

## CRUISE REPORT

Cruise Number: HX287

FOCI Number: 2HX04

Ship: R/V *Alpha Helix*

**Area of Operations:** Gulf of Alaska

Seward, AK – July 8, 2004

Seward, AK – July 19, 2004

**Participating Organizations:**

NOAA Pacific Marine Environmental Laboratory  
Alaska Fisheries Science Center

**Chief Scientist:**

Nancy Kachel  
NOAA/PMEL  
206-526-6780  
[Nancy.Kachel@noaa.gov](mailto:Nancy.Kachel@noaa.gov)

**Personnel:**

Dr. Nancy Kachel	Female	PMEL	<a href="mailto:Nancy.Kachel@noaa.gov">Nancy.Kachel@noaa.gov</a>
Dr. Carol Ladd	Female	PMEL	<a href="mailto:Carol.Ladd@noaa.gov">Carol.Ladd@noaa.gov</a>

Colleen Harpold	Female	AFSC	<a href="mailto:Collen.Harpold@noaa.gov">Collen.Harpold@noaa.gov</a>

**Objectives of Cruise:**

This cruise was in support of the Steller Sea Lion Research, Pacific Marine Environmental Laboratory's FOCI base, and United States Global Ocean Ecosystems Dynamics (U.S. GLOBEC) programs. It was undertaken by FOCI to support research into the physical, chemical, and biological mechanisms acting in the coastal Gulf of Alaska that cause it to be an extremely productive ecosystem, the home to diverse species of fish, shellfish, marine mammals and birds. The research focused on two prominent features hypothesized to contribute to the transport of nutrients to the shelf regions south and east of Kodiak Island, and to assess their importance in

sustaining production in this area throughout the summer months. The first feature studied was one of the large anti-cyclonic eddies that originate near Yakutat during the winter, then move across the deep Gulf of Alaska and begin to impinge on continental margin south of the Kenai Peninsula between late spring and early fall ([Fig. 1](#)). These eddies are hypothesized to bring High Nitrate/Low Chlorophyll water to the shelf areas from the deep Gulf of Alaska. Next we wanted to investigate the possibility that up-trough transport of nutrients, followed by tidal mixing over the banks, causes the banks south and east of Kodiak Island to be regions of sustained production throughout the summer. This study focused on Portlock Bank and Stevenson Trough. Lastly, we wanted to contrast these areas to the region of the Alaskan Coastal Current south of the Kenai Peninsula.

### **Summary of Cruise:**

The cruise departed Seward, AK on July 8, 2004 at 10:00 AM. While still in Resurrection Bay, we tested the Triaxus, University of Alaska Fairbanks's new towed vehicle, and practiced procedures for deploying and retrieving it. We then proceeded to three mooring sites on the Seward Line, to make calibration CTD casts, and a MARMAP bongo tow at GB3, where an optical plankton counter is deployed ([Fig. 2](#)). We then transited to the region off the slope, and just west of this year's eddy, that formed during the winter off Yakutat and then moved to its July position south of the Kenai Peninsula. We then made a 10-hour, 120 km transit eastward using the Triaxus, which was equipped with a temperature and conductivity sensor. This transit covered a region from west of the eddy to 40 km east of the center. The structure of the temperature field along this Triaxus transect is shown in [Fig. 3](#). Next we occupied an east-west line of CTD stations across the eddy. CTD stations were taken to a depth of 1500m. At approximately every second station /MARMAP bongo tows and CalVET tows were taken. The bongo tows were made to a depth of 300m (or 10m off the bottom) using two sets of bongo nets with mesh sizes of 330m and 120m, respectively. The CalVET tows were made to a depth of 60m or 5m off the bottom ([Fig. 6](#)).

