mapping, viewing the map, and productivity improved by GIS. The major recommendations made include the following: (1) regularly measure the GIS effectiveness for each crisis events and establish a backlog; (2) consider some other measurements of technical, individual, and organizational factors based on GIS future capabilities, crisis context, and organization needs.

The evolving environment for Net Centric Operations (NCO) is changing the requirements and capabilities that are needed for successful military and civil operations. This in turn is demanding science and technology developments of new enabling technologies with associated NCO capabilities. The Office of Naval Research (ONR) has studied these needs and has developed a Technical Taxonomy and associated shortfalls for Naval Net Centric Operations. This paper discusses that taxonomy and provides an examination of eight technology areas that are required to support five enabling functions necessary

for Net Centric Operations. These enabling technology areas are: 1. Reliable communications and infrastructure management, 2. Information distribution management, 3. Geographically distributed, computing infrastructure, 4. Situation understanding, 5. Automated adaptive dynamic planning, 6. Human machine interface, 7. Information assurance and information operations and 8. Modeling and simulation.

ONLINE: <http://hdl.handle.net/100.2/ADA466132>

Many emerging application domains require database systems to support efficient access over highly multidimensional datasets. The current state-of-the-art technique to indexing high dimensional data is to first reduce the dimensionality of the data using Principal Component Analysis and then indexing the reduced dimensionality space using a multidimensional index structure. The above technique, referred to as global dimensionality reduction (GDR), works well when the data set is globally correlated, i.e. most of the variation in the data can be captured by a few dimensions. In practice, datasets are often not globally correlated. In such cases, reducing the data dimensionality using GDR causes significant loss of distance information resulting in a large number of false positives and hence a high query cost. Even when a global correlation does not exist, there may exist subsets of data that are locally correlated. In this paper, we propose a technique called Local Dimensionality Reduction (LDR) that tries to find local correlations in the data and performs dimensionality reduction on the locally correlated clusters of data individually. We develop an index structure that exploits the correlated clusters to efficiently support point, range and k-nearest neighbor queries over high dimensional datasets. Our experiments on synthetic as well as real-life datasets show that our technique (1) reduces the dimensionality of the data with significantly lower loss in distance information compared to GDR and (2) significantly outperforms the GDR, original space indexing and linear scan techniques in terms of the query cost for both synthetic and real-life datasets.

Report No.(s): AD-A466150; XA-CERDEC/C2/NJ; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA466150>

The Army Future Force (FF), including Units of Employment (UE) and subordinate Units of Action (UA) equipped with Future Combat Systems (FCS) and manned by Future Force Warriors (FFW), is distinguished from legacy and interim force units and systems by its exceptional responsiveness, deployability, agility, versatility, lethality, survivability and sustainability. These characteristics are meaningful individually but are not completely independent of each other. To support such characteristics, the Future Force is expected to be an order of magnitude more complex in its force structure, doctrinal requirements and technology than the current legacy force. A coherent, comprehensive and manageable set of complementary reference concepts are needed to facilitate the formulation of an overarching information model, reinforced by the rigor of UML, XML and metadata registries, to support system engineering and integration and to assess interdependencies and tradeoffs among the above characteristics based upon more detailed capabilities and their measures-of-performance (MoPs). In this paper we discuss and motivate the use of such an information model derived from the C2RM that is well suited to flesh out C2 UML architectures and C2 XML schemata. The C2RM defines common layers for C2 entities where each layer defines and requests Information Exchange Requirements (IERs) from peer entities using the layer below as well as provide an Information Exchange Products (IEPs) to peer entities which encapsulate the results of its services as requested by the next higher layer. The IERs/IEPs are organized into a common schema following the outline of an operations order (OPORD).

ONLINE: <http://hdl.handle.net/100.2/ADA466183>

The proliferation of online information resources increases the importance of effective and efficient information retrieval in a multicollection environment. Multicollection searching is cast in three parts: collection selection (also referred to as database selection), query processing and results merging. In this work, we focus our attention on the evaluation of the first step, collection selection. In this article, we present a detailed discussion of the methodology that we used to evaluate and compare collection selection approaches, covering both test environments and evaluation measures. We compare the CORI, CVV and gGROSS collection selection approaches using six test environments utilizing three document testbeds. We note similar trends in performance among the collection selection approaches, but the CORI approach consistently outperforms the other approaches, suggesting that effective collection selection can be achieved using limited information about each collection. The contributions of this work are both the assembled evaluation methodology as well as the application of that methodology to compare collection selection approaches in a standardized environment.

**Using Dynamic Adjustment of Serialization Order for Real-Time Database Systems**

Lee, Juhnyoung; Son, Sang H; Jan 1993; 11 pp.; In English; Original contains color illustrations

Report No.(s): AD-A466196; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA466196>

Studies in [7, 8, 9] concluded that for a variety of reasons, optimistic concurrency control appears well-suited to real-time database systems. Especially, they showed that in a real-time database system that discards tardy transactions, optimistic concurrency control outperforms locking. In this paper, we show that the optimistic algorithms used in those studies incur restarts unnecessary to ensure data consistency. We present a new optimistic concurrency control algorithm that can avoid such unnecessary restarts by adjusting serialization order dynamically, and demonstrate that the new algorithm outperforms the previous ones over a wide range of system workload. It appears that this algorithm is a promising candidate for basic concurrency control mechanism for real-time database systems.

ONLINE: <http://hdl.handle.net/100.2/ADA466315>

The Agile Coalition Environment (ACE) program consists of a combined synergistic group of emerging network-centric and information assurance (IA) technologies. These combined ACE technologies provide the warfighter with enhanced information sharing, collaborative tools, and situational awareness capabilities that are both dynamic and secure. Warfighters have access to all required user applications and multiple security enclaves of information at a single workstation. Interoperability is achieved across all applications, platforms, and security domains. ACE is presented as a network capability that can be applied to the Coalition Enterprise Information Exchange System (CENTRIXS) as well as other coalition or Community of Interest (COI) networks that require information sharing across multiple security domains between U.S. and coalition forces. ACE technologies have evolved during a 4-year spiral development cycle and have targeted warfighters at all levels for improving interoperability and knowledge management for current and future joint and coalition operations. This evolution for developing tomorrow's IT capabilities has been based on requirements, technology insertion, operational experimentation, and improvements as a result of Joint, Coalition, and Naval Fleet feedback. The USA Pacific Command (USPACOM) is the ACE program's sponsoring organization, and the U.S. Navy Space and Warfare Systems Command (SPAWAR) provides project management and technical support. Twenty-three briefing charts summarize the presentation.

**Towards Next Generation WWW: Push, Reuse and Classification**

Kang, Byeong Ho; Compton, Paul; Motoda, Hiroshi; Kim, Yang Sok; Park, Sung Sik; Apr 2006; 56 pp.; In English  
Contract(s)/Grant(s): FA5209-05-P-0253

Report No.(s): AD-A466329; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA466329>

The major problem of the current WWW technology is that it is based on the 'pull' style of information delivery, where the uploaded information waits for visitors, and not the 'push' style (Franklin and Zdonik 1998), where the new information is delivered to the users when it becomes available. Although there are several research studies focusing on the development of 'push' based information delivery, these studies overlook following two important functions: Firstly, many of the new studies are not concerned with existing HTML documents. It is not wise to expect that all people will follow the new suggested representation like XML or RSS and will convert their existing information to the new format. Secondly, the information classification system is the other issue. Without using the appropriate classification system, people find that delivered information is often redundant. Therefore, an automated classification system that selects only the relevant information for each user is required. The main research task for this system is how to implement the incremental knowledge acquisition process for the classification knowledge because human classification knowledge is always heuristic and changes rapidly and, therefore, it is necessary to maintain the knowledge base incrementally.

Report No.(s): AD-A466340; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA466340>

The objective of this effort was to provide enhancements to the Automated Information Extraction System (AIES) to improve its usability as a data collection tool for Social Network Analysis (SNA) for the Joint Warfare Analysis Center (JWAC) located in Dahlgren, VA. This effort continued the development efforts provided under previous tasking to JWAC to expand and enhance the AIES system. Enhancements included attribute discovery and name disambiguation prototypes. Usability considerations included quality of extracted results, integration with other tools and data sources, and graphical user interface (GUI) enhancements to provide JWAC intelligence analysts with deeper data viewing and manipulation capabilities. In general, this effort addressed the challenge of discovering the links and relationships between entities within a domain and providing summaries and visualizations that can be used as decision-making tools by high-level users of the intelligence product. To analyze documents in domains of interest in SNA, additional and deeper capabilities are required in an information extraction system to address critical and relational peculiarities of how the players and activities are expressed and discussed in documents.

ONLINE: <http://hdl.handle.net/100.2/ADA466400>

Achieving coalition interoperability is difficult; competing National interests (military, economic or political) probably will necessitate imposing compromise solutions. Architecting solutions, which all respective parties would adopt and adhere to, is therefore problematic. To address these problem areas, a combination of a system architecture and design methodology is employed that emphasizes the use of COTS products. There are several recognizable phases within this approach, most of which are recognizable: Operational capability requirement definition; Analysis \* Architecture synthesis; Component solution identification and capabilities assessment; and Design synthesis. This paper will discuss some of the problems defining interoperable coalition system architectures for these defined organizations and our approach to circumventing these obstacles.

The paper will be presented from the US Army CECOM Security Assistance perspective in utilizing US grant funds such as Foreign Military Financing (FMF) to provide solutions for foreign militaries and multinational military organizations.

This paper examines the implications of network-centric warfare for information system development: How should we build C2 information systems for net-centric operations? We begin with six highly-probable predictions for the NCW future. From these we derive a number of present implications for system development: things we should do now, and problems we will have to solve along the way. Our answers touch on the information technology to be employed within the systems, the architectural principles that will guide and structure their development, and the acquisition process used to build and deploy the systems.

ONLINE: <http://hdl.handle.net/100.2/ADA466413>

Future deployments of Objective Force units are required to be not only network-centric with respect to their own assets but also with respect to other Joint, National and Coalition assets. The main issue for any network-centric architecture is how to establish connectivity, federation, collaboration and interoperability in a self organizing way among all elements of the force to include combat, combat support, combat service support and C2 assets. When a combat force element such as a unit of action (UA) combat team or task force is organized it may include assets and resources that are not organic and include cross-attached coalition elements. Its combat support forces, combat service support as well as its C2 resources will most likely also require subordinated coalition elements. This necessitates a well thought out alignment of the different C2 processes employed by each of the coalition partners to enable and assure unity of command, synchronization of the tasks and critical battle space de-confliction. The recommended technical solutions and possible changes to tactic, techniques and procedures essential to achieve that alignment must be subject to a rigorous experimentation program supported by evolving C2 systems stimulated by combat simulations that would ensure utmost flexibility to support the full spectrum of operational needs. In addition, the capabilities of Joint, National and Coalition assets to partner with us must also be taken into account.

ONLINE: <http://hdl.handle.net/100.2/ADA466439>

Advances in the fields of simulation and data mining are proving relevant to providing battlespace decision support. High performance computing, improved modeling techniques, and new decision support methodologies drive these advances. Combat simulations now generate behaviors at increasingly finer scales. Data mining provides a mechanism for uncovering key patterns in larger data sets such as those generated by modern combat simulations. The capability of simulating detailed courses of action (COAs) opens up the possibility of mining collected data for insights. Specifically, decision support systems could assist commanders in examining simulation data for relationships between the structure of the COA and various battle objectives. Our current experimentation centers on the use of complex or urban terrain for warfighting. The synergy of data

mining tools, high performance computing, and high resolution simulation has the potential to assist battle planners in the improvement of battlefield assessments and the expedient modification of COAs.

ONLINE: <http://hdl.handle.net/100.2/ADA466489>

In today's Command and Control (C2) environment critical information is located in many disparate data sources. C2 decision-making can be adversely affected by insufficient or unavailable access to information located in these disparate data sources. This paper will provide an overview of the problems surrounding this issue, a real-world scenario representing the problem, and how the problem was overcome using a network centric approach. The paper will also demonstrate how the application of current technology can be leveraged to present a unified view of data from disparate data sources, and how our organization is leveraging technology to help the Warfighter eliminate the stove-piping of information to increase network centrality. The objective of this paper is to present the reader with insight on how to utilize today's technology to allow leaders to make well-informed decisions, thus increasing their effectiveness in fighting the Global War on Terrorism (GWOT). By understanding our use of technology in support of the Warfighter, the reader will gain key insights on how to improve their own organization's capabilities to support C2 decision-making.

ONLINE: <http://hdl.handle.net/100.2/ADA466512>

Delegating the coordination role to proxy agents can improve the overall outcome of the task at the expense of cognitive overload due to switching subtasks. Stability and commitment are characteristics of human teamwork but must not prevent the detection of better opportunities. In addition, coordination proxy agents must be trained from examples as a single agent but must interact with multiple agents. We apply machine learning techniques to the task of learning team preferences from mixed-initiative interactions and compare the outcome results of different simulated user patterns. This paper introduces a novel approach for the adjustable autonomy of coordination proxies based on the reinforcement learning of abstract actions.

**Sense Making - Underpinning Concepts and Relation to Military Decision-Making**

Burnett, Mark; Wooding, Pete; Prekop, Paul; Sep 2004; 19 pp.; In English; Original contains color illustrations

Report No.(s): AD-A466530; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA466530>

Decision makers at all echelons go through a process of goal-directed sense making when dealing with complex and dynamic problems involving, for instance, ambiguous or poor information, changing circumstances and multiple players. In this paper we argue that the key to sense making is understanding the nature of and the nexus between the knowledge that humans bring to the process and the way in which that knowledge is applied in a creative thinking framework to build meaning and to provide judgements, insights and conclusions. In this respect, there are three main concepts in this paper: \*Knowledge as a cognitive process that is key to sense making; \*Philosophy and epistemology as a framework in which knowledge is applied, refuted, tested and grown; \*The recognition that sense making deals with complex systems underpins new ways of perceiving the world and generating conjectures that can be tested within an epistemological framework. The relationship between sense making and decision-making for military operations is illustrated with respect to two decision-making doctrines OODA and the newly proposed CECA (Critique-Explore-Compare-Adapt). The ideas in this paper resonate more with CECA than OODA, and could be further developed in an experimental environment that looks at different sense and decision-making approaches.

**An Efficient Metaheuristic for Dynamic Network Design and Message Routing**

Hartlage, Robert B; Feb 2007; 118 pp.; In English; Original contains color illustrations

Report No.(s): AD-A466537; AFIT/GOR/ENS/07-10; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA466537>

The implementation of Net-centric warfare presents major challenges in terms of effectively and efficiently delivering critical information across the Global Information Grid. In many cases, the amount of information requested will exceed the capabilities of the network. One challenge is to dynamically design the network (assign transceivers) to maximize the amount of required information that can be transmitted and the quality of service for those transmissions - to best implement the communications tasking order. The problem is as follows: given a list of required message traffic, to include source, destination, size, and priority, design the network to maximize the delivery of the message traffic based on message priority and quality of service. Once the network is designed, the routing for the messages must be determined. Due to the dynamic nature of the problem and the combinatorial explosion in size as new network nodes are added, a quick-running heuristic approach is needed. In this research, metaheuristic to dynamically design the network based on the projected message traffic requirements and to efficiently route the required messages on the network to maximize priority of messages successfully delivered and the quality of service of the delivery. The meta-heuristic is tested against previous efforts and is shown to generate high quality solutions in a very short amount of time.

**Focused Knowledge to the Warfighter**

Emmerman, Philip J; Woodson, Randy; Sep 2004; 24 pp.; In English; Original contains color illustrations

Report No.(s): AD-A466548; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA466548>

The future dismounted battlespace will require an unprecedented level of automation (software and physical agents) to ensure situational awareness. Soldier directed information management agents, organic autonomous, and semi-autonomous ground and air sensor platforms along with dismounted soldiers must function as a tightly coupled team. These information management functions include operations on global information sources, in particular the fusion of relevant local and global information. Physical agents, such as robotic sensor platforms, will be ubiquitous in the future battlefield, significantly lowering the risks to our warfighters. These physical agents are to complement future manned systems and therefore they must be able to collaborate not only amongst themselves but also with their manned partners. The information from local organic sensor platforms and human assets must be fused to provide enhanced situational understanding. This situational understanding will be further enhanced with the fusion of global information and provided to the dismounted warfighter in

a highly intuitive form for rapid assimilation and action. The Army Research Laboratory has recently demonstrated this concept of real time fused information supporting the dismounted infantry. This paper will present the Warrior's Edge information fusion concept, architecture, and demonstration results.

**Information Operations, Electronic Warfare, and Cyberwar: Capabilities and Related Policy Issues**

Wilson, Clay; Mar 20, 2007; 18 pp.; In English; Original contains color illustrations

Report No.(s): AD-A466599; CRS-RL31787; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA466599>

This report describes the emerging areas of information operations, electronic warfare, and cyberwar in the context of U.S. national security. It also suggests related policy issues of potential interest to Congress. For military planners, the control of information is critical to military success, and communications networks and computers are of vital operational importance. The use of technology to both control and disrupt the flow of information has been generally referred to by several names: information warfare, electronic warfare, cyberwar, netwar, and Information Operations (IO). Currently, IO activities are grouped by the Department of Defense (DoD) into five core capabilities: (1) Psychological Operations, (2) Military Deception, (3) Operational Security, (4) Computer Network Operations, and (5) Electronic Warfare. Current U.S. military doctrine for IO now places increased emphasis on Psychological Operations, Computer Network Operations, and Electronic Warfare, which includes the use of non-kinetic electromagnetic pulse (EMP) weapons, and nonlethal weapons for crowd control. However, as high technology is increasingly incorporated into military functions, the boundaries between all five IO core capabilities are becoming blurred. DoD has noted that military functions involving the electromagnetic spectrum take place in what is now called the cyber domain, similar to air, land, and sea. This cyber domain is the responsibility of the new Air Force Cyber Command and includes cyberwarfare, electronic warfare, and protection of U.S. critical infrastructure networks that support telecommunications systems, utilities, and transportation. This report will be updated to accommodate significant changes.

**The Use of Cognitive Task Analysis and Simulators for the After Action Review of Medical Events in Iraq**

Clark, Richard E; Sep 2005; 17 pp.; In English

Contract(s)/Grant(s): W81XWH-04-C-0093

Report No.(s): AD-A466686; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA466686>

Prior attempts to use standard interview protocols to extract After Action Review (AAR) descriptions of emergency event decision making and problem solving strategies generated by participants are problematical. Cognitive psychological studies suggest that the resulting information often contains significant errors and omissions (Glaser et al., 1985; Besnard, 2000). These errors are often not recognized by participants who have solved important problems in emergency situations because the knowledge they are describing is largely automated and unconscious (Wheatley & Wegner, 2001). The problem is further complicated because experienced medical personnel mistakenly believe that their reports are complete and accurate and that they have solved the problems they are describing in a conscious, willful, and deliberate manner (Wegner, 2002). These reporting errors most likely increase in number and severity under time pressure battlefield situations (Hunt & Joslyn, 2000). This research attempts to improve medical AAR with a novel combination of Cognitive Task Analysis (CTA) conducted while interviewees moulage simulators (Clark & Estes, 2002; Clark & Estes, 1996; Velmahos et al., 2002). In this study, three medical experts who have experienced and solved the same type of medical problem in Iraq will be interviewed separately and together. It is hypothesized that interview protocols employing a novel combination of medical CTA combined with the moulage of simulators will more accurately capture the mix of automated and conscious decisions used to solve critical medical problems on the battlefield in Iraq. Each expert will be interviewed separately and, after reviewing the results, the other two experts will be asked to correct and improve on the information gathered from the 'other' experts. This process has been found to identify and eliminate errors as well as provide accurate and efficient descriptions of medical decisions and actions that solved battlefield problems.

**A Reference Architecture for Network-Centric Information Systems**

Renner, Scott; Schaefer, Ronald; Jun 2003; 41 pp.; In English; Original contains color illustrations

Report No.(s): AD-A466692; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA466692>

This paper presents the 'C2 Enterprise Reference Architecture' (C2ERA), which is a new technical concept of operations for building information systems better suited to the Network-Centric Warfare (NCW) environment. The C2ERA is the technical architecture mandated by the Designated Acquisition Commander for C4ISR Enterprise Integration in the U.S. Air Force. The C2ERA contains two key ideas. Related activities and functions are gathered into a C2 Node, with a designated node manager responsible for delivering and sustaining an integrated capability to the user community. The development of mission functionality is separated from the system infrastructure. This infrastructure (and the responsibility for it) is divided into one part that must be the same across the enterprise, called the 'Common Integrated Infrastructure,' and another part that may vary between C2 Nodes, called the 'node platforms'. Thirty-one briefing charts summarize the presentation.

Kramer, Franklin D; Wentz, Larry; Starr, Stuart; Feb 2007; 9 pp.; In English; Original contains color illustrations

Report No.(s): AD-A466767; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA466767>

Information and information technology (I/IT) can significantly increase the likelihood of success in stability operations if they are engaged as part of an overall strategy that coordinates the actions of outside intervenors and focuses on generating effective results for the host nation. Properly utilized, I/IT can help create a knowledgeable intervention, organize complex activities, and integrate stability operations with the host nation, making stability operations more effective. Key to these results is a strategy that requires that 1) the U.S. Government gives high priority to such an approach and ensures that the effort is a joint civilian-military activity; 2) the military makes I/IT part of the planning and execution of the stability operation; 3) preplanning and the establishment of I/IT partnerships are undertaken with key regular participants in stability operations, such

as the United Nations and the World Bank; 4) the focus of the intervention, including the use of I/IT, is on the host nation, supporting host-nation governmental, societal, and economic development; and 5) key information technology capabilities are harnessed to support the strategy. Implementing the strategy will include 1) development of an information business plan for the host nation so that I/IT is effectively used to support stabilization and reconstruction; 2) agreements among intervenors on data-sharing and collaboration, including data-sharing on a differentiated basis; and 3) use of commercial IT tools and data provided on an unclassified basis.

**A Strategies-to-Tasks Framework for Planning and Executing Intelligence, Surveillance, and Reconnaissance (ISR) Operations**

Rhodes, Carl; Hagen, Jeff; Westergren, Mark; Jan 2007; 30 pp.; In English

Contract(s)/Grant(s): F49642-01-C-0003; FA7014-06-C-0001

Report No.(s): AD-A466789; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA466789>

To assist in moving intelligence, surveillance, and reconnaissance (ISR) planning and execution forward from a fixed target and deliberate planning focus to one centered on emerging targets, the authors propose enhancing the collection management process with a strategies-to-tasks and utility framework. By linking collection targets to operational tasks, objectives, and the top-level commander's guidance with relative utilities, planning for the daily intelligence collections and real-time retasking for ad hoc ISR targets could be enhanced. When current tools are modified to provide this information, planners will be able to link collection targets to top-level objectives for better decision making and optimization of low-density, high-demand collection assets. Similarly, on the Air Operations Center (AOC) floor, intelligence officers will be better able to deal with time-sensitive, emerging targets by rapidly comparing the value of collecting an ad hoc collection with the value of collecting opportunities already planned. To handle the ISR demands posed by the rapidly changing battlefield of the future, this new, more-capable framework may be needed for making the best use of intelligence capabilities against emerging collection opportunities. Future research will focus on quantifying the advantages of this approach in comparison with the current process.

**The Benefit of Ontologies for Interoperability of CCIS. (Easy, Quick and Cheap Solutions are Impossible, if Semantics of CCIS are Affected.)**

Wunder, Michael A; Jun 2003; 9 pp.; In English; Original contains color illustrations

Report No.(s): AD-A466798; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA466798>

In spite of their efforts, no one has yet succeeded in making Command and Control Information Systems (CCIS) semantically interoperable. The harmonization of information systems is extremely expensive and, in many cases, it has not brought the expected improvements. Another approach to the problem of semantic harmonization may be necessary. According to the author, information exchange can be supported by knowledge-based linguistic algorithms that analyze incoming information and convert it according to the required semantic boundary conditions of the target database. These algorithms are based on ontologies, which are the formal descriptions of concepts and relationships of objects that are relevant for a domain. They describe how we see the world we are looking at. No changes to existing CCIS are necessary -- they may remain as they are.

**Elicitation of British Army Commanders' Personal Constructs**

Turner, Paddy; Jun 2003; 52 pp.; In English; Original contains color illustrations

Report No.(s): AD-A466805; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA466805>

The design of information systems to aid the attainment of Situation Awareness would benefit from an understanding of the mental models that commanders reference in assessing situations. This paper presents novel experimental research conducted to elicit the personal constructs that constitute the fabric of British Army commanders' mental models. For a given scenario, it is shown that four out of the twenty-one identified constructs accounted for the majority of individual situation assessments made; three of these four were, in fact, common to all ten participants. There were, however, individual differences: four of the participants referenced a specific pair of constructs in the majority of their assessments whilst the remainder used a far wider set. The constructs were mapped onto Endsley's three levels of Situation Awareness and a significant positive correlation was found between experience level and the mean Situation Awareness level of the constructs referenced. This suggests that experience influences the fabric of commanders mental models and indicates how this manifests itself in terms of constructs.

Report No.(s): AD-A466821; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA466821>

Intelligence, Surveillance, Target Acquisition and Reconnaissance (ISTAR) is an evolving information operations (IO) concept in the Canadian Land Force. ISTAR provides the commander with a system to collect and process required information for producing intelligence on the threat, and knowledge on the environment, during operations, as well as knowledge needed to identify, acquire and engage targets. The various processes used to collect and analyze the information are the result of numerous individual systems some of which have only been recently introduced in the field while many others are still in development as a result of advances in the information age. This compendium of systems makes ISTAR a 'System of systems', as opposed to a single system. These four papers present the new Canadian information centric collaborative workspace concept that provides a more coherent information management approach to better support the Commander in both its tactical intelligence and operations activities at brigade level. The info-centric collaborative workspace concept aims at offering a seamless collaborative environment enabling the ISTAR staff to perform their tasks using different applications/services through a standardized Human Computer Interface (HCI).

ONLINE: <http://hdl.handle.net/100.2/ADA466832>

The Design of Experiments project is developing recommendations for a new TOPM for applying DOE Techniques to the US Army's complex operational testing environment. These recommendations are being based upon evaluations of existing event design plans and testing reports. The focus has been primarily upon small- to medium-scale testing scenarios in order to provide recommendations that are easy to understand. The inherent complexity of large-scale testing events also increases the difficulty of making clear recommendations for improvements in testing. It is hoped that through the development of case studies and leveraging AFOTEC's work, we will develop recommendations that tailor DOE techniques and exploit their benefits for use by operation research analysts with USAOTC scenarios. These statistical techniques are expected to afford opportunities for substantial savings in resources for conduct of operational testing as well as accommodate testing of complex large systems.

**New Metrics for Blog Mining**

Ulicny, Brian; Baclawski, Ken; Magnus, Amy; Jan 2007; 13 pp.; In English

Contract(s)/Grant(s): FA9550-06-C-0023

Report No.(s): AD-A466875; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA466875>

Blogs represent an important new arena for knowledge discovery in open source intelligence gathering. Bloggers are a vast network of human (and sometimes non-human) information sources monitoring important local and global events, and other blogs, for items of interest upon which they comment. Increasingly, issues erupt from the blog world and into the real world. In order to monitor blogging about important events, we must develop models and metrics that represent blogs correctly. The structure of blogs requires new techniques for evaluating such metrics as the relevance, specificity, credibility and timeliness of blog entries. Techniques that have been developed for standard information retrieval purposes (e.g. Google's PageRank) are suboptimal when applied to blogs because of their high degree of exophoricity, quotation, brevity, and rapidity of update. In this paper, we offer new metrics related for blog entry relevance, specificity, timeliness and credibility that we are implementing in a blog search and analysis tool for international blogs. This tool utilizes new blog-specific metrics and techniques for extracting the necessary information from blog entries automatically, using some shallow natural language processing techniques supported by background knowledge captured in domain-specific ontologies.

**Content Based Retrieval Database Management System with Support for Similarity Searching and Query Refinement**

Ortega-Binderberger, Michael; Jan 2002; 184 pp.; In English; Original contains color illustrations

Report No.(s): AD-A466965; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA466965>

With the emergence of many application domains that require imprecise similarity based access to information, techniques to support such a retrieval paradigm over database systems have emerged as a critical area of research. This thesis explores how to enhance database systems with content based search over arbitrary abstract data types in a similarity based framework with query refinement. This scope opens a number of challenges previously not faced by databases, among them: \* Extension of abstract data types to support arbitrary similarity functions and support for query refinement. (Intra type similarity and feedback) \* Extension of the already developed query refinement models under the MARS system to a general multi table relational model. (Inter Type similarity and feedback) \* Extension of query processing models from a set based model where tuples either satisfy or not the query predicate to a result where the degree to which tuples satisfy a predicate is represented by their similarity values. (Similarity predicates) \* Based on the similarity values, return only the best k matches. This implies a sorting on the similarity values and ample optimizations are possible to use lazy evaluation and only compute those answers that the user will see. (Ranked Retrieval) \* Optimization of query execution under the similarity conditions which requires access to specialized indices. Optimized composite predicate merging is possible based on earlier work on the MARS project to compute the similarity value for a predicate based on independent streams rather than using the value directly. (Incremental top-k merging) We are building a prototype system that implements the proposed functionality in an efficient way and we evaluate the quality of the answers returned to the user.

**Multi-Hypothesis Structures, Taxonomies and Recognition of Tactical Elements for Combat Identification Fusion**

Schuck, Tod M; Hunter, J B; Wilson, Daniel D; Sep 2004; 38 pp.; In English; Original contains color illustrations

Report No.(s): AD-A466968; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA466968>

One of the greatest difficulties in developing a fusion process is determining the type, quantity, and quality of the information provided. Even when this is accomplished, the utility (relationship) of the information is often difficult to establish. For the problem of combat identification, or Combat ID, this is especially taxing. Often numerous sources provide information, but relationship guidelines are not well developed, or are ambiguous or inconsistent. This deficiency leads to poorly constructed fusion architectures and methodologies because information is either ignored or improperly combined in the fusion process. Using the Joint Directors of Laboratories (JDL) information fusion model as a guide, this paper will address

the movement of attribute information across multiple hypothesis classes as it relates to developing the identification of different objects, and how it can be combined both within and between JDL fusion levels. The result of this analysis will lead to an information architecture that is naturally adaptive to information regardless of quality, level, or specificity. Such a full Combat ID architecture must be able to facilitate a broad range of information at various levels. In this paper, the authors provide examples for taxonomies, multiple hypotheses, and the recognition of tactical elements to illustrate the relevant issues. They also present an architectural model. Implementation of such an architecture may facilitate a 'power to the edge' approach to decision-making when edge units are provided with Combat ID information at the level of recognizable 'tactical elements' for which decisions are made. Seventeen briefing charts summarize the presentation.

**Optimizing Parallel Execution of Detailed Wireless Network Simulation**

Ji, Zhengrong; Zhou, Junlan; Takai, Mineo; Martin, Jay; Bagrodia, Rajive; Jan 2004; 9 pp.; In English

Contract(s)/Grant(s): N66001-00-2-8937

Report No.(s): AD-A467039; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA467039>

With Parallel and Discrete Event Simulation (PDES) techniques, the runtime performance of detailed wireless network simulation can be improved significantly without compromising fidelity of the simulation results. However, modelling characteristics of wireless communications such as signal propagation and interference may severely hinder the potential speedup yielded by PDES. This paper proposes various optimization techniques to address three major concerns in achieving efficient parallel execution of wireless network simulation: i.e., (1) reducing communication and computation overhead of simulating signal propagation across multiple logical processes; (2) reducing synchronization overhead among logical processes; (3) minimizing event scheduling overhead within individual logical processes. These techniques have been implemented in a parallel version of GloMoSim and QualNet. The experimental results with mobile ad hoc networking scenarios demonstrate that the proposed optimization techniques can improve the performance of parallel wireless network simulation by up to an order of magnitude.

ONLINE: <http://hdl.handle.net/100.2/ADA467058>

The purpose of the University of Hawaii Telemedicine Curriculum Research Project is to develop an effective web-based curriculum for training military healthcare personnel in the use of contemporary communication, automation, and informatics technology in the delivery of healthcare. The overall curriculum is generic in nature, while specific modules can be tailored to the needs of the military healthcare provider (HCP). The goal of the telemedicine curriculum is to impart both the necessary knowledge and practice skills to the HCP. The HCP will learn the various clinical uses of telemedicine and will also understand the clinical and organizational barriers of the successful utilization of telemedicine. The telemedicine curriculum has been designed to address the communication and automation tools available to the military healthcare system. This advanced toolkit of telemedicine curriculum modules will support the efforts of the DoD to efficiently and effectively apply the latest technological advances in communication and data transfer to improving healthcare delivery.

**Understanding and Improving Knowledge Transactions in Command and Control**

Moore, Ronald A; Schermerhorn, Janel H; Oonk, Heather M; Morrison, Jeffrey G; Jun 2003; 36 pp.; In English; Original contains color illustrations

Report No.(s): AD-A467096; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA467096>

Numerous factors impact the efficient and effective exchange of information and knowledge in modern command and control. One factor in particular is the extent to which those who create and share information and knowledge understand the tasks and information requirements of those who will use the shared information. Efficient and effective information exchange requires that two classes of users, referred to as information consumers and information producers, develop a shared understanding of tasks, resources, and information requirements. This shared understanding serves as a framework for the intricate series of 'knowledge transactions' collaboration, inherent to planning, and decision support. This paper will 1) introduce some of the current work associated with military command and control knowledge transactions, 2) provide examples of real-world knowledge transaction characteristics and limitations, and 3) discuss recent, ongoing, and planned research efforts to better understand and improve such transactions.

Report No.(s): AD-A467178; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA467178>

This paper deals with information availability related to crisis management, an area that has become a prioritized national and international concern. The paper looks into two different scenarios with a view to identify some shortcomings and possibilities inherent in a national information infrastructure. By fairly simple means it is possible to obtain significant improvement of data availability, which in turn will give a substantial contribution to improved emergency preparedness through the availability of a national crisis information grid. A network centric solution is suggested, where the limitations inherent in today's information grid are overcome, and where information is dynamically made available as required.

**The Analysis of Network Centric Maritime Interdiction Operations (MIO) Using Queueing Theory**

Hazen, Mark G; Burton, Robert; Klingbeil, Ralph; Sullivan, Keith; Fewell, Matthew; Grivell, Ian; Philp, Chris; Marland, Peter; Jun 2003; 38 pp.; In English; Original contains color illustrations

Report No.(s): AD-A467314; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA467314>

In 2001 the Maritime Systems Group of The Technical Cooperation Program (TTCP) set-up an Action Group (AG-1) to examine the exponential increases in warfighting capability claimed for Network-Centric Maritime Warfare (NCMW). Analysis of NCMW is a two-stage process of finding analysis processes for estimating the NCMW effects on the scenario parameters and then applying appropriate warfare models to relate NCMW-sensitive scenario parameters to force effectiveness. This paper will report on the results of a modeling workshop held by AG-1 in November 2002. The workshop's focus was to investigate the usefulness of applying a queueing model to Maritime Interdiction Operations (MIO) within the context of the NCMW concept of tactical collaborative planning. Both analytical and simulation-based queueing models were examined, and the theoretical model was applied parametrically to two MIO scenarios. Using the steady-state probability of target vessel interdiction (i.e., service) as the primary measure of effectiveness, the workshop was able to demonstrate the usefulness of queueing to relate NCMW application measures to force effectiveness. In addition, the queueing models provided valuable insight into the aspects of the MIO task where NCMW concepts might be applied. Thus, queueing is directly applicable to the second stage of analysis for operations that can be viewed as a demand for service, and provides direction in the process of refining NCMW concepts into testable applications. The parametric results from the workshop provide general bounds on expected improvements in effectiveness; however, specific results will depend upon the particular NCMW applications and how they are used.

Contract(s)/Grant(s): FA8650-05-2-6649; Proj-1710

Report No.(s): AD-A467336; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA467336>

Complexity, customization, and packaging of military platforms and systems increase maintenance difficulty at the same time as the available pool of skilled technical personnel may be shrinking. In this environment maintenance training, technical order presentation, and flight-line operational practice may need to adopt 'just-in-time' procedural aids. Moreover, the realities of real-world maintenance may not permit the hardware indulgences and rigid controls of laboratory settings for visualization and training systems, and at the same time the actual activities of maintainers will challenge requirements for portable or wearable devices. This project has investigated technologies that may be used by Air Force maintainers for training or job aids.

**Advancing Software Security - The Software Protection Initiative**

Hughes, Jeff; Stytz, Martin R; Jun 2003; 47 pp.; In English; Original contains color illustrations

Report No.(s): AD-A467435; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA467435>

In December 2001, the Software Protection Initiative (SPI) was established to prevent the unauthorized distribution and exploitation of national security application software by our adversaries. To achieve this, the SPI has several goals, which are to institutionalize software protection within the software development life-cycle, educate and train the community, develop user-friendly protection techniques, and ensure that protection technology and policy are appropriately applied, balancing mission requirements with security. The focus of the SPI is to improve protections for critical scientific, engineering, and modeling and simulation software running on desktops through supercomputers. Not only does software of this nature represent a significant portion of DoD's intellectual property (IP), it also enables the development of next generation weapon systems. In addition to the traditional two components of information assurance, namely network security and operating system integrity, SPI adds a new component, a 'third leg' to the information assurance triad, based on an application-centric approach to protecting important DoD software. The SPI program is accomplishing these goals by providing military-strength application protection, focused investigation, research and development of advanced technologies for software protection across the entire spectrum of computational hardware.

**Multi-Agent Systems in Mobile Ad hoc Networks**

Macker, Joseph P; Chao, William; Mittu, Ranjeev; Abramson, Myriam; Jan 2005; 8 pp.; In English; Original contains color illustrations

Report No.(s): AD-A467463; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA467463>

A number of technologies are evolving that will help formulate more adaptive and robust network architectures intended to operate in dynamic, mobile environments. One technology area, mobile ad hoc networking (MANET) enables self organizing, multi-hop heterogeneous network routing services and organization. Such technology is important in future DoD networking, especially in the forward edge of the battlespace where self-organizing, robust networking is needed. A second technology area, Multi-Agent Systems (MAS) can enable autonomous, team based problem solving under varying environmental conditions. Previous work done in MAS has assumed relatively benign wired network behavior and inter-agent communications characteristics that may not be well supported in MANET environments. In addition, the resource costs associated with performing inter-agent communications have a more profound impact in a mobile wireless environment. The combined operation of these technology areas, including cross-layer design considerations, has largely been unexplored to date. This paper describes ongoing research to improve the ability of these technologies to work in concert. An outline of various design and system architecture issues is first presented. We then describe models, agent systems, MANET protocols, and additional components that are being applied in our research. We present an analysis method to measure agent effectiveness and early evaluations of working prototypes within MANET environments. We conclude by outlining some open issues and areas of further work.

**Modeling the Structure and Effectiveness of Intelligence Organizations: Dynamic Information Flow Simulation**

Behrman, Robert; Carley, Kathleen; Jun 2003; 27 pp.; In English; Original contains color illustrations

Report No.(s): AD-A467468; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA467468>

This paper describes the Dynamic Information Flow Simulation (DIFS), an abstract model for analyzing the structure and function of intelligence support organizations and the activities of entities within them. In order to do so, DIFS simulates the flow of tasks and reports between various units (decision makers, collectors, processors (analysts), databases, etc.) and agencies within an intelligence organization. DIFS is a dynamic, discrete, multi-agent, networked simulation. The structure of the simulation i.e., the types and properties of entities, communication ties, agencies, and operating procedures - is described. The performance metrics used in, equations used in, and assumptions behind its design are discussed. Methods of

conducting a virtual experiment using the simulation, output generated, and a strategy for validating the results is given. DIFS is intended to provide a method of analysis of intelligence support effectiveness abstracted from sources, methods, and content. Using this analysis, marginal performance change caused by change in organization structure or policy can be quantitatively modeled. Over- and under-loaded units, units that are not re-tasked when intelligence requirements change, and changes in information flow can be identified and modeled. Finally, the weaknesses, benefits, and additional applications of DIFS and areas where further research is desired are discussed.

**Coalition CINC 21 - Leading-Edge Information Technologies to Support Coalition Operations**

Gouin, Denis; Woodliffe, Elizabeth; Sep 2002; 16 pp.; In English; Original contains color illustrations

Report No.(s): AD-A467477; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA467477>

Over the last decade, the number of coalition operations has significantly increased, necessitating greater interoperability with our Allies. Several organizational, cultural, system and technological issues need to be addressed to enable synchronization of operations and shared coalition situation awareness. In order to address Coalition Situation Awareness requirements and contribute to interoperability in future coalition operations, a four-nation collaboration known as Coalition CINC 21 (C-CINC 21) has been established between the USA, Australia, Canada and UK. C-CINC 21 participated in Joint Warrior Interoperability Demonstrations (JWID) in 2001 and 2002, to demonstrate the use of portal technology and distributed collaborative services to share coalition information and to experiment with a coalition-shared infrastructure for geospatial access and with a number of collaborative planning and decision-support tools. This paper addresses a number of interoperability issues associated with coalition operations, describes the C-CINC 21 activities, draws lessons from the collaboration and outlines a way ahead for further collaboration.

**Information Technology and Knowledge Distribution in C3I teams**

Carley, Kathleen M; Schreiber, Craig; Jun 2002; 12 pp.; In English; Original contains color illustrations

Contract(s)/Grant(s): N00014-97-1-0037

Report No.(s): AD-A467479; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA467479>

This paper lays out a computational model for analyzing the relative efficacy of different C3I architectures for teams with access to different types of databases (ITT). Then using this model, a virtual experiment is conducted. Aspects of this virtual experiment are patterned off of behavior and technology surrounding the knowledge wall. Results suggest that bringing ITT in to traditionally structured teams may reduce their efficiency. Some guidance is provided for how to design C3I architectures for high performance and adaptive teams who are ITT enabled. Implications of these results for the knowledge wall are provided. This study, although preliminary, provides guidance for how to reason about team design in a network centric context.

**Consolidated Situational Awareness for Aircraft Carrier Decision Centers**

Hicks, Jeffrey D; Petrov, Plamen V; Stoyen, Alexander D; Zhu, Quiming; Jun 2002; 14 pp.; In English; Original contains color illustrations

Report No.(s): AD-A467481; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA467481>

As the Naval Forces progress toward the network-centric environment envisioned by JV 2010 and JV2020, their dependency upon decision-making aids will grow exponentially as the warfighter's thirst for knowledge from the flood of information rises. As noted from Joint Vision 2020, we '...must be able to take advantage of superior information converted to superior knowledge to achieve 'decision superiority' - better decisions arrived at and implemented faster....'. Particularly

of concern are the shortfalls in the consolidated situational awareness available to the decision makers in the Tactical Flag Command Center (TFCCs) and Combat Direction Center (CDCs) onboard aircraft carriers. The existing CDC and TFCC systems do not provide integrated and fused information which requires more people to glean information out of multiple, stove-piped systems. The current systems are not designed to enhance decision-making and information is not presented in an integrated, graphically based manner that facilitates communications and decision support. This increases response times, resulting in reduced mission effectiveness. 21st Century Systems, Inc. is proposing a unique solution to this issue, the Advanced Battlestation with Decision Support System (ABS/DSS) that utilizes an Agent-based Decision Support System coupled with a 2D/3D Battlespace Visualization Tool. The ABS/DSS utilizes 21CSI's Agent Enhanced Decision Guide Environment (AEDGE(TradeMark)) Architecture which expedites generation of Agent-based systems.

**Russian and Chinese Information Warfare: Theory and Practice**

Thomas, Timothy L; Elliot, Cathy; Jun 2004; 55 pp.; In English; Original contains color illustrations

Report No.(s): AD-A467510; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA467510>

Russian and China have developed concepts of information operations (IO) and information superiority (IS) that differ from US concepts. Russia divides IO theory into information-technical and information-psychological aspects. According to Rastorguyev, 'an information weapon can be any technical, biological, or social means or system that is used for the purposeful production, processing, transmitting, presenting or blocking of data and or processes that work with the data.' Effectiveness of disorganizing an enemy's control system determines who will win or lose, even in wars of a limited nature. Chinese General Dai states that 'Information operations are a series of operations with an information environment as the basic battlefield condition, with military information and an information system as the direct operational targets, and with electronic warfare and a computer network war as the principal forms; focus is on strength of forces and knowledge.' China's focus is on stratagems and control; its IW thinking is evolving away from Western thinking.

**Data Fusion 'Cube': A Multi-Dimensional Perspective**

Phister, Paul W; Plonisch, Igor; Jun 2002; 8 pp.; In English; Original contains color illustrations

Report No.(s): AD-A467519; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA467519>

In the classical sense, data fusion can be viewed as a one-dimensional entity having five distinct levels. However, this view does not convey the multi-dimensional aspect of data fusion. This paper argues that data fusion is not one-dimensional, but rather a three-dimensional entity. These three attributes are sensor fusion, system fusion and information fusion. Sensor fusion can be thought of as taking the raw sensor data and fusing it together so it seems to have come from a single sensor. System fusion can be thought of as combining the output of various heterogeneous systems together into a single fused output. Information fusion can be thought of as taking information gathered from various sources and fusing it into a single output. This paper provides an overview and discussion of this three-dimensional perspective of data fusion in order to illustrate its multi-faceted capabilities and applications. For each of the three dimensions, a definition and possible application, along with a discussion and comparison to the classical Level-0 to Level-4 levels of data fusion, is presented. Finally, this new data fusion 'cube' is offered for consideration in which each axis (Sensor, System, Information) has a corresponding relationship to the classical aspects of data fusion.

**Lessons Learned from War Room Designs and Implementations**

Shaker, Steven M; Jun 2002; 16 pp.; In English; Original contains color illustrations

Report No.(s): AD-A467523; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA467523>

Maximizing the flow and control of information is key to competitiveness, whether it be on the battlefield, the campaign

trail or in the boardroom. Both government and commercial organizations have set up 'war rooms' as a means to handle and enhance decision making and planning. There have been both failures and successes from which worthwhile lessons have been learned and can be applied to future war room developmental efforts. Successful war rooms are innovative tools used to manage information in a time-sensitive environment. They are dynamic facilities, which channel the collection, analysis and dissemination of information. They foster collaboration and team based decision making. Command Posts and other optimized facilities supporting military and business decision making (war rooms) can benefit from the experiences and lessons learned from war room designs and implementations developed for government, industry and political campaigns. This paper describes some of the author's most recent and relevant developments and experiences in 'analog', 'digital' and 'virtual' war rooms. Case studies include: a counter-proliferation war room used by DARPA to influence their investment decision making; an advocacy campaign war room used to support a CEO of a major utility in his efforts to slow the pace of deregulation; and a war room supporting a large telecommunication firm's decision making.

**A Case Study for the Naval Training Meta-FOM (NTMF): Analyzing the Requirements from MAGTF FOM**

Mittu, Ranjeev; Clark, Doug; Jun 2002; 10 pp.; In English; Original contains color illustrations

Report No.(s): AD-A467612; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA467612>

An analysis of a representative cross section of Naval simulation/stimulation & training systems highlighted that the battle-spaces represented in these systems differ in both content and resolution. These differences currently preclude Naval training systems from operating together in a meaningful way. In response, the Navy Modeling and Simulation Office (NAVMSMO) together with NAVSEA PMS430 has sponsored the development of a Naval Training Meta-Federation Object Model (FOM) (NTMF). The NTMF is being developed by inputs from the Navy M&S trainer experts in response to the DoD M&S vision of interoperability and consistency. The NTMF is focused on providing the mechanism to deliver a synthetic battlespace representation that is interoperable and consistent for use by Navy and Marine Corps trainers. The NTMF will contribute to the DoD vision through interaction and communication between participating simulations/stimulations, and it will be the basis for the creation of a common synthetic battle-space representation. This paper will begin with an overview of the NTMF. Next we will discuss recent developments within the Marine Air Ground Task Force (MAGTF) FOM. Lastly, we will analyze the MAGTF FOM requirements and their impact to the development of the NTMF, as well as additional topics for inclusion within the NTMF.

**C2 Interoperability. A Force Multiplier for Joint/Combined Operations and Homeland Security**

Hamilton, Jr , John A; Sanders, Pamela A; Melear, John; Endicott, George; Jun 2002; 8 pp.; In English; Original contains color illustrations

Report No.(s): AD-A467617; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA467617>

The intensity and frequency of joint and combined operations, including operations other than war (OOTW) as well as the accelerating technological advances in command and control have highlighted C2 interoperability issues. The Command and Control Research Program continues to provide an important intellectual forum for military C2 interoperability problems. This forum has been particularly useful for members of the three service C2 acquisition commands and their major interoperability initiative. The commanders of the service C2 acquisition centers, Communications and Electronics Command, Fort Monmouth (CECOM), Space and Naval Warfare Systems Command, San Diego (SPAWAR), Electronic Systems Center, Hanscom, AFB (ESC), formed the Joint Command and Control Integration Interoperability Group (JC2I2G). The JC2I2G exists to promote joint interoperability and change processes and structures by initiating 'bottom up' change to implement Joint C2 integration and interoperability, and by supporting the unified commands in resolving interoperability issues of service specific systems. Recognizing the pivotal role the US Joint Forces Command (USJFCOM) as the Joint Force Integrator, the Director, J6 of USJFCOM serves as principal member of the JC2I2G.

**Intelligent Nodes in Coalition Warfare**

Dawidowicz, Edward; Langston, John; Sep 2002; 11 pp.; In English

Report No.(s): AD-A467672; XA-CERDEC/C2/NJ; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA467672>

Just the recognition that 'knowledge is power' is not sufficient to utilize available information and transform this information into the powerful asset we call 'knowledge.' With a continuous increase in the complexity and tempo on the modern battlefield; new demands are placed on rapid and precise information dissemination. The volume of information available to the user becomes larger while the time necessary to correctly interpret and understand this information becomes prohibitively smaller. Cognitive processing of information at the receiving nodes is a potential solution to this information overflow problem. These nodes we will call Intelligent Nodes [Dawidowicz, 2001]. This paper will introduce the architecture of an Intelligent Node and will demonstrate its hierarchical scalability across all echelons and Battlefield Functional Areas. This technology is also directly applicable to the Objective Force and Future Combat Systems.

**Improving Analysis with Information Extraction Technology**

Taylor, Sarah M; Jun 2003; 53 pp.; In English; Original contains color illustrations

Report No.(s): AD-A467926; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA467926>

Information Extraction is an emerging technology with the potential to transform the way textual information is analyzed and used for many information analysis tasks. However, as a relatively new technology, its best uses have not yet necessarily been discovered. This paper provides some background on Information Extraction and discusses several effective uses of the technology from recent Lockheed Martin experience in applications of its AeroText(TM) software. The paper provides examples of the ways in which different visual organizations of extracted information can improve analysis. Information Extraction enables better analysis by allowing the analyst access to a far greater depth of information than he could read on his own, and by providing the analyst with the capability to view the data in multiple organizations and formats, thus increasing his ability to see trends and to discover the unexpected.

**Effects of the Advanced Combat Helmet (ACH) and Selected Communication and Hearing Protection Systems (C&HPSs) on Speech Communication: Talk-Through Systems**

Weatherless, Rachel A; Wilson, Rhoda M; Garrett, Lamar; Letowski, Tomasz R; Binseel, Mary S; Apr 2007; 36 pp.; In English; Original contains color illustrations

Contract(s)/Grant(s): Proj-AH70

Report No.(s): AD-A466837; ARL-TR-4078; No Copyright; Avail.: Defense Technical Information Center (DTIC)

Communication in military settings must be clear and understandable to avoid possible fatal accidents and mistakes. Speech intelligibility is the overall quality of speech that makes it comprehensible. Intelligibility of speech depends on the properties of the talker, transmission channel, and the listener. The purpose of the reported study was to evaluate intelligibility of speech provided by five communication and hearing protection systems (C&HPSs) operating in talk-through mode. The systems evaluated in this study were the Product Improved-Combat Vehicle Crewman's (PI-CVC) helmet, Bose Improved Tactical Headset (ITH), Mine Safety Appliances-Sordin Gen II headset (Gen II), Communications Enhancement and Protection System (CEPS), and Combat Arms Earplugs (CAE). All systems except for the first one were worn with the Advanced Combat Helmet (ACH). The baseline conditions for assessing the communication data were bare head and the ACH worn alone. Results show that the ACH only, PI-CVC, and Gen II conditions provided significantly better speech intelligibility than the CAE and CEPS for the listeners participating in the study. Performance data for the ITH condition fell between the two groupings. Overall, the earplug-based communication systems (CAE and CEPS) resulted in lower performance and larger data variability than the earmuff-based systems. This larger variability could be attributed to poor repeatability in earplug insertion, which may be limited through more extensive training.

**Database Dictionary for Ethiopian National Ground-Water Database (ENGDA) Data Fields**

Kuniansky, Eve L; Litke, David W; Tucci, Patrick; Jan 2007; 141 pp.; In English; Original contains color illustrations  
Report No.(s): AD-A466896; OFR-2007-1099; No Copyright; Avail.: Defense Technical Information Center (DTIC)

This document describes the data fields that are used for both field forms and the Ethiopian National Ground-water Database (ENGDA) tables associated with information stored about production wells, springs, test holes, test wells, and water level or water-quality observation wells. Several different words are used in this database dictionary and in the ENGDA database to describe a narrow shaft constructed in the ground. The most general term is borehole, which is applicable to any type of hole. A well is a borehole specifically constructed to extract water from the ground; however, for this data dictionary and for the ENGDA database, the words well and borehole are used interchangeably. A production well is defined as any well used for water supply and includes hand-dug wells, small-diameter bored wells equipped with hand pumps, or large-diameter bored wells equipped with large-capacity motorized pumps. Test holes are borings made to collect information about the subsurface with continuous core or non-continuous core and/or where geophysical logs are collected. Test holes are not converted into wells. A test well is a well constructed for hydraulic testing of an aquifer in order to plan a larger groundwater production system. A water-level or water-quality observation well is a well that is used to collect information about an aquifer and not used for water supply. A spring is any naturally flowing, local, ground-water discharge site.

**Export Controls: Agencies Should Assess Vulnerabilities and Improve Guidance for Protecting Export-Controlled Information at Universities**

Hutton, John P; Neumann, John; Candon, Sharron; Harmon, Gregory; Holguin, Arturo; Thomas, Angela; Moore, Sandra; Ahearn, Marie; Sloan, Karen; Dec 2006; 36 pp.; In English; Original contains color illustrations  
Report No.(s): AD-A466913; GAO-07-70; No Copyright; Avail.: Defense Technical Information Center (DTIC)

Foreign students and scholars have made substantial contributions to U.S. research efforts and technology development. However, according to a federal government intelligence assessment, foreign access to sensitive U.S. technology has imposed a significant but unquantifiable cost to the USA. Given this risk, GAO was asked to do the following: (1) describe the nature of the research at universities and identify steps they take to comply with export controls, and (2) assess efforts by the Departments of Commerce and State -- the key export control agencies -- to determine the risk of export violations in university research. GAO reviewed Commerce and State export control programs and met with officials from 13 universities, selected based on their foreign student populations, applications for export licenses, and federal grants and contracts. GAO recommends that Commerce and State use available information to assess potential vulnerabilities and based on this assessment improve outreach, guidance, and interagency coordination. The agencies generally concurred, but State disagreed with GAO's recommendation on assessing vulnerabilities. Broader assessments would increase State's knowledge of risks and help improve its guidance to universities.

**Land Use Mapping with Evidential Fusion of Polarimetric Synthetic Aperture Radar and Hyperspectral Imagery**

Jouan, Alexandre; Allard, Yannick; Allen, Steve; Sep 2002; 17 pp.; In English; Original contains color illustrations  
Report No.(s): AD-A467018; No Copyright; Avail.: Defense Technical Information Center (DTIC)

As part of the Earth Observation Application Development Program (EOADP) program sponsored by the Canada Space Agency, Lockheed Martin Canada has developed the Intelligent Data Fusion System (IDFS) for evidential fusion of features extracted from polarimetric SAR and Hyperspectral imagery. This paper presents the use of IDFS for land use mapping. IDFS is made of three modules. The polarimetric SAR module contains polarimetric classifiers (Cloude decomposition, polarization response parameters), textural classifiers (GLCM, backscattering coefficient) that provide hypotheses about the likelihood that some object of interest may be present in the scene based on textural and scattering properties of the analysed surface. The Hyperspectral module contains the Iterative Error Analysis endmembers selection technique proposed by the Canada Center for Remote Sensing to provide a set of pixel-based hypotheses reflecting the likelihood that some typical material may be present in the scene based on the spectral properties of the analysed surface. Hypotheses provided by each module represent an incomplete, inaccurate and imprecise description of the reality. The data fusion module combines PolSAR and HSI hypotheses using the evidence theory proposed by Dempster-Shafer. This paper presents an overview of the current

functionality of IDFS. Results of evidential fusion are shown for land use mapping. The data-sets acquired over Indian-Head (Saskatchewan) with an airborne C-Band CV-580 PolSAR sensor and HSI Probe-1 imagery were provided by the Canada Center for Remote Sensing.

**Sensor Management in Command & Control**

Benaskeur, Abder; Sep 2002; 16 pp.; In English; Original contains color illustrations

Report No.(s): AD-A467042; No Copyright; Avail.: Defense Technical Information Center (DTIC)

The sensing resources represent an important source of information on which the Command & Control (C2) process bases most of its reasoning. Therefore, a major prerequisite to the success of the whole C2 process is the effective use of these scarce and costly resources. This is the problem of sensor management that has to do with how best to manage and coordinate the use of sensing resources to improve data acquisition and ultimately perception and comprehension. Conscious of the important role sensor management has to play in modern C2 systems, the Decision Support Systems (DSS) Section at Defense Research & Development Canada - Valcartier (DRDC-V) is currently studying advanced sensor management concepts and applications, to increase the survivability of the current Halifax and Iroquois Class ships, as well as their possible future upgrades. The objective of the reported part of this study is twofold i) to present the sensor management problem and the requirements for its solution ii) to demonstrate, through a tracking application, the benefits that can be gained by the closed-loop management of the sensors.

**Automated Run-Time Mission and Dialog Generation**

Kelly, John D; Mar 2007; 75 pp.; In English

Report No.(s): AD-A467074; No Copyright; Avail.: Defense Technical Information Center (DTIC)

Current mission driven systems, be they games or training simulations, are generally restricted to using a set of training missions that are hard coded into the system. This has the unfortunate effect of limiting the number of times a person or team can be sent through a simulator before it begins to lose its training value or the number of times a person can replay a game without it becoming predictable and somewhat boring. The fact that all of the mission parameters must be hard coded also increases the time required for scenario development. This study defines an architecture for automating the creation of missions at run time allowing much larger variety in the number and content of missions in a given system. Our architecture also allows for the creation of varied and more believable dialog with minimal scenario creation time required. We also explore an alternate method for determining agents attitudes towards the users avatar which is more robust than the more commonly used system and which can be used as an input to dialog generation further improving the realism of the dialog. A commercial game, Neverwinter Nights by Bioware, has been used to produce a proof of concept.

**Requirements and Information Metadata System**

Beckman, Erin M; Mar 2007; 87 pp.; In English

Report No.(s): AD-A467106; No Copyright; Avail.: Defense Technical Information Center (DTIC)

This thesis proposes an adoption of a data schema called RIMS (Requirements and Information Metadata System) developed as a pilot project in the Pittsburgh Field Office of the FBI and sets out to determine if RIMS could be an effective and efficient method to capture, catalogue and retrieve intelligence information within the Federal Bureau of Investigation (FBI). RIMS would enhance the search platform used by FBI analysts and investigators who gather or data mine existing information in furtherance of the FBI's priorities. The use of this coding system can be adapted for use by other U.S. intelligence and law enforcement communities for commonality and uniformity in retrieval, cataloguing, and collecting of intelligence information. The use of this system can be manipulated into a non-classified code for use by state, local, and tribal law enforcement and intelligence entities. Finally, the use of the coding system within the intelligence community will

consolidate and integrate information and intelligence and reduce delays in detecting and retrieving pertinent intelligence obtained and shared within the intelligence community.

**Service Oriented Architecture for Coast Guard Command and Control**

Dash, Russell E; Creigh, Robert H; Mar 2007; 151 pp.; In English

Report No.(s): AD-A467111; No Copyright; Avail.: Defense Technical Information Center (DTIC)

The Coast Guard's software architecture does not meet the organization's needs for information sharing or command and control. The Commandant of the Coast Guard recently mandated the implementation of a Service Oriented Architecture (SOA) to address this problem. This thesis describes a Service Oriented Architecture for Coast Guard Command and Control that integrates legacy applications and provides new capabilities. Traditional software architecture descriptions make it difficult to identify and understand the trade-offs between quality attributes that are inherent in the design. We clarify these critical issues by using multiple scenarios and use cases, in addition to diagrams and functionality requirements. Defining the architecture in this manner enables an auditor to determine the architecture's validity. The Coast Guard also needs a plan to implement this SOA. This thesis defines a process that will deliver value in the form of usable capabilities in an incremental manner. It recognizes the constantly changing nature of both the problem and the necessary solution, and evolves accordingly. It continually plans for, adapts to, and exploits predictable advances in technology to deliver more value. The iterative method we propose includes cyclical evaluation of the system requirements, architecture, and implementation to provide continuous improvement.

**The USA PATRIOT Act: A Sketch**

Doyle, Charles; Apr 18, 2002; 6 pp.; In English

Report No.(s): AD-A467148; CRS-RS21203; No Copyright; Avail.: Defense Technical Information Center (DTIC)

Congress passed the USA PATRIOT Act in response to the terrorist attacks of September 11, 2001. The Act gives federal officials greater authority to track and intercept communications, both for law enforcement and foreign intelligence gathering purposes. It vests the Secretary of the Treasury with regulatory powers to combat corruption of U.S. financial institutions for foreign money laundering purposes. It seeks to further close U.S. borders to foreign terrorists and to detain and remove those within its borders. It creates new crimes, new penalties, and new procedural efficiencies for use against domestic and international terrorists. Although it is not without safeguards, critics contend some of its provisions go too far. Although it grants many of the enhancements sought by the Department of Justice, others are concerned that it does not go far enough. The Act originated as H.R. 2975 (the PATRIOT Act) in the House and S.1510 in the Senate (the USA Act). S.1510 passed the Senate on October 11, 2001, 147 Cong. Rec. S10604 (daily ed.). The House Judiciary Committee reported out an amended version of H.R. 2975 on the same day, H.R.Rep.No. 107-236. The House passed H.R. 2975 the following day after substituting the text of H.R. 3108, 147 Cong. Rec. H6775-776 (daily ed. Oct. 12, 2001). The House version incorporated most of the money laundering provisions found in an earlier House bill, H.R. 3004, many of which had counterparts in S.1510 as approved by the Senate. The House subsequently passed a clean bill, H.R. 3162 (under suspension of the rules), which resolved the differences between H.R. 2975 and S.1510, 147 Cong. Rec. H7224 (daily ed. Oct. 24, 2001). The Senate agreed to the changes, 147 Cong. Rec. S10969 (daily ed. Oct. 24, 2001), and H.R. 3162 was sent to the President who signed it on October 26, 2001. This is an abbreviated version of 'The USA PATRIOT Act: A Legal Analysis,' CRS Report RL31377, stripped of its citations and footnotes.

**National Security Letters in Foreign Intelligence Investigations: A Glimpse of the Legal Background and Recent Amendments**

Doyle, Charles; Mar 21, 2006; 6 pp.; In English

Report No.(s): AD-A467194; CRS-RS22406; No Copyright; Avail.: Defense Technical Information Center (DTIC)

Five statutory provisions vest government agencies responsible for certain foreign intelligence investigations (principally

the Federal Bureau of Investigation [FBI]) with authority to issue written commands comparable to administrative subpoenas. These National Security Letters (NSLs) seek customer and consumer transaction information in national security investigations from communications providers, financial institutions, and credit agencies. Section 505 of the USA PATRIOT Act expanded the circumstances under which an NSL could be used. Subsequent press accounts suggested that their use had become widespread. Two lower federal courts, however, found the uncertainties, practices, and policies associated with the use of NSL authority contrary to the First Amendment right of freedom of speech, and thus brought into question the extent to which NSL authority could be used in the future. The USA PATRIOT Improvement and Reauthorization Act, P.L. 109-177, 120 Stat. 192 (2006) (H.R. 3199), and P.L. 109-178, 120 Stat. 278 (2006) (S. 2271), amend the NSL statutes and related law to address some of the concerns raised by critics and the courts. This is an abridged version of CRS Report RL33320, 'National Security Letters in Foreign Intelligence Investigations: Legal Background and Recent Amendments,' without the footnotes, appendices, and most of the citations to authority found in the longer report.

**National Security Letters in Foreign Intelligence Investigations: Legal Background and Recent Amendments**

Doyle, Charles; Mar 20, 2007; 34 pp.; In English

Report No.(s): AD-A467195; CRS-RL33320; No Copyright; Avail.: Defense Technical Information Center (DTIC)

Five federal statutes authorize intelligence officials to request certain business records in connection with national security investigations. The authority to issue these national security letters (NSLs) is comparable to the authority to issue administrative subpoenas. The USA PATRIOT Act expanded the authority under four of the NSL statutes and created the fifth. Thereafter, the authority has been reported to have been widely used. But prospects of its continued use dimmed after two lower federal courts held that the lack of judicial review and the absolute confidentiality requirements in one of the statutes rendered it constitutionally suspect. The USA PATRIOT Improvement and Reauthorization Act (H.R. 3199), P.L. 109-177, and its companion P.L. 109-178, amended the five NSL sections to expressly provide for judicial review of both the NSLs and the confidentiality requirements that attend them. The sections also have been made explicitly judicially enforceable and sanctions recognized for failure to comply with an NSL request or to breach NSL confidentiality requirements with the intent to obstruct justice. The use of the authority has been made subject to greater Congressional oversight. The text of the five provisions -- section 1114(a)(5) of the Right to Financial Privacy Act (12 U.S.C. 3414(a)(5)); sections 626 and 627 of the Fair Credit Reporting Act (15 U.S.C. 1681u, 1681v); section 2709 of title 18 of the USA Code; and section 802 of the National Security Act (50 U.S.C. 436) -- in their amended form are appended. A Dept. of Justice report found that in its early use of its expanded USA PATRIOT Act authority the FBI had 'used NSLs in violation of applicable NSL statutes, Attorney General Guidelines, and internal FBI policies,' but that no criminal laws had been broken. This report is available abridged as CRS Report RS22406, 'National Security Letters in Foreign Intelligence Investigations: A Glimpse of the Legal Background and Recent Amendments.'

**Terrorism Information Management Within the New York City Fire Department: Past, Present and Future**

Flynn, John P; Mar 2007; 156 pp.; In English

Report No.(s): AD-A467227; No Copyright; Avail.: Defense Technical Information Center (DTIC)

The New York City Fire Department, like the entire fire service, has been proven to be a primary stakeholder in Homeland Security. The mindset of firefighters is influenced by traditional and expected roles that are not fully considerate of the challenges accompanying the new enemy of terrorism. A fundamental deficiency is herein identified as the manner in which information is managed. The FDNY must adapt so as to recognize information as an entity that must be collected, saved and utilized holistically for greater preventative and response capabilities. It must adopt lessons learned by others in the pursuit of better information management. These needs also exist, to a great extent, within the national fire service. This thesis will use a detailed analysis of existing FDNY information systems, a review of the criticality of information to past events, and the perspectives of FDNY firefighters to identify common denominators of deficiency. It will examine the manner in which others have confronted the issue of information management with an eye toward extracting salient lessons. The operational

and psychological ramifications of poor information management will be explored. Finally, concepts that hold promise for the underpinning of practical solutions to the information management problem are presented.

**Portfolio Management Decision Support Tools Analysis Relating to Management Value Metrics**

Goodson, Christopher J; Knutson, Richard D; Mar 2007; 55 pp.; In English

Report No.(s): AD-A467243; No Copyright; Avail.: Defense Technical Information Center (DTIC)

The general area of research is Maritime Domain Awareness, where we will be looking at the ship tracking process in prevention and interdiction functions. The objective of this research is to demonstrate that the Knowledge Value Added (KVA) and Real Options (RO) methodologies can be used to assess the current performance of core Maritime Domain Awareness (MDA) processes. This type of approach will help with identification and valuation of future options for an MDA process. The results of this research will assist MDA managers, and operational leaders, in making portfolio management decisions for allocating resources to create the correct support tools for MDA processes and support systems. The research will provide a proof of concept test of a set of decision support tools to support managers in the MDA ship tracking process. We also explored a new methodology for determining value added of management.

**'Sensitive But Unclassified' Information and Other Controls: Policy and Options for Scientific and Technical Information**

Knezo, Genevieve J; Dec 29, 2006; 94 pp.; In English

Report No.(s): AD-A467255; CRS-RL33303; No Copyright; Avail.: Defense Technical Information Center (DTIC)

Since the September 11, 2001 terrorist attacks, controls increasingly have been placed on some unclassified research and S&T information, including that used to inform decision making and citizen oversight. These controls include 'sensitive but unclassified' (SBU) labels; restrictive contract clauses; visa controls; controlled laboratories; and wider legal restrictions on access to some federal biological, transportation, critical infrastructure, geospatial, environmental impact, and nuclear information. Federal agencies do not have uniform definitions of SBU or consistent policies to safeguard or release it. Following the 2001 terrorist attacks, the Bush Administration issued guidance that reversed the Clinton Administration's 'presumption of disclosure' approach to releasing information under Freedom of Information Act (FOIA) and cautioned agencies to consider withholding SBU information if there was a 'sound legal basis' to do so. Some agencies contend that SBU information is exempt from disclosure under FOIA, even though such information per se is not exempt under FOIA. During the 109th Congress, P.L. 109-90 and P.L. 109-295 focused on management, oversight, and appropriate use of the sensitive security information (SSI) category. Legislative proposals focused on standardizing concepts of 'sensitive' information; modifying penalties for disclosure; and clarifying FOIA. During the 110th Congress, additional topics likely to be controversial include limiting the number of persons who can designate SBU; widening the use of risk-based approaches to control; centralizing review, handling, and appeals; and evaluating the impact of federal policies on nongovernmental professional groups' prepublication review and self-policing of sensitive research.

**Libraries and the USA PATRIOT Act**

Doyle, Charles; Jul 6, 2005; 7 pp.; In English

Report No.(s): AD-A467257; CRS-RS21441; No Copyright; Avail.: Defense Technical Information Center (DTIC)

The USA PATRIOT Act, P.L. 107-56, enacted to help track down and punish terrorists and to prevent further terrorism, contains no provisions specifically directed at libraries or their patrons. It has several provisions, however, that might apply in a library context. The most frequently mentioned of these is Section 215 that amends the business record sections of the Foreign Surveillance Intelligence Act (FISA). Before the USA PATRIOT Act, federal authorities, engaged in gathering foreign intelligence information or conducting an investigation of international terrorism, could seek a FISA court order for access to hotel, airline, storage locker, or car rental business records. The businesses to whom the orders were addressed were bound

to silence. Section 215 amended the procedure so that in a foreign intelligence or international terrorism investigation federal authorities may obtain a FISA order for access to 'any tangible item no matter who holds it,' including by implication library loan records and the records of library computer use. Although past practices have apparently made the library community apprehensive, the extent to which the authority of Section 215 has been used, if at all, is unclear. Media accounts of federal investigations involving library patrons ordinarily do not distinguish between simple inquiries, grand jury subpoenas, criminal search warrants, FISA physical search orders, and FISA tangible item orders. Moreover, the Justice Department has indicated that as of March 30, 2005 the authority under Section 215 had been exercised on 35 occasions, but had not been used in any instance to secure library, bookstore, gun sale, or medical records. The House-passed Commerce, State, Justice appropriations bill for FY2006 contains an amendment that bars the expenditure of funds to use Section 215 to acquire library or book store records; the amendment does not appear in the Senate committee-reported version of the bill.

Report No.(s): AD-A467272; AFIT/GIR/ENV/07-M17; No Copyright; Avail.: Defense Technical Information Center

(DTIC)

Knowledge is a critical resource for organizations today, especially to the DoD. When organizations understand what knowledge is, they can begin to draw value from it. Drawing value from knowledge is best accomplished through the processes of knowledge management: knowledge creation, knowledge storage and retrieval, knowledge transfer, and knowledge application (Alavi and Leidner, 2001). Organizations can create an environment in which these processes flourish by ensuring the organization has the elements of a supportive leadership, structure to control and optimize knowledge sharing, technology to facilitate the KM processes, and a commitment to maximize knowledge sharing and continuously improve (Stankosky et al, 1999). KM education is the means by which organizations can successfully develop an understanding of KM, and those organizational elements required to implement and institutionalize KM. Statistical evidence shows that those organizations that do not adequately address KM education are more likely to fail with their KM systems (Koenig, 2004). Organizations desiring to capitalize on knowledge should then ensure that their KM education efforts are effective by establishing education goals, developing a curriculum to meet these goals, and continuously evaluating goal attainment. This case study research documents how the DoD is addressing knowledge management education.

**From the Battlefield to the Homeland: Building the Case for Network-Centric Response**

Peterson, Michael C; Mar 2007; 217 pp.; In English

Report No.(s): AD-A467280; No Copyright; Avail.: Defense Technical Information Center (DTIC)

Our nation's ability to respond to natural or man-made disasters has remained relatively unchanged since the attacks of 9/11. Current response operations are characterized by the inability to efficiently produce a collaborative and effective response to incidents of national significance and address the challenges of the Information Age. The military has adapted network-centric tenants and principles from business applications to effectively operate in the Information Age and increase mission effectiveness. These tenants and principles can be adapted by responders to address current deficiencies and increase mission effectiveness. Implementation of network centric response is both technologically and organizationally feasible. Network-centric response operations would allow responders to meet the challenges and leverage the opportunities of the Information Age, resulting in increased mission effectiveness.

**A Correlation Between Quality Management Metrics and Technical Performance Measurement**

Turner, Jeffrey L; Mar 2007; 153 pp.; In English

Report No.(s): AD-A467303; No Copyright; Avail.: Defense Technical Information Center (DTIC)

The quality of software management has an affect on the degree of success or failure of a software development program,

this statement has been argued successfully by Martin J. Machniak in his thesis Development of a Quality Management Metric (QMM) Measuring Software Program Management Quality. The QMM metrics can be used both to characterize the quality of software management and provide a template for improving software management performance. Technical Performance Measurement (TPM) in the most basic form is a plan of expected technical achievement in which the actual progress is compared with periodic measurements. However, the difference between the plan and the actual measures is a technical variance which can be considered good or bad, depending on the level of tolerance given in the requirements. TPM is breaking new ground in the development of various techniques for TPM where planning is integrated with cost, schedule, and program impact assessment. The author administered the QMM questionnaire to measure the perceptions of program managers that have the responsibility for software development programs within the U.S. Army. The author then gathered TPM data using an informal verification and validation of the same programs used for the QMM questionnaire, and compared the results and found an inconclusive correlation between them.

**China: Possible Missile Technology Transfers from U.S. Satellite Export Policy - Actions and Chronology**

Kan, Shirley A; Sep 5, 2001; 62 pp.; In English

Report No.(s): AD-A467313; No Copyright; Avail.: Defense Technical Information Center (DTIC)

Congress has been concerned about whether U.S. firms, in exporting satellites, provided expertise to China for use in its ballistic missile and space programs and whether the Administration's policies might facilitate transfers of military-related technology to China. This CRS Report discusses security concerns, policy changes, congressional action, and a chronology of major developments since 1988. Some critics opposed satellite exports to China, while others were concerned that the Clinton Administration relaxed export controls and monitoring of commercial satellites in moving the licensing authority from the State Department to Commerce in 1996. A range of concerns were prompted by New York Times reports in April 1998 that the Justice Department began a criminal investigation into whether Loral Space and Communications Ltd. and Hughes Electronics Corp. violated export control laws. The firms allegedly shared their findings with China on the cause of a rocket's explosion while launching a U.S.-origin satellite in February 1996. The companies are said to have provided expertise that China could use to improve the accuracy and reliability of its future ballistic missiles, including their guidance systems. At least three classified studies reportedly found that U.S. national security was harmed. In the fall of 1998, Congress passed the FY1999 National Defense Authorization Act that transferred licensing authority over satellites back to the State Department (effective March 15, 1999). On October 5, 1999, the President signed into law the FY2000 National Defense Authorization Act (P.L. 106-65) in which Congress addressed export controls relating to missile technology, satellites, and other issues.

**Intelligent Data Fusion for Wide-Area Assessment of UXO Contamination. SERDP Project MM-1510. 2006 Annual Report**

Rose-Pehrsson, Susan L; Johnson, Kevin; Minor, Christian; Guthrie, Verner; Apr 20, 2007; 69 pp.; In English; Original contains color illustrations

Contract(s)/Grant(s): MIPR-W74RDV53203308; Proj-MM-1510

Report No.(s): AD-A467324; NRL/MR/6180--07-9039; No Copyright; Avail.: Defense Technical Information Center (DTIC)

Intelligent data fusion techniques are being developed and optimized for use in enhancing wide-area assessment UXO remediation efforts. A data fusion framework will be created to provide a cohesive data management and decision-making utility that will capture all available data and more efficiently direct the expenditure of time, labor, and resources. The objectives of the first year are to determine the feasibility of feature selection methods for data fusion. The first year of project MM-1510 successfully demonstrated the feasibility of feature extraction from wide-area assessment survey data. In contrast to the individual data sources, feature extraction yielded enhanced data for the Pueblo PBR #2 that was well-suited for data fusion. Preliminary combination of feature maps from the various data sources yielded a map for the Pueblo site that was more accurate than any one data source alone. Probability densities were generated from the feature maps and make possible the combination of estimates of data quality, UXO-related features, non-UXO backgrounds, and correlations among the data sets in a Bayesian-based approach to data fusion.

**Building Collaborative Capacity for Biosecurity at the Georgia Seaports**

Neu, Annette L; Mar 2007; 89 pp.; In English

Report No.(s): AD-A467339; No Copyright; Avail.: Defense Technical Information Center (DTIC)

When public health interventions are incorporated into a comprehensive seaport security strategy, they can effectively prevent and reduce morbidity and mortality, resulting from natural or man-made disasters. The challenge is to build collaborative capacities through new and renewed seaport surveillance activities among government agencies and private companies to strengthen the role of public health to detect, intercept, and mitigate the potential effects of the intentional or unintentional introduction of diseases. Currently, effective collaborative processes between public health agencies and other local, state and federal partners in seaport security are weak and primarily the result of informal activities. Although seaport security receives considerable policy attention in other areas of risk management, such as radiological detection, public health investments are relatively neglected. Effective, sustainable approaches to building interagency collaboration could prove to be an indispensable homeland security initiative to prepare for a bioterrorism attack or other infectious disease incidents.

**A Comparative Assessment of Knowledge Management Leadership Approaches within the Department of Defense**

Marshall, II, Tommy V; Mar 2007; 70 pp.; In English; Original contains color illustrations

Report No.(s): AD-A467369; AFIT/GIR/ENV/07-M12; No Copyright; Avail.: Defense Technical Information Center (DTIC)

Knowledge has superseded traditional corporate assets and has become the strategic resource for competitive advantage. To reap the benefits of knowledge, organizations must harvest and leverage the collective knowledge of the entire workforce. This is achieved through effective knowledge management. KM involves processes to create, to store, and transfer knowledge to accomplish business objectives and to achieve a competitive advantage. The Department of Defense has also recognized the importance of KM and has since mandated the acquiring, refining, and sharing of knowledge. The Departments of the Army, Air Force, and Navy have each undertaken individual KM efforts. This research, guided by Dr. Michael Stankosky's Four Pillar Framework, used a case study methodology to investigate each of the department's KM leadership and described how they compare and contrast (Stankosky, 1999). This study identified evidence of each KM leadership element for all three departments. Additionally, this research revealed that each department approaches KM leadership uniquely.

**The USA PATRIOT Act: A Legal Analysis**

Doyle, Charles; Apr 15, 2002; 79 pp.; In English

Report No.(s): AD-A467389; CRS-RL31377; No Copyright; Avail.: Defense Technical Information Center (DTIC)

The USA PATRIOT Act passed in the wake of the September 11 terrorist attacks. It flows from a consultation draft circulated by the Department of Justice, to which Congress made substantial modifications and additions. The stated purpose of the Act is to enable law enforcement officials to track down and punish those responsible for the attacks and to protect against any similar attacks. The Act grants federal officials greater powers to trace and intercept terrorists' communications both for law enforcement and foreign intelligence purposes. It re-enforces federal anti-money laundering laws and regulations in an effort to deny terrorists the resources necessary for future attacks. It tightens immigration laws to close U.S. borders to foreign terrorists and to expel those who are here. Finally, it creates a few new federal crimes, such as the one outlawing terrorists attacks on mass transit; increases the penalties for many others; and institutes several procedural changes, such as a longer statute of limitations for crimes of terrorism. Critics have suggested that it may go too far. The authority to monitor e-mail traffic, to share grand jury information with intelligence and immigration officers, to confiscate property, and to impose new book-keeping requirements on financial institutions, are among the features troubling to some. The Act itself responds to some of these reservations. Many of the wiretapping and foreign intelligence amendments sunset on December 31, 2005. The Act creates judicial safeguards for e-mail monitoring and grand jury disclosures; recognizes innocent owner defenses to forfeiture; and entrusts enhanced anti-money laundering powers to those regulatory authorities whose concerns include the well-being of U.S. financial institutions. This report, stripped of its citations and footnotes, is available in an abbreviated form as 'The USA PATRIOT Act: A Sketch,' CRS report RS21203.

**Client Location in 802.11 Networks**

Dang, Tuan Q; Bangalan, Rolan T; Mar 2007; 91 pp.; In English

Report No.(s): AD-A467416; No Copyright; Avail.: Defense Technical Information Center (DTIC)

Location awareness is invaluable to the military commander. Any application that can accurately deliver this service is highly desirable. Being able to extract accurate distances is the first step towards developing a proposed 802.11 local area positioning system. This thesis explores a number of different methods of using 802.11 to capture physical distance separation between mobile stations. The first method of measuring distance, involves using 802.11 round trip signal times. Round trip signal times are determined from a transmitter to a receiver and back, and are used with the speed of light to measure distance between the nodes. Another method of using 802.11 to measure distance involves using signal strength measurements and a client-server arrangement. Distances can be extracted by extrapolating through a range of signal strength measurements. Because signal strength is a measurement of power, its behavior is governed by the inverse-square law. If environmental variables, such as humidity and RF interference do not significantly change, a line graph of signal strength measurements versus distance can be used to determine positions under these constant conditions.

**Interoperability -- An Australian View**

Warner, Neil; Sep 2002; 16 pp.; In English; Original contains color illustrations

Report No.(s): AD-A467489; No Copyright; Avail.: Defense Technical Information Center (DTIC)

Australia's traditional allies have been New Zealand, the UK (UK), and the USA (U.S.). Before the advent of digital C3I Systems, interoperability among Australian, British, and American forces was maintained through the use of common communications equipment and procedures but also by people, training, and doctrine. Australia has traditionally procured its major military equipment, including C3I systems, from the USA and the UK. This tradition has assured the Australian Defence Force (ADF) some level of interoperability with U.S. and UK forces. Australia also has a long history of training with military forces in the UK and the USA and participating in exchanges of personnel. Looking over the past decade, it is clear that the majority of future operations conducted by the ADF will be Operations Other Than War (OOTW). This will require the ADF to operate in coalitions or alliances. The partners within these coalitions or alliances may not have common doctrine, training, or operating procedures. Security also will be a major issue. In addition, the operational environment within these partnerships will need to take into account civil and national influences, as well as influence from United Nations participation or control and from Non-Governmental Organizations (NGOs). Interoperability can be defined as the ability of systems, units, or forces to provide to and accept services from other systems, units, or forces, and to use the services so exchanged to enable them to operate effectively together. Interoperability cannot be thought of solely on an information systems level; it must include doctrine, people, procedures, and training. This paper will examine the interoperability of Command and Control Systems (C3I) with reference to the ADF. The paper includes a discussion of the technical concepts of interoperability, as well as an examination of ADF requirements and its current status.

**Strategic Planning to Conduct Joint Force Network Operations: A Content Analysis of NETOPS Organizations Strategic Plans**

Scurlock, Antonio J; Mar 2007; 84 pp.; In English; Original contains color illustrations

Report No.(s): AD-A467507; AFIT/GIR/ENV/07-M18; No Copyright; Avail.: Defense Technical Information Center (DTIC)

Within the joint force network operations environment, war fighters will treat net centric adversaries and global information grid defense in depth situations as complex, adaptive enclaves that are the product of the dynamic interactions between connected entities and processes. Because of net centrality, no entity or process of the enclave can be considered in isolation; no singular engagement methodology will accurately capture the enclave's complexity, and an alignment of DoD combatant commanders, services, and agencies strategic planning is pivotal. To achieve and maintain information dominance, Joint Network Operations (NETOPS) organizations need to be strategically aligned. As result, to enhance the capabilities-based effects of NETOPS and reduce our NETOP infrastructures susceptibility to compromise. Once the key organizations were identified, their strategic plans were analyzed using a structured content analysis framework. The results illustrated that the strategic plans were aligned with the community of interests tasking to conduct NETOPS. Further research is required into the strategic alignment beyond the strategic (national/theater) and operational levels to determine if the developed NETOPS strategic alignment construct is applicable to all levels of war.

**A Distributed Approach for Multi-Constrained Path Selection and Routing Optimization**

Li, Zhenjiang; Garcia-Luna-Aceves, J J; Jan 2006; 10 pp.; In English; Original contains color illustrations

Contract(s)/Grant(s): W911NF-05-1-0246; CNS-0435522

Report No.(s): AD-A467530; No Copyright; Avail.: Defense Technical Information Center (DTIC)

Multi-constrained path (MCP) selection, in which the key objective is to search for feasible paths satisfying multiple routing constraints simultaneously, is known to be an NP-Complete problem. Multi-constrained path optimization (MCPO) is different from MCP mainly in that, the feasible paths selected should also be optimal with regard to an optimization metric, which makes path computation in MCPO even harder. We propose a fully distributed multi-constrained path optimization routing (MPOR) protocol that solves the general -constrained path selection and routing optimization problems. MPOR computes paths using distance vectors exchanged only amongst neighboring nodes and does not require the maintenance of global network state about the topology or resources; supports hop-by-hop, connectionless routing of data packets, and implements constrained path optimization by distributively constructing an x-optimal path set (i.e., the shortest, the second shortest and up to the xth shortest path in terms of the optimization metric) for each destination at each node. Simulations show that MPOR has satisfactory routing success ratios for multiconstrained path selection, and performs consistently with varying number of constraints. For constrained path optimization, MPOR has high probabilities of finding feasible paths that are also optimal or near-optimal for the given optimization metric.

**Savage Modeling and Analysis Language (SMAL): Metadata for Tactical Simulations and X3D Visualizations**

Rauch, Travis M; Mar 2006; 264 pp.; In English

Report No.(s): AD-A467546; No Copyright; Avail.: Defense Technical Information Center (DTIC)

Visualizing operations environments in three-dimensions is in keeping with the military's drive to increase the speed and accuracy with which warfighters make decisions in the command center and in the field. Three-dimensional (3D) environments support speed in decision-making by presenting complex systems in an integrated, naturalistic display format. Constructing these environments is a time-consuming task requiring specific expertise not typically available in the command center. The future use of 3D visualization in military operations depends on the ability to create virtual environments quickly and accurately by personnel with minimal graphics experience leveraging data available in the command center. It depends on autogeneration. Assembling and making sense of data necessary to autogenerate a 3D environment requires context and good documentation, best-accomplished using metadata. Metadata supports data-centric, component-based design; key philosophies in promoting interoperability of networked applications. This thesis proposes an XML metadata standard to collect and organize the information necessary to create and populate a 3D virtual environment. The logical extension of a well-designed

standard is the ability to cross the boundaries of usage, allowing simulators to share data with command and control suites and mission planning tools based on the construction of a virtual scene.

**Refinement of an Instrument to Assess Readiness for Knowledge Management**

Bailey, Landon C; Mar 2007; 85 pp.; In English; Original contains color illustrations

Report No.(s): AD-A467548; AFIT/GIR/ENV/07-M2; No Copyright; Avail.: Defense Technical Information Center (DTIC)

Academics and practitioners have described knowledge as a primary source for competitive advantage for organizations; however, many attempts at instituting knowledge management programs to increase organizational competitiveness do not succeed. Instituting knowledge management programs generally requires organizations to make significant changes and the concept of readiness has long been believed to be an important precondition for successful organizational change. By linking previous research in enablers for knowledge management and organizational change, it is possible to adapt an established organizational change readiness instrument to measure readiness for knowledge management. This study culminates in the development and field-testing of the resultant knowledge management readiness instrument, filling in an important gap in contemporary literature.

**Towards the Development of a Defensive Cyber Damage and Mission Impact Methodology**

Fortson, Jr, Larry W; Mar 2007; 254 pp.; In English; Original contains color illustrations

Contract(s)/Grant(s): Proj-07-376

Report No.(s): AD-A467549; AFIT/GIR/ENV/07-M9; No Copyright; Avail.: Defense Technical Information Center (DTIC)

The purpose of this research is to establish a conceptual methodological framework that will facilitate effective cyber damage and mission impact assessment and reporting following a cyber-based information incidents. Joint and service guidance requires mission impact reporting, but current efforts to implement such reporting have proven ineffective. This research seeks to understand the impediments existing in the current implementation and to propose an improved methodology. The research employed a hybrid historical analysis and case study methodology for data collection through extensive literature review, examination of existing case study research and interviews with Air Force members and civilian personnel employed as experts in cyber damage and mission impact assessment of Air Force networks. Nine respondents provided valuable first hand information about the current implementation cyber damage and mission impact assessment. This research identified several critical impediments to current mission impact assessment efforts on Air Force networks. Based upon these findings, a proposal is made for a new operations-focused defensive cyber damage and mission impact methodology. The methodology will address the critical impediments identified and will result in profound benefits in other areas of cyber asset protection. Recommendations for conceptual implementation and operationalization are presented and related future research topics are discussed.

**Internet Protocol Geolocation: Development of a Delay-Based Hybrid Methodology for Locating the Geographic Location of a Network Node**

Roehl, John M; Mar 2007; 184 pp.; In English; Original contains color illustrations

Report No.(s): AD-A467550; AFIT/GIR/ENV/07-M15; No Copyright; Avail.: Defense Technical Information Center (DTIC)

Internet Protocol Geolocation (IP Geolocation), the process of determining the approximate geographic location of an IP addressable node, has proven useful in a wide variety of commercial applications. Commercial applications of IP Geolocation include market research, redirection for performance enhancement, restricting content, and combating fraud. The potential for military applications include securing remote access via geographic authentication, intelligence collection, and cyber attack attribution. IP Geolocation methods can be divided into three basic categories based upon which information is used to

determine the geographic location of the given IP address: 1) Information contained in databases, 2) information that is leaked during connections with the IP of interest, and 3) network-based routing and timing information. This thesis focused upon an analysis in the third category: delay-based methods for IP Geolocation. Specifically, a comparative analysis of three existing delay-based IP Geolocation methods: Upper-bound Multilateration (UBM), Constraint Based Geolocation (CBG), and Time to Location Heuristic (TTLH) is conducted using a simulated network. Based upon analysis of the results, a new hybrid methodology is proposed to improve the accuracy when conducting IP Geolocation. Simulations of the new hybrid methodology show that the hybrid methodology is superior to all existing delay-based methods for IP Geolocation.

**C2 Interoperability: Simulation, Architecture and Information Security**

Hamilton, Jr , John A; Melear, John; Endicott, George; Sep 2002; 11 pp.; In English; Original contains color illustrations  
Report No.(s): AD-A467579; No Copyright; Avail.: Defense Technical Information Center (DTIC)

The intensity and frequency of joint and combined operations, including Operations Other Than War (OOTW), and the accelerating technological advances in Command and Control (C2) have highlighted C2 interoperability issues. Communications are increasingly software-driven, which makes the role of software architecture increasingly important in the design of interoperable communications systems. Simulation has an important role to play in defining and resolving interoperability issues stemming from requirements, policies, and procedures. Interoperability is such a challenge that the security implications of enhanced interoperability are often not considered. This paper suggests that the CCRP consider publishing a volume on C2 interoperability that codifies the body of knowledge developed by the JC2I2G offices. The paper is divided into the following sections: formation of the Joint Command and Control Integration Interoperability Group (JC2I2G) and the CINC Interoperability Program Offices (CIPOs), the software-driven interoperability domain, simulation and interoperability, software architecture, and interoperability and information security.

**HUMINT Communication Information Systems for Complex Warfare**

Pigeon, Luc; Beamish, Clark J; Zybala, Michel; Sep 2002; 16 pp.; In English; Original contains color illustrations  
Report No.(s): AD-A467646; No Copyright; Avail.: Defense Technical Information Center (DTIC)

Human intelligence (HUMINT) is one of the most versatile and powerful information sources available for situation awareness and decision-making. Its low cost and ready availability could make it the silver bullet of intelligence. This is particularly true within urban operations and operations in complex terrain, where technically acquired information may be degraded by that particular environment. Unfortunately, there are several drawbacks to HUMINT, in that it can be time-consuming; it may take several months to initially set up effective contacts in a particular environment; and it can be susceptible to deception. This paper proposes a framework for HUMINT and counter-HUMINT communication information system (CIS) development. The proposed framework is built to include both legacy HUMINT analytical processes/systems and to define new criteria for future HUMINT operations regarding information collection and information management. Objectives and accuracy achievements are proposed through the DITE (detection, identification, track, and estimate of future state) sequence of events. Data is structured by five-dimensions based on space, time and possible worlds. Processing is proposed with respect to common ontology, data merging and data fusion, resources management and learning capabilities.

Examples illustrate the CIS design for C-HUMINT, social networks, and urban operations human intelligence assessment.

**An Agent-Based Dynamic Information Security Model in Information Warfare**

Kuo, M H; Sep 2002; 12 pp.; In English; Original contains color illustrations

Report No.(s): AD-A467655; No Copyright; Avail.: Defense Technical Information Center (DTIC)

In this paper, the author proposes an agent-based Dynamic Information Security Decision Model (DISDM) that automatically integrates all distributed information security systems to achieve efficient defense information warfare (IW-D). The proposed DISDM can automatically drive intrusion inspection by dynamically executing sound security strategies (e.g., firewalls, high-assurance guards, authentication, intrusion detection, encryption, and security management, etc.) 24 hours a day. It also can repair the damage when systems have been under attack. Thus, it is expected to yield IW-D cost-effective solutions.

**Sharing the Dragon's Teeth: Terrorist Groups and the Exchange of New Technologies**

Cragin, Kim; Chalk, Peter; Daly, Sara A; Jackson, Brian A; Jan 2007; 131 pp.; In English; Original contains color illustrations

Report No.(s): AD-A467696; No Copyright; Avail.: Defense Technical Information Center (DTIC)

Operation Enduring Freedom and the global war on terrorism forced many members of al Qaeda to disperse, as the U.S. Government and its allies removed safe havens and arrested a number of key leaders. As a result, the nature of the terrorist threat against the USA appears to have changed. For example, some like-minded terrorist groups that perhaps do not have the global reach of a pre-9/11 al Qaeda nevertheless have formed regional alliances. Similarly, other events have caused terrorist groups that are not linked ideologically to form mutually beneficial partnerships. These partnerships have provided otherwise less capable terrorist groups with the opportunity to improve their skills and their reach. In each circumstance, emerging alliances could increase the threat that terrorism will pose to the USA in the next 3-15 years. Understanding these interactions, therefore, is essential to ongoing and future efforts in the U.S. global war on terrorism. Terrorist groups in three areas -- Mindanao, the West Bank and Gaza Strip, and southwest Colombia -- have exchanged technologies and knowledge in an effort to improve their operational capabilities. Studying these situations can provide the Department of Homeland Security (DHS) with examples of why and how terrorists might share new technologies in the future, as well as the degree to which these exchanges might be successful. The authors chose these case studies because the terrorist groups active in these regions are highly capable. This book examines a variety of different technologies and exchange processes, ranging from remote-detonation devices to converted field ordnance to katyusha rockets. In some instances, terrorists successfully obtained and deployed the technologies involved. Counterterrorism forces disrupted other technology exchanges. In total, the authors examined 11 terrorist groups that operate in these three regions.

**DoD Personnel Clearances: Delays and Inadequate Documentation Found for Industry Personnel**

Stewart, Derek B; May 17, 2007; 25 pp.; In English

Report No.(s): AD-A467747; GAO-07-842T; No Copyright; Avail.: Defense Technical Information Center (DTIC)

Individuals working for private industry are playing a larger role in national security work conducted by Department of Defense (DoD) and other federal agencies. As of May 2006, private industry personnel held about 34 percent of DoD-maintained personnel security clearances. The damage that the unauthorized disclosure of classified information can cause to national security necessitates the prompt and careful consideration of who is granted a security clearance. Long-standing delays in determining clearance eligibility and other challenges led GAO to designate the DoD personnel security clearance program as a high-risk area in January 2005 and again in GAO's January 2007 update of high-risk areas. In February 2005, DoD transferred its security clearance investigation functions to the Office of Personnel Management (OPM) and now obtains almost all of its clearance investigations from OPM. The Office of Management and Budget (OMB)

is responsible for effective implementation of policy relating to determinations of eligibility for access to classified information. This testimony addresses the timeliness of the process and completeness of documentation used to determine eligibility of industry personnel for top secret clearances in January and February 2006. This statement relies primarily on GAO's September 2006 report (GAO-06-1070).

**Generic Organisation Data Integration Solution: The Fast and Convenient Way to Integrate Data**

d'Anjou, Richard; Martel, Francois; Sep 2002; 16 pp.; In English; Original contains color illustrations

Report No.(s): AD-A467761; No Copyright; Avail.: Defense Technical Information Center (DTIC)

The best solution to making tactical and strategic decisions at a coalition level would be to completely integrate information systems in a seamless manner without considering the various participating countries. Various technological solutions offer the required functionality to accomplish this. Unfortunately, even though considerable efforts are currently being deployed to make this possible, presently it is impossible to rapidly integrate information systems that would allow the existence of C2 applications to manage coalitions formed by any NATO member country. Given the requirements of countries to rapidly intervene in theatres of operation, often jointly with many countries, many army corps, it would be important to have a transitory solution that would allow the rapid integration of the various C2 applications that are used by the various involved countries, until all countries can standardize their respective applications. The Operational Data Store (ODS), is the data structure that integrates heterogeneous data coming from various sources into a coherent set of data and serve as a data source for C2 applications. In this paper, we will present a solution that uses an ODS to rapidly integrate C2 applications from various countries in order to provide C2 functions to a coalition.

**Modeling the Joint Battlespace Infosphere**

Hillman, Robert G; Hanna, James P; Walter, Martin J; Jun 2001; 9 pp.; In English; Original contains color illustrations

Report No.(s): AD-A467815; No Copyright; Avail.: Defense Technical Information Center (DTIC)

The Air Force is developing a concept known as the Joint Battlespace Infosphere (JBI) in order to achieve information superiority. The JBI builds on the Global Information Grid and will move the state-of-the-art in information management into information-centric warfare. JBI will address more than five million information objects, thousands of users and provide scalability challenges for currently available information management hardware and software systems and drive design requirements to create systems that are more capable. JBI concepts will initially be created working with prototypes and will eventually culminate in fielded implementations. Important issues, such as bandwidth, connectivity, computational requirements and storage, information protection and assurance, must be addressed. Significant efforts will be required to implement JBI resources, such as network technologies and topologies, required to achieve JBI's stated objective to achieve warfare information superiority. Key JBI resources are being modeled and simulated to identify, quantify, and resolve technology and topology issues influencing the prototyping, development, and deployment of an operational JBI. This simulation research will allow JBI developers to identify and mitigate programmatic risk early enough within the JBI seven-year development window to allow successful development and deployment of JBI. This paper will discuss the proof of concept assessment performed and the resulting development.

**Mapping of WDMET in AIS 2005 and AIS 2005 Military**

Champion, Howard R; Apr 2007; 10 pp.; In English; Original contains color illustrations

Contract(s)/Grant(s): W81XWH-06-C-0365

Report No.(s): AD-A467831; No Copyright; Avail.: Defense Technical Information Center (DTIC)

Prior to current efforts to document combat casualty care and outcome in OEF/OIF, the WDMET was the largest collection of detailed combat casualty injuries available to guide military medical planners. The WDMET database collected in the later half of the Vietnam War remains a valuable research tool. This project has mapped some 7832 patient's injuries

from over 3,000 combat incidents that are recorded in the WDMET into contemporary injury severity taxonomies including injury severity scoring. The IECC is a collection of other combat casualty injury data (American, British and Israeli) also mapped from AIS-98 to AIS 2005 Civilian and Military. The result is that the WDMET and IECC databases are now usable in a fashion that can relate to contemporary injury databases, particularly the datasets that are being developed from the contemporary conflicts in Iraq and Afghanistan. This project has executed a fundamental step in furthering the understanding of the nature and severity of combat injury. It provides an analyzable database to combine or contrast with OEF/OIF data.

**Multinational Interoperability Requirements -- A Core Competency**

Hartel, Robert; Chamberlain, Sam; Oct 2000; 7 pp.; In English

Report No.(s): AD-A467857; No Copyright; Avail.: Defense Technical Information Center (DTIC)

Multinational coalitions are the standard for land forces in the full spectrum of land warfighting from operations other than war to armed conflict. Recent events in Bosnia, Kosovo, and East Timor necessitated interaction among the peacekeeping participants, most notably through their liaison channels. Automation of routine liaison tasks could result in a significant improvement in accurate command and control (C2) information exchange. Routine tasks handled through automation will complement the tasks of the liaison officer or cell, especially when the cooperating armies speak different languages. Multinational requirements in support of liaison and defined in the C2 information system (CCIS) are vital to gaining interoperability among multinational coalitions. However, the current process of defining multinational C2 requirements is flawed. The service tradition of working service requirements first, then joint requirements, and finally multinational requirements is a long-standing sequential process that mimics the implementation process. Funding also reflects this sequence. This paper makes the case that this sequence is backwards, and although it may be unrealistic to expect to change this order for the implementation process, there are no technical impediments that prevent reversing the order for the requirements definition process.

**The Quest for Effective Interoperability - Issues in Achieving a Naval Coalition Force Virtual Combat System**

Looney, Michael J; Conrad, Thomas P; Jun 2001; 10 pp.; In English

Report No.(s): AD-A467949; No Copyright; Avail.: Defense Technical Information Center (DTIC)

Over the last few years, experiences in naval coalition force activities have indicated a considerable shortfall in interoperability between participants. This has been detrimental to their overall capability and reduced their effectiveness. The problems are associated not only with the technical differences between the participating platforms but also with the lack of understanding of how to function as a network centric coalition task force. The latter being caused by the limited experience of working in such an environment, due to their limited occurrence, and also the cost of running any large scale exercises to address the basic problems. A collaborative venture has been underway for 18 months between UK and US naval research groups where an encrypted link is being used for the network connectivity to provide a suitable research environment to

investigate the problems. The objective is to address such areas as data requirements, management and filtering along with the necessary control strategies essential for effective interoperability in a networked coalition force. As well as gaining experience in areas that can be transferred onto operational systems, the four year program should provide some yardstick for measurement of interoperability and whether there is an improvement in technical capability or, perhaps, show that coalition force activity is primarily a political requirement.

#### **Evolution of a Mission Plan**

Heacox, Nancy J; Quinn, Michael L; Smillie, Robert J; Hayes, James A; Jensen, Jens A; Jun 2001; 13 pp.; In English; Original contains color illustrations

Report No.(s): AD-A467951; No Copyright; Avail.: Defense Technical Information Center (DTIC)

A prototype Decision Support System for Coalition Operations (DSSCO) is being developed by the Space and Naval Warfare Systems Center, San Diego, to support the Operations Planning Team (OPT) of the Commander in Chief, USA Pacific Command (CINCPAC). The goal of DSSCO is to apply and integrate organizational design concepts and decision support technologies in planning and executing multinational coalition operations. Employing a user-centered design approach, DSSCO researchers have developed a multi-component toolset. The Planning Module functions as a surrogate expert planner and guides OPT personnel through the evolution of a mission plan using the Crisis Action Planning process. DSSCO's supporting resources include a Coalition Planning Guide and access to relevant information regarding coalition partners and other organizations with whom the U.S. military must interface during a coalition operation. The Task Visualization Module presents the plan. It provides a collaborative display that enables distributed coalition forces to maintain shared situation awareness in real-time of their own activities in relation to those of other organizations. This paper describes the DSSCO toolset and the functional support it will provide to the OPT.

#### **Levels of Interoperability in Coalition Systems**

Handley, Holly A; Levis, Alexander H; Bares, Michel; Jun 2001; 16 pp.; In English; Original contains color illustrations

Contract(s)/Grant(s): N00014-00-1-0267

Report No.(s): AD-A467953; No Copyright; Avail.: Defense Technical Information Center (DTIC)

Systems of different command centers that are brought together in a coalition operation must have some level of interoperability in order to work together. Bares [2000] has introduced a formalism of three interoperability domains that describe the ability of the systems to define their own level of interoperability within the coalition by assessing their own and the other systems ability to interact on actions of the coalition. The lowest domain, interconnectivity, reflects the ability to exchange messages; this level must already have been achieved in order for the systems to participate in the coalition. The second domain, interoperability, reflects a system's ability to identify what tasks it is able to interoperate on. The third level, intercooperability, indicates that all systems have the ability to evaluate all other systems in the coalition. By describing the interoperability domains in this manner, the domains represent increasing levels of awareness of each system's own capabilities and those of the other systems; it represents the transition from exchanging data to exchanging knowledge. This research looks particularly at the interoperability level and the ability of systems to evaluate their own interoperability on the coalition's actions by using Bares' formalism of interoperability to assign actions to systems participating in the coalition.

#### **Toward an Interoperability Architecture**

Buddenberg, Rex; Jun 2001; 12 pp.; In English

Report No.(s): AD-A467957; No Copyright; Avail.: Defense Technical Information Center (DTIC)

In moving toward an interoperability architecture, the concept of network centric is a step in the right direction - all modules connect to the network, not to each other. And a handful of good network citizenship rules provide a syntactical guide for attachment. From the point of view of the network designer this is sufficient - we have enough to build internetworks for

the common good. The continued burgeoning of the Internet constitutes an existence proof. But a common networking base is insufficient to reach a goal of cross-system interoperability - the large information system. Many standardization efforts have attempted to solve this problem, but appear to have lacked the necessary scope. For instance, there have been many efforts aimed at standardizing data elements; these efforts, if followed through, yield some gains, but never seem to quite reach the interoperability goal. If we are to truly erect an interoperability architecture, we need to broaden the scope. This problem of cross-program, cross-service and cross-ally interoperability requires that we agree on the what of modularization, not just the how. This paper is aimed at framing the interoperability architecture problem.

**Data Mining and Homeland Security: An Overview**

Seifert, Jeffrey W; Mar 28, 2007; 36 pp.; In English; Original contains color illustrations

Report No.(s): AD-A468032; CRS-RL31798; No Copyright; Avail.: Defense Technical Information Center (DTIC)

Data mining has become one of the key features of many homeland security initiatives. Often used as a means for detecting fraud, assessing risk, and product retailing, data mining involves the use of data analysis tools to discover previously unknown, valid patterns and relationships in large data sets. In the context of homeland security, data mining can be a potential means to identify terrorist activities, such as money transfers and communications, and to identify and track individual terrorists themselves, such as through travel and immigration records. While data mining represents a significant advance in the type of analytical tools currently available, there are limitations to its capability. One limitation is that although data mining can help reveal patterns and relationships, it does not tell the user the value or significance of these patterns. These types of determinations must be made by the user. A second limitation is that while data mining can identify connections between behaviors and/or variables, it does not necessarily identify a causal relationship. Successful data mining still requires skilled technical and analytical specialists who can structure the analysis and interpret the output.

**20070027674** Diabetes Technology Society, Foster City, CA USA

**Third Annual Clinical Diabetes Technology Meeting**

Klonoff, David D; May 2007; 22 pp.; In English; Original contains color illustrations

Contract(s)/Grant(s): W81XWH-06-1-0793

Report No.(s): AD-A468075; No Copyright; Avail.: Defense Technical Information Center (DTIC)

The Third Annual Clinical Diabetes Technology Meeting was presented by the Diabetes Technology Society at the San Diego California Marriott Mission Valley Hotel on April 20-21 2007. The attendance was 378 healthcare providers and scientists. The first day of the meeting covered Technologies for Diabetes Monitoring and the second day covered Technologies for Diabetes Therapy. On April 20 2007 which was the Technologies for Diabetes Monitoring day, the first presentation was made by Christopher Saudek, M.D. on the topic 'The Impact of Self Monitoring of Blood Glucose on Glycemic Control'. This clinician emphasized the benefits of glucose monitoring to achieve glycemic targets. Bruce Buckingham, M.D. presented an overview on Continuous Glucose Monitoring. He described how metabolic monitoring with continuous glucose monitoring can provide information about nutritional and metabolic status that is unavailable with spot glucose testing. William Clarke, M.D. discussed the concept of 'Glycemic Variability' which means that acute fluctuations in blood glucose levels can be as harmful for the circulation as prolonged severe hyperglycemia. Glycemic variability can be best measured through continuous glucose monitoring technology. Howard Wolpert, M.D. discussed 'Establishing a CGM Program' and pointed out how important it is to utilize the data provided by continuous glucose monitoring to determine therapy of diabetes. He provided examples of glycemic patterns that can be discerned through this monitoring technology. Darrell Wilson, M.D. spoke on the use of CGM to Improve Control and Prevent hypoglycemia: Case Studies' and gave examples of how continuous glucose monitoring can provide insight into patient behavior and assist in determining drug and diet therapy. He described the work of the multicenter research group DirectNET.

**Data Mining and Homeland Security: An Overview**

Seifert, Jeffrey W; Jan 18, 2007; 34 pp.; In English; Original contains color illustrations

Report No.(s): AD-A468120; CRS-RL31798; No Copyright; Avail.: Defense Technical Information Center (DTIC)

Data mining has become one of the key features of many homeland security initiatives. Often used to detect fraud and assess risk, data mining involves the use of data analysis tools to discover previously unknown, valid patterns and relationships in large data sets. In the context of homeland security, data mining can be a potential means to identify terrorist activities, such as money transfers and communications, and to identify and track individual terrorists themselves, such as through travel and immigration records. While data mining represents a significant advance in the type of analytical tools currently available, there are limitations to its capability. One limitation is that although data mining can help reveal patterns and relationships, it does not tell the user the value or significance of these patterns. These types of determinations must be made by the user. A second limitation is that while data mining can identify connections between behaviors and/or variables, it does not necessarily identify a causal relationship. Successful data mining still requires skilled technical and analytical specialists who can structure the analysis and interpret the output. Some homeland security data mining initiatives that have attracted congressional interest include the Terrorism Information Awareness (TIA) Program, (now-discontinued); the Computer-Assisted Passenger Prescreening System II (CAPPS II, now canceled and replaced by Secure Flight); the Multi-State Anti-Terrorism Information Exchange (MATRIX) pilot project; the Able Danger program; the Automated Targeting System (ATS); and data collection and analysis projects being conducted by the National Security Agency (NSA). While technological capabilities are important, there are other implementation and oversight issues that can influence the success of a project's outcome: data quality, software interoperability, mission creep, and privacy.

**Developing an Information Superiority-Command and Control Joint Experimentation Strategy**

Richards, Russell; Curtis, Keith; Paradiso, Rick; Oct 2000; 5 pp.; In English

Report No.(s): AD-A468154; No Copyright; Avail.: Defense Technical Information Center (DTIC)

This paper describes the rationale, development, and intended outcome of a joint experimentation strategy that will be used to investigate three concepts under study at the Joint Experimentation Directorate (J9) of the U.S. Joint Forces Command (USJFCOM). The concepts are Common Relevant Operational Picture (CROP), Joint Interactive Planning (JIP), and Adaptive Joint Command and Control (AJC2). USJFCOM J9 defines an experimentation strategy as a systematic and detailed plan of action encompassing methods to be adopted from beginning to end for evaluating a concept. In contrast to an experimental design, which is a plan for the conduct of an experimental study, an experimentation strategy is a plan for investigating a concept. This distinction is critical, as concept-based experimentation, the USJFCOM J9 approach to experimentation, is still so new that there is little agreement on definitions and terms among the many organizations involved. This paper presents the roadmap of how J9 plans to address the investigation of these three concepts. Initial efforts by the CROP, JIP, and AJC2 Integrated Concept Teams (ICTs) focused on developing a separate experimentation strategy for each concept. But after much study, the ICT members found that there were so many similarities and interrelationships among the concepts, it made more sense to combine the ICTs and develop a single strategy for concept investigation. For clarity and consistency, the experimentation strategy for the three information-related concepts is being called the Information Superiority - Command and Control (IS-C2) Experimentation Strategy. The IS-C2 concepts are the enablers that will allow the U.S. military to transform traditional operational warfighting by making changes in weapon systems, doctrine, culture, and organization.

**Integration of Information Operations into Effects-Based Operations: Some Observations**

Wentz, Larry K; Wagenhals, Lee W; Jun 2003; 36 pp.; In English; Original contains color illustrations

Contract(s)/Grant(s): N00014-00-1-0267; F49620-02-1-0332

Report No.(s): AD-A468338; No Copyright; Avail.: Defense Technical Information Center (DTIC)

Information Operations (IO) has become a primary war fighting capability and is now considered a military core competency. The military Services are establishing IO as a military career field equivalent to other war fighting fields and they are developing supporting education and training programs to create a pipeline of trained and experienced information operations warriors. Transforming doctrine into an operational reality has, however, proven to be a challenge and the training

programs and operational planning and assessment tools have been slow to materialize. Operations in the Balkan's and Afghanistan have afforded the military the opportunity to conduct IO and to document experiences and lessons from these real world operations. A number of experiments and exercises also have explored new military concepts that included the use of non-kinetic IO means of national power to influence adversary behavior and actions. This paper explores some of the challenges of executing and assessing IO courses of action including some observations regarding integration of IO into EBO. The insights and observations offered are based on the authors multiple experiences. Operationalizing IO is work in progress and much remains to be done to bridge policy, doctrine, applications and tools.

**Assessing Perceptions of Knowledge Management Maturity/Capabilities: A Case Study of SAF/FM**

Blair, Aaron M; Mar 2007; 118 pp.; In English; Original contains color illustrations

Report No.(s): AD-A468368; AFIT/GIR/ENV/07-M3; No Copyright; Avail.: Defense Technical Information Center (DTIC)

Knowledge is an essential organizational resource that is required at all echelons to accomplish processes, to make decisions, and to improve efficiency and effectiveness. In order to take advantage of the benefits of knowledge, organizations must harvest and leverage the collective knowledge of the entire workforce through effective knowledge management (KM). The Air Force Center of Excellence for Knowledge Management recognized SAF/FM as having an exemplar KM program within the Air Force. This research used the Knowledge Management Capability Assessment (KMCA) framework to assess the overall KM maturity and capabilities of the seemingly mature SAF/FM KM program. The results indicate that the SAF/FM KM program is at an overall KM maturity of level 2; the organization recognizes the value of knowledge assets, its culture encourages activities associated with knowledge sharing, and the senior leadership communicates the value of and shows commitment to knowledge sharing. The organization's KM maturity is inhibited by its lack of a KM strategy and lack of formal mechanisms and processes to acquire and store its knowledge assets.

**The Challenge of New and Emerging Information Operations**

Heath, James E; Woodcock, Alexander E; Jun 1999; 9 pp.; In English; Original contains color illustrations

Report No.(s): AD-A468421; No Copyright; Avail.: Defense Technical Information Center (DTIC)

Information operations as defined in Joint Publication 3-13 of the Joint Staff (1998) are aimed at influencing the information and information systems of an adversary and defending one's own information and information systems. Such operations require the continuous and close integration of offensive and defensive activities; the design, integration, and interaction of C2 procedures with supporting intelligence; and may involve public and civil affairs-related actions. Offensive IO involve the use of supporting information and intelligence capabilities and assets to influence adversarial decision-makers and to achieve specific objectives. Defensive IO are aimed at protecting and defending friendly information assets through information assurance, operations security, physical security, counter-deception, and electronic warfare. IO in support of civil-military interactions is becoming increasingly more important as non-kinetic courses-of-action are required. Incorporating IO into military operations up until now has been extremely difficult due to the lack of doctrine and operational or technological support. However, Joint Publication 3-13 has addressed the doctrinal requirements while innovative operational sites such as the Army's INSCOM Information Dominance Center (IDC) are addressing the operational and technological needs. The IDC serves as a model for the DoD and a proposed virtual hearing room for Congress. As the IDC and its supporting technologies mature, individuals will be able to freely enter, navigate, plan, and execute operations within Perceptual and Knowledge Landscapes. This capability begins the transition from Information Dominance to Knowledge Dominance. The IDC is instantiating such entities as smart rooms, avatars, square pixel displays, polymorphic views, and other technologies for directly interacting in virtual domains. This will take us to the next paradigm of human-machine interaction within the multi-dimensional spaces required for IO.

**Industrial Base Model Data Requirements (IBMDR)**

Leake, Charles R; Apr 2003; 27 pp.; In English

Report No.(s): AD-A468467; CAA-R-03-05; No Copyright; Avail.: Defense Technical Information Center (DTIC)

The project determined if a data base existed that could be used in analysis of the organic Department of Defense (DOD) industrial base. This data base, although suitable for numerous analyses, did not contain all the data elements required for the, 'Optimizing the Capacity and Operation of U.S. Army Ammunition Production Facilities' model, developed by Vedat Bayram at the Naval Postgraduate School. A new model would have to be developed or the current model changed to conduct an optimization study using the DOD data base presently available.

**Security Classification Policy and Procedure: E.O. 12958, as Amended**

Relyea, Harold C; Apr 23, 2007; 7 pp.; In English; Original contains color illustrations

Report No.(s): AD-A468540; CRS-97-771-GOV; No Copyright; Avail.: Defense Technical Information Center (DTIC)

After two years of preparation, Executive Order 12958, prescribing security classification policy and procedure, was signed by President William Clinton in mid-April 1995. The order was prompted by changing security conditions in the aftermath of the end of the Cold War and a desire for more economical and effective management of classified information. The directive was modified in late March 2003 by Executive Order 13292, issued by President George W. Bush. Largely prescribed in a series of successive presidential executive orders issued over the past 50 years, security classification policy and procedure provide the rationale and arrangements for designating information officially secret for reasons of national security, and for its declassification as well.

**Access to Government Information in the USA**

Relyea, Harold C; Kolakowski, Michael W; Apr 23, 2007; 7 pp.; In English; Original contains color illustrations

Report No.(s): AD-A468541; CRS-97-71-GOV; No Copyright; Avail.: Defense Technical Information Center (DTIC)

The Constitution of the USA makes no specific allowance for any one of the co-equal branches to have access to information held by the others and contains no provision expressly establishing a procedure for, or a right of, public access to government information. Nonetheless, Congress has legislated various public access laws. These include two records access statutes -- the Freedom of Information Act (FOI Act or FOIA; 5 U.S.C. 552) and the Privacy Act (5 U.S.C. 552a) -- and two meetings access statutes -- the Federal Advisory Committee Act (FACA; 5 U.S.C. App.) and the Government in the Sunshine Act (5 U.S.C. 552b). Moreover, due to the American separation of powers model of government, interbranch conflicts over the accessibility of information are neither unexpected nor necessarily destructive. The federal courts, historically, have been reluctant to review and resolve 'political questions' involving information disputes between Congress and the executive branch. Although there is considerable interbranch cooperation, such conflicts probably will continue to occur on occasion.

