Vegetables and Melons Situation and Outlook Yearbook

**Gary Lucier, Charles Plummer,
and Alberto Jerardo**

Abstract

In 2003, total per capita vegetable and melon use increased 1 percent to 443 pounds (fresh-weight basis). Per capita use of fresh-market vegetables (excluding melons, potatoes, sweet potatoes, and mushrooms) declined 1 percent to 141.3 pounds. Including melons, potatoes, sweet potatoes, and mushrooms, fresh-market vegetable consumption totaled 222.4 pounds—up 1 percent from a year earlier. There were several notable changes in vegetable consumption a year ago. These changes included a 21-percent gain in fresh-market spinach use to 1.7 pounds—the highest per capita spinach use since 1949. Spinach consumption, which peaked at 2.9 pounds in 1939, is expected to continue trending higher in 2004. Total U.S. vegetable and melon production fell 3 percent in 2003 as inclement spring and summer weather limited yields and reduced shipments. Vegetable output in 2003 was 8 percent below the 1999 peak but 3 percent above the average for the 1990s.

Keywords: Potatoes, tomatoes, onions, dry beans, production, consumption, prices.

Approved by the World Agricultural Outlook Board. Summary released July 23, 2004. The next *Vegetables and Melons Outlook* newsletter is scheduled for release on August 19, 2004. Summaries and text of Situation and Outlook reports may be accessed electronically; for details, call (202) 694-5050.

Summary

In 2004, per capita vegetable disappearance (also referred to as use or consumption) is forecast to increase about 1 percent to 446 pounds (fresh-weight basis). Increased use is expected for fresh-market vegetables, melons, and processing vegetables, with declining use expected for potatoes and sweet potatoes. Assuming continued favorable weather into the fall and a strengthening economy, consumption of several fresh-market vegetables could approach record-highs in 2004. With strong romaine shipments, per capita use of leaf and romaine lettuce is expected to reach a record-high of 10 pounds in 2004. Domestic fresh-market tomato production is expected to recover from the weather-reduced levels of 2003 and help push tomato disappearance close to the 2002 record-high of 19.2 pounds per person. Similarly, increased acreage could push onion production higher in 2004, which could allow use of fresh dry-bulb onions to move back toward the 2002 record-high. Little change is expected for dry edible bean use as stock reductions and lower exports offset the effect of another small crop this fall.

For 2003, total per capita vegetable and melon use increased 1 percent to 443 pounds (fresh-weight basis). Per capita use of fresh-market vegetables (excluding melons, potatoes, sweet potatoes, and mushrooms) declined 1 percent to 141.3 pounds. Including melons, potatoes, sweet potatoes, and mushrooms, fresh-market vegetable consumption totaled 222.4 pounds—up 1 percent from a year earlier. There were several notable changes in vegetable consumption a year ago. These changes included a 21-percent gain in fresh-market spinach use to 1.7 pounds—the highest per capita spinach use since 1949. Spinach consumption, which peaked at 2.9 pounds in 1939, is expected to continue trending higher in 2004 as spinach finds favor as both a tasty and nutritious salad ingredient and versatile side dish.

Disappearance of vegetables for freezing (excluding potatoes) remained about even at 6.2 billion pounds (23.0 billion including potatoes) in 2003. On a per capita use basis, freezing vegetables (excluding potatoes) declined 1 percent to 21.2 pounds last year. Including preliminary estimates for potatoes, freezing vegetable use rose 3 percent to 78.8 pounds per person. Increases were noted for broccoli (up 23 percent), cauliflower (up 19 percent), spinach (up 15 percent), and green peas (up 9 percent), with declines coming in carrots (down 21 percent), miscellaneous vegetables (down 10 percent), and sweet corn (down 4 percent). The sizeable gain in broccoli largely reflects a reported doubling of output within the previously shrinking domestic industry. If this figure holds through next winter's annual revisions, it would be the largest reported production of broccoli for freezing since 1995.

Per capita use of canning vegetables (excluding potatoes) declined fractionally to 97.2 pounds. Total domestic disappearance of canning vegetables in 2003 rose nearly 1 percent to 28.4 billion pounds. Aside from chile peppers, cabbage, and cucumbers for pickles, estimated use of all major canning vegetables either increased or remained constant. Despite reduced production (down 16 percent), lower imports (down 24 percent), and a sizeable increase in exports (up 19 percent), per capita use of processing tomatoes rose 1 percent. Tomatoes accounted for 72 percent of 2003 canning

vegetable disappearance. The outlook for 2004 indicates a small gain in per capita use of processing tomatoes as output and imports each rise.

According to preliminary data for 2003 (utilization estimates for the previous crop year are not published until September 23), per capita use of potatoes, the largest vegetable category, likely increased 7 pounds to 139 pounds. The gain in 2003 largely reflects a return to average use following a decline the previous year caused by the small crop of 2001/02. Use of potatoes for frozen french fries during the early 2000s is averaging 57.1 pounds per capita (28.6 pounds on a product-weight basis). This exceeds the average use during the 1990s by 4 percent and is one-third greater than the average use during the 1980s.

