radiation treatment to patients. Linear accelerators, used in a procedure called external beam therapy, project high-energy x-rays at targeted cancer cells. As the x-rays collide with human tissue, they produce highly energized ions that can shrink and eliminate cancerous tumors. Radiation therapy sometimes is used as the sole treatment for cancer, but usually is used in conjunction with chemotherapy or surgery.

The first step in the radiation treatment process is called simulation. During simulation, a radiation therapist uses an x-ray imaging machine to pinpoint the location of the tumor. The therapist also may use a computerized tomography or CT scan to help determine how best to direct the radiation to minimize damage to healthy tissue. The therapist then positions the patient and adjusts the linear accelerator so that, during treatment, radiation exposure is concentrated on the tumor cells. The radiation therapist then develops a treatment plan in conjunction with a radiation oncologist (a physician who specializes in therapeutic radiology), and a dosimetrist (a technician who calculates the dose of radiation that will be used for treatment). The therapist later explains the treatment plan to the patient and answers any questions that the patient may have.

After simulation, the radiation therapist positions the patient and adjusts the linear accelerator to mirror the conditions that were established in simulation. Then the therapist leaves the room to administer the radiation treatment. From a separate room that is protected from the x-ray radiation, the therapist operates the linear accelerator and monitors the patient's condition through a TV monitor and an intercom system. Treatment can take anywhere from 10 to 30 minutes and is usually administered once a day, 5 days a week, for a period of 2 to 9 weeks.

During the treatment phase, the radiation therapist monitors the patient's physical condition to determine if any adverse side effects are taking place. In addition, the therapist must be aware of the patient's emotional condition. Because many patients are under stress, and are emotionally fragile, it is important for the therapist to maintain a positive attitude and provide emotional support. Radiation therapists also must keep detailed records of their patients' treatments. These records include information such as the dose of radiation used for each treatment, the total amount of radiation used to date, the area treated, and the patient's reactions. Radiation oncologists and dosimetrists review these records to ensure that the treatment plan is working, to monitor the amount of radiation exposure that the patient has received, and to keep unwanted side effects to a minimum.

Radiation therapists also assist medical radiation physicists, who keep the linear accelerator working. Because radiation therapists often work alone during the treatment phase, they need to be able to check the linear accelerator for problems and make any adjustments that are needed. Therapists also may assist dosimetrists, who calculate the amount of radiation for each treatment. Therapists may perform the routine aspects of this process, called dosimetry, which involves complex mathematical computations.

Working Conditions

Radiation therapists work in hospitals or in cancer treatment centers. These places are clean, well lighted, and well ventilated. Therapists do a considerable amount of lifting and must be able to help disabled patients get on and off treatment tables. Therapists also work on their feet most of the time. Therapists generally work 40 hours a week, and, unlike other health care occupations, they normally work only during the day. However, because radiation therapy emergencies do occur, some therapists are required to be on call and may have to work outside of their normal hours.

Because they work around radioactive materials, radiation therapists take great care to ensure that they are not exposed to

Radiation therapists use machines called linear accelerators to administer radiation treatment to patients.

dangerous levels of radiation. Following standard safety procedures can prevent overexposure.

Training, Other Qualifications, and Advancement

Employers generally require applicants to complete an associate or a bachelor's degree program in radiation therapy. Individuals also may become qualified by completing an associate or a bachelor's degree program in radiography, which is the study of radiological imaging, and then completing a 12-month certificate program in radiation therapy. Radiation therapy programs have core courses on radiation therapy procedures and the scientific theories behind these procedures. In addition, such programs often include courses on human anatomy, human physiology, physics, algebra, precalculus, writing, public speaking, computer science, and research methodology.

Some States require that radiation therapists be licensed by a State accrediting board. Some States, as well as many employers, also require that radiation therapists be certified by the American Registry of Radiologic Technologists (ARRT). In order to become ARRT-certified, an applicant needs to complete an accredited radiation therapy program, adhere to ARRT ethical standards, and pass the ARRT certification examination. In 2005 there were 94 accredited radiation therapy programs. While enrolled in an accredited radiation therapy program, students who wish to become ARRT-certified must take classes that are related to the subject matter of the certification examination. The certification examination

covers radiation protection and quality assurance, clinical concepts in radiation oncology, treatment planning, treatment delivery, and patient care and education. Candidates also must demonstrate competency in several clinical practices, which include patient care activities; simulation procedures; dosimetry calculations; fabrication of beam modification devices; low-volume, high-risk procedures; and radiation treatment procedures.

AART certification is valid for 1 year, after which therapists must renew their certification. Requirements for renewal include abiding by the ARRT ethical standards, paying the annual dues, and satisfying the continuing education requirements. Continuing education requirements must be met every 2 years and include either the completion of 24 credits of radiation therapy-related courses or the successful attainment of ARRT certification in a discipline other than radiation therapy. Renewed certification, however, may not be required by all States or employers that require initial certification.

Individuals interested in becoming radiation therapists should be psychologically capable of working with cancer patients. They should be caring and empathetic because they work with patients who are ill and under stress. Individuals also need good communication skills because their work involves a great deal of patient interaction. They should be able to keep accurate, detailed records. They also should be physically fit because they work on their feet for long periods and lift and move disabled patients.

Experienced radiation therapists may advance to manage radiation therapy programs in treatment centers or other health care facilities. Managers generally continue to treat patients while taking on management responsibilities. Other advancement opportunities include teaching, technical sales, and research. With additional training and certification, therapists also can become dosimetrists, who use complex mathematical formulas to calculate proper radiation doses.

Employment

Radiation therapists held about 15,000 jobs in 2004. About 84 percent worked in the health care industry, primarily in hospitals and in physicians' offices. Another 13 percent worked for State and local governments.

Job Outlook

Good job opportunities are expected. Applicants who are certified and who possess a bachelor's or an associate degree or a certificate in radiation therapy should have the best prospects.

Employment of radiation therapists is projected to grow faster than the average for all occupations during the 2004-14 period. As the U.S. population grows and ages, demand will increase for radiation treatment. As radiation technology advances, radiation treatment will be prescribed for an increasing proportion of cancer patients. In addition to new jobs created over the projection period, a number of job openings will result as experienced radiation therapists retire or leave the occupation for other reasons.

Earnings

The median annual earnings of radiation therapists in May 2004 were \$57,700. The middle 50 percent earned between \$47,380 and \$69,650. The lowest 10 percent earned less than \$38,550, and the highest 10 percent earned more than \$83,340. Some employers also reimburse their employees for the cost of continuing education.

Related Occupations

Radiation therapists use advanced machinery to administer medical treatment to patients. Other occupations that perform similar duties include radiation technologists and technicians, diagnostic medical sonographers, nuclear medicine technicians, dental hygienists,

respiratory therapists, physical therapy assistants and aides, registered nurses, and physicians and surgeons.

Besides radiation therapists, occupations that build relationships with patients and provide them with emotional support include nursing, psychiatric, and home health aides; counselors; psychologists; social workers; and social and human service assistants.

Recreational Therapists

(O*NET 29-1125.00)

Significant Points

- Overall employment of recreational therapists is expected to grow more slowly than the average for all occupations, but employment of therapists who work in community care facilities for the elderly and in residential mental retardation, mental health, and substance abuse facilities should grow faster than the average.
- Opportunities should be best for persons with a bachelor's degree in therapeutic recreation, or in recreation with a concentration in therapeutic recreation.
- Recreational therapists should be comfortable working with persons who are ill or who have disabilities.

Nature of the Work

Recreational therapists, also referred to as *therapeutic recreation specialists*, provide treatment services and recreation activities to individuals with disabilities or illnesses. Using a variety of techniques, including arts and crafts, animals, sports, games, dance and movement, drama, music, and community outings, therapists treat and maintain the physical, mental, and emotional well-being of their clients. Therapists help individuals reduce depression, stress, and anxiety; recover basic motor functioning and reasoning abilities; build confidence; and socialize effectively so that they can enjoy greater independence, as well as reduce or eliminate the effects of their illness or disability. In addition, therapists help integrate people with disabilities into the community by teaching them how to use community resources and recreational activities. Recreational therapists should not be confused with recreation workers, who organize recreational activities primarily for enjoyment. (Recreation workers are discussed elsewhere in the *Handbook*.)

In acute health care settings, such as hospitals and rehabilitation centers, recreational therapists treat and rehabilitate individuals with specific health conditions, usually in conjunction or collaboration with physicians, nurses, psychologists, social workers, and physical and occupational therapists. In long-term and residential care facilities, recreational therapists use leisure activities—especially structured group programs—to improve and maintain their clients' general health and well-being. They also may provide interventions

to prevent the client from suffering further medical problems and complications related to illnesses and disabilities.

Recreational therapists assess clients on the basis of information the therapists learn from standardized assessments, observations, medical records, the medical staff, the clients' families, and the clients themselves. They then develop and carry out therapeutic interventions consistent with the clients' needs and interests. For example, clients who are isolated from others or who have limited social skills may be encouraged to play games with others, and right-handed persons with right-side paralysis may be instructed in how to adapt to using their unaffected left side to throw a ball or swing a racket. Recreational therapists may instruct patients in relaxation techniques to reduce stress and tension, stretching and limbering exercises, proper body mechanics for participation in recreational activities, pacing and energy conservation techniques, and individual as well as team activities. In addition, therapists observe and document a patient's participation, reactions, and progress.

Community-based recreational therapists may work in park and recreation departments, special-education programs for school districts, or programs for older adults and people with disabilities. Included in the last group are programs and facilities such as assisted-living, adult day care, and substance abuse rehabilitation centers. In these programs, therapists use interventions to develop specific skills, while providing opportunities for exercise, mental stimulation, creativity, and fun. Although most therapists are employed in other areas, those who work in schools help counselors, teachers, and parents address the special needs of students, including easing disabled students' transition into adult life.

Working Conditions

Recreational therapists provide services in special activity rooms, but also plan activities and prepare documentation in offices. When working with clients during community integration programs, they may travel locally to instruct the clients regarding the accessibility of public transportation and other public areas, such as parks, playgrounds, swimming pools, restaurants, and theaters.

Therapists often lift and carry equipment, as well as lead recreational activities. Recreational therapists generally work a 40-hour week that may include some evenings, weekends, and holidays.

Training, Other Qualifications, and Advancement

A bachelor's degree in therapeutic recreation, or in recreation with a concentration in therapeutic recreation, is the usual requirement for

Using a variety of techniques, including games, recreational therapists treat clients and maintain their well-being.

entry-level positions. Persons may qualify for paraprofessional positions with an associate degree in therapeutic recreation or a health care related field. An associate degree in recreational therapy; training in art, drama, or music therapy; or qualifying work experience may be sufficient for activity director positions in nursing homes.

Approximately 150 programs prepare students to become recreational therapists. Most offer bachelor's degrees, although some also offer associate, master's, or doctoral degrees. Programs include courses in assessment, treatment and program planning, intervention design, and evaluation. Students also study human anatomy, physiology, abnormal psychology, medical and psychiatric terminology, characteristics of illnesses and disabilities, professional ethics, and the use of assistive devices and technology.

Although certification is usually voluntary, most employers prefer to hire candidates who are certified therapeutic recreation specialists. The National Council for Therapeutic Recreation Certification is the certifying agency. To become certified, specialists must have a bachelor's degree, pass a written certification examination, and complete an internship of at least 480 hours. Additional requirements apply in order to maintain certification and to recertify. Some States require licensure or certification to practice recreational therapy.

Recreational therapists should be comfortable working with persons who are ill or who have disabilities. Therapists must be patient, tactful, and persuasive when working with people who have a variety of special needs. Ingenuity, a sense of humor, and imagination are needed to adapt activities to individual needs, and good physical coordination is necessary to demonstrate or participate in recreational activities.

Therapists may advance to supervisory or administrative positions. Some teach, conduct research, or consult for health or social services agencies.

Employment

Recreational therapists held about 24,000 jobs in 2004. About 6 out of 10 were in nursing care facilities and hospitals. Others worked in State and local government agencies and in community care facilities for the elderly, including assisted-living facilities. The rest worked primarily in residential mental retardation, mental health, and substance abuse facilities; individual and family services; Federal Government agencies; educational services; and outpatient care centers. Only a small number of therapists were self-employed, generally contracting with long-term care facilities or community agencies to develop and oversee programs.

Job Outlook

Overall employment of recreational therapists is expected to grow more slowly than the average for all occupations through the year 2014. In nursing care facilities—the largest industry employing recreational therapists—employment will grow slightly faster than the occupation as a whole as the number of older adults continues to grow. Employment is expected to decline, however, in hospitals as services shift to outpatient settings and employers emphasize cost containment. Fast employment growth is expected in the residential and outpatient settings that serve disabled persons, the elderly, or those diagnosed with mental retardation, mental illness, or substance abuse problems. Among these settings are community care facilities for the elderly (including assisted-living facilities); residential mental retardation, mental health, and substance abuse facilities; and facilities that provide individual and family services (such as day care centers for disabled persons and the elderly). Opportunities should be best for persons with a bachelor's degree in therapeutic recreation or in recreation with an option in therapeutic recreation. Opportunities

also should be good for therapists who hold specialized certifications, for example, in, aquatic therapy, meditation, or crisis intervention.

Health care facilities will support a growing number of jobs in adult day care and outpatient programs offering short-term mental health and alcohol or drug abuse services. Rehabilitation, home health care, and transitional programs will provide additional jobs.

The rapidly growing number of older adults is expected to spur job growth for recreational therapy professionals and paraprofessionals in assisted-living facilities, adult day care programs, and other social assistance agencies. Continued growth also is expected in community residential care facilities, as well as in day care programs for individuals with disabilities.

Earnings

Median annual earnings of recreational therapists were \$32,900 in May 2004. The middle 50 percent earned between \$25,520 and \$42,130. The lowest 10 percent earned less than \$20,130, and the highest 10 percent earned more than \$51,800. In May 2004, median annual earnings for recreational therapists were \$28,130 in nursing care facilities.

Related Occupations

Recreational therapists primarily design activities to help people with disabilities lead more fulfilling and independent lives. Other workers who have similar jobs are occupational therapists, physical therapists, recreation workers, and rehabilitation counselors.

Registered Nurses

(O*NET 29-1111.00)

Significant Points

- Registered nurses constitute the largest health care occupation, with 2.4 million jobs.
- About 3 out of 5 jobs are in hospitals.
- The three major educational paths to registered nursing are a bachelor's degree, an associate degree, and a diploma from an approved nursing program.
- Registered nurses are projected to create the second largest number of new jobs among all occupations; job opportunities in most specialties and employment settings are expected to be excellent, with some employers reporting difficulty in attracting and retaining enough RNs.

Nature of the Work

Registered nurses (RNs), regardless of specialty or work setting, perform basic duties that include treating patients, educating patients

and the public about various medical conditions, and providing advice and emotional support to patients' family members. RNs record patients' medical histories and symptoms, help to perform diagnostic tests and analyze results, operate medical machinery, administer treatment and medications, and help with patient follow-up and rehabilitation.

RNs teach patients and their families how to manage their illness or injury, including post-treatment home care needs, diet and exercise programs, and self-administration of medication and physical therapy. Some RNs also are trained to provide grief counseling to family members of critically ill patients. RNs work to promote general health by educating the public on various warning signs and symptoms of disease and where to go for help. RNs also might run general health screening or immunization clinics, blood drives, and public seminars on various conditions.

RNs can specialize in one or more patient care specialties. The most common specialties can be divided into roughly four categories—by work setting or type of treatment; disease, ailment, or condition; organ or body system type; or population. RNs may combine specialties from more than one area—for example, pediatric oncology or cardiac emergency—depending on personal interest and employer needs.

RNs may specialize by work setting or by type of care provided. For example, *ambulatory care nurses* treat patients with a variety of illnesses and injuries on an outpatient basis, either in physicians' offices or in clinics. Some ambulatory care nurses are involved in telehealth, providing care and advice through electronic communications media such as videoconferencing or the Internet. *Critical care nurses* work in critical or intensive care hospital units and provide care to patients with cardiovascular, respiratory, or pulmonary failure. *Emergency, or trauma, nurses* work in hospital emergency departments and treat patients with life-threatening conditions caused by accidents, heart attacks, and strokes. Some emergency nurses are flight nurses, who provide medical care to patients who must be flown by helicopter to the nearest medical facility. *Holistic nurses* provide care such as acupuncture, massage and aroma therapy, and biofeedback, which are meant to treat patients' mental and spiritual health in addition to their physical health. *Home health care nurses* provide at-home care for patients who are recovering from surgery, accidents, and childbirth. *Hospice and palliative care nurses* provide care for, and help ease the pain of, terminally ill patients outside of hospitals. *Infusion nurses* administer medications, fluids, and blood to patients through injections into patients' veins. *Long-term care nurses* provide medical services on a recurring basis to patients with chronic physical or mental disorders. *Medical-surgical nurses* provide basic medical care to a variety of patients in all health settings. *Occupational health nurses* provide treatment for job-related injuries and illnesses and help employers to detect workplace hazards and implement health and safety standards. *Perianesthesia nurses* provide preoperative and postoperative care to patients undergoing anesthesia during surgery. *Perioperative nurses* assist surgeons by selecting and handling instruments, controlling bleeding, and suturing incisions. Some of these nurses also can specialize in plastic and reconstructive surgery. *Psychiatric nurses* treat patients with personality and mood disorders. *Radiologic nurses* provide care to patients undergoing diagnostic radiation procedures such as ultrasounds and magnetic resonance imaging. *Rehabilitation nurses* care for patients with temporary and permanent disabilities. *Transplant nurses* care for both transplant recipients and living donors and monitor signs of organ rejection.

RNs specializing in a particular disease, ailment, or condition are employed in virtually all work settings, including physicians' offices, outpatient treatment facilities, home health care agencies, and hospitals. For instance, *addictions nurses* treat patients seeking

help with alcohol, drug, and tobacco addictions. *Developmental disabilities nurses* provide care for patients with physical, mental, or behavioral disabilities; care may include help with feeding, controlling bodily functions, and sitting or standing independently. *Diabetes management nurses* help diabetics to manage their disease by teaching them proper nutrition and showing them how to test blood sugar levels and administer insulin injections. *Genetics nurses* provide early detection screenings and treatment of patients with genetic disorders, including cystic fibrosis and Huntington's disease. *HIV/AIDS nurses* care for patients diagnosed with HIV and AIDS. *Oncology nurses* care for patients with various types of cancer and may administer radiation and chemotherapies. Finally, *wound, ostomy, and continence nurses* treat patients with wounds caused by traumatic injury, ulcers, or arterial disease; provide post-operative care for patients with openings that allow for alternative methods of bodily waste elimination; and treat patients with urinary and fecal incontinence.

RNs specializing in treatment of a particular organ or body system usually are employed in specialty physicians' offices or outpatient care facilities, although some are employed in hospital specialty or critical care units. For example, *cardiac and vascular nurses* treat patients with coronary heart disease and those who have had heart surgery, providing services such as postoperative rehabilitation. *Dermatology nurses* treat patients with disorders of the skin, such as skin cancer and psoriasis. *Gastroenterology nurses* treat patients with digestive and intestinal disorders, including ulcers, acid reflux disease, and abdominal bleeding. Some nurses in this field also specialize in endoscopic procedures, which look inside the gastrointestinal tract using a tube equipped with a light and a camera that can capture images of diseased tissue. *Gynecology nurses* provide care to women with disorders of the reproductive system, including endometriosis, cancer, and sexually transmitted diseases. *Nephrology nurses* care for patients with kidney disease caused by diabetes, hypertension, or substance abuse. *Neuroscience nurses* care for patients with dysfunctions of the nervous system, including brain and spinal cord injuries and seizures. *Ophthalmic nurses* provide care to patients with disorders of the eyes, including blindness and glaucoma, and to patients undergoing eye surgery. *Orthopedic nurses* care for patients with muscular and skeletal problems, including arthritis, bone fractures, and muscular dystrophy. *Otorhinolaryngology nurses* care for patients with ear, nose, and throat disorders, such as cleft palates, allergies, and sinus disorders. *Respiratory nurses* provide care to patients with respiratory disorders such as asthma, tuberculosis, and cystic fibrosis. *Urology nurses* care for patients with disorders of the kidneys, urinary tract, and male reproductive organs, including infections, kidney and bladder stones, and cancers.

Finally, RNs may specialize by providing preventive and acute care in all health care settings to various segments of the population, including newborns (neonatology), children and adolescents (pediatrics), adults, and the elderly (gerontology or geriatrics). RNs also may provide basic health care to patients outside of health care settings in such venues as including correctional facilities, schools, summer camps, and the military. Some RNs travel around the United States and abroad providing care to patients in areas with shortages of medical professionals.

Most RNs work as staff nurses, providing critical health care services along with physicians, surgeons, and other health care practitioners. However, some RNs choose to become advanced practice nurses, who often are considered primary health care practitioners and work independently or in collaboration with physicians. For example, *clinical nurse specialists* provide direct patient care and expert consultations in one of many of the nursing specialties listed above. *Nurse anesthetists* administer anesthesia, monitor patient's vital signs during surgery, and provide post-an-

esthesia care. *Nurse midwives* provide primary care to women, including gynecological exams, family planning advice, prenatal care, assistance in labor and delivery, and neonatal care. *Nurse practitioners* provide basic preventive health care to patients, and increasingly serve as primary and specialty care providers in mainly medically underserved areas. The most common areas of specialty for nurse practitioners are family practice, adult practice, women's health, pediatrics, acute care, and gerontology; however, there are many other specialties. In most States, advanced practice nurses can prescribe medications.

Some nurses have jobs that require little or no direct patient contact. Most of these positions still require an active RN license. *Case managers* ensure that all of the medical needs of patients with severe injuries and illnesses are met, including the type, location, and duration of treatment. *Forensics nurses* combine nursing with law enforcement by treating and investigating victims of sexual assault, child abuse, or accidental death. *Infection control nurses* identify, track, and control infectious outbreaks in health care facilities; develop methods of outbreak prevention and biological terrorism responses; and staff immunization clinics. *Legal nurse consultants* assist lawyers in medical cases by interviewing patients and witnesses, organizing medical records, determining damages and costs, locating evidence, and educating lawyers about medical issues. *Nurse administrators* supervise nursing staff, establish work schedules and budgets, and maintain medical supply inventories. *Nurse educators* teach student nurses and also provide continuing education for RNs. *Nurse informaticists* collect, store, and analyze nursing data in order to improve efficiency, reduce risk, and improve patient care. RNs also may work as health care consultants, public policy advisors, pharmaceutical and medical supply researchers and salespersons, and medical writers and editors.

Working Conditions

Most RNs work in well-lighted, comfortable health care facilities. Home health and public health nurses travel to patients' homes, schools, community centers, and other sites. RNs may spend considerable time walking and standing. Patients in hospitals and nursing care facilities require 24-hour care; consequently, nurses in these institutions may work nights, weekends, and holidays. RNs also may be on call—available to work on short notice. Nurses who work in office settings are more likely to work regular business hours. About 23 percent of RNs worked part time in 2004, and 7 percent held more than one job.

Working as a school nurse is one of many specialties practiced by registered nurses.

Nursing has its hazards, especially in hospitals, nursing care facilities, and clinics, where nurses may care for individuals with infectious diseases. RNs must observe rigid, standardized guidelines to guard against disease and other dangers, such as those posed by radiation, accidental needle sticks, chemicals used to sterilize instruments, and anesthetics. In addition, they are vulnerable to back injury when moving patients, shocks from electrical equipment, and hazards posed by compressed gases. RNs who work with critically ill patients also may suffer emotional strain from observing patient suffering and from close personal contact with patients' families.

Training, Other Qualifications, and Advancement

In all States and the District of Columbia, students must graduate from an approved nursing program and pass a national licensing examination, known as the NCLEX-RN, in order to obtain a nursing license. Nurses may be licensed in more than one State, either by examination or by the endorsement of a license issued by another State. Currently 18 States participate in the Nurse Licensure Compact Agreement, which allows nurses to practice in member States without recertifying. All States require periodic renewal of licenses, which may involve continuing education.

There are three major educational paths to registered nursing: A bachelor's of science degree in nursing (BSN), an associate degree in nursing (ADN), and a diploma. BSN programs, offered by colleges and universities, take about 4 years to complete. In 2004, 674 nursing programs offered degrees at the bachelor's level. ADN programs, offered by community and junior colleges, take about 2 to 3 years to complete. About 846 RN programs in 2004 granted associate degrees. Diploma programs, administered in hospitals, last about 3 years. Only 69 programs offered diplomas in 2004. Generally, licensed graduates of any of the three types of educational programs qualify for entry-level positions as staff nurses.

Many RNs with an ADN or diploma later enter bachelor's programs to prepare for a broader scope of nursing practice. Often, they can find a staff nurse position and then take advantage of tuition reimbursement benefits to work toward a BSN by completing an RN-to-BSN program. In 2004, there were 600 RN-to-BSN programs in the United States. Accelerated master's degree programs in nursing also are available. These programs combine 1 year of an accelerated BSN program with 2 years of graduate study. In 2004, there were 137 RN-to-MSN programs.

Accelerated BSN programs also are available for individuals who have a bachelor's or higher degree in another field and who are interested in moving into nursing. In 2004, more than 165 of these programs were available. Accelerated BSN programs last 12 to 18 months and provide the fastest route to a BSN for individuals who already hold a degree.

Individuals considering nursing should carefully weigh the advantages and disadvantages of enrolling in a BSN program, because, if they do, their advancement opportunities usually are broader. In fact, some career paths are open only to nurses with a bachelor's or master's degree. A bachelor's degree often is necessary for administrative positions and is a prerequisite for admission to graduate nursing programs in research, consulting, and teaching, and all four advanced practice nursing specialties—clinical nurse specialists, nurse anesthetists, nurse midwives, and nurse practitioners. Individuals who complete a bachelor's receive more training in areas such as communication, leadership, and critical thinking, all of which are becoming more important as nursing care becomes more complex. Additionally, bachelor's degree programs offer more clinical experience in nonhospital settings. In 2004, 417 nursing schools offered master's degrees, 93 offered doctoral degrees, and 46 offered accelerated BSN-to-doctoral programs.

All four advanced practice nursing specialties require at least a master's degree. Most programs last about 2 years and require a BSN degree and some programs require at least 1 to 2 years of clinical experience as an RN for admission. In 2004, there were 329 master's and post-master's programs offered for nurse practitioners, 218 master's and post-master's programs for clinical nurse specialists, 92 programs for nurse anesthetists, and 45 programs for nurse midwives. Upon completion of a program, most advanced practice nurses become nationally certified in their area of specialty. In some States, certification in a specialty is required in order to practice that specialty.

All nursing education programs include classroom instruction and supervised clinical experience in hospitals and other health care facilities. Students take courses in anatomy, physiology, microbiology, chemistry, nutrition, psychology and other behavioral sciences, and nursing. Coursework also includes the liberal arts for ADN and BSN students.

Supervised clinical experience is provided in hospital departments such as pediatrics, psychiatry, maternity, and surgery. A growing number of programs include clinical experience in nursing care facilities, public health departments, home health agencies, and ambulatory clinics.

Nurses should be caring, sympathetic, responsible, and detail oriented. They must be able to direct or supervise others, correctly assess patients' conditions, and determine when consultation is required. They need emotional stability to cope with human suffering, emergencies, and other stresses.

Some RNs start their careers as licensed practical nurses or nursing aides, and then go back to school to receive their RN degree. Most RNs begin as staff nurses, and with experience and good performance often are promoted to more responsible positions. In management, nurses can advance to assistant head nurse or head nurse and, from there, to assistant director, director, and vice president. Increasingly, management-level nursing positions require a graduate or an advanced degree in nursing or health services administration. They also require leadership, negotiation skills, and good judgment.

Some nurses move into the business side of health care. Their nursing expertise and experience on a health care team equip them to manage ambulatory, acute, home-based, and chronic care. Employers—including hospitals, insurance companies, pharmaceutical manufacturers, and managed care organizations, among others—need RNs for health planning and development, marketing, consulting, policy development, and quality assurance. Other nurses work as college and university faculty or conduct research.

Foreign-educated nurses wishing to work in the United States must obtain a work visa. Applicants are required to undergo a review of their education and licensing credentials and pass a nursing certification and English proficiency exam, both conducted by the Commission on Graduates of Foreign Nursing Schools. (The commission is an immigration-neutral, nonprofit organization that is recognized internationally as an authority on credentials evaluation in the health care field.) Applicants from Australia, Canada (except Quebec), Ireland, New Zealand, and the United Kingdom are exempt from the language proficiency exam. In addition to these national requirements, most States have their own requirements.

Employment

As the largest health care occupation, registered nurses held about 2.4 million jobs in 2004. About 3 out of 5 jobs were in hospitals, in inpatient and outpatient departments. Others worked in offices of physicians, nursing care facilities, home health care services, employment services, government agencies, and outpatient care centers. The remainder worked mostly in social assistance agencies and educational services, public and private. About 1 in 4 RNs worked part time.

Job Outlook

Job opportunities for RNs in all specialties are expected to be excellent. Employment of registered nurses is expected to grow much faster than the average for all occupations through 2014, and, because the occupation is very large, many new jobs will result. In fact, registered nurses are projected to create the second largest number of new jobs among all occupations. Thousands of job openings also will result from the need to replace experienced nurses who leave the occupation, especially as the median age of the registered nurse population continues to rise.

Much faster-than-average growth will be driven by technological advances in patient care, which permit a greater number of medical problems to be treated, and by an increasing emphasis on preventive care. In addition, the number of older people, who are much more likely than younger people to need nursing care, is projected to grow rapidly.

Employers in some parts of the country and in certain employment settings are reporting difficulty in attracting and retaining an adequate number of RNs, primarily because of an aging RN workforce and a lack of younger workers to fill positions. Enrollments in nursing programs at all levels have increased more rapidly in the past couple of years as students seek jobs with stable employment. However, many qualified applicants are being turned away because of a shortage of nursing faculty to teach classes. The need for nursing faculty will only increase as a large number of instructors nears retirement. Many employers also are relying on foreign-educated nurses to fill open positions.

Even though employment opportunities for all nursing specialties are expected to be excellent, they can vary by employment setting. For example, employment is expected to grow more slowly in hospitals—which comprise health care's largest industry—than in most other health care industries. While the intensity of nursing care is likely to increase, requiring more nurses per patient, the number of inpatients (those who remain in the hospital for more than 24 hours) is not likely to grow by much. Patients are being discharged earlier, and more procedures are being done on an outpatient basis, both inside and outside hospitals. Rapid growth is expected in hospital outpatient facilities, such as those providing same-day surgery, rehabilitation, and chemotherapy.

Despite the slower employment growth in hospitals, job opportunities should still be excellent because of the relatively high turnover of hospital nurses. RNs working in hospitals frequently work overtime and night and weekend shifts and also treat seriously ill and injured patients, all of which can contribute to stress and burnout. Hospital departments in which these working conditions occur most frequently—critical care units, emergency departments, and operating rooms—generally will have more job openings than other departments.

To attract and retain qualified nurses, hospitals may offer signing bonuses, family-friendly work schedules, or subsidized training. A growing number of hospitals also are experimenting with online bidding to fill open shifts, in which nurses can volunteer to fill open shifts at premium wages. This can decrease the amount of mandatory overtime that nurses are required to work.

More and more sophisticated procedures, once performed only in hospitals, are being performed in physicians' offices and in outpatient care centers, such as freestanding ambulatory surgical and emergency centers. Accordingly, employment is expected to grow much faster than average in these places as health care in general expands. However, RNs may face greater competition for these positions because they generally offer regular working hours and more comfortable working environments.

Employment in nursing care facilities is expected to grow faster than average because of increases in the number of elderly, many

of whom require long-term care. In addition, the financial pressure on hospitals to discharge patients as soon as possible should produce more admissions to nursing care facilities. Job growth also is expected in units that provide specialized long-term rehabilitation for stroke and head injury patients, as well as units that treat Alzheimer's victims.

Employment in home health care is expected to increase rapidly in response to the growing number of older persons with functional disabilities, consumer preference for care in the home, and technological advances that make it possible to bring increasingly complex treatments into the home. The type of care demanded will require nurses who are able to perform complex procedures.

Generally, RNs with at least a bachelor's degree will have better job prospects than those without a bachelor's. In addition, all four advanced practice specialties—clinical nurse specialists, nurse practitioners, midwives, and anesthetists—will be in high demand, particularly in medically underserved areas such as inner cities and rural areas. Relative to physicians, these RNs increasingly serve as lower-cost primary care providers.

Earnings

Median annual earnings of registered nurses were \$52,330 in May 2004. The middle 50 percent earned between \$43,370 and \$63,360. The lowest 10 percent earned less than \$37,300, and the highest 10 percent earned more than \$74,760. Median annual earnings in the industries employing the largest numbers of registered nurses in May 2004 were as follows:

Employment services	\$63,170
General medical and surgical hospitals.....	53,450
Home health care services	48,990
Offices of physicians.....	48,250
Nursing care facilities	48,220

Many employers offer flexible work schedules, child care, educational benefits, and bonuses.

Related Occupations

Workers in other health care occupations with responsibilities and duties related to those of registered nurses are cardiovascular technologists and technicians; diagnostic medical sonographers; dietitians and nutritionists; emergency medical technicians and paramedics; licensed practical and licensed vocational nurses; massage therapists; medical and health services managers; nursing, psychiatric, and home health aides; occupational therapists; physical therapists; physician assistants; physicians and surgeons; radiologic technologists and technicians; respiratory therapists; and surgical technologists.

Respiratory Therapists

(O*NET 29-1126.00, 29-2054.00)

Significant Points

- Job opportunities will be very good, especially for therapists with cardiopulmonary care skills or experience working with infants.
- All States (except Alaska and Hawaii), the District of Columbia, and Puerto Rico require respiratory therapists to obtain a license.
- Hospitals will continue to employ the vast majority of respiratory therapists, but a growing number of therapists will work in other settings.

Nature of the Work

Respiratory therapists and *respiratory therapy technicians*—also known as respiratory care practitioners—evaluate, treat, and care for patients with breathing or other cardiopulmonary disorders. Practicing under the direction of a physician, respiratory therapists assume primary responsibility for all respiratory care therapeutic treatments and diagnostic procedures, including the supervision of respiratory therapy technicians. Respiratory therapy technicians follow specific, well-defined respiratory care procedures under the direction of respiratory therapists and physicians. In clinical practice, many of the daily duties of therapists and technicians overlap; furthermore, the two have the same education and training requirements. However, therapists generally have greater responsibility than technicians. For example, respiratory therapists will consult with physicians and other health care staff to help develop and modify individual patient care plans. Respiratory therapists also are more likely to provide complex therapy requiring considerable independent judgment, such as caring for patients on life support in intensive-care units of hospitals. In this *Handbook* statement, the term *respiratory therapists* includes both respiratory therapists and respiratory therapy technicians.

Respiratory therapists evaluate and treat all types of patients, ranging from premature infants whose lungs are not fully developed to elderly people whose lungs are diseased. Respiratory therapists provide temporary relief to patients with chronic asthma or emphysema, as well as emergency care to patients who are victims of a heart attack, stroke, drowning, or shock.

To evaluate patients, respiratory therapists interview them, perform limited physical examinations, and conduct diagnostic tests. For example, respiratory therapists test patients' breathing capacity and determine the concentration of oxygen and other gases in patients' blood. They also measure patients' pH, which indicates the acidity or alkalinity of the blood. To evaluate a patient's lung capacity, respiratory therapists have the patient breathe into an instrument that measures the volume and flow of oxygen during inhalation and exhalation. By comparing the reading with the norm for the patient's age, height, weight, and sex, respiratory therapists can provide information that helps determine whether the patient has any lung deficiencies. To analyze oxygen, carbon dioxide, and pH levels, therapists draw an arterial blood sample, place it in a blood gas analyzer, and relay the results to a physician, who then may make treatment decisions.

To treat patients, respiratory therapists use oxygen or oxygen mixtures, chest physiotherapy, and aerosol medications. When a patient has difficulty getting enough oxygen into his or her blood, therapists increase the patient's concentration of oxygen by placing an oxygen mask or nasal cannula on the patient and set the oxygen flow at the level prescribed by a physician. Therapists also connect patients who cannot breathe on their own to ventilators that deliver pressurized oxygen into the lungs. The therapists insert a tube into the patient's trachea, or windpipe; connect the tube to the ventilator; and set the rate, volume, and oxygen concentration of the oxygen mixture entering the patient's lungs.

Therapists perform regular assessments of patients and equipment. If the patient appears to be having difficulty breathing or if the oxygen, carbon dioxide, or pH level of the blood is abnormal, therapists change the ventilator setting according to the doctor's orders or check the equipment for mechanical problems. In home care, therapists teach patients and their families to use ventilators and other life-support systems. In addition, therapists visit patients several times a month to inspect and clean equipment and to ensure its proper use. Therapists also make emergency visits if equipment problems arise.

Respiratory therapists perform chest physiotherapy on patients to remove mucus from their lungs and make it easier for them to breathe. For example, during surgery, anesthesia depresses respiration, so chest physiotherapy may be prescribed to help get the patient's lungs back to normal and to prevent congestion. Chest physiotherapy also helps patients suffering from lung diseases, such as cystic fibrosis, that cause mucus to collect in the lungs. Therapists

place patients in positions that help drain mucus, and then vibrate the patients' rib cages and instruct the patients to cough.

Respiratory therapists also administer aerosols—liquid medications suspended in a gas that forms a mist which is inhaled—and teach patients how to inhale the aerosol properly to ensure its effectiveness.

In some hospitals, therapists perform tasks that fall outside their traditional role. Therapists' tasks are expanding into areas such as pulmonary rehabilitation, smoking cessation counseling, disease prevention, case management, and polysomnography—the diagnosis of breathing disorders during sleep, such as apnea. Respiratory therapists also increasingly treat critical care patients, either as part of surface and air transport teams or as part of rapid-response teams in hospitals.

Working Conditions

Respiratory therapists generally work between 35 and 40 hours a week. Because hospitals operate around the clock, therapists may work evenings, nights, or weekends. They spend long periods standing and walking between patients' rooms. In an emergency, therapists work under a great deal of stress. Respiratory therapists employed in home health care must travel frequently to the homes of patients.

Respiratory therapists are trained to work with hazardous gases stored under pressure. Adherence to safety precautions and regular maintenance and testing of equipment minimize the risk of injury. As in many other health occupations, respiratory therapists run the risk of catching an infectious disease, but carefully following proper procedures minimizes this risk.

Training, Other Qualifications, and Advancement

Formal training is necessary for entry into this field. Training is offered at the postsecondary level by colleges and universities, medical schools, vocational-technical institutes, and the Armed Forces. An associate's degree is required for entry into the field. Most programs award associate's or bachelor's degrees and prepare graduates for jobs as advanced respiratory therapists. A limited number of associate's degree programs lead to jobs as entry-level respiratory therapists. According to the Commission on Accreditation of Allied Health Education Programs (CAAHEP), 51 entry-level and 329 advanced respiratory therapy programs were accredited in the United States, including Puerto Rico, in 2005.

Among the areas of study in respiratory therapy are human anatomy and physiology, pathophysiology, chemistry, physics, microbiology, pharmacology, and mathematics. Other courses deal with therapeutic and diagnostic procedures and tests, equipment, patient assessment, cardiopulmonary resuscitation, the application of clinical practice guidelines, patient care outside of hospitals, cardiac and pulmonary rehabilitation, respiratory health promotion and disease prevention, and medical recordkeeping and reimbursement.

The National Board for Respiratory Care (NBRC) offers certification and registration to graduates of programs accredited by CAAHEP or the Committee on Accreditation for Respiratory Care (CoARC). Two credentials are awarded to respiratory therapists who satisfy the requirements: Registered Respiratory Therapist (RRT) and Certified Respiratory Therapist (CRT). Graduates from accredited entry-level or advanced-level programs in respiratory therapy may take the CRT examination. CRTs who were graduated from advanced-level programs and who meet additional experience requirements can take two separate examinations leading to the award of the RRT credential.

All States (except Alaska and Hawaii), the District of Columbia, and Puerto Rico require respiratory therapists to obtain a license. Passing the CRT exam qualifies respiratory therapists for

Respiratory therapists conduct diagnostic tests on patients with breathing and cardiopulmonary disorders.

State licenses. Also, most employers require respiratory therapists to maintain a cardiopulmonary resuscitation (CPR) certification. Supervisory positions and intensive-care specialties usually require the RRT or at least RRT eligibility.

Therapists should be sensitive to patients' physical and psychological needs. Respiratory care practitioners must pay attention to detail, follow instructions, and work as part of a team. In addition, operating advanced equipment requires proficiency with computers.

High school students interested in a career in respiratory care should take courses in health, biology, mathematics, chemistry, and physics. Respiratory care involves basic mathematical problem solving and an understanding of chemical and physical principles. For example, respiratory care workers must be able to compute dosages of medication and calculate gas concentrations.

Respiratory therapists advance in clinical practice by moving from general care to the care of critically ill patients who have significant problems in other organ systems, such as the heart or kidneys. Respiratory therapists, especially those with bachelor's or master's degrees, also may advance to supervisory or managerial positions in a respiratory therapy department. Respiratory therapists in home health care and equipment rental firms may become branch managers. Some respiratory therapists advance by moving into teaching positions.

Employment

Respiratory therapists held about 118,000 jobs in 2004. More than 4 out of 5 jobs were in hospital departments of respiratory care, anesthesiology, or pulmonary medicine. Most of the remaining jobs were in offices of physicians or other health practitioners, consumer-goods rental firms that supply respiratory equipment for home use, nursing care facilities, and home health care services. Holding a second job is relatively common for respiratory therapists. About 13 percent held another job, compared with 5 percent of workers in all occupations.

Job Outlook

Job opportunities are expected to be very good, especially for respiratory therapists with cardiopulmonary care skills or experience working with infants. Employment of respiratory therapists is expected to increase faster than the average for all occupations through the year 2014, because of substantial growth in the numbers of the middle-aged and elderly population—a development that will heighten the incidence of cardiopulmonary disease—and because of the expanding role of respiratory therapists in the early detection of pulmonary disorders, case management, disease prevention, and emergency care.

Older Americans suffer most from respiratory ailments and cardiopulmonary diseases such as pneumonia, chronic bronchitis, emphysema, and heart disease. As their numbers increase, the need for respiratory therapists will increase as well. In addition, advances in inhalable medications and in the treatment of lung transplant patients, heart attack and accident victims, and premature infants (many of whom are dependent on a ventilator during part of their treatment) will increase the demand for the services of respiratory care practitioners.

Although hospitals will continue to employ the vast majority of therapists, a growing number can expect to work outside of hospitals in home health care services, offices of physicians or other health practitioners, or consumer-goods rental firms.

Earnings

Median annual earnings of respiratory therapists were \$43,140 in May 2004. The middle 50 percent earned between \$37,650 and \$50,860. The lowest 10 percent earned less than \$32,220, and the

highest 10 percent earned more than \$57,580. In general medical and surgical hospitals, median annual earnings of respiratory therapists were \$43,140 in May 2004.

Median annual earnings of respiratory therapy technicians were \$36,740 in May 2004. The middle 50 percent earned between \$30,490 and \$43,830. The lowest 10 percent earned less than \$24,640, and the highest 10 percent earned more than \$52,280. Median annual earnings of respiratory therapy technicians employed in general medical and surgical hospitals were \$36,990 in May 2004.

Related Occupations

Under the supervision of a physician, respiratory therapists administer respiratory care and life support to patients with heart and lung difficulties. Other workers who care for, treat, or train people to improve their physical condition include registered nurses, occupational therapists, physical therapists, and radiation therapists.

Speech-Language Pathologists

(O*NET 29-1127.00)

Significant Points

- About half work in educational services, and most others were employed by health care and social assistance facilities.
- A master's degree in speech-language pathology is the standard credential required for licensing in most States.
- Employment is expected to grow because the expanding population in older age groups is prone to medical conditions that result in speech, language, and swallowing problems.
- Excellent job opportunities are expected.

Nature of the Work

Speech-language pathologists, sometimes called *speech therapists*, assess, diagnose, treat, and help to prevent speech, language, cognitive-communication, voice, swallowing, fluency, and other related disorders.

Speech-language pathologists work with people who cannot produce speech sounds, or cannot produce them clearly; those with speech rhythm and fluency problems, such as stuttering; people with voice disorders, such as inappropriate pitch or harsh voice; those with problems understanding and producing language; those who wish to improve their communication skills by modifying an ac-

cent; and those with cognitive communication impairments, such as attention, memory, and problem solving disorders. They also work with people who have swallowing difficulties.

Speech, language, and swallowing difficulties can result from a variety of causes including stroke, brain injury or deterioration, developmental delays or disorders, learning disabilities, cerebral palsy, cleft palate, voice pathology, mental retardation, hearing loss, or emotional problems. Problems can be congenital, developmental, or acquired. Speech-language pathologists use qualitative and quantitative assessment methods, including standardized tests, as well as special instruments, to analyze and diagnose the nature and extent of speech, language, and swallowing impairments. Speech-language pathologists develop an individualized plan of care, tailored to each patient's needs. For individuals with little or no speech capability, speech-language pathologists may select augmentative or alternative communication methods, including automated devices and sign language, and teach their use. They teach these individuals how to make sounds, improve their voices, or increase their oral or written language skills to communicate more effectively. They also teach individuals how to strengthen muscles or use compensatory strategies to swallow without choking or inhaling food or liquid. Speech-language pathologists help patients develop, or recover, reliable communication and swallowing skills so patients can fulfill their educational, vocational, and social roles.

Speech-language pathologists keep records on the initial evaluation, progress, and discharge of clients. This helps pinpoint problems, tracks client progress, and justifies the cost of treatment when applying for reimbursement. They counsel individuals and their families concerning communication disorders and how to cope with the stress and misunderstanding that often accompany them. They also work with family members to recognize and change behavior patterns that impede communication and treatment and show them communication-enhancing techniques to use at home.

Most speech-language pathologists provide direct clinical services to individuals with communication or swallowing disorders. In medical facilities, they may perform their job in conjunction with physicians,

social workers, psychologists, and other therapists. Speech-language pathologists in schools collaborate with teachers, special educators, interpreters, other school personnel, and parents to develop and implement individual or group programs, provide counseling, and support classroom activities. Some speech-language pathologists conduct research on how people communicate. Others design and develop equipment or techniques for diagnosing and treating speech problems.

Working Conditions

Speech-language pathologists usually work at a desk or table in clean comfortable surroundings. In medical settings, they may work at the patient's bedside and assist in positioning the patient. In school settings they may work with students in an office or classroom. Some deliver services in the client's home. While the job is not physically demanding, it requires attention to detail and intense concentration. The emotional needs of clients and their families may be demanding. Most full-time speech-language pathologists work 40 hours per week; about 1 in 5 work part time. Those who work on a contract basis may spend a substantial amount of time traveling between facilities.

Training, Other Qualifications, and Advancement

In 2005, 47 States required speech-language pathologists to be licensed if they worked in a health care setting, and all States required a master's degree or equivalent. A passing score on the national examination on speech-language pathology, offered through the Praxis Series of the Educational Testing Service, is needed as well. Other requirements typically are 300 to 375 hours of supervised clinical experience and 9 months of postgraduate professional clinical experience. Forty-one States have continuing education requirements for licensure renewal. Medicaid, Medicare, and private health insurers generally require a practitioner to be licensed to qualify for reimbursement.

Only 11 States require this same license to practice in the public schools. The other States issue a teaching license or certificate that typically requires a master's degree from an approved college or university. Some States will grant a temporary teaching license or certificate to bachelor's degree applicants, but a master's degree must be earned in 3 to 5 years. A few States grant a full teacher's certificate or license to bachelor's degree applicants.

In 2004, 239 colleges and universities offered graduate programs in speech-language pathology that are accredited by the Council on Academic Accreditation in Audiology and Speech-Language Pathology. While graduation from an accredited program is not always required to become a speech-language pathologist, it may be helpful in obtaining a license or may be required to obtain a license in some States. Courses cover the anatomy, physiology, and the development of the areas of the body involved in speech, language, and swallowing; the nature of disorders; acoustics; and psychological aspects of communication. Graduate students also learn to evaluate and treat speech, language, and swallowing disorders and receive supervised clinical training in communication disorders.

Speech-language pathologists can acquire the Certificate of Clinical Competence in Speech-Language Pathology (CCC-SLP) offered by the American Speech-Language-Hearing Association. To earn a CCC, a person must have a graduate degree and 400 hours of supervised clinical experience, complete a 36-week postgraduate clinical fellowship, and pass the Praxis Series examination in speech-language pathology administered by the Educational Testing Service (ETS).

Speech-language pathologists should be able to effectively communicate diagnostic test results, diagnoses, and proposed treatment in a manner easily understood by their patients and their families. They must

About half of speech-language pathologists work in schools, helping students with communication-related disorders.

be able to approach problems objectively and be supportive. Because a patient's progress may be slow, patience, compassion, and good listening skills are necessary.

As speech-language pathologists gain clinical experience and engage in continuing professional education, many develop expertise with certain populations, such as preschoolers and adolescents, or disorders, such as aphasia and learning disabilities. Some may obtain board recognition in a specialty area, such as child language, fluency, or feeding and swallowing. Experienced clinicians may become mentors or supervisors of other therapists or be promoted to administrative positions.

Employment

Speech-language pathologists held about 96,000 jobs in 2004. About half were employed in educational services, primarily in preschools and elementary and secondary schools. Others were employed in hospitals; offices of other health practitioners, including speech-language pathologists; nursing care facilities; home health care services; individual and family services; outpatient care centers; and child day care centers.

A few speech-language pathologists are self-employed in private practice. They contract to provide services in schools, offices of physicians, hospitals, or nursing care facilities, or work as consultants to industry.

Job Outlook

Employment of speech-language pathologists is expected to grow about as fast as the average for all occupations through the year 2014. As the members of the baby boom generation continue to age, the possibility of neurological disorders and associated speech, language, and swallowing impairments increases. Medical advances are also improving the survival rate of premature infants and trauma and stroke victims, who then need assessment and possible treatment. An increased emphasis also has been placed on early identification of speech and language problems in young children. The combination of growth in the occupation and an expected increase in retirements over the coming years should create excellent job opportunities for speech-language pathologists. Opportunities should be particularly favorable for those with the ability to speak a second language, such as Spanish.

In health care facilities, restrictions on reimbursement for therapy services may limit the growth of speech-language pathologists in the near term. However, over the long run, the demand for therapists should continue to rise as growth in the number of individuals with disabilities or limited function spurs demand for therapy services.

Employment in educational services will increase along with growth in elementary and secondary school enrollments, including enrollment of special education students. Federal law guarantees special education and related services to all eligible children with disabilities. Greater awareness of the importance of early identification and diagnosis of speech and language disorders will also increase employment.

The number of speech-language pathologists in private practice will rise due to the increasing use of contract services by hospitals, schools, and nursing care facilities.

Earnings

Median annual earnings of speech-language pathologists were \$52,410 in May 2004. The middle 50 percent earned between \$42,090 and \$65,750. The lowest 10 percent earned less than \$34,720, and the highest 10 percent earned more than \$82,420. Median annual earnings in the industries employing the largest numbers of speech-language pathologists in May 2004 were:

Offices of other health practitioners.....	\$57,240
General medical and surgical hospitals.....	55,900
Elementary and secondary schools.....	48,320

According to a 2003 survey by the American Speech-Language-Hearing Association, the median annual salary for full-time certified speech-language pathologists who worked on a calendar-year basis, generally 11 or 12 months annually, was \$48,000. Certified speech-language pathologists who worked 25 or fewer hours per week had a median hourly salary of \$40.00. Starting salaries for certified speech-language pathologists with one to three years of experience were \$42,000 for those who worked on a calendar-year. According to a 2004 survey by the American Speech-Language-Hearing Association, the median annual salary for speech-language pathologists in schools was \$50,000 for those employed on an academic year basis (usually 9 or 10 months).

Related Occupations

Speech-language pathologists specialize in the prevention, diagnosis, and treatment of speech and language problems. Workers in related occupations include audiologists, occupational therapists, optometrists, physical therapists, psychologists, and recreational therapists. Speech-language pathologists in school systems often work closely with special education teachers in assisting students with disabilities.

Sources of Additional Information

State licensing boards can provide information on licensure requirements. State departments of education can supply information on certification requirements for those who wish to work in public schools.

For information on careers in speech-language pathology, a description of the CCC-SLP credential, and a listing of accredited graduate programs in speech-language pathology, contact:

► American Speech-Language-Hearing Association, 10801 Rockville Pike, Rockville, MD 20852. Internet: <http://www.asha.org>

Veterinarians

(O*NET 29-1131.00)

Significant Points

- Veterinarians should have an affinity for animals and the ability to get along with their owners.
- Graduation from an accredited college of veterinary medicine and a State license are required.
- Competition for admission to veterinary school is keen; however, graduates should have very good job opportunities.
- About 1 out of 5 veterinarians was self-employed; self-employed veterinarians usually have to work hard and long to build a sufficient client base.

Nature of the Work

Veterinarians play a major role in the healthcare of pets, livestock, and zoo, sporting, and laboratory animals. Some veterinarians use their skills to protect humans against diseases carried by animals and conduct clinical research on human and animal health problems. Others work in basic research, broadening the scope of fundamental theoretical knowledge, and in applied research, developing new ways to use knowledge.

Most veterinarians perform clinical work in private practices. More than 50 percent of these veterinarians predominantly, or exclusively, treat small animals. Small-animal practitioners usually care for companion animals, such as dogs and cats, but also treat birds, reptiles, rabbits, and other animals that can be kept as pets. About one-fourth of all veterinarians work in mixed animal practices, where they see pigs, goats, sheep, and some non-domestic animals in addition to companion animals. Veterinarians in clinical practice diagnose animal health problems; vaccinate against diseases, such as distemper and rabies; medicate animals suffering from infections or illnesses; treat and dress wounds; set fractures; perform surgery; and advise owners about animal feeding, behavior, and breeding.

A small number of private-practice veterinarians work exclusively with large animals, mostly horses or cows; some also care for various kinds of food animals. These veterinarians usually drive to farms or ranches to provide veterinary services for herds or individual animals. Much of this work involves preventive care to maintain the health of the animals. These veterinarians test for and vaccinate against diseases and consult with farm or ranch owners and managers regarding animal production, feeding, and housing issues. They also treat and dress wounds, set fractures, and perform surgery, including cesarean sections on birthing animals. Veterinarians euthanize animals when necessary. Other veterinarians care for zoo, aquarium, or laboratory animals.

Employment opportunities for veterinarians are expected to be very good, but competition to veterinary school is keen.

Veterinarians who treat animals use medical equipment such as stethoscopes, surgical instruments, and diagnostic equipment, including radiographic and ultrasound equipment. Veterinarians working in research use a full range of sophisticated laboratory equipment.

Veterinarians can contribute to human as well as animal health. A number of veterinarians work with physicians and scientists as they research ways to prevent and treat various human health problems. For example, veterinarians contributed greatly in conquering malaria and yellow fever, solved the mystery of botulism, produced an anticoagulant used to treat some people with heart disease, and defined and developed surgical techniques for humans, such as hip and knee joint replacements and limb and organ transplants. Today, some determine the effects of drug therapies, antibiotics, or new surgical techniques by testing them on animals.

Some veterinarians are involved in food safety at various levels. Veterinarians who are livestock inspectors check animals for transmissible diseases, advise owners on the treatment of their animals and may quarantine animals. Veterinarians who are meat, poultry, or egg product inspectors examine slaughtering and processing plants, check live animals and carcasses for disease, and enforce government regulations regarding food purity and sanitation.

Working Conditions

Veterinarians often work long hours. Those in group practices may take turns being on call for evening, night, or weekend work; solo practitioners may work extended and weekend hours, responding to emergencies or squeezing in unexpected appointments. The work setting often can be noisy.

Veterinarians in large-animal practice spend time driving between their office and farms or ranches. They work outdoors in all kinds of weather and may have to treat animals or perform surgery under unsanitary conditions. When working with animals that are frightened or in pain, veterinarians risk being bitten, kicked, or scratched.

Veterinarians working in nonclinical areas, such as public health and research, have working conditions similar to those of other professionals in those lines of work. In these cases, veterinarians enjoy clean, well-lit offices or laboratories and spend much of their time dealing with people rather than animals.

Training, Other Qualifications, and Advancement

Prospective veterinarians must graduate with a Doctor of Veterinary Medicine (D.V.M. or V.M.D.) degree from a 4-year program at an accredited college of veterinary medicine and must obtain a license to practice. There are 28 colleges in 26 States that meet accreditation standards set by the Council on Education of the American Veterinary Medical Association (AVMA). The prerequisites for admission vary. Many of these colleges do not require a bachelor's degree for entrance, but all require a significant number of credit hours—ranging from 45 to 90 semester hours—at the undergraduate level. However, most of the students admitted have completed an undergraduate program. Applicants without a bachelor's degree face a difficult task gaining admittance.

Preveterinary courses emphasize the sciences. Veterinary medical colleges typically require classes in organic and inorganic chemistry, physics, biochemistry, general biology, animal biology, animal nutrition, genetics, vertebrate embryology, cellular biology, microbiology, zoology, and systemic physiology. Some programs require calculus; some require only statistics, college algebra and trigonometry, or precalculus. Most veterinary medical colleges also require core courses, including some in English or literature, the social sciences, and the humanities. Increasingly, courses in practice management and career development are becoming a standard part of the curriculum, to provide a foundation of general business knowledge for new graduates.

In addition to satisfying preveterinary course requirements, applicants must submit test scores from the Graduate Record Examination (GRE), the Veterinary College Admission Test (VCAT), or the Medical College Admission Test (MCAT), depending on the preference of the college to which they are applying. Currently, 22 schools require the GRE, 4 require the VCAT, and 2 accept the MCAT.

In admittance decisions, some veterinary medical colleges place heavy consideration on a candidate's veterinary and animal experience. Formal experience, such as work with veterinarians or scientists in clinics, agribusiness, research, or some area of health science, is particularly advantageous. Less formal experience, such as working with animals on a farm or ranch or at a stable or animal shelter, also is helpful. Students must demonstrate ambition and an eagerness to work with animals.

There is keen competition for admission to veterinary school. The number of accredited veterinary colleges has remained largely the same since 1983, whereas the number of applicants has risen significantly. Only about 1 in 3 applicants was accepted in 2004. AVMA-recognized veterinary specialties—such as pathology, internal medicine, dentistry, nutrition, ophthalmology, surgery, radiology, preventive medicine, and laboratory animal medicine—are usually in the form of a 2-year internship. Interns receive a small salary but usually find that their internship experience leads to a higher beginning salary, relative to those of other starting veterinarians. Veterinarians who seek board certification in a specialty also must complete a 3- to 4-year residency program that provides intensive training in specialties such as internal medicine, oncology, radiology, surgery, dermatology, anesthesiology, neurology, cardiology, ophthalmology, and exotic small-animal medicine.

All States and the District of Columbia require that veterinarians be licensed before they can practice. The only exemptions are for veterinarians working for some Federal agencies and some State governments. Licensing is controlled by the States and is not strictly uniform, although all States require the successful completion of the D.V.M. degree—or equivalent education—and a passing grade on a national board examination. The Educational Commission for Foreign Veterinary Graduates (ECFVG) grants certification to individuals trained outside the United States who demonstrate that they meet specified requirements for the English language and for clinical proficiency. ECFVG certification fulfills the educational requirement for licensure in all States. Applicants for licensure satisfy the examination requirement by passing the North American Veterinary Licensing Exam (NAVLE), an 8-hour computer-based examination consisting of 360 multiple-choice questions covering all aspects of veterinary medicine. Administered by the National Board of Veterinary Medical Examiners (NBVME), the NAVLE includes visual materials designed to test diagnostic skills and constituting 10 percent of the total examination.

The majority of States also require candidates to pass a State jurisprudence examination covering State laws and regulations. Some States do additional testing on clinical competency as well. There are few reciprocal agreements between States, making it difficult for a veterinarian to practice in a different State without first taking that State's examination.

Nearly all States have continuing education requirements for licensed veterinarians. Requirements differ by State and may involve attending a class or otherwise demonstrating knowledge of recent medical and veterinary advances.

Most veterinarians begin as employees in established practices. Despite the substantial financial investment in equipment, office space, and staff, many veterinarians with experience set up their own practice or purchase an established one.

Newly trained veterinarians can become U.S. Government meat and poultry inspectors, disease-control workers, animal welfare and

safety workers, epidemiologists, research assistants, or commissioned officers in the U.S. Public Health Service or various branches of the U.S. Armed Forces. A State license may be required.

Prospective veterinarians must have good manual dexterity. They should have an affinity for animals and the ability to get along with their owners, especially pet owners, who tend to form a strong bond with their pet. Veterinarians who intend to go into private practice should possess excellent communication and business skills, because they will need to manage their practice and employees successfully and promote, market, and sell their services.

Employment

Veterinarians held about 61,000 jobs in 2004. About 1 out of 5 veterinarians was self-employed in a solo or group practice. Most others were salaried employees of another veterinary practice. The Federal Government employed about 1,200 civilian veterinarians, chiefly in the U.S. Departments of Agriculture, Health and Human Services, and, increasingly, Homeland Security. Other employers of veterinarians are State and local governments, colleges of veterinary medicine, medical schools, research laboratories, animal food companies, and pharmaceutical companies. A few veterinarians work for zoos, but most veterinarians caring for zoo animals are private practitioners who contract with the zoos to provide services, usually on a part-time basis.

In addition, many veterinarians hold veterinary faculty positions in colleges and universities. (See the statement on teachers—post-secondary elsewhere in the *Handbook*.)

Job Outlook

Employment of veterinarians is expected to increase as fast as the average for all occupations over the 2004–14 projection period. Despite this average growth, very good job opportunities are expected because the 28 schools of veterinary medicine, even at full capacity, result in a limited number of graduates each year. However, as mentioned earlier, there is keen competition for admission to veterinary school. As pets are increasingly viewed as a member of the family, pet owners will be more willing to spend on advanced veterinary medical care, creating further demand for veterinarians.

Most veterinarians practice in animal hospitals or clinics and care primarily for companion animals. Recent trends indicate particularly strong interest in cats as pets. Faster growth of the cat population is expected to increase the demand for feline medicine and veterinary services, while demand for veterinary care for dogs should continue to grow at a more modest pace.

Pet owners are becoming more aware of the availability of advanced care and are more willing to pay for intensive veterinary care than in the past because many pet owners are more affluent and because they consider their pet part of the family. More pet owners even purchase pet insurance, increasing the likelihood that a considerable amount of money will be spent on veterinary care for their pets. More pet owners also will take advantage of nontraditional veterinary services, such as preventive dental care.

New graduates continue to be attracted to companion-animal medicine because they prefer to deal with pets and to live and work near heavily populated areas. This situation will not necessarily limit the ability of veterinarians to find employment or to set up and maintain a practice in a particular area. Rather, beginning veterinarians may take positions requiring evening or weekend work to accommodate the extended hours of operation that many practices are offering. Some veterinarians take salaried positions in retail stores offering veterinary services. Self-employed veterinarians usually have to work hard and long to build a sufficient client base.

The number of jobs for large-animal veterinarians is likely to grow more slowly than that for veterinarians in private practice

who care for companion animals. Nevertheless, job prospects may be better for veterinarians who specialize in farm animals than for companion-animal practitioners because of low earnings in the former specialty and because many veterinarians do not want to work in rural or isolated areas.

Continued support for public health and food safety, national disease control programs, and biomedical research on human health problems will contribute to the demand for veterinarians, although positions in these areas of interest are few in number. Homeland security also may provide opportunities for veterinarians involved in efforts to minimize animal diseases and prevent them from entering the country. Veterinarians with training in food safety, animal health and welfare, and public health and epidemiology should have the best opportunities for a career in the Federal Government.

Earnings

Median annual earnings of veterinarians were \$66,590 in May 2004. The middle 50 percent earned between \$51,420 and \$88,060. The lowest 10 percent earned less than \$39,020, and the highest 10 percent earned more than \$118,430.

According to a survey by the American Veterinary Medical Association, average starting salaries of veterinary medical college graduates in 2004 varied by type of practice as follows:

Small animals, predominantly	\$50,878
Small animals, exclusively.....	50,703
Large animals, exclusively.....	50,403
Private clinical practice.....	49,635
Large animals, predominantly	48,529
Mixed animals.....	47,704
Equine (horses)	38,628

The average annual salary for veterinarians in the Federal Government in nonsupervisory, supervisory, and managerial positions was \$78,769 in 2005.

Related Occupations

Veterinarians prevent, diagnose, and treat diseases, disorders, and injuries in animals. Those who do similar work for humans include chiropractors, dentists, optometrists, physicians and surgeons, and podiatrists. Veterinarians have extensive training in physical and life sciences, and some do scientific and medical research, similar to the work of biological scientists and medical scientists.

Animal care and service workers and veterinary technologists and technicians work extensively with animals. Like veterinarians, they must have patience and feel comfortable with animals. However, the level of training required for these occupations is substantially less than that needed by veterinarians.

Sources of Additional Information

► American Veterinary Medical Association, 1931 N. Meacham Rd., Suite 100, Schaumburg, IL 60173-4360. Internet: <http://www.avma.org>

For information on veterinary education, write to:

► Association of American Veterinary Medical Colleges, 1101 Vermont Ave. N.W., Suite 710, Washington, DC 20005. Internet: <http://www.aavmc.org>

For information on scholarships, grants, and loans, contact the financial aid officer at the veterinary schools to which you wish to apply.

Information on obtaining a veterinary position with the Federal Government is available from the Office of Personnel Management through USAJOBS, the Federal Government's official employment information system. This resource for locating and applying for job opportunities can be accessed through the Internet at <http://www.usajobs.opm.gov> or through an interactive voice response telephone system at (703) 724-1850 or TDD (978) 461-8404. These numbers are not tollfree, and charges may result.

Health Technologists and Technicians

Athletic Trainers

(O*NET 29-9091.00)

Significant Points

- Job prospects should be good in the health care industry; however, competition is expected for positions with sports teams.
- Long hours, sometimes including nights and weekends, are common.
- About one-third of athletic trainers work in health care.
- About 7 out of 10 athletic trainers have a master's or higher degree.

Nature of the Work

Athletic trainers help prevent and treat injuries for people of all ages. Their clients include everyone from professional athletes to industrial workers. Recognized by the American Medical Association as allied health professionals, athletic trainers specialize in the prevention, assessment, treatment, and rehabilitation of musculoskeletal injuries. Athletic trainers are often one of the first health care providers on the scene when

injuries occur, and therefore must be able to recognize, evaluate, and assess injuries and provide immediate care when needed. They also are heavily involved in the rehabilitation and reconditioning of injuries.

Athletic trainers often help prevent injuries by advising on the proper use of equipment and applying protective or injury-preventive devices such as tape, bandages, and braces. Injury prevention also often includes educating people on what they should do to avoid putting themselves at risk for injuries. Athletic trainers should not be confused with fitness trainers or personal trainers, who are not health care workers, but rather train people to become physically fit. (Fitness workers are discussed elsewhere in the *Handbook*.)

Athletic trainers work under the supervision of a licensed physician, and in cooperation with other health care providers. The level of medical supervision varies, depending upon the setting. Some athletic trainers meet with the team physician or consulting physician once or twice a week; others interact with a physician every day. The extent of the supervision ranges from discussing specific injuries and treatment options with a physician to performing evaluations and treatments as directed by a physician.

Athletic trainers also may have administrative responsibilities. These may include regular meetings with an athletic director or other administrative officer to deal with budgets, purchasing, policy implementation, and other business-related issues.

Athletic trainers are heavily involved in the rehabilitation and reconditioning of injuries.

Working Conditions

The work of athletic trainers requires frequent interaction with others. This includes consulting with physicians as well as frequent contact with athletes and patients to discuss and administer treatments, rehabilitation programs, injury-preventive practices, and other health-related issues. Many athletic trainers work indoors most of the time; others, especially those in some sports-related jobs, spend much of their time working outdoors. The job also might require standing for long periods, working with medical equipment or machinery, and being able to walk, run, kneel, crouch, stoop, or crawl. Some travel may be required.

Schedules vary by work setting. Athletic trainers in nonsports settings generally have an established schedule with nights and weekends off; the number of hours differs by employer, but usually are about 40 to 50 hours per week. Trainers working in hospitals and clinics spend part of their time working at other locations on an outreach basis. Most commonly, those outreach programs include secondary schools, colleges, and commercial business locations. Athletic trainers in sports settings, however, deal with schedules that are longer and more variable. These trainers must be present for team practices and games, which often are on evenings and weekends, and their schedules can change on short notice when games and practices have to be rescheduled. As a result, athletic trainers in sports settings regularly may have to work 6 or 7 days per week, including late hours.

In high schools, athletic trainers who also teach may work at least 60 to 70 hours a week. In NCAA Division I colleges and universities, athletic trainers generally work with one team; when that team's sport is in season, working at least 50 to 60 hours a week is common. Athletic trainers in smaller colleges and universities often work with several teams and have teaching responsibilities. During the off-season, a 40-hour to 50-hour work week may be normal in most settings. Athletic trainers for professional sports teams generally work the most hours per week. During training camps, practices, and competitions, they may be required to work up to 12 hours a day.

There is some stress involved with being an athletic trainer, as there is with most health-related occupations. Athletic trainers are responsible for their clients' health, and sometimes have to make quick decisions that could affect the health or career of their clients. Athletics trainers also can be affected by the pressure to win that is typical of competitive sports teams.

Training, Other Qualifications, and Advancement

A bachelor's degree from an accredited college or university is required for almost all jobs as an athletic trainer. In 2004, there were more than 300 accredited programs nationwide. Students in these programs are educated both in the classroom and in clinical settings. Formal education includes many science and health-related courses, such as human anatomy, physiology, nutrition, and biomechanics.

A bachelor's degree with a major in athletic training from an accredited program is part of the requirement for becoming certified by the Board of Certification (BOC). In addition, a successful candidate for board certification must pass an examination that includes written questions and practical applications. To retain certification, credential holders must continue taking medical-related courses and adhere to standards of practice. In the 43 States with athletic trainer licensure or registration or both in 2004, BOC certification was required.

According to the National Athletic Trainers Association, 70 percent of athletic trainers have a master's or doctoral degree. Athletic trainers may need a master's or higher degree to be eligible for some positions, especially those in colleges and universities, and to increase their advancement opportunities. Because some positions in high schools involve teaching along with athletic trainer responsibilities, a teaching certificate or license could be required.

There are a number of ways in which athletic trainers can advance or move into related positions. Assistant athletic trainers may become head athletic trainers and, eventually, athletic directors. Athletic trainers might also enter a physician group practice and assume a management role. Some athletic trainers move into sales and marketing positions, using their athletic trainer expertise to sell medical and athletic equipment.

Because all athletic trainers deal directly with a variety of people, they need good social and communication skills. They should be able to manage difficult situations and the stress associated with them—for example, when disagreements arise with coaches, clients, or parents regarding suggested treatment. Athletic trainers also should be organized, be able to manage time wisely, be inquisitive, and have a strong desire to help people.

Employment

Athletic trainers held about 15,000 jobs in 2004 and are found in every part of the country. Most athletic trainer jobs are related to sports, although many also work in nonsports settings. About one-third of athletic trainers worked in health care, including jobs in hospitals, offices of physicians, and offices of other health practitioners. Another one-third were found in public and private educational services, primarily in colleges, universities, and high schools. About 20 percent worked in fitness and recreational sports centers.

Job Outlook

Employment of athletic trainers is expected to grow much faster than the average for all occupations through 2014. Job growth will be concentrated in health care industry settings, such as ambulatory health care services and hospitals. Growth in sports-related positions will be somewhat slower, as most professional sports clubs and colleges, universities, and professional schools already have complete athletic training staffs. Job prospects should be good for people looking for a position in the health care industry. Athletic trainers looking for a position with a sports team, however, may face competition.

The demand for health care should grow dramatically as the result of advances in technology, increasing emphasis on preventive care, and an increasing number of older people who are more likely to need medical care. Athletic trainers will benefit from this expansion, because they provide a cost-effective way to increase the number of health professionals in an office or other setting. Also, employers increasingly emphasize sports medicine, in which an immediate responder, such as an athletic trainer, is on site to help prevent injuries and provide immediate treatment for any injuries that do occur. Athletic trainers' increased licensure requirements and regulation has led to a greater acceptance of their role as qualified health care providers. As a result, third-party reimbursement is expected to continue to grow for athletic training services. As athletic trainers continue to expand their services, more employers are expected to use these workers to realize the cost savings that can be achieved by providing health care in-house. Settings outside the sports world, especially those that focus on health care, are expected to experience fast employment growth among athletic trainers over the next decade. Continuing efforts to have an athletic trainer in every high school reflect concern for student-athletes' health as well as efforts to provide more funding for schools, and may lead to growth in the number of athletic trainers employed in high schools.

Turnover among athletic trainers is limited. When dealing with sports teams, there is a tendency to want to continue to work with the same coaches, administrators, and players when a good working relationship already exists. Because of relatively low worker turnover, the settings with the best job prospects will be the ones that are expected to grow most quickly, primarily positions in health care settings. There will also be opportunities in elementary and secondary schools as more positions are created. Some of these positions also will require teaching responsibilities. There will be more competition for positions within colleges, universities, and professional schools as well as professional sports clubs. The occupation is expected to continue to change over the next decade including more administrative responsibilities, adapting to new technology, and working with larger populations, and job seekers must be able to adapt to these changes.

Earnings

Most athletic trainers work in full-time positions, and typically receive benefits. The salary of an athletic trainer depends on experience and job responsibilities, and varies by job setting. Median annual earnings of athletic trainers were \$33,940 in May 2004. The middle 50 percent earned between \$27,140 and \$42,380. The lowest 10 percent earned less than \$20,770, while the top 10 percent earned more than \$53,760. Also, many employers pay for some of the continuing education required of ATCs, although the amount covered varies from employer to employer.

Related Occupations

The American Medical Association recognizes athletic trainers as allied health professionals. They work under the direction of physicians and provide immediate care for injuries. Also, they provide education and advice on the prevention of injuries and work closely with injured patients to rehabilitate and recondition injuries, often through therapy. Other occupations that may require similar responsibilities include emergency medical technicians and paramedics, physical therapists, physician assistants, registered nurses, licensed practical and licensed vocational nurses, recreational therapists, occupational therapists, and respiratory therapists.

There also are opportunities for athletic trainers to join the military, although they would not be classified as an athletic trainer. Enlisted soldiers and officers who are athletic trainers are

usually placed in another program in which their skills are useful, such as health educator or training specialist. (For information on military careers, see the *Handbook* statement on job opportunities in the armed forces.)

Cardiovascular Technologists and Technicians

(O*NET 29-2031.00)

Significant Points

- About 3 out of 4 jobs were in hospitals.
- The vast majority of cardiovascular technologists and technicians complete a 2-year junior or community college program.
- Employment will grow much faster than the average, but the number of job openings created will be low because the occupation is small.
- Employment of most specialties will grow, but fewer EKG technicians will be needed.

Nature of the Work

Cardiovascular technologists and technicians assist physicians in diagnosing and treating cardiac (heart) and peripheral vascular (blood vessel) ailments. Cardiovascular technologists may specialize in any of three areas of practice: invasive cardiology, echocardiography, and vascular technology. Cardiovascular technicians who specialize in electrocardiograms (EKGs), stress testing, and Holter monitors are known as *cardiographic technicians*, or *EKG technicians*.

Cardiovascular technologists specializing in invasive procedures are called *cardiology technologists*. They assist physicians with cardiac catheterization procedures in which a small tube, or catheter, is threaded through a patient's artery from a spot on the patient's groin to the heart. The procedure can determine whether a blockage exists in the blood vessels that supply the heart muscle. The procedure also can help to diagnose other problems. Part of the procedure may involve balloon angioplasty, which can be used to treat blockages of blood vessels or heart valves without the need for heart surgery. Cardiology technologists assist physicians as they insert a catheter with a balloon on the end to the point of the obstruction.

Technologists prepare patients for cardiac catheterization and balloon angioplasty by first positioning them on an examining table and then shaving, cleaning, and administering anesthesia to the top of their leg near the groin. During the procedures, they monitor patients' blood pressure and heart rate with EKG equipment and notify the physician if something appears to be wrong. Technologists also may prepare and monitor patients during open-heart surgery and during the insertion of pacemakers and stents that open up blockages in arteries to the heart and major blood vessels.

Cardiovascular technologists who specialize in echocardiography or vascular technology often run noninvasive tests using ultrasound instrumentation, such as Doppler ultrasound. Tests are called "noninvasive" if they do not require the insertion of probes or other

instruments into the patient's body. The ultrasound instrumentation transmits high-frequency sound waves into areas of the patient's body and then processes reflected echoes of the sound waves to form an image. Technologists view the ultrasound image on a screen and may record the image on videotape or photograph it for interpretation and diagnosis by a physician. As the instrument scans the image, technologists check the image on the screen for subtle differences between healthy and diseased areas, decide which images to include in the report to the physician, and judge whether the images are satisfactory for diagnostic purposes. They also explain the procedure to patients, record any additional medical history the patient relates, select appropriate equipment settings, and change the patient's position as necessary. (See the statement on diagnostic medical sonographers elsewhere in the *Handbook* to learn more about other sonographers.)

Those who assist physicians in the diagnosis of disorders affecting the circulation are known as *vascular technologists* or *vascular sonographers*. They perform a medical history, evaluate pulses and assess blood flow in arteries and veins by listening to the vascular flow sounds for abnormalities. Then they perform a noninvasive procedure using ultrasound instrumentation to record vascular information such as vascular blood flow, blood pressure, changes in limb volume, oxygen saturation, cerebral circulation, peripheral circulation, and abdominal circulation. Many of these tests are performed during or immediately after surgery.

Technologists who use ultrasound to examine the heart chambers, valves, and vessels are referred to as *cardiac sonographers*, or *echocardiographers*. They use ultrasound instrumentation to create images called echocardiograms. An echocardiogram may be performed while the patient is either resting or physically active. Technologists may administer medication to physically active patients to assess their heart function. Cardiac sonographers also may assist physicians who perform transesophageal echocardiography, which involves placing a tube in the patient's esophagus to obtain ultrasound images.

Cardiovascular technicians who obtain EKGs are known as *electrocardiograph* (or *EKG*) *technicians*. To take a basic EKG, which traces electrical impulses transmitted by the heart, technicians attach electrodes to the patient's chest, arms, and legs, and then manipulate switches on an EKG machine to obtain a reading. An EKG is printed out for interpretation by the physician. This test is done before most kinds of surgery or as part of a routine physical examination, especially on persons who have reached middle age or who have a history of cardiovascular problems.

EKG technicians with advanced training perform Holter monitor and stress testing. For Holter monitoring, technicians place electrodes on the patient's chest and attach a portable EKG monitor to the patient's belt. Following 24 or more hours of normal activity by the patient, the technician removes a tape from the monitor and places it in a scanner. After checking the quality of the recorded impulses on an electronic screen, the technician usually prints the information from the tape for analysis by a physician. Physicians use the output from the scanner to diagnose heart ailments, such as heart rhythm abnormalities or problems with pacemakers.

For a treadmill stress test, EKG technicians document the patient's medical history, explain the procedure, connect the patient to an EKG monitor, and obtain a baseline reading and resting blood pressure. Next, they monitor the heart's performance while the patient is walking on a treadmill, gradually increasing the treadmill's speed to observe the effect of increased exertion. Like vascular technologists and cardiac sonographers, cardiographic technicians who perform EKG, Holter monitor, and stress tests are known as "noninvasive" technicians.

Cardiovascular technologists use ultrasound technology to produce images for diagnosis.

Some cardiovascular technologists and technicians schedule appointments, type doctors' interpretations, maintain patient files, and care for equipment.

Working Conditions

Technologists and technicians generally work a 5-day, 40-hour week that may include weekends. Those in catheterization laboratories tend to work longer hours and may work evenings. They also may be on call during the night and on weekends.

Cardiovascular technologists and technicians spend a lot of time walking and standing. Heavy lifting may be involved to move equipment or transfer patients. These workers wear heavy protective aprons while conducting some procedures. Those who work in catheterization laboratories may face stressful working conditions because they are in close contact with patients with serious heart ailments. For example, some patients may encounter complications that have life-or-death implications.

Training, Other Qualifications, and Advancement

Although a few cardiovascular technologists, vascular technologists, and cardiac sonographers are currently trained on the job, most receive training in 2- to 4-year programs. The majority of technologists complete a 2-year junior or community college program, but 4-year programs are increasingly available. The first year is dedicated to core courses and is followed by a year of specialized instruction in either invasive, noninvasive cardiovascular, or noninvasive vascular technology. Those who are qualified in an allied health profession need to complete only the year of specialized instruction.

Graduates of the 33 programs accredited by the Joint Review Committee on Education in Cardiovascular Technology are eligible to obtain professional certification in cardiac catheterization, echocardiography, vascular ultrasound, and cardiographic techniques from Cardiovascular Credentialing International. Cardiac sonographers and vascular technologists also may obtain certification from the American Registry of Diagnostic Medical Sonographers.

Most EKG technicians are trained on the job by an EKG supervisor or a cardiologist. On-the-job training usually lasts about 8 to 16 weeks. Most employers prefer to train people already in the health care field—nursing aides, for example. Some EKG technicians are students enrolled in 2-year programs to become technologists, working part time to gain experience and make contact with

employers. One-year certification programs exist for basic EKGs, Holter monitoring, and stress testing.

Cardiovascular technologists and technicians must be reliable, have mechanical aptitude, and be able to follow detailed instructions. A pleasant, relaxed manner for putting patients at ease is an asset.

Employment

Cardiovascular technologists and technicians held about 45,000 jobs in 2004. About 3 out of 4 jobs were in hospitals (private and government), primarily in cardiology departments. The remaining jobs were mostly in offices of physicians, including cardiologists or in medical and diagnostic laboratories, including diagnostic imaging centers.

Job Outlook

Employment of cardiovascular technologists and technicians is expected to grow much faster than the average for all occupations through the year 2014. Growth will occur as the population ages, because older people have a higher incidence of heart problems and use more diagnostic imaging. Employment of vascular technologists and echocardiographers will grow as advances in vascular technology and sonography reduce the need for more costly and invasive procedures. However, fewer EKG technicians will be needed, as hospitals train nursing aides and others to perform basic EKG procedures. Individuals trained in Holter monitoring and stress testing are expected to have more favorable job prospects than are those who can perform only a basic EKG.

Some job openings for cardiovascular technologists and technicians will arise from replacement needs as individuals transfer to other jobs or leave the labor force. However, job growth and replacement needs will produce relatively few job openings because the occupation is small.

Earnings

Median annual earnings of cardiovascular technologists and technicians were \$38,690 in May 2004. The middle 50 percent earned between \$27,890 and \$50,130. The lowest 10 percent earned less than \$21,790, and the highest 10 percent earned more than \$59,000. Median annual earnings of cardiovascular technologists and technicians in May 2004 were \$36,890 in offices of physicians and \$38,150 in general medical and surgical hospitals.

Related Occupations

Cardiovascular technologists and technicians operate sophisticated equipment that helps physicians and other health practitioners to diagnose and treat patients. So do diagnostic medical sonographers, nuclear medicine technologists, radiation therapists, radiologic technologists and technicians, and respiratory therapists.

Clinical Laboratory Technologists and Technicians

(O*NET 29-2011.00, 29-2012.00)

Significant Points

- Faster than average employment growth is expected as the volume of laboratory tests continues to increase with both population growth and the development of new types of tests.
- Clinical laboratory technologists usually have a bachelor's degree with a major in medical technology or in one of the life sciences; clinical laboratory technicians generally need either an associate degree or a certificate.
- Job opportunities are expected to be excellent.

Nature of the Work

Clinical laboratory testing plays a crucial role in the detection, diagnosis, and treatment of disease. Clinical laboratory technologists, also referred to as clinical laboratory scientists or medical technologists, and clinical laboratory technicians, also known as medical technicians or medical laboratory technicians, perform most of these tests.

Clinical laboratory personnel examine and analyze body fluids, and cells. They look for bacteria, parasites, and other microorganisms; analyze the chemical content of fluids; match blood for transfusions; and test for drug levels in the blood to show how a patient is responding to treatment. Technologists also prepare specimens for examination, count cells, and look for abnormal cells in blood and body fluids. They use automated equipment and computerized instruments capable of performing a number of tests simultaneously, as well as microscopes, cell counters, and other sophisticated laboratory equipment. Then they analyze the results and relay them to physicians. With increasing automation and the use of computer technology, the work of technologists and technicians has become less hands-on and more analytical.

The complexity of tests performed, the level of judgment needed, and the amount of responsibility workers assume depend largely on the amount of education and experience they have.

Clinical laboratory technologists perform complex chemical, biological, hematological, immunologic, microscopic, and bacteriological tests. Technologists microscopically examine blood and other body fluids. They make cultures of body fluid and tissue samples, to determine the presence of bacteria, fungi, parasites, or other microorganisms. Clinical laboratory technologists analyze samples for chemical content or a chemical reaction and determine concentrations of compounds such as blood glucose and cholesterol levels. They also type and cross match blood samples for transfusions.

Clinical laboratory technologists evaluate test results, develop and modify procedures, and establish and monitor programs, to ensure the accuracy of tests. Some technologists supervise clinical laboratory technicians.

Technologists in small laboratories perform many types of tests, whereas those in large laboratories generally specialize. Technologists who prepare specimens and analyze the chemical and hormonal contents of body fluids are called clinical chemistry technologists. Those who examine and identify bacteria and other microorganisms are microbiology technologists. Blood bank technologists, or immunohematology technologists, collect, type, and prepare blood and its components for transfusions. Immunology technologists examine elements of the human immune system and its response to foreign bodies. Cytotechnologists prepare slides of body cells and examine these cells microscopically for abnormalities that may signal the beginning of a cancerous growth. Molecular biology technologists perform complex protein and nucleic acid testing on cell samples.

Clinical laboratory technicians perform less complex tests and laboratory procedures than technologists perform. Technicians may prepare specimens and operate automated analyzers, for example, or they may perform manual tests in accordance with detailed instructions. Like technologists, they may work in several areas of the clinical laboratory or specialize in just one. Histotechnicians cut and stain tissue specimens for microscopic examination by pathologists, and phlebotomists collect blood samples. They usually work under the supervision of medical and clinical laboratory technologists or laboratory managers.

Working Conditions

Hours and other working conditions of clinical laboratory technologists and technicians vary with the size and type of employment setting. In large hospitals or in independent laboratories that operate continuously, personnel usually work the day, evening, or night shift and may work weekends and holidays. Laboratory personnel in small facilities may work on rotating shifts, rather than on a regular shift. In some facilities, laboratory personnel are on call several nights a week or on weekends, in case of an emergency.

Clinical laboratory personnel are trained to work with infectious specimens. When proper methods of infection control and sterilization

are followed, few hazards exist. Protective masks, gloves, and goggles are often necessary to ensure the safety of laboratory personnel.

Laboratories usually are well lighted and clean; however, specimens, solutions, and reagents used in the laboratory sometimes produce fumes. Laboratory workers may spend a great deal of time on their feet.

Training, Other Qualifications, and Advancement

The usual requirement for an entry-level position as a clinical laboratory technologist is a bachelor's degree with a major in medical technology or in one of the life sciences; although it is possible to qualify through a combination of education, on-the-job, and specialized training. Universities and hospitals offer medical technology programs.

Bachelor's degree programs in medical technology include courses in chemistry, biological sciences, microbiology, mathematics, and statistics, as well as specialized courses devoted to knowledge and skills used in the clinical laboratory. Many programs also offer or require courses in management, business, and computer applications. The Clinical Laboratory Improvement Act requires technologists who perform highly complex tests to have at least an associate degree.

Medical and clinical laboratory technicians generally have either an associate degree from a community or junior college or a certificate from a hospital, a vocational or technical school, or one of the U.S. Armed Forces. A few technicians learn their skills on the job.

The National Accrediting Agency for Clinical Laboratory Sciences (NAACLS) fully accredits 469 programs for medical and clinical laboratory technologists, medical and clinical laboratory technicians, histotechnologists and histotechnicians, cytogenetic technologists, and diagnostic molecular scientists. NAACLS also approves 57 programs in phlebotomy and clinical assisting. Other nationally recognized accrediting agencies that accredit specific areas for clinical laboratory workers include the Commission on Accreditation of Allied Health Education Programs and the Accrediting Bureau of Health Education Schools.

Some States require laboratory personnel to be licensed or registered. Information on licensure is available from State departments of health or boards of occupational licensing. Certification is a voluntary process by which a nongovernmental organization, such as a professional society or certifying agency, grants recognition to an individual whose professional competence meets prescribed standards. Widely accepted by employers in the health care industry, certification is a prerequisite for most jobs and often is necessary for advancement. Agencies certifying medical and clinical laboratory technologists and technicians include the Board of Registry of the American Society for Clinical Pathology, the American Medical Technologists, the National Credentialing Agency for Laboratory Personnel, and the Board of Registry of the American Association of Bioanalysts. These agencies have different requirements for certification and different organizational sponsors.

Clinical laboratory personnel need good analytical judgment and the ability to work under pressure. Close attention to detail is essential, because small differences or changes in test substances or numerical readouts can be crucial for patient care. Manual dexterity and normal color vision are highly desirable. With the widespread use of automated laboratory equipment, computer skills are important. In addition, technologists in particular are expected to be good at problem solving.

Technologists may advance to supervisory positions in laboratory work or may become chief medical or clinical laboratory technologists or laboratory managers in hospitals. Manufacturers

Clinical laboratory technicians may prepare specimens, operate automated analyzers, or perform manual tests in accordance with detailed instructions.

of home diagnostic testing kits and laboratory equipment and supplies seek experienced technologists to work in product development, marketing, and sales. A graduate degree in medical technology, one of the biological sciences, chemistry, management, or education usually speeds advancement. A doctorate is needed to become a laboratory director; however, Federal regulation allows directors of moderately complex laboratories to have either a master's degree or a bachelor's degree, combined with the appropriate amount of training and experience. Technicians can become technologists through additional education and experience.

Employment

Clinical laboratory technologists and technicians held about 302,000 jobs in 2004. More than half of jobs were in hospitals. Most of the remaining jobs were in offices of physicians and in medical and diagnostic laboratories. A small proportion was in educational services and in all other ambulatory health care services.

Job Outlook

Job opportunities are expected to be excellent, because the number of job openings is expected to continue to exceed the number of job seekers. Employment of clinical laboratory workers is expected to grow faster than the average for all occupations through the year 2014, as the volume of laboratory tests continues to increase with both population growth and the development of new types of tests.

Technological advances will continue to have two opposing effects on employment. On the one hand, new, increasingly powerful diagnostic tests will encourage additional testing and spur employment. On the other hand, research and development efforts targeted at simplifying routine testing procedures may enhance the ability of nonlaboratory personnel—physicians and patients in particular—to perform tests now conducted in laboratories. Although hospitals are expected to continue to be the major employer of clinical laboratory workers, employment is expected to grow faster in medical and diagnostic laboratories, offices of physicians, and all other ambulatory health care services.

Although significant, job growth will not be the only source of opportunities. As in most occupations, many openings will result from the need to replace workers who transfer to other occupations, retire, or stop working for some other reason.

Earnings

Median annual earnings of medical and clinical laboratory technologists were \$45,730 in May 2004. The middle 50 percent earned between \$38,740 and \$54,310. The lowest 10 percent earned less than \$32,240, and the highest 10 percent earned more than \$63,120. Median annual earnings in the industries employing the largest numbers of medical and clinical laboratory technologists in May 2004 were as follows:

General medical and surgical hospitals.....	\$46,020
Medical and diagnostic laboratories	45,840
Offices of physicians.....	41,070

Median annual earnings of medical and clinical laboratory technicians were \$30,840 in May 2004. The middle 50 percent earned between \$24,890 and \$37,770. The lowest 10 percent earned less than \$20,410, and the highest 10 percent earned more than \$45,680. Median annual earnings in the industries employing the largest numbers of medical and clinical laboratory technicians in May 2004 were as follows:

Colleges, universities, and professional schools.....	\$32,410
General medical and surgical hospitals.....	31,830
Offices of physicians.....	29,620
Medical and diagnostic laboratories	29,220
Other ambulatory health care services.....	28,130

According to the American Society for Clinical Pathology, median hourly wages of staff clinical laboratory technologists and technicians in 2003 varied by specialty and laboratory type as follows:

	<i>Hospital</i>	<i>Private clinic</i>	<i>Physician office laboratory</i>
Cytotechnologist	\$24.70	\$24.07	\$25.66
Histotechnologist	19.88	19.22	20.50
Medical technologist.....	20.40	19.00	18.00
Histotechnician	16.97	16.13	20.00
Medical laboratory technician.....	16.12	15.00	14.75
Phlebotomist	11.13	10.57	10.50

Related Occupations

Clinical laboratory technologists and technicians analyze body fluids, tissue, and other substances, using a variety of tests. Similar or related procedures are performed by chemists and materials scientists, science technicians, and veterinary technologists and technicians.

Dental Hygienists

(O*NET 29-2021.00)

Significant Points

- Most dental hygiene programs grant an associate degree; others offer a certificate, a bachelor's degree, or a master's degree.
- Dental hygienists rank among the fastest growing occupations.
- Job prospects are expected to remain excellent.
- More than half work part time, and flexible scheduling is a distinctive feature of this job.

Nature of the Work

Dental hygienists remove soft and hard deposits from teeth, teach patients how to practice good oral hygiene, and provide other preventive dental care. Hygienists examine patients' teeth and gums, recording the presence of diseases or abnormalities. They remove calculus, stains, and plaque from teeth; perform root planing as a periodontal therapy; take and develop dental x rays; and apply cavity-preventive agents such as fluorides and pit and fissure sealants. In some States, hygienists administer anesthetics; place and carve filling materials, temporary fillings, and periodontal dressings; remove sutures; and smooth and polish metal restorations. Although hygienists may not diagnose diseases, they can prepare clinical and laboratory diagnostic tests for the dentist to interpret. Hygienists sometimes work chairside with the dentist during treatment.

Dental hygienists also help patients develop and maintain good oral health. For example, they may explain the relationship between diet and oral health or inform patients how to select toothbrushes and show them how to brush and floss their teeth.

Dental hygienists use hand and rotary instruments and ultrasonics to clean and polish teeth, x-ray machines to take dental pictures, syringes with needles to administer local anesthetics, and models of teeth to explain oral hygiene.

Working Conditions

Flexible scheduling is a distinctive feature of this job. Full-time, part-time, evening, and weekend schedules are widely available. Dentists frequently hire hygienists to work only 2 or 3 days a week, so hygienists may hold jobs in more than one dental office.

Dental hygienists work in clean, well-lighted offices. Important health safeguards include strict adherence to proper radiological procedures, and the use of appropriate protective devices when administering anesthetic gas. Dental hygienists also wear safety glasses, surgical masks, and gloves to protect themselves and patients from infectious diseases.

Training, Other Qualifications, and Advancement

Dental hygienists must be licensed by the State in which they practice. To qualify for licensure in nearly all States, a candidate

must graduate from an accredited dental hygiene school and pass both a written and clinical examination. The American Dental Association's Joint Commission on National Dental Examinations administers the written examination, which is accepted by all States and the District of Columbia. State or regional testing agencies administer the clinical examination. In addition, most States require an examination on the legal aspects of dental hygiene practice. Alabama allows candidates to take its examinations if they have been trained through a State-regulated on-the-job program in a dentist's office.

In 2004, the Commission on Dental Accreditation accredited 266 programs in dental hygiene. Most dental hygiene programs grant an associate degree, although some also offer a certificate, a bachelor's degree, or a master's degree. A minimum of an associate degree or certificate in dental hygiene is generally required for practice in a private dental office. A bachelor's or master's degree usually is required for research, teaching, or clinical practice in public or school health programs.

A high school diploma and college entrance test scores are usually required for admission to a dental hygiene program. Also, some dental hygiene programs prefer applicants who have completed at least 1 year of college. Requirements vary from one school to another. Schools offer laboratory, clinical, and classroom instruction in subjects such as anatomy, physiology, chemistry, microbiology, pharmacology, nutrition, radiography, histology (the study of tissue structure), periodontology (the study of gum diseases), pathology, dental materials, clinical dental hygiene, and social and behavioral sciences.

Dental hygienists should work well with others and must have good manual dexterity, because they use dental instruments within a patient's mouth, with little room for error. High school students interested in becoming a dental hygienist should take courses in biology, chemistry, and mathematics.

Employment

Dental hygienists held about 158,000 jobs in 2004. Because multiple job holding is common in this field, the number of jobs exceeds the number of hygienists. More than half of all dental hygienists worked part time—less than 35 hours a week.

Almost all jobs for dental hygienists were in offices of dentists. A very small number worked for employment services or in offices of physicians.

Job Outlook

Employment of dental hygienists is expected to grow much faster than the average for all occupations through 2014, ranking among the fastest growing occupations, in response to increasing demand for dental care and the greater utilization of hygienists to perform services previously performed by dentists. Job prospects are expected to remain excellent.

Population growth and greater retention of natural teeth will stimulate demand for dental hygienists. Older dentists, who have been less likely to employ dental hygienists, are leaving the occupation and will be replaced by recent graduates, who are more likely to employ one or even two hygienists. In addition, as dentists' workloads increase, they are expected to hire more hygienists to perform preventive dental care, such as cleaning, so that they may devote their own time to more profitable procedures.

Earnings

Median hourly earnings of dental hygienists were \$28.05 in May 2004. The middle 50 percent earned between \$22.72 and \$33.82 an hour. The lowest 10 percent earned less than \$18.05, and the highest 10 percent earned more than \$40.70 an hour.

Dental hygienists remove calculus, stains, and plaque from teeth.

Earnings vary by geographic location, employment setting, and years of experience. Dental hygienists may be paid on an hourly, daily, salary, or commission basis.

Benefits vary substantially by practice setting and may be contingent upon full-time employment. According to the American Dental Association (ADA), almost all full-time dental hygienists employed by private practitioners received paid vacation. The ADA also found that 9 out of 10 full-time and part-time dental hygienists received dental coverage. Dental hygienists who work for school systems, public health agencies, the Federal Government, or State agencies usually have substantial benefits.

Related Occupations

Other workers supporting health practitioners in an office setting include dental assistants, medical assistants, occupational therapist assistants and aides, physical therapist assistants and aides, physician assistants, and registered nurses.

Diagnostic Medical Sonographers

(O*NET 29-2032.00)

Significant Points

- Job opportunities should be favorable, as sonography becomes an increasingly attractive alternative to radiologic procedures.
- About 6 out of 10 sonographers were employed by hospitals, and most of the rest worked in offices of physicians or in medical and diagnostic laboratories, including diagnostic imaging centers.
- Sonographers may train in hospitals, vocational-technical institutions, colleges and universities, and the Armed Forces.

Nature of the Work

Diagnostic imaging embraces several procedures that aid in diagnosing ailments. Besides the familiar xray, another common diagnostic imaging method is magnetic resonance imaging, which uses giant magnets that create radio waves, rather than radiation, to form an image. Not all imaging technologies use ionizing radiation or radio waves, however. Sonography, or ultrasonography, is the use of sound waves to generate an image for the assessment and diagnosis of various medical conditions. Sonography usually is associated with obstetrics and the use of ultrasound imaging during pregnancy, but this technology has many other applications in the diagnosis and treatment of medical conditions.

Diagnostic medical sonographers, also known as *ultrasonographers*, use special equipment to direct nonionizing, high frequency sound waves into areas of the patient's body. Sonographers operate

the equipment, which collects reflected echoes and forms an image that may be videotaped, transmitted, or photographed for interpretation and diagnosis by a physician.

Sonographers begin by explaining the procedure to the patient and recording any medical history that may be relevant to the condition being viewed. They then select appropriate equipment settings and direct the patient to move into positions that will provide the best view. To perform the exam, sonographers use a transducer, which transmits sound waves in a cone- or rectangle-shaped beam. Although techniques vary with the area being examined, sonographers usually spread a special gel on the skin to aid the transmission of sound waves.

Viewing the screen during the scan, sonographers look for subtle visual cues that contrast healthy areas with unhealthy ones. They decide whether the images are satisfactory for diagnostic purposes and select which ones to show to the physician. Sonographers take measurements, calculate values, and analyze the results in preliminary reports for the physicians.

Diagnostic medical sonographers may specialize in obstetric and gynecologic sonography (the female reproductive system), abdominal sonography (the liver, kidneys, gallbladder, spleen, and pancreas), neurosonography (the brain), or breast sonography. In addition, sonographers may specialize in vascular technology or echocardiography. (Vascular technologists and echocardiographers are covered in the *Handbook* statement on cardiovascular technologists and technicians.)

Obstetric and gynecologic sonographers specialize in the study of the female reproductive system. Included in the discipline is one of the more well-known uses of sonography: examining the fetus of a pregnant woman to track the baby's growth and health.

Abdominal sonographers inspect a patient's abdominal cavity to help diagnose and treat conditions primarily involving the gallbladder, bile ducts, kidneys, liver, pancreas, and spleen. Abdominal sonographers also are able to scan parts of the chest, although studies of the heart using sonography usually are done by echocardiographers.

Neurosonographers focus on the nervous system, including the brain. In neonatal care, neurosonographers study and diagnose neurological and nervous system disorders in premature infants. They also may scan blood vessels to check for abnormalities indicating a stroke in infants diagnosed with sickle-cell anemia. Like other sonographers, neurosonographers operate transducers to perform the sonogram, but use frequencies and beam shapes different from those used by obstetric and abdominal sonographers.

Breast sonographers use sonography to study the disease in breasts. Sonography aids mammography in the detection of breast cancer. Breast sonography can also track tumors, blood supply conditions, and assist in the accurate biopsy of breast tissue. Breast sonographers use high-frequency transducers, made exclusively to study breast tissue.

In addition to working directly with patients, diagnostic medical sonographers keep patient records and adjust and maintain equipment. They also may prepare work schedules, evaluate equipment purchases, or manage a sonography or diagnostic imaging department.

Working Conditions

Most full-time sonographers work about 40 hours a week. Hospital-based sonographers may have evening and weekend hours and times when they are on call and must be ready to report to work on short notice.

Sonographers typically work in healthcare facilities that are clean and well lighted. Some travel to patients in large vans equipped with sophisticated diagnostic equipment. A growing number of

Using ultrasound equipment, a diagnostic medical sonographer creates an image of a patient's throat.

sonographers work as contract employees and may perform tests at a number of different hospitals. Sonographers are on their feet for long periods and may have to lift or turn disabled patients. They work at diagnostic imaging machines, but also may perform some procedures at patients' bedsides.

Training, Other Qualifications, and Advancement

There are several avenues for entry into the field of diagnostic medical sonography. Sonographers may train in hospitals, vocational-technical institutions, colleges and universities, and the Armed Forces. Some training programs prefer applicants with a background in science or experience in other healthcare professions, but also will consider high school graduates with courses in mathematics and science, as well as applicants with liberal arts backgrounds.

Colleges and universities offer formal training in both 2- and 4-year programs, culminating in an associate or a bachelor's degree. Two-year programs are most prevalent. Course work includes classes in anatomy, physiology, instrumentation, basic physics, patient care, and medical ethics. The Commission on Accreditation for Allied Health Education Programs accredits most formal training programs—132 programs in 2005.

Some healthcare workers, such as obstetric nurses and radiologic technologists, increase their marketability by seeking training in fields such as sonography. This usually requires completion of an additional 1-year program that may result in a certificate. In addi-

tion, sonographers specializing in one particular discipline often seek competency in others; for example, obstetric sonographers might seek training in abdominal sonography to broaden their opportunities.

Although no State requires licensure in diagnostic medical sonography, organizations such as the American Registry for Diagnostic Medical Sonography (ARDMS) certify the competency of sonographers through registration. Because registration provides an independent, objective measure of an individual's professional standing, many employers prefer to hire registered sonographers. Registration with ARDMS requires passing a general physical principles and instrumentation examination, in addition to passing an exam in a specialty such as obstetric and gynecologic sonography, abdominal sonography, or neurosonography. To keep their registration current, sonographers must complete continuing education to stay abreast of technological advances related to the occupation.

Sonographers need good communication and interpersonal skills because they must be able to explain technical procedures and results to their patients, some of whom may be nervous about the exam or the problems it may reveal. Sonographers also should have a background in mathematics and science.

Employment

Diagnostic medical sonographers held about 42,000 jobs in 2004. About 6 out of 10 sonographer jobs were in hospitals—public and private. Most of the rest were in offices of physicians or in medical and diagnostic laboratories, including diagnostic imaging centers

Job Outlook

Employment of diagnostic medical sonographers is expected to grow much faster than the average for all occupations through 2014 as the population grows and ages, increasing the demand for diagnostic imaging and therapeutic technology. In addition to job openings from growth, some job openings will arise from the need to replace sonographers who leave the occupation permanently.

Opportunities should be favorable because sonography is becoming an increasingly attractive alternative to radiologic procedures, as patients seek safer treatment methods. Unlike most diagnostic imaging methods, sonography does not involve radiation, so harmful side effects and complications from repeated use are rarer for both the patient and the sonographer. Sonographic technology is expected to evolve rapidly and to spawn many new sonography procedures, such as 3D- and 4D-sonography for use in obstetric and ophthalmologic diagnosis. However, high costs may limit the rate at which some promising new technologies are adopted.

Hospitals will remain the principal employer of diagnostic medical sonographers. However, employment is expected to grow more rapidly in offices of physicians and in medical and diagnostic laboratories, including diagnostic imaging centers. Healthcare facilities such as these are expected to grow very rapidly through 2014 because of the strong shift toward outpatient care, encouraged by third-party payers and made possible by technological advances that permit more procedures to be performed outside the hospital.

Earnings

Median annual earnings of diagnostic medical sonographers were \$52,490 in May 2004. The middle 50 percent earned between \$44,720 and \$61,360 a year. The lowest 10 percent earned less than \$37,800, and the highest 10 percent earned more than \$72,230. Median annual earnings of diagnostic medical sonographers in May 2004 were \$53,790 in offices of physicians and \$51,860 in general medical and surgical hospitals.

Related Occupations

Diagnostic medical sonographers operate sophisticated equipment to help physicians and other health practitioners diagnose and treat patients. Workers in related occupations include cardiovascular technologists and technicians, clinical laboratory technologists and technicians, nuclear medicine technologists, radiologic technologists and technicians, and respiratory therapists.

Emergency Medical Technicians and Paramedics

(O*NET 29-2041.00)

Significant Points

- Because emergency services function 24 hours a day, emergency medical technicians and paramedics have irregular working hours.
- Emergency medical technicians and paramedics need formal training and certification, but requirements vary by State.
- Employment is projected to grow much faster than average as paid emergency medical technician positions replace unpaid volunteers.
- Competition will be greater for jobs in local fire, police, and rescue squad departments than in private ambulance services; opportunities will be best for those who have advanced certification.

Nature of the Work

People's lives often depend on the quick reaction and competent care of emergency medical technicians (EMTs) and paramedics—EMTs with additional advanced training to perform more difficult prehospital medical procedures. Incidents as varied as automobile accidents, heart attacks, drownings, childbirth, and gunshot wounds all require immediate medical attention. EMTs and paramedics provide this vital attention as they care for and transport the sick or injured to a medical facility.

In an emergency, EMTs and paramedics typically are dispatched to the scene by a 911 operator, and often work with police and fire department personnel. (Police and detectives and firefighting occupations are discussed elsewhere in the *Handbook*.) Once they arrive, they determine the nature and extent of the patient's condition while trying to ascertain whether the patient has pre-

existing medical problems. Following strict rules and guidelines, they give appropriate emergency care and, when necessary, transport the patient. Some paramedics are trained to treat patients with minor injuries on the scene of an accident or at their home without transporting them to a medical facility. Emergency treatment for more complicated problems is carried out under the direction of medical doctors by radio preceding or during transport.

EMTs and paramedics may use special equipment, such as backboards, to immobilize patients before placing them on stretchers and securing them in the ambulance for transport to a medical facility. Usually, one EMT or paramedic drives while the other monitors the patient's vital signs and gives additional care as needed. Some EMTs work as part of the flight crew of helicopters that transport critically ill or injured patients to hospital trauma centers.

At the medical facility, EMTs and paramedics help transfer patients to the emergency department, report their observations and actions to emergency room staff, and may provide additional emergency treatment. After each run, EMTs and paramedics replace used supplies and check equipment. If a transported patient had a contagious disease, EMTs and paramedics decontaminate the interior of the ambulance and report cases to the proper authorities.

Beyond these general duties, the specific responsibilities of EMTs and paramedics depend on their level of qualification and training. To determine this, the National Registry of Emergency Medical Technicians (NREMT) registers emergency medical service (EMS) providers at four levels: First Responder, EMT-Basic, EMT-Intermediate, and EMT-Paramedic. Some States, however, do their own certification and use numeric ratings from 1 to 4 to distinguish levels of proficiency.

The lowest-level workers—First Responders—are trained to provide basic emergency medical care because they tend to be the first persons to arrive at the scene of an incident. Many firefighters, police officers, and other emergency workers have this level of training. The EMT-Basic, also known as EMT-1, represents the first component of the emergency medical technician system. An EMT-1 is trained to care for patients at the scene of an accident and while transporting patients by ambulance to the hospital under medical direction. The EMT-1 has the emergency skills to assess a patient's condition and manage respiratory, cardiac, and trauma emergencies.

The EMT-Intermediate (EMT-2 and EMT-3) has more advanced training that allows the administration of intravenous fluids, the use of manual defibrillators to give lifesaving shocks to a stopped heart, and the application of advanced airway techniques and equipment to assist patients experiencing respiratory emergencies. EMT-Paramedics (EMT-4) provide the most extensive prehospital care. In addition to carrying out the procedures already described, paramedics may administer drugs orally and intravenously, interpret electrocardiograms (EKGs), perform endotracheal intubations, and use monitors and other complex equipment.

Working Conditions

EMTs and paramedics work both indoors and outdoors, in all types of weather. They are required to do considerable kneeling, bending, and heavy lifting. These workers risk noise-induced hearing loss from sirens and back injuries from lifting patients. In addition, EMTs and paramedics may be exposed to diseases such as hepatitis-B and AIDS, as well as violence from drug overdose victims or mentally unstable patients. The work is not only physically strenuous, but can be stressful, sometimes involving life-or-death situations and suffering patients. Nonetheless, many people find

Emergency medical technicians provide medical care to patients at the scene of an emergency.

the work exciting and challenging and enjoy the opportunity to help others.

EMTs and paramedics employed by fire departments work about 50 hours a week. Those employed by hospitals frequently work between 45 and 60 hours a week, and those in private ambulance services, between 45 and 50 hours. Some of these workers, especially those in police and fire departments, are on call for extended periods. Because emergency services function 24 hours a day, EMTs and paramedics have irregular working hours.

Training, Other Qualifications, and Advancement

Formal training and certification is needed to become an EMT or paramedic. A high school diploma is typically required to enter a formal training program. Some programs offer an associate degree along with the formal EMT training. All 50 States have a certification procedure. In most States and the District of Columbia, registration with the NREMT is required at some or all levels of certification. Other States administer their own certification examination or provide the option of taking the NREMT examination. To maintain certification, EMTs and paramedics must reregister, usually every 2 years. In order to reregister, an individual must be working as an EMT or paramedic and meet a continuing education requirement.

Training is offered at progressive levels: EMT-Basic, also known as EMT-1; EMT-Intermediate, or EMT-2 and EMT-3; and EMT-

Paramedic, or EMT-4. EMT-Basic coursework typically emphasizes emergency skills, such as managing respiratory, trauma, and cardiac emergencies, and patient assessment. Formal courses are often combined with time in an emergency room or ambulance. The program also provides instruction and practice in dealing with bleeding, fractures, airway obstruction, cardiac arrest, and emergency childbirth. Students learn how to use and maintain common emergency equipment, such as backboards, suction devices, splints, oxygen delivery systems, and stretchers. Graduates of approved EMT basic training programs who pass a written and practical examination administered by the State certifying agency or the NREMT earn the title "Registered EMT-Basic." The course also is a prerequisite for EMT-Intermediate and EMT-Paramedic training.

EMT-Intermediate training requirements vary from State to State. Applicants can opt to receive training in EMT-Shock Trauma, wherein the caregiver learns to start intravenous fluids and give certain medications, or in EMT-Cardiac, which includes learning heart rhythms and administering advanced medications. Training commonly includes 35 to 55 hours of additional instruction beyond EMT-Basic coursework, and covers patient assessment as well as the use of advanced airway devices and intravenous fluids. Prerequisites for taking the EMT-Intermediate examination include registration as an EMT-Basic, required classroom work, and a specified amount of clinical experience.

The most advanced level of training for this occupation is EMT-Paramedic. At this level, the caregiver receives additional training in body function and learns more advanced skills. The Technology program usually lasts up to 2 years and results in an associate degree in applied science. Such education prepares the graduate to take the NREMT examination and become certified as an EMT-Paramedic. Extensive related coursework and clinical and field experience is required. Because of the longer training requirement, almost all EMT-Paramedics are in paid positions, rather than being volunteers. Refresher courses and continuing education are available for EMTs and paramedics at all levels.

EMTs and paramedics should be emotionally stable, have good dexterity, agility, and physical coordination, and be able to lift and carry heavy loads. They also need good eyesight (corrective lenses may be used) with accurate color vision.

Advancement beyond the EMT-Paramedic level usually means leaving fieldwork. An EMT-Paramedic can become a supervisor, operations manager, administrative director, or executive director of emergency services. Some EMTs and paramedics become instructors, dispatchers, or physician assistants, while others move into sales or marketing of emergency medical equipment. A number of people become EMTs and paramedics to assess their interest in health care, and then decide to return to school and become registered nurses, physicians, or other health workers.

Employment

EMTs and paramedics held about 192,000 jobs in 2004. Most career EMTs and paramedics work in metropolitan areas. Volunteer EMTs and paramedics are more common in small cities, towns, and rural areas. These individuals volunteer for fire departments, emergency medical services (EMS), or hospitals, and may respond to only a few calls for service per month or may answer the majority of calls, especially in smaller communities. EMTs and paramedics work closely with firefighters, who often are certified as EMTs as well and act as first responders. A large number of EMTs or paramedics belong to a union.

Full-time and part-time paid EMTs and paramedics were employed in a number of industries. About 4 out of 10 worked as employees of private ambulance services. About 3 out of 10 worked in local government for fire departments, public ambulance

services, and EMS. Another 2 out of 10 were found in hospitals, working full time within the medical facility or responding to calls in ambulances or helicopters to transport critically ill or injured patients. The remainder worked in various industries providing emergency services.

Job Outlook

Employment of emergency medical technicians and paramedics is expected to grow much faster than the average for all occupations through 2014, as full-time paid EMTs and paramedics replace unpaid volunteers. As population and urbanization increase, and as a large segment of the population—aging baby boomers—becomes more likely to have medical emergencies, demand will increase for EMTs and paramedics. There will still be demand for part-time, volunteer EMTs and paramedics in rural areas and smaller metropolitan areas. In addition to jobs arising from growth, openings will occur because of replacement needs; turnover is relatively high in this occupation because of the limited potential for advancement and the modest pay and benefits in private-sector jobs.

Job opportunities should be best in private ambulance services. Competition will be greater for jobs in local government, including fire, police, and independent third-service rescue squad departments, in which salaries and benefits tend to be slightly better. EMTs and paramedics who have advanced certifications, such as EMT-Intermediate and EMT-Paramedic, should enjoy the most favorable job prospects as clients and patients demand higher levels of care before arriving at the hospital.

Earnings

Earnings of EMTs and paramedics depend on the employment setting and geographic location as well as the individual's training and experience. Median annual earnings of EMTs and paramedics were \$25,310 in May 2004. The middle 50 percent earned between \$19,970 and \$33,210. The lowest 10 percent earned less than \$16,090, and the highest 10 percent earned more than \$43,240. Median annual earnings in the industries employing the largest numbers of EMTs and paramedics in May 2004 were:

Local government	\$27,710
General medical and surgical hospitals.....	26,590
Other ambulatory health care services.....	23,130

Those in emergency medical services who are part of fire or police departments receive the same benefits as firefighters or police officers. For example, many are covered by pension plans that provide retirement at half pay after 20 or 25 years of service or if the worker is disabled in the line of duty.

Related Occupations

Other workers in occupations that require quick and level-headed reactions to life-or-death situations are air traffic controllers, fire-fighting occupations, physician assistants, police and detectives, and registered nurses.

Sources of Additional Information

General information about emergency medical technicians and paramedics is available from:

Licensed Practical and Licensed Vocational Nurses

(O*NET 29-2061.00)

Significant Points

- Training lasting about 1 year is available in about 1,200 State-approved programs, mostly in vocational or technical schools.
- Applicants for jobs in hospitals may face competition as the number of hospital jobs for licensed practical nurses declines; however, rapid employment growth is projected in other health care industries, with the best job opportunities occurring in nursing care facilities and in home health care services.
- Replacement needs will be a major source of job openings, as many workers leave the occupation permanently.

Nature of the Work

Licensed practical nurses (LPNs), or licensed vocational nurses (LVNs), care for the sick, injured, convalescent, and disabled under the direction of physicians and registered nurses. (The work of physicians and surgeons and of registered nurses is described elsewhere in the *Handbook*.)

Most LPNs provide basic bedside care, taking vital signs such as temperature, blood pressure, pulse, and respiration. They also prepare and give injections and enemas, monitor catheters, apply dressings, treat bedsores, and give alcohol rubs and massages. LPNs monitor their patients and report adverse reactions to medications or treatments. They collect samples for testing, perform routine laboratory tests, feed patients, and record food and fluid intake and output. To help keep patients comfortable, LPNs assist with bathing, dressing, and personal hygiene. In States where the law allows, they may administer prescribed medicines or start intravenous fluids. Some LPNs help to deliver, care for, and feed infants. Experienced LPNs may supervise nursing assistants and aides.

In addition to providing routine bedside care, LPNs in nursing care facilities help to evaluate residents' needs, develop care plans, and supervise the care provided by nursing aides. In

Licensed practical nurses often stand for long periods and help patients move into bed, stand, or walk.

doctors' offices and clinics, they also may make appointments, keep records, and perform other clerical duties. LPNs who work in private homes may prepare meals and teach family members simple nursing tasks.

Working Conditions

Most licensed practical nurses in hospitals and nursing care facilities work a 40-hour week, but because patients need round-the-clock care, some work nights, weekends, and holidays. They often stand for long periods and help patients move in bed, stand, or walk.

LPNs may face hazards from caustic chemicals, radiation, and infectious diseases such as hepatitis. They are subject to back injuries when moving patients and shock from electrical equipment. They often must deal with the stress of heavy workloads. In addition, the patients they care for may be confused, irrational, agitated, or uncooperative.

Training, Other Qualifications, and Advancement

All States and the District of Columbia require LPNs to pass a licensing examination, known as the NCLEX-PN, after completing a State-approved practical nursing program. A high school diploma or its equivalent usually is required for entry, although some programs accept candidates without a diploma, and some are designed as part of a high school curriculum.

In 2004, approximately 1,200 State-approved programs provided training in practical nursing. Most training programs are available from technical and vocational schools, or from community and junior colleges. Other programs are available through high schools, hospitals, and colleges and universities.

Most practical nursing programs last about 1 year and include both classroom study and supervised clinical practice (patient care). Classroom study covers basic nursing concepts and patient care-related subjects, including anatomy, physiology, medical-surgical nursing, pediatrics, obstetrics, psychiatric nursing, the administration of drugs, nutrition, and first aid. Clinical practice usually is in a hospital, but sometimes includes other settings.

In some employment settings, such as nursing homes, LPNs can advance to become charge nurses who oversee the work of other LPNs and of nursing aides. Some LPNs also choose to become registered nurses through numerous LPN-to-RN training programs.

LPNs should have a caring, sympathetic nature. They should be emotionally stable because working with the sick and injured can be stressful. They also should have keen observational, decision-making, and communication skills. As part of a health care team, they must be able to follow orders and work under close supervision.

Employment

Licensed practical nurses held about 726,000 jobs in 2004. About 27 percent of LPNs worked in hospitals, 25 percent in nursing care facilities, and another 12 percent in offices of physicians. Others worked for home health care services; employment services; community care facilities for the elderly; public and private educational services; outpatient care centers; and Federal, State, and local government agencies. About 1 in 5 worked part time.

Job Outlook

Employment of LPNs is expected to grow about as fast as the average for all occupations through 2014 in response to the long-term care needs of an increasing elderly population and the general growth of health care services. Replacement needs will be a ma-

job source of job openings, as many workers leave the occupation permanently. Applicants for jobs in hospitals may face competition as the number of hospital jobs for LPNs declines; however, rapid employment growth is projected in other health care industries, with the best job opportunities occurring in nursing care facilities and in home health care services.

Employment of LPNs in hospitals is expected to continue to decline. Sophisticated procedures once performed only in hospitals are being performed in physicians' offices and in outpatient care centers such as ambulatory surgical and emergency medical centers, largely because of advances in technology. Consequently, employment of LPNs in most health care industries outside the traditional hospital setting is projected to grow faster than average.

Employment of LPNs is expected to grow much faster than average in home health care services. Home health care agencies also will offer the most new jobs for LPNs because of an increasing number of older persons with functional disabilities, consumer preference for care in the home, and technological advances that make it possible to bring increasingly complex treatments into the home.

Employment of LPNs in nursing care facilities is expected to grow about as fast as average because of the growing number of aged and disabled persons in need of long-term care. In addition, LPNs in nursing care facilities will be needed to care for the increasing number of patients who have been discharged from the hospital but who have not recovered enough to return home. However, changes in consumer preferences towards less restrictive and more cost-effective care from assisted living facilities and home health care agencies will limit employment growth.

Earnings

Median annual earnings of licensed practical nurses were \$33,970 in May 2004. The middle 50 percent earned between \$28,830 and \$40,670. The lowest 10 percent earned less than \$24,480, and the highest 10 percent earned more than \$46,270. Median annual earnings in the industries employing the largest numbers of licensed practical nurses in May 2004 were:

Employment services	\$41,550
Nursing care facilities	35,460
Home health care services	35,180
General medical and surgical hospitals.....	32,570
Offices of physicians.....	30,400

Related Occupations

LPNs work closely with people while helping them. So do emergency medical technicians and paramedics; medical assistants; nursing, psychiatric, and home health aides; registered nurses; social and human service assistants; and surgical technologists.

A list of State-approved LPN programs is available from individual State boards of nursing.

Medical Records and Health Information Technicians

(O*NET 29-2071.00)

Significant Points

- Employment is expected to grow much faster than average.
- Job prospects should be very good; technicians with a strong background in medical coding will be in particularly high demand.
- Entrants usually have an associate degree; courses include anatomy, physiology, medical terminology, statistics, and computer science.
- This is one of the few health occupations in which there is little or no direct contact with patients.

Nature of the Work

Every time a patient receives health care, a record is maintained of the observations, medical or surgical interventions, and treatment outcomes. This record includes information that the patient provides concerning his or her symptoms and medical history, the results of examinations, reports of x rays and laboratory tests, diagnoses, and treatment plans. Medical records and health information technicians organize and evaluate these records for completeness and accuracy.

Technicians assemble patients' health information. They make sure that patients' initial medical charts are complete, that all forms are completed and properly identified and signed, and that all necessary information is in the computer. They regularly communicate with physicians and other health care professionals to clarify diagnoses or to obtain additional information.

Some medical records and health information technicians specialize in coding patients' medical information for insurance purposes. Technicians who specialize in coding are called *health information coders*, *medical record coders*, *coder/abstractors*, or *coding specialists*. These technicians assign a code to each diagnosis and procedure. They consult classification manuals and also rely on their knowledge of disease processes. Technicians then use computer software to assign the patient to one of several hundred "diagnosis-related groups," or DRGs. The DRG determines the amount for which the hospital will be reimbursed if the patient is covered by Medicare or other insurance programs using the DRG system. In addition to the DRG system, coders use other coding systems, such as those geared toward ambulatory settings or long-term care.

Some technicians also use computer programs to tabulate and analyze data to improve patient care, control costs, provide documentation for use in legal actions, respond to surveys, or use in research studies. For example, *cancer* (or tumor) *registrars* maintain facility, regional, and national databases of cancer patients. Registrars review patient records and pathology reports, assign codes for the diagnosis and treatment of different cancers and selected benign tumors. Registrars conduct annual followups on all patients in the registry to track their treatment, survival, and recovery. Physicians and public health organizations then use this information to calculate survivor rates and success rates of various types of treatment, locate geographic areas with high incidences of certain cancers, and identify potential participants for clinical drug trials. Cancer registry data also is used by public health officials to target areas for the allocation of resources to provide intervention and screening.

Medical records and health information technicians ensure that patient records are complete and accurate.

Medical records and health information technicians' duties vary with the size of the facility where they work. In large to medium-sized facilities, technicians might specialize in one aspect of health information or might supervise health information clerks and transcriptionists while a medical records and health information administrator manages the department. (See the statement on medical and health services managers elsewhere in the *Handbook*.) In small facilities, a credentialed medical records and health information technician sometimes manages the department.

Working Conditions

Medical records and health information technicians usually work a 40-hour week. Some overtime may be required. In hospitals—where health information departments often are open 24 hours a day, 7 days a week—technicians may work day, evening, and night shifts.

Medical records and health information technicians work in pleasant and comfortable offices. This is one of the few health occupations in which there is little or no direct contact with patients. Because accuracy is essential in their jobs, technicians must pay close attention to detail. Technicians who work at computer monitors for prolonged periods must guard against eyestrain and muscle pain.

Training, Other Qualifications, and Advancement

Medical records and health information technicians entering the field usually have an associate degree from a community or junior

college. In addition to general education, coursework includes medical terminology, anatomy and physiology, legal aspects of health information, coding and abstraction of data, statistics, database management, quality improvement methods, and computer science. Applicants can improve their chances of admission into a program by taking biology, chemistry, health, and computer science courses in high school.

Hospitals sometimes advance promising health information clerks to jobs as medical records and health information technicians, although this practice may be less common in the future. Advancement usually requires 2 to 4 years of job experience and completion of a hospital's in-house training program.

Most employers prefer to hire Registered Health Information Technicians (RHIT), who must pass a written examination offered by the American Health Information Management Association (AHIMA). To take the examination, a person must graduate from a 2-year associate degree program accredited by the Commission on Accreditation for Health Informatics and Information Management Education (CAHIIM). Technicians trained in non-CAHIIM-accredited programs or trained on the job are not eligible to take the examination. In 2005, CAHIIM accredited 184 programs for health information technicians.

Experienced medical records and health information technicians usually advance in one of two ways—by specializing or managing. Many senior technicians specialize in coding, particularly Medicare coding, or in cancer registry. Most coding and registry skills are learned on the job. Some schools offer certificates in coding as part of the associate degree program for health information technicians, although there are no formal degree programs in coding. For cancer registry, there were 11 formal 2-year certificate programs in 2005 approved by the National Cancer Registrars Association (NCRA). Some schools and employers offer intensive 1- to 2-week training programs in either coding or cancer registry. Once coders and registrars gain some on-the-job experience, many choose to become certified. Certifications in coding are available either from AHIMA or from the American Academy of Professional Coders. Certification in cancer registry is available from the NCRA.

In large medical records and health information departments, experienced technicians may advance to section supervisor, overseeing the work of the coding, correspondence, or discharge sections, for example. Senior technicians with RHIT credentials may become director or assistant director of a medical records and health information department in a small facility. However, in larger institutions, the director usually is an administrator with a bachelor's degree in medical records and health information administration.

Employment

Medical records and health information technicians held about 159,000 jobs in 2004. About 2 out of 5 jobs were in hospitals. The rest were mostly in offices of physicians, nursing care facilities, outpatient care centers, and home health care services. Insurance firms that deal in health matters employ a small number of health information technicians to tabulate and analyze health information. Public health departments also hire technicians to supervise data collection from health care institutions and to assist in research.

Job Outlook

Job prospects should be very good. Employment of medical records and health information technicians is expected to grow much faster than the average for all occupations through 2014 because of rapid growth in the number of medical tests, treatments, and procedures that will be increasingly scrutinized by health

insurance companies, regulators, courts, and consumers. Also, technicians will be needed to enter patient information into computer databases to comply with Federal legislation mandating the use of electronic patient records.

Although employment growth in hospitals will not keep pace with growth in other health care industries, many new jobs will, nevertheless, be created. The majority of new jobs is expected in offices of physicians as a result of increasing demand for detailed records, especially in large group practices. Rapid growth also is expected in home health care services, outpatient care centers, and nursing and residential care facilities. Additional job openings will result from the need to replace technicians who retire or leave the occupation permanently.

Technicians with a strong background in medical coding will be in particularly high demand. Changing government regulations and the growth of managed care have increased the amount of paperwork involved in filing insurance claims. Additionally, health care facilities are having difficulty attracting qualified workers, primarily because of the lack of both formal training programs and sufficient resources to provide on-the-job training for coders. Job opportunities may be especially good for coders employed through temporary help agencies or by professional services firms.

Some cancer registrars may have difficulty finding open positions in their geographic area because of a limited number of registrars employed by health care facilities and low job turnover. However, when a position does become vacant, qualified cancer registrars have excellent prospects because of the limited number of trained registrars available for employment.

Earnings

Median annual earnings of medical records and health information technicians were \$25,590 in 2004. The middle 50 percent earned between \$20,650 and \$32,990. The lowest 10 percent earned less than \$17,720, and the highest 10 percent earned more than \$41,760. Median annual earnings in the industries employing the largest numbers of medical records and health information technicians in 2004 were as follows:

General medical and surgical hospitals.....	\$26,640
Nursing care facilities.....	26,330
Outpatient care centers.....	23,870
Offices of physicians.....	22,130

Related Occupations

Medical records and health information technicians need a strong clinical background to analyze the contents of medical records. Other workers who need knowledge of medical terminology, anatomy, and physiology but have little or no direct contact with patients include medical secretaries and medical transcriptionists.

Nuclear Medicine Technologists

(O*NET 29-2033.00)

Significant Points

- About 7 out of 10 work in hospitals.
- Nuclear medicine technology programs range in length from 1 to 4 years and lead to a certificate, an associate degree, or a bachelor's degree.
- Faster than average growth will arise from an increase in the number of middle-aged and elderly persons, who are the primary users of diagnostic procedures.
- The number of job openings each year will be relatively low because the occupation is small; technologists who also are trained in other diagnostic methods, such as radiologic technology or diagnostic medical sonography, will have the best prospects.

Nature of the Work

Diagnostic imaging embraces several procedures that aid in diagnosing ailments, the most familiar being the x ray. Another increasingly common diagnostic imaging method, called magnetic resonance imaging (MRI), uses giant magnets and radio waves, rather than radiation, to create an image. In nuclear medicine, radionuclides—unstable atoms that emit radiation spontaneously—are used to diagnose and treat disease. Radionuclides are purified and compounded to form radiopharmaceuticals. Nuclear medicine technologists administer radiopharmaceuticals to patients and then monitor the characteristics and functions of tissues or organs in which the drugs localize. Abnormal areas show higher-than-expected or lower-than-expected concentrations of radioactivity. Nuclear medicine differs from other diagnostic imaging technologies because it determines the presence of disease on the basis of biological changes rather than changes in organ structure.

Nuclear medicine technologists operate cameras that detect and map the radioactive drug in a patient's body to create diagnostic images. After explaining test procedures to patients, technologists prepare a dosage of the radiopharmaceutical and administer it by mouth, injection, inhalation, or other means. They position patients and start a gamma scintillation camera, or "scanner," which creates images of the distribution of a radiopharmaceutical as it localizes in, and emits signals from, the patient's body. The images are produced on a computer screen or on film for a physician to interpret.

When preparing radiopharmaceuticals, technologists adhere to safety standards that keep the radiation dose to workers and patients as low as possible. Technologists keep patient records and record the amount and type of radionuclides that they receive, use, and discard.

Radiologic technologists and technicians, diagnostic medical sonographers, and cardiovascular technologists and technicians also operate diagnostic imaging equipment, but their equipment creates images by means of a different technology. (See the statements on these occupations elsewhere in the *Handbook*.)

Nuclear medicine technologists also perform radioimmunoassay studies that assess the behavior of a radioactive substance inside the body. For example, technologists may add radioactive substances to blood or serum to determine levels of hormones or of therapeutic drugs in the body. Most nuclear medicine studies, such as cardiac function studies, are processed with the aid of a computer.

Working Conditions

Nuclear medicine technologists generally work a 40-hour week, perhaps including evening or weekend hours, in departments that

A nuclear medicine technologist prepares a patient prior to a scan.

operate on an extended schedule. Opportunities for part-time and shift work also are available. In addition, technologists in hospitals may have on-call duty on a rotational basis.

Physical stamina is important because technologists are on their feet much of the day and may lift or turn disabled patients.

Although the potential for radiation exposure exists in this field, it is kept to a minimum by the use of shielded syringes, gloves, and other protective devices and by adherence to strict radiation safety guidelines. The amount of radiation in a nuclear medicine procedure is comparable to that received during a diagnostic x-ray procedure. Technologists also wear badges that measure radiation levels. Because of safety programs, badge measurements rarely exceed established safety levels.

Training, Other Qualifications, and Advancement

Many employers and an increasing number of States require certification or licensure. Aspiring nuclear medicine technologists should check the requirements of the State in which they plan to work. Certification is available from the American Registry of Radiologic Technologists and from the Nuclear Medicine Technology Certification Board. Some workers receive certification from both agencies. Nuclear medicine technologists must meet the minimum Federal standards on the administration of radioactive drugs and the operation of radiation detection equipment.

Nuclear medicine technology programs range in length from 1 to 4 years and lead to a certificate, an associate degree, or a bachelor's degree. Generally, certificate programs are offered in hospitals, associate degree programs in community colleges, and bachelor's degree programs in 4-year colleges and universities. Courses cover the physical sciences, biological effects of radiation exposure, radiation protection and procedures, the use of radiopharmaceuticals, imaging techniques, and computer applications.

One-year certificate programs are for health professionals who already possess an associate degree—especially radiologic technologists and diagnostic medical sonographers—but who wish to specialize in nuclear medicine. The programs also attract medical technologists, registered nurses, and others who wish to change fields or specialize. Others interested in nuclear medicine technology have three options: a 2-year certificate program, a 2-year associate degree program, or a 4-year bachelor's degree program.

The Joint Review Committee on Education Programs in Nuclear Medicine Technology accredits most formal training programs in

nuclear medicine technology. In 2005, there were 100 accredited programs in the continental United States and Puerto Rico.

Nuclear medicine technologists should be sensitive to patients' physical and psychological needs. They must pay attention to detail, follow instructions, and work as part of a team. In addition, operating complicated equipment requires mechanical ability and manual dexterity.

Technologists may advance to supervisor, then to chief technologist, and, finally, to department administrator or director. Some technologists specialize in a clinical area such as nuclear cardiology or computer analysis or leave patient care to take positions in research laboratories. Some become instructors in, or directors of, nuclear medicine technology programs, a step that usually requires a bachelor's or master's degree in the subject. Others leave the occupation to work as sales or training representatives for medical equipment and radiopharmaceutical manufacturing firms or as radiation safety officers in regulatory agencies or hospitals.

Employment

Nuclear medicine technologists held about 18,000 jobs in 2004. About 7 out of 10 were in hospitals—private and government. Most of the rest were in offices of physicians or in medical and diagnostic laboratories, including diagnostic imaging centers.

Job Outlook

Employment of nuclear medicine technologists is expected to grow faster than the average for all occupations through the year 2014. Growth will arise from technological advancement, the development of new nuclear medicine treatments, and an increase in the number of middle-aged and older persons, who are the primary users of diagnostic procedures, including nuclear medicine tests. However, the number of openings each year will be relatively low because the occupation is small. Technologists who also are trained in other diagnostic methods, such as radiologic technology or diagnostic medical sonography, will have the best prospects.

Technological innovations may increase the diagnostic uses of nuclear medicine. One example is the use of radiopharmaceuticals in combination with monoclonal antibodies to detect cancer at far earlier stages than is customary today and without resorting to surgery. Another is the use of radionuclides to examine the heart's ability to pump blood. New nuclear medical imaging technologies, including positron emission tomography (PET) and single photon emission computed tomography (SPECT), are expected to be used increasingly and to contribute further to employment growth. The wider use of nuclear medical imaging to observe metabolic and biochemical changes during neurology, cardiology, and oncology procedures also will spur demand for nuclear medicine technologists.

Nonetheless, cost considerations will affect the speed with which new applications of nuclear medicine grow. Some promising nuclear medicine procedures, such as positron emission tomography, are extremely costly, and hospitals contemplating these procedures will have to consider equipment costs, reimbursement policies, and the number of potential users.

Earnings

Median annual earnings of nuclear medicine technologists were \$56,450 in May 2004. The middle 50 percent earned between \$48,720 and \$67,460. The lowest 10 percent earned less than \$41,800, and the highest 10 percent earned more than \$80,300. Median annual earnings of nuclear medicine technologists in May 2004 were \$54,920 in general medical and surgical hospitals.

Related Occupations

Nuclear medical technologists operate sophisticated equipment to help physicians and other health practitioners diagnose and treat

patients. Cardiovascular technologists and technicians, clinical laboratory technologists and technicians, diagnostic medical sonographers, radiation therapists, radiologic technologists and technicians, and respiratory therapists perform similar functions.

Occupational Health and Safety Specialists and Technicians

(O*NET 29-9011.00, 29-9012.00)

Significant Points

- About 2 out of 5 specialists worked in Federal, State, and local government agencies that enforce rules on safety, health, and the environment.
- Many employers, including the Federal Government, require a bachelor's degree in occupational health, safety, or a related field for some specialist positions.
- Projected average employment growth reflects a balance of continuing public demand for a safe and healthy work environment against the desire for smaller government and fewer regulations.

Nature of the Work

Occupational health and safety specialists and technicians, also known as *safety and health practitioners* or *occupational health and safety inspectors*, help prevent harm to workers, property, the environment, and the general public. They promote occupational health and safety within organizations in many ways, such as by advising management on how to increase worker productivity through raising morale and reducing absenteeism, turnover, and equipment downtime while securing savings on insurance premiums, workers' compensation benefits, and litigation expenses. (Industrial engineers, including health and safety, have similar goals. See the section on engineers elsewhere in the *Handbook*.)

Occupational health and safety specialists analyze work environments and design programs to control, eliminate, and prevent disease or injury caused by chemical, physical, radiological, and biological agents or ergonomic factors that involve the impact of equipment design on a worker's comfort or fatigue. They may conduct inspections and inform the management of a business which areas may not be in compliance with State and Federal laws or employer policies, in order to gain their support for addressing these areas. They advise management on the cost and effectiveness of safety and health programs.

Occupational health and safety technicians collect data on work environments for analysis by occupational health and safety specialists. Usually working under the supervision of specialists, they help implement and evaluate programs designed to limit risks to workers.

The specific responsibilities of occupational health and safety specialists and technicians vary by industry, workplace, and types of hazards affecting employees. In most settings, they initially focus on identifying hazardous conditions and practices. Sometimes they develop methods to predict hazards from experience, historical data, workplace analysis, and other information sources. Then they identify potential hazards in systems, equipment, products, facilities, or processes planned for use in the future. For example, they might uncover patterns in injury data that implicate a specific cause such as system failure, human error, incomplete or faulty decision making, or a weakness in existing policies or practices. After reviewing the causes or effects of hazards, they evaluate the probability and severity of accidents or exposures to hazardous materials that may result. Then they identify where controls need to be implemented to reduce or eliminate hazards and advise if a new program or practice is required. As necessary, they conduct training sessions for management, supervisors, and workers on health and safety practices and regulations to promote an understanding of a new or existing process. After implementation, they may monitor and evaluate the program's progress, making additional suggestions when needed.

To ensure the machinery and equipment meet appropriate safety regulations, occupational health and safety specialists and technicians may examine and test machinery and equipment, such as lifting devices, machine guards, or scaffolding. They may check that personal protective equipment, such as masks, respirators, protective eyewear, or hardhats, is being used in workplaces according to regulations. They also check that hazardous materials are stored correctly. They test and identify work areas for potential accident and health hazards, such as toxic vapors, mold, mildew, and explosive gas-air mixtures, and help implement appropriate control measures, such as adjustments to ventilation systems. Their survey of the workplace might involve talking with workers and observing their work, as well as inspecting elements in their work environment, such as lighting, tools, and equipment.

To measure and control hazardous substances, such as the noise or radiation levels, occupational health and safety specialists and technicians prepare and calibrate scientific equipment. They must properly collect and handle samples of dust, gases, vapors, and other potentially toxic materials to ensure personal safety and accurate test results.

If an injury or illness occurs, occupational health and safety specialists and technicians help investigate unsafe working conditions, study possible causes, and recommend remedial action. Some occupational health and safety specialists and technicians assist with the rehabilitation of workers after accidents and injuries, and make sure they return to work successfully.

Frequent communication with management may be necessary to report on the status of occupational health and safety programs. Consultation with engineers or physicians also may be required.

Occupational health and safety specialists and technicians prepare reports including accident reports, Occupational Safety and Health Administration record-keeping forms, observations, analysis of contaminants, and recommendations for control and correction of hazards. They may prepare documents to be used in legal proceedings and give testimony in court proceedings. Those who develop expertise in certain areas may develop occupational health and safety systems, including policies, procedures, and manuals.

Specialists and technicians that concentrate in particular areas include environmental protection officers, ergonomists, health physicists, industrial hygienists, and mine examiners. Environmental protection officers evaluate and coordinate programs that impact the environment, such as the storage and handling of hazardous waste or monitoring the

Occupational health and safety specialists and technicians must properly collect and handle samples of dust, gases, vapors, and other potentially toxic materials to ensure accurate test results.

cleanup of contaminated soil or water. Ergonomists help ensure that the work environment allows employees to maximize their comfort, safety, and productivity. Health physicists help protect people and the environment from hazardous radiation exposure by monitoring the manufacture, handling, and disposal of radioactive material. Industrial hygienists examine the workplace for health hazards, such as worker exposure to lead, asbestos, pesticides, or communicable diseases. Mine examiners are technicians who inspect mines for proper air flow and health hazards such as the buildup of methane or other noxious gases.

Working Conditions

Occupational health and safety specialists and technicians work with many different people in a variety of environments. Their jobs often involve considerable fieldwork, and some travel frequently. Many occupational health and safety specialists and technicians work long and often irregular hours.

Occupational health and safety specialists and technicians may be exposed to many of the same physically strenuous conditions and hazards as industrial employees, and the work may be performed in unpleasant, stressful, and dangerous working conditions. They may find themselves in an adversarial role if the management of an organization disagrees with the recommendations for ensuring a safe working environment.

Training, Other Qualifications, and Advancement

All occupational health and safety specialists and technicians are trained in the applicable laws or inspection procedures through

some combination of classroom and on-the-job training. Awards and degrees in programs related to occupational safety and health include 1-year certificates, associate degrees, bachelor's degrees, and graduate degrees. The Accreditation Board for Engineering and Technology (ABET) accredits health physics, industrial hygiene, and safety programs, in addition to engineering programs. Many employers, including the Federal Government, require a bachelor's degree in occupational health, safety, or a related field, such as engineering, biology, or chemistry, for some specialist positions. Many industrial hygiene programs result in a master's degree. Experience as an occupational health and safety professional is also a prerequisite for many positions. Advancement to senior specialist positions is likely to require an advanced degree and substantial experience in several areas of practice.

In general, people who want to enter this occupation should be responsible and like detailed work. Occupational health and safety specialists and technicians should be able to communicate well. Recommended high school courses include English, mathematics, chemistry, biology, and physics.

Certification is available through the Board of Certified Safety Professionals (BCSP) and the American Board of Industrial Hygiene (ABIH). The BCSP offers the Certified Safety Professional (CSP) credential, while the ABIH offers the Certified Industrial Hygienist (CIH) and Certified Associate Industrial Hygienist (CAIH) credentials. Also, the Council on Certification of Health, Environmental, and Safety Technologists, a joint effort between the BCSP and ABIH, awards the Occupational Health and Safety Technologist (OHST) and Construction Health and Safety Technician (CHST) credentials. Requirements for the OHST and CHST credentials are less stringent than those for the CSP, CIH, or CAIH credentials. Once education and experience requirements have been met, certification may be obtained through an examination. Continuing education is required for recertification. Although voluntary, many employers encourage certification.

Federal Government occupational health and safety specialists and technicians whose job performance is satisfactory advance through their career ladder to a specified full-performance level. For positions above this level, usually supervisory positions, advancement is competitive and based on agency needs and individual merit. Advancement opportunities in State and local governments and the private sector are often similar to those in the Federal Government.

Research or related teaching positions at the college level require advanced education.

Employment

Occupational health and safety specialists held about 40,000 jobs in 2004. While the majority of jobs were spread throughout the private sector, about 2 out of 5 specialists worked for government agencies. Local governments employed 19 percent, State governments employed 18 percent, and the Federal Government employed 4 percent. Other occupational health and safety specialists were employed in manufacturing firms; private general medical and surgical hospitals; management, scientific, and technical consulting services; management of companies and enterprises; support activities for mining; research and development in the physical, engineering, and life sciences; private colleges, universities, and professional schools; and electric power generation, transmission, and distribution. Some were self-employed.

Occupational health and safety technicians held about 12,000 jobs in 2004. Nearly 3 out of 10 technicians worked in government agencies. Local governments employed 13 percent, State governments employed 7 percent, and the Federal Government employed 9 percent. Other occupational health and safety technicians were employed in manufacturing firms; private general medical and surgical hospitals; private colleges, universities, and professional schools; employment services; management, scientific, and technical consulting services; testing laboratories

for architectural, engineering, and related services; research and development in the physical, engineering, and life sciences; and electric power generation, transmission, and distribution.

Within the Federal Government, most jobs are as Occupational Safety and Health Administration (OSHA) inspectors, who enforce U.S. Department of Labor regulations that ensure adequate safety principles, practices, and techniques are applied in workplaces. Employers may be fined for violation of OSHA standards. Within the U.S. Department of Health and Human Services, occupational health and safety specialists working for the National Institute of Occupational Safety and Health (NIOSH) provide private companies with an avenue to evaluate the health and safety of their employees without the risk of being fined. Most large government agencies also employ occupational health and safety specialists and technicians who work to protect agency employees.

Most private companies either employ their own occupational health and safety personnel or contract with occupational health and safety professionals to ensure the safety of their workers and compliance with Federal, State, and local government agencies that enforce rules on safety, health, and the environment.

Job Outlook

Employment of occupational health and safety specialists and technicians is expected to grow about as fast as the average for all occupations through 2014, reflecting a balance of continuing public demand for a safe and healthy work environment against the desire for smaller government and fewer regulations. Since the September 11, 2001 attacks, emergency preparedness has become a greater focus for the public and private sectors, and for occupational health and safety specialists and technicians. Additional job openings will arise from the need to replace those who transfer to other occupations, retire, or leave for other reasons. In private industry, employment growth will reflect industry growth and the continuing self-enforcement of government and company regulations and policies.

Employment of occupational health and safety specialists and technicians in the private sector is somewhat affected by general economic fluctuations. Federal, State, and local governments, which employ about 2 out of 5 of all specialists and technicians, provide considerable job security; workers are less likely to be affected by changes in the economy.

Earnings

Median annual earnings of occupational health and safety specialists were \$51,570 in May 2004. The middle 50 percent earned between \$39,580 and \$65,370. The lowest 10 percent earned less than \$30,590, and the highest 10 percent earned more than \$79,530. Median annual earnings of occupational health and safety specialists in May 2004 were \$48,710 in local government and \$44,400 in State government.

Median annual earnings of occupational health and safety technicians were \$42,130 in May 2004. The middle 50 percent earned between \$29,900 and \$56,640. The lowest 10 percent earned less than \$22,860, and the highest 10 percent earned more than \$70,460.

Most occupational health and safety specialists and technicians work in large private firms or for Federal, State, and local governments, most of which generally offer more generous benefits than smaller firms.

Related Occupations

Occupational health and safety specialists and technicians help to ensure that laws and regulations are obeyed. Others who enforce laws and regulations include agricultural inspectors, construction and building inspectors, correctional officers, financial examiners, fire inspectors, police and detectives, and transportation inspectors.

Information on obtaining positions as occupational health and safety specialists and technicians with the Federal Government is available from the Office of Personnel Management through USA-JOBS, the Federal Government's official employment information system. This resource for locating and applying for job opportunities can be accessed through the Internet at <http://www.usajobs.opm.gov> or through an interactive voice response telephone system at (703) 724-1850 or TDD (978) 461-8404. These numbers are not tollfree, and charges may result.

Opticians, Dispensing

(O*NET 29-2081.00)

Significant Points

- Most dispensing opticians receive training on the job or through apprenticeships lasting 2 or more years; however, some employers seek graduates of postsecondary training programs in opticianry.
- About 20 States require a license.
- Projected average employment growth reflects the steady demand for corrective lenses and eyeglass frames that are in fashion.

Nature of Work

Dispensing opticians fit eyeglasses and contact lenses, following prescriptions written by ophthalmologists or optometrists. (The

work of optometrists is described in a statement elsewhere in the *Handbook*. See the statement on physicians and surgeons for information about ophthalmologists.)

Dispensing opticians examine written prescriptions to determine the specifications of lenses. They recommend eyeglass frames, lenses, and lens coatings after considering the prescription and the customer's occupation, habits, and facial features. Dispensing opticians measure clients' eyes, including the distance between the centers of the pupils and the distance between the ocular surface and the lens. For customers without prescriptions, dispensing opticians may use a focimeter to record eyeglass measurements in order to duplicate the eyeglasses. They also may obtain a customer's previous record to re-make eyeglasses or contact lenses, or they may verify a prescription with the examining optometrist or ophthalmologist.

Dispensing opticians prepare work orders that give ophthalmic laboratory technicians information needed to grind and insert lenses into a frame. The work order includes prescriptions for lenses and information on their size, material, color, and style. Some dispensing opticians grind and insert lenses themselves. After the glasses are made, dispensing opticians verify that the lenses have been ground to specifications. Then they may reshape or bend the frame, by hand or using pliers, so that the eyeglasses fit the customer properly and comfortably. Some also fix, adjust, and refit broken frames. They instruct clients about adapting to, wearing, or caring for eyeglasses.

Some dispensing opticians, after additional education and training, specialize in fitting contacts, artificial eyes, or cosmetic shells to cover blemished eyes.

To fit contact lenses, dispensing opticians measure the shape and size of the eye, select the type of contact lens material, and prepare work orders specifying the prescription and lens size. Fitting contact lenses requires considerable skill, care, and patience. Dispensing opticians observe customers' eyes, corneas, lids, and contact lenses with specialized instruments and microscopes. During several follow-up visits, opticians teach proper insertion, removal, and care of contact lenses. Opticians do all this to ensure that the fit is correct.

Dispensing opticians keep records on customers' prescriptions, work orders, and payments; track inventory and sales; and perform other administrative duties.

Dispensing opticians deal directly with the public, so they should be tactful, pleasant, and communicate well.

Working Conditions

Dispensing opticians work indoors in attractive, well-lighted, and well-ventilated surroundings. They may work in medical offices or small stores where customers are served one at a time. Some work in large stores where several dispensing opticians serve a number of customers at once. Opticians spend a fair amount of time on their feet. If they prepare lenses, they need to take precautions against the hazards associated with glass cutting, chemicals, and machinery.

Most dispensing opticians work about 40 hours a week, although a few work longer hours. Those in retail stores may work evenings and weekends. Some work part time.

Training, Other Qualifications, and Advancement

Employers usually hire individuals with no background as an optician or as an ophthalmic laboratory technician. (See the statement on ophthalmic laboratory technicians elsewhere in the *Handbook*.) The employers then provide the required training. Most dispensing opticians receive training on the job or through apprenticeships lasting 2 or more years. Some employers, however, seek people with postsecondary training in the field.

Knowledge of physics, basic anatomy, algebra, and trigonometry as well as experience with computers are particularly valuable, because training usually includes instruction in optical mathematics, optical physics, and the use of precision measuring instruments and other machinery and tools. Dispensing opticians deal directly with the public, so they should be tactful, pleasant, and communicate well. Manual dexterity and the ability to do precision work are essential.

Large employers usually offer structured apprenticeship programs; small employers provide more informal, on-the-job training. About 20 States require dispensing opticians to be licensed. States may require individuals to pass one of more of the following for licensure: a State practical examination, a State written examination, and certification examinations offered by the American Board of Opticianry (ABO) and the National Contact Lens Examiners (NCLE). To qualify for the examinations, States often require applicants to complete postsecondary training or work from 2 to 4 years as apprentices. Continuing education is commonly required for licensure renewal. Information about specific licensing requirements is available from the State board of occupational licensing. Apprenticeships or formal training programs are offered in other States as well.

Apprentices receive technical training and learn office management and sales. Under the supervision of an experienced optician, optometrist, or ophthalmologist, apprentices work directly with patients, fitting eyeglasses and contact lenses.

Formal training in the field is offered in community colleges and a few colleges and universities. In 2004, the Commission on Opticianry Accreditation accredited 24 programs that awarded 2-year associate degrees. There also are shorter programs of 1 year or less. Some States that offer a license to dispensing opticians allow graduates to take the licensure exam immediately upon graduation; others require a few months to a year of experience.

Dispensing opticians may apply to the ABO and the NCLE for certification of their skills. All applicants age 18 or older with a high school diploma or equivalent are eligible for the exam; however, some States licensing boards have additional eligibility requirements. Certification must be renewed every 3 years through continuing education. Those licensed in States where licensure renewal requirements include continuing education credits may use proof of their renewed State license to meet the recertification requirements of the ABO. Likewise, the NCLE will accept proof of renewal from any State that has contact lens requirements.

Many experienced dispensing opticians open their own optical stores. Others become managers of optical stores or sales representatives for wholesalers or manufacturers of eyeglasses or lenses.

Employment

Dispensing opticians held about 66,000 jobs in 2004. Nearly one-third worked in health and personal care stores, including optical goods stores. Many of these stores offer one-stop shopping. Customers may have their eyes examined, choose frames, and have glasses made on the spot. About 30 percent of dispensing opticians worked in offices of other health practitioners, including offices of optometrists. Over 10 percent worked in offices of physicians, including ophthalmologists who sell glasses directly to patients. Some work in optical departments of department stores or other general merchandise stores, such as warehouse clubs and superstores. Nearly 6 percent are self-employed and run their own unincorporated businesses.

Job Outlook

Employment of dispensing opticians is expected to increase about as fast as the average for all occupations through 2014 as demand grows for corrective lenses. The number of middle-aged and elderly persons is projected to increase rapidly. Middle age is a time when many individuals use corrective lenses for the first time, and elderly persons generally require more vision care than others. Fashion also influences demand. Frames come in a growing variety of styles and colors—encouraging people to buy more than one pair.

Increasing awareness of laser surgery that corrects some vision problems will have an impact on demand for eyewear. Although the surgery remains relatively more expensive than eyewear, patients who successfully undergo this surgery may not require glasses or contact lenses for several years.

The need to replace those who leave the occupation will result in additional job openings. Nevertheless, the number of job openings will be limited because the occupation is small. Dispensing opticians are vulnerable to changes in the business cycle, because eyewear purchases often can be deferred for a time.

Earnings

Median annual earnings of dispensing opticians were \$27,950 in May 2004. The middle 50 percent earned between \$21,360 and \$35,940. The lowest 10 percent earned less than \$17,390, and the highest 10 percent earned more than \$45,340. Median annual earnings in the industries employing the largest numbers of dispensing opticians in May 2004 were:

Health and personal care stores.....	\$30,890
Offices of physicians.....	30,560
Offices of other health practitioners.....	26,970

Related Occupations

Other workers who deal with customers and perform delicate work include jewelers and precious stone and metal workers, locksmiths and safe repairers, orthotists and prosthetists, and precision instrument and equipment repairers.

Pharmacy Technicians

(O*NET 29-2052.00)

Significant Points

- Job opportunities are expected to be good for full-time and part-time work, especially for those with certification or previous work experience.
- Many technicians work evenings, weekends, and holidays.
- About 7 out of 10 of jobs were in retail pharmacies, grocery stores, department stores, or mass retailers.

Nature of the Work

Pharmacy technicians help licensed pharmacists provide medication and other health care products to patients. Technicians usually perform routine tasks to help prepare prescribed medication for patients, such as counting tablets and labeling bottles. Technicians refer any questions regarding prescriptions, drug information, or health matters to a *pharmacist*. (See the statement on pharmacists elsewhere in the *Handbook*.)

Pharmacy aides work closely with pharmacy technicians. They often are clerks or cashiers who primarily answer telephones, handle money, stock shelves, and perform other clerical duties. (See the statement on pharmacy aides elsewhere in the *Handbook*.) Pharmacy technicians usually perform more complex tasks than do pharmacy aides, although in some States their duties and job titles may overlap.

Pharmacy technicians who work in retail or mail-order pharmacies have varying responsibilities, depending on State rules and regulations. Technicians receive written prescriptions or requests for prescription refills from patients. They also may receive prescriptions sent electronically from the doctor's office. They must verify that the information on the prescription is complete and accurate. To prepare the prescription, technicians must retrieve, count, pour, weigh, measure, and sometimes mix the medication. Then, they prepare the prescription labels, select the type of prescription container, and affix the prescription and auxiliary labels to the container. Once the prescription is filled, technicians price and file the prescription, which must be checked by a pharmacist before it is given to the patient. Technicians may establish and maintain patient profiles, prepare insurance claim forms, and stock and take inventory of prescription and over-the-counter medications.

In hospitals, nursing homes, and assisted-living facilities, technicians have added responsibilities, including reading patients' charts and preparing and delivering the medicine to patients. Still, the pharmacist must check the order before it is delivered to the patient. The technician then copies the information about the prescribed medication onto the patient's profile. Technicians also may assemble a 24-hour supply of medicine for every patient. They package and label each dose separately. The packages are then placed in the medicine cabinets of patients until the supervising pharmacist checks them for accuracy. The packages are then given to the patients.

Working Conditions

Pharmacy technicians work in clean, organized, well-lighted, and well-ventilated areas. Most of their workday is spent on their feet. They may be required to lift heavy boxes or to use stepladders to retrieve supplies from high shelves.

Pharmacy technicians help licensed pharmacists provide medication and other health care products to patients.

Technicians work the same hours that pharmacists work. These may include evenings, nights, weekends, and holidays, particularly in facilities, such as hospitals and retail pharmacies, that are open 24 hours a day. As their seniority increases, technicians often acquire increased control over the hours they work. There are many opportunities for part-time work in both retail and hospital settings.

Training, Other Qualifications, and Advancement

Although most pharmacy technicians receive informal on-the-job training, employers favor those who have completed formal training and certification. However, there are currently few State and no Federal requirements for formal training or certification of pharmacy technicians. Employers who have insufficient resources to give on-the-job training often seek formally educated pharmacy technicians. Formal education programs and certification emphasize the technician's interest in and dedication to the work. In addition to the military, some hospitals, proprietary schools, vocational or technical colleges, and community colleges offer formal education programs.

Formal pharmacy technician education programs require classroom and laboratory work in a variety of areas, including medical and pharmaceutical terminology, pharmaceutical calculations, pharmacy recordkeeping, pharmaceutical techniques, and pharmacy law and ethics. Technicians also are required to learn medication names, actions, uses, and doses. Many training programs include internships, in which students gain hands-on experience in actual pharmacies. Students receive a diploma, a certificate, or an associate's degree, depending on the program.

Prospective pharmacy technicians with experience working as an aide in a community pharmacy or volunteering in a hospital may have an advantage. Employers also prefer applicants with strong customer service and communication skills, as well as those with experience managing inventories, counting tablets, measuring dosages, and using computers. Technicians entering the field need strong mathematics, spelling, and reading skills. A background in chemistry, English, and health education also may be beneficial. Some technicians are hired without formal training, but under the condition that they obtain certification within a specified period to retain their employment.

The Pharmacy Technician Certification Board administers the National Pharmacy Technician Certification Examination. This exam is voluntary in most States and displays the competency of the individual to act as a pharmacy technician. However, more States and employers are requiring certification as reliance on pharmacy technicians grows. Eligible candidates must have a high school diploma or

GED and no felony convictions, and those who pass the exam earn the title of Certified Pharmacy Technician (CPhT). The exam is offered several times per year at various locations nationally. Employers—often pharmacists—know that individuals who pass the exam have a standardized body of knowledge and skills. Many employers also will reimburse the costs of the exam as an incentive for certification.

Certified technicians must be recertified every 2 years. Technicians must complete 20 contact hours of pharmacy-related topics within the 2-year certification period to become eligible for recertification. Contact hours are awarded for on-the-job training, attending lectures, and college coursework. At least 1 contact hour must be in pharmacy law. Contact hours can be earned from several different sources, including pharmacy associations, pharmacy colleges, and pharmacy technician training programs. Up to 10 contact hours can be earned when the technician is employed under the direct supervision and instruction of a pharmacist.

Successful pharmacy technicians are alert, observant, organized, dedicated, and responsible. They should be willing and able to take directions. They must be precise; details are sometimes a matter of life and death. Although a pharmacist must check and approve all their work, they should be able to work independently without constant instruction from the pharmacist. Candidates interested in becoming pharmacy technicians cannot have prior records of drug or substance abuse.

Strong interpersonal and communication skills are needed because pharmacy technicians interact daily with patients, coworkers, and health care professionals. Teamwork is very important because technicians often are required to work with pharmacists, aides, and other technicians.

Employment

Pharmacy technicians held about 258,000 jobs in 2004. About 7 out of 10 jobs were in retail pharmacies, either independently owned or part of a drugstore chain, grocery store, department store, or mass retailer. About 2 out of 10 jobs were in hospitals and a small proportion was in mail-order and Internet pharmacies, clinics, pharmaceutical wholesalers, and the Federal Government.

Job Outlook

Good job opportunities are expected for full-time and part-time work, especially for technicians with formal training or previous experience. Job openings for pharmacy technicians will result from the expansion of retail pharmacies and other employment settings and from the need to replace workers who transfer to other occupations or leave the labor force.

Employment of pharmacy technicians is expected to grow much faster than the average for all occupations through 2014 because as the population grows and ages, demand for pharmaceuticals will increase dramatically. The increased number of middle-aged and elderly people—who use more prescription drugs than younger people—will spur demand for technicians in all practice settings. With advances in science, more medications are becoming available to treat a greater number of conditions.

In addition, cost-conscious insurers, pharmacies, and health systems will continue to expand the role of technicians. As a result, pharmacy technicians will assume responsibility for some of the more routine tasks previously performed by pharmacists. Pharmacy technicians also will need to learn and master new pharmacy technology as it emerges. For example, robotic machines are being increasingly used to dispense medicine into containers; technicians must oversee the machines, stock the bins, and label the containers. Thus, while automation is increasingly incorporated into the job, it will not necessarily reduce the need for technicians.

Almost all States have legislated the maximum number of technicians who can safely work under a pharmacist at one time. In some States, technicians have assumed more medication-dispensing duties

as pharmacists have become more involved in patient care, resulting in more technicians per pharmacist. Changes in these laws could directly affect employment.

Earnings

Median hourly earnings of wage and salary pharmacy technicians in May 2004 were \$11.37. The middle 50 percent earned between \$9.40 and \$13.85. The lowest 10 percent earned less than \$7.96, and the highest 10 percent earned more than \$16.61. Median hourly earnings in the industries employing the largest numbers of pharmacy technicians in May 2004 were:

General medical and surgical hospitals.....	\$12.93
Grocery stores	11.77
Other general merchandise stores	11.11
Department stores	10.56
Health and personal care stores.....	10.51

Certified technicians may earn more. Shift differentials for working evenings or weekends also can increase earnings. Some technicians belong to unions representing hospital or grocery store workers.

Related Occupations

This occupation is most closely related to pharmacists and pharmacy aides. Workers in other medical support occupations include dental assistants, licensed practical and licensed vocational nurses, medical transcriptionists, medical records and health information technicians, occupational therapist assistants and aides, physical therapist assistants and aides, and surgical technologists.

Sources of Additional Information

For information on the Certified Pharmacy Technician designation, contact:

Radiologic Technologists and Technicians

(O*NET 29-2034.01, 29-2034.02)

Significant Points

- Job opportunities are expected to be favorable; some employers report difficulty hiring sufficient numbers of radiologic technologists and technicians.
- Formal training programs in radiography range in length from 1 to 4 years and lead to a certificate, an associate degree, or a bachelor's degree.
- Although hospitals will remain the primary employer, a greater number of new jobs will be found in physicians' offices and diagnostic imaging centers.

Nature of the Work

Radiologic technologists and technicians take x rays and administer non-radioactive materials into patients' bloodstreams for diagnostic purposes.

Some specialize in diagnostic imaging technologies, such as computerized tomography (CT) and magnetic resonance imaging (MRI).

In addition to radiologic technologists and technicians, others who conduct diagnostic imaging procedures include cardiovascular technologists and technicians, diagnostic medical sonographers, and nuclear medicine technologists. (Each is discussed elsewhere in the *Handbook*.)

Radiologic technologists and technicians, also referred to as *radiographers*, produce x-ray films (radiographs) of parts of the human body for use in diagnosing medical problems. They prepare patients for radiologic examinations by explaining the procedure, removing articles such as jewelry, through which x rays cannot pass, and positioning patients so that the parts of the body can be appropriately radiographed. To prevent unnecessary exposure to radiation, these workers surround the exposed area with radiation protection devices, such as lead shields, or limit the size of the x-ray beam. Radiographers position radiographic equipment at the correct angle and height over the appropriate area of a patient's body. Using instruments similar to a measuring tape, they may measure the thickness of the section to be radiographed and set controls on the x-ray machine to produce radiographs of the appropriate density, detail, and contrast. They place the x-ray film under the part of the patient's body to be examined and make the exposure. They then remove the film and develop it.

Experienced radiographers may perform more complex imaging procedures. For fluoroscopies, radiographers prepare a solution of contrast medium for the patient to drink, allowing the radiologist (a physician who interprets radiographs) to see soft tissues in the body. Some radiographers, called *CT technologists*, operate CT scanners to produce cross-sectional images of patients. Radiographers who operate machines that use strong magnets and radio waves, rather than radiation, to create an image are called *MRI technologists*.

Radiologic technologists and technicians must follow physicians' orders precisely and conform to regulations concerning the use of radiation to protect themselves, their patients, and their coworkers from unnecessary exposure.

In addition to preparing patients and operating equipment, radiologic technologists and technicians keep patient records and adjust and maintain equipment. They also may prepare work schedules, evaluate purchases of equipment, or manage a radiology department.

Working Conditions

Most full-time radiologic technologists and technicians work about 40 hours a week. They may, however, have evening, weekend, or on-call hours. Opportunities for part-time and shift work also are available.

Radiologic technologists use advanced imaging technology to create diagnostic images for interpretation by a physician.

Physical stamina is important, because technologists and technicians are on their feet for long periods and may lift or turn disabled patients. Technologists and technicians work at diagnostic machines, but also may perform some procedures at patients' bedsides. Some travel to patients in large vans equipped with sophisticated diagnostic equipment.

Although radiation hazards exist in this occupation, they are minimized by the use of lead aprons, gloves, and other shielding devices, as well as by instruments monitoring exposure to radiation. Technologists and technicians wear badges measuring radiation levels in the radiation area, and detailed records are kept on their cumulative lifetime dose.

Training, Other Qualifications, and Advancement

Preparation for this profession is offered in hospitals, colleges and universities, vocational-technical institutes, and the U.S. Armed Forces. Hospitals, which employ most radiologic technologists and technicians, prefer to hire those with formal training.

Formal training programs in radiography range in length from 1 to 4 years and lead to a certificate, an associate degree, or a bachelor's degree. Two-year associate degree programs are most prevalent.

Some 1-year certificate programs are available for experienced radiographers or individuals from other health occupations, such as medical technologists and registered nurses, who want to change fields or specialize in CT or MRI. A bachelor's or master's degree in one of the radiologic technologies is desirable for supervisory, administrative, or teaching positions.

The Joint Review Committee on Education in Radiologic Technology accredits most formal training programs for the field. The committee accredited 606 radiography programs in 2005. Radiography programs require, at a minimum, a high school diploma or the equivalent. High school courses in mathematics, physics, chemistry, and biology are helpful. The programs provide both classroom and clinical instruction in anatomy and physiology, patient care procedures, radiation physics, radiation protection, principles of imaging, medical terminology, positioning of patients, medical ethics, radiobiology, and pathology.

Federal legislation protects the public from the hazards of unnecessary exposure to medical and dental radiation by ensuring that operators of radiologic equipment are properly trained. Under this legislation, the Federal Government sets voluntary standards that the States may use for accrediting training programs and certifying individuals who engage in medical or dental radiography.

In 2005, 38 States certified radiologic technologists and technicians. Certification, which is voluntary, is offered by the American Registry of Radiologic Technologists. To be eligible for certification, technologists generally must graduate from an accredited program and pass an examination. Many employers prefer to hire certified radiographers. To be recertified, radiographers must complete 24 hours of continuing education every two years.

Radiologic technologists and technicians should be sensitive to patients' physical and psychological needs. They must pay attention to detail, follow instructions, and work as part of a team. In addition, operating complicated equipment requires mechanical ability and manual dexterity.

With experience and additional training, staff technologists may become specialists, performing CT scanning, angiography, and magnetic resonance imaging. Experienced technologists also may be promoted to supervisor, chief radiologic technologist, and, ultimately, department administrator or director. Depending on the institution, courses or a master's degree in business or health administration may be necessary for the director's position. Some technologists progress by leaving the occupation to become instructors or directors in radiologic technology programs; others take jobs as sales representatives or instructors with equipment manufacturers.

Employment

Radiologic technologists and technicians held about 182,000 jobs in 2004. More than half of all jobs were in hospitals. Most of the rest were in offices of physicians; medical and diagnostic laboratories, including diagnostic imaging centers; and outpatient care centers.

Job Outlook

Job opportunities are expected to be favorable. Some employers report difficulty hiring sufficient numbers of radiologic technologists and technicians. Imbalances between the demand for, and supply of, radiologic technologists and technicians should spur efforts to attract and retain qualified workers, such as improved compensation and working conditions. Radiologic technologists who also are experienced in more complex diagnostic imaging procedures, such as CT and MRI, will have better employment opportunities, brought about as employers seek to control costs by using multi-skilled employees.

Employment of radiologic technologists and technicians is expected to grow faster than the average for all occupations through 2014, as the population grows and ages, increasing the demand for diagnostic imaging. Although healthcare providers are enthusiastic about the clinical benefits of new technologies, the extent to which they are adopted depends largely on cost and reimbursement considerations. For example, digital imaging technology can improve the quality of the images and the efficiency of the procedure, but remains expensive. Some promising new technologies may not come into widespread use because they are too expensive and third-party payers may not be willing to pay for their use.

Hospitals will remain the principal employer of radiologic technologists and technicians. However, a greater number of new jobs will be found in offices of physicians and diagnostic imaging centers. Health facilities such as these are expected to grow rapidly through 2014, due to the strong shift toward outpatient care, encouraged by third-party payers and made possible by technological advances that permit more procedures to be performed outside the hospital. Some job openings also will arise from the need to replace technologists and technicians who leave the occupation.

Earnings

Median annual earnings of radiologic technologists and technicians were \$43,350 in May 2004. The middle 50 percent earned between \$36,170 and \$52,430. The lowest 10 percent earned less than \$30,020, and the highest 10 percent earned more than \$60,210. Median annual earnings in the industries employing the largest numbers of radiologic technologists and technicians in May 2004 were:

Medical and diagnostic laboratories	\$46,620
General medical and surgical hospitals.....	43,960
Offices of physicians.....	40,290

Related Occupations

Radiologic technologists and technicians operate sophisticated equipment to help physicians, dentists, and other health practitioners diagnose and treat patients. Workers in related occupations include cardiovascular technologists and technicians, clinical laboratory technologists and technicians, diagnostic medical sonographers, nuclear medicine technologists, radiation therapists, and respiratory therapists.

Surgical Technologists

(O*NET 29-2055.00)

Significant Points

- Employment is expected to grow much faster than the average for all occupations through the year 2014.
- Job opportunities are expected to be good.
- Training programs last 9 to 24 months and lead to a certificate, diploma, or associate degree.
- Hospitals will continue to be the primary employer, although much faster employment growth is expected in offices of physicians and in outpatient care centers, including ambulatory surgical centers.

Nature of the Work

Surgical technologists, also called scrubs and surgical or operating room technicians, assist in surgical operations under the supervision of surgeons, registered nurses, or other surgical personnel. Surgical technologists are members of operating room teams, which most commonly include surgeons, anesthesiologists, and circulating nurses. Before an operation, surgical technologists help prepare the operating room by setting up surgical instruments and equipment, sterile drapes, and sterile solutions. They assemble both sterile and nonsterile equipment, as well as adjust and check it to ensure it is working properly. Technologists also get patients ready for surgery by washing, shaving, and disinfecting incision sites. They transport patients to the operating room, help position them on the operating table, and cover them with sterile surgical "drapes." Technologists also observe patients' vital signs, check charts, and assist the surgical team with putting on sterile gowns and gloves.

During surgery, technologists pass instruments and other sterile supplies to surgeons and surgeon assistants. They may hold retractors, cut sutures, and help count sponges, needles, supplies, and instruments. Surgical technologists help prepare, care for, and dispose of specimens taken for laboratory analysis and help apply dressings. Some operate sterilizers, lights, or suction machines, and help operate diagnostic equipment.

After an operation, surgical technologists may help transfer patients to the recovery room and clean and restock the operating room.

Working Conditions

Surgical technologists work in clean, well-lighted, cool environments. They must stand for long periods and remain alert during operations. At times they may be exposed to communicable diseases and unpleasant sights, odors, and materials.

Most surgical technologists work a regular 40-hour week, although they may be on call or work nights, weekends, and holidays on a rotating basis.

Training, Other Qualifications, and Advancement

Surgical technologists receive their training in formal programs offered by community and junior colleges, vocational schools, universities,

Before an operation, surgical technologists help prepare the operating room by setting up surgical instruments and equipment, sterile drapes, and sterile solutions.

hospitals, and the military. In 2005, the Commission on Accreditation of Allied Health Education Programs (CAAHEP) recognized more than 400 accredited programs. Programs last from 9 to 24 months and lead to a certificate, diploma, or associate degree. High school graduation normally is required for admission. Recommended high school courses include health, biology, chemistry, and mathematics.

Programs provide classroom education and supervised clinical experience. Students take courses in anatomy, physiology, microbiology, pharmacology, professional ethics, and medical terminology. Other studies cover the care and safety of patients during surgery, sterile techniques, and surgical procedures. Students also learn to sterilize instruments; prevent and control infection; and handle special drugs, solutions, supplies, and equipment.

Most employers prefer to hire certified technologists. Technologists may obtain voluntary professional certification from the Liaison Council on Certification for the Surgical Technologist by graduating from a CAAHEP-accredited program and passing a national certification examination. They may then use the Certified Surgical Technologist (CST) designation. Continuing education or reexamination is required to maintain certification, which must be renewed every 4 years.

Certification also may be obtained from the National Center for Competency Testing. To qualify to take the exam, candidates follow one of three paths: complete an accredited training program; undergo a 2-year hospital on-the-job training program; or acquire seven years of experience working in the field. After passing the exam, individuals may use the designation Tech in Surgery-Certified, TS-C (NCCT). This certification may be renewed every 5 years through either continuing education or reexamination.

Surgical technologists need manual dexterity to handle instruments quickly. They also must be conscientious, orderly, and emotionally stable to handle the demands of the operating room environment. Technologists must respond quickly and must be familiar with operating procedures in order to have instruments ready for surgeons without having to be told. They are expected to keep abreast of new developments in the field.

Technologists advance by specializing in a particular area of surgery, such as neurosurgery or open heart surgery. They also may work as circulating technologists. A circulating technologist is the "unsterile" member of the surgical team who prepares patients; helps with anesthesia; obtains and opens packages for the "sterile" persons to remove the sterile contents during the procedure; interviews the patient before surgery; keeps a written account of the surgical procedure; and answers the surgeon's questions about the patient during

the surgery. With additional training, some technologists advance to first assistants, who help with retracting, sponging, suturing, cauterizing bleeders, and closing and treating wounds. Some surgical technologists manage central supply departments in hospitals, or take positions with insurance companies, sterile supply services, and operating equipment firms.

Employment

Surgical technologists held about 84,000 jobs in 2004. About 7 out of 10 jobs for surgical technologists were in hospitals, mainly in operating and delivery rooms. Other jobs were in offices of physicians or dentists who perform outpatient surgery and in outpatient care centers, including ambulatory surgical centers. A few, known as private scrubs, are employed directly by surgeons who have special surgical teams, like those for liver transplants.

Job Outlook

Employment of surgical technologists is expected to grow much faster than the average for all occupations through the year 2014 as the volume of surgery increases. Job opportunities are expected to be good. The number of surgical procedures is expected to rise as the population grows and ages. The number of older people, including the baby boom generation, who generally require more surgical procedures, will account for a larger portion of the general population. Technological advances, such as fiber optics and laser technology, will permit an increasing number of new surgical procedures to be performed and also will allow surgical technologists to assist with a greater number of procedures.

Hospitals will continue to be the primary employer of surgical technologists, although much faster employment growth is expected in offices of physicians and in outpatient care centers, including ambulatory surgical centers.

Earnings

Median annual earnings of surgical technologists were \$34,010 in May 2004. The middle 50 percent earned between \$28,560 and \$40,750. The lowest 10 percent earned less than \$23,940, and the highest 10 percent earned more than \$45,990. Median hourly earnings in the industries employing the largest numbers of surgical technologists in May 2004 were:

Offices of dentists	\$37,510
Offices of physicians.....	36,570
General medical and surgical hospitals.....	33,130

Related Occupations

Other health occupations requiring approximately 1 year of training after high school include dental assistants, licensed practical and licensed vocational nurses, clinical laboratory technologists and technicians, and medical assistants.

Veterinary Technologists and Technicians

(O*NET 29-2056.00)

Significant Points

- Animal lovers get satisfaction in this occupation, but aspects of the work can be unpleasant, physically and emotionally demanding, and sometimes dangerous.
- Entrants generally complete a 2-year or 4-year veterinary technology program and must pass a State examination.
- Employment is expected to grow much faster than average.
- Keen competition is expected for jobs in zoos.

Nature of the Work

Owners of pets and other animals today expect state-of-the-art veterinary care. To provide this service, veterinarians use the skills of veterinary technologists and technicians, who perform many of the same duties for a veterinarian that a nurse would for a physician, including routine laboratory and clinical procedures. Although specific job duties vary by employer, there often is little difference between the tasks carried out by technicians and by technologists, despite some differences in formal education and training. As a result, most workers in this occupation are called technicians.

Veterinary technologists and technicians typically conduct clinical work in a private practice under the supervision of a veterinarian—often performing various medical tests along with treating and diagnosing medical conditions and diseases in animals. For example, they may perform laboratory tests such as urinalysis and blood counts, assist with dental prophylaxis, prepare tissue samples, take blood samples, or assist veterinarians in a variety of tests and analyses in which they often utilize various items of medical equipment, such as test tubes and diagnostic equipment. While most of these duties are performed in a laboratory setting, many are not. For example, some veterinary technicians obtain and record patients' case histories, expose and develop x rays, and provide specialized nursing care. In addition, experienced veterinary technicians may discuss a pet's condition with its owners and train new clinic personnel. Veterinary technologists and technicians assisting small-animal practitioners usually care for companion animals, such as cats and dogs, but can perform a variety of duties with mice, rats, sheep, pigs, cattle, monkeys, birds, fish, and frogs. Very few veterinary technologists work in mixed animal practices where they care for both small companion animals and larger, nondomestic animals.

Besides working in private clinics and animal hospitals, veterinary technologists and technicians may work in research facilities, where they may administer medications orally or topically, prepare samples for laboratory examinations, and record information on an animal's genealogy, diet, weight, medications, food intake, and clinical signs of pain and distress. Some may be required to sterilize laboratory and surgical equipment and provide routine postoperative care. At research facilities, veterinary technologists typically work under the guidance of veterinarians, physicians, and other laboratory technicians. Some veterinary technologists vaccinate newly admitted animals and occasionally are required to euthanize seriously ill, severely injured, or unwanted animals.

