

DRAFT

Fish Passage Improvement Projects And Habitat Access Conditions In the Coastal Coho ESU

Liz Dent

Andy Herstrom

Erin Gilbert

DRAFT

Habitat Factors For Decline

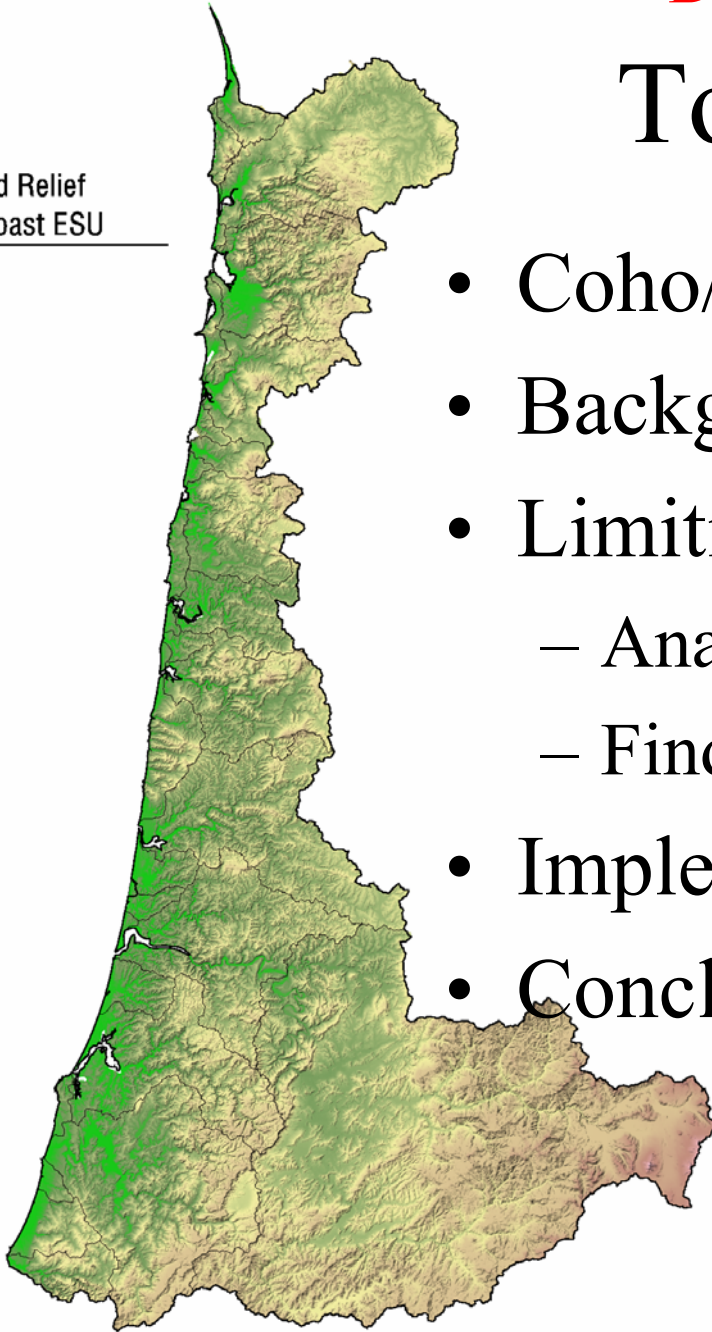

- Channel Form
- Substrate
- Roughness
- Estuaries and Wetlands
- Riparian Areas
- Water Quality
- Stream flow
- **Passage**
- Habitat Elimination

DRAFT

Today's Presentation

Shaded Relief
North Coast ESU

- Coho/Oregon Plan Evaluation
- Background on Fish Passage
- Limiting Factors Analysis
 - Analytical Process and Tools
 - Findings
- Implementation and Effectiveness
- Conclusions

DRAFT

Background on Fish Passage: Not just spawning adult fish!