**Performance Analysis and Training for Digital Command Staff: Training for the Battle Command Reengineering III**

Campbell, Charlotte H; Deatz, Richard C; Quinkert, Kathleen A; Jun 2000; 17 pp.; In English

Report No.(s): AD-A468588; No Copyright; Avail.: Defense Technical Information Center (DTIC)

The transition to the digital Army of Force XXI and beyond is characterized by challenges to how the Army will train, maintain, and operate as an information age force. In response to the concerns and issues resulting from digitization, the U. S. Army Research Institute for the Behavioral and Social Sciences (ARI), Armored Forces Research Unit, is engaged in the design and development of training and performance evaluation techniques to support Force XXI digital capabilities. This paper summarizes an ARI project that addressed training for leaders and staffs of future digital environments. Based on learning and performance research on team training and operations in digital environments, a training support package for a future-battlefield experiment was constructed. Coordination between ARI and the Mounted Maneuver Battlespace Laboratory

(MMBL) at Fort Knox, Kentucky enabled the two organizations to work together as a team to accomplish multiple goals. Observations and data collection during implementation of the training led to formulation of a series of lessons learned on training content and training structure. These lessons are addressed to several audiences, including developers of future staff training and researchers conducting future systems experiments and training.

ONLINE: <http://hdl.handle.net/100.2/ADA466475>

The Office of Technology Transition (OTT) was established by the Secretary of Defense in response to 10 U.S.C. 2515 to serve as a focal point for the domestic technology transfer activities of the Department of Defense. This report, required by Section 2515 (See Appendix A), summarizes the accomplishments and highlights key technology transfer efforts throughout the Department for FY 2004 and FY 2005. This 11th report discusses our major efforts and successes in transferring technology. Appendix B displays specific data elements showing the trends in Cooperative Research and Development Agreements (CRADAs) and Patent License Agreements (PLAs), and the increase in royalty income as a result of licensing DoD developed technologies. Appendix C describes the DoD George F. Linsteadt Technology Transfer Achievement Award and provides information on the award winners. Appendix D highlights some of the technology transfers such as the Vein Viewer which is a system and method for enhancing visualization of veins, arteries, and other subcutaneous natural or foreign structure in the body. Appendices E and F provide the details of the Federal Laboratory Consortium (FLC) awards to DoD activities for FY 2004 and FY 2005, respectively.

**Organisational Interoperability: Evaluation and Further Development of the OIM Model**

Fewell, Suzanne; Clark, Thea; Jun 2003; 42 pp.; In English; Original contains color illustrations

Report No.(s): AD-A466378; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA466378>

The military imperative to achieve increased interoperability both within forces and with other nations is well recognized. DSTO previously developed an Organizational Interoperability Maturity Model (OIM) to evaluate interoperability at the organizational level. The OIM considers the human-activity aspects of military operations, which are not covered in other models. This paper describes how the model has been used to identify problems and to conduct evaluations in coalition operations such as INTERFET and the Australia US Interoperability Review. These assessments showed that the attributes of the OIM needed development and refinement. Further work on the model is presented. This model is then used to conduct a preliminary evaluation of interoperability between Australia and the US in the Multinational Limited Objective Experiment 2.

**A Theory of Interoperability Failures**

McBeth, Michael S; Mar 2003; 64 pp.; In English; Original contains color illustrations

Report No.(s): AD-A466372; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA466372>

This paper develops a theory of interoperability failures. Interoperability in this paper refers to the exchange of information and the use of information, once exchanged, between two or more systems. The need for a theory of interoperability failures is introduced along with a discussion of the reinforcing relationship between theory and experiment. First, the interoperability of two systems over time is considered. The failure rate for electronic equipment as it ages over time often follows a life distribution model in the shape of the widely known Bathtub curve. By analogy, if one considers the interaction of two systems over time, a theory of interoperability failures can be developed by postulating a life distribution

model with three distinct time periods: early, mediate, and relative obsolescence. A causal analysis that focuses on intended functionality, requirements, design implementation, and developmental testing is used to explain the existence of these three time periods. Then, the relationship between interoperability and complexity in terms of interaction and coupling is discussed. Finally, the theory is used to develop criteria for selecting specific systems to study and collect data to refute or lend credence to the theory.

**The President's Identity Theft Task Force: Combating Identity Theft a Strategic Plan**

Apr 11, 2007; 120 pp.; In English; Original contains color illustrations

Report No.(s): AD-A467064; No Copyright; Avail.: Defense Technical Information Center (DTIC)

From Main Street to Wall Street, from the back porch to the front office, from the kitchen table to the conference room, Americans are talking about identity theft. The reason: millions of Americans each year suffer the financial and emotional trauma it causes. This crime takes many forms, but it invariably leaves victims with the task of repairing the damage to their lives. It is a problem with no single cause and no single solution. Eight years ago, Congress enacted the Identity Theft and Assumption Deterrence Act,<sup>1</sup> which created the federal crime of identity theft and charged the Federal Trade Commission (FTC) with taking complaints from identity theft victims, sharing these complaints with federal, state, and local law enforcement, and providing the victims with information to help them restore their good name. Since then, federal, state, and local agencies have taken strong action to combat identity theft. The FTC has developed the Identity Theft Data Clearinghouse into a vital resource for consumers and law enforcement agencies; the Department of Justice (DOJ) has prosecuted vigorously a wide range of identity theft schemes under the identity theft statutes and other laws; the federal financial regulatory agencies<sup>2</sup> have adopted and enforced robust data security standards for entities under their jurisdiction; Congress passed, and the Department of Homeland Security issued draft regulations on, the REAL ID Act of 2005; and numerous other federal agencies, such as the Social Security Administration (SSA), have educated consumers on avoiding and recovering from identity theft. Many private sector entities, too, have taken proactive and significant steps to protect data from identity thieves, educate consumers about how to prevent identity theft, assist law enforcement in apprehending identity thieves, and assist identity theft victims who suffer losses.

**Army Intelligence Analysis and Interpretation: Assessing the Utility and Limitations of Computational Diagnostic Reasoning**

Powell, Gerald M; Jun 2004; 12 pp.; In English; Original contains color illustrations

Report No.(s): AD-A466043; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA466043>

The U.S. Army's Future Force is critically dependent on information superiority levels that will support timely, quality decision-making during high tempo operations. The Future Force is anticipated to produce unprecedented levels of data requiring analysis. Data fusion is considered by some as the potential solution to handling this severe data overload. The Joint Directors of Laboratories Data Fusion model categorizes data fusion-related functions at a high level of generality. For fusion in the Army, little has been published reflecting an elaboration of functionality on levels 2 and 3 of this model, both of which are viewed as critical elements of intelligence analysis and interpretation. Walsh (2002) offered a first-level decomposition of functionality for Level 2. Powell and Broome (2002) and Powell (2002) indicated the complex set of interrelationships among problems within and between fusion levels characterizing Army intelligence analysis and interpretation suggests a user-centric, holistic approach addressing fusion levels 1 through 5. The present paper characterizes selected key aspects of analysis and interpretation problems and processes based on observations of Army intelligence analysis (in practice) associated with anticipated requirements for the Unit of Action. We analyze the utility and limitations of a computational model of diagnostic reasoning with respect to intelligence analysis and interpretation and identify classes of knowledge that appear to be essential to performing these tasks. The results are considered with respect to their implications for automated support to intelligence analysis and interpretation.

**Methods for Effective Virtual Screening and Scaffold-Hopping in Chemical Compounds**

Wale, Nikil; Karypis, George; Watson, Ian A; Apr 4, 2007; 12 pp.; In English; Original contains color illustrations  
Contract(s)/Grant(s): DAAD19-01-2-0014; EIA-9986042; NSF ACI-01-33464; NSF IIS-04-31135; NIH-RLM008713A  
Report No.(s): AD-A467533; TR07-010; No Copyright; Avail.: Defense Technical Information Center (DTIC)

Methods that can screen large databases to retrieve a structurally diverse set of compounds with desirable bioactivity properties are critical in the drug discovery and development process. This paper presents a set of such methods, which are designed to find compounds that are structurally different to a certain query compound while retaining its bioactivity properties (scaffold hops). These methods utilize various indirect ways of measuring the similarity between the query and a compound that take into account additional information beyond their structure-based similarities. Two sets of techniques are presented that capture these indirect similarities using approaches based on automatic relevance feedback and on analyzing the similarity network formed by the query and the database compounds. Experimental evaluation shows that many of these methods substantially outperform previously developed approaches both in terms of their ability to identify structurally diverse active compounds as well as active compounds in general.

**Data Alignment between Army C4I Databases and Army Simulations**

Hieb, Michael R; Blalock, James; Jun 2001; 11 pp.; In English; Original contains color illustrations  
Report No.(s): AD-A468229; No Copyright; Avail.: Defense Technical Information Center (DTIC)  
ONLINE: <http://hdl.handle.net/100.2/ADA468229>

C4I Interfaces to Simulations are limited in functionality. One of the principle factors causing this is a lack of interface standards. While standards are a necessary condition, they are not sufficient. In order to have a complete interface, the data to be exchanged must be represented in both systems (C4I and Simulation). However, the current status is that C4I systems and simulations 1) do not contain the same data elements; 2) represent data differently, and 3) are often unaware of the other's data requirements. The Joint Technical Architecture-Army (JTA-Army) mandates use of specific data models for certain classes of information systems (such as tactical C4I systems). Simulation developers should be cognizant of these data models in the development of new Army Simulations. The Army is using a common data base, the Joint Common Data Base (JCDB,) in it's Army Battle Command Systems (ABCS). In order to interface effectively to Army C4I systems, simulations must represent the critical data elements that are 1) used to initialize the JCDB; and 2) sent between the simulations and C4I systems. However, often Army simulations do not contain these critical data elements which will result in functionality that must be provided by interfaces. Each data element that does not have an exact match on the simulation side causes a translation/transformation to occur, with resulting cost and complexity. Since any interface must align any differences, the interface can become quite complex. This paper compares an Army C4I Data Model of the JCDB to a simulation representation (an Army Modeling and Simulation Office proposed standard that is representative of current and future simulations) to identify areas which are not aligned. Results of this analysis show that current Army representations are not aware of the standard data models that will be used in future Army ABCS systems.

**Forecasting Complex Political and Military Events: The Application of Expected Utility to Crisis Situations**

Kugler, Jacek; Abdollahian, Mark A; Tammen, Ronald L; Jun 2000; 44 pp.; In English; Original contains color illustrations  
Report No.(s): AD-A468439; No Copyright; Avail.: Defense Technical Information Center (DTIC)

This paper introduces the C2 community to a new technology based process that permits the analyzing and forecasting of complex political and military issues, with particularly reference to crisis decision making. Traditional crisis decision making exercises and simulations constrain role playing and the inability to utilize current information effectively. Exercises usually contain dimensions of artificiality or designs based on future scenarios. There is a need to create 'real time' crisis decision-making environments where players can apply their current information base and manipulate hundreds of variables to achieve optimum outcomes. Our approach uses real world events and then forecasts their likely outcome allowing players

to engage in real time policy manipulation. In addition, we provide a means to alter policy actions to maximize national security gains. We demonstrate this analytical technology by offering the results of an experiment conducted during February/March 2000 at the National War College using the Chechnya crisis as a model.

**Building a Deterrence Policy Against Strategic Information Warfare**

French, Geoffrey S; Jun 2002; 14 pp.; In English

Report No.(s): AD-A467493; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA467493>

As the USA continues as the sole nation with a vested interest in every region of the world, it is increasingly sensitive to asymmetric threats that neutralize or circumvent its ability to defend against or respond to hostile activity. One of these areas is broadly described as information warfare. One specific aspect of this refers to strategic information warfare (SIW) attack against the information technology base of the nation's critical infrastructures. Defending those infrastructures is problematic for the U.S. government. Although the military relies on the civilian infrastructure, it does not control it. Neither is the civilian government in a position to dictate to the private infrastructure organizations. Any attempts to defend the national information infrastructure may be based largely, therefore, on deterring an attack, rather than detecting and thwarting it. Although deterrence may be most commonly associated with nuclear warfare, the USA still relies to a large extent on deterring aggressive foreign activity to protect its interests worldwide. This paper assesses the threat from SIW attacks and reviews the theories of deterrence, focusing on deterrence in the post-Cold War era. It then describes some strategies the USA can build to deter SIW most effectively.

ONLINE: <http://hdl.handle.net/100.2/ADA467503>

The uncertainties of future scenarios require us to carefully investigate the real problems and issues to be addressed in modelling and analysis of Command and Control. This problem formulation process then needs to be supported by new tools for problem solution. In consequence, a new generation of Command and Control center constructive simulation models of conflict is being developed by Dstl in the UK. These have a coherent approach to the representation of Command and Control which is described in the paper. This baseline approach is then complemented by mathematical models of such processes (metamodels) which give insight into the likely modes of emergent behavior.

**Multinational Information Sharing and Collaborative Planning Limited Objective Experiments**

Curtis, Keith P; Jun 2002; 15 pp.; In English; Original contains color illustrations

Report No.(s): AD-A467502; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA467502>

This paper describes Multinational Collaboration and Information Sharing Limited Objective Experiment (LOEs) that examine multinational aspects of joint command and control concepts at the US Joint Forces Command (USJFCOM). LOEs are designed to be both exploratory and structured, so there is an element of discovery that is extremely useful. LOEs also examine assertions made by joint concepts. The LOE was completed in November 2001 and focused on collaborative planning with multinational partners planning a rapid decisive operation when planning time is short. The LOE compared courses of action (COAs) developed using traditional planning with COAs developed using integrated planning. Australia, Germany, UK, and USA formed traditional and integrated planning staffs, which were formed into independent planning teams linked through a secure global network. The two planning teams were presented with identical situations and background information, and using identical collaboration software asked to develop COAs in the allotted time. Senior subject matter experts from participating nations evaluated COAs for suitability, completeness, and accuracy to determine which process, traditional or integrated, produced a superior plan when planning time was short. Evaluations were blind since evaluators knew neither the process used nor the lead nation.

**Information Superiority through Data Warehousing**

Warner, Neil; Jun 2001; 15 pp.; In English; Original contains color illustrations

Report No.(s): AD-A468487; No Copyright; Avail.: Defense Technical Information Center (DTIC)

The aim of a Command Support System is to achieve decision superiority by providing a knowledge edge to the Commander. A precursor to a knowledge edge is Information Superiority. Within most current Command Support Systems minimal integration and fusion of data is undertaken to provide the basis of information superiority. Most data remains in its island and any integration of data is provided by human intervention or through the use of specific and often limited applications. Despite the introduction of computer systems and communication networks, decision makers cannot readily access critical information that already exists in an organization. Data is locked up in a myriad of computer systems and is exceedingly difficult to get at - 'data in jail'. Only a small fraction of the data that is captured, processed and stored in the enterprise is actually available to decision makers. Data Warehousing provides technology that has evolved into a new technology making it possible to attack the problem of providing commanders with access to whatever level of information is needed to make decisions. This paper will address the concept of providing improved information superiority and therefore decision superiority by the use of the commercial information technology 'data warehousing' concepts and tools.

**EyeKon: Distributed Augmented Reality for Soldier Teams**

Hicks, Jeffrey; Flanagan, Richard; Petrov, Plamen; Stoyen, Alexander; Jun 2003; 30 pp.; In English; Original contains color illustrations

Report No.(s): AD-A467774; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA467774>

The battlefield is a place of violence ruled by uncertainty. Timely knowledge of what's happening around a soldier can mean the difference between life and death. The goals of an enhanced mobile infantry are becoming a reality due, in part, to the U.S. Army's 21st Century Land Warrior (LW) program. However, the current system does not provide a head up display capability like that provided by today's avionics. When the soldier employs the weapon, he should see objects easily distinguishable as friendly or not, as well as enemy locations. The EyeKon project is an intelligent agent-based decision support system hosted on the soldier's wearable computer. EyeKon will use the soldier's private network to provide a perspective view in the weapon sight. This will naturally draw the warrior to the most desirable target. There are many performance and human factors issues to address before the concept can be used in lethal situations.

**Communication of Context in Multi-Echelon Information Exchange Environments**

Oonk, Heather M; Moore, Ronald A; Morrison, Jeffrey G; Jun 2004; 44 pp.; In English; Original contains color illustrations  
Report No.(s): AD-A466497; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA466497>

In fast-paced, distributed, multi-echelon, collaborative environments such as those experienced by the USA military during Operations Enduring Freedom and Iraqi Freedom, task performance very often depends on effective and efficient information exchange. One way to facilitate information exchange is to ensure that information producers and consumers develop a thorough shared situation context. Unfortunately, developing such a shared understanding of situation context is extremely difficult in these types of environments. This paper discusses a series of experiments that investigated methods of communicating context to information producers, and the impact this had on task performance. The results of these studies are intended to facilitate the design and development of tools to aid information producers and consumers in quickly and easily building shared situation context, and developing useful, usable information products based on this shared understanding. This paper reports the methods and results of the experiments conducted. The experiment results highlight important issues associated with building a shared situation context among information producers and consumers, and provide important insights necessary to develop tools to facilitate efficient and effective information exchange.

**Critical Infrastructure Information Disclosure and Homeland Security**

Moteff, John D; Stevens, Gina M; Jan 29, 2003; 23 pp.; In English

Report No.(s): AD-A467310; No Copyright; Avail.: Defense Technical Information Center (DTIC)

Critical infrastructures have been defined as those systems and assets so vital to the USA that the incapacity of such systems and assets would have a debilitating impact on the USA. One of the findings of the President's Commission on Critical Infrastructure Protection, established by President Clinton in 1996, was the need for the federal government and owners and operators of the nation's critical infrastructures to share information on vulnerabilities and threats. However, the Commission noted that owners and operators are reluctant to share confidential business information, and the government is reluctant to share information that might compromise intelligence sources or investigations. Among the strategies to promote information sharing was a proposal to exempt critical infrastructure information from disclosure under the Freedom of

Information Act. The Freedom of Information Act (FOIA) was passed to ensure by citizen access to government information. Nine categories of information may be exempted from disclosure. Three of the nine exemptions provide possible protection against the release of critical infrastructure information: exemption 1 (national security information); exemption 3 (information exempted by statute); and exemption 4 (confidential business information). Congress has considered several proposals to exempt critical infrastructure information from FOIA. Generally, the legislation has created an exemption 3 statute, or adopted the exemption 4 D.C. Circuit standard.

Shared awareness is not a simple construct; different levels of shared awareness arise when participants have access to information that is identical (common), consistent, conflicting or some combination of these. This paper discusses how individuals achieve awareness from information, and the impact for shared awareness. It identifies six levels of shared awareness that may exist between two individuals, which have distinct properties. The differences between three of these: Common Awareness, Potentially Shared Awareness and Fully Shared Awareness are discussed in the context of an Air-to-Air scenario where one set of planes is equipped with Link-16 and the other only has access to voice communications.

#### **Journalists' Privilege: Overview of the Law and 109th Congress Legislation**

Cohen, Henry; Oct 3, 2006; 7 pp.; In English

Report No.(s): AD-A467237; CRS-RS22205; No Copyright; Avail.: Defense Technical Information Center (DTIC)

Journalists, the Supreme Court has written, claim 'that to gather news it is often necessary to agree either not to identify the source of information published or to publish only part of the facts revealed, or both; that if the reporter is nevertheless forced to reveal these confidences to a grand jury the source so identified and other confidential sources of other reporters will be measurably deterred from furnishing publishable information, all to the detriment of the free flow of information protected by the First Amendment.' Though the Supreme Court concluded that the First Amendment does not provide a journalists' privilege, 49 states have adopted a journalists' privilege, and bills to adopt a journalists' privilege have been introduced in the 109th Congress, 1st session, in both the House and the Senate (S. 1419 and H.R. 3323) In addition, S. 2831 was introduced in the 109th Congress, 2d session.

#### **Defense Infrastructure. Actions Needed to Guide DOD's Efforts to Identify, Prioritize, and Assess Its Critical Infrastructure**

May 2007; 49 pp.; In English; Original contains color illustrations

Report No.(s): AD-A468295; GAO-07-461; No Copyright; Avail.: Defense Technical Information Center (DTIC)

While DOD has taken some important steps to implement DCIP, it has not developed a comprehensive management plan to guide its efforts. Our prior work,<sup>10</sup> as well as the Standards for Internal Control in the Federal Government,<sup>11</sup> emphasizes the importance of such a plan and management controls, respectively, to guide program implementation. Accordingly, this plan should include key elements, such as developing and issuing guidance, coordinating stakeholders efforts, and identifying resource requirements and sources. DOD's most recent effort to protect critical infrastructure began in September 2003 and, as of May 2007, most of DOD's DCIP guidance was either newly issued or still in draft form. In the absence of finalized guidance, DOD components have been pursuing Results in on established programs, such as the antiterrorism program, to implement DCIP, even though antiterrorism has not been formally linked to DCIP. Although DOD issued a DCIP directive in August 2005, the lead office ASD(HD&ASA) lacks a chartering directive that defines important roles, responsibilities, and relationships with other DOD organizations and missions. In March 2003, the Deputy Secretary of Defense required the

Director of Administration and Management within the Office of the Secretary of Defense to, among other things, define the relationship between the Directorates for HD&ASA and Special Operations and Low- Intensity Conflict and Interdependent Capabilities regarding several matters, including antiterrorism missions, in a chartering directive. However, as of May 2007, more than 4 years later, this task has not been accomplished. Similarly, because DOD s strategy on tracking and monitoring critical infrastructure was not issued until 2006, components have been collecting different information on their infrastructure, which, over the long term, could complicate information sharing and analysis across the DOD components and sector lead agents.

**Assessing an Automated, Information Sharing Technology in the Post ‘9-11’ Era: Do Local Law Enforcement Officers Think It Meets Their Needs**

Zaworski, M. J.; Feb. 2005; 218 pp.; In English

Report No.(s): PB2007-109803; Copyright; Avail.: National Technical Information Service (NTIS)

In the wake of the 9-11 terrorists attacks, the U.S. Government has turned to information technology (IT) to address a lack of information sharing among law enforcement agencies. This research determined if and how information-sharing technology helps law enforcement by examining the differences in perception of the value of IT between law enforcement officers who have access to automated regional information sharing and those who do not. It also examined the effect of potential intervening variables such as user characteristics, training, and experience, on the officers evaluation of IT. The sample was limited to 588 officers from two sheriffs offices; one of them (the study group) uses information sharing technology, the other (the comparison group) does not. Triangulated methodologies included surveys, interviews, direct observation, and a review of agency records. Data analysis involved the following statistical methods: descriptive statistics, Chi-Square, factor analysis, principal component analysis, Cronbach’s Alpha, Mann-Whitney tests, analysis of variance (ANOVA), and Scheffe post hoc analysis.

**Charting a Course for the 21st Century: NLM’s (National Library of Medicine’s) Long Range Plan, 2006-2016**

Sep. 2006; 77 pp.; In English

Report No.(s): PB2007-110365; No Copyright; Avail.: National Technical Information Service (NTIS)

In a world that is increasingly digital, the National Library of Medicine (NLM) already plays a pivotal role in enabling biomedical research, supporting health care and public health, and promoting healthy behavior. By connecting and making the results of research--from scientific data to published literature to patient and consumer health information--readily available, the Library magnifies the positive impact of the countrys investment in the creation of new knowledge. In the next ten years, NLMs programs and services will become even more central to scientific discovery, treatment, and prevention. Careful planning and visionary thinking are critical to the pursuit of that future. This Long Range Plan contains four overall goals: Goal 1. Seamless, Uninterrupted Access to Expanding Collections of Biomedical Data, Medical Knowledge, and Health Information; Goal 2. Trusted Information Services that Promote Health Literacy and the Reduction of Health Disparities Worldwide; Goal 3. Integrated Biomedical, Clinical, and Public Health Information Systems that Promote Scientific Discovery and Speed the Translation of Research into Practice; Goal 4. A Strong and Diverse Workforce for Biomedical Informatics Research, Systems Development, and Innovative Service Delivery.

**Security Classified and Controlled Information: History, Status, and Emerging Management Issues**

Relyea, Harold C; Mar 8, 2007; 37 pp.; In English; Original contains color illustrations

Report No.(s): AD-A468627; CRS-RL33494; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA468627>

The security classification regime in use within the federal executive branch traces its origins to armed forces information protection practices of the World War I era. The classification system designating information, according to prescribed criteria

and procedures, protected in accordance with one of three levels of sensitivity, based on the amount of harm to the national security that would result from its disclosure attained a presidential character in 1940 when President Franklin D. Roosevelt issued the initial executive order prescribing these information security arrangements. Refinements in the creation, management, and declassification of national security information followed over the succeeding decades, and continue today. In many regards, these developments represent attempts to narrow the bases and discretion for assigning official secrecy to executive branch documents and materials. Limiting the quantity of security classified information has been thought to be desirable for a variety of important reasons: (1) promoting an informed citizenry, (2) effectuating accountability for government policies and practices, (3) realizing oversight of government operations, and (4) achieving efficiency and economy in government management. Because security classification, however, was not possible for some kinds of information deemed in some quarters to be sensitive, other kinds of designations or markings came to be applied to alert federal employees regarding its privileged or potentially harmful character. Sometimes these markings derived from statutory provisions requiring the protection of a type of information; others were administratively authorized with little detail about their use. In the current environment, still affected by the long shadow of the terrorist attacks of September 11, 2001, several issues have arisen regarding security classified and controlled information.

**Defense Transportation. DOD Needs a Comprehensive Approach to Planning for Implementing Its New Personal Property Program**

May 2007; 56 pp.; In English

Report No.(s): AD-A468673; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA468673>

What GAO Found DOD has taken some initial steps to achieve the goals and benefits of Families First, but delays in developing a new information management system have put the overall goals of improving the quality of service from moving companies and streamlining the claims process at risk. The information management system, the Defense Personal Property System (DPS), is now more than 2 years behind schedule. DOD has missed DPS milestones because of software development issues and is now working to address issues identified in recent software testing. Since DPS has been delayed, DOD is in the process of implementing a backup plan to meet a statutory mandate to provide service members with the full replacement value of goods lost or damaged during a move by March 1, 2008. However, there are risks and costs associated with DOD's backup plan because it relies on an increasingly unreliable legacy computer system; also, DOD's plan may not cover all moves by March 1, 2008. The Families First program could increase costs to DOD by \$1.4 billion over current program costs through fiscal year 2011 for two main reasons: (1) DOD estimates the program will increase costs to the services' household goods budgets by 13 percent and (2) DOD has significantly increased the cost estimate for a new information management system since GAO's last assessment. While DOD's estimate that the Families First program will increase costs by 13 percent has not changed since 2005, all of the services have not yet fully budgeted for this cost increase, which GAO analysis shows could be about \$1.2 billion. Additionally, DOD has increased its estimate for an information management system for Families First because it decided to develop DPS rather than upgrade the legacy system. DOD estimated that the upgrade would cost \$4 million to \$6 million, and the program office estimated that DPS will cost about \$180 million through fiscal year 2011.

**The Department of Defense Net-Centric Data Strategy: Implementation Requires a Joint Community of Interest (COI) Working Group and Joint COI Oversight Council**

Bigger, Clinton R; May 17, 2007; 85 pp.; In English; Original contains color illustrations

Report No.(s): AD-A468811; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA468811>

In 2003, the ASD(NII) DoD CIO published the DoD Net-Centric Data Strategy providing guidance to DoD Components for the development of policies and practices to improve data sharing throughout the DoD. The objective of this strategy is to make data more visible, accessible, and understandable to users of the Global Information Grid (GIG). The stated goal of the strategy is to empower users through faster access to data by posting data prior to processing. The DoD Net-Centric Data Strategy provides a middle management approach to data management through Communities of Interest (COI), the reuse of discovery and content metadata, and use of GIG Enterprise Services (GES). COIs will be responsible for the development of

data sharing capabilities in developing Information Technology programs. COIs are encouraged to reuse metadata previously registered by other COIs. Commonly referred to as 'data tagging,' metadata is the technical link between data stored in the GIG and users searching for data. GES provides the enterprise services for the development of metadata and for data searches. The results of a 2006, Progress and Compliance Report, completed by the ASD(NII) DoD CIO document progress on the part of Mission Areas and DoD Components in creating COIs and establishing data sharing policies. However, in four key findings, the report documented areas that require attention by the DoD to achieve the goals of the DoD Net-Centric Data Strategy. Analysis of the report demonstrates a decentralized approach to developing data sharing policy has emerged and additional guidance is required to ensure DoD Net-Centric Data Strategy goals are met. To effectively implement the strategy, a Joint CIO Working Group and Joint CIO Oversight Council should be established to provide unity of effort to the creation of DoD data sharing policy and the development of discovery and content metadata standards.

ONLINE: <http://hdl.handle.net/100.2/ADA468836>

Amidst the rapid advancement of nano-technologies, the key role played by mechanics and mechanical characterization techniques cannot be overemphasized. Research on experimental, theoretical and computational mechanics enables the bridging of science and technology of all engineering materials and devices. We thus organized this symposium encompassing a broad spectrum of application areas and yet focusing on the mechanics and mechanical characterization at the nano- and micro-scales. The basic venue of the symposium is on a mixture of keynote addresses and short lectures given by top-notch researchers in the fields. This symposium has forged a synergistic interaction among materials scientists and solid technicians working toward the advancement of nano-technologies.

**A Model of Trust for Developing Trustworthy Systems From Untrustworthy Actors**

Ray, Indrajit; Ray, Indrakshi; Apr 2007; 91 pp.; In English; Original contains color illustrations

Contract(s)/Grant(s): F30602-03-1-0101; Proj-FAA6

Report No.(s): AD-A468853; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA468853>

The objective of this effort is to develop a new model of trust that allowed one to reason about trust relationships in information systems with special emphasis on trust as it related to integrity and availability. The project has produced the following results. 1. It has proposed a formal model to assess multiple levels of trust that is more inclusive than the current binary models. A major strength of the model is that it is more in keeping with the social models of trust used by policy makers. 2. It has defined a notion of degrees of trust and proposed expressions and procedures to evaluate and establish the degree of trust of different systems. 3. It has defined procedures to compare information at different degrees of trust. 4. It has developed procedures to determine the trust level of composed information. 5. It has formulated processes and procedures to manage trust relationships.

**Army Digitization Operational Impacts**

Stein, Fred P; Jun 1999; 7 pp.; In English; Original contains color illustrations

Report No.(s): AD-A468423; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA468423>

This paper analyzes the current and near-term state of digitization within the USA Army. The author discusses the overall effort the Army is making to coordinate the introduction of new and radically different Information Age material into its Doctrine, Organization, Training, Logistics, Leadership, and Personnel. The Army has committed to changing its basic command and control (C2) process through the introduction of Information Age technologies. These technologies will enable vastly better Situational Awareness (SA). The future battlefield will be one in which SA will spell the difference between a war of attrition and one that is determined very quickly, perhaps without bloodshed. The Army has already begun to change the basic organizational structure of its current active duty divisions and its combat service support structures. The Army will field over 70 new systems in direct support of the first digitized division, the 4th Infantry Division at Fort Hood, Texas, by 1 January 2000. The four major systems that make up the digitization effort are as follows: the new Abrams weapon system, the new Bradley weapon system, Future Battlefield Command and Control Brigade and Below (FBCB2), and the Army Battlefield Command System (ABCS). New communications systems and weapon systems will support these C2 systems. The Army created a Digital Force Coordination Cell (DFCC) at Fort Hood to ensure that the new weapon systems and information systems were coordinated with Doctrine, Training, Leader Development, Organization, Materiel, and Soldiers (DTLOM-S). This paper provides brief descriptions of these systems and discusses their impact on the operational and tactical levels of war. The discussion includes lessons learned from real-life applications of the new technologies.

**Regaining the High Ground: The Challenges of Perception Management in National Strategy and Military Operations**

Martemucci, Matteo G; Jun 17, 2007; 86 pp.; In English; Original contains color illustrations

Report No.(s): AD-A468873; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA468873>

The informational element of power may be the most elusive for the U.S. Government to wield, but its importance is proportional to its difficulty. With the rise in global terrorist networks and a precipitous decline in world opinion of America's foreign policy, Perception Management is more critical now than at any time in America's history. This paper attempts to answer the question of why, in this time of conflict, it is so difficult for the U.S. Government to effectively leverage the informational element of power. It explores three friction-inducing elements that afflict the U.S. Government, including the military. The U.S. Government's politics and personalities, bureaucracy, and aversion to the use of mass media, even in time of war, have precluded an integrated Perception Management campaign. A historical review of Perception Management strategies since World War I reveals that this difficulty is based largely on individual personalities, an ever-growing bureaucracy, and an historical American concern about the perceived manipulation of the media by its government. To solve this problem, the President must clearly define lines of authority regarding the Government's Perception Management strategy. He also must give that authority to a strong leader capable of coordinating the disparate efforts of numerous Government agencies. Finally, the U.S. Government must take a more proactive approach to media engagement as part of an integrated strategic Perception Management campaign.

**RIDE vs. CLASP Comparison and Evaluation: Models and Parameters**

Folchi, John S; Apr 2007; 61 pp.; In English; Original contains color illustrations

Contract(s)/Grant(s): DAAD19-02-D-0001

Report No.(s): AD-A468891; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA468891>

CLASP, the Navy's enlisted personnel classification algorithm, has been used operationally since the early 1980s. The Navy is considering replacing it with the RIDE algorithm, as part of its transition from PRIDE to NRAMS. The purpose of this research was to evaluate and compare the algorithms, so classification policymakers could better judge the feasibility and wisdom of the proposed change. The RIDE algorithm was analyzed to identify and evaluate the assumptions upon which it is based. Particular attention was given to the First Pass Pipeline Success (FPPS) school performance criterion and the Point of Diminishing Returns (PDR) concept. RIDE school performance prediction models were compared with logistic regression prediction models to evaluate the RIDE mode development methodology. In addition, corresponding components of CLASP and RIDE were compared to better understand their similarities and differences. Sparsely documented aspects of the CLASP model were described in detail so policymakers could better understand the unique characteristics of CLASP and the methodology used to develop the CLASP utility functions.

**Development of a Geospatial Data-Sharing Method for Unmanned Vehicles Based on the Joint Architecture for Unmanned Systems (JAUS)**

Evans, III, Carl P; Aug 2005; 133 pp.; In English; Original contains color illustrations

Report No.(s): AD-A468989; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA468989>

A task performed almost effortlessly by humans, perception is perhaps one of the most difficult tasks for autonomous vehicles. While substantial research has been done to develop these technologies, few studies have examined ways for multiple heterogeneous unmanned systems to cooperate in their perception tasks. Our study examined ways to model both perceived and a priori geospatial information, and formatting these data so that they can be used by the growing unmanned systems community. We introduce a perception system model, consisting of distributed smart sensors. This system of sensors was developed for the Team CIMAR entry into the inaugural DARPA Grand Challenge autonomous vehicle competition held in March 2004. The Smart Sensor Architecture proved to be a power method of distributing the possessing of sensor data to systems developed by engineers who best knew a particular sensor modality. By standardizing the logical, transport, and electrical interfaces, the smart sensor architecture developed into a powerful world modeling method. We also investigated current geospatial data-modeling methods used in the unmanned systems and geodetic information systems (GIS) communities. Our study determined the commonalities among current methods and resulted in a first-generation geospatial data-sharing standard for unmanned systems compliant with the Joint Architecture for Unmanned Systems (JAUS).

**Consumer Control of Electronic Personal Health Information: What Does It Mean. Why Is it Important. A Report on Three Consumer Focus Group Meetings Convened October 2005 by the Office of the Assistant Secretary for Planning and Evaluation**

Mar. 2006; 53 pp.; In English

Report No.(s): PB2007-110730; No Copyright; Avail.: CASI: [A04](#), Hardcopy

Public and private health care sectors recognize that health information technology (HIT) plays a pivotal role for improving health care quality while reducing health care cost. Many new initiatives have created a momentum greater than in the past for adopting electronic health records (EHRs) and HIT in general. In the current environment, the principle that the patient and consumer control their personal health information (PHI) is frequently invoked and linked to the broader principle of patient-centricity. Surveys by the Markle Foundation and the California Health Care Foundation confirm that most consumers are concerned about the privacy and security of their PHI. While many consumers recognize the benefits of EHRs

and other forms of HIT, they want and expect to control access of their PHI who sees it, what they see and under what conditions.

**Health Information Exchange in Post-Acute and Long-Term Care**

Feb. 2007; 61 pp.; In English

Report No.(s): PB2007-110289; No Copyright; Avail.: CASI: [A04](#), Hardcopy

Clinicians require accurate and timely data to provide high quality patient care (Institute of Medicine, 2001). Nowhere is this more important than at times of care transition, when patients are transferred from one health setting to another. Transfers among care settings are common. Twenty-three percent of hospitalized patients over the age of 65 are discharged to another institution, and 12% are discharged from hospital with skilled home care services (Agency for Healthcare Research & Quality HCUPnet, 1999). An estimated 19% of patients discharged from a hospital to a skilled nursing facility (SNF) are re-admitted to the hospital within 30 days (Kramer, Eilertsen, Lin & Hutt, 2000). One study tracked post-hospital transitions for 30 days in a large, nationally representative sample of Medicare beneficiaries. Transitions in this study were defined as transfers to or from an acute hospital, emergency department, skilled nursing or rehabilitation facility, or home with or without home healthcare. Overall, 46 unique care patterns were identified during this relatively brief time period (Coleman, Min, Chomiak & Kramer, 2004b).

**Information Technology: When is Enough?**

Talkington, Darin; Mar 22, 2007; 18 pp.; In English

Report No.(s): AD-A469129; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA469129>

When does one have enough information technology? When do we cross the point of diminishing return? At what point in time do information planners and program managers provide too much information access? Will the vast Army investments in information technology, high speed data networking, and robust beyond line-of-sight telecommunications at the brigade and below level enable the tactical war fight? Or, will this investment in technology at the tactical level overtax already weary staffs and further inhibit their ability to focus their commanders on the most relevant information necessary to make sound timely decisions? As part of this research I plan to present an understanding of the challenges currently facing tactical commanders with regard to information overload. I will provide examples that underscore the dangers inherent in tactical commanders having too much information or too much reliance on information technology. I will present the current year range of investments being made in information technology and attempt to present the merits of increased investment in information analysis and dissemination management. I will compare the capabilities of information technology enablers like tactical networking support against the anticipated threats over the upcoming decade.

**Intelligence Reform and Terrorism Prevention Act of 2004: ‘Lone Wolf’ Amendment to the Foreign Intelligence Surveillance Act**

Bazan, Elizabeth B; Yeh, Brian T; Dec 19, 2006; 7 pp.; In English

Report No.(s): AD-A467266; CRS-RS22011; No Copyright; Avail.: Defense Technical Information Center (DTIC)

Section 6001 of the Intelligence Reform and Terrorism Prevention Act of 2004, P.L. 108-458, amended the definition of ‘agent of a foreign power’ in the Foreign Intelligence Surveillance Act (FISA), 50 U.S.C. 1801(b)(1), to add a new category of covered individuals. Under this lone wolf provision, a non-USA person who engages in international terrorism or activities in preparation for international terrorism is deemed to be an ‘agent of a foreign power’ under FISA. This provision does not change the procedures to be used to apply for a court order authorizing electronic surveillance or a physical search under FISA. If an order is sought under this definition of an ‘agent of a foreign power,’ however, the applicant is not required to demonstrate a connection between the target of the electronic surveillance or the physical search and a foreign nation, foreign group, or international terrorist group. Nor does the Foreign Intelligence Surveillance Court (FISC), in approving such an order, have to find probable cause to believe that such a connection existed. Rather, if the court authorizes such a surveillance or physical search using this definition of ‘agent of a foreign power,’ the FISC judge has to find, in pertinent part, that, based upon the information provided by the applicant for the order, the target had engaged in or was engaging in international terrorism or activities in preparation therefor. By operation of the sunset provision in Section 103 of the USA PATRIOT Improvement and Reauthorization Act, P.L. 109-177, the amendment to the definition of ‘agent of a foreign power’ in FISA will cease to have effect on December 31, 2009.

**A Study of the Attraction Forces of Lunar Dust Simulant**

Bradley, Robert Kelley; Jeevarajan, Antony; Thomas, Valor; August 08, 2007; 1 pp.; In English; USRA CASS Summer Student Presentation, 8 Aug. 2007, Houston, TX, USA; Copyright; Avail.: Other Sources; Abstract Only

In previous manned lunar missions little work was done on countermeasures to combat the spread of lunar dust onto equipment and into the habitat because the astronauts were not scheduled to stay on the lunar surface for extended periods of time. However, as NASA prepares to return to the moon for longer durations than before developing materials that can help in the fight against lunar dust is important. The purpose of this project is to examine the attraction forces between lunar dust and various materials in an effort to discover materials which have a low affinity for lunar dust. The adhesion forces present between individual grains of dust and various materials were analyzed using an atomic force microscope (AFM). The AFM probes were calibrated by the added-mass technique to find the spring constant of the cantilever. The probes were modified by attaching a particle of lunar dust stimulant to the cantilever arm. The adhesion force between the dust particle and various materials were determined by analysis of AFM force spectra.

**The Status and Future of the ICRF**

Fey, A L; Dec 2006; 7 pp.; In English

Report No.(s): AD-A466353; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA466353>

The International Celestial Reference Frame (ICRF) is currently defined by the radio positions of 212 extragalactic objects. Since its inception there have been two extensions to the ICRF. These extensions included revised positions of ICRF candidate and 'other' sources, based on inclusion of additional observations, as well as positions of an additional 109 'new' sources. With continued applicable Very Long Baseline Interferometry (VLBI) observations and improvements in analysis a better realization of the ICRF is now possible and an even better realization is feasible in the foreseeable future. Planning for a second realization of the ICRF is currently underway with a projected completion date concurrent with the 2009 IAU General Assembly. Within the next decade, optical astrometric satellites will present serious competition to the radio-based ICRF. Reevaluation of the spectral regime at which the ICRF is defined will then be necessary.

**Progress Report of the IAU Working Group on Precession and the Ecliptic**

Hilton, J L; Capitaine, N; Chapront, J; Ferrandiz, J M; Fienga, A; Fukushima, T; Getino, J; Mathews, P; Simon, J-L; Soffel, M; Dec 2006; 6 pp.; In English

Report No.(s): AD-A466354; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA466354>

The IAU Working group on Precession and the Ecliptic looked at several solutions for replacing the precession part of the IAU 2000A precession-nutation model, which is not dynamically consistent. These comparisons show that the Capitaine et al. (2003) precession theory, P03, is both dynamically consistent and the solution most compatible with the IAU 2000A nutation model. The two greatest sources of uncertainty in the precession theory are the rate of change of the Earth's dynamical flattening,  $\Delta J_2$ , and the precession rates (i.e., the constants of integration used in deriving the precession). The combined uncertainties limit the accuracy in the precession theory to approximately 2 mas cent(exp -2). Given that there are difficulties with the traditional angles used to parameterize the precession, the working group has decided that the choice of parameters should be left to the user. They shall provide a consistent set of parameters that may be used with either the traditional rotation matrix, or those rotation matrices described in Capitaine et al. (2003) and Fukushima (2003). They recommend that the ecliptic pole be explicitly defined by the mean orbital angular momentum vector of the Earth-Moon barycenter in an inertial reference frame, and explicitly state that this definition is being used to avoid confusion with previous definitions of the ecliptic. Finally, they recommend that the terms 'precession of the equator' and 'precession of the ecliptic' replace the terms 'lunisolar precession' and 'planetary precession,' respectively.

Report No.(s): AD-A466703; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA466703>

We present an atlas of Hubble Space Telescope images and ground-based, long-slit, narrowband spectra centered on the 6584 Angstrom line of [N ii] and the 5007 Angstrom line of [O iii]. The spectra were obtained for a variety of slit positions across each target (as shown on the images) in an effort to account for nonspherical nebular geometries in a robust manner.

We have extended the prolate ellipsoidal shell model originally devised by Aaquist, Zhang, and Kwok to generate synthetic images, as well as long-slit spectra. Using this model, we have derived basic parameters for the subsample of PNe that present ellipsoidal appearances and regular kinematic patterns. We find differences between our parameters for the target PNe as compared to those of previous studies, which we attribute to increased spatial resolution for our image data and the inclusion of kinematic data in the model fits. The data and analysis presented in this paper can be combined with detections of nebular angular expansion rates to determine precise distances to the PN targets.

#### **Evolution of Time Scales**

McCarthy, Dennis D; Dec 2006; 7 pp.; In English

Report No.(s): AD-A466355; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA466355>

Time scales have continued to evolve to meet the developing needs of users in modern times. Fifty years ago time based on astronomical observations of the Earth's rotation was sufficient to meet the needs for time, both civil and technical. During that 50-year interval, however, not only have these scales been expanded, but the advent of practical atomic clocks has led to the development of time scales based on atomic frequency transitions. In addition, the development of modern space techniques and the improvement in observational accuracy by orders of magnitude have led to the improvement of the theoretical concepts of time and the resulting relativistic definitions of time scales. The following sections provide a brief description of the chronological development of time scales since the middle of the 20th century: Mean Solar Time, Universal Time (UT), Ephemeris Time (ET), Atomic Time, Coordinated Universal Time (UTC), Dynamical Time Scales, and the Future of Time Scales.

#### **Analogical Reasoning and Conceptual Change: A Case Study of Johannes Kepler**

Gentner, Dedre; Brem, Sarah; Ferguson, Ronald W; Markman, Arthur B; Levidow, Bjorn B; Wolff, Phillip; Forbus, Kenneth D; Jan 1997; 39 pp.; In English

Contract(s)/Grant(s): N00014-89-J-1272

Report No.(s): AD-A466820; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA466820>

The work of Johannes Kepler offers clear examples of conceptual change. In this article, using Kepler's work as a case study, we argue that analogical reasoning facilitates change of knowledge in four ways: (a) highlighting, (b) projection, (c) representation, and (d) restructuring. We present these four mechanisms within the context of structure-mapping theory and its computational implementation, the structure-mapping engine. We exemplify these mechanisms using the extended analogies Kepler used in developing a causal theory of planetary motion.

#### **High Contrast Imaging Using Adaptive Optics for Extrasolar Planet Detection**

Evans, J. W.; Aug. 31, 2006; 124 pp.; In English

Report No.(s): DE2007-900101; UCRL-TH-224123; No Copyright; Avail.: National Technical Information Service (NTIS)

Direct imaging of extrasolar planets is an important, but challenging, next step in planetary science. Most planets identified to date have been detected indirectly not by emitted or reflected light but through the effect of the planet on the parent star. For example, radial velocity techniques measure the doppler shift in the spectrum of the star produced by the presence of a planet. Indirect techniques only probe about 15% of the orbital parameter space of our solar system. Direct methods would probe new parameter space, and the detected light can be analyzed spectroscopically, providing new information about detected planets.

**Understanding Magnetic Eruptions in the Sun and Their Interplanetary Consequences**

Fisher, George H; Apr 30, 2006; 4 pp.; In English; Original contains color illustrations

Contract(s)/Grant(s): F49620-01-1-0360

Report No.(s): AD-A468802; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA468802>

A major goal of our MURI project was to develop a state-of-the-art, observationally- tested 3-d numerical modeling system for predicting magnetic eruptions on the Sun and their interplanetary consequences. This project is motivated by the fact that the Sun drives the most violent space weather events. The mechanisms that trigger and drive these eruptions are the least understood aspects of space weather. A better physical understanding of how magnetic eruptions occur and how these disturbances propagate will surely lead to more accurate and longer range forecasts.

**Zero Gyro Kalman Filtering in the Presence of a Reaction Wheel Failure**

Hur-Diaz, Sun; Wirzburger, John; Smith, Dan; Myslinski, Mike; August 19, 2007; 4 pp.; In English; 2007 AAS/AIAA Astrodynamics Specialist Conference, 19-23 Aug. 2007, Mackinac Island, MI, USA; Original contains black and white illustrations

Contract(s)/Grant(s): NAS5-50000; Copyright; Avail.: CASI: [A01](#), Hardcopy

Typical implementation of Kalman filters for spacecraft attitude estimation involves the use of gyros for three-axis rate measurements. When there are less than three axes of information available, the accuracy of the Kalman filter depends highly on the accuracy of the dynamics model. This is particularly significant during the transient period when a reaction wheel with a high momentum fails, is taken off-line, and spins down. This paper looks at how a reaction wheel failure can affect the zero-gyro Kalman filter performance for the Hubble Space Telescope and what steps are taken to minimize its impact.

**Fast Coronal Mass Ejection Environments and the Production of Solar Energetic Particle Events**

Kahler, S W; Vourlidas, A; Oct 5, 2005; 9 pp.; In English

Contract(s)/Grant(s): Proj-2311

Report No.(s): AD-A467051; No Copyright; Avail.: Defense Technical Information Center (DTIC)

The search continues for coronal environmental factors that determine whether a fast coronal mass ejection (CME) results in a solar energetic particle (SEP) event at 1 AU. From a plot of peak 20 MeV SEP intensities versus associated CME speeds we select for comparison two groups of fast, wide, western hemisphere CMEs observed with the LASCO coronagraph from 1998 to 2002. The SEP-rich CME group produced the largest observed SEP events, and the SEP-poor CME group produced the smallest or no observed SEP events. The major differences are that the SEP-rich CMEs are brighter and more likely to be streamer blowouts and to follow colocated CMEs within 12 or 24 hours. The SEP-poor CMEs are fainter and less likely to interact with streamers or to follow preceding colocated CMEs. Thus we confirm the recent result that the SEP event peak intensities are higher when the associated driver CMEs are preceded within a day by wide CMEs at the same locations. However, the enhanced brightness, and therefore mass, of the SEP-rich CMEs appears to be their most dominant characteristic and suggests that either large longitudinal and latitudinal extents or higher densities are needed for fast CMEs to produce SEPs.

**Near-Relativistic Electron  $c/v$  Onset Plots**

Kahler, S; Ragot, B R; Jul 20, 2006; 9 pp.; In English

Contract(s)/Grant(s): Proj-2311

Report No.(s): AD-A467053; No Copyright; Avail.: Defense Technical Information Center (DTIC)

It is often assumed that the first arriving electrons of a near-relativistic ( $E > 30$  keV) electron event are injected at the Sun impulsively and simultaneously at all observed energies and propagate scatter-free to 1 AU. In that case, a plot of the onset times  $T$  versus  $c/v$  for various electron speeds  $v$  should yield the solar injection time  $T_{inj}$  and the propagation distance  $D$ . In some electron events  $D > 1.2$  AU, but the inferred injection times are characteristically delayed by 10 minutes after the start of metric/decametric type III radio bursts believed to be signatures of electron injection. The delays may indicate electron injections not directly associated with the type III bursts, but the delays could also result from gradual or energy-dependent injections or from significant coronal/interplanetary electron scattering, even for well-beamed events. These effects could invalidate the  $c/v$  plot analyses. We use Wind 3D Plasma and Energetic Particle (3DP) electron data to make  $c/v$  onset plots for 80 near-relativistic solar electron events to test for the consistency of the inferred values of  $D$ , which are found to be broadly distributed between 0.15 and 2.7 AU. In most cases  $D < 1$  AU, an unphysical result partially due to instrumental effects in the high-energy 3DP detector, but also clearly inconsistent with the assumptions of impulsive and energy-independent injection onsets and scatter-free propagation of the electrons. We also discuss how previous results from  $c/v$  plot analyses have yielded contradictory and/or challenging injection results for the near-relativistic electrons as well as for gradual and impulsive solar energetic ion events.

**Ultraviolet Properties of Halo Coronal Mass Ejections: Doppler Shifts, Angles, Shocks, and Bulk Morphology**

Ciaravella, A; Raymond, J C; Kahler, S W; Nov 20, 2006; 20 pp.; In English

Contract(s)/Grant(s): Proj-2311

Report No.(s): AD-A467055; AFRL-VS-HA-TR-2007-1050; No Copyright; Avail.: Defense Technical Information Center (DTIC)

We present UV spectral information for 22 halo or partial halo CMEs observed by UVCs. The CME fronts show broad line profiles, while the line intensities are comparable to the background corona. The Doppler shifts of the front material are generally small, showing that the motion of gas in the fronts is mostly transverse to the line of sight. This indicates that, at

least in halo CMEs, the fronts generally correspond to coronal plasma swept up by a shock or compression wave, rather than plasma carried outward by magnetic loops. This favors an ice cream cone (or a spherical shell) model, as opposed to an expanding arcade of loops. We use the line widths to discriminate between shock heating and bulk expansion. Of 14 cases where we detected the CME front, the line broadening in 7 cases can be attributed to shock heating, while in 3 cases it is the line-of-sight component of the CME expansion. For the CME cores we determine the angles between the motion and the plane of the sky, along with the actual heliocentric distances, in order to provide quantitative estimates of projection effects.

**Solar Radio Burst and Solar Wind Associations With Inferred Near-Relativistic Electron Injections**

Kahler, S W; Aurass, H; Mann, G; Klassen, A; Feb 10, 2007; 11 pp.; In English

Contract(s)/Grant(s): Proj-2311

Report No.(s): AD-A467056; No Copyright; Avail.: Defense Technical Information Center (DTIC)

The solar injections of near-relativistic (NR) electron events observed at 1 AU appear to be systematically delayed by 10 minutes from the associated flare impulsive phases. We compare inferred injection times of 80 electron events observed by the 3DP electron detector on the Wind spacecraft with 40-800 MHz solar observations by the AIP radio telescope in Potsdam-Tremsdoff, Germany. Other than preceding type III bursts, we find no single radio signature characteristic of the inferred electron injection times. The injection delays from the preceding type III bursts do not correlate with the 1 AU solar wind Beta Rho or Beta but do correlate with densities  $n_e$  and inversely with speeds  $V_{sw}$ , consistent with propagation effects. About half of the events are associated with metric or decametric-hectometric (dh) type II bursts, but most injections occur before or after those bursts. Electron events with long (greater than or equal to 2 hr) beaming times at 1 AU are preferentially associated with type II bursts, which supports the possibility of a class of shock-accelerated NR electron events.

The Naval Research Laboratory (NRL) Space Science Division (SSD) conducts a broad-spectrum RDT&E program in solar-terrestrial physics, astrophysics, upper/middle atmospheric science, and astronomy. Instruments to be flown on satellites, sounding rockets and balloons, and ground-based facilities and mathematical models are conceived and developed. Division researchers apply these and other capabilities to the study of the atmospheres of the Sun and the Earth, including solar activity and its effects on the Earth's ionosphere, upper atmosphere and middle atmosphere, laboratory astrophysics, and the unique physics and properties of celestial sources. The program is important to orbital tracking, radio communications and navigation that affect the operation of ships and aircraft, utilization of the near-space and space environment of the Earth, and to the fundamental understanding of natural radiation and geophysical phenomena. This first quarterly newsletter provides highlights of SSD activities in January 2007, and a summary of SSD accomplishments in 2006.

**Interplanetary CMEs Without Observed Coronagraph CMEs**

Simnett, G M; Kahler, S W; Jan 2005; 5 pp.; In English

Contract(s)/Grant(s): Proj-2311

Report No.(s): AD-A467442; No Copyright; Avail.: Defense Technical Information Center (DTIC)

The SMEI has observed 88 interplanetary coronal mass ejections (ICMEs) in 2003. This work has established that most of those ICMEs, observed beyond  $\sim 30$  degrees elongation angles, are associated with bright CMEs with appropriate speeds and position angles observed out to  $30 R_0$ (solar) in the SOHO LASCO coronagraph. However, about one quarter of the ICMEs do not have obvious candidate CME associations despite good LASCO observational coverage. We examine the

characteristics of those SMEI ICMEs without LASCO CME associations to determine whether or how they differ from the other ICMEs. In particular we examine the speed profiles and brightness of those ICMEs. We discuss possible ways in which the ICMEs can arise as discrete observable structures in the interplanetary medium without being observed to any significant degree in coronagraph images.

**Imaging Interplanetary Disturbances Causing Forbush Decreases**

Kahler, S W; Simnett, G M; Jan 2005; 5 pp.; In English

Contract(s)/Grant(s): Proj-2311

Report No.(s): AD-A467444; No Copyright; Avail.: Defense Technical Information Center (DTIC)

Forbush decreases (FDs) in neutron monitor (NM) counting rates are caused by enhanced magnetic fields in interplanetary shocks and solar ejecta that shield the Earth from galactic cosmic rays (GCRs). The solar origins of those ejecta can be observed as coronal mass ejections (CMEs) in coronagraphs, but their propagation through interplanetary space near or past the Earth has not been previously observable. The Solar Mass Ejection Imager (SMEI), launched into polar Earth orbit in January 2003, now allows us to search for the white light signatures of interplanetary CMEs (ICMEs) responsible for FDs. SMEI is unique in that it can monitor the progress of CMEs through the inner heliosphere out to distances beyond 1 AU and distinguish those which hit the Earth from those that do not. For comparison with SMEI observations, we selected all FDs of greater than or equal 2% observed with the Oulu, Finland, NM. We find an excellent association of SMEI CMEs with those FDs and for each of the associated SMEI CMEs a good candidate associated LASCO CME was also found. The SMEI observations provide information on the approximate spatial locations and trajectories of large ICMEs that may result in FDs and hence can be useful as a space weather tool.

**Acceleration and Propagation in the Heliosphere**

Kahler, S W; Kecskemety, K; Kiraly, P; Jan 2005; 10 pp.; In English

Contract(s)/Grant(s): Proj-2311

Report No.(s): AD-A467447; No Copyright; Avail.: Defense Technical Information Center (DTIC)

Heliospheric energetic particles represent a mixture of populations. Sites of original energization of those particles range from solar flares through coronal and interplanetary shocks to distant heliospheric and even galactic sources. Although increasingly sophisticated methods of measuring their energy spectra, composition, charge state, temporal variation and anisotropy help in distinguishing those populations, most studies on particle acceleration and propagation are based on measurements that cannot make such fine distinctions. The lack of clear-cut separation of populations is also reflected in the somewhat ambiguous classification of SN papers in ICRCs. 'Solar emissions' and 'Galactic cosmic rays in the heliosphere' appear reasonably well separated topics (although Galactic and Anomalous CR could be more appropriate, and space weather as part of the galactic CR topic could be questioned). Acceleration and propagation issues, however, can be only rather artificially separated from the above two. As it happened during this conference, the pre-assigned rapporteur for the 'Acceleration and propagation' topic was unable to participate, and the other two rapporteurs for SH topics kindly agreed to report on most papers in the borderline range. Thus we report here only on a relatively small number of papers that could be classified into three general topics: a) Shocks and solar energetic particles; b) Solar energetic particle propagation; c) Radiation environment at Mars.

**Relativistic Jets in the Radio Reference Frame Image Database. 1. Apparent Speeds From the First 5 Years of Data**

Piner, B G; Mahmud, M; Fey, A L; Gospodinova, K; Feb 11, 2007; 33 pp.; In English; Original contains color illustrations

Contract(s)/Grant(s): NSF-0305475

Report No.(s): AD-A467929; No Copyright; Avail.: Defense Technical Information Center (DTIC)

We present the results of an analysis of relativistic jet apparent speeds from VLBI images in the Radio Reference Frame

Image Database (RRFID). The images are snapshot VLBI images at 8 and 2 GHz using the VLBA, plus up to 10 additional antennas that provide global VLBI coverage. We have analyzed the 8 GHz images from the first 5 years of the database (1994-1998), for all sources observed at three or more epochs during this time range. This subset comprises 966 images of 87 sources. The sources in this subset have an average of 11 epochs of observation over the years 1994-1998, with the best-observed sources having 19 epochs. About half of the sources in this RRFID kinematic survey have not been previously studied with multiepoch VLBI observations. We have measured apparent speeds for a total of 184 jet components in 77 sources, of which the best-measured 94 component speeds in 54 sources are used in the final analysis. The apparent speed distribution shows a peak at low apparent speeds (consistent with stationary components), a tail extending out to apparent speeds of about 30c, and a mean apparent speed of 3.6c. A total of 36 of the sources in this paper are also included in the 2 cm VLBA survey by Kellermann et al., with similar angular resolution, sensitivity, and time range. For those sources, we present a detailed component-by-component comparison of the apparent speeds measured by the 2 cm survey and those measured in this paper. Many of the independent apparent speed measurements agree very well, but for approximately 25% of the components we find significant differences in the apparent speeds measured by the two surveys. The leading cause of these discrepancies is differences in how the two surveys have identified jet components from epoch to epoch.

**Predicting the Cosmological Constant from the Causal Entropic Principle**

Bousoo, R.; Harnik, R.; Kribs, G. D.; Perez, G.; Feb. 2007; 38 pp.; In English

Contract(s)/Grant(s): DE-AC02-76SF00515

Report No.(s): DE2007-899842; SLAC-PUB-12353; No Copyright; Avail.: Department of Energy Information Bridge

We compute the expected value of the cosmological constant in our universe from the Causal Entropic Principle. Since observers must obey the laws of thermodynamics and causality, it asserts that physical parameters are most likely to be found in the range of values for which the total entropy production within a causally connected region is maximized. Despite the absence of more explicit anthropic criteria, the resulting probability distribution turns out to be in excellent agreement with observation. In particular, we find that dust heated by stars dominates the entropy production, demonstrating the remarkable power of this thermodynamic selection criterion. The alternative approach weighting by the number of observers per baryon is less well-defined, requires problematic assumptions about the nature of observers, and yet prefers values larger than present experimental bounds.

**Observational Properties of Coronal Mass Ejections**

Kahler, S W; Jan 2006; 13 pp.; In English

Contract(s)/Grant(s): Proj-2311

Report No.(s): AD-A467052; AFRL-VS-HA-TR-2007-1047; No Copyright; Avail.: Defense Technical Information Center (DTIC)

Coronal mass ejections (CMEs) have been known and observed for over 30 years. The total number of observed CMEs is now approaching 10,000, most of them detected with the LASCO coronagraph on the SOHO spacecraft. We review statistical work on CME widths, latitudes, accelerations, speeds, masses, and rates of occurrence. Solar-cycle variations of these parameters are presented. Recent work has focused on CME internal properties and compositions and on CME dynamics, particularly at low (< 3 solar radii) altitudes. The challenges to understand the magnetic topology of narrow (< 20 deg width) CMEs, to determine the relationship of coronal holes to CMEs, and to observe magnetic reconnection that effects magnetic disconnections of CMEs from the Sun are discussed.

**Hypothesis of the Magnetostatic Turbulence and its Implications for Astrophysics**

Ryutov, D. D.; Remington, B. A.; Feb. 27, 2007; 11 pp.; In English

Report No.(s): DE2007-902294; UCRL-PROC-228382; No Copyright; Avail.: Department of Energy Information Bridge

Arguments are presented in favor of a possible existence of a random, force-free magnetic field. Ponderomotive forces

in such a field are small, and the evolutionary time is much longer than Alfvén crossing time over the vortex scale, whence the suggested term magnetostatic. The presence of this long-lived random magnetic field provides stiffness with respect to large-scale compressional motions. On the other hand, such a field cannot be detected by techniques involving line-of-sight averaging. It may therefore be a source of stiffness for various astrophysical objects, ranging from plasmas in clusters of galaxies to the interiors of molecular clouds in HII regions, and remaining at the same time undetectable. Analysis of large-scale motions on the background of the magnetostatic turbulence is presented; it is concluded that these large-scale motions can be roughly described by a usual hydrodynamics for the matter with an isotropic pressure; the adiabatic index is  $4/3$ .

Report No.(s): DE2007-902290; UCRL-TR-228590; No Copyright; Avail.: National Technical Information Service (NTIS)

Materials can be experimentally characterized at high pressures and densities by sending a laser-induced shock wave through a sample that is pre-compressed inside a diamond-anvil cell. This combination of static- and dynamic-compression methods has been experimentally demonstrated, and ultimately provides access to the 10-100 TPa (0.1-1 Gbar) pressure range that is relevant to planetary science. We report on dynamical measurements of the high pressure compressibility of helium, hydrogen and helium/hydrogen mixtures up to 230 GPa by combining laser shocks and static compression in diamond anvil cells. The initial density of samples in these precompressed targets has been varied by a factor of 3. The measurements on the principal He Hugoniot, i.e with the initial density of cryo-helium, is extended above 100 GPa and a maximum of compression ratio of greater than 5-fold of the initial density is observed. Also, a strong decrease in compressibility is observed by increasing the initial density. A similar data set has been produced for precompressed H<sub>2</sub> and a mixture of He and H<sub>2</sub>.

**FY06 LDRD Final Report 'The Creation of a Neutron Star Atmosphere'**

Klein, R. I.; Remington, B.; Moon, S.; MacKinnon, A.; Patel, P.; Mar. 04, 2007; 35 pp.; In English

Report No.(s): DE2007-902271; UCRL-TR-228633; No Copyright; Avail.: National Technical Information Service (NTIS)

We have taken the initiative to examine whether experiments on HED facilities, present and future, could achieve the extreme scaled conditions relevant to accreting neutron star atmospheres and accretion disks around black holes. The preliminary conclusion from this detailed scaling assessment is that if an exact scaled version of the photon bubble instability physics is desired, this will require experiments with (simultaneously) spatial scales of order approx. 1 mm, temperatures of order approx. 5 keV, magnetic fields of order a hundred megaGauss, and time scales of order several hundred psec. Aspects (subsets) of this physics can be studied under less demanding conditions. To achieve the temperatures required in targets of order several optical depths, we come to the preliminary conclusion that we would require an energy source that delivers of order of a megajoule of energy into a high Z target. A conceptual design for such an experiment could be to use the energy from a high gain ignition NIF capsule as our principle source of heating and acceleration whereby the target is in close proximity to the ignition capsule and then use external petawatt lasers to develop the magnetic fields required.

**Adaptive Optics Views of the Hubble Deep Fields Final Report on LLNL LDRD Project 03-ERD-002**

Max, C. E.; Pennington, D.; Gibbard, S.; van Dam, M.; Larkin, J.; Feb. 26, 2007; 17 pp.; In English

Report No.(s): DE2007-902259; UCRL-TR-228357; No Copyright; Avail.: National Technical Information Service (NTIS)

We used laser guide star adaptive optics at the Lick and Keck Observatories to study active galactic nuclei and galaxies, with emphasis on those in the early Universe. The goals were to observe large galaxies like our own Milky Way in the process of their initial assembly from subcomponents, to identify central active galactic nuclei due to accreting black holes in galaxy cores, and to measure rates of star formation and evolution in galaxies. In the distant universe our focus was on the GOODS and GEMS fields (regions in the Northern and Southern sky that include the Hubble Deep Fields) as well as the Extended

Groth Strip and COSMOS fields. Each of these parts of the sky has been intensively studied at multiple wavelengths by the Hubble Space Telescope, the Chandra X-Ray Observatory, the XMM Space Telescope, the Spitzer Space Telescope, and several ground-based telescopes including the Very Large Array radio interferometer, in order to gain an unbiased view of a significant statistical sample of galaxies in the early universe.

**Progress on the Europium Neutron-Capture Study Using DANCE**

Agvaanluvsan, U.; Becker, J. A.; Macri, R. A.; Parker, W.; Wilk, P.; Oct. 17, 2006; 12 pp.; In English

Report No.(s): DE2007-900869; UCRL-PROC-225343; No Copyright; Avail.: National Technical Information Service (NTIS)

The accurate measurement of neutron-capture cross sections of the Eu isotopes is important for many reasons including nuclear astrophysics and nuclear diagnostics. Neutron capture excitation functions of  $^{151,153}\text{Eu}$  targets were measured recently using a 4 a-ray calorimeter array DANCE located at the Los Alamos Neutron Science Center for  $E_n = 0.1 - 100$  keV. The progress on the data analysis efforts is given in the present paper. The gamma-ray multiplicity distributions for the Eu targets and Be backing are significantly different. The gamma-ray multiplicity distribution is found to be the same for different neutron energies for both  $^{151}\text{Eu}$  and  $^{153}\text{Eu}$ . The statistical simulation to model the gamma-ray decay cascade is summarized.

**Large Synoptic Survey Telescope and Foundations for Data Exploitation of Petabyte Data Sets**

Cooke, K. H.; Nikolaev, S.; Huber, M. E.; Feb. 28, 2007; 9 pp.; In English

Report No.(s): DE2007-902312; UCRL-TR-228468; No Copyright; Avail.: Department of Energy Information Bridge

The next generation of imaging surveys in astronomy, such as the Large Synoptic Survey Telescope (LSST), will require multigigapixel cameras that can process enormous amounts of data read out every few seconds. This huge increase in data throughput (compared to megapixel cameras and minute- to hour-long integrations of today's instruments) calls for a new paradigm for extracting the knowledge content. We have developed foundations for this new approach. In this project, we have studied the necessary processes for extracting information from large time-domain databases--the systematics. In the process, we have produced significant scientific breakthroughs by developing new methods to probe both the elusive time and spatial variations in astrophysics data sets from the SuperMACHO (Massive Compact Halo Objects) survey, the Lowell Observatory Near-Earth Object Search (LONEOS), and the Taiwanese American Occultation Survey (TAOS). This project continues to contribute to the development of the scientific foundations for future wide-field, time-domain surveys. Our algorithm and pipeline development has provided the building blocks for the development of the LSST science software system. Our database design and performance measures have helped to size and constrain LSST database design. LLNL made significant contributions to the foundations of the LSST, which has applications for large-scale imaging and data-mining activities at LLNL.

**Gravi-Leptogenesis: Leptogenesis from Gravity Waves in Pseudo-Scalar Driven Inflation Models**

Alexander, S.; Peskin, M.; Sheikh-Jabbari, M. M.; Feb. 2007; 7 pp.; In English

Report No.(s): DE2007-900238; SLAC-PUB-12371; No Copyright; Avail.: Department of Energy Information Bridge

In this talk we present a mechanism for leptogenesis which is based on gravity waves produced during inflation. We show that when inflation is driven by a pseudo-scalar field the metric perturbations generated during inflation can become birefringent, therefore giving a non-vanishing contribution to the gravitational triangle anomaly and sourcing lepton anti-lepton asymmetry. As this asymmetry is sourced by the fields which are active during inflation, it is not washed out or diluted by inflation. The amount of matter asymmetry generated in our model can be of realistic size for the parameters within the range of some inflationary scenarios and grand unified theories. This talk is based on (1) which has appeared on the arXiv as hep-th/0403069.

**Critical Review of the U.S. Marine Corps' Space Cadre Strategy**

Deist, David W; Mar 30, 2007; 21 pp.; In English

Report No.(s): AD-A469109; No Copyright; Avail.: Defense Technical Information Center (DTIC)

ONLINE: <http://hdl.handle.net/100.2/ADA469109>

The National Space Human Capital Resource Strategy of February 2004 required the services to develop and manage a service unique cadre of space professionals to support their unique mission requirements. To date, the Marine Corps space cadre consists of only active and reserve officers, with billets identified for only active duty officers. If the Marine Corps is going to effectively incorporate space power, it must develop a human capital resource strategy and plan that includes officers, enlisted, active duty, reservists, and civilians. Failure to develop and execute such a plan will put Marine Corps success on the 21st century battlefield at risk. The Army, Navy, and Air Force have developed Space Human Capital Resource Strategies and implemented plans with varying degrees of success. This research project reviews the national guidance for space professional development and each service's response and success. It then investigates the applicability of the other services successes to the Marine Corps and concludes with recommendations for a way ahead.

**All-Wavelength Extended Groth Strip International Survey (AEGIS) Data Sets**

Davis, M.; Guhathakurta, P.; Konidaris, N. P.; Newman, J. A.; Ashby, M. L. N.; Jun. 23, 2006; 21 pp.; In English

Report No.(s): DE2007-887066; SLAC-PUB-11973; No Copyright; Avail.: National Technical Information Service (NTIS)

In this the first of a series of 'Letters', we present a description of the panchromatic data sets that have been acquired in the Extended Groth Strip region of the sky. Our survey, the All-wavelength Extended Groth Strip International Survey (AEGIS), is intended to study the physical properties and evolutionary processes of galaxies at  $z$  (approx) 1. It includes the following deep, wide-field imaging data sets: Chandra/ACIS(sup 30) X-ray (0.5-10 keV), GALEX(sup 31) ultraviolet (1200-2500 A), CFHT/MegaCam Legacy Survey(sup 32) optical (3600-9000 (angstrom)), CFHT/CFH12K optical (4500-9000 (angstrom)), Hubble Space Telescope/ACS(sup 33) optical (4400-8500 (angstrom)), Palomar/WIRC(sup 34) near-infrared (1.2-2.2 (micro)m), Spitzer/IRAC(sup 35) mid-infrared (3.6-8.0 (micro)m), Spitzer/MIPS far-infrared (24-70 (micro)m), and VLA(sup 36) radio continuum (6-20 cm). In addition, this region of the sky has been targeted for extensive spectroscopy using the DEIMOS spectrograph on the Keck II 10 m telescope(sup 37). Our survey is compared to other large multiwavelength surveys in terms of depth and sky coverage.

**Eta Carinae: Viewed from Multiple Vantage Points**

Gull, Theodore; June 18, 2007; 1 pp.; In English; International Workshop on CLUMPING in Hot-Star Winds, 18-22 Jun. 2007, Potsdam, Germany; No Copyright; Avail.: Other Sources; Abstract Only

The central source of Eta Carinae and its ejecta is a massive binary system buried within a massive interacting wind structure which envelops the two stars. However the hot, less massive companion blows a small cavity in the very massive primary wind, plus ionizes a portion of the massive wind just beyond the wind-wind boundary. We gain insight on this complex structure by examining the spatially-resolved Space Telescope Imaging Spectrograph (STIS) spectra of the central source (0.1') with the wind structure which extends out to nearly an arcsecond (2300AU) and the wind-blown boundaries, plus the ejecta of the Little Homunculus. Moreover, the spatially resolved Very Large Telescope/UltraViolet Echelle Spectrograph (VLT/UVES) stellar spectrum (one arcsecond) and spatially sampled spectra across the foreground lobe of the Homunculus provide us vantage points from different angles relative to line of sight. Examples of wind line profiles of Fe II, and the highly excited [Fe III], [Ne III], [Ar III] and [S III], plus other lines will be presented.

**Mitigating Atmospheric Effects in High-Resolution Infra-Red Surveillance Imagery with Bispectral Speckle Imaging**

Carrano, C. J.; May 30, 2006; 14 pp.; In English

Report No.(s): DE2007-900853; UCRL-CONF-221713; No Copyright; Avail.: Department of Energy Information Bridge

Obtaining a high-resolution image of an object or scene from a long distance away can be very problematic, even with the best optical system. This is because atmospheric blurring and distortion will limit the resolution and contrast of high-resolution imaging systems with substantial sized apertures over horizontal and slant paths. Much of the horizontal and slant-path surveillance imagery we have previously collected and successfully enhanced has been collected at visible wavelengths where atmospheric effects are the strongest. Imaging at longer wavelengths has the benefit of seeing through obscurants or even at night, but even though the atmospheric effects are noticeably reduced, they are nevertheless present, especially near the ground. This paper will describe our recent work on enhanced infrared (IR) surveillance using bispectral speckle imaging. Bispectral speckle imaging in this context is an image postprocessing algorithm that aims to solve the atmospheric blurring and distortion problem of imaging through horizontal or slant path turbulence. A review of the algorithm as well as descriptions of the IR camera and optical systems used in our data collections will be given. Examples of horizontal and slant-path imagery before and after speckle processing will also be presented to demonstrate the resolution improvement gained by the processing. Comparisons of IR imagery to visible wavelength imagery of the same target under the same conditions will be shown to demonstrate the tradeoffs of going to longer wavelengths.

**Assessing the Biohazard Potential of Putative Martian Organisms for Exploration Class Human Space Missions**

Warmflash, David; Larios-Sanz, Maia; Jones, Jeffrey; Fox, George E.; McKay, David S.; [2007]; 24 pp.; In English; Original contains color and black and white illustrations

Contract(s)/Grant(s): NAG5-12366; NNG05GN18G; Copyright; Avail.: CASI: [A03](#), Hardcopy

Exploration Class missions to Mars will require precautions against potential contamination by any native microorganisms that may be incidentally pathogenic to humans. While the results of NASA's Viking biology experiments of 1976 have been generally interpreted as inconclusive for surface organisms, the possibility of native surface life has never been ruled out and more recent studies suggest that the case for biological interpretation of the Viking Labeled Release data may now be stronger than it was when the experiments were originally conducted. It is possible that, prior to the first human landing on Mars, robotic craft and sample return missions will provide enough data to know with certainty whether or not future human landing sites harbor extant life forms. However, if native life is confirmed, it will be problematic to determine whether any of its species may present a medical risk to astronauts. Therefore, it will become necessary to assess empirically the risk that the planet contains pathogens based on terrestrial examples of pathogenicity and to take a reasonably cautious approach to bio-hazard protection. A survey of terrestrial pathogens was conducted with special emphasis on those pathogens whose evolution has not depended on the presence of animal hosts. The history of the development and implementation of Apollo anticontamination protocol and recent recommendations of the NRC Space Studies Board regarding Mars were reviewed. Organisms can emerge in nature in the absence of indigenous animal hosts and both infectious and non-infectious human pathogens are theoretically possible on Mars. The prospect of Martian surface life, together with the existence of a diversity of routes by which pathogenicity has emerged on Earth, suggests that the possibility of human pathogens on Mars, while low, is not zero. Since the discovery and study of Martian life can have long-term benefits for humanity, the risk that Martian life might include pathogens should not be an obstacle to human exploration. As a precaution, however, it is recommended that EVA suits be decontaminated when astronauts enter surface habitats when returning from field activity and that biosafety protocol approximating laboratory BSL 2 be developed for astronauts working in laboratories on the Martian surface. Quarantine of astronauts and Martian materials arriving on Earth should also be part of a human Mars mission and this and the surface biosafety program should be integral to human expeditions from the earliest stages of the mission planning.

Contract(s)/Grant(s): 337-42-04-01; Copyright; Avail.: Other Sources; Abstract Only

Minimizing astronaut's short and long-term medical risks arising from exposure to ionizing radiation during space missions is a major concern for NASA's manned spaceflight program, particularly exploration missions. For ethical and legal reasons, NASA follows the 'as low as reasonably achievable' (ALARA) principal in managing astronaut's radiation exposures. One implementation of ALARA is the response to space weather events. Of particular concern are energetic solar particle events, and in low Earth orbit (LEO), electron belt enhancements. To properly respond to these events, NASA's Space Radiation Analysis Group (SRAG), in partnership with the NOAA Space Environment Center (SEC), provides continuous flight support during U.S. manned missions. In this partnership, SEC compiles space weather data from numerous ground and space based assets and makes it available in near real-time to SRAG (along with alerts and forecasts), who in turn uses these data as input to models to calculate estimates of the resulting exposure to astronauts. These calculations and vehicle instrument data form the basis for real-time recommendations to flight management. It is also important to implement ALARA during the design phase. In order to appropriately weigh the risks associated with various shielding and vehicle configuration concepts, the expected environment must be adequately characterized for nominal and worst case scenarios for that portion of the solar cycle and point in space. Even with the best shielding concepts and materials in place (unlikely), there will be numerous occasions where the crew is at greater risk due to being in a lower shielded environment (short term transit or lower shielded vehicles, EVAs), so that accurate space weather forecasts and nowcasts, of particles at the relevant energies, will be crucial to protecting crew health and safety.

Communication Security Establishment Briefing on Government of Canada Biometrics Reports – 477

Independent Testing of Iris Recognition Technology (ITIRT) – 475

Modeling and Analysis of Information Technology Change and Access Controls in the Business Context – 478

Secure Enterprise Access Control (SEAC) Role Based Access Control (RBAC) – 483

Technical and Non-Technical Problems in Biometric Physical Access Control Systems – 473

Today's Biometric Projects Need Mobile & Handheld Readers - Why? Applications and Readers – 476

Transforming Intra- and Interagency Processes through Advanced Models and Simulations: An Information Assurance Model – 487

Usability and Acceptability of Biometric Security Systems – 473

## ACCIDENT INVESTIGATION

Shuttle Entry Imaging Using Infrared Thermography – 57

## ACCIDENT PREVENTION

Learning from Past Experiences – 56

## ACCRETION DISKS

FY06 LDRD Final Report 'The Creation of a Neutron Star Atmosphere' – 672

## ACCUMULATORS

8 GeV Beam Line Optics Optimization for the Rapid Antiproton Transfers at Fermilab – 557

Development of a Charged-particle Accumulator Using an RF Confinement Method II – 591

Development of a Charged-Particle Accumulator Using an RF Confinement Method – 593

Solar Buildings. Transpired Air Collectors Ventilation Preheating – 250

## ACCURACY

An Inverse of the Circular Coverage Function – 525

An Inverse of the Elliptic Coverage Function – 525

An Inverse of the Generalized Circular Error Function – 525

Systematic Procedure for Assigning Uncertainties to Data Evaluations – 567

The Accuracy of a Fingerprint/Voice Multimodal Verification System – 473

## ACETYL COMPOUNDS

Acetylcholinesterase Inhibition: Does it Explain the Toxicity of Organophosphorus Compounds? – 372

Atropine and Other Anticholinergic Drugs – 372

Prenatal Exposure to Nicotine and Childhood Asthma: Role of Nicotine Acetylcholine Receptors, Neuropeptides and Fibronectin Expression in Lung – 333

## ACETYLATION

Maintenance of Glucose Homeostasis through Acetylation of the Metabolic Transcriptional Coactivator PGC-1alpha – 343

## ACETYLCHOLINE

Prenatal Exposure to Nicotine and Childhood Asthma: Role of Nicotine Acetylcholine Receptors, Neuropeptides and Fibronectin Expression in Lung – 333

## ACHIEVEMENT

Baylor College of Medicine Saturday Morning Science Workshop – 608

## ACOUSTIC EMISSION

A Device for the In-Situ Measurement of Acoustically Stimulated Bioluminescence – 310

## ACOUSTIC IMAGING

Contrast Enhancement for Thermal Acoustic Breast Cancer Imaging via Resonant Stimulation – 314

## ACOUSTIC MEASUREMENT

Fault Tolerance in Autonomous Acoustic Arrays – 185

## ACOUSTIC PROPAGATION

A Numerical Study of the Regimes of Weak Fluctuation Theory for Ocean Acoustic Propagation through Random Internal Wave Sound Speed Fields – 589

## ACOUSTIC PROPERTIES

Acoustic Identification of Filler Materials in Unexploded Ordnance – 82

Signal Event Detection System – 590

## ACOUSTIC SCATTERING

A Geometric Investigation of Acoustical Wavefront Scattering and Healing Induced by Ocean Internal Waves – 588

## ACOUSTIC VELOCITY

A Numerical Study of the Regimes of Weak Fluctuation Theory for Ocean Acoustic Propagation through Random Internal Wave Sound Speed Fields – 589

## ACOUSTICS

A Rocket-Like Coaxial Injector in an Acoustic Field Under Sub- and Supercritical Conditions (POSTPRINT) – 218

Characteristics and Use of a Parametric End-Fired Array for Acoustics in Air – 224

Dark Core Analysis of Coaxial Injectors at Sub-, Near-, and Supercritical Conditions in a Transverse Acoustic Field – 589

Design and Validation of an Aeroacoustic Anechoic Test Facility – 587

Early Detection of Prostate Cancer – 323

NOAA National Passive Acoustics Workshop, 2006 – 590

Phase-Shift-Based Time-Delay Estimators for Proximity Acoustic Sensors – 509

## ACQUISITION

Defense Acquisitions. Improved Management and Oversight Needed to Better Control DOD's Acquisition of Services – 492

## ACTINOMYCETES

Degradation of Polycyclic Aromatic Hydrocarbons by Actinomycetes – 104

## ACTIVATED CARBON

Adsorption and Desorption of Dinitrotoluene on Activated Carbon – 91

## ACTIVATION

Activation and Protection of Dendritic Cells in the Prostate Cancer Environment – 313

Method, System and Device for Microscopic Examination Employing Fibre-Prepared Sample Grasping Element – 206

Platelet Activating Factor: A Growth Factor for Breast Cancer – 341

Targeting Breast Cancers Featuring Activating Mutations in PIK3CA by Generating a Lethal Dose of PIP3 – 358

## ACTIVE CONTROL

Active Control of Flow Separation on a High-Lift System with Slotted Flap at High Reynolds Number – 4

Distributed Command and Control Research: Networking Multiple Simulation Platforms – 495

Distributed Computing and Collaboration Framework (DCCF) – 466

Dynamic-Active Flow Control - Phase I – 2

Performance Measurement for Diagnosing and Debriefing Distributed Command and Control Teams – 150

## ACTUATORS

Distributed Mechanical Actuators for Design of a Closed-Loop Flow-Control System (Postprint) – 18

High Temperature Magnetic Shape Memory Ni-Mn-Ga Alloys for a New Class of Actuators and Sensor – 119

Low Dimensional Modeling of Zero-Net Mass-Flux Actuators – 215

Lumped Element Modeling of Piezoelectric-Driven Synthetic Jet Actuators – 551

Optimization of Synthetic Jet Actuators – 235

Performance Measurement of the Upgraded D0 Central Track Trigger – 558

Pneumatically Actuated Flexible Coupling and Effectors for Lapping/Polishing – 34

SparkJet Actuators for Flow Control – 235

Tip Clearance Control Using Plasma Actuators – 16

## ADA (PROGRAMMING LANGUAGE)

Ada County Sheriff's Office Internet Site – 429

## ADAPTATION

Adaptive Sampling for Network Management – 485

Agent-Based Modeling for Testing and Designing Novel Decentralized Command and Control System Paradigms – 537

Climate Change Impacts and Adaptation in California. Staff Paper – 279

Conditions for Achieving Network-Centric Operations in Systems of Systems – 465

Inhibiting Adaptation – 169

Military Information Networks as Complex Adaptive Systems – 512

Principles of Adaptive Array Processing – 176

System-of-Systems Governance: New Patterns of Thought – 465

Training Coordination Proxy Agents – 616

User-Level QoS-Adaptive Resource Management in Server End-Systems – 485

## ADAPTIVE CONTROL

Nonlinear Robust/Adaptive Controller Design for an Air-Breathing Hypersonic Vehicle Model (Preprint) – 21

Organizational Fragility Curves: Sense-making under Stress – 544

## ADAPTIVE FILTERS

Adaptive Identification of Fluid-Dynamic Systems – 215

## ADAPTIVE OPTICS

Adaptive Optics Ophthalmologic Systems Using Dual Deformable Mirrors – 600

Adaptive Optics Views of the Hubble Deep Fields Final Report on LLNL LDRD Project 03-ERD-002 – 672

Exploiting Adaptive Optics with Deformable Secondary Mirrors – 231

High Contrast Imaging Using Adaptive Optics for Extrasolar Planet Detection – 666

How Important is Oblique Vision in Aviation? – 596

Mitigating Atmospheric Effects in High-Resolution Infra-Red Surveillance Imagery with Bispectral Speckle Imaging – 675

## ADDITIVES

Development and Testing of Flame Retardant Additives and Polymers – 67

Fuel Property Effects on T700 Exhaust Particulates – 132

Investigation of Low Temperature Metal Induced Crystallization and Doping of Silicon Using Various Excitation Sources for Solar Cells and other Microelectronic Applications. – 604

Nanoengineered Additives for Active Coatings – 61

## ADDUCTS

Feasibility of Biomonitoring of Exposure to Permethrin Through Analysis of Long-Lived (Metabolite) Adducts to Proteins – 320

## ADENOVIRUSES

Midkine Promoter-Driven Adenovirus as Potential Therapy for NF1 – 341

Vasculature-Specific Adenovirus Vectors for Gene Therapy of Prostate Cancer – 352

## ADHESION TESTS

System and Method for Field Testing a Tack Coat Layer – 75

## ADHESION

A Study of the Attraction Forces of Lunar Dust Simulant – 664

FGFR4 Downregulation of Cell Adhesion in Prostate Cancer – 376

The Role of TSC Proteins in Regulating Cell Adhesion and Motility – 281

## ADHESIVE BONDING

Best Practice in Adhesive-Bonded Structures and Repairs – 67

## ADHESIVES

Integration of Soluble and Adhesive Gradient Signals in Directed Cell Migration – 310

Nano Enabled Thermo-Mechanical Materials in Adhesive Joints: A New Paradigm to Materials Functionality (Preprint) – 81

## **ADIPOSE TISSUES**

Adipose Estrogen and Increased Breast Cancer Risk in Obesity: Regulation by Leptin and Insulin – 357

## **ADSORPTION**

Adsorption and Desorption of Dinitrotoluene on Activated Carbon – 91

## **ADVECTION**

A Detailed Study of Advection Sea Fog Formation to Reduce the Operational Impacts Along the Northern Gulf of Mexico – 268

## **AERIAL EXPLOSIONS**

Detection of Atmospheric Explosions at IMS Monitoring Stations using Infrared Sound Techniques – 265

## **AERIAL RECONNAISSANCE**

A Bold 21st Century Strategy for U.S. Airborne ISR – 24

A Strategies-to-Tasks Framework for Planning and Executing Intelligence, Surveillance, and Reconnaissance (ISR) Operations – 620

Background Modeling and Algorithm Fusion for Airborne Landmine Detection – 517

Flight Test Results From the Ultra High Resolution, Electro-Optical Framing Camera Containing a 9216 by 9216 Pixel, Wafer Scale, Focal Plane Array – 222

Pilot Study: Parasitic and Passive Radar – 179

The Coalition Aerial Surveillance and Reconnaissance (CAESAR) Approach to Enhancing the Interoperability of Coalition Ground Surveillance Systems – 224

## **AEROACOUSTICS**

Design and Validation of an Aeroacoustic Anechoic Test Facility – 588

## **AEROBES**

Microbial Degradation of Fuel Oxygenates under Aerobic Conditions – 114

Push-Pull Tests for Evaluating the Aerobic Cometabolism of Chlorinated Aliphatic Hydrocarbons – 101

## **AEROBRAKING**

Thermal Modeling of the Mars Reconnaissance Orbiter's Solar Panel and Instruments during Aerobraking – 59

## **AERODYNAMIC CONFIGURATIONS**

Structural Design and Analysis of Initial Extended Area Protection and Survivability (EAPS) Projectile Configurations – 217

## **AERODYNAMIC DRAG**

Development of Aeroservoelastic Analytical Models and Gust Load Alleviation Control Laws of a SensorCraft Wind-Tunnel Model Using Measured Data – 4

## **AERODYNAMIC FORCES**

Application of the Simplified Phase Plane to the Analysis and Design of Missile Jet-Relay Control Systems – 2

Fault Tolerant Optimal Trajectory Generation for Reusable Launch Vehicles (Preprint) – 48

## **AERODYNAMIC HEATING**

Re-Entry Aeroheating Analysis of Tile-Repair Augers for the Shuttle Orbiter – 58

## **AERODYNAMIC NOISE**

Design and Validation of an Aeroacoustic Anechoic Test Facility – 588

## **AERODYNAMIC STABILITY**

Analysis of Crossflow Transition Flight Experiment aboard the Pegasus Launch Vehicle – 44

Unattended Ground Sensor Assembly – 436

## **AERODYNAMIC STALLING**

Mathematical Fluid Dynamic Modeling of Plasma Stall-Spin Departure Control – 519

## **AERODYNAMICS**

Application of the Simplified Phase Plane to the Analysis and Design of Missile Jet-Relay Control Systems – 2

Characteristics of Runback Ice Accretions and Their Aerodynamic Effects – 1

High-Speed/-Hypersonic-Weapon-Development-Tool Integration – 22

Relaxed Fidelity CFD Methods Applied to Store Separation Problems – 5

Simulation and Analysis of Dart Dispense Events with Collisions – 235

## **AERONAUTICS**

A Review of Australian and New Zealand Investigations on Aeronautical Fatigue During the Period April 2005 to March 2007 – 3

## **AEROSERVOELASTICITY**

Development of Aeroservoelastic Analytical Models and Gust Load Alleviation Control Laws of a SensorCraft Wind-Tunnel Model Using Measured Data – 4

F-15B QuietSpike(TradeMark) Aeroservoelastic Flight Test Data Analysis – 35

## **AEROSOLS**

Automating the Shadow Method for Aerosol Optical Depth Retrieval – 462

Determination of Antibiotic Efficacy Against Bacillus Anthracis in a Mouse Aerosol Challenge Model – 335

Effect of Atmospheric Background Aerosols on Biological Agent Detectors – 222

Meteorological Integration for the Biological Warning and Incident Characterization (BWIC) System: General Guidance for BWIC Cities – 274

Solar Buildings. Transpired Air Collectors Ventilation Preheating – 250

Theoretical Characterization of the Radiative Properties of Dust Aerosol for the Air Force Combat Climatology Center Point Analysis Intelligence System – 271

## **AEROSPACE ENGINEERING**

Fully Reusable Access to Space Technology (FAST) Methane Rocket – 46

## **AEROSPACE ENVIRONMENTS**

Critical Review of the U.S. Marine Corps' Space Cadre Strategy – 674

Exploration Medical Capability (ExMC) Program – 417

MURI Center for Materials Chemistry in the Space Environment – 112

Naval Research Laboratory Space Science Division Newsletter: 01/2007 – 669

## **AEROSPACE MEDICINE**

A Comprehensive Characterization of Microorganisms and Allergens in Spacecraft Environment – 414

An Evidence-based Approach to Developing a Management Strategy for Medical Contingencies on the Lunar Surface: The NASA/Haughton-Mars Project (HMP) 2006 Lunar Medical Contingency Simulation at Devon Island – 415

An Introduction to the History of Aerospace Medicine – 419

Artificial Gravity: Will it Preserve Bone Health on Long-Duration Missions? – 411

Behavioral Health Program Element – 417

Effects of Hind Limb Unloading on Pharmacokinetics of Procainamide in Mice – 416

Exploration Medical Capability (ExMC) Program – 417

Flight Attendant Fatigue – 412

Fundamentals of Aerospace Medicine: Cosmic Radiation – 412

IMMR Phase 1 Prototyping Plan Inputs – 663

Integrated Clinical Training for Space Flight Using a High-Fidelity Patient Simulator in a Simulated Microgravity Environment – 415

Integrated Crew Health Care System for Space Flight – 412

Johnson Space Center Flight Medicine Clinic Experience – 413

Multi-System Effects of Daily Artificial Gravity Exposures in Humans Deconditioned by Bed Rest – 418

Operational Aspects of Space Radiation Analysis – 676

Revitalization of Space-Related Human Factors, Environmental and Habitability Data – 425

Selective Serotonin Reuptake Inhibitors: Medical History of Fatally Injured Aviation Accident Pilots – 419

Space Medicine Issues and Healthcare Systems for Space Exploration Medicine – 415

- The Need for an Aerospace Pharmacy Residency – 419
- Translational Research in Space Exploration – 413
- AEROSPACE SAFETY**  
Learning from Past Experiences – 56
- AEROSPACE SYSTEMS**  
Alternatives for Military Space Radar – 223  
An Evaluation of High Velocity Wear – 142  
F-15B QuietSpike(TradeMark) Aeroservoelastic Flight Test Data Analysis – 35  
Sustaining Air Force Space Systems: A Model for the Global Positioning System – 26  
Synthesis and Characterization of Space-Survivable POSS-Kapton (TradeMark) Polyimides (Preprint) – 52  
The Combined Aerospace Operations Center (CAOC) of the Future – 160
- AEROSPACE VEHICLES**  
Challenges and Opportunities for Nanotechnology in Multi-Functional Composite Structures (Preprint) – 17  
Fault Tolerant Optimal Trajectory Generation for Reusable Launch Vehicles (Preprint) – 48  
Novel Continuous Carbon Nanofibers for the Next Generation Lightweight Structural Nanocomposites – 112
- AEROSTATICS**  
Potential Military Use of Airships and Aerostats – 28
- AEROTHERMODYNAMICS**  
Characterization and Evaluation of a Mass Efficient Heat Storage Device. – 237  
Re-Entry Aeroheating Analysis of Tile-Repair Augers for the Shuttle Orbiter – 58  
Technologies for Propelled Hypersonic Flight, Volume 1 - Subgroup 1: Plug Nozzles – 40
- AFGHANISTAN**  
Impact of Illness and Non-Combat Injury During Operations Iraqi Freedom and Enduring Freedom (Afghanistan) – 396  
Knowledge, Attitudes, and Practices Regarding Epidemiology and Management of Travelers' Diarrhea: A Survey of Front-Line Providers in Iraq and Afghanistan – 375  
Long-Range Operational Military Forecasts for Afghanistan – 271
- AFRICA**  
A Partnership Training Program in Breast Cancer Diagnosis: Concept Development of the Next Generation Diagnostic Breast Imaging Using Digital Image Library and Networking Techniques – 296  
Application of the Community Radiative Transfer Model to Evaluate Satellite-Based Measurements Across the African Easterly Jet Over Western Africa – 47  
Collaborative Research: Ground Truth of African and Eastern Mediterranean Shallow Seismicity Using SAR Interferometry and Gibbs Sampling Inversion – 261  
Dietary Fat, Fat Metabolizing Genes, and Prostate Cancer Risk in African-Americans and Whites – 340  
PSA-Based Screening Outcomes, Dietary Heterocyclic Amine Exposure, and Prostate Cancer Risk in African Americans – 302  
Short-Term Exercise and Prostate Cancer Prevention in African American Men – 359  
The Use of a Low-Concentration Heparin Solution to Extend the Life of Central Venous Catheters in the African Green Monkeys (*Chlorocebus aethiops*) – 402
- AGGREGATES**  
Application of Surface Energy Measurements to Evaluate Moisture Susceptibility of Asphalt and Aggregates – 74
- AGING (BIOLOGY)**  
Biological Impact of Senescence Induction in Prostate Cancer Therapy – 293
- AGREEMENTS**  
Extensively Drug-Resistant Tuberculosis (XDR-TB): Quarantine and Isolation – 398

- CANPASS Air/NEXUS Air - Border Clearance in the Blink of an Eye – 476
- Decks for Rapid Runway Mat Application (Postprint) – 45
- Development and Implementation of Noise Analysis Standards for ACSA Airports – 255

Environmental Impacts of Airport Operations: Maintenance, and Expansion – 44

Grout Impregnation of Pre-Placed Recycled Concrete Pavement (RCP) for Rapid Repair of Deteriorated Portland Cement Concrete Airfield Pavement – 45

Homeland Security: Protecting Airspace in the National Capital Region – 25

Public Health Assessment for Galena Airport (A.K.A. USAF Galena Air Force Station), Galena, Yukon-Koyukuk County, Alaska, May 21, 2007. EPA Facility ID: AK9570028655 – 257

Subgrade CBR Values for Alpha Factor Determination Using Data Collected at the National Airport Pavement Test Facility – 13

TARDEC National Automotive Center - Selfridge Air National Guard Base – 132

Today's Biometric Projects Need Mobile & Handheld Readers - Why? Applications and Readers – 476

## AIRSHIPS

Potential Military Use of Airships and Aerostats – 28

## AIRSPACE

Homeland Security: Protecting Airspace in the National Capital Region – 25

## ALASKA

Public Health Assessment for Galena Airport (A.K.A. USAF Galena Air Force Station), Galena, Yukon-Koyukuk County, Alaska, May 21, 2007. EPA Facility ID: AK9570028655 – 257

## ALBEDO

Correcting the Response of an Albedo Neutron Dosimeter for Energy – 220

## ALBUMINS

Feasibility of Biomonitoring of Exposure to Permethrin Through Analysis of Long-Lived (Metabolite) Adducts to Proteins – 320

## ALCOHOLS

Facilitating Smoking Cessation and Preventing Relapse in Primary Care: Minimizing Weight Gain by Reducing Alcohol Consumption – 337

Immobilized Iminophosphatranes Useful for Transesterification – 70

Large Scale Green Synthesis of 1,2,4-Butanetriol – 66

Microbial Degradation of Fuel Oxygenates under Aerobic Conditions – 113

NMR Analysis of Thiodiglycol Oxidation by Mammalian Alcohol Dehydrogenases – 371

Thiodiglycol, the Hydrolysis Product of Sulfur Mustard: Analysis of In Vitro Biotransformation by Mammalian Alcohol Dehydrogenases using Nuclear Magnetic Resonance – 384

## ALGEBRA

High-Order Higdon Non-Reflecting Boundary Conditions for the Linearized Euler Equations – 527

Implementation of a High-Speed Numeric Function Generator on a COTS Reconfigurable Computer – 513

Learning Robustly From Instructions – 519

Parallel Auxiliary Space AMG for Definite Maxwell Problems – 436

Parallel Eigensolver for H (curl) Problems using H1 Auxiliary Space AMG Preconditioning – 434

Some Experience with a H1 Based Auxiliary Space AMG for H (curl) Problems – 437

## ALGORITHMS

A Comparison of Trajectory Determination Approaches for Small UAVs – 11

A Feasibility Study of Life-Extending Controls for Aircraft Turbine Engines Using a Generic Air Force Model (Preprint) – 550

A Heuristic Design Information Sharing Framework for Hard Discrete Optimization Problems – 542

A New Multi-Sensor Track Fusion Architecture for Multi-Sensor Information Integration – 510

A Parallel Particle Swarm Optimizer – 533

A Review of Recent Algorithms and a New and Improved Cooperative Control Design for Generating a Phantom Track (Preprint) – 26

Advanced Radar Signal and Data Processing – 174

Agent-Based Modeling for Testing and Designing Novel Decentralized Command and Control System Paradigms – 537

An Inverse of the Circular Coverage Function – 525

An Inverse of the Elliptic Coverage Function – 525

An Inverse of the Generalized Circular Error Function – 525

An Inverse of the Incomplete Beta Function (F-(Variance Ratio) Distribution Function) – 467

Automated Patient Positioning Guided by Cone-Beam CT for Prostate Radiotherapy – 286

Automatic Target Recognition User Interface Tool – 510

Background Modeling and Algorithm Fusion for Airborne Landmine Detection – 517

Code Verification Results of an LLNL ASC Code on Some Tri-Lab Verification Test Suite Problems – 562

Comparing the Performance of Collection Selection Algorithms – 613

Description of ALARMA. The Alarm Algorithm Developed for the Nuclear Car Wash – 580

Development and Assessment of a Complete ATR Algorithm Based on ISAR Euler Imagery – 468

Development of an Experimental Platform for Testing Autonomous UAV Guidance and Control Algorithms – 38

Digital Watermarking Using Syndrome Codes – 516

Discrete Data Transfer Technique for Fluid-Structure Interaction – 478

Empirical Effective Dimension and Optimal Rates for Regularized Least Squares Algorithm – 524

Evaluation of a Particle Swarm Algorithm for Biomechanical Optimization – 511

Fault-Tolerant Parallel Algorithms for Adaptive Matched-Field Processing on Distributed Array Systems – 509

Hyperspectral Imagery Target Detection Using Principal Component Analysis – 522

Integrated Sensing and Processing (ISP) Phase 2: Demonstration and Evaluation for Distributed Sensor Networks and Missile Seeker Systems – 514

New Tools for Hybrid Systems – 517

Parallel Global Optimization with the Particle Swarm Algorithm (Preprint) – 533

Proceedings of the Quantum Computation for Physical Modeling Workshop Held in North Falmouth, Massachusetts on October 18-19, 2000 – 519

Prognostic Fusion for Uncertainty Reduction – 35

Quantum Algorithms and Initialization – 547

Re-Entry Aeroheating Analysis of Tile-Repair Augers for the Shuttle Orbiter – 58

RIDE vs. CLASP Comparison and Evaluation: Models and Parameters – 662

Risk Bounds for Regularized Least-Squares Algorithm with Operator-Value Kernels – 524

Scale-Independent Biomechanical Optimization – 521

Self-Stabilizing Mobile Node Location Management and Message – 511

Space-Time Adaptive Processing: Algorithms – 177

The Matrix Pencil and its Applications to Speech Processing – 589

Theory and Applications of Computational Time-Reversal Imaging – 516

UAV Scheduling via the Vehicle Routing Problem with Time Windows (Preprint) – 20

Using a Shortest Path Algorithm for Identifying Areas of Interest in An Area of Operations – 543

Virtual Stationary Automata for Mobile Networks – 536

**ALIGNMENT**

Data Alignment between Army C4I Databases and Army Simulations – 653

Strategic Planning to Conduct Joint Force Network Operations: A Content Analysis of NETOPS Organizations Strategic Plans – 640

Survey and Alignment of the Fermilab Electron Cooling System – 585

Vertical Alignment of Single-Walled Carbon Nanotubes on Nanostructure Fabricated by Atomic Force Microscope – 88

**ALIPHATIC HYDROCARBONS**

Push-Pull Tests for Evaluating the Aerobic Cometabolism of Chlorinated Aliphatic Hydrocarbons – 102

**ALKALIES**

Heat of Dilution Calculation for 19 Molar Sodium Hydroxide with Water for Use in 241-S-112 – 103

**ALKENES**

Alkene- and Alkyne- Substituted Methylimidazolium Bromides: Structural Effects and Physical properties (Preprint) – 100

**ALKYLATION**

Bifunctional Alkylating Agent-Induced p53 and Nonclassical Nuclear Factor kB Responses and Cell Death are Altered by Caffeic Acid Phenethyl Ester: A Potential Role for Antioxidant/Electrophilic Response-Element Signaling – 388

**ALKYNES**

Alkene- and Alkyne- Substituted Methylimidazolium Bromides: Structural Effects and Physical properties (Preprint) – 100

**ALLOCATIONS**

A Method for Including Control Effector Interactions in the Control Allocation Problem (Preprint) – 461

Optimizing the Allocation of Sensor Assets for the Unit of Action – 531

Using Cyclic Memory Allocation to Eliminate Memory Leaks – 442

**ALLOYS**

Meso-Scale Self-Assembly Pilot Study – 199

Processing, Microstructure, and Tensile Properties of the Ti-6Al-4V-1.55B Eutectic Alloy (Preprint) – 99

**ALTERNATING CURRENT**

AC Field Measurements of Fermilab Booster Correctors Using a Rotating Coil System – 605

**ALTERNATIVES**

Alternatives for Military Space Radar – 223

Analysis of Operational Alternatives to the Terminal Doppler Weather Radar (TDWR) – 276

**ALUMINATES**

Substrate/Oxide Interface Interaction in LaAlO<sub>3</sub>/Si Structures – 96

**ALUMINIDES**

Characteristics of Round and Extracted Strands of Mb(3)A1 Rutherford Cable – 558

**ALUMINUM ALLOYS**

Fretting Wear-Resistant, Micro-Arc Oxidation Coatings for Aluminum and Titanium Alloy Bearings (Preprint) – 44

Microstructural Evolution of Commercial-Purity Ti and Superplasticity of Ti-6Al-4V Alloy Processed by Equal Channel Angular Extrusion – 116

The Effect of Inhomogeneous Plastic Deformation on the Ductility and Fracture Behavior of Age Hardenable Aluminum Alloys – 115

**ALUMINUM GALLIUM ARSENIDES**

Pyroelectric AlGaIn/GaN HEMTs for ion-, gas- and Polar-Liquid Sensors – 97

**ALUMINUM OXIDES**

Effects of Temperature and Environment on Creep Behavior of an Oxide-Oxide Ceramic Matrix Composite – 103

High Strain Rate Mechanical Properties of Epoxy and Epoxy-Based Particulate Composites (Preprint) – 125

Stoichiometry and Characterization of Aluminum Oxynitride Thin Films by Ion-Beam-Assisted Pulsed Laser Deposition (Preprint) – 127

Supported Metal Catalyst with Improved Thermal Stability – 64

**ALUMINUM**

Mechanical and Microstructural Effects of Cold Spray Aluminum on Al 7075 Using Kinetic Metallization and Cold Spray Processes (Preprint) – 99

Multilayer Aluminum Oxynitride Capacitors for Higher Energy Density, Wide Temperature Applications (Preprint) – 91

Stoichiometry and Characterization of Aluminum Oxynitride Thin Films by Ion-Beam-Assisted Pulsed Laser Deposition (Preprint) – 127

**AMBIENCE**

Review of the Ambient Air Quality Standards for Ozone: Policy Assessment of Scientific and Technical Information. OAQPS Staff Paper – 256

**AMERICAN INDIANS**

Telemedicine Based Ultrasound for Detecting Neonatal Heart Disease in Babies at Remote Military or Native American Health Care Facilities – 360

**AMINES**

PSA-Based Screening Outcomes, Dietary Heterocyclic Amine Exposure, and Prostate Cancer Risk in African Americans – 303

**AMINO ACIDS**

Spectrophotometric Analysis of the Cyanide Metabolite 1-Aminothiazoline-6-Carboxylic Acid – 110

Ten Novel HLA-DRB1 Alleles and One Novel DRB3 Allele – 394

**AMMUNITION**

Acoustic Identification of Filler Materials in Unexploded Ordnance – 82

Adaptive and Iterative Processing Techniques for Overlapping Signatures – 555

Evaluation of airborne Electromagnetic Systems for Detection and Characterization of unexploded ordnance (uXo) – 12

Handheld Broadband Electromagnetic UXO Sensor – 198

Intelligent Data Fusion for Wide-Area Assessment of UXO Contamination. SERDP Project MM-1510. 2006 Annual Report – 637

Non-Thermal, On-Site Decontamination and Destruction of Practice Bombs – 141

Screening Level Ecological Risk Assessments of Some Military Munitions and Obscurant-related Compounds for Selected Threatened and Endangered Species – 251

Test and Evaluation of Value Engineering Proposal: Removal of Rubber PAD in 120 MM PA 153 Ammunition Fiber Container – 140

Unexploded Ordnance Site Investigation of US Military Ranges in Panama: Empire, Balboa West and Pina Ranges – 135

**AMORPHOUS MATERIALS**

Application of Neutron-Absorbing Structural-Amorphous Metal (SAM) Coatings for Spent Nuclear Fuel (SNF) Container to Enhance Criticality Safety Controls – 131

Collaborations in Nuclear Reactors – 559

Corrosion Resistance of Structural Amorphous Metal – 104

Corrosion Resistances of Iron Based Amorphous Metals with Yttrium and Tungsten Additions in Hot Calcium Chloride Brine & Natural Seawater. Fe48Mo14Cr15Y2C15B6 and W-Containing Variants – 69

Corrosion Resistances of Iron-Based Amorphous Metals with Yttrium and Tungsten Additions in Hot Calcium Chloride Brine and Natural Seawater. Fe48Mo14Cr15Y2C15B6 and Variants – 107

- High-Performance Corrosion Resistant Iron Based Amorphous Metals. The Effects of Composition, Structure and Environment. Fe<sub>49.7</sub>Cr<sub>17.7</sub>Mn<sub>1.9</sub>Mo<sub>7.4</sub>W<sub>1.6</sub>B<sub>15.2</sub>C<sub>3.8</sub>Si<sub>2.4</sub> – 107
- Infrared and Electrical Properties of Amorphous Sputtered (La<sub>x</sub>Al<sub>1-x</sub>)<sub>2</sub>O<sub>3</sub> films – 63
- Molecular Volume and Electronic and Vibrational Polarizabilities for Amorphous LaAlO<sub>3</sub> – 86
- Substrate/Oxide Interface Interaction in LaAlO<sub>3</sub>/Si Structures – 96
- X ray Diffraction Techniques for Structural Determination of Amorphous Materials – 69
- AMORPHOUS SILICON**  
Investigation of Low Temperature Metal Induced Crystallization and Doping of Silicon Using Various Excitation Sources for Solar Cells and other Microelectronic Applications. – 605
- AMOUNT**  
Active Detection of Small Quantities of Shielded Highly-Enriched Uranium Using Low-Dose 60-keV Neutron Interrogation – 570
- AMPLIFICATION**  
Prostate Cancer Gene Discovery Using ROMA – 371
- ANALOG TO DIGITAL CONVERTERS**  
Quarter-Rate Superconducting Modulator for Improved High Resolution Analog-to-Digital Converter – 441  
The Synergic Integrated Concepts of C2S – 174
- ANALOGIES**  
An Evidence-based Approach to Developing a Management Strategy for Medical Contingencies on the Lunar Surface: The NASA/Haughton-Mars Project (HMP) 2006 Lunar Medical Contingency Simulation at Devon Island – 415  
Analogical Reasoning and Conceptual Change: A Case Study of Johannes Kepler – 666  
Content Based Retrieval Database Management System with Support for Similarity Searching and Query Refinement – 622
- ANALOGS**  
Atomtronics: Ultracold Atom Analogs of Electronic Devices – 194
- ANALYSIS (MATHEMATICS)**  
Investigating the Mechanism of Action and the Identification of Breast Carcinogens by Computational Analysis of Female Rodent Carcinogens – 405
- ANALYSIS OF VARIANCE**  
Feasibility Study of Variance Reduction in the Logistics Composite Model – 523
- ANATOMY**  
Bone Conduction: Anatomy, Physiology, and Communication – 163
- High Resolution Anatomic and Elastographic Transrectal Ultrasound for Improved Diagnosis of Prostate Cancer – 350
- Integration of Anatomic and Pathogenetic Bases for Early Lung Cancer Diagnosis – 506
- ANECHOIC CHAMBERS**  
Characteristics and Use of a Parametric End-Fired Array for Acoustics in Air – 225  
Design and Validation of an Aeroacoustic Anechoic Test Facility – 587
- ANESTHETICS**  
Evaluation of Daphnia Magna Neonate Viability under Low Temperature Exposure Conditions – 310
- ANGIOGENESIS**  
Anti-Angiogenic Action of Neutral Endopeptidase – 285  
Chemokine Blockade in Combination with Cyto-reductive Conditioning in Metastatic Breast Cancer – 290
- ANGULAR DISTRIBUTION**  
New Results on X(3872) from CDF – 585  
Possibility for Artificially Inducing Strong Pitch Angle Diffusion in the Magnetosphere – 261
- ANHYDRIDES**  
Characterization of the Structure-Processing-Performance Relations of Phenylethynyl Phthalic Anhydride Crosslinked Fluorinated Polyimides (AFR-PEPA-N) and Their Carbon Fiber Composites – 85
- ANIMALS**  
Acoustic Thermometry of Ocean Climate: Marine Mammal Issues – 587  
Health Effects Support Document for Terbacil – 73  
NIOSH Health Hazard Evaluation Report: HETA No. 2007-0068-3042, Noise Exposures and Hearing Loss Assessments among Animal Shelter Workers, Louisiana Society for the Prevention of Cruelty to Animals, Algiers, Louisiana, May 2007 – 252  
Optical, Biochemical, and Molecular Characterization of New Bioluminescence Systems – 354
- ANIONS**  
Cloning and Characterization of SLC26A7 and SLC26A9 Anion Exchangers – 68  
Ionic Cross-Linking of Ionic Cotton with Small Molecular Weight Anionic or Cationic Molecules – 103
- ANISOTROPY**  
Determination of Metal Ions in Solution by Photoluminescence Anisotropy – 115
- Elastic-Viscoplastic an Isotropic Modeling of Textured Metals and Validation using the Taylor Cylinder Impact Test – 117
- Impact Location for a Multilayer Transversely Isotropic Plate – 604
- ANNIHILATION REACTIONS**  
Conceptual Modeling for the Probability of Raid Annihilation (Pra) Testbed – 454
- ANOMALIES**  
Cfetool. A General Purpose Tool for Anomaly Detection in Periodic Data – 439  
Characterization of Breast Masses Using a new Method of Ultrasound Contrast Agent Imaging in 3D Mapping of Vascular Anomalies – 391  
Characterization of Breast Masses Using a New Method of Ultrasound Contrast Agent Imaging in 3D Mapping of Vascular Anomalies – 391  
Hyperspectral Imagery Target Detection Using Improved Anomaly Detection and Signature Matching Methods – 592  
Long-Range Operational Military Forecasts for Afghanistan – 271
- ANTARCTIC REGIONS**  
Analysis of ICESat Data Using Kalman Filter and Kriging to Study Height Changes in East Antarctica – 241
- ANTENNA ARRAYS**  
Non-Multiple Delay Element Values for Phase Shifting – 199  
Principles of Adaptive Array Processing – 176  
T/R Module for Satellite TT&C Ground Link – 200
- ANTENNA DESIGN**  
10x Improvement of Power Transmission over Free Space Using Integrated Antennas on Silicon Substrates – 191  
A Pareto Approach to Lossy Matching – 203  
Very High Resolution SAR and Multichannel SAR/MTI – 175
- ANTHROPOMETRY**  
Anthropometric Accommodation in Space Suit Design – 424  
Assessment of Injury Potential in Aircraft Side-Facing Seats Using the ES-2 Anthropomorphic Test Dummy – 10
- ANTIAIRCRAFT MISSILES**  
Enhancing Army S&T Lessons from 'Project Hindsight Revisited' – 22
- ANTIBIOTICS**  
Antimicrobial Polymeric Surfaces – 79  
Determination of Antibiotic Efficacy Against Bacillus Anthracis in a Mouse Aerosol Challenge Model – 335  
Posttreatment Changes in Escherichia coli Antimicrobial Susceptibility Rates Among Diarrheic Patients Treated with Ciprofloxacin – 385

Short-Course Postexposure Antibiotic Prophylaxis Combined with Vaccination Protects Against Experimental Inhalational Anthrax – 340

## ANTIBODIES

Genomic Characterization of KIR2DL4 in Families and Unrelated Individuals Reveals Extensive Diversity in Exon and Intron Sequences Including a Common Frameshift Variation Occurring in Several Alleles – 381

Human Spotted Fever Rickettsial Infections – 386

Human-Derived, Plant-Produced Monoclonal Antibody for the Treatment of Anthrax – 377

Investigating the Functional Role of Prostate-Specific Membrane Antigen and its Enzymatic Activity in Prostate Cancer Metastasis – 344

Mechanism of Action of Prostate Stem Cell Antigen Targeted Antibody Therapy and Its Relevance to Clinical Application in Prostate Cancer – 351

Mode of Action of Invasion-Inhibitory Antibodies Directed against Apical Membrane Antigen 1 of Plasmodium falciparum – 379

Murine Macrophages Kill the Vegetative Form of Bacillus anthracis – 394

Process Research and Development of Antibodies as Countermeasures for C. Botulinum – 308

Protection Against Scrub Typhus by a Plasmid Vaccine Encoding the 56-KD Outer Membrane Protein Antigen Gene – 399

## ANTICHOLINERGICS

Atropine and Other Anticholinergic Drugs – 372

## ANTICONVULSANTS

Anticonvulsants for Nerve Agent-Induced Seizures: The Influence of the Therapeutic Dose of Atropine – 110

## ANTIFERROMAGNETISM

Antiferromagnetically Stabilized Pseudo Spin Valve for Memory Applications – 438

## ANTIGENS

A Comprehensive Survey of the Plasmodium Life Cycle by Genomic, Transcriptomic, and Proteomic Analyses – 389

Cloning and Sequence Analysis of the 22-kDa Antigen Genes of Orientia tsutsugamushi Strains Kato, TA763, AFSC 7, 18-032460, TH1814, and MAK 119 – 399

Cross-Serotype Neutralization of Dengue Virus in Aotus nancymae Monkeys – 387

Developing Models to Facilitate the Appropriate Selection and Effective Targeting of Candidate Antigens for Specific Cellular Immunotherapy of Prostate Cancer – 349

Development of Antigen Presenting Cells for Adoptive Immunotherapy in Prostate Cancer – 286

Efficacy and Tolerability of Artesunate Plus Sulfadoxine-Pyrimethamine and Sulfadoxine-Pyrimethamine Alone for the Treatment of Uncomplicated Plasmodium falciparum Malaria in Peru – 380

HLA-A2 Supertype-Restricted Cell-Mediated Immunity by Peripheral Blood Mononuclear Cells Derived from Malian Children with Severe or Uncomplicated Plasmodium falciparum Malaria and Healthy Controls – 400