While the goal of most veterinary technologists and technicians is to promote animal health, some contribute to human health as well. Veterinary technologists occasionally assist veterinarians as

Veterinary technologists and technicians often assist veterinarians by taking x rays.

they work with other scientists in medical-related fields such as gene therapy and cloning. Some find opportunities in biomedical research, wildlife medicine, the military, livestock management, or pharmaceutical sales.

Working Conditions

People who love animals get satisfaction from working with and helping them. However, some of the work may be unpleasant, physically and emotionally demanding, and sometimes dangerous. At times, veterinary technicians must clean cages and lift, hold, or restrain animals, risking exposure to bites or scratches. These workers must take precautions when treating animals with germicides or insecticides. The work setting can be noisy.

Veterinary technologists and technicians who witness abused animals or who euthanize unwanted, aged, or hopelessly injured animals may experience emotional stress. Those working for humane societies and animal shelters often deal with the public, some of whom might react with hostility to any implication that the owners are neglecting or abusing their pets. Such workers must maintain a calm and professional demeanor while they enforce the laws regarding animal care. In some animal hospitals, research facilities, and animal shelters, a veterinary technician is on duty 24 hours a day, which means that some may work night shifts. Most full-time veterinary technologists and technicians work about 40 hours a week, although some work 50 or more hours a week.

Training, Other Qualifications, and Advancement

There are primarily two levels of education and training for entry to this occupation: a 2-year program for veterinary technicians and a 4-year program for veterinary technologists. Most entry-level veterinary technicians have a 2-year degree, usually an associate's degree, from an accredited community college program in veterinary technology in which courses are taught in clinical and laboratory settings using live animals. About 15 colleges offer veterinary technology programs that are longer and that culminate in a 4-year bachelor's degree in veterinary technology. These 4-year colleges, in addition to some vocational schools, also offer 2-year programs in laboratory animal science. Approximately 5 schools offer distance learning.

In 2004, 116 veterinary technology programs in 43 States were accredited by the American Veterinary Medical Association (AVMA). Graduation from an AVMA-accredited veterinary technology program allows students to take the credentialing exam in any

State in the country. Each State regulates veterinary technicians and technologists differently; however, all States require them to pass a credentialing exam following coursework. Passing the State exam assures the public that the technician or technologist has sufficient knowledge to work in a veterinary clinic or hospital. Candidates are tested for competency through an examination that includes oral, written, and practical portions and that is regulated by the State Board of Veterinary Examiners or the appropriate State agency. Depending on the State, candidates may become registered, licensed, or certified. Most States, however, use the National Veterinary Technician (NVT) exam. Prospects usually can have their passing scores transferred from one State to another, so long as both States utilize the same exam.

Employers recommend American Association for Laboratory Animal Science (AALAS) certification for those seeking employment in a research facility. AALAS offers certification for three levels of technician competence, with a focus on three principal areas—animal husbandry, facility management, and animal health and welfare. Those who wish to become certified must satisfy a combination of education and experience requirements prior to taking an exam. Work experience must be directly related to the maintenance, health, and well-being of laboratory animals and must be gained in a laboratory animal facility as defined by AALAS. Candidates who meet the necessary criteria can begin pursuing the desired certification on the basis of their qualifications. The lowest level of certification is Assistant Laboratory Animal Technician (ALAT), the second level is Laboratory Animal Technician (LAT), and the highest level of certification is Laboratory Animal Technologist (LATG). The examination consists of multiple-choice questions and is longer and more difficult for higher levels of certification, ranging from 2 hours for the ALAT to 3 hours for the LATG.

Persons interested in careers as veterinary technologists and technicians should take as many high school science, biology, and math courses as possible. Science courses taken beyond high school, in an associate's or bachelor's degree program, should emphasize practical skills in a clinical or laboratory setting. Because veterinary technologists and technicians often deal with pet owners, communication skills are very important. In addition, technologists and technicians should be able to work well with others, because teamwork with veterinarians is common. Organizational ability and the ability to pay attention to detail also are important.

Technologists and technicians usually begin work as trainees in routine positions under the direct supervision of a veterinarian. Entry-level workers whose training or educational background encompasses extensive hands-on experience with a variety of laboratory equipment, including diagnostic and medical equipment, usually require a shorter period of on-the-job training. As they gain experience, technologists and technicians take on more responsibility and carry out more assignments under only general veterinary supervision. Some eventually may become supervisors.

Employment

Veterinary technologists and technicians held about 60,000 jobs in 2004. Most worked in veterinary services. The remainder worked in boarding kennels, animal shelters, stables, grooming salons, zoos, and local, State, and Federal agencies.

Job Outlook

Employment of veterinary technologists and technicians is expected to grow much faster than the average for all occupations through

the year 2014. Job openings also will stem from the need to replace veterinary technologists and technicians who leave the occupation over the 2004–14 period. Keen competition is expected for veterinary technologist and technician jobs in zoos, due to expected slow growth in zoo capacity, low turnover among workers, the limited number of positions, and the fact that the occupation attracts many candidates.

Pet owners are becoming more affluent and more willing to pay for advanced care because many of them consider their pet to be part of the family. This growing affluence and view of pets will spur employment growth for veterinary technologists and technicians. The number of dogs used as companion pets, which also drives employment growth, is expected to increase more slowly during the projection period than in the previous decade. However, the rapidly growing number of cats utilized as companion pets is expected to boost the demand for feline medicine and services, offsetting any reduced demand for veterinary care for dogs. The availability of advanced veterinary services, such as preventive dental care and surgical procedures, may provide opportunities for workers specializing in those areas. Biomedical facilities, diagnostic laboratories, wildlife facilities, humane societies, animal control facilities, drug or food manufacturing companies, and food safety inspection facilities will provide additional jobs for veterinary technologists and technicians. Furthermore, demand for these workers will stem from the desire to replace veterinary assistants with more highly skilled technicians and technologists in animal clinics and hospitals, shelters, kennels, and humane societies.

Employment of veterinary technicians and technologists is relatively stable during periods of economic recession. Layoffs are less likely to occur among veterinary technologists and technicians than in some other occupations because animals will continue to require medical care.

Earnings

Median hourly earnings of veterinary technologists and technicians were \$11.99 in May 2004. The middle 50 percent earned between \$9.88 and \$14.56. The bottom 10 percent earned less than \$8.51, and the top 10 percent earned more than \$17.12.

Related Occupations

Others who work extensively with animals include animal care and service workers, veterinary assistants, and laboratory animal caretakers. Like veterinary technologists and technicians, they must have patience and feel comfortable with animals. However, the level of training required for these occupations is less than that needed by veterinary technologists and technicians. Veterinarians, who need much more formal education, also work extensively with animals, preventing, diagnosing, and treating their diseases, disorders, and injuries.

Service Occupations

Healthcare Support Occupations

Dental Assistants

(O*NET 31-9091.00)

Significant Points

- Job prospects should be excellent.
- Dentists are expected to hire more assistants to perform routine tasks so that they may devote their own time to more complex procedures.
- Most assistants learn their skills on the job, although an increasing number are trained in dental-assisting programs; most programs take 1 year or less to complete.

Nature of the Work

Dental assistants perform a variety of patient care, office, and laboratory duties. They work chairside as dentists examine and treat patients. They make patients as comfortable as possible in the dental chair, prepare them for treatment, and obtain their dental records. Assistants hand instruments and materials to dentists and keep patients' mouths dry and clear by using suction or other devices. Assistants also sterilize and disinfect instruments and equipment, prepare trays of instruments for dental procedures, and instruct patients on postoperative and general oral health care.

Some dental assistants prepare materials for impressions and restorations, take dental x rays, and process x-ray film as directed by a dentist. They also may remove sutures, apply topical anesthetics

About 2 out of 5 dental assistants work part time, sometimes in more than one dental office.

to gums or cavity-preventive agents to teeth, remove excess cement used in the filling process, and place rubber dams on the teeth to isolate them for individual treatment.

Those with laboratory duties make casts of the teeth and mouth from impressions, clean and polish removable appliances, and make temporary crowns. Dental assistants with office duties schedule and confirm appointments, receive patients, keep treatment records, send bills, receive payments, and order dental supplies and materials.

Dental assistants should not be confused with dental hygienists, who are licensed to perform different clinical tasks. (See the statement on dental hygienists elsewhere in the *Handbook*.)

Working Conditions

Dental assistants work in a well-lighted, clean environment. Their work area usually is near the dental chair so that they can arrange instruments, materials, and medication and hand them to the dentist when needed. Dental assistants must wear gloves, masks, eyewear, and protective clothing to protect themselves and their patients from infectious diseases. Assistants also follow safety procedures to minimize the risks associated with the use of x-ray machines.

About half of dental assistants have a 35- to 40-hour workweek, which may include work on Saturdays or evenings.

Training, Other Qualifications, and Advancement

Most assistants learn their skills on the job, although an increasing number are trained in dental-assisting programs offered by community and junior colleges, trade schools, technical institutes, or the Armed Forces. Assistants must be a second pair of hands for a dentist; therefore, dentists look for people who are reliable, work well with others, and have good manual dexterity. High school students interested in a career as a dental assistant should take courses in biology, chemistry, health, and office practices.

The Commission on Dental Accreditation within the American Dental Association (ADA) approved 265 dental-assisting training programs in 2005. Programs include classroom, laboratory, and preclinical instruction in dental-assisting skills and related theory. In addition, students gain practical experience in dental schools, clinics, or dental offices. Most programs take 1 year or less to complete and lead to a certificate or diploma. Two-year programs offered in community and junior colleges lead to an associate degree. All programs require a high school diploma or its equivalent, and some require science or computer-related courses for admission. A number of private vocational schools offer 4-month to 6-month courses in dental assisting, but the Commission on Dental Accreditation does not accredit these programs.

Most States regulate the duties that dental assistants are allowed to perform through licensure or registration. Licensure or registration may require passing a written or practical examination. States offering licensure or registration have a variety of schools offering courses—approximately 10 to 12 months in length—that meet their State's requirements. Other States require dental assistants to complete State-approved education courses of 4 to 12 hours in length. Some States offer registration of other dental assisting credentials with little or no education required. Some States require continuing education to maintain licensure or registration. A few States allow dental assistants to perform any function delegated to them by the dentist.

Individual States have adopted different standards for dental assistants who perform certain advanced duties, such as radiological procedures. Completion of the Radiation Health and Safety examination offered by the Dental Assisting National Board (DANB) meets those standards in more than 30 States. Some States require completion of a State-approved course in radiology as well.

Certification is available through DANB and is recognized or required in more than 30 States. Other organizations offer registration, most often at the State level. Certification is an acknowledgment of an assistant's qualifications and professional competence and may be an asset when one is seeking employment. Candidates may qualify to take the DANB certification examination by graduating from an ADA-accredited dental assisting education program or by having 2 years of full-time, or 4 years of part-time, experience as a dental assistant. In addition, applicants must have current certification in cardiopulmonary resuscitation. For annual recertification, individuals must earn continuing education credits.

Without further education, advancement opportunities are limited. Some dental assistants become office managers, dental-assisting instructors, or dental product sales representatives. Others go back to school to become dental hygienists. For many, this entry-level occupation provides basic training and experience and serves as a steppingstone to more highly skilled and higher paying jobs.

Employment

Dental assistants held about 267,000 jobs in 2004. Almost all jobs for dental assistants were in offices of dentists. A small number of jobs were in the Federal, State, and local governments or in offices of physicians. About 2 out of 5 dental assistants worked part time, sometimes in more than one dental office.

Job Outlook

Job prospects for dental assistants should be excellent. Employment is expected to grow much faster than the average for all occupations through the year 2014. In fact, dental assistants is expected to be one of the fastest growing occupations over the 2004-14 projection period.

In addition to job openings due to employment growth, numerous job openings will arise out of the need to replace assistants who transfer to other occupations, retire, or leave for other reasons. Many opportunities are for entry-level positions offering on-the-job training.

Population growth and greater retention of natural teeth by middle-aged and older people will fuel demand for dental services. Older dentists, who have been less likely to employ assistants, are leaving the occupation and will be replaced by recent graduates, who are more likely to use one or even two assistants. In addition, as dentists' workloads increase, they are expected to hire more assistants to perform routine tasks, so that they may devote their own time to more complex procedures.

Earnings

Median hourly earnings of dental assistants were \$13.62 in May 2004. The middle 50 percent earned between \$11.06 and \$16.65 an hour. The lowest 10 percent earned less than \$9.11, and the highest 10 percent earned more than \$19.97 an hour.

Benefits vary substantially by practice setting and may be contingent upon full-time employment. According to the American Dental Association (ADA), almost all full-time dental assistants employed by private practitioners received paid vacation time. The ADA also found that 9 out of 10 full-time and part-time dental assistants received dental coverage.

Related Occupations

Other workers supporting health practitioners include medical assistants, occupational therapist assistants and aides, pharmacy aides, pharmacy technicians, and physical therapist assistants and aides.

► National Association of Dental Assistants, 900 South Washington St., Suite G-13, Falls Church, VA 22046.

Massage Therapists

(O*NET 31-9011.00)

Significant Points

- Employment is expected to grow faster than average over the 2004-2014 period as more people learn about the benefits of massage therapy.
- Many States require formal training and a national certification in order to practice massage therapy.
- This occupation contains a large number of part-time and self-employed workers.

Nature of the Work

Many physicians have been recommending massage therapy for years. Nearly 2,400 years. The medical benefits of "friction" were first documented in Western culture by the Greek physician Hippocrates around 400 BC. Today, massage therapy is being used as a means of treating painful ailments, decompressing tired and overworked muscles, reducing stress, rehabilitating sports injuries, and promoting general health. This is accomplished by manipulating a client's soft tissues in order to improve the body's circulation and remove waste products from the muscles.

While massage therapy is done for medical benefit, a massage can be given to simply relax or rejuvenate the person being massaged. It is important to note that this type of massage is not intended for a medical purpose, and provides medical value only through general stress reduction and increased energy levels. Massage therapy, on the other hand, is practiced by thoroughly trained individuals who provide specialized care with their client's medical health in mind.

Massage therapists can specialize in over 80 different types of massage, called modalities. Swedish massage, deep tissue massage, reflexology, acupressure, sports massage, and neuromuscular massage are just a few of the many approaches to massage therapy. Most massage therapists specialize in several modalities, which require different techniques. Some use exaggerated strokes ranging the length of a body part, while others use quick, percussion-like strokes with a cupped or closed hand. A massage can be as long as two hours or as short as five or ten minutes. Usually, the type of

massage therapists give depends on the client's needs and the client's physical condition. For example, they use special techniques for elderly clients that they would not use for athletes, and they would use approaches for clients with injuries that would not be appropriate for clients seeking relaxation. There are also some forms of massage that are given solely to one type of client, for example prenatal massage and infant massage.

Massage therapists work by appointment. Before beginning a massage therapy session, therapists conduct an informal interview with the client to find out about the person's medical history and desired results from the massage. This gives therapists a chance to discuss which techniques could be beneficial to the client and which could be harmful. Because massage therapists tend to specialize in only a few areas of massage, customers will often be referred or seek a therapist with a certain type of massage in mind. Based on the person's goals, ailments, medical history, and stress- or pain-related problem areas, a massage therapist will conclude whether a massage would be harmful, and if not, move forward with the session while concentrating on any areas of particular discomfort to the client. While giving the massage, therapists alter their approach or concentrate on a particular area as necessary.

Many modalities of massage therapy use massage oils, lotions, or creams to massage and rub the client's muscles. Most massage therapists, particularly those who are self-employed, supply their own table or chair, sheets, pillows, and body lotions or oils. Most modalities of massage require clients to be covered in a sheet or blanket, and require clients to be undressed or to wear loose-fitting clothing. The therapist only exposes the body part on which he or she is currently massaging. Some types of massage are done without oils or lotions and are performed with the client fully-clothed.

Massage can be a delicate issue for some clients, and those clients may indicate that they are comfortable with contact only in specified areas. For this reason—and also for general purpose business risks—about half of all massage therapists have liability insurance, either through a professional association membership or through other insurance carriers.

Seated massage is just one type of therapy used by massage therapists.

Massage therapists must develop a rapport with their clients if repeat customers are to be secured. Because those who seek a therapist tend to make regular visits, developing a loyal clientele is an important part of becoming successful.

Working Conditions

Massage therapists work in an array of settings both private and public: private offices, studios, hospitals, nursing homes, fitness centers, sports medicine facilities, airports, and shopping malls, for example. Some massage therapists also travel to clients' homes or offices to provide a massage. It is not uncommon for full-time massage therapists to divide their time among several different settings, depending on the clients and locations scheduled.

Most massage therapists give massages in dimly lit settings. Using candles and/or incense is not uncommon. Ambient or other calm, soothing music is often played. The dim lighting, smells, and background noise are meant to put clients at ease. On the other hand, when visiting a client's office, a massage therapist may not have those amenities. The working conditions depend heavily on a therapist's location and what the client wants.

Because massage is physically demanding, massage therapists can succumb to injury if the proper technique is not used. Repetitive motion problems and fatigue from standing for extended periods of time are most common. This risk can be limited by use of good technique, proper spacing between sessions, exercise, and in many cases by the therapists themselves receiving a massage on a regular basis.

Because of the physical nature of the work and time needed in between sessions, massage therapists typically give massages less than 40 hours per week. Therapists who give massages anywhere from 15 to 30 hours per week usually consider themselves to be full-time workers.

Training, Other Qualifications, and Advancement

Training standards and requirements for massage therapists vary greatly by State and locality. In 2004, 33 States and the District of Columbia had passed laws regulating massage therapy in some way. Most of the boards governing massage therapy in these States require practicing massage therapists to complete a formal education program and pass the national certification examination or a State exam. Some State regulations require that therapists keep up on their knowledge and technique through continuing education. It is best to check information on licensing, certification, and accreditation on a State-by-State basis.

There are roughly 1,300 massage therapy postsecondary schools, college programs, and training programs throughout the country. Massage therapy programs generally cover subjects such as anatomy; physiology, the study of organs and tissues; kinesiology, the study of motion and body mechanics; business; ethics; as well as hands-on practice of massage techniques. Most formal training programs require an application and some require an in-person interview. Training programs may concentrate on certain modalities of massage. Several programs also provide alumni services such as post-graduate job placement and continuing educational services. Both full- and part-time programs are available.

These programs vary in accreditation. Massage therapy training programs are generally accredited by a State board or other accrediting agency. Of the many massage therapy programs in the country, about 300 are accredited by a State board or department of education-certified accrediting agency. In States that regulate massage therapy, graduation from an approved school or training program is usually required in order to practice massage therapy.

After completion of a training program, many massage therapists opt to take the national certification examination for therapeutic

massage and bodywork. This exam is administered by the National Certification Board for Therapeutic Massage and Bodywork (NCBTMB), which has eligibility requirements of its own. Several States require that a massage therapist pass this test in order to practice massage therapy. In States that require massage therapy program accreditation, an exam candidate must graduate from a State-licensed training institute with at least 500 hours of training or submit a portfolio of training experience for NCBTMB review; in locations that do not require accredited training programs, this is unnecessary. After the applicant is approved for testing, the applicant may schedule a test time at a local testing center. Tests are available six or seven days a week, depending on the test site, and are entirely computer based with multiple choice questions. The exam covers six areas of content: general knowledge of the body systems; detailed knowledge of anatomy, physiology and kinesiology; pathology; therapeutic massage assessment; therapeutic massage application; and professional standards, ethics, business and legal practices.

When a therapist passes the national certification exam for therapeutic massage and bodywork, he or she can use the recognized national credential: Nationally Certified in Therapeutic Massage and Bodywork (NCTMB). The credential must be renewed every four years. In order to remain certified, a therapist must perform at least 200 hours of therapeutic massage during the four year period, and complete a minimum of 48 credit hours of continuing education. In 2005, the NCBTMB introduced a new national certification test and corresponding professional credential. These are the national certification exam for therapeutic massage and the Nationally Certified in Therapeutic Massage (NCTM) credential. The new test covers the same topics as the traditional national certification exam, but covers fewer modalities of massage therapy. Recognition of this new national certification varies by State.

Many of the national, State, and local requirements coincide. States that require the national credential also require accredited training programs to comply with NCBTMB standards of training. Professional associations require that a professional member graduate from a training program that meets NCBTMB standards, have a State license, and/or have a national certification from the NCBTMB. Actual requirements differ on a State-by-State basis.

Because of the nature of massage therapy, opportunities for advancement are limited. However, with increased experience and an expanding client base, there are opportunities for therapists to increase client fees, and therefore income. Both strong communication skills and a friendly, empathetic personality are extremely helpful qualities for fostering a trusting relationship with clients and in turn, expanding one's client base. In addition, those who are well organized and have an entrepreneurial spirit may even go into business for themselves. Self-employed massage therapists with a large client base have the highest earnings.

Employment

Massage therapists held about 97,000 jobs in 2004. About two-thirds were self-employed. Of those self-employed, most owned their own business, and the rest worked as independent contractors. Others found employment in salons and spas; the offices of physicians and chiropractors; fitness and recreational sports centers; and hotels. About three-quarters of all massage therapists worked part-time or had variable schedules, although as mentioned earlier many massage therapists who work 15 to 30 hours per week consider themselves to be full-time workers.

Job Outlook

Employment for massage therapists is expected to increase faster than average over the period from 2004 to 2014 as more people learn about the benefits of massage therapy. In States that regulate

massage therapy, therapists who complete formal training programs and pass the national certification exam are likely to have very good job opportunities. Because referrals are a very important source of work for massage therapists, networking will increase the number of job opportunities. Joining a State or local chapter of a professional association can also help build strong contacts and further increase the likelihood of steady work.

Massage is an increasingly popular technique for relaxation and reduction of stress. As workplaces try to distinguish themselves as employee-friendly, providing professional in-office, seated massages for employees is becoming a popular on-the-job benefit.

Increased interest in alternative medicine and holistic healing will mean increased opportunities for those skilled in massage therapy. Healthcare providers and medical insurance companies are beginning to recognize massage therapy as a legitimate treatment and preventative measure for several types of injuries and illnesses. The health care industry is using massage therapy more often as a supplement to conventional medical techniques for ailments such as muscle problems, some sicknesses and diseases, and stress-related health problems. Massage therapy's growing acceptance as a medical tool, particularly by the medical provider and insurance industries, will greatly increase employment opportunities.

Older citizens who are in nursing homes or assisted living homes are also finding benefits from massage, such as increased energy levels and reduced health problems. Demand for massage therapy should grow among older age groups because they increasingly enjoy longer, more active lives and persons age 55 and older are projected to be the most rapidly growing segment of the U.S. population over the next decade. However, demand for massage therapy is presently greatest among young adults, and they are likely to continue to enjoy the benefits of massage therapy as they age.

Earnings

Median hourly earnings of massage therapists, including gratuities earned, were \$15.36 in May 2004. The middle 50 percent earned between \$9.78 and \$23.82. The lowest 10 percent earned less than \$7.16, and the highest 10 percent earned more than \$32.21. Generally, massage therapists earn 15 to 20 percent of their income as gratuities. For those who work in a hospital or other clinical setting, however, tipping is not common.

Related Occupations

Other workers in the healthcare industry who provide therapy to clients include physical therapists, physical therapists' assistants and aides, chiropractors, and workers in other occupations that use touch to aid healing or relieve stress.

Medical Assistants

(O*NET 31-9092.00)

Significant Points

- About 6 out of 10 medical assistants work in offices of physicians.
- Some medical assistants are trained on the job, but many complete 1- or 2-year programs in vocational-technical high schools, postsecondary vocational schools, and community and junior colleges.
- Medical assistants is projected to be one of the fastest growing occupations over the 2004-14 period.
- Job prospects should be best for medical assistants with formal training or experience, particularly those with certification.

Nature of the Work

Medical assistants perform administrative and clinical tasks to keep the offices of physicians, podiatrists, chiropractors, and other health practitioners running smoothly. They should not be confused with physician assistants, who examine, diagnose, and treat patients under the direct supervision of a physician. (Physician assistants are discussed elsewhere in the *Handbook*.)

The duties of medical assistants vary from office to office, depending on the location and size of the practice and the practitioner's specialty. In small practices, medical assistants usually are generalists, handling both administrative and clinical duties and reporting directly to an office manager, physician, or other health practitioner. Those in large practices tend to specialize in a particular area, under the supervision of department administrators.

Medical assistants perform many administrative duties, including answering telephones, greeting patients, updating and filing patients' medical records, filling out insurance forms, handling correspondence, scheduling appointments, arranging for hospital admission and laboratory services, and handling billing and bookkeeping.

Clinical duties vary according to State law and include taking medical histories and recording vital signs, explaining treatment procedures to patients, preparing patients for examination, and assisting the physician during the examination. Medical assistants collect and prepare laboratory specimens or perform basic laboratory tests on the premises, dispose of contaminated supplies, and sterilize medical instruments. They instruct patients about medications and special diets, prepare and administer medications as directed by a physician, authorize drug refills as directed, telephone prescriptions to a pharmacy, draw blood, prepare patients for x rays, take electrocardiograms, remove sutures, and change dressings.

Medical assistants also may arrange examining room instruments and equipment, purchase and maintain supplies and equipment, and keep waiting and examining rooms neat and clean.

Ophthalmic medical assistants and *podiatric medical assistants* are examples of specialized assistants who have additional duties. Ophthalmic medical assistants help ophthalmologists provide eye care. They conduct diagnostic tests, measure and record vision, and test eye muscle function. They also show patients how to insert, remove, and care for contact lenses, and they apply eye dressings. Under the direction of the physician, ophthalmic medical assistants may administer eye medications. They also maintain optical and surgical instruments and may assist the ophthalmologist in surgery. Podiatric medical assistants make castings of feet, expose and develop x rays, and assist podiatrists in surgery.

Clinical duties of medical assistants vary according to State law and include taking medical histories and recording vital signs.

Working Conditions

Medical assistants work in well-lit, clean environments. They constantly interact with other people and may have to handle several responsibilities at once.

Most full-time medical assistants work a regular 40-hour week. Many work part time, evenings, or weekends.

Training, Other Qualifications, and Advancement

Most employers prefer graduates of formal programs in medical assisting. Such programs are offered in vocational-technical high schools, postsecondary vocational schools, and community and junior colleges. Postsecondary programs usually last either 1 year, resulting in a certificate or diploma, or 2 years, resulting in an associate degree. Courses cover anatomy, physiology, and medical terminology, as well as typing, transcription, recordkeeping, accounting, and insurance processing. Students learn laboratory techniques, clinical and diagnostic procedures, pharmaceutical principles, the administration of medications, and first aid. They study office practices, patient relations, medical law, and ethics. Accredited programs include an internship that provides practical experience in physicians' offices, hospitals, or other health care facilities.

Both the Commission on Accreditation of Allied Health Education Programs (CAAHEP) and the Accrediting Bureau of Health Education Schools (ABHES) accredit programs in medical assisting. In 2005, there were over 500 medical assisting programs accredited by CAAHEP and about 170 accredited by ABHES. The Committee on Accreditation for Ophthalmic Medical Personnel approved 17 programs in ophthalmic medical assisting and 2 programs in ophthalmic clinical assisting.

Formal training in medical assisting, while generally preferred, is not always required. Some medical assistants are trained on the job, although this practice is less common than in the past. Applicants usually need a high school diploma or the equivalent. Recommended high school courses include mathematics, health, biology, typing, bookkeeping, computers, and office skills. Volunteer experience in the health care field also is helpful.

Although medical assistants are not licensed, some States require them to take a test or a course before they can perform certain tasks, such as taking x rays or giving injections.

Employers prefer to hire experienced workers or certified applicants who have passed a national examination, indicating that the medical assistant meets certain standards of competence. The American Association of Medical Assistants awards the Certified Medical Assistant credential; American Medical Technologists awards the Registered Medical Assistant credential; the American Society of Podiatric Medical Assistants awards the Podiatric Medical Assistant, Certified credential; and the Joint Commission on Allied Health Personnel in Ophthalmology awards credentials at three levels: Certified Ophthalmic Assistant; Certified Ophthalmic Technician; and Certified Ophthalmic Medical Technologist.

Medical assistants deal with the public; therefore, they must be neat and well groomed and have a courteous, pleasant manner. Medical assistants must be able to put patients at ease and explain physicians' instructions. They must respect the confidential nature of medical information. Clinical duties require a reasonable level of manual dexterity and visual acuity.

Medical assistants may be able to advance to office manager. They may qualify for a variety of administrative support occupations or may teach medical assisting. With additional education, some enter other health occupations, such as nursing and medical technology.

Employment

Medical assistants held about 387,000 jobs in 2004. About 6 out of 10 worked in offices of physicians; about 14 percent worked in public and private hospitals, including inpatient and outpatient facilities; and 11 percent worked in offices of other health practitioners, such as chiropractors, optometrists, and podiatrists. The rest worked mostly in outpatient care centers, public and private educational services, other ambulatory health care services, State and local government agencies, employment services, medical and diagnostic laboratories, and nursing care facilities.

Job Outlook

Employment of medical assistants is expected to grow much faster than the average for all occupations through the year 2014 as the health care industry expands because of technological advances in medicine and the growth and aging of the population. Increasing utilization of medical assistants in the rapidly growing health care industry will further stimulate job growth. In fact, medical assistants is projected to be one of the fastest growing occupations over the 2004–14 period.

Employment growth will be driven by the increase in the number of group practices, clinics, and other health care facilities that need a high proportion of support personnel, particularly the flexible medical assistant who can handle both administrative and clinical duties. Medical assistants work primarily in outpatient settings, a rapidly growing sector of the health care industry.

In view of the preference of many health care employers for trained personnel, job prospects should be best for medical assistants with formal training or experience, particularly for those with certification.

Earnings

The earnings of medical assistants vary, depending on their experience, skill level, and location. Median annual earnings of medical assistants were \$24,610 in May 2004. The middle 50 percent earned

between \$20,650 and \$28,930. The lowest 10 percent earned less than \$18,010, and the highest 10 percent earned more than \$34,650. Median annual earnings in the industries employing the largest numbers of medical assistants in May 2004 were:

Colleges, universities, and professional schools.....	\$27,490
Outpatient care centers.....	25,360
General medical and surgical hospitals.....	25,160
Offices of physicians.....	24,930
Offices of other health practitioners.....	21,930

Related Occupations

Workers in other medical support occupations include dental assistants, medical records and health information technicians, medical secretaries, occupational therapist assistants and aides, pharmacy aides, and physical therapist assistants and aides.

Medical Transcriptionists

(O*NET 31-9094.00)

Significant Points

- Job opportunities will be good.
- Employers prefer medical transcriptionists who have completed a postsecondary training program at a vocational school or community college.
- Many medical transcriptionists telecommute from home-based offices as employees or subcontractors for hospitals and transcription services or as self-employed, independent contractors.
- About 4 out of 10 worked in hospitals and another 3 out of 10 worked in offices of physicians.

Nature of the Work

Medical transcriptionists listen to dictated recordings made by physicians and other health care professionals and transcribe them into medical reports, correspondence, and other administrative material. They generally listen to recordings on a headset, using a foot pedal to pause the recording when necessary, and key the text into a personal computer or word processor, editing as necessary for grammar and clarity. The documents they produce include discharge summaries, history and physical examination reports, operative reports, consultation reports, autopsy reports, diagnostic imaging studies, progress notes, and referral letters. Medical transcriptionists return transcribed documents to the physicians or other health care professionals who dictated them for review and signature, or correction. These documents eventually become part of patients' permanent files.

To understand and accurately transcribe dictated reports into a format that is clear and comprehensible for the reader, medical transcriptionists must understand medical terminology, anatomy and physiology, diagnostic procedures, pharmacology, and treatment assessments. They also must be able to translate medical jargon and abbreviations into their expanded forms. To help identify terms appropriately, transcriptionists refer to standard medical reference materials—both printed and electronic; some of these are available over the Internet. Medical transcriptionists must comply with specific standards that apply to the style of medical records, in addition to the legal and ethical requirements involved with keeping patient information confidential.

Experienced transcriptionists spot mistakes or inconsistencies in a medical report and check to correct the information. Their ability to understand and correctly transcribe patient assessments and treatments reduces the chance of patients receiving ineffective or even harmful treatments and ensures high-quality patient care.

Currently, most health care providers transmit dictation to medical transcriptionists using either digital or analog dictating equipment. The Internet has grown to be a popular mode for transmitting documentation. Many transcriptionists receive dictation over the Internet and are able to quickly return transcribed documents to clients for approval. Another increasingly popular method utilizes speech recognition technology, which electronically translates sound into text and creates drafts of reports. Reports are then formatted; edited for mistakes in translation, punctuation, or grammar; and checked for consistency and any possible medical errors. Transcriptionists working in areas with standardized terminology, such as radiology or pathology, are more likely to encounter speech recognition technol-

Many medical transcriptionists receive dictation over the Internet and are able to quickly return transcribed documents to clients for approval.

ogy. However, use of speech recognition technology will become more widespread as the technology becomes more sophisticated.

Medical transcriptionists who work in physicians' offices may have other office duties, such as receiving patients, scheduling appointments, answering the telephone, and handling incoming and outgoing mail. Medical secretaries, discussed in the statement on secretaries and administrative assistants elsewhere in the *Handbook*, also may transcribe as part of their jobs. Court reporters, also discussed elsewhere in the *Handbook*, have similar duties, but with a different focus. They take verbatim reports of speeches, conversations, legal proceedings, meetings, and other events when written accounts of spoken words are necessary for correspondence, records, or legal proof.

Working Conditions

The majority of these workers are employed in comfortable settings, such as hospitals, physicians' offices, transcription service offices, clinics, laboratories, medical libraries, government medical facilities, or their own homes. Many medical transcriptionists telecommute from home-based offices as employees or subcontractors for hospitals and transcription services or as self-employed, independent contractors.

Work in this occupation presents hazards from sitting in the same position for long periods. Workers can suffer wrist, back, neck, or eye problems due to strain and risk repetitive motion injuries such as carpal tunnel syndrome. The constant pressure to be accurate and productive also can be stressful.

Many medical transcriptionists work a standard 40-hour week. Self-employed medical transcriptionists are more likely to work irregular hours—including part time, evenings, weekends, or on call at any time.

Training, Other Qualifications, and Advancement

Employers prefer to hire transcriptionists who have completed postsecondary training in medical transcription, offered by many vocational schools, community colleges, and distance-learning programs. Completion of a 2-year associate degree or 1-year certificate program—including coursework in anatomy, medical terminology, legal issues relating to health care documentation, and English grammar and punctuation—is highly recommended, but not always required. Many of these programs include supervised on-the-job experience. Some transcriptionists, especially those already familiar with medical terminology from previous experience as a nurse or medical secretary, become proficient through refresher courses and training.

The American Association for Medical Transcription (AAMT) awards the voluntary designation Certified Medical Transcriptionist (CMT), to those who earn a passing score on a certification examination. As in many other fields, certification is recognized as a sign of competence. Because medicine is constantly evolving, medical transcriptionists are encouraged to update their skills regularly. Every 3 years, CMTs must earn continuing education credits to be recertified.

In addition to understanding medical terminology, transcriptionists must have good English grammar and punctuation skills, as well as proficiency with personal computers and word processing software. Normal hearing acuity and good listening skills also are necessary. Employers require applicants to take pre-employment tests and usually prefer individuals with experience.

With experience, medical transcriptionists can advance to supervisory positions, home-based work, editing, consulting, or teaching. With additional education or training, some become medical records and health information technicians, medical coders, or medical records and health information administrators.

Employment

Medical transcriptionists held about 105,000 jobs in 2004. About 4 out of 10 worked in hospitals and another 3 out of 10 worked in offices of physicians. Others worked for business support services; medical and diagnostic laboratories; outpatient care centers; and offices of physical, occupational and speech therapists, and audiologists.

Job Outlook

Job opportunities will be good. Employment of medical transcriptionists is projected to grow faster than the average for all occupations through 2014. Demand for medical transcription services will be spurred by a growing and aging population. Older age groups receive proportionately greater numbers of medical tests, treatments, and procedures that require documentation. A high level of demand for transcription services also will be sustained by the continued need for electronic documentation that can easily be shared among providers, third-party payers, regulators, consumers, and health information systems. Growing numbers of medical transcriptionists will be needed to amend patients' records, edit documents from speech recognition systems, and identify discrepancies in medical reports.

Contracting out transcription work overseas and advancements in speech recognition technology are not expected to significantly reduce the need for well-trained medical transcriptionists. Outsourcing transcription work abroad—to countries such as India, Pakistan, Philippines, and the Caribbean—has grown more popular as transmitting confidential health information over the Internet has become more secure; however, the demand for overseas transcription services is expected only to supplement the demand for well-trained domestic medical transcriptionists. In addition, reports transcribed by overseas medical transcription services usually require editing for accuracy by domestic medical transcriptionists before they meet domestic quality standards. Speech-recognition technology allows physicians and other health professionals to dictate medical reports to a computer that immediately creates an electronic document. In spite of the advances in this technology, the software has been slow to grasp and analyze the human voice and the English language, and the medical vernacular with all its diversity. As a result, there will continue to be a need for skilled medical transcriptionists to identify and appropriately edit the inevitable errors created by speech recognition systems, and to create a final document.

Hospitals will continue to employ a large percentage of medical transcriptionists, but job growth there will not be as fast as in other industries. An increasing demand for standardized records should result in rapid employment growth in physicians' offices, especially in large group practices.

Earnings

Medical transcriptionists had median hourly earnings of \$13.64 in May 2004. The middle 50 percent earned between \$11.50 and \$16.32. The lowest 10 percent earned less than \$9.67, and the highest 10 percent earned more than \$19.11. Median hourly earnings in the industries employing the largest numbers of medical transcriptionists in May 2004 were:

General medical and surgical hospitals.....	\$13.83
Offices of physicians.....	13.40
Business support services	13.40

Compensation methods for medical transcriptionists vary. Some are paid based on the number of hours they work or on the number of lines they transcribe. Others receive a base pay per hour with incentives for extra production. Employees of transcription services and independent contractors almost always receive production-based

pay. Independent contractors earn more than do transcriptionists who work for others, but independent contractors have higher expenses than their corporate counterparts, receive no benefits, and may face higher risk of termination than do employed transcriptionists.

Related Occupations

A number of other workers type, record information, and process paperwork. Among these are court reporters; human resources assistants, except payroll and timekeeping; receptionists and information clerks; and secretaries and administrative assistants. Other workers who provide medical support include medical assistants and medical records and health information technicians.

Sources of Additional Information

For information on a career as a medical transcriptionist, send a self-addressed, stamped envelope to:

► American Association for Medical Transcription, 100 Sycamore Ave., Modesto, CA 95354-0550. Internet: <http://www.aamt.org>

State employment service offices can provide information about job openings for medical transcriptionists.

Nursing, Psychiatric, and Home Health Aides

(O*NET 31-1011.00, 31-1012.00, 31-1013.00)

Significant Points

- Home health aides is projected to be the fastest growing occupation through 2014.
- Numerous job openings and excellent job opportunities are expected.
- Most jobs are in nursing and residential care facilities, hospitals, and home health care services.
- Modest entry requirements, low pay, high physical and emotional demands, and lack of advancement opportunities characterize this occupation.

Nature of the Work

Nursing and psychiatric aides help care for physically or mentally ill, injured, disabled, or infirm individuals confined to hospitals, nursing care facilities, and mental health settings. Home health aides have duties that are similar, but they work in patients' homes or residential care facilities.

Nursing aides—also known as nursing assistants, certified nursing assistants, geriatric aides, unlicensed assistive personnel, orderlies, or hospital attendants—perform routine tasks under the supervision of nursing and medical staff. They answer patients' call lights; deliver messages; serve meals; make beds; and help patients to eat, dress, and bathe. Aides also may provide skin care to patients; take their temperature, pulse rate, respiration rate, and blood pressure; and help them to get into and out of bed and walk. They also may escort patients to operating and examining rooms, keep patients' rooms neat, set up equipment, store and move supplies, and assist with some procedures. Aides observe patients' physical, mental, and emotional conditions and report any change to the nursing or medical staff.

Nursing aides employed in nursing care facilities often are the principal caregivers, having far more contact with residents than do other members of the staff. Because some residents may stay in a nursing care facility for months or even years, aides develop ongoing relationships with them and interact with them in a positive, caring way.

Home health aides help elderly, convalescent, or disabled persons live in their own homes instead of in a health care facility. Under the direction of nursing or medical staff, they provide health-related services, such as administering oral medications. (Personal and home care aides, who provide mainly housekeeping and routine personal care services, are discussed elsewhere in the *Handbook*.) Like nursing aides, home health aides may check patients' pulse rate, temperature, and respiration rate; help with simple prescribed exercises; keep patients' rooms neat; and help patients to move from bed, bathe, dress, and groom. Occasionally, they change nonsterile dressings, give massages and alcohol rubs, or assist with braces and artificial limbs. Experienced home health aides also may assist with medical equipment such as ventilators, which help patients breathe.

Most home health aides work with elderly or disabled persons who need more extensive care than family or friends can provide. Some help discharged hospital patients who have relatively short-term needs.

In home health agencies, a registered nurse, physical therapist, or social worker usually assigns specific duties to and supervises home health aides, who keep records of the services they perform and record each patient's condition and progress. The aides report changes in a patient's condition to the supervisor or case manager.

Psychiatric aides, also known as mental health assistants or psychiatric nursing assistants, care for mentally impaired or emotionally disturbed individuals. They work under a team that may include psychiatrists, psychologists, psychiatric nurses, social workers, and therapists.

Taking a patient's pulse is one of the many routine medical tasks performed by aides.

In addition to helping patients to dress, bathe, groom themselves, and eat, psychiatric aides socialize with them and lead them in educational and recreational activities. Psychiatric aides may play games such as cards with the patients, watch television with them, or participate in group activities, such as sports or field trips. They observe patients and report any physical or behavioral signs that might be important for the professional staff to know. They accompany patients to and from examinations and treatment. Because they have such close contact with patients, psychiatric aides can have a great deal of influence on their patients' outlook and treatment.

Working Conditions

Most full-time aides work about 40 hours a week, but, because patients need care 24 hours a day, some aides work evenings, nights, weekends, and holidays. Many work part time. In 2004, 25 percent of aides worked part time compared with 16 percent of all workers. Aides spend many hours standing and walking, and they often face heavy workloads. Aides must guard against back injury because they may have to move patients into and out of bed or help them to stand or walk. Aides also may face hazards from minor infections and major diseases, such as hepatitis, but can avoid infections by following proper procedures.

Aides often have unpleasant duties, such as emptying bedpans and changing soiled bed linens. The patients they care for may be disoriented, irritable, or uncooperative. Psychiatric aides must be prepared to care for patients whose illness may cause violent behavior. While their work can be emotionally demanding, many aides gain satisfaction from assisting those in need.

Home health aides may go to the same patient's home for months or even years. However, most aides work with a number of different patients, each job lasting a few hours, days, or weeks. Home health aides often visit multiple patients on the same day.

Home health aides generally work alone, with periodic visits from their supervisor. They receive detailed instructions explaining when to visit patients and what services to perform. Aides are individually responsible for getting to patients' homes, and they may spend a good portion of the working day traveling from one patient to another. Because mechanical lifting devices available in institutional settings are seldom available in patients' homes, home health aides are particularly susceptible to injuries resulting from overexertion when they assist patients.

Training, Other Qualifications, and Advancement

In many cases, a high school diploma or equivalent is necessary for a job as a nursing or psychiatric aide. However, a high school diploma generally is not required for jobs as home health aides. Hospitals may require previous experience as a nursing aide or home health aide. Nursing care facilities often hire inexperienced workers, who must complete a minimum of 75 hours of mandatory training and pass a competency evaluation as part of a State-approved training program within 4 months of their employment. Aides who complete the program are known as certified nurse assistants (CNAs) and are placed on the State registry of nursing aides. Some States also require psychiatric aides to complete a formal training program. However, most psychiatric aides learn their skills on the job from experienced workers.

Nursing and psychiatric aide training is offered in high schools, vocational-technical centers, some nursing care facilities, and some community colleges. Courses cover body mechanics, nutrition, anatomy and physiology, infection control, communication skills, and resident rights. Personal care skills, such as how to help patients to bathe, eat, and groom themselves, also are taught.

Some employers provide classroom instruction for newly hired aides, while others rely exclusively on informal on-the-job instruction by a licensed nurse or an experienced aide. Such training may

last from several days to a few months. Aides also may attend lectures, workshops, and in-service training.

The Federal Government has guidelines for home health aides whose employers receive reimbursement from Medicare. Federal law requires home health aides to pass a competency test covering a wide range of areas: communication; documentation of patient status and care provided; reading and recording of vital signs; basic infection-control procedures; basic bodily functions; maintenance of a healthy environment; emergency procedures; physical, emotional, and developmental characteristics of patients; personal hygiene and grooming; safe transfer techniques; normal range of motion and positioning; and basic nutrition.

A home health aide may receive training before taking the competency test. Federal law suggests at least 75 hours of classroom and practical training, supervised by a registered nurse. Training and testing programs may be offered by the employing agency but must meet the standards of the Center for Medicare and Medicaid Services. State regulations for training programs vary.

The National Association for Home Care offers national certification for home health aides. The certification is a voluntary demonstration that the individual has met industry standards. Some States also require aides to be licensed.

Aides must be in good health. A physical examination, including State-regulated tests such as those for tuberculosis, may be required. A criminal background check also is usually required for employment.

Applicants should be tactful, patient, understanding, emotionally stable, and dependable and should have a desire to help people. They also should be able to work as part of a team, have good communication skills, and be willing to perform repetitive, routine tasks. Home health aides should be honest and discreet, because they work in private homes. They also will need access to their own car or public transportation to reach patients' homes.

For some individuals, these occupations serve as entry-level jobs, as in the case of high school and college students who may work while also attending school. In addition, experience as an aide can help individuals decide whether to pursue a career in health care. Opportunities for advancement within these occupations are limited. Aides generally need additional formal training or education in order to enter other health occupations. The most common health care occupations for former aides are licensed practical nurse, registered nurse, and medical assistant.

Employment

Nursing, psychiatric, and home health aides held about 2.1 million jobs in 2004. Nursing aides held the most jobs—approximately 1.5 million. Home health aides held roughly 624,000 jobs and psychiatric aides held about 59,000 jobs. Around 42 percent of nursing aides worked in nursing care facilities, and another 27 percent worked in hospitals. Most home health aides—about 34 percent—were employed by home health care services. Others were employed in nursing and residential care facilities and social assistance agencies. Around 54 percent of all psychiatric aides worked in hospitals, primarily in psychiatric and substance abuse hospitals, although some also worked in the psychiatric units of general medical and surgical hospitals. Others were employed in State government agencies; residential mental retardation, mental health, and substance abuse facilities; outpatient care centers; and nursing care facilities.

Job Outlook

Numerous job openings for nursing, psychiatric, and home health aides will arise from a combination of fast employment growth and high replacement needs. High replacement needs in this large occupation reflect modest entry requirements, low pay, high physical and emotional demands, and lack of opportunities for advancement. For these same

reasons, many people are unwilling to perform the kind of work required by the occupation, limiting the number of entrants. Many aides also leave the occupation to attend training programs for other health care occupations. Therefore, persons who are interested in, and suited for, this work should have excellent job opportunities.

Overall employment of nursing, psychiatric, and home health aides is projected to grow much faster than the average for all occupations through the year 2014, although individual occupational growth rates will vary. Home health aides is expected to be the fastest growing occupation, as a result of both growing demand for home services from an aging population and efforts to contain costs by moving patients out of hospitals and nursing care facilities as quickly as possible. Consumer preference for care in the home and improvements in medical technologies for in-home treatment also will contribute to much-faster-than-average employment growth for home health aides.

Nursing aide employment will not grow as fast as home health aide employment, largely because nursing aides are concentrated in slower growing nursing care facilities and hospitals. Employment of nursing aides is expected to grow faster than the average for all occupations through 2014, in response to the long-term care needs of an increasing elderly population. Financial pressures on hospitals to discharge patients as soon as possible should boost admissions to nursing care facilities. As a result, job opportunities will be more numerous in nursing and residential care facilities than in hospitals. Modern medical technology also will drive demand for nursing aides because, as the technology saves and extends more lives, it increases the need for long-term care provided by aides.

Employment of psychiatric aides—the smallest of the three occupations—is expected to grow more slowly than the average for all occupations. Most psychiatric aides currently work in hospitals, but most job growth will be in residential mental health facilities and in home health care agencies. There is a long-term trend toward treating mental health patients outside of hospitals because it is more cost effective and allows patients to live more normal lives. Demand for psychiatric aides in residential facilities will rise in response to growth in the number of older persons—many of whom will require mental health services—but also as an increasing number of mentally disabled adults, who were formerly cared for by their elderly parents, seek care. Job growth also could be affected by changes in government funding of programs for the mentally ill.

Earnings

Median hourly earnings of nursing aides, orderlies, and attendants were \$10.09 in May 2004. The middle 50 percent earned between \$8.59 and \$12.09 an hour. The lowest 10 percent earned less than \$7.31, and the highest 10 percent earned more than \$14.02 an hour. Median hourly earnings in the industries employing the largest numbers of nursing aides, orderlies, and attendants in May 2004 were as follows:

Employment services	\$11.29
Local government	11.10
General medical and surgical hospitals.....	10.44
Nursing care facilities	9.86
Community care facilities for the elderly	9.56

Nursing and psychiatric aides in hospitals generally receive at least 1 week of paid vacation after 1 year of service. Paid holidays and sick leave, hospital and medical benefits, extra pay for late-shift work, and pension plans also are available to many hospital employees and to some nursing care facility employees.

Median hourly earnings of home health aides were \$8.81 in May 2004. The middle 50 percent earned between \$7.52 and \$10.38 an hour. The lowest 10 percent earned less than \$6.52, and the highest 10 percent earned more than \$12.32 an hour. Median hourly earnings

in the industries employing the largest numbers of home health aides in May 2004 were as follows:

Nursing care facilities	\$9.11
Residential mental retardation, mental health and substance abuse facilities.....	8.97
Home health care services	8.57
Community care facilities for the elderly	8.57
Individual and family services	8.47

Home health aides receive slight pay increases with experience and added responsibility. Usually, they are paid only for the time worked in the home, not for travel time between jobs. Most employers hire only on-call hourly workers and provide no benefits.

Median hourly earnings of psychiatric aides were \$11.19 in May 2004. The middle 50 percent earned between \$9.09 and \$14.09 an hour. The lowest 10 percent earned less than \$7.63, and the highest 10 percent earned more than \$16.74 an hour. Median hourly earnings in the industries employing the largest numbers of psychiatric aides in May 2004 were as follows:

General medical and surgical hospitals.....	\$11.31
Psychiatric and substance abuse hospitals.....	11.06
Residential mental retardation, mental health and substance abuse facilities.....	9.37

Related Occupations

Nursing, psychiatric, and home health aides help people who need routine care or treatment. So do child care workers, licensed practical and licensed vocational nurses, medical assistants, occupational therapist assistants and aides, personal and home care aides, physical therapist assistants and aides, and registered nurses.

Sources of Additional Information

Information about employment opportunities may be obtained from local hospitals, nursing care facilities, home health care agencies, psychiatric facilities, State boards of nursing, and local offices of the State employment service.

Information on licensing requirements for nursing and home health aides, and lists of State-approved nursing aide programs are available from State departments of public health, departments of occupational licensing, boards of nursing, and home care associations.

Occupational Therapist Assistants and Aides

(O*NET 31-2011.00, 31-2012.00)

Significant Points

- Employment is projected to increase much faster than the average, reflecting growth in the number of individuals with disabilities or limited function who require therapeutic services.
- Occupational therapist assistants generally must complete an associate degree or a certificate program; in contrast, occupational therapist aides usually receive most of their training on the job.
- In an effort to control rising health care costs, third-party payers are expected to encourage occupational therapists to delegate more hands-on therapy work to lower-paid occupational therapist assistants and aides.

Nature of the Work

Occupational therapist assistants and aides work under the direction of occupational therapists to provide rehabilitative services to persons with mental, physical, emotional, or developmental impairments. The ultimate goal is to improve clients' quality of life and ability to perform daily activities. For example, occupational therapist assistants help injured workers re-enter the labor force by teaching them how to compensate for lost motor skills or help individuals with learning disabilities increase their independence.

Occupational therapist assistants, commonly known as *occupational therapy assistants*, help clients with rehabilitative activities and exercises outlined in a treatment plan developed in collaboration with an occupational therapist. Activities range from teaching the proper method of moving from a bed into a wheelchair to the best way to stretch and limber the muscles of the hand. Assistants monitor an individual's activities to make sure that they are performed correctly and to provide encouragement. They also record their client's progress for the occupational therapist. If the treatment is not having the intended effect, or the client is not improving as expected, the therapist may alter the treatment program in hopes of obtaining better results. In addition, occupational therapist assistants document the billing of the client's health insurance provider.

Occupational therapist aides typically prepare materials and assemble equipment used during treatment. They are responsible for a range of clerical tasks, including scheduling appointments, answering the telephone, restocking or ordering depleted supplies, and filling out insurance forms or other paperwork. Aides are not licensed, so the law does not allow them to perform as wide a range of tasks as occupational therapist assistants.

Working Conditions

The hours and days that occupational therapist assistants and aides work vary with the facility and with whether they are full- or part-time employees. Many outpatient therapy offices and clinics have evening and weekend hours, to help coincide with patients' personal schedules.

Occupational therapist assistants and aides need to have a moderate degree of strength, because of the physical exertion required in assisting patients with their treatment. For example, assistants and aides may need to lift patients. Constant kneeling, stooping, and standing for long periods also are part of the job.

Occupational therapist assistants and aides provide rehabilitative services to persons with mental, physical, emotional, or developmental impairments.

Training, Other Qualifications, and Advancement

An associate degree or a certificate from an accredited community college or technical school is generally required to qualify for occupational therapist assistant jobs. In contrast, occupational therapist aides usually receive most of their training on the job.

There were 135 accredited occupational therapist assistant programs in 2005. The first year of study typically involves an introduction to health care, basic medical terminology, anatomy, and physiology. In the second year, courses are more rigorous and usually include occupational therapist courses in areas such as mental health, adult physical disabilities, gerontology, and pediatrics. Students also must complete 16 weeks of supervised fieldwork in a clinic or community setting. Applicants to occupational therapist assistant programs can improve their chances of admission by taking high school courses in biology and health and by performing volunteer work in nursing care facilities, occupational or physical therapists' offices, or other health care settings.

Occupational therapist assistants are regulated in most States and must pass a national certification examination after they graduate. Those who pass the test are awarded the title "Certified Occupational Therapy Assistant."

Occupational therapist aides usually receive most of their training on the job. Qualified applicants must have a high school diploma, strong interpersonal skills, and a desire to help people in need. Applicants may increase their chances of getting a job by volunteering their services, thus displaying initiative and aptitude to the employer.

Assistants and aides must be responsible, patient, and willing to take directions and work as part of a team. Furthermore, they should be caring and want to help people who are not able to help themselves.

Employment

Occupational therapist assistants and aides held about 27,000 jobs in 2004. Occupational therapist assistants held about 21,000 jobs, and occupational therapist aides held approximately 5,400. About 30 percent of jobs for assistants and aides were in hospitals, 23 percent were in offices of occupational therapists, and 18 percent were in nursing care facilities. The rest were primarily in community care facilities for the elderly, home health care services, individual and family services, and State government agencies.

Job Outlook

Employment of occupational therapist assistants and aides is expected to grow much faster than the average for all occupations through 2014. The impact of proposed Federal legislation imposing limits on reimbursement for therapy services may adversely affect the job market for occupational therapist assistants and aides in the short run. Over the long run, however, demand for occupational therapist assistants and aides will continue to rise because of the increasing number of individuals with disabilities or limited function. Job growth will result from an aging population, including the baby-boom generation, which will need more occupational therapy services. The increased prevalence of sensory disorders in children will increase the demand for occupational therapy services. Increasing demand also will result from advances in medicine that allow more people with critical problems to survive and then need rehabilitative therapy. In an effort to control rising health care costs, third-party payers are expected to encourage occupational therapists to delegate more hands-on therapy work to lower-paid occupational therapist assistants and aides.

Earnings

Median annual earnings of occupational therapist assistants were \$38,430 in May 2004. The middle 50 percent earned between \$31,970 and \$44,390. The lowest 10 percent earned less than \$25,880, and the highest 10 percent earned more than \$52,700. Median annual earnings of occupational therapist assistants were \$40,130 in offices of other health practitioners, which includes offices of occupational therapists.

Median annual earnings of occupational therapist aides were \$23,150 in May 2004. The middle 50 percent earned between \$19,080 and \$31,910. The lowest 10 percent earned less than \$15,820, and the highest 10 percent earned more than \$41,560.

Related Occupations

Occupational therapist assistants and aides work under the supervision and direction of occupational therapists. Other workers in the health care field who work under similar supervision include dental assistants, medical assistants, pharmacy aides, pharmacy technicians, and physical therapist assistants and aides.

Sources of Additional Information

For information on a career as an occupational therapist assistant or aide, and a list of accredited programs, contact:

Pharmacy Aides

(O*NET 31-9095.00)

Significant Points

- Job opportunities are expected to be good for full-time and part-time work, especially for those with related work experience.
- Many pharmacy aides work evenings, weekends, and holidays.
- About 80 percent work in retail pharmacies, grocery stores, department stores, or mass retailers.

Nature of the Work

Pharmacy aides help licensed pharmacists with administrative duties in running a pharmacy. Aides often are clerks or cashiers who primarily answer telephones, handle money, stock shelves, and perform other clerical duties. They work closely with pharmacy technicians. *Pharmacy technicians* usually perform more complex tasks than do aides, although in some States the duties and titles of the jobs overlap. (See the statement on pharmacy technicians elsewhere in the *Handbook*.) Aides refer any questions regarding prescriptions, drug information, or health matters to a pharmacist. (See the statement on pharmacists elsewhere in the *Handbook*.)

Aides have several important duties that help the pharmacy to function smoothly. They may establish and maintain patient profiles, prepare insurance claim forms, and stock and take inventory of prescription and over-the-counter medications. Accurate recordkeeping is necessary to help avert dangerous drug interactions. In addition, because many people have medical insurance to help pay for prescriptions, it is essential that pharmacy aides correspond efficiently and correctly with the third-party insurance providers to obtain payment. Pharmacy

Pharmacy aides answer telephones, handle money, stock shelves, and perform other clerical duties.

aides also maintain inventory and inform the supervisor of stock needs so that the pharmacy does not run out of the vital medications that customers need. Some also clean pharmacy equipment, help with the maintenance of equipment and supplies, and manage the cash register.

Working Conditions

Pharmacy aides work in clean, organized, well-lit, and well-ventilated areas. Most of their workday is spent on their feet. They may be required to lift heavy boxes or to use stepladders to retrieve supplies from high shelves.

Aides work the same hours that pharmacists work. These include evenings, nights, weekends, and some holidays, particularly in facilities, such as hospitals and retail pharmacies that are open 24 hours a day. There are many opportunities for part-time work in both retail and hospital settings.

Training, Other Qualifications, and Advancement

Most pharmacy aides receive informal on-the-job training, but employers favor those with at least a high school diploma. Prospective pharmacy aides with experience working as cashiers may have an advantage when applying for jobs. Employers also prefer applicants with strong customer service and communication skills, experience managing inventories, and experience using computers. Aides entering the field need strong spelling, reading, and mathematics skills.

Successful pharmacy aides are organized, dedicated, friendly, and responsible. They should be willing and able to take directions. Candidates interested in becoming pharmacy aides cannot have prior records of drug or substance abuse. Strong interpersonal and communication skills are needed because pharmacy aides interact daily with patients, coworkers, and health care professionals. Teamwork is very important because aides are often required to work with technicians and pharmacists.

Pharmacy aides almost always are trained on the job. They may begin by observing a more experienced worker. After they become familiar with the store's equipment, policies, and procedures, they begin to work on their own. Once they become experienced, aides are not likely to receive additional training, except when new equipment is introduced or when policies or procedures change.

To become a pharmacy aide, one should be able to perform repetitive work accurately. Aides need good basic mathematics

skills and good manual dexterity. Pharmacy aides should be neat in appearance and able to deal pleasantly and tactfully with customers. Some employers may prefer people with experience typing, handling money, or operating specialized equipment, including computers.

Advancement usually is limited, although some aides may decide to become pharmacy technicians or to enroll in pharmacy school to become pharmacists.

Employment

Pharmacy aides held about 50,000 jobs in 2004. About 80 percent work in retail pharmacies either independently owned or part of a drug store chain, grocery store, department store, or mass retailer; the vast majority of these are in drug stores. About 10 percent work in hospitals, and the rest work in mail-order pharmacies, clinics, and pharmaceutical wholesalers.

Job Outlook

Job opportunities for full-time and part-time work are expected to be good, especially for aides with related work experience in pharmacies or as cashiers or stock clerks in other retail settings. Job openings will be created by employment growth and by the need to replace workers who transfer to other occupations or leave the labor force.

Employment of pharmacy aides is expected to grow about as fast as the average for all occupations through 2014 because of the increasing use of medication in treating patients. In addition, a greater number of middle-aged and elderly people—who use more prescription drugs than younger people—will spur demand for aides in all practice settings.

Cost-conscious insurers, pharmacies, and health systems will continue to employ aides. As a result, pharmacy aides will assume some responsibility for routine tasks previously performed by pharmacists and pharmacy technicians, thereby giving pharmacists more time to interact with patients and technicians more time to prepare medications. Employment of pharmacy aides will not grow as fast as employment of pharmacists and pharmacy technicians, however, because of legal limitations regarding aides' duties. Many smaller pharmacies that can afford only a small staff will favor pharmacy technicians because of their more extensive training and job skills.

Earnings

Median hourly wage and salary earnings of pharmacy aides were \$8.86 in May 2004. The middle 50 percent earned between \$7.39 and \$10.96; the lowest 10 percent earned less than \$6.34, and the highest 10 percent earned more than \$13.79. In May 2004, median hourly earnings of pharmacy aides were \$8.29 in health and personal care stores and \$9.80 in grocery stores.

Related Occupations

The work of pharmacy aides is closely related to that of pharmacy technicians, cashiers, and stock clerks and order fillers. Workers in other medical support occupations include dental assistants, licensed practical and licensed vocational nurses, medical transcriptionists, medical records and health information technicians, occupational therapist assistants and aides, physical therapist assistants and aides, and surgical technologists.

Sources of Additional Information

For information on employment opportunities, contact local employers or local offices of the State employment service.

Physical Therapist Assistants and Aides

(O*NET 31-2021.00, 31-2022.00)

Significant Points

- Employment is projected to increase much faster than average; physical therapist aides may face keen competition from the large pool of qualified applicants.
- Physical therapist assistants generally have an associate degree, but physical therapist aides usually learn skills on the job.
- About 60 percent of jobs are in hospitals or offices of physical therapists.

Nature of the Work

Physical therapist assistants and aides perform components of physical therapy procedures and related tasks selected by a supervising physical therapist. These workers assist physical therapists in providing services that help improve mobility, relieve pain, and prevent or limit permanent physical disabilities of patients suffering from injuries or disease. Patients include accident victims and individuals with disabling conditions such as low-back pain, arthritis, heart disease, fractures, head injuries, and cerebral palsy.

Physical therapist assistants perform a variety of tasks. Components of treatment procedures performed by these workers, under the direction and supervision of physical therapists, involve exercises, massages, electrical stimulation, paraffin baths, hot and cold packs, traction, and ultrasound. Physical therapist assistants record the patient's responses to treatment and report the outcome of each treatment to the physical therapist.

Physical therapist aides help make therapy sessions productive, under the direct supervision of a physical therapist or physical therapist assistant. They usually are responsible for keeping the treatment area clean and organized and for preparing for each patient's therapy. When patients need assistance moving to or from a treatment area, aides push them in a wheelchair or provide them with a shoulder to lean on. Because they are not licensed, aides do not perform the clinical tasks of a physical therapist assistant.

The duties of aides include some clerical tasks, such as ordering depleted supplies, answering the phone, and filling out insurance forms and other paperwork. The extent to which an aide or an assistant performs clerical tasks depends on the size and location of the facility.

Working Conditions

The hours and days that physical therapist assistants and aides work vary with the facility and with whether they are full- or part-time employees. Many outpatient physical therapy offices and clinics have evening and weekend hours, to help coincide with patients' personal schedules. About 30 percent of all physical therapist assistants and aides work part time.

Physical therapist assistants and aides need a moderate degree of strength because of the physical exertion required in assisting patients with their treatment. In some cases, assistants and aides need to lift patients. Constant kneeling, stooping, and standing for long periods also are part of the job.

Training, Other Qualifications, and Advancement

Physical therapist aides are trained on the job, but physical therapist assistants typically earn an associate degree from an accred-

Physical therapist assistants and aides perform physical therapy procedures and related tasks.

ited physical therapist assistant program. Not all States require licensure or registration in order for the physical therapist assistant to practice. The States that require licensure stipulate specific educational and examination criteria. Complete information on practice acts and regulations can be obtained from the State licensing boards. Additional requirements may include certification in cardiopulmonary resuscitation (CPR) and other first aid and a minimum number of hours of clinical experience.

According to the American Physical Therapy Association, there were 238 accredited physical therapist assistant programs in the United States as of 2004. Accredited physical therapist assistant programs are designed to last 2 years, or 4 semesters, and culminate in an associate degree. Programs are divided into academic study and hands-on clinical experience. Academic course work includes algebra, anatomy and physiology, biology, chemistry, and psychology. Many programs require that students complete a semester of anatomy and physiology and have certifications in CPR and other first aid even before they begin their clinical field experience. Both educators and prospective employers view clinical experience as integral to ensuring that students understand the responsibilities of a physical therapist assistant.

Employers typically require physical therapist aides to have a high school diploma, strong interpersonal skills, and a desire to assist people in need. Most employers provide clinical on-the-job training.

Employment

Physical therapist assistants and aides held about 101,000 jobs in 2004. Physical therapist assistants held about 59,000 jobs, physical therapist aides approximately 43,000. Both work with physical therapists in a variety of settings. About 60 percent of jobs were in hospitals or in offices of physical therapists. Others worked primarily in nursing care facilities, offices of physicians, home health care services, and outpatient care centers.

Job Outlook

Employment of physical therapist assistants and aides is expected to grow much faster than the average for all occupations through the year 2014. The impact of proposed Federal legislation imposing limits on reimbursement for therapy services may adversely affect the short-term job outlook for physical therapist assistants and aides. However, over the long run, demand for physical therapist assistants

and aides will continue to rise, in accordance with the increasing number of individuals with disabilities or limited function. The growing elderly population is particularly vulnerable to chronic and debilitating conditions that require therapeutic services. These patients often need additional assistance in their treatment, making the roles of assistants and aides vital. The large baby-boom generation is entering the prime age for heart attacks and strokes, further increasing the demand for cardiac and physical rehabilitation. In addition, future medical developments should permit an increased percentage of trauma victims to survive, creating added demand for therapy services.

Physical therapists are expected to increasingly utilize assistants to reduce the cost of physical therapy services. Once a patient is evaluated and a treatment plan is designed by the physical therapist, the physical therapist assistant can provide many aspects of treatment, as prescribed by the therapist.

Physical therapist assistants and aides with prior experience working in a physical therapy office or other health care setting will have the best job opportunities. Physical therapist aides may face keen competition from the large pool of qualified individuals with a high school diploma.

Earnings

Median annual earnings of physical therapist assistants were \$37,890 in May 2004. The middle 50 percent earned between \$31,060 and \$44,050. The lowest 10 percent earned less than \$24,110, and the highest 10 percent earned more than \$52,110. Median annual earn-

ings in the industries employing the largest numbers of physical therapist aides in May 2004 were:

Nursing care facilities	\$40,360
General medical and surgical hospitals.....	37,790
Offices of other health practitioners.....	37,120

Median annual earnings of physical therapist aides were \$21,380 in May 2004. The middle 50 percent earned between \$17,990 and \$26,310. The lowest 10 percent earned less than \$15,380, and the highest 10 percent earned more than \$33,550. Median annual earnings of physical therapist aides in May 2004 were \$21,120 in general medical and surgical hospitals and \$20,360 in offices of physical therapists.

Related Occupations

Physical therapist assistants and aides work under the supervision of physical therapists. Other workers in the health care field who work under similar supervision include dental assistants, medical assistants, occupational therapist assistants and aides, pharmacy aides, pharmacy technicians, and social and human service assistants.

Sources of Additional Information

Career information on physical therapist assistants and a list of schools offering accredited programs can be obtained from:

Protective Service Occupations

Correctional Officers

(O*NET 33-1011.00, 33-3011.00, 33-3012.00)

Significant Points

- The work can be stressful and hazardous.
- Most correctional officers are employed in State and Federal prisons.
- Job opportunities are expected to be excellent.

Nature of the Work

Correctional officers are responsible for overseeing individuals who have been arrested and are awaiting trial or who have been convicted of a crime and sentenced to serve time in a jail, reformatory, or penitentiary. Correctional officers maintain security and inmate accountability to prevent disturbances, assaults, and escapes. Officers have no law enforcement responsibilities outside the institution where they work. (For more information on related occupations, see the statements on police and detectives and on probation officers and correctional treatment specialists, elsewhere in the *Handbook*.)

Police and sheriffs' departments in county and municipal jails or precinct station houses employ many correctional officers, also known as *detention officers*. Most of the approximately 3,400 jails in the United States are operated by county governments, with about three-quarters of all jails under the jurisdiction of an elected sheriff. Individuals in the jail population change constantly as some are released, some are convicted and transferred to prison, and new offenders are arrested and enter the system. Correctional

officers in local jails admit and process about 12 million people a year, with about 700,000 offenders in jail at any given time. When individuals are first arrested, the jail staff may not know their true identity or criminal record, and violent detainees may be placed in the general population. This is the most dangerous phase of the incarceration process for correctional officers.

Most correctional officers are employed in State and Federal prisons, watching over the approximately 1.4 million offenders who are incarcerated there at any given time. Other correctional officers oversee individuals being held by the U.S. Immigration and Naturalization Service pending release or deportation, or work for correctional institutions that are run by private for-profit organizations. Although both jails and prisons can be dangerous places to work, prison populations are more stable than jail populations, and correctional officers in prisons know the security and custodial requirements of the prisoners with whom they are dealing.

Regardless of the setting, correctional officers maintain order within the institution and enforce rules and regulations. To help ensure that inmates are orderly and obey rules, correctional officers monitor the activities and supervise the work assignments of inmates. Sometimes, officers must search inmates and their living quarters for contraband like weapons or drugs, settle disputes between inmates, and enforce discipline. Correctional officers periodically inspect the facilities, checking cells and other areas of the institution for unsanitary conditions, contraband, fire hazards, and any evidence of infractions of rules. In addition, they routinely inspect locks, window bars, grilles, doors, and gates for signs of tampering. Finally, officers inspect mail and visitors for prohibited items.

Correctional officers report orally and in writing on inmate conduct and on the quality and quantity of work done by inmates. Officers also report security breaches, disturbances, violations of

rules, and any unusual occurrences. They usually keep a daily log or record of their activities. Correctional officers cannot show favoritism and must report any inmate who violates the rules. Should the situation arise, they help the responsible law enforcement authorities investigate crimes committed within their institution or search for escaped inmates.

In jail and prison facilities with direct supervision cellblocks, officers work unarmed. They are equipped with communications devices so that they can summon help if necessary. These officers often work in a cellblock alone, or with another officer, among the 50 to 100 inmates who reside there. The officers enforce regulations primarily through their interpersonal communications skills and through the use of progressive sanctions, such as the removal of some privileges.

In the highest security facilities, where the most dangerous inmates are housed, correctional officers often monitor the activities of prisoners from a centralized control center with closed-circuit television cameras and a computer tracking system. In such an environment, the inmates may not see anyone but officers for days or weeks at a time and may leave their cells only for showers, solitary exercise time, or visitors. Depending on the offenders' security classification within the institution, correctional officers may have to restrain inmates in handcuffs and leg irons to safely escort them to and from cells and other areas and to see authorized visitors. Officers also escort prisoners between the institution and courtrooms, medical facilities, and other destinations outside the institution.

Bailiffs, also known as *marshals* or *court officers*, are law enforcement officers who maintain safety and order in courtrooms. Their duties, which vary by location, include enforcing courtroom rules, assisting judges, guarding juries from outside contact, delivering court documents, and providing general security for courthouses.

Working Conditions

Working in a correctional institution can be stressful and hazardous. Every year, correctional officers are injured in confrontations with inmates. Correctional officers may work indoors or outdoors. Some correctional institutions are well lighted, temperature controlled, and ventilated, but others are old, overcrowded, hot, and noisy. Correctional officers usually work an 8-hour day, 5 days a week, on rotating shifts. Because prison and jail security must be provided around the clock, officers work all hours of the day and night, weekends, and holidays. In addition, officers may be required to work paid overtime.

In high security facilities, correctional officers often monitor prisoners from a centralized control center.

Training, Other Qualifications, and Advancement

Most institutions require correctional officers to be at least 18 to 21 years of age and a U.S. citizen; have a high school education or its equivalent; demonstrate job stability, usually by accumulating 2 years of work experience; and have no felony convictions. Promotion prospects may be enhanced by obtaining a postsecondary education.

The Federal Bureau of Prisons requires entry-level correctional officers to have at least a bachelor's degree; or 3 years of full-time experience in a field providing counseling, assistance, or supervision to individuals; or a combination of these two requirements.

Correctional officers must be in good health. Candidates for employment are generally required to meet formal standards of physical fitness, eyesight, and hearing. In addition, many jurisdictions use standard tests to determine applicant suitability to work in a correctional environment. Good judgment and the ability to think and act quickly are indispensable. Applicants are typically screened for drug abuse, subject to background checks, and required to pass a written examination.

Federal, State, and some local departments of corrections provide training for correctional officers based on guidelines established by the American Correctional Association and the American Jail Association. Some States have regional training academies that are available to local agencies. At the conclusion of formal instruction, all State and local correctional agencies provide on-the-job training, including training on legal restrictions and interpersonal relations. Many systems require firearms proficiency and self-defense skills. Officer trainees typically receive several weeks or months of training in an actual job setting under the supervision of an experienced officer. However, specific entry requirements and on-the-job training vary widely from agency to agency.

Academy trainees generally receive instruction in a number of subjects, including institutional policies, regulations, and operations, as well as custody and security procedures. New Federal correctional officers must undergo 200 hours of formal training within the first year of employment. They also must complete 120 hours of specialized training at the U.S. Federal Bureau of Prisons residential training center at Glynco, GA, within 60 days of their appointment. Experienced officers receive annual in-service training to keep abreast of new developments and procedures.

Some correctional officers are members of prison tactical response teams, which are trained to respond to disturbances, riots, hostage situations, forced cell moves, and other potentially dangerous confrontations. Team members practice disarming prisoners wielding weapons, protecting themselves and inmates against the effects of chemical agents, and other tactics.

With education, experience, and training, qualified officers may advance to the position of correctional sergeant. Correctional sergeants supervise correctional officers and usually are responsible for maintaining security and directing the activities of other officers during an assigned shift or in an assigned area. Ambitious and qualified correctional officers can be promoted to supervisory or administrative positions all the way up to warden. Officers sometimes transfer to related jobs, such as probation officers, parole officers, and correctional treatment specialists.

Employment

Bailiffs, correctional officers, and jailers held about 484,000 jobs in 2004. About 3 of every 5 jobs were in State correctional institutions such as prisons, prison camps, and youth correctional facilities. About 16,000 jobs for correctional officers were in Federal correctional institutions, and about 15,000 jobs were in privately owned and managed prisons.

Most of the remaining jobs were in city and county jails or in other institutions run by local governments. Some 300 of these jails, all of them in urban areas, are large: they house over 1,000 inmates. Most correctional officers who work in jails, however, work in institutions located in rural areas with smaller inmate populations.

Job Outlook

Job opportunities for correctional officers are expected to be excellent. The need to replace correctional officers who transfer to other occupations, retire, or leave the labor force, coupled with rising employment demand, will generate thousands of job openings each year. In the past, some local and State corrections agencies have experienced difficulty in attracting and keeping qualified applicants, largely because of low salaries, shift work, and the concentration of jobs in rural locations. This situation is expected to continue.

Employment of correctional officers is expected to grow more slowly than the average for all occupations through 2014. Increasing demand for correctional officers will stem from mandatory sentencing guidelines calling for longer sentences and reduced parole for inmates, and from expansion and new construction of corrections facilities. However, mandatory sentencing guidelines are being reconsidered in many States because of a combination of budgetary constraints, court decisions, and doubts about their effectiveness. Instead, there may be more emphasis on reducing sentences or putting offenders on probation or in rehabilitation programs in many States. As a result, the prison population, and employment of correctional officers, will probably grow at a slower rate than in the past. Some employment opportunities also will arise in the private sector, as public authorities contract with private companies to provide and staff corrections facilities.

Layoffs of correctional officers are rare because of increasing offender populations. While officers are allowed to join bargaining units, they are not allowed to strike.

Earnings

Median annual earnings of correctional officers and jailers were \$33,600 in May 2004. The middle 50 percent earned between \$26,560 and \$44,200. The lowest 10 percent earned less than \$22,630, and the highest 10 percent earned more than \$54,820. Median annual earnings in the public sector were \$44,700 in the Federal Government, \$33,750 in State government, and \$33,080 in local government. In the facilities support services industry, where the relatively small number of officers employed by privately operated prisons is classified, median annual earnings were \$21,490. According to the Federal Bureau of Prisons, the starting salary for Federal correctional officers was about \$26,747 a year in 2005. Starting Federal salaries were slightly higher in areas where prevailing local pay levels were higher.

Median annual earnings of first-line supervisors/managers of correctional officers were \$44,720 in May 2004. The middle 50 percent earned between \$33,070 and \$60,550. The lowest 10 percent earned less than \$27,770, and the highest 10 percent earned more than \$70,990. Median annual earnings were \$41,080 in State government and \$49,470 in local government.

Median annual earnings of bailiffs were \$33,870 in May 2004. The middle 50 percent earned between \$24,710 and \$44,240. The lowest 10 percent earned less than \$17,930, and the highest 10 percent earned more than \$54,770. Median annual earnings were \$30,410 in local government.

In addition to typical benefits, correctional officers employed in the public sector usually are provided with uniforms or a clothing allowance to purchase their own uniforms. Civil service systems or

merit boards cover officers employed by the Federal Government and most State governments. Their retirement coverage entitles correctional officers to retire at age 50 after 20 years of service or at any age with 25 years of service.

Related Occupations

A number of options are available to those interested in careers in protective services and security. Security guards and gaming surveillance officers protect people and property against theft, vandalism, illegal entry, and fire. Police and detectives maintain law and order, prevent crime, and arrest offenders. Probation officers and correctional treatment specialists monitor and counsel offenders and evaluate their progress in becoming productive members of society.

Information on entrance requirements, training, and career opportunities for correctional officers at the Federal level may be obtained from the Federal Bureau of Prisons. Internet: <http://www.bop.gov>

Information on obtaining a position as a correctional officer with the Federal Government is available from the Office of Personnel Management through USAJOBS, the Federal Government's official employment information system. This resource for locating and applying for job opportunities can be accessed through the Internet at <http://www.usajobs.opm.gov> or through an interactive voice response telephone system at (703) 724-1850 or TDD (978) 461-8404. These numbers are not tollfree, and charges may result.

Fire Fighting Occupations

(O*NET 33-1021.01, 33-1021.02, 33-2011.01, 33-2011.02, 33-2021.01, 33-2021.02, 33-2022.00)

Significant Points

- Fire fighting involves hazardous conditions and long, irregular hours.
- About 9 out of 10 fire fighting workers were employed by municipal or county fire departments.
- Applicants for municipal fire fighting jobs generally must pass written, physical, and medical examinations.
- Although employment is expected to grow faster than the average, keen competition for jobs is expected because this occupation attracts many qualified candidates.

Nature of the Work

Every year, fires and other emergencies take thousands of lives and destroy property worth billions of dollars. Fire fighters help protect the public against these dangers by rapidly responding to a variety of emergencies. They are frequently the first emergency personnel at the scene of a traffic accident or medical emergency and may be called upon to put out a fire, treat injuries, or perform other vital functions.

During duty hours, fire fighters must be prepared to respond immediately to a fire or any other emergency that arises. Because fighting fires is dangerous and complex, it requires organization and

teamwork. At every emergency scene, fire fighters perform specific duties assigned by a superior officer. At fires, they connect hose lines to hydrants, operate a pump to send water to high-pressure hoses, and position ladders to enable them to deliver water to the fire. They also rescue victims, provide emergency medical attention as needed, ventilate smoke-filled areas, and attempt to salvage the contents of buildings. Their duties may change several times while the company is in action. Sometimes they remain at the site of a disaster for days at a time, rescuing trapped survivors and assisting with medical treatment.

Fire fighters work in a variety of settings, including urban and suburban areas, airports, chemical plants, other industrial sites, and rural areas like grasslands and forests. They have also assumed a range of responsibilities, including emergency medical services. In fact, most calls to which fire fighters respond involve medical emergencies, and 65 percent of all fire departments provide emergency medical service. In addition, some fire fighters work in hazardous materials units that are trained for the control, prevention, and cleanup of materials; for example, these fire fighters respond to oil spills. (For more information, see the *Handbook* statement on hazardous material removal workers.) Workers in urban and suburban areas, airports, and industrial sites typically use conventional fire fighting equipment and tactics, while forest fires and major hazardous materials spills call for different methods.

In national forests and parks, *forest fire inspectors and prevention specialists* spot fires from watchtowers and report their findings to headquarters by telephone or radio. Forest rangers patrol to ensure that travelers and campers comply with fire regulations. When fires break out, crews of fire fighters are brought in to suppress the blaze with heavy equipment, hand tools, and water hoses. Fighting forest fires, like fighting urban fires, is rigorous work. One of the most effective means of battling a blaze is creating fire lines—cutting down trees and digging out grass and all other combustible vegetation in the path of the fire—to deprive it of fuel. Elite fire fighters called smoke jumpers parachute from airplanes to reach otherwise inaccessible areas. This tactic, however, can be extremely hazardous because the crews have no way to escape if the wind shifts and causes the fire to burn toward them.

Between alarms, fire fighters clean and maintain equipment, conduct practice drills and fire inspections, and participate in physical fitness activities. They also prepare written reports on fire incidents and review fire science literature to keep abreast of technological developments and changing administrative practices and policies.

Firefighters help protect the public in the case of fires and other emergencies.

Most fire departments have a fire prevention division, usually headed by a fire marshal and staffed by *fire inspectors*. Workers in this division conduct inspections of structures to prevent fires and ensure compliance with fire codes. These fire fighters also work with developers and planners to check and approve plans for new buildings. Fire prevention personnel often speak on these subjects in schools and before public assemblies and civic organizations.

Some fire fighters become *fire investigators*, who determine the origin and causes of fires. They collect evidence, interview witnesses, and prepare reports on fires in cases where the cause may be arson or criminal negligence. They often are called upon to testify in court.

Working Conditions

Fire fighters spend much of their time at fire stations, which usually have features in common with a residential facility like a dormitory. When an alarm sounds, fire fighters respond rapidly, regardless of the weather or hour. Fire fighting involves the risk of death or injury from sudden cave-ins of floors, toppling walls, traffic accidents when responding to calls, and exposure to flames and smoke. Fire fighters also may come in contact with poisonous, flammable, or explosive gases and chemicals, as well as radioactive or other hazardous materials that may have immediate or long-term effects on their health. For these reasons, they must wear protective gear that can be very heavy and hot.

Work hours of fire fighters are longer and vary more widely than hours of most other workers. Many work more than 50 hours a week, and sometimes they may work even longer. In some agencies, fire fighters are on duty for 24 hours, then off for 48 hours, and receive an extra day off at intervals. In others, they work a day shift of 10 hours for 3 or 4 days, a night shift of 14 hours for 3 or 4 nights, have 3 or 4 days off, and then repeat the cycle. In addition, fire fighters often work extra hours at fires and other emergencies and are regularly assigned to work on holidays. Fire lieutenants and fire captains often work the same hours as the fire fighters they supervise. Duty hours include time when fire fighters study, train, and perform fire prevention duties.

Training, Other Qualifications, and Advancement

Applicants for municipal fire fighting jobs generally must pass a written exam; tests of strength, physical stamina, coordination, and agility; and a medical examination that includes drug screening. Workers may be monitored on a random basis for drug use after accepting employment. Examinations are generally open to persons who are at least 18 years of age and have a high school education or the equivalent. Those who receive the highest scores in all phases of testing have the best chances for appointment. The completion of community college courses in fire science may improve an applicant's chances for appointment. In recent years, an increasing proportion of entrants to this occupation have had some postsecondary education.

As a rule, entry-level workers in large fire departments are trained for several weeks at the department's training center or academy. Through classroom instruction and practical training, the recruits study fire fighting techniques, fire prevention, hazardous materials control, local building codes, and emergency medical procedures, including first aid and cardiopulmonary resuscitation.

They also learn how to use axes, chain saws, fire extinguishers, ladders, and other fire fighting and rescue equipment. After successfully completing this training, the recruits are assigned to a fire company, where they undergo a period of probation.

Almost all departments require fire fighters to be certified as emergency medical technicians. (For more information, see the *Handbook* statement on emergency medical technicians and paramedics.)

While most fire departments require the lowest level of certification, EMT-Basic, larger departments in major metropolitan areas are increasingly requiring paramedic certification. Some departments include this training in the fire academy, while others prefer that recruits have EMT certification beforehand, but will give them up to 1 year to become certified on their own.

A number of fire departments have accredited apprenticeship programs lasting up to 4 years. These programs combine formal, technical instruction with on-the-job training under the supervision of experienced fire fighters. Technical instruction covers subjects such as fire fighting techniques and equipment, chemical hazards associated with various combustible building materials, emergency medical procedures, and fire prevention and safety.

In addition to participating in advanced training programs conducted by local fire departments, some fire fighters attend training sessions sponsored by the U.S. National Fire Academy. These training sessions cover topics such as executive development, anti-arson techniques, disaster preparedness, hazardous materials control, and public fire safety and education. Some States also have either voluntary or mandatory fire fighter training and certification programs. In addition, a number of colleges and universities offer courses leading to 2- or 4-year degrees in fire engineering or fire science. Many fire departments offer fire fighters incentives such as tuition reimbursement or higher pay for completing advanced training.

Among the personal qualities fire fighters need are mental alertness, self-discipline, courage, mechanical aptitude, endurance, strength, and a sense of public service. Initiative and good judgment also are extremely important, because fire fighters make quick decisions in emergencies. Members of a crew live and work closely together under conditions of stress and danger for extended periods, so they must be dependable and able to get along well with others. Leadership qualities are necessary for officers, who must establish and maintain discipline and efficiency, as well as direct the activities of fire fighters in their companies.

Most experienced fire fighters continue studying to improve their job performance and prepare for promotion examinations. To progress to higher level positions, they acquire expertise in advanced fire fighting equipment and techniques, building construction, emergency medical technology, writing, public speaking, management and budgeting procedures, and public relations.

Opportunities for promotion depend upon the results of written examinations, as well as job performance, interviews, and seniority. Increasingly, fire departments are using assessment centers, which simulate a variety of actual job performance tasks, to screen for the best candidates for promotion. The line of promotion usually is to engineer, lieutenant, captain, battalion chief, assistant chief, deputy chief, and, finally, chief. For promotion to positions higher than battalion chief, many fire departments now require a bachelor's degree, preferably in fire science, public administration, or a related field. An associate's degree is required for executive fire officer certification from the National Fire Academy.

Employment

Employment figures in this *Handbook* statement include only paid career fire fighters—they do not cover volunteer fire fighters, who perform the same duties and may constitute the majority of fire fighters in a residential area. According to the U.S. Fire Administration, 70 percent of fire companies are staffed by volunteer fire fighters. In 2004, total employment in firefighting occupations was about 353,000. Fire fighters held about 282,000 jobs, first-line supervisors/managers of fire fighting and prevention workers held about 56,000, and fire inspectors held about 15,000.

About 9 out of 10 fire fighting workers were employed by municipal or county fire departments. Some large cities have thousands of career fire fighters, while many small towns have only a few. Most of the remainder worked in fire departments on Federal and State installations, including airports. Private fire fighting companies employ a small number of fire fighters and usually operate on a subscription basis.

In response to the expanding role of fire fighters, some municipalities have combined fire prevention, public fire education, safety, and emergency medical services into a single organization commonly referred to as a public safety organization. Some local and regional fire departments are being consolidated into countywide establishments in order to reduce administrative staffs, cut costs, and establish consistent training standards and work procedures.

Job Outlook

Prospective fire fighters are expected to face keen competition for available job openings. Many people are attracted to fire fighting because (1) it is challenging and provides the opportunity to perform an essential public service, (2) a high school education is usually sufficient for entry, and (3) a pension is guaranteed upon retirement after 25 years. Consequently, the number of qualified applicants in most areas exceeds the number of job openings, even though the written examination and physical requirements eliminate many applicants. This situation is expected to persist in coming years. Applicants with the best opportunities are those who are physically fit and score the highest on physical conditioning and mechanical aptitude exams. Those who have completed some fire fighter education at a community college and have EMT certification will have an additional advantage.

Employment of fire fighters is expected to grow faster than the average for all occupations through 2014. Most job growth will occur as volunteer fire fighting positions are converted to paid positions in growing suburban areas. In addition to job growth, openings are expected to result from the need to replace fire fighters who retire, stop working for other reasons, or transfer to other occupations.

Layoffs of fire fighters are uncommon. Fire protection is an essential service, and citizens are likely to exert considerable pressure on local officials to expand or at least preserve the level of fire protection. Even when budget cuts do occur, local fire departments usually trim expenses by postponing purchases of equipment or by not hiring new fire fighters, rather than through staff reductions.

Earnings

Median hourly earnings of fire fighters were \$18.43 in May 2004. The middle 50 percent earned between \$13.65 and \$24.14. The lowest 10 percent earned less than \$9.71, and the highest 10 percent earned more than \$29.21. Median hourly earnings were \$18.78 in local government, \$17.34 in the Federal Government, and \$14.94 in State government.

Median annual earnings of first-line supervisors/managers of fire fighting and prevention workers were \$58,920 in May 2004. The middle 50 percent earned between \$46,880 and \$72,600. The lowest 10 percent earned less than \$36,800, and the highest 10 percent earned more than \$90,860. First-line supervisors/managers of fire fighting and prevention workers employed in local government earned about \$60,800 a year.

Median annual earnings of fire inspectors and investigators were \$46,340 in May 2004. The middle 50 percent earned between \$36,030 and \$58,260 a year. The lowest 10 percent earned less than \$28,420, and the highest 10 percent earned more than \$71,490. Fire inspectors and investigators employed in local government earned about \$48,020 a year.

According to the International City-County Management Association, average salaries in 2004 for sworn full-time positions were as follows:

	<i>Minimum</i>	<i>Maximum</i>
	<i>annual base salary</i>	<i>annual base salary</i>
Fire chief	\$68,701	\$89,928
Deputy chief	63,899	79,803
Assistant fire chief	57,860	73,713
Battalion chief	58,338	73,487
Fire captain	49,108	59,374
Fire lieutenant	44,963	53,179
Fire prevention/code inspector	43,297	54,712
Engineer	41,294	52,461

Fire fighters who average more than a certain number of hours a week are required to be paid overtime. The hours threshold is determined by the department during the fire fighter's work period, which ranges from 7 to 28 days. Fire fighters often earn overtime for working extra shifts to maintain minimum staffing levels or for special emergencies.

Fire fighters receive benefits that usually include medical and liability insurance, vacation and sick leave, and some paid holidays. Almost all fire departments provide protective clothing (helmets, boots, and coats) and breathing apparatus, and many also provide dress uniforms. Fire fighters generally are covered by pension plans, often providing retirement at half pay after 25 years of service or if the individual is disabled in the line of duty.

Related Occupations

Like fire fighters, emergency medical technicians and paramedics and police and detectives respond to emergencies and save lives.

Sources of Additional Information

Information about a career as a fire fighter may be obtained from local fire departments and from either of the following organizations:

- ▶ International Association of Fire Fighters, 1750 New York Ave. N.W., Washington, DC 20006. Internet: <http://www.iaff.org>
- ▶ U.S. Fire Administration, 16825 South Seton Ave., Emmitsburg, MD 21727. Internet: <http://www.usfa.fema.gov>

Information about professional qualifications and a list of colleges and universities offering 2- or 4-year degree programs in fire science or fire prevention may be obtained from:

- ▶ National Fire Academy, 16825 South Seton Ave., Emmitsburg, MD 21727. Internet: <http://www.usfa.fema.gov/nfa/index.htm>

Police and Detectives

(O*NET 33-1012.00, 33-3021.01, 33-3021.02, 33-3021.03, 33-3021.04, 33-3021.05, 33-3031.00, 33-3051.01, 33-3051.02, 33-3051.03, 33-3052.00)

Significant Points

- Police and detective work can be dangerous and stressful.
- Competition should remain keen for higher paying jobs with State and Federal agencies and police departments in affluent areas; opportunities will be better in local and special police departments that offer relatively low salaries or in urban communities where the crime rate is relatively high.
- Applicants with college training in police science or military police experience should have the best opportunities.

Nature of the Work

People depend on police officers and detectives to protect their lives and property. Law enforcement officers, some of whom are State or Federal special agents or inspectors, perform these duties in a variety of ways, depending on the size and type of their organization. In most jurisdictions, they are expected to exercise authority when necessary, whether on or off duty.

Uniformed police officers have general law enforcement duties, including maintaining regular patrols and responding to calls for service. They may direct traffic at the scene of an accident, investigate a burglary, or give first aid to an accident victim. In large police departments, officers usually are assigned to a specific type of duty. Many urban police agencies are involved in community policing—a practice in which an officer builds relationships with the citizens of local neighborhoods and mobilizes the public to help fight crime.

Police agencies are usually organized into geographic districts, with uniformed officers assigned to patrol a specific area, such as part of the business district or outlying residential neighborhoods. Officers may work alone, but, in large agencies, they often patrol with a partner. While on patrol, officers attempt to become thoroughly familiar with their patrol area and remain alert for anything unusual. Suspicious circumstances and hazards to public safety are investigated or noted, and officers are dispatched to individual calls for assistance within their district. During their shift, they may identify, pursue, and arrest suspected criminals; resolve problems within the community; and enforce traffic laws.

Public college and university police forces, public school district police, and agencies serving transportation systems and facilities are examples of special police agencies. These agencies have special geographic jurisdictions and enforcement responsibilities in the United States. Most sworn personnel in special agencies are uniformed officers; a smaller number are investigators.

Some police officers specialize in such diverse fields as chemical and microscopic analysis, training and firearms instruction, or handwriting and fingerprint identification. Others work with special units, such as horseback, bicycle, motorcycle or harbor patrol; canine corps; special weapons and tactics (SWAT); or emergency response teams. A few local and special law enforcement officers primarily perform jail-related duties or work in courts. Regardless of job duties or location, police officers and detectives at all levels must write reports and maintain meticulous records that will be needed if they testify in court.

Sheriffs and deputy sheriffs enforce the law on the county level. Sheriffs are usually elected to their posts and perform duties similar to those of a local or county police chief. Sheriffs' departments tend to be relatively small, most having fewer than 50 sworn officers. Deputy sheriffs have law enforcement duties similar to those of officers in urban police departments. Police and sheriffs' deputies who provide security in city and county courts are sometimes called bailiffs. (For information on other officers who work in jails and prisons, see correctional officers elsewhere in the *Handbook*.)

State police officers (sometimes called *State troopers* or *highway patrol officers*) arrest criminals Statewide and patrol highways to enforce motor vehicle laws and regulations. State police officers are best known for issuing traffic citations to motorists. At the scene of accidents, they may direct traffic, give first aid, and call for emergency equipment. They also write reports used to determine the cause of the accident. State police officers are frequently called upon to render assistance to other law enforcement agencies, especially those in rural areas or small towns.

State law enforcement agencies operate in every State except Hawaii. Most full-time sworn personnel are uniformed officers who regularly patrol and respond to calls for service. Others work as investigators, perform court-related duties, or carry out administrative or other assignments.

Detectives are plainclothes investigators who gather facts and collect evidence for criminal cases. Some are assigned to inter-agency task forces to combat specific types of crime. They conduct interviews, examine records, observe the activities of suspects, and participate in raids or arrests. Detectives and State and Federal agents and inspectors usually specialize in investigating one of a wide variety of violations, such as homicide or fraud. They are assigned cases on a rotating basis and work on them until an arrest and conviction occurs or until the case is dropped.

Fish and game wardens enforce fishing, hunting, and boating laws. They patrol hunting and fishing areas, conduct search and rescue operations, investigate complaints and accidents, and aid in prosecuting court cases.

The Federal Government maintains a high profile in many areas of law enforcement. *Federal Bureau of Investigation (FBI) agents* are the Government's principal investigators, responsible for investigating violations of more than 200 categories of Federal law and conducting sensitive national security investigations. Agents may conduct surveillance, monitor court-authorized wiretaps, examine business records, investigate white-collar crime, or participate in sensitive undercover assignments. The FBI investigates organized crime, public corruption, financial crime, fraud against the Government, bribery, copyright infringement, civil rights violations, bank robbery, extortion, kidnapping, air piracy, terrorism, espionage, interstate criminal activity, drug trafficking, and other violations of Federal statutes.

U.S. Drug Enforcement Administration (DEA) agents enforce laws and regulations relating to illegal drugs. Not only is the DEA the lead agency for domestic enforcement of Federal drug laws, it also has sole responsibility for coordinating and pursuing U.S. drug investigations abroad. Agents may conduct complex criminal investigations, carry out surveillance of criminals, and infiltrate illicit drug organizations using undercover techniques.

U.S. marshals and deputy marshals protect the Federal courts and ensure the effective operation of the judicial system. They provide protection for the Federal judiciary, transport Federal prisoners, protect Federal witnesses, and manage assets seized from criminal enterprises. They enjoy the widest jurisdiction of any Federal law enforcement agency and are involved to some degree in nearly all Federal law enforcement efforts. In addition, U.S. marshals pursue and arrest Federal fugitives.

Bureau of Alcohol, Tobacco, Firearms, and Explosives agents regulate and investigate violations of Federal firearms and explosives laws, as well as Federal alcohol and tobacco tax regulations.

The U.S. Department of State *Bureau of Diplomatic Security special agents* are engaged in the battle against terrorism. Overseas, they advise ambassadors on all security matters and manage a complex range of security programs designed to protect personnel, facilities, and information. In the United States, they investigate passport and visa fraud, conduct personnel security investigations, issue security clearances, and protect the Secretary of State and a number of foreign dignitaries. They also train foreign civilian police and administer a counter-terrorism reward program.

The *Department of Homeland Security* employs numerous law enforcement officers under several different agencies, including *Customs and Border Protection*, *Immigration and Customs Enforcement*, and the *U.S. Secret Service*. *U.S. Border Patrol agents* protect more than 8,000 miles of international land and water boundaries. Their missions are to detect and prevent the smuggling and unlawful entry of undocumented foreign nationals into the United States; to apprehend those persons violating the immigration laws; and to interdict contraband, such as narcotics.

Immigration inspectors interview and examine people seeking entrance to the United States and its territories. They inspect pass-

ports to determine whether people are legally eligible to enter the United States. Immigration inspectors also prepare reports, maintain records, and process applications and petitions for immigration or temporary residence in the United States.

Customs inspectors enforce laws governing imports and exports by inspecting cargo, baggage, and articles worn or carried by people, vessels, vehicles, trains, and aircraft entering or leaving the United States. These inspectors examine, count, weigh, gauge, measure, and sample commercial and noncommercial cargoes entering and leaving the United States. Customs inspectors seize prohibited or smuggled articles; intercept contraband; and apprehend, search, detain, and arrest violators of U.S. laws. *Customs agents* investigate violations, such as narcotics smuggling, money laundering, child pornography, and customs fraud, and they enforce the Arms Export Control Act. During domestic and foreign investigations, they develop and use informants; conduct physical and electronic surveillance; and examine records from importers and exporters, banks, couriers, and manufacturers. They conduct interviews, serve on joint task forces with other agencies, and get and execute search warrants.

Federal Air Marshals provide air security by fighting attacks targeting U.S. airports, passengers, and crews. They disguise themselves as ordinary passengers and board flights of U.S. air carriers to locations worldwide.

U.S. Secret Service special agents protect the President, Vice President, and their immediate families; Presidential candidates; former Presidents; and foreign dignitaries visiting the United States. Secret Service agents also investigate counterfeiting, forgery of Government checks or bonds, and fraudulent use of credit cards.

In most jurisdictions, police officers are expected to exercise arrest authority, whether they are on or off duty.

Other Federal agencies employ police and special agents with sworn arrest powers and the authority to carry firearms. These agencies include the Postal Service, the Bureau of Indian Affairs Office of Law Enforcement, the Forest Service, and the National Park Service.

Working Conditions

Police and detective work can be very dangerous and stressful. In addition to the obvious dangers of confrontations with criminals, police officers and detectives need to be constantly alert and ready to deal appropriately with a number of other threatening situations. Many law enforcement officers witness death and suffering resulting from accidents and criminal behavior. A career in law enforcement may take a toll on their private lives.

Uniformed officers, detectives, agents, and inspectors are usually scheduled to work 40-hour weeks, but paid overtime is common. Shift work is necessary because protection must be provided around the clock. Junior officers frequently work weekends, holidays, and nights. Police officers and detectives are required to work at any time their services are needed and may work long hours during investigations. In most jurisdictions, whether on or off duty, officers are expected to be armed and to exercise their authority whenever necessary.

The jobs of some Federal agents such as U.S. Secret Service and DEA special agents require extensive travel, often on very short notice. They may relocate a number of times over the course of their careers. Some special agents in agencies such as the U.S. Border Patrol work outdoors in rugged terrain for long periods and in all kinds of weather.

Training, Other Qualifications, and Advancement

Civil service regulations govern the appointment of police and detectives in most States, large municipalities, and special police agencies, as well as in many smaller jurisdictions. Candidates must be U.S. citizens, usually must be at least 20 years of age, and must meet rigorous physical and personal qualifications. Physical examinations for entrance into law enforcement often include tests of vision, hearing, strength, and agility. Eligibility for appointment usually depends on performance in competitive written examinations and previous education and experience. In larger departments, where the majority of law enforcement jobs are found, applicants usually must have at least a high school education, and some departments require a year or two of college coursework. Federal and State agencies typically require a college degree. Candidates should enjoy working with people and meeting the public.

Because personal characteristics such as honesty, sound judgment, integrity, and a sense of responsibility are especially important in law enforcement, candidates are interviewed by senior officers, and their character traits and backgrounds are investigated. In some agencies, candidates are interviewed by a psychiatrist or a psychologist or given a personality test. Most applicants are subjected to lie detector examinations or drug testing. Some agencies subject sworn personnel to random drug testing as a condition of continuing employment.

Before their first assignments, officers usually go through a period of training. In State and large local departments, recruits get training in their agency's police academy, often for 12 to 14 weeks. In small agencies, recruits often attend a regional or State academy. Training includes classroom instruction in constitutional law and civil rights, State laws and local ordinances, and accident investigation. Recruits also receive training and supervised experience in patrol, traffic control, use of firearms, self-defense, first aid, and emergency

response. Police departments in some large cities hire high school graduates who are still in their teens as police cadets or trainees. They do clerical work and attend classes, usually for 1 to 2 years, at which point they reach the minimum age requirement and may be appointed to the regular force.

Police officers usually become eligible for promotion after a probationary period ranging from 6 months to 3 years. In a large department, promotion may enable an officer to become a detective or to specialize in one type of police work, such as working with juveniles. Promotions to corporal, sergeant, lieutenant, and captain usually are made according to a candidate's position on a promotion list, as determined by scores on a written examination and on-the-job performance.

Most States require at least two years of college study to qualify as a fish and game warden. Applicants must pass written and physical examinations and vision, hearing, psychological, and drug tests similar to those taken by other law enforcement officers. Once hired, officers attend a training academy lasting from 3 to 12 months, sometimes followed by further training in the field.

To be considered for appointment as an FBI agent, an applicant must be a graduate of an accredited law school or a college graduate with one of the following: a major in accounting, electrical engineering, or information technology; fluency in a foreign language; or three years of related full-time work experience. All new agents undergo 18 weeks of training at the FBI Academy on the U.S. Marine Corps base in Quantico, Virginia.

Applicants for special agent jobs with the U.S. Secret Service and the Bureau of Alcohol, Tobacco, and Firearms must have a bachelor's degree, a minimum of three years' related work experience, or a combination of education and experience. Prospective special agents undergo 11 weeks of initial criminal investigation training at the Federal Law Enforcement Training Center in Glynco, Georgia, and another 17 weeks of specialized training with their particular agencies.

Applicants for special agent jobs with the DEA must have a college degree with at least a 2.95 grade point average or specialized skills or work experience, such as foreign language fluency, technical skills, law enforcement experience, or accounting experience. DEA special agents undergo 14 weeks of specialized training at the FBI Academy in Quantico, Virginia.

U.S. Border Patrol agents must be U.S. citizens, be younger than 37 years of age at the time of appointment, possess a valid driver's license, and pass a three-part examination on reasoning and language skills. A bachelor's degree or previous work experience that demonstrates the ability to handle stressful situations, make decisions, and take charge is required for a position as a Border Patrol agent. Applicants may qualify through a combination of education and work experience.

Postal inspectors must have a bachelor's degree and 1 year of related work experience. It is desirable that they have one of several professional certifications, such as that of certified public accountant. They also must pass a background investigation, meet certain health requirements, undergo a drug screening test, possess a valid State driver's license, and be a U.S. citizen between 21 and 36 years of age when hired.

Law enforcement agencies are encouraging applicants to take postsecondary school training in law enforcement-related subjects. Many entry-level applicants for police jobs have completed some formal postsecondary education, and a significant number are college graduates. Many junior colleges, colleges, and universities offer programs in law enforcement or administration of justice. Other courses helpful in preparing for a career in law enforcement include accounting, finance, electrical engineering, computer science, and

foreign languages. Physical education and sports are helpful in developing the competitiveness, stamina, and agility needed for many law enforcement positions. Knowledge of a foreign language is an asset in many Federal agencies and urban departments.

Continuing training helps police officers, detectives, and special agents improve their job performance. Through police department academies, regional centers for public safety employees established by the States, and Federal agency training centers, instructors provide annual training in self-defense tactics, firearms, use-of-force policies, sensitivity and communications skills, crowd-control techniques, relevant legal developments, and advances in law enforcement equipment. Many agencies pay all or part of the tuition for officers to work toward degrees in criminal justice, police science, administration of justice, or public administration, and pay higher salaries to those who earn such a degree.

Employment

Police and detectives held about 842,000 jobs in 2004. About 80 percent were employed by local governments. State police agencies employed about 12 percent, and various Federal agencies employed about 6 percent. A small proportion worked for educational services, rail transportation, and contract investigation and security services.

According to the U.S. Bureau of Justice Statistics, police and detectives employed by local governments primarily worked in cities with more than 25,000 inhabitants. Some cities have very large police forces, while thousands of small communities employ fewer than 25 officers each.

Job Outlook

The opportunity for public service through law enforcement work is attractive to many because the job is challenging and involves much personal responsibility. Furthermore, law enforcement officers in many agencies may retire with a pension after 25 or 30 years of service, allowing them to pursue a second career while still in their 40s or 50s. Because of relatively attractive salaries and benefits, the number of qualified candidates exceeds the number of job openings in Federal law enforcement agencies and in most State police departments—resulting in increased hiring standards and selectivity by employers. Competition should remain keen for higher paying jobs with State and Federal agencies and police departments in more affluent areas. Opportunities will be better in local and special police departments, especially in departments that offer relatively low salaries, or in urban communities where the crime rate is relatively high. Applicants with college training in police science, military police experience, or both should have the best opportunities.

Employment of police and detectives is expected to grow about as fast as the average for all occupations through 2014. A more security-conscious society and concern about drug-related crimes should contribute to the increasing demand for police services. However, employment growth will be hindered by reductions in Federal hiring grants to local police departments and by expectations of low crime rates by the general public.

The level of government spending determines the level of employment for police and detectives. The number of job opportunities, therefore, can vary from year to year and from place to place. Layoffs, on the other hand, are rare because retirements enable most staffing cuts to be handled through attrition. Trained law enforcement officers who lose their jobs because of budget cuts usually have little difficulty finding jobs with other agencies. The need to replace workers who retire, transfer to other occupations, or stop working for other reasons will be the source of many job openings.

Earnings

Police and sheriff’s patrol officers had median annual earnings of \$45,210 in May 2004. The middle 50 percent earned between \$34,410 and \$56,360. The lowest 10 percent earned less than \$26,910, and the highest 10 percent earned more than \$68,880. Median annual earnings were \$44,750 in Federal Government, \$48,980 in State government, and \$45,010 in local government.

In May 2004, median annual earnings of police and detective supervisors were \$64,430. The middle 50 percent earned between \$49,370 and \$80,510. The lowest 10 percent earned less than \$36,690, and the highest 10 percent earned more than \$96,950. Median annual earnings were \$86,030 in Federal Government, \$62,300 in State government, and \$63,590 in local government.

In May 2004, median annual earnings of detectives and criminal investigators were \$53,990. The middle 50 percent earned between \$40,690 and \$72,280. The lowest 10 percent earned less than \$32,180, and the highest 10 percent earned more than \$86,010. Median annual earnings were \$75,700 in Federal Government, \$46,670 in State government, and \$49,650 in local government.

Federal law provides special salary rates to Federal employees who serve in law enforcement. Additionally, Federal special agents and inspectors receive law enforcement availability pay (LEAP)—equal to 25 percent of the agent’s grade and step—awarded because of the large amount of overtime that these agents are expected to work. For example, in 2005, FBI agents entered Federal service as GS-10 employees on the pay scale at a base salary of \$42,548, yet they earned about \$53,185 a year with availability pay. They could advance to the GS-13 grade level in field nonsupervisory assignments at a base salary of \$64,478, which was worth \$80,597 with availability pay. FBI supervisory, management, and executive positions in grades GS-14 and GS-15 paid a base salary of about \$76,193 and \$89,625 a year, respectively, which amounted to \$95,241 or \$112,031 per year including availability pay. Salaries were slightly higher in selected areas where the prevailing local pay level was higher. Because Federal agents may be eligible for a special law enforcement benefits package, applicants should ask their recruiter for more information.

According to the International City-County Management Association’s annual Police and Fire Personnel, Salaries, and Expenditures Survey, average salaries for sworn full-time positions in 2004 were as follows:

	<i>Minimum annual base salary</i>	<i>Maximum annual base salary</i>
Police chief.....	\$72,924	\$92,983
Deputy chief.....	61,110	76,994
Police captain.....	60,908	75,497
Police lieutenant.....	56,115	67,580
Police sergeant.....	49,895	59,454
Police corporal.....	41,793	51,661

Total earnings for local, State, and special police and detectives frequently exceed the stated salary because of payments for overtime, which can be significant. In addition to the common benefits—paid vacation, sick leave, and medical and life insurance—most police and sheriffs’ departments provide officers with special allowances for uniforms. Because police officers usually are covered by liberal pension plans, many retire at half-pay after 25 or 30 years of service.

Related Occupations

Police and detectives maintain law and order, collect evidence and information, and conduct investigations and surveillance. Workers in related occupations include correctional officers, private detectives and investigators, and security guards and gaming surveillance officers.

Sources of Additional Information

Information about entrance requirements may be obtained from Federal, State, and local law enforcement agencies.

In other cases, especially those involving missing persons and background checks, investigators often interview people to gather as much information as possible about an individual. In all cases, private detectives and investigators assist attorneys, businesses, and the public with legal, financial, and personal problems.

Private detectives and investigators offer many services, including executive, corporate, and celebrity protection; pre-employment verification; and individual background profiles. They investigate computer crimes, such as identity theft, harassing e-mails, and illegal downloading of copyrighted material. They also provide assistance in civil liability and personal injury cases, insurance claims and fraud, child custody and protection cases, missing persons cases, and pre-marital screening. They are sometimes hired to investigate individuals to prove or disprove infidelity.

Most detectives and investigators are trained to perform physical surveillance. They may observe a site, such as the home of a subject, from an inconspicuous location or a vehicle. They continue the surveillance, which is often carried out using still and video cameras, binoculars, and a cell phone, until the desired evidence is obtained. This watching and waiting often continues for a long time.

Detectives also may perform computer database searches or work with someone who does. Computers allow investigators to quickly obtain massive amounts of information on individuals' prior arrests, convictions, and civil legal judgments; telephone numbers; motor vehicle registrations; association and club memberships; and other matters.

The duties of private detectives and investigators depend on the needs of their clients. In cases for employers that involve fraudulent workers' compensation claims, for example, investigators may carry out long-term covert observation of subjects. If an investigator observes a subject performing an activity that contradicts injuries stated in a worker's compensation claim, the investigator would take video or still photographs to document the activity and report it to the client.

Private detectives and investigators often specialize. Those who focus on intellectual property theft, for example, investigate and document acts of piracy, help clients stop illegal activity, and provide intelligence for prosecution and civil action. Other investigators specialize in developing financial profiles and asset searches. Their reports reflect information gathered through interviews, investigation and surveillance, and research, including review of public documents.

Legal investigators specialize in cases involving the courts and are normally employed by law firms or lawyers. They frequently assist in preparing criminal defenses, locating witnesses, serving legal documents, interviewing police and prospective witnesses, and gathering and reviewing evidence. Legal investigators also may collect information on the parties to the litigation, take photographs, testify in court, and assemble evidence and reports for trials.

Corporate investigators conduct internal and external investigations for corporations. In internal investigations, they may investigate drug use in the workplace, ensure that expense accounts are not abused, or determine whether employees are stealing merchandise or information. External investigations are typically done to uncover criminal schemes originating outside the corporation, such as theft of company assets through fraudulent billing of products by suppliers.

Financial investigators may be hired to develop confidential financial profiles of individuals or companies that are prospective parties to large financial transactions. These investigators often are certified public accountants (CPAs) who work closely with invest-

Private Detectives and Investigators

(O*Net 33-9021.00)

Significant Points

- Work hours are often irregular, and the work can be dangerous.
- About 1 in 4 are self-employed.
- Applicants typically have related experience in areas such as law enforcement, insurance, the military, or government investigative or intelligence jobs.
- Despite faster-than-average employment growth, keen competition is expected because of the large number of qualified people who are attracted to this occupation; the most opportunities will be found in entry-level jobs with detective agencies or in stores that hire detectives on a part-time basis.

Nature of the Work

Private detectives and investigators use many methods to determine the facts in a variety of matters. To carry out investigations, they may use various types of surveillance or searches. To verify facts, such as an individual's place of employment or income, they may make phone calls or visit a subject's workplace.

Some private detectives and investigators work in their offices most of the day, conducting computer searches and making phone calls.

ment bankers and other accountants. They search for assets in order to recover damages awarded by a court in fraud or theft cases.

Detectives who work for retail stores or hotels are responsible for controlling losses and protecting assets. *Store detectives*, also known as *loss prevention agents*, safeguard the assets of retail stores by apprehending anyone attempting to steal merchandise or destroy store property. They prevent theft by shoplifters, vendor representatives, delivery personnel and even store employees. Store detectives also conduct periodic inspections of stock areas, dressing rooms, and restrooms, and sometimes assist in opening and closing the store. They may prepare loss prevention and security reports for management and testify in court against persons they apprehend. *Hotel detectives* protect guests of the establishment from theft of their belongings and preserve order in hotel restaurants and bars. They also may keep undesirable individuals, such as known thieves, off the premises.

Working Conditions

Private detectives and investigators often work irregular hours because of the need to conduct surveillance and contact people who are not available during normal working hours. Early morning, evening, weekend, and holiday work is common.

Many detectives and investigators spend time away from their offices conducting interviews or doing surveillance, but some work in their office most of the day conducting computer searches and making phone calls. Those who have their own agencies and employ other investigators may work primarily in an office and have normal business hours.

When the investigator is working on a case away from the office, the environment might range from plush boardrooms to seedy bars. Store and hotel detectives work in the businesses that they protect. Investigators generally work alone, but they sometimes work with others during surveillance or when following a subject in order to avoid detection by the subject.

Some of the work involves confrontation, so the job can be stressful and dangerous. Some situations call for the investigator to be armed, such as certain bodyguard assignments for corporate or celebrity clients. Detectives and investigators who carry handguns must be licensed by the appropriate authority. In most cases, however, a weapon is not necessary, because the purpose of the work is gathering information and not law enforcement or criminal apprehension. Owners of investigative agencies have the added stress of having to deal with demanding and sometimes distraught clients.

Training, Other Qualifications, and Advancement

There are no formal education requirements for most private detective and investigator jobs, although many private detectives have college degrees. Private detectives and investigators typically have previous experience in other occupations. Some work initially for insurance or collections companies, in the private security industry, or as paralegals. Many investigators enter the field after serving in law enforcement, the military, government auditing and investigative positions, or Federal intelligence jobs.

Former law enforcement officers, military investigators, and government agents, who are frequently able to retire after 25 years of service, often become private detectives or investigators in a second career. Others enter from such diverse fields as finance, accounting, commercial credit, investigative reporting, insurance, and law. These individuals often can apply their prior work experience in a related investigative specialty. A few enter the occupation directly after graduation from college, generally with associate's or bachelor's degrees in criminal justice or police science.

The majority of States and the District of Columbia require private detectives and investigators to be licensed. Licensing requirements vary, however. Seven States—Alabama, Alaska, Colorado, Idaho, Mississippi, Missouri, and South Dakota—have no statewide licensing requirements, some States have few requirements, and many other States have stringent regulations. A growing number of States are enacting mandatory training programs for private detectives and investigators. For example, the Bureau of Security and Investigative Services of the California Department of Consumer Affairs requires private investigators to be 18 years of age or older; have a combination of education in police science, criminal law, or justice and experience equaling 3 years (6,000 hours) of investigative experience; pass a criminal history background check by the California Department of Justice and the FBI (in most States, convicted felons cannot be issued a license); and receive a qualifying score on a 2-hour written examination covering laws and regulations. There are additional requirements for a firearms permit.

For private detective and investigator jobs, most employers look for individuals with ingenuity, persistence, and assertiveness. A candidate must not be afraid of confrontation, should communicate well, and should be able to think on his or her feet. Good interviewing and interrogation skills also are important and usually are acquired in earlier careers in law enforcement or other fields. Because the courts often are the ultimate judge of a properly conducted investigation, the investigator must be able to present the facts in a manner that a jury will believe.

Training in subjects such as criminal justice and police science is helpful to aspiring private detectives and investigators. Most corporate investigators must have a bachelor's degree, preferably in a business-related field. Some corporate investigators have a master's degree in business administration or a law degree, while others are CPAs. Corporate investigators hired by large companies may receive formal training from their employers on business practices, management structure, and various finance-related topics. The screening process for potential employees typically includes a background check for a criminal history.

Some investigators receive certification from a professional organization to demonstrate competency in a field. For example, the National Association of Legal Investigators (NALI) confers the Certified Legal Investigator designation to licensed investigators who devote a majority of their practice to negligence or criminal defense investigations. To receive the designation, applicants must satisfy experience, educational, and continuing-training requirements and must pass written and oral exams administered by the NALI.

Most private-detective agencies are small, with little room for advancement. Usually, there are no defined ranks or steps, so advancement takes the form of increases in salary and assignment status. Many detectives and investigators work for detective agencies at the beginning of their careers and, after a few years, start their own firms. Corporate and legal investigators may rise to supervisor or manager of the security or investigations department.

Employment

Private detectives and investigators held about 43,000 jobs in 2004. About 26 percent were self-employed, including many who held a secondary job as a self-employed private detective. Around 27 percent of jobs were in investigation and security services, including private detective agencies, while another 15 percent were in department or other general merchandise stores. The rest worked mostly in State and local government, legal services firms, employment services companies, insurance agencies, and credit mediation establishments, including banks and other depository institutions.

Job Outlook

Keen competition is expected because private detective and investigator careers attract many qualified people, including relatively young retirees from law enforcement and military careers. The best opportunities will be in entry-level jobs with detective agencies or in stores that hire detectives on a part-time basis. The best prospects for those seeking store detective jobs will be with large chains and discount stores.

Employment of private detectives and investigators is expected to grow faster than the average for all occupations through 2014. In addition to growth, replacement of those who retire or leave the occupation for other reasons should create many job openings. Increased demand for private detectives and investigators will result from fear of crime, increased litigation, and the need to protect confidential information and property of all kinds. The proliferation of criminal activity on the Internet, such as identity theft, spamming, e-mail harassment, and illegal downloading of copyrighted materials, will increase the demand for private investigators. Employee background checks, conducted by private investigators, will become standard for an increasing number of jobs. Growing financial activity worldwide will increase the demand for investigators to control internal and external financial losses and to monitor competitors and prevent industrial spying.

Earnings

Median annual earnings of salaried private detectives and investigators were \$32,110 in May 2004. The middle 50 percent earned between \$24,080 and \$43,260. The lowest 10 percent earned less than \$19,260, and the highest 10 percent earned more than \$58,470. Earnings of private detectives and investigators vary greatly by employer, specialty, and geographic area.

Related Occupations

Private detectives and investigators often collect information and protect the property and other assets of companies and individuals. Others with related duties include bill and account collectors; claims adjusters, appraisers, examiners, and investigators; police and detectives; and security guards and gaming surveillance officers. Investigators who specialize in conducting financial profiles and asset searches perform work closely related to that of accountants, auditors, financial analysts, and personal financial advisors.

(O*NET 33-9031.00, 33-9032.00)

Significant Points

- Opportunities for most jobs should be favorable, but competition is expected for higher paying positions at facilities requiring longer periods of training and a high level of security, such as nuclear power plants and weapons installations.
- Because of limited formal training requirements and flexible hours, this occupation attracts many individuals seeking a second or part-time job.
- Some positions, such as those of armored car guards, are hazardous.

Nature of the Work

Guards, who are also called *security officers*, patrol and inspect property to protect against fire, theft, vandalism, terrorism, and illegal activity. These workers protect their employer's investment, enforce laws on the property, and deter criminal activity and other problems. They use radio and telephone communications to call for assistance from police, fire, or emergency medical services as the situation dictates. Security guards write comprehensive reports outlining their observations and activities during their assigned shift. They also may interview witnesses or victims, prepare case reports, and testify in court.

Although all security guards perform many of the same duties, their specific duties vary with whether the guard works in a "static" security position or on a mobile patrol. Guards assigned to static security positions usually serve the client at one location for a specified length of time. These guards must become closely acquainted with the property and people associated with it and must often monitor alarms and closed-circuit TV cameras. In contrast, guards assigned to mobile patrol duty drive or walk from location to location and conduct security checks within an assigned geographical zone. They may detain or arrest criminal violators, answer service calls concerning criminal activity or problems, and issue traffic violation warnings.

The security guard's job responsibilities also vary with the size, type, and location of the employer. In department stores, guards protect people, records, merchandise, money, and equipment. They often work with undercover store detectives to prevent theft by customers or employees, and they help apprehend shoplifting suspects prior to the arrival of the police. Some shopping centers and theaters have officers who patrol their parking lots to deter car thefts and robberies. In office buildings, banks, and hospitals, guards maintain order and protect the institutions' property, staff, and customers. At air, sea, and rail terminals and other transportation facilities, guards protect

people, freight, property, and equipment. Using metal detectors and high-tech equipment, they may screen passengers and visitors for weapons and explosives, ensure that nothing is stolen while a vehicle is being loaded or unloaded, and watch for fires and criminals.

Guards who work in public buildings such as museums or art galleries protect paintings and exhibits by inspecting people and packages entering and leaving the building. In factories, laboratories, government buildings, data processing centers, and military bases, security officers protect information, products, computer codes, and defense secrets and check the credentials of people and vehicles entering and leaving the premises. Guards working at universities, parks, and sports stadiums perform crowd control, supervise parking and seating, and direct traffic. Security guards stationed at the entrance to bars and places of adult entertainment, such as nightclubs, prevent access by minors, collect cover charges at the door, maintain order among customers, and protect property and patrons.

Armored car guards protect money and valuables during transit. In addition, they protect individuals responsible for making commercial bank deposits from theft or bodily injury. When the armored car arrives at the door of a business, an armed guard enters, signs for the money, and returns to the truck with the valuables in hand. Carrying money between the truck and the business can be extremely hazardous; because of this risk, armored car guards usually wear bulletproof vests.

All security officers must show good judgment and common sense, follow directions and directives from supervisors, testify accurately in court, and follow company policy and guidelines. Guards should have a professional appearance and attitude and be able to interact with the public. They also must be able to take charge and direct others in emergencies or other dangerous incidents. In a large organization, the security manager often is in charge of a trained guard force divided into shifts; in a small organization, a single worker may be responsible for all security.

Gaming surveillance officers, also known as *surveillance agents*, and *gaming investigators* act as security agents for casino managers and patrons. Using primarily audio and video equipment in an observation room, they observe casino operations for irregular activities, such as cheating or theft, by either employees or patrons. They keep recordings that are sometimes used as evidence against alleged criminals in police investigations. Some casinos use a catwalk over one-way mirrors located above the casino floor to augment electronic surveillance equipment. Surveillance agents occasionally leave the surveillance room and walk the casino floor.

Security guards patrol and inspect property to deter crime.

Working Conditions

Most security guards and gaming surveillance officers spend considerable time on their feet, either assigned to a specific post or patrolling buildings and grounds. Guards may be stationed at a guard desk inside a building to monitor electronic security and surveillance devices or to check the credentials of persons entering or leaving the premises. They also may be stationed at a guardhouse outside the entrance to a gated facility or community and may use a portable radio or cellular telephone that allows them to be in constant contact with a central station. The work usually is routine, but guards must be constantly alert for threats to themselves and the property they are protecting. Guards who work during the day may have a great deal of contact with other employees and members of the public. Gaming surveillance often takes place behind a bank of monitors controlling several cameras in a casino and thus can cause eyestrain.

Guards usually work at least 8-hour shifts for 40 hours per week and often are on call in case an emergency arises. Some employers have three shifts, and guards rotate to divide daytime, weekend, and holiday work equally. Guards usually eat on the job instead of taking a regular break away from the site. In 2004, 16% of guards worked part time, and many individuals held a second job as a guard to supplement their primary earnings.

Training, Other Qualifications, and Advancement

Most States require that guards be licensed. To be licensed as a guard, individuals must usually be at least 18 years old, pass a background check, and complete classroom training in such subjects as property rights, emergency procedures, and detention of suspected criminals. Drug testing often is required and may be random and ongoing.

Many employers of unarmed guards do not have any specific educational requirements. For armed guards, employers usually prefer individuals who are high school graduates or who hold an equivalent certification. Many jobs require a driver's license. For positions as armed guards, employers often seek people who have had responsible experience in other occupations.

Guards who carry weapons must be licensed by the appropriate government authority, and some receive further certification as special police officers, allowing them to make limited types of arrests while on duty. Armed guard positions have more stringent background checks and entry requirements than those of unarmed guards because of greater insurance liability risks. Compared with unarmed security guards, armed guards and special police typically enjoy higher earnings and benefits, greater job security, and more potential for advancement. Usually, they also are given more training and responsibility.

Rigorous hiring and screening programs consisting of background, criminal record, and fingerprint checks are becoming the norm in the occupation. Applicants are expected to have good character references, no serious police record, and good health. They should be mentally alert, emotionally stable, and physically fit to cope with emergencies. Guards who have frequent contact with the public should communicate well.

The amount of training guards receive varies. Training requirements are higher for armed guards because their employers are legally responsible for any use of force. Armed guards receive formal training in areas such as weapons retention and laws covering the use of force.

Many employers give newly hired guards instruction before they start the job and provide on-the-job training. An increasing number of States are making ongoing training a legal requirement for retention of certification. Guards may receive training in protection, public relations, report writing, crisis deterrence, and first aid, as well as specialized training relevant to their particular assignment.

The American Society for Industrial Security International has written voluntary training guidelines that are intended to provide regulating bodies consistent minimum standards for the quality of security services. These guidelines recommend that security guards receive at least 48 hours of training within the first 100 days of employment. The guidelines also suggest that security guards be required to pass a written or performance examination covering topics such as sharing information with law enforcement, crime prevention, handling evidence, the use of force, court testimony, report writing, interpersonal and communication skills, and emergency response procedures. In addition, they recommend annual training and additional firearms training for armed officers.

Guards who are employed at establishments placing a heavy emphasis on security usually receive extensive formal training. For example, guards at nuclear power plants undergo several months of training before being placed on duty—and even then, they perform their tasks only under close supervision. They are taught to use firearms, administer first aid, operate alarm systems and electronic security equipment, and spot and deal with security problems. Guards who are authorized to carry firearms may be periodically tested in their use.

Because many people do not stay long in this occupation, opportunities for advancement are good for those who are career security officers. Most large organizations use a military type of ranking that offers the possibility of advancement in both position and salary. Some guards may advance to supervisor or security manager positions. Guards with management skills may open their own contract security guard agencies. Pay rates vary substantially with the security level of the establishment, so there is also the opportunity to move to higher paying jobs with increased experience and training.

In addition to possessing the keen observation skills required to perform their jobs, gaming surveillance officers and gaming investigators must have excellent verbal and writing abilities to document violations or suspicious behavior. They also need to be physically fit and have quick reflexes, because they sometimes must detain individuals until local law enforcement officials arrive.

Gaming surveillance officers and investigators usually need some training beyond high school, but not a bachelor's degree; previous security experience is a plus. Several educational institutes offer certification programs. Training classes usually are conducted in a casino-like atmosphere and use surveillance camera equipment. Employers prefer either individuals with significant knowledge of casino operations through work experience or those with experience conducting investigations, such as former law enforcement officers.

Employment

Security guards and gaming surveillance officers held over 1.0 million jobs in 2004. Over half of all jobs for security guards were in investigation and security services, including guard and armored car services. These organizations provide security on a contract basis, assigning their guards to buildings and other sites as needed. Most other security officers were employed directly by educational services, hospitals, food services and drinking places, traveler accommodation (hotels), department stores, manufacturing firms, lessors of real estate (residential and nonresidential buildings), and governments. Guard jobs are found throughout the country, most commonly in metropolitan areas. Gaming surveillance officers worked primarily in gambling industries; traveler accommodation, which includes casino hotels; and local government. Gaming surveillance officers were employed only in those States and on those Indian reservations where gambling has been legalized.

A significant number of law enforcement officers work as security guards when they are off duty, in order to supplement their incomes. Often working in uniform and with the official cars assigned to them,

they add a high-profile security presence to the establishment with which they have contracted. At construction sites and apartment complexes, for example, their presence often deters crime. (Police and detectives are discussed elsewhere in the *Handbook*.)

Job Outlook

Opportunities for security guards and gaming surveillance officers should be favorable. Numerous job openings will stem from employment growth attributable to the demand for increased security and from the need to replace those who leave this large occupation each year. In addition to full-time job opportunities, the limited training requirements and flexible hours attract many persons seeking part-time or second jobs. However, competition is expected for higher paying positions that require longer periods of training; these positions usually are found at facilities that require a high level of security, such as nuclear power plants or weapons installations.

Employment of security guards and gaming surveillance officers is expected to grow as fast as the average for all occupations through 2014 as concern about crime, vandalism, and terrorism continues to increase the need for security. Demand for guards also will grow as private security firms increasingly perform duties—such as providing security at public events and in residential neighborhoods—that were formerly handled by police officers. Casinos will continue to hire more surveillance officers as more States legalize gambling and as the number of casinos increases in States where gambling is already legal. In addition, casino security forces will employ more technically trained personnel as technology becomes increasingly important in thwarting casino cheating and theft.

Earnings

Median annual earnings of security guards were \$20,320 in May 2004. The middle 50 percent earned between \$16,640 and \$25,510. The lowest 10 percent earned less than \$14,390, and the highest 10 percent earned more than \$33,270. Median annual earnings in the industries employing the largest numbers of security guards in May 2004 were as follows:

Elementary and secondary schools	\$25,030
General medical and surgical hospitals.....	24,750
Local government	23,690
Traveler accommodation.....	21,710
Investigation and security services	19,030

Gaming surveillance officers and gaming investigators had median annual earnings of \$25,840 in May 2004. The middle 50 percent earned between \$20,430 and \$33,790. The lowest 10 percent earned less than \$17,710, and the highest 10 percent earned more than \$42,420.

Related Occupations

Guards protect property, maintain security, and enforce regulations and standards of conduct in the establishments at which they work. Related security and protective service occupations include correctional officers, police and detectives, and private detectives and investigators.

Sources of Additional Information

Further information about work opportunities for guards is available from local security and guard firms and State employment service offices. Information about licensing requirements for guards may be obtained from the State licensing commission or the State police department. In States where local jurisdictions establish licensing requirements, contact a local government authority such as the sheriff, county executive, or city manager.

Food Preparation and Service Related Occupations

Chefs, Cooks, and Food Preparation Workers

(O*NET 35-1011.00, 35-2011.00, 35-2012.00, 35-2013.00, 35-2014.00, 35-2015.00, 35-2021.00)

Significant Points

- Many young people worked as cooks and food preparation workers—almost 19 percent were between 16 and 19 years old.
- More than 2 out of 5 food preparation workers were employed part time.
- Job openings are expected to be plentiful, because many of these workers transfer to other occupations with higher earnings or burn out from the fast work pace and pressure to fill orders quickly.

Nature of the Work

Chefs, cooks, and food preparation workers prepare, season, and cook a wide range of foods—from soups, snacks, and salads to entrees, side dishes, and desserts—in a variety of restaurants and other food services establishments. Chefs and cooks create recipes and prepare meals, while food preparation workers peel and cut vegetables, trim meat, prepare poultry, and perform other duties such as keeping work areas clean and monitoring temperatures of ovens and stovetops.

In general, *chefs* and *cooks* measure, mix, and cook ingredients according to recipes, using a variety of pots, pans, cutlery, and other equipment, including ovens, broilers, grills, slicers, grinders, and blenders. Chefs and head cooks also are responsible for directing the work of other kitchen workers, estimating food requirements, and ordering food supplies.

Larger restaurants and food services establishments tend to have varied menus and larger kitchen staffs. They often include several chefs and cooks, sometimes called assistant or line cooks, along with other lesser skilled kitchen workers, such as *food preparation workers*. Each chef or cook works an assigned station that is equipped with the types of stoves, grills, pans, and ingredients needed for the foods prepared at that station. Job titles often reflect the principal ingredient prepared or the type of cooking performed—*vegetable cook*, *fry cook*, or *grill cook*.

Executive chefs and *head cooks* coordinate the work of the kitchen staff and direct the preparation of meals. They determine serving sizes, plan menus, order food supplies, and oversee kitchen operations to ensure uniform quality and presentation of meals. The terms chef and cook often are used interchangeably, but generally reflect the different types of chefs and the organizational structure of the kitchen staff. For example, an *executive chef* is in charge of all food service operations and also may supervise the many kitchens of a hotel, restaurant group, or corporate dining operation. A *chef de cuisine* reports to an executive chef and is responsible for the daily operations of a single kitchen. A *sous chef*, or sub chef, is the second-in-command and runs the kitchen in the absence of the chef. Chefs tend to be more highly skilled and better trained than cooks. Many chefs earn fame both for themselves and for their kitchens because of the quality and distinctive nature of the food they serve.

The specific responsibilities of most cooks are determined by a number of factors, including the type of restaurant in which they work. *Institution and cafeteria cooks*, for example, work in the kitchens of schools, cafeterias, businesses, hospitals, and other institutions. For each meal, they prepare a large quantity of a limited number of entrees, vegetables, and desserts. *Restaurant cooks* usually prepare a wider selection of dishes, cooking most orders individually. *Short-order cooks* prepare foods in restaurants and coffee shops that emphasize fast service and quick food preparation. They grill and garnish hamburgers, prepare sandwiches, fry eggs, and cook French fries, often working on several orders at the same time. *Fast-food cooks* prepare a limited selection of menu items in fast-food restaurants. They cook and package batches of food, such as hamburgers and fried chicken, to be kept warm until served. (*Combined food preparation and service workers*, who both prepare and serve items in fast-food restaurants, are included with the material on food and beverage serving and related workers elsewhere in the *Handbook*.)

Some cooks do not work in restaurant or food service kitchens. *Private household cooks (or personal chefs)* plan and prepare meals in private homes according to the client's tastes or dietary needs. They order groceries and supplies, clean the kitchen and wash dishes and utensils. They also may serve meals. *Research chefs* combine culinary skills with knowledge of food science to develop recipes and test new formulas, experiment with flavors and eye appeal of prepared foods, and test new products and equipment for chain restaurants, food growers and processors, and manufacturers and marketers.

Food preparation workers perform routine, repetitive tasks such as readying ingredients for complex dishes, slicing and dicing vegetables, and composing salads and cold items, under the direction of chefs and cooks. They weigh and measure ingredients, go after pots and pans, and stir and strain soups and sauces. Food preparation workers may cut and grind meats, poultry, and seafood in preparation for cooking. Their responsibilities also include cleaning work areas, equipment, utensils, dishes, and silverware.

The number and types of workers employed in kitchens depends on the type of establishment. For example, fast-food establishments offer only a few items, which are prepared by fast-food cooks. Small, full-service restaurants offering casual dining often feature a limited number of easy-to-prepare items supplemented by short-order specialties and ready-made desserts. Typically, one cook prepares all the food with the help of a short-order cook and one or two other kitchen workers.

Grocery and specialty food stores employ chefs, cooks, and food preparation workers to develop recipes and prepare meals for customers to carry out. Typically, entrees, side dishes, salads, or other items are prepared in large quantities and stored at an appropriate temperature. Servers portion and package items according to customer orders for serving at home.

Working Conditions

Many restaurant and institutional kitchens have modern equipment, convenient work areas, and air conditioning, but kitchens in older and smaller eating places are often not as well designed. Kitchens must be well ventilated, appropriately lit, and properly equipped with sprinkler systems to protect against fires. Kitchen staffs invariably work in small quarters against hot stoves and ovens. They are under constant pressure to prepare meals quickly, while ensuring quality is maintained and safety and sanitation guidelines are observed.

Chefs, cooks, and food preparation workers must observe local health and sanitation standards.

Working conditions vary with the type and quantity of food prepared and the local laws governing food service operations. Workers usually must withstand the pressure and strain of standing for hours at a time, lifting heavy pots and kettles, and working near hot ovens and grills. Job hazards include slips and falls, cuts, and burns, but injuries are seldom serious.

Work hours in restaurants may include early mornings, late evenings, holidays, and weekends. Work schedules of chefs, cooks and other kitchen workers in factory and school cafeterias may be more regular. In 2004, about 40 percent of cooks and 46 percent of food preparation workers had part-time schedules, compared to 16 percent of workers throughout the economy. Work schedules in fine-dining restaurants, however, tend to be longer, because of the time required to prepare ingredients in advance. Many executive chefs regularly work 12-hour days because they oversee the delivery of foodstuffs early in the day, plan the menu, and start preparing those menu items that take the greatest amount of preparation time or skill.

The wide range in dining hours and the need for fully-staffed kitchens during all open hours creates work opportunities for individuals seeking supplemental income, flexible work hours, or variable schedules. For example, almost 19 percent of cooks and food preparation workers were 16-19 years old in 2004, and almost 11 percent had variable schedules. Kitchen workers employed by schools may work during the school year only, usually for 9 or 10 months. Similarly, resort establishments usually only offer seasonal employment.

Training, Other Qualifications, and Advancement

Most fast-food or short-order cooks and food preparation workers require little education or training; most skills are learned on the job. Training generally starts with basic sanitation and workplace safety subjects and continues with instruction on food handling, preparation, and cooking procedures.

A high school diploma is not required for beginning jobs, but it is recommended for those planning a career as a cook or chef. High school or vocational school programs may offer courses in basic food safety and handling procedures and general business and computer classes for those who want to manage or open their own place. Many school districts, in cooperation with State departments of education, provide on-the-job training and summer workshops for cafeteria kitchen workers who aspire to become cooks. Large corporations in the food services and hospitality industries also offer paid internships and summer jobs to those just starting out in the field. Internships provide valuable experience and can lead to placement in more formal chef training programs.

Executive chefs and head cooks who work in fine-dining restaurants require many years of training and experience and an intense desire to cook. Some chefs and cooks may start their training in high school or post-high school vocational programs. Others may receive formal training through independent cooking schools, professional culinary institutes, or 2- or 4-year college degree programs in hospitality or culinary arts. In addition, some large hotels and restaurants operate their own training and job-placement programs for chefs and cooks. Most formal training programs require some form of apprenticeship, internship, or out-placement program jointly offered by the school and affiliated restaurants. Professional culinary institutes, industry associations, and trade unions also may sponsor formal apprenticeship programs in coordination with the U.S. Department of Labor. Many chefs are trained on the job, receiving real work experience and training from chef mentors in the restaurants where they work.

People who have had courses in commercial food preparation may start in a cook or chef job without spending a lot of time in lower-skilled kitchen jobs. Their education may give them an advantage when looking for jobs in better restaurants. Some vocational programs in high schools may offer training, but employers usually prefer training given by trade schools, vocational centers, colleges, professional associations, or trade unions. Postsecondary courses range from a few months to 2 years or more. Degree-granting programs are open only to high school graduates. Chefs also may compete and test for certification as master chefs. Although certification is not required to enter the field, it can be a measure of accomplishment and lead to further advancement and higher-paying positions. The U.S. Armed Forces also are a good source of training and experience.

Although curricula may vary, students in formal culinary training programs spend most of their time in kitchens learning to use the appropriate equipment and to prepare meals through actual practice. They learn good knife techniques, safe food-handling procedures, and proper use and care of kitchen equipment. Training programs often include courses in nutrition, menu planning, portion control, purchasing and inventory methods, proper food storage procedures, and use of leftover food to minimize waste. Students also learn sanitation and public health rules for handling food. Training in food service management, computer accounting and inventory software, and banquet service are featured in some training programs.

The number of formal and informal culinary training programs continues to increase to meet demand. Formal programs, which may offer training leading to a certificate or a 2- or 4-year degree, are geared more for training chefs for fine-dining or upscale restaurants. They offer a wider array of training options and specialties, such as advanced cooking techniques; cooking for banquets, buffets, or parties; and cuisines and cooking styles from around the world.

The American Culinary Federation accredits more than 100 formal training programs and sponsors apprenticeship programs around the country. Typical apprenticeships last three years and combine classroom training and work experience. Accreditation is an indication that a culinary program meets recognized standards regarding course content, facilities, and quality of instruction. The American Culinary Federation also certifies pastry professionals, personal chefs, and culinary educators in addition to various levels of chefs. Certification standards are based primarily on experience and formal training.

Vocational or trade-school programs typically offer more basic training in preparing food, such as food handling and sanitation procedures, nutrition, slicing and dicing methods for various kinds of meats and vegetables, and basic cooking methods, such as baking, broiling, and grilling.

Important characteristics for chefs, cooks, and food preparation workers include working well as part of a team, having a keen sense of taste and smell, and working efficiently to turn out meals rapidly. Personal cleanliness is essential because most States require health certificates indicating that workers are free from communicable diseases. Knowledge of a foreign language can be an asset because it may improve communication with other restaurant staff, vendors, and the restaurant's clientele.

Advancement opportunities for chefs, cooks, and food preparation workers depend on their training, work experience, and ability to perform more responsible and sophisticated tasks. Many food preparation workers, for example, may move into assistant or line cook positions. Chefs and cooks who demonstrate an eagerness to learn new cooking skills and to accept greater responsibility may move up within the kitchen and take on responsibility for training or supervising newer or lesser skilled kitchen staff. Others may move from one kitchen or restaurant to another.

Some chefs and cooks go into business as caterers or personal chefs or they open their own restaurant. Others become instructors in culinary training programs. A number of cooks and chefs advance to executive chef positions or food service management positions, particularly in hotels, clubs, or larger, more elegant restaurants where they may oversee operations in a number of kitchens or restaurants. (See the statement on food service managers elsewhere in the *Handbook*.)

Employment

Chefs, cooks and food preparation workers held nearly 3.1 million jobs in 2004. The distribution of jobs among the various types of chefs, cooks, and food preparation workers was as follows:

Food preparation workers	\$889,000
Cooks, restaurant	783,000
Cooks, fast food	662,000
Cooks, institution and cafeteria	424,000
Cooks, short order	230,000
Chefs and head cooks	125,000
Cooks, private household	9,200

Nearly two-thirds of all chefs, cooks, and food preparation workers were employed in restaurants and other food services and drinking places. Almost one-fifth worked in institutions such as schools, universities, hospitals, and nursing care facilities. Grocery stores, hotels, gasoline stations with convenience stores, and other organizations employed the remainder.

Job Outlook

Job openings for chefs, cooks, and food preparation workers are expected to be plentiful through 2014; however, competition should be keen for jobs in the top kitchens of higher end restaurants. While job growth will create new positions, primarily due to the expansion of family-casual dining, the overwhelming majority of job openings will stem from the need to replace workers who leave this large occupational group. Many chef, cook, and food preparation worker jobs are attractive to people seeking first-time or short-term employment, additional income, or a flexible schedule. Employers typically hire a large number of part-time workers and require minimal education and training for these lesser skilled entry-level positions. Many of these workers transfer to other occupations or stop working, creating numerous openings for those entering the field.

Overall employment of chefs, cooks, and food preparation workers is expected to increase about as fast as the average for all occupations over the 2004-14 period. Employment growth will be spurred by increases in population, household income, and leisure

time that will allow people to more often dine out and take vacations. In addition, the large number of two-income households will lead more families to opt for the convenience of dining out.

Projected employment growth, however, varies by specialty. The number of higher-skilled chefs and cooks working in full-service restaurants—those that offer table service and more varied menus—is expected to increase about as fast as the average. Much of the increase in this segment, however, will come from job growth in more casual dining, rather than up-scale full-service restaurants. Dining trends suggest increasing numbers of meals eaten away from home and growth in family dining restaurants, but greater limits on expense-account meals. Similarly, employment of food preparation workers will grow faster than the average reflecting diners desires for convenience as they shop for carryout meals in a greater variety of places—full-service restaurants, limited-service eating places, or grocery stores.

Employment of fast-food cooks is expected to grow about as fast as the average. Duties of cooks in fast-food restaurants are limited; most workers are likely to be combined food preparation and serving workers, rather than fast-food cooks. Employment of short-order cooks is expected to increase about as fast as the average. Short-order cooks may work a grill or sandwich station in a full-line restaurant, but also may work in lunch counters or coffee shops that specialize in meals served quickly.

Employment of institution and cafeteria chefs and cooks will show little or no growth. Their employment will not keep pace with the rapid growth in the educational and health services industries—where their employment is concentrated. In an effort to make “institutional food” more attractive to office workers, students, staff, visitors, and patients, offices, schools and hospitals increasingly contract out their food services. Employment of cooks, private household, however, is projected to decline, reflecting the general decline in private household service employment.

Employment of chefs, cooks, and food preparation workers who prepare meals-to-go, such as those who work in the prepared foods sections of grocery or specialty food stores, should increase much faster than the average as people continue to demand quality meals and convenience. Similarly, much faster than average growth also is expected among those who work in contract food service establishments, such as those that provide catering services, and those who support employee dining rooms or staff hotel restaurants on a contract basis. These changes reflect a continuing trend among large establishments to contract out food services so they may better focus on their core business of running a hospital, hotel, factory or school. Also, there is a growing consumer desire for healthier, made-from-scratch meals without sacrificing the convenience of pre-packaged prepared foods or fast-food dining.

Earnings

Wages of chefs, cooks, and food preparation workers vary greatly according to region of the country and the type of food services establishment in which they work. Wages usually are highest in elegant restaurants and hotels, where many executive chefs are employed, and in major metropolitan areas.

Median hourly earnings of chefs and head cooks were \$14.75 in May 2004. The middle 50 percent earned between \$10.71 and \$20.28. The lowest 10 percent earned less than \$8.28, and the highest 10 percent earned more than \$26.75 per hour. Median hourly earnings in the industries employing the largest number of chefs and head cooks in May 2004 were:

Other amusement and recreation industries	\$19.27
Traveler accommodations	18.25
Special food services	15.06
Full-service restaurants	13.57
Limited-service eating places	12.00

Median hourly earnings of cooks, private household were \$9.42 in May 2004. The middle 50 percent earned between \$7.08 and \$12.79.

The lowest 10 percent earned less than \$6.01, and the highest 10 percent earned more than \$16.55 per hour.

Median hourly earnings of restaurant cooks were \$9.39 in May 2004. The middle 50 percent earned between \$7.79 and \$11.13. The lowest 10 percent earned less than \$6.76, and the highest 10 percent earned more than \$13.37 per hour. Median hourly earnings in the industries employing the largest numbers of restaurant cooks in May 2004 were:

Traveler accommodations	\$10.69
Other amusement and recreation industries	10.55
Special food services	10.00
Full-service restaurants	9.34
Drinking places (alcoholic beverages)	9.27
Limited-service eating places	8.25

Median hourly earnings of institution and cafeteria cooks were \$9.10 in May 2004. The middle 50 percent earned between \$7.20 and \$11.22. The lowest 10 percent earned less than \$6.08, and the highest 10 percent earned more than \$13.72 per hour. Median hourly earnings in the industries employing the largest numbers of institution and cafeteria cooks in May 2004 were:

General medical and surgical hospitals.....	\$10.38
Special food services.....	10.11
Community care facilities for the elderly	9.60
Nursing care facilities	9.33
Elementary and secondary schools	8.06

Median hourly earnings of short-order cooks were \$8.11 in May 2004. The middle 50 percent earned between \$6.90 and \$9.92. The lowest 10 percent earned less than \$5.97, and the highest 10 percent earned more than \$11.50 per hour. Median hourly earnings in the industries employing the largest number of short-order cooks in May 2004 were:

Full-service restaurants	\$8.53
Drinking places (alcoholic beverages).....	8.08
Other amusement and recreation industries	7.79
Limited-service eating places	7.21
Gasoline stations	6.99

Median hourly earnings of food preparation workers were \$8.03 in May 2004. The middle 50 percent earned between \$6.89 and \$9.78. The lowest 10 percent earned less than \$5.97, and the highest 10 percent earned more than \$11.90 per hour. Median hourly earnings in the industries employing the largest number of food preparation workers in May 2004 were:

Elementary and secondary schools	\$9.04
Grocery stores	8.54
Nursing care facilities	8.10
Full-service restaurants	7.94
Limited-service eating places	7.27

Median hourly earnings of fast-food cooks were \$7.07 in May 2004. The middle 50 percent earned between \$6.20 and \$8.22. The lowest 10 percent earned less than \$5.68, and the highest 10 percent earned more than \$9.63 per hour. Median hourly earnings in the industries employing the largest number of fast-food cooks in May 2004 were:

Grocery stores	\$8.26
Special food services.....	7.97
Gasoline stations	7.18
Full-service restaurants	7.16
Limited-service eating places	7.02

Some employers provide employees with uniforms and free meals, but Federal law permits employers to deduct from their employees' wages the cost or fair value of any meals or lodging provided, and some employers do so. Chefs, cooks, and food preparation workers who work full time often receive typical benefits, but part-time workers usually do not.

In some large hotels and restaurants, kitchen workers belong to unions. The principal unions are the Hotel Employees and Restaurant Employees International Union and the Service Employees International Union.

Related Occupations

Workers who perform tasks similar to those of chefs, cooks, and food preparation workers include food processing occupations, such as butchers and meat cutters, and bakers. Others who work closely with these workers include food service managers and food and beverage serving and related workers

Sources of Additional Information

Information about job opportunities may be obtained from local employers and local offices of the State employment service.

Career information about chefs, cooks, and other kitchen workers, as well as a directory of 2- and 4-year colleges that offer courses or programs that prepare persons for food service careers, is available from:

Food and Beverage Serving and Related Workers

(O*NET 35-3011.00, 35-3021.00, 35-3022.00, 35-3031.00, 35-3041.00, 35-9011.00, 35-9021.00, 35-9031.00, 35-9099.99)

Significant Points

- Most jobs are part time so many opportunities exist for young people—about one-fourth of these workers were 16 to 19 years old, almost six times the proportion for all workers.
- Job openings are expected to be abundant through 2014 because many of these workers transfer to other occupations or stop working, creating numerous openings.
- Tips comprise a major portion of earnings, so keen competition is expected for jobs where potential earnings from tips are greatest—bartenders, waiters and waitresses, and other jobs in popular restaurants and fine dining establishments.

Nature of the Work

Food and beverage serving and related workers are the front line of customer service in restaurants, coffee shops, and other food service establishments. These workers greet customers, escort them to seats and hand them menus, take food and drink orders, and serve food and beverages. They also answer questions, explain menu items and specials, and keep tables and dining areas clean and set for new diners. Most work as part of a team, helping coworkers to improve workflow and customer service.

Waiters and waitresses, the largest group of these workers, take customers' orders, serve food and beverages, prepare itemized checks, and sometimes accept payment. Their specific duties vary considerably, depending on the establishment. In coffee shops serving routine, straightforward fare, such as salads, soups, and sandwiches, servers are expected to provide fast, efficient, and courteous service. In fine dining restaurants, where more complicated meals are prepared and often served over several courses, waiters and waitresses provide more formal service emphasizing personal, attentive treatment and a more leisurely pace. They may recommend certain dishes and identify ingredients or explain how various items on the menu are prepared. Some prepare salads, desserts, or other menu items tableside. Additionally, they may check the identification of patrons to ensure they meet the minimum age requirement for the purchase of alcohol and tobacco products.

Waiters and waitresses sometimes perform the duties of other food and beverage service workers. These tasks may include escorting guests to tables, serving customers seated at counters, clearing and setting up tables, or operating a cash register. However, full-service restaurants frequently hire other staff, such as hosts and hostesses, cashiers, or dining room attendants, to perform these duties.

Bartenders fill drink orders either taken directly from patrons at the bar or through waiters and waitresses who place drink orders for dining room customers. Bartenders check identification of customers seated at the bar, to ensure they meet the minimum age requirement for the purchase of alcohol and tobacco products. They prepare mixed drinks, serve bottled or draught beer, and pour wine or other beverages. Bartenders must know a wide range of drink recipes and be able to mix drinks accurately, quickly, and without waste. Besides mixing and serving drinks, bartenders stock and prepare garnishes for drinks; maintain an adequate supply of ice, glasses, and other bar supplies; and keep the bar area clean for customers. They also may collect payment, operate the cash register, wash glassware and utensils, and serve food to customers seated at the bar. Bartenders usually are responsible for ordering and maintaining an inventory of liquor, mixes, and other bar supplies.

The majority of bartenders directly serve and interact with patrons. Bartenders should be friendly and enjoy talking with customers. Bartenders at service bars, on the other hand, have less contact with customers. They work in small bars often located off the kitchen in restaurants, hotels, and clubs where only waiters and waitresses place drink orders. Some establishments, especially larger, higher volume ones, use equipment that automatically measures, pours and mixes drinks at the push of a button. Bartenders who use this equipment, however, still must work quickly to handle a large volume of drink orders and be familiar with the ingredients for special drink requests. Much of a bartender's work still must be done by hand to fill each individual order.

Hosts and hostesses welcome guests and maintain reservation or waiting lists. They may direct patrons to coatrooms, restrooms, or to a place to wait until their table is ready. Hosts and hostesses assign guests to tables suitable for the size of their group, escort patrons to their seats, and provide menus. They also schedule dining

reservations, arrange parties, and organize any special services that are required. In some restaurants, they act as cashiers.

Dining room and cafeteria attendants and bartender helpers assist waiters, waitresses, and bartenders by cleaning tables, removing dirty dishes, and keeping serving areas stocked with supplies. Sometimes called backwaiters or runners, they bring meals out of the kitchen and assist waiters and waitresses by distributing dishes to individual diners. They also replenish the supply of clean linens, dishes, silverware, and glasses in the dining room and keep the bar stocked with glasses, liquor, ice, and drink garnishes. Dining room attendants set tables with clean tablecloths, napkins, silverware, glasses, and dishes and serve ice water, rolls, and butter. At the conclusion of meals, they remove dirty dishes and soiled linens from tables. Cafeteria attendants stock serving tables with food, trays, dishes, and silverware and may carry trays to dining tables for patrons. *Bartender helpers* keep bar equipment clean and wash glasses. *Dishwashers* clean dishes, cutlery, and kitchen utensils and equipment.

Counter attendants take orders and serve food in cafeterias, coffee shops, and carryout eateries. In cafeterias, they serve food displayed on steam tables, carve meat, dish out vegetables, ladle sauces and soups, and fill beverage glasses. In lunchrooms and coffee shops, counter attendants take orders from customers seated at the counter, transmit orders to the kitchen, and pick up and serve food. They also fill cups with coffee, soda, and other beverages and prepare fountain specialties, such as milkshakes and ice cream sundaes. Counter attendants also take carryout orders from diners and wrap or place items in containers. They clean counters, write itemized checks, and sometimes accept payment. Some counter attendants may prepare short-order items, such as sandwiches and salads.

Some food and beverage serving workers take orders from customers at counters or drive-through windows at fast-food restaurants. They assemble orders, hand them to customers, and accept payment. Many of these are *combined food preparation and serving workers* who also cook and package food, make coffee, and fill beverage cups using drink-dispensing machines.

Other workers serve food to patrons outside of a restaurant environment, such as in hotels, hospital rooms, or cars.

Working Conditions

Food and beverage service workers are on their feet most of the time and often carry heavy trays of food, dishes, and glassware. During busy dining periods, they are under pressure to serve customers quickly and efficiently. The work is relatively safe, but care must be taken to avoid slips, falls, and burns.

Waiters and waitresses are under pressure to serve customers quickly, courteously, and efficiently during busy dining periods.

Part-time work is more common among food and beverage serving and related workers than among workers in almost any other occupation. In 2004, those on part-time schedules included half of all waiters and waitresses, and 40 percent of all bartenders.

Food service and drinking establishments typically maintain long dining hours and offer flexible and varied work opportunities. Many food and beverage serving and related workers work evenings, weekends, and holidays. Many students and teenagers seek part time or seasonal work as food and beverage serving and related workers as a first job to gain work experience or to earn spending money while in school. Around one-fourth of food and beverage serving and related workers were 16 to 19 years old—about six times the proportion for all workers.

Training, Other Qualifications, and Advancement

There are no specific educational requirements for food and beverage service jobs. Many employers prefer to hire high school graduates for waiter and waitress, bartender, and host and hostess positions, but completion of high school usually is not required for fast-food workers, counter attendants, dishwashers, and dining room attendants and bartender helpers. For many people a job as a food and beverage service worker serves as a source of immediate income, rather than a career. Many entrants to these jobs are in their late teens or early twenties and have a high school education or less. Usually, they have little or no work experience. Many are full-time students or homemakers. Food and beverage service jobs are a major source of part-time employment for high school and college students.

Restaurants rely on good food and quality customer service to retain loyal customers and succeed in a competitive industry. Food and beverage serving and related workers who exhibit excellent personal qualities—such as a neat clean appearance, a well-spoken manner, an ability to work as a member of team, and a pleasant way with patrons—will be highly sought after.

Waiters and waitresses need a good memory to avoid confusing customers' orders and to recall faces, names, and preferences of frequent patrons. These workers also should be comfortable using computers to place orders and generate customers' bills. Some may need to be quick at arithmetic so they can total bills manually. Knowledge of a foreign language is helpful to communicate with a diverse clientele and staff. Prior experience waiting on tables is preferred by restaurants and hotels that have rigid table service standards. Jobs at these establishments often offer higher wages and have greater income potential from tips, but they may also have stiffer employment requirements than other establishments, such as prior table service experience or higher education.

Usually, bartenders must be at least 21 years of age, but employers prefer to hire people who are 25 or older. Bartenders should be familiar with State and local laws concerning the sale of alcoholic beverages.

Most food and beverage serving and related workers pick up their skills on the job by observing and working with more experienced workers. Some full-service restaurants also provide new dining room employees with some form of classroom-type training that alternates with periods of actual on-the-job work experience. These training programs communicate the operating philosophy of the restaurant, help establish a personal rapport with other staff and instill a desire to work as a team. They also provide an opportunity to discuss customer service situations and the proper ways of handling unpleasant circumstances or unruly patrons with new employees. Additionally, managers, chefs and servers may meet before each shift to discuss the menu and any new items or specials, review ingredients for any potential food allergies, or talk about any food safety concerns, coordination between the kitchen and the dining room, and any customer service issues from the previous day or shift.

Some employers, particularly those in fast-food restaurants, use self-instruction or on-line programs with audiovisual presentations and instructional booklets to teach new employees food preparation and service skills. Some public and private vocational schools, restaurant associations, and large restaurant chains provide classroom training in a generalized food service curriculum. All employees receive training on safe food handling procedures and sanitation practices.

Some bartenders acquire their skills by attending a bartending or vocational and technical school. These programs often include instruction on State and local laws and regulations, cocktail recipes, proper attire and conduct, and stocking a bar. Some of these schools help their graduates find jobs. Although few employers require any minimum level of educational attainment, some specialized training is usually needed in food handling and legal issues surrounding serving alcoholic beverages and tobacco. Employers are more likely to hire and promote based on people skills and personal qualities rather than education.

Due to the relatively small size of most food-serving establishments, opportunities for promotion are limited. After gaining experience, some dining room and cafeteria attendants and bartender helpers advance to waiter, waitress, or bartender jobs. For waiters, waitresses, and bartenders, advancement usually is limited to finding a job in a busier or more expensive restaurant or bar where prospects for tip earnings are better. Some bartenders, hosts and hostesses and waiters and waitresses advance to supervisory jobs, such as dining room supervisor, maitre d'hotel, assistant manager, or restaurant general manager. A few bartenders open their own businesses. In larger restaurant chains, food and beverage service workers who excel at their work often are invited to enter the company's formal management training program. (For more information, see the *Handbook* report on food service managers.)

Employment

Food and beverage serving and related workers held 6.8 million jobs in 2004. The distribution of jobs among the various food and beverage serving workers was as follows:

Waiters and waitresses	2,252,000
Combined food preparation and serving workers, including fast food	2,150,000
Dishwashers	507,000
Bartenders	474,000
Counter attendants, cafeteria, food concession, and coffee shop	465,000
Dining room and cafeteria attendants and bartender helpers	401,000
Hosts and hostesses, restaurant, lounge, and coffee shop	328,000
Food servers, nonrestaurant	189,000
All other food preparation and serving related workers	64,000

The overwhelming majority of jobs for food and beverage serving and related workers were found in food services and drinking places, such as restaurants, coffee shops, and bars. Other jobs were found primarily in traveler accommodation (hotels); amusement, gambling, and recreation industries; educational services; grocery stores; nursing care facilities; civic and social organizations; and hospitals.

Jobs are located throughout the country but are typically plentiful in large cities and tourist areas. Vacation resorts offer seasonal employment, and some workers alternate between summer and winter resorts, instead of remaining in one area the entire year.

Job Outlook

Job openings are expected to be abundant for food and beverage serving and related workers. Overall employment of these workers

is expected to increase as fast as the average over the 2004-14 period as population, personal incomes, and employment expand. While employment growth will create many new jobs, the overwhelming majority of openings will arise from the need to replace the high proportion of workers who leave the occupations each year. There is substantial movement into and out of these occupations because education and training requirements are minimal and the predominance of part-time jobs are attractive to people seeking a short-term source of income rather than a career. However, keen competition is expected for bartender, waiter and waitress, and other food and beverage service jobs in popular restaurants and fine dining establishments, where potential earnings from tips are greatest.

Projected employment growth between 2004 and 2014 varies somewhat by type of job; however, average employment growth is expected for almost all food and beverage serving and related occupations. Employment of combined food preparation and serving workers, which includes fast-food workers, is expected to increase as fast as the average in response to the continuing fast-paced lifestyle of many Americans and the addition of healthier foods at many fast-food restaurants. Average employment growth is expected for waiters and waitresses and hosts and hostesses because increases in the number of families and the more affluent, 55-and-older population will result in more restaurants that offer table service and more varied menus. Employment of bartenders, dining room attendants, and dishwashers will grow more slowly than other food and beverage serving and related workers because diners increasingly are eating at more casual dining spots, such as coffee bars and sandwich shops, rather than at the full-service restaurants and drinking places that employ more of these workers.

Earnings

Food and beverage serving and related workers derive their earnings from a combination of hourly wages and customer tips. Earnings vary greatly, depending on the type of job and establishment. For example, fast-food workers and hosts and hostesses usually do not receive tips, so their wage rates may be higher than those of waiters and waitresses and bartenders in full-service restaurants, who typically earn more from tips than from wages. In some restaurants, workers contribute all or a portion of their tips to a tip pool, which is distributed among qualifying workers. Tip pools allow workers who don't usually receive tips directly from customers, such as dining room attendants, to feel a part of a team and to share in the rewards of good service.

In May 2004, median hourly earnings (including tips) of waiters and waitresses were \$6.75. The middle 50 percent earned between \$6.04 and \$8.34. The lowest 10 percent earned less than \$5.60, and the highest 10 percent earned more than \$11.27 an hour. For most waiters and waitresses, higher earnings are primarily the result of receiving more in tips rather than higher hourly wages. Tips usually average between 10 and 20 percent of guests' checks; waiters and waitresses working in busy, expensive restaurants earn the most.

Bartenders had median hourly earnings (including tips) of \$7.42 in May 2004. The middle 50 percent earned between \$6.34 and \$9.26. The lowest 10 percent earned less than \$5.72, and the highest 10 percent earned more than \$12.47 an hour. Like waiters and waitresses, bartenders employed in public bars may receive more than half of their earnings as tips. Service bartenders often are paid higher hourly wages to offset their lower tip earnings.

Median hourly earnings (including tips) of dining room and cafeteria attendants and bartender helpers were \$7.10 in May 2004. The middle 50 percent earned between \$6.24 and \$8.25. The lowest 10 percent earned less than \$5.68, and the highest 10 percent earned more than \$9.88 an hour. Most received over half of their earnings as wages; the rest of their income was a share of the proceeds from tip pools.

Median hourly earnings of hosts and hostesses were \$7.52 in May 2004. The middle 50 percent earned between \$6.48 and \$8.63. The lowest 10 percent earned less than \$5.77, and the highest 10 percent earned more than \$10.49 an hour. Wages comprised the majority of their earnings. In some cases, wages were supplemented by proceeds from tip pools.

Median hourly earnings of combined food preparation and serving workers, including fast food, were \$7.06 in May 2004. The middle 50 percent earned between \$6.18 and \$8.25. The lowest 10 percent earned less than \$5.65, and the highest 10 percent earned more than \$9.85 an hour. Although some combined food preparation and serving workers receive a part of their earnings as tips, fast-food workers usually do not.

Median hourly earnings of counter attendants in cafeterias, food concessions, and coffee shops (including tips) were \$7.53 in May 2004. The middle 50 percent earned between \$6.50 and \$8.59 an hour. The lowest 10 percent earned less than \$5.80, and the highest 10 percent earned more than \$10.38 an hour.

Median hourly earnings of dishwashers were \$7.35 in May 2004. The middle 50 percent earned between \$6.41 and \$8.37. The lowest 10 percent earned less than \$5.76, and the highest 10 percent earned more than \$9.81 an hour.

Median hourly earnings of nonrestaurant food servers were \$7.95 in May 2004. The middle 50 percent earned between \$6.64 and \$9.98. The lowest 10 percent earned less than \$5.86, and the highest 10 percent earned more than \$12.53 an hour.

Many beginning or inexperienced workers start earning the Federal minimum wage of \$5.15 an hour. However, a few States set minimum wages higher than the Federal minimum. Also, various minimum wage exceptions apply under specific circumstances to disabled workers, full-time students, youth under age 20 in their first 90 days of employment, tipped employees, and student-learners. Tipped employees are those who customarily and regularly receive more than \$30 a month in tips. The employer may consider tips as part of wages, but the employer must pay at least \$2.13 an hour in direct wages. Employers also are permitted to deduct from wages the cost, or fair value, of any meals or lodging provided. Many employers, however, provide free meals and furnish uniforms. Food and beverage service workers who work full time often receive typical benefits, while part-time workers usually do not.

In some large restaurants and hotels, food and beverage serving and related workers belong to unions—principally the Hotel Employees and Restaurant Employees International Union and the Service Employees International Union.

Related Occupations

Other workers whose job involves serving customers and handling money include flight attendants, gaming services workers, and retail salespersons.

Sources of Additional Information

Information about job opportunities may be obtained from local employers and local offices of State employment services agencies.

Building and Grounds Cleaning and Maintenance Occupations

Building Cleaning Workers

(O*NET 37-1011.01, 37-1011.02, 37-2011.00, 37-2012.00)

Significant Points

- This very large occupation requires few skills to enter and has one of the largest numbers of job openings of any occupation each year.
- Most job openings result from the need to replace the many workers who leave these jobs because of their limited opportunities for training or advancement, low pay, and high incidence of only part-time or temporary work.
- Most new jobs will occur in businesses providing janitorial and cleaning services on a contract basis.

Nature of the Work

Building cleaning workers—including janitors, maids, housekeeping cleaners, window washers, and rug shampooers—keep office buildings, hospitals, stores, apartment houses, hotels, and residences clean, sanitary, and in good condition. Some do only cleaning, while others have a wide range of duties.

Janitors and cleaners perform a variety of heavy cleaning duties, such as cleaning floors, shampooing rugs, washing walls and glass, and removing rubbish. They may fix leaky faucets, empty trash cans, do painting and carpentry, replenish bathroom supplies, mow lawns, and see that heating and air-conditioning equipment works properly. On a typical day, janitors may wet- or dry-mop floors, clean bathrooms, vacuum carpets, dust furniture, make minor repairs, and exterminate insects and rodents. They also clean snow or debris from sidewalks in front of buildings and notify management of the need for major repairs. While janitors typically perform most of the duties mentioned, cleaners tend to work for companies that specialize in one type of cleaning activity, such as washing windows.

Maids and housekeeping cleaners perform any combination of light cleaning duties to keep private households or commercial establishments such as hotels, restaurants, hospitals, and nursing homes clean and orderly. In hotels, aside from cleaning and maintaining the

premises, maids and housekeeping cleaners may deliver ironing boards, cribs, and rollaway beds to guests' rooms. In hospitals, they also may wash bed frames, brush mattresses, make beds, and disinfect and sterilize equipment and supplies with germicides and sterilizing equipment.

Janitors, maids, and cleaners use many kinds of equipment, tools, and cleaning materials. For one job they may need standard cleaning implements; another may require an electric polishing machine and a special cleaning solution. Improved building materials, chemical cleaners, and power equipment have made many tasks easier and less time consuming, but cleaning workers must learn the proper use of equipment and cleaners to avoid harming floors, fixtures, and themselves.

Cleaning supervisors coordinate, schedule, and supervise the activities of janitors and cleaners. They assign tasks and inspect building areas to see that work has been done properly; they also issue supplies and equipment and inventory stocks to ensure that supplies on hand are adequate. They also screen and hire job applicants; train new and experienced employees; and recommend promotions, transfers, or dismissals. Supervisors may prepare reports concerning the occupancy of rooms, hours worked, and department expenses. Some also perform cleaning duties.

Cleaners and servants in private households dust and polish furniture; sweep, mop, and wax floors; vacuum; and clean ovens, refrigerators, and bathrooms. They also may wash dishes, polish silver, and change and make beds. Some wash, fold, and iron clothes; a few wash windows. General houseworkers also may take clothes and laundry to the cleaners, buy groceries, and perform many other errands.

Building cleaning workers in large office and residential buildings, and more recently in large hotels, often work in teams consisting of workers who specialize in vacuuming, picking up trash, and cleaning restrooms, among other things. Supervisors conduct inspections to ensure that the building is cleaned properly and the team is functioning efficiently. In hotels, one member of the team is responsible for reporting electronically to the supervisor when rooms are cleaned.

Working Conditions

Because most office buildings are cleaned while they are empty, many cleaning workers work evening hours. Some, however, such as school and hospital custodians, work in the daytime. When there is a need for 24-hour maintenance, janitors may be assigned to shifts. Most full-time building cleaners work about 40 hours a week. Part-time cleaners usually work in the evenings and on weekends.

Building cleaning workers usually work inside heated, well-lit buildings. However, they sometimes work outdoors, sweeping walkways, mowing lawns, or shoveling snow. Working with machines can be noisy, and some tasks, such as cleaning bathrooms and trashrooms, can be dirty and unpleasant. Janitors may suffer cuts, bruises, and burns from machines, handtools, and chemicals. They spend most of their time on their feet, sometimes lifting or pushing heavy furniture or equipment. Many tasks, such as dusting or sweeping, require constant bending, stooping, and stretching. As a result, janitors also may suffer back injuries and sprains.

Training, Other Qualifications, and Advancement

No special education is required for most janitorial or cleaning jobs, but beginners should know simple arithmetic and be able to follow

A building cleaning worker operates a compacting machine.

instructions. High school shop courses are helpful for jobs involving repair work.

Most building cleaners learn their skills on the job. Beginners usually work with an experienced cleaner, doing routine cleaning. As they gain more experience, they are assigned more complicated tasks. In some cities, programs run by unions, government agencies, or employers teach janitorial skills. Students learn how to clean buildings thoroughly and efficiently; how to select and safely use various cleansing agents; and how to operate and maintain machines, such as wet and dry vacuums, buffers, and polishers. Students learn to plan their work, to follow safety and health regulations, to interact positively with people in the buildings they clean, and to work without supervision. Instruction in minor electrical, plumbing, and other repairs also may be given. Those who come in contact with the public should have good communication skills. Employers usually look for dependable, hard-working individuals who are in good health, follow directions well, and get along with other people.

Building cleaners usually find work by answering newspaper advertisements, applying directly to organizations where they would like to work, contacting local labor unions, or contacting State employment service offices.

Advancement opportunities for workers usually are limited in organizations where they are the only maintenance worker. Where there is a large maintenance staff, however, cleaning workers can be promoted to supervisor or to area supervisor or manager. A high school diploma improves the chances for advancement. Some janitors set up their own maintenance or cleaning businesses.

Supervisors usually move up through the ranks. In many establishments, they are required to take some inservice training to improve their housekeeping techniques and procedures and to enhance their supervisory skills.

A small number of cleaning supervisors and managers are members of the International Executive Housekeepers Association, which offers two kinds of certification programs for cleaning supervisors and managers: Certified Executive Housekeeper (CEH) and Registered Executive Housekeeper (REH). The CEH designation is offered to those with a high school education, while the REH designation is offered to those who have a 4-year college degree. Both designations are earned by attending courses and passing exams, and both must be renewed every 2 years to ensure that workers keep abreast of new cleaning methods. Those with the REH designation usually oversee the cleaning services of hotels, hospitals, casinos, and other large institutions that rely on well-trained experts for their cleaning needs.

Employment

Building cleaning workers held more than 4 million jobs in 2004. More than 6 percent were self-employed.

Janitors and cleaners work in nearly every type of establishment and held about 2.4 million jobs. They accounted for more than 58 percent of all building cleaning workers. More than 29 percent worked for firms supplying building maintenance services on a contract basis, more than 20 percent were employed in public or private educational services, and 2 percent worked in hotels or motels. Other employers included hospitals; restaurants; religious institutions; manufacturing firms; government agencies; and operators of apartment buildings, office buildings, and other types of real estate.

First-line supervisors of housekeeping and janitorial workers held about 236,000 jobs. Approximately 23 percent worked in firms supplying building maintenance services on a contract basis, while approximately 13 percent were employed in hotels or motels. More than 20 percent worked for State and local governments, primarily at schools and colleges. Others worked for hospitals, nursing homes and other residential care facilities.

Maids and housekeepers held about 1.4 million jobs. Private households employed the most maids and housekeepers—almost 28 percent—while hotels, motels, and other traveler accommodations employed the second most—almost 27 percent. Hospitals, nursing homes, and other residential care facilities employed large numbers, also. Although cleaning jobs can be found in all cities and towns, most are located in highly populated areas where there are many office buildings, schools, apartment houses, nursing homes, and hospitals.

Job Outlook

Overall employment of building cleaning workers is expected to grow as fast as average for all occupations through 2014, as more office complexes, apartment houses, schools, factories, hospitals, and other buildings requiring cleaning are built to accommodate a growing population and economy. As many firms reduce costs by contracting out the cleaning and maintenance of buildings, businesses providing janitorial and cleaning services on a contract basis are expected to have the greatest number of new jobs in this field. Although there have been some improvements in productivity in the way buildings are cleaned and maintained—using teams of cleaners, for example, and better cleaning supplies—cleaning still is very much a labor-intensive job. Faster than average growth is expected among janitors and cleaners and among cleaning supervisors, but as fast as average growth is projected for maids and housekeeping cleaners. In addition to job openings arising due to growth, numerous openings should result from the need to replace those who leave this very large occupation each year. Limited promotion potential, low pay, and the fact that many jobs are part-time and temporary, induce many to leave the occupation, thereby contributing to the number of job openings and the need to replace these workers.

Much of the growth in these occupations will come from cleaning residential properties. As families become more pressed for time, they increasingly are hiring cleaning and handyman services to perform a variety of tasks in their homes. Also, as the population ages, older people will need to hire cleaners to help maintain their houses. In addition, housekeeping cleaners will be needed to clean the growing number of residential care facilities for the elderly. These facilities, including assisted-living residences, generally provide housekeeping services as part of the rent.

Earnings

Median annual earnings of janitors and cleaners, except maids and housekeeping cleaners, were \$18,790 in May 2004. The middle 50 percent earned between \$15,320 and \$24,420. The lowest 10 percent earned less than \$13,010 and the highest 10 percent earned more than \$31,780. Median annual earnings in 2004 in the industries employing the largest numbers of janitors and cleaners, except maids and housekeeping cleaners, were as follows:

Elementary and secondary schools	\$22,910
Local government	22,860
Colleges, universities, and professional schools.....	21,860
Lessors of real estate.....	21,050
Services to buildings and dwellings.....	16,820

Median annual earnings of maids and housekeepers were \$16,900 in May 2004. The middle 50 percent earned between \$14,570 and \$20,570. The lowest 10 percent earned less than \$12,530, and the highest 10 percent earned more than \$25,220. Median annual earnings in 2004 in the industries employing the largest numbers of maids and housekeepers were as follows:

General medical and surgical hospitals.....	\$18,770
Services to buildings and dwellings.....	17,130
Community care facilities for the elderly	17,010
Nursing care facilities.....	16,960
Traveler accommodation.....	16,250

Median annual earnings of first-line supervisors and managers of housekeeping and janitorial workers were \$29,510 in May 2004. The middle 50 percent earned between \$22,720 and \$38,790. The lowest 10 percent earned less than \$18,550, and the highest 10 percent earned more than \$49,230. Median annual earnings in May 2004 in the industries employing the largest numbers of first-line supervisors and managers of housekeeping and janitorial workers were as follows:

Local government	\$34,780
Elementary and secondary schools	33,760
Nursing care facilities	28,370
Services to buildings and dwellings.....	27,760
Traveler accommodation.....	24,310

Related Occupations

Workers who specialize in one of the many job functions of janitors and cleaners include pest control workers; general maintenance and repair workers; and grounds maintenance workers.

Sources of Additional Information

Information about janitorial jobs may be obtained from State employment service offices.

For information on certification in executive housekeeping, contact:

Grounds Maintenance Workers

(O*NET 37-1012.01, 37-1012.02, 37-3011.00, 37-3012.00, 37-3013.00, 37-3019.99)

Significant Points

- Opportunities should be very good, especially for workers willing to work seasonal or variable schedules, because of significant job turnover and increasing demand by landscaping services companies.
- Many beginning jobs have low earnings and are physically demanding.
- Most workers learn through short-term on-the-job training.