Further highlights in the annual per capita use estimates for 2003 include:

- An 8-percent rise in fresh-market sweet corn consumption, which reached a record 9.7 pounds (both production and exports also set records). Despite various low-carb diets, consumers continue to be drawn to the improved quality and value offered by today's supersweet varieties.
- Fresh broccoli use rose 7 percent to 5.7 pounds per person, reversing a 3-year slide in consumption.
- Estimated fresh-market cauliflower consumption jumped 17 percent to 1.7 pounds as acreage and yields (up 7 percent) increased.
- Use of all tomatoes declined 1 percent to 87.7 pounds per person (fresh-equivalent basis) as a 5-percent reduction in fresh-market use (to 18.1 pounds) outweighed a slight increase in processing use (to 69.6 pounds, fresh-equivalent basis).
- Combined fresh and processing dry-bulb onion consumption was little changed from a year earlier at 20.3 pounds per person in 2003. Despite a smaller fresh-market crop, record-high imports and average shrink and loss (around 10 percent of the crop) helped the fresh-market onion industry post its second-highest per capita use at 18.9 pounds last year (19.3 pounds were recorded in 2002).
- Supported by ever-increasing imports, asparagus for fresh consumption rose 15 percent to 1.1 pounds per capita—the highest fresh-market use since 1947.
- Fresh-market carrot use, which has been trending lower since the 1997 peak, rose 5 percent to 8.8 pounds in 2003. Domestic disappearance of fresh carrots totaled 2.6 billion pounds last year.
- Driven by record-high yields (140 hundredweight (cwt) per acre), per capita use of artichokes (in all forms) increased 15 percent to 0.7 pounds—the second highest on record.
- Per capita use of garlic (fresh and processing) rose 13 percent to 2.8 pounds—second only to 1999's 3.3 pounds.

Vegetable Output Drops in 2003

Total U.S. vegetable and melon output fell 3 percent in 2003 as inclement spring and summer weather limited yields and reduced shipments. Vegetable output in 2003 was 8 percent below the 1999 peak but 3 percent above the average for the 1990s. Reduced output for dry edible beans (down 26

percent), processing tomatoes (down 16 percent), and fresh-market tomatoes (down 11 percent), outweighed gains for smaller crops such as processing green peas (up 34 percent), sweet potatoes (up 24 percent), and cauliflower (up 10 percent). Fresh-market vegetable and melon production declined 1 percent largely due to weather-reduced spring and summer yields, while processing vegetable production declined 9 percent due largely to lower yields for California processing tomatoes. A 16-percent reduction in the processing tomato crop drove canning vegetable production down from the previous year. Reduced harvested acreage (down 23 percent) and lower yields pushed the U.S. dry bean crop down 26 percent in 2003, with another small crop expected in 2004. Meanwhile, a 13-percent increase in harvested area and favorable weather resulting in record-high yields (up 10 percent to 172 cwt/acre) helped drive the sweet potato crop 24 percent higher to 15.9 million cwt—the largest crop since 1962.

Fresh Market Prices Up

During the first 6 months of 2004, shipping-point prices (a proxy for grower prices) averaged 1 percent above a year earlier as higher prices during the first quarter (Jan.-Mar.) outweighed lower prices during the second quarter. During the first quarter, shipping-point prices increased 16 percent from a year earlier as cool, wet weather in California and Mexico reduced market supplies. Despite periods of extreme heat along the California coast and gusty winds in Florida, supplies during the spring were strong enough to prevent prices from reaching the highs of a year earlier, with second-quarter prices averaging 11 percent below a year earlier.

In 2003, shipping-point prices for fresh-market vegetables and melons increased 1 percent from a year earlier. All of the gain came after the first quarter when shipping-point prices averaged 43 percent below a year earlier. This was followed by 24-percent higher spring-season prices than a year earlier and a 14-percent increase over the summer quarter. In the fall, shipping-point prices leaped 46 percent to a new fourth-quarter high led by record-high lettuce prices. With unusually high temperatures reducing yields during the fall growing season in California and Arizona, f.o.b shipping-point prices for U.S. iceberg lettuce surged 161 percent over Oct.-Dec. a year earlier to \$29.80 per cwt. With a few exceptions (e.g. onions, asparagus, and tomatoes), the various high and low shipping prices throughout the year were largely offsetting for most commodities, with most averaging near year-earlier levels.

Despite the fluctuations in open-market f.o.b. prices, retail prices for fresh-market vegetables (including potatoes) in 2003 averaged just 2 percent above a year earlier—the smallest rise since 1999. The farm value share of the fresh vegetable retail price remained steady at 20 percent in 2003. Fresh-market retail prices fell 1 percent during January-June and rose 5 percent during the last half of the year. Consumers paid more for tomatoes (up 8 percent) and other miscellaneous vegetables (up 3 percent) and less for potatoes (down 4 percent) and head lettuce (down 2 percent). The decline in fresh potato prices follows an 18-percent jump a year earlier when the increase in retail prices was the highest since 1989. In 2004, retail prices for fresh-market vegetables are projected to average 1 to 4 percent above a year ago due largely to increased costs for energy, labor, and packaging.

Vegetable Trade Deficit Widens

In calendar year 2003, weak demand in some key export markets and continued U.S. demand for lower-cost processed imports allowed the trade deficit in vegetable crops (includes melons, pulses, potatoes, and planting seed) to continue expanding. While the value of U.S. exports increased 1 percent to \$3.3 billion, imports rose 13 percent to \$5.4 billion. The value of exports last exceeded imports in 1995. In 2003, U.S. vegetable, melon, and pulse imports from Mexico rose 17 percent while Mexico's share of U.S. import value rose from 43 to 44 percent. Over the past few years, Mexico's share of imports has generally trended lower, with share largely being lost to Canada. However, thanks to increased shipments of tomatoes and potato chips (due to a new reconstituted chip plant), Mexico was able to regain some lost market share in 2003. Imports from Canada rose 16 percent to \$1.4 billion in 2003, driven largely by fresh greenhouse vegetables, fresh and frozen potatoes, and mushrooms (largely fresh). Canada's share of the U.S. vegetable, melon, pulse, and seed import markets remained steady at 25 percent in 2003. China continued to experience double-digit growth in exports of vegetables and products to the United States in 2003. With increased shipments of fresh garlic (up 15 percent) and mushrooms (up 76 percent to \$47 million), imports from China (including Hong Kong) increased 20 percent to \$220 million—remaining at 4 percent of the U.S. import market.

