

Logistics Response Vehicle

Region 6 emergency response personnel use the logistics response vehicle (LRV) to provide quick and effective communication during an incident. This “office on wheels” contains telephone and internet connections, televisions, a presentation room, and a satellite to facilitate conference calls. Completed in June 2007, the LRV streamlines the response process by eliminating the time and resources it takes to contract out for the same equipment and space.

The LRV has been used in response to floods in Oklahoma, as well as in several training exercises. This cost-effective, easy-to-operate system makes emergency response smoother for EPA staff and for the citizens affected by disaster.