Nature of the Work

Attractively designed, healthy, and well-maintained lawns, gardens, and grounds create a positive first impression, establish a peaceful mood, and increase property values. Grounds maintenance workers perform the variety of tasks necessary to achieve a pleasant and functional outdoor environment. They also care for indoor gardens and plantings in commercial and public facilities, such as malls, hotels, and botanical gardens.

The duties of *landscaping workers* and *groundskeeping workers* are similar and often overlap. Landscaping workers physically install and maintain landscaped areas. They grade property, install lighting or sprinkler systems, and build walkways, terraces, patios,

decks, and fountains. In addition to initially transporting and planting new vegetation, they transplant, mulch, fertilize, and water flowering plants, trees, and shrubs and mow and water lawns. A growing number of residential and commercial clients, such as managers of office buildings, shopping malls, multiunit residential buildings, and hotels and motels, favor full-service landscape maintenance. Landscaping workers perform a range of duties, including mowing, edging, trimming, fertilizing, dethatching, and mulching for such clients on a regular basis during the growing season.

Groundskeeping workers, also called *groundskeepers*, maintain a variety of facilities, including athletic fields, golf courses, cemeteries, university campuses, and parks. In addition to caring for sod, plants, and trees, they rake and mulch leaves, clear snow from walkways and parking lots, and use irrigation methods to adjust the amount of water consumption and prevent waste. They see to the proper upkeep and repair of sidewalks, parking lots, groundskeeping equipment, pools, fountains, fences, planters, and benches.

Groundskeeping workers who care for athletic fields keep natural and artificial turf in top condition, mark out boundaries, and before events paint turf with team logos and names. They must make sure that the underlying soil on fields with natural turf has the required composition to allow proper drainage and to support the grasses used on the field. Groundskeeping workers mow, water, fertilize, and aerate the fields regularly. They also vacuum and disinfect synthetic turf after its use, in order to prevent the growth of harmful bacteria, and they remove the turf and replace the cushioning pad periodically.

Workers who maintain golf courses are called *greenskeepers*. Greenskeepers do many of the same things as other groundskeepers. In addition, greenskeepers periodically relocate the holes on putting greens to eliminate uneven wear of the turf and to add interest and challenge to the game. Greenskeepers also keep canopies, benches, ball washers, and tee markers repaired and freshly painted.

Some groundskeeping workers specialize in caring for cemeteries and memorial gardens. They dig graves to specified depths, generally using a backhoe. They mow grass regularly, apply fertilizers and other chemicals, prune shrubs and trees, plant flowers, and remove debris from graves.

Groundskeeping workers in parks and recreation facilities care for lawns, trees, and shrubs, maintain athletic fields and playgrounds, clean buildings, and keep parking lots, picnic areas, and other public spaces free of litter. They also may remove snow and ice from roads and walkways, erect and dismantle snow fences, and maintain swimming pools. These workers inspect buildings and equipment, make needed repairs, and keep everything freshly painted.

Landscaping and groundskeeping workers use handtools such as shovels, rakes, pruning and regular saws, hedge and brush trimmers, and axes, as well as power lawnmowers, chain saws, snowblowers, and electric clippers. Some use equipment such as tractors and twin-axle vehicles. Landscaping and groundskeeping workers at parks, schools, cemeteries, and golf courses may use sod cutters to harvest sod that will be replanted elsewhere.

Pesticide handlers, sprayers, and applicators, vegetation, mix pesticides, herbicides, fungicides, or insecticides and apply them through sprays, dusts, vapors into the soil, or onto trees, shrubs, lawns, or botanical crops. Those working for chemical lawn service firms are more specialized, inspecting lawns for problems and applying fertilizers, herbicides, pesticides, and other chemicals to stimulate growth and prevent or control weeds, diseases, or insect infestation. Many practice integrated pest-management techniques.

Tree trimmers and pruners cut away dead or excess branches from trees or shrubs either to maintain rights-of-way for roads,

sidewalks, or utilities or to improve the appearance, health, and value of trees. Some of these workers also specialize in pruning, trimming and shaping ornamental trees and shrubs for private residences, golf courses, or other institutional grounds. Tree trimmers and pruners use handsaws, pruning hooks, shears, and clippers. When trimming near power lines, they usually use truck-mounted lifts and power pruners.

Supervisors of landscaping and groundskeeping workers perform various functions. They prepare cost estimates, schedule work for crews on the basis of weather conditions or the availability of equipment, perform spot checks to ensure the quality of the service, and suggest changes in work procedures. In addition, supervisors train workers in their tasks; keep employees' time records and record work performed; and even assist workers when deadlines are near. Supervisors who own their own business are also known as *landscape contractors*. They may also call themselves *landscape designers* if they create landscape design plans.

Supervisors of tree trimmers and pruners are often referred to as arborists. Arborists specialize in the care of individual trees and are trained and equipped to provide proper care. Some arborists plant trees, and most can recommend types of trees that are appropriate for a specific location, as the wrong tree in the wrong location could lead to future problems as a result of limited growing space, insects, diseases, or poor growth. Arborists are employed by cities to improve urban green space, utilities to maintain power distribution networks, companies to care for residential and commercial properties, as well as many other settings.

Working Conditions

Many of the jobs for grounds maintenance workers are seasonal, meaning that they are in demand mainly in the spring, summer, and fall, when most planting, mowing, trimming, and cleanup are necessary. Most of the work is performed outdoors in all kinds of weather. It can be physically demanding and repetitive, involving much bending, lifting, and shoveling. Workers in landscaping and groundskeeping may be under pressure to get the job completed, especially when they are preparing for scheduled events such as athletic competitions.

Those who work with pesticides, fertilizers, and other chemicals, as well as dangerous equipment and tools such as power lawnmowers, chain saws, and power clippers, must exercise safety precautions. Workers who use motorized equipment must take care to protect themselves against hearing damage.

Many grounds maintenance jobs are seasonal.

Training, Other Qualifications, and Advancement

There usually are no minimum educational requirements for entry-level positions in grounds maintenance, although a diploma is necessary for some jobs. In 2004, most workers had a high school education or less. Short-term on-the-job training generally is sufficient to teach new hires how to operate equipment such as mowers, trimmers, leaf blowers, and small tractors and to follow correct safety procedures. Entry-level workers must be able to follow directions and learn proper planting and maintenance procedures for their localities. They also must learn how to repair the equipment they're using. If driving is an essential part of a job, employers look for applicants with a good driving record and some experience driving a truck. Employers also look for responsible, self-motivated individuals because grounds maintenance workers often work with little supervision. Workers who deal directly with customers must get along well with people.

Laborers who demonstrate a willingness to work hard and quickly, have good communication skills, and take an interest in the business may advance to crew leader or other supervisory positions. Advancement or entry into positions such as grounds manager and landscape contractor usually requires some formal education beyond high school and several years of progressively more responsible experience.

Most States require certification for workers who apply pesticides. Certification requirements vary, but usually include passing a test on the proper and safe use and disposal of insecticides, herbicides, and fungicides. Some States require that landscape contractors be licensed.

The Professional Grounds Management Society (PGMS) offers certification to grounds managers who have a combination of 8 years of experience and formal education beyond high school and who pass an examination covering subjects such as equipment management, personnel management, environmental issues, turf care, ornamentals, and circulatory systems. The PGMS also offers certification to groundskeepers who have a high school diploma or equivalent, plus 2 years of experience in the grounds maintenance field.

The Professional Landcare Network (PLANET) offers the designations "Certified Landscape Professional" (Exterior and Interior) and "Certified Landscape Technician" (Exterior or Interior) to those who meet established education and experience standards and who pass a specific examination. The hands-on test for technicians covers areas such as the operation of maintenance equipment and the installation of plants by reading a plan. A written safety test also is administered. PLANET also offers the designations "Certified Turfgrass Professional" (CTP) and "Certified Ornamental Landscape Professional" (COLP), which require written exams.

Some workers with groundskeeping backgrounds may start their own businesses after several years of experience.

Employment

Grounds maintenance workers held about 1.5 million jobs in 2004. Employment was distributed as follows:

Landscaping and groundskeeping workers.....	1,177,000
First-line supervisors/managers of landscaping, lawn service, and groundskeeping workers.....	184,000
Tree trimmers and pruners	55,000
Pesticide handlers, sprayers, and applicators, vegetation	30,000
Grounds maintenance workers, all other	21,000

About one-third of the workers in grounds maintenance were employed in companies providing landscaping services to buildings and dwellings. Others worked for property management and real-estate development firms, lawn and garden equipment and supply

stores, and amusement and recreation facilities, such as golf courses and racetracks. Some were employed by local governments, installing and maintaining landscaping for parks, schools, hospitals, and other public facilities.

Almost 1 out of every 4 grounds maintenance workers was self-employed, providing landscape maintenance directly to customers on a contract basis. About 1 of every 7 worked part time; about 8% were of school age.

Job Outlook

Those interested in grounds maintenance occupations should find plentiful job opportunities in the future. Demand for their services is growing, and because wages for beginners are low and the work is physically demanding, many employers have difficulty attracting enough workers to fill all openings, creating very good job opportunities. In addition, high turnover will generate a large number of job openings, including at the supervisory and managerial level.

More workers also will be needed to keep up with increasing demand by lawn care and landscaping companies. Employment of grounds maintenance workers is expected to grow faster than the average for all occupations through the year 2014. Expected growth in the construction of all types of buildings, from office buildings to shopping malls and residential housing, plus more highways and parks, will increase demand for grounds maintenance workers. In addition, the upkeep and renovation of existing landscaping and grounds are continuing sources of demand for grounds maintenance workers. Owners of many buildings and facilities recognize the importance of “curb appeal” in attracting business and maintaining the value of the property and are expected to use grounds maintenance services more extensively to maintain and upgrade their properties. Grounds maintenance workers working for State and local governments, however, may face budget cuts, which may affect hiring.

Homeowners are a growing source of demand for grounds maintenance workers. Many two-income households lack the time to take care of their lawn so they are increasingly hiring people to maintain it for them. They also know that a nice yard will increase the property’s value. In addition, there is a growing interest by homeowners in their backyards, as well as a desire to make the yards more attractive for outdoor entertaining. With many newer homes having more and bigger windows overlooking the yard, it becomes more important to maintain and beautify the grounds. Also, as the population ages, more elderly homeowners will require lawn care services to help maintain their yards.

Job opportunities for tree trimmers and pruners should also increase as utility companies step up pruning of trees around electric lines to prevent power outages. Additionally, tree trimmers and pruners will be needed to help combat infestations caused by new species of insects from other countries. Ash trees in Michigan, for example, have been especially hurt by a pest from China.

Job opportunities for nonseasonal work are more numerous in regions with temperate climates, where landscaping and lawn services are required all year. However, opportunities may vary with local economic conditions.

Earnings

Median hourly earnings in May 2004 of grounds maintenance workers were as follows:

First-line supervisors/managers of landscaping, lawn service, and groundskeeping workers.....	\$16.99
Tree trimmers and pruners	12.57
Pesticide handlers, sprayers, and applicators, vegetation	12.30
Landscaping and groundskeeping workers	9.82
Grounds maintenance workers, all other	9.57

Median hourly earnings in the industries employing the largest numbers of landscaping and groundskeeping workers in May 2004 were as follows:

Elementary and secondary schools	\$13.25
Local government	11.25
Services to buildings and dwellings.....	9.78
Other amusement and recreation industries	9.14
Employment services	8.64

Related Occupations

Grounds maintenance workers perform most of their work outdoors and have some knowledge of plants and soils. Others whose jobs may require that they work outdoors are agricultural workers; farmers, ranchers, and agricultural managers; forest, conservation, and logging workers; landscape architects; and biological scientists.

Pest Control Workers

(O*NET 37-2021.00)

Significant Points

- Federal and State laws require that pest control workers be licensed.
- Training on the safe use of pest control products and a passing score on an examination are required for licensure.
- Job prospects should be favorable for qualified applicants because many people leave the occupation.

Nature of the Work

Roaches, rats, mice, spiders, termites, fleas, ants, and bees—few people welcome them into their homes or offices. Unwanted creatures that infest households, buildings, or surrounding areas are pests that can pose serious risks to human health and safety. It is a pest control worker’s job to eliminate them.

Pest control workers locate, identify, destroy, control, and repel pests. They use their knowledge of pests’ biology and habits, along with an arsenal of pest management techniques—applying chemicals, setting traps, operating equipment, and even modifying structures—to alleviate pest problems.

Part of pest control may require pesticide application. Pest control workers use two different types of pesticides—general use and restricted use. General use pesticides are the most widely used and are readily available; in diluted concentrations they are available

Pest control workers need extensive training to work with pest control chemicals.

to the public. Restricted use pesticides are available only to certified professionals for controlling the most severe infestations. Their registration, labeling, and application are regulated by Federal law, interpreted by the U.S. Environmental Protection Agency (EPA), because of their potential harm to pest control workers, customers, and the environment.

Pesticides are not pest control workers' only tool, however. Pest control workers increasingly use a combination of pest management techniques, known as integrated pest management. One method involves using proper sanitation and creating physical barriers, for pests cannot survive without food and will not infest a building if they cannot enter it. Another method involves using baits, some of which destroy the pests, and others that prevent them from reproducing. Yet another method involves using mechanical devices, such as traps, that remove pests from the immediate environment.

Integrated pest management is becoming popular for several reasons. First, pesticides can pose environmental and health risks. Second, some pests are becoming more resistant to pesticides in certain situations. Finally, an integrated pest management plan is more effective in the long term than use of a pesticide alone.

New technology has been introduced that allows pest control workers to conduct home inspections, mainly of termites, in much less time. The technology works by implanting microchips in baiting stations, which emit signals that can tell pest control workers if there is termite activity at one of the baiting stations. Workers pick up the signals using a device similar to a metal detector and it allows them to assess much more quickly whether termites are present.

Most pest control workers are employed as pest control technicians, applicators, or supervisors. Position titles vary by State, but the hierarchy—based on training and responsibility required—remains consistent.

Pest control technicians identify potential pest problems, conduct inspections, and design control strategies. They work directly with the customer. Some technicians require a higher level of training depending on their task. If certain products are used, the technician may be required to become a certified *applicator*.

Applicators that specialize in controlling termites are called termite control technicians. They use chemicals and modify structures to eliminate termites and prevent reinfestation. To treat infested areas, termite control technicians drill holes and cut openings into buildings to access infestations, install physical barriers, or bait systems around the structure. Some termite control technicians even repair structural damage caused by termites.

Fumigators are applicators who control pests using poisonous gases called fumigants. Fumigators pretreat infested buildings by examining, measuring, and sealing the buildings. Then, using cylinders, hoses, and valves, they fill structures with the proper amount and concentration of fumigant. They also monitor the premises during treatment for leaking gas. To prevent accidental fumigant exposure, fumigators padlock doors and post warning signs.

Pest control supervisors, also known as operators, direct service technicians and certified applicators. Supervisors are licensed to apply pesticides, but they usually are more involved in running the business. Supervisors are responsible for ensuring that employees obey rules regarding pesticide use, and they must resolve any problems that arise with regulatory officials or customers. Most States require each pest control establishment to have a supervisor; self-employed business owners usually are supervisors.

Working Conditions

Pest control workers must kneel, bend, reach, and crawl to inspect, modify, and treat structures. They work both indoors and out, in all weather conditions. During warm weather, applicators may be uncomfortable wearing the heavy protective gear—such as respirators, gloves, and goggles—required for working with pesticides.

Almost half of all pest control workers work a 40-hour week, but 25% work more hours. Pest control workers often work evenings and weekends, but many work consistent shifts.

There are health risks associated with pesticide use. Various pest control chemicals are toxic and could be harmful if not used properly. Health risks are minimized, however, by the extensive training required for certification and the use of recommended protective equipment, resulting in fewer reported cases of lost work. Because pest control workers travel to visit clients, the potential risk of motor vehicle accidents is another occupational hazard.

Training, Other Qualifications, and Advancement

A high school diploma or equivalent is the minimum qualification for most pest control jobs. Although a college degree is not required, more than 4 in 10 pest control workers have either attended college or earned a degree.

Pest control workers must have basic skills in math, chemistry, and writing, either learned at school or through an employer. Because of the extensive interaction that pest control workers have with their customers, employers prefer to hire people who have good communication and interpersonal skills. In addition, most pest control companies require their employees to have a good driving record. Pest control workers must be in good health because of the physical demands of the job, and they also must be able to withstand extreme conditions—such as the heat of climbing into an attic in the summertime or the chill of sliding into a crawlspace during winter.

Both Federal and State laws regulate pest control workers. These laws require them to be certified through training and examination, for which most pest control firms help their employees prepare. Workers may receive both formal classroom and on-the-job training, but they also must study on their own. Because the pest control industry is constantly changing, workers must attend continuing education classes to maintain their certification.

Requirements for pest control workers vary by State. Pest control workers usually begin their careers as apprentice technicians. Before performing any pest control services, apprentices must attend general training in pesticide safety and use. In addition, they must train in each pest control category in which they wish to practice. Categories may include general pest control, rodent control, termite control, fumigation, and ornamental and turf control.

In many States, training usually involves spending 10 hours in the classroom and 60 hours on the job for each category. After

completing the required training, apprentices can provide supervised pest control services. To be eligible to become applicators, technicians must have a combination of experience and education and pass a test. This requirement is sometimes waived for individuals who have either a college degree in biological sciences or extensive related work experience. To become certified as applicators, technicians must pass an additional set of category exams. Depending on the State, applicators must attend additional classes every 1 to 6 years to be recertified.

Applicators with several years of experience often become supervisors. To qualify as a pest control supervisor, applicators may have to pass State-administered exams and have experience in the industry, usually a minimum of 2 years.

Employment

Pest control workers held about 68,000 jobs in 2004; about 83 percent of workers were employed in the services to buildings and dwellings industry, which includes pest control firms. Jobs are concentrated in States with warmer climates, due to the greater number of pests in these areas that thrive year round. About 12 percent of workers were self-employed.

Job Outlook

Job prospects should be favorable for qualified applicants because the nature of pest control work is not universally appealing and turnover in this occupation is relatively high. Thus, in addition to job openings arising from employment growth, opportunities will result from the need to replace workers who leave the occupation. Employment growth of pest control workers is expected to be faster than the average for all occupations through 2014. One factor limiting growth in this occupation, however, is the lack of sufficient numbers of workers willing to go into this field.

Demand for pest control workers is projected to increase for a number of reasons. Growth in the population will generate new residential and commercial buildings that will require inspections by pest control workers. Also, more people are expected to use pest control services as environmental and health concerns, greater numbers of dual-income households, and improvements in the standard of living convince more people to hire professionals rather than attempt pest control work themselves. In addition, tougher regula-

tions limiting pesticide use will demand more complex integrated pest management strategies.

Concerns about the effects of pesticide use in schools have increasingly prompted more school districts to investigate alternative means of pest control, such as integrated pest management. Furthermore, use of some newer materials for insulation around foundations has made many homes more susceptible to pest infestation. Finally, continuing population shifts to the more pest-prone sunbelt States should increase the number of households in need of pest control.

Earnings

Median hourly earnings of full-time wage and salary pest control workers were \$12.61 in May 2004. The middle 50 percent earned between \$10.06 and \$15.97. The lowest 10 percent earned less than \$8.13, and the top 10 percent earned over \$20.19. Pest control supervisors usually earn the most and technicians the least, with earnings of certified applicators falling somewhere in between. Some pest control workers earn commissions based on the number of contracts for pest control services they sell. Others may earn bonuses for exceeding performance goals.

Related Occupations

Pesticide handlers also apply pesticides in a safe manner to lawns, trees, and other plants. Pest control workers visit homes and places of business to provide building services. Other workers who provide services to buildings include building cleaning workers; grounds maintenance workers; various construction trades workers, such as carpenters; and heating, air-conditioning, and refrigeration mechanics and installers.

Sources of Additional Information

Private employment agencies and State employment services offices have information about available job opportunities for pest control workers.

For information about the training and certification required in your State, contact your local office of the U.S. Department of Agriculture or your State's Environmental Protection (or Conservation) Agency.

Personal Care and Service Occupations

Animal Care and Service Workers

(O*NET 39-2011.00, 39-2021.00)

Significant Points

- Animal lovers get satisfaction in this occupation, but the work can be unpleasant, physically and emotionally demanding, and sometimes dangerous.
- Most workers are trained on the job, but employers generally prefer to hire people who have some experience with animals; some jobs require a bachelor's degree in biology, animal science, or a related field.
- Good employment opportunities are expected for most positions; however, keen competition is expected for jobs as zookeepers.
- Earnings are relatively low.

Nature of the Work

Many people like animals. But, as pet owners can attest, taking care of them is hard work. Animal care and service workers—which include animal caretakers and animal trainers—train, feed, water, groom, bathe, and exercise animals, and clean, disinfect, and repair their cages. They also play with the animals, provide companionship, and observe behavioral changes that could indicate illness or injury. Boarding kennels, animal shelters, veterinary hospitals and clinics, stables, laboratories, aquariums, and zoological parks all house animals and employ animal care and service workers. Job titles and duties vary by employment setting.

Kennel attendants care for pets while their owners are working or traveling out of town. Beginning attendants perform basic tasks, such as cleaning cages and dog runs, filling food and water dishes, and exercising animals. Experienced attendants may provide basic animal healthcare, as well as bathe animals, trim nails, and attend to other grooming needs. Attendants who work in kennels also may sell pet food and supplies, assist in obedience training, help with breeding, or prepare animals for shipping.

Animal caretakers who specialize in grooming or maintaining a pet's—usually a dog's or cat's—appearance are called *groomers*. Some groomers work in kennels, veterinary clinics, animal shelters, or pet-supply stores. Others operate their own grooming business, typically at a salon, or increasingly, by making house calls. Such mobile services are growing rapidly as it offers convenience for pet owners and flexible hours for groomers. Groomers answer telephones, schedule appointments, discuss pets' grooming needs with clients, and collect information on the pet's disposition and its veterinarian. Groomers often are the first to notice a medical problem, such as an ear or skin infection, that requires veterinary care.

Grooming the pet involves several steps: an initial brush-out is followed by an initial clipping of hair or fur using electric clippers, combs, and grooming shears; the groomer then cuts the nails, cleans the ears, bathes, and blow-dries the animal, and ends with a final clipping and styling.

Animal caretakers in animal shelters perform a variety of duties and work with a wide variety of animals. In addition to attending to the basic needs of the animals, caretakers also must keep records of the animals received and discharged and any tests or treatments done. Some vaccinate newly admitted animals under the direction of a veterinarian or veterinary technician, and euthanize (painlessly put to death) seriously ill, severely injured, or unwanted animals. Animal caretakers in animal shelters also interact with the public, answering telephone inquiries, screening applicants for animal adoption, or educating visitors on neutering and other animal health issues.

Animal caretakers who specialize in grooming or maintaining a pet's appearance are called groomers.

Caretakers in stables are called *grooms*. They saddle and unsaddle horses, give them rubdowns, and walk them to cool them off after a ride. They also feed, groom, and exercise the horses; clean out stalls and replenish bedding; polish saddles; clean and organize the tack (harness, saddle, and bridle) room; and store supplies and feed. Experienced grooms may help train horses.

In zoos, animal care and service workers, called *keepers*, prepare the diets and clean the enclosures of animals, and sometimes assist in raising them when they are very young. They watch for any signs of illness or injury, monitor eating patterns or any changes in behavior, and record their observations. Keepers also may answer questions and ensure that the visiting public behaves responsibly toward the exhibited animals. Depending on the zoo, keepers may be assigned to work with a broad group of animals such as mammals, birds, or reptiles, or they may work with a limited collection of animals such as primates, large cats, or small mammals.

Animal trainers train animals for riding, security, performance, obedience, or assisting persons with disabilities. Animal trainers do this by accustoming the animal to human voice and contact, and conditioning the animal to respond to commands. Trainers use several techniques to help them train animals. One technique, known as a bridge, is a stimulus that a trainer uses to communicate the precise moment an animal does something correctly. When the animal responds correctly, the trainer gives positive reinforcement in a variety of ways: food, toys, play, rubdowns, or speaking the word "good." Animal training takes place in small steps, and often takes months and even years of repetition. During the conditioning process, trainers provide animals mental stimulation, physical exercise, and husbandry care. In addition to their hands-on work with the animals, trainers often oversee other aspects of the animal's care, such as diet preparation. Trainers often work in competitions or shows, such as the circus or marine parks. Trainers who work in shows also may participate in educational programs for visitors and guests.

Working Conditions

People who love animals get satisfaction from working with and helping them. However, some of the work may be unpleasant, physically and emotionally demanding, and sometimes dangerous. Most animal care and service workers have to clean animal cages and lift, hold, or restrain animals, risking exposure to bites or scratches. Their work often involves kneeling, crawling, repeated bending, and lifting heavy supplies like bales of hay or bags of feed. Animal caretakers must take precautions when treating animals with germicides or insecticides. The work setting can be noisy. Caretakers of show and sports animals travel to competitions.

Animal care and service workers who witness abused animals or who assist in the euthanizing of unwanted, aged, or hopelessly injured animals may experience emotional distress. Those working for private humane societies and municipal animal shelters often deal with the public, some of whom might react with hostility to any implication that the owners are neglecting or abusing their pets. Such workers must maintain a calm and professional demeanor while they enforce the laws regarding animal care.

Animal care and service workers may work outdoors in all kinds of weather. Hours are irregular. Animals must be fed every day, so caretakers often work weekend and holiday shifts. In some animal hospitals, research facilities, and animal shelters, an attendant is on duty 24 hours a day, which means night shifts.

Training, Other Qualifications, and Advancement

Most animal care and service workers are trained on the job; however, employers generally prefer to hire people who have some experience with animals. Some training programs are available

for specific types of animal caretakers, such as groomers, but formal training is usually not necessary for entry-level positions. Animal trainers often need to possess a high school diploma or GED equivalent. However, some animal training jobs may require a bachelor's degree and additional skills. For example, a marine mammal trainer usually needs a bachelor's degree in biology, marine biology, animal science, psychology, zoology, or related field, plus strong swimming skills and SCUBA certification. All animal trainers need patience, sensitivity, and experience with problem-solving and animal obedience. Certification is not mandatory for animal trainers, but several organizations offer training programs and certification for prospective animal trainers.

Most pet groomers learn their trade by completing an informal apprenticeship, usually lasting 6 to 10 weeks, under the guidance of an experienced groomer. Prospective groomers also may attend one of the 50 State-licensed grooming schools throughout the country, with programs varying in length from 2 to 18 weeks. The National Dog Groomers Association of America offers certification for master status as a groomer with a focus on four principle areas—non-sporting, sporting, terrier, and masters. The examination consists of 400 questions with a separate part testing practical skills. Beginning groomers often start by taking on one duty, such as bathing and drying the pet. They eventually assume responsibility for the entire grooming process, from the initial brush-out to the final clipping. Groomers who work in large retail establishments or kennels may, with experience, move into supervisory or managerial positions. Experienced groomers often choose to open their own salons.

Beginning animal caretakers in kennels learn on the job, and usually start by cleaning cages and feeding and watering animals. Kennel caretakers may be promoted to kennel supervisor, assistant manager, and manager, and those with enough capital and experience may open up their own kennels. The American Boarding Kennels Association (ABKA) offers a three-stage, home-study program for individuals interested in pet care. The first two stages address basic and advanced principles of animal care, while the third stage focuses on indepth animal care and good business procedures. Those who complete the third stage and pass oral and written examinations administered by the ABKA become Certified Kennel Operators (CKO).

Some zoological parks may require their caretakers to have a bachelor's degree in biology, animal science, or a related field. Most require experience with animals, preferably as a volunteer or paid keeper in a zoo. Zookeepers may advance to senior keeper, assistant head keeper, head keeper, and assistant curator, but very few openings occur, especially for the higher level positions.

Animal caretakers in animal shelters are not required to have any specialized training, but training programs and workshops are increasingly available through the Humane Society of the United States, the American Humane Association, and the National Animal Control Association. Workshop topics include cruelty investigations, appropriate methods of euthanasia for shelter animals, proper guidelines for capturing animals techniques for preventing problems with wildlife, and dealing with the general public. Because shelter workers often deal with individuals who abandon their pets, excellent communication skills, including the ability to handle emotional people, is vital. With experience and additional training, caretakers in animal shelters may become adoption coordinators, animal control officers, emergency rescue drivers, assistant shelter managers, or shelter directors.

Employment

Animal care and service workers held 172,000 jobs in 2004. Almost 3 out of 4 worked as nonfarm animal caretakers; the remainder worked as animal trainers. Nonfarm animal caretakers worked

primarily in boarding kennels, animal shelters, stables, grooming shops, animal hospitals, and veterinary offices. A significant number also worked for animal humane societies, racing stables, dog and horse racetrack operators, zoos, theme parks, circuses, and other amusement and recreations services. In 2004, nearly 1 out of every 3 nonfarm animal caretakers was self-employed.

Employment of animal trainers was concentrated in animal services that specialize in training horses, pets, and other animal specialties; and in commercial sports, training racehorses and dogs. About 3 in 5 animal trainers were self-employed.

Job Outlook

Good job opportunities are expected for most positions because many workers leave this occupation each year. The need to replace workers leaving the field will create the overwhelming majority of job openings. Many animal caretaker jobs require little or no training and have flexible work schedules, attracting people seeking their first job, students, and others looking for temporary or part-time work, including retired people. The outlook for caretakers in zoos, however, is not favorable due to slow growth in zoo capacity and keen competition for the few positions. Job opportunities for animal care and service workers may vary from year to year, because the strength of the economy affects demand for these workers. Pet owners tend to spend more on animal services when the economy is strong.

In addition to replacement needs, employment of animal care and service workers is expected to grow faster than the average for all occupations through 2014. The companion pet population—which drives employment of animal caretakers in kennels, grooming shops, animal shelters, and veterinary clinics and hospitals—is expected to increase. Pet owners—including a large number of baby boomers, whose disposable income is expected to increase as they age—are expected to increasingly take advantage of grooming services, daily and overnight boarding services, training services, and veterinary services, resulting in more jobs for animal care and service workers. As many pet owners increasingly consider their pet as part of the family, their demand for luxury animal services and willingness to spend greater amounts of money on their pet will continue to grow.

Demand for animal care and service workers in animal shelters is expected to remain steady. Communities are increasingly recognizing the connection between animal abuse and abuse toward humans, and will probably continue to commit private funds to animal shelters, many of which are working hand-in-hand with social service agencies and law enforcement teams. Employment growth of personal and group animal trainers will stem from an increased number of animal owners seeking training services for their pets, including behavior modification and feline behavior training. Job openings as shelter workers will continue to be driven by high turnover as the job is extremely demanding and stressful.

Earnings

Earnings are relatively low. Median hourly earnings of nonfarm animal caretakers were \$8.39 in May 2004. The middle 50 percent earned between \$7.16 and \$10.50. The bottom 10 percent earned less than \$6.17, and the top 10 percent earned more than \$13.66. Median hourly earnings in the industries employing the largest numbers of nonfarm animal caretakers in May 2004 were:

Spectator sports.....	\$8.48
Other personal services.....	8.47
Social advocacy organizations.....	8.15
Other miscellaneous store retailers.....	7.95
Other professional, scientific, and technical services.....	7.86

Median hourly earnings of animal trainers were \$10.60 in May 2004. The middle 50 percent earned between \$8.10 and \$15.23. The lowest 10 percent earned less than \$7.07, and the top 10 percent earned more than \$20.62.

Related Occupations

Others who work extensively with animals include farmers, ranchers, and agricultural managers; agricultural workers; veterinarians; veterinary technologists and technicians; veterinary assistants; biological scientists; and medical scientists.

Barbers, Cosmetologists, and Other Personal Appearance Workers

(O*NET 39-5011.00, 39-5012.00, 39-5091.00, 39-5092.00, 39-5093.00, 39-5094.00)

Significant Points

- Job opportunities generally should be good, but competition is expected for jobs and clients at higher paying salons; opportunities will be best for those licensed to provide a broad range of services.
- A State license is required for barbers, cosmetologists, and most other personal appearance workers, with the exception of shampooers; qualifications vary by State.
- About 48 percent of workers are self-employed; many also work flexible schedules.

Nature of the Work

Barbers and cosmetologists, also called *hairdressers* and *hairstylists*, provide hair care services to enhance the appearance of consumers. Other personal appearance workers, such as *manicurists* and *pedicurists*, *shampooers*, and *skin care specialists* provide specialized services that help clients look and feel their best.

Barbers cut, trim, shampoo, and style hair. They also fit hairpieces and offer scalp treatments and facial shaving. In many States, barbers are licensed to color, bleach, or highlight hair and to offer permanent-wave services. Many barbers also provide skin care and nail treatments.

Hairdressers, *hairstylists*, and *cosmetologists* offer beauty services, such as shampooing, cutting, coloring, and styling hair. They may advise clients on how to care for their hair, how to straighten their hair or give it a permanent wave, or how to lighten or darken their hair color. In addition, cosmetologists may be trained to give manicures, pedicures, and scalp and facial treatments; provide makeup analysis; and clean and style wigs and hairpieces.

A number of workers offer specialized services. *Manicurists* and *pedicurists*, called *nail technicians* in some States, work exclusively on nails and provide manicures, pedicures, coloring, and nail extensions to clients. Another group of specialists is *skin care specialists*, or *estheticians*, who cleanse and beautify the skin by giving facials, full-body treatments, and head and neck massages and by removing hair through waxing. *Electrologists* use an electrolysis machine to remove hair. Finally, in some larger salons, *shampooers* specialize in shampooing and conditioning hair.

In addition to working with clients, personal appearance workers are expected to maintain clean work areas and sanitize all their work instruments. They may make appointments and keep records of hair color and permanent-wave formulas used by their regular clients. A growing number actively sell hair care products and other cosmetic supplies. Barbers, cosmetologists, and other personal appearance workers who operate their own salons have managerial duties that may include hiring, supervising, and firing workers, as well as keeping business and inventory records, ordering supplies, and arranging for advertising.

Working Conditions

Barbers, cosmetologists, and other personal appearance workers usually work in clean, pleasant surroundings with good lighting and ventilation. Good health and stamina are important, because these workers are on their feet for most of their shift. Prolonged exposure to some hair and nail chemicals may cause irritation, so protective clothing, such as plastic gloves or aprons, may be worn.

Nearly half of workers are self-employed, and many work flexible schedules.

Most full-time barbers, cosmetologists, and other personal appearance workers put in a 40-hour week, but longer hours are common, especially among self-employed workers. Work schedules may include evenings and weekends, the times when beauty salons and barbershops are busiest. Barbers and cosmetologists generally work on weekends and during lunch and evening hours; as a result, they may arrange to take breaks during less busy times. About 32 percent of cosmetologists and 17 percent of barbers work part time, and 14 percent of cosmetologists and 17 percent of barbers have variable schedules.

Training, Other Qualifications, and Advancement

All States require barbers, cosmetologists, and most other personal appearance workers, with the exception of shampooers, to be licensed; however, qualifications for a license vary by State. Generally, a person must have graduated from a State-licensed barber or cosmetology school and be at least 16 years old. A few States require applicants to pass a physical examination. Some States require graduation from high school, while others require as little as an eighth-grade education. In a few States, the completion of an apprenticeship can substitute for graduation from a school, but very few barbers or cosmetologists learn their skills in this way. Applicants for a license usually are required to pass a written test and demonstrate an ability to perform basic barbering or cosmetology services.

Some States have reciprocity agreements that allow licensed barbers and cosmetologists to obtain a license in a different State without additional formal training. Such agreements are uncommon, however, and most States do not recognize training or licenses obtained from a different State. Consequently, persons who wish to work in a particular State should review the laws of that State before entering a training program.

Public and private vocational schools offer daytime or evening classes in barbering and cosmetology. Full-time programs in barbering and cosmetology usually last 9 to 24 months, but training for manicurists and pedicurists, skin care specialists, and electrologists requires significantly less time. An apprenticeship program can last from 1 to 3 years. Shampooers generally do not need formal training or a license. Formal training programs include classroom study, demonstrations, and practical work. Students study the basic services—cutting and styling hair, chemically treating hair, shaving customers, and giving hair and scalp treatments—and, under supervision, practice on customers in school “clinics.” Students attend lectures on the use and care of instruments, sanitation and hygiene, chemistry, anatomy, physiology, and the recognition of simple skin ailments. Instruction also is provided in communication, sales, and general business practices. Experienced barbers and cosmetologists may take advanced courses in hairstyling, coloring, the sale and service of wigs and hairpieces, and sales and marketing.

After graduating from a training program, students can take a State licensing examination, which consists of a written test and, in some cases, a practical test of styling skills based on established performance criteria. A few States include an oral examination in which applicants are asked to explain the procedures they are following while taking the practical test. In many States, cosmetology training may be credited toward a barbering license, and vice versa. A few States combine the two licenses into one hairstyling license. Many States require separate licensing examinations for manicurists, pedicurists, and skin care specialists.

For many barbers, cosmetologists, and other personal appearance workers, formal training and a license are only the first steps in a career that requires years of continuing education. Personal appearance workers must keep abreast of the latest fashions and beauty techniques as hairstyles change, new products are developed,

and services expand to meet clients’ needs. They attend training at salons, cosmetology schools, or industry trade shows. Through workshops and demonstrations of the latest techniques, industry representatives introduce cosmetologists to a wide range of products and services. As retail sales become an increasingly important part of salons’ revenue, the ability to be an effective salesperson becomes ever more vital for salon workers.

Successful personal appearance workers should have an understanding of fashion, art, and technical design. They should enjoy working with the public and be willing and able to follow clients’ instructions. Communication, image, and attitude play an important role in career success. Some cosmetology schools consider “people skills” to be such an integral part of the job that they require coursework in that area. Business skills are important for those who plan to operate their own salons.

During their first months on the job, new workers are given relatively simple tasks or are assigned the simplest procedures. Once they have demonstrated their skills, they are gradually permitted to perform more complicated tasks, such as coloring hair or applying permanent waves. As they continue to work in the field, more training usually is required to learn the techniques particular to each salon and to build on the basics learned in cosmetology school.

Advancement usually takes the form of higher earnings as barbers and cosmetologists gain experience and build a steady clientele. Some barbers and cosmetologists manage large salons, lease booth space in salons, or open their own salons after several years of experience. Others teach in barber or cosmetology schools or provide training through vocational schools. Still others advance to become sales representatives, image or fashion consultants, or examiners for State licensing boards.

Employment

Barbers, cosmetologists, and other personal appearance workers held about 790,000 jobs in 2004. Of these, barbers, hairdressers, hairstylists, and cosmetologists held 670,000 jobs, manicurists and pedicurists 60,000, skin care specialists 30,000, and shampooers 27,000.

Most of these workers are employed in beauty salons or barber shops, but they also are found in nail salons, day and resort spas, department stores, nursing and other residential care homes, and drug and cosmetics stores. Nearly every town has a barbershop or beauty salon, but employment in this occupation is concentrated in the most populous cities and States.

About 48 percent of all barbers, cosmetologists, and other personal appearance workers are self-employed. Many own their own salon, but a growing number lease booth space or a chair from the salon’s owner.

Job Outlook

Job opportunities generally should be good. However, competition is expected for jobs and clients at higher paying salons as applicants compete with a large pool of licensed and experienced cosmetologists for these positions. Opportunities will be best for those with previous experience and for those licensed to provide a broad range of services.

Overall employment of barbers, cosmetologists, and other personal appearance workers is projected to grow about as fast as the average for all occupations through 2014, because of an increasing population, rising incomes, and growing demand for personal appearance services. In addition to those arising from job growth, numerous job openings will come about from the need to replace workers who transfer to other occupations, retire, or leave the labor force for other reasons.

Employment trends are expected to vary among the different occupational specialties. On the one hand, slower-than-average growth is expected in employment of barbers because of the large number of retirements expected over the 2004–14 projection period and because of the relatively small number of cosmetology school graduates opting to obtain barbering licenses. On the other hand, employment of hairdressers, hairstylists, and cosmetologists should grow about as fast as the average for all workers because many now cut and style both men's and women's hair and because the demand for hair treatment by teens and aging baby boomers is expected to remain steady or even grow.

Continued growth in the number of nail salons and full-service day spas will generate numerous job openings for manicurists, pedicurists, skin care specialists, and shampooers. Employment of manicurists, pedicurists, and skin care specialists will grow faster than the average, while employment of shampooers will grow about as fast as the average. Nail salons specialize in providing manicures and pedicures. Day spas typically provide a full range of services, including beauty wraps, manicures and pedicures, facials, and massages.

Earnings

A number of factors, including the size and location of the salon, clients' tipping habits, and competition from other barber shops and salons, determine the total income of barbers, cosmetologists, and other personal appearance workers. They may receive commissions based on the price of the service, or a salary based on the number of hours worked, and many receive commissions on the products they sell. In addition, some salons pay bonuses to employees who bring in new business. A cosmetologist's or barber's initiative and ability to attract and hold regular clients also are key factors in determining his or her earnings. Earnings for entry-level workers are usually low; however, for those who stay in the profession, earnings can be considerably higher.

Although some salons offer paid vacations and medical benefits, many self-employed and part-time workers in this occupation do not enjoy such benefits.

Median annual earnings in May 2004 for salaried hairdressers, hairstylists, and cosmetologists, including tips and commission, were \$19,800. The middle 50 percent earned between \$ 15,480 and \$26,600. The lowest 10 percent earned less than \$12,920, and the highest 10 percent earned more than \$35,990.

Median annual earnings in May 2004 for salaried barbers, including tips, were \$21,200. The middle 50 percent earned between \$15,380 and \$30,390. The lowest 10 percent earned less than \$12,950, and the highest 10 percent earned more than \$43,170.

Among skin care specialists, median annual earnings, including tips, were \$ 24,010, for manicurists and pedicurists \$18,500, and for shampooers \$14,610.

Related Occupations

Other workers who provide a personal service to clients and usually must be professionally licensed or certified include massage therapists and fitness workers.

Child Care Workers

(O*NET 39-9011.00)

Significant Points

- About 1 out of 3 child care workers are self-employed; most of these are family child care providers.
- Training requirements vary from a high school diploma to a college degree, although a high school diploma and little or no experience are adequate for many jobs.
- Many workers leave these jobs every year, creating good job opportunities.

Nature of the Work

Child care workers nurture and care for children who have not yet entered formal schooling and also work with older children in before- and after-school situations. These workers play an important role in a child's development by caring for the child when parents are at work or away for other reasons. In addition to attending to children's basic needs, child care workers organize activities that stimulate children's physical, emotional, intellectual, and social growth. They help children explore individual interests, develop talents and independence, build self-esteem, and learn how to get along with others.

Child care workers generally are classified in three different groups, depending on the setting in which they work: Workers who care for children at the children's home, called private household workers; those who care for children in their own home, called family child care providers; and those that work at separate child care centers and centers that provide preschool services to 3- and 4-year-old children.

Private household workers who are employed on an hourly basis usually are called *babysitters*. These child care workers bathe, dress, and feed children; supervise their play; wash their clothes; and clean their rooms. Babysitters also may put children to bed and wake them, read to them, involve them in educational games, take them for doctors' visits, and discipline them. Those who are in charge of infants, sometimes called *infant nurses*, also prepare bottles and change diapers. *Nannies* work full or part time for a single family. They generally take care of children from birth to age 10 or 12, tending to the child's early education, nutrition, health, and other needs, and also may perform the duties of a housekeeper, including cleaning and laundry.

Family child care providers often work alone with a small group of children, though some work in larger settings with multiple adults. Child care centers generally have more than one adult per group of children; in groups of older children, a child care worker may assist a more experienced preschool teacher.

Most child care workers perform a combination of basic care and teaching duties, but the majority of their time is spent on caregiving activities. Workers whose primary responsibility is teaching are classified as preschool teachers, covered in the separate *Handbook* statement on teachers—preschool, kindergarten, elementary, middle, and secondary. However, many basic care activities also are opportunities for children to learn. For example, a worker who shows a child how to tie a shoelace teaches the child while also providing for that child's basic care needs. Child care programs help children learn about trust and gain a sense of security.

Child care workers spend most of their day working with children. However, they do maintain contact with parents or guardians through informal meetings or scheduled conferences to discuss each child's progress and needs. Many child care workers keep records of each child's progress and suggest ways in which parents can stimulate their child's learning and development at home. Some child care centers and before- and after-school programs actively recruit parent volunteers to work with the children and participate in administrative decisions and program planning.

Young children learn mainly through play. Child care workers recognize this and capitalize on children's play to further language development (storytelling and acting games), improve social skills (working together to build a neighborhood in a sandbox), and introduce scientific and mathematical concepts (balancing and counting blocks when building a bridge or mixing colors when painting). Often a less structured approach is used to teach young children, including small-group lessons; one-on-one instruction; and creative activities such as art, dance, and music. Child care workers play a vital role in preparing children to build the skills they will need in school.

Child care workers in child care centers or family child care homes greet young children as they arrive, help them to remove outer garments, and select an activity of interest. When caring for infants, they feed and change them. To ensure a well-balanced program, child care workers prepare daily and long-term schedules of activities. Each day's activities balance individual and group play, as well as quiet and active time. Children are given some freedom to participate in activities in which they are interested.

Concern over school-aged children being home alone before and after school has spurred many parents to seek alternative ways for their children to constructively spend their time. The purpose of before- and afterschool programs is to watch over school-aged children during the gap between school hours and their parents' work hours. These programs also may operate during the summer and on weekends. Workers in before- and after-school programs may help students with their homework or engage them in other extracurricular activities. These activities may include field trips,

learning about computers, painting, photography, and participating in sports. Some child care workers may be responsible for taking children to school in the morning and picking them up from school in the afternoon. Before- and afterschool programs may be operated by public school systems, local community centers, or other private organizations.

Helping keep young children healthy is an important part of the job. Child care workers serve nutritious meals and snacks and teach good eating habits and personal hygiene. They ensure that children have proper rest periods. They identify children who may not feel well and, in some cases, may help parents locate programs that will provide basic health services. Child care workers also watch for children who show signs of emotional or developmental problems and discuss these matters with their supervisor and the child's parents. Early identification of children with special needs—such as those with behavioral, emotional, physical, or learning disabilities—is important to improve their future learning ability. Special education teachers often work with these preschool children to provide the individual attention they need. (Special education teachers are discussed elsewhere in the *Handbook*.)

Working Conditions

Helping children grow, learn, and gain new skills can be very rewarding. Child care workers help to improve children's communication, learning, and other personal skills. The work is sometimes routine; however, new activities and challenges mark each day. Child care can be physically and emotionally taxing, as workers constantly stand, walk, bend, stoop, and lift to attend to each child's interests and problems.

To ensure that children in child care centers receive proper supervision, State or local regulations may require a certain ratio of workers to children. The ratio varies with the age of the children. Child development experts generally recommend that a single caregiver be responsible for no more than 3 or 4 infants (less than 1 year old), 5 or 6 toddlers (1 to 2 years old), or 10 preschool-aged children (between 2 and 5 years old). In before- and afterschool programs, workers may be responsible for many school-aged children at a time.

Family child care providers work out of their own homes. While this arrangement provides convenience, it also requires that their homes be accommodating to young children. Private household workers usually work in the pleasant and comfortable homes or apartments of their employers. Most are day workers who live in their own homes and travel to work, though some live in the home of their employer, generally with their own room and bath. They often become part of their employer's family and may derive satisfaction from caring for the family.

The work hours of child care workers vary widely. Child care centers usually are open year round, with long hours so that parents can drop off and pick up their children before and after work. Some centers employ full-time and part-time staff with staggered shifts to cover the entire day. Some workers are unable to take regular breaks during the day due to limited staffing. Public and many private preschool programs operate during the typical 9- or 10-month school year, employing both full-time and part-time workers. Family child care providers have flexible hours and daily routines, but they may work long or unusual hours to fit parents' work schedules. Live-in nannies usually work longer hours than do those who have their own homes. However, although nannies may work evenings or weekends, they usually get other time off.

Training, Other Qualifications, and Advancement

The training and qualifications required of child care workers vary widely. Each State has its own licensing requirements that regu-

Child care workers help young children learn and develop through play.

late caregiver training; these range from a high school diploma to community college courses to a college degree in child development or early childhood education. State requirements are generally higher for workers at child care centers than for family child care providers; child care workers in private settings who care for only a few children often are not regulated by States at all. Child care workers generally can obtain some form of employment with a high school diploma and little or no experience, but certain private firms and publicly funded programs have more demanding training and education requirements.

Some employers prefer to hire child care workers who have earned a nationally recognized Child Development Associate (CDA) credential or the Certified Childcare Professional designation, have taken secondary or postsecondary courses in child development and early childhood education, or have work experience in a child care setting. Other employers require their own specialized training. An increasing number of employers require an associate degree in early childhood education.

Child care workers must anticipate and prevent problems, deal with disruptive children, provide fair but firm discipline, and be enthusiastic and constantly alert. They must communicate effectively with the children and their parents, as well as with other teachers and child care workers. Workers should be mature, patient, understanding, and articulate and have energy and physical stamina. Skills in music, art, drama, and storytelling also are important. Self-employed child care workers must have business sense and management abilities.

Opportunities for advancement are limited. However, as child care workers gain experience, some may advance to supervisory or administrative positions in large child care centers or preschools. Often, these positions require additional training, such as a bachelor's or master's degree. Other workers move on to work in resource and referral agencies, consulting with parents on available child services. A few workers become involved in policy or advocacy work related to child care and early childhood education. With a bachelor's degree, workers may become preschool teachers or become certified to teach in public or private schools. Some workers set up their own child care businesses.

Employment

Child care workers held about 1.3 million jobs in 2004. Many worked part time. About 1 out of 3 child care workers were self-employed; most of these were family child care providers.

Seventeen percent of all child care workers are found in child day care services, and about 21 percent work for private households. The remainder worked primarily in local government educational services; nursing and residential care facilities; religious organizations; amusement and recreation industries; private educational services; civic and social organizations; individual and family services; and local government, excluding education and hospitals. Some child care programs are for-profit centers; some of these are affiliated with a local or national chain. Religious institutions, community agencies, school systems, and State and local governments operate nonprofit programs. A very small percentage of private industry establishments operate onsite child care centers for the children of their employees.

Job Outlook

High replacement needs should create good job opportunities for child care workers. Qualified persons who are interested in this work should have little trouble finding and keeping a job. Many child care workers must be replaced each year as they leave the occupation

temporarily to fulfill family responsibilities, to study, or for other reasons. Others leave permanently because they are interested in pursuing other occupations or because of dissatisfaction with hours, low pay and benefits, and stressful conditions.

Employment of child care workers is projected to increase about as fast as the average for all occupations through the year 2014. The number of women in the labor force of childbearing age (widely considered to be ages 15 to 44) and the number of children under 5 years of age are both expected to rise over the next 10 years. Also, the proportion of children being cared for exclusively by parents or other relatives is likely to continue to decline, spurring demand for additional child care workers. Concern about the behavior of school-aged children during nonschool hours also should increase demand for before- and afterschool programs and child care workers to staff them.

The growth in demand for child care workers will be moderated, however, by an increasing emphasis on early childhood education programs. While only a few States currently provide targeted or universal preschool programs, many more are considering or currently implementing such programs. There also is likely to be a rise in enrollment in private preschools as the value of formal education before kindergarten becomes more widely accepted. Since the majority of workers in these programs are classified as preschool teachers, this growth in preschool enrollment will mean that relatively fewer child care workers will be needed for children old enough to participate in preschool.

Earnings

Pay depends on the educational attainment of the worker and the type of establishment. Although the pay generally is very low, more education usually means higher earnings. Median hourly earnings of wage and salary child care workers were \$8.06 in May 2004. The middle 50 percent earned between \$6.75 and \$10.01. The lowest 10 percent earned less than \$5.90, and the highest 10 percent earned more than \$12.34. Median hourly earnings in the industries employing the largest numbers of child care workers in 2004 were as follows:

Other residential care facilities	\$9.66
Elementary and secondary schools	9.22
Civic and social organizations	7.62
Other amusement and recreation industries	7.58
Child day care services	7.34

Earnings of self-employed child care workers vary depending on the hours worked, the number and ages of the children, and the location.

Benefits vary, but are minimal for most child care workers. Many employers offer free or discounted child care to employees. Some offer a full benefits package, including health insurance and paid vacations, but others offer no benefits at all. Some employers offer seminars and workshops to help workers learn new skills. A few are willing to cover the cost of courses taken at community colleges or technical schools. Live-in nannies receive free room and board.

Related Occupations

Child care work requires patience; creativity; an ability to nurture, motivate, teach, and influence children; and leadership, organizational, and administrative skills. Others who work with children and need these qualities and skills include teacher assistants; teachers—preschool, kindergarten, elementary, middle, and secondary; and teachers—special education.

Fitness Workers

(O*NET 39-9031.00)

Significant Points

- Many group fitness and personal training jobs are part time, but many workers increase their hours by working at several different facilities or at clients' homes.
- Night and weekend working hours are common.
- Most fitness workers need to be certified.
- Employment prospects are expected to be good because of rapid growth in the fitness industry.

Nature of the Work

Fitness workers lead, instruct, and motivate individuals or groups in exercise activities, including cardiovascular exercise, strength training, and stretching. They work in commercial and nonprofit health clubs, country clubs, hospitals, universities, yoga and Pilates studios, resorts, and clients' homes. Increasingly, fitness workers also are found in workplaces, where they organize and direct health and fitness programs for employees of all ages.

Although gyms and health clubs offer a variety of exercise activities such as weightlifting, yoga, cardiovascular training, and karate, fitness workers typically specialize in only a few areas.

Personal trainers work one-on-one with clients either in a gym or in the client's home. Trainers help clients assess their level of physical fitness and set and reach fitness goals. Trainers also demonstrate various exercises and help clients improve their exercise techniques. Trainers may keep records of their clients' exercise sessions to assess clients' progress toward physical fitness.

Group exercise instructors conduct group exercise sessions that involve aerobic exercise, stretching, and muscle conditioning. Because cardiovascular conditioning classes often involve movement to music, outside of class instructors must choose and mix the music and choreograph a corresponding exercise sequence. Pilates and yoga are two increasingly popular conditioning methods taught in exercise classes. Instructors demonstrate the different moves and positions of the particular method; they also observe students and correct those who are doing the exercises improperly. Group

exercise instructors are responsible for ensuring that their classes are motivating, safe, and challenging, yet not too difficult for the participants.

Fitness directors oversee the fitness-related aspects of a health club or fitness center. Their work involves creating and maintaining programs that meet the needs of the club's members, including new member orientations, fitness assessments, and workout incentive programs. They also select fitness equipment; coordinate personal training and group exercise programs; hire, train, and supervise fitness staff; and carry out administrative duties.

Fitness workers in smaller facilities with few employees may perform a variety of functions in addition to their fitness duties, such as tending the front desk, signing up new members, giving tours of the fitness center, writing newsletter articles, creating posters and flyers, and supervising the weight training and cardiovascular equipment areas. In larger commercial facilities, personal trainers are often required to sell their services to members and to make a specified number of sales. Some fitness workers may combine the duties of group exercise instructors and personal trainers, and in smaller facilities, the fitness director may teach classes and do personal training.

(Workers in a related occupation—*athletes, coaches, umpires, and related workers*—participate in organized sports; this occupation is described elsewhere in the *Handbook*.)

Working Conditions

Most fitness workers spend their time indoors at fitness centers and health clubs. Fitness directors and supervisors, however, typically spend most of their time in an office, planning programs and special events and tending to administrative issues. Those in smaller fitness centers may split their time among the office, personal training, and teaching classes. Directors and supervisors generally engage in less physical activity than do lower-level fitness workers. Nevertheless, workers at all levels risk suffering injuries during physical activities.

Since most fitness centers are open long hours, fitness workers often work nights and weekends and even occasional holidays. Some may have to travel from place to place throughout the day, to different gyms or to clients' homes, to maintain a full work schedule.

Fitness workers generally enjoy a lot of autonomy. Group exercise instructors choreograph or plan their own classes, and personal trainers have the freedom to design and implement their clients' workout routines.

Personal trainers work one-on-one with their clients to help them achieve their fitness goals.

Training, Other Qualifications, and Advancement

Personal trainers must obtain certification in the fitness field to gain employment, while group fitness instructors do not necessarily need certification to begin working. The most important characteristic that an employer looks for in a new group fitness instructor is the ability to plan and lead a class that is motivating and safe. Group fitness instructors often get started by participating in exercise classes, and some become familiar enough to successfully audition and begin teaching class. They also may improve their skills by taking training courses or attending fitness conventions. Most organizations encourage their group instructors to become certified, and many require it.

In the fitness field, there are many organizations—some of which are listed in the last section of this statement—that offer certification. Becoming certified by one of the top certification organizations is increasingly important, especially for personal trainers. One way to ensure that a certifying organization is reputable is to see whether it is accredited or seeking accreditation by the National Commission for Certifying Agencies.

Most certifying organizations require candidates to have a high school diploma, be certified in cardiopulmonary resuscitation (CPR), and pass an exam. All certification exams have a written component, and some also have a practical component. The exams measure knowledge of human physiology, proper exercise techniques, assessment of client fitness levels, and development of appropriate exercise programs. There is no particular training program required for certifications; candidates may prepare however they prefer. Certifying organizations do offer study materials, including books, CD-ROMs, other audio and visual materials, and exam preparation workshops and seminars, but exam candidates are not required to purchase materials to sit for the exams. Certification generally is good for 2 years, after which workers must become recertified by attending continuing education classes. Some organizations offer more advanced certification, requiring an associate or bachelor's degree in an exercise-related subject for individuals interested in training athletes, working with people who are injured or ill, or advising clients on whole-life health.

Training for Pilates and yoga teachers is changing. Because interest in these forms of exercise has exploded in recent years, the demand for teachers has grown faster than the ability to train them properly. However, because inexperienced teachers have contributed to student injuries, there has been a push toward more standardized, rigorous requirements for teacher training.

Pilates and yoga teachers usually do not need group exercise certifications like the ones described above. It is more important that they have specialized training in their particular method of exercise. For Pilates, training options range from weekend-long workshops to year-long programs, but the trend is toward requiring more training. The Pilates Method Alliance has established training standards that recommend at least 200 hours of training; the group also has standards for training schools and maintains a list of training schools that meet the requirements. However, some Pilates teachers are certified group exercise instructors who go through short Pilates workshops; currently, many fitness centers hire people with minimal Pilates training if the applicants have a fitness certification and group fitness experience.

Training requirements for yoga teachers are similar to those for Pilates teachers. Training programs range from a few days to more than 2 years. Many people get their start by taking yoga; eventually, their teachers may consider them suited to assist or to substitute teach. Some students may begin teaching their own classes when their yoga teachers think they are ready; the

teachers may even provide letters of recommendation. Those who wish to pursue teaching more seriously usually then pursue formal teacher training. Currently, there are many training programs through the yoga community as well as programs through the fitness industry. The Yoga Alliance has established training standards of at least 200 training hours, with a specified number of hours in areas including techniques, teaching methodology, anatomy, physiology, and philosophy. The Yoga Alliance also registers schools that train students to the standards. Because some schools may meet the standards but not be registered, prospective students should check the requirements and decide if particular schools meet them.

An increasing number of employers require fitness workers to have a bachelor's degree in a field related to health or fitness, such as exercise science or physical education. Some employers allow workers to substitute a college degree for certification, but most employers who require a bachelor's degree require both a degree and certification.

People planning fitness careers should be outgoing, good at motivating people, and sensitive to the needs of others. Excellent health and physical fitness are important due to the physical nature of the job. Those who wish to be personal trainers in a large commercial fitness center should have strong sales skills.

Fitness workers usually do not receive much on-the-job training; they are expected to know how to do their jobs when they are hired. The exception is newly certified personal trainers with no work experience, who sometimes begin by working alongside an experienced trainer before being allowed to train clients alone. Workers may receive some organizational training to learn about the operations of their new employer. They occasionally receive specialized training if they are expected to teach or lead a specific method of exercise or focus on a particular age or ability group.

A bachelor's degree, and in some cases a master's degree, in exercise science, physical education, kinesiology, or a related area, along with experience, usually is required to advance to management positions in a health club or fitness center. As in many fields, managerial skills are needed to advance to supervisory or managerial positions. College courses in management, business administration, accounting, and personnel management may be helpful for advancement to supervisory or managerial jobs, but many fitness companies have corporate universities in which they train employees for management positions.

Personal trainers may advance to head trainer, with responsibility for hiring and overseeing the personal training staff and for bringing in new personal training clients. Group fitness instructors may be promoted to group exercise director, responsible for hiring instructors and coordinating exercise classes. A next possible step is the fitness director, who manages the fitness budget and staff. The general manager's main focus is on the financial aspect of the organization, particularly setting and achieving sales goals; in a small fitness center, however, the general manager usually is involved with all aspects of running the facility.

Some workers go into business for themselves and open their own fitness centers.

Employment

Fitness workers held about 205,000 jobs in 2004. Almost all personal trainers and group exercise instructors worked in physical fitness facilities, health clubs, and fitness centers, mainly in the amusement and recreation industry or in civic and social organizations. About 7 percent of fitness workers were self-employed; many of these were personal trainers, while others were group fitness instructors working on a contract basis with fitness centers. Many fitness jobs are part time, and many workers hold multiple jobs, teaching and/or

doing personal training at several different fitness centers and at clients' homes.

Job Outlook

Opportunities are expected to be good for fitness workers because of rapid growth in the fitness industry. Many job openings also will stem from the need to replace the large numbers of workers who leave these occupations each year.

Employment of fitness workers—who are concentrated in the rapidly growing arts, entertainment, and recreation industry—is expected to increase much faster than the average for all occupations through 2014. An increasing number of people spend more time and money on fitness, and more businesses are recognizing the benefits of health and fitness programs and other services such as wellness programs for their employees.

Aging baby boomers are concerned with staying healthy, physically fit, and independent. They have become the largest demographic group of health club members. The reduction of physical education programs in schools, combined with parents' growing concern about childhood obesity, has resulted in rapid increases in children's health club membership. Increasingly, athletic youth also are hiring personal trainers, and weight-training gyms for children younger than 18 are expected to continue to grow. Health club membership among young adults also has grown steadily, driven by concern with physical fitness and by rising incomes.

As health clubs strive to provide more personalized service to keep their members motivated, they will continue to offer personal training and a wide variety of group exercise classes. Participation in yoga and Pilates is expected to continue to grow, driven partly by the aging population demanding low-impact forms of exercise and relief from ailments such as arthritis.

Earnings

Median annual earnings of personal trainers and group exercise instructors in May 2004 were \$25,470. The middle 50 percent earned between \$17,380 and \$40,030. The bottom 10 percent earned less than \$14,530 while the top 10 percent earned \$55,560 or more. Earnings of successful self-employed personal trainers can be much higher. Median annual earnings in the industries employing the largest numbers of fitness workers in May 2004 were as follows:

Other amusement and recreation industries	\$28,670
Other schools and instruction.....	22,320
Civic and social organizations	20,530

Because many fitness workers work part time, they often do not receive benefits such as health insurance or retirement plans from their employers. They do get the unusual benefit of the use of fitness facilities at no cost.

Related Occupations

Occupations that focus on physical fitness, as do fitness workers, include athletes, coaches, umpires, and related workers.

Flight Attendants

(O*NET 39-6031.00)

Significant Points

- Job duties are learned through formal on-the-job training.
- Competition for positions will remain strong because the opportunity for travel attracts more applicants than there are jobs, with only the most qualified being hired.
- A high school diploma is the minimum educational requirement; however, applicants with a college degree and with experience in dealing with the public are likely to have the best employment opportunities.

Nature of the Work

Major airlines are required by law to provide flight attendants for the safety of the traveling public. Although the primary job of the flight attendants is to ensure that safety regulations are followed, attendants also try to make flights comfortable and enjoyable for passengers.

At least 1 hour before each flight, attendants are briefed by the captain—the pilot in command—on such things as emergency evacuation procedures, coordination of the crew, the length of the flight, expected weather conditions, and special issues having to do with passengers. Flight attendants make sure that first-aid kits and other emergency equipment are aboard and in working order and that the passenger cabin is in order, with adequate supplies of food, beverages, and any other provided amenities. As passengers board the plane, flight attendants greet them, check their tickets, and tell them where to store carry-on items.

Before the plane takes off, flight attendants instruct all passengers in the use of emergency equipment and check to see that seatbelts are fastened, seat backs are in upright positions, and all carry-on items are properly stowed. In the air, helping passengers in the event of an emergency is the most important responsibility of a flight attendant. Safety-related actions may range from reassuring passengers during rough weather to directing passengers who must evacuate a plane following an emergency landing. Flight attendants also answer questions about the flight; distribute reading material, pillows, and blankets; and help small children, elderly or disabled persons, and any others needing assistance. They may administer first aid to passengers who become ill. Flight attendants gener-

ally serve beverages and other refreshments and, on many flights, heat and distribute precooked meals or snacks. Prior to landing, flight attendants take inventory of headsets, alcoholic beverages, and moneys collected. They also report any medical problems passengers may have had, the condition of cabin equipment, and lost and found articles.

Lead, or first, flight attendants, sometimes known as pursers, oversee the work of the other attendants aboard the aircraft, while performing most of the same duties.

Working Conditions

Because airlines operate around the clock and year round, flight attendants may work nights, holidays, and weekends. In most cases, agreements between the airline and the employees' union determine the total daily and monthly working time. Scheduled on-duty time usually is limited to 12 hours per day although some contracts provide daily actual maximums of 14 hours, with somewhat greater maximums for international flying. Attendants usually fly 65 to 90 hours a month and, in addition, generally spend about 50 hours a month on the ground preparing planes for flights, writing reports following completed flights, and waiting for planes to arrive. They may be away from their home base at least one-third of the time. During this period, the airlines provide hotel accommodations and an allowance for meal expenses.

Flight attendants are required, by law, on major airlines in order to ensure the safety of the traveling public.

Flight attendants must be flexible, reliable, and willing to relocate. However, many flight attendants elect to live in one place and commute to their assigned home base. Home bases and routes worked are bid for on a seniority basis. The longer the flight attendant has been employed, the more likely he or she is to work on chosen flights. Almost all flight attendants start out working on reserve status or on call. On small corporate airlines, flight attendants often work on an as-needed basis and must adapt to varying environments and passengers.

The combination of free time and discount airfares provides flight attendants the opportunity to travel and see new places. However, the work can be strenuous and trying. Flight attendants stand during much of the flight and must remain pleasant and efficient, regardless of how tired they are or how demanding passengers may be. Occasionally, flight attendants must deal with disruptive passengers. Also, turbulent flights can add to possible difficulties regarding service, including potential injuries to passengers.

Working in a moving aircraft leaves flight attendants susceptible to injuries. For example, back injuries and mishaps can occur when opening overhead compartments or while pushing heavy service carts. In addition, medical problems can arise from irregular sleeping and eating patterns, dealing with stressful passengers, working in a pressurized environment, and breathing recycled air.

Training, Other Qualifications, and Advancement

Airlines prefer to hire poised, tactful, and resourceful people who can interact comfortably with strangers and remain calm under duress. Applicants usually must be at least 18 to 21 years old, although some carriers may have higher minimum-age requirements. Flight attendants must have excellent health and the ability to speak clearly. All U.S. airlines require that applicants be citizens of the United States or registered aliens with legal rights to obtain employment in the United States.

Airlines usually have physical and appearance requirements. There are height requirements for reaching overhead bins, which often contain emergency equipment, and most airlines want candidates with weight proportionate to height. Vision is required to be correctable to 20/30 or better with glasses or contact lenses (uncorrected no worse than 20/200). Men must have their hair cut above the collar and be clean shaven. Airlines prefer applicants with no visible tattoos, body piercing, or unusual hairstyles or makeup.

A high school diploma is the minimum educational requirement. However, airlines increasingly prefer applicants with a college degree and with experience in dealing with the public. Applicants who attend schools and colleges that offer flight attendant training may have an advantage over other applicants. Highly desirable areas of concentration include people-oriented disciplines such as psychology and education. Flight attendants for international airlines generally must speak a foreign language fluently. For their international flights, some of the major airlines prefer candidates who can speak two major foreign languages.

In addition to education and training, airlines conduct a thorough background check as required by the FAA, which goes back as many as 10 years. Everything about an applicant is investigated, including date of birth, employment history, criminal record, school records, and gaps in employment. Employment is contingent on a successful background check. An applicant will not be offered a job or will be immediately dismissed if his or her background check shows any discrepancies.

Once hired, all candidates must undergo a period of formal training. The length of training, ranging from 3 to 8 weeks, depends on the size and type of carrier and takes place at the airline's flight training center. Airlines that do not operate training

centers generally send new employees to the center of another airline. Some airlines may provide transportation to the training centers and an allowance for room, board, and school supplies, while other airlines charge individuals for training. New trainees are not considered employees of the airline until they successfully complete the training program. Trainees learn emergency procedures such as evacuating an airplane, operating emergency systems and equipment, administering first aid, and surviving in the water. In addition, trainees are taught how to deal with disruptive passengers and with hijacking and terrorist situations. New hires learn flight regulations and duties, gain knowledge of company operations and policies, and receive instruction on personal grooming and weight control. Trainees for the international routes get additional instruction in passport and customs regulations. Trainees must perform many drills and duties unaided, in front of the training staff. Throughout training, they also take tests designed to eliminate unsuccessful trainees. Toward the end of their training, students go on practice flights. Upon successful completion of training, flight attendants receive the FAA's Certificate of Demonstrated Proficiency. Flight attendants also are required to go through periodic retraining and pass an FAA safety examination to continue flying.

After completing initial training, flight attendants are assigned to one of their airline's bases. New flight attendants are placed on reserve status and are called either to staff extra flights or to fill in for crewmembers who are sick, on vacation, or rerouted. When they are not on duty, reserve flight attendants must be available to report for flights on short notice. They usually remain on reserve for at least 1 year, but, in some cities, it may take 5 to 10 years or longer to advance from reserve status. Flight attendants who no longer are on reserve bid monthly for regular assignments. Because assignments are based on seniority, usually only the most experienced attendants get their choice of assignments. Advancement takes longer today than in the past because experienced flight attendants are remaining in this career longer than they used to.

Some flight attendants become supervisors or take on additional duties such as recruiting and instructing. Their experience also may qualify them for numerous airline-related jobs involving contact with the public, such as reservation ticket agent or public-relations specialist.

Employment

Flight attendants held about 102,000 jobs in 2004. Commercial airlines employed the vast majority of flight attendants, most of whom lived in their employer's home-base city. A small number of flight attendants worked for large companies that operated aircraft for business purposes.

Job Outlook

In the long run, opportunities for persons seeking flight attendant jobs should improve as the airline industry continues to recover from the effects of September 11, 2001, and the downturn in the economy. Employment of flight attendants is expected to grow about as fast as the average for all occupations through the year 2014. Population growth and an improving economy are expected to boost the number of airline passengers. As airlines expand their capacity to meet rising demand by increasing the number and size of planes in operation, more flight attendants will be needed. Over the next decade, however, demand for flight attendants will fluctuate with the demand for air travel, which is highly sensitive to swings in the economy. During downturns, as air traffic declines, the hiring of flight attendants declines, and some experienced attendants may be laid off until traffic recovers.

Despite the improving outlook, competition is expected to be keen because this job usually attracts more applicants than there are jobs, with only the most qualified eventually being hired. College graduates who have experience dealing with the public should have the best chance of being hired. Job opportunities may be better with the faster growing regional and commuter, low-fare, and charter airlines. There also are job opportunities for professionally trained flight attendants to work for companies operating private aircraft for their executives.

The majority of job openings through the year 2014 will arise from the need to replace flight attendants who leave the labor force or transfer to other occupations, often for higher earnings or a more stable lifestyle. With the job now viewed increasingly as a profession, however, fewer flight attendants leave their jobs, and job turnover is not as high as in the past. The average job tenure of attendants is currently more than 7 years and is increasing.

Earnings

Median annual earnings of flight attendants were \$43,440 in May 2004. The middle 50 percent earned between \$31,310 and \$67,590. The lowest 10 percent earned less than \$23,450, and the highest 10 percent earned more than \$95,850.

According to data from the Association of Flight Attendants, beginning attendants had median earnings of about \$15,552 a year in 2004. Beginning pay scales for flight attendants vary by carrier, however. New hires usually begin at the same pay scale regardless of experience, and all flight attendants receive the same future pay increases based on an established pay scale. Flight attendants receive extra compensation for increased hours. Further, some airlines offer incentive pay for working holidays, night and international flights, or taking positions that require additional responsibility or paperwork. Most airlines guarantee a minimum of 65 to 85 flight hours per month, with the option to work additional hours. Flight attendants also receive a "per diem" allowance for meal expenses while on duty away from home. In addition, flight attendants and their immediate families are entitled to free or discounted fares on their own airline and reduced fares on most other airlines. Some airlines require that the flight attendant be with an airline for 3 to 6 months before taking advantage of this benefit. Other benefits may include medical, dental, and life insurance; 401K or other retirement plan; sick leave; paid holidays; stock options; paid vacations; and tuition reimbursement.

Flight attendants are required to purchase uniforms and wear them while on duty. The airlines usually pay for uniform replacement items, and may provide a small allowance to cover cleaning and upkeep of the uniforms.

The majority of flight attendants hold union membership, primarily with the Association of Flight Attendants. Other unions that represent flight attendants include the Transport Workers Union of America and the International Brotherhood of Teamsters.

Related Occupations

Other jobs that involve helping people as a safety professional, while requiring the ability to be calm even under trying circumstances, include emergency medical technicians and paramedics and firefighting occupations.

Sources of Additional Information

Information about job opportunities and qualifications required for work at a particular airline may be obtained by writing to the airline's human resources office.

For further information on flight attendants, contact:

► Association of Flight Attendants, 501 Third St. NW., Washington, DC 20001. Internet: <http://www.afanet.org>

Gaming Services Occupations

(O*NET 39-1011.00, 39-1012.00, 39-3011.00, 39-3012.00, 39-3019.99, 39-3099.99)

Significant Points

- Job opportunities are available nationwide and are no longer limited to Nevada and New Jersey.
- Workers need a license issued by a regulatory agency, such as a State casino control board or commission; licensure requires proof of residency in the State in which gaming workers are employed.
- Employment is projected to grow faster than average.
- Job prospects are best for those with a degree or certification in gaming or a hospitality-related field, previous training or experience in casino gaming, and strong interpersonal and customer service skills.

Nature of the Work

Legalized gambling in the United States today includes casino gaming, State lotteries, pari-mutuel wagering on contests such as horse or dog racing, and charitable gaming. Gaming, the playing of games of chance, is a multibillion-dollar industry that is responsible for the creation of a number of unique service occupations.

The majority of all gaming services workers are employed in casinos. Their duties and titles may vary from one establishment to another. Despite differences in job title and task, however, workers perform many of the same basic functions in all casinos. Some positions are associated with oversight and direction—supervision, surveillance, and investigation—while others involve working with the games or patrons themselves, performing such activities as tending slot machines, handling money, writing and running tickets, and dealing cards or running games.

Like nearly every business establishment, casinos have workers who direct and oversee day-to-day operations. *Gaming supervisors* oversee the gaming operations and personnel in an assigned area. They circulate among the tables and observe the operations to ensure that all of the stations and games are covered for each shift. It is not uncommon for gaming supervisors to explain and interpret the operating rules of the house to patrons who may have difficulty understanding the rules. Gaming supervisors also may plan and organize activities to create a friendly atmosphere for the guests staying in their hotels or in casino hotels. Periodically, they address and adjust complaints about service.

Some gaming occupations demand specially acquired skills—dealing blackjack, for example—that are unique to casino work. Others require skills common to most businesses, such as the ability to conduct financial transactions. In both capacities, the workers in these jobs interact directly with patrons in attending to slot machines, making change, cashing or selling tokens and coins, writing and running for other games, and dealing cards at table games. Part of their responsibility is to make those interactions enjoyable.

Slot key persons coordinate and supervise the slot department and its workers. Their duties include verifying and handling payoff winnings to patrons, resetting slot machines after completing the payoff, and refilling machines with money. Slot key persons must be familiar with a variety of slot machines and be able to make minor repairs and adjustments to the machines as needed. If major repairs are required, slot key persons determine whether the slot machine should be removed from the floor. Working the floor as frontline personnel, they enforce safety rules and report hazards.

Gaming service workers must keep track of all the money being paid to and received from patrons.

Gaming and sportsbook writers and runners assist in the operations of games such as bingo and keno, in addition to taking bets on sporting events. They scan tickets presented by patrons and calculate and distribute winnings. Some writers and runners operate the equipment that randomly selects the numbers. Others may announce numbers selected, pick up tickets from patrons, collect bets, or receive, verify, and record patrons' cash wagers.

Gaming dealers operate table games such as craps, blackjack, and roulette. Standing or sitting behind the table, dealers provide dice, dispense cards to players, or run the equipment. Some dealers also monitor the patrons for infractions of casino rules. Gaming dealers must be skilled in customer service and in executing their game. Dealers determine winners, calculate and pay winning bets, and collect losing bets. Because of the fast-paced work environment, most gaming dealers are competent in at least two games, usually blackjack and craps.

Working Conditions

The atmosphere in casinos is generally filled with fun and often considered glamorous. However, casino work can also be physically demanding. Most occupations require that workers stand for long periods; some require the lifting of heavy items. The atmosphere in casinos exposes workers to certain hazards, such as cigarette, cigar, and pipe smoke. Noise from slot machines, gaming tables, and talking workers and patrons may be distracting to some, although workers wear protective headgear in areas where loud machinery is used to count money.

Most casinos are open 24 hours a day, seven days a week and offer three staggered shifts.

Training, Other Qualifications, and Advancement

There usually are no minimum educational requirements for entry-level gaming jobs, although most employers prefer at least a high school diploma or GED. Each casino establishes its own requirements for education, training, and experience. Some of the major casinos and slot manufacturers run their own training schools, and almost all provide some form of in-house training in addition to requiring certification. The type and quantity of classes needed may vary. Many institutions of higher learning give training toward certificates in gaming, as well as offering an associate, bachelor's, or master's degree in a hospitality-related field such as hospitality management, hospitality administration, or hotel management. Some schools offer training in games, gaming supervision, slot attendant and slot repair technician work, slot department management, and surveillance and security.

Gaming services workers are required to have a license issued by a regulatory agency, such as a State casino control board or commission. Applicants for a license must provide photo identification, offer proof of residency in the State in which they anticipate working, and pay a fee. Age requirements vary by State. The licensing application process also includes a background investigation.

In addition to possessing a license, gaming services workers need superior customer service skills. Casino gaming workers provide entertainment and hospitality to patrons, and the quality of their service contributes to an establishment's success or failure. Therefore, gaming workers need good communication skills, an outgoing personality, and the ability to maintain their composure even when dealing with angry or demanding patrons. Personal integrity also is important, because workers handle large amounts of money.

Gaming services workers who manage money should have some experience handling cash or using calculators or computers. For such positions, most casinos administer a math test to assess an applicant's level of competency.

Most gaming supervisors have experience in other gaming occupations, typically as dealers, and have a broad knowledge of casino rules, regulations, procedures, and games. While an associate or bachelor's degree is beneficial, it is not a requirement for most positions. Gaming supervisors must have strong leadership, organizational, and communication skills. Excellent customer service and employee skills also are necessary.

Slot key persons do not need to meet formal educational requirements to enter the occupation, but completion of slot attendant or slot technician training is helpful. As with most other gaming workers, slot key persons receive on-the-job training during the first several weeks of employment.

Gaming and sportsbook writers and runners must have at least a high school diploma or GED. Most of these workers receive on-the-job training. Because gaming and sportsbook writers and runners work closely with patrons, they need excellent customer service skills.

Most gaming dealers acquire their skills by attending a dealer school or vocational and technical school. Most of these schools are found in Nevada and New Jersey. They teach the rules and procedures of the games as well as State and local laws and regulations. Graduation from one of these schools does not guarantee a job at many casinos, however, as most casinos require prospective dealers to also audition for open positions. During the audition, personal qualities are assessed along with knowledge of the games. Experienced dealers, who often are able to attract new or return business, have the best job prospects. Dealers with more experience are placed at the "high-roller" tables.

Advancement opportunities in casino gaming depend less on workers' previous casino duties and titles than on their ability and eagerness to learn new jobs. For example, an entry-level gaming worker eventually might advance to become a dealer or card room manager or to assume some other supervisory position.

Employment

Gaming services occupations provided 177,000 jobs in 2004. Employment by occupational specialty was distributed as follows:

Gaming dealers	83,000
Gaming supervisors	38,000
Slot key persons	23,000
Gaming and sports book writers and runners	18,000
Gaming service workers, all other	15,000

Gaming services workers are found mainly in the traveler accommodation and gaming industries. Most are employed in commercial

casinos, including land-based or riverboat casinos, in 11 States: Colorado, Illinois, Indiana, Iowa, Louisiana, Michigan, Mississippi, Missouri, Nevada, New Jersey, and South Dakota. The largest number works in casinos in Nevada, and the second-largest group works in similar establishments in Atlantic City, New Jersey. Mississippi, which boasts the greatest number of riverboat casinos in operation, employs the most workers in that venue. In addition, there are 28 States with Indian casinos. Legal lotteries are held in 40 States and the District of Columbia, and pari-mutuel wagering is legal in 40 States. Forty-seven States and the District of Columbia also allow charitable gaming. Other States have recently passed legislation to permit gambling, but no casinos have been opened as of yet.

For most workers, gaming licensure requires proof of residency in the State in which gaming workers are employed. But some gaming services workers do not limit themselves to one State or even one country, finding jobs on the small number of casinos located on luxury cruise liners that travel the world. These individuals live and work aboard the vessel.

Job Outlook

With demand for gaming showing no sign of waning, employment in gaming services occupations is projected to grow faster than the average for all occupations through 2014. Even during the recent downturn in the economy, revenues at casinos have risen. In addition, the increasing popularity and prevalence of Indian casinos, particularly in California, and pari-mutuel casinos will provide substantial job openings that were not available in the past. With many States benefiting from casino gambling in the form of tax revenue or agreements with Indian tribes, additional States are reconsidering their opposition to legalized gambling and will likely approve the construction of more casinos and other gaming establishments during the next decade. Some job growth will occur in established gaming areas in Nevada and Atlantic City, New Jersey, but most of the openings in these locations will come from job turnover.

The increase in gaming reflects growth in the population and in its disposable income, both of which are expected to continue. Higher expectations for customer service among gaming patrons also should result in more jobs for gaming services workers.

Job prospects in gaming services occupations will be best for those with previous casino gaming experience, a degree or technical or vocational training in gaming or a hospitality-related field, and strong interpersonal and customer service skills. As a direct result of increasing demand for additional table games in gaming establishments, the most rapid growth is expected among gaming dealers. However, there are generally more applicants than jobs for dealers, creating keen competition for jobs. In addition to job openings arising from employment growth, opportunities will result from the need to replace workers transferring to other occupations or leaving the labor force.

Earnings

Wage earnings for gaming services workers vary according to occupation, level of experience, training, location, and size of the gaming establishment. The following were median earnings for various gaming services occupations in May 2004:

Gaming supervisors	\$40,840
Slot key persons	23,010
Gaming service workers, all other	20,820
Gaming and sports book writers and runners	18,390
Gaming dealers	14,340

Gaming dealers generally receive a large portion of their earnings from tokes, which are tips in the form of tokens received from

players. Earnings from tokens can vary depending on the table games the dealer operates and the personal traits of the dealer.

Related Occupations

Many other occupations provide hospitality and customer service. Some examples of related occupations are security guards and gaming surveillance officers, sales worker supervisors, cashiers, gaming change persons and booth cashiers, retail salespersons, gaming cage workers, and tellers.

Sources of Additional Information

For additional information on careers in gaming, visit your public library and your State gaming regulatory agency or casino control commission.

Personal and Home Care Aides

(O*NET 39-9021.00)

Significant Points

- Job opportunities are expected to be excellent because of rapid growth in home health care and high replacement needs.
- Skill requirements are low, as is the pay.
- About 33 percent of personal and home care aides work part time; most aides work with a number of different clients, each job lasting a few hours, days, or weeks.

Nature of the Work

Personal and home care aides help elderly, disabled, ill, and mentally disabled persons live in their own homes or in residential care facilities instead of in health facilities. Most personal and home care aides work with elderly or physically or mentally disabled clients who need more extensive personal and home care than family or friends can provide. Some aides work with families in which a parent is incapacitated and small children need care. Others help discharged hospital patients who have relatively short-term needs. (*Home health aides*—who provide health-related services, rather than mainly housekeeping and routine personal care—are discussed in the statement on nursing, psychiatric, and home health aides, elsewhere in the *Handbook*.)

Personal and home care aides—also called *homemakers*, *caregivers*, *companions*, and *personal attendants*—provide housekeeping and routine personal care services. They clean clients' houses, do laundry, and change bed linens. Aides may plan meals (including special diets), shop for food, and cook. Aides also may help clients get out of bed, bathe, dress, and groom. Some accompany clients to doctors' appointments or on other errands.

Personal and home care aides provide instruction and psychological support to their patients. They may advise families and patients on nutrition, cleanliness, and household tasks. Aides also may assist in toilet training a severely mentally handicapped child, or they may just listen to clients talk about their problems.

In home health care agencies, a registered nurse, physical therapist, or social worker assigns specific duties and supervises personal and home care aides. Aides keep records of services performed

and of clients' condition and progress. They report changes in the client's condition to the supervisor or case manager. In carrying out their work, aides cooperate with health care professionals, including registered nurses, therapists, and other medical staff.

Working Conditions

The personal and home care aide's daily routine may vary. Aides may go to the same home every day for months or even years. However, most aides work with a number of different clients, each job lasting a few hours, days, or weeks. Aides often visit four or five clients on the same day.

Surroundings differ from case to case. Some homes are neat and pleasant, whereas others are untidy and depressing. Some clients are pleasant and cooperative; others are angry, abusive, depressed, or otherwise difficult.

Personal and home care aides generally work on their own, with periodic visits by their supervisor. They receive detailed instructions explaining when to visit clients and what services to perform for them. About one-third of aides work part time, and some work weekends or evenings to suit the needs of their clients.

Aides are individually responsible for getting to the client's home. They may spend a good portion of the working day traveling from one client to another. Because mechanical lifting devices that are available in institutional settings are seldom available in patients' homes, aides must be careful to avoid overexertion or injury when they assist clients.

Most aides provide routine personal care and housekeeping services to elderly or disabled patients.

Training, Other Qualifications, and Advancement

In some States, the only requirement for employment is on-the-job training, which generally is provided by most employers. Other States may require formal training, which is available from community colleges, vocational schools, elder care programs, and home health care agencies. The National Association for Home Care and Hospice (NAHC) offers national certification for personal and home care aides. Certification is a voluntary demonstration that the individual has met industry standards. Certification requires the completion of a standard 75-hour course and written exam developed by NAHC. Home care aides seeking certification are evaluated on 17 different skills by a registered nurse.

Personal and home care aides should have a desire to help people and not mind hard work. They should be responsible, compassionate, emotionally stable, and cheerful. In addition, aides should be tactful, honest, and discreet because they work in private homes. Aides also must be in good health. A physical examination, including State-mandated tests such as those for tuberculosis, may be required. A criminal background check also may be required for employment. Additionally, personal and home care aides are responsible for their own transportation to reach patients' homes.

Advancement for personal and home care aides is limited. In some agencies, workers start out performing homemaker duties, such as cleaning. With experience and training, they may take on personal care duties. Some aides choose to receive additional training to become nursing and home health aides, licensed practical nurses, or registered nurses. Some experienced personal and home care aides may start their own home care agency.

Employment

Personal and home care aides held about 701,000 jobs in 2004. The majority of jobs were in home health care services; individual and family services; residential care facilities; and private households. Self-employed aides have no agency affiliation or supervision and accept clients, set fees, and arrange work schedules on their own.

Job Outlook

Excellent job opportunities are expected for this occupation, because rapid employment growth and high replacement needs are projected to produce a large number of job openings.

Employment of personal and home care aides is projected to grow much faster than the average for all occupations through the year 2014. The number of elderly people, an age group characterized by mounting health problems and requiring some assistance with daily activities, is projected to rise substantially. In addition to the elderly, other patients, such as the mentally disabled, will increasingly rely on home care. This trend reflects several developments, including efforts to contain costs by moving patients out of hospitals and nursing care facilities as quickly as possible; the realization that treatment can be more effective in familiar rather than clinical surroundings; and the development and improvement of medical technologies for in-home treatment.

In addition to job openings created by the increase in demand for these workers, replacement needs are expected to lead to many openings. The relatively low skill requirements, low pay, and high emotional demands of the work result in high replacement needs. For these same reasons, many people are reluctant to seek jobs in the occupation. Therefore, persons who are interested in and suited for this work—particularly those with experience or training as personal care, home health, or nursing aides—should have excellent job prospects.

Earnings

Median hourly earnings of personal and home care aides were \$8.12 in May 2004. The middle 50 percent earned between \$6.83 and \$9.70 an hour. The lowest 10 percent earned less than \$5.93, and the highest 10 percent earned more than \$10.87 an hour. Median hourly earnings in the industries employing the largest numbers of personal and home care aides in May 2004 were as follows:

Residential mental retardation, mental health and substance abuse facilities.....	\$9.09
Vocational rehabilitation services	8.76
Community care facilities for the elderly	8.49
Individual and family services	8.48
Home health care services	6.99

Most employers give slight pay increases with experience and added responsibility. Aides usually are paid only for the time they work in the home, not for travel time between jobs. Employers often hire on-call hourly workers and provide no benefits.

Related Occupations

Personal and home care aides combine the duties of caregivers and social service workers. Workers in related occupations that involve personal contact to help others include childcare workers; nursing, psychiatric, and home health aides; occupational therapist assistants and aides; physical therapist assistants and aides; and social and human service assistants.

Sources of Additional Information

Information about employment opportunities may be obtained from local hospitals, nursing care facilities, home health care agencies, psychiatric facilities, residential mental health facilities, social assistance agencies, and local offices of the State employment service.

Recreation Workers

(O*NET 39-9032.00)

Significant Points

- Educational requirements for recreation workers range from a high school diploma to a graduate degree.
- Competition will remain keen for full-time career positions in recreation.
- The recreation field offers an unusually large number of part-time and seasonal job opportunities.

Nature of the Work

People spend much of their leisure time participating in a wide variety of organized recreational activities, such as arts and crafts, the performing arts, camping, and sports. Recreation workers plan, organize, and direct these activities in local playgrounds and recreation areas, parks, community centers, religious organizations, camps, theme parks, and tourist attractions. Increasingly, recreation workers also are being found in workplaces, where they organize and direct leisure activities for employees.

Recreation workers hold a variety of positions at different levels of responsibility. *Recreation leaders*, who are responsible for a recreation program's daily operation, primarily organize and direct participants. They may lead and give instruction in dance, drama, crafts, games, and sports; schedule the use of facilities; keep records of equipment use; and ensure that recreation facilities and equip-

A lifesaving certificate is a prerequisite for teaching or coaching water-related activities.

ment are used properly. Workers who provide instruction and coach groups in specialties such as art, music, drama, swimming, or tennis may be called *activity specialists*. *Recreation supervisors* oversee recreation leaders and plan, organize, and manage recreational activities to meet the needs of a variety of populations. These workers often serve as liaisons between the director of the park or recreation center and the recreation leaders. Recreation supervisors with more specialized responsibilities also may direct special activities or events or oversee a major activity, such as aquatics, gymnastics, or performing arts. *Directors of recreation and parks* develop and manage comprehensive recreation programs in parks, playgrounds, and other settings. Directors usually serve as technical advisors to State and local recreation and park commissions and may be responsible for recreation and park budgets. (Workers in a related occupation, *recreational therapists*, help individuals to recover from or adjust to illness, disability, or specific social problems; this occupation is described elsewhere in the *Handbook*.)

Camp counselors lead and instruct children and teenagers in outdoor-oriented forms of recreation, such as swimming, hiking, horseback riding, and camping. In addition, counselors provide campers with specialized instruction in subjects such as archery, boating, music, drama, gymnastics, tennis, and computers. In resident camps, counselors also provide guidance and supervise daily living and general socialization. *Camp directors* typically supervise camp counselors, plan camp activities or programs, and perform the various administrative functions of a camp.

Working Conditions

Recreation workers may work in a variety of settings—for example, a cruise ship, a woodland recreational park, a summer camp, or a playground in the center of a large urban community. Regardless of the setting, most recreation workers spend much of their time outdoors and may work in a variety of weather conditions. Recreation directors and supervisors, however, typically spend most of their time in an office, planning programs and special events. Directors and supervisors generally engage in less physical activity than do lower level recreation workers. Nevertheless, recreation workers at all levels risk suffering injuries during physical activities.

Many recreation workers work about 40 hours a week. People entering this field, especially camp counselors, should expect some night and weekend work and irregular hours. Many recreation jobs are seasonal.

Training, Other Qualifications, and Advancement

Educational requirements for recreation workers range from a high school diploma—or sometimes less for those seeking many summer jobs—to graduate degrees for some administrative positions in large public recreation systems. Full-time career professional positions usually require a college degree with a major in parks and recreation or leisure studies, but a bachelor's degree in any liberal arts field may be sufficient for some jobs in the private sector. In industrial recreation, or “employee services” as it is more commonly called, companies prefer to hire those with a bachelor's degree in recreation or leisure studies and a background in business administration.

Specialized training or experience in a particular field, such as art, music, drama, or athletics, is an asset for many jobs. Some jobs also require certification. For example, a lifesaving certificate is a prerequisite for teaching or coaching water-related activities. Graduates of associate's degree programs in parks and recreation, social work, and other human services disciplines also enter some career recreation positions. High school graduates occasionally enter career positions, but this is not common. Some college students work part time as recreation workers while earning degrees.

A bachelor's degree in a recreation-related discipline and experience are preferred for most recreation supervisor jobs and are required for higher level administrative jobs. However, an increasing number of recreation workers who aspire to administrative positions are obtaining master's degrees in parks and recreation, business administration, or public administration. Certification in the recreation field may be helpful for advancement. Also, many persons in other disciplines, including social work, forestry, and resource management, pursue graduate degrees in recreation.

Programs leading to an associate's or bachelor's degree in parks and recreation, leisure studies, or related fields are offered at several hundred colleges and universities. Many also offer master's or doctoral degrees in the field. In 2004, about 100 bachelor's degree programs in parks and recreation were accredited by the National Recreation and Park Association (NRPA). Accredited programs provide broad exposure to the history, theory, and practice of park and recreation management. Courses offered include community organization; supervision and administration; recreational needs of special populations, such as the elderly or disabled; and supervised fieldwork. Students may specialize in areas such as therapeutic recreation, park management, outdoor recreation, industrial or commercial recreation, or camp management.

The NRPA certifies individuals for professional and technical jobs. Certified Park and Recreation Professionals must pass an exam; earn a bachelor's degree with a major in recreation, park resources, or leisure services from a program accredited by the NRPA and the American Association for Leisure and Recreation; or earn a bachelor's degree and have at least 5 years of relevant full-time work experience. Continuing education is necessary to remain certified.

Persons planning recreation careers should be outgoing, good at motivating people, and sensitive to the needs of others. Excellent health and physical fitness are often required, due to the physical nature of some jobs. Volunteer experience, part-time work during school, or a summer job can lead to a full-time career as a recreation worker. As in many fields, managerial skills are needed to advance to supervisory or managerial positions.

Employment

Recreation workers held about 310,000 jobs in 2004, and many additional workers held summer jobs in the occupation. Of those with year-round jobs as recreation workers, about 35 percent worked for local governments, primarily in park and recreation departments. Around 11 percent of recreation workers were employed in civic and social organizations, such as the Boy Scouts or Girl Scouts or the Red Cross. Another 15 percent of recreation workers were employed by nursing and other personal care facilities.

The recreation field has an unusually large number of part-time, seasonal, and volunteer jobs, including summer camp counselors, craft specialists, and afterschool and weekend recreation program leaders. In addition, many teachers and college students accept jobs as recreation workers when school is not in session. The vast majority of volunteers serve as activity leaders at local day camp programs, or in youth organizations, camps, nursing homes, hospitals, senior centers, and other settings.

Job Outlook

Competition will remain keen for career positions as recreation workers because the field attracts many applicants and because the number of career positions is limited compared with the number of lower level seasonal jobs. Opportunities for staff positions should be best for persons with formal training and experience gained in part-time or seasonal recreation jobs. Those with graduate degrees should have the best opportunities for supervisory or administrative positions. Job openings also will stem from the need to replace the large numbers of workers who leave the occupation each year.

Overall employment of recreation workers is expected to grow about as fast as the average for all occupations through 2014. People will spend more time and money on recreation, spurring growth in civic and social organizations and, to a lesser degree, State and local government. Much growth will be driven by retiring baby boomers, who, with more leisure time, high disposable income, and concern for health and fitness, are expected to increase their consumption of recreation services. Job growth also will be driven by rapidly increasing employment in nursing and residential care facilities. Employment growth may be inhibited, however, by budget constraints that local governments may face over the 2004–14 projection period.

The large number of temporary, seasonal jobs in the recreation field typically are filled by high school or college students, generally do not have formal education requirements, and are open to anyone with the desired personal qualities. Employers compete for a share of the vacationing student labor force, and although salaries in recreation often are lower than those in other fields, the nature of the work and the opportunity to work outdoors are attractive to many.

Earnings

In May 2004, median annual earnings of recreation workers who worked full time were \$19,320. The middle 50 percent earned between \$15,640 and \$25,380. The lowest paid 10 percent earned less than \$13,260, while the highest paid 10 percent earned \$34,280 or more. However, earnings of recreation directors and others in supervisory or managerial positions can be substantially higher. Most public and private recreation agencies provide full-time recreation workers with typical benefits; part-time workers receive few, if any, benefits. In May 2004, median annual earnings in the industries employing the largest numbers of recreation workers were as follows:

Nursing care facilities	\$20,660
Local government	19,650
Individual and family services	19,260
Other amusement and recreation industries	17,060
Civic and social organizations	16,950

Related Occupations

Recreation workers must exhibit leadership and sensitivity when dealing with people. Other occupations that require similar personal qualities include counselors, probation officers and correctional treatment specialists, psychologists, recreational therapists, and social workers.

Sales and Related Occupations

Advertising Sales Agents

(O*NET 41-3011.00)

Significant Points

- Overall earnings are higher than average but can vary considerably because they are usually based on a salary plus performance-based commissions and bonuses.
- Pressure to meet monthly sales quotas can be stressful.

Nature of the Work

Advertising sales agents—often referred to as *account executives* or *advertising sales representatives*—sell or solicit advertising, including graphic art, advertising space in publications, custom-made signs, or television and radio advertising time. More than half of all advertising sales agents work in the information sector, mostly for media firms, including television and radio broadcasters, print and Internet publishers, and cable program distributors. Other agents work for firms engaged in direct mail advertising or display and outdoor advertising, such as billboards and signs. Because most revenue for magazines, newspapers, directories, and broadcasters is generated from advertising, advertising sales agents play an important role in their success.

Outside sales agents call on clients and prospects at their place of business. They may have an appointment, or they may practice “cold calling,” arriving without an appointment. *Inside sales agents* work on their employer’s premises and handle sales to customers who walk in or telephone the firm to inquire about advertising. Some also may make telephone sales calls—calling prospects, attempting to sell the media firm’s advertising space or time, and arranging follow-up appointments between interested prospects and outside sales agents. Advertising sales agents should not be confused with *telemarketers*, whose duties are limited solely to soliciting orders for goods or services over the telephone and who work primarily in call centers that provide telemarketing services on contract.

Within the advertising and related services industry, media representative firms sell advertising space or time for media owners, including print and Internet publishers, radio and television stations, and cable systems. Media representative firms maintain offices in major cities and employ their own teams of advertising sales agents. These agents work exclusively with the executives at advertising agencies, called media buyers, who purchase advertising space for their clients. Media representative firms may represent any number of publications and radio or television stations, selling space to advertising agencies with clients who want to initiate a national advertising campaign or place advertisements outside their local market. Sales agents employed in media representation normally do not cultivate new advertisers but maintain contacts with existing advertisers through the advertising agencies. A local television or radio station or publication would have a national sales manager to promote its best interests and coordinate the efforts of all the media representative firms on its behalf.

Local sales agents are employed by local publications or radio and television stations and are responsible for sales in a local territory. For these sales agents, obtaining new accounts is an important part of the job, and they may spend much of their time traveling to and visiting prospective advertisers and current clients. During a sales call, they

discuss the client’s advertising needs and suggest how their products and services can meet those needs. A critical part of building a relationship with a client is to find out as much as possible about the client and its products. Sales agents inquire about the client’s current customers, prospective customers, and the geographic area of the target market.

During the first meeting with a client, sales agents gather background information and explain how specific types of advertising will help promote a client’s products or services most effectively. Next, the advertising sales agent prepares an advertising proposal to present to the client. This entails determining the advertising medium to be used, preparing sample advertisements, and providing clients with estimates of the cost of the proposal. Consolidation in the media industries has brought the sale of different types of advertising under one roof. Sales are increasingly made of integrated packages that include advertisements to be placed in print, online, and with a broadcast subsidiary.

After a contract has been established, advertising sales agents serve as the main contact between the client and the firm. They handle communication between the parties and assist the client in developing sample artwork or radio and television spots. They also arrange for commercial taping sessions and may accompany clients to the sessions.

Beyond selling, advertising sales agents have other duties as well. They analyze sales statistics, prepare reports, and handle the scheduling of their appointments and work hours. They read about new and existing products and monitor the sales, prices, and products of their competitors. In many firms, the advertising sales agent handles the drafting of contracts specifying the advertising work to be performed and its cost, as well as the billing and record-keeping for their customers’ accounts—which may include customer service responsibilities such as answering questions or addressing any problems the client may have with the proposal. Sales agents also are responsible for developing sales tools, promotional plans, and media kits, which they use to help make the sale.

Working Conditions

Selling can be stressful work because income and job security depend directly on the agent’s ability to maintain and expand clientele. Companies generally set monthly sales quotas and place considerable

Calling clients to obtain new accounts is important to an advertising sales agent’s success.

pressure on advertising sales agents to meet those quotas. The added stress of rejection places more pressure on the agent.

Many advertising sales agents work more than 40 hours per week. Although the hours are long and often irregular, most have the freedom to determine their own schedule. The Internet and other electronic tools allow agents to do more work from home or while on the road, enabling them to send messages and documents to clients and coworkers, keep up with industry news, and access databases that help them target potential customers. Advertising sales agents use e-mail to conduct much of the business with their clients. Use of e-mail has considerably shortened the time it takes to negotiate a sale and place the ad. Sales agents may accomplish more in less time, but many work more hours than in the past, spending additional time on follow-up and service calls.

Training, Other Qualifications, and Advancement

Some employers prefer applicants with a college degree, particularly for sales positions that require meeting with clients. Courses in marketing, leadership, communication, business, and advertising are helpful. For those who sell over the telephone or who have a proven record of successfully selling other products, a high school degree may be sufficient. After gaining entry into the occupation, successful sales experience becomes more important than education when looking for a position. In general, smaller companies are more willing to hire unproven individuals.

Personality traits are equally important as academic background. Because they represent their employers to the executives of client organizations, advertising sales agents must have excellent interpersonal and written communication skills. Employers look for applicants who possess a pleasant personality, honesty, and a neat professional appearance. Self-motivation, organization, persistence, independence, and the ability to multitask are required because advertising sales agents set their own schedules and perform their duties without much supervision.

Training takes place mainly on the job. In most cases, an experienced sales manager instructs a newly hired advertising sales agent who lacks sales experience. In this one-on-one environment, the supervisor typically coaches the new hire and observes as she makes sales calls and contacts clients. The supervisor then advises the new hire on ways to improve. To conduct more specialized training—for example, in selling to a particular market segment, such as real estate professionals or automotive dealers—the employer may bring in a consultant.

Advancement in the occupation means taking on bigger, more important clients. Agents with proven leadership ability and a strong sales record may advance to supervisory and managerial positions such as sales supervisor, sales manager, or vice president of sales. Frequent contact with managers of other departments and people in other firms provides sales agents with leads about job openings, enhancing advancement opportunities. In small firms, where the number of supervisory and management positions is limited, advancement may come slowly. Promotion may occur more quickly in large firms.

Employment

Advertising sales agents held over 154,000 jobs in 2004. Workers were concentrated in three industries: More than 3 in 10 jobs were in newspaper, periodical, book, and directory publishers; 3 in 10 in advertising and related services; and 2 in 10 in radio and television broadcasting. A relatively small number of jobs were found in specialized design services, including industrial and graphic designers; printing and related support activities; computer systems design and related services; business support services; and cable and other program distribution.

Employment was spread around the country, but jobs in larger, well-known publications or radio and television stations were concentrated in big cities. Media representative firms also were concentrated in large cities with many advertising agencies.

Part-time employment of advertising sales agents was most common in advertising and related services and less common in publishing and radio and television broadcasting. Self-employment also was more common in advertising and related services. Overall, relatively few advertising sales agents were self-employed.

Job Outlook

Employment of advertising sales agents is expected to grow about as fast as the average for all occupations through the year 2014 because of growth in population and advertising revenue. Rising demand for advertising sales agents also will stem from fast growth in cable systems and from the expansion of firms into the growing Hispanic market.

The industries employing advertising sales agents experienced considerable consolidation in recent years, and that trend is expected to continue over the next decade, although at a slower pace. This consolidation is not expected to affect employment of advertising sales agents significantly because prospective clients still will require sales agents to create and demonstrate advertising proposals. Technology has made advertising sales agents more productive, allowing them to take on additional duties and improve the quality of the services they provide, without substantially lessening overall demand. Productivity gains have occurred mostly in the accounting, proposal creation, and customer service responsibilities of sales agents, allowing them to provide improved services.

In addition to the job openings generated by employment growth, openings will occur each year because of the need to replace sales representatives who transfer to other occupations or leave the labor force. Each year, many advertising sales agents discover they are unable to earn enough money and leave the occupation. As a result, job opportunities should be good, especially for those with a college degree or a proven sales record.

Advertising revenues are sensitive to economic downturns, which cause the industries and companies that advertise to reduce both the frequency of campaigns and the overall level of spending on advertising. Advertising sales agents must work hard to get the most out of every dollar spent on advertising under these conditions. Therefore, the number of job opportunities for advertising sales agents fluctuates with the business cycle.

Earnings

Most employers pay a combination of salaries, commissions, and bonuses. Commissions are usually based on the amount of sales, whereas bonuses may depend on individual performance, on the performance of all sales workers in the group or district, or on the company's performance. For agents covering multiple areas or regions, commissions also may be based on the difficulty in making a sale in that particular area. Sales revenue is affected by the economic conditions and business expectations facing the industries that tend to advertise. Earnings from commissions are likely to be high when these industries are doing well, low when companies decide not to advertise as frequently.

Median annual earnings for all advertising sales agents were \$40,300 including commissions, in May 2004. The middle 50 percent earned between \$27,740 and \$59,880 a year. The lowest 10 percent earned less than \$20,210, and the highest 10 percent earned more than \$89,720 a year. Median annual earnings for sales agents in May 2004 in the industries employing the largest numbers of them were as follows:

Advertising and related services	\$44,900
Radio and television broadcasting	38,980
Newspaper, periodical, book, and directory publishers	35,090

In addition to their earnings, advertising sales agents usually are reimbursed for expenses such as transportation costs, meals, hotels, and entertaining customers. They often receive benefits such as health and life insurance, pension plans, vacation and sick leave, personal use of a company car, and frequent flier mileage. Some companies offer incentives such as free vacation trips or gifts for outstanding sales workers.

Related Occupations

Advertising sales agents must have sales ability and knowledge of their clients' needs and businesses. Workers in other occupations requiring these skills include advertising, marketing, promotions, public relations, and sales managers; insurance sales agents; purchasing managers, buyers, and purchasing agents; real estate brokers and sales agents; sales engineers; sales representatives, wholesale and manufacturing; and securities, commodities, and financial services sales agents.

Cashiers

(O*NET 41-2011.00, 41-2012.00)

Significant Points

- Cashiers are trained on the job; this occupation provides opportunities for many young people with no previous work experience.
- Nearly one-half of all cashiers work part time.
- Despite projected slower-than-average employment growth, good employment opportunities are expected because of the large number of workers who leave this occupation each year.
- Many cashiers start at minimum wage.

Nature of the Work

Supermarkets, department stores, gasoline service stations, movie theaters, restaurants, and many other businesses employ cashiers to register the sale of their merchandise. Most cashiers total bills, receive money, make change, fill out charge forms, and give receipts.

Although specific job duties vary by employer, cashiers usually are assigned to a register at the beginning of their shifts and are given drawers containing a specific amount of money with which to start—their “tills.” They must count their tills to ensure that they contain the correct amount of money and adequate supplies of change. Cashiers also handle returns and exchanges. They must ensure that returned merchandise is in good condition, and determine where and when it was purchased and what type of payment was used.

After entering charges for all items and subtracting the value of any coupons or special discounts, cashiers total the customer's bill and take payment. Acceptable forms of payment include cash, personal checks, credit cards, and debit cards. Cashiers must know

the store's policies and procedures for each type of payment the store accepts. For checks and charges, they may request additional identification from the customer or call in for an authorization. They must verify the age of customers purchasing alcohol or tobacco. When the sale is complete, cashiers issue a receipt to the customer and return the appropriate change. They may also wrap or bag the purchase.

At the end of their shifts, they once again count the drawers' contents and compare the totals with sales data. An occasional shortage of small amounts may be overlooked but, in many establishments, repeated shortages are grounds for dismissal. In addition to counting the contents of their drawers at the end of their shifts, cashiers usually separate and total charge forms, return slips, coupons, and any other noncash items.

Most cashiers now use scanners and computers, but some establishments still require price and product information to be entered manually. In a store with scanners, a cashier passes a product's Universal Product Code over the scanning device, which transmits the code number to a computer. The computer identifies the item and its price. In other establishments, cashiers manually enter codes into computers, and descriptions of the items and their prices appear on the screen.

Depending on the type of establishment, cashiers may have other duties as well. In many supermarkets, for example, cashiers weigh produce and bulk food, as well as return unwanted items to the shelves. In convenience stores, cashiers may be required to know how to use a variety of machines other than cash registers, and how to furnish money orders and sell lottery tickets. Operating ticket-dispensing machines and answering customers' questions are common duties for cashiers who work at movie theaters and ticket agencies. In casinos, *gaming change persons* and *booth cashiers* exchange coins and tokens and may issue payoffs. They may also operate a booth in the slot-machine area and furnish change persons with a money bank at the start of the shift, or count and audit money in drawers.

Working Conditions

Nearly one-half of all cashiers work part time. Hours of work often vary depending on the needs of the employer. Generally, cashiers are expected to work weekends, evenings, and holidays to accommodate customers' needs. However, many employers offer flexible schedules. Because the holiday season is the busiest time for most retailers, many employers restrict the use of vacation time from Thanksgiving through the beginning of January.

Cashiers handle money and interact with customers face-to-face.

Most cashiers work indoors, usually standing in booths or behind counters. In addition, they often are unable to leave their workstations without supervisory approval because they are responsible for large sums of money. The work of cashiers can be very repetitious, but improvements in workstation design are being made to combat problems caused by repetitive motion. In addition, the work can sometimes be dangerous; cashiers' risk from robberies and homicides is much higher than that of the total workforce, although more safety precautions are being taken to help deter robbers.

Gaming change persons and booth cashiers can expect a safer work environment than cashiers in other industries. However, casinos are not without their hazards such as exposure to fumes from cigarettes, cigars, and pipes and noise from slot machines.

Training, Other Qualifications, and Advancement

Cashier jobs tend to be entry-level positions requiring little or no previous work experience. Although there are no specific educational requirements, employers filling full-time jobs often prefer applicants with high school diplomas. Gaming change persons and booth cashiers are required to obtain a license and background check from their State's gaming board and must meet a certain age requirement, usually set at 21 years old.

Nearly all cashiers are trained on the job. In small businesses, an experienced worker often trains beginners. The trainee spends the first day observing the operation and becoming familiar with the store's equipment, policies, and procedures. After this, trainees are assigned to a register—frequently under the supervision of an experienced worker. In larger businesses, trainees spend several days in classes before being placed at cash registers. Topics typically covered in class include a description of the industry and the company, store policies and procedures, equipment operation, and security.

Training for experienced workers is not common, except when new equipment is introduced or when procedures change. In these cases, the employer or a representative of the equipment manufacturer trains workers on the job.

Persons who want to become cashiers should be able to do repetitious work accurately. They also need basic mathematics skills and good manual dexterity. Because cashiers deal constantly with the public, they should be neat in appearance and able to deal tactfully and pleasantly with customers. In addition, some businesses prefer to hire persons who can operate specialized equipment or who have business experience, such as typing, selling, or handling money. Advancement opportunities for cashiers vary. For those working part time, promotion may be to a full-time position. Others advance to head cashier or cash-office clerk. In addition, this job offers a good opportunity to learn about an employer's business and can serve as a steppingstone to a more responsible position.

Employment

Cashiers held about 3.5 million jobs in 2004. Of these, 29,000 were employed as gaming change persons and booth cashiers. Although cashiers are employed in almost every industry, 27 percent of all jobs were in food and beverage stores. Gasoline stations, department stores, other retail establishments, and restaurants also employed large numbers of these workers. Outside of retail establishments, many cashiers worked in amusement, gambling, and recreation industries, local government, and personal and laundry services. Because cashiers are needed in businesses and organizations of all types and sizes, job opportunities are found throughout the country.

Job Outlook

Opportunities for full-time and part-time cashier jobs should continue to be good, because of employment growth and the need to replace the large number of workers who transfer to other oc-

cupations or leave the labor force. There is substantial movement into and out of the occupation because education and training requirements are minimal, and the predominance of part-time jobs is attractive to people seeking a short-term source of income rather than a full-time career. Historically, workers under the age of 25 have filled many of the openings in this occupation—in 2004, almost fifty percent of all cashiers were 24 years of age or younger. Some establishments have begun hiring elderly and disabled persons to fill some of their job openings.

Cashier employment is expected to grow more slowly than the average for all occupations through the year 2014. The rising popularity of purchasing goods online may reduce the employment growth of cashiers, although many customers still prefer the traditional method of purchasing goods at stores. Also, the growing use of self-service check-out systems in retail trade, especially at grocery stores, should have an adverse effect on employment of cashiers. These self-checkout systems may outnumber checkouts with clerks in the future in many establishments. The impact on employment growth of cashiers will largely depend on the public's acceptance of the new self-service technology.

Job opportunities may vary from year to year, because the strength of the economy affects demand for cashiers. Companies tend to hire more persons for such jobs when the economy is strong. Seasonal demand for cashiers also causes fluctuations in employment.

Opportunities will be strong for gaming cashiers as more States legalize casinos and gaming becomes more popular. An increasing number of gaming venues and high turnover in this occupation will generate many job openings. However, many casinos are finding ways to use less cash in their operations, particularly the slot machines, which now generate tickets that can be accepted by other slot machines.

Earnings

Many cashiers start at the Federal minimum wage, which was \$5.15 an hour in 2005. Some State laws set the minimum wage higher, and establishments must pay at least that amount. Wages tend to be higher in areas in which there is intense competition for workers.

Median hourly earnings of cashiers, except gaming in May 2004 were \$7.81. The middle 50 percent earned between \$6.72 and \$9.10 an hour. The lowest 10 percent earned less than \$5.91, and the highest 10 percent earned more than \$11.30 an hour. Median hourly earnings in the industries employing the largest numbers of cashiers in May 2004 were:

Grocery stores	\$7.90
Department stores	7.89
Other general merchandise stores	7.85
Health and personal care stores.....	7.68
Gasoline stations	7.54

Median hourly earnings for gaming cashiers in May 2004 were \$9.87. The middle 50 percent earned between \$8.23 and \$11.74 an hour. The lowest 10 percent earned less than \$7.07, and the highest 10 percent earned more than \$13.51 an hour.

Benefits for full-time cashiers tend to be better than those for cashiers working part time. In addition to typical benefits, those working in retail establishments often receive discounts on purchases, and cashiers in restaurants may receive free or low-cost meals. Some employers also offer employee stock-option plans and education-reimbursement plans.

Related Occupations

Cashiers accept payment for the purchase of goods and services. Other workers with similar duties include tellers, counter and rental clerks, food and beverage serving and related workers, gaming cage

workers, Postal Service workers, and retail salespersons, all of whom are discussed elsewhere in the *Handbook*.

Counter and Rental Clerks

(O*NET 41-2021.00)

Significant Points

- Jobs primarily are entry level and require little or no experience and minimal formal education.
- Faster-than-average employment growth is expected as businesses strive to improve customer service.
- Part-time employment opportunities should be plentiful.

Nature of the Work

Whether renting videos, air compressors, or moving vans or dropping off clothes to be drycleaned or appliances to be serviced, customers rely on counter and rental clerks to handle their transactions efficiently. Although the specific duties of these workers vary by establishment, counter and rental clerks answer questions involving product availability, cost, and rental provisions. Counter and rental clerks also take orders, calculate fees, receive payments, and accept returned merchandise. (Cashiers and retail salespersons, two occupations with similar duties, are discussed elsewhere in the *Handbook*.)

Regardless of where they work, counter and rental clerks must be knowledgeable about the company's goods and services, policies, and procedures. Depending on the type of establishment, counter and rental clerks use their special knowledge to give advice on a wide variety of products and services, ranging from hydraulic tools to shoe repair. For example, in the car rental industry, these workers inform customers about the features of different types of automobiles and about daily and weekly rental costs. They also ensure that customers meet age and other requirements for renting cars, and they indicate when and in what condition the cars must be returned. Those in the equipment rental industry have similar duties but also must know how to operate and care for the machinery rented. In drycleaning establishments, counter clerks inform customers when items will be ready and about the effects, if any, of the chemicals used on garments. In video rental stores, counter clerks advise customers about the use of video and game players and the length of a rental, scan returned movies and games, restock shelves, handle money, and log daily reports.

When taking orders, counter and rental clerks use various types of equipment. In some establishments, they write out tickets and order forms, although most use computers or barcode scanners. Most of these computer systems are user friendly, require very little data entry, and are customized for each firm. Scanners read the product

code and display a description of the item on a computer screen. However, clerks must ensure that the data on the screen pertain to the product.

Working Conditions

Firms employing counter and rental clerks usually operate nights and weekends for the convenience of their customers. As a result, many employers offer flexible schedules. Some counter and rental clerks work 40-hour weeks, but about half are on part-time schedules—usually during rush periods, such as weekends, evenings, and holidays.

Working conditions usually are pleasant; most stores and service establishments are clean, well lighted, and temperature controlled. However, clerks are on their feet much of the time and may be confined behind a small counter area or may be required to move, lift, or carry heavy machinery or other equipment. The job requires constant interaction with the public and can be stressful, especially during busy periods.

Training, Other Qualifications, and Advancement

Most counter and rental clerk jobs are entry-level positions that require little or no experience and minimal formal education. However, many employers prefer workers with at least a high school diploma.

In video rental stores, counter clerks advise customers about the use of video and game players and the length of a rental, scan returned movies and games, restock shelves, handle money, and log daily reports.

In most companies, counter and rental clerks are trained on the job, sometimes through the use of videos, brochures, and pamphlets. Clerks usually learn how to operate a firm's equipment and become familiar with the firm's policies and procedures under the observation of a more experienced worker. However, some employers have formal classroom training programs lasting from a few hours to a few weeks. Topics covered in this training include the nature of the industry, the company and its policies and procedures, operation of equipment, sales techniques, and customer service. Counter and rental clerks also must become familiar with the different products and services rented or provided by their company to give customers the best possible service.

Counter and rental clerks should enjoy working with people and should have the ability to deal tactfully with difficult customers. They also should be able to handle several tasks at once, while continuing to provide friendly service. In addition, good oral and written communication skills are essential.

Advancement opportunities depend on the size and type of company. Many establishments that employ counter or rental clerks tend to be small businesses, making advancement difficult. In larger establishments, however, jobs such as counter and rental clerks offer good opportunities for workers to learn about their company's products and business practices. These jobs can lead to more responsible positions. It is common in many establishments to promote counter and rental clerks to event planner, assistant manager, or salesperson. Workers may choose to pursue related positions, such as mechanic, or even establish their own business.

In certain industries, such as equipment repair, counter and rental jobs may be an additional or alternative source of income for workers who are unemployed or semiretired. For example, retired mechanics could prove invaluable at tool rental centers because of their knowledge of, and familiarity with, tools.

Employment

Counter and rental clerks held 451,000 jobs in 2004. About 23 percent of clerks worked in consumer goods rental, which includes video rental stores. Other large employers included drycleaning and laundry services; automotive equipment rental and leasing services; automobile dealers; amusement, gambling, and recreation industries; and grocery stores.

Counter and rental clerks are employed throughout the country, but are concentrated in metropolitan areas, where personal services and renting and leasing services are in greater demand.

Job Outlook

Employment of counter and rental clerks is expected to increase faster than the average for all occupations through the year 2014, as all types of businesses strive to improve customer service by hiring more clerks. In addition, some industries employing counter and rental clerks—for example, rental and leasing services and amusement and recreation industries—are expected to grow rapidly. Nevertheless, most job openings will arise from the need to replace experienced workers who transfer to other occupations or leave the labor force. Part-time employment opportunities are expected to be plentiful.

Earnings

Counter and rental clerks typically start at the minimum wage, which, in establishments covered by Federal law, was \$5.15 an hour in 2004. In some States, the law sets the minimum wage higher, and establishments must pay at least that amount. Wages also tend to be higher in areas where there is intense competition for workers. In addition to wages, some counter and rental clerks receive

commissions, based on the number of contracts they complete or services they sell.

Median hourly earnings of counter and rental clerks in May 2004 were \$8.79. The middle 50 percent earned between \$7.21 and \$11.99 an hour. The lowest 10 percent earned less than \$6.15 an hour, and the highest 10 percent earned more than \$16.79 an hour. Median hourly earnings in the industries employing the largest number of counter and rental clerks in May 2004 were as follows:

Automobile dealers	\$17.87
Automotive equipment rental and leasing	10.42
Lessors of real estate	9.92
Consumer goods rental	7.78
Drycleaning and laundry services	7.62

Full-time workers typically receive health and life insurance, paid vacation, and sick leave. Benefits for counter and rental clerks who work part time or work for independent stores tend to be significantly less than for those who work full time. Many companies offer discounts to both full-time and part-time employees on the goods or services they provide.

Related Occupations

Counter and rental clerks take orders and receive payment for services rendered. Other workers with similar duties include tellers, cashiers, food and beverage serving and related workers, gaming cage workers, Postal Service workers, and retail salespersons.

Demonstrators, Product Promoters, and Models

(O*NET 41-9011.00, 41-9012.00)

Significant Points

- Job openings should be plentiful for demonstrators and product promoters, but keen competition is expected for modeling jobs.
- Most jobs are part time or have variable work schedules, and many jobs require frequent travel.
- Formal training and education requirements are limited.

Nature of the Work

Demonstrators, product promoters, and models create public interest in buying products such as clothing, cosmetics, food items, and housewares. The information they provide helps consumers make educated choices among the wide variety of products and services available.

Demonstrators and product promoters create public interest in buying a product by demonstrating it to prospective customers and answering their questions. They may sell the demonstrated mer-

Models often have to travel and go on location for shoots.

chandise, or gather names of prospects to contact at a later date or to pass on to a sales staff. *Demonstrators* promote sales of a product to consumers, while *product promoters* try to induce retail stores to sell particular products and market them effectively. Product demonstration is an effective technique used by both to introduce new products or promote sales of old products because it allows face-to-face interaction with potential customers.

Demonstrators and product promoters build current and future sales of both sophisticated and simple products, ranging from computer software to mops. They attract an audience by offering samples, administering contests, distributing prizes, and using direct-mail advertising. They must greet and catch the attention of possible customers and quickly identify those who are interested and qualified. They inform and educate customers about the features of products and demonstrate their use with apparent ease to inspire confidence in the product and its manufacturer. They also distribute information, such as brochures and applications. Some demonstrations are intended to generate immediate sales through impulse buying, while others are considered an investment to generate future sales and increase brand awareness.

Demonstrations and product promotions are conducted in retail and grocery stores, shopping malls, trade shows, and outdoor fairs. Locations are selected based on both the nature of the product and the type of audience. Demonstrations at large events may require teams of demonstrators to efficiently handle large crowds. Some demonstrators promote products on videotape or on television programs, such as “infomercials” or home shopping programs.

Demonstrators and product promoters may prepare the content of a presentation and alter it to target a specific audience or to keep it current. They may participate in the design of an exhibit or customize exhibits for particular audiences. Results obtained by demonstrators and product promoters are analyzed, and presentations are adjusted to make them more effective. Demonstrators and product promoters also may be involved in transporting, assembling, and disassembling materials used in demonstrations.

A demonstrator’s presentation may include visuals, models, case studies, testimonials, test results, and surveys. The equipment used for a demonstration varies with the product being demonstrated.

A food product demonstration might require the use of cooking utensils, while a software demonstration could require the use of a multimedia computer. Demonstrators must be familiar with the product to be able to relate detailed information to customers and to answer any questions that arise before, during, or after a demonstration. Therefore, they may research the product to be presented, the products of competitors, and the interests and concerns of the target audience before conducting a demonstration. Demonstrations of complex products can require practice.

Models pose for photos or as subjects for paintings or sculptures. They display clothing, such as dresses, coats, underclothing, swimwear, and suits, for a variety of audiences and in various types of media. They model accessories, such as handbags, shoes, and jewelry, and promote beauty products, including fragrances and cosmetics. The most successful models, called supermodels, hold celebrity status and often use their image to sell products such as books, calendars, and fitness videos. In addition to modeling, they may appear in movies and television shows.

Models’ clients use printed publications, live modeling, and television to advertise and promote products and services. There are different categories of modeling jobs within these media, and the nature of a model’s work may vary with each. Most modeling jobs are for printed publications, and models usually do a combination of editorial, commercial, and catalog work. Editorial print modeling uses still photographs of models for fashion magazine covers and to accompany feature articles, but does not include modeling for advertisements. Commercial print modeling includes work for advertisements in magazines and newspapers, and for outdoor advertisements such as billboards. Catalog models appear in department store and mail order catalogs.

During a photo shoot, a model poses to demonstrate the features of clothing and products. Models make small changes in posture and facial expression to capture the look desired by the client. As they shoot film, photographers instruct models to pose in certain positions and to interact with their physical surroundings. Models work closely with photographers, hair and clothing stylists, makeup artists, and clients to produce the desired look and to finish the photo shoot on schedule. Stylists and makeup artists prepare the model for the photo shoot, provide touchups, and change the look of models throughout the day. If stylists are not provided, models must apply their own makeup and bring their own clothing. Because the client spends time and money planning for and preparing an advertising campaign, the client usually is present to ensure that the work is satisfactory. The client also may offer suggestions.

Editorial printwork generally pays less than other types of modeling, but provides exposure for a model and can lead to commercial modeling opportunities. Often, beginning fashion models work in foreign countries where fashion magazines are more plentiful.

Live modeling is done in a variety of locations. Live models stand, turn, and walk to demonstrate clothing to a variety of audiences. At fashion shows and in showrooms, garment buyers are the primary audience. Runway models display clothes that either are intended for direct sale to consumers or are the artistic expressions of the designer. High fashion, or haute couture, runway models confidently walk a narrow runway before an audience of photographers, journalists, designers, and garment buyers. Live modeling also is done in apparel marts, department stores, and fitting rooms of clothing designers. In retail establishments, models display clothing directly for shoppers and may be required to describe the features and price of the clothing. Other models pose for sketching artists, painters, and sculptors.

Models may compete with actors and actresses for work in television and may even receive speaking parts. Television work includes commercials, cable television programs, and even game

shows. However, competition for television work is intense because of the potential for high earnings and extensive exposure.

Because advertisers need to target very specific segments of the population, models may specialize in a certain area. Petite and plus-size fashions are modeled by women whose dress size is smaller or larger than that worn by the typical model. Models who are disabled may be used to model fashions or products for disabled consumers. "Parts" models have a body part, such as a hand or foot, that is particularly well-suited to model products such as fingernail polish or shoes.

Almost all models work through agents. Agents provide a link between models and clients. Clients pay models, while the agency receives a portion of the model's earnings for its services. Agents scout for new faces, advise and train new models, and promote them to clients. A typical modeling job lasts only 1 day, so modeling agencies differ from other employment agencies in that they maintain an ongoing relationship with the model. Agents find and nurture relationships with clients, arrange auditions called "go-sees," and book shoots if a model is hired. They also provide bookkeeping and billing services to models and may offer them financial planning services. Relatively short careers and variable incomes make financial planning an important issue for many models.

With the help of agents, models spend a considerable amount of time promoting and developing themselves. Models assemble and maintain portfolios, print composite cards, and travel to go-sees. A portfolio is a collection of a model's previous work that is carried to all go-sees and bookings. A composite card, or comp card, contains the best photographs from a model's portfolio, along with his or her measurements.

Models must gather information before a job. From an agent, they learn the pay, date, time, and length of the shoot. Also, models need to ask if hair, makeup, and clothing stylists will be provided. It is helpful to know what product is being promoted and what image they should project. Some models research the client and the product being modeled to prepare for a shoot. Models use a document called a voucher to record the rate of pay and the actual duration of the job. The voucher is used for billing purposes after both the client and model sign it. Once a job is completed, models must check in with their agency and plan for the next appointment.

Working Conditions

More than half of all demonstrators, product promoters, and models work part time and about 1 in 4 have variable work schedules. Many positions last 6 months or less.

Demonstrators and product promoters may work long hours while standing or walking, with little opportunity to rest. Some of them travel frequently, and night and weekend work often is required. The atmosphere of a crowded trade show or State fair is often hectic, and demonstrators and product promoters may feel pressure to influence the greatest number of consumers possible in a very limited amount of time. However, many enjoy the opportunity to interact with a variety of people.

Models work under a variety of conditions, which can often be both difficult and glamorous. The coming season's fashions may be modeled in a comfortable, climate-controlled studio or in a cold, damp outdoor location. Schedules can be demanding, and models must keep in constant touch with an agent so that they do not miss an opportunity for work. Being away from friends and family, and needing to focus on the photographer's instructions despite constant interruption for touchups, clothing, and set changes can be stressful. Yet, successful models interact with a variety of people and enjoy frequent travel. They may meet potential clients at several go-sees in one day and often travel to work in distant cities, foreign countries, and exotic locations.

Training, Other Qualifications, and Advancement

Formal training and education requirements are limited for demonstrators, product promoters, and models. Training usually is moderate term, lasting a month or more. Postsecondary education, while helpful, usually is not required: only 1 in 5 of these workers has a bachelor's degree or higher.

Demonstrators and product promoters usually receive on-the-job training. Training is primarily product oriented because a demonstrator must be familiar with the product to demonstrate it properly. The length of training varies with the complexity of the product. Experience with the product or familiarity with similar products may be required for demonstration of complex products, such as computers. During the training process, demonstrators may be introduced to the manufacturer's corporate philosophy and preferred methods for dealing with customers.

Employers look for demonstrators and product promoters with good communication skills and a pleasant appearance and personality. Demonstrators and product promoters must be comfortable with public speaking. They should be able to entertain an audience and use humor, spontaneity, and personal interest in the product as promotional tools. Foreign language skills are helpful.

While no formal training is required to begin a modeling career, models should be photogenic and have a basic knowledge of hair styling, makeup, and clothing. Some local governments require models under the age of 18 to hold a work permit. An attractive physical appearance is necessary to become a successful model. A model should have flawless skin, healthy hair, and attractive facial features. Specific requirements depend on the client, but most models must be within certain ranges for height, weight, and dress or coat size in order to meet the practical needs of fashion designers, photographers, and advertisers. Requirements may change slightly from time to time as our society's perceptions about physical beauty change; however, most fashion designers feel that their clothing looks its best on tall, thin models. Although physical requirements may be relaxed for some types of modeling jobs, opportunities are limited for those who do not meet these basic requirements.

Because a model's career depends on preservation of his or her physical characteristics, models must control their diet, exercise regularly, and get enough sleep in order to stay healthy. Haircuts, pedicures, and manicures are necessary work-related expenses for models.

In addition to being attractive, models must be photogenic. The ability to relate to the camera in order to capture the desired look on film is essential, and agents test prospective models using snapshots or professional photographs. For photographic and runway work, models must be able to move gracefully and confidently. Training in acting, voice, and dance is useful and allows a model to be considered for television work. Foreign language skills are useful because successful models travel frequently to foreign countries.

Because models must interact with a large number of people, personality plays an important role in success. Models must be professional, polite, and prompt; every contact could lead to future employment. Organizational skills are necessary to manage personal lives, financial matters, and busy work and travel schedules. Because competition for jobs is stiff and clients' needs are very specific, patience and persistence are essential.

Modeling schools provide training in posing, walking, makeup application, and other basic tasks, but attending such schools does not necessarily lead to job opportunities. In fact, many agents prefer beginning models with little or no previous experience and discourage models from attending modeling schools and purchasing professional photographs. A model's selection of an agency is an important factor for advancement in the occupation. The better the reputation and skill of the agency, the more assignments a model is likely to get. Because

clients prefer to work with agents, it is very difficult for a model to pursue a freelance career.

Agents continually scout for new faces, and many of the top models are discovered in this way. Most agencies review snapshots or have “open calls”, during which models are seen in person; this service usually is provided free of charge. Some agencies sponsor modeling contests and searches. Very few people who send in snapshots or attend open calls are offered contracts.

Agencies advise models on how to dress, wear makeup, and conduct themselves properly during go-sees and bookings. Because models’ advancement depends on their previous work, development of a good portfolio is key to getting assignments. Models accumulate and display current tear sheets—examples of a model’s editorial print work—and photographs in the portfolio. The higher the quality and currency of the photos in the portfolio, the more likely it is that the model will find work.

Demonstrators and product promoters who perform well and show leadership ability may advance to other marketing and sales occupations or open their own businesses. Because modeling careers are relatively short, most models eventually transfer to other occupations.

Employment

Demonstrators, product promoters, and models held about 120,000 jobs in 2004. Of these, models held only about 2,200 jobs in 2004. About 23 percent of all salaried jobs for demonstrators, product promoters, and models were in retail trade, especially general merchandise stores, and 14 percent were in administrative and support services—which includes employment services. Other jobs were found in advertising and related services.

Demonstrator and product promoter jobs may be found in communities throughout the Nation, but modeling jobs are concentrated in New York, Chicago, Miami, and Los Angeles.

Job Outlook

Employment of demonstrators, product promoters, and models is expected to grow about as fast as the average for all occupations through 2014. Job growth should be driven by increases in the number and size of trade shows and greater use of these workers in department stores and various retail shops for in-store promotions. Additional job openings will arise from the need to replace demonstrators, product promoters, and models that transfer to other occupations, retire, or stop working for other reasons.

Job openings should be plentiful for demonstrators and product promoters. Employers may have difficulty finding qualified demonstrators who are willing to fill part-time, short-term positions. Product demonstration is considered a very effective marketing tool. New jobs should arise as firms devote a greater percentage of marketing budgets to product demonstration.

On the other hand, modeling is considered a glamorous occupation, with limited formal entry requirements. Consequently, those who wish to pursue a modeling career can expect keen competition for jobs. The modeling profession typically attracts many more jobseekers than there are job openings available. Only models who closely meet the unique requirements of the occupation will achieve regular employment. The increasing diversification of the general population should boost demand for models more representative of diverse racial and ethnic groups. Work for male models also should increase as society becomes more receptive to the marketing of men’s fashions. Because fashions change frequently, demand for a model’s look may fluctuate. Most models experience periods of unemployment.

Employment of demonstrators, product promoters, and models is affected by downturns in the business cycle. Many firms tend to reduce advertising budgets during recessions.

Earnings

Demonstrators and product promoters had median hourly earnings of \$9.95 in May 2004. The middle 50 percent earned between \$8.18 and \$13.29. The lowest 10 percent earned less than \$7.25, and the highest 10 percent earned more than \$20.08. Employers of demonstrators, product promoters, and models generally pay for job-related travel expenses.

Median hourly earnings of models were \$10.50 in May 2004. The middle 50 percent earned between \$8.44 and \$14.34. The lowest 10 percent earned less than \$7.16, and the highest 10 percent earned more than \$17.17. Earnings vary for different types of modeling, and depend on the experience and reputation of the model. Female models typically earn more than male models for similar work. Hourly earnings can be relatively high, particularly for supermodels and others in high demand, but models may not have work every day, and jobs may last only a few hours. Models occasionally receive clothing or clothing discounts instead of, or in addition to, regular earnings. Almost all models work with agents, and pay 15 to 20 percent of their earnings in return for an agent’s services. Models who do not find immediate work may receive payments, called advances, from agents to cover promotional and living expenses. Models must provide their own health and retirement benefits.

Related Occupations

Demonstrators, product promoters, and models create public interest in buying clothing, products, and services. Others who create interest in a product or service include actors, producers, and directors; insurance sales agents; real estate brokers; retail salespersons; sales representatives, wholesale and manufacturing; and reservation and transportation ticket agents and travel clerks.

Sources of Additional Information

For information about modeling schools and agencies in your area, contact a local consumer affairs organization such as the Better Business Bureau.

Insurance Sales Agents

(O*NET 41-3021.00)

Significant Points

- Agents increasingly offer comprehensive financial planning services, including retirement and estate planning; as a result, in addition to offering insurance policies, agents sell mutual funds, annuities, and securities.
- Agents must obtain a license in the States where they plan to do their selling.
- Despite slower than average growth, job opportunities should be good for college graduates who have sales ability, excellent interpersonal skills, and expertise in a wide range of insurance and financial services.
- Successful agents often have high earnings, but many beginning agents fail to earn enough from commissions to meet their income goals and eventually transfer to other careers.

Nature of the Work

Most people have their first contact with an insurance company through an insurance sales agent. These workers help individuals, families, and businesses select insurance policies that

An increasing number of insurance sales agents offer comprehensive financial planning services to their clients.

provide the best protection for their lives, health, and property. Insurance sales agents who work exclusively for one insurance company are referred to as captive agents. Independent insurance agents, or brokers, represent several companies and place insurance policies for their clients with the company that offers the best rate and coverage. In either case, agents prepare reports, maintain records, seek out new clients, and, in the event of a loss, help policyholders settle their insurance claims. Increasingly, some are also offering their clients financial analysis or advice on ways the clients can minimize risk.

Insurance sales agents, commonly referred to as “producers” in the insurance industry, sell one or more types of insurance, such as property and casualty, life, health, disability, and long-term care. Property and casualty insurance agents sell policies that protect individuals and businesses from financial loss resulting from automobile accidents, fire, theft, storms, and other events that can damage property. For businesses, property and casualty insurance can also cover injured workers’ compensation, product liability claims, or medical malpractice claims.

Life insurance agents specialize in selling policies that pay beneficiaries when a policyholder dies. Depending on the policyholder’s circumstances, a cash-value policy can be designed to provide retirement income, funds for the education of children, or other benefits. Life insurance agents also sell annuities that promise a retirement income. Health insurance agents sell health insurance policies that cover the costs of medical care and loss of income due to illness or injury. They also may sell dental insurance and short-term and long-term-disability insurance policies.

An increasing number of insurance sales agents are offering comprehensive financial planning services to their clients, such as retirement planning, estate planning, or assistance in setting up pension plans for businesses. As a result, many insurance agents are involved in “cross-selling” or “total account development.” Besides offering insurance, these agents may become licensed to sell mutual funds, variable annuities, and other securities. This practice is most common with life insurance agents who already sell annuities; however, property and casualty agents also sell financial products.

(See the statement on securities, commodities, and financial services sales agents elsewhere in the *Handbook*.)

Technology has greatly affected the insurance agency, making it much more efficient and giving the agent the ability to take on more clients. Agents’ computers are now linked directly to the insurance carriers via the Internet, making the tasks of obtaining price quotes and processing applications and service requests faster and easier. Computers also allow agents to be better informed about new products that the insurance carriers may be offering.

The growth of the Internet in the insurance industry is gradually altering the relationship between agent and client. In the past, agents devoted much of their time to marketing and selling products to new clients, a practice that is now changing. Increasingly, clients are obtaining insurance quotes from a company’s Web site and then contacting the company directly to purchase policies. This interaction gives the client a more active role in selecting a policy at the best price, while reducing the amount of time agents spend actively seeking new clients. Because insurance sales agents also obtain many new accounts through referrals, it is important that they maintain regular contact with their clients to ensure that the clients’ financial needs are being met. Developing a satisfied clientele that will recommend an agent’s services to other potential customers is a key to success in this field.

Increasing competition in the insurance industry has spurred carriers and agents to find new ways to keep their clients satisfied. One solution is to increase the use of call centers, which usually are accessible to clients 24 hours a day, 7 days a week. Insurance carriers and sales agents also are hiring customer service representatives to handle routine tasks such as answering questions, making changes in policies, processing claims, and selling more products to clients. The opportunity to cross-sell new products to clients will help agents’ businesses grow. The use of call centers also allows agents to concentrate their efforts on seeking out new clients and maintaining relationships with old ones. (See separate *Handbook* statements on customer service representatives and on claims adjusters, appraisers, examiners, and investigators.)

Working Conditions

Most insurance sales agents are based in small offices, from which they contact clients and provide information on the policies they sell. However, much of their time may be spent outside their offices, traveling locally to meet with clients, close sales, or investigate claims. Agents usually determine their own hours of work and often schedule evening and weekend appointments for the convenience of clients. Although most agents work a 40-hour week, some work 60 hours a week or longer. Commercial sales agents, in particular, may meet with clients during business hours and then spend evenings doing paperwork and preparing presentations to prospective clients.

Training, Other Qualifications, and Advancement

For insurance sales agent jobs, most companies and independent agencies prefer to hire college graduates—especially those who have majored in business or economics. High school graduates are occasionally hired if they have proven sales ability or have been successful in other types of work. In fact, many entrants to insurance sales agent jobs transfer from other occupations. In selling commercial insurance, technical experience in a particular field can help sell policies to those in the same profession. As a result, new agents tend to be older than entrants in many other occupations.

College training may help agents grasp the technical aspects of insurance policies and the fundamentals and procedures of selling insurance. Many colleges and universities offer courses in insurance, and a few schools offer a bachelor’s degree in the field.

College courses in finance, mathematics, accounting, economics, business law, marketing, and business administration enable insurance sales agents to understand how social and economic conditions relate to the insurance industry. Courses in psychology, sociology, and public speaking can prove useful in improving sales techniques. In addition, because computers provide instantaneous information on a wide variety of financial products and greatly improve agents' efficiency, familiarity with computers and popular software packages has become very important.

Insurance sales agents must obtain a license in the States where they plan to do their selling. Separate licenses are required for agents to sell life and health insurance and property and casualty insurance. In most States, licenses are issued only to applicants who complete specified prelicensing courses and who pass State examinations covering insurance fundamentals and State insurance laws. The insurance industry is increasingly moving toward uniform State licensing standards and reciprocal licensing, allowing agents who earn a license in one State to become licensed in other States upon passing the appropriate courses and examination.

A number of organizations offer professional designation programs that certify one's expertise in specialties such as life, health, and property and casualty insurance, as well as financial consulting. For example, The National Alliance for Education and Research offers a wide variety of courses in health, life and property, and casualty insurance for independent insurance agents. Although voluntary, such programs assure clients and employers that an agent has a thorough understanding of the relevant specialty. Agents are usually required to complete a specified number of hours of continuing education to retain their designation.

Employers also are placing greater emphasis on continuing professional education as the diversity of financial products sold by insurance agents increases. It is important for insurance agents to keep up to date on issues concerning clients. Changes in tax laws, government benefits programs, and other State and Federal regulations can affect the insurance needs of clients and the way in which agents conduct business. Agents can enhance their selling skills and broaden their knowledge of insurance and other financial services by taking courses at colleges and universities and by attending institutes, conferences, and seminars sponsored by insurance organizations. Most State licensing authorities also have mandatory continuing education requirements focusing on insurance laws, consumer protection, and the technical details of various insurance policies.

As the demand for financial products and financial planning increases, many insurance agents are choosing to gain the proper licensing and certification to sell securities and other financial products. Doing so, however, requires substantial study and passing an additional examination—either the Series 6 or Series 7 licensing exam, both of which are administered by the National Association of Securities Dealers (NASD). The Series 6 exam is for individuals who wish to sell only mutual funds and variable annuities, whereas the Series 7 exam is the main NASD series license that qualifies agents as general securities sales representatives. In addition, to further demonstrate competency in the area of financial planning, many agents find it worthwhile to earn the certified financial planner or chartered financial consultant designation. The Certified Financial Planner credential issued by the Certified Financial Planner Board of Standards, requires relevant experience, completion of education requirements, passing a comprehensive examination, and adherence to an enforceable code of ethics. The CFP exams test the candidate's knowledge of the financial planning process, insurance and risk management, employee benefits planning, taxes and retirement planning, and investment and estate planning. The Chartered Financial Consultant (ChFC) designation, issued by the American

College in Bryn Mawr, Pennsylvania, which requires experience and the completion of an eight-course program of study. The CFP and ChFC designation and other professional designations have continuing education requirements.

Insurance sales agents should be flexible, enthusiastic, confident, disciplined, hard working, and willing to solve problems. They should communicate effectively and inspire customer confidence. Because they usually work without supervision, sales agents must be able to plan their time well and have the initiative to locate new clients.

An insurance sales agent who shows ability and leadership may become a sales manager in a local office. A few advance to agency superintendent or executive positions. However, many who have built up a good clientele prefer to remain in sales work. Some—particularly in the property and casualty field—establish their own independent agencies or brokerage firms.

Employment

Insurance sales agents held about 400,000 jobs in 2004. Most insurance sales agents employed in wage and salary positions work for insurance agencies and brokerages. A decreasing number work directly for insurance carriers. Although most insurance agents specialize in life and health insurance or property and casualty insurance, a growing number of “multiline” agents sell all lines of insurance. A small number of agents work for banks and securities brokerages as a result of the increasing integration of finance and insurance industries. Approximately 1 out of 4 insurance sales agents is self-employed.

Insurance sales agents are employed throughout the country, but most work in or near large urban centers. Some are employed in the headquarters of insurance companies, but the majority work out of local offices or independent agencies.

Job Outlook

Although employment of insurance sales agents is expected to grow more slowly than the average for all occupations through 2014, opportunities will be favorable for college graduates who have sales ability, excellent interpersonal skills, and expertise in a wide range of insurance and financial services. Multilingual agents also should be in high demand because they can serve a wider range of customers. Insurance language tends to be quite technical, so it is important for insurance sales agents to have a firm understanding of relevant technical and legal terms. Many beginning agents fail to earn enough from commissions to meet their income goals and eventually transfer to other careers. Most job openings are likely to result from the need to replace agents who leave the occupation or retire. A large number of agents are expected to retire over the next decade.

Future demand for insurance sales agents depends largely on the volume of sales of insurance and other financial products. Sales of health insurance and long-term-care insurance are expected to rise sharply as the population ages. In addition, a growing population will increase demand for insurance for automobiles, homes, and high-priced valuables and equipment. As new businesses emerge and existing firms expand their insurance coverage, sales of commercial insurance also should increase, including coverage such as product liability, workers' compensation, employee benefits, and pollution liability insurance.

Employment of agents will not keep up with the rising level of insurance sales, however. Many insurance carriers are trying to contain costs. As a result, many are shedding their captive agents—those agents working directly for insurance carriers—and are relying more on independent agents or direct marketing through the mail, by phone, or on the Internet.

Agents who incorporate new technology into their existing businesses will remain competitive. Agents who use the Internet to market their products will reach a broader client base and expand their businesses, but because most clients value their relationship with their agent, the Internet should not threaten jobs, given that many individuals still prefer discussing their policies directly with their agents, rather than through a computer. Also, the automation of policy and claims processing is allowing insurance agents to take on more clients.

Agents may face increased competition from traditional securities brokers and bankers as they begin to sell insurance policies. Because of increasing consolidation among insurance companies, banks, and brokerage firms, and due to increasing demands from clients for more comprehensive financial planning, insurance sales agents will need to expand the products and services they offer.

Agents who offer better customer service also will remain competitive. Call centers are another important way carriers and agents are offering better service to customers, because such centers provide greater access to their policies and more prompt services.

Insurance and investments are becoming more complex, and many people and businesses lack the time and expertise to buy insurance without the advice of an agent. Moreover, most individuals and businesses consider insurance a necessity, regardless of economic conditions. Therefore, agents are not likely to face unemployment because of a recession.

Earnings

The median annual earnings of wage and salary insurance sales agents were \$41,720 in May 2004. The middle 50 percent earned between \$29,980 and \$66,160. The lowest 10 percent had earnings of \$23,170 or less, while the highest 10 percent earned more than \$108,800. Median annual earnings in May 2004 in the two industries employing the largest number of insurance sales agents were \$42,010 for insurance carriers, and \$41,840 for agencies, brokerages, and other insurance related activities.

Many independent agents are paid by commission only, whereas sales workers who are employees of an agency or an insurance carrier may be paid in one of three ways—salary only, salary plus commission, or salary plus bonus. In general, commissions are the most common form of compensation, especially for experienced agents. The amount of the commission depends on the type and amount of insurance sold and on whether the transaction is a new policy or a renewal. Bonuses usually are awarded when agents meet their sales goals or when an agency meets its profit goals. Some agents involved with financial planning receive a fee for their services, rather than a commission.

Company-paid benefits to insurance sales agents usually include continuing education, training to qualify for licensing, group insurance plans, office space, and clerical support services. Some companies also may pay for automobile and transportation expenses, attendance at conventions and meetings, promotion and marketing expenses, and retirement plans. Independent agents working for insurance agencies receive fewer benefits, but their commissions may be higher to help them pay for marketing and other expenses.

Related Occupations

Other workers who provide or sell financial products or services include real estate sales agents and brokers; securities, commodities, and financial services sales agents; financial analysts and personal financial advisors; and financial managers. Other occupations in the insurance industry include insurance underwriters; claims adjusters, examiners, and investigators.

Sources of Additional Information

Occupational information about insurance sales agents is available from the home office of many insurance companies. Information on State licensing requirements may be obtained from the department of insurance at any State capital.

Real Estate Brokers and Sales Agents

(O*NET 41-9021.00, 41-9022.00)

Significant Points

- Real estate brokers and sales agents often work evenings and weekends and usually are on call to suit the needs of clients.
- A license is required in every State and the District of Columbia.
- Although gaining a job may be relatively easy, beginning workers may face competition from well-established, more experienced agents and brokers in obtaining listings and in closing an adequate number of sales.
- Employment is sensitive to swings in the economy, especially interest rates; during periods of declining economic activity and increasing interest rates, the volume of sales and the resulting demand for sales workers fall.

Nature of the Work

One of the most complex and significant financial events in peoples' lives is the purchase or sale of a home or investment property. Because of this complexity and significance, people typically seek the help of real estate brokers and sales agents when buying or selling real estate.

Real estate brokers and sales agents have a thorough knowledge of the real estate market in their communities. They know which neighborhoods will best fit clients' needs and budgets. They are familiar with local zoning and tax laws and know where to obtain financing. Agents and brokers also act as intermediaries in price negotiations between buyers and sellers.

Real estate agents usually are independent sales workers who provide their services to a licensed real estate broker on a contract basis. In return, the broker pays the agent a portion of the commission earned from the agent's sale of the property. Brokers are independent businesspeople who sell real estate owned by others; they also may

rent or manage properties for a fee. When selling real estate, brokers arrange for title searches and for meetings between buyers and sellers during which the details of the transactions are agreed upon and the new owners take possession of the property. A broker may help to arrange favorable financing from a lender for the prospective buyer; often, this makes the difference between success and failure in closing a sale. In some cases, brokers and agents assume primary responsibility for closing sales; in others, lawyers or lenders do. Brokers supervise agents who may have many of the same job duties. Brokers also supervise their own offices, advertise properties, and handle other business matters. Some combine other types of work, such as selling insurance or practicing law, with their real estate business.

Besides making sales, agents and brokers must have properties to sell. Consequently, they spend a significant amount of time obtaining listings—agreements by owners to place properties for sale with the firm. When listing a property for sale, agents and brokers compare the listed property with similar properties that recently sold, in order to determine a competitive market price for the property. Once the property is sold, both the agent who sold it and the agent who obtained the listing receive a portion of the commission. Thus, agents who sell a property that they themselves have listed can increase their commission.

Most real estate brokers and sales agents sell residential property. A small number—usually employed in large or specialized firms—sell commercial, industrial, agricultural, or other types of real estate. Every specialty requires knowledge of that particular type of property and clientele. Selling or leasing business property requires an understanding of leasing practices, business trends, and the location of the property. Agents who sell or lease industrial properties must know about the region's transportation, utilities, and labor supply. Whatever the type of property, the agent or broker must know how to meet the client's particular requirements.

Before showing residential properties to potential buyers, agents meet with them to get a feeling for the type of home the buyers would like. In this prequalifying phase, the agent determines how much the buyers can afford to spend. In addition, the agent and the buyer usually sign a loyalty contract which states that the agent will be the only one to show houses to buyers. An agent or broker then generates lists of properties for sale, their location and description, and available sources of financing. In some cases, agents and brokers use computers to give buyers a virtual tour of properties in which they are interested. With a computer, buyers can view interior and exterior images or floor plans without leaving the real estate office.

Real estate brokers and sales agents have a thorough knowledge of the real estate market in their communities.

Agents may meet several times with prospective buyers to discuss and visit available properties. Agents identify and emphasize the most pertinent selling points. To a young family looking for a house, they may emphasize the convenient floor plan, the area's low crime rate, and the proximity to schools and shopping centers. To a potential investor, they may point out the tax advantages of owning a rental property and the ease of finding a renter. If bargaining over price becomes necessary, agents must follow their client's instructions carefully and may have to present counteroffers in order to get the best possible price.

Once both parties have signed the contract, the real estate broker or agent must make sure that all special terms of the contract are met before the closing date. For example, the agent must make sure that the mandated and agreed-upon inspections, including that of the home and termite and radon inspections, take place. Also, if the seller agrees to any repairs, the broker or agent must see that they are made. Increasingly, brokers and agents are handling environmental problems as well, by making sure that the properties they sell meet environmental regulations. For example, they may be responsible for dealing with lead paint on the walls. While loan officers, attorneys, or other persons handle many details, the agent must ensure that they are carried out.

Working Conditions

Advances in telecommunications and the ability to retrieve data about properties over the Internet allow many real estate brokers and sales agents to work out of their homes instead of real estate offices. Even with this convenience, much of the time of these workers is spent away from their desks—showing properties to customers, analyzing properties for sale, meeting with prospective clients, or researching the state of the market.

Agents and brokers often work more than a standard 40-hour week. They usually work evenings and weekends and are always on call to suit the needs of clients. Although the hours are long and frequently irregular, most agents and brokers have the freedom to determine their own schedule. Consequently, they can arrange their work so that they can have time off when they want it. Business usually is slower during the winter season.

Training, Other Qualifications, and Advancement

In every State and the District of Columbia, real estate brokers and sales agents must be licensed. Prospective agents must be high school graduates, be at least 18 years old, and pass a written test. The examination—more comprehensive for brokers than for agents—includes questions on basic real estate transactions and laws affecting the sale of property. Most States require candidates for the general sales license to complete between 30 and 90 hours of classroom instruction. Those seeking a broker's license need between 60 and 90 hours of formal training and a specific amount of experience selling real estate, usually 1 to 3 years. Some States waive the experience requirements for the broker's license for applicants who have a bachelor's degree in real estate.

State licenses typically must be renewed every 1 or 2 years; usually, no examination needs to be taken. However, many States require continuing education for license renewals. Prospective agents and brokers should contact the real estate licensing commission of the State in which they wish to work in order to verify the exact licensing requirements.

As real estate transactions have become more legally complex, many firms have turned to college graduates to fill positions. A large number of agents and brokers have some college training. College courses in real estate, finance, business administration, statistics, economics, law, and English are helpful. For those who intend to start their own company, business courses such as marketing and accounting are as significant as courses in real estate or finance.

Personality traits are equally as important as one's academic background. Brokers look for applicants who possess a pleasant personality, are honest, and present a neat appearance. Maturity, good judgment, trustworthiness, and enthusiasm for the job are required in order to encourage prospective customers in this highly competitive field. Agents should be well organized, be detail oriented, and have a good memory for names, faces, and business particulars.

Those interested in jobs as real estate agents often begin in their own communities. Their knowledge of local neighborhoods is a clear advantage. Under the direction of an experienced agent, beginners learn the practical aspects of the job, including the use of computers to locate or list available properties and identify sources of financing.

Many firms offer formal training programs for both beginners and experienced agents. Larger firms usually offer more extensive programs than smaller firms. More than a thousand universities, colleges, and junior colleges offer courses in real estate. At some, a student can earn an associate's or bachelor's degree with a major in real estate; several offer advanced degrees. Many local real estate associations that are members of the National Association of Realtors sponsor courses covering the fundamentals and legal aspects of the field. Advanced courses in mortgage financing, property development and management, and other subjects also are available.

Advancement opportunities for agents may take the form of higher rates of commission. As agents gain knowledge and expertise, they become more efficient in closing a greater number of transactions and increase their earnings. In many large firms, experienced agents can advance to sales manager or general manager. Persons who have received their broker's license may open their own offices. Others with experience and training in estimating property value may become real estate appraisers, and people familiar with operating and maintaining rental properties may become property managers. (See the *Handbook* statements on property, real estate, and community association managers; and appraisers and assessors of real estate.) Experienced agents and brokers with a thorough knowledge of business conditions and property values in their localities may enter mortgage financing or real estate investment counseling.

Employment

In 2004, real estate brokers and sales agents held about 460,000 jobs; real estate sales agents held approximately 24 percent of these jobs. Many worked part time, combining their real estate activities with other careers. About 6 out of 10 real estate agents and brokers were self-employed. Real estate is sold in all areas, but employment is concentrated in large urban areas and in rapidly growing communities.

Most real estate firms are relatively small; indeed, some are one-person businesses. By contrast, some large real estate firms have several hundred agents operating out of numerous branch offices. Many brokers have franchise agreements with national or regional real estate organizations. Under this type of arrangement, the broker pays a fee in exchange for the privilege of using the more widely known name of the parent organization. Although franchised brokers often receive help in training sales staff and running their offices, they bear the ultimate responsibility for the success or failure of their firms.

Real estate brokers and sales agents are older, on average, than most other workers. Historically, many homemakers and retired persons were attracted to real estate sales by the flexible and part-time work schedules characteristic of the field. These individuals could enter, leave, and later return to the occupation, depending on the strength of the real estate market, their family responsibilities, or other personal circumstances. Recently, however, the attractiveness of part-time real estate work has declined, as increasingly complex

legal and technological requirements are raising startup costs associated with becoming an agent.

Job Outlook

Employment of real estate brokers and sales agents is expected to grow about as fast as the average for all occupations through the year 2014, because of the increasing housing needs of a growing population, as well as the perception that real estate is a good investment. Relatively low interest rates should continue to stimulate sales of real estate, resulting in the need for more agents and brokers. In addition, a large number of job openings will arise each year from the need to replace workers who transfer to other occupations or leave the labor force. However, job growth will be somewhat limited by the increasing use of technology, which is improving the productivity of agents and brokers. For example, prospective customers often can perform their own searches for properties that meet their criteria by accessing real estate information on the Internet. The increasing use of technology is likely to be more detrimental to part-time or temporary real estate agents than to full-time agents, because part-time agents generally are not able to compete with full-time agents who have invested in new technology. Changing legal requirements, such as disclosure laws, also may dissuade some who are not serious about practicing full time from continuing to work part time.

This occupation is relatively easy to enter and is attractive because of its flexible working conditions; the high interest in, and familiarity with, local real estate markets that entrants often have; and the potential for high earnings. Therefore, although gaining a job as a real estate agent or broker may be relatively easy, beginning agents and brokers may face competition from their well-established, more experienced counterparts in obtaining listings and in closing an adequate number of sales. Well-trained, ambitious people who enjoy selling—particularly those with extensive social and business connections in their communities—should have the best chance for success.

Employment of real estate brokers and sales agents often is sensitive to swings in the economy, especially interest rates. During periods of declining economic activity and increasing interest rates, the volume of sales and the resulting demand for sales workers falls. As a result, the earnings of agents and brokers decline, and many work fewer hours or leave the occupation altogether.

Earnings

The median annual earnings of salaried real estate sales agents, including commissions, were \$35,670 in May 2004. The middle 50 percent earned between \$23,500 and \$58,110 a year. The lowest 10 percent earned less than \$17,600, and the highest 10 percent earned more than \$92,770. Median hourly earnings in the industries employing the largest number of real estate sales agents in May 2004 were as follows:

Residential building construction	\$54,770
Offices of real estate agents and brokers.....	37,970
Activities related to real estate	32,460
Lessors of real estate	25,840

Median annual earnings of salaried real estate brokers, including commission, were \$58,720 in May 2004. The middle 50 percent earned between \$33,480 and \$99,820 a year. Median annual earnings of real estate brokers were \$61,550 in offices of real estate agents and brokers and \$44,920 in activities related to real estate.

Commissions on sales are the main source of earnings of real estate agents and brokers. The rate of commission varies according to whatever the agent and broker agree on, the type of property, and its value. The percentage paid on the sale of farm and commercial properties or unimproved land is typically higher than the percentage paid for selling a home.

Commissions may be divided among several agents and brokers. When the property is sold, the broker or agent who obtained the listing usually shares the commission with the broker or agent who made the sale and with the firm that employs each of them. Although an agent's share varies greatly from one firm to another, often it is about half of the total amount received by the firm. Agents who both list and sell a property maximize their commission.

Income usually increases as an agent gains experience, but individual motivation, economic conditions, and the type and location of the property also affect earnings. Sales workers who are active in community organizations and in local real estate associations can broaden their contacts and increase their earnings. A beginner's earnings often are irregular, because a few weeks or even months may go by without a sale. Although some brokers allow an agent to draw against future earnings from a special account, the practice is not common with new employees. The beginner, therefore, should have enough money to live for about 6 months or until commissions increase.

Related Occupations

Selling expensive items such as homes requires maturity, tact, and a sense of responsibility. Other sales workers who find these character traits important in their work include insurance sales agents; retail salespersons; sales representatives, wholesale and manufacturing; and securities, commodities, and financial services sales agents. Although not involving sales, the work of property, real estate, and community association managers, as well as appraisers and assessors of real estate, requires an understanding of real estate.

Sources of Additional Information

Information on licensing requirements for real estate brokers and sales agents is available from most local real estate organizations or from the State real estate commission or board.

More information about opportunities in real estate is available on the Internet site of the following organization:

► National Association of Realtors. Internet: <http://www.realtor.org>

Retail Salespersons

(O*NET 41-2031.00)

Significant Points

- Good employment opportunities are expected because of the need to replace the large number of workers who leave the occupation each year.
- Most salespersons work evenings and weekends, particularly during sales and other peak retail periods.
- Employers look for people who enjoy working with others and who have tact, patience, an interest in sales work, a neat appearance, and the ability to communicate clearly.

Nature of the Work

Whether selling shoes, computer equipment, or automobiles, retail salespersons assist customers in finding what they are looking for and try to interest them in buying the merchandise. They describe a product's features, demonstrate its use, or show various models and colors. For some sales jobs, particularly those involving expensive and complex items, retail salespersons need special knowledge or skills. For example, salespersons who sell automobiles must be able to explain the features of various models, the manufacturers'

specifications, the types of options and financing available, and the warranty.

Consumers spend millions of dollars every day on merchandise and often form their impression of a store by evaluating its sales force. Therefore, retailers stress the importance of providing courteous and efficient service to remain competitive. For example, when a customer wants an item that is not on the sales floor, the salesperson may check the stockroom, place a special order, or call another store to locate the item.

In addition to selling, most retail salespersons—especially those who work in department and apparel stores—make out sales checks; receive cash, checks, debit, and charge payments; bag or package purchases; and give change and receipts. Depending on the hours they work, retail salespersons may have to open or close cash registers. This work may include counting the money in the register; separating charge slips, coupons, and exchange vouchers; and making deposits at the cash office. Salespersons often are held responsible for the contents of their registers, and repeated shortages are cause for dismissal in many organizations. (Cashiers, who have similar duties, are discussed elsewhere in the *Handbook*.)

Salespersons also may handle returns and exchanges of merchandise, wrap gifts, and keep their work areas neat. In addition, they may help stock shelves or racks, arrange for mailing or delivery of purchases, mark price tags, take inventory, and prepare displays.

Frequently, salespersons must be aware of special sales and promotions. They also must recognize security risks and thefts and know how to handle or prevent such situations.

Working Conditions

Most salespersons in retail trade work in clean, comfortable, well-lighted stores. However, they often stand for long periods and may need supervisory approval to leave the sales floor. They also may work outdoors if they sell items such as cars, plants, or lumber yard materials.

The Monday-through-Friday, 9-to-5 workweek is the exception rather than the rule in retail trade. Most salespersons work evenings and weekends, particularly during sales and other peak retail periods. The end-of-year holiday season is the busiest time for most retailers. As a result, many employers restrict the use of vacation time to some period other than Thanksgiving through the beginning of January.

The job can be rewarding for those who enjoy working with people. Patience and courtesy are required, especially when the work is repetitious and the customers are demanding.

Retail salespersons describe a product's features, demonstrate its use, or show various models and colors.

Training, Other Qualifications, and Advancement

There usually are no formal education requirements for this type of work, although a high school diploma or the equivalent is preferred. Employers look for people who enjoy working with others and who have the tact and patience to deal with difficult customers. Among other desirable characteristics are an interest in sales work, a neat appearance, and the ability to communicate clearly and effectively. The ability to speak more than one language may be helpful for employment in communities where people from various cultures tend to live and shop. Before hiring a salesperson, some employers may conduct a background check, especially for a job selling high-priced items.

In most small stores, an experienced employee or the proprietor instructs newly hired sales personnel in making out sales checks and operating cash registers. In large stores, training programs are more formal and are usually conducted over several days. Topics generally discussed are customer service, security, the store's policies and procedures, and how to work a cash register. Depending on the type of product they are selling, employees may be given additional specialized training by manufacturers' representatives. For example, those working in cosmetics receive instruction on the types of products the store has available and for whom the cosmetics would be most beneficial. Likewise, salespersons employed by motor vehicle dealers may be required to participate in training programs designed to provide information on the technical details of standard and optional equipment available on new vehicle models. Since providing the best possible service to customers is a high priority for many employers, employees often are given periodic training to update and refine their skills.

As salespersons gain experience and seniority, they usually move to positions of greater responsibility and may be given their choice of departments in which to work. This often means moving to areas with potentially higher earnings and commissions. The highest earnings potential usually lies in selling "big-ticket" items—such as cars, jewelry, furniture, and electronic equipment—although doing so often requires extensive knowledge of the product and an extraordinary talent for persuasion.

Opportunities for advancement vary in small stores. In some establishments, advancement is limited because one person—often the owner—does most of the managerial work. In others, some salespersons are promoted to assistant managers. Large retail businesses usually prefer to hire college graduates as management trainees, making a college education increasingly important. However, motivated and capable employees without college degrees still may advance to administrative or supervisory positions in large establishments.

Retail selling experience may be an asset when one is applying for sales positions with larger retailers or in other industries, such as financial services, wholesale trade, or manufacturing.

Employment

Retail salespersons held about 4.3 million wage and salary jobs in 2004. They worked in stores ranging from small specialty shops employing a few workers to giant department stores with hundreds of salespersons. In addition, some were self-employed representatives of direct-sales companies and mail-order houses. The largest employers of retail salespersons are department stores, clothing and clothing accessories stores, building material and garden equipment and supplies dealers, other general merchandise stores, and motor vehicle and parts dealers.

This occupation offers many opportunities for part-time work and is especially appealing to students, retirees, and others seeking to supplement their income. However, most of those selling big-ticket items work full time and have substantial experience.

Because retail stores are found in every city and town, employment is distributed geographically in much the same way as the population.

Job Outlook

As in the past, employment opportunities for retail salespersons are expected to be good because of the need to replace the large number of workers who transfer to other occupations or leave the labor force each year. In addition, many new jobs will be created for retail salespersons as businesses seek to expand operations and enhance customer service. Employment is expected to grow about as fast as the average for all occupations through the year 2014, reflecting rising retail sales stemming from a growing population. Opportunities for part-time work should be abundant, and demand will be strong for temporary workers during peak selling periods, such as the end-of-year holiday season. The availability of part-time and temporary work attracts many people seeking to supplement their income.

During economic downturns, sales volumes and the resulting demand for sales workers usually decline. Purchases of costly items, such as cars, appliances, and furniture, tend to be postponed during difficult economic times. In areas of high unemployment, sales of many types of goods decline. However, because turnover among retail salespersons is high, employers often can adjust employment levels simply by not replacing all those who leave.

Despite the growing popularity of electronic commerce, Internet sales have not decreased the need for retail salespersons. Retail stores commonly use an online presence to complement their in-store sales; there are very few Internet-only apparel and specialty stores. Retail salespersons will remain important in assuring customers that they will receive specialized service and in improving customer satisfaction, something Internet services cannot do. Therefore, the impact of electronic commerce on employment of retail salespersons is expected to be minimal.

Earnings

The starting wage for many retail sales positions is the Federal minimum wage, which was \$5.15 an hour in 2004. In areas where employers have difficulty attracting and retaining workers, wages tend to be higher than the legislated minimum.

Median hourly earnings of retail salespersons, including commissions, were \$8.98 in May 2004. The middle 50 percent earned between \$7.46 and \$12.22 an hour. The lowest 10 percent earned less than \$6.38, and the highest 10 percent earned more than \$17.85 an hour. Median hourly earnings in the industries employing the largest numbers of retail salespersons in May 2004 were as follows:

Automobile dealers	\$18.61
Building material and supplies dealers	10.85
Department stores	8.47
Other general merchandise stores	8.36
Clothing stores	8.17

Compensation systems vary by type of establishment and merchandise sold. Salespersons receive hourly wages, commissions, or a combination thereof. Under a commission system, salespersons receive a percentage of the sales they make. This system offers sales workers the opportunity to increase their earnings considerably, but they may find that their earnings strongly depend on their ability to sell their product and on the ups and downs of the economy. Employers may use incentive programs such as awards, banquets, bonuses, and profit-sharing plans to promote teamwork among the sales staff.

Benefits may be limited in smaller stores, but benefits in large establishments usually are comparable to those offered by other

employers. In addition, nearly all salespersons are able to buy their store's merchandise at a discount, with the savings depending on the type of merchandise.

Related Occupations

Salespersons use sales techniques, coupled with their knowledge of merchandise, to assist customers and encourage purchases. Workers in other occupations who use these same skills include sales representatives, wholesale and manufacturing; securities, commodities, and financial services sales agents; counter and rental clerks; real estate brokers and sales agents; purchasing managers, buyers, and purchasing agents; insurance sales agents; sales engineers; and cashiers.

Sales Engineers

(O*NET 41-9031.00)

Significant Points

- A bachelor's degree in engineering typically is required; many sales engineers have previous work experience in an engineering specialty.
- Projected employment growth stems from the increasing number and technical nature of products and services to be sold.
- More job opportunities are expected in independent sales agencies.
- Earnings are based on a combination of salary and commissions.

Nature of the Work

Many products and services, especially those purchased by large companies and institutions, are highly complex. Sales engineers—who also may be called *manufacturers' agents*, *sales representatives*, or *technical sales support workers*—work with the production, engineering, or research and development departments of their companies, or with independent sales firms, to determine how products and services could be designed or modified to suit customers' needs. They also may advise customers on how best to use the products or services provided.

Selling, of course, is an important part of the job. Sales engineers use their technical skills to demonstrate to potential customers how and why the products or services they are selling would suit the customer better than competitors' products. Often, there may not be a directly competitive product. In these cases, the job of the

sales engineer is to demonstrate to the customer the usefulness of the product or service—for example, how much money new production machinery would save.

Most sales engineers have a bachelor's degree in engineering, and many have previous work experience in an engineering specialty. Engineers apply the theories and principles of science and mathematics to technical problems. Their work is the link between scientific discoveries and commercial applications. Many sales engineers specialize in an area related to an engineering specialty. For example, sales engineers selling chemical products may have chemical engineering backgrounds, while those selling business software or information systems may have degrees in computer engineering. Information on engineers, including 17 engineering specialties, appears elsewhere in the *Handbook*.

Many of the duties of sales engineers are similar to those of other salespersons. They must interest the client in purchasing their products, many of which are durable manufactured products such as turbines. Sales engineers often are teamed with other salespersons who concentrate on the marketing and sales, enabling the sales engineer to concentrate on the technical aspects of the job. By working on a sales team, each member is able to focus on his or her strengths and knowledge. (Information on other sales occupations, including sales representatives, wholesale and manufacturing, appears elsewhere in the *Handbook*.)

Sales engineers tend to employ selling techniques that are different from those used by most other sales workers. They generally use a "consultative" style; that is, they focus on the client's problem and show how it could be solved or mitigated with their product or service. This selling style differs from the "benefits and features" method, whereby the salesperson describes the product and leaves the customer to decide how it would be useful.

In addition to maintaining current clients and attracting new ones, sales engineers help clients solve any problems that arise when the product is installed. Afterward, they may continue to serve as a liaison between the client and their company. Increasingly, sales engineers are asked to undertake tasks related to sales, such as market research, because of their familiarity with clients' purchasing needs. Drawing on this same familiarity, sales engineers may help identify and develop new products.

Sales engineers may work directly for manufacturers or service providers, or they may work in small independent sales firms. In an independent firm, they may sell complementary products from several different suppliers and be paid entirely on commission.

Sales engineers consult with their clients to offer them products or services that solve specific problems they may face.

Working Conditions

Many sales engineers work more than 40 hours per week to meet sales goals and their clients' needs. Selling can be stressful because sales engineers' income and job security often directly depend on their success in sales and customer service.

Some sales engineers have large territories and travel extensively. Because sales regions may cover several States, sales engineers may be away from home for several days or even weeks at a time. Others work near their home base and travel mostly by car. International travel, to secure contracts with foreign clients, is becoming more common.

Although the hours may be long and often are irregular, many sales engineers have the freedom to determine their own schedule. Consequently, they often can arrange their appointments so that they can have time off when they want it. However, most independent sales engineers do not earn any income while on vacation.

Training, Other Qualifications, and Advancement

A bachelor's degree in engineering usually is required to become a sales engineer. However, some workers with previous experience in sales combined with technical experience or training sometimes hold the title of sales engineer. Also, workers who have a degree in a science, such as chemistry, or even a degree in business with little or no previous sales experience, may be termed sales engineers.

Admissions requirements for undergraduate engineering schools include a solid background in mathematics (algebra, geometry, trigonometry, and calculus) and the physical sciences (biology, chemistry, and physics), as well as basic courses in English, social studies, humanities, and computer science. University programs vary in content, though all require the development of computer skills. For example, some programs emphasize industrial practices, preparing students for a job in industry, whereas others are more theoretical and prepare students for graduate school. Therefore, students should investigate curriculums and check accreditations carefully before making a selection. Once a university has been selected, a student must choose an area of engineering in which to specialize. Some programs offer a general engineering curriculum; students then specialize on the job or in graduate school. Most engineering degrees are granted in electrical, mechanical, or civil engineering. However, engineers trained in one branch may work in related branches.

Many sales engineers first work as engineers. For some, the engineering experience is necessary to obtain the technical background needed to sell their employers' products or services effectively. Others move into the occupation because it offers better earnings and advancement potential or because they are looking for a new challenge.

New graduates with engineering degrees may need sales experience and training before they can work directly as sales engineers. Training may involve teaming with a sales mentor who is familiar with the employer's business practices, customers, procedures, and company culture. After the training period has been completed, sales engineers may continue to partner with someone who lacks technical skills, yet excels in the art of sales.

Promotion may include a higher commission rate, larger sales territory, or elevation to the position of supervisor or marketing manager. Alternatively, sales engineers may leave their companies and form independent firms that may offer higher commissions and more freedom. Independent firms tend to be small, although relatively few sales engineers are self-employed.

It is important for sales engineers to continue their engineering and sales education throughout their careers because much of their value to their employers depends on their knowledge of the latest technology and their ability to sell that technology. Sales engi-

neers in high-technology areas, such as information technology or advanced electronics, may find that technical knowledge rapidly becomes obsolete.

Employment

Sales engineers held about 74,000 jobs in 2004. About 35 percent were employed in wholesale trade and another 27 percent were employed in the manufacturing industries. Smaller numbers of sales engineers worked in information industries, such as software publishers and telecommunications; professional, scientific, and technical services, such as computer systems designs and related services and architectural, engineering, and related services; and other industries. Unlike workers in many other sales occupations, very few sales engineers are self-employed.

Job Outlook

Employment of sales engineers is expected to grow about as fast as the average for all occupations through the year 2014. Projected employment growth stems from the increasing variety and technical nature of goods and services to be sold. Competitive pressures and advancing technology will force companies to improve and update product designs more frequently and to optimize their manufacturing and sales processes. In addition to new positions created as companies expand their sales forces, some openings will arise each year from the need to replace sales engineers who transfer to other occupations or leave the labor force.

Manufacturers, especially foreign manufacturers that sell their products in the United States, are expected to continue outsourcing more of their sales functions to independent sales agencies in an attempt to control costs. This should result in more job opportunities for sales engineers in independent agencies.

In wholesale trade, both outsourcing to independent sales agencies and the use of information technology are expected to affect employment opportunities for sales engineers. Although outsourcing should lead to more jobs in independent agencies, employment growth for sales engineers in wholesale trade likely will be dampened by the increasing ability of businesses to find, order, and track shipments directly from wholesalers through the Internet, without assistance from sales engineers. Since direct purchases from wholesalers are more likely to be of commodity products, their impact on sales engineers should remain somewhat limited.

Employment opportunities and earnings may fluctuate from year to year because sales are affected by changing economic conditions, legislative issues, and consumer preferences. Prospects will be best for those with the appropriate knowledge or technical expertise, as well as the personal traits necessary for successful sales work.

Earnings

Compensation varies significantly by the type of firm and the product sold. Most employers offer a combination of salary and commission payments or a salary plus a bonus. Commissions usually are based on the amount of sales, whereas bonuses may depend on individual performance, on the performance of all workers in the group or district, or on the company's performance. Earnings from commissions and bonuses may vary greatly from year to year, depending on sales ability, the demand for the company's products or services, and the overall economy.

Median annual earnings of sales engineers, including commissions, were \$70,620 in May 2004. The middle 50 percent earned between \$53,270 and \$91,500 a year. The lowest 10 percent earned less than \$41,430, and the highest 10 percent earned more than \$117,260 a year. Median annual earnings of those employed by firms in the computer systems design and related services industry were \$86,980.

In addition to their earnings, sales engineers who work for manufacturers usually are reimbursed for expenses such as transportation, meals, hotels, and customer entertainment. In addition to typical benefits, sales engineers often get personal use of a company car and frequent-flyer mileage. Some companies offer incentives such as free vacation trips or gifts for outstanding performance. Sales engineers who work in independent firms may have higher but less stable earnings and, often, relatively few benefits.

Related Occupations

Sales engineers must have sales ability and knowledge of the products and services they sell, as well as technical and analytical skills. Other occupations that require similar skills include advertising, marketing, promotions, public relations, and sales managers; engineers; insurance sales agents; purchasing managers, buyers, and purchasing agents; real estate brokers and sales agents; sales representatives, wholesale and manufacturing; and securities, commodities, and financial services sales agents.

Sources of Additional Information

Information on careers for manufacturers' representatives and agents is available from:

- ▶ Manufacturers' Agents National Association, P.O. Box 3467, Laguna Hills, CA 92654-3467. Internet: <http://www.manaonline.org>
- ▶ Manufacturers' Representatives Educational Research Foundation, P.O. Box 247, Geneva, IL 60134. Internet: <http://www.mrref.org>

Sales Representatives, Wholesale and Manufacturing

(O*NET 41-4011.01, 41-4011.02, 41-4011.03, 41-4011.04, 41-4011.05, 41-4011.06, 41-4012.00)

Significant Points

- Employment opportunities will be best for those with a college degree, the appropriate knowledge or technical expertise, and the personal traits necessary for successful selling.
- Job prospects for wholesale sales representatives will be better than those for manufacturing sales representatives, particularly in small firms.
- Earnings of sales representatives usually are based on a combination of salary and commissions.