In 2003, the United States exported nearly 8 percent of its fresh-market vegetable and melon supplies (production plus imports)—largely unchanged over the past decade. On the other side of the ledger, higher fresh-market domestic prices again increased the incentive to export to the United States, with the fresh-market import share of consumption rising from just over 15 percent to 16 percent—exceeding 1998's record-high. Monthly import volume has remained above year-earlier levels since mid-2003.

Processing Output Down in 2003; Expected To Rise in 2004

Processors of five major vegetables (tomatoes, sweet corn, snap beans, green peas, and cucumbers for pickles) have contracted 1.24 million acres in 2004—down 2 percent from the comparable producing States of a year earlier. Canneries, which account for two-thirds of all processing vegetable area, have contracted for 2 percent fewer acres than a year ago. Area for tomatoes, the largest single processing vegetable, will be 1 percent larger than a year ago despite lackluster wholesale prices and the prospect of larger world supplies in the coming year. Given average yields, contract production of the five leading canning vegetables could rise about a 10th from that of 2003. For processors of frozen vegetables, contract area is forecast to decline 4 percent as lower sweet corn plantings outweigh small increases for snap beans and green peas. Given average yields, contract production for the three leading vegetables for freezing is expected to decline 10 to 12 percent from a year ago.

Assuming average acreage losses and yields hovering near the mean of the previous three seasons, total production of the 11 selected processing vegetables could increase 7 to 9 percent from the 15.7 million short tons harvested in 2003. However, the majority of any gain in processing output

this year will likely stem from the expected recovery in California tomato yields from last year's weather-reduced levels (about 5 tons below trend). Average retail prices for processed vegetables (frozen, canned, and dried) increased about 2 percent during the first 6 months of 2004, reflecting higher packaging, transportation, and marketing costs.

Green peas: The first estimate of 2004 contract production for processing green peas indicated a 17-percent reduction from a year earlier to 388,890 short tons. Estimated area for harvest was down 7 percent from a year earlier. Per-acre yields are also expected to decline 10 percent to 1.81 tons after reaching a record-high 2.01 tons in 2003. Green pea production is expected to decline 35 percent in Minnesota, the top producing State and 36 percent in Wisconsin—the third leading State. Wholesale prices for canned peas are averaging about 3 percent higher than a year ago, while prices for frozen green peas have been running about the same as a year earlier.

Tomatoes: The 19-percent increase expected in the 2004 contract for the processing tomato crop follows a 16-percent decline in 2003. Harvested acreage was down 6 percent in 2003, and unsettled weather pulled yields down 11 percent from the near record-high levels of 2002. Calendar 2003 import volume for all tomato products (fresh-weight basis) was down 24 percent, with sauces declining 20 percent, paste down 53 percent, and ketchup 4 percent lower. Sauces (61 percent) and ketchup (25 percent) accounted for the majority of tomato product imports last year. Imports accounted for nearly 6 percent of consumption in 2003—down from 8 percent a year earlier. With lower world supplies, calendar year exports jumped 19 percent to a record 2.9 billion pounds (fresh-weight equivalent), equal to 8 percent of available supply (production plus imports and beginning stocks). Calendar year 2003 per capita use of processing tomatoes increased 1 percent to an estimated 69.6 pounds (fresh-weight)—continuing the recovery from the recession-impacted low of 2001.

Sweet corn: Area, yield, and production of processing sweet corn are each expected to decline in 2004. Lower production in 2004 will offset last year's crop, which rose 8 percent as output of both canning corn (up 9 percent) and sweet corn destined for frozen products (up 4 percent) increased. Imports of canned sweet corn increased for the seventh consecutive year—rising 28 percent, with Canada supplying 60 percent and Thailand 39 percent. Imports reached another record-high in 2003 and presently account for about 6 percent of consumption. Exports, the primary market for 16 percent of supplies, declined for the sixth consecutive year—falling 6 percent to the lowest level since 1991. The inability to meet competition in export markets, particularly in Japan, remains critical to an industry which faces declining long-run domestic demand. Although the long-run trend in domestic use is negative, per capita use of canning corn increased 6 percent in 2003 to 8.3 pounds—the largest year-to-year increase since 1992.

New Census Data Released

In June, USDA's National Agricultural Statistics Service (NASS) released the *2002 U.S. Agricultural Census*, reporting by State the number of farms, area harvested, and area under irrigation for a number of major vegetable

and melon commodities. The number of farms reporting vegetable and melon area declined 10 percent to 54,391. Aside from a brief increase in 1997, the number of farms producing vegetables and melons has declined steadily over the past several decades. This reflects the continued consolidation of farms into larger and more efficient business units and increasing productivity within the sector, which allows more volume to be harvested from fewer acres. The share of acreage produced under irrigation in 2002 rose to 69 percent—up from 68 percent in 1997. While irrigation is ubiquitous in States such as California and Arizona, the share of area under irrigation continues to rise in seasonal producing States such as Ohio, New Jersey, and Georgia. Harvested area for fresh and processing vegetables and melons (excludes potatoes, sweet potatoes, and pulses) declined 5 percent to 3.9 million acres since the 1997 census.

