

CRS Report for Congress

Received through the CRS Web

Net Neutrality: Background and Issues

Angele A. Gilroy
Specialist in Telecommunications
Resources, Science, and Industry

Summary

As the 109th Congress continues to debate telecommunications reform, a major point of contention is the question of whether action is needed to ensure unfettered access to the Internet. The move to place restrictions on the owners of the networks that compose and provide access to the Internet, to ensure equal access and non-discriminatory treatment, is referred to as “net neutrality.” There is no single accepted definition of “net neutrality.” However, most agree that any such definition should include the general principles that owners of the networks that compose and provide access to the Internet should not control how consumers lawfully use that network; and should not be able to discriminate against content provider access to that network. Concern over whether it is necessary to take steps to ensure access to the Internet for content, services, and applications providers, as well as consumers, and if so, what these should be, is a major focus in the debate over telecommunications reform. Some policymakers contend that more specific regulatory guidelines may be necessary to protect the marketplace from potential abuses which could threaten the net neutrality concept. Others contend that existing laws and FCC policies are sufficient to deal with potential anti-competitive behavior and that such regulations would have negative effects on the expansion and future development of the Internet. The issue of “net neutrality” is expected to remain in the forefront as the 109th Congress continues its debate over telecommunications reform. For information on legislative activity see CRS Issue Brief IB10045, *Broadband Internet Regulation and Access: Background and Issues*, by Angele A. Gilroy and Lennard G. Kruger. This report will be updated as events warrant.

Network Neutrality

As the 109th Congress continues to debate telecommunications reform, a major point of contention is the question of whether action is needed to ensure unfettered access to the Internet. The move to place restrictions on the owners of the networks that compose and provide access to the Internet, to ensure equal access and non-discriminatory treatment, is referred to as “net neutrality.” There is no single accepted definition of “net neutrality.” However, most agree that any such definition should include the general principles that owners of the networks that compose and provide access to the Internet should not control

how consumers lawfully use that network; and should not be able to discriminate against content provider access to that network.

What, if any, action should be taken to ensure “net neutrality” has become a major focal point in the debate over broadband, or high-speed Internet access, regulation. As the marketplace for broadband continues to evolve, some contend that no new regulations are needed, and if enacted will slow deployment of and access to the Internet, as well as limit innovation. Others, however, contend that the consolidation and diversification of broadband providers into content providers has the potential to lead to discriminatory behaviors which conflict with net neutrality principles. The two potential behaviors most often cited are the network providers’ ability to control access to and the pricing of broadband facilities, and the incentive to favor network-owned content, thereby placing unaffiliated content providers at a competitive disadvantage.¹

In 2005 two major actions dramatically changed the regulatory landscape as it applied to broadband services, further fueling the net neutrality debate. In both cases these actions led to the classification of broadband Internet access services as Title I information services, thereby subjecting them to a less rigorous regulatory framework than those services classified as telecommunications services. In the first action, the US Supreme Court, in a June 2005 decision (*National Cable & Telecommunications Association v. Brand X Internet Services*), upheld the Federal Communications Commission’s (FCC) 2002 ruling that the provision of cable modem service (i.e., cable television broadband Internet) is an interstate information service and is therefore subject to the less stringent regulatory regime under Title I of the Communications Act of 1934.² In a second action, the FCC in an August 5, 2005 decision, extended the same regulatory relief to telephone company Internet access services (i.e., wireline broadband Internet access, or DSL), thereby also defining such services as information services subject to Title I regulation.³ As a result neither telephone companies nor cable companies, when providing broadband services, are required to adhere to the more stringent regulatory regime for telecommunications services found under Title II (common carrier) of the 1934 Act.⁴ However, classification as an information service does not free the service from

¹ The practice of consumer tiering, that is the charging of different rates to subscribers based on access speed, is not the concern. Access tiering, that is the charging of different fees, or the establishment of different terms and conditions to content, services, or applications providers for access to the broadband pipe is the focus of the net neutrality policy debate.

² 47U.S.C. 151 et seq. For a full discussion of the Brand X decision see CRS Report RL32958, *Defining Cable Broadband Internet Access Service: Background and Analysis of the Supreme Court’s Brand X Decision*, by R. Eric Petersen and Sula P. Richardson.

For a summary of the final rule see *Appropriate Framework for Broadband Access to the Internet Over Wireline Facilities*. *Federal Register*, Vol. 70, No. 199, October, 17, 2005, p. 60222.