Next we made a detailed CTD/MARMAP bongo tow survey of Portlock Bank and Stevenson Trough, east of Kodiak Island to assess the mechanisms of transport to the bank and mixing of salinity and nutrients on top of it ([Fig. 4](#)). Those stations at which bongo tows were taken is

shown in [Fig. 5](#). As part of that study, we quickly occupied two lines of stations with ~1nmi distance between stations. We made these transects twice on each of the two lines (PBA and PBC). The second occupation began 6 hrs after the first, in order to assess the impact that tides might have on the distribution of water properties. The lines of these stations are labeled UPA, UPB on the PBA transect, and UPC and UPD on the PBC transect. The Portlock Bank survey ended with a transect cutting from continental slope on the eastern side of the bank, to the western side near Afognak and Kodiak Islands.

We next made two transects that form two sides of a box of stations occupied in 2003 on the Kilo Moana (KM0309 and KM0313). These cut across the Alaska Coastal Current from Afognak Island to Portlock Bank (AP) and from there to Gore Point (GP) on the Kenai Peninsula. The objective of these transects was to contrast the hydrological conditions and plankton in the ACC with those on the Bank and in the trough. Three of those casts were calibration stations for the Gore Point moorings. We ended the cruise by returning to the Seward line and FOCI's GLOBEC moorings, for calibration CTD casts and another MARMAP bongo tow at the site of the AFSC deployment of an optical plankton counter at GB3.

The cruise ended when we arrived in Seward, AK on the morning of July 19, 2004. The cruise encountered good to excellent weather, so no time was lost due to weather, and all our research goals were met.

**Table 1: Cruise Statistics For FOCI Cruise 2HX04 (HX287)**

<b>Gear Used</b>	<b>No. Tows</b>
20cm bongo (20Bon)	61
60cm bongo (60Bon)	61
CalCOFI vertical egg tow net (CalVET)	22
Seabird SeaCAT CTD (CAT)	61
CTD without bottle samples (CTD)	65
CTD with bottle samples (CTDB)	126
Deployment of satellite buoy (SatBuoy)	6
Towed vehicle collecting; temp,salinity (Triaxus)	one tow/120km

**Table 2: Cruise Statistics For FOCI Cruise 2HX04 (HX287)**

<b>Gear Used</b>	<b># Tows</b>	<b>Samples</b>
SeaBird SeaCat CTD (CAT)	62	
Extracted chlorophyll (Chlor)	124	638
SeaBird CTD (CTD)	193	
Deployment of buoy or mooring (Deploy)	6	6
CTD casts with Stimulated fluorescence (Fluor) data	193	
CTD casts with Photosynthetically Active Radiation (PAR) data	191	
Nutrient Samples (Chlor)		1241
Quantitative tow preserved in formalin (QTowF)	142	151
Transect with towed Triaxus (TriTrans)		2