Human Leukocyte Antigen (HLA) Genotype as a Contributor to Racial/Ethnic Differences in Breast Cancer: A Population-Based Molecular Epidemiologic Study – 285

Identification, Cloning, and Expression of Potential Diagnostic Markers for Q Fever – 388

Improved Formulation of a Recombinant Ricin A-chain Vaccine Increases its Stability and Effective Antigenicity – 353

Intra-Prostate Cancer Vaccine Inducer – 316

Investigating the Functional Role of Prostate-Specific Membrane Antigen and its Enzymatic Activity in Prostate Cancer Metastasis – 344

Mechanism of Action of Prostate Stem Cell Antigen Targeted Antibody Therapy and Its Relevance to Clinical Application in Prostate Cancer – 351

Mode of Action of Invasion-Inhibitory Antibodies Directed against Apical Membrane Antigen 1 of Plasmodium falciparum – 379

Origin and Properties of Prostatic Stem Cells – 299

Protection Against Scrub Typhus by a Plasmid Vaccine Encoding the 56-KD Outer Membrane Protein Antigen Gene – 399

Ten Novel HLA-DRB1 Alleles and One Novel DRB3 Allele – 394

The Plasmodium falciparum Sexual Development Transcriptome: A Microarray Analysis using Ontology-Based Pattern Identification – 401

White Blood Cell Counts and Malaria – 400

## ANTIHISTAMINICS

First-Generation H1 Antihistamines Found in Pilot Fatalities of Civil Aviation Accidents, 1990-2005 – 10

## ANTIINFECTIVES AND ANTIBACTERIALS

Antimicrobial Polymeric Surfaces – 79

Posttreatment Changes in Escherichia coli Antimicrobial Susceptibility Rates Among Diarrheic Patients Treated with Ciprofloxacin – 385

## ANTIMISSILE DEFENSE

A System of Systems Interface Hazard Analysis Technique – 541

## ANTIOXIDANTS

Antioxidant Prophylaxis in the Prevention of Prostatic Epithelial Neoplasia – 337

Bifunctional Alkylating Agent-Induced p53 and Nonclassical Nuclear Factor  $\kappa$ B Responses and Cell Death are Altered by Caffeic Acid Phenethyl Ester: A Potential Role for Antioxidant/Electrophilic Response-Element Signaling – 388

Monitoring and Counteracting Functional Deterioration in Parkinson's Disease: A Multilevel Integrative Approach in a Primate Model System – 319

Post-Coupling Synthetic Approach for Polymeric Antioxidants – 65

## ANTIPIROTONS

8 GeV Beam Line Optics Optimization for the Rapid Antiproton Transfers at Fermilab – 557

Development of a Charged-Particle Accumulator Using an RF Confinement Method – 593

## ANTISUBMARINE WARFARE

Analysis of Network-Enabled ASW Concepts of Operation – 529

Utilizing Network-Enabled Command and Control Concepts to Enhance ASW Effectiveness – 590

## ANTITANK MISSILES

Enhancing Army S&T Lessons from 'Project Hindsight Revisited' – 22

## APERTURES

Multiple Aperture Radiation Therapy (MART) for Breast Cancer – 292

Vertical Cavity Surface Emitting Laser Having a Gain Guide Aperture Interior to an Oxide Confinement Layer – 599

## APOGEE BOOST MOTORS

Agent-Based Modeling for Testing and Designing Novel Decentralized Command and Control System Paradigms – 538

## APOPTOSIS

A Biophysico-computational Perspective of Breast Cancer Pathogenesis and Treatment Response – 325

Apoptosis and Tumor Progression in Prostate Cancer – 338

Apoptosis-Dependent and Apoptosis-Independent Functions of Bim in Prostate Cancer Cells – 307

Cell Cycle Dependence of TRAIL Sensitivity in Prostate Cancer Cells – 303

Development of Novel Bifunctional Compounds that Induce Apoptosis in Prostate Cancer Cells – 365

Intracellular Survival of Campylobacter jejuni in Human Monocytic Cells and Induction of Apoptotic Death by Cytolethal Distending Toxin – 394

Mechanism of Telomerase Inhibition Using Small Inhibitory RNAs and Induction of Breast Tumor Cell Sensitivity – 287

Mechanisms of p53-Mediated Apoptosis – 350

Methylselenium and Prostate Cancer Apoptosis – 339

Molecular Analysis of Neurotoxin-Induced Apoptosis – 323

Radio-sensitizing Effects of Novel Histone De-Acetylase Inhibitors in Prostate Cancer – 283

Regulation of Apoptosis by AFG3L2, a Potential Oncogene – 293

#### **APPLICATIONS PROGRAMS (COMPUTERS)**

An Adaptive Quality of Service Aware Middleware for Replicated Services – 521

#### **APPROXIMATION**

An Approximation Technique for Belief Revision in Timed Influence Nets – 521

Approximate Analysis of an Unreliable M/M/2 Retrial Queue – 494

Implementation of a High-Speed Numeric Function Generator on a COTS Reconfigurable Computer – 513

Workforce Configuration of a Canadian Forces Gematics Division – 539

#### **AQUATIC PLANTS**

Experimental Effects of Lime Application on Aquatic Macrophytes: 4. Growth Response of Three Species – 89

#### **AQUIFERS**

CLMT2 User's Guide: A Coupled Model for Simulation of Hydraulic Processes from Canopy to Aquifer – 276

#### **ARCHITECTURE (COMPUTERS)**

A Modular, Scalable, Architecture for Unmanned Vehicles – 547

An Open Architecture Approach to Network Enabled Capability – 656

Framework for Measuring the Impact of C4ISR Technologies and Concepts on Warfighter Effectiveness Using High Resolution Simulation – 144

Open Architecture in Naval Combat System Computing of the 21st Century: Network-Centric Applications – 442

Quality-Attribute-Based Economic Valuation of Architectural Patterns – 479

Recommendations for Network-and Internet-based Synchronized E-activities for Location- and Time-dependent Information – 457

Reconfigurable Matrix Multiplier Architecture and Extended Borrow Parallel Counter and Small-Multiplier Circuits – 208

Service Oriented Architecture for Coast Guard Command and Control – 633

Software Communications Architecture (SCA) Compliant Software Defined Radio Design for Interim Standard 95B (IS-95B) Transceiver – 463

Standard-Cell, Open-Architecture Power Conversion Systems – 247

System Level Architecture of Cooperative Satellite Control Using Hierarchical Hybrid Systems and Automata Theory – 50

The DoD Architecture Framework Views as Requirements Vehicles in a Model Driven Architecture Systems Development Process – 496

Using Formal Methods to Reason about Architectural Standards – 472

USNORTHCOM Integrated Architecture: A Means to an End – 494

#### **ARCTIC REGIONS**

On Recent Interannual Variability of the Arctic Winter Mesosphere: Implications for Tracer Descent – 263

#### **ARMATURES**

Incident, Action, Recovery, and Recommissioning for the 4.5-MJ Pulsed Power Supply Located at the Electromagnetic Gun Facility, Barricade C, Aberdeen Proving Ground, MD – 202

#### **ARMED FORCES (UNITED STATES)**

Forecasting Demand for Civilian Pilots: A Cost Savings Approach to Managing Air Force Pilot Resources – 27

Hurricane Katrina: Lessons for Army Planning and Operations – 163

Solving Wireless Communications Interoperability Problems among Emergency First Responders Depends on Greater National Guard Involvement – 181

TARDEC National Automotive Center - Selfridge Air National Guard Base – 132

The Effect of Graduate Education on the Performance of Air Force Officers – 526

#### **ARMOR**

Defense Logistics: Army and Marine Corps' Body Armor Requirements, Controls, and Other Issues – 426

FCS Technology Insertion and Transition – 508

#### **ARRAYS**

Electro-Optic Array Interface – 213

Fault Tolerance in Autonomous Acoustic Arrays – 185

#### **ARSENIC**

Method of Affinity Purifying Proteins Using Modified Bis-Arsenical Fluorescein – 65

#### **ARTHROPODS**

Evaluation of Daphnia Magna Neonate Viability under Low Temperature Exposure Conditions – 310

#### **ARTIFICIAL GRAVITY**

Artificial Gravity: Will it Preserve Bone Health on Long-Duration Missions? – 411

Multi-System Effects of Daily Artificial Gravity Exposures in Humans Deconditioned by Bed Rest – 418

#### **ARTIFICIAL INTELLIGENCE**

A Qualitative Approach to Rigid Body Mechanics – 501

An Agent-Based Dynamic Information Security Model in Information Warfare – 643

Automated Run-Time Mission and Dialog Generation – 632

Automatic Author Profiling of Online Chat Logs – 503

Boot Camp for Cognitive Systems: A Model for Preparing Systems with Machine Learning for Deployment – 463

Dynamic Cross-Time Measurement Interpretation: Maintaining Qualitative Understandings of Physical System Behavior – 500

Flexible UAV Mission Management Using Emerging Technologies – 23

Information Fusion for Hypothesis Generation under Uncertain and Partial Information Access Situation – 499

Introducing Actions into Qualitative Simulation – 499

Modeling Command and Control in Multi-Agent Systems – 452

Qualitative Reasoning about Fluids and Mechanics – 446

The Logic of Occurrence – 500

#### **ARTIFICIAL SATELLITES**

Application of the Community Radiative Transfer Model to Evaluate Satellite-Based Measurements Across the African Easterly Jet Over Western Africa – 48

Mission Support for the Communications/Navigation Outage Forecast Satellite – 49

Polymers Used as Fuel for Laser Plasma Thrusters in Small Satellites – 123

Prioritizing Satellite Payload Selection via Optimization – 46

Quick-Turn Finite Element Analysis for Plug-and-Play Satellite Structures – 520

Real Options as a Strategic Management Framework: A Case Study of the Operationally Responsive Space Initiative – 51

System Level Architecture of Cooperative Satellite Control Using Hierarchical Hybrid Systems and Automata Theory – 50

Video Enabling the Combatant Commander's Headquarters – 48

## ARTILLERY

Human Factors Evaluation of the High Mobility Artillery Rocket System (HIMARS) in the Combined HIMARS-Guided Multiple Launch Rocket System (GMLRS) Initial Operational Test – [424](#)

Human Factors Evaluation of the XM30 Guided Multiple Launch Rocket System (GMLRS) in the Combined High Mobility Artillery Rocket System (HIMARS)-GMLRS Initial Operational Test – [423](#)

## ASBESTOS

Asbestos Survey for Fort Point US Coast Guard Station. Presidio of San Francisco. Volume 2 – [241](#)

Jefferson Proving Ground, South of the Firing Line, Final Asbestos Survey Summary Report. Volume 3. Buildings 230 through 475 – [241](#)

## ASIA

Collaborative Research: Ground Truth of African and Eastern Mediterranean Shallow Seismicity Using SAR Interferometry and Gibbs Sampling Inversion – [262](#)

Continent-Wide Maps of 5-50 S Rayleigh-Wave Attenuation for Eurasia Inferred from Maps of 1-Hz Lg Coda Q and its Frequency Dependence – [265](#)

Regionalization of Crustal and Upper Mantle Q Structure in Eastern Eurasia Using Multiple Regional Waves – [262](#)

## ASPHALT

Application of Surface Energy Measurements to Evaluate Moisture Susceptibility of Asphalt and Aggregates – [74](#)

System for the Evaluation of Moisture Damage Using Fundamental Material Properties – [74](#)

## ASSAYING

Development of In Vitro Correlate Assays of Immunity to Infection with Yersinia Pestis – [327](#)

Liquid Mixing Reactor for Biochemical Assays – [71](#)

## ASSOCIATIVE MEMORY

Feasibility Study on Magnetic Content Addressable Memory – [196](#)

## ASTHMA

IAQ Tools for Schools. Managing Asthma in the School Environment – [260](#)

Prenatal Exposure to Nicotine and Childhood Asthma: Role of Nicotine Acetylcholine Receptors, Neuropeptides and Fibronectin Expression in Lung – [333](#)

Scavenger Receptors and Resistance to Inhaled Allergens – [328](#)

## ASTRONAUTS

A Study of the Attraction Forces of Lunar Dust Simulant – [664](#)

Effects of Lunar Dust Simulant (JSC-1A-vf) on WI-38 Human Embryonic Lung Cells – [417](#)

Johnson Space Center Flight Medicine Clinic Experience – [413](#)

Operational Aspects of Space Radiation Analysis – [676](#)

## ASTRONOMICAL OBSERVATORIES

Exploring the High Energy Universe: GLAST Mission and Science – [667](#)

## ASTROPHYSICS

Hypothesis of the Magnetostatic Turbulence and its Implications for Astrophysics – [672](#)

Naval Research Laboratory Space Science Division Newsletter: 01/2007 – [669](#)

Relativistic Jets in the Radio Reference Frame Image Database. 1. Apparent Speeds From the First 5 Years of Data – [670](#)

## ASYMMETRY

Characterization Of Commonly Encountered Explosives Using Highfield Asymmetric Waveform Ion Mobility Spectrometry Coupled With Mass Spectrometry – [594](#)

e-/e+ Accelerating Structure with Cyclic Variation of Azimuth Asymmetry – [578](#)

Exploring Hypersonic, Unstructured-Grid Issues through Structured Grids – [437](#)

Measurements of CP-Violating Asymmetries in B0 to a1+(1260) pi+ Decays – [578](#)

Method and Apparatus for Providing an Asymmetric Watermark Carrier – [430](#)

## ATMOSPHERIC BOUNDARY LAYER

Implementation of the Immersed Boundary Method in the Weather Research and Forecasting Model – [275](#)

Meteorological Factors That Lead to Separation of the California Coastal Jet from the Central Coast – [270](#)

## ATMOSPHERIC COMPOSITION

Achievements in Stratospheric Ozone Protection – [278](#)

## ATMOSPHERIC EFFECTS

Mitigating Atmospheric Effects in High-Resolution Infra-Red Surveillance Imagery with Bispectral Speckle Imaging – [675](#)

## ATMOSPHERIC ENTRY

Shuttle Entry Imaging Using Infrared Thermography – [57](#)

## ATMOSPHERIC MODELS

Determination of Antibiotic Efficacy Against Bacillus Anthracis in a Mouse Aerosol Challenge Model – [335](#)

Implementation of the Immersed Boundary Method in the Weather Research and Forecasting Model – [275](#)

Inversion of Ionospheric Backscatter Radar Data in Order to Map and Model the Ionosphere – [260](#)

Stratospheric Relaxation in IMPACTs Radiation Code – [275](#)

Using DUSTRAN to Simulate Fog-Oil Dispersion and Its Impacts on Local Insect Populations at Ft. Hood: Final Report – [253](#)

## ATMOSPHERIC SOUNDING

On Recent Interannual Variability of the Arctic Winter Mesosphere: Implications for Tracer Descent – [263](#)

## ATMOSPHERIC STRATIFICATION

Implementation of the Immersed Boundary Method in the Weather Research and Forecasting Model – [275](#)

## ATMOSPHERIC TEMPERATURE

Microphysics of Air-Sea Exchanges – [274](#)

Vertical Variation of Dust and Its Impact on the Top of the Atmosphere Brightness Temperature in the Midwave Infrared – [271](#)

## ATMOSPHERIC TIDES

Observation of Tidal Effects on LWIR Radiance Above the Mesopause – [262](#)

## ATOMIC FORCE MICROSCOPY

Ionic Liquid Lubrication of MEMS Devices: An AFM Based Analysis and Evaluation on Test Devices (Preprint) – [591](#)

## ATOMIC PHYSICS

Proving Atomicity: An Assertional Approach – [487](#)

## ATOMIC STRUCTURE

On the Importance of Atomic Packing in Determining Dielectric Permittivities – [553](#)

## ATOMIZING

A Method to Predict Atomization Performance in Gas-Centered Swirl-Coaxial Injectors – [218](#)

A Rocket-Like Coaxial Injector in an Acoustic Field Under Sub- and Supercritical Conditions (POSTPRINT) – [218](#)

Atomization Performance Predictions of Gas-Centered Swirl-Coaxial Injectors – [216](#)

## ATOMS

Atomic-Scale Design of Iron Fischer-Tropsch Catalysts: A Combined Computational Chemistry, Experimental, and Microkinetic Modeling Approach. (3rd Annual Report) – [105](#)

Atomtronics: Ultracold Atom Analogs of Electronic Devices – [194](#)

On the Importance of Atomic Packing in Determining Dielectric Permittivities – [553](#)

Scalability, Complexity and Reliability in Quantum Information Processing – [591](#)

Vertical Alignment of Single-Walled Carbon Nanotubes on Nanostructure Fabricated by Atomic Force Microscope – [88](#)

## ATROPINE

Anticonvulsants for Nerve Agent-Induced Seizures: The Influence of the Therapeutic Dose of Atropine – [110](#)

- Atropine and Other Anticholinergic Drugs – 372
- ATTACK AIRCRAFT**  
Enhancing Army S&T Lessons from ‘Project Hindsight Revisited’ – 22

A Review of Australian and New Zealand Investigations on Aeronautical Fatigue During the Period April 2005 to March 2007 – 3  
Developing and Evolving a Joint Australian Task List – 155  
Interoperability -- An Australian View – 639  
Joint Essential Tasks and a Framework for Evaluation – 136
- AUTOMATA THEORY**  
System Level Architecture of Cooperative Satellite Control Using Hierarchical Hybrid Systems and Automata Theory – 50  
Virtual Stationary Automata for Mobile Networks – 536
- AUTOMATIC CONTROL**  
Automated STR Analysis for DNA Databases – 429  
Development of an Experimental Platform for Testing Autonomous UAV Guidance and Control Algorithms – 38  
Enhancing Child Support Enforcement Efforts: Summary of Data Warehouse Efforts in Nine States – 439  
QoS Negotiation in Real-Time Systems and its Application to Automated Flight Control – 43
- AUTOMATION**  
ISO/IEC JTC1 SC37 Overview – 474
- AUTOMOBILES**  
How the Car Affects the Activity patterns of Children and Youth – 170  
Tank Automotive Research, Development, and Engineering Center – 129  
TARDEC National Automotive Center - Selfridge Air National Guard Base – 132  
The Supreme Court’s Climate Change Decision: Massachusetts v. EPA – 263
- AUTONOMIC NERVOUS SYSTEM**  
Atropine and Other Anticholinergic Drugs – 372  
Growth Factor Dependent Cholinergic Function and Survival in Primary Mouse Spinal Cord Cultures – 373  
PHM Integration with Maintenance and Inventory Management Systems (Preprint) – 498
- AUTONOMOUS NAVIGATION**  
A Modular, Scalable, Architecture for Unmanned Vehicles – 547  
A Study of Autonomous Micro-Robots and Their Application to Complex Environments, Volume 1 – 543  
Compliant Formation Control of an Autonomous Multiple Vehicle System – 507
- Path Planning Software and Graphics Interface for an Autonomous Vehicle, Accounting for Terrain Features – 480  
Probability Modeling of Multi-Type Autonomous Unmanned Combat Aerial Vehicles Engaging Non-Homogeneous Targets Under Imperfect Information – 26  
Spatial and Temporal Abstractions in POMDPs Applied to Robot Navigation – 523  
Vector Pursuit Path Tracking for Autonomous Ground Vehicles – 507  
Wide Area Search and Engagement Simulation Validation – 32
- AUTONOMY**  
A Distributed Parallel Embedded System for Autonomous Sonar Arrays – 450  
A Study of Autonomous Micro-Robots and Their Application to Complex Environments, Volume 1 – 543  
An Expose of Autonomous Agents in Command and Control Planning – 498  
Autonomous Unmanned Aerial Vehicle Rendezvous for Automated Aerial Refueling – 11  
Autonomous Virtual Mobile Nodes – 535  
Compliant Formation Control of an Autonomous Multiple Vehicle System – 507  
Development of an Experimental Platform for Testing Autonomous UAV Guidance and Control Algorithms – 38  
Fault Tolerance in Autonomous Acoustic Arrays – 185  
Implementing a Low-Cost Long-Range Unmanned Underwater Vehicle: The SeaDiver Glider – 505  
Information Fusion for Hypothesis Generation under Uncertain and Partial Information Access Situation – 499  
Lethality and Autonomous Robots: An Ethical Stance – 504  
Optimal UAV Task Assignment and Scheduling (Preprint) – 24  
Path Planning Software and Graphics Interface for an Autonomous Vehicle, Accounting for Terrain Features – 480  
Performance Evaluation of Ad Hoc Routing Protocols in a Swarm of Autonomous Unmanned Aerial Vehicles – 38  
Probability Modeling of Multi-Type Autonomous Unmanned Combat Aerial Vehicles Engaging Non-Homogeneous Targets Under Imperfect Information – 26  
Research Institute for Autonomous Precision Guided Systems – 31  
Simultaneous Planning and Control for Autonomous Ground Vehicles – 507  
Spatial and Temporal Abstractions in POMDPs Applied to Robot Navigation – 523

- Vector Pursuit Path Tracking for Autonomous Ground Vehicles – 507
- AUXILIARY POWER SOURCES**  
A Review of the History of Fire Suppression on U.S. DoD Aircraft – 34
- AVIONICS**  
A Multiservice Switch for Advanced Avionics Data Networks – 43  
Guidance Material for Mode S-Specific Protocol Application Avionics – 37
- AWACS AIRCRAFT**  
IEIST Technologies Enabling TCT Prosecution – 538  
Weapons Director Intelligent-Agent-Assist Task: Procedure and Findings for a Validation Study – 7
- AXIAL FLOW**  
Novel Collective Protection Filters for Emerging TIC Requirements: Axial and Radial-Flow Filter Designs – 55
- AZIDES (INORGANIC)**  
Investigation of Ignition Delay: Novel Beta-Substituted Ethylazide Derivatives as Potential New Liquid Propellant Fuels (Preprint) – 100
- AZIDES (ORGANIC)**  
Investigation of Ignition Delay: Novel Beta-Substituted Ethylazide Derivatives as Potential New Liquid Propellant Fuels (Preprint) – 100
- AZIMUTH**  
e-/e+ Accelerating Structure with Cyclic Variation of Azimuth Asymmetry – 578
- BACILLUS**  
Determination of Antibiotic Efficacy Against Bacillus Anthracis in a Mouse Aerosol Challenge Model – 335  
Human-Derived, Plant-Produced Monoclonal Antibody for the Treatment of Anthrax – 377  
Microarray Analysis of Transposon Insertion Mutants in Bacillus Anthracis: Global Identification of Genes Required for Sporulation and Germination – 335  
Microarray-based Resequencing of Multiple Bacillus anthracis Isolates – 386  
Murine Macrophages Kill the Vegetative Form of Bacillus anthracis – 394  
Role of Superoxide in the Germination of Bacillus Anthracis Endospores – 380
- BACKSCATTERING**  
Inversion of Ionospheric Backscatter Radar Data in Order to Map and Model the Ionosphere – 261
- BACTERIA**  
A Comprehensive Characterization of Microorganisms and Allergens in Spacecraft Environment – 414  
Biomimetic Energy Transduction: Artificial Photosynthesis in a Stabilized Lipid Membrane Coupled to a Semiconductor – 204  
Cell-surface Alpha-glucan in Campylobacter jejuni 81-176 – 401
- Diarrheal Illness Among Deployed U.S. Military Personnel During Operation Bright Star 2001-Egypt – 375  
Microbial Dynamics during Barley Tempeh Fermentation – 104  
Process Research and Development of Antibodies as Countermeasures for C. Botulinum – 308  
Production of Recombinant Protein Pap31 and Its Application for the Diagnosis of Bartonella bacilliformis Infection – 398  
Proteomic Analysis of Rickettsia prowazekii – 395  
Role of Superoxide in the Germination of Bacillus Anthracis Endospores – 380  
Short- and Long-Term Immune Responses of CD-1 Outbred Mice to the Scrub Typhus DNA Vaccine Candidate: p47Kp – 399  
Spaceflight Alters Bacterial Gene Expression and Virulence and Reveals Role for Global Regulator Hfq – 420  
Structural Studies on Intact Clostridium Botulinum Neurotoxins Complexed with Inhibitors Leading to Drug Design – 304
- BAGGAGE**  
Tag Device, Luggage Tag, and Method of Manufacturing a Tag Device – 200
- BALANCE**  
WABED Model in the SMS: Part 2. Graphical Interface – 470
- BALL BEARINGS**  
Development of ASTM Precision Bearing Grease Guide – 64
- BALLISTIC RANGES**  
Boundary Layer Transition Experiments in Support of the Hypersonics Program – 1
- BALLISTICS**  
Ballistic Evaluation of Magnesium Alloy AZ31B – 117
- BANDWIDTH**  
A CBO Study. The Army's Bandwidth Bottleneck – 154  
Infiniband Performance Comparisons of SDR, DDR and Infinipath – 204  
Very High Resolution SAR and Multichannel SAR/MTI – 175
- BARIUM**  
Searching for Double Beta Decay with the Enriched Xenon Observatory – 566
- BARLEY**  
Microbial Dynamics during Barley Tempeh Fermentation – 104
- BARYONS**  
AdS/CFT and QCD – 572  
First Observation of Bottom Baryon Sigma(b) States at CDF – 586  
SELEX: Recent Progress in the Analysis of Charm-Strange and Double-Charm Baryons – 557
- BATHS**  
Development of a Recovery System for Metals and Acids from Pickling Baths Using Nanofiltration and Crystallisation – 109
- BATS**  
Measurement of Fog Oil Penetration into Model Underground Burrow and Hollow Tree Nest Cavities – 250
- BATTERY CHARGERS**  
Servicing Hawker Vehicle Batteries with Standard Battery Charging and Test Equipment – 248
- BAYES THEOREM**  
Survey of Bayesian Models for Modelling of Stochastic Temporal Processes – 434
- BEACONS**  
Exploiting Adaptive Optics with Deformable Secondary Mirrors – 232
- BEAM INTERACTIONS**  
Closed Orbit Distortion and the Beam-Beam Interaction – 556
- BEAMFORMING**  
Fundamentals of Signal Processing for Phased Array Radar – 176  
Principles of Adaptive Array Processing – 176  
Real-Time Sonar Beamforming on High-Performance Distributed Computers – 596
- BEAMS (SUPPORTS)**  
Study of Free-Free Beam Structural Dynamics Perturbations due to Mounted Cable Harnesses – 53
- BED REST**  
Multi-System Effects of Daily Artificial Gravity Exposures in Humans Deconditioned by Bed Rest – 419
- BETA PARTICLES**  
Searching for Double Beta Decay with the Enriched Xenon Observatory – 566
- BIBLIOGRAPHIES**  
Detonation Nanodiamonds and Related Materials. Bibliography Index, Issue 1 – 103
- BIDIRECTIONAL REFLECTANCE**  
Coherence Solution for Bidirectional Reflectance of Surfaces with Wavelength-Scale Statistics (Postprint) – 529  
Materials on the International Space Station Experiment (MISSE): Optical Analysis of Molecular Contamination on PEC1 Tray 2 – 54
- BINARY STARS**  
Eta Carinae: Viewed from Multiple Vantage Points – 674
- BINDERS (MATERIALS)**  
Composite Materials Containing a Nanostructured Carbon Binder Phase and High Pressure Process for Making the Same – 83

## BIOASTRONAUTICS

A Comprehensive Characterization of Microorganisms and Allergens in Spacecraft Environment – 414

An Evidence-based Approach to Developing a Management Strategy for Medical Contingencies on the Lunar Surface: The NASA/Haughton-Mars Project (HMP) 2006 Lunar Medical Contingency Simulation at Devon Island – 415

Integrated Crew Health Care System for Space Flight – 412

Space Medicine Issues and Healthcare Systems for Space Exploration Medicine – 415

## BIOAVAILABILITY

Effects of Hind Limb Unloading on Pharmacokinetics of Procainamide in Mice – 417

## BIOCHEMISTRY

Liquid Mixing Reactor for Biochemical Assays – 71

Optical, Biochemical, and Molecular Characterization of New Bioluminescence Systems – 354

Transformational Medical Technologies Initiative (TMTI) – 310

Ultra Fast Coherent Diffraction Imaging of Single Particles, Clusters and Biomolecules – 572

## BIODEGRADATION

Biodegradation of DIMP, Dieldrin, Isodrin, DBCP, and PCPMSO in Rocky Mountain Arsenal Soils. Installation Restoration Program, Environmental Technology Development – 305

Literature Review of Biodegradation in Soil of Selected Rocky Mountain Arsenal Contaminants: Isodrin, Dieldrin, Diisopropylmethyl-Phosphonate, 1,2-Dibromo-3-Chloropropane, and p-Chloro-Phenylmethylsulfoxide – 61

Microbial Degradation of Fuel Oxygenates under Aerobic Conditions – 113

Review of Laboratory Program on Degradation Mechanisms in Soil of Wastewater From Nitroguanidine Manufacture – 93

## BIODYNAMICS

Evaluation of a Particle Swarm Algorithm for Biomechanical Optimization – 512

Mathematical Modeling of Physical and Cognitive Performance Decrement from Mechanical and Inhalation Insults – 297

Scale-Independent Biomechanical Optimization – 521

## BIOLOGICAL HAZARDS

Assessing the Biohazard Potential of Putative Martian Organisms for Exploration Class Human Space Missions – 675

## BIOLOGICAL WEAPONS

Effect of Atmospheric Background Aerosols on Biological Agent Detectors – 222

Meteorological Integration for the Biological Warning and Incident Characterization (BWIC) System: General Guidance for BWIC Cities – 274

## BIOLUMINESCENCE

A Device for the In-Situ Measurement of Acoustically Stimulated Bioluminescence – 310

IDO Inhibitors for Combination Therapy of Prostate Cancer – 317

Optical, Biochemical, and Molecular Characterization of New Bioluminescence Systems – 354

## BIOMARKERS

A Chemoprevention Trial to Study the Effects of High Tea Consumption on Smoking-Related Oxidative Stress – 340

Analysis of MALDI-TOF Serum Profiles for Biomarker Selection and Sample Classification – 308

Biomarkers for Amyotrophic Lateral Sclerosis in Active Duty Military – 338

HOXC5 as a Biomarker of Disease Presence in Tumor-Associated Normal Prostate – 290

Human Exposure Biomarkers - Permethrin as a Militarily-Relevant Model – 375

## BIOMEDICAL DATA

An Evidence-based Approach to Developing a Management Strategy for Medical Contingencies on the Lunar Surface: The NASA/Haughton-Mars Project (HMP) 2006 Lunar Medical Contingency Simulation at Devon Island – 415

Testing the Effectiveness of the North Shore - LIJ Health System's Bioterrorism Response Program to Identified Surveillance Data – 345

Translational Research in Space Exploration – 413

## BIOMETRICS

An Enterprise Solution for Biometric Authentication and Identification – 473

Biometric Security Issues – 474

CANPASS Air/NEXUS Air - Border Clearance in the Blink of an Eye – 476

Challenges and Potential Research Areas in Biometrics – 476

Challenges for Biometrics Systems: Performance and Fake Resistance – 475

Communication Security Establishment Briefing on Government of Canada Biometrics Reports – 477

DigitalPersona - Case Study: Department of Defense – 475

Enhancing Information Systems Security through Biometrics – 472

Future Applications in Using Biometrics to Enhance Security Level of Coalition Information Sharing Networks – 477

Human Factors and Privacy – 476

Immunology, Systems Biology, and Immunotherapy of Breast Cancer – 360

ISO/IEC JTC1 SC37 Overview – 474

Multimodal Biometric Systems – 472

Privacy and Biometrics: The Human Factors – 477

Security Strategy for a Biometrics Deployment – 474

Technical and Non-Technical Problems in Biometric Physical Access Control Systems – 473

Testing and Evaluation of Dynasig Biometric Pen in Support of Tactical Military and Law Enforcement Missions – 422

The Accuracy of a Fingerprint/Voice Multimodal Verification System – 473

Today's Biometric Projects Need Mobile & Handheld Readers - Why? Applications and Readers – 476

Usability and Acceptability of Biometric Security Systems – 473

Vulnerabilities in Biometric Encryption Systems – 473

White Blood Cell Counts and Malaria – 400

## BIOMIMETICS

Biomimetic Energy Transduction: Artificial Photosynthesis in a Stabilized Lipid Membrane Coupled to a Semiconductor – 204

## BIOPROCESSING

Effects of Hind Limb Unloading on Pharmacokinetics of Procainamide in Mice – 417

## BIOREACTORS

Simulated Microgravity Regulates Gene Transcript Profiles of 2T3 Preosteoblasts: Comparison of the Random Positioning Machine and the Rotating Wall Vessel Bioreactor – 412

## BIOTECHNOLOGY

2006 In Vitro Biology Meeting. Volume 42 – 291

Quarterly Performance/Technical Reports: HLA Typing for Bone Marrow Transplantation, and Development of Medical Technology for Contingency Response to Marrow Toxic Agents – 305

Transformational Medical Technologies Initiative (TMTI) – 310

## BIPOLAR TRANSISTORS

Pseudomorphic Bipolar Quantum Resonant-Tunneling Transistor – 186

## BIPOLARITY

Pseudomorphic Bipolar Quantum Resonant-Tunneling Transistor – 186

## BIRDS

Development of a Mouse Model for Prostate Cancer Imaging and Study of Disease Progression – 322

## BITUMENS

System and Method for Field Testing a Tack Coat Layer – 75

## **BLACK HOLES (ASTRONOMY)**

FY06 LDRD Final Report 'The Creation of a Neutron Star Atmosphere' – 672

## **BLACK SEA**

European Security in the Wider Black Sea Area – 242

## **BLOOD CELLS**

Cord Blood Stem Cell Procurement in Minority Donors – 302

HLA-A2 Supertype-Restricted Cell-Mediated Immunity by Peripheral Blood Mononuclear Cells Derived from Malian Children with Severe or Uncomplicated Plasmodium falciparum Malaria and Healthy Controls – 400

Mechanisms of Disease Persistence in Chronic Myelogenous Leukemia (CML) – 318

## **BLOOD CIRCULATION**

A Hemoglobin-based Oxygen Carrier, Bovine Polymerized Hemoglobin (HBOC-201) Versus Hetastarch (HEX) in a Moderate Severity Hemorrhagic Shock Swine Model with Delayed Evacuation – 395

A Physiologically Based Pharmacokinetic (PB/PK) Model for Multiple Exposure Routes of Soman in Multiple Species – 374

## **BLOOD COAGULATION**

Effects of Bovine Polymerized Hemoglobin in Coagulation in Controlled Hemorrhagic Shock in Swine – 385

## **BLOOD PRESSURE**

Effects of Bovine Polymerized Hemoglobin in Coagulation in Controlled Hemorrhagic Shock in Swine – 385

## **BLOOD VESSELS**

Anti-Angiogenic Action of Neutral Endopeptidase – 285

## **BLOOD**

Analysis of MALDI-TOF Serum Profiles for Biomarker Selection and Sample Classification – 309

Biomarkers for Amyotrophic Lateral Sclerosis in Active Duty Military – 338

Direct Detection of Stereospecific Soman Hydrolysis by Wild-Type Human Serum Paraoxonase – 374

Effects of Bovine Polymerized Hemoglobin in Coagulation in Controlled Hemorrhagic Shock in Swine – 385

Epidemiology of Transfusion-Transmitted Infections Among Multi-Transfused Patients in Seven Hospitals in Peru – 403

Human Spotted Fever Rickettsial Infections – 386

Immunology, Systems Biology, and Immunotherapy of Breast Cancer – 360

Phylogenetic Analysis of a Novel Molecular Isolate of Spotted Fever Group Rickettsiae from Northern Peru – 404

Seroincidence and Phylogeny of Human Immunodeficiency Virus Infections in a Cohort of Commercial Sex Workers in Montevideo, Uruguay – 389

Serologic Correlates of Protection against Enterotoxigenic Escherichia coli Diarrhea – 379

White Blood Cell Counts and Malaria – 400

## **BODY FLUIDS**

Far Forward Treatment of Hemorrhagic Shock – 378

## **BODY SIZE (BIOLOGY)**

Anthropometric Accommodation in Space Suit Design – 424

## **BODY WEIGHT**

The Effect of Increasing Mass on Locomotion – 414

## **BODY-WING AND TAIL CONFIGURATIONS**

Innovative Concept for a Heavy-Load Aircraft Utilizing a Two-Dimensional Wing – 36

## **BOLOMETERS**

GISMO – 231

## **BONDED JOINTS**

Best Practice in Adhesive-Bonded Structures and Repairs – 67

Nano Enabled Thermo-Mechanical Materials in Adhesive Joints: A New Paradigm to Materials Functionality (Preprint) – 81

## **BONDING**

Solid State Synthesis Under Supramolecular Control of a 2D Heterotetrapotic Self-complementary Tecton Tailored to Halogen Bonding – 98

## **BONE DEMINERALIZATION**

Artificial Gravity: Will it Preserve Bone Health on Long-Duration Missions? – 411

Simulated Microgravity Regulates Gene Transcript Profiles of 2T3 Preosteoblasts: Comparison of the Random Positioning Machine and the Rotating Wall Vessel Bioreactor – 411

## **BONE MARROW**

Autologous Marrow-Derived Stem Cell-Seeded Gene-Supplemented Collagen Scaffolds for Spinal Cord Regeneration as a Treatment for Paralysis – 299

Origin and Properties of Prostatic Stem Cells – 299

Quarterly Performance/Technical Reports: HLA Typing for Bone Marrow Transplantation, and Development of Medical Technology for Contingency Response to Marrow Toxic Agents – 305

## **BONES**

Artificial Gravity: Will it Preserve Bone Health on Long-Duration Missions? – 411

Bone Conduction: Anatomy, Physiology, and Communication – 163

Do Capacity Coupled Electric Fields Accelerate Tibial Stress Fracture Healing – 287

Effect of COX-2 (PGE2) and IL-6 on Prostate Cancer Bone Mets – 294

Efficacy of Calcium and Vitamin D Supplementation for the Prevention of Stress Fractures in Female Naval Recruits – 288

Hepatocyte Growth Factor and Interleukin-6 in Prostate Cancer Bone Metastasis – 344

Imaging Primary Prostate Cancer and Bone Metastasis – 325

Leg Muscle Usage Effects on Tibial Elasticity during Running – 295

Molecular Mechanisms of Soft Tissue Regeneration and Bone Formation in Mice: Implications in Fracture Repair and Wound Healing in Humans – 298

Simulated Microgravity Regulates Gene Transcript Profiles of 2T3 Preosteoblasts: Comparison of the Random Positioning Machine and the Rotating Wall Vessel Bioreactor – 411

Skeletal Complications in Neurofibromatosis Type 1: The Role of Neurofibromin Haploinsufficiency in Defective Skeletal Remodeling and Bone Healing in NF1 – 377

Targeted Therapies for Myeloma and Metastatic Bone Cancers – 328

Vulnerable Factors to Improve Bone Healing – 347

## **BOOSTER ROCKET ENGINES**

The Independent Readiness Team (IRRT) of SMC – 49

## **BOSNIA AND HERZEGOVINA**

Coalition Information Sharing: Lessons from Kosovo – 183

## **BOSONS**

Search for Chargino and Neutralino at Run II of the Tevatron Collider – 576

W + Jet Production at CDF – 585

## **BOUNDARIES**

Freezing Fog Formation in a Supercooled Boundary Layer: Solving the Winter Fog Forecasting Challenge for Elmendorf Air Force Base, Alaska – 270

## **BOUNDARY CONDITIONS**

Concepts Associated with Transferring Temporal and Spatial Boundary Conditions Between Modules in the Framework for Risk Analysis in Multimedia Environmental Systems (FRAMES) – 431

High-Order Higdon Non-Reflecting Boundary Conditions for the Linearized Euler Equations – 526

Simulation of Stagnation Region Heating in Hypersonic Flow on Tetrahedral Grids – 430

## **BOUNDARY LAYER FLOW**

Analysis of Crossflow Transition Flight Experiment aboard the Pegasus Launch Vehicle – 44

Direct Numerical Simulation and Experimental Validation of Hypersonic Boundary-Layer Receptivity and Instability – 512

Effects of Nose Bluntness on Stability of Hypersonic Boundary Layers over Blunt Cone – 4

Implementation of the Immersed Boundary Method in the Weather Research and Forecasting Model – 275

## **BOUNDARY LAYER SEPARATION**

Active Control of Flow Separation on a High-Lift System with Slotted Flap at High Reynolds Number – 4

## **BOUNDARY LAYER TRANSITION**

Boundary Layer Transition Experiments in Support of the Hypersonics Program – 1

Shuttle Entry Imaging Using Infrared Thermography – 57

## **BOUNDARY LAYERS**

Direct Numerical Simulation and Experimental Validation of Hypersonic Boundary-Layer Receptivity and Instability – 512

Freezing Fog Formation in a Supercooled Boundary Layer: Solving the Winter Fog Forecasting Challenge for Elmendorf Air Force Base, Alaska – 270

Meteorological Factors That Lead to Separation of the California Coastal Jet from the Central Coast – 270

## **BRAGG GRATINGS**

Thermally Compensated Fiber Bragg Grating Mount – 236

## **BRAIN DAMAGE**

Preventing Epilepsy after Traumatic Brain Injury – 366

## **BRAIN**

Brain's DNA Repair Response to Neurotoxicants – 317

Development of Multisensory Orientation Technology for Reducing Spatial Disorientation Mishaps – 6

High-Throughput Analysis of Dynamic Gene Expression Associated with Sleep Deprivation and Recovery Sleep in the Mouse Brain – 409

Systems and Methods for Altering Vestibular Biology – 506

The Role of TSC Proteins in Regulating Cell Adhesion and Motility – 281

## **BRANCHING (PHYSICS)**

First NNLL Prediction of  $B(\text{bar}B \text{ right arrow } Xs \text{ gamma})$  – 567

## **BRAZIL**

Automatic Generation of Best Emergency Routes and Procedures on a Brazilian Frigate – 467

## **BRAZING**

Titanium Brazing for Structures and Survivability – 120

## **BREAST**

A Biophysico-computational Perspective of Breast Cancer Pathogenesis and Treatment Response – 325

A Dual-Action Approach to Multidrug-Resistant Breast Cancer: Prophylaxis to Ensure Therapeutic Effect – 406

A MicroRNA Cluster as a Potential Breast Cancer Oncogene – 358

A Partnership Training Program in Breast Cancer Diagnosis: Concept Development of the Next Generation Diagnostic Breast Imaging Using Digital Image Library and Networking Techniques – 296

A Rat Model for Human Ductal Carcinoma In Situ – 392

Adipose Estrogen and Increased Breast Cancer Risk in Obesity: Regulation by Leptin and Insulin – 357

Antagonism of Taxol Cytotoxicity by Prolactin: Implications for Patient Resistance to Chemotherapy – 364

Are Anti-Inflammatory Lymphocytes Able to Induce Remission of Breast Cancer. Addendum – 364

Association between Microtubule Associated Protein -2 and the EGFR Signaling in Breast Cancer – 296

BRCA1 in Gene-Specific Coordination of Transcription and DNA Damage Response – 406

Cellular Senescence and Breast Cancer – 292

Characterization of Breast Masses Using a new Method of Ultrasound Contrast Agent Imaging in 3D Mapping of Vascular Anomalies – 391

Characterization of Breast Masses Using a New Method of Ultrasound Contrast Agent Imaging in 3D Mapping of Vascular Anomalies – 391

Characterization of the Role of Breast Tumor Kinase (BRK) in Breast Cancer Cells Non-responsive to EGFR-targeted Agents – 329

Chemokine Blockade in Combination with Cytoreductive Conditioning in Metastatic Breast Cancer – 290

Combined Contrast-Enhanced MRI and Fluorescence Molecular Tomography for Breast Tumor Imaging – 376

Contrast Enhancement for Thermal Acoustic Breast Cancer Imaging via Resonant Stimulation – 314

cSrc and Her2 Signaling Pathways Cooperate with Estrogen to Promote ER Phosphorylation, Ubiquitination and Proteolysis in ER Negative Breast Cancers – 356

Deciphering the Molecular Mechanisms of Breast Cancer – 324

Detection and Evaluation of Early Breast Cancer via Magnetic Resonance Imaging: Studies of Mouse Models and Clinical Implementation – 365

Detection of Genes Modifying Sensitivity to Proteasome Inhibitors Using a shRNA Library in Breast Cancer – 364

Development of an Automated Modality-Independent Elastographic Image Analysis System for Tumor Screening – 357

Disruption of the Circadian Rhythms of Gene Expression and the Development of Breast Cancer – 313

Domain Specific Effects of Herstatin, an Alternative HER-2 (erbB-2) Product, on erbB Positive Breast Cancer – 348

Effects of Extracellular Matrix on DNA Repair in Vivo – 363

Effects of Herstatin, an Alternative HER-2 (erbB-2) Product, on Hormonal Responsiveness of Breast Cancer – 362

Endothelial Progenitors as Vectors for Systemic Gene Therapy of Breast Cancer – 332

Evaluation of DNA Methylation as a Target for Intraductal Therapy for Ductal Carcinoma in Situ of the Breast – 319

Exploring Early Detection Methods: Using the Intraductal Approach to Predict Breast Cancer – 326

Expression and Genomic Profiling of Minute Breast Cancer Samples – 281

Functional Genomic Analysis of Breast Cancer Cell Tumorigenicity Using a Noval Gene Silencing Resource – 325

Genomic Approaches for Detection and Treatment of Breast Cancer – 346

Hot Flashes and Quality of Life Among Breast Cancer Patients – 288

Human Leukocyte Antigen (HLA) Genotype as a Contributor to Racial/Ethnic Differences in Breast Cancer: A Population-Based Molecular Epidemiologic Study – 285

Immunology, Systems Biology, and Immunotherapy of Breast Cancer – 360

Immunotherapy Targeting Tumor Stromal Fibroblasts Improves Chemotherapy of Breast Cancer – 301

Investigating the Mechanism of Action and the Identification of Breast Carcinogens by Computational Analysis of Female Rodent Carcinogens – 405

Measuring 'Impossible' Intermolecular Cross-Peaks to Improve Selectivity and Sensitivity in Breast MRI – 396

Mechanism of Telomerase Inhibition Using Small Inhibitory RNAs and Induction of Breast Tumor Cell Sensitivity – 287

Mechanisms of p53-Mediated Apoptosis – 350

Modulation of Postmenopausal Steroid Hormone Levels by Phytoestrogens and Correlation with Breast Proliferative Activity and Menopausal Symptoms – 324

Molecular Differentiation of Risk for Disease Progression: Delineating Stage-Specific Therapeutic Targets for Disease Management in Breast Cancer – 289

Molecular Mechanisms in Compromised Endothelial Barrier during Breast Cancer Metastasis – 377

Multiple Aperture Radiation Therapy (MART) for Breast Cancer – 292

Physiological Stress Reactivity and Breast Cancer – 391

Platelet Activating Factor: A Growth Factor for Breast Cancer – 341

Prognostic Significance of Telomere Attrition in Ductal Carcinoma in Situ of the Breast – 390

Protein Transduction Based Therapies for Breast Cancer – 315

Proteomic Analysis to Identify Novel Circulating Breast Cancer Markers – 322

Regulation of Apoptosis by AFG3L2, a Potential Oncogene – 293

Screening Doses for Induction of Cancers Calculated with the Interactive RadioEpidemiological Program (IREP) – 348

Selenium and Breast Cancer Chemoprevention – 339

Semi-Synthesis and In-vitro Anticancer Evaluation of Derivatives of a New Microtubule Poison with a Taxol-Like Mechanism – 401

Structure-Based Approach for Discovery of Small Molecule Inhibitors Targeted at AKT – 296

Structure-Based Design of Cdk4/6-Specific Inhibitors – 290

Structural Determination of Certain Novel ER Complexes – 304

Targeting Breast Cancers Featuring Activating Mutations in PIK3CA by Generating a Lethal Dose of PIP3 – 358

The Distribution, Levels, and Relevance of the Interleukin-1 Family of Cytokines and Receptors in Human Breast Carcinoma-Induced Osteolysis – 300

The Effect of COX-2 Inhibitors on the Aromatase Gene (CYP19) Expression in Human Breast Cancer – 347

The Impact of Tyrosine Kinase Signaling on Breast Cancer Development – 289

The Opposing Roles of Nucleophosmin and the ARF Tumor Suppressor in Breast Cancer – 283

The Role of CRELD1 Isoform 9B in the Pathogenesis of Breast Cancer – 280

The Role of RB in the Therapeutic Response of Breast Cancer – 301

The Use of a Cognitive Protectant to Help Maintain Quality of Life and Cognition in Premenopausal Women with Breast Cancer Undergoing Adjuvant Chemotherapy – 361

Three-Dimensional near Infrared Imaging of Pathophysiological Changes within the Breast – 363

#### **BRIDGES (STRUCTURES)**

Composite Action during Construction of Steel Trapezoidal Box Girder Bridges – 240

#### **BRIGHTNESS TEMPERATURE**

Vertical Variation of Dust and Its Impact on the Top of the Atmosphere Brightness Temperature in the Midwave Infrared – 272

#### **BRIGHTNESS**

Final Scientific/Technical Phase I Report on Sliding Mode Pulsed Current Averaging IC Drivers for High-Brightness Light Emitting Diodes – 603

New Strategic Plan Takes the ALS into the Future – 576

#### **BRILLOUIN ZONES**

3D Photonic Crystals Build Up By Self-Organization Of Nanospheres – 450

#### **BRINES**

Corrosion Resistances of Iron Based Amorphous Metals with Yttrium and Tungsten Additions in Hot Calcium Chloride Brine & Natural Seawater. Fe48Mo14Cr15Y2C15B6 and W-Containing Variants – 69

Corrosion Resistances of Iron-Based Amorphous Metals with Yttrium and Tungsten Additions in Hot Calcium Chloride Brine and Natural Seawater. Fe48Mo14Cr15Y2C15B6 and Variants – 107

#### **BROADBAND**

Analysis and Design of Ultra Wide-Band and High-Power Microwave Pulse Interactions With Electronic Circuits and Systems – 196

Analysis of USA' Broadband Policy – 491

GaN Wide Band Power Integrated Circuits (Preprint) – 95

Handheld Broadband Electromagnetic UXO Sensor – 198

Linearity and Efficiency Performance of GaN HEMTs with Digital Pre-Distortion Correction (Preprint) – 95

On Recent Interannual Variability of the Arctic Winter Mesosphere: Implications for Tracer Descent – 263

Predictive & Prognostic Controller for Wide Band Gap (Silicon Carbide) Power Conversion (Preprint) – 184

#### **BROADCASTING**

Global Broadcast Service Security Classification/Declassification Guide (SCG) – 160

Partnerships: The Path to Improving Crisis Communication – 156

#### **BROKEN SYMMETRY**

Broken Symmetries and Magnetic Dynamics – 220

#### **BROMIDES**

Alkene- and Alkyne- Substituted Methylimidazolium Bromides: Structural Effects and Physical properties (Preprint) – 100

Neuropsychological Functioning in Gulf War Veterans Exposed to Pesticides and Pyridostigmine Bromide – 350

#### **BUBBLES**

Application of Morse Theory to Analysis of Rayleigh Taylor Topology – 569

Feasibility of Measuring 3He Bubble Diameter Populations in Deuterium-Tritium Ice Layers Using Mie Scattering – 573

#### **BUCKLING**

Nanomaniipulation: Buckling, Transport and Rolling at the Nanoscale – 188

#### **BUDGETING**

Navy-Marine Corps Tactical Air Integration Plan: Background and Issues for Congress – 9

#### **BUILDINGS**

Jefferson Proving Ground, South of the Firing Line, Final Asbestos Survey Summary Report. Volume 3. Buildings 230 through 475 – 241

No Further Action Decision Under CERCLA, Fort Devens Study Area 58, Buildings 2648 and 2650 Fuel Oil Spills – 128

Radon Screening of Buildings at the Umatilla Depot Activity, Hermiston, Oregon – 94

Seismic Response of a Half-Scale Masonry Building with Flexible Diaphragms – 239

Solar Buildings. Transpired Air Collectors Ventilation Preheating – 250

#### **BULK MODULUS**

Estimating Runflat Stiffness – 552

#### **BUNCHING**

Emittance Correction in the 2006 ILC Bunch Compressor – 580

#### **BUOYANCY**

Filtered Rayleigh Scattering Measurements in a Buoyant Flowfield – 544

#### **BUOYS**

Ocean Wave Energy Harvesting Devices – 480

#### **BURNS (INJURIES)**

State of the Science Meeting: Burn Care: Goals for Treatment and Research – 370

#### **BUTENES**

Microbial Degradation of Fuel Oxygenates under Aerobic Conditions – 114

## BY-PRODUCTS

Storage, Generation, and Use of Hydrogen – 69

## C BAND

Non-Electronic Radio Front-End (NERF) – 211

## C-135 AIRCRAFT

Forecasting the KC-135 Cost Per Flying Hour: A Panel Data Analysis – 8

Programmed Depot Maintenance Capacity Assessment Tool: Workloads, Capacity, and Availability – 33

Simulation of the Dynamically Coupled KC-135 Tanker and Refueling Boom – 11

## C-141 AIRCRAFT

Vaporous Hydrogen Peroxide (VHP) Decontamination of a C-141B Starlifter Aircraft: Validation of VHP and Modified VHP (mVHP) Fumigation Decontamination Process via VHP-Sensor, Biological Indicator, and HD Simulant in a Large-Scale Environment – 32

## CADMIUM TELLURIDES

Studies of Basic Electronic Properties of CdTe-Based Solar Cells and Their Evolution During Processing and Stress. Final Technical Report October 16, 2001-August 31, 2005 – 246

## CADMIUM

Cadmium, Zinc, and Selenium Levels in Carcinoma of the Human Prostate – 356

Nano-Dots Enhanced White Organic Light-Emitting Diodes – 90

## CALCIFEROL

Efficacy of Calcium and Vitamin D Supplementation for the Prevention of Stress Fractures in Female Naval Recruits – 289

## CALCIUM CHLORIDES

Corrosion Resistances of Iron Based Amorphous Metals with Yttrium and Tungsten Additions in Hot Calcium Chloride Brine & Natural Seawater. Fe48Mo14Cr15Y2C15B6 and W-Containing Variants – 69

Corrosion Resistances of Iron-Based Amorphous Metals with Yttrium and Tungsten Additions in Hot Calcium Chloride Brine and Natural Seawater. Fe48Mo14Cr15Y2C15B6 and Variants – 107

## CALCIUM OXIDES

Experimental Effects of Lime Application on Aquatic Macrophytes: 4. Growth Response of Three Species – 89

## CALCIUM

Efficacy of Calcium and Vitamin D Supplementation for the Prevention of Stress Fractures in Female Naval Recruits – 289

## CALIBRATING

A Novel Approach to Calibrating Wave-makers and Generating Wavemaker Transfer Functions – 516

BOUSSOLE: A Joint CNRS-INSU, ESA, CNES, and NASA Ocean Color Calibration and Validation Activity – 279

Collaborative Research: Ground Truth of African and Eastern Mediterranean Shallow Seismicity Using SAR Interferometry and Gibbs Sampling Inversion – 261

Preflight and Vicarious Calibration of Hyperspectral Imagers – 598

Shakedown & Determination of Tunnel Control Settings for Refurbished Trisonic Gasdynamic Facility (TGF) – 134

Simultaneous Localization, Calibration, and Tracking in an ad Hoc Sensor Network – 536

## CALIFORNIA

A GSSHA Model of the Perris Basin of the San Jacinto River Watershed, Riverside County, California – 222

Climate Change Impacts and Adaptation in California. Staff Paper – 279

## CALORIMETERS

Design and Application of the Reconstruction Software for the BaBar Calorimeter – 584

Progress on the Europium Neutron-Capture Study Using DANCE – 673

Superconducting High Resolution Fast-Neutron Spectrometers – 564

## CAMERAS

An Infrared Camera Simulation for Estimating Spatial Temperature Profiles and Signal-to-Noise Ratios of an Airborne Laser-Illuminated Target – 234

An Ultra High Resolution, Electro-Optical Framing Camera for Reconnaissance and Other Applications Using a 9216 by 9216 Pixel, Wafer Scale, Focal Plane Array – 222

Center for Coastline Security Technology, Year-2 – 228

Flight Test Results From the Ultra High Resolution, Electro-Optical Framing Camera Containing a 9216 by 9216 Pixel, Wafer Scale, Focal Plane Array – 222

GISMO – 231

Infrared Damage Detection System (IDDS) for Real-Time, Small-Scale Damage Monitoring – 118

Platform Camera Aircraft Detection for Approach Evaluation and Training – 29

Source Camera Identification and Blind Tamper Detections for Images – 504

## CAMOUFLAGE

Analysis of the Thermal Shielding Properties of Camouflage Materials Brief – 192

Analysis of the Thermal Shielding Properties of Camouflage Materials – 191

## CANADA

A Conceptual Operational Model for Command and Control of International Missions in the Canadian Forces – 180

Canadian Network Enabled Operations Initiatives – 144

CANPASS Air/NEXUS Air - Border Clearance in the Blink of an Eye – 476

Scenario-Based Assessment of Sensors for the Canadian Recognized Maritime Picture – 227

The Canadian ISTAR Information-Centric Collaborative Workspace Concept. Paper 1: The Info-Centric Collaborative Workspace from an Organizational Perspective – 621

The Canadian ISTAR Information-Centric Collaborative Workspace Concept. Paper 2: The Info-Centric Collaborative Workspace from the Processes Perspective – 623

The Canadian ISTAR Information-Centric Collaborative Workspace Concept. Paper 3: The Info-Centric Collaborative Workspace from a Systems Perspective – 623

Workforce Configuration of a Canadian Forces Gematics Division – 539

## CANCER

A Biophysico-computational Perspective of Breast Cancer Pathogenesis and Treatment Response – 325

A Chemoprevention Trial to Study the Effects of High Tea Consumption on Smoking-Related Oxidative Stress – 339

A Dual-Action Approach to Multidrug-Resistant Breast Cancer: Prophylaxis to Ensure Therapeutic Effect – 406

A MicroRNA Cluster as a Potential Breast Cancer Oncogene – 358

A Partnership Training Program in Breast Cancer Diagnosis: Concept Development of the Next Generation Diagnostic Breast Imaging Using Digital Image Library and Networking Techniques – 296

A Phase II Immunotherapeutic Trial: Combination Androgen Ablative Therapy and CTLA-4 Blockade as a Treatment for Advanced Prostate Cancer – 297

A Rat Model for Human Ductal Carcinoma In Situ – 392

Activation and Protection of Dendritic Cells in the Prostate Cancer Environment – 312

Adipose Estrogen and Increased Breast Cancer Risk in Obesity: Regulation by Leptin and Insulin – 357

Adjuvant Immunotherapy for Patients at High Risk of Recurrence Following Radiation Therapy for Prostate Cancer – 298

Analysis of MALDI-TOF Serum Profiles for Biomarker Selection and Sample Classification – 308

Antagonism of Taxol Cytotoxicity by Prolactin: Implications for Patient Resistance to Chemotherapy – 364

- Anti-Angiogenic Action of Neutral Endopeptidase – 285
- Antioxidant Prophylaxis in the Prevention of Prostatic Epithelial Neoplasia – 336
- Apoptosis and Tumor Progression in Prostate Cancer – 338
- Apoptosis-Dependent and Apoptosis-Independent Functions of Bim in Prostate Cancer Cells – 307
- Are Anti-Inflammatory Lymphocytes Able to Induce Remission of Breast Cancer. Addendum – 364
- Association between Microtubule Associated Protein -2 and the EGFR Signaling in Breast Cancer – 296
- ATM Heterozygosity and the Development of Radiation-Induced Erectile Dysfunction and Urinary Morbidity Following Radiotherapy for Prostate Cancer – 344
- Automated Patient Positioning Guided by Cone-Beam CT for Prostate Radiotherapy – 286
- Biological Basis for Chemoprevention of Ovarian Cancer – 359
- Biological Impact of Senescence Induction in Prostate Cancer Therapy – 293
- BRCA1 in Gene-Specific Coordination of Transcription and DNA Damage Response – 406
- Cadmium, Zinc, and Selenium Levels in Carcinoma of the Human Prostate – 356
- Cannabinoid Receptors: A Novel Target for Therapy of Prostate Cancer – 320
- Cell Cycle Dependence of TRAIL Sensitivity in Prostate Cancer Cells – 303
- Cellular Senescence and Breast Cancer – 292
- Centrosome-Based Mechanisms, Prognostics and Therapeutics in Prostate Cancer – 345
- Characterization of Breast Masses Using a new Method of Ultrasound Contrast Agent Imaging in 3D Mapping of Vascular Anomalies – 391
- Characterization of Breast Masses Using a New Method of Ultrasound Contrast Agent Imaging in 3D Mapping of Vascular Anomalies – 391
- Characterization of the Role of Breast Tumor Kinase (BRK) in Breast Cancer Cells Non-responsive to EGFR-targeted Agents – 329
- Chemokine Blockade in Combination with Cytoreductive Conditioning in Metastatic Breast Cancer – 290
- Combined Contrast-Enhanced MRI and Fluorescence Molecular Tomography for Breast Tumor Imaging – 376
- Contrast Enhancement for Thermal Acoustic Breast Cancer Imaging via Resonant Stimulation – 314
- cSrc and Her2 Signaling Pathways Cooperate with Estrogen to Promote ER Phosphorylation, Ubiquitination and Proteolysis in ER Negative Breast Cancers – 356
- Decipher the Transcriptional Program in Prostate Cancer Cells – 305
- Deciphering the Molecular Mechanisms of Breast Cancer – 324
- Delaware Consortium for Undergraduate Minority Training in Prostate Cancer – 362
- Detection and Evaluation of Early Breast Cancer via Magnetic Resonance Imaging: Studies of Mouse Models and Clinical Implementation – 365
- Detection of Genes Modifying Sensitivity to Proteasome Inhibitors Using a shRNA Library in Breast Cancer – 364
- Developing Models to Facilitate the Appropriate Selection and Effective Targeting of Candidate Antigens for Specific Cellular Immunotherapy of Prostate Cancer – 349
- Development of a Mouse Model for Prostate Cancer Imaging and Study of Disease Progression – 321
- Development of a Novel, Non-Invasive Diagnostic Test for Prostate Cancer – 284
- Development of an Automated Modality-Independent Elastographic Image Analysis System for Tumor Screening – 357
- Development of Antigen Presenting Cells for Adoptive Immunotherapy in Prostate Cancer – 286
- Development of Methodology to Maintain Primary Cultures of Normal and Malignant Human Prostatic Epithelial Cells in Vivo – 342
- Development of Novel Bifunctional Compounds that Induce Apoptosis in Prostate Cancer Cells – 365
- Dietary Fat, Fat Metabolizing Genes, and Prostate Cancer Risk in African-Americans and Whites – 340
- Differential Mechanisms of Androgen Resistance – 313

- Stromal Mesenchyme Cell Genes in Prostate Cancer Development: Epigenetic Markers for Cancer and Potential Targets for Therapy – 316

Structure-Based Approach for Discovery of Small Molecule Inhibitors Targeted at AKT – 296

Structure-Based Design of Cdk4/6-Specific Inhibitors – 290

Structural Determination of Certain Novel ER Complexes – 304

Studies of Prostate Tumor Development Via CRE/LOXP Technology – 309

Targeted Therapies for Myeloma and Metastatic Bone Cancers – 328

Targeting Breast Cancers Featuring Activating Mutations in PIK3CA by Generating a Lethal Dose of PIP3 – 358

The Development of Novel Small Molecule Inhibitors of the Phosphoinositide-3-Kinase Pathway through High-Throughput Cell-Based Screens – 329

The Distribution, Levels, and Relevance of the Interleukin-1 Family of Cytokines and Receptors in Human Breast Carcinoma-Induced Osteolysis – 300

The Effect of COX-2 Inhibitors on the Aromatase Gene (CYP19) Expression in Human Breast Cancer – 347

The Impact of Tyrosine Kinase Signaling on Breast Cancer Development – 289

The Opposing Roles of Nucleophosmin and the ARF Tumor Suppressor in Breast Cancer – 283

The Role of CRELD1 Isoform 9B in the Pathogenesis of Breast Cancer – 280

The Role of Oncogene/Tumor Suppressor Interaction with the Centrosome Protein Pericentrin in Prostate Tumorigenesis – 322

The Role of RB in the Therapeutic Response of Breast Cancer – 301

The Significance of Focal Basal Cell Layer Disruption-Induced Immuno-Cell Infiltration in Prostate Cancer Invasion – 364

The Use of a Cognitive Protectant to Help Maintain Quality of Life and Cognition in Premenopausal Women with Breast Cancer Undergoing Adjuvant Chemotherapy – 361

Unique Approaches to Androgen Effects on Prostate Cancer – 334

Validation of Quantitative Multimodality Analysis of Telomerase Activity in Urine Cells as a Noninvasive Diagnostic and Prognostic Tool for Prostate Cancer – 366

Vasculature-Specific Adenovirus Vectors for Gene Therapy of Prostate Cancer – 352

## CANYONS

Computational Experimentation with the Virtual Design Team: Bridging the Chasm between Laboratory and Field Research in C2 – 445

## CAPACITORS

Multilayer Aluminum Oxynitride Capacitors for Higher Energy Density, Wide Temperature Applications (Preprint) – 91

Solid State Capacitor Discharge Pulsed Power Supply Design for Railguns – 193

## CAPILLARY TUBES

Kapillaarelektrofores i Tva Dimensioner. Slutrapport Fran Innovationsprojekt 14215 (Two-Dimensional Capillary Electrophoresis Final Report of the Innovative Project 14215) – 68

## CAPTURE EFFECT

Progress on the Europium Neutron-Capture Study Using DANCE – 673

## CARBON COMPOUNDS

Toxicity and Radioprotective Effects of DF-1 and Carbon Nanotubes in Human Lung and Liver Cell Lines – 418

## CARBON CYCLE

Environmental Consequences of Large-Scale Deployment of New Energy Systems – 253

## CARBON DIOXIDE

Demonstration of Clean Particle Seeding for Particle Image Velocimetry in a Closed Circuit Supersonic Wind Tunnel – 15

## CARBON FIBER REINFORCED PLASTICS

Structural Diagnostics of CFRP Composite Aircraft Components by Ultrasonic Guided Waves and Built-In Piezoelectric Transducers – 35

## CARBON FIBERS

Characterization of the Structure-Processing-Performance Relations of Phenylethynyl Phthalic Anhydride Crosslinked Fluorinated Polyimides (AFR-PEPA-N) and Their Carbon Fiber Composites – 85

Tension-Compression Fatigue Behavior of a Carbon Fiber/Epoxy (IM7/EPON 862) Composite Fabricated Using Vacuum Assisted Resin Transfer Molding Process – 85

## CARBON MONOXIDE

Ligand Field Strengths of Carbon Monoxide and Cyanide in Octahedral Coordination – 92

## CARBON NANOTUBES

Growth of a Single Freestanding Multi-wall Carbon Nanotube on each Nanonickel Dot – 92

Influence of Multi-Walled Carbon Nanotubes on the Thermal and Mechanical Behavior of Carbon/Epoxy Composites (Preprint) – 113

Multi-Wall Carbon Nanotubes for Flow-Induced Voltage Generation (Preprint) – 95

Novel Continuous Carbon Nanofibers for the Next Generation Lightweight Structural Nanocomposites – 112

Novel Synthesis of Branched Carbon Nanotubes – 207

Synthesis, Structure, and Properties of PBO/SWNT Composites – 104

Toxicity and Radioprotective Effects of DF-1 and Carbon Nanotubes in Human Lung and Liver Cell Lines – 418

Tubular Carbon Nano/micro Structures and Method of Making Same – 74

Vertical Alignment of Single-Walled Carbon Nanotubes on Nanostructure Fabricated by Atomic Force Microscope – 88

## CARBON STEELS

Heat of Dilution Calculation for 19 Molar Sodium Hydroxide with Water for Use in 241-S-112 – 103

## CARBONIZATION

Carbonization Studies of Glassy Carbon Derived from Bis-Ortho-Diynylarenes (BODA) (Postprint) – 100

## CARBON

Composite Materials Containing a Nanostructured Carbon Binder Phase and High Pressure Process for Making the Same – 83

Effect of Excess Carbon on the Crystallographic, Microstructural, and Mechanical Properties of CVD Silicon Carbide Fibers – 83

Large Concentration-Dependent Nonlinear Optical Responses of Starburst Diphenylamino-fluorenocarbonyl Methano[60]Fullerene Pentaads – 87

Novel Continuous Carbon Nanofibers for the Next Generation Lightweight Structural Nanocomposites – 112

Oxygen Plasma Treatment and Deposition of CN<sub>x</sub> on a Fluorinated Polymer Matrix Composite for Improved Erosion Resistance (Preprint) – 121

Tubular Carbon Nano/micro Structures and Method of Making Same – 74

## CARBONYL COMPOUNDS

Large Concentration-Dependent Nonlinear Optical Responses of Starburst Diphenylamino-fluorenocarbonyl Methano[60]Fullerene Pentaads – 88

## CARBOXYLIC ACIDS

Spectrophotometric Analysis of the Cyanide Metabolite 1-Aminothiazoline-6-Carboxylic Acid – 110

## CARCINOGENS

A Chemoprevention Trial to Study the Effects of High Tea Consumption on Smoking-Related Oxidative Stress – 340

A MicroRNA Cluster as a Potential Breast Cancer Oncogene – 358

Are Anti-Inflammatory Lymphocytes Able to Induce Remission of Breast Cancer. Addendum – 364

Interactions between Dietary Factors and Inflammation in Prostate Carcinogenesis – 349

A 4-Mbit Non-Volatile Chalcogenide-Random Access Memory Designed for Space Applications (Preprint) – 54

## CHANGE DETECTION

Change-Point Methods for Overdispersed Count Data – 522

## CHAOS

The Chaos of Katrina – 267

## CHARACTERIZATION

Characterization and Evaluation of a Mass Efficient Heat Storage Device. – 237

Cloning and Characterization of SLC26A7 and SLC26A9 Anion Exchangers – 68

Experimental Characterization of Turbulent Flow Around Cylinder Arrays – 219

Meteorological Integration for the Biological Warning and Incident Characterization (BWIC) System: General Guidance for BWIC Cities – 274

New Generation Photonics Materials: Design, Development, Characterization, and Applications – 210

Novel Two- and Three-Photon Pumped Lasing Dyes: Design, Synthesis, and Characterization – 232

Three-Dimensional near Infrared Imaging of Pathophysiological Changes within the Breast – 363

## CHARGE TRANSFER

Charge Transfer Nanocomposites: The Effects of Scale-Hierarchy – 111

Investigation of Ignition Delay: Novel Beta-Substituted Ethylazide Derivatives as Potential New Liquid Propellant Fuels (Preprint) – 100

## CHARGED PARTICLES

Development of a Charged-particle Accumulator Using an RF Confinement Method II – 591

Development of a Charged-Particle Accumulator Using an RF Confinement Method – 593

Hamiltonian Analysis of Charged Particle Gyromotion in Cylindrical Coordinates – 513

Improved Charged Particle Model in CALEICF – 569

## CHARM (PARTICLE PHYSICS)

SELEX: Recent Progress in the Analysis of Charm-Strange and Double-Charm Baryons – 557

## CHARTS

A Multivariate Magnitude Robust Control Chart for Mean Shift Detection and Change Point Estimation – 510

A Unifying Strategy for Data Integration for Global Force Management (Briefing Charts) – 147

Army Fuels: Policies, Regulations, and Executive Orders – 129

Charting a Course for the 21st Century: NLM's (National Library of Medicine's) Long Range Plan, 2006-2016 – 658

Modeling Performance in C4ISR Sustained Operations: A Multi-Level Approach (Briefing Charts) – 411

Scenario Design for the Empirical Testing of Organizational Congruence (Briefing Charts) – 537

## CHEMICAL ANALYSIS

Analytical and Characterization Studies of Organic Chemicals, Drugs and Drug Formulations – 61

Detection of Explosives on Airline Passengers: Recommendation of the 9/11 Commission and Related Issues – 10

Health Effects Support Document for Terbacil – 73

Site Inspection at Fort Allen, Puerto Rico Preliminary Assessments at San Juan ASSF, Puerto Rico and Blair Hangar AASF, St. Croix, USVI – 87

## CHEMICAL ATTACK

Aircraft Downwind Hazard Distance After a Chemical Attack – 34

## CHEMICAL BONDS

Vertical Alignment of Single-Walled Carbon Nanotubes on Nanostructure Fabricated by Atomic Force Microscope – 88

## CHEMICAL COMPOSITION

Methods for Effective Virtual Screening and Scaffold-Hopping in Chemical Compounds – 653

Screening Level Ecological Risk Assessments of Some Military Munitions and Obscure-related Compounds for Selected Threatened and Endangered Species – 251

## CHEMICAL ENERGY

Critical Infrastructure: Control Systems and the Terrorist Threat – 496

## CHEMICAL OXYGEN-IODINE LASERS

Improving COIL Efficiency By Iodine Pre-Dissociation Via Corona Discharge In The Transonic Section Of The Secondary Flow – 234

## CHEMICAL REACTIONS

Controls of Fluid Chemistry on Fracture Growth – 106

MURI Center for Materials Chemistry in the Space Environment – 112

Stab Sensitivity of Energetic Nanolaminates – 84

## CHEMICAL WARFARE

Aircraft Downwind Hazard Distance After a Chemical Attack – 34

Analytical and Characterization Studies of Organic Chemicals, Drugs and Drug Formulations – 284

Direct Detection of Stereospecific Soman Hydrolysis by Wild-Type Human Serum Paraoxonase – 374

Genomic Analysis of Rodent Pulmonary Tissue Following Bis-(2-chloroethyl) Sulfide Exposure – 379

Microfabricated Electrochemical Sensor for Chemical Warfare Agents: Smaller is Better (Preprint) – 230

Priority of Chemicals for Detection in Air at International Missions for Reducing Threats to Personnel at Acute Toxic Releases to Air – 256

## CHEMICALS

Chemical Management Resource Guide for School Administrators – 75

## CHEMILUMINESCENCE

Optical, Biochemical, and Molecular Characterization of New Bioluminescence Systems – 355

## CHEMOTHERAPY

A Dual-Action Approach to Multidrug-Resistant Breast Cancer: Prophylaxis to Ensure Therapeutic Effect – 406

Antagonism of Taxol Cytotoxicity by Prolactin: Implications for Patient Resistance to Chemotherapy – 364

Are Anti-Inflammatory Lymphocytes Able to Induce Remission of Breast Cancer. Addendum – 364

Biological Impact of Senescence Induction in Prostate Cancer Therapy – 293

Discovery of Therapeutics for Ricin Toxicosis – 299

Gene Expression Analysis of Circulating Hormone Refractory Prostate Cancer Micrometastases – 329

Immunotherapy Targeting Tumor Stromal Fibroblasts Improves Chemotherapy of Breast Cancer – 301

Pim Protein Kinase-Levels Correlate with Prostate Tumor Growth and Chemoresistance - Potential Mechanism of PIM Action – 282

Regulation of Apoptosis by AFG3L2, a Potential Oncogene – 293

Selenium and Breast Cancer Chemoprevention – 339

The Use of a Cognitive Protectant to Help Maintain Quality of Life and Cognition in Premenopausal Women with Breast Cancer Undergoing Adjuvant Chemotherapy – 361

## CHILDREN

Children's Hospice – 293

HLA-A2 Supertype-Restricted Cell-Mediated Immunity by Peripheral Blood Mononuclear Cells Derived from Malian Children with Severe or Uncomplicated Plasmodium falciparum Malaria and Healthy Controls – 400

How the Car Affects the Activity patterns of Children and Youth – 170

- Randomized Double-Blind Phase III Pivotal Field Trial of the Comparative Immunogenicity Safety and Tolerability of Two Yellow Fever 17D Vaccines (ARILVAX-(Trademark) and YF-VAX(Trademark)) in Healthy Infants and Children in Peru – [387](#)

Development and Testing of a Multiple Frequency Continuous Wave Radar for Target Detection and Classification – 223

Global Broadcast Service Security Classification/Declassification Guide (SCG) – 160

Security Classification Policy and Procedure: E.O. 12958, as Amended – 650

Security Classified and Controlled Information: History, Status, and Emerging Management Issues – 658

Towards Next Generation WWW: Push, Reuse and Classification – 614

Utilizing Network-Enabled Command and Control Concepts to Enhance ASW Effectiveness – 590

## CLEANING

Demonstration of Clean Particle Seeding for Particle Image Velocimetry in a Closed Circuit Supersonic Wind Tunnel – 15

Fort Holabird Defense Investigative Service (DIS), Base Realignment and Closure (BRAC) Cleanup Plan (BCP), Version II – 422

## CLEARANCES

DoD Personnel Clearances: Delays and Inadequate Documentation Found for Industry Personnel – 644

Real Time Identification – 475

Simulation and Analysis of Dart Dispense Events with Collisions – 235

Tip Clearance Control Using Plasma Actuators – 16

## CLIENT SERVER SYSTEMS

A Distributed Parallel Processing System for Command and Control Imagery – 466

A Limited Objective Experiment on Wireless Peer-To-Peer Collaborative Networking – 492

Agile Coalition Environment (ACE) – 613

An Agent-Based Dynamic Information Security Model in Information Warfare – 643

Approximate Analysis of an Unreliable M/M/2 Retrial Queue – 494

Distributed Computing and Collaboration Framework (DCCF) – 466

User-Level QoS-Adaptive Resource Management in Server End-Systems – 485

## CLIMATE CHANGE

Agriculture: The Potential Consequences of Climate Variability and Change for the USA – 278

Bringing Climate Change Into Natural Resource Management. Proceedings of a Workshop – 273

Climate Change Impact on Forest Resources. White Paper – 277

Climate Change Impacts and Adaptation in California. Staff Paper – 279

Coastal and Marine Ecosystems and Global Climate Change: Potential Effects on U.S. Resources – 277

Ecosystems and Climate Change: Research Priorities for the U.S. Climate Change Science Program. Recommendations from the Scientific Community – 278

Environmental Consequences of Large-Scale Deployment of New Energy Systems – 253

Inventory of U.S. Greenhouse Gas Emissions and Sinks: 1990-2005 – 259

National Security and the Threat of Climate Change – 279

The Supreme Court's Climate Change Decision: Massachusetts v. EPA – 263

U.S. Climate Change Technology Program: Vision and Framework for Strategy and Planning – 258

## CLIMATE MODELS

Environmental Consequences of Large-Scale Deployment of New Energy Systems – 253

## CLIMATE

Global Climate Change: National Security Implications – 267

Long-Range Operational Military Forecasts for Afghanistan – 271

National Security and the Threat of Climate Change – 279

## CLIMATOLOGY

1958-2006 Precipitation Climatology for Lawrence Livermore National Laboratory, Livermore Site and Site 300 – 275

Coastal and Marine Ecosystems and Global Climate Change: Potential Effects on U.S. Resources – 277

Global Climate Change: National Security Implications – 266

Severe Weather Forecasting for Laughlin AFB, TX – 267

Theoretical Characterization of the Radiative Properties of Dust Aerosol for the Air Force Combat Climatology Center Point Analysis Intelligence System – 271

## CLINICAL MEDICINE

ATM Heterozygosity and the Development of Radiation-Induced Erectile Dysfunction and Urinary Morbidity Following Radiotherapy for Prostate Cancer – 344

Automating Behavioral Health Screening - Addressing Risk Communication Electronically – 306

Development of Antigen Presenting Cells for Adoptive Immunotherapy in Prostate Cancer – 286

Early Detection of Dengue Infections using Cluster Sampling Around Index Cases – 394

Johnson Space Center Flight Medicine Clinic Experience – 413

Mechanism of Action of Prostate Stem Cell Antigen Targeted Antibody Therapy and Its Relevance to Clinical Application in Prostate Cancer – 351

Molecular Differentiation of Risk for Disease Progression: Delineating Stage-Specific Therapeutic Targets for Disease Management in Breast Cancer – 289

Multiple Aperture Radiation Therapy (MART) for Breast Cancer – 292

National Institutes of Health Consensus Development Project on Criteria for Clinical Trials in Chronic Graft-versus-Host Disease: I. Diagnosis and Staging Working Group Report – 397

Randomized Double-Blind Phase III Pivotal Field Trial of the Comparative Immunogenicity Safety and Tolerability of Two Yellow Fever 17D Vaccines (ARILVAX-(Trademark) and YF-VAX(Trademark)) in Healthy Infants and Children in Peru – 387

Short Report: Detection of Orientia Tsutsugamushi in Clinical Samples by Quantitative Real-Time Polymerase Chain Reaction – 385

Three-Dimensional Cell Culture Models for Infectious Disease and Drug Development – 371

Translational Research from an Informatics Perspective – 416

UH-USA Agreement - A Telemedicine Research Proposal – 624

## CLINOROTATION

Simulated Microgravity Regulates Gene Transcript Profiles of 2T3 Preosteoblasts: Comparison of the Random Positioning Machine and the Rotating Wall Vessel Bioreactor – 412

## CLINOSTATS

Simulated Microgravity Regulates Gene Transcript Profiles of 2T3 Preosteoblasts: Comparison of the Random Positioning Machine and the Rotating Wall Vessel Bioreactor – 412

## CLONING (BIOLOGY)

Cloning and Characterization of SLC26A7 and SLC26A9 Anion Exchangers – 68

Cloning and Sequence Analysis of the 22-kDa Antigen Genes of Orientia tsutsugamushi Strains Kato, TA763, AFSC 7, 18-032460, TH1814, and MAK 119 – 399

Identification, Cloning, and Expression of Potential Diagnostic Markers for Q Fever – 388

Identification, Cloning, Expression, and Characterization of the Gene for Plasmodium knowlesi Surface Protein Containing an Altered Thrombospondin Repeat Domain – 389

## **CLOSTRIDIUM BOTULINUM**

Evaluation of Lateral-Flow Clostridium botulinum Neurotoxin Detection Kits for Food Analysis – 403

Process Research and Development of Antibodies as Countermeasures for C. Botulinum – 308

Protection with Recombinant Clostridium botulinum C1 and D Binding Domain Subunit (Hc) Vaccines Against C and D Neurotoxins – 369

Structural Studies on Intact Clostridium Botulinum Neurotoxins Complexed with Inhibitors Leading to Drug Design – 304

## **CLOSURES**

Assessment of Gradient Diffusion Closures for Modeling Rayleigh Taylor and Richtmyer Meshkov Instability Induced Mixing – 568

## **CLUTTER**

CFD Investigation of Flow Past Idealized Engine Nacelle Clutter – 227

## **CMOS**

Fabrication, Characterization, and Analysis of a DRIE CMOS-MEMS Gyroscope – 140

## **COAGULATION**

Effects of Bovine Polymerized Hemoglobin in Coagulation in Controlled Hemorrhagic Shock in Swine – 385

The Effect of Hypotensive Resuscitation and Fluid Type on Mortality, Bleeding, Coagulation, & Dysfunctional Inflammation in a Swine Grade V Liver Injury Model – 314

## **COAL DERIVED GASES**

Conversion of Hydrogen Sulfide in Coal Gases to Liquid Elemental Sulfur with Monolithic Catalysts. (Annual Report, October 1, 2005-September 30, 2006) – 107

## **COAL GASIFICATION**

Diffusion Coatings for Corrosion-Resistant Components in Coal Gasification Systems. (Quarterly Technical Report 14, October 1, 2006-December 31, 2006.) – 126

## **COAL**

Hydrogen Production via a Commercially Ready Inorganic Membrane Reactor. Semi-Annual Technical Progress Report for April 1, 2006 to September 30, 2006 – 68

Optical Fiber Chemical Sensor with Sol-Gel Derived Refractive Material as Transducer for High Temperature Gas Sensing in Clean Coal Technology (Final Report, October 1, 2004-December 31, 2006) – 254

## **COASTAL WATER**

Physical, Nutrient, and Biological Measurements of Coastal Waters off Central California in October 2006 – 407

## **COASTS**

Analyzing the Interdiction of Sea-Borne Threats Using Simulation Optimization – 451

Asbestos Survey for Fort Point US Coast Guard Station. Presidio of San Francisco. Volume 2 – 241

Center for Coastline Security Technology, Year-2 – 228

Coastal and Marine Ecosystems and Global Climate Change: Potential Effects on U.S. Resources – 277

Meteorological Factors That Lead to Separation of the California Coastal Jet from the Central Coast – 270

Scenario-Based Assessment of Sensors for the Canadian Recognized Maritime Picture – 227

Service Oriented Architecture for Coast Guard Command and Control – 633

The California Central Coast Research Partnership: Building Relationships, Partnerships and Paradigms for University-Industry Research Collaboration – 193

## **COATINGS**

Report on the Wisconsin-Stanford-Kansas-Davis-Florida State MURI on Scientific Challenges of Coated Conductors – 555

## **COATING**

An Electron Beam Method for Creating Combinatorial Libraries: Application to Next Generation Thermal Barrier Coating Systems – 60

Biofiltration as a Viable Alternative for Air Pollution Control at Department of Defense Surface Coating Facilities – 64

## **COBALT**

Structural Investigations of Surface and Orientation-Specific Phenomena in Nanocrystals and Their Assemblies – 203

## **COCKPITS**

Signals Intelligence Support to the Cockpit – 504

## **CODE DIVISION MULTIPLE ACCESS**

Design and Evaluation of a Virtual Quadrant Receiver for 4-ary Pulse Position Modulation/Optical Code Division Multiple Access (4-ary PPM/O-CDMA) – 178

## **CODING**

Digital Watermarking Using Syndrome Codes – 516

Multi-Description Coding for Video Delivery Over Networks – 440

Protection Against Scrub Typhus by a Plasmid Vaccine Encoding the 56-KD Outer Membrane Protein Antigen Gene – 399

Simulation of Coherent Signals with Forward Error Correction Coding – 540

The Matrix Pencil and its Applications to Speech Processing – 589

Ultra-fast Object Recognition from Few Spikes – 501

## **COEFFICIENTS**

Test Suite for Nuclear Data I. Deterministic Calculations for Critical Assemblies and Replacement Coefficients – 575

## **COGNITION**

A New Perspective on Use of the Critical Decision Method with Intelligence Analysts – 610

A Process Model of Situated Cognition in Military Command and Control – 421

Boot Camp for Cognitive Systems: A Model for Preparing Systems with Machine Learning for Deployment – 463

Mathematical Modeling of Physical and Cognitive Performance Decrement from Mechanical and Inhalation Insults – 297

The Right Information...and Intelligent Nodes – 456

The Use of a Cognitive Protectant to Help Maintain Quality of Life and Cognition in Premenopausal Women with Breast Cancer Undergoing Adjuvant Chemotherapy – 361

## **COHERENT LIGHT**

Gas Detector LCLS Engineering Specifications Document – 574

## **COHERENT RADIATION**

Ultra Fast Coherent Diffraction Imaging of Single Particles, Clusters and Biomolecules – 572

## **COLD TOLERANCE**

Cognitive, Psychomotor, and Physical Performance in Cold Air After Cooling by Exercise in Cold Water – 410

## **COLD WATER**

Cognitive, Psychomotor, and Physical Performance in Cold Air After Cooling by Exercise in Cold Water – 410

## **COLLAGENS**

A Biophysico-computational Perspective of Breast Cancer Pathogenesis and Treatment Response – 325

Autologous Marrow-Derived Stem Cell-Seeded Gene-Supplemented Collagen Scaffolds for Spinal Cord Regeneration as a Treatment for Paralysis – 299

## **COLLISIONS**

Simulation and Analysis of Dart Dispense Events with Collisions – 236

SOME Aspects of Hadron Hadron Collisions in High Energy Interactions (B(O)(s) Mixing Oscillations in Semileptonic Decay at D0 Experiment) – 557

## **COLLOIDS**

Structural Investigations of Surface and Orientation-Specific Phenomena in Nanocrystals and Their Assemblies – 203

## COLONIES

Sulfur Mustard-induced Neutropenia: Treatment with Granulocyte Colony-stimulating Factor – 110

## COLOR INFRARED PHOTOGRAPHY

Integrated Stereo Infrared and Color Human Detection on the ART platform – 226

## COLOR

Developing the Federal Aviation Administration's Requirements for Color Use in Air Traffic Control Displays – 16

## COMBAT

A Model of Command and Control Processes for JWARS: Test Results from Controlled Experiments and Simulation Runs – 152

A Model of Tactical Battle Rhythm – 170

A Review of Recent Algorithms and a New and Improved Cooperative Control Design for Generating a Phantom Track (Preprint) – 26

Application of NCO Conceptual Framework to US/UK Coalition Combat Operations during Operation Iraqi Freedom – 494

C3X: Correlation, Causation and Controlled Experimentation for C2 – 146

Consolidated Situational Awareness for Aircraft Carrier Decision Centers – 627

Effects of the Advanced Combat Helmet (ACH) and Selected Communication and Hearing Protection Systems (C&HPSs) on Speech Communication: Talk-Through Systems – 630

Enablers of Self-Synchronization for Network-Centric Operations: Design of a Complex Command and Control Experiment – 460

FCS Technology Insertion and Transition – 508

Framework for Measuring the Impact of C4ISR Technologies and Concepts on Warfighter Effectiveness Using High Resolution Simulation – 144

High-Energy Laser Weapon Integration with Ground Vehicles – 234

Impact of Illness and Non-Combat Injury During Operations Iraqi Freedom and Enduring Freedom (Afghanistan) – 396

Incorporating New Technology to Create a Comprehensive Realistic Training Environment for the 91W – 343

Lightweight and Advanced Materials for Defense: Materials for Military Ground Vehicles – 85

M1114 -- Golden HMMWV Power: Electrical Systems Used in Theater – 192

Mapping of WDMET in AIS 2005 and AIS 2005 Military – 644

Modeling Command and Control in Multi-Agent Systems – 452

Multi-Hypothesis Structures, Taxonomies and Recognition of Tactical Elements for Combat Identification Fusion – 622

NDIA FORCENet Study - Overview of the Human Element Group's Findings: Implications for C2 and other Aspects of NCW – 172

Open Architecture in Naval Combat System Computing of the 21st Century: Network-Centric Applications – 442

Particle Filter Based Tracking in a Detection Sparse Discrete Event Simulation Environment – 541

Preparing Junior Officers for Roles in FORCENet & Network Centric Operations – 152

Probability Modeling of Multi-Type Autonomous Unmanned Combat Aerial Vehicles Engaging Non-Homogeneous Targets Under Imperfect Information – 26

Selection Process of a Non-Primary Power Source for a Combat Vehicle – 242

Suitability of Agent Technology for Military Command and Control in the Future Combat System Environment – 457

Techniques for the Statistical Analysis of Observer Data – 524

The Quest for Effective Interoperability - Issues in Achieving a Naval Coalition Force Virtual Combat System – 645

Theoretical Characterization of the Radiative Properties of Dust Aerosol for the Air Force Combat Climatology Center Point Analysis Intelligence System – 271

Treatment of PTSD-Related Anger in Troops Returning from Hazardous Deployments – 384

US/UK Sensor-To-Shooter Multinational C4 Interoperability Study Force-On-Force Effectiveness Methodology – 179

Utilizing Network-Enabled Command and Control Concepts to Enhance ASW Effectiveness – 590

Value Added Analysis - VAAFY03 – 532

Voice Recognition Interface in the Rehabilitation of Combat Amputees – 307

## COMBINATORIAL ANALYSIS

An Electron Beam Method for Creating Combinatorial Libraries: Application to Next Generation Thermal Barrier Coatings Systems – 60

## COMBUSTION CHAMBERS

Design, Construction, and Validation of the AFIT Small Scale Combustion Facility and Sectional Model of the Ultra-Compact Combustor – 139

Development of Subscale Fast Cookoff Test – 134

Laser Induced Breakdown Spectroscopy (LIBS) Applied to Reacting Gases for Mixture Ratio Measurement and Detection of Metallic Species – 99

Numerical Analysis of Chamber Wall Heat Transfer in a GH2/GO2 Sub-Scale Combustor – 98

Reduced Exhaust Emissions Gas Turbine Engine Combustor – 39

## COMBUSTION PRODUCTS

AB 1007 Full /Fuel Cycle Analysis (FFCA) Peer Review – 255

Laser Induced Breakdown Spectroscopy (LIBS) Applied to Reacting Gases for Mixture Ratio Measurement and Detection of Metallic Species – 99

Phase 1 Report: Cost-Effective Reciprocating Engine Emissions Control and Monitoring for E&P Field and Gathering Engines – 237

Proteomic Analysis of Bronchoalveolar Lavage Fluid: Effect of Acute Exposure to Diesel Exhaust Particles in Rats – 335

Report 17: Cost-Effective Reciprocating Engine Emissions Control and Monitoring for E&P Field and Gathering Engines. (Technical Report, October 1, 2006-December 31, 2006) – 237

Southern Nevada Air Quality Study – 236

## COMBUSTION STABILITY

Lessons Learned in Solid Rocket Combustion Instability – 93

## COMBUSTION

Code Validation of CFD Heat Transfer Models for Liquid Rocket Engine Combustion Devices – 217

Design, Construction, and Validation of the AFIT Small Scale Combustion Facility and Sectional Model of the Ultra-Compact Combustor – 139

Heat Flux and Infrared Spectral Measurements of Burning SRM Propellant (Postprint) – 130

High-Speed Digital-Image Data Acquisition, Processing, and Visualization System for Turbulent Mixing and Combustion – 77

Modeling JP-8 Fuel Effects on Diesel Combustion Systems – 120

Swirl-Stabilized Injector Flow and Combustion Dynamics for Liquid Propellants at Supercritical Conditions – 217

## COMMAND AND CONTROL

A CBO Study. The Army's Bandwidth Bottleneck – 154

A Computer Tool for Modeling C4I Applications – 167

A Conceptual Operational Model for Command and Control of International Missions in the Canadian Forces – 180

A Correlation Between Quality Management Metrics and Technical Performance Measurement – 636

A Cultural Framework for the Interoperability of C2 Systems – 150

- A Distributed Parallel Processing System for Command and Control Imagery – 466
- A Model of Command and Control Processes for JWARS: Test Results from Controlled Experiments and Simulation Runs – 151
- A Model of Tactical Battle Rhythm – 170
- A New Multi-Sensor Track Fusion Architecture for Multi-Sensor Information Integration – 510
- A Pragmatic C4ISR Approach From the US Army CECOM Security Assistance Perspective – 614
- A Process Model of Situated Cognition in Military Command and Control – 421
- A Reference Architecture for Network-Centric Information Systems – 619

- From Simple Prescriptive to Complex Descriptive Models: An Example from a Recent Command Decision Experiment – 147
- From Stove-pipe to Network Centric Leveraging Technology to Present a Unified View – 616
- Generic Organisation Data Integration Solution: The Fast and Convenient Way to Integrate Data – 644
- Human Systems Integration Assessment of Network Centric Command and Control – 421
- Hurricane Katrina: Lessons for Army Planning and Operations – 163
- Identifying Battlefield Metrics Through Experimentation – 158
- Information Engineering in Support of Multilateral Joint Operational Interoperability – 611
- Information Superiority through Data Warehousing – 655

Information Technology and Knowledge Distribution in C3I teams – 627

Inhibiting Adaptation – 169

Interoperability -- An Australian View – 639

Investigation of Complex Command, Control and Communications Decision-making under Sustained Operations – 166

Joint and Allied Logistics Opportunities and Tools Supporting 21st Century War Fighter Rapid Decisive Operations – 149

Joint Space Forces in Theater: Coordination is No Longer Sufficient – 47

Levels of Interoperability in Coalition Systems – 646

Leveraging Command and Control Technology to Provide Advanced Environmental Effects Decision Aids on the Battlefield – 273

Making the Mix Work: Coalition C2 Interoperability during Recent Operations – 161

Methodology for Rapid Development of C2 Planning Systems – 173

Modeling and Simulation Links with Command & Control (C2) Systems: Considerations in Architecture Designs – 162

Modeling and Simulation to Support C4ISR Acquisition and Transformation – 461

Modeling Command and Control in Multi-Agent Systems – 452

Modeling Performance in C4ISR Sustained Operations: A Multi-Level Approach (Briefing Charts) – 411

Modelling a Network of Decision Makers – 610

Models of Jointness: Infrastructure Issues for Inter-Organisational Working – 642

Monitoring the Command and Control Weapon System. A Master Caution Panel for C2 System Monitoring – 154

Multinational C2 Experiments Supported by C2 Systems and Modeling and Simulations Addressing Army Transformation of Collaborative Planning and Interoperable Execution in a Coalition Environment – 615

Multinational Interoperability Requirements -- A Core Competency – 645

Multipurpose Activity Definitions and Interfaces to Support Operational Needs (MADISON) – 542

Network Centric Operations: Background and Oversight Issues for Congress – 486

Network Centric Warfare in the U.S. Navy's Fifth Fleet. Network-Supported Operational Level Command and Control in Operation Enduring Freedom – 143

New Approaches C4I Data Warehousing for Crisis Action - Synchronization, Replication, Sustainment Design Implications – 645

Operational Trust: A New Look at the Human Requirement in Network Centric Warfare – 146

Optimising the Design of Land Force C2 Architectures – 152

Performance Measurement for Diagnosing and Debriefing Distributed Command and Control Teams – 150

Performance Measurement in C2 Systems – 496

Preparing Junior Officers for Roles in FORCEnet & Network Centric Operations – 152

Quality of Service Behavioral Model From Event Trace Analysis – 166

Report Out of the C4I Study Group – 162

Re-Use of Integrated Dictionary Components for C4ISR Architectures – 148

Savage Modeling and Analysis Language (SMAL): Metadata for Tactical Simulations and X3D Visualizations – 640

Sensor Management in Command & Control – 632

Service Oriented Architecture for Coast Guard Command and Control – 633

Software Agents as Facilitators of Coherent Coalition Operations – 459

Suitability of Agent Technology for Military Command and Control in the Future Combat System Environment – 457

Supporting the Coalition Agents eXperiment (CoAX) through the Technology Integration Experiment (TIE) Process – 452

The Benefit of Ontologies for Interoperability of CCIS. (Easy, Quick and Cheap Solutions are Impossible, if Semantics of CCIS are Affected.) – 620

The Combined Aerospace Operations Center (CAOC) of the Future – 160

The Contribution of Command and Control to Unity of Effort – 157

The Critical Role of Intelligent Software Agents in Enabling Net-Centric Command and Control – 444

The Development of a Virtual McKenna Military Operations in Urban Terrain (MOUT) Site for Command, Control, Communication, Computing, Intelligence, Surveillance, and Reconnaissance (C4ISR) Studies – 164

The Synergic Integrated Concepts of C2S – 174

Toward an Interoperability Architecture – 646

Transforming Coalition Warfare with Network Centric Capabilities – 149

Understanding and Improving Knowledge Transactions in Command and Control – 624

USAF Command Doctrine of Centralized Control with Decentralized Execution: Never Divide the Fleet – 170

Use of Information Technology to Develop a Collaborative Decision Support System for Command and Control – 469

Use of Modeling and Simulation (M&S) in Support of the Quantitative Assessment of FORCEnet Systems and Concepts – 456

Using a Combination of UML, C2RM, XML, and Metadata Registries to Support Long-Term Development/Engineering – 452

Using Gaming and Agent Technology to Explore C2 – 537

Using the Command and Control Framework to Analyse Command Challenges – 151

Using Wargames for Command and Control Experimentation – 145

Using Work-Centered Support System Technology to Enhance Command and Control – 488

US/UK Sensor-To-Shooter Multinational C4 Interoperability Study Force-On-Force Effectiveness Methodology – 179

Utilizing Network-Enabled Command and Control Concepts to Enhance ASW Effectiveness – 590

Workforce Configuration of a Canadian Forces Gematics Division – 539

## COMMERCE

A Possible Solution for the U.S. Navy's Addiction to Petroleum: A Business Case Analysis for Transitioning the U.S. Navy From Petroleum to Synthetic Fuel Resources – 63

An Enterprise Solution for Biometric Authentication and Identification – 473

Modeling and Analysis of Information Technology Change and Access Controls in the Business Context – 478

Operational Agility: Composing and Orchestrating Mission Capability Packages Through Business Process Execution Language (BPEL) – 444

## COMMERCIAL AIRCRAFT

Civil Reserve Air Fleet (CRAF) – 26

Detection of Explosives on Airline Passengers: Recommendation of the 9/11 Commission and Related Issues – 10

Forecasting Demand for Civilian Pilots: A Cost Savings Approach to Managing Air Force Pilot Resources – 27

## COMMERCIAL OFF-THE-SHELF PRODUCTS

Achieving AFRL Universal FADEC Vision With Open Architecture Addressing Capability and Obsolescence for Military and Commercial Applications (Preprint) – 6

## COMMUNICATING

A Study of Communicating Science and Engineering – 142

Cost-Effective Strategies for Communicating with Remote Surveillance Stations: A Summary – 178

## COMMUNICATION NETWORKS

A Limited Objective Experiment on Wireless Peer-To-Peer Collaborative Networking – 492

A Strong Zero-One Law for Connectivity in One-Dimensional Geometric Random Graphs With Non-Vanishing Densities – 527

A Unifying Strategy for Data Integration for Global Force Management (Briefing Charts) – 147

A Woven Web of Guesses – 538

An Efficient Metaheuristic for Dynamic Network Design and Message Routing – 617

Analysis and Classification of Traffic in Wireless Sensor Network – 159

C2 Interoperability: Simulation, Architecture and Information Security – 642

Communications Architecture Recommendations to Enable Joint Vision 2020 – 488

Cooperative Multi-Agent Systems in Mobile Ad Hoc Networks – 495

Defense Science Board 2006 Summer Study of Information Management for Net-Centric Operations. Volume 2. Operations Panel Report – 158

Defense Science Board 2006 Summer Study on Information Management for Net-Centric Operations. Volume 1: Main Report – 158

Distributed Fault-Tolerant Quality Of Service Routing in Hybrid Directional Wireless Networks – 182

Future Naval Concepts -- Crew Reductions through Improved Damage Control Communications (FNC-CRIDCC) – 145

Metrics for Command in an NEC Era: Operational Analysis of Way of Command in the Era of Network Enabled Capability – 170

Mobile Sensor Networks: A Discrete Event Simulation of WMD Threat Detection in Urban Traffic Schemes – 156

Modeling and Simulation in Support of Network Centric Warfare Analysis – 143

Modular Structures in a Multinational Force Headquarters – 147

Multicast Performance Analysis for High-Speed Torus Networks – 484

Network Aware Tactical Collaborative Environments – 165

Network Centric Warfare for Coalition Integrated Defense Against Terrorism – 165

Network-Centric Applications and Tactical Networks – 173

Observation Uncertainty in Gaussian Sensor Networks – 162

Potential System Vulnerabilities of a Network Enabled Force – 487

Preparing Junior Officers for Roles in FORCENet & Network Centric Operations – 152

Quick-Turn Finite Element Analysis for Plug-and-Play Satellite Structures – 520

Real-Time Communication and Coordination in Embedded Sensor Networks – 533

Solving Wireless Communications Interoperability Problems among Emergency First Responders Depends on Greater National Guard Involvement – 181

Static Reachability Analysis and Validation Regarding Security Policies Implemented via Packet Filters – 489

Time Synchronization in Wireless Sensor Networks – 164

## COMMUNICATION

Decentralized Control Using Global Optimization (DCGO) (Preprint) – 495

## COMPARISON

Rayleigh Taylor Instability induced Mixing. Initial Conditions Modeling, Three Dimensional Simulations and Comparisons with Experiment – 570

## COMPARTMENTS

A Review of the History of Fire Suppression on U.S. DoD Aircraft – 34

## COMPILERS

Next Generation Systems Languages – 455

## COMPLEX COMPOUNDS

Determination of Metal Ions in Solution by Photoluminescence Anisotropy – 115

## COMPLEX SYSTEMS

Complex Processes in Electrochemical Systems – 114

Executive Overview of SEI MOSAIC: Managing for Success Using a Risk-Based Approach – 545

Military Information Networks as Complex Adaptive Systems – 512

Organizational Fragility Curves: Sense-making under Stress – 544

## COMPOSITE MATERIALS

Advanced Polymer Composite Molding Through Intelligent Process Analysis and Control – 85

Characterization of the Structure-Processing-Performance Relations of Phenylethynyl Phthalic Anhydride Crosslinked Fluorinated Polyimides (AFR-PEPA-N) and Their Carbon Fiber Composites – 84

Composite Materials Containing a Nanostructured Carbon Binder Phase and High Pressure Process for Making the Same – 83

Decks for Rapid Runway Mat Application (Postprint) – 45

Detection of Localized Heat Damage in a Polymer Matrix Composite by Thermo-Elastic Method (Preprint) – 81

Development and Manufacture of Cost Effective Composite Drill Pipe. 2006 Annual Technical Progress Report – 84

Development of Nanocomposite Reinforced Polymeric Materials to be Used for Racks for Retorting Polymeric Trays – 123

Effect of Excess Carbon on the Crystallographic, Microstructural, and Mechanical Properties of CVD Silicon Carbide Fibers – 83

Image Reconstruction Based Modeling of 3D Textile Composite (Postprint) – 127

Nano Enabled Thermo-Mechanical Materials in Adhesive Joints: A New Paradigm to Materials Functionality (Preprint) – 81

Numerical Investigation for the Microstructural Effects on the Crack Growth Behavior of Particulate Composite Materials – 79

Permeability Prediction of Three-Dimensional Woven Fabrics – 89

Research Institute for Autonomous Precision Guided Systems – 31

Structural Diagnostics of CFRP Composite Aircraft Components by Ultrasonic Guided Waves and Built-In Piezoelectric Transducers – 34

Vertical Alignment of Single-Walled Carbon Nanotubes on Nanostructure Fabricated by Atomic Force Microscope – 88

## COMPOSITE STRUCTURES

Challenges and Opportunities for Nanotechnology in Multi-Functional Composite Structures (Preprint) – 17

Chamber Core Structures for Fairing Acoustic Mitigation – 50

Structural Diagnostics of CFRP Composite Aircraft Components by Ultrasonic Guided Waves and Built-In Piezoelectric Transducers – 34

Titanium Brazing for Structures and Survivability – 120

## COMPOSITION (PROPERTY)

High-Performance Corrosion Resistant Iron Based Amorphous Metals. The Effects of Composition, Structure and Environment. Fe49.7Cr17.7Mn1.9Mo7.4W1.6B15.2C3.8Si2.4 – 107

## COMPRESSION LOADS

Investigation of the Effect of Fuselage Dents on Compressive Failure Load – 23

## COMPRESSOR EFFICIENCY

Toward a Real-Time Measurement-Based System for Estimation of Helicopter Engine Degradation Due to Compressor Erosion – 39

## COMPRESSORS

Emission Correction in the 2006 ILC Bunch Compressor – 580

## COMPUTATIONAL CHEMISTRY

Applications of Molecular and Materials Modeling – 94

Atomic-Scale Design of Iron Fischer-Tropsch Catalysts: A Combined Computational Chemistry, Experimental, and Microkinetic Modeling Approach. (3rd Annual Report) – 105

## COMPUTATIONAL FLUID DYNAMICS

Atomization Performance Predictions of Gas-Centered Swirl-Coaxial Injectors – 216

CFD Investigation of Flow Past Idealized Engine Nacelle Clutter – 226

Code Validation of CFD Heat Transfer Models for Liquid Rocket Engine Combustion Devices – 217

Demonstration of Clean Particle Seeding for Particle Image Velocimetry in a Closed Circuit Supersonic Wind Tunnel – 15

Discrete Data Transfer Technique for Fluid-Structure Interaction – 478

IHRPRT Improvements to the Solid Performance Program (SPP) – 542

Probabilistic Modeling of Space Shuttle Debris Impact – 58

Quantifying Non-Equilibrium in Hypersonic Flows Using Entropy Generation – 219

Relaxed Fidelity CFD Methods Applied to Store Separation Problems – 5

Technologies for Propelled Hypersonic Flight, Volume 1 - Subgroup 1: Plug Nozzles – 40

Technologies for Propelled Hypersonic Flight, Volume 3 - Subgroup 3: CFD Validation for Hypersonic Flight – 41

Technologies for Propelled Hypersonic Flight – 40

## COMPUTATIONAL GRIDS

Exploring Hypersonic, Unstructured-Grid Issues through Structured Grids – 437

Inversion of Ionospheric Backscatter Radar Data in Order to Map and Model the Ionosphere – 260

Summary of LLNL Russian Projects – 573

## COMPUTATION

A Parallel Particle Swarm Optimizer – 533

Computational Experimentation in C2 – 140

Experiments, Computation, and Modeling for Temperature Dependence of Absorption, Scattering, Reflection, Transmission, and Index of Refraction of Optical Radiation in Biological Tissues – 597

## COMPUTER AIDED DESIGN

Introducing Actions into Qualitative Simulation – 499

Sharp-Looking Geometric Partitioning – 199

## COMPUTER AIDED TOMOGRAPHY

Advanced Technologies in Safe and Efficient Operating Rooms – 309

Enhancement of the Computational Efficiency of Membrane Computing Models – 550

## COMPUTER ASSISTED INSTRUCTION

Advanced Visual and Instruction Systems for Maintenance Support (AVIS-MS) – 625

## COMPUTER GRAPHICS

Towards a Computational Model of Sketching – 451

## COMPUTER INFORMATION SECURITY

Advancing Software Security - The Software Protection Initiative – 626

An Agent-Based Dynamic Information Security Model in Information Warfare – 643

Applying the Concept of Minimal Essential to Maintain Operational Continuity and Attain Mission Assurance During Internal and External Attacks on the Information Environment – 495

Assessing Technology, Methods, and Information for Committing and Combating Cyber Crime – 428

Communication Security Establishment Briefing on Government of Canada Biometrics Reports – 477

Digital Convergence Authenticated Video, Voice, & Text – 476

DigitalPersona - Case Study: Department of Defense – 475

Enhancing Information Systems Security through Biometrics – 472

Incident Management Capability Metrics Version 0.1 – 482

Information Security: Federal Deposit Insurance Corporation Needs to Sustain Progress Improving Its Program – 167

Intrusion and Misuse Deterrence System Employing a Virtual Network – 432

Issues and Requirements for Cybersecurity in Network Centric Warfare – 446

Key Establishment in Heterogeneous Self-Organized Networks – 484

Management and Education of the Risk of Insider Threat (MERIT): Mitigating the Risk of Sabotage to Employers' Information, Systems, or Networks – 497

Mediators in Infrastructure Survivability Enhancement – 449

Modelling Information Age Warfare: Work In Progress – 654

Multimodal Biometric Systems – 472

Route Optimization for Mobile IPV6 Using the Return Routability Procedure: Test Bed Implementation and Security Analysis – 489

The President's Identity Theft Task Force: Combating Identity Theft a Strategic Plan – 652

Willow System Demonstration – 449

## COMPUTER NETWORKS

An Open Architecture Approach to Network Enabled Capability – 656

Bridging the Gap in Port Security; Network Centric Theory Applied to Public/Private Collaboration – 492

Client Location in 802.11 Networks – 639

Emergency Preparedness and the Year 2000 Challenge – 443

Hacking Social Networks: Examining the Viability of Using Computer Network Attack Against Social Networks – 491

Incident Management Capability Metrics Version 0.1 – 482

Intrusion and Misuse Deterrence System Employing a Virtual Network – 432

Intrusion Deception in Defense of Computer Systems – 462

Investigations Involving the Internet and Computer Networks – 438

Issues and Requirements for Cybersecurity in Network Centric Warfare – 446

Making Network Intrusion Detection Work With IPsec – 505

Method and System for Interactive Modeling of High-Level Network Performance with Low-Level Link Design – 436

Multi-Description Coding for Video Delivery Over Networks – 440

Net-Centric Test & Evaluation – 133

Network Centric Operations Conceptual Framework Air-to-Ground Case Study – 483

Operational Agility: Composing and Orchestrating Mission Capability Packages Through Business Process Execution Language (BPEL) – 444

Pattern Analysis of Directed Graphs Using DEDICOM: An Application to Enroll Email – 439

Performance Evaluation of Ad Hoc Routing Protocols in a Swarm of Autonomous Unmanned Aerial Vehicles – 38

Recommendations for Network-and Internet-based Synchronized E-activities for Location- and Time-dependent Information – 457

Secure Peer-to-Peer Object Storage System – 439

Willow System Demonstration – 449

## COMPUTER PROGRAMMING

A Practical Example of Applying Application-Driven Design (ADD), Version 2.0 – 545

A Proposed Taxonomy for Software Development Risks for High-Performance Computing (HPC) Scientific/Engineering Applications – 478

An Empirical Assessment of the Impact of Requirements Uncertainty on Development Quality Performance – 446

Automating the Shadow Method for Aerosol Optical Depth Retrieval – 462

Boot Camp for Cognitive Systems: A Model for Preparing Systems with Machine Learning for Deployment – 463

C2 Interoperability: Simulation, Architecture and Information Security – 642

CASE Planning and the Software Process – 481

Case Study: Accelerating Process Improvement by Integrating the TSP and CMMI – 481

CCG-LCONE CT Reconstruction Code User and Programmers Guide – 570

Conditions for Achieving Network-Centric Operations in Systems of Systems – 465

Design and Implementation of a Modular Manipulator Architecture – 546

Distributed Computing and Collaboration Framework (DCCF) – 466

Evolution of C4I Systems – 174

Experiments with the Sun Java Real-Time System -- Part 2 – 466

Firefighting Agent Research, Phase I – 10

Mediators in Infrastructure Survivability Enhancement – 449

Modeling and Analysis of Information Technology Change and Access Controls in the Business Context – 478

Optimizing the Prioritization of Natural Disaster Recovery Projects – 274

Quality-Attribute-Based Economic Valuation of Architectural Patterns – 479

Supporting the Coalition Agents eXperiment (CoAX) through the Technology Integration Experiment (TIE) Process – 452

System-of-Systems Governance: New Patterns of Thought – 465

Task Adaptable Display of Information for Training, Maintenance, and Emergency Response – 654

The Federal Networking and Information Technology Research and Development Program: Funding Issues and Activities – 480

Topics in Interoperability: Structural Programmatics in a System of Systems – 465

Willow System Demonstration – 449

## COMPUTER PROGRAMS

3D Photonic Crystals Build Up By Self-Organization Of Nanospheres – 450

A Methodology for End-to-End Evaluation of Arabic Document Image Processing Software – 468

CASE Planning and the Software Process – 481

Cooperative Multi-Agent Systems in Mobile Ad Hoc Networks – 495

ERDC-CERL LD-870 Download Program Developed for Aberdeen Test Center: User's Manual – 469

Formal Methods for Developing High Assurance Computer Systems: Working Group Report – 471

Issues and Requirements for Cybersecurity in Network Centric Warfare – 446

Modeling the Joint Battlespace Infosphere – 644

Multi-Description Coding for Video Delivery Over Networks – 440

Next Generation Systems Languages – 455

Protection of Software-based Survivability Mechanisms – 447

Rotational Response of Toe-Restrained Retaining Walls to Earthquake Ground Motions – 265

Software to Generate 3-Dimensional Displays of Inverse Synthetic aperture Radar Data – 455

Stratospheric Relaxation in IMPACTs Radiation Code – 275

The Joy of Computing with Volume-Integrals – 19

Visual Spreadsheets in VisIt – 432

Voice Recognition Interface in the Rehabilitation of Combat Amputees – 307

## COMPUTER STORAGE DEVICES

A 4-Mbit Non-Volatile Chalcogenide-Random Access Memory Designed for Space Applications (Preprint) – 54

Antiferromagnetically Stabilized Pseudo Spin Valve for Memory Applications – 438

Feasibility Study on Magnetic Content Addressable Memory – 196

High Performance Polymer Memory and Its Formation – 210

Molecular Random Access Memory Cell – 441

Two Bit/Four Bit SONOS Flash Memory Cell – 200

Using Cyclic Memory Allocation to Eliminate Memory Leaks – 442

Victim Migration: Dynamically Adapting Between Private and Shared CMP Caches – 442

## COMPUTER SYSTEMS DESIGN

Formal Methods for Developing High Assurance Computer Systems: Working Group Report – 471

Methodology for Rapid Development of C2 Planning Systems – 173

## COMPUTER SYSTEMS PROGRAMS

Report to the Institutional Computing Executive Group (ICEG) August 14, 2006 – 433

## COMPUTER TECHNIQUES

Building a Deterrence Policy Against Strategic Information Warfare – 654

CASE Planning and the Software Process – 481

Development of an Assistive Technology and Environmental Assessment Instrument for National Surveys: Final Report. Part One: Recommended Modules and Instrument Development Process – 440

Integration of Anatomic and Pathogenic Bases for Early Lung Cancer Diagnosis – 506

## COMPUTER VISION

Velocity Estimation Using Forward Looking Sonar – 463

## COMPUTERIZED SIMULATION

A Physiologically Based Pharmacokinetic (PB/PK) Model for Multiple Exposure Routes of Soman in Multiple Species – 375

Advanced Technologies in Safe and Efficient Operating Rooms – 309

Analyzing the Interdiction of Sea-Borne Threats Using Simulation Optimization – 451

Assessing Error in PMI (Post-Mortem Interval) Prediction Using a Forensic Entomological Computer Model – 437

Assessment of Two Desk-Top Computer Simulations Used to Train Tactical Decision Making (TDM) of Small Unit Infantry Leaders – 481

Boundary Layer Transition Experiments in Support of the Hypersonics Program – 1

Cell Multipole Method for Molecular Simulations in Bulk and Confined Systems – 454

Computational Experimentation with the Virtual Design Team: Bridging the Chasm between Laboratory and Field Research in C2 – 445

Conceptual Modeling for the Probability of Raid Annihilation (Pra) Testbed – 453

Distributed Simulation Run Automation Capability for the Navy PRA Test-bed – 453

Firefighting Agent Research, Phase I – 10

Minimization of Thruster Plume Effects on Spacecraft Surfaces – 52

Modeling and Simulation to Support C4ISR Acquisition and Transformation – 461

Modeling the Structure and Effectiveness of Intelligence Organizations: Dynamic Information Flow Simulation – 626

Modeling the U.S. Military Intelligence Process – 448

Modelling Operational Command Structures Using ORGAHEAD – 451

New Navy Solutions: Developing Simulation Based C4I Applications – 445

Ocean Wave Energy Harvesting Devices – 479

Particle Splitting for Monte-Carlo Simulation of the National Ignition Facility – 561

Qualitative Reasoning about Fluids and Mechanics – 446

Research Institute for Autonomous Precision Guided Systems – 31

Risk Advised Course of Action (COA) Analysis – 532

Self-Organized Air Tasking: Examining a Non-Hierarchical Model for Joint Air Operations – 499

Simulating Candidate Missions for a Novel Glider Unmanned Underwater Vehicle – 464

Simulation-Based Learning: Workshops for Researchers and Educators in the Western USA, and the Pacific Rim – 619

System Level Architecture of Cooperative Satellite Control Using Hierarchical Hybrid Systems and Automata Theory – 50

Use of Modeling and Simulation (M&S) in Support of the Quantitative Assessment of FORCenet Systems and Concepts – 456

WABED Model in the SMS: Part 2. Graphical Interface – 470

Weapons Director Intelligent-Agent-Assist Task: Procedure and Findings for a Validation Study – 7

Wide Area Search and Engagement Simulation Validation – 32

## COMPUTERS

A Computer Tool for Modeling C4I Applications – 167

A High-Performance Communication Service for Parallel Computing on Distributed DSP Systems – 449

Data Alignment between Army C4I Databases and Army Simulations – 653

Digital C4I Interoperability: The EM Protection Issue – 163

Emergency Preparedness and the Year 2000 Challenge – 443

Field Level Computer Exploitation Package – 464

Intrusion Deception in Defense of Computer Systems – 462

Methods and Computer-Readable Medium for Navigating between a Plurality of Discrete Images – 432