- **Must pass resident and juvenile fish too.**

DRAFT

Juvenile and Resident Fish Move

- Opportunities for food
- Cooler temperatures
- Slower water for given life stages
- Avoid predation

DRAFT

Limiting Factors Analysis

Limiting Factors Analysis

- What percent of stream miles have improved access because of passage improvement projects reported as part of the Oregon Plan?
 - What type of habitat was accessed?
- What percent of stream miles have limited access, are accessible, or have unknown access status?

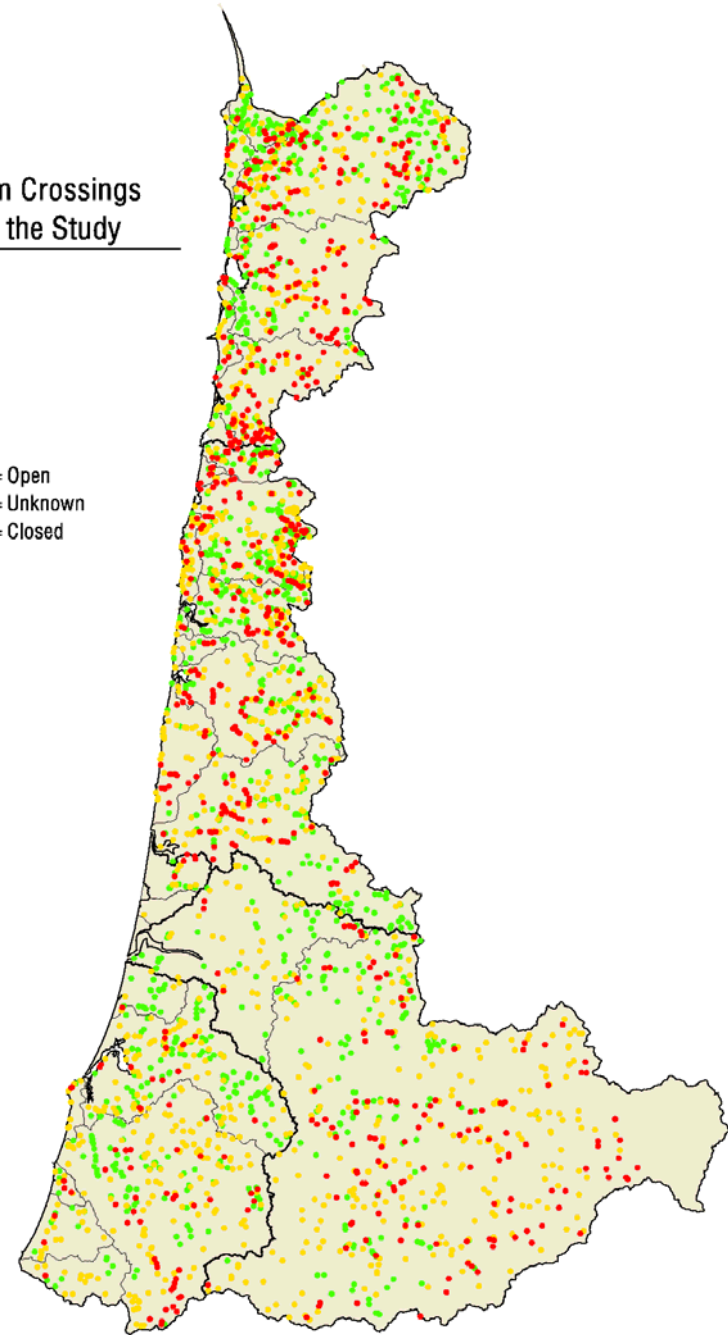

Data Sources

- **State Agencies:** OWEB, ODF State Forests, ODF&W
- **Federal Agencies:** BLM and Forest Service
- **Private Industrial Forest Landowners:**
5 industrial land owners in the Coastal Coho ESU