⁴ For example, Title II regulations impose rigorous anti-discrimination, interconnection and access requirements. For a further discussion of Title I versus Title II regulatory authority see CRS Report RL32958, cited above.

regulation. The FCC continues to have regulatory authority over information services under its Title I, ancillary jurisdiction.⁵

Simultaneous to the issuing of its August 2005 information services classification order, the FCC also adopted a policy statement outlining the following four principles to “encourage broadband deployment and preserve and promote the open and interconnected nature of [the] public Internet:” 1) consumers are entitled to access the lawful Internet content of their choice; 2) consumers are entitled to run applications and services of their choice (subject to the needs of law enforcement); 3) consumers are entitled to connect their choice of legal devices that do not harm the network; and 4) consumers are entitled to competition among network providers, application and service providers, and content providers. These principles have no legal force and FCC Chairman Martin has not called for their codification. However, he stated that they will be incorporated into the policymaking activities of the Commission.⁶

Network Prioritization

As consumers expand their use of the Internet and new multimedia and voice services become more commonplace, control over network quality also becomes an issue. In the past, Internet traffic has been delivered on a “best efforts” basis. The quality of service needed for the delivery of the most popular uses, such as email or surfing the Web, is not as dependent on guaranteed quality. However, as Internet use expands to include video, online gaming, and voice service, the need for uninterrupted streams of data becomes important. As the demand for such services continues to expand, network broadband operators are moving to prioritize network traffic to ensure the quality of these services. Prioritization may benefit consumers by ensuring faster delivery and quality of service and may be necessary to ensure the proper functioning of expanded service options. However, the move on the part of network operators to establish prioritized networks, while embraced by some, has led to a number of policy concerns.

There is concern that the ability of network providers to prioritize traffic may give them too much power over the operation of and access to the Internet. If a multi-tiered Internet develops where content providers pay for different service levels, the potential to limit competition exists, if smaller, less financially secure content providers are unable to afford to pay for a higher level of access. Also, if network providers have control over who is given priority access, the ability to discriminate among who gets such access is also present. If such a scenario were to develop, the potential benefits to consumers of a prioritized network would be lessened by a decrease in consumer choice and/or increased costs, if the fees charged for premium access are passed on to the consumer. The potential for these abuses, however, is significantly decreased in a marketplace where multiple, competing broadband providers exist. If a network broadband provider blocks access to

⁵ Title I of the 1934 Communications Act gives the FCC such authority if assertion of jurisdiction is “reasonably ancillary to the effective performance of [its] various responsibilities.” The FCC in its order, cites consumer protection, network reliability, or national security obligations as examples of cases where such authority would apply (see paragraph 36 of the final rule summarized in the *Federal Register* cite in footnote 3, above).

⁶ See [<http://www.fcc.gov/headlines2005.html>]. August 5, 2005. *FCC Adopts Policy Statement on Broadband Internet Access*.

content or charges unreasonable fees, in a competitive market, content providers and consumers could obtain their access from other network providers. As consumers and content providers migrate to competitors, market share and profits of the offending network provider will decrease leading to corrective action or failure. However, this scenario assumes that every market will have a number of equally competitive broadband options from which to choose, and all competitors will have equal access to, if not identical, at least comparable content.

Despite the FCC's ability to regulate broadband services under its Title I ancillary authority and the issuing of its broadband principles, some policymakers feel that more specific regulatory guidelines may be necessary to protect the marketplace from potential abuses; a consensus on what these should entail, however, has yet to form. Others feel that existing laws and FCC policies regarding competitive behavior are sufficient to deal with potential anti-competitive behavior and that no action is needed and if enacted at this time, could result in harm.

The Congressional Debate

The issue of net neutrality, and whether legislation is needed to ensure access to broadband networks and services, has become a major focal point in the debate over telecommunications reform.⁷ Those opposed to the enactment of legislation to impose specific Internet network access or "net neutrality" mandates claim that such action goes against the long standing policy to keep the Internet as free as possible from regulation. The imposition of such requirements, they state, is not only unnecessary, but would have negative consequences for the deployment and advancement of broadband facilities. For example, further expansion of networks by existing providers and the entrance of new network providers, would be discouraged, they claim, as investors would be less willing to finance networks that may be operating under mandatory build-out and/or access requirements. Application innovation could also be discouraged, they contend, if, for example, network providers are restricted in the way they manage their networks or are limited in their ability to offer new service packages or formats. Such legislation is not needed, they claim, as major Internet access providers have stated publicly that they are committed to upholding the FCC's four policy principles.⁸ Opponents also state that advocates of regulation cannot point to any widespread behavior that justifies the need to establish such regulations and note that competition between telephone and cable system providers, as well as the growing presence of new technologies (e.g., satellite, wireless, and power lines) will serve to counteract any potential anti-discriminatory behavior. Furthermore, opponents claim, even if such a violation should occur, the FCC already has the needed authority to pursue violators. They note that the FCC has not requested further

⁷ For a more lengthy discussion regarding proponents' and opponents' views see, for example, testimony from Senate Commerce Committee hearings on Net Neutrality, February 7, 2006; [<http://commerce.senate.gov/hearings/witnesslist.cfm?id=1705>].

