World Agricultural Production

Ukraine Wheat Condition Favorable with Higher Area

The USDA estimates production of Ukraine wheat for 2007/08 at 17.5 million tons (against 14.0 million last year), from harvested area of 6.0 (5.5) million hectares. Winter wheat accounts for about 95 percent of total wheat output. Yield is estimated at 2.92 tons per hectare, 15 percent above last year and 13 percent above the 5-year average. Personnel from the USDA Foreign Agricultural Service conducted crop-assessment travel in the main wheat-production region of Ukraine during mid-April. Conditions for winter wheat were observed to be very good. Although farmers expressed concern about declining soil moisture, crops were showing no signs of moisture stress in mid-April and have received light rainfall since that time in most areas. The team saw little evidence of either poor fall emergence or frost damage. Because of favorable fall moisture conditions and mild winter weather, winterkill (which includes losses due to both fall dryness and winter frost) is estimated to be below average.

Approved by the World Agricultural Outlook Board

Three factors are contributing to higher yields for major Ukrainian crops in recent years: the increased use of high-quality planting seed, the steady replacement of Soviet-era tractors and combines with newer machinery (including a significant amount of western equipment), and an increase in the share of agricultural land under the management of larger and more efficient agricultural enterprises. *(For more information, contact Mark Lindeman at 202-690-0143.)*

EU-27: Drought and Spring Freeze Reduce Wheat Production Prospects

The USDA forecasts the 2007/08 European Union (EU-27) wheat crop at 127.3 million tons, 2.5 million above last year's drought-reduced crop, but 2.1 million below the five-year average. Harvested area is estimated at 24.9 million hectares, up 0.4 million from last year. Yield is forecast at 5.11 tons per hectare, essentially matching both last year and the five-year average but well below the record 5.65 tons-per-hectare yield of 2004/05.

The cumulative effect of unusual and unfavorable weather, including widespread drought and recent cold weather in northern Europe, has lowered earlier expectations of a robust yield. The winter of 2006-07 was one of the mildest on record for Europe. Because of the warm weather, which continued into the spring, winter wheat development was two to four weeks ahead of normal. As a result, the crop in the north was likely at or near the temperature-sensitive heading stage when widespread freezes occurred on April 24 and May 2. In Poland, minimum temperatures reached minus 3 to minus 6 degrees Celsius during the heading stage, likely resulting in significant damage. Damage likely occurred in Germany and the Czech Republic as well, but to a lesser degree. Northern and central Europe were largely without precipitation during April. Moisture supplies were low in northern Italy's agriculturally intensive Po River Valley, due to lower-than-normal snow pack in the Alps. Long-term dryness has likely cut yields in the Balkan countries: dryness was most severe along the Danube River valley of Romania and Bulgaria, as well as in neighboring Greece. The United Kingdom also incurred spring drought but had accumulated higher winter moisture reserves, allowing it to fare better than continental Europe. *(For more information, contact Bryan Purcell at 202-690-0138.)*

Australia: Wheat Production Projected to Rebound

Australian wheat production for 2007/08 is forecast at 22.1 million tons, up 11.6 million or 110 percent from last year. The large year-to-year rise is the result of projected increases in both area and yield. Area is forecast at 13.0 million hectares, 1.7 million above last year. This season's area increase is a culmination of three factors: improved rainfall, strong economic incentive for growers to recoup losses incurred during the 2006 drought, and the conversion of last season's pasture into field crops. Farmers sold off large numbers of cattle and sheep last year because of the drought, and therefore need less area for pasture this year. Sowing of the 2007/08 wheat crop occurs April through June. The 2007/08 yield forecast is 1.70 tons per hectare, 83 percent above last year, and 15 percent above the five-year average. Western Australia and South Australia have received abundant April rainfall in most growing areas, but major areas in New South Wales need rainfall. Normal rainfall from now until late June will be sufficient for timely planting. *(For more information, contact Jim Crutchfield at 202-690-0135.)*

Canada: Corn Production Up 24 Percent on Increased Planting Intentions

The USDA estimates Canadian corn production for 2007/08 at 11.5 million tons, up 2.2 million from last year. Harvested area is estimated at 1.4 million hectares against 1.1 million last year. Statistics Canada reports that the intended planted area for 2007/08 corn increased by 26 percent, to a record 1.42 million hectares, due chiefly to steadily increasing demand from the ethanol industry. Planting typically begins in May and continues into June. *(For more information, contact Mark Lindeman at 202-690-0143.)*