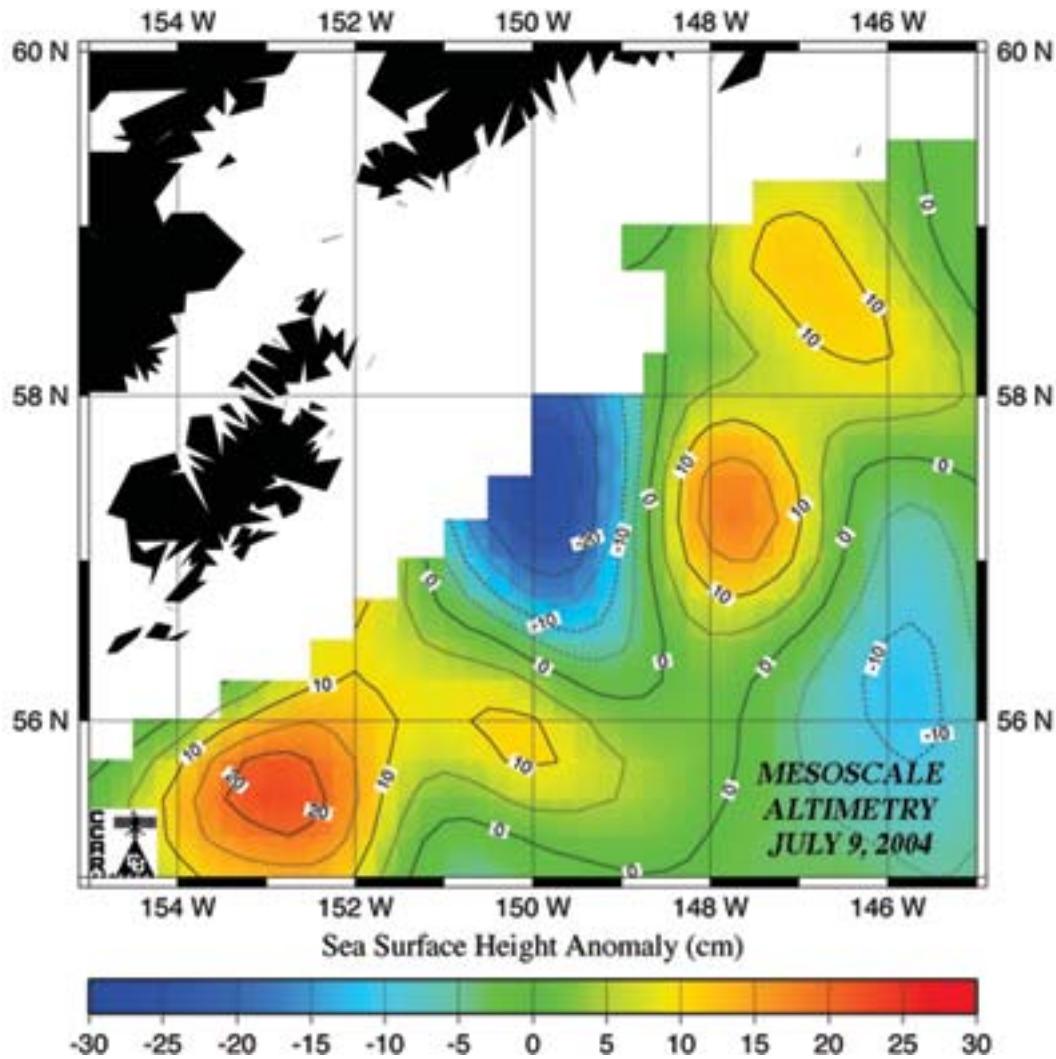

Fig. 1. Sea surface altimetry of the eddies near the Kenai Peninsula/Kodiak I. continental slope on July 9, 2004. The eddy in the southwest originated in 2003. The eddy near 57°N x 148°W originated in 2004. These were produced from the following website:

[http://e450.colorado.edu/realtime/gsfc\\_global-real-time\\_ssh/](http://e450.colorado.edu/realtime/gsfc_global-real-time_ssh/)