Data Description

- 4,412 crossings and barriers
 - 1,140 OWEB crossings
- Passage Status
 - Limited
 - Open
 - Unknown Status

All Stream Crossings
Used in the Study

- **Modeled Stream Layer:**
 - topographic and channel features
 - predicted average annual flow
 - (~ 1:24K)
- **Modeled “*Intrinsic*” Habitat Potential:**

Characterizes stream reaches as:

 - High Intrinsic Potential (HIP) or Low Intrinsic Potential (LIP).
 - *Winter* Habitat for Coho
 - Gradient, flow, valley width

DRAFT

Coho CLAMS streams

-  All CLAMS Streams
-  Coho Streams

MAX_GRAD_D LE .0705 and BARRIER = 0

DRAFT

HIP CLAMS streams

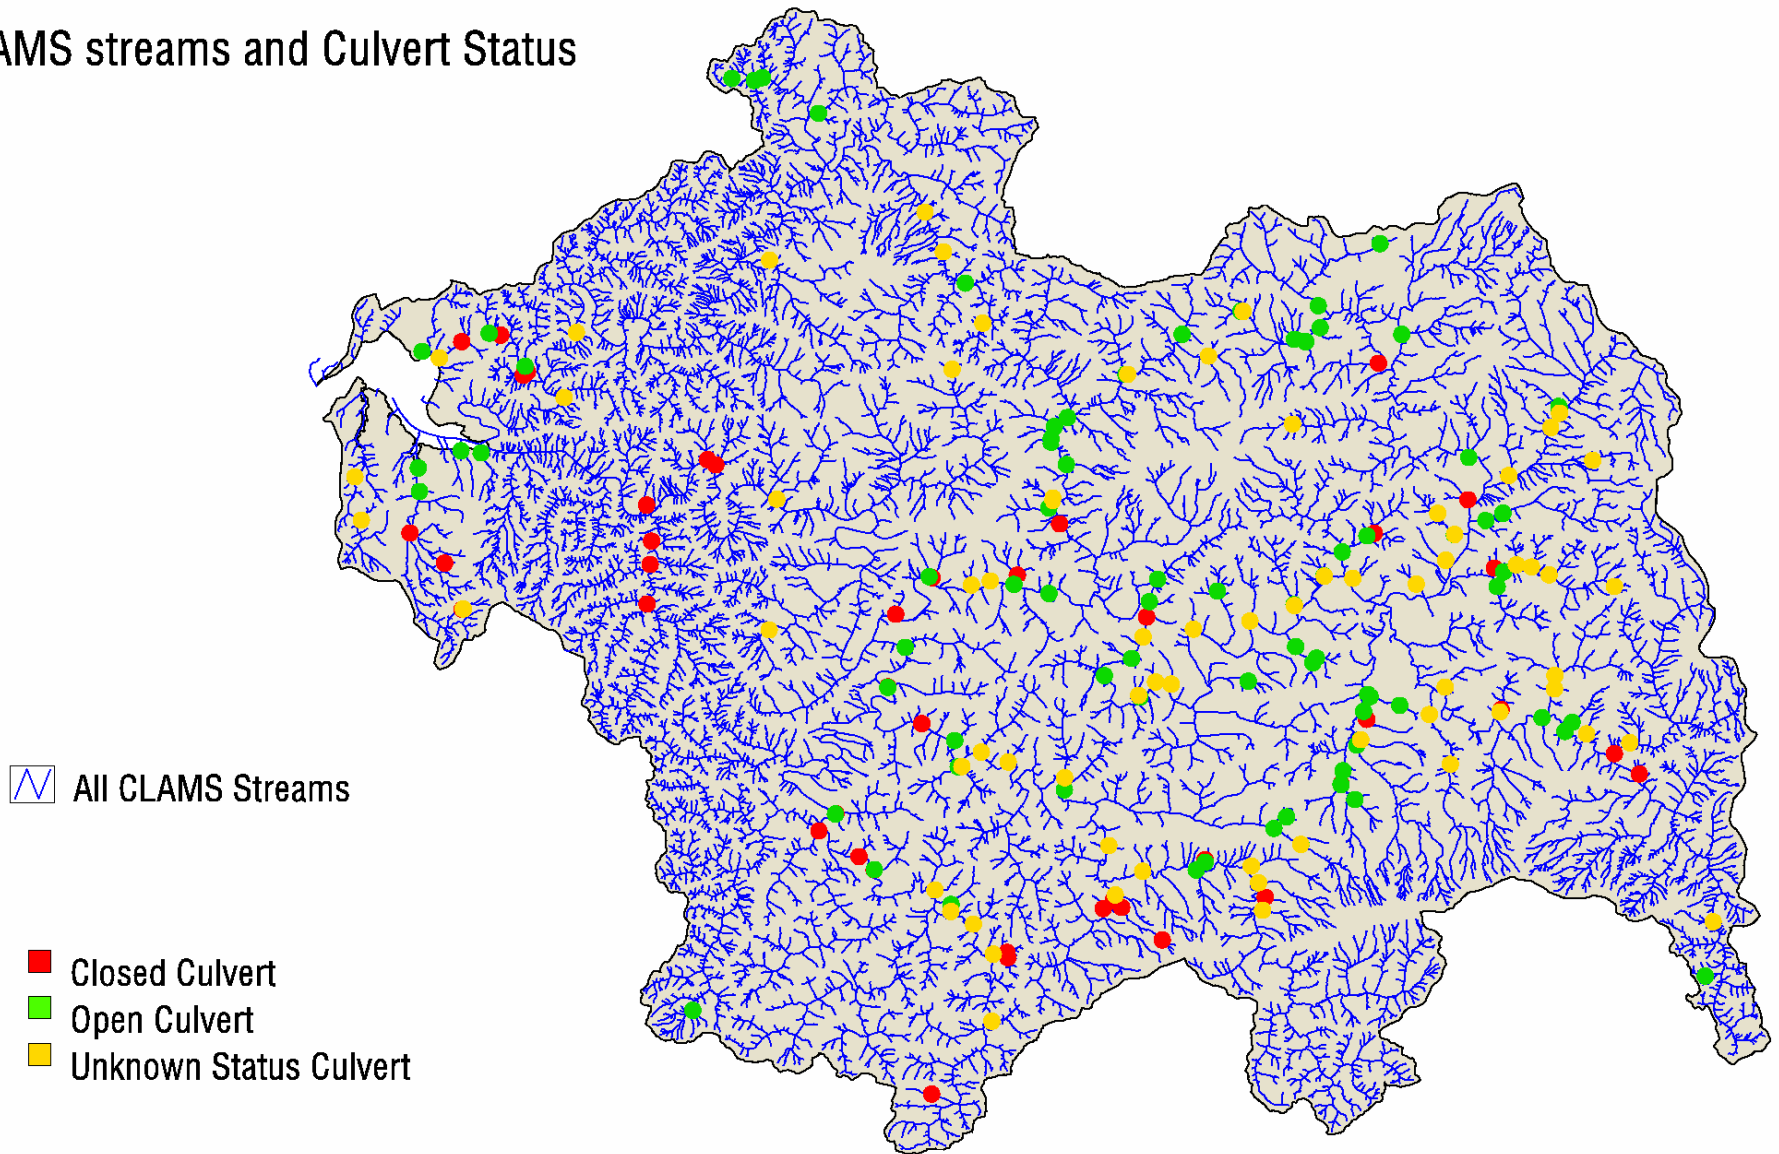

-  HIP streams
-  All CLAMS Streams

HIP streams = MAX_GRAD_D LE .0705 and COIPLT7 ge .8 and BARRIER = 0

DRAFT

CLAMS streams and Culvert Status

Draft August 2004

CLAMS streams and Culvert Status

 All CLAMS Streams

-  **Limited access**
-  Open Culvert
-  Unknown Status Culvert

CLAMS Streams above Open Culverts (‘UNKNOWN’ status culverts treated as open)