Nature of the Work

Sales representatives are an important part of manufacturers' and wholesalers' success. Regardless of the type of product they sell, their primary duties are to interest wholesale and retail buyers and purchasing agents in their merchandise and to address clients' questions and concerns. Sales representatives represent one or several manufacturers or wholesale distributors by selling one product or a complementary line of products. Sales representatives demonstrate their products and advise clients on how using these products can reduce costs and increase sales. They market their company's products to manufacturers, wholesale and retail establishments, construction contractors, government agencies, and other institutions. (Retail salespersons, who sell directly to consumers, and sales engineers, who specialize in sales of technical products and services, are discussed elsewhere in the *Handbook*.)

Depending on where they work, sales representatives have different job titles. Those employed directly by a manufacturer or

wholesaler often are called *sales representatives*. *Manufacturers' agents* or *manufacturers' representatives* are self-employed sales workers or independent firms who contract their services to all types of manufacturing companies. Many of these titles, however, are used interchangeably.

Sales representatives spend much of their time traveling to and visiting with prospective buyers and current clients. During a sales call, they discuss the client's needs and suggest how their merchandise or services can meet those needs. They may show samples or catalogs that describe items their company stocks and inform customers about prices, availability, and ways in which their products can save money and boost productivity. Because a vast number of manufacturers and wholesalers sell similar products, sales representatives must emphasize any unique qualities of their products and services. Manufacturers' agents or manufacturers' representatives might sell several complementary products made by different manufacturers and, thus, take a broad approach to their customers' business. Sales representatives may help install new equipment and train employees in its use. They also take orders and resolve any problems with or complaints about the merchandise.

Obtaining new accounts is an important part of the job. Sales representatives follow leads from other clients, track advertisements in trade journals, participate in trade shows and conferences, and may visit potential clients unannounced. In addition, they may spend time meeting with and entertaining prospective clients during evenings and weekends.

Sales representatives demonstrate their products and advise clients on how using these products can reduce costs and increase sales.

In a process that can take several months, sales representatives present their product to a customer and negotiate the sale. Aided by a laptop computer connected to the Internet, or other telecommunications device, they can make a persuasive audiovisual sales pitch and often can answer technical and nontechnical questions immediately.

Frequently, sales representatives who lack technical expertise work as a team with a technical expert. In this arrangement, the technical expert—sometimes a sales engineer—attends the sales presentation to explain the product and answer questions or concerns. The sales representative makes the preliminary contact with customers, introduces the company's product, and closes the sale. The representative is then able to spend more time maintaining and soliciting accounts and less time acquiring technical knowledge. After the sale, representatives may make followup visits to ensure that the equipment is functioning properly and may even help train customers' employees to operate and maintain new equipment. Those selling consumer goods often suggest how and where merchandise should be displayed. Working with retailers, they may help arrange promotional programs, store displays, and advertising.

Sales representatives have several duties beyond selling products. They analyze sales statistics; prepare reports; and handle administrative duties, such as filing expense account reports, scheduling appointments, and making travel plans. They read about new and existing products and monitor the sales, prices, and products of their competitors.

Manufacturers' agents who operate a sales agency also must manage their business. This requires organizational and general business skills, as well as knowledge of accounting, marketing, and administration.

Working Conditions

Some sales representatives have large territories and travel considerably. Because a sales region may cover several States, representatives may be away from home for several days or weeks at a time. Others work near their home base and travel mostly by car. Because of the nature of the work and the amount of travel, sales representatives may work more than 40 hours per week.

Although the hours are long and often irregular, most sales representatives have the freedom to determine their own schedule. Sales representatives often are on their feet for long periods and may carry heavy sample products, necessitating some physical stamina.

Dealing with different types of people can be stimulating but demanding. Sales representatives often face competition from representatives of other companies. Companies usually set goals or quotas that representatives are expected to meet. Because their earnings depend on commissions, manufacturers' agents are also under the added pressure to maintain and expand their clientele.

Training, Other Qualifications, and Advancement

The background needed for sales jobs varies by product line and market. Many employers hire individuals with previous sales experience who lack a college degree, but they increasingly prefer or require a bachelor's degree because job requirements have become more technical and analytical. Nevertheless, for some consumer products, factors such as sales ability, personality, and familiarity with brands are more important than educational background. On the other hand, firms selling complex, technical products may require a technical degree in addition to some sales experience. Many sales representatives attend seminars in sales techniques or take courses in marketing, economics, communication, or even a foreign language to provide the extra edge needed to make sales. In general, companies are looking for the best and brightest individuals who have the personality and desire to sell. Sales representatives need to be familiar with computer technology as computers are

increasingly used in the workplace to place and track orders and to monitor inventory levels.

Many companies have formal training programs for beginning sales representatives lasting up to 2 years. However, most businesses are accelerating these programs to reduce costs and expedite the returns from training. In some programs, trainees rotate among jobs in plants and offices to learn all phases of production, installation, and distribution of the product. In others, trainees take formal classroom instruction at the plant, followed by on-the-job training under the supervision of a field sales manager.

New workers may get training by accompanying experienced workers on their sales calls. As they gain familiarity with the firm's products and clients, the new workers are given increasing responsibility until they are eventually assigned their own territory. As businesses experience greater competition, increased pressure is placed upon sales representatives to produce sales.

Sales representatives stay abreast of new products and the changing needs of their customers in a variety of ways. They attend trade shows at which new products and technologies are showcased. They also attend conferences and conventions to meet other sales representatives and clients and discuss new product developments. In addition, the entire sales force may participate in company-sponsored meetings to review sales performance, product development, sales goals, and profitability.

There are many certifications designed to raise standards and develop the skills of sales representatives, wholesale and manufacturing. A few examples are the Certified Professional Manufacturers' Representative, the Certified Sales Professional, and the Certified National Pharmaceutical Representative. Certification may involve completion of formal training and passing an examination.

Those who want to become sales representatives should be goal oriented, persuasive, and able to work well both independently and as part of a team. A pleasant personality and appearance, the ability to communicate well with people, and problem-solving skills are highly valued. Patience and perseverance also are key to completing a sale, which can take several months.

Frequently, promotion takes the form of an assignment to a larger account or territory where commissions are likely to be greater. Experienced sales representatives may move into jobs as sales trainers, who instruct new employees on selling techniques and on company policies and procedures. Those who have good sales records and leadership ability may advance to higher level positions such as sales supervisor, district manager, or vice president of sales. In addition to advancement opportunities within a firm, some manufacturers' agents go into business for themselves. Others find opportunities in purchasing, advertising, or marketing research.

Employment

Manufacturers' and wholesale sales representatives held about 1.9 million jobs in 2004. About half of all salaried representatives worked in wholesale trade. Others were employed in manufacturing, retail trade, information, and construction. Because of the diversity of products and services sold, employment opportunities are available in every part of the country in a wide range of industries.

In addition to those working directly for a firm, many sales representatives are self-employed manufacturers' agents. They often form small sales firms and work for a straight commission based on the value of their own sales. Usually, however, manufacturers' agents gain experience and recognition with a manufacturer or wholesaler before becoming self-employed.

Job Outlook

Employment of sales representatives, wholesale and manufacturing, is expected to grow about as fast as the average for all occupations

through the year 2014, primarily because of continued growth in the variety and number of goods to be sold. Also, many job openings will result from the need to replace workers who transfer to other occupations or leave the labor force.

Prospective customers require sales workers to demonstrate or illustrate the particulars of a good or service. Computer technology makes sales representatives more effective and productive, for example, by allowing them to provide accurate and current information to customers during sales presentations.

Job prospects for sales representatives, wholesale and manufacturing, will be best for persons with the appropriate knowledge or technical expertise as well as the personal traits necessary for successful selling. Opportunities will be better for wholesale sales representatives than for manufacturing sales representatives because manufacturers are expected to continue contracting out sales duties to independent agents rather than using in-house or direct selling personnel. Agents are paid only if they sell, a practice that reduces the overhead cost to their clients. Also, by using an agent who usually contracts his or her services to more than one company, companies can share costs with the other companies involved with that agent. As their customers and manufacturers continue to merge with other companies, independent agents and other wholesale trade firms will, in response, also merge with each other to better serve their clients. Although the demand for independent sales agents will increase over the 2004-14 projection period, the supply is expected to remain stable, or possibly decline, because of the difficulties associated with self-employment. This factor could lead to many opportunities for sales representatives to start their own independent sales agencies.

Those interested in this occupation should keep in mind that direct selling opportunities in manufacturing are likely to be best for products for which there is strong demand. Furthermore, jobs will be most plentiful in small wholesale and manufacturing firms because a growing number of these companies will rely on agents to market their products as a way to control their costs and expand their customer base.

Employment opportunities and earnings may fluctuate from year to year because sales are affected by changing economic conditions, legislative issues, and consumer preferences.

Earnings

Compensation methods vary significantly by the type of firm and the product sold. Most employers use a combination of salary and commissions or salary plus bonus. Commissions usually are based on the amount of sales, whereas bonuses may depend on individual performance, on the performance of all sales workers in the group or district, or on the company's performance.

Median annual earnings of sales representatives, wholesale and manufacturing, technical and scientific products, were \$58,580, including commissions, in May 2004. The middle 50 percent earned between \$41,660 and \$84,480 a year. The lowest 10 percent earned less than \$30,270, and the highest 10 percent earned more than \$114,540 a year. Median annual earnings in the industries employing the largest numbers of sales representatives, technical and scientific products, in May 2004 were as follows:

Computer systems design and related services	\$70,220
Wholesale electronic markets and agents and brokers	65,990
Drugs and druggists' sundries merchant wholesalers	60,130
Professional and commercial equipment and supplies merchant wholesalers	59,080
Electrical and electronic goods merchant wholesalers	52,870

Median annual earnings of sales representatives, wholesale and manufacturing, except technical and scientific products, were

\$45,400, including commission, in May 2004. The middle 50 percent earned between \$32,640 and \$65,260 a year. The lowest 10 percent earned less than \$24,070, and the highest 10 percent earned more than \$92,740 a year. Median annual earnings in the industries employing the largest numbers of sales representatives, except technical and scientific products, in May 2004 were as follows:

Wholesale electronic markets and agents and brokers	\$50,680
Machinery, equipment, and supplies merchant wholesalers	46,030
Professional and commercial equipment and supplies merchant wholesalers	45,320
Grocery and related product wholesalers	44,210
Miscellaneous nondurable goods merchant wholesalers	40,240

In addition to their earnings, sales representatives usually are reimbursed for expenses such as transportation costs, meals, hotels, and entertaining customers. They often receive benefits such as health and life insurance, pension plan, vacation and sick leave, personal use of a company car, and frequent flyer mileage. Some companies offer incentives such as free vacation trips or gifts for outstanding sales workers.

Unlike those working directly for a manufacturer or wholesaler, manufacturers' agents are paid strictly on commission and usually are not reimbursed for expenses. Depending on the type of product or products they are selling, their experience in the field, and the number of clients they have, they can earn significantly more or less than those working in direct sales.

Related Occupations

Sales representatives, wholesale and manufacturing, must have sales ability and knowledge of the products they sell. Other occupations that require similar skills include advertising, marketing, promotions, public relations, and sales managers; insurance sales agents; purchasing managers, buyers, and purchasing agents; real estate brokers and sales agents; retail salespersons; sales engineers; and securities, commodities, and financial services sales agents.

Sales Worker Supervisors

(O*NET 41-1011.00, 41-1012.00)

Significant Points

- Overall employment is projected to grow more slowly than average; the number of self-employed sales worker supervisors is expected to decline.
- Applicants with retail experience should have the best job opportunities.
- In many retail establishments, managers are promoted from within the company; a postsecondary degree may speed a sales worker supervisor's advancement into management.
- Long, irregular hours, including evenings and weekends, are common.

Nature of the Work

Sales worker supervisors oversee the work of sales and related workers, such as retail salespersons; cashiers; customer service representatives; stock clerks and order fillers; sales engineers; and sales representatives, wholesale and manufacturing. Sales worker supervisors are responsible for interviewing, hiring, and training employees, as well as for preparing work schedules and assigning workers to specific duties. Many of these workers hold job titles such as *sales manager* or *department manager*. Under the occupational classification system used in the *Handbook*, however, workers with the title *manager* who mainly supervise nonsupervisory workers are called *supervisors* rather than *managers*, even though many of these workers often perform numerous managerial functions. (Related occupations discussed elsewhere in the *Handbook* are retail salespersons; cashiers; customer service representatives; stock clerks and order fillers; sales engineers; and sales representatives, wholesale and manufacturing.)

In retail establishments, sales worker supervisors ensure that customers receive satisfactory service and quality goods. They also answer customers' inquiries, deal with complaints, and sometimes handle purchasing, budgeting, and accounting. Their responsibilities vary with the size and type of establishment. As the size of retail stores and the types of goods and services increase, supervisors tend to specialize in one department or one aspect of merchandising. (Managers in eating and drinking places are discussed in the *Handbook* statement on food service managers.)

Sales worker supervisors in large retail establishments, often referred to as department managers, provide day-to-day oversight of individual departments, such as shoes, cosmetics, or housewares in large department stores; produce and meat in grocery stores; and sales in automotive dealerships. These workers establish and implement policies, goals, objectives, and procedures for their specific departments; coordinate activities with other department heads; and strive for smooth operations within their departments. They supervise employees who price and ticket goods and place them on display; clean and organize shelves, displays, and inventories in stockrooms; and inspect merchandise to ensure that nothing is

outdated. Sales worker supervisors also review inventory and sales records, develop merchandising techniques, and coordinate sales promotions. In addition, they may greet and assist customers and promote sales and good public relations.

Sales worker supervisors in nonretail establishments supervise and coordinate the activities of sales workers who sell industrial products, automobiles, or services such as advertising or Internet services. They may prepare budgets, make personnel decisions, devise sales-incentive programs, assign sales territories, and approve sales contracts.

In small or independent companies and retail stores, sales worker supervisors not only directly supervise sales associates, but also are responsible for the operation of the entire company or store. Some are self-employed business or store owners.

Working Conditions

Most sales worker supervisors have offices. In retail trade, their offices are within the stores, usually close to the areas they oversee. Although they spend some time in the office completing merchandise orders or arranging work schedules, a large portion of their workday is spent on the sales floor, supervising employees or selling.

Work hours of supervisors vary greatly among establishments because work schedules usually depend on customers' needs. Supervisors generally work at least 40 hours a week. Long, irregular hours are common, particularly during sales, holidays, and busy shopping hours and at times when inventory is taken. Supervisors are expected to work evenings and weekends but usually are compensated with a day off during the week. Hours can change weekly, and managers sometimes must report to work on short notice, especially when employees are absent. Independent owners often can set their own schedules, but hours must be convenient to customers.

Training, Other Qualifications, and Advancement

Sales worker supervisors usually acquire knowledge of management principles and practices—an essential requirement for a supervisory or managerial position in retail trade—through work experience. Many supervisors begin their careers on the sales floor as salespersons, cashiers, or customer service representatives. In these positions, they learn merchandising, customer service, and the basic policies and procedures of the company.

The educational backgrounds of sales worker supervisors vary widely. Regardless of the education they receive, recommended courses include accounting, marketing, management, and sales, as well as psychology, sociology, and communication. Supervisors also must be computer literate because almost all cash registers, inventory control systems, and sales quotes and contracts are computerized.

Supervisors who have postsecondary education often hold associate or bachelor's degrees in liberal arts, social sciences, business, or management. To gain experience, many college students participate in internship programs that usually are developed jointly by individual schools and firms.

The type and amount of training available to supervisors vary from company to company. Many national retail chains and companies have formal training programs for management trainees that include both classroom and on-site training. Training time may be as brief as 1 week but may also last more than 1 year in organizations that require trainees to gain experience during all sales seasons.

Ordinarily, classroom training includes topics such as interviewing and customer service skills, employee and inventory management, and scheduling. Management trainees may work in one specific department while training on the job, or they may rotate through several departments to gain a well-rounded knowledge of the company's operation. Training programs for retail franchises are generally extensive, covering all functions of the company's

Sales worker supervisors ensure that customers receive satisfactory service and quality goods.

operation, including budgeting, marketing, management, finance, purchasing, product preparation, human resource management, and compensation. College graduates usually can enter management training programs directly.

Sales worker supervisors must get along with all types of people. They need initiative, self-discipline, good judgment, and decisiveness. Patience and a conciliatory temperament are necessary when dealing with demanding customers. Sales worker supervisors also must be able to motivate, organize, and direct the work of subordinates and communicate clearly and persuasively with customers and other supervisors.

Individuals who display leadership and team-building skills, self-confidence, motivation, and decisiveness become candidates for promotion to assistant manager or manager. A postsecondary degree may speed a sales worker supervisor's advancement into management because employers view it as a sign of motivation and maturity—qualities deemed important for promotion to more responsible positions. In many retail establishments, managers are promoted from within the company. In small retail establishments, where the number of positions is limited, advancement to a higher management position may come slowly. Large establishments often have extensive career ladder programs and may offer supervisors the opportunity to transfer to another store in the chain or to the central office if an opening occurs. Although promotions may occur more quickly in large establishments, some managers may need to relocate every several years in order to advance. Supervisors also can become advertising, marketing, promotions, public relations, and sales managers (workers who coordinate marketing plans, monitor sales, and propose advertisements and promotions) or purchasing managers, buyers, or purchasing agents (workers who purchase goods and supplies for their organization or for resale). (These occupations are covered elsewhere in the *Handbook*.)

Some supervisors who have worked in their industry for a long time open their own stores or sales firms. However, retail trade and sales occupations are highly competitive, and although many independent owners succeed, some fail to cover expenses and eventually go out of business. To prosper, owners usually need good business sense and strong customer service and public relations skills.

Employment

Sales worker supervisors held about 2.2 million jobs in 2004. Approximately 36 percent were self-employed, most of whom were store owners. About 43 percent were wage and salary sales worker supervisors employed in the retail sector; some of the largest employers were grocery stores, department stores, motor vehicle and parts dealers, and clothing and clothing accessory stores. The remaining sales worker supervisors worked in nonretail establishments.

Job Outlook

Candidates who have retail experience—as a retail salesperson, cashier, or customer service representative, for example—will have the best opportunities for jobs as sales worker supervisors. As in other fields, competition is expected for supervisory jobs, particularly those with the most attractive earnings and working conditions.

Employment of sales worker supervisors is expected to grow more slowly than the average for all occupations through the year 2014. Growth in the occupation will be restrained somewhat as retail companies hire more sales staff and increase the responsibilities of sales worker supervisors. Many job openings will occur as experienced supervisors move into higher levels of management, transfer to other occupations, or leave the labor force. However, as with other supervisory and managerial occupations, job turnover is relatively low.

The Internet and electronic commerce are creating new opportunities to reach and communicate with potential customers. Some firms are hiring Internet sales managers, who are in charge of maintaining an Internet site and answering inquiries relating to the product, to prices, and to the terms of delivery—a trend that will increase demand for these supervisors. Overall, Internet sales and electronic commerce may reduce the number of additional sales workers needed, thus reducing the number of additional supervisors required. However, the impact of electronic commerce on employment of sales worker supervisors should be minimal.

Projected employment growth of sales worker supervisors will mirror, in part, the patterns of employment growth in the industries in which they work. For example, faster-than-average employment growth is expected in many of the rapidly growing service-providing industries. In contrast, the number of self-employed sales worker supervisors is expected to decline as independent retailers face increasing competition from national chains.

Unlike mid-level and top-level managers, retail store managers generally will not be affected by the restructuring and consolidation taking place at the corporate headquarters of many retail chains.

Earnings

Salaries of sales worker supervisors vary substantially, depending on the level of responsibility the individual has; the person's length of service; and the type, size, and location of the firm.

In May 2004, median annual earnings of salaried supervisors of retail sales workers, including commissions, were \$32,720. The middle 50 percent earned between \$25,120 and \$43,110 a year. The lowest 10 percent earned less than \$20,110, and the highest 10 percent earned more than \$58,400 a year. Median annual earnings in the industries employing the largest numbers of salaried supervisors of retail sales workers in May 2004 were as follows:

Building material and supplies dealers	\$34,210
Grocery stores	31,360
Clothing stores	30,660
Other general merchandise stores	30,150
Gasoline stations	27,510

In May 2004, median annual earnings of salaried supervisors of nonretail sales workers, including commissions, were \$59,300. The middle 50 percent earned between \$43,350 and \$87,580 a year. The lowest 10 percent earned less than \$30,830, and the highest 10 percent earned more than \$127,870 a year. Median annual earnings in the industries employing the largest numbers of salaried supervisors of nonretail sales workers in May 2004 were as follows:

Wholesale electronic markets and agents and brokers	\$79,480
Professional and commercial equipment and supplies merchant wholesalers	72,320
Machinery, equipment, and supplies merchant wholesalers	61,150
Grocery and related product wholesalers.....	59,130
Postal Service.....	52,490

Compensation systems vary by type of establishment and by merchandise sold. Many supervisors receive a commission or a combination of salary and commission. Under a commission system, supervisors receive a percentage of department or store sales. Thus, supervisors have the opportunity to increase their earnings considerably, but their earnings depend on their ability to sell their product and the condition of the economy. Those who sell large amounts of merchandise or exceed sales goals often receive bonuses or other awards.

Related Occupations

Sales worker supervisors serve customers, supervise workers, and direct and coordinate the operations of an establishment. Others with similar responsibilities include financial managers, food service managers, lodging managers, and medical and health services managers.

Sources of Additional Information

Information on employment opportunities for sales worker supervisors may be obtained from the employment offices of various retail establishments or from State employment service offices.

Securities, Commodities, and Financial Services Sales Agents

(O*NET 41-3031.01, 41-3031.02)

Significant Points

- A college degree, sales ability, good interpersonal and communication skills, and a strong desire to succeed are important qualifications.
- Securities and commodities sales agents must pass licensing exams.
- Competition for entry-level jobs usually is keen, especially in larger firms; opportunities should be better in smaller firms.
- Turnover is high for beginning agents, who often are unable to establish a sizable clientele; once established, securities and commodities sales agents have a very strong attachment to their occupation because of their high earnings and considerable investment in training.

Nature of the Work

Most investors, whether they are individuals with a few hundred dollars to invest or large institutions with millions, use *securities, commodities, and financial services sales agents* when buying or selling stocks, bonds, shares in mutual funds, insurance annuities, or other financial products. In addition, many clients seek out these agents for advice on investments, insurance, tax planning, estate planning, and other financial matters.

Securities and commodities sales agents, also called brokers, stockbrokers, registered representatives, account executives, or financial consultants, perform a variety of tasks, depending on their specific job duties. When an investor wishes to buy or sell a security, for example, sales agents may relay the order through

their firm's computers to the floor of a securities exchange, such as the New York Stock Exchange. There, securities and commodities sales agents known as *floor brokers* negotiate the price with other floor brokers, make the sale, and forward the purchase price to the sales agents. If a security is not traded on an exchange, as in the case of bonds and over-the-counter stocks, the broker sends the order to the firm's trading department. Here, using their own funds or those of the firm, other securities sales agents, known as *dealers*, buy and sell securities directly from other dealers, with the intention of reselling the security to customers at a profit. After the transaction has been completed, the broker notifies the customer of the final price.

Securities and commodities sales agents also provide many related services for their customers. They may explain stock market terms and trading practices, offer financial counseling or advice on the purchase or sale of particular securities, and design an individual client's financial portfolio, which could include securities, life insurance, corporate and municipal bonds, mutual funds, certificates of deposit, annuities, and other investments.

Not all customers have the same investment goals. Some individuals prefer long-term investments, for capital growth or to provide income over a number of years; others might want to invest in speculative securities, which they hope will quickly rise in price. On the basis of each customer's objectives, securities and commodities sales agents furnish information about the advantages and disadvantages of an investment. They also supply the latest price quotes on any securities, as well as information on the activities and financial positions of the corporations issuing the securities.

Most securities and commodities sales agents serve individual investors; others specialize in institutional investors, such as banks and pension funds. In institutional investing, sales agents usually concentrate on a specific financial product, such as stocks, bonds, options, annuities, or commodity futures. At other times, they may also handle the sale of new issues, such as corporate securities issued to finance the expansion of a plant.

The most important part of a sales representative's job is finding clients and building a customer base. Thus, beginning securities and commodities sales agents spend much of their time searching for customers—relying heavily on telephone solicitation. They also may meet clients through business and social contacts. Agents often join civic organizations and other social organizations to expand their networks. Many sales agents find it useful to contact potential clients by teaching adult education investment courses or by giving lectures at libraries or social clubs. Brokerage firms may give sales agents lists of people with whom the firm has done business in the past. Some agents inherit the clients of agents who have retired. After an agent is established, referrals from satisfied clients are an important source of new business.

Financial services sales agents sell a wide variety of banking and related services. They contact potential customers to explain their services and to ascertain customers' banking and other financial needs. In doing so, they discuss services such as loans, deposit accounts, lines of credit, sales or inventory financing, certificates of deposit, cash management, mutual funds, or investment services. They also may solicit businesses to participate in consumer credit card programs. Financial services sales agents who serve all the financial needs of a single affluent individual or a business often are called private bankers or relationship managers.

With deregulation of the financial services industry, the distinctions among sales agents are becoming less clear as securities firms, banks, and insurance companies venture further into each other's products and services. The agents' jobs also are becoming more important as competition between the firms intensifies.

People increasingly seek the advice and services of securities, commodities, and financial services sales agents to realize their financial goals.

Working Conditions

Most securities and commodities sales agents work in offices under fairly stressful conditions. They have access to “quote boards” or computer terminals that continually provide information on the prices of securities. When sales activity increases, due perhaps to unanticipated changes in the economy, the pace can become very hectic.

Established securities and commodities sales agents usually work a standard 40-hour week. Beginners who are seeking customers usually work longer hours. New brokers spend a great deal of time learning the firm’s products and services and studying for exams in order to qualify to sell other products, such as insurance and commodities. Most securities and commodities sales agents accommodate customers by meeting with them in the evenings or on weekends.

A growing number of securities sales agents, employed mostly by discount or online brokerage firms, work in call-center environments. In these centers, hundreds of agents spend much of the day on the telephone taking orders from clients or offering advice and information on different securities. Often, such call centers operate 24 hours a day, requiring agents to work in shifts.

Financial services sales agents normally work 40 hours a week in a comfortable, less stressful office environment. They may spend considerable time outside the office, meeting with current and prospective clients, attending civic functions, and participating in trade association meetings. Some financial services sales agents work exclusively inside banks, providing service to walk-in customers.

Training, Other Qualifications, and Advancement

Because securities and commodities sales agents must be knowledgeable about economic conditions and trends, a college education is important, especially in larger securities firms. In fact, the overwhelming majority of workers in this occupation are college graduates. Although employers seldom require specialized academic training, courses in business administration, economics, and finance are helpful.

Many employers consider personal qualities and skills more important than academic training. Employers seek applicants who have considerable sales ability, good interpersonal and communication skills, and a strong desire to succeed. Some employers also make sure that applicants have a good credit history and a clean record. Self-confidence and an ability to handle frequent rejections are important ingredients for success.

Because maturity and the ability to work independently are important, many employers prefer to hire those who have achieved success in other jobs. Most firms prefer candidates with sales experience, particularly those who have worked on commission in areas such as real estate or insurance. Therefore, most entrants to this occupation transfer from other jobs. Some begin working as securities and commodities sales agents following retirement from other fields.

Securities and commodities sales agents must meet State licensing requirements, which usually include passing an examination and, in some cases, furnishing a personal bond. In addition, sales agents must register as representatives of their firm with the National Association of Securities Dealers, Inc. (NASD). Before beginners can qualify as registered representatives, they must pass the General Securities Registered Representative Examination (Series 7 exam), administered by the NASD, and be an employee of a registered firm for at least 4 months.

Most States require a second examination—the Uniform Securities Agents State Law Examination. This test measures the prospective representative’s knowledge of the securities business in general, customer protection requirements, and recordkeeping procedures. Many take correspondence courses in preparation for the securities examinations. Within 2 years, brokers are encouraged to take additional licensing exams in order to sell mutual funds, insurance, and commodities.

Most employers provide on-the-job training to help securities and commodities sales agents meet the registration requirements for certification. In most firms, the training period takes about 4 months. Trainees in large firms may receive classroom instruction in securities analysis, effective speaking, and the finer points of selling; may take courses offered by business schools and associations; and may undergo a period of on-the-job training lasting up to 2 years. Many firms like to rotate their trainees among various departments, to give them a broad perspective of the securities business. In small firms, sales agents often receive training in outside institutions and on the job.

Securities and commodities sales agents must understand the basic characteristics of the wide variety of financial products offered by brokerage firms. Brokers periodically take training through their firms or outside institutions in order to keep abreast of new financial products and to improve their sales techniques. Computer training also is important, because the securities sales business is highly automated. It is mandatory for all registered securities and commodities sales agents to attend periodic continuing education classes to maintain their licenses. Courses consist of computer-based training in regulatory matters and company training on new products and services. In addition, more sales agents are taking courses to become certified financial planners. The Certified Financial Planner credential issued by the Certified Financial Planner Board of

Standards, requires relevant experience, completion of education requirements, passing a comprehensive examination, and adherence to an enforceable code of ethics. The CFP exams test the candidate's knowledge of the financial planning process, insurance and risk management, employee benefits planning, taxes and retirement planning, and investment and estate planning.

The principal form of advancement for securities and commodities sales agents is an increase in the number and size of the accounts they handle. Although beginners usually service the accounts of individual investors, they may eventually handle very large institutional accounts, such as those of banks and pension funds. After taking a series of tests, some brokers become portfolio managers and have greater authority to make investment decisions regarding an account. Some experienced sales agents become branch office managers and supervise other sales agents while continuing to provide services for their own customers. A few agents advance to top management positions or become partners in their firms.

Banks and other credit institutions prefer to hire college graduates for financial services sales jobs. A business administration degree with a specialization in finance or a liberal arts degree that includes courses in accounting, economics, and marketing serves as excellent preparation for this job. Often, financial services sales agents learn their jobs through on-the-job training under the supervision of bank officers. However, those who wish to sell mutual funds and insurance products may need to undergo formal training and pass some of the same exams required of securities sales agents.

Employment

Securities, commodities, and financial services sales agents held about 281,000 jobs in 2004. More than half of jobs were found in securities, commodity contracts, and other financial investments and related activities. One in 5 worked in depository and nondepository credit intermediation, including commercial banks, savings institutions, and credit unions. Although securities and commodities sales agents are employed by firms in all parts of the country, many work for a small number of large securities and investment banking firms headquartered in New York City. About 1 out of 8 securities, commodities, and financial services sales agents were self-employed.

Job Outlook

Employment of securities, commodities, and financial services sales agents is expected to grow about as fast as the average for all occupations through 2014. As people's incomes continue to climb, they will increasingly seek the advice and services of securities, commodities, and financial services sales agents to realize their financial goals. Growth in the volume of stocks traded over the Internet will limit job growth. Nevertheless, the overall increase in investment is expected to spur employment growth among these workers, with a majority of transactions still requiring the advice and services of securities, commodities, and financial services sales agents.

Baby boomers in their peak savings years will fuel much of this increase in investment. Saving for retirement has been made much easier by the government, which continues to offer a number of tax-favorable pension plans, such as the 401(k) and the Roth IRA. The participation of more women in the workforce also means higher household incomes and more women qualifying for pensions. Many of these pensions are self-directed, meaning that the recipient has the responsibility for investing the money. With such large amounts of money to invest, sales agents, in their role as financial advisors, will be in great demand.

Other factors that will affect the demand for brokers are the increasing number and complexity of investment products, as well as the effects of globalization. As the public and businesses become more sophisticated about investing, they are venturing into the op-

tions and futures markets. Brokers are needed to buy or sell these products, which are not traded online. Also, markets for investment are expanding with the increase in global trading of stocks and bonds. Furthermore, the New York Stock Exchange has extended its trading hours to accommodate trading in foreign stocks and compete with foreign exchanges.

Employment of sales agents is adversely affected by downturns in the stock market or the economy. Turnover is high for beginning agents, who often are unable to establish a sizable clientele even in good times. Once established, securities and commodities sales agents have a very strong attachment to their occupation because of their high earnings and considerable investment in training. Competition usually is keen, especially in larger companies with more applicants than jobs. Opportunities for beginning sales agents should be better in smaller firms.

Employment of financial services sales agents in banks will increase as banks expand their product offerings in order to compete directly with other investment firms.

Earnings

Median annual earnings of securities, commodities, and financial services sales agents were \$69,200 in May 2004. The middle half earned between \$40,750 and \$131,290.

Median annual earnings in the industries employing the largest numbers of securities, commodities, and financial services sales agents in 2004 were:

Other financial investment activities.....	\$94,670
Securities and commodity contracts intermediation and brokerage	85,350
Management of companies and enterprises	67,690
Nondepository credit intermediation	51,820
Depository credit intermediation	44,670

Stockbrokers, who provide personalized service and more guidance with respect to a client's investments, usually are paid a commission based on the amount of stocks, bonds, mutual funds, insurance, and other products they sell. Earnings from commissions are likely to be high when there is much buying and selling, and low when there is a slump in market activity. Most firms provide sales agents with a steady income by paying a "draw against commission"—a minimum salary based on commissions they can be expected to earn. Securities and commodities sales agents who can provide their clients with the most thorough financial services should enjoy the greatest income stability. Trainee brokers usually are paid a salary until they develop a client base. The salary gradually decreases in favor of commissions as the broker gains clients. A small, but increasing, number of full-service brokers are paid a percentage of the assets they oversee. This fee often covers a certain number of trades done for free.

Brokers who work for discount brokerage firms that promote the use of telephone and online trading services usually are paid a salary, sometimes boosted by bonuses that reflect the profitability of the office. Financial services sales agents usually are paid a salary also; however, bonuses or commissions from sales are starting to account for a larger share of their income.

Related Occupations

Other jobs requiring knowledge of finance and an ability to sell include insurance sales agents, real estate brokers and sales agents, and financial analysts and personal financial advisors.

Travel Agents

(O*NET 41-3041.00)

Significant Points

- Travel benefits, such as reduced rates for transportation and lodging, attract many people to this occupation.
- Training at a postsecondary vocational school, college, or university is increasingly important.
- Travel agents increasingly specialize in specific destinations or type of travel or traveler.
- Keen competition for jobs is expected.

Nature of the Work

Constantly changing airfares and schedules, thousands of available vacation packages, and a vast amount of travel information on the Internet can make travel planning frustrating and time consuming. To sort out the many travel options, tourists and business people often turn to travel agents, who assess their needs and help them make the best possible travel arrangements. Also, many major cruise lines, resorts, and specialty travel groups use travel agents to promote travel packages to millions of people every year.

In general, travel agents give advice on destinations and make arrangements for transportation, hotel accommodations, car rentals, tours, and recreation. They also may advise on weather conditions, restaurants, and tourist attractions. For international travel, agents also provide information on customs regulations, required papers (passports, visas, and certificates of vaccination), and currency exchange rates.

Travel agents consult a variety of published and computer-based sources for information on departure and arrival times, fares, and hotel ratings and accommodations. They may visit hotels, resorts, and restaurants to evaluate comfort, cleanliness, and quality of food and service so that they can base recommendations on their own travel experiences or those of colleagues or clients.

Travel agents give advice on destinations and make arrangements for transportation, hotel accommodations, car rentals, tours, and recreation.

Travel agents also promote their services, using telemarketing, direct mail, and the Internet. They make presentations to social and special-interest groups, arrange advertising displays, and suggest company-sponsored trips to business managers. Travel agents no longer receive commission payments from domestic airlines, and agents face increasing competition from the Internet for low-cost fares. In an effort to find a niche in the market, many travel agents now specialize in travel to certain regions or for certain groups of people, such as honeymooners, grandparents, or ethnic groups.

Working Conditions

Travel agents spend most of their time behind a desk conferring with clients, completing paperwork, contacting airlines and hotels for travel arrangements, and promoting group tours. During vacation seasons and holiday periods, they may be under a great deal of pressure. Many agents, especially those who are self-employed, frequently work long hours. With advanced computer systems and telecommunication networks, it is increasingly common for travel agents to work at home.

Training, Other Qualifications, and Advancement

The minimum requirement for those interested in becoming a travel agent is a high school diploma or equivalent. Technology and computerization have increased the training needs, however, and many employers prefer applicants with more education, such as a postsecondary vocational award. Many vocational schools offer full-time travel agent programs that last several months, as well as evening and weekend programs. Travel agent courses also are offered in public adult education programs and in community and 4-year colleges. A few colleges offer bachelor's or master's degrees in travel and tourism. Although few college courses relate directly to travel or tourism, a college education sometimes is desired by employers to establish a background in fields such as computer science, geography, communication, foreign languages, and world history. Courses in accounting and business management also are important, especially for those who expect to manage or start their own travel agencies.

The American Society of Travel Agents offers a correspondence course that provides a basic understanding of the travel industry. Travel agencies also provide on-the-job training for their employees, a significant part of which consists of computer instruction. All employers require computer skills of workers whose jobs involve the operation of airline and centralized reservation systems.

Continuing education is critical, as the abundance of travel information readily available through the Internet and other sources has resulted in a more informed consumer who wants to deal with an expert when choosing a travel agent. Experienced travel agents can take advanced self-study or group-study courses from the Travel Institute, leading to the Certified Travel Counselor designation. The Travel Institute also offers marketing and sales skills development programs and destination specialist programs, which provide detailed knowledge of regions such as North America, Western Europe, the Caribbean, and the Pacific Rim. With the trend toward more specialization, these and other destination specialist courses are increasingly important.

Personal travel experience or experience as an airline reservation agent is an asset because knowledge about a city or foreign country often helps influence a client's travel plans. Patience and the ability to gain the confidence of clients also are useful qualities. Travel agents must be well-organized, accurate, and meticulous to compile information from various sources and plan and organize their clients' travel itineraries. Also, agents who specialize in business travel must work quickly and efficiently because business travel often must be arranged on short notice.

As the Internet has become an important tool for making travel arrangements, more travel agencies are using websites to provide their services to clients. This trend has increased the importance of computer skills in this occupation. Other desirable qualifications include good writing and interpersonal and sales skills.

Some employees start as reservation clerks or receptionists in travel agencies. With experience and some formal training, they can take on greater responsibilities and eventually assume travel agent duties. In agencies with many offices, travel agents may advance to office manager or to other managerial positions.

Those who start their own agencies generally have had experience in an established agency. Before they can receive commissions, these agents usually must gain formal approval from suppliers or corporations, such as airlines, ship lines, or rail lines. The Airlines Reporting Corporation and the International Airlines Travel Agency Network, for example, are the approving bodies for airlines. To gain approval, an agency must be financially sound and employ at least one experienced manager or travel agent.

There are no Federal licensing requirements for travel agents. In 2004, however, 13 States required some form of registration or certification of retail sellers of travel services. More information may be obtained by contacting the Office of the Attorney General or Department of Commerce in each State.

Employment

Travel agents held about 103,000 jobs in 2004 and are found in every part of the country. More than 3 out of 5 agents worked for travel agencies. Around 14 percent were self-employed.

Job Outlook

Employment of travel agents is expected to decline through 2014. Most openings will occur as experienced agents transfer to other occupations or leave the labor force. Because of the projected decline in employment and the fact that a number of people are attracted by the travel benefits associated with this occupation, keen competition for jobs is expected. Travel agents who specialize and can utilize the Internet to reduce their costs and better compete with other travel suppliers should have the best chance for success.

The Internet increasingly allows people to access travel information from their personal computers, enabling them to research and plan their own trips, make their own reservations and travel arrangements, and purchase their own tickets. As a result, demand will decline for travel agents who simply take orders, such as booking tickets for a specified date and time. Also, domestic airlines no longer pay commissions to travel agencies, which has reduced revenues and caused some agencies to go out of business. This change also has led many travel agents to begin charging fees for their services. To justify those fees, customers expect travel agents to provide good service and travel expertise. Opportunities may be better for agents who specialize in specific destinations, luxury travel, or particular types of travelers such as ethnic groups or groups with a special interest or hobby. Many consumers still prefer to use a professional travel agent to plan a complete trip; to deal with some of the more complex transactions; to ensure reliability; to suggest excursions or destinations that might otherwise be missed; to save time; or, in some cases, to save money.

Several factors should offset the adverse effect of Internet travel arrangement and the loss of revenues from airline bookings. For example, spending on tourism and travel is expected to increase over the next decade. With rising household incomes, smaller families,

and an increasing number of older people who are more likely to travel, more people are expected to travel on vacation—and to do so more frequently—than in the past. Business travel also should rebound from recession and terrorism-related declines as business activity expands. Business travel also should increase as U.S. businesses open more foreign operations and businesses increasingly sell their goods and services worldwide. In addition, luxury and specialty travel should increase among the growing number of Americans with the available time and money for these more expensive trips.

Another positive factor is the increasing affordability of air travel. Greater competition among airlines, especially from low-cost carriers, has brought airfares within the budgets of more people. In addition, American travel agents now organize more tours for the growing number of foreign visitors. Also, travel agents often are able to offer various travel packages at a substantial discount.

The demand for travel is sensitive to economic downturns and international political crises, when travel plans are likely to be deferred. Therefore, the number of job opportunities for travel agents fluctuates. However, the number of travelers has risen recently, possibly reflecting demand from consumers who delayed travel because of terrorism and safety concerns. Demand for travel remains volatile, though, and trends could change at any time.

Earnings

Experience, sales ability, and the size and location of the agency determine the salary of a travel agent. Median annual earnings of travel agents were \$27,640 in May 2004. The middle 50 percent earned between \$21,600 and \$35,070. The lowest 10 percent earned less than \$17,180, while the top 10 percent earned more than \$44,090. Median earnings in May 2004 for travel agents employed in the travel arrangement and reservation services industry were \$27,490.

Salaried agents usually enjoy standard employer-paid benefits that self-employed agents must provide for themselves. When traveling for personal reasons, agents usually get reduced rates for transportation and accommodations. In addition, agents sometimes take “familiarization” trips, at lower cost or no cost to themselves, to learn about various vacation sites. These benefits attract many people to this occupation.

Earnings of travel agents who own their agencies depend mainly on commissions from travel-related bookings and service fees they charge clients. Often it takes time to acquire a sufficient number of clients to have adequate earnings, so it is not unusual for new self-employed agents to have low earnings. Established agents may have lower earnings during economic downturns.

Related Occupations

Travel agents organize and schedule business, educational, or recreational travel or activities. Other workers with similar responsibilities include tour and travel guides, and reservation and transportation ticket agents and travel clerks.

Office and Administrative Support Occupations

Financial Clerks

Bill and Account Collectors

(O*NET 43-3011.00)

Significant Points

- About 1 in 5 collectors works for a collection agency; others work in banks, retail stores, government, physicians' offices, hospitals, and other institutions that lend money and extend credit.
- Most jobs in this occupation require only a high school diploma, though many employers prefer workers with some postsecondary training.
- Faster-than-average employment growth is expected as companies focus more efforts on collecting unpaid debts.

Nature of the Work

Bill and account collectors, called simply *collectors*, keep track of accounts that are overdue and attempt to collect payment on them. Some are employed by third-party collection agencies, while others—known as “in-house collectors”—work directly for the original creditors, such as department stores, hospitals, or banks.

The duties of bill and account collectors are similar in the many different organizations in which they are employed. First, collectors are called upon to locate and notify customers of delinquent accounts, usually over the telephone, but sometimes by letter. When customers move without leaving a forwarding address, collectors may check with the post office, telephone companies, credit bureaus, or former neighbors to obtain the new address. The attempt to find the new address is called “skip tracing.” New computer systems assist in tracing by automatically tracking when customers change their address or contact information on any of their open accounts.

Once collectors find the debtor, they inform him or her of the overdue account and solicit payment. If necessary, they review the terms of the sale, service, or credit contract with the customer. Collectors also may attempt to learn the cause of the delay in payment. Where feasible, they offer the customer advice on how to pay off the debts, such as by taking out a bill consolidation loan. However, the collector's prime objective is always to ensure that the customer pays the debt in question.

If a customer agrees to pay, collectors record this commitment and check later to verify that the payment was indeed made. Collectors may have authority to grant an extension of time if customers ask for one. If a customer fails to respond, collectors prepare a statement indicating the customer's action for the credit department of the establishment. In more extreme cases, collectors may initiate repossession proceedings, disconnect the customer's service, or hand the account over to an attorney for legal action. Most collectors handle other administrative functions for the accounts assigned to them, including recording changes of addresses and purging the records of the deceased.

Collectors use computers and a variety of automated systems to keep track of overdue accounts. Typically, collectors work at video

Bill and account collectors calculate overdue accounts and arrange repayments.

display terminals that are linked to computers. In sophisticated predictive dialer systems, a computer dials the telephone automatically, and the collector speaks only when a connection has been made. Such systems eliminate time spent calling busy or nonanswering numbers. Many collectors use regular telephones, but others wear headsets like those used by telephone operators.

Working Conditions

In-house bill and account collectors typically are employed in an office environment, while those who work for third-party collection agencies may work in a call-center environment. Workers spend most of their time on the phone tracking down and contacting people with debts. The work can be stressful as some customers can be confrontational when pressed about their debts, although some appreciate assistance in resolving their outstanding debt. Collectors may also feel pressured to meet targets for the amount of debt they are expected to recover in a certain period.

Bill and account collectors often have to work evenings and weekends, when it usually is easier to reach people. As a result, it is not uncommon for workers to work part time or on flexible work schedules, though the majority work 40 hours per week.

Training, Other Qualifications, and Advancement

Most bill and account collectors are required to have at least a high school diploma. However, employers prefer workers

who have completed some college or who have experience in other occupations that involve contact with the public. Workers should have good communication skills and be computer literate; experience with advanced telecommunications equipment is also useful.

Once hired, workers usually receive on-the-job training. Under the guidance of a supervisor or some other senior worker, new employees learn company procedures. Some formal classroom training also may be necessary, such as training in specific computer software. Additional training topics usually include telephone techniques and negotiation skills. Workers are also instructed in the laws governing the collection of debt as mandated by the Fair Debt Collection Practices Act (FDCPA), which applies to all third party and some in-house collectors.

Workers usually advance by taking on more duties in the same occupation for higher pay or by transferring to a closely related occupation. Many companies fill supervisory positions by promoting individuals from within the organization, and workers who acquire additional skills, experience, and training improve their advancement opportunities.

Employment

Bill and account collectors held about 456,000 jobs in 2004. About 1 in 5 collectors works for a collection agency. Many others work in banks, retail stores, government, physician's offices, hospitals, and other institutions that lend money and extend credit.

Job Outlook

Employment of bill and account collectors is expected to grow faster than the average for all occupations through 2014. Cash flow is becoming increasingly important to companies, which are now placing greater emphasis on collecting unpaid debts sooner. Thus, the workload for collectors is expected to continue to increase as they seek to collect not only debts that are relatively old, but ones that are more recent. Also, as more companies in a wide range of industries get involved in lending money and issuing their own credit cards, they will need to hire collectors, because debt levels will likely continue to rise. In addition to job openings from employment growth, a significant number of openings will result from the high level of turnover in the occupation. As a result, job opportunities should be favorable.

Hospitals and physicians' offices are two of the fastest growing industries requiring collectors. With insurance reimbursements not keeping up with cost increases, the health care industry is seeking to recover more money from patients. Government agencies also are making more use of collectors to collect on everything from parking tickets to child-support payments and past-due taxes. Finally, the Internal Revenue Service (IRS) is looking into outsourcing the collection of overdue Federal taxes to third-party collection agencies. If the IRS does outsource, more collectors will be required for this large job.

Despite the increasing demand for bill collectors, employment growth may be limited due to an increased use of third party debt collectors, who are generally more efficient than in-house collectors. Also, some firms are beginning to use offshore collection agencies, whose lower cost structures allow them to collect debts that are too small for domestic collection agencies. Contrary to the pattern in most occupations, employment of bill and account collectors tends to rise during recessions, reflecting the difficulty that many people have in meeting their financial obligations. However, collectors usually have more success at getting people to repay their debts when the economy is good.

Earnings

Median hourly earnings of bill and account collectors were \$13.20 in May 2004. The middle 50 percent earned between \$10.87 and \$16.28. The lowest 10 percent earned less than \$9.22, and the highest 10 percent earned more than \$20.10. In addition to a basic rate of pay, many bill and account collectors earn commissions based on the amount of debt they recover.

Related Occupations

Bill and account collectors review and collect information on accounts. Other occupations with similar responsibilities include credit authorizers, checkers, and clerks; loan officers; and interviewers.

Sources of Additional Information

Career information on bill and account collectors is available from

Billing and Posting Clerks and Machine Operators

(O*NET 43-3021.01, 43-3021.02, 43-3021.03)

Significant Points

- The health care industry employs 1 out of 3 workers.
- Most jobs in this occupation require only a high school diploma; however, many employers prefer to hire workers who have completed some college courses or a degree.
- Slower-than-average employment growth is expected as increased automation of billing services reduces the need for billing clerks.

Nature of the Work

Billing and posting clerks and machine operators, commonly called billing clerks, compile records of charges for services rendered or goods sold, calculate and record the amounts of these services and goods, and prepare invoices to be mailed to customers.

Billing clerks review purchase orders, sales tickets, hospital records, or charge slips to calculate the total amount due from a customer. They must take into account any applicable discounts, special rates, or credit terms. A billing clerk for a trucking company often needs to consult a rate book to determine shipping costs of machine parts, for example. A hospital's billing clerk may need to contact an insurance company to determine what items will be reimbursed and for how much. In accounting, law, consulting, and similar firms, billing clerks calculate client fees based on the actual time required to perform the task. They keep track of the accumulated hours and dollar amounts to charge to each job, the type of job performed for a customer, and the percentage of work completed.

After billing clerks review all necessary information, they compute the charges, using calculators or computers. They then prepare itemized statements, bills, or invoices used for billing and recordkeeping purposes. In one organization, the clerk might prepare a bill containing the amount due and the date and type of service; in another, the clerk would produce a detailed invoice with codes

Billing clerks review statements for errors before sending them to customers.

for all goods and services provided. This latter form might list the items sold, the terms of credit, the date of shipment or the dates services were provided, a salesperson's or doctor's identification, if necessary, and the sales total.

Computers and specialized billing software allow many clerks to calculate charges and prepare bills in one step. Computer packages prompt clerks to enter data from handwritten forms, and to manipulate the necessary entries of quantities, labor, and rates to be charged. Billing clerks verify the entry of information and check for errors before the computer prints the bill. After the bills are printed, billing clerks check them again for accuracy. Computer software also allows bills to be sent electronically if both the biller and the customer prefer not to use paper copies; this, coupled with the prevalence of electronic payment options, allows a completely paperless billing process. In offices that are not automated, *billing machine operators* run off the bill on a billing machine to send to the customer.

In addition to producing invoices, billing clerks may be asked to handle follow-up questions from customers and resolve any discrepancies or errors. Finally, all changes must be entered in the accounting records.

Working Conditions

Billing clerks typically are employed in an office environment, although a growing number—particularly medical billers—work at home. Most billing clerks work 40 hours per week during regular business hours, though about one in seven works part time. Because billing clerks use

computers on a daily basis, workers may have to sit for extended periods and also may experience eye and muscle strain, backaches, headaches, and repetitive motion injuries.

Training, Other Qualifications, and Advancement

Most billing clerks need at least a high school diploma. However, many employers prefer to hire workers who have completed some college courses or a degree. Workers with an associate or bachelor's degree are likely to start at higher salaries and advance more easily than those without degrees. Employers also seek workers who are computer literate, and in particular those who have experience with billing software programs.

Billing clerks usually receive on-the-job training from their supervisor or some other senior worker. Some formal classroom training also may be necessary, such as training in the specific computer software used by the company. Workers must be careful, orderly, and detail oriented with an aptitude for working with numbers in order to avoid making errors and to recognize errors made by others. Workers also should be discreet and trustworthy, because they frequently come in contact with confidential material. Medical billers in particular need to understand and follow the regulations of the Health Insurance Portability and Accountability Act (HIPAA), which were enacted to maintain the confidentiality of patient medical records.

A number of community and career colleges offer certificate programs in medical billing. Courses typically cover basic biology, anatomy, and physiology in addition to training on coding and computer billing software.

Billing clerks usually advance by taking on more duties in the same occupation for higher pay or by transferring to a closely related occupation. Most companies fill office and administrative support supervisory and managerial positions by promoting individuals from within the organization. Workers who acquire additional skills, experience, and training improve their advancement opportunities. With appropriate experience and education, some billing clerks may become accountants, human resource specialists, or buyers.

Employment

In 2004, billing and posting clerks and machine operators held about 523,000 jobs. Although all industries employ billing clerks, the health care industry employs the most, about a third of all billing clerks. The wholesale and retail trade industries also employ a large number of billing clerks. Third-party billing companies—companies that provide billing services for other companies—are employing a growing number of billing clerks. Industries that are providing this service are the accounting, tax preparation, bookkeeping, and payroll services industry and the office administrative and business support services industries. These industries currently employ around 5 percent of the occupation, although a portion of clerks in these industries are performing the function on their own accounts. Another 3 percent—mostly medical billers—were self employed.

Job Outlook

Employment of billing and posting clerks and machine operators is expected to grow more slowly than the average for all occupations through the year 2014. Automated and electronic billing processes are greatly simplifying billing and allowing companies to send out bills faster without hiring additional workers. In addition, as the billing process becomes simplified, other people, particularly accounting and bookkeeping clerks, are taking on the billing function. Strong growth in the health care industry, which employs many billing clerks due to the complicated nature of medical billing, will generate some jobs for billing clerks in the future. Although growth will be limited, many job openings will occur as workers transfer to other occupations or leave the labor force. Turnover in the occupation is relatively high,

characteristic of an entry-level occupation that typically requires only a high school diploma.

Employment growth will occur in the expanding health care industries, but growth will be limited as more hospitals and physicians' offices use contract billing companies. Contract billing companies generally have much more sophisticated technology and software, enabling them to produce more bills per person. In all industries, including health care, the billing function is becoming increasingly automated and invoices and statements are automatically generated upon delivery of the service or shipment of goods. Bills also will increasingly be delivered electronically over the Internet, eliminating the production and mailing of paper bills.

Earnings

Median hourly earnings of billing and posting clerks and machine operators were \$13.00 in May 2004. The middle 50 percent earned between \$10.76 and \$15.86. The lowest 10 percent earned less than \$9.12, and the highest 10 percent earned more than \$18.88.

Related Occupations

Billing clerks process and send records of transactions for payment; other occupations with similar responsibilities include payroll and timekeeping clerks; bookkeeping, auditing, and accounting clerks; tellers; and order clerks.

Sources of Additional Information

Information on employment opportunities for billing clerks is available from local offices of the State employment service.

Bookkeeping, Accounting, and Auditing Clerks

(O*NET 43-3031.00)

Significant Points

- Bookkeeping, accounting, and auditing clerks held more than 2 million jobs in 2004 and are employed in every industry.
- Employment is projected to grow more slowly than average as the spread of office automation lifts worker productivity.
- The large size of this occupation ensures plentiful job openings, including many opportunities for temporary and part-time work; those who can carry out a wider range of bookkeeping and accounting activities will be in greater demand than specialized clerks.

Nature of the Work

Bookkeeping, accounting, and auditing clerks are an organization's financial recordkeepers. They update and maintain one or more accounting records, including those which tabulate expenditures, receipts, accounts payable and receivable, and profit and loss. They represent a wide range of skills and knowledge from full-charge bookkeepers who can maintain an entire company's books to accounting clerks who handle specific accounts. All of these clerks make numerous computations each day and increasingly must be comfortable using computers to calculate and record data.

In small establishments, *bookkeeping clerks* handle all financial transactions and recordkeeping. They record all transactions, post debits and credits, produce financial statements, and prepare reports

Bookkeeping, accounting, and auditing clerks update and maintain accounting records.

and summaries for supervisors and managers. Bookkeepers also prepare bank deposits by compiling data from cashiers, verifying and balancing receipts, and sending cash, checks, or other forms of payment to the bank. They also may handle payroll, make purchases, prepare invoices, and keep track of overdue accounts.

In large offices and accounting departments, *accounting clerks* have more specialized tasks. Their titles, such as accounts payable clerk or accounts receivable clerk, often reflect the type of accounting they do. In addition, their responsibilities vary by level of experience. Entry-level accounting clerks post details of transactions, total accounts, and compute interest charges. They also may monitor loans and accounts to ensure that payments are up to date.

More advanced accounting clerks may total, balance, and reconcile billing vouchers; ensure the completeness and accuracy of data on accounts; and code documents according to company procedures. These workers post transactions in journals and on computer files and update the files when needed. Senior clerks also review computer printouts against manually maintained journals and make necessary corrections. They may review invoices and statements to ensure that all the information appearing on them is accurate and complete, and they may reconcile computer reports with operating reports.

Auditing clerks verify records of transactions posted by other workers. They check figures, postings, and documents to ensure that they are correct, mathematically accurate, and properly coded. They also correct or note errors for accountants or other workers to adjust.

As organizations continue to computerize their financial records, many bookkeeping, accounting, and auditing clerks are using specialized accounting software on personal computers. With manual posting to general ledgers becoming obsolete, these clerks increasingly are posting charges to accounts on computer spreadsheets and databases. They now enter information from receipts or bills into computers, and the information is then stored either electronically or as computer printouts (or both). The widespread use of computers also has enabled bookkeeping, accounting, and auditing clerks to take on additional responsibilities, such as payroll, procurement, and billing. Many of these functions require these clerks to write letters, make phone calls to customers or clients, and interact with colleagues. Therefore, good communication skills are becoming increasingly important in the occupation.

Working Conditions

Bookkeeping, accounting, and auditing clerks work in an office environment. They may experience eye and muscle strain, back-

aches, headaches, and repetitive motion injuries as a result of using computers on a daily basis. Clerks may have to sit for extended periods while reviewing detailed data.

Many bookkeeping, accounting, and auditing clerks work regular business hours and a standard 40-hour week. A substantial number work just part time. Full-time and part-time clerks may work some evenings and weekends. Bookkeeping, accounting, and auditing clerks may work longer hours to meet deadlines at the end of the fiscal year, during tax time, or when monthly or yearly accounting audits are performed. Those who work in hotels, restaurants, and stores may put in overtime during peak holiday and vacation seasons.

Training, Other Qualifications, and Advancement

Most bookkeeping, accounting, and auditing clerks are required to have a high school degree at a minimum. However, having some college is increasingly important and an associate degree in business or accounting is required for some positions. Although a college degree is rarely required, graduates may accept bookkeeping, accounting, and auditing clerk positions to get into a particular company or to enter the accounting or finance field with the hope of eventually being promoted to professional or managerial positions.

Experience in a related job and working in an office environment also is recommended. Employers prefer workers who are computer-literate; knowledge of word processing and spreadsheet software is especially valuable.

Once hired, bookkeeping, accounting, and auditing clerks usually receive on-the-job training. Under the guidance of a supervisor or other senior worker, new employees learn company procedures. Some formal classroom training also may be necessary, such as training in specific computer software. Bookkeeping, accounting, and auditing clerks must be careful, orderly, and detail-oriented in order to avoid making errors and to recognize errors made by others. These workers also should be discreet and trustworthy, because they frequently come in contact with confidential material. In addition, all bookkeeping, accounting, and auditing clerks should have a strong aptitude for numbers.

Bookkeepers, particularly those who handle all the recordkeeping for companies, may find it beneficial to become certified. The Certified Bookkeeper designation, awarded by the American Institute of Professional Bookkeepers, assures employers that individuals have the skills and knowledge required to carry out all the bookkeeping and accounting functions up through the adjusted trial balance, including payroll functions. For certification, candidates must have at least 2 years of bookkeeping experience, pass three tests, and adhere to a code of ethics. More than 100 colleges and universities offer a preparatory course for certification and another 150 offer a course online. The Universal Accounting Center offers the Professional Bookkeeper designation.

Bookkeeping, accounting, and auditing clerks usually advance by taking on more duties in the same occupation for higher pay or by transferring to a closely related occupation. Most companies fill office and administrative support supervisory and managerial positions by promoting individuals from within their organizations, so clerks who acquire additional skills, experience, and training improve their advancement opportunities. With appropriate experience and education, some bookkeeping, accounting, and auditing clerks may become accountants or auditors.

Employment

Bookkeeping, accounting, and auditing clerks held more than 2 million jobs in 2004. They are found in all industries and at all levels of government. Local government and the accounting, tax preparation, bookkeeping, and payroll services industry are among the individual industries employing the largest numbers of these clerks. A growing number work for employment services firms, the result of an increase

in outsourcing of this occupation. About 1 out of 4 bookkeeping, accounting, and auditing clerks worked part time in 2004.

Job Outlook

Employment of bookkeeping, accounting, and auditing clerks is projected to grow more slowly than the average for all occupations through 2014. More job openings will stem from replacement needs than from job growth. Each year, numerous jobs will become available as these clerks transfer to other occupations or leave the labor force. The large size of this occupation ensures plentiful job openings, including many opportunities for temporary and part-time work.

Although a growing economy will result in more financial transactions and other activities that require these clerical workers, the continuing spread of office automation will lift worker productivity and contribute to the slower-than-average increase in employment. In addition, organizations of all sizes will continue to downsize and consolidate various recordkeeping functions, thus reducing the demand for bookkeeping, accounting, and auditing clerks. Furthermore, some work performed by these workers will be outsourced to lower-wage foreign countries. Those who can carry out a wider range of bookkeeping and accounting activities will be in greater demand than specialized clerks. Demand for full-charge bookkeepers is expected to increase, because they are called upon to do much of the work of accountants, as well as perform a wider variety of financial transactions, from payroll to billing. Certified bookkeepers and those with several years of accounting or bookkeeper experience will have the best job prospects.

Earnings

In May 2004, the median wage and salary annual earnings of bookkeeping, accounting, and auditing clerks were \$28,570. The middle half of the occupation earned between \$22,960 and \$35,450. The top 10 percent of bookkeeping, accounting, and auditing clerks more than \$43,570, and the bottom 10 percent earned less than \$18,580.

Related Occupations

Bookkeeping, accounting, and auditing clerks work with financial records. Other clerks who perform similar duties include bill and account collectors; billing and posting clerks and machine operators; brokerage clerks; credit authorizers, checkers, and clerks; payroll and timekeeping clerks; procurement clerks; and tellers.

Sources of Additional Information

For information on the Certified Bookkeeper designation, contact:
 ► American Institute of Professional Bookkeepers, 6001 Montrose Rd., Suite 500, Rockville, MD 20852. Internet: <http://www.aipb.org>

Gaming Cage Workers

(O*NET 43-3041.00)

Significant Points

- Job opportunities are available nationwide and are no longer limited to Nevada and New Jersey.
- Most employers prefer applicants who have at least a high school diploma as well as experience in handling money or previous casino employment.
- Workers need a license issued by a regulatory agency, such as a State casino control board or commission; licensure requires proof of residency in the State in which gaming workers are employed and a background investigation.

Nature of the Work

Gaming cage workers, more commonly called *cage cashiers*, work in casinos and other gaming establishments. The “cage” where these workers can be found is the central depository for money, gaming chips, and paperwork necessary to support casino play.

Cage workers carry out a wide range of financial transactions and handle any paperwork that may be required. They perform credit checks and verify credit references for people who want to open a house credit account. They cash checks according to rules established by the casino. Cage workers sell gambling chips, tokens, or tickets to patrons or to other workers for resale to patrons and exchange chips and tokens for cash. They may use cash registers, adding machines, or computers to calculate and record transactions. At the end of their shift, cage cashiers must balance the books.

Because gaming establishments are closely scrutinized, cage workers must follow a number of rules and regulations related to their handling of money. For example, they monitor large cash transactions for money laundering and tax purposes, and report these transactions to the Internal Revenue Service. Also, in determining when to extend credit or cash a check, cage workers must follow detailed procedures.

Working Conditions

The atmosphere in casinos is often considered glamorous. However, casino work can also be physically demanding. This occupation requires workers to stand for long periods with constant reaching and grabbing. Sometimes cage workers may be expected to lift and carry relatively heavy items. The casino atmosphere exposes workers to certain hazards, such as cigarette, cigar, and pipe smoke. Noise from slot machines, gaming tables, and talking workers and patrons may be distracting to some, although workers wear protective headgear in areas where loud machinery is used to count money.

Most casinos are open 24 hours a day, seven days a week and offer three staggered shifts. Casinos typically require cage workers to work on nights, weekends, and holidays.

Training, Other Qualifications, and Advancement

There usually are no minimum educational requirements, although most employers prefer at least a high school diploma or the equivalent. Experience in handling money or previous casino employment also is preferred. Prospective gaming cage workers are sometimes required to pass a basic math test. Good customer

service skills and computer proficiency are also necessary for this occupation. Each casino establishes its own requirements for education, training, and experience.

Once hired, gaming cage workers usually receive on-the-job training. Under the guidance of a supervisor or other senior worker, new employees learn company procedures. Some formal classroom training also may be necessary, such as training in specific gaming regulations and procedures. Gaming cage workers must be careful, orderly, and detail-oriented in order to avoid making errors and to recognize errors made by others. These workers also should be discreet and trustworthy, because they frequently come in contact with confidential material.

All gaming workers are required to have a license issued by a regulatory agency, such as a State casino control board or commission. Applicants for a license must provide photo identification, offer proof of residency in the State in which they anticipate working, and pay a fee. Age requirements vary by State. The licensing application process also includes a background investigation.

Employment

Gaming cage workers held about 20,000 jobs in 2004. All of these individuals work in establishments that offer gaming, and employment is concentrated in Nevada and Atlantic City, New Jersey. However, a growing number of States and Indian reservations have legalized gambling, and gaming establishments can now be found in many parts of the country.

Job Outlook

Employment of gaming cage workers is expected to increase about as fast as the average for all occupations through 2014. The outlook for gaming cage workers depends on the demand for gaming, which is expected to remain strong. No longer confined to Nevada and New Jersey, gaming is becoming legalized in more States that consider gaming an effective way to increase revenues. A substantial portion of this growth will come from the construction of new Indian casinos and “racinos,” which are race tracks that offer casino games.

Gaming cage workers, however, will have fewer job opportunities than others in gaming establishments, as casinos find ways to reduce the amount of cash handled by employees. For example, self-serve cash-out and change machines are common along with automated teller machines. In addition, slot machines are now able to make payouts in tickets, instead of coins, which can be read by other slot machines and the amount on the ticket transferred to the new machine. These technologies reduce the amount of cash needed to play and speed up the exchange process, which means less workers are needed to handle the cage than in the past. However, a fair number of openings will result from high turnover in this occupation, due to the high level of scrutiny workers receive and the need to be accurate. Persons with good mathematics abilities, previous casino experience, some background in accounting or bookkeeping, and good customer service skills should have the best opportunities.

Earnings

Wage earnings for gaming cage workers vary according to level of experience, training, location, and size of the gaming establishment. Median hourly earnings of gaming cage workers were \$10.74 in May 2004. The middle 50 percent earned between \$9.24 and \$12.85 an hour. The lowest 10 percent earned less than \$7.91, and the highest 10 percent earned more than \$14.99 an hour.

Gaming cage workers perform credit checks for patrons trying to establish house credit accounts.

Related Occupations

Many other occupations provide hospitality and customer service. Some examples of related occupations are credit authorizers, checkers, and clerks; gaming service occupations; sales worker supervisors; cashiers; retail salespersons; and tellers.

Sources of Additional Information

Information on employment opportunities for gaming cage workers is available from local offices of the State employment service.

Information on careers in gaming also is available from:

► American Gaming Association, 555 13th St. NW., Suite 1010 East, Washington, DC 20004. Internet: <http://www.americangaming.org>

Payroll and Timekeeping Clerks

(O*NET 43-3051.00)

Significant Points

- Payroll and timekeeping clerks are found in every industry.
- Most employers prefer applicants with a high school diploma; computer skills are very desirable.
- Those who have completed a certification program, indicating that they can handle more complex payroll issues, will have an advantage in the job market.

Nature of the Work

Payroll and timekeeping clerks perform a vital function: ensuring that employees are paid on time and that their paychecks are accurate. If inaccuracies occur, such as monetary errors or incorrect amounts of vacation time, these workers research and correct the records. In addition, they may perform various other clerical tasks. Automated timekeeping systems that allow employees to enter the number of hours they have worked directly into a computer have eliminated much of the data entry and review by timekeepers and have elevated the job of payroll clerk. In offices that have not automated this function, however, payroll and timekeeping clerks still perform many of the traditional job functions.

The fundamental task of *timekeeping clerks* is distributing and collecting timecards each pay period. These workers review em-

Payroll and timekeeping clerks ensure that employees are paid on time and that their paychecks are accurate.

ployee work charts, timesheets, and timecards to ensure that information is properly recorded and that records have the signatures of authorizing officials. In companies that bill for the time spent by staff, such as law or accounting firms, timekeeping clerks make sure that the hours recorded are charged to the correct job so that clients can be properly billed. These clerks also review computer reports listing timecards that cannot be processed because of errors, and they contact the employee or the employee's supervisor to resolve the problem. In addition, timekeeping clerks are responsible for informing managers and other employees about procedural changes in payroll policies.

Payroll clerks, also called payroll technicians, screen timecards for calculating, coding, or other errors. They compute pay by subtracting allotments, including Federal and State taxes and contributions to retirement, insurance, and savings plans, from gross earnings. Increasingly, computers are performing these calculations and alerting payroll clerks to problems or errors in the data. In small organizations or for new employees whose records are not yet entered into a computer system, clerks may perform the necessary calculations manually. In some small offices, clerks or other employees in the accounting department process payroll.

Payroll clerks record changes in employees' addresses; close out files when workers retire, resign, or transfer; and advise employees on income tax withholding and other mandatory deductions. They also issue and record adjustments to workers' pay because of previous errors or retroactive increases. Payroll clerks need to follow changes in tax and deduction laws, so they are aware of the most recent revisions. Finally, they prepare and mail earnings and tax-withholding statements for employees' use in preparing income tax returns.

In small offices, payroll and timekeeping duties are likely to be included in the duties of a general office clerk, a secretary, or an accounting clerk. However, large organizations employ specialized payroll and timekeeping clerks to perform these functions. In offices that have automated timekeeping systems, payroll clerks perform more analysis of the data, examine trends, and work with computer systems. They also spend more time answering employees' questions and processing unique data.

Working Conditions

Payroll and timekeeping clerks usually work in clean, pleasant, and comfortable office settings. Clerks usually work a standard 35- to 40-hour week; however, longer hours might be necessary during busy periods. Payroll and timekeeping clerks also may face stress at times, particularly from the pressure to meet deadlines.

Training, Other Qualifications, and Advancement

Most employers prefer applicants with a high school diploma or GED. Computer skills are very desirable. Payroll and timekeeping clerks learn their skills through a combination of on-the-job experience and informal training. Training also can be attained through programs in high schools, business schools, and community colleges. New workers receive training in payroll, timekeeping, personnel issues, workplace practices, and company policies.

Payroll and timekeeping clerks must be able to interact and communicate with individuals at all levels of the organization. In addition, clerks should demonstrate poise, tactfulness, and diplomacy, and have a high level of interpersonal skills in order to handle sensitive and confidential situations.

Most organizations specializing in payroll and timekeeping offer classes intended to enhance the marketable skills of their members. Some organizations offer certification programs; completion of a certification program indicates competence and can enhance one's advancement opportunities. For example, the American Payroll As-

sociation offers two levels of certification, the Fundamental Payroll Certification (FPC) and the Certified Payroll Professional (CPP). The FPC is open to all individuals who wish to demonstrate basic payroll competency. The more advanced CPP is available those who have been employed in the practice of payroll for at least 3 years and who have obtained the FPC within the last 18 months. Both require experience and a passing score on a comprehensive exam.

Employment

Payroll and timekeeping clerks held about 214,000 jobs in 2004. They can be found in every industry, but a growing number work for employment services companies as temporary employees, or for accounting, tax preparation, bookkeeping, and payroll services firms, which increasingly are taking on the payroll function as a service to other companies. Approximately 18 percent of all payroll and timekeeping clerks worked part time in 2004.

Job Outlook

Employment of payroll and timekeeping clerks is expected to grow about as fast as the average for all occupations through 2014. In addition to job growth, numerous job openings will arise each year as payroll and timekeeping clerks leave the labor force or transfer to other occupations. Those who have completed a certification program, indicating that they can handle more complex payroll issues, will have an advantage in the job market.

As entering and recording payroll and timekeeping information becomes more simplified, the job itself is becoming more complex, with companies now offering a greater variety of pension, 401(k), and other investment plans to their employees. Also, the growing use of garnishment of wages for child support is adding to the complexity. These developments will fuel the demand for payroll and timekeeping clerks, who will be needed to record and monitor such information.

Firms increasingly are outsourcing the payroll function. As a result, the best employment opportunities are expected to be in companies that specialize in payroll, including companies in the employment services industry and the accounting, tax preparation, bookkeeping, and payroll services industry. Many of these companies are data processing facilities, but accounting firms also are taking on the payroll function to supplement their accounting work.

The increasing use of computers will limit employment growth of payroll and timekeeping clerks. For example, automated time clocks, which calculate employee hours, allow large organizations to centralize their timekeeping duties in one location. At individual sites, employee hours increasingly are tracked by computer and verified by managers. This information is compiled and sent to a central office to be processed by payroll clerks. In addition, the growing use of direct deposit will reduce the need to draft paychecks, because these funds are transferred automatically each pay period. Also, more organizations are allowing employees to update their payroll records electronically. In smaller organizations, payroll and timekeeping duties are being assigned to secretaries, general office clerks, or accounting clerks. Furthermore, the greater complexity of the job, coupled with the automation of records that is simplifying data entry, is resulting in payroll professionals, not payroll and timekeeping clerks, doing more of the work.

Earnings

Salaries of payroll and timekeeping clerks may vary considerably. The region of the country, size of city, and type and size of establishment all influence salary levels. Also, the level of expertise required and the complexity and uniqueness of a clerk's responsibilities may affect earnings.

Median annual earnings of payroll and timekeeping clerks in May 2004 were \$30,350. The middle 50 percent earned between \$24,430 and \$36,930. The lowest 10 percent earned less than \$19,680, and the highest 10 percent earned more than \$44,270. Median annual earnings in the industries employing the largest numbers of payroll and timekeeping clerks in May 2004 were:

Management of companies and enterprises	\$32,600
Elementary and secondary schools	32,390
Local government	31,620
Accounting, tax preparation, bookkeeping, and payroll services .	29,040
Employment services	28,010

Some employers offer educational assistance to payroll and timekeeping clerks.

Related Occupations

Payroll and timekeeping clerks perform a vital financial function—ensuring that employees are paid on time and that their paychecks are accurate. In addition, they may perform various other office and administrative support duties. Other financial clerks include bill and account collectors; billing and posting clerks and machine operators; bookkeeping, accounting, and auditing clerks; gaming cage workers; procurement clerks; and tellers.

Procurement Clerks

(O*NET 43-3061.00)

Significant Points

- About 3 in 10 procurement clerks work for Federal, State, and local governments.
- Most employers prefer applicants who have a high school diploma and who are computer-literate.
- Overall employment is expected to decline through 2014 as a result of increasing automation.

Nature of the Work

Procurement clerks compile requests for materials, prepare purchase orders, keep track of purchases and supplies, and handle inquiries about orders. Usually called *purchasing clerks* or *purchasing technicians*, they perform a variety of tasks related to the ordering of goods and supplies for an organization and make sure that what was purchased arrives on schedule and meets the purchaser's specifications.

Automation is having a profound effect on this occupation. Orders for goods now can be placed electronically when supplies are low. For example, computers integrated with cash registers at stores record purchases and automatically reorder goods when supplies reach a certain target level. However, automation is still years away for many firms, and the role of the procurement clerk is unchanged in many organizations.

Procurement clerks perform a wide range of tasks and also have a wide range of responsibilities. Some clerks act more like buyers, particularly at small to medium-size companies, while others perform strictly clerical functions. In general, procurement clerks process requests for purchases. They first determine whether there is any of the requested product left in inventory and may go through catalogs or to the Internet to find suppliers. They may prepare invitation-to-bid forms and mail them to suppliers or distribute them for public posting. Procurement clerks may interview potential suppliers by telephone or face-to-face to check on prices and specifications and thereby put together spreadsheets with price comparisons and other facts about each supplier. Upon the organization's approval of a supplier, purchase orders are prepared, mailed, and entered into computers. Procurement clerks keep track of orders and determine the causes of any delays. If the supplier has questions, clerks try to answer them and resolve any problems. When the shipment arrives, procurement clerks may reconcile the purchase order with the shipment, making sure that they match; notify the vendors when invoices are not received; and verify that the bills concur with the purchase orders.

Some purchasing departments, particularly in small companies, are responsible for overseeing the organization's inventory control system. At these organizations, procurement clerks monitor in-house inventory movement and complete inventory transfer forms for bookkeeping purposes. They may keep inventory spreadsheets and place orders when materials on hand are insufficient.

Working Conditions

Procurement clerks usually work a standard 40-hour week. Most procurement clerks work in areas that are clean, well lit, and relatively quiet. These workers sit for long periods of time in front of computer terminals, which many cause eyestrain and headaches. Workers in this occupation may sometimes be expected to work overtime or varied shifts.

Procurement clerks process requests for purchases.

Training, Other Qualifications, and Advancement

Most employers prefer applicants with a high school diploma or its equivalent or a mix of education and related experience. Most employers prefer workers who are computer-literate and have a working knowledge of word processing and spreadsheet software.

Most procurement clerks are trained on the job under close supervision of more experienced employees. Proficiency with desktop computer software is becoming increasingly important as most tasks, such as preparing purchase orders, are being filed electronically. Some procurement clerks that have more education and show a greater understanding of contracts and purchasing may be promoted to the position of purchasing agent or buyer.

Employment

In 2004, procurement clerks held about 74,000 jobs. Procurement clerks are found in every industry, including manufacturing, retail and wholesale trade, health care, and government. About 3 in 10 procurement clerks work for Federal, State, and local governments; most of these clerks work for the Federal Government.

Job Outlook

Employment of procurement clerks is expected to decline through 2014 as a result of increasing automation. The need for procurement clerks will be reduced as the use of computers to place orders directly with suppliers—called electronic data interchange—and as ordering over the Internet—known as “e-procurement”—become more commonplace. In addition, procurement authority for some purchases is now being given to employees in the departments originating the purchase. These departments may be issued procurement cards, which are similar to credit cards that enable a department to charge purchases up to a specified amount.

Although overall employment in the occupation is expected to decline, job outlook varies by industry. For example, employment will decline in manufacturing, the primary employer of procurement clerks in the goods-producing sector of the economy. In contrast, employment of procurement clerks will increase in some industries in the service-providing sector—such as retail trade, professional services, and health care—which are beginning to realize that a centralized procurement department may be more cost effective than units making purchases independently, as many service companies had been doing. However, most job openings will arise out of the need to replace workers who transfer to other occupations or leave the labor force. Persons with good writing and communication skills, along with computer skills, will have the best opportunities for employment.

Earnings

Median hourly earnings of procurement clerks in May 2004 were \$14.85. The middle 50 percent earned between \$11.82 and \$18.11. The lowest 10 percent earned less than \$9.52 and the highest 10 percent earned more than \$21.03. Procurement clerks working for the Federal Government had an average annual income of \$39,011 in 2005.

Related Occupations

Procurement clerks compile information and records to draw up purchase orders for materials and services. Other workers who perform similar duties are purchasing agents and buyers, order clerks, file clerks, secretaries, and receptionists and information clerks.

Sources of Additional Information

Information on employment opportunities for procurement clerks is available from local offices of the State employment service.

Tellers

(O*NET 43-3071.00)

Significant Points

- Most jobs require only a high school diploma; tellers should enjoy public contact, must feel comfortable handling large amounts of money, and should be discreet and trustworthy.
- About 3 out of 10 tellers work part time.
- Most job openings will arise from replacement needs because turnover is high.
- Although the job outlook for tellers has improved recently, employment is projected to grow more slowly than average.

Nature of the Work

The teller is the person most people associate with a bank. Tellers make up approximately one-fourth of bank employees and conduct most of a bank's routine transactions. Among the responsibilities of tellers are cashing checks, accepting deposits and loan payments, and processing withdrawals. They also may sell savings bonds, accept payment for customers' utility bills and charge cards, process necessary paperwork for certificates of deposit, and sell travelers' checks. Some tellers specialize in handling foreign currencies or commercial or business accounts.

Being a teller requires a great deal of attention to detail. Before cashing a check, a teller must verify the date, the name of the bank, the identity of the person who is to receive payment, and the legality of the document. A teller also must make sure that the written and numerical amounts agree and that the account has sufficient funds to cover the check. The teller then must carefully count cash to avoid errors. Sometimes a customer withdraws money in the form of a cashier's check, which the teller prepares and verifies. When accepting a deposit, tellers must check the accuracy of the deposit slip before processing the transaction.

Prior to starting their shifts, tellers receive and count an amount of working cash for their drawers. A supervisor—usually the head teller—verifies this amount. Tellers use this cash for payments during the day and are responsible for its safe and accurate handling. Before leaving, tellers count their cash on hand, list the currency-received tickets on a balance sheet, make sure that the accounts balance, and sort checks and deposit slips. Over the course of a workday, tellers also may process numerous mail transactions. Some tellers replenish their cash drawers and corroborate deposits and payments to automated teller machines (ATMs).

In most banks, head tellers are responsible for the teller line. They set work schedules, ensure that the proper procedures are adhered to, and act as a mentor to less experienced tellers. In addition, head tellers may perform the typical duties of a teller, as needed, and may deal with the more difficult customer problems. They may access the vault, ensure that the correct cash balance is in the vault, and oversee large cash transactions. Technology continues to play a large role in the job duties of all tellers. In most banks, for example, tellers use computer terminals to record deposits and withdrawals. These terminals often give tellers quick access to detailed information on customer accounts. Tellers can use this information to tailor the bank's services to fit a customer's needs or to recommend an appropriate bank product or service.

As banks begin to offer more and increasingly complex financial services, tellers are being trained to identify sales opportunities.

Tellers must pay attention to detail.

This task requires them to learn about the various financial products and services the bank offers so that they can briefly explain them to customers and refer interested customers to appropriate specialized sales personnel. In addition, tellers in many banks are being cross-trained to perform some of the functions of customer service representatives. (Customer service representatives are discussed separately in the *Handbook*.)

Working Conditions

Tellers work in an office environment. They may experience eye and muscle strain, backaches, headaches, and repetitive motion injuries as a result of using computers on a daily basis. Tellers may have to sit for extended periods while reviewing detailed data.

Many tellers work regular business hours and a standard 40-hour week. A substantial number work just part time. Full-time and part-time tellers may work some evenings and weekends.

Training, Other Qualifications, and Advancement

Most tellers are required to have at least a high school diploma. Some have some college training or even a bachelor's degree in business, accounting, or liberal arts. Although a degree is rarely required, graduates may accept teller positions to get into a particular company or to enter the banking field with the hope of eventually being promoted to professional or managerial positions.

Experience working in an office environment or in customer service, and particularly cash-handling experience, can be important for tellers. Regardless of experience, employers prefer workers who have good communication skills and who are computer-literate; knowledge of word processing and spreadsheet software also is valuable.

Once hired, tellers usually receive on-the-job training. Under the guidance of a supervisor or other senior worker, new employees learn company procedures. Some formal classroom training also may be necessary, such as training in specific computer software.

Tellers should enjoy contact with the public. They must have a strong aptitude for numbers and feel comfortable handling large amounts of money. They should be discreet and trustworthy,

because they frequently come in contact with confidential material. Tellers also must be careful, orderly, and detail-oriented in order to avoid making errors and to recognize errors made by others.

Tellers can prepare for better jobs by taking courses offered throughout the country by banking and financial institutes, colleges and universities, and private training institutions.

Tellers usually advance by taking on more duties in the same occupation or by being promoted to head teller or to another supervisory job. Many banks and other employers fill supervisory and managerial positions by promoting individuals from within their organizations, so outstanding tellers who acquire additional skills, experience, and training improve their advancement opportunities.

Employment

Tellers held about 558,000 jobs in 2004. The overwhelming majority worked in commercial banks, savings institutions, or credit unions. The remainder worked in a variety of other finance and other industries. About 3 out of 10 worked part time.

Job Outlook

Employment prospects for tellers have improved recently. Employment is projected to grow, but more slowly than the average for all occupations through 2014. Banks are looking at their branch offices as places to attract customers for the increasing number and variety of financial products the banks sell. As recently as a few years ago, banks were closing branch offices and discouraging the use of tellers in an effort to cut costs, but in a turnaround, banks are now opening branch offices in more locations. They also are keeping them open longer during the day and on weekends, a practice that is expected to increase opportunities for tellers, particularly those who work part time. Most job openings will arise from replacement needs because turnover is high—a characteristic typical of large occupations that normally require little formal education and offer relatively low pay. Tellers who have excellent customer service skills, are knowledgeable about a variety of financial services, and can sell those services will be in greater demand in the future.

Despite the improved outlook, automation and technology will continue to reduce the need for tellers who perform only routine

transactions. For example, ATMs and the increased use of direct deposit of paychecks and benefit checks have reduced the need for bank customers to interact with tellers for routine transactions. In addition, electronic banking is spreading rapidly throughout the banking industry. This type of banking, conducted over the telephone or the Internet, also will reduce the number of tellers over the long run.

Employment of tellers also is being affected by the increasing use of 24-hour telephone centers by many large banks. These centers allow a customer to interact with a bank representative at a distant location, either by telephone or by video terminal. Such centers usually are staffed by customer service representatives, who can handle a wider variety of transactions than tellers can, including applications for loans and credit cards.

Earnings

Salaries of tellers may vary with their experience and with the region of the country, size of city, and type and size of establishment. Median annual earnings of tellers were \$21,120 in May 2004. The middle 50 percent earned between \$18,320 and \$23,900 a year. The lowest 10 percent earned less than \$15,850, and the highest 10 percent earned more than \$28,100 a year.

As in other occupations, part-time tellers may not enjoy the same benefits—such as vacations, health and life insurance, and pensions—as full-time workers.

Related Occupations

Tellers enter data into a computer, handle cash, and keep track of financial transactions. Other clerks who perform similar duties include bill and account collectors; billing and posting clerks and machine operators; bookkeeping, accounting, and auditing clerks; gaming cage workers; brokerage clerks; and credit authorizers, checkers, and clerks.

Sources of Additional Information

Information on employment opportunities for tellers is available from banks and other employers and local offices of the State employment service and from:

► Bank Administration Institute, 1 North Franklin St., Chicago, IL 60606.

Information and Record Clerks

Brokerage Clerks

(O*NET 43-4011.00)

Significant Points

- More than 9 out of 10 worked for securities and commodities, banks, and other finance industries.
- Brokerage clerks may be high school or college graduates, but positions dealing with the public, such as broker's or sales assistant and those dealing with more complicated financial records are increasingly being held by college graduates.
- Although a growing economy will result in more financial transactions that require these workers, the continuing spread of office automation and the emergence of online trading will result in slower-than-average growth in employment.

Nature of the Work

Brokerage clerks handle much of the day-to-day operations of brokerages, performing a number of different jobs with a wide range of responsibilities; all involve computing and recording data pertaining to securities transactions. Brokerage clerks also may contact customers, take orders, and inform clients of changes to their accounts. Some of these jobs are more clerical and require only a high school diploma, while others are considered entry-level positions for which a bachelor's degree is needed. Brokerage clerks, who work in the operations departments of securities firms, on trading floors, and in branch offices, also are called margin clerks, dividend clerks, transfer clerks, and broker's assistants.

The broker's assistant, also called sales assistant, is the most common type of brokerage clerk. These workers typically assist two brokers, for whom they take calls from clients, write up order tickets, process the paperwork for opening and closing accounts, record a client's purchases and sales, and inform clients of changes to their accounts. All broker's assistants must be knowledgeable about investment products so that they can communicate clearly with clients. Those with a "Series 7" license can make recommendations to clients

at the instruction of the broker. This license, issued to securities and commodities sales representatives by the National Association of Securities Dealers (NASD), allows them to provide advice on securities to the public. (Securities, commodities, and financial services sales agents are discussed elsewhere in the *Handbook*.)

Brokerage clerks in the operations areas of securities firms perform many duties to facilitate the sale and purchase of stocks, bonds, commodities, and other kinds of investments. These clerks produce the necessary records of all transactions that occur in their area of the business. Job titles for many of them depend upon the type of work that they perform. Purchase-and-sale clerks, for example, match orders to buy with orders to sell. They balance and verify trades of stock by comparing the records of the selling firm with those of the buying firm. Dividend clerks ensure timely payments of stock or cash dividends to clients of a particular brokerage firm. Transfer clerks execute customer requests for changes to security registration and examine stock certificates to make sure that they adhere to banking regulations. Receive-and-deliver clerks facilitate the receipt and delivery of securities among firms and institutions. Margin clerks record and monitor activity in customers' accounts to ensure that clients make payments and stay within legal boundaries concerning their purchases of stock.

Technology is changing the nature of many of these jobs. A significant and growing number of brokerage clerks use custom-designed software programs to process transactions more quickly. Only a few customized accounts are still handled manually. Furthermore, the rapid expansion of online trading reduces the amount of paperwork because brokerage clerks are able to make trades electronically.

Working Conditions

Brokerage clerks work in offices. Usually the work flow is fairly regular; however, when sales activity increases, the pace can become hectic.

Brokerage clerks generally work a standard 40-hour week, but, they may work overtime during particularly busy periods. Most brokerage clerks work in areas that are clean and well lit, but may be noisy at times.

Training, Other Qualifications, and Advancement

Depending on the job description, brokerage clerks can be high school or college graduates. Positions dealing with the public, such as broker's or sales assistant, and those dealing with more complicated financial records are increasingly being held by college graduates.

Brokerage clerk jobs require good organizational and communication skills, as well as attention to detail. Computer skills also

are important in order to enter and retrieve data quickly. A Series 7 brokerage license can make a clerk more valuable to the broker because it gives the assistant the ability to answer more of a client's questions and to pass along securities recommendations from the broker. Before clerks can obtain a license, however, they must pass the General Securities Registered Representative Examination (Series 7 exam), administered by the NASD, and be an employee of a registered firm for at least 4 months.

Most new employees are trained on the job, working under the close supervision of more experienced employees. Some firms offer formal training that may include courses in telephone etiquette, computer use, and customer service skills.

Clerks may be promoted to sales representative positions or other professional positions within the securities industry. Some of the larger firms have training programs, especially for their college graduates, that provide clerks with the skills they need for advancement.

Employment

Brokerage clerks held about 75,000 jobs in 2004. More than 9 out of 10 worked for securities and commodities, banks, and other finance industries.

Job Outlook

Employment of brokerage clerks is expected to grow more slowly than the average for all occupations through the year 2014. Although a growing economy will result in more financial transactions and other activities that require these workers, the continuing spread of office automation will lift worker productivity and restrict job growth.

With people increasingly investing in securities, brokerage clerks will be required to process larger volumes of transactions. Moreover, some brokerage clerks will still be needed to update records, enter changes into customers' accounts, and verify transfers of securities. However, the emergence of online trading and widespread automation in the securities and commodities industry will limit demand for brokerage clerks in the coming decade. Some job openings will stem from the need to replace clerks who transfer to other occupations or stop working.

Earnings

Median hourly earnings of brokerage clerks were \$16.94 in May 2004. The middle 50 percent earned between \$13.52 and \$21.60. The lowest 10 percent earned less than \$11.22 and the highest 10 percent earned more than \$27.11.

Related Occupations

Brokerage clerks compute and record data. Other workers who perform calculations and record data include bill and account collectors; billing and posting clerks and machine operators; bookkeeping, accounting, and auditing clerks; order clerks; and tellers.

Sources of Additional Information

State employment service offices and agencies can provide information about job openings for brokerage clerks.

Credit Authorizers, Checkers, and Clerks

(O*NET 43-4041.01, 43-4041.02)

Significant Points

- Most jobs require only a high school diploma.
- Employment is expected to decline.

Brokerage clerks record data pertaining to securities transactions.

Nature of the Work

Credit authorizers, checkers, and clerks review credit history and obtain the information needed to determine the creditworthiness of individuals or businesses applying for credit. They spend much of their day on the telephone or on the Internet obtaining information from credit bureaus, employers, banks, credit institutions, and other sources to determine applicants' credit history and ability to repay what they borrow or charge.

Credit authorizers, checkers, and clerks process and authorize applications for credit, including applications for credit cards. Although the distinctions among the three job titles are disappearing, some general differences remain. *Credit clerks* typically handle the processing of credit applications by verifying the information on the application, calling applicants if additional data are needed, contacting credit bureaus for a credit rating, and obtaining any other information necessary to determine applicants' creditworthiness. If clerks work in a department store or other establishment that offers instant credit, they enter the applicant's information into a computer at the point of sale. A credit rating is then transmitted from a central office within seconds to indicate whether the application should be rejected or approved.

Credit checkers investigate the credit history and current credit standing of a person or business prior to the issuance of a loan or line of credit. Credit checkers also may contact credit departments of businesses and service companies to obtain information about an applicant's credit standing. Credit reporting agencies and bureaus hire checkers to secure, update, and verify information for credit

Credit authorizers process applications for credit cards.

reports. These workers often are called *credit investigators* or *credit reporters*.

Credit authorizers approve charges against customers' existing accounts. Most charges are approved automatically by computer. However, when accounts are past due, overextended, or invalid, or when they show a change of address, salespersons refer the associated transactions to credit authorizers located in a central office. These authorizers evaluate the customers' computerized credit records and payment histories and quickly decide whether to approve new charges.

Working Conditions

Credit authorizers, checkers, and clerks usually work a standard 40-hour week. However, they may work overtime during particularly busy periods, such as holiday shopping seasons and store sales. Most credit authorizers, checkers, and clerks work in areas that are clean, well lit, and relatively quiet. These workers sit for long periods of time in front of computer screens, which may cause eyestrain and headaches. Part-time work is available, and temporary workers are often hired during peak workloads.

Training, Other Qualifications, and Advancement

A high school diploma or its equivalent is usually the minimum requirement for these workers. Other requirements of the job include good telephone and organizational skills and the ability to pay close attention to details and meet tight deadlines. Computer skills also are important in order to enter and retrieve data quickly.

Most new employees are trained on the job, working under close supervision of more experienced employees. Some firms offer formal training that may include courses in telephone etiquette, computer use, and customer service skills. Some credit authorizers, checkers, and clerks also take courses in credit offered by banking and credit associations, public and private vocational schools, and colleges and universities. These workers typically can advance to loan or credit department supervisor or team leader of a small group of clerks.

Employment

Credit authorizers, checkers, and clerks held about 67,000 jobs in 2004. Nearly half of these workers were employed by finance and insurance industries, mainly firms in credit intermediation and related activities, such as commercial and savings banks; credit unions; and mortgage, finance, and loan companies. Credit bureaus, collection agencies, and wholesale and retail trade establishments also employ these clerks.

Job Outlook

Employment of credit authorizers, checkers, and clerks is expected to decline through 2014. Despite a projected increase in the number of credit applications, technology will allow these applications to be processed, checked, and authorized by fewer workers than were required in the past.

Credit scoring is a major development that has improved the productivity of credit authorizers, checkers, and clerks, thus limiting employment growth in the occupation. Companies and credit bureaus now can purchase software that quickly analyzes an applicant's creditworthiness and summarizes it with a "score." Credit issuers then can easily decide whether to accept or reject an application on the basis of its score, speeding up the authorization of loans or credit. Obtaining credit ratings also has become much easier for credit checkers and authorizers because businesses now have computer systems directly linked to credit bureaus that provide immediate access to a person's credit history.

The job outlook for credit authorizers, checkers, and clerks is sensitive to overall economic activity. A downturn in the economy or a rise in interest rates usually leads to a decline in demand for

credit. Even in slow economic times, however, job openings will arise from the need to replace workers who leave the occupation for various reasons.

Earnings

Median hourly earnings of credit authorizers, checkers, and clerks in May 2004 were \$13.97. The middle 50 percent earned between \$11.27 and \$17.56. The lowest 10 percent earned less than \$9.19, and the highest 10 percent earned more than \$21.90. Median hourly earnings in nondepository credit intermediation were \$13.74 in 2004, while median earnings in depository credit intermediation were \$13.62.

Related Occupations

Credit authorizers, checkers, and clerks obtain and analyze credit histories. Other workers who review account information include bill and account collectors, loan officers, and insurance underwriters.

Sources of Additional Information

State employment service offices and agencies can provide information about job openings for credit authorizers, checkers, and clerks.

Customer Service Representatives

(O*NET 43-4051.01, 43-4051.02)

Significant Points

- Job prospects are expected to be excellent.
- Most jobs require only a high school diploma but educational requirements are rising.
- Strong verbal communication and listening skills are important.

Nature of the Work

Customer service representatives are employed by many different types of companies throughout the country to serve as a direct point of contact for customers. They are responsible for ensuring that their company's customers receive an adequate level of service or help with their questions and concerns. These customers may be individual consumers or other companies, and the nature of their service needs can vary considerably.

All customer service representatives interact with customers to provide information in response to inquiries about products or services and to handle and resolve complaints. They communicate with customers through a variety of means—by telephone; by e-mail, fax, or regular mail correspondence; or in person. Some customer service representatives handle general questions and complaints, whereas others specialize in a particular area.

Many customer inquiries involve routine questions and requests. For example, customer service representatives may be asked to provide a customer with their credit card balance, or to check on the status of an order that has been placed. Obtaining the answers to such questions usually requires simply looking up information on their computer. Other questions are more involved, and may call for additional research or further explanation on the part of the customer service representative. In handling customers' complaints, customer service representatives must attempt to resolve the problem according to guidelines established by the company. These procedures may involve asking questions to determine the validity of a complaint; offering possible solutions; or providing customers with

refunds, exchanges, or other offers, such as discounts or coupons. In some cases, customer service representatives are required to follow up with an individual customer until a question is answered or an issue is resolved.

Some customer service representatives help people decide what types of products or services would best suit their needs. They may even aid customers in completing purchases or transactions. Although the primary function of customer service representatives is not sales, some may spend a part of their time with customers encouraging them to purchase additional products or services. (For information on workers whose primary function is sales, see the statements on sales and related occupations elsewhere in the *Handbook*.) Customer service representatives also may make changes or updates to a customer's profile or account information. They may keep records of transactions and update and maintain databases of information.

Most customer service representatives use computers and telephones extensively in their work. Customer service representatives frequently enter information into a computer as they are speaking to customers. Often, companies have large amounts of data, such as account information, that can be pulled up on a computer screen while the representative is talking to a customer so that he or she can answer specific questions relating to the account. Customer service representatives also may have access to information such as answers to the most common customer questions, or guidelines for dealing with complaints. In the event that they encounter a question or situation to which they do not know how to respond, workers consult with a supervisor to determine the best course of action. Customer service representatives use multiline telephones systems, which often route calls directly to the most appropriate representative. However, at times, the customer service representative must transfer a call to someone who may be better able to respond to the customer's needs.

In some organizations, customer service representatives spend their entire day on the telephone. In others, they may spend part of their day answering e-mails and the remainder of the day taking calls. For some, most of their contact with the customer is face to face. Customer service representatives need to remain aware of the amount of time spent with each customer so that they can fairly distribute their time among the people who require their assistance. This is particularly important for customer service representatives whose primary activities are answering telephone calls and whose conversations often are required to be kept within set time limits. For customer service representatives working in call centers, there usually is very little time between telephone calls; as soon as representatives have finished with one call, they must move on to another. When working in call centers, customer service representatives are likely to be under close supervision. Telephone calls may be taped and reviewed by supervisors to ensure that company policies and procedures are being followed, or a supervisor may listen in on conversations.

Job responsibilities can differ, depending on the industry in which a customer service representative is employed. For example, a customer service representative working in the branch office of a bank may assume the responsibilities of other workers, such as teller or new account clerk, as needed. In insurance agencies, a customer service representative interacts with agents, insurance companies, and policyholders. These workers handle much of the paperwork related to insurance policies, such as policy applications and changes and renewals to existing policies. They answer questions regarding policy coverage, help with reporting claims, and do anything else that may need to be done. Although they must know as much as insurance agents about insurance products, and usually must have credentials equal

Customer service representatives interact with customers to provide information about products or services.

to those of an agent in order to sell products and make changes to policies, the duties of a customer service representative differ from those of an agent in that customer service representatives are not responsible for actively seeking potential customers. Customer service representatives employed by utilities and communications companies assist individuals interested in opening accounts for various utilities such as electricity and gas, or for communication services such as cable television and telephone. They explain various options and receive orders for services to be installed, turned on, turned off, or changed. They also may look into and resolve complaints about billing and service provided by utility, telephone, and cable television companies.

Working Conditions

Although customer service representatives can work in a variety of settings, most work in areas that are clean and well lit. Many work in call or customer contact centers. In this type of environment, workers generally have their own workstation or cubicle space equipped with a telephone, headset, and computer. Because many call centers are open extended hours, beyond the traditional work day, or are staffed around the clock, these positions may require workers to take on early morning, evening, or late night shifts. Weekend or holiday work also may be necessary. As a result, the occupation is well suited to flexible work schedules. Nearly 1 out of 5 customer service representatives work part time.

The occupation also offers the opportunity for seasonal work in certain industries, often through temporary help agencies.

Call centers may be crowded and noisy, and work may be repetitive and stressful, with little time between calls. Workers usually must attempt to minimize the length of each call, while still providing excellent service. To ensure that these procedures are followed, conversations may be monitored by supervisors, something that can be stressful. Also, long periods spent sitting, typing, or looking at a computer screen may cause eye and muscle strain, backaches, headaches, and repetitive motion injuries.

Customer service representatives working outside of a call center environment may interact with customers through several different means. For example, workers employed by an insurance agency or in a grocery store may have customers approach them in person or contact them by telephone, computer, mail, or fax. Many of these customer service representatives work a standard 40-hour week; however, their hours generally depend on the hours of operation of the establishment in which they are employed. Work environments outside of a call center also vary accordingly. Most customer service representatives work either in an office or at a service or help desk.

For virtually all types of customer service representatives, dealing with difficult or irate customers can be a trying task; however, the ability to resolve customers' problems has the potential to be very rewarding.

Training, Other Qualifications, and Advancement

Most customer service representative jobs require only a high school diploma. However, due to employers demanding a higher skilled workforce, many customer service jobs now require an associate or bachelor's degree. Basic to intermediate computer knowledge and good interpersonal skills also are important qualities for people who wish to be successful in the field. Because customer service representatives constantly interact with the public, good communication and problem-solving skills are a must. Verbal communication and listening skills are especially important. Additionally, for workers who communicate through e-mail, good typing, spelling, and written communication skills are necessary. High school courses in computers, English, or business are helpful in preparing for a job in customer service.

Customer service representatives play a critical role in providing an interface between customer and company, and for this reason employers seek out people who come across in a friendly and professional manner. The ability to deal patiently with problems and complaints and to remain courteous when faced with difficult or angry people is very important. Also, a customer service representative needs to be able to work independently within specified time constraints. Workers should have a clear and pleasant speaking voice and be fluent in English. However, the ability to speak a foreign language is becoming increasingly necessary, and bilingual skills are considered a plus.

Training requirements vary by industry. Almost all customer service representatives are provided with some training prior to beginning work, and training continues once on the job. This training generally covers customer service and phone skills, products and services and common customer problems with them, the use or operation of the telephone and/or computer systems, and company policies and regulations. Length of training varies, but it usually lasts at least several weeks. Because of a constant need to update skills and knowledge, most customer service representatives continue to receive instruction and training throughout their career. This is particularly true of workers in industries such as banking, in which regulations and products are continually changing.

Although some positions may require previous industry, office, or customer service experience, many customer service jobs are entry level. Customer service jobs are often good introductory positions into a company or an industry. In some cases, experienced workers can move up within the company into supervisory or managerial positions or they may move into areas such as product development, in which they can use their knowledge to improve products and services.

Within insurance agencies and brokerages, however, a customer service representative job usually is not an entry-level position. Workers must have previous experience in insurance and are often required by State regulations to be licensed like insurance sales agents. A variety of designations are available to demonstrate that a candidate has sufficient knowledge and skill, and continuing education and training are often offered through the employer. As they gain more knowledge of industry products and services, customer service representatives in insurance may advance to other, higher level positions, such as insurance sales agent.

Employment

Customer service representatives held about 2.1 million jobs in 2004. Although they were found in a variety of industries, about 1 in 4 customer service representatives worked in finance and insurance. The largest numbers were employed by insurance carriers, insurance agencies and brokerages, and banks and credit unions.

About 1 in 8 customer service representatives were employed in administrative and support services. These workers were concentrated in the business support services industry (which includes telephone call centers) and employment services (which includes temporary help services and employment placement agencies). Another 1 in 8 customer service representatives were employed in retail trade establishments such as general merchandise stores, food and beverage stores, or nonstore retailers. Other industries that employ significant numbers of customer service representatives include information, particularly the telecommunications industry; manufacturing, such as printing and related support activities; and wholesale trade.

Although they are found in all States, customer service representatives who work in call centers tend to be concentrated geographically. Four States—California, Texas, Florida, and New York—employ 30 percent of customer service representatives. Delaware, Arizona, South Dakota, and Utah, have the highest concentration of workers in this occupation, with customer service representatives comprising over 2 percent of total employment in these States.

Job Outlook

Prospects for obtaining a job in this field are expected to be excellent, with more job openings than jobseekers. Bilingual jobseekers, in particular, may enjoy favorable job prospects. In addition to many new openings occurring as businesses and organizations expand, numerous job openings will result from the need to replace experienced customer service representatives who transfer to other occupations or leave the labor force. Replacement needs are expected to be significant in this large occupation because many young people work as customer service representatives before switching to other jobs. This occupation is well suited to flexible work schedules, and many opportunities for part-time work will continue to be available, particularly as organizations attempt to cut labor costs by hiring more temporary workers.

Employment of customer service representatives is expected to increase faster than the average for all occupations through the year 2014. Beyond growth stemming from expansion of the industries in which customer service representatives are employed, a need for additional customer service representatives is likely to result from

heightened reliance on these workers. Customer service is critical to the success of any organization that deals with customers, and strong customer service can build sales and visibility as companies try to distinguish themselves from competitors. In many industries, gaining a competitive edge and retaining customers will be increasingly important over the next decade. This is particularly true in industries such as financial services, communications, and utilities, which already employ numerous customer service representatives. As the trend toward consolidation in industries continues, centralized call centers will provide an effective method for delivering a high level of customer service. As a result, employment of customer service representatives may grow at a faster rate in call centers than in other areas. However, this growth may be tempered: a variety of factors, including technological improvements, make it increasingly feasible and cost-effective for call centers to be built or relocated outside of the United States.

Technology is affecting the occupation in many ways. The Internet and automated teller machines have provided customers with means of obtaining information and conducting transactions that do not entail interacting with another person. Technology also allows for a greater streamlining of processes, while at the same time increasing the productivity of workers. The use of computer software to filter e-mails, generating automatic responses or directing messages to the appropriate representative, and the use of similar systems to answer or route telephone inquiries are likely to become more prevalent in the future. Also, with rapidly improving telecommunications, some organizations have begun to position their call centers overseas.

Despite such developments, the need for customer service representatives is expected to remain strong. In many ways, technology has heightened consumers' expectations for information and services, and availability of information online seems to have generated more need for customer service representatives, particularly to respond to e-mail. Also, technology cannot replace human skills. As more sophisticated technologies are able to resolve many customers' questions and concerns, the nature of the inquiries to be handled by customer service representatives is likely to become increasingly complex.

Furthermore, the job responsibilities of customer service representatives are expanding. As companies downsize or take other measures to increase profitability, workers are being trained to perform additional duties such as opening bank accounts or cross-selling products. As a result, employers may increasingly prefer customer service representatives who have education beyond high school, such as some college or even a college degree.

While jobs in some industries, such as retail trade, may be affected by economic downturns, the customer service occupation is generally resistant to major fluctuations in employment.

Earnings

In May 2004, median annual earnings for wage and salary customer service representatives were \$27,020. The middle 50 percent earned between \$21,510 and \$34,560. The lowest 10 percent earned less than \$17,680, and the highest 10 percent earned more than \$44,160.

Earnings for customer service representatives vary according to level of skill required, experience, training, location, and size of firm. Median annual earnings in the industries employing the largest numbers of these workers in May 2004 are shown below:

Insurance carriers	\$29,790
Agencies, brokerages, and other insurance related activities	28,800
Depository credit intermediation	26,140
Employment services	23,100
Business support services	21,390

In addition to receiving an hourly wage, full-time customer service representatives who work evenings, nights, weekends, or holidays may receive shift differential pay. Also, because call centers are often open during extended hours, or even 24 hours a day, some customer service representatives have the benefit of being able to work a schedule that does not conform to the traditional workweek. Other benefits can include life and health insurance, pensions, bonuses, employer-provided training, and discounts on the products and services the company offers.

Related Occupations

Customer service representatives interact with customers to provide information in response to inquiries about products and services and to handle and resolve complaints. Other occupations in which workers have similar dealings with customers and the public are information and record clerks; financial clerks, such as tellers and new-account clerks; insurance sales agents; securities, commodities, and financial services sales agents; retail salespersons; computer support specialists; and gaming services workers.

Sources of Additional Information

State employment service offices can provide information about employment opportunities for customer service representatives.

File Clerks

(O*NET 43-4071.00)

Significant Points

- About 3 out of 10 file clerks work part time.
- A high school diploma or its equivalent is the most common educational requirement.
- Employment is expected to decline through the year 2014.

Nature of the Work

The amount of information generated by organizations continues to grow rapidly. File clerks classify, store, retrieve, and update this information. In many small offices, they often have additional responsibilities, such as entering data, performing word processing, sorting mail, and operating copying or fax machines. File clerks are employed across the Nation by organizations of all types.

File clerks, also called record, information, or record center clerks, examine incoming material and code it numerically, alphabetically, or by subject matter. They then store paper forms, letters, receipts, or reports or enter necessary information into other storage devices. Some clerks operate mechanized files that rotate to bring the needed records to them; others convert documents to film that is then stored on microforms, such as microfilm or microfiche. A growing number of file clerks use imaging systems that scan paper files or film and store the material on computers.

In order for records to be useful, they must be up to date and accurate. File clerks ensure that new information is added to files in a timely manner and may discard outdated file materials or transfer them to inactive storage. Clerks also check files at regular intervals to make sure that all items are correctly sequenced and placed. When records cannot be found, file clerks attempt to locate the missing material. As an organization's needs for information change, file clerks implement changes to the filing system.

When records are requested, file clerks locate them and give them to the person requesting them. A record may be a sheet of

paper stored in a file cabinet or an image on microform. In the former case, the clerk retrieves the document manually and hands or forwards it to the requester. In the latter case, the clerk retrieves the microform and displays it on a microform reader. If necessary, file clerks make copies of records and distribute them. In addition, they keep track of materials removed from the files, to ensure that borrowed files are returned.

Increasingly, file clerks are using computerized filing and retrieval systems that have a variety of storage devices, such as a mainframe computer, CD-ROM, or floppy disk. To retrieve a document in these systems, the clerk enters the document's identification code, obtains the location of the document, and gets the document for the patron. Accessing files in a computer database is much quicker than locating and physically retrieving paper files. Still, even when files are stored electronically, backup paper or electronic copies usually are also kept.

Working Conditions

File clerks usually work in areas that are clean, well lit, and relatively quiet. The work is not overly strenuous but may involve a lot of standing, walking, reaching, pulling, and bending, depending on the method used to retrieve files. Prolonged exposure to computer screens may lead to eyestrain for the many file clerks who work with computers.

Training, Other Qualifications, and Advancement

Most employers prefer applicants with a high school diploma or its equivalent or a mix of education and related experience. File clerks must be able to work with others since part of the job may consist of helping fellow workers. These workers must be alert, accurate, and able to make quick decisions. Also, willingness to do routine and detailed work is important.

Most new employees are trained on the job under close supervision of more experienced employees. Proficiency with desktop computer software is becoming increasingly important as more files are now being stored electronically. These workers can advance to more senior clerical office positions such as receptionist or book-keeping clerk.

File clerks classify, store, and retrieve large amounts of information.

Employment

File clerks held about 255,000 jobs in 2004. Although file clerk jobs are found in nearly every sector of the economy, more than 90 percent of these workers are employed in service-providing industries, including government. Healthcare establishments employed around 1 out of every 4 file clerks. About 3 out of every 10 file clerks worked part time in 2004.

Job Outlook

Employment of file clerks is expected to decline through the year 2014 largely due to productivity gains stemming from office automation and the consolidation of clerical jobs. Most files are stored digitally and can be retrieved electronically, reducing the demand for file clerks. Nonetheless, there will be some job opportunities for file clerks as a large number of workers will be needed to replace workers who leave the occupation each year. Job turnover among file clerks reflects the lack of formal training requirements, limited advancement potential, and relatively low pay. Demand for file clerks stems from the need for these workers to record and retrieve information in organizations across the economy

Jobseekers who have typing and other secretarial skills and who are familiar with a wide range of office machines, especially personal computers, should have the best job opportunities. File clerks should find opportunities for temporary or part-time work, especially during peak business periods.

Earnings

Median hourly earnings of file clerks in May 2004 were \$10.11. The middle 50 percent earned between \$8.22 and \$12.59. The lowest 10 percent earned less than \$6.97, and the highest 10 percent earned more than \$15.72. Median hourly earnings in the industries employing the largest number of file clerks in May 2004 are shown below:

Local government	\$11.79
General medical and surgical hospitals.....	10.38
Legal services.....	10.32
Employment services.....	10.06
Offices of physicians.....	9.07

Related Occupations

File clerks classify and retrieve files. Other workers who perform similar duties include receptionists and information clerks and stock clerks and order fillers.

Sources of Additional Information

State employment service offices and agencies can provide information about job openings for file clerks.

Hotel, Motel, and Resort Desk Clerks

(O*NET 43-4081.00)

Significant Points

- Job opportunities should be plentiful, because of substantial replacement needs.
- Evening, weekend, and part-time work hours create potential for flexible schedules.
- Professional appearance and personality are more important than formal academic training in landing a job.

Nature of the Work

Hotel, motel, and resort desk clerks perform a variety of services for guests of hotels, motels, and other lodging establishments. Regardless of the type of accommodation, most desk clerks have similar responsibilities. They register arriving guests, assign rooms, and check out guests at the end of their stay. They also keep records of room assignments and other registration-related information on computers. When guests check out, desk clerks prepare and explain the charges, as well as process payments.

Front-desk clerks always are in the public eye and typically are the first line of customer service for a lodging property. Their attitude and behavior greatly influence the public’s impressions of the establishment. And as such, they always must be courteous and helpful. Desk clerks answer questions about services, checkout times, the local community, or other matters of public interest. Clerks also report problems with guest rooms or public facilities to members of the housekeeping or maintenance staff for them to correct the problems. In larger hotels or in larger cities, desk clerks may refer queries about area attractions to a concierge and may direct more complicated questions to the appropriate manager.

In some smaller hotels and motels, where smaller staffs are employed, clerks may take on a variety of additional responsibilities, such as bringing fresh linens to rooms, which usually are performed by employees in other departments of larger lodging establishments. In the smaller places, desk clerks often are responsible for all front-office operations, information, and services. For example, they may perform the work of a bookkeeper, advance reservation agent, cashier, laundry attendant, and telephone switchboard operator.

Working Conditions

Hotels are open around the clock creating the need for night and weekend work. Extended hours of operation also afford the many part-time job seekers an opportunity to find work in these establishments, especially on evenings and late-night shifts or on weekends and holidays. About half of all desk clerks work a 35 to 40 hour week—most of the rest work fewer hours—so the jobs are attractive to persons seeking part-time work or jobs with flexible schedules. Most clerks work in areas that are clean, well lit, and relatively quiet, although lobbies can become crowded and noisy when busy. Many hotels have stringent dress guidelines for desk clerks.

Desk clerks may experience particularly hectic times during check-in and check-out times or incur the pressures encountered when dealing with convention guests or large groups of tourists

Hotel, motel, and resort desk clerks answer questions about lodging services, checkout times, the local community, or other matters of public interest.

at one time. Moreover, dealing with irate guests can be stressful. Computer failures can further complicate an already busy time and add to stress levels. Hotel desk clerks may be on their feet most of the time and may occasionally be asked to lift heavy guest luggage.

Training, Other Qualifications, and Advancement

Hotel, motel, and resort desk clerks deal directly with the public, so a professional appearance and a pleasant personality are important. A clear speaking voice and fluency in English also are essential, because these employees talk directly with hotel guests and the public and frequently use the telephone or public-address systems. Good spelling and computer literacy are needed, because most of the work involves use of a computer. In addition, speaking a foreign language fluently is increasingly helpful, because of the growing international clientele of many properties.

Most hotel, motel, and resort desk clerks receive orientation and training on the job. Orientation may include an explanation of the job duties and information about the establishment, such as the arrangement of sleeping rooms, availability of additional services, such as a business or fitness center, and location of guest facilities, such as ice and vending machines, restaurants and other nearby retail stores. New employees learn job tasks through on-the-job training under the guidance of a supervisor or an experienced desk clerk. They often receive additional training on interpersonal or customer service skills and on how to use the computerized reservation, room assignment, and billing systems and equipment. Desk clerks typically continue to receive instruction on new procedures and on company policies after their initial training ends.

Formal academic training generally is not required so many students take jobs as desk clerks on evening or weekend shifts or during school vacation periods. Most employers look for people who are friendly and customer-service oriented, well groomed, and display the maturity and self confidence to demonstrate good judgment. Desk clerks, especially in high-volume and higher-end properties should be quick-thinking, show initiative, and be able to work as a member of a team. Hotel managers typically look for these personal characteristics when hiring first-time desk clerks, because it is easier to teach company policy and computer skills than personality traits.

Large hotel and motel chains may offer better opportunities for advancement than small, independently owned establishments. The large chains have more extensive career ladder programs and may offer desk clerks an opportunity to participate in a management training program. Also, the Educational Institute of the American Hotel and Motel Association offers home-study or group-study courses in lodging management, which may help some obtain promotions more rapidly.

Employment

Hotel, motel, and resort desk clerks held about 195,000 jobs in 2004. Virtually all were in hotels, motels, and other establishments in the accommodation industry. Few were self employed.

Job Outlook

Employment of hotel, motel, and resort desk clerks is expected to grow about as fast as the average for all occupations through 2014, as more hotels, motels, and other lodging establishments are built and occupancy rates rise. Job opportunities for hotel and motel desk clerks also will result from a need to replace workers, because many of these clerks either transfer to other occupations that offer better pay and advancement opportunities or simply leave the workforce altogether. Opportunities for part-time work should continue to be plentiful, because these businesses typically are staffed 24 hours a day, 7 days a week.

Employment of hotel and motel desk clerks should benefit from an increase in business and leisure travel. Shifts in preferences away from

long vacations and toward long weekends and other, more frequent, shorter trips also should boost demand for these workers, because such stays increase the number of nights spent in hotels. While many lower budget and extended-stay establishments are being built to cater to families and the leisure traveler, many new luxury and resort accommodations also are opening to serve the upscale client. With the increased number of units requiring staff, employment opportunities for desk clerks should be good.

Growth of hotel, motel, and resort desk clerk jobs will be moderated by technology. Automated check-in and check-out procedures reduce the backlog of guests waiting for desk service and may reduce peak front desk staffing needs in many establishments. Nevertheless, the front desk remains the principal point of contact for guests at most properties and most will continue to have clerks on duty.

Employment of desk clerks is sensitive to cyclical swings in the economy. During recessions, vacation and business travel declines, and hotels and motels need fewer desk clerks. Similarly, employment is affected by special events, business and convention business, and seasonal fluctuations.

Earnings

Median annual earnings of hotel, motel and resort desk clerks were \$17,700 in May 2004. The middle 50 percent earned between \$15,190 and \$21,270. The lowest 10 percent earned less than \$13,040, while the highest 10 percent earned more than \$25,200.

Earnings of hotel, motel and resort desk clerks vary by a number of seasonal or geographic factors, such as whether the establishment is in a major metropolitan area, a resort community, or other economic or regional characteristic. Earnings also will vary according to the size of the hotel and the level of service offered. For example, luxury hotels that offer guests more personal attention and a greater number of services typically have stricter and more demanding requirements for their desk staff. However, these higher standards of service also result in higher earnings for employees.

Related Occupations

Other positions in the hospitality industry include lodging managers. Occupations that also require workers to deal face-to-face with the public include counter and rental clerks, customer service representatives, receptionists and information clerks, and retail salespersons.

Sources of Additional Information

Information on careers in the lodging industry, as well as information about professional development and training programs, may be obtained from:

Human Resources Assistants, Except Payroll and Timekeeping

(O*NET 43-4161.00)

Significant Points

- About 1 out of 4 work for Federal, State, and local governments.
- Employment will grow as human resources assistants assume more responsibilities.
- Computer, communication, and interpersonal skills are important.

Human resources assistants maintain the records of an organization's employees.

Nature of the Work

Human resources assistants maintain the human resource records of an organization's employees. These records include information such as name, address, job title, and earnings; benefits such as health and life insurance; and tax withholding. On a daily basis, these assistants record information and answer questions about employee absences and supervisory reports on employees' job performance. When an employee receives a promotion or switches health insurance plans, the human resources assistant updates the appropriate form. Human resources assistants also may prepare reports for managers elsewhere within the organization. For example, they might compile a list of employees eligible for an award.

In small organizations, some human resources assistants perform a variety of other clerical duties, including answering telephone or written inquiries from the public, sending out announcements of job openings or job examinations, and issuing application forms. When credit bureaus and finance companies request confirmation of a person's employment, the human resources assistant provides authorized information from the employee's personnel records. Assistants also may contact payroll departments and insurance companies to verify changes to records.

Some human resources assistants are involved in hiring. They screen job applicants to obtain information such as their education and work experience; administer aptitude, personality, and interest tests; explain the organization's employment policies and refer qualified applicants to the employing official; and request references from present or past employers. Also, human resources assistants inform job applicants, by telephone or letter, of their acceptance for or denial of employment.

In some job settings, human resources assistants have specific job titles. For example, *assignment clerks* notify a firm's existing employees of upcoming vacancies, identify applicants who qualify for the vacancies, and assign those who are qualified to various positions. They also keep track of vacancies that arise throughout the organization, and they complete and distribute forms advertising vacancies. When filled-out applications are returned, these clerks review and verify the information in them, using personnel records. After a selection for a position is made, they notify all of the applicants of their acceptance or rejection.

As another example, *identification clerks* are responsible for security matters at defense installations. They compile and record personal data about vendors, contractors, and civilian and military personnel and their dependents. The identification clerk's job duties

include interviewing applicants; corresponding with law enforcement authorities; and preparing badges, passes, and identification cards.

Working Conditions

Human resources assistants usually work in clean, pleasant, and comfortable office settings. Assistants usually work a standard 35- to 40-hour week. Prolonged exposure to video display terminals may lead to eyestrain for assistants who work with computers.

Training, Other Qualifications, and Advancement

Most employers prefer applicants with a high school diploma or GED. Generally, training beyond high school is not required. However, training in computers, in filing and maintaining filing systems, in organizing, and in human resources practices is desirable. Proficiency using Microsoft Word, Excel, and other computer applications also is very desirable. Many of these skills can be learned in a vocational high school program aimed at office careers, and the remainder can be learned on the job.

Formal training is available at a small number of colleges, most of which offer diploma programs in office automation. Many proprietary schools also offer such programs.

Human resources assistants must be able to interact and communicate with individuals at all levels of the organization. In addition, assistants should demonstrate poise, tactfulness, diplomacy, and good interpersonal skills in order to handle sensitive and confidential situations.

Employment

Human resources assistants held about 172,000 jobs in 2004. About 1 out of 4 work for Federal, State, and local governments. Other jobs for human resources assistants were in various industries such as health care; management of companies and enterprises; finance and insurance; and administrative and support services.

Job Outlook

Employment of human resources assistants is expected to grow about as fast as the average for all occupations through 2014, as assistants assume more responsibilities. For example, workers conduct Internet research to locate resumes, they must be able to scan resumes of job candidates quickly and efficiently, and they must be increasingly sensitive to confidential information such as salaries and Social Security numbers. In a favorable job market, more emphasis is placed on human resources departments, thus increasing the demand for assistants. However, even in economic downturns there is demand for assistants, as human resources departments in all industries try to make their organizations more efficient by determining what type of employees to hire and strategically filling job openings. Human resources assistants may play an instrumental role in their organization's human resources policies. For example, they may talk to staffing firms and consulting firms, conduct other research, and then offer their ideas on issues such as whether to hire temporary contract workers or full-time staff.

As with other office and administrative support occupations, the growing use of computers in human resources departments means that much of the data entry that is done by human resources assistants can be eliminated, as employees themselves enter the data and send the electronic file to the human resources office. Such an arrangement, which is most feasible in large organizations with multiple human resources offices, could limit job growth among human resources assistants.

In addition to positions arising from job growth, replacement needs will account for many job openings for human resources

assistants as they advance within the human resources department, take jobs unrelated to human resources administration, or leave the labor force.

Earnings

Median annual earnings of human resources assistants in May 2004 were \$31,750. The middle 50 percent earned between \$25,780 and \$38,770. The lowest 10 percent earned less than \$21,250 and the highest 10 percent earned more than \$45,780. Median annual earnings in the industries employing the largest number of human resources assistants in May 2004 were:

Federal Government.....	\$35,490
Elementary and secondary schools	33,030
Local government	32,460
Management of companies and enterprises	30,930
General medical and surgical hospitals.....	29,390

In 2005, the Federal Government typically paid salaries ranging from \$20,984 to \$88,103 a year. Beginning human resources assistants with a high school diploma or 6 months of experience were paid an average annual salary of \$20,984. The average salary for all human resources assistants employed by the Federal Government was \$36,576 in 2005.

Some employers offer educational assistance to human resources assistants.

Related Occupations

Human resources assistants maintain the personnel records of an organization's employees. On a daily basis, these assistants record information and answer questions about employee absences and supervisory reports on employees' job performance. Other workers with similar skills and expertise in interpersonal relations include bookkeeping, accounting, and auditing clerks; communications equipment operators; customer service representatives; data entry and information processing workers; order clerks; receptionists and information clerks; secretaries and administrative assistants; stock clerks and order fillers; and tellers.

Interviewers

(O*NET 43-4061.01, 43-4061.02, 43-4111.00, 43-4131.00)

Significant Points

- A high school diploma or its equivalent is the most common educational requirement.
- The number of interviewers, except eligibility and loan, is projected to grow faster than average; however, the number of loan interviewers and clerks, and eligibility interviewers for government programs, is projected to decline.

Nature of the Work

Interviewers obtain information from individuals and business representatives who are opening bank accounts, trying to obtain loans, seeking admission to medical facilities, participating in consumer

surveys, applying to receive aid from government programs, or providing data for various other purposes. By mail, by telephone, or in person, these workers solicit and verify information, create files, and perform a number of other related tasks.

The specific duties and job titles of *interviewers*, except *eligibility and loan*, depend upon the type of employer. In doctors' offices and other health care facilities, for example, *interviewing clerks* also are known as *admitting interviewers* or *patient representatives*. These workers obtain all preliminary information required for a patient's record or for his or her admission to a hospital, such as the patient's name, address, age, medical history, present medications, previous hospitalizations, religion, persons to notify in case of emergency, attending physician, and party responsible for payment. In some cases, interviewing clerks may be required to verify that an individual is eligible for health benefits or to work out financing options for those who might need them.

Other duties of interviewers in health care include assigning patients to rooms and summoning escorts to take patients to their rooms; sometimes, interviewers may escort patients themselves. Using the facility's computer system, interviewers schedule laboratory work, x rays, and surgeries; prepare admission and discharge records; and route these medical records to appropriate departments. They also may bill patients, receive payments, and answer the telephone. In an outpatient or office setting, interviewers schedule appointments, keep track of cancellations, and provide general information about care. In addition, the role of the admissions staff, particularly in hospitals, is expanding to include a wide range of patient services, from assisting patients with financial and medical questions to helping family members find hotel rooms.

Interviewing clerks who conduct market research surveys and polls for research firms have somewhat different responsibilities. These interviewers ask a series of prepared questions, record the responses, and forward the results to management. They may ask individuals questions about their occupation and earnings, political preferences, buying habits, satisfaction with certain goods or services sold to them, or other aspects of their lives. Although most interviews are conducted over the telephone, some are conducted in focus groups or by randomly polling people in a public place. More recently, the Internet is being used to elicit people's opinions. Almost all interviewers use computers or similar devices to enter the responses to questions.

Eligibility interviewers, *government programs*, determine the eligibility of individuals applying to receive government assistance, such as welfare, unemployment benefits, Social Security benefits, and public housing. These interviewers gather the relevant personal and financial information on an applicant and, on the basis of the rules and regulations of the particular government program, grant, modify, deny, or terminate an individual's eligibility for the program in question. They also help to detect fraud committed by persons who try to obtain benefits that they are not eligible to receive.

Loan interviewers and clerks review individuals' credit history and obtain the information needed to determine the creditworthiness of applicants for loans and credit cards. These workers spend much of their day on the telephone, obtaining information from credit bureaus, employers, banks, credit institutions, and other sources to determine an applicant's credit history and ability to pay back a loan or charge.

Loan clerks, also called *loan processing clerks*, *loan closers*, or *loan service clerks*, assemble documents pertaining to a loan, process the paperwork associated with the loan, and ensure that all information is complete and verified. Mortgage loans are the primary type of loan handled by loan clerks, who also may have to order appraisals of the property, set up escrow accounts, and secure any additional information required to transfer the property.

Interviewers ask specific questions, record answers, and may assist persons with completing applications.

The specific duties of loan clerks vary by specialty. Loan closers, for example, complete the loan process by gathering the proper documents for signature at the closing, including deeds of trust, property insurance papers, and title commitments. They set the time and place for the closing, make sure that all parties are present, and ensure that all conditions for settlement have been met. After the settlement, the loan closer records all of the documents involved and submits the final package to the owner of the loan. Loan service clerks maintain the payment records on a loan once it is issued. These clerical workers process the paperwork for payment of fees to insurance companies and tax authorities, and also may record changes in clients' addresses and ownership of a loan. When necessary, they answer calls from customers with routine inquiries as well.

Loan interviewers have duties that are similar to those of loan clerks. They interview potential borrowers; help them fill out applications for loans; investigate the applicant's background and references; verify the information on the application; and forward any findings, reports, or documents to the company's appraisal department. Finally, interviewers inform the applicant as to whether the loan has been accepted or denied.

Working Conditions

Working conditions vary for different types of interviewers, but most of these workers work in areas that are clean, well lit, and relatively quiet. Most of these workers work a standard 35 to 40 hour week, but evening and weekend work may be required in some establishments. Some interviewers may conduct surveys on the street or in shopping malls, or they may even go door to door.

Training, Other Qualifications, and Advancement

Most employers prefer applicants with a high school diploma or its equivalent or a mix of education and related experience. Because interviewers deal with the public, they must have a pleasant personality, clear speaking voice, and professional appearance. Familiarity with computers and strong interpersonal skills are very important. Fluency in a foreign language also can be beneficial.

New employees are generally trained on the job, working under the close supervision of more experienced employees, although some firms offer formal training. Some loan interviewers also take courses in credit offered by banking and credit associations, public and private vocational schools, and colleges and universities.

Experienced interviewers may advance to positions with added responsibilities or supervisory duties. Many organizations elect to

fill open positions by promoting qualified individuals from within the company. Interviewers who obtain additional skills or training will have the best opportunities. For certain managerial positions, a college degree may be required.

Employment

Interviewers held about 515,000 jobs in 2004. Approximately 199,000 were interviewers, except eligibility and loan; 218,000 were loan interviewers and clerks; and 98,000 were eligibility interviewers, government programs. About 2 out of every 5 interviewers, except eligibility and loan, worked in health care and social assistance industries, while most loan interviewers and clerks worked in financial institutions. Almost all eligibility interviewers, government programs, worked in State and local government. Around 1 out of every 4 interviewers, except eligibility and loan, worked part time.

Job Outlook

Employment of interviewers is expected to grow more slowly than the average for all occupations through 2014. However, the projected change in employment varies by specialty. Most job openings should arise from the need to replace the numerous interviewers who leave the occupation or the labor force each year. Prospects for filling these openings will be best for applicants with a broad range of job skills, such as good customer service, math, and telephone skills. In addition to openings for full-time jobs, opportunities also should be available for part-time and temporary jobs.

The number of interviewers, except eligibility and loan, is projected to grow faster than average, reflecting growth in the health care and social assistance sector. This sector will hire more admissions interviewers as health care facilities consolidate staff and expand the role of the admissions staff and as an aging and growing population requires more visits to health care practitioners. In addition, an increasing use of market research will create more jobs requiring interviewers to collect data. In the future, though, more market research is expected to be conducted over the Internet, thus reducing the need for telephone interviewers to make individual calls.

The number of loan interviewers and clerks is projected to decline due to advances in technology that are making these workers more productive. Despite a projected increase in the number of applications for loans, automation will increase productivity so that fewer workers will be required to process, check, and authorize applications than in the past. The effects of automation on employment will be moderated, however, by the many interpersonal aspects of the job. Mortgage loans, for example, require loan processors to personally verify financial data on the application, and loan closers are needed to assemble documents and prepare them for settlement. Employment, however, also will be adversely affected by changes in the financial services industry. For example, significant consolidation has occurred among mortgage loan servicing companies. As a result, fewer mortgage banking companies are involved in servicing loans, making the function more efficient and reducing the need for loan service clerks.

The job outlook for loan interviewers and clerks is sensitive to overall economic activity. A downturn in the economy or a rise in interest rates usually leads to a decline in the demand for loans, particularly mortgage loans, and can result in layoffs. Even in slow economic times, however, job openings will arise from the need to replace workers who leave the occupation for various reasons.

Like that of loan interviewers and clerks, employment of eligibility interviewers for government programs also is projected to decline due to advances in technology and the transformation of government aid programs over the last decade. Automation should have a significant effect on these workers because, as with credit and loan

ratings, eligibility for government aid programs can be determined instantaneously by entering information into a computer. The job outlook for eligibility interviewers, however, also is sensitive to overall economic activity; a severe slowdown in the economy will cause more people to apply for government aid programs, increasing demand for eligibility interviewers.

Earnings

Median hourly earnings of eligibility interviewers, government programs, in May 2004 were \$15.92. The middle 50 percent earned between \$13.04 and \$19.32. The lowest 10 percent earned less than \$11.19, and the highest 10 percent earned more than \$21.83. Median hourly earnings of eligibility interviewers, government programs, was \$15.67 in State government and \$16.43 in local government in May 2004.

Median hourly earnings of loan interviewers and clerks in May 2004 were \$13.94. The middle 50 percent earned between \$11.45 and \$17.26. The lowest 10 percent earned less than \$9.48, and the highest 10 percent earned more than \$21.20. Median hourly earnings of loan interviewers and clerks in depository credit intermediation was \$13.13 in May 2004, while median hourly earnings in nondepository credit intermediation was \$14.48.

Median hourly earnings of interviewers, except eligibility and loan, in May 2004 were \$11.38. The middle 50 percent earned between \$9.19 and \$13.93. The lowest 10 percent earned less than \$7.57, and the highest 10 percent earned more than \$16.98. Median hourly earnings in the industries employing the largest number of interviewers, except eligibility and loan, in May 2004 were as follows:

State government	\$16.78
Colleges, universities, and professional schools.....	13.55
General medical and surgical hospitals.....	11.94
Scientific research and development services.....	10.71
Other professional, scientific, and technical services	8.89

Related Occupations

Interviewers obtain information from individuals. Other workers who perform similar duties include procurement clerks, customer service representatives, and bill and account collectors.

Sources of Additional Information

State employment service offices can provide information about employment opportunities for interviewers.

Library Assistants, Clerical

(O*NET 43-4121.00)

Significant Points

- Minimal training requirements and flexible schedules make this occupation appealing to students, retirees, and others interested in part-time work.
- Most libraries use electronic cataloging systems so computers skills are essential.

Nature of the Work

Library assistants, clerical—sometimes referred to as *library media assistants*, *library aides*, or *circulation assistants*—assist librarians and library technicians in organizing library resources and making

them available to users. (Librarians and library technicians are discussed elsewhere in the *Handbook*.) Library assistants register patrons so that they can borrow materials from the library and then issue a library card.

At the circulation desk, library assistants lend and collect books, periodicals, videotapes, and other materials. When an item is borrowed, assistants scan the patron's library card and the material to record the transaction in the library database; they then print a receipt with the due date or stamp the due date on the item. When an item is returned, assistants inspect returned materials for damage and enter the materials into the circulation database. Electronic circulation systems are able to automatically generate overdue notices reminding patrons that their materials are overdue, but library assistants review the record for accuracy before sending out the notice. They also answer patrons' questions and refer those they cannot answer to a librarian.

Throughout the library, assistants sort returned books, periodicals, and other items and put them on their designated shelves, in the appropriate files, or in storage areas. They locate materials to be lent, to either a patron or another library. Because nearly all card catalogues are computerized, library assistants must be familiar with computers. Before reshelving returned materials, if they notice any damage, these workers try to repair it. For example, they may use tape or paste to repair torn pages or book covers and use other specialized processes to repair more valuable materials.

Some library assistants specialize in helping patrons who have vision problems. Sometimes referred to as *library, talking-books*, or *braille-and-talking-books clerks*, they review the borrower's list of desired reading materials. They locate those materials or closely related substitutes from the library collection of large-type or braille volumes, tape cassettes, and open-reel talking books; complete the requisite paperwork; and give or mail the materials to the borrower.

Working Conditions

Library assistants who prepare library materials may sit at desks or computer terminals for long periods and can develop headaches or eyestrain from working with the terminals. Some duties can be repetitive and boring, such as shelving new or returned materials. Others can be rewarding, such as assisting patrons who are performing computer searches with the use of local and regional library networks and cooperatives. Library assistants may lift and carry books, climb ladders to reach high stacks, and bend low to shelve books on bottom shelves.

Library assistants sort and reshelve returned items.

Library assistants in school libraries work regular school hours. Those in public libraries and college and university (academic) libraries also work weekends, evenings and some holidays. About half of all library assistants work part time, making the job appealing to retirees, students, and others interested in flexible schedules.

Training, Other Qualifications, and Advancement

Training requirements for library assistants are generally minimal; most libraries prefer to hire workers with a high school diploma or GED, but little to no formal postsecondary training is expected. Some employers hire individuals with experience in other clerical jobs, while others train inexperienced workers on the job. Given the rapid spread of automation in libraries, computer skills are needed for most jobs; knowledge of databases and other library automation systems is especially useful.

Library assistants usually advance by assuming added responsibilities. Many begin by performing simple jobs such as shelving books or cataloging new books and periodicals when they arrive. After gaining experience, they may move into positions that allow them to interact with patrons, such as manning the circulation desk. Experienced aids may be able to advance into library technician positions, which involve more responsibility in providing library services to patrons.

Employment

Library assistants held about 109,000 jobs in 2004. More than half of these workers were employed by local governments in public libraries; most of the remaining employees worked in school, college, and university libraries. Opportunities for flexible schedules are abundant; nearly half of these workers were on part-time schedules.

Job Outlook

Employment of library assistants is expected to grow as fast as the average for all occupations through 2014. Efforts to contain costs in local governments and academic institutions of all types may result in more hiring of library support staff than librarians. Also, due to changing roles within libraries, library assistants are taking on more responsibility.

Many library assistants leave this relatively low-paying occupation for other jobs that offer higher pay or full-time work, so job opportunities should be good for persons interested in jobs as library assistants. The work is often attractive to retirees, students, and others who want a part-time schedule, and there is a lot of movement into and out of the occupation. Some positions become available as library assistants move within the organization. Library assistants can be promoted to library technicians and, eventually, supervisory positions in public-service or technical-service areas. Advancement opportunities are greater in large libraries.

Because most are employed by public institutions, library assistants are not directly affected by the ups and downs of the business cycle. However, some of these workers may lose their jobs if there are cuts in government budgets.

Earnings

Median hourly earnings of library assistants, clerical were \$9.96 in May 2004. The middle 50 percent earned between \$7.77 and \$12.89. The lowest 10 percent earned less than \$6.41, and the highest 10 percent earned more than \$16.08.

Sources of Additional Information

Information about a career as a library assistant can be obtained from either of the following organizations:

► Council on Library/Media Technology, P.O. Box 42048, Mesa, AZ 85274-2048. Internet: <http://colt.ucr.edu>

► American Library Association, 50 East Huron St., Chicago, IL 60611. Internet: <http://www.ala.org/hrdr>

Public libraries and libraries in academic institutions also can provide information about job openings for library assistants.

Order Clerks

(O*NET 43-4151.00)

Significant Points

- Employment is expected to decline because of growth in online retailing and in business-to-business electronic commerce, and the use of automated systems that make placing orders easy and convenient.
- A high school diploma or its equivalent is the most common educational requirement.

Nature of the Work

Order clerks receive and process orders for a variety of goods or services, such as spare parts for machines, consumer appliances, gas and electric power connections, film rentals, and articles of clothing. They sometimes are called order-entry clerks, sales representatives, order processors, or order takers.

Orders for materials, merchandise, or services can come from inside or from outside of an organization. In large companies with many worksites, such as automobile manufacturers, clerks order parts and equipment from the company's warehouses. Inside order clerks receive orders from other workers employed by the same company or from salespersons in the field.

Many other order clerks, however, receive orders from outside companies or individuals. Order clerks in wholesale businesses, for instance, receive orders from retail establishments for merchandise that the retailer, in turn, sells to the public. An increasing number of order clerks are working for catalog companies and online retailers, receiving orders from individual customers by telephone, fax, regular mail, or e-mail. Order clerks dealing primarily with the public sometimes are referred to as outside order clerks.

Computers provide order clerks with ready access to information such as stock numbers, prices, and inventory. The successful filling of an order frequently depends on having the right products in stock and being able to determine which products are most appropriate for the customer's needs. Some order clerks—especially those in industrial settings—must be able to give price estimates for entire jobs, not just single parts. Others must be able to take special orders, give expected arrival dates, prepare contracts, and handle complaints.

Many order clerks receive orders directly by telephone, entering the required information as the customer places the order. However, a rapidly increasing number of orders now are received through computer systems, the Internet, faxes, and e-mail. In some cases, these orders are sent directly from the customer's terminal to the order clerk's terminal. Orders received by regular mail are sometimes scanned into a database that is instantly accessible to clerks.

Clerks review orders for completeness and clarity. They may fill in missing information or contact the customer for the information. Clerks also contact customers if the customers need additional information, such as prices or shipping dates, or if delays in filling the order are anticipated. For orders received by regular mail, clerks extract checks or money orders, sort them, and send them for processing.

After an order has been verified and entered, the customer's final cost is calculated. The clerk then routes the order to the proper

Order clerks review orders for completeness and clarity.

department—such as the warehouse—which actually sends out or delivers the item in question.

In organizations with sophisticated computer systems, inventory records are adjusted automatically, as sales are made. In less automated organizations, order clerks may adjust inventory records. Clerks also may notify other departments when inventories are low or when filling certain orders would deplete supplies.

Some order clerks must establish priorities in filling orders. For example, an order clerk in a blood bank may receive a request from a hospital for a certain type of blood. The clerk must first find out whether the request is routine or an emergency and then take appropriate action.

Working Conditions

Order clerks usually work a standard 40-hour workweek. Most order clerks work in areas that are clean, well lit, and relatively quiet. These workers sit for long periods of time in front of computer terminals, which may cause eyestrain and headaches. Order clerks in retail establishments typically work overtime during peak holiday seasons, when sales volume is high.

Training, Other Qualifications, and Advancement

Employers prefer applicants with a high school diploma or its equivalent or a mix of education and related experience. Most employers prefer workers who are computer literate and have a working knowledge of word-processing and spreadsheet software.

Most order clerks are trained on the job under the close supervision of more experienced employees. Proficiency with computer software is becoming increasingly important because most orders are being filed electronically. By taking on more duties, ambitious order clerks can receive higher pay or become eligible for advancement opportunities. Some use their experience as an order clerk to move into sales positions.

Employment

Order clerks held about 293,000 jobs in 2004. Over 50 percent of order clerks were employed in wholesale and retail trade establishments, and another 16 percent were employed in manufacturing firms. Other jobs for order clerks were in industries such as information, warehousing and storage, couriers, and business support services.

Job Outlook

Job openings for order clerks likely will be limited, as improvements in technology and office automation continue to increase worker

productivity. While overall employment of order clerks is expected to decline through the year 2014, numerous openings will occur each year to replace order clerks who transfer to other occupations or leave the labor force completely. Many of these openings will be for seasonal work, especially in catalog companies or online retailers catering to holiday gift buyers.

The growth in online retailing and in business-to-business electronic commerce, and the use of automated systems that make placing orders easy and convenient, will decrease demand for order clerks. The spread of electronic data interchange, which enables computers to communicate directly with each other, allows orders within establishments to be placed with little human intervention. In addition, internal systems allowing a firm's employees to place orders directly are becoming increasingly common. Outside orders placed over the Internet often are entered directly into the computer by the customer; thus, the order clerk is not involved at all in placing the order. Some companies also use automated phone menus that are accessible with a touch-tone phone to receive orders, and others use answering machines. Developments in voice recognition technology may further reduce the demand for order clerks.

Furthermore, increased automation will allow current order clerks to be more productive, with each clerk able to handle an increasingly higher volume of orders. Sophisticated inventory control and automatic billing systems permit companies to track inventory and accounts with much less help from order clerks than in the past.

Earnings

Median hourly earnings of order clerks in May 2004 were \$12.07. The middle 50 percent earned between \$9.45 and \$15.53. The lowest 10 percent earned less than \$7.75, and the highest 10 percent earned more than \$19.34. Median hourly earnings in electronic shopping and mail-order houses was \$9.83 while median earnings in machinery, equipment, and supplies merchant wholesalers was \$14.05 in May 2004. In business support services, median hourly earning was \$9.71 in May 2004.

Related Occupations

Order clerks receive and process orders. Other workers who perform similar duties include stock clerks and order fillers as well as hotel, motel, and resort desk clerks.

Sources of Additional Information

State employment service offices and agencies can provide information about job openings for order clerks.

Receptionists and Information Clerks

(O*NET 43-4171.00)

Significant Points

- Good interpersonal skills are critical.
- A high school diploma or its equivalent is the most common educational requirement.
- Employment is expected to grow faster than average.

Nature of the Work

Receptionists and information clerks are charged with a responsibility that may have a lasting impact on the success of an organization: making a good first impression. These workers often are the first representatives of an organization that a visitor may encounter,

Receptionists answer telephones, route calls, greet visitors, and provide information about the organization.

so good interpersonal skills—being courteous, professional, and helpful—are critical. Receptionists answer telephones, route and screen calls, greet visitors, respond to inquiries from the public, and provide information about the organization. Some receptionists are responsible for the coordination of all mail into and out of the office. In addition, receptionists contribute to the security of an organization by helping to monitor the access of visitors—a function that has become increasingly important since the terrorist attacks of September 11, 2001, heightened security concerns.

Whereas some tasks are common to most receptionists and information clerks, the specific responsibilities of receptionists vary with the type of establishment in which they work. For example, receptionists in hospitals and in doctors' offices may gather patients' personal and financial information and direct them to the proper waiting rooms. In corporate headquarters, receptionists may greet visitors and manage the scheduling of the board room or common conference area. In beauty or hair salons, by contrast, receptionists arrange appointments, direct customers to the hairstylist, and may serve as cashiers. In factories, large corporations, and government offices, they may provide identification cards and arrange for escorts to take visitors to the proper office. Those working for bus and train companies respond to inquiries about departures, arrivals, stops, and other related matters.

Increasingly, receptionists use multiline telephone systems, personal computers, and fax machines. Despite the widespread use of automated answering systems or voice mail, many receptionists still take messages and inform other employees of visitors' arrivals or cancellation of an appointment. When they are not busy with callers, most receptionists are expected to perform a variety of office duties, including opening and sorting mail, collecting and distributing parcels, transmitting and delivering facsimiles, updating appointment calendars, preparing travel vouchers, and performing basic bookkeeping, word processing, and filing.

Working Conditions

Receptionists who greet customers and visitors usually work in areas that are highly visible and designed and furnished to make a good impression. Most work stations are clean, well lighted, and relatively quiet. The work performed by some receptionists and information clerks may be tiring, repetitious, and stressful as many receptionists spend all day answering continuously ringing telephones and sometimes encounter difficult or irate callers. The

work environment, however, may be very friendly and motivating for individuals who enjoy greeting customers face to face and making them feel comfortable.

Training, Other Qualifications, and Advancement

Although hiring requirements for receptionists and information clerks vary by industry, a high school diploma or its equivalent is the most common educational requirement. Good interpersonal skills and being technologically proficient also are important to employers.

Receptionists and information clerks generally receive on-the-job training. However, employers often look for applicants who already possess certain skills, such as prior computer experience or answering telephones. Some employers also may prefer some formal office education or training. On the job, they learn how to operate the telephone system and computers. They also learn the proper procedures for greeting visitors and for distributing mail, faxes, and parcels.

Advancement for receptionists generally comes about either by transferring to a more responsible occupation or by being promoted to a supervisory position. Receptionists with especially strong computer skills may advance to a better paying job as a secretary or an administrative assistant.

Employment

Receptionists and information clerks held about 1.1 million jobs in 2004. More than 90 percent worked in service-providing industries. Among service-providing industries, healthcare and social assistance industries—including doctors' and dentists' offices, hospitals, nursing homes, urgent-care centers, surgical centers, and clinics—employed about one-third of all receptionists and information clerks. Manufacturing, wholesale and retail trade, government, and real estate industries also employed large numbers of receptionists and information clerks. More than 3 of every 10 receptionists and information clerks worked part time.

Job Outlook

Employment of receptionists and information clerks is expected to grow faster than the average for all occupations through 2014. This increase will result from rapid growth in service-providing industries—including physicians' offices, law firms, temporary help agencies, and consulting firms—where most are employed. In addition, turnover in this large occupation will create numerous openings as receptionists and information clerks transfer to other occupations or leave the labor force altogether. Opportunities should be best for persons with a wide range of clerical and technical skills, particularly those with related work experience.

Technology will have conflicting effects on the demand for receptionists and information clerks. The increasing use of voice mail and other telephone automation reduces the need for receptionists by allowing one receptionist to perform work that formerly required several. However, the increasing use of other technology has caused a consolidation of clerical responsibilities and growing demand for workers with diverse clerical and technical skills. Because receptionists and information clerks may perform a wide variety of clerical tasks, they should continue to be in demand. Further, they perform many tasks that are interpersonal in nature and are not easily automated, ensuring continued demand for their services in a variety of establishments.

Earnings

Median hourly earnings of receptionists and information clerks in May 2004 were \$10.50. The middle 50 percent earned between \$8.62 and \$12.88. The lowest 10 percent earned less than \$7.21,

and the highest 10 percent earned more than \$15.53. Median hourly earnings in the industries employing the largest number of receptionists and information clerks in May 2004 are shown below:

Offices of dentists	\$12.37
General medical and surgical hospitals.....	11.07
Offices of physicians.....	10.92
Employment services.....	10.28
Personal care services.....	8.16

In 2005, the Federal Government typically paid salaries ranging from \$22,937 to \$27,818 a year to beginning receptionists with a high school diploma or 6 months of experience. The average annual salary for all receptionists employed by the Federal Government was about \$29,185 in 2005.

Related Occupations

Receptionists deal with the public and often direct people to others who can assist them. Other workers who perform similar duties include dispatchers, secretaries and administrative assistants, and customer service representatives.

Sources of Additional Information

State employment offices can provide information on job openings for receptionists.

Reservation and Transportation Ticket Agents and Travel Clerks

(O*NET 43-4181.01, 43-4181.02)

Significant Points

- Most jobs are found in large metropolitan airports, downtown ticket offices, large reservation centers, and train or bus stations.
- A high school diploma or its equivalent is the most common educational requirement.
- Employment is expected to grow more slowly than average because of the significant impact of technology on worker productivity.
- Applicants for jobs are likely to encounter considerable competition; those who have previous experience in the travel industry, in sales, or in customer service should have the best chances.

Nature of the Work

Each year, millions of Americans travel by plane, train, ship, bus, and automobile. Many of these travelers rely on the services of reservation and transportation ticket agents and travel clerks, who perform functions as varied as selling tickets, confirming reservations, checking baggage, and providing tourists with useful travel information.

Most *reservation agents* work for large hotel chains or airlines, helping people to plan trips and make reservations. They usually work in large reservation centers, answering telephone or e-mail inquiries and offering suggestions and information about travel arrangements, such as routes, schedules, rates, and types of accommodation. Reservation agents quote fares and room rates, provide travel information, and make and confirm transportation and hotel reservations. Most agents use proprietary networks to obtain, as

quickly as possible, information needed to make, change, or cancel reservations for customers.

Transportation ticket agents are sometimes known as passenger service agents, passenger booking clerks, reservation clerks, airport service agents, ticket clerks, or ticket sellers. They work in airports, train stations, and bus stations, selling tickets, assigning seats to passengers, and checking baggage. In addition, they may answer inquiries and give directions, examine passports and visas, or check in pets. They may be required assist customers who have trouble operating self-service ticket printing machines, which also are known as kiosks. Other ticket agents, more commonly known as *gate or station agents*, work in airport terminals, assisting passengers boarding airplanes. These workers direct passengers to the correct boarding area, check tickets and seat assignments, make boarding announcements, and provide special assistance to young, elderly, or disabled passengers when they board or disembark.

Most *travel clerks* are employed by membership organizations, such as automobile clubs. These workers, sometimes called *member services counselors* or *travel counselors*, plan trips, calculate mileage, and offer travel suggestions, such as the best route from the point of origin to the destination, to club members. Travel clerks also may prepare an itinerary indicating points of interest, restaurants, overnight accommodations, and availability of emergency services during a trip. In some cases, they make rental car, hotel, and restaurant reservations for club members.

Reservation and transportation ticket agents and travel clerks sell tickets, confirm reservations, check baggage, and provide tourists with travel information.

Passenger rate clerks generally work for bus companies. They sell tickets for regular bus routes and arrange nonscheduled or chartered trips. They plan travel routes, compute rates, and keep customers informed of appropriate details. They also may arrange travel accommodations.

Working Conditions

Most reservation and transportation ticket agents and travel clerks work in areas that are clean and well lit. This is especially true for agents who greet customers and visitors in person. Reservation and ticket agents may spend much of their day talking on the telephone; however, they commonly work away from the public, often in large centralized reservation or phone centers. Because a large number of agents or clerks may share the same workspace, it may be crowded and noisy.

Although most reservation and transportation ticket agents and travel clerks work a standard 40-hour week, about 2 out of 10 work part time. Some high school and college students are employed part time in this occupation, working after school or during vacations. Some agents work evenings, late nights, weekends, and holidays. In general, employees with the most seniority tend to be assigned the more desirable shifts.

The work performed by reservation and transportation ticket agents and travel clerks may be repetitive and stressful. They often work under stringent time constraints or must meet quotas on the number of calls answered or reservations made. Difficult or angry customers also can create stressful situations as agents usually bear the brunt of customers' dissatisfaction. Agents may work on their feet for a large portion of their shift, and may have to lift heavy baggage. In addition, prolonged exposure to a computer monitor, which is common in this occupation, may lead to eyestrain.

Training, Other Qualifications, and Advancement

A high school diploma or its equivalent is the most common educational requirement for reservation and transportation ticket agent and travel clerk jobs. Some employers, however, prefer applicants who have completed college coursework in management or business. Experience with computers, including good typing skills, also is usually required. Some jobs require applicants to be over 18 years of age and possess a valid driver's license. Agents who handle passenger luggage must be able to lift heavy objects.

Most airline reservation and ticket agents learn their skills through formal company training programs that can last several weeks. Here, they learn company and industry policies as well as ticketing procedures. Trainees also learn to use the airline's computer system to obtain information on schedules, fares, and the availability of seats; to make reservations for passengers; and to plan passenger itineraries. In addition, they must become familiar with airport and airline code designations, regulations, and safety procedures. After completing classroom instruction, new agents work under the direct guidance of a supervisor or experienced agent. During this time the supervisors may, for example, monitor telephone conversations to improve the quality of customer service so that agents learn to provide customer service in a courteous manner, while limiting the time spent on each call.

In contrast to those who work for airlines, reservation and transportation ticket agents and travel clerks who work for automobile clubs, bus lines, and railroads are trained on the job through short in-house classes that last several days.

Many reservation and transportation ticket agents and travel clerks deal directly with the public, so a professional appearance and a pleasant personality are important. A clear speaking voice and fluency in the English language also are essential, because these employees frequently use the telephone or public-address systems.

In addition, fluency in a foreign language is becoming increasingly helpful for those seeking reservation and ticket agent jobs.

Reservation and transportation ticket agents and travel clerks may advance by being transferred to a position with more responsibilities, or by being promoted to a supervisory position. Many travel companies fill supervisory and managerial positions by promoting individuals within their organization, so those who acquire additional skills, experience, and training improve their opportunities for advancement. Some companies require that candidates for supervisory positions have an associate degree in a business-related field, such as management, business administration, or marketing. Within the airline industry, a ticket agent may advance to lead worker on the shift.

Employment

Reservation and transportation ticket agents and travel clerks held about 163,000 jobs in 2004. About 6 out of 10 are employed by airlines. Others work for automobile clubs, hotels and other lodging places, railroad companies, bus lines, and other companies that provide transportation services.

Although agents and clerks are found throughout the country, most work in large metropolitan airports, downtown ticket offices, large reservation centers, and train or bus stations. The remainder work in small, regional airports, or in small communities served only by intercity bus or railroad lines.

Job Outlook

Applicants for reservation and transportation ticket agent jobs are likely to encounter considerable competition, because the supply of qualified applicants will exceed the expected number of job openings. Entry requirements for these jobs are minimal, and many people seeking to get into the airline industry or another travel-related business often start out in such positions. The jobs provide excellent travel benefits, and many people view airline and other travel-related jobs as glamorous. Applicants who have previous experience in the travel industry, in sales, or in customer service should have the best chances.

Employment of reservation and transportation ticket agents and travel clerks is expected to grow more slowly than the average for all occupations through 2014. Although a growing population will demand additional travel services, employment of these workers will grow more slowly than this demand because of the significant impact of technology on worker productivity. Automated reservations and ticketing, as well as "ticketless" travel, for example, are reducing the need for some workers. Most train stations and airports now have self-service ticket printing machines, called kiosks, which enable passengers to make reservations, purchase tickets, and check-in for train rides and flights themselves. Many passengers also are able to check flight times and fares, make reservations, purchase tickets, and check-in for flights on the Internet. Nevertheless, not all travel-related passenger services can be fully automated, primarily for safety and security reasons. As a result, job openings will continue to become available as the occupation grows and as workers transfer to other occupations, retire, or leave the labor force altogether.

Employment of reservation and transportation ticket agents and travel clerks is sensitive to cyclical swings in the economy. During recessions, discretionary passenger travel declines, and transportation service companies are less likely to hire new workers and may even resort to layoffs.

Earnings

Median annual earnings of reservation and transportation ticket agents and travel clerks in May 2004 were \$27,750. The middle 50 percent earned between \$21,430 and \$39,410. The lowest 10 percent earned less than \$17,720, and the highest 10 percent earned more than \$45,100. Many employers offer discounts on travel services

to their employees. In May 2004, median annual earnings in the industries employing the largest number of agents were:

Scheduled air transportation	\$31,750
Travel arrangement and reservation services.....	22,370
Traveler accommodation.....	22,050

Related Occupations

Other occupations that provide travel-related services include hotel, motel, and resort desk clerks; travel agents; and flight attendants. Other occupations that make sales and provide information to

customers include counter and rental clerks, order clerks, customer service representatives, and receptionists and information clerks.

Sources of Additional Information

For information about job opportunities as reservation and transportation ticket agents and travel clerks, write to the personnel manager of individual transportation companies. Addresses of airlines are available from:

Material Recording, Scheduling, Dispatching, and Distributing Occupations

Cargo and Freight Agents

(O*NET 43-5011.00)

Significant Points

- Many jobs are entry level and do not require more than a high school diploma.
- Although cargo traffic is expected to grow faster than in the past, employment of cargo and freight agents will not keep pace because of technological advances.

Nature of the Work

Cargo and freight agents arrange for and track incoming and outgoing cargo and freight shipments in airline, train, or trucking terminals or on shipping docks. They expedite shipments by determining the route that shipments are to take and by preparing all necessary shipping documents. The agents take orders from customers and arrange for the pickup of freight or cargo for delivery to loading platforms. Cargo and freight agents may keep records of the cargo, such as its amount, type, weight, and dimensions. They keep a tally of missing items, record the condition of damaged items, and document any excess supplies.

Cargo and freight agents arrange cargo according to its destination. They also determine the shipping rates and other charges that can sometimes apply to the freight. For imported or exported freight, they verify that the proper customs paperwork is in order. Cargo and

freight agents often track shipments electronically, using bar codes, and answer customers' inquiries on the status of their shipments.

Working Conditions

Cargo and freight agents work in a wide variety of businesses, institutions, and industries. Some work in warehouses, stockrooms, or shipping and receiving rooms that may not be temperature controlled. Others may spend time in cold storage rooms or outside on loading platforms, where they are exposed to the weather.

Most jobs for cargo and freight agents involve frequent standing, bending, walking, and stretching. Some lifting and carrying of smaller items also may be involved. Although automated devices have lessened the physical demands of this occupation, their use remains somewhat limited. The work still can be strenuous, even though mechanical material-handling equipment is employed to move heavy items.

The typical workweek is Monday through Friday; however, evening and weekend hours are common in some jobs and may be required in other jobs when large shipments are involved.

Training, Other Qualifications, and Advancement

Many jobs are entry level and do not require more than a high school diploma. Employers, however, prefer to hire those familiar with computers. Typing, filing, recordkeeping, and other clerical skills also are important.

Cargo and freight agents start out by checking items to be shipped and then attaching labels to them and making sure that the addresses are correct. Training in the use of automated equipment usually is done informally, on the job. As this occupation becomes more automated, however, workers may need longer periods of training in order to master the use of the equipment.

Advancement opportunities for cargo and freight agents vary with the place of employment.

Employment

Cargo and freight agents held about 70,000 jobs in 2004. Most jobs were in transportation. Approximately 20 percent worked in the air transportation industry and 8 percent worked in the truck transportation industry. Couriers employed another 11 percent. In addition, about 43 percent worked for firms engaged in support activities for the transportation industry.

Job Outlook

Employment of cargo and freight agents is expected to decline through 2014. Although cargo traffic is expected to grow faster than in the past, employment of cargo and freight agents will not keep pace because of technological advances. For example, the

Cargo and freight agents take orders from customers and arrange for the pickup of freight or cargo for delivery to loading platforms.

increasing use of bar codes on cargo and freight allows agents and customers to track these shipments quickly over the Internet, rather than manually tracking their location. In addition, customs and insurance paperwork now can be completed over the Internet by customers, reducing the need for cargo and freight agents.

Despite these advances in technology that dampen job growth among cargo and freight agents, job openings will continue to arise due to increases in buying over the Internet, which will result in more shipments. Jobs also will open up because of the increasing importance of same-day delivery, which expands the role of agents. In addition, many job openings will be created to replace cargo and freight agents who leave the occupation.

Earnings

Median annual earnings of cargo and freight agents in May 2004 were \$34,250. The middle 50 percent earned between \$25,720 and \$43,250. The lowest 10 percent earned less than \$20,700, and the highest 10 percent earned more than \$54,480.

These workers usually receive the same benefits as most other workers. If uniforms are required, employers generally provide them or offer an allowance to purchase them.

Related Occupations

Cargo and freight agents plan and coordinate shipments of cargo by airlines, trains, and trucks. They also arrange freight pickup with customers. Others who do similar work are couriers and messengers; shipping, receiving, and traffic clerks; weighers, measurers, checkers, and samplers, recordkeeping; truck drivers and driver/sales workers; and Postal Service workers.

Sources of Additional Information

Information about job opportunities may be obtained from local employers and local offices of the State employment service.

Couriers and Messengers

(O*NET 43-5021.00)

Significant Points

- Most jobs as couriers and messengers do not require more than a high school diploma.
- Employment is expected to decline, reflecting the more widespread use of electronic information-handling technologies such as e-mail and fax.

Nature of the Work

Couriers and messengers move and distribute information, documents, and small packages for businesses, institutions, and government agencies. They pick up and deliver letters, important business documents, or packages that need to be sent or received quickly within a local area. Trucks and vans are used for larger deliveries, such as legal caseloads and conference materials. By sending an item by courier or messenger, the sender ensures that it reaches its destination the same day or even within the hour. Couriers and messengers also deliver items that the sender is unwilling to entrust to other means of delivery, such as important legal or financial documents, passports, airline tickets, or medical samples to be tested.

Couriers and messengers receive their instructions either in person—by reporting to their office—or by telephone, two-way radio, or wireless data service. Then they pick up the item and carry it to its destination. After each pickup or delivery, they check in with their dispatcher to receive instructions. Sometimes the dispatcher will

Most couriers and messengers spend much of their time outdoors or in their vehicle.

contact them while they are between stops, and they may be routed to go past a stop that recently called in a delivery. Consequently, most couriers and messengers spend much of their time outdoors or in their vehicle. They usually maintain records of deliveries and often obtain signatures from the persons receiving the items.

Most couriers and messengers deliver items within a limited geographic area, such as a city or metropolitan area. Items that need to go longer distances usually are sent by mail or by an overnight delivery service. Some couriers and messengers carry items only for their employer, which typically might be a law firm, bank, medical laboratory, or financial institution. Others may act as part of an organization's internal mail system and carry items mainly within the organization's buildings or entirely within one building. Many couriers and messengers work for messenger or courier services; for a fee, they pick up items from anyone and deliver them to specified destinations within a local area. Most are paid on a commission basis.

Couriers and messengers reach their destination by several methods. Many drive vans or cars or ride motorcycles. A few travel by foot, especially in urban areas or when making deliveries nearby. In congested urban areas, messengers often use bicycles to make deliveries. Bicycle messengers usually are employed by messenger or courier services. Although e-mail and fax machines can deliver information faster than couriers and messengers can, and although a great deal of information is available over the Internet, an electronic copy cannot substitute for the original document in many types of business transactions.

Working Conditions

Couriers and messengers spend most of their time alone, making deliveries, and usually are not closely supervised. Those who deliver by bicycle must be physically fit and are exposed to all weather conditions, as well as to the many hazards associated with heavy traffic. Car, van, and truck couriers must sometimes carry heavy loads, either manually or with the aid of a hand truck. They also have to deal with difficult parking situations, as well as traffic jams and road construction. The pressure of making as many deliveries as possible to increase one's earnings can be stressful and may lead to unsafe driving or bicycling practices. The typical workweek is Monday through Friday; however, evening and weekend hours are common.

Training, Other Qualifications, and Advancement

Most couriers and messengers are at the entry level and do not require more than a high school diploma. Employers, however, prefer to hire those familiar with computers and other electronic office and business equipment. Because communication with other people is

an integral part of some courier and messenger jobs, good oral and written communication skills are essential.

Couriers and messengers usually learn on the job, training with an experienced worker for a short time. Those who work as independent contractors for a messenger or delivery service may be required to have a valid driver's license, a registered and inspected vehicle, a good driving record, and insurance coverage. Many couriers and messengers who are employees, rather than independent contractors, also are required to provide and maintain their own vehicle. Although some companies have spare bicycles or mopeds that their riders may rent for a short period, almost all two-wheeled couriers own their own bicycle, moped, or motorcycle. A good knowledge of the geographic area in which they travel and a good sense of direction also are important.

Couriers and messengers, especially those who work for messenger or courier services, have limited advancement opportunities; a few move into the office to learn dispatching or to take service requests by phone.

Employment

Couriers and messengers together held about 147,000 jobs in 2004. Approximately 23 percent were employed in the couriers and messengers industry. About 13 percent worked in healthcare, and around 8 percent worked in the legal services industry. Another 8 percent were employed in finance and insurance firms. Technically, many messengers are self-employed independent contractors, because they provide their own vehicles and, to a certain extent, set their own schedules. In many respects, however, they are like employees, because they usually work for one company.

Job Outlook

Employment of couriers and messengers is expected to decline through 2014, despite an increasing volume of parcels, business documents, promotional materials, and other written information that must be handled and delivered as the economy expands. However, some jobs will arise out of the need to replace couriers and messengers who leave the occupation.

Employment of couriers and messengers will continue to be adversely affected by the more widespread use of electronic information-handling technologies such as e-mail and fax. Many documents, forms, and other materials that people used to have delivered by hand are now downloaded from the Internet. Many legal and financial documents, which used to be delivered by hand because they required a handwritten signature, now can be delivered electronically with online signatures. However, couriers and messengers still will be needed to transport materials that cannot be sent electronically—such as blueprints and other oversized materials, securities, and passports. Also, they still will be required by medical and dental laboratories to pick up and deliver medical samples, specimens, and other materials.

Earnings

Median annual earnings of couriers and messengers in May 2004 were \$20,190. The middle 50 percent earned between \$16,390 and \$24,720. The lowest 10 percent earned less than \$14,020, and the highest 10 percent earned more than \$30,510.

These workers usually receive the same benefits as most other workers. If uniforms are required, employers generally provide them or offer an allowance to purchase them.

Related Occupations

Messengers and couriers deliver letters, parcels, and other items. They also keep accurate records of their work. Others who do similar work are Postal Service workers; truck drivers and driver/sales workers; shipping, receiving, and traffic clerks; and cargo and freight agents.

Sources of Additional Information

Information about job opportunities may be obtained from local employers and local offices of the State employment service. Persons interested in courier and messenger jobs also may contact messenger and courier services, mail-order firms, banks, printing and publishing firms, utility companies, retail stores, or other large companies.

Dispatchers

(O*NET 43-5031.00, 43-5032.00)

Significant Points

- Population growth and economic expansion are expected to spur employment growth for all types of dispatchers.
- Many dispatchers are at the entry level and do not require more than a high school diploma.
- Although there are no mandatory licensing or certification requirements, some States require public safety dispatchers to be certified.

Nature of the Work

Dispatchers schedule and dispatch workers, equipment, or service vehicles to carry materials or passengers. They keep records, logs, and schedules of the calls that they receive, the transportation vehicles that they monitor and control, and the actions that they take. They maintain information on each call and then prepare a detailed report on all activities occurring during their shifts. Many dispatchers employ computer-aided dispatch systems to accomplish these tasks. The work of dispatchers varies greatly, depending on the industry in which they work.

Regardless of where they work, all dispatchers are assigned a specific territory and have responsibility for all communications within that area. Many work in teams, especially dispatchers in large communications centers or companies. One person usually handles all dispatching calls to the response units or company drivers, while the other members of the team usually receive the incoming calls and deal with the public.

Police, fire, and ambulance dispatchers, also called public safety dispatchers, monitor the location of emergency services personnel from any one or all of the jurisdiction's emergency services departments. These workers dispatch the appropriate type and number of units in response to calls for assistance. Dispatchers, or call takers, often are the first people the public contacts when emergency assistance is required. If certified for emergency medical services, the dispatcher may provide medical instruction to those on the scene of the emergency until the medical staff arrives.

Police, fire, and ambulance dispatchers work in a variety of settings: A police station, a fire station, a hospital, or, increasingly, a centralized communications center. In many areas, the police department serves as the communications center. In these situations, all emergency calls go to the police department, where a dispatcher handles the police calls and screens the others before transferring them to the appropriate service.

When handling calls, dispatchers question each caller carefully to determine the type, seriousness, and location of the emergency. The information obtained is posted either electronically by computer or, with decreasing frequency, by hand. The request for help is communicated immediately to uniformed or supervisory personnel, who quickly decide on the priority of the incident, the

kind and number of units needed, and the location of the closest and most suitable units available. Typically, a team answers calls and relays the information to be dispatched. Responsibility then shifts to the dispatchers, who send response units to the scene and monitor the activity of the public safety personnel answering the dispatched message. During the course of the shift, dispatchers may rotate these functions.

When appropriate, dispatchers stay in close contact with other service providers—for example, a police dispatcher would monitor the response of the fire department when there is a major fire. In a medical emergency, dispatchers keep in close touch not only with the dispatched units, but also with the caller. They may give extensive first-aid instructions before the emergency personnel arrive, while the caller is waiting for the ambulance. Dispatchers continuously give updates on the patient's condition to the ambulance personnel and often serve as a link between the medical staff in a hospital and the emergency medical technicians in the ambulance. (A separate statement on emergency medical technicians and paramedics appears elsewhere in the *Handbook*.)

Other dispatchers coordinate deliveries, service calls, and related activities for a variety of firms. *Truck dispatchers*, who work for local and long-distance trucking companies, coordinate the movement of trucks and freight between cities. These dispatchers direct the pickup and delivery activities of drivers, receive customers' requests for the pickup and delivery of freight, consolidate freight orders into truckloads for specific destinations, assign

drivers and trucks, and draw up routes and pickup and delivery schedules. *Bus dispatchers* make sure that local and long-distance buses stay on schedule. They handle all problems that may disrupt service, and they dispatch other buses or arrange for repairs in order to restore service and schedules. *Train dispatchers* ensure the timely and efficient movement of trains according to orders and schedules. They must be aware of track switch positions, track maintenance areas, and the location of other trains running on the track. *Taxicab dispatchers*, or starters, dispatch taxis in response to requests for service and keep logs on all road service calls. *Tow-truck dispatchers* take calls for emergency road service. They relay the nature of the problem to a nearby service station or a tow-truck service and see to it that the road service is completed. *Gas and water service dispatchers* monitor gaslines and water mains and send out service trucks and crews to take care of emergencies.

Working Conditions

The work of dispatchers can be very hectic when many calls come in at the same time. The job of public safety dispatcher is particularly stressful because a slow or an improper response to a call can result in serious injury or further harm. Also, callers who are anxious or afraid may become excited and be unable to provide needed information; some may even become abusive. Despite provocations, dispatchers must remain calm, objective, and in control of the situation.

Dispatchers sit for long periods, using telephones, computers, and two-way radios. Much of their time is spent at video display terminals, viewing monitors and observing traffic patterns. As a result of working for long stretches with computers and other electronic equipment, dispatchers can experience significant eyestrain and back discomfort. Generally, dispatchers work a 40-hour week; however, rotating shifts and compressed work schedules are common. Alternative work schedules are necessary to accommodate evening, weekend, and holiday work, as well as 24-hour-per-day, 7-day-per-week operations.

Training, Other Qualifications, and Advancement

Many dispatchers are at the entry level and do not require more than a high school diploma. Employers, however, prefer to hire people familiar with computers and other electronic office and business equipment. Typing, filing, recordkeeping, and other clerical skills also are important.

State or local government civil service regulations usually govern police, fire, emergency medical, and ambulance dispatching jobs. Candidates for these positions may have to pass written, oral, and performance tests. Also, they may be asked to attend training classes and attain the proper certification in order to qualify for advancement.

Workers usually develop the necessary skills on the job. This informal training lasts from several days to a few months, depending on the complexity of the job. Public safety dispatchers usually require the most extensive training. While working with an experienced dispatcher, new employees monitor calls and learn how to operate a variety of communications equipment, including telephones, radios, and various wireless devices. As trainees gain confidence, they begin to handle calls themselves. In smaller operations, dispatchers sometimes act as customer service representatives, processing orders. Many public safety dispatchers also participate in structured training programs sponsored by their employer. Increasingly, public safety dispatchers receive training in stress and crisis management as well as family counseling. This training helps them to provide effective services to others;

Dispatchers may sit for long periods, using telephones, computers, maps, and two-way radios.

and, at the same time, it helps them manage the stress involved in their work.

Communication skills and the ability to work under pressure are important personal qualities for dispatchers. Residency in the city or county of employment frequently is required for public safety dispatchers. Dispatchers in transportation industries must be able to deal with sudden influxes of shipments and disruptions of shipping schedules caused by bad weather, road construction, or accidents.

Although there are no mandatory licensing or certification requirements, some States require that public safety dispatchers possess a certificate to work on a State network, such as the Police Information Network. Many dispatchers participate in these programs in order to improve their prospects for career advancement.

Dispatchers who work for private firms, which usually are small, will find few opportunities for advancement. In contrast, public safety dispatchers may become a shift or divisional supervisor or chief of communications, or they may move to higher paying administrative jobs. Some become police officers or firefighters.

Employment

Dispatchers held 266,000 jobs in 2004. About 36 percent were police, fire, and ambulance dispatchers, almost all of whom worked for State and local governments—primarily local police and fire departments. About 26 percent of all dispatchers worked in the transportation and warehousing industry, and the rest worked in a wide variety of mainly service-providing industries.

Although dispatching jobs are found throughout the country, most dispatchers work in urban areas, where large communications centers and businesses are located.

Job Outlook

Employment of dispatchers is expected to grow about as fast as the average for all occupations through 2014. In addition to those positions resulting from job growth, many openings will arise from the need to replace workers who transfer to other occupations or leave the labor force.

Population growth and economic expansion are expected to spur employment growth for all types of dispatchers. The growing and aging population will increase demand for emergency services and stimulate employment growth of police, fire, and ambulance dispatchers. Many districts are consolidating their communications centers into a shared area-wide facility. Individuals with computer skills and experience will have a greater opportunity for employment as public safety dispatchers.

Employment of some dispatchers is more adversely affected by economic downturns than employment of other dispatchers. For example, when economic activity falls, demand for transportation services declines. As a result, taxicab, train, and truck dispatchers may experience layoffs or a shortened workweek, and jobseekers may have some difficulty finding entry-level jobs. Employment of tow-truck dispatchers, by contrast, is seldom affected by general economic conditions, because of the emergency nature of their business.

Earnings

Median annual earnings of dispatchers, except police, fire, and ambulance in May 2004 were \$30,920. The middle 50 percent earned between \$23,480 and \$41,040. The lowest 10 percent earned less than \$18,820, and the highest 10 percent earned more than \$52,440.

Median annual earnings of police, fire, and ambulance dispatchers in 2004 were \$28,930. The middle 50 percent earned between \$23,060 and \$35,970. The lowest 10 percent earned less than \$18,710, and the highest 10 percent earned more than \$44,520.

Dispatchers usually receive the same benefits as most other workers.

Related Occupations

Other occupations that involve directing and controlling the movement of vehicles, freight, and personnel, as well as distributing information and messages, include air traffic controllers, communications equipment operators, customer service representatives, and reservation and transportation ticket agents and travel clerks.

Sources of Additional Information

For further information on training and certification for police, fire, and emergency dispatchers, contact:

► Association of Public Safety Communications Officials, International, 351 N. Williamson Blvd., Daytona Beach, FL 32114-1112. Internet: <http://www.apco911.org>

► International Municipal Signal Association (IMSA), PO Box 359, 165 E. Union Street, Newark, NY 14513-0539. Internet: <http://www.IMSAsafety.org>

Information on job opportunities for police, fire, and emergency dispatchers is available from personnel offices of State and local governments or police departments. Information about work opportunities for other types of dispatchers is available from local employers and State employment service offices.

Meter Readers, Utilities

(O*NET 43-5041.00)

Significant Points

- Employment is expected to decline, as a result of new automated meter reading (AMR) systems that allow meters to be monitored and billed from a central point.
- Most meter readers are employed by electric, gas, or water utilities or by local governments.

Nature of the Work

Meter readers read electric, gas, water, or steam consumption meters and record the volume used. They serve both residential and commercial consumers, either walking or driving along a designated route. Their duties include inspecting the meters and their connections for any defects or damage, supplying repair and maintenance workers with the necessary information to fix damaged meters, keeping track of the average usage, and recording reasons for any extreme fluctuations in volume.

Meter readers are constantly aware of any abnormal behavior or consumption that might indicate an unauthorized connection. They may turn off service for questionable behavior or nonpayment of charges, and they also are responsible for turning on service for new occupants. These workers usually keep records showing that the meters on which they have completed work have been serviced.

