Note: The above analysis is a simulation and should not be regarded as a projection of future health care spending. Simulated spending shares are derived by controlling the age-mix of selected future years to the 2004 total population and 2004 Medicare population, respectively. These newly distributed populations are then multiplied by 2004 per person/per enrollee spending estimates to derive new interim spending levels. We sum those spending levels to derive a total expenditure level that may be above or below the 2004 total expenditure level depending on the effect of the age-mix. The difference in total spending from 2004 is expressed as an index.

<sup>&</sup>lt;sup>1</sup> All other services includes: Other professionals, dental, other personal, home health, durables, and non-durables.