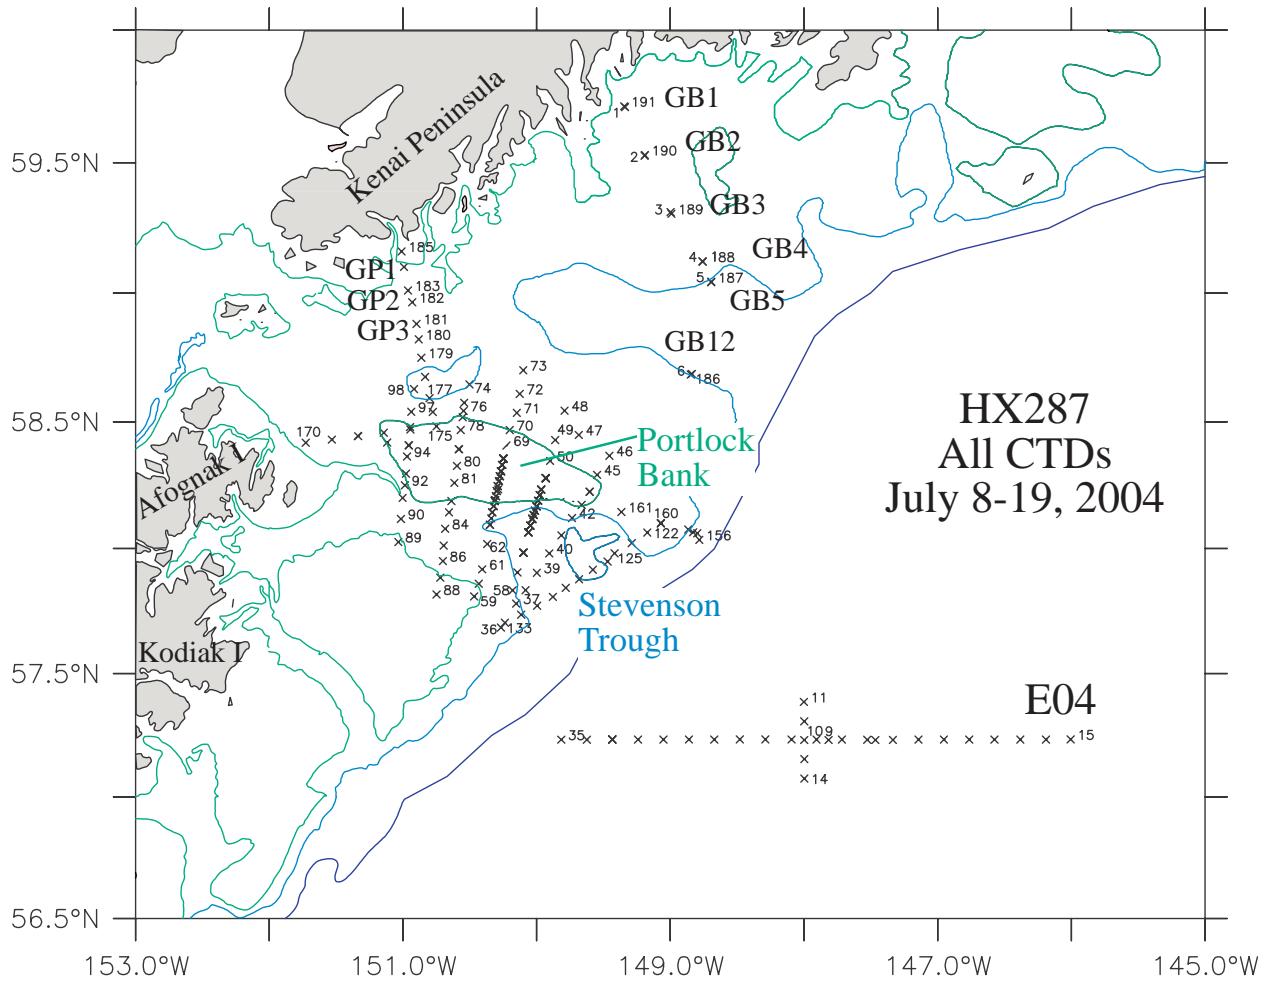

Figure 2. Map of CTD lines and stations for HX287 from July 8-19, 2004. Line E04 crosses the 2004 Yakutat eddy seen in Fig. 1. The Seward line moorings (GB) and Gore Point (GP) mooring locations, the sites of calibration casts are indicated. The line names of stations on and near Portlock Bank are presented in Fig. 4.