Working Conditions

Meter readers, who usually work 40 hours a week, work outdoors in all types of weather as they travel through communities and neighborhoods taking readings. The typical workweek is Monday through Friday.

Most meter readers are employed by electric, gas, or water utilities or by local governments.

Training, Other Qualifications, and Advancement

Many meter readers are at the entry level and do not require more than a high school diploma. Employers, however, prefer to hire those familiar with computers and other electronic office and business equipment. Typing, recordkeeping, and other clerical skills also are important.

Utility meter readers usually work with a more experienced meter reader until they feel comfortable doing the job on their own. They learn how to read the meters and determine the consumption rate. They also must learn the route that they need to travel to read all their customers' meters.

Advancement opportunities for meter readers vary with the place of employment.

Employment

Meter readers held about 50,000 jobs in 2004. About 44 percent were employed by electric, gas, and water utilities. Most of the rest were employed in local government, reading water meters or meters for other government-owned utilities.

Job Outlook

Employment of meter readers is expected to decline through 2014. New AMR systems allow meters to be monitored and billed from a central point, reducing the need for meter readers. However, because it will be many years before AMR systems can be implemented in all locations, there still will be some openings for meter readers, mainly to replace workers leaving the occupation.

Earnings

Median annual earnings of utility meter readers in May 2004 were \$29,440. The middle 50 percent earned between \$23,000 and \$38,890. The lowest 10 percent earned less than \$18,550, and the highest 10 percent earned more than \$47,830.

These workers usually receive the same benefits as most other workers. If uniforms are required, employers generally provide them or offer an allowance to purchase them.

Related Occupations

Other workers responsible for the distribution and control of utilities include power plant operators, distributors, and dispatchers.

Sources of Additional Information

Information about job opportunities may be obtained from local employers and local offices of the State employment service.

Postal Service Workers

(O*NET 43-5051.00, 43-5052.00, 43-5053.00)

Significant Points

- Employment of Postal Service workers is expected to decline because of the increasing use of automation and electronic communication, such as the Internet.
- Keen competition is expected because the number of qualified applicants should continue to exceed the number of job openings.
- Qualification is based on an examination.
- Applicants customarily wait 1 to 2 years or more after passing the examination before being hired.

Nature of the Work

Each week, the U.S. Postal Service delivers billions of pieces of mail, including letters, bills, advertisements, and packages. To do this in an efficient and timely manner, the Postal Service employs about 619,000 individuals. Most Postal Service workers are clerks, mail carriers, or mail sorters, processors, and processing machine operators. Postal clerks wait on customers at post offices, whereas mail sorters, processors, and processing machine operators sort incoming and outgoing mail at post offices and mail processing centers. Mail carriers deliver mail to urban and rural residences and businesses throughout the United States.

Postal Service clerks, also known as window clerks, sell stamps, money orders, postal stationary, and mailing envelopes and boxes. They also weigh packages to determine postage and check that packages are in satisfactory condition for mailing. These clerks register, certify, and insure mail and answer questions about postage rates, post office boxes, mailing restrictions, and other postal matters. Window clerks also help customers file claims for damaged packages.

Postal Service mail sorters, processors, and processing machine operators prepare incoming and outgoing mail for distribution. These workers are commonly referred to as mail handlers, distribution clerks, mail processors, or mail processing clerks. They load and unload postal trucks and move mail around a mail processing center with forklifts, small electric tractors, or hand-pushed carts. They also load and operate mail processing, sorting, and canceling machinery.

Postal Service mail carriers deliver mail, once it has been processed and sorted. Although carriers are classified by their type of route—either city or rural—duties of city and rural carriers are similar. Most travel established routes, delivering and collecting mail. Mail carriers start work at the post office early in the morning, when they arrange the mail in delivery sequence. Automated equipment has reduced the time that carriers need to sort the mail, allowing them to spend more time delivering it.

Mail carriers cover their routes on foot, by vehicle, or a combination of both. On foot, they carry a heavy load of mail in a satchel or push it on a cart. In most urban and rural areas, they use a car or small truck. Although the Postal Service provides vehicles to city carriers, most rural carriers must use their own automobiles. Deliveries are made house-to-house, to roadside mailboxes, and to large buildings such as offices or apartments, which generally have all of their tenants' mailboxes in one location.

Besides delivering and collecting mail, carriers collect money for postage-due and COD (cash-on-delivery) fees and obtain signed receipts for registered, certified, and insured mail. If a customer is not

Although machines increasingly are used to sort mail, some mail still is sorted by hand.

home, the carrier leaves a notice that tells where special mail is being held. After completing their routes, carriers return to the post office with mail gathered from street collection boxes, homes, and businesses and turn in the mail, receipts, and money collected during the day.

Some city carriers may have specialized duties such as delivering only parcels or picking up mail from mail collection boxes. In contrast to city carriers, rural carriers provide a wider range of postal services, in addition to delivering and picking up mail. For example, rural carriers may sell stamps and money orders and register, certify, and insure parcels and letters. All carriers, however, must be able to answer customers' questions about postal regulations and services and provide change-of-address cards and other postal forms when requested.

Working Conditions

Window clerks usually work in the public portion of clean, well-ventilated, and well-lit buildings. They have a variety of duties and frequent contact with the public, but they rarely work at night. However, they may have to deal with upset customers, stand for long periods, and be held accountable for an assigned stock of stamps and funds. Depending on the size of the post office in which they work, they also may be required to sort mail.

Despite the use of automated equipment, the work of mail sorters, processors, and processing machine operators can be physically demanding. Workers may have to move heavy sacks of mail around a mail processing center. These workers usually are on their feet, reaching for sacks and trays of mail or placing packages and bundles into sacks and trays. Processing mail can be tiring and boring. Many sorters, processors, and machine operators work at night or on weekends, because most large post offices process mail around the clock, and the largest volume of mail is sorted during the evening and night shifts. Workers can experience stress as they process mail under tight production deadlines and quotas.

Most carriers begin work early in the morning—those with routes in a business district can start as early as 4 a.m. Overtime hours are frequently required for urban carriers. A carrier's schedule has its advantages, however. Carriers who begin work early in the morning are through by early afternoon and spend most of the day on their own, relatively free from direct supervision. Carriers spend most of their time outdoors, delivering mail in all kinds of weather. Even those who drive often must walk periodically when making deliveries and must lift heavy sacks of parcel post items when loading their vehicles. In addition, carriers must be cautious of potential hazards on their routes. Wet and icy roads

and sidewalks can be treacherous, and each year dogs attack numerous carriers.

Training, Other Qualifications, and Advancement

Postal Service workers must be at least 18 years old. They must be U.S. citizens or have been granted permanent resident-alien status in the United States, and males must have registered with the Selective Service upon reaching age 18. Applicants should have a basic competency of English. Qualification is based on a written examination that measures speed and accuracy at checking names and numbers and the ability to memorize mail distribution procedures. Applicants must pass a physical examination and drug test, and may be asked to show that they can lift and handle mail sacks weighing 70 pounds. Applicants for mail carrier positions must have a driver's license and a good driving record, and must receive a passing grade on a road test.

Jobseekers should contact the post office or mail processing center where they wish to work to determine when an exam will be given. Applicants' names are listed in order of their examination scores. Five points are added to the score of an honorably discharged veteran and 10 points are added to the score of a veteran who was wounded in combat or is disabled. When a vacancy occurs, the appointing officer chooses one of the top three applicants; the rest of the names remain on the list to be considered for future openings until their eligibility expires—usually 2 years after the examination date.

Relatively few people become postal clerks or mail carriers on their first job, because of keen competition and the customary waiting period of 1 to 2 years or more after passing the examination. It is not surprising, therefore, that most entrants transfer from other occupations.

New Postal Service workers are trained on the job by experienced workers. Many post offices offer classroom instruction on safety and defensive driving. Workers receive additional instruction when new equipment or procedures are introduced. In these cases, workers usually are trained by another postal employee or a training specialist.

Postal clerks and mail carriers should be courteous and tactful when dealing with the public, especially when answering questions or receiving complaints. A good memory and the ability to read rapidly and accurately are important. Good interpersonal skills also are vital, because mail distribution clerks work closely with other postal workers, frequently under the tension and strain of meeting dispatch or transportation deadlines and quotas.

Postal Service workers often begin on a part-time, flexible basis and become regular or full time in order of seniority, as vacancies occur. Full-time workers may bid for preferred assignments, such as the day shift or a high-level nonsupervisory position. Carriers can look forward to obtaining preferred routes as their seniority increases. Postal Service workers can advance to supervisory positions on a competitive basis.

Employment

The U.S. Postal Service employed 75,000 clerks; 335,000 mail carriers; and 209,000 mail sorters, processors, and processing machine operators in 2004. Most of them worked full time. Most postal clerks provided window service at post office branches. Many mail sorters, processors, and processing machine operators sorted mail at major metropolitan post offices; others worked at mail processing centers. The majority of mail carriers worked in cities and suburbs, while the rest worked in rural areas.

Postal Service workers are classified as casual, part-time flexible, part-time regular, or full time. Casuals are hired for 90 days at a time to help process and deliver mail during peak mailing or vacation peri-

ods. Part-time flexible workers do not have a regular work schedule or weekly guarantee of hours but are called as the need arises. Part-time regulars have a set work schedule of fewer than 40 hours per week, often replacing regular full-time workers on their scheduled day off. Full-time postal employees work a 40-hour week over a 5-day period.

Job Outlook

Employment of Postal Service workers is expected to decline through 2014. Still, many jobs will become available because of the need to replace those who retire or leave the occupation. Those seeking jobs as Postal Service workers can expect to encounter keen competition. The number of applicants should continue to exceed the number of job openings because of the occupation's low entry requirements and attractive wages and benefits.

A small decline in employment is expected among window clerks over the 2004-14 projection period. Efforts by the Postal Service to provide better service may somewhat increase the demand for window clerks, but the demand for such clerks will be offset by the use of electronic communication, such as the Internet, and private delivery companies. Employment of mail sorters, processors, and processing machine operators is expected to decline because of the increasing use of automated materials handling equipment and optical character readers, barcode sorters, and other automated sorting equipment.

A small decline in employment among mail carriers is expected through 2014. Competition from alternative delivery systems and the increasing use of electronic communication are expected to influence the demand for mail carriers. In addition, the Postal Service is moving toward more centralized mail delivery, such as the use of cluster boxes, to cut down on the number of door-to-door deliveries. The best employment opportunities for mail carriers are expected to be in less urbanized areas as the number of addresses to which mail must be delivered continues to grow, especially in fast growing rural areas. However, increased use of the "delivery point sequencing" system, which allows machines to sort mail directly by the order of delivery, should reduce the amount of time that carriers spend sorting their mail, allowing them more time to handle longer routes.

The role of the Postal Service as a government-approved monopoly continues to be a topic of debate. Any legislative changes that would privatize or deregulate the Postal Service might affect employment of all its workers. Employment and schedules in the Postal Service fluctuate with the demand for its services. When mail volume is high, full-time employees work overtime, part-time workers get additional hours, and casual workers may be hired. When mail volume is low, overtime is curtailed, part-timers work fewer hours, and casual workers are discharged.

Earnings

Median annual earnings of Postal Service mail carriers were \$44,450 in May 2004. The middle 50 percent earned between \$37,590 and \$50,580. The lowest 10 percent had earnings of less than \$31,980, while the top 10 percent earned more than \$54,240. Rural mail carriers are reimbursed for mileage put on their own vehicles while delivering mail.

Median annual earnings of Postal Service clerks were \$40,950 in 2004. The middle 50 percent earned between \$37,880 and \$44,030. The lowest 10 percent had earnings of less than \$36,040, while the top 10 percent earned more than \$50,510.

Median annual earnings of Postal Service mail sorters, processors, and processing machine operators were \$39,430 in 2004. The middle 50 percent earned between \$36,240 and \$42,620. The lowest 10 percent had earnings of less than \$24,290, while the top 10 percent earned more than \$44,540.

Postal Service workers enjoy a variety of employer-provided benefits similar to those enjoyed by Federal Government workers. The American Postal Workers Union, the National Association of Letter Carriers, the National Postal Mail Handlers Union, and the National Rural Letter Carriers Association together represent most of these workers.

Related Occupations

Other occupations with duties similar to those of Postal Service clerks include cashiers; counter and rental clerks; file clerks; and shipping, receiving, and traffic clerks. Others with duties related to those of Postal Service mail carriers include couriers and messengers, and truck drivers and driver/sales workers. Occupations whose duties are related to those of Postal Service mail sorters, processors, and processing machine operators include inspectors, testers, sorters, samplers, and weighers, and material moving occupations.

Sources of Additional Information

Local post offices and State employment service offices can supply details about entrance examinations and specific employment opportunities for Postal Service workers.

Production, Planning, and Expediting Clerks

(O*NET 43-5061.00)

Significant Points

- Many production, planning, and expediting jobs are at the entry level and do not require more than a high school diploma.
- Manufacturing firms and wholesale and retail trade establishments are the primary employers.
- Production, planning, and expediting clerks work closely with supervisors who must approve production and work schedules.

Nature of the Work

Production, planning, and expediting clerks coordinate and expedite the flow of information, work, and materials within or among offices. Most of their work is done according to production, work, or shipment schedules that are devised by supervisors who determine work progress and completion dates. Production, planning, and expediting clerks compile reports on the progress of work and on production problems. They also may schedule workers, estimate costs, schedule the shipment of parts, keep an inventory of materials, inspect and assemble materials, and write special orders for services and merchandise. In addition, they may route and deliver parts to ensure that production quotas are met and that merchandise is delivered on the date promised.

Production and planning clerks compile records and reports on various aspects of production, such as materials and parts used, products produced, machine and instrument readings, and frequency of defects. These workers prepare work tickets or other production guides and distribute them to other workers. Production and planning clerks coordinate, schedule, monitor, and chart production and its progress, either manually or with electronic equipment. They also gather information from customers' orders or other specifications and use the information to prepare a detailed production sheet that serves as a guide in assembling or manufacturing the product.

Employers prefer to hire production, planning, and expediting clerks who are familiar with computers and other electronic office and business equipment.

Expediting clerks contact vendors and shippers to ensure that merchandise, supplies, and equipment are forwarded on the specified shipping dates. They communicate with transportation companies to prevent delays in transit, and they may arrange for the distribution of materials upon their arrival. They may even visit work areas of vendors and shippers to check the status of orders. Expediting clerks locate and distribute materials to specified production areas. They may inspect products for quality and quantity to ensure their adherence to specifications. They also keep a chronological list of due dates and may move work that does not meet the production schedule to the top of the list.

Working Conditions

Production, planning, and expediting clerks work closely with supervisors who must approve production and work schedules. The typical workweek is Monday through Friday.

Training, Other Qualifications, and Advancement

Many production, planning, and expediting jobs are at the entry level and do not require more than a high school diploma. Employers, however, prefer to hire those familiar with computers and other electronic office and business equipment. Applicants who have taken business courses or have specific job-related experience may be preferred. Because communication with other people is an integral part of some jobs in the occupation, good oral and written communication skills are essential. Typing, filing, recordkeeping, and other clerical skills also are important.

Production, planning, and expediting clerks usually learn the job by doing routine tasks under close supervision. They learn how to count and mark stock, and then they start keeping records and taking inventory. Strength, stamina, good eyesight, and an ability to work at repetitive tasks, sometimes under pressure, are important characteristics. Production, planning, and expediting clerks must learn both how their company operates and the company's priorities before they can begin to write production and work schedules efficiently.

Advancement opportunities for production, planning, and expediting clerks vary with the place of employment.

Employment

In 2004, production, planning, and expediting clerks held 292,000 jobs. Jobs in manufacturing made up 42 percent. Another 14 percent were in wholesale and retail trade establishments.

Job Outlook

As increasing pressure is put on firms to manufacture and deliver their goods more quickly and efficiently, the need for production, planning, and expediting clerks will grow, although the expected decline in overall employment in manufacturing will result in slower than average employment growth for production, planning, and expediting clerks through 2014. The work of production, planning, and expediting clerks is less likely to be automated than the work of many other administrative support occupations. In addition to openings due to employment growth, job openings will arise from the need to replace production, planning, and expediting clerks who leave the labor force or transfer to other occupations.

Earnings

Median annual earnings of production, planning, and expediting clerks in May 2004 were \$36,340. The middle 50 percent earned between \$27,690 and \$45,880. The lowest 10 percent earned less than \$21,690, and the highest 10 percent earned more than \$55,850.

These workers usually receive the same benefits as most other workers. If uniforms are required, employers generally provide them or offer an allowance to purchase them.

Related Occupations

Other workers who coordinate the flow of information to assist the production process include cargo and freight agents; shipping, receiving, and traffic clerks; stock clerks and order fillers; and weighers, measurers, checkers, and samplers, recordkeeping.

Sources of Additional Information

Information about job opportunities may be obtained from local employers and from local offices of the State employment service.

Shipping, Receiving, and Traffic Clerks

(O*NET 43-5071.00)

Significant Points

- Many shipping, receiving, and traffic clerk positions are at the entry level and do not require more than a high school diploma.
- Slower-than-average employment growth is expected, as a result of increasing automation and the growing use of computers to store and retrieve shipping and receiving records.

Nature of the Work

Shipping, receiving, and traffic clerks keep records of all goods shipped and received. Their duties depend on the size of the establishment they work for and the level of automation used. Larger companies typically are better able to finance the purchase of computers and other equipment to handle some or all of a clerk's responsibilities. In smaller companies, a clerk maintains records, prepares shipments, and accepts deliveries. In both environments, shipping, receiving, and traffic clerks may lift cartons of various sizes.

Shipping clerks keep records of all outgoing shipments. They prepare shipping documents and mailing labels and make sure that orders have been filled correctly. Also, they record items taken from inventory and note when orders were filled. Sometimes they fill the order themselves, obtaining merchandise from the stockroom, not-

ing when inventories run low, and wrapping or packing the goods in shipping containers. They also address and label packages, look up and compute freight or postal rates, and record the weight and cost of each shipment. In addition, shipping clerks may prepare invoices and furnish information about shipments to other parts of the company, such as the accounting department. Once a shipment is checked and ready to go, shipping clerks may move the goods from the plant—sometimes by forklift—to the shipping dock and direct their loading.

Receiving clerks perform tasks similar to those of shipping clerks. They determine whether orders have been filled correctly by verifying incoming shipments against the original order and the accompanying bill of lading or invoice. They make a record of the shipment and the condition of its contents. In many firms, receiving clerks either use hand-held scanners to record barcodes on incoming products or manually enter the information into a computer. These data then can be transferred to the appropriate departments. The shipment is checked for any discrepancies in quantity, price, and discounts. Receiving clerks may route or move shipments to the proper department, warehouse section, or stockroom. They also may arrange for adjustments with shippers whenever merchandise is lost or damaged. Receiving clerks in small businesses may perform some duties similar to those of stock clerks. In larger establishments, receiving clerks may control all receiving platform operations, such as scheduling of trucks, recording of shipments, and handling of damaged goods.

Traffic clerks maintain records on the destination, weight, and charges on all incoming and outgoing freight. They verify rate charges by comparing the classification of materials with rate charts. In many companies, this work may be automated. Information either is scanned or is entered by hand into a computer for use by the accounting department or other departments within the company. Traffic clerks also keep a file of claims for overcharges and for damage to goods in transit.

Working Conditions

Most jobs for shipping, receiving, and traffic clerks involve frequent standing, bending, walking, and stretching. Some lifting and carrying of smaller items also may be involved. Although automated devices have lessened the physical demands of this occupation, their use remains somewhat limited. The work still can be strenuous, even though mechanical material-handling equipment is employed to move heavy items.

Due to automation and the growing use of computers to store and retrieve product information, employment of shipping and receiving clerks will grow more slowly than average.

The typical workweek is Monday through Friday; however, evening and weekend hours are common in some jobs and may be required in other jobs when large shipments are involved.

Training, Other Qualifications, and Advancement

Many shipping, receiving, and traffic clerk positions are at the entry level and do not require more than a high school diploma. Employers, however, prefer to hire those familiar with computers and other electronic office and business equipment.

Shipping, receiving, and traffic clerks usually learn the job by doing routine tasks under close supervision. They first learn how to count and mark stock, and then they start keeping records and taking inventory. Strength, stamina, good eyesight, and an ability to work at repetitive tasks, sometimes under pressure, are important characteristics. Shipping, receiving, and traffic clerks who handle jewelry, liquor, or drugs may be bonded.

Shipping, receiving, and traffic clerks check items to be shipped and attach labels to them, making sure that the addresses are correct. Training in the use of automated equipment usually is done informally, on the job. As these occupations become more automated, however, workers in them may need longer periods of training to master the use of the equipment. Advancement opportunities for shipping, receiving, and traffic clerks vary with the place of employment. Shipping, receiving, and traffic clerks are promoted to head clerk, and those with a broad understanding of shipping and receiving may enter a related field, such as industrial traffic management.

Employment

Shipping, receiving, and traffic clerks held about 751,000 jobs in 2004. Almost three out of four were employed in manufacturing or by wholesale and retail establishments. Although jobs for shipping, receiving, and traffic clerks are found throughout the country, most clerks work in urban areas, where shipping depots in factories and wholesale establishments usually are located. (For information on workers who perform duties similar to those of shipping, receiving, and traffic clerks and who are employed by the U.S. Postal Service, see the statement on Postal Service workers elsewhere in the *Handbook*.)

Job Outlook

Employment of shipping, receiving, and traffic clerks is expected to grow more slowly than the average for all occupations through 2014. Job growth will continue to be limited by automation as all but the smallest firms move to reduce labor costs by using computers to store and retrieve shipping and receiving records.

Methods of handling materials have changed significantly in recent years. Large warehouses are increasingly becoming automated, with equipment such as computerized conveyor systems, robots, computer-directed trucks, and automatic data storage and retrieval systems. Automation, coupled with the growing use of hand-held scanners and personal computers in shipping and receiving departments, has increased the productivity of shipping, receiving, and traffic clerks.

Despite technology, job openings will continue to arise because of increasing economic and trade activity and because certain tasks cannot be automated. For example, someone needs to check shipments before they go out and when they arrive, to ensure that everything is in order. In addition, openings will occur because of the need to replace shipping, receiving, and traffic clerks who leave the occupation. Because this is an entry-level occupation, many vacancies are created by a worker's normal career progression.

Earnings

Median annual earnings of shipping, receiving, and traffic clerks in May 2004 were \$24,400. The middle 50 percent earned between \$19,600 and \$30,720. The lowest 10 percent earned less than \$16,290, and the highest 10 percent earned more than \$37,610.

These workers usually receive the same benefits as most other workers. If uniforms are required, employers generally provide them or offer an allowance to purchase them.

Related Occupations

Shipping, receiving, and traffic clerks record, check, and often store materials that a company receives. They also process and pack goods for shipment. Other workers who perform similar duties are stock clerks and order fillers; production, planning, and expediting clerks; cargo and freight agents; and Postal Service workers.

Sources of Additional Information

Information about job opportunities may be obtained from local employers and local offices of the State employment service.

Stock Clerks and Order Fillers

(O*NET 43-5081.01, 43-5081.02, 43-5081.03, 43-5081.04)

Significant Points

- Employers prefer to hire stock clerks and order fillers who are familiar with computers and other electronic office and business equipment.
- Employment is projected to decline, due to the use of automation in factories, warehouses, and stores.

Nature of the Work

Stock clerks and order fillers receive, unpack, check, store, and track merchandise or materials. They keep records of items entering or leaving the stockroom and inspect damaged or spoiled goods. They sort, organize, and mark items with identifying codes, such as price, stock, or inventory control codes, so that inventories can be located quickly and easily. They also may be required to lift cartons of various sizes. In larger establishments, where they may be responsible for only one task, they may be called *stock-control clerks*, *merchandise distributors*, or *property custodians*. In smaller firms, they also may

Most jobs for stock clerks and order fillers involve frequent standing, bending, walking, and stretching.

perform tasks usually handled by shipping and receiving clerks. (A separate statement on shipping, receiving, and traffic clerks appears elsewhere in the *Handbook*.)

In many firms, stock clerks and order fillers use hand-held scanners connected to computers to keep inventories up to date. In retail stores, stock clerks bring merchandise to the sales floor and stock shelves and racks. In stockrooms and warehouses, stock clerks store materials in bins, on floors, or on shelves. Instead of putting the merchandise on the sales floor or on shelves, order fillers take customers' orders and either hold the merchandise until the customers can pick it up or send it to them.

Working Conditions

Working conditions vary considerably by employment setting. Most jobs for stock clerks and order fillers involve frequent standing, bending, walking, and stretching. Some lifting and carrying of smaller items also may be involved. Although automated devices have lessened the physical demands of this occupation, their use remains somewhat limited. Even though mechanical material-handling equipment is employed to move heavy items, the work still can be strenuous.

The typical workweek is Monday through Friday; however, evening and weekend hours are common and may be required when large shipments are involved or when inventory is taken.

Training, Other Qualifications, and Advancement

Many stock clerk and order filler positions are at the entry level and do not require more than a high school diploma. Employers, however, prefer to hire those familiar with computers and other electronic office and business equipment. Typing, filing, record-keeping, and other clerical skills also are important.

Stock clerks and order fillers usually learn the job by doing routine tasks under close supervision. They learn how to count and mark stock, and then they start keeping records and taking inventory. Strength, stamina, good eyesight, and an ability to work at repetitive tasks, sometimes under pressure, are important characteristics. Stock clerks whose sole responsibility is to bring merchandise to the sales floor to stock shelves and racks need little training. Stock clerks and order fillers who handle jewelry, liquor, or drugs may be bonded.

Training in the use of automated equipment usually is done informally, on the job. As this occupation becomes more automated, however, workers may need longer periods of training to master the use of the equipment.

Advancement opportunities for stock clerks and order fillers vary with the place of employment. With additional training, some stock clerks and order fillers advance to jobs as warehouse manager or purchasing agent.

Employment

Stock clerks and order fillers held about 1.6 million jobs in 2004. More than three out of four work in wholesale and retail trade. The greatest numbers are found in grocery stores, followed by department stores. Jobs for stock clerks are found in all parts of the country, but most work in large urban areas that have many large suburban shopping centers, warehouses, and factories.

Job Outlook

Employment of stock clerks and order fillers is projected to decline through 2014 as a result of the use of automation in factories, warehouses, and stores. Because the occupation is very large and many jobs are entry level, however, numerous job openings will occur each year to replace those who transfer to other jobs or leave the labor force.

The growing use of computers for inventory control and the installation of new, automated equipment are expected to inhibit growth in demand for stock clerks and order fillers, especially in manufacturing and wholesale trade industries, where operations are most easily automated. In addition to using computerized inventory control systems, firms in these industries are relying more on sophisticated conveyor belts and automatic high stackers to store and retrieve goods. Also, expanded use of battery-powered, driverless, automatically guided vehicles can be expected.

Employment of stock clerks and order fillers who work in grocery, general merchandise, department, apparel, and accessories stores is expected to be somewhat less affected by automation because much of their work is done manually and is difficult to automate. In addition, the increasing role of large retail outlets and warehouses, as well as catalog, mail, telephone, and Internet shopping services, should bolster employment of stock clerks and order fillers in these sectors of retail trade.

Earnings

Median annual earnings of stock clerks and order fillers in May 2004 were \$20,100. The middle 50 percent earned between \$16,250 and \$25,910. The lowest 10 percent earned less than \$13,970, and the highest 10 percent earned more than \$33,420.

These workers usually receive the same benefits as most other workers. If uniforms are required, employers generally provide them or offer an allowance to purchase them.

Related Occupations

Workers who also handle, move, organize, store, and keep records of materials include shipping, receiving, and traffic clerks; production, planning, and expediting clerks; cargo and freight agents; and procurement clerks.

Sources of Additional Information

State employment service offices can provide information about job openings for stock clerks and order fillers.

Weighers, measurers, checkers, and samplers, recordkeeping

(O*NET 43-5111.00)

Significant Points

- Many jobs are at the entry level and do not require more than a high school diploma.
- Employment of weighers, measurers, checkers, and samplers is expected to decline because of the increased use of automated equipment that performs the function of these workers.

Nature of the Work

Weighers, measurers, checkers, and samplers weigh, measure, and check materials, supplies, and equipment in order to keep accurate records. Most of their duties are clerical. Using either manual or automated data-processing systems, they verify the quantity, quality, and overall value of the items they are responsible for and check the condition of items purchased, sold, or produced against records, bills, invoices, or receipts. They check the items to ensure the accuracy of the recorded data. They prepare reports on warehouse inventory levels and on use of parts. Weighers, measurers, checkers, and samplers also check for any defects in the items and record the severity of the defects they find.

Many workers use weight scales, counting devices, tally sheets, and calculators to obtain information about products.

These workers use weight scales, counting devices, tally sheets, and calculators to obtain information about the products. They usually move objects to and from the scales with a handtruck or forklift. They issue receipts for the products when needed or requested.

Working Conditions

Working conditions vary considerably by employment setting. Weighers, measurers, checkers, and samplers work in a wide variety of businesses, institutions, and industries. Some work in warehouses, stockrooms, or shipping and receiving rooms that may not be temperature controlled. Others may spend time in cold storage rooms or on loading platforms where they are exposed to the weather.

Training, Other Qualifications, and Advancement

Many weigher, measurer, checker, and sampler jobs are at the entry level and do not require more than a high school diploma. Employers, however, prefer to hire those familiar with computers. Applicants who have specific job-related experience may be preferred. Typing, filing, recordkeeping, and other clerical skills also are important. Advancement opportunities vary with the place of employment.

Employment

Weighers, measurers, checkers, and samplers held about 88,000 jobs in 2004. Their employment is spread across many industries. Retail trade accounted for 20 percent of those jobs, manufacturing accounted for about 21 percent, and wholesale trade employed another 13 percent.

Job Outlook

Employment of weighers, measurers, checkers, and samplers is expected to decline through 2014 because of the increased use of automated equipment that performs the function of these workers. Also, many of the industries that employ these workers are expected to decrease employment. In addition to job openings resulting from job growth, openings should arise from the need to replace workers who leave the labor force or transfer to other occupations.

Earnings

Median annual earnings of weighers, measurers, checkers, and samplers in May 2004 were \$24,570. The middle 50 percent earned between \$19,360 and \$32,560. The lowest 10 percent earned less than \$16,140, and the highest 10 percent earned more than \$42,190.

These workers usually receive the same benefits as most other workers. If uniforms are required, employers generally provide them or offer an allowance to purchase them.

Related Occupations

Other workers who determine and document characteristics of materials or equipment include cargo and freight agents; production,

planning, and expediting clerks; shipping, receiving, and traffic clerks; stock clerks and order fillers; and procurement clerks.

Sources of Additional Information

Information about job opportunities may be obtained from local employers and local offices of the State employment service.

Other Office and Administrative Support Occupations

Communications Equipment Operators

(O*NET 43-2011.00, 43-2021.01, 43-2021.02, 43-2099.99)

Significant Points

- Switchboard operators hold 4 out of 5 jobs.
- Workers train on the job.
- Employment is expected to decline.

Nature of the Work

Most communications equipment operators work as *switchboard operators* for a wide variety of businesses, such as hospitals, hotels, telephone call centers, and government agencies. Switchboard operators use private branch exchange (PBX) or voice over Internet protocol (VoIP) switchboards to relay incoming, outgoing, and interoffice calls, usually for a single organization. They also may handle other clerical duties, such as supplying information, taking messages, and announcing visitors. Technological improvements have automated many of the tasks handled by switchboard operators. New systems automatically connect outside calls to the correct destination or automated directories, and voice-mail systems take messages without the assistance of an operator.

Some communications equipment operators work as *telephone operators*, assisting customers in making telephone calls. Although most calls are connected automatically, callers sometimes require the assistance of an operator. *Central office operators* help customers to complete local and long-distance calls, usually under special circumstances. *Directory assistance operators* provide customers with information such as telephone numbers or area codes.

When callers dial “0,” they usually reach a central office operator, also known as a *local, long-distance, or call completion operator*. Most of these operators work for telephone companies, and many of their responsibilities have been automated. For example, callers can make international, collect, and credit card calls without the assistance of a central office operator. Other tasks previously handled by these operators, such as billing calls to third parties and monitoring the cost of a call, also have been automated.

Callers still need a central office operator for a limited number of tasks, including placing person-to-person calls or interrupting busy lines if an emergency warrants the disruption. When natural disasters such as storms or earthquakes occur, central office operators provide callers with emergency phone contacts. They also assist callers who are having difficulty with automated phone systems. An operator monitoring an automated system that aids a caller in placing collect calls, for example, may intervene if a caller needs assistance with the system.

Directory assistance operators provide callers with information such as telephone numbers or area codes. Most directory assistance operators work for telephone companies; increasingly, they also

work for companies that provide business services. Automated systems now handle many of the responsibilities once performed by directory assistance operators. The systems prompt callers for a listing and may even connect the call after providing the telephone number. However, directory assistance operators monitor many of the calls received by automated systems. The operators listen to recordings of the customer’s request and then key information into electronic directories to access the correct telephone numbers. Directory assistance operators also provide personal assistance to customers having difficulty using the automated system.

Other communications equipment operators include workers who operate satellite communications equipment, telegraph equipment, and a wide variety of other communications equipment.

Working Conditions

Most communications equipment operators work in pleasant, well-lighted surroundings. Because telephone operators spend much time seated at keyboards and video monitors, employers often provide workstations designed to decrease glare and other physical discomforts. Such improvements reduce the incidence of eyestrain, back discomfort, and injury due to repetitive motion.

Switchboard operators generally work the same hours as other clerical employees at their company. In most organizations, full-time operators work regular business hours over a 5-day workweek. Work schedules are more irregular in hotels, hospitals, and other organizations that require round-the-clock operator services. In these companies, switchboard operators may work in the evenings and on holidays and weekends.

Central office and directory assistance operators must be accessible to customers 24 hours a day; therefore, they work a variety of shifts. Some operators work split shifts, coming on duty during peak calling

Many communications equipment operators also perform clerical work.

periods in the late morning and early evening and going off duty during the intervening hours. Telephone companies normally assign shifts by seniority, allowing the most experienced operators first choice of schedules. As a result, entry-level operators may have less desirable schedules, including late evening, split-shift, and weekend work. Telephone company operators may work overtime during emergencies.

Approximately 1 in 6 communications equipment operators works part time. Because of the irregular nature of telephone operator schedules, many employers seek part-time workers for those shifts that are difficult to fill.

An operator's work may be quite repetitive and the pace hectic during peak calling periods. To maintain operators' efficiency, supervisors at telephone companies often monitor their performance, including the amount of time they spend on each call. The rapid pace of the job and frequent monitoring may cause stress.

Training, Other Qualifications, and Advancement

Switchboard operators usually receive informal on-the-job training, lasting only a few days or weeks. Because they are often the first contact with the public or client, switchboard operators often receive some training in customer service. Training may also vary by place of employment—a switchboard operator in a hospital would need training on how to handle different emergencies. Since switchboard operators' duties may include clerical work, basic computer skills training may also be required.

Entry-level central office and directory assistance operators at telecommunications companies may receive both classroom and on-the-job instruction that can last several weeks. These operators may be paired with experienced personnel who provide hands-on instruction.

New employees in both occupations are trained in the operation of their equipment and in procedures designed to maximize efficiency. They are familiarized with company policies, including the expected level of customer service. Instructors monitor both the time and quality of trainees' responses to customer requests. Supervisors may continue to monitor new employees closely after they complete their initial training session.

Employers generally require a high school diploma. Applicants should have clear speech, good hearing, and strong reading, spelling, and numerical skills. Computer literacy and typing skills also are important, and familiarity with a foreign language is helpful for some positions because of the increasing diversity of the population. Candidates for positions may be required to take an examination covering basic language and math skills. Most companies emphasize customer service and seek operators who will remain courteous to customers while working at a fast pace.

After 1 or 2 years on the job, communications equipment operators may advance to other positions within a company. Many enter clerical occupations in which their operator experience is valuable, such as customer service representative, dispatcher, and receptionist. (See the *Handbook* statements on these occupations.) Operators interested in more technical work may take training classes and advance into positions having to do with installing and repairing equipment. (See the *Handbook* statements on radio and telecommunications equipment installers and repairers, and line installers and repairers.) Promotion to supervisory positions also is possible.

Employment

Communications equipment operators held about 256,000 jobs in 2004. About 4 out of 5 worked as switchboard operators. Employment was distributed as follows:

Switchboard operators, including answering service.....	213,000
Telephone operators	39,000
All other communications equipment operators	4,200

Switchboard operators work in almost all industries, but are concentrated in telephone call centers, hospitals, and hotels. Many work as temporary employees in the employment services industry.

Job Outlook

Employment of communications equipment operators is projected to decline through 2014, due largely to new labor-saving communications technologies, the movement of jobs to foreign countries, and consolidation of telephone operator jobs into fewer locations, often staffed by temporary or contract workers. Virtually all job openings will result from the need to replace communications equipment operators who transfer to other occupations or leave the labor force.

Developments in communications technologies—in particular, voice recognition systems that are accessible and easy to use—will continue to have a significant impact on the demand for communications equipment operators. Voice recognition technology allows automated telephone systems to recognize human speech. Callers speak directly to the system, which interprets the speech and then connects the call. Because voice recognition systems do not require callers to input data through a telephone keypad, they are easier to use than touch-tone systems. Voice recognition systems are increasingly able to understand sophisticated vocabulary and grammatical structures; however, many companies will continue to employ operators so that those callers who do have problems can access a “live” employee if they desire.

The proliferation of cell phones has negatively affected both switchboard operators and telephone operators. By allowing for direct communication between persons, cell phones have eliminated the need for operators to transfer calls in certain situations. Cell phones have reduced the demand for directory assistance and collect calls, and have resulted in decreasing use of pay phones that often required operators to assist with the call. The increasing use of cell phones also have reduced demand for switchboard operators in hotels, because hotel guests now use in-room phones less frequently.

Electronic communication through the Internet or e-mail provides alternatives to telephone communication and requires no operators. Internet directory assistance services are reducing the need for directory assistance operators. Local telephone companies currently have the most reliable telephone directory data; however, Internet services provide information such as addresses and maps, in addition to telephone numbers. As the functions of telephones and computers converge, the convenience of Internet directory assistance is expected to attract many customers, reducing the need for telephone operators to provide this service.

As communications technologies have improved and the price of long-distance service has fallen, companies are finding other ways to reduce costs by consolidating operator jobs in low cost locations. Increasingly this has entailed the movement of telephone operator jobs offshore to other lower-wage countries in order to reduce costs.

Earnings

Median hourly earnings of switchboard operators, including answering service, were \$10.38 in May 2004. The middle 50 percent earned between \$8.69 and \$12.64. The lowest 10 percent earned less than \$7.35, and the highest 10 percent earned more than \$15.13. Median hourly earnings in the industries employing the largest numbers of switchboard operators in May 2004 are:

Offices of physicians.....	\$10.54
General medical and surgical hospitals.....	10.47
Traveler accommodation.....	10.25
Automobile dealers	9.60
Business support services	8.91

Median hourly earnings of telephone operators in May 2004 were \$13.65. The middle 50 percent earned between \$10.28 and \$19.32. The lowest 10 percent earned less than \$8.91, and the highest 10 percent earned more than \$21.32.

Some telephone operators working at telephone companies are members of the Communications Workers of America or the International Brotherhood of Electrical Workers. For these operators, union contracts govern wage rates, wage increases, and the time required to advance from one pay step to the next. It normally takes 4 years to rise from the lowest paying nonsupervisory operator position to the highest. Contracts call for extra pay for work beyond the normal 6-1/2 to 7-1/2 hours a day or 5 days a week, for Sunday and holiday work, and for bilingual positions. A pay differential also is guaranteed for night work and split shifts. Many contracts provide for a 1-week vacation after 6 months of service, 2 weeks after 1 year, 3 weeks after 7 years, 4 weeks after 15 years, and 5 weeks after 25 years. Holidays range from 9 to 11 days a year.

Median hourly earnings of communication equipment operators, all other, in May 2004 were \$15.23. The middle 50 percent earned between \$12.27 and \$18.99. The lowest 10 percent earned less than \$10.23, and the highest 10 percent earned more than \$22.70.

Related Occupations

Other workers who provide information to the general public include dispatchers; hotel, motel, and resort desk clerks; customer service representatives; receptionists and information clerks; and reservation and transportation ticket agents and travel clerks.

Computer Operators

(O*NET 43-9011.00)

Significant Points

- Computer operators rank among the most rapidly declining occupations over the 2004-14 period because advances in technology are making many of the duties traditionally performed by computer operators obsolete.
- Computer operators usually receive on-the-job training; the length of training varies with the job and the experience of the worker.
- Opportunities will be best for operators who have formal computer education, are familiar with a variety of operating systems, and keep up to date with the latest technology.

Nature of the Work

Computer operators oversee the operation of computer hardware systems, ensuring that these machines are used as efficiently and

securely as possible. They may work with mainframes, minicomputers, or networks of personal computers. Computer operators must anticipate problems and take preventive action, as well as solve problems that occur during operations.

The duties of computer operators vary with the size of the installation, the type of equipment used, and the policies of the employer. Generally, operators control the console of either a mainframe digital computer or a group of minicomputers. Working from operating instructions prepared by programmers, users, or operations managers, computer operators set controls on the computer and on peripheral devices required to run a particular job.

Computer operators load equipment with tapes, disks, and paper, as needed. While the computer is running—which may be 24 hours a day for large computers—computer operators monitor the control console and respond to operating and computer messages. Messages indicate the individual specifications of each job being run. If an error message occurs, operators must locate and solve the problem or terminate the program. Operators also maintain logbooks or operating records, listing each job that is run and events, such as machine malfunctions, that occur during their shift. In addition, computer operators may help programmers and systems analysts test and debug new programs. (See the statements on computer programmers and computer systems analysts, elsewhere in the *Handbook*.)

As the number and complexity of computer networks continue to grow, a greater number of computer operators are working on personal computers (PCs) and minicomputers. In many offices, factories, and other work settings, PCs and minicomputers are connected in networks, often referred to as local area networks (LANs) or multi-user systems. Whereas users in the area operate some of these computers, many require the services of full-time operators. The tasks performed on PCs and minicomputers are very similar to those performed on large computers. This includes trying to keep computer networks secure in the face of an increasing number of cyber-attacks.

As organizations continue to look for opportunities to increase productivity, automation is expanding into additional areas of computer operations. Sophisticated software, coupled with robotics, enables a computer to perform many routine tasks formerly done by computer

Computer operators oversee the operation of computer hardware systems.

operators. Scheduling, loading and downloading programs, mounting tapes, rerouting messages, and running periodic reports can be done without the intervention of an operator. Consequently, these improvements will change what computer operators do in the future. As technology advances, the responsibilities of many computer operators are shifting to areas such as network operations, user support, and database maintenance.

Working Conditions

Computer operators generally work in well-lighted, well-ventilated, comfortable rooms. Because many organizations use their computers 24 hours a day, 7 days a week, computer operators may be required to work evening or night shifts and weekends. Shift assignments usually are made based on seniority. However, increasingly automated operations will lessen the need for shift work, because many companies can let the computer take over operations during less desirable working hours. In addition, advances in telecommuting technologies—such as faxes, modems, and e-mail—and data center automation, such as automated tape libraries, enable some operators to monitor batch processes, check systems performance, and record problems for the next shift.

Because computer operators generally spend a lot of time in front of a computer monitor, as well as performing repetitive tasks such as loading and unloading printers, they may be susceptible to eyestrain, back discomfort, and hand and wrist problems.

Training, Other Qualifications, and Advancement

Computer operators usually receive on-the-job training in order to become acquainted with their employer's equipment and routines. The length of training varies with the job and the experience of the worker. However, previous work experience is the key to obtaining an operator job in many large establishments. Employers generally look for specific, hands-on experience with the type of equipment and related operating systems they use. Additionally, formal computer training, perhaps through a community college or technical school, is recommended. Related training also can be obtained through the U.S. Armed Forces and from some computer manufacturers. As computer technology changes and data processing centers become more automated, employers will increasingly require candidates to have formal training and experience for operator jobs. And, although not required, a bachelor's degree in a computer field can be helpful when one is seeking employment as a computer operator or advancement to a managerial position.

Because computer technology changes so rapidly, operators must be adaptable and willing to learn. Analytical and technical expertise also are needed, particularly by operators who work in automated data centers, to deal with unique or high-level problems that a computer is not programmed to handle. Operators must be able to communicate well, and to work effectively with programmers, users, and other operators. Computer operators also must be able to work independently because they may have little or no direct supervision.

A few computer operators may advance to supervisory jobs, although most management positions within data processing or computer operations centers require advanced formal education, such as a bachelor's or higher degree. Through on-the-job experience and additional formal education, some computer operators may advance to jobs in areas such as network operations or support. As they gain experience in programming, some operators may advance to jobs as programmers or analysts. A move into these types of jobs is becoming much more difficult, as employers increasingly require candidates for more skilled computer jobs to possess at least a bachelor's degree.

Employment

Computer operators held about 149,000 jobs in 2004. Jobs are found in various industries such as government, health care, manufacturing, data processing services and other information industries, and finance and insurance. A number of computer operators are employed by firms in computer systems design and related services, as more companies contract out their data processing operations.

Job Outlook

Employment of computer operators is projected to decline significantly. In fact, computer operators rank among the most rapidly declining occupations over the 2004-14 period because advances in technology are making many of the duties traditionally performed by computer operators obsolete. Experienced operators are expected to compete for the few job openings that will arise each year to replace workers who transfer to other occupations or leave the labor force. Opportunities will be best for operators who have formal computer education, are familiar with a variety of operating systems, and keep up to date with the latest technology.

Advances in technology have reduced both the size and cost of computer equipment, while increasing the capacity for data storage and processing automation. Sophisticated computer hardware and software are now used in practically every industry, in such areas as factory and office automation, telecommunications, health care, education, and government. The expanding use of software that automates computer operations gives companies the option of making systems more user-friendly, greatly reducing the need for operators. Such improvements require operators to monitor a greater number of operations at the same time and be capable of solving a broader range of problems that may arise. The result is that fewer operators will be needed to perform more highly skilled work.

Computer operators who are displaced by automation may be reassigned to support staffs that maintain personal computer networks or assist other members of the organization. Operators who keep up with changing technology, by updating their skills through additional training, should have the best prospects of moving into other areas such as network administration and technical support. Others may be retrained to perform different job duties, such as supervising an operations center, maintaining automation packages, or analyzing computer operations to recommend ways to increase productivity. In the future, operators who wish to work in the computer field will need to know more about programming, automation software, graphics interface, client/server environments, and open systems in order to take advantage of changing job opportunities.

Earnings

Median annual earnings of computer operators were \$31,070 in May 2004. The middle 50 percent earned between \$24,190 and \$39,900 a year. The highest 10 percent earned more than \$48,720, and the lowest 10 percent earned less than \$19,250. Median annual earnings in the industries employing the largest numbers of computer operators in May 2004 are shown below:

Management of companies and enterprises	\$34,370
Computer systems design and related services	31,780
Colleges, universities, and professional schools	28,990
Data processing, hosting, and related services	28,930
Depository credit intermediation	24,880

The average salary for computer operators employed by the Federal Government was \$45,158 in 2005.

According to Robert Half International, the average starting salaries for computer operators ranged from \$27,250 to \$39,500

in 2005. Salaries generally are higher in large organizations than in small ones.

Related Occupations

Other occupations involving work with computers include computer software engineers; computer programmers; computer support specialists and systems administrators; computer systems analysts, and computer scientists and database administrators. Other occupations in which workers operate electronic office equipment include data entry and information processing workers, as well as secretaries and administrative assistants.

Sources of Additional Information

For information about a career as a computer operator, contact:

► Association for Computer Operations Management (AFCOM), 722 E. Chapman Ave., Orange, CA 92860.

For information about work opportunities in computer operations, contact establishments with large computer centers, such as banks, manufacturing firms, insurance companies, colleges and universities, and data processing service organizations. The local office of the State employment service can supply information about employment and training opportunities.

Data Entry and Information Processing Workers

(O*NET 43-9021.00, 43-9022.00)

Significant Points

- Employers generally hire high school graduates who meet company requirements for keyboarding speed; for many people, a job as a data entry and information processing worker is their first job after graduating from high school.
- Although overall employment is projected to decline, the need to replace workers who leave this large occupation each year should produce many job openings.
- Job prospects should be best for those with expertise in appropriate computer software applications.

Nature of the Work

Organizations need to process a rapidly growing amount of information. Data entry and information processing workers help ensure the smooth and efficient handling of information. By keying in text, entering data into a computer, operating a variety of office machines, and performing other clerical duties, these workers help organizations keep up with the rapid changes that are characteristic of today's "Information Age." In addition to the job titles discussed below—such as word processors, typists, and data entry keyers—data entry and information processing workers are known by various other titles, including electronic data processors, keypunch technicians, and transcribers.

Word processors usually set up and prepare reports, letters, mailing labels, and other text material. As entry-level workers, word processors may begin by keying headings on form letters, addressing envelopes, or preparing standard forms on computers. As they gain experience, they often are assigned tasks requiring a higher degree of accuracy and independent judgment. Senior word processors may work with highly technical material, plan and key complicated statistical tables,

combine and rearrange materials from different sources, or prepare master copies.

Most keyboarding is now done on computers that normally are connected to a monitor, keyboard, and printer and may have "add-on" capabilities, such as optical character recognition readers. *Word processors* use this equipment to record, edit, store, and revise letters, memos, reports, statistical tables, forms, and other printed materials. Although it is becoming less common, some word processing workers are employed on centralized word processing teams that handle transcription and keying for several departments.

In addition to fulfilling the duties mentioned above, word processors often perform other office tasks, such as answering telephones, filing, and operating copiers or other office machines. Job titles of these workers frequently vary to reflect these duties. For example, administrative clerks combine word processing with filing, sorting mail, answering telephones, and other general office work. Note readers transcribe stenotyped notes of court proceedings into standard formats.

Data entry keyers usually input lists of items, numbers, or other data into computers or complete forms that appear on a computer screen. They also may manipulate existing data, edit current information, or proofread new entries into a database for accuracy. Some examples of data sources include customers' personal information, medical records, and membership lists. Usually, this information is used internally by a company and may be reformatted before other departments or customers utilize it.

Keyers use various types of equipment to enter data. Many use a machine that converts the information they type to magnetic impulses on tapes or disks for entry into a computer system. Others prepare materials for printing or publication by using data entry composing machines. Some keyers operate online terminals or personal computers. Increasingly, data entry keyers are working with nonkeyboard forms of data entry, such as scanners and electronically transmitted files. When using the new character recognition systems, data entry keyers often enter only those data which cannot be recognized by machines. In some offices, keyers also operate computer peripheral equipment such as printers and tape readers, act as tape librarians, and perform other clerical duties.

Working Conditions

Data entry and information processing workers usually work a standard 40-hour week in clean offices. They sit for long periods and

Data entry and information processing workers help ensure the smooth and efficient handling of information.

sometimes must contend with high noise levels caused by various office machines. These workers are susceptible to repetitive strain injuries such as carpal tunnel syndrome, neck and back injuries, and eyestrain. To help prevent these conditions, many offices have adopted regularly scheduled exercise breaks, ergonomically designed keyboards, and workstations that allow workers to stand or sit as they wish.

Training, Other Qualifications, and Advancement

Employers generally hire high school graduates who meet their requirements for keyboarding speed. Increasingly, employers also are expecting applicants to have training or experience in word processing or data entry tasks. Spelling, punctuation, and grammar skills are important, as is familiarity with standard office equipment and procedures.

Students acquire skills in keyboarding and in the use of word processing, spreadsheet, and database management computer software packages through high schools, community colleges, business schools, temporary help agencies, or self-teaching aids such as books, tapes, and Internet tutorials.

For many people, a job as a data entry and information processing worker is their first job after graduating from high school or after a period of full-time family responsibilities. This work frequently serves as a steppingstone to higher paying jobs with increased responsibilities. Large companies and government agencies usually have training programs to help administrative employees upgrade their skills and advance to higher level positions. It is common for data entry and information processing workers to transfer to other administrative jobs, such as secretary, administrative assistant, or statistical clerk, or to be promoted to a supervisory job in a word processing or data entry center.

Employment

Data entry and information processing workers held about 525,000 jobs in 2004 and were employed in every sector of the economy; 330,000 were data entry keyers and 194,000 were word processors. Some workers telecommute, working from their homes on personal computers linked by telephone lines to those in the main office. This arrangement enables them to key in material at home while still being able to produce printed copy in their offices.

About 1 out of 5 data entry and information processing workers held jobs in firms providing administrative and support services, including temporary help and word processing agencies, and another 1 in 5 worked for State or local government.

Job Outlook

Overall employment of data entry and information processing workers is projected to decline through 2014. Nevertheless, the need to replace those who transfer to other occupations or leave this large occupation for other reasons will produce numerous job openings each year. Job prospects will be most favorable for those with the best technical skills—in particular, expertise in appropriate computer software applications. Data entry and information processing workers must be willing to upgrade their skills continuously in order to remain marketable.

Although data entry and information processing workers are affected by productivity gains stemming from organizational restructuring and the implementation of new technologies, projected growth differs among these workers. Employment of word processors and typists is expected to decline because of the proliferation of personal computers, which allows other workers to perform duties formerly assigned to word processors and typists. Most professionals and managers, for example, now use desktop

personal computers to do their own word processing. However, because technologies affecting data entry keyers tend to be costlier to implement, employment of these workers will decline less than word processors and typists.

Employment growth of data entry keyers will be dampened by productivity gains as various data-capturing technologies, such as barcode scanners, voice recognition technologies, and sophisticated character recognition readers, become more prevalent. These technologies can be applied to a variety of business transactions, such as inventory tracking, invoicing, and placing orders. Moreover, as telecommunications technology improves, many organizations will increasingly take advantage of computer networks that allow data to be transmitted electronically. These networks will permit more data to be entered automatically into computers, reducing the demand for data entry keyers.

In addition to being affected by technology, employment of data entry and information processing workers will be adversely affected by businesses that are increasingly contracting out their work. Many organizations have reduced or even eliminated permanent in-house staff—for example, in favor of temporary employment and staffing services firms. Some large data entry and information processing firms increasingly employ workers in nations with relatively lower wages. As international trade barriers continue to fall and telecommunications technology improves, this transfer of jobs will mean reduced demand for data entry keyers in the United States.

Earnings

Median annual earnings of word processors and typists in May 2004 were \$28,030. The middle 50 percent earned between \$22,850 and \$34,900. The lowest 10 percent earned less than \$18,960, while the highest 10 percent earned more than \$43,190. The salaries of these workers vary by industry and by region. In May 2004, median annual earnings in the industries employing the largest numbers of word processors and typists were as follows:

Legal services.....	\$36,890
Local government	29,190
Elementary and secondary schools	27,630
State government	27,210
Employment services	25,450

Median annual earnings of data entry keyers in May 2004 were \$23,250. The middle 50 percent earned between \$19,630 and \$28,150. The lowest 10 percent earned less than \$16,480, and the highest 10 percent earned more than \$34,410. The following are median annual earnings for May 2004 in the industries employing the largest numbers of data entry keyers:

Insurance carriers	\$23,980
Accounting, tax preparation, bookkeeping, and payroll services ..	23,120
Depository credit intermediation	21,950
Employment services	21,550
Data processing, hosting, and related services.....	20,750

Related Occupations

Data entry and information processing workers must transcribe information quickly. Other workers who deliver information in a timely manner are dispatchers and communications equipment operators. Data entry and information processing workers also must be comfortable working with office technology, and in this regard they are similar to court reporters, medical records and health information technicians, secretaries and administrative assistants, and computer operators.

Sources of Additional Information

For information about job opportunities for data entry and information processing workers, contact the nearest office of the State employment service.

Desktop Publishers

(O*NET 43-9031.00)

Significant Points

- About 4 out of 10 work for newspaper, periodical, book, and directory publishers, while 1 out of 4 work in printing and related support activities.
- Employment is expected to grow faster than the average for all occupations.
- Most employers prefer to hire experienced desktop publishers; among persons without experience, opportunities should be best for those with certificates or degrees in desktop publishing or graphic design.

Nature of the Work

Using computer software, desktop publishers format and combine text, numerical data, photographs, charts, and other visual graphic elements to produce publication-ready material. Depending on the nature of a particular project, desktop publishers may write and edit text, create graphics to accompany text, convert photographs and drawings into digital images and then manipulate those images, design page layouts, create proposals, develop presentations and advertising campaigns, typeset and do color separation, and translate electronic information onto film or other traditional forms. Materials produced by desktop publishers include books, business cards, calendars, magazines, newsletters and newspapers, packaging, slides, and tickets. As companies have brought the production of marketing, promotional, and other kinds of materials in-house, they increasingly have employed people who can produce such materials.

Desktop publishers use a keyboard to enter and select formatting properties, such as the size and style of type, column width, and spacing, and store them in the computer, which then displays and arranges columns of type on a video display terminal or computer monitor. An entire newspaper, catalog, or book page, complete with artwork and graphics, can be created on the screen exactly as it will appear in print. Operators transmit the pages for production either into film and then into printing plates, or directly into plates.

Desktop publishing is a rapidly changing field that encompasses a number of different kinds of jobs. Personal computers enable desktop publishers to perform publishing tasks that would otherwise require complicated equipment and extensive human effort. Advances in computer software and printing technology continue to change and enhance desktop publishing work. Instead of receiving simple typed text from customers, desktop publishers get the material over the Internet or on a computer disk. Other innovations in the occupation include digital color page makeup systems, electronic page layout systems, and off-press color proofing systems. In addition, because most materials today often are published on the Internet, desktop publishers may need to know electronic publishing technologies, such as Hypertext Markup Language (HTML) and may be responsible for converting text and graphics to an Internet-ready format.

Typesetting and page layout have been affected by the technological changes shaping desktop publishing. Increasingly, desktop publishers are using computers to do much of the typesetting and page-layout work formerly done by prepress workers, posing new

challenges for the printing industry. The old “hot type” method of text composition—which used molten lead to create individual letters, paragraphs, and full pages of text—is nearly extinct. Today, composition work is done primarily with computers. Improvements in desktop-publishing software also allow customers to do much more of their own typesetting.

Desktop publishers use scanners to capture photographs, images, or art as digital data that can be either incorporated directly into electronic page layouts or further manipulated with the use of computer software. The desktop publisher then can correct mistakes or compensate for deficiencies in the original color print or transparency. Digital files are used to produce printing plates. Like photographers and multimedia artists and animators, desktop publishers also can create special effects or other visual images using film, video, computers, or other electronic media. (Separate statements on photographers and on artists and related workers appear elsewhere in the *Handbook*.)

Desktop publishers often perform writing and editing tasks as well as page layout and design. For example, in addition to laying out articles for a newsletter, desktop publishers may be responsible for editing content they receive or for writing original content themselves. A desktop publisher’s writing and editing responsibilities vary widely from employer to employer. Small firms typically need desktop publishers to perform a wide range of tasks, while desktop publishers at large firms specialize in a certain part of the publishing process. (Writers and editors are discussed elsewhere in the *Handbook*.)

Depending on the establishment employing these workers, desktop publishers also may be referred to as publications specialists, electronic publishers, DTP operators, desktop publishing editors, electronic prepress technicians, electronic publishing specialists, image designers, typographers, compositors, layout artists, and Web publications designers.

Working Conditions

Desktop publishers usually work in clean, air-conditioned office areas with little noise. They generally work an 8-hour day, 5 days a week. Some workers work night shifts, weekends, and holidays.

Desktop publishers often are subject to stress and the pressures of short deadlines and tight work schedules. Like other workers who spend long hours working in front of a computer monitor, they may be susceptible to eyestrain, back discomfort, and hand and wrist problems.

Using computer software, desktop publishers capture photographs, images, or art as digital data that can be incorporated directly into electronic page layouts.

Training, Other Qualifications, and Advancement

Most workers qualify for jobs as desktop publishers by taking classes or completing certificate programs at vocational schools, universities, and colleges or through the Internet. Programs range in length, but the average certificate program takes approximately 1 year. However, some desktop publishers train on the job to develop the necessary skills. The length of on-the-job training varies by company. An internship or part-time desktop-publishing assignment is another way to gain experience as a desktop publisher.

Students interested in pursuing a career in desktop publishing may obtain an associate degree in applied science or a bachelor's degree in graphic arts, graphic communications, or graphic design. Graphic arts programs are a good way to learn about desktop publishing software used to format pages; assign type characteristics; and import text and graphics into electronic page layouts to produce printed materials such as advertisements, brochures, newsletters, and forms. Applying this knowledge of graphic arts techniques and computerized typesetting usually is intended for students who may eventually move into management positions, while 2-year associate degree programs are designed to train skilled workers. Students also develop finely tuned skills in typography, print media, packaging, branding and identity, Web site design, and motion graphics. The programs teach print and graphic design fundamentals and provide an extensive background in imaging, prepress operations, print reproduction, and emerging media. Courses in other aspects of printing also are available at vocational-technical institutes, industry-sponsored update and retraining programs, and private trade and technical schools.

Although formal training is not always required, those with certificates or degrees will have the best job opportunities. Most employers prefer to hire people who have at least a high school diploma and who possess good communication skills, basic computer skills, and a strong work ethic. Desktop publishers should be able to deal courteously with people because, in small shops, they may have to take customers' orders. They also may have to add, subtract, multiply, divide, and compute ratios to estimate job costs. Persons interested in working for firms using advanced printing technology need to know the basics of electronics and computers.

Desktop publishers need good manual dexterity, and they must be able to pay attention to detail and work independently. Good eyesight, including visual acuity, depth perception, a wide field of view, color vision, and the ability to focus quickly also are assets. Artistic ability often is a plus. Employers also seek persons who are even tempered and adaptable—important qualities for workers who often must meet deadlines and learn how to operate new equipment.

Workers with limited training and experience may start as helpers. They begin with instruction from an experienced desktop publisher and advance on the basis of their demonstrated mastery of skills at each level. All workers should expect to be retrained from time to time to handle new, improved software and equipment. As workers gain experience, they advance to positions with greater responsibility. Some move into supervisory or management positions. Other desktop publishers may start their own company or work as independent consultants, while those with more artistic talent and further education may find opportunities in graphic design or commercial art.

Employment

Desktop publishers held about 34,000 jobs in 2004. About 4 out of 10 worked for newspaper, periodical, book, and directory publishers, while 1 out of 4 worked in printing and related support activities; the rest worked in a wide variety of industries.

Firms in the publishing industry publish newspapers, periodicals, books, directory and mailing lists, and greeting cards. Printing and related support activities firms print a wide range of products—news-papers, books, labels, business cards, stationery, inserts, catalogs, pamphlets, and advertisements—while business form establishments print material such as sales receipts and business forms and perform support activities such as data imaging and bookbinding. Establishments in printing and related support activities typically perform custom composition, platemaking, and related prepress services. (A separate statement on prepress technicians and workers appears elsewhere in the *Handbook*.) Other desktop publishers print or publish materials in-house or in-plant for business services firms, government agencies, hospitals, or universities, typically in a reproduction or publications department that operates within the organization.

The printing and publishing industries are two of the most geographically dispersed industries in the United States, and desktop publishing jobs are found throughout the country. However, most jobs are in large metropolitan cities.

Job Outlook

Employment of desktop publishers is expected to grow faster than the average for all occupations through 2014, as more page layout and design work is performed in-house using computers and sophisticated publishing software. Desktop publishing is replacing much of the prepress work done by compositors and typesetters, enabling organizations to reduce costs while increasing production speeds. Many new jobs for desktop publishers are expected to emerge in commercial printing and publishing establishments. However, more companies also are turning to in-house desktop publishers, as computers with elaborate text and graphics capabilities have become common, and desktop publishing software has become cheaper and easier to use. In addition to employment growth, many job openings for desktop publishers also will result from the need to replace workers who move into managerial positions, transfer to other occupations, or leave the labor force.

Printing and publishing costs represent a significant portion of a corporation's expenses, and firms are finding it more profitable to print their own newsletters and other reports than to send them out to trade shops. Desktop publishing reduces the time needed to complete a printing job and allows commercial printers to make inroads into new markets that require fast turnaround.

Most employers prefer to hire experienced desktop publishers. As more people gain desktop-publishing experience, however, competition for jobs may increase. Among persons without experience, opportunities should be best for those with computer backgrounds who are certified or who have completed postsecondary programs in desktop publishing or graphic design. Many employers prefer graduates of these programs because the comprehensive training they receive helps them learn the page layout process and adapt more rapidly to new software and techniques.

Earnings

Earnings for desktop publishers vary according to level of experience, training, location, and size of firm. Median annual earnings of desktop publishers were \$32,340 in May 2004. The middle 50 percent earned between \$24,660 and \$42,070. The lowest 10 percent earned less than \$19,460, and the highest 10 percent earned more than \$52,460 a year. Median annual earnings of desktop publishers in May 2004 were \$36,040 in printing and related support services and \$29,040 in newspaper, periodical, book, and directory publishers.

Related Occupations

Desktop publishers use artistic and editorial skills in their work. These skills also are essential for artists and related workers; com-

mercial and industrial designers; news analysts, reporters, and correspondents; prepress technicians and workers; public relations specialists; and writers and editors.

Sources of Additional Information

Details about training programs may be obtained from local employers such as newspapers and printing shops or from local offices of the State employment service.

Office and Administrative Support Worker Supervisors and Managers

(O*NET 43-1011.01, 43-1011.02)

Significant Points

- Most jobs are filled by promoting office or administrative support workers from within the organization.
- Office automation will cause employment in some office and administrative support occupations to grow slowly or even decline, resulting in slower-than-average growth among supervisors and managers.
- Applicants are likely to encounter keen competition because their numbers should greatly exceed the number of job openings.

Nature of the Work

All organizations need timely and effective office and administrative support to operate efficiently. Office and administrative support supervisors and managers coordinate this support. These workers are employed in virtually every sector of the economy, working in positions as varied as teller supervisor, customer services manager, or shipping and receiving supervisor.

Although specific functions of office and administrative support supervisors and managers vary significantly, they share many common duties. For example, supervisors perform administrative tasks to ensure that their staffs can work efficiently. Equipment and machinery used in their departments must be in good working order. If the computer system goes down or a fax machine malfunctions, the supervisors must try to correct the problem or alert repair personnel. They also request new equipment or supplies for their department when necessary.

Planning the work and supervising the staff are key functions of this job. To do these effectively, the supervisor must know the strengths and weaknesses of each member of the staff, as well as the results required from and time allotted to each job. Supervisors must make allowances for unexpected staff absences and other disruptions by adjusting assignments or performing the work themselves if the situation requires it.

After allocating work assignments and issuing deadlines, office and administrative support supervisors and managers oversee the work to ensure that it is proceeding on schedule and meeting established quality standards. This may involve reviewing each person's work on a computer—as in the case of accounting clerks—or listening to how a worker deals with customers—as in the case of customer services representatives. When supervising long-term

projects, the supervisor may meet regularly with staff members to discuss their progress.

Office and administrative support supervisors and managers also evaluate each worker's performance. If a worker has done a good job, the supervisor indicates that in the employee's personnel file and may recommend a promotion or other award. Alternatively, if a worker is performing inadequately, the supervisor discusses the problem with the employee to determine the cause and helps the worker to improve his or her performance. This might require sending the employee to a training course or arranging personal counseling. If the situation does not improve, the supervisor may recommend a transfer, demotion, or dismissal.

Office and administrative support supervisors and managers usually interview and evaluate prospective employees. When new workers arrive on the job, supervisors greet them and provide orientation to acquaint them with their organization and its operating routines. Some supervisors may be actively involved in recruiting new workers—for example, by making presentations at high schools and business colleges. They also may serve as the primary liaisons between their offices and the general public through direct contact and by preparing promotional information.

Supervisors help train new employees in organization and office procedures. They may teach new employees how to use the telephone system and operate office equipment. Because most administrative support work is computerized, they also must teach new employees to use the organization's computer system. When new office equipment or updated computer software is introduced, supervisors train experienced employees to use it efficiently or, if this is not possible, arrange for their employees to receive special outside training.

Office and administrative support supervisors and managers often act as liaisons between the administrative support staff and the professional, technical, and managerial staff. This may involve implementing new company policies or restructuring the workflow in their departments. They also must keep their superiors informed of their progress and any potential problems. Often, this communication takes the form of research projects and progress reports. Because supervisors and managers have access to information such as their department's performance records, they may compile and present these data for use in planning or designing new policies.

Office and administrative support supervisors and managers also may have to resolve interpersonal conflicts among the staff. In

Office and administrative support supervisors and managers interview and evaluate prospective employees.

organizations covered by union contracts, supervisors must know the provisions of labor-management agreements and run their departments accordingly. They also may meet with union representatives to discuss work problems or grievances.

Working Conditions

Office and administrative support supervisors and managers are employed in a wide variety of work settings, but most work in clean and well-lit offices that usually are comfortable.

Most office and administrative support supervisors and managers work a standard 40-hour week. However, because some organizations operate around the clock, supervisors may have to work nights, weekends, and holidays. Sometimes, supervisors rotate among the three 8-hour shifts in a workday; in other cases, shifts are assigned on the basis of seniority.

Training, Other Qualifications, and Advancement

Most firms fill office and administrative support supervisory and managerial positions by promoting office or administrative support workers from within their organizations. To become eligible for promotion to a supervisory position, administrative support workers must prove they are capable of handling additional responsibilities. When evaluating candidates, supervisors look for strong teamwork, problem-solving, leadership, and communication skills, as well as determination, loyalty, poise, and confidence. They also look for more specific supervisory attributes, such as the ability to organize and coordinate work efficiently, to set priorities, and to motivate others. Increasingly, supervisors need a broad base of office skills coupled with personal flexibility to adapt to changes in organizational structure and move among departments when necessary.

In addition, supervisors must pay close attention to detail to identify and correct errors made by the staff they oversee. Good working knowledge of the organization's computer system also is an advantage. Many employers require postsecondary training—in some cases, an associate or even a bachelor's degree.

Administrative support workers with potential supervisory abilities may be given occasional supervisory assignments. To prepare for full-time supervisory duties, workers may attend in-house training or take courses in time management, project management, or interpersonal relations.

Some office and administrative support supervisor positions are filled with people from outside the organization. These positions may serve as entry-level training for potential higher level managers. New college graduates may rotate through departments of an organization at this level to learn the work of the organization.

Employment

Office and administrative support supervisors and managers held 1.5 million jobs in 2004. Although jobs for office and administrative support supervisors and managers are found in practically every industry, the largest number are found in organizations with a large administrative support workforce, such as banks, wholesalers, government agencies, retail establishments, business service firms, health care facilities, schools, and insurance companies. Because of most organizations' need for continuity of supervision, few office and administrative support supervisors and managers work on a temporary or part-time basis.

Job Outlook

Like those seeking other supervisory and managerial occupations, applicants for jobs as office and administrative support worker supervisors and managers are likely to encounter keen

competition because the number of applicants should greatly exceed the number of job openings. Employment is expected to grow more slowly than the average for all occupations through 2014. Besides the job openings arising from growth, a large number of openings will stem from the need to replace workers who transfer to other occupations or leave this large occupation for other reasons.

Employment of office and administrative support supervisors and managers is determined largely by the demand for administrative support workers. New technology should increase office and administrative support workers' productivity and allow a wider variety of tasks to be performed by people in professional positions. These trends will cause employment in some administrative support occupations to grow slowly or even decline. As a result, supervisors will direct smaller permanent staffs—supplemented by increased use of temporary administrative support staff—and perform more professional tasks. Office and administrative support managers will coordinate the increasing amount of administrative work and make sure that the technology is applied and running properly. However, organizational restructuring should continue to reduce employment in some managerial positions, distributing more responsibility to office and administrative support supervisors.

Earnings

Median annual earnings of office and administrative support supervisors and managers were \$41,030 in May 2004; the middle 50 percent earned between \$31,860 and \$53,110. The lowest paid 10 percent earned less than \$25,190, while the highest paid 10 percent earned more than \$67,800. In May 2004, median annual earnings in the industries employing the largest numbers of office and administrative support supervisors and managers were:

Insurance carriers	\$49,610
Local government	42,100
State government	40,930
Offices of physicians.....	39,690
Depository credit intermediation	36,980

In addition to typical benefits, some office and administrative support supervisors and managers, particularly in the private sector, may receive additional compensation in the form of bonuses and stock options.

Related Occupations

Office and administrative support supervisors and managers must understand and sometimes perform the work of those whom they oversee, including bookkeeping, accounting, and auditing clerks; cashiers; communications equipment operators; customer service representatives; data entry and information processing workers; general office clerks; receptionists and information clerks; stock clerks and order fillers; order clerks; and tellers. Their supervisory and administrative duties are similar to those of other supervisors and managers.

Office Clerks, General

(O*NET 43-9061.00)

Significant Points

- Employment growth and high replacement needs in this large occupation will result in numerous job openings.
- Prospects should be best for those with knowledge of basic computer applications and office machinery as well as good communication skills.
- Part-time and temporary positions are common.

Nature of the Work

Rather than performing a single specialized task, general office clerks have responsibilities that often change daily with the needs of the specific job and the employer. Whereas some clerks spend their days filing or keyboarding, others enter data at a computer terminal. They also can be called on to operate photocopiers, fax machines, and other office equipment; prepare mailings; proofread documents; and answer telephones and deliver messages.

The specific duties assigned to a clerk vary significantly, depending on the type of office in which he or she works. An office clerk in a doctor's office, for example, would not perform the same tasks that a clerk in a large financial institution or in the office of an auto parts wholesaler would perform. Although both may sort checks, keep payroll records, take inventory, and access information, clerks also perform duties unique to their employer, such as organizing medications, making transparencies for a presentation, or filling orders received by fax machine.

Clerks' duties also vary by level of experience. Whereas inexperienced employees make photocopies, stuff envelopes, or record inquiries, experienced clerks usually are given additional responsibilities. For example, they may maintain financial or other records, set up spreadsheets, verify statistical reports for accuracy and completeness, handle and adjust customer complaints, work with vendors, make travel arrangements, take inventory of equipment and supplies, answer questions on departmental services and functions, or help prepare invoices or budgetary requests. Senior office clerks may be expected to monitor and direct the work of lower level clerks.

Office clerks have responsibilities that often change daily with the needs of the specific job and the employer.

Working Conditions

For the most part, general office clerks work in comfortable office settings. Those on full-time schedules usually work a standard 40-hour week; however, some work shifts or overtime during busy periods. About 16 percent of clerks work part time. Many clerks also work in temporary positions.

Training, Other Qualifications, and Advancement

Although most office clerk jobs are entry-level administrative support positions, employers may prefer or require previous office or business experience. Employers usually require a high school diploma or equivalent, and some require basic computer skills, including familiarity with word processing software, as well as other general office skills.

Training for this occupation is available through business education programs offered in high schools, community and junior colleges, and postsecondary vocational schools. Courses in office practices, word processing, and other computer applications are particularly helpful.

Because general office clerks usually work with other office staff, they should be cooperative and able to work as part of a team. Employers prefer individuals who are able to perform a variety of tasks and satisfy the needs of the many departments within a company. In addition, applicants should have good communication skills, be detail oriented, and adaptable.

General office clerks who exhibit strong communication, interpersonal, and analytical skills may be promoted to supervisory positions. Others may move into different, more senior administrative jobs, such as receptionist, secretary, or administrative assistant. After gaining some work experience or specialized skills, many workers transfer to jobs with higher pay or greater advancement potential. Advancement to professional occupations within an organization normally requires additional formal education, such as a college degree.

Employment

General office clerks held about 3.1 million jobs in 2004. Most are employed in relatively small businesses. Although they work in every sector of the economy, about 46 percent worked in local government; health care and social assistance; administrative and support services; finance and insurance; or professional, scientific, and technical services industries.

Job Outlook

Employment growth and high replacement needs in this large occupation will result in numerous job openings for general office clerks. In addition to those for full-time jobs, many job openings are expected for part-time and temporary general office clerks. Prospects should be best for those who have knowledge of basic computer applications and office machinery—such as fax machines, telephone systems, and scanners—and good writing and communication skills. As general administrative support duties continue to be consolidated, employers will increasingly seek well-rounded individuals with highly developed communication skills and the ability to perform multiple tasks.

Employment of general office clerks is expected to grow more slowly than the average for all occupations through the year 2014. The employment outlook for these workers will be affected by the increasing use of technology, expanding office automation, and the consolidation of administrative support tasks. Automation has led to productivity gains, allowing a wide variety of duties to be performed by fewer office workers. However, automation also has led to a consolidation of administrative support staffs and a diver-

sification of job responsibilities. This consolidation increases the demand for general office clerks because they perform a variety of administrative support tasks. It will become increasingly common within small businesses to find a single general office clerk in charge of all administrative support work.

Job opportunities may vary from year to year because the strength of the economy affects demand for general office clerks. Companies tend to employ more workers when the economy is strong. Industries least likely to be affected by economic fluctuations tend to be the most stable places for employment.

Earnings

Median annual earnings of general office clerks were \$22,770 in May 2004; the middle 50 percent earned between \$18,090 and \$28,950 annually. The lowest 10 percent earned less than \$14,530, and the highest 10 percent earned more than \$35,810. Median annual salaries in the industries employing the largest numbers of general office clerks in May 2004 were:

Local government	\$25,880
State government	24,970
Elementary and secondary schools	23,500
Colleges, universities, and professional schools	23,160
Employment services	20,910

Related Occupations

The duties of general office clerks can include a combination of bookkeeping, keyboarding, office machine operation, and filing. Other office and administrative support workers who perform similar duties include bookkeeping, accounting, and auditing clerks; communications equipment operators; customer service representatives; data entry and information processing workers; order clerks; receptionists and information clerks; secretaries and administrative assistants; stock clerks and order fillers; and tellers. Nonclerical entry-level workers include cashiers; counter and rental clerks; and food and beverage serving and related workers.

Sources of Additional Information

State employment service offices and agencies can provide information about job openings for general office clerks.

For information related to administrative occupations, including educational programs and certified designations, contact:

► International Association of Administrative Professionals, 10502 NW Ambassador Dr., P.O. Box 20404, Kansas City, MO 64195-0404. Internet: <http://www.iaap-hq.org>

Secretaries and Administrative Assistants

(O*NET 43-6011.00, 43-6012.00, 43-6013.00, 43-6014.00)

Significant Points

- Numerous job openings will result from the need to replace workers who leave this very large occupation each year.
- Opportunities should be best for applicants with extensive knowledge of software applications.
- Increasing office automation and organizational restructuring will lead to slower than average growth in overall employment of secretaries and administrative assistants, but average growth is projected for legal and medical secretaries.

Nature of the Work

As the reliance on technology continues to expand in offices, the role of the office professional has greatly evolved. Office automation and organizational restructuring have led secretaries and administrative assistants to assume responsibilities once reserved for managerial and professional staff. Many secretaries and administrative assistants now provide training and orientation for new staff, conduct research on the Internet, and operate and troubleshoot new office technologies. In spite of these changes, however, the core responsibilities for secretaries and administrative assistants have remained much the same: Performing and coordinating an office's administrative activities and storing, retrieving, and integrating information for dissemination to staff and clients.

Secretaries and administrative assistants are responsible for a variety of administrative and clerical duties necessary to run an organization efficiently. They serve as information and communication managers for an office; plan and schedule meetings and appointments; organize and maintain paper and electronic files; manage projects; conduct research; and disseminate information by using the telephone, mail services, Web sites, and e-mail. They also may handle travel and guest arrangements.

Secretaries and administrative assistants are aided in these tasks by a variety of office equipment, such as fax machines, photocopiers, scanners, and videoconferencing and telephone systems. In addition, secretaries and administrative assistants often use computers to do tasks previously handled by managers and professionals: create spreadsheets; compose correspondence; manage databases; and create presentations, reports, and documents using desktop publishing software and digital graphics. They also may negotiate with vendors, maintain and examine leased equipment, purchase supplies, manage areas such as stockrooms or corporate libraries, and retrieve data from various sources. At the same time, managers and professionals have assumed many tasks traditionally assigned to secretaries and administrative assistants, such as keyboarding and answering the telephone. Because secretaries and administrative assistants often are not responsible for dictation and word processing, they have time to support more members of the executive staff. In a number of organizations, secretaries and administrative assistants work in teams to work flexibly and share their expertise.

Specific job duties vary with experience and titles. *Executive secretaries and administrative assistants*, for example, may perform

Secretaries and administrative assistants are responsible for a variety of administrative and clerical duties necessary to efficiently run an organization.

fewer clerical tasks than do secretaries. In addition to arranging conference calls and scheduling meetings, they may handle more complex responsibilities such as conducting research, preparing statistical reports, training employees, and hiring and supervising other clerical staff.

Some secretaries and administrative assistants, such as legal and medical secretaries, perform highly specialized work requiring knowledge of technical terminology and procedures. For instance, *legal secretaries* prepare correspondence and legal papers such as summonses, complaints, motions, responses, and subpoenas under the supervision of an attorney or a paralegal. They also may review legal journals and assist with legal research—for example, by verifying quotes and citations in legal briefs. *Medical secretaries* transcribe dictation, prepare correspondence, and assist physicians or medical scientists with reports, speeches, articles, and conference proceedings. They also record simple medical histories, arrange for patients to be hospitalized, and order supplies. Most medical secretaries need to be familiar with insurance rules, billing practices, and hospital or laboratory procedures. Other technical secretaries who assist engineers or scientists may prepare correspondence, maintain their organization's technical library, and gather and edit materials for scientific papers.

Working Conditions

Secretaries and administrative assistants usually work in schools, hospitals, corporate settings, government agencies, or legal and medical offices. Their jobs often involve sitting for long periods. If they spend a lot of time keyboarding, particularly at a computer monitor, they may encounter problems of eyestrain, stress, and repetitive motion ailments such as carpal tunnel syndrome.

Office work can lend itself to alternative or flexible working arrangements, such as part-time work or telecommuting—especially if the job requires extensive computer use. About 19 percent of secretaries work part time and many others work in temporary positions. A few participate in job-sharing arrangements, in which two people divide responsibility for a single job. The majority of secretaries and administrative assistants, however, are full-time employees who work a standard 40-hour week.

Training, Other Qualifications, and Advancement

High school graduates who have basic office skills may qualify for entry-level secretarial positions. However, employers increasingly require extensive knowledge of software applications, such as word processing, spreadsheets, and database management.

Secretaries and administrative assistants should be proficient in keyboarding and good at spelling, punctuation, grammar, and oral communication. Employers also look for good customer service and interpersonal skills because secretaries and administrative assistants must be tactful in their dealings with people. Discretion, good judgment, organizational or management ability, initiative, and the ability to work independently are especially important for higher level administrative positions.

As office automation continues to evolve, retraining and continuing education will remain integral parts of secretarial jobs. Changes in the office environment have increased the demand for secretaries and administrative assistants who are adaptable and versatile.

Secretaries and administrative assistants may have to attend classes or participate in online education to learn how to operate new office technologies, such as information storage systems, scanners, the Internet, or new updated software packages. They also may assist in selecting and maintaining office equipment.

Secretaries and administrative assistants acquire skills in various ways. Training ranges from high school vocational education programs that teach office skills and keyboarding to 1- and 2-year

programs in office administration offered by business schools, vocational-technical institutes, and community colleges. Many temporary placement agencies also provide formal training in computer and office skills. However, many skills tend to be acquired through on-the-job instruction by other employees or by equipment and software vendors. Specialized training programs are available for students planning to become medical or legal secretaries or administrative technology specialists. Bachelor's degrees and professional certifications are becoming increasingly important as business continues to become more global.

Testing and certification for proficiency in entry-level office skills is available through organizations such as the International Association of Administrative Professionals; National Association of Legal Secretaries (NALS), Inc.; and Legal Secretaries International, Inc. As secretaries and administrative assistants gain experience, they can earn several different designations. Prominent designations include the Certified Professional Secretary (CPS) and the Certified Administrative Professional (CAP), which can be earned by meeting certain experience or educational requirements and passing an examination. Similarly, those with 1 year of experience in the legal field, or who have concluded an approved training course and who want to be certified as a legal support professional, can acquire the Accredited Legal Secretary (ALS) designation through a testing process administered by NALS. NALS offers two additional designations: Professional Legal Secretary (PLS), considered an advanced certification for legal support professionals, and a designation for proficiency as a paralegal. Legal Secretaries International confers the Certified Legal Secretary Specialist (CLSS) designation in areas such as intellectual property, criminal law, civil litigation, probate, and business law to those who have 5 years of legal experience and pass an examination. In some instances, certain requirements may be waived.

Secretaries and administrative assistants generally advance by being promoted to other administrative positions with more responsibilities. Qualified administrative assistants who broaden their knowledge of a company's operations and enhance their skills may be promoted to senior or executive secretary or administrative assistant, clerical supervisor, or office manager. Secretaries with word processing or data entry experience can advance to jobs as word processing or data entry trainers, supervisors, or managers within their own firms or in a secretarial, word processing, or data entry service bureau. Secretarial and administrative support experience also can lead to jobs such as instructor or sales representative with manufacturers of software or computer equipment. With additional training, many legal secretaries become paralegals.

Employment

Secretaries and administrative assistants held about 4.1 million jobs in 2004, ranking among the largest occupations in the U.S. economy. The following tabulation shows the distribution of employment by secretarial specialty:

Secretaries, except legal, medical, and executive	1,934,000
Executive secretaries and administrative assistants	1,547,000
Medical secretaries	373,000
Legal secretaries	272,000

Secretaries and administrative assistants are employed in organizations of every type. Around 9 out of 10 secretaries and administrative assistants are employed in service providing industries, ranging from education and health care to government and retail trade. Most of the rest work for firms engaged in manufacturing or construction.

Job Outlook

Overall employment of secretaries and administrative assistants is expected to grow more slowly than the average for all occupations over the 2004-14 period. In addition to those resulting from growth, numerous job openings will result from the need to replace workers who transfer to other occupations or leave this very large occupation for other reasons each year. Opportunities should be best for applicants with extensive knowledge of software applications, particularly experienced secretaries and administrative assistants.

Projected employment of secretaries and administrative assistants varies by occupational specialty. Employment growth in the health care and social assistance and legal services industries should lead to average growth for medical and legal secretaries. Employment of executive secretaries and administrative assistants is projected to grow average for all occupations. Growing industries—such as administrative and support services; health care and social assistance; educational services (private); and professional, scientific, and technical services—will continue to generate most new job opportunities. A decline in employment is expected for secretaries, except legal, medical, or executive; they account for about 47 percent of all secretaries and administrative assistants.

Increasing office automation and organizational restructuring will continue to make secretaries and administrative assistants more productive in coming years. Computers, e-mail, scanners, and voice message systems will allow secretaries and administrative assistants to accomplish more in the same amount of time. The use of automated equipment also is changing the distribution of work in many offices. In some cases, such traditional secretarial duties as keyboarding, filing, photocopying, and bookkeeping are being assigned to workers in other units or departments. Professionals and managers increasingly do their own word processing and data entry and handle much of their own correspondence rather than submit the work to secretaries and other support staff. Also, in some law and medical offices, paralegals and medical assistants are assuming some tasks formerly done by secretaries. As other workers assume more of these duties, there is a trend in many offices for professionals and managers to replace the traditional arrangement of one secretary per manager with secretaries and administrative assistants who support the work of systems, departments, or units. This approach often means that secretaries and administrative assistants assume added responsibilities and are seen as valuable members of a team, but it also contributes to the projected decline in the overall number of secretarial and administrative assistant positions.

Developments in office technology are certain to continue, and they will bring about further changes in the work of secretaries and administrative assistants. However, many secretarial and administrative duties are of a personal, interactive nature and, therefore, not easily automated. Responsibilities such as planning conferences, working with clients, and instructing staff require tact and communication skills. Because technology cannot substitute for these personal skills, secretaries and administrative assistants will continue to play a key role in most organizations.

Earnings

Median annual earnings of executive secretaries and administrative assistants were \$34,970 in May 2004. The middle 50 percent earned between \$28,500 and \$43,430. The lowest 10 percent earned less than \$23,810, and the highest 10 percent earned more than \$53,460. Median annual earnings in the industries employing the largest numbers of executive secretaries and administrative assistants in May 2004 were:

Management of companies and enterprises	\$38,950
Local government	36,940
Colleges, universities, and professional schools	34,280
Employment services	31,620
State government	30,750

Median annual earnings of legal secretaries were \$36,720 in May 2004. The middle 50 percent earned between \$29,070 and \$46,390. The lowest 10 percent earned less than \$23,270, and the highest 10 percent earned more than \$56,590. Medical secretaries earned a median annual salary of \$26,540 in May 2004. The middle 50 percent earned between \$21,980 and \$32,690. The lowest 10 percent earned less than \$19,140, and the highest 10 percent earned more than \$39,140. Median annual earnings of secretaries, except legal, medical, and executive, were \$26,110 in May 2004.

Salaries vary a great deal, however, reflecting differences in skill, experience, and level of responsibility. Certification in this field usually is rewarded by a higher salary.

Related Occupations

Workers in a number of other occupations type, record information, and process paperwork. Among them are bookkeeping, accounting, and auditing clerks; receptionists and information clerks; communications equipment operators; court reporters; human resources assistants, except payroll and timekeeping; computer operators; data entry and information processing workers; paralegals and legal assistants; medical assistants; and medical records and health information technicians. A growing number of secretaries and administrative assistants share in managerial and human resource responsibilities. Occupations requiring these skills include office and administrative support supervisors and managers; computer and information systems managers; administrative services managers; and human resources, training, and labor relations managers and specialists.

Sources of Additional Information

State employment offices provide information about job openings for secretaries and administrative assistants.

Farming, Fishing, and Forestry Occupations

Agricultural Workers

(O*NET 45-2011.00, 45-2021.00, 45-2041.00, 45-2091.00, 45-2092.01, 45-2092.02, 45-2093.00, and 45-2099.99)

Significant Points

- Duties and working conditions vary widely, from raising plants in greenhouses, to harvesting crops and tending to livestock outdoors, to inspecting agricultural products at border crossings.
- Farmworkers learn through short-term on-the-job training; agricultural inspectors and animal breeders require work experience or a college degree.
- Most farmworkers receive low pay and perform strenuous work outdoors in all kinds of weather but many enjoy the rural lifestyle.
- Employment is projected to decline slightly.

Nature of the Work

Agricultural workers play a large role in getting food, plants, and other agricultural products to market. Working mostly on farms or ranches or in nurseries, slaughterhouses, or ports of entry, these workers have numerous and diverse duties. Among their activities are planting and harvesting crops, installing irrigation, delivering animals, and making sure that our food is safe.

More than 8 out of 10 agricultural workers are farmworkers and laborers. *Farmworkers and laborers, crop, nursery, and greenhouse* perform numerous activities related to growing and harvesting grains, fruits, vegetables, nuts, fiber, trees, shrubs, and other crops. Among their activities are planting and seeding, pruning, irrigating, harvesting, and packing and loading crops for shipment. Farmworkers also apply pesticides, herbicides, and fertilizers to crops; repair fences; and help with irrigation. Nursery and greenhouse workers prepare land or greenhouse beds for growing horticultural products, such as trees, plants, flowers, and sod. Their duties include planting, watering, pruning, weeding, and spraying the plants. They may cut, roll, and stack sod; stake trees; tie, wrap, and pack plants to fill orders; and dig up or move field-grown and containerized shrubs and trees.

Farmworkers, farm and ranch animals care for live farm, ranch, or aquacultural animals that may include cattle, sheep, swine, goats, horses, poultry, finfish, shellfish, and bees. The animals are usually raised to supply such products as meat, fur, skins, feathers, eggs, milk, and honey. The farmworkers' duties may include feeding, watering, herding, grazing, castrating, branding, debeaking, weighing, catching, and loading animals. On dairy farms, farmworkers operate milking machines; they also may maintain records on animals, examine animals to detect diseases and injuries, assist in delivering animals at their birth, and administer medications, vaccinations, or insecticides as appropriate. Daily duties of such farmworkers include cleaning and maintaining animal housing areas.

Other farmworkers known as *agricultural equipment operators* operate a variety of farm equipment used in plowing, sowing, maintaining, and harvesting agricultural products. The equipment may include tractors, fertilizer spreaders, haybines, raking equipment, balers, combines, and threshers, as well as trucks. These

farmworkers also operate machines used in moving and treating crops after their harvest, such as conveyor belts, loading machines, separators, cleaners, and dryers. In addition, they may make adjustments and minor repairs to equipment. When not operating machines, agricultural equipment operators may perform other farm duties that are not typical of other farmworkers.

Agricultural inspectors, another type of agricultural worker, are employed by Federal and State governments to ensure compliance with laws and regulations governing the health, quality, and safety of agricultural commodities. Inspectors also make sure that the facilities and equipment used in processing the commodities meet quality standards. Meat safety is one of their prime responsibilities, and they try to ensure that the meat we eat is free of harmful ingredients or bacteria. In meat-processing facilities, inspectors may collect samples of suspected diseased animals or materials and send the samples to a laboratory for identification and analysis. They also may inspect livestock to help determine the effectiveness of medication and feeding programs. Some inspectors are stationed at export and import sites to weigh and inspect agricultural shipments leaving and entering the country to ensure the quality and quantity of the shipments. A few work at logging sites, making sure that safety regulations are enforced.

Graders and sorters of agricultural products examine agricultural commodities being prepared to be packed for market and classify them according to quality or size guidelines. They grade, sort, or classify unprocessed food and other agricultural products by size, weight, color, or condition and discard inferior or defective products. For example, graders sort eggs by color and size and also examine the fat content, or marbling, of beef, assigning a grade of "Prime," "Choice," or something else, as appropriate. The grade that is assigned determines the price at which the commodity may be sold.

Animal breeders select and breed animals using their knowledge of genetics and animal science to produce offspring with desired traits and characteristics, such as chickens that lay more eggs, pigs that produce leaner meat, and sheep with more desirable wool. Animal breeders also raise and breed animals simply to sell their offspring for money, including cats and dogs and other household pets. The larger and more expensive animals that are bred, such as horses and cattle, are usually bred through artificial insemination, which requires the taking of semen from the male and then inseminating the female with it. Using this process insures better results and also enables one prized male to sire many more offspring than through conventional mating. To know when and which animals to breed, breeders keep detailed records, including the health of the animal, its size and weight, and the amount and quality of the product produced by the animal. They also keep track of the traits of the offspring. Some breeders work as consultants for a number of farmers, while others breed and raise their own animals for eventual sale or to breed. For breeders that raise animals, they may also have to care and clean animal shelters, feed and water the animals, and oversee their day-to-day health or supervise others that perform these jobs. Additionally, animal breeders read journals and newsletters to remain current with the latest information on animal breeding and veterinary advice.

Working Conditions

Working conditions for agricultural workers vary widely. Much of the work of farmworkers and laborers on farms and ranches takes place outdoors in all kinds of weather and is physical in nature.

Many agricultural workers are found in nurseries, growing flowers and other plants.

Harvesting fruits and vegetables, for example, may require much bending, stooping, and lifting. Workers may lack adequate sanitation facilities while working in the field, and their drinking water may be limited. The year-round nature of much livestock production work means that ranch workers must be out in the heat of summer, as well as the cold of winter. While some of these workers enjoy the day-to-day variability of the work, the rural setting, working on the land, and raising animals, the work hours are generally uneven and often long, and work cannot be delayed when crops must be planted and harvested or when animals must be sheltered and fed. Weekend work is common, and farmworkers may work a 6- or 7-day week during planting and harvesting seasons. Because much of the work is seasonal in nature, many workers also obtain other jobs during slow seasons. Migrant farmworkers, who move from location to location as crops ripen, live an unsettled lifestyle, which can be stressful.

Work also is seasonal for farmworkers in nurseries; spring and summer are the busiest times of the year. Greenhouse workers enjoy relatively comfortable working conditions while tending to plants indoors. However, during the busy seasons, when landscape contractors need plants, work schedules may be more demanding, requiring weekend work. Moreover, the transition from warm weather to cold weather means that nursery workers might have to work overtime with little notice given in order to move plants indoors to protect them from a frost.

Federal meat inspectors may work in highly mechanized plants or with poultry or livestock in confined areas with extremely cold temperatures and slippery floors. The duties often require working with sharp knives, moderate lifting, and walking or standing for long periods. Many inspectors work long and often irregular hours. Inspectors may find themselves in adversarial roles when the organization or individual being inspected objects to the inspection or its potential consequences. Some inspectors travel frequently to visit farms and processing facilities. Others work at ports, inspecting cargo on the docks or on boats.

Graders and sorters may work with similar products for an entire shift, or they may be assigned a variety of items. They may be on

their feet all day and may have to lift heavy objects, whereas others may sit during most of their shift and do little strenuous work. Some graders work in clean, air-conditioned environments, suitable for carrying out controlled tests. Some may work evenings or weekends because of the perishable nature of the products. Overtime may be required to meet production goals.

Animal breeders spend most of their time outdoors around animals, but can also work in offices or in laboratories. If consulting, breeders may have to travel from farm to farm. If they need to sell the offspring, breeders may have to travel to attend shows and to meet with potential buyers. While tending to the animals, breeders may be bitten or kicked.

Farmworkers in crop production risk exposure to pesticides and other hazardous chemicals sprayed on crops or plants. However, exposure is relatively minimal if safety procedures are followed. Those who work on mechanized farms must take precautions to avoid injury when working with tools and heavy equipment. Those who work directly with animals risk being bitten or kicked.

Training, Other Qualifications, and Advancement

Farmworkers learn through short-term on-the-job training. Most do not have a high school diploma. Workers without a high school diploma are particularly common in the crop production sector, where there are more labor-intensive establishments employing migrant farmworkers.

In nurseries, entry-level workers must be able to follow directions and learn proper planting procedures. If driving is an essential part of a job, employers look for applicants with a good driving record and some experience driving a truck. Workers who deal directly with customers must get along well with people. Employers also look for responsible, self-motivated individuals, because nursery workers sometimes work with little supervision.

For graders and sorters, training requirements vary on the basis of their responsibilities. For those who perform tests on various agricultural products, a high school diploma is preferred and may be required. Simple jobs requiring mostly visual inspection may be filled by beginners provided with short-term on-the-job training.

Becoming an agricultural inspector requires relevant work experience or some college course work in a field such as biology or agricultural science. Inspectors are trained in the applicable laws or inspection procedures through some combination of classroom and on-the-job training. In general, people who want to enter this occupation should be responsible, like detailed work, and be able to communicate well. Federal Government inspectors whose job performance is satisfactory advance through a career ladder to a specified full-performance level. For positions above this level -usually supervisory positions- advancement is competitive and based on agency needs and individual merit. Advancement opportunities in State and local governments and in the private sector often are similar to those in the Federal Government.

The education and training requirements for animal breeders vary with the type of breeding they do. For those whose primary activity is breeding, particularly livestock and other large or expensive animals, rather than raising animals, a bachelor's degree or higher in the animal sciences is recommended with courses in genetics, animal breeding, and animal physiology. For those with experience raising animals or those who are breeding their own animals, an associate's degree or other postsecondary training in animal breeding is recommended. Experience working around animals, especially on a farm, is helpful, even for those getting a degree.

Advancement of agricultural workers depends on motivation and experience. Farmworkers who work hard and quickly, have good communication skills, and take an interest in the business may advance to crew leader or other supervisory positions. Some

agricultural workers may aspire to become farm, ranch, and other agricultural managers, or farmers or ranchers themselves. (Farmers, ranchers, and agricultural managers are discussed elsewhere in the Handbook.) In addition, their knowledge of raising and harvesting produce may provide an excellent background for becoming purchasing agents and buyers of farm products. Knowledge of working a farm as a business can help agricultural workers become farm and home management advisors. Those who earn a college degree in agricultural science could become agricultural and food scientists.

Employment

Agricultural workers held about 834,000 jobs in 2004. Of these, farmworkers were the most numerous, holding about 690,000 jobs. Graders and sorters held about 45,000 jobs, agricultural inspectors 14,000 jobs, agricultural equipment operators 60,000 jobs, and animal breeders 12,000 jobs. More than 66 percent of all agricultural workers worked for crop and livestock producers, while more than 5 percent worked for agricultural service providers, mostly farm labor contractors.

Job Outlook

Overall employment of agricultural workers is projected to decline slightly over the 2004-14 period, primarily reflecting the outlook for farmworkers in crops, nurseries, and greenhouses, who make up the large majority of all agricultural workers. Low wages, the physical demands of the work, and the large numbers of workers who leave these jobs for other occupation should result in abundant job opportunities, however.

Continued consolidation of farms and technological advancements in farm equipment that make farmworkers both more efficient and less needed will cause fewer of them to be hired. Farmworkers will increasingly work for farm labor contractors rather than being hired directly by the farm. The agriculture industry also is expected to undergo increased competition from foreign countries and rising imports, particularly from Central America, owing to the passing of a free trade agreement with that region. Nursery and greenhouse workers should experience some growth in this period, reflecting the increasing demand for landscaping services.

Slower-than-average employment growth is anticipated for agricultural inspectors. Governments at all levels are not expected to hire significant numbers of new inspectors, choosing to leave more of the routine inspection to businesses. Slower-than-average growth also is expected for graders and sorters, while employment of agricultural equipment operators is expected to decline slightly, reflecting the agriculture industry’s continuing ability to produce more with fewer workers. Animal breeders also will grow more slowly than the average, as large commercial farmers continue to attempt to breed the perfect animal. However, because the occupation is so small there will be few job openings.

Earnings

Median hourly earnings in May 2004 for each of the occupations found in this statement are as follows:

Agricultural inspectors.....	\$14.92
Animal breeders.....	13.55
Agricultural workers, all other.....	10.15
Agricultural equipment operators.....	8.88
Farmworkers, farm and ranch animals.....	8.31
Graders and sorters, agricultural products.....	7.90
Farmworkers and laborers, crop, nursery, and greenhouse.....	7.70

Few agricultural workers are members of unions.

Related Occupations

The duties of farmworkers who perform outdoor labor are related to the work of fishers and operators of fishing vessels; forest, conservation, and logging workers; and grounds maintenance workers. Farmworkers who work with farm and ranch animals perform work related to that of animal care and service workers. Animal breeders may perform some duties related to those of veterinary technologists or veterinarians.

Information on obtaining positions as an agricultural inspector with the Federal Government is available from the Office of Personnel Management through USAJOBS, the Federal Government’s official employment information system. This resource for locating and applying for job opportunities can be accessed through the Internet at <http://www.usajobs.opm.gov> or through an interactive voice response telephone system at (703) 724-1850 or TDD (978) 461-8404. These numbers are not tollfree, and charges may result.

Fishers and Fishing Vessel Operators

(O*NET 45-3011.00)

Significant Points

- More than 50 percent of all workers are self-employed, among the highest proportion in the workforce.
- Many jobs require strenuous work and long hours and provide only seasonal employment.
- Employment is projected to decline, due to the depletion of fish stocks and new Federal and State laws restricting both commercial and recreational fishing.

Nature of the Work

Fishers and fishing vessel operators catch and trap various types of marine life for human consumption, animal feed, bait, and other uses. (Aquaculture the raising and harvesting, under controlled conditions, of fish and other aquatic life in ponds or confined bodies of water is covered in the *Handbook* section on farmers, ranchers, and agricultural managers.)

Fishing hundreds of miles from shore with commercial fishing vessels large boats capable of hauling a catch of tens of thousands of pounds of fish requires a crew that includes a captain, or skipper, a first mate and sometimes a second mate, a boatswain (called a deckboss on some smaller boats), and deckhands with specialized skills.

The *fishing boat captain* plans and oversees the fishing operation the fish to be sought, the location of the best fishing grounds, the method of capture, the duration of the trip, and the sale of the catch.

The captain ensures that the fishing vessel is seaworthy; oversees the purchase of supplies, gear, and equipment, such as fuel, netting, and cables; obtains the required fishing permits and licenses; and hires qualified crew members and assigns their duties. The captain plots the vessel’s course using compasses, charts, and often electronic

navigational equipment such as autopilots, loran systems, and satellite navigation systems. Ships also use radar to avoid obstacles and utilize depth sounders to indicate the water depth and whether there is marine life between the vessel and sea bottom. Sophisticated tracking technology allows captains to better locate and analyze schools of fish. The captain directs the fishing operation through the officers' actions and records daily activities in the ship's log. Upon returning to port, the captain arranges for the sale of the catch directly to buyers or through a fish auction and ensures that each crew member receives the prearranged portion of adjusted net proceeds from the sale of the catch. Some captains have begun buying and selling fish via the Internet, and as electronic commerce grows as a method of finding buyers for fresh catch, more captains may use computers.

The *first mate* the captain's assistant, who must be familiar with navigation requirements and the operation of all electronic equipment assumes control of the vessel when the captain is off duty. Duty shifts, called watches, usually last 6 hours. The mate's regular duty, with the help of the boatswain and under the captain's oversight, is to direct the fishing operations and sailing responsibilities of the deckhands, including the operation, maintenance, and repair of the vessel and the gathering, preservation, stowing, and unloading of the catch.

The *boatswain*, a highly experienced deckhand with supervisory responsibilities, directs the *deckhands* as they carry out the sailing and fishing operations. Before departure, the boatswain directs the deckhands to load equipment and supplies, either by hand or with hoisting equipment, and to untie lines from other boats and the dock. When necessary, boatswains repair fishing gear, equipment, nets, and accessories. They operate the fishing gear, letting out and pulling in nets and lines, and extract the catch, such as pollock, flounder, and tuna, from the nets or the lines' hooks. Deckhands use dip nets to prevent the escape of small fish and gaffs to facilitate the landing of large fish. They then wash, salt, ice, and stow away the catch. Deckhands also must ensure that decks are clear and clean at all times and that the vessel's engines and equipment are kept in good working order. Upon return to port, they secure the vessel's lines to and from the docks and other vessels. Unless "lumpers" (laborers or longshore workers) are hired, the deckhands unload the catch.

Large fishing vessels that operate in deep water generally have technologically advanced equipment, and some may have facilities on board where the fish are processed and prepared for sale. Such vessels are equipped for long stays at sea and can perform the work of several smaller boats.

Some full-time and many part-time fishers work on small boats in relatively shallow waters, often in sight of land. Navigation and communication needs are vital and constant for almost all types of boats. Crews are small usually, only one or two people collaborate on all aspects of the fishing operation, which may include placing gill nets across the mouths of rivers or inlets, entrapment nets in bays and lakes, or pots and traps for fish or shellfish such as lobsters and crabs. Dredges and scrapes are sometimes used to gather shellfish such as oysters and scallops. A very small proportion of commercial fishing is conducted as diving operations. Depending upon the water's depth, divers wearing regulation diving suits with an umbilical (air line) or a scuba outfit and equipment use spears to catch fish and use nets and other equipment to gather shellfish, coral, sea urchins, abalone, and sponges. In very shallow waters, fish are caught from small boats having an outboard motor, from rowboats, or by wading or seining from shore. Fishers use a wide variety of hand-operated equipment for example, nets, tongs, rakes, hoes, hooks, and shovels to gather fish and shellfish; catch amphibians and reptiles such as frogs and turtles; and harvest marine vegetation such as Irish moss and kelp.

Fishing vessel workers must be mechanically inclined in order to maintain their equipment.

Although most fishers are involved in commercial fishing, some captains and deckhands use their expertise in fishing for sport or recreational purposes. For this type of fishing, a group of people charter a fishing vessel, the captain, and possibly several deckhands for periods ranging from several hours to a number of days and embark upon sportfishing, socializing, and relaxation.

Working Conditions

Fishing operations are conducted under various environmental conditions, depending on the region of the country and the kind of species sought. Storms, fog, and wind may hamper fishing vessels or cause them to suspend fishing operations and return to port. Divers are affected by murky water and unexpected shifts in underwater currents. In relatively busy fisheries, smaller boats have to take care not to be hit by larger vessels.

Fishers and fishing vessel operators work under some of the most hazardous conditions of any occupation, and often help is not readily available when injuries occur. Treatment for any serious injuries may have to await transfer to a hospital. The crew must be on guard against the danger of injury from malfunctioning fishing gear, entanglement in fishing nets and gear, slippery decks resulting from fish-processing operations, ice formation in the winter, or being swept overboard a fearsome situation. Malfunctioning navigation or communication equipment may lead to collisions or shipwrecks. Divers must guard against entanglement of air lines, malfunction of scuba equipment, decompression problems, and attacks by predatory fish.

Fishers and fishing vessel operators face strenuous outdoor work and long hours. Commercial fishing trips may require a stay of several weeks or even months hundreds of miles away from one's home port. The pace of work may vary, but even during travel between the home port and the fishing grounds, deckhands on smaller boats try to finish their cleaning duties so that there are no chores remaining to be done at port. However, lookout watches are a regular responsibility, and crew members must be prepared to stand watch at prearranged times of the day or night. Although fishing gear has improved, and operations have become more mechanized, netting and processing fish are strenuous activities. Newer vessels have improved living quarters and amenities such as television and shower stalls, but crews still experience the aggravations of confined quarters, continuous close personal contact, and the absence of family.

Training, Other Qualifications, and Advancement

Fishers usually acquire their occupational skills on the job, many as members of families involved in fishing activities. No formal

academic requirements exist. Operators of large commercial fishing vessels are required to complete a Coast Guard-approved training course. Students can expedite their entrance into these occupations by enrolling in 2-year vocational-technical programs offered by secondary schools. In addition, some community colleges and universities offer fishery technology and related programs that include courses in seamanship, vessel operations, marine safety, navigation, vessel repair and maintenance, health emergencies, and fishing gear technology. Courses include hands-on experience. Secondary and postsecondary programs are normally offered in or near coastal areas.

Experienced fishers may find short-term workshops offered through various postsecondary institutions especially useful. These programs provide a good working knowledge of electronic equipment used in navigation and communication and offer information on the latest improvements in fishing gear.

Captains and mates on large fishing vessels of at least 200 gross tons must be licensed. Captains of sportfishing boats used for charter, regardless of the boats' size, must also be licensed. Crew members on certain fish-processing vessels may need a merchant mariner's document. The U.S. Coast Guard issues these documents and licenses to individuals who meet the stipulated health, physical, and academic requirements. (For information about merchant marine occupations, see the section on water transportation occupations elsewhere in the Handbook.)

Fishers must be in good health and possess physical strength. Good coordination, mechanical aptitude, and the ability to work under difficult or dangerous conditions are necessary to operate, maintain, and repair equipment and fishing gear. Fishers need stamina to work long hours at sea, often under difficult conditions. On large vessels, they must be able to work as members of a team. Fishers must be patient, yet always alert, to overcome the boredom of long watches when they are not engaged in fishing operations. The ability to assume any deckhand's functions on short notice is important. As supervisors, mates must be able to assume all duties, including the captain's, when necessary. The captain must be highly experienced, mature, and decisive and also must possess the business skills needed to run business operations.

On fishing vessels, most fishers begin as deckhands. Experienced, reliable deckhands who display supervisory qualities may become boatswains, who, in turn, may become second mates, first mates, and, finally, captains. Deckhands who acquire experience and whose interests are in ship engineering the maintenance and repair of ship engines and equipment can eventually become licensed chief engineers on large commercial vessels after meeting the Coast Guard's experience, physical, and academic requirements. Almost all captains become self-employed, and the overwhelming majority eventually own, or have an interest in, one or more fishing ships. Some may choose to run a sport or recreational fishing operation. When their seagoing days are over, experienced individuals may work in or, manage, or own stores selling fishing and marine equipment and supplies. Some captains may assume advisory or administrative positions in industry trade associations or government offices, such as harbor development commissions, or in teaching positions in industry-sponsored workshops or educational institutions. Divers with experience in fishing operations can enter a commercial diving activity for example, repairing ships or maintaining piers and marinas usually after the completion of a certified training program sponsored by an educational institution or industry association.

Employment

Fishers and fishing vessel operators held an estimated 38,000 jobs in 2004. One out of two was self-employed. Most fishing takes

place off the coasts, with Alaska, Louisiana, Virginia, California, and Massachusetts bringing in the greatest volume of fish. While fishing off the New England coast has declined in recent years because of restrictions on catching certain species, it still ranks high in total value of fish caught, according to the National Marine Fisheries Service.

Job Outlook

Employment of fishers and fishing vessel operators is expected to decline through the year 2014. Some job openings will nevertheless arise from the need to replace workers who leave the occupation or retire. Fishers and fishing vessel operators depend on the natural ability of fish stocks to replenish themselves through growth and reproduction, as well as on governmental regulation to promote replenishment of fisheries. Many operations are currently at or beyond the maximum sustainable yield, partially because of habitat destruction, and the number of workers who can earn an adequate income from fishing is expected to decline. Many fishers and fishing vessel operators leave the occupation because of the strenuous and hazardous nature of the job and the lack of steady, year-round income.

The use of sophisticated electronic equipment for navigation, for communication, and for locating fish has raised the efficiency of finding fish stocks. Also, improvements in fishing gear and the use of highly automated floating processors, where the catch is processed aboard the vessel, have greatly increased fish hauls. In many areas, particularly the North Atlantic and Pacific Northwest, damage to spawning grounds and excess fish harvesting capacity have adversely affected the stock of fish and, consequently, the employment opportunities for fishers. Some fisheries councils have issued various types of restrictions on harvesting, to allow stocks of fish and shellfish to naturally replenish, thereby idling many fishers. In addition, low prices for some species and rising seafood imports are adversely affecting fishing income and also causing some fishers to leave the industry. Fishers are also facing competition from farm-raised fish. Sportfishing boats, however, will continue to provide some job opportunities.

Governmental efforts to replenish stocks are having some positive results, which should increase the stock of fish in the future. Furthermore, efforts by private fishers' associations on the West Coast to increase government monitoring of the fisheries may help significantly to prevent the type of decline in fish stocks found in waters off the East Coast. Nevertheless, fewer fishers and fishing vessel operators are expected to make their living from the Nation's waters in the years ahead.

Earnings

Based on limited information, the majority of full-time wage and salary fishers earn between \$322 and \$775 per week. Earnings of fishers and fishing vessel operators normally are highest in the summer and fall when demand for services peaks and environmental conditions are favorable and lowest during the winter. Many full-time and most part-time workers supplement their income by working in other activities during the off-season. For example, fishers may work in seafood-processing plants, in establishments selling fishing and marine equipment, in construction, or in a number of unrelated seasonal occupations.

Earnings of fishers vary widely, depending upon their position, their ownership percentage of the vessel, the size of their ship, and the amount and value of the catch. The costs of the fishing operation—the physical aspects of operating the ship, such as the fuel costs, repair and maintenance of gear and equipment, and the crew's supplies—are deducted from the sale of the catch. Net proceeds are distributed among the crew members in accordance with a prearranged percentage. Generally, the ship's owner usually its captain receives half of the net proceeds. From this amount, the

owner pays for depreciation, maintenance and repair, and replacement and insurance costs of the ship and its equipment; the money that remains is the owner's profit.

Related Occupations

Other occupations that involve outdoor work with fish and watercraft include water transportation occupations and fish and game wardens.

Forest, Conservation, and Logging Workers

(O*NET 45-4011.00, 45-4021.00, 45-4022.01, 45-4023.00, 45-4029.99)

Significant Points

- Workers spend all their time outdoors, sometimes in poor weather and often in isolated areas.
- Most jobs are physically demanding and can be hazardous.
- A slight increase in overall employment is expected.

Nature of the Work

The Nation's forests are a rich natural resource, providing beauty and tranquility, varied recreational areas, and wood for commercial use. Managing and harvesting the forests and woodlands require many different kinds of workers. Forest and conservation workers

A logging equipment operator uses a feller to cut trees.

help develop, maintain, and protect the forests by growing and planting new seedlings, fighting insects and diseases that attack trees, and helping to control soil erosion. Timber-cutting and logging workers harvest thousands of acres of forests each year for the timber that provides the raw material for countless consumer and industrial products.

Forest and conservation workers perform a variety of tasks to reforest and conserve timberlands, and to maintain forest facilities, such as roads and campsites. Some forest workers, called tree planters, use digging and planting tools called "dibble bars" and "hoedads" to plant seedlings to reforest timberland areas. Forest workers also remove diseased or undesirable trees with power saws or handsaws, spray trees with insecticides and fungicides to kill insects and to protect against disease, and apply herbicides on undesirable brush and trees to reduce competing vegetation. Forest workers in private industry, usually working under the direction of professional foresters, paint boundary lines, assist with prescribed burning, aid in marking and measuring trees, and keep tallies of those trees examined and counted. Forest workers who work for State and local governments or who are under contract to the Federal Government also clear away brush and debris from camp trails, roadsides, and camping areas. Some of these workers clean kitchens and rest rooms at recreational facilities and campgrounds.

Other forest and conservation workers work in forest nurseries, sorting out tree seedlings and discarding those not meeting prescribed standards of root formation, stem development, and condition of foliage.

Some forest workers are employed on tree farms, where they plant, cultivate, and harvest many different kinds of trees. Their duties vary with the type of farm. Those who work on specialty farms, such as farms growing Christmas or ornamental trees for nurseries, are responsible for shearing treetops and limbs to control the growth of the trees under their care, to increase the density of limbs, and to improve the shapes of the trees. In addition, these workers' duties include planting the seedlings, spraying to control surrounding weed growth and insects, and harvesting the trees.

Other forest workers gather, by hand or with the use of handtools, products from the woodlands, such as decorative greens, tree cones and barks, moss, and other wild plant life. Still others tap trees for sap to make syrup or to produce chemicals.

The timber-cutting and logging process is carried out by a variety of workers who make up a logging crew. *Fallers*, commonly known as *tree fallers*, cut down trees with hand-held power chain saws or mobile felling machines. Usually using gas-powered chain saws, *buckers* trim off the tops and branches and buck (cut) the resulting logs into specified lengths.

Choke setters fasten chokers (steel cables or chains) around logs to be skidded (dragged) by tractors or forwarded by the cable-yarding system to the landing or deck area, where the logs are separated by species and type of product, such as pulpwood, saw logs, or veneer logs, and loaded onto trucks. *Rigging slingers* and *chasers* set up and dismantle the cables and guy wires of the yarding system. *Log sorters, markers, movers, and chippers* sort, mark, and move logs, based on species, size, and ownership, and tend machines that chip up logs.

Logging equipment operators on a logging crew perform a number of duties. They use tree harvesters to fell the trees, shear the limbs off trees, and then cut the logs into desired lengths. They drive tractors mounted on crawler tracks, called crawlers, and self-propelled machines called skidders or forwarders, which drag or transport logs from the felling site in the woods to the log landing area for loading. They also operate grapple loaders, which lift and load logs into trucks. Some logging equipment operators use tracked or wheeled equipment similar to a forklift to unload logs and pulpwood off of

trucks or gondola railroad cars, usually at a sawmill or a pulp-mill woodyard. Some newer, more efficient logging equipment is now equipped with state-of-the-art computer technology, requiring more skilled operators with more training.

Log graders and *scalers* inspect logs for defects, measure logs to determine their volume, and estimate the marketable content or value of logs or pulpwood. These workers often use hand-held data collection devices to enter data about individual trees; later, the data can be downloaded or sent from the scaling area to a central computer via modem.

Other timber-cutting and logging workers have a variety of responsibilities. Some hike through forests to assess logging conditions. Some clear areas of brush and other growth to prepare for logging activities or to promote the growth of desirable species of trees.

The timber-cutting and logging industry is characterized by a large number of small crews of four to eight workers. A typical crew might consist of one or two tree fallers or one tree harvesting machine operator, one buckler, two logging skidder operators to drag cut trees to the loading deck, and one equipment operator to load the logs onto trucks. Most crews work for self-employed logging contractors who possess substantial logging experience, the capital to purchase equipment, and the skills needed to run a small business successfully. Many contractors work alongside their crews as supervisors and often operate one of the logging machines, such as the grapple loader or the tree harvester. Some manage more than one crew and function as owner-supervisors.

Although timber-cutting and logging equipment has greatly improved and operations are becoming increasingly mechanized, many logging jobs still are dangerous and very labor intensive. These jobs require various levels of skill, ranging from the unskilled task of manually moving logs, branches, and equipment to skillfully using chain saws to fell trees, and heavy equipment to skid and load logs onto trucks. To keep costs down, many timber-cutting and logging workers maintain and repair the equipment they use. A skillful, experienced logging worker is expected to handle a variety of logging operations.

Working Conditions

Forestry and logging jobs are physically demanding. Workers spend all their time outdoors, sometimes in poor weather and often in isolated areas. The increased use of enclosed machines has decreased some of the discomforts caused by inclement weather and in general made the tasks to be performed much safer. A few logging camps in Alaska and Maine house workers in bunkhouses. Workers in some sparsely populated western States, as well as northern Maine, commute long distances between their homes and logging sites. In the more densely populated eastern and southern States, commuting distances are shorter.

Most logging occupations involve lifting, climbing, and other strenuous activities, although machinery has eliminated some of the heavy labor. Loggers work under unusually hazardous conditions. Falling branches, vines, and rough terrains are constant hazards, as are the dangers associated with tree-felling and log-handling operations. Special care must be taken during strong winds, which can even halt logging operations. Slippery or muddy ground, hidden roots, or vines not only reduce efficiency, but also present a constant danger, especially in the presence of moving vehicles and machinery. Poisonous plants, brambles, insects, snakes, heat, humidity, and extreme cold are everyday occurrences where loggers work. The use of hearing protection devices is required on logging operations because the high noise level of felling and skidding operations over long periods may impair one's hearing. Experience, the exercise of caution, and the use of proper safety measures and equipment such

as hardhats, eye and ear protection, and safety clothing and boots are extremely important to avoid injury.

The jobs of forest and conservation workers generally are much less hazardous than those of loggers. It may be necessary for some forestry aides or forest workers to walk long distances through densely wooded areas to accomplish their work tasks.

Training, Other Qualifications, and Advancement

Most forest, conservation, and logging workers develop skills through on-the-job training, with instruction coming primarily from experienced workers. Logging workers must familiarize themselves with the character and dangers of the forest environment and the operation of logging machinery and equipment. However, logging companies and trade associations, such as the Northeastern Loggers Association, the American Loggers Council, and the Forest Resources Association, Inc., offer training programs for workers who operate large, expensive machinery and equipment. Often, a representative of the equipment manufacturer spends several days in the field explaining and overseeing the operation of newly purchased machinery. Safety training is a vital and required part of the instruction of all logging workers.

Many State forestry or logging associations provide training sessions for tree fallers, whose job duties require more skill and experience than do other positions on the logging team. Sessions may take place in the field, where trainees, under the supervision of an experienced logger, have the opportunity to practice various felling techniques. Fallers learn how to manually cut down extremely large or expensive trees safely and with minimal damage to the felled or surrounding trees.

Training programs for loggers and foresters are common in many States. These training programs also include sessions on encouraging the health and productivity of the Nation's forests through the forest product industry's Sustainable Forest Initiative program. Logger training programs vary by State, but generally include classroom or field training in a number of areas: best management practices, environmental compliance, safety, endangered species, reforestation, and business management. Some programs lead to logger certification.

Generally, a college education is not required for most forest, conservation, and logging occupations. Many secondary schools, including vocational and technical schools and some community colleges, offer courses leading to a two-year technical degree in forestry, wildlife management, conservation, and forest harvesting, all of which are helpful in obtaining a job. A curriculum that includes field trips to observe or participate in forestry or logging activities provides a particularly good background. Generally, there are no educational requirements for forest worker jobs. Many of these workers are high school or college students who are hired on a part-time or seasonal basis to perform short-term, labor-intensive tasks, such as planting tree seedlings or conducting precommercial tree thinnings.

Experience working at a nursery or as a laborer can be useful in obtaining a job as a forest or conservation worker. Logging workers generally advance from occupations involving primarily manual labor to those involving the operation of expensive, sometimes complicated logging equipment. Inexperienced entrants usually begin as laborers, carrying tools and equipment, clearing brush, performing equipment maintenance, and loading and unloading logs and brush. For some, familiarization with logging operations may lead to jobs such as log-handling equipment operator. Further experience may lead to jobs involving the operation of more complicated machinery and yarding towers to transport, load, and unload logs. Those who have the motor skills required for the efficient use of power saws and other equipment may become fallers and bucklers.

Forest, conservation, and logging workers must be in good health and able to work outdoors every day. They also must be able to work as part of a team. Many logging occupations require physical strength and stamina. Maturity and good judgment are important in making quick, intelligent decisions in dealing with hazards as they arise. Mechanical aptitude and coordination are necessary qualities for operators of machinery and equipment, who often are responsible for repair and maintenance as well. Initiative and managerial and business skills are necessary for success as a self-employed logging contractor.

Employment

Forest, conservation, and logging workers held about 92,000 jobs in 2004, distributed among the following occupations:

Logging equipment operators	43,000
Forest and conservation workers	17,000
Fallers.....	15,000
Log graders and scalers.....	9,000
Logging workers, all other.....	7,000

Most tree fallers, and almost half of all logging equipment operators, are employed in logging, although some work for sawmills and planing mills. Employment of log graders and scalers is concentrated largely in sawmills and planing mills.

About 45 percent of all forest and conservation workers work for government, primarily at the State and local level. Twenty one percent are employed by companies that operate timber tracts, tree farms, or forest nurseries, or for contractors that supply services to agriculture and forestry industries. Some of those employed in forestry services work on a contract basis for the U.S. Department of Agriculture's Forest Service. A small number of forest and conservation workers work in sawmills and planing mills. Although forest and conservation workers are located in every State, employment is concentrated in the West and Southeast, where many national and private forests and parks are located.

Self-employed forest, conservation, and logging workers account for more than 3 of every 10 such workers a much higher proportion of self-employment than in most other occupations.

Seasonal demand for forest, conservation, and logging workers varies by region. For example, in the northern States, winter work is common because the frozen ground facilitates logging. In the Southeast, logging and related activities occur year-round, except during periods of very wet weather.

Job Outlook

Overall employment of forest, conservation, and logging workers is expected to increase more slowly than the average for all occupations through the year 2014. Most job openings will result from replacement needs. Many logging workers transfer to other jobs that are less physically demanding and dangerous, or else they retire. In addition, some forestry workers are youths who are not committed to the occupation on a long-term basis.

Employment of forest and conservation workers is expected to grow more slowly than the average for all occupations. Setting aside more land to protect natural resources or wildlife habitats helps to create demand for more forest and conservation workers. In addition, recent Federal legislation designed to prevent destructive wildfires by thinning the forests and setting controlled burns may create more jobs for forest and conservation workers in those areas of the Nation with drier climates and higher susceptibility to forest fires.

New federal policy allowing some access to federal timberland may create some logging jobs, and job opportunities also will arise from owners of privately owned forests and tree farms. Nevertheless,

domestic timber producers continue to face increasing competition from foreign producers, who can harvest the same amount of timber at lower cost. As competition increases, the logging industry is expected to continue to consolidate in order to reduce costs, thereby eliminating some jobs.

Increased mechanization of logging operations and improvements in logging equipment will continue to depress demand for many manual timber-cutting and logging workers. Employment of fallers, buckers, choke setters, and other workers whose jobs are labor intensive should decline as safer laborsaving machinery and other equipment are increasingly used. Employment of machinery and equipment operators, such as tree harvesting, skidding, and log-handling equipment operators, will be less adversely affected and should rise slightly as logging companies switch away from manual tree felling.

Weather can force the curtailment of logging operations during the muddy spring season and the cold winter months, depending on the geographic region. Changes in the level of construction, particularly residential construction, also affect logging activities in the short term. In addition, logging operations must be relocated when timber in a particular area has been harvested. During prolonged periods of inactivity, some workers may stay on the job to maintain or repair logging machinery and equipment; while others are laid off or forced to find jobs in other occupations.

Earnings

Earnings vary with the particular forestry or logging occupation and with experience. Earnings range from the minimum wage in some beginning forestry and conservation positions to about \$25.46 an hour for some experienced fallers. Median hourly earnings in May 2004 for forest, conservation, and logging occupations were as follows:

Logging workers, all other	\$14.29
Fallers.....	13.23
Logging equipment operators	13.18
Log graders and scalers.....	12.29
Forest and conservation workers	9.51

Earnings of logging workers vary by size of establishment and by geographic area. Workers in the largest establishments earn more than those in the smallest ones. Workers in Alaska and the Northwest earn more than those in the South, where the cost of living is generally lower.

Forest and conservation workers who work for State and local governments or for large, private firms generally enjoy more generous benefits than do workers in smaller firms. Small logging contractor firms generally offer timber-cutting and logging workers few benefits beyond vacation leave. However, some employers offer full-time workers basic benefits, such as medical coverage, and provide safety apparel and equipment.

Related Occupations

Other occupations concerned with the care of trees and their environment include conservation scientists and foresters, forest and conservation technicians, and grounds maintenance workers. Logging equipment operators have skills similar to material-moving operators, such as industrial truck and tractor operators, and crane and tower operators.

A list of State forestry associations and other forestry-related State associations is available at most public libraries. Schools of Forestry at State land-grant colleges or universities also should be useful sources of information.

Construction Trades and Related Workers

Boilermakers

(O*NET 47-2011.00)

Significant Points

- A formal apprenticeship is the best way to learn this trade.
- Average employment growth is expected; additional openings will be created because many boilermakers are expected to retire.
- Persons with a welding certification or other welding training get priority in selection to apprenticeship programs.

Nature of the Work

Boilermakers and *boilermaker mechanics* make, install, and repair boilers, vats, and other large vessels that hold liquids and gases. Boilers supply steam to drive huge turbines in electric powerplants and to provide heat and power in buildings, factories, and ships. Tanks and vats are used to process and store chemicals, oil, beer, and hundreds of other products.

Boilers and other high-pressure vessels usually are made in sections, by casting each piece out of molten iron or steel. Manufacturers are increasingly automating this process to increase the quality of these vessels. Boiler sections are then welded together, often using automated orbital welding machines, which make more consistent welds than are possible by hand. Small boilers may be assembled in the manufacturing plant; larger boilers usually are assembled on site.

Following blueprints, boilermakers locate and mark reference points on the boiler foundation, using straightedges, squares, transits, and tape measures. Boilermakers attach rigging and signal crane operators to lift heavy frame and plate sections and other parts into place. They align sections, using plumb bobs, levels, wedges, and turnbuckles. Boilermakers use hammers, files, grinders, and cutting torches to remove irregular edges, so that edges fit properly. They then bolt or weld edges together. Boilermakers align and attach water tubes, stacks, valves, gauges, and other parts and test complete vessels for leaks or other defects. They also install refractory brick and other heat-resistant materials in fireboxes or pressure vessels. Usually, they assemble large vessels temporarily in a fabrication shop to ensure a proper fit before final assembly on the permanent site.

Because boilers last a long time—35 years or more—boilermakers regularly maintain them and update components, such as burners and boiler tubes, to increase efficiency. Boilermaker mechanics maintain and repair boilers and similar vessels. They inspect tubes, fittings, valves, controls, and auxiliary machinery and clean or supervise the cleaning of boilers using scrapers, wire brushes, and cleaning solvents. They repair or replace defective parts, using hand and power tools, gas torches, and welding equipment, and may operate metalworking machinery to repair or make parts. They also dismantle leaky boilers, patch weak spots with metal stock, replace defective sections, and strengthen joints.

Working Conditions

Boilermakers often use potentially dangerous equipment, such as acetylene torches and power grinders, handle heavy parts, and

Because boilers last a long time, boilermakers need to regularly maintain them and replace components, such as burners and boiler tubes.

work on ladders or on top of large vessels. Work is physically demanding and may be done in cramped quarters inside boilers, vats, or tanks that are often damp and poorly ventilated. In some instances, work may be done at high elevations for an extended period. To reduce the chance of injuries, boilermakers may wear hardhats, harnesses, protective clothing, safety glasses and shoes, and respirators. Boilermakers may experience extended periods of overtime when equipment is shut down for maintenance. Overtime work also may be necessary to meet construction or production deadlines. At other times there may be periods of unemployment between jobs.

Training, Other Qualifications, and Advancement

Many boilermakers learn this trade through a formal apprenticeship. Others become boilermakers through a combination of trade or technical school training and employer-provided training. Apprenticeship programs usually consist of 4 years of on-the-job training, supplemented by a minimum of 144 hours of classroom instruction each year in subjects such as set-up and assembly rigging, welding of all types, blueprint reading, and layout. Those with welding training or a welding certification will have priority in applying for apprenticeship programs. Experienced boilermakers often attend apprenticeship classes or seminars to learn about new equipment, procedures, and technology. When an apprenticeship becomes available, the local union publicizes the opportunity by notifying local vocational schools and high school vocational programs.

Some boilermakers advance to supervisory positions. Because of their broader training, apprentices usually have an advantage in promotion over those who have not gone through the full program.

Employment

Boilermakers held about 19,000 jobs in 2004. Nearly 7 out of 10 worked in the construction industry, assembling and erecting boilers and other vessels. More than 1 in 7 worked in manufacturing, primarily in boiler manufacturing shops, iron and steel plants, petroleum refineries, chemical plants, and shipyards. Some also worked for boiler repair firms or railroads.

Job Outlook

Average growth in employment of boilermakers is expected through the year 2014. Additional openings will be created by the need to replace experienced workers who are expected to retire in great numbers in the next 10 years. Unionized boilermakers are eligible to retire earlier than many other workers, partly due to the physically demanding nature of the work. Persons who have welding training or a welding certificate should have the best opportunities for being selected for boilermaker apprenticeship programs.

Growth will be limited by trends toward repairing and retrofitting, rather than replacing, existing boilers; the growing use of small boilers, which require less onsite assembly; and automation of production technologies. However, many boilers are getting older and will need replacing, which will create some demand for more boilermakers. In addition, utility companies will need to upgrade many of their boiler systems in the next few years to meet the Federal Clean Air Act. Also, as more power companies convert to coal as their primary source of fuel, additional boilers will be needed.

Most industries that purchase boilers are sensitive to economic conditions. Therefore, during economic downturns, boilermakers in the construction industry may be laid off. However, maintenance and repairs of boilers must continue even during economic downturns so boilermaker mechanics in manufacturing and other industries generally have more stable employment.

Earnings

In May 2004, the median hourly earnings of boilermakers were about \$21.68. The middle 50 percent earned between \$17.80 and \$26.82. The lowest 10 percent earned less than \$14.07, and the highest 10 percent earned more than \$32.46. Apprentices generally start at about half of journey-level wages, with wages gradually increasing to the journey wage as progress is made in the apprenticeship.

About half of all boilermakers belong to labor unions. The principal union is the International Brotherhood of Boilermakers. Other boilermakers are members of the International Association of Machinists, the United Automobile Workers, or the United Steelworkers of America.

Related Occupations

Workers in a number of other occupations assemble, install, or repair metal equipment or machines. These occupations include assemblers and fabricators; machinists; industrial machinery installation, repair, and maintenance workers, except millwrights; millwrights; pipelayers, plumbers, pipefitters, and steamfitters; sheet metal workers; tool-and-die makers; and welding, soldering, and brazing workers.

Sources of Additional Information

For further information regarding boilermaking apprenticeships or other training opportunities, contact local offices of the unions previously mentioned, local construction companies and boiler manufacturers, or the local office of your State employment service.

For information on apprenticeships and the boilermaking occupation, contact:

► International Brotherhood of Boilermakers, Iron Ship Builders, Blacksmiths, Forgers, and Helpers, 753 State Ave., Suite 570, Kansas City, KS 66101. Internet: <http://www.boilermakers.org>

Brickmasons, Blockmasons, and Stonemasons

(O*NET 47-2021.00, 47-2022.00)

Significant Points

- Job prospects are expected to be very good.
- Most entrants learn informally on the job, but apprenticeship programs provide the most thorough training.
- The work is usually outdoors and involves lifting heavy materials and working on scaffolds.
- Nearly 1 out of 3 are self-employed.

Nature of the Work

Brickmasons, blockmasons, and stonemasons work in closely related trades creating attractive, durable surfaces and structures. The work varies in complexity, from laying a simple masonry walkway to installing an ornate exterior on a highrise building. *Brickmasons* and *blockmasons*—who often are called simply *bricklayers*—build and repair walls, floors, partitions, fireplaces, chimneys, and other structures with brick, precast masonry panels, concrete block, and other masonry materials. Some brickmasons specialize in installing firebrick linings in industrial furnaces. *Stonemasons* build stone walls, as well as set stone exteriors and floors. They work with two types of stone—natural cut stone, such as marble, granite, and limestone; and artificial stone made from concrete, marble chips, or other masonry materials. Stonemasons usually work on nonresidential structures, such as houses of worship, hotels, and office buildings, but they also work on residences.

When building a structure, brickmasons use 1 of 2 methods, either the corner lead or the corner pole. Using the corner lead method, they begin by constructing a pyramid of bricks at each corner—called a lead. After the corner leads are complete, less experienced brickmasons fill in the wall between the corners using a line from corner to corner to guide each course, or layer, of brick. Due to the precision needed, corner leads are time-consuming to erect and require the skills of experienced bricklayers.

Because of the expense associated with building corner leads, some brickmasons use corner poles, also called masonry guides, that enable them to build an entire wall at the same time. They fasten the corner poles (posts) in a plumb position to define the wall line and stretch a line between them. This line serves as a guide for each course of brick. Brickmasons then spread a bed of mortar (a cement, lime, sand, and water mixture) with a trowel (a flat, bladed metal tool with a handle), place the brick on the mortar bed, and press and tap the brick into place. Depending on blueprint specifications, brickmasons either cut bricks with a hammer and chisel or saw them to fit around windows, doors, and other openings. Mortar joints are then finished with jointing tools for a sealed, neat, uniform appearance. Although brickmasons typically use steel supports, or lintels, at window and door openings, they sometimes build brick arches, which support and enhance the beauty of the brickwork.

Stonemasons often work from a set of drawings, in which each stone has been numbered for identification. Helpers may locate and carry these prenumbered stones to the masons. A derrick operator using a hoist may be needed to lift large stone pieces into place.

When building a stone wall, masons set the first course of stones into a shallow bed of mortar. They then align the stones with wedges,

plumb lines, and levels, and work them into position with a hard rubber mallet. Masons continue to build the wall by alternating layers of mortar and courses of stone. As the work progresses, masons remove the wedges, fill the joints between stones, and use a pointed metal tool, called a tuck pointer, to smooth the mortar to an attractive finish. To hold large stones in place, stonemasons attach brackets to the stone and weld or bolt these brackets to anchors in the wall. Finally, masons wash the stone with a cleansing solution to remove stains and dry mortar.

When setting stone floors, which often consist of large and heavy pieces of stone, masons first use a trowel to spread a layer of damp mortar over the surface to be covered. Using crowbars and hard rubber mallets for aligning and leveling, they then set the stone in the mortar bed. To finish, workers fill the joints and clean the stone slabs.

Masons use a special hammer and chisel to cut stone. They cut stone along the grain to make various shapes and sizes, and valuable pieces often are cut with a saw that has a diamond blade. Some masons specialize in setting marble, which, in many respects, is similar to setting large pieces of stone. Brickmasons and stonemasons also repair imperfections and cracks, and replace broken or missing masonry units in walls and floors.

Most nonresidential buildings now are built with walls made of concrete block, brick veneer, stone, granite, marble, tile, or glass. In the past, masons doing nonresidential interior work mainly built block partition walls and elevator shafts, but because many types of masonry and stone are used in the interiors of today's nonresidential structures, these workers now must be more versatile. For example, some brickmasons and blockmasons now install structural insulated wall panels and masonry accessories used in many highrise buildings.

Refractory masons are brickmasons who specialize in installing firebrick and refractory tile in high-temperature boilers, furnaces, cupolas, ladles, and soaking pits in industrial establishments. Most of these workers are employed in steel mills, where molten materials flow on refractory beds from furnaces to rolling machines.

Stonemasons often work from a set of drawings in which each stone has been numbered for identification

Working Conditions

Brickmasons, blockmasons, and stonemasons usually work outdoors, but in contrast to the past when work slowed down in the winter months, new processes and materials are allowing these masons to work in a greater variety of weather conditions. Masons stand, kneel, and bend for long periods and often have to lift heavy materials. Common hazards include injuries from tools and falls from scaffolds, but these can often be avoided when proper safety equipment is used and safety practices are followed.

Training, Other Qualifications, and Advancement

Most brickmasons, blockmasons, and stonemasons pick up their skills informally, observing and learning from experienced workers. Many others receive training in vocational education schools or from industry-based programs that are common throughout the country. Another way to learn these skills is through an apprenticeship program, which generally provides the most thorough training. Knowledge of algebra, geometry, and mechanical drawing are important in this trade.

Individuals who learn the trade on the job usually start as helpers, laborers, or mason tenders. These workers carry materials, move scaffolds, and mix mortar. When the opportunity arises, they learn from experienced craftworkers how to spread mortar, lay brick and block, or set stone. As they gain experience, they make the transition to full-fledged craftworkers. The learning period on the job may last longer than if trained in an apprenticeship program. Industry-based training programs offered through construction companies usually last between 2 and 4 years.

Apprenticeships for brickmasons, blockmasons, and stonemasons usually are sponsored by local contractors, trade associations, or by local union-management committees. The apprenticeship program requires 3 years of on-the-job training, in addition to a minimum 144 hours of classroom instruction each year in subjects such as blueprint reading, mathematics, layout work, and sketching. Applicants for apprenticeships must be at least 17 years old and in good physical condition. A high school education is preferable with courses in mathematics, mechanical drawing, and shop helpful.

Apprentices often start by working with laborers, carrying materials, mixing mortar, and building scaffolds. This period generally lasts about a month and familiarizes the apprentice with job routines and materials. Next, apprentices learn to lay, align, and join brick and block. They may also learn on the job or before they are hired to work with stone and concrete, which enables them to work with more than one masonry material.

Bricklayers who work in nonresidential construction usually work for large contractors and receive well-rounded training—normally through apprenticeship in all phases of brick or stone work. Those who work in residential construction usually work primarily for small contractors and specialize in only one or two aspects of the job.

With additional training and experience, brickmasons, blockmasons, and stonemasons may become supervisors for masonry contractors. Some eventually become owners of businesses employing many workers and may spend most of their time as managers rather than as brickmasons, blockmasons, or stonemasons. Others move into closely related areas such as construction management or building inspection.

Employment

Brickmasons, blockmasons, and stonemasons held 177,000 jobs in 2004. The vast majority were brickmasons. Workers in these crafts are employed primarily by building, specialty trade, or general contractors. Brickmasons, blockmasons, and stonemasons work throughout the country but, like the general population, are concentrated in metropolitan areas.

Nearly 1 out of 3 brickmasons, blockmasons, and stonemasons are self-employed. Many of the self-employed are contractors that work on small jobs, such as patios, walkways, and fireplaces.

Job Outlook

Job opportunities for brickmasons, blockmasons, and stonemasons are expected to be very good through 2014. A large number of masons are expected to retire over the next decade and in some areas there are not enough applicants for the skilled masonry jobs to replace those that are leaving.

Jobs for brickmasons, blockmasons, and stonemasons are also expected to increase about as fast as the average for all occupations over the 2004-14 period, as population and business growth create a need for new houses, industrial facilities, schools, hospitals, offices, and other structures. Also stimulating demand will be the need to restore a growing stock of old masonry buildings, as well as the increasing use of brick and stone for decorative work on building fronts and in lobbies and foyers. Brick exteriors should remain very popular, reflecting a growing preference for durable exterior materials requiring little maintenance.

Employment of brickmasons, blockmasons, and stonemasons, like that of many other construction workers, is sensitive to changes in the economy. When the level of construction activity falls, workers in these trades can experience periods of unemployment.

Earnings

Median hourly earnings of brickmasons and blockmasons in May 2004 were \$20.07. The middle 50 percent earned between \$15.34 and \$25.20. The lowest 10 percent earned less than \$11.68, and the highest 10 percent earned more than \$30.43. Median hourly earnings in the two industries employing the largest number of brickmasons in 2004 were \$22.98 in the nonresidential building construction industry and \$19.95 in the foundation, structure, and building exterior contractors industry.

Median hourly earnings of stonemasons in 2004 were \$16.82. The middle 50 percent earned between \$12.74 and \$21.45. The lowest 10 percent earned less than \$9.97, and the highest 10 percent earned more than \$27.23.

Earnings for workers in these trades can be reduced on occasion because poor weather and slowdowns in construction activity limit the time they can work. Apprentices or helpers usually start at about 50 percent of the wage rate paid to experienced workers. Pay increases as apprentices gain experience and learn new skills.

Some brickmasons, blockmasons, and stonemasons are members of the International Union of Bricklayers and Allied Craftworkers.

Related Occupations

Brickmasons, blockmasons, and stonemasons combine a thorough knowledge of brick, concrete block, stone, and marble with manual skill to erect attractive, yet highly durable, structures. Workers in other occupations with similar skills include carpet, floor, and tile installers and finishers; cement masons, concrete finishers, segmental pavers, and terrazzo workers; and plasterers and stucco masons.

Sources of Additional Information

For details about apprenticeships or other work opportunities in these trades, contact local bricklaying, stonemasonry, or marble-setting contractors; the Associated Builders and Contractors; a local office of the International Union of Bricklayers and Allied Craftworkers; a local joint union-management apprenticeship committee; or the nearest office of the State employment service or apprenticeship agency. Carpenters

(O*NET 47-2031.01, 47-2031.02, 47-2031.03, 47-2031.04, 47-2031.05, 47-2031.06)

Significant Points

- About one-third of all carpenters—the largest construction trade—were self-employed.
- Job opportunities should be excellent for those with the most training and all-round skills.
- To become a skilled carpenter usually takes between 3 and 4 years of both on-the-job training and classroom instruction.

Nature of the Work

Carpenters are involved in many different kinds of construction activity, from the building of highways and bridges, to the installation of kitchen cabinets. Carpenters construct, erect, install, and repair structures and fixtures made from wood and other materials. Depending on the type of work and the employer, carpenters may specialize in one or two activities or may be required to know how to perform many different tasks. Small home builders and remodeling companies may require carpenters to learn about all aspects of building a house—framing walls and partitions, putting in doors and windows, building stairs, installing cabinets and molding, and many other tasks. Large construction contractors or specialty contractors, however, may require their carpenters to perform only a few regular tasks, such as framing walls, constructing wooden forms for pouring concrete, or erecting scaffolding. Carpenters also build tunnel bracing, or brattices, in underground passageways and mines to control the circulation of air through the passageways and to worksites.

Each carpentry task is somewhat different, but most involve the same basic steps. Working from blueprints or instructions from supervisors, carpenters first do the layout—measuring, marking, and arranging materials—in accordance with local building codes. They cut and shape wood, plastic, fiberglass, or drywall using hand and power tools, such as chisels, planes, saws, drills, and sanders. They then join the materials with nails, screws, staples, or adhesives. In the final step, carpenters check the accuracy of their work with levels, rules, plumb bobs, framing squares, or electronic versions of these tools, and make any necessary adjustments. When working with prefabricated components, such as stairs or wall panels, the carpenter's task is somewhat simpler because it does not require as

Carpenters construct, erect, install, and repair structures and fixtures made primarily of wood.

much layout work or the cutting and assembly of as many pieces. Prefabricated components are designed for easy and fast installation and generally can be installed in a single operation.

Carpenters who remodel homes and other structures need a broad range of carpentry skills because they must be able to perform any of the many different tasks these jobs may require. Since they are so well-trained, these carpenters often can switch from residential building to commercial construction or remodeling work, depending on which offers the best work opportunities.

Carpenters employed outside the construction industry perform a variety of installation and maintenance work. They may replace panes of glass, ceiling tiles, and doors, as well as repair desks, cabinets, and other furniture. Depending on the employer, carpenters install partitions, doors, and windows; change locks; and repair broken furniture. In manufacturing firms, carpenters may assist in moving or installing machinery. (For more information on workers who install machinery, see the discussion of millwrights as well as industrial machinery installation, repair, and maintenance workers, except millwrights, elsewhere in the *Handbook*.)

Working Conditions

As is true of other building trades, carpentry work is sometimes strenuous. Prolonged standing, climbing, bending, and kneeling often are necessary. Carpenters risk injury working with sharp or rough materials, using sharp tools and power equipment, and working in situations where they might slip or fall. Although many carpenters work indoors, those that work outdoors are subject to variable weather conditions.

Some carpenters change employers each time they finish a construction job. Others alternate between working for a contractor and working as contractors themselves on small jobs, depending on where the work is available.

Training, Other Qualifications, and Advancement

Carpenters learn their trade through formal and informal training programs. To become a skilled carpenter usually takes between

3 and 4 years of both classroom and on-the-job training. While there are a number of different ways to obtain this training, in general, the more formalized the process, the more skilled you will become, and the more in demand by employers. For some, this training can begin in a high school, where classes in English, algebra, geometry, physics, mechanical drawing, blueprint reading, and general shop are recommended. After high school, there are a number of different avenues that one can take to obtain the necessary training. One of the ways is to obtain a job with a contractor who will then provide on-the-job training. Entry-level workers generally start as helpers, assisting more experienced workers. During this time, the carpenter's helper may elect to attend a trade or vocational school, or community college to receive further trade-related training.

Some employers, particularly large nonresidential construction contractors with union membership, offer employees formal apprenticeships. These programs combine on-the-job training with related classroom instruction. Apprenticeship applicants usually must be at least 18 years old and meet local requirements; some union locals, for example, test an applicant's aptitude for carpentry. Apprenticeship programs are usually 3 to 4 years in length, but vary with the apprentice's skill. The number of apprenticeship programs is limited, however, so only a small proportion of carpenters learn their trade through these programs, mostly those working for commercial and industrial building contractors.

On the job, apprentices learn elementary structural design and become familiar with common carpentry jobs, such as layout, form building, rough framing, and outside and inside finishing. They also learn to use the tools, machines, equipment, and materials of the trade. Apprentices receive classroom instruction in safety, first aid, blueprint reading, freehand sketching, basic mathematics, and various carpentry techniques. Both in the classroom and on the job, they learn the relationship between carpentry and the other building trades.

Some persons aiming for carpentry careers choose to obtain their classroom training before seeking a job. There are a number of public and private vocational-technical schools and training academies affiliated with the unions and contractors that offer training to become a carpenter. Employers often look favorably upon these students and usually start them at a higher level than those without the training.

Some skills needed to become a carpenter include manual dexterity, eye-hand coordination, physical fitness, and a good sense of balance. The ability to solve arithmetic problems quickly and accurately also is required. In addition, a good work history or military service is viewed favorably by contractors.

Carpenters usually have greater opportunities than most other construction workers to become general construction supervisors because carpenters are exposed to the entire construction process. For those who would like to advance, it is increasingly important to be able to communicate in both English and Spanish in order to relay instructions and safety precautions to workers with limited understanding of English; Spanish-speaking workers make up a large part of the construction workforce in many areas. Carpenters may advance to carpentry supervisor or general construction supervisor positions. Others may become independent contractors. Supervisors and contractors need good communication skills to deal with clients and subcontractors, should be able to identify and estimate the quantity of materials needed to complete a job, and accurately estimate how long a job will take to complete and at what cost.

Employment

Carpenters are employed throughout the country in almost every community and make up the largest building trades occupation. They held about 1.3 million jobs in 2004. About one-third worked in building construction and about one-fifth worked for special trade contractors. Most of the rest of the wage and salary workers worked

for manufacturing firms, government agencies, retail establishments and a wide variety of other industries. About one-third of all carpenters were self-employed.

Job Outlook

Job opportunities for carpenters are expected to be excellent over the 2004-14 period, particularly for those with the most skills. Employment of carpenters is expected to increase about as fast as average for all occupations through 2014, and turnover also creates a large number of openings each year. Contractors report having trouble finding skilled carpenters to fill many of their openings, due in part to the fact that many jobseekers are not inclined to go into construction, preferring work that is less strenuous with more comfortable working conditions. Also, many people with limited skills take jobs as carpenters but eventually leave the occupation because they dislike the work or cannot find steady employment.

The need for carpenters is expected to grow as construction activity increases in response to demand for new housing, office and retail space, and for modernizing and expanding schools and industrial plants. A strong home remodeling market also will create a large demand for carpenters.

Some of the demand for carpenters, however, will be offset by expected productivity gains resulting from the increasing use of prefabricated components and improved fasteners and tools. Prefabricated wall panels, roof assemblies and stairs and prehung doors and windows can be installed very quickly. Instead of having to be built on the worksite, prefabricated walls, partitions, and stairs can be lifted into place in one operation; beams—and, in some cases, entire roof assemblies—are lifted into place using a crane. As prefabricated components become more standardized, builders will use them more often. In addition, improved adhesives are reducing the time needed to join materials, and lightweight, cordless, and pneumatic tools—such as nailers and drills—will all continue to make carpenters more efficient. New and improved tools, equipment, techniques, and materials also have vastly increased carpenter versatility.

Carpenters with all-round skills will have better opportunities for steady work than carpenters who can perform only a few relatively simple, routine tasks. Carpenters can experience periods of unemployment because of the short-term nature of many construction projects, winter slowdowns in construction activity in northern areas, and the cyclical nature of the construction industry. During economic downturns, the number of job openings for carpenters declines. Building activity depends on many factors that vary with the state of the economy—interest rates, availability of mortgage funds, government spending, and business investment.

Job opportunities for carpenters also vary by geographic area. Construction activity parallels the movement of people and businesses and reflects differences in local economic conditions. The areas with the largest population increases will also provide the best job opportunities for carpenters and apprenticeship opportunities for persons seeking to enter carpentry.

Earnings

In May 2004, median hourly earnings of carpenters were \$16.78. The middle 50 percent earned between \$12.91 and \$22.62. The lowest 10 percent earned less than \$10.36, and the highest 10 percent earned more than \$28.65. Median hourly earnings in the industries employing the largest numbers of carpenters in May 2004 were as follows:

Nonresidential building construction.....	\$18.70
Building finishing contractors.....	17.51
Residential building construction	16.48
Foundation, structure, and building exterior contractors	16.40
Employment services	13.94

Earnings can be reduced on occasion, because carpenters lose worktime in bad weather and during recessions when jobs are unavailable.

Some carpenters are members of the United Brotherhood of Carpenters and Joiners of America.

Related Occupations

Carpenters are skilled construction workers. Other skilled construction occupations include brickmasons, blockmasons, and stonemasons; cement masons, concrete finishers, segmental pavers, and terrazzo workers; electricians; pipelayers, plumbers, pipefitters, and steamfitters; and plasterers and stucco masons.

Sources of Additional Information

For information about carpentry apprenticeships or other work opportunities in this trade, contact local carpentry contractors, locals of the union mentioned above, local joint union-contractor apprenticeship committees, or the nearest office of the State employment service or apprenticeship agency. You can also find information on the registered apprenticeship system with links to State apprenticeship programs on the U.S. Department of Labor’s website: http://www.doleta.gov/atels_bat

Carpet, Floor, and Tile Installers and Finishers

(O*NET 47-2041.00, 47-2042.00, 47-2043.00, 47-2044.00)

Significant Points

- Around two-fifths of all carpet, floor, and tile installers and finishers are self-employed.
- Most workers learn on the job.
- Tile installers and setters will see the fastest growth; carpet installers will have the most job openings.
- Employment of carpet, floor, and tile installers and finishers is less sensitive to fluctuations in construction activity than that of other construction trades workers.

Nature of the Work

Carpet, tile, and other types of floor coverings not only serve an important basic function in buildings, but their decorative qualities also contribute to the appeal of the buildings. Carpet, floor, and tile installers and finishers lay these floor coverings in homes, offices, hospitals, stores, restaurants, and many other types of buildings. Tile also may be installed on walls and ceilings.

Before installing carpet, *carpet installers* first inspect the surface to be covered to determine its condition and, if necessary, correct any imperfections that could show through the carpet or cause the

carpet to wear unevenly. They must measure the area to be carpeted and plan the layout, keeping in mind expected traffic patterns and placement of seams for best appearance and maximum wear.

When installing wall-to-wall carpet without tacks, installers first fasten a tackless strip to the floor, next to the wall. They then install the padded cushion or underlay. Next, they roll out, measure, mark, and cut the carpet, allowing for 2 to 3 inches of extra carpet for the final fitting. Using a device called a “knee kicker,” they position the carpet, stretching it to fit evenly on the floor and snugly against each wall and door threshold. They then cut off the excess carpet. Finally, using a power stretcher, they stretch the carpet, hooking it to the tackless strip to hold it in place. The installers then finish the edges using a wall trimmer.

Because most carpet comes in 12-foot widths, wall-to-wall installations require installers to join carpet sections together for large rooms. The installers join the sections using heat-taped seams—seams held together by a special plastic tape that is activated by heat.

On special upholstery work, such as stairs, carpet may be held in place with staples. Also, in commercial installations, carpet often is glued directly to the floor or to padding that has been glued to the floor.

Carpet installers use hand tools such as hammers, drills, staple guns, carpet knives, and rubber mallets. They also may use carpet-laying tools, such as carpet shears, knee kickers, wall trimmers, loop pile cutters, heat irons, and power stretchers.

Floor installers and floor layers lay floor coverings such as laminate, linoleum, vinyl, cork, and rubber for decorative purposes, or to deaden sounds, absorb shocks, or create air-tight environments. Although they also may install carpet, wood or tile, that is not their main job. Before installing the floor, floor layers inspect the surface to be covered and, if necessary, correct any imperfections in order to start with a smooth, clean foundation. They measure and cut floor covering materials according to plans or blueprints. Next, they may nail or staple a wood underlayment to the surface or may use an adhesive to cement the foundation material to the floor; the foundation helps to deaden sound and prevents the top floor covering from wearing at board joints. Finally, floor layers install the floor covering to form a tight fit.

After a carpenter installs a new hardwood floor or when a customer wants to refinish an old wood floor, *floor sanders and finishers* are called in to smooth any imperfections in the wood and apply finish coats of varnish or polyurethane. To remove imperfections and smooth the surface, they will scrape and sand wooden floors using floor-sanding machines. They then inspect the floor and remove excess glue from joints using a knife or wood chisel and may further sand the wood surfaces by hand, using sandpaper. Finally, they apply coats of finish.

Tile installers, tilesetters, and marble setters apply hard tile and marble to floors, walls, ceilings, countertops, and roof decks. Tile and marble are durable, impervious to water, and easy to clean, making them a popular building material in hospitals, tunnels, lobbies of buildings, bathrooms, and kitchens.

Prior to installation, tilesetters use measuring devices and levels to ensure that the tile is placed in a consistent manner. Tile varies in color, shape, and size, ranging in size from 1 inch to 24 or more inches on a side, so tilesetters sometimes prearrange tiles on a dry floor according to the intended design. This allows them to examine the pattern, check that they have enough of each type of tile, and determine where they will have to cut tiles to fit the design in the available space. In order to cover all exposed areas, including corners and around pipes, tubs, and wash basins, tilesetters cut tiles to fit with a machine saw or a special cutting tool. To set tile on a flat, solid surface such as drywall, concrete, plaster, or wood,

tilesetters first use a tooth-edged trowel to spread a “thin set,” or thin layer, of cement adhesive or “mastic,” a very sticky paste. They then properly position the tile and gently tap the surface with their trowel handle, rubber mallet, and/or a small block of wood to seat the tile evenly and firmly.

To apply tile to an area that lacks a solid surface, tilesetters nail a support of metal mesh or tile backer board to the wall or ceiling to be tiled. They use a trowel to apply a cement mortar—called a “scratch coat”—onto the metal screen, and scratch the surface of the soft mortar with a small tool similar to a rake. After the scratch coat has dried, tilesetters apply a brown coat of mortar to level the surface, and then apply mortar to the brown coat and place tile it onto the surface.

When the cement or mastic has set, tilesetters fill the joints with “grout,” which is very fine cement and includes sand for joints 1/8th of an inch and larger. They then apply the grout to the surface with a rubber-edged device called a grout float or a grouting trowel to dress the joints and remove excess grout. Before the grout sets, they finish the joints with a damp sponge for a uniform appearance.

Marble setters cut and set marble slabs in floors and walls of buildings. They trim and cut marble to specified size using a power wet saw, other cutting equipment, or handtools. After setting the marble in place, they polish the marble to high luster using power tools or by hand.

Working Conditions

Carpet, floor, and tile installers and finishers generally work indoors and have regular daytime hours. However, when floor covering installers need to work in occupied stores or offices, they may work evenings and weekends to avoid disturbing customers or employees. Installers and finishers usually work under better conditions than do most other construction workers. By the time workers install carpets, flooring, or tile in a new structure, most construction has been completed and the work area is relatively clean and uncluttered. Installing these materials is labor intensive; workers spend much of

In order to cover all exposed areas, including in corners and around pipes, tilesetters use a machine saw or a special cutting tool to cut tiles to fit.

their time bending, kneeling, and reaching—activities that require endurance. Carpet installers frequently lift heavy rolls of carpet and may move heavy furniture. Safety regulations may require that they wear kneepads or safety goggles when using certain tools. Carpet and floor layers may be exposed to fumes from various kinds of glue and to fibers of certain types of carpet.

Although workers are subject to cuts from tools or materials, falls from ladders, and strained muscles, the occupation is not as hazardous as some other construction occupations.

Training, Other Qualifications, and Advancement

The vast majority of carpet, floor, and tile installers and finishers learn their trade informally on the job. A few, mostly tile setters, learn through formal apprenticeship programs taking nearly 3 years to complete, which include on-the-job training as well as related classroom instruction.

Informal training for carpet installers often is sponsored by individual contractors. Workers start as helpers, and begin with simple assignments, such as installing stripping and padding, or helping to stretch newly installed carpet. With experience, helpers take on more difficult assignments, such as measuring, cutting, and fitting.

Tile and marble setters also learn their craft mostly through on-the-job training. They start by helping carry materials and learning about the tools of the trade. They then learn to prepare the subsurface for tile or marble. As they progress they learn to cut the tile and marble to fit the job. They will also learn to apply grout and sealants used in finishing the materials to give it its final appearance. Apprenticeship programs and some contractor-sponsored programs provide comprehensive training in all phases of the tilesetting and floor layer trades.

Floor layers, except carpet, wood, and hard tile, learn on the job and begin by learning how to use the tools of the trade. They next learn to prepare surfaces to receive flooring. As they progress, they learn to cut and install the various floor coverings.

Some skills needed to become carpet, floor, and tile installers and finishers include manual dexterity, eye-hand coordination, physical fitness, and a good sense of balance and color. The ability to solve arithmetic problems quickly and accurately also is required. In addition, reliability and a good work history is viewed favorably by contractors.

Carpet, floor, and tile installers and finishers may advance to positions as supervisors or become salespersons or estimators. In these positions, they should be able to identify and estimate the quantity of materials needed to complete a job, and accurately estimate how long a job will take to complete and at what cost.

Some carpet installers may become managers for large installation firms. Many carpet, floor, and tile installers and finishers who begin working for someone else eventually go into business for themselves as independent subcontractors. Around two-fifths of all carpet, floor, and tile installers and finishers are self-employed.

For those who would like to advance, it is increasingly important to be able to communicate in both English and Spanish in order to relay instructions and safety precautions to workers with limited understanding of English; Spanish-speaking workers make up a large part of the construction workforce in many areas. Workers who want to advance supervisor jobs or become contractors need good English skills to deal with clients and subcontractors.

Employment

Carpet, floor, and tile installers and finishers held about 184,000 jobs in 2004. About 42 percent of all carpet, floor, and tile installers and finishers were self-employed, compared with 19 percent of all construction trades workers. The following tabulation shows 2004 wage and salary employment by specialty:

Tile and marble setters	44,000
Carpet installers	41,000
Floor layers, except carpet, wood, and hard tiles.....	16,000
Floor sanders and finishers.....	7,000

Many carpet installers work for flooring contractors or floor covering retailers. Most salaried tilesetters are employed by tilesetting contractors who work mainly on nonresidential construction projects, such as schools, hospitals, and office buildings. Most self-employed tilesetters work on residential projects.

Although carpet, floor, and tile installers and finishers are employed throughout the Nation, they tend to be concentrated in populated areas where there are high levels of construction activity.

Job Outlook

Employment of carpet, floor, and tile installers and finishers is expected to grow about as fast as the average for all occupations through the year 2014, reflecting the continued need to renovate and refurbish existing structures. Job growth and opportunities, however, will differ among the individual occupations. Tile and marble setters will have faster than average job growth and excellent job opportunities as demand for these workers outstrips the supply; however, because it is a small occupation, job openings will be limited. Carpet installers, the largest specialty, should have the most job openings due to high turnover in this occupation. Employment of floor sanders and finishers—a small specialty—is projected to grow more slowly than average due to the increasing use of prefinished hardwood and laminate flooring.

Carpet is expected to increasingly be used as a floor covering in nonresidential structures such as schools, offices, and hospitals. Residential homes will also continue to use carpet in many areas of the house, although other flooring types are currently more popular. Carpet is also required or highly recommended in many multifamily structures as it provides sound dampening.

Demand for tile and marble setters will stem from population and business growth, which will result in more construction of shopping malls, hospitals, schools, restaurants, and other structures in which tile is used extensively. Tile is also becoming more popular as a building material in residential structures, particularly in the growing number of more expensive homes.

Demand for floor sanders and finishers will be primarily based on growth in the residential construction and remodeling market, as homeowners increasingly choose hardwood as their flooring of choice. The need to periodically refinish older wood floors will also continue to generate demand, but growth will be slowed by the use of more prefinished hardwood and more durable finishes and laminate products that look like wood. Slow employment growth, together with the small size of this occupation, will result in relatively few job openings for these workers.

Employment of carpet, floor, and tile installers and finishers is less sensitive to changes in construction activity than most other construction occupations because much of the work involves replacing worn carpet and other flooring in existing buildings. As a result, these workers tend to be less affected by slowdowns in new construction activity.

Earnings

In May 2004, the median hourly earnings of carpet installers were \$16.39. The middle 50 percent earned between \$11.94 and \$22.20. The lowest 10 percent earned less than \$9.16, and the top 10 percent earned more than \$29.27. In May 2004, median hourly earnings of carpet installers were \$16.55 working for building finishing contractors, and \$15.43 for home furnishings stores.

Carpet installers are paid either on an hourly basis, or by the number of yards of carpet installed. The rates vary widely depending on the geographic location and whether the installer is affiliated with a union.

Median hourly earnings of floor layers except carpet, wood, and hard tiles were \$15.68 in May 2004. The middle 50 percent earned between \$11.80 and \$20.93. The lowest 10 percent earned less than \$8.98, and the top 10 percent earned more than \$28.09.

Median hourly earnings of floor sanders and finishers were \$12.88 in May 2004. The middle 50 percent earned between \$10.30 and \$16.47. The lowest 10 percent earned less than \$8.91, and the top 10 percent earned more than \$21.03.

Median hourly earnings of tile and marble setters were \$17.02 in May 2004. The middle 50 percent earned between \$12.69 and \$22.59. The lowest 10 percent earned less than \$9.85, and the top 10 percent earned more than \$29.35. Earnings of tile and marble setters also vary greatly by geographic location and by union membership status.

Apprentices and other trainees usually start out earning about half of what an experienced worker earns, although their wage rate increases as they advance through the training program.

Some carpet, floor, and tile installers and finishers belong to the United Brotherhood of Carpenters and Joiners of America. Some tilesetters belong to the International Union of Bricklayers and Allied Craftsmen, while some carpet installers belong to the International Brotherhood of Painters and Allied Trades.

Related Occupations

Carpet, floor, and tile installers and finishers measure, cut, and fit materials to cover a space. Workers in other occupations involving similar skills, but using different materials, include brickmasons, blockmasons, and stonemasons; carpenters; cement masons, concrete finishers, segmental pavers, and terrazzo workers; drywall installers, ceiling tile installers, and tapers; painters and paperhangers; roofers; and sheet metal workers.

Sources of Additional Information

For details about apprenticeships or work opportunities, contact local flooring or tiling contractors or retailers, locals of the unions previously mentioned, or the nearest office of the State apprenticeship agency or employment service.

Cement Masons, Concrete Finishers, Segmental Pavers, and Terrazzo Workers

(O*NET 47-2051.00, 47-2053.00, 47-4091.00)

Significant Points

- Job opportunities are expected to be good due to a combination of job growth and a growing number of retirements.
- Most learn the job through a combination of classroom and on-the-job training that can take 3 to 4 years.
- Like many other construction trades, these workers may experience reduced earnings and layoffs during downturns in construction activity.
- Cement masons often work overtime, with premium pay, because once concrete has been placed, the job must be completed.

Nature of the Work

Cement masons, concrete finishers, and terrazzo workers all work with concrete, one of the most common and durable materials used in construction. Once set, concrete—a mixture of Portland cement, sand, gravel, and water—becomes the foundation for everything from decorative patios and floors to huge dams or miles of roadways.

Cement masons and *concrete finishers* place and finish the concrete. They also may color concrete surfaces; expose aggregate (small stones) in walls and sidewalks; or fabricate concrete beams, columns, and panels. In preparing a site for placing concrete, cement masons first set the forms for holding the concrete and properly align them. They then direct the casting of the concrete and supervise laborers who use shovels or special tools to spread it. Masons then guide a straightedge back and forth across the top of the forms to “screed,” or level, the freshly placed concrete. Immediately after leveling the concrete, masons carefully smooth the concrete surface with a “bull float,” a long-handled tool about 8 by 48 inches that covers the coarser materials in the concrete and brings a rich mixture of fine cement paste to the surface.

After the concrete has been leveled and floated, concrete finishers press an edger between the forms and the concrete and guide it along the edge and the surface. This produces slightly rounded edges and helps prevent chipping or cracking. Concrete finishers use a special tool called a “groover” to make joints or grooves at specific intervals that help control cracking. Next, they trowel the surface using either a powered or hand trowel, a small, smooth, rectangular metal tool.

Sometimes, cement masons perform all the steps of laying concrete, including the finishing. As the final step, they retrowel the concrete surface back and forth with powered and hand trowels to create a smooth finish. For a coarse, nonskid finish, masons brush the surface with a broom or stiff-bristled brush. For a pebble finish, they embed small gravel chips into the surface. They then wash any excess cement from the exposed chips with a mild acid solution. For color, they use colored premixed concrete. On concrete surfaces that will remain exposed after the forms are stripped, such as columns, ceilings, and wall panels, cement masons cut away high spots and loose concrete with hammer and chisel, fill any large indentations with a Portland cement paste, and smooth the surface with a carborundum stone. Finally, they coat the exposed area with a rich Portland cement mixture, using either a special tool or a coarse cloth to rub the concrete to a uniform finish.

Throughout the entire process, cement masons must monitor how the wind, heat, or cold affects the curing of the concrete. They must have a thorough knowledge of concrete characteristics so that, by using sight and touch, they can determine what is happening to the concrete and take measures to prevent defects.

Segmental pavers lay out, cut, and install pavers, which are flat pieces of masonry usually made from compacted concrete or brick. Pavers are used to pave paths, patios, playgrounds, driveways, and steps. They are manufactured in various textures and often interlock together to form an attractive pattern. Segmental pavers first prepare the site by removing the existing pavement or soil. They grade the remaining soil to the proper depth and determine the amount of base material that is needed, depending on the local soil conditions. They then install and compact the base material, a granular material that compacts easily, and lay the pavers from the center out, so that any trimmed pieces will be on the outside rather than in the center. Then, they install edging materials to prevent the pavers from shifting and fill the spaces between the pavers with dry sand.

Terrazzo workers create attractive walkways, floors, patios, and panels by exposing marble chips and other fine aggregates on the surface of finished concrete. Much of the preliminary work of terrazzo workers is similar to that of cement masons. Attractive, marble-chip terrazzo requires three layers of materials. First, cement masons or terrazzo workers build a solid, level concrete foundation that is 3 to 4 inches deep. After the forms are removed from the foundation, workers add a 1-inch layer of sandy concrete. Terrazzo workers partially embed, or attach with adhesive, metal divider strips in the concrete wherever there is to be a joint or change of color in the terrazzo. For the final layer, terrazzo workers blend and place into each of the panels a fine marble chip mixture that may be color-pigmented. While the mixture is still wet, workers add additional marble chips of various colors into each panel and roll a lightweight roller over the entire surface.

When the terrazzo is thoroughly set, helpers grind it with a terrazzo grinder, which is somewhat like a floor polisher, only much heavier. Any depressions left by the grinding are filled with a matching grout material and hand-troweled for a smooth, uniform surface. Terrazzo workers then clean, polish, and seal the dry surface for a lustrous finish.

Working Conditions

Concrete, segmental paving, or terrazzo work is fast-paced and strenuous, and requires continuous physical effort. Because most finishing is done at floor level, workers must bend and kneel of-

Cement masons and concrete finishers spread the concrete, and then smooth and finish the surfaces.

ten. Many jobs are outdoors, and work is generally halted during inclement weather. The work, either indoors or outdoors, may be in areas that are muddy, dusty, or dirty. To avoid chemical burns from uncured concrete and sore knees from frequent kneeling, many workers wear kneepads. Workers usually also wear water-repellent boots while working in wet concrete.

Training, Other Qualifications, and Advancement

Most cement masons, concrete finishers, segmental pavers, and terrazzo workers learn their trades either through on-the-job training as helpers, or through 3-year or 4-year apprenticeship programs. Some workers also learn their jobs by attending trade or vocational-technical schools.

Many masons and finishers first gain experience as construction laborers. (See the section on construction laborers elsewhere in the *Handbook*.) When hiring helpers and apprentices, employers prefer high school graduates who are at least 18 years old, possess a driver's license, and are in good physical condition. The ability to get along with others is also important because cement masons frequently work in teams. High school courses in general science, mathematics, and vocational-technical subjects, such as blueprint reading and mechanical drawing provide a helpful background.

On-the-job training programs consist of informal instruction, in which experienced workers teach helpers to use the tools, equipment, machines, and materials of the trade. Trainees begin with tasks such as edging, jointing, and using a straightedge on freshly placed concrete. As training progresses, assignments become more complex, and trainees can usually do finishing work within a short time.

Apprenticeship programs usually are sponsored by local contractors, trade associations, or by local union-management committees. They provide on-the-job training in addition to the recommended minimum of 144 hours of classroom instruction each year. A written test and a physical exam may be required. In the classroom, apprentices learn applied mathematics, blueprint reading, and safety. Apprentices generally receive special instruction in layout work and cost estimation.

Cement masons, concrete finishers, segmental pavers, and terrazzo workers should enjoy doing demanding work. They should take pride in craftsmanship and be able to work without close supervision.

With additional training, cement masons, concrete finishers, segmental pavers, or terrazzo workers may become supervisors for masonry contractors, or move into construction management, building inspection, or contract estimation. Some eventually become owners of businesses, where they may spend most of their time managing rather than practicing their original trade. For those who want to own their own business, taking business classes will help to prepare workers for operating a business.

Employment

Cement masons, concrete finishers, segmental pavers, and terrazzo workers held about 209,000 jobs in 2004; segmental pavers and terrazzo workers accounted for only a small portion of the total. Most cement masons and concrete finishers worked for specialty trade contractors, primarily foundation, structure, and building exterior contractors. They also worked for contractors in residential and non-residential building construction and in heavy and civil engineering construction on projects such as highways; bridges; shopping malls; or large buildings such as factories, schools, and hospitals. A small number were employed by firms that manufacture concrete products. Most segmental pavers and terrazzo workers worked for specialty trade contractors who install decorative floors and wall panels.

Less than 5 percent of cement masons, concrete finishers, segmental pavers, and terrazzo workers were self-employed, a smaller proportion than in other building trades. Most self-employed masons specialized in small jobs, such as driveways, sidewalks, and patios.

Job Outlook

Opportunities for cement masons, concrete finishers, segmental pavers, and terrazzo workers are expected to be good, particularly for those with the most experience and skills. Employers report difficulty in finding workers with the right skills, as many qualified jobseekers often prefer work that is less strenuous and has more comfortable working conditions.

Employment of cement masons, concrete finishers, segmental pavers, and terrazzo workers is expected to grow as fast as average for all occupations through 2014. These workers will be needed to build new highways, bridges, factories, and other residential and nonresidential structures to meet the demand of a growing population. Additionally, cement masons will be needed to repair and renovate existing highways and bridges, which are deteriorating rapidly, and other aging structures. The increasing use of concrete as a building material, particularly since September 2001, will add to the demand. In addition to job growth, there are expected to be a significant number of retirements over the next decade, which will create more job openings.

Employment of cement masons, concrete finishers, segmental pavers, and terrazzo workers, like that of many other construction workers, is sensitive to the fluctuations of the economy. Workers in these trades may experience periods of unemployment when the overall level of construction falls. On the other hand, shortages of these workers may occur in some areas during peak periods of building activity.

Earnings

In May 2004, the median hourly earnings of cement masons and concrete finishers were \$15.10. The middle 50 percent earned between \$11.76 and \$20.11. The bottom 10 percent earned less than \$9.53, and the top 10 percent earned over \$25.89. Median hourly earnings in the industries employing the largest numbers of cement masons and concrete finishers in May 2004 were as follows:

Residential building construction	\$16.28
Nonresidential building construction.....	15.91
Other specialty trade contractors	15.58
Foundation, structure, and building exterior contractors	14.98
Highway, street, and bridge construction.....	14.86

In May 2004, the median hourly earnings of terrazzo workers and finishers were \$13.45. The middle 50 percent earned between \$10.44 and \$19.57. The bottom 10 percent earned less than \$9.07, and the top 10 percent earned over \$25.72.

Like those of other construction trades workers, earnings of cement masons, concrete finishers, segmental pavers, and terrazzo workers may be reduced on occasion because poor weather and slowdowns in construction activity limit the amount of time they can work. Nonunion workers generally have lower wage rates than union workers. Apprentices usually start at 50 to 60 percent of the rate paid to experienced workers. Cement masons often work overtime, with premium pay, because once concrete has been placed, the job must be completed.

Some cement masons, concrete finishers, segmental pavers, and terrazzo workers belong to unions, mainly the Operative Plasterers' and Cement Masons' International Association of the United States and Canada and the International Union of Bricklayers and Allied Craftworkers. A few terrazzo workers belong to the United Brotherhood of Carpenters and Joiners of the United States.

Related Occupations

Cement masons, concrete finishers, segmental pavers, and terrazzo workers combine skill with knowledge of building materials to

construct buildings, highways, and other structures. Other occupations involving similar skills and knowledge include brickmasons, blockmasons, and stonemasons; carpet, floor, and tile installers and finishers; drywall installers, ceiling tile installers, and tapers; and plasterers and stucco masons.

Construction and Building Inspectors

(O*NET 47-4011.00)

Significant Points

- About 45 percent of inspectors worked for local governments, primarily municipal or county building departments.
- Many home inspectors are self-employed.
- Opportunities should be best for experienced construction supervisors and craftworkers who have some college education, engineering or architectural training, or certification as construction inspectors or plan examiners.
- Home inspection has become a standard practice in the home-purchasing process, creating more opportunities for home inspectors.

Nature of the Work

Construction and building inspectors examine buildings, highways and streets, sewer and water systems, dams, bridges, and other structures to ensure that their construction, alteration, or repair complies with building codes and ordinances, zoning regulations, and contract specifications. Building codes and standards are the primary means

by which building construction is regulated in the United States for the health and safety of the general public. National model building codes are published by the International Code Council (ICC), although many localities have additional ordinances and codes that modify or add to the National model codes. To monitor compliance with regulations, inspectors make an initial inspection during the first phase of construction and follow up with further inspections throughout the construction project. However, no inspection is ever exactly the same. In areas where certain types of severe weather or natural disasters—such as earthquakes or hurricanes—are more common, inspectors monitor compliance with additional safety regulations designed to protect structures and occupants during those events.

There are many types of inspectors. *Building inspectors* inspect the structural quality and general safety of buildings. Some specialize in such areas as structural steel or reinforced-concrete structures. Before construction begins, *plan examiners* determine whether the plans for the building or other structure comply with building code regulations and whether they are suited to the engineering and environmental demands of the building site. To inspect the condition of the soil and the positioning and depth of the footings, inspectors visit the worksite before the foundation is poured. Later, they return to the site to inspect the foundation after it has been completed. The size and type of structure, as well as the rate at which it proceeds toward completion, determine the number of other site visits they must make. Upon completion of the project, they make a final, comprehensive inspection.

