

NORTHERN MANITOBA AND NORTHERN SASKATCHEWAN

Waterfowl Breeding Population Survey

2008

The data presented in this report are preliminary and subject to further editing. Final estimates will be available from the U.S. Fish and Wildlife Service, Office of Migratory Bird Management, Laurel, Maryland 20708

Waterfowl Breeding Population Survey: Northern Manitoba, Northern Saskatchewan

<u>STRATA SURVEYED:</u>	21-24			
<u>DATES:</u>	May 15-June 8, 2008			
<u>DATA SUPPLIED BY:</u>	U. S. Fish and Wildlife Service			
<u>AERIAL CREW</u>				
Pilot/Observer:	Fred Roetker, Flyway Biologist Division of Migratory Bird Management Lafayette, LA			
Observer:	Paul Yakupzack, Refuge Manager Mandalay National Wildlife Refuge Houma, LA			
<u>ABSTRACT:</u> Waterfowl numbers were mixed in northern Saskatchewan and northern Manitoba. Mallard numbers were 10.9% above 2007 values. Results from selected species are listed below:				
	Estimates in thousands	% change from 2007	% change from 10 yr. mean	% change from 1955-07 mean
Mallard	532.2	10.9%	-16.6%	-32.6%
Wigeon	78.5	-32.9%	-43.4%	-60.1%
GW-Teal	253.6	-12.5%	1.2%	55.4%
Scaup	342.1	42.2%	4.4%	-22.7%
Ringneck	331.7	-19.9%	-8.5%	27.2%

METHODS: The procedures followed in conducting this survey are contained in the Standard Operating Procedures for Aerial Breeding Population and Habitat Surveys in North America, Section III, revised 1987. Waterfowl data were collected using an aerial onboard computerized recording system designed to attribute each waterfowl observation with a respective latitude/longitude location. Observations were then logged along with sample details, i.e., strata transects, segments, time, and climatic conditions. This survey system began testing in Alaska during 1996 and has been gradually been implemented in each survey crew area since. During this transition, the Migratory Bird Management Office elected to redesign the sampling of stratum 25, historically included in this report. This effort, effective during the 1998 and 1999 surveys, was intended to more appropriately sample the number and distribution of breeding waterfowl across the stratified habitat type. Historically, nine segments were concentrated in the Saskatchewan River delta and were not all oriented on latitude. In the new design, all thirty segments have been oriented on latitude with only five segments in the river delta area. There are now a total of five transects evenly distributed throughout the stratum, however, the sampling area is still identical to the historic survey. Direct comparisons of the 1998-2008 and historic data should be made only after evaluating this design change. Beginning with the May 2000 survey, the Migratory Bird Office elected to report Stratum 25 data in the Southern Manitoba Waterfowl Breeding Population Survey report since the southern Manitoba crew typically flies Stratum 25 and collects the data. Historic tables and graphs in this report have been adjusted to accommodate this change. An amphibian Cessna 206 was used to complete the survey. No crew member changes occurred in 2008. This was the second BPOP survey in this crew area for Paul Yakupzack, Mandalay National Wildlife Refuge, Houma, LA. The 2007 effort was the 14th consecutive in this survey area for the pilot/observer.

WEATHER AND HABITAT CONDITIONS: Spring break-up was later than in several years. Large, deep lakes were very slow to give up their thicker than normal ice. However while the large lakes were thawing, smaller habitats were being well used by waterfowl. Flocked mallard drakes were prevalent by mid-May, and we observed our first Canada goose brood on May 23. Apparently a short window of mild spring weather gave several species enough open water to get underway. Wetland conditions were variable throughout northern Saskatchewan and Manitoba. Water levels were generally low in streams and major rivers. However, some drainages would uncharacteristically exhibit high water or minor flooding. Snowfall was evidently quite variable across the region, and run-off was variable as well. Conditions in the countless small wetlands and beaver ponds across the landscape were not as stable as usual. Many were dry and others recessional. The Nelson River system in Manitoba was lower than typical; loafing sites along with miles of quality shoreline nesting habitat abounded.

BREEDING POPULATION ESTIMATES: Table 1 presents breeding waterfowl population data along with comparisons to 2007, the 1998 to 2007 average, and the 1955-2007 average. Appendix 1 presents earlier waterfowl breeding estimates.

CONCLUSIONS: Breeding waterfowl numbers were mixed in 2007. Mallard and pintail numbers were up (10.9%) and (38.2%) respectively from 2007, however wigeon (-32.9%) and green-winged teal (-12.5%) estimates were down. Scaup were up (42.2%) from 2007, up (4.4%) from the ten year mean, however continued to be down (-22.7%) from the long term mean. The late spring and recessional nature of many small wetlands are negative factors. However the absence of flooding along major rivers, and the overall abundance of habitat at these northern latitudes should bode well for waterfowl production.

Table 1: Status of waterfowl population estimates (thousands, adjusted for visibility bias), by species and stratum with comparison for the previous year, the previous 10-year mean, and the long-term mean for Northern Saskatchewan, and Northern Manitoba.