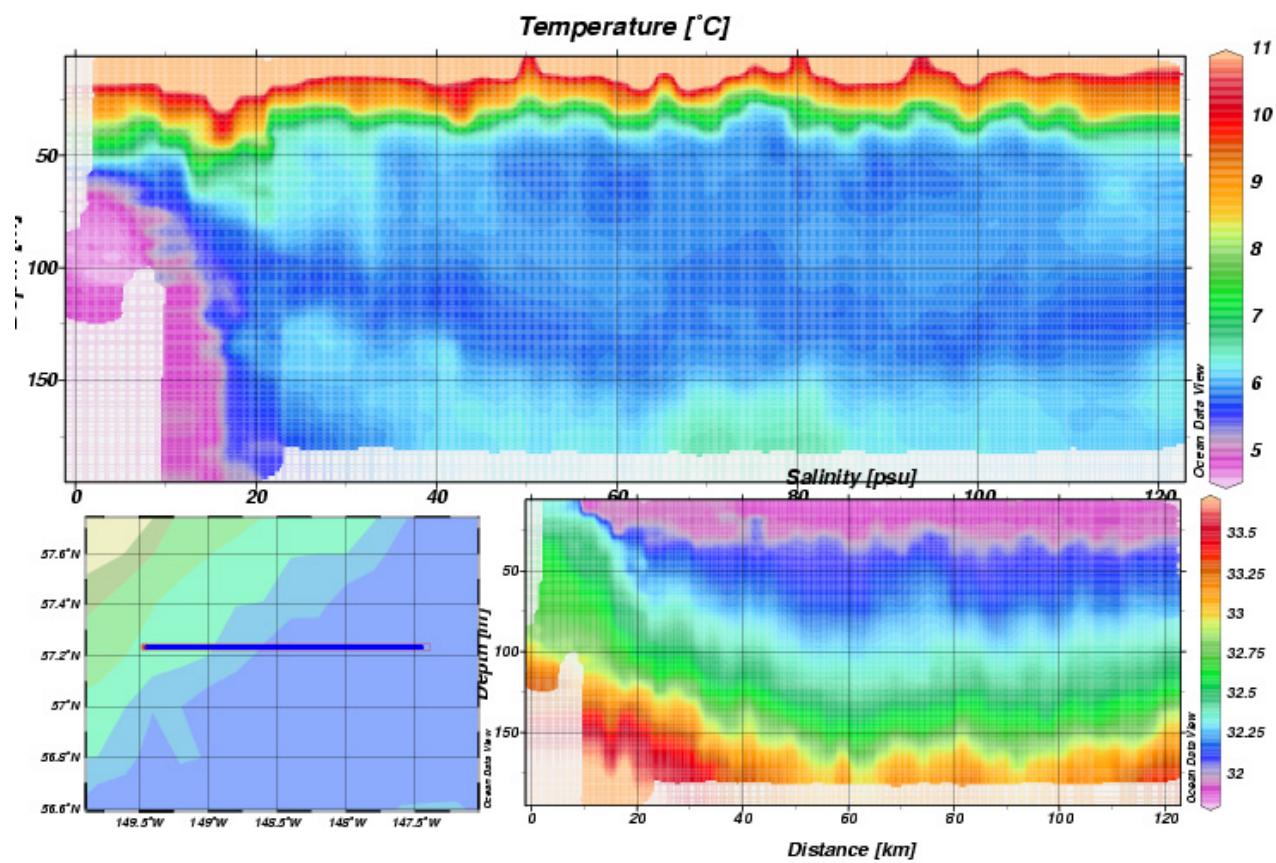

Figure 3. Temperature transect measured using the Triaxus towed vehicle.