In addition to structural characteristics, a primary concern of building inspectors is fire safety. They inspect structures' fire sprinklers, alarms, smoke control systems, fire exits. Inspectors assess the type of construction, contents of the building, adequacy of fire protection equipment, and risks posed by adjoining buildings.

Electrical inspectors examine the installation of electrical systems and equipment to ensure that they function properly and comply with electrical codes and standards. They visit worksites to inspect new and existing sound and security systems, wiring, lighting, motors, and generating equipment. They also inspect the installation of the electrical wiring for heating and air-conditioning systems, appliances, and other components.

Elevator inspectors examine lifting and conveying devices such as elevators, escalators, moving sidewalks, lifts and hoists, inclined railways, ski lifts, and amusement rides.

Home inspectors conduct inspections of newly built or previously owned homes, condominiums, town homes, manufactured homes, residential-unit living (apartments), and at times commercial buildings. Home inspection has become a standard practice in the home-purchasing process. Typically, home inspectors are hired by prospective home buyers to inspect and report on the condition of a home's systems, components, and structure. Although they look for and report violations of building codes, they do not have the power to enforce compliance with the codes. Typically, are hired either immediately prior to a purchase offer on a home or as a contingency to a sales contract. In addition to examining structural quality, home inspectors inspect all home systems and features, including roofing as well as the exterior, site, attached garage or carport, foundation, interior, plumbing, electrical, and heating and cooling systems. Some home inspections are done for homeowners who want an evaluation of their home's condition or as a way to diagnose problems.

Mechanical inspectors inspect the installation of the mechanical components of commercial kitchen appliances, heating and air-conditioning equipment, gasoline and butane tanks, gas and oil piping, and gas-fired and oil-fired appliances. Some specialize in boilers or ventilating equipment as well.

Plumbing inspectors examine plumbing systems, including private disposal systems, water supply and distribution systems, plumbing fixtures and traps, and drain, waste, and vent lines.

Public works inspectors ensure that Federal, State, and local government construction of water and sewer systems, highways, streets, bridges, and dams conforms to detailed contract specifications. They inspect excavation and fill operations, the placement of forms for concrete, concrete mixing and pouring, asphalt paving, and grading operations. They record the work and materials used so that contract payments can be calculated. Public works inspectors may specialize in highways, structural steel, reinforced concrete, or ditches. Others specialize in dredging operations required for bridges and dams or for harbors.

The owner of a building or structure under construction employs *specification inspectors* to ensure that work is done according to design specifications. Specification inspectors represent the owner's interests, not those of the general public. Insurance companies and financial institutions also may use the services of specification inspectors.

Details concerning construction projects, building and occupancy permits, and other documentation generally are stored on computers so that they can easily be retrieved, kept accurate, and be updated. For example, inspectors may use laptop computers to record their findings while inspecting a site. Most inspectors use computers to help them monitor the status of construction inspection activities and keep track of permits issued, and some can access all construction and building codes from their computers on the jobsite, decreasing the need for paper binders. However, many inspectors continue to use a paper checklist to detail their findings.

Although inspections are primarily visual, inspectors may use tape measures, survey instruments, metering devices, and equipment such as concrete strength measurers. They keep a log of their work, take photographs, and file reports. Many inspectors also use laptops or other portable electronic devices onsite to facilitate the accuracy of their written reports, as well as e-mail and fax machines to send

About 45 percent of all construction and building inspectors work for local governments, while many home inspectors are self-employed.

out the results. If necessary, they act on their findings. For example, government and construction inspectors notify the construction contractor, superintendent, or supervisor when they discover a violation of a code or ordinance or something that does not comply with the contract specifications or approved plans. If the problem is not corrected within a reasonable or otherwise specified period, government inspectors have authority to issue a “stop-work” order.

Many inspectors also investigate construction or alterations being done without proper permits. Inspectors who are employees of municipalities enforce laws pertaining to the proper design, construction, and use of buildings. They direct violators of permit laws to obtain permits and to submit to inspection.

Working Conditions

Construction and building inspectors usually work alone. However, several may be assigned to large, complex projects, particularly because inspectors tend to specialize in different areas of construction. Although they spend considerable time inspecting construction worksites, inspectors also spend time in a field office reviewing blueprints, answering letters or telephone calls, writing reports, and scheduling inspections.

Many construction sites are dirty and may be cluttered with tools, materials, or debris. Inspectors may have to climb ladders or many flights of stairs or crawl around in tight spaces. Although their work generally is not considered hazardous, inspectors, like other construction workers, wear hardhats and adhere to other safety requirements while at a construction site.

Inspectors normally work regular hours. However, they may work additional hours during periods when a lot of construction is taking place. Also, if an accident occurs at a construction site, inspectors must respond immediately and may work additional hours to complete their report. Nongovernment inspectors—especially those who are self-employed—may have a varied work schedule, at times working evenings and weekends.

Training, Other Qualifications, and Advancement

Although requirements vary considerably, depending upon where one is employed, construction and building inspectors should have a thorough knowledge of construction materials and practices in either a general area, such as structural or heavy construction, or a specialized area, such as electrical or plumbing systems, reinforced concrete, or structural steel. Home inspectors combine a knowledge of multiple specialties, so many of them have a combination of certifications, as well as previous experience in various construction trades. For example, many inspectors previously worked as carpenters, electricians, plumbers, or pipefitters.

Because inspectors must possess the right mix of technical knowledge, experience, and education, employers prefer applicants who have both formal training and experience. Most employers require at least a high school diploma or the equivalent, even for workers with considerable experience. More often, employers look for persons who have studied engineering or architecture or who have a degree from a community or junior college with courses in building inspection, home inspection, construction technology, drafting, and mathematics. Many community colleges offer certificate or associate’s degree programs in building inspection technology. Courses in blueprint reading, algebra, geometry, and English also are useful. A growing number of construction and building inspectors are entering the occupation with a college degree, which often can substitute for previous experience.

Construction and building inspectors must be in good physical condition in order to walk and climb about construction and building sites. They also must have a driver’s license, so that they can get to scheduled appointments.

The level of training requirements varies by type of inspector and State. In general, construction and building inspectors receive much of their training on the job, although they must learn building codes and standards on their own. Working with an experienced inspector, they learn about inspection techniques; codes, ordinances, and regulations; contract specifications; and recordkeeping and reporting duties. Supervised onsite inspections also may be a part of the training. Other requirements can include various courses and assigned reading. Some courses and instructional material are available online as well as through formal venues. An engineering or architectural degree often is required for advancement to supervisory positions.

Most States and local jurisdictions require some type of certification for employment. Even if not required, certification can enhance an inspector’s opportunities for employment and advancement to more responsible positions. To become certified, inspectors with substantial experience and education must pass examinations on code requirements, construction techniques and materials, standards of practice, and codes of ethics. The International Code Council (ICC) offers multiple voluntary certifications, as do other professional associations. Many categories of certification are awarded for inspectors and plan examiners in a variety of specialties, including the Certified Building Official (CBO) certification, for code compliance, and the Residential Building Inspector (RBI) certification, for home inspectors. In a few cases, there are no education or experience prerequisites, and certification consists of passing an examination in a designated field either at a regional location or online. In addition, Federal, State, and many local governments may require inspectors to pass a civil service exam. Being a member of a nationally recognized inspection association enhances employment opportunities and may be required by some employers.

Because they advise builders and the general public on building codes, construction practices, and technical developments, construction and building inspectors must keep abreast of changes in these areas. Continuing education is imperative and is required by many States and certifying organizations. Numerous employers provide formal training to broaden inspectors’ knowledge of construction materials, practices, and techniques. Inspectors who work for small agencies or firms that do not conduct their own training programs can expand their knowledge and upgrade their skills by attending State-sponsored training programs, by taking college or correspondence courses, or by attending seminars and conferences sponsored by various related organizations, such as the ICC.

Employment

Construction and building inspectors held about 94,000 jobs in 2004. Local governments—primarily municipal or county building departments—employed 45 percent. Employment of local government inspectors is concentrated in cities and in suburban areas undergoing rapid growth. Local governments employ large inspection staffs, including many plan examiners or inspectors who specialize in structural steel, reinforced concrete, and boiler, electrical, and elevator inspection.

Another 25 percent of construction and building inspectors worked for architectural and engineering services firms, conducting inspections for a fee or on a contract basis. Many of these were home inspectors working on behalf of potential real estate purchasers. Most of the remaining inspectors were employed in other service-providing industries or by State governments. About 1 in 10 construction and building inspectors was self-employed. Since many home inspectors are self-employed, it is likely that most self-employed construction and building inspectors were home inspectors.

Job Outlook

Job opportunities in construction and building inspection should be best for those highly experienced supervisors and construction craft workers who have some college education, engineering or architectural training, or certification as inspectors or plan examiners. Thorough knowledge of construction practices and skills in areas such as reading and evaluating blueprints and plans is essential.

Employment of construction and building inspectors is expected to grow faster than the average for most occupations through 2014. Concern for public safety and a desire for improvement in the quality of construction should continue to stimulate demand for construction and building inspectors in government as well as in firms specializing in architectural, engineering, and related services. Inspectors are involved in all phases of construction, including maintenance and repair work, and are therefore less likely to lose their jobs when new construction slows during recessions. In addition to openings stemming from the expected employment growth, some job openings will arise from the need to replace inspectors who transfer to other occupations or leave the labor force.

The routine practice of obtaining home inspections is a relatively recent development, causing employment of home inspectors to increase rapidly. Although employment of home inspectors is expected to continue to increase, the attention given to this specialty, combined with the desire of some construction workers to move into less strenuous and potentially higher paying work, may result in competition in some areas. In addition, increasing State regulations are starting to limit entry into the specialty only to those who have a given level of previous experience and are certified.

Earnings

Median annual earnings of construction and building inspectors were \$43,670 in May 2004. The middle 50 percent earned between \$34,620 and \$54,970. The lowest 10 percent earned less than \$27,760, and the highest 10 percent earned more than \$67,380. Median annual earnings in the industries employing the largest numbers of construction and building inspectors in May 2004 were:

Local government	\$43,960
Architectural, engineering, and related services	43,880
State government	39,310

Building inspectors, including plan examiners, generally earn the highest salaries. Salaries in large metropolitan areas are substantially higher than those in small jurisdictions.

Related Occupations

Because construction and building inspectors are familiar with construction principles, the most closely related occupations are construction occupations, especially carpenters, plumbers, and electricians. Construction and building inspectors also combine knowledge of construction principles and law with an ability to coordinate data, diagnose problems, and communicate with people. Workers in other occupations using a similar combination of skills include architects, except landscape and naval; appraisers and assessors of real estate; construction managers; civil engineers; cost estimators; engineering technicians; and surveyors, cartographers, photogrammetrists, and surveying technicians.

Sources of Additional Information

Information about certification and a career as a construction or building inspector is available from:

Construction Equipment Operators

(O*NET 47-2071.00, 47-2072.00, 47-2073.01, 47-2073.02)

Significant Points

- Many construction equipment operators acquire their skills on the job, but formal apprenticeship programs provide more comprehensive training.
- Job opportunities are expected to be good, with employment growing about as fast as the average for all occupations.
- Hourly pay is relatively high, but some construction equipment operators cannot work in inclement weather, so total annual earnings may be reduced.

Nature of the Work

Construction equipment operators use machinery to move construction materials, earth, and other heavy materials at construction sites, mines, and sometimes your back yard. They operate equipment that clears and grades land to prepare it for construction of roads, buildings, and neighborhoods. They dig trenches to lay or repair sewer and other pipelines, and they hoist heavy construction materials. They may even work offshore constructing oil rigs. Construction equipment operators also operate machinery that applies asphalt and concrete to roads and other structures.

Operators control equipment by moving levers or foot pedals, operating switches, or turning dials. The operation of much of this equipment is becoming more complex as a result of computerized controls. Global Positioning System (GPS) technology also is being used to help with grading and leveling activities. In addition to controlling the equipment, construction equipment operators also set up and inspect the equipment, make adjustments, and perform some maintenance and minor repairs.

Construction equipment operators include: paving, surfacing, and tamping equipment operators; piledriver operators; and operating engineers and other construction equipment operators. *Operating engineers and other construction equipment operators* operate one or several types of power construction equipment. They may operate excavation and loading machines equipped with scoops, shovels, or buckets that dig sand, gravel, earth, or similar materials and load it into trucks or onto conveyors. In addition to the familiar bulldozers, they operate trench excavators, road graders, and similar equipment. Sometimes, they may drive and control industrial trucks

or tractors equipped with forklifts or booms for lifting materials or with hitches for pulling trailers. They also may operate and maintain air compressors, pumps, and other power equipment at construction sites. Construction equipment operators who are classified as operating engineers are capable of operating several different types of construction equipment.

Paving and surfacing equipment operators use levers and other controls to operate machines that spread and level asphalt or spread and smooth concrete for roadways or other structures. *Asphalt paving machine operators* turn valves to regulate the temperature and flow of asphalt onto the roadbed. They must take care that the machine distributes the paving material evenly and without voids, and make sure that there is a constant flow of asphalt going into the hopper. *Concrete paving machine operators* control levers and turn handwheels to move attachments that spread, vibrate, and level wet concrete within forms. They must observe the surface of concrete to identify low spots into which workers must add concrete. They use other attachments to smooth the surface of the concrete, spray on a curing compound, and cut expansion joints. *Tamping equipment operators* operate tamping machines that compact earth and other fill materials for roadbeds. They also may operate machines with interchangeable hammers to cut or break up old pavement and drive guardrail posts into the earth.

Piledriver operators operate piledrivers—large machines, mounted on skids, barges, or cranes, that hammer piles into the ground. Piles are long heavy beams of wood or steel driven into the ground to support retaining walls, bulkheads, bridges, piers, or building foundations. Some piledriver operators work on offshore oil rigs. Piledriver operators move hand and foot levers and turn valves to activate, position, and control the pile-driving equipment.

Working Conditions

Many construction equipment operators work outdoors, in nearly every type of climate and weather condition, although in many areas of the country, some types of construction operations must be suspended in winter. Also, during periods of extremely wet weather grading and leveling activities can be difficult to perform and may be suspended. Bulldozers, scrapers, and especially tampers and piledrivers are noisy and shake or jolt the operator. Operating heavy construction equipment can be dangerous. As with most machinery, accidents generally can be avoided by observing proper operating procedures and safety practices. Construction equipment operators

Construction equipment operators use machinery to move construction materials, earth, and other heavy materials at construction sites.

are cold in the winter and hot in the summer, and often get dirty, greasy, muddy, or dusty.

Operators may have irregular hours because work on some construction projects continues around the clock or must be performed late at night or early in the morning. Some operators work in remote locations on large construction projects, such as highways and dams, or in factory or mining operations.

Training, Other Qualifications, and Advancement

Construction equipment operators usually learn their skills on the job. They may start by operating light equipment under the guidance of an experienced operator. Later, they may operate heavier equipment, such as bulldozers and cranes. However, it is generally accepted that formal training provides more comprehensive skills. Some construction equipment operators train in formal operating engineer apprenticeship programs administered by union-management committees of the International Union of Operating Engineers and the Associated General Contractors of America. Because apprentices learn to operate a wider variety of machines than do other beginners, they usually have better job opportunities. Apprenticeship programs consist of at least 3 years, or 6,000 hours, of on-the-job training and 144 hours a year of related classroom instruction.

Employers of construction equipment operators generally prefer to hire high school graduates, although some employers may train nongraduates to operate some types of equipment. Technologically advanced construction equipment has computerized controls and improved hydraulics and electronics, requiring more skill to operate. Operators of such equipment may need more training and some understanding of electronics. Mechanical aptitude and high school training in automobile mechanics are helpful because workers may perform some maintenance on their machines. Also, high school courses in science and mechanical drawing are useful. Experience operating related mobile equipment, such as farm tractors or heavy equipment, in the Armed Forces or elsewhere is an asset.

Private vocational schools offer instruction in the operation of certain types of construction equipment. Completion of such programs may help a person get a job as a trainee or apprentice. However, persons considering such training should check the school's reputation among employers in the area and find out if it offers the opportunity to work on actual machines in realistic situations.

Operators need to be in good physical condition and have a good sense of balance, the ability to judge distance, and eye-hand-foot coordination. Some operator positions require the ability to work at heights.

Employment

Construction equipment operators held about 449,000 jobs in 2004. Jobs were found in every section of the country and were distributed among various types of operators as follows:

Operating engineers and other construction equipment operators	382,000
Paving, surfacing, and tamping equipment operators.....	63,000
Pile-driver operators.....	4,400

About three out of five construction equipment operators worked in the construction industry. Many equipment operators worked in heavy construction, building highways, bridges, or railroads. About one out of five of all construction equipment operators worked in State and local government. Others—mostly grader, bulldozer, and scraper operators—worked in mining. Some also worked in manufacturing and for utility companies. Less than one in twenty construction equipment operators were self-employed.

Job Outlook

Job opportunities for construction equipment operators are expected to be good through 2014. Some potential workers may choose not to enter training programs because they prefer work that has more comfortable working conditions.

Employment of construction equipment operators is expected to increase as fast as the average for all occupations through the year 2014 even with improvements in equipment expected to continue to raise worker productivity and to moderate demand for these workers. Employment is expected to increase as population and business growth create a need for new houses, industrial facilities, schools, hospitals, offices, and other structures. More construction equipment operators also will be needed as a result of expected growth in highway, bridge, and street construction. Bridge construction is expected to grow the fastest, due to the need to repair or replace structures before they become unsafe. Highway conditions also will spur demand for highway maintenance and repair. In addition to job growth, many job openings will arise because of the need to replace experienced construction equipment operators who transfer to other occupations, retire, or leave the job for other reasons.

Like that of other construction workers, employment of construction equipment operators is sensitive to fluctuations in the economy. Workers may experience periods of unemployment when the level of construction activity falls.

Earnings

Earnings for construction equipment operators vary. In May 2004, median hourly earnings of operating engineers and other construction equipment operators were \$17.00. The middle 50 percent earned between \$13.19 and \$23.00. The lowest 10 percent earned less than \$10.98, and the highest 10 percent earned more than \$29.34. Median hourly earnings in the industries employing the largest numbers of operating engineers in May 2004 were:

Highway, street, and bridge construction.....	\$19.20
Utility system construction	18.13
Other specialty trade contractors	17.73
Local government	15.20
State government	13.52

Median hourly earnings of paving, surfacing, and tamping equipment operators were \$14.42 in May 2004. The middle 50 percent earned between \$11.35 and \$19.30. The lowest 10 percent earned less than \$9.47, and the highest 10 percent earned more than \$26.51. Median hourly earnings in the industries employing the largest numbers of paving, surfacing, and tamping equipment operators in May 2004 were as follows:

Other specialty trade contractors	\$15.03
Highway, street, and bridge construction.....	14.56
Local government	13.70

In May 2004, median hourly earnings of piledriver operators were \$21.29. The middle 50 percent earned between \$15.50 and \$30.23. The lowest 10 percent earned less than \$11.78, and the highest 10 percent earned more than \$34.04.

Pay scales generally are higher in large metropolitan areas. Annual earnings of some workers may be lower than hourly rates would indicate because worktime may be limited by bad weather.

Related Occupations

Other workers who operate mechanical equipment include: agricultural equipment operators; truck drivers, heavy and tractor trailer; logging equipment operators; and a variety of material moving occupations.

Sources of Additional Information

For further information about apprenticeships or work opportunities for construction equipment operators, contact a local of the International Union of Operating Engineers, a local apprenticeship committee, or the nearest office of the State apprenticeship agency or employment service. Construction Laborers

(O*NET 47-2061.00)

Significant Points

- Job opportunities should be good.
- With training and experience, construction laborers can move into other skilled craft occupations.
- Most construction laborers learn through informal on-the-job training, but formal apprenticeship programs provide more thorough preparation.
- Like many other construction occupations, employment opportunities are affected by the cyclical nature of the construction industry and can vary greatly by State and locality.

Nature of the Work

Construction laborers can be found on almost all construction sites performing a wide range of tasks from the very easy to the potentially hazardous. They can be found at building, highway, and heavy construction sites; tunnel and shaft excavations; and demolition sites. Many of the jobs they perform require physical strength and some training and experience. Other jobs require little skill and can be learned in a short amount of time. While most construction laborers tend to specialize in a type of construction, such as highway or tunnel construction, they are generalists who perform many different tasks during all stages of construction. However, construction laborers who work in underground construction, such as in tunnels, or in demolition are more likely to specialize in only those areas.

Construction laborers clean and prepare construction sites, which may require them to remove asbestos or lead-based paint from buildings. Laborers also remove trees and debris, tend pumps, compressors and generators, and build forms for pouring concrete. They erect and disassemble scaffolding and other temporary structures. They load, unload, identify, and distribute building materials to the appropriate location according to project plans and specifications. Laborers also tend machines; for example, they may mix concrete using a portable mixer or tend a machine that pumps concrete, grout, cement, sand, plaster, or stucco through a spray gun for application to ceilings and walls. Construction laborers often help other craftworkers, including carpenters, plasterers, operating engineers, and masons.

Construction laborers are responsible for oversight of the installation and maintenance of traffic control devices and patterns. At heavy and highway construction sites, this work may include clearing and preparing highway work zones and rights of way; installing traffic barricades, cones, and markers; and controlling traffic passing near, in, and around work zones. They also dig trenches, install sewer, water, and storm

drain pipes, and place concrete and asphalt on roads. Other highly specialized tasks include operating laser guidance equipment to place pipes, operating air, electric, and pneumatic drills, and transporting and setting explosives for tunnel, shaft, and road construction.

Construction laborers operate a variety of equipment including pavement breakers; jackhammers; earth tampers; concrete, mortar, and plaster mixers; electric and hydraulic boring machines; torches; small mechanical hoists; laser beam equipment; and surveying and measuring equipment. They may use computers and other high-tech input devices to control robotic pipe cutters and cleaners. To perform their jobs effectively, construction laborers must be familiar with the duties of other craftworkers and with the materials, tools, and machinery they use.

Construction laborers often work as part of a team with other skilled craftworkers, jointly carrying out assigned construction tasks. At other times, construction laborers may work alone, reading and interpreting instructions, plans, and specifications with little or no supervision.

Working Conditions

Most laborers do physically demanding work. They may lift and carry heavy objects, and stoop, kneel, crouch, or crawl in awkward positions. Some work at great heights, or outdoors in all weather conditions. Some jobs expose workers to harmful materials or chemicals, fumes, odors, loud noise, or dangerous machinery. Some laborers may be exposed to lead-based paint, asbestos, or other hazardous substances during their work especially when working in confined spaces. To avoid injury, workers in these jobs wear safety clothing, such as gloves, hardhats, protective chemical suits, and devices to protect their eyes, respiratory system, or hearing. While working in underground construction, construction laborers must be especially alert to safely follow procedures and must deal with a variety of hazards.

Construction laborers generally work 8-hour shifts, although longer shifts are common. Overnight work may be required when working on highways. Construction laborers may work only during certain seasons in certain parts of the country. They may also experience weather-related work stoppages at any time of the year.

Construction laborers can be found on almost all construction sites performing a wide range of tasks from simple to potentially hazardous.

Training, Other Qualifications, and Advancement

Many construction laborer jobs require few skills, but others require specialized training and experience. Many workers enter the occupation with few skills by obtaining a job with a contractor who will then provide on-the-job training. Entry-level workers generally start as helpers, assisting more experienced workers. A growing route of entry is through temporary help agencies that send laborers to construction sites for short-term work. Beginning laborers perform routine tasks, such as cleaning and preparing the worksite and unloading materials. When the opportunity arises, they learn from experienced construction trades workers how to do more difficult tasks, such as operating tools and equipment. During this time, the construction laborer may elect to attend a trade or vocational school, or community college to receive further trade-related training.

The most skilled laborers usually have more formalized training. Some employers, particularly large nonresidential construction contractors with union membership, offer employees formal apprenticeships. These programs include between 2 and 4 years of classroom and on-the-job training. A core curriculum consisting of basic construction skills such as blueprint reading, the correct use of tools and equipment, and knowledge of safety and health procedures comprises the first 200 hours. The remainder of the curriculum consists of specialized skills training in three of the largest segments of the construction industry: Building construction; heavy/highway construction; and environmental remediation, such as lead or asbestos abatement, and mold or hazardous waste remediation. Workers who use dangerous equipment or handle toxic chemicals usually receive specialized training in safety awareness and procedures. Apprenticeship applicants usually must be at least 18 years old and meet local requirements. Because the number of apprenticeship programs is limited, however, only a small proportion of laborers learn their trade through these programs.

High school classes in English, mathematics, physics, mechanical drawing, blueprint reading, welding, and general shop are recommended. Laborers need manual dexterity, eye-hand coordination, good physical fitness, an ability to work as a member of a team, and a good sense of balance. The ability to solve arithmetic problems quickly and accurately also is required. In addition, a good work history or military service is viewed favorably by contractors. Computer skills also are important for advancement as construction becomes increasingly mechanized and computerized.

Through training and experience, laborers can move into other construction occupations. Laborers may also advance to become construction supervisors or general contractors. For those who would like to advance, it is increasingly important to be able to communicate in both English and Spanish in order to relay instructions and safety precautions to workers with limited understanding of English; Spanish-speaking workers make up a large part of the construction workforce in many areas. Supervisors and contractors need good English skills in order to deal with clients and subcontractors. Supervisors and contractors should be able to identify and estimate the quantity of materials needed to complete a job, and accurately estimate how long a job will take to complete and at what cost.

Employment

Construction laborers held about 1 million jobs in 2004. They worked throughout the country but, like the general population, were concentrated in metropolitan areas. Most construction laborers work in the construction industry and almost one-third work for special trade contractors. About 15 percent were self-employed in 2004.

Job Outlook

Employment of construction laborers is expected to grow more slowly than the average for all occupations through the year 2014 as the construction industry in general grows more slowly than it has in the recent past. However, job opportunities are expected to be good due to the numerous openings that rise each year as laborers leave the occupation. Opportunities will be best for those with experience and specialized skills, and for those willing to relocate to areas with new construction projects. Opportunities will also be good for laborers specializing in lead, asbestos, and other hazardous materials removal.

Although construction will continue to grow, construction laborer jobs will be adversely affected by automation as some jobs are replaced by new machines and equipment that improve productivity and quality. Also, laborers will be increasingly employed by staffing agencies that will contract laborers out to employers on a temporary basis.

Employment of construction laborers, like that of many other construction workers, can be variable or intermittent due to the limited duration of construction projects and the cyclical nature of the construction industry. Employment opportunities can vary greatly by State and locality. During economic downturns, job openings for construction laborers decrease as the level of construction activity declines.

Earnings

Median hourly earnings of construction laborers in May 2004 were \$12.10. The middle 50 percent earned between \$9.47 and \$16.88. The lowest 10 percent earned less than \$7.71, and the highest 10 percent earned more than \$23.61. Median hourly earnings in the industries employing the largest number of construction laborers in May 2004 were as follows:

Highway, street, and bridge construction.....	\$13.55
Nonresidential building construction.....	12.94
Other specialty trade contractors	12.43
Residential building construction	12.18
Foundation, structure, and building exterior contractors.....	11.90

Earnings for construction laborers can be reduced by poor weather or by downturns in construction activity, which sometimes result in layoffs. Apprentices or helpers usually start at about 50 percent of the wage rate paid to experienced workers. Pay increases as apprentices gain experience and learn new skills.

Some laborers belong to the Laborers' International Union of North America.

Related Occupations

The work of construction laborers is closely related to other construction occupations. Other workers who perform similar physical work include persons in material-moving occupations; forest, conservation, and logging workers; and grounds maintenance workers.

Sources of Additional Information

For information about jobs as construction laborers, contact local building or construction contractors, local joint labor-management apprenticeship committees, apprenticeship agencies, or the local office of your State Employment Service.

For information on education programs for laborers, contact:

Drywall Installers, Ceiling Tile Installers, and Tapers

(O*NET 47-2081.01, 47-2081.02, 47-2082.00)

Significant Points

- Most workers learn the trade on the job by starting as helpers to more experienced workers; additional classroom instruction may also be needed.
- Job prospects are expected to be good.
- Inclement weather seldom interrupts work, but workers may be idled when downturns in the economy slow new construction activity.

Nature of the Work

Drywall consists of a thin layer of gypsum between two layers of heavy paper. It is used for walls and ceilings in most buildings today because it is both faster and cheaper to install than plaster.

There are two kinds of drywall workers—installers and tapers—although many workers do both types of work. Installers, also called *applicators* or *hangers*, fasten drywall panels to the inside framework of residential houses and other buildings. *Tapers* or *finishers*, prepare these panels for painting by taping and finishing joints and imperfections.

Because drywall panels are manufactured in standard sizes—usually 4 feet by 8 or 12 feet—drywall installers must measure, cut, and fit some pieces around doors and windows. They also saw or cut holes in panels for electrical outlets, air-conditioning units, and plumbing. After making these alterations, installers may glue, nail, or screw the wallboard panels to the wood or metal framework. Because drywall is heavy and cumbersome, a helper generally assists the installer in positioning and securing the panel. Workers often use a lift when placing ceiling panels.

After the drywall is installed, tapers fill joints between panels with a joint compound. Using the wide, flat tip of a special trowel, they spread the compound into and along each side of the joint with brush-like strokes. They immediately use the trowel to press a paper tape—used to reinforce the drywall and to hide imperfections—into the wet compound and to smooth away excess material. Nail and screw depressions also are covered with this compound, as are imperfections caused by the installation of air-conditioning vents and other fixtures. On large projects, finishers may use automatic taping tools that apply the joint compound and tape in one step. Tapers apply second and third coats of the compound, sanding the treated areas where needed after each coat to make them as smooth as the rest of the wall surface. This results in a very smooth and almost perfect surface. Some tapers apply textured surfaces to walls and ceilings with trowels, brushes, or spray guns.

Ceiling tile installers, or *acoustical carpenters*, apply or mount acoustical tiles or blocks, strips, or sheets of shock-absorbing materials to ceilings and walls of buildings to reduce reflection of sound or to decorate rooms. First, they measure and mark the surface according to blueprints and drawings. Then, they nail or screw moldings to the wall to support and seal the joint between the ceiling tile and the wall. Finally, they mount the tile, either by applying a cement adhesive to the back of the tile and then pressing the tile into place, or by nailing, screwing, stapling, or wire-tying the lath directly to the structural framework.

Lathers also are included in this occupation. Lathers fasten metal or rockboard lath to walls, ceilings, and partitions of buildings. Lath forms the support base for plaster, fireproofing, or acoustical materials. At one time, lath was made of wooden strips. Now, lathers work

After the drywall is installed, tapers fill joints between panels with a joint compound.

mostly with wire, metal mesh, or rockboard lath. Metal lath is used where the plaster application will be exposed to weather or water or for curved or irregular surfaces for which drywall is not a practical material. Using handtools and portable power tools, lathers nail, screw, staple, or wire-tie the lath directly to the structural framework.

Working Conditions

As in many other construction trades, the work sometimes is strenuous. Drywall installers, ceiling tile installers, and tapers spend most of the day on their feet, either standing, bending, or kneeling. Some tapers use stilts to tape and finish ceiling and angle joints. Installers have to lift and maneuver heavy panels. Hazards include falls from ladders and scaffolds and injuries from power tools and from working with sharp materials. Because sanding a joint compound to a smooth finish creates a great deal of dust, some finishers wear masks for protection.

Training, Other Qualifications, and Advancement

Drywall installers, ceiling tile installers, and tapers learn their trade through formal and informal training programs. To become a skilled drywall installer, ceiling tile installer, or taper, between 3 and 4 years of both classroom and on-the-job training may be required, but many of the skills can be learned within the first year. While there are a number of different ways to obtain this training, in general the more formalized the process, the more skilled the individual becomes, and the more in demand they are by employers.

There are a number of different avenues that one can take to obtain the necessary training. The most common entry route is

to obtain a job with a contractor who will then provide on-the-job training. Entry-level workers generally start as helpers, assisting more experienced workers. During this time, employers may send the employee to a trade or vocational school, or community college to receive further classroom training.

Some employers, particularly large nonresidential construction contractors with union membership, offer employees formal apprenticeships. These programs combine on-the-job training with related classroom instruction. Usually, apprenticeship applicants must be at least 18 years old and meet local requirements. The length of the program, usually 3 to 4 years, varies with the apprentice's skill. Because the number of apprenticeship programs is limited, however, only a small proportion of drywall installers, ceiling tile installers, and tapers learn their trade through these programs.

Other jobseekers may choose to obtain their classroom training before seeking a job. There are a number of public and private vocational-technical schools and training academies affiliated with the unions and contractors that offer training to become a drywall installer, ceiling tile installer, and taper. Employers often look favorably upon these students and usually start them at a higher level than those without the training.

Installer helpers start by carrying materials, lifting and holding panels, and cleaning up debris. They also learn to use the tools, machines, equipment, and materials of the trade. Within a few weeks, they learn to measure, cut, and install materials. Eventually, they become fully experienced workers. Tapers learn their job by taping joints and touching up nail holes, scrapes, and other imperfections. They soon learn to install corner guards and to conceal openings around pipes. At the end of their training, drywall installers, ceiling tile installers, and tapers learn to estimate the cost of installing and finishing drywall.

Training for this profession can begin in a high school, where classes in English, math, mechanical drawing, blueprint reading, and general shop are recommended. Some skills needed to become a drywall installer, ceiling tile installer, and taper include manual dexterity, eye-hand coordination, good physical fitness, and a good sense of balance. The ability to solve arithmetic problems quickly and accurately also is required. In addition, a good work history or military service is viewed favorably by contractors.

Drywall installers, ceiling tile installers, and tapers may advance to carpentry supervisor or general construction supervisor positions. Others may become independent contractors. For those who would like to advance, it is increasingly important to be able to communicate in both English and Spanish in order to relay instructions and safety precautions to workers with limited understanding of English; Spanish-speaking workers make up a large part of the construction workforce in many areas. Hispanic workers who want to advance should learn English. Supervisors and contractors need good English skills in order to deal with clients and subcontractors. They also should be able to identify and estimate the quantity of materials needed to complete a job, and accurately estimate how long a job will take to complete and at what cost.

Employment

Drywall installers, ceiling tile installers, and tapers held about 196,000 jobs in 2004. Most worked for contractors specializing in drywall and ceiling tile installation; others worked for contractors doing many kinds of construction. About 43,000 were self-employed independent contractors.

Most installers and tapers are employed in populous areas. In other areas, where there may not be enough work to keep a drywall or ceiling tile installer employed full time, carpenters and painters usually do the work.

Job Outlook

Job opportunities for drywall installers, ceiling tile installers, and tapers are expected to be good. Many potential workers are not attracted to this occupation because they prefer work that is less strenuous and has more comfortable working conditions. Experienced workers will have especially favorable opportunities.

Employment is expected to increase more slowly than average for all occupations over the 2004-14 period reflecting the number of new construction and remodeling projects. In addition to jobs involving traditional interior work, drywall workers will find employment opportunities in the installation of insulated exterior wall systems, which are becoming increasingly popular.

Besides those resulting from job growth, many jobs will open up each year because of the need to replace workers who transfer to other occupations or leave the labor force. Some drywall installers, ceiling tile installers, and tapers with limited skills leave the occupation when they find that they dislike the work or fail to find steady employment.

Despite the growing use of exterior panels, most drywall installation and finishing is done indoors. Therefore, drywall workers lose less worktime because of inclement weather than do some other construction workers. Nevertheless, they may be unemployed between construction projects and during downturns in construction activity.

Earnings

In May 2004, the median hourly earnings of drywall and ceiling tile installers were \$16.36. The middle 50 percent earned between \$12.59 and \$21.82. The lowest 10 percent earned less than \$9.98, and the highest 10 percent earned more than \$28.30. The median hourly earnings in the industries employing the largest numbers of drywall and ceiling tile installers in May 2004 were as follows:

Residential building construction	\$17.33
Building finishing contractors.....	16.53
Nonresidential building construction.....	14.57

In May 2004, the median hourly earnings of tapers were \$18.78. The middle 50 percent earned between \$14.07 and \$24.43. The lowest 10 percent earned less than \$10.66, and the highest 10 percent earned more than \$28.79.

Some contractors pay these workers according to the number of panels they install or finish per day; others pay an hourly rate. A 40-hour week is standard, but the workweek may sometimes be longer or shorter. Workers who are paid hourly rates receive premium pay for overtime. Trainees usually started at about half the rate paid to experienced workers and received wage increases as they became more highly skilled.

Related Occupations

Drywall installers, ceiling tile installers, and tapers combine strength and dexterity with precision and accuracy to make materials fit according to a plan. Other occupations that require similar abilities include carpenters; carpet, floor, and tile installers and finishers; insulation workers; and plasterers and stucco masons.

Sources of Additional Information

For information about work opportunities in drywall application and finishing and ceiling tile installation, contact local drywall installation and ceiling tile installation contractors, a local joint union-management apprenticeship committee, a State or local chapter of the Associated Builders and Contractors, or the nearest office of the State employment service or apprenticeship agency.

For details about job qualifications and training programs in dry-wall application and finishing and ceiling tile installation, contact:

- ▶ Associated Builders and Contractors, 4250 North Fairfax Dr., 9th Floor Arlington, VA 22203. Internet: www.trytools.org

Electricians

(O*NET 47-2111.00)

Significant Points

- Job opportunities are expected to be good, especially for those with the right skills.
- Most electricians acquire their skills by completing an apprenticeship program lasting 4 to 5 years.
- Nearly three-fourths of electricians work for building contractors or are self-employed, but there also will be many job openings for electricians in other industries.

Nature of the Work

Electricity is essential for light, power, air-conditioning, and refrigeration. Electricians install, connect, test, and maintain electrical systems for a variety of purposes, including climate control, security, and communications. They also may install and maintain the electronic controls for machines in business and industry.

Electricians generally specialize in construction or maintenance work, although a growing number do both. Electricians specializing in construction work primarily install wiring systems into new homes, businesses, and factories, but they also rewire or upgrade existing electrical systems as needed. Electricians specializing in maintenance work primarily maintain and upgrade existing electrical systems and repair electrical equipment.

Electricians work with blueprints when they install electrical systems. Blueprints indicate the locations of circuits, outlets, load centers, panel boards, and other equipment. Electricians must follow the National Electrical Code and comply with State and local building codes when they install these systems. Regulations vary depending on the setting and require various types of installation procedures.

When electricians install wiring systems in factories and commercial settings, they first place conduit (pipe or tubing) inside partitions, walls, or other concealed areas as designated by the blueprints. They also fasten to the walls small metal or plastic boxes that will house electrical switches and outlets. They pull insulated wires or cables through the conduit to complete circuits between these boxes. In residential construction, electricians usually install plastic encased insulated wire, which does not need to be run through conduit. The gauge and number of wires installed in all settings depends upon the load and end use of that part of the electrical system. The greater the diameter of the wire, the higher the voltage and amperage that can flow through it.

Electricians connect all types of wire to circuit breakers, transformers, outlets, or other components. They join the wires in boxes

Electricians connect all types of wire to circuit breakers, transformers, outlets, or other components.

with various specially designed connectors. During installation, electricians use hand tools such as conduit benders, screwdrivers, pliers, knives, hacksaws, and wire strippers, as well as power tools such as drills and saws. After they finish installing the wiring, they use testing equipment, such as ammeters, ohmmeters, voltmeters, and oscilloscopes, to check the circuits for proper connections, ensuring electrical compatibility, and safety of components.

Maintenance work varies greatly, depending on where the electrician is employed. Electricians who specialize in residential work perform a wide variety of electrical work for homeowners. They may rewire a home and replace an old fuse box with a new circuit breaker box to accommodate additional appliances, or they may install new lighting and other electric household items, such as ceiling fans. Those who work in large factories may repair motors, transformers, generators, and electronic controllers on machine tools and industrial robots. Those in office buildings and small plants may repair all types of electrical equipment.

Maintenance electricians working in factories, hospitals, and other settings repair electric and electronic equipment when breakdowns occur and install new electrical equipment. When breakdowns occur, they must make the necessary repairs as quickly as possible in order to minimize inconvenience. They may replace items such as circuit breakers, fuses, switches, electrical and electronic components, or wire. Electricians also periodically inspect all equipment to ensure it is operating properly, and locate and correct problems before breakdowns occur. Electricians also advise management whether continued operation of equipment could be hazardous. When working with complex electronic devices, they may work with engineers, engineering technicians, line installers and repairers, or industrial machinery installation, repair, and maintenance workers. (Sections on these occupations appear elsewhere in the *Handbook*.)

Although primarily classified as work for line installers and repairers, electricians also may install low voltage wiring systems in addition to wiring a building's electrical system. Low voltage wiring involves voice, data, and video wiring systems, such as those for telephones, computers and related equipment, intercoms, and fire alarm and security systems. Electricians also may install coaxial or fiber optic cable for computers and other telecommunications equipment and electronic controls for industrial uses.

Working Conditions

Electricians work both indoors and out; at construction sites, in homes, and in businesses or factories. Work may be strenuous at times and include bending conduit, lifting heavy objects, and standing, stooping, and kneeling for long periods of time. When working outdoors, they may be subject to inclement weather conditions. Some electricians may have to travel long distances to jobsites. Electricians risk injury from electrical shock, falls, and cuts; they must follow strict safety procedures to avoid injuries.

Most electricians work a standard 40-hour week, although overtime may be required. Those in maintenance work may work nights or weekends, and be on call to go to the worksite when needed. Electricians working in industrial settings may also have periodic extended overtime during scheduled maintenance or retooling periods. Companies that operate 24 hours a day may employ three shifts of electricians.

Training, Other Qualifications, and Advancement

Most electricians learn their trade through apprenticeship programs. These programs combine on-the-job training with related classroom instruction. Apprenticeship programs may be sponsored by joint training committees made up of local unions of the International Brotherhood of Electrical Workers and local chapters of the National Electrical Contractors Association; company management committees of individual electrical contracting companies; or local chapters of the Associated Builders and Contractors and the Independent Electrical Contractors Association. Because of the comprehensive training received, those who complete apprenticeship programs qualify to do both maintenance and construction work.

Applicants for apprenticeships usually must be at least 18 years old and have a high school diploma or a G.E.D. They should have good math and English skills, since most instruction manuals are in English. They also may have to pass a test and meet other requirements. Apprenticeship programs usually last 4 years and each year include at least 144 hours of classroom instruction and 2,000 hours of on-the-job training. In the classroom, apprentices learn electrical theory and installing and maintaining electrical systems. There also take classes in blueprint reading, mathematics, electrical code requirements, and safety and first aid practices also may receive specialized training in soldering, communications, fire alarm systems, and cranes and elevators. On the job, apprentices work under the supervision of experienced electricians. At first, they drill holes, set anchors, and attach conduit. Later, they measure, fabricate, and install conduit, as well as install, connect, and test wiring, outlets, and switches. They also learn to set up and draw diagrams for entire electrical systems. To complete the apprenticeship and become electricians, apprentices must demonstrate mastery of the electrician's work.

Some persons seeking to become electricians choose to obtain their classroom training before seeking a job. Training to become an electrician is offered by a number of public and private vocational-technical schools and training academies in affiliation with local unions and contractor organizations. Employers often hire students who complete these programs and usually start them at a more advanced level than those without the training. A few persons become electricians by first working as helpers, assisting electricians setting up job sites, gathering materials, and doing other nonelectrical work, before entering an apprenticeship program.

Skills needed to become an electrician include manual dexterity, eye-hand coordination, physical fitness, and a good sense of balance. The ability to solve arithmetic problems quickly and accurately also is required. Good color vision is needed because workers frequently must identify electrical wires by color. In addition, a good work history or military service is viewed favorably by apprenticeship committees and employers.

Most localities require electricians to be licensed. Although licensing requirements vary from area to area, electricians usually must pass an examination that tests their knowledge of electrical theory, the National Electrical Code, and local electric and building codes. Experienced electricians periodically take courses offered by their employer or union to keep abreast of changes in the National Electrical Code and new materials or methods of installation. For example, classes on installing low voltage voice, data, and video systems have recently become common as these systems have become more prevalent.

Experienced electricians can advance to jobs as supervisors. In construction they also may become project managers or construction superintendents. Those with sufficient capital and management skills may start their own contracting business, although this may require an electrical contractor's license. Many electricians also become electrical inspectors. Supervisors and contractors should be able to identify and estimate the correct type and quantity of materials needed to complete a job, and accurately estimate how long a job will take to complete and at what cost. For those who seek to advance, it is increasingly important to be able to communicate in both English and Spanish in order to relay instructions and safety precautions to workers with limited understanding of English; Spanish-speaking workers make up a large part of the construction workforce in many areas. Spanish-speaking workers who want to advance in this occupation need very good English skills to understand instruction presented in classes and installation instructions, which are usually written in English and are highly technical.

Employment

Electricians held about 656,000 jobs in 2004. Nearly two-thirds of wage and salary workers were employed in the construction industry; while the remainder worked as maintenance electricians in other industries. In addition, about one in ten electricians were self-employed.

Because of the widespread need for electrical services, electrician jobs are found in all parts of the country.

Job Outlook

Employment of electricians is expected to increase as fast as the average for all occupations through the year 2014. As the population and economy grow, more electricians will be needed to install and maintain electrical devices and wiring in homes, factories, offices, and other structures. New technologies also are expected to continue to stimulate the demand for these workers. For example, buildings need to increasingly accommodate the use of computers and telecommunications equipment. Also, the increasing prevalence in factories of robots and other automated manufacturing systems will require more complex wiring systems be installed and maintained. Additional jobs will be created as older structures are rehabilitated and retrofitted, which usually requires that they be brought up to meet existing electrical codes.

In addition to jobs created by the increased demand for electrical work, many openings are expected to occur over the next decade as a large number of electricians are expected to retire. This will create good job opportunities for the most qualified jobseekers. Job openings for electricians, though, will vary by area and will be greatest in the fastest growing regions of the country.

Employment of construction electricians, like that of many other construction workers, is sensitive to changes in the economy. This results from the limited duration of construction projects and the cyclical nature of the construction industry. During economic downturns, job openings for electricians are reduced as the level of construction activity declines. Apprenticeship opportunities also are less plentiful during these periods.

Although employment of maintenance electricians is steadier than that of construction electricians, those working in the automotive and other manufacturing industries that are sensitive to

cyclical swings in the economy may be laid off during recessions. Also, opportunities for maintenance electricians may be limited in many industries by the increased contracting out for electrical services in an effort to reduce operating costs and increase productivity. However, increased job opportunities for electricians in electrical contracting firms should partially offset job losses in other industries.

Earnings

In May 2004, median hourly earnings of electricians were \$20.33. The middle 50 percent earned between \$15.43 and \$26.90. The lowest 10 percent earned less than \$12.18, and the highest 10 percent earned more than \$33.63. Median hourly earnings in the industries employing the largest numbers of electricians in May 2004 were as follows:

Motor vehicle parts manufacturing	\$30.04
Local government	22.24
Nonresidential building construction	19.99
Building equipment contractors	19.76
Employment services	15.62

Apprentices usually start at between 40 and 50 percent of the rate paid to fully trained electricians, depending on experience. As apprentices become more skilled, they receive periodic pay increases throughout the course of their training.

Some electricians are members of the International Brotherhood of Electrical Workers. Among unions representing maintenance electricians are the International Brotherhood of Electrical Workers; the International Union of Electronic, Electrical, Salaried, Machine, and Furniture Workers; the International Association of Machinists and Aerospace Workers; the International Union, United Automobile, Aircraft and Agricultural Implement Workers of America; and the United Steelworkers of America.

Related Occupations

To install and maintain electrical systems, electricians combine manual skill and knowledge of electrical materials and concepts. Workers in other occupations involving similar skills include heating, air-conditioning, and refrigeration mechanics and installers; line installers and repairers; electrical and electronics installers and repairers; electronic home entertainment equipment installers and repairers; and elevator installers and repairers.

Sources of Additional Information

For details about apprenticeships or other work opportunities in this trade, contact the offices of the State employment service, the State apprenticeship agency, local electrical contractors or firms that employ maintenance electricians, or local union-management electrician apprenticeship committees. This information also may be available from local chapters of the Independent Electrical Contractors, Inc.; the National Electrical Contractors Association; the Home Builders Institute; the Associated Builders and Contractors; and the International Brotherhood of Electrical Workers.

Elevator Installers and Repairers

(O*NET 47-4021.00)

Significant Points

- Most workers belong to a union and enter the occupation through a 4-year apprenticeship program.
- High pay and good benefits, together with expected slow job growth and few separations, should result in keen competition for the few job opportunities that arise in this small occupation; prospects should be best for those with postsecondary education in electronics.
- Elevator installers and repairers are less affected by downturns in the economy and inclement weather than other construction trades workers.

Nature of the Work

Elevator installers and repairers—also called *elevator constructors* or *elevator mechanics*—assemble, install, and replace elevators, escalators, dumbwaiters, moving walkways, and similar equipment in new and old buildings. Once the equipment is in service, they maintain and repair it as well. They also are responsible for modernizing older equipment.

To install, repair, and maintain modern elevators, which are almost all electronically controlled, elevator installers and repairers must have a thorough knowledge of electronics, electricity, and hydraulics. Many elevators are controlled with microprocessors, which are programmed to analyze traffic conditions in order to dispatch elevators in the most efficient manner. With these computer controls, it is possible to get the greatest amount of service with the least number of cars.

When installing a new elevator, installers and repairers begin by studying blueprints to determine the equipment needed to install rails, machinery, car enclosures, motors, pumps, cylinders, and plunger foundations. Once this has been done, they begin equipment installation. Working on scaffolding or platforms, installers bolt or weld steel rails to the walls of the shaft to guide the elevator.

Elevator installers put in electrical wires and controls by running tubing, called conduit, along a shaft's walls from floor to floor. Once the conduit is in place, mechanics pull plastic-covered electrical wires through it. They then install electrical components and related devices required at each floor and at the main control panel in the machine room.

Installers bolt or weld together the steel frame of an elevator car at the bottom of the shaft; install the car's platform, walls, and doors; and attach guide shoes and rollers to minimize the lateral motion of the car as it travels through the shaft. They also install the outer doors and door frames at the elevator entrances on each floor.

For cabled elevators, these workers install geared or gearless machines with a traction drive wheel that guides and moves heavy steel cables connected to the elevator car and counterweight. (The counterweight moves in the opposite direction from the car and balances most of the weight of the car to reduce the weight that the elevator's motor must lift.) Elevator installers also install elevators in which a car sits on a hydraulic plunger that is driven by a pump. The plunger pushes the elevator car up from underneath, similar to a lift in an auto service station.

Elevator installers and repairers must have a thorough knowledge of electronics, electricity, and hydraulics.

Installers and repairers also install escalators. They put in place the steel framework, the electrically powered stairs and the tracks, and install associated motors and electrical wiring. In addition to elevators and escalators, installers and repairers also may install devices such as dumbwaiters and material lifts—which are similar to elevators in design—as well as moving walkways, stair lifts, and wheelchair lifts.

The most highly skilled elevator installers and repairers, called “adjusters,” specialize in fine-tuning all the equipment after installation. Adjusters make sure that an elevator is working according to specifications and is stopping correctly at each floor within a specified time. Once an elevator is operating properly, it must be maintained and serviced regularly to keep it in safe working condition. Elevator installers and repairers generally do preventive maintenance—such as oiling and greasing moving parts, replacing worn parts, testing equipment with meters and gauges, and adjusting equipment for optimal performance. They also troubleshoot and may be called to do emergency repairs.

A service crew usually handles major repairs—for example, replacing cables, elevator doors, or machine bearings. This may require the use of cutting torches or rigging equipment—tools that an elevator repairer normally would not carry. Service crews also do major modernization and alteration work, such as moving and replacing electrical motors, hydraulic pumps, and control panels.

Elevator installers and repairers usually specialize in installation, maintenance, or repair work. Maintenance and repair workers generally need greater knowledge of electricity and electronics than do installers, because a large part of maintenance and repair work is troubleshooting. Similarly, adjusters need a thorough knowledge of electricity, electronics, and computers to ensure that newly installed elevators operate properly.

Working Conditions

Most elevator installers and repairers work a 40-hour week. However, overtime is required when essential elevator equipment must be repaired, and some workers are on 24-hour call. Unlike most elevator installers, workers who specialize in elevator maintenance are on their own most of the day and typically service the same elevators periodically.

Elevator installers lift and carry heavy equipment and parts, and may work in cramped spaces or awkward positions. Potential hazards include falls, electrical shock, muscle strains, and other injuries related to handling heavy equipment. Because most of their work is performed indoors in buildings under construction or in existing buildings, elevator installers and repairers lose less work time due to inclement weather than do other construction trades workers.

Training, Other Qualifications, and Advancement

Most elevator installers and repairers apply for their jobs through a local of the International Union of Elevator Constructors. Applicants for apprenticeship positions must be at least 18 years old, have a high school diploma or equivalent, and pass an aptitude test. Good physical condition and mechanical aptitude also are important.

Elevator installers and repairers learn their trade in a program administered by local joint educational committees representing the employers and the union. These programs, through which the apprentice learns everything from installation to repair, combine on-the-job training with classroom instruction in blueprint reading, electrical and electronic theory, mathematics, applications of physics, and safety. In nonunion shops, workers may complete training programs sponsored by independent contractors.

Apprentices generally must complete a 6-month probationary period. After successful completion, they work toward becoming fully qualified within 4 years. To be classified as a fully qualified elevator installer or repairer, union trainees must pass a standard examination administered by the National Elevator Industry Educational Program. Most States and cities also require elevator installers and repairers to pass a licensing examination. Both union and nonunion technicians may take the Certified Elevator Technician (CET) or the Certified Accessibility and Private Residence Lift Technician (CAT) program courses offered by the National Association of Elevator Contractors.

Most apprentices assist experienced elevator installers and repairers. Beginners carry materials and tools, bolt rails to walls, and assemble elevator cars. Eventually, apprentices learn more difficult tasks such as wiring, which requires knowledge of local and national electrical codes.

High school courses in electricity, mathematics, and physics provide a useful background. As elevators become increasingly sophisticated, workers may find it necessary to acquire more advanced formal education—for example, in a postsecondary technical school or junior college—with an emphasis on electronics. Workers with more formal education, such as an associate degree, usually advance more quickly than do their counterparts without a degree.

Many elevator installers and repairers also receive training from their employers or through manufacturers to become familiar with a particular company's equipment. Retraining is very important if a worker is to keep abreast of technological developments in elevator repair. In fact, union elevator installers and repairers typically receive continual training throughout their careers, through correspondence courses, seminars, or formal classes. Although voluntary, this training greatly improves one's chances for promotion and retention.

Some installers may receive further training in specialized areas and advance to the position of mechanic-in-charge, adjuster, supervisor, or elevator inspector. Adjusters, for example, may be picked for their position because they possess particular skills or are electronically inclined. Other workers may move into management, sales, or product design jobs.

Employment

Elevator installers and repairers held about 22,000 jobs in 2004. Most were employed by specialty trades contractors, particularly elevator maintenance and repair contractors. Others were employed by field offices of elevator manufacturers, machinery wholesalers, government agencies, or businesses that do their own elevator maintenance and repair.

Job Outlook

Workers should expect keen competition when seeking to enter this occupation. Elevator installer and repairer jobs have relatively high earnings and good benefits, involve a significant investment in training, and a large proportion are unionized. As a result, workers tend to stay in this occupation for a long time and few leave and need to

be replaced, thus reducing job opportunities. Job prospects should be best for those with postsecondary education in electronics.

Employment of elevator installers and repairers is expected to increase as fast as the average for all occupations through the year 2014. Most of the demand for workers will be due to replacements. Demand for additional elevator installers depends greatly on growth in nonresidential construction, such as commercial office buildings and stores that have elevators and escalators. This sector of the construction industry is expected to grow during the decade in response to expansion of the economy. In addition, the need to continually update and repair old equipment, expand access to the disabled, and install increasingly sophisticated equipment and computerized controls also should add to the demand for elevator installers and repairers. Adding to the demand for elevator installers and repairers is a growing residential market where an increasing number of the elderly require easier access to their homes through stair lifts and residential elevators.

Elevators, escalators, lifts, moving walkways, and related equipment need to be kept in good working condition year round, so employment of elevator repairers is less affected by economic downturns and seasonality than other construction trades.

Earnings

Earnings of elevator installers and repairers are among the highest of all construction trades. Median hourly earnings of elevator installers and repairers were \$28.23 in May 2004. The middle 50 percent earned between \$22.96 and \$33.68. The lowest 10 percent earned less than \$17.36, and the top 10 percent earned more than \$39.65. In May 2004, median hourly earnings in the miscellaneous special trade contractors industry were \$28.68.

Three out of four elevator installers and repairers were members of unions or covered by a union contract, one of the highest proportions of all occupations. The largest numbers were members of the International Union of Elevator Constructors. In addition to free continuing education, elevator installers and repairers receive basic benefits enjoyed by most other workers.

Related Occupations

Elevator installers and repairers combine electrical and mechanical skills with construction skills, such as welding, rigging, measuring, and blueprint reading. Other occupations that require many of these skills are boilermakers; electricians; electrical and electronics installers and repairers; industrial machinery installation, repair, and maintenance workers; sheet metal workers; and structural and reinforcing iron and metal workers.

Glaziers

(O*NET 47-2121.00)

Significant Points

- Many glaziers learn the trade by working as helpers to experienced glaziers.
- Job opportunities are expected to be good.

Nature of the Work

Glass serves many uses in modern life. Insulated and specially treated glass keeps in warmed or cooled air and provides good condensation and sound control qualities, while tempered and laminated glass makes doors and windows more secure. In large commercial buildings, glass panels give office buildings a distinctive look while reducing the need for artificial lighting. The creative use of large windows, glass doors, skylights, and sunroom additions makes homes bright, airy, and inviting.

Glaziers are responsible for selecting, cutting, installing, replacing, and removing all types of glass. They generally work on one of several types of projects. Residential glazing involves work such as replacing glass in home windows; installing glass mirrors, shower doors, and bathtub enclosures; and fitting glass for tabletops and display cases. On commercial interior projects, glaziers install items such as heavy, often etched, decorative room dividers or security windows. Glazing projects also may involve replacement of storefront windows for establishments such as supermarkets, auto dealerships, or banks. In the construction of large commercial buildings, glaziers build metal framework extrusions and install glass panels or curtain walls.

Besides working with glass, glaziers also may work with plastics, granite, marble, and other similar materials used as glass substitutes, as well as films or laminates that improve the durability or safety of the glass. They may mount steel and aluminum sashes or frames and attach locks and hinges to glass doors. For most jobs, the glass is pre-cut and mounted in frames at a factory or a contractor's shop. It arrives at the jobsite ready for glaziers to position and secure it in place. They may use a crane or hoist with suction cups to lift large, heavy pieces of glass. They then gently guide the glass into position by hand.

Once glaziers have the glass in place, they secure it with mastic, putty, or other paste-like cement, or with bolts, rubber gaskets, glazing compound, metal clips, or metal or wood moldings. When they secure glass using a rubber gasket—a thick, molded rubber half-tube with a split running its length—they first secure the gasket around the perimeter within the opening, then set the glass into the split side of the gasket, causing it to clamp to the edges and hold the glass firmly in place.

When they use metal clips and wood moldings, glaziers first secure the molding to the opening, place the glass in the molding, and then force springlike metal clips between the glass and the molding. The clips exert pressure and keep the glass firmly in place.

When a glazing compound is used, glaziers first spread it neatly against and around the edges of the molding on the inside of the opening. Next, they install the glass. Pressing it against the compound on the inside molding, workers screw or nail outside molding that loosely holds the glass in place. To hold it firmly, they pack the space between the molding and the glass with glazing compound and then trim any excess material with a glazing knife.

For some jobs, the glazier must cut the glass manually at the jobsite. To prepare the glass for cutting, glaziers rest it either on edge on a rack, or "A-frame," or flat against a cutting table. They then measure and mark the glass for the cut.

Glaziers cut glass with a special tool that has a small, very hard metal wheel. Using a straightedge as a guide, the glazier presses the cutter's wheel firmly on the glass, guiding and rolling it carefully to make a score just below the surface. To help the cutting tool move smoothly across the glass, workers brush a thin layer of oil along the line of the intended cut or dip the cutting tool in oil. Immediately after cutting, the glazier presses on the shorter end of the glass to break it cleanly along the cut.

In addition to handtools such as glasscutters, suction cups, and glazing knives, glaziers use power tools such as saws, drills, cutters, and grinders. An increasing number of glaziers use computers in the shop or at the jobsite to improve their layout work and reduce the amount of glass that is wasted.

Using a straightedge as a guide, the glazier makes a score on the surface of the glass before cutting it.

Working Conditions

Glaziers often work outdoors, sometimes in inclement weather. Their work can, at times, result in injuries as they work with sharp tools and may need to remove broken glass. They must be prepared to lift heavy glass panels and work on scaffolding, sometimes at great heights. Glaziers do a considerable amount of bending, kneeling, lifting, and standing during the installation process.

Training, Other Qualifications, and Advancement

Glaziers learn their trade through formal and informal training programs. To become a skilled glazier usually takes 3 years of both classroom and on-the-job training. There are a number of different avenues that one can take to obtain the necessary training. One of the ways is to obtain a job with a contractor who will then provide on-the-job training. Entry-level workers generally start as helpers, assisting more experienced workers. During this time, employers may send the employee to a trade or vocational school, or community college to receive further classroom training.

Some employers offer employees formal apprenticeships. These programs combine on-the-job training with related classroom instruction. Apprenticeship applicants usually must be at least 18 years old and meet local requirements. The length of the program is usually 3 years, but varies with the apprentice's skill. Because the number of apprenticeship programs is limited, however, only a small proportion of glaziers learn their trade through these programs.

On the job, apprentices or helpers, will start by carrying glass and cleaning up debris in glass shops. They often practice cutting on discarded glass. After a while, they are given an opportunity to cut glass for a job and assist experienced workers on simple installation jobs. By working with experienced glaziers, they eventually acquire the skills of a fully qualified glazier. On the job, they learn to use the tools and equipment of the trade; handle, measure, cut, and install glass and metal framing; cut and fit moldings; and install and balance glass doors. In the classroom, they are taught about glass and installation techniques as well as basic mathematics, blueprint reading and sketching, general construction techniques, safety practices and first aid.

Because most glaziers do not learn the trade through a formal apprenticeship program, some associations offer a series of written examinations that certify an individual's competency to perform glazier work at three progressively more difficult levels of proficiency. These levels include Level I Glazier; Level II Commercial Interior/Residential Glazier or Storefront/Curtainwall Glazier; and Level III Master Glazier. There also is a certification program for auto-glass repair.

Some skills needed to become a glazier include manual dexterity, eye-hand coordination, physical fitness, and a good sense of balance. The ability to solve arithmetic problems quickly and accurately also is required. In addition, a good work history or military service is viewed favorably by contractors.

Advancement generally consists of increases in pay for most glaziers; some advance to supervisory jobs or become contractors or estimators. For those who would like to advance, it is increasingly important to be able to communicate in both English and Spanish in order to relay instructions and safety precautions to workers with limited understanding of English; Spanish-speaking workers make up a large part of the construction workforce in many areas. Glaziers may advance to glazier supervisor or general construction supervisor positions. Others may become independent contractors. Supervisors and contractors need good communication skills to deal with clients and subcontractors and should be able to identify and estimate the quantity of materials needed to complete a job and accurately estimate how long a job will take to complete and at what cost.

Employment

Glaziers held 49,000 jobs in 2004. Almost two-thirds of glaziers worked for glazing contractors engaged in new construction, alteration, and repair. About 1 in 10 glaziers worked in retail glass shops that install or replace glass and for wholesale distributors of products containing glass.

Job Outlook

Job opportunities for glaziers are expected to be good as some employers report difficulty in finding qualified workers. In addition, employment is expected to grow about as fast as the average for all occupations through the year 2014.

Employment of glaziers is expected to increase as a result of growth in residential and nonresidential construction. Demand for glaziers also will be spurred by the continuing need to modernize and repair existing structures, which often involves installing new windows. Homeowners also are preferring rooms with more sunlight and are adding sunrooms and skylights to houses. Demand for specialized safety glass and glass coated with protective laminates is also growing in response to a higher need for security and the need to withstand hurricanes, particularly in many commercial and government buildings.

Like other construction trades workers, glaziers employed in the construction industry should expect to experience periods of unemployment resulting from the limited duration of construction projects and the cyclical nature of the construction industry. During bad economic times, job openings for glaziers are reduced as the level of construction declines. However, construction activity varies from area to area, so job openings fluctuate with local economic conditions. Employment opportunities should be greatest in metropolitan areas, where most glazing contractors and glass shops are located.

Earnings

In May 2004, median hourly earnings of glaziers were \$15.70. The middle 50 percent earned between \$12.08 and \$21.58. The lowest 10 percent earned less than \$9.73, and the highest 10 percent earned more than \$30.36. In May 2004, median hourly earnings in the foundation, structure, and building exterior contractors industry, where most glass shops are found, were \$16.10.

Glaziers covered by union contracts generally earn more than their nonunion counterparts. Apprentice wage rates usually start at 40 to 50 percent of the rate paid to experienced glaziers and increase as they gain experience in the field. Because glaziers can lose time due to weather conditions and fluctuations in construction activity, their overall earnings may be lower than their hourly wages suggest.

Some glaziers employed in construction are members of the International Union of Painters and Allied Trades.

Related Occupations

Glaziers use their knowledge of construction materials and techniques to install glass. Other construction workers whose jobs also involve skilled, custom work are brickmasons, blockmasons, and stonemasons; carpenters; carpet, floor, and tile installers and finishers; cement masons, concrete finishers, segmental pavers, and terrazzo workers; sheet metal workers; and painters and paper-hangers. Other related occupations include automotive body and related repairers who install broken or damaged glass on vehicles that they repair.

Sources of Additional Information

For more information about glazier apprenticeships or work opportunities, contact local glazing or general contractors, a local of the International Union of Painters and Allied Trades, a local joint union-management apprenticeship agency, or the nearest office of the State employment service or State apprenticeship agency.

For information concerning training for glaziers, contact:

► National Glass Association, Education and Training Department, 8200 Greensboro Dr., Suite 302, McLean, VA 22102-3881. Internet: <http://www.glass.org>

► Associated Builders and Contractors, Workforce Development Department, 4250 North Fairfax Dr., 9th Floor, Arlington, VA 22203. Internet: www.trytools.org

Hazardous Materials Removal Workers

(O*NET 47-4041.00)

Significant Points

- Working conditions can be hazardous, and the use of protective clothing often is required.
- Formal education beyond high school is not required, but a training program leading to a Federal license is mandatory.
- Excellent job opportunities are expected.

Nature of the Work

Increased public awareness and Federal and State regulations are resulting in the removal of hazardous materials from buildings, facilities, and the environment to prevent further contamination of natural resources and to promote public health and safety. Hazardous materials removal workers identify, remove, package, transport, and dispose of various hazardous materials, including asbestos, lead, and radioactive and nuclear materials. They also respond to emergencies where harmful substances are present. The removal of hazardous materials, or "hazmats," from public places and the environment also is called abatement, remediation, and decontamination.

Hazardous materials removal workers use a variety of tools and equipment, depending on the work at hand. Equipment ranges from brooms to personal protective suits that completely isolate workers from the hazardous material. The equipment required varies with the threat of contamination and can include disposable or reusable coveralls, gloves, hardhats, shoe covers, safety glasses or goggles,

chemical-resistant clothing, face shields, and devices to protect one's hearing. Most workers also are required to wear respirators while working, to protect them from airborne particles. The respirators range from simple versions that cover only the mouth and nose to self-contained suits with their own air supply.

Asbestos and lead are two of the most common contaminants that hazardous materials removal workers encounter. In the past, asbestos was used to fireproof roofing and flooring, for heat insulation, and for a variety of other purposes. Today, asbestos is rarely used in buildings, but there still are structures that contain the material. Embedded in materials, asbestos is fairly harmless; airborne, however, it can cause several lung diseases, including lung cancer and asbestosis. Similarly, lead was a common building component found in paint and plumbing fixtures and pipes until the late 1970s. Because lead is easily absorbed into the bloodstream, often from breathing lead dust or from eating chips of paint containing lead, it can cause serious health risks, especially in children. Due to these risks, it has become necessary to remove lead-based products and asbestos from buildings and structures.

Asbestos abatement workers and lead abatement workers remove asbestos, lead, and other materials from buildings scheduled to be renovated or demolished. Using a variety of hand and power tools, such as vacuums and scrapers, these workers remove the asbestos and lead from surfaces. A typical residential lead abatement project involves the use of a chemical to strip the lead-based paint from the walls of the home. Lead abatement workers apply the compound with a putty knife and allow it to dry. Then they scrape the hazardous material into an impregnable container for transport and storage. They also use sandblasters and high-pressure water sprayers to remove lead from large structures. The vacuums utilized by asbestos abatement workers have special, highly efficient filters designed to trap the asbestos, which later is disposed of or stored. During the abatement, special monitors measure the amount of asbestos and lead in the air, to protect the workers; in addition, lead abatement workers wear a personal air monitor that indicates the amount of lead to which a worker has been exposed. Workers also use monitoring devices to identify the asbestos, lead, and other materials that need to be removed from the surfaces of walls and structures.

Transportation of hazardous materials is safer today than it was in the past, but accidents still occur. *Emergency and disaster response workers* clean up hazardous materials after train derailments and trucking accidents. These workers also are needed when an immediate cleanup is required, as would be the case after an attack by biological or chemical weapons.

Radioactive materials are classified as either high- or low-level wastes. High-level wastes are primarily nuclear-reactor fuels used to produce electricity. Low-level wastes include any radioactively contaminated protective clothing, tools, filters, medical equipment, and other items. *Decontamination technicians* perform duties similar to those of janitors and cleaners. They use brooms, mops, and other tools to clean exposed areas and remove exposed items for decontamination or disposal. Some of these jobs are now being done by robots controlled by persons away from the contamination site.

With experience, decontamination technicians can advance to *radiation-protection technician* jobs and use radiation survey meters to locate and evaluate materials, operate high-pressure cleaning equipment for decontamination, and package radioactive materials for transportation or disposal.

Decommissioning and decontamination workers remove and treat radioactive materials generated by nuclear facilities and power plants. With a variety of handtools, they break down contaminated items such as "gloveboxes," which are used to process radioactive materials. At decommissioning sites, the workers clean and

decontaminate the facility, as well as remove any radioactive or contaminated materials.

Treatment, storage, and disposal workers transport and prepare materials for treatment or disposal. To ensure proper treatment of the materials, laws require these workers to be able to verify shipping manifests. At incinerator facilities, treatment, storage, and disposal workers transport materials from the customer or service center to the incinerator. At landfills, they follow a strict procedure for the processing and storage of hazardous materials. They organize and track the location of items in the landfill and may help change the state of a material from liquid to solid in preparation for its storage. These workers typically operate heavy machinery, such as forklifts, earthmoving machinery, and large trucks and rigs.

Mold remediation is a new and growing part of the work of some hazardous materials removal workers. Some types of mold can cause allergic reactions, especially in people who are susceptible to them. Although mold is present in almost all structures, some mold—especially the types that cause allergic reactions—can infest a building to such a degree that extensive efforts must be taken to remove it safely. Mold typically grows in damp areas, in heating and air-conditioning ducts, within walls, and in attics and basements. Although some mold remediation work is undertaken by other construction workers, mold often must be removed by hazardous materials removal workers, who take special precautions to protect themselves and surrounding areas from being contaminated.

Hazardous materials removal workers also may be required to construct scaffolding or erect containment areas prior to abatement or decontamination. In most cases, government regulation dictates that hazardous materials removal workers be closely supervised on the worksite. The standard usually is 1 supervisor to every 10 workers. The work is highly structured, sometimes planned years in advance, and team oriented. There is a great deal of cooperation among supervisors and workers. Because of the hazard presented by the materials being removed, work areas are restricted to licensed hazardous materials removal workers, thus minimizing exposure to the public.

Working Conditions

Hazardous materials removal workers function in a highly structured environment to minimize the danger they face. Each phase of an operation is planned in advance, and workers are trained to deal with safety breaches and hazardous situations. Crews and supervisors take every precaution to ensure that the worksite is safe. Whether they work with asbestos, mold, lead abatement or in radioactive decontamination, hazardous materials removal workers must stand, stoop, and kneel for long periods. Some must wear fully enclosed personal protective suits for several hours at a time; these suits may be hot and uncomfortable and may cause some individuals to experience claustrophobia.

Hazardous materials removal workers face different working conditions, depending on their area of expertise. Although many work a standard 40-hour week, overtime and shift work are common, especially in asbestos and lead abatement. Asbestos abatement and lead abatement workers are found primarily in structures such as office buildings and schools. Because they are under pressure to complete their work within certain deadlines, workers may experience fatigue. Completing projects frequently requires night and weekend work, because hazardous materials removal workers often work around the schedules of others. Treatment, storage, and disposal workers are employed primarily at facilities such as landfills, incinerators, boilers, and industrial furnaces. These facilities often are located in remote areas, due to the kinds of work being done. As a result, workers employed by treatment, storage, or disposal facilities may commute long distances to their jobs.

Hazardous materials removal workers need a license to work in this occupation.

Decommissioning and decontamination workers, decontamination technicians, and radiation protection technicians work at nuclear facilities and electric power plants. Like treatment, storage, and disposal facilities, these sites often are far from urban areas. Workers, who often perform jobs in cramped conditions, may need to use sharp tools to dismantle contaminated objects. A hazardous materials removal worker must have great self-control and a level head to cope with the daily stress associated with handling hazardous materials.

Hazardous materials removal workers may be required to travel outside their normal working areas in order to respond to emergencies, the cleanup of which sometimes take several days or weeks to complete. During the cleanup, workers may be away from home for the entire time.

Training, Other Qualifications, and Advancement

No formal education beyond a high school diploma is required for a person to become a hazardous materials removal worker. Federal regulations require an individual to have a license to work in the occupation, although, at present, there are few laws regulating mold removal. Most employers provide technical training on the job, but a formal 32- to 40-hour training program must be completed if one is to be licensed as an asbestos abatement and lead abatement worker or a treatment, storage, and disposal worker. The program covers health hazards, personal protective equipment and clothing, site safety, recognition and identification of hazards, and decontamination. In some cases, workers discover one hazardous material while abating another. If they are not licensed to work with the newly

discovered material, they cannot continue to work with it. Many experienced workers opt to take courses in additional disciplines to avoid this situation. Some employers prefer to hire workers licensed in multiple disciplines.

For decommissioning and decontamination workers employed at nuclear facilities, training is more extensive. In addition to the standard 40-hour training course in asbestos, lead, and hazardous waste, workers must take courses dealing with regulations governing nuclear materials and radiation safety. These courses add up to approximately 3 months of training, although most are not taken consecutively. Many agencies, organizations, and companies throughout the country provide training programs that are approved by the U.S. Environmental Protection Agency, the U.S. Department of Energy, and other regulatory bodies. Workers in all fields are required to take refresher courses every year in order to maintain their license.

Workers must be able to perform basic mathematical conversions and calculations, and should have good physical strength and manual dexterity. Because of the nature of the work and the time constraints sometimes involved, employers prefer people who are dependable, prompt, and detail-oriented. Because much of the work is done in buildings, a background in construction is helpful.

Employment

Hazardous materials removal workers held about 38,000 jobs in 2004. About 8 in 10 were employed in waste management and remediation services. About 1 in 20 were employed in construction, primarily in asbestos abatement and lead abatement. A small number worked at nuclear and electric plants as decommissioning and decontamination workers and radiation safety and decontamination technicians.

Job Outlook

Job opportunities are expected to be excellent for hazardous materials removal workers. The occupation is characterized by a relatively high rate of turnover, resulting in a number of job openings each year stemming from experienced workers leaving the occupation. In addition, many potential workers are not attracted to this occupation, because they may prefer work that is less strenuous and has safer working conditions. Experienced workers will have especially favorable opportunities, particularly in the private sector, as more State and local governments contract out hazardous materials removal work to private companies.

Employment of hazardous materials removal workers is expected to grow much faster than the average for all occupations through the year 2014, reflecting increasing concern for a safe and clean environment. Special-trade contractors will have strong demand for the largest segment of these workers, namely, asbestos abatement and lead abatement workers; lead abatement should offer particularly good opportunities. Mold remediation is a growing part of the occupation at the present time, but it is unclear whether the growth will continue as builders find ways to prevent moisture from entering homes.

Employment of decontamination technicians, radiation safety technicians, and decommissioning and decontamination workers is expected to grow in response to increased pressure for safer and cleaner nuclear and electric generator facilities. Renewed interest in nuclear power production could lead to the construction of additional facilities. However, the number of older closed facilities that need decommissioning may continue to grow due to Federal legislation. These workers are less affected by economic fluctuations because the facilities in which they work must operate, regardless of the state of the economy.

Earnings

Median hourly earnings of hazardous materials removal workers were \$16.02 in May 2004. The middle 50 percent earned between \$12.52 and \$22.27 per hour. The lowest 10 percent earned less than \$10.48 per hour, and the highest 10 percent earned more than \$27.25 per hour. The median hourly earnings in remediation and other waste management services, the largest industry employing hazardous materials removal workers in May 2004, were \$15.46.

According to the limited data available, treatment, storage, and disposal workers usually earn slightly more than asbestos abatement and lead abatement workers. Decontamination and decommissioning workers and radiation protection technicians, though constituting the smallest group, tend to earn the highest wages.

Related Occupations

Asbestos abatement workers and lead abatement workers share skills with other construction trades workers, including painters and paperhangers; insulation workers; and sheet metal workers. Treatment, storage, and disposal workers, decommissioning and decontamination workers, and decontamination and radiation safety technicians work closely with plant and system operators, such as power-plant operators, distributors, and dispatchers and water and wastewater treatment plant operators. Police officers and firefighters also respond to emergencies and often are the first ones to respond to incidents where hazardous materials may be present.

Insulation Workers

(O*NET 47-2131.00, 47-2132.00)

Significant Points

- Workers must follow strict safety guidelines to protect themselves from insulating irritants.
- Most insulation workers learn their work informally on the job; others complete formal apprenticeship programs.
- Job opportunities in the occupation are expected to be excellent.

Nature of the Work

Properly insulated buildings reduce energy consumption by keeping heat in during the winter and out in the summer. Refrigerated storage rooms, vats, tanks, vessels, boilers, and steam and hot-water pipes also are insulated to prevent the wasteful loss of heat. Insulation workers install the materials used to insulate buildings and equipment.

Insulation workers cement, staple, wire, tape, or spray insulation. When covering a steampipe, for example, insulation workers measure and cut sections of insulation to the proper length, stretch it open along a cut that runs the length of the material, and slip it over the pipe. They fasten the insulation with adhesive, staples, tape, or wire bands. Sometimes, they wrap a cover of aluminum, plastic, or canvas over the insulation and cement or band the cover in place. Insulation workers may screw on sheet metal around insulated pipes to protect the insulation from weather conditions or physical abuse.

When covering a wall or other flat surface, workers may use a hose to spray foam insulation onto a wire mesh that provides a rough surface to which the foam can cling and that adds strength to the finished surface. Workers may then install drywall or apply a final coat of plaster for a finished appearance.

In attics or exterior walls of uninsulated buildings, workers may blow in loose-fill insulation. A helper feeds a machine with fiberglass, cellulose, or rock-wool insulation, while another worker blows the insulation with a compressor hose into the space being filled.

In new construction or on major renovations, insulation workers staple fiberglass or rock-wool batts to exterior walls and ceilings before drywall, paneling, or plaster walls are put in place. In making major renovations to old buildings or when putting new insulation around pipes and industrial machinery, insulation workers often must first remove the old insulation. In the past, asbestos—now known to cause cancer in humans—was used extensively in walls and ceilings and to cover pipes, boilers, and various industrial equipment. Because of this danger, U.S. Environmental Protection Agency regulations require that asbestos be removed before a building undergoes major renovations or is demolished. When asbestos is present, specially trained workers must remove the asbestos before insulation workers can install the new insulating materials. (See the statement on hazardous materials removal workers elsewhere in the *Handbook*.)

Insulation workers use common handtools—trowels, brushes, knives, scissors, saws, pliers, and stapling guns. They may use power saws to cut insulating materials, welding machines to join sheet metal or secure clamps, and compressors to blow or spray insulation.

Working Conditions

Insulation workers generally work indoors in residential and industrial settings. They spend most of the workday on their feet, either standing, bending, or kneeling. They also work from ladders or in confined spaces. Their work usually requires more coordination than strength. In industrial settings insulation workers often must insulate pipes and vessels with temperatures that may cause burns. Minute particles from insulation materials, especially when blown, can irritate the eyes, skin, and respiratory system. Workers must follow strict safety guidelines

Insulation materials can irritate the eyes, skin, and respiratory system, requiring insulation workers to wear masks and other protective gear.

to protect themselves from insulating irritants. They keep work areas well ventilated; wear protective suits, masks, and respirators; and take decontamination showers when necessary.

Training, Other Qualifications, and Advancement

Most insulation workers learn their trade informally on the job, although some complete formal apprenticeship programs. For entry-level jobs, insulation contractors prefer high school graduates who are in good physical condition and licensed to drive. High school courses in blueprint reading, shop mathematics, science, sheet metal layout, woodworking, and general construction provide a helpful background. Applicants seeking apprenticeship positions should have a high school diploma or its equivalent and be at least 18 years old.

Trainees who learn on the job receive instruction and supervision from experienced insulation workers. Trainees begin with simple tasks, such as carrying insulation or holding material while it is fastened in place. On-the-job training can take up to 2 years, depending on the nature of the work. Installing insulation in homes generally requires less training than does learning to apply insulation in commercial and industrial settings. As they gain experience, trainees receive less supervision, more responsibility, and higher pay. A certification program has been developed by insulation contractor organizations to help all workers prove their skills and knowledge. Certification is currently limited to residential installation. Workers need at least six months of experience before they can complete certification. Certification in industrial settings is being developed.

Trainees in formal apprenticeship programs receive in-depth instruction in all phases of insulation. Apprenticeship programs may be provided by a joint committee of local insulation contractors and the local union of the International Association of Heat and Frost Insulators and Asbestos Workers, to which some insulation workers belong. Programs normally consist of 4 years of on-the-job training coupled with classroom instruction, and trainees must pass practical and written tests to demonstrate their knowledge of the trade.

Skilled insulation workers may advance to supervisor, shop superintendent, or insulation contract estimator, or they may set up their own insulation business.

Employment

Insulation workers held about 61,000 jobs in 2004. The construction industry employed 4 out of 5 workers; most worked for building finishing contractors. Small numbers of insulation workers held jobs in the Federal Government, in wholesale trade, and in shipbuilding and other manufacturing industries that have extensive installations for power, heating, and cooling. In less populated areas, carpenters, heating and air-conditioning installers or drywall installers may do insulation work.

Job Outlook

Job opportunities are expected to be excellent for insulation workers. Because there are no strict training requirements for entry, many people with limited skills work as insulation workers for a short time and then move on to other types of work, creating many job openings. In addition, openings will arise from the need to replace workers who retire or leave the labor force for other reasons.

In addition to the regular need to replace workers, some new jobs will arise as employment of insulation workers is expected to increase more slowly than the average for all occupations through the year 2014. In contrast to other construction workers, insulation workers work mainly on new construction, which is expected to moderate some over the next decade. Growth also will be limited by the increased efficiency of these workers and installation techniques, such as blow-in and spray-in insulation, which allows more work to be done in a shorter time and with fewer people. Insulation also is increasingly being installed by other workers in other occupations.

Some demand for insulation workers will be spurred by the continuing need for energy efficient buildings, which will generate work in existing structures as well as new construction.

Insulation workers in the construction industry may experience periods of unemployment because of the short duration of many construction projects and the cyclical nature of construction activity. Workers employed to perform industrial plant maintenance generally have more stable employment because maintenance and repair must be done on a continuing basis. Most insulation is applied after buildings are enclosed, so weather conditions have less effect on the employment of insulation workers than on that of some other construction occupations.

Earnings

In May 2004, median hourly earnings of insulation workers, floor, ceiling, and wall were \$14.57. The middle 50 percent earned between \$10.63 and \$20.20. The lowest 10 percent earned less than \$8.53, and the highest 10 percent earned more than \$27.35. In May 2004, median hourly earnings of insulation workers, mechanical were \$16.03. The middle 50 percent earned between \$12.16 and \$21.15. The lowest 10 percent earned less than \$9.82, and the highest 10 percent earned more than \$28.85. Median hourly earnings in the industries employing the largest numbers of insulation workers in May 2004 were:

Insulation workers, mechanical	
Building equipment contractors	\$15.66
Building finishing contractors	15.55
Insulation workers, floor, ceiling, and wall	
Building finishing contractors	13.95

Union workers tend to earn more than nonunion workers. Apprentices start at about one-half of the journey worker's wage. Insulation workers doing commercial and industrial work earn substantially more than those working in residential construction, which does not require as much skill.

Related Occupations

Insulation workers combine their knowledge of insulation materials with the skills of cutting, fitting, and installing materials. Workers in occupations involving similar skills include carpenters; carpet, floor, and tile installers and finishers; drywall installers, ceiling tile installers, and tapers; roofers; and sheet metal workers.

Sources of Additional Information

For information about training programs or other work opportunities in this trade, contact a local insulation contractor, the nearest office of the State employment service or apprenticeship agency, or one of the following organizations:

- ▶ National Insulation Association, 99 Canal Center Plaza, Suite 222, Alexandria, VA 22314. Internet: <http://www.insulation.org>
- ▶ Insulation Contractors Association of America, 1321 Duke St., Suite 303, Alexandria, VA 22314. Internet: <http://www.insulate.org>

Painters and Paperhangers

(O*NET 47-2141.00, 47-2142.00)

Significant Points

- Employment prospects should be excellent due to the expected job growth, coupled with the large numbers of workers who retire or leave the occupation for other jobs.
- Most workers learn informally on the job as helpers, but training experts recommend completion of an apprenticeship program.
- Nearly one-half of all painters and paperhangers are self-employed.

Nature of the Work

Paint and wall coverings make surfaces clean, attractive, and bright. In addition, paints and other sealers protect exterior surfaces from wear caused by exposure to the weather.

Painters apply paint, stain, varnish, and other finishes to buildings and other structures. They choose the right paint or finish for the surface to be covered, taking into account durability, ease of handling, method of application, and customers' wishes. Painters first prepare the surfaces to be covered, so that the paint will adhere properly. This may require removing the old coat of paint by stripping, sanding, wire brushing, burning, or water and abrasive blasting. Painters also wash walls and trim to remove dirt and grease, fill nail holes and cracks, sandpaper rough spots, and brush off dust. On new surfaces, they apply a primer or sealer to prepare the surface for the finish coat. Painters also mix paints and match colors, relying on knowledge of paint composition and color harmony. In large paint shops or hardware stores, these functions are automated.

There are several ways to apply paint and similar coverings. Painters must be able to choose the right paint applicator for each job, depending on the surface to be covered, the characteristics of the finish, and other factors. Some jobs need only a good bristle brush with a soft, tapered edge; others require a dip or fountain pressure roller; still others can best be done using a paint sprayer. Many jobs need several types of applicators. The right tools for each job not only expedite the painter's work but also produce the most attractive surface.

When working on tall buildings, painters erect scaffolding, including "swing stages," scaffolds suspended by ropes, or cables attached to roof hooks. When painting steeples and other conical structures, they use a bosun's chair, a swing-like device.

Paperhangers cover walls and ceilings with decorative wall coverings made of paper, vinyl, or fabric. They first prepare the surface to be covered by applying "sizing," which seals the surface and makes the covering adhere better. When redecorating, they may first remove the old covering by soaking, steaming, or applying solvents. When necessary, they patch holes and take care of other imperfections before hanging the new wall covering.

After the surface has been prepared, paperhangers must prepare the paste or other adhesive. Then, they measure the area to be covered, check the covering for flaws, cut the covering into strips of the proper size, and closely examine the pattern in order to match it when the strips are hung. Much of this process can now be handled by specialized equipment.

The next step is to brush or roll the adhesive onto the back of the covering, if needed, and to then place the strips on the wall or ceiling, making sure the pattern is matched, the strips are hung straight, and the

edges are butted together to make tight, closed seams. Finally, paperhangers smooth the strips to remove bubbles and wrinkles, trim the top and bottom with a razor knife, and wipe off any excess adhesive.

Working Conditions

Most painters and paperhangers work 40 hours a week or less; about one-fourth have variable schedules or work part time. Painters and paperhangers must stand for long periods, often working from scaffolding and ladders. Their jobs also require a considerable amount of climbing and bending. These workers must have stamina, because much of the work is done with their arms raised overhead. Painters often work outdoors but seldom in wet, cold, or inclement weather. Some painting jobs can leave a worker covered with paint.

Painters and paperhangers sometimes work with materials that are hazardous or toxic, such as when they are required to remove lead-based paints. In the most dangerous situations, painters work in a sealed self-contained suit to prevent inhalation of or contact with hazardous materials.

Training, Other Qualifications, and Advancement

Painting and paperhanging is learned mostly through on-the-job training and by working as a helper to an experienced painter. However, there are a number of formal and informal training programs that provide more thorough instruction and a better career foundation. In general, the more formal the training received the more likely the individual will enter the profession at a higher level. Besides apprenticeships, some workers gain skills by attending technical schools that offer training prior to employment. These schools can take about a year to complete. Others receive training through local vocational high schools. Applicants should have good manual dexterity and color sense. There are limited opportunities for informal training for paperhangers because there are fewer paperhangers and helpers are usually not required.

If available, apprenticeships are usually the best way to enter the profession. They generally provide a mixture of classroom instruction and on-the-job training. Apprenticeships for painters and paperhangers consist of 2 to 4 years of on-the-job training, supplemented by 144 hours of related classroom instruction each year. Apprentices or helpers generally must be at least 18 years old and in good physical condition. A high school education or its equivalent, with courses in mathematics, usually is required to enter an apprenticeship program. Apprentices receive instruction in color harmony, use and care of tools and equipment, surface preparation, application techniques, paint mixing and matching, characteristics of different finishes, blueprint reading, wood finishing, and safety.

Whether a painter learns the trade through a formal apprenticeship or informally as a helper, on-the-job instruction covers similar skill areas. Under the direction of experienced workers, trainees carry supplies, erect scaffolds, and do simple painting and surface preparation tasks while they learn about paint and painting equipment. As they gain experience, trainees learn to prepare surfaces for painting and paperhanging, to mix paints, and to apply paint and wall coverings efficiently and neatly. Near the end of their training, they may learn decorating concepts, color coordination, and cost-estimating techniques. In addition to learning craft skills, painters must become familiar with safety and health regulations so that their work complies with the law.

Painters and paperhangers may advance to supervisory or estimating jobs with painting and decorating contractors. Many establish their own painting and decorating businesses. For those who would like to advance, it is increasingly important to be able to communicate in both English and Spanish in order to relay instructions and safety precautions to workers with limited English skills; Spanish speaking workers make up a large part of the construction workforce in many

Most painters start out as helpers and learn on the job.

areas. Painting contractors need good English skills in order to deal with clients and subcontractors.

Employment

Painters and paperhangers held about 486,000 jobs in 2004; most were painters. Around one-third of painters and paperhangers work for painting and wall covering contractors engaged in new construction, repair, restoration, or remodeling work. In addition, organizations that own or manage large buildings—such as apartment complexes—employ maintenance painters, as do some schools, hospitals, factories, and government agencies.

Self-employed independent painting contractors accounted for nearly one-half of all painters and paperhangers, significantly greater than the one in five of construction trades workers in general.

Job Outlook

Job prospects should be excellent because each year thousands of painters retire or leave for jobs in other occupations. There are no strict training requirements for entry into these jobs, so many people with limited skills work as painters or helpers for a short time and then move on to other types of work. Many fewer openings will arise for paperhangers because the number of these jobs is comparatively small.

In addition to the need to replace experienced workers who leave, new jobs will be created. Employment of painters is expected to grow as fast as the average for all occupations through the year 2014, reflecting increases in the level of new construction and in the stock of buildings and other structures that require maintenance and renovation. The relatively short life of exterior paints as well as changing color trends will stir demand for painters. Painting is labor-intensive and not susceptible to technological changes that might make workers more productive and slow employment growth. Paperhangers should see slower than average employment growth as easy application materials and reduced demand for paperhanging services limits growth.

Jobseekers considering these occupations should expect some periods of unemployment, especially until they gain experience. Many construction projects are of short duration, and construction activity is cyclical and seasonal in nature. Remodeling, restoration, and maintenance projects, however, often provide many jobs for painters and paperhangers even when new construction activity declines. The most versatile painters and skilled paperhangers generally are best able to keep working steadily during downturns in the economy.

Earnings

In May 2004, median hourly earnings of painters, construction and maintenance, were \$14.55. The middle 50 percent earned between \$11.59 and \$19.04. The lowest 10 percent earned less than \$9.47, and the highest 10 percent earned more than \$25.11. Median hourly earnings in the industries employing the largest numbers of painters in May 2004 were as follows:

Local government	\$18.36
Residential building construction	15.09
Nonresidential building construction.....	14.97
Building finishing contractors.....	14.44
Employment services	11.31

In May 2004, median earnings for paperhangers were \$15.73. The middle 50 percent earned between \$12.23 and \$20.71. The lowest 10 percent earned less than \$9.57, and the highest 10 percent earned more than \$26.58.

Earnings for painters may be reduced on occasion because of bad weather and the short-term nature of many construction jobs. Hourly wage rates for apprentices usually start at 40 to 50 percent of the rate for experienced workers and increase periodically.

Some painters and paperhangers are members of the International Brotherhood of Painters and Allied Trades. Some maintenance painters are members of other unions.

Related Occupations

Painters and paperhangers apply various coverings to decorate and protect wood, drywall, metal, and other surfaces. Other construction occupations in which workers do finishing work include carpenters; carpet, floor, and tile installers and finishers; drywall installers, ceiling tile installers, and tapers; painting and coating workers, except construction and maintenance; and plasterers and stucco masons.

Sources of Additional Information

For details about painting and paperhanging apprenticeships or work opportunities, contact local painting and decorating contractors, local trade organizations, a local of the International Union of Painters and Allied Trades, a local joint union-management apprenticeship committee, or an office of the State apprenticeship agency or employment service.

Pipelayers, Plumbers, Pipefitters, and Steamfitters

(O*NET 47-2151.00, 47-2152.01, 47-2152.02, 47-2152.03)

Significant Points

- Job opportunities should be excellent because not enough people are seeking training.
- Pipelayers, plumbers, pipefitters, and steamfitters make up one of the largest and highest paid construction occupations.

Nature of the Work

Most people are familiar with plumbers, who come to their home to unclog a drain or install an appliance. In addition to these activities, however, pipelayers, plumbers, pipefitters, and steamfitters install, maintain, and repair many different types of pipe systems. For example, some systems move water to a municipal water treatment plant and then to residential, commercial, and public buildings. Other systems dispose of waste, provide gas to stoves and furnaces, or provide for heating and cooling needs. Pipe systems in powerplants carry the steam that powers huge turbines. Pipes also are used in manufacturing plants to move material through the production process. Specialized piping systems are very important in both pharmaceutical and computer-chip manufacturing.

Although pipelaying, plumbing, pipefitting, and steamfitting sometimes are considered a single trade, workers generally specialize in one of five areas. *Pipelayers* lay clay, concrete, plastic, or cast-iron pipe for drains, sewers, water mains, and oil or gas lines. Before laying the pipe, pipelayers prepare and grade the trenches either manually or with machines. After laying the pipe, they weld, glue, cement or

otherwise join the pieces together. *Plumbers* install and repair the water, waste disposal, drainage, and gas systems in homes and commercial and industrial buildings. Plumbers also install plumbing fixtures—bathtubs, showers, sinks, and toilets—and appliances such as dishwashers and water heaters. *Pipefitters* install and repair both high- and low-pressure pipe systems used in manufacturing, in the generation of electricity, and in the heating and cooling of buildings. They also install automatic controls that are increasingly being used to regulate these systems. Some pipefitters specialize in only one type of system. *Steamfitters* install pipe systems that move liquids or gases under high pressure. *Sprinklerfitters* install automatic fire sprinkler systems in buildings.

Pipelayers, plumbers, pipefitters, and steamfitters use many different materials and construction techniques, depending on the type of project. Residential water systems, for example, incorporate copper, steel, and plastic pipe that can be handled and installed by one or two plumbers. Municipal sewerage systems, on the other hand, are made of large cast-iron pipes; installation normally requires crews of pipefitters. Despite these differences, all pipelayers, plumbers, pipefitters, and steamfitters must be able to follow building plans or blueprints and instructions from supervisors, lay out the job, and work efficiently with the materials and tools of their trade. Computers and specialized software are used to create blueprints and plan layouts.

When construction plumbers install piping in a new house, for example, they work from blueprints or drawings that show the planned location of pipes, plumbing fixtures, and appliances. Recently, plumbers have become more involved in the design process. Their knowledge of codes and the operation of plumbing systems can cut costs. They first lay out the job to fit the piping into the structure of the house with the least waste of material. Then they measure and mark areas in which pipes will be installed and connected. Construction plumbers also check for obstructions such as electrical wiring and, if necessary, plan the pipe installation around the problem.

Sometimes, plumbers have to cut holes in walls, ceilings, and floors of a house. For some systems, they may hang steel supports from ceiling joists to hold the pipe in place. To assemble a system, plumbers—using saws, pipe cutters, and pipe-bending machines—cut and bend lengths of pipe. They connect lengths of pipe with fittings, using methods that depend on the type of pipe used. For plastic pipe, plumbers connect the sections and fittings with adhesives. For copper pipe, they slide a fitting over the end of the pipe and solder it in place with a torch.

After the piping is in place in the house, plumbers install the fixtures and appliances and connect the system to the outside water or sewer lines. Finally, using pressure gauges, they check the system to ensure that the plumbing works properly.

Pipelayers, plumbers, pipefitters, and steamfitters make up one of the largest and highest paid construction occupations.

Working Conditions

Pipefitters and steamfitters most often work in industrial and power plants. Plumbers work in commercial and residential settings where water and septic systems need to be installed and maintained. Pipelayers work outdoors, sometime in remote areas, as they build the pipelines that connect sources of oil, gas, and chemicals with the users of these materials. Sprinklerfitters work mostly in multistory buildings that require the use of sprinkler systems.

Because pipelayers, plumbers, pipefitters, and steamfitters frequently must lift heavy pipes, stand for long periods, and sometimes work in uncomfortable or cramped positions, they need physical strength as well as stamina. They also may have to work outdoors in inclement weather. In addition, they are subject to possible falls from ladders, cuts from sharp tools, and burns from hot pipes or soldering equipment.

Pipelayers, plumbers, pipefitters, and steamfitters engaged in construction generally work a standard 40-hour week; those involved in maintaining pipe systems, including those who provide maintenance services under contract, may have to work evening or weekend shifts, as well as be on call. These maintenance workers may spend quite a bit of time traveling to and from worksites.

Training, Other Qualifications, and Advancement

Pipelayers, plumbers, pipefitters, and steamfitters enter into the profession in a variety of ways. Most residential and industrial plumbers get their training in career and technical schools and community colleges and from on-the-job training. Pipelayers, plumbers, pipefitters, and steamfitters who work mainly for commercial enterprises are usually trained through formal apprenticeship programs.

Apprenticeship programs generally provide the most comprehensive training available for these jobs. They are administered by either union locals and their affiliated companies or by nonunion contractor organizations. Organizations that sponsor apprenticeships include: the United Association of Journeymen and Apprentices of the Plumbing and Pipefitting Industry of the United States and Canada; local employers of either the Mechanical Contractors Association of America, the National Association of Plumbing-Heating-Cooling Contractors, or the National Fire Sprinkler Association; the Associated Builders and Contractors; the National Association of Plumbing-Heating-Cooling Contractors; the American Fire Sprinkler Association, or the Home Builders Institute of the National Association of Home Builders.

Apprenticeships—both union and nonunion—consist of 4 or 5 years of on-the-job training, in addition to at least 144 hours per year of related classroom instruction. Classroom subjects include drafting and blueprint reading, mathematics, applied physics and chemistry, safety, and local plumbing codes and regulations. On the job, apprentices first learn basic skills, such as identifying grades and types of pipe, using the tools of the trade, and safely unloading materials. As apprentices gain experience, they learn how to work with various types of pipe and how to install different piping systems and plumbing fixtures. Apprenticeship gives trainees a thorough knowledge of all aspects of the trade. Although most pipelayers, plumbers, pipefitters, and steamfitters are trained through apprenticeship, some still learn their skills informally on the job.

Applicants for union or nonunion apprentice jobs must be at least 18 years old and in good physical condition. Apprenticeship committees may require applicants to have a high school diploma or its equivalent. Armed Forces training in pipelaying, plumbing, and pipefitting is considered very good preparation. In fact, persons with this background may be given credit for previous experience when entering a civilian apprenticeship program. Secondary or postsecondary courses in shop, plumbing, general mathematics, drafting, blueprint reading, computers, and physics also are good preparation.

Although there are no uniform national licensing requirements, most communities require plumbers to be licensed. Licensing requirements vary from area to area, but most localities require workers to pass an examination that tests their knowledge of the trade and of local plumbing codes.

With additional training, some pipelayers, plumbers, pipefitters, and steamfitters become supervisors for mechanical and plumbing contractors. Others, especially plumbers, go into business for themselves, often starting as a self-employed plumber working from home. Some eventually become owners of businesses employing many workers and may spend most of their time as managers rather than as plumbers. Others move into closely related areas such as construction management or building inspection.

Employment

Pipelayers, plumbers, pipefitters, and steamfitters constitute one of the largest construction occupations, holding about 561,000 jobs in 2004. About 1 in 2 worked for plumbing, heating, and air-conditioning contractors engaged in new construction, repair, modernization, or maintenance work. Others did maintenance work for a variety of industrial, commercial, and government employers. For example, pipefitters were employed as maintenance personnel in the petroleum and chemical industries, in which manufacturing operations require the moving of liquids and gases through pipes. More than 1 in 10 pipelayers, plumbers, pipefitters, and steamfitters were self-employed. Almost 1 in 3 pipelayers, plumbers, pipefitters, and steamfitters belonged to a union.

Jobs for pipelayers, plumbers, pipefitters, and steamfitters are distributed across the country in about the same proportion as the general population.

Job Outlook

Job opportunities are expected to be excellent, as demand for skilled pipelayers, plumbers, pipefitters, and steamfitters is expected to outpace the supply of workers trained in this craft. Many employers report difficulty finding potential workers with the right qualifications. In addition, many people currently working in these trades are expected to retire over the next 10 years, which will create additional job openings.

Employment of pipelayers, plumbers, pipefitters, and steamfitters is expected to grow about as fast as the average for all occupations through the year 2014. Demand for plumbers will stem from new construction and building renovation. Bath remodeling, in particular, is expected to continue to grow and create more jobs for plumbers. In addition, repair and maintenance of existing residential systems will keep plumbers employed. Demand for pipefitters and steamfitters will be driven by maintenance activities for places having extensive systems of pipes, such as powerplants, water and wastewater treatment plants, office buildings, and factories. Growth of pipelayer jobs will stem from the building of new water and sewer lines and pipelines to new oil and gas fields. Demand for sprinklerfitters will increase due to changes to State and local rules for fire protection in homes and businesses.

Traditionally, many organizations with extensive pipe systems have employed their own plumbers or pipefitters to maintain equipment and keep systems running smoothly. But, to reduce labor costs, many of these firms no longer employ full-time, in-house plumbers or pipefitters. Instead, when they need a plumber, they rely on workers provided under service contracts by plumbing and pipefitting contractors.

Construction projects generally provide only temporary employment. When a project ends, some pipelayers, plumbers, pipefitters, and steamfitters may be unemployed until they can begin work on a new project, although most companies are trying to limit these periods of unemployment in order to retain workers. In addition, the jobs

of pipelayers, plumbers, pipefitters, and steamfitters are generally less sensitive to changes in economic conditions than jobs in other construction trades. Even when construction activity declines, maintenance, rehabilitation, and replacement of existing piping systems, as well as the increasing installation of fire sprinkler systems, provide many jobs for pipelayers, plumbers, pipefitters, and steamfitters.

Earnings

Pipelayers, plumbers, pipefitters, and steamfitters are among the highest paid construction occupations. In May 2004, median hourly earnings of pipelayers were \$13.68. The middle 50 percent earned between \$11.05 and \$18.69. The lowest 10 percent earned less than \$9.19, and the highest 10 percent earned more than \$25.07. Also in May 2004, median hourly earnings of plumbers, pipefitters, and steamfitters were \$19.85. The middle 50 percent earned between \$15.01 and \$26.67. The lowest 10 percent earned less than \$11.62, and the highest 10 percent earned more than \$33.72. Median hourly earnings in the industries employing the largest numbers of plumbers, pipefitters, and steamfitters in May 2004 were as follows:

Natural gas distribution.....	\$23.86
Nonresidential building construction.....	21.55
Building equipment contractors.....	19.85
Utility system construction.....	18.29
Local government.....	16.30

Apprentices usually begin at about 50 percent of the wage rate paid to experienced pipelayers, plumbers, pipefitters, and steamfitters. Wages increase periodically as skills improve. After an initial waiting period, apprentices receive the same benefits as experienced pipelayers, plumbers, pipefitters, and steamfitters.

Many pipelayers, plumbers, pipefitters, and steamfitters are members of the United Association of Journeymen and Apprentices of the Plumbing and Pipefitting Industry of the United States and Canada.

Related Occupations

Other occupations in which workers install and repair mechanical systems in buildings are boilermakers; electricians; elevator installers and repairers; heating, air-conditioning, and refrigeration mechanics and installers; industrial machinery installation, repair, and maintenance workers, except millwrights; millwrights; sheet metal workers; and stationary engineers and boiler operators. Other related occupations include construction managers and construction and building inspectors.

Sources of Additional Information

For information about apprenticeships or work opportunities in pipelaying, plumbing, pipefitting, and steamfitting, contact local plumbing, heating, and air-conditioning contractors; a local or State chapter of the National Association of Plumbing, Heating, and Cooling Contractors; a local chapter of the Mechanical Contractors Association; a local chapter of the United Association of Journeymen and Apprentices of the Plumbing and Pipefitting Industry of the United States and Canada; or the nearest office of your State employment service or apprenticeship agency.

Plasterers and Stucco Masons

(O*NET 47-2161.00)

Significant Points

- Plastering is physically demanding.
- Plastering is learned on the job, either through a formal apprenticeship program or by working as a helper.
- Job opportunities are expected to be good, particularly in the South and Southwest.

Nature of the Work

Plastering—one of the oldest crafts in the building trades—remains popular due to the relatively low cost of the material and overall durability of work. Plasterers apply plaster to interior walls and ceilings to form fire-resistant and relatively soundproof surfaces. They also apply plaster veneer over drywall to create smooth or textured abrasion-resistant finishes. In addition, plasterers install prefabricated exterior insulation systems over existing walls—for good insulation and interesting architectural effects—and cast ornamental designs in plaster. Stucco masons apply durable plasters, such as polymer-based acrylic finishes and stucco, to exterior surfaces. Plasterers and stucco masons should not be confused with drywall installers, ceiling tile installers, and tapers—discussed elsewhere in the *Handbook*—who use drywall instead of plaster when erecting interior walls and ceilings.

Plasterers can plaster either solid surfaces, such as concrete block, or supportive wire mesh called lath. When plasterers work with interior surfaces, such as concrete block and concrete, they first apply a brown coat of gypsum plaster that provides a base, which is followed by a second, or finish, coat—also called “white coat”—made of a lime-based plaster. When plastering metal lath foundations, they apply a preparatory, or “scratch,” coat with a trowel. They spread this rich plaster mixture into and over the metal lath. Before the plaster sets, plasterers scratch its surface with a rake-like tool to produce ridges, so that the subsequent brown coat will bond tightly.

Helpers prepare a thick, smooth plaster for the brown coat. Plasterers spray or trowel this mixture onto the surface, then finish by smoothing it to an even, level surface.

For the finish coat, plasterers prepare a mixture of lime, plaster of paris, and water. They quickly apply this to the brown coat using a “hawk”—a light, metal plate with a handle—trowel, brush, and water. This mixture, which sets very quickly, produces a very smooth, durable finish.

Plasterers also work with a plaster material that can be finished in a single coat. This “thin-coat” or gypsum veneer plaster is made

of lime and plaster of paris and is mixed with water at the jobsite. This plaster provides a smooth, durable, abrasion-resistant finish on interior masonry surfaces, special gypsum baseboard, or drywall prepared with a bonding agent.

Plasterers create decorative interior surfaces as well. One way that they do this is by pressing a brush or trowel firmly against a wet plaster surface and using a circular hand motion to create decorative swirls.

For exterior work, stucco masons usually apply stucco—a mixture of Portland cement, lime, and sand—over cement, concrete, masonry, or lath. Stucco may also be applied directly to a wire lath with a scratch coat, followed by a brown coat and then a finish coat. Stucco masons may also embed marble or gravel chips into the finish coat to achieve a pebblelike, decorative finish.

When required, plasterers apply insulation to the exteriors of new and old buildings. They cover the outer wall with rigid foam insulation board and reinforcing mesh, and then trowel on a polymer-based or polymer-modified base coat. They may apply an additional coat of this material with a decorative finish.

Plasterers sometimes do complex decorative and ornamental work that requires special skill and creativity. For example, they may mold intricate wall and ceiling designs. Following an architect’s blueprint, plasterers pour or spray a special plaster into a mold and allow it to set. Workers then remove the molded plaster and put it in place, according to the plan.

Working Conditions

Most plastering jobs are indoors; however, plasterers and stucco masons work outside when applying stucco or exterior wall insulation and exterior decorative finish systems. Exterior work can be greatly impacted by inclement weather as stucco must be applied when the weather permits. Plasterers work on scaffolds high above the ground.

Plastering is physically demanding, requiring considerable standing, bending, lifting, and reaching overhead. The work can be dusty and dirty, soiling shoes and clothing, and can irritate the skin and eyes, unless the proper personal protective equipment is used.

Plastering—one of the oldest crafts in the building trades—remains popular due to the relatively low cost of the material and its overall durability.

Training, Other Qualifications, and Advancement

Plasterers and stucco masons learn their trade through formal and informal training programs. Most people learn this trade informally by starting out as helpers for experienced plasterers and stucco masons. Between 2 and 3 years of on-the-job training supplemented by formal classroom training may be required to become a skilled plasterer and stucco mason.

Preparation for a career as a plasterer or stucco mason can begin in high school, where classes in mathematics, mechanical drawing, and general shop are recommended. After high school, there are a number of different avenues that one can take to obtain the necessary training. The most common way is to obtain a job with a contractor who will provide on-the-job training. Entry-level workers generally start as helpers, assisting more experienced workers. They may start by carrying materials, setting up scaffolds, and mixing plaster. Later, they learn to apply the scratch, brown, and finish coats and may also learn to replicate plaster decorations for restoration work. Employers may enroll helpers in an employer-provided training program or send the employee to a trade or vocational school, or community college to receive further classroom training.

Although most employers recommend apprenticeship as the best way to learn plastering, apprenticeships for this occupation are few. Apprenticeship programs, sponsored by local joint committees of contractors and unions, generally consist of 2 or 3 years of on-the-job training, in addition to at least 144 hours annually of classroom instruction in drafting, blueprint reading, and mathematics for layout work.

In the classroom, apprentices start with a history of the trade and the industry. They also learn about the uses of plaster, estimating materials and costs, and casting ornamental plaster designs. On the job, they learn about lath bases, plaster mixes, methods of plastering, blueprint reading, and safety. They also learn how to use various tools, such as hand and powered trowels, floats, brushes, straight-edges, power tools, plaster-mixing machines, and piston-type pumps. Some apprenticeship programs allow individuals to obtain training in related occupations, such as cement masonry and bricklaying.

Applicants for apprentice or helper jobs normally must be at least 18 years old, in good physical condition, and have good manual dexterity. Applicants who have a high school education are preferred. Courses in general mathematics, mechanical drawing, and shop provide a useful background.

With additional training and experience, plasterers and stucco masons may advance to positions as supervisors, superintendents, or estimators for plastering contractors. Many become self-employed contractors. Others become building inspectors.

Employment

Plasterers and stucco masons held about 59,000 jobs in 2004. Most plasterers and stucco masons work on new construction sites. Some repair and renovate older buildings. Many plasterers and stucco masons are employed in Florida, California, and the Southwest, where exterior stucco with decorative finishes is very popular.

Most plasterers and stucco masons work for independent contractors. About 1 out of every 20 plasterers and stucco masons is self-employed.

Job Outlook

Job opportunities for plasterers and stucco masons are expected to be good through 2014. Many potential workers choose not to enter this occupation because they prefer work that is less strenuous and has more comfortable working conditions. Most job openings will be the result of plasterers and stucco masons transferring to other occupations or leaving the labor force. The best employment opportunities should continue to be in Florida, California, and the Southwest, where exterior plaster and decorative finishes are

expected to remain popular. Plastering in the Northeast continues to remain in demand, especially in restoration.

Employment of plasterers and stucco masons is expected to grow more slowly than the average for all occupations through the year 2014. In past years, employment of plasterers declined as more builders switched to drywall construction. This decline has halted, however, and employment of plasterers is expected to grow as a result of the appreciation for the durability and attractiveness that troweled finishes provide. Thin-coat plastering—or veneering—in particular is gaining wide acceptance as more builders recognize its ease of application, durability, quality of finish, and sound-proofing and fire-retarding qualities, although the increased use of fire sprinklers will reduce the demand for fire-resistant plaster work. Prefabricated wall systems and new polymer-based or polymer-modified acrylic exterior insulating finishes also are gaining popularity, particularly in the South and Southwest regions of the country. This is not only because of their durability, attractiveness, and insulating properties, but also because of their relatively low cost. In addition, plasterers will be needed to renovate plasterwork in old structures and to create special architectural effects, such as curved surfaces, which are not practical with drywall materials.

Most plasterers and stucco masons work in construction, where prospects fluctuate from year to year due to changing economic conditions. Bad weather affects plastering less than other construction trades because most work is indoors. On exterior surfacing jobs, however, plasterers and stucco masons may lose time because plastering materials cannot be applied under wet or freezing conditions.

Earnings

In May 2004, median hourly earnings of plasterers and stucco masons were \$15.60. The middle 50 percent earned between \$12.27 and \$20.32. The lowest 10 percent earned less than \$9.80, and the top 10 percent earned more than \$26.84.

The median hourly earnings in the largest industries employing plasterers and stucco masons in May 2004 were \$15.75 in building finishing contractors, and \$14.62 in foundation, structure, and building exterior contractors.

Apprentice wage rates start at about half the rate paid to experienced plasterers and stucco masons. Annual earnings for plasterers and stucco masons and apprentices can be less than the hourly rate would indicate, because poor weather and periodic declines in construction activity can limit work hours.

Related Occupations

Other construction workers who use a trowel as their primary tool include brickmasons, blockmasons, and stonemasons; cement masons, concrete finishers, segmental pavers, and terrazzo workers; and drywall installers, ceiling tile installers, and tapers.

Sources of Additional Information

For information about apprenticeships or other work opportunities, contact local plastering contractors, locals of the unions mentioned below, local joint union-management apprenticeship committees, or the nearest office of your State apprenticeship agency or employment service.

Roofers

(O*NET 47-2181.00)

Significant Points

- Most roofers acquire their skills informally on the job; some roofers train through 3-year apprenticeship programs.
- Job openings for roofers should be plentiful because the work is hot, strenuous, and dirty, causing many individuals to leave for jobs in other construction trades.
- Demand for roofers is less susceptible to downturns in the economy than demand for other construction trades because most roofing work consists of repair and reroofing.

Nature of the Work

A leaky roof can damage ceilings, walls, and furnishings. To protect buildings and their contents from water damage, roofers repair and install roofs made of tar or asphalt and gravel; rubber or thermoplastic; metal; or shingles made of asphalt, slate, fiberglass, wood, tile, or other material. Repair and reroofing—replacing old roofs on existing buildings—makes up the majority of work for these workers.

There are two types of roofs—low- and steep-sloped. Roofs considered low-slope rise 4 inches per horizontal foot or less and steep-slope roofs increase more than 4 inches per horizontal foot. Most commercial, industrial, and apartment buildings have low-sloping roofs. Most houses have steep-sloped roofs. Some roofers work on both types; others specialize.

Most low-slope roofs are covered with several layers of materials. Roofers first put a layer of insulation on the roof deck. Over the insulation, they then spread a coat of molten bitumen, a tarlike substance. Next, they install partially overlapping layers of roofing felt—a fabric saturated in bitumen—over the surface. Roofers use a mop to spread hot bitumen over the surface and under the next layer. This seals the seams and makes the surface watertight. Roofers repeat these steps to build up the desired number of layers, called “plies.” The top layer either is glazed to make a smooth finish or has gravel embedded in the hot bitumen to create a rough surface.

An increasing number of low-slope roofs are covered with a single-ply membrane of waterproof rubber or thermoplastic compounds. Roofers roll these sheets over the roof’s insulation and seal the seams. Adhesive, mechanical fasteners, or stone ballast hold the sheets in place. The building must be of sufficient strength to hold the ballast. A small, but growing number of flat-roofed buildings are now having “green” roofs installed. A “green” roof begins with a single or multi-ply waterproof system. After it is proven to be leak free, a root barrier is placed onto it, and then layers of soil, in which trees and grass are planted. Roofers are generally responsible for making sure the roof is watertight and can withstand the weight and water needs of the plantings.

Most residential steep-slope roofs are covered with shingles. To apply shingles, roofers first lay, cut, and tack 3-foot strips of roofing felt lengthwise over the entire roof. Then, starting from the bottom edge, they staple or nail overlapping rows of shingles to the roof. Workers measure and cut the felt and shingles to fit intersecting roof surfaces and to fit around vent pipes and chimneys. Wherever two roof surfaces intersect, or shingles reach a vent pipe or chimney, roofers cement or nail flashing-strips of metal or shingle over the joints to make them watertight. Finally,

Starting from the bottom edge, roofers staple or nail overlapping rows of shingles to the roof.

roofers cover exposed nailheads with roofing cement or caulking to prevent water leakage. Roofers who use tile, metal shingles, or shakes follow a similar process.

Because of their expertise in waterproofing roofs, some roofers also waterproof and dampproof masonry and concrete walls and floors, including foundations. To prepare surfaces for waterproofing, they hammer and chisel away rough spots, or remove them with a rubbing brick, before applying a coat of liquid waterproofing compound. They also may paint or spray surfaces with a waterproofing material, or attach waterproofing membrane to surfaces. When dampproofing, they usually spray a bitumen-based coating on interior or exterior surfaces. Roofers also install equipment that requires cutting through roofs, such as ventilation ducts and attic fans.

Working Conditions

Roofing work is strenuous. It involves heavy lifting, as well as climbing, bending, and kneeling. Roofers work outdoors in all types of weather, particularly when making repairs. However, they rarely work in very cold weather as ice can be treacherous. In northern States, roofing work is generally not performed during winter months.

Workers risk slips or falls from scaffolds, ladders, or roofs, or burns from hot bitumen, but safety precautions, if followed, can eliminate most accidents. In addition, roofs can become extremely hot during the summer, causing heat-related illnesses.

Training, Other Qualifications, and Advancement

Most roofers acquire their skills informally by working as helpers for experienced roofers and by taking some employer-provided classes. Safety training is one of the first classes that a worker takes. Trainees start by carrying equipment and material, and erecting scaffolds and hoists. Within 2 or 3 months, trainees are taught to measure, cut, and fit roofing materials and, later, to lay asphalt or fiberglass shingles. Because some roofing materials are used infrequently, it can take several years to get experience working on all the various types of roofing applications.

Some roofers train through 3-year apprenticeship programs administered by local union-management committees representing roofing contractors and locals of the United Union of Roofers, Waterproofers, and Allied Workers. The apprenticeship program generally consists of a minimum of 2,000 hours of on-the-job training annually, plus a minimum of 144 hours of classroom instruction a year in subjects such as tools and their use, arithmetic, and safety. On-the-job training for apprentices is similar to that for helpers, except that the apprenticeship program is more structured. Apprentices also learn to dampproof and waterproof walls.

Good physical condition and good balance are essential for roofers, along with no fear of heights. A high school education, or its equivalent, is helpful, as are courses in mechanical drawing and basic mathematics. Most apprentices must be at least 18 years old. Experience with metal-working is helpful for workers who install metal roofing.

Roofers may advance to supervisor or estimator for a roofing contractor, or become contractors themselves.

Employment

Roofers held about 162,000 jobs in 2004. Almost all wage and salary roofers worked for roofing contractors. About 1 out of every 4 roofers was self-employed. Many self-employed roofers specialized in residential work.

Job Outlook

Job opportunities for roofers should be good through the year 2014, primarily because of the need to replace workers who leave the occupation. The proportion of roofers who leave the occupation each year is higher than in most construction trades—roofing work is hot, strenuous, and dirty, and a significant number of workers treat roofing as a temporary job until something better comes along. Some roofers leave the occupation to go into other construction trades.

Employment of roofers is expected to grow as fast as the average for all occupations through 2014. Roofs deteriorate faster and are more susceptible to weather damage than most other parts of buildings and periodically need to be repaired or replaced. Roofing has a much higher proportion of repair and replacement work than most other construction occupations. As a result, demand for roofers is less susceptible to downturns in the economy than demand for other construction trades. In addition to repair and reroofing work on the growing stock of buildings, new construction of industrial, commercial, and residential buildings will add to the demand for roofers. Jobs should be easiest to find during spring and summer when most roofing is done.

Earnings

In May 2004, median hourly earnings of roofers were \$14.83. The middle 50 percent earned between \$11.54 and \$19.80. The lowest 10 percent earned less than \$9.41, and the highest 10 percent earned more than \$25.59. The median hourly earnings of roofers in the foundation, structure, and building exterior contractors industry were \$14.90 in May 2004.

Apprentices usually start at about 40 percent to 50 percent of the rate paid to experienced roofers and receive periodic raises as they

acquire the skills of the trade. Earnings for roofers are reduced on occasion because poor weather limits the time they can work.

Some roofers are members of the United Union of Roofers, Waterproofers, and Allied Workers.

Related Occupations

Roofers use shingles, bitumen and gravel, single-ply plastic or rubber sheets, or other materials to waterproof building surfaces. Workers in other occupations who cover surfaces with special materials for protection and decoration include carpenters; carpet, floor, and tile installers and finishers; cement masons, concrete finishers, segmental pavers, and terrazzo workers; drywall installers, ceiling tile installers, and tapers; plasterers and stucco masons; and sheet metal workers.

Sources of Additional Information

For information about apprenticeships or job opportunities in roofing, contact local roofing contractors, a local chapter of the roofers union, a local joint union-management apprenticeship committee, or the nearest office of your State employment service or apprenticeship agency.

Sheet Metal Workers

(O*NET 47-2211.00)

Significant Points

- Nearly two-thirds of the jobs are found in the construction industry; about one quarter are in manufacturing.
- Apprenticeship programs lasting 4 or 5 years are considered the best training.
- Job opportunities in construction should be good.

Nature of the Work

Sheet metal workers make, install, and maintain heating, ventilation, and air-conditioning duct systems; roofs; siding; rain gutters; downspouts; skylights; restaurant equipment; outdoor signs; railroad cars; tailgates; customized precision equipment; and many other products made from metal sheets. They also may work with fiberglass and plastic materials. Although some workers specialize in fabrication, installation, or maintenance, most do all three jobs. Sheet metal workers do both construction-related sheet metal work and mass production of sheet metal products in manufacturing.

Sheet metal workers first study plans and specifications to determine the kind and quantity of materials they will need. They then measure, cut, bend, shape, and fasten pieces of sheet metal to make ductwork, countertops, and other custom products. In an increasing number of shops, sheet metal workers use computerized metalworking equipment. This enables them to perform their tasks more quickly and to experiment with different layouts to find the one that results in the least waste of material. They cut, drill, and form parts with computer-controlled saws, lasers, shears, and presses.

In shops without computerized equipment, and for products that cannot be made on such equipment, sheet metal workers make the required calculations and use tapes, rulers, and other measuring devices for layout work. They then cut or stamp the parts on machine tools.

Before assembling pieces, sheet metal workers check each part for accuracy using measuring instruments such as calipers and micrometers and, if necessary, finish it by using hand, rotary, or squaring shears and hacksaws. After the parts have been inspected, workers fasten seams and joints together with welds, bolts, cement, rivets, solder, specially formed sheet metal drive clips, or other connecting devices. They then take the parts to the construction site, where they further assemble the pieces as they install them. These workers install ducts, pipes, and tubes by joining them end to end and hanging them with metal hangers secured to a ceiling or a wall. They also use shears, hammers, punches, and drills to make parts at the worksite or to alter parts made in the shop.

Some jobs are done completely at the jobsite. When installing a metal roof, for example, sheet metal workers measure and cut the roofing panels that are needed to complete the job. They secure the first panel in place and interlock and fasten the grooved edge of the next panel into the grooved edge of the first. Then, they nail or weld the free edge of the panel to the structure. This two-step process is repeated for each additional panel. Finally, the workers fasten machine-made molding at joints, along corners, and around windows and doors for a neat, finished effect.

In addition to installation, some sheet metal workers specialize in testing, balancing, adjusting, and servicing existing air-conditioning and ventilation systems to make sure they are functioning properly and to improve their energy efficiency. Properly installed duct systems are a key component to heating, ventilation, and air-condition-

ing (HVAC) systems, which causes duct installers to sometimes be referred to as *HVAC technicians*. A growing activity for sheet metal workers is building commissioning, which is a complete mechanical inspection of a building's HVAC, water, and lighting systems.

Sheet metal workers in manufacturing plants make sheet metal parts for products such as aircraft or industrial equipment. Although some of the fabrication techniques used in large-scale manufacturing are similar to those used in smaller shops, the work may be highly automated and repetitive. Sheet metal workers doing such work may be responsible for reprogramming the computer control systems of the equipment they operate.

Working Conditions

Sheet metal workers usually work a 40-hour week. Those who fabricate sheet metal products work in shops that are well-lighted and well-ventilated. However, they stand for long periods and lift heavy materials and finished pieces. Sheet metal workers must follow safety practices because working around high-speed machines can be dangerous. They also are subject to cuts from sharp metal, burns from soldering and welding, and falls from ladders and scaffolds. They are often required to wear safety glasses and must not wear jewelry or loose-fitting clothing that could easily be caught in a machine. They may work at a variety of different production stations to reduce the repetitiveness of the work.

Those performing installation work do considerable bending, lifting, standing, climbing, and squatting, sometimes in close quarters or in awkward positions. Although duct systems and kitchen equipment are installed indoors, the installation of siding, roofs, and gutters involves much outdoor work, requiring sheet metal workers to be exposed to various kinds of weather.

Training, Other Qualifications, and Advancement

Sheet metal workers learn their trade through both formal and informal training programs. To become a skilled sheet metal worker usually takes between 4 and 5 years of both classroom and on-the-job training. While there are a number of different ways to obtain this training, generally the more formalized the training received by an individual, the more thoroughly skilled become, and the more are likely to be in demand by employers. For some, this training can begin in a high school, where classes in English, algebra, geometry, physics, mechanical drawing and blueprint reading, and general shop are recommended.

After high school, there are a number of different avenues that one can take to obtain the necessary training. One of the ways is to obtain a job with a contractor who will then provide training on the job. Entry-level workers generally start as helpers, assisting more experienced workers. Most begin by carrying metal and cleaning up debris in a metal shop while they learn about materials and tools and their uses. Later, they learn to operate machines that bend or cut metal. In time, helpers go out on the jobsite to learn installation. Employers may send the employee to courses at a trade or vocational school or community college to receive further formal training. Helpers may be promoted to the journey level if they show the requisite knowledge and skills. Most sheet metal workers in large-scale manufacturing receive on-the-job training, with additional class work or in-house training as necessary. The training needed to become proficient in manufacturing takes less time than the training for construction.

Some employers, particularly large nonresidential construction contractors with union membership, offer formal apprenticeships. These programs combine on-the-job training with related classroom instruction. Usually, apprenticeship applicants must be at least 18 years old and meet local requirements. The length of the program, usually 4 to 5 years, varies with the apprentice's skill. Apprenticeship programs provide comprehensive instruction in both sheet metal

Sheet metal workers make products mainly for the construction and manufacturing industries.

fabrication and installation. They may be administered by local joint committees composed of the Sheet Metal Workers' International Association and local chapters of the Sheet Metal and Air-Conditioning Contractors National Association.

On the job, apprentices learn the basics of pattern layout and how to cut, bend, fabricate, and install sheet metal. They begin by learning to install and maintain basic ductwork and gradually advance to more difficult jobs, such as making more complex ducts, commercial kitchens, and decorative pieces. They also use materials such as fiberglass, plastics, and other nonmetallic materials. Some workers may focus on exterior or architectural sheet metal installation. In the classroom, apprentices learn drafting, plan and specification reading, trigonometry and geometry applicable to layout work, the use of computerized equipment, welding, and the principles of heating, air-conditioning, and ventilating systems. Safety is stressed throughout the program. In addition, apprentices learn the relationship between sheet metal work and other construction work.

Sheet metal workers need to be in good physical condition and have mechanical and mathematical aptitude as well as good reading skills. Some additional skills needed are good eye-hand coordination, spatial and form perception, and manual dexterity also are important. Courses in algebra, trigonometry, geometry, mechanical drawing, and shop provide a helpful background for learning the trade, as does related work experience obtained in the Armed Services.

It is important for experienced sheet metal workers to keep abreast of new technological developments, such as the use of computerized layout and laser-cutting machines. Workers often take additional training, provided by the union or by their employer, to improve existing skills or to acquire new ones.

Sheet metal workers in construction may advance to supervisory jobs. Some of these workers take additional training in welding and do more specialized work. Workers who perform building and system testing are able to move into construction and building inspection. Others go into the contracting business for themselves. Because a sheet metal contractor must have a shop with equipment to fabricate products, this type of contracting business is more expensive to start than other types of construction contracting. Sheet metal workers in manufacturing may advance to positions as supervisors or quality inspectors. Some of these workers may move into other management positions.

Employment

Sheet metal workers held about 198,000 jobs in 2004. Nearly two-thirds of all sheet metal workers were found in the construction industry. Of those employed in construction, almost two-thirds worked for plumbing, heating, and air-conditioning contractors; most of the rest worked for roofing and sheet metal contractors. Some worked for other special trade contractors and for general contractors engaged in residential and commercial building. One-quarter of all sheet metal workers work outside of construction and are found in manufacturing industries, such as the fabricated metal products, machinery, and aerospace products and parts industries. Some sheet metal workers work for the Federal Government.

Compared with workers in most construction craft occupations, relatively few sheet metal workers are self-employed.

Job Outlook

Job opportunities are expected to be good for sheet metal workers in the construction industry, reflecting both employment growth and openings arising each year as experienced sheet metal workers leave the occupation. Opportunities should be particularly good for individuals who acquire apprenticeship training or who are certified welders. Job prospects in manufacturing will not be as good because

a number of manufacturing plants that employ sheet metal workers are moving to lower wage parts of the country or abroad and the ones that remain are becoming more productive.

Employment of sheet metal workers is expected to increase as fast as the average, reflecting growth in the number of industrial, commercial, and residential structures being built. The need to install energy-efficient air-conditioning, heating, and ventilation systems in older buildings as well as perform other types of renovation and maintenance work also should boost employment. In addition, the popularity of decorative sheet metal products and increased architectural restoration are expected to add to the demand for sheet metal workers.

Sheet metal workers in construction may experience periods of unemployment, particularly when construction projects end and economic conditions dampen construction activity. Nevertheless, employment of sheet metal workers is less sensitive to declines in new construction than is the employment of some other construction workers, such as carpenters. Maintenance of existing equipment—which is less affected by economic fluctuations than is new construction—makes up a large part of the work done by sheet metal workers. Installation of new air-conditioning and heating systems in existing buildings continues during construction slumps, as individuals and businesses adopt more energy-efficient equipment to cut utility bills. In addition, a large proportion of sheet metal installation and maintenance is done indoors, so sheet metal workers usually lose less worktime due to bad weather than other construction workers do.

Earnings

In May 2004, median hourly earnings of sheet metal workers were \$17.09. The middle 50 percent earned between \$12.49 and \$23.89. The lowest 10 percent of all sheet metal workers earned less than \$9.80, and the highest 10 percent earned more than \$30.78. The median hourly earnings of the largest industries employing sheet metal workers in May 2004 were as follows:

Federal executive branch and United States Postal Service	\$20.75
Building equipment contractors.....	18.04
Building finishing contractors.....	17.41
Foundation, structure, and building exterior contractors	15.34
Architectural and structural metals manufacturing.....	15.14

Apprentices normally start at about 40 to 50 percent of the rate paid to experienced workers. As apprentices acquire more skills throughout the course of their training, they receive periodic increases until their pay approaches that of experienced workers. In addition, union workers in some areas receive supplemental wages from the union when they are on layoff or shortened workweeks.

Related Occupations

To fabricate and install sheet metal products, sheet metal workers combine metalworking skills and knowledge of construction materials and techniques. Other occupations in which workers lay out and fabricate metal products include assemblers and fabricators; machinists; machine setters, operators, and tenders—metal and plastic; and tool and die makers. Construction occupations requiring similar skills and knowledge include glaziers and heating, air-conditioning, and refrigeration mechanics and installers.

Sources of Additional Information

For more information about apprenticeships or other work opportunities, contact local sheet metal contractors or heating, refrigeration, and air-conditioning contractors; a local of the Sheet Metal Workers International Association; a local of the Sheet Metal and Air-Conditioning Contractors National Association; a local joint

union-management apprenticeship committee; or the nearest office of your State employment service or apprenticeship agency.

Structural and Reinforcing Iron and Metal Workers

(O*NET 47-2171.00, 47-2221.00)

Significant Points

- Earnings of structural iron and steel workers are among the highest of all construction trades.
- Most employers recommend completion of a 3- or 4-year apprenticeship.
- Workers need to be in good physical condition and not have a fear of heights.

Nature of the Work

Structural and reinforcing iron and metal workers place and install iron or steel girders, columns, and other construction materials to form buildings, bridges, and other structures. They also position and secure steel bars or mesh in concrete forms in order to reinforce the concrete used in highways, buildings, bridges, tunnels, and other structures. In addition, they repair and renovate older buildings and structures. Even though the primary metal involved in this work is steel, these workers often are known as *ironworkers*. Some ironworkers fabricate structural metal in fabricating shops, which are usually located away from the construction site. These workers are covered in the statement on assemblers and fabricators found elsewhere in the *Handbook*.

Before construction can begin, ironworkers must erect steel frames and assemble the cranes and derricks that move structural steel, reinforcing bars, buckets of concrete, lumber, and other materials and equipment around the construction site. Once this job has been completed, workers begin to connect steel columns, beams, and girders according to blueprints and instructions from supervisors and superintendents. Structural steel, reinforcing rods, and ornamental iron generally come to the construction site ready for erection—cut to the proper size, with holes drilled for bolts and numbered for assembly.

Ironworkers at the construction site unload and stack the prefabricated steel so that it can be hoisted easily when needed. To hoist the steel, ironworkers attach cables (slings) to the steel and to the crane or derrick. One worker directs the hoist operator with hand signals while another worker holds a rope (tag line) attached to the steel to prevent it from swinging. The crane or derrick hoists steel into place in the framework, whereupon two connectors position the steel with connecting bars and spud wrenches. Workers using driftpins or the handle of a spud wrench—a long wrench with a pointed handle—align the holes in the steel with the holes in the framework. Before the bolts are permanently tightened, ironworkers check vertical and horizontal alignment with plumb bobs, laser equipment, transits, or levels; then they bolt or weld the piece permanently in place.

Reinforcing iron and rebar workers set reinforcing bars (often called rebar) in the forms that hold concrete, following blueprints showing the location, size, and number of bars. They then fasten the bars together by tying wire around them with pliers. When reinforcing floors, ironworkers place spacers under the rebar to hold the bars off the deck. Although these materials usually arrive ready to use, ironworkers occasionally must cut bars with metal shears or acetylene torches, bend them by hand or machine, or weld them with arc-welding equipment. Some concrete is reinforced with welded wire fabric. Using hooked rods, workers cut and fit the fabric, and while a concrete crew places the concrete, ironworkers properly position the fabric into the concrete. Post-tensioning is another technique used in reinforcing concrete. In this technique, workers substitute cables for reinforcing bars. When the concrete is poured, the ends of the cables are left exposed. After the concrete cures, ironworkers tighten the cables with jacking equipment specially designed for the purpose. Post-tensioning allows designers to create larger open areas in a building, because supports can be placed further apart. This technique is commonly employed in parking garages and arenas.

Ornamental ironworkers install stairs, handrails, curtain walls (the nonstructural walls and window frames of many large buildings), and other miscellaneous metal after the structure of the building has been completed. As they hoist pieces into position, ornamental ironworkers make sure that the pieces are properly fitted and aligned before bolting or welding them for a secure fit.

Working Conditions

Structural and reinforcing iron and metal workers usually work outside in all kinds of weather. However, those who work at great heights do not work during wet, icy, or extremely windy conditions. Because the danger of injuries due to falls is great, ironworkers use safety devices such as safety harnesses, scaffolding, and nets to reduce risk.

Training, Other Qualifications, and Advancement

Most employers recommend a 3- or 4-year apprenticeship consisting of on-the-job training and evening classroom instruction as the best way to learn this trade. Apprenticeship programs are administered by

Because the danger of falls is great, ironworkers use safety devices such as safety belts, scaffolding, and nets to reduce risk.

committees made up of representatives of local unions of the International Association of Bridge, Structural, Ornamental and Reinforcing Iron Workers or the local chapters of contractors' associations.

Ironworkers must be at least 18 years old. A high school diploma is preferred by employers and local apprenticeship committees. High school courses in general mathematics, mechanical drawing, English, and welding are considered helpful. Because materials used in iron working are heavy and bulky, ironworkers must be in good physical condition. They also need good agility, balance, eyesight, and depth perception to work safely at great heights on narrow beams and girders. Ironworkers should not be afraid of heights or suffer from dizziness.

In the classroom, apprentices study blueprint reading; mathematics, the basics of structural erecting, rigging, reinforcing, welding, assembling, and safety training. Apprentices also study the care and safe use of tools and materials. On the job, apprentices work in all aspects of the trade, such as unloading and storing materials at the job site, rigging materials for movement by crane, connecting structural steel, and welding.

Some ironworkers learn the trade informally on the job, without completing an apprenticeship. These workers generally do not receive classroom training, although some large contractors have extensive training programs. On-the-job trainees usually begin by assisting experienced ironworkers on simple jobs, such as carrying various materials. With experience, trainees perform more difficult tasks, such as cutting and fitting different parts; however, learning through work experience alone may not provide training as complete as an apprenticeship program, and it usually takes longer.

Some experienced workers are promoted to supervisor. Others may go into the contracting business for themselves. The ability to communicate in both English and Spanish will improve opportunities for advancement.

Employment

Ironworkers held about 106,000 jobs in 2004. Structural iron and steel workers held about 73,000 jobs in 2004, while reinforcing iron and rebar workers held about 34,000 jobs. More than 4 out of 5 worked in construction, with nearly half working for foundation, structure, and building exterior contractors. Most of the remaining ironworkers worked for contractors specializing in the construction of homes; factories; commercial buildings; religious structures; schools; bridges and tunnels; and water, sewer, communications, and power lines.

Structural and reinforcing iron and metal workers are employed in all parts of the country, but most work in metropolitan areas, where the bulk of commercial and industrial construction takes place.

Job Outlook

Employment of structural and reinforcing iron and metal workers is expected to grow about as fast as average for all occupations through the year 2014, largely on the basis of projected growth in nonresidential and heavy construction. The rehabilitation, maintenance, and replacement of a growing number of older buildings, powerplants, highways, and bridges is expected to create employment opportunities. State and federal legislatures continue to support and fund the building of roads, which will secure jobs for the near future. In addition to new jobs that arise, many job openings will result from the need to replace experienced ironworkers who leave the occupation or retire.

In most areas job opportunities should be good for those with the right qualifications, although the number of job openings can fluctuate from year to year with economic conditions and the level of construction activity. During economic downturns, ironworkers can experience periods of unemployment. Similarly, job opportunities for ironworkers may vary widely by geographic area. Population growth in the South and West should create more job opportunities

than elsewhere as buildings and roads are constructed to meet the needs of the people. Job openings for ironworkers usually are more abundant during the spring and summer months, when the level of construction activity increases. Workers who are willing to relocate are often able to find work in another area.

Earnings

In May 2004, median hourly earnings of structural iron and steel workers in all industries were \$20.40. The middle 50 percent earned between \$14.84 and \$27.21. The lowest 10 percent earned less than \$11.25, and the highest 10 percent earned more than \$33.53. In May 2004, median hourly earnings of reinforcing iron and rebar workers in all industries were \$16.90. The middle 50 percent earned between \$12.45 and \$25.94. The lowest 10 percent earned less than \$10.03, and the highest 10 percent earned more than \$32.59.

Median hourly earnings of structural iron and steel workers in May 2004 in foundation, structure, and building exterior contractors were \$21.81 and in nonresidential building construction, \$17.47. Reinforcing iron and rebar workers earned median hourly earnings of \$16.52 in foundation, structure, and building exterior contractors in May 2004.

About half of the workers in this trade are members of the International Association of Bridge, Structural, Ornamental, and Reinforcing Iron Workers. According to the union, average hourly earnings, including benefits, for structural and reinforcing metal workers who belonged to a union and worked full time were slightly higher than the hourly earnings of nonunion workers. Structural and reinforcing iron and metal workers in New York, Boston, San Francisco, Chicago, Los Angeles, Philadelphia, and other large cities received the highest wages.

Apprentices generally start at about 50 percent to 60 percent of the rate paid to experienced journey workers. Throughout the course of the apprenticeship program, as they acquire the skills of the trade, they receive periodic increases until their pay approaches that of experienced workers.

Earnings for ironworkers may be reduced on occasion because work can be limited by bad weather, the short-term nature of construction jobs, and economic downturns.

Related Occupations

Structural and reinforcing iron and metal workers play an essential role in erecting buildings, bridges, highways, power lines, and other structures. Others who work on these construction jobs include assemblers and fabricators; boilermakers; civil engineers; cement masons, concrete finishers, segmental pavers, and terrazzo workers; construction managers; and welding, soldering, and brazing workers.

Sources of Additional Information

For more information on apprenticeships or other work opportunities, contact local general contractors; a local of the International Association of Bridge, Structural, Ornamental, and Reinforcing Iron Workers Union; a local ironworkers' joint union-management apprenticeship committee; a local or State chapter of the Associated Builders and Contractors or the Associated General Contractors; or the nearest office of your State employment service or apprenticeship agency.

Installation, Maintenance, and Repair Occupations

Electrical and Electronic Equipment Mechanics, Installers, and Repairers

Computer, Automated Teller, and Office Machine Repairers

(O*NET 49-2011.01, 49-2011.02, 49-2011.03)

Significant Points

- Workers qualify for these jobs by receiving training in electronics from associate degree programs, the military, vocational schools, equipment manufacturers, or employers.
- Job growth reflects the increasing dependence of businesses and individuals on computers and other sophisticated office machines.
- Job prospects will be best for applicants with knowledge of electronics as well as repair experience.

Nature of the Work

Computer repairers, also known as *computer service technicians* or *data processing equipment repairers*, service mainframe, server, and personal computers; printers; and disc drives. These workers perform primarily hands-on repair, maintenance, and installation of computers and related equipment. Workers who provide technical assistance, in person or by telephone, to computer system users are known as computer support specialists or computer support technicians. (See the statement on computer support specialists and systems administrators elsewhere in the *Handbook*.)

Automated teller machines (ATMs) allow customers to carry out bank transactions without the assistance of a teller. ATMs now also provide a growing variety of other services, including stamp, phone card, and ticket sales. *Automated teller machine servicers* repair and service these machines.

Office machine and cash register servicers work on photocopiers, cash registers, mail-processing equipment, and fax machines. Newer models of office machinery include computerized components that allow them to function more effectively than earlier models.

To install large equipment, such as mainframe computers and ATMs, repairers connect the equipment to power sources and communication lines that allow the transmission of information over computer networks. For example, when an ATM dispenses cash, it transmits the withdrawal information to the customer's bank. Workers also may install operating software and peripheral equipment, checking that all components are configured to function together correctly. The installation of personal computers and other small office machines is less complex and may be handled by the purchaser.

When equipment breaks down, many repairers travel to customers' workplaces or other locations to make the necessary repairs. These workers, known as *field technicians*, often have assigned areas in which they perform preventive maintenance on a regular basis.

Bench technicians work in repair shops located in stores, factories, or service centers. In small companies, repairers may work both in repair shops and at customer locations.

Computer repairers usually replace subsystems instead of repairing them. Replacement is common because subsystems are inexpensive and businesses are reluctant to shut down their computers for time-consuming repairs. Subsystems commonly replaced by computer repairers include video cards, which transmit signals from the computer to the monitor; hard drives, which store data; and network cards, which allow communication over the network. Defective modules may be given to bench technicians, who use software programs to diagnose the problem and who may repair the modules, if possible.

When ATMs malfunction, computer networks recognize the problem and alert repairers. Common problems include worn magnetic heads on card readers, which prevent the equipment from recognizing customers' bankcards, and "pick failures," which prevent the equipment from dispensing the correct amount of cash. Field technicians travel to the locations of ATMs and usually repair equipment by removing and replacing defective components. Broken components are taken to a repair shop, where bench technicians make the necessary repairs. Field technicians perform routine maintenance on a regular basis, replacing worn parts and running diagnostic tests to ensure that the equipment functions properly.

Office machine repairers usually work on machinery at the customer's workplace; alternatively, if the machines are small enough, customers may bring them to a repair shop for maintenance. Common malfunctions include paper misfeeds caused by worn or dirty parts, and poor-quality copy resulting from problems with lamps, lenses, or mirrors. These malfunctions usually can be resolved simply by cleaning the relevant components. Breakdowns

Computer repairers repair, maintain, and install computers and related equipment.

also may result from the failure of commonly used parts. For example, heavy use of a photocopier may wear down the printhead, which applies ink to the final copy. In such cases, the repairer usually replaces the part instead of repairing it.

Workers use a variety of tools for diagnostic tests and repair. To diagnose malfunctions, they use multimeters to measure voltage, current, resistance, and other electrical properties; signal generators to provide test signals; and oscilloscopes to monitor equipment signals. To diagnose computerized equipment, repairers use software programs. To repair or adjust equipment, workers use handtools, such as pliers, screwdrivers, soldering irons, and wrenches.

Working Conditions

Repairers usually work in clean, well-lighted surroundings. Because computers and office machines are sensitive to extreme temperatures and to humidity, repair shops usually are air-conditioned and well ventilated. Field repairers must travel frequently to various locations to install, maintain, or repair customers' equipment. ATM repairers may have to perform their jobs in small, confined spaces that house the equipment.

Because computers and ATMs are critical for many organizations to function efficiently, data processing equipment repairers and ATM field technicians often work around the clock. Their schedules may include evening, weekend, and holiday shifts, sometimes assigned on the basis of seniority. Office machine and cash register servicers usually work regular business hours because the equipment they repair is not as critical.

Although their job is not strenuous, repairers must lift equipment and work in a variety of postures. Repairers of computer monitors need to discharge voltage from the equipment to avoid electrocution. Workers may have to wear protective goggles.

Training, Other Qualifications, and Advancement

Knowledge of electronics is necessary for employment as a computer, automated teller, or office machine repairer. Employers prefer workers who are certified as repairers or who have training in electronics from associate degree programs, the military, vocational schools, or equipment manufacturers. Employers generally provide some training to new repairers on specific equipment; however, workers are expected to arrive on the job with a basic understanding of equipment repair. Employers may send experienced workers to training sessions to keep up with changes in technology and service procedures.

Most office machine and ATM repairer positions require an associate degree in electronics. A basic understanding of mechanical equipment also is important, because many of the parts that fail in office machines and ATMs, such as paper loaders, are mechanical. Entry-level employees at large companies normally receive on-the-job training lasting several months. Such training may include a week of classroom instruction, followed by a period of 2 weeks to several months assisting an experienced repairer.

Field technicians work closely with customers and must have good communications skills and a neat appearance. Employers normally require that field technicians have a driver's license.

Various organizations offer certification. To receive certification, repairers must pass qualifying examinations corresponding to their level of training and experience.

Newly hired computer repairers may work on personal computers or peripheral equipment. With experience, they can advance to positions maintaining more sophisticated systems, such as networking equipment and servers. Field repairers of ATMs may advance to bench technician positions responsible for more complex repairs. Experienced workers may become specialists who help other repairers

diagnose difficult problems or who work with engineers in designing equipment and developing maintenance procedures. Experienced workers also may move into management positions responsible for supervising other repairers.

Because of their familiarity with equipment, experienced repairers may move into customer service or sales positions. Some experienced workers open their own repair shops or become wholesalers or retailers of electronic equipment.

Employment

Computer, automated teller, and office machine repairers held about 168,000 jobs in 2004. Wholesale trade establishments employed about 35 percent of the workers in this occupation; most of these establishments were wholesalers of professional and commercial equipment and supplies. Many workers also were employed in electronics, appliance, and office supply stores. Others worked in electronic and precision equipment repair shops and computer systems design firms. A small number found employment with computer and peripheral equipment manufacturers, government agencies, and Internet service providers. About 15 percent of computer, automated teller, and office machine repairers were self-employed, which is more than twice the proportion for all installation, maintenance, and repair occupations.

Job Outlook

Employment of computer, automated teller, and office machine repairers is expected to grow more slowly than the average for all occupations through 2014. Limited job growth will be driven by the increasing dependence of business and individuals on computers and other sophisticated office machines. The need to maintain this equipment will create new jobs for repairers. In addition, openings will result from the need to replace repairers who retire or transfer to new occupations.

Job prospects will be best for applicants with knowledge of electronics as well as repair experience. Although computer equipment continues to become less expensive and more reliable, malfunctions still occur and can cause severe problems for users, most of whom lack the knowledge to make repairs. Computers are critical to most businesses today and will become even more so to companies that do business on the Internet and to individuals that bank, pay bills, or make purchases online.

People also are becoming increasingly reliant on ATMs. Besides offering bank and retail transactions, ATMs provide an increasing number of other services, such as employee information processing and distribution of government payments. Improvements in ATM design have increased reliability and simplified repair tasks, reducing the number and extent of repairs. However, opportunities for ATM repairers should still be available arising primarily from the need to replace workers who leave the specialty, rather than from employment growth.

Conventional office machines, such as calculators, are inexpensive, and often are replaced instead of repaired. However, digital copiers and other, newer office machines are more costly and complex. This equipment often is computerized, designed to work on a network, and capable of performing multiple functions. The growing need for repairers to service such sophisticated equipment should result in job opportunities for office machine repairers.

Earnings

Median hourly earnings of computer, automated teller, and office machine repairers were \$16.90 in May 2004. The middle 50 percent earned between \$13.11 and \$21.36. The lowest 10 percent earned less than \$10.31, and the highest 10 percent earned more than

\$26.28. Median hourly earnings in the industries employing the largest numbers of computer, automated teller, and office machine repairers in May 2004 are shown below:

Professional and commercial equipment and supplies merchant wholesalers	\$18.51
Computer systems design and related services	18.08
Office supplies, stationery, and gift stores	15.69
Electronic and precision equipment repair and maintenance	14.95
Electronics and appliance stores	14.04

Related Occupations

Workers in other occupations who repair and maintain electronic equipment include broadcast and sound engineering technicians and radio operators; electronic home entertainment equipment installers and repairers; electrical and electronics installers and repairers; industrial machinery mechanics and maintenance workers; and radio and telecommunications equipment installers and repairers.

Electrical and Electronics Installers and Repairers

(O*NET 49-2092.01, 49-2092.02, 49-2092.03, 49-2092.04, 49-2092.05, 49-2092.06, 49-2093.00, 49-2094.00, 49-2095.00, 49-2096.00)

Significant Points

- Knowledge of electrical equipment and electronics is necessary for employment; many applicants complete 1 to 2 years at vocational schools and community colleges, although some less skilled repairers may have only a high school diploma.
- Employment is projected to grow more slowly than average, but prospects vary by occupational specialty.
- Job opportunities will be best for applicants with a thorough knowledge of electrical and electronic equipment as well as repair experience.

Nature of the Work

Businesses and other organizations depend on complex electronic equipment for a variety of functions. Industrial controls automatically monitor and direct production processes on the factory floor. Transmitters and antennae provide communication links for many organizations. Electric power companies use electronic equipment to operate and control generating plants, substations, and monitoring equipment. The Federal Government uses radar and missile control systems to provide for the national defense and to direct commercial air traffic. These complex pieces of electronic equipment are installed, maintained, and repaired by electrical and electronics installers and repairers.

Electrical equipment and electronic equipment are two distinct types of industrial equipment, although much equipment contains

both electrical and electronic components. In general, electrical portions provide the power for the equipment, while electronic components control the device, although many types of equipment still are controlled with electrical devices. Electronic sensors monitor the equipment and the manufacturing process, providing feedback to the programmable logic control (PLC), which controls the equipment. The PLC processes the information provided by the sensors and makes adjustments to optimize output. To adjust the output, the PLC sends signals to the electrical, hydraulic, and pneumatic devices that power the machine—changing feed rates, pressures, and other variables in the manufacturing process. Many installers and repairers, known as *field technicians*, travel to factories or other locations to repair equipment. These workers often have assigned areas in which they perform preventive maintenance on a regular basis. When equipment breaks down, field technicians go to a customer's site to repair the equipment. *Bench technicians* work in repair shops located in factories and service centers, fixing components that cannot be repaired on the factory floor.

Some industrial electronic equipment is self-monitoring and alerts repairers to malfunctions. When equipment breaks down, repairers first check for common causes of trouble, such as loose connections or obviously defective components. If routine checks do not locate the trouble, repairers may refer to schematics and manufacturers' specifications that show connections and provide instructions on how to locate problems. Automated electronic control systems are increasing in complexity, making diagnosis more challenging. With these systems, repairers use software programs and testing equipment to diagnose malfunctions. Among their diagnostic tools are multimeters, which measure voltage, current, and resistance, and advanced multimeters, which measure capacitance, inductance, and current gain of transistors. Repairers also use signal generators, which provide test signals, and oscilloscopes, which display signals graphically. Finally, repairers use handtools such as pliers, screwdrivers, soldering irons, and wrenches to replace faulty parts and adjust equipment.

Because repairing components is a complex activity and factories cannot allow production equipment to stand idle, repairers on the factory floor usually remove and replace defective units, such as circuit boards, instead of fixing them. Defective units are discarded or returned to the manufacturer or a specialized shop for repair. Bench technicians at these locations have the training, tools, and parts needed to thoroughly diagnose and repair circuit boards or other complex components. These workers also locate and repair circuit defects, such as poorly soldered joints, blown fuses, or malfunctioning transistors.

Electrical and electronics installers often fit older manufacturing equipment with new automated control devices. Older manufacturing machines are frequently in good working order but are limited by inefficient control systems for which replacement parts are no longer available. Installers replace old electronic control units with new PLCs. Setting up and installing a new PLC involves connecting it to different sensors and electrically powered devices (electric motors, switches, and pumps) and writing a computer program to operate the PLC. Electronics installers coordinate their efforts with those of other workers who are installing and maintaining equipment. (See the statement on industrial machinery mechanics and maintenance workers elsewhere in the *Handbook*.)

Electrical and electronics installers and repairers, transportation equipment install, adjust, or maintain mobile electronic communication equipment, including sound, sonar, security, navigation, and surveillance systems on trains, watercraft, or other vehicles. *Electrical and electronics repairers, powerhouse, substation, and relay* inspect, test, maintain, or repair electrical equipment used in generating stations, substations, and in-service relays. These work-

ers may be known as powerhouse electricians, relay technicians, or power transformer repairers. *Electric motor, power tool, and related repairers*—such as armature winders, generator mechanics, and electric golf cart repairers—specialize in installing, maintaining, and repairing electric motors, wiring, or switches.

Electronic equipment installers and repairers, motor vehicles have a significantly different job. They install, diagnose, and repair communication, sound, security, and navigation equipment in motor vehicles. Most installation work involves either new alarm or sound systems. New sound systems vary significantly in cost and complexity of installation. Replacing a head unit (radio) with a new CD player is simple, requiring the removal of a few screws and the connection of a few wires. Installing a new sound system with a subwoofer, amplifier, and fuses is far more complicated. The installer builds a fiberglass or wood box designed to hold the subwoofer and to fit inside the unique dimensions of the automobile. Installing sound-deadening material, which often is necessary with more powerful speakers, requires an installer to remove many parts of a car (for example, seats, carpeting, or interiors of doors), add sound-absorbing material in empty spaces, and reinstall the interior parts. The installer also runs new speaker and electrical cables. The new system may require additional fuses, a new electrical line to be run from the battery through a newly drilled hole in the firewall into the interior of the vehicle, or an additional or more powerful alternator or battery. Motor vehicle installers and repairers work with an increasingly complex range of electronic equipment, including DVD players, satellite navigation equipment, passive security systems, and active security systems.

Working Conditions

Many electrical and electronics installers and repairers work on factory floors, where they are subject to noise, dirt, vibration, and heat. Bench technicians work primarily in repair shops, where the surroundings are relatively quiet, comfortable, and well lighted.

Installers and repairers may have to do heavy lifting and work in a variety of positions. They must follow safety guidelines and often wear protective goggles and hardhats. When working on ladders or on elevated equipment, repairers must wear harnesses to avoid falls.

Many electrical and electronics installers and repairers diagnose, install, and repair equipment in motor vehicles.

Before repairing a piece of machinery, these workers must follow procedures to ensure that others cannot start the equipment during the repair process. They also must take precautions against electric shock by locking off power to the unit under repair.

Motor vehicle electronic equipment installers and repairers normally work indoors in well-ventilated and well-lighted repair shops. Minor cuts and bruises are common, but serious accidents usually are avoided when safety practices are observed.

Training, Other Qualifications, and Advancement

Knowledge of electrical equipment and electronics is necessary for employment. Many applicants gain this knowledge through programs lasting 1 to 2 years at vocational schools or community colleges, although some less skilled repairers may have only a high school diploma. Entry-level repairers may work closely with more experienced technicians who provide technical guidance.

Installers and repairers should have good eyesight and color perception to work with the intricate components used in electronic equipment. Field technicians work closely with customers and should have good communication skills and a neat appearance. Employers also may require that field technicians have a driver's license.

Various organizations offer certification. Repairers may specialize—in industrial electronics, for example. To receive certification, repairers must pass qualifying exams corresponding to their level of training and experience.

Experienced repairers with advanced training may become specialists or troubleshooters who help other repairers diagnose difficult problems. Workers with leadership ability may become supervisors of other repairers. Some experienced workers open their own repair shops.

Employment

Electrical and electronics installers and repairers held about 158,000 jobs in 2004. The following tabulation breaks down their employment by occupational specialty:

Electrical and electronics repairers, commercial and industrial equipment	72,000
Electric motor, power tool, and related repairers	28,000
Electrical and electronics repairers, powerhouse, substation, and relay	21,000
Electronic equipment installers and repairers, motor vehicles	19,000
Electrical and electronics installers and repairers, transportation equipment.....	18,000

Many repairers worked for utilities; building equipment contractors; machinery and equipment repair shops; wholesalers; the Federal Government; retailers of automotive parts and accessories; rail transportation companies; and manufacturers of electrical, electronic, and transportation equipment.

Job Outlook

Job opportunities should be best for applicants with a thorough knowledge of electrical equipment and electronics as well as with repair experience. Overall employment of electrical and electronics installers and repairers is expected to grow more slowly than the average for all occupations during the 2004–14 period, but prospects vary by occupational specialty. In addition to employment growth, the need to replace workers who transfer to other occupations or leave the labor force will result in many job openings.

Average employment growth is projected for electrical and electronics installers and repairers of commercial and industrial equipment. This equipment will become more sophisticated and

will be used more frequently as businesses strive to lower costs by increasing and improving automation. Companies will install electronic controls, robots, sensors, and other equipment to automate processes such as assembly and testing. As prices decline, applications will be found across a number of industries, including services, utilities, and construction, as well as manufacturing. Improved reliability of equipment should not constrain employment growth, however: companies increasingly will rely on repairers because malfunctions that idle commercial and industrial equipment will continue to be costly.

Employment of motor vehicle electronic equipment installers and repairers also is expected to grow about as fast as the average. However, as motor vehicle manufacturers install more and better sound, security, entertainment, and navigation systems in new vehicles, and as newer electronic systems require progressively less maintenance, employment growth for aftermarket electronic equipment installers will be limited.

Employment of electric motor, power tool, and related repairers is expected to grow more slowly than average. Improvements in electrical and electronic equipment design should limit job growth by simplifying repair tasks. The design of more parts that are easily disposable will further reduce employment growth.

Employment of electrical and electronic installers and repairers of transportation equipment is also expected to grow more slowly than the average because of declining industry employment in railroad rolling stock manufacturing and shipbuilding and boatbuilding.

Employment of electrical and electronics installers and repairers, powerhouse, substation, and relay is expected to decline slightly. Consolidation and privatization in utilities industries should improve productivity, reducing employment. Newer equipment will be more reliable and easier to repair, further limiting employment.

Earnings

Median hourly earnings of electrical and electronics repairers, commercial and industrial equipment were \$20.48 in May 2004. The middle 50 percent earned between \$16.04 and \$25.07. The lowest 10 percent earned less than \$12.55, and the highest 10 percent earned more than \$28.68. In May 2004, median hourly earnings were \$23.79 in the Federal Government and \$17.82 in building equipment contractors, the industries employing the largest numbers of electrical and electronics repairers, commercial and industrial equipment.

Median hourly earnings of electric motor, power tool, and related repairers were \$15.54 in May 2004. The middle 50 percent earned between \$12.12 and \$19.71. The lowest 10 percent earned less than \$9.48, and the highest 10 percent earned more than \$23.90. In May 2004, median hourly earnings were \$15.02 in commercial and industrial machinery and equipment (except automotive and electronic) repair and maintenance, the industry employing the largest number of electronic motor, power tool, and related repairers.

Median hourly earnings of electrical and electronics repairers, powerhouse, substation, and relay were \$25.86 in May 2004. The middle 50 percent earned between \$22.47 and \$29.73. The lowest 10 percent earned less than \$18.01, and the highest 10 percent earned more than \$33.82. In May 2004, median hourly earnings were \$26.37 in electric power generation, transmission, and distribution—the industry employing the largest number of these repairers.

Median hourly earnings of electronics installers and repairers, motor vehicles were \$12.79 in May 2004. The middle 50 percent earned between \$10.27 and \$16.55. The lowest 10 percent earned less than \$8.85, and the highest 10 percent earned more than \$22.02.

Median hourly earnings of electrical and electronics repairers, transportation equipment were \$19.25 in May 2004. The middle 50 percent earned between \$15.06 and \$23.57. The lowest 10 percent earned less than \$11.86, and the highest 10 percent earned more than \$27.70.

Related Occupations

Workers in other occupations who install and repair electronic equipment include broadcast and sound technicians and radio operators; computer, automated teller, and office machine repairers; electronic home entertainment equipment installers and repairers; and radio and telecommunications equipment installers and repairers. Industrial machinery mechanics and maintenance workers also install, maintain, and repair industrial machinery.

Electronic Home Entertainment Equipment Installers and Repairers

(O*NET 49-2097.00)

Significant Points

- Employers prefer applicants who have basic knowledge and skills in electronics; many applicants gain these skills at vocational training programs and community colleges.
- Employment is expected to grow more slowly than the average for all occupations because it often is cheaper to replace equipment than to repair it.
- Job opportunities will be best for applicants with knowledge of electronics and with related hands-on experience.

Nature of the Work

Electronic home entertainment equipment installers and repairers, also called *service technicians*, repair a variety of equipment, including televisions and radios, stereo components, video and audio disc players, video cameras, and video recorders. They also install and repair home security systems, intercom equipment, satellite television dishes, and home theater systems, which consist of large-screen televisions and sophisticated surround-sound audio components.

Customers usually bring small, portable equipment to repair shops for servicing. Repairers at these locations, known as *bench technicians*, are equipped with a full array of electronic tools and parts. When larger, less mobile equipment breaks down, customers may pay repairers to come to their homes. These repairers, known as *field technicians*, travel with a limited set of tools and parts, and attempt to complete the repair at the customer's location. If the job is complex, technicians may bring defective components back to the shop for thorough diagnosis and repair.

When equipment breaks down, repairers check for common causes of trouble, such as dirty or defective components. Many

repairs consist simply of cleaning and lubricating equipment. If routine checks do not locate the trouble, repairers may refer to schematics and manufacturers' specifications that provide instructions on how to locate problems. Repairers use a variety of test equipment to diagnose and identify malfunctions. Multimeters detect short circuits, failed capacitors, and blown fuses by measuring voltage, current, and resistance. Color-bar and dot generators provide on-screen test patterns, signal generators test signals, and oscilloscopes and digital storage scopes measure complex waveforms produced by electronic equipment. Repairs may involve removing and replacing a failed capacitor, transistor, or fuse. Repairers use handtools, such as pliers, screwdrivers, soldering irons, and wrenches, to replace faulty parts. They also make adjustments to equipment, such as focusing and converging the picture of a television set or balancing the audio on a surround-sound system.

Improvements in technology have miniaturized and digitized many audio and video recording devices. Miniaturization has made repair work significantly more difficult because both the components and the acceptable tolerances are smaller. For example, an analog video camera operates at 1,800 revolutions per minute (rpm), while a digital video camera may operate at 9,000 rpm. Also, components now are mounted on the surface of circuit boards, instead of plugged into slots, requiring more precise soldering when a new part is installed. Improved technologies have lowered the price of electronic home entertainment equipment to the point where customers often replace broken equipment instead of repairing it.

Working Conditions

Most repairers work in well-lighted electrical repair shops. Field technicians, however, spend much time traveling in service vehicles and working in customers' residences.

Repairers may have to work in a variety of positions and carry heavy equipment. Although the work of repairers is comparatively safe, they must take precautions against minor burns and electric shock. Because television monitors carry high voltage even when they are turned off, repairers need to discharge the voltage before servicing such equipment.

Training, Other Qualifications, and Advancement

Employers prefer applicants who have basic knowledge and skills in electronics. Applicants should be familiar with schematics and have some hands-on experience repairing electronic equipment. Many applicants gain these skills at vocational training programs

Many electronic home entertainment equipment installers and repairers are self-employed.

and community colleges. Training programs should include both hands-on experience and theoretical education in digital consumer electronics. Entry-level repairers may work closely with more experienced technicians, who provide technical guidance.

Field technicians work closely with customers and must have good communication skills and a neat appearance. Employers also may require that field technicians have a driver's license.

Various organizations offer certification for electronic home entertainment equipment installers and repairers. Repairers may specialize in a variety of skill areas, including consumer electronics. To receive certification, repairers must pass qualifying exams corresponding to their level of training and experience.

Experienced repairers with advanced training may become specialists or troubleshooters, helping other repairers to diagnose difficult problems. Workers with leadership ability may become supervisors of other repairers. Some experienced workers open their own repair shops.

Employment

Electronic home entertainment equipment installers and repairers held about 47,000 jobs in 2004. Most repairers worked in electronics and appliance stores that sell and service electronic home entertainment products or in electronic and precision equipment repair and maintenance shops. About 1 electronic home entertainment equipment installers and repairers in 3 were self-employed, more than 4 times the proportion for all installation, maintenance, and repair occupations.

Job Outlook

Employment of electronic home entertainment equipment installers and repairers is expected to grow more slowly than average through 2014, due to decreased demand for repair work. Nevertheless, job openings will come about because of employment growth; some openings will also result from the need to replace workers who retire or who transfer to higher paying jobs in other occupations requiring electronics experience. Opportunities will be best for applicants with knowledge of electronics and with related hands-on experience.

The need for repairers is expected to grow slowly because home entertainment equipment is less expensive than in the past. As technological developments have lowered the price and improved the reliability of equipment, the demand for repair services has decreased. When malfunctions do occur, it often is cheaper for consumers to replace equipment rather than to pay for repairs.

Employment growth will be spurred somewhat by the introduction of sophisticated digital equipment, such as DVDs, high-definition digital televisions, and digital camcorders. So long as the price of such equipment remains high, purchasers will be willing to hire repairers when malfunctions occur. There also will be demand to install sophisticated home entertainment systems, such as home theaters.

Earnings

Median hourly earnings of electronic home entertainment equipment installers and repairers were \$13.44 in May 2004. The middle 50 percent earned between \$10.39 and \$17.10. The lowest 10 percent earned less than \$8.17, and the highest 10 percent earned more than \$21.36. In May 2004, median hourly earnings of electronic home entertainment equipment installers and repairers were \$12.86 in electronics and appliance stores and \$12.28 in electronic and precision equipment repair and maintenance.

Related Occupations

Other workers who repair and maintain electronic equipment include broadcast and sound engineering technicians and radio operators;

computer, automated teller, and office machine repairers; electrical and electronics installers and repairers; and radio and telecommunications equipment installers and repairers.

Radio and Telecommunications Equipment Installers and Repairers

(O*NET 49-2021.00, 49-2022.01, 49-2022.02, 49-2022.03, 49-2022.04, 49-2022.05)

Significant Points

- Employment is projected to decline.
- Job opportunities will vary by specialty; for example, good opportunities should be available for central office and PBX installers and repairers experienced in current technology, while station installers and repairers can expect keen competition.
- Applicants with computer skills and postsecondary electronics training should have the best opportunities.
- Weekend and holiday hours are common; repairers may be on call around the clock in case of emergencies.

Nature of the Work

Telephones and radios depend on a variety of equipment to transmit communications signals. From electronic switches that route telephone signals to their destinations to radio transmitters and receivers that relay signals from wireless phones, the workers who set up and maintain this sophisticated equipment are called radio and telecommunications equipment installers and repairers. These workers no longer just work on equipment that transmits voice signals, but also transmissions such as data, graphics, and video.

Central office installers set up switches, cables, and other equipment in central offices. These locations are the hubs of a telecommunications network—they contain the switches and routers that direct packets of information to their destinations. Although most telephone lines connecting houses to central offices and switching stations are still copper, the lines connecting these central hubs are fiber optic. Fiber optic lines have led to a revolution in switching equipment. The greatly increased transmission capacity of each line has allowed a few fiber optic lines to replace many copper lines. Packet switching equipment is evolving rapidly, ever increasing the amount of information that a single fiber optic line can carry. These switches and routers have the ability to transmit, process, amplify, and direct a massive amount of information. Installing and maintaining this equipment requires a high level of technical knowledge.

The increasing reliability of telephone switches and routers has simplified maintenance. New self-monitoring telephone switches alert repairers to malfunctions. Some switches allow repairers to diagnose and correct problems from remote locations. When faced with a malfunction, the repairer may refer to manufacturers' manuals that provide maintenance instructions.

When problems with telecommunications equipment arise, telecommunications equipment repairers diagnose the source of the problem by testing each of the different parts of the equipment, which requires an understanding of how the software and hardware interact. Repairers often use spectrum and/or network analyzers to locate the problem. A network analyzer sends a signal through the equipment to detect any distortion in the signal. The nature of the signal distortion often directs the repairer to the source of the problem. To fix the equipment, repairers may use small handtools, including pliers and screwdrivers, to remove and replace defective components such as circuit boards or wiring. Newer equipment is easier to repair because whole boards and parts are designed to be quickly removed and replaced. Repairers also may install updated software or programs that maintain existing software.

Cable television companies employ technicians to install and maintain their distribution centers, called head ends. Their work is similar to central office installers.

PBX installers and repairers set up private branch exchange (PBX) switchboards, which relay incoming, outgoing, and inter-office calls within a single location or organization. To install switches and switchboards, installers first connect the equipment to power lines and communications cables and install frames and supports. They test the connections to ensure that adequate power is available and that the communication links function. They also install equipment such as power systems, alarms, and telephone sets. New switches and switchboards are computerized; workers install software or program the equipment to provide specific features. For example, as a cost-cutting feature, an installer may program a PBX switchboard to route calls over different lines at different times of the day. However, other workers, such as computer support specialists generally handle complex programming. (The work of computer support specialists is described in the *Handbook* statement on computer support specialists and systems administrators.) Finally, the installer performs tests to verify that the newly installed equipment functions properly. If a problem arises, PBX repairers determine whether it is located within the PBX system or originates in the telephone lines maintained by the local phone company.

Due to rapidly developing technologies, PBX installers must adapt and learn new technologies. Instead of installing PBX systems, companies are choosing to install voice-over Internet protocol (VoIP) systems. VoIP systems operate like a PBX system, but they use a company's computer wiring to run Internet access, network applications, and telephone communications. Specialized phones have their own Internet protocol (IP) addresses. The phones can be plugged into any port in the system and still use the same number.

Station installers and repairers, telephone—commonly known as *telephone installers and repairers* or *telecommunications service technicians*—install and repair telephone wiring and equipment on customers' premises. They install telephone or digital subscriber line (DSL) service by connecting customers' telephone wires to outside service lines. These lines run on telephone poles or in underground conduits. The installer may climb poles or ladders to make the connections. Once the connection is made, the line is tested. When a maintenance problem occurs, repairers test the customers' lines to determine if the problem is located in the customers' premises or in the outside service lines. When onsite procedures fail to resolve installation or maintenance problems, repairers may request support from their technical service center. Line installers and repairers, covered elsewhere in the *Handbook*, install the wires and cables that connect customers with central offices.

Radio mechanics install and maintain radio transmitting and receiving equipment. This includes stationary equipment mounted on transmission towers and mobile equipment, such as radio

communications systems in service and emergency vehicles. Radio mechanics do not work on cellular communications towers and equipment. Newer radio equipment is self-monitoring and may alert mechanics to potential malfunctions. When malfunctions occur, these mechanics examine equipment for damaged components and loose or broken wires. They use electrical measuring instruments to monitor signal strength, transmission capacity, interference, and signal delay, as well as handtools to replace defective components and parts and to adjust equipment so that it performs within required specifications.

Working Conditions

Radio and telecommunications equipment installers and repairers generally work in clean, well-lit, air-conditioned surroundings, such as a telephone company's central office, a customer's location, or an electronic repair shop or service center. Telephone installers and repairers work on rooftops, ladders, and telephone poles. Telephone, PBX, and VoIP installers must travel to a customer's location. Radio mechanics may maintain equipment located on the tops of transmissions towers. While working outdoors, these workers are subject to a variety of weather conditions.

Nearly all radio and telecommunications equipment installers and repairers work full time. Many work regular business hours to meet the demand for repair services during the workday. Schedules are more irregular at companies that need repair services 24 hours a day or where installation and maintenance must take place after business hours. At these locations, mechanics work a variety of shifts, including weekend and holiday hours. Repairers may be on call around the clock, in case of emergencies, and may have to work overtime.

The work of most repairers involves lifting, reaching, stooping, crouching, and crawling. Adherence to safety precautions is important in order to guard against work hazards. These hazards include falls, minor burns, electrical shock, and contact with hazardous materials.

Training, Other Qualifications, and Advancement

Most employers seek applicants with postsecondary training in electronics and a familiarity with computers. Training sources include 2-year and 4-year college programs in electronics or communications, trade schools, and equipment and software manufacturers. Military experience with communications equipment is valued

Radio and telecommunications equipment installers often use computers to diagnose problems with telecommunications switching equipment.

by many employers. Some equipment repairers begin working in telecommunications companies as line installers or telephone installers, before moving up to the job of central office installer and other more complex work.

Newly hired repairers usually receive some training from their employers. This may include formal classroom training in electronics, communications systems, or software and informal hands-on training assisting an experienced repairer. Large companies may send repairers to outside training sessions to keep them informed about new equipment and service procedures. As networks have become more sophisticated—often including equipment from a variety of companies—the knowledge needed for installation and maintenance also has increased.

Telecommunications equipment companies provide much of the training on specific equipment. With the rapid advances in switches, routers, and other equipment, repairers need to continually take courses and work to obtain manufacturers' certifications on the latest technology.

Repairers must be able to distinguish colors, because wires are color-coded, and they must be able to hear distinctions in the various tones on a telephone system. For positions that require climbing poles and towers, workers must be in good physical shape. Repairers who handle assignments alone at a customer's site must be able to work without close supervision. For workers who frequently contact customers, a pleasant personality, neat appearance, and good communications skills also are important.

Experienced repairers with advanced training may become specialists or troubleshooters who help other repairers diagnose difficult problems, or may work with engineers in designing equipment and developing maintenance procedures. Because of their familiarity with equipment, repairers are particularly well qualified to become manufacturers' sales workers. Workers with leadership ability also may become maintenance supervisors or service managers. Some experienced workers open their own repair services or shops, or become wholesalers or retailers of electronic equipment.

Employment

Radio and telecommunications equipment installers and repairers held about 222,000 jobs in 2004. About 215,000 were telecommunications equipment installers and repairers, except line installers, mostly working in the telecommunications industry, and the rest were radio mechanics. Radio mechanics worked in electronic and precision equipment repair and maintenance, telecommunications, electronics and appliance stores, and many other industries.

Job Outlook

Employment of radio and telecommunications equipment installers and repairers is expected to decline through 2014. Although the need for installation work will remain as companies seek to upgrade their telecommunications networks, there will be a declining need for maintenance work—performed by telecommunications equipment installers and repairers, except line installers—because of increasingly reliable self-monitoring and self-diagnosing equipment and because installation of higher capacity equipment will reduce the amount of equipment needed. The replacement of two-way radio systems with wireless systems, especially in service vehicles, will eliminate the need in many companies for onsite radio mechanics. The increased reliability of wireless equipment and the use of self-monitoring systems also will continue to lessen the need for radio mechanics. Applicants with computer skills and postsecondary electronics training should have the best opportunities for radio and telecommunications equipment installer and repairer jobs.

Job opportunities will vary by specialty. For example, good opportunities should be available for central office and PBX installers and repairers experienced in current technology, as the growing popularity of VoIP, expanded multimedia offerings such as video on demand, and other telecommunications services continue to place additional demand on telecommunications networks. These new services require high data transfer rates, which can be achieved only by installing new optical switching and routing equipment. Extending high-speed communications from central offices to customers also will require the installation of more advanced switching and routing equipment. Whereas increased reliability and automation of switching equipment will limit opportunities, these effects will be somewhat offset by the demand for installation and upgrading of switching equipment.

Station installers and repairers can expect keen competition. Prewired buildings and the increasing reliability of telephone equipment will reduce the need for installation and maintenance of customers' telephones. Upgrading internal lines in businesses and the wiring of new homes and businesses with fiber optic lines should offset some of these losses. As cellular telephones have increased in popularity, the number of pay phones is declining, which also will adversely affect employment of station installers and repairers as pay phone installation and maintenance is one of their major functions.

Earnings

In May 2004, median hourly earnings of telecommunications equipment installers and repairers, except line installers were \$23.96. The middle 50 percent earned between \$19.46 and \$27.07. The bottom 10 percent earned less than \$14.65, whereas the top 10 percent earned

more than \$30.85. The median hourly earnings of these workers in the wired telecommunications carriers (telephone) industry were \$24.92 in May 2004.

Median hourly earnings of radio mechanics in May 2004 were \$17.65. The middle 50 percent earned between \$13.59 and \$21.90. The bottom 10 percent earned less than \$10.42, whereas the top 10 percent earned more than \$27.62.

Related Occupations

Related occupations that involve work with electronic equipment include broadcast and sound engineering technicians and radio operators; computer, automated teller, and office machine repairers; electronic home entertainment equipment installers and repairers; and electrical and electronics installers and repairers. Line installers and repairers also set up and install telecommunications equipment. Engineering technicians also may repair electronic equipment as part of their duties.

Vehicle and Mobile Equipment Mechanics, Installers, and Repairers

Aircraft and Avionics Equipment Mechanics and Service Technicians

(O*NET 49-2091.00, 49-3011.01, 49-3011.02, 49-3011.03)

Significant Points

- Most workers learn their job in 1 of about 170 schools certified by the Federal Aviation Administration (FAA).
- Job opportunities should be excellent for persons who have completed an aircraft mechanic training program, but keen competition is likely for the best paying airline jobs.
- Job opportunities are likely to be the best at small commuter and regional airlines, at FAA repair stations, and in general aviation.