One of the key strengths (and most difficult challenges) of the Census of Agriculture data set is universal inclusion—the attempt to enumerate the U.S. national agricultural universe. For vegetables and melons, this means receiving valuable information for crops not covered in the NASS vegetable estimation program such as green onions, parsley, and Chinese cabbage. It also means receiving a U.S. total covering virtually all States for commodities like broccoli, pumpkins, and tomatoes for which NASS covers the major States but may still leave out some key producers (e.g. Maine broccoli).

Fresh Output Down in 2003; Summer 2004 Area Down

This summer (largely July-September), fresh-market vegetable (excluding melons) area for harvest is forecast to decline 2 percent from a year earlier to 310,000 acres. For the most part, declining area for head lettuce, tomatoes, and sweet corn will outweigh increases in crops such as cucumbers, broccoli, and carrots. This decline in summer area follows increases in both winter and spring vegetable area. Although vegetable area is down this summer, melon area for harvest is expected to increase 4 percent this summer with area up for honeydews (up 12 percent), cantaloups (up 5 percent), and watermelon (up less than 1 percent). Several shippers continue to increase offerings of small “personal” watermelon varieties in an attempt to serve a market niche that may be hesitant to purchase the larger fruit due to difficulty in handling or fear of waste.

Growers in California, accounting for 47 percent of this year's summer-season vegetable and melon area (up from 46 percent a year earlier), increased acreage less than 1 percent. New York, the second leading summer-season producer, with 18 percent of acreage, expects to harvest 5 percent fewer acres than a year ago, due largely to excess rains during planting this spring. Although U.S. fresh-market area is down, better yields are expected to lead to stronger market volume in areas that were hit by excessive/untimely rains last year. Assuming continued gains in economic activity and attendant demand, summer-season fresh-market vegetable prices are likely to average somewhat below the relatively strong levels of the past year. During the summer quarter of 2003 (July-September), prices received by growers and shippers of fresh-market vegetables and melons averaged 14-percent above those of the previous year.

Despite significant fluctuations throughout 2003, annual fresh-market output (including melons) declined just 1 percent, and shipping-point prices averaged 1 percent above those of the previous year. Some of the 2003 fresh-market highlights for selected crops follow:

Head lettuce: Lower yields, particularly in California (down 8 percent), pulled head lettuce production down 3 percent in 2003. Import volume, which until 2002 was normally less than 1 percent of consumption, was second only to that of 2002—remaining near 2 percent of consumption. Export volume rose 7 percent, continuing to recover from two poor export years in 2000 and 2001. About 7 percent of supplies were exported in 2003—the most since 1991. The average shipping-point price fell 15 percent to \$18.00 per cwt—still the third highest on record. Total consumption was an estimated 6.2 billion pounds in 2003—down from 6.5 billion pounds the previous year. This was the equivalent of 21.4 pounds per capita, down 5 percent from a year earlier and the lowest since 1967. Head lettuce consumption has been trending lower since peaking in 1989 as consumers have broadened their diets to include other types of lettuces (such as romaine) and leafy greens (such as spinach).

Tomatoes: Field tomato production fell 11 percent in 2003 to 3.5 billion pounds as national per-acre yields dropped 8 percent from their record-tying high in 2002. Import volume (field and hothouse) increased for the third consecutive year, rising 9 percent to a record 2.1 billion pounds. Import share of consumption rose to a record 39 percent in 2003. Import share is expected to ease back to around 35 percent in 2004 as domestic production recovers from the weather-reduced lows of a year earlier. For the third consecutive year after reaching its 2000 pinnacle, tomato export volume fell—dropping 5 percent to 314 million pounds. Given the reduction in supply, estimated domestic consumption fell 5 percent to 5.3 billion pounds in 2003, with per capita use dropping from the 2002 record-high to 18.1 pounds. Based on industry estimates of production, including domestically-produced hothouse tomato production would add another pound to tomato per capita use. The inclusion of cherry and grape tomatoes (for which there are no official production estimates) would also boost tomato consumption estimates.

Onions: U.S. fresh-market onion production fell 1 percent in 2003 to 6.1 billion pounds as higher yields were offset by lower harvested area. Imports, which increased 9 percent to a record-high 660 million pounds, accounted for 12 percent of domestic consumption—up from 11 percent the previous year. The majority of the volume was shipped from Mexico (57 percent of the total), Canada (18 percent), and Peru (15 percent). Shipments from Chile more than doubled in 2003 and now account for 5 percent of onion import volume. After declining for two consecutive years, onion exports rose 6 percent to 679 million pounds despite little change in shipments to Canada, Japan, and Mexico—typically top export destinations. With lower production, smaller beginning stocks, and larger exports, domestic per capita use of fresh-market onions declined 1 percent to 19.2 pounds—second only to the 2002 record-high.

Bell peppers: U.S. bell pepper production rose 5 percent in 2003 to 1.65 billion pounds as production in California, the leading producer, increased 9 percent. With increased domestic output, imports fell 2 percent from the previous year's record level and accounted for 27 percent of domestic

consumption. Mexico was the source for 67 percent of import volume followed by Canada (17 percent) and the Netherlands (9 percent). Exports fell 1 percent and now take 7 percent of supply—well below the record 12 percent in the early 1990s. Bell pepper consumption rose 3 percent, reaching 2 billion pounds for the first time. On a per capita basis, 2003 consumption was the second highest on record at 7.0 pounds and is projected to set a new standard in 2004.