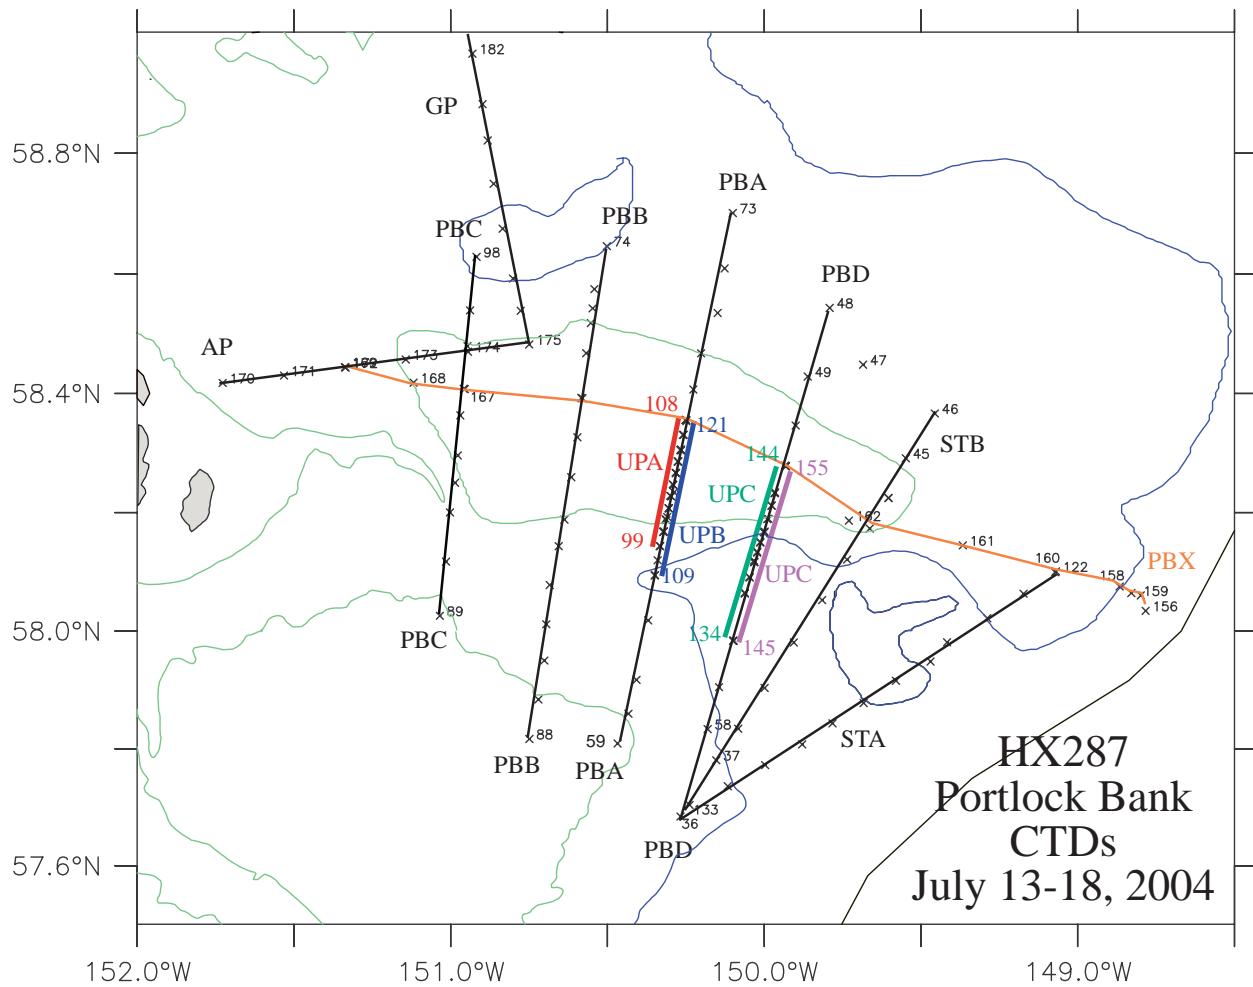

Figure 4. Station map for CTD stations taken near Portlock bank from July 13-18, 2004. Lines PBA, PBB, PBC, PBD and PBX cross Portlock Bank and the middle to upper portions of Stevenson Trough, while STA and STB traverse the outer portion of Stevenson Trough and the eastern end of Portlock Bank. GP is the Gore Point line. Line AP crosses between Afognak I. and Portlock Bank. GP is the Gore Point line. The red and blue lines identify those stations taken during on PBA during the UPA and UPB quick CTD transects. The green and purple lines identify those stations taken during on PBA during the UPC and UPD quick transects.