-  "Accessible" Streams
-  Streams Above Closed Culverts
-  Closed Culvert
-  Open Culvert
-  Unknown Status Culvert

CLAMS Streams above Open Culverts (‘UNKNOWN’ status culverts treated as closed)

-  "Accessible" Streams
-  Streams Above Closed Culverts
-  Closed Culvert
-  Open Culvert
-  Unknown Status Culvert

Strengths

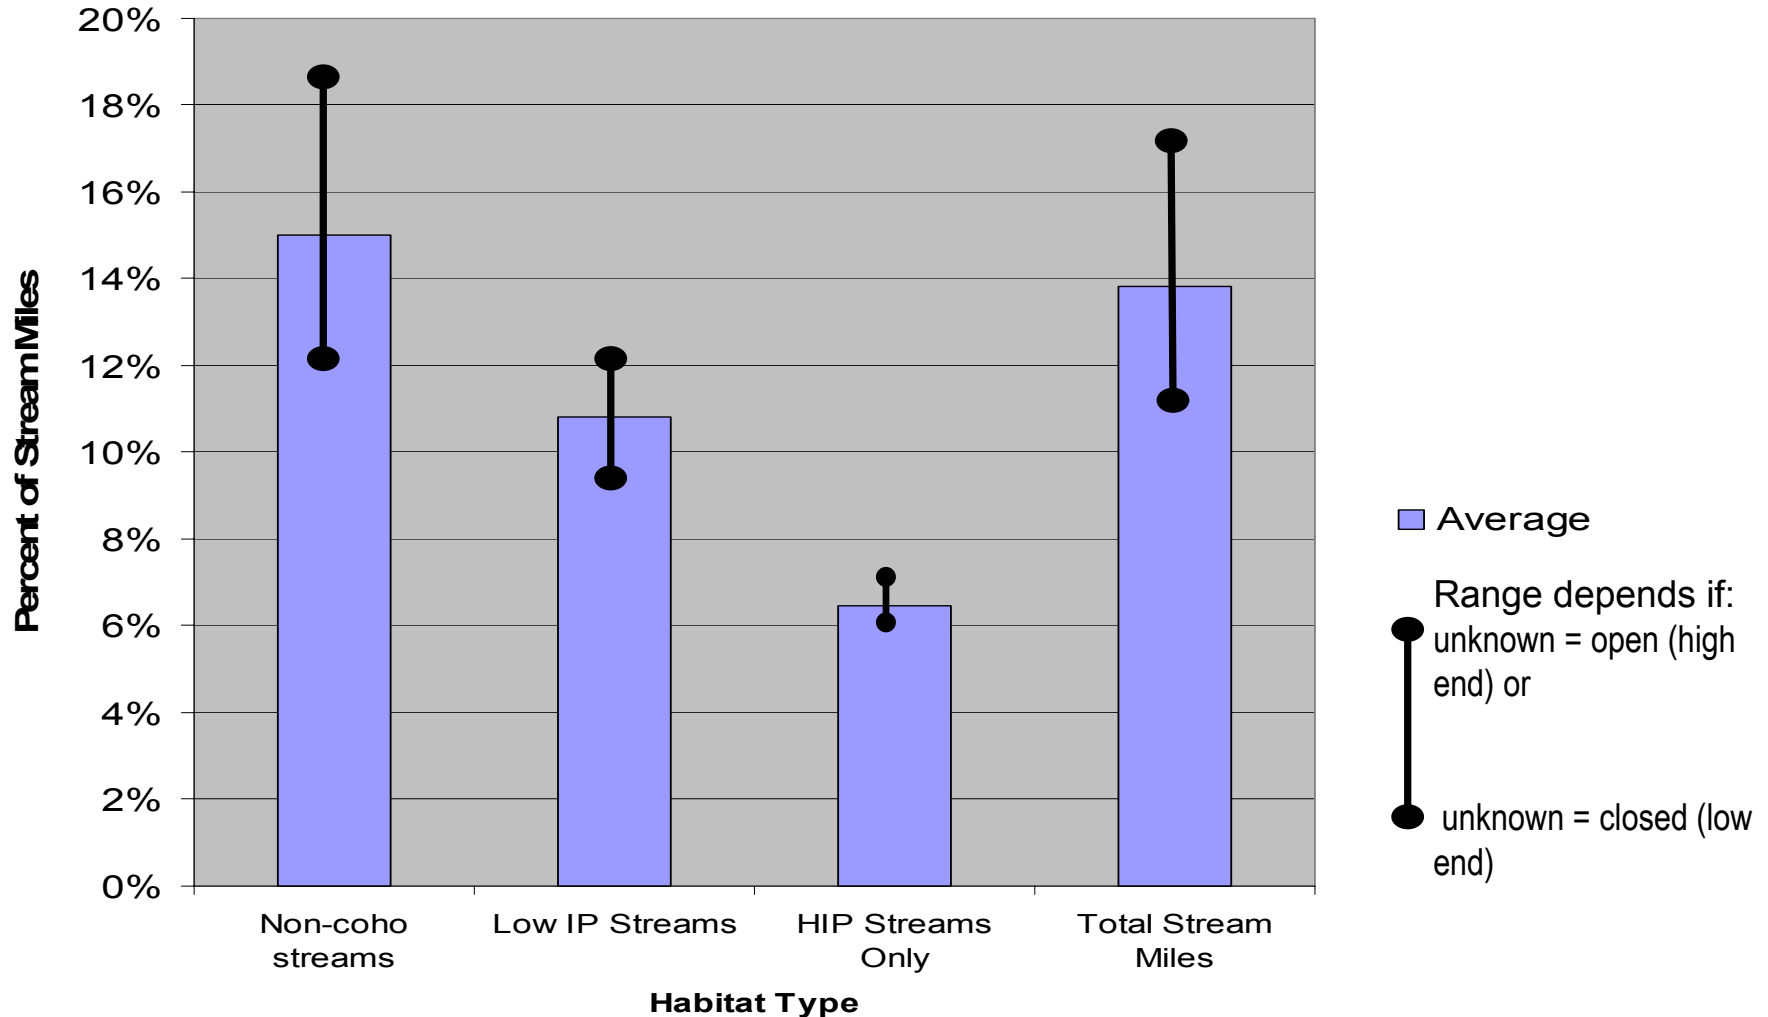

- The only data set of its kind at this scale
- Majority of crossings and barriers in Coho habitat
- Use of tool for future prioritization that can be adapted to other species

Limitations

- Don't have all data
- 22% could not be accurately located and were not included in the analysis
- Lumping into "limited"

