NOTE: Chained (1996) dollars (and chain-type quantity indexes) provide the best available measures of how a particular series changes over time. However, users of this table are cautioned that comparisons across chained (1996) dollar components of GDP may be misleading, particularly for periods before 1987, when the residual is sometimes quite large. For example, during the years of World War II, the residual column in this table, which is the difference between GDP and the sum of the most detailed component series in this table, is very large. During these years, because of spending associated with World War II, the share of GDP accounted for by government consumption expenditures and gross investment doubled before returning to a more normal share; in addition, the prices paid for goods and services throughout the economy were tightly controlled and very different from postwar levels.

The large residuals illustrate the problems with calculating contributions to GDP or other aggregates from the chained (1996) dollar values. Accurate estimates can be made of the contributions of components to the percent change in GDP; these estimates are provided in NIPA table 8.2. Contributions to percent change in major components of real GDP are shown in tables 8.3 through 8.6. Additional historical data may be found on BEA's Web site at <www.bea.doc.gov>.

For a more detailed discussion of the use of chained dollars, including a method for closely approximating contributions to changes in real GDP for longer periods, see "BEA's Chain Indexes, Time Series, and Measures of Long-Term Economic Growth" in the May 1997 SURVEY OF CURRENT BUSINESS. Additional versions of NIPA table 1.2 that use alternative reference years are available on BEA's Web site. Tables 1.2A, 1.2B, 1.2C, and 1.2D will be based on chained 1937, 1952, 1972, and 1982 dollars, respectively.