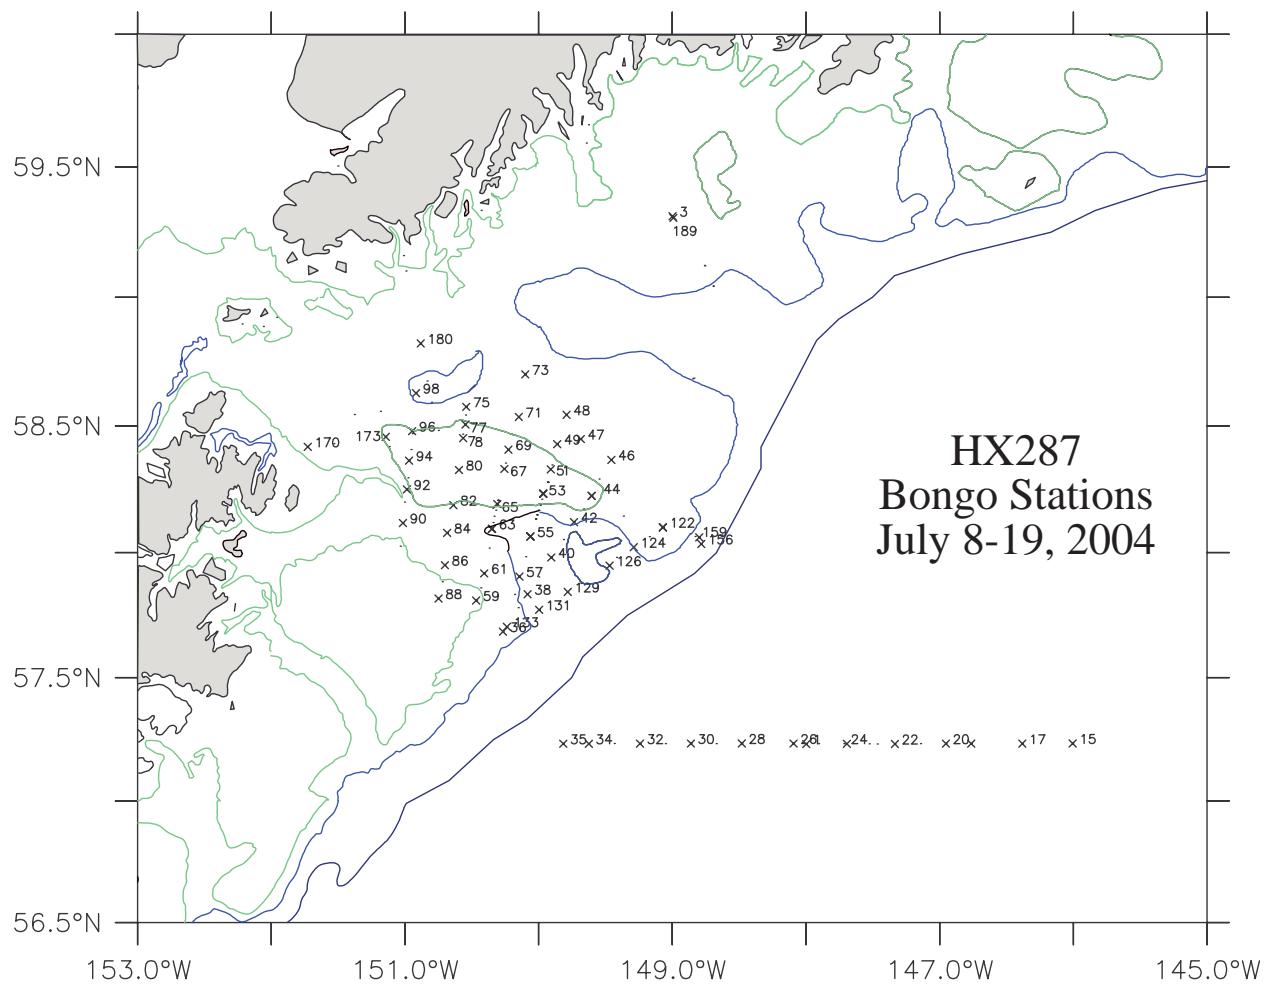

Figure 5. CTD stations with MARMAP bongo tows conducted between July 8 –19, 2004 on HX287.