Real-Time Sonar Beamforming on High-Performance Distributed Computers – 596

Systems and Methods for Altering Vestibular Biology – 506

US/UK Sensor-To-Shooter Multinational C4 Interoperability Study Force-On-Force Effectiveness Methodology – 179

## CONCENTRATORS

Preliminary Low Frequency Electromagnetic Analysis of a Flux Concentrator – 569

## CONCRETES

A Value-Focused Thinking Model for the Selection of the Best Rigid Pavement, Partial-Depth Spall Repair Material – 20

Application of Surface Energy Measurements to Evaluate Moisture Susceptibility of Asphalt and Aggregates – 74

Area Factor Determinations for an Industrial Worker Exposed to a Concrete Slab End State – 255

Degradation of the Blister Agent BIS(2-Chloroethyl) Sulfide and Simulant 2-Chloroethyl Phenyl Sulfide on Concrete – 306

Evaluation of Serviceability Requirements for Load Rating Prestressed Concrete Bridges – 240

Grout Impregnation of Pre-Placed Recycled Concrete Pavement (RCP) for Rapid Repair of Deteriorated Portland Cement Concrete Airfield Pavement – 45

Modeling Damage and Fragmentation in Concrete – 122

## CONDUCTING POLYMERS

Dynamically Modifiable Polymer Coatings and Devices – 126

Reversible Electrodeposition Optical Modulation Device with Conducting Polymer Counter Electrode – 213

## CONDUCTORS

Report on the Wisconsin-Stanford-Kansas-Davis-Florida State MURI on Scientific Challenges of Coated Conductors – 555

## CONFERENCES

Army Science Conference 2006 TECHNOLOGY ASSESSMENT of SOLDIER and MAN PORTABLE FUEL CELL POWER – 249

Automated Aerial Refueling Presentation to 2007 ARSAG Conference (Preprint) – 15

Bringing Climate Change Into Natural Resource Management. Proceedings of a Workshop – 273

Proceedings of the 1st Army Installation Energy Security and Independence Conference – 245

Proceedings of the Quantum Computation for Physical Modeling Workshop 2004. Held in North Falmouth, MA on 12-15 September 2004 – 592

Proceedings of the Quantum Computation for Physical Modeling Workshop Held in North Falmouth, Massachusetts on October 18-19, 2000 – 519

Proceedings of the Symposium on Ferroelectricity and Piezoelectricity (IMRC 2005) – 76

Symposium on Nano- and Micro-Scale Mechanics of Engineering Materials – 660

Symposium Q: Magnetic Thin Films, Heterostructures, and Device Materials – 197

Truck Driver Occupational Safety and Health. 2003 Conference Report and Selective Literature Review – 238

What's in a Name. Examination of Light and Intermittent Smokers. Helping to Set the Tobacco Control Research Agenda. – 257

## CONFIGURATION INTERACTION

A Multireference Density Functional Approach to the Calculation of the Excited States of Uranium Ions – 87

## CONFIGURATION MANAGEMENT

Configuration Management Support for Long Haul C2 Circuit Switched Services – 155

## CONFINEMENT

Cell Multipole Method for Molecular Simulations in Bulk and Confined Systems – 454

Cooling Performance of a Partially-Confined FC-72 Spray: The Effect of Dissolved Air (Postprint) – 55

Cooling Performance of a Partially-Confined FC-72 Spray: The Effect of Variable Gravity (Postprint) – 55

Development of a Charged-particle Accumulator Using an RF Confinement Method II – 591

Development of a Charged-Particle Accumulator Using an RF Confinement Method – 593

Formation of a Field Reversed Configuration for Magnetic and Electrostatic Confinement of Plasma – 574

Vertical Cavity Surface Emitting Laser Having a Gain Guide Aperture Interior to an Oxide Confinement Layer – 599

## CONGRESSIONAL REPORTS

Report to Congress on Assessment of Potential Impact of Concentrating Solar Power for Electricity Generation (EPACT 2005 - Section 934 (c)) – [247](#)

Report to Congress on the Activities of the DoD Office of Technology Transition – [651](#)

## CONGRUENCES

Scenario Design for the Empirical Testing of Organizational Congruence (Briefing Charts) – [537](#)

## CONJUGATION

A New Synthesis of Porphyrins with Extended Conjugation and their Photophysics – [62](#)

HIV Gag Protein Conjugated to a Toll-like Receptor 7/8 Agonist Improves the Magnitude and Quality of Th1 and CD8+ T Cell Responses in Nonhuman Primates – [397](#)

Placement of Conjugated Oligomers in an Alkanethiol Matrix by Scanned Probe Microscope Lithography – [121](#)

## CONNECTORS

Microconnectors and Non-Powered Microassembly Therewith – [202](#)

## CONSERVATION LAWS

Convergence of High Order Finite Volume Weighted Essentially Non-Oscillatory Scheme and Discontinuous Galerkin Method for Nonconvex Conservation Laws – [515](#)

## CONSERVATION

Convergence of High Order Finite Volume Weighted Essentially Non-Oscillatory Scheme and Discontinuous Galerkin Method for Nonconvex Conservation Laws – [515](#)

## CONSISTENCY

An Adaptive Quality of Service Aware Middleware for Replicated Services – [521](#)

## CONSOLIDATION

Bilateral Interoperability through Enterprise Architecture – [494](#)

## CONSTRUCTION

Composite Action during Construction of Steel Trapezoidal Box Girder Bridges – [240](#)

Design, Construction, and Validation of the AFIT Small Scale Combustion Facility and Sectional Model of the Ultra-Compact Combustor – [139](#)

Final Environmental Assessment for Construction of an Addition to Support the Joint Strike Fighter Reprogramming Facility, Building 614, on Eglin Air Force Base, Florida – [251](#)

Modular Structures in a Multinational Force Headquarters – [147](#)

Searching for Double Beta Decay with the Enriched Xenon Observatory – [566](#)

## CONSUMERS

Consumer Control of Electronic Personal Health Information: What Does It Mean. Why Is it Important. A Report on Three Consumer Focus Group Meetings Convened October 2005 by the Office of the Assistant Secretary for Planning and Evaluation – [663](#)

## CONTAMINANTS

Field Demonstration and Validation of a New Device for Measuring Groundwater and Perchlorate Fluxes at IHDIV-NSWC, Indian Head, MD – [139](#)

Field Demonstration and Validation of a New Device for Measuring Water and Solute Fluxes at Naval Base Ventura County (NBVC), Port Hueneme, CA – [138](#)

Field Demonstration and Validation of a New Device for Measuring Water and Solute Fluxes NASA LC-34 SITE – [138](#)

Mixtures of Metals and Polynuclear Aromatic Hydrocarbons May Elicit Complex, Nonadditive Toxicological Interactions – [78](#)

Purification of Contaminated MIL-PRF-83282 Hydraulic Fluid Using the Pall Purifier and Multiple Process Configurations (Preprint) – [123](#)

Trial Burn Plan for a Transportable Incineration System (TIS) at the Savanna Army Depot Activity (SADA) Washout Lagoon Area – [252](#)

No Further Action Decision Under CERCLA, Study Area 43P Historic Gas Station Sites, Fort Devens, Massachusetts – [62](#)

Nuclear Safety: DOE's Investigation of Phosgene Gas Contamination was Inadequate, but Experts Conclude that Worker Safety and Facilities Are Not Threatened – [131](#)

Purification of Contaminated MIL-PRF-83282 Hydraulic Fluid Using the Pall Purifier and Multiple Process Configurations (Preprint) – [123](#)

Push-Pull Tests for Evaluating the Aerobic Cometabolism of Chlorinated Aliphatic Hydrocarbons – [101](#)

Radon-222 as a Natural Tracer for Monitoring the Remediation of NAPL Contamination in the Subsurface – [102](#)

Site Inspection at Fort Allen, Puerto Rico Preliminary Assessments at San Juan ASSF, Puerto Rico and Blair Hangar AASF, St. Croix, USVI – [87](#)

## CONTINGENCY

Quarterly Performance/Technical Reports: HLA Typing for Bone Marrow Transplantation, and Development of Medical Technology for Contingency Response to Marrow Toxic Agents – [305](#)

## CONTINUOUS RADIATION

Development and Testing of a Multiple Frequency Continuous Wave Radar for Target Detection and Classification – [224](#)

## CONTINUOUS WAVE RADAR

Development and Testing of a Multiple Frequency Continuous Wave Radar for Target Detection and Classification – [224](#)

## CONTINUUM MECHANICS

Atomistic Calculation of Elastic Moduli in Strained Silicon – [187](#)

## CONTRACTORS

Defense Acquisitions: Analysis of Processes Used to Evaluate Active Protection Systems – [426](#)

DoD Personnel Clearances: Delays and Inadequate Documentation Found for Industry Personnel – [643](#)

## CONTROL EQUIPMENT

A Method for Including Control Effector Interactions in the Control Allocation Problem (Preprint) – [461](#)

Biofiltration as a Viable Alternative for Air Pollution Control at Department of Defense Surface Coating Facilities – [64](#)

Toward Neural Control of Prosthetic Devices – [209](#)

## CONTROL SIMULATION

Distributed Command and Control Research: Networking Multiple Simulation Platforms – [495](#)

## CONTROL SURFACES

Biofiltration as a Viable Alternative for Air Pollution Control at Department of Defense Surface Coating Facilities – [64](#)

Development of Aeroservoelastic Analytical Models and Gust Load Alleviation Control Laws of a SensorCraft Wind-Tunnel Model Using Measured Data – [3](#)

## CONTROL SYSTEMS DESIGN

Nonlinear Robust/Adaptive Controller Design for an Air-Breathing Hypersonic Vehicle Model (Preprint) – [21](#)

## CONTROL THEORY

F-15B QuietSpike(TradeMark) Aeroservoelastic Flight Test Data Analysis – 36

Need for Robust Sensors for Inherently Fail-Safe Gas Turbine Engine Controls, Monitoring, and Prognostics (Postprint) – 23

Nonlinear Robust/Adaptive Controller Design for an Air-Breathing Hypersonic Vehicle Model (Preprint) – 21

Utilizing Network-Enabled Command and Control Concepts to Enhance ASW Effectiveness – 590

## CONTROLLERS

New Tools for Hybrid Systems – 518

Predictive & Prognostic Controller for Wide Band Gap (Silicon Carbide) Power Conversion (Preprint) – 184

## CONTROL

A Feasibility Study of Life-Extending Controls for Aircraft Turbine Engines Using a Generic Air Force Model (Preprint) – 551

Application of the Simplified Phase Plane to the Analysis and Design of Missile Jet-Relay Control Systems – 2

Export Controls: Agencies Should Assess Vulnerabilities and Improve Guidance for Protecting Export-Controlled Information at Universities – 631

Research Institute for Autonomous Precision Guided Systems – 31

## CONVECTIVE HEAT TRANSFER

Nonequilibrium Stagnation-Line Radiative Heating for Fire II – 221

## CONVERGENCE

Convergence of High Order Finite Volume Weighted Essentially Non-Oscillatory Scheme and Discontinuous Galerkin Method for Nonconvex Conservation Laws – 515

## COOLING SYSTEMS

Survey and Alignment of the Fermilab Electron Cooling System – 585

## COOLING

Cognitive, Psychomotor, and Physical Performance in Cold Air After Cooling by Exercise in Cold Water – 410

Cooling Performance of a Partially-Confined FC-72 Spray: The Effect of Dissolved Air (Postprint) – 55

Cooling Performance of a Partially-Confined FC-72 Spray: The Effect of Variable Gravity (Postprint) – 55

Motor Frame Cooling with Hot Liquid Refrigerant and Internal Liquid – 76

Skin Temperature Feedback Optimizes Microclimate Cooling – 272

Studies of a Gas-Filled Helical Muon Beam Cooling Channel – 565

Survey and Alignment of the Fermilab Electron Cooling System – 585

## COORDINATES

Command, Control, Coordination, and Cooperation during Defense Support to Civil Authority Operations – 182

Massive Metrology: Development and Implementation of a 3D Reference Frame for the Realignment of Fermilab's Tevatron – 606

Relativistic Jets in the Radio Reference Frame Image Database. 1. Apparent Speeds From the First 5 Years of Data – 670

The Status and Future of the ICRF – 665

## COORDINATION

BRCA1 in Gene-Specific Coordination of Transcription and DNA Damage Response – 407

Command, Control, Coordination, and Cooperation during Defense Support to Civil Authority Operations – 182

Joint Space Forces in Theater: Coordination is No Longer Sufficient – 47

Ligand Field Strengths of Carbon Monoxide and Cyanide in Octahedral Coordination – 92

Motion Coordination Using Virtual Nodes – 454

Real-Time Communication and Coordination in Embedded Sensor Networks – 533

Role of Bond Coordination and Molecular Volume on the Dielectric Constant of Mixed-Oxide Compounds – 90

Training Coordination Proxy Agents – 616

## COPOLYMERS

Rheological Behavior of Entangled Polystyrene-Polyhedral Oligosilsesquioxane (POSS) Copolymer – 81

## COPPER

Neutron Induced Cross Sections for Radiochemistry Isotopes of Nickel, Copper and Zinc – 106

## CORDAGE

Cord Blood Stem Cell Procurement in Minority Donors – 302

## CORES

Photonic Crystal Fibers – 232

## CORONAGRAPHS

Interplanetary CMEs Without Observed Coronagraph CMEs – 670

Observational Properties of Coronal Mass Ejections – 671

## CORONAL MASS EJECTION

Fast Coronal Mass Ejection Environments and the Production of Solar Energetic Particle Events – 668

Imaging Interplanetary Disturbances Causing Forbush Decreases – 670

Interplanetary CMEs Without Observed Coronagraph CMEs – 669

Observational Properties of Coronal Mass Ejections – 671

Solar Radio Burst and Solar Wind Associations With Inferred Near-Relativistic Electron Injections – 669

Ultraviolet Properties of Halo Coronal Mass Ejections: Doppler Shifts, Angles, Shocks, and Bulk Morphology – 668

## CORONAS

Fast Coronal Mass Ejection Environments and the Production of Solar Energetic Particle Events – 668

Ultraviolet Properties of Halo Coronal Mass Ejections: Doppler Shifts, Angles, Shocks, and Bulk Morphology – 668

## CORRECTION

Correcting the Response of an Albedo Neutron Dosimeter for Energy – 220

First NNLL Prediction of B(barB right arrow Xs gamma) – 567

Wavefront Aberration Correction Using Zernike Polynomial Parameterizations of Optical Phased Arrays (PRE-PRINT) – 597

## CORROSION PREVENTION

Modeling JP-8 Fuel Effects on Diesel Combustion Systems – 120

Releaseable Corrosion Inhibitor Compositions – 108

## CORROSION RESISTANCE

Application of Neutron-Absorbing Structural-Amorphous Metal (SAM) Coatings for Spent Nuclear Fuel (SNF) Container to Enhance Criticality Safety Controls – 131

Corrosion Resistance of Structural Amorphous Metal – 104

Corrosion Resistances of Iron Based Amorphous Metals with Yttrium and Tungsten Additions in Hot Calcium Chloride Brine & Natural Seawater. Fe48Mo14Cr15Y2C15B6 and W-Containing Variants – 69

Corrosion Resistances of Iron-Based Amorphous Metals with Yttrium and Tungsten Additions in Hot Calcium Chloride Brine and Natural Seawater. Fe48Mo14Cr15Y2C15B6 and Variants – 107

Diffusion Coatings for Corrosion-Resistant Components in Coal Gasification Systems. (Quarterly Technical Report 14, October 1, 2006-December 31, 2006.) – 126

High-Performance Corrosion Resistant Iron Based Amorphous Metals. The Effects of Composition, Structure and Environment. Fe49.7Cr17.7Mn1.9Mo7.4W1.6B15.2C3.8Si2.4 – 107

Oxygen Plasma Treatment and Deposition of CNx on a Fluorinated Polymer Matrix Composite for Improved Erosion Resistance (Preprint) – 121

## CORROSION

Crevice Repassivation Potentials for Alloy 22 in Simulated Concentrated Ground Waters – 119

Modeling the Effects of Crevice Former, Particulates, and the Evolving Surface Profile In Crevice Corrosion – 119

Releaseable Corrosion Inhibitor Compositions – 108

## COSMIC RAYS

Fundamentals of Aerospace Medicine: Cosmic Radiation – 413

Proposal to Upgrade the MIPP Experiment – 563

## COSMOLOGY

Predicting the Cosmological Constant from the Causal Entropic Principle – 671

## COST ANALYSIS

Forecasting the KC-135 Cost Per Flying Hour: A Panel Data Analysis – 8

Human Factors Engineering: An Enabler for Military Transformation Through Effective Integration of Technology and Personnel – 424

Information Age Architectures Must Be Enterprise Architecture – 171

Price vs. Performance: The Value of Next Generation Fighter Aircraft – 25

Value Added Analysis - VAAFY03 – 532

## COST EFFECTIVENESS

Can GWOT Primary Prevention Strategy More Effectively Impede Religious Extremism? – 390

Cost-Effective Strategies for Communicating with Remote Surveillance Stations: A Summary – 178

Development and Manufacture of Cost Effective Composite Drill Pipe. 2006 Annual Technical Progress Report – 84

Guidebook for Selecting Cost-Effective Wireless Communication Technologies for Intelligent Transportation Systems – 183

Integrating the Department of Defense Military Services' Technology Development Programs to Improve Time, Cost, and Technical Quality Parameters – 135

Phase 1 Report: Cost-Effective Reciprocating Engine Emissions Control and Monitoring for E&P Field and Gathering Engines – 237

Report 17: Cost-Effective Reciprocating Engine Emissions Control and Monitoring for E&P Field and Gathering Engines. (Technical Report, October 1, 2006-December 31, 2006) – 237

The Costs of Not Using Green Design in the USAF: Would Using Green Building Design Have Resulted in Life Cycle Cost – 212

Value Added Analysis - VAAFY03 – 532

## COST REDUCTION

DigitalPersona - Case Study: Department of Defense – 475

Forecasting Demand for Civilian Pilots: A Cost Savings Approach to Managing Air Force Pilot Resources – 27

## COSTS

Forecasting Demand for Civilian Pilots: A Cost Savings Approach to Managing Air Force Pilot Resources – 27

Forecasting the KC-135 Cost Per Flying Hour: A Panel Data Analysis – 8

Human Factors Engineering: An Enabler for Military Transformation Through Effective Integration of Technology and Personnel – 424

Integrating the Department of Defense Military Services' Technology Development Programs to Improve Time, Cost, and Technical Quality Parameters – 135

The Costs of Not Using Green Design in the USAF: Would Using Green Building Design Have Resulted in Life Cycle Cost – 212

Unmanned Aerial Vehicles: Background and Issues for Congress – 30

## COTTON

Ionic Cross-Linking of Ionic Cotton with Small Molecular Weight Anionic or Cationic Molecules – 103

## COUNTERMEASURES

Artificial Gravity: Will it Preserve Bone Health on Long-Duration Missions? – 411

Bio-Defense Now: 56 Suggestions for Immediate Improvements – 427

Flight Attendant Fatigue – 412

Improved Formulation of a Recombinant Ricin A-chain Vaccine Increases its Stability and Effective Antigenicity – 353

Process Research and Development of Antibodies as Countermeasures for C. Botulinum – 308

## COUNTING

White Blood Cell Counts and Malaria – 401

## COUPLERS

Variable Directional Coupler for an Alternate ILC High-Power RF Distribution Scheme – 605

## COUPLINGS

Photonic Device and Method for Making Same – 209

## COUPLING

Post-Coupling Synthetic Approach for Polymeric Antioxidants – 65

## CP VIOLATION

Charmless B Decays – 577

Measurements of CP-Violating Asymmetries in B0 to a1+- (1260) pi+ Decays – 578

## CRACK PROPAGATION

3-Dimensional Crack Growth Behavior of Turbine Engine Materials (Preprint) – 555

Controls of Fluid Chemistry on Fracture Growth – 105

Crack Growth and Stress Intensity Prediction Techniques. Delivery Order 0004: Implementing Models and Libraries – 31

Numerical Investigation for the Microstructural Effects on the Crack Growth Behavior of Particulate Composite Materials – 79

## CRACKS

Crevice Repassivation Potentials for Alloy 22 in Simulated Concentrated Ground Waters – 119

Modeling the Effects of Crevice Former, Particulates, and the Evolving Surface Profile In Crevice Corrosion – 119

Nondestructive Evaluation (NDE) Technology Initiatives II Delivery Order 0001: Multi-Layer Cracks and Multi-site Damage NDE – 193

## CRASHWORTHINESS

Assessment of Injury Potential in Aircraft Side-Facing Seats Using the ES-2 Anthropomorphic Test Dummy – 10

## CREEP PROPERTIES

Effects of Temperature and Environment on Creep Behavior of an Oxide-Oxide Ceramic Matrix Composite – 103

Off-Axis Creep Behavior of Oxide/Oxide Nextel(Trademark)720/AS-0 (Preprint) – 122

Time-Dependent Response of MI SiC/SiC Composites Part 1: Standard Samples (Preprint) – 122

## CREW EXPLORATION VEHICLE

Sonic Boom Assessment for the Crew Exploration Vehicle – 56

## CRIME

Incident Management Capability Metrics Version 0.1 – 482

Investigations Involving the Internet and Computer Networks – 438

The President's Identity Theft Task Force: Combating Identity Theft a Strategic Plan – 652

## CROSS FLOW

Analysis of Crossflow Transition Flight Experiment aboard the Pegasus Launch Vehicle – 44

## CROSS SECTIONS

POINT 2007: A Temperature Dependent ENDF/B-VII.0 Data Cross Section Library – 562

t-tbar Production at the Tevatron. Event Selection and Cross Section Measurement – 586

## CROSSLINKING

Characterization of the Structure-Processing-Performance Relations of Phenylethynyl Phthalic Anhydride Crosslinked Fluorinated Polyimides (AFR-PEPA-N) and Their Carbon Fiber Composites – 85

Crosslinked Compounds and Methods of Making and Using Thereof – 72

Ionic Cross-Linking of Ionic Cotton with Small Molecular Weight Anionic or Cationic Molecules – 103

Telechelic Alkadiene Polymers with Crosslinkable End Groups and Methods for Making the Same – 73

## CRUDE OIL

A Possible Solution for the U.S. Navy's Addiction to Petroleum: A Business Case Analysis for Transitioning the U.S. Navy From Petroleum to Synthetic Fuel Resources – 63

European Security in the Wider Black Sea Area – 242

Oil Vulnerabilities and USA Strategy – 241

## CRUSTS

Regionalization of Crustal and Upper Mantle Q Structure in Eastern Eurasia Using Multiple Regional Waves – 262

## CRYPTOGRAPHY

An Agent-Based Dynamic Information Security Model in Information Warfare – 643

An Evaluation Methodology for Protocol Analysis Systems – 490

Method and Apparatus for Providing an Asymmetric Watermark Carrier – 430

Signals Intelligence Support to the Cockpit – 504

Vulnerabilities in Biometric Encryption Systems – 473

## CRYSTAL GROWTH

Dynamics of Epitaxy on the Nano-sized Semiconductor Surfaces – 188

## CRYSTAL STRUCTURE

Alkene- and Alkyne- Substituted Methyylimidazolium Bromides: Structural Effects and Physical properties (Preprint) – 100

## CRYSTALLINITY

Topological Close Packing in Structurally Complex Intermetallics (Crystalline, Quasicrystalline and Noncrystalline) – 116

## CRYSTALLIZATION

Development of a Recovery System for Metals and Acids from Pickling Baths Using Nanofiltration and Crystallisation – 109

High Throughput Screening of Crystallization of Materials – 71

Investigation of Low Temperature Metal Induced Crystallization and Doping of Silicon Using Various Excitation Sources for Solar Cells and other Microelectronic Applications. – 604

## CRYSTALLOGRAPHY

Effect of Excess Carbon on the Crystallographic, Microstructural, and Mechanical Properties of CVD Silicon Carbide Fibers – 84

## CRYSTALS

3D Photonic Crystals Build Up By Self-Organization Of Nanospheres – 450

Chiral Multichromic Single Crystals for Optical Devices – 580

High Spatial Resolution X-ray and Gamma Ray Imaging System Using Crystal Diffraction Lenses – 556

Photonic Crystal Fibers – 232

## CULTURE TECHNIQUES

Dynamic Tissue Culture from Prostate Biopsy Specimens as a Model for Predicting Tumor Radiosensitivity to Ionizing Radiation Treatment – 381

## CURRENT DENSITY

Electromigration Related Effects At Metal-Metal Interfaces: Application To Railguns – 96

Synthesis of One-dimensional Nano-sized Defects in High Tc Superconductor – 552

## CYANATES

A New Silicon-Containing Bis(Cyanate) Ester Resin with Improved Thermal Oxidation and Moisture Resistance – 125

## CYANIDES

Ligand Field Strengths of Carbon Monoxide and Cyanide in Octahedral Coordination – 92

Spectrophotometric Analysis of the Cyanide Metabolite 1-Aminothiazoline-6-Carboxylic Acid – 110

## CYCLES

AFCI Storage and Disposal FY-06 Progress Report – 106

## CYCLONES

A Weighted Consensus Approach to Tropical Cyclone 96-H and 120-H Track Forecasting – 269

Downstream Impacts Due to the Extratropical Transition of Tropical Cyclones Over the Western North Pacific – 267

## CYCLOTRON RESONANCE

High Resolution Fourier Transform Ion Cyclotron Resonance (FT-ICR) Mass Spectrometry Methods and Apparatus – 72

Possibility for Artificially Inducing Strong Pitch Angle Diffusion in the Magnetosphere – 261

## CYLINDRICAL BODIES

CFD Investigation of Flow Past Idealized Engine Nacelle Clutter – 227

Hypersonic Magneto-Fluid-Dynamic Compression in Cylindrical Inlet – 221

## CYLINDRICAL COORDINATES

Hamiltonian Analysis of Charged Particle Gyromotion in Cylindrical Coordinates – 513

## CYTOLOGY

Exploring Early Detection Methods: Using the Intraductal Approach to Predict Breast Cancer – 326

Integration of Anatomic and Pathogenetic Bases for Early Lung Cancer Diagnosis – 506

Role of Merlin in the Growth and Transformation of Arachnoidal Cells – 370

## DAMAGE ASSESSMENT

Shuttle Entry Imaging Using Infrared Thermography – 57

Towards the Development of a Defensive Cyber Damage and Mission Impact Methodology – 641

## DAMAGE

Application of Surface Energy Measurements to Evaluate Moisture Susceptibility of Asphalt and Aggregates – 74

Automatic Generation of Best Emergency Routes and Procedures on a Brazilian Frigate – 467

BRCA1 in Gene-Specific Coordination of Transcription and DNA Damage Response – 406

Crack Growth and Stress Intensity Prediction Techniques. Delivery Order 0004: Implementing Models and Libraries – 31

Detection of Incipient Thermal Damage in Polymer Matrix Composites (Preprint) – 80

Detection of Localized Heat Damage in a Polymer Matrix Composite by Thermo-Elastic Method (Preprint) – 81

DNA Damage and Genomic Instability Induced by Inappropriate DNA Replication – 336

Future Naval Concepts -- Crew Reductions through Improved Damage Control Communications (FNC-CRIDCC) – 145

Infrared Damage Detection System (IDDS) for Real-Time, Small-Scale Damage Monitoring – 118

Modeling Damage and Fragmentation in Concrete – 122

Nondestructive Evaluation (NDE) Technology Initiatives II Delivery Order 0001: Multi-Layer Cracks and Multi-site Damage NDE – 193

Quantification of Impact Damage in CMC Thermal Protection Systems Using Thin-Film Piezoelectric Sensors (Preprint) – 211

Re-Entry Aeroheating Analysis of Tile-Repair Augers for the Shuttle Orbiter – 58

System for the Evaluation of Moisture Damage Using Fundamental Material Properties – 74

Uncertainty Quantification of Composite Laminate Damage with the Generalized Information Theory – 86

## DAMPING

Durability Patch: Application of Passive Damping to High Cycle Fatigue Cracking on Aircraft – 583

## DATA ACQUISITION

A Strategies-to-Tasks Framework for Planning and Executing Intelligence, Surveillance, and Reconnaissance (ISR) Operations – 620

Continuous Pre-hospital Data as a Predictor of Outcome Following Major Trauma: A Study Using Improved and Expanded Data – 354

Electronic Vehicle Identification: Industry Standards, Performance, and Privacy Issues – 178

High-Speed Digital-Image Data Acquisition, Processing, and Visualization System for Turbulent Mixing and Combustion – 77

Hospital Quality Data: HHS Should Specify Steps and Time Frame for Using Information Technology to Collect and Submit Data – 428

Internet Protocol Geolocation: Development of a Delay-Based Hybrid Methodology for Locating the Geographic Location of a Network Node – 641

POINT 2007: A Temperature Dependent ENDF/B-VII.0 Data Cross Section Library – 562

Proposal to Upgrade the MIPP Experiment – 563

Signals Intelligence Support to the Cockpit – 504

Subgrade CBR Values for Alpha Factor Determination Using Data Collected at the National Airport Pavement Test Facility – 13

Test Suite for Nuclear Data I. Deterministic Calculations for Critical Assemblies and Replacement Coefficients – 574

The Department of Defense Net-Centric Data Strategy: Implementation Requires a Joint Community of Interest (COI) Working Group and Joint COI Oversight Council – 659

## DATA BASE MANAGEMENT SYSTEMS

Content Based Retrieval Database Management System with Support for Similarity Searching and Query Refinement – 622

## DATA BASES

A Partnership Training Program in Breast Cancer Diagnosis: Concept Development of the Next Generation Diagnostic Breast Imaging Using Digital Image Library and Networking Techniques – 296

Automated STR Analysis for DNA Databases – 429

Content Based Retrieval Database Management System with Support for Similarity Searching and Query Refinement – 622

Data Alignment between Army C4I Databases and Army Simulations – 653

Data Mining and Homeland Security: An Overview – 648

Database Dictionary for Ethiopian National Ground-Water Database (ENGDA) Data Fields – 631

Database Manipulations Using Group Theory – 435

Hao Spectral Diagnostic Package for Emitted Radiation (Haos-Diper) Reference Guide. Version 1.0 – 558

HEND: A Database for High Energy Nuclear Data – 559

Industrial Base Model Data Requirements (IBMDR) – 650

Information Technology and Knowledge Distribution in C3I teams – 627

Locally Dimensionality Reduction: A New Approach to Indexing High Dimensional Spaces (Preprint) – 612

Mapping of WDMET in AIS 2005 and AIS 2005 Military – 644

MDS MIC Catalog Inputs – 416

Methods for Effective Virtual Screening and Scaffold-Hopping in Chemical Compounds – 653

National Solar Radiation Data Base 1991-2005 Update: User's Manual – 245

Preliminary Findings: Design of Experiments University XXI (FY05) Research and Support for the US Army – 621

Relativistic Jets in the Radio Reference Frame Image Database. 1. Apparent Speeds From the First 5 Years of Data – 670

Using Dynamic Adjustment of Serialization Order for Real-Time Database Systems – 613

## DATA INTEGRATION

A Unifying Strategy for Data Integration for Global Force Management (Briefing Charts) – 147

Generic Organisation Data Integration Solution: The Fast and Convenient Way to Integrate Data – 644

## DATA LINKS

A Link Scheduling and Ad Hoc Networking Approach Using Directional Antennas – 190

Knowledge Based Systems as a Means of Managing Aspects of Datalink Within a Decision Support System for Naval Airborne Early Warning – 460

T/R Module for Satellite TT&C Ground Link – 200

## DATA MANAGEMENT

A Unifying Strategy for Data Integration for Global Force Management (Briefing Charts) – 147

An Enterprise Identifier Strategy for Global Naming Across Arbitrary C4I Systems – 459

Client Location in 802.11 Networks – 639

ERDC-CERL LD-870 Download Program Developed for Aberdeen Test Center: User's Manual – 469

Focused Knowledge to the Warfighter – 617

Integration of SATURN System and VGIS – 530

Site Inspection at Fort Allen, Puerto Rico Preliminary Assessments at San Juan ASSF, Puerto Rico and Blair Hangar AASF, St. Croix, USVI – 87

The Department of Defense Net-Centric Data Strategy: Implementation Requires a Joint Community of Interest (COI) Working Group and Joint COI Oversight Council – 659

The Hybrid Tree: An Index Structure for High Dimensional Feature Spaces (Preprint) – 529

## DATA MINING

Assessing C3I in Support of Dismounted Operations in Complex Terrain – 540

Data Mining and Homeland Security: An Overview – 647

Data Mining Techniques Applied to Urban Terrain Command and Control Experimentation – 615

Towards Next Generation WWW: Push, Reuse and Classification – 614

## DATA PROCESSING

Advanced Radar Signal and Data Processing – 175

Automated Run-Time Mission and Dialog Generation – 632

Building the Readiness Data Warehouse – 479

Cfetooth. A General Purpose Tool for Anomaly Detection in Periodic Data – 439

Data Mining and Homeland Security: An Overview – 648

Dataflow Integration and Simulation Techniques for DSP System Design Tools – 467

Forecasting the KC-135 Cost Per Flying Hour: A Panel Data Analysis – 8

Grid Computing for High Performance Computing (HPC) Data Centers – 451

Health Information Exchange in Post-Acute and Long-Term Care – 663

Human Factors and Privacy – 476

Diesel Particulate Measurement Research, 2007. Phase 3 – 238

Evaluation of Emission Control Strategies for the 8-Hour Ozone Standard in the Houston and Dallas Areas and A Pilot-Scale Study of In-Use Emissions from Heavy-Duty Diesel Dump Trucks using a Portable Emissions Monitoring System (PEMS) – 255

Evaluation of Portable Emissions Measurement Systems (PEMS) for Inventory Purposes and the Not-to-Exceed Heavy-Duty Diesel Engine Regulation – 236

Proteomic Analysis of Bronchoalveolar Lavage Fluid: Effect of Acute Exposure to Diesel Exhaust Particles in Rats – 335

#### **DIESEL FUELS**

Modeling JP-8 Fuel Effects on Diesel Combustion Systems – 120

#### **DIETS**

Antioxidant Prophylaxis in the Prevention of Prostatic Epithelial Neoplasia – 337

Dietary Fat, Fat Metabolizing Genes, and Prostate Cancer Risk in African-Americans and Whites – 340

Interactions between Dietary Factors and Inflammation in Prostate Carcinogenesis – 349

PSA-Based Screening Outcomes, Dietary Heterocyclic Amine Exposure, and Prostate Cancer Risk in African Americans – 302

#### **DIFFERENTIAL EQUATIONS**

High-Order Higdon Non-Reflecting Boundary Conditions for the Linearized Euler Equations – 527

The Matrix Pencil and its Applications to Speech Processing – 589

#### **DIFFRACTION**

High Spatial Resolution X-ray and Gamma Ray Imaging System Using Crystal Diffraction Lenses – 557

Ultra Fast Coherent Diffraction Imaging of Single Particles, Clusters and Biomolecules – 572

WABED Model in the SMS: Part 2. Graphical Interface – 470

## DIFFUSION THEORY

Hypersonic Magneto-Fluid-Dynamic Compression in Cylindrical Inlet – 221

## DIFFUSION

Assessment of Gradient Diffusion Closures for Modeling Rayleigh Taylor and Richtmyer Meshkov Instability Induced Mixing – 568

Diffusion Coatings for Corrosion-Resistant Components in Coal Gasification Systems. (Quarterly Technical Report 14, October 1, 2006-December 31, 2006.) – 126

Electromechanics of Dielectric and Piezoelectric Crystals With Point, Line, and Surface Defects – 187

Possibility for Artificially Inducing Strong Pitch Angle Diffusion in the Magneto-sphere – 261

## DIGITAL CAMERAS

Source Camera Identification and Blind Tamper Detections for Images – 505

## DIGITAL DATA

High-Speed Digital-Image Data Acquisition, Processing, and Visualization System for Turbulent Mixing and Combustion – 77

## DIGITAL SYSTEMS

A High-Performance Communication Service for Parallel Computing on Distributed DSP Systems – 449

Achieving AFRL Universal FADEC Vision With Open Architecture Addressing Capability and Obsolescence for Military and Commercial Applications (Preprint) – 5

Army Digitization Operational Impacts – 661

Can a Self-Diagnostic Digitally Controlled Pacemaker/Defibrillator Device be Used for Alerting Military Personnel When a Soldier Health Condition Becomes Compromised Out in the Field – 426

Digital C4I Interoperability: The EM Protection Issue – 163

Introduction to Synthetic Aperture Radar (SAR) – 175

Performance Analysis and Training for Digital Command Staff: Training for the Battle Command Reengineering III – 650

## DIGITAL TECHNIQUES

A Partnership Training Program in Breast Cancer Diagnosis: Concept Development of the Next Generation Diagnostic Breast Imaging Using Digital Image Library and Networking Techniques – 296

Army Digitization Operational Impacts – 661

Digital Evidence in the Courtroom: A Guide for Law Enforcement and Prosecutors – 437

## DIGITAL TELEVISION

Digital Convergence Authenticated Video, Voice, & Text – 476

## DILUTION

Heat of Dilution Calculation for 19 Molar Sodium Hydroxide with Water for Use in 241-S-112 – 103

## DIMENSIONAL MEASUREMENT

Physical, Nutrient, and Biological Measurements of Coastal Waters off Central California in October 2006 – 407

## DIMENSIONLESS NUMBERS

Summary of Dimensionless Texas Hyetographs and Distribution of Storm Depth Developed for Texas Department of Transportation Research Project 0-4194 – 276

## DIODES

Pyroelectric AlGaIn/GaN HEMTs for ion-, gas- and Polar-Liquid Sensors – 97

## DIRECT CURRENT

Vertical Alignment of Single-Walled Carbon Nanotubes on Nanostructure Fabricated by Atomic Force Microscope – 88

## DIRECT NUMERICAL SIMULATION

Direct Numerical Simulation and Experimental Validation of Hypersonic Boundary-Layer Receptivity and Instability – 512

## DIRECTIONAL ANTENNAS

A Link Scheduling and Ad Hoc Networking Approach Using Directional Antennas – 190

## DISASTERS

Hurricane Katrina: Lessons for Army Planning and Operations – 164

Medical Reserve Corps Volunteers' Ability and Willingness to Report to Work for the Department of Health During Catastrophic Disasters – 312

Optimizing the Prioritization of Natural Disaster Recovery Projects – 274

Solving Wireless Communications Interoperability Problems among Emergency First Responders Depends on Greater National Guard Involvement – 181

The Chaos of Katrina – 267

## DISCONTINUITY

The Entropy Solutions for the Lighthill-Whitham-Richards Traffic Flow Model with a Discontinuous Flow-Density Relationship – 515

## DISCRETE FUNCTIONS

Discrete Data Transfer Technique for Fluid-Structure Interaction – 478

## DISEASES

Analysis of MALDI-TOF Serum Profiles for Biomarker Selection and Sample Classification – 309

Brain's DNA Repair Response to Neurotoxicants – 317

Cell-surface Alpha-glucan in Campylobacter jejuni 81-176 – 401

Comparison of Meglumine Antimoniate and Pentamidine for Peruvian Cutaneous Leishmaniasis – 386

Developing Human Embryonic Stem Cells for Grafting in Parkinson's Disease – 343

Development of a Mouse Model for Prostate Cancer Imaging and Study of Disease Progression – 321

Differential Mechanisms of Androgen Resistance – 313

Eliciting Autoimmunity to Ovarian Tumors in Mice by Genetic Disruption of T Cell Tolerance Mechanisms. Addendum – 357

Establishment of a Non-human Primate Campylobacter Disease Model for the Pre-clinical Evaluation of Campylobacter Vaccine Formulations – 396

History of U.S. Military Contributions to the Study of Diarrheal Diseases – 408

HOXC5 as a Biomarker of Disease Presence in Tumor-Associated Normal Prostate – 290

Mechanisms of Alpha-synuclein Aggregation and Toxicity – 330

Mechanisms of Disease Persistence in Chronic Myelogenous Leukemia (CML) – 318

Modeling Phenotypes of Tuberculous Sclerosis in the Mouse – 310

Molecular Differentiation of Risk for Disease Progression: Delineating Stage-Specific Therapeutic Targets for Disease Management in Breast Cancer – 289

Monitoring and Counteracting Functional Deterioration in Parkinson's Disease: A Multilevel Integrative Approach in a Primate Model System – 319

National Institutes of Health Consensus Development Project on Criteria for Clinical Trials in Chronic Graft-versus-Host Disease: I. Diagnosis and Staging Working Group Report – 397

New Structural Approaches to Understanding the Disease Related Forms of the Prion Protein – 348

Program Project on the Pathogenesis and Treatment of Parkinson's Disease – 334

Telemedicine Based Ultrasound for Detecting Neonatal Heart Disease in Babies at Remote Military or Native American Health Care Facilities – 360

Testing the Effectiveness of the North Shore - LIJ Health System's Bioterrorism Response Program to Identified Surveillance Data – 345

The Role of CRELD1 Isoform 9B in the Pathogenesis of Breast Cancer – 280

Vasculature-Specific Adenovirus Vectors for Gene Therapy of Prostate Cancer – 352

## DISORDERS

Post Traumatic Stress Disorder: The Facts – 369

Treatment of PTSD-Related Anger in Troops Returning from Hazardous Deployments – 384

## DISORIENTATION

Development of Multisensory Orientation Technology for Reducing Spatial Disorientation Mishaps – 7

## DISPENSERS

Simulation and Analysis of Dart Dispense Events with Collisions – 236

## DISPERSING

Terrorist 'Dirty Bombs': A Brief Primer – 251

## DISPLACEMENT

High Throughput Screening of Potential Displacer Molecules – 73

Microfabrication of a Mechanically Controllable Break Junction in Silicon – 186

Rotational Response of Toe-Restrained Retaining Walls to Earthquake Ground Motions – 265

## DISPLAY DEVICES

Counter-Trafficking Integrated Display System (CIDS): A GIS-Based Command & Control Environment for Coalition Nations – 471

Developing the Federal Aviation Administration's Requirements for Color Use in Air Traffic Control Displays – 16

Effects of Multimodal Displays About Threat Location on Target Acquisition and Attention to Visual and Auditory Communications – 153

Method and System for Interactive Modeling of High-Level Network Performance with Low-Level Link Design – 436

Receptive Field Structures for Recognition – 190

Software to Generate 3-Dimensional Displays of Inverse Synthetic Aperture Radar Data – 455

Task Adaptable Display of Information for Training, Maintenance, and Emergency Response – 654

The Interactive DataWall – 209

The Tactile Modality: A Review of Tactile Sensitivity and Human Tactile Interfaces – 423

Visual Simulation S&T: Summary of Accomplishments – 7

## DISSOCIATION

Improving COIL Efficiency By Iodine Pre-Dissociation Via Corona Discharge In The Transonic Section Of The Secondary Flow – 234

## DISTORTION

Closed Orbit Distortion and the Beam-Beam Interaction – 556

Linearity and Efficiency Performance of GaN HEMTs with Digital Pre-Distortion Correction (Preprint) – 95

## DISTRIBUTED INTERACTIVE SIMULATION

Performance Measurement for Diagnosing and Debriefing Distributed Command and Control Teams – 150

## DISTRIBUTED PARAMETER SYSTEMS

Distributed Command and Control Research: Networking Multiple Simulation Platforms – 495

Distributed Computing and Collaboration Framework (DCCF) – 466

Performance Measurement for Diagnosing and Debriefing Distributed Command and Control Teams – 150

## DISTRIBUTED PROCESSING

A Distributed Parallel Processing System for Command and Control Imagery – 466

A High-Performance Communication Service for Parallel Computing on Distributed DSP Systems – 449

Comparative Performance Analysis of Directed Flow Control for Real-Time SCI – 448

Distributed Computing and Collaboration Framework (DCCF) – 466

Performance Modeling and Evaluation of Topologies for Low-Latency SCI Systems – 448

Proving Atomicity: An Assertional Approach – 487

QoS Negotiation in Real-Time Systems and its Application to Automated Flight Control – 43

Visual Spreadsheets in VisIt – 432

## DISTRIBUTION FUNCTIONS

An Inverse of the Incomplete Beta Function (F-(Variance Ratio) Distribution Function) – 467

Materials on the International Space Station Experiment (MISSE): Optical Analysis of Molecular Contamination on PEC1 Tray 2 – 54

Radiated Susceptibility Test in Reverberation Chamber – 202

## DOCUMENT MARKUP LANGUAGES

Savage Modeling and Analysis Language (SMAL): Metadata for Tactical Simulations and X3D Visualizations – 641

Using a Combination of UML, C2RM, XML, and Metadata Registries to Support Long-Term Development/Engineering – 452

## DOCUMENTATION

IMMR Phase 1 Prototyping Plan Inputs – 663

## DOPAMINE

Ethanol and Mesolimbic Serotonin/Dopamine Interactions via 5HT-1B Receptors – 346

PCBs Alter Dopamine Mediated Function in Aging Workers – 294

## DOPED CRYSTALS

Highly Doped III-Nitride Semiconductors (PAT-APPL-11-082 070) – 207

Highly Doped III-Nitride Semiconductors (PAT-APPL-11-082 378) – 206

Red Photoluminescence Emission of Laser Dye Doped DNA and PMMA (Preprint) – 63

## DOPPLER EFFECT

Ultraviolet Properties of Halo Coronal Mass Ejections: Doppler Shifts, Angles, Shocks, and Bulk Morphology – 669

## DOPPLER RADAR

Analysis of Operational Alternatives to the Terminal Doppler Weather Radar (TDWR) – 277

## DOSAGE

Acetylcholinesterase Inhibition: Does it Explain the Toxicity of Organophosphorus Compounds? – 372

Active Detection of Small Quantities of Shielded Highly-Enriched Uranium Using Low-Dose 60-keV Neutron Interrogation – 570

Anticonvulsants for Nerve Agent-Induced Seizures: The Influence of the Therapeutic Dose of Atropine – 110

Automated Patient Positioning Guided by Cone-Beam CT for Prostate Radiotherapy – 286

Effects of Hind Limb Unloading on Pharmacokinetics of Procainamide in Mice – 416

Screening Doses for Induction of Cancers Calculated With the Interactive Radio Epidemiological Program (IREP) – 306

Screening Doses for Induction of Cancers Calculated with the Interactive RadioEpidemiological Program (IREP) – 348

Targeting Breast Cancers Featuring Activating Mutations in PIK3CA by Generating a Lethal Dose of PIP3 – 358

X-Ray Dose in Microfocus Radiographic Inspections – 137

## DOSIMETERS

Correcting the Response of an Albedo Neutron Dosimeter for Energy – 220

X-Ray Dose in Microfocus Radiographic Inspections – 137

## DRONE AIRCRAFT

Finite Element Solution: Nonlinear Flapping Beams for Use with Micro Air Vehicle Design – 3

## DRONE VEHICLES

A Bold 21st Century Strategy for U.S. Airborne ISR – 24

A Comparison of Trajectory Determination Approaches for Small UAVs – 11

A Review of Recent Algorithms and a New and Improved Cooperative Control Design for Generating a Phantom Track (Preprint) – 26

Autonomous Unmanned Aerial Vehicle Rendezvous for Automated Aerial Refueling – 11

Development of an Experimental Platform for Testing Autonomous UAV Guidance and Control Algorithms – 38

North West Shelf Unmanned Aerial System Trial – 18

Optimal UAV Task Assignment and Scheduling (Preprint) – 24

Research Institute for Autonomous Precision Guided Systems – 31

Tour Planning for an Unmanned Air Vehicle Under Wind Conditions (Preprint) – 19

Unmanned Aerial Vehicles: Background and Issues for Congress – 30

Wide Area Search and Engagement Simulation Validation – 32

## DRUGS

A Dual-Action Approach to Multidrug-Resistant Breast Cancer: Prophylaxis to Ensure Therapeutic Effect – 406

Analytical and Characterization Studies of Organic Chemicals, Drugs and Drug Formulations – 60

Atropine and Other Anticholinergic Drugs – 372

Differential Effects of Dengue Virus on Infected and Bystander Dendritic Cells – 378

Discovery of Therapeutics for Ricin Toxicosis – 299

Effects of Hind Limb Unloading on Pharmacokinetics of Procainamide in Mice – 416

Extensively Drug-Resistant Tuberculosis (XDR-TB): Quarantine and Isolation – 398

Mosaic Structure of a Multiple-Drug-Resistant, Conjugative Plasmid from *Campylobacter jejuni* – 407

Novel and Efficient Synthesis of the Promising Drug Candidate Discodermolide – 355

pH Triggerable Polymeric Particles – 66

Selenium and Breast Cancer Chemoprevention – 339

Smallpox Antiviral Drug – 285

Structural Studies on Intact Clostridium Botulinum Neurotoxins Complexed with Inhibitors Leading to Drug Design – 304

Three-Dimensional Cell Culture Models for Infectious Disease and Drug Development – 371

## DRUMS (CONTAINERS)

Improving Thermal Performance of Radioactive Material Drum Type Packages by Using Heat Pipes – 131

## DRYING

A Review of the History of Fire Suppression on U.S. DoD Aircraft – 34

## DUCTILITY

Micro and Nano-structure Development and Multiscale Physics at Sliding Metal Interfaces. Final Report May 2006 – 78

The Effect of Inhomogeneous Plastic Deformation on the Ductility and Fracture Behavior of Age Hardenable Aluminum Alloys – 115

## DURABILITY

Durability Patch: Application of Passive Damping to High Cycle Fatigue Cracking on Aircraft – 583

## DUST

Theoretical Characterization of the Radiative Properties of Dust Aerosol for the Air Force Combat Climatology Center Point Analysis Intelligence System – 271

Using DUSTRAN to Simulate Fog-Oil Dispersion and Its Impacts on Local Insect Populations at Ft. Hood: Final Report – 253

Vertical Variation of Dust and Its Impact on the Top of the Atmosphere Brightness Temperature in the Midwave Infrared – 271

## DWELL

Time-Dependent Response of MI SiC/SiC Composites Part 1: Standard Samples (Preprint) – 122

## DYE LASERS

Novel Two- and Three-Photon Pumped Lasing Dyes: Design, Synthesis, and Characterization – 232

## DYES

Red Photoluminescence Emission of Laser Dye Doped DNA and PMMA (Preprint) – 64

## DYNAMIC CHARACTERISTICS

Notes on Longitudinal Dynamics in UMER – 568

## DYNAMIC CONTROL

Dynamic-Active Flow Control - Phase I – 2

## DYNAMIC LOADS

Parametric Dynamic Load Prediction of a Narrow Gauge Rocket Sled – 135

## DYNAMIC MODELS

An Agent-Based Dynamic Information Security Model in Information Warfare – 643

Global Local Dynamic Models – 572

Mathematical Fluid Dynamic Modeling of Plasma Stall-Spin Departure Control – 518

Mathematical Modeling of Physical and Cognitive Performance Decrement from Mechanical and Inhalation Insults – 297

## DYNAMIC PROGRAMMING

Multi-Cumulant and Non-Inferior Strategies for Multi-Player Pursuit-Evasion (PREPRINT) – 544

## DYNAMIC RESPONSE

Study of Free-Free Beam Structural Dynamics Perturbations due to Mounted Cable Harnesses – 53

## DYNAMIC STRUCTURAL ANALYSIS

Study of Free-Free Beam Structural Dynamics Perturbations due to Mounted Cable Harnesses – 53

## DYNAMICAL SYSTEMS

Global Local Dynamic Models – 572

## E-2 AIRCRAFT

Effects of Using NATEC Services within E-2C and FA-18 Operational Squadrons – 25

## EAR PROTECTORS

Effects of the Advanced Combat Helmet (ACH) and Selected Communication and Hearing Protection Systems (C&HPSs) on Speech Communication: Talk-Through Systems – 630

## EARLY WARNING SYSTEMS

Knowledge Based Systems as a Means of Managing Aspects of Datalink Within a Decision Support System for Naval Airborne Early Warning – 461

Space Surveillance and Early Warning Radars: Buried Treasure for the Information Grid – 165

## EARPHONES

Effects of the Advanced Combat Helmet (ACH) and Selected Communication and Hearing Protection Systems (C&HPSs) on Speech Communication: Talk-Through Systems – 630

## EARTH ATMOSPHERE

Gravity-Wave Dynamics in the Atmosphere – 264

## EARTH IONOSPHERE

Inversion of Ionospheric Backscatter Radar Data in Order to Map and Model the Ionosphere – 261

## EARTH MOVEMENTS

Rotational Response of Toe-Restrained Retaining Walls to Earthquake Ground Motions – 265

## EARTH RESOURCES

European Security in the Wider Black Sea Area – 242

## EARTH SURFACE

CLMT2 User's Guide: A Coupled Model for Simulation of Hydraulic Processes from Canopy to Aquifer – 276

## EARTHQUAKES

Collaborative Research: Ground Truth of African and Eastern Mediterranean Shallow Seismicity Using SAR Interferometry and Gibbs Sampling Inversion – 262

Regionalization of Crustal and Upper Mantle Q Structure in Eastern Eurasia Using Multiple Regional Waves – 262

- Rotational Response of Toe-Restrained Retaining Walls to Earthquake Ground Motions – 265
- Seismic Response of a Half-Scale Masonry Building with Flexible Diaphragms – 239
- ECHOES**  
Acoustic Proximity Ranging in the Presence of Secondary Echoes – 588
- ECLIPTIC**  
Progress Report of the IAU Working Group on Precession and the Ecliptic – 665
- ECONOMETRICS**  
Analysis of Metrics Utilized in U.S. Joint Experimentation of Future C2 Concepts – 171  
Price vs. Performance: The Value of Next Generation Fighter Aircraft – 25
- ECONOMICS**  
Quality-Attribute-Based Economic Valuation of Architectural Patterns – 479
- ECOSYSTEMS**  
Coastal and Marine Ecosystems and Global Climate Change: Potential Effects on U.S. Resources – 277  
Ecosystems and Climate Change: Research Priorities for the U.S. Climate Change Science Program. Recommendations from the Scientific Community – 278
- EDDY CURRENTS**  
Eddy Current Scanning of Niobium for SRF Cavities at Fermilab – 565  
Reduced Magnetic Vector Potential and Electric Scalar Potential Formulation for Eddy Current Modeling (Postprint) – 534
- EDEMA**  
Hantavirus Pulmonary Syndrome in Central Bolivia: Relationships Between Reservoir Hosts, Habitats, and Viral Genotypes – 378
- EDUCATION**  
A Case Study for the Naval Training Meta-FOM (NTMF): Analyzing the Requirements from MAGTF FOM – 629  
A Comparative Assessment of Knowledge Management Education Across the USA Department of Defense – 636  
A Partnership Training Program in Breast Cancer Diagnosis: Concept Development of the Next Generation Diagnostic Breast Imaging Using Digital Image Library and Networking Techniques – 296  
A Study of Communicating Science and Engineering – 142  
Advanced Visual and Instruction Systems for Maintenance Support (AVIS-MS) – 625  
American Competitiveness Initiative: Leading the World in Innovation – 136  
Baylor College of Medicine Saturday Morning Science Workshop – 608
- Critical Review of the U.S. Marine Corps' Space Cadre Strategy – 674
- Delaware Consortium for Undergraduate Minority Training in Prostate Cancer – 362
- Evaluating an Interactive, Multimedia Education and Decision Program for Early-Stage Prostate Cancer Patients in a Randomized Controlled Trial – 342
- Experimentation with Evolving C2 Operation Centers - Implications for the Human Element – 137
- Helmet-Mounted Displays for Use in Air Force Training and Simulation – 6
- Incorporating New Technology to Create a Comprehensive Realistic Training Environment for the 91W – 343
- Knowledge Tracing and Prediction of Future Trainee Performance – 531
- Management and Education of the Risk of Insider Threat (MERIT): Mitigating the Risk of Sabotage to Employers' Information, Systems, or Networks – 497
- Mathematical Programming Model for Fighter Training Squadron Pilot Scheduling – 32
- Operator Influence of Unexploded Ordnance Sensor Technologies – 227
- Performance Analysis and Training for Digital Command Staff: Training for the Battle Command Reengineering III – 650
- Platform Camera Aircraft Detection for Approach Evaluation and Training – 29
- The Effect of Graduate Education on the Performance of Air Force Officers – 526
- The Need for an Aerospace Pharmacy Residency – 419
- Training Coordination Proxy Agents – 616
- UH-USA Agreement - A Telemedicine Research Proposal – 624
- Weapons Director Intelligent-Agent-Assist Task: Procedure and Findings for a Validation Study – 7
- EGYPT**  
Diarrheal Illness Among Deployed U.S. Military Personnel During Operation Bright Star 2001-Egypt – 375
- EIGENVALUES**  
Parallel Eigensolver for H (curl) Problems using H1 Auxiliary Space AMG Preconditioning – 434
- EIGENVECTORS**  
Eigenvector Analysis for Multipath – 549
- ELASTIC ANISOTROPY**  
On the Correlation Between the Self-Organized Island Pattern and Substrate Elastic Anisotropy – 552
- ELASTIC PROPERTIES**  
Compliant Formation Control of an Autonomous Multiple Vehicle System – 507  
Compliant, Nanoscale Free-Standing Multilayer Films – 66  
Elastic-Viscoplastic An Isotropic Modeling of Textured Metals and Validation using the Taylor Cylinder Impact Text – 117  
High Resolution Anatomic and Elastographic Transrectal Ultrasound for Improved Diagnosis of Prostate Cancer – 350  
Leg Muscle Usage Effects on Tibial Elasticity during Running – 295  
On the Correlation Between the Self-Organized Island Pattern and Substrate Elastic Anisotropy – 552  
Software Communications Architecture (SCA) Compliant Software Defined Radio Design for Interim Standard 95B (IS-95B) Transceiver – 463  
Web Enabling HLA Compliant Simulations to Support Network Centric Applications – 444
- ELASTOMERS**  
Nanosilica Modification of Elastomer-Modified VARTM Epoxy Resins for Improved Resin and Composite Toughness – 122
- ELECTRIC BATTERIES**  
Aircraft Battery Design Concept for Improved Ultra Low Temperature Performance (Postprint) – 17  
Battery System – 246  
Complex Processes in Electrochemical Systems – 114  
Polymer Electrolyte, Intercalation Compounds and Electrodes for Batteries – 246  
Servicing Hawker Vehicle Batteries with Standard Battery Charging and Test Equipment – 248
- ELECTRIC CONDUCTORS**  
Report on the Wisconsin-Stanford-Kansas-Davis-Florida State MURI on Scientific Challenges of Coated Conductors – 555
- ELECTRIC CORONA**  
Improving COIL Efficiency By Iodine Pre-Dissociation Via Corona Discharge In The Transonic Section Of The Secondary Flow – 234
- ELECTRIC CURRENT**  
Electromigration Related Effects At Metal-Metal Interfaces: Application To Railguns – 96  
Microfabrication of a Mechanically Controllable Break Junction in Silicon – 186
- ELECTRIC EQUIPMENT**  
M1114 -- Golden HMMWV Power: Electrical Systems Used in Theater – 192

## **ELECTRIC FIELDS**

AC Field Measurements of Fermilab Booster Correctors Using a Rotating Coil System – 605

Do Capacity Coupled Electric Fields Accelerate Tibial Stress Fracture Healing – 287

## **ELECTRIC MOTORS**

Motor Frame Cooling with Hot Liquid Refrigerant and Internal Liquid – 76

## **ELECTRIC POTENTIAL**

Incident, Action, Recovery, and Recommissioning for the 4.5-MJ Pulsed Power Supply Located at the Electromagnetic Gun Facility, Barricade C, Aberdeen Proving Ground, MD – 202

Multi-Wall Carbon Nanotubes for Flow-Induced Voltage Generation (Preprint) – 95

Reduced Magnetic Vector Potential and Electric Scalar Potential Formulation for Eddy Current Modeling (Postprint) – 534

## **ELECTRIC POWER**

Joint Light Tactical Vehicle Power Requirements – 250

## **ELECTRIC WIRE**

Study of Free-Free Beam Structural Dynamics Perturbations due to Mounted Cable Harnesses – 53

## **ELECTRICAL MEASUREMENT**

Spatially Resolved Electromagnetic Property Measurement – 556

## **ELECTRICAL PROPERTIES**

Infrared and Electrical Properties of Amorphous Sputtered (LaxA11-x)2O3 films – 63

Studies of Basic Electronic Properties of CdTe-Based Solar Cells and Their Evolution During Processing and Stress. Final Technical Report October 16, 2001-August 31, 2005 – 246

## **ELECTRICITY**

Report to Congress on Assessment of Potential Impact of Concentrating Solar Power for Electricity Generation (EPACT 2005 - Section 934 (c)) – 247

The Costs of Not Using Green Design in the USAF: Would Using Green Building Design Have Resulted in Life Cycle Cost – 212

## **ELECTROCHEMICAL CELLS**

Impedance Analysis of Electrochemical NOx Sensor Using a Au/Yttria-Stabilized Zirconia (YSZ) Au Cell – 247

## **ELECTROCHEMISTRY**

Complex Processes in Electrochemical Systems – 114

Detection of Staphylococcus Aureus Enterotoxin A and B Genes with PCR-EIA and a Hand-Held Electrochemical Sensor – 331

Electrochemical Investigations of the Interface at Li/Li+ Ion Conducting Channel – 90

Microfabricated Electrochemical Sensor for Chemical Warfare Agents: Smaller is Better (Preprint) – 230

## **ELECTRODEPOSITION**

Reversible Electrodeposition Optical Modulation Device with Conducting Polymer Counter Electrode – 214

## **ELECTRODES**

Polymer Electrolyte, Intercalation Compounds and Electrodes for Batteries – 246

Reversible Electrodeposition Optical Modulation Device with Conducting Polymer Counter Electrode – 213

## **ELECTROENCEPHALOGRAPHY**

Anticonvulsants for Nerve Agent-Induced Seizures: The Influence of the Therapeutic Dose of Atropine – 110

## **ELECTROLUMINESCENCE**

Nano-Dots Enhanced White Organic Light-Emitting Diodes – 90

Organic Light-Emitting Diodes and Related Hole Transport Compounds – 207

## **ELECTROLYTES**

Charge Transfer Nanocomposites: The Effects of Scale-Hierarchy – 111

Polymer Electrolyte, Intercalation Compounds and Electrodes for Batteries – 246

## **ELECTROMAGNETIC FIELDS**

Theory for the RF Surface Field for Various Metals at the Destructive Breakdown Limit – 73

Through-the-Wall Imaging from Electromagnetic Scattered Field Measurements – 553

## **ELECTROMAGNETIC INTERFERENCE**

Analysis and Design of Ultra Wide-Band and High-Power Microwave Pulse Interactions With Electronic Circuits and Systems – 196

Digital C4I Interoperability: The EM Protection Issue – 163

## **ELECTROMAGNETIC MEASUREMENT**

Spatially Resolved Electromagnetic Property Measurement – 556

## **ELECTROMAGNETIC NOISE**

The Mitigation of Radio Noise from External Sources at Receiving Sites – 163

## **ELECTROMAGNETIC PROPERTIES**

The Joy of Computing with Volume-Integrals – 19

## **ELECTROMAGNETIC PULSES**

Analysis and Design of Ultra Wide-Band and High-Power Microwave Pulse Interactions With Electronic Circuits and Systems – 196

High Altitude Electromagnetic Pulse (HEMP) and High Power Microwave (HPM) Devices: Threat Assessments – 554

Non-Electronic Radio Front-End (NERF) – 211

Solid State Capacitor Discharge Pulsed Power Supply Design for Railguns – 193

## **ELECTROMAGNETIC RADIATION**

Coherence and Polarization Properties of Far Fields Generated by Quasi-Homogeneous Planar Electromagnetic Sources (Postprint) – 602

Contrast Enhancement for Thermal Acoustic Breast Cancer Imaging via Resonant Stimulation – 314

Non-Electronic Radio Front-End (NERF) – 211

Terrorist 'Dirty Bombs': A Brief Primer – 250

Working Report on Visible and IR Electromagnetic Emissions from HMMWV External Black-Out (BO) Lighting – 597

## **ELECTROMAGNETIC SCATTERING**

Through-the-Wall Imaging from Electromagnetic Scattered Field Measurements – 553

## **ELECTROMAGNETIC SPECTRA**

Signal Population in the License-Exempt Wireless-Radio Bands at the MOUT Site – 152

## **ELECTROMAGNETIC WAVE TRANSMISSION**

3D Photonic Crystals Build Up By Self-Organization Of Nanospheres – 450

Simulation of Radiowave Propagation in a Dense Urban Environment – 554

## **ELECTROMAGNETISM**

Spatially Resolved Electromagnetic Property Measurement – 556

## **ELECTROMAGNETS**

Fundamental Physics and Practical Applications of Electromagnetic Local Flow Control in High Speed Flows – 216

## **ELECTROMECHANICAL DEVICES**

Surface-Templated Assembly for Mass-Production of ZnO Nanowire-Based Integrated Devices – 90

## **ELECTROMECHANICS**

Electromechanics of Dielectric and Piezoelectric Crystals With Point, Line, and Surface Defects – 187

## **ELECTROMIGRATION**

Electromigration Related Effects At Metal-Metal Interfaces: Application To Railguns – 96

## **ELECTRON BEAMS**

An Electron Beam Method for Creating Combinatorial Libraries: Application to Next Generation Thermal Barrier Coatings Systems – 60

Employment of Second Order Ruled Surfaces in Design of Sheet Beam Guns – 579

Fabrication of Nanoscaled Systems – 229

Injector Test Facility for the LCLS. Executive Summary – 566

- Interaction of Intense Electron Beams with Plasma – 582
- Ohmic Contacts for Technology for Frequency Agile Digitally Synthesized Transmitters – 113
- Quantitative Experiments with Electrons in a Positively Charged Beam – 606
- Self-Consistent Simulations of High-Intensity Beams and E-Fields with WARP POSINST – 568
- ELECTRON CLOUDS**  
Quantitative Experiments with Electrons in a Positively Charged Beam – 606
- ELECTRON DENSITY (CONCENTRATION)**  
Interaction of Intense Electron Beams with Plasma – 582
- On the Non-Intrusive Determination of Electron Density in the Sheath of a Spherical Probe – 551
- ELECTRON ENERGY**  
Characterizing Electron Temperature Gradient Turbulence Via Numerical Simulation – 604
- ELECTRON GUNS**  
Employment of Second Order Ruled Surfaces in Design of Sheet Beam Guns – 579
- ELECTRON MICROSCOPES**  
Method, System and Device for Microscopic Examination Employing Fiber-Prepared Sample Grasping Element – 206
- ELECTRON MICROSCOPY**  
Ohmic Contacts for Technology for Frequency Agile Digitally Synthesized Transmitters – 113
- ELECTRON OPTICS**  
Possible Use of Electron Lenses in LHC – 587
- ELECTRON PROBES**  
On the Non-Intrusive Determination of Electron Density in the Sheath of a Spherical Probe – 551
- ELECTRON STATES**  
Studies of Basic Electronic Properties of CdTe-Based Solar Cells and Their Evolution During Processing and Stress. Final Technical Report October 16, 2001-August 31, 2005 – 246
- ELECTRON TRANSFER**  
Non-Equilibrium Quantum Dots: Transport – 185
- Semiconductor Quantum Dot Resonant Tunneling Spectroscopy – 185
- ELECTRON TRANSITIONS**  
Non-Equilibrium Quantum Dots: Transport – 185
- ELECTRONIC COMMERCE**  
Internet: An Overview of Key Technology Policy Issues Affecting Its Use and Growth – 497
- ELECTRONIC CONTROL**  
Achieving AFRL Universal FADEC Vision With Open Architecture Addressing Capability and Obsolescence for Military and Commercial Applications (Preprint) – 6
- ELECTRONIC EQUIPMENT**  
Atomtronics: Ultracold Atom Analogs of Electronic Devices – 194
- Cooling Performance of a Partially-Confined FC-72 Spray: The Effect of Dissolved Air (Postprint) – 55
- Cooling Performance of a Partially-Confined FC-72 Spray: The Effect of Variable Gravity (Postprint) – 55
- Electronic and Optoelectronic Devices and Methods for Preparing Same – 213
- Motor Frame Cooling with Hot Liquid Refrigerant and Internal Liquid – 76
- Studies on Electrical Safety, When Using ESD Protective Equipment, Especially ESD Protective Garments – 205
- ELECTRONIC MAIL**  
Pattern Analysis of Directed Graphs Using DEDICOM: An Application to Enroll Email – 439
- The Outlook Y-JBI: An E-Mail Based Approach to Prototyping the Joint Battlespace Infosphere – 152

- ELECTRONS**  
e-/e+ Accelerating Structure with Cyclic Variation of Azimuth Asymmetry – 578
- Quantitative Experiments with Electrons in a Positively Charged Beam – 606
- ELECTRO-OPTICAL PHOTOGRAPHY**  
An Ultra High Resolution, Electro-Optical Framing Camera for Reconnaissance and Other Applications Using a 9216 by 9216 Pixel, Wafer Scale, Focal Plane Array – 223
- ELECTRO-OPTICS**  
An Ultra High Resolution, Electro-Optical Framing Camera for Reconnaissance and Other Applications Using a 9216 by 9216 Pixel, Wafer Scale, Focal Plane Array – 223
- Chiral Multichromic Single Crystals for Optical Devices – 580
- Electronic and Optoelectronic Devices and Methods for Preparing Same – 213
- Electro-Optic Array Interface – 213
- Flight Test Results From the Ultra High Resolution, Electro-Optical Framing Camera Containing a 9216 by 9216 Pixel, Wafer Scale, Focal Plane Array – 222
- High Performance Polymer Memory and Its Formation – 210
- New Generation Photonics Materials: Design, Development, Characterization, and Applications – 210
- New Materials, Techniques and Device Concepts for Organic NLO Chromophore-based Electrooptic Devices. Part 1 – 291
- Non-Electronic Radio Front-End (NERF) – 211
- Object Detection in Electro-Optic Sensor Images – 208
- Toward Neural Control of Prosthetic Devices – 209
- ELECTROPHORESIS**  
Identification, Cloning, and Expression of Potential Diagnostic Markers for Q Fever – 388
- Kapillaarelektrofores i Tva Dimensioner. Slutrapport Fran Innovationsprojekt 14215 (Two-Dimensional Capillary Electrophoresis Final Report of the Innovative Project 14215) – 68
- ELECTROPHYSIOLOGY**  
Growth Factor Dependent Cholinergic Function and Survival in Primary Mouse Spinal Cord Cultures – 373
- ELECTROSTATICS**  
Electrostatic Modeling of Vacuum Insulator Triple Junctions – 205
- Formation of a Field Reversed Configuration for Magnetic and Electrostatic Confinement of Plasma – 574
- ELEMENTARY PARTICLES**  
Measurements of Top Quark Properties at CDF – 564
- ELEVATION**  
Application of the Unscented Transformation to Obtain Target Range, Bearing, Elevation, Range Rate, Speed and Course Estimates and Errors From Tracks Given in Cartesian Coordinates – 517
- ELLIPSOIDS**  
Outlier Detection in Hyperspectral Imaging Using Closest Distance to Center with Ellipsoidal Multivariate Trimming – 223
- ELLIPTIC FUNCTIONS**  
An Inverse of the Elliptic Coverage Function – 525
- EMBEDDING**  
A Multi-Ring Framework for Survivable Group Communications – 441
- C4I Tactical Applications Utilizing Embedded Simulations – 150
- Digital Convergence Authenticated Video, Voice, & Text – 476

Digital Watermarking Using Syndrome Codes – 516

Real-Time Communication and Coordination in Embedded Sensor Networks – 533

## EMBRYOS

Developing Human Embryonic Stem Cells for Grafting in Parkinson's Disease – 343

## EMERGENCIES

Automatic Generation of Best Emergency Routes and Procedures on a Brazilian Frigate – 467

Civil Reserve Air Fleet (CRAF) – 25

Continuous Pre-hospital Data as a Predictor of Outcome Following Major Trauma: A Study Using Improved and Expanded Data – 354

Emergency Preparedness and the Year 2000 Challenge – 443

Forecasting Complex Political and Military Events: The Application of Expected Utility to Crisis Situations – 653

Information Grid in Support of Crisis Management – 625

Integrating Local Public Health Agencies into the Homeland Security Community – 311

Partnerships: The Path to Improving Crisis Communication – 156

Shared Situational Awareness Environment for Tactical Level Humanitarian Emergency Operations – 454

Solving Wireless Communications Interoperability Problems among Emergency First Responders Depends on Greater National Guard Involvement – 181

Task Adaptable Display of Information for Training, Maintenance, and Emergency Response – 654

The Chaos of Katrina – 267

The Multidimensional Measurements of Geographic Information Systems (GIS) Effectiveness in Crisis Management – 611

The Use of Cognitive Task Analysis and Simulators for After Action Review of Medical Events in Iraq – 367

The Use of Cognitive Task Analysis and Simulators for the After Action Review of Medical Events in Iraq – 618

Using Templates to Support Crisis Action Mission Planning – 455

Weathering the Storm. Leading Your Organization Through a Pandemic – 368

## EMISSION

Fabrications and Characterizations of ZnO/Zn1-xMgxO Nanorod Quantum Structures – 186

Working Report on Visible and IR Electromagnetic Emissions from HMMWV External Black-Out (BO) Lighting – 597

## EMITTANCE

Emittance Correction in the 2006 ILC Bunch Compressor – 580

Flash X-ray (FXR) Linear Induction Accelerator(LIA) Optimization Upgrade of the OTR Emittance Diagnostic – 575

Hao Spectral Diagnostic Package for Emitted Radiation (Haos-Diper) Reference Guide. Version 1.0 – 558

## EMITTERS

Electrospray Emitter for Microfluidic Channel – 206

## EMPLOYMENT

Medical Risk in the Future Force Unit of Employment. Results of the Army Medical Department Transformation Workshop V – 304

## ENCLOSURE

Microsystem Enclosure and Method of Hermetic Sealing – 71

## END EFFECTORS

Pneumatically Actuated Flexible Coupling end Effectors for Lapping/Polishing – 34

## ENDANGERED SPECIES

Screening Level Ecological Risk Assessments of Some Military Munitions and Obscurant-related Compounds for Selected Threatened and Endangered Species – 251

## ENDOCRINE GLANDS

Studies of Prostate Tumor Development Via CRE/LOXP Technology – 309

## ENDOTHELIUM

Anti-Angiogenic Action of Neutral Endopeptidase – 285

Endothelial Progenitors as Vectors for Systemic Gene Therapy of Breast Cancer – 332

Molecular Mechanisms in Compromised Endothelial Barrier during Breast Cancer Metastasis – 377

## ENERGETIC PARTICLES

Fast Coronal Mass Ejection Environments and the Production of Solar Energetic Particle Events – 668

## ENERGY CONSERVATION

Navy Ship Propulsion Technologies: Options for Reducing Oil Use - Background for Congress – 244

Report to Congress on Assessment of Potential Impact of Concentrating Solar Power for Electricity Generation (EPACT 2005 - Section 934 (c)) – 247

## ENERGY CONSUMPTION

Building Alternative-Energy Partnerships with Latin America – 249

M1114 -- Golden HMMWV Power: Electrical Systems Used in Theater – 192

Status and Prospects of the Fast Ignition Inertial Fusion Concept – 571

Transforming the Way DOD Looks at Energy. An Approach to Establishing an Energy Strategy – 243

## ENERGY CONVERSION

Biomimetic Energy Transduction: Artificial Photosynthesis in a Stabilized Lipid Membrane Coupled to a Semiconductor – 204

Predictive & Prognostic Controller for Wide Band Gap (Silicon Carbide) Power Conversion (Preprint) – 184

Standard-Cell, Open-Architecture Power Conversion Systems – 247

## ENERGY GAPS (SOLID STATE)

3D Photonic Crystals Build Up By Self-Organization Of Nanospheres – 450

Nonclassical Properties of Pulsed Second-Subharmonic Generation in Photonic-Band-Gap Structures – 196

Predictive & Prognostic Controller for Wide Band Gap (Silicon Carbide) Power Conversion (Preprint) – 184

Self Assembled, Ultra-Hydrophobic Micro/Nano-Textured Surfaces – 79

## ENERGY POLICY

A Decision Model for Selecting Energy Efficient Technologies for Low-Sloping Roof Tops Using Value-Focused Thinking – 243

AB 1007 Full /Fuel Cycle Analysis (FFCA) Peer Review – 254

Army Facility Energy Demand and the Impact on National Security – 243

China's Energy Security and Its Military Modernization Efforts: How China Plans to Dominate the World – 248

In the Midst of a Fuels Evolution - An Army Perspective – 38

Proceedings of the 1st Army Installation Energy Security and Independence Conference – 245

## ENERGY REQUIREMENTS

Emerging Energy Requirements for Future C4ISR – 244

## ENERGY STORAGE

Model of Energy Storage Circuit for Isotope Battery Based on SiC Schottky Diode – 212

Persistent Monitoring Platforms – 36

## ENERGY TRANSFER

Confined Detonations and Pulse Detonation Engines – 42

Emerging Energy Requirements for Future C4ISR – 244

MURI Center for Materials Chemistry in the Space Environment – 112

Ocean Wave Energy Harvesting Devices – 479

## ENGINE CONTROL

Achieving AFRL Universal FADEC Vision With Open Architecture Addressing Capability and Obsolescence for Military and Commercial Applications (Preprint) – 6

- Need for Robust Sensors for Inherently Fail-Safe Gas Turbine Engine Controls, Monitoring, and Prognostics (Postprint) – 23
- ENGINE PARTS**
- 3-Dimensional Crack Growth Behavior of Turbine Engine Materials (Preprint) – 555

## EQUATIONS

Finding Stable Causal Interpretations of Equations – 506

Proceedings of the Quantum Computation for Physical Modeling Workshop Held in North Falmouth, Massachusetts on October 18-19, 2000 – 519

## EQUATORS

Progress Report of the IAU Working Group on Precession and the Ecliptic – 665

## EQUILIBRIUM FLOW

Quantifying Non-Equilibrium in Hypersonic Flows Using Entropy Generation – 219

## EQUIPMENT SPECIFICATIONS

Defect Prevention and Detection in Software for Automated Test Equipment – 430

## EROSION

Oxygen Plasma Treatment and Deposition of CN<sub>x</sub> on a Fluorinated Polymer Matrix Composite for Improved Erosion Resistance (Preprint) – 121

## ERROR ANALYSIS

An Inverse of the Circular Coverage Function – 525

An Inverse of the Elliptic Coverage Function – 525

An Inverse of the Generalized Circular Error Function – 525

Prediction and Classification of Operational Errors and Routine Operations Using Sector Characteristics Variables – 12

Relationship of Complexity Factor Ratings With Operational Errors – 513

Simulation of Coherent Signals with Forward Error Correction Coding – 540

## ERROR CORRECTING CODES

Digital Watermarking Using Syndrome Codes – 516

Simulation of Coherent Signals with Forward Error Correction Coding – 540

## ERROR FUNCTIONS

An Inverse of the Generalized Circular Error Function – 525

## ERROR SIGNALS

The Matrix Pencil and its Applications to Speech Processing – 589

## ERRORS

Assessing Error in PMI (Post-Mortem Interval) Prediction Using a Forensic Entomological Computer Model – 437

Correction to Attenuation Treatment in the Monterey-Miami Parabolic Equation Model – 514

Human Error Investigation Software Tool (HEIST) – 427

Relationship of Complexity Factor Ratings With Operational Errors – 513

The Use of Cognitive Task Analysis and Simulators for the After Action Review of Medical Events in Iraq – 618

## ESCHERICHIA

Detection of Staphylococcus Aureus Enterotoxin A and B Genes with PCR-EIA and a Hand-Held Electrochemical Sensor – 331

New Structural Approaches to Understanding the Disease Related Forms of the Prion Protein – 352

Posttreatment Changes in Escherichia coli Antimicrobial Susceptibility Rates Among Diarrheic Patients Treated with Ciprofloxacin – 385

Serologic Correlates of Protection against Enterotoxigenic Escherichia coli Diarrhea – 379

## ESSENTIALLY NON-OSCILLATORY SCHEMES

A High Order WENO Scheme for a Hierarchical Size-Structured Model – 549

A Weighted Essentially Non-Oscillatory Numerical Scheme for a Multi-Class LWR Model – 508

Convergence of High Order Finite Volume Weighted Essentially Non-Oscillatory Scheme and Discontinuous Galerkin Method for Nonconvex Conservation Laws – 515

Effects of Nose Bluntness on Stability of Hypersonic Boundary Layers over Blunt Cone – 4

## ESTERS

A New Silicon-Containing Bis(Cyanate) Ester Resin with Improved Thermal Oxidation and Moisture Resistance – 125

Bifunctional Alkylating Agent-Induced p53 and Nonclassical Nuclear Factor κB Responses and Cell Death are Altered by Caffeic Acid Phenethyl Ester: A Potential Role for Antioxidant/Electrophilic Response-Element Signaling – 388

Development of ASTM Precision Bearing Grease Guide – 64

Immobilized Iminophosphatranes Useful for Transesterification – 70

## ESTIMATES

Application of the Unscented Transformation to Obtain Target Range, Bearing, Elevation, Range Rate, Speed and Course Estimates and Errors From Tracks Given in Cartesian Coordinates – 517

Spread Spectrum Signal Characteristic Estimation Using Exponential Averaging and an AD-HOC Chip rate Estimator – 195

## ESTIMATING

An Infrared Camera Simulation for Estimating Spatial Temperature Profiles and Signal-to-Noise Ratios of an Airborne Laser-Illuminated Target – 234

Estimating Runflat Stiffness – 552

Guidance for Estimating VOC and NO<sub>x</sub> Emission Changes from MACT Rules – 257

## ESTROGENS

Adipose Estrogen and Increased Breast Cancer Risk in Obesity: Regulation by Leptin and Insulin – 357

cSrc and Her2 Signaling Pathways Cooperate with Estrogen to Promote ER Phosphorylation, Ubiquitination and Proteolysis in ER Negative Breast Cancers – 356

Effects of Herstatin, an Alternative HER-2 (erbB-2) Product, on Hormonal Responsiveness of Breast Cancer – 362

Modulation of Postmenopausal Steroid Hormone Levels by Phytoestrogens and Correlation with Breast Proliferative Activity and Menopausal Symptoms – 324

## ETCHING

Fabrication, Characterization, and Analysis of a DRIE CMOS-MEMS Gyroscope – 140

Study on Wide-gap Gallium-nitride Based Films and Their Quantum-dots Devices – 196

## ETHERS

Microbial Degradation of Fuel Oxygenates under Aerobic Conditions – 114

## ETHICS

Lethality and Autonomous Robots: An Ethical Stance – 504

## ETHIOPIA

Database Dictionary for Ethiopian National Ground-Water Database (ENGDA) Data Fields – 631

## ETHNIC FACTORS

Human Leukocyte Antigen (HLA) Genotype as a Contributor to Racial/Ethnic Differences in Breast Cancer: A Population-Based Molecular Epidemiologic Study – 285

## ETHYL ALCOHOL

AB 1007 Full /Fuel Cycle Analysis (FFCA) Peer Review – 255

Ethanol and Mesolimbic Serotonin/Dopamine Interactions via 5HT-1B Receptors – 346

## ETHYL COMPOUNDS

Microbial Degradation of Fuel Oxygenates under Aerobic Conditions – 114

## ETHYLENE

Investigation of Ignition Delay: Novel Beta-Substituted Ethylazide Derivatives as Potential New Liquid Propellant Fuels (Preprint) – 100

## EUROPE

Continent-Wide Maps of 5-50 S Rayleigh-Wave Attenuation for Eurasia Inferred from Maps of 1-Hz Lg Coda Q and its Frequency Dependence – 265

Regionalization of Crustal and Upper Mantle Q Structure in Eastern Eurasia Using Multiple Regional Waves – 262

## EUROPIUM ISOTOPES

Progress on the Europium Neutron-Capture Study Using DANCE – 673

## EUROPIUM

Progress on the Europium Neutron-Capture Study Using DANCE – 673

## EUTECTIC ALLOYS

Processing, Microstructure, and Tensile Properties of the Ti-6Al-4V-1.55B Eutectic Alloy (Preprint) – 99

## EUTECTIC COMPOSITES

Processing, Microstructure, and Tensile Properties of the Ti-6Al-4V-1.55B Eutectic Alloy (Preprint) – 99

## EUTECTICS

Processing, Microstructure, and Tensile Properties of the Ti-6Al-4V-1.55B Eutectic Alloy (Preprint) – 99

## EVALUATION

A Methodology for End-to-End Evaluation of Arabic Document Image Processing Software – 469

Conceptual Modeling for the Probability of Raid Annihilation (Pra) Testbed – 453

Defense Logistics: Army and Marine Corps' Body Armor Requirements, Controls, and Other Issues – 425

Distributed Simulation Run Automation Capability for the Navy PRA Testbed – 453

Joint Essential Tasks and a Framework for Evaluation – 136

NAC Off-Vehicle Brake Testing Project – 139

Performance Evaluation of Ad Hoc Routing Protocols in a Swarm of Autonomous Unmanned Aerial Vehicles – 38

Performance Measurement of the Upgraded D0 Central Track Trigger – 558

Systematic Procedure for Assigning Uncertainties to Data Evaluations – 567

Test and Evaluation of Value Engineering Proposal: Removal of Rubber PAD in 120 MM PA 153 Ammunition Fiber Container – 140

## EVAPOTRANSPIRATION

Micrometeorological and Soil Data for Calculating Evapotranspiration for Rainier Mesa, Nevada Test Site, Nevada, 2002-05 – 273

## EXCIMER LASERS

Evaluation of the Safety and Efficacy of Excimer Laser Keratorefractive Surgery in U.S. Army Soldiers using the latest Battlefield Technologies – 233

## EXCIMERS

Evaluation of the Safety and Efficacy of Excimer Laser Keratorefractive Surgery in U.S. Army Soldiers using the latest Battlefield Technologies – 233

## EXCITATION

A Multireference Density Functional Approach to the Calculation of the Excited States of Uranium Ions – 87

Investigation of Low Temperature Metal Induced Crystallization and Doping of Silicon Using Various Excitation Sources for Solar Cells and other Microelectronic Applications. – 604

## EXCITONS

Fabrications and Characterizations of ZnO/Zn1-xMgxO Nanorod Quantum Structures – 186

## EXHAUST EMISSION

Diesel Particulate Measurement Research, 2007. Phase 3 – 238

Guidance for Estimating VOC and NOx Emission Changes from MACT Rules – 257

Inventory of U.S. Greenhouse Gas Emissions and Sinks: 1990-2005 – 259

Phase 1 Report: Cost-Effective Reciprocating Engine Emissions Control and Monitoring for E&P Field and Gathering Engines – 237

Proteomic Analysis of Bronchoalveolar Lavage Fluid: Effect of Acute Exposure to Diesel Exhaust Particles in Rats – 335

Reduced Exhaust Emissions Gas Turbine Engine Combustor – 39

Report 17: Cost-Effective Reciprocating Engine Emissions Control and Monitoring for E&P Field and Gathering Engines. (Technical Report, October 1, 2006-December 31, 2006) – 237

The Supreme Court's Climate Change Decision: Massachusetts v. EPA – 263

## EXHAUST GASES

Fuel Property Effects on T700 Exhaust Particulates – 132

Inventory of U.S. Greenhouse Gas Emissions and Sinks: 1990-2005 – 259

Minimization of Thruster Plume Effects on Spacecraft Surfaces – 52

Phase 1 Report: Cost-Effective Reciprocating Engine Emissions Control and Monitoring for E&P Field and Gathering Engines – 237

Proteomic Analysis of Bronchoalveolar Lavage Fluid: Effect of Acute Exposure to Diesel Exhaust Particles in Rats – 335

Report 17: Cost-Effective Reciprocating Engine Emissions Control and Monitoring for E&P Field and Gathering Engines. (Technical Report, October 1, 2006-December 31, 2006) – 237

## EXPERIMENT DESIGN

Computational Experimentation with the Virtual Design Team: Bridging the Chasm between Laboratory and Field Research in C2 – 445

Design of Experiments Study of the Initial Extended Area Protection and Survivability (EAPS) Projectile System – 527

New Column Designs for MicroGC (Preprint) – 197

Preliminary Findings: Design of Experiments University XXI (FY05) Research and Support for the US Army – 621

The Costs of Not Using Green Design in the USAF: Would Using Green Building Design Have Resulted in Life Cycle Cost – 212

## EXPERIMENTATION

Experimenting with C2 Applications and Federated Infrastructures for Integrated Full-Spectrum Operational Environments in Support of Collaborative Planning and Interoperable Execution – 144

## EXPERT SYSTEMS

Advanced Visual and Instruction Systems for Maintenance Support (AVIS-MS) – 625

Link Analysis for Dynamic Planning and Scheduling – 502

The Critical Role of Intelligent Software Agents in Enabling Net-Centric Command and Control – 444

## EXPLOITATION

Different Approaches for the Creation and Exploitation of 3D Urban Models – 159

Field Level Computer Exploitation Package – 464

Large Synoptic Survey Telescope and Foundations for Data Exploitation of Petabyte Data Sets – 673

Rapid C4I High Performance Computing for Hyperspectral Imaging Exploitation – 598

## EXPLOSIVES DETECTION

Adaptive and Iterative Processing Techniques for Overlapping Signatures – 556

Detection of Explosives on Airline Passengers: Recommendation of the 9/11 Commission and Related Issues – 10

Evaluation of airborne Electromagnetic Systems for Detection and Characterization of unexploded ordnance (uXo) – 12

Terahertz Fiber Laser for Explosives Detection – 229

## EXPLOSIVES

Adsorption and Desorption of Dinitrotoluene on Activated Carbon – 91

Characterization Of Commonly Encountered Explosives Using Highfield Asymmetric Waveform Ion Mobility Spectrometry Coupled With Mass Spectrometry – 594

Detection of Explosives on Airline Passengers: Recommendation of the 9/11 Commission and Related Issues – 10

Insensitive High-Performance Replacements for RDX in Explosive and Propellant Formulations – 59

Role of Thermochemical Decomposition in Energetic Material Initiation Sensitivity and Explosive Performance – 101

## EXPOSURE

A Physiologically Based Pharmacokinetic (PB/PK) Model for Multiple Exposure Routes of Soman in Multiple Species – 375

Area Factor Determinations for an Industrial Worker Exposed to a Concrete Slab End State – 255

Boosting of DNA Vaccine-Elicited Gamma Interferon Responses in Humans by Exposure to Malaria Parasites – 402

Evaluation of Daphnia Magna Neonate Viability under Low Temperature Exposure Conditions – 310

Feasibility of Biomonitoring of Exposure to Permethrin Through Analysis of Long-Lived (Metabolite) Adducts to Proteins – 320

Genomic Analysis of Rodent Pulmonary Tissue Following Bis-(2-chloroethyl) Sulfide Exposure – 379

Human Exposure Biomarkers - Permethrin as a Militarily-Relevant Model – 375

Lithographic Characterization of Low-Order Aberrations in a 0.3-NA EUV Microfield Exposure Tool – 600

Multi-System Effects of Daily Artificial Gravity Exposures in Humans Deconditioned by Bed Rest – 418

NIOSH Health Hazard Evaluation Report: HETA No. 2007-0068-3042, Noise Exposures and Hearing Loss Assessments among Animal Shelter Workers, Louisiana Society for the Prevention of Cruelty to Animals, Algiers, Louisiana, May 2007 – 252

Noninvasive Methods for Determining Lesion Depth from Vesicant Exposure – 373

Prenatal Exposure to Nicotine and Childhood Asthma: Role of Nicotine Acetylcholine Receptors, Neuropeptides and Fibronectin Expression in Lung – 333

Proteomic Analysis of Bronchoalveolar Lavage Fluid: Effect of Acute Exposure to Diesel Exhaust Particles in Rats – 335

PSA-Based Screening Outcomes, Dietary Heterocyclic Amine Exposure, and Prostate Cancer Risk in African Americans – 302

USA Meteorological Data: Daily and Hourly Files to Support Predictive Exposure Modeling – 277

## EXTERNAL STORE SEPARATION

Advances in Modeling and Simulation Capabilities for Predicting Store Trajectories - Past Success and Future Challenges – 5

## EXTRACTION

Application of Morse Theory to Analysis of Rayleigh Taylor Topology – 569

Automated Information Extraction System (AIES) Capability Enhancement and Support – 614

Critiquing: A Methodology to Extract C2 Expertise – 166

Improving Analysis with Information Extraction Technology – 630

## EXTRASOLAR PLANETS

Creating the Core Conditions of Extrasolar and Solar Giant Planets – 672

High Contrast Imaging Using Adaptive Optics for Extrasolar Planet Detection – 666

## EXTRATERRESTRIAL LIFE

Assessing the Biohazard Potential of Putative Martian Organisms for Exploration Class Human Space Missions – 675

## EXTRATERRESTRIAL RADIATION

Minimizing Astronauts' Risk from Space Radiation during Future Lunar Missions – 676

Operational Aspects of Space Radiation Analysis – 676

## EXTREME ULTRAVIOLET RADIATION

EUV Inspection of Reticule Defect Repair Sites – 600

Lithographic Characterization of Low-Order Aberrations in a 0.3-NA EUV Microfield Exposure Tool – 600

## EXTREMELY LOW FREQUENCIES

Autonomous Virtual Mobile Nodes – 535

Placement of Conjugated Oligomers in an Alkanethiol Matrix by Scanned Probe Microscope Lithography – 121

## EXTRUDING

Microstructural Evolution of Commercial-Purity Ti and Superplasticity of Ti-6Al-4V Alloy Processed by Equal Channel Angular Extrusion – 117

## EYE (ANATOMY)

Evaluation of the Safety and Efficacy of Excimer Laser Keratorefractive Surgery in U.S. Army Soldiers using the latest Battlefield Technologies – 233

## FABRICATION

Characterization and Evaluation of a Mass Efficient Heat Storage Device. – 237

Compliant, Nanoscale Free-Standing Multilayer Films – 66

Damascene Process for Use in Fabricating Semiconductor Structures Having Micro/Nano Gaps – 213

Fabrication, Characterization, and Analysis of a DRIE CMOS-MEMS Gyroscope – 140

Fabrication of Nanoscaled Systems – 229

Fabrications and Characterizations of ZnO/Zn<sub>1-x</sub>Mg<sub>x</sub>O Nanorod Quantum Structures – 186

Growth of a Single Freestanding Multi-wall Carbon Nanotube on each Nanonickel Dot – 92

Materials and Fabrication Issues for Large Machined Germanium Immersion Gratings – 575

Method for Constructing Antennas from Textile Fabrics and Components – 179

Microfabricated Electrochemical Sensor for Chemical Warfare Agents: Smaller is Better (Preprint) – 230

Microstructure of Dense Thin Sheets of gamma-TiAl Fabricated by Hot Isostatic Pressing of Tape-Cast Monotapes (Preprint) – 92

New Column Designs for MicroGC (Preprint) – 197

Study on Wide-gap Gallium-nitride Based Films and Their Quantum-dots Devices – 196

Surface-Templated Assembly for Mass-Production of ZnO Nanowire-Based Integrated Devices – 89

Tension-Compression Fatigue Behavior of a Carbon Fiber/Epoxy (IM7/EPON 862) Composite Fabricated Using Vacuum Assisted Resin Transfer Molding Process – 85

Vertical Alignment of Single-Walled Carbon Nanotubes on Nanostructure Fabricated by Atomic Force Microscope – 88

## FABRICS

Method for Constructing Antennas from Textile Fabrics and Components – 179

Permeability Prediction of Three-Dimensional Woven Fabrics – 89

Wettability Tests of Polymer Films and Fabrics and Determination of Their Surface Energy by Contact-Angle Methods – 89

## FACE (ANATOMY)

Facial Recognition Evaluation Project Passport Office of Canada - The Methodology and Findings – 228

## FAIL-SAFE SYSTEMS

Need for Robust Sensors for Inherently Fail-Safe Gas Turbine Engine Controls, Monitoring, and Prognostics (Postprint) – 24

## FAILURE ANALYSIS

Classifying Failing States – 528

## FAILURE MODES

Type B Radioactive Material Package Failure Modes and Contents Compliance – 239

## FAILURE

2-D Biaxial Testing and Failure Predictions of IM7/977-2 Carbon/Epoxy Quasi-Isotropic Laminates – 82

A Theory of Interoperability Failures – 651

Comanche Helicopter Program - A Strategic Failure – 30

- Critical Infrastructure: Control Systems and the Terrorist Threat – 496
- First Principles and Multi-Scale Modeling of the Roles of Impurities and Dopants on Thermal Barrier Coating Failure – 88
- Investigation of the Effect of Fuselage Dents on Compressive Failure Load – 23
- Need for Robust Sensors for Inherently Fail-Safe Gas Turbine Engine Controls, Monitoring, and Prognostics (Postprint) – 23
- Zero Gyro Kalman Filtering in the Presence of a Reaction Wheel Failure – 667
- FAIRINGS**  
Chamber Core Structures for Fairing Acoustic Mitigation – 50
- FAN BLADES**  
Double Near-Net Forging of Article – 41
- FAR FIELDS**  
Coherence and Polarization Properties of Far Fields Generated by Quasi-Homogeneous Planar Electromagnetic Sources (Postprint) – 602  
Far Field Approximation in the Generalized Geometry Holdup (GGH) Model – 581
- FAR ULTRAVIOLET RADIATION**  
Nonequilibrium Stagnation-Line Radiative Heating for Fire II – 221
- FAST NEUTRONS**  
Superconducting High Resolution Fast-Neutron Spectrometers – 565
- FATIGUE LIFE**  
A Review and Assessment of Current Airframe Lifting Methodologies and Tools in Air Vehicles Division – 20  
Evaluation of Serviceability Requirements for Load Rating Prestressed Concrete Bridges – 240  
The Effect of As-Large-As (ALA) Grains on the High-Temperature Fatigue Life of Waspaloy – 117
- FATTY ACIDS**  
Dietary Fat, Fat Metabolizing Genes, and Prostate Cancer Risk in African-Americans and Whites – 340
- FAULT TOLERANCE**  
A Practical Example of Applying Application-Driven Design (ADD), Version 2.0 – 545  
Distributed Fault-Tolerant Quality Of Service Routing in Hybrid Directional Wireless Networks – 182  
Exploiting Data-Flow for Fault-Tolerance in a Wide-Area Parallel System – 447  
Fault Tolerance in Autonomous Acoustic Arrays – 185  
Fault Tolerant Optimal Trajectory Generation for Reusable Launch Vehicles (Preprint) – 48
- Fault-Tolerant Parallel Algorithms for Adaptive Matched-Field Processing on Distributed Array Systems – 509
- FEASIBILITY**  
A Feasibility Study of Life-Extending Controls for Aircraft Turbine Engines Using a Generic Air Force Model (Preprint) – 551  
Feasibility Study of H(sub2)S Abatement by Incineration of Noncondensable Gases in Vented Steam Flow from Davies-State 5206-1 Geothermal Steam Well, Geysers Geothermal Steam Field, Lake County, California – 259  
Feasibility Study of Variance Reduction in the Logistics Composite Model – 522  
Feasibility Study on Magnetic Content Addressable Memory – 196  
Preliminary Low Frequency Electromagnetic Analysis of a Flux Concentrator – 569  
Single Cell Chromatography, LDRD, Feasibility Study – 105
- FEDERAL BUDGETS**  
The Federal Networking and Information Technology Research and Development Program: Funding Issues and Activities – 481
- FEEDBACK CONTROL**  
Distributed Mechanical Actuators for Design of a Closed-Loop Flow-Control System (Postprint) – 18  
Electromechanics of Dielectric and Piezoelectric Crystals With Point, Line, and Surface Defects – 187
- FEEDBACK**  
An Approach to Integrating Query Refinement in SQL – 530  
Cooperative Solutions in Multi-Person Quadratic Decision Problems: Finite-Horizon and State-Feedback Cost-Cumulant Control Paradigm – 516  
Skin Temperature Feedback Optimizes Microclimate Cooling – 272
- FEMALES**  
Efficacy of Calcium and Vitamin D Supplementation for the Prevention of Stress Fractures in Female Naval Recruits – 289  
Investigating the Mechanism of Action and the Identification of Breast Carcinogens by Computational Analysis of Female Rodent Carcinogens – 405  
The Use of a Cognitive Protectant to Help Maintain Quality of Life and Cognition in Premenopausal Women with Breast Cancer Undergoing Adjuvant Chemotherapy – 361

Helmet-Mounted Displays for Use in Air Force Training and Simulation – 6
- FLIGHT SIMULATORS**  
Visual Simulation S&T: Summary of Accomplishments – 7

## **FLIGHT STRESS (BIOLOGY)**

Flight Attendant Fatigue – 412

## **FLIGHT SURGEONS**

Integrated Clinical Training for Space Flight Using a High-Fidelity Patient Simulator in a Simulated Microgravity Environment – 415

Johnson Space Center Flight Medicine Clinic Experience – 413

## **FLIGHT TESTS**

Air Force-Navy Team Achieves Important Flight Test Milestone for Responsive Space Lift – 50

F-15B QuietSpike(TradeMark) Aerose-voelastic Flight Test Data Analysis – 35

Flight Test Results From the Ultra High Resolution, Electro-Optical Framing Camera Containing a 9216 by 9216 Pixel, Wafer Scale, Focal Plane Array – 222

Shuttle Entry Imaging Using Infrared Thermography – 57

Technologies for Propelled Hypersonic Flight, Volume 3 - Subgroup 3: CFD Validation for Hypersonic Flight – 41

Use of Statistical Tools to Improve Modeling and Simulation of Store Separation – 4

V-22 Osprey Tilt-Rotor Aircraft – 17

## **FLIGHT TRAINING**

Helmet-Mounted Displays for Use in Air Force Training and Simulation – 6

Mathematical Programming Model for Fighter Training Squadron Pilot Scheduling – 32

The Effectiveness of a PC-Based C-130 Crew Resource Management Aircrew Training Device – 8

## **FLOATING**

Coolerless Photonic Integrated Circuits (PICs) for WDM Transmission Networks and PICs Operable with a Floating Signal Channel Grid Changing with Temperature but with Fixed Channel Spacing in the Floating Grid – 214

## **FLOW CHARACTERISTICS**

Characteristics of Runback Ice Accretions and Their Aerodynamic Effects – 1

## **FLOW DISTRIBUTION**

CFD Investigation of Flow Past Idealized Engine Nacelle Clutter – 227

Dynamic-Active Flow Control - Phase I – 2

Effects of Nose Bluntness on Stability of Hypersonic Boundary Layers over Blunt Cone – 4

Filtered Rayleigh Scattering Measurements in a Buoyant Flowfield – 544

Fundamental Physics and Practical Applications of Electromagnetic Local Flow Control in High Speed Flows – 216

Low Dimensional Modeling of Zero-Net Mass-Flux Actuators – 215

Nonequilibrium Stagnation-Line Radiative Heating for Fire II – 220

SparkJet Actuators for Flow Control – 235

Technologies for Propelled Hypersonic Flight, Volume 1 - Subgroup 1: Plug Nozzles – 40

## **FLOW VELOCITY**

Low Dimensional Modeling of Zero-Net Mass-Flux Actuators – 215

## **FLOW VISUALIZATION**

Dynamic-Active Flow Control - Phase I – 2

## **FLOW**

Dataflow Integration and Simulation Techniques for DSP System Design Tools – 468

The Entropy Solutions for the Lighthill-Whitham-Richards Traffic Flow Model with a Discontinuous Flow-Density Relationship – 515

## **FLUCTUATION THEORY**

A Numerical Study of the Regimes of Weak Fluctuation Theory for Ocean Acoustic Propagation through Random Internal Wave Sound Speed Fields – 589

## **FLUE GASES**

Removal of Elemental Mercury from a Gas Stream Facilitated by a Non-Thermal Plasma Device. Final Report – 258

## **FLUID DYNAMICS**

Adaptive Identification of Fluid-Dynamic Systems – 215

Gravity-Wave Dynamics in the Atmosphere – 264

Hypersonic Magneto-Fluid-Dynamic Compression in Cylindrical Inlet – 221

Mathematical Fluid Dynamic Modeling of Plasma Stall-Spin Departure Control – 518

Swirl-Stabilized Injector Flow and Combustion Dynamics for Liquid Propellants at Supercritical Conditions – 217

The California Central Coast Research Partnership: Building Relationships, Partnerships and Paradigms for University-Industry Research Collaboration – 193

Tip Clearance Control Using Plasma Actuators – 16

## **FLUID FLOW**

Controls of Fluid Chemistry on Fracture Growth – 106

Electromigration Related Effects At Metal-Metal Interfaces: Application To Railguns – 96

Qualitative Reasoning about Fluids and Mechanics – 446

## **FLUID INJECTION**

Swirl-Stabilized Injector Flow and Combustion Dynamics for Liquid Propellants at Supercritical Conditions – 217

## **FLUID MECHANICS**

Large-eddy Simulation of Round Turbulent Jets Using the Inertial LES Method with Multifractal Subgrid-Scale Modeling – 220

Qualitative Reasoning about Fluids and Mechanics – 446

## **FLUORESCENCE**

Combined Contrast-Enhanced MRI and Fluorescence Molecular Tomography for Breast Tumor Imaging – 376

Optical, Biochemical, and Molecular Characterization of New Bioluminescence Systems – 354

## **FLUOROPOLYMERS**

Liquid Xenon Ionization Chamber in an All-Fluoropolymer Vessel – 582

Oxygen Plasma Treatment and Deposition of CNx on a Fluorinated Polymer Matrix Composite for Improved Erosion Resistance (Preprint) – 121

## **FLUX DENSITY**

Multilayer Aluminum Oxynitride Capacitors for Higher Energy Density, Wide Temperature Applications (Preprint) – 91

Smart Fuel Cell C20-MP Hybrid Fuel Cell Power Source – 249

The Entropy Solutions for the Lighthill-Whitham-Richards Traffic Flow Model with a Discontinuous Flow-Density Relationship – 515

## **FLUX (RATE)**

Summary of LLNL Russian Projects – 573

## **FOCAL PLANE DEVICES**

An Ultra High Resolution, Electro-Optical Framing Camera for Reconnaissance and Other Applications Using a 9216 by 9216 Pixel, Wafer Scale, Focal Plane Array – 223

Flight Test Results From the Ultra High Resolution, Electro-Optical Framing Camera Containing a 9216 by 9216 Pixel, Wafer Scale, Focal Plane Array – 222

## **FOG**

A Detailed Study of Advection Sea Fog Formation to Reduce the Operational Impacts Along the Northern Gulf of Mexico – 268

Freezing Fog Formation in a Supercooled Boundary Layer: Solving the Winter Fog Forecasting Challenge for Elmendorf Air Force Base, Alaska – 270

Measurement of Fog Oil Penetration into Model Underground Burrow and Hollow Tree Nest Cavities – 250

Using DUSTRAN to Simulate Fog-Oil Dispersion and Its Impacts on Local Insect Populations at Ft. Hood: Final Report – 253

## FOOD

Evaluation of Lateral-Flow Clostridium botulinum Neurotoxin Detection Kits for Food Analysis – 403

## FORBIDDEN BANDS

Venturing Through the Forbidden Band – 194

## FORBUSH DECREASES

Imaging Interplanetary Disturbances Causing Forbush Decreases – 670

## FORECASTING

A Detailed Study of Advection Sea Fog Formation to Reduce the Operational Impacts Along the Northern Gulf of Mexico – 268

A Weighted Consensus Approach to Tropical Cyclone 96-H and 120-H Track Forecasting – 268

Application of the Community Radiative Transfer Model to Evaluate Satellite-Based Measurements Across the African Easterly Jet Over Western Africa – 47

Evaluation of High Density Surface Observations in Complex Terrain and Their Contribution to the MM5 Model – 268

Forecasting Complex Political and Military Events: The Application of Expected Utility to Crisis Situations – 653

Forecasting Demand for Civilian Pilots: A Cost Savings Approach to Managing Air Force Pilot Resources – 27

Forecasting the KC-135 Cost Per Flying Hour: A Panel Data Analysis – 8

Freezing Fog Formation in a Supercooled Boundary Layer: Solving the Winter Fog Forecasting Challenge for Elmendorf Air Force Base, Alaska – 270

Leveraging Command and Control Technology to Provide Advanced Environmental Effects Decision Aids on the Battlefield – 273

Long-Range Operational Military Forecasts for Afghanistan – 271

Long-Range Operational Military Forecasts for Iraq – 269

Mission Support for the Communications/Navigation Outage Forecast Satellite – 49

Problem representation and variation in the forecasts of 'political experts' – 543

Severe Weather Forecasting for Laughlin AFB, TX – 267

Study of the Utility of NWP Forecast Guidance and Simple Ocean Modeling as a Tool for Planning During Reactive Situations – 269

## FOREIGN POLICY

Building Alternative-Energy Partnerships with Latin America – 249

Foreign Policy Effects on Strategic Communications and the Ability to Influence – 180

The Iran Sanctions Act (ISA) – 593

## FORESTS

Climate Change Impact on Forest Resources. White Paper – 277

## FORGING

Double Near-Net Forging of Article – 41

## FORTTRAN

An Inverse of the Circular Coverage Function – 525

An Inverse of the Elliptic Coverage Function – 525

An Inverse of the Generalized Circular Error Function – 525

An Inverse of the Incomplete Beta Function (F-(Variance Ratio) Distribution Function) – 467

## FOURIER TRANSFORMATION

High Resolution Fourier Transform Ion Cyclotron Resonance (FT-ICR) Mass Spectrometry Methods and Apparatus – 72

## FRACTURE MECHANICS

The Effect of Inhomogeneous Plastic Deformation on the Ductility and Fracture Behavior of Age Hardenable Aluminum Alloys – 116

## FRACTURES (MATERIALS)

Controls of Fluid Chemistry on Fracture Growth – 106

Do Capacity Coupled Electric Fields Accelerate Tibial Stress Fracture Healing – 287

Efficacy of Calcium and Vitamin D Supplementation for the Prevention of Stress Fractures in Female Naval Recruits – 288

Leg Muscle Usage Effects on Tibial Elasticity during Running – 295

Skeletal Complications in Neurofibromatosis Type 1: The Role of Neurofibromin Haploinsufficiency in Defective Skeletal Remodeling and Bone Healing in NF1 – 377

## FRACTURING

Controls of Fluid Chemistry on Fracture Growth – 106

Do Capacity Coupled Electric Fields Accelerate Tibial Stress Fracture Healing – 287

Leg Muscle Usage Effects on Tibial Elasticity during Running – 295

Molecular Mechanisms of Soft Tissue Regeneration and Bone Formation in Mice: Implications in Fracture Repair and Wound Healing in Humans – 298

## FRAGMENTATION

Modeling Damage and Fragmentation in Concrete – 122

## FRAGMENTS

fRMSDPred: Predicting Local RMSD Between Structural Fragments Using Sequence Information – 369

## FRAMING CAMERAS

An Ultra High Resolution, Electro-Optical Framing Camera for Reconnaissance and Other Applications Using a 9216 by 9216 Pixel, Wafer Scale, Focal Plane Array – 223

Flight Test Results From the Ultra High Resolution, Electro-Optical Framing Camera Containing a 9216 by 9216 Pixel, Wafer Scale, Focal Plane Array – 222

## FREE ELECTRON LASERS

Fermi Timing and Synchronization System – 606

Gas Detector LCLS Engineering Specifications Document – 573

Injector Test Facility for the LCLS. Executive Summary – 566

## FREEZING

Freezing Fog Formation in a Supercooled Boundary Layer: Solving the Winter Fog Forecasting Challenge for Elmendorf Air Force Base, Alaska – 270

## FREQUENCIES

Characteristics and Use of a Parametric End-Fired Array for Acoustics in Air – 225

Continent-Wide Maps of 5-50 S Rayleigh-Wave Attenuation for Eurasia Inferred from Maps of 1-Hz Lg Coda Q and its Frequency Dependence – 265

Development and Testing of a Multiple Frequency Continuous Wave Radar for Target Detection and Classification – 223

Ohmic Contacts for Technology for Frequency Agile Digitally Synthesized Transmitters – 113

## FREQUENCY DISTRIBUTION

Classification and Discrimination of Sources with Time-Varying Frequency and Spatial Spectra – 224

## FRETTING

Fretting Wear-Resistant, Micro-Arc Oxidation Coatings for Aluminum and Titanium Alloy Bearings (Preprint) – 44

## FRICTION REDUCTION

In-Track Demonstration of Laser-Treated Rail to Reduce Friction and Wear – 74

## FRICTION

Ionic Liquid Lubrication of MEMS Devices: An AFM Based Analysis and Evaluation on Test Devices (Preprint) – 591

## FUEL CELLS

Army Science Conference 2006 TECHNOLOGY ASSESSMENT of SOLDIER and MAN PORTABLE FUEL CELL POWER – 249

Navy Ship Propulsion Technologies: Options for Reducing Oil Use - Background for Congress – 244

Smart Fuel Cell C20-MP Hybrid Fuel Cell Power Source – 249

## FUEL COMBUSTION

Modeling JP-8 Fuel Effects on Diesel Combustion Systems – 120

## FUEL CONSUMPTION

Army Fuels: Policies, Regulations, and Executive Orders – 129

Navy Ship Propulsion Technologies: Options for Reducing Oil Use - Background for Congress – 244

## FUEL OILS

No Further Action Decision Under CERCLA, Fort Devens Study Area 58, Buildings 2648 and 2650 Fuel Oil Spills – 128

## FUEL PRODUCTION

Constraints on JP-900 Jet Fuel Production Concepts – 128

## FUEL TANK PRESSURIZATION

Hydrogen Pressurization of LOX: High Risk/High Reward (Preprint) – 97

## FUEL TANKS

A Review of the History of Fire Suppression on U.S. DoD Aircraft – 34

## FUELS

Army Fuels: Policies, Regulations, and Executive Orders – 129

In the Midst of a Fuels Evolution - An Army Perspective – 38

Investigation of Ignition Delay: Novel Beta-Substituted Ethylazide Derivatives as Potential New Liquid Propellant Fuels (Preprint) – 100

Modeling JP-8 Fuel Effects on Diesel Combustion Systems – 120

No Further Action Decision Under CERCLA, Fort Devens Study Area 58, Buildings 2648 and 2650 Fuel Oil Spills – 128

Summary of the Study of E85 Fuel in the USA, Winter 2006-2007 – 257

Transforming the Way DOD Looks at Energy. An Approach to Establishing an Energy Strategy – 243

## FULLERENES

Large Concentration-Dependent Nonlinear Optical Responses of Starburst Diphenylamino-fluorene-carbonyl Methano[60]Fullerene Pentaads – 88

Toxicity and Radioprotective Effects of DF-1 and Carbon Nanotubes in Human Lung and Liver Cell Lines – 418

Utility of DF-1 for Radioprotection in Lymphocytes – 420

## FUMIGATION

Vaporous Hydrogen Peroxide (VHP) Decontamination of a C-141B Starlifter Aircraft: Validation of VHP and Modified VHP (mVHP) Fumigation Decontamination Process via VHP-Sensor, Biological Indicator, and HD Simulant in a Large-Scale Environment – 32

## FUNCTION GENERATORS

Implementation of a High-Speed Numeric Function Generator on a COTS Reconfigurable Computer – 513

## FUNCTIONAL ANALYSIS

Functional Genomic Analysis of Breast Cancer Cell Tumorigenicity Using a Novel Gene Silencing Resource – 325

## FURNACES

Thermal Testing of Prototype General Purpose Fissile Packages Using a Furnace – 59

## FUSELAGES

Innovative Concept for a Heavy-Load Aircraft Utilizing a Two-Dimensional Wing – 36

Investigation of the Effect of Fuselage Dents on Compressive Failure Load – 23

## FUSION REACTORS

Summary Report--FY2006 ITER Work Accomplished – 575

Visible and Infrared Optical Design for the ITER Upper Ports – 599

## GALAXIES

All-Wavelength Extended Groth Strip International Survey (AEGIS) Data Sets – 674

## GALERKIN METHOD

Convergence of High Order Finite Volume Weighted Essentially Non-Oscillatory Scheme and Discontinuous Galerkin Method for Nonconvex Conservation Laws – 515

L2 Stability Analysis of the Central Discontinuous Galerkin Method and a Comparison between the Central and Regular Discontinuous Galerkin Methods – 523

## GALLIUM NITRIDES

GaN Wide Band Power Integrated Circuits (Preprint) – 96

Performance and RF Reliability of GaN-ON-SiC HEMTs Using Dual-Gate Architectures – 192

Pyroelectric A1GaN/GaN HEMTs for ion-, gas- and Polar-Liquid Sensors – 96

Study on Wide-gap Gallium-nitride Based Films and Their Quantum-dots Devices – 196

## GALVANIC SKIN RESPONSE

Galvanic Skin Response as a Measure of Soldier Stress – 410

## GAME THEORY

Automated Run-Time Mission and Dialog Generation – 632

Updating Optimal Decisions Using Game Theory and Exploring Risk Behavior Through Response Surface Methodology – 534

Using Gaming and Agent Technology to Explore C2 – 537

## GAMMA RAY ASTRONOMY

Exploring the High Energy Universe: GLAST Mission and Science – 667

## GAMMA RAY BURSTS

Exploring the High Energy Universe: GLAST Mission and Science – 667

## GAMMA RAY TELESCOPES

Exploring the High Energy Universe: GLAST Mission and Science – 667

## GAMMA RAYS

Exploring the High Energy Universe: GLAST Mission and Science – 667

High Spatial Resolution X-ray and Gamma Ray Imaging System Using Crystal Diffraction Lenses – 556

Inter- and Intra-Chromosomal Aberrations in Human Cells Exposed in vitro to Space-like Radiations – 370

Self Attenuation Correction for Holdup Measurements. An Historical Perspective – 581

Utility of DF-1 for Radioprotection in Lymphocytes – 420

## GANGLIA

Structural Studies on Intact Clostridium Botulinum Neurotoxins Complexed with Inhibitors Leading to Drug Design – 304

## GARMENTS

Studies on Electrical Safety, When Using ESD Protective Equipment, Especially ESD Protective Garments – 205

Thermal Conductivity of Copoly(ethylene vinyl acetate)/Nano-Filler Blends – 83

## GAS ANALYSIS

Optical Fiber Chemical Sensor with Sol-Gel Derived Refractive Material as Transducer for High Temperature Gas Sensing in Clean Coal Technology (Final Report, October 1, 2004-December 31, 2006) – 254

## GAS CHROMATOGRAPHY

A Fully-Integrated MEMS Preconcentrator for Rapid Gas Sampling (Preprint) – 113

A Method for the Analysis of Tabun in Multisol Using Gas Chromatographic Flame Photometric Detection – 77

Microbial Degradation of Fuel Oxygenates under Aerobic Conditions – 113

## GAS DETECTORS

Gas Detector LCLS Engineering Specifications Document – 574

Pyroelectric A1GaN/GaN HEMTs for ion-, gas- and Polar-Liquid Sensors – 96

## GAS FLOW

IHRPRT Improvements to the Solid Performance Program (SPP) – 542

## GAS GIANT PLANETS

Creating the Core Conditions of Extrasolar and Solar Giant Planets – 672

## GAS IONIZATION

A Fully-Integrated MEMS Preconcentrator for Rapid Gas Sampling (Preprint) – 113

## **GAS STREAMS**

Removal of Elemental Mercury from a Gas Stream Facilitated by a Non-Thermal Plasma Device. Final Report – 258

## **GAS TURBINE ENGINES**

Double Near-Net Forging of Article – 41

Gas Turbine Engine Including a Low Pressure Sump Seal Buffer Source and Thermally Isolated Sump – 41