Nature of the Work

To keep aircraft in peak operating condition, aircraft and avionics equipment mechanics and service technicians perform scheduled maintenance, make repairs, and complete inspections required by the Federal Aviation Administration (FAA).

Many aircraft mechanics, also called airframe mechanics, power plant mechanics, and avionics technicians, specialize in preventive

maintenance. They inspect aircraft engines, landing gear, instruments, pressurized sections, accessories—brakes, valves, pumps, and air-conditioning systems, for example—and other parts of the aircraft, and do the necessary maintenance and replacement of parts. They also maintain records related to the maintenance performed on the aircraft. Mechanics and technicians conduct inspections following a schedule based on the number of hours the aircraft has flown, calendar days since the last inspection, cycles of operation, or a combination of these factors. In large, sophisticated planes equipped with aircraft monitoring systems, mechanics can gather valuable diagnostic information from electronic boxes and consoles that monitor the aircraft's basic operations. In planes of all sorts, aircraft mechanics examine engines by working through specially designed openings while standing on ladders or scaffolds or by using hoists or lifts to remove the entire engine from the craft. After taking an engine apart, mechanics use precision instruments to measure parts for wear and use x-ray and magnetic inspection equipment to check for invisible cracks. They repair or replace worn or defective parts. Mechanics also may repair sheet metal or composite surfaces; measure the tension of control cables; and check for corrosion, distortion, and cracks in the fuselage, wings, and tail. After completing all repairs, they must test the equipment to ensure that it works properly.

Mechanics specializing in repair work rely on the pilot's description of a problem to find and fix faulty equipment. For example, during a preflight check, a pilot may discover that the aircraft's

fuel gauge does not work. To solve the problem, mechanics may troubleshoot the electrical system, using electrical test equipment to make sure that no wires are broken or shorted out, and replace any defective electrical or electronic components. Mechanics work as fast as safety permits so that the aircraft can be put back into service quickly.

Some mechanics work on one or many different types of aircraft, such as jets, propeller-driven airplanes, and helicopters. Others specialize in one section of a particular type of aircraft, such as the engine, hydraulics, or electrical system. *Airframe mechanics* are authorized to work on any part of the aircraft except the instruments, power plants, and propellers. *Powerplant mechanics* are authorized to work on engines and do limited work on propellers. *Combination airframe-and-powerplant mechanics*—called A&P mechanics—work on all parts of the plane except the instruments. Most mechanics working on civilian aircraft today are A&P mechanics. In small, independent repair shops, mechanics usually inspect and repair many different types of aircraft.

Avionics systems are now an integral part of aircraft design and have vastly increased aircraft capability. *Avionics technicians* repair and maintain components used for aircraft navigation and radio communications, weather radar systems, and other instruments and computers that control flight, engine, and other primary functions. These duties may require additional licenses, such as a radiotelephone license issued by the U.S. Federal Communications Commission (FCC). Because of the increasing use of technology, more time is spent repairing electronic systems, such as computerized controls. Technicians also may be required to analyze and develop solutions to complex electronic problems.

Working Conditions

Mechanics usually work in hangars or in other indoor areas. When hangars are full or when repairs must be made quickly, they can work outdoors, sometimes in unpleasant weather. Mechanics often work under time pressure to maintain flight schedules or, in general aviation, to keep from inconveniencing customers. At the same time, mechanics have a tremendous responsibility to maintain safety standards, and this can cause the job to be stressful.

Frequently, mechanics must lift or pull objects weighing more than 70 pounds. They often stand, lie, or kneel in awkward positions and occasionally must work in precarious positions, such as on scaffolds or ladders. Noise and vibration are common when engines are being tested, so ear protection is necessary. Aircraft mechanics

Many aircraft mechanics specialize in preventive maintenance by inspecting aircraft engines, landing gear, instruments, pressurized sections, accessories, and other parts of the aircraft.

usually work 40 hours a week on 8-hour shifts around the clock. Overtime work is frequent.

Training, Other Qualifications, and Advancement

Most mechanics who work on civilian aircraft are certified by the FAA as an “airframe mechanic” or a “powerplant mechanic.” Mechanics who also have an inspector’s authorization can certify work completed by other mechanics and perform required inspections. Uncertified mechanics are supervised by those with certificates.

The FAA requires at least 18 months of work experience for an airframe or powerplant certificate. For a combined A&P certificate, at least 30 months of experience working with both engines and airframes is required. Completion of a program at an FAA-certified mechanic school can substitute for the work experience requirement. Applicants for all certificates also must pass written and oral tests and demonstrate that they can do the work authorized by the certificate. To obtain an inspector’s authorization, a mechanic must have held an A&P certificate for at least 3 years, with 24 months of hands on experience. Most airlines require that mechanics have a high school diploma and an A&P certificate.

Although a few people become mechanics through on-the-job training, most learn their job in 1 of about 170 trade schools certified by the FAA. About one-third of these schools award 2-year and 4-year degrees in avionics, aviation technology, or aviation maintenance management.

FAA standards established by law require that certified mechanic schools offer students a minimum of 1,900 actual class hours. Coursework in schools normally lasts from 18 to 24 months and provides training with the tools and equipment used on the job. Aircraft trade schools are placing more emphasis on technologies such as turbine engines, composite materials—including graphite, fiberglass, and boron—and aviation electronics, which are increasingly being used in the construction of new aircraft. Additionally, employers prefer mechanics who can perform a variety of tasks.

Some aircraft mechanics in the Armed Forces acquire enough general experience to satisfy the work experience requirements for the FAA certificate. With additional study, they may pass the certifying exam. In general, however, jobs in the military services are too specialized to provide the broad experience required by the FAA. Most Armed Forces mechanics have to complete the entire training program, although a few receive some credit for the material they learned in the service. In any case, military experience is a great advantage when seeking employment; employers consider applicants with formal training to be the most desirable applicants.

Courses in mathematics, physics, chemistry, electronics, computer science, and mechanical drawing are helpful because they demonstrate many of the principles involved in the operation of aircraft, and knowledge of these principles is often necessary to make repairs. Courses that develop writing skills also are important because mechanics are often required to submit reports.

FAA regulations require current work experience to keep the A&P certificate valid. Applicants must have at least 1,000 hours of work experience in the previous 24 months or take a refresher course. As new and more complex aircraft are designed, more employers are requiring mechanics to take ongoing training to update their skills. Recent technological advances in aircraft maintenance necessitate a strong background in electronics—both for acquiring and for retaining jobs in this field. FAA certification standards also make ongoing training mandatory. Every 24 months, mechanics are required to take at least 16 hours of training to keep their certificate. Many mechanics take courses offered by manufacturers or employers, usually through outside contractors.

Aircraft mechanics must do careful and thorough work that requires a high degree of mechanical aptitude. Employers seek

applicants who are self-motivated, hard working, enthusiastic, and able to diagnose and solve complex mechanical problems. Agility is important for the reaching and climbing necessary to do the job. Because they may work on the tops of wings and fuselages on large jet planes, aircraft mechanics must not be afraid of heights.

Advances in computer technology, aircraft systems, and the materials used to manufacture airplanes have made mechanics' jobs more highly technical. Aircraft mechanics must possess the skills necessary to troubleshoot and diagnose complex aircraft systems. They also must continually update their skills with and knowledge of new technology and advances in aircraft technology.

As aircraft mechanics gain experience, they may advance to lead mechanic (or crew chief), inspector, lead inspector, or shop supervisor positions. Opportunities are best for those who have an aircraft inspector's authorization. In the airlines, where promotion often is determined by examination, supervisors sometimes advance to executive positions. Those with broad experience in maintenance and overhaul might become inspectors with the FAA. With additional business and management training, some open their own aircraft maintenance facilities. Mechanics learn many different skills in their training that can be applied to other jobs, and some transfer to other skilled repairer occupations or electronics technician jobs. Mechanics with the necessary pilot licenses and flying experience may take the FAA examination for the position of flight engineer, with opportunities to become pilots.

Employment

Aircraft and avionics equipment mechanics and service technicians held about 142,000 jobs in 2004; about 5 in 6 of these workers was an aircraft mechanic and service technician. More than half of aircraft and avionics equipment mechanics and service technicians worked for air transportation companies. About 18 percent worked for the Federal Government, and about 14 percent worked for aerospace products and parts manufacturing firms. Most of the rest worked for companies that operate their own planes to transport executives and cargo. Few mechanics and technicians were self-employed.

Most airline mechanics and service technicians work at major airports near large cities. Civilian mechanics employed by the U.S. Armed Forces work at military installations. Mechanics who work for aerospace manufacturing firms typically are located in California or in Washington State. Others work for the FAA, many at the facilities in Oklahoma City, Atlantic City, Wichita, or Washington, DC. Mechanics for independent repair shops work at airports in every part of the country.

Job Outlook

Opportunities for aircraft and avionics equipment mechanics and service technicians should be excellent for who have completed aircraft mechanic training programs. Employment is expected to increase about as fast as the average for all occupations through the year 2014, and large numbers of additional job openings should arise from the need to replace experienced mechanics who retire.

Reduced passenger traffic—resulting from a weak economy and the events of September 11, 2001—forced airlines to cut back flights and take aircraft out of service. However, over the next decade passenger traffic is expected to increase as the result of an expanding economy and a growing population, and the need for aircraft mechanics and service technicians will grow accordingly. Furthermore, if the number of graduates from aircraft mechanic training programs continues to fall short of employer needs, opportunities for graduates of mechanic training programs should be excellent.

Most job openings for aircraft mechanics through the year 2014 will stem from replacement needs. Many mechanics are expected to retire over the next decade and create several thousand job openings

per year. In addition, others will leave to work in related fields, such as automobile repair, as their skills are largely transferable to other maintenance and repair occupations. Also contributing to favorable future job opportunities for mechanics is the long-term trend toward fewer students entering technical schools to learn skilled maintenance and repair trades. Many of the students who have the ability and aptitude to work on planes are choosing to go to college, work in computer-related fields, or go into other repair and maintenance occupations with better working conditions. If the trend continues, the supply of trained aviation mechanics will not be able to keep up with the needs of the air transportation industry.

Job opportunities are likely to be the best at small commuter and regional airlines, at FAA repair stations, and in general aviation. Commuter and regional airlines are the fastest growing segment of the air transportation industry, but wages in these companies tend to be lower than those in the major airlines, so they attract fewer job applicants. Also, some jobs will become available as experienced mechanics leave for higher paying jobs with the major airlines or transfer to another occupation. At the same time, general aviation aircraft are becoming increasingly sophisticated, boosting the demand for qualified mechanics. Mechanics will face more competition for jobs with large airlines because the high wages and travel benefits that these jobs offer generally attract more qualified applicants than there are openings. Also, there is an increasing trend for large airlines to outsource aircraft and avionics equipment mechanic jobs overseas; however, most airline companies prefer maintenance work done on aircraft be performed in the U.S. because of safety and regulation issues of overseas contractors.

In spite of these factors, job opportunities with the airlines are expected to be better than they have been in the past. But, in general, prospects will be best for applicants with experience. Mechanics who keep abreast of technological advances in electronics, composite materials, and other areas will be in greatest demand. Also, mechanics who are mobile and willing to relocate to smaller rural areas will have better job opportunities. The number of job openings for aircraft mechanics in the Federal Government should decline as the government increasingly contracts out service and repair functions to private repair companies.

Job opportunities for avionics technicians who are prepared to master the intricacies of the aircraft and work with A&P mechanics are expected to be good. Technicians who are cross-trained and able to work with complex aircraft systems should have the best job prospects. Additionally, technicians with licensing that enables them to work on the airplane, either removing or reinstalling equipment, are expected to be in especially high demand.

Earnings

Median hourly earnings of aircraft mechanics and service technicians were about \$21.77 in May 2004. The middle 50 percent earned between \$17.82 and \$27.18. The lowest 10 percent earned less than \$13.99, and the highest 10 percent earned more than \$33.84. Median hourly earnings in the industries employing the largest numbers of aircraft mechanics and service technicians in May 2004 were:

Scheduled air transportation	\$27.37
Federal Government.....	21.67
Nonscheduled air transportation	20.88
Aerospace product and parts manufacturing.....	20.60
Support activities for air transportation	18.70

Median hourly earnings of avionics technicians were about \$21.30 in May 2004. The middle 50 percent earned between \$18.12 and \$25.12. The lowest 10 percent earned less than \$14.63, and the highest 10 percent earned more than \$27.85.

Mechanics who work on jets for the major airlines generally earn more than those working on other aircraft. Airline mechanics and their immediate families receive reduced-fare transportation on their own and most other airlines.

About 4 in 10 aircraft and avionics equipment mechanics and service technicians are members of unions or covered by union agreements. The principal unions are the International Association of Machinists and Aerospace Workers, and the Transport Workers Union of America. Some mechanics are represented by the International Brotherhood of Teamsters.

Related Occupations

Workers in some other occupations that involve similar mechanical and electrical work are electricians, electrical and electronics installers and repairers, and elevator installers and repairers.

Sources of Additional Information

Information about jobs with a particular airline can be obtained by writing to the personnel manager of the company.

For general information about aircraft and avionics equipment mechanics and service technicians, contact:

For information on jobs in a particular area, contact employers at local airports or local offices of the State employment service.

Information on obtaining positions as aircraft and avionics equipment mechanics and service technicians with the Federal Government is available from the Office of Personnel Management through USA-JOBS, the Federal Government's official employment information system. This resource for locating and applying for job opportunities can be accessed through the Internet at <http://www.usajobs.opm.gov> or through an interactive voice response telephone system at (703) 724-1850 or TDD (978) 461-8404. These numbers are not tollfree, and charges may result.

Automotive Body and Related Repairers

(O*NET 49-3021.00, 49-3022.00)

Significant Points

- To become a fully skilled automotive body repairer, formal training followed by on-the-job instruction is recommended because repair of newer automobiles require more advanced skills to fix their new technologies and new body materials.
- Repairers need good reading ability and basic mathematics and computer skills in order to follow instructions and diagrams in print and computer-based technical manuals.

Nature of the Work

While running errands or driving to and from work, we sometimes observe traffic accidents. Most of the vehicle damage resulting from these collisions can be repaired and the vehicle refinished to once again look and drive like new. Automotive body repairers, also often called collision repair technicians, straighten bent bodies, remove dents, and replace crumpled parts that cannot be fixed. They repair all types of vehicles, and although some work on large trucks, buses, or tractor-trailers, most work on cars and small trucks.

Automotive body repairers use special equipment to restore damaged metal frames and body sections. Repairers chain or clamp frames and sections to alignment machines that use hydraulic pressure to align damaged components. "Unibody" vehicles—designs built without frames—must be restored to precise factory specifications for the vehicle to operate correctly. To do so, repairers use benchmark systems to make accurate measurements of how much each section is out of alignment, and hydraulic machinery to return the vehicle to its original shape.

Body repairers remove badly damaged sections of body panels with a pneumatic metal-cutting gun or by other means, and then weld in replacement sections. Repairers pull out less serious dents with a hydraulic jack or hand prying bar or knock them out with handtools or pneumatic hammers. They smooth out small dents and creases in the metal by holding a small anvil against one side of the damaged area while hammering the opposite side. Repairers also remove very small pits and dimples with pick hammers and punches in a process called metal finishing. Body repairers use plastic or solder to fill small dents that cannot be worked out of plastic or metal panels. On metal panels, they file or grind the hardened filler to the original shape and clean the surface with a media blaster before repainting the damaged portion of the vehicle.

Body repairers also repair or replace the plastic body parts that are increasingly being used on new-model vehicles. They remove damaged panels and identify the type and properties of the plastic used on the vehicle. With most types of plastic, repairers can apply heat from a hot-air welding gun or by immersion in hot water and press the softened panel back into its original shape by hand. They replace plastic parts that are badly damaged or very difficult to repair. A few body repairers specialize in repairing fiberglass car bodies.

The advent of assembly-line repairs in large shops enables the establishment to move away from the one-vehicle, one-repairer method to a team approach that allows body repairers to specialize in one type of repair, such as straightening frames, repairing doors and fenders, or painting and refinishing. In most shops, automotive painters do the painting. (These workers are discussed in the section on painting and coating workers, except construction and maintenance elsewhere in the *Handbook*.) However, in small shops, workers often do both body repairing and painting. Some body repairers specialize in installing and repairing glass in automobiles and other vehicles. *Automotive glass installers and repairers* remove broken, cracked, or pitted windshields and window glass. Glass installers apply a moisture-proofing compound along the edges of the glass, place the

After a collision, automotive body repairers straighten, align, buff, or otherwise finish damaged parts.

glass in the vehicle, and install rubber strips around the sides of the windshield or window to make it secure and weatherproof.

Body repair work has variety and challenges: each damaged vehicle presents a different problem. Using their broad knowledge of automotive construction and repair techniques, repairers must develop appropriate methods for each job. They usually work alone, with only general directions from supervisors. In some shops, helpers or apprentices assist experienced repairers.

Working Conditions

Most automotive body repairers work a standard 40-hour week, although some, including the self-employed, work more than 40 hours a week. Repairers work indoors in body shops that are noisy with the clatters of hammers against metal and the whine of power tools. Most shops are well ventilated, in order to disperse dust and paint fumes. Body repairers often work in awkward or cramped positions, and much of their work is strenuous and dirty. Hazards include cuts from sharp metal edges, burns from torches and heated metal, injuries from power tools, and fumes from paint. However, serious accidents usually are avoided when the shop is kept clean and orderly and safety practices are observed.

Training, Other Qualifications, and Advancement

Automotive technology is rapidly increasing in sophistication, and most training authorities strongly recommend that persons seeking automotive body repair and related jobs complete a formal training program in automotive body repair or refinishing. Programs are offered in high school or in postsecondary vocational schools and community colleges, but these programs provide only a portion of the training needed to become fully skilled. Most new repairers receive primarily on-the-job training, supplemented with short-term training sessions given by vehicle, parts, and equipment manufacturers, when available. Training is necessary because advances in technology have greatly changed the structure, components, and materials used in automobiles. As a result, proficiency in new repair techniques is necessary. For example, the bodies of automobiles are usually a combination of materials—traditional steel, aluminum, and a growing variety of metal alloys and plastics. Each of these materials or composites requires the use of somewhat different techniques to reshape parts and smooth out dents and small pits.

Fully skilled automotive body repairers must have good reading ability and basic mathematics and computer skills. Restoring unibody automobiles to their original form requires body repairers to follow instructions and diagrams in technical manuals in order to make precise three-dimensional measurements of the position of one body section relative to another.

New repairers begin by assisting experienced body repairers in tasks such as removing damaged parts, sanding body panels, and installing repaired parts. Novices learn to remove small dents and to make other minor repairs. They then progress to more difficult tasks, such as straightening body parts and returning them to their correct alignment. Generally, to become skilled in all aspects of body repair requires 3 to 4 years of on-the-job training.

Certification by the National Institute for Automotive Service Excellence (ASE), although voluntary, is the recognized industry credential for automotive body repairers. Repairers may take from one to four ASE Master Collision Repair and Refinish Exams. Repairers who pass at least one exam and have 2 years of hands-on work experience earn ASE certification. The completion of a postsecondary program in automotive body repair may be substituted for 1 year of work experience. Those who pass all four exams become ASE Master Collision Repair and Refinish Technicians. Automotive body repairers must retake the examination at least every 5 years to retain their certification. While the ASE designations are

the most widely recognized, many vehicle manufacturers and paint manufacturers also have product certification programs available for body repairers.

Continuing education is required throughout a career in automotive body repair. Automotive parts, body materials, and electronics continue to change and to become more complex and technologically advanced. To keep up with the technological advances, repairers must continue to gain new skills, read technical manuals, and attend seminars and classes. Many companies within the automotive body repair industry provide ongoing training for workers.

As beginners increase their skills, learn new techniques, and complete work more rapidly, their pay increases. An experienced automotive body repairer with managerial ability may advance to shop supervisor. Some workers even open their own body repair shops. Others become automobile damage appraisers for insurance companies.

Employment

Automotive body and related repairers held about 223,000 jobs in 2004; about 1 in 10 specialized in automotive glass installation and repair. Most repairers worked for automotive repair and maintenance shops or automobile dealers. Others worked for organizations that maintain their own motor vehicles, such as trucking companies. A small number worked for wholesalers of motor vehicles, parts, and supplies. More than 1 automotive body repairer in 5 was self-employed, more than double the proportion for all installation, maintenance, and repair occupations.

Job Outlook

Employment of automotive body repairers is expected to grow as fast as average for all occupations through the year 2014. The need to replace experienced repairers who transfer to other occupations or who retire or stop working for other reasons will account for the majority of job openings. Opportunities will be best for persons with formal training in automotive body repair and refinishing. Those without formal training in automotive body refinishing or collision repair will face competition for these jobs.

Demand for qualified body repairers will increase as the number of motor vehicles in operation continues to grow in line with the Nation's population. With each rise in the number of motor vehicles in use, the number of vehicles damaged in accidents also will grow. New automobile designs increasingly have body parts made of steel alloys, aluminum, and plastics—materials that are more difficult to work with than are traditional steel body parts. In addition, new automotive designs of lighter weight are prone to greater collision damage than are older, heavier designs, so more time is consumed in repair.

However, increasing demand due to growth in the number of vehicles in operation will be somewhat tempered by improvements in the quality of vehicles and technological innovations that enhance safety and reduce the likelihood of accidents. Also, more body parts are simply being replaced rather than repaired. Larger shops also are instituting productivity enhancements, such as employing a team approach to repairs to decrease repair time and expand their volume of work. In addition, demand for automotive body repair services will be constrained as more vehicles are declared a total loss after accidents. In many such cases, the vehicles are not repaired because of the high cost of replacing the increasingly complex parts and electronic components and fixing the extensive damage that results when airbags deploy. Employment growth will continue to be concentrated in automotive body, paint, interior, and glass repair shops. Automobile dealers will employ a smaller portion of this occupation as the equipment needed for collision repair becomes more specialized and expensive to operate and maintain.

Experienced body repairers are rarely laid off during a general slowdown in the economy. Automotive repair business is not very sensitive to changes in economic conditions because major body damage must be repaired if a vehicle is to be restored to safe operating condition. However, repair of minor dents and crumpled fenders often can be deferred when drivers' budgets become tight.

Earnings

Median hourly earnings of automotive body and related repairers, including incentive pay, were \$16.68 in May 2004. The middle 50 percent earned between \$12.55 and \$22.04 an hour. The lowest 10 percent earned less than \$9.42, and the highest 10 percent earned more than \$28.45 an hour. In May 2004, median hourly earnings of automotive body and related repairers were \$17.73 in automobile dealers and \$16.44 in automotive repair and maintenance.

Median hourly earnings of automotive glass installers and repairers, including incentive pay, were \$13.45 in May 2004. The middle 50 percent earned between \$10.36 and \$17.04 an hour. The lowest 10 percent earned less than \$8.53, and the highest 10 percent earned more than \$20.63 an hour. Median hourly earnings in automotive repair and maintenance shops, the industry employing most automotive glass installers and repairers, were \$13.43.

The majority of body repairers employed by independent repair shops and automotive dealers are paid on an incentive basis. Under this method, body repairers are paid a predetermined amount for various tasks, and earnings depend on the amount of work assigned to the repairer and how fast it is completed. Employers frequently guarantee workers a minimum weekly salary. Body repairers who work for trucking companies, buslines, and other organizations that maintain their own vehicles usually receive an hourly wage.

Helpers and trainees typically earn from 30 percent to 60 percent of the earnings of skilled workers. Helpers and trainees usually receive an hourly rate until they are skilled enough to be paid on an incentive basis.

Related Occupations

Repairing damaged motor vehicles often involves working on mechanical components, as well as vehicle bodies. Automotive body repairers often work closely with individuals in several related occupations, including automotive service technicians and mechanics, diesel service technicians and mechanics, auto damage insurance appraisers, and painting and coating workers, except construction and maintenance.

Sources of Additional Information

Additional details about work opportunities may be obtained from automotive body repair shops, automobile dealers, or local offices of your State employment service. State employment service offices also are a source of information about training programs.

For general information about automotive body repairer careers, contact any of the following sources:

Automotive Service Technicians and Mechanics

(O*NET 49-3023.01, 49-3023.02)

Significant Points

- Formal automotive technician training is the best preparation for these challenging technology-based jobs.
- Opportunities should be very good for automotive service technicians and mechanics with diagnostic and problem-solving skills, knowledge of electronics and mathematics, and mechanical aptitude.
- Automotive service technicians and mechanics must continually adapt to changing technology and repair techniques as vehicle components and systems become increasingly sophisticated.

Nature of the Work

Anyone whose car or light truck has broken down knows the importance of the jobs of automotive service technicians and mechanics. The ability to diagnose the source of a problem quickly and accurately requires good reasoning ability and a thorough knowledge of automobiles. Many technicians consider diagnosing hard-to-find troubles one of their most challenging and satisfying duties.

The work of automotive service technicians and mechanics has evolved from mechanical repair to a high technology job. As a result, these workers are now usually called "technicians" in automotive services and the term "mechanic" is falling into disuse. Today, integrated electronic systems and complex computers run vehicles and measure their performance while on the road. Technicians must have an increasingly broad base of knowledge about how vehicles' complex components work and interact, as well as the ability to work with electronic diagnostic equipment and computer-based technical reference materials.

Automotive service technicians use their high-tech skills to inspect, maintain, and repair automobiles and light trucks that run on gasoline, ethanol and other alternative fuels, such as electricity. The increasing sophistication of automotive technology now requires workers who can use computerized shop equipment and work with electronic components while maintaining their skills with traditional hand tools. (Service technicians who work on diesel-powered trucks, buses, and equipment are discussed in the *Handbook* section on diesel service technicians and mechanics. Motorcycle technicians—who repair and service motorcycles, motor scooters, mopeds, and, occasionally, small all-terrain vehicles—are discussed in the *Handbook* section on small engine mechanics.)

When mechanical or electrical troubles occur, technicians first get a description of the symptoms from the owner or, if they work in a large shop, from the repair service estimator or service advisor who wrote the repair order. To locate the problem, technicians use a diagnostic approach. First, they test to see whether components and systems are proper and secure. Then, they isolate the components or systems that could not logically be the cause of the problem. For example, if an air-conditioner malfunctions, the technician's diagnostic approach can pinpoint a problem as simple as a low coolant level or as complex as a bad drive-train connection that has shorted out the air conditioner. Technicians may have to test drive the vehicle or use a variety of testing equipment, such as onboard and hand-held diagnostic computers or compression gauges, to identify the source of the problem. These tests may indicate whether a component is salvageable or whether a new one is required to get the vehicle back in working order.

During routine service inspections, technicians test and lubricate engines and other major components. In some cases, the technician may repair or replace worn parts before they cause breakdowns that could damage critical components of the vehicle. Technicians usually follow a checklist to ensure that they examine every critical part. Belts, hoses, plugs, brake and fuel systems, and other potentially troublesome items are among those closely watched.

Service technicians use a variety of tools in their work—power tools, such as pneumatic wrenches to remove bolts quickly; machine tools like lathes and grinding machines to rebuild brakes; welding and flame-cutting equipment to remove and repair exhaust systems, and jacks and hoists to lift cars and engines. They also use common hand tools, such as screwdrivers, pliers, and wrenches, to work on small parts and in hard-to-reach places.

Computers also have become commonplace in modern repair shops. Service technicians compare the readouts from computerized diagnostic testing devices with the benchmarked standards given by the manufacturer of the components being tested. Deviations outside of acceptable levels are an indication to the technician that further attention to an area is necessary. A shop's computerized system provides automatic updates to technical manuals and unlimited access to manufacturers' service information, technical service bulletins, and other databases that allow technicians to keep current on problem spots and to learn new procedures.

Automotive service technicians in large shops have increasingly become specialized. For example, *transmission technicians and rebuilders* work on gear trains, couplings, hydraulic pumps, and other parts of transmissions. Extensive knowledge of computer controls, the ability to diagnose electrical and hydraulic problems, and other specialized skills are needed to work on these complex components, which employ some of the most sophisticated technology used in vehicles. *Tuneup technicians* adjust the ignition timing and valves, and adjust or replace spark plugs and other parts to ensure efficient engine performance. They often use electronic testing equipment to isolate and adjust malfunctions in fuel, ignition, and emissions control systems.

Automotive air-conditioning repairers install and repair air-conditioners and service their components, such as compressors, condensers, and controls. These workers require special training in Federal and State regulations governing the handling and disposal of refrigerants. *Front-end mechanics* align and balance wheels and repair steering mechanisms and suspension systems. They frequently use special alignment equipment and wheel-balancing machines. *Brake repairers* adjust brakes, replace brake linings and pads, and make other repairs on brake systems. Some technicians specialize in both brake and front-end work. Even though electronics and electronic systems in automobiles were a specialty in the past, electronics are now so common that it is essential for all types of service technicians to be familiar with at least the basic principles of electronics.

Service technicians can specialize in several types of automotive repair, including brake repair.

Working Conditions

Nearly half of automotive service technicians work more than 40 hours a week. Some may also work evenings and weekends to satisfy customer service needs. Generally, service technicians work indoors in well-ventilated and -lighted repair shops. However, some shops are drafty and noisy. Although some problems can be fixed with simple computerized adjustments, technicians frequently work with dirty and greasy parts, and in awkward positions. They often lift heavy parts and tools. Minor cuts, burns, and bruises are common, but technicians can usually avoid serious accidents if the shop is kept clean and orderly, and safety practices are observed.

Training, Other Qualifications, and Advancement

Automotive technology is rapidly increasing in sophistication, and most training authorities strongly recommend that persons seeking automotive service technician and mechanic jobs complete a formal training program in high school, or in a postsecondary vocational school or community college. However, some service technicians still learn the trade solely by assisting and learning from experienced workers. Courses in automotive repair, electronics, physics, chemistry, English, computers, and mathematics provide a good educational background for a career as a service technician.

High school programs, while an asset, vary greatly in scope. Some aim to equip graduates with enough skills to get a job as a technician's helper or trainee technician. Other programs offer only an introduction to automotive technology and service for the future consumer or hobbyist. Some of the more extensive programs participate in Automotive Youth Education Service (AYES), which has about 500 participating schools and more than 4000 participating dealers. Students who complete these programs receive an AYES certification and upon high school graduation are better prepared to enter entry-level technician positions, or to advance their technical education.

Postsecondary automotive technician training programs vary greatly in format, but normally provide intensive career preparation through a combination of classroom instruction and hands-on practice. Some trade and technical school programs provide concentrated training for 6 months to a year, depending on how many hours the student attends each week, and award a certificate. Community college programs normally award an associate degree or certificate and usually spread the training over 2 years by supplementing the automotive training with instruction in English, basic mathematics,

computers, and other subjects. Some students earn repair certificates in one particular skill and opt to leave the program to begin their career before graduation. Recently, some programs have added to their curriculums training on employability skills such as customer service and stress management. Employers find that these skills help technicians handle the additional responsibilities of dealing with the customers and parts vendors.

The various automobile manufacturers and their participating dealers sponsor 2-year associate degree programs at postsecondary schools across the Nation. The Accrediting Commission of Career Schools and Colleges of Technology (ACCSC) currently certifies a number of automotive and diesel technology schools. Schools update their curriculums frequently to reflect changing technology and equipment. Students in these programs typically spend alternate 6- to 12-week periods attending classes full time and working full time in the service departments of sponsoring dealers. At these dealerships, students get practical experience while assigned to an experienced worker who provides hands-on instruction and timesaving tips.

The ASE certification is a nationally recognized standard for programs offered by high schools, postsecondary trade schools, technical institutes, and community colleges that train automobile service technicians. Some automotive manufacturers provide ASE-certified instruction programs with service equipment and current-model cars on which students practice new skills and learn the latest automotive technology. While ASE certification is voluntary, it does signify that the program meets uniform standards for instructional facilities, equipment, staff credentials, and curriculum. To ensure that programs keep up with ever-changing technology, repair techniques, and ASE standards, the certified programs are subjected to periodic compliance reviews and mandatory recertification, as are the ASE standards themselves. In 2004, about 2000 high school and postsecondary automotive service technician training programs had been certified by ASE.

For trainee automotive service technician jobs, employers look for people with strong communication and analytical skills. Technicians need good reading, mathematics, and computer skills to study technical manuals and to keep abreast of new technology and learn new service and repair procedures and specifications. Trainees also must possess mechanical aptitude and knowledge of how automobiles work. Most employers regard the successful completion of a vocational training program in automotive service technology as the best preparation for trainee positions. Experience working on motor vehicles in the Armed Forces or as a hobby also is valuable. Because of the complexity of new vehicles, a growing number of employers require completion of high school and additional postsecondary training.

Many new cars have several onboard computers, operating everything from the engine to the radio. Engine controls and dashboard instruments were among the first components to use electronics, but today most automotive systems, such as braking, transmission, and steering systems, are controlled primarily by computers and electronic components. Some of the more advanced vehicles have global positioning systems, Internet access, and other high-tech features integrated into the functions of the vehicle. The training in electronics is vital because electrical components, or a series of related components, account for nearly all malfunctions in modern vehicles.

In addition to electronics and computers, automotive service technicians will have to learn and understand the science behind the alternate-fuel vehicles that have begun to enter the market. The fuel for these vehicles will come from the dehydrogenization of water, electric fuel cells, natural gas, solar power, and other non-petroleum-based sources. Hybrid vehicles, for example, use the energy from braking to recharge batteries that power an electric motor, which supplements

a gasoline engine. As vehicles with these new technologies become more common, technicians will need additional training to learn the science and engineering that makes them possible. Currently, the manufacturers of these alternate-fuel vehicles are providing the necessary training. However, as the warranties begin to expire, technicians in all industries will need to be trained to service these vehicles. As the number of these automobiles on the road increases, some technicians will likely specialize in the service and repair of these vehicles.

Those new to automotive service usually start as trainee technicians, technicians' helpers, or lubrication workers, and gradually acquire and practice their skills by working with experienced mechanics and technicians. With a few months' experience, beginners perform many routine service tasks and make simple repairs. While some graduates of postsecondary automotive training programs are often able to earn promotion to the journey level after only a few months on the job, it typically takes 2 to 5 years of experience to become a journey level service technician, who is expected to quickly perform the more difficult types of routine service and repairs. An additional 1 to 2 years of experience familiarizes technicians with all types of repairs. Complex specialties, such as transmission repair, require another year or two of training and experience. In contrast, brake specialists may learn their jobs in considerably less time because they do not need a complete knowledge of automotive repair.

At work, the most important possessions of technicians are their hand tools. Technicians usually provide their own tools, and many experienced workers have thousands of dollars invested in them. Employers typically furnish expensive power tools, engine analyzers, and other diagnostic equipment, but technicians accumulate hand tools with experience. Some formal training programs have alliances with tool manufacturers that help entry-level technicians accumulate tools during their training period.

Employers increasingly send experienced automotive service technicians to manufacturer training centers to learn to repair new models or to receive special training in the repair of components, such as electronic fuel injection or air-conditioners. Motor vehicle dealers and other automotive service providers also may send promising beginners to manufacturer-sponsored technician training programs; most employers periodically send experienced technicians to manufacturer-sponsored technician training programs for additional training to maintain or upgrade employees' skills and thus increase the employees' value to the employer. Factory representatives also visit many shops to conduct short training sessions.

Voluntary certification by the National Institute for Automotive Service Excellence (ASE) has become a standard credential for automotive service technicians. Certification is available in 1 or more of 8 different areas of automotive service, such as electrical systems, engine repair, brake systems, suspension and steering, and heating and air-conditioning. For certification in each area, technicians must have at least 2 years of experience and pass the examination. Completion of an automotive training program in high school, vocational or trade school, or community or junior college may be substituted for 1 year of experience. For ASE certification as a master automobile technician, technicians must be certified in all eight areas. Technicians must retake each examination once every 5 years to maintain their certifications.

Experienced technicians who have leadership ability sometimes advance to shop supervisor or service manager. Those who work well with customers may become automotive repair service estimators. Some with sufficient funds open independent repair shops.

Employment

Automotive service technicians and mechanics held about 803,000 jobs in 2004. The majority worked for automotive repair and maintenance shops, automobile dealers, and retailers and wholesalers of automotive parts, accessories, and supplies. Others found

employment in gasoline stations; home and auto supply stores; automotive equipment rental and leasing companies; Federal, State, and local governments; and other organizations. More than 16 percent of service technicians were self-employed, more than twice the proportion for all installation, maintenance, and repair occupations.

Job Outlook

Job opportunities in this occupation are expected to be very good for persons who complete automotive training programs in high school, vocational and technical schools, or community colleges as employers report difficulty in finding workers with the right skills. Persons with good diagnostic and problem-solving abilities, and whose training includes basic electronics and computer courses, should have the best opportunities. For well-prepared people with a technical background, automotive service technician careers offer an excellent opportunity for good pay and the satisfaction of highly skilled work with vehicles incorporating the latest in advanced technology. However, persons without formal automotive training are likely to face competition for entry-level jobs.

Employment of automotive service technicians and mechanics is expected to increase as fast as the average through the year 2014. Over the 2004-14 period, demand for technicians will grow as the number of vehicles in operation increases, reflecting continued growth in the number of multi-car families. Growth in demand will be offset somewhat by slowing population growth and the continuing increase in the quality and durability of automobiles, which will require less frequent service. Additional job openings will be due to the need to replace a growing number of retiring technicians, who tend to be the most experienced workers.

Most persons who enter the occupation can expect steady work, even through downturns in the economy. While car owners may postpone maintenance and repair on their vehicles when their budgets become strained, and employers of automotive technicians may cut-back hiring new workers, changes in economic conditions generally have minor effects on the automotive service and repair business.

Employment growth will continue to be concentrated in automobile dealerships and independent automotive repair shops. Many new jobs also will be created in small retail operations that offer after-warranty repairs, such as oil changes, brake repair, air-conditioner service, and other minor repairs generally taking less than 4 hours to complete. Employment of automotive service technicians and mechanics in gasoline service stations will continue to decline, as fewer stations offer repair services.

Earnings

Median hourly earnings of automotive service technicians and mechanics, including commission, were \$15.60 in May 2004. The middle 50 percent earned between \$11.31 and \$20.75 per hour. The lowest 10 percent earned less than \$8.70, and the highest 10 percent earned more than \$26.22 per hour. Median annual earnings in the industries employing the largest numbers of service technicians in May 2004 were as follows:

Local government	\$38,160
Automobile dealers	38,060
Automotive repair and maintenance	28,810
Gasoline stations	28,030
Automotive parts, accessories, and tire stores	27,180

Many experienced technicians employed by automobile dealers and independent repair shops receive a commission related to the labor cost charged to the customer. Under this method, weekly earnings depend on the amount of work completed. Employers frequently guarantee commissioned technicians a minimum weekly salary.

Some automotive service technicians are members of labor unions such as the International Association of Machinists and Aerospace Workers; the International Union, United Automobile, Aerospace and Agricultural Implement Workers of America; the Sheet Metal Workers' International Association; and the International Brotherhood of Teamsters.

Related Occupations

Other workers who repair and service motor vehicles include automotive body and related repairers, diesel service technicians and mechanics, and small engine mechanics.

Sources of Additional Information

For more details about work opportunities, contact local automobile dealers and repair shops or local offices of the State employment service. The State employment service also may have information about training programs.

Diesel Service Technicians and Mechanics

(O*NET 49-3031.00)

Significant Points

- A career as a diesel service technician or mechanic can offer relatively high wages and the challenge of skilled repair work.
- Opportunities are expected to be very good for persons who complete formal training programs.
- National certification is the recognized standard of achievement for diesel service technicians and mechanics.

Nature of the Work

The diesel engine is the workhorse powering the Nation's trucks and buses because it delivers more power, is more efficient, and is more durable than its gasoline-burning counterpart. Diesel-powered engines also are becoming more prevalent in light vehicles, including passenger vehicles, pickups, and other work trucks.

Diesel service technicians and mechanics, which includes *bus and truck mechanics* and *diesel engine specialists*, repair and maintain the diesel engines that power transportation equipment such as heavy trucks, buses, and locomotives. Some diesel technicians and mechanics also work on heavy vehicles and mobile equipment, including bulldozers, cranes, road graders, farm tractors, and combines. Other technicians repair diesel-powered passenger automobiles, light trucks, or boats. (For information on technicians and mechanics working primarily on gasoline-powered automobiles, heavy vehicles, mobile equipment, or boats, see the *Handbook* sections on automotive, heavy vehicle, and mobile equipment; and small engine service mechanics.

Technicians who work for organizations that maintain their own vehicles spend most of their time doing preventive maintenance, to ensure that equipment will operate safely. These workers also eliminate unnecessary wear on, and damage to, parts that could result in costly breakdowns. During a routine maintenance check on a vehicle, technicians follow a checklist that includes inspecting brake systems, steering mechanisms, wheel bearings, and other important parts. Following inspection, technicians repair or adjust parts that do not work properly or remove and replace parts that cannot be fixed.

Increasingly, technicians must be versatile, in order to adapt to customers' needs and new technologies. It is common for technicians to handle all kinds of repairs, from working on a vehicle's electrical system one day to doing major engine repairs the next. Diesel maintenance is becoming increasingly complex, as more electronic components are used to control the operation of an engine. For example, microprocessors now regulate and manage fuel timing, increasing the engine's efficiency. Also, new emissions standards are requiring mechanics to retrofit engines to comply with pollution regulations. In modern shops, diesel service technicians use hand-held or laptop computers to diagnose problems and adjust engine functions. Because of continual advances in automotive technology, technicians must regularly learn new techniques to repair vehicles.

Diesel service technicians use a variety of tools in their work, including power tools, such as pneumatic wrenches, to remove

Diesel technicians perform regular maintenance on engine parts to prevent unnecessary wear and save money on costly repairs.

bolts quickly; machine tools, such as lathes and grinding machines, to rebuild brakes; welding and flame-cutting equipment, to remove and repair exhaust systems; and jacks and hoists, to lift and move large parts. Common handtools—screwdrivers, pliers, and wrenches—are used to work on small parts and get at hard-to-reach places. Diesel service technicians and mechanics also use a variety of computerized testing equipment to pinpoint and analyze malfunctions in electrical systems and engines.

In large shops, technicians generally receive their assignments from shop supervisors or service managers. Most supervisors and managers are experienced technicians who also assist in diagnosing problems and maintaining quality standards. Technicians may work as a team or be assisted by an apprentice or helper when doing heavy work, such as removing engines and transmissions.

Working Conditions

Diesel technicians usually work indoors, although they occasionally make repairs to vehicles on the road. Diesel technicians may lift heavy parts and tools, handle greasy and dirty parts, and stand or lie in awkward positions to repair vehicles and equipment. Minor cuts, burns, and bruises are common, although serious accidents can usually be avoided if the shop is kept clean and orderly and if safety procedures are followed. Technicians normally work in well-lighted, heated, and ventilated areas; however, some shops are drafty and noisy. Many employers provide lockers and shower facilities.

Training, Other Qualifications, and Advancement

Although many persons qualify for diesel service technician and mechanic jobs through years of on-the-job training, authorities on diesel engines recommend the completion of a formal diesel engine training program. Employers prefer to hire graduates of formal training programs because those workers often have a head start in training and are able to advance quickly to the journey level of diesel service.

Many community colleges and trade and vocational schools offer programs in diesel repair. These programs, lasting 6 months to 2 years, lead to a certificate of completion or an associate degree. Programs vary in the degree of hands-on training they provide on equipment. Some offer about 30 hours per week on equipment, whereas others offer more lab or classroom instruction. Training provides a foundation in the latest diesel technology and instruction in the service and repair of the vehicles and equipment that technicians will encounter on the job. Training programs also improve the skills needed to interpret technical manuals and to communicate with coworkers and customers. In addition to the hands-on aspects of the training, many institutions teach communication skills, customer service, basic understanding of physics, and logical thought. Increasingly, employers work closely with representatives of training programs, providing instructors with the latest equipment, techniques, and tools and offering jobs to graduates.

Whereas most employers prefer to hire persons who have completed formal training programs, some technicians and mechanics continue to learn their skills on the job. Unskilled beginners generally are assigned tasks such as cleaning parts, fueling and lubricating vehicles, and driving vehicles into and out of the shop. Beginners usually are promoted to trainee positions as they gain experience and as vacancies become available. In some shops, beginners with experience in automobile service start as trainee technicians.

After a few months' experience, most trainees can perform routine service tasks and make minor repairs. These workers advance to increasingly difficult jobs as they prove their ability and competence. After technicians master the repair and service of diesel engines, they learn to work on related components, such as brakes, transmissions,

and electrical systems. Generally, technicians with at least 3 to 4 years of on-the-job experience will qualify as journey-level diesel technicians. The completion of a formal training program speeds advancement to the journey level.

For unskilled entry-level jobs, employers usually look for applicants who have mechanical aptitude and strong problem-solving skills and who are at least 18 years of age and in good physical condition. Nearly all employers require the completion of high school. Courses in automotive repair, electronics, English, mathematics, and physics provide a strong educational background for a career as a diesel service technician or mechanic. Technicians need a State commercial driver's license to test-drive trucks or buses on public roads. Many companies also require applicants to pass a drug test. Practical experience in automobile repair at an automotive service station, in the Armed Forces, or as a hobby is valuable as well.

Employers often send experienced technicians and mechanics to special training classes conducted by manufacturers and vendors, in which workers learn the latest technology and repair techniques. Technicians constantly receive updated technical manuals and instructions outlining changes in techniques and standards for repair. It is essential for technicians to read, interpret, and comprehend service manuals in order to keep abreast of engineering changes.

Voluntary certification by the National Institute for Automotive Service Excellence (ASE) is the recognized industry credential for diesel service technicians and mechanics. Diesel service technicians may be certified as master medium/heavy truck technicians, master school bus technicians, or master truck equipment technicians. They may also be ASE-certified in specific areas of truck repair, such as gasoline engines, drivetrains, brakes, suspension and steering, electrical and electronic systems, or preventive maintenance and inspection.

For certification in each area, a technician must pass one or more of the ASE-administered exams and present proof of 2 years of relevant hands-on work experience. Two years of relevant formal training from a high school, vocational or trade school, or community or junior college program may be substituted for up to 1 year of the work experience requirement. To remain certified, technicians must be retested every 5 years. Retesting ensures that service technicians and mechanics keep up with changing technology.

The most important work possessions of technicians and mechanics are their handtools. Technicians usually provide their own tools, and many experienced workers have thousands of dollars invested in them. Employers typically furnish expensive power tools, computerized engine analyzers, and other diagnostic equipment, but individual workers ordinarily accumulate their own hand tools with experience.

Experienced diesel service technicians and mechanics with leadership ability may advance to shop supervisor or service manager. Technicians and mechanics with sales ability sometimes become sales representatives. Some open their own repair shops.

Employment

Diesel service technicians and mechanics held about 270,000 jobs in 2004. They were employed by almost every industry; in particular, those that use trucks, buses, and equipment to haul, deliver, and transport materials, goods, and people. The largest employer, the truck transportation industry, employed nearly one out of six diesel service technicians and mechanics. Slightly fewer were employed by local governments, mainly to repair school buses, waste removal trucks, and road equipment. About 1 out of 10 was employed by automotive and commercial equipment repair and maintenance facilities. The rest were employed throughout the economy, including construction, manufacturing, retail and wholesale trade, and automotive leasing. A relatively small number

were self-employed. Nearly every section of the country employs diesel service technicians and mechanics, although most work in towns and cities where trucking companies, bus lines, and other fleet owners have large operations.

Job Outlook

Employment of diesel service technicians and mechanics is expected to increase about as fast as the average for all occupations through the year 2014. Besides openings resulting from employment growth, opportunities will be created by the need to replace workers who retire or transfer to other occupations.

Employment of diesel service technicians and mechanics is expected to grow as freight transportation by truck increases. Additional trucks will be needed to keep pace with the increasing volume of freight shipped nationwide. Trucks also serve as intermediaries for other forms of transportation, such as rail and air. Due to the greater durability and economy of the diesel engine relative to the gasoline engine, the number of buses, trucks, and passenger vehicles that are powered by diesel engines is expected to increase.

While diesel engines are a more efficient and powerful option, diesel engines tend to produce more pollutants than gasoline-powered engines. As governments have applied emissions-lowering standards to diesel engines, many older diesel engines must be retrofitted to comply. These new emissions control systems, such as emissions filters and catalysts, may create additional jobs for diesel service technicians and mechanics.

Careers as diesel service technicians attract many because they offer relatively high wages and the challenge of skilled repair work. Opportunities should be very good for persons who complete formal training in diesel mechanics at community and junior colleges or vocational and technical schools. Applicants without formal training may face stiffer competition for entry-level jobs.

Most persons entering this occupation can expect relatively steady work, because changes in economic conditions have less of an effect on the diesel repair business than on other sectors of the economy. During a downturn in the economy, however, some employers may lay off workers or be reluctant to hire new workers.

Earnings

Median hourly earnings of bus and truck mechanics and diesel engine specialists, including incentive pay, were \$17.20 in May 2004. The middle 50 percent earned between \$13.73 and \$21.13 an hour. The lowest 10 percent earned less than \$11.19, and the highest 10 percent earned more than \$25.67 an hour. Median hourly earnings in the industries employing the largest numbers of bus and truck mechanics and diesel engine specialists in May 2004 were as follows:

Local government, excluding schools.....	\$20.18
Motor vehicle and motor vehicle parts and supplies merchant wholesalers	17.97
Automotive repair and maintenance	16.65
General freight trucking	16.33
Elementary and secondary schools	15.73

Because many experienced technicians employed by truck fleet dealers and independent repair shops receive a commission related to the labor cost charged to the customer, weekly earnings depend on the amount of work completed. Beginners usually earn from 50 to 75 percent of the rate of skilled workers and receive increases as they become more skilled.

The majority of service technicians work a standard 40-hour week, although some work longer hours, particularly if they are self-employed. A growing number of shops have expanded their hours, either to perform repairs and routine service in a more timely fashion

or as a convenience to customers. Those technicians employed by truck and bus firms providing service around the clock may work evenings, nights, and weekends, usually at a higher rate of pay than those working traditional hours.

Many diesel service technicians and mechanics are members of labor unions, including the International Association of Machinists and Aerospace Workers; the Amalgamated Transit Union; the International Union, United Automobile, Aerospace and Agricultural Implement Workers of America; the Transport Workers Union of America; the Sheet Metal Workers' International Association; and the International Brotherhood of Teamsters.

Related Occupations

Diesel service technicians and mechanics repair trucks, buses, and other diesel-powered equipment. Related technician and mechanic occupations include aircraft and avionics equipment mechanics and service technicians, automotive service technicians and mechanics, heavy vehicle and mobile equipment service technicians and mechanics, and small engine mechanics.

Sources of Additional Information

More details about work opportunities for diesel service technicians and mechanics may be obtained from local employers such as trucking companies, truck dealers, or buslines; locals of the unions previously mentioned; and local offices of your State employment service. Local State employment service offices also may have information about training programs. State boards of postsecondary career schools have information on licensed schools with training programs for diesel service technicians and mechanics.

For general information about a career as a diesel service technician or mechanic, write:

► Association of Diesel Specialists, 10 Laboratory Dr., PO Box 13966, Research Triangle Park, NC 27709. Internet: <http://www.diesel.org>

Information on how to become a certified diesel technician of medium to heavy-duty vehicles or a certified bus technician is available from:

► National Institute for Automotive Service Excellence (ASE), 101 Blue Seal Dr. SE, Suite 101, Leesburg, VA 20175. Internet: <http://www.asecert.org>

Heavy Vehicle and Mobile Equipment Service Technicians and Mechanics

(O*NET 49-3041.00, 49-3042.00, 49-3043.00)

Significant Points

- Opportunities should be good for persons with formal postsecondary training in diesel or heavy equipment mechanics, especially if they also have training in basic electronics and hydraulics.
- This occupation offers relatively high wages and the challenge of skilled repair work.
- Skill in using computerized diagnostic equipment is important in this occupation.

Nature of the Work

Heavy vehicles and mobile equipment are indispensable to many industrial activities, from construction to railroads. Various types of equipment move materials, till land, lift beams, and dig earth to pave the way for development and production. *Heavy vehicle and mobile equipment service technicians and mechanics* repair and maintain engines and hydraulic, transmission, and electrical systems powering farm machinery, cranes, bulldozers, and railcars, for example. (For more detailed information on service technicians specializing in diesel engines, see the section on diesel service technicians and mechanics elsewhere in the *Handbook*.)

Service technicians perform routine maintenance checks on diesel engines and on fuel, brake, and transmission systems to ensure peak performance, safety, and longevity of the equipment. Maintenance checks and comments from equipment operators usually alert technicians to problems. With many types of modern heavy and mobile equipment, technicians can plug diagnostic computers into onboard computers to diagnose a component needing adjustment or repair. After locating the problem, these technicians rely on their training and experience to use the best possible technique to solve the problem. If necessary, they may partially dismantle the component to examine parts for damage or excessive wear. Then, using hand-held tools, they repair, replace, clean, and lubricate parts as necessary. In some cases, technicians calibrate systems by typing codes into the onboard computer. After reassembling the component and testing it for safety, they put it back into the equipment and return the equipment to the field.

Many types of heavy and mobile equipment use hydraulics, to raise and lower movable parts. When hydraulic components malfunction, technicians examine them for fluid leaks, ruptured hoses, or worn gaskets on fluid reservoirs. Occasionally, the equipment requires extensive repairs, as when a defective hydraulic pump needs replacing.

In addition to conducting routine maintenance checks, service technicians perform a variety of other repairs. They diagnose electrical problems and adjust or replace defective components. They also disassemble and repair undercarriages and track assemblies. Occasionally, technicians weld broken equipment frames and structural parts, using electric or gas welders.

It is common for technicians in large shops to specialize in one or two types of repair. For example, a shop may have individual specialists in major engine repair, transmission work, electrical systems, and suspension or brake systems. Technicians in smaller shops, on the other hand, generally perform multiple functions.

The technology used in heavy equipment is becoming more sophisticated with the increased use of electronic and computer-controlled components that run much of the equipment's functions. These onboard computers are accessed using other computers and electronic devices that are manipulated by the technician. As a result, technicians need training in electronics and the use of hand-held diagnostic computers to make engine adjustments and diagnose problems.

Service technicians use a variety of tools in their work: power tools, such as pneumatic wrenches to remove bolts quickly; machine tools, like lathes and grinding machines, to rebuild brakes; welding and flame-cutting equipment to remove and repair exhaust systems; and jacks and hoists to lift and move large parts. Service technicians also use common handtools—screwdrivers, pliers, and wrenches—to work on small parts and to get at hard-to-reach places. They may use a variety of computerized testing equipment to pinpoint and analyze malfunctions in electrical systems and other essential systems. Tachometers and dynamometers, for example, serve to locate engine malfunctions. Service technicians also use ohmmeters, ammeters, and voltmeters when working on electrical systems.

Mobile heavy equipment mechanics and service technicians keep construction and surface mining equipment, such as bulldozers, cranes, crawlers, draglines, graders, excavators, and other equipment,

in working order. Typically, these workers are employed by equipment wholesale distribution and leasing firms, large construction and mining companies, local and Federal governments, and other organizations operating and maintaining heavy machinery and equipment fleets. Service technicians employed by the Federal Government may work on tanks and other armored equipment.

Farm equipment mechanics service, maintain, and repair farm equipment, as well as smaller lawn and garden tractors sold to suburban homeowners. What typically was a general repairer's job around the farm has evolved into a specialized technical career. Farmers have increasingly turned to farm equipment dealers to service and repair their equipment because the machinery has grown in complexity. Modern equipment uses more computers, electronics and hydraulics, making it difficult to perform repairs without some specialized training.

Railcar repairers specialize in servicing railroad locomotives and other rolling stock, streetcars and subway cars, or mine cars. Most work for railroads, public and private transit companies, and railcar manufacturers.

Working Conditions

Heavy vehicle and mobile equipment service technicians usually work indoors, although if repairs are needed urgently, or the machinery cannot be moved to a shop, many technicians make repairs at the worksite. To repair vehicles and equipment, technicians often lift heavy parts and tools, handle greasy and dirty parts, and stand or lie in awkward positions. Minor cuts, burns, and bruises are common; serious accidents normally are avoided when the shop is kept clean and orderly and when safety practices are observed. Technicians usually work in well-lighted, heated, and ventilated areas. However, some shops are drafty and noisy. Many employers provide uniforms, locker rooms, and shower facilities.

When heavy or mobile equipment breaks down at a construction site, it may be too difficult or expensive to bring into a repair shop, so the shop will send a field service technician to the site to make repairs. Field service technicians work outdoors and spend much of their time away from the shop. Generally, the more experienced

service technicians specialize in field service. They usually drive trucks specially equipped with replacement parts and tools. On occasion, they must travel many miles to reach disabled machinery. Field technicians normally earn a higher wage than their counterparts, because they are required to make on-the-spot decisions that are necessary to serve their customers.

The hours of work for farm equipment mechanics vary according to the season of the year. During the busy planting and harvesting seasons, mechanics often work 6 or 7 days a week, 10 to 12 hours daily. In slow winter months, however, mechanics may work fewer than 40 hours a week.

Training, Other Qualifications, and Advancement

Many persons qualify for service technician jobs through years of on-the-job training, but most employers prefer that applicants complete a formal diesel or heavy equipment mechanic training program after graduating from high school. They seek persons with mechanical aptitude who are knowledgeable about the fundamentals of diesel engines, transmissions, electrical systems, computers, and hydraulics. In addition, the constant change in equipment technology makes it necessary for technicians to be flexible and have the capacity to learn new skills quickly.

Many community colleges and vocational schools offer programs in diesel technology. Some tailor programs to heavy equipment mechanics. These programs educate the student in the basics of analytical and diagnostic techniques, electronics, and hydraulics. The increased use of electronics and computers makes training in the fundamentals of electronics essential for new heavy and mobile equipment mechanics. Some 1- to 2-year programs lead to a certificate of completion, whereas others lead to an associate degree in diesel or heavy equipment mechanics. These programs not only provide a foundation in the components of diesel and heavy equipment technology, but also enable trainee technicians to advance to the journey, or experienced worker, level sooner than would otherwise be possible.

A combination of formal and on-the-job training prepares trainee technicians with the knowledge to service and repair equipment typically seen by a shop. After a few months' experience, most beginners perform routine service tasks and make minor repairs. As they prove their ability and competence, they advance to harder jobs. After trainees master the repair and service of diesel engines, they learn to work on related components, such as brakes, transmissions, and electrical systems. Generally, a service technician with at least 3 to 4 years of on-the-job experience is accepted as fully qualified.

Many employers send trainee technicians to training sessions conducted by heavy equipment manufacturers. The sessions, which typically last up to 1 week, provide intensive instruction in the repair of the manufacturer's equipment. Some sessions focus on particular components found in the equipment, such as diesel engines, transmissions, axles, and electrical systems. Other sessions focus on particular types of equipment, such as crawler-loaders and crawler-dozers. As they progress, trainees may periodically attend additional training sessions. When appropriate, experienced technicians attend training sessions to gain familiarity with new technology or equipment.

High school courses in automobile repair, physics, chemistry, and mathematics provide a strong foundation for a career as a service technician or mechanic. It is also essential for technicians to be able to read and interpret service manuals in order to keep abreast of engineering changes. Experience working on diesel engines and heavy equipment acquired in the Armed Forces is valuable as well.

Voluntary certification by the National Institute for Automotive Service Excellence is the recognized industry credential for

On-the-job repairs are usually done by the most experienced heavy vehicle technicians.

heavy vehicle and mobile equipment service technicians, who may be certified as a master medium/heavy truck technician or in a specific area of heavy-duty equipment repair, such as brakes, gasoline engines, diesel engines, drivetrains, electrical systems, or suspension and steering. For certification in each area, technicians must pass a written examination and have at least 2 years' experience. High school, vocational or trade school, or community or junior college training in gasoline or diesel engine repair may substitute for up to 1 year's experience. To remain certified, technicians must be retested every 5 years. Retesting ensures that service technicians keep up with changing technology. However, ASE currently offers no certification programs for more advanced heavy vehicle and mobile equipment repair specialties.

The most important work possessions of technicians are their handtools. Service technicians typically buy their own handtools, and many experienced technicians have thousands of dollars invested in them. Employers typically furnish expensive power tools, computerized engine analyzers, and other diagnostic equipment, but handtools are normally accumulated with experience.

Experienced technicians may advance to field service jobs, wherein they have a greater opportunity to tackle problems independently and earn additional pay. Field positions may require a commercial driver's license and a clean driving record. Technicians with leadership ability may become shop supervisors or service managers. Some technicians open their own repair shops or invest in a franchise.

Employment

Heavy vehicle and mobile equipment service technicians and mechanics held about 178,000 jobs in 2004. Approximately 125,000 were mobile heavy equipment mechanics, 33,000 were farm equipment mechanics, and 20,000 were railcar repairers. About 30 percent were employed by machinery, equipment, and supplies merchant wholesalers. More than 13 percent worked in construction, primarily for specialty trade contractors and highway, street, and bridge construction companies; another 12 percent were employed by Federal, State, and local governments. Other service technicians worked in agriculture; mining; rail transportation and support activities; and commercial and industrial machinery and equipment rental, leasing, and repair. A small number repaired equipment for machinery and railroad rolling stock manufacturers or lawn and garden equipment and supplies stores. Less than 4 percent of service technicians were self-employed.

Nearly every section of the country employs heavy and mobile equipment service technicians and mechanics, although most work in towns and cities where equipment dealers, equipment rental and leasing companies, and construction companies have repair facilities.

Job Outlook

Opportunities for heavy vehicle and mobile equipment service technicians and mechanics should be good for those who have completed formal training programs in diesel or heavy equipment mechanics. Persons without formal training are expected to encounter growing difficulty entering these jobs.

Employment of heavy vehicle and mobile equipment service technicians and mechanics is expected to grow slower than the average for all occupations through the year 2014. Most job openings will arise from the need to replace experienced repairers who retire. Employers report difficulty finding candidates with formal postsecondary training to fill available service technician positions, because many young people with mechanic training

and experience opt to take jobs as automotive service technicians, diesel service technicians, or industrial machinery repairers—jobs that offer more openings and a wider variety of locations in which to work.

Faster employment growth is expected for mobile heavy equipment mechanics than for farm equipment mechanics or railcar repairers. Increasing numbers of heavy duty and mobile equipment service technicians will be required to support growth in the construction industry, equipment dealers, and rental and leasing companies. Because of the nature of construction activity, demand for service technicians follows the Nation's economic cycle. As the economy expands, construction activity increases, resulting in the use of more mobile heavy equipment to grade construction sites, excavate basements, and lay water and sewer lines. The increased use of such equipment increases the need for periodic service and repair. In addition, the construction and repair of highways and bridges requires more technicians to service equipment. As equipment becomes more complicated, repairs increasingly must be made by specially trained technicians. Job openings for farm equipment mechanics and railcar repairers are expected to arise mostly because of replacement needs.

Construction and mining are particularly sensitive to changes in the level of economic activity; therefore, heavy and mobile equipment may be idled during downturns. In addition, winter is traditionally the slow season for construction and farming activity, particularly in cold regions. During periods when equipment is used less, few technicians may be needed, and employers may be reluctant to hire inexperienced workers. However, employers usually try to retain experienced workers during these slow periods.

Earnings

Median hourly earnings of mobile heavy equipment mechanics were \$18.34 in May 2004. The middle 50 percent earned between \$14.96 and \$21.75. The lowest 10 percent earned less than \$12.11, and the highest 10 percent earned more than \$26.27. Median hourly earnings in the industries employing the largest numbers of mobile heavy equipment mechanics in May 2004 were as follows:

Federal Government.....	\$20.41
Local government	19.22
Machinery, equipment, and supplies merchant wholesalers	18.49
Other specialty trade contractors	17.81
Highway, street, and bridge construction.....	17.79

Median hourly earnings of farm equipment mechanics were \$13.40 in May 2004. The middle 50 percent earned between \$10.77 and \$16.34. The lowest 10 percent earned less than \$9.08, and the highest 10 percent earned more than \$19.40. In May 2004, median hourly earnings were \$13.66 in machinery, equipment, and supplies merchant wholesalers, the industry employing the largest number of farm equipment mechanics.

Median hourly earnings of railcar repairers were \$19.48 in May 2004. The middle 50 percent earned between \$16.12 and \$21.76. The lowest 10 percent earned less than \$12.07, and the highest 10 percent earned more than \$25.52. In May 2004, median hourly earnings were \$20.38 in rail transportation, the industry employing the largest number of railcar repairers.

Many heavy vehicle and mobile equipment service technicians and mechanics are members of unions, including the International Association of Machinists and Aerospace Workers, the International Union of Operating Engineers, and the International Brotherhood of Teamsters.

Related Occupations

Workers in related repair occupations include aircraft and avionics equipment mechanics and service technicians; automotive service technicians and mechanics; diesel service technicians and mechanics; industrial machinery mechanics and maintenance workers; and small engine mechanics.

Sources of Additional Information

More details about job openings for heavy vehicle and mobile equipment service technicians and mechanics may be obtained from local heavy and mobile equipment dealers and distributors, construction contractors, and government agencies. Local offices of the State employment service also may have information on job openings and training programs.

Small Engine Mechanics

(O*NET 49-3051.00, 49-3052.00, 49-3053.00)

Significant Points

- Employment is expected to grow as fast as the average for all occupations, and persons with formal training as a mechanic should enjoy good job prospects.
- Use of motorcycles, motorboats, and outdoor power equipment is seasonal in many areas, so mechanics may service other types of equipment or work reduced hours in the winter.

Nature of the Work

Small engines powering motorcycles, motorboats, and outdoor power equipment share many characteristics with their larger counterparts, including breakdowns. Small engine mechanics repair and service power equipment ranging from racing motorcycles to chain saws. Mechanics usually specialize in the service and repair of one type of equipment, although they may work on closely related products.

Motorcycle mechanics repair and overhaul motorcycles, motor scooters, mopeds, dirt bikes, and all-terrain vehicles. Besides repairing engines, they may work on transmissions, brakes, and ignition systems and make minor body repairs. Mechanics often service just a few makes and models of motorcycles, because most work for dealers that service only the products they sell.

Motorboat mechanics, or *marine equipment mechanics*, repair and adjust the electrical and mechanical equipment of inboard and outboard boat engines. Most small boats have portable outboard engines that are removed and brought into the repair shop. Larger craft, such as cabin cruisers and commercial fishing boats, are powered by diesel or gasoline inboard or inboard-outboard engines, which are removed only for major overhauls. Most of these repairs are performed at the docks or marinas. Motorboat mechanics also

may work on propellers, steering mechanisms, marine plumbing, and other boat equipment.

Outdoor power equipment and other small engine mechanics service and repair outdoor power equipment, such as lawnmowers, garden tractors, edge trimmers, and chain saws. They also may occasionally work on portable generators and go-carts. In addition, small engine mechanics in certain parts of the country may work on snowblowers and snowmobiles, but demand for this type of repair is both seasonal and regional.

Like large engines, small engines require periodic service to minimize the chance of breakdowns and to keep them operating at peak performance. During routine equipment maintenance, mechanics follow a checklist that includes the inspection and cleaning of brakes, electrical systems, fuel injection systems, plugs, carburetors, and other parts. Following inspection, mechanics usually repair or adjust parts that do not work properly or replace unfixable parts. Routine maintenance is normally a major part of the mechanic's work.

When a piece of equipment breaks down, mechanics use various techniques to diagnose the source and extent of the problem. The mark of a skilled mechanic is the ability to diagnose mechanical, fuel, and electrical problems and to make repairs in a minimal amount of time. Quick and accurate diagnosis requires problem-solving ability and a thorough knowledge of the equipment's operation.

In larger repair shops, mechanics may use special computerized diagnostic testing equipment as a preliminary tool in analyzing equipment. This computerized equipment provides a systematic performance report of various components to compare against normal ratings. After pinpointing the problem, the mechanic makes the needed adjustments, repairs, or replacements. Some jobs require minor adjustments or the replacement of a single item, while a complete engine overhaul requires a number of hours to disassemble the engine and replace worn valves, pistons, bearings, and other internal parts.

Small engine mechanics use common handtools, such as wrenches, pliers, and screwdrivers. They also utilize power tools,

Routine maintenance is a major part of a small engine mechanic's job.

such as drills and grinders, when customized repairs warrant their use. Computerized engine analyzers, compression gauges, ammeters and voltmeters, and other testing devices help mechanics locate faulty parts and tune engines. Some highly skilled mechanics use specialized components and the latest computerized equipment to customize and tune motorcycles and motorboats for racing.

Working Conditions

Small engine mechanics usually work in repair shops that are well lighted and ventilated, but are sometimes noisy when engines are tested. Motorboat mechanics may work outdoors at docks or marinas, as well as in all weather conditions, when making repairs aboard boats. They may work in cramped or awkward positions to reach a boat's engine.

During the winter months in the northern United States, mechanics may work fewer than 40 hours a week, because the amount of repair and service work declines when lawnmowers, motorboats, and motorcycles are not in use. Many mechanics work only during the busy spring and summer seasons. However, many schedule time-consuming engine overhauls or work on snowmobiles and snowblowers during winter downtime. Mechanics may work considerably more than 40 hours a week when demand is strong.

Training, Other Qualifications, and Advancement

Due to the increasing complexity of motorcycles and motorboats, most employers prefer to hire mechanics who have graduated from formal training programs for small engine mechanics. Because the number of these specialized postsecondary programs is limited, most mechanics learn their skills on the job or while working in related occupations. For trainee jobs, employers hire persons with mechanical aptitude who are knowledgeable about the fundamentals of small two- and four-stroke engines. Many trainees develop an interest in mechanics and acquire some basic skills through working on automobiles, motorcycles, motorboats, or outdoor power equipment as a hobby. Others may be introduced to mechanics through vocational automotive training in high school or one of many postsecondary institutions.

Trainees learn routine service tasks under the guidance of experienced mechanics by replacing ignition points and spark plugs or by taking apart, assembling, and testing new equipment. As they gain experience and proficiency, trainees progress to more difficult tasks, such as advanced computerized diagnosis and engine overhauls. Anywhere from 3 to 5 years of on-the-job training may be necessary before a novice worker becomes competent in all aspects of the repair of motorcycle and motorboat engines.

Employers often send mechanics and trainees to special courses conducted by motorcycle, motorboat, and outdoor power equipment manufacturers or distributors. These courses, which last as long as 2 weeks, upgrade workers' skills and provide information on repairing new models. They also may be used as a refresher for employees. They are usually a prerequisite for any mechanic who performs warranty work for manufacturers or insurance companies.

Most employers prefer to hire high school graduates for trainee mechanic positions, but will accept applicants with less education if they possess adequate reading, writing, and arithmetic skills. Many equipment dealers employ students part time and during the summer to help assemble new equipment and perform minor repairs. Helpful high school courses include small engine repair, automobile mechanics, science, and business arithmetic.

Knowledge of basic electronics is essential for small engine mechanics, because electronic components control an engine's

performance, the vehicle's instrument displays, and a variety of other functions of motorcycles, motorboats, and outdoor power equipment.

The most important work possessions of mechanics are their handtools. Mechanics usually provide their own tools, and many experienced mechanics have invested thousands of dollars in them. Employers typically furnish expensive power tools, computerized engine analyzers, and other diagnostic equipment, but mechanics accumulate handtools with experience.

The skills used as a small engine mechanic generally transfer to other occupations, such as automobile, diesel, or heavy vehicle and mobile equipment mechanics. Experienced mechanics with leadership ability may advance to shop supervisor or service manager jobs. Mechanics with sales ability sometimes become sales representatives or open their own repair shops.

Employment

Small engine mechanics held about 73,000 jobs in 2004. Motorcycle mechanics held around 19,000 jobs. Motorboat mechanics held approximately 23,000 and outdoor power equipment and other small engine mechanics about 31,000. Almost half worked for other motor vehicle dealers, an industry that includes retail dealers of motorcycles, boats, and miscellaneous vehicles; or for retail hardware, lawn, and garden stores. Most of the remainder were employed by independent repair shops, marinas and boatyards, equipment rental companies, wholesale distributors, and landscaping services. About 20 percent were self-employed, compared to about 7 percent of workers in all installation, maintenance, and repair occupations.

Job Outlook

Employment of small engine mechanics is expected to grow about as fast as the average for all occupations through the year 2014. Most of the job openings are expected to be due to the need to replace many experienced small engine mechanics that are expected to transfer to other occupations, retire, or stop working for other reasons. Job prospects should be especially favorable for persons who complete mechanic training programs.

Motorcycle usage should continue to be popular with persons between 18 and 24 years, an age group that historically has had the greatest proportion of motorcycle enthusiasts. Motorcycles also are becoming increasingly popular with persons over the age of 40. Traditionally, this group has more disposable income to spend on recreational equipment such as motorcycles and motorboats.

Over the next decade, more people will be entering the 40-and-older age group, the group responsible for the largest segment of marine craft purchases. These potential buyers will help expand the market for motorboats, while maintaining the demand for qualified mechanics.

The construction of new single-family houses will result in an increase in the lawn and garden equipment in operation, increasing the need for mechanics. However, equipment growth will be slowed by trends toward smaller lawns and the contracting out of maintenance to lawn service firms. Small engine mechanics' growth will also be tempered by the tendency of many consumers to dispose of and replace relatively inexpensive items rather than have them repaired.

Employers will increasingly prefer mechanics to have knowledge of both two- and four-stroke engines, as well as other emissions-reducing technology, as the government increases regulation over the emissions produced by small engines. While advancements in technology will lengthen the interval between checkups, the need for qualified mechanics to perform services on motorcycles, motorboats, and lawn and garden equipment will increase.

Earnings

Median hourly earnings of motorcycle mechanics were \$13.70 in May 2004. The middle 50 percent earned between \$10.58 and \$17.53. The lowest 10 percent earned less than \$8.48, and the highest 10 percent earned more than \$21.95. Median hourly earnings in May 2004 in other motor vehicle dealers, the industry employing the largest number of motorcycle mechanics, were \$13.60.

Median hourly earnings of motorboat mechanics were \$14.74. The middle 50 percent earned between \$11.46 and \$18.11. The lowest 10 percent earned less than \$9.21, and the highest 10 percent earned more than \$21.90. Median hourly earnings in May 2004 in other motor vehicle dealers, the industry employing the largest number of motorboat mechanics, were \$14.29.

Median hourly earnings of outdoor power equipment and other small engine mechanics were \$11.98 in May 2004. The middle 50 percent earned between \$9.44 and \$15.25. The lowest 10 percent earned less than \$7.53, and the highest 10 percent earned more than \$19.19. Median hourly earnings in lawn and garden equipment and supplies stores, the industry employing the largest number of outdoor power equipment and other small engine mechanics, were \$11.40.

Small engine mechanics tend to receive few benefits in small shops, but those employed in larger shops often receive paid vacations, sick leave, and health insurance. Some employers also pay for work-related training and provide uniforms.

Related Occupations

Mechanics and repairers who work on mobile equipment other than small engines include automotive service technicians and mechanics, diesel service technicians and mechanics, and heavy vehicle and mobile equipment service technicians and mechanics.

Sources of Additional Information

For more details about work opportunities, contact local motorcycle, motorboat, and lawn and garden equipment dealers, boatyards, and marinas. Local offices of the State employment service also may have information about employment and training opportunities.

For a list of accredited private trade and technical schools that offer programs in small engine servicing and repair, contact:

Other Installation, Maintenance, and Repair Occupations

Coin, Vending, and Amusement Machine Servicers and Repairers

(O*NET 49-9091.00)

Significant Points

- Most workers in this occupation learn their skills on the job.
- Opportunities should be especially good for persons with some knowledge of electronics.

Nature of the Work

Coin, vending, and amusement machines are a familiar sight in offices, schools, arcades, and casinos. These machines give out change, test our gaming skills, and dispense refreshments nearly everywhere we turn. Coin, vending, and amusement machine servicers and repairers install, service, and stock such machines and keep them in good working order.

Vending machine servicers, often called route drivers, visit machines that dispense soft drinks, candy and snacks, and other items. They collect money from the coin and cash-operated machines, restock merchandise, and change labels to indicate new selections. They also keep the machines clean and appealing.

Vending machine repairers, often called mechanics or technicians, make sure that the machines operate correctly. When checking complicated electrical and electronic machines, such as beverage dispensers, they ascertain whether the machines mix drinks properly and whether the refrigeration and heating units work correctly. If the machines are not in good working order, the mechanics repair them. On the relatively simple gravity-operated machines, repairers check the keypads, motors, and merchandise chutes. They also test coin, bill, and change-making mechanisms.

When installing machines, vending machine repairers make the necessary water and electrical connections and check the machines

for proper operation. They also make sure that the installation complies with local plumbing and electrical codes. Because many vending machines dispense food, these workers, along with vending machine servicers, must comply with State and local public health and sanitation standards.

Amusement machine servicers and repairers work on jukeboxes, video games, pinball machines, and slot machines. They make sure that the various levers, joysticks, and mechanisms function properly, so that the games remain fair and the jukebox selections are accurate. They update selections, repair or replace malfunctioning parts, and rebuild existing equipment. Those who work in the gaming industry must adhere to strict guidelines, because Federal and State agencies regulate many gaming machines.

Preventive maintenance—avoiding trouble before it starts—is a major job of repairers. For example, they periodically clean refrigeration condensers, lubricate mechanical parts, and adjust machines so that they perform properly.

If a machine breaks down, vending and amusement machine repairers inspect it for obvious problems, such as loose electrical wires, malfunctions of the coin mechanism or bill validator, and leaks. When servicing electronic machines, repairers test them with hand-held diagnostic computers that determine the extent and location of any problem. Repairers may only have to replace a circuit board or other component to fix the problem. However, if the problem cannot be readily located, these workers refer to technical manuals and wiring diagrams and use testing devices, such as electrical circuit testers, to find defective parts. Repairers decide whether they must replace a part and whether they can fix the malfunction onsite or whether they have to send the machine to the repair shop.

In the repair shop, vending and amusement machine repairers use power tools, such as grinding wheels, saws, and drills, as well as voltmeters, ohmmeters, oscilloscopes, and other testing equipment. They also use ordinary repair tools, such as screwdrivers, pliers, and wrenches.

Vending machine servicers and repairers employed by small companies may both fill and fix machines on a regular basis. These

Some vending machine repairers work in repair shops, while others repair machines on site.

combination servicers-repairers stock machines, collect money, fill coin and currency changers, and repair machines when necessary.

Servicers and repairers also do some paperwork, such as filing reports, preparing repair cost estimates, ordering parts, and keeping daily records of merchandise distributed and money collected. However, new machines with computerized inventory controls reduce the paperwork that a servicer must complete.

Working Conditions

Some vending and amusement machine repairers work primarily in company repair shops that generally are quiet, well lighted, and have adequate workspace. Others many spend substantial time on the road, visiting machines wherever they have been placed. Repairers generally work a total of 40 hours a week. However, vending and amusement machines operate around the clock, so repairers may be on call to work at night and on weekends and holidays.

Repair work is relatively safe, although servicers and repairers must take care to avoid hazards such as electrical shocks and cuts from sharp tools and other metal objects. They also must follow safe work procedures, especially when moving heavy vending and amusement machines.

Training, Other Qualifications, and Advancement

Most workers learn their skills on the job. New workers are trained informally on the job to fill and fix machines by observing, working

with, and receiving instruction from experienced repairers. Employers normally hire high school graduates, and give preference to those with high school or vocational school courses in electricity, refrigeration, and machine repair. Employers usually require applicants to demonstrate mechanical ability, either through work experience or by scoring well on mechanical-aptitude tests.

Because coin, vending, and amusement machine servicers and repairers sometimes handle thousands of dollars in merchandise and cash, employers try to hire persons who are trustworthy and have no criminal records. Also, the ability to deal tactfully with people is important, because the servicers and repairers play a significant role in relaying customers' requests and concerns. A driver's license and a good driving record are essential for most vending and amusement machine servicer and repairer jobs. Some employers require their servicers to be bonded.

Electronics have become more prevalent in vending and amusement machines and employers will increasingly prefer applicants who have training in electronics. Technologically advanced machines with features such as multilevel pricing, inventory control, and scrolling messages use electronics and microchip computers extensively. Some vocational high schools and junior colleges offer 1- to 2-year training programs in basic electronics.

Beginners start training with simple jobs, such as cleaning or stocking machines. They then learn to rebuild machines by removing defective parts and repairing, adjusting, and testing the machines. Next, they accompany an experienced repairer on service calls and, finally, make visits on their own. This learning process takes from 6 months to 2 years, depending on the individual's abilities, previous education, types of machines serviced, and quality of instruction.

The National Automatic Merchandising Association has a self-study technician training program for vending machine repairers. Manuals give instruction in subjects such as customer relations, safety, electronics, and reading schematics. Upon completion of the program, repairers must pass a written test to become certified as a technician or journeyman.

To learn about new machines, repairers and servicers sometimes attend training sessions sponsored by manufacturers and distributors that may last from a few days to several weeks. Both trainees and experienced workers sometimes take evening courses in basic electricity, electronics, microwave ovens, refrigeration, and other related subjects to stay on top of new techniques and equipment. Skilled servicers and repairers may be promoted to supervisory jobs or go into business for themselves.

Employment

Coin, vending, and amusement machine servicers and repairers held about 46,000 jobs in 2004. Most repairers work for vending machine operators that sell food and other items through machines. Others work for beverage manufacturing companies that have their own machines. A growing number of servicers and repairers work for amusement, gambling, and recreation establishments that own video games, pinball machines, jukeboxes, slot machines, and similar types of amusement equipment. Although vending and amusement machine servicers and repairers are employed throughout the country, most are located in areas with large populations and, thus, many vending and amusement machines.

Job Outlook

Employment of coin, vending, and amusement machine servicers and repairers is expected to grow more slowly than the average for all occupations through the year 2014. However, opportunities should be good for persons with some formal training in electronics, which can include high school or equivalent classes in basic

mechanics, electronics, circuitry, or diagnostics. Job openings for coin, vending, and amusement machine servicers and repairers will arise mostly from the need to replace experienced workers who transfer to other occupations or leave the labor force.

Establishments are likely to install additional vending machines in industrial plants, hospitals, stores, schools and prisons to meet the public demand for inexpensive snacks and other food items. The range of products dispensed by the machines is expected to increase, as vending machines continue to become increasingly automated and begin to incorporate microwave ovens, minirefrigerators, and freezers. In addition casinos and other amusement establishments are becoming an increasing source of entertainment. State and multi-State lotteries are increasingly using coin-operated machines to sell scratch-off tickets in grocery stores and other public places.

Although the number of vending machines in use is expected to increase, improved technology in newer machines will moderate employment growth because these machines require less maintenance than do older ones. The new machines also need restocking less often, and they contain computers that record sales and inventory data, reducing the amount of time-consuming paperwork that otherwise would have to be filled out. The Internet is beginning to play a large role in the monitoring of vending machines from remote locations. In addition, some new machines use wireless data transmitters to signal the vending machine company when the machine needs restocking or repairing. This allows servicers and repairers to be dispatched only when needed, instead of having to check each machine on a regular schedule.

Earnings

Median hourly earnings of coin, vending, and amusement machine servicers and repairers were \$13.47 in May 2004. The middle 50 percent earned between \$10.70 and \$16.68 an hour. The lowest 10 percent earned less than \$8.74 an hour, and the highest 10 percent earned more than \$20.51 an hour. Median hourly earnings were \$12.66 in vending machine operators, the industry employing the largest number of coin, vending, and amusement machine servicers and repairers in May 2004.

Typically, States with some form of legalized gaming have the highest wages. Most coin, vending, and amusement machine servicers and repairers work 8 hours a day, 5 days a week, and receive premium pay for overtime. Some union contracts stipulate higher pay for night work and for emergency repair jobs on weekends and holidays than for regular hours.

Some vending machine repairers and servicers are members of the International Brotherhood of Teamsters.

Related Occupations

Other workers who repair equipment with electrical and electronic components include electrical and electronics installers and repairers; electronic home-entertainment equipment installers and repairers; heating, air-conditioning, and refrigeration mechanics and installers; and home appliance repairers.

Sources of Additional Information

Information on job opportunities in this field can be obtained from local vending machine firms and local offices of your State employment service.

For general information on vending machine servicing and repair, contact:

Heating, Air-Conditioning, and Refrigeration Mechanics and Installers

(O*NET 49-9021.01, 49-9021.02)

Significant Points

- Employment is projected to grow faster than average.
- Job prospects are expected to be excellent, particularly for those with training from an accredited technical school or with formal apprenticeship training.
- Obtaining certification through one of several organizations is increasingly recommended by employers and may increase advancement opportunities.

Nature of the Work

Heating and air-conditioning systems control the temperature, humidity, and the total air quality in residential, commercial, industrial, and other buildings. Refrigeration systems make it possible to store and transport food, medicine, and other perishable items. Heating, air-conditioning, and refrigeration mechanics and installers—also called technicians—install, maintain, and repair such systems. Because heating, ventilation, air-conditioning, and refrigeration systems often are referred to as HVACR systems, these workers also may be called HVACR technicians.

Heating, air-conditioning, and refrigeration systems consist of many mechanical, electrical, and electronic components, such as motors, compressors, pumps, fans, ducts, pipes, thermostats, and switches. In central forced air heating systems, for example, a furnace heats air that is distributed throughout the building via a system of metal or fiberglass ducts. Technicians must be able to maintain, diagnose, and correct problems throughout the entire system. To do this, they adjust system controls to recommended settings and test the performance of the entire system using special tools and test equipment.

Technicians often specialize in either installation or maintenance and repair, although they are trained to do both. They also may specialize in doing heating work or air-conditioning or refrigeration work. Some specialize in one type of equipment—for example, hydraulics (water-based heating systems), solar panels, or commercial refrigeration. Technicians also try to sell service contracts to their clients. Service contracts provide for regular maintenance of the heating and cooling systems and they help to reduce the seasonal fluctuations of this type of work.

Technicians follow blueprints or other specifications to install oil, gas, electric, solid-fuel, and multiple-fuel heating systems and air conditioning systems. After putting the equipment in place, they install fuel and water supply lines, air ducts and vents, pumps, and other components. They may connect electrical wiring and controls and check the unit for proper operation. To ensure the proper functioning of the system, furnace installers often use combustion test equipment, such as carbon dioxide testers, carbon monoxide testers, combustion analyzers and oxygen testers.

After a furnace or air-conditioning unit has been installed, technicians often perform routine maintenance and repair work to keep the systems operating efficiently. They may adjust burners and blowers and check for leaks. If the system is not operating properly, they check the thermostat, burner nozzles, controls or other parts to diagnose and then correct the problem.

During the summer, when the heating system is not being used, heating equipment technicians do maintenance work, such as replac-

ing filters, ducts, and other parts of the system that may accumulate dust and impurities during the operating season. During the winter, air-conditioning mechanics inspect the systems and do required maintenance, such as overhauling compressors.

Refrigeration mechanics install, service, and repair industrial and commercial refrigerating systems and a variety of refrigeration equipment. They follow blueprints, design specifications, and manufacturers' instructions to install motors, compressors, condensing units, evaporators, piping, and other components. They connect this equipment to the ductwork, refrigerant lines, and electrical power source. After making the connections, they charge the system with refrigerant, check it for proper operation, and program control systems.

When air-conditioning and refrigeration technicians service equipment, they must use care to conserve, recover, and recycle chlorofluorocarbon (CFC), hydrochlorofluorocarbon (HCFC), hydrofluorocarbon (HFC), and other refrigerants used in air-conditioning and refrigeration systems. The release of these refrigerants can be harmful to the environment. Technicians conserve the refrigerant by making sure that there are no leaks in the system; they recover it by venting the refrigerant into proper cylinders; they recycle it for reuse with special filter-dryers; or they insure that the refrigerant is properly disposed.

Heating, air-conditioning, and refrigeration mechanics and installers are adept at using a variety of tools, including hammers, wrenches, metal snips, electric drills, pipe cutters and benders,

Heating and air-conditioning mechanics often work evenings and weekends, and can be on call if an emergency arises.

measurement gauges, and acetylene torches, to work with refrigerant lines and air ducts. They use voltmeters, thermometers, pressure gauges, manometers, and other testing devices to check airflow, refrigerant pressure, electrical circuits, burners, and other components.

Other craftworkers sometimes install or repair cooling and heating systems. For example, on a large air-conditioning installation job, especially where workers are covered by union contracts, ductwork might be done by sheet metal workers and duct installers; electrical work by electricians; and installation of piping, condensers, and other components by pipelayers, plumbers, pipefitters, and steamfitters. Home appliance repairers usually service room air-conditioners and household refrigerators. (Additional information about each of these occupations appears elsewhere in the *Handbook*.)

Working Conditions

Heating, air-conditioning, and refrigeration mechanics and installers work in homes, retail establishments, hospitals, office buildings, and factories—anywhere there is climate-control equipment. They may be assigned to specific job sites at the beginning of each day, or may be dispatched to a variety of locations if they are making service calls.

Technicians may work outside in cold or hot weather or in buildings that are uncomfortable because the air-conditioning or heating equipment is broken. In addition, technicians might have to work in awkward or cramped positions and sometimes are required to work in high places. Hazards include electrical shock, burns, muscle strains, and other injuries from handling heavy equipment. Appropriate safety equipment is necessary when handling refrigerants because contact can cause skin damage, frostbite, or blindness. Inhalation of refrigerants when working in confined spaces also is a possible hazard.

The majority of mechanics and installers work at least a 40-hour week. During peak seasons they often work overtime or irregular hours. Maintenance workers, including those who provide maintenance services under contract, often work evening or weekend shifts and are on call. Most employers try to provide a full workweek year-round by scheduling both installation and maintenance work, and many manufacturers and contractors now provide or even require service contracts. In most shops that service both heating and air-conditioning equipment, employment is stable throughout the year.

Training, Other Qualifications, and Advancement

Because of the increasing sophistication of heating, air-conditioning, and refrigeration systems, employers prefer to hire those with technical school training or those who have completed an apprenticeship. Some mechanics and installers, however, still learn the trade informally on the job.

Many secondary and postsecondary technical and trade schools, junior and community colleges, and the U.S. Armed Forces offer 6-month to 2-year programs in heating, air-conditioning, and refrigeration. Students study theory, design, and equipment construction, as well as electronics. They also learn the basics of installation, maintenance, and repair. There are three accrediting agencies that have set academic standards for HVACR programs. These accrediting bodies are HVAC Excellence, the National Center for Construction Education and Research (NCCER) and the Partnership for Air Conditioning, Heating, and Refrigeration Accreditation (PHARA). After completing these programs, new technicians generally need between an additional 6 months and 2 years of field experience before they can be considered proficient.

Apprenticeship programs frequently are run by joint committees representing local chapters of the Air-Conditioning Contractors

of America, the Mechanical Contractors Association of America, Plumbing-Heating-Cooling Contractors—National Association, and locals of the Sheet Metal Workers' International Association or the United Association of Journeymen and Apprentices of the Plumbing and Pipefitting Industry of the United States and Canada. Other apprenticeship programs are sponsored by local chapters of the Associated Builders and Contractors and the National Association of Home Builders. Formal apprenticeship programs normally last 3 to 5 years and combine on-the-job training with classroom instruction. Classes include subjects such as the use and care of tools, safety practices, blueprint reading, and the theory and design of heating, ventilation, air-conditioning, and refrigeration systems. Applicants for these programs must have a high school diploma or equivalent. Math and reading skills are essential. After completing an apprenticeship program, technicians are considered skilled trades workers and capable of working alone. These programs are also a pathway to certification and in some cases college credits.

Those who acquire their skills on the job usually begin by assisting experienced technicians. They may begin by performing simple tasks such as carrying materials, insulating refrigerant lines, or cleaning furnaces. In time, they move on to more difficult tasks, such as cutting and soldering pipes and sheet metal and checking electrical and electronic circuits.

Courses in shop math, mechanical drawing, applied physics and chemistry, electronics, blueprint reading, and computer applications provide a good background for those interested in entering this occupation. Some knowledge of plumbing or electrical work also is helpful. A basic understanding of electronics is becoming more important because of the increasing use of this technology in equipment controls. Because technicians frequently deal directly with the public, they should be courteous and tactful, especially when dealing with an aggravated customer. They also should be in good physical condition because they sometimes have to lift and move heavy equipment.

All technicians who purchase or work with refrigerants must be certified in their proper handling. To become certified to purchase and handle refrigerants, technicians must pass a written examination specific to the type of work in which they specialize. The three possible areas of certification are: Type I—servicing small appliances, Type II—high-pressure refrigerants, and Type III—low-pressure refrigerants. Exams are administered by organizations approved by the U.S. Environmental Protection Agency, such as trade schools, unions, contractor associations, or building groups.

Several organizations have begun to offer basic self-study, classroom, and Internet courses for individuals with limited experience. In addition to understanding how systems work, technicians also must learn about refrigerant products and the legislation and regulations that govern their use.

Throughout the learning process, job candidates may have to take a number of tests that measure their skills in the field. For those with less than 1 year of experience and taking classes, the industry has developed a series of exams to test basic competency in residential heating and cooling, light commercial heating and cooling, and commercial refrigeration. These are referred to as "Entry-level" certification exams and are commonly conducted at both secondary and postsecondary technical and trade schools. For HVACR technicians who have at least one year of experience performing installations and 2 years of experience performing maintenance and repair, they can take a number of different tests to certify their competency in working with more specific types of equipment, such as oil-burning furnaces. The tests are offered through Refrigeration Service Engineers Society (RSES), HVAC Excellence, The Carbon Monoxide Safety Association (COSA), Air Conditioning and Refrigeration Safety Coalition, and North American Technician

Excellence, Inc. (NATE), among others. Passing these tests and obtaining certification is increasingly recommended by employers and may increase advancement opportunities.

Advancement usually takes the form of higher wages. Some technicians, however, may advance to positions as supervisor or service manager. Others may move into areas such as sales and marketing. Still others may become building superintendents, cost estimators, or, with the necessary certification, teachers. Those with sufficient money and managerial skill can open their own contracting business.

Employment

Heating, air-conditioning, and refrigeration mechanics and installers held about 270,000 jobs in 2004; almost half worked for plumbing, heating, and air conditioning contractors. The remainder was employed in a variety of industries throughout the country, reflecting a widespread dependence on climate-control systems. Some worked for fuel oil dealers, refrigeration and air-conditioning service and repair shops, schools, and stores that sell heating and air-conditioning systems. Local governments, the Federal Government, hospitals, office buildings, and other organizations that operate large air-conditioning, refrigeration, or heating systems employed others. About 15 percent of mechanics and installers were self-employed.

Job Outlook

Job prospects for heating, air-conditioning, and refrigeration mechanics and installers are expected to be excellent, particularly for those with training from an accredited technical school or with formal apprenticeship training, and especially in the fastest growing areas of the country. A growing number of retirements of highly skilled technicians are expected to generate many job openings. In addition, employment of heating, air-conditioning, and refrigeration mechanics and installers is projected to increase faster than the average for all occupations through the year 2014. As the population and stock of buildings grows, so does the demand for residential, commercial, and industrial climate-control systems. The increased complexity of HVACR systems, increasing the possibility that equipment may malfunction, also will create opportunities for service technicians. Technicians who specialize in installation work may experience periods of unemployment when the level of new construction activity declines, but maintenance and repair work usually remains relatively stable. People and businesses depend on their climate-control systems and must keep them in good working order, regardless of economic conditions.

Concern for the environment has prompted the development of new energy-saving heating and air-conditioning systems. An emphasis on better energy management should lead to the replacement of older systems and the installation of newer, more efficient systems in existing homes and buildings. Also, demand for maintenance and service work should increase as businesses and homeowners strive to keep increasingly complex systems operating at peak efficiency. Regulations prohibiting the discharge and production of CFC and HCFC refrigerants should continue to result in the need to replace many existing air conditioning systems or modify them to use new environmentally safe refrigerants. The pace of replacement in the commercial and industrial sectors will quicken if Congress or individual States cut the time needed to fully depreciate the cost of new HVACR systems, which is being considered.

A growing focus on improving indoor air quality, as well as the increasing use of refrigerated equipment by a growing number of stores and gasoline stations that sell food, also should contribute to the creation of more jobs for heating, air-conditioning, and refrigeration technicians.

Earnings

Median hourly earnings of heating, air-conditioning, and refrigeration mechanics and installers were \$17.43 in May 2004. The middle 50 percent earned between \$13.51 and \$22.21 an hour. The lowest 10 percent earned less than \$10.88, and the top 10 percent earned more than \$27.11. Median hourly earnings in the industries employing the largest numbers of heating, air-conditioning, and refrigeration mechanics and installers in May 2004 were:

Hardware and plumbing and heating equipment and supplies merchant wholesalers	\$19.51
Direct selling establishments	17.81
Elementary and secondary schools	17.56
Commercial and industrial machinery and equipment (except automotive and electronic) repair and maintenance	17.52
Building equipment contractors	16.80

Apprentices usually begin at about 50 percent of the wage rate paid to experienced workers. As they gain experience and improve their skills, they receive periodic increases until they reach the wage rate of experienced workers.

Heating, air-conditioning, and refrigeration mechanics and installers enjoy a variety of employer-sponsored benefits. In addition to typical benefits such as health insurance and pension plans, some employers pay for work-related training and provide uniforms, company vans, and tools.

About 16 percent of heating, air-conditioning, and refrigeration mechanics and installers are members of a union. The unions to which the greatest numbers of mechanics and installers belong are the Sheet Metal Workers International Association and the United Association of Journeymen and Apprentices of the Plumbing and Pipefitting Industry of the United States and Canada.

Related Occupations

Heating, air-conditioning, and refrigeration mechanics and installers work with sheet metal and piping, and repair machinery, such as electrical motors, compressors, and burners. Other workers who have similar skills include boilermakers; home appliance repairers; electricians; sheet metal workers; and pipelayers, plumbers, pipefitters, and steamfitters.

Sources of Additional Information

For more information about opportunities for training, certification, and employment in this trade, contact local vocational and technical schools; local heating, air-conditioning, and refrigeration contractors; a local of the unions or organizations previously mentioned; a local joint union-management apprenticeship committee; or the nearest office of the State employment service or apprenticeship agency.

Home Appliance Repairers

(O*NET 49-9031.01, 49-9031.02)

Significant Points

- Good job prospects are expected, with job openings continuing to outnumber jobseekers.
- Individuals with formal training in appliance repair and electronics should have the best opportunities.
- Overall employment is projected to grow more slowly than average, reflecting average growth among wage and salary workers and a decline among self-employed repairers.
- Repairers of small household appliances usually are trained on the job, whereas repairers of large household appliances often are trained in a formal trade school, in a community college, or directly from the appliance manufacturer.

Nature of the Work

Anyone whose washer, dryer, or refrigerator has ever broken knows the importance of a dependable repair person. Home appliance repairers, often called service technicians, keep home appliances working and help prevent unwanted breakdowns. Some repairers work specifically on small appliances such as microwaves and vacuum cleaners; others specialize in major appliances such as refrigerators, dishwashers, washers, and dryers.

Home appliance repairers visually inspect appliances and check for unusual noises, excessive vibration, leakage of fluid, or loose parts to determine why the appliances fail to operate properly. They use service manuals, troubleshooting guides, and experience to diagnose particularly difficult problems. Repairers disassemble the appliance to examine its internal parts for signs of wear or corrosion. They follow wiring diagrams and use testing devices such as ammeters, voltmeters, and wattmeters to check electrical systems for shorts and faulty connections.

After identifying problems, home appliance repairers replace or repair defective belts, motors, heating elements, switches, gears, or other items. They tighten, align, clean, and lubricate parts as necessary. Repairers use common handtools, including screwdrivers, wrenches, files, and pliers, as well as soldering guns and special tools designed for particular appliances. When repairing appliances with electronic parts, they may replace circuit boards or other electronic components.

When repairing refrigerators and window air-conditioners, repairers must take care to conserve, recover, and recycle chlorofluorocarbon (CFC) and hydrochlorofluorocarbon (HCFC) refrigerants used in the cooling systems, as is required by law. Repairers

conserve the refrigerant by making sure that there are no leaks in the system; they recover the refrigerant by venting it into proper cylinders; and they recycle the refrigerant with special filter-dryers so that it can be used again. Federal regulations also require that home appliance repairers document the capture and disposal of refrigerants.

Home appliance repairers generally install household durable goods such as refrigerators, washing machines, and cooking products. They may have to install pipes in a customer's home to connect the appliances to the gas line. They measure, lay out, cut, thread, and connect pipe to a feeder line and then to the appliance. They may have to saw holes in walls or floors and hang steel supports from beams or joists in order to hold gas pipes in place. Once the gas line is in place, they turn on the gas and check for leaks. *Gas appliance repairers* check the heating unit and replace tubing, thermocouples, thermostats, valves, and indicator spindles. They also answer emergency calls about gas leaks.

Repairers also answer customers' questions about the care and use of appliances. For example, they demonstrate how to load automatic washing machines, arrange dishes in dishwashers, or sharpen chain saws to maximize their performance.

Repairers write up estimates of the cost of repairs for customers, keep records of parts used and hours worked, prepare bills, and collect payments. Self-employed repairers also deal with the original appliance manufacturers to recoup monetary claims for work performed on appliances still under warranty.

Working Conditions

Home appliance repairers who handle portable appliances usually work in repair shops that generally are quiet and adequately lighted and ventilated. Those who repair major appliances usually make service calls to customers' homes. They carry their tools and a number of commonly used parts with them in a truck or van on their service calls. Repairers may spend several hours a day driving to and from appointments and emergency calls. They may work in clean, comfortable rooms such as kitchens, but they also may work in damp, dirty, or dusty areas of homes. Repairers sometimes work in cramped and uncomfortable positions when they are replacing parts in hard-to-reach areas of appliances. Repairer jobs generally are not hazardous, but workers must exercise care and follow safety precautions to avoid electrical shocks and prevent injuries when lifting and moving large appliances. When repairing gas appliances and microwave ovens, repairers must be aware of the dangers of gas and radio-frequency energy leaks.

On-the-job repairs are usually done by the most experienced heavy vehicle technicians.

Home appliance repairers usually work with little or no direct supervision, a feature of the job that is appealing to many people. Many home appliance repairers work a standard 40-hour week, but may work overtime and weekend hours in the summer months, when they are in high demand to fix air-conditioners and refrigerators. Some repairers work early morning, evening, and weekend shifts and may remain on call in case of an emergency.

Training, Other Qualifications, and Advancement

Employers generally require a high school diploma for home appliance repairer jobs. Once employed, repairers of small appliances usually are trained on the job, whereas repairers of large household appliances often are trained in a formal trade school, in a community college, or directly from the appliance manufacturer. Mechanical and electrical aptitudes are desirable, and those who work in customers' homes must be courteous and tactful.

Employers prefer to hire people with formal training in appliance repair and electronics. Many repairers complete 1- or 2-year formal training programs in appliance repair and related subjects in high schools, private vocational schools, and community colleges. Courses in basic electricity and electronics are becoming increasingly important as more manufacturers install circuit boards and other electronic control systems in home appliances.

Whether their basic skills are developed through formal training or on the job, trainees usually receive additional training from their employer and from manufacturers. In shops that fix portable appliances, they work on a single type of appliance, such as a vacuum cleaner, until they master its repair. Then they move on to others, until they can repair all those handled by the shop. In companies that repair major appliances, beginners assist experienced repairers on service visits. They also may study on their own. They learn to read schematic drawings, analyze problems, determine whether to repair or replace parts, and follow proper safety procedures. Up to 3 years of on-the-job training may be needed for a technician to become skilled in all aspects of repair.

Some appliance manufacturers and department store chains have formal training programs that include home study and shop classes, in which trainees work with demonstration appliances and other training equipment. Many repairers receive supplemental instruction through 2- or 3-week seminars conducted by appliance manufacturers. Experienced repairers also often attend training classes and study service manuals. Repairers authorized for warranty work by manufacturers are required to attend periodic training sessions.

The U.S. Environmental Protection Agency (EPA) has mandated that all repairers who buy or work with refrigerants be certified in the proper handling of refrigerants. In order to become certified, a technician must pass a written examination. Exams are administered by EPA-approved organizations, such as trade schools, unions, and employer associations. There also are EPA-approved take-home certification exams. Although no formal training is required for certification, many of these organizations offer training programs designed to prepare workers for the certification examination.

In addition to earning the certification required by the EPA, home appliance repairers may exhibit their competence by passing one of several certification examinations offered by various organizations. Although voluntary, such certifications can be helpful when seeking employment. The National Appliance Service Technician Certification (NASTeC), which is administered by the International Society of Certified Electronics Technicians (ISCET), requires repairers to pass a comprehensive examination that tests their competence in the diagnosis, repair, and maintenance of major home appliances. Examinations are given in three specialty areas of appliance repair: refrigeration and air-conditioning; cooking; and laundry and dishwashing. Although the NASTeC credential does not expire, continuing education classes

are available so that repairers can keep abreast of technological changes. The Professional Service Association (PSA) administers a similar certification program. Those who pass the PSA examination earn the Certified Appliance Professional (CAP) designation, which is valid for 4 years. If CAP-certified repairers complete at least 15 credit hours of instruction each year during the 4 years, they need not take the examination to become recertified. Otherwise, they must take the examination again to become recertified.

Repairers in large shops or service centers may be promoted to supervisor, assistant service manager, or service manager. Some repairers advance to managerial positions such as regional service manager or parts manager for appliance or tool manufacturers. Preference is given to those who demonstrate technical competence and show an ability to get along with other workers and customers. Experienced repairers who have sufficient funds and knowledge of small-business management may open their own repair shops.

Employment

Home appliance repairers held 50,000 jobs in 2004. About 42 percent of salaried repairers worked in retail trade establishments such as department stores and electronics and appliance stores. About 20 percent of repairers are self-employed. Almost every community in the country employs home appliance repairers; a high concentration of jobs is found in more populated areas.

Job Outlook

Good job prospects are expected, with job openings continuing to outnumber jobseekers. Many prospective workers may choose not to enter this occupation, because they prefer work that is less strenuous and that is performed under more comfortable working conditions. Individuals with formal training in appliance repair and electronics should have the best opportunities.

Overall employment of home appliance repairers is expected to increase more slowly than the average for all occupations through the year 2014. Slower-than-average employment growth is expected among wage and salary workers, while the number of self-employed home appliance repairers is projected to decline.

The number of home appliances in use is expected to increase with growth in the numbers of households and businesses. Appliances also are becoming more technologically advanced and will increasingly require a skilled technician to diagnose and fix problems. In recent years, consumers have tended to purchase new appliances when existing warranties expire rather than repair old appliances. However, over the next decade, as more consumers purchase higher priced appliances designed to have much longer lives, they will be more likely to use repair services than to purchase new appliances. Employment is relatively steady during economic downturns because there is still demand for appliance repair services. In addition to new jobs created over the 2004–14 period, openings will arise as home appliance repairers retire or transfer to other occupations.

Jobs are expected to be increasingly concentrated in larger companies as the number of smaller shops and family-owned businesses declines. However, repairers who maintain strong industry relationships may still go into business for themselves.

Earnings

Median annual earnings, including commissions, of home appliance repairers were \$32,180 in May 2004. The middle 50 percent earned between \$23,510 and \$41,090 a year. The lowest 10 percent earned less than \$17,890, and the highest 10 percent earned more than \$49,760 a year. Median annual earnings of home appliance repairers in May 2004 were \$30,840 in electronics and appliance stores and \$33,790 in personal and household goods repair and maintenance.

Earnings of home appliance repairers vary with the skill level required to fix equipment, the geographic location, and the type of equipment repaired. Because many repairers receive a commission along with their salary, earnings increase with the number of jobs a repairer can complete in a day.

Many larger dealers, manufacturers, and service stores offer typical benefits such as health insurance coverage, sick leave, and retirement and pension programs. Some home appliance repairers belong to the International Brotherhood of Electrical Workers.

Related Occupations

Other workers who repair electrical and electronic equipment include electrical and electronics installers and repairers; electronic home entertainment equipment installers and repairers; small-engine mechanics; coin, vending, and amusement machine servicers and repairers; and heating, air-conditioning, and refrigeration mechanics and installers.

Industrial Machinery Mechanics and Maintenance Workers

(O*NET 49-9041.00, 49-9043.00)

Significant Points

- Highly skilled mechanics usually learn their trade through a 4-year apprenticeship program, while lower skilled maintenance workers receive short-term on-the-job training.
- Employment is projected to grow more slowly than average, but applicants with broad skills in machine repair and maintenance should have favorable job prospects.
- Unlike some manufacturing occupations, these workers usually are not affected by changes in production.

Nature of the Work

A wide range of employees is required to keep sophisticated industrial machinery running smoothly—from highly skilled industrial machinery mechanics to lower skilled machinery maintenance workers who perform routine tasks. Their work is vital to the success of industrial facilities, not only because an idle machine will delay production, but also because a machine that is not properly repaired and maintained may damage the machine, the final product or injure an operator.

The most basic tasks in this process are performed by *machinery maintenance workers*. These employees are responsible for cleaning and lubricating machinery, performing basic diagnostic tests, checking

performance, and testing damaged machine parts to determine whether major repairs are necessary. In carrying out these tasks, maintenance workers must follow machine specifications and adhere to maintenance schedules. Maintenance workers may perform minor repairs, but major repairs are generally left to machinery mechanics.

Industrial machinery mechanics, also called industrial machinery repairers or maintenance machinists, are highly skilled workers who maintain and repair machinery in a plant or factory. To do this effectively, they must be able to detect minor problems and correct them before they become major problems. Machinery mechanics use their understanding of the equipment, technical manuals, and careful observation to discover the cause. For example, after hearing a vibration from a machine, the mechanic must decide whether it is due to worn belts, weak motor bearings, or some other problem. Computerized diagnostic systems and vibration analysis techniques are aiding in determining the problem, but mechanics still need years of training and experience.

After diagnosing the problem, the industrial machinery mechanic disassembles the equipment to repair or replace the necessary parts. When repairing electronically controlled machinery, mechanics may work closely with electronic repairers or electricians who maintain the machine's electronic parts. (Statements on electrical and electronic installers and repairers, as well as electricians, appear elsewhere in the *Handbook*.) Increasingly, mechanics need electronic and computer skills in order to repair sophisticated equipment on their own. Once a repair is made, mechanics perform tests to ensure that the machine is running smoothly.

Primary responsibilities of industrial machinery mechanics include repair, preventive maintenance, and installation of new machinery. For example, they adjust and calibrate automated manufacturing equipment, such as industrial robots. As plants retool and invest in new equipment, they increasingly rely on mechanics to properly situate and install the machinery. In many plants, this has traditionally been the job of millwrights, but mechanics are increasingly called upon to carry out this task. (See the statement on millwrights elsewhere in the *Handbook*.)

Industrial machinery mechanics and machinery maintenance workers use a variety of tools to perform repairs and preventive maintenance. They may use a screwdriver and wrench to adjust a motor, or a hoist to lift a printing press off the ground. When replacements for broken or defective parts are not readily available, or when a machine must be quickly returned to production, mechanics may sketch a part to be fabricated by the plant's machine shop. Mechanics use catalogs to order replacement parts and often follow blueprints, technical manuals, and engineering specifications to maintain and fix equipment. By keeping complete and up-to-date records, mechanics try to anticipate trouble and service equipment before factory production is interrupted.

Working Conditions

In production facilities, these workers are subject to common shop injuries such as cuts, bruises, and strains. They also may work in awkward positions, including on top of ladders or in cramped conditions under large machinery, which exposes them to additional hazards. They often use protective equipment such as hardhats, safety glasses, steel-tipped shoes, hearing protectors, and belts.

Because factories and other facilities cannot afford to have industrial machinery out of service for long periods, mechanics may be called to the plant at night or on weekends for emergency repairs. Overtime is common among industrial machinery mechanics; about 30 percent work over 40 hours a week.

Training, Other Qualifications, and Advancement

Machinery maintenance workers typically receive short-term on-the-job training in order to perform routine tasks, such as setting

An industrial machinery mechanic adjusts a belt to reduce friction.

up, cleaning, lubricating, and starting machinery. This training may be offered by experienced workers, professional trainers, or product representatives.

Industrial machinery mechanics, on the other hand, often learn their trade through 4-year apprenticeship programs that combine classroom instruction with on-the-job-training. These programs usually are sponsored by a local trade union. Other mechanics start as helpers and learn the skills of the trade informally or by taking courses offered by machinery manufacturers and community colleges.

Mechanics learn from experienced repairers how to operate, disassemble, repair, and assemble machinery. Classroom instruction focuses on subjects such as shop mathematics, blueprint reading, welding, electronics, and computer training.

Employers prefer to hire those who have completed high school or technical school, and have taken courses in mechanical drawing, mathematics, blueprint reading, computers, and electronics. Mechanical aptitude and manual dexterity are important characteristics for workers in this trade. Good reading comprehension is also necessary to understand the technical manuals of a wide range of machines. And, in general, good physical conditioning and agility are necessary because repairers sometimes have to lift heavy objects or climb to reach equipment.

Opportunities for advancement vary by specialty. Machinery maintenance workers may gain additional skills to make more complex

repairs to machinery or work as supervisors. Industrial machinery mechanics also may advance either by working with more complicated equipment or by becoming supervisors. The most highly skilled repairers can be promoted to master mechanic or can become millwrights.

Employment

Industrial machinery mechanics and maintenance workers held about 306,000 jobs in 2004. Of these, 220,000 were held by the more highly skilled industrial machinery mechanics, while machinery maintenance workers accounted for 86,000 jobs. Two out of three workers were employed in the manufacturing sector, in industries such as food processing, textile mills, chemicals, fabricated metal products, motor vehicles, and primary metals. Others worked for government agencies, public utilities, mining companies, and other establishments in which industrial machinery is used.

Job Outlook

Employment of industrial machinery mechanics and maintenance workers is projected to grow more slowly than the average for all occupations through 2014. Nevertheless, applicants with broad skills in machine repair and maintenance should have favorable job prospects. Many mechanics are expected to retire in coming years, and employers have reported difficulty in recruiting young workers with the necessary skills to be industrial machinery mechanics. Most job openings will stem from the need to replace workers who transfer to other occupations or who retire or leave the labor force for other reasons.

As more firms introduce automated production equipment, these workers will be needed to ensure that these machines are properly maintained and consistently in operation. However, many new machines are capable of self-diagnosis, increasing their reliability and somewhat reducing the need for repairers.

Industrial machinery mechanics and maintenance workers are not usually affected by changes in production. During slack periods, when some plant workers are laid off, mechanics often are retained to do major overhaul jobs and to keep expensive machinery in working order. Although these workers may face layoffs or a reduced workweek when economic conditions are particularly severe, they usually are less affected than other workers because machines have to be maintained regardless of production level.

Earnings

Median hourly earnings of industrial machinery mechanics were \$18.78 in May 2004. The middle 50 percent earned between \$15.09 and \$22.95. The lowest 10 percent earned less than \$12.14, and the highest 10 percent earned more than \$27.59.

Machinery maintenance workers earned less than the higher skilled industrial machinery mechanics. Median hourly earnings of machinery maintenance workers were \$15.79 in May 2004. The middle 50 percent earned between \$12.21 and \$20.18. The lowest 10 percent earned less than \$9.60, and the highest 10 percent earned more than \$24.59.

Earnings vary by industry and geographic region. Median hourly earnings in the industries employing the largest numbers of industrial machinery mechanics in May 2004 are:

Electric power generation, transmission and distribution.....	\$25.78
Motor vehicle parts manufacturing	21.79
Plastics product manufacturing.....	18.04
Machinery, equipment, and supplies merchant wholesalers	17.74
Commercial and industrial machinery and equipment (except automotive and electronic) repair and maintenance.....	16.93

About 25 percent of industrial machinery mechanics and maintenance workers are union members. Labor unions that represent

these workers include the United Steelworkers of America; the United Auto Workers; the International Association of Machinists and Aerospace Workers; the United Brotherhood of Carpenters and Joiners of America; and the International Union of Electronic, Electrical, Salaried, Machine, and Furniture Workers-Communications Workers of America.

Related Occupations

Other occupations that involve repairing and maintaining machinery include aircraft and avionics equipment mechanics and service technicians; automotive service technicians and mechanics; diesel service technicians and mechanics; elevator installers and repairers; heating, air-conditioning, and refrigeration mechanics and installers; heavy vehicle and mobile equipment service technicians and mechanics; machinists; maintenance and repair workers, general; millwrights; and small engine mechanics.

Sources of Additional Information

Information about employment and apprenticeship opportunities may be obtained from local employers, from local offices of the State employment service, or from:

Line Installers and Repairers

(O*NET 49-9051.00, 49-9052.00)

Significant Points

- Line installers and repairers work outdoors; conditions can be hazardous.
- Employers prefer applicants with knowledge of electricity and electronics obtained through experience or classroom training.
- Overall employment is projected to increase more slowly than average, although a growing number of retirements should create very good job opportunities, especially for electrical powerline installers and repairers.
- Earnings are higher than in most other occupations that do not require postsecondary education.

Nature of the Work

Vast networks of wires and cables provide customers with electrical power and communications services. Networks of electrical power lines deliver electricity from generating plants to customers. Communications networks of telephone and cable television lines provide voice, video, and other communications services. These networks are constructed and maintained by *electrical powerline installers and repairers* and *telecommunications line installers and repairers*.

While the work performed by telecommunications and electrical powerline installers is quite similar, they are two distinct occupations. Working with powerlines requires specialized knowledge of transformers, electrical power distribution systems, and substations. Working with telecommunications lines requires specialized knowledge of fiber optics and telecommunications switches and routers. While both powerline and telecommunications line installers have specialized knowledge, the procedures for installing both kinds of lines are quite similar.

All line installers, or line erectors, install new lines by constructing utility poles, towers, and underground trenches to carry the wires and cables. Line erectors use a variety of construction equipment, including digger derricks, trenchers, cable plows, and borers. Digger derricks are trucks equipped with augers and cranes; workers use augers to dig holes in the ground, and cranes are used to set utility poles in place. Trenchers and cable plows are used to cut openings in the earth for the laying of underground cables. Borers, which tunnel under the earth, are used to install tubes for the wire without opening a trench in the soil.

When construction is complete, line installers string cable along the poles, towers, tunnels, and trenches. While working on poles and towers, installers first use truck-mounted buckets to reach the top of the structure or physically climb the pole or tower. Next, they pull up cable from large reels mounted on trucks. The line is then set in place and pulled so that it has the correct amount of tension. Finally, line installers attach the cable to the structure using hand and hydraulic tools. When working with electrical power lines, installers bolt or clamp insulators onto the poles before attaching the cable. Underground cable is laid directly in a trench, pulled through a tunnel, or strung through a conduit running through a trench.

Other installation duties include setting up service for customers and installing network equipment. To set up service, line installers string cable between the customers' premises and the lines running on poles or towers or in trenches. They install wiring to houses and check the connection for proper voltage readings. Line installers also may install a variety of equipment. Workers on telephone and cable television lines install amplifiers and repeaters that maintain the strength of communications transmissions. Workers on electrical powerlines install and replace transformers, circuitbreakers, switches, fuses, and other equipment to control and direct the electrical current.

In addition to installation, line installers and repairers also are responsible for maintenance of electrical, telecommunications, and cable television lines. Workers periodically travel in trucks, helicopters, and airplanes to visually inspect the wires and cables. Sensitive monitoring equipment can automatically detect malfunctions on the network, such as loss of current flow. When line repairers identify a problem, they travel to the location of the malfunction and repair or replace defective cables or equipment. Bad weather or natural disasters can cause extensive damage to networks. Line installers and repairers must respond quickly to these emergencies to restore critical utility and communications services. This can often involve working outdoors in adverse weather conditions.

Installation and repair work may require splicing, or joining together, separate pieces of cable. Each cable contains numerous individual wires; splicing the cables together requires that each wire in one piece of cable be joined to another wire in the matching piece. Line installers splice cables using small handtools, epoxy, or mechanical equipment. At each splice, they place insulation over the conductor and seal the splice with moistureproof covering. At some companies, *cable splicing technicians* perform splices on larger lines.

Communications networks are transitioning to fiber optic cables instead of conventional wire or metal cables. Fiber optic cables are made of hair-thin strands of glass, which convey pulses of light. These cables carry much more information at higher speeds than conventional cables. The higher transmission capacity of fiber optic cable has allowed communication networks to offer upgraded services, such as high-speed Internet access. Splicing fiber optic cable requires specialized equipment that carefully slices, matches, and aligns individual glass fibers. The fibers are joined by either electrical fusion (welding) or a mechanical fixture and gel (glue). More newly constructed buildings are being wired with fiber optic lines.

Line installers use safety equipment to prevent falls.

Working Conditions

Line installers and repairers must climb and maintain their balance while working on poles and towers. They lift equipment and work in a variety of positions, such as stooping or kneeling. Their work often requires that they drive utility vehicles, travel long distances, and work outdoors under a variety of weather conditions. Many line installers and repairers work a 40-hour week; however, emergencies may require overtime work. For example, when severe weather damages electrical and communications lines, line installers and repairers may work long and irregular hours to restore service.

Line installers and repairers encounter serious hazards on their jobs and must follow safety procedures to minimize potential danger. They wear safety equipment when entering utility holes and test for the presence of gas before going underground. Electric powerline workers have the more hazardous jobs. High-voltage powerlines can cause electrocution, and line installers and repairers must consequently use electrically insulated protective devices and tools when working with live cables. Powerlines are typically higher than telephone and cable television lines, increasing the risk of severe injury due to falls. To prevent these injuries, line installers and repairers must use fall-protection equipment when working on poles or towers.

Training, Other Qualifications, and Advancement

Employers of line installers and repairers usually require applicants to have at least a high school diploma. They also strongly prefer applicants with a technical knowledge of electricity or electronics, or experience obtained through vocational/technical programs, community colleges, or the Armed Forces. Programs in telecommunications, electronics, or electricity are offered by many community or technical colleges. These programs often are operated with assistance from local employers and unions. Some schools, working with local companies, offer 1-year certificate programs that emphasize hands-on field work. More advanced 2-year associate degree programs provide students with a broader knowledge of telecommunications and electrical utilities technology through courses in electricity, electronics, fiber optics, and microwave transmission. Graduates of these programs often get preferential treatment in the hiring process.

Prospective employees also should possess a basic knowledge of algebra and trigonometry, and have mechanical ability. Customer service and interpersonal skills also are important, especially for those dealing with customers. Because the work entails lifting heavy objects (many employers require applicants to be able to lift at least 50 pounds), climbing, and other physical activity, applicants should have stamina, strength, and coordination, and must be unafraid of heights. The ability to distinguish colors is necessary because wires and cables may be color-coded. A good driving record is important because workers often hold commercial driver’s licenses and operate company-owned vehicles.

Line installers and repairers receive most of their training on the job. Electrical line installers and repairers often must complete formal apprenticeships or other employer training programs. These programs, which can last up to 5 years, combine on-the-job training with formal classroom courses and are sometimes administered jointly by the employer and the union representing the workers. The unions include the International Brotherhood of Electrical Workers, the Communications Workers of America, and the Utility Workers Union of America. Government safety regulations strictly define the training and education requirements for apprentice electrical line installers.

Line installers and repairers working for telephone and cable television companies receive several years of on-the-job training. They also may attend training or take online courses provided by equipment manufacturers, schools, unions, or industry training organizations. The Society of Cable Television Engineers (SCTE) provides certification programs for line installers and repairers. Applicants for certification must be employed in the cable television industry and attend training sessions at local SCTE chapters.

Entry-level line installers may be hired as ground workers, helpers, or tree trimmers, who clear branches from telephone and power lines. These workers may advance to positions stringing cable and performing service installations. With experience, they may advance to more sophisticated maintenance and repair positions responsible for increasingly larger portions of the network. Promotion to supervisory or training positions also is possible, but more advanced supervisory positions often require a college diploma.

Employment

Line installers and repairers held about 251,000 jobs in 2004. Approximately 147,000 were telecommunications line installers and repairers; the remainder were electrical powerline installers and repairers. Nearly all line installers and repairers worked for telecommunications, construction, or electric power generation, transmission, and distribution companies. Approximately 4,800 line installers and repairers were self-employed. Many of these were contractors employed by the telecommunications companies to handle customer service problems and installations.

Job Outlook

Overall employment of line installers and repairers is expected to grow more slowly than the average for all occupations through 2014. However, because many line installers and repairers are nearing retirement, job opportunities for new workers in this field should be very good, particularly for electrical powerline installers. Some companies are expanding their hiring in anticipation of increased retirements.

Employment of telecommunications line installers is projected to grow about as fast as the average for all occupations. Much of their work will involve replacing old wiring with fiber optic cable and expanding their networks to provide customers with high-speed access to data, video, and graphics. Line installers and repairers will be needed to construct and maintain the networks. However, the increasing use of wireless systems, increasingly reliable lines, and improved speeds

of data transmission over existing lines will limit employment growth. The number of households with wired telephone service is declining because of the increasing use of wireless telephones. Wireless networks do not require as many technicians to maintain and expand their systems, a characteristic that will reduce job growth. Satellite television providers are also providing strong competition. As wireless systems offer higher-speed Internet access, the number of households with wired phone or cable TV should decline further.

Very little employment growth is expected among electrical powerline installers and repairers. Despite consistently rising demand for electricity, industry deregulation is pushing companies to cut costs and maintenance, which tends to reduce employment. Most new jobs are expected to arise in the construction industry.

Earnings

Earnings for line installers and repairers are higher than those in most other occupations that do not require postsecondary education. Median hourly earnings for electrical powerline installers and repairers were \$23.61 in May 2004. The middle 50 percent earned between \$18.00 and \$27.64. The lowest 10 percent earned less than \$13.31, and the highest 10 percent earned more than \$32.54. Median hourly earnings in the industries employing the largest numbers of electrical powerline installers and repairers in May 2004 are shown below:

Electric power generation, transmission and distribution.....	\$24.96
Wired telecommunications carriers	24.15
Local government	22.25
Utility system construction	18.01
Building equipment contractors.....	15.77

Median hourly earnings for telecommunications line installers and repairers were \$19.39 in May 2004. The middle 50 percent earned between \$13.98 and \$25.10. The lowest 10 percent earned less than \$10.96, and the highest 10 percent earned more than \$28.56. Median hourly earnings in the industries employing the largest numbers of telecommunications line installers and repairers in May 2004 are shown below:

Wired telecommunications carriers	\$24.80
Cable and other subscription programming.....	17.36
Cable and other program distribution	16.58
Building equipment contractors.....	15.76
Utility system construction	14.53

Most line installers and repairers belong to unions, principally the Communications Workers of America, the International Brotherhood of Electrical Workers, and the Utility Workers Union of America. For these workers, union contracts set wage rates, wage increases, and the time needed to advance from one job level to the next.

Related Occupations

Other workers who install and repair electrical and electronic equipment include broadcast and sound engineering technicians and radio operators, electricians, and radio and telecommunications equipment installers and repairers.

Sources of Additional Information

For more details about employment opportunities, contact the telephone, cable television, or electrical power companies in your community. For general information and some educational resources on line installer and repairer jobs, write to:

- Communications Workers of America, 501 3rd St. NW., Washington, DC 20001.
- International Brotherhood of Electrical Workers, Telecommunications Department, 1125 15th St. NW., Washington, DC 20005.

Maintenance and Repair Workers, General

(O*NET 49-9042.00)

Significant Points

- General maintenance and repair workers are employed in almost every industry.
- Many workers learn their skills informally on the job; others learn by working as helpers to other repairers or to construction workers such as carpenters, electricians, or machinery repairers.
- Job opportunities should be favorable, with many openings occurring as a result of turnover in this large occupation.

Nature of the Work

Most craft workers specialize in one kind of work, such as plumbing or carpentry. General maintenance and repair workers, however, have skills in many different crafts. They repair and maintain machines, mechanical equipment, and buildings and work on plumbing, electrical, and air-conditioning and heating systems. They build partitions, make plaster or drywall repairs, and fix or paint roofs, windows, doors, floors, woodwork, and other parts of building structures. They also maintain and repair specialized equipment and machinery found in cafeterias, laundries, hospitals, stores, offices, and factories. Typical duties include troubleshooting and fixing faulty electrical switches, repairing air-conditioning motors, and unclogging drains. New buildings sometimes have computer-controlled systems that allow maintenance workers to make adjustments in building settings and monitor for problems from a central location. For example, they can remotely control light sensors that turn off lights automatically after a set amount of time or identify a broken ventilation fan that needs to be replaced.

General maintenance and repair workers inspect and diagnose problems and determine the best way to correct them, frequently checking blueprints, repair manuals, and parts catalogs. They obtain supplies and repair parts from distributors or storerooms. Using common hand and power tools such as screwdrivers, saws, drills, wrenches, and hammers, as well as specialized equipment and electronic testing devices, these workers replace or fix worn or broken parts, where necessary, or make adjustments to correct malfunctioning equipment and machines.

General maintenance and repair workers also perform routine preventive maintenance and ensure that machines continue to run smoothly, building systems operate efficiently, and the physical condition of buildings does not deteriorate. Following a checklist, they may inspect drives, motors, and belts, check fluid levels, replace filters, and perform other maintenance actions. Maintenance and repair workers keep records of their work.

Employees in small establishments, where they are often the only maintenance worker, make all repairs, except for very large or difficult jobs. In larger establishments, their duties may be limited to the general maintenance of everything in a workshop or a particular area.

Working Conditions

General maintenance and repair workers often carry out several different tasks in a single day, at any number of locations. They may work inside of a single building or in several different buildings. They may have to stand for long periods, lift heavy objects, and work

General maintenance and repair workers ensure that building equipment functions properly.

in uncomfortably hot or cold environments, in awkward and cramped positions, or on ladders. They are subject to electrical shock, burns, falls, cuts, and bruises. Most general maintenance workers work a 40-hour week. Some work evening, night, or weekend shifts or are on call for emergency repairs.

Those employed in small establishments often operate with only limited supervision. Those working in larger establishments frequently are under the direct supervision of an experienced worker.

Training, Other Qualifications, and Advancement

Many general maintenance and repair workers learn their skills informally on the job. They start as helpers, watching and learning from skilled maintenance workers. Helpers begin by doing simple jobs, such as fixing leaky faucets and replacing lightbulbs, and progress to more difficult tasks, such as overhauling machinery or building walls. Some learn their skills by working as helpers to other repair or construction workers, including carpenters, electricians, or machinery repairers.

Necessary skills also can be learned in high school shop classes and postsecondary trade or vocational schools. It generally takes from 1 to 4 years of on-the-job training or school, or a combination of both, to become fully qualified, depending on the skill level required. Because a growing number of new buildings rely on computers to control various of their systems, general maintenance and repair workers may need basic computer skills, such as how to log onto a central computer system and navigate through a series of menus. Usually, companies that install computer-controlled equipment provide on-site training for general maintenance and repair workers.

Graduation from high school is preferred for entry into this occupation. High school courses in mechanical drawing, electricity, woodworking, blueprint reading, science, mathematics, and computers are useful. Mechanical aptitude, the ability to use shop mathematics, and manual dexterity are important. Good health is necessary because the job involves much walking, standing, reaching, and heavy lifting. Difficult jobs require problem-solving ability, and many positions require the ability to work without direct supervision.

Many general maintenance and repair workers in large organizations advance to maintenance supervisor or become a craftworker such as an electrician, a heating and air-conditioning mechanic, or a plumber. Within small organizations, promotion opportunities are limited.

Employment

General maintenance and repair workers held 1.3 million jobs in 2004. They were employed in almost every industry. Around 1 in 5 worked in manufacturing industries, almost evenly distributed through all sectors, while about 1 in 6 worked for different government bodies. Others worked for wholesale and retail firms and for real estate firms that operate office and apartment buildings.

Job Outlook

Job opportunities should be favorable, especially for those with experience in maintenance or related fields. General maintenance and repair is a large occupation with significant turnover. Additionally, many job openings are expected to result from the retirement of many experienced maintenance workers over the next decade.

Employment of general maintenance and repair workers is expected to grow about as fast as average for all occupations through 2014. Employment is related to the number of buildings—for example, office and apartment buildings, stores, schools, hospitals, hotels, and factories—and the amount of equipment needing maintenance and repair. However, as machinery becomes more advanced and requires less maintenance, the need for general maintenance and repair workers diminishes. Also, as more buildings are controlled by computers, buildings can be monitored more efficiently.

Earnings

Median hourly earnings of general maintenance and repair workers were \$14.76 in May 2004. The middle 50 percent earned between \$11.11 and \$19.17. The lowest 10 percent earned less than \$8.70, and the highest 10 percent earned more than \$23.40. Median hourly earnings in the industries employing the largest numbers of general maintenance and repair workers in May 2004 are shown in the following tabulation:

Local government	\$15.70
Elementary and secondary schools	14.93
Activities related to real estate	12.71
Lessors of real estate	11.96
Traveler accommodation.....	11.19

Some general maintenance and repair workers are members of unions, including the American Federation of State, County, and Municipal Employees and the United Auto Workers.

Related Occupations

Some duties of general maintenance and repair workers are similar to those of carpenters; pipelayers, plumbers, pipefitters, and steamfitters; electricians; and heating, air-conditioning, and refrigeration mechanics. Other duties are similar to those of coin, vending, and amusement machine servicers and repairers; electrical and electronics installers and repairers; electronic home entertainment equipment installers and repairers; and radio and telecommunications equipment installers and repairers.

Sources of Additional Information

Information about job opportunities may be obtained from local employers and local offices of the State Employment Service.

Millwrights

(O*NET 49-9044.00)

Significant Points

- Training through apprenticeship programs, or through community colleges coupled with on-the-job training, generally lasts 4 years.
- Despite projected slower-than-average employment growth, skilled applicants should have good job opportunities.
- About 54 percent of millwrights belong to labor unions, one of the highest rates of membership in the economy.

Nature of the Work

Millwrights install, repair, replace, and dismantle the machinery and heavy equipment used in many industries. About half of all millwrights work in a variety of manufacturing industries; another third work for construction builders and contractors. The wide range of facilities and the development of new technologies require millwrights to continually update their skills—from blueprint reading and pouring concrete for machinery to set on to diagnosing and solving mechanical problems.

The millwright's responsibilities begin when machinery arrives at the jobsite. New equipment must be unloaded, inspected, and moved into position. To lift and move light machinery, millwrights use rigging and hoisting devices, such as pulleys and cables. With heavier equipment, they may require the assistance of hydraulic lift-truck or crane operators to position the machinery. Because millwrights often decide which device to use for moving machinery, they must know the load-bearing properties of rope, cables, hoists, and cranes.

Millwrights consult with production managers and others to determine the optimal placement of machines in a plant. When this placement requires building a new foundation, millwrights either prepare the foundation themselves or supervise its construction. As a result, they must know how to read blueprints and work with a variety of building materials.

To assemble machinery, millwrights fit bearings, align gears and wheels, attach motors, and connect belts, according to the manufacturer's blueprints and drawings. Precision leveling and alignment are important in the assembly process, so millwrights measure angles, material thickness, and small distances with tools such as squares, calipers, and micrometers. When a high level of precision is required, devices such as lasers and ultrasonic measuring and alignment tools may be used. Millwrights also work with hand and power tools, such as cutting torches, welding machines, hydraulic torque wrenches, hydraulic stud tensioners, soldering guns, and with metalworking equipment, including lathes and grinding machines.

In addition to installing and dismantling machinery, many millwrights work with mechanics and maintenance workers to repair and maintain equipment. This includes preventive maintenance, such as lubrication and fixing or replacing worn parts. (For further information on machinery maintenance, see the section on industrial machinery installation, repair, and maintenance workers, except millwrights, elsewhere in the *Handbook*.)

Increasingly sophisticated automation means more complicated machines for millwrights to install and maintain, requiring millwrights to specialize in certain machines or brand names. For example, millwrights install and maintain turbines in power plants that can weigh hundreds of tons and contain thousands

Millwrights assemble and maintain complex industrial machinery.

of parts. This machinery requires special care and knowledge, so millwrights receive additional training and are required to be certified by the manufacturer of the turbine.

Working Conditions

Working conditions vary by industry. Millwrights employed in manufacturing often work in a typical shop setting and use protective equipment to avoid common hazards. For example, protective devices, such as safety belts, protective glasses, and hardhats may be worn to prevent injuries from falling objects or machinery. Those employed in construction may work outdoors in difficult weather conditions.

Advances in some equipment, such as hydraulic wrenches and hydraulic stud tensioners, have made the work safer and eliminated the need for millwrights to use a sledge hammer to pound bolts into position. Other equipment has reduced the amount of heavy lifting and other strenuous tasks that would often cause injuries in the past.

Millwrights work independently or as part of a team. Their tasks must be performed quickly and precisely, because disabled machinery costs a company time and money. Many millwrights work overtime; about 4 in 10 millwrights report working more than 40 hours during a typical week. During power outages or other emergencies, millwrights are often assigned overtime and shift work.

Millwrights that work at construction sites may have to travel long distances to reach different worksites. For example, millwrights who specialize in turbine installation travel to wherever new power plants are being built.

Training, Other Qualifications, and Advancement

Millwrights normally receive training through 4- to 5-year apprenticeship programs that combine on-the-job training with classroom instruction, or through community college programs coupled with informal on-the-job training. These programs include training in dismantling, moving, erecting, and repairing machinery. Trainees also may work with concrete and receive instruction in related skills,

such as carpentry, welding, and sheet-metal work. Millwright apprentices attend about one week of classes every three months. Classroom instruction covers mathematics, blueprint reading, hydraulics, electricity, computers, electronics, and instruction in specific machinery.

Employers prefer applicants with a high school diploma or equivalency and some vocational training or experience. Courses in science, mathematics, mechanical drawing, computers, and machine shop practice are useful. Millwrights are expected to keep their skills up-to-date and may need additional training on technological advances, such as laser shaft alignment and vibration analysis.

Because millwrights assemble and disassemble complicated machinery, mechanical aptitude is very important. Strength and agility also are necessary for lifting and climbing. Millwrights need good interpersonal and communication skills to work as part of a team and to effectively give detailed instructions to others.

Advancement for millwrights usually takes the form of higher wages. Some advance to the position of supervisor or superintendent, while others may become self-employed contractors.

Employment

Millwrights held about 59,000 jobs in 2004. Most work in manufacturing, primarily in durable goods industries, such as motor vehicle and parts manufacturing and iron and steel mills. About 1 in 3 millwrights are employed in construction, where most work for contracting firms. Although millwrights work in every State, employment is concentrated in heavily industrialized areas.

Job Outlook

Employment of millwrights is projected to grow more slowly than the average for all occupations through the year 2014. Because millwrights will always be needed to maintain and repair existing machinery, dismantle old machinery, and install new equipment, skilled applicants should have good job opportunities. Prospects will be best for millwrights with training in installing newer production technologies. In addition to employment growth, many job openings for these workers will stem from the need to replace experienced millwrights who transfer to other occupations or retire.

Employment of millwrights has historically been cyclical, rising and falling in line with investments in automation in the Nation's factories and production facilities. To remain competitive in coming years, firms will continue to require the services of millwrights to dismantle old equipment and install new high-technology machinery. Additionally, as the services sector of the economy grows, there is an increasing number of companies in this sector employing new technology to make them more efficient, which will likely offset the loss of manufacturing work. Warehouse and distribution companies, for example, are deploying highly automated conveyor systems which are being maintained by millwrights. Employment growth from new automation will be dampened somewhat by foreign competition and the introduction of new technologies, such as hydraulic torque wrenches, ultrasonic measuring tools, and laser shaft alignment, which allow fewer millwrights to perform more work. In addition, the demand for millwrights may be adversely affected as lower paid workers, such as electronics technicians and industrial machinery mechanics and maintenance workers, assume some installation and maintenance duties.

Earnings

Median hourly earnings of millwrights were \$21.02 in May 2004. The middle 50 percent earned between \$16.53 and \$27.07. The lowest 10 percent earned less than \$13.02, and the highest 10 percent

earned more than \$32.17. Earnings vary by industry and geographic location. Median hourly earnings in the industries employing the largest numbers of millwrights in May 2004 were as follows:

Motor vehicle parts manufacturing	\$28.76
Building equipment contractors	19.88

About 54 percent of millwrights belong to labor unions, one of the highest rates of membership in the economy.

Related Occupations

To set up machinery for use in a plant, millwrights must know how to use hoisting devices and how to assemble, disassemble, and sometimes repair machinery. Other workers with similar job duties include industrial machinery installation, repair, and maintenance workers, except millwrights; tool and die makers; aircraft and avionics equipment mechanics and service technicians; structural and reinforcing iron and metal workers; assemblers and fabricators; and heavy vehicle and mobile equipment service technicians and mechanics. Millwrights also machine parts and operate computer-controlled machine tools like machinists and computer control machine tool programmers and operators. Millwrights often use welding and soldering to assemble and repair machines like welding, soldering and brazing workers.

Sources of Additional Information

For further information on apprenticeship programs, write to the Apprenticeship Council of your State's labor department, local offices of your State employment service, or local firms that employ millwrights. In addition, you may contact:

Precision Instrument and Equipment Repairers

(O*NET 49-9061.00, 49-9062.00, 49-9063.01, 49-9063.02, 49-9063.03, 49-9063.04, 49-9064.00, 49-9069.99)

Significant Points

- Training requirements include a high school diploma and, in most cases, postsecondary education, coupled with significant on-the-job training.
- Good opportunities are expected for most types of jobs.
- Overall employment is expected to grow about as fast as average, but projected growth varies by detailed occupation.
- About 1 out of 6 are self-employed.

Nature of the Work

Repairing and maintaining watches, cameras, musical instruments, medical equipment, and other precision instruments requires a high level of skill and attention to detail. For example, some devices contain tiny gears that must be manufactured to within one one-hundredth

of a millimeter of design specifications, and other devices contain sophisticated electronic controls.

Camera and photographic equipment repairers work through a series of steps in fixing a camera. The first step is determining whether a repair should be attempted, because many inexpensive cameras cost more to repair than to replace. Of the problems for which repair seems worthwhile, the most complicated or expensive are referred back to the manufacturer or to a large repair center. If the repairers decide to proceed with the job themselves, they diagnose the problem, often by disassembling numerous small parts in order to reach the source. They then make needed adjustments or replace a defective part. Many problems are caused by the electronic circuits used in cameras, and fixing these circuits requires an understanding of electronics. Camera repairers also maintain cameras by removing and replacing broken or worn parts and cleaning and lubricating gears and springs. Because many of the components involved are extremely small, repairers must have a great deal of manual dexterity. Frequently, older camera parts are no longer available, requiring repairers to build replacement parts or to strip junked cameras. When machining new parts, workers often use a small lathe, a grinding wheel, and other metalworking tools.

Repairs on digital cameras are similar to those on conventional cameras, but because digital cameras have no film to wind, they have fewer moving parts. Digital cameras rely on software, so any repair to the lens requires that it be calibrated with the use of software and by connecting the camera to a personal computer.

Watch and clock repairers work almost exclusively on expensive and antique timepieces, because moderately priced timepieces are cheaper to replace than to repair. Electrically powered clocks and quartz watches and clocks function with almost no moving parts, limiting necessary maintenance to replacing the battery. Many expensive timepieces still employ old-style mechanical movements and a manual or automatic winding mechanism. This type of timepiece must be regularly adjusted and maintained. Repair and maintenance work on a mechanical timepiece requires using handtools to disassemble many fine gears and components. Each part is inspected for signs of wear. Some gears or springs may need to be replaced or machined. Exterior portions of the watch may require polishing and buffing. Specialized machines are used to clean all of the parts with ultrasonic waves and a series of baths in cleaning agents. Reassembling a watch requires lubricating key parts.

As with older cameras, replacement parts are frequently unavailable for antique watches or clocks. In such cases, watch repairers must machine their own parts. They employ small lathes and other machines in creating tiny parts.

Musical instrument repairers and tuners combine their love of music with a highly skilled craft. Often referred to as technicians, these artisans work in four specialties: Band instruments, pianos and organs, violins, and guitars. (Repairers and tuners who work on electronic organs are discussed in the *Handbook* statement on electronic home entertainment equipment installers and repairers.)

Band instrument repairers, brass and wind instrument repairers, and percussion instrument repairers focus on woodwind, brass, reed, and percussion instruments damaged through deterioration or by accident. They move mechanical parts or play scales to find problems. They may unscrew and remove rod pins, keys, worn cork pads, and pistons and remove soldered parts by means of gas torches. Using filling techniques or a mallet, they repair dents in metal and wood. These repairers use gas torches, grinding wheels, lathes, shears, mallets, and small handtools and are skilled in metalworking and woodworking. Percussion instrument repairers often must install new drumheads, which formerly were cut from animal skin, but now are made exclusively from Mylar® and other synthetic materials.

Violin and guitar repairers adjust and repair stringed instruments. Some repairers work on both stringed and band instruments. Initially, repairers play and inspect the instrument to find any defects. They replace or repair cracked or broken sections and damaged parts. They also restring the instruments and repair damage to their finish. Because the specifications of all types of instruments vary greatly, custom parts machining is considered an essential skill.

Piano tuners and repairers use similar techniques, skills, and tools. Most workers in this group are piano tuners, tuning and making minor repairs. Tuning involves tightening and loosening different strings to achieve the proper tone or pitch. Because pianos are difficult to transport, tuners normally make house calls. Some repairers specialize in restoring older pianos. Restoration is complicated work, often involving replacing many of the parts, which number more than 12,000 in some pianos. With proper maintenance and restoration, pianos often survive more than 100 years.

Pipe organ repairers do work similar to that of piano repairers, but on a larger scale. In addition, they assemble new organs. Because pipe organs are too large to transport, they must be assembled onsite. Even with repairers working in teams or with assistants, the organ assembly process can take several weeks or even months, depending upon the size of the organ.

Medical equipment repairers and other precision instrument and equipment repairers maintain, adjust, calibrate, and repair electronic, electromechanical, and hydraulic equipment. They use various tools, including multimeters, specialized software, and computers designed to communicate with specific pieces of hardware. Among their specialized tools is equipment designed to simulate water or air pressure. These repairers use handtools, soldering irons, and other electronic tools to repair and adjust equipment. Faulty circuit boards and other parts are normally removed and replaced. Medical equipment repairers and other precision instrument repairers must maintain careful, detailed logs of all maintenance and repair that they perform on each piece of equipment they work with.

Medical equipment repairers, often called *biomedical equipment technicians*, work on medical equipment such as defibrillators, heart monitors, medical imaging equipment (x rays, CAT scanners, and ultrasound equipment), voice-controlled operating tables, and electric wheelchairs.

Other precision instrument and equipment repairers service, repair, and replace a wide range of equipment associated with automated or instrument-controlled manufacturing processes. A precision instrument repairer working at an electric powerplant, for example, would repair and maintain instruments that monitor the operation of the plant, such as pressure and temperature gauges. Replacement parts are not always available, so repairers sometimes machine or fabricate a new part. Preventive maintenance involves regular lubrication, cleaning, and adjustment of many measuring devices. Increasingly, it also involves solving computer software problems as more control devices, such as valves, are controlled by or linked to computer networks. To adjust a control device, a technician may need to connect a laptop computer to the control device's computer and make adjustments through changes to the software commands.

Working Conditions

Camera, watch, and musical instrument repairers work under fairly similar solitary, low-stress conditions with minimal supervision. A quiet, well-lighted workshop or repair shop is typical, while a few of these repairers travel to the instrument being repaired, such as a piano, an organ, or a grandfather clock. Often, these workers can adjust their schedules, allowing for second jobs as needed. Musical instrument repairer jobs are attractive to many professional musicians because

Watch repairers use fine motor skills to perform detailed work.

the flexible hours common to repair work allow musicians to do the work while still maintaining a regular performing schedule.

Medical equipment and precision instrument and equipment repairers normally work daytime hours, but are often expected to be on call. Still, like other hospital and factory employees, some repairers work irregular hours. Precision instrument repairers work under a wide array of conditions, from hot, dirty, noisy factories, to air-conditioned workshops, to the outdoors on fieldwork. Attention to safety is essential, as the work sometimes involves dangerous machinery or toxic chemicals. Due to the individualized nature of the work, supervision is fairly minimal.

Training, Other Qualifications, and Advancement

Most employers require at least a high school diploma for beginning precision instrument and equipment repairers. Many employers prefer applicants with some postsecondary education. Much training takes place on the job. The ability to read and understand technical manuals is important. Necessary physical qualities include good fine-motor skills and acute vision. Also, precision equipment repairers must be able to pay close attention to details, enjoy problem solving, and have the desire to disassemble machines to see how they work. Most precision equipment repairers must be able to work alone with minimal supervision.

The educational background required for camera and photographic equipment repairers varies, but some knowledge of electronics is necessary. A number of workers complete postsecondary training, such as an associate degree, in electronics. The job requires the ability to read electronic schematic diagrams and comprehend other technical information, in addition to manual dexterity. New employees are trained on the job in two stages over about a year. First, they learn to repair a single product over a couple of weeks. Then, they learn to repair other products and refine their skills for 6–12 months while working under the close supervision of an experienced repairer. Finally, repairers continually teach themselves through studying manuals and attending manufacturer-sponsored seminars on the specifics of new models.

Training also varies for watch and clock repairers. Several associations, including the American Watchmakers-Clockmakers

Institute and the National Association of Watch and Clock Collectors, offer certifications. Some certifications can be completed in a few months; others require simply passing an examination; the most demanding certifications require 3,000 hours, taken over 2 years, of classroom time in technical institutes or colleges. Those who have earned the most demanding certifications are usually the most sought after by employers. Clock repairers generally require less training than do watch repairers, because watches have smaller components and require greater precision. Some repairers opt to learn through assisting a master watch repairer. Nevertheless, developing proficiency in watch or clock repair requires several years of education and experience.

For musical instrument repairers and tuners, employers prefer people with post-high school training in music repair technology. According to a Piano Technicians Guild membership survey, the overwhelming majority of respondents had completed at least some college work; most had a bachelor's or higher degree, although not always in music repair technology. Almost all repairers have a strong musical background; many are musicians themselves. Also, a basic ability to play the instruments being repaired is normally required. Courses in instrument repair are offered only at a few technical schools and colleges. Correspondence courses are common for piano tuners. Graduates of these programs normally receive additional training on the job, working with an experienced repairer. Many musical instrument repairers and tuners begin learning their trade on the job as assistants or apprentices. Trainees perform a variety of tasks around the shop. Full qualification usually requires 2 to 5 years of training and practice. Musical instrument repair and tuning requires good manual dexterity, an "ear" for pitch and tone, and good hand-eye coordination. While piano tuning requires good hearing, it can be performed by the blind.

Medical equipment repairers' training includes on-the-job training, manufacturer training classes, and associate degree programs. While an associate degree in electronics or medical technology is normally required, training varies by specialty. For those with a background in electronics, on-the-job training is more common for workers repairing less critical equipment, such as hospital beds or electric wheelchairs. An associate or even a bachelor's degree, often in medical technology or engineering, and a passing grade on a certification exam is likely to be required of persons repairing more critical equipment, such as CAT scanners and defibrillators. Some repairers are trained in the military. New repairers begin by observing and assisting an experienced worker over a period of 3 to 6 months, learning a single piece of equipment at a time. Gradually, they begin working independently, while still under close supervision. Biomedical equipment repairers are constantly learning new technologies and equipment through seminars, self-study, and certification exams.

Educational requirements for other precision instrument and equipment repair jobs also vary, but include a high school diploma, with a focus on mathematics and science courses. Because repairers need to understand blueprints, electrical schematic diagrams, and electrical, hydraulic, and electromechanical systems, most employers require an associate or sometimes a bachelor's degree in instrumentation and control, electronics, or a related engineering field. In addition to formal education, a year or two of on-the-job training is required before a repairer is considered fully qualified. Many instrument and equipment repairers begin by working in a factory in another capacity, such as repairing electrical equipment. As companies seek to improve efficiency, other types of repair workers are trained to repair precision measuring equipment. Some advancement opportunities exist, but many supervisory positions require a bachelor's degree.

Employment

Precision instrument and equipment repairers held 62,000 jobs in 2004. Employment was distributed among the detailed occupations as follows:

Medical equipment repairers.....	29,000
Precision instrument and equipment repairers, all other.....	17,000
Musical instrument repairers and tuners.....	6,100
Camera and photographic equipment repairers.....	5,100
Watch repairers.....	4,300

Medical equipment repairers often work for hospitals or wholesale equipment suppliers, while those in the occupation "all other precision instrument repairers" frequently work for manufacturing companies and wholesalers of durable goods. About 1 out of 6 precision instrument and equipment repairers was self-employed—they may own jewelry, camera, medical equipment, or music stores.

Job Outlook

Good opportunities are expected for most types of precision instrument and equipment repairer jobs. Overall employment growth is projected to be about as fast as the average for all occupations over the 2004–14 period; however, projected growth varies by detailed occupation.

Job growth among medical equipment repairers should be about as fast as the average for all occupations over the projection period. The rapidly expanding healthcare industry and elderly population should spark demand for increasingly sophisticated medical equipment and, in turn, create good employment opportunities in this occupation.

By contrast, employment of musical instrument repairers is expected to increase more slowly than the average. Replacement needs are expected to provide the most job opportunities as many repairers and tuners retire. School budget cuts to music programs—specifically, stringed-instrument programs—should hurt the outlook for musical repairers. With fewer new musicians, there will be a slump in instrument rentals, purchases, and repairs. Because training in the repair of musical instruments is difficult to obtain—there are only a few schools that offer training programs, and few experienced workers are willing to take on apprentices—opportunities should be good for those who receive training. Schools report that their graduates easily find employment.

Employment of camera and photographic equipment repairers is expected to decline. The popularity of inexpensive cameras adversely affects employment in this occupation, as most point-and-shoot cameras are cheaper to replace than repair. When a camera breaks, not only is replacing the camera often not much more expensive than repairing it, but the new model is also far more advanced than the old one. However, consumers are spending more on high-end digital cameras than they did on conventional cameras in the past, which should make repairing the cameras more economical.

Employment of watch repairers is expected to increase more slowly than the average. Over the past few decades, changes in technology, including the invention of digital and quartz watches that need few repairs, caused a significant decline in the demand for watch repairers. In recent years, this trend was somewhat reversed, as the growing popularity of expensive mechanical watches increased the need for these repairers. Nonetheless, few new repairers entered the field. Thus, the small number of entrants, coupled with the fact that a large proportion of watch and clock repairers are approaching retirement age, should result in very good job opportunities in this field.

The projected slower-than-average employment growth of other precision instrument and equipment repairers reflects the expected lack of employment growth in manufacturing and other industries

in which they are employed. Nevertheless, good employment opportunities are expected for these workers due to the relatively small number of people entering the occupation and the need to replace repairers who retire.

Earnings

The following tabulation shows median hourly earnings for various precision instrument and equipment repairers in May 2004:

Precision instrument and equipment repairers, all other.....	\$21.25
Medical equipment repairers.....	17.90
Camera and photographic equipment repairers	15.54
Watch repairers	13.87
Musical instrument repairers and tuners.....	13.47

Earnings ranged from less than \$7.94 for the lowest 10 percent of musical instrument repairers and tuners to more than \$32.32 for the highest 10 percent in the occupation “all other precision instrument and equipment repairers.”

Earnings within the different occupations vary significantly, depending upon skill levels. For example, a lesser skilled watch and clock repairer may simply change batteries and replace worn wrist straps, while a highly skilled watch and clock repairer with years of training and experience may rebuild and replace worn parts.

Related Occupations

Many precision instrument and equipment repairers work with precision mechanical and electronic equipment. Other workers who repair precision mechanical and electronic equipment include computer, automated teller, and office machine repairers and coin, vending, and amusement machine servicers and repairers. Other workers who make precision items include dental laboratory technicians and ophthalmic laboratory technicians. Some precision instrument and equipment repairers work with a wide array of industrial equipment.

Their work environment and responsibilities are similar to those of industrial machinery installation, maintenance, and repair workers. Much of the work of watch repairers is similar to that of jewelers and precious stone and metal workers. Camera repairers' work is similar to that of electronic home entertainment equipment installers and repairers; both occupations work with consumer electronics that are based around a circuit board, but that also involve numerous moving mechanical parts.

Production Occupations

Assemblers and Fabricators

(O*NET 51-2011.01, 51-2011.02, 51-2011.03, 51-2021.00, 51-2022.00, 51-2023.00, 51-2031.00, 51-2041.01, 51-2041.02, 51-2091.00, 51-2092.00, 51-2093.00, 51-2099.99)

Significant Points

- More than half of all assemblers are team assemblers.
- Work areas may be noisy, and many assemblers may have to sit or stand for long periods.
- A high school diploma is preferred for most positions, but specialized training is required for some assembly jobs.

Nature of the Work

Assemblers and fabricators play an important role in the manufacturing process. They are responsible for putting together finished and semifinished goods, assembling the pieces of components of a product and then joining the components into a whole product. The products they produce range from entire airplanes to intricate timing devices. They fabricate and assemble household appliances, automobiles and automobile engines and parts, as well as computers and other electronic devices.

Assemblers begin by reading detailed schematics or blue prints that show how to assemble complex machines. After determining how parts should connect, they often need to use hand or power tools to trim, shim, cut, and make other adjustments to make components fit together and align properly. Once the parts are properly aligned, they connect parts with bolts and screws or by welding or soldering pieces together. Careful quality control is important throughout the assembly process, so assemblers look for both mistakes in the assembly process and faulty components. They try to help fix problems before more defective products are produced.

Changes in technology have transformed the manufacturing and assembly process. Automated manufacturing systems now use robots, computers, programmable motion control devices, and various sensing technologies. These systems change the way in which goods are made and affect the jobs of those who make them. The more advanced assemblers must be able to work with these new technologies and be comfortable using them to produce goods.

Manufacturing techniques are evolving away from traditional assembly line systems towards “lean” manufacturing systems, which is causing the nature of assemblers’ work to change. Lean manufacturing involves using teams of workers within “cells” to produce entire products or components. *Team assemblers* perform all of the assembly tasks assigned to their teams, rotating through the different tasks, rather than specializing in a single task as would be done on an assembly line. The team also may decide how the work is to be assigned and how different tasks are to be performed. This worker flexibility helps companies to cover for absent workers, improves productivity, and increases their ability to respond to changes in demand by shifting labor from one product line to another. For example, if demand for a product drops, companies may reduce the number of workers involved, while individual workers perform more stages of the assembly process. Some aspects of lean production, such as rotating tasks and seeking worker input on

improving the assembly process, are common to all assembly and fabrication occupations.

Although more than half of all assemblers and fabricators are classified as “team assemblers,” others specialize in producing one type of product or perform the same or similar functions throughout the assembly process. These workers are classified according to the type of products they assemble or produce. *Electrical and electronic equipment assemblers* build products such as electric motors, batteries, computers, electronic control devices and sensing equipment. *Electromechanical equipment assemblers* assemble and modify electromechanical devices such as household appliances, dynamometers, actuators, or vending machines. *Coil winders, tapers, and finishers* wind wire coil used in resistors, transformers, generators, and electric motors. *Engine and other machine assemblers* construct, assemble, or rebuild engines and turbines, and machines used in almost all manufacturing industries, including agriculture, construction, mining, rolling mills, and textile, paper, and food processing. *Aircraft structure, surfaces, rigging, and systems assemblers* assemble, fit, fasten and install parts of airplanes, space vehicles, or missiles, such as the tails and wings, landing gear, and heating and ventilation systems. *Structural metal fabricators and fitters* cut, align, and fit together structural metal parts according to detailed specifications prior to welding or riveting. *Fiberglass laminators and fabricators* create products made of fiberglass, mainly boat decks and hulls and automobile body parts. *Timing device assemblers, adjusters, and calibrators* perform precision assembling or adjusting of timing devices within very narrow tolerances.

Involving assemblers and fabricators in product development has become more common. Designers and engineers consult manufacturing workers during the design stage to improve product reliability and manufacturing efficiency. For example, an assembler may tell a designer that the dash of a new car design will be too difficult to install quickly and consistently. The designer could then redesign the dash to make it easier to install.

Some experienced assemblers work with designers and engineers to build prototypes or test products. These assemblers read and interpret complex engineering specifications from text, drawings, and computer-aided drafting systems. They also may use a variety of tools and precision measuring instruments.

Working Conditions

The working conditions for assemblers and fabricators vary from plant to plant and from industry to industry. They may even vary within a plant. One consistent trend is increasingly improving working conditions. Many physically difficult tasks, such as manually tightening massive bolts or moving heavy parts in position, have been made much easier through the use hydraulic and electromechanical equipment. Most factories today are generally clean, well-lit, and well-ventilated, and depending on what type of work is being performed, they may also need to be dirt and dust-free. Electronic and electromechanical assemblers particularly must work in environments free of dust that could affect the operation of the products they build. Some assemblers may also come into contact with potentially harmful chemicals or fumes, but ventilation systems and other safety precautions normally minimize any harmful effects. Other assemblers may come in contact with oil and grease, and their working areas may be quite noisy.

Electronics assemblers work in a clean, well-lighted environment.

Most full-time assemblers work a 40-hour week, although overtime and shift work is fairly common in some industries. Work schedules of assemblers may vary at plants with more than one shift.

Training, Other Qualifications, and Advancement

New assemblers and fabricators are normally considered entry-level employees. The ability to do accurate work at a rapid pace and to follow detailed instructions are key job requirements. A high school diploma is preferred for most positions. Following detailed assembly instructions requires basic reading skills, although many instructions rely on pictures and diagrams.

Applicants need specialized training for some assembly jobs. For example, employers may require that applicants for electrical, electronic, or aircraft assembler jobs be technical school graduates or have equivalent military training. Other positions require only on-the-job training, sometimes including employer-sponsored classroom instruction, in the broad range of assembly duties that employees may be required to perform. Many new assemblers are hired as temporary workers, often through employment services firms.

Good eyesight, with or without glasses, is required for assemblers and fabricators who work with small parts. Plants that make electrical and electronic products may test applicants for color vision, because many of their products contain many differently colored wires. Manual dexterity and the ability to carry out complex, repetitive tasks quickly and methodically also are important.

As assemblers and fabricators become more experienced, they may progress to jobs that require greater skill and be given more responsibility. Experienced assemblers may become product repairers if they have learned the many assembly operations and understand the construction of a product. These workers fix assembled articles that operators or inspectors have identified as defective. Assemblers also can advance to quality control jobs or be promoted to supervisor. Experienced assemblers and fabricators also may become members of research and development teams, working with engineers and other project designers to design, develop, and build prototypes, and test new product models. In some companies, assemblers can become trainees for one of the skilled trades, such as machinist. Those with a background in math, science, and computers may advance to become programmers or operators of more highly automated production equipment.

Employment

Assemblers and fabricators held nearly 2 million jobs in 2004. They were found in almost every industry, but the vast majority, nearly

3 out of 4, were found in manufacturing. In addition, 9 percent of workers were employed by employment services firms, mostly as temporary workers. In all likelihood, many of these temporary workers were assigned to manufacturing plants. Wholesale and retail trade firms employed the next highest number of assemblers and fabricators. Team assemblers, the largest specialty, accounted for 62 percent of assembler and fabricator jobs. The distribution of employment among the various types of assemblers was as follows:

Team assemblers	1,200,000
All other assemblers and fabricators	268,000
Electrical and electronic equipment assemblers	221,000
Structural metal fabricators and fitters	90,000
Electromechanical equipment assemblers	52,000
Engine and other machine assemblers	46,000
Fiberglass laminators and fabricators	31,000
Coil winders, tapers, and finishers	28,000
Aircraft structure, surfaces, rigging, and systems assemblers ...	19,000
Timing device assemblers, adjusters, and calibrators	3,300

Within the manufacturing sector, assembly of transportation equipment, such as aircraft, autos, trucks, and buses, accounted for 19 percent of all jobs. Assembly of computers and electronic products accounted for another 11 percent of all jobs. Other industries that employ many assemblers and fabricators were machinery manufacturing (heating and air-conditioning equipment; agriculture, construction, and mining machinery; and engine, turbine, and power transmission equipment); electrical equipment, appliance, and component manufacturing (lighting, household appliances, and electrical equipment); and fabricated metal products.

The following tabulation shows wage and salary employment in manufacturing industries employing the most assemblers and fabricators in 2004.

Transportation equipment manufacturing	387,000
Computer and electronic product manufacturing	225,000
Machinery manufacturing	193,000
Fabricated metal product manufacturing	143,000
Electrical equipment, appliance, and component manufacturing	139,000

Job Outlook

Employment of assemblers and fabricators is expected to grow more slowly than average through the year 2014, reflecting growth in mainly nonmanufacturing industries. The largest increase in the number of assemblers and fabricators is projected to be in the employment services industry, which supplies temporary workers to the various industries. Temporary workers are gaining in importance in the manufacturing sector and elsewhere as companies strive for a more flexible workforce to meet the fluctuations in the market. There will also be more jobs for assemblers and fabricators in the wholesale and retail sectors of the economy. As more goods come unassembled from foreign countries to save on shipping costs, it is increasingly up to wholesalers and retailers to provide assembly of products to their customers.

Within the manufacturing sector, employment of assemblers and fabricators is expected to grow mainly in motor vehicle and motor vehicle parts manufacturing, furniture manufacturing, and food processing due to increasing sales of these products. In many other manufacturing industries, assemblers and fabricators have been negatively affected by increasing automation, improving productivity, and the shift of assembly to countries with lower labor costs. In addition to new jobs stemming from growth in this occupation, many job openings will result from the need to replace workers leaving this large occupational group.

The effects of automation will be felt more among some types of assemblers and fabricators than among others. Automated manufacturing systems are expensive, and a large volume of repetitive work is required to justify their purchase. Also, where the assembly parts involved are irregular in size or location, new technology only now is beginning to make inroads. For example, much assembly in the aerospace industry is done in hard-to-reach locations—inside airplane fuselages or gear boxes, for example—which are unsuited to robots; as a result, aircraft assemblers will not be easily replaced by automated processes.

The use of team production techniques has been a success in the manufacturing sector, boosting productivity and improving the quality of goods. Workers collaborate to decide how to best perform assembly tasks. Team assemblers are often consulted during the design phase of production, to make sure that the product is easy to assemble. Through continued efforts to improve the assembly process, most manufacturing companies have significantly reduced the amount of labor needed to assemble a product. By boosting productivity, companies are better able to compete with low wage companies. Thus, while the number of assemblers overall will decline in manufacturing, the number of team assemblers will remain stable.

Many producers have sent their assembly functions to countries where labor costs are lower. Decisions by American corporations to move assembly to other nations should limit employment growth for assemblers in some industries, but a free trade environment also may lead to growth in the export of goods assembled in the United States.

Earnings

Earnings vary by industry, geographic region, skill, educational level, and complexity of the machinery operated. Median hourly earnings of team assemblers were \$11.42 in May 2004. The middle 50 percent earned between \$9.12 and \$14.60. The lowest 10 percent earned less than \$7.56, and the highest 10 percent earned \$18.80. Median hourly earnings in the manufacturing industries employing the largest numbers of team assemblers in May 2004 are shown below:

Motor vehicle manufacturing.....	\$22.45
Motor vehicle parts manufacturing.....	12.91
Other wood product manufacturing.....	10.90
Plastics product manufacturing.....	10.54
Employment services.....	8.66

Median hourly earnings of electrical and electronic equipment assemblers were \$11.68 in May 2004. The middle 50 percent earned

between \$9.54 and \$14.84. The lowest 10 percent earned less than \$8.01, and the highest 10 percent earned more than \$18.64. Median hourly earnings in the manufacturing industries employing the largest numbers of electrical and electronic equipment assemblers in May 2004 are shown below:

Computer and peripheral equipment manufacturing	\$12.80
Navigational, measuring, electromedical, and control instruments manufacturing.....	12.61
Electrical equipment manufacturing.....	12.55
Communications equipment manufacturing.....	11.61
Semiconductor and other electronic component manufacturing	11.02

In May 2004, other assemblers and fabricators had the following median hourly earnings:

Aircraft structure, surfaces, rigging, and systems assemblers	\$17.79
Engine and other machine assemblers.....	16.73
Structural metal fabricators and fitters.....	14.34
Timing device assemblers, adjusters, and calibrators.....	13.76
Electromechanical equipment assemblers.....	12.71
Coil winders, tapers, and finishers.....	12.24
Fiberglass laminators and fabricators.....	12.18
Assemblers and fabricators, all other.....	11.90

Many assemblers and fabricators are members of labor unions. These unions include the International Association of Machinists and Aerospace Workers; the United Electrical, Radio and Machine Workers of America; the United Automobile, Aerospace and Agricultural Implement Workers of America; the International Brotherhood of Electrical Workers; and the United Steelworkers of America.

Related Occupations

Other occupations that involve operating machines and tools and assembling products include welding, soldering, and brazing workers; and machine setters, operators, and tenders—metal and plastic. Assemblers and fabricators also are responsible for some quality control and product testing, as is the case for inspectors, testers, sorters, samplers, and weighers.

Sources of Additional Information

Information about employment opportunities for assemblers is available from local offices of the State employment service and from locals of the unions mentioned earlier.

Food Processing Occupations

(O*NET 51-3011.01, 51-3011.02, 51-3021.00, 51-3022.00, 51-3023.00, 51-3091.00, 51-3092.00, 51-3093.00)

Significant Points

- Most employees in manual food-processing jobs require little or no training prior to being hired.
- As more jobs involving cutting and processing meat shift from retail stores to food-processing plants, job growth will be concentrated among lesser skilled workers, who are employed primarily in manufacturing.

Nature of the Work

Food processing occupations include many different types of workers who process raw food products into the finished goods sold by grocers or wholesalers, restaurants, or institutional food services. These workers perform a variety of tasks and are responsible for producing many of the food products found in every household.

Butchers as well as meat, poultry, and fish cutters and trimmers are employed at different stages in the process by which animal carcasses are converted into manageable pieces of meat, known as boxed meat, that are suitable for sale to wholesalers and retailers. Meat, poultry, and fish cutters and trimmers commonly work in animal slaughtering and processing plants, while butchers and meatcutters usually are

employed in retail establishments. As a result, the nature of these jobs varies significantly.

In animal slaughtering and processing plants, *slaughterers and meatpackers* slaughter cattle, hogs, goats, and sheep and cut the carcasses into large wholesale cuts, such as rounds, loins, ribs, and chucks, to facilitate the handling, distribution, and marketing of meat. In some of these plants, slaughterers and meatpackers also further process the large parts into cuts that are ready for retail use. These workers also produce hamburger meat and meat trimmings, which are used to prepare sausages, luncheon meats, and other fabricated meat products. Slaughterers and meatpackers usually work on assembly lines, with each individual responsible for only a few of the many cuts needed to process a carcass. Depending on the type of cut, these workers use knives; cleavers; meat saws; bandsaws; or other potentially dangerous equipment.

In grocery stores, wholesale establishments that supply meat to restaurants, and institutional food service facilities, *butchers and meatcutters* separate wholesale cuts of meat into retail cuts or individually sized servings. These workers cut meat into steaks and chops, shape and tie roasts, and grind beef for sale as chopped meat. Boneless cuts are prepared with the use of knives, slicers, or power cutters, while bandsaws are required to carve bone-in pieces of meat. Butchers and meatcutters in retail food stores also may weigh, wrap, and label the cuts of meat; arrange them in refrigerated cases for display; and prepare special cuts to fill unique orders by customers.

Poultry cutters and trimmers slaughter and cut up chickens, turkeys, and other types of poultry. Although the poultry processing industry is becoming increasingly automated, many jobs, such as trimming, packing, and deboning, are still done manually. As in the animal slaughtering and processing industry, most poultry cutters and trimmers perform routine cuts on poultry as it moves along production lines.

Unlike some of the other occupations just listed, *fish cutters and trimmers*, also called *fish cleaners*, are likely to be employed in both manufacturing and retail establishments. These workers primarily scale, cut, and dress fish by removing the head, scales, and other inedible portions and cutting the fish into steaks or fillets. In retail markets, these workers may also wait on customers and clean fish to order.

Meat, poultry, and fish cutters and trimmers also prepare ready-to-heat foods. This preparation often entails filleting meat or fish; cutting it into bite-sized pieces; preparing and adding vegetables; and applying sauces, marinades, or breading.

Food processing occupations include many different types of workers, such as butchers and meatcutters, who process raw food into finished goods.

Bakers mix and bake ingredients in accordance with recipes to produce varying quantities of breads, pastries, and other baked goods. Bakers commonly are employed in grocery stores and specialty shops, and produce small quantities of breads, pastries, and other baked goods for consumption on premises or for sale as specialty baked goods. In manufacturing, bakers produce goods in large quantities, using high-volume mixing machines, ovens, and other equipment. Goods produced in large quantities usually are available for sale through distributors, grocery stores, or manufacturers' outlets.

Others in food processing occupations include *food batchmakers*, who set up and operate equipment that mixes, blends, or cooks ingredients used in the manufacture of food products, according to formulas or recipes; *food cooking machine operators and tenders*, who operate or tend to cooking equipment, such as steam-cooking vats, deep-fry cookers, pressure cookers, kettles, and boilers to prepare food products, such as meat, sugar, cheese, and grain; and *food and tobacco roasting, baking, and drying machine operators and tenders*, who use equipment to reduce the moisture content of food or tobacco products or to process food in preparation for canning. Some of the machines that are used include hearth ovens, kiln driers, roasters, char kilns, steam ovens, and vacuum drying equipment.

Working Conditions

Working conditions vary by type and size of establishment. In animal slaughtering and processing plants and large retail food establishments, butchers and meatcutters work in large meatcutting rooms equipped with power machines and conveyors. In small retail markets, the butcher or fish cleaner may work in a cramped space behind the meat or fish counter. To prevent viral and bacterial infections, work areas must be kept clean and sanitary.

Butchers and meatcutters, poultry and fish cutters and trimmers, and slaughterers and meatpackers often work in cold, damp rooms. The work areas are refrigerated to prevent meat from spoiling and are damp because meat cutting generates large amounts of blood, condensation, and fat. Cool, damp floors increase the likelihood of slips and falls. In addition, cool temperatures, long periods of standing, and repetitious physical tasks make the work tiring. As a result, butchers as well as meat, poultry, and fish cutters and trimmers are more susceptible to injury than are most other workers.

Injuries include cuts and occasional amputations, which occur when knives, cleavers, or power tools are used improperly. Also, repetitive slicing and lifting often lead to cumulative trauma injuries, such as carpal tunnel syndrome. To reduce the incidence of cumulative trauma injuries, some employers have reduced employee workloads, added prescribed rest periods, redesigned jobs and tools, and promoted increased awareness of early warning signs so that steps can be taken to prevent further injury. Nevertheless, workers in the occupation still face the serious threat of disabling injuries.

Most traditional bakers work in bakeries, cake shops, hot-bread shops, hotels, restaurants, and cafeterias, and in the bakery departments of supermarkets. Bakers may work under hot and noisy conditions. Also, bakers typically work under strict order deadlines and critical time-sensitive baking requirements, both of which can induce stress. Bakers usually work in shifts and may work early mornings, evenings, weekends, and holidays. While many bakers often work as part of a team, they also may work alone when baking particular items. These workers may supervise assistants and teach apprentices and trainees. Bakers in retail establishments may be required to serve customers.

Other food processing workers—such as food batchmakers; food and tobacco roasting, baking, and drying machine operators and tenders; and food cooking machine operators and tenders—typically work in production areas that are specially designed for food preservation or processing. Food batchmakers, in particular, work in kitchen-type, assembly-line production facilities. Because this work involves food, work areas must meet governmental sanitary regulations. The ovens, as well as the motors of blenders, mixers, and other equipment, often make work areas very warm and noisy. There are some hazards, such as burns, created by the equipment that these workers use. Food batchmakers; food and tobacco roasting, baking, and drying machine operators; and food cooking machine operators and tenders spend a great deal of time on their feet and generally work a regular 40-hour week that may include evening and night shifts.

Training, Other Qualifications, and Advancement

Training varies widely among food processing occupations. However, most manual food processing workers require little or no training prior to being hired.

Most butchers as well as poultry and fish cutters and trimmers acquire their skills on the job through formal and informal training programs. The length of training varies significantly. Simple cutting operations require a few days to learn, while more complicated tasks, such as eviscerating slaughtered animals, generally require several months to learn. The training period for highly skilled butchers at the retail level may be 1 or 2 years.

Generally, on-the-job trainees begin by doing less difficult jobs, such as making simple cuts or removing bones. Under the guidance of experienced workers, trainees learn the proper use and care of tools and equipment and how to prepare various cuts of meat. After demonstrating skill with various meatcutting tools, trainees learn to divide carcasses into wholesale cuts and wholesale cuts into retail and individual portions. Trainees also may learn to roll and tie roasts, prepare sausage, and cure meat. Those employed in retail food establishments often are taught operations, such as inventory control, meat buying, and recordkeeping. In addition, growing concern about food-borne pathogens in meats has led employers to offer numerous safety seminars and extensive training in food safety to employees.

Skills that are important to meat, poultry, and fish cutters and trimmers include manual dexterity, good depth perception, color discrimination, and good hand-eye coordination. Physical strength often is needed to lift and move heavy pieces of meat. Butchers and fish cleaners who wait on customers should have a pleasant personality, a neat appearance, and the ability to communicate clearly. In some States, a health certificate is required for employment.

Bakers often start as apprentices or trainees. Apprentice bakers usually start in craft bakeries, while trainees usually begin in store bakeries, such as those in supermarkets. Bakers need to be skilled in baking, icing, and decorating. They also need to be able to follow instructions, have an eye for detail, and communicate well with others. Knowledge of bakery products and ingredients, as well as mechanical mixing and baking equipment, is important. Many apprentice bakers participate in correspondence study and may work towards a certificate in baking. Working as a baker’s assistant or at other activities that involve handling food also is a useful tool for training. The complexity of the skills required for certification as a baker often is underestimated. Bakers need to know about applied chemistry; ingredients and nutrition; government health and sanitation regulations; business concepts; and production processes, including how to operate and maintain machinery. Modern food

plants typically use high-speed automated equipment that often is operated by computers.

Food machine operators and tenders usually are trained on the job. They learn to run the different types of equipment by watching and helping other workers. Training can last anywhere from a month to a year, depending on the complexity of the tasks and the number of products involved. A degree in the appropriate area—dairy processing for those working in dairy product operations, for example—is helpful for advancement to a lead worker or a supervisory role. Most food batchmakers participate in on-the-job training, usually from about a month to a year. Some food batchmakers learn their trade through an approved apprenticeship program.

Food processing workers in retail or wholesale establishments may progress to supervisory jobs, such as department managers or team leaders in supermarkets. A few of these workers may become buyers for wholesalers or supermarket chains. Some food processing workers go on to open their own markets or bakeries. In processing plants, workers may advance to supervisory positions or become team leaders.

Employment

Food processing workers held 725,000 jobs in 2004. Employment among the various types of food processing occupations was distributed as follows:

Bakers	166,000
Meat, poultry, and fish cutters and trimmers.....	140,000
Slaughterers and meat packers.....	136,000
Butchers and meat cutters	134,000
Food batchmakers	87,000
Food cooking machine operators and tenders	43,000
Food and tobacco roasting, baking, and drying machine operators and tenders.....	18,000

Thirty-five percent of all food processing workers were employed in animal slaughtering and processing plants. Another 23 percent were employed at grocery stores. Most of the remainder worked in other food manufacturing industries. Butchers, meatcutters, and bakers are employed in almost every city and town in the Nation, while most other food processing jobs are concentrated in communities with food-processing plants.

Job Outlook

Overall employment in the food processing occupations is projected to grow about as fast as the average for all occupations through 2014. Increasingly, cheaper meat imports from abroad will have a negative effect on domestic employment in many food processing occupations. As more jobs involving cutting and processing meat shift from retail stores to food-processing plants, job growth will be concentrated among lesser skilled workers, who are employed primarily in manufacturing. Nevertheless, job opportunities should be available at all levels of the occupation due to the need to replace experienced workers who transfer to other occupations or leave the labor force.