Record Production Forecast for Paraguay Soybeans

Paraguay's soybean production for 2006/07 is forecast at a record 6.0 million tons, up 0.5 million from last month, and up 2.4 million from last year. Harvested area for 2006/07 is forecast at 2.4 million hectares, up 0.3 million from last month, and up 0.4 million from last year. Yield is forecast at 2.55 tons per hectare, which is slightly reduced from last month, but up 40 percent from last year. This year's record production is the result of optimal weather throughout most of the soybean growing region. However, some fungal infestations (*Macrophomina phaseolina*) in the south have reduced local yields. Soybean rust, while still present, affected production to a lesser extent. Overall, Paraguayan producers are re-energized by this year's high-yielding soybeans, especially after three years of less than optimal weather and poor yields. The main concern for this year's crop is potential bottlenecks in the export and processing sectors. *(For more information, contact Nicole Wagner at 202-720-0882.)*

China: Slightly Higher Cotton Crop in 2007/08

China's 2007/08 cotton production is forecast at a record 31.0 million bales (6.75 million tons), up 0.1 million from last year. Area is estimated at 5.5 million hectares, up nearly 2 percent from last year, while the forecast yield of 1227 kilograms per hectare is down about 2 percent from last year's record yield. Among the factors encouraging higher area in 2007 are favorable planting weather, the government's new cotton seed subsidy worth 500 million Yuan (US \$64 million), continued strong cotton demand, and favorable returns in 2006. However, domestic prices and demand for corn and other grains are also strong, and there is serious competition between cotton and grain for arable land and water supplies on the North China Plain. Planted area in Xinjiang, China's most important cotton province, is expected to be stable this year.

About 85 percent of China's cotton crop is planted in April, with the remainder planted after the winter wheat is harvested in June. According to local officials, warm and relatively dry April weather allowed spring cotton planting to progress smoothly. Seasonable rainfall and temperatures in the Yangtze River basin and Xinjiang favored rapid cotton germination and emergence. However, a significant spring drought has developed in the central Yellow River Basin (northern Henan, southern Hebei, southern Shanxi, and Shaanxi), a major cotton production area. The drought could hamper crop emergence and early development if it continues through May. China's National Meteorological Center predicts above-average outbreaks of crop diseases and pests this year due to unusually warm weather during the winter of 2006-07. *(For more information, contact Paulette Sandene at 202-690-0133.)*

This report uses information from the Foreign Agricultural Service's (FAS) global network of agricultural attachés and counselors, official statistics of foreign governments and other foreign source materials, and the analysis of economic data and satellite imagery. Estimates of foreign area, yield, and production are from the International Production Assessment Branch, FAS, and are reviewed by USDA's Inter-Agency Commodity Estimates Committee. Estimates of U.S. area, yield, and production are from USDA's National Agricultural Statistics Service. Numbers within the report may not add to totals because of rounding. This report reflects official USDA estimates released in the World Agricultural Supply and Demand Estimates (WASDE-442), May 11, 2007.

Printed copies are available from the National Technical Information Service. Download an order form at http://www.ntis.gov/products/specialty/usda/fas_a-g.asp, or call NTIS at 1-800-363-2068.

The FAS International Production Assessment Branch prepared this report. The next issue of World Agricultural Production will be released after 9:30 a.m. Eastern Time, June 11, 2007.

World and Selected Countries and Regions

5/11/2007 8:54:26 AM

TABLE 18

The table below presents a 26-year record of the differences between the May projection and the final estimate. Using world wheat production as an example, changes between the May projection and the final estimate have averaged 14.9 million tons (2.7percent) and ranged from -35.0to 30.0 million tons. The May projection has been below the final 15 times and above the final 11 times.

RELIABILITY OF PRODUCTION PROJECTIONS

COMMODITY AND REGION	PROJECTION AND FINAL ESTIMATES, 1981/82 - 2005/06 1/					
	Difference		Lowest	Highest	Below	Above

1/ The final estimate for 1981/82-2004/05 is defined as the first December estimate following the marketing year.

2/ May not total 25 if projection was the same as the final.

3/ Includes corn, sorghum, barley, oats, rye, millet, and mixed grain.