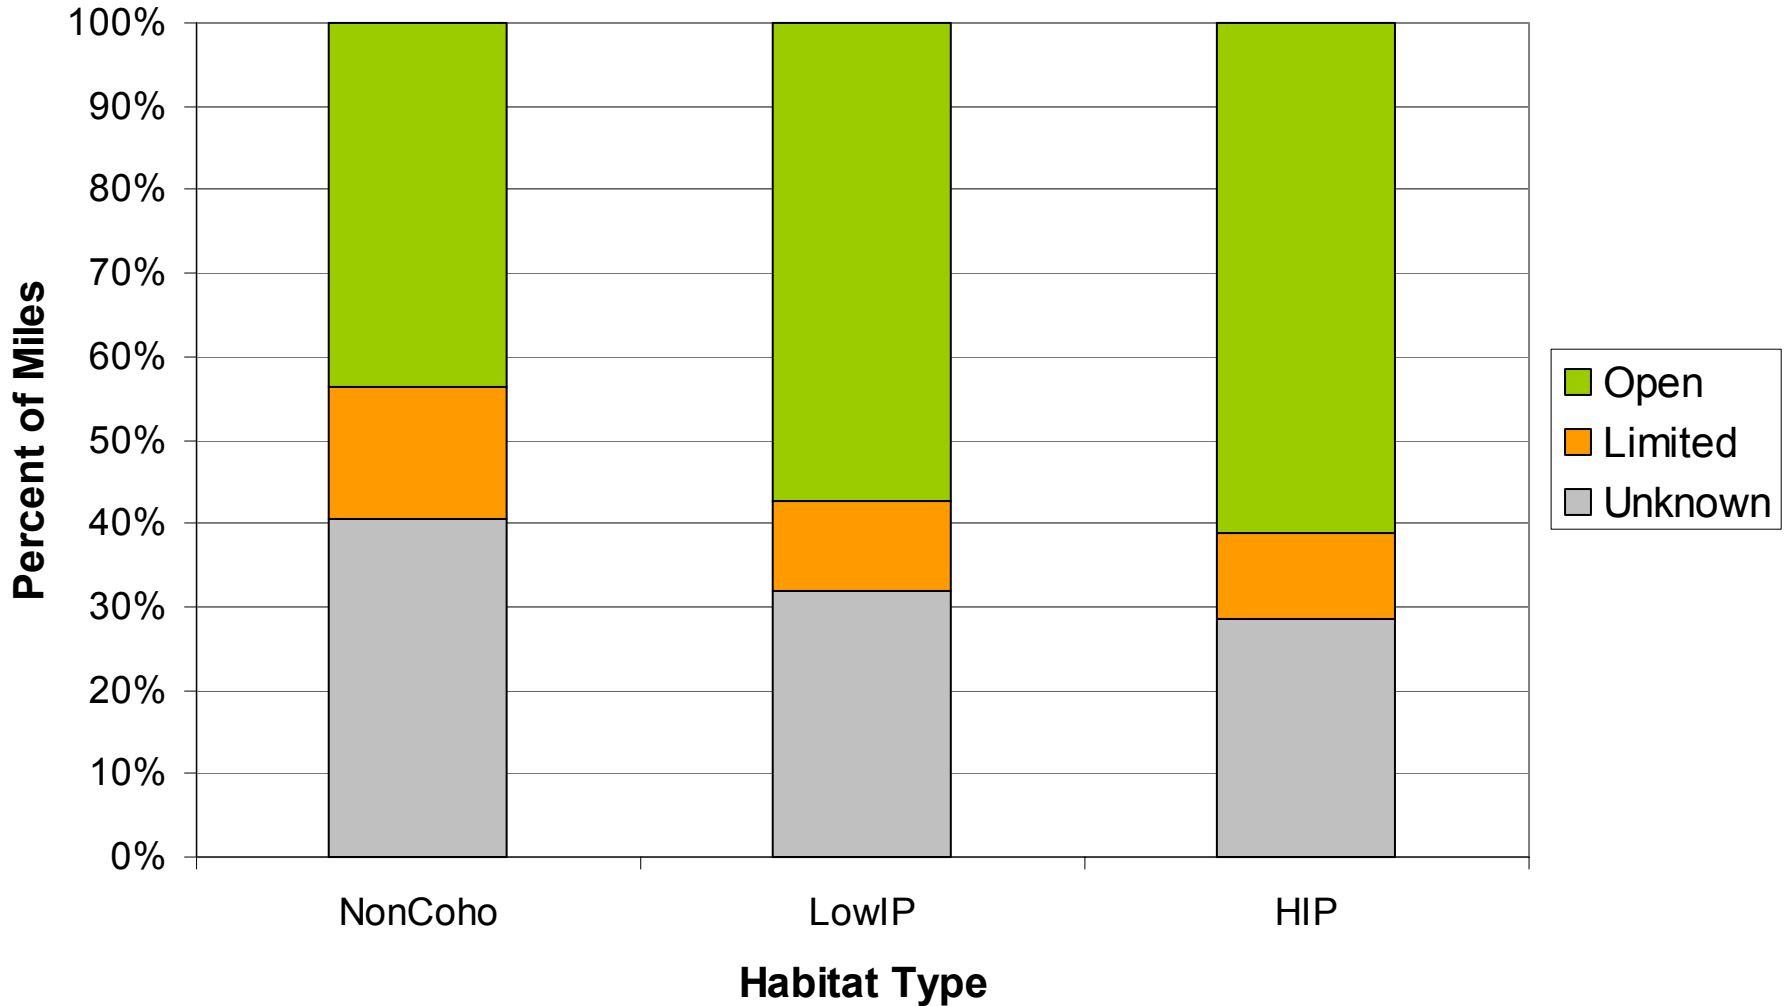

DRAFT

Percent of Stream Miles With Improved Access (OWEB Database 1997-2003)

DRAFT

**ESU: Percent of Stream Miles
Estimated Access By Habitat Type**

DRAFT

Percent of Stream Miles with Limited or Unknown Access

Non-Coho: 56%

- 16% limited
- 40% unknown

Low IP Streams: 43%

- 11% limited
- 32% unknown

HIP Streams: 38%

- 10% limited
- 28% unknown

DRAFT

Implementation and Effectiveness

Types of Barriers

- Natural Features such as:
 - waterfalls, steep channels, low flow
- Artificial Structures such as:
 - **stream crossings**, tide gates, hatchery facilities, and impoundments

DRAFT

Multiple Approaches to Improving Passage through Artificial Barriers

DRAFT

Draft August 2004

DRAFT

Draft August 2004

DRAFT

Implementation and Compliance

Existing Studies Provide Wide Range of Compliance

- 75% of culverts in forested basins are blockages or impediments (Conroy 1997)
- 23-28% of 1997/1998 installations low likelihood of passing juveniles (ODF 2000)
- 13% loss in coho summer rearing habitat (Beechie et al. 1994)

Implementation Under Oregon Plan

- 1,140 fish passage restoration projects reported since 1997 in the ESU
- Second Highest Restoration Investment (behind roads)

Draft August 2004

All OWEB Stream Crossings
Used in the Study

Estimated Implementation For ESU