Output of Pulses and Potatoes Mixed in 2004

Potatoes: U.S. fall-season potato growers expect to harvest 6 percent fewer acres in 2004. Harvested area is expected to be lower for all major producing States, including Idaho (down 3 percent), Washington (down 1 percent), Wisconsin (down 7 percent), and North Dakota (down 19 percent). During the March to May period, when most fall-season potatoes were being planted, U.S. shipping-point prices for all potatoes averaged \$6.49 per cwt, 6 percent below a year ago and 22 percent below 2 years ago. Because of lower potato prices at planting time and high prices for competing crops, summer-season potato growers expect to follow winter and spring season growers by reducing harvested area 3 percent this year. Although per-acre yields are expected to be up 2 percent, summer potato production is forecast to decline 2 percent. The summer crop typically accounts for about 4 percent of all potato production, with Texas, California, and Colorado the leading States.

In 2003, smaller harvested area (down 1 percent) offset stronger yields (up 1 percent to the second highest on record) which left total U.S. potato production largely unchanged from a year earlier at 459 million cwt. Production in 2003 was 5 percent larger than 2 years ago. Fall potato production was generally higher in the Central and Eastern States, but lower in the West—the converse of the previous year's crop. California fall-season yields suffered from hot weather that reduced production 20 percent from the previous year. In fact, hot weather and/or drought also led to reduced yields in Colorado, Idaho, and Oregon while yields were up from the previous fall in Washington, Utah, Nevada, and Montana. In Idaho, the leading potato State, production declined 8 percent from a year earlier due to lower acreage and reduced yields in the eastern part of the State. Despite lower area, increased yields pushed production up 1 percent in Washington, the second leading producing State.

Total domestic potato shipments (fresh, seed, chipping) rose fractionally from a year earlier during calendar 2003 and ran 1-percent above a year earlier during the first half of 2004. Despite lower potato prices in the United States in 2003, import volume of fresh-market potatoes (excluding seed) from Canada increased 2 percent from the previous year's strong levels. At the same time, the volume of frozen potato imports from Canada (which accounts for 99 percent of all U.S. frozen potato imports) continued to climb to another record-high, rising 14 percent from a year earlier to 1.64 billion pounds. Imports now account for 20 percent of frozen potato consumption compared with 3 percent in 1992. The preliminary season-average farm price received for all U.S. 2003-crop potatoes was estimated at \$5.85 per cwt, down 13 percent from the previous season.

Sweet potatoes: U.S. sweet potato growers planted 99,100 acres in 2004, up 3 percent from last year and 3 percent above 2002 for comparable States. Five States expect increased acreage (California, Louisiana, Mississippi, North Carolina, and Texas) and three expect reductions (Alabama, South Carolina, and Virginia).

The increase in 2004 area is a response to record grower prices (unadjusted for inflation) for the 2003 crop. The season-average price for 2003-crop sweet potatoes was \$19.20/cwt, up 14 percent from the 2002 crop and 9 percent higher than the previous record set in 1999. Higher prices for the 2003 crop was especially noteworthy because it occurred in conjunction with a 24-percent increase in production over a year earlier. The 2003 sweet potato crop was the largest since 1962.

Domestic sweet potato use appears to have made a comeback in recent years. After averaging 5.1 pounds per person during the 1970s, average per capita use fell during the 1980s and 1990s to 4.6 and 4.1 pounds respectively, reaching an annual low of 3.7 pounds twice in the 1990s. Thus far in the 2000s, per capita use has rebounded to an average of 4.3 pounds, reaching 4.7 pounds in 2003. During this time, U.S. exports of sweet potatoes have also surged, rising 51 percent from 2000 to 2003. Exports have risen steadily since the late 1980s—2003 sweet potato exports were 4 times what they were in 1989—indicating that international demand for U.S. sweet potatoes has also increased. About 4 percent of supply is now being shipped to nations such as Canada and the United Kingdom compared with 2 percent of supplies exported in the 1990s.

Dry beans: In 2004, U.S. dry bean growers expect to harvest 1.33 million acres—2 percent fewer than a year earlier. Planted area increased just 1 percent in response to lethargic dry bean prices, relatively unstable domestic and export demand, and more attractive prices and revenue streams for alternative crops. With some exceptions, such as black beans and navy beans, production is expected to decline and prices should continue to strengthen during the 2004/05 season.

In 2003, a 23-percent reduction in harvested area (to 1.35 million acres) and 4 percent lower yields sent dry bean production down 26 percent to 22.5 million cwt. The largest reduction in output from a year earlier occurred in Michigan (down 50 percent), where area planted was a record-low 170,000 acres. Output was also reduced in Washington (down 37 percent) and North Dakota (down 27 percent from the 2002 record-high). Output was reduced for 8 of the 13 identified classes, with notable declines for navy beans (down 53 percent) and pinto beans (down 21 percent).

Among classes experiencing increases were Great Northern beans (up 42 percent) and blackeye beans (up 45 percent). With output down for other classes, stocks were being drawn down, but grower and dealer prices were slow to respond, resulting in some growers choosing to plant more lucrative alternative crops in 2004. With output down, the farm value of the 2003 dry bean crop was estimated to be \$412 million—down 20 percent from a year earlier. Despite the smaller crop, carryover supplies proved burdensome enough to keep prices in check, with the season average price for all dry beans estimated to have risen just 4 percent to \$17.80/cwt. Calendar year

dry bean export volume declined for the fourth consecutive year in 2003, falling 2 percent to 680 million pounds—18 percent of available supply. With a smaller crop and reduced imports (down 23 percent), per capita dry bean use in 2003 totaled 6.6 pounds—down 1 percent from a year earlier.

