Fleet Characterization

Combat Element

Cumulative
Miles

Significant logistics support is required to transport fuel and supplies to the combat elements at the “tip of the spear”. An increase of truck fuel economy will reduce the numbers of trucks necessary to support a given fighting force.

Tactical Wheeled Fleet Characterization

	Total Quantity	Avg Age	Replacement Age	O&S Costs \$/mile <i>(includes fuel & parts)</i>
HMMWV	105225	13.2	15	0.74
FMTV LMTV 2.5 ton / MTV 5 ton	10294 / 8782	5.4 / 4.0	20 / 22	0.67 / 0.84
M809	10124	29.6	20	1.24
M939	30533	15.4	20	1.23
M35	23716	31.1	20	0.85
HEMTT	12626	13.6	20	3.43
PLS	3499	7.7	20	1.80
HETS	2263	6.4	20	2.98
M915	5791	13.9	20	0.61
LT Trailers	27300	22.1	20 – 30	Not Available
MD Trailers	31800	32.3	20 – 30	Not Available
HV Trailers	26500	19.5	20 – 30	Not Available

Logistics Footprint Reduction

~65% of the fuel consumed in theater is for fuel transportation to the battlefield

Source: Footprint Reduction 2 Study, CAA MTW – E1

"Diesel" Fuel Characterization

- **Single Fuel Forward policy**
 - Deployed vehicles only
 - JP-8 primary fuel, diesel if JP-8 not available
- **Military fuel usage within US**
 - JP-8 / Diesel primary
 - Biodiesel also used to help meet alternative fuel requirements
- **Benefits of synthetic and biomass for military**

TARDEC

Battlefield Power Requirements

Source: US Army TACOM BFVS PM office

TARDEC

In the Battlefield

- **Silent Watch**
 - Reduce smoke, noise, thermal identification signatures
- **Design needs**
 - Simplicity of design and components
 - Supportability in the field
 - Packaging – MORE constrained than commercial applications!!!

TARDEC

Commercial Industry & the EPA

- 95% reduction of nitrogen oxides and hydrocarbons from pre-Oct 2002 levels
- 99% reduction of particulate matter from pre-Oct 2002 levels
- California Air Resources Board is developing standards for hybrid vehicles that aren't tied to ICE power output
- Engines produced in 2007 will require low sulfur diesel fuels to meet these standards
- 2006 on-road diesel fuel sulfur limit will be 15 ppm

NAC

The Military & the EPA

- **Waivers / exemptions**
 - Combat vs. tactical
 - Deployed vs. non-deployable
- **Legislative mandates**
 - Above and beyond commercial requirements that military vehicles must comply to
 - Military vehicles must be emissions compliant for the year the vehicle is built, unless they have a waiver
 - Gov fleet vehicles (all agencies) in the US:
 - EPA Act 1992
 - 75% of newly procured light duty vehicles for federal fleets must be alternative fuel vehicles
 - E.O. 13149 (April 01)
 - Mandates a 20% reduction in petroleum consumption from 1999 levels by 2005

TARDEC

Military Issues

- Reduce logistical footprint
- Comply with EPA & legislative requirements
- Meet increasing vehicle electric power demands
- Fuel-flexible equipment

All of these requirements have commonality with commercial market IR technologies

NAC Fuel Cell Technology Team

Solid Oxide Fuel
Cell APU
for a Heavy-
Duty Truck

NAC

A Fuel Cell Is:

- A machine that makes electricity by chemically reacting fuel with an oxidizer
 - Usually hydrogen fuel and air oxidizer
 - An efficient electric power source
 - Runs as long as fuel and air are supplied
- There are several types of fuel cells: PEM, solid oxide, direct methanol, and others
- Fuel cells need air cleaners, radiators, electronic controls and starting batteries, just like engines

Fuel Cell Readiness for Military Vehicles

- **The first big battlefield use for fuel cells is quiet, efficient stand-by electric power**
- **Commercial vehicles will probably set the pace for military vehicle fuel cell propulsion**
 - If a fuel cell works in general purpose commercial trucks, it will probably work in military trucks
 - Military vehicle fuel cells must be able to use JP-8 jet fuel
 - Fuel cell vehicles are only as good as their electric drive systems
- **Heavy truck auxiliary power units (APUs) are a nearer-term commercial application with military benefits**
- **Strategy: Emphasize early APU applications**

TARDEC

Fuel Cell Strategy

- In an April 2002 report to Congress, the NAC proposed a Defense/Industry Fuel Cell Partnership to address three areas:
 - Develop auxiliary power units (APUs)
 - Demonstrate commercial fuel cell vehicles on military bases in conjunction with DOE programs
 - Pursue technologies to move fuel cell propulsion from civilian to military vehicles
- TARDEC is developing a fuel cell test lab and simulation capabilities to support its strategy

NAC

Hydrogen Fuel

- Hydrogen can work for cars – fuel cell Focus gets 200 miles per fill.
- Hydrogen must be made, it's not an energy source
 - Electrolysis – Electricity splits water into hydrogen & oxygen
 - Reforming – A chemical reactor uses petroleum energy to make hydrogen; around 80% efficient
- Hydrogen is very bulky
 - A 2-liter bottle at 5000 psi holds enough hydrogen for an hour at 800 watts or one horsepower
 - A gallon of liquid hydrogen holds about ¼ the energy of a gallon of gasoline
- The U.S. chemical industry makes and uses enough hydrogen for about 30 million fuel cell cars

Military Fuel Issues

- JP-8 jet fuel is the single battlefield fuel
 - Aircraft need it and it works in diesel engines, too
 - Basically commercial Jet A-1 fuel plus additives
 - 3,000 ppm S limit, but typically around 500 ppm
 - EGR and / or aftertreatment
- Sulfur is a fuel cell and reformer catalyst poison
- Overseas fuels can have very high sulfur levels
- Present-day aircraft can't be converted to hydrogen
- Battlefield hydrogen could work for low-volume, high-value uses – but its bulk makes high-volume use difficult

Operate Fuel Cell Vehicles and Hydrogen Infrastructure on CONUS Bases

TARDEC

Summary of TARDEC's Fuel Cell Approach

- **Get maximum leverage from industry work**
- **Maximize joint efforts with other services**
- **Enlist other agencies: DOE, DOT, EPA**
- **Apply R&D to unique military fuel cell problems**
- **Expand military automotive fuel cell uses**