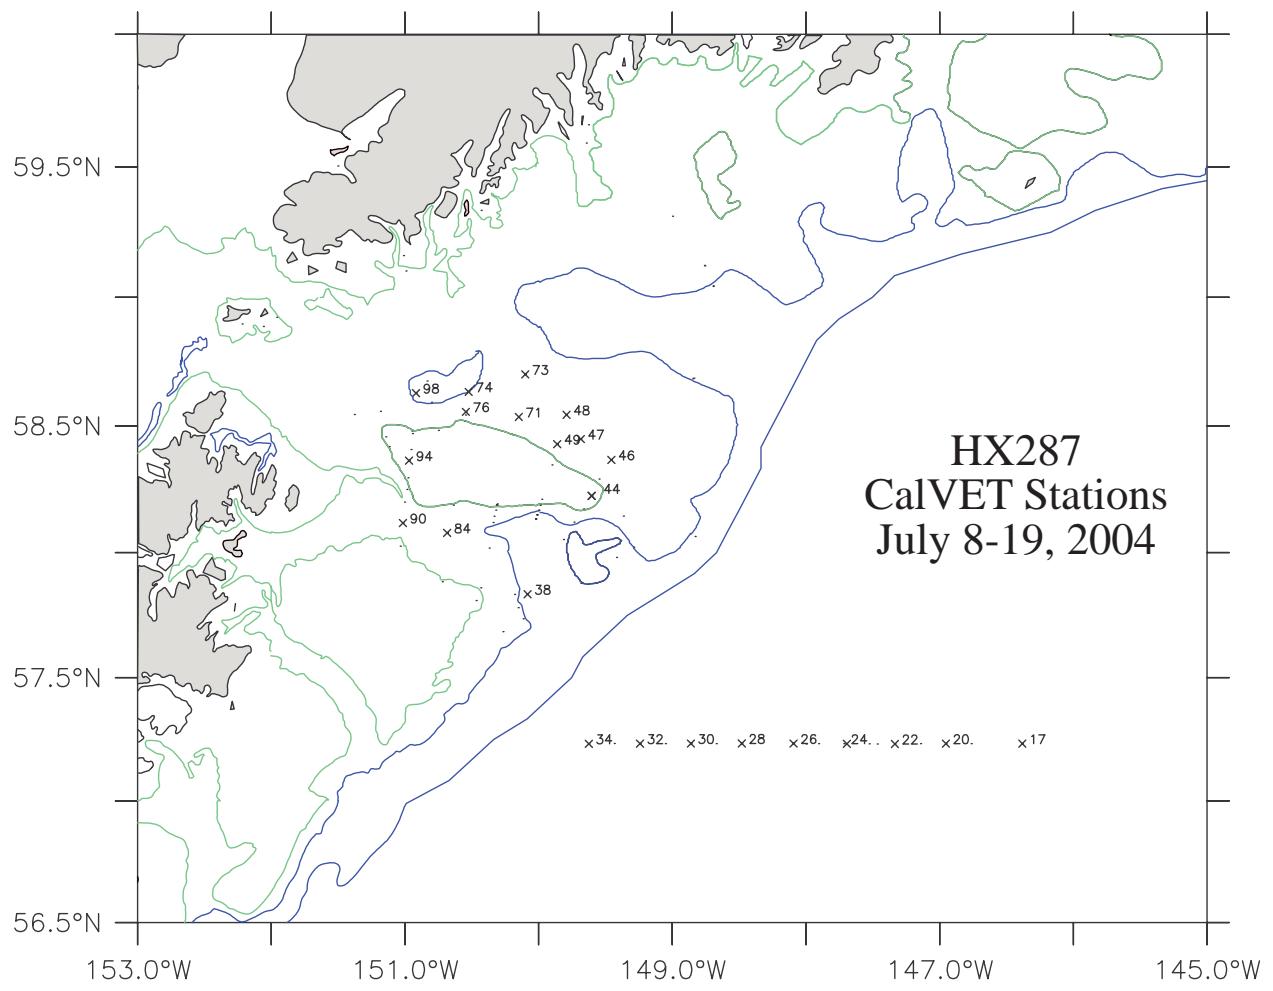

Figure 6. CTD stations with CalVET tows conducted between July 8 –19, 2004 on HX287.

Table 3. Event log for R/V Alpha Helix cruise HX287.