Dry peas and lentils: Due to more attractive prices and the income security offered by the marketing loan program, area planted and harvested increased for both dry peas and lentils in 2003. For dry peas, strong yields in the upper Midwest outweighed low yields in the Pacific Northwest caused by heat and drought, leaving yields up from a year earlier. As a result, U.S. dry pea production (excluding wrinkled seed peas) increased from a year earlier. According to industry data, all the increase was for dry green peas (up 27 percent), while output of yellow peas dropped 22 percent.

With prices remaining attractive, harvested area increased again for both dry peas and lentils in 2004. According to both USDA and industry estimates, 2004 dry pea planted area was up more than one-third while lentil area rose about one-fifth. With relatively favorable weather pointing toward average yields or better, production will likely be up for peas and lentils. The new larger crops will be added to existing carryover stocks that USDA measured on June 1 for the first time (the crop year begins on July 1). The stocks report, which was initiated in support of the marketing loan program, indicated there were 571,000 cwt of dry edible peas, 271,000 cwt of lentils, and 28,000 cwt of Austrian winter peas stored in all positions on June 1.

The preliminary 2003/04 season-average price for all dry edible peas fell 15 percent to \$6.60 per cwt, while the average price for all lentils was estimated to have risen 15 percent to \$16.40 per cwt. As a result, the value of U.S. dry pea and lentil production (excluding wrinkled seed peas but including Austrian winter peas) totaled \$76 million in the 2003 season—up 8 percent from a year earlier. The 2003/04 lentil crop was valued at \$40 million, up 12 percent from a year ago.

Mushrooms: During the 2002/03 crop year (July-June), total U.S. mushroom sales volume remained unchanged at 844 million pounds. Volume of fresh-market Agaricus mushrooms, which accounted for 82 percent of all Agaricus sales, rose less than 1 percent to 692 million pounds. Agaricus processing volume declined 2 percent to 139 million pounds—45 percent below the 1992/93 peak. The industry continues to move toward fresh-market uses, with the outlets for processed products becoming increasingly limited. Intended Agaricus bed and tray production area for the 2003/04 season is expected to remain steady at 141 million square feet. Brown Agaricus mushrooms (including portobello and crimini varieties) continue to be the fastest growing segment of the mushroom industry over the last several years. These varieties now account for 111 million pounds in sales—13 percent of total Agaricus volume. Volume has more than doubled since 1998/99 when brown Agaricus sales totaled 50 million pounds. The sales volume of specialty mushrooms (excluding brown Agaricus), most of which are sold in the fresh market, remained flat at 13 million pounds. Shiitake mushroom sales increased 3 percent to 8.3 million pounds while sales of oyster (down 16 percent) and other specialties declined. Per capita use of all mushrooms increased slightly in 2003 to 4.1 pounds, with a 2-percent increase in fresh market use offsetting lower processing use.

Glossary of Specialized Terms

Arrivals: Quantity of produce received by wholesalers and chain stores in selected cities, as shipped from major production areas.

Carryover stocks: The quantity of product remaining in storage at the end of the crop year.

Cash receipts: The value of commodity marketings during the calendar year, irrespective of the year of production. For program crops, also includes net CCC loans (there are none for vegetables or potatoes).

C.I.F. value: (Cost, insurance, and freight). Terms of sale whereby the seller's (exporter) price includes the cost of the goods being sold and all transportation charges, including insurance expenses, to the destination point (importer).

Cold storage: The quantity of product in refrigerated warehouses at a point in time.

Constant 1996 dollars: Expression of value in terms of 1996 purchasing power. Frequently referred to as deflated or real dollars.

Contract acreage: Area planted by agreement between processors and growers, generally at an agreed price and conditions, including quality.

Customs Import Value: Represents a value in the foreign country and therefore excludes U.S. import duties, freight, insurance, and other charges incurred in bringing the merchandise to the United States. This valuation is primarily used for collection of import duties and frequently does not reflect the actual transaction values (see C.I.F. value).

Cwt: Abbreviation for hundredweight, a unit of measure equal to 100 pounds.

Dual-purpose vegetables: Commodities that may be sold in fresh or processing markets. Dual commodities include asparagus, broccoli, cauliflower, celery, chile peppers, and bell peppers.

Dumping: The sale of a commodity in a foreign market at less than fair market value.

Fall season: Production period which mainly spans October to December.

Farm weight: The raw or unprocessed weight of a product in fresh form prior to any processing; also called fresh-weight, field-run, or orchard-run.

F.A.S. value: (free alongside ship). A price quotation that includes all costs of transportation and delivery of the goods to the dock alongside the ship (or other means of transport).

F.o.b. (free on board) shipping-point price: A price quotation that includes a loading charge at the shipping point but no further transport cost. In this publication, f.o.b. is the average, unweighted unit price received by

the shipper or grower-shipper primarily for sales in carload or truckload quantities, but also including mixed loads.

Fresh-cut vegetables (fresh-processed): Fresh-market vegetables that have been trimmed, peeled, or cut (but not heated) into a completely usable fresh product, which is marketed in a prepackaged form. Examples include bagged salads, baby peeled carrots, and broccoli florets. In terms of the data in this report, these products are still considered fresh-market commodities.

Fresh-market vegetables: Sold primarily as fresh; includes artichokes, asparagus, green lima beans, snap beans, broccoli, Brussels sprouts, cabbage, cantaloupes, carrots, cauliflower, celery, sweet corn, cucumbers, eggplant, escarole and endive, garlic, radishes, honeydews, lettuce, onions, bell peppers, spinach, tomatoes, and watermelons. Includes fresh-cut products such as baby carrots, baby spinach, and bagged salads.

Grower-packer return: Price received by the grower-packer.

Marketing spread: The difference between the retail price and the grower-packer return.