Need for Robust Sensors for Inherently Fail-Safe Gas Turbine Engine Controls, Monitoring, and Prognostics (Post-print) – 23

Reduced Exhaust Emissions Gas Turbine Engine Combustor – 39

## **GAS TURBINES**

An Electron Beam Method for Creating Combinatorial Libraries: Application to Next Generation Thermal Barrier Coatings Systems – 60

## **GASEOUS FUELS**

Experimental and Detailed Numerical Studies of Fundamental Flame Properties of Gaseous and Liquid Fuels – 38

## **GASES**

A Fully-Integrated MEMS Preconcentrator for Rapid Gas Sampling (Pre-print) – 113

Mathematical Modeling of Physical and Cognitive Performance Decrement from Mechanical and Inhalation Insults – 297

Pyroelectric A1GaN/GaN HEMTs for ion-, gas- and Polar-Liquid Sensors – 96

## **GASIFICATION**

Hydrogen Production via a Commercially Ready Inorganic Membrane Reactor. Semi-Annual Technical Progress Report for April 1, 2006 to September 30, 2006 – 68

## **GASOLINE**

Guidelines for Oxygenated Gasoline Credit Programs under Section 211(m) of the Clean Air Act as Amended – 252

## **GASTROINTESTINAL SYSTEM**

Cell-surface Alpha-glucan in *Campylobacter jejuni* 81-176 – 402

Comparison of Meglumine Antimoniate and Pentamidine for Peruvian Cutaneous Leishmaniasis – 386

## **GEARS**

High Ratio, Reduced Size Epicyclic Gear Transmission for Rotary Wing Aircraft with Improved Safety and Noise Reduction – 35

## **GENE EXPRESSION**

Disruption of the Circadian Rhythms of Gene Expression and the Development of Breast Cancer – 314

FGFR4 Downregulation of Cell Adhesion in Prostate Cancer – 376

Gene Expression Analysis of Circulating Hormone Refractory Prostate Cancer Micrometastases – 329

High-Throughput Analysis of Dynamic Gene Expression Associated with Sleep Deprivation and Recovery Sleep in the Mouse Brain – 409

Microarray Analysis of Transposon Insertion Mutants in *Bacillus Anthracis*: Global Identification of Genes Required for Sporulation and Germination – 335

Pilot Comparison of Stromal Gene Expression among Normal Prostate Tissues and Primary Prostate Cancer Tissues in White and Black Men – 313

Spaceflight Alters Bacterial Gene Expression and Virulence and Reveals Role for Global Regulator Hfq – 420

The Effect of COX-2 Inhibitors on the Aromatase Gene (CYP19) Expression in Human Breast Cancer – 347

Transcriptional Analysis of In vivo Plasmodium yoelii Liver Stage Gene Expression – 404

## **GENE THERAPY**

Control of DNA Dehybridization via Nanoparticle Antennas for Antisense Gene Therapy – 383

Endothelial Progenitors as Vectors for Systemic Gene Therapy of Breast Cancer – 332

Vasculature-Specific Adenovirus Vectors for Gene Therapy of Prostate Cancer – 352

## **GENERAL AVIATION AIRCRAFT**

Homeland Security: Protecting Airspace in the National Capital Region – 25

## **GENERAL OVERVIEWS**

ISO/IEC JTC1 SC37 Overview – 474

## **GENES**

BRCA1 in Gene-Specific Coordination of Transcription and DNA Damage Response – 407

Cloning and Sequence Analysis of the 22-kDa Antigen Genes of *Orientia tsutsugamushi* Strains Kato, TA763, AFSC 7, 18-032460, TH1814, and MAK 119 – 399

Deciphering the Molecular Mechanisms of Breast Cancer – 324

Detection of Genes Modifying Sensitivity to Proteasome Inhibitors Using a shRNA Library in Breast Cancer – 364

Detection of *Staphylococcus aureus* Enterotoxin A and B Genes with PCR-EIA and a Hand-Held Electrochemical Sensor – 331

Development of a Mouse Model for Prostate Cancer Imaging and Study of Disease Progression – 321

Dietary Fat, Fat Metabolizing Genes, and Prostate Cancer Risk in African-Americans and Whites – 340

Disruption of the Circadian Rhythms of Gene Expression and the Development of Breast Cancer – 313

Functional Characterization of Two Novel Human Prostate Cancer Metastasis Related Genes – 341

Genomic Analysis of Rodent Pulmonary Tissue Following Bis-(2-chloroethyl) Sulfide Exposure – 379

Genomic Characterization of KIR2DL4 in Families and Unrelated Individuals Reveals Extensive Diversity in Exon and Intron Sequences Including a Common Frameshift Variation Occurring in Several Alleles – 381

High-Throughput Analysis of Dynamic Gene Expression Associated with Sleep Deprivation and Recovery Sleep in the Mouse Brain – 409

HOXC5 as a Biomarker of Disease Presence in Tumor-Associated Normal Prostate – 290

Human Leukocyte Antigen (HLA) Genotype as a Contributor to Racial/Ethnic Differences in Breast Cancer: A Population-Based Molecular Epidemiologic Study – 285

Identification, Cloning, Expression, and Characterization of the Gene for *Plasmodium knowlesi* Surface Protein Containing an Altered Thrombospondin Repeat Domain – 389

Mechanism of Tumor Metastasis Suppression by the KA11 Gene – 318

Microarray Analysis of Transposon Insertion Mutants in *Bacillus Anthracis*: Global Identification of Genes Required for Sporulation and Germination – 335

Molecular Mechanisms of Soft Tissue Regeneration and Bone Formation in Mice: Implications in Fracture Repair and Wound Healing in Humans – 298

PARK2, a Large Common Fragile Site Gene, is Part of a Stress Response Network in Normal Cells That is Disrupted During the Development of Ovarian Cancer – 359

Pilot Comparison of Stromal Gene Expression among Normal Prostate Tissues and Primary Prostate Cancer Tissues in White and Black Men – 313

Protection Against Scrub Typhus by a Plasmid Vaccine Encoding the 56-KD Outer Membrane Protein Antigen Gene – 399

Stromal Mesenchyme Cell Genes in Prostate Cancer Development: Epigenetic Markers for Cancer and Potential Targets for Therapy – 316

Transcriptional Analysis of In vivo *Plasmodium yoelii* Liver Stage Gene Expression – 404

## **GENETIC ALGORITHMS**

A Comparison of Trajectory Determination Approaches for Small UAVs – 11

## **GENETICS**

2006 In Vitro Biology Meeting. Volume 42 – 291

- Deciphering the Molecular Mechanisms of Breast Cancer – 324
- Dietary Fat, Fat Metabolizing Genes, and Prostate Cancer Risk in African-Americans and Whites – 340
- Eliciting Autoimmunity to Ovarian Tumors in Mice by Genetic Disruption of T Cell Tolerance Mechanisms. Addendum – 357
- Expression and Genomic Profiling of Minute Breast Cancer Samples – 281
- Genetic and Molecular Analysis of the Mechanisms by Which TSC Regulates Neuronal Differentiation – 321
- Locating a Prostate Cancer Susceptibility Gene on the X Chromosome by Linkage Disequilibrium Mapping Using Three Founder Populations in Quebec and Switzerland – 352
- Methods and Program Products for Optimizing Problem Clustering – 435
- Modeling Phenotypes of Tuberous Sclerosis in the Mouse – 310
- Protein Transduction Based Therapies for Breast Cancer – 315
- GENOME**
- A Comprehensive Survey of the Plasmodium Life Cycle by Genomic, Transcriptomic, and Proteomic Analyses – 389
- DNA Damage and Genomic Instability Induced by Inappropriate DNA Replication – 336
- Evaluation of Genomic Instability in the Abnormal Prostate – 405
- Expression and Genomic Profiling of Minute Breast Cancer Samples – 281
- Genomic Analysis of Rodent Pulmonary Tissue Following Bis-(2-chloroethyl) Sulfide Exposure – 379
- Genomic Approaches for Detection and Treatment of Breast Cancer – 346
- Genomic Characterization of KIR2DL4 in Families and Unrelated Individuals Reveals Extensive Diversity in Exon and Intron Sequences Including a Common Frameshift Variation Occurring in Several Alleles – 381
- Prognostic Significance of Telomere Attrition in Ductal Carcinoma in Situ of the Breast – 390
- GEOCHEMISTRY**
- Infrared Spectroscopy and Stable Isotope Geochemistry of Hydrated Silicate Glasses – 254
- GEODESIC LINES**
- Development of a Geospatial Data-Sharing Method for Unmanned Vehicles Based on the Joint Architecture for Unmanned Systems (JAUS) – 662
- GEOGRAPHIC INFORMATION SYSTEMS**
- Integration of SATURN System and VGIS – 530
- The Multidimensional Measurements of Geographic Information Systems (GIS) Effectiveness in Crisis Management – 611
- GEOGRAPHY**
- Internet Protocol Geolocation: Development of a Delay-Based Hybrid Methodology for Locating the Geographic Location of a Network Node – 642
- GEOMETRY**
- Sharp-Looking Geometric Partitioning – 199
- GERMANIUM**
- Increasing the Laser Induced Damage Threshold of Single Crystal ZnGeP<sub>2</sub> – 234
- Materials and Fabrication Issues for Large Machined Germanium Immersion Gratings – 575
- GERMINATION**
- Microarray Analysis of Transposon Insertion Mutants in Bacillus Anthracis: Global Identification of Genes Required for Sporulation and Germination – 335
- Role of Superoxide in the Germination of Bacillus Anthracis Endospores – 380
- GEYSERS**
- Feasibility Study of H<sub>2</sub>S Abatement by Incineration of Noncondensable Gases in Vented Steam Flow from Davies-State 5206-1 Geothermal Steam Well, Geysers Geothermal Steam Field, Lake County, California – 259
- GIRDERS**
- Composite Action during Construction of Steel Trapezoidal Box Girder Bridges – 240
- GLASS**
- Infrared Spectroscopy and Stable Isotope Geochemistry of Hydrated Silicate Glasses – 254
- Preliminary Assessment of Stroboscopic Shutter Glasses on Motion Sickness in Helicopter Passengers – 30
- GLASSY CARBON**
- Carbonization Studies of Glassy Carbon Derived from Bis-Ortho-Diynylarenes (BODA) (Postprint) – 100
- GLIDERS**
- Implementing a Low-Cost Long-Range Unmanned Underwater Vehicle: The SeaDiver Glider – 505
- Interim Heavy Airlift: Sea Base Logistics Glider Concept – 14
- Simulating Candidate Missions for a Novel Glider Unmanned Underwater Vehicle – 464
- GLOBAL POSITIONING SYSTEM**
- Determining Logistics Ground Support Manpower Requirements for a Reusable Military Launch Vehicle – 58
- Global Climate Change: National Security Implications – 266
- Sustaining Air Force Space Systems: A Model for the Global Positioning System – 26
- GLOBULINS**
- Genomic Characterization of KIR2DL4 in Families and Unrelated Individuals Reveals Extensive Diversity in Exon and Intron Sequences Including a Common Frameshift Variation Occurring in Several Alleles – 381
- Human Spotted Fever Rickettsial Infections – 386
- GLUCOSE**
- Artificial Pancreas for Control of BG and Insulin Levels in Hospitalized Patients with Diabetes and Stress Hyperglycemia – 328
- Maintenance of Glucose Homeostasis through Acetylation of the Metabolic Transcriptional Coactivator PGC-1 $\alpha$  – 343
- Third Annual Clinical Diabetes Technology Meeting – 647
- GLUONS**
- National Software Infrastructure for Lattice Quantum Chromodynamics – 582
- GOGGLES**
- Rapid Wall-Breaching Kit, Ingress Hole Determination Experiment – 225
- GOVERNMENT PROCUREMENT**
- Defense Acquisitions: Analysis of Processes Used to Evaluate Active Protection Systems – 426
- VXX Presidential Helicopter: Background and Issues for Congress – 29
- GRADIENTS**
- Assessment of Gradient Diffusion Closures for Modeling Rayleigh Taylor and Richtmyer Meshkov Instability Induced Mixing – 568

- Nuclear Safety: DOE’s Investigation of Phosgene Gas Contamination was Inadequate, but Experts Conclude that Worker Safety and Facilities Are Not Threatened – 131

PHM Integration with Maintenance and Inventory Management Systems (Preprint) – 498

Public Health Assessment for Galena Airport (A.K.A. USAF Galena Air Force Station), Galena, Yukon-Koyukuk County, Alaska, May 21, 2007. EPA Facility ID: AK9570028655 – 257

Risk Assessment: Evidence Base – 529

Selenium and Breast Cancer Chemoprevention – 339

Smog: Who Does it Hurt. What You Need to Know about Ozone and Your Health – 259

Space Medicine Issues and Healthcare Systems for Space Exploration Medicine – 415

Strategies for the Integration of Medical and Health Representation within Law Enforcement Intelligence Fusion Centers – 312

Technology Review of Smart Sensors with Wireless Networks for Applications in Hazardous Work Environments – 168

Telemedicine Based Ultrasound for Detecting Neonatal Heart Disease in Babies at Remote Military or Native American Health Care Facilities – 360

Testing the Effectiveness of the North Shore - LIJ Health System's Bioterrorism Response Program to Identified Surveillance Data – 345

The Demise of Russian Health Capital: The Continuity of Ineffective Government Policy – 323

Translational Research from an Informatics Perspective – 416

Truck Driver Occupational Safety and Health. 2003 Conference Report and Selective Literature Review – 238

Utility of DF-1 for Radioprotection in Lymphocytes – 420

## HEARING

Effects of the Advanced Combat Helmet (ACH) and Selected Communication and Hearing Protection Systems (C&HPSs) on Speech Communication: Talk-Through Systems – 630

## HEART DISEASES

Telemedicine Based Ultrasound for Detecting Neonatal Heart Disease in Babies at Remote Military or Native American Health Care Facilities – 360

## HEART RATE

Skin Temperature Feedback Optimizes Microclimate Cooling – 272

## HEAT EXCHANGERS

High Temperature Heat Exchanger Development – 216

## HEAT FLUX

Development of Subscale Fast Cookoff Test – 135

Experimental and Numerical Investigations of RP-2 Under High Heat Fluxes – 130

Exploring Hypersonic, Unstructured-Grid Issues through Structured Grids – 437

Heat Flux and Infrared Spectral Measurements of Burning SRM Propellant (Postprint) – 130

## HEAT GENERATION

Heat Generation during Overcharge in Sealed Cells – 248

## HEAT MEASUREMENT

Design and Application of the Reconstruction Software for the BaBar Calorimeter – 584

## HEAT PIPES

Improving Thermal Performance of Radioactive Material Drum Type Packages by Using Heat Pipes – 131

## HEAT RESISTANT ALLOYS

Recrystallization and Grain-Growth Behavior of a Nickel-Base Superalloy During Multi-Hit Deformation (Preprint) – 118

The Effect of As-Large-As (ALA) Grains on the High-Temperature Fatigue Life of Waspaloy – 117

## HEAT SHIELDING

Analysis of the Thermal Shielding Properties of Camouflage Materials Brief – 192

Analysis of the Thermal Shielding Properties of Camouflage Materials – 191

## HEAT STORAGE

Characterization and Evaluation of a Mass Efficient Heat Storage Device. – 237

## HEAT TRANSFER COEFFICIENTS

Thermal Modeling of the Mars Reconnaissance Orbiter's Solar Panel and Instruments during Aerobraking – 59

## HEAT TRANSFER

Code Validation of CFD Heat Transfer Models for Liquid Rocket Engine Combustion Devices – 217

Exploring Hypersonic, Unstructured-Grid Issues through Structured Grids – 437

Numerical Analysis of Chamber Wall Heat Transfer in a GH2/GO2 Sub-Scale Combustor – 98

Re-Entry Aeroheating Analysis of Tile-Repair Augers for the Shuttle Orbiter – 58

## HEATING

Simulation of Stagnation Region Heating in Hypersonic Flow on Tetrahedral Grids – 431

Solar Buildings. Transpired Air Collectors Ventilation Preheating – 250

## HEAT

Detection of Localized Heat Damage in a Polymer Matrix Composite by Thermo-Elastic Method (Preprint) – 82

## HEAVY ELEMENTS

LDRD Final Report: Surrogate Nuclear Reactions and the Origin of the Heavy Elements (04-ERD-057) – 563

## HEIGHT

A Novel Approach to Calibrating Wavemakers and Generating Wavemaker Transfer Functions – 516

Analysis of ICESat Data Using Kalman Filter and Kriging to Study Height Changes in East Antarctica – 240

## HELICOPTER ENGINES

Toward a Real-Time Measurement-Based System for Estimation of Helicopter Engine Degradation Due to Compressor Erosion – 39

## HELICOPTERS

Comanche Helicopter Program - A Strategic Failure – 30

Military Helicopter Modernization: Background and Issues for Congress – 28

Preliminary Assessment of Stroboscopic Shutter Glasses on Motion Sickness in Helicopter Passengers – 30

Solutions Analysis for Helicopter Brownout – 33

VXX Presidential Helicopter: Background and Issues for Congress – 29

## HELIOSPHERE

Acceleration and Propagation in the Heliosphere – 670

## HELIUM

Feasibility of Measuring 3He Bubble Diameter Populations in Deuterium-Tritium Ice Layers Using Mie Scattering – 573

## HELMET MOUNTED DISPLAYS

Helmet-Mounted Displays for Use in Air Force Training and Simulation – 6

Visual Simulation S&T: Summary of Accomplishments – 7

## HELMETS

Effects of the Advanced Combat Helmet (ACH) and Selected Communication and Hearing Protection Systems (C&HPSs) on Speech Communication: Talk-Through Systems – 630

## HEMATOLOGY

Mechanisms of Disease Persistence in Chronic Myelogenous Leukemia (CML) – 318

## HEMOGLOBIN

A Hemoglobin-based Oxygen Carrier, Bovine Polymerized Hemoglobin (HBOC-201) Versus Hetastarch (HEX) in a Moderate Severity Hemorrhagic Shock Swine Model with Delayed Evacuation – 395

Effects of Bovine Polymerized Hemoglobin in Coagulation in Controlled Hemorrhagic Shock in Swine – 385

## HEMORRHAGES

Early Detection of Dengue Infections using Cluster Sampling Around Index Cases – 394

- The Effect of Hypotensive Resuscitation and Fluid Type on Mortality, Bleeding, Coagulation, & Dysfunctional Inflammation in a Swine Grade V Liver Injury Model – 314

High Resolution Real Time Phase Contrast Radiology Study of Hydrodynamic in Micrometer Scale – 133  
High Spatial Resolution X-ray and Gamma Ray Imaging System Using Crystal Diffraction Lenses – 556  
Mitigating Atmospheric Effects in High-Resolution Infra-Red Surveillance Imagery with Bispectral Speckle Imaging – 675  
New Strategic Plan Takes the ALS into the Future – 576  
Optical and Radio Frequency Refractivity Fluctuations from High Resolution Point Sensors: Sea Breezes and Other Observations – 554  
Quarter-Rate Superconducting Modulator for Improved High Resolution Analog-to-Digital Converter – 441  
Superconducting High Resolution Fast-Neutron Spectrometers – 564  
Very High Resolution SAR and Multichannel SAR/MTI – 175  
X-Ray Absorption Edge Detector for High-Resolution Measurement of Undulator Effective K-Parameter – 577
- HIGH REYNOLDS NUMBER**  
Active Control of Flow Separation on a High-Lift System with Slotted Flap at High Reynolds Number – 4
- HIGH SPEED**  
An Evaluation of High Velocity Wear – 142  
Fundamental Physics and Practical Applications of Electromagnetic Local Flow Control in High Speed Flows – 216  
High-Speed Digital-Image Data Acquisition, Processing, and Visualization System for Turbulent Mixing and Combustion – 77  
High-Speed-/Hypersonic-Weapon-Development-Tool Integration – 22

Implementation of a High-Speed Numeric Function Generator on a COTS Reconfigurable Computer – 513

Multicast Performance Analysis for High-Speed Torus Networks – 484

#### HIGH TEMPERATURE GASES

Optical Fiber Chemical Sensor with Sol-Gel Derived Refractive Material as Transducer for High Temperature Gas Sensing in Clean Coal Technology (Final Report, October 1, 2004-December 31, 2006) – 254

#### HIGH TEMPERATURE SUPERCONDUCTORS

Synthesis of One-dimensional Nano-sized Defects in High Tc Superconductor – 552

#### HIGH TEMPERATURE

A Comparison of High Temperature Performance of SiC DMOSFETs and JFETs (Preprint) – 184

Elevated-Temperature Life Limiting Behavior of Hi-Nicalon SiC/SiC Ceramic Matrix Composite in Interlaminar Shear – 80

High Temperature Heat Exchanger Development – 215

High Temperature Magnetic Shape Memory Ni-Mn-Ga Alloys for a New Class of Actuators and Sensor – 119

The Effect of As-Large-As (ALA) Grains on the High-Temperature Fatigue Life of Waspaloy – 117

#### HIGH VOLTAGES

Final Task Report on NRF Measurements of Photon Scattering Resonances in Plutonium at the High Voltage Research Laboratory of MIT – 561

Understanding and Improving High Voltage Vacuum Insulators for Microsecond Pulses – 203

#### HIGHWAYS

Research Plan for Measuring Noise Levels in Highway Pavements in Texas – 259

#### HISTOLOGY

Functional Characterization of Two Novel Human Prostate Cancer Metastasis Related Genes – 341

Integration of Anatomic and Pathogenic Bases for Early Lung Cancer Diagnosis – 506

Pilot Comparison of Stromal Gene Expression among Normal Prostate Tissues and Primary Prostate Cancer Tissues in White and Black Men – 313

#### HISTORIES

Military Airpower: A Revised Digest of Airpower Opinions and Thoughts – 14

Self Attenuation Correction for Holdup Measurements. An Historical Perspective – 581

#### HOMEOSTASIS

Maintenance of Glucose Homeostasis through Acetylation of the Metabolic Transcriptional Coactivator PGC-1alpha – 343

#### HOMING DEVICES

Integrated Sensing and Processing (ISP) Phase 2: Demonstration and Evaluation for Distributed Sensor Networks and Missile Seeker Systems – 515

#### HORIZON

Cooperative Solutions in Multi-Person Quadratic Decision Problems: Finite-Horizon and State-Feedback Cost-Cumulant Control Paradigm – 517

Defense Horizons. I-Power: The Information Revolution and Stability Operations. Number 55 – 619

#### HORMONES

A Novel Mechanism of Androgen Receptor Action – 288

Differential Mechanisms of Androgen Resistance – 313

Effects of Herstatin, an Alternative HER-2 (erbB-2) Product, on Hormonal Responsiveness of Breast Cancer – 362

Gene Expression Analysis of Circulating Hormone Refractory Prostate Cancer Micrometastases – 329

Identifying Molecular Factors in Androgen Receptor Nuclear Export – 282

Knockout AR in Prostate – 280

Modulation of Postmenopausal Steroid Hormone Levels by Phytoestrogens and Correlation with Breast Proliferative Activity and Menopausal Symptoms – 324

Preclinical Testing the Therapeutic Potential of a Potent and Novel Small-Molecule Inhibitor of Bcl-2 as a Novel Therapy for Hormone-Refractory Prostate Cancer – 302

Role of Growth Hormone in Prostate Cancer – 342

Selective Androgen Receptor Downregulators (SARDs): A New Prostate Cancer Therapy – 303

Studies of Prostate Tumor Development Via CRE/LOXP Technology – 309

Unique Approaches to Androgen Effects on Prostate Cancer – 334

#### HOSPITALS

Continuous Pre-hospital Data as a Predictor of Outcome Following Major Trauma: A Study Using Improved and Expanded Data – 354

Epidemiology of Transfusion-Transmitted Infections Among Multi-Transfused Patients in Seven Hospitals in Peru – 403

Hospital Quality Data: HHS Should Specify Steps and Time Frame for Using Information Technology to Collect and Submit Data – 428

#### HOT ISOSTATIC PRESSING

Microstructure of Dense Thin Sheets of gamma-TiAl Fabricated by Hot Isostatic Pressing of Tape-Cast Monotapes (Preprint) – 92

#### HOUSTON (TX)

Evaluation of Emission Control Strategies for the 8-Hour Ozone Standard in the Houston and Dallas Areas and A Pilot-Scale Study of In-Use Emissions from Heavy-Duty Diesel Dump Trucks using a Portable Emissions Monitoring System (PEMS) – 256

#### HUBBLE SPACE TELESCOPE

Zero Gyro Kalman Filtering in the Presence of a Reaction Wheel Failure – 667

#### HUMAN BEINGS

Pilot Comparison of Stromal Gene Expression among Normal Prostate Tissues and Primary Prostate Cancer Tissues in White and Black Men – 313

Short-Term Exercise and Prostate Cancer Prevention in African American Men – 359

#### HUMAN BODY

Assessment of Injury Potential in Aircraft Side-Facing Seats Using the ES-2 Anthropomorphic Test Dummy – 10

#### HUMAN FACTORS ENGINEERING

Anthropometric Accommodation in Space Suit Design – 424

Assessing Human Factors in Command and Control: Workload and Situational Awareness Metrics – 422

Behavioral Health Program Element – 417

Experimentation with Evolving C2 Operation Centers - Implications for the Human Element – 137

Eyekon: Distributed Augmented Reality for Soldier Teams – 655

Human Engineering Design Data Digest – 22

Human Error Investigation Software Tool (HEIST) – 427

Human Factors and Privacy – 476

Human Factors Engineering: An Enabler for Military Transformation Through Effective Integration of Technology and Personnel – 424

Human Factors Evaluation of the High Mobility Artillery Rocket System (HIMARS) in the Combined HIMARS-Guided Multiple Launch Rocket System (GMLRS) Initial Operational Test – 423

Human Factors Evaluation of the XM30 Guided Multiple Launch Rocket System (GMLRS) in the Combined High Mobility Artillery Rocket System (HIMARS)-GMLRS Initial Operational Test – 423

Human Systems Integration Assessment of Network Centric Command and Control – 421

Privacy and Biometrics: The Human Factors – 477

## IMMUNE SYSTEMS

A Comprehensive Survey of the Plasmodium Life Cycle by Genomic, Transcriptomic, and Proteomic Analyses – 389

Efficacy and Tolerability of Artesunate Plus Sulfadoxine-Pyrimethamine and Sulfadoxine-Pyrimethamine Alone for the Treatment of Uncomplicated Plasmodium falciparum Malaria in Peru – 380

Hepatocyte Growth Factor and Interleukin-6 in Prostate Cancer Bone Metastasis – 344

HLA-A2 Supertype-Restricted Cell-Mediated Immunity by Peripheral Blood Mononuclear Cells Derived from Malian Children with Severe or Uncomplicated Plasmodium falciparum Malaria and Healthy Controls – 400

Mode of Action of Invasion-Inhibitory Antibodies Directed against Apical Membrane Antigen 1 of Plasmodium falciparum – 379

The Distribution, Levels, and Relevance of the Interleukin-1 Family of Cytokines and Receptors in Human Breast Carcinoma-Induced Osteolysis – 300

The Plasmodium falciparum Sexual Development Transcriptome: A Microarray Analysis using Ontology-Based Pattern Identification – 401

White Blood Cell Counts and Malaria – 400

## IMMUNITY

Development of In Vitro Correlate Assays of Immunity to Infection with Yersinia Pestis – 327

Eliciting Autoimmunity to Ovarian Tumors in Mice by Genetic Disruption of T Cell Tolerance Mechanisms. Addendum – 357

Establishment of a Non-human Primate Campylobacter Disease Model for the Pre-clinical Evaluation of Campylobacter Vaccine Formulations – 396

HLA-A2 Supertype-Restricted Cell-Mediated Immunity by Peripheral Blood Mononuclear Cells Derived from Malian Children with Severe or Uncomplicated Plasmodium falciparum Malaria and Healthy Controls – 400

Radiation-Induced Immune Modulation in Prostate Cancer – 325

Short- and Long-Term Immune Responses of CD-1 Outbred Mice to the Scrub Typhus DNA Vaccine Candidate: p47Kp – 399

The Immune Status of Kupffer Cells Profoundly Influences their Responses to Infectious Plasmodium berghei sporozoites – 404

Transcriptome Analysis of Human Immune Responses Following Live Vaccine Strain (LVS) Francisella Tularensis Vaccination – 332

## IMMUNOLOGY

Immunology, Systems Biology, and Immunotherapy of Breast Cancer – 360

Mandatory Vaccinations: Precedent and Current Laws – 393

Short-Course Postexposure Antibiotic Prophylaxis Combined with Vaccination Protects Against Experimental Inhalational Anthrax – 340

Transcriptome Analysis of Human Immune Responses Following Live Vaccine Strain (LVS) Francisella Tularensis Vaccination – 332

## IMPACT DAMAGE

Quantification of Impact Damage in CMC Thermal Protection Systems Using Thin-Film Piezoelectric Sensors (Preprint) – 212

Towards the Development of a Defensive Cyber Damage and Mission Impact Methodology – 641

## IMPACT LOADS

Quantification of Impact Damage in CMC Thermal Protection Systems Using Thin-Film Piezoelectric Sensors (Preprint) – 212

The Effect of Increasing Mass on Locomotion – 413

## IMPACT PREDICTION

A Novel Approach to Calibrating Wavemakers and Generating Wavemaker Transfer Functions – 516

## IMPACT TESTS

Assessment of Injury Potential in Aircraft Side-Facing Seats Using the ES-2 Anthropomorphic Test Dummy – 10

Elastic-Viscoplastic An Isotropic Modeling of Textured Metals and Validation using the Taylor Cylinder Impact Test – 117

## **IMPACT VELOCITY**

Probabilistic Modeling of Space Shuttle Debris Impact – [58](#)

## **IMPEDANCE**

Impedance Analysis of Electrochemical NO<sub>x</sub> Sensor Using a Au/Yttria-Stabilized Zirconia (YSZ) Au Cell – [247](#)

## **IMPLANTATION**

Steroid Lipid-Modified Polyurethane as an Implantable Biomaterial, the Preparation and Uses Thereof – [72](#)

Toward Neural Control of Prosthetic Devices – [209](#)

## **IMPLOSIONS**

Isochoric Implosions for Fast Ignition – [570](#)

## **IMPREGNATING**

Grout Impregnation of Pre-Placed Recycled Concrete Pavement (RCP) for Rapid Repair of Deteriorated Portland Cement Concrete Airfield Pavement – [45](#)

## **IMPULSES**

Development of Aeroservoelastic Analytical Models and Gust Load Alleviation Control Laws of a SensorCraft Wind-Tunnel Model Using Measured Data – [4](#)

## **IMPURITIES**

First Principles and Multi-Scale Modeling of the Roles of Impurities and Dopants on Thermal Barrier Coating Failure – [88](#)

## **IN SITU MEASUREMENT**

A Device for the In-Situ Measurement of Acoustically Stimulated Bioluminescence – [310](#)

## **IN VITRO METHODS AND TESTS**

2006 In Vitro Biology Meeting. Volume 42 – [291](#)

Development of In Vitro Correlate Assays of Immunity to Infection with *Yersinia Pestis* – [327](#)

Evaluation of Lateral-Flow Clostridium botulinum Neurotoxin Detection Kits for Food Analysis – [403](#)

Inter- and Intra-Chromosomal Aberrations in Human Cells Exposed in vitro to Space-like Radiations – [370](#)

p63 in Development and Maintenance of the Prostate Epithelium – [355](#)

Semi-Synthesis and In-vitro Anticancer Evaluation of Derivatives of a New Microtubule Poison with a Taxol-Like Mechanism – [401](#)

Thiodiglycol, the Hydrolysis Product of Sulfur Mustard: Analysis of In Vitro Biotransformation by Mammalian Alcohol Dehydrogenases using Nuclear Magnetic Resonance – [384](#)

## **IN VIVO METHODS AND TESTS**

Development of Methodology to Maintain Primary Cultures of Normal and Malignant Human Prostatic Epithelial Cells in Vivo – [342](#)

DNA Ligase I is an In Vivo Substrate of DNA-Dependent Protein Kinase and is Activated by Phosphorylation in Response to DNA Double-Strand Breaks – [383](#)

Effect of COX-2 (PGE2) and IL-6 on Prostate Cancer Bone Mets – [294](#)

Effects of Extracellular Matrix on DNA Repair in Vivo – [363](#)

In Vivo Cholinesterase Inhibitory Specificity of Organophosphorus Nerve Agents – [77](#)

p63 in Development and Maintenance of the Prostate Epithelium – [355](#)

Transcriptional Analysis of In vivo Plasmodium yoelii Liver Stage Gene Expression – [404](#)

## **INCINERATORS**

Feasibility Study of H<sub>2</sub>S Abatement by Incineration of Noncondensable Gases in Vented Steam Flow from Davies-State 5206-1 Geothermal Steam Well, Geysers Geothermal Steam Field, Lake County, California – [259](#)

Trial Burn Plan for a Transportable Incineration System (TIS) at the Savanna Army Depot Activity (SADA) Washout Lagoon Area – [252](#)

## **INDEPENDENT VARIABLES**

Global Local Dynamic Models – [572](#)

Parameter Space: The Final Frontier. Certified Reduced Basis Methods for Real-Time Reliable Solution of Parameterized Partial Differential Equations – [512](#)

## **INDIANA**

Final Site Safety and Health Plan for Phase II RCRA Facility Investigation Fort Benjamin Harrison Marion County, Indiana – [308](#)

## **INDIA**

India's Nuclear Separation Plan: Issues and Views – [595](#)

## **INDIUM GALLIUM ARSENIDES**

Pseudomorphic Bipolar Quantum Resonant-Tunneling Transistor – [186](#)

## **INDIUM PHOSPHIDES**

Ohmic Contacts for Technology for Frequency Agile Digitally Synthesized Transmitters – [113](#)

## **INDOOR AIR POLLUTION**

IAQ Tools for Schools. Managing Asthma in the School Environment – [260](#)

## **INDUSTRIAL PLANTS**

Closed Orbit Distortion and the Beam-Beam Interaction – [556](#)

Radiative Penguin Decays at the B Factories – [578](#)

## **INDUSTRIES**

DoD Personnel Clearances: Delays and Inadequate Documentation Found for Industry Personnel – [644](#)

Electronic Vehicle Identification: Industry Standards, Performance, and Privacy Issues – [178](#)

In-Track Demonstration of Laser-Treated Rail to Reduce Friction and Wear – [74](#)

Oil Vulnerabilities and USA Strategy – [241](#)

Pager Phones: Installation – [167](#)

The California Central Coast Research Partnership: Building Relationships, Partnerships and Paradigms for University-Industry Research Collaboration – [193](#)

## **INERTIAL CONFINEMENT FUSION**

Status and Prospects of the Fast Ignition Inertial Fusion Concept – [571](#)

## **INERTIAL NAVIGATION**

Fusion of Imaging and Inertial Sensors for Navigation – [228](#)

## **INERTIA**

On-Orbit Identification of Inertia Properties of Spacecraft using Robotics Technology – [49](#)

## **INFECTIOUS DISEASES**

A Comprehensive Characterization of Microorganisms and Allergens in Spacecraft Environment – [414](#)

Analytical and Characterization Studies of Organic Chemicals, Drugs and Drug Formulations – [60](#)

Building Collaborative Capacity for Biosecurity at the Georgia Seaports – [638](#)

Cell-surface Alpha-glucan in *Campylobacter jejuni* 81-176 – [401](#)

Cross-Serotype Neutralization of Dengue Virus in *Aotus nancymae* Monkeys – [387](#)

Development of Antigen Presenting Cells for Adoptive Immunotherapy in Prostate Cancer – [286](#)

Development of In Vitro Correlate Assays of Immunity to Infection with *Yersinia Pestis* – [327](#)

Differential Effects of Dengue Virus on Infected and Bystander Dendritic Cells – [378](#)

Early Detection of Dengue Infections using Cluster Sampling Around Index Cases – [394](#)

Efficacy and Tolerability of Artesunate Plus Sulfadoxine-Pyrimethamine and Sulfadoxine-Pyrimethamine Alone for the Treatment of Uncomplicated Plasmodium Falciparum Malaria in Peru – [380](#)

Epidemiology of Transfusion-Transmitted Infections Among Multi-Transfused Patients in Seven Hospitals in Peru – [403](#)

Establishment of a Non-human Primate *Campylobacter* Disease Model for the Pre-clinical Evaluation of *Campylobacter* Vaccine Formulations – [396](#)

Extensively Drug-Resistant Tuberculosis (XDR-TB): Quarantine and Isolation – 398

Human Spotted Fever Rickettsial Infections – 386

Human-Derived, Plant-Produced Monoclonal Antibody for the Treatment of Anthrax – 377

Identification, Cloning, Expression, and Characterization of the Gene for Plasmodium knowlesi Surface Protein Containing an Altered Thrombospondin Repeat Domain – 389

Identification of a Protein for Prostate-Specific Infection – 301

Mandatory Vaccinations: Precedent and Current Laws – 393

Microarray Analysis of Transposon Insertion Mutants in Bacillus Anthracis: Global Identification of Genes Required for Sporulation and Germination – 335

Murine Macrophages Kill the Vegetative Form of Bacillus anthracis – 394

Prevalences, Genotypes, and Risk Factors for HIV Transmission in South America – 393

Production of Recombinant Protein Pap31 and Its Application for the Diagnosis of Bartonella bacilliformis Infection – 398

Protection Against Scrub Typhus by a Plasmid Vaccine Encoding the 56-KD Outer Membrane Protein Antigen Gene – 399

Research and Operational Support for the Study of Militarily Relevant Infectious Diseases of Interest to the USA Army and the Royal Thai Army – 282

Role of Superoxide in the Germination of Bacillus Anthracis Endospores – 380

Seroincidence and Phylogeny of Human Immunodeficiency Virus Infections in a Cohort of Commercial Sex Workers in Montevideo, Uruguay – 389

Short Report: Detection of Orientia Tsutsugamushi in Clinical Samples by Quantitative Real-Time Polymerase Chain Reaction – 385

Short-Course Postexposure Antibiotic Prophylaxis Combined with Vaccination Protects Against Experimental Inhalational Anthrax – 340

Sources of Variability in Determining Malaria Parasite Density by Microscopy – 392

Spaceflight Alters Bacterial Gene Expression and Virulence and Reveals Role for Global Regulator Hfq – 420

Testing the Effectiveness of the North Shore - LIJ Health System's Bioterrorism Response Program to Identified Surveillance Data – 345

The Immune Status of Kupffer Cells Profoundly Influences their Responses to Infectious Plasmodium berghei sporozoites – 404

The Plasmodium falciparum Sexual Development Transcriptome: A Microarray Analysis using Ontology-Based Pattern Identification – 401

Three-Dimensional Cell Culture Models for Infectious Disease and Drug Development – 371

#### **INFILTRATION**

The Significance of Focal Basal Cell Layer Disruption-Induced Immuno-Cell Infiltration in Prostate Cancer Invasion – 364

S&T Implications for Net Centric Operations – 611

System-of-Systems Governance: New Patterns of Thought – 465

Task Adaptable Display of Information for Training, Maintenance, and Emergency Response – 654

Terrorism Information Management Within the New York City Fire Department: Past, Present and Future – 634

Testing the Effectiveness of the North Shore - LIJ Health System's Bioterrorism Response Program to Identified Surveillance Data – 345

The Benefit of Ontologies for Interoperability of CCIS. (Easy, Quick and Cheap Solutions are Impossible, if Semantics of CCIS are Affected.) – 620

The Critical Role of Intelligent Software Agents in Enabling Net-Centric Command and Control – 444

The Federal Networking and Information Technology Research and Development Program: Funding Issues and Activities – 480

The Interactive DataWall – 209

The Quest for Effective Interoperability - Issues in Achieving a Naval Coalition Force Virtual Combat System – 645

Toward an Interoperability Architecture – 646

Use of Information Technology to Develop a Collaborative Decision Support System for Command and Control – 469

Using Work-Centered Support System Technology to Enhance Command and Control – 488

Willow System Demonstration – 449

## INFORMATION THEORY

Probability Modeling of Multi-Type Autonomous Unmanned Combat Aerial Vehicles Engaging Non-Homogeneous Targets Under Imperfect Information – 26

Russian and Chinese Information Warfare: Theory and Practice – 628

Uncertainty Quantification of Composite Laminate Damage with the Generalized Information Theory – 86

## INFORMATION TRANSFER

A Roadmap for Developing Architectures in a Net-Centric World – 609

Active Conceptual Modeling of Learning Workshop 10-12 May 2006 – 656

Building an Experimental Joint Battlespace Inosphere (YJBI-CB) – 460

Communication of Context in Multi-Echelon Information Exchange Environments – 656

Degrees of Shared Awareness – 657

Global Broadcast Service Security Classification/Declassification Guide (SCG) – 160

Journalists' Privilege: Overview of the Law and 109th Congress Legislation – 657

Metrics for Command in an NEC Era: Operational Analysis of Way of Command in the Era of Network Enabled Capability – 170

Strategies for the Integration of Medical and Health Representation within Law Enforcement Intelligence Fusion Centers – 312

UH-USA Agreement - A Telemedicine Research Proposal – 624

Use of a Novel Organizational Structure to Support Complex Decisionmaking During Global Wargame 2000 – 489

## **INFORMATION**

Translational Research from an Informatics Perspective – 416

## **INFRARED DETECTORS**

Application of the Community Radiative Transfer Model to Evaluate Satellite-Based Measurements Across the African Easterly Jet Over Western Africa – 48

Infrared Damage Detection System (IDDS) for Real-Time, Small-Scale Damage Monitoring – 118

Integrated Stereo Infrared and Color Human Detection on the ART platform – 226

Outlier Detection in Hyperspectral Imaging Using Closest Distance to Center with Ellipsoidal Multivariate Trimming – 223

## **INFRARED FILTERS**

Working Report on Visible and IR Electromagnetic Emissions from HMMWV External Black-Out (BO) Lighting – 597

## **INFRARED IMAGERY**

Mitigating Atmospheric Effects in High-Resolution Infra-Red Surveillance Imagery with Bispectral Speckle Imaging – 675

Polarimetric Thermal Imaging – 540

Shuttle Entry Imaging Using Infrared Thermography – 57

Three-Dimensional near Infrared Imaging of Pathophysiological Changes within the Breast – 363

## **INFRARED INSTRUMENTS**

Design of the TMT Mid-Infrared Echelle: Science Drivers and Design Overview – 226

## **INFRARED LASERS**

A Hybrid Nano-Imprinting Lithography Method for Nano-Patterning Based on Infrared Pulsed Laser Heating – 233

## **INFRARED RADIATION**

An Infrared Camera Simulation for Estimating Spatial Temperature Profiles and Signal-to-Noise Ratios of an Airborne Laser-Illuminated Target – 234

Analysis of the Thermal Shielding Properties of Camouflage Materials Brief – 192

Design of the TMT Mid-Infrared Echelle: Science Drivers and Design Overview – 226

Heat Flux and Infrared Spectral Measurements of Burning SRM Propellant (Postprint) – 130

Infrared and Electrical Properties of Amorphous Sputtered (LaxA11-x)2O3 films – 63

Infrared Damage Detection System (IDDS) for Real-Time, Small-Scale Damage Monitoring – 118

Observation of Tidal Effects on LWIR Radiance Above the Mesopause – 262

Vertical Variation of Dust and Its Impact on the Top of the Atmosphere Brightness Temperature in the Midwave Infrared – 271

Visible and Infrared Optical Design for the ITER Upper Ports – 599

## **INFRARED SPECTROSCOPY**

Design Tradeoffs for a High Spectral Resolution Mid-Infrared Echelle Spectrograph on the Thirty-Meter Telescope – 592

Infrared and Electrical Properties of Amorphous Sputtered (LaxA11-x)2O3 films – 63

Infrared Spectroscopy and Stable Isotope Geochemistry of Hydrous Silicate Glasses – 254

## **INFRASONIC FREQUENCIES**

Detection of Atmospheric Explosions at IMS Monitoring Stations using Infrared Sound Techniques – 265

## **INGESTION (ENGINES)**

Toward a Real-Time Measurement-Based System for Estimation of Helicopter Engine Degradation Due to Compressor Erosion – 39

## **INHIBITORS**

Atropine and Other Anticholinergic Drugs – 372

Bifunctional Alkylating Agent-Induced p53 and Nonclassical Nuclear Factor κB Responses and Cell Death are Altered by Caffeic Acid Phenethyl Ester: A Potential Role for Antioxidant/Electrophilic Response-Element Signaling – 388

Cell Cycle Dependence of TRAIL Sensitivity in Prostate Cancer Cells – 303

Detection of Genes Modifying Sensitivity to Proteasome Inhibitors Using a shRNA Library in Breast Cancer – 364

IDO Inhibitors for Combination Therapy of Prostate Cancer – 317

In Vivo Cholinesterase Inhibitory Specificity of Organophosphorus Nerve Agents – 77

Preclinical Testing the Therapeutic Potential of a Potent and Novel Small-Molecule Inhibitor of Bcl-2 as a Novel Therapy for Hormone-Refractory Prostate Cancer – 302

Pulmonary Toxicity of Cholinesterase Inhibitors – 382

Radio-sensitizing Effects of Novel Histone De-Acetylase Inhibitors in Prostate Cancer – 283

Structural Studies on Intact Clostridium Botulinum Neurotoxins Complexed with Inhibitors Leading to Drug Design – 304

Structure-Based Approach for Discovery of Small Molecule Inhibitors Targeted at AKT – 296

Structure-Based Design of Cdk4/6-Specific Inhibitors – 290

The Development of Novel Small Molecule Inhibitors of the Phosphoinositide-3-Kinase Pathway through High-Throughput Cell-Based Screens – 329

The Effect of COX-2 Inhibitors on the Aromatase Gene (CYP19) Expression in Human Breast Cancer – 347

## **INJECTION**

Preliminary Study of Using 'Pipetron'-Type Magnets for a Pre-Accelerator for the LHC – 566

Swirl-Stabilized Injector Flow and Combustion Dynamics for Liquid Propellants at Supercritical Conditions – 217

## **INJECTORS**

A Method to Predict Atomization Performance in Gas-Centered Swirl-Coaxial Injectors – 218

A Rocket-Like Coaxial Injector in an Acoustic Field Under Sub- and Supercritical Conditions (POSTPRINT) – 218

Atomization Performance Predictions of Gas-Centered Swirl-Coaxial Injectors – 216

Dark Core Analysis of Coaxial Injectors at Sub-, Near-, and Supercritical Conditions in a Transverse Acoustic Field – 589

Injector Test Facility for the LCLS. Executive Summary – 566

Swirl-Stabilized Injector Flow and Combustion Dynamics for Liquid Propellants at Supercritical Conditions – 217

## **INJURIES**

A Hemoglobin-based Oxygen Carrier, Bovine Polymerized Hemoglobin (HBOC-201) Versus Hetastarch (HEX) in a Moderate Severity Hemorrhagic Shock Swine Model with Delayed Evacuation – 395

Assessment of Injury Potential in Aircraft Side-Facing Seats Using the ES-2 Anthropomorphic Test Dummy – 10

Continuous Pre-hospital Data as a Predictor of Outcome Following Major Trauma: A Study Using Improved and Expanded Data – 354

Impact of Illness and Non-Combat Injury During Operations Iraqi Freedom and Enduring Freedom (Afghanistan) – 396

Improved Wound Healing of Cutaneous Sulfur Mustard Injuries in a Weanling Pig Model – 383

Mathematical Modeling of Physical and Cognitive Performance Decrement from Mechanical and Inhalation Insults – 297

Preventing Epilepsy after Traumatic Brain Injury – 366

The Effect of Hypotensive Resuscitation and Fluid Type on Mortality, Bleeding, Coagulation, & Dysfunctional Inflammation in a Swine Grade V Liver Injury Model – 314

The Use of Cognitive Task Analysis and Simulators for After Action Review of Medical Events in Iraq – 367

Treatment of PTSD-Related Anger in Troops Returning from Hazardous Deployments – 384

Truck Driver Occupational Safety and Health. 2003 Conference Report and Selective Literature Review – 238

Voice Recognition Interface in the Rehabilitation of Combat Amputees – 307

## **INORGANIC PEROXIDES**

Role of Superoxide in the Germination of Bacillus Anthracis Endospores – 380

## **INOSITOLS**

Prevention of Prostate Cancer by Inositol Hexaphosphate – 361

## **INSECTS**

Behavioral Responses to DDT and Pyrethroids Between Anopheles Minimus Species A and C Malaria Vectors in Thailand – 393

Using DUSTRAN to Simulate Fog-Oil Dispersion and Its Impacts on Local Insect Populations at Ft. Hood: Final Report – 253

## **INSOMNIA**

Prevalence and Outcomes of Restless Legs Syndrome Among Veterans – 346

## **INSPECTION**

Aviation Security: Foreign Airport Assessments and Air Carrier Inspections Help Enhance Security, but Oversight of These Efforts Can Be Strengthened – 13

EUV Inspection of Reticle Defect Repair Sites – 599

Iran's Nuclear Program: Recent Developments – 594

On the Non-Intrusive Determination of Electron Density in the Sheath of a Spherical Probe – 551

Site Inspection at Fort Allen, Puerto Rico Preliminary Assessments at San Juan ASSF, Puerto Rico and Blair Hangar AASF, St. Croix, USVI – 87

X-Ray Dose in Microfocus Radiographic Inspections – 137

## **INSTALLING**

Biodegradation of DIMP, Dieltrin, Isodrin, DBCP, and PCPMSO in Rocky Mountain Arsenal Soils. Installation Restoration Program, Environmental Technology Development – 305

Novel Technology Evaluation for Volatile Organic Compounds Emission Control – 60

Pager Phones: Installation – 167

Proceedings of the 1st Army Installation Energy Security and Independence Conference – 245

Trial Burn Plan for a Transportable Incineration System (TIS) at the Savanna Army Depot Activity (SADA) Washout Lagoon Area – 252

## **INSTRUMENTS**

Design of the TMT Mid-Infrared Echelle: Science Drivers and Design Overview – 226

Refinement of an Instrument to Assess Readiness for Knowledge Management – 641

## **INSULATORS**

Electrostatic Modeling of Vacuum Insulator Triple Junctions – 205

Understanding and Improving High Voltage Vacuum Insulators for Microsecond Pulses – 203

## **INSULIN**

Adipose Estrogen and Increased Breast Cancer Risk in Obesity: Regulation by Leptin and Insulin – 357

Artificial Pancreas for Control of BG and Insulin Levels in Hospitalized Patients with Diabetes and Stress Hyperglycemia – 328

## **INSURANCE (CONTRACTS)**

Information Security: Federal Deposit Insurance Corporation Needs to Sustain Progress Improving Its Program – 167

## **INTEGRAL EQUATIONS**

The Joy of Computing with Volume-Integrals – 19

## **INTEGRALS**

The Joy of Computing with Volume-Integrals – 19

## **INTEGRATED CIRCUITS**

Coolerless Photonic Integrated Circuits (PICs) for WDM Transmission Networks and PICs Operable with a Floating Signal Channel Grid Changing with Temperature but with Fixed Channel Spacing in the Floating Grid – 214

GaN Wide Band Power Integrated Circuits (Preprint) – 95

Meso-Scale Self-Assembly Pilot Study – 199

## **INTELLECTUAL PROPERTY**

Advancing Software Security - The Software Protection Initiative – 626

## **INTELLIGENCE**

A Bold 21st Century Strategy for U.S. Airborne ISR – 24

A New Perspective on Use of the Critical Decision Method with Intelligence Analysts – 609

A Strategies-to-Tasks Framework for Planning and Executing Intelligence, Surveillance, and Reconnaissance (ISR) Operations – 620

A Study of Autonomous Micro-Robots and Their Application to Complex Environments, Volume 1 – 543

Analysis of MALDI-TOF Serum Profiles for Biomarker Selection and Sample Classification – 308

Army Intelligence Analysis and Interpretation: Assessing the Utility and Limitations of Computational Diagnostic Reasoning – 652

Data Alignment between Army C4I Databases and Army Simulations – 653

Data Mining and Homeland Security: An Overview – 648

Framework for Measuring the Impact of C4ISR Technologies and Concepts on Warfighter Effectiveness Using High Resolution Simulation – 144

Intelligence Reform and Terrorism Prevention Act of 2004: 'Lone Wolf' Amendment to the Foreign Intelligence Surveillance Act – 664

Libraries and the USA PATRIOT Act – 635

Methods and System Design of the FOI Information Fusion Demonstrator - IFD03 – 450

Modeling and Simulation to Support C4ISR Acquisition and Transformation – 461

Modeling the Structure and Effectiveness of Intelligence Organizations: Dynamic Information Flow Simulation – 626

Modeling the U.S. Military Intelligence Process – 448

National Security Letters in Foreign Intelligence Investigations: A Glimpse of the Legal Background and Recent Amendments – 633

National Security Letters in Foreign Intelligence Investigations: Legal Background and Recent Amendments – 634

Requirements and Information Metadata System – 632

Signals Intelligence Support to the Cockpit – 504

Strategies for the Integration of Medical and Health Representation within Law Enforcement Intelligence Fusion Centers – 312

The Canadian ISTAR Information-Centric Collaborative Workspace Concept. Paper 1: The Info-Centric Collaborative Workspace from an Organizational Perspective – 621

The Canadian ISTAR Information-Centric Collaborative Workspace Concept. Paper 2: The Info-Centric Collaborative Workspace from the Processes Perspective – 623

The Canadian ISTAR Information-Centric Collaborative Workspace Concept. Paper 3: The Info-Centric Collaborative Workspace from a Systems Perspective – 623

The Development of a Virtual McKenna Military Operations in Urban Terrain (MOUT) Site for Command, Control, Communication, Computing, Intelligence, Surveillance, and Reconnaissance (C4ISR) Studies – 164

Theoretical Characterization of the Radiative Properties of Dust Aerosol for the Air Force Combat Climatology Center Point Analysis Intelligence System – 271

## INTELLIGIBILITY

A Model for Predicting Intelligibility of Binaurally Perceived Speech – 153

Effects of the Advanced Combat Helmet (ACH) and Selected Communication and Hearing Protection Systems (C&HPSs) on Speech Communication: Talk-Through Systems – 630

## INTERCALATION

Polymer Electrolyte, Intercalation Compounds and Electrodes for Batteries – 246

## INTERFACES

HPC-Colony: Services and Interfaces to Support Systems with Very Large Numbers of Processors. (2006 Annual Report, January-December 2006) – 432

## INTERFEROMETRY

Collaborative Research: Ground Truth of African and Eastern Mediterranean Shallow Seismicity Using SAR Interferometry and Gibbs Sampling Inversion – 262

The Status and Future of the ICRF – 665

## INTERFERON

Boosting of DNA Vaccine-Elicited Gamma Interferon Responses in Humans by Exposure to Malaria Parasites – 403

## INTERLEUKINS

Hepatocyte Growth Factor and Interleukin-6 in Prostate Cancer Bone Metastasis – 344

The Distribution, Levels, and Relevance of the Interleukin-1 Family of Cytokines and Receptors in Human Breast Carcinoma-Induced Osteolysis – 300

## INTERMETALLICS

Molecular Volume and Electronic and Vibrational Polarizabilities for Amorphous LaAlO<sub>3</sub> – 86

Topological Close Packing in Structurally Complex Intermetallics (Crystalline, Quasicrystalline and Noncrystalline) – 116

## INTERMODULATION

Linearity and Efficiency Performance of GaN HEMTs with Digital Pre-Distortion Correction (Preprint) – 95

## INTERNAL COMBUSTION ENGINES

Phase 1 Report: Cost-Effective Reciprocating Engine Emissions Control and Monitoring for E&P Field and Gathering Engines – 238

Report 17: Cost-Effective Reciprocating Engine Emissions Control and Monitoring for E&P Field and Gathering Engines. (Technical Report, October 1, 2006-December 31, 2006) – 237

## INTERNAL WAVES

A Geometric Investigation of Acoustical Wavefront Scattering and Healing Induced by Ocean Internal Waves – 588

A Numerical Study of the Regimes of Weak Fluctuation Theory for Ocean Acoustic Propagation through Random Internal Wave Sound Speed Fields – 588

## INTERNATIONAL COOPERATION

Changing the Cultural Paradigm to Meet Emerging Requirements – 56

Integrated Crew Health Care System for Space Flight – 412

Multinational Information Sharing and Collaborative Planning Limited Objective Experiments – 655

## INTERNATIONAL RELATIONS

Ukraine's Search for its Place in Europe: The East or the West? – 548

## INTERNATIONAL SPACE STATION

Materials on the International Space Station Experiment (MISSE): Optical Analysis of Molecular Contamination on PEC1 Tray 2 – 54

Synthesis and Characterization of Space-Survivable POSS-Kapton (Trade-mark) Polyimides (Preprint) – 52

## INTERNATIONAL TRADE

America's Energy Security Policy: Goals for 2025 – 129

China: Possible Missile Technology Transfers from U.S. Satellite Export Policy - Actions and Chronology – 637

Export Controls: Agencies Should Assess Vulnerabilities and Improve Guidance for Protecting Export-Controlled Information at Universities – 631

Identifying Molecular Factors in Androgen Receptor Nuclear Export – 282

The Iran Sanctions Act (ISA) – 593

## INTERNETS

Ada County Sheriff's Office Internet Site – 429

Analysis of USA's Broadband Policy – 491

Challenges to Ensuring Secure .COM and .EDU Access to a Web-Based Air Force Laboratory Program Management – 488

Dominating Cyberspace – 660

Internet: An Overview of Key Technology Policy Issues Affecting Its Use and Growth – 497

Internet Protocol Geolocation: Development of a Delay-Based Hybrid Methodology for Locating the Geographic Location of a Network Node – 641

Investigations Involving the Internet and Computer Networks – 438

Mediators in Infrastructure Survivability Enhancement – 449

Network Centric Operations: Background and Oversight Issues for Congress – 486

Recommendations for Network-and Internet-based Synchronized E-activities for Location- and Time-dependent Information – 457

Route Optimization for Mobile IPV6 Using the Return Routability Procedure: Test Bed Implementation and Security Analysis – 489

Towards Next Generation WWW: Push, Reuse and Classification – 614

User-Level QoS-Adaptive Resource Management in Server End-Systems – 485

## INTEROPERABILITY

A Case Study for the Naval Training Meta-FOM (NTMF): Analyzing the Requirements from MAGTF FOM – 629

A Cultural Framework for the Interoperability of C2 Systems – 150

A Pragmatic C4ISR Approach From the US Army CECOM Security Assistance Perspective – 614

A Reference Architecture for Network-Centric Information Systems – 619

A Roadmap for Developing Architectures in a Net-Centric World – 609

A System Design Archetype for C4ISR Systems of the 21st Century – 159

A Theory of Interoperability Failures – 651

Agile Coalition Environment (ACE) – 613

An Examination of a Structural Modeling Risk Probe Technique – 544

Army and Air Force Transformation - Are They Synchronized? – 157

Bilateral Interoperability through Enterprise Architecture – 493

C2 Interoperability. A Force Multiplier for Joint/Combined Operations and Homeland Security – 629

C2 Interoperability: Simulation, Architecture and Information Security – 642

C4I-Simulation Interoperability Using the DII COE and HLA – 468

Coalition Interoperability Ontology: Sharing Situational Awareness with Allies and Agents – 619

Command and Control Automation - MIP and MSC2 FOSC – 161

Data Alignment between Army C4I Databases and Army Simulations – 653

Evaluation of Organisational Interoperability in a Network Centric Warfare Environment – 146

Finishing Together: Coalition End-State Development Since 1990 – 161

From the Battlefield to the Homeland: Building the Case for Network-Centric Response – 636

Independent Testing of Iris Recognition Technology (ITIRT) – 475

Information Engineering in Support of Multilateral Joint Operational Interoperability – 611

Integrating the Department of Defense Military Services' Technology Development Programs to Improve Time, Cost, and Technical Quality Parameters – 135

Interoperability -- An Australian View – 639

Levels of Interoperability in Coalition Systems – 646

Making the Mix Work: Coalition C2 Interoperability during Recent Operations – 161

Models of Jointness: Infrastructure Issues for Inter-Organisational Working – 642

Multinational C2 Experiments Supported by C2 Systems and Modeling and Simulations Addressing Army Transformation of Collaborative Planning and Interoperable Execution in a Coalition Environment – 615

Multinational Interoperability Requirements -- A Core Competency – 645

Multipurpose Activity Definitions and Interfaces to Support Operational Needs (MADISON) – 542

Operational Agility: Composing and Orchestrating Mission Capability Packages Through Business Process Execution Language (BPEL) – 444

Organisational Interoperability: Evaluation and Further Development of the OIM Model – 651

Report Out of the C4I Study Group – 162

Savage Modeling and Analysis Language (SMAL): Metadata for Tactical Simulations and X3D Visualizations – 640

Solving Wireless Communications Interoperability Problems among Emergency First Responders Depends on Greater National Guard Involvement – 181

System-of-Systems Governance: New Patterns of Thought – 465

The Benefit of Ontologies for Interoperability of CCIS. (Easy, Quick and Cheap Solutions are Impossible, if Semantics of CCIS are Affected.) – 620

The Coalition Aerial Surveillance and Reconnaissance (CAESAR) Approach to Enhancing the Interoperability of Coalition Ground Surveillance Systems – 224

The Quest for Effective Interoperability - Issues in Achieving a Naval Coalition Force Virtual Combat System – 645

Topics in Interoperability: Structural Programmatic in a System of Systems – 465

Toward an Interoperability Architecture – 646

Use of a Novel Organizational Structure to Support Complex Decisionmaking During Global Wargame 2000 – 489

US/UK Sensor-To-Shooter Multinational C4 Interoperability Study Force-On-Force Effectiveness Methodology – 179

## INTERPLANETARY MAGNETIC FIELDS

Near-Relativistic Electron  $c/v$  Onset Plots – 668

## INTERPLANETARY MEDIUM

Solar Radio Burst and Solar Wind Associations With Inferred Near-Relativistic Electron Injections – 669

## INTERPLANETARY SPACE

Imaging Interplanetary Disturbances Causing Forbush Decreases – 670

## INTERPOLATION

Evaluation of High Density Surface Observations in Complex Terrain and Their Contribution to the MM5 Model – 268

## INTERPROCESSOR COMMUNICATION

Efficient Hierarchic Management for Reconfiguration of Networked Information Systems – 485

Multicast Performance Analysis for High-Speed Torus Networks – 484

The USA PATRIOT Act: A Legal Analysis – 638

The USA PATRIOT Act: A Sketch – 633

User-Level QoS-Adaptive Resource Management in Server End-Systems – 485

## INTERROGATION

Active Detection of Small Quantities of Shielded Highly-Enriched Uranium Using Low-Dose 60-keV Neutron Interrogation – 570

## INTESTINES

Cell-surface Alpha-glucan in *Campylobacter jejuni* 81-176 – 402

Mosaic Structure of a Multiple-Drug-Resistant, Conjugative Plasmid from *Campylobacter jejuni* – 407

## INTRUSION DETECTION (COMPUTERS)

Intrusion and Misuse Deterrence System Employing a Virtual Network – 432

## INTRUSION

Intrusion Deception in Defense of Computer Systems – 462

## INVARIANCE

Measurements of CP-Violating Asymmetries in  $B_0$  to  $a_{1+}(1260) \pi^+ \pi^-$  Decays – 578

## INVENTORIES

A Comparable Market Study of RFID for Manual Item-Level Accountability Inventory and Tracking Systems – 156

Evaluation of Portable Emissions Measurement Systems (PEMS) for Inventory Purposes and the Not-to-Exceed Heavy-Duty Diesel Engine Regulation – 236

Inventory of U.S. Greenhouse Gas Emissions and Sinks: 1990-2005 – 259

## INVENTORY CONTROLS

A Comparable Market Study of RFID for Manual Item-Level Accountability Inventory and Tracking Systems – 156

## INVENTORY MANAGEMENT

PHM Integration with Maintenance and Inventory Management Systems (Preprint) – 498

## INVERSIONS

Collaborative Research: Ground Truth of African and Eastern Mediterranean Shallow Seismicity Using SAR Interferometry and Gibbs Sampling Inversion – 262

Inversion of Ionospheric Backscatter Radar Data in Order to Map and Model the Ionosphere – 260

Through-the-Wall Imaging from Electromagnetic Scattered Field Measurements – 553

## IODINE

Improving COIL Efficiency By Iodine Pre-Dissociation Via Corona Discharge In The Transonic Section Of The Secondary Flow – 234

## ION ACCELERATORS

Overview of the Pulse Line Ion Accelerator – 577

## ION BEAMS

Berkeley Accelerator Space Effects (BASE) Light Ion Facility Upgrade – 584

Quantitative Experiments with Electrons in a Positively Charged Beam – 606

- Self-Consistent Simulations of High-Intensity Beams and E-Coulds with WARP POSINST – 568
- Stoichiometry and Characterization of Aluminum Oxynitride Thin Films by Ion-Beam-Assisted Pulsed Laser Deposition (Preprint) – 127
- ION CYCLOTRON RADIATION**  
High Resolution Fourier Transform Ion Cyclotron Resonance (FT-ICR) Mass Spectrometry Methods and Apparatus – 72  
The Status and Future of the ICRF – 665
- ION EXCHANGE RESINS**  
Perchlorate Removal, Destruction, and Field Monitoring Demonstration – 101
- ION IRRADIATION**  
Collaborations in Nuclear Reactors – 559
- IONIZATION CHAMBERS**  
Liquid Xenon Ionization Chamber in an All-Fluoropolymer Vessel – 582
- IONIZED GASES**  
Piezoelectric AlGaN/GaN HEMTs for ion-, gas- and Polar-Liquid Sensors – 97
- IONIZING RADIATION**  
Dynamic Tissue Culture from Prostate Biopsy Specimens as a Model for Predicting Tumor Radiosensitivity to Ionizing Radiation Treatment – 381
- IONOSPHERES**  
On the Relationship of SAPS to Storm-Enhanced Density – 263
- IONS**  
A Multireference Density Functional Approach to the Calculation of the Excited States of Uranium Ions – 87  
Determination of Metal Ions in Solution by Photoluminescence Anisotropy – 115  
Ionic Cross-Linking of Ionic Cotton with Small Molecular Weight Anionic or Cationic Molecules – 103  
Pentazole-Based Energetic Ionic Liquids: A Computational Study (Preprint) – 97
- IRAN**  
Iran's Nuclear Program: Recent Developments – 594  
The Iran Sanctions Act (ISA) – 593
- IRAQ**  
Knowledge, Attitudes, and Practices Regarding Epidemiology and Management of Travelers' Diarrhea: A Survey of Front-Line Providers in Iraq and Afghanistan – 375  
Long-Range Operational Military Forecasts for Iraq – 269  
The Use of Cognitive Task Analysis and Simulators for After Action Review of Medical Events in Iraq – 367
- The Use of Cognitive Task Analysis and Simulators for the After Action Review of Medical Events in Iraq – 618
- IRIDIUM**  
Superconductors on Iridium Substrates and Buffer Layers – 606
- IRON**  
Atomic-Scale Design of Iron Fischer-Tropsch Catalysts: A Combined Computational Chemistry, Experimental, and Microkinetic Modeling Approach. (3rd Annual Report) – 105  
Corrosion Resistances of Iron Based Amorphous Metals with Yttrium and Tungsten Additions in Hot Calcium Chloride Brine & Natural Seawater. Fe48Mo14Cr15Y2C15B6 and W-Containing Variants – 69  
Corrosion Resistances of Iron-Based Amorphous Metals with Yttrium and Tungsten Additions in Hot Calcium Chloride Brine and Natural Seawater. Fe48Mo14Cr15Y2C15B6 and Variants – 107  
High-Performance Corrosion Resistant Iron Based Amorphous Metals. The Effects of Composition, Structure and Environment. Fe49.7Cr17.7Mn1.9Mo7.4W1.6B15.2C3.8Si2.4 – 107
- IRRADIATION**  
Changes in Delta-Plutonium Due to Self-Irradiation Aging Observed by Continuous In-Situ X-ray Scattering – 120
- ISCHEMIA**  
Human Platelets Exhibit Chemotaxis using Functional N-Formyl Peptide Receptors – 386
- ISOCHORIC PROCESSES**  
Isochoric Implosions for Fast Ignition – 570
- ISOLATION**  
Extensively Drug-Resistant Tuberculosis (XDR-TB): Quarantine and Isolation – 398  
Payload Isolation System for Launch Vehicles – 54
- ISOTOPES**  
Infrared Spectroscopy and Stable Isotope Geochemistry of Hydrated Silicate Glasses – 254  
Model of Energy Storage Circuit for Isotope Battery Based on SiC Schottky Diode – 212  
Neutron Induced Cross Sections for Radiochemistry Isotopes of Nickel, Copper and Zinc – 106
- ISOTROPISM**  
Impact Location for a Multilayer Transversely Isotropic Plate – 604
- ISOTROPY**  
2-D Biaxial Testing and Failure Predictions of IM7/977-2 Carbon/Epoxy Quasi-Isotropic Laminates – 82
- Elastic-Viscoplastic an Isotropic Modeling of Textured Metals and Validation using the Taylor Cylinder Impact Text – 117
- Impact Location for a Multilayer Transversely Isotropic Plate – 604
- ITERATIVE SOLUTION**  
Implicit Solvers for Large Scale Nonlinear Problems – 434
- JAMMING**  
Demonstratore Foer Stoerskydd av GNSS-Mottagare (Demonstrator for Anti-Jamming of GNSS Receivers) – 204
- JAPAN**  
Microsystems Research in Japan – 191
- JAVA (PROGRAMMING LANGUAGE)**  
Experiments with the Sun Java Real-Time System -- Part 2 – 467
- JET AIRCRAFT**  
Price vs. Performance: The Value of Next Generation Fighter Aircraft – 25
- JET CONTROL**  
Application of the Simplified Phase Plane to the Analysis and Design of Missile Jet-Relay Control Systems – 2
- JET ENGINE FUELS**  
Constraints on JP-900 Jet Fuel Production Concepts – 128  
Experimental and Detailed Numerical Studies of Fundamental Flame Properties of Gaseous and Liquid Fuels – 37
- JET ENGINES**  
Fuel Property Effects on T700 Exhaust Particulates – 132  
High Temperature Heat Exchanger Development – 215
- JET FLOW**  
Large-eddy Simulation of Round Turbulent Jets Using the Inertial LES Method with Multifractal Subgrid-Scale Modeling – 220
- JOINTS (JUNCTIONS)**  
Role of Bond Coordination and Molecular Volume on the Dielectric Constant of Mixed-Oxide Compounds – 90
- JP-8 JET FUEL**  
Modeling JP-8 Fuel Effects on Diesel Combustion Systems – 120
- KALMAN FILTERS**  
Analysis of ICESat Data Using Kalman Filter and Kriging to Study Height Changes in East Antarctica – 241  
Fusion of Imaging and Inertial Sensors for Navigation – 228  
Toward a Real-Time Measurement-Based System for Estimation of Helicopter Engine Degradation Due to Compressor Erosion – 39  
Zero Gyro Kalman Filtering in the Presence of a Reaction Wheel Failure – 667

## **KAPTON (TRADEMARK)**

Synthesis and Characterization of Space-Survivable POSS-Kapton (Trademark) Polyimides (Preprint) – 53

## **KEPLER LAWS**

Analogical Reasoning and Conceptual Change: A Case Study of Johannes Kepler – 666

## **KERNEL FUNCTIONS**

Risk Bounds for Regularized Least-Squares Algorithm with Operator-Value Kernels – 524

## **KEROSENE**

Experimental and Numerical Investigations of RP-2 Under High Heat Fluxes – 130

## **KINEMATICS**

A Qualitative Approach to Rigid Body Mechanics – 501

Qualitative Kinematics of Linkages – 500

Qualitative Reasoning about Fluids and Mechanics – 446

Scale-Independent Biomechanical Optimization – 521

## **KINETIC ENERGY**

Downstream Impacts Due to the Extratropical Transition of Tropical Cyclones Over the Western North Pacific – 267

## **KINETICS**

Comparison of Isoconversional and Model Fitting Approaches to Kinetic Parameter Estimation and Application Predictions – 108

Electromechanics of Dielectric and Piezoelectric Crystals With Point, Line, and Surface Defects – 187

Electromigration Related Effects At Metal-Metal Interfaces: Application To Railguns – 96

Mechanical and Microstructural Effects of Cold Spray Aluminum on Al 7075 Using Kinetic Metallization and Cold Spray Processes (Preprint) – 99

## **KITS**

Evaluation of Lateral-Flow Clostridium botulinum Neurotoxin Detection Kits for Food Analysis – 403

Rapid Wall-Breaching Kit, Ingress Hole Determination Experiment – 225

## **KNOWLEDGE BASED SYSTEMS**

Applying the Concept of Minimal Essential to Maintain Operational Continuity and Attain Mission Assurance During Internal and External Attacks on the Information Environment – 495

Assessing Perceptions of Knowledge Management Maturity/Capabilities: A Case Study of SAF/FM – 649

Knowledge Based Systems as a Means of Managing Aspects of Datalink Within a Decision Support System for Naval Airborne Early Warning – 460

Refinement of an Instrument to Assess Readiness for Knowledge Management – 641

Towards a Computational Model of Sketching – 450

Yet Another Role for Team Building and Work Motivation -Enabler of Knowledge Creation and Knowledge Sharing – 457

## **KRIGING**

Analysis of ICESat Data Using Kalman Filter and Kriging to Study Height Changes in East Antarctica – 241

## **LABORATORIES**

1958-2006 Precipitation Climatology for Lawrence Livermore National Laboratory, Livermore Site and Site 300 – 275

Challenges to Ensuring Secure .COM and .EDU Access to a Web-Based Air Force Laboratory Program Management – 488

## **LACTIC ACID**

Microbial Dynamics during Barley Tempeh Fermentation – 104

## **LAGOONS**

Trial Burn Plan for a Transportable Incineration System (TIS) at the Savanna Army Depot Activity (SADA) Washout Lagoon Area – 252

## **LAKES**

Feasibility Study of H(sub2)S Abatement by Incineration of Noncondensable Gases in Vented Steam Flow from Davies-State 5206-1 Geothermal Steam Well, Geysers Geothermal Steam Field, Lake County, California – 259

## **LAMINATES**

2-D Biaxial Testing and Failure Predictions of IM7/977-2 Carbon/Epoxy Quasi-Isotropic Laminates – 82

Probabilistic Analysis for the Mechanical Properties of Cross-Ply Fiber-Reinforced Composite Laminate (Postprint) – 115

Stab Sensitivity of Energetic Nanolaminates – 84

Uncertainty Quantification of Composite Laminate Damage with the Generalized Information Theory – 86

## **LAND ICE**

Analysis of ICESat Data Using Kalman Filter and Kriging to Study Height Changes in East Antarctica – 241

## **LAND USE**

Land Use Mapping with Evidential Fusion of Polarimetric Synthetic Aperture Radar and Hyperspectral Imagery – 632

## **LANDING SITES**

A Value-Focused Thinking Model for the Selection of the Best Rigid Pavement, Partial-Depth Spall Repair Material – 20

Grout Impregnation of Pre-Placed Recycled Concrete Pavement (RCP) for Rapid Repair of Deteriorated Portland Cement Concrete Airfield Pavement – 45

## **LANGUAGES**

A Physiologically Based Pharmacokinetic (PB/PK) Model for Multiple Exposure Routes of Soman in Multiple Species – 375

Next Generation Systems Languages – 455

## **LANTHANUM**

Molecular Volume and Electronic and Vibrational Polarizabilities for Amorphous LaAlO3 – 86

Substrate/Oxide Interface Interaction in LaAlO3/Si Structures – 96

## **LARGE EDDY SIMULATION**

Large-eddy Simulation of Round Turbulent Jets Using the Inertial LES Method with Multifractal Subgrid-Scale Modeling – 220

## **LASER CAVITIES**

Vertical Cavity Surface Emitting Laser Having a Gain Guide Aperture Interior to an Oxide Confinement Layer – 599

## **LASER DAMAGE**

Increasing the Laser Induced Damage Threshold of Single Crystal ZnGeP2 – 234

## **LASER HEATING**

A Hybrid Nano-Imprinting Lithography Method for Nano-Patterning Based on Infrared Pulsed Laser Heating – 233

## **LASER INDUCED FLUORESCENCE**

High-Speed Digital-Image Data Acquisition, Processing, and Visualization System for Turbulent Mixing and Combustion – 77

## **LASER INTERFEROMETRY**

Looking for Anomalous Dispersion in Weakly Ionized Plasmas Using X ray Laser Interferometry – 603

## **LASER PLASMA INTERACTIONS**

Laser Plasma Interactions in High Energy Density Plasmas – 602

## **LASER PLASMAS**

Development of Technologies to Utilize Laser Plasma Radiations Sources for Radiation Effects Sciences – 600

Polymers Used as Fuel for Laser Plasma Thrusters in Small Satellites – 123

## **LASER TARGETS**

An Infrared Camera Simulation for Estimating Spatial Temperature Profiles and Signal-to-Noise Ratios of an Airborne Laser-Illuminated Target – 234

## **LASER WEAPONS**

High-Energy Laser Weapon Integration with Ground Vehicles – 234

## **LASER-INDUCED BREAKDOWN SPECTROSCOPY**

Laser Induced Breakdown Spectroscopy (LIBS) Applied to Reacting Gases for Mixture Ratio Measurement and Detection of Metallic Species – 99

## LASERS

An Infrared Camera Simulation for Estimating Spatial Temperature Profiles and Signal-to-Noise Ratios of an Airborne Laser-Illuminated Target – 234

Development of Technologies to Utilize Laser Plasma Radiations Sources for Radiation Effects Sciences – 600

Evaluation of the Safety and Efficacy of Excimer Laser Keratorefractive Surgery in U.S. Army Soldiers using the latest Battlefield Technologies – 233

Exploiting Adaptive Optics with Deformable Secondary Mirrors – 231

High Resolution Anatomic and Elastographic Transrectal Ultrasound for Improved Diagnosis of Prostate Cancer – 350

In-Track Demonstration of Laser-Treated Rail to Reduce Friction and Wear – 74

Photonic Crystal Fibers – 232

Polymers Used as Fuel for Laser Plasma Thrusters in Small Satellites – 123

Red Photoluminescence Emission of Laser Dye Doped DNA and PMMA (Preprint) – 63

Terahertz Fiber Laser for Explosives Detection – 229

Time Resolved Soft X-Ray Imaging (SXRI) Diagnostic for Use at the NIF and OMEGA Laser (version 2) – 601

## LASING

Novel Two- and Three-Photon Pumped Lasing Dyes: Design, Synthesis, and Characterization – 232

## LAUNCH VEHICLES

Air Force-Navy Team Achieves Important Flight Test Milestone for Responsive Space Lift – 50

Analysis of Crossflow Transition Flight Experiment aboard the Pegasus Launch Vehicle – 43

Chamber Core Structures for Fairing Acoustic Mitigation – 50

Determining Logistics Ground Support Manpower Requirements for a Reusable Military Launch Vehicle – 57

Fault Tolerant Optimal Trajectory Generation for Reusable Launch Vehicles (Preprint) – 48

Investigation of Advanced Propellants to Enable Single Stage to Orbit Launch Vehicles – 51

Payload Isolation System for Launch Vehicles – 54

The Independent Readiness Team (IRRT) of SMC – 49

## LAUNCHING

Human Factors Evaluation of the High Mobility Artillery Rocket System (HIMARS) in the Combined HIMARS-Guided Multiple Launch Rocket System (GMLRS) Initial Operational Test – 424

Human Factors Evaluation of the XM30 Guided Multiple Launch Rocket System (GMLRS) in the Combined High Mobility Artillery Rocket System (HIMARS)-GMLRS Initial Operational Test – 423

## LAW (JURISPRUDENCE)

Access to Government Information in the USA – 650

Assessing an Automated, Information Sharing Technology in the Post '9-11' Era: Do Local Law Enforcement Officers Think It Meets Their Needs – 658

Assessing Error in PMI (Post-Mortem Interval) Prediction Using a Forensic Entomological Computer Model – 437

Assessing Technology, Methods, and Information for Committing and Combating Cyber Crime – 428

Detection of Explosives on Airline Passengers: Recommendation of the 9/11 Commission and Related Issues – 10

Digital Evidence in the Courtroom: A Guide for Law Enforcement and Prosecutors – 437

Extensively Drug-Resistant Tuberculosis (XDR-TB): Quarantine and Isolation – 398

Homeland Security Act of 2002: Critical Infrastructure Information Act – 639

Homeland Security: Protecting Airspace in the National Capital Region – 25

Information Security: Federal Deposit Insurance Corporation Needs to Sustain Progress Improving Its Program – 167

Journalists' Privilege: Overview of the Law and 109th Congress Legislation – 657

Libraries and the USA PATRIOT Act – 635

Mandatory Vaccinations: Precedent and Current Laws – 393

National Security Letters in Foreign Intelligence Investigations: A Glimpse of the Legal Background and Recent Amendments – 633

National Security Letters in Foreign Intelligence Investigations: Legal Background and Recent Amendments – 634

Privacy: An Abbreviated Outline of Federal Statutes Governing Wiretapping and Electronic Eavesdropping – 156

Real Time Identification – 475

Requirements and Information Metadata System – 632

Strategies for the Integration of Medical and Health Representation within Law Enforcement Intelligence Fusion Centers – 312

Technical and Non-Technical Problems in Biometric Physical Access Control Systems – 473

Testing and Evaluation of Dynasig Biometric Pen in Support of Tactical Military and Law Enforcement Missions – 422

The President's Identity Theft Task Force: Combating Identity Theft a Strategic Plan – 652

The USA PATRIOT Act: A Legal Analysis – 638

The USA PATRIOT Act: A Sketch – 633

## LAWS

A Strong Zero-One Law for Connectivity in One-Dimensional Geometric Random Graphs With Non-Vanishing Densities – 527

Mandatory Vaccinations: Precedent and Current Laws – 393

## LEAD ACID BATTERIES

Heat Generation during Overcharge in Sealed Cells – 248

## LEADERSHIP

A Comparative Assessment of Knowledge Management Education Across the USA Department of Defense – 636

A Comparative Assessment of Knowledge Management Leadership Approaches within the Department of Defense – 638

Assessing Perceptions of Knowledge Management Maturity/Capabilities: A Case Study of SAF/FM – 649

Defense Acquisitions. Improved Management and Oversight Needed to Better Control DOD's Acquisition of Services – 492

Impact of Information Technology-For Strategic Leaders – 181

Portfolio Management Decision Support Tools Analysis Relating to Management Value Metrics – 635

The Effects of Social Network Centrality on Group Satisfaction – 477

Yet Another Role for Team Building and Work Motivation -Enabler of Knowledge Creation and Knowledge Sharing – 457

## LEADING EDGES

Coalition CINC 21 - Leading-Edge Information Technologies to Support Coalition Operations – 627

Effects of Nose Bluntness on Stability of Hypersonic Boundary Layers over Blunt Cone – 4

Hypersonic Magneto-Fluid-Dynamic Compression in Cylindrical Inlet – 221

## LEAKAGE

GaN Wide Band Power Integrated Circuits (Preprint) – 96

Self Limiting Gate Leakage Driver – 200

Using Cyclic Memory Allocation to Eliminate Memory Leaks – 442

## LEARNING

Active Conceptual Modeling of Learning Workshop 10-12 May 2006 – 656

Learning Robustly From Instructions – 519

- Simulation-Based Learning: Workshops for Researchers and Educators in the Western USA, and the Pacific Rim – 619
- Yet Another Role for Team Building and Work Motivation -Enabler of Knowledge Creation and Knowledge Sharing – 457
- LEAST SQUARES METHOD**
- Empirical Effective Dimension and Optimal Rates for Regularized Least Squares Algorithm – 524
- Risk Bounds for Regularized Least-Squares Algorithm with Operator-Value Kernels – 524
- LEGAL LIABILITY**
- The Supreme Court's Climate Change Decision: Massachusetts v. EPA – 263
- LENSES**
- High Spatial Resolution X-ray and Gamma Ray Imaging System Using Crystal Diffraction Lenses – 557
- How the Car Affects the Activity patterns of Children and Youth – 170
- Possible Use of Electron Lenses in LHC – 586
- LEPTONS**
- Gravi-Leptogenesis: Leptogenesis from Gravity Waves in Pseudo-Scalar Driven Inflation Models – 673
- Radiative Penguin Decays at the B Factories – 578
- Resonant Second Generation Slepton Production at the Tevatron – 586
- SUSY Multilepton Signatures at Tevatron – 576
- LESIONS**
- Noninvasive Methods for Determining Lesion Depth from Vesicant Exposure – 373
- The Role of Oncogene/Tumor Suppressor Interaction with the Centrosome Protein Pericentrin in Prostate Tumorigenesis – 322
- LETHALITY**
- Lethality and Autonomous Robots: An Ethical Stance – 504
- Targeting Breast Cancers Featuring Activating Mutations in PIK3CA by Generating a Lethal Dose of PIP3 – 358
- LEUKEMIAS**
- A BCR-ABL Kinase Activity-Independent Signaling Pathway in Chronic Myelogenous Leukemia – 351
- Mechanisms of Disease Persistence in Chronic Myelogenous Leukemia (CML) – 318
- LEUKOCYTES**
- Human Leukocyte Antigen (HLA) Genotype as a Contributor to Racial/Ethnic Differences in Breast Cancer: A Population-Based Molecular Epidemiologic Study – 285
- Sulfur Mustard-induced Neutropenia: Treatment with Granulocyte Colony-stimulating Factor – 110
- White Blood Cell Counts and Malaria – 400
- LIBRARIES**
- A Partnership Training Program in Breast Cancer Diagnosis: Concept Development of the Next Generation Diagnostic Breast Imaging Using Digital Image Library and Networking Techniques – 296
- Charting a Course for the 21st Century: NLM's (National Library of Medicine's) Long Range Plan, 2006-2016 – 658
- Crack Growth and Stress Intensity Prediction Techniques. Delivery Order 0004: Implementing Models and Libraries – 31
- Detection of Genes Modifying Sensitivity to Proteasome Inhibitors Using a shRNA Library in Breast Cancer – 364
- Grid Computing for High Performance Computing (HPC) Data Centers – 451
- Libraries and the USA PATRIOT Act – 635
- POINT 2007: A Temperature Dependent ENDF/B-VII.0 Data Cross Section Library – 562
- LIFE CYCLE COSTS**
- The Costs of Not Using Green Design in the USAF: Would Using Green Building Design Have Resulted in Life Cycle Cost – 213
- LIFE (DURABILITY)**
- A Comprehensive Survey of the Plasmodium Life Cycle by Genomic, Transcriptomic, and Proteomic Analyses – 389
- A Feasibility Study of Life-Extending Controls for Aircraft Turbine Engines Using a Generic Air Force Model (Preprint) – 550
- Need for Robust Sensors for Inherently Fail-Safe Gas Turbine Engine Controls, Monitoring, and Prognostics (Postprint) – 23
- LIGANDS**
- Cell Cycle Dependence of TRAIL Sensitivity in Prostate Cancer Cells – 303
- Ligand Field Strengths of Carbon Monoxide and Cyanide in Octahedral Coordination – 92
- LIGHT EMITTING DIODES**
- Final Scientific/Technical Phase I Report on Sliding Mode Pulsed Current Averaging IC Drivers for High-Brightness Light Emitting Diodes – 603
- Nano-Dots Enhanced White Organic Light-Emitting Diodes – 90
- Organic Light-Emitting Diodes and Related Hole Transport Compounds – 207
- Self Assembled, Ultra-Hydrophobic Micro/Nano-Textured Surfaces – 79
- LIGHT IONS**
- Berkeley Accelerator Space Effects (BASE) Light Ion Facility Upgrade – 584
- LIGHT MODULATION**
- Reversible Electrodeposition Optical Modulation Device with Conducting Polymer Counter Electrode – 214
- LIGHT MODULATORS**
- Coherence and Polarization Properties of Far Fields Generated by Quasi-Homogeneous Planar Electromagnetic Sources (Postprint) – 602
- LIGHT SOURCES**
- Gas Detector LCLS Engineering Specifications Document – 574
- High Efficiency Grazing Incidence Pumped X ray Laser – 601
- New Strategic Plan Takes the ALS into the Future – 576
- LIGHTHILL GAS MODEL**
- A Weighted Essentially Non-Oscillatory Numerical Scheme for a Multi-Class LWR Model – 509
- LIGHTNING**
- Pager Phones: Circuit Protection – 168
- LINEAR ACCELERATORS**
- Berkeley Accelerator Space Effects (BASE) Light Ion Facility Upgrade – 584
- Flash X-ray (FXR) Linear Induction Accelerator(LIA) Optimization Upgrade of the OTR Emittance Diagnostic – 575
- Gas Detector LCLS Engineering Specifications Document – 573
- Injector Test Facility for the LCLS. Executive Summary – 566
- LINEAR ARRAYS**
- Characteristics and Use of a Parametric End-Fired Array for Acoustics in Air – 225
- Nondestructive Evaluation (NDE) Technology Initiatives II Delivery Order 0001: Multi-Layer Cracks and Multi-site Damage NDE – 193
- Reconfigurable Linear Sensor Arrays for Reduced Channel Count – 208
- LINEAR EQUATIONS**
- High-Order Higdon Non-Reflecting Boundary Conditions for the Linearized Euler Equations – 527
- Implementation of a High-Speed Numeric Function Generator on a COTS Reconfigurable Computer – 513
- Learning Robustly From Instructions – 519
- LINEAR PROGRAMMING**
- A Method for Including Control Effector Interactions in the Control Allocation Problem (Preprint) – 461
- Optimal UAV Task Assignment and Scheduling (Preprint) – 24

UAV Scheduling via the Vehicle Routing Problem with Time Windows (Preprint) – 20

#### LINEAR SYSTEMS

Implementation of a High-Speed Numeric Function Generator on a COTS Reconfigurable Computer – 513

Parallel Auxiliary Space AMG for Definite Maxwell Problems – 436

#### LINEARITY

Linearity and Efficiency Performance of GaN HEMTs with Digital Pre-Distortion Correction (Preprint) – 95

Proving Atomicity: An Assertional Approach – 487

Reconfigurable Linear Sensor Arrays for Reduced Channel Count – 208

#### LINKAGES

Locating a Prostate Cancer Susceptibility Gene on the X Chromosome by Linkage Disequilibrium Mapping Using Three Founder Populations in Quebec and Switzerland – 353

Qualitative Kinematics of Linkages – 500

#### LIPID METABOLISM

Dietary Fat, Fat Metabolizing Genes, and Prostate Cancer Risk in African-Americans and Whites – 340

#### LIPIDS

A Dual-Action Approach to Multidrug-Resistant Breast Cancer: Prophylaxis to Ensure Therapeutic Effect – 406

Biomimetic Energy Transduction: Artificial Photosynthesis in a Stabilized Lipid Membrane Coupled to a Semiconductor – 204

Steroid Lipid-Modified Polyurethane as an Implantable Biomaterial, the Preparation and Uses Thereof – 72

#### LIQUEFACTION

Electromigration Related Effects At Metal-Metal Interfaces: Application To Railguns – 96

#### LIQUEFIED GASES

Liquid Xenon Ionization Chamber in an All-Fluoropolymer Vessel – 582

#### LIQUEFIED NATURAL GAS

Consequence Assessment Methods for Incidents Involving Releases From Liquefied Natural Gas Carriers – 607

Improving the Resiliency of the Natural Gas Supply and Distribution Network – 129

Liquefied Natural Gas (LNG) Import Terminals: Siting, Safety and Regulation – 129

#### LIQUID CHROMATOGRAPHY

Identification, Cloning, and Expression of Potential Diagnostic Markers for Q Fever – 388

#### LIQUID COOLING

Thermal Conductivity of Copoly(ethylene vinyl acetate)/Nano-Filler Blends – 83

#### LIQUID CRYSTALS

Development of a 3-D Defocusing Liquid Crystal Particle Thermometry and Velocimetry (3DDLCPTV) System – 111

Polymers for Orientation and Stability of Liquid Crystals – 75

#### LIQUID FUELS

Experimental and Detailed Numerical Studies of Fundamental Flame Properties of Gaseous and Liquid Fuels – 38

Experimental and Numerical Investigations of RP-2 Under High Heat Fluxes – 130

#### LIQUID OXYGEN

Hydrogen Pressurization of LOX: High Risk/High Reward (Preprint) – 97

#### LIQUID PROPELLANT ROCKET ENGINES

Code Validation of CFD Heat Transfer Models for Liquid Rocket Engine Combustion Devices – 217

Dark Core Analysis of Coaxial Injectors at Sub-, Near-, and Supercritical Conditions in a Transverse Acoustic Field – 589

Experimental and Numerical Investigations of RP-2 Under High Heat Fluxes – 130

Laser Induced Breakdown Spectroscopy (LIBS) Applied to Reacting Gases for Mixture Ratio Measurement and Detection of Metallic Species – 99

Numerical Analysis of Chamber Wall Heat Transfer in a GH<sub>2</sub>/GO<sub>2</sub> Sub-Scale Combustor – 98

#### LIQUID ROCKET PROPELLANTS

Hydrogen Pressurization of LOX: High Risk/High Reward (Preprint) – 97

Investigation of Ignition Delay: Novel Beta-Substituted Ethylazide Derivatives as Potential New Liquid Propellant Fuels (Preprint) – 100

Swirl-Stabilized Injector Flow and Combustion Dynamics for Liquid Propellants at Supercritical Conditions – 217

#### LIQUIDS

Pentazole-Based Energetic Ionic Liquids: A Computational Study (Preprint) – 97

Radon-222 as a Natural Tracer for Monitoring the Remediation of NAPL Contamination in the Subsurface – 102

#### LITHIUM NIOBATES

Nonclassical Properties of Pulsed Second-Subharmonic Generation in Photonic-Band-Gap Structures – 196

#### LITHIUM

Battery System – 246

#### LITHOGRAPHY

A Hybrid Nano-Imprinting Lithography Method for Nano-Patterning Based on Infrared Pulsed Laser Heating – 233

Fabrication of Nanoscaled Systems – 229

Placement of Conjugated Oligomers in an Alkanethiol Matrix by Scanned Probe Microscope Lithography – 121

#### LIVER

Analysis of MALDI-TOF Serum Profiles for Biomarker Selection and Sample Classification – 309

The Effect of Hypotensive Resuscitation and Fluid Type on Mortality, Bleeding, Coagulation, & Dysfunctional Inflammation in a Swine Grade V Liver Injury Model – 314

Toxicity and Radioprotective Effects of DF-1 and Carbon Nanotubes in Human Lung and Liver Cell Lines – 418

Transcriptional Analysis of In vivo Plasmodium yoelii Liver Stage Gene Expression – 404

#### LOADS (FORCES)

Evaluation of Serviceability Requirements for Load Rating Prestressed Concrete Bridges – 240

Incident, Action, Recovery, and Recommissioning for the 4.5-MJ Pulsed Power Supply Located at the Electromagnetic Gun Facility, Barricade C, Aberdeen Proving Ground, MD – 202

Innovative Concept for a Heavy-Load Aircraft Utilizing a Two-Dimensional Wing – 36

Topology of On/Off Marx Modulator with Protection of Load and Solid State Switches – 579

#### LOCAL AREA NETWORKS

A Limited Objective Experiment on Wireless Peer-To-Peer Collaborative Networking – 492

Leveraging Command and Control Technology to Provide Advanced Environmental Effects Decision Aids on the Battlefield – 273

Multi-Agent Systems in Mobile Ad hoc Networks – 626

Wireless Intrusion Detection – 483

#### LOCOMOTION

The Effect of Increasing Mass on Locomotion – 414

The Role of TSC Proteins in Regulating Cell Adhesion and Motility – 281

#### LOGISTICS MANAGEMENT

Determining Logistics Ground Support Manpower Requirements for a Reusable Military Launch Vehicle – 58

The Chaos of Katrina – 267

#### LOGISTICS

An Expose of Autonomous Agents in Command and Control Planning – 499

Feasibility Study of Variance Reduction in the Logistics Composite Model – 522

Interim Heavy Airlift: Sea Base Logistics Glider Concept – 14

- Joint and Allied Logistics Opportunities and Tools Supporting 21st Century War Fighter Rapid Decisive Operations – 149
- PHM Integration with Maintenance and Inventory Management Systems (Preprint) – 498
- Puzzle-Based Storage Systems – 518
- Reducing the 'Gap of Pain': A Strategy for Optimizing Federal Resource Availability in Response to Major Incidents – 526
- Sizing Mobility Readiness Spares Packages for Today's Warfighting Units – 21
- LONG DURATION SPACE FLIGHT**
- Artificial Gravity: Will it Preserve Bone Health on Long-Duration Missions? – 411
- Multi-System Effects of Daily Artificial Gravity Exposures in Humans Deconditioned by Bed Rest – 418
- LONG WAVE RADIATION**
- Observation of Tidal Effects on LWIR Radiance Above the Mesopause – 262
- LONGITUDINAL CONTROL**
- Modeling and Simulation of Longitudinal Dynamics for LEH-HER PEP II Rings – 581
- LONGITUDINAL STABILITY**
- Notes on Longitudinal Dynamics in UMER – 568
- LOSSES**
- Effects of Bovine Polymerized Hemoglobin in Coagulation in Controlled Hemorrhagic Shock in Swine – 385
- LOW CONCENTRATIONS**
- The Use of a Low-Concentration Heparin Solution to Extend the Life of Central Venous Catheters in the African Green Monkeys (*Chlorocebus aethiops*) – 402
- LOW COST**
- Implementing a Low-Cost Long-Range Unmanned Underwater Vehicle: The SeaDiver Glider – 505
- Low Cost Parachute – 2
- LOW FREQUENCIES**
- Acoustic Thermometry of Ocean Climate: Marine Mammal Issues – 587
- Preliminary Low Frequency Electromagnetic Analysis of a Flux Concentrator – 569
- LOW PRESSURE**
- Gas Turbine Engine Including a Low Pressure Sump Seal Buffer Source and Thermally Isolated Sump – 41
- LOW TEMPERATURE**
- Aircraft Battery Design Concept for Improved Ultra Low Temperature Performance (Postprint) – 17
- Evaluation of *Daphnia Magna* Neonate Viability under Low Temperature Exposure Conditions – 310
- Investigation of Low Temperature Metal Induced Crystallization and Doping of Silicon Using Various Excitation Sources for Solar Cells and other Microelectronic Applications. – 604
- LUBRICATION**
- Ionic Liquid Lubrication of MEMS Devices: An AFM Based Analysis and Evaluation on Test Devices (Preprint) – 591
- LUMINAIRES**
- Working Report on Visible and IR Electromagnetic Emissions from HMMWV External Black-Out (BO) Lighting – 597
- LUNAR DUST**
- A Study of the Attraction Forces of Lunar Dust Simulant – 664
- Effects of Lunar Dust Simulant (JSC-1A-vf) on WI-38 Human Embryonic Lung Cells – 417
- LUNAR SURFACE**
- A Study of the Attraction Forces of Lunar Dust Simulant – 664
- An Evidence-based Approach to Developing a Management Strategy for Medical Contingencies on the Lunar Surface: The NASA/Haughton-Mars Project (HMP) 2006 Lunar Medical Contingency Simulation at Devon Island – 415
- LUNGS**
- A Chemoprevention Trial to Study the Effects of High Tea Consumption on Smoking-Related Oxidative Stress – 340
- Effects of Lunar Dust Simulant (JSC-1A-vf) on WI-38 Human Embryonic Lung Cells – 417
- Genomic Analysis of Rodent Pulmonary Tissue Following Bis-(2-chloroethyl) Sulfide Exposure – 379
- IMPACT (Imaging and Molecular Markers for Patients with Lung Cancer: Approaches with Molecular Targets and Complementary, Innovative and Therapeutic Modalities) – 345
- Integration of Anatomic and Pathogenic Bases for Early Lung Cancer Diagnosis – 506
- Prenatal Exposure to Nicotine and Childhood Asthma: Role of Nicotine Acetylcholine Receptors, Neuropeptides and Fibronectin Expression in Lung – 333
- Proteomic Analysis of Bronchoalveolar Lavage Fluid: Effect of Acute Exposure to Diesel Exhaust Particles in Rats – 335
- Toxicity and Radioprotective Effects of DF-1 and Carbon Nanotubes in Human Lung and Liver Cell Lines – 418
- LYMPHOCYTES**
- Are Anti-Inflammatory Lymphocytes Able to Induce Remission of Breast Cancer. Addendum – 364
- HIV Gag Protein Conjugated to a Toll-like Receptor 7/8 Agonist Improves the Magnitude and Quality of Th1 and CD8+ T Cell Responses in Nonhuman Primates – 397
- HLA-A2 Supertype-Restricted Cell-Mediated Immunity by Peripheral Blood Mononuclear Cells Derived from Malian Children with Severe or Uncomplicated Plasmodium falciparum Malaria and Healthy Controls – 400
- Intra-Prostate Cancer Vaccine Inducer – 354
- MACH NUMBER**
- Analysis of Crossflow Transition Flight Experiment aboard the Pegasus Launch Vehicle – 44
- MACHINE LEARNING**
- A Survey of Statistical Machine Translation – 510
- Boot Camp for Cognitive Systems: A Model for Preparing Systems with Machine Learning for Deployment – 463
- MACHINE TRANSLATION**
- A Survey of Statistical Machine Translation – 510
- MACROPHAGES**
- Murine Macrophages Kill the Vegetative Form of *Bacillus anthracis* – 395
- MAGNESIUM ALLOYS**
- Ballistic Evaluation of Magnesium Alloy AZ31B – 117
- MAGNETIC FIELD RECONNECTION**
- Observational Properties of Coronal Mass Ejections – 671
- MAGNETIC FIELDS**
- Hamiltonian Analysis of Charged Particle Gyromotion in Cylindrical Coordinates – 513
- On the Relationship of SAPS to Storm-Enhanced Density – 263
- Understanding Magnetic Eruptions in the Sun and Their Interplanetary Consequences – 667
- MAGNETIC FILMS**
- Symposium Q: Magnetic Thin Films, Heterostructures, and Device Materials – 197
- MAGNETIC INDUCTION**
- Adaptive and Iterative Processing Techniques for Overlapping Signatures – 556
- MAGNETIC MATERIALS**
- Symposium Q: Magnetic Thin Films, Heterostructures, and Device Materials – 197
- MAGNETIC MEASUREMENT**
- Field Demonstration and Validation of a New Device for Measuring Groundwater and Perchlorate Fluxes at IHDIV-NSWC, Indian Head, MD – 139

Field Demonstration and Validation of a New Device for Measuring Water and Solute Fluxes at Naval Base Ventura County (NBVC), Port Hueneme, CA – 138

Field Demonstration and Validation of a New Device for Measuring Water and Solute Fluxes NASA LC-34 SITE – 138

#### **MAGNETIC PROPERTIES**

Organic Polymers with Magneto-Dielectric Properties – 124

Radiation Damage Effects on the Magnetic Properties of  $\text{Pu}(1-x)\text{Am}(x)$  ( $x=0.224$ ) – 562

Spin Electronics – 189

#### **MAGNETIC RESONANCE**

Combined Contrast-Enhanced MRI and Fluorescence Molecular Tomography for Breast Tumor Imaging – 376

Detection and Evaluation of Early Breast Cancer via Magnetic Resonance Imaging: Studies of Mouse Models and Clinical Implementation – 365

Intensity Modulated Radiation Treatment of Prostate Cancer Guided by High Field MR Spectroscopic Imaging – 355

Magnetic Resonance Based Diagnostics for Polymer Production and Surveillance – 67

Measuring 'Impossible' Intermolecular Cross-Peaks to Improve Selectivity and Sensitivity in Breast MRI – 396

MR Imaging Based Treatment Planning for Radiotherapy of Prostate Cancer – 349

Potential Applications of Microtesla Resonance Imaging Detected Using a Superconducting Quantum Interference Device – 560

#### **MAGNETIC STORAGE**

Antiferromagnetically Stabilized Pseudo Spin Valve for Memory Applications – 438

Feasibility Study on Magnetic Content Addressable Memory – 196

High Temperature Magnetic Shape Memory Ni-Mn-Ga Alloys for a New Class of Actuators and Sensor – 119

#### **MAGNETOHYDRODYNAMIC STABILITY**

Mission Support for the Communications/Navigation Outage Forecast Satellite – 49

#### **MAGNETOHYDRODYNAMIC TURBULENCE**

Broken Symmetries and Magnetic Dynamos – 220

#### **MAGNETO-OPTICS**

Spin Electronics – 189

#### **MAGNETORESISTIVITY**

Nondestructive Evaluation (NDE) Technology Initiatives II Delivery Order 0001: Multi-Layer Cracks and Multi-site Damage NDE – 193

Symposium Q: Magnetic Thin Films, Heterostructures, and Device Materials – 197

#### **MAGNETOSPHERES**

Possibility for Artificially Inducing Strong Pitch Angle Diffusion in the Magnetosphere – 261

#### **MAGNETOSTATICS**

Hypothesis of the Magnetostatic Turbulence and its Implications for Astrophysics – 672

#### **MAGNETS**

Preliminary Study of Using 'Pipetron'-Type Magnets for a Pre-Accelerator for the LHC – 566

#### **MAINTAINABILITY**

Building the Readiness Data Warehouse – 479

Effects of Using NATEC Services within E-2C and FA-18 Operational Squadrons – 24

Refinement of an Instrument to Assess Readiness for Knowledge Management – 641

#### **MAINTENANCE TRAINING**

Task Adaptable Display of Information for Training, Maintenance, and Emergency Response – 654

#### **MAINTENANCE**

Advanced Visual and Instruction Systems for Maintenance Support (AVIS-MS) – 625

Capability Based Resourcing for DPEM – 9

Environmental Impacts of Airport Operations: Maintenance, and Expansion – 44

FEM Modeling of Guided Wave Behavior in Integrally Stiffened Plate Structures – 29

Maintenance of Glucose Homeostasis through Acetylation of the Metabolic Transcriptional Coactivator PGC-1 $\alpha$  – 343

p63 in Development and Maintenance of the Prostate Epithelium – 355

PHM Integration with Maintenance and Inventory Management Systems (Preprint) – 498

Programmed Depot Maintenance Capacity Assessment Tool: Workloads, Capacity, and Availability – 33

Rapid Runway Repair (RRR): An Optimization for Minimum Operating Strip (MOS) Selection – 45

Thermal Applications for Advanced Metallic Materials (Preprint) – 18

#### **MALES**

A Novel Mechanism of Androgen Receptor Action – 288

Differential Mechanisms of Androgen Resistance – 313

Identifying Molecular Factors in Androgen Receptor Nuclear Export – 282

Knockout AR in Prostate – 280

Pilot Comparison of Stromal Gene Expression among Normal Prostate Tissues and Primary Prostate Cancer Tissues in White and Black Men – 313

Selective Androgen Receptor Downregulators (SARDs): A New Prostate Cancer Therapy – 303

Short-Term Exercise and Prostate Cancer Prevention in African American Men – 359

Unique Approaches to Androgen Effects on Prostate Cancer – 334

#### **MAMMALS**

NMR Analysis of Thiodiglycol Oxidation by Mammalian Alcohol Dehydrogenases – 372

Physical, Nutrient, and Biological Measurements of Coastal Waters off Central California in October 2006 – 407

Thiodiglycol, the Hydrolysis Product of Sulfur Mustard: Analysis of In Vitro Biotransformation by Mammalian Alcohol Dehydrogenases using Nuclear Magnetic Resonance – 384

#### **MAMMARY GLANDS**

A Biophysico-computational Perspective of Breast Cancer Pathogenesis and Treatment Response – 325

A Dual-Action Approach to Multidrug-Resistant Breast Cancer: Prophylaxis to Ensure Therapeutic Effect – 406

A MicroRNA Cluster as a Potential Breast Cancer Oncogene – 358

A Partnership Training Program in Breast Cancer Diagnosis: Concept Development of the Next Generation Diagnostic Breast Imaging Using Digital Image Library and Networking Techniques – 296

A Rat Model for Human Ductal Carcinoma In Situ – 392

Adipose Estrogen and Increased Breast Cancer Risk in Obesity: Regulation by Leptin and Insulin – 357

Antagonism of Taxol Cytotoxicity by Pro-lactin: Implications for Patient Resistance to Chemotherapy – 364

Are Anti-Inflammatory Lymphocytes Able to Induce Remission of Breast Cancer. Addendum – 364

Association between Microtubule Associated Protein -2 and the EGRF Signaling in Breast Cancer – 296

BRCA1 in Gene-Specific Coordination of Transcription and DNA Damage Response – 406

Cellular Senescence and Breast Cancer – 292

Characterization of Breast Masses Using a new Method of Ultrasound Contrast Agent Imaging in 3D Mapping of Vascular Anomalies – 391

Characterization of Breast Masses Using a New Method of Ultrasound Contrast Agent Imaging in 3D Mapping of Vascular Anomalies – 391

Characterization of the Role of Breast Tumor Kinase (BRK) in Breast Cancer Cells Non-responsive to EGFR-targeted Agents – 329

Chemokine Blockade in Combination with Cytoreductive Conditioning in Metastatic Breast Cancer – 290

Combined Contrast-Enhanced MRI and Fluorescence Molecular Tomography for Breast Tumor Imaging – 376

Contrast Enhancement for Thermal Acoustic Breast Cancer Imaging via Resonant Stimulation – 314

cSrc and Her2 Signaling Pathways Cooperate with Estrogen to Promote ER Phosphorylation, Ubiquitination and Proteolysis in ER Negative Breast Cancers – 356

Deciphering the Molecular Mechanisms of Breast Cancer – 324

Detection and Evaluation of Early Breast Cancer via Magnetic Resonance Imaging: Studies of Mouse Models and Clinical Implementation – 365

Detection of Genes Modifying Sensitivity to Proteasome Inhibitors Using a shRNA Library in Breast Cancer – 364

Development of an Automated Modality-Independent Elastographic Image Analysis System for Tumor Screening – 357

Disruption of the Circadian Rhythms of Gene Expression and the Development of Breast Cancer – 313

Domain Specific Effects of Herstatin, an Alternative HER-2 (erbB-2) Product, on erbB Positive Breast Cancer – 348

Effects of Extracellular Matrix on DNA Repair in Vivo – 363

Effects of Herstatin, an Alternative HER-2 (erbB-2) Product, on Hormonal Responsiveness of Breast Cancer – 362

Endothelial Progenitors as Vectors for Systemic Gene Therapy of Breast Cancer – 332

Evaluation of DNA Methylation as a Target for Intraductal Therapy for Ductal Carcinoma in Situ of the Breast – 319

Exploring Early Detection Methods: Using the Intraductal Approach to Predict Breast Cancer – 326

Expression and Genomic Profiling of Minute Breast Cancer Samples – 281

Functional Genomic Analysis of Breast Cancer Cell Tumorigenicity Using a Novel Gene Silencing Resource – 325

Genomic Approaches for Detection and Treatment of Breast Cancer – 346

Hot Flashes and Quality of Life Among Breast Cancer Patients – 288

Human Leukocyte Antigen (HLA) Genotype as a Contributor to Racial/Ethnic Differences in Breast Cancer: A Population-Based Molecular Epidemiologic Study – 285

Immunology, Systems Biology, and Immunotherapy of Breast Cancer – 360

Immunotherapy Targeting Tumor Stromal Fibroblasts Improves Chemotherapy of Breast Cancer – 301

Investigating the Mechanism of Action and the Identification of Breast Carcinogens by Computational Analysis of Female Rodent Carcinogens – 405

Measuring 'Impossible' Intermolecular Cross-Peaks to Improve Selectivity and Sensitivity in Breast MRI – 396

Mechanism of Telomerase Inhibition Using Small Inhibitory RNAs and Induction of Breast Tumor Cell Sensitivity – 287

Mechanisms of p53-Mediated Apoptosis – 350

Modulation of Postmenopausal Steroid Hormone Levels by Phytoestrogens and Correlation with Breast Proliferative Activity and Menopausal Symptoms – 324

Molecular Differentiation of Risk for Disease Progression: Delineating Stage-Specific Therapeutic Targets for Disease Management in Breast Cancer – 289

Molecular Mechanisms in Compromised Endothelial Barrier during Breast Cancer Metastasis – 377

Multiple Aperture Radiation Therapy (MART) for Breast Cancer – 292

Physiological Stress Reactivity and Breast Cancer – 391

Platelet Activating Factor: A Growth Factor for Breast Cancer – 341

Prognostic Significance of Telomere Attrition in Ductal Carcinoma in Situ of the Breast – 390

Protein Transduction Based Therapies for Breast Cancer – 315

Proteomic Analysis to Identify Novel Circulating Breast Cancer Markers – 322

Regulation of Apoptosis by AFG3L2, a Potential Oncogene – 293

Screening Doses for Induction of Cancers Calculated with the Interactive RadioEpidemiological Program (IREP) – 348

Selenium and Breast Cancer Chemoprevention – 339

Semi-Synthesis and In-vitro Anticancer Evaluation of Derivatives of a New Microtubule Poison with a Taxol-Like Mechanism – 401

Structure-Based Approach for Discovery of Small Molecule Inhibitors Targeted at AKT – 296

Structure-Based Design of Cdk4/6-Specific Inhibitors – 290

Structural Determination of Certain Novel ER Complexes – 304

Targeting Breast Cancers Featuring Activating Mutations in PIK3CA by Generating a Lethal Dose of PIP3 – 358

The Distribution, Levels, and Relevance of the Interleukin-1 Family of Cytokines and Receptors in Human Breast Carcinoma-Induced Osteolysis – 300

The Effect of COX-2 Inhibitors on the Aromatase Gene (CYP19) Expression in Human Breast Cancer – 347

The Impact of Tyrosine Kinase Signaling on Breast Cancer Development – 289

The Opposing Roles of Nucleophosmin and the ARF Tumor Suppressor in Breast Cancer – 283

The Role of CRELD1 Isoform 9B in the Pathogenesis of Breast Cancer – 280

The Role of RB in the Therapeutic Response of Breast Cancer – 301

The Use of a Cognitive Protectant to Help Maintain Quality of Life and Cognition in Premenopausal Women with Breast Cancer Undergoing Adjuvant Chemotherapy – 361

Three-Dimensional near Infrared Imaging of Pathophysiological Changes within the Breast – 363

## MAN MACHINE SYSTEMS

Design and Implementation of a Modular Manipulator Architecture – 546

Design and Implementation of an Intelligent Primitive Driver – 550

The Challenge of New and Emerging Information Operations – 649

## MANAGEMENT ANALYSIS

Portfolio Management Decision Support Tools Analysis Relating to Management Value Metrics – 635

## MANAGEMENT INFORMATION SYSTEMS

Defense Transportation. DOD Needs a Comprehensive Approach to Planning for Implementing Its New Personal Property Program – 659

Efficient Hierarchic Management for Reconfiguration of Networked Information Systems – 485

Knowledge Management in an Information Age Army – 547

## MANAGEMENT METHODS

Forecasting Complex Political and Military Events: The Application of Expected Utility to Crisis Situations – 654

Information Grid in Support of Crisis Management – 625

Integrating Local Public Health Agencies into the Homeland Security Community – 311

Partnerships: The Path to Improving Crisis Communication – 156

The Chaos of Katrina – 267

The Multidimensional Measurements of Geographic Information Systems (GIS) Effectiveness in Crisis Management – 611

Using Templates to Support Crisis Action Mission Planning – 455

Weathering the Storm. Leading Your Organization Through a Pandemic – 368

## MANAGEMENT PLANNING

A Strategies-to-Tasks Framework for Planning and Executing Intelligence, Surveillance, and Reconnaissance (ISR) Operations – 620

Collaboration Tool Suites Developed to Support Joint Command and Control Planning and Decisionmaking – 471

Conditions for Achieving Network-Centric Operations in Systems of Systems – 465

Defense Infrastructure. Actions Needed to Guide DOD's Efforts to Identify, Prioritize, and Assess Its Critical Infrastructure – 657

Development of a Battlefield Management System: How to Use the User – 172

Nanoscience and Technology at the Air Force Research Laboratory (AFRL) – 54

Regaining the High Ground: The Challenges of Perception Management in National Strategy and Military Operations – 661

Risk Advised Course of Action (COA) Analysis – 532

Site Inspection at Fort Allen, Puerto Rico Preliminary Assessments at San Juan ASSF, Puerto Rico and Blair Hangar AASF, St. Croix, USVI – 87

Strategic Planning to Conduct Joint Force Network Operations: A Content Analysis of NETOPS Organizations Strategic Plans – 640

System-of-Systems Governance: New Patterns of Thought – 465

The Federal Networking and Information Technology Research and Development Program: Funding Issues and Activities – 480

Topics in Interoperability: Structural Programmatic in a System of Systems – 465

U.S. Climate Change Technology Program: Vision and Framework for Strategy and Planning – 258

## MANAGEMENT SYSTEMS

PHM Integration with Maintenance and Inventory Management Systems (Preprint) – 498

Systems and Capability Relation Management in Defence Systems-of-System Context – 616

## MANAGEMENT

Chemical Management Resource Guide for School Administrators – 75

Developing the Federal Aviation Administration's Requirements for Color Use in Air Traffic Control Displays – 16

## MANEUVERS

A Centripetal Acceleration Statistic for Tracking Maneuvering Targets with Radar – 225

## MANGANESE ALLOYS

High Temperature Magnetic Shape Memory Ni-Mn-Ga Alloys for a New Class of Actuators and Sensor – 119

## MANIFOLDS (MATHEMATICS)

Towards Multi Level Optimization. Space Mapping and Manifold Mapping – 433

## MANIPULATORS

Design and Implementation of a Modular Manipulator Architecture – 546

Nanomanipulation: Buckling, Transport and Rolling at the Nanoscale – 188

## MANNED MARS MISSIONS

Assessing the Biohazard Potential of Putative Martian Organisms for Exploration Class Human Space Missions – 675

## MANNED SPACE FLIGHT

A Study of the Attraction Forces of Lunar Dust Simulant – 664

Operational Aspects of Space Radiation Analysis – 676

## MANPOWER

Determining Logistics Ground Support Manpower Requirements for a Reusable Military Launch Vehicle – 58

Effects of the Global War on Terror on Medical Service Corps Retention Rates – 311

Human Factors Engineering: An Enabler for Military Transformation Through Effective Integration of Technology and Personnel – 424

Steps Towards Determining the Right Number of Dental Recruits the Navy Should Access to Meet the Projected Targets for Navy Dental Corps Officers – 311

The Potential Impact of an Auction Based Retention Bonus and Other Factors on Continuation Rates of General Dentists Completing Their Initial Obligation – 525

## MANUALS

CCG-LCONE CT Reconstruction Code User and Programmers Guide – 571

ERDC-CERL LD-870 Download Program Developed for Aberdeen Test Center: User's Manual – 469

## MANUFACTURING

Achieving AFRL Universal FADEC Vision With Open Architecture Addressing Capability and Obsolescence for Military and Commercial Applications (Preprint) – 6

Development and Manufacture of Cost Effective Composite Drill Pipe. 2006 Annual Technical Progress Report – 84

Development of Nanocomposite Reinforced Polymeric Materials to be Used for Racks for Retorting Polymeric Trays – 123

Experience Scaling-Up Manufacturing and Emerging Photovoltaic Technologies – 245

Tag Device, Luggage Tag, and Method of Manufacturing a Tag Device – 200

## MAPPING

Multi-Hypothesis Structures, Taxonomies and Recognition of Tactical Elements for Combat Identification Fusion – 623

Regionalization of Crustal and Upper Mantle Q Structure in Eastern Eurasia Using Multiple Regional Waves – 262

## MAPS

Continent-Wide Maps of 5-50 S Rayleigh-Wave Attenuation for Eurasia Inferred from Maps of 1-Hz Lg Coda Q and its Frequency Dependence – 265