⁸ See testimony of Kyle McSlarrow, President and CEO of the National Cable and Telecommunications Association and Walter McCormick, President and CEO of the United States Telecom Association, hearing on Net Neutrality before the Senate Commerce Committee, February 7, 2006; [<http://commerce.senate.gov/hearings/witnesslist.cfm?id=1705>].

authority⁹ and has successfully used its existing authority, in a March 3, 2005, action. In that case, the FCC intervened and resolved, through a consent decree, an alleged case of port blocking by Madison River Communications, a local exchange (telephone) company.¹⁰ The full force of antitrust law is also available, they claim, in cases of discriminatory behavior.

Proponents of net neutrality legislation, however, feel that absent some regulation, Internet access providers will become gatekeepers and use their market power to the disadvantage of Internet users and competing content and application providers. They cite concerns that the Internet could develop into a two-tiered system favoring large, established businesses or those with ties to broadband network providers. While market forces should be a deterrent to such anti-competitive behavior, they point out that today's market for broadband delivery is largely dominated by only two providers, the telephone and cable television companies, and that, at a minimum, a strong third player is needed to ensure that the benefits of competition will prevail.¹¹ The need to formulate a national policy to clarify expectations and ensure the "openness" of the Internet is important to protect the benefits and promote the further expansion of broadband, they claim. The adoption of a single, coherent, regulatory framework to prevent discrimination, supporters claim, would be a positive step for further development of the Internet, by providing the marketplace stability needed to encourage investment and foster the growth of new services and applications. Furthermore, relying on current laws and case-by-case anti-trust-like enforcement, they claim, is too cumbersome, slow, and expensive, particularly for small start-up enterprises.¹²

⁹ FCC Chairman Martin has indicated that the FCC has the necessary tools to uphold the FCC's stated policy principles and has not requested additional authority. Furthermore, Chairman Martin has stated that he is "... confident that the marketplace will continue to ensure that these principles are maintained" and is "... confident therefore, that regulation is not, nor will be, required." See *Chairman Kevin J. Martin Comments on Commission Policy Statement*, at [http://hraunfoss.fcc.gov/edocs_public/attachmatch/DOC-260435A2.pdf]. However, FCC Commissioner Copps, in an April 3, 2006 speech, did express concerns over the concentration in broadband facilities providers and their "... ability, and possibly even the incentive, to act as Internet gatekeepers..." and called for a "national policy" on "... issues regarding consumer rights, Internet openness, and broadband deployment." See [http://hraunfoss.fcc.gov/edocs_public/attachmatch/DOC-264765A1.pdf], for a copy of Commissioner Copps' speech.

¹⁰ The FCC entered into a consent decree with Madison River Communications to settle charges that the company had deliberately blocked the ports on its network that were used by Vonage Corp. to provide voice over Internet protocol (VoIP) service. Under terms of the decree Madison River agreed to pay a \$15,000 fine and not block ports used for VoIP applications. See [http://hraunfoss.fcc.gov/edocs_public/attachmatch/DA-05-543A2.pdf]. for a copy of the consent decree.

View report at [http://hraunfoss.fcc.gov/edocs_public/attachmatch/DOC-264744A1.pdf].

¹² For example, see testimony of Vint Cerf, VP Google, Earl Comstock, President and CEO of CompTel, and Jeffrey Citron, Chairman and CEO Vonage, hearing on Net Neutrality, before the Senate Commerce Committee, February 7, 2006; [<http://commerce.senate.gov/hearings/witnesslist.cfm?id=1705>].

Outlook

Concern over whether it is necessary to take steps to ensure access to the Internet for content, services, and applications providers, and consumers, and if so, what these should be, has become a major focus in the debate over telecommunications reform. Both the House and Senate Commerce Committees have examined the issue in conjunction with their efforts to revise existing telecommunications law. Legislation has been introduced in both the House and Senate that offers a wide range of approaches relating to the net neutrality issue.¹³ (For information on legislative activity see CRS Issue Brief IB10045, *Broadband Internet Regulation and Access: Background and Issues*.) Some have also called on a strong role for antitrust enforcement to address the net neutrality debate. The House Judiciary Committee's Telecommunications and Antitrust Task Force held an oversight hearing, on April 25, 2006, to explore net neutrality issues relating to competition, innovation, and nondiscriminatory access.¹⁴ While a consensus on this issue has not yet formed, the debate over net neutrality is expected to remain in the forefront as the 109th Congress continues to address the broader issue of telecommunications reform.