(Dent et al. Draft)

- 43% pass fish
- 20% limit fish passage
- 37% with unknown access status

Draft August 2004

All Stream Crossings
Used in the Study

- Status = Open
- Status = Unknown
- Status = Closed

DRAFT

Effectiveness

DRAFT

Effectiveness of Fish Passage Strategies

Likely success based on physical attributes of crossing

Draft August 2004

DRAFT

**Evaluate actual
fish movement**

DRAFT

Greatest Likelihood to Pass Fish

Maintain or simulate natural stream bed

Effectiveness

Need more field studies on the effectiveness of these strategies over time:

- Actual fish passage
- Physical attributes

DRAFT

Conclusions

DRAFT

How significant is fish passage as a limiting factor for coho recovery?

Relatively small percent of coho streams remain inaccessible: (10 - 11%).

But, passage status is unknown for about 1/3 of coho streams.

Conclusions: Implementation

Projects to date have been fairly evenly distributed throughout coho and non-coho streams

- consider focused effort on coho streams.

Estimate that 43% of crossings pass fish at all life stages

Conclusions: Effectiveness

Oregon Plan activities have improved access to coho streams:

- High IP streams by 6%
- Low IP streams by 10%

DRAFT

Conclusions: Effectiveness

The greatest success with stream crossing projects is associated with stream simulation strategies