## MARIJUANA

Cannabinoid Receptors: A Novel Target for Therapy of Prostate Cancer – 321

## MARINE BIOLOGY

Acoustic Thermometry of Ocean Climate: Marine Mammal Issues – 587

Physical, Nutrient, and Biological Measurements of Coastal Waters off Central California in October 2006 – 407

## MARINE ENVIRONMENTS

Coastal and Marine Ecosystems and Global Climate Change: Potential Effects on U.S. Resources – 277

Ocean Wave Energy Harvesting Devices – 479

## MARINE MAMMALS

Acoustic Thermometry of Ocean Climate: Marine Mammal Issues – 587

## MARINE METEOROLOGY

Meteorological Factors That Lead to Separation of the California Coastal Jet from the Central Coast – 271

## MARINE PROPULSION

Navy Ship Propulsion Technologies: Options for Reducing Oil Use - Background for Congress – 244

## MARINE TECHNOLOGY

Studies on Three-Dimensional Slamming on Slender Ships – 221

## MARKERS

A Chemoprevention Trial to Study the Effects of High Tea Consumption on Smoking-Related Oxidative Stress – 340

Biomarkers for Amyotrophic Lateral Sclerosis in Active Duty Military – 338

Identification, Cloning, and Expression of Potential Diagnostic Markers for Q Fever – 388

- IMPACT (Imaging and Molecular Markers for Patients with Lung Cancer: Approaches with Molecular Targets and Complementary, Innovative and Therapeutic Modalities) – 345
- Non-Invasive Markers of Tumor Growth, Metastases, and Sensitivity to Anti-Neoplastic Therapy – 363
- Proteomic Analysis to Identify Novel Circulating Breast Cancer Markers – 322
- Selenium and Breast Cancer Chemoprevention – 339
- Stromal Mesenchyme Cell Genes in Prostate Cancer Development: Epigenetic Markers for Cancer and Potential Targets for Therapy – 316
- MARKOV PROCESSES**
- Effects-Based Design of Robust Organizations – 520
- Spatial and Temporal Abstractions in POMDPs Applied to Robot Navigation – 523
- MARS RECONNAISSANCE ORBITER**
- Thermal Modeling of the Mars Reconnaissance Orbiter's Solar Panel and Instruments during Aerobraking – 59
- MASKS**
- EUV Inspection of Reticle Defect Repair Sites – 600
- MASONRY**
- Seismic Response of a Half-Scale Masonry Building with Flexible Diaphragms – 239
- MASS SPECTROMETERS**
- Identification, Cloning, and Expression of Potential Diagnostic Markers for Q Fever – 388
- MASS SPECTROSCOPY**
- Analysis of MALDI-TOF Serum Profiles for Biomarker Selection and Sample Classification – 309
- Characterization Of Commonly Encountered Explosives Using Highfield Asymmetric Waveform Ion Mobility Spectrometry Coupled With Mass Spectrometry – 594
- High Resolution Fourier Transform Ion Cyclotron Resonance (FT-ICR) Mass Spectrometry Methods and Apparatus – 71
- Polymers Used as Fuel for Laser Plasma Thrusters in Small Satellites – 123
- Proteomic Analysis of Bronchoalveolar Lavage Fluid: Effect of Acute Exposure to Diesel Exhaust Particles in Rats – 335
- Proteomic Analysis to Identify Novel Circulating Breast Cancer Markers – 322
- Strategic Partnership for Research in Nanotechnology – 210
- MASSIVELY PARALLEL PROCESSORS**
- Purple Computational Environment with Mappings to Ace Requirements for the General Availability User Environment Capabilities. Version 2.0 – 433
- MATHEMATICAL MODELS**
- A Model for Predicting Intelligibility of Binaurally Perceived Speech – 153
- A Model of the Effects of Acceleration on a Pursuit Tracking Task – 37
- A Quantum Approach to Multi-Agent Systems (MAS), Organizations, and Control – 534
- Advances in Modeling and Simulation Capabilities for Predicting Store Trajectories - Past Success and Future Challenges – 5
- An Analysis of Small Navy Tactics Using a Modified Hughes' Salvo Model – 541
- Characterization and Evaluation of a Mass Efficient Heat Storage Device. – 237
- Characterization of VSW Environment for UUV-N Operations – 214
- Correction to Attenuation Treatment in the Monterey-Miami Parabolic Equation Model – 514
- Dynamic Tissue Culture from Prostate Biopsy Specimens as a Model for Predicting Tumor Radiosensitivity to Ionizing Radiation Treatment – 381
- Enhancement of the Computational Efficiency of Membrane Computing Models – 550
- F-15B QuietSpike(TradeMark) Aerosevoelastic Flight Test Data Analysis – 35
- Finding Stable Causal Interpretations of Equations – 506
- Knowledge Tracing and Prediction of Future Trainee Performance – 531
- Low Dimensional Modeling of Zero-Net Mass-Flux Actuators – 215
- Mathematical Fluid Dynamic Modeling of Plasma Stall-Spin Departure Control – 518
- Mathematical Modeling of Physical and Cognitive Performance Decrement from Mechanical and Inhalation Insults – 297
- Modelling Information Age Warfare: Work In Progress – 654
- Numerical Investigation for the Microstructural Effects on the Crack Growth Behavior of Particulate Composite Materials – 79
- Optimizing the Allocation of Sensor Assets for the Unit of Action – 531
- Performance Modeling and Evaluation of Topologies for Low-Latency SCI Systems – 448
- Probabilistic Modeling of Space Shuttle Debris Impact – 58

- Parametric Dynamic Load Prediction of a Narrow Gauge Rocket Sled – 135
- MECHANICAL ENGINEERING**
- Characterization and Evaluation of a Mass Efficient Heat Storage Device. – 237
- Distributed Mechanical Actuators for Design of a Closed-Loop Flow-Control System (Postprint) – 18
- MECHANICAL PROPERTIES**
- Distributed Mechanical Actuators for Design of a Closed-Loop Flow-Control System (Postprint) – 18
- Effect of Excess Carbon on the Crystallographic, Microstructural, and Mechanical Properties of CVD Silicon Carbide Fibers – 83
- High Strain Rate Mechanical Properties of Epoxy and Epoxy-Based Particulate Composites (Preprint) – 125

Image Reconstruction Based Modeling of 3D Textile Composite (Postprint) – 127

Influence of Multi-Walled Carbon Nanotubes on the Thermal and Mechanical Behavior of Carbon/Epoxy Composites (Preprint) – 113

Mechanical and Microstructural Effects of Cold Spray Aluminum on Al 7075 Using Kinetic Metallization and Cold Spray Processes (Preprint) – 99

Novel Continuous Carbon Nanofibers for the Next Generation Lightweight Structural Nanocomposites – 112

Probabilistic Analysis for the Mechanical Properties of Cross-Ply Fiber-Reinforced Composite Laminate (Postprint) – 115

#### **MEDICAL EQUIPMENT**

Quarterly Performance/Technical Reports: HLA Typing for Bone Marrow Transplantation, and Development of Medical Technology for Contingency Response to Marrow Toxic Agents – 305

The Use of a Low-Concentration Heparin Solution to Extend the Life of Central Venous Catheters in the African Green Monkeys (*Chlorocebus aethiops*) – 402

#### **MEDICAL PERSONNEL**

An Analysis of Robust Workforce Scheduling Models for a Nurse Rostering Problem – 300

Effects of the Global War on Terror on Medical Service Corps Retention Rates – 311

Integrated Clinical Training for Space Flight Using a High-Fidelity Patient Simulator in a Simulated Microgravity Environment – 415

MDS MIC Catalog Inputs – 416

Medical Reserve Corps Volunteers' Ability and Willingness to Report to Work for the Department of Health During Catastrophic Disasters – 312

#### **MEDICAL SCIENCE**

2006 In Vitro Biology Meeting. Volume 42 – 291

Can GWOT Primary Prevention Strategy More Effectively Impede Religious Extremism? – 390

Evaluation of Lateral-Flow Clostridium botulinum Neurotoxin Detection Kits for Food Analysis – 403

MDS MIC Catalog Inputs – 416

Military Nutrition Research: Four Tasks to Address Personnel Readiness and Warfighter Performance – 366

Quarterly Performance/Technical Reports: HLA Typing for Bone Marrow Transplantation, and Development of Medical Technology for Contingency Response to Marrow Toxic Agents – 305

State of the Science Meeting: Burn Care: Goals for Treatment and Research – 370

Support for the Resident Research Associateship Program with the U.S. Army Medical Research and Materiel Command – 338

Vulnerability Factors to Improve Bone Healing – 347

#### **MEDICAL SERVICES**

Advanced Technologies in Safe and Efficient Operating Rooms – 333

Children's Hospice – 293

COHORT: An Integrated Information Approach to Decision Support for Military Subpopulation Health Care – 368

Dental Considerations in a Unified Medical Command – 402

Effects of the Global War on Terror on Medical Service Corps Retention Rates – 311

Epidemiology of Transfusion-Transmitted Infections Among Multi-Transfused Patients in Seven Hospitals in Peru – 403

Evaluation of Lateral-Flow Clostridium botulinum Neurotoxin Detection Kits for Food Analysis – 403

Evaluation of the Safety and Efficacy of Excimer Laser Keratorefractive Surgery in U.S. Army Soldiers using the latest Battlefield Technologies – 233

Hospital Quality Data: HHS Should Specify Steps and Time Frame for Using Information Technology to Collect and Submit Data – 428

Incorporating New Technology to Create a Comprehensive Realistic Training Environment for the 91W – 343

Integrated Clinical Training for Space Flight Using a High-Fidelity Patient Simulator in a Simulated Microgravity Environment – 415

Mapping of WDMET in AIS 2005 and AIS 2005 Military – 644

Medical Reserve Corps Volunteers' Ability and Willingness to Report to Work for the Department of Health During Catastrophic Disasters – 312

Medical Risk in the Future Force Unit of Employment. Results of the Army Medical Department Transformation Workshop V – 304

Molecular Differentiation of Risk for Disease Progression: Delineating Stage-Specific Therapeutic Targets for Disease Management in Breast Cancer – 289

Observation on the Joint Service Military Medical Facility What Does the Future Hold – 398

Research and Operational Support for the Study of Militarily Relevant Infectious Diseases of Interest to the USA Army and the Royal Thai Army – 282

Steps Towards Determining the Right Number of Dental Recruits the Navy Should Access to Meet the Projected Targets for Navy Dental Corps Officers – 311

Strategies for the Integration of Medical and Health Representation within Law Enforcement Intelligence Fusion Centers – 312

The Demise of Russian Health Capital: The Continuity of Ineffective Government Policy – 323

Voice Recognition Interface in the Rehabilitation of Combat Amputees – 307

#### **MEDICINE**

Charting a Course for the 21st Century: NLM's (National Library of Medicine's) Long Range Plan, 2006-2016 – 658

MDS MIC Catalog Inputs – 416

#### **MEDITERRANEAN SEA**

BOUSSOLE: A Joint CNRS-INSU, ESA, CNES, and NASA Ocean Color Calibration and Validation Activity – 280

#### **MEMBRANES**

Biomimetic Energy Transduction: Artificial Photosynthesis in a Stabilized Lipid Membrane Coupled to a Semiconductor – 204

Enhancement of the Computational Efficiency of Membrane Computing Models – 550

Hydrogen Production via a Commercially Ready Inorganic Membrane Reactor. Semi-Annual Technical Progress Report for April 1, 2006 to September 30, 2006 – 68

Investigating the Functional Role of Prostate-Specific Membrane Antigen and its Enzymatic Activity in Prostate Cancer Metastasis – 344

Mode of Action of Invasion-Inhibitory Antibodies Directed against Apical Membrane Antigen 1 of *Plasmodium falciparum* – 379

Oxygen Transport Ceramic Membranes. Quarterly Report from October 2006 through December 2006 – 126

Protection Against Scrub Typhus by a Plasmid Vaccine Encoding the 56-KD Outer Membrane Protein Antigen Gene – 399

#### **MEMORY (COMPUTERS)**

Antiferromagnetically Stabilized Pseudo Spin Valve for Memory Applications – 438

Molecular Random Access Memory Cell – 441

Two Bit/Four Bit SONOS Flash Memory Cell – 200

#### **MENTAL HEALTH**

Automating Behavioral Health Screening - Addressing Risk Communication Electronically – 306

Treatment of PTSD-Related Anger in Troops Returning from Hazardous Deployments – 384

#### MENTAL PERFORMANCE

Classifying C2 Decision Making Jobs Using Cognitive Task Analyses and Verbal Protocol Analysis – 459

Cognitive, Psychomotor, and Physical Performance in Cold Air After Cooling by Exercise in Cold Water – 409

Mathematical Modeling of Physical and Cognitive Performance Decrement from Mechanical and Inhalation Insults – 297

Pharmacological and Nonpharmacological Methods of Treatment for Fragile – 410

The Use of Cognitive Task Analysis and Simulators for After Action Review of Medical Events in Iraq – 367

The Use of Cognitive Task Analysis and Simulators for the After Action Review of Medical Events in Iraq – 618

#### MERCURY CADMIUM TELLURIDES

Narrow Gap HgCdTe Absorption Behavior Near the Band Edge Including Non-parabolicity and the Urbach Tail – 102

#### MESAS

Micrometeorological and Soil Data for Calculating Evapotranspiration for Rainier Mesa, Nevada Test Site, Nevada, 2002-05 – 273

#### MESONS

Closed Orbit Distortion and the Beam-Beam Interaction – 556

#### MESOPAUSE

Observation of Tidal Effects on LWIR Radiance Above the Mesopause – 262

#### MESOSCALE PHENOMENA

Evaluation of High Density Surface Observations in Complex Terrain and Their Contribution to the MM5 Model – 268

Ultrafast, In Situ Probing of Shocked Solids at the Mesoscale and Beyond: a New Paradigm for Materials Dynamics – 573

#### MESOSPHERE

On Recent Interannual Variability of the Arctic Winter Mesosphere: Implications for Tracer Descent – 263

#### MESSAGE PROCESSING

A High-Performance Communication Service for Parallel Computing on Distributed DSP Systems – 449

Self-Stabilizing Mobile Node Location Management and Message – 511

#### MESSAGES

An Efficient Metaheuristic for Dynamic Network Design and Message Routing – 617

Self-Stabilizing Mobile Node Location Management and Message – 511

#### METABOLIC DISEASES

Artificial Pancreas for Control of BG and Insulin Levels in Hospitalized Patients with Diabetes and Stress Hyperglycemia – 328

Diabetes Care and Treatment Project: A Joslin Telemedicine Initiative – 373

Medical Vanguard Diabetes Management – 390

Third Annual Clinical Diabetes Technology Meeting – 647

#### METABOLISM

Maintenance of Glucose Homeostasis through Acetylation of the Metabolic Transcriptional Coactivator PGC-1alpha – 343

Skin Temperature Feedback Optimizes Microclimate Cooling – 272

Third Annual Clinical Diabetes Technology Meeting – 647

#### METABOLITES

Feasibility of Biomonitoring of Exposure to Permethrin Through Analysis of Long-Lived (Metabolite) Adducts to Proteins – 320

Human Exposure Biomarkers - Permethrin as a Militarily-Relevant Model – 375

Spectrophotometric Analysis of the Cyanide Metabolite 1-Aminothiazoline-6-Carboxylic Acid – 110

#### METADATA

Building an Experimental Joint Battlespace Infosphere (YJBI-CB) – 460

Requirements and Information Metadata System – 632

Savage Modeling and Analysis Language (SMAL): Metadata for Tactical Simulations and X3D Visualizations – 640

Using a Combination of UML, C2RM, XML, and Metadata Registries to Support Long-Term Development/Engineering – 452

#### METAL COATINGS

Application of Neutron-Absorbing Structural-Amorphous Metal (SAM) Coatings for Spent Nuclear Fuel (SNF) Container to Enhance Criticality Safety Controls – 131

#### METAL FILMS

Stoichiometry and Characterization of Aluminum Oxynitride Thin Films by Ion-Beam-Assisted Pulsed Laser Deposition (Preprint) – 127

#### METAL IONS

Determination of Metal Ions in Solution by Photoluminescence Anisotropy – 115

#### METAL OXIDE SEMICONDUCTORS

A Comparison of High Temperature Performance of SiC DMOSFETs and JFETs (Preprint) – 184

Self Limiting Gate Leakage Driver – 200

#### METAL OXIDES

Mixed Metal Oxide Ceramic Compositions for Reduced Conductivity Thermal Barrier Coatings – 65

Optical Fiber Chemical Sensor with Sol-Gel Derived Refractive Material as Transducer for High Temperature Gas Sensing in Clean Coal Technology (Final Report, October 1, 2004-December 31, 2006) – 254

#### METALLIC GLASSES

Microcompression of Bulk Metallic Glass and Tungsten - Bulk Metallic Glass Composites – 115

#### METALLIZING

Mechanical and Microstructural Effects of Cold Spray Aluminum on Al 7075 Using Kinetic Metallization and Cold Spray Processes (Preprint) – 99

#### METALS

Application of Neutron-Absorbing Structural-Amorphous Metal (SAM) Coatings for Spent Nuclear Fuel (SNF) Container to Enhance Criticality Safety Controls – 131

Corrosion Resistance of Structural Amorphous Metal – 104

Corrosion Resistances of Iron Based Amorphous Metals with Yttrium and Tungsten Additions in Hot Calcium Chloride Brine & Natural Seawater. Fe48Mo14Cr15Y2C15B6 and W-Containing Variants – 69

Corrosion Resistances of Iron-Based Amorphous Metals with Yttrium and Tungsten Additions in Hot Calcium Chloride Brine and Natural Seawater. Fe48Mo14Cr15Y2C15B6 and Variants – 107

Development of a Recovery System for Metals and Acids from Pickling Baths Using Nanofiltration and Crystallisation – 109

Elastic-Viscoplastic an Isotropic Modeling of Textured Metals and Validation using the Taylor Cylinder Impact Test – 117

High-Performance Corrosion Resistant Iron Based Amorphous Metals. The Effects of Composition, Structure and Environment. Fe49.7Cr17.7Mn1.9Mo7.4W1.6B15.2C3.8Si2.4 – 107

Mixtures of Metals and Polynuclear Aromatic Hydrocarbons May Elicit Complex, Nonadditive Toxicological Interactions – 78

Supported Metal Catalyst with Improved Thermal Stability – 64

Theory for the RF Surface Field for Various Metals at the Destructive Breakdown Limit – 73

Thermal Applications for Advanced Metallic Materials (Preprint) – 18

## **METASTASIS**

Chemokine Blockade in Combination with Cytoreductive Conditioning in Metastatic Breast Cancer – 290

Effect of COX-2 (PGE2) and IL-6 on Prostate Cancer Bone Mets – 294

Functional Characterization of Two Novel Human Prostate Cancer Metastasis Related Genes – 341

Gene Expression Analysis of Circulating Hormone Refractory Prostate Cancer Micrometastases – 329

Hepatocyte Growth Factor and Interleukin-6 in Prostate Cancer Bone Metastasis – 344

Imaging Primary Prostate Cancer and Bone Metastasis – 325

Immunotherapy Targeting Tumor Stromal Fibroblasts Improves Chemotherapy of Breast Cancer – 301

Investigating the Functional Role of Prostate-Specific Membrane Antigen and its Enzymatic Activity in Prostate Cancer Metastasis – 344

Mechanism of Tumor Metastasis Suppression by the KA11 Gene – 318

Molecular Mechanisms in Compromised Endothelial Barrier during Breast Cancer Metastasis – 377

Non-Invasive Markers of Tumor Growth, Metastases, and Sensitivity to Anti-Neoplastic Therapy – 363

Targeted Therapies for Myeloma and Metastatic Bone Cancers – 328

The Distribution, Levels, and Relevance of the Interleukin-1 Family of Cytokines and Receptors in Human Breast Carcinoma-Induced Osteolysis – 300

## **METEOROLOGICAL PARAMETERS**

Meteorological Factors That Lead to Separation of the California Coastal Jet from the Central Coast – 271

Meteorological Integration for the Biological Warning and Incident Characterization (BWIC) System: General Guidance for BWIC Cities – 274

On the Relationship of SAPS to Storm-Enhanced Density – 263

Theoretical Characterization of the Radiative Properties of Dust Aerosol for the Air Force Combat Climatology Center Point Analysis Intelligence System – 271

USA Meteorological Data: Daily and Hourly Files to Support Predictive Exposure Modeling – 277

## **METEOROLOGICAL RADAR**

Analysis of Operational Alternatives to the Terminal Doppler Weather Radar (TDWR) – 277

## **METEOROLOGY**

A Weighted Consensus Approach to Tropical Cyclone 96-H and 120-H Track Forecasting – 269

Catalog of Air Force Weather Technical Documents, 1941-2006 – 266

## **METHANE**

Fully Reusable Access to Space Technology (FAST) Methane Rocket – 46

New Column Designs for MicroGC (Preprint) – 197

## **METHOD OF MOMENTS**

The Joy of Computing with Volume-Integrals – 19

## **METHODOLOGY**

A Systematic Approach to Optimize Organizations Operating in Uncertain Environments: Design Methodology and Applications – 169

Facial Recognition Evaluation Project Passport Office of Canada - The Methodology and Findings – 228

## **METHYL ALCOHOL**

Smart Fuel Cell C20-MP Hybrid Fuel Cell Power Source – 249

## **METHYL COMPOUNDS**

Health Effects Support Document for Terbacil – 73

Microbial Degradation of Fuel Oxygenates under Aerobic Conditions – 113

## **METHYLATION**

Evaluation of DNA Methylation as a Target for Intraductal Therapy for Ductal Carcinoma in Situ of the Breast – 319

## **METROLOGY**

Developing Metrics in Systems Integration (ISS Program COTS Integration Model) – 608

Massive Metrology: Development and Implementation of a 3D Reference Frame for the Realignment of Fermilab's Tevatron – 606

## **MICE**

Characterization of Neurofibromas of the Skin and Spinal Roots in a Mouse Model – 408

Detection and Evaluation of Early Breast Cancer via Magnetic Resonance Imaging: Studies of Mouse Models and Clinical Implementation – 365

Determination of Antibiotic Efficacy Against Bacillus Anthracis in a Mouse Aerosol Challenge Model – 335

Development of a Mouse Model for Prostate Cancer Imaging and Study of Disease Progression – 321

Eliciting Autoimmunity to Ovarian Tumors in Mice by Genetic Disruption of T Cell Tolerance Mechanisms. Addendum – 357

Growth Factor Dependent Cholinergic Function and Survival in Primary Mouse Spinal Cord Cultures – 373

High-Throughput Analysis of Dynamic Gene Expression Associated with Sleep Deprivation and Recovery Sleep in the Mouse Brain – 409

Modeling Phenotypes of Tuberosclerosis in the Mouse – 310

Program Project on the Pathogenesis and Treatment of Parkinson's Disease – 334

Short- and Long-Term Immune Responses of CD-1 Outbred Mice to the Scrub Typhus DNA Vaccine Candidate: p47Kp – 399

## **MICROBIOLOGY**

A Comprehensive Characterization of Microorganisms and Allergens in Spacecraft Environment – 414

Cloning and Characterization of SLC26A7 and SLC26A9 Anion Exchangers – 68

## **MICROCLIMATOLOGY**

Skin Temperature Feedback Optimizes Microclimate Cooling – 272

## **MICROCOMPUTERS**

Automatic Author Profiling of Online Chat Logs – 503

## **MICROCRACKS**

Infrared Damage Detection System (IDDS) for Real-Time, Small-Scale Damage Monitoring – 119

## **MICROELECTROMECHANICAL SYSTEMS**

A Fully-Integrated MEMS Preconcentrator for Rapid Gas Sampling (Preprint) – 113

Characterization of a Silicon-Micromachined Thermal Shear-Stress Sensor – 133

Defect-Related Internal Dissipation in Mechanical Resonators and the Study of Coupled Mechanical Systems – 204

Fabrication, Characterization, and Analysis of a DRIE CMOS-MEMS Gyroscope – 140

Ionic Liquid Lubrication of MEMS Devices: An AFM Based Analysis and Evaluation on Test Devices (Preprint) – 591

MEMS Shear Stress Sensors: Promise and Progress – 190

Microconnectors and Non-Powered Microassembly Therewith – 202

Micromechanical Resonator Device Having a Desired Mode Shape – 201

Microsystems Research in Japan – 191

## **MICROELECTRONICS**

10x Improvement of Power Transmission over Free Space Using Integrated Antennas on Silicon Substrates – 191

Investigation of Low Temperature Metal Induced Crystallization and Doping of Silicon Using Various Excitation Sources for Solar Cells and other Microelectronic Applications. – 604

Microconnectors and Non-Powered Microassembly Therewith – 202

## **MICROFLUIDIC DEVICES**

Electrospray Emitter for Microfluidic Channel – 206

## **MICROGRAVITY**

Effects of Hind Limb Unloading on Pharmacokinetics of Procainamide in Mice – 417

Integrated Clinical Training for Space Flight Using a High-Fidelity Patient Simulator in a Simulated Microgravity Environment – 415

Spaceflight Alters Bacterial Gene Expression and Virulence and Reveals Role for Global Regulator Hfq – 420

## **MICROINSTRUMENTATION**

Microfabrication of a Mechanically Controllable Break Junction in Silicon – 186

## **MICROMACHINING**

Characterization of a Silicon-Micromachined Thermal Shear-Stress Sensor – 134

Microfabrication of a Mechanically Controllable Break Junction in Silicon – 186

## **MICROMECHANICS**

Finite Element Solution: Nonlinear Flapping Beams for Use with Micro Air Vehicle Design – 3

Micromechanical Resonator Device Having a Desired Mode Shape – 201

## **MICROMETEOROLOGY**

Micrometeorological and Soil Data for Calculating Evapotranspiration for Rainier Mesa, Nevada Test Site, Nevada, 2002-05 – 273

## **MICROMETERS**

High Resolution Real Time Phase Contrast Radiology Study of Hydrodynamic in Micrometer Scale – 133

## **MICROORGANISMS**

A Comprehensive Characterization of Microorganisms and Allergens in Spacecraft Environment – 414

Antimicrobial Polymeric Surfaces – 79

Assessing the Biohazard Potential of Putative Martian Organisms for Exploration Class Human Space Missions – 675

Microarray Analysis of Transposon Insertion Mutants in Bacillus Anthracis: Global Identification of Genes Required for Sporulation and Germination – 335

Microarray-based Resequencing of Multiple Bacillus anthracis Isolates – 386

Microbial Degradation of Fuel Oxygenates under Aerobic Conditions – 113

Microbial Dynamics during Barley Tempeh Fermentation – 104

Posttreatment Changes in Escherichia coli Antimicrobial Susceptibility Rates Among Diarrheic Patients Treated with Ciprofloxacin – 385

Production of Recombinant Protein Pap31 and Its Application for the Diagnosis of Bartonella bacilliformis Infection – 398

Spaceflight Alters Bacterial Gene Expression and Virulence and Reveals Role for Global Regulator Hfq – 420

Tools for Ultraspecific Probe/Primer Design – 327

## **MICROPROCESSORS**

Parallel Simulation of Chip-Multiprocessor Architectures – 447

Potential Thermal Security Risks – 441

## **MICROSCOPES**

Placement of Conjugated Oligomers in an Alkanethiol Matrix by Scanned Probe Microscope Lithography – 121

## **MICROSCOPY**

Ionic Liquid Lubrication of MEMS Devices: An AFM Based Analysis and Evaluation on Test Devices (Preprint) – 591

Nanomanipulation: Buckling, Transport and Rolling at the Nanoscale – 188

Sources of Variability in Determining Malaria Parasite Density by Microscopy – 392

## **MICROSTRUCTURE**

Effect of Excess Carbon on the Crystallographic, Microstructural, and Mechanical Properties of CVD Silicon Carbide Fibers – 84

Mechanical and Microstructural Effects of Cold Spray Aluminum on Al 7075 Using Kinetic Metallization and Cold Spray Processes (Preprint) – 99

Micro and Nano-structure Development and Multiscale Physics at Sliding Metal Interfaces. Final Report May 2006 – 78

Microstructural Evolution of Commercial-Purity Ti and Superplasticity of Ti-6Al-4V Alloy Processed by Equal Channel Angular Extrusion – 116

Microstructure of Dense Thin Sheets of gamma-TiAl Fabricated by Hot Isostatic Pressing of Tape-Cast Monotapes (Preprint) – 92

Numerical Investigation for the Microstructural Effects on the Crack Growth Behavior of Particulate Composite Materials – 79

Processing, Microstructure, and Tensile Properties of the Ti-6Al-4V-1.55B Eutectic Alloy (Preprint) – 99

## **MICROWAVE EQUIPMENT**

Application of the Community Radiative Transfer Model to Evaluate Satellite-Based Measurements Across the African Easterly Jet Over Western Africa – 48

## **MICROWAVES**

Analysis and Design of Ultra Wide-Band and High-Power Microwave Pulse Interactions With Electronic Circuits and Systems – 196

High Altitude Electromagnetic Pulse (HEMP) and High Power Microwave (HPM) Devices: Threat Assessments – 554

## **MIDDLE EAST**

Collaborative Research: Ground Truth of African and Eastern Mediterranean Shallow Seismicity Using SAR Interferometry and Gibbs Sampling Inversion – 262

## **MIE SCATTERING**

Feasibility of Measuring <sup>3</sup>He Bubble Diameter Populations in Deuterium-Tritium Ice Layers Using Mie Scattering – 573

## **MIGRATION**

Enhancement of Tumor Immunotherapy by Blockade of a Prostate Tumor Derived Immunosuppressive Factor – 281

Integration of Soluble and Adhesive Gradient Signals in Directed Cell Migration – 310

Technical Work Plan for: Near-Field Environment: Engineered Barrier System: Radionuclide Transport Abstraction Model Report – 253

Victim Migration: Dynamically Adapting Between Private and Shared CMP Caches – 442

## **MILITARY AIR FACILITIES**

Final Environmental Assessment for Construction of an Addition to Support the Joint Strike Fighter Reprogramming Facility, Building 614, on Eglin Air Force Base, Florida – 251

## **MILITARY AIRCRAFT**

Navy-Marine Corps Tactical Air Integration Plan: Background and Issues for Congress – 9

## **MILITARY HELICOPTERS**

Comanche Helicopter Program - A Strategic Failure – 30

Enhancing Army S&T Lessons from 'Project Hindsight Revisited' – 21

Military Helicopter Modernization: Background and Issues for Congress – 28

## **MILITARY OPERATIONS**

A Conceptual Operational Model for Command and Control of International Missions in the Canadian Forces – 180

A Model of Tactical Battle Rhythm – 170

A Pragmatic C4ISR Approach From the US Army CECOM Security Assistance Perspective – 614

Agile Coalition Environment (ACE) – 613

AI on the Battlefield: An Experimental Exploration (Preprint) – 501

Airborne Armed Full Motion Video: The Nexus of OPS/INTEL Integration in the Joint/Coalition Environment – 229

An Analysis of Small Navy Tactics Using a Modified Hughes' Salvo Model – 541

Analysis of Metrics Utilized in U.S. Joint Experimentation of Future C2 Concepts – 171

Army and Air Force Transformation - Are They Synchronized? – 157

Army Fire Support Investment Framework – 472

Background Modeling and Algorithm Fusion for Airborne Landmine Detection – 517

## MINING

New Metrics for Blog Mining – 622

Pager Phones: Circuit Protection – 168

Pager Phones: Installation – 167

Technology Review of Smart Sensors with Wireless Networks for Applications in Hazardous Work Environments – 168

## MINORITIES

Cord Blood Stem Cell Procurement in Minority Donors – 302

Delaware Consortium for Undergraduate Minority Training in Prostate Cancer – 362

## MISALIGNMENT

Determination of the Misorientation Dependence of the Relative Grain-Boundary Energy of Commercial-Purity Nickel (Preprint) – 118

## MISSILE CONTROL

Application of the Simplified Phase Plane to the Analysis and Design of Missile Jet-Relay Control Systems – 2

## MISSILE DEFENSE

Challenges for Vertical Collaboration Among Warfighters for Missile Defense C2 – 444

## MISSILE SYSTEMS

Integrated Sensing and Processing (ISP) Phase 2: Demonstration and Evaluation for Distributed Sensor Networks and Missile Seeker Systems – 515

## MISSILES

China: Possible Missile Technology Transfers from U.S. Satellite Export Policy - Actions and Chronology – 637

## MISSION PLANNING

Using Templates to Support Crisis Action Mission Planning – 455

## MITOCHONDRIA

Mechanisms of Alpha-synuclein Aggregation and Toxicity – 330

## MITOSIS

Centrosome-Based Mechanisms, Prognostics and Therapeutics in Prostate Cancer – 346

## MIXING LAYERS (FLUIDS)

Application of Morse Theory to Analysis of Rayleigh Taylor Topology – 569

## MIXTURES

Kapillaerelektrofores i Tva Dimensioner. Slutrapport Fran Innovationsprojekt 14215 (Two-Dimensional Capillary Electrophoresis Final Report of the Innovative Project 14215) – 68

## MOBILITY

Characterization Of Commonly Encountered Explosives Using Highfield Asymmetric Waveform Ion Mobility Spectrometry Coupled With Mass Spectrometry – 594

Human Factors Evaluation of the High Mobility Artillery Rocket System (HIMARS) in the Combined HIMARS-Guided Multiple Launch Rocket System (GMLRS) Initial Operational Test – 423

Human Factors Evaluation of the XM30 Guided Multiple Launch Rocket System (GMLRS) in the Combined High Mobility Artillery Rocket System (HIMARS)-GMLRS Initial Operational Test – 423

Route Optimization for Mobile IPV6 Using the Return Routability Procedure: Test Bed Implementation and Security Analysis – 489

Sizing Mobility Readiness Spares Packages for Today's Warfighting Units – 21

Working Report on Visible and IR Electromagnetic Emissions from HMMWV External Black-Out (BO) Lighting – 597

## MODELS

A Conceptual Operational Model for Command and Control of International Missions in the Canadian Forces – 180

A High Order WENO Scheme for a Hierarchical Size-Structured Model – 549

A Model of Command and Control Processes for JWARS: Test Results from Controlled Experiments and Simulation Runs – 151

A Strong Zero-One Law for Connectivity in One-Dimensional Geometric Random Graphs With Non-Vanishing Densities – 527

A Systematic Approach to Optimize Organizations Operating in Uncertain Environments: Design Methodology and Applications – 169

A Weighted Essentially Non-Oscillatory Numerical Scheme for a Multi-Class LWR Model – 508

Agent-Based Modeling for Testing and Designing Novel Decentralized Command and Control System Paradigms – 537

An Examination of a Structural Modeling Risk Probe Technique – 544

An Integrated Approach to Conversion, Verification, Validation and Integrity of AFRL Generic Engine Model and Simulation (Postprint) – 6

Collective Choice with Uncertain Domain Models – 535

Comparison of Isoconversional and Model Fitting Approaches to Kinetic Parameter Estimation and Application Predictions – 108

Correction to Attenuation Treatment in the Monterey-Miami Parabolic Equation Model – 514

Development of a Mouse Model for Prostate Cancer Imaging and Study of Disease Progression – 321

Elastic-Viscoplastic an Isotropic Modeling of Textured Metals and Validation using the Taylor Cylinder Impact Text – 117

Feasibility Study of Variance Reduction in the Logistics Composite Model – 522

Lumped Element Modeling of Piezoelectric-Driven Synthetic Jet Actuators – 551

Methods and Program Products for Optimizing Problem Clustering – 435

Modeling and Simulation of Longitudinal Dynamics for LEH-HER PEP II Rings – 580

Modeling the U.S. Military Intelligence Process – 448

Modelling a Network of Decision Makers – 610

Nondestructive Evaluation (NDE) Technology Initiatives II Delivery Order 0001: Multi-Layer Cracks and Multi-site Damage NDE – 193

Organisational Interoperability: Evaluation and Further Development of the OIM Model – 651

Probabilistic Analysis for the Mechanical Properties of Cross-Ply Fiber-Reinforced Composite Laminate (Postprint) – 115

Programmed Depot Maintenance Capacity Assessment Tool: Workloads, Capacity, and Availability – 33

Stochastic Lanchester Air-To-Air Campaign Model: Methods Used to Generate Model Outputs and a User's Guide: 2007 – 527

The Analysis of Network Centric Maritime Interdiction Operations (MIO) Using Queueing Theory – 625

The Entropy Solutions for the Lighthill-Whitham-Richards Traffic Flow Model with a Discontinuous Flow-Density Relationship – 515

The Role of Continuity in Residual-Based Variational Multiscale Modeling of Turbulence – 514

Transforming Intra- and Interagency Processes through Advanced Models and Simulations: An Information Assurance Model – 487

Using a Combination of UML, C2RM, XML, and Metadata Registries to Support Long-Term Development/Engineering – 452

## MODULATION

Modulation of Postmenopausal Steroid Hormone Levels by Phytoestrogens and Correlation with Breast Proliferative Activity and Menopausal Symptoms – 324

Radiation-Induced Immune Modulation in Prostate Cancer – 325

## MODULATORS

Coreless Approaches for On/Off Marx Type Modulators – 579

Quarter-Rate Superconducting Modulator for Improved High Resolution Analog-to-Digital Converter – 441

Topology of On/Off Marx Modulator with Protection of Load and Solid State Switches – 579

## MODULES

Development of an Assistive Technology and Environmental Assessment Instrument for National Surveys: Final Report. Part One: Recommended Modules and Instrument Development Process – 440

Unattended Ground Sensor Assembly – 436

## MODULUS OF ELASTICITY

Atomistic Calculation of Elastic Moduli in Strained Silicon – 187

## MOISTURE CONTENT

Skin Temperature Feedback Optimizes Microclimate Cooling – 272

## MOISTURE RESISTANCE

A New Silicon-Containing Bis(Cyanate) Ester Resin with Improved Thermal Oxidation and Moisture Resistance – 125

## MOISTURE

Application of Surface Energy Measurements to Evaluate Moisture Susceptibility of Asphalt and Aggregates – 74

System for the Evaluation of Moisture Damage Using Fundamental Material Properties – 74

## MOLECULAR BIOLOGY

Role of Merlin in the Growth and Transformation of Arachnoidal Cells – 370

Single-Cell Level Investigation of Cytoskeletal/Cellular Response to External Stimuli – 107

## MOLECULAR DYNAMICS

Applications of Molecular and Materials Modeling – 94

Atomistic Calculation of Elastic Moduli in Strained Silicon – 187

Firefighting Agent Research, Phase I – 10

Structure-Based Approach for Discovery of Small Molecule Inhibitors Targeted at AKT – 296

## MOLECULAR INTERACTIONS

Novel Molecular Interactions and Biological Functions of the Neurofibromatosis 2 Tumor Suppressor Protein, Merlin – 328

## MOLECULAR IONS

Large Concentration-Dependent Nonlinear Optical Responses of Starburst Diphenylamino-fluorencarbonyl Methano[60]Fullerene Pentaads – 88

## MOLECULAR ORBITALS

Perylene N-Type Semiconductors and Related Devices – 205

## MOLECULAR STRUCTURE

Assessment of Detection and Refinement Strategies for de novo Protein Structures using Force Field and Statistical Potentials – 353

Molecular Structure Analysis of Aminophenyl Silsesquioxane (Preprint) – 97

## MOLECULAR WEIGHT

Ionic Cross-Linking of Ionic Cotton with Small Molecular Weight Anionic or Cationic Molecules – 103

Wettability Tests of Polymer Films and Fabrics and Determination of Their Surface Energy by Contact-Angle Methods – 89

## MOLECULES

High Throughput Screening of Potential Displacer Molecules – 73

Ionic Cross-Linking of Ionic Cotton with Small Molecular Weight Anionic or Cationic Molecules – 103

Molecular Random Access Memory Cell – 441

Role of Bond Coordination and Molecular Volume on the Dielectric Constant of Mixed-Oxide Compounds – 90

The Development of Novel Small Molecule Inhibitors of the Phosphoinositide-3-Kinase Pathway through High-Throughput Cell-Based Screens – 329

## MOMENTUM TRANSFER

W + Jet Production at CDF – 585

## MONITORS

ERDC-CERL LD-870 Download Program Developed for Aberdeen Test Center: User's Manual – 469

## MONKEYS

Cross-Serotype Neutralization of Dengue Virus in *Aotus nancymae* Monkeys – 387

Establishment of a Non-human Primate *Campylobacter* Disease Model for the Pre-clinical Evaluation of *Campylobacter* Vaccine Formulations – 396

The Use of a Low-Concentration Heparin Solution to Extend the Life of Central Venous Catheters in the African Green Monkeys (*Chlorocebus aethiops*) – 402

## MONOCYTES

Intracellular Survival of *Campylobacter jejuni* in Human Monocytic Cells and Induction of Apoptotic Death by Cytolethal Distending Toxin – 394

## MONOMERS

An All-Atom Model of the Pore-Like Structure of Hexameric VP40 from Ebola: Structural Insights into the Monomer-Hexamer Transition – 331

Carbonization Studies of Glassy Carbon Derived from Bis-Ortho-Diynylarenes (BODA) (Postprint) – 100

## MONTE CARLO METHOD

An Electron Beam Method for Creating Combinatorial Libraries: Application to Next Generation Thermal Barrier Coatings Systems – 60

Applications of Molecular and Materials Modeling – 94

Cell Multipole Method for Molecular Simulations in Bulk and Confined Systems – 454

Effects-Based Design of Robust Organizations – 520

Grid-Search Techniques for Seismic Event Location and Phase Association – 261

Particle Splitting for Monte-Carlo Simulation of the National Ignition Facility – 561

## MOON

Progress Report of the IAU Working Group on Precession and the Ecliptic – 665

## MORPHOLOGY

Automating the Shadow Method for Aerosol Optical Depth Retrieval – 462

Tubular Carbon Nano/micro Structures and Method of Making Same – 74

Ultraviolet Properties of Halo Coronal Mass Ejections: Doppler Shifts, Angles, Shocks, and Bulk Morphology – 668

## MORTALITY

The Effect of Hypotensive Resuscitation and Fluid Type on Mortality, Bleeding, Coagulation, & Dysfunctional Inflammation in a Swine Grade V Liver Injury Model – 314

## MOAISCS

Mosaic Structure of a Multiple-Drug-Resistant, Conjugative Plasmid from *Campylobacter jejuni* – 407

## MOTION PICTURES

A Study of Communicating Science and Engineering – 142

## MOTION SICKNESS

Preliminary Assessment of Stroboscopic Shutter Glasses on Motion Sickness in Helicopter Passengers – 30

## MOTION SIMULATORS

Experiences Linking Vehicle Motion Simulators to Distributed Simulation Experiments – 443

## MOTION

Experiences Linking Vehicle Motion Simulators to Distributed Simulation Experiments – 443

## MOTIVATION

Searching for new Physics at CDF – 560

Yet Another Role for Team Building and Work Motivation -Enabler of Knowledge Creation and Knowledge Sharing – 457

## MOTOR VEHICLES

The Supreme Court's Climate Change Decision: Massachusetts v. EPA – 263

## MOUNTAINS

Biodegradation of DIMP, Dieldrin, Isodrin, DBCP, and PCPMSO in Rocky Mountain Arsenal Soils. Installation Restoration Program, Environmental Technology Development – 305

Gravity-Wave Dynamics in the Atmosphere – 264

Literature Review of Biodegradation in Soil of Selected Rocky Mountain Arsenal Contaminants: Isodrin, Dieldrin, Diisopropylmethyl-Phosphonate, 1,2-Dibromo-3-Chloropropane, and p-Chloro-Phenylmethylsulfonoxide – 61

## MOVING TARGET INDICATORS

Alternatives for Military Space Radar – 223

Space-Time Adaptive Processing: Fundamentals – 177

## MULTICHANNEL COMMUNICATION

Channel Hopping Multiple Access with Packet Trains for Ad Hoc Networks – 161

## MULTIDISCIPLINARY RESEARCH

MURI Center for Materials Chemistry in the Space Environment – 112

## MULTIMEDIA

Concepts Associated with Transferring Temporal and Spatial Boundary Conditions Between Modules in the Framework for Risk Analysis in Multimedia Environmental Systems (FRAMES) – 431

Evaluating an Interactive, Multimedia Education and Decision Program for Early-Stage Prostate Cancer Patients in a Randomized Controlled Trial – 342

Using Formal Methods to Reason about Architectural Standards – 472

## MULTIPATH TRANSMISSION

Eigenvector Analysis for Multipath – 549

## MULTIPLE ACCESS

A Link Scheduling and Ad Hoc Networking Approach Using Directional Antennas – 190

Channel Hopping Multiple Access with Packet Trains for Ad Hoc Networks – 161

## MULTIPLICATION

Reconfigurable Matrix Multiplier Architecture and Extended Borrow Parallel Counter and Small-Multiplier Circuits – 209

## MULTIPLIERS

Reconfigurable Matrix Multiplier Architecture and Extended Borrow Parallel Counter and Small-Multiplier Circuits – 209

## MULTIPOLES

Cell Multipole Method for Molecular Simulations in Bulk and Confined Systems – 454

## MULTIPROCESSING (COMPUTERS)

Parallel Simulation of Chip-Multiprocessor Architectures – 447

Victim Migration: Dynamically Adapting Between Private and Shared CMP Caches – 442

## MULTISENSOR APPLICATIONS

A New Multi-Sensor Track Fusion Architecture for Multi-Sensor Information Integration – 511

## MULTISENSOR FUSION

A New Multi-Sensor Track Fusion Architecture for Multi-Sensor Information Integration – 511

Advanced Target Tracking Techniques – 175

Army Intelligence Analysis and Interpretation: Assessing the Utility and Limitations of Computational Diagnostic Reasoning – 652

Concept of C4I Data Fusion Command Center for Urban Operations – 155

Counter-Trafficking Integrated Display System (CIDS): A GIS-Based Command & Control Environment for Coalition Nations – 470

Data Fusion 'Cube': A Multi-Dimensional Perspective – 628

Focused Knowledge to the Warfighter – 617

HUMINT Communication Information Systems for Complex Warfare – 642

Intelligent Data Fusion for Wide-Area Assessment of UXO Contamination. SERDP Project MM-1510. 2006 Annual Report – 637

Land Use Mapping with Evidential Fusion of Polarimetric Synthetic Aperture Radar and Hyperspectral Imagery – 631

Measuring the Value of High Level Fusion – 608

Multi-Hypothesis Structures, Taxonomies and Recognition of Tactical Elements for Combat Identification Fusion – 622

Multi-Sensor Information Fusion Technology Applied to the Development of Smart Aircraft – 8

Prognostic Fusion for Uncertainty Reduction – 35

The Canadian ISTAR Information-Centric Collaborative Workspace Concept. Paper 1: The Info-Centric Collaborative Workspace from an Organizational Perspective – 621

The Canadian ISTAR Information-Centric Collaborative Workspace Concept. Paper 2: The Info-Centric Collaborative Workspace from the Processes Perspective – 623

The Canadian ISTAR Information-Centric Collaborative Workspace Concept. Paper 3: The Info-Centric Collaborative Workspace from a Systems Perspective – 623

The Interactive DataWall – 209

Tracking and Data Fusion Applications – 177

Utilizing Network-Enabled Command and Control Concepts to Enhance ASW Effectiveness – 590

## MULTISPECTRAL RADAR

Development and Testing of a Multiple Frequency Continuous Wave Radar for Target Detection and Classification – 224

## MULTISTATIC RADAR

Bi- and Multistatic Radar – 176

## MULTIVARIATE STATISTICAL ANALYSIS

A Multivariate Magnitude Robust Control Chart for Mean Shift Detection and Change Point Estimation – 510

Outlier Detection in Hyperspectral Imaging Using Closest Distance to Center with Ellipsoidal Multivariate Trimming – 223

## MUONS

Neutron Production by Muon Spallation I: Theory – 571

Studies of a Gas-Filled Helical Muon Beam Cooling Channel – 565

## MUSCLES

Leg Muscle Usage Effects on Tibial Elasticity during Running – 296

Modeling Phenotypes of Tuberoscleriosis in the Mouse – 310

## MUSCULOSKELETAL SYSTEM

A Randomized Trial of Musculoskeletal Pain Treatment in a Military Population – 333

Behavioral Health Program Element – 417

Comparison of Meglumine Antimoniate and Pentamidine for Peruvian Cutaneous Leishmaniasis – 386

Skeletal Complications in Neurofibromatosis Type 1: The Role of Neurofibromin Haploinsufficiency in Defective Skeletal Remodeling and Bone Healing in NF1 – 377

## MUTATIONS

Microarray Analysis of Transposon Insertion Mutants in *Bacillus Anthracis*: Global Identification of Genes Required for Sporulation and Germination – 335

Restoration of Wild-Type Activity to Mutant p53 in Prostate Cancer: A Novel Therapeutic Approach – 365

Targeting Breast Cancers Featuring Activating Mutations in PIK3CA by Generating a Lethal Dose of PIP3 – 358

## NACELLES

A Review of the History of Fire Suppression on U.S. DoD Aircraft – 34

CFD Investigation of Flow Past Idealized Engine Nacelle Clutter – 226

Experimental Characterization of Turbulent Flow Around Cylinder Arrays – 219

## NAMING

An Enterprise Identifier Strategy for Global Naming Across Arbitrary C4I Systems – 459

## NANOCOMPOSITES

Challenges and Opportunities for Nanotechnology in Multi-Functional Composite Structures (Preprint) – 17

Charge Transfer Nanocomposites: The Effects of Scale-Hierarchy – 111

Development of Nanocomposite Reinforced Polymeric Materials to be Used for Racks for Retorting Polymeric Trays – 123

New Generation Photonics Materials: Design, Development, Characterization, and Applications – 210

Novel Continuous Carbon Nanofibers for the Next Generation Lightweight Structural Nanocomposites – 112

Thermal Conductivity of Copoly(ethylene vinyl acetate)/Nano-Filler Blends – 83

## NANOCRYSTALS

Collaborations in Nuclear Reactors – 559

Final Report LDRD 04-ERD-021 – 67

Structural Investigations of Surface and Orientation-Specific Phenomena in Nanocrystals and Their Assemblies – 203

## NANOINDENTATION

Final Report LDRD 04-ERD-021 – 68

## NANOPARTICLES

Control of DNA Dehybridization via Nanoparticle Antennas for Antisense Gene Therapy – 383

## NANORODS

Fabrications and Characterizations of ZnO/Zn<sub>1-x</sub>Mg<sub>x</sub>O Nanorod Quantum Structures – 186

Structural Investigations of Surface and Orientation-Specific Phenomena in Nanocrystals and Their Assemblies – 203

Synthesis of One-dimensional Nanosized Defects in High T<sub>c</sub> Superconductor – 552

## NANOSTRUCTURE (CHARACTERISTICS)

Designing of Bulk Nano-Structures with Enhanced Thermoelectric Properties – 189

Designing of Bulk Nano-Structures With Enhanced Thermoelectric Properties – 553

Micro and Nano-structure Development and Multiscale Physics at Sliding Metal Interfaces. Final Report May 2006 – 78

Vertical Alignment of Single-Walled Carbon Nanotubes on Nanostructure Fabricated by Atomic Force Microscope – 88

## **NANOSTRUCTURE GROWTH**

Novel Synthesis of Branched Carbon Nanotubes – 207

## **NANOSTRUCTURES (DEVICES)**

Advanced Materials Deposition for Semiconductor Nanostructures Using Supercritical Fluids – 185

Challenges and Opportunities for Nanotechnology in Multi-Functional Composite Structures (Preprint) – 16

Designing of Bulk Nano-Structures With Enhanced Thermoelectric Properties – 553

Fabrications and Characterizations of ZnO/Zn1-xMgxO Nanorod Quantum Structures – 186

Nanomaniipulation: Buckling, Transport and Rolling at the Nanoscale – 188

Non-Equilibrium Quantum Dots: Transport – 185

Novel Continuous Carbon Nanofibers for the Next Generation Lightweight Structural Nanocomposites – 112

Semiconductor Quantum Dot Resonant Tunnelling Spectroscopy – 185

Spin Electronics – 189

Vertical Alignment of Single-Walled Carbon Nanotubes on Nanostructure Fabricated by Atomic Force Microscope – 88

## **NANOTECHNOLOGY**

A Hybrid Nano-Imprinting Lithography Method for Nano-Patterning Based on Infrared Pulsed Laser Heating – 233

Challenges and Opportunities for Nanotechnology in Multi-Functional Composite Structures (Preprint) – 16

Compliant, Nanoscale Free-Standing Multilayer Films – 66

Defense Nanotechnology Research and Development Program – 212

Detonation Nanodiamonds and Related Materials. Bibliography Index, Issue 1 – 102

Fabrication of Nanoscaled Systems – 229

Fabrications and Characterizations of ZnO/Zn1-xMgxO Nanorod Quantum Structures – 186

Growth of a Single Freestanding Multi-wall Carbon Nanotube on each Nanonickel Dot – 92

Nanoscience and Technology at the Air Force Research Laboratory (AFRL) – 54

Non-Equilibrium Quantum Dots: Transport – 185

Novel Organic Field Effect Transistors via Nano-Modification – 197

Semiconductor Quantum Dot Resonant Tunnelling Spectroscopy – 185

Strategic Partnership for Research in Nanotechnology – 210

Taiwan - AFOSR Nanoscience Initiative Status – 198

The Basic Research Manager for the Air Force – 211

The California Central Coast Research Partnership: Building Relationships, Partnerships and Paradigms for University-Industry Research Collaboration – 193

## **NANOWIRES**

Surface-Templated Assembly for Mass-Production of ZnO Nanowire-Based Integrated Devices – 90

## **NAPHTHALENE**

Carbonization Studies of Glassy Carbon Derived from Bis-Ortho-Diynylarenes (BODA) (Postprint) – 100

## **NARROWBAND**

Distributed Computing and Collaboration Framework (DCCF) – 466

## **NASA PROGRAMS**

Johnson Space Center Flight Medicine Clinic Experience – 413

## **NATURAL GAS**

Conversion of Hydrogen Sulfide in Coal Gases to Liquid Elemental Sulfur with Monolithic Catalysts. (Annual Report, October 1, 2005-September 30, 2006) – 107

European Security in the Wider Black Sea Area – 242

Improving the Resiliency of the Natural Gas Supply and Distribution Network – 129

Phase 1 Report: Cost-Effective Reciprocating Engine Emissions Control and Monitoring for E&P Field and Gathering Engines – 237

Report 17: Cost-Effective Reciprocating Engine Emissions Control and Monitoring for E&P Field and Gathering Engines. (Technical Report, October 1, 2006-December 31, 2006) – 237

## **NATURAL LANGUAGE (COMPUTERS)**

A Survey of Statistical Machine Translation – 510

Automated Run-Time Mission and Dialog Generation – 632

New Metrics for Blog Mining – 622

## **NAVIGATION SATELLITES**

Mission Support for the Communications/Navigation Outage Forecast Satellite – 49

## **NAVIGATION**

Advanced Target Tracking Techniques – 175

Methods and Computer-Readable Medium for Navigating between a Plurality of Discrete Images – 432

Spatial and Temporal Abstractions in POMDPs Applied to Robot Navigation – 523

Tracking and Data Fusion Applications – 177

Velocity Estimation Using Forward Looking Sonar – 463

## **NAVY**

A Possible Solution for the U.S. Navy's Addiction to Petroleum: A Business Case Analysis for Transitioning the U.S. Navy From Petroleum to Synthetic Fuel Resources – 63

Air Force-Navy Team Achieves Important Flight Test Milestone for Responsive Space Lift – 50

An Analysis of Small Navy Tactics Using a Modified Hughes' Salvo Model – 541

Distributed Simulation Run Automation Capability for the Navy PRA Testbed – 453

Evolution of a Mission Plan – 646

'How Much is a Pound of C4ISR Worth?' An Assessment methodology to Evolve Network Centric Measures and Metrics for Application to FORCENet – 173

Knowledge Based Systems as a Means of Managing Aspects of Datalink Within a Decision Support System for Naval Airborne Early Warning – 460

Modeling and Simulation in Support of Network Centric Warfare Analysis – 143

Navy Nuclear-Powered Surface Ships: Background, Issues, and Options for Congress – 593

Navy Ship Propulsion Technologies: Options for Reducing Oil Use - Background for Congress – 244

Navy-Marine Corps Tactical Air Integration Plan: Background and Issues for Congress – 9

New Navy Solutions: Developing Simulation Based C4I Applications – 445

Steps Towards Determining the Right Number of Dental Recruits the Navy Should Access to Meet the Projected Targets for Navy Dental Corps Officers – 311

The Potential Impact of an Auction Based Retention Bonus and Other Factors on Continuation Rates of General Dentists Completing Their Initial Obligation – 525

## NEAR FIELDS

Technical Work Plan for: Near-Field Environment: Engineered Barrier System: Radionuclide Transport Abstraction Model Report – 253

## NEAR INFRARED RADIATION

Three-Dimensional near Infrared Imaging of Pathophysiological Changes within the Breast – 363

## NEBULAE

An Atlas of [N ii] and [O iii] Images and Spectra of Planetary Nebulae – 666

## NEGATIVE IONS

Ionic Cross-Linking of Ionic Cotton with Small Molecular Weight Anionic or Cationic Molecules – 103

## NEGATIVE RESISTANCE CIRCUITS

Room-Temperature Negative Differential Resistance in Nanoscale Molecular Junctions – 187

## NEOPLASMS

Characterization of Neurofibromas of the Skin and Spinal Roots in a Mouse Model – 408

HOXC5 as a Biomarker of Disease Presence in Tumor-Associated Normal Prostate – 290

The Development of Novel Small Molecule Inhibitors of the Phosphoinositide-3-Kinase Pathway through High-Throughput Cell-Based Screens – 333

The Opposing Roles of Nucleophosmin and the ARF Tumor Suppressor in Breast Cancer – 283

## NERVES

Anticonvulsants for Nerve Agent-Induced Seizures: The Influence of the Therapeutic Dose of Atropine – 110

Direct Detection of Stereospecific Soman Hydrolysis by Wild-Type Human Serum Paraoxonase – 374

Effects of Sarin on the Operant Behavior of Guinea Pigs – 382

In Vivo Cholinesterase Inhibitory Specificity of Organophosphorus Nerve Agents – 77

## NERVOUS SYSTEM

Ethanol and Mesolimbic Serotonin/Dopamine Interactions via 5HT-1B Receptors – 346

Genetic and Molecular Analysis of the Mechanisms by Which TSC Regulates Neuronal Differentiation – 321

Growth Factor Dependent Cholinergic Function and Survival in Primary Mouse Spinal Cord Cultures – 373

Midkine Promoter-Driven Adenovirus as Potential Therapy for NF1 – 341

Molecular Analysis of Neurotoxin-Induced Apoptosis – 323

Neurofibromatosis and the Painful Neuroma – 315

Program Project on the Pathogenesis and Treatment of Parkinson's Disease – 334

## NETS

An Approximation Technique for Belief Revision in Timed Influence Nets – 521

## NETWORK ANALYSIS

A Multiservice Switch for Advanced Avionics Data Networks – 43

Analysis of Origin Destination Flows (Raw Data) – 521

Defending Electrical Power Grids – 243

Examining Clandestine Social Networks for the Presence of Non-Random Structure – 523

Hacking Social Networks: Examining the Viability of Using Computer Network Attack Against Social Networks – 491

Methods for Effective Virtual Screening and Scaffold-Hopping in Chemical Compounds – 653

Modeling and Simulation in Support of Network Centric Warfare Analysis – 143

Operational Agility: Composing and Orchestrating Mission Capability Packages Through Business Process Execution Language (BPEL) – 444

Strategic Planning to Conduct Joint Force Network Operations: A Content Analysis of NETOPS Organizations Strategic Plans – 640

Workforce Configuration of a Canadian Forces Gematics Division – 539

## NETWORK CONTROL

Human Systems Integration Assessment of Network Centric Command and Control – 421

Utilizing Network-Enabled Command and Control Concepts to Enhance ASW Effectiveness – 590

## NETWORKS

A Review of Recent Algorithms and a New and Improved Cooperative Control Design for Generating a Phantom Track (Preprint) – 26

Adaptive Sampling for Network Management – 485

Advancing Software Security - The Software Protection Initiative – 626

Application of NCO Conceptual Framework to US/UK Coalition Combat Operations during Operation Iraqi Freedom – 494

Autonomous Virtual Mobile Nodes – 535

Effective Mobile Routing Through Dynamic Addressing – 182

Examining Clandestine Social Networks for the Presence of Non-Random Structure – 523

Extending Simple Network Management Protocol (SNMP) Beyond Network Management: A MIB Architecture for Network-Centric Services – 490

Integrated Sensing and Processing (ISP) Phase 2: Demonstration and Evaluation for Distributed Sensor Networks and Missile Seeker Systems – 514

Internet Protocol Geolocation: Development of a Delay-Based Hybrid Methodology for Locating the Geographic Location of a Network Node – 641

Key Establishment in Heterogeneous Self-Organized Networks – 484

Simultaneous Localization and Tracking in Wireless Ad-hoc Sensor Networks – 188

The Effects of Social Network Centrality on Group Satisfaction – 477

## NEURAL NETS

Inclusive high-p(T)b anti-b Cross Section Measurement at s \*\* (1/2) Equals 1.96 TeV – 560

## NEUROLOGY

Cell-surface Alpha-glucan in Campylobacter jejuni 81-176 – 402

Neuropsychological Functioning in Gulf War Veterans Exposed to Pesticides and Pyridostigmine Bromide – 350

PCBs Alter Dopamine Mediated Function in Aging Workers – 294

Toward Neural Control of Prosthetic Devices – 209

## NEUROPHYSIOLOGY

Genetic and Molecular Analysis of the Mechanisms by Which TSC Regulates Neuronal Differentiation – 321

## NEUROSES

Post Traumatic Stress Disorder: The Facts – 369

## NEUROTRANSMITTERS

Prostate Cancer Cell Growth: Stimulatory Role of Neurotensin And Mechanism of Inhibition by Flavonoids as Related to Protein Kinase C – 352

## NEUTRALIZERS

Characterization of VSW Environment for UUV-N Operations – 214

## NEUTRINOS

Combined muon-neutrino and electron-neutrino Oscillation Search at Mini-BooNE – 558

Long Baseline Neutrino Physics in the U.S – 578

Proposal to Upgrade the MIPP Experiment – 563

## NEUTRON CROSS SECTIONS

Neutron Induced Cross Sections for Radiochemistry Isotopes of Nickel, Copper and Zinc – 106

## NEUTRON RADIOGRAPHY

High-Energy Neutron Imaging Development at LLNL – 567

## NEUTRON SPECTROMETERS

Superconducting High Resolution Fast-Neutron Spectrometers – 565

## NEUTRON STARS

FY06 LDRD Final Report 'The Creation of a Neutron Star Atmosphere' – 672

## NEUTRONS

Active Detection of Small Quantities of Shielded Highly-Enriched Uranium Using Low-Dose 60-keV Neutron Interrogation – 570

Application of Neutron-Absorbing Structural-Amorphous Metal (SAM) Coatings for Spent Nuclear Fuel (SNF) Container to Enhance Criticality Safety Controls – 130

Correcting the Response of an Albedo Neutron Dosimeter for Energy – 219

High-Energy Neutron Imaging Development at LLNL – 567

Neutron Generators Developed at LBNL for Homeland Security and Imaging Applications – 566

Neutron Production by Muon Spallation I: Theory – 571

Progress on the Europium Neutron-Capture Study Using DANCE – 673

Superconducting High Resolution Fast-Neutron Spectrometers – 564

Systematic Procedure for Assigning Uncertainties to Data Evaluations – 567

Theory of (3He alpha) Surrogate Reactions for Deformed Uranium Nuclei – 582

## NEVADA

Annual Transportation Report for Radioactive Waste Shipments to and from the Nevada Test Site. (Fiscal Year 2006) – 131

Micrometeorological and Soil Data for Calculating Evapotranspiration for Rainier Mesa, Nevada Test Site, Nevada, 2002-05 – 273

Southern Nevada Air Quality Study – 236

## NEW YORK CITY (NY)

Terrorism Information Management Within the New York City Fire Department: Past, Present and Future – 635

## NEW ZEALAND

A Review of Australian and New Zealand Investigations on Aeronautical Fatigue During the Period April 2005 to March 2007 – 3

## NEWS MEDIA

Foreign Policy Effects on Strategic Communications and the Ability to Influence – 181

## NICKEL ALLOYS

Recrystallization and Grain-Growth Behavior of a Nickel-Base Superalloy During Multi-Hit Deformation (Preprint) – 118

The Effect of As-Large-As (ALA) Grains on the High-Temperature Fatigue Life of Waspaloy – 117

## NICKEL

Determination of the Misorientation Dependence of the Relative Grain-Boundary Energy of Commercial-Purity Nickel (Preprint) – 118

Growth of a Single Freestanding Multi-wall Carbon Nanotube on each Nanonickel Dot – 92

Neutron Induced Cross Sections for Radiochemistry Isotopes of Nickel, Copper and Zinc – 106

Recrystallization and Grain-Growth Behavior of a Nickel-Base Superalloy During Multi-Hit Deformation (Preprint) – 118

## NICOTINE

Prenatal Exposure to Nicotine and Childhood Asthma: Role of Nicotine Acetylcholine Receptors, Neuropeptides and Fibronectin Expression in Lung – 333

## NIGHT VISION

Rapid Wall-Breaching Kit, Ingress Hole Determination Experiment – 225

## NIOBIUM

Characteristics of Round and Extracted Strands of Mb(3)A1 Rutherford Cable – 558

Eddy Current Scanning of Niobium for SRF Cavities at Fermilab – 565

## NITRATES

Review of Laboratory Program on Degradation Mechanisms in Soil of Wastewater From Nitroguanidine Manufacture – 93

## NITRIDES

Highly Doped III-Nitride Semiconductors (PAT-APPL-11-082 070) – 207

Highly Doped III-Nitride Semiconductors (PAT-APPL-11-082 378) – 206

Study on Wide-gap Gallium-nitride Based Films and Their Quantum-dots Devices – 196

Two Bit/Four Bit SONOS Flash Memory Cell – 200

## NITROGEN COMPOUNDS

Insensitive High-Performance Replacements for RDX in Explosive and Propellant Formulations – 60

## NITROGEN OXIDES

Guidance for Estimating VOC and NOx Emission Changes from MACT Rules – 257

Impedance Analysis of Electrochemical NOx Sensor Using a Au/Yttria-Stabilized Zirconia (YSZ) Au Cell – 247

## NITROGUANIDINE

Review of Laboratory Program on Degradation Mechanisms in Soil of Wastewater From Nitroguanidine Manufacture – 93

## NITROUS OXIDES

Guidance for Estimating VOC and NOx Emission Changes from MACT Rules – 257

## NOISE INTENSITY

Research Plan for Measuring Noise Levels in Highway Pavements in Texas – 259

## NOISE MEASUREMENT

Development and Implementation of Noise Analysis Standards for ACSA Airports – 255

## NOISE REDUCTION

Chamber Core Structures for Fairing Acoustic Mitigation – 50

Development and Implementation of Noise Analysis Standards for ACSA Airports – 255

High Ratio, Reduced Size Epicyclic Gear Transmission for Rotary Wing Aircraft with Improved Safety and Noise Reduction – 35

## NOISE (SOUND)

NIOSH Health Hazard Evaluation Report: HETA No. 2007-0068-3042, Noise Exposures and Hearing Loss Assessments among Animal Shelter Workers, Louisiana Society for the Prevention of Cruelty to Animals, Algiers, Louisiana, May 2007 – 252

Preliminary Findings from Noise Testing on PFC Pavements in Texas – 260

## NONCONDENSABLE GASES

Feasibility Study of H(sub2)S Abatement by Incineration of Noncondensable Gases in Vented Steam Flow from Davies-State 5206-1 Geothermal Steam Well, Geysers Geothermal Steam Field, Lake County, California – 259

## NONDESTRUCTIVE TESTS

A Test Method to Assess the Foldability of Flexible Structural Materials – 125

Detection of Incipient Thermal Damage in Polymer Matrix Composites (Preprint) – 80

Detection of Localized Heat Damage in a Polymer Matrix Composite by Thermo-Elastic Method (Preprint) – 81

Nondestructive Evaluation (NDE) Technology Initiatives II Delivery Order 0001: Multi-Layer Cracks and Multi-site Damage NDE – 193

Structural Diagnostics of CFRP Composite Aircraft Components by Ultrasonic Guided Waves and Built-In Piezoelectric Transducers – 34

## NONEQUILIBRIUM FLOW

Comparison of Thermodynamic Equilibrium and Non-Equilibrium Representation of Materials – 219

Quantifying Non-Equilibrium in Hypersonic Flows Using Entropy Generation – 219

## NONINTRUSIVE MEASUREMENT

On the Non-Intrusive Determination of Electron Density in the Sheath of a Spherical Probe – 551

## NONLINEAR OPTICS

New Materials, Techniques and Device Concepts for Organic NLO Chromophore-based Electrooptic Devices. Part 1 – 291

## NONLINEAR SYSTEMS

Experimental Methods to Characterize Nonlinear Vibration of Flapping Wing Micro Air Vehicles – 32

F-15B QuietSpike(TradeMark) Aeroservoelastic Flight Test Data Analysis – 35

## NONLINEARITY

Computational Nonlinear Optics: Femtosecond Atmospheric Light String Applications – 266

Experimental Methods to Characterize Nonlinear Vibration of Flapping Wing Micro Air Vehicles – 32

Finite Element Solution: Nonlinear Flapping Beams for Use with Micro Air Vehicle Design – 3

Implicit Solvers for Large Scale Nonlinear Problems – 433

Large Concentration-Dependent Nonlinear Optical Responses of Starburst Diphenylamino-fluorenocarbonyl Methano[60]Fullerene Pentaads – 87

Nonlinear Robust/Adaptive Controller Design for an Air-Breathing Hypersonic Vehicle Model (Preprint) – 21

## NONPARAMETRIC STATISTICS

An Analysis of Robust Workforce Scheduling Models for a Nurse Rostering Problem – 300

## NOZZLE FLOW

IHPRT Improvements to the Solid Performance Program (SPP) – 542

## N-TYPE SEMICONDUCTORS

Perylene N-Type Semiconductors and Related Devices – 205

## NUCLEAR EXPLOSIONS

Detection of Atmospheric Explosions at IMS Monitoring Stations using Infrared Sound Techniques – 265

Screening Doses for Induction of Cancers Calculated With the Interactive Radio Epidemiological Program (IREP) – 306

## NUCLEAR FUELS

Application of Neutron-Absorbing Structural-Amorphous Metal (SAM) Coatings for Spent Nuclear Fuel (SNF) Container to Enhance Criticality Safety Controls – 131

Iran's Nuclear Program: Recent Developments – 594

## NUCLEAR MAGNETIC RESONANCE

Degradation of the Blister Agent BIS(2-Chloroethyl) Sulfide and Simulant 2-Chloroethyl Phenyl Sulfide on Concrete – 306

New Structural Approaches to Understanding the Disease Related Forms of the Prion Protein – 352

NMR Analysis of Thiodiglycol Oxidation by Mammalian Alcohol Dehydrogenases – 371

Thiodiglycol, the Hydrolysis Product of Sulfur Mustard: Analysis of In Vitro Biotransformation by Mammalian Alcohol Dehydrogenases using Nuclear Magnetic Resonance – 384

## NUCLEAR PHYSICS

Nuclear Photo-Science and Applications with T-Rex Sources – 563

Test Suite for Nuclear Data I. Deterministic Calculations for Critical Assemblies and Replacement Coefficients – 574

## NUCLEAR POWER PLANTS

Hot Leg Piping Materials Issues (U) – 596

India's Nuclear Separation Plan: Issues and Views – 595

## NUCLEAR POWERED SHIPS

Navy Nuclear-Powered Surface Ships: Background, Issues, and Options for Congress – 593

## NUCLEAR PROPULSION

Navy Ship Propulsion Technologies: Options for Reducing Oil Use - Background for Congress – 244

## NUCLEAR RADIATION

A Rationale for Establishing Survivability Requirements for Objective Force Unmanned Army Platforms and Systems – 191

Fundamentals of Aerospace Medicine: Cosmic Radiation – 412

## NUCLEAR REACTIONS

LDRD Final Report: Surrogate Nuclear Reactions and the Origin of the Heavy Elements (04-ERD-057) – 563

Neutron Induced Cross Sections for Radiochemistry Isotopes of Nickel, Copper and Zinc – 106

## NUCLEAR REACTORS

Collaborations in Nuclear Reactors – 559

Emerging Energy Requirements for Future C4ISR – 244

Iran's Nuclear Program: Recent Developments – 595

## NUCLEAR TRANSFORMATIONS

AFCI Storage and Disposal FY-06 Progress Report – 106

## NUCLEAR WEAPONS

Iran's Nuclear Program: Recent Developments – 594

## NUCLEIC ACIDS

Phylogenetic Analysis of a Novel Molecular Isolate of Spotted Fever Group Rickettsiae from Northern Peru – 405

## NUCLEONS

Proposal to Upgrade the MIPP Experiment – 564

## NUCLEOTIDES

Ten Novel HLA-DRB1 Alleles and One Novel DRB3 Allele – 394

## NUMBER THEORY

Parallel Eigensolver for H (curl) Problems using H1 Auxiliary Space AMG Preconditioning – 434

## NUMERICAL ANALYSIS

Broken Symmetries and Magnetic Dynamics – 220

Characterizing Electron Temperature Gradient Turbulence Via Numerical Simulation – 603

Fundamental Study on Quantum Nanojets – 548

National Software Infrastructure for Lattice Quantum Chromodynamics – 581

Numerical Analysis of Chamber Wall Heat Transfer in a GH2/GO2 Sub-Scale Combustor – 98

Receptive Field Structures for Recognition – 190

## NUMERICAL APERTURE

Lithographic Characterization of Low-Order Aberrations in a 0.3-NA EUV Microfield Exposure Tool – 600

## NUMERICAL CONTROL

A Security Risk Measurement for the RAdAC Model – 490

Modeling and Analysis of Information Technology Change and Access Controls in the Business Context – 478

Transforming Intra- and Interagency Processes through Advanced Models and Simulations: An Information Assurance Model – 487

## NUTRITION

Military Nutrition Research: Four Tasks to Address Personnel Readiness and Warfighter Performance – 367

Platelet Activating Factor: A Growth Factor for Breast Cancer – 341

Selenium and Breast Cancer Chemoprevention – 339

Third Annual Clinical Diabetes Technology Meeting – 647

## OBESITY

Adipose Estrogen and Increased Breast Cancer Risk in Obesity: Regulation by Leptin and Insulin – 357

Role of Obesity in Prostate Cancer Development – 336

## OBSERVATION

Spatial and Temporal Abstractions in POMDPs Applied to Robot Navigation – 524

## OBSERVATORIES

Searching for Double Beta Decay with the Enriched Xenon Observatory – 566

## OCEAN MODELS

Study of the Utility of NWP Forecast Guidance and Simple Ocean Modeling as a Tool for Planning During Reactive Situations – 269

## OCEAN SURFACE

A Geometric Investigation of Acoustical Wavefront Scattering and Healing Induced by Ocean Internal Waves – 588

Navy Nuclear-Powered Surface Ships: Background, Issues, and Options for Congress – 593

Ocean Wave Energy Harvesting Devices – 479

## OCEANOGRAPHY

A Numerical Study of the Regimes of Weak Fluctuation Theory for Ocean Acoustic Propagation through Random Internal Wave Sound Speed Fields – 589

Physical, Nutrient, and Biological Measurements of Coastal Waters off Central California in October 2006 – 407

## OCEANS

A Numerical Study of the Regimes of Weak Fluctuation Theory for Ocean Acoustic Propagation through Random Internal Wave Sound Speed Fields – 589

Acoustic Thermometry of Ocean Climate: Marine Mammal Issues – 587

BOUSSOLE: A Joint CNRS-INSU, ESA, CNES, and NASA Ocean Color Calibration and Validation Activity – 279

NOAA National Passive Acoustics Workshop, 2006 – 590

North West Shelf Unmanned Aerial System Trial – 18

Ocean Wave Energy Harvesting Devices – 479

Study of the Utility of NWP Forecast Guidance and Simple Ocean Modeling as a Tool for Planning During Reactive Situations – 269

## OFFSHORE PLATFORMS

Studies on Three-Dimensional Slamming on Slender Ships – 221

## OIL SLICKS

No Further Action Decision Under CERCLA, Fort Devens Study Area 58, Buildings 2648 and 2650 Fuel Oil Spills – 128

## OILS

America's Energy Security Policy: Goals for 2025 – 129

Building Alternative-Energy Partnerships with Latin America – 249

China's Energy Security and Its Military Modernization Efforts: How China Plans to Dominate the World – 248

Measurement of Fog Oil Penetration into Model Underground Burrow and Hollow Tree Nest Cavities – 250

Navy Ship Propulsion Technologies: Options for Reducing Oil Use - Background for Congress – 244

Oil Vulnerabilities and USA Strategy – 241

Studies to Support Deployment of Edible Oils as the Final cVOC Remediation in T-Area. Summary Report – 109

Using DUSTRAN to Simulate Fog-Oil Dispersion and Its Impacts on Local Insect Populations at Ft. Hood: Final Report – 253

## OLIGOMERS

Placement of Conjugated Oligomers in an Alkanethiol Matrix by Scanned Probe Microscope Lithography – 121

## ONCOGENES

A MicroRNA Cluster as a Potential Breast Cancer Oncogene – 358

Locating a Prostate Cancer Susceptibility Gene on the X Chromosome by Linkage Disequilibrium Mapping Using Three Founder Populations in Quebec and Switzerland – 352

Regulation of Apoptosis by AFG3L2, a Potential Oncogene – 293

The Role of Oncogene/Tumor Suppressor Interaction with the Centrosome Protein Pericentrin in Prostate Tumorigenesis – 322

## ON-LINE SYSTEMS

Air Force Information Workflow Automation through Synchronized Air Power Management (SAPM) – 610

## OPERATING SYSTEMS (COMPUTERS)

Recent Physics Results from NSTX – 571

## OPERATIONAL PROBLEMS

'COM as Shooter' Operational Planning using C2 for Confronting and Collaborating – 169

## OPERATIONS RESEARCH

History of Operations Research in the USA Army, Volume 1: 1942-1962 – 546

Preliminary Findings: Design of Experiments University XXI (FY05) Research and Support for the US Army – 621

## OPERATOR PERFORMANCE

Operator Influence of Unexploded Ordnance Sensor Technologies – 228

## OPTICAL COMMUNICATION

Design and Evaluation of a Virtual Quadrant Receiver for 4-ary Pulse Position Modulation/Optical Code Division Multiple Access (4-ary PPM/O-CDMA) – 178

Effects of Multimodal Displays About Threat Location on Target Acquisition and Attention to Visual and Auditory Communications – 153

Wavefront Aberration Correction Using Zernike Polynomial Parameterizations of Optical Phased Arrays (PRE-PRINT) – 597

## OPTICAL EQUIPMENT

Chiral Multichromic Single Crystals for Optical Devices – 580

Enhancement of Near-Real-Time Cloud Analysis and Related Analytic Support for Whole Sky Imagers – 272

Introduction to Synthetic Aperture Radar (SAR) – 175

Reversible Electrodeposition Optical Modulation Device with Conducting Polymer Counter Electrode – 213

Visible and Infrared Optical Design for the ITER Upper Ports – 599

## OPTICAL FIBERS

Optical Fiber Chemical Sensor with Sol-Gel Derived Refractive Material as Transducer for High Temperature Gas Sensing in Clean Coal Technology (Final Report, October 1, 2004-December 31, 2006) – 254

## OPTICAL PROPERTIES

A Verification of Optical Depth Retrievals From High Resolution Satellite Imagery – 225

BOUSSOLE: A Joint CNRS-INSU, ESA, CNES, and NASA Ocean Color Calibration and Validation Activity – 279

Experiments, Computation, and Modeling for Temperature Dependence of Absorption, Scattering, Reflection, Transmission, and Index of Refraction of Optical Radiation in Biological Tissues – 597

New Generation Photonics Materials: Design, Development, Characterization, and Applications – 210

Polarized Optical Probes – 599

## OPTICAL SWITCHING

Self Assembled Nano-Photonic Devices Derived from Marine DNA for Opto-Electronic Applications – 292

## OPTICAL THICKNESS

A Verification of Optical Depth Retrievals From High Resolution Satellite Imagery – 225

Automating the Shadow Method for Aerosol Optical Depth Retrieval – 462

## OPTICAL WAVEGUIDES

Photonic Device and Method for Making Same – 209

## OPTIMIZATION

A Comparison of Trajectory Determination Approaches for Small UAVs – 11

A Distributed Approach for Multi-Constrained Path Selection and Routing Optimization – 640

A Heuristic Design Information Sharing Framework for Hard Discrete Optimization Problems – 542

A Parallel Particle Swarm Optimizer – 533

A Systematic Approach to Optimize Organizations Operating in Uncertain Environments: Design Methodology and Applications – 169

Decentralized Control Using Global Optimization (DCGO) (Preprint) – 495

Evaluation of a Particle Swarm Algorithm for Biomechanical Optimization – 511

Implicit Solvers for Large Scale Nonlinear Problems – 433

Minimization of Thruster Plume Effects on Spacecraft Surfaces – 52

Optimization of Synthetic Jet Actuators – 235

Optimizing the Prioritization of Natural Disaster Recovery Projects – 274

Parallel Global Optimization with the Particle Swarm Algorithm (Preprint) – 533

Prioritizing Satellite Payload Selection via Optimization – 46

Scale-Independent Biomechanical Optimization – 521

Towards Multi Level Optimization. Space Mapping and Manifold Mapping – 433

Value Added Analysis - VAAFY03 – 532

## OPTOELECTRONIC DEVICES

Electronic and Optoelectronic Devices and Methods for Preparing Same – 213

New Materials, Techniques and Device Concepts for Organic NLO Chromophore-based Electrooptic Devices. Part 1 – 291

Perylene N-Type Semiconductors and Related Devices – 205

## ORDER-DISORDER TRANSFORMATIONS

Sinodal Decomposition and Order Disorder Transformation in a Water Quenched U-6wtNb Alloy – 70

## ORDNANCE

Acoustic Identification of Filler Materials in Unexploded Ordnance – 82

Adaptive and Iterative Processing Techniques for Overlapping Signatures – 555

Evaluation of airborne Electromagnetic Systems for Detection and Characterization of unexploded ordnance (uXo) – 12

Intelligent Data Fusion for Wide-Area Assessment of UXO Contamination. SERDP Project MM-1510. 2006 Annual Report – 637

Non-Thermal, On-Site Decontamination and Destruction of Practice Bombs – 141

Operator Influence of Unexploded Ordnance Sensor Technologies – 227

Signal Event Detection System – 590

Unexploded Ordnance Site Investigation of US Military Ranges in Panama: Empire, Balboa West and Pina Ranges – 135

## ORGANIC CHEMISTRY

Analytical and Characterization Studies of Organic Chemicals, Drugs and Drug Formulations – 61

## ORGANIC COMPOUNDS

Novel Technology Evaluation for Volatile Organic Compounds Emission Control – 60

## ORGANIC MATERIALS

Novel Organic Field Effect Transistors via Nano-Modification – 197

Organic Polymers with Magneto-Dielectric Properties – 124

## ORGANIC PHOSPHORUS COMPOUNDS

Acetylcholinesterase Inhibition: Does it Explain the Toxicity of Organophosphorus Compounds? – 372

Atropine and Other Anticholinergic Drugs – 372

In Vivo Cholinesterase Inhibitory Specificity of Organophosphorus Nerve Agents – 77

Microfabricated Electrochemical Sensor for Chemical Warfare Agents: Smaller is Better (Preprint) – 230

## ORGANIC SEMICONDUCTORS

Perylene N-Type Semiconductors and Related Devices – 205

## ORGANISMS

Assessing the Biohazard Potential of Putative Martian Organisms for Exploration Class Human Space Missions – 675

NOAA National Passive Acoustics Workshop, 2006 – 590

Optical, Biochemical, and Molecular Characterization of New Bioluminescence Systems – 354

## ORGANIZATIONS

A CBO Study. The Army's Bandwidth Bottleneck – 154

A Model for Effective Organization and Communication of Homeland Security Activity at the State Level – 157

A Quantum Approach to Multi-Agent Systems (MAS), Organizations, and Control – 534

A Systematic Approach to Optimize Organizations Operating in Uncertain Environments: Design Methodology and Applications – 169

Assessing Human Factors in Command and Control: Workload and Situational Awareness Metrics – 422

Corporate Entrepreneurship Assessment Instrument (CEAI): Refinement and Validation of a Survey Measure – 136

Delaware Consortium for Undergraduate Minority Training in Prostate Cancer – 362

Distributed Command and Organizational Situation Awareness – 142

DoD Personnel Clearances: Delays and Inadequate Documentation Found for Industry Personnel – 643

Effective Mobile Routing Through Dynamic Addressing – 182

Effects-Based Design of Robust Organizations – 520

'How Much is a Pound of C4ISR Worth?' An Assessment methodology to Evolve Network Centric Measures and Metrics for Application to FORCENet – 173

Long-Range Operational Military Forecasts for Iraq – 269

Medical Risk in the Future Force Unit of Employment. Results of the Army Medical Department Transformation Workshop V – 304

Modelling Operational Command Structures Using ORGAHEAD – 451

Optimising the Design of Land Force C2 Architectures – 152

Scenario Design for the Empirical Testing of Organizational Congruence (Briefing Charts) – 537

Sharing the Dragon's Teeth: Terrorist Groups and the Exchange of New Technologies – 643

Strategic Planning to Conduct Joint Force Network Operations: A Content Analysis of NETOPS Organizations Strategic Plans – 640

System Instantiation Comparison Method: A Technique for Comparing Military Headquarters – 542

Time-Base Tree Graphs for Stabilized Force Structure Representations – 539

When Do Organizations Need to Change (Part I)? Coping with Incongruence – 141

When Do Organizations Need to Change (Part II)? Incongruence in Action – 140

## OSCILLATIONS

A High Order WENO Scheme for a Hierarchical Size-Structured Model – 549

A Weighted Essentially Non-Oscillatory Numerical Scheme for a Multi-Class LWR Model – 508

Combined muon-neutrino and electron-neutrino Oscillation Search at Mini-BooNE – 557

Convergence of High Order Finite Volume Weighted Essentially Non-Oscillatory Scheme and Discontinuous Galerkin Method for Nonconvex Conservation Laws – 515

Long Baseline Neutrino Physics in the U.S – 578

SOME Aspects of Hadron Hadron Collisions in High Energy Interactions (B(O)s) Mixing Oscillations in Semileptonic Decay at D0 Experiment) – 557

The Matrix Pencil and its Applications to Speech Processing – 589

## OSTEOBLASTS

Simulated Microgravity Regulates Gene Transcript Profiles of 2T3 Preosteoblasts: Comparison of the Random Positioning Machine and the Rotating Wall Vessel Bioreactor – 412

## OSTEOPOROSIS

Artificial Gravity: Will it Preserve Bone Health on Long-Duration Missions? – 411

Skeletal Complications in Neurofibromatosis Type 1: The Role of Neurofibromin Haploinsufficiency in Defective Skeletal Remodeling and Bone Healing in NF1 – 377

## OUTLIERS (STATISTICS)

Outlier Detection in Hyperspectral Imaging Using Closest Distance to Center with Ellipsoidal Multivariate Trimming – 223

## OVARIES

Biological Basis for Chemoprevention of Ovarian Cancer – 359

Eliciting Autoimmunity to Ovarian Tumors in Mice by Genetic Disruption of T Cell Tolerance Mechanisms. Addendum – 357

Mechanisms and Chemoprevention of Ovarian Carcinogenesis – 358

PARK2, a Large Common Fragile Site Gene, is Part of a Stress Response Network in Normal Cells That is Disrupted During the Development of Ovarian Cancer – 359

## OVER-THE-HORIZON RADAR

Scenario-Based Assessment of Sensors for the Canadian Recognized Maritime Picture – 227

## OXIDATION RESISTANCE

A New Silicon-Containing Bis(Cyanate) Ester Resin with Improved Thermal Oxidation and Moisture Resistance – 125

## OXIDATION-REDUCTION REACTIONS

Electronically Induced Redox Barriers for Treatment of Groundwater – 198

## OXIDATION

A Chemoprevention Trial to Study the Effects of High Tea Consumption on Smoking-Related Oxidative Stress – 340

Fretting Wear-Resistant, Micro-Arc Oxidation Coatings for Aluminum and Titanium Alloy Bearings (Preprint) – 44

NMR Analysis of Thiodiglycol Oxidation by Mammalian Alcohol Dehydrogenase – 371

## OXIDES

Effects of Temperature and Environment on Creep Behavior of an Oxide-Oxide Ceramic Matrix Composite – 103

Impedance Analysis of Electrochemical NO<sub>x</sub> Sensor Using a Au/Yttria-Stabilized Zirconia (YSZ) Au Cell – 247

Off-Axis Creep Behavior of Oxide/Oxide Nextel(Trademark)720/AS-0 (Preprint) – 122

Role of Bond Coordination and Molecular Volume on the Dielectric Constant of Mixed-Oxide Compounds – 90

Substrate/Oxide Interface Interaction in LaAlO<sub>3</sub>/Si Structures – 96

Vertical Cavity Surface Emitting Laser Having a Gain Guide Aperture Interior to an Oxide Confinement Layer – 599

## OXYGEN ATOMS

Synthesis and Characterization of Space-Survivable POSS-Kapton (Trademark) Polyimides (Preprint) – 53

## OXYGEN PLASMA

Oxygen Plasma Treatment and Deposition of CN<sub>x</sub> on a Fluorinated Polymer Matrix Composite for Improved Erosion Resistance (Preprint) – 121

## OXYGENATION

Guidelines for Oxygenated Gasoline Credit Programs under Section 211(m) of the Clean Air Act as Amended – 252

## OXYGEN

A Hemoglobin-based Oxygen Carrier, Bovine Polymerized Hemoglobin (HBOC-201) Versus Hetastarch (HEX) in a Moderate Severity Hemorrhagic Shock Swine Model with Delayed Evacuation – 395

Oxygen Transport Ceramic Membranes. Quarterly Report from October 2006 through December 2006 – 126

## OXYNITRIDES

Multilayer Aluminum Oxynitride Capacitors for Higher Energy Density, Wide Temperature Applications (Preprint) – 91

Stoichiometry and Characterization of Aluminum Oxynitride Thin Films by Ion-Beam-Assisted Pulsed Laser Deposition (Preprint) – 127

## OZONE

Achievements in Stratospheric Ozone Protection – 278

Evaluation of Emission Control Strategies for the 8-Hour Ozone Standard in the Houston and Dallas Areas and A Pilot-Scale Study of In-Use Emissions from Heavy-Duty Diesel Dump Trucks using a Portable Emissions Monitoring System (PEMS) – 255

Guidance for Estimating VOC and NO<sub>x</sub> Emission Changes from MACT Rules – 257

Review of the Ambient Air Quality Standards for Ozone: Policy Assessment of Scientific and Technical Information. OAQPS Staff Paper – 256

Smog: Who Does it Hurt. What You Need to Know about Ozone and Your Health – 259

## OZONOSPHERE

Achievements in Stratospheric Ozone Protection – 278

## PACIFIC OCEAN

Downstream Impacts Due to the Extratropical Transition of Tropical Cyclones Over the Western North Pacific – 267

## PACKAGING

Improving Thermal Performance of Radioactive Material Drum Type Packages by Using Heat Pipes – 131

Thermal Testing of Prototype General Purpose Fissile Packages Using a Furnace – 59

Type B Radioactive Material Package Failure Modes and Contents Compliance – 238

## PACKET SWITCHING

Performance Modeling and Evaluation of Topologies for Low-Latency SCI Systems – 448

## PACKING DENSITY

On the Importance of Atomic Packing in Determining Dielectric Permittivities – 553

## PAIN

A Randomized Trial of Musculoskeletal Pain Treatment in a Military Population – 333

Neurofibromatosis and the Painful Neuroma – 315

## PAINTS

Biofiltration as a Viable Alternative for Air Pollution Control at Department of Defense Surface Coating Facilities – 64

## PANCREAS

Artificial Pancreas for Control of BG and Insulin Levels in Hospitalized Patients with Diabetes and Stress Hyperglycemia – 328

## PARABOLIC DIFFERENTIAL EQUATIONS

Correction to Attenuation Treatment in the Monterey-Miami Parabolic Equation Model – 514

## PARACHUTES

Low Cost Parachute – 2

## PARALLEL PROCESSING (COMPUTERS)

A Distributed Parallel Embedded System for Autonomous Sonar Arrays – 450

A Distributed Parallel Processing System for Command and Control Imagery – 466

A High-Performance Communication Service for Parallel Computing on Distributed DSP Systems – 449

A Parallel Particle Swarm Optimizer – 533

Comparative Performance Analysis of Directed Flow Control for Real-Time SCI – 448

Exploiting Data-Flow for Fault-Tolerance in a Wide-Area Parallel System – 447

Fault-Tolerant Parallel Algorithms for Adaptive Matched-Field Processing on Distributed Array Systems – 509

HPC-Colony: Services and Interfaces to Support Systems with Very Large Numbers of Processors. (2006 Annual Report, January-December 2006) – 431

Parallel Simulation of Chip-Multiprocessor Architectures – 447

Performance Modeling and Evaluation of Topologies for Low-Latency SCI Systems – 448

Purple Computational Environment with Mappings to Ace Requirements for the General Availability User Environment Capabilities. Version 2.0 – 433

Report to the Institutional Computing Executive Group (ICEG) August 14, 2006 – 433

#### PARALLEL PROGRAMMING

PCA RAW FABRIC: Architectural Prototyping, Demonstration and Evaluation – 462

#### PARALYSIS

Autologous Marrow-Derived Stem Cell-Seeded Gene-Supplemented Collagen Scaffolds for Spinal Cord Regeneration as a Treatment for Paralysis – 299

#### PARAMETER IDENTIFICATION

Comparison of Isoconversional and Model Fitting Approaches to Kinetic Parameter Estimation and Application Predictions – 108

Fundamentals of Signal Processing for Phased Array Radar – 176

#### PARAMETERIZATION

Regression Strategies for Parameter Space Exploration. A Case Study in Semicoarsening Multigrid and R – 435

Wavefront Aberration Correction Using Zernike Polynomial Parameterizations of Optical Phased Arrays (PRE-PRINT) – 597

#### PARASITES

A Comprehensive Survey of the Plasmodium Life Cycle by Genomic, Transcriptomic, and Proteomic Analyses – 389

Analytical and Characterization Studies of Organic Chemicals, Drugs and Drug Formulations – 284

Boosting of DNA Vaccine-Elicited Gamma Interferon Responses in Humans by Exposure to Malaria Parasites – 402

Comparison of Meglumine Antimoniate and Pentamidine for Peruvian Cutaneous Leishmaniasis – 386

Production of Recombinant Protein Pap31 and Its Application for the Diagnosis of Bartonella bacilliformis Infection – 398

Sources of Variability in Determining Malaria Parasite Density by Microscopy – 392

The Plasmodium falciparum Sexual Development Transcriptome: A Microarray Analysis using Ontology-Based Pattern Identification – 401

Transcriptional Analysis of In vivo Plasmodium yoelii Liver Stage Gene Expression – 404

#### PARASITIC DISEASES

A Comprehensive Survey of the Plasmodium Life Cycle by Genomic, Transcriptomic, and Proteomic Analyses – 389

Behavioral Responses to DDT and Pyrethroids Between Anopheles Minimus Species A and C Malaria Vectors in Thailand – 393

Boosting of DNA Vaccine-Elicited Gamma Interferon Responses in Humans by Exposure to Malaria Parasites – 402

Efficacy and Tolerability of Artesunate Plus Sulfadoxine-Pyrimethamine and Sulfadoxine-Pyrimethamine Alone for the Treatment of Uncomplicated Plasmodium falciparum Malaria in Peru – 380

HLA-A2 Supertype-Restricted Cell-Mediated Immunity by Peripheral Blood Mononuclear Cells Derived from Malian Children with Severe or Uncomplicated Plasmodium falciparum Malaria and Healthy Controls – 400

Sources of Variability in Determining Malaria Parasite Density by Microscopy – 392

The Plasmodium falciparum Sexual Development Transcriptome: A Microarray Analysis using Ontology-Based Pattern Identification – 401

White Blood Cell Counts and Malaria – 400

#### PARTIAL DIFFERENTIAL EQUATIONS

Parameter Space: The Final Frontier. Certified Reduced Basis Methods for Real-Time Reliable Solution of Parameterized Partial Differential Equations – 512

#### PARTICLE ACCELERATORS

8 GeV Beam Line Optics Optimization for the Rapid Antiproton Transfers at Fermilab – 557

AC Field Measurements of Fermilab Booster Correctors Using a Rotating Coil System – 605

Characteristics of Round and Extracted Strands of Mb(3)A1 Rutherford Cable – 558

Eddy Current Scanning of Niobium for SRF Cavities at Fermilab – 565

High-Energy Neutron Imaging Development at LLNL – 567

Implementation of the Polarized HD Target at the Thomas Jefferson National Accelerator. Reporting Period for January 1, 2002 to December 31, 2006 – 583

Inclusive high-p(T)b anti-b Cross Section Measurement at  $s^{**}(1/2)$  Equals 1.96 TeV – 560

Injector Test Facility for the LCLS. Executive Summary – 566

Massive Metrology: Development and Implementation of a 3D Reference Frame for the Realignment of Fermilab's Tevatron – 606

Overview of Theory and Simulations in the Heavy Ion Fusion Science Virtual National Laboratory – 559

Performance Measurement of the Upgraded D0 Central Track Trigger – 558

Preliminary Study of Using 'Pipetron'-Type Magnets for a Pre-Accelerator for the LHC – 566

Quantitative Experiments with Electrons in a Positively Charged Beam – 606

Radiation Shielding Issues for Superconducting RF Cavity Test Facility at Fermilab – 564

Resonant Second Generation Slepton Production at the Tevatron – 586

Results on QCD Physics from the CDF-II Experiment – 559

Search for Chargino and Neutralino at Run II of the Tevatron Collider – 576

Searching for new Physics at CDF – 560

Some Searches for New Physics with the D0 Detector – 585

Spectroscopy and Decay of B Hadrons at the Tevatron – 576

Survey and Alignment of the Fermilab Electron Cooling System – 585

SUSY Multilepton Signatures at Tevatron – 576

t-tbar Production at the Tevatron. Event Selection and Cross Section Measurement – 586

Variable Directional Coupler for an Alternate ILC High-Power RF Distribution Scheme – 605

#### PARTICLE COLLISIONS

Measurements of the B Production Cross Section in Proton-Antiproton Collisions at  $s^{**}(1/2) = 1.96$  TeV using Semileptonic Decays of b Hadrons – 586

#### PARTICLE DECAY

B0 to K0K0bar and Other Hadronic b to d Decays – 567

Charmless B Decays – 577

Measurements of the B Production Cross Section in Proton-Antiproton Collisions at  $s^{**}(1/2) = 1.96$  TeV using Semileptonic Decays of b Hadrons – 586

Some Aspects of Hadron Hadron Collisions in High Energy Interactions (B(O)(s) Mixing Oscillations in Semileptonic Decay at D0 Experiment) – 557

## **PARTICLE ENERGY**

Improved Charged Particle Model in CA-LEICF – 569

## **PARTICLE IMAGE VELOCIMETRY**

Demonstration of Clean Particle Seeding for Particle Image Velocimetry in a Closed Circuit Supersonic Wind Tunnel – 15

## **PARTICLE MOTION**

Particle Splitting for Monte-Carlo Simulation of the National Ignition Facility – 561

## **PARTICLE PRODUCTION**

Search for Higgs at CDF – 564

## **PARTICLES**

pH Triggerable Polymeric Particles – 66

Resuspension Physics of Fine Particles – 260

## **PARTICULATES**

Diesel Particulate Measurement Research, 2007. Phase 3 – 238

Fuel Property Effects on T700 Exhaust Particulates – 132

High Strain Rate Mechanical Properties of Epoxy and Epoxy-Based Particulate Composites (Preprint) – 125

Modeling the Effects of Crevice Former, Particulates, and the Evolving Surface Profile In Crevice Corrosion – 119

Numerical Investigation for the Microstructural Effects on the Crack Growth Behavior of Particulate Composite Materials – 79

Purification of Contaminated MIL-PRF-83282 Hydraulic Fluid Using the Pall Purifier and Multiple Process Configurations (Preprint) – 123

## **PASSENGERS**

Aviation Security: Efforts to Strengthen International Passenger Prescreening are Under Way, but Planning and Implementation Issues Remain – 3

Detection of Explosives on Airline Passengers: Recommendation of the 9/11 Commission and Related Issues – 10

Preliminary Assessment of Stroboscopic Shutter Glasses on Motion Sickness in Helicopter Passengers – 30

## **PATCH ANTENNAS**

Method for Constructing Antennas from Textile Fabrics and Components – 179

## **PATENT APPLICATIONS**

Antimicrobial Polymeric Surfaces – 79

Chemical Modifications to Polymer Surfaces and the Application of Polymer Grafting to Biomaterials – 72

Cooled Turbine Airfoil – 42

Coolerless Photonic Integrated Circuits (PICs) for WDM Transmission Networks and PICs Operable with a Floating Signal Channel Grid Changing with Temperature but with Fixed Channel Spacing in the Floating Grid – 214

Determination of Metal Ions in Solution by Photoluminescence Anisotropy – 115

High Spatial Resolution X-ray and Gamma Ray Imaging System Using Crystal Diffraction Lenses – 556

Integrated Plasmon and Dielectric Waveguides – 587

Method and System for Interactive Modeling of High-Level Network Performance with Low-Level Link Design – 436

Novel Synthesis of Branched Carbon Nanotubes – 207

Pneumatically Actuated Flexible Coupling and Effectors for Lapping/Polishing – 34

Signal Event Detection System – 590

Steroid Lipid-Modified Polyurethane as an Implantable Biomaterial, the Preparation and Uses Thereof – 72

System and Method for Field Testing a Tack Coat Layer – 75

Systems and Methods for Altering Vestibular Biology – 506

Thermally Compensated Fiber Bragg Grating Mount – 236

Tubular Carbon Nano/micro Structures and Method of Making Same – 74

## **PATHOGENESIS**

A Biophysico-computational Perspective of Breast Cancer Pathogenesis and Treatment Response – 325

Prenatal Exposure to Nicotine and Childhood Asthma: Role of Nicotine Acetylcholine Receptors, Neuropeptides and Fibronectin Expression in Lung – 333

Program Project on the Pathogenesis and Treatment of Parkinson's Disease – 334

The Role of CRELD1 Isoform 9B in the Pathogenesis of Breast Cancer – 280

## **PATHOGENS**

Microarray Analysis of Transposon Insertion Mutants in Bacillus Anthracis: Global Identification of Genes Required for Sporulation and Germination – 335

Microarray-based Resequencing of Multiple Bacillus anthracis Isolates – 386

Spaceflight Alters Bacterial Gene Expression and Virulence and Reveals Role for Global Regulator Hfq – 420

Tools for Ultraspecific Probe/Primer Design – 327

## **PATHOLOGY**

Integration of Anatomic and Pathogenetic Bases for Early Lung Cancer Diagnosis – 506

## **PATIENTS**

Adjuvant Immunotherapy for Patients at High Risk of Recurrence Following Radiation Therapy for Prostate Cancer – 298

Antagonism of Taxol Cytotoxicity by Pro-lactin: Implications for Patient Resistance to Chemotherapy – 364

Artificial Pancreas for Control of BG and Insulin Levels in Hospitalized Patients with Diabetes and Stress Hyperglycemia – 328

Automated Patient Positioning Guided by Cone-Beam CT for Prostate Radiotherapy – 286

Epidemiology of Transfusion-Transmitted Infections Among Multi-Transfused Patients in Seven Hospitals in Peru – 403

Evaluating an Interactive, Multimedia Education and Decision Program for Early-Stage Prostate Cancer Patients in a Randomized Controlled Trial – 342

Health Information Exchange in Post-Acute and Long-Term Care – 663

Hot Flashes and Quality of Life Among Breast Cancer Patients – 288

IMPACT (Imaging and Molecular Markers for Patients with Lung Cancer: Approaches with Molecular Targets and Complementary, Innovative and Therapeutic Modalities) – 345

Posttreatment Changes in Escherichia coli Antimicrobial Susceptibility Rates Among Diarrheic Patients Treated with Ciprofloxacin – 385

## **PATTERN RECOGNITION**

Conditional Random People: Tracking Humans with CRFs and Grid Filters – 505

Facial Recognition Evaluation Project Passport Office of Canada - The Methodology and Findings – 228

Intelligent Data Fusion for Wide-Area Assessment of UXO Contamination. SERDP Project MM-1510. 2006 Annual Report – 637

New Metrics for Blog Mining – 622

Pattern Analysis of Directed Graphs Using DEDICOM: An Application to Enroll Email – 439

Training Coordination Proxy Agents – 616

Ultra-fast Object Recognition from Few Spikes – 501

## **PATTERN REGISTRATION**

Advanced Technologies in Safe and Efficient Operating Rooms – 309

## **PAVEMENTS**

A Value-Focused Thinking Model for the Selection of the Best Rigid Pavement, Partial-Depth Spall Repair Material – 20

Grout Impregnation of Pre-Placed Recycled Concrete Pavement (RCP) for Rapid Repair of Deteriorated Portland Cement Concrete Airfield Pavement – 45

Preliminary Findings from Noise Testing on PFC Pavements in Texas – 260

Research Plan for Measuring Noise Levels in Highway Pavements in Texas – 259

Subgrade CBR Values for Alpha Factor Determination Using Data Collected at the National Airport Pavement Test Facility – 13

System for the Evaluation of Moisture Damage Using Fundamental Material Properties – 74

#### **PAYLOADS**

Payload Isolation System for Launch Vehicles – 54

Prioritizing Satellite Payload Selection via Optimization – 46

Unmanned Aerial Vehicles: Background and Issues for Congress – 30

#### **PEACETIME**

Coalition Information Sharing: Lessons from Kosovo – 183

Command and Control in Peace Support Operations Model PAX - Approaching New Challenges in the Modeling of C2 – 148

#### **PENETRATION**

A Multipurpose Projectile for Penetrating Urban Targets – 519

Analysis of USA' Broadband Policy – 491

Measurement of Fog Oil Penetration into Model Underground Burrow and Hollow Tree Nest Cavities – 250

#### **PEPTIDES**

Biomarkers for Amyotrophic Lateral Sclerosis in Active Duty Military – 338

Human Platelets Exhibit Chemotaxis using Functional N-Formyl Peptide Receptors – 386

New Structural Approaches to Understanding the Disease Related Forms of the Prion Protein – 352

Prenatal Exposure to Nicotine and Childhood Asthma: Role of Nicotine Acetylcholine Receptors, Neuropeptides and Fibronectin Expression in Lung – 333

Protein Transduction Based Therapies for Breast Cancer – 315

#### **PERCEPTION**

Assessing Perceptions of Knowledge Management Maturity/Capabilities: A Case Study of SAF/FM – 649

#### **PERCHLORATES**

Field Demonstration and Validation of a New Device for Measuring Groundwater and Perchlorate Fluxes at IHDIV-NSWC, Indian Head, MD – 139

Perchlorate Removal, Destruction, and Field Monitoring Demonstration – 101

#### **PERFORMANCE PREDICTION**

A Method to Predict Atomization Performance in Gas-Centered Swirl-Coaxial Injectors – 218

Atomization Performance Predictions of Gas-Centered Swirl-Coaxial Injectors – 216

Flight Attendant Fatigue – 412

Knowledge Tracing and Prediction of Future Trainee Performance – 531

Mathematical Modeling of Physical and Cognitive Performance Decrement from Mechanical and Inhalation Insults – 297

Method and System for Interactive Modeling of High-Level Network Performance with Low-Level Link Design – 436

Modeling Performance in C4ISR Sustained Operations: A Multi-Level Approach (Briefing Charts) – 411

Performance Modeling and Evaluation of Topologies for Low-Latency SCI Systems – 448

#### **PERFORMANCE TESTS**

Infiniband Performance Comparisons of SDR, DDR and Infinipath – 205

Performance Evaluation of Ad Hoc Routing Protocols in a Swarm of Autonomous Unmanned Aerial Vehicles – 38

Performance Measurement in C2 Systems – 496

Performance Measurement of the Upgraded D0 Central Track Trigger – 558

#### **PERMEABILITY**

Permeability Prediction of Three-Dimensional Woven Fabrics – 89

Preliminary Findings from Noise Testing on PFC Pavements in Texas – 260

#### **PERMITTIVITY**

On the Importance of Atomic Packing in Determining Dielectric Permittivities – 553

Role of Bond Coordination and Molecular Volume on the Dielectric Constant of Mixed-Oxide Compounds – 90

#### **PERSONAL GULF**

Federally Sponsored Health Care Research Gulf War Illnesses and Beyond – 400

Neuropsychological Functioning in Gulf War Veterans Exposed to Pesticides and Pyridostigmine Bromide – 350

#### **PERSONAL COMPUTERS**

Assessment of Two Desk-Top Computer Simulations Used to Train Tactical Decision Making (TDM) of Small Unit Infantry Leaders – 482

#### **PERSONNEL DEVELOPMENT**

Experimentation with Evolving C2 Operation Centers - Implications for the Human Element – 137

Weapons Director Intelligent-Agent-Assist Task: Procedure and Findings for a Validation Study – 7

#### **PERSONNEL MANAGEMENT**

Management and Education of the Risk of Insider Threat (MERIT): Mitigating the Risk of Sabotage to Employers' Information, Systems, or Networks – 497

#### **PERSONNEL**

Assessment of Two Desk-Top Computer Simulations Used to Train Tactical Decision Making (TDM) of Small Unit Infantry Leaders – 482

Defense Logistics: Army and Marine Corps' Body Armor Requirements, Controls, and Other Issues – 425

DoD Personnel Clearances: Delays and Inadequate Documentation Found for Industry Personnel – 643

Human Factors Engineering: An Enabler for Military Transformation Through Effective Integration of Technology and Personnel – 424

Military Nutrition Research: Four Tasks to Address Personnel Readiness and Warfighter Performance – 366

NIOSH Health Hazard Evaluation Report: HETA No. 2007-0068-3042, Noise Exposures and Hearing Loss Assessments among Animal Shelter Workers, Louisiana Society for the Prevention of Cruelty to Animals, Algiers, Louisiana, May 2007 – 252

PCBs Alter Dopamine Mediated Function in Aging Workers – 294

Platform Camera Aircraft Detection for Approach Evaluation and Training – 29

Portfolio Management Decision Support Tools Analysis Relating to Management Value Metrics – 635

Priority of Chemicals for Detection in Air at International Missions for Reducing Threats to Personnel at Acute Toxic Releases to Air – 256

Seroincidence and Phylogeny of Human Immunodeficiency Virus Infections in a Cohort of Commercial Sex Workers in Montevideo, Uruguay – 389

The Effect of Graduate Education on the Performance of Air Force Officers – 526

#### **PERTURBATION**

A Physiologically Based Pharmacokinetic (PB/PK) Model for Multiple Exposure Routes of Soman in Multiple Species – 375

Study of Free-Free Beam Structural Dynamics Perturbations due to Mounted Cable Harnesses – 53

#### **PERU**

Efficacy and Tolerability of Artesunate Plus Sulfadoxine-Pyrimethamine and Sulfadoxine-Pyrimethamine Alone for the Treatment of Uncomplicated Plasmodium Falciparum Malaria in Peru – 381

Epidemiology of Transfusion-Transmitted Infections Among Multi-Transfused Patients in Seven Hospitals in Peru – 403

Phylogenetic Analysis of a Novel Molecular Isolate of Spotted Fever Group Rickettsiae from Northern Peru – 404

- Randomized Double-Blind Phase III Pivotal Field Trial of the Comparative Immunogenicity Safety and Tolerability of Two Yellow Fever 17D Vaccines (ARILVAX-(Trademark) and YF-VAX(Trademark)) in Healthy Infants and Children in Peru – 387
- PESTICIDES**  
Neuropsychological Functioning in Gulf War Veterans Exposed to Pesticides and Pyridostigmine Bromide – 350  
USA Meteorological Data: Daily and Hourly Files to Support Predictive Exposure Modeling – 277
- PETROLEUM PRODUCTS**  
A Possible Solution for the U.S. Navy's Addiction to Petroleum: A Business Case Analysis for Transitioning the U.S. Navy From Petroleum to Synthetic Fuel Resources – 63  
No Further Action Decision Under CERCLA Study Area 43E Historic Gas Station Sites Fort Devens, Massachusetts – 62  
No Further Action Decision Under CERCLA, Study Area 43P Historic Gas Station Sites, Fort Devens, Massachusetts – 62
- PHARMACOLOGY**

## PHYSICAL EXERCISE

Cognitive, Psychomotor, and Physical Performance in Cold Air After Cooling by Exercise in Cold Water – 410

Short-Term Exercise and Prostate Cancer Prevention in African American Men – 359

The Effect of Increasing Mass on Locomotion – 413

## PHYSICIANS

Immunology, Systems Biology, and Immunotherapy of Breast Cancer – 360

## PHYSIOLOGICAL EFFECTS

Defense Health Care: Activities Related to Past Drinking Water Contamination at Marine Corps Base Camp Lejeune – 321

Effects of Hind Limb Unloading on Pharmacokinetics of Procainamide in Mice – 416

Flight Attendant Fatigue – 412

Galvanic Skin Response as a Measure of Soldier Stress – 410

Mathematical Modeling of Physical and Cognitive Performance Decrement from Mechanical and Inhalation Insults – 297

Space Medicine Issues and Healthcare Systems for Space Exploration Medicine – 415

## PHYSIOLOGICAL RESPONSES

Short- and Long-Term Immune Responses of CD-1 Outbred Mice to the Scrub Typhus DNA Vaccine Candidate: p47Kp – 400

Space Medicine Issues and Healthcare Systems for Space Exploration Medicine – 415

Transcriptome Analysis of Human Immune Responses Following Live Vaccine Strain (LVS) Francisella Tularensis Vaccination – 332

## PHYSIOLOGY

Development of Multisensory Orientation Technology for Reducing Spatial Disorientation Mishaps – 7

Mathematical Modeling of Physical and Cognitive Performance Decrement from Mechanical and Inhalation Insults – 297

Multi-System Effects of Daily Artificial Gravity Exposures in Humans Deconditioned by Bed Rest – 418

Physiological Stress Reactivity and Breast Cancer – 391

## PICKLING (METALLURGY)

Development of a Recovery System for Metals and Acids from Pickling Baths Using Nanofiltration and Crystallisation – 109

## PIEZOELECTRIC CRYSTALS

Electromechanics of Dielectric and Piezoelectric Crystals With Point, Line, and Surface Defects – 187

## PIEZOELECTRIC TRANSDUCERS

Structural Diagnostics of CFRP Composite Aircraft Components by Ultrasonic Guided Waves and Built-In Piezoelectric Transducers – 35

## PIEZOELECTRICITY

Electromechanics of Dielectric and Piezoelectric Crystals With Point, Line, and Surface Defects – 187

Lumped Element Modeling of Piezoelectric-Driven Synthetic Jet Actuators – 551

Optimization of Synthetic Jet Actuators – 235

Proceedings of the Symposium on Ferroelectricity and Piezoelectricity (IMRC 2005) – 76

Quantification of Impact Damage in CMC Thermal Protection Systems Using Thin-Film Piezoelectric Sensors (Preprint) – 211

## PILOTLESS AIRCRAFT

A Comparison of Trajectory Determination Approaches for Small UAVs – 11

Autonomous Unmanned Aerial Vehicle Rendezvous for Automated Aerial Refueling – 11

Performance Evaluation of Ad Hoc Routing Protocols in a Swarm of Autonomous Unmanned Aerial Vehicles – 38

Persistent Monitoring Platforms – 36

Probability Modeling of Multi-Type Autonomous Unmanned Combat Aerial Vehicles Engaging Non-Homogeneous Targets Under Imperfect Information – 26

RF Design for Tactical Ultra-Light Unmanned Aerial Vehicle Radar System – 27

Unmanned Aerial Vehicles: Background and Issues for Congress – 30

## PILOTS

Forecasting Demand for Civilian Pilots: A Cost Savings Approach to Managing Air Force Pilot Resources – 27

Mathematical Programming Model for Fighter Training Squadron Pilot Scheduling – 32

Platform Camera Aircraft Detection for Approach Evaluation and Training – 29

## PIPES (TUBES)

Development and Manufacture of Cost Effective Composite Drill Pipe. 2006 Annual Technical Progress Report – 84

From Stove-pipe to Network Centric Leveraging Technology to Present a Unified View – 616

Hot Leg Piping Materials Issues (U) – 595

## PISTON ENGINES

Phase 1 Report: Cost-Effective Reciprocating Engine Emissions Control and Monitoring for E&P Field and Gathering Engines – 238

Report 17: Cost-Effective Reciprocating Engine Emissions Control and Monitoring for E&P Field and Gathering Engines. (Technical Report, October 1, 2006-December 31, 2006) – 237

## PITCH (INCLINATION)

Possibility for Artificially Inducing Strong Pitch Angle Diffusion in the Magnetosphere – 261

## PITUITARY HORMONES

Antagonism of Taxol Cytotoxicity by Pro lactin: Implications for Patient Resistance to Chemotherapy – 364

Role of Growth Hormone in Prostate Cancer – 342

## PIXELS

An Ultra High Resolution, Electro-Optical Framing Camera for Reconnaissance and Other Applications Using a 9216 by 9216 Pixel, Wafer Scale, Focal Plane Array – 223

Flight Test Results From the Ultra High Resolution, Electro-Optical Framing Camera Containing a 9216 by 9216 Pixel, Wafer Scale, Focal Plane Array – 222

Polarimeter in a Pixel – 195

## PLANAR STRUCTURES

Position Analysis of Planar Tensegrity Structures – 583

## PLANET DETECTION

High Contrast Imaging Using Adaptive Optics for Extrasolar Planet Detection – 666

## PLANETARY NEBULAE

An Atlas of [N ii] and [O iii] Images and Spectra of Planetary Nebulae – 666

## PLANETARY QUARANTINE

Extensively Drug-Resistant Tuberculosis (XDR-TB): Quarantine and Isolation – 398

## PLANNING

A Conceptual Operational Model for Command and Control of International Missions in the Canadian Forces – 180

AI on the Battlefield: An Experimental Exploration (Preprint) – 501

C3X: Correlation, Causation and Controlled Experimentation for C2 – 146

Changing the Cultural Paradigm to Meet Emerging Requirements – 56

Collaboration Tool Suites Developed to Support Joint Command and Control Planning and Decisionmaking – 471

Flexible UAV Mission Management Using Emerging Technologies – 23

Link Analysis for Dynamic Planning and Scheduling – 502

Long-Range Operational Military Forecasts for Afghanistan – 271

Multinational Information Sharing and Collaborative Planning Limited Objective Experiments – 655

A Qualitative Approach to Rigid Body Mechanics – 501

A Quantum Approach to Multi-Agent Systems (MAS), Organizations, and Control – 534

Cooperative Solutions in Multi-Person Quadratic Decision Problems: Finite-Horizon and State-Feedback Cost-Cumulant Control Paradigm – 516

Implicit Solvers for Large Scale Nonlinear Problems – 433

Multi-Agent Systems in Mobile Ad hoc Networks – 626

Parallel Eigensolver for H (curl) Problems using H1 Auxiliary Space AMG Preconditioning – 434

Problem representation and variation in the forecasts of 'political experts' – 543