Pack: The quantity of fresh or processed product placed in containers (e.g., cans). Generally refers to the output of a processing industry (e.g., frozen pack of broccoli).

Pay weight: The weight of useable product delivered to the processing plant and paid for at the rates specified by contract.

Per capita use: A measure of commodity disappearance on a per-person basis. Equal to total supply (production plus imports plus beginning stocks) less uses (exports, shrink and loss, seed use, ending stocks) divided by total U.S. population (including military).

Processing vegetables: Commodities sold primarily to processors; include (but not limited to) green lima beans, snap beans, beets, cabbage, sweet corn, cucumbers, chile peppers, green peas, spinach, and tomatoes.

Product weight: The weight of a product in its final packaged form. For example, the weight of the contents of a can of tomato paste.

Pulses: A term used collectively for dry edible beans, dry edible peas, and lentils.

Season-average price: Average price received by the grower-packer (grower-shipper), weighted by quantity marketed.

Shipments: Quantity of produce marketed from major production areas.

Short ton: A unit of measure equal to 2,000 pounds. A metric ton is equal to 1,000 kilograms or 2,204.62 pounds.

Specialties: A term for commodities (limited here to vegetables) not generally considered to be mainstream. Examples include jicama, dasheen, and

cassava. May also include “minor vegetables,” such as okra, chile peppers, pumpkins, and tropical vegetables.

Spring season: Production period which mainly spans April to June.

Summer season: Production period which mainly spans July to September.

Value of production: The value of commodities produced during the crop year. Calculated as production times marketing year average price. May be equal to cash receipts when the crop year for a vegetable runs from January through December.

Winter season: Production period which mainly spans January to March.

Fresh and Processing Supply and Use

43. U.S. fresh tomatoes: Supply, utilization, and price, farm weight, 1979-200455
44. U.S. fresh bell peppers: Supply, utilization, and price, farm weight, 1979-200456
45. U.S. fresh head lettuce: Supply, utilization, and price, farm weight, 1979-200456
46. U.S. leaf and romaine lettuce: Supply, utilization, and price, farm weight, 1990-200457
47. U.S. fresh onions: Supply, utilization, and price, farm weight, 1979-200457
48. U.S. fresh sweet corn: Supply, utilization, and price, farm weight, 1979-200458
49. U.S. fresh carrots: Supply, utilization, and price, farm weight, 1979-200458
50. U.S. fresh broccoli: Supply, utilization, and price, farm weight, 1979-200459
51. U.S. fresh cauliflower: Supply, utilization, and price, farm weight, 1979-200459
52. U.S. fresh asparagus: Supply, utilization, and price, farm weight, 1979-200460

53. U.S. fresh celery: Supply, utilization, and price, farm weight, 1979-200460
54. U.S. fresh cucumbers: Supply, utilization, and price, farm weight, 1979-200461
55. U.S. cabbage: Supply, utilization, and price, farm weight, 1979-200461
56. U.S. artichokes, all uses: Supply, utilization, and price, farm weight, 1979-200462
57. U.S. eggplant, all uses: Supply, utilization, and price, farm weight, 1979-200462
58. U.S. garlic, all uses: Supply, utilization, and price, farm weight, 1979-200463
59. U.S. fresh-market snap beans: Supply, utilization, and price, farm weight, 1979-200463
60. U.S. fresh-market spinach: Supply, utilization, and price, farm weight, 1979-200464
61. U.S. fresh-market potatoes: Supply, utilization, and price, farm weight, 1979-200464
62. U.S. honeydew melons: Supply, utilization, and price, farm weight, 1979-200465
63. U.S. cantaloupes: Supply, utilization, and price, farm weight, 1979-200465
64. U.S. watermelons: Supply, utilization, and price, farm weight, 1979-200466
65. U.S. asparagus for freezing: Supply, utilization, and price, farm weight, 1979-200466
66. U.S. broccoli for processing: Supply, utilization, and price, farm weight, 1979-200467
67. U.S. cauliflower for processing: Supply, utilization, and price, farm weight, 1979-200467
68. U.S. green peas for freezing: Supply, utilization, and price, farm weight, 1979-200468
69. U.S. snap beans for freezing: Supply, utilization, and price, farm weight, 1979-200468
70. U.S. sweet corn for freezing: Supply, utilization, and price, farm weight, 1979-200469

71. U.S. potatoes for freezing: Supply and utilization, farm weight, 1979-2004	69
72. U.S. spinach for freezing: Supply and utilization, farm weight, 1979-2004	70
73. U.S. carrots for freezing: Supply, utilization, and price, farm weight, 1979-2004	70
74. U.S. tomatoes for processing: Supply, utilization, and price, farm weight, 1979-2004	71
75. U.S. cucumbers for pickles: Supply, utilization, and price, farm weight, 1979-2004	71
76. U.S. sweet potatoes, all uses: Supply, utilization, and price, farm weight, 1979-2004	72
77. U.S. squash, all uses: Supply, utilization, and price, farm weight, 1979-2004	72
78. U.S. onions for dehydrating: Supply, utilization, and price, farm weight, 1979-2004	73

f = Forecast. r = Revised. -- = Not available. 1/ All production for processing broccoli and cauliflower is for freezing. 2/ Industry allocation suggests that 27 percent of processing carrot production is for canning and 73 percent is for freezing. 3/ On-cob basis. 4/ In-shell basis. 5/ Includes artichokes, brussels sprouts, eggplant, endive/escarole, garlic, radishes, green limas, squash, and spinach. In 2000, okra, pumpkins, kale, collards, turnip greens, and mustard greens added. 6/ Includes beets, green limas (1992-2004), spinach, and miscellaneous imports (1990-2004). 7/ Includes green limas, spinach, and miscellaneous freezing vegetables. 8/ Fresh, canning, and freezing data do not sum to the total because onions for dehydrating are included in the total. 9/ Production from new areas in upper Midwest added in 1998. A portion of this is used for animal feed.