Some Experience with a H1 Based Auxiliary Space AMG for H (curl) Problems – 437

The Use of Cognitive Task Analysis and Simulators for After Action Review of Medical Events in Iraq – 367

The Use of Cognitive Task Analysis and Simulators for the After Action Review of Medical Events in Iraq – 618

Using Templates to Support Crisis Action Mission Planning – 455

#### PROCEDURES

Best Practice in Adhesive-Bonded Structures and Repairs – 67

Knowledge, Attitudes, and Practices Regarding Epidemiology and Management of Travelers' Diarrhea: A Survey of Front-Line Providers in Iraq and Afghanistan – 375

Supporting Effects-Based Operations with Information Technology Tools: Examining Underlying Assumptions of EBO Tool Development Practices – 536

System-of-Systems Governance: New Patterns of Thought – 465

#### PROCUREMENT

Conditions for Achieving Network-Centric Operations in Systems of Systems – 465

Cord Blood Stem Cell Procurement in Minority Donors – 302

Modeling and Simulation to Support C4ISR Acquisition and Transformation – 461

Report to the Institutional Computing Executive Group (ICEG) August 14, 2006 – 433

Topics in Interoperability: Structural Grammaticals in a System of Systems – 465

Unmanned Aerial Vehicles: Background and Issues for Congress – 30

#### PRODUCTIVITY

The Federal Networking and Information Technology Research and Development Program: Funding Issues and Activities – 481

#### PROGNOSIS

Prognostic Significance of Telomere Attrition in Ductal Carcinoma in Situ of the Breast – 391

#### PROGRAM VERIFICATION (COMPUTERS)

Enhancing Information Systems Security through Biometrics – 472

#### PROGRAMMING LANGUAGES

Hao Spectral Diagnostic Package for Emitted Radiation (Haos-Diper) Reference Guide. Version 1.0 – 558

Operational Agility: Composing and Orchestrating Mission Capability Packages Through Business Process Execution Language (BPEL) – 444

PCA RAW FABRIC: Architectural Prototyping, Demonstration and Evaluation – 462

#### PROJECT MANAGEMENT

Challenges to Ensuring Secure .COM and .EDU Access to a Web-Based Air Force Laboratory Program Management – 489

Concept of C4I Data Fusion Command Center for Urban Operations – 155

Framework for Information Age Assessment Metrics – 171

Information Age Architectures Must Be Enterprise Architecture – 171

#### PROJECT PLANNING

NOAA National Passive Acoustics Workshop, 2006 – 590

#### PROJECTILES

A Multipurpose Projectile for Penetrating Urban Targets – 519

Design of Experiments Study of the Initial Extended Area Protection and Survivability (EAPS) Projectile System – 527

Stochastic Analysis of Initial Extended Area Protection and Survivability (EAPS) Projectile – 427

Structural Design and Analysis of Initial Extended Area Protection and Survivability (EAPS) Projectile Configurations – 216

#### PROPELLANT TANKS

Hydrogen Pressurization of LOX: High Risk/High Reward (Preprint) – 97

#### PROPELLANTS

Heat Flux and Infrared Spectral Measurements of Burning SRM Propellant (Postprint) – 130

Insensitive High-Performance Replacements for RDX in Explosive and Propellant Formulations – 59

Investigation of Advanced Propellants to Enable Single Stage to Orbit Launch Vehicles – 51

## PROPELLERS

Technologies for Propelled Hypersonic Flight, Volume 2 - Subgroup 2: Scram Propulsion – 41

Technologies for Propelled Hypersonic Flight, Volume 3 - Subgroup 3: CFD Validation for Hypersonic Flight – 41

## PROPHYLAXIS

A Dual-Action Approach to Multidrug-Resistant Breast Cancer: Prophylaxis to Ensure Therapeutic Effect – 406

Antioxidant Prophylaxis in the Prevention of Prostatic Epithelial Neoplasia – 336

Short-Course Postexposure Antibiotic Prophylaxis Combined with Vaccination Protects Against Experimental Inhalational Anthrax – 340

## PROPORTIONAL NAVIGATION

Proportional Navigation With Adaptive Terminal Guidance For Aircraft Rendezvous (Preprint) – 7

## PROPOSALS

UH-USA Agreement - A Telemedicine Research Proposal – 624

## PROPULSION SYSTEM CONFIGURATIONS

Confined Detonations and Pulse Detonation Engines – 42

## PROPULSION

Investigation of Advanced Propellants to Enable Single Stage to Orbit Launch Vehicles – 52

Technologies for Propelled Hypersonic Flight – 40

## PROSTATE GLAND

A Phase II Immunotherapeutic Trial: Combination Androgen Ablative Therapy and CTLA-4 Blockade as a Treatment for Advanced Prostate Cancer – 298

Activation and Protection of Dendritic Cells in the Prostate Cancer Environment – 312

Adjuvant Immunotherapy for Patients at High Risk of Recurrence Following Radiation Therapy for Prostate Cancer – 298

Anti-Angiogenic Action of Neutral Endopeptidase – 285

Antioxidant Prophylaxis in the Prevention of Prostatic Epithelial Neoplasia – 336

Apoptosis and Tumor Progression in Prostate Cancer – 338

Apoptosis-Dependent and Apoptosis-Independent Functions of Bim in Prostate Cancer Cells – 307

ATM Heterozygosity and the Development of Radiation-Induced Erectile Dysfunction and Urinary Morbidity Following Radiotherapy for Prostate Cancer – 344

Automated Patient Positioning Guided by Cone-Beam CT for Prostate Radiotherapy – 286

Biological Impact of Senescence Induction in Prostate Cancer Therapy – 293

Cadmium, Zinc, and Selenium Levels in Carcinoma of the Human Prostate – 356

Cannabinoid Receptors: A Novel Target for Therapy of Prostate Cancer – 320

Cell Cycle Dependence of TRAIL Sensitivity in Prostate Cancer Cells – 303

Centrosome-Based Mechanisms, Prognostics and Therapeutics in Prostate Cancer – 345

Decipher the Transcriptional Program in Prostate Cancer Cells – 305

Delaware Consortium for Undergraduate Minority Training in Prostate Cancer – 362

Developing Models to Facilitate the Appropriate Selection and Effective Targeting of Candidate Antigens for Specific Cellular Immunotherapy of Prostate Cancer – 349

Development of a Mouse Model for Prostate Cancer Imaging and Study of Disease Progression – 321

Development of a Novel, Non-Invasive Diagnostic Test for Prostate Cancer – 284

Development of Antigen Presenting Cells for Adoptive Immunotherapy in Prostate Cancer – 286

Development of Methodology to Maintain Primary Cultures of Normal and Malignant Human Prostatic Epithelial Cells in Vivo – 342

Development of Novel Bifunctional Compounds that Induce Apoptosis in Prostate Cancer Cells – 365

Dietary Fat, Fat Metabolizing Genes, and Prostate Cancer Risk in African-Americans and Whites – 340

Differential Mechanisms of Androgen Resistance – 313

DRF3 as a Cholesterol-Dependent Regulator of Src in Prostate Cancer – 315

Dynamic Tissue Culture from Prostate Biopsy Specimens as a Model for Predicting Tumor Radiosensitivity to Ionizing Radiation Treatment – 381

Early Detection of Prostate Cancer – 323

Effect of COX-2 (PGE2) and IL-6 on Prostate Cancer Bone Mets – 294

Effects of Modifications in the Laminin-10 Basal Laminina on Prostate Cancer Invasion – 376

Enhancement of Tumor Immunotherapy by Blockade of a Prostate Tumor Derived Immunosuppressive Factor – 281

Evaluating an Interactive, Multimedia Education and Decision Program for Early-Stage Prostate Cancer Patients in a Randomized Controlled Trial – 342

Evaluation of Genomic Instability in the Abnormal Prostate – 405

FGFR4 Downregulation of Cell Adhesion in Prostate Cancer – 376

Functional Characterization of Two Novel Human Prostate Cancer Metastasis Related Genes – 341

Gene Expression Analysis of Circulating Hormone Refractory Prostate Cancer Micrometastases – 329

GKLF as a Novel Target in Selenium Chemoprevention of Prostate Cancer – 361

Hepatocyte Growth Factor and Interleukin-6 in Prostate Cancer Bone Metastasis – 344

High Resolution Anatomic and Elastographic Transrectal Ultrasound for Improved Diagnosis of Prostate Cancer – 350

HOXC5 as a Biomarker of Disease Presence in Tumor-Associated Normal Prostate – 290

Humanin: A Novel Therapeutic Target in Prostate Cancer – 319

Identification of a Protein for Prostate-Specific Infection – 301

Identification of Sonic Hedgehog-Induced Stromal Factors That Stimulate Prostate Tumor Growth – 295

Identifying Molecular Factors in Androgen Receptor Nuclear Export – 282

IDO Inhibitors for Combination Therapy of Prostate Cancer – 317

Imaging Primary Prostate Cancer and Bone Metastasis – 325

Intensity Modulated Radiation Treatment of Prostate Cancer Guided by High Field MR Spectroscopic Imaging – 355

Interactions between Dietary Factors and Inflammation in Prostate Carcinogenesis – 349

Intra-Prostate Cancer Vaccine Inducer – 316

Investigating the Functional Role of Prostate-Specific Membrane Antigen and its Enzymatic Activity in Prostate Cancer Metastasis – 344

Involvement and Regulation of Heparanase in Prostate Cancer Progression – 318

Knockout AR in Prostate – 280

Locating a Prostate Cancer Susceptibility Gene on the X Chromosome by Linkage Disequilibrium Mapping Using Three Founder Populations in Quebec and Switzerland – 352

Long-Term Outcomes of Alternative Brachytherapy Techniques for Early Prostate Cancer – 294

Mechanism of Action of Prostate Stem Cell Antigen Targeted Antibody Therapy and Its Relevance to Clinical Application in Prostate Cancer – 351

Mechanism of Tumor Metastasis Suppression by the KA11 Gene – 318

Methylselenium and Prostate Cancer Apoptosis – 339

Molecular Effects of 13C/DIM in Prostate Cancer – 406

MR Imaging Based Treatment Planning for Radiotherapy of Prostate Cancer – 349

Non-Invasive Markers of Tumor Growth, Metastases, and Sensitivity to Anti-Neoplastic Therapy – 363

Origin and Properties of Prostatic Stem Cells – 299

p63 in Development and Maintenance of the Prostate Epithelium – 355

Pilot Comparison of Stromal Gene Expression among Normal Prostate Tissues and Primary Prostate Cancer Tissues in White and Black Men – 313

Pim Protein Kinase-Levels Correlate with Prostate Tumor Growth and Chemo-Resistance - Potential Mechanism of PIM Action – 282

Preclinical Testing the Therapeutic Potential of a Potent and Novel Small-Molecule Inhibitor of Bcl-2 as a Novel Therapy for Hormone-Refractory Prostate Cancer – 302

Prevention of Prostate Cancer by Inositol Hexaphosphate – 361

Proof of Concept for Systematic Collection of Optimal Molecular Quality Anatomically Oriented Normal Prostate from Diverse Age and Race Transplant Donors – 326

Prostate Cancer Cell Growth: Stimulatory Role of Neurotensin And Mechanism of Inhibition by Flavonoids as Related to Protein Kinase C – 352

Prostate Cancer Gene Discovery Using ROMA – 371

PSA-Based Screening Outcomes, Dietary Heterocyclic Amine Exposure, and Prostate Cancer Risk in African Americans – 302

Radiation-Induced Immune Modulation in Prostate Cancer – 325

Radio-sensitizing Effects of Novel Histone De-Acetylase Inhibitors in Prostate Cancer – 283

Restoration of Wild-Type Activity to Mutant p53 in Prostate Cancer: A Novel Therapeutic Approach – 365

Role of Caveolin-1 in Prostate Cancer Angiogenesis – 286

Role of Growth Hormone in Prostate Cancer – 342

Role of Obesity in Prostate Cancer Development – 336

Role of Reactive Stroma in Prostate Cancer Progression – 317

Selective Androgen Receptor Downregulators (SARDs): A New Prostate Cancer Therapy – 303

Short-Term Exercise and Prostate Cancer Prevention in African American Men – 359

Stromal Mesenchyme Cell Genes in Prostate Cancer Development: Epigenetic Markers for Cancer and Potential Targets for Therapy – 316

Studies of Prostate Tumor Development Via CRE/LOXP Technology – 309

The Development of Novel Small Molecule Inhibitors of the Phosphoinositide-3-Kinase Pathway through High-Throughput Cell-Based Screens – 329

The Role of Oncogene/Tumor Suppressor Interaction with the Centrosome Protein Pericentrin in Prostate Tumorigenesis – 322

The Significance of Focal Basal Cell Layer Disruption-Induced Immuno-Cell Infiltration in Prostate Cancer Invasion – 364

Unique Approaches to Androgen Effects on Prostate Cancer – 334

Validation of Quantitative Multimodality Analysis of Telomerase Activity in Urine Cells as a Noninvasive Diagnostic and Prognostic Tool for Prostate Cancer – 366

Vasculature-Specific Adenovirus Vectors for Gene Therapy of Prostate Cancer – 352

## PROSTHETIC DEVICES

Toward Neural Control of Prosthetic Devices – 210

## PROTECTION

Achievements in Stratospheric Ozone Protection – 278

Activation and Protection of Dendritic Cells in the Prostate Cancer Environment – 312

Advancing Software Security - The Software Protection Initiative – 626

Cross-Protection against Marburg Virus Strains by Using a Live, Attenuated Recombinant Vaccine – 331

Defending Electrical Power Grids – 243

Defense Acquisitions: Analysis of Processes Used to Evaluate Active Protection Systems – 426

Design of Experiments Study of the Initial Extended Area Protection and Survivability (EAPS) Projectile System – 527

Digital C4I Interoperability: The EM Protection Issue – 163

FCS Technology Insertion and Transition – 508

Homeland Security -- Reducing the Vulnerability of Public and Private Information Infrastructures to Terrorism: An Overview – 493

Homeland Security: Protecting Airspace in the National Capital Region – 25

Issues and Requirements for Cybersecurity in Network Centric Warfare – 446

Novel Collective Protection Filters for Emerging TIC Requirements: Axial and Radial-Flow Filter Designs – 55

Postexposure Protection of Guinea Pigs against a Lethal Ebola Virus Challenge is Conferred by RNA Interference – 330

Protection Against Scrub Typhus by a Plasmid Vaccine Encoding the 56-KD Outer Membrane Protein Antigen Gene – 399

Protection of Software-based Survivability Mechanisms – 447

Protection with Recombinant Clostridium botulinum C1 and D Binding Domain Subunit (Hc) Vaccines Against C and D Neurotoxins – 369

Serologic Correlates of Protection against Enterotoxigenic Escherichia coli Diarrhea – 379

Stochastic Analysis of Initial Extended Area Protection and Survivability (EAPS) Projectile – 427

Structural Design and Analysis of Initial Extended Area Protection and Survivability (EAPS) Projectile Configurations – 216

Technical and Non-Technical Problems in Biometric Physical Access Control Systems – 473

Topology of On/Off Marx Modulator with Protection of Load and Solid State Switches – 579

## PROTECTIVE COATINGS

First Principles and Multi-Scale Modeling of the Roles of Impurities and Dopants on Thermal Barrier Coating Failure – 88

Nanoengineered Additives for Active Coatings – 61

Oxygen Plasma Treatment and Deposition of CNx on a Fluorinated Polymer Matrix Composite for Improved Erosion Resistance (Preprint) – 121

Releaseable Corrosion Inhibitor Compositions – 108

## PROTECTORS

Skin Temperature Feedback Optimizes Microclimate Cooling – 272

Studies on Electrical Safety, When Using ESD Protective Equipment, Especially ESD Protective Garments – 205

## PROTEINS

An All-Atom Model of the Pore-Like Structure of Hexameric VP40 from Ebola: Structural Insights into the Monomer-Hexamer Transition – 331

Assessment of Detection and Refinement Strategies for de novo Protein Structures using Force Field and Statistical Potentials – 353

Association between Microtubule Associated Protein -2 and the EGRF Signaling in Breast Cancer – 296

Biomarkers for Amyotrophic Lateral Sclerosis in Active Duty Military – 338

Deciphering the Molecular Mechanisms of Breast Cancer – 324

DNA Ligase I is an In Vivo Substrate of DNA-Dependent Protein Kinase and is Activated by Phosphorylation in Response to DNA Double-Strand Breaks – 383

DRF3 as a Cholesterol-Dependent Regulator of Src in Prostate Cancer – 315

Enhancement of Tumor Immunotherapy by Blockade of a Prostate Tumor Derived Immunosuppressive Factor – 281

Feasibility of Biomonitoring of Exposure to Permethrin Through Analysis of Long-Lived (Metabolite) Adducts to Proteins – 320

fRMSDPred: Predicting Local RMSD Between Structural Fragments Using Sequence Information – 369

HIV Gag Protein Conjugated to a Toll-like Receptor 7/8 Agonist Improves the Magnitude and Quality of Th1 and CD8+ T Cell Responses in Nonhuman Primates – 397

Identification, Cloning, and Expression of Potential Diagnostic Markers for Q Fever – 388

Identification, Cloning, Expression, and Characterization of the Gene for Plasmodium knowlesi Surface Protein Containing an Altered Thrombospondin Repeat Domain – 389

Identification of a Protein for Prostate-Specific Infection – 301

Kapillaerelektrofores i Tva Dimensioner. Slutrapport Fran Innovationsprojekt 14215 (Two-Dimensional Capillary Electrophoresis Final Report of the Innovative Project 14215) – 68

Mechanisms of Alpha-synuclein Aggregation and Toxicity – 330

Method of Affinity Purifying Proteins Using Modified Bis-Arsenical Fluorescein – 65

New Structural Approaches to Understanding the Disease Related Forms of the Prion Protein – 348

Novel Molecular Interactions and Biological Functions of the Neurofibromatosis 2 Tumor Suppressor Protein, Merlin – 327

Pim Protein Kinase-Levels Correlate with Prostate Tumor Growth and Chemoresistance - Potential Mechanism of PIM Action – 282

Production of Recombinant Protein Pap31 and Its Application for the Diagnosis of Bartonella bacilliformis Infection – 398

Prostate Cancer Cell Growth: Stimulatory Role of Neurotensin And Mechanism of Inhibition by Flavonoids as Related to Protein Kinase C – 352

Protection Against Scrub Typhus by a Plasmid Vaccine Encoding the 56-KD Outer Membrane Protein Antigen Gene – 399

Protein Transduction Based Therapies for Breast Cancer – 315

Selective Androgen Receptor Downregulators (SARDs): A New Prostate Cancer Therapy – 303

Spaceflight Alters Bacterial Gene Expression and Virulence and Reveals Role for Global Regulator Hfq – 420

The Development of Novel Small Molecule Inhibitors of the Phosphoinositide-3-Kinase Pathway through High-Throughput Cell-Based Screens – 329

The Role of Oncogene/Tumor Suppressor Interaction with the Centrosome Protein Pericentrin in Prostate Tumorigenesis – 322

The Role of RB in the Therapeutic Response of Breast Cancer – 301

The Role of TSC Proteins in Regulating Cell Adhesion and Motility – 281

## PROTEOME

A Comprehensive Survey of the Plasmodium Life Cycle by Genomic, Transcriptomic, and Proteomic Analyses – 389

Proteomic Analysis of Bronchoalveolar Lavage Fluid: Effect of Acute Exposure to Diesel Exhaust Particles in Rats – 335

Proteomic Analysis of Rickettsia prowazekii – 395

Proteomic Analysis to Identify Novel Circulating Breast Cancer Markers – 322

## PROTOCOL (COMPUTERS)

A Distributed Approach for Multi-Constrained Path Selection and Routing Optimization – 640

A Multi-Ring Framework for Survivable Group Communications – 440

A Test Method to Assess the Foldability of Flexible Structural Materials – 125

An Evaluation Methodology for Protocol Analysis Systems – 490

C2 Interoperability. A Force Multiplier for Joint/Combined Operations and Homeland Security – 629

Classifying C2 Decision Making Jobs Using Cognitive Task Analyses and Verbal Protocol Analysis – 459

Comparative Performance Analysis of Directed Flow Control for Real-Time SCI – 448

Decentralized Control Using Global Optimization (DCGO) (Preprint) – 495

Extending Simple Network Management Protocol (SNMP) Beyond Network Management: A MIB Architecture for Network-Centric Services – 490

Guidance Material for Mode S-Specific Protocol Application Avionics – 37

Internet Protocol Geolocation: Development of a Delay-Based Hybrid Methodology for Locating the Geographic Location of a Network Node – 641

Performance Evaluation of Ad Hoc Routing Protocols in a Swarm of Autonomous Unmanned Aerial Vehicles – 38

Performance Modeling and Evaluation of Topologies for Low-Latency SCI Systems – 448

Static Reachability Analysis and Validation Regarding Security Policies Implemented via Packet Filters – 489

Testing for Compliance to NTCIP Standards – 428

## PROTON BEAMS

Berkeley Accelerator Space Effects (BASE) Light Ion Facility Upgrade – 584

## PROTON-ANTI-PROTON INTERACTIONS

Measurements of the B Production Cross Section in Proton-Antiproton Collisions at  $s^{1/2} = 1.96$  TeV using Semileptonic Decays of b Hadrons – 586

SUSY Multilepton Signatures at Tevatron – 576

## PROTONS

Potential Applications of Microtesla Resonance Imaging Detected Using a Superconducting Quantum Interference Device – 560

## PROTOTYPES

Case Study of a Prototype Set of Behaviorally Anchored Rating Scales (BARS) for C2 Assessment – 135

Evolution of a Mission Plan – 646

IEIST Technologies Enabling TCT Prosecution – 538

IMMR Phase 1 Prototyping Plan Inputs – 663

PCA RAW FABRIC: Architectural Prototyping, Demonstration and Evaluation – 462

Systems Engineering for Rapid Prototyping: Friendly Marking Device – 227

The Synergic Integrated Concepts of C2S – 174

U.S. Army Toxic and Hazardous Materials Agency Quality Assurance Program – 93

#### QUANTITATIVE ANALYSIS

Analysis of Network-Enabled ASW Concepts of Operation – 529

Quantitative Analysis of Situational Awareness (QUASA): Applying Signal Detection Theory to True/False Probes and Self-Ratings – 132

Use of Modeling and Simulation (M&S) in Support of the Quantitative Assessment of FORCEnet Systems and Concepts – 456

Validation of Quantitative Multimodality Analysis of Telomerase Activity in Urine Cells as a Noninvasive Diagnostic and Prognostic Tool for Prostate Cancer – 366

#### QUANTUM CHEMISTRY

Applications of Molecular and Materials Modeling – 94

Pentazole-Based Energetic Ionic Liquids: A Computational Study (Preprint) – 97

#### QUANTUM CHROMODYNAMICS

AdS/CFT and QCD – 572

BlueGene/L Supercomputer and Quantum ChromoDynamics – 560

Conformal Template and New Perspectives for Quantum Chromodynamics – 574

First Observation of Bottom Baryon Sigma(b) States at CDF – 586

National Software Infrastructure for Lattice Quantum Chromodynamics – 581

Results on QCD Physics from the CDF-II Experiment – 559

W + Jet Production at CDF – 585

#### QUANTUM COMPUTATION

Proceedings of the Quantum Computation for Physical Modeling Workshop 2004. Held in North Falmouth, MA on 12-15 September 2004 – 592

Proceedings of the Quantum Computation for Physical Modeling Workshop Held in North Falmouth, Massachusetts on October 18-19, 2000 – 519

#### QUANTUM DOTS

Designing of Bulk Nano-Structures with Enhanced Thermoelectric Properties – 189

Dynamics of Epitaxy on the Nano-sized Semiconductor Surfaces – 188

Method of Forming Quantum Dots at Predetermined Positions on a Substrate – 201

New Generation Photonics Materials: Design, Development, Characterization, and Applications – 210

Non-Equilibrium Quantum Dots: Transport – 185

Semiconductor Quantum Dot Resonant Tunnelling Spectroscopy – 185

Study on Wide-gap Gallium-nitride Based Films and Their Quantum-dots Devices – 196

#### QUANTUM ELECTRONICS

Method of Forming Quantum Dots at Predetermined Positions on a Substrate – 201

#### QUANTUM THEORY

A Quantum Approach to Multi-Agent Systems (MAS), Organizations, and Control – 535

Fabrications and Characterizations of ZnO/Zn<sub>1-x</sub>Mg<sub>x</sub>O Nanorod Quantum Structures – 186

Fundamental Study on Quantum Nanojets – 548

Physical Renormalization of Quantum Field Theories – 556

Proceedings of the Quantum Computation for Physical Modeling Workshop 2004. Held in North Falmouth, MA on 12-15 September 2004 – 592

Proceedings of the Quantum Computation for Physical Modeling Workshop Held in North Falmouth, Massachusetts on October 18-19, 2000 – 519

Scalability, Complexity and Reliability in Quantum Information Processing – 591

#### QUANTUM WELLS

Pseudomorphic Bipolar Quantum Resonant-Tunneling Transistor – 186

#### QUARKS

Measurements of Top Quark Properties at CDF – 564

National Software Infrastructure for Lattice Quantum Chromodynamics – 581

t-bar Production at the Tevatron. Event Selection and Cross Section Measurement – 586

#### QUEBEC

Locating a Prostate Cancer Susceptibility Gene on the X Chromosome by Linkage Disequilibrium Mapping Using Three Founder Populations in Quebec and Switzerland – 353

#### QUERY LANGUAGES

Semantic Graph Query Language – 434

#### QUEUEING THEORY

The Analysis of Network Centric Maritime Interdiction Operations (MIO) Using Queueing Theory – 625

Utilizing Network-Enabled Command and Control Concepts to Enhance ASW Effectiveness – 590

Workforce Configuration of a Canadian Forces Gematics Division – 539

#### RACES (ANTHROPOLOGY)

Dietary Fat, Fat Metabolizing Genes, and Prostate Cancer Risk in African-Americans and Whites – 340

#### RADAR BEAMS

Space-Time Adaptive Processing: Fundamentals – 177

#### RADAR DATA

Bi- and Multistatic Radar – 176

Inversion of Ionospheric Backscatter Radar Data in Order to Map and Model the Ionosphere – 260

Software to Generate 3-Dimensional Displays of Inverse Synthetic aperture Radar Data – 455

#### RADAR DETECTION

Advanced Radar Signal and Data Processing – 175

Fundamentals of Signal Processing for Phased Array Radar – 176

Space-Time Adaptive Processing: Fundamentals – 177

#### RADAR EQUIPMENT

RF Design for Tactical Ultra-Light Unmanned Aerial Vehicle Radar System – 27

#### RADAR IMAGERY

Alternatives for Military Space Radar – 223

Development and Assessment of a Complete ATR Algorithm Based on ISAR Euler Imagery – 468

Land Use Mapping with Evidential Fusion of Polarimetric Synthetic Aperture Radar and Hyperspectral Imagery – 631

Software to Generate 3-Dimensional Displays of Inverse Synthetic aperture Radar Data – 455

#### RADAR RANGE

Bi- and Multistatic Radar – 176

#### RADAR SIGNATURES

Development and Testing of a Multiple Frequency Continuous Wave Radar for Target Detection and Classification – 224

#### RADAR TARGETS

Advanced Target Tracking Techniques – 175

Development and Testing of a Multiple Frequency Continuous Wave Radar for Target Detection and Classification – 223

Space-Time Adaptive Processing: Algorithms – 177

Tracking and Data Fusion Applications – 177

#### RADAR TRACKING

A Centripetal Acceleration Statistic for Tracking Maneuvering Targets with Radar – 225

Scenario-Based Assessment of Sensors for the Canadian Recognized Maritime Picture – 227

#### **RADAR**

A Review of Recent Algorithms and a New and Improved Cooperative Control Design for Generating a Phantom Track (Preprint) – 26

Inversion of Ionospheric Backscatter Radar Data in Order to Map and Model the Ionosphere – 260

Pilot Study: Parasitic and Passive Radar – 179

The Effects of Wind Turbine Farms on Air Defence Radars – 22

#### **RADIAL FLOW**

Novel Collective Protection Filters for Emerging TIC Requirements: Axial and Radial-Flow Filter Designs – 55

#### **RADIANCE**

Observation of Tidal Effects on LWIR Radiance Above the Mesopause – 262

Vertical Variation of Dust and Its Impact on the Top of the Atmosphere Brightness Temperature in the Midwave Infrared – 271

#### **RADIANT COOLING**

Nonequilibrium Stagnation-Line Radiative Heating for Fire II – 221

#### **RADIATION DAMAGE**

Radiation Damage Effects on the Magnetic Properties of Pu(1-x)Am(x) (x=0.224) – 562

#### **RADIATION DOSAGE**

Correcting the Response of an Albedo Neutron Dosimeter for Energy – 220

Long-Term Outcomes of Alternative Brachytherapy Techniques for Early Prostate Cancer – 294

Minimizing Astronauts' Risk from Space Radiation during Future Lunar Missions – 676

Multiple Aperture Radiation Therapy (MART) for Breast Cancer – 292

#### **RADIATION EFFECTS**

Development of Technologies to Utilize Laser Plasma Radiations Sources for Radiation Effects Sciences – 600

Minimizing Astronauts' Risk from Space Radiation during Future Lunar Missions – 676

Radiation-Induced Immune Modulation in Prostate Cancer – 325

Toxicity and Radioprotective Effects of DF-1 and Carbon Nanotubes in Human Lung and Liver Cell Lines – 418

Utility of DF-1 for Radioprotection in Lymphocytes – 420

#### **RADIATION HAZARDS**

Consequence Assessment Methods for Incidents Involving Releases From Liquefied Natural Gas Carriers – 607

Minimizing Astronauts' Risk from Space Radiation during Future Lunar Missions – 676

#### **RADIATION PROTECTION**

A Rationale for Establishing Survivability Requirements for Objective Force Unmanned Army Platforms and Systems – 191

Minimizing Astronauts' Risk from Space Radiation during Future Lunar Missions – 676

Nuclear Safety: DOE's Investigation of Phosgene Gas Contamination was Inadequate, but Experts Conclude that Worker Safety and Facilities Are Not Threatened – 131

Toxicity and Radioprotective Effects of DF-1 and Carbon Nanotubes in Human Lung and Liver Cell Lines – 418

Utility of DF-1 for Radioprotection in Lymphocytes – 420

#### **RADIATION SHIELDING**

Minimizing Astronauts' Risk from Space Radiation during Future Lunar Missions – 676

Radiation Shielding Issues for Superconducting RF Cavity Test Facility at Fermilab – 564

#### **RADIATION SPECTRA**

Experiments, Computation, and Modeling for Temperature Dependence of Absorption, Scattering, Reflection, Transmission, and Index of Refraction of Optical Radiation in Biological Tissues – 597

#### **RADIATION THERAPY**

Adjuvant Immunotherapy for Patients at High Risk of Recurrence Following Radiation Therapy for Prostate Cancer – 298

ATM Heterozygosity and the Development of Radiation-Induced Erectile Dysfunction and Urinary Morbidity Following Radiotherapy for Prostate Cancer – 344

Automated Patient Positioning Guided by Cone-Beam CT for Prostate Radiotherapy – 286

MR Imaging Based Treatment Planning for Radiotherapy of Prostate Cancer – 349

Multiple Aperture Radiation Therapy (MART) for Breast Cancer – 292

#### **RADIATION TOLERANCE**

Dynamic Tissue Culture from Prostate Biopsy Specimens as a Model for Predicting Tumor Radiosensitivity to Ionizing Radiation Treatment – 381

#### **RADIATION TRANSPORT**

Summary of LLNL Russian Projects – 573

#### **RADIATIVE TRANSFER**

Application of the Community Radiative Transfer Model to Evaluate Satellite-Based Measurements Across the African Easterly Jet Over Western Africa – 48

Theoretical Characterization of the Radiative Properties of Dust Aerosol for the Air Force Combat Climatology Center Point Analysis Intelligence System – 271

Vertical Variation of Dust and Its Impact on the Top of the Atmosphere Brightness Temperature in the Midwave Infrared – 271

#### **RADICALS**

Health Effects Support Document for Terbacil – 73

Microbial Degradation of Fuel Oxygenates under Aerobic Conditions – 113

#### **RADIO ASTRONOMY**

GISMO – 231

#### **RADIO BURSTS**

Near-Relativistic Electron c/v Onset Plots – 668

#### **RADIO FREQUENCIES**

Assured Reference Technology Research (ARTHR) Project. Delivery Order 0004: Fiber-Optic RF Distribution (FORD) (PREPRINT) – 596

Development of a Charged-particle Accumulator Using an RF Confinement Method II – 591

Development of a Charged-Particle Accumulator Using an RF Confinement Method – 593

Model Based Statistical Estimation of Sandia RF Ohmic Switch Dynamic Operation from Stroboscopic X-ray Imaging – 207

Neutron Generators Developed at LBNL for Homeland Security and Imaging Applications – 566

RIDE vs. CLASP Comparison and Evaluation: Models and Parameters – 662

## RATIONS

Development of Nanocomposite Reinforced Polymeric Materials to be Used for Racks for Retorting Polymeric Trays – 123

Retort Racks for Polymeric Trays in 1400 Style Spray Retorts – 518

## RATS

A Rat Model for Human Ductal Carcinoma In Situ – 392

Hypothermia Induction and Recovery in Free-Ranging Rats – 409

Proteomic Analysis of Bronchoalveolar Lavage Fluid: Effect of Acute Exposure to Diesel Exhaust Particles in Rats – 335

## RAYLEIGH SCATTERING

Filtered Rayleigh Scattering Measurements in a Buoyant Flowfield – 544

## RAYLEIGH WAVES

Continent-Wide Maps of 5-50 S Rayleigh-Wave Attenuation for Eurasia Inferred from Maps of 1-Hz Lg Coda Q and its Frequency Dependence – 265

Regionalization of Crustal and Upper Mantle Q Structure in Eastern Eurasia Using Multiple Regional Waves – 262

## RDX

Insensitive High-Performance Replacements for RDX in Explosive and Propellant Formulations – 60

## REACTION KINETICS

The Effect of Increasing Mass on Locomotion – 414

## REACTION WHEELS

Zero Gyro Kalman Filtering in the Presence of a Reaction Wheel Failure – 667

## REACTIVITY

Crosslinked Compounds and Methods of Making and Using Thereof – 72

Effects of Lunar Dust Simulant (JSC-1A-vf) on WI-38 Human Embryonic Lung Cells – 417

Fabrication, Characterization, and Analysis of a DRIE CMOS-MEMS Gyroscope – 140

Physiological Stress Reactivity and Breast Cancer – 391

Role of Reactive Stroma in Prostate Cancer Progression – 317

Study of the Utility of NWP Forecast Guidance and Simple Ocean Modeling as a Tool for Planning During Reactive Situations – 269

Utility of DF-1 for Radioprotection in Lymphocytes – 420

## REACTOR SAFETY

Emerging Energy Requirements for Future C4ISR – 244

## REACTOR TECHNOLOGY

Iran's Nuclear Program: Recent Developments – 594

## READERS

Today's Biometric Projects Need Mobile & Handheld Readers - Why? Applications and Readers – 476

## REAL TIME OPERATION

A High-Performance Communication Service for Parallel Computing on Distributed DSP Systems – 449

Comparative Performance Analysis of Directed Flow Control for Real-Time SCI – 448

Enhancement of Near-Real-Time Cloud Analysis and Related Analytic Support for Whole Sky Imagers – 272

Experiments with the Sun Java Real-Time System -- Part 2 – 466

Grid Computing for High Performance Computing (HPC) Data Centers – 451

High Resolution Real Time Phase Contrast Radiology Study of Hydrodynamic in Micrometer Scale – 133

Independent Testing of Iris Recognition Technology (ITIRT) – 475

Infrared Damage Detection System (IDDS) for Real-Time, Small-Scale Damage Monitoring – 118

Parameter Space: The Final Frontier. Certified Reduced Basis Methods for Real-Time Reliable Solution of Parametrized Partial Differential Equations – 512

QoS Negotiation in Real-Time Systems and its Application to Automated Flight Control – 43

Real-Time Communication and Coordination in Embedded Sensor Networks – 533

Real-Time Sonar Beamforming on High-Performance Distributed Computers – 596

Short Report: Detection of Orientia Tsutsugamushi in Clinical Samples by Quantitative Real-Time Polymerase Chain Reaction – 385

Toward a Real-Time Measurement-Based System for Estimation of Helicopter Engine Degradation Due to Compressor Erosion – 39

Using Dynamic Adjustment of Serialization Order for Real-Time Database Systems – 613

## RECEIVERS

Demonstratore Foer Stoerskydd av GNSS-Mottagare (Demonstrator for Anti-Jamming of GNSS Receivers) – 204

Design and Evaluation of a Virtual Quadrant Receiver for 4-ary Pulse Position Modulation/Optical Code Division Multiple Access (4-ary PPM/O-CDMA) – 177

## RECLAMATION

Work Plan and Field Sampling Plan Site Investigations Fort Devens, Massachusetts – 251

## RECONFIGURABLE HARDWARE

Implementation of a High-Speed Numeric Function Generator on a COTS Reconfigurable Computer – 513

## RECONNAISSANCE

A Strategies-to-Tasks Framework for Planning and Executing Intelligence, Surveillance, and Reconnaissance (ISR) Operations – 620

Alternatives for Military Space Radar – 223

An Ultra High Resolution, Electro-Optical Framing Camera for Reconnaissance and Other Applications Using a 9216 by 9216 Pixel, Wafer Scale, Focal Plane Array – 222

Flight Test Results From the Ultra High Resolution, Electro-Optical Framing Camera Containing a 9216 by 9216 Pixel, Wafer Scale, Focal Plane Array – 222

Framework for Measuring the Impact of C4ISR Technologies and Concepts on Warfighter Effectiveness Using High Resolution Simulation – 144

Modeling and Simulation to Support C4ISR Acquisition and Transformation – 461

The Canadian ISTAR Information-Centric Collaborative Workspace Concept. Paper 1: The Info-Centric Collaborative Workspace from an Organizational Perspective – 621

The Canadian ISTAR Information-Centric Collaborative Workspace Concept. Paper 2: The Info-Centric Collaborative Workspace from the Processes Perspective – 623

The Canadian ISTAR Information-Centric Collaborative Workspace Concept. Paper 3: The Info-Centric Collaborative Workspace from a Systems Perspective – 623

The Coalition Aerial Surveillance and Reconnaissance (CAESAR) Approach to Enhancing the Interoperability of Coalition Ground Surveillance Systems – 224

The Development of a Virtual McKenna Military Operations in Urban Terrain (MOUT) Site for Command, Control, Communication, Computing, Intelligence, Surveillance, and Reconnaissance (C4ISR) Studies – 164

## RECRYSTALLIZATION

Recrystallization and Grain-Growth Behavior of a Nickel-Base Superalloy During Multi-Hit Deformation (Preprint) – 118

## REDUNDANCY

Homeland Security -- Reducing the Vulnerability of Public and Private Information Infrastructures to Terrorism: An Overview – 493

## REFINING

Corporate Entrepreneurship Assessment Instrument (CEAI): Refinement and Validation of a Survey Measure – 136

## REFLECTANCE

Coherence Solution for Bidirectional Reflectance of Surfaces with Wavelength-Scale Statistics (Postprint) – 529

## REFLECTION

High-Order Higdon Non-Reflecting Boundary Conditions for the Linearized Euler Equations – 527

## REFRACTIVITY

Experiments, Computation, and Modeling for Temperature Dependence of Absorption, Scattering, Reflection, Transmission, and Index of Refraction of Optical Radiation in Biological Tissues – 597

Optical and Radio Frequency Refractivity Fluctuations from High Resolution Point Sensors: Sea Breezes and Other Observations – 554

Optical Fiber Chemical Sensor with Sol-Gel Derived Refractive Material as Transducer for High Temperature Gas Sensing in Clean Coal Technology (Final Report, October 1, 2004-December 31, 2006) – 254

## REFRACTORIES

Gene Expression Analysis of Circulating Hormone Refractory Prostate Cancer Micrometastases – 330

Preclinical Testing the Therapeutic Potential of a Potent and Novel Small-Molecule Inhibitor of Bcl-2 as a Novel Therapy for Hormone-Refractory Prostate Cancer – 302

## REFRIGERANTS

Motor Frame Cooling with Hot Liquid Refrigerant and Internal Liquid – 76

## REFUELING

Automated Aerial Refueling Presentation to 2007 ARSAG Conference (Preprint) – 15

Autonomous Unmanned Aerial Vehicle Rendezvous for Automated Aerial Refueling – 11

Proportional Navigation With Adaptive Terminal Guidance For Aircraft Rendezvous (Preprint) – 7

Simulation of the Dynamically Coupled KC-135 Tanker and Refueling Boom – 11

## REGENERATORS

Storage, Generation, and Use of Hydrogen – 69

## REGRESSION ANALYSIS

fRMSDPred: Predicting Local RMSD Between Structural Fragments Using Sequence Information – 369

The Effect of Graduate Education on the Performance of Air Force Officers – 526

The Potential Impact of an Auction Based Retention Bonus and Other Factors on Continuation Rates of General Dentists Completing Their Initial Obligation – 525

## REGULATIONS

Army Fuels: Policies, Regulations, and Executive Orders – 129

DigitalPersona - Case Study: Department of Defense – 475

The Supreme Court's Climate Change Decision: Massachusetts v. EPA – 263

## REGULATORS

DRF3 as a Cholesterol-Dependent Regulator of Src in Prostate Cancer – 316

## REINFORCING FIBERS

Symposium on Nano- and Micro-Scale Mechanics of Engineering Materials – 660

## RELATIONAL DATA BASES

Survey of Probabilistic Models for Relational Data – 435

## RELATIVISTIC EFFECTS

Evolution of Time Scales – 666

## RELIABILITY ANALYSIS

Comparative Performance Analysis of Directed Flow Control for Real-Time SCI – 448

Multicast Performance Analysis for High-Speed Torus Networks – 484

Performance Analysis and Training for Digital Command Staff: Training for the Battle Command Reengineering III – 650

## RELIABILITY

Antiferromagnetically Stabilized Pseudo Spin Valve for Memory Applications – 438

Performance and RF Reliability of GaN-ON-SiC HEMTs Using Dual-Gate Architectures – 192

Scalability, Complexity and Reliability in Quantum Information Processing – 591

Usability and Acceptability of Biometric Security Systems – 473

## REMOTE CONTROL

Design and Implementation of an Intelligent Primitive Driver – 550

## REMOTE SENSING

Automating the Shadow Method for Aerosol Optical Depth Retrieval – 462

BOUSSOLE: A Joint CNRS-INSU, ESA, CNES, and NASA Ocean Color Calibration and Validation Activity – 279

System Level Architecture of Cooperative Satellite Control Using Hierarchical Hybrid Systems and Automata Theory – 50

## REMOTELY PILOTED VEHICLES

Pictorial Display Design to Enhance Spatial Awareness of Operators in Unmanned Aviation – 28

Probability Modeling of Multi-Type Autonomous Unmanned Combat Aerial Vehicles Engaging Non-Homogeneous Targets Under Imperfect Information – 26

## RENDEZVOUS GUIDANCE

Proportional Navigation With Adaptive Terminal Guidance For Aircraft Rendezvous (Preprint) – 7

## REPLACING

Test Suite for Nuclear Data I. Deterministic Calculations for Critical Assemblies and Replacement Coefficients – 575

## REPLICAS

An Adaptive Quality of Service Aware Middleware for Replicated Services – 521

## REPTILES

Measurement of Fog Oil Penetration into Model Underground Burrow and Hollow Tree Nest Cavities – 250

## REQUIREMENTS

An Empirical Assessment of the Impact of Requirements Uncertainty on Development Quality Performance – 446

Defense Logistics: Army and Marine Corps' Body Armor Requirements, Controls, and Other Issues – 425

Industrial Base Model Data Requirements (IBMDR) – 650

Multinational Interoperability Requirements -- A Core Competency – 645

## RESEARCH AND DEVELOPMENT

AFRL/IF Technology Transition to the Warfighter via the CAOC-X – 465

Challenges and Potential Research Areas in Biometrics – 476

Communication and Decision Making in C4ISR Sustained Operations: An Experimental Approach – 409

Defense Nanotechnology Research and Development Program – 212

Enhancing Army S&T Lessons from 'Project Hindsight Revisited' – 21

Establishment of a Center for Defense Robotics – 508

Hydrogen Technology Research at the Savannah River National Laboratory. Center for Hydrogen Research and the Hydrogen Technology Research Laboratory – 109

Military Nutrition Research: Four Tasks to Address Personnel Readiness and Warfighter Performance – 366

Nanoscience and Technology at the Air Force Research Laboratory (AFRL) – 54

Research and Operational Support for the Study of Militarily Relevant Infectious Diseases of Interest to the USA Army and the Royal Thai Army – 282

Taiwan - AFOSR Nanoscience Initiative Status – 198

The Federal Networking and Information Technology Research and Development Program: Funding Issues and Activities – 480

## RESEARCH FACILITIES

Design, Construction, and Validation of the AFIT Small Scale Combustion Facility and Sectional Model of the Ultra-Compact Combustor – 139

## RESEARCH MANAGEMENT

Challenges to Ensuring Secure .COM and .EDU Access to a Web-Based Air Force Laboratory Program Management – 489

Delaware Consortium for Undergraduate Minority Training in Prostate Cancer – 362

Report to Congress on the Activities of the DoD Office of Technology Transition – 651

The Basic Research Manager for the Air Force – 211

## RESEARCH

The Basic Research Manager for the Air Force – 211

## RESERVES

Critical Review of the U.S. Marine Corps' Space Cadre Strategy – 674

Medical Reserve Corps Volunteers' Ability and Willingness to Report to Work for the Department of Health During Catastrophic Disasters – 312

## RESERVOIRS

Hantavirus Pulmonary Syndrome in Central Bolivia: Relationships Between Reservoir Hosts, Habitats, and Viral Genotypes – 378

## RESIDUAL STRESS

Investigation of Lattice and Thermal Stress in GaN/AlGaIn Field-Effect Transistors – 194

## RESIN TRANSFER MOLDING

Hyperbranched Polymers for Resin Transfer Molding – 127

Nanosilica Modification of Elastomer-Modified VARTM Epoxy Resins for Improved Resin and Composite Toughness – 121

Tension-Compression Fatigue Behavior of a Carbon Fiber/Epoxy (IM7/EPON 862) Composite Fabricated Using Vacuum Assisted Resin Transfer Molding Process – 85

## RESINS

A New Silicon-Containing Bis(Cyanate) Ester Resin with Improved Thermal Oxidation and Moisture Resistance – 125

Nanosilica Modification of Elastomer-Modified VARTM Epoxy Resins for Improved Resin and Composite Toughness – 121

## RESONANT TUNNELING

Non-Equilibrium Quantum Dots: Transport – 185

Pseudomorphic Bipolar Quantum Resonant-Tunneling Transistor – 186

Semiconductor Quantum Dot Resonant Tunneling Spectroscopy – 185

## RESONATORS

Chamber Core Structures for Fairing Acoustic Mitigation – 50

Defect-Related Internal Dissipation in Mechanical Resonators and the Study of Coupled Mechanical Systems – 204

Micromechanical Resonator Device Having a Desired Mode Shape – 201

Non-Electronic Radio Front-End (NERF) – 211

## RESOURCES MANAGEMENT

Analyzing the Interdiction of Sea-Borne Threats Using Simulation Optimization – 451

Bringing Climate Change Into Natural Resource Management. Proceedings of a Workshop – 273

Capability Based Resourcing for DPEM – 9

Classifying C2 Decision Making Jobs Using Cognitive Task Analyses and Verbal Protocol Analysis – 459

Sensor Management in Command & Control – 632

The Effectiveness of a PC-Based C-130 Crew Resource Management Aircrew Training Device – 8

User-Level QoS-Adaptive Resource Management in Server End-Systems – 485

## RESPIRATION

Mathematical Modeling of Physical and Cognitive Performance Decrement from Mechanical and Inhalation Injuries – 297

## RESPIRATORY DISEASES

Scavenger Receptors and Resistance to Inhaled Allergens – 328

## RESPONSES

Emergency Preparedness and the Year 2000 Challenge – 443

Hurricane Katrina: Lessons for Army Planning and Operations – 163

Time-Dependent Response of MI SiC/SiC Composites. Part 2: Samples with Holes – 91

## RESTORATION

Biodegradation of DIMP, Dieldrin, Isodrin, DBCP, and PCPMSO in Rocky Mountain Arsenal Soils. Installation Restoration Program, Environmental Technology Development – 305

Novel Technology Evaluation for Volatile Organic Compounds Emission Control – 60

Restoration of Wild-Type Activity to Mutant p53 in Prostate Cancer: A Novel Therapeutic Approach – 365

Trial Burn Plan for a Transportable Incineration System (TIS) at the Savanna Army Depot Activity (SADA) Washout Lagoon Area – 252

## RESUSCITATION

A Hemoglobin-based Oxygen Carrier, Bovine Polymerized Hemoglobin (HBOC-201) Versus Hetastarch (HEX) in a Moderate Severity Hemorrhagic Shock Swine Model with Delayed Evacuation – 395

Far Forward Treatment of Hemorrhagic Shock – 378

The Effect of Hypotensive Resuscitation and Fluid Type on Mortality, Bleeding, Coagulation, & Dysfunctional Inflammation in a Swine Grade V Liver Injury Model – 314

## RETAINING

Rotational Response of Toe-Restrained Retaining Walls to Earthquake Ground Motions – 265

## RETICLES

EUV Inspection of Reticle Defect Repair Sites – 600

## REUSABLE HEAT SHIELDING

Intensity Modulated Radiation Treatment of Prostate Cancer Guided by High Field MR Spectroscopic Imaging – 355

## REUSABLE LAUNCH VEHICLES

Determining Logistics Ground Support Manpower Requirements for a Reusable Military Launch Vehicle – 58

Fault Tolerant Optimal Trajectory Generation for Reusable Launch Vehicles (Preprint) – 48

## REUSE

Re-Use of Integrated Dictionary Components for C4ISR Architectures – 148

## REVERBERATION CHAMBERS

Radiated Susceptibility Test in Reverberation Chamber – 202

## REVERSE ENGINEERING

Scenario Design for the Empirical Testing of Organizational Congruence (Briefing Charts) – 537

## REYNOLDS NUMBER

Filtered Rayleigh Scattering Measurements in a Buoyant Flowfield – 544

## RHEOLOGY

Rheological Behavior of Entangled Polystyrene-Polyhedral Oligosilsesquioxane (POSS) Copolymer – 81

## RIBONUCLEIC ACIDS

A Comprehensive Survey of the Plasmodium Life Cycle by Genomic, Transcriptomic, and Proteomic Analyses – 389

A MicroRNA Cluster as a Potential Breast Cancer Oncogene – 358

An All-Atom Model of the Pore-Like Structure of Hexameric VP40 from Ebola: Structural Insights into the Monomer-Hexamer Transition – 330

HOXC5 as a Biomarker of Disease Presence in Tumor-Associated Normal Prostate – 290

Intra-Prostate Cancer Vaccine Inducer – 316

Mechanism of Telomerase Inhibition Using Small Inhibitory RNAs and Induction of Breast Tumor Cell Sensitivity – 287

p63 in Development and Maintenance of the Prostate Epithelium – 355

Pilot Comparison of Stromal Gene Expression among Normal Prostate Tissues and Primary Prostate Cancer Tissues in White and Black Men – 313

Postexposure Protection of Guinea Pigs against a Lethal Ebola Virus Challenge is Conferred by RNA Interference – 330

## **RIGID STRUCTURES**

A Qualitative Approach to Rigid Body Mechanics – 501

FEM Modeling of Guided Wave Behavior in Integrally Stiffened Plate Structures – 29

## **RISK**

A Correlation Between Quality Management Metrics and Technical Performance Measurement – 637

A Proposed Taxonomy for Software Development Risks for High-Performance Computing (HPC) Scientific/Engineering Applications – 478

A Security Risk Measurement for the RAdAC Model – 490

Adipose Estrogen and Increased Breast Cancer Risk in Obesity: Regulation by Leptin and Insulin – 357

Adjuvant Immunotherapy for Patients at High Risk of Recurrence Following Radiation Therapy for Prostate Cancer – 298

An Examination of a Structural Modeling Risk Probe Technique – 544

Automating Behavioral Health Screening - Addressing Risk Communication Electronically – 306

Biometric Security Issues – 474

Building Collaborative Capacity for Biosecurity at the Georgia Seaports – 638

Challenges for Biometrics Systems: Performance and Fake Resistance – 475

COHORT: An Integrated Information Approach to Decision Support for Military Subpopulation Health Care – 368

Concepts Associated with Transferring Temporal and Spatial Boundary Conditions Between Modules in the Framework for Risk Analysis in Multimedia Environmental Systems (FRAMES) – 431

Dietary Fat, Fat Metabolizing Genes, and Prostate Cancer Risk in African-Americans and Whites – 340

DoD Personnel Clearances: Delays and Inadequate Documentation Found for Industry Personnel – 643

Executive Overview of SEI MOSAIC: Managing for Success Using a Risk-Based Approach – 545

Export Controls: Agencies Should Assess Vulnerabilities and Improve Guidance for Protecting Export-Controlled Information at Universities – 631

Field Demonstration and Validation of a New Device for Measuring Groundwater and Perchlorate Fluxes at IHDIV-NSWC, Indian Head, MD – 139

Field Demonstration and Validation of a New Device for Measuring Water and Solute Fluxes at Naval Base Ventura County (NBVC), Port Hueneme, CA – 138

Field Demonstration and Validation of a New Device for Measuring Water and Solute Fluxes NASA LC-34 SITE – 138

Hydrogen Pressurization of LOX: High Risk/High Reward (Preprint) – 97

Learning from Past Experiences – 56

Management and Education of the Risk of Insider Threat (MERIT): Mitigating the Risk of Sabotage to Employers' Information, Systems, or Networks – 497

Medical Risk in the Future Force Unit of Employment. Results of the Army Medical Department Transformation Workshop V – 304

Molecular Differentiation of Risk for Disease Progression: Delineating Stage-Specific Therapeutic Targets for Disease Management in Breast Cancer – 289

Potential Thermal Security Risks – 441

Prevalences, Genotypes, and Risk Factors for HIV Transmission in South America – 393

Privacy and Biometrics: The Human Factors – 477

PSA-Based Screening Outcomes, Dietary Heterocyclic Amine Exposure, and Prostate Cancer Risk in African Americans – 302

Risk Advised Course of Action (COA) Analysis – 532

Risk Assessment: Evidence Base – 529

Risk Bounds for Regularized Least-Squares Algorithm with Operator-Value Kernels – 524

Risk of Cyberterrorism to Naval Ships Inport Naval Station Everett: A Model Based Project Utilizing SIAM – 491

Screening Level Ecological Risk Assessments of Some Military Munitions and Obscurant-related Compounds for Selected Threatened and Endangered Species – 251

Seroincidence and Phylogeny of Human Immunodeficiency Virus Infections in a Cohort of Commercial Sex Workers in Montevideo, Uruguay – 389

The Independent Readiness Team (IRRT) of SMC – 49

Tsunami Risk Reduction for the USA: A Framework for Action – 264

Updating Optimal Decisions Using Game Theory and Exploring Risk Behavior Through Response Surface Methodology – 534

## **RIVERS**

A GSSHA Model of the Perris Basin of the San Jacinto River Watershed, Riverside County, California – 222

## **ROADS**

Impacts of Traveler Information on Transportation Network Operations and Potential Deployment Technologies – 178

## **ROBOTICS**

Development of a Geospatial Data-Sharing Method for Unmanned Vehicles Based on the Joint Architecture for Unmanned Systems (JAUS) – 662

Establishment of a Center for Defense Robotics – 508

FCS Technology Insertion and Transition – 508

Focused Knowledge to the Warfighter – 617

Implementing a Low-Cost Long-Range Unmanned Underwater Vehicle: The SeaDiver Glider – 505

Information Fusion for Hypothesis Generation under Uncertain and Partial Information Access Situation – 499

On-Orbit Identification of Inertia Properties of Spacecraft using Robotics Technology – 49

## **ROBOTS**

A Study of Autonomous Micro-Robots and Their Application to Complex Environments, Volume 1 – 543

An Intelligent Interface-Agent Framework for Supervisory Command and Control – 498

Compliant Formation Control of an Autonomous Multiple Vehicle System – 507

Design and Implementation of a Modular Manipulator Architecture – 546

Lethality and Autonomous Robots: An Ethical Stance – 504

Simultaneous Planning and Control for Autonomous Ground Vehicles – 507

Spatial and Temporal Abstractions in POMDPs Applied to Robot Navigation – 523

## **ROCKET LAUNCHERS**

Human Factors Evaluation of the XM30 Guided Multiple Launch Rocket System (GMLRS) in the Combined High Mobility Artillery Rocket System (HIMARS)-GMLRS Initial Operational Test – 423

## ROCKY MOUNTAINS (NORTH AMERICA)

Biodegradation of DIMP, Dieldrin, Iso-drin, DBCP, and PCPMSO in Rocky Mountain Arsenal Soils. Installation Restoration Program, Environmental Technology Development – 305

## RODENTS

Genomic Analysis of Rodent Pulmonary Tissue Following Bis-(2-chloroethyl) Sulfide Exposure – 379

Investigating the Mechanism of Action and the Identification of Breast Carcinogens by Computational Analysis of Female Rodent Carcinogens – 405

Murine Macrophages Kill the Vegetative Form of Bacillus anthracis – 394

Origin and Properties of Prostatic Stem Cells – 299

## ROOFS

A Decision Model for Selecting Energy Efficient Technologies for Low-Sloping Roof Tops Using Value-Focused Thinking – 243

## ROOM TEMPERATURE

Room-Temperature Negative Differential Resistance in Nanoscale Molecular Junctions – 187

## ROOMS

Advanced Technologies in Safe and Efficient Operating Rooms – 309

## ROTARY WING AIRCRAFT

High Ratio, Reduced Size Epicyclic Gear Transmission for Rotary Wing Aircraft with Improved Safety and Noise Reduction – 35

## ROTATING ENVIRONMENTS

Simulated Microgravity Regulates Gene Transcript Profiles of 2T3 Preosteoblasts: Comparison of the Random Positioning Machine and the Rotating Wall Vessel Bioreactor – 412

## ROTATING GENERATORS

Broken Symmetries and Magnetic Dynamics – 220

## ROTATION

AC Field Measurements of Fermilab Booster Correctors Using a Rotating Coil System – 605

## ROUTES

A Physiologically Based Pharmacokinetic (PB/PK) Model for Multiple Exposure Routes of Soman in Multiple Species – 375

Automatic Generation of Best Emergency Routes and Procedures on a Brazilian Frigate – 467

Impacts of Traveler Information on Transportation Network Operations and Potential Deployment Technologies – 178

Route Optimization for Mobile IPv6 Using the Return Routability Procedure: Test Bed Implementation and Security Analysis – 489

## RUBBER

Microbial Degradation of Fuel Oxygenates under Aerobic Conditions – 114

Test and Evaluation of Value Engineering Proposal: Removal of Rubber PAD in 120 MM PA 153 Ammunition Fiber Container – 140

## RUNWAY INCURSIONS

Enhanced Aircraft Conspicuity to Reduce Runway Incursions – 13

## RUNWAYS

Decks for Rapid Runway Mat Application (Postprint) – 46

Rapid Runway Repair (RRR): An Optimization for Minimum Operating Strip (MOS) Selection – 45

## RUSSIAN FEDERATION

Russian and Chinese Information Warfare: Theory and Practice – 628

The Demise of Russian Health Capital: The Continuity of Ineffective Government Policy – 323

## S WAVES

Acoustic Proximity Ranging in the Presence of Secondary Echoes – 588

Continent-Wide Maps of 5-50 S Rayleigh-Wave Attenuation for Eurasia Inferred from Maps of 1-Hz Lg Coda Q and its Frequency Dependence – 265

## SABOTAGE

Management and Education of the Risk of Insider Threat (MERIT): Mitigating the Risk of Sabotage to Employers' Information, Systems, or Networks – 497

## SAFETY FACTORS

A System of Systems Interface Hazard Analysis Technique – 541

## SAFETY MANAGEMENT

Learning from Past Experiences – 56

## SAFETY

Application of Neutron-Absorbing Structural-Amorphous Metal (SAM) Coatings for Spent Nuclear Fuel (SNF) Container to Enhance Criticality Safety Controls – 131

Epidemiology of Transfusion-Transmitted Infections Among Multi-Transfused Patients in Seven Hospitals in Peru – 403

Evaluation of the Safety and Efficacy of Excimer Laser Keratorefractive Surgery in U.S. Army Soldiers using the latest Battlefield Technologies – 233

Final Site Safety and Health Plan for Phase II RCRA Facility Investigation Fort Benjamin Harrison Marion County, Indiana – 308

High Ratio, Reduced Size Epicyclic Gear Transmission for Rotary Wing Aircraft with Improved Safety and Noise Reduction – 35

Human Error Investigation Software Tool (HEIST) – 427

Liquefied Natural Gas (LNG) Import Terminals: Siting, Safety and Regulation – 129

Next Generation Systems Languages – 455

NIOSH Health Hazard Evaluation Report: HETA No. 2007-0068-3042, Noise Exposures and Hearing Loss Assessments among Animal Shelter Workers, Louisiana Society for the Prevention of Cruelty to Animals, Algiers, Louisiana, May 2007 – 252

Nuclear Safety: DOE's Investigation of Phosgene Gas Contamination was Inadequate, but Experts Conclude that Worker Safety and Facilities Are Not Threatened – 131

Randomized Double-Blind Phase III Pivotal Field Trial of the Comparative Immunogenicity Safety and Tolerability of Two Yellow Fever 17D Vaccines (ARILVAX-(Trademark) and YF-VAX(Trademark)) in Healthy Infants and Children in Peru – 387

Studies on Electrical Safety, When Using ESD Protective Equipment, Especially ESD Protective Garments – 205

Technology Review of Smart Sensors with Wireless Networks for Applications in Hazardous Work Environments – 168

Truck Driver Occupational Safety and Health. 2003 Conference Report and Selective Literature Review – 238

## SALIVA

Galvanic Skin Response as a Measure of Soldier Stress – 410

## SAMPLED DATA SYSTEMS

Systematic Procedure for Assigning Uncertainties to Data Evaluations – 568

## SAMPLERS

Solar Buildings. Transpired Air Collectors Ventilation Preheating – 250

## SAMPLING

A Fully-Integrated MEMS Preconcentrator for Rapid Gas Sampling (Preprint) – 113

Adaptive Sampling for Network Management – 485

Collaborative Research: Ground Truth of African and Eastern Mediterranean Shallow Seismicity Using SAR Interferometry and Gibbs Sampling Inversion – 261

Early Detection of Dengue Infections using Cluster Sampling Around Index Cases – 394

Quarterly Groundwater Monitoring First Quarter Sampling Results Fort Dix, New Jersey – 61

Work Plan and Field Sampling Plan Site Investigations Fort Devens, Massachusetts – 251

## SAN FRANCISCO (CA)

Asbestos Survey for Fort Point US Coast Guard Station. Presidio of San Francisco. Volume 2 – 241

## SANDWICH STRUCTURES

Decks for Rapid Runway Mat Application (Postprint) – 46

## SATELLITE COMMUNICATION

Global Broadcast Service Security Classification/Declassification Guide (SCG) – 160

## SATELLITE CONTROL

System Level Architecture of Cooperative Satellite Control Using Hierarchical Hybrid Systems and Automata Theory – 50

## SATELLITE IMAGERY

A Verification of Optical Depth Retrievals From High Resolution Satellite Imagery – 225

Automating the Shadow Method for Aerosol Optical Depth Retrieval – 462

## SATELLITE NETWORKS

T/R Module for Satellite TT&C Ground Link – 200

## SCALARS

Gravi-Leptogenesis: Leptogenesis from Gravity Waves in Pseudo-Scalar Driven Inflation Models – 673

Reduced Magnetic Vector Potential and Electric Scalar Potential Formulation for Eddy Current Modeling (Postprint) – 534

## SCANNERS

Wide Area Search and Engagement Simulation Validation – 32

## SCANNING ELECTRON MICROSCOPY

Placement of Conjugated Oligomers in an Alkanethiol Matrix by Scanned Probe Microscope Lithography – 121

Strategic Partnership for Research in Nanotechnology – 210

## SCANNING

Wide Area Search and Engagement Simulation Validation – 32

## SCATTERING

Experiments, Computation, and Modeling for Temperature Dependence of Absorption, Scattering, Reflection, Transmission, and Index of Refraction of Optical Radiation in Biological Tissues – 597

Final Task Report on NRF Measurements of Photon Scattering Resonances in Plutonium at the High Voltage Research Laboratory of MIT – 561

Point Spread Function Characterization of a Radially Displaced Scatterer Using Circular Synthetic Aperture Radar – 230

Terrorist 'Dirty Bombs': A Brief Primer – 250

## SCHEDULING

A Link Scheduling and Ad Hoc Networking Approach Using Directional Antennas – 190

An Analysis of Robust Workforce Scheduling Models for a Nurse Rostering Problem – 300

Link Analysis for Dynamic Planning and Scheduling – 502

Mathematical Programming Model for Fighter Training Squadron Pilot Scheduling – 32

Optimal UAV Task Assignment and Scheduling (Preprint) – 24

UAV Scheduling via the Vehicle Routing Problem with Time Windows (Preprint) – 20

## SCHOOLS

Chemical Management Resource Guide for School Administrators – 75

IAQ Tools for Schools. Managing Asthma in the School Environment – 259

## SCHOTTKY DIODES

Model of Energy Storage Circuit for Isotope Battery Based on SiC Schottky Diode – 212

Pyroelectric AlGaIn/GaN HEMTs for ion-, gas- and Polar-Liquid Sensors – 96

## SCIENCE

Science & Technology Review January/February 2007 – 575

## SCIENTISTS

Support for the Resident Research Associateship Program with the U.S. Army Medical Research and Materiel Command – 338

## SCORING

Mapping of WDMET in AIS 2005 and AIS 2005 Military – 645

## SEA BREEZE

Optical and Radio Frequency Refractivity Fluctuations from High Resolution Point Sensors: Sea Breezes and Other Observations – 554

## SEA WATER

A Detailed Study of Advection Sea Fog Formation to Reduce the Operational Impacts Along the Northern Gulf of Mexico – 268

Corrosion Resistances of Iron Based Amorphous Metals with Yttrium and Tungsten Additions in Hot Calcium Chloride Brine & Natural Seawater. Fe<sub>48</sub>Mo<sub>14</sub>Cr<sub>15</sub>Y<sub>2</sub>C<sub>15</sub>B<sub>6</sub> and W-Containing Variants – 69

Corrosion Resistances of Iron-Based Amorphous Metals with Yttrium and Tungsten Additions in Hot Calcium Chloride Brine and Natural Seawater. Fe<sub>48</sub>Mo<sub>14</sub>Cr<sub>15</sub>Y<sub>2</sub>C<sub>15</sub>B<sub>6</sub> and Variants – 107

Emerging Energy Requirements for Future C4ISR – 244

## SEALING

Microsystem Enclosure and Method of Hermetic Sealing – 71

## SEARCH PROFILES

Grid-Search Techniques for Seismic Event Location and Phase Association – 261

## SEARCH RADAR

Further Evidence of the Effects of Wind Turbine Farms on AD Radar – 532

The Effects of Wind Turbine Farms on ATC Radar – 134

## SEAS

A Detailed Study of Advection Sea Fog Formation to Reduce the Operational Impacts Along the Northern Gulf of Mexico – 268

Analyzing the Interdiction of Sea-Borne Threats Using Simulation Optimization – 451

Interim Heavy Airlift: Sea Base Logistics Glider Concept – 14

## SEATS

Assessment of Injury Potential in Aircraft Side-Facing Seats Using the ES-2 Anthropomorphic Test Dummy – 10

## SECONDARY FLOW

Improving COIL Efficiency By Iodine Pre-Dissociation Via Corona Discharge In The Transonic Section Of The Secondary Flow – 234

## SECURITY

A Model for Effective Organization and Communication of Homeland Security Activity at the State Level – 157

A Model of Trust for Developing Trustworthy Systems From Untrustworthy Actors – 660

A Pragmatic C4ISR Approach From the US Army CECOM Security Assistance Perspective – 614

A Security Risk Measurement for the RAdAC Model – 490

Advancing Software Security - The Software Protection Initiative – 626

America's Energy Security Policy: Goals for 2025 – 129

An Agent-Based Dynamic Information Security Model in Information Warfare – 643

Analyzing the Interdiction of Sea-Borne Threats Using Simulation Optimization – 451

Army Facility Energy Demand and the Impact on National Security – 243

Aviation Security: Foreign Airport Assessments and Air Carrier Inspections Help Enhance Security, but Oversight of These Efforts Can Be Strengthened – 12

Biometric Security Issues – 474

Bridging the Gap in Port Security; Network Centric Theory Applied to Public/Private Collaboration – 492

Building Collaborative Capacity for Biosecurity at the Georgia Seaports – 638

C2 Interoperability: A Force Multiplier for Joint/Combined Operations and Homeland Security – 629

C2 Interoperability: Simulation, Architecture and Information Security – 642

C4ISR Architectural Frameworks in Coalition Environments – 153

Capacity Building and Sustainment: Focusing on the End-State for Homeland Security – 503

Center for Coastline Security Technology, Year-2 – 228

Challenges for Biometrics Systems: Performance and Fake Resistance – 475

Challenges to Ensuring Secure .COM and .EDU Access to a Web-Based Air Force Laboratory Program Management – 488

China's Energy Security and Its Military Modernization Efforts: How China Plans to Dominate the World – 248

Communications Architecture Recommendations to Enable Joint Vision 2020 – 488

Critical Infrastructure: Control Systems and the Terrorist Threat – 496

Critical Infrastructure Information Disclosure and Homeland Security – 656

Data Mining and Homeland Security: An Overview – 647

DoD Personnel Clearances: Delays and Inadequate Documentation Found for Industry Personnel – 643

European Security in the Wider Black Sea Area – 242

Future Applications in Using Biometrics to Enhance Security Level of Coalition Information Sharing Networks – 477

Global Broadcast Service Security Classification/Declassification Guide (SCG) – 160

Global Climate Change: National Security Implications – 266

Homeland Security -- Reducing the Vulnerability of Public and Private Information Infrastructures to Terrorism: An Overview – 493

Homeland Security Act of 2002: Critical Infrastructure Information Act – 639

Homeland Security: Protecting Airspace in the National Capital Region – 25

Impact of Information Technology-For Strategic Leaders – 181

Information Operations, Electronic Warfare, and Cyberwar: Capabilities and Related Policy Issues – 618

Integrating Local Public Health Agencies into the Homeland Security Community – 311

Internet: An Overview of Key Technology Policy Issues Affecting Its Use and Growth – 497

Issues and Requirements for Cybersecurity in Network Centric Warfare – 446

National Security and the Threat of Climate Change – 279

National Security Letters in Foreign Intelligence Investigations: A Glimpse of the Legal Background and Recent Amendments – 633

National Security Letters in Foreign Intelligence Investigations: Legal Background and Recent Amendments – 634

Network Centric Warfare for Coalition Integrated Defense Against Terrorism – 165

Neutron Generators Developed at LBNL for Homeland Security and Imaging Applications – 566

Potential Thermal Security Risks – 441

Proceedings of the 1st Army Installation Energy Security and Independence Conference – 245

Real Time Identification – 475

Realistic and Affordable Cyberware Opponents for the Information Warfare Battlespace – 537

Recommendations for Network- and Internet-based Synchronized E-activities for Location- and Time-dependent Information – 457

Route Optimization for Mobile IPV6 Using the Return Routability Procedure: Test Bed Implementation and Security Analysis – 489

Secure Enterprise Access Control (SEAC) Role Based Access Control (RBAC) – 483

Security Classification Policy and Procedure: E.O. 12958, as Amended – 650

Security Classified and Controlled Information: History, Status, and Emerging Management Issues – 658

Security Strategy for a Biometrics Deployment – 474

Signals Intelligence Support to the Cockpit – 504

Static Reachability Analysis and Validation Regarding Security Policies Implemented via Packet Filters – 489

Tag Device, Luggage Tag, and Method of Manufacturing a Tag Device – 200

Technical and Non-Technical Problems in Biometric Physical Access Control Systems – 473

Terrorism Information Management Within the New York City Fire Department: Past, Present and Future – 634

Terrorist 'Dirty Bombs': A Brief Primer – 250

The California Central Coast Research Partnership: Building Relationships, Partnerships and Paradigms for University-Industry Research Collaboration – 193

Towards the Development of a Defensive Cyber Damage and Mission Impact Methodology – 641

Transformational Medical Technologies Initiative (TMTI) – 310

Usability and Acceptability of Biometric Security Systems – 473

Vulnerabilities in Biometric Encryption Systems – 473

'Sensitive But Unclassified' Information and Other Controls: Policy and Options for Scientific and Technical Information – 635

## SEDIMENTS

Mixtures of Metals and Polynuclear Aromatic Hydrocarbons May Elicit Complex, Nonadditive Toxicological Interactions – 78

## SEEDS

Demonstration of Clean Particle Seeding for Particle Image Velocimetry in a Closed Circuit Supersonic Wind Tunnel – 15

## SEISMIC WAVES

Continent-Wide Maps of 5-50 S Rayleigh-Wave Attenuation for Eurasia Inferred from Maps of 1-Hz Lg Coda Q and its Frequency Dependence – 265

Grid-Search Techniques for Seismic Event Location and Phase Association – 261

Review of the Stability Analysis for the LANL BSL-3 Building Foundation – 264

## SEISMOLOGY

Collaborative Research: Ground Truth of African and Eastern Mediterranean Shallow Seismicity Using SAR Interferometry and Gibbs Sampling Inversion – 262

Continent-Wide Maps of 5-50 S Rayleigh-Wave Attenuation for Eurasia Inferred from Maps of 1-Hz Lg Coda Q and its Frequency Dependence – 265

Grid-Search Techniques for Seismic Event Location and Phase Association – 261

Review of the Stability Analysis for the LANL BSL-3 Building Foundation – 264

## SELECTION

Collective Choice with Uncertain Domain Models – 535

## SELENIUM

Cadmium, Zinc, and Selenium Levels in Carcinoma of the Human Prostate – 356

GKLF as a Novel Target in Selenium Chemoprevention of Prostate Cancer – 361

Nano-Dots Enhanced White Organic Light-Emitting Diodes – 90

- Selenium and Breast Cancer Chemoprevention – 339
- SELF ASSEMBLY**  
Meso-Scale Self-Assembly Pilot Study – 199
- SELF ORGANIZING SYSTEMS**  
Self-Organized Air Tasking: Examining a Non-Hierarchical Model for Joint Air Operations – 500
- SEMANTICS**  
Advanced Visual and Instruction Systems for Maintenance Support (AVIS-MS) – 625  
Information Engineering in Support of Multilateral Joint Operational Interoperability – 611  
Semantic Graph Query Language – 434  
The Benefit of Ontologies for Interoperability of CCIS. (Easy, Quick and Cheap Solutions are Impossible, if Semantics of CCIS are Affected.) – 620
- SEMICONDUCTING FILMS**  
Study on Wide-gap Gallium-nitride Based Films and Their Quantum-dots Devices – 196
- SEMICONDUCTOR DEVICES**  
Damascene Process for Use in Fabricating Semiconductor Structures Having Micro/Nano Gaps – 213  
Linearity and Efficiency Performance of GaN HEMTs with Digital Pre-Distortion Correction (Preprint) – 95  
Predictive & Prognostic Controller for Wide Band Gap (Silicon Carbide) Power Conversion (Preprint) – 184  
Spin Electronics – 189
- SEMICONDUCTOR LASERS**  
Coolerless Photonic Integrated Circuits (PICs) for WDM Transmission Networks and PICs Operable with a Floating Signal Channel Grid Changing with Temperature but with Fixed Channel Spacing in the Floating Grid – 214  
Deep Ultraviolet Laser Diode for UV-Resonance Enhanced Raman Identification of Biological Agents – 230
- SEMICONDUCTORS (MATERIALS)**  
Advanced Materials Deposition for Semiconductor Nanostructures Using Super-critical Fluids – 185  
Biomimetic Energy Transduction: Artificial Photosynthesis in a Stabilized Lipid Membrane Coupled to a Semiconductor – 204  
Designing of Bulk Nano-Structures with Enhanced Thermoelectric Properties – 189  
Dynamics of Epitaxy on the Nano-sized Semiconductor Surfaces – 188  
Highly Doped III-Nitride Semiconductors (PAT-APPL-11-082 070) – 206  
Highly Doped III-Nitride Semiconductors (PAT-APPL-11-082 378) – 206
- Non-Equilibrium Quantum Dots: Transport – 185  
Pseudomorphic Bipolar Quantum Resonant-Tunneling Transistor – 186  
Self-Aligned Body Tie for a Partially Depletion SOI Device Structure – 201  
Semiconductor Quantum Dot Resonant Tunnelling Spectroscopy – 185  
Structural Investigations of Surface and Orientation-Specific Phenomena in Nanocrystals and Their Assemblies – 203  
Two Bit/Four Bit SONOS Flash Memory Cell – 200  
Venturing Through the Forbidden Band – 194
- SENSE ORGANS**  
Ethanol and Mesolimbic Serotonin/Dopamine Interactions via 5HT-1B Receptors – 346
- SENSITIVITY**  
A Strategies-to-Tasks Framework for Planning and Executing Intelligence, Surveillance, and Reconnaissance (ISR) Operations – 620  
Cell Cycle Dependence of TRAIL Sensitivity in Prostate Cancer Cells – 303  
Detection of Genes Modifying Sensitivity to Proteasome Inhibitors Using a shRNA Library in Breast Cancer – 364  
Measuring ‘Impossible’ Intermolecular Cross-Peaks to Improve Selectivity and Sensitivity in Breast MRI – 396  
Mechanism of Telomerase Inhibition Using Small Inhibitory RNAs and Induction of Breast Tumor Cell Sensitivity – 287  
Non-Invasive Markers of Tumor Growth, Metastases, and Sensitivity to Anti-Neoplastic Therapy – 363  
Role of Thermochemical Decomposition in Energetic Material Initiation Sensitivity and Explosive Performance – 101  
Shot-Peening Sensitivity of Aerospace Materials – 5  
Stab Sensitivity of Energetic Nanolaminates – 84  
The Tactile Modality: A Review of Tactile Sensitivity and Human Tactile Interfaces – 423  
‘Sensitive But Unclassified’ Information and Other Controls: Policy and Options for Scientific and Technical Information – 635
- SENSITIZING**  
Radio-sensitizing Effects of Novel Histone De-Acetylase Inhibitors in Prostate Cancer – 283
- SENSORS**  
Fusion of Imaging and Inertial Sensors for Navigation – 228  
Microfabricated Electrochemical Sensor for Chemical Warfare Agents: Smaller is Better (Preprint) – 230
- Microfabrication of a Mechanically Controllable Break Junction in Silicon – 186  
Object Detection in Electro-Optic Sensor Images – 208
- SEPARATED FLOW**  
Active Control of Flow Separation on a High-Lift System with Slotted Flap at High Reynolds Number – 4
- SEPARATORS**  
Heat Generation during Overcharge in Sealed Cells – 248
- SEQUENCING**  
Genomic Characterization of KIR2DL4 in Families and Unrelated Individuals Reveals Extensive Diversity in Exon and Intron Sequences Including a Common Frameshift Variation Occurring in Several Alleles – 381
- SEROTONIN**  
Ethanol and Mesolimbic Serotonin/Dopamine Interactions via 5HT-1B Receptors – 346
- SERUMS**  
Analysis of MALDI-TOF Serum Profiles for Biomarker Selection and Sample Classification – 309  
Biomarkers for Amyotrophic Lateral Sclerosis in Active Duty Military – 338  
Direct Detection of Stereospecific Soman Hydrolysis by Wild-Type Human Serum Paraoxonase – 374  
Human Spotted Fever Rickettsial Infections – 386  
IDO Inhibitors for Combination Therapy of Prostate Cancer – 317  
Seroincidence and Phylogeny of Human Immunodeficiency Virus Infections in a Cohort of Commercial Sex Workers in Montevideo, Uruguay – 389  
Serologic Correlates of Protection against Enterotoxigenic Escherichia coli Diarrhea – 379
- SERVICE ORIENTED ARCHITECTURE**  
Service Oriented Architecture for Coast Guard Command and Control – 633
- SEX**  
Seroincidence and Phylogeny of Human Immunodeficiency Virus Infections in a Cohort of Commercial Sex Workers in Montevideo, Uruguay – 389  
Studies of Prostate Tumor Development Via CRE/LOXP Technology – 309  
Unique Approaches to Androgen Effects on Prostate Cancer – 334
- SHALLOW WATER**  
Characterization of VSW Environment for UUV-N Operations – 214
- SHAPE MEMORY ALLOYS**  
High Temperature Magnetic Shape Memory Ni-Mn-Ga Alloys for a New Class of Actuators and Sensor – 119
- SHAPES**  
A Multipurpose Projectile for Penetrating Urban Targets – 519

- High Temperature Magnetic Shape Memory Ni-Mn-Ga Alloys for a New Class of Actuators and Sensor – 119
- SHEAR STRESS**  
 Characterization of a Silicon-Micromachined Thermal Shear-Stress Sensor – 134  
 Elevated-Temperature Life Limiting Behavior of Hi-Nicalon SiC/SiC Ceramic Matrix Composite in Interlaminar Shear – 80  
 MEMS Shear Stress Sensors: Promise and Progress – 190
- SHEATHS**  
 On the Non-Intrusive Determination of Electron Density in the Sheath of a Spherical Probe – 551
- SHELTERS**  
 NIOSH Health Hazard Evaluation Report: HETA No. 2007-0068-3042, Noise Exposures and Hearing Loss Assessments among Animal Shelter Workers, Louisiana Society for the Prevention of Cruelty to Animals, Algiers, Louisiana, May 2007 – 252
- SHIELDING**  
 Analysis of the Thermal Shielding Properties of Camouflage Materials Brief – 192
- SHIPS**  
 A Pareto Approach to Lossy Matching – 203  
 Conceptual Modeling for the Probability of Raid Annihilation (Pra) Testbed – 453  
 Distributed Simulation Run Automation Capability for the Navy PRA Testbed – 453  
 Navy Ship Propulsion Technologies: Options for Reducing Oil Use - Background for Congress – 244  
 Scenario-Based Assessment of Sensors for the Canadian Recognized Maritime Picture – 227
- SHOCK (PHYSIOLOGY)**  
 A Hemoglobin-based Oxygen Carrier, Bovine Polymerized Hemoglobin (HBOC-201) Versus Hetastarch (HEX) in a Moderate Severity Hemorrhagic Shock Swine Model with Delayed Evacuation – 395  
 Effects of Bovine Polymerized Hemoglobin in Coagulation in Controlled Hemorrhagic Shock in Swine – 385  
 Far Forward Treatment of Hemorrhagic Shock – 378  
 The Effect of Hypotensive Resuscitation and Fluid Type on Mortality, Bleeding, Coagulation, & Dysfunctional Inflammation in a Swine Grade V Liver Injury Model – 314
- SHOCK WAVES**  
 Comparison of Thermodynamic Equilibrium and Non-Equilibrium Representation of Materials – 219
- SHORELINES**  
 Center for Coastline Security Technology, Year-2 – 229
- SHOT PEENING**  
 Shot-Peening Sensitivity of Aerospace Materials – 5
- SICKNESSES**  
 Cell-surface Alpha-glucan in Campylobacter jejuni 81-176 – 402  
 Diarrheal Illness Among Deployed U.S. Military Personnel During Operation Bright Star 2001-Egypt – 375  
 Federally Sponsored Health Care Research Gulf War Illnesses and Beyond – 400  
 History of U.S. Military Contributions to the Study of Diarrheal Diseases – 408  
 Impact of Illness and Non-Combat Injury During Operations Iraqi Freedom and Enduring Freedom (Afghanistan) – 396
- SIDELOBES**  
 Principles of Adaptive Array Processing – 176
- SIGNAL DETECTION**  
 Quantitative Analysis of Situational Awareness (QUASA): Applying Signal Detection Theory to True/False Probes and Self-Ratings – 133  
 Signal Event Detection System – 590
- SIGNAL DETECTORS**  
 Early Detection of Prostate Cancer – 323  
 Phase-Shift-Based Time-Delay Estimators for Proximity Acoustic Sensors – 509
- SIGNAL PROCESSING**  
 A High-Performance Communication Service for Parallel Computing on Distributed DSP Systems – 449  
 Dataflow Integration and Simulation Techniques for DSP System Design Tools – 467  
 Fundamentals of Signal Processing for Phased Array Radar – 176  
 Introduction to Synthetic Aperture Radar (SAR) – 175  
 Nondestructive Evaluation (NDE) Technology Initiatives II Delivery Order 0001: Multi-Layer Cracks and Multi-site Damage NDE – 193  
 Real-Time Sonar Beamforming on High-Performance Distributed Computers – 596  
 Signals Intelligence Support to the Cockpit – 504
- SIGNAL TO NOISE RATIOS**  
 An Infrared Camera Simulation for Estimating Spatial Temperature Profiles and Signal-to-Noise Ratios of an Airborne Laser-Illuminated Target – 234
- Spread Spectrum Signal Characteristic Estimation Using Exponential Averaging and an AD-HOC Chip rate Estimator – 195
- SIGNATURES**  
 Adaptive and Iterative Processing Techniques for Overlapping Signatures – 556  
 Hyperspectral Imagery Target Detection Using Improved Anomaly Detection and Signature Matching Methods – 592  
 SUSY Multilepton Signatures at Tevatron – 576
- SIGNS AND SYMPTOMS**  
 Can GWOT Primary Prevention Strategy More Effectively Impede Religious Extremism? – 390  
 Diarrheal Illness Among Deployed U.S. Military Personnel During Operation Bright Star 2001-Egypt – 375  
 Digital Watermarking Using Syndrome Codes – 516  
 Efficacy and Tolerability of Artesunate Plus Sulfadoxine-Pyrimethamine and Sulfadoxine-Pyrimethamine Alone for the Treatment of Uncomplicated Plasmodium Falciparum Malaria in Peru – 380  
 Hantavirus Pulmonary Syndrome in Central Bolivia: Relationships Between Reservoir Hosts, Habitats, and Viral Genotypes – 378  
 Long-Term Outcomes of Alternative Brachytherapy Techniques for Early Prostate Cancer – 294  
 Modulation of Postmenopausal Steroid Hormone Levels by Phytoestrogens and Correlation with Breast Proliferative Activity and Menopausal Symptoms – 324  
 Neuropsychological Functioning in Gulf War Veterans Exposed to Pesticides and Pyridostigmine Bromide – 350  
 Pharmacological and Nonpharmacological Methods of Treatment for Fragile – 410  
 Prevalence and Outcomes of Restless Legs Syndrome Among Veterans – 346
- SILICATES**  
 Infrared Spectroscopy and Stable Isotope Geochemistry of Hydrated Silicate Glasses – 254  
 Processing of Multifunctional Epoxy Resins Modified with Silicon Based Nanomaterials (POSTPRINT) – 124
- SILICON CARBIDES**  
 A Comparison of High Temperature Performance of SiC DMOSFETs and JFETs (Preprint) – 184  
 Effect of Excess Carbon on the Crystallographic, Microstructural, and Mechanical Properties of CVD Silicon Carbide Fibers – 83  
 Elevated-Temperature Life Limiting Behavior of Hi-Nicalon SiC/SiC Ceramic Matrix Composite in Interlaminar Shear – 80

Model of Energy Storage Circuit for Isotope Battery Based on SiC Schottky Diode – 212

Performance and RF Reliability of GaN-ON-SiC HEMTs Using Dual-Gate Architectures – 192

Predictive & Prognostic Controller for Wide Band Gap (Silicon Carbide) Power Conversion (Preprint) – 184

Time-Dependent Response of MI SiC/SiC Composites. Part 2: Samples with Holes – 91

## SILICON DIOXIDE

Materials on the International Space Station Experiment (MISSE): Optical Analysis of Molecular Contamination on PEC1 Tray 2 – 54

Microfabrication of a Mechanically Controllable Break Junction in Silicon – 186

## SILICON OXIDES

Two Bit/Four Bit SONOS Flash Memory Cell – 201

## SILICON

10x Improvement of Power Transmission over Free Space Using Integrated Antennas on Silicon Substrates – 191

A New Silicon-Containing Bis(Cyanate) Ester Resin with Improved Thermal Oxidation and Moisture Resistance – 125

Atomistic Calculation of Elastic Moduli in Strained Silicon – 187

Characterization of a Silicon-Micromachined Thermal Shear-Stress Sensor – 133

Investigation of Low Temperature Metal Induced Crystallization and Doping of Silicon Using Various Excitation Sources for Solar Cells and other Microelectronic Applications. – 604

Microfabrication of a Mechanically Controllable Break Junction in Silicon – 186

Processing of Multifunctional Epoxy Resins Modified with Silicon Based Nanomaterials (POSTPRINT) – 124

Self-Aligned Body Tie for a Partially Depletion SOI Device Structure – 201

Substrate/Oxide Interface Interaction in LaAlO<sub>3</sub>/Si Structures – 96

## SIMULATION

A Model of Command and Control Processes for JWARS: Test Results from Controlled Experiments and Simulation Runs – 152

A Multipurpose Projectile for Penetrating Urban Targets – 519

A Physiologically Based Pharmacokinetic (PB/PK) Model for Multiple Exposure Routes of Soman in Multiple Species – 374

Advances in Modeling and Simulation Capabilities for Predicting Store Trajectories - Past Success and Future Challenges – 5

Agent-Based Modeling for Testing and Designing Novel Decentralized Command and Control System Paradigms – 537

An Infrared Camera Simulation for Estimating Spatial Temperature Profiles and Signal-to-Noise Ratios of an Airborne Laser-Illuminated Target – 234

An Integrated Approach to Conversion, Verification, Validation and Integrity of AFRL Generic Engine Model and Simulation (Postprint) – 6

Analyzing the Interdiction of Sea-Borne Threats Using Simulation Optimization – 451

Automated Run-Time Mission and Dialog Generation – 632

C2 Interoperability: Simulation, Architecture and Information Security – 642

C4I Tactical Applications Utilizing Embedded Simulations – 150

C4I-Simulation Interoperability Using the DII COE and HLA – 468

Cell Multipole Method for Molecular Simulations in Bulk and Confined Systems – 454

CFD Investigation of Flow Past Idealized Engine Nacelle Clutter – 226

Characterizing Electron Temperature Gradient Turbulence Via Numerical Simulation – 603

CLMT2 User's Guide: A Coupled Model for Simulation of Hydraulic Processes from Canopy to Aquifer – 276

Data Alignment between Army C4I Databases and Army Simulations – 653

Dataflow Integration and Simulation Techniques for DSP System Design Tools – 467

Direct Numerical Simulation and Experimental Validation of Hypersonic Boundary-Layer Receptivity and Instability – 512

Distributed Simulation Run Automation Capability for the Navy PRA Testbed – 453

Experiences Linking Vehicle Motion Simulators to Distributed Simulation Experiments – 443

F-15B QuietSpike(TradeMark) Aeroservoelastic Flight Test Data Analysis – 35

Framework for Measuring the Impact of C4ISR Technologies and Concepts on Warfighter Effectiveness Using High Resolution Simulation – 144

Helmet-Mounted Displays for Use in Air Force Training and Simulation – 6

Introducing Actions into Qualitative Simulation – 499

Large-eddy Simulation of Round Turbulent Jets Using the Inertial LES Method with Multifractal Subgrid-Scale Modeling – 220

Mobile Sensor Networks: A Discrete Event Simulation of WMD Threat Detection in Urban Traffic Schemes – 156

Modeling and Simulation in Support of Network Centric Warfare Analysis – 143

Modeling and Simulation Links with Command & Control (C2) Systems: Considerations in Architecture Designs – 162

Modeling and Simulation of Longitudinal Dynamics for LEH-HER PEP II Rings – 580

Modeling and Simulation to Support C4ISR Acquisition and Transformation – 461

Modeling Command and Control in Multi-Agent Systems – 452

Modeling the Structure and Effectiveness of Intelligence Organizations: Dynamic Information Flow Simulation – 626

Modeling the U.S. Military Intelligence Process – 448

Multinational C2 Experiments Supported by C2 Systems and Modeling and Simulations Addressing Army Transformation of Collaborative Planning and Interoperable Execution in a Coalition Environment – 615

New Navy Solutions: Developing Simulation Based C4I Applications – 445

On-Orbit Identification of Inertia Properties of Spacecraft using Robotics Technology – 49

Optimizing Parallel Execution of Detailed Wireless Network Simulation – 624

Overview of Theory and Simulations in the Heavy Ion Fusion Science Virtual National Laboratory – 559

Parallel Simulation of Chip-Multiprocessor Architectures – 447

Particle Filter Based Tracking in a Detection Sparse Discrete Event Simulation Environment – 541

Purple Computational Environment with Mappings to Ace Requirements for the General Availability User Environment Capabilities. Version 2.0 – 433

Rayleigh Taylor Instability induced Mixing. Initial Conditions Modeling, Three Dimensional Simulations and Comparisons with Experiment – 570

Research Institute for Autonomous Precision Guided Systems – 31

Risk Advised Course of Action (COA) Analysis – 532

Savage Modeling and Analysis Language (SMAL): Metadata for Tactical Simulations and X3D Visualizations – 640

Self-Consistent Simulations of High-Intensity Beams and E-Coulsds with WARP POSINST – 568

Self-Organized Air Tasking: Examining a Non-Hierarchical Model for Joint Air Operations – 499

Simulated Performance of a Second Generation Compact Compton Imaging Detector – 569

Simulating Candidate Missions for a Novel Glider Unmanned Underwater Vehicle – 464

Simulation and Analysis of Dart Dispense Events with Collisions – 235

Simulation of Coherent Signals with Forward Error Correction Coding – 540

Simulation of Radiowave Propagation in a Dense Urban Environment – 554

Simulation of Stagnation Region Heating in Hypersonic Flow on Tetrahedral Grids – 430

Simulation of the Dynamically Coupled KC-135 Tanker and Refueling Boom – 11

Simulation-Based Learning: Workshops for Researchers and Educators in the Western USA, and the Pacific Rim – 619

The GeoGraph 3D Computational Laboratory – 538

Transforming Intra- and Interagency Processes through Advanced Models and Simulations: An Information Assurance Model – 487

Use of Modeling and Simulation (M&S) in Support of the Quantitative Assessment of FORCEnet Systems and Concepts – 456

Use of Statistical Tools to Improve Modeling and Simulation of Store Separation – 4

Visual Simulation S&T: Summary of Accomplishments – 7

Web Enabling HLA Compliant Simulations to Support Network Centric Applications – 444

Wide Area Search and Engagement Simulation Validation – 32

## **SIMULATORS**

An Integrated Approach to Conversion, Verification, Validation and Integrity of AFRL Generic Engine Model and Simulation (Postprint) – 6

Experiences Linking Vehicle Motion Simulators to Distributed Simulation Experiments – 443

Integrated Clinical Training for Space Flight Using a High-Fidelity Patient Simulator in a Simulated Microgravity Environment – 415

The Effectiveness of a PC-Based C-130 Crew Resource Management Aircrew Training Device – 8

The Use of Cognitive Task Analysis and Simulators for After Action Review of Medical Events in Iraq – 367

The Use of Cognitive Task Analysis and Simulators for the After Action Review of Medical Events in Iraq – 618

## **SINGLE CRYSTALS**

Chiral Multichromic Single Crystals for Optical Devices – 580

Increasing the Laser Induced Damage Threshold of Single Crystal ZnGeP2 – 233

## **SITES**

1958-2006 Precipitation Climatology for Lawrence Livermore National Laboratory, Livermore Site and Site 300 – 275

## **SITUATIONAL AWARENESS**

Analysis of Network-Enabled ASW Concepts of Operation – 529

Assessing Human Factors in Command and Control: Workload and Situational Awareness Metrics – 422

Coalition Interoperability Ontology: Sharing Situational Awareness with Allies and Agents – 619

Consolidated Situational Awareness for Aircraft Carrier Decision Centers – 627

Constructible Assessment for Situation Awareness in a Distributed C2 Environment – 148

Data Fusion 'Cube': A Multi-Dimensional Perspective – 628

Development of Multisensory Orientation Technology for Reducing Spatial Disorientation Mishaps – 6

Distributed Command and Organizational Situation Awareness – 142

From the Battlefield to the Homeland: Building the Case for Network-Centric Response – 636

HUMINT Communication Information Systems for Complex Warfare – 642

Measuring the Value of High Level Fusion – 608

Models of Jointness: Infrastructure Issues for Inter-Organisational Working – 642

Monitoring the Command and Control Weapon System. A Master Caution Panel for C2 System Monitoring – 154

Pictorial Display Design to Enhance Spatial Awareness of Operators in Unmanned Aviation – 28

Quantitative Analysis of Situational Awareness (QUASA): Applying Signal Detection Theory to True/False Probes and Self-Ratings – 132

Shared Situational Awareness Environment for Tactical Level Humanitarian Emergency Operations – 454

The Interactive DataWall – 209

Utilizing Network-Enabled Command and Control Concepts to Enhance ASW Effectiveness – 590

Workload, Stress, and Situation Awareness of Soldiers Who are Controlling Unmanned Vehicles in Future Urban Operations – 408

## **SKEWNESS**

Exploring Hypersonic, Unstructured-Grid Issues through Structured Grids – 437

## **SLABS**

Area Factor Determinations for an Industrial Worker Exposed to a Concrete Slab End State – 255

## **SLAMMING**

Studies on Three-Dimensional Slamming on Slender Ships – 221

## **SLEDS**

An Evaluation of High Velocity Wear – 142

Parametric Dynamic Load Prediction of a Narrow Gauge Rocket Sled – 135

## **SLEEP DEPRIVATION**

High-Throughput Analysis of Dynamic Gene Expression Associated with Sleep Deprivation and Recovery Sleep in the Mouse Brain – 409

## **SLEEP**

A Collaborative Study of Sleep, Performance and Health Relationships – 383

High-Throughput Analysis of Dynamic Gene Expression Associated with Sleep Deprivation and Recovery Sleep in the Mouse Brain – 409

## **SLENDER CONES**

Effects of Nose Bluntness on Stability of Hypersonic Boundary Layers over Blunt Cone – 4

## **SLIDING**

Final Scientific/Technical Phase I Report on Sliding Mode Pulsed Current Averaging IC Drivers for High-Brightness Light Emitting Diodes – 603

Micro and Nano-structure Development and Multiscale Physics at Sliding Metal Interfaces. Final Report May 2006 – 78

## **SLOPES**

A Decision Model for Selecting Energy Efficient Technologies for Low-Sloping Roof Tops Using Value-Focused Thinking – 243

## **SMALLPOX**

Smallpox Antiviral Drug – 286

## **SMOG**

Smog: Who Does it Hurt. What You Need to Know about Ozone and Your Health – 259

## **SMOKE**

Facilitating Smoking Cessation and Preventing Relapse in Primary Care: Minimizing Weight Gain by Reducing Alcohol Consumption – 337

Measurement of Fog Oil Penetration into Model Underground Burrow and Hollow Tree Nest Cavities – 250

## **SOCIAL FACTORS**

The Use of a Cognitive Protectant to Help Maintain Quality of Life and Cognition in Premenopausal Women with Breast Cancer Undergoing Adjuvant Chemotherapy – 362

## **SOCIOLOGY**

The Effects of Social Network Centrality on Group Satisfaction – 478

## **SODIUM HYDROXIDES**

Heat of Dilution Calculation for 19 Molar Sodium Hydroxide with Water for Use in 241-S-112 – 103

## **SOFTWARE DEVELOPMENT TOOLS**

A Computer Tool for Modeling C4I Applications – 167

A Review and Assessment of Current Airframe Lifting Methodologies and Tools in Air Vehicles Division – 20

Field Level Computer Exploitation Package – 464

Infra-Gravity Wave Input Toolbox (IGWT): User's Guide – 470

Military Information Networks as Complex Adaptive Systems – 512

Modelling Operational Command Structures Using ORGAHEAD – 451

Optimizing Parallel Execution of Detailed Wireless Network Simulation – 624

Path Planning Software and Graphics Interface for an Autonomous Vehicle, Accounting for Terrain Features – 480

Simulating Candidate Missions for a Novel Glider Unmanned Underwater Vehicle – 464

Software Communications Architecture (SCA) Compliant Software Defined Radio Design for Interim Standard 95B (IS-95B) Transceiver – 463

## **SOFTWARE ENGINEERING**

A Practical Example of Applying Application-Driven Design (ADD), Version 2.0 – 545

A Proposed Taxonomy for Software Development Risks for High-Performance Computing (HPC) Scientific/Engineering Applications – 478

An Empirical Assessment of the Impact of Requirements Uncertainty on Development Quality Performance – 446

Boot Camp for Cognitive Systems: A Model for Preparing Systems with Machine Learning for Deployment – 463

C2 Interoperability: Simulation, Architecture and Information Security – 642

CASE Planning and the Software Process – 481

Case Study: Accelerating Process Improvement by Integrating the TSP and CMMI – 481

Conditions for Achieving Network-Centric Operations in Systems of Systems – 465

Design and Application of the Reconstruction Software for the BaBar Calorimeter – 584

Design and Implementation of a Modular Manipulator Architecture – 546

Distributed Computing and Collaboration Framework (DCCF) – 466

Experiments with the Sun Java Real-Time System -- Part 2 – 466

Firefighting Agent Research, Phase I – 10

Mediators in Infrastructure Survivability Enhancement – 449

Modeling and Analysis of Information Technology Change and Access Controls in the Business Context – 478

Quality-Attribute-Based Economic Valuation of Architectural Patterns – 479

Supporting the Coalition Agents eXperiment (CoAX) through the Technology Integration Experiment (TIE) Process – 452

System-of-Systems Governance: New Patterns of Thought – 465

Task Adaptable Display of Information for Training, Maintenance, and Emergency Response – 654

The Federal Networking and Information Technology Research and Development Program: Funding Issues and Activities – 480

Topics in Interoperability: Structural Programmatics in a System of Systems – 465

Willow System Demonstration – 449

## **SOIL MOISTURE**

Micrometeorological and Soil Data for Calculating Evapotranspiration for Rainier Mesa, Nevada Test Site, Nevada, 2002-05 – 273

## **SOILS**

Biodegradation of DIMP, Dieldrin, Isodrin, DBCP, and PCPMSO in Rocky Mountain Arsenal Soils. Installation Restoration Program, Environmental Technology Development – 305

Literature Review of Biodegradation in Soil of Selected Rocky Mountain Arsenal Contaminants: Isodrin, Dieldrin, Diisopropylmethyl-Phosphonate, 1,2-Dibromo-3-Chloropropane, and p-Chloro-Phenylmethylsulfonate – 61

Micrometeorological and Soil Data for Calculating Evapotranspiration for Rainier Mesa, Nevada Test Site, Nevada, 2002-05 – 273

Radon-222 as a Natural Tracer for Monitoring the Remediation of NAPL Contamination in the Subsurface – 102

Review of Laboratory Program on Degradation Mechanisms in Soil of Wastewater From Nitroguanidine Manufacture – 93

## **SOLAR ARRAYS**

Deployable Solar Array Assembly – 47

## **SOLAR CELLS**

Deployable Solar Array Assembly – 47

Investigation of Low Temperature Metal Induced Crystallization and Doping of Silicon Using Various Excitation Sources for Solar Cells and other Microelectronic Applications. – 604

Studies of Basic Electronic Properties of CdTe-Based Solar Cells and Their Evolution DURING Processing and Stress. Final Technical Report October 16, 2001-August 31, 2005 – 246

Thermal Modeling of the Mars Reconnaissance Orbiter's Solar Panel and Instruments during Aerobraking – 59

## **SOLAR COLLECTORS**

Wave Front Sensor for Solar Concentrator Control – 52

## **SOLAR CORPUSCULAR RADIATION**

Fast Coronal Mass Ejection Environments and the Production of Solar Energetic Particle Events – 668

Minimizing Astronauts' Risk from Space Radiation during Future Lunar Missions – 676

## **SOLAR CYCLES**

Observational Properties of Coronal Mass Ejections – 671

## **SOLAR ENERGY**

Biomimetic Energy Transduction: Artificial Photosynthesis in a Stabilized Lipid Membrane Coupled to a Semiconductor – 204

Experience Scaling-Up Manufacturing and Emerging Photovoltaic Technologies – 245

Navy Ship Propulsion Technologies: Options for Reducing Oil Use - Background for Congress – 244

Report to Congress on Assessment of Potential Impact of Concentrating Solar Power for Electricity Generation (EPACT 2005 - Section 934 (c)) – 247

Wave Front Sensor for Solar Concentrator Control – 52

## **SOLAR FLARES**

Acceleration and Propagation in the Heliosphere – 670

Fast Coronal Mass Ejection Environments and the Production of Solar Energetic Particle Events – 668

## **SOLAR GENERATORS**

Report to Congress on Assessment of Potential Impact of Concentrating Solar Power for Electricity Generation (EPACT 2005 - Section 934 (c)) – 247

## **SOLAR HEATING**

Solar Buildings. Transpired Air Collectors Ventilation Preheating – 250

## **SOLAR INSTRUMENTS**

Thermal Modeling of the Mars Reconnaissance Orbiter's Solar Panel and Instruments during Aerobraking – 59

## **SOLAR POWERED AIRCRAFT**

Persistent Monitoring Platforms – 36

## **SOLAR RADIATION**

MURI Center for Materials Chemistry in the Space Environment – 112

National Solar Radiation Data Base 1991-2005 Update: User's Manual – 245

## **SOLAR RADIO BURSTS**

Solar Radio Burst and Solar Wind Associations With Inferred Near-Relativistic Electron Injections – 669

## **SOLAR STORMS**

Fast Coronal Mass Ejection Environments and the Production of Solar Energetic Particle Events – 668

## **SOLAR SYSTEM**

Fundamentals of Aerospace Medicine: Cosmic Radiation – 413

## **SOLAR WIND**

Solar Radio Burst and Solar Wind Associations With Inferred Near-Relativistic Electron Injections – 669

## **SOLENOIDS**

Summary Report--FY2006 ITER Work Accomplished – 575

## **SOL-GEL PROCESSES**

Optical Fiber Chemical Sensor with Sol-Gel Derived Refractive Material as Transducer for High Temperature Gas Sensing in Clean Coal Technology (Final Report, October 1, 2004-December 31, 2006) – 254

## **SOLID PROPELLANT ROCKET ENGINES**

IHPRT Improvements to the Solid Performance Program (SPP) – 542

Lessons Learned in Solid Rocket Combustion Instability – 93

## **SOLID ROCKET PROPELLANTS**

Heat Flux and Infrared Spectral Measurements of Burning SRM Propellant (Postprint) – 130

## **SOLID STATE**

Degradation of the Blister Agent BIS(2-Chloroethyl) Sulfide and Simulant 2-Chloroethyl Phenyl Sulfide on Concrete – 306

Electromechanics of Dielectric and Piezoelectric Crystals With Point, Line, and Surface Defects – 187

Solid State Capacitor Discharge Pulsed Power Supply Design for Railguns – 193

Solid State Synthesis Under Supramolecular Control of a 2D Heterotetrapotic Self-complementary Tecton Tailored to Halogen Bonding – 98

Topology of On/Off Marx Modulator with Protection of Load and Solid State Switches – 579

## **SOLIDS**

Ultrafast, In Situ Probing of Shocked Solids at the Mesoscale and Beyond: a New Paradigm for Materials Dynamics – 573

## **SOLUBILITY**

Enhancement of Tumor Immunotherapy by Blockade of a Prostate Tumor Derived Immunosuppressive Factor – 281

## **SOLUTES**

Field Demonstration and Validation of a New Device for Measuring Water and Solute Fluxes at Naval Base Ventura County (NBVC), Port Hueneme, CA – 138

Field Demonstration and Validation of a New Device for Measuring Water and Solute Fluxes NASA LC-34 SITE – 138

## **SOLVENTS**

Nano-Dots Enhanced White Organic Light-Emitting Diodes – 90

Studies to Support Deployment of Edible Oils as the Final cVOC Remediation in T-Area. Summary Report – 109

## **SONAR**

A Distributed Parallel Embedded System for Autonomous Sonar Arrays – 450

Center for Coastline Security Technology, Year-2 – 228

Real-Time Sonar Beamforming on High-Performance Distributed Computers – 596

Velocity Estimation Using Forward Looking Sonar – 463

## **SONIC BOOMS**

Sonic Boom Assessment for the Crew Exploration Vehicle – 56

## **SORBENTS**

Optical Fiber Chemical Sensor with Sol-Gel Derived Refractive Material as Transducer for High Temperature Gas Sensing in Clean Coal Technology (Final Report, October 1, 2004-December 31, 2006) – 254

## **SOUND FIELDS**

A Rocket-Like Coaxial Injector in an Acoustic Field Under Sub- and Supercritical Conditions (POSTPRINT) – 218

Dark Core Analysis of Coaxial Injectors at Sub-, Near-, and Supercritical Conditions in a Transverse Acoustic Field – 589

## **SOUND GENERATORS**

Chamber Core Structures for Fairing Acoustic Mitigation – 50

## **SOUND TRANSMISSION**

A Numerical Study of the Regimes of Weak Fluctuation Theory for Ocean Acoustic Propagation through Random Internal Wave Sound Speed Fields – 589

Acoustic Thermometry of Ocean Climate: Marine Mammal Issues – 587

Effects of Multimodal Displays About Threat Location on Target Acquisition and Attention to Visual and Auditory Communications – 153

## **SOUTH AMERICA**

Building Alternative-Energy Partnerships with Latin America – 249

Prevalences, Genotypes, and Risk Factors for HIV Transmission in South America – 393

## **SPACE BASES**

Berkeley Accelerator Space Effects (BASE) Light Ion Facility Upgrade – 584

## **SPACE COOLING (BUILDINGS)**

Solar Buildings. Transpired Air Collectors Ventilation Preheating – 250

## **SPACE EXPLORATION**

Exploration Medical Capability (ExMC) Program – 417

Regression Strategies for Parameter Space Exploration. A Case Study in Semicoarsening Multigrid and R – 435

Translational Research in Space Exploration – 413

## **SPACE FLIGHT**

Integrated Crew Health Care System for Space Flight – 412

## **SPACE HEATING (BUILDINGS)**

Solar Buildings. Transpired Air Collectors Ventilation Preheating – 250

## **SPACE LOGISTICS**

Changing the Cultural Paradigm to Meet Emerging Requirements – 56

## **SPACE MISSIONS**

Joint Space Forces in Theater: Coordination is No Longer Sufficient – 47

## **SPACE PROGRAMS**

Learning from Past Experiences – 56

## **SPACE PSYCHOLOGY**

Space Medicine Issues and Healthcare Systems for Space Exploration Medicine – 416

## **SPACE SHUTTLE MISSIONS**

Spaceflight Alters Bacterial Gene Expression and Virulence and Reveals Role for Global Regulator Hfq – 420

## **SPACE SHUTTLE ORBITERS**

Re-Entry Aeroheating Analysis of Tile-Repair Augers for the Shuttle Orbiter – 58

## **SPACE SHUTTLES**

Probabilistic Modeling of Space Shuttle Debris Impact – 58

Shuttle Entry Imaging Using Infrared Thermography – 57

## **SPACE STATIONS**

Materials on the International Space Station Experiment (MISSE): Optical Analysis of Molecular Contamination on PEC1 Tray 2 – 54

## SPACE SUITS

Anthropometric Accommodation in Space Suit Design – 424

Thermal Conductivity of Copoly(ethylene vinyl acetate)/Nano-Filler Blends – 83

## SPACE TRANSPORTATION

Changing the Cultural Paradigm to Meet Emerging Requirements – 56

Developing Metrics in Systems Integration (ISS Program COTS Integration Model) – 608

## SPACEBORNE ASTRONOMY

Exploring the High Energy Universe: GLAST Mission and Science – 667

## SPACEBORNE TELESCOPES

Exploring the High Energy Universe: GLAST Mission and Science – 667

Fine Pointing of Military Spacecraft – 51

## SPACECRAFT CONSTRUCTION MATERIALS

Shot-Peening Sensitivity of Aerospace Materials – 5

## SPACECRAFT DESIGN

Thermal Modeling of the Mars Reconnaissance Orbiter's Solar Panel and Instruments during Aerobraking – 59

## SPACECRAFT ENVIRONMENTS

A Comprehensive Characterization of Microorganisms and Allergens in Spacecraft Environment – 414

Revitalization of Space-Related Human Factors, Environmental and Habitability Data – 425

Space Medicine Issues and Healthcare Systems for Space Exploration Medicine – 415

Spaceflight Alters Bacterial Gene Expression and Virulence and Reveals Role for Global Regulator Hfq – 420

## SPACECRAFT TRACKING

Conditional Random People: Tracking Humans with CRFs and Grid Filters – 505

## SPACECREWS

Behavioral Health Program Element – 417

Exploration Medical Capability (ExMC) Program – 417

Integrated Crew Health Care System for Space Flight – 412

Revitalization of Space-Related Human Factors, Environmental and Habitability Data – 425

## SPACE-TIME ADAPTIVE PROCESSING

Space-Time Adaptive Processing: Algorithms – 177

Space-Time Adaptive Processing: Fundamentals – 177

## SPACING

Coolerless Photonic Integrated Circuits (PICs) for WDM Transmission Networks and PICs Operable with a Floating Signal Channel Grid Changing with Temperature but with Fixed Channel Spacing in the Floating Grid – 214

## SPALLATION

Neutron Production by Muon Spallation I: Theory – 571

## SPARE PARTS

Sizing Mobility Readiness Spares Packages for Today's Warfighting Units – 21

## SPATIAL DISTRIBUTION

The Status and Future of the ICRF – 665

## SPATIAL RESOLUTION

High Spatial Resolution X-ray and Gamma Ray Imaging System Using Crystal Diffraction Lenses – 557

## SPECTRAL RESOLUTION

Design Tradeoffs for a High Spectral Resolution Mid-Infrared Echelle Spectrograph on the Thirty-Meter Telescope – 592

## SPECTRA

An Atlas of [N ii] and [O iii] Images and Spectra of Planetary Nebulae – 666

Classification and Discrimination of Sources with Time-Varying Frequency and Spatial Spectra – 224

Experimenting with C2 Applications and Federated Infrastructures for Integrated Full-Spectrum Operational Environments in Support of Collaborative Planning and Interoperable Execution – 143

Hao Spectral Diagnostic Package for Emitted Radiation (Haos-Diper) Reference Guide. Version 1.0 – 558

Spread Spectrum Signal Characteristic Estimation Using Exponential Averaging and an AD-HOC Chip rate Estimator – 195

## SPECTROGRAPHS

Design of the TMT Mid-Infrared Echelle: Science Drivers and Design Overview – 226

Design Tradeoffs for a High Spectral Resolution Mid-Infrared Echelle Spectrograph on the Thirty-Meter Telescope – 592

## SPECTROMETERS

Beam Dynamics in a Spectrometer for the Polarized Positron Production Experiment – 584

Characterization Of Commonly Encountered Explosives Using Highfield Asymmetric Waveform Ion Mobility Spectrometry Coupled With Mass Spectrometry – 594

Compact Imaging Spectrometer Utilizing Immersed Gratings – 602

Superconducting High Resolution Fast-Neutron Spectrometers – 564

## SPECTROPHOTOMETRY

Spectrophotometric Analysis of the Cyanide Metabolite 1-Aminothiazoline-6-Carboxylic Acid – 110

## SPECTROSCOPY

All-Wavelength Extended Groth Strip International Survey (AEGIS) Data Sets – 674

Final Project Report for Terahertz Spectroscopy of Complex Matter – 106

Intensity Modulated Radiation Treatment of Prostate Cancer Guided by High Field MR Spectroscopic Imaging – 355

Semiconductor Quantum Dot Resonant Tunneling Spectroscopy – 185

Spectroscopy and Decay of B Hadrons at the Tevatron – 576

## SPECTRUM ANALYSIS

A Study of the Attraction Forces of Lunar Dust Simulant – 664

Heat Flux and Infrared Spectral Measurements of Burning SRM Propellant (Postprint) – 130

## SPEECH RECOGNITION

A Model for Predicting Intelligibility of Binaurally Perceived Speech – 153

The Accuracy of a Fingerprint/Voice Multimodal Verification System – 473

Voice Recognition Interface in the Rehabilitation of Combat Amputees – 307

## SPENT FUELS

Application of Neutron-Absorbing Structural-Amorphous Metal (SAM) Coatings for Spent Nuclear Fuel (SNF) Container to Enhance Criticality Safety Controls – 131

## SPILLING

Consequence Assessment Methods for Incidents Involving Releases From Liquefied Natural Gas Carriers – 607

## SPINAL CORD

Autologous Marrow-Derived Stem Cell-Seeded Gene-Supplemented Collagen Scaffolds for Spinal Cord Regeneration as a Treatment for Paralysis – 299

Characterization of Neurofibromas of the Skin and Spinal Roots in a Mouse Model – 407

Growth Factor Dependent Cholinergic Function and Survival in Primary Mouse Spinal Cord Cultures – 373

## SPINDLES

Centrosome-Based Mechanisms, Prognostics and Therapeutics in Prostate Cancer – 346

## SPINE

Characterization of Neurofibromas of the Skin and Spinal Roots in a Mouse Model – 408

## SPORES

Human-Derived, Plant-Produced Monoclonal Antibody for the Treatment of Anthrax – 377

## STIMULATION

Contrast Enhancement for Thermal Acoustic Breast Cancer Imaging via Resonant Stimulation – 314

Do Capacity Coupled Electric Fields Accelerate Tibial Stress Fracture Healing – 287

Sulfur Mustard-induced Neutropenia: Treatment with Granulocyte Colony-stimulating Factor – 110

## STOCHASTIC PROCESSES

Reducing the 'Gap of Pain': A Strategy for Optimizing Federal Resource Availability in Response to Major Incidents – 526

Scale-Independent Biomechanical Optimization – 521

Stochastic Analysis of Initial Extended Area Protection and Survivability (EAPS) Projectile – 427

Stochastic Lanchester Air-To-Air Campaign Model: Methods Used to Generate Model Outputs and a User's Guide: 2007 – 527

Survey of Bayesian Models for Modelling of Stochastic Temporal Processes – 434

## STOICHIOMETRY

Stoichiometry and Characterization of Aluminum Oxynitride Thin Films by Ion-Beam-Assisted Pulsed Laser Deposition (Preprint) – 127

Substrate/Oxide Interface Interaction in LaAlO<sub>3</sub>/Si Structures – 96

## STORAGE BATTERIES

Model of Energy Storage Circuit for Isotope Battery Based on SiC Schottky Diode – 212

Servicing Hawker Vehicle Batteries with Standard Battery Charging and Test Equipment – 248

## STORAGE RINGS (PARTICLE ACCELERATORS)

Modeling and Simulation of Longitudinal Dynamics for LEH-HER PEP II Rings – 581

## STORAGE TANKS

Survey of Underground Storage Tanks and Other Subsurface Structures at the Umatilla Depot Activity, Hermiston, Oregon – 239

## STORAGE

Puzzle-Based Storage Systems – 518

## STORMS

On the Relationship of SAPS to Storm-Enhanced Density – 263

Summary of Dimensionless Texas Hyetographs and Distribution of Storm Depth Developed for Texas Department of Transportation Research Project 0-4194 – 276

Weathering the Storm. Leading Your Organization Through a Pandemic – 368

## STRAIN RATE

High Strain Rate Mechanical Properties of Epoxy and Epoxy-Based Particulate Composites (Preprint) – 125