2004 p	810,331	789,664	927,132	694,820	488,674								

p = Preliminary. 1/ Excludes melons, potatoes, and mushrooms. 2/ Monthly distribution as reported by the Census is partly in error for 1976, 1980, 1981, and 1986.

For July and August of 1981 and May of 1986, some quantities are included that actually arrived in earlier months. 3/ Import data beginning January

1989 are reported under the Harmonized Tariff Schedule (HS) of the U.S. Department of Commerce.

Source: Bureau of the Census, U.S. Department of Commerce.

p = Preliminary. 1/ Includes asparagus, green beans, broccoli, Brussels sprouts, cabbage, cauliflower, carrots, cucumbers, sweet corn, garlic, celery, lettuce, onions, peppers, tomatoes, and misc. vegetables. Excludes melons. 2/ With the exception of the "all other vegetables" category, USDC data for exports to Canada during 1979-89 were adjusted using import data from Statistics Canada.

1/ Monthly distribution as reported by the Census Bureau is partly in error for 1981 and 1986. For July and August of 1981 and May of 1986, some quantities are included that actually arrived in earlier months. 2/ Import data beginning January 1989 are reported under the Harmonized Tariff Schedule (HS) of the U.S. Department of Commerce.

1/ Source: National Agricultural Statistics Service, USDA (1970-81 and 1992-present). Between 1981 and 1991, production is from the California County Agricultural Commissioners' annual report. 2/ Source: Bureau of the Census, U.S. Department of Commerce. From 1978-89, exports were adjusted using Canadian import data from Statistics Canada. Includes dried garlic and garlic flour after 1977. Dried adjusted to fresh basis using the factor 2.7.

3/ Seed use estimated as 2 percent of California output until 2000 when seed-producing states were added to the NASS production estimate.

4/ Constant-dollar prices were calculated using the GDP implicit price deflator, 2000=100.

1/ Calendar year. Includes both fresh and processing squash of all types. Source: ERS through 1999, USDA, NASS thereafter. 2/ Source: Bureau of the Census, USDC. Includes chayote squash since 1989. Exports are estimated as 5 percent of misc vegetables (HS 0709905000). Import codes = 0709902000, 0709901000.

4/ Through 1999, prices are the season average for Florida squash. U.S. average price used from 2000 on. 3/ Constant dollar prices calculated using the GDP implicit price deflator, 2000=100.

1/ Excludes onions for fresh, canning, and freezing. 2/ From 1979-92, estimated as 76 percent of California summer crop. After 1992, production for processing estimated by USDA/NASS. Price data also estimated by USDA/NASS starting in 1993. 3/ Product-weight data was converted to fresh basis using factor of 9.0. 4/ Data from FATUS, USDA-ERS. 5/ Stocks are for raw product to be processed and do not include finished inventory. Estimated as 80 percent of California summer onion stocks from 1970-80. Since 1980, estimated as 2.5 percent of U.S. Jan 1 onion inventory. 6/ Estimated as 50 percent of California's summer crop shrinkage and loss (assumes lower shrink in processing). 7/ Unit value of California onions destined for processing. 8/ Deflated by the GDP implicit price deflator, 2000=100.

1/ Prices are simple 12-month averages. 2/ Adjusted to allow 10 percent for waste and spoilage incurred during marketing.

3/ Average of monthly f.o.b. shipping-point prices as reported by USDA-NASS. 4/ Retail prices not reported in 1979.

Sources: Bureau of Labor Statistics, U.S. Department of Labor and National Agricultural Statistics Service, USDA.

-- = Not available. f = ERS forecast.

1/ Prices are simple 12-month averages. 2/ Adjusted to allow 4 percent for waste and spoilage incurred during marketing. 3/ Average of monthly f.o.b. shipping-point prices as reported by USDA-NASS. Includes fresh market only after 1983. From 1970-83, includes potatoes for all uses.

4/ Retail prices not reported in 1979.

-- = Not available.

1/ Exports are in product weight as reported by Census. Due to under-reporting, U.S. exports to Canada prior to 1990 may be understated. 2/ Excludes shelled beans. 3/ Data were converted from gallons using a factor of 8.485 pounds per gallon. 4/ Tomato products not elsewhere classified. For 1989-2003, represents whole tomatoes.

1/ Pinto exports to Dominican Republic in 2003 were \$3.296 million.

2/ Great Northern exports to Iraq in 2003 were \$8.242 million.

3/ Rwanda was \$0.992 million in 2003.

4/ In 2003, exports to Angola were \$0.861 million and to Honduras were \$0.845 million.

5/ Exports to Spain were \$1.274 million in 2003.

6/ Iraq was \$23.2 million in 2003.

-- = Not available. f = ERS forecast. 1/ Crop year begins July 1 and ends June 30. 2/ From 1970 to 1988, includes dried, desiccated, and dehydrated peas, other than split peas. After 1988, under the Harmonized Tariff Schedule, includes the sum of green and yellow peas (excluding split). 3/ From 1970 to 1988, includes green and yellow peas. After 1988, includes split peas only. 4/ Includes Austrian winter peas, misc. dry peas, and dry pea and lentil seeds.

5/ Pea data series broken following the 1987/88 season due to the January 1989 change to the harmonized system. Data in this table prior to 1989 are on a Sept-Aug year.