## STRAKES

Hypersonic Magneto-Fluid-Dynamic Compression in Cylindrical Inlet – 221

## STRANDS

Characteristics of Round and Extracted Strands of Mb(3)A1 Rutherford Cable – 558

DNA Ligase I is an In Vivo Substrate of DNA-Dependent Protein Kinase and is Activated by Phosphorylation in Response to DNA Double-Strand Breaks – 383

## STRATEGY

Multi-Cumulant and Non-Inferior Strategies for Multi-Player Pursuit-Evasion (PREPRINT) – 544

Strategic Airlift Modernization: Background, Issues and Options – 14

Strategic Planning to Conduct Joint Force Network Operations: A Content Analysis of NETOPS Organizations Strategic Plans – 640

U.S. Climate Change Technology Program: Vision and Framework for Strategy and Planning – 258

## STRATOSPHERE RADIATION

Stratospheric Relaxation in IMPACTs Radiation Code – 275

## STRATOSPHERE

Achievements in Stratospheric Ozone Protection – 278

Gravity-Wave Dynamics in the Atmosphere – 264

Stratospheric Relaxation in IMPACTs Radiation Code – 275

## STRESS (BIOLOGY)

Post Traumatic Stress Disorder: The Facts – 369

## STRESS INTENSITY FACTORS

Crack Growth and Stress Intensity Prediction Techniques. Delivery Order 0004: Implementing Models and Libraries – 31

## STRESS (PHYSIOLOGY)

Workload, Stress, and Situation Awareness of Soldiers Who are Controlling Unmanned Vehicles in Future Urban Operations – 409

## STRESS (PSYCHOLOGY)

Workload, Stress, and Situation Awareness of Soldiers Who are Controlling Unmanned Vehicles in Future Urban Operations – 409

## STRING THEORY

AdS/CFT and QCD – 572

Constraints on Meta-Stable de Sitter Flux Vacua – 579

## STRINGS

Computational Nonlinear Optics: Femtosecond Atmospheric Light String Applications – 266

## STRUCTURAL ANALYSIS

Composite Action during Construction of Steel Trapezoidal Box Girder Bridges – 240

Mechanical and Microstructural Effects of Cold Spray Aluminum on Al 7075 Using Kinetic Metallization and Cold Spray Processes (Preprint) – 99

Position Analysis of Planar Tensegrity Structures – 583

Re-Entry Aeroheating Analysis of Tile-Repair Augers for the Shuttle Orbiter – 58

## STRUCTURAL BASINS

Acoustic Thermometry of Ocean Climate: Marine Mammal Issues – 587

## STRUCTURAL DESIGN

Structural Design and Analysis of Initial Extended Area Protection and Survivability (EAPS) Projectile Configurations – 217

## STRUCTURED GRIDS (MATHEMATICS)

Discrete Data Transfer Technique for Fluid-Structure Interaction – 478

Exploring Hypersonic, Unstructured-Grid Issues through Structured Grids – 437

## STUDENTS

Baylor College of Medicine Saturday Morning Science Workshop – 608

Delaware Consortium for Undergraduate Minority Training in Prostate Cancer – 362

Immunology, Systems Biology, and Immunotherapy of Breast Cancer – 360

Knowledge Tracing and Prediction of Future Trainee Performance – 531

## SUBLETHAL DOSAGE

Effects of Sarin on the Operant Behavior of Guinea Pigs – 382

## SUBMERGING

Materials and Fabrication Issues for Large Machined Germanium Immersion Gratings – 575

## SUBROUTINES

An Inverse of the Circular Coverage Function – 525

An Inverse of the Elliptic Coverage Function – 525

An Inverse of the Generalized Circular Error Function – 525

An Inverse of the Incomplete Beta Function (F-(Variance Ratio) Distribution Function) – 467

## SUBSONIC FLOW

High-Speed Digital-Image Data Acquisition, Processing, and Visualization System for Turbulent Mixing and Combustion – 77

## SUBSTRATES

10x Improvement of Power Transmission over Free Space Using Integrated Antennas on Silicon Substrates – 191

Degradation of Polycyclic Aromatic Hydrocarbons by Actinomycetes – 104

DNA Ligase I is an In Vivo Substrate of DNA-Dependent Protein Kinase and is Activated by Phosphorylation in Response to DNA Double-Strand Breaks – 383

Method of Forming Quantum Dots at Predetermined Positions on a Substrate – 201

On the Correlation Between the Self-Organized Island Pattern and Substrate Elastic Anisotropy – 552

Substrate/Oxide Interface Interaction in LaAlO<sub>3</sub>/Si Structures – 96

Superconductors on Iridium Substrates and Buffer Layers – 606

## SULFIDES

Degradation of the Blister Agent BIS(2-Chloroethyl) Sulfide and Simulant 2-Chloroethyl Phenyl Sulfide on Concrete – 306

Genomic Analysis of Rodent Pulmonary Tissue Following Bis-(2-chloroethyl) Sulfide Exposure – 379

## SULFUR

Conversion of Hydrogen Sulfide in Coal Gases to Liquid Elemental Sulfur with Monolithic Catalysts. (Annual Report, October 1, 2005-September 30, 2006) – 107

Improved Wound Healing of Cutaneous Sulfur Mustard Injuries in a Weanling Pig Model – 383

Sulfur Mustard-induced Neutropenia: Treatment with Granulocyte Colony-stimulating Factor – 110

Thiodiglycol, the Hydrolysis Product of Sulfur Mustard: Analysis of In Vitro Biotransformation by Mammalian Alcohol Dehydrogenases using Nuclear Magnetic Resonance – 384

## SUMMER

Defense Science Board 2006 Summer Study of Information Management for Net-Centric Operations. Volume 2. Operations Panel Report – 158

Defense Science Board 2006 Summer Study on Information Management for Net-Centric Operations. Volume 1: Main Report – 158

## SUMPS

Gas Turbine Engine Including a Low Pressure Sump Seal Buffer Source and Thermally Isolated Sump – 41

## SUN

Experiments with the Sun Java Real-Time System -- Part 2 – 467

Progress Report of the IAU Working Group on Precession and the Eclipse – 665

Understanding Magnetic Eruptions in the Sun and Their Interplanetary Consequences – 667

## SUPERCOMPUTERS

Advancing Software Security - The Software Protection Initiative – 626

BlueGene/L Supercomputer and Quantum ChromoDynamics – 560

Purple Computational Environment with Mappings to Ace Requirements for the General Availability User Environment Capabilities. Version 2.0 – 433

## SUPERCONDUCTING CAVITY RESONATORS

Radiation Shielding Issues for Superconducting RF Cavity Test Facility at Fermilab – 564

## SUPERCONDUCTING MAGNETS

Summary Report--FY2006 ITER Work Accomplished – 575

## SUPERCONDUCTIVITY

New Strategic Plan Takes the ALS into the Future – 577

Quarter-Rate Superconducting Modulator for Improved High Resolution Analog-to-Digital Converter – 441

Radiation Shielding Issues for Superconducting RF Cavity Test Facility at Fermilab – 564

Superconducting High Resolution Fast-Neutron Spectrometers – 564

Synthesis of One-dimensional Nanosized Defects in High T<sub>c</sub> Superconductor – 552

## SUPERCONDUCTORS (MATERIALS)

Superconducting High Resolution Fast-Neutron Spectrometers – 565

Superconductors on Iridium Substrates and Buffer Layers – 606

## SUPERCOOLING

Freezing Fog Formation in a Supercooled Boundary Layer: Solving the Winter Fog Forecasting Challenge for Elmendorf Air Force Base, Alaska – 270

## SUPERCritical FLOW

A Rocket-Like Coaxial Injector in an Acoustic Field Under Sub- and Supercritical Conditions (POSTPRINT) – 218

Advanced Materials Deposition for Semiconductor Nanostructures Using Supercritical Fluids – 184

## SUPERCritical FLUIDS

Advanced Materials Deposition for Semiconductor Nanostructures Using Supercritical Fluids – 185

Swirl-Stabilized Injector Flow and Combustion Dynamics for Liquid Propellants at Supercritical Conditions – 217

## SUPERLATTICES

Superlattice Nanopatterning of Wires and Complex Patterns – 207

## SUPERPLASTICITY

Microstructural Evolution of Commercial-Purity Ti and Superplasticity of Ti-6Al-4V Alloy Processed by Equal Channel Angular Extrusion – 117

## SUPERSONIC COMBUSTION RAMJET ENGINES

Technologies for Propelled Hypersonic Flight, Volume 2 - Subgroup 2: Scram Propulsion – 41

## SUPERSONIC COMBUSTION

Technologies for Propelled Hypersonic Flight, Volume 2 - Subgroup 2: Scram Propulsion – 41

## SUPERSONIC FLOW

High-Speed Digital-Image Data Acquisition, Processing, and Visualization System for Turbulent Mixing and Combustion – 77

## SUPERSONIC WIND TUNNELS

Demonstration of Clean Particle Seeding for Particle Image Velocimetry in a Closed Circuit Supersonic Wind Tunnel – 15

## SUPERSYMMETRY

Constraints on Meta-Stable de Sitter Flux Vacua – 579

Search for Chargino and Neutralino at Run II of the Tevatron Collider – 576

## SUPPLYING

Final Scientific/Technical Phase I Report on Sliding Mode Pulsed Current Averaging IC Drivers for High-Brightness Light Emitting Diodes – 603

Oil Vulnerabilities and USA Strategy – 241

Proceedings of the 1st Army Installation Energy Security and Independence Conference – 245

Selection Process of a Non-Primary Power Source for a Combat Vehicle – 242

## SUPPORT SYSTEMS

A Model of Tactical Battle Rhythm – 171

Determining Logistics Ground Support Manpower Requirements for a Reusable Military Launch Vehicle – 57

Enhancing Child Support Enforcement Efforts: Summary of Data Warehouse Efforts in Nine States – 439

HPC-Colony: Services and Interfaces to Support Systems with Very Large Numbers of Processors. (2006 Annual Report, January-December 2006) – 431

Using Work-Centered Support System Technology to Enhance Command and Control – 488

## SUPPORTS

Thermally Compensated Fiber Bragg Grating Mount – 236

## SUPPRESSORS

The Opposing Roles of Nucleophosmin and the ARF Tumor Suppressor in Breast Cancer – 283

The Role of Oncogene/Tumor Suppressor Interaction with the Centrosome Protein Pericentrin in Prostate Tumorigenesis – 322

The Role of RB in the Therapeutic Response of Breast Cancer – 301

#### **SURFACE DEFECTS**

Electromechanics of Dielectric and Piezoelectric Crystals With Point, Line, and Surface Defects – 187

#### **SURFACE DIFFUSION**

Simulation of Stagnation Region Heating in Hypersonic Flow on Tetrahedral Grids – 431

#### **SURFACE EMITTING LASERS**

Vertical Cavity Surface Emitting Laser Having a Gain Guide Aperture Interior to an Oxide Confinement Layer – 599

#### **SURFACE ENERGY**

Application of Surface Energy Measurements to Evaluate Moisture Susceptibility of Asphalt and Aggregates – 74

Wettability Tests of Polymer Films and Fabrics and Determination of Their Surface Energy by Contact-Angle Methods – 89

#### **SURFACE PROPERTIES**

Antimicrobial Polymeric Surfaces – 79

Chemical Modifications to Polymer Surfaces and the Application of Polymer Grafting to Biomaterials – 72

#### **SURFACE REACTIONS**

Controls of Fluid Chemistry on Fracture Growth – 106

Liquid Mixing Reactor for Biochemical Assays – 71

Stab Sensitivity of Energetic Nanolaminates – 84

#### **SURFACE VEHICLES**

Lightweight and Advanced Materials for Defense: Materials for Military Ground Vehicles – 85

#### **SURFACE WAVES**

Infra-Gravity Wave Input Toolbox (IGWT): User's Guide – 470

Scenario-Based Assessment of Sensors for the Canadian Recognized Maritime Picture – 227

#### **SURGERY**

Advanced Technologies in Safe and Efficient Operating Rooms – 309

Evaluation of the Safety and Efficacy of Excimer Laser Keratorefractive Surgery in U.S. Army Soldiers using the latest Battlefield Technologies – 233

#### **SURGES**

M1114 -- Golden HMMWV Power: Electrical Systems Used in Theater – 192

Reducing the 'Gap of Pain': A Strategy for Optimizing Federal Resource Availability in Response to Major Incidents – 526

#### **SURVEILLANCE**

A Bold 21st Century Strategy for U.S. Airborne ISR – 24

A Comparison of Trajectory Determination Approaches for Small UAVs – 11

A Strategies-to-Tasks Framework for Planning and Executing Intelligence, Surveillance, and Reconnaissance (ISR) Operations – 620

Advanced Target Tracking Techniques – 175

COHORT: An Integrated Information Approach to Decision Support for Military Subpopulation Health Care – 368

Cost-Effective Strategies for Communicating with Remote Surveillance Stations: A Summary – 178

Digital Convergence Authenticated Video, Voice, & Text – 476

Framework for Measuring the Impact of C4ISR Technologies and Concepts on Warfighter Effectiveness Using High Resolution Simulation – 144

Guidance Material for Mode S-Specific Protocol Application Avionics – 37

Libraries and the USA PATRIOT Act – 635

Magnetic Resonance Based Diagnostics for Polymer Production and Surveillance – 67

Mitigating Atmospheric Effects in High-Resolution Infra-Red Surveillance Imagery with Bispectral Speckle Imaging – 675

Modeling and Simulation to Support C4ISR Acquisition and Transformation – 461

North West Shelf Unmanned Aerial System Trial – 18

Persistent Monitoring Platforms – 36

Scenario-Based Assessment of Sensors for the Canadian Recognized Maritime Picture – 227

Testing the Effectiveness of the North Shore - LIJ Health System's Bioterrorism Response Program to Identified Surveillance Data – 345

The Canadian ISTAR Information-Centric Collaborative Workspace Concept. Paper 1: The Info-Centric Collaborative Workspace from an Organizational Perspective – 621

The Canadian ISTAR Information-Centric Collaborative Workspace Concept. Paper 2: The Info-Centric Collaborative Workspace from the Processes Perspective – 623

The Canadian ISTAR Information-Centric Collaborative Workspace Concept. Paper 3: The Info-Centric Collaborative Workspace from a Systems Perspective – 623

The Coalition Aerial Surveillance and Reconnaissance (CAESAR) Approach to Enhancing the Interoperability of Coalition Ground Surveillance Systems – 224

The Development of a Virtual McKenna Military Operations in Urban Terrain (MOUT) Site for Command, Control, Communication, Computing, Intelligence, Surveillance, and Reconnaissance (C4ISR) Studies – 164

The USA PATRIOT Act: A Legal Analysis – 638

The USA PATRIOT Act: A Sketch – 633

Tracking and Data Fusion Applications – 177

Very High Resolution SAR and Multi-channel SAR/MTI – 175

#### **SURVEYS**

A Comprehensive Survey of the Plasmodium Life Cycle by Genomic, Transcriptomic, and Proteomic Analyses – 389

A Survey of Statistical Machine Translation – 509

All-Wavelength Extended Groth Strip International Survey (AEGIS) Data Sets – 674

Asbestos Survey for Fort Point US Coast Guard Station, Presidio of San Francisco. Volume 2 – 241

Corporate Entrepreneurship Assessment Instrument (CEAI): Refinement and Validation of a Survey Measure – 136

Development of an Assistive Technology and Environmental Assessment Instrument for National Surveys: Final Report. Part One: Recommended Modules and Instrument Development Process – 440

Galvanic Skin Response as a Measure of Soldier Stress – 410

Jefferson Proving Ground, South of the Firing Line, Final Asbestos Survey Summary Report. Volume 3. Buildings 230 through 475 – 241

Knowledge, Attitudes, and Practices Regarding Epidemiology and Management of Travelers' Diarrhea: A Survey of Front-Line Providers in Iraq and Afghanistan – 375

Large Synoptic Survey Telescope and Foundations for Data Exploitation of Petabyte Data Sets – 673

Lethality and Autonomous Robots: An Ethical Stance – 504

Radon Screening of Buildings at the Umatilla Depot Activity, Hermiston, Oregon – 94

Survey and Alignment of the Fermilab Electron Cooling System – 585

Survey of Bayesian Models for Modelling of Stochastic Temporal Processes – 434

Survey of Hurricane Katrina and Hurricane Rita Contracts and Grants. Public Release – 279

Survey of Probabilistic Models for Relational Data – 435

Survey of Underground Storage Tanks and Other Subsurface Structures at the Umatilla Depot Activity, Hermiston, Oregon – 239

## **SURVIVAL**

Environmental Survival, Military Reliance, and Persistence of Burkholderia Pseudomallei – 291

Growth Factor Dependent Cholinergic Function and Survival in Primary Mouse Spinal Cord Cultures – 373

Intracellular Survival of Campylobacter jejuni in Human Monocytic Cells and Induction of Apoptotic Death by Cytolethal Distending Toxin – 394

## **SWINE**

A Hemoglobin-based Oxygen Carrier, Bovine Polymerized Hemoglobin (HBOC-201) Versus Hetastarch (HEX) in a Moderate Severity Hemorrhagic Shock Swine Model with Delayed Evacuation – 395

Effects of Bovine Polymerized Hemoglobin in Coagulation in Controlled Hemorrhagic Shock in Swine – 385

The Effect of Hypotensive Resuscitation and Fluid Type on Mortality, Bleeding, Coagulation, & Dysfunctional Inflammation in a Swine Grade V Liver Injury Model – 314

## **SWITCHES**

A Multiservice Switch for Advanced Avionics Data Networks – 43

Model Based Statistical Estimation of Sandia RF Ohmic Switch Dynamic Operation from Stroboscopic X-ray Imaging – 207

Topology of On/Off Marx Modulator with Protection of Load and Solid State Switches – 579

## **SWITCHING CIRCUITS**

Coreless Approaches for On/Off Marx Type Modulators – 579

Model Based Statistical Estimation of Sandia RF Ohmic Switch Dynamic Operation from Stroboscopic X-ray Imaging – 207

## **SWITCHING**

A Multiservice Switch for Advanced Avionics Data Networks – 43

Antiferromagnetically Stabilized Pseudo Spin Valve for Memory Applications – 438

Configuration Management Support for Long Haul C2 Circuit Switched Services – 154

Final Scientific/Technical Phase I Report on Sliding Mode Pulsed Current Averaging IC Drivers for High-Brightness Light Emitting Diodes – 602

## **SWITZERLAND**

Locating a Prostate Cancer Susceptibility Gene on the X Chromosome by Linkage Disequilibrium Mapping Using Three Founder Populations in Quebec and Switzerland – 353

## **SYMMETRY**

Control of Spinning Symmetric Airframes – 553

## **SYNCHRONISM**

Enablers of Self-Synchronization for Network-Centric Operations: Design of a Complex Command and Control Experiment – 460

Fermi Timing and Synchronization System – 605

New Approaches C4I Data Warehousing for Crisis Action - Synchronization, Replication, Sustainment Design Implications – 645

## **SYNCHROTRONS**

AC Field Measurements of Fermilab Booster Correctors Using a Rotating Coil System – 605

## **SYNOPTIC METEOROLOGY**

The Forcing of 25-Knot Winds at Hickam and Andersen AFB – 270

## **SYNTHESIS (CHEMISTRY)**

Large Scale Green Synthesis of 1,2,4-Butanetriol – 66

Mesostructured Zeolitic Materials, and Methods of Making and Using the Same – 76

Synthesis, Structure, and Properties of PBO/SWNT Composites – 104

Tubular Carbon Nano/micro Structures and Method of Making Same – 74

## **SYNTHETIC APERTURE RADAR**

Alternatives for Military Space Radar – 223

Collaborative Research: Ground Truth of African and Eastern Mediterranean Shallow Seismicity Using SAR Interferometry and Gibbs Sampling Inversion – 261

Development and Assessment of a Complete ATR Algorithm Based on ISAR Euler Imagery – 468

Introduction to Synthetic Aperture Radar (SAR) – 175

Land Use Mapping with Evidential Fusion of Polarimetric Synthetic Aperture Radar and Hyperspectral Imagery – 631

Point Spread Function Characterization of a Radially Displaced Scatterer Using Circular Synthetic Aperture Radar – 230

Software to Generate 3-Dimensional Displays of Inverse Synthetic aperture Radar Data – 455

## **SYNTHETIC FUELS**

A Possible Solution for the U.S. Navy's Addiction to Petroleum: A Business Case Analysis for Transitioning the U.S. Navy From Petroleum to Synthetic Fuel Resources – 63

AB 1007 Full /Fuel Cycle Analysis (FFCA) Peer Review – 254

## **SYSTEM EFFECTIVENESS**

A Methodology for End-to-End Evaluation of Arabic Document Image Processing Software – 469

Airborne Armed Full Motion Video: The Nexus of OPS/INTEL Integration in the Joint/Coalition Environment – 229

Application of NCO Conceptual Framework to US/UK Coalition Combat Operations during Operation Iraqi Freedom – 494

Conceptual Modeling for the Probability of Raid Annihilation (Pra) Testbed – 453

Conditions for Achieving Network-Centric Operations in Systems of Systems – 465

Defense Logistics: Army and Marine Corps' Body Armor Requirements, Controls, and Other Issues – 425

Distributed Simulation Run Automation Capability for the Navy PRA Testbed – 453

Further Evidence of the Effects of Wind Turbine Farms on AD Radar – 532

Joint Essential Tasks and a Framework for Evaluation – 136

Military Helicopter Modernization: Background and Issues for Congress – 28

Modeling and Analysis of Information Technology Change and Access Controls in the Business Context – 478

Multipurpose Activity Definitions and Interfaces to Support Operational Needs (MADISON) – 542

NAC Off-Vehicle Brake Testing Project – 139

Scenario-Based Assessment of Sensors for the Canadian Recognized Maritime Picture – 227

Test and Evaluation of Value Engineering Proposal: Removal of Rubber PAD in 120 MM PA 153 Ammunition Fiber Container – 140

## **SYSTEM IDENTIFICATION**

F-15B QuietSpike(TradeMark) Aeroseervoelastic Flight Test Data Analysis – 36

## **SYSTEMS ANALYSIS**

A System of Systems Interface Hazard Analysis Technique – 541

Applying Executable Architectures to Support Dynamic Analysis of C2 Systems – 482

Dynamic Across-Time Measurement Interpretation: Maintaining Qualitative Understandings of Physical System Behavior – 500

Human Systems Integration Assessment of Network Centric Command and Control – 421

System for the Evaluation of Moisture Damage Using Fundamental Material Properties – 74

System Instantiation Comparison Method: A Technique for Comparing Military Headquarters – 542

The Logic of Occurrence – 500

## SYSTEMS ENGINEERING

A System Design Archetype for C4ISR Systems of the 21st Century – 159

A System of Systems Interface Hazard Analysis Technique – 541

Dataflow Integration and Simulation Techniques for DSP System Design Tools – 467

Evolution of C4I Systems – 174

LCLS XTOD Tunnel Vacuum Transport System (XVTS) Final Design Report – 563

Methods and System Design of the FOI Information Fusion Demonstrator - IFD03 – 450

NDIA FORCEnet Study - Overview of the Human Element Group's Findings: Implications for C2 and other Aspects of NCW – 172

Solutions Analysis for Helicopter Brownout – 33

Sustaining Air Force Space Systems: A Model for the Global Positioning System – 26

Systems Engineering for Rapid Prototyping: Friendly Marking Device – 227

The DoD Architecture Framework Views as Requirements Vehicles in a Model Driven Architecture Systems Development Process – 496

## SYSTEMS INTEGRATION

A Reference Architecture for Network-Centric Information Systems – 619

A Unifying Strategy for Data Integration for Global Force Management (Briefing Charts) – 147

Conditions for Achieving Network-Centric Operations in Systems of Systems – 465

Counter-Trafficking Integrated Display System (CIDS): A GIS-Based Command & Control Environment for Coalition Nations – 470

Defense Acquisitions. Improved Management and Oversight Needed to Better Control DOD's Acquisition of Services – 492

Developing Metrics in Systems Integration (ISS Program COTS Integration Model) – 608

Human Systems Integration Assessment of Network Centric Command and Control – 421

Integrated Information Management (IIM) – 484

Leveraging Command and Control Technology to Provide Advanced Environmental Effects Decision Aids on the Battlefield – 273

System-of-Systems Governance: New Patterns of Thought – 465

The Accuracy of a Fingerprint/Voice Multimodal Verification System – 473

The DoD Architecture Framework Views as Requirements Vehicles in a Model Driven Architecture Systems Development Process – 496

## SYSTEMS MANAGEMENT

Systems and Capability Relation Management in Defence Systems-of-System Context – 616

## SYSTEMS STABILITY

New Tools for Hybrid Systems – 518

## TACHYONS

Constraints on Meta-Stable de Sitter Flux Vacua – 579

## TACTICS

An Analysis of Small Navy Tactics Using a Modified Hughes' Salvo Model – 541

## TAIWAN

Taiwan - AFOSR Nanoscience Initiative Status – 199

## TANKER AIRCRAFT

Programmed Depot Maintenance Capacity Assessment Tool: Workloads, Capacity, and Availability – 33

Simulation of the Dynamically Coupled KC-135 Tanker and Refueling Boom – 11

## TARGET ACQUISITION

Alternatives for Military Space Radar – 223

An Inverse of the Circular Coverage Function – 525

An Inverse of the Elliptic Coverage Function – 525

An Inverse of the Generalized Circular Error Function – 525

Classification and Discrimination of Sources with Time-Varying Frequency and Spatial Spectra – 224

Development and Testing of a Multiple Frequency Continuous Wave Radar for Target Detection and Classification – 223

Effects of Multimodal Displays About Threat Location on Target Acquisition and Attention to Visual and Auditory Communications – 153

Hyperspectral Imagery Target Detection Using Improved Anomaly Detection and Signature Matching Methods – 592

Hyperspectral Imagery Target Detection Using Principal Component Analysis – 522

Integrated Sensing and Processing (ISP) Phase 2: Demonstration and Evaluation for Distributed Sensor Networks and Missile Seeker Systems – 514

Optimizing the Allocation of Sensor Assets for the Unit of Action – 531

The Canadian ISTAR Information-Centric Collaborative Workspace Concept. Paper 1: The Info-Centric Collaborative Workspace from an Organizational Perspective – 621

The Canadian ISTAR Information-Centric Collaborative Workspace Concept. Paper 2: The Info-Centric Collaborative Workspace from the Processes Perspective – 623

The Canadian ISTAR Information-Centric Collaborative Workspace Concept. Paper 3: The Info-Centric Collaborative Workspace from a Systems Perspective – 623

Theory and Applications of Computational Time-Reversal Imaging – 516

## TARGET RECOGNITION

Advanced Radar Signal and Data Processing – 175

Automatic Target Recognition User Interface Tool – 510

Development and Assessment of a Complete ATR Algorithm Based on ISAR Euler Imagery – 468

Point Spread Function Characterization of a Radially Displaced Scatterer Using Circular Synthetic Aperture Radar – 230

Wide Area Search and Engagement Simulation Validation – 32

## TARGETS

A Centripetal Acceleration Statistic for Tracking Maneuvering Targets with Radar – 225

A Multipurpose Projectile for Penetrating Urban Targets – 519

A Strategies-to-Tasks Framework for Planning and Executing Intelligence, Surveillance, and Reconnaissance (ISR) Operations – 620

Adaptive and Iterative Processing Techniques for Overlapping Signatures – 555

Alternatives for Military Space Radar – 223

An Infrared Camera Simulation for Estimating Spatial Temperature Profiles and Signal-to-Noise Ratios of an Airborne Laser-Illuminated Target – 234

Application of the Unscented Transformation to Obtain Target Range, Bearing, Elevation, Range Rate, Speed and Course Estimates and Errors From Tracks Given in Cartesian Coordinates – 517

Berkeley Accelerator Space Effects (BASE) Light Ion Facility Upgrade – 584

Cannabinoid Receptors: A Novel Target for Therapy of Prostate Cancer – 320

Classification and Discrimination of Sources with Time-Varying Frequency and Spatial Spectra – 224

Development and Application of a Predictive Computational Tool for Short-Pulse, High-Intensity Target Interactions – 603

Development and Testing of a Multiple Frequency Continuous Wave Radar for Target Detection and Classification – 223

Development of a Mouse Model for Prostate Cancer Imaging and Study of Disease Progression – 321

Enablers of Self-Synchronization for Network-Centric Operations: Design of a Complex Command and Control Experiment – 460

Evaluation of DNA Methylation as a Target for Intraductal Therapy for Ductal Carcinoma in Situ of the Breast – 319

GKLF as a Novel Target in Selenium Chemoprevention of Prostate Cancer – 361

High Throughput Screening of Crystallization of Materials – 71

Humanin: A Novel Therapeutic Target in Prostate Cancer – 319

IEIST Technologies Enabling TCT Prosecution – 538

IMPACT (Imaging and Molecular Markers for Patients with Lung Cancer: Approaches with Molecular Targets and Complementary, Innovative and Therapeutic Modalities) – 345

Implementation of the Polarized HD Target at the Thomas Jefferson National Accelerator. Reporting Period for January 1, 2002 to December 31, 2006 – 583

Liquid Mixing Reactor for Biochemical Assays – 71

Molecular Differentiation of Risk for Disease Progression: Delineating Stage-Specific Therapeutic Targets for Disease Management in Breast Cancer – 289

Probability Modeling of Multi-Type Autonomous Unmanned Combat Aerial Vehicles Engaging Non-Homogeneous Targets Under Imperfect Information – 26

Second Preliminary Report on X-Ray Yields from OMEGA II Targets – 601

Simultaneous Localization and Tracking in Wireless Ad-hoc Sensor Networks – 188

Simultaneous Localization, Calibration, and Tracking in an ad Hoc Sensor Network – 536

Steps Towards Determining the Right Number of Dental Recruits the Navy Should Access to Meet the Projected Targets for Navy Dental Corps Officers – 311

Stromal Mesenchyme Cell Genes in Prostate Cancer Development: Epigenetic Markers for Cancer and Potential Targets for Therapy – 316

Toward Neural Control of Prosthetic Devices – 209

Utilizing Network-Enabled Command and Control Concepts to Enhance ASW Effectiveness – 590

## TASKS

A Model of the Effects of Acceleration on a Pursuit Tracking Task – 37

Classifying C2 Decision Making Jobs Using Cognitive Task Analyses and Verbal Protocol Analysis – 459

Issues Related to Experience & Automated Agent Technology in Synthetic Task Performance – 503

RIDE vs. CLASP Comparison and Evaluation: Models and Parameters – 662

The Use of Cognitive Task Analysis and Simulators for After Action Review of Medical Events in Iraq – 367

The Use of Cognitive Task Analysis and Simulators for the After Action Review of Medical Events in Iraq – 618

## TAXONOMY

A Proposed Taxonomy for Software Development Risks for High-Performance Computing (HPC) Scientific/Engineering Applications – 478

A Survey of Statistical Machine Translation – 509

Multi-Hypothesis Structures, Taxonomies and Recognition of Tactical Elements for Combat Identification Fusion – 622

## TAYLOR INSTABILITY

Assessment of Gradient Diffusion Closures for Modeling Rayleigh Taylor and Richtmyer Meshkov Instability Induced Mixing – 568

Rayleigh Taylor Instability induced Mixing. Initial Conditions Modeling, Three Dimensional Simulations and Comparisons with Experiment – 570

## TEA LASERS

A Chemoprevention Trial to Study the Effects of High Tea Consumption on Smoking-Related Oxidative Stress – 340

## TECHNOLOGIES

Automated STR Analysis for DNA Databases – 429

Enhancing Army S&T Lessons from 'Project Hindsight Revisited' – 21

Internet: An Overview of Key Technology Policy Issues Affecting Its Use and Growth – 497

Pilot Study: Parasitic and Passive Radar – 179

Science & Technology Review January/February 2007 – 575

## TECHNOLOGY ASSESSMENT

Army Science Conference 2006 TECHNOLOGY ASSESSMENT of SOLDIER and MAN PORTABLE FUEL CELL POWER – 249

Development of an Assistive Technology and Environmental Assessment Instrument for National Surveys: Final Report. Part One: Recommended Modules and Instrument Development Process – 440

Nanoscience and Technology at the Air Force Research Laboratory (AFRL) – 54

Using Work-Centered Support System Technology to Enhance Command and Control – 488

## TECHNOLOGY TRANSFER

AFRL/IF Technology Transition to the Warfighter via the CAOC-X – 465

China: Possible Missile Technology Transfers from U.S. Satellite Export Policy - Actions and Chronology – 637

Report to Congress on the Activities of the DoD Office of Technology Transition – 651

Sharing the Dragon's Teeth: Terrorist Groups and the Exchange of New Technologies – 643

## TECHNOLOGY UTILIZATION

A 4-Mbit Non-Volatile Chalcogenide-Random Access Memory Designed for Space Applications (Preprint) – 54

ISO/IEC JTC1 SC37 Overview – 474

Technologies for Propelled Hypersonic Flight, Volume 2 - Subgroup 2: Scram Propulsion – 40

Technologies for Propelled Hypersonic Flight, Volume 3 - Subgroup 3: CFD Validation for Hypersonic Flight – 41

## TELECOMMUNICATION

A Model for Effective Organization and Communication of Homeland Security Activity at the State Level – 157

A Multi-Ring Framework for Survivable Group Communications – 440

An Evaluation Methodology for Protocol Analysis Systems – 490

Assessing Human Factors in Command and Control: Workload and Situational Awareness Metrics – 422

Automating Behavioral Health Screening - Addressing Risk Communication Electronically – 306

Bone Conduction: Anatomy, Physiology, and Communication – 163

Communication of Context in Multi-Echelon Information Exchange Environments – 656

Cost-Effective Strategies for Communicating with Remote Surveillance Stations: A Summary – 178

Degrees of Shared Awareness – 657

Effective Mobile Routing Through Dynamic Addressing – 182

Effects of Multimodal Displays About Threat Location on Target Acquisition and Attention to Visual and Auditory Communications – 153

Effects of the Advanced Combat Helmet (ACH) and Selected Communication and Hearing Protection Systems (C&HPSs) on Speech Communication: Talk-Through Systems – 630

HUMINT Communication Information Systems for Complex Warfare – 642

Mission Support for the Communications/Navigation Outage Forecast Satellite – 49

Modeling and Simulation in Support of Network Centric Warfare Analysis – 143

Non-Electronic Radio Front-End (NERF) – 211

Privacy: An Abbreviated Outline of Federal Statutes Governing Wiretapping and Electronic Eavesdropping – 156

The Development of a Virtual McKenna Military Operations in Urban Terrain (MOUT) Site for Command, Control, Communication, Computing, Intelligence, Surveillance, and Reconnaissance (C4ISR) Studies – 164

The USA PATRIOT Act: A Legal Analysis – 638

The USA PATRIOT Act: A Sketch – 633

## TELEMEDICINE

Continuous Pre-hospital Data as a Predictor of Outcome Following Major Trauma: A Study Using Improved and Expanded Data – 354

Diabetes Care and Treatment Project: A Joslin Telemedicine Initiative – 373

Integrated Clinical Training for Space Flight Using a High-Fidelity Patient Simulator in a Simulated Microgravity Environment – 415

Medical Vanguard Diabetes Management – 390

Telemedicine Based Ultrasound for Detecting Neonatal Heart Disease in Babies at Remote Military or Native American Health Care Facilities – 360

UH-USA Agreement - A Telemedicine Research Proposal – 624

## TELEPHONES

Analysis of Origin Destination Flows (Raw Data) – 521

Development of an Assistive Technology and Environmental Assessment Instrument for National Surveys: Final Report. Part One: Recommended Modules and Instrument Development Process – 440

Pager Phones: Circuit Protection – 168

Pager Phones: Installation – 167

## TELESCOPES

Adaptive Optics Views of the Hubble Deep Fields Final Report on LLNL LDRD Project 03-ERD-002 – 673

Design of the TMT Mid-Infrared Echelle: Science Drivers and Design Overview – 226

Design Tradeoffs for a High Spectral Resolution Mid-Infrared Echelle Spectrograph on the Thirty-Meter Telescope – 592

Exploiting Adaptive Optics with Deformable Secondary Mirrors – 231

Fine Pointing of Military Spacecraft – 51

Large Synoptic Survey Telescope and Foundations for Data Exploitation of Petabyte Data Sets – 673

Mitigating Atmospheric Effects in High-Resolution Infra-Red Surveillance Imagery with Bispectral Speckle Imaging – 675

## TELOMERES

Prognostic Significance of Telomere Attrition in Ductal Carcinoma in Situ of the Breast – 391

## TEMPERATURE CONTROL

Cooling Performance of a Partially-Confined FC-72 Spray: The Effect of Dissolved Air (Postprint) – 55

Cooling Performance of a Partially-Confined FC-72 Spray: The Effect of Variable Gravity (Postprint) – 55

Potential Thermal Security Risks – 441

## TEMPERATURE DEPENDENCE

Experiments, Computation, and Modeling for Temperature Dependence of Absorption, Scattering, Reflection, Transmission, and Index of Refraction of Optical Radiation in Biological Tissues – 597

POINT 2007: A Temperature Dependent ENDF/B-VII.0 Data Cross Section Library – 562

## TEMPERATURE DISTRIBUTION

Thermal Modeling of the Mars Reconnaissance Orbiter's Solar Panel and Instruments during Aerobraking – 59

## TEMPERATURE EFFECTS

Effects of Temperature and Environment on Creep Behavior of an Oxide-Oxide Ceramic Matrix Composite – 103

Improving Thermal Performance of Radioactive Material Drum Type Packages by Using Heat Pipes – 131

Influence of Multi-Walled Carbon Nanotubes on the Thermal and Mechanical Behavior of Carbon/Epoxy Composites (Preprint) – 113

## TEMPERATURE GRADIENTS

Characterizing Electron Temperature Gradient Turbulence Via Numerical Simulation – 604

Freezing Fog Formation in a Supercooled Boundary Layer: Solving the Winter Fog Forecasting Challenge for Elmendorf Air Force Base, Alaska – 270

## TEMPERATURE MEASUREMENT

Acoustic Thermometry of Ocean Climate: Marine Mammal Issues – 587

Development of a 3-D Defocusing Liquid Crystal Particle Thermometry and Velocimetry (3DDLCPVT) System – 111

## TEMPERATURE PROFILES

An Infrared Camera Simulation for Estimating Spatial Temperature Profiles and Signal-to-Noise Ratios of an Airborne Laser-Illuminated Target – 234

## TEMPERATURE SENSORS

Optical Fiber Chemical Sensor with Sol-Gel Derived Refractive Material as Transducer for High Temperature Gas Sensing in Clean Coal Technology (Final Report, October 1, 2004-December 31, 2006) – 254

## TEMPLATES

Conformal Template and New Perspectives for Quantum Chromodynamics – 574

Surface-Templated Assembly for Mass-Production of ZnO Nanowire-Based Integrated Devices – 89

Using Templates to Support Crisis Action Mission Planning – 455

## TEMPORAL DISTRIBUTION

Classification and Discrimination of Sources with Time-Varying Frequency and Spatial Spectra – 224

## TENSEGRITY STRUCTURES

Position Analysis of Planar Tensegrity Structures – 583

## TENSILE PROPERTIES

Mechanical and Microstructural Effects of Cold Spray Aluminum on Al 7075 Using Kinetic Metallization and Cold Spray Processes (Preprint) – 99

Processing, Microstructure, and Tensile Properties of the Ti-6Al-4V-1.55B Eutectic Alloy (Preprint) – 99

## TENSILE STRENGTH

Off-Axis Creep Behavior of Oxide/Oxide Nextel(Trademark)720/AS-0 (Preprint) – 123

## TERMINAL GUIDANCE

Proportional Navigation With Adaptive Terminal Guidance For Aircraft Rendezvous (Preprint) – 7

## TERRAIN

Assessing C3I in Support of Dismounted Operations in Complex Terrain – 540

Data Mining Techniques Applied to Urban Terrain Command and Control Experimentation – 615

Evaluation of High Density Surface Observations in Complex Terrain and Their Contribution to the MM5 Model – 268

Path Planning Software and Graphics Interface for an Autonomous Vehicle, Accounting for Terrain Features – 480

The Development of a Virtual McKenna Military Operations in Urban Terrain (MOUT) Site for Command, Control, Communication, Computing, Intelligence, Surveillance, and Reconnaissance (C4ISR) Studies – 164

## TERRORISM

Building Collaborative Capacity for Biosecurity at the Georgia Seaports – 638

Can GWOT Primary Prevention Strategy More Effectively Impede Religious Extremism? – 390

Classifying Failing States – 528

Homeland Security: Protecting Airspace in the National Capital Region – 25

Intelligence Reform and Terrorism Prevention Act of 2004: 'Lone Wolf' Amendment to the Foreign Intelligence Surveillance Act – 664

Network Centric Warfare for Coalition Integrated Defense Against Terrorism – 165

Strategies for the Integration of Medical and Health Representation within Law Enforcement Intelligence Fusion Centers – 312

Terrorism Information Management Within the New York City Fire Department: Past, Present and Future – 634

Winning the Battle of Ideas in the War on Terrorism – 181

## TEST CHAMBERS

Radiated Susceptibility Test in Reverberation Chamber – 202

## TEST EQUIPMENT

Development of Subscale Fast Cookoff Test – 135

Servicing Hawker Vehicle Batteries with Standard Battery Charging and Test Equipment – 248

## TEST FACILITIES

Design and Validation of an Aeroacoustic Anechoic Test Facility – 588

Injector Test Facility for the LCLS. Executive Summary – 566

Radiation Shielding Issues for Superconducting RF Cavity Test Facility at Fermilab – 564

Subgrade CBR Values for Alpha Factor Determination Using Data Collected at the National Airport Pavement Test Facility – 13

Technologies for Propelled Hypersonic Flight, Volume 3 - Subgroup 3: CFD Validation for Hypersonic Flight – 41

## TEST STANDS

Network-Centric Applications and Tactical Networks – 173

Route Optimization for Mobile IPV6 Using the Return Routability Procedure: Test Bed Implementation and Security Analysis – 489

## TETRAHEDRONS

Simulation of Stagnation Region Heating in Hypersonic Flow on Tetrahedral Grids – 431

## TEXTILES

Image Reconstruction Based Modeling of 3D Textile Composite (Postprint) – 128

Method for Constructing Antennas from Textile Fabrics and Components – 179

Thermal Applications for Advanced Metallic Materials (Preprint) – 18

## TEXTS

Elastic-Viscoplastic an Isotropic Modeling of Textured Metals and Validation using the Taylor Cylinder Impact Text – 118

## THAILAND

Behavioral Responses to DDT and Pyrethroids Between Anopheles Minimus Species A and C Malaria Vectors in Thailand – 393

## THEMATIC MAPPING

Land Use Mapping with Evidential Fusion of Polarimetric Synthetic Aperture Radar and Hyperspectral Imagery – 632

## THERAPY

A Dual-Action Approach to Multidrug-Resistant Breast Cancer: Prophylaxis to Ensure Therapeutic Effect – 406

A Phase II Immunotherapeutic Trial: Combination Androgen Ablative Therapy and CTLA-4 Blockade as a Treatment for Advanced Prostate Cancer – 297

Anticonvulsants for Nerve Agent-Induced Seizures: The Influence of the Therapeutic Dose of Atropine – 110

Biological Impact of Senescence Induction in Prostate Cancer Therapy – 293

Cannabinoid Receptors: A Novel Target for Therapy of Prostate Cancer – 320

Control of DNA Dehybridization via Nanoparticle Antennas for Antisense Gene Therapy – 383

Evaluation of DNA Methylation as a Target for Intraductal Therapy for Ductal Carcinoma in Situ of the Breast – 319

Humanin: A Novel Therapeutic Target in Prostate Cancer – 319

IDO Inhibitors for Combination Therapy of Prostate Cancer – 317

IMPACT (Imaging and Molecular Markers for Patients with Lung Cancer: Approaches with Molecular Targets and Complementary, Innovative and Therapeutic Modalities) – 345

Mechanism of Action of Prostate Stem Cell Antigen Targeted Antibody Therapy and Its Relevance to Clinical Application in Prostate Cancer – 351

Midkine Promoter-Driven Adenovirus as Potential Therapy for NF1 – 341

Molecular Differentiation of Risk for Disease Progression: Delineating Stage-Specific Therapeutic Targets for Disease Management in Breast Cancer – 289

Non-Invasive Markers of Tumor Growth, Metastases, and Sensitivity to Anti-Neoplastic Therapy – 363

Postexposure Protection of Guinea Pigs against a Lethal Ebola Virus Challenge is Conferred by RNA Interference – 330

Preclinical Testing the Therapeutic Potential of a Potent and Novel Small-Molecule Inhibitor of Bcl-2 as a Novel Therapy for Hormone-Refractory Prostate Cancer – 302

Protein Transduction Based Therapies for Breast Cancer – 315

Restoration of Wild-Type Activity to Mutant p53 in Prostate Cancer: A Novel Therapeutic Approach – 365

Selective Androgen Receptor Downregulators (SARDs): A New Prostate Cancer Therapy – 303

Stromal Mesenchyme Cell Genes in Prostate Cancer Development: Epigenetic Markers for Cancer and Potential Targets for Therapy – 316

Targeted Therapies for Myeloma and Metastatic Bone Cancers – 328

The Role of RB in the Therapeutic Response of Breast Cancer – 301

Ultrasound Phased Arrays – 208

## THERMAL ANALYSIS

Decomposition Kinetic of Greases by Thermal Analysis – 127

Improving Thermal Performance of Radioactive Material Drum Type Packages by Using Heat Pipes – 131

## THERMAL CONDUCTIVITY

Effect of Thermal Conductivity on the Knudsen Layer at Ablative Surfaces – 607

Nano Enabled Thermo-Mechanical Materials in Adhesive Joints: A New Paradigm to Materials Functionality (Preprint) – 81

Thermal Applications for Advanced Metallic Materials (Preprint) – 18

Thermal Conductivity of Copoly(ethylene vinyl acetate)/Nano-Filler Blends – 83

Thermal Diffusivity and Conductivity Measurements in Diamond Anvil Cells – 561

## THERMAL CONTROL COATINGS

An Electron Beam Method for Creating Combinatorial Libraries: Application to Next Generation Thermal Barrier Coatings Systems – 60

First Principles and Multi-Scale Modeling of the Roles of Impurities and Dopants on Thermal Barrier Coating Failure – 88

- Mixed Metal Oxide Ceramic Compositions for Reduced Conductivity Thermal Barrier Coatings – 65
- THERMAL DIFFUSIVITY**  
Thermal Diffusivity and Conductivity Measurements in Diamond Anvil Cells – 561
- THERMAL MAPPING**  
Characterization of a Hall Effect Thruster Using Thermal Imaging – 608  
Contrast Enhancement for Thermal Acoustic Breast Cancer Imaging via Resonant Stimulation – 314  
Polarimetric Thermal Imaging – 540
- THERMAL PLASMAS**  
Removal of Elemental Mercury from a Gas Stream Facilitated by a Non-Thermal Plasma Device. Final Report – 258
- THERMAL PROTECTION**  
Quantification of Impact Damage in CMC Thermal Protection Systems Using Thin-Film Piezoelectric Sensors (Preprint) – 212
- THERMAL RADIATION**  
An Infrared Camera Simulation for Estimating Spatial Temperature Profiles and Signal-to-Noise Ratios of an Airborne Laser-Illuminated Target – 234
- THERMAL RESISTANCE**  
A New Silicon-Containing Bis(Cyanate) Ester Resin with Improved Thermal Oxidation and Moisture Resistance – 125
- THERMAL STABILITY**  
Ohmic Contacts for Technology for Frequency Agile Digitally Synthesized Transmitters – 113  
Supported Metal Catalyst with Improved Thermal Stability – 64
- THERMAL STRESSES**  
Investigation of Lattice and Thermal Stress in GaN/AlGaN Field-Effect Transistors – 194
- THERMOCHEMISTRY**  
Role of Thermochemical Decomposition in Energetic Material Initiation Sensitivity and Explosive Performance – 101
- THERMODYNAMIC EQUILIBRIUM**  
Comparison of Thermodynamic Equilibrium and Non-Equilibrium Representation of Materials – 219
- THERMODYNAMIC PROPERTIES**  
Analysis of the Thermal Shielding Properties of Camouflage Materials Brief – 192  
Characterization of a Hall Effect Thruster Using Thermal Imaging – 607  
Designing of Bulk Nano-Structures With Enhanced Thermoelectric Properties – 553  
Influence of Multi-Walled Carbon Nanotubes on the Thermal and Mechanical Behavior of Carbon/Epoxy Composites (Preprint) – 113
- Multilayer Aluminum Oxynitride Capacitors for Higher Energy Density, Wide Temperature Applications (Preprint) – 91  
Thermal Applications for Advanced Metallic Materials (Preprint) – 18  
Vertical Variation of Dust and Its Impact on the Top of the Atmosphere Brightness Temperature in the Midwave Infrared – 271
- THERMODYNAMICS**  
Comparison of Thermodynamic Equilibrium and Non-Equilibrium Representation of Materials – 219  
Modeling Damage and Fragmentation in Concrete – 122  
Nano Enabled Thermo-Mechanical Materials in Adhesive Joints: A New Paradigm to Materials Functionality (Preprint) – 81  
Structure-Based Design of Cdk4/6-Specific Inhibitors – 290
- THERMOELASTICITY**  
Detection of Localized Heat Damage in a Polymer Matrix Composite by Thermo-Elastic Method (Preprint) – 82
- THERMOELECTRIC MATERIALS**  
Designing of Bulk Nano-Structures with Enhanced Thermoelectric Properties – 189
- THERMOELECTRICITY**  
Designing of Bulk Nano-Structures with Enhanced Thermoelectric Properties – 189  
Designing of Bulk Nano-Structures With Enhanced Thermoelectric Properties – 553  
Thermal Applications for Advanced Metallic Materials (Preprint) – 18
- THERMOGRAPHY**  
Shuttle Entry Imaging Using Infrared Thermography – 57
- THERMOGRAVIMETRY**  
Molecular Structure Analysis of Aminophenyl Silsesquioxane (Preprint) – 98
- THERMOLUMINESCENCE**  
Correcting the Response of an Albedo Neutron Dosimeter for Energy – 220
- THERMOMETERS**  
Development of a 3-D Defocusing Liquid Crystal Particle Thermometry and Velocimetry (3DDLCPV) System – 111
- THERMONUCLEAR POWER GENERATION**  
Status and Prospects of the Fast Ignition Inertial Fusion Concept – 571
- THERMONUCLEAR REACTIONS**  
Improved Charged Particle Model in CALEICF – 569  
Summary Report--FY2006 ITER Work Accomplished – 575  
Visible and Infrared Optical Design for the ITER Upper Ports – 599
- THERMOPHYSICAL PROPERTIES**  
Nonequilibrium Stagnation-Line Radiative Heating for Fire II – 221
- THERMOPLASTICITY**  
Rheological Behavior of Entangled Polystyrene-Polyhedral Oligosilsesquioxane (POSS) Copolymer – 81
- THERMOSETTING RESINS**  
A New Silicon-Containing Bis(Cyanate) Ester Resin with Improved Thermal Oxidation and Moisture Resistance – 125
- THESES**  
Resonant Second Generation Slepton Production at the Tevatron – 586
- THICKNESS**  
Nano Enabled Thermo-Mechanical Materials in Adhesive Joints: A New Paradigm to Materials Functionality (Preprint) – 81
- THIN FILMS**  
Compliant, Nanoscale Free-Standing Multilayer Films – 66  
Final Project Report for Terahertz Spectroscopy of Complex Matter – 106  
Growth of a Single Freestanding Multi-wall Carbon Nanotube on each Nanonickel Dot – 92  
Infrared and Electrical Properties of Amorphous Sputtered (LaxA1-x)2O3 films – 63  
Quantification of Impact Damage in CMC Thermal Protection Systems Using Thin-Film Piezoelectric Sensors (Preprint) – 211  
Stoichiometry and Characterization of Aluminum Oxynitride Thin Films by Ion-Beam-Assisted Pulsed Laser Deposition (Preprint) – 127  
Substrate/Oxide Interface Interaction in LaAlO3/Si Structures – 96  
Symposium Q: Magnetic Thin Films, Heterostructures, and Device Materials – 197
- THIOLS**  
Crosslinked Compounds and Methods of Making and Using Thereof – 72
- THREAT EVALUATION**  
Sharing the Dragon's Teeth: Terrorist Groups and the Exchange of New Technologies – 643  
Tsunami Risk Reduction for the USA: A Framework for Action – 264
- THREE DIMENSIONAL FLOW**  
IHPRT Improvements to the Solid Performance Program (SPP) – 542
- THREE DIMENSIONAL MODELS**  
Different Approaches for the Creation and Exploitation of 3D Urban Models – 159  
Three-Dimensional Cell Culture Models for Infectious Disease and Drug Development – 371

## THROMBOSIS

Identification, Cloning, Expression, and Characterization of the Gene for Plasmodium knowlesi Surface Protein Containing an Altered Thrombospondin Repeat Domain – 389

## THRUST VECTOR CONTROL

Technologies for Propelled Hypersonic Flight, Volume 1 - Subgroup 1: Plug Nozzles – 40

## THYRISTORS

Solid State Capacitor Discharge Pulsed Power Supply Design for Railguns – 193

## TIBIA

Do Capacity Coupled Electric Fields Accelerate Tibial Stress Fracture Healing – 287

Leg Muscle Usage Effects on Tibial Elasticity during Running – 295

## TIDES

Observation of Tidal Effects on LWIR Radiance Above the Mesopause – 262

## TILES

Re-Entry Aeroheating Analysis of Tile-Repair Augers for the Shuttle Orbiter – 58

## TILT ROTOR AIRCRAFT

V-22 Osprey Tilt-Rotor Aircraft – 17

## TIME DEPENDENCE

Enablers of Self-Synchronization for Network-Centric Operations: Design of a Complex Command and Control Experiment – 460

IEIST Technologies Enabling TCT Prosecution – 538

Recommendations for Network-and Internet-based Synchronized E-activities for Location- and Time-dependent Information – 457

Time-Dependent Response of MI SiC/SiC Composites Part 1: Standard Samples (Preprint) – 122

Time-Dependent Response of MI SiC/SiC Composites. Part 2: Samples with Holes – 91

## TIME DIVISION MULTIPLE ACCESS

A Link Scheduling and Ad Hoc Networking Approach Using Directional Antennas – 190

## TIME LAG

Phase-Shift-Based Time-Delay Estimators for Proximity Acoustic Sensors – 509

## TIME MEASUREMENT

Dynamic Across-Time Measurement Interpretation: Maintaining Qualitative Understandings of Physical System Behavior – 501

Fermi Timing and Synchronization System – 605

## TIME SERIES ANALYSIS

A Novel Approach to Calibrating Wavemakers and Generating Wavemaker Transfer Functions – 516

## TIME SYNCHRONIZATION

Time Synchronization in Wireless Sensor Networks – 164

## TIME

Classification and Discrimination of Sources with Time-Varying Frequency and Spatial Spectra – 224

Theory and Applications of Computational Time-Reversal Imaging – 516

## TIRES

Estimating Runflat Stiffness – 552

Preliminary Findings from Noise Testing on PFC Pavements in Texas – 260

## TISSUE CULTURING

Dynamic Tissue Culture from Prostate Biopsy Specimens as a Model for Predicting Tumor Radiosensitivity to Ionizing Radiation Treatment – 381

## TISSUE ENGINEERING

Tissue Engineering Research – 307

## TISSUES (BIOLOGY)

Dynamic Tissue Culture from Prostate Biopsy Specimens as a Model for Predicting Tumor Radiosensitivity to Ionizing Radiation Treatment – 381

Experiments, Computation, and Modeling for Temperature Dependence of Absorption, Scattering, Reflection, Transmission, and Index of Refraction of Optical Radiation in Biological Tissues – 597

Ultrasound Phased Arrays – 208

## TITANIUM ALLOYS

Fretting Wear-Resistant, Micro-Arc Oxidation Coatings for Aluminum and Titanium Alloy Bearings (Preprint) – 44

Microstructural Evolution of Commercial-Purity Ti and Superplasticity of Ti-6Al-4V Alloy Processed by Equal Channel Angular Extrusion – 116

Processing, Microstructure, and Tensile Properties of the Ti-6Al-4V-1.55B Eutectic Alloy (Preprint) – 99

Titanium Brazing for Structures and Survivability – 120

## TITANIUM ALUMINIDES

Microstructure of Dense Thin Sheets of gamma-TiAl Fabricated by Hot Isostatic Pressing of Tape-Cast Monotapes (Preprint) – 92

## TITANIUM

Double Near-Net Forging of Article – 41

Titanium Brazing for Structures and Survivability – 120

## TOBACCO

Facilitating Smoking Cessation and Preventing Relapse in Primary Care: Minimizing Weight Gain by Reducing Alcohol Consumption – 337

What's in a Name. Examination of Light and Intermittent Smokers. Helping to Set the Tobacco Control Research Agenda. – 257

## TOKAMAK DEVICES

Characterizing Electron Temperature Gradient Turbulence Via Numerical Simulation – 604

Summary Report--FY2006 ITER Work Accomplished – 575

Visible and Infrared Optical Design for the ITER Upper Ports – 599

## TOLERANCES (MECHANICS)

Crack Growth and Stress Intensity Prediction Techniques. Delivery Order 0004: Implementing Models and Libraries – 31

Prognostic Fusion for Uncertainty Reduction – 35

## TOMOGRAPHY

CCG-LCONE CT Reconstruction Code User and Programmers Guide – 571

Combined Contrast-Enhanced MRI and Fluorescence Molecular Tomography for Breast Tumor Imaging – 376

Exploiting Adaptive Optics with Deformable Secondary Mirrors – 231

Three-Dimensional near Infrared Imaging of Pathophysiological Changes within the Breast – 363

## TOPOLOGY

Analysis and Design of Ultra Wide-Band and High-Power Microwave Pulse Interactions With Electronic Circuits and Systems – 196

Application of Morse Theory to Analysis of Rayleigh Taylor Topology – 569

Comparative Performance Analysis of Directed Flow Control for Real-Time SCI – 448

Multicast Performance Analysis for High-Speed Torus Networks – 484

Performance Modeling and Evaluation of Topologies for Low-Latency SCI Systems – 448

Real-Time Communication and Coordination in Embedded Sensor Networks – 533

Time varying Reeb Graphs. A Topological Framework Supporting the Analysis of Continuous Time varying Data – 438

Time-Base Tree Graphs for Stabilized Force Structure Representations – 539

Topological Close Packing in Structurally Complex Intermetallics (Crystalline, Quasicrystalline and Noncrystalline) – 116

Topology of On/Off Marx Modulator with Protection of Load and Solid State Switches – 579

## TORUSES

Multicast Performance Analysis for High-Speed Torus Networks – 485

Recent Physics Results from NSTX – 571

## **TOUCH**

The Tactile Modality: A Review of Tactile Sensitivity and Human Tactile Interfaces – 423

## **TOUGHNESS**

Nanosilica Modification of Elastomer-Modified VARTM Epoxy Resins for Improved Resin and Composite Toughness – 122

## **TOXIC HAZARDS**

Human Exposure Biomarkers - Permethrin as a Militarily-Relevant Model – 375

U.S. Army Toxic and Hazardous Materials Agency Quality Assurance Program – 93

## **TOXICITY**

A Fully-Integrated MEMS Preconcentrator for Rapid Gas Sampling (Preprint) – 113

Acetylcholinesterase Inhibition: Does it Explain the Toxicity of Organophosphorus Compounds? – 372

Effects of Lunar Dust Simulant (JSC-1A-vf) on WI-38 Human Embryonic Lung Cells – 417

Evaluation of Daphnia Magna Neonate Viability under Low Temperature Exposure Conditions – 310

Long-Term Outcomes of Alternative Brachytherapy Techniques for Early Prostate Cancer – 294

Mechanisms of Alpha-synuclein Aggregation and Toxicity – 330

Mechanisms of p53-Mediated Apoptosis – 350

Mixtures of Metals and Polynuclear Aromatic Hydrocarbons May Elicit Complex, Nonadditive Toxicological Interactions – 78

Priority of Chemicals for Detection in Air at International Missions for Reducing Threats to Personnel at Acute Toxic Releases to Air – 256

Pulmonary Toxicity of Cholinesterase Inhibitors – 382

Quarterly Performance/Technical Reports: HLA Typing for Bone Marrow Transplantation, and Development of Medical Technology for Contingency Response to Marrow Toxic Agents – 305

Toxicity and Radioprotective Effects of DF-1 and Carbon Nanotubes in Human Lung and Liver Cell Lines – 418

U.S. Army Toxic and Hazardous Materials Agency Quality Assurance Program – 93

## **TOXINS AND ANTITOXINS**

Discovery of Therapeutics for Ricin Toxicosis – 300

Evaluation of Lateral-Flow Clostridium botulinum Neurotoxin Detection Kits for Food Analysis – 403

Improved Formulation of a Recombinant Ricin A-chain Vaccine Increases its Stability and Effective Antigenicity – 353

Intracellular Survival of Campylobacter jejuni in Human Monocytic Cells and Induction of Apoptotic Death by Cytholethal Distending Toxin – 394

Process Research and Development of Antibodies as Countermeasures for C. Botulinum – 308

Serologic Correlates of Protection against Enterotoxigenic Escherichia coli Diarrhea – 379

Structural Studies on Intact Clostridium Botulinum Neurotoxins Complexed with Inhibitors Leading to Drug Design – 304

Structural Studies on Toxins and Virulence Factors of Yersinia Pestis – 284

## **TRACKING (POSITION)**

A Model of the Effects of Acceleration on a Pursuit Tracking Task – 37

Advanced Target Tracking Techniques – 175

Tracking and Data Fusion Applications – 177

## **TRACKING RADAR**

Bi- and Multistatic Radar – 176

## **TRADEOFFS**

Design Tradeoffs for a High Spectral Resolution Mid-Infrared Echelle Spectrograph on the Thirty-Meter Telescope – 592

## **TRAFFIC**

An Efficient Metaheuristic for Dynamic Network Design and Message Routing – 617

Analysis and Classification of Traffic in Wireless Sensor Network – 159

Cost-Effective Strategies for Communicating with Remote Surveillance Stations: A Summary – 178

Guidebook for Selecting Cost-Effective Wireless Communication Technologies for Intelligent Transportation Systems – 183

Research Plan for Measuring Noise Levels in Highway Pavements in Texas – 259

The Entropy Solutions for the Lighthill-Whitham-Richards Traffic Flow Model with a Discontinuous Flow-Density Relationship – 515

## **TRAINING DEVICES**

The Effectiveness of a PC-Based C-130 Crew Resource Management Aircrew Training Device – 9

## **TRAJECTORIES**

A Comparison of Trajectory Determination Approaches for Small UAVs – 11

Advances in Modeling and Simulation Capabilities for Predicting Store Trajectories - Past Success and Future Challenges – 5

Application of the Community Radiative Transfer Model to Evaluate Satellite-Based Measurements Across the African Easterly Jet Over Western Africa – 47

Application of the Simplified Phase Plane to the Analysis and Design of Missile Jet-Relay Control Systems – 2

Fault Tolerant Optimal Trajectory Generation for Reusable Launch Vehicles (Preprint) – 48

Nonlinear Robust/Adaptive Controller Design for an Air-Breathing Hypersonic Vehicle Model (Preprint) – 21

Sonic Boom Assessment for the Crew Exploration Vehicle – 56

## **TRAJECTORY OPTIMIZATION**

A Distributed Approach for Multi-Constrained Path Selection and Routing Optimization – 640

## **TRAJECTORY PLANNING**

Path Planning Software and Graphics Interface for an Autonomous Vehicle, Accounting for Terrain Features – 480

## **TRANSDUCERS**

Microfabrication of a Mechanically Controllable Break Junction in Silicon – 186

Need for Robust Sensors for Inherently Fail-Safe Gas Turbine Engine Controls, Monitoring, and Prognostics (Postprint) – 23

Optical Fiber Chemical Sensor with Sol-Gel Derived Refractive Material as Transducer for High Temperature Gas Sensing in Clean Coal Technology (Final Report, October 1, 2004-December 31, 2006) – 254

## **TRANSFER FUNCTIONS**

A Novel Approach to Calibrating Wavemakers and Generating Wavemaker Transfer Functions – 516

## **TRANSFER OF TRAINING**

Incorporating New Technology to Create a Comprehensive Realistic Training Environment for the 91W – 344

## **TRANSFERRING**

Protein Transduction Based Therapies for Breast Cancer – 315

## **TRANSFUSION**

Effects of Bovine Polymerized Hemoglobin in Coagulation in Controlled Hemorrhagic Shock in Swine – 385

Epidemiology of Transfusion-Transmitted Infections Among Multi-Transfused Patients in Seven Hospitals in Peru – 403

## **TRANSISTORS**

Ohmic Contacts for Technology for Frequency Agile Digitally Synthesized Transmitters – 113

Pseudomorphic Bipolar Quantum Resonant-Tunneling Transistor – 186

## TRANSITION FLIGHT

Analysis of Crossflow Transition Flight Experiment aboard the Pegasus Launch Vehicle – 44

## TRANSLATING

Translational Research from an Informatics Perspective – 416

## TRANSMISSIONS (MACHINE ELEMENTS)

High Ratio, Reduced Size Epicyclic Gear Transmission for Rotary Wing Aircraft with Improved Safety and Noise Reduction – 35

## TRANSMITTER RECEIVERS

Bi- and Multistatic Radar – 176

Software Communications Architecture (SCA) Compliant Software Defined Radio Design for Interim Standard 95B (IS-95B) Transceiver – 463

T/R Module for Satellite TT&C Ground Link – 200

## TRANSMITTERS

Ohmic Contacts for Technology for Frequency Agile Digitally Synthesized Transmitters – 113

## TRANSPLANTATION

Proof of Concept for Systematic Collection of Optimal Molecular Quality Anatomically Oriented Normal Prostate from Diverse Age and Race Transplant Donors – 326

Quarterly Performance/Technical Reports: HLA Typing for Bone Marrow Transplantation, and Development of Medical Technology for Contingency Response to Marrow Toxic Agents – 305

## RESPONDERS

Solving Wireless Communications Interoperability Problems among Emergency First Responders Depends on Greater National Guard Involvement – 181

## TRANSPORT AIRCRAFT

Civil Reserve Air Fleet (CRAF) – 26

Flexible Precision: Air Force's Answer to Army Transformation and Intratheater Airlift on the 21st Century Battlefield – 14

Investigation of the Effect of Fuselage Dents on Compressive Failure Load – 23

Strategic Airlift Modernization: Background, Issues and Options – 14

## TRANSPORT THEORY

Organic Light-Emitting Diodes and Related Hole Transport Compounds – 208

## TRANSPORTATION NETWORKS

Impacts of Traveler Information on Transportation Network Operations and Potential Deployment Technologies – 178

## TRANSPORTATION

Annual Transportation Report for Radioactive Waste Shipments to and from the Nevada Test Site. (Fiscal Year 2006) – 131

Defense Transportation. DOD Needs a Comprehensive Approach to Planning for Implementing Its New Personal Property Program – 659

Guidebook for Selecting Cost-Effective Wireless Communication Technologies for Intelligent Transportation Systems – 183

Human Error Investigation Software Tool (HEIST) – 427

Reducing the 'Gap of Pain': A Strategy for Optimizing Federal Resource Availability in Response to Major Incidents – 526

Summary of Dimensionless Texas Hyetographs and Distribution of Storm Depth Developed for Texas Department of Transportation Research Project 0-4194 – 276

Testing for Compliance to NTCIP Standards – 428

Today's Biometric Projects Need Mobile & Handheld Readers - Why? Applications and Readers – 476

## TRANSVERSE MOMENTUM

Inclusive high-p(T)b anti-b Cross Section Measurement at  $s^{**} (1/2)$  Equals 1.96 TeV – 560

## TRAYS

Development of Nanocomposite Reinforced Polymeric Materials to be Used for Racks for Retorting Polymeric Trays – 123

Materials on the International Space Station Experiment (MISSE): Optical Analysis of Molecular Contamination on PEC1 Tray 2 – 54

Retort Racks for Polymeric Trays in 1400 Style Spray Retorts – 518

## TRICHLOROETHYLENE

Defense Health Care: Activities Related to Past Drinking Water Contamination at Marine Corps Base Camp Lejeune – 321

Quarterly Groundwater Monitoring First Quarter Sampling Results fort Dix, New Jersey – 61

## TRISONIC WIND TUNNELS

Shakedown & Determination of Tunnel Control Settings for Refurbished Trisonic Gasdynamic Facility (TGF) – 134

## TRITIUM

Feasibility of Measuring  $^3\text{He}$  Bubble Diameter Populations in Deuterium-Tritium Ice Layers Using Mie Scattering – 573

## TROPICAL REGIONS

A Weighted Consensus Approach to Tropical Cyclone 96-H and 120-H Track Forecasting – 269

## TROPICAL STORMS

A Weighted Consensus Approach to Tropical Cyclone 96-H and 120-H Track Forecasting – 269

Downstream Impacts Due to the Extratropical Transition of Tropical Cyclones Over the Western North Pacific – 267

## TRUCKS

Evaluation of Emission Control Strategies for the 8-Hour Ozone Standard in the Houston and Dallas Areas and A Pilot-Scale Study of In-Use Emissions from Heavy-Duty Diesel Dump Trucks using a Portable Emissions Monitoring System (PEMS) – 256

Truck Driver Occupational Safety and Health. 2003 Conference Report and Selective Literature Review – 238

## TRYPTOPHAN

IDO Inhibitors for Combination Therapy of Prostate Cancer – 318

## TSUNAMI WAVES

Tsunami Risk Reduction for the USA: A Framework for Action – 264

## TUBERCULOSIS

Extensively Drug-Resistant Tuberculosis (XDR-TB): Quarantine and Isolation – 398

## TUMOR SUPPRESSOR PROTEINS

Novel Molecular Interactions and Biological Functions of the Neurofibromatosis 2 Tumor Suppressor Protein, Merlin – 328

## TUMORS

A MicroRNA Cluster as a Potential Breast Cancer Oncogene – 358

Apoptosis and Tumor Progression in Prostate Cancer – 338

Cell Cycle Dependence of TRAIL Sensitivity in Prostate Cancer Cells – 303

Characterization of the Role of Breast Tumor Kinase (BRK) in Breast Cancer Cells Non-responsive to EGFR-targeted Agents – 329

Combined Contrast-Enhanced MRI and Fluorescence Molecular Tomography for Breast Tumor Imaging – 376

Development of a Mouse Model for Prostate Cancer Imaging and Study of Disease Progression – 321

Development of an Automated Modality-Independent Elastographic Image Analysis System for Tumor Screening – 357

Dietary Fat, Fat Metabolizing Genes, and Prostate Cancer Risk in African-Americans and Whites – 340

Dynamic Tissue Culture from Prostate Biopsy Specimens as a Model for Predicting Tumor Radiosensitivity to Ionizing Radiation Treatment – 381

Eliciting Autoimmunity to Ovarian Tumors in Mice by Genetic Disruption of T Cell Tolerance Mechanisms. Addendum – 357

Enhancement of Tumor Immunotherapy by Blockade of a Prostate Tumor Derived Immunosuppressive Factor – 281

HOXC5 as a Biomarker of Disease Presence in Tumor-Associated Normal Prostate – 290

Identification of Sonic Hedgehog-Induced Stromal Factors That Stimulate Prostate Tumor Growth – 295

Immunotherapy Targeting Tumor Stromal Fibroblasts Improves Chemotherapy of Breast Cancer – 301

Interactions between Dietary Factors and Inflammation in Prostate Carcinogenesis – 349

Mechanism of Action of Prostate Stem Cell Antigen Targeted Antibody Therapy and Its Relevance to Clinical Application in Prostate Cancer – 351

Mechanism of Telomerase Inhibition Using Small Inhibitory RNAs and Induction of Breast Tumor Cell Sensitivity – 287

Mechanism of Tumor Metastasis Suppression by the KA11 Gene – 318

Non-Invasive Markers of Tumor Growth, Metastases, and Sensitivity to Anti-Neoplastic Therapy – 363

Pim Protein Kinase-Levels Correlate with Prostate Tumor Growth and Chemo-Resistance - Potential Mechanism of PIM Action – 282

Regulation of Apoptosis by AFG3L2, a Potential Oncogene – 293

Studies of Prostate Tumor Development Via CRE/LOXP Technology – 309

The Opposing Roles of Nucleophosmin and the ARF Tumor Suppressor in Breast Cancer – 283

The Role of Oncogene/Tumor Suppressor Interaction with the Centrosome Protein Pericentrin in Prostate Tumorigenesis – 322

## **TUNGSTEN ALLOYS**

Microcompression of Bulk Metallic Glass and Tungsten - Bulk Metallic Glass Composites – 115

## **TUNGSTEN**

Corrosion Resistances of Iron Based Amorphous Metals with Yttrium and Tungsten Additions in Hot Calcium Chloride Brine & Natural Seawater. Fe48Mo14Cr15Y2C15B6 and W-Containing Variants – 69

Corrosion Resistances of Iron-Based Amorphous Metals with Yttrium and Tungsten Additions in Hot Calcium Chloride Brine and Natural Seawater. Fe48Mo14Cr15Y2C15B6 and Variants – 107

Microcompression of Bulk Metallic Glass and Tungsten - Bulk Metallic Glass Composites – 114

## **TURBINE BLADES**

Tip Clearance Control Using Plasma Actuators – 16

## **TURBINE ENGINES**

3-Dimensional Crack Growth Behavior of Turbine Engine Materials (Preprint) – 555

A Feasibility Study of Life-Extending Controls for Aircraft Turbine Engines Using a Generic Air Force Model (Preprint) – 550

An Integrated Approach to Conversion, Verification, Validation and Integrity of AFRL Generic Engine Model and Simulation (Postprint) – 6

Cooled Turbine Airfoil – 42

Fuel Property Effects on T700 Exhaust Particulates – 132

## **TURBINES**

Cooled Turbine Airfoil – 42

The Effects of Wind Turbine Farms on Air Defence Radars – 22

The Effects of Wind Turbine Farms on ATC Radar – 134

## **TURBOMACHINERY**

Tip Clearance Control Using Plasma Actuators – 16

Turbulence and Complex Flow Phenomena in Multi-Stage Axial Turbomachines – 582

## **TURBOSHAFTS**

Toward a Real-Time Measurement-Based System for Estimation of Helicopter Engine Degradation Due to Compressor Erosion – 39

## **TURBULENCE**

Assessment of Gradient Diffusion Closures for Modeling Rayleigh Taylor and Richtmyer Meshkov Instability Induced Mixing – 568

Characterizing Electron Temperature Gradient Turbulence Via Numerical Simulation – 603

Gravity-Wave Dynamics in the Atmosphere – 264

High-Speed Digital-Image Data Acquisition, Processing, and Visualization System for Turbulent Mixing and Combustion – 77

Hypothesis of the Magnetostatic Turbulence and its Implications for Astrophysics – 671

The Role of Continuity in Residual-Based Variational Multiscale Modeling of Turbulence – 514

Turbulence and Complex Flow Phenomena in Multi-Stage Axial Turbomachines – 582

## **TURBULENT FLOW**

Analysis of Crossflow Transition Flight Experiment aboard the Pegasus Launch Vehicle – 44

Experimental Characterization of Turbulent Flow Around Cylinder Arrays – 219

Large-eddy Simulation of Round Turbulent Jets Using the Inertial LES Method with Multifractal Subgrid-Scale Modeling – 220

## **TURBULENT JETS**

Large-eddy Simulation of Round Turbulent Jets Using the Inertial LES Method with Multifractal Subgrid-Scale Modeling – 220

## **TURBULENT MIXING**

High-Speed Digital-Image Data Acquisition, Processing, and Visualization System for Turbulent Mixing and Combustion – 77

## **TURTLES**

Measurement of Fog Oil Penetration into Model Underground Burrow and Hollow Tree Nest Cavities – 250

## **TWO DIMENSIONAL FLOW**

Innovative Concept for a Heavy-Load Aircraft Utilizing a Two-Dimensional Wing – 36

## **TYPHOONS**

Downstream Impacts Due to the Extratropical Transition of Tropical Cyclones Over the Western North Pacific – 267

## **TYPHUS**

Cloning and Sequence Analysis of the 22-kDa Antigen Genes of *Orientia tsutsugamushi* Strains Kato, TA763, AFSC 7, 18-032460, TH1814, and MAK 119 – 399

Protection Against Scrub Typhus by a Plasmid Vaccine Encoding the 56-KD Outer Membrane Protein Antigen Gene – 399

Short- and Long-Term Immune Responses of CD-1 Outbred Mice to the Scrub Typhus DNA Vaccine Candidate: p47Kp – 399

## **TYROSINE**

Characterization of the Role of Breast Tumor Kinase (BRK) in Breast Cancer Cells Non-responsive to EGFR-targeted Agents – 329

DRF3 as a Cholesterol-Dependent Regulator of Src in Prostate Cancer – 315

The Impact of Tyrosine Kinase Signaling on Breast Cancer Development – 289

## **UKRAINE**

Ukraine's Search for its Place in Europe: The East or the West? – 548

## **ULLAGE**

A Review of the History of Fire Suppression on U.S. DoD Aircraft – 34

## **ULTRASONIC TESTS**

Structural Diagnostics of CFRP Composite Aircraft Components by Ultrasonic Guided Waves and Built-In Piezoelectric Transducers – 35

## **ULTRASONIC WAVE TRANSDUCERS**

Ultrasound Phased Arrays – 208

## ULTRASONICS

Characteristics and Use of a Parametric End-Fired Array for Acoustics in Air – 225

Characterization of Breast Masses Using a new Method of Ultrasound Contrast Agent Imaging in 3D Mapping of Vascular Anomalies – 391

Characterization of Breast Masses Using a New Method of Ultrasound Contrast Agent Imaging in 3D Mapping of Vascular Anomalies – 391

High Resolution Anatomic and Elastographic Transrectal Ultrasound for Improved Diagnosis of Prostate Cancer – 350

Telemedicine Based Ultrasound for Detecting Neonatal Heart Disease in Babies at Remote Military or Native American Health Care Facilities – 360

Ultrasound Phased Arrays – 208

## ULTRAVIOLET LASERS

Deep Ultraviolet Laser Diode for UV-Resonance Enhanced Raman Identification of Biological Agents – 230

## ULTRAVIOLET RADIATION

Ultraviolet Properties of Halo Coronal Mass Ejections: Doppler Shifts, Angles, Shocks, and Bulk Morphology – 669

## UNCERTAIN SYSTEMS

Systematic Procedure for Assigning Uncertainties to Data Evaluations – 568

## UNDERGROUND STORAGE

Survey of Underground Storage Tanks and Other Subsurface Structures at the Umatilla Depot Activity, Hermiston, Oregon – 239

## UNDERGROUND STRUCTURES

Survey of Underground Storage Tanks and Other Subsurface Structures at the Umatilla Depot Activity, Hermiston, Oregon – 239

## UNDERWATER ACOUSTICS

A Numerical Study of the Regimes of Weak Fluctuation Theory for Ocean Acoustic Propagation through Random Internal Wave Sound Speed Fields – 589

Acoustic Thermometry of Ocean Climate: Marine Mammal Issues – 587

Correction to Attenuation Treatment in the Monterey-Miami Parabolic Equation Model – 514

## UNDERWATER VEHICLES

Center for Coastline Security Technology, Year-2 – 229

Characterization of VSW Environment for UUV-N Operations – 214

Implementing a Low-Cost Long-Range Unmanned Underwater Vehicle: The SeaDiver Glider – 505

Simulating Candidate Missions for a Novel Glider Unmanned Underwater Vehicle – 464

Velocity Estimation Using Forward Looking Sonar – 463

## UNITED KINGDOM

Elicitation of British Army Commanders' Personal Constructs – 621

## UNITED NATIONS

Iran's Nuclear Program: Recent Developments – 594

## UNITED STATES

A Comparative Assessment of Knowledge Management Education Across the USA Department of Defense – 636

Access to Government Information in the USA – 650

Agriculture: The Potential Consequences of Climate Variability and Change for the USA – 277

American Competitiveness Initiative: Leading the World in Innovation – 136

Analysis of Metrics Utilized in U.S. Joint Experimentation of Future C2 Concepts – 171

Analysis of USA' Broadband Policy – 491

Critical Infrastructure Information Disclosure and Homeland Security – 656

Emergency Preparedness and the Year 2000 Challenge – 443

History of Operations Research in the USA Army, Volume 1: 1942-1962 – 546

Libraries and the USA PATRIOT Act – 635

National Security Letters in Foreign Intelligence Investigations: A Glimpse of the Legal Background and Recent Amendments – 633

National Security Letters in Foreign Intelligence Investigations: Legal Background and Recent Amendments – 634

Oil Vulnerabilities and USA Strategy – 241

Regaining the High Ground: The Challenges of Perception Management in National Strategy and Military Operations – 661

Research and Operational Support for the Study of Militarily Relevant Infectious Diseases of Interest to the USA Army and the Royal Thai Army – 282

Simulation-Based Learning: Workshops for Researchers and Educators in the Western USA, and the Pacific Rim – 619

The Chaos of Katrina – 267

The Supreme Court's Climate Change Decision: Massachusetts v. EPA – 263

USA Meteorological Data: Daily and Hourly Files to Support Predictive Exposure Modeling – 277

USNORTHCOM Integrated Architecture: A Means to an End – 494

'Sensitive But Unclassified' Information and Other Controls: Policy and Options for Scientific and Technical Information – 635

## UNIVERSAL TIME

Evolution of Time Scales – 666

## UNIVERSE

Predicting the Cosmological Constant from the Causal Entropic Principle – 671

## UNIVERSITIES

Export Controls: Agencies Should Assess Vulnerabilities and Improve Guidance for Protecting Export-Controlled Information at Universities – 631

## UNMANNED GROUND VEHICLES

Establishment of a Center for Defense Robotics – 508

## UNSTRUCTURED GRIDS (MATHEMATICS)

Discrete Data Transfer Technique for Fluid-Structure Interaction – 478

Exploring Hypersonic, Unstructured-Grid Issues through Structured Grids – 437

Simulation of Stagnation Region Heating in Hypersonic Flow on Tetrahedral Grids – 430

## URACIL

Health Effects Support Document for Terbacil – 73

## URANIUM

A Multireference Density Functional Approach to the Calculation of the Excited States of Uranium Ions – 87

Active Detection of Small Quantities of Shielded Highly-Enriched Uranium Using Low-Dose 60-keV Neutron Interrogation – 570

Far Field Approximation in the Generalized Geometry Holdup (GGH) Model – 581

Iran's Nuclear Program: Recent Developments – 594

Nuclear Safety: DOE's Investigation of Phosgene Gas Contamination was Inadequate, but Experts Conclude that Worker Safety and Facilities Are Not Threatened – 131

Theory of (3He alpha) Surrogate Reactions for Deformed Uranium Nuclei – 582

## URBAN RESEARCH

Different Approaches for the Creation and Exploitation of 3D Urban Models – 159

## URBAN TRANSPORTATION

Mobile Sensor Networks: A Discrete Event Simulation of WMD Threat Detection in Urban Traffic Schemes – 156

## URINE

ATM Heterozygosity and the Development of Radiation-Induced Erectile Dysfunction and Urinary Morbidity Following Radiotherapy for Prostate Cancer – 344

Murine Macrophages Kill the Vegetative Form of *Bacillus anthracis* – 394

Validation of Quantitative Multimodality Analysis of Telomerase Activity in Urine Cells as a Noninvasive Diagnostic and Prognostic Tool for Prostate Cancer – 366

## UROLOGY

ATM Heterozygosity and the Development of Radiation-Induced Erectile Dysfunction and Urinary Morbidity Following Radiotherapy for Prostate Cancer – 344

## URUGUAY

Seroincidence and Phylogeny of Human Immunodeficiency Virus Infections in a Cohort of Commercial Sex Workers in Montevideo, Uruguay – 389

## USER MANUALS (COMPUTER PROGRAMS)

ERDC-CERL LD-870 Download Program Developed for Aberdeen Test Center: User's Manual – 469

National Solar Radiation Data Base 1991-2005 Update: User's Manual – 245

## USER REQUIREMENTS

Methodology for Rapid Development of C2 Planning Systems – 174

## V-22 AIRCRAFT

V-22 Osprey Tilt-Rotor Aircraft – 17

## VACCINES

Boosting of DNA Vaccine-Elicited Gamma Interferon Responses in Humans by Exposure to Malaria Parasites – 403

Cloning and Sequence Analysis of the 22-kDa Antigen Genes of *Orientia tsutsugamushi* Strains Kato, TA763, AFSC 7, 18-032460, TH1814, and MAK 119 – 399

Cross-Protection against Marburg Virus Strains by Using a Live, Attenuated Recombinant Vaccine – 331

Development of In Vitro Correlate Assays of Immunity to Infection with *Yersinia Pestis* – 327

Establishment of a Non-human Primate *Campylobacter* Disease Model for the Pre-clinical Evaluation of *Campylobacter* Vaccine Formulations – 396

HIV Gag Protein Conjugated to a Toll-like Receptor 7/8 Agonist Improves the Magnitude and Quality of Th1 and CD8+ T Cell Responses in Nonhuman Primates – 397

HLA-A2 Supertype-Restricted Cell-Mediated Immunity by Peripheral Blood Mononuclear Cells Derived from Malian Children with Severe or Uncomplicated *Plasmodium falciparum* Malaria and Healthy Controls – 400

Identification, Cloning, Expression, and Characterization of the Gene for *Plasmodium knowlesi* Surface Protein Containing an Altered Thrombospondin Repeat Domain – 389

Immunotherapy Targeting Tumor Stromal Fibroblasts Improves Chemotherapy of Breast Cancer – 301

Improved Formulation of a Recombinant Ricin A-chain Vaccine Increases its Stability and Effective Antigenicity – 353

Intra-Prostate Cancer Vaccine Inducer – 316

Protection Against Scrub Typhus by a Plasmid Vaccine Encoding the 56-KD Outer Membrane Protein Antigen Gene – 399

Protection with Recombinant *Clostridium botulinum* C1 and D Binding Domain Subunit (Hc) Vaccines Against C and D Neurotoxins – 369

Randomized Double-Blind Phase III Pivotal Field Trial of the Comparative Immunogenicity Safety and Tolerability of Two Yellow Fever 17D Vaccines (ARILVAX-(Trademark) and YF-VAX(Trademark)) in Healthy Infants and Children in Peru – 387

Short- and Long-Term Immune Responses of CD-1 Outbred Mice to the Scrub Typhus DNA Vaccine Candidate: p47Kp – 399

Transcriptome Analysis of Human Immune Responses Following Live Vaccine Strain (LVS) *Francisella tularensis* Vaccination – 332

## VACUUM SYSTEMS

LCLS XTOD Tunnel Vacuum Transport System (XVTS) Final Design Report – 563

## VACUUM

Constraints on Meta-Stable de Sitter Flux Vacua – 579

Electrostatic Modeling of Vacuum Insulator Triple Junctions – 205

Nanosilica Modification of Elastomer-Modified VARTM Epoxy Resins for Improved Resin and Composite Toughness – 121

Tension-Compression Fatigue Behavior of a Carbon Fiber/Epoxy (IM7/EPON 862) Composite Fabricated Using Vacuum Assisted Resin Transfer Molding Process – 85

Understanding and Improving High Voltage Vacuum Insulators for Microsecond Pulses – 203

## VALUE ENGINEERING

A Decision Model for Selecting Energy Efficient Technologies for Low-Sloping Roof Tops Using Value-Focused Thinking – 243

Test and Evaluation of Value Engineering Proposal: Removal of Rubber PAD in 120 MM PA 153 Ammunition Fiber Container – 140

## VALVES

Antiferromagnetically Stabilized Pseudo Spin Valve for Memory Applications – 438

## VANADIUM ALLOYS

Microstructural Evolution of Commercial-Purity Ti and Superplasticity of Ti-6Al-4V Alloy Processed by Equal Channel Angular Extrusion – 117

## VANGUARD PROJECT

Application of the Simplified Phase Plane to the Analysis and Design of Missile Jet-Relay Control Systems – 2

## VAPOR DEPOSITION

Effect of Excess Carbon on the Crystallographic, Microstructural, and Mechanical Properties of CVD Silicon Carbide Fibers – 84

Growth of a Single Freestanding Multi-wall Carbon Nanotube on each Nanonickel Dot – 92

Novel Synthesis of Branched Carbon Nanotubes – 207

Vertical Alignment of Single-Walled Carbon Nanotubes on Nanostructure Fabricated by Atomic Force Microscope – 88

## VAPORS

Vaporous Hydrogen Peroxide (VHP) Decontamination of a C-141B Starlifter Aircraft: Validation of VHP and Modified VHP (mVHP) Fumigation Decontamination Process via VHP-Sensor, Biological Indicator, and HD Simulant in a Large-Scale Environment – 32

## VARIABILITY

Appraising Policies to Reduce Freight Transport Time and Its Variability-A New Method – 430

On Recent Interannual Variability of the Arctic Winter Mesosphere: Implications for Tracer Descent – 263

Sources of Variability in Determining Malaria Parasite Density by Microscopy – 392

## VARIATIONS

Classification and Discrimination of Sources with Time-Varying Frequency and Spatial Spectra – 224

## VECTOR ANALYSIS

Analysis of MALDI-TOF Serum Profiles for Biomarker Selection and Sample Classification – 309

Eigenvector Analysis for Multipath – 549

Endothelial Progenitors as Vectors for Systemic Gene Therapy of Breast Cancer – 332

Tour Planning for an Unmanned Air Vehicle Under Wind Conditions (Preprint) – 19

## VEGETATION

Murine Macrophages Kill the Vegetative Form of *Bacillus anthracis* – 395

## VEINS

Genomic Analysis of Rodent Pulmonary Tissue Following Bis-(2-chloroethyl) Sulfide Exposure – 379

## VELOCITY MEASUREMENT

Development of a 3-D Defocusing Liquid Crystal Particle Thermometry and Velocimetry (3DDLCP TV) System – 111

## VENTILATION

Solar Buildings. Transpired Air Collectors Ventilation Preheating – 250

## VENTS

Quality of Service Behavioral Model From Event Trace Analysis – 166

## VERBAL COMMUNICATION

Classifying C2 Decision Making Jobs Using Cognitive Task Analyses and Verbal Protocol Analysis – 459

## VERTICAL LANDING

Solutions Analysis for Helicopter Brown-out – 33

## VERTICAL ORIENTATION

CFD Investigation of Flow Past Idealized Engine Nacelle Clutter – 227

## VERY LARGE SCALE INTEGRATION

Sharp-Looking Geometric Partitioning – 199

## VESTIBULES

Systems and Methods for Altering Vestibular Biology – 506

## VETERINARY MEDICINE

The Use of a Low-Concentration Heparin Solution to Extend the Life of Central Venous Catheters in the African Green Monkeys (*Chlorocebus aethiops*) – 402

## VIABILITY

Evaluation of *Daphnia Magna* Neonate Viability under Low Temperature Exposure Conditions – 310

Hacking Social Networks: Examining the Viability of Using Computer Network Attack Against Social Networks – 491

## VIBRATION MODE

Micromechanical Resonator Device Having a Desired Mode Shape – 201

## VIBRATION

Experimental Methods to Characterize Nonlinear Vibration of Flapping Wing Micro Air Vehicles – 32

Molecular Volume and Electronic and Vibrational Polarizabilities for Amorphous LaAlO<sub>3</sub> – 86

Payload Isolation System for Launch Vehicles – 54

## VIDEO SIGNALS

Advanced Technologies in Safe and Efficient Operating Rooms – 333

Platform Camera Aircraft Detection for Approach Evaluation and Training – 29

Video Enabling the Combatant Commander's Headquarters – 48

## VIRAL DISEASES

Early Detection of Dengue Infections using Cluster Sampling Around Index Cases – 394

## VIRTUAL REALITY

Advanced Technologies in Safe and Efficient Operating Rooms – 309

Advanced Visual and Instruction Systems for Maintenance Support (AVIS-MS) – 625

Savage Modeling and Analysis Language (SMAL): Metadata for Tactical Simulations and X3D Visualizations – 640

The Development of a Virtual McKenna Military Operations in Urban Terrain (MOUT) Site for Command, Control, Communication, Computing, Intelligence, Surveillance, and Reconnaissance (C4ISR) Studies – 164

## VIRULENCE

Proteomic Analysis of *Rickettsia prowazekii* – 396

Structural Studies on Toxins and Virulence Factors of *Yersinia Pestis* – 284

## VIRUSES

A MicroRNA Cluster as a Potential Breast Cancer Oncogene – 358

An All-Atom Model of the Pore-Like Structure of Hexameric VP40 from Ebola: Structural Insights into the Monomer-Hexamer Transition – 330

Cross-Protection against Marburg Virus Strains by Using a Live, Attenuated Recombinant Vaccine – 331

Cross-Serotype Neutralization of Dengue Virus in *Aotus nancymae* Monkeys – 387

Development of a Mouse Model for Prostate Cancer Imaging and Study of Disease Progression – 321

Differential Effects of Dengue Virus on Infected and Bystander Dendritic Cells – 378

Epidemiology of Transfusion-Transmitted Infections Among Multi-Transfused Patients in Seven Hospitals in Peru – 403

Hantavirus Pulmonary Syndrome in Central Bolivia: Relationships Between Reservoir Hosts, Habitats, and Viral Genotypes – 378

HIV Gag Protein Conjugated to a Toll-like Receptor 7/8 Agonist Improves the Magnitude and Quality of Th1 and CD8+ T Cell Responses in Nonhuman Primates – 397

Mechanism of Action of Prostate Stem Cell Antigen Targeted Antibody Therapy and Its Relevance to Clinical Application in Prostate Cancer – 351

Nanomanipulation: Buckling, Transport and Rolling at the Nanoscale – 188

Postexposure Protection of Guinea Pigs against a Lethal Ebola Virus Challenge is Conferred by RNA Interference – 330

Prevalences, Genotypes, and Risk Factors for HIV Transmission in South America – 393

Seroincidence and Phylogeny of Human Immunodeficiency Virus Infections in a Cohort of Commercial Sex Workers in Montevideo, Uruguay – 389

Smallpox Antiviral Drug – 285

## VISCOELASTICITY

Rheological Behavior of Entangled Polystyrene-Polyhedral Oligosilsesquioxane (POSS) Copolymer – 81

## VISCOPLASTICITY

Elastic-Viscoplastic an Isotropic Modeling of Textured Metals and Validation using the Taylor Cylinder Impact Test – 118

## VISIBILITY

Enhanced Aircraft Conspicuity to Reduce Runway Incursions – 13

## VISION

How Important is Oblique Vision in Aviation? – 597

## VISUAL AIDS

Video Enabling the Combatant Commander's Headquarters – 49

## VISUAL PERCEPTION

Evaluation of the Safety and Efficacy of Excimer Laser Keratorefractive Surgery in U.S. Army Soldiers using the latest Battlefield Technologies – 233

## VISUAL STIMULI

Ultra-fast Object Recognition from Few Spikes – 502

## VOICE COMMUNICATION

Assessing Human Factors in Command and Control: Workload and Situational Awareness Metrics – 422

Effects of Multimodal Displays About Threat Location on Target Acquisition and Attention to Visual and Auditory Communications – 153

Effects of the Advanced Combat Helmet (ACH) and Selected Communication and Hearing Protection Systems (C&HPSs) on Speech Communication: Talk-Through Systems – 630

Towards a Computational Model of Sketching – 450

## VOLATILE ORGANIC COMPOUNDS

Extended Research on Detection of Deception Using Volatile Organic Compound (VOC) Emissions. Final Report – 425

Guidance for Estimating VOC and NO<sub>x</sub> Emission Changes from MACT Rules – 257

Novel Technology Evaluation for Volatile Organic Compounds Emission Control – 60

## VORTEX SHEDDING

CFD Investigation of Flow Past Idealized Engine Nacelle Clutter – 227

## VORTICES

CFD Investigation of Flow Past Idealized Engine Nacelle Clutter – 227

Large-eddy Simulation of Round Turbulent Jets Using the Inertial LES Method with Multifractal Subgrid-Scale Modeling – 220

## VOTING

Collective Choice with Uncertain Domain Models – 535

## VULNERABILITY

Export Controls: Agencies Should Assess Vulnerabilities and Improve Guidance for Protecting Export-Controlled Information at Universities – 631

Homeland Security -- Reducing the Vulnerability of Public and Private Information Infrastructures to Terrorism: An Overview – 493

Homeland Security Act of 2002: Critical Infrastructure Information Act – 639

Oil Vulnerabilities and USA Strategy – 241

Potential System Vulnerabilities of a Network Enabled Force – 487

Vulnerabilities in Biometric Encryption Systems – 473

## WAFERS

An Ultra High Resolution, Electro-Optical Framing Camera for Reconnaissance and Other Applications Using a 9216 by 9216 Pixel, Wafer Scale, Focal Plane Array – 223

Flight Test Results From the Ultra High Resolution, Electro-Optical Framing Camera Containing a 9216 by 9216 Pixel, Wafer Scale, Focal Plane Array – 222

Materials on the International Space Station Experiment (MISSE): Optical Analysis of Molecular Contamination on PEC1 Tray 2 – 54

## WALLS

Atomization Performance Predictions of Gas-Centered Swirl-Coaxial Injectors – 216

Multi-Wall Carbon Nanotubes for Flow-Induced Voltage Generation (Preprint) – 95

Numerical Analysis of Chamber Wall Heat Transfer in a GH2/GO2 Sub-Scale Combustor – 98

Rapid Wall-Breaching Kit, Ingress Hole Determination Experiment – 225

Rotational Response of Toe-Restrained Retaining Walls to Earthquake Ground Motions – 265

The Interactive DataWall – 209

Through-the-Wall Imaging from Electromagnetic Scattered Field Measurements – 553

## WAR GAMES

New Navy Solutions: Developing Simulation Based C4I Applications – 445

Use of a Novel Organizational Structure to Support Complex Decisionmaking During Global Wargame 2000 – 489

Using Wargames for Command and Control Experimentation – 145

## WARFARE

A Limited Objective Experiment on Wireless Peer-To-Peer Collaborative Networking – 492

A Model of Command and Control Processes for JWARS: Test Results from Controlled Experiments and Simulation Runs – 151

A Model of Tactical Battle Rhythm – 170

A Reference Architecture for Network-Centric Information Systems – 619

A Woven Web of Guesses – 538

An Agent-Based Dynamic Information Security Model in Information Warfare – 643

An Analysis of Small Navy Tactics Using a Modified Hughes' Salvo Model – 541

An Efficient Metaheuristic for Dynamic Network Design and Message Routing – 617

Analytical and Characterization Studies of Organic Chemicals, Drugs and Drug Formulations – 284

Bio-Defense Now: 56 Suggestions for Immediate Improvements – 427

Building a Deterrence Policy Against Strategic Information Warfare – 654

Building Information Systems for Network-Centric Warfare – 615

Can GWOT Primary Prevention Strategy More Effectively Impede Religious Extremism? – 390

Combined Enterprise Regional Information Exchange System (CENTRIXS): Supporting Coalition Warfare World-Wide – 486

Consolidated Situational Awareness for Aircraft Carrier Decision Centers – 627

Dominating Cyberspace – 660

Effects of the Global War on Terror on Medical Service Corps Retention Rates – 311

Evaluation of Organisational Interoperability in a Network Centric Warfare Environment – 146

Evolution of a Mission Plan – 646

Federally Sponsored Health Care Research Gulf War Illnesses and Beyond – 400

From Stove-pipe to Network Centric Leveraging Technology to Present a Unified View – 616

From the Battlefield to the Homeland: Building the Case for Network-Centric Response – 636

Human Systems Integration Assessment of Network Centric Command and Control – 421

HUMINT Communication Information Systems for Complex Warfare – 642

Information Operations, Electronic Warfare, and Cyberwar: Capabilities and Related Policy Issues – 618

Intelligent Agent-Based Software Architecture for Tactical Decision Aid under Overwhelming Information Inflow and Uncertainty – 502

Intelligent Nodes in Coalition Warfare – 630

Issues and Requirements for Cybersecurity in Network Centric Warfare – 446

Joint and Allied Logistics Opportunities and Tools Supporting 21st Century War Fighter Rapid Decisive Operations – 149

Knowledge Management in an Information Age Army – 547

Lessons Learned from War Room Designs and Implementations – 628

Lethality and Autonomous Robots: An Ethical Stance – 504

Lightweight and Advanced Materials for Defense: Materials for Military Ground Vehicles – 85

Modeling and Simulation in Support of Network Centric Warfare Analysis – 143

Modelling a Network of Decision Makers – 610

Modelling Information Age Warfare: Work In Progress – 654

Multinational C2 Experiments Supported by C2 Systems and Modeling and Simulations Addressing Army Transformation of Collaborative Planning and Interoperable Execution in a Coalition Environment – 615

Net-Centric Test & Evaluation – 133

Network Centric Operations: Background and Oversight Issues for Congress – 486

Network Centric Warfare for Coalition Integrated Defense Against Terrorism – 165

Network Centric Warfare in the U.S. Navy's Fifth Fleet. Network-Supported Operational Level Command and Control in Operation Enduring Freedom – 143

Network-Centric Applications and Tactical Networks – 173

Neuropsychological Functioning in Gulf War Veterans Exposed to Pesticides and Pyridostigmine Bromide – 350

Operational Trust: A New Look at the Human Requirement in Network Centric Warfare – 146

Optimising the Design of Land Force C2 Architectures – 152

Patterns of War Termination: A Statistical Approach – 528

Post Traumatic Stress Disorder: The Facts – 369

Realistic and Affordable Cyberware Opponents for the Information Warfare Battlespace – 537

Regaining the High Ground: The Challenges of Perception Management in National Strategy and Military Operations – 661

Russian and Chinese Information Warfare: Theory and Practice – 628

Stochastic Lanchester Air-To-Air Campaign Model: Methods Used to Generate Model Outputs and a User's Guide: 2007 – 527

The Analysis of Network Centric Maritime Interdiction Operations (MIO) Using Queueing Theory – 625

The Challenge of New and Emerging Information Operations – 649

Toward an Interoperability Architecture – 646

Towards Dominant Battlespace Comprehension in Network Centric Warfare – 549

Towards the Development of a Defensive Cyber Damage and Mission Impact Methodology – 641

Transforming Coalition Warfare with Network Centric Capabilities – 149

Utilizing Network-Enabled Command and Control Concepts to Enhance ASW Effectiveness – 590

Winning the Battle of Ideas in the War on Terrorism – 181

## **WARNING SYSTEMS**

Capacity Building and Sustainment: Focusing on the End-State for Homeland Security – 503

Description of ALARMA. The Alarm Algorithm Developed for the Nuclear Car Wash – 580

Evaluation of High Density Surface Observations in Complex Terrain and Their Contribution to the MM5 Model – 268

Making Network Intrusion Detection Work With IPsec – 505

Multimodal Biometric Systems – 472

Tsunami Risk Reduction for the USA: A Framework for Action – 264

Usability and Acceptability of Biometric Security Systems – 473

Wireless Intrusion Detection – 483

## **WASPALOY**

The Effect of As-Large-As (ALA) Grains on the High-Temperature Fatigue Life of Waspaloy – 117

## **WASTE DISPOSAL**

Technical Work Plan for: Near-Field Environment: Engineered Barrier System: Radionuclide Transport Abstraction Model Report – 253

## **WASTE WATER**

Review of Laboratory Program on Degradation Mechanisms in Soil of Wastewater From Nitroguanidine Manufacture – 93

## **WATER COLOR**

BOUSSOLE: A Joint CNRS-INSU, ESA, CNES, and NASA Ocean Color Calibration and Validation Activity – 280

## **WATER FLOW**

A GSSHA Model of the Perris Basin of the San Jacinto River Watershed, Riverside County, California – 222

## **WATER POLLUTION**

Defense Health Care: Activities Related to Past Drinking Water Contamination at Marine Corps Base Camp Lejeune – 321

Electronically Induced Redox Barriers for Treatment of Groundwater – 198

Health Effects Support Document for Terbacil – 73

Quarterly Groundwater Monitoring First Quarter Sampling Results fort Dix, New Jersey – 61

Trial Burn Plan for a Transportable Incineration System (TIS) at the Savanna Army Depot Activity (SADA) Washout Lagoon Area – 252

## **WATER QUALITY**

Evaluation of Daphnia Magna Neonate Viability under Low Temperature Exposure Conditions – 310

## **WATER WAVES**

A Geometric Investigation of Acoustical Wavefront Scattering and Healing Induced by Ocean Internal Waves – 588

Ocean Wave Energy Harvesting Devices – 479

## **WATERSHEDS**

A GSSHA Model of the Perris Basin of the San Jacinto River Watershed, Riverside County, California – 222

## **WATER**

Defense Health Care: Activities Related to Past Drinking Water Contamination at Marine Corps Base Camp Lejeune – 321

Field Demonstration and Validation of a New Device for Measuring Water and Solute Fluxes at Naval Base Ventura County (NBVC), Port Hueneme, CA – 138

Field Demonstration and Validation of a New Device for Measuring Water and Solute Fluxes NASA LC-34 SITE – 138

Heat of Dilution Calculation for 19 Molar Sodium Hydroxide with Water for Use in 241-S-112 – 103

Quarterly Groundwater Monitoring First Quarter Sampling Results fort Dix, New Jersey – 61

Sinodal Decomposition and Order Disorder Transformation in a Water Quenched U-6wtNb Alloy – 70

## **WAVE ATTENUATION**

Continent-Wide Maps of 5-50 S Rayleigh-Wave Attenuation for Eurasia Inferred from Maps of 1-Hz Lg Coda Q and its Frequency Dependence – 265

## **WAVE DISPERSION**

New Column Designs for MicroGC (Preprint) – 197

## **WAVE EQUATIONS**

Infra-Gravity Wave Input Toolbox (IGWT): User's Guide – 470

WABED Model in the SMS: Part 2. Graphical Interface – 470

## **WAVE FRONTS**

A Geometric Investigation of Acoustical Wavefront Scattering and Healing Induced by Ocean Internal Waves – 588

How Important is Oblique Vision in Aviation? – 596

Wave Front Sensor for Solar Concentrator Control – 52

Wavefront Aberration Correction Using Zernike Polynomial Parameterizations of Optical Phased Arrays (PRE-PRINT) – 597

## **WAVE INTERACTION**

Characteristics and Use of a Parametric End-Fired Array for Acoustics in Air – 225

## **WAVE PROPAGATION**

A Numerical Study of the Regimes of Weak Fluctuation Theory for Ocean Acoustic Propagation through Random Internal Wave Sound Speed Fields – 589

Characteristics and Use of a Parametric End-Fired Array for Acoustics in Air – 224

Comparison of Thermodynamic Equilibrium and Non-Equilibrium Representation of Materials – 218

## **WAVEFORMS**

Characterization Of Commonly Encountered Explosives Using Highfield Asymmetric Waveform Ion Mobility Spectrometry Coupled With Mass Spectrometry – 594

## **WAVEGUIDES**

FEM Modeling of Guided Wave Behavior in Integrally Stiffened Plate Structures – 29

Integrated Plasmon and Dielectric Waveguides – 587

- Nonclassical Properties of Pulsed Second-Subharmonic Generation in Photonic-Band-Gap Structures – 196
- WEAPON SYSTEMS**

#### WOUND HEALING

Improved Wound Healing of Cutaneous Sulfur Mustard Injuries in a Weanling Pig Model – 383

Molecular Mechanisms of Soft Tissue Regeneration and Bone Formation in Mice: Implications in Fracture Repair and Wound Healing in Humans – 298

#### X RAY ABSORPTION

X-Ray Absorption Edge Detector for High-Resolution Measurement of Undulator Effective K-Parameter – 578

#### X RAY DIFFRACTION

X ray Diffraction Techniques for Structural Determination of Amorphous Materials – 70

#### X RAY IMAGERY

High Spatial Resolution X-ray and Gamma Ray Imaging System Using Crystal Diffraction Lenses – 557

Model Based Statistical Estimation of Sandia RF Ohmic Switch Dynamic Operation from Stroboscopic X-ray Imaging – 207

Time Resolved Soft X-Ray Imaging (SXRI) Diagnostic for Use at the NIF and OMEGA Laser (version 2) – 601

#### X RAY LASERS

High Efficiency Grazing Incidence Pumped X ray Laser – 601

Injector Test Facility for the LCLS. Executive Summary – 566

Looking for Anomalous Dispersion in Weakly Ionized Plasmas Using X ray Laser Interferometry – 603

Second Preliminary Report on X-Ray Yields from OMEGA II Targets – 601

#### X RAY SCATTERING

Changes in Delta-Plutonium Due to Self-Irradiation Aging Observed by Continuous In-Situ X-ray Scattering – 120

#### X RAY SOURCES

High Spatial Resolution X-ray and Gamma Ray Imaging System Using Crystal Diffraction Lenses – 557

Nuclear Photo-Science and Applications with T-Rex Sources – 562

#### X RAYS

Bisphosphonate-Based Contrast Agents for Radiological Imaging of Microcalcifications – 362

Flash X-ray (FXR) Linear Induction Accelerator(LIA) Optimization Upgrade of the OTR Emittance Diagnostic – 575

High Resolution Real Time Phase Contrast Radiology Study of Hydrodynamic in Micrometer Scale – 133

LCLS XTOD Tunnel Vacuum Transport System (XVTS) Final Design Report – 563

Nuclear Photo-Science and Applications with T-Rex Sources – 562

Second Preliminary Report on X-Ray Yields from OMEGA II Targets – 601

Time Resolved Soft X-Ray Imaging (SXRI) Diagnostic for Use at the NIF and OMEGA Laser (version 2) – 601

X-Ray Dose in Microfocus Radiographic Inspections – 137

#### XENON ISOTOPES

Searching for Double Beta Decay with the Enriched Xenon Observatory – 566

#### XENON

Liquid Xenon Ionization Chamber in an All-Fluoropolymer Vessel – 582

Searching for Double Beta Decay with the Enriched Xenon Observatory – 566

#### YAG LASERS

Improved Wound Healing of Cutaneous Sulfur Mustard Injuries in a Weanling Pig Model – 383

#### YEAST

Microbial Dynamics during Barley Tempeh Fermentation – 104

#### YIELD POINT

Increasing the Laser Induced Damage Threshold of Single Crystal ZnGeP<sub>2</sub> – 234

#### YOUTH

How the Car Affects the Activity patterns of Children and Youth – 170

#### YTTRIA-STABILIZED ZIRCONIA

Impedance Analysis of Electrochemical NO<sub>x</sub> Sensor Using a Au/Yttria-Stabilized Zirconia (YSZ) Au Cell – 247

#### YTTRIUM OXIDES

Impedance Analysis of Electrochemical NO<sub>x</sub> Sensor Using a Au/Yttria-Stabilized Zirconia (YSZ) Au Cell – 247

#### YTTRIUM-ALUMINUM GARNET

Improved Wound Healing of Cutaneous Sulfur Mustard Injuries in a Weanling Pig Model – 383

#### YTTRIUM

Corrosion Resistance of Structural Amorphous Metal – 105

Corrosion Resistances of Iron Based Amorphous Metals with Yttrium and Tungsten Additions in Hot Calcium Chloride Brine & Natural Seawater. Fe<sub>48</sub>Mo<sub>14</sub>Cr<sub>15</sub>Y<sub>2</sub>C<sub>15</sub>B<sub>6</sub> and W-Containing Variants – 69

Corrosion Resistances of Iron-Based Amorphous Metals with Yttrium and Tungsten Additions in Hot Calcium Chloride Brine and Natural Seawater. Fe<sub>48</sub>Mo<sub>14</sub>Cr<sub>15</sub>Y<sub>2</sub>C<sub>15</sub>B<sub>6</sub> and Variants – 107

#### ZEOLITES

Mesostructured Zeolitic Materials, and Methods of Making and Using the Same – 77

#### ZINC OXIDES

Surface-Templated Assembly for Mass-Production of ZnO Nanowire-Based Integrated Devices – 90

#### ZINC

Cadmium, Zinc, and Selenium Levels in Carcinoma of the Human Prostate – 356

Increasing the Laser Induced Damage Threshold of Single Crystal ZnGeP<sub>2</sub> – 233

Neutron Induced Cross Sections for Radiochemistry Isotopes of Nickel, Copper and Zinc – 106

#### ZIRCONIUM OXIDES

Impedance Analysis of Electrochemical NO<sub>x</sub> Sensor Using a Au/Yttria-Stabilized Zirconia (YSZ) Au Cell – 247

Mixed Metal Oxide Ceramic Compositions for Reduced Conductivity Thermal Barrier Coatings – 65

An All-Atom Model of the Pore-Like Structure of Hexameric VP40 from Ebola: Structural Insights into the Monomer-Hexamer Transition – 330
- Zajicek, Mark**  
Incident Management Capability Metrics Version 0.1 – 482
- Zak, Stephen**  
Future Naval Concepts -- Crew Reductions through Improved Damage Control Communications (FNC-CRIDCC) – 145
- Zander, Nicole**  
Nanoengineered Additives for Active Coatings – 61  
Self Assembled, Ultra-Hydrophobic Micro/Nano-Textured Surfaces – 79
- Zapp, N. E.**  
Operational Aspects of Space Radiation Analysis – 676
- Zaret, David R**  
Wireless Intrusion Detection – 483
- Zawada, Larry P**  
Off-Axis Creep Behavior of Oxide/Oxide Nextel(Trademark)720/AS-0 (Preprint) – 122
- Zawilski, Kevin T**  
Increasing the Laser Induced Damage Threshold of Single Crystal ZnGeP2 – 233
- Zaworski, M. J.**  
Assessing an Automated, Information Sharing Technology in the Post '9-11' Era: Do Local Law Enforcement Officers Think It Meets Their Needs – 658
- Zeman, Laurinda L**  
Hurricane Katrina: Lessons for Army Planning and Operations – 163
- Zeng, Zhiwei**  
Reduced Magnetic Vector Potential and Electric Scalar Potential Formulation for Eddy Current Modeling (Postprint) – 534
- Zhang, Mengping**  
A High Order WENO Scheme for a Hierarchical Size-Structured Model – 549  
A Weighted Essentially Non-Oscillatory Numerical Scheme for a Multi-Class LWR Model – 508  
L2 Stability Analysis of the Central Discontinuous Galerkin Method and a Comparison between the Central and Regular Discontinuous Galerkin Methods – 523  
The Entropy Solutions for the Lighthill-Whitham-Richards Traffic Flow Model with a Discontinuous Flow-Density Relationship – 515
- Zhang, Michael**  
Victim Migration: Dynamically Adapting Between Private and Shared CMP Caches – 442
- Zhang, N**  
GaN Wide Band Power Integrated Circuits (Preprint) – 95
- Zhang, T**  
Proteomic Analysis of Rickettsia prowazekii – 395
- Zhang, Xiefei**  
Synthesis, Structure, and Properties of PBO/SWNT Composites – 104
- Zhang, Yimin**  
Classification and Discrimination of Sources with Time-Varying Frequency and Spatial Spectra – 224
- Zhang, Z**  
Production of Recombinant Protein Pap31 and Its Application for the Diagnosis of Bartonella bacilliformis Infection – 398
- Zhao, Jean J**  
Targeting Breast Cancers Featuring Activating Mutations in PIK3CA by Generating a Lethal Dose of PIP3 – 358
- Zheltovodov, Alexander**  
Fundamental Physics and Practical Applications of Electromagnetic Local Flow Control in High Speed Flows – 216
- Zheng, Hong**  
Identification, Cloning, Expression, and Characterization of the Gene for Plasmodium knowlesi Surface Protein Containing an Altered Thrombospondin Repeat Domain – 389
- Zheng, Jie**  
Cell Multipole Method for Molecular Simulations in Bulk and Confined Systems – 454
- Zhong, Xiaolin**  
Direct Numerical Simulation and Experimental Validation of Hypersonic Boundary-Layer Receptivity and Instability – 512
- Zhou, C**  
Microfabrication of a Mechanically Controllable Break Junction in Silicon – 186
- Zhou, Eric**  
Image Reconstruction Based Modeling of 3D Textile Composite (Postprint) – 127
- Zhou, J.**  
Sinodal Decomposition and Order Disorder Transformation in a Water Quenched U-6wtNb Alloy – 70
- Zhou, Junlan**  
Optimizing Parallel Execution of Detailed Wireless Network Simulation – 624
- Zhou, Yingyao**  
The Plasmodium falciparum Sexual Development Transcriptome: A Microarray Analysis using Ontology-Based Pattern Identification – 401
- Zhou, Yuanxin**  
Influence of Multi-Walled Carbon Nanotubes on the Thermal and Mechanical Behavior of Carbon/Epoxy Composites (Preprint) – 113
- Zhu, Qiuming**  
Intelligent Agent-Based Software Architecture for Tactical Decision Aid under Overwhelming Information Inflow and Uncertainty – 502
- Zhu, Quiming**  
Consolidated Situational Awareness for Aircraft Carrier Decision Centers – 627
- Zhu, Richard**  
Atomistic Calculation of Elastic Moduli in Strained Silicon – 187

On the Correlation Between the Self-Organized Island Pattern and Substrate Elastic Anisotropy – [552](#)

**Zhu, Yuan**

Characterization of Neurofibromas of the Skin and Spinal Roots in a Mouse Model – [407](#)

**Zhu, Yu**

PARK2, a Large Common Fragile Site Gene, is Part of a Stress Response Network in Normal Cells That is Disrupted During the Development of Ovarian Cancer – [359](#)

**Ziegenfuss, P S**

Biodegradation of DIMP, Dieldrin, Iso-drin, DBCP, and PCPMSO in Rocky Mountain Arsenal Soils. Installation Restoration Program, Environmental Technology Development – [305](#)

**Zielinski, Alex**

Incident, Action, Recovery, and Recommissioning for the 4.5-MJ Pulsed Power Supply Located at the Electromagnetic Gun Facility, Barricade C, Aberdeen Proving Ground, MD – [202](#)

**Zimmer, Jeannot**

Human Exposure Biomarkers - Permethrin as a Militarily-Relevant Model – [375](#)

**Zirkelbach, Thomas**

Pictorial Display Design to Enhance Spatial Awareness of Operators in Unmanned Aviation – [28](#)

**Zmuda, Henry**

Contrast Enhancement for Thermal Acoustic Breast Cancer Imaging via Resonant Stimulation – [314](#)

**Zou, H.**

Atomic-Scale Design of Iron Fischer-Tropsch Catalysts: A Combined Computational Chemistry, Experimental, and Microkinetic Modeling Approach. (3rd Annual Report) – [105](#)

**zuBentrup, K. Honer**

Spaceflight Alters Bacterial Gene Expression and Virulence and Reveals Role for Global Regulator Hfq – [420](#)

**Zundel, Alan K**

Infra-Gravity Wave Input Toolbox (IGWT): User's Guide – [470](#)

**Zundel, Alan**

WABED Model in the SMS: Part 2. Graphical Interface – [470](#)

**Zupanc, Frank J.**

Reduced Exhaust Emissions Gas Turbine Engine Combustor – [39](#)

**Zweber, Jeffrey**

Fully Reusable Access to Space Technology (FAST) Methane Rocket – [46](#)

**Zwick, Michael E**

Microarray-based Resequencing of Multiple Bacillus anthracis Isolates – [386](#)

**Zwicker, Theodore**

Flight Test Results From the Ultra High Resolution, Electro-Optical Framing Camera Containing a 9216 by 9216 Pixel, Wafer Scale, Focal Plane Array – [222](#)

**Zybala, Michel**

HUMINT Communication Information Systems for Complex Warfare – [642](#)