As the Nation’s population grows, the demand for meat, poultry, and seafood should continue to increase. Successful marketing by the poultry industry is likely to increase demand for chicken and ready-to-heat products. Similarly, the development of prepared food products that are lower in fat and more nutritious promises to stimulate the consumption of red meat. The trend toward preparing meat in containers at the processing level also should contribute to demand for animal slaughterers and meatpackers.

Lesser skilled meat, poultry, and fish cutters and trimmers—who work primarily in animal slaughtering and processing plants—should experience average employment growth. With the growing popularity of labor-intensive, ready-to-heat poultry products, demand for poultry workers should remain firm. Fish cutters also will be in demand, as the task of preparing ready-to-heat fish goods gradually shifts from retail stores to processing plants. Also, advances in fish farming, or “aquaculture,” should help meet the growing demand for fish and produce opportunities for fish cutters.

Employment of more highly skilled butchers and meatcutters, who work primarily in retail stores, is expected to grow more slowly than average. Automation and the consolidation of the animal slaughtering and processing industries are enabling employers to transfer employment from higher paid butchers to lower wage slaughterers and meatpackers in meatpacking plants. At present, most red meat arrives at grocery stores partially cut up, but a growing share of meat is being delivered prepackaged, with additional fat removed, to wholesalers and retailers. This trend is resulting in less work and, thus, fewer jobs for retail butchers.

While high-volume production equipment limits the demand for bakers in manufacturing, overall employment of bakers is expected to increase about as fast as average due to growing numbers of large wholesale bakers in stores, specialty shops, and traditional bakeries. In addition to the growing numbers of cookie, muffin, and cinnamon roll bakeries, the numbers of specialty bread and bagel shops have been growing, spurring demand for bread and pastry bakers.

Employment of food batchmakers, food cooking machine operators and tenders, and food and tobacco cooking and roasting machine operators and tenders, is expected to grow more slowly than average. As more of this work is being done at the manufacturing level rather than at the retail level, potential employment gains will be offset by productivity gains from automated cooking and roasting equipment.

Earnings

Earnings vary by industry, skill, geographic region, and educational level. Median annual earnings of butchers and meatcutters were \$25,890 in May 2004. The middle 50 percent earned between \$19,780 and \$34,260. The highest 10 percent earned more than \$41,980 annually, while the lowest 10 percent earned less than \$15,920. Butchers and meatcutters employed at the retail level typically earn more than those in manufacturing. Median annual earnings in the industries employing the largest numbers of butchers and meatcutters in May 2004 were as follows:

Other general merchandise stores	\$31,900
Grocery stores	27,030
Specialty food stores	22,010
Animal slaughtering and processing.....	21,440

Meat, poultry, and fish cutters and trimmers typically earn less than butchers and meatcutters. In May 2004, median annual earnings for these lower skilled workers were \$18,900. The middle 50 percent earned between \$16,240 and \$22,360. The highest 10 percent earned more than \$27,430, while the lowest 10 percent earned less than \$14,410. Median annual earnings in the industries employing the largest numbers of meat, poultry, and fish cutters and trimmers in May 2004 are shown in the following tabulation:

Grocery and related product wholesalers.....	\$20,790
Grocery stores	20,650
Animal slaughtering and processing.....	18,660
Seafood product preparation and packaging.....	18,040

Median annual earnings of bakers were \$21,330 in May 2004. The middle 50 percent earned between \$17,070 and \$27,210. The highest 10 percent earned more than \$34,410, and the lowest 10 percent earned less than \$14,680. Median annual earnings in the industries employing the largest numbers of bakers in May 2004 are given in the following tabulation:

Other general merchandise stores	\$23,390
Bakeries and tortilla manufacturing.....	22,170
Grocery stores	21,340
Full-service restaurants	19,980
Limited-service eating places	18,690

Median annual earnings of food batchmakers were \$22,090 in May 2004. The middle 50 percent earned between \$17,010 and \$28,790. The highest 10 percent earned more than \$35,540, and the lowest 10 percent earned less than \$14,370. Median annual earnings in the industries employing the largest numbers of food batchmakers in May 2004 are presented in the following tabulation:

Dairy product manufacturing.....	\$26,550
Other food manufacturing.....	23,970
Fruit and vegetable preserving and specialty food manufacturing.....	23,230
Sugar and confectionery product manufacturing.....	21,420
Bakeries and tortilla manufacturing.....	20,890

In May 2004, median annual earnings for slaughterers and meatpackers were \$20,860. The middle 50 percent earned between \$18,120 and \$23,920. The highest 10 percent earned more than \$27,910, and the lowest 10 percent earned less than \$15,520. Median annual earnings in animal slaughtering and processing, the industry employing the largest number of slaughterers and meatpackers, were \$20,900 in May 2004.

Median annual earnings for food cooking machine operators and tenders were \$20,850 in May 2004. The middle 50 percent earned between \$16,680 and \$26,670. The highest 10 percent earned more than \$33,780, and the lowest 10 percent earned less than \$13,930. Median annual earnings in fruit and vegetable preserving and specialty food manufacturing, the industry employing the largest number of food cooking machine operators and tenders, were \$24,370 in May 2004.

In May 2004, median annual earnings for food and tobacco roasting, baking, and drying machine operators and tenders were \$23,840. The middle 50 percent earned between \$18,600 and \$30,590. The highest 10 percent earned more than \$37,000, and the lowest 10 percent earned less than \$15,000.

Food processing workers generally received typical benefits, including pension plans for union members or those employed by grocery stores. However, poultry workers rarely earned substantial benefits. In 2004, 21 percent of all food processing workers were union members or were covered by a union contract. Many food processing workers are members of the United Food and Commercial Workers International Union.

Related Occupations

Food processing workers must be skilled at both hand and machine work and must have some knowledge of processes and techniques that are involved in handling and preparing food. Other occupations that require similar skills and knowledge include chefs, cooks, and food preparation workers.

Sources of Additional Information

State employment service offices can provide information about job openings for food processing occupations.

Metal Workers and Plastic Workers

Computer Control Programmers and Operators

(O*NET 51-4011.01, 51-4012.00)

Significant Points

- Manufacturing industries employ almost all of these workers.
- Workers learn in apprenticeship programs, informally on the job, and in secondary, vocational, or post-secondary schools; many entrants have previously worked as machinists or machine setters, operators, and tenders.
- Despite the projected decline in employment, job opportunities should be good, as employers are expected to continue to have difficulty finding qualified workers.

Nature of the Work

Computer control programmers and operators use computer numerically controlled (CNC) machines to cut and shape precision products, such as automobile parts, machine parts, and compressors. CNC machines include machining tools such as lathes, multiaxis spindles, milling machines, laser cutting, water jet cutting, and wire electrical discharge machines (EDM), but the functions formerly performed by human operators are performed by a computer-control module. CNC machines cut away material from a solid block of metal, plastic, or glass—known as a workpiece—to form a finished part. Computer control programmers and operators normally produce large quantities of one part, although they may produce small batches or one-of-a-kind items. They use their knowledge of the working properties of metals and their skill with CNC programming to design and carry out the operations needed to make machined products that meet precise specifications.

Before CNC programmers—also referred to as numerical tool and process control programmers—machine a part, they must carefully plan and prepare the operation. First, these workers review three-dimensional computer aided/automated design (CAD) blueprints of the part. Next, they calculate where to cut or bore into the workpiece, how fast to feed the metal into the machine, and how much metal to remove. They then select tools and materials for the job and plan the sequence of cutting and finishing operations.

Next, CNC programmers turn the planned machining operations into a set of instructions. These instructions are translated into a computer aided/automated manufacturing (CAM) program containing a set of commands for the machine to follow. These commands normally are a series of numbers (hence, numerical control) that describes where cuts should occur, what type of cut should be used, and the speed of the cut. CNC programmers and operators check new programs to ensure that the machinery will function properly and that the output will meet specifications. Because a problem with the program could damage costly machinery and cutting tools or simply waste valuable time and materials, computer simulations may be used to check the program instead of a trial run. If errors are found, the program must be changed and retested until the problem is resolved. In

addition, growing connectivity between CAD/CAM software and CNC machine tools is raising productivity by automatically translating designs into instructions for the computer controller on the machine tool. These new CAM technologies enable programs to be easily modified for use on other jobs with similar specifications.

After the programming work is completed, CNC operators—also referred to as computer-controlled machine tool operators, metal and plastic—perform the necessary machining operations. The CNC operators transfer the commands from the server to the CNC control module using a computer network link or floppy disk. Many advanced control modules are conversational, meaning that they ask the operator a series of questions about the nature of the task. CNC operators position the metal stock on the CNC machine tool—spindle, lathe, milling machine, or other—set the controls, and let the computer make the cuts. Heavier objects may be loaded with the assistance of other workers, autoloaders, a crane, or a forklift. During the machining process, computer-control operators constantly check to see if any problems exist. Machine tools have unique characteristics, which can be problematic. During a machining operation, the operator modifies the cutting program to account for any problems encountered. Operators who make these adjustments need a basic knowledge of CNC programming. Unique, modified CNC programs are saved for every different machine that performs a task.

In order to boost productivity, manufacturers increasingly prefer workers who can quickly adapt to new technology and perform a wide range of tasks. As a result, CNC operators often are required to perform many of the basic skills of a machinist and a CNC programmer. However, some manufacturers simply need CNC operators to be “button-pushers.” They primarily start and stop machines, load cutting programs, and load and unload parts and tools.

Regardless of skill level, all CNC operators detect some problems by listening for specific sounds—for example, a dull cutting tool that needs changing or excessive vibration. Machine tools rotate at high speeds, which can create problems with harmonic vibrations in the workpiece. Vibrations cause the machine tools to make minor cutting errors, hurting the quality of the product. Operators listen for vibrations and then adjust the cutting speed to compensate. In older, slower machine tools, the cutting speed would be reduced to eliminate the vibrations, but the amount of time needed to finish the product would increase as a result. In newer, high-speed CNC machines, increasing the cutting speed normally eliminates the vibrations and reduces production time. CNC operators also ensure that the workpiece is being properly lubricated and cooled, because the machining of metal products generates a significant amount of heat.

Since CNC machines can operate with limited input from the operator, a single operator may monitor several machines simultaneously. Typically, an operator might monitor two machines cutting relatively simple parts cut from softer materials, while devoting most of his or her attention to a third machine cutting a much more difficult part cut from a hard metal, such as stainless steel. Operators are often expected to carefully schedule their work so that all of the machines are always operating.

Working Conditions

Most machine shops are clean, well lit, and ventilated. Most modern CNC machines are partially or totally enclosed, minimizing the

Computer control operators load programs into a machine.

exposure of workers to noise, debris, and the lubricants used to cool workpieces during machining. Nevertheless, working around machine tools presents certain dangers, and workers must follow safety precautions. Computer-controlled machine tool operators, metal and plastic, wear protective equipment, such as safety glasses to shield against bits of flying metal and earplugs to dampen machinery noise. They also must exercise caution when handling hazardous coolants and lubricants. The job requires stamina because operators stand most of the day and, at times, may need to lift moderately heavy workpieces.

Numerical tool and process control programmers work on desktop computers in offices that typically are near, but separate from, the shop floor. These work areas usually are clean, well lit, and free of machine noise. Numerical tool and process control programmers occasionally need to enter the shop floor to monitor CNC machining operations. On the shop floor, CNC programmers encounter the same hazards and exercise the same safety precautions as do CNC operators.

Most computer control programmers and operators work a 40-hour week. CNC operators increasingly work evening and weekend shifts as companies justify investments in more expensive machinery by extending hours of operation. Overtime is common during peak production periods.

Training, Other Qualifications, and Advancement

Computer control programmers and operators train in various ways—in apprenticeship programs, informally on the job, and in secondary, vocational, or postsecondary schools. In general, the more skills needed for the job, the more education and training that is needed to qualify. For example, a growing number of computer control programmers and the more skilled operators are receiving their formal training from community or technical colleges. For some specialized types of programming, such as that needed to produce complex parts for the aerospace or shipbuilding industries, employers may prefer individuals with a degree in engineering.

Less-skilled CNC operators (button-pushers) may need only a couple of weeks of on-the-job training.

Employers prefer to hire workers who have a basic knowledge of computers and electronics and experience with machine tools. In fact, many entrants to these occupations have previously worked as machinists or machine setters, operators, and tenders. Due to a shortage of applicants with the appropriate training, many employers are providing introductory courses in operating metalworking machines, safety, and blueprint reading. Persons interested in becoming computer control programmers or operators should be mechanically inclined and able to work independently and do highly accurate work.

High school or vocational school courses in mathematics (trigonometry and algebra), blueprint reading, computer programming, metalworking, and drafting are recommended. Apprenticeship programs consist of shop training and related classroom instruction. In shop training, apprentices learn filing, handtapping, and dowel fitting, as well as the operation of various machine tools. Classroom instruction includes math, physics, programming, blueprint reading, CAD software, safety, and shop practices. Skilled computer control programmers and operators need an understanding of the machining process, including the complex physics that occur at the cutting point. Thus, most training programs teach CNC operators and programmers to perform operations on manual machines prior to operating CNC machines.

To boost the skill level of all metalworkers and to create a more uniform standard of competency, a number of training facilities and colleges have recently begun implementing curriculums incorporating national skills standards developed by the National Institute of Metalworking Skills (NIMS). After completing such a curriculum and passing a performance requirement and written exam, trainees are granted a NIMS credential that provides formal recognition of competency in a metalworking field. Completion of a formal certification program provides expanded career opportunities.

Classroom training includes an introduction to computer numerical control, the basics of programming, and more complex topics, such as computer-aided manufacturing. Trainees start writing simple programs under the direction of an experienced programmer. Although machinery manufacturers are trying to standardize programming languages, there are numerous languages in use. Because of this, computer control programmers and operators should be able to learn new programming languages.

As new automation is introduced, computer control programmers and operators normally receive additional training to update their skills. This training usually is provided by a representative of the equipment manufacturer or a local technical school. Many employers offer tuition reimbursement for job-related courses.

Computer control programmers and operators can advance in several ways. Experienced CNC operators may become CNC programmers, and some are promoted to supervisory or administrative positions in their firms. A few open their own shops.

Employment

Computer control programmers and operators held about 143,000 jobs in 2004, mostly working in machine shops, plastics products manufacturing, machinery manufacturing, or transportation equipment manufacturing making mostly aerospace and automobile parts. Although computer control programmers and operators work in all parts of the country, jobs are most plentiful in the areas where manufacturing is concentrated.

Job Outlook

Computer control programmers and operators should have good job opportunities, despite the projected decline in employment. Due to the limited number of people entering training programs, employers are expected to continue to have difficulty finding workers with the necessary skills and knowledge.

Employment of both computer-controlled machine tool operators and numerical tool and process control programmers is expected to decline through 2014. While CNC machine tools will be increasingly used, advances in CNC machine tools and manufacturing technology will further automate the production process, boosting CNC operator productivity and limiting employment. The demand for computer control programmers also will be negatively affected by the increasing use of software (CAD/CAM) that automatically translates part and product designs into CNC machine tool instructions.

Employment levels of computer control programmers and operators are influenced by economic cycles—as the demand for machined goods falls, programmers and operators involved in production may be laid off or forced to work fewer hours.

Earnings

Median hourly earnings of computer-controlled machine tool operators, metal and plastic, were \$14.75 in May 2004. The middle 50 percent earned between \$11.65 and \$18.21. The lowest 10 percent earned less than \$9.47, whereas the top 10 percent earned more than \$21.67. Median hourly earnings in the manufacturing industries employing the largest numbers of computer-controlled machine tool operators, metal and plastic, in May 2004 were:

Metalworking machinery manufacturing.....	\$16.34
Other fabricated metal product manufacturing	15.62
Machine shops; turned product; and screw, nut, and bolt manufacturing	14.73
Motor vehicle parts manufacturing	13.55
Plastics product manufacturing.....	11.78

Median hourly earnings of numerical tool and process control programmers were \$19.31 in May 2004. The middle 50 percent earned between \$15.67 and \$24.00. The lowest 10 percent earned less than \$12.89, while the top 10 percent earned more than \$28.89.

Related Occupations

Occupations most closely related to computer control programmers and operators are other metal and plastic working occupations, which include machinists; tool and die makers; machine setters, operators, and tenders—metal and plastic; and welding, soldering, and brazing workers. Numerical tool and process control programmers apply their knowledge of machining operations, metals, blueprints, and machine programming to write programs that run machine tools. Computer programmers also write detailed programs to meet precise specifications.

Machinists

(O*NET 51-4041.00)

Significant Points

- Machinists learn in apprenticeship programs, informally on the job, and in vocational schools or community or technical colleges.
- Many entrants previously have worked as machine setters, operators, or tenders.
- Job opportunities are expected to be good.

Nature of the Work

Machinists use machine tools, such as lathes, milling machines, and machining centers, to produce precision metal parts. Although they may produce large quantities of one part, precision machinists often produce small batches or one-of-a-kind items. They use their knowledge of the working properties of metals and their skill with machine tools to plan and carry out the operations needed to make machined products that meet precise specifications.

Before they machine a part, machinists must carefully plan and prepare the operation. These workers first review electronic or written blueprints or specifications for a job. Next, they calculate where to cut or bore into the workpiece (the piece of steel, aluminum, titanium, plastic, silicon or any other material that is being shaped), how fast to feed the workpiece into the machine, and how much material to remove. They then select tools and materials for the job, plan the sequence of cutting and finishing operations, and mark the workpiece to show where cuts should be made.

After this layout work is completed, machinists perform the necessary machining operations. They position the workpiece on the machine tool—drill press, lathe, milling machine, or other type of machine—set the controls, and make the cuts. During the machining process, they must constantly monitor the feed rate and speed of the machine. Machinists also ensure that the workpiece is being properly lubricated and cooled, because the machining of metal products generates a significant amount of heat. The temperature of the workpiece is a key concern because most metals expand when heated; machinists must adjust the size of their cuts relative to the temperature. Some rare but increasingly popular metals, such as titanium, are machined at extremely high temperatures.

Machinists detect some problems by listening for specific sounds—for example, a dull cutting tool or excessive vibration. Dull cutting tools are removed and replaced. Cutting speeds are adjusted to compensate for harmonic vibrations, which can decrease the accuracy of cuts, particularly on newer high-speed spindles and lathes. After the work is completed, machinists use both simple and highly sophisticated measuring tools to check the accuracy of their work against blueprints.

Some machinists, often called production machinists, may produce large quantities of one part, especially parts requiring the use of complex operations and great precision. Many modern machine tools are computer numerically controlled (CNC). CNC machines, following a computer program, control the cutting tool speed, change dull tools, and perform all of the necessary cuts to create a part. Frequently, machinists work with computer control programmers to determine how the automated equipment will cut a part. (See the statement on computer control programmers and operators elsewhere in the *Handbook*.) The programmer may determine the path of the cut, while the machinist determines the type of cutting tool, the speed of the cutting tool, and the feed rate. Because most machinists train

in CNC programming, they may write basic programs themselves and often set offsets (modify programs) in response to problems encountered during test runs. After the production process is designed, relatively simple and repetitive operations normally are performed by machine setters, operators, and tenders. (See the statement on machine setters, operators, and tenders—metal and plastic, elsewhere in the *Handbook*.)

Some manufacturing techniques employ automated parts loaders, automatic tool changers, and computer controls, allowing machine tools to operate without anyone present. One production machinist, working 8 hours a day, might monitor equipment, replace worn cutting tools, check the accuracy of parts being produced, adjust offsets, and perform other tasks on several CNC machines that operate 24 hours a day (lights-out manufacturing). During lights-out manufacturing, a factory may need only a few machinists to monitor the entire factory.

Other machinists do maintenance work—repairing or making new parts for existing machinery. To repair a broken part, maintenance machinists may refer to blueprints and perform the same machining operations that were needed to create the original part.

Because the technology of machining is changing rapidly, machinists must learn to operate a wide range of machines. Along with operating machines that use metal cutting tools to shape workpieces, machinists operate machines that cut with lasers, water jets, or electrified wires. While some of the computer controls may be similar, machinists must understand the unique cutting properties of these different machines. As engineers create new types of machine tools and new materials to machine, machinists must constantly learn new machining properties and techniques.

Working Conditions

Today, most machine shops are relatively clean, well lit, and ventilated. Many computer-controlled machines are partially or totally enclosed, minimizing the exposure of workers to noise, debris, and the lubricants used to cool workpieces during machining. Nevertheless, working around machine tools presents certain dangers, and workers must follow safety precautions. Machinists wear protective equipment, such as safety glasses to shield against bits of flying metal and earplugs to dampen machinery noise. They also must exercise caution when handling hazardous coolants and lubricants, although many common water-based lubricants present little hazard. The job requires stamina, because machinists stand most of the day and, at times, may need to lift moderately heavy workpieces. Modern factories extensively employ autoloaders and overhead cranes, reducing heavy lifting.

Machinists use computer controlled machine tools to make parts.

Many machinists work a 40-hour week. Evening and weekend shifts are becoming more common as companies justify investments in more expensive machinery by extending hours of operation. However, this trend is somewhat offset by the increasing use of lights-out manufacturing and the use of machine operators for less desirable shifts. Overtime is common during peak production periods.

Training, Other Qualifications, and Advancement

Machinists train in apprenticeship programs, informally on the job, and in vocational schools, or community or technical colleges. Experience with machine tools is helpful. In fact, many entrants previously have worked as machine setters, operators, or tenders. Persons interested in becoming machinists should be mechanically inclined, have good problem-solving abilities, be able to work independently, and be able to do highly accurate work (tolerances may reach 1/10,000th of an inch) that requires concentration and physical effort.

High school or vocational school courses in mathematics (especially trigonometry), blueprint reading, metalworking, and drafting are highly recommended. Apprenticeship programs consist of shop training and related classroom instruction lasting up to 4 years. In shop training, apprentices work almost full time, and are supervised by an experienced machinist while learning to operate various machine tools. Classroom instruction includes math, physics, materials science, blueprint reading, mechanical drawing, and quality and safety practices. In addition, as machine shops have increased their use of computer-controlled equipment, training in the operation and programming of CNC machine tools has become essential. Apprenticeship classes are often taught in cooperation with local community or vocational colleges. A growing number of machinists learn the trade through 2-year associate degree programs at community or technical colleges. Graduates of these programs still need significant on-the-job experience before they are fully qualified.

To boost the skill level of machinists and to create a more uniform standard of competency, a number of training facilities and colleges are implementing curriculums that incorporate national skills standards developed by the National Institute of Metalworking Skills (NIMS). After completing such a curriculum and passing a performance requirement and written exam, trainees are granted a NIMS credential, which provides formal recognition of competency in a metalworking field. Completing a recognized certification program provides a machinist with better career opportunities.

As new automation is introduced, machinists normally receive additional training to update their skills. This training usually is provided by a representative of the equipment manufacturer or a local technical school. Some employers offer tuition reimbursement for job-related courses.

Machinists can advance in several ways. Experienced machinists may become CNC programmers, tool and die makers, or mold makers, or be promoted to supervisory or administrative positions in their firms. A few open their own shops.

Employment

Machinists held about 370,000 jobs in 2004. Most machinists work in small machining shops or in manufacturing industries, such as machinery manufacturing and transportation equipment manufacturing (motor vehicle parts and aerospace products and parts). Maintenance machinists work in most industries that use production machinery.

Job Outlook

Despite relatively slow employment growth, job opportunities for machinists should continue to be good. Many young people with the necessary educational and personal qualifications needed to obtain machining skills often prefer to attend college or may not wish to enter

production occupations. Therefore, the number of workers obtaining the skills and knowledge necessary to fill machinist jobs is expected to be less than the number of job openings arising each year from the need to replace experienced machinists who transfer to other occupations or retire, and from job growth.

Employment of machinists is projected to grow more slowly than the average for all occupations over the 2004-14 period because of rising productivity among these workers and strong foreign competition. Machinists will become more efficient as a result of the expanded use of and improvements in technologies such as CNC machine tools, autoloading, and high-speed machining. This allows fewer machinists to accomplish the same amount of work previously performed by more workers. Technology is not expected to affect the employment of machinists as significantly as that of most other production occupations, however, because machinists monitor and maintain many automated systems. Due to modern production techniques, employers prefer workers, such as machinists, who have a wide range of skills and are capable of performing almost any task in a machine shop.

Employment levels in this occupation are influenced by economic cycles—as the demand for machined goods falls, machinists involved in production may be laid off or forced to work fewer hours. Employment of machinists involved in plant maintenance, however, often is more stable because proper maintenance and repair of costly equipment remain critical to manufacturing operations, even when production levels fall.

Earnings

Median hourly earnings of machinists were \$16.33 in May 2004. The middle 50 percent earned between \$12.84 and \$20.33. The lowest 10 percent earned less than \$10.08, while the top 10 percent earned more than \$24.34. Median hourly earnings in the manufacturing industries employing the largest number of machinists in May 2004 were:

Aerospace product and parts manufacturing.....	\$17.78
Motor vehicle parts manufacturing	17.46
Metalworking machinery manufacturing.....	17.06
Machine shops; turned product; and screw, nut, and bolt manufacturing	15.87
Employment services	11.09

Apprentices earn much less than machinists, but earnings increase quickly as they improve their skills. Also most employers pay for apprentices' training classes.

Related Occupations

Occupations most closely related to that of machinist are other machining occupations, which include tool and die makers; machine setters, operators, and tenders—metal and plastic; and computer control programmers and operators. Another occupation that requires precision and skill in working with metal is welding, soldering, and brazing workers.

Machine Setters, Operators, and Tenders—Metal and Plastic

(O*NET 51-4021.00, 51-4022.00, 51-4023.00, 51-4031.01, 51-4031.02, 51-4031.03, 51-4031.04, 51-4032.00, 51-4033.01, 51-4033.02, 51-4034.00, 51-4035.00, 51-4051.00, 51-4052.00, 51-4061.00, 51-4062.00, 51-4071.00, 51-4072.01, 51-4072.02, 51-4072.03, 51-4072.04, 51-4072.05, 51-4081.01, 51-4081.02, 51-4191.01, 51-4191.02, 51-4191.03, 51-4192.00, 51-4193.01, 51-4193.02, 51-4193.03, 51-4193.04, 51-4194.00, 51-4199.99)

Significant Points

- Manufacturing industries employ 10 out of 11 workers.
- A few weeks of on-the-job training is sufficient for most workers to learn basic machine operations, but a year or more is required to become a highly skilled operator or setter.
- Employment in most machine setter, operator, and tender occupations will decline over the 2004-14 period as a result of productivity improvements and competition for jobs from abroad.

Nature of the Work

Consider the parts of a toaster, such as the metal or plastic housing or the lever that lowers the toast. These parts, and many other metal and plastic products, are produced by machine setters, operators, and tenders—metal and plastic. In fact, machine tool operators in the metalworking and plastics industries play a major role in producing most of the consumer products on which we rely daily.

In general, these workers can be separated into two groups—those who set up machines for operation and those who tend the machines during production. Setup workers prepare the machines *prior* to production and may adjust the machinery during its operation. Operators and tenders primarily monitor the machinery *during* its operation, sometimes loading or unloading the machine or making minor adjustments to the controls. Many workers both set up and operate equipment. Because the setup process requires an understanding of the entire production process, setters usually have more training and are more highly skilled than those who simply operate or tend machinery. As new automation simplifies the setup process, however, less skilled workers also are increasingly able to set up machines for operation.

Setters, operators, and tenders usually are identified by the type of machine with which they work. Some examples of specific titles are drilling- and boring-machine toolsetters, milling- and planing-machine tenders, and lathe- and turning-machine tool operators. Job duties usually vary with the size of the firm and the type of machine being operated. Although some workers specialize in one or two types of machinery, many are trained to set up or operate a variety of machines. Increasing automation allows machine setters to operate multiple machines simultaneously. In addition, newer production techniques, such as team-oriented “lean” manufacturing, require machine operators to rotate between different machines. Rotating assignments result in more varied work, but also require workers to have a wider range of skills.

Machine setters, operators, and tenders—metal set up and tend machines that cut and form all types of metal parts. Setup workers plan and set up the sequence of operations according to blueprints, layouts, or other instructions. Often this involves loading a computer program with instructions into the machine's computer controls. On all machines, including those with computer controls, setup workers respond to problems during operation by adjusting the speed, feed and other variables, choosing the proper coolants and lubricants, and selecting the instru-

ments or tools for each operation. Using micrometers, gauges, and other precision measuring instruments, they also may compare the completed work with the tolerance limits stated in the specifications.

Although there are many different types of metalworking machine tools that require specific knowledge and skills, most operators perform similar tasks. Whether tending grinding machines that remove excess material from the surface of machined products or presses that extrude metal through a die to form wire, operators usually perform simple, repetitive operations that can be learned quickly. Typically, these workers place metal stock in a machine on which the operating specifications have already been set. They may watch one or more machines and make minor adjustments according to their instructions. Regardless of the type of machine they operate, machine tenders usually depend on skilled setup workers for major adjustments when the machines are not functioning properly.

Machine setters, operators, and tenders—plastic set up and tend machines that transform plastic compounds—chemical-based products that can be produced in powder, pellet, or syrup form—into a wide variety of consumer goods such as toys, tubing, and auto parts. These products are manufactured by various methods, of which injection molding is the most common. The injection-molding machine heats and liquefies a plastic compound and forces it into a mold. After the part has cooled and hardened, the mold opens and the part is released. Many common kitchen products are produced with this method. To produce long parts such as pipes or window frames, an extruding machine usually is employed. These machines force a plastic compound through a die that contains an opening with the desired shape of the final product. Blow molding is another common plasticsworking technique. Blow-molding machines force hot air into a mold that contains a plastic tube. As the air moves into the mold, the tube is inflated to the shape of the mold, and a plastic container is formed. The familiar 2-liter soft-drink bottles are produced by this method.

Workers in three distinct specialties—setters, operators, and tenders—operate injection-molding machines. Most other types of plastic machines function in a similar manner. A typical injection-molding machine may have 25 different controls that can be adjusted. Setters or technicians set up the machines prior to their operation. These workers

are responsible for repairing any major problem. Operators monitor the many gauges on injection-molding machines, adjusting different inputs, pressures, and speeds to maintain quality. Tenders remove the cooled plastic from the mold, loading the product into boxes.

Working Conditions

Most machine setters, operators, and tenders—metal and plastic work in areas that are clean, well lit, and well ventilated. Nevertheless, many operators require stamina, because they are on their feet much of the day and may do moderately heavy lifting. Also, these workers operate powerful, high-speed machines that can be dangerous if strict safety rules are not observed. Most operators wear protective equipment, such as safety glasses and earplugs, to protect against flying particles of metal or plastic and against noise from the machines. However, many modern machines are enclosed, minimizing the exposure of workers to noise, dust, and lubricants used during machining. Other required safety equipment varies by work setting and machine. For example, those in the plastics industry who work near materials that emit dangerous fumes or dust must wear face masks or self-contained breathing apparatus.

Most workers in the occupation put in a 40-hour week, but overtime is common during periods of increased production. Because many metalworking and plastics working shops operate more than one shift daily, some operators work nights and weekends.

Training, Other Qualifications, and Advancement

Machine setters, operators, and tenders—metal and plastic learn their skills on the job. Trainees begin by observing and assisting experienced workers, sometimes in formal training programs. Under supervision, they may start as tenders, supplying materials, starting and stopping the machine, or removing finished products from it. Then they advance to the more difficult tasks performed by operators, such as adjusting feed speeds, changing cutting tools, or inspecting a finished product for defects. Eventually, they become responsible for their own machines.

The complexity of the equipment largely determines the time required to become an operator. Most operators learn the basic machine operations and functions in a few weeks, but they may need a year or more to become skilled operators or to advance to the more highly skilled job of setter. Although many operators learn on the job, some community colleges and other educational institutions offer courses and certifications in operating metal and plastics machines. In addition to providing on-the-job training, some employers send promising machine tenders to operator classes. Other employers prefer to hire workers who have completed, or currently are enrolled in, a training program.

Setters or technicians normally need a thorough knowledge of the machinery and of the products being manufactured, because they often plan the sequence of work, make the first production run, and determine which adjustments need to be made. Strong analytical abilities are particularly important for this job. Some companies have formal training programs for operators and setters; often, the programs combine classroom instruction with on-the-job training.

Although no special education is required for many jobs in the occupation, employers prefer to hire applicants with good basic skills. Many require employees to have a high school education and to read, write, and speak English. Because machinery is becoming more complex and shop-floor organization is changing, employers increasingly look for persons with good communication and interpersonal skills. Mechanical aptitude, manual dexterity, and experience working with machinery also are helpful. Those interested in becoming machine setters, operators, and tenders can improve their employment opportunities by completing high school courses in shop and blueprint reading and by gaining a working knowledge of the properties of metals and

A machine operator monitors a cutting and grinding machine.

plastics. A solid math background, including courses in algebra, geometry, trigonometry, and basic statistics, also is useful. With increasing automation, experience with computers also is helpful.

Job opportunities and advancement can be enhanced as well by becoming certified in a particular machining skill. The National Institute for Metalworking Skills has developed standards for machine setters, operators, and tenders—metal. After taking a course approved by the organization and passing a written exam and performance requirement, the worker is issued a credential that signifies competence in a specific machining operation. The Society of Plastics Industry, the national trade association representing plastics manufacturers, also certifies workers in that industry. To achieve machine-operator certification, 2 years of experience operating a plastics-processing machine is recommended, and one must pass a computer-based exam.

Advancement for operators usually takes the form of higher pay, although there are some limited opportunities for operators to advance to new positions as well. For example, they can become multiple-machine operators, setup operators, or trainees for the more highly skilled position of machinist, tool and die maker, or computer-control programmer or operator. (See the statements on machinists, computer control programmers and operators, and tool and die makers elsewhere in the *Handbook*.) Some setup workers may advance to supervisory positions.

Employment

Machine setters, operators, and tenders—metal and plastic held about 1.1 million jobs in 2004. Approximately 10 of 11 jobs were found in manufacturing, primarily in fabricated metal product manufacturing, plastics and rubber products manufacturing, primary metal manufacturing, machinery manufacturing, and motor vehicle parts manufacturing. The following tabulation shows the distribution of employment of machine setters, operators, and tenders—metal and plastic by detailed occupation.

Cutting, punching, and press machine setters, operators, and tenders, metal and plastic	251,000
Molding, coremaking, and casting machine setters, operators, and tenders, metal and plastic	157,000
Grinding, lapping, polishing, and buffing machine tool setters, operators, and tenders, metal and plastic	101,000
Multiple machine tool setters, operators, and tenders, metal and plastic	97,000
Extruding and drawing machine setters, operators, and tenders, metal and plastic	89,000
Lathe and turning machine tool setters, operators, and tenders, metal and plastic	71,000
Metal workers and plastic workers, all other	55,000
Drilling and boring machine tool setters, operators, and tenders, metal and plastic	42,000
Plating and coating machine setters, operators, and tenders, metal and plastic	40,000
Forging machine setters, operators, and tenders, metal and plastic	38,000
Rolling machine setters, operators, and tenders, metal and plastic	37,000
Milling and planing machine setters, operators, and tenders, metal and plastic	31,000
Heat treating equipment setters, operators, and tenders, metal and plastic	26,000
Tool grinders, filers, and sharpeners	21,000
Metal-refining furnace operators and tenders	17,000
Foundry mold and coremakers	17,000
Pourers and casters, metal	14,000
Lay-out workers, metal and plastic	11,000
Model makers, metal and plastic	8,100
Patternmakers, metal and plastic	6,000

Job Outlook

Overall employment in the various machine setter, operator, and tender occupations is expected to decline over the 2004–14 period. In general, employment of these workers will be affected by technological advances, changing demand for the goods they produce, foreign competition, and the reorganization of production processes. Despite the overall employment decline, a large number of machine setter, operator, and tender jobs will become available due to an expected surge in retirements as some baby boomers become eligible for retirement by the end of the decade.

One of the most important factors influencing employment change in this occupation is the implementation of labor-saving machinery. In order to remain competitive by improving quality and lowering production costs, many firms are adopting new technologies, such as computer-controlled machine tools and robots. Computer-controlled equipment allows operators to tend a greater number of machines simultaneously and often makes setup easier, thereby reducing the amount of time setup workers spend on each machine. Robots are being used to load and unload parts from machines. The lower skilled manual machine tool operators and tenders are more likely to be eliminated by these new technologies, because the functions they perform are more easily automated.

The demand for machine setters, operators, and tenders—metal and plastic largely mirrors the demand for the parts they produce. The consumption of plastic products has grown as they have been substituted for metal goods in many consumer and manufactured products in recent years. The process is likely to continue and should result in stronger demand for machine operators in plastics than in metal.

Both the plastics and metal industries, however, face stiff foreign competition that is limiting the demand for domestically produced parts. One way in which larger U.S. producers have responded to this competition is by moving production operations to other countries where labor costs are lower. These moves are likely to continue and will further reduce employment opportunities for many machine operators, setters, and tenders—metal and plastic in the United States. Another way domestic manufacturers compete with low-wage foreign competition is by increasing their use of automated systems, which can make manufacturing establishments more competitive by improving their productivity. However, increased automation also limits employment growth.

Workers with a thorough background in machine operations, exposure to a variety of machines, and a good working knowledge of the properties of metals and plastics will be best able to adjust to the changing environment. In addition, new shop-floor arrangements will reward workers with good basic mathematics and reading skills, good communication skills, and the ability and willingness to learn new tasks. As workers adapt to team-oriented production methods, those who can operate multiple machines will have the best job opportunities.

Earnings

Earnings for machine operators can vary by size of the company, union or nonunion status, industry, and skill level and experience of the operator. Also, temporary employees, who are being hired in greater numbers, usually get paid less than company-employed workers. The median hourly earnings in May 2004 for a variety of machine setters, operators, and tenders—metal and plastic were:

Model makers, metal and plastic	\$21.28
Patternmakers, metal and plastic.....	17.86
Metal workers and plastic workers, all other	16.15
Metal-refining furnace operators and tenders	15.74
Lay-out workers, metal and plastic	15.65
Lathe and turning machine tool setters, operators, and tenders, metal and plastic	15.04
Milling and planing machine setters, operators, and tenders, metal and plastic	14.91
Tool grinders, filers, and sharpeners	14.52
Rolling machine setters, operators, and tenders, metal and plastic	14.33
Heat treating equipment setters, operators, and tenders, metal and plastic.....	14.26
Multiple machine tool setters, operators, and tenders, metal and plastic.....	14.06
Pourers and casters, metal.....	13.92

Related Occupations

Workers in occupations closely related to machine setters, operators, and tenders—metal and plastic include machinists; tool and die makers; assemblers and fabricators; computer control programmers and operators; and welding, soldering, and brazing workers. Often, machine operators are responsible for checking the quality of parts being produced, work similar to that of inspectors, testers, sorters, samplers, and weighers.

Tool and Die Makers

(O*NET 51-4111.00)

Significant Points

- Most tool and die makers train for 4 or 5 years in apprenticeships or postsecondary programs; employers typically recommend apprenticeship training.
- Employment is projected to decline because of strong foreign competition and advancements in automation.
- Excellent job opportunities are expected; employers in certain parts of the country report difficulty attracting well-trained applicants.

Nature of the Work

Tool and die makers are among the most highly skilled workers in manufacturing. These workers produce tools, dies, and special guiding and holding devices that enable machines to manufacture a variety of products we use daily—from clothing and furniture to heavy equipment and parts for aircraft.

Toolmakers craft precision tools and machines that are used to cut, shape, and form metal and other materials. They also produce jigs and fixtures (devices that hold metal while it is bored, stamped, or drilled) and gauges and other measuring devices. Die makers construct metal forms (dies) that are used to shape metal in stamping and forging operations. They also make metal molds for diecasting and for molding plastics, ceramics, and composite materials. Some tool and die makers craft prototypes of parts, and then, working with engineers and designers, determine how best to manufacture the part. In addition to developing, designing, and producing new tools and dies, these workers also may repair worn or damaged tools, dies, gauges, jigs, and fixtures.

To perform these functions, tool and die makers employ many types of machine tools and precision measuring instruments. They also must be familiar with the machining properties, such as hardness and heat tolerance, of a wide variety of common metals, alloys, plastics, ceramics, and other composite materials. As a result, tool and die makers are knowledgeable in machining operations, mathematics, and blueprint reading. In fact, tool and die makers often are considered highly specialized machinists. The main difference between tool and die makers and machinists is that machinists normally make a single part during the production process, while tool and die makers make parts and assemble and adjust machines used in the production process. (See the statement on machinists elsewhere in the *Handbook*.)

Traditionally, tool and die makers, working from blueprints, first must plan the sequence of operations necessary to manufacture the tool or die. Next, they measure and mark the pieces of metal that will be cut to form parts of the final product. At this point, tool and die makers cut, drill, or bore the part as required, checking to ensure that the final product meets specifications. Finally, these workers assemble the parts and perform finishing jobs such as filing, grinding, and polishing surfaces. While manual machining has declined, companies still employ it for some simple and low-quantity parts.

Most tool and die makers today use computer-aided design (CAD) to develop products and parts. Specifications entered into computer programs can be used to electronically develop blueprints for the required tools and dies. Numerical tool and process control programmers use computer-aided design or computer-aided manufacturing (CAD/CAM) programs to convert electronic drawings into CAM-based computer programs that contain instructions for a sequence of cutting tool operations. (See the statement on computer-control programmers and operators elsewhere in the *Handbook*.) Once these programs are developed, computer numerically controlled (CNC) machines follow the set of instructions contained in the program to produce the part. Computer-controlled machine tool operators or machinists normally operate CNC machines; however, tool and die makers are trained in both operating CNC machines and writing CNC programs, and they may perform either task. CNC programs are stored electronically for future use, saving time and increasing worker productivity.

After machining the parts, tool and die makers carefully check the accuracy of the parts using many tools, including coordinate measuring machines (CMM), which use software and sensor arms

A tool and die maker operates a manual lathe.

to compare the dimensions of the part to electronic blueprints. Next, they assemble the different parts into a functioning machine. They file, grind, shim, and adjust the different parts to properly fit them together. Finally, the tool and die makers set up a test run using the tools or dies they have made to make sure that the manufactured parts meet specifications. If problems occur, they compensate by adjusting the tools or dies.

Working Conditions

Tool and die makers usually work in toolrooms. These areas are quieter than the production floor because there are fewer machines in use at one time. They also are generally kept clean and cool to minimize heat-related expansion of metal workpieces and to accommodate the growing number of computer-operated machines. To minimize the exposure of workers to moving parts, machines have guards and shields. Most computer-controlled machines are totally enclosed, minimizing the exposure of workers to noise, dust, and the lubricants used to cool workpieces during machining. Tool and die makers also must follow safety rules and wear protective equipment, such as safety glasses to shield against bits of flying metal, earplugs to protect against noise, and gloves and masks to reduce exposure to hazardous lubricants and cleaners. These workers also need stamina because they often spend much of the day on their feet and may do moderately heavy lifting.

Companies employing tool and die makers have traditionally operated only one shift per day. Overtime and weekend work are common, especially during peak production periods.

Training, Other Qualifications, and Advancement

Most tool and die makers learn their trade through 4 or 5 years of education and training in formal apprenticeships or postsecondary programs. Apprenticeship programs include a mix of classroom instruction and on-the-job-training. According to most employers these apprenticeship programs are the best way to learn all aspects of tool and die making. A number of tool and die makers receive most of their formal classroom training from community and technical colleges, often in conjunction with an apprenticeship program.

Traditional apprenticeship programs allowed workers to advance by completing a set number of hours of on-the-job-training and successfully completing specific courses. The National Institute of Metalworking Skills (NIMS) is developing new standards that would replace the required number of hours

with competency-based tests. Whether competency tests will change the length of the traditional training process will probably depend upon the apprentice's prior experience, dedication, and natural ability. However, the required training courses for a journeyman tool and die maker will continue to take 4-5 years to complete.

Even after completing the apprenticeship, tool and die makers still need years of experience to become highly skilled. Most specialize in making certain types of tools, molds, or dies.

Tool and die maker trainees learn to operate milling machines, lathes, grinders, wire electrical discharge machines, and other machine tools. They also learn to use handtools for fitting and assembling gauges, and other mechanical and metal-forming equipment. In addition, they study metalworking processes, such as heat treating and plating. Classroom training usually consists of tool designing, tool programming, blueprint reading, and, if needed, mathematics courses, including algebra, geometry, trigonometry, and basic statistics. Tool and die makers increasingly must have good computer skills to work with CAD/CAM technology, CNC machine tools, and computerized measuring machines.

Workers who become tool and die makers without completing formal apprenticeships generally acquire their skills through a combination of informal on-the-job training and classroom instruction at a vocational school or community college. They often begin as machine operators and gradually take on more difficult assignments. Many machinists become tool and die makers.

Because tools and dies must meet strict specifications—precision to one ten-thousandth of an inch is common—the work of tool and die makers requires skill with precision measuring devices and a high degree of patience and attention to detail. Good eyesight is essential. Persons entering this occupation also should be mechanically inclined, able to work and solve problems independently, have strong mathematical skills, and be capable of doing work that requires concentration and physical effort.

Employers generally look for someone with a strong educational background as an indication that the person can more easily adapt to change, which is a constant in this occupation. As automation continues to change the way tools and dies are made, workers regularly need to update their skills in order to learn how to operate new equipment. Also, as materials such as alloys, ceramics, polymers, and plastics are increasingly used, tool and die makers need to learn new machining techniques to deal with the new materials.

There are several ways for skilled workers to advance. Some move into supervisory and administrative positions in their firms or they may start their own shop. Others may take computer courses and become computer-controlled machine tool programmers. With a college degree, a tool and die maker can go into engineering or tool design.

Employment

Tool and die makers held about 103,000 jobs in 2004. Most worked in industries that manufacture metalworking machinery, transportation equipment (such as motor vehicle parts and aerospace products), and fabricated metal products, as well as plastics product manufacturing. Although they are found throughout the country, jobs are most plentiful in the Midwest, Northeast, and West, where many of the metalworking industries are located.

Job Outlook

Despite declining employment, excellent job opportunities are expected. Employers in certain parts of the country report difficulty

attracting qualified applicants. The number of workers receiving training in this occupation is expected to continue to be fewer than the number of openings created each year by tool and die makers who retire or transfer to other occupations. A major factor limiting the number of people entering the occupation is that many young people who have the educational and personal qualifications necessary to learn tool and die making may prefer to attend college or may not wish to enter production occupations.

Employment of tool and die makers is projected to decline over the 2004-14 period because of strong foreign competition and advancements in automation, including CNC machine tools and computer-aided design, that should improve worker productivity. On the other hand, tool and die makers play a key role in building and maintaining advanced automated manufacturing equipment. As firms invest in new equipment, modify production techniques, and implement product design changes more rapidly, they will continue to rely heavily on skilled tool and die makers for retooling.

Earnings

Median hourly earnings of tool and die makers were \$20.55 in May 2004. The middle 50 percent earned between \$16.70 and \$25.93. The lowest 10 percent had earnings of less than \$13.57, while the top 10 percent earned more than \$31.19. Median hourly earnings in the manufacturing industries employing the largest numbers of tool and die makers in May 2004 are:

Motor vehicle parts manufacturing	\$26.93
Plastics product manufacturing	20.17
Forging and stamping	20.09
Metalworking machinery manufacturing	19.82
Machine shops; turned product; and screw, nut, and bolt manufacturing	18.84

Apprentice's pay is tied to their skill level. As they gain more skills and reach specific levels of performance and experience, their pay increases.

Related Occupations

The occupations most closely related to the work of tool and die makers are other machining occupations. These include machinists; computer control programmers and operators; and machine setters, operators, and tenders—metal and plastic. Another occupation that requires precision and skill in working with metal is welding, soldering, and brazing workers.

Like tool and die makers, assemblers and fabricators assemble complex machinery. When measuring parts, tool and die makers use some of the same tools and equipment that inspectors, testers, sorters, samplers, and weighers use in their jobs.

Welding, Soldering, and Brazing Workers

(O*NET 51-4121.01, 51-4121.02, 51-4121.03, 51-4121.04, 51-4121.05, 51-4122.01, 51-4122.02, 51-4122.03, 51-4122.04)

Significant Points

- More than 6 out of 10 jobs are found in manufacturing industries.
- Training ranges from a few weeks of school or on-the-job training for low-skilled positions to several years of combined school and on-the-job training for highly skilled jobs.
- Employment is projected to grow more slowly than average.
- Job prospects should be excellent as employers report difficulty finding enough qualified people.

Nature of the Work

Welding is the most common way of permanently joining metal parts. In this process, heat is applied to metal pieces, melting and fusing them to form a permanent bond. Because of its strength, welding is used in shipbuilding, automobile manufacturing and repair, aerospace applications, and thousands of other manufacturing activities. Welding also is used to join beams when constructing buildings, bridges, and other structures, and to join pipes in pipelines, power plants, and refineries.

Welders use many types of welding equipment set up in a variety of positions, such as flat, vertical, horizontal, and overhead. They may perform manual welding, in which the work is entirely controlled by the welder, or semiautomatic welding, in which the welder uses machinery, such as a wire feeder, to perform welding tasks.

There are about 100 different types of welding. Arc welding is the most common type. Standard arc welding involves two large metal alligator clips that carry a strong electrical current. One clip is attached to any part of the workpiece being welded. The second clip is connected to a thin welding rod. When the rod touches the workpiece, a powerful electrical circuit is created. The massive heat created by the electrical current causes both the workpiece and the steel core of the rod to melt together, cooling quickly to form a solid bond. During welding, the flux that surrounds the rod's core vaporizes, forming an inert gas that serves to protect the weld from atmospheric elements that might weaken it. Welding speed is important. Variations in speed can change the amount of flux applied, weakening the weld, or weakening the surrounding metal by increasing heat exposure.

Two common but advanced types of arc welding are Tungsten Inert Gas (TIG) and Metal Inert Gas (MIG) welding. TIG welding often is used with stainless steel or aluminum. While TIG uses welding rods, MIG uses a spool of continuously fed wire, which allows the welder to join longer stretches of metal without stopping to replace the rod. In TIG welding, the welder holds the welding rod in one hand and an electric torch in the other hand. The torch is used to simultaneously melt the rod and the workpiece. In MIG welding, the welder holds the wire feeder, which functions like the alligator clip in arc welding. Instead of using gas flux surrounding the rod, TIG and MIG protect the initial weld from the environment by blowing inert gas onto the weld.

Like arc welding, soldering and brazing use molten metal to join two pieces of metal. However, the metal added during the process has a

melting point lower than that of the workpiece, so only the added metal is melted, not the workpiece. Soldering uses metals with a melting point below 800 degrees Fahrenheit; brazing uses metals with a higher melting point. Because soldering and brazing do not melt the workpiece, these processes normally do not create the distortions or weaknesses in the workpiece that can occur with welding. Soldering commonly is used to join electrical, electronic, and other small metal parts. Brazing produces a stronger joint than does soldering, and often is used to join metals other than steel, such as brass. Brazing can also be used to apply coatings to parts to reduce wear and protect against corrosion.

Skilled welding, soldering, and brazing workers generally plan work from drawings or specifications or use their knowledge of fluxes and base metals to analyze the parts to be joined. These workers then select and set up welding equipment, execute the planned welds, and examine welds to ensure that they meet standards or specifications. They are even examining the weld while they're welding. By observing problems with the weld, they compensate by adjusting the speed, voltage, amperage, or feed of the rod. Highly skilled welders often are trained to work with a wide variety of materials in addition to steel, such as titanium, aluminum, or plastics. Some welders have more limited duties, however. They perform routine jobs that already have been planned and laid out and do not require extensive knowledge of welding techniques.

Automated welding is used in an increasing number of production processes. In these instances, a machine or robot performs the welding tasks while monitored by a welding machine operator. Welding, soldering, and brazing machine setters, operators, and tenders follow specified layouts, work orders, or blueprints. Operators must load parts correctly and constantly monitor the machine to ensure that it produces the desired bond.

The work of arc, plasma, and oxy-gas cutters is closely related to that of welders. However, instead of joining metals, cutters use the heat from an electric arc, a stream of ionized gas (plasma), or burning gases to cut and trim metal objects to specific dimensions. Cutters also dismantle large objects, such as ships, railroad cars, automobiles, buildings, or aircraft. Some operate and monitor cutting machines similar to those used by welding machine operators. Plasma cutting has been increasing in popularity because, unlike other methods, it can cut a wide variety of metals, including stainless steel, aluminum, and titanium.

Working Conditions

Welding, soldering, and brazing workers often are exposed to a number of hazards, including the intense light created by the arc, poisonous fumes, and very hot materials. They wear safety shoes,

Eye protection is important during arc welding.

goggles, hoods with protective lenses, and other devices designed to prevent burns and eye injuries and to protect them from falling objects. They normally work in well-ventilated areas to limit their exposure to fumes. Automated welding, soldering, and brazing machine operators are not exposed to as many dangers, however, and a face shield or goggles usually provide adequate protection for these workers.

Welders and cutters may work outdoors, often in inclement weather, or indoors, sometimes in a confined area designed to contain sparks and glare. Outdoors, they may work on a scaffold or platform high off the ground. In addition, they may be required to lift heavy objects and work in a variety of awkward positions, while bending, stooping, or standing to perform work overhead.

Although about 52 percent of welders, solderers, and brazers work a 40-hour week, overtime is common, and some welders work up to 70 hours per week. Welders also may work in shifts as long as 12 hours. Some welders, solderers, brazers, and machine operators work in factories that operate around the clock, necessitating shift work.

Training, Other Qualifications, and Advancement

Training for welding, soldering, and brazing workers can range from a few weeks of school or on-the-job training for low-skilled positions to several years of combined school and on-the-job training for highly skilled jobs. Formal training is available in high schools, vocational schools, and postsecondary institutions, such as vocational-technical institutes, community colleges, and private welding schools. The Armed Forces operate welding schools as well. While some employers provide basic training, they prefer to hire workers with experience or more formal training. Courses in blueprint reading, shop mathematics, mechanical drawing, physics, chemistry, and metallurgy are helpful. An understanding of electricity also is very helpful and knowledge of computers is gaining importance, especially for welding, soldering, and brazing machine operators, who are becoming more responsible for the programming of computer-controlled machines, including robots.

Some welders become certified, a process whereby the employer sends a worker to an institution, such as an independent testing lab, equipment manufacturer, or technical school, to weld a test specimen according to specific codes and standards required by the employer. Testing procedures are based on the standards and codes set by industry associations with which the employer may be affiliated. If the welding inspector at the examining institution determines that the worker has performed according to the employer's guidelines, the inspector will then certify that the welder being tested is able to work with a particular welding procedure.

Welding, soldering, and brazing workers need good eyesight, hand-eye coordination, and manual dexterity. They should be able to concentrate on detailed work for long periods and be able to bend, stoop, and work in awkward positions. In addition, welders increasingly need to be willing to receive training and perform tasks in other production jobs.

Welders can advance to more skilled welding jobs with additional training and experience. For example, they may become welding technicians, supervisors, inspectors, or instructors. Some experienced welders open their own repair shops.

Employment

Welding, soldering, and brazing workers held about 429,000 jobs in 2004. Of these jobs, more than 6 of every 10 were found in manufacturing. Jobs were concentrated in fabricated metal product manufacturing, transportation equipment manufacturing (motor vehicle body and parts and ship and boat building), machinery manufacturing (agriculture, construction, and mining machinery), architectural and structural metals manufacturing, and construction. Most jobs for welding, soldering, and brazing machine setters, operators, and

tenders were found in the same manufacturing industries as skilled welding, soldering, and brazing workers.

Job Outlook

Employment of welding, soldering, and brazing workers is expected to grow more slowly than the average for all occupations over the 2004-14 period. Despite this, job prospects should be excellent as employers report difficulty finding enough qualified people. In addition, many openings are expected to arise as a large number of workers retire over the next decade.

The major factor affecting employment of welders is the health of the industries in which they work. The manufacturing sector, which employs the most welding, soldering, and brazing workers, is expected to continue to decline as more manufacturing moves overseas. Because almost every manufacturing industry uses welding at some stage of manufacturing or in the repair and maintenance of equipment, this overall decline will affect the demand for welders, although some industries will fare better than others. The construction industry is expected to have solid growth over the next decade and an increasing demand for welders. Government funding for shipbuilding as well as for infrastructure repairs and improvements are expected to generate additional welding jobs.

Pressures to improve productivity and hold down labor costs are leading many companies to invest more in automation, especially computer-controlled and robotically controlled welding machinery. This will reduce the demand for some welders, solderers, and brazers because many repetitive jobs are being automated. The growing use of automation, however, should increase demand for welding, soldering, and brazing machine setters, operators, and tenders. Welders working on construction projects or in equipment repair will not be affected by technology change to the same extent, because their jobs are often unique and not as easily automated.

Despite slower-than-average job growth, technology is creating more uses for welding in the workplace and expanding employment opportunities. For example, new ways are being developed to bond dissimilar materials and nonmetallic materials, such as plastics, composites, and new alloys. Also, laser beam and electron beam welding, new fluxes, and other new technologies and techniques are improving the results of welding, making it useful in a wider assortment of applications. Improvements in technology have also boosted welding productivity, making welding more competitive with other methods of joining materials.

Earnings

Median hourly earnings of welders, cutters, solderers, and brazers were \$14.72 in May 2004. The middle 50 percent earned between

\$11.90 and \$18.05. The lowest 10 percent had earnings of less than \$9.79, while the top 10 percent earned over \$22.20. The range of earnings of welders reflects the wide range of skill levels. Median hourly earnings in the industries employing the largest numbers of welders, cutters, solderers, and brazers in May 2004 were:

Motor vehicle parts manufacturing	\$16.47
Agriculture, construction, and mining machinery manufacturing ..	14.12
Architectural and structural metals manufacturing	13.98
Commercial and industrial machinery and equipment (except automotive and electronic) repair and maintenance	13.45
Motor vehicle body and trailer manufacturing	13.45

Median hourly earnings of welding, soldering, and brazing machine setters, operators, and tenders were \$14.32 in May 2004. The middle 50 percent earned between \$11.73 and \$17.78. The lowest 10 percent had earnings of less than \$9.63, while the top 10 percent earned over \$23.54. Median hourly earnings in motor vehicle parts manufacturing, the industry employing the largest numbers of welding machine operators in May 2004, were \$15.43.

Many welders belong to unions. Among these are the International Association of Machinists and Aerospace Workers; the International Brotherhood of Boilermakers, Iron Ship Builders, Blacksmiths, Forgers and Helpers; the International Union, United Automobile, Aerospace and Agricultural Implement Workers of America; the United Association of Journeymen and Apprentices of the Plumbing, Pipefitting, Sprinkler Fitting Industry of the United States and Canada; and the United Electrical, Radio, and Machine Workers of America.

Related Occupations

Welding, soldering, and brazing workers are skilled metal workers. Other metal workers include machinists; machine setters, operators, and tenders—metal and plastic; computer control programmers and operators; tool and die makers; sheet metal workers; and boilermakers. Assemblers and fabricators of electrical and electronic equipment often assemble parts using soldering.

Sources of Additional Information

For information on training opportunities and jobs for welding, soldering, and brazing workers, contact local employers, the local office of the State employment service, or schools providing welding, soldering, or brazing training.

Information on careers and educational opportunities in welding is available from:

Printing Occupations

Bookbinders and Bindery Workers

(O*NET 51-5011.01, 51-5011.02, 51-5012.00)

Significant Points

- Most bookbinders and bindery workers train on the job.
- Employment is expected to decline, reflecting the use of more productive machinery and the growth of imports of printed material that is already bound.
- Opportunities for hand bookbinders are limited because only a small number of establishments do this highly specialized work.

Nature of the Work

The process of combining printed sheets into finished products such as books, magazines, catalogs, folders, directories is known as “binding.” Binding involves cutting, folding, gathering, gluing, stapling, stitching, trimming, sewing, wrapping, and other finishing operations. Bindery workers set up, operate, and maintain the machines that perform these various tasks.

Job duties depend on the kind of material being bound. In libraries where repair work on rare books is needed, *bookbinders* sew, stitch, or glue the assembled printed sheets, shape the book bodies with presses and trimming machines, and reinforce them with glued fabric strips. Covers are created separately, and glued, pasted, or stitched onto the book bodies. The books then undergo a variety of finishing operations, often including wrapping in paper

jackets. In establishments that print new books, this work is done mechanically.

In firms that do *edition binding*, workers bind books produced in large numbers, or “runs.” A small number of bookbinders work in hand binderies. These highly skilled workers design original or special bindings for limited editions, or restore and rebind rare books. *Library binders* repair books and provide other specialized binding services to libraries.

Some types of binding and finishing jobs consist of only one step. Preparing leaflets or newspaper inserts, for example, requires only folding. Binding of books and magazines, on the other hand, requires a number of steps. Workers first assemble the books and magazines from large, flat, printed sheets of paper. They then operate machines that first fold printed sheets into “signatures,” which are groups of pages arranged sequentially. They then assemble the signatures in sequence and join them by means of a saddle-stitch process or perfect binding (where no stitches are used).

Bookbinders and bindery workers in small shops may perform many binding tasks, while those in large shops usually are assigned only one or a few operations, such as assembling sheets in a specified sequence, performing perfect binding, or operating laminating machinery. Others specialize as folder operators or cutter operators, and may perform adjustments and minor repairs to equipment as needed.

Working Conditions

Binderies often are noisy and jobs can be fairly strenuous, requiring considerable lifting, standing, and carrying. Binding often resembles an assembly line on which workers perform repetitive tasks. The jobs also may require stooping, kneeling, and crouching, but equipment is now widely available, such as scissor lifts, that minimize such activity out of concern for ergonomics.

Training, Other Qualifications, and Advancement

Most bookbinders and bindery workers learn the craft through on-the-job training. Inexperienced workers usually are assigned simple tasks such as moving paper from cutting machines to folding machines. They learn basic binding skills, including the characteristics of paper and how to cut large sheets of paper into different sizes with the least amount of waste. Usually, it takes 1 to 3 months to learn to operate the simpler machines but it can take up to 1 year to become completely familiar with more complex equipment, such as computerized binding machines. On letterpress equipment, as workers gain experience they advance to more difficult tasks, such as embossing and adding holograms. As workers advance, they learn to operate more types of equipment.

A bindery worker uses a machine to install a plastic spine on a document.

Formal apprenticeships are not as common as they used to be, but still are offered by some employers. Apprenticeships provide a more structured program that enables workers to acquire the high levels of specialization and skill needed for some bindery jobs.

High school students interested in bindery careers should take shop courses or attend a vocational-technical high school. Occupational skill centers also provide an introduction to a bindery career. To keep pace with changing technology, retraining is increasingly important for bindery workers. Students with computer skills and mechanical aptitude are especially in demand.

Bindery workers need basic mathematics and language skills. Bindery work requires careful attention to detail; accuracy, patience, neatness, and good eyesight also are important. Manual dexterity is essential in order to count, insert, and fold. Mechanical aptitude is needed to operate the newer, more automated equipment. Artistic ability and imagination are necessary for hand bookbinding.

Training in graphic communications also can be an asset. Vocational-technical institutes offer postsecondary programs in the graphic arts, as do some skill-updating or retraining programs and community colleges. Some updating and retraining programs require students to have bindery experience; other programs are made available by unions to their members. Four-year colleges also offer programs, but their emphasis is on preparing people for careers as graphic artists, educators, or managers in the graphic arts field.

Without additional training, advancement opportunities outside of bindery work are limited. In large binderies, experienced bookbinders or bindery workers may advance to supervisory positions.

Employment

In 2004, bookbinders and bindery workers held about 81,000 jobs, including 7,200 as skilled bookbinders and 74,000 as bindery workers. More than 3 out of 4 bindery jobs are in commercial printing plants. Traditionally, the largest employers of bindery workers were bindery trade shops, which are companies that specialize in providing binding services for printers without binderies or whose printing production exceeds their binding capabilities. However, this type of binding is now being done increasingly in-house, and is now called in-line finishing.

The publishing industry employed nearly 1 in 10 bindery workers and the advertising industry an additional number. About one in twenty work in the employment services industry, which supplies temporary workers to companies that need their services.

Job Outlook

Overall employment of bookbinders and bindery workers is expected to decline through 2014 as demand for printed material slows and productivity in printing and bindery operations increases. Contributing to this situation is the trend toward outsourcing of work to firms in foreign countries, where books and other materials with long lead times can be produced more cheaply. Most job openings, however, will result from the need to replace experienced workers who leave the occupation, many of whom will be retiring in the next decade.

Computers have caused binding to become increasingly automated. New computer-operated “in-line” equipment performs a number of operations in sequence, beginning with the presses’ output and ending with a finished product. Technological advances such as automatic tabbers, counters, palletizers, and joggers have reduced labor requirements and have induced printing companies to acquire in-house binding and finishing equipment and maintain a permanent staff to operate them.

Growth in demand for specialized bindery workers who assist skilled bookbinders will be slowed as binding machinery continues

to become more efficient. New technology requires a considerable investment in capital expenditures and employee training, so computer skills and mechanical aptitude are increasingly important for bindery workers.

Because the number of establishments that do hand bookbinding is small, opportunities for hand bookbinders will be limited. Though experienced workers will continue to have the best opportunities for these specialist jobs, the work done by hand bookbinders is being replaced by other activities in the binding-and-finishing field.

Earnings

Median hourly earnings of bookbinders were \$13.71 in May 2004. The middle 50 percent earned between \$10.22 and \$18.14 an hour. The lowest 10 percent earned less than \$8.67, and the highest 10 percent earned more than \$21.50.

Median hourly earnings of bindery workers were \$11.31 in May 2004. The middle 50 percent earned between \$8.92 and \$15.06 an hour. The lowest 10 percent earned less than \$7.38, and the highest 10 percent earned more than \$19.30. Workers covered by union contracts usually had higher earnings.

Related Occupations

Other workers who set up and operate production machinery include prepress technicians and workers; printing machine operators; machine setters, operators, and tenders—metal and plastic; and various other precision machine operators.

Sources of Additional Information

Information about apprenticeships and other training opportunities may be obtained from local printing industry associations, local bookbinding shops, local offices of the Graphic Communications International Union, or local offices of the State employment service.

Prepress Technicians and Workers

(O*NET 51-5021.00, 51-5022.01, 51-5022.02, 51-5022.03, 51-5022.04, 51-5022.05, 51-5022.06, 51-5022.07, 51-5022.08, 51-5022.09, 51-5022.10, 51-5022.11, 51-5022.12, 51-5022.13)

Significant Points

- Most prepress technician jobs now require formal post-secondary graphic communications training in the various types of computer software used in digital imaging.
- Employment is projected to decline as the increased use of computers in typesetting and page layout requires fewer prepress technicians.

Nature of the Work

The printing process has three stages—prepress, press, and binding or postpress. In small print shops, *job printers* are usually responsible for all three stages. They check proofs for errors and print clarity and correct mistakes, print the job, and attach each copy's pages together. In most printing firms, however, each of the stages is the responsibility of a specialized group of workers. *Prepress technicians and workers* are responsible for the first stage, preparing the material for printing presses. They perform a variety of tasks involved with transforming text and pictures into finished pages and making printing plates of the pages.

Advances in computer software and printing technology continue to change prepress work. Most customers today are able to provide printers with pages of material that look like the desired finished product they want printed and bound in volume. Using a process called “desktop publishing,” customers are increasingly using their own computers to do much of the typesetting and page layout work formerly done by designers on artboards. Much of this work is now done by desktop publishers or graphic designers with knowledge of publishing software. (Sections on desktop publishers and graphic designers appear elsewhere in the *Handbook*.) It is increasingly common for prepress technicians or other printing workers to receive files from the customer on a computer disk or submitted electronically via e-mail or “file transfer protocol”, known as “ftp”, that contains typeset material already laid out in pages.

Prepress work is now done with the use of digital imaging technology by prepress technicians known as “preflight technicians” or production coordinators. Using this technology, these technicians take the electronic files received from customers, check it for completeness, and format it into pages using electronic page layout systems. Even though the pages may already be laid out, they still may have to be formatted to fit the dimensions of the paper stock to be used. When color printing is required, the technicians use digital color page-makeup systems to electronically produce an image of the printed pages, then use off-press color proofing systems to print a copy, or “proof,” of the pages as they will appear when printed. The technician then has the proofs delivered or mailed to the customer for a final check. Once the customer gives the “OK to print,” technicians use laser “imagesetters” to expose digital images of the pages directly onto thin aluminum printing plates.

Platemakers for a long time used a photographic process to make printing plates. The flat, a layout sheet onto which a negative has been attached, was placed on top of a thin metal plate coated with a light-sensitive resin. Exposure to ultraviolet light activated the chemical in parts of the plate not protected by the film's dark areas. The plate was then developed in a solution that removes the unexposed nonimage area, exposing bare metal. The chemical on areas of the plate exposed to the light hardened and became water repellent. The hardened parts of the plate form the text and images to be printed. Now, the printing industry has largely moved to technology known as “direct-to-plate”, by which the prepress technicians send the data directly to a plating system, by-passing the need for stripping film onto a flat.

During the printing process, the plate is first covered with a thin coat of water. The water adheres only to the bare metal nonimage areas, and is repelled by the hardened areas that were exposed to light. Next, the plate comes in contact with a rubber roller covered with oil-based ink. Because oil and water do not mix, the ink is repelled by the water-coated area and sticks to the hardened areas. The ink covering the hardened text is transferred to paper.

The job of prepress technicians has become highly computerized.

Working Conditions

Prepress technicians and workers usually work in clean, air-conditioned areas with little noise. Some workers may develop eyestrain from working in front of a video display terminal, or musculoskeletal problems such as backaches. Those platemakers who still work with toxic chemicals face the hazard of skin irritations. Workers are often subject to stress and the pressures of short deadlines and tight work schedules.

Prepress employees usually work an 8-hour day. Some workers—particularly those employed by newspapers—work night shifts, weekends, and holidays.

Training, Other Qualifications, and Advancement

Digital imaging technology has largely replaced cold type print technology. Instead of painstakingly taping pieces of photographic negatives to flats, today's prepress technicians use computer software skills to electronically modify and lay out the material; in some cases, the first time the material appears on paper is when the final product rolls off the printing press. Traditionally, prepress technicians and workers started as helpers and were trained on the job, with some jobs requiring years of experience performing the detailed handwork to become skillful enough to perform even difficult tasks quickly. Today, persons seeking to enter prepress technician jobs require formal postsecondary graphic communications training in the various types of computer software used in digital imaging.

Postsecondary graphic communications programs are available from a variety of sources. For beginners, 2-year associate degree programs offered by community and junior colleges and technical schools, and some 4-year bachelor's degree programs in graphic design colleges teach the latest prepress skills and allow students to practice applying them. However, bachelor's programs usually are intended for students who may eventually move into management positions in printing or design jobs. Community and junior colleges, 4-year colleges and universities, vocational-technical institutes, industry-sponsored update and retraining programs, and private trade and technical schools all also offer prepress-related courses for workers who do not wish to enroll in a degree program. Many workers with experience in other printing jobs take a few college graphic communications courses to upgrade their skills and qualify for prepress jobs. Prepress training designed to train skilled workers already employed in the printing industry also is offered through unions in the printing industry. Many employers view individuals with

a combination of experience in the printing industry and formal training in the new digital technology as the best candidates for prepress jobs. The experience of these applicants in printing press operator or other jobs provides them with an understanding of how printing plants operate, familiarizes them with basic prepress functions, and demonstrates their reliability and interest in advancing in the industry.

Employers prefer workers with good communication skills, both oral and written, for prepress jobs. Prepress technicians and workers should be able to deal courteously with people because, when prepress problems arise, they sometimes have to contact the customer to resolve them. Also, in small shops, they may take customer orders. Persons interested in working for firms using advanced printing technology need to know the basics of electronics and computers. Mathematical skills also are essential for operating many of the software packages used to run modern, computerized prepress equipment. At times, prepress personnel may have to perform computations in order to estimate job costs.

Prepress technicians and workers need good manual dexterity, and they must be able to pay attention to detail and work independently. Good eyesight, including visual acuity, depth perception, field of view, color vision, and the ability to focus quickly, also are needed assets. Artistic ability is often a plus. Employers also seek persons who possess an even temperament and an ability to adapt, important qualities for workers who often must meet deadlines and learn how to use new software or operate new equipment.

Employment

Prepress technicians and workers overall held about 141,000 jobs in 2004. Of these, approximately 63,000 were employed as job printers; the remainder was employed as prepress technicians and other prepress workers. Most prepress jobs are found in the printing industry, while newspaper publishing employs the second largest number of prepress technicians and workers.

The printing and publishing industries are two of the most geographically dispersed in the United States, and prepress jobs are found throughout the country. However, jobs are concentrated in large metropolitan areas such as Chicago, Los Angeles–Long Beach, New York City, Minneapolis–St. Paul, Philadelphia, Boston, and Washington, DC.

Job Outlook

Overall employment of prepress technicians and workers is expected to decline through 2014. Demand for printed material should continue to grow, spurred by rising levels of personal income, increasing school enrollments, higher levels of educational attainment, and expanding markets. But the use of computers and publishing software—often by the clients of the printing company—will result in rising productivity of prepress technicians.

Computer software now allows office workers to specify text typeface and style, and to format pages at a desktop computer terminal, shifting many prepress functions away from the traditional printing plants into advertising and public relations agencies, graphic design firms, and large corporations. Many companies are turning to in-house desktop publishing as page layout and graphic design capabilities of computer software have improved and become less expensive and more user-friendly. Some firms are finding it less costly to prepare their own newsletters and other reports than to send them out to trade shops. At newspapers, writers and editors also are doing more composition using publishing software. Rapid growth in the use of desktop publishing software already has eliminated most prepress typesetting and composition

technician jobs associated with the older technologies, such as cold-type. However, opportunities will be favorable for prepress technicians with strong computer skills, such as preflight technicians, who are employed to check materials prepared by clients and adapt it for printing.

In order to compete in the desktop publishing environment, commercial printing companies are adding desktop publishing and electronic prepress work to the list of services they provide. Electronic prepress technicians, digital proofers, platemakers, and graphic designers are using new equipment and ever-changing software to design and layout publications and complete their printing more quickly. The increasing range of services offered by printing companies using new digital technologies mean that opportunities in prepress work will be best for those with computer backgrounds who have completed postsecondary programs in printing technology or graphic communications. Workers with this background will be better able to adapt to the continuing evolution of publishing and printing technology.

Earnings

Median hourly earnings of prepress technicians and workers were \$15.30 in May 2004. The middle 50 percent earned between \$11.69 and \$20.01 an hour. The lowest 10 percent earned less than \$9.06, and the highest 10 percent earned more than \$24.82 an hour.

For job printers, median hourly earnings were \$15.41 in May 2004. The middle 50 percent earned between \$12.00 and \$20.04 an hour. The lowest 10 percent earned less than \$9.57, while the highest 10 percent earned more than \$24.05 an hour.

Median hourly earnings in commercial printing, the industry employing the largest number of prepress technicians and workers, were \$15.91 in May 2004, while the figure for these workers in the newspaper, periodical, and book publishing industry was \$14.22 an hour. For job printers, median hourly earnings in commercial printing in May 2004 were \$15.67, while in the newspaper, periodical, and book publishing industry median hourly earnings were \$15.63.

Wage rates for prepress technicians and workers vary according to occupation, level of experience, training, location, size of firm, and union membership status.

Related Occupations

Prepress technicians and workers use artistic skills in their work. These skills also are essential for artists and related workers, graphic designers, and desktop publishers. Moreover, many of the skills used in Web site design also are employed in prepress technology.

In addition to typesetters, other workers who operate machines equipped with keyboards include data entry and information processing workers. Prepress technicians' work also is tied in closely with that of printing machine operators, including job printers.

Sources of Additional Information

Details about training programs may be obtained from local employers such as newspapers and printing shops, or from local offices of the State employment service.

Printing Machine Operators

(O*NET 51-5023.01, 51-5023.02, 51-5023.03, 51-5023.04, 51-5023.05, 51-5023.06, 51-5023.07, 51-5023.08, 51-5023.09)

Significant Points

- Most printing machine operators are trained on the job.
- Those skilled in digital printing operations will have the best job opportunities as more printing firms convert to this printing process because of the rising demand for customized print jobs.
- The expected retirements of skilled press operators will create openings for workers with the proper training.

Nature of the Work

Printing machine operators, also known as press operators, prepare, operate, and maintain the printing presses in a pressroom. Duties of printing machine operators vary according to the type of press they operate—offset lithography, gravure, flexography, screen printing, letterpress, and digital. Offset lithography, which transfers an inked impression from a rubber-covered cylinder to paper or other material, is the dominant printing process. With gravure, the recesses on an etched plate or cylinder are inked and pressed to paper. Flexography is a form of rotary printing in which ink is applied to a surface by a flexible rubber printing plate with a raised image area. Use of flexography should increase over the next decade, but letterpress, in which an inked, raised surface is pressed against paper, remains in existence only as specialty printing. In addition to the major printing processes, plateless or nonimpact processes are coming into general use. Plateless processes—including digital, electrostatic, and ink-jet printing—are used for copying, duplicating, and document and specialty printing, usually by quick and in-house printing shops, and increasingly by commercial printers for short-run jobs and variable data printing.

To prepare presses for printing, machine operators install and adjust the printing plate, adjust pressure, ink the presses, load paper, and adjust the press to the paper size. Press operators ensure that paper and ink meet specifications, and adjust margins and the flow of ink to the inking rollers accordingly. They then feed paper through the press cylinders and adjust feed and tension controls. However, new technology becoming available skips these steps and sends the files directly to the press.

While printing presses are running, press operators monitor their operation and keep the paper feeders well stocked. They make adjustments to correct uneven ink distribution, speed, and temperatures in the drying chamber, if the press has one. If paper jams or tears and the press stops, which can happen with some offset presses, operators quickly correct the problem to minimize downtime. Similarly, operators working with other high-speed presses constantly look for problems, making quick corrections to avoid expensive losses of paper and ink. Throughout the run, operators must regularly pull sheets to check for any printing imperfections, though much of this checking for quality is now being by done computers.

In most shops, press operators also perform preventive maintenance. They oil and clean the presses and make minor repairs.

Machine operators' jobs differ from one shop to another because of differences in the kinds and sizes of presses. Small commercial shops are operated by one person and tend to have relatively small presses, which print only one or two colors at a time. Operators

Printing machine operators are increasingly using computers to operate printing presses.

who work with large presses have assistants and helpers. Large newspaper, magazine, and book printers use giant “in-line web” presses that require a crew of several press operators and press assistants. These presses are fed paper in big rolls up to 50 inches or more in width. Presses print the paper on both sides; trim, assemble, score, and fold the pages; and count the finished sections as they come off the press.

Most plants have or will soon have installed printing presses with computers and sophisticated instruments to control press operations, making it possible to set up for jobs in less time. Computers allow press operators to perform many of their tasks electronically. With this equipment, press operators monitor the printing process on a control panel or computer monitor, which allows them to adjust the press electronically.

Working Conditions

Operating a press can be physically and mentally demanding, and sometimes tedious. Printing machine operators are on their feet most of the time. Often, operators work under pressure to meet deadlines. Most printing presses are capable of high printing speeds, and adjustments must be made quickly to avoid waste. Pressrooms are noisy, and workers in certain areas wear ear protectors. Working with press machinery can be hazardous, but accidents can be avoided when press operators follow safe work practices. The threat of accidents has decreased with newer computerized presses because operators make most adjustments from a control panel. Many press operators, particularly those who work for newspapers, work weekends, nights, and holidays. They also may work overtime to meet deadlines.

Training, Other Qualifications, and Advancement

Although completion of a formal apprenticeship or a postsecondary program in printing equipment operation continues to be the best way to learn the trade, most printing machine operators are trained on the job while they work as assistants or helpers to experienced operators. Beginning press operators load, unload, and clean presses. With time and training, they may move up to become fully qualified press operators on the type of equipment on which they trained. Some operators gain experience on many kinds of printing presses during the course of their career.

Apprenticeships for press operators, once the dominant method for preparing for this occupation, are becoming less prevalent. When they are offered by the employer, they usually include on-the-job

instruction and some related classroom training or correspondence school courses. Apprenticeships used to be for a fixed period of time, but now completion is based on ability to demonstrate competencies.

In contrast, formal postsecondary programs in printing equipment operation offered by technical and trade schools, community colleges, and universities are growing in importance. Some postsecondary school programs require 2 years of study and award an associate degree. Postsecondary courses in printing are increasingly important because they provide the theoretical and technical knowledge needed to operate advanced equipment.

Persons who wish to become printing machine operators need mechanical aptitude to make press adjustments and repairs. Oral and writing skills also are required. Operators should possess the mathematical skills necessary to compute percentages, weights, and measures, and to calculate the amount of ink and paper needed to do a job. Because of technical developments in the printing industry, courses in chemistry, electronics, color theory, and physics are helpful.

Technological changes have had a tremendous effect on the skills needed by printing machine operators. New presses now require operators to possess basic computer skills. Even experienced operators periodically receive retraining and skill updating. For example, printing plants that change from sheet-fed offset presses to digital presses have to retrain the entire press crew because skill requirements for the two types of presses are different.

Printing machine operators may advance in pay and responsibility by working on a more complex printing press. Through experience and demonstrated ability, for example, a one-color sheet-fed press operator may become a four-color sheet-fed press operator. Others may advance to pressroom supervisor and become responsible for an entire press crew. Press operators can also draw on their knowledge of press operations to become cost estimators, providing estimates of printing jobs to potential customers.

Employment

Printing machine operators held about 191,000 jobs in 2004. Nearly half of all operator jobs were in the printing industry. Paper manufacturers and newspaper publishers were also large employers. Additional jobs were in the “in-plant” section of organizations and businesses that do their own printing—such as banks, insurance companies, government agencies, and universities.

The printing and newspaper publishing industries are two of the most geographically dispersed in the United States, and press operators can find jobs throughout the country. However, jobs are concentrated in large printing centers such as Chicago, Los Angeles–Long Beach, New York, Minneapolis–St. Paul, Philadelphia, Boston, and Washington, DC.

Job Outlook

Employment of printing machine operators is expected to grow more slowly than average through 2014 as the output of printed materials is expected to keep going up, but increasing automation of the printing industry and the outsourcing of production to foreign countries will moderate the increase. Looming retirements of printing machine operators and the need for workers trained on increasingly computerized printing equipment will also create many job openings over the next decade, particularly for those persons who qualify for formal apprenticeship training or who complete postsecondary training programs in printing.

Demand for books and magazines will increase as school enrollments rise and information proliferates. Additional growth will also

come from the increasing ability of the printing industry to profitably print shorter runs—smaller quantities—which should widen the market for printed materials as production costs decline. However, small printing jobs will increasingly be run on sophisticated high-speed digital printing equipment that requires a more complex set of operator skills, such as database management.

Demand for commercial printing also will continue to be driven by increased expenditures for print advertising materials. New market research techniques are leading advertisers to increase spending on messages targeted to specific audiences, and should continue to require the printing of a wide variety of catalogs, direct mail enclosures, newspaper inserts, and other kinds of print advertising. Newspaper printing also will continue to provide jobs.

Employment will not grow in line with output, however, because increased use of new computerized printing equipment will require fewer operators. This will especially be true with the increasing automation of the large printing presses used in the newspaper industry. In addition, more companies are having their work printed out of the country when time sensitivity of the material is not an issue. Also, new business practices within the publishing industry, such as printing-on-demand and electronic publishing, will cut into the production of printed materials. Printing-on-demand refers to the printing of materials as they are requested by customers, in contrast to printing thousands of copies of a publication prior to purchase, many of which are subsequently discarded.

Earnings

Median hourly earnings of printing machine operators were \$14.38 in May 2004. The middle 50 percent earned between \$10.73 and \$18.83 an hour. The lowest 10 percent earned less than \$8.54, and the highest 10 percent earned more than \$23.06 an hour. Median hourly earnings in the industries employing the largest numbers of printing machine operators in May 2004 were:

Newspaper, periodical, book, and directory publishers	\$16.46
Converted paper product manufacturing	15.72
Printing and related support activities.....	15.16
Plastics product manufacturing.....	13.76
Advertising and related services	12.68

The basic wage rate for a printing machine operator depends on the geographic area in which the work is located and on the type of press being run: pay varies by the complexity of the press and its size. Workers covered by union contracts usually have higher earnings in the newspaper industry.

Related Occupations

Other workers who set up and operate production machinery include machine setters, operators, and tenders—metal and plastic; bookbinders and bindery workers; and various precision machine operators.

Textile, Apparel, and Furnishings Occupations

(O*NET 51-6011.01, 51-6011.02, 51-6011.03, 51-6021.01, 51-6021.02, 51-6021.03, 51-6031.01, 51-6031.02, 51-6041.00, 51-6042.00, 51-6051.00, 51-6052.01, 51-6052.02, 51-6061.00, 51-6062.00, 51-6063.00, 51-6064.00, 51-6091.00, 51-6092.00, 51-6093.00, 51-6099.99)

Significant Points

- Most workers learn through on-the-job training.
- This group ranks among the most rapidly declining occupations because of increases in imports, offshore assembly, productivity gains from automation, and new fabrics that do not need as much processing.
- Earnings of most workers are low.

Nature of the Work

Textile, apparel, and furnishings workers produce fibers, cloth, and upholstery, and fashion them into a wide range of products that we use in our daily lives. Jobs range from those that involve computers, to those in which the worker operates large industrial machinery and smaller power equipment, to those that require substantial handwork.

Textile machine setters, operators, and tenders. Textile machine setters, operators, and tenders run machines that make

textile products from fibers. Textiles are the basis of towels, bed linens, hosiery and socks, and nearly all clothing, but they also are a key ingredient in products ranging from roofing to tires. The first step in manufacturing textiles is preparing the natural or synthetic fibers. *Extruding and forming machine operators, synthetic and glass fibers*, set up and operate machines that extrude or force liquid synthetic material such as rayon, fiberglass, or liquid polymers through small holes and draw out filaments. Other operators put natural fibers such as cotton, wool, flax, or hemp through carding and combing machines that clean and align them into short lengths collectively called “sliver.” In making sliver, operators may combine different types of natural fibers and synthetics filaments to give the product a desired texture, durability, or other characteristics. *Textile winding, twisting, and drawing-out machine operators* take the sliver and draw out, twist, and wind it to produce yarn, taking care to repair any breaks.

Textile bleaching and dyeing machine operators control machines that wash, bleach, or dye either yarn or finished fabrics and other products. *Textile knitting and weaving machine operators* put the yarn on machines that weave, knit, loop, or tuft it into a product. Woven fabrics are used to make apparel and other goods, whereas some knitted products (such as hosiery) and tufted products (such as

carpeting) emerge in near-finished form. Different types of machines are used for these processes, but operators perform similar tasks, repairing breaks in the yarn and monitoring the yarn supply while tending many machines at once. *Textile cutting machine operators* trim the fabric into various widths and lengths, depending on its intended use.

Apparel workers. Apparel workers cut fabric and other materials and sew it into clothing and related products. Workers in a variety of occupations fall under the heading of apparel workers. *Tailors, dressmakers, and sewers* make custom clothing and alter and repair garments for individuals. However, workers in most apparel occupations are found in manufacturing, performing specialized tasks in the production of large numbers of garments that are shipped to retail establishments for sale.

Fabric and apparel patternmakers convert a clothing designer's original model of a garment into a pattern of separate parts that can be laid out on a length of fabric. After discussing the item with the designer, these skilled workers usually use a computer to outline the parts and draw in details to indicate the positions of pleats, buttonholes, and other features. (In the past, patternmakers laid out the parts on paper, using pencils and drafting instruments such as rulers.) Patternmakers then alter the size of the pieces in the pattern to produce garments of various sizes, and they may mark the fabric to show the best layout of pattern pieces to minimize waste of material.

Once an item's pattern has been made and marked, mass production of the garment begins. Cutters and trimmers take the patterns and cut out material, paying close attention to their work because mistakes are costly. Following the outline of the pattern, they place multiple layers of material on the cutting table and use an electric knife or other tools to cut out the various pieces of the garment; delicate materials may be cut by hand. In some companies, computer-controlled machines do the cutting.

Sewing machine operators join the parts of a garment together, reinforce seams, and attach buttons, hooks, zippers, and accessories to produce clothing. After the product is sewn, other workers remove lint and loose threads and inspect and package the garments.

Shoe and leather workers. Shoe and leather workers are employed either in manufacturing or in personal services. In shoe manufacturing, *shoe machine operators and tenders* operate a variety of specialized machines that perform cutting, joining, and finishing functions. In personal services, *shoe and leather workers and repairers* perform a variety of repairs and custom leatherwork for the general public. They construct, decorate, or repair shoes, belts, purses, saddles, luggage, and other leather products. They also may repair some products made of canvas or plastic. When making custom shoes or modifying existing footwear for people with foot problems or special needs, shoe and leather workers and repairers cut pieces of leather, shape them over a form shaped like a foot, and sew them together. They then attach soles and heels, using sewing machines or cement and nails. They also dye and polish the items, utilizing a buffing wheel for a smooth surface and lustrous shine. When making luggage, they fasten leather to a frame and attach handles and other hardware. They also cut and secure linings inside the frames and sew or stamp designs onto the exterior of the luggage. In addition to performing all of the preceding steps, saddlemakers often apply leather dyes and liquid topcoats to produce a glossy finish on a saddle. They also may decorate the surface of the saddle by hand stitching or by stamping the leather with decorative patterns and designs. Shoe and leather workers and repairers who own their own shops keep records and supervise other workers.

Many upholsters reupholster old furniture.

Upholsters. *Upholsters* make, fix, and restore furniture that is covered with fabric. Using hammers and tack pullers, upholsters who restore furniture remove old fabric and stuffing to get down to the springs and wooden frame. Then they reglue loose sections of the frame and refinish exposed wood. The springs sit on a cloth mat, called webbing, that is attached to the frame. Upholsters replace torn webbing, examine the springs, and replace broken or bent ones.

Upholsters who make new furniture start with a bare wooden frame. First, they install webbing, tacking it to one side of the frame, stretching it tight, and tacking it to the other side. Then, they tie each spring to the webbing and to its neighboring springs. Next, they cover the springs with filler, such as foam, a polyester batt, or similar fibrous batting material, to form a smooth, rounded surface. Then they measure and cut fabric for the arms, backs, seats, sides, and other surfaces, leaving as little waste as possible. Finally, sewing the fabric pieces together and attaching them to the frame with tacks, staples, or glue, they affix any ornaments, such as fringes, buttons, or rivets. Sometimes, upholsters provide pickup and delivery of the furniture they work on. They also help customers select new coverings by providing samples of fabrics and pictures of finished pieces.

Laundry and drycleaning workers. *Laundry and drycleaning workers* clean cloth garments, linens, draperies, blankets, and other articles. They also may clean leather, suede, furs, and rugs. When necessary, they treat spots and stains on articles before laundering or drycleaning. They tend machines during cleaning and ensure that items are not lost or misplaced with those of another customer. *Pressers, textile, garment, and related materials*, shape and remove wrinkles from items after steam pressing them or ironing them by hand. Workers then assemble each customer's items, box or bag them, and prepare an itemized bill for the customer.

Working Conditions

Most people in textile, apparel, and furnishings occupations work a standard 5-day, 35- to 40-hour week. Working on evenings and weekends is common for shoe and leather workers; laundry and drycleaning workers; and tailors, dressmakers, and sewers employed in retail stores. Many textile and fiber mills often use rotating schedules of shifts so that employees do not continuously work nights or days. But these rotating shifts sometimes cause workers to have sleep disorders and stress-related problems.

Although much of the work in apparel manufacturing still is based on a piecework system that allows for little interpersonal contact,

some apparel firms are placing more emphasis on teamwork and cooperation. Under this new system, individuals work closely with one another, and each team or module often governs itself, increasing the overall responsibility of each operator.

Working conditions vary by establishment and by occupation. In manufacturing, machinery in textile mills often is noisy, as are areas in which sewing and pressing are performed in apparel factories; patternmaking and spreading areas tend to be much quieter. Many older factories are cluttered, hot, and poorly lit and ventilated, but more modern facilities usually have more workspace and are well lit and ventilated. Textile machinery operators use protective glasses and masks that cover their noses and mouths to protect against airborne materials. Many machines operate at high speeds, and textile machinery workers must be careful not to wear clothing or jewelry that could get caught in moving parts. In addition, extruding and forming machine operators wear protective shoes and clothing when working with certain chemical compounds.

Work in apparel production can be physically demanding. Some workers sit for long periods, and others spend many hours on their feet, leaning over tables and operating machinery. Operators must be attentive while running sewing machines, pressers, automated cutters, and the like. A few workers wear protective devices such as gloves. In some instances, new machinery and production techniques have decreased the physical demands on workers. For example, newer pressing machines are controlled by foot pedals or by computer and do not require much strength to operate.

Laundries and drycleaning establishments often are hot and noisy; those in retail stores, however, tend to be less noisy and more comfortable. Areas in which shoe and leather workers make or repair shoes and other leather items can be noisy, and odors from leather dyes and stains frequently are present. Workers need to pay close attention when working with machines, to avoid punctures, lacerations, and abrasions.

Upholstery work is not dangerous, but upholsterers usually wear protective gloves and clothing when using sharp tools and lifting and handling furniture or springs. During most of the workday, upholsterers stand and may do a lot of bending and heavy lifting. They also may work in awkward positions for short periods.

Training, Other Qualifications, and Advancement

Most employers prefer to hire high school graduates for jobs in textile, apparel, and furnishings occupations. Entrants with postsecondary vocational training or previous work experience in apparel production usually have a better chance of getting a job and advancing to a supervisory position. Regardless of the setting, workers usually begin by performing simple tasks.

In manufacturing, textile and apparel workers need good hand-eye coordination, manual dexterity, physical stamina, and the ability to perform repetitive tasks for long periods. Machine operators usually are trained on the job by more experienced employees or by machinery manufacturers' representatives. As they gain experience, these workers are assigned more difficult operations. Further advancement is limited, however. Some production workers may become first-line supervisors, but most can advance only to more skilled operator jobs. As machinery in the industry continues to become more complex, knowledge of the basics of computers and electronics will increasingly be an asset. In addition, the trends toward cross-training of operators and working in teams will increase the time needed to become fully trained on all machines and require interpersonal skills to work effectively with others.

Retailers prefer to hire custom tailors, dressmakers, and sewers with previous experience in apparel production, design, or alteration. Knowledge of fabrics, design, and construction is very important. Custom tailors sometimes learn these skills through

courses in high school or a community college. Some experienced custom tailors open their own tailoring shop. Custom tailoring is a highly competitive field, however, and training in small-business operations can mean the difference between success and failure. Although laundries and drycleaners prefer entrants with previous work experience, they routinely hire inexperienced workers.

Precision shoe and leather workers and repairers generally learn their skills on the job. Manual dexterity and the mechanical aptitude to work with handtools and machines are important in shoe repair and leatherworking. Shoe and leather workers who produce custom goods should have artistic ability as well. Beginners start as helpers for experienced workers, but, in manufacturing, they may attend more formal in-house training programs. Beginners gradually take on more tasks until they are fully qualified workers, a process that takes about 2 years in an apprenticeship program or as a helper in a shop. In a vocational training program, it can take 6 months to a year. Learning to make saddles takes longer. Shoe repairers need to keep their skills up to date to work with the rapidly changing footwear styles and materials. Some do this by attending trade shows; others attend specialized training seminars and workshops in custom shoemaking, shoe repair, and other leatherwork sponsored by associations. Some in the shoemaking and leatherworking occupations begin as workers or repairers and advance to salaried supervisory and managerial positions. Some open their own shop, but knowledge of business practices and management and a pleasant manner when dealing with customers are needed to stay in business.

Most upholsterers learn their skills on the job, but a few do so through apprenticeships. Inexperienced persons also may take training in basic upholstery in vocational schools and some community colleges. Upholsterers should have manual dexterity, good coordination, and the strength needed to lift heavy furniture. An eye for detail, a flair for color, and the ability to use fabrics creatively also are helpful. The length of training may vary from 6 weeks to 3 years. Upholsterers who work on custom-made pieces may train for 8 to 10 years. The primary forms of advancement for upholsterers are opening their own shop or moving into management. The upholstery business is highly competitive, so operating a shop successfully is difficult. In large shops and factories, experienced or highly skilled upholsterers may become supervisors or samplemakers.

Employment

Textile, apparel, and furnishings workers held 929,000 jobs in 2004. Employment in the detailed occupations that make up this group was distributed as follows:

Sewing machine operators	256,000
Laundry and dry-cleaning workers	235,000
Tailors, dressmakers, and sewers	85,000
Pressers, textile, garment, and related materials	82,000
Upholsterers	53,000
Textile winding, twisting, and drawing out machine setters, operators, and tenders.....	53,000
Textile knitting and weaving machine setters, operators, and tenders	46,000
Textile cutting machine setters, operators, and tenders	28,000
All other textile, apparel, and furnishings workers	23,000
Extruding and forming machine setters, operators, and tenders, synthetic and glass fibers	23,000
Textile bleaching and dyeing machine operators and tenders	21,000
Shoe and leather workers and repairers	10,000
Fabric and apparel patternmakers	9,200
Shoe machine operators and tenders.....	4,600

Manufacturing jobs are concentrated in California, North Carolina, Georgia, New York, Texas, and South Carolina. Jobs in reupholstery, shoe repair and custom leatherwork, and laundry and drycleaning establishments are found in cities and towns throughout the Nation. Overall, about 11 percent of all workers in textile, apparel, and furnishings occupations were self-employed; however, 54 percent of tailors, dressmakers, and sewers and 27 percent of upholsterers were self-employed.

Job Outlook

Employment of textile, apparel, and furnishings workers is expected to decline through 2014. Apparel workers have been among the most rapidly declining occupational groups in the economy, and increasing imports, the use of offshore assembly, and greater productivity through new automation will contribute to additional job losses. Also, many new textiles require less production and processing. Employment in specialty apparel and textiles, where it may be necessary for production facilities to be close to their market, might not decrease as much as in other areas of apparel and textile production. Because of the large size of this occupation, however, job openings arise each year from the need to replace workers who transfer to other occupations, retire, or leave the occupation for other reasons.

Employment in the domestic textile and apparel industries has declined in recent years as foreign producers have gained a greater share of the U.S. market. Domestic production of apparel and textiles will continue to move abroad, and imports to the U.S. market will increase. Declines in U.S. apparel production will cause reductions in domestic textile production because the apparel industry is the largest consumer of American-made textiles. Fierce competition in the market for apparel will keep domestic apparel and textile firms under intense pressure to cut costs and produce more with fewer workers.

Although the textile industry already is highly automated, it will continue to seek to increase worker productivity through the introduction of labor-saving machinery and the invention of new fibers and fabrics that reduce production costs. Despite advances in technology, the apparel industry has had difficulty employing automated equipment extensively due to the “soft” properties of textile products. The industry produces a wide variety of apparel items that change frequently with changes in style and season. Technological developments, such as computer-aided marking and grading, computer-controlled cutters, semiautomatic sewing and pressing machines, and automated material-handling systems have increased output while reducing the need for some workers in larger firms. However, assembly continues to be the most labor-intensive step in the production of apparel, and increasing numbers of sewing machine operator jobs are expected to be lost to low-wage workers abroad. Still, improvements in productivity will allow many of the presewing functions of design, patternmaking, marking, and cutting to continue to be done domestically, and employment of workers who perform these functions will not be as adversely affected.

Outside of the manufacturing sector, tailors, dressmakers, and sewers—the most skilled apparel workers—also are expected to experience declining employment. Demand for their services will continue to lessen because it is often cheaper to buy new apparel than to have clothes altered or repaired.

Employment of shoe and leather workers is expected to decline through 2014 as a result of growing imports of less expensive shoes and leather goods and increasing productivity of U.S. manufacturers. Also, buying new shoes often is cheaper than repairing worn

or damaged ones. However, declines are expected to be offset somewhat as the population continues to age and more people need custom shoes for health reasons.

Employment of upholsterers is expected to decline through 2014 as new furniture and automotive seats use more durable coverings and as manufacturing firms continue to become more automated and efficient. Demand for the reupholstery of furniture also is expected to decline as the increasing manufacture of new, relatively inexpensive upholstered furniture causes many consumers simply to replace old, worn furniture. However, demand will continue to be steady for upholsterers who restore very valuable furniture. Most reupholstery work is labor intensive and not easily automated.

Earnings

Earnings of textile, apparel, and furnishings workers vary by occupation. Because many production workers in apparel manufacturing are paid according to the number of acceptable pieces they produce, their total earnings depend on skill, speed, and accuracy. Workers covered by union contracts tend to have higher earnings. Median hourly earnings by occupation in May 2004 were as follows:

Fabric and apparel patternmakers	\$13.85
Extruding and forming machine setters, operators, and tenders, synthetic and glass fibers	13.37
Upholsterers	12.35
Textile knitting and weaving machine setters, operators, and tenders	11.48
Textile winding, twisting, and drawing out machine setters, operators, and tenders.....	10.87
Tailors, dressmakers, and custom sewers	10.79
Textile bleaching and dyeing machine operators and tenders	10.56
All other textile, apparel, and furnishings workers.....	10.34
Textile cutting machine setters, operators, and tenders	9.80
Shoe machine operators and tenders.....	9.44
Shoe and leather workers and repairers	9.29
Sewers, hand	9.13
Sewing machine operators	8.61
Pressers, textile, garment, and related materials	8.33
Laundry and dry-cleaning workers	8.28

Benefits also vary. A few large employers, for example, include childcare in their benefits package. Apparel workers in retail trade also may receive a discount on their purchases from the company for which they work. In addition, some of the larger manufacturers operate company stores from which employees can purchase apparel products at significant discounts. Some small firms, however, offer only limited benefits.

Related Occupations

Textile, apparel, and furnishings workers apply their knowledge of textiles and leathers to fashion products with use of handtools and machinery. Others who produce products using handtools, machines, and their knowledge of the materials with which they work include assemblers and fabricators; medical, dental, and ophthalmic laboratory technicians; food-processing workers; jewelers and precious stone and metal workers; and woodworkers.

Sources of Additional Information

Information about job opportunities in textile, apparel, and furnishings occupations is available from local employers and local offices of State employment services.

Woodworkers

(O*NET 51-7011.00, 51-7021.00, 51-7031.00, 51-7032.00, 51-7041.01, 51-7041.02, 51-7042.01, 51-7042.02, 51-7099.99)

Significant Points

- Most woodworkers are trained on the job; basic machine operations may be learned in a few months, but becoming a skilled woodworker often requires 2 or more years.
- Overall employment is expected to decline.
- Job prospects will be best for highly skilled woodworkers who produce customized output, which is less susceptible to automation and import competition, and for those who know how to operate computerized numerical control (CNC) machines.
- Employment is highly sensitive to economic cycles; during economic downturns, workers are subject to layoffs or reductions in hours.

Nature of the Work

Despite the development of sophisticated plastics and other materials, the demand for wood products continues unabated. Helping to meet this demand are woodworkers. Woodworkers are found in industries that produce wood, such as sawmills and plywood mills; in industries that use wood to produce furniture, kitchen cabinets, musical instruments, and other fabricated wood products; and in small shops that make architectural woodwork, furniture, and many other specialty items.

All woodworkers are employed at some stage of the process through which logs of wood are transformed into finished products. Some of these workers produce the structural elements of buildings; others mill hardwood and softwood lumber; still others assemble finished wood products. They operate machines that cut, shape, assemble, and finish raw wood to make the doors, windows, cabinets, trusses, plywood, flooring, paneling, molding, and trim that are components of most homes. Others may fashion home accessories, such as beds, sofas, tables, dressers, and chairs. In addition to these household goods, woodworkers also make sporting goods, including baseball bats and oars, as well as musical instruments, toys, caskets, tool handles, and thousands of other wooden items.

Production woodworkers set up, operate, and tend woodworking machines such as power saws, planers, sanders, lathes, jointers, and routers that cut and shape components from lumber, plywood, and other wood products. In sawmills, *sawing machine operators and tenders* set up, operate, or tend wood-sawing machines that cut logs into planks, timbers, or boards. In plants manufacturing wood products, woodworkers first determine the best method of shaping and assembling parts, working from blueprints, supervisors' instructions, or shop drawings that woodworkers themselves produce. Before cutting, they often must measure and mark the materials. They verify dimensions and may trim parts using handtools such as planes, chisels, wood files, or sanders to ensure a tight fit. *Woodworking machine operators and tenders* set up, operate, or tend specific woodworking machines, such as drill presses, lathes, shapers, routers, sanders, planers, and wood-nailing machines. Lower skilled operators may merely press a switch on a woodworking machine and monitor the automatic operation, whereas more highly skilled operators set up equipment, cut and

shape wooden parts, and verify dimensions using a template, caliper, or rule.

The next step in the manufacturing process is the production of subassemblies using fasteners and adhesives. Next, the pieces are brought together to form a complete unit. The product is then finish-sanded; stained; and, if necessary, coated with a sealer, such as lacquer or varnish. Woodworkers may perform this work in teams or be assisted by a helper.

Woodworkers have been greatly affected by the introduction of computer-controlled machinery. This technology has raised worker productivity by allowing one operator to simultaneously tend a greater number of machines. An operator can program a CNC machine to perform a sequence of operations automatically, resulting in greater precision and reliability. The integration of computers with equipment has improved production speed and capability, simplified setup and maintenance requirements, and increased the demand for workers with computer skills.

While this costly equipment has had a great effect on workers in the largest, most efficient firms, precision or custom woodworkers—who generally work in smaller firms—have continued to employ the same production techniques they have used for many years. Workers such as *cabinetmakers and bench carpenters, modelmakers and patternmakers, and furniture finishers* work on a customized basis, often building one-of-a-kind items. These highly skilled precision woodworkers usually perform a complete cycle of tasks—cutting, shaping, and preparing surfaces and assembling prepared parts of complex wood components into a finished wood product. For this reason, these workers normally need substantial training and an ability to work from detailed instructions and specifications. In addition, they often are required to exercise independent judgment when undertaking an assignment.

Precision or custom woodworkers often build one-of-a-kind items from start to finish.

Working Conditions

Working conditions vary by industry and specific job duties. In logging and sawmills, for example, working conditions are physically demanding because of the handling of heavy, bulky material. Workers in these industries also may encounter excessive noise, dust, and other air pollutants. However, the use of earplugs and respirators may partially alleviate these problems. Also, rigid adherence to safety precautions minimizes risk of injury from contact with rough wood stock, sharp tools, and power equipment. The risk of injury also is lowered by the installation of computer-controlled equipment, which reduces the physical labor and hands-on contact with machinery.

In furniture and kitchen cabinet manufacturing, employees who operate machinery often must wear ear and eye protection. They also must follow operating safety instructions and use safety shields or guards to prevent accidents. Those who work in the finishing area must be provided with an appropriate dust or vapor mask or a complete protective safety suit, or must work in a finishing environment that removes all vapors and dust particles from the atmosphere. Prolonged standing, lifting, and fitting of heavy objects are common characteristics of the job.

Training, Other Qualifications, and Advancement

Most woodworkers are trained on the job, picking up skills informally from experienced workers. Most woodworkers learn basic machine operations and job tasks in a few months, but becoming a skilled woodworker often requires 2 or more years.

Woodworkers increasingly acquire skills through vocational education. Some may learn by working as carpenters on construction jobs. Others may attend colleges or universities that offer training in areas including wood technology, furniture manufacturing, wood engineering, and production management. These programs prepare students for positions in production, supervision, engineering, and management and are increasingly important as woodworking technology becomes more advanced.

Beginners usually observe and help experienced machine operators. They may supply material to, or remove fabricated products from, machines. Trainees also do simple machine operating jobs while closely supervised by experienced workers, but as beginners gain experience, they perform more complex jobs with less supervision. Some may learn to read blueprints, set up machines, and plan the sequence of the work.

Employers seek applicants with a high school diploma or the equivalent because of the growing sophistication of machinery and the constant need for retraining. People seeking woodworking jobs can enhance their employment and advancement prospects by completing high school and receiving training in mathematics, science, and computer applications. Other important qualities for entrants in this occupation include mechanical ability, manual dexterity, and the ability to pay attention to detail.

Advancement opportunities often are limited and depend on education and training, seniority, and a worker's skills and initiative. Sometimes experienced woodworkers become inspectors or supervisors responsible for the work of a group of woodworkers. Production workers often can advance into these positions by assuming additional responsibilities and by attending workshops, seminars, or college programs. Those who are highly skilled may set up their own woodworking shops.

Employment

Woodworkers held about 364,000 jobs in 2004. Self-employed woodworkers, mostly cabinetmakers and furniture finishers, accounted for 14 percent of these jobs. Employment among detailed woodworking occupations was distributed as follows:

Cabinetmakers and bench carpenters.....	148,000
Woodworking machine setters, operators, and tenders, except sawing	92,000
Sawing machine setters, operators, and tenders, wood.....	58,000
Furniture finishers	34,000
Model makers, wood.....	3,200
Patternmakers, wood.....	2,500
All other woodworkers	26,000

Almost 3 out of 4 woodworkers were employed in manufacturing industries. One-third of woodworkers were found in establishments fabricating household and office furniture and fixtures, and 30 percent worked in wood product manufacturing, producing a variety of raw, intermediate, and finished woodstock. Wholesale and retail lumber dealers, furniture stores, reupholstery and furniture repair shops, and construction firms also employ woodworkers.

Woodworking jobs are found throughout the country. However, lumber and wood products-related production jobs are concentrated in the South and Northwest, close to the supply of wood, whereas furnituremakers are more prevalent in the Southeast. Custom shops can be found everywhere, but generally are concentrated in or near highly populated areas.

Job Outlook

Overall employment of woodworkers is expected to decline through 2014, although job growth and opportunities will vary by specialty. In general, opportunities for more highly skilled woodworkers will be better than for woodworkers in specialties susceptible to productivity improvements and competition from imported wood products. Despite the expected overall decline in employment of woodworkers, many job opportunities still will arise each year because of the need to replace experienced woodworkers who transfer to other occupations or leave the labor force. Firms will need woodworkers with technical skills to operate their increasingly advanced computerized machinery.

The number of new workers entering these occupations is expected to be below because, as school systems face tighter budgets, the first programs to be cut often are vocational-technical programs, including those that train woodworkers. Also, interest in pursuing these jobs will continue to decline as workers question the stability of manufacturing occupations. For these reasons, competition should be mild, and opportunities should be best for woodworkers who, through vocational education or experience, develop highly specialized woodworking skills or knowledge of CNC machine tool operation.

Employment of sawing and woodworking machine setters, operators, and tenders is expected to decline through 2014. Jobs in the United States will continue to be lost as imports grow. To remain competitive with these imports, some domestic firms are expected to continue to move their production processes to foreign countries, further reducing employment. Others are using advanced technology, such as robots and CNC machinery, to reduce the number of workers needed in production. These forces will prevent employment from rising with the demand for wood products, particularly in the mills and manufacturing plants where many processes can be automated. Among woodworking machine operators, job prospects will be best for those skilled in CNC machine tool operation.

Employment of furniture finishers is expected to decline. Since furniture is largely mass-produced, it is highly susceptible to import competition; the percentage of furniture sold in the United States that is produced abroad has steadily increased over the past 10 years, a trend that is expected to continue.

Employment of bench carpenters, cabinetmakers, modelmakers, patternmakers, and other specialized woodworking occupations will grow more slowly than the average. Demand for these workers will stem from increases in population, personal income, and business expenditures, in addition to the continuing need for repair and renovation of residential and commercial properties. Therefore,

opportunities should be available for those who specialize in items such as moldings, cabinets, stairs, and windows. Firms that focus on custom woodwork will be best able to compete against imports without transferring jobs offshore, so opportunities should be very good in specialized woodworking sectors, such as architectural woodworking. Modelmakers and patternmakers who know how to create and execute designs on a computer may have the best opportunities.

Employment in all woodworking specialties is highly sensitive to economic cycles. During economic downturns, workers are subject to layoffs or reductions in hours.

Earnings

Median hourly earnings of cabinetmakers and bench carpenters were \$12.16 in May 2004. The middle 50 percent earned between \$9.69 and \$15.51. The lowest 10 percent earned less than \$8.00, and the highest 10 percent earned more than \$19.28. Median hourly earnings in the industries employing the largest numbers of cabinetmakers and bench carpenters in May 2004 are shown below:

Office furniture (including fixtures) manufacturing	\$13.42
Household and institutional furniture and kitchen cabinet manufacturing	11.83
Other wood product manufacturing	11.82

Median hourly earnings of sawing machine setters, operators, and tenders, wood, were \$10.91 in May 2004. The middle 50 percent earned between \$8.95 and \$13.34. The lowest 10 percent earned less than \$7.46, and the highest 10 percent earned more than \$16.20. Median hourly earnings in the industries employing the largest numbers of sawing machine setters, operators, and tenders, wood, in May 2004, are shown below:

Sawmills and wood preservation	\$11.82
Veneer, plywood, and engineered wood product manufacturing....	11.49
Household and institutional furniture and kitchen cabinet manufacturing	10.65
Other wood product manufacturing	10.49

Median hourly earnings of woodworking machine setters, operators, and tenders, except sawing, were \$10.93 in May 2004.

The middle 50 percent earned between \$8.93 and \$13.40. The lowest 10 percent earned less than \$7.55, and the highest 10 percent earned more than \$16.33. Median hourly earnings in the industries employing the largest numbers of woodworking machine setters, operators, and tenders, except sawing, in May 2004, are shown below:

Office furniture (including fixtures) manufacturing	\$11.66
Veneer, plywood, and engineered wood product manufacturing ...	11.19
Household and institutional furniture and kitchen cabinet manufacturing	11.00
Sawmills and wood preservation	10.83
Other wood product manufacturing	10.47

In May 2004, median hourly earnings were \$11.35 for furniture finishers and \$10.16 for all other woodworkers.

Some woodworkers, such as those in logging or sawmills who are engaged in processing primary wood and building materials, are members of the International Association of Machinists. Others belong to the United Brotherhood of Carpenters and Joiners of America.

Related Occupations

Carpenters also work with wood. In addition, many woodworkers follow blueprints and drawings and use machines to shape and form raw wood into a final product. Workers who perform similar functions working with other materials include sheet metal workers, structural and reinforcing iron and metal workers, computer-control programmers and operators, machinists, and tool and die makers.

Plant and System Operators

Power Plant Operators, Distributors, and Dispatchers

(O*NET 51-8011.00, 51-8012.00, 51-8013.01, 51-8013.02)

Significant Points

- Keen competition for jobs is expected; opportunities will be best for operators with training in computers and automated equipment.
- Employment is projected to decline.
- Most entry-level workers start as helpers or laborers, and several years of training and experience are required to become fully qualified.

Nature of the Work

Electricity is vital for most everyday activities. From the moment you flip the first switch each morning, you are connecting to a huge

network of people, electric lines, and generating equipment. Power plant operators control the machinery that generates electricity. Power plant distributors and dispatchers control the flow of electricity from the power plant, over a network of transmission lines, to industrial plants and substations, and, finally, over distribution lines to residential users.

Power plant operators control and monitor boilers, turbines, generators, and auxiliary equipment in power-generating plants. Operators distribute power demands among generators, combine the current from several generators, and monitor instruments to maintain voltage and regulate electricity flows from the plant. When power requirements change, these workers start or stop generators and connect or disconnect them from circuits. They often use computers to keep records of switching operations and loads on generators, lines, and transformers. Operators also may use computers to prepare reports of unusual incidents, malfunctioning equipment, or maintenance performed during their shift.

Operators in plants with automated control systems work mainly in a central control room and usually are called *control room operators* or *control room operator trainees* or *assistants*. In older plants,

the controls for the equipment are not centralized, and *switchboard operators* control the flow of electricity from a central point, whereas *auxiliary equipment operators* work throughout the plant, operating and monitoring valves, switches, and gauges.

The Nuclear Regulatory Commission (NRC) licenses operators of nuclear power plants. *Reactor operators* are authorized to control equipment that affects the power of the reactor in a nuclear power plant. In addition, an NRC-licensed *senior reactor operator* must be on duty during each shift to act as the plant supervisor and supervise the operation of all controls in the control room.

Power distributors and dispatchers, also called *load dispatchers* or *systems operators*, control the flow of electricity through transmission lines to industrial plants and substations that supply residential needs for electricity. They monitor and operate current converters, voltage transformers, and circuit breakers. Dispatchers also monitor other distribution equipment and record readings at a pilot board—a map of the transmission grid system showing the status of transmission circuits and connections with substations and industrial plants.

Dispatchers also anticipate power needs, such as those caused by changes in the weather. They call control room operators to start or stop boilers and generators, in order to bring production into balance with needs. Dispatchers handle emergencies such as transformer or transmission line failures and route current around affected areas. In substations, they also operate and monitor equipment that increases or decreases voltage, and they operate

Power plant operators in plants with automated control systems usually spend most of their time in a central control room.

switchboard levers to control the flow of electricity in and out of the substations.

Working Conditions

Because electricity is provided around the clock, operators, distributors, and dispatchers usually work one of three daily 8-hour shifts or one of two 12-hour shifts on a rotating basis. Shift assignments may change periodically, so that all operators can share duty on less desirable shifts. Work on rotating shifts can be stressful and fatiguing, because of the constant change in living and sleeping patterns. Operators, distributors, and dispatchers who work in control rooms generally sit or stand at a control station. This work is not physically strenuous, but it does require constant attention. Operators who work outside the control room may be exposed to danger from electric shock, falls, and burns.

Nuclear power plant operators are subject to random drug and alcohol tests, as are most workers at such plants.

Training, Other Qualifications, and Advancement

Employers often seek high school graduates for entry-level operator, distributor, and dispatcher positions. Candidates with strong mathematics and science skills are preferred. College-level courses and prior experience in a mechanical or technical job are becoming increasingly helpful in a competitive job market. With computers now used to keep records, generate reports, and track maintenance, employers are increasingly requiring computer proficiency. Most entry-level workers start as helpers or laborers. Depending on the results of aptitude tests, their own preferences, and the availability of openings, workers may be assigned to train for one of many utility positions.

Workers selected for training as a fossil-fueled power plant operator or distributor undergo extensive on-the-job and classroom instruction. Several years of training and experience are required for a worker to become a fully qualified control room operator or power plant distributor. With further training and experience, workers may advance to shift supervisor. Utilities generally promote from within; therefore, opportunities to advance by moving to another employer are limited.

Extensive training and experience are necessary to pass the NRC examinations for reactor operators and senior reactor operators. To maintain their license, licensed reactor operators must pass an annual practical plant operation exam and a biennial written exam administered by their employers. Training may include simulator and on-the-job training, classroom instruction, and individual study. Entrants to nuclear power plant operator trainee jobs must have strong mathematics and science skills. Experience in other power plants or with Navy nuclear propulsion plants also is helpful. With further training and experience, reactor operators may advance to senior reactor operator positions.

In addition to receiving preliminary training as a power plant operator, distributor, or dispatcher, most workers are given periodic refresher training—frequently in the case of nuclear power plant operators. Refresher training usually is taken on plant simulators designed specifically to replicate procedures and situations that might be encountered at the trainee's plant.

Employment

Power plant operators, distributors, and dispatchers held about 47,000 jobs in 2004. Jobs were located throughout the country. About 64 percent of jobs were in electric power generation, transmission, and distribution. About 20 percent worked in government, mainly in local government. Others worked for manufacturing establishments that produced electricity for their own use.

Job Outlook

People who want to become power plant operators, distributors, and dispatchers are expected to encounter keen competition for these relatively high-paying jobs. While demand for electricity will increase, the slow pace of construction of new plants will limit opportunities for these workers. In addition, the increasing use of automatic controls and more computerized equipment should boost productivity and decrease the demand for operators. As a result, individuals with training in computers and automated equipment will have the best job prospects. Some job opportunities will arise from the need to replace workers who retire or leave the occupation. However, cost considerations may restrict the number of workers who are replaced, with the job duties instead being given to other workers.

A decline in employment of power plant operators, distributors, and dispatchers is projected through the year 2014, as the utilities industry continues to restructure in response to deregulation and increasing competition. Independent producers are now allowed to sell power directly to industrial and other wholesale customers. Consequently, some utilities that historically operated as regulated local monopolies have restructured their operations in order to reduce costs and compete effectively. While much of this restructuring is complete, the focus on reducing costs persists. This new focus is present in regulated utilities, as well as those that have been deregulated. As a result, the number of jobs is expected to decline.

Earnings

Median annual earnings of power plant operators were \$52,530 in May 2004. The middle 50 percent earned between \$43,310 and \$62,030. The lowest 10 percent earned less than \$34,550, and the highest 10 percent earned more than \$70,330. Median annual earnings of power plant operators in May 2004 were \$53,820 in electric power generation, transmission and distribution.

Median annual earnings of nuclear power reactor operators were \$64,090 in May 2004. The middle 50 percent earned between \$56,890 and \$71,160. The lowest 10 percent earned less than \$49,690, and the highest 10 percent earned more than \$82,220.

Median annual earnings of power distributors and dispatchers were \$57,330 in May 2004. The middle 50 percent earned between \$48,010 and \$69,100. The lowest 10 percent earned less than \$38,220, and the highest 10 percent earned more than \$83,030.

Related Occupations

Other workers who monitor and operate plant and system equipment include chemical plant and system operators; petroleum pump system operators, refinery operators, and gaugers; stationary engineers and boiler operators; and water and liquid waste treatment plant and system operators.

Stationary Engineers and Boiler Operators

(O*NET 51-8021.01, 51-8021.02)

Significant Points

- Workers usually acquire their skills through a formal apprenticeship program or through on-the-job training supplemented by courses at a trade or technical school.
- Most States and cities have licensing requirements.
- Employment is expected to grow more slowly than the average for all occupations through the year 2014.
- Applicants may face competition for jobs; opportunities will be best for workers with training in computerized controls and instrumentation.

Nature of the Work

Heating, air-conditioning, refrigeration, and ventilation systems keep large buildings and other commercial facilities comfortable all year long. Industrial plants often have facilities to provide electrical power, steam, or other services. Stationary engineers and boiler operators operate and maintain these systems, which include boilers, air-conditioning and refrigeration equipment, diesel engines, turbines, generators, pumps, condensers, and compressors. The equipment that stationary engineers and boiler operators control is similar to equipment operated by locomotive or marine engineers, except that it is not in a moving vehicle.

Stationary engineers and boiler operators start up, regulate, repair, and shut down equipment. They ensure that the equipment operates safely, economically, and within established limits by monitoring meters, gauges, and computerized controls. Stationary engineers and boiler operators control equipment manually and, if necessary, make adjustments. They also record relevant events and facts concerning the operation and maintenance of the equipment. With regard to steam boilers, for example, they observe, control, and record the steam pressure, temperature, water level, chemistry, power output, fuel consumption, and emissions from the vessel. They watch and listen to machinery and routinely check safety devices, identifying and correcting any trouble that develops. They use hand and power tools to perform repairs and maintenance ranging from a complete overhaul to replacing defective valves, gaskets, or bearings. Servicing, troubleshooting, repairing, and monitoring modern systems all require the use of sophisticated electrical and electronic test equipment.

Stationary engineers typically use computers to operate the mechanical, electrical, and fire safety systems of new buildings and plants. Engineers monitor, adjust, and diagnose these systems from a central location, using a computer linked into the buildings' communications network.

Routine maintenance, such as lubricating moving parts, replacing filters, and removing soot and corrosion that can reduce the boiler's operating efficiency, is a regular part of the work of stationary engineers and boiler operators. They test the water in the boiler and add chemicals to prevent corrosion and harmful deposits. In most facilities, stationary engineers are responsible for the maintenance and balancing of air systems, as well as hydronic systems that heat or cool buildings by circulating fluid (such as water or water vapor) in a closed system of pipes. They also may check the air quality of the ventilation system and make adjustments to keep the operation of the boiler within mandated guidelines.

Stationary engineers and boiler operators work around hazardous machinery and must follow procedures to guard against injuries.

In a large building or industrial plant, a stationary engineer may be in charge of all mechanical systems in the building. Engineers may supervise the work of assistant stationary engineers, turbine operators, boiler tenders, and air-conditioning and refrigeration operators and mechanics. Most stationary engineers perform other maintenance duties, such as carpentry, plumbing, locksmithing, and electrical repairs. In a small building or industrial plant, there may be only one stationary engineer.

Working Conditions

Stationary engineers and boiler operators generally have steady, year-round employment. The average workweek is 40 hours. In facilities that operate around the clock, engineers and operators usually work one of three daily 8-hour shifts on a rotating basis. Weekend and holiday work often is required.

Engine rooms, power plants, boiler rooms, mechanical rooms, and electrical rooms usually are clean and well lighted. Even under the most favorable conditions, however, some stationary engineers and boiler operators are exposed to high temperatures, dust, dirt, and high noise levels from the equipment. General maintenance duties also may require contact with oil, grease, or smoke. Workers spend much of the time on their feet. They also may have to crawl inside boilers and work in crouching or kneeling positions to inspect, clean, or repair equipment.

Stationary engineers and boiler operators work around hazardous machinery, such as low- and high-pressure boilers and electrical equipment. They must follow procedures to guard against burns, electric shock, noise, danger from moving parts, and exposure to hazardous materials, such as asbestos or certain chemicals.

Training, Other Qualifications, and Advancement

Stationary engineers and boiler operators usually acquire their skills through a formal apprenticeship program or through on-the-job training supplemented by courses at a trade or technical school. In addition, valuable experience can be obtained in the Navy or the merchant marine, because marine engineering plants are similar to many stationary power and heating plants. Most employers prefer to hire persons with at least a high school diploma or the equivalent. However, continuing

education—such as college courses—is becoming increasingly important, in part because of the growing complexity of the equipment with which engineers and operators now work. Mechanical aptitude, manual dexterity, and good physical condition also are important.

The International Union of Operating Engineers sponsors apprenticeship programs and is the principal union for stationary engineers and boiler operators. In selecting apprentices, most local labor-management apprenticeship committees prefer applicants with education or training in mathematics, computers, mechanical drawing, machine shop practice, physics, and chemistry. An apprenticeship usually lasts 4 years and includes 8,000 hours of on-the-job training. In addition, apprentices receive 600 hours of classroom instruction in subjects such as boiler design and operation, elementary physics, pneumatics, refrigeration, air-conditioning, electricity, and electronics.

Those who acquire their skills on the job usually start as boiler tenders or helpers to experienced stationary engineers and boiler operators. This practical experience may be supplemented by postsecondary vocational training in computerized controls and instrumentation. However, becoming an engineer or operator without completing a formal apprenticeship program usually requires many years of work experience.

Most large and some small employers encourage and pay for skill-improvement training for their employees. Training almost always is provided when new equipment is introduced or when regulations concerning some aspect of the workers' duties change.

Most States and cities have licensing requirements for stationary engineers and boiler operators. Applicants usually must be at least 18 years of age, reside for a specified period in the State or locality in which they wish to work, meet experience requirements, and pass a written examination. A stationary engineer or boiler operator who moves from one State or city to another may have to pass an examination for a new license due to regional differences in licensing requirements.

There are several classes of stationary engineer licenses. Each class specifies the type and size of equipment the engineer is permitted to operate without supervision. A licensed first-class stationary engineer is qualified to run a large facility, supervise others, and operate equipment of all types and capacities. An applicant for this license may be required to have a high school education, apprenticeship or on-the-job training, and several years of experience. Licenses below first class limit the types or capacities of equipment the engineer may operate without supervision.

Stationary engineers and boiler operators advance by being placed in charge of larger, more powerful, or more varied equipment. Generally, engineers advance to these jobs as they obtain higher class licenses. Some stationary engineers and boiler operators advance to boiler inspectors, chief plant engineers, building and plant superintendents, or building managers. A few obtain jobs as examining engineers or technical instructors.

Employment

Stationary engineers and boiler operators held about 50,000 jobs in 2004. Jobs were dispersed throughout a variety of industries. The majority of jobs were in State and local government facilities; hospitals; educational services; electric power generation, transmission, and distribution facilities; and manufacturing firms, such as pulp, paper, and paperboard mills. Other jobs were in architectural, engineering, and related services and real estate firms. Some were employed as contractors to a building or plant.

Stationary engineers and boiler operators worked throughout the country, generally in the more heavily populated areas in which large industrial and commercial establishments are located.

Job Outlook

Applicants may face competition for jobs as stationary engineers and boiler operators. Employment opportunities will be best for

those with apprenticeship training or vocational school courses covering systems that are operated by computerized controls and instrumentation.

Employment of stationary engineers and boiler operators is expected to grow more slowly than the average for all occupations through the year 2014. Continuing commercial and industrial development will increase the amount of equipment to be operated and maintained. However, automated systems and computerized controls are making newly installed equipment more efficient, thus reducing the number of jobs needed for its operation. Furthermore, relatively few job openings will arise from the need to replace experienced workers who transfer to other occupations or leave the labor force. The low replacement rate in this occupation reflects its relatively high wages.

Earnings

Median annual earnings of stationary engineers and boiler operators were \$44,150 in May 2004. The middle 50 percent earned between \$34,500 and \$55,460. The lowest 10 percent earned less than \$27,010, and the highest 10 percent earned more than \$66,570. Median annual earnings of stationary engineers and boiler operators in May 2004 were \$48,340 in local government and \$43,710 in general medical and surgical hospitals.

Related Occupations

Workers who monitor and operate stationary machinery include chemical plant and system operators; gas plant operators; petroleum pump system operators, refinery operators, and gaugers; power plant operators, distributors, and dispatchers; and water and liquid waste treatment plant and system operators. Other workers who maintain the equipment and machinery in a building or plant are industrial machinery mechanics and maintenance workers, as well as millwrights.

Sources of Additional Information

Information about apprenticeships, vocational training, and work opportunities is available from State employment service offices, locals of the International Union of Operating Engineers, vocational schools, and State and local licensing agencies.

Water and Liquid Waste Treatment Plant and System Operators

(O*NET 51-8031.00)

Significant Points

- Employment is concentrated in local government and private water, sewage, and other systems utilities.
- Completion of an associate degree or a 1-year certificate program increases an applicant's chances for employment and promotion.
- Because the number of applicants in this field is normally low, job prospects will be good for qualified individuals, particularly those with training in all aspects of water and wastewater treatment.

Nature of the Work

Clean water is essential for everyday life. *Water treatment plant and system operators* treat water so that it is safe to drink. *Liquid waste treatment plant and system operators*, also known as wastewater treatment plant and system operators, remove harmful pollutants from domestic and industrial liquid waste so that it is safe to return to the environment.

Water is pumped from wells, rivers, streams, and reservoirs to water treatment plants, where it is treated and distributed to customers. Wastewater travels through customers' sewer pipes to wastewater treatment plants, where it is either treated and returned to streams, rivers, and oceans or reused for irrigation and landscaping. Operators in both types of plants control equipment and processes that remove or destroy harmful materials, chemical compounds, and microorganisms from the water. They also control pumps, valves, and other equipment that moves the water or wastewater through the various treatment processes, after which they dispose of the removed waste materials.

Operators read, interpret, and adjust meters and gauges to make sure that plant equipment and processes are working properly. Operators operate chemical-feeding devices, take samples of the water or wastewater, perform chemical and biological laboratory analyses, and adjust the amounts of chemicals, such as chlorine, in the water. They use a variety of instruments to sample and measure water quality and they utilize common hand and power tools to make repairs to valves, pumps, and other equipment.

Water and wastewater treatment plant and system operators increasingly rely on computers to help monitor equipment, store the results of sampling, make process-control decisions, schedule and record maintenance activities, and produce reports. When equipment malfunctions, operators also may use computers to determine the cause of the malfunction and seek its solution.

Occasionally, operators must work during emergencies. A heavy rainstorm, for example, may cause large amounts of wastewater to flow into sewers, exceeding a plant's treatment capacity. Emergencies also can be caused by conditions inside a plant, such as chlorine gas leaks or oxygen deficiencies. To handle these conditions, operators are trained to make an emergency management response and use special safety equipment and procedures to protect public health and the facility. During these periods, operators may work under extreme pressure to correct problems as quickly as possible. Because working conditions may be dangerous, operators must be extremely cautious.

The specific duties of plant operators depend on the type and size of the plant. In smaller plants, one operator may control all of the machinery, perform tests, keep records, handle complaints, and perform repairs and maintenance. A few operators may handle both a water treatment and a wastewater treatment plant. In larger plants with many employees, operators may be more specialized and monitor only one process. The staff also may include chemists, engineers, laboratory technicians, mechanics, helpers, supervisors, and a superintendent.

Water pollution standards are largely set by two major Federal environmental statutes: the Clean Water Act, which regulates the discharge of pollutants, and the Safe Drinking Water Act, which specifies standards for drinking water. Industrial facilities that send their wastes to municipal treatment plants must meet certain minimum standards to ensure that the wastes have been adequately pretreated and will not damage municipal treatment facilities. Municipal water treatment plants also must meet stringent standards for drinking water. The list of contaminants regulated by these statutes has grown over time. As a result, plant operators must be familiar with the guidelines established by Federal regulations and how they affect their plant. In addition, operators must be aware

Water and liquid waste treatment plant and system operators control equipment that treats water to make it safe for use or disposal.

of any guidelines imposed by the State or locality in which the plant operates.

Working Conditions

Water and wastewater treatment plant and system operators work both indoors and outdoors and may be exposed to noise from machinery and to unpleasant odors. Operators' work is physically demanding and often is performed in unclean locations. Operators must pay close attention to safety procedures because of the presence of hazardous conditions, such as slippery walkways, dangerous gases, and malfunctioning equipment. Plants operate 24 hours a day, 7 days a week; therefore, operators work one of three 8-hour shifts, including weekends and holidays, on a rotational basis. Operators may be required to work overtime.

Training, Other Qualifications, and Advancement

A high school diploma usually is required for an individual to become a water or wastewater treatment plant operator. Operators need mechanical aptitude and should be competent in basic mathematics, chemistry, and biology. They must have the ability to apply data to formulas prescribing treatment requirements, flow levels, and concentration levels. Some basic familiarity with computers also is necessary because of the trend toward computer-controlled equipment and more sophisticated instrumentation. Certain positions—particularly in larger cities and towns—are covered by civil service regulations. Applicants for these positions may be required to pass a written examination testing their mathematics skills, mechanical aptitude, and general intelligence.

The completion of an associate degree or a 1-year certificate program in water quality and wastewater treatment technology increases an applicant's chances for employment and promotion, because plants are becoming more complex. Offered throughout the country, these programs provide a good general knowledge of water and wastewater treatment processes, as well as basic preparation for becoming an operator.

Trainees usually start as attendants or operators-in-training and learn their skills on the job under the direction of an experienced operator. They learn by observing and doing routine tasks such as recording meter readings, taking samples of wastewater and sludge, and performing simple maintenance and repair work on pumps, electric motors, valves, and other plant equipment. Larger treatment plants generally combine this on-the-job training with formal classroom or self-paced study programs.

The Safe Drinking Water Act Amendments of 1996, enforced by the U.S. Environmental Protection Agency, specify national minimum standards for certification and recertification of operators of community and nontransient, noncommunity water systems. As a result, operators must pass an examination certifying that they are capable of overseeing wastewater treatment plant operations. There are different levels of certification, depending on the operator's experience and training. Higher levels qualify the operator for overseeing a wider variety of treatment processes. Certification requirements vary by State and by size of the treatment plant. Although relocation may mean having to become certified in a new jurisdiction, many States accept other States' certifications.

Most State drinking water and water pollution control agencies offer courses to improve operators' skills and knowledge. The courses cover principles of treatment processes and process control, laboratory procedures, maintenance, management skills, collection systems, safety, chlorination, sedimentation, biological treatment, sludge treatment and disposal, and flow measurements. Some operators take correspondence courses on subjects related to water and wastewater treatment, and some employers pay part of the tuition for related college courses in science or engineering.

As operators are promoted, they become responsible for more complex treatment processes. Some operators are promoted to plant supervisor or superintendent; others advance by transferring to a larger facility. Postsecondary training in water and wastewater treatment, coupled with increasingly responsible experience as an operator, may be sufficient to qualify a worker for becoming superintendent of a small plant, where a superintendent also serves as an operator. However, educational requirements are rising as larger, more complex treatment plants are built to meet new drinking water and water pollution control standards. With each promotion, the operator must have greater knowledge of Federal, State, and local regulations. Superintendents of large plants generally need an engineering or science degree.

A few operators get jobs as technicians with State drinking water or water pollution control agencies. In that capacity, they monitor and provide technical assistance to plants throughout the State. Vocational-technical school or community college training generally is preferred for technician jobs. Experienced operators may transfer to related jobs with industrial liquid waste treatment plants, water or liquid waste treatment equipment and chemical companies, engineering consulting firms, or vocational-technical schools.

Employment

Water and wastewater treatment plant and system operators held about 94,000 jobs in 2004. Almost 4 in 5 operators worked for local governments. Others worked primarily for private water, sewage, and other systems utilities and for private waste treatment and disposal and waste management services companies. Private firms are increasingly providing operation and management services to local governments on a contract basis.

Water and wastewater treatment plant and system operators were employed throughout the country, but most jobs were in larger towns and cities. Although nearly all operators worked full time, those in small towns may work only part time at the treatment plant, with the remainder of their time spent handling other municipal duties.

Job Outlook

Employment of water and wastewater treatment plant and system operators is expected to grow about as fast as the average for all occupations through the year 2014. Job prospects will be good for qualified individuals because the number of applicants in this field is normally low, due primarily to the unclean and physically demanding nature of the work. Workers who have training in all aspects of water and wastewater treatment and who can handle multiple duties will have the best opportunities.

The increasing population and the growth of the economy are expected to boost demand for essential water and wastewater treatment services. As new plants are constructed to meet this demand, employment of water and wastewater treatment plant and system operators will increase. In addition, many job openings will occur as experienced operators leave the labor force or transfer to other occupations.

Local governments are the largest employers of water and wastewater treatment plant and system operators. However, Federal certification requirements have increased utilities' reliance on private firms specializing in the operation and management of water and wastewater treatment facilities. As a result, employment in privately owned facilities will grow faster than the average.

Earnings

Median annual earnings of water and wastewater treatment plant and system operators were \$34,960 in May 2004. The middle 50 percent earned between \$27,180 and \$43,720. The lowest 10 percent earned less than \$21,700, and the highest 10 percent earned more than \$53,540. Median annual earnings of water and liquid waste treat-

ment plant and systems operators in May 2004 were \$34,990 in local government and \$32,350 in water, sewage, and other systems.

In addition to their annual salaries, water and wastewater treatment plant and system operators usually receive benefits that may include health and life insurance, a retirement plan, and educational reimbursement for job-related courses.

Related Occupations

Other workers whose main activity consists of operating a system of machinery to process or produce materials include chemical plant and system operators; gas plant operators; petroleum pump system operators, refinery operators, and gaugers; power plant operators, distributors, and dispatchers; and stationary engineers and boiler operators.

Other Production Occupations

Inspectors, Testers, Sorters, Samplers, and Weighers

(O*NET 51-9061.01, 51-9061.02, 51-9061.03, 51-9061.04, 51-9061.05)

Significant Points

- Two in three are employed in manufacturing establishments.
- While a high school diploma is sufficient for basic testing of products, complex precision-inspecting positions are filled by experienced assemblers, machine operators, or mechanics who already have a thorough knowledge of the products and production processes.
- Employment is expected to decline, reflecting the growth of automated inspection and the redistribution of quality-control responsibilities from inspectors to other production workers.

Nature of the Work

Inspectors, testers, sorters, samplers, and weighers ensure that your food will not make you sick, that your car will run properly, and that your pants will not split the first time you wear them. These workers monitor or audit quality standards for virtually all manufactured products, including foods, textiles, clothing, glassware, motor vehicles, electronic components, computers, and structural steel. As product quality becomes increasingly important to the

success of many manufacturing firms, daily duties of inspectors have changed. In some cases, the job titles of these workers also have been changed to *quality-control inspector* or a similar name, reflecting the growing importance of quality. (A separate statement on construction and building inspectors appears elsewhere in the *Handbook*.)

Regardless of title, all inspectors, testers, sorters, samplers, and weighers work to guarantee the quality of the goods their firms produce. Job duties, even within one company, vary by the type of products produced or the stage of production. Specific job duties also vary across the wide range of industries in which these workers are found. For example, materials inspectors may check products by sight, sound, feel, smell, or even taste to locate imperfections such as cuts, scratches, bubbles, missing pieces, misweaves, or crooked seams. These workers also may verify dimensions, color, weight, texture, strength, or other physical characteristics of objects. Mechanical inspectors generally verify that parts fit, move correctly, and are properly lubricated; check the pressure of gases and the level of liquids; test the flow of electricity; and do a test run to check for proper operation. Some jobs involve only a quick visual inspection; others require a longer, detailed one. Sorters may separate goods according to length, size, fabric type, or color, while samplers test or inspect a sample taken from a batch or production run for malfunctions or defects. Weighers weigh quantities of materials for use in production.

Inspectors, testers, sorters, samplers, and weighers are involved at every stage of the production process. Some inspectors examine materials received from a supplier before sending them to the production line. Others inspect components and assemblies or perform a final check

on the finished product. Depending on their skill level, inspectors also may set up and test equipment, calibrate precision instruments, repair defective products, or record data.

Inspectors, testers, sorters, samplers, and weighers rely on a number of tools to perform their jobs. Although some still use hand held measurement devices such as micrometers, calipers, and alignment gauges, it is more common for them to operate electronic inspection equipment, such as coordinate measuring machines (CMMs). These machines use sensitive probes to measure a part's dimensional accuracy and allow the inspector to analyze the results using computer software. Inspectors testing electrical devices may use voltmeters, ammeters, and oscilloscopes to test insulation, current flow, and resistance. All the tools that inspectors use are maintained by calibration technicians, who ensure that they work properly and generate accurate readings.

Inspectors mark, tag, or note problems. They may reject defective items outright, send them for repair or correction, or fix minor problems themselves. If the product is acceptable, inspectors may screw a nameplate onto it, tag it, stamp it with a serial number, or certify it in some other way. Inspectors, testers, sorters, samplers, and weighers record the results of their inspections, compute the percentage of defects and other statistical measures, and prepare inspection and test reports. Some electronic inspection equipment automatically provides test reports containing these inspection results. When defects are found, inspectors notify supervisors and help to analyze and correct the production problems.

The emphasis on finding the root cause of defects is a basic tenet of modern management and production philosophies. Industrial production managers (see the statement on this occupation elsewhere in the *Handbook*) work closely with the inspectors to reduce defects and improve quality. In the past, a certain level of defects was considered acceptable because variations would always occur. Current philosophies emphasize constant quality improvement through analysis and correction of the causes of defects. The nature of inspectors' work has changed from merely checking for defects, to determining the cause of those defects.

Increased emphasis on quality control in manufacturing means that inspection is more fully integrated into the production process than in the past. Now, companies have integrated teams of inspection and production workers to jointly review and improve product quality. In addition, many companies now use self-monitoring production machines to ensure that the output is produced within quality standards. Self-monitoring machines can alert inspectors to production problems and automatically repair defects in some cases.

Some firms have completely automated inspection with the help of advanced vision inspection systems, using machinery installed at one or several points in the production process. Inspectors in these firms monitor the equipment, review output, and perform random product checks.

Testers repeatedly test existing products or prototypes under real-world conditions. For example, they may purposely abuse a machine by not changing its oil to see when failure occurs. They may devise automated machines to repeat a basic task thousands of times, such as opening and closing a car door. Through these tests, companies determine how long a product will last, what parts will break down first, and how to improve durability.

Working Conditions

Working conditions vary by industry and establishment size. As a result, some inspectors examine similar products for an entire shift, whereas others examine a variety of items. In manufacturing, it is common for most inspectors to remain at one workstation. Inspectors in some industries may be on their feet all day and may have to lift heavy objects, whereas, in other industries, they sit during most of their shift and do little strenuous work. Workers in heavy manufac-

Inspectors verify that company quality control standards are being met.

turing plants may be exposed to the noise and grime of machinery; in other plants, inspectors work in clean, air-conditioned environments suitable for carrying out controlled tests. Other inspectors rarely see the products they are inspecting and instead do the majority of their work examining electronic readouts in front of a computer.

Some inspectors work evenings, nights, or weekends. Shift assignments generally are made on the basis of seniority. Overtime may be required to meet production goals.

Training, Other Qualifications, and Advancement

Training requirements vary, based on the responsibilities of the inspector, tester, sorter, sampler, or weigher. For workers who perform simple "pass/fail" tests of products, a high school diploma generally is sufficient together with basic in-house training. Training for new inspectors may cover the use of special meters, gauges, computers and other instruments; quality-control techniques; blueprint reading; safety; and reporting requirements. There are some postsecondary training programs in testing, but many employers prefer to train inspectors on the job.

Complex precision-inspecting positions are filled by experienced assemblers, machine operators, or mechanics who already have a thorough knowledge of the products and production processes. To advance to these positions, experienced workers may need training in statistical process control, new automation, or the company's quality assurance policies. As automated inspection equipment and electronic recording of results is common, computer skills are also important.

In general, inspectors, testers, sorters, samplers, and weighers need mechanical aptitude, math and communication skills, and good hand-eye coordination and vision. Advancement for these workers frequently takes the form of higher pay. They also may advance to inspector of more complex products, supervisor, or related positions such as purchaser of materials and equipment.

Employment

Inspectors, testers, sorters, samplers, and weighers held about 508,000 jobs in 2004. About 2 in 3 worked in manufacturing establishments that produced such products as motor vehicle parts, plastics products, semiconductor and other electronic components, and aerospace products and parts. Inspectors, testers, sorters, samplers, and weighers also were found in employment services, architectural, engineering, and related services, wholesale trade, and government agencies.

Job Outlook

Like that of many other occupations concentrated in manufacturing industries, employment of inspectors, testers, sorters, samplers,

and weighers is expected to decline through the year 2014. The decline stems primarily from the growing use of automated inspection and the redistribution of some quality-control responsibilities from inspectors to production workers. Although numerous job openings will arise due to turnover in this large occupation, many of these jobs will be open only to experienced workers with advanced skills.

Employment of inspectors, testers, sorters, samplers, and weighers will be positively affected by the continuing focus on quality in American industry. The emphasis on improving quality and productivity has led manufacturers to invest in automated inspection equipment and to take a more systematic approach to quality inspection. Continued improvements in technologies, such as spectrophotometers and computer-assisted visual inspection systems, allow firms to effectively automate inspection tasks, increasing worker productivity and reducing the demand for inspectors. Inspectors will continue to operate these automated machines and monitor the defects they detect. Thus, while the increased emphasis on quality has increased the importance of inspection, the increased automation of inspection has limited the demand for inspectors.

Apart from automation, firms are integrating quality control into the production process. Many inspection duties are being redistributed from specialized inspectors to fabrication and assembly workers who monitor quality at every stage of the production process. In addition, the growing implementation of statistical process control is resulting in "smarter" inspection. Using this system, firms survey the sources and incidence of defects so that they can better focus their efforts on reducing production of defective products.

In some industries, however, automation is not a feasible alternative to manual inspection. Where key inspection elements are oriented toward size, such as length, width, or thickness, automation will become more important in the future. But where taste, smell, texture, appearance, fabric complexity, or product performance is important, inspection will continue to be done by workers. Employment of inspectors, testers, sorters, samplers, and weighers is expected to increase in the rapidly growing employment services industry, as more manufacturers and industrial firms hire temporary inspectors to increase the flexibility of their staffing strategies.

Earnings

Median hourly earnings of inspectors, testers, sorters, samplers, and weighers were \$13.66 in May 2004. The middle 50 percent earned between \$10.43 and \$18.23 an hour. The lowest 10 percent earned less than \$8.30 an hour, and the highest 10 percent earned more than \$24.45 an hour. Median hourly earnings in the industries employing the largest numbers of inspectors, testers, sorters, samplers, and weighers in May 2004 were:

Motor vehicle parts manufacturing	\$16.54
Architectural, engineering, and related services	15.59
Semiconductor and other electronic component manufacturing	12.94
Plastics product manufacturing.....	12.40
Employment services	10.08

Related Occupations

Other workers who conduct inspections include agricultural inspectors, construction and building inspectors, fire inspectors and investigators, occupational health and safety specialists and technicians, and transportation inspectors.

Jewelers and Precious Stone and Metal Workers

(O*NET 51-9071.01, 51-9071.02, 51-9071.03, 51-9071.04, 51-9071.05, 51-9071.06)

Significant Points

- About 40 percent of all jewelers are self-employed.
- Jewelers usually learn their trade in vocational or technical schools, through distance-learning centers, or on the job.
- Prospects for new jewelers should be excellent; many employers have difficulty finding and retaining workers with the right skills to replace those who retire or who leave the occupation for other reasons.

Nature of the Work

Jewelers and precious stone and metal workers use a variety of common and specialized handtools and equipment to design and manufacture new pieces of jewelry; cut, set, and polish gem stones; repair or adjust rings, necklaces, bracelets, earrings, and other jewelry; and appraise jewelry, precious metals, and gems. Jewelers usually specialize in one or more of these areas and may work for large jewelry manufacturing firms, for small retail jewelry shops, or as owners of their own businesses. Regardless of the type of work done or the work setting, jewelers require a high degree of skill, precision, and attention to detail.

Some jewelers design or make their own jewelry. Following their own designs or those created by designers or customers, they begin by shaping the metal or by carving wax to make a model for casting the metal. The individual parts then are soldered together, and the jeweler may mount a diamond or other gem or may engrave a design into the metal. Others do finishing work, such as setting stones, polishing, or engraving. Typical repair work includes enlarging or reducing ring sizes, resetting stones, and replacing broken clasps and mountings.

In larger manufacturing businesses, jewelers usually specialize in a single operation. *Mold and model makers* create models or tools for the jewelry that is to be produced. *Assemblers* solder or fuse jewelry and their parts; they also may set stones. *Engravers* etch designs into the metal with specialized tools, and *polishers* bring a finished luster to the final product.

Jewelers typically do the handiwork required to produce a piece of jewelry, while *gemologists* and laboratory graders analyze, describe, and certify the quality and characteristics of gem stones. Gemologists may work in gemological laboratories or as quality control experts for retailers, importers, or manufacturers. After using microscopes, computerized tools, and other grading instruments to examine gem stones or finished pieces of jewelry, they write reports certifying that the items are of a particular quality. Many jewelers also study gemology in order to become familiar with the physical properties of the gem stones with which they work.

Jewelry *appraisers* carefully examine jewelry to determine its value, after which they write appraisal documents. They determine the value of a piece by researching the jewelry market, using reference books, auction catalogs, price lists, and the Internet. They may work for jewelry stores, appraisal firms, auction houses, pawnbrokers, or insurance companies. Many gemologists also become appraisers.

In small retail stores or repair shops, jewelers and appraisers may be involved in all aspects of the work. Those who own or manage

stores or shops also hire and train employees; order, market, and sell merchandise; and perform other managerial duties.

New technology is helping to produce jewelry of higher quality at a reduced cost and in a shorter amount of time. For example, lasers are often used for cutting and improving the quality of stones, for applying intricate engraving or design work, and for inscribing personal messages or identification on jewelry. Jewelers also use lasers to weld metals together in milliseconds with no seams or blemishes, improving the quality and appearance of jewelry.

Some manufacturing firms use computer-aided design and manufacturing (CAD/CAM) to facilitate product design and automate some steps in the moldmaking and modelmaking process. CAD allows jewelers to create a virtual-reality model of a piece of jewelry. Using CAD, jewelers can modify the design, change the stone, or try a different setting and see the changes on a computer screen before cutting a stone or performing other costly steps. Once they are satisfied with the model, CAM produces it in a waxlike or other material. After the mold of the model is made, it is easier for manufacturing firms to produce numerous copies of a given piece of jewelry, which are then distributed to retail establishments across the country. Similar techniques may be used in the retail setting, allowing individual customers to review their jewelry designs with the jeweler and make modifications before committing themselves to the expense of a customized piece of jewelry.

Working Conditions

A jeweler's work involves a great deal of concentration and attention to detail. Working on precious stones and metals while trying to satisfy customers' and employers' demands for speed and quality can cause fatigue or stress. However, the use of more ergonomically correct jewelers' benches has eliminated most of the strain and discomfort caused by spending long periods bending over a workbench in one position.

Lasers require both careful handling to avoid injury and steady hands to direct precision tasks. In larger manufacturing plants and some smaller repair shops, chemicals, sharp or pointed tools, and jewelers' torches pose safety threats and may cause injury if proper care is not taken. Most dangerous chemicals, however, have been replaced with synthetic, less toxic products to meet safety requirements.

In repair shops, jewelers usually work alone with little supervision. In retail stores, they may talk with customers about repairs, perform custom design work, and even do some selling. Because many of their materials are valuable, jewelers must observe strict security procedures, including working behind locked doors that are opened only by a buzzer, working on the other side of barred windows, making use of burglar alarms, and, in larger jewelry establishments, working in the presence of armed guards.

Training, Other Qualifications, and Advancement

Jewelers usually learn their trade in vocational or technical schools, through distance-learning centers, or on the job. Colleges and art and design schools offer programs that can lead to the degree of bachelor of fine arts, or master of fine arts, in jewelry design. Formal training in the basic skills of the trade enhances one's employment and advancement opportunities. Many employers prefer jewelers with design, repair, and sales skills.

For those interested in working in a jewelry store or repair shop, vocational and technical training or courses offered by public and private colleges are the best sources of training. In these programs, which can vary in length from 6 months to 1 year, students learn the use and care of jewelers' tools and machines and basic jewelry-making and jewelry-repairing skills, such as designing, casting, and setting and polishing stones. Technical school courses also cover

Jewelers and precious stone and metal workers use both common and specialized tools to make pieces of jewelry.

topics such as blueprint reading, math, and shop theory. To enter some technical school programs and most college programs, a high school diploma or its equivalent is required. However, some schools specializing in jewelry training do not require graduation from high school. Computer-aided design is being used increasingly in the jewelry field, and students—especially those interested in design and manufacturing—may wish to obtain training in CAD; however, most employers will provide such training.

Various institutes offer courses and programs in gemology. Programs cover a wide range of topics, including the identification and grading of diamonds and gem stones.

Most employers feel that vocational school and technical school graduates need up to a year of additional supervised on-the-job training or apprenticeship in order to refine their repair skills and learn more about the operation of the store or shop. In addition, some employers encourage workers to improve their skills by enrolling in short-term technical school courses such as fabricating, jewelry design, jewelry manufacturing, wax carving, and gemology. Employers may pay all or part of the cost of this additional training.

In jewelry manufacturing plants, workers traditionally develop their skills through informal apprenticeships and on-the-job training. The apprenticeship or training period lasts up to 1 year, depending on the difficulty of the specialty. Training usually focuses on casting, setting stones, making models, or engraving. In recent years, a growing number of technical schools have begun to offer training designed for jewelers working in manufacturing. Employers in manufacturing

may prefer graduates of these programs because they are familiar with the production process, requiring less on-the-job training.

The precise and delicate nature of jewelry work requires finger and hand dexterity, good hand-eye coordination, patience, and concentration. Artistic ability and fashion consciousness are major assets, because jewelry must be stylish and attractive. Those who work in jewelry stores have frequent contact with customers and should be neat, personable, and knowledgeable about the merchandise. In addition, employers require workers of good character, because jewelers work with valuable materials.

Advancement opportunities are limited and depend greatly on an individual's skill and initiative. In manufacturing, some jewelers advance to supervisory jobs, such as master jeweler or head jeweler, but for most, advancement takes the form of higher pay for doing the same job. Jewelers who work in jewelry stores or repair shops may become managers; some open their own businesses.

Those interested in starting their own business should first establish themselves and build a reputation for their work within the jewelry trade. Once they obtain sufficient credit from jewelry suppliers and wholesalers, they can acquire the necessary inventory. Also, because the jewelry business is highly competitive, jewelers who plan to open their own store should have sales experience, as well as knowledge of marketing and business management. Courses in these areas often are available from technical schools and community colleges.

Employment

Jewelers and precious stone and metal workers held about 42,000 jobs in 2004. About 40 percent of these workers were self-employed; many operated their own store or repair shop, and some specialized in designing and creating custom jewelry.

About 1 out of 5 jobs for jewelers and precious stone and metal workers were in other miscellaneous manufacturing, which includes jewelry and silverware manufacturing. Another 3 out of 10 jobs were in retail trade, primarily in jewelry, luggage, and leather goods stores. A small number of jobs were with merchant wholesalers of miscellaneous durable goods and in repair shops providing repair and maintenance of personal and household goods. Although jewelry stores and repair shops were found in every city and in many small towns, most jobs were in larger metropolitan areas. In 2004, many jewelers employed in manufacturing worked in Rhode Island, New York, or California.

Job Outlook

Employment of jewelers and precious stone and metal workers is expected to decline slightly through 2014. Employment opportunities, however, should be excellent. New jewelers will be needed to replace those who retire or who leave the occupation for other reasons. When master jewelers retire, they take with them years of experience that require substantial time and financial resources to replace. Many employers have difficulty finding and retaining jewelers with the right skills and the necessary knowledge. Some technological advances have made jewelerymaking more efficient; however, many tasks cannot be fully automated. Jewelry work is a labor-intensive process that requires excellent handiwork.

The increasing numbers of affluent individuals, working women, double-income households, and fashion-conscious men are expected to keep jewelry sales strong. The population aged 45 and older, which accounts for a major portion of jewelry sales, also is on the rise.

Nontraditional jewelry marketers, such as discount stores, mail-order and catalogue companies, television shopping networks, and Internet retailers, have expanded the number of buying options and increased their sales volume. However, these establishments

require fewer sales staff, limiting employment opportunities for jewelers and precious stone and metal workers who work mainly in sales. Because such establishments enjoy increases in sales, however, they will need highly skilled jewelers to make and repair the jewelry they sell.

Opportunities in jewelry stores and repair shops will be best for graduates from training programs for jewelers or gemologists. Despite an increase in sales by nontraditional jewelry marketers, traditional jewelers should not be affected greatly, because they have the advantage of being able to build client relationships based on trust. Many clients prefer to work directly with a jeweler, to ensure that the product is of the highest quality and meets their specifications. Many traditional jewelers expand their businesses as clients recommend their services to friends and relatives.

The jewelry industry can be cyclical. During economic downturns, demand for jewelry products and for jewelers tends to decrease. However, demand for repair workers should remain strong even during economic slowdowns, because maintaining and repairing jewelry is an ongoing process. In fact, demand for jewelry repair may increase during recessions, as people repair or restore existing pieces rather than purchase new ones. Also, many nontraditional vendors typically do not offer repair services.

Within manufacturing, increasing automation will adversely affect employment of low-skilled occupations, such as assemblers and polishers. Automation will have a lesser impact on more creative, highly skilled positions, such as moldmakers and modelmakers. Furthermore, small manufacturers, which typify the industry, will have an increasingly difficult time competing with the larger manufacturers when it comes to supplying large retailers.

Because of recent international trade agreements, exports are increasing modestly as manufacturers become more competitive in foreign markets. However, imports from foreign manufacturers are increasing more rapidly than exports, due to these same agreements. Imports compete mainly with mass-produced jewelry. Therefore, employment in luxury and custom jewelry manufacturing is least susceptible to decline caused by import competition.

Earnings

Median annual earnings for jewelers and precious stone and metal workers were \$27,400 in May 2004. The middle 50 percent earned between \$20,510 and \$37,280. The lowest 10 percent earned less than \$16,040, and the highest 10 percent earned more than \$49,020. In May 2004, median annual earnings in the industries employing the largest numbers of jewelers and precious stone and metal workers were \$30,530 in jewelry, luggage, and leather goods stores and \$23,590 in other miscellaneous manufacturing.

Most jewelers start out with a base salary, but once they become more proficient, they may begin charging by the number of pieces completed. Jewelers who work in retail stores may earn a commission for each piece of jewelry sold. Many jewelers also enjoy a variety of benefits, including reimbursement from their employers for work-related courses and discounts on jewelry purchases.

Related Occupations

Jewelers and precious stone and metal workers do precision handwork. Other skilled workers who do similar jobs include precision instrument and equipment repairers; welding, soldering, and brazing workers; and woodworkers. Some jewelers and precious stone and metal workers create their own jewelry designs. Other occupations that require visual arts abilities include artists and related workers, and various designers—commercial and industrial, fashion, floral, graphic, and interior. Finally, some jewelers and precious stone

and metal workers are involved in the buying and selling of stones, metals, or finished pieces of jewelry. Similar occupations include retail salespersons and sales representatives in wholesale trade.

Medical, Dental, and Ophthalmic Laboratory Technicians

(O*NET 51-9081.00, 51-9082.00, 51-9083.01, 51-9083.02)

Significant Points

- Around 3 out of 5 salaried jobs were in medical equipment and supply manufacturing laboratories, which usually are small, privately owned businesses with fewer than 5 employees.
- Most medical, dental, and ophthalmic laboratory technicians learn their craft on the job; however, many employers prefer to hire those with formal training in a related field.
- Slower-than-average employment growth is expected for dental and ophthalmic laboratory technicians, while average employment growth is expected for medical appliance technicians.
- Job opportunities should be favorable as employers have difficulty filling trainee positions.

Nature of the Work

When patients require a special appliance to see clearly, chew and speak well, or walk, their health care providers send requests to medical, dental, and ophthalmic laboratory technicians. These technicians produce a wide variety of appliances to help patients.

Medical appliance technicians construct, fit, maintain, and repair braces, artificial limbs, joints, arch supports, and other surgical and medical appliances. They read prescriptions or detailed information from orthotists, podiatrists, or prosthetists. Orthotists treat patients who need braces, supports, or corrective shoes. Podiatrists are doctors who treat foot problems and request the same appliances as orthotists. Prosthetists work with patients who need a replacement limb, such as an arm, leg, hand, or foot, due to a birth defect or an accident. The appliances are called orthoses and prostheses. Medical appliance technicians are also referred to as orthotic and prosthetic technicians.

For orthoses such as arch supports, technicians first make a wax or plastic impression of the patient's foot. Then they bend and form a material so that it conforms to prescribed contours required to fabricate structural components. If a support is mainly required to correct the balance of a patient with legs of different lengths, a rigid material is used. If the support is primarily intended to protect those with arthritic or diabetic feet, a soft material is used. Supports and braces are polished with grinding and buffing wheels. Technicians may cover arch supports with felt to make them more comfortable.

For prostheses, technicians construct or receive a plaster cast of the patient's limb to use as a pattern. Then, they lay out parts and use precision measuring instruments to measure them. Technicians may use wood, plastic, metal, or other material for the parts of the artificial limb. Next, they carve, cut, or grind the material using hand or power tools. Then, they drill holes for rivets and glue, rivet, or weld the parts together. They are able to do very precise work using common tools. Next, technicians use grinding and buffing wheels to smooth and polish artificial limbs. Lastly, they may cover or pad the limbs with rubber, leather, felt, plastic, or another material. Also, technicians may mix pigments according to formulas to match the patient's skin color and apply the mixture to the artificial limb.

After fabrication, medical appliance technicians test devices for proper alignment, movement, and biomechanical stability using meters and alignment fixtures. They also may fit the appliance on the patient and adjust them as necessary. Over time the appliance will wear down, so technicians must repair and maintain the device. They also may service and repair the machinery used for the fabrication of orthotic and prosthetic devices.

Dental laboratory technicians fill prescriptions from dentists for crowns, bridges, dentures, and other dental prosthetics. First, dentists send a specification of the item to be manufactured, along with an impression (mold) of the patient's mouth or teeth. Then, dental laboratory technicians, also called dental technicians, create a model of the patient's mouth by pouring plaster into the impression and allowing it to set. Next, they place the model on an apparatus that mimics the bite and movement of the patient's jaw. The model serves as the basis of the prosthetic device. Technicians examine the model, noting the size and shape of the adjacent teeth, as well as gaps within the gumline. Based upon these observations and the dentist's specifications, technicians build and shape a wax tooth or teeth model, using small hand instruments called wax spatulas and wax carvers. They use this wax model to cast the metal framework for the prosthetic device.

After the wax tooth has been formed, dental technicians pour the cast and form the metal and, using small hand-held tools, prepare the surface to allow the metal and porcelain to bond. They then apply porcelain in layers, to arrive at the precise shape and color of a tooth. Technicians place the tooth in a porcelain furnace to bake the porcelain onto the metal framework, and then adjust the shape and color, with subsequent grinding and addition of porcelain to achieve a sealed finish. The final product is a nearly exact replica of the lost tooth or teeth.

In some laboratories, technicians perform all stages of the work, whereas, in other labs, each technician does only a few. Dental laboratory technicians can specialize in 1 of 5 areas: orthodontic appliances, crowns and bridges, complete dentures, partial dentures, or ceramics. Job titles can reflect specialization in these areas. For example, technicians who make porcelain and acrylic restorations are called *dental ceramists*.

Ophthalmic laboratory technicians—also known as manufacturing opticians, optical mechanics, or optical goods workers—make prescription eyeglass or contact lenses. Prescription lenses are

curved in such a way that light is correctly focused onto the retina of the patient's eye, improving his or her vision. Some ophthalmic laboratory technicians manufacture lenses for other optical instruments, such as telescopes and binoculars. Ophthalmic laboratory technicians cut, grind, edge, and finish lenses according to specifications provided by dispensing opticians, optometrists, or ophthalmologists and may insert lenses into frames to produce finished glasses. Although some lenses still are produced by hand, technicians are increasingly using automated equipment to make lenses.

Ophthalmic laboratory technicians should not be confused with workers in other vision care occupations. Ophthalmologists and optometrists are "eye doctors" who examine eyes, diagnose and treat vision problems, and prescribe corrective lenses. Ophthalmologists are physicians who perform eye surgery. Dispensing opticians, who also may do the work of ophthalmic laboratory technicians, help patients select frames and lenses, and adjust finished eyeglasses. (See the statement on physicians and surgeons, which includes ophthalmologists, as well as the statements on optometrists and opticians, dispensing, elsewhere in the *Handbook*.)

Ophthalmic laboratory technicians read prescription specifications, select standard glass or plastic lens blanks, and then mark them to indicate where the curves specified on the prescription should be ground. They place the lens in the lens grinder, set the dials for the prescribed curvature, and start the machine. After a minute or so, the lens is ready to be "finished" by a machine that rotates it against a fine abrasive, to grind it and smooth out rough edges. The lens is then placed in a polishing machine with an even finer abrasive, to polish it to a smooth, bright finish.

Next, the technician examines the lens through a lensometer, an instrument similar in shape to a microscope, to make sure that the degree and placement of the curve are correct. The technician then cuts the lenses and bevels the edges to fit the frame, dips each lens into dye if the prescription calls for tinted or coated lenses, polishes

the edges, and assembles the lenses and frame parts into a finished pair of glasses.

In small laboratories, technicians usually handle every phase of the operation. In large ones, in which virtually every phase of the operation is automated, technicians may be responsible for operating computerized equipment. Technicians also inspect the final product for quality and accuracy.

Working Conditions

Medical, dental, and ophthalmic laboratory technicians generally work in clean, well-lighted, and well-ventilated laboratories. They have limited contact with the public. Salaried laboratory technicians usually work 40 hours a week, but some work part time. At times, technicians wear goggles to protect their eyes, gloves to handle hot objects, or masks to avoid inhaling dust. They may spend a great deal of time standing.

Dental technicians usually have their own workbenches, which can be equipped with Bunsen burners, grinding and polishing equipment, and hand instruments, such as wax spatulas and wax carvers. Some dental technicians have computer-aided milling equipment to assist them with creating artificial teeth.

Training, Other Qualifications, and Advancement

Most medical, dental, and ophthalmic laboratory technicians learn their craft on the job; however, many employers prefer to hire those with formal training in a related field.

Medical appliance technicians begin as a helper and gradually learn new skills as they gain experience. Formal training is also available. There are currently 4 programs actively accredited by the National Commission on Orthotic and Prosthetic Education (NCOPE). These programs offer either an associate degree for orthotics and prosthetic technicians or one-year certificate for orthotic technicians or prosthetic technicians. The programs instruct students on human anatomy and physiology, orthotic and prosthetic equipment and materials, and applied biomechanical principles to customize orthoses or prostheses. The programs also include clinical rotations to provide hands-on experience.

Voluntary certification is available through the American Board for Certification in Orthotics and Prosthetics (ABC). Applicants are eligible for an exam after completing a program accredited by NCOPE or obtaining two years of experience as a technician under the direct supervision of an ABC-certified practitioner. After successfully passing the appropriate exam, technicians receive the Registered Orthotic Technician, Registered Prosthetic Technician, or Registered Prosthetic-Orthotic Technician credential.

High school students interested in becoming medical appliance technicians should take mathematics, metal and wood shop, and drafting. With additional formal education, medical appliance technicians can advance to become orthotists or prosthetists.

Dental laboratory technicians begin with simple tasks, such as pouring plaster into an impression, and progress to more complex procedures, such as making porcelain crowns and bridges. Becoming a fully trained technician requires an average of 3 to 4 years, depending upon the individual's aptitude and ambition, but it may take a few years more to become an accomplished technician.

Training in dental laboratory technology also is available through community and junior colleges, vocational-technical institutes, and the U.S. Armed Forces. Formal training programs vary greatly both in length and in the level of skill they impart.

In 2004, 25 programs in dental laboratory technology were approved (accredited) by the Commission on Dental Accreditation in

Dental laboratory technicians use Bunsen burners, grinding and polishing equipment, and hand instruments, such as wax spatulas and wax carvers.

conjunction with the American Dental Association (ADA). These programs provide classroom instruction in dental materials science, oral anatomy, fabrication procedures, ethics, and related subjects. In addition, each student is given supervised practical experience in a school or an associated dental laboratory. Accredited programs normally take 2 years to complete and lead to an associate degree. A few programs take about 4 years to complete and offer a bachelor's degree in dental technology.

Graduates of 2-year training programs need additional hands-on experience to become fully qualified. Each dental laboratory owner operates in a different way, and classroom instruction does not necessarily expose students to techniques and procedures favored by individual laboratory owners. Students who have taken enough courses to learn the basics of the craft usually are considered good candidates for training, regardless of whether they have completed a formal program. Many employers will train someone without any classroom experience.

The National Board for Certification, an independent board established by the National Association of Dental Laboratories, offers certification in dental laboratory technology. Certification, which is voluntary, can be obtained in five specialty areas: crowns and bridges, ceramics, partial dentures, complete dentures, and orthodontic appliances.

In large dental laboratories, technicians may become supervisors or managers. Experienced technicians may teach or may take jobs with dental suppliers in such areas as product development, marketing, and sales. Still, for most technicians, opening one's own laboratory is the way toward advancement and higher earnings.

A high degree of manual dexterity, good vision, and the ability to recognize very fine color shadings and variations in shape are necessary. An artistic aptitude for detailed and precise work also is important. High school students interested in becoming dental laboratory technicians should take courses in art, metal and wood shop, drafting, and sciences. Courses in management and business may help those wishing to operate their own laboratories.

Ophthalmic laboratory technicians start on simple tasks if they are trained to produce lenses by hand. They may begin with marking or blocking lenses for grinding; then, they progress to grinding, cutting, edging, and beveling lenses; finally, they are trained in assembling the eyeglasses. Depending on individual aptitude, it may take up to 6 months to become proficient in all phases of the work.

Employers filling trainee jobs prefer applicants who are high school graduates. Courses in science, mathematics, and computers are valuable; manual dexterity and the ability to do precision work are essential. Technicians using automated systems will find computer skills valuable.

A very small number of ophthalmic laboratory technicians learn their trade in the Armed Forces or in the few programs in optical technology offered by vocational-technical institutes or trade schools. These programs have classes in optical theory, surfacing and lens finishing, and the reading and applying of prescriptions. Programs vary in length from 6 months to 1 year and award certificates or diplomas.

Ophthalmic laboratory technicians can become supervisors and managers. Some become dispensing opticians, although further education or training generally is required in that occupation.

Employment

Medical, dental, and ophthalmic laboratory technicians held about 87,000 jobs in 2004. Around 3 out of 5 salaried jobs were in medical equipment and supply manufacturing laboratories, which

usually are small, privately owned businesses with fewer than five employees. However, some laboratories are large; a few employ more than 1,000 workers.

Employment by detailed occupation is presented in the following tabulation:

Dental laboratory technicians	50,000
Ophthalmic laboratory technicians	25,000
Medical appliance technicians	11,000

Some medical appliance technicians worked in health and personal care stores, while others worked in public and private hospitals, professional and commercial equipment and supplies merchant wholesalers, offices of physicians, or consumer goods rental centers. Some were self-employed.

Some dental laboratory technicians work in offices of dentists. Others work for hospitals providing dental services, including U.S. Department of Veterans Affairs hospitals. Some dental laboratory technicians open their own offices or work in dental laboratories in their homes.

Around 30 percent of ophthalmic laboratory technicians were in health and personal care stores, such as optical goods stores that manufacture and sell prescription glasses and contact lenses. Some were in offices of optometrists or ophthalmologists. Others worked at professional and commercial equipment and supplies merchant wholesalers. A few worked in commercial and service industry machine manufacturing firms that produce lenses for other optical instruments, such as telescopes and binoculars.

Job Outlook

Job opportunities for medical, dental, and ophthalmic laboratory technicians should be favorable, despite expected slower-than-average growth in overall employment through the year 2014. Employers have difficulty filling trainee positions, probably because entry-level salaries are relatively low and because the public is not familiar with these occupations. Most job openings will arise from the need to replace technicians who transfer to other occupations or who leave the labor force.

Medical appliance technicians will grow faster than dental and ophthalmic laboratory technicians, with employment projected to increase about as fast as the average for all occupations, due to the increasing prevalence of the two leading causes of limb loss—diabetes and cardiovascular disease. Advances in technology may spur demand for prostheses that allow for greater movement.

During the last few years, demand has arisen from an aging public that is growing increasingly interested in cosmetic prostheses. For example, many dental laboratories are filling orders for composite fillings that are the same shade of white as natural teeth to replace older, less attractive fillings. However, job growth for dental laboratory technicians will be limited. The overall dental health of the population has improved because of fluoridation of drinking water, which has reduced the incidence of dental cavities, and greater emphasis on preventive dental care since the early 1960s. As a result, full dentures will be less common, as most people will need only a bridge or crown.

Demographic trends also make it likely that many more Americans will need vision care in the years ahead. Not only will the population grow, but also, the proportion of middle-aged and older adults is projected to increase rapidly. Middle age is a time when many people use corrective lenses for the first time, and elderly persons usually require more vision care than others. However,

the increasing use of automated machinery will limit job growth for ophthalmic laboratory technicians.

Earnings

Median hourly earnings of medical appliance technicians were \$13.38 in May 2004. The middle 50 percent earned between \$10.46 and \$18.22 an hour. The lowest 10 percent earned less than \$8.21, and the highest 10 percent earned more than \$23.66 an hour. Median hourly earnings of medical appliance technicians in May 2004 were \$13.00 in medical equipment and supplies manufacturing.

Median hourly earnings of dental laboratory technicians were \$14.93 in May 2004. The middle 50 percent earned between \$11.18 and \$19.71 an hour. The lowest 10 percent earned less than \$8.86, and the highest 10 percent earned more than \$25.48 an hour. Median hourly earnings of dental laboratory technicians in May 2004 were \$15.95 in offices of dentists and \$14.40 in medical equipment and supplies manufacturing.

Dental technicians in large laboratories tend to specialize in a few procedures and, therefore, tend to be paid a lower wage than those employed in small laboratories who perform a variety of tasks.

Median hourly earnings of ophthalmic laboratory technicians were \$11.40 in May 2004. The middle 50 percent earned between \$9.33 and \$14.67 an hour. The lowest 10 percent earned less than \$7.89, and the highest 10 percent earned more than \$17.61 an hour. Median hourly earnings of ophthalmic laboratory technicians in May 2004 were \$10.88 in health and personal care stores and \$10.79 in medical equipment and supplies manufacturing.

Related Occupations

Medical, dental, and ophthalmic laboratory technicians manufacture a variety of health implements, such as artificial limbs, corrective lenses, and artificial teeth, following specifications and instructions provided by health care practitioners. Other workers who make and repair medical devices or other items include dispensing opticians, orthotists and prosthetists, and precision instrument and equipment repairers.

Painting and Coating Workers, Except Construction and Maintenance

(O*NET 51-9121.01, 51-9121.02, 51-9122.00, 51-9123.00)

Significant Points

- About 70 percent of jobs are in manufacturing establishments.
- Most workers acquire their skills on the job; for most operators, training lasts from a few days to several months, but becoming skilled in all aspects of automotive painting usually requires 1 to 2 years.
- Overall employment is projected to grow more slowly than average; transportation equipment painters are expected to grow about as fast as average, while coating, painting, and spraying machine setters, operators, and tenders are expected to decline.

Nature of the Work

Millions of items ranging from cars to candy are covered by paint, plastic, varnish, chocolate, or some other type of coating solution. Often, the protection provided by the paint or coating is essential to the product, as with the coating of insulating material covering wires and other electrical and electronic components. Also, many paints and coatings have dual purposes; for example, the paint finish on an automobile heightens the visual appearance of the vehicle while providing protection from corrosion.

Coating, painting, and spraying machine setters, operators, and tenders control the machinery that applies these paints and coatings to a wide range of manufactured products. Perhaps the most straightforward technique is simply dipping an item in a large vat of paint or other coating. This is the technique used by *dippers*, who immerse racks or baskets of articles in vats of paint, liquid plastic, or other solutions by means of a power hoist. Similarly, *tumbling barrel painters* deposit articles made of porous materials into a barrel of paint, varnish, or other coating; the barrel is then rotated to ensure thorough coverage.

Another familiar technique is spraying products with a solution of paint or some other coating. *Spray machine operators* use spray guns to coat metal, wood, ceramic, fabric, paper, and food products with paint and other coating solutions. Following a formula, operators fill the machine's tanks with a mixture of paints or chemicals, adding prescribed amounts of solution. Then they adjust nozzles on the guns to obtain the proper dispersion of the spray, and they hold or position the guns so as to direct the spray onto the article. Operators also check the flow and viscosity of the paint or solution and visually inspect the quality of the coating. When products are drying, these workers often must regulate the temperature and air circulation in drying ovens. Individuals who paint, coat, or decorate articles such as furniture, glass, pottery, toys, cakes, and books are known as *painting, coating, and decorating workers*.

Painting and coating workers use various types of machines to coat a range of products. Frequently, their job title reflects the specialized nature of the machine or of the coating being applied. For example, *enrobing machine operators* coat, or "enrobe," confectionery, bakery, and other food products with melted chocolate, cheese, oils, sugar, or other substances. *Paper coating machine operators* spray "size" on rolls of paper to give it its gloss or finish. *Silvering applicators* spray silver, tin, and copper solutions on glass in the manufacture of mirrors.

In response to concerns about air pollution and worker safety, manufacturers increasingly are using new types of paints and coatings, instead of high-solvent paints, on their products. Water-based paints and powder coatings are two of the most common. These compounds do not emit as many volatile organic compounds into the air and can be applied to a variety of products. Powder coatings are sprayed such as are liquid paints and then are heated to melt and cure the coating.

The adoption of new types of paints often is accompanied by a conversion to more automated painting equipment that the operator sets and monitors. When using these machines, operators position the automatic spray guns, set the nozzles, and synchronize the action of the guns with the speed of the conveyor carrying articles through the machine and drying ovens. The operator also may add solvents or water to the paint vessel, thereby preparing the paint for application. During the operation of the equipment, these workers tend painting machines, observe gauges on the control panel, and check articles for evidence of any variation from specifications. The operator then uses a spray gun to “touch up” spots where necessary.

Although the majority of painting and coating workers are employed in manufacturing, the best known group refinishes old and damaged cars, trucks, and buses in automotive body repair and paint shops. *Transportation equipment painters*, or *automotive painters*, are among the most highly skilled manual spray operators, because they perform intricate, detailed work and mix paints to match the original color, a task that is especially difficult if the color has faded.

To prepare a vehicle for painting, painters or their helpers use power sanders and sandpaper to remove the original paint or rust and then fill small dents and scratches with body filler. They also remove or mask parts they do not want to paint, such as chrome trim, headlights, windows, and mirrors. Automotive painters use a spray gun to apply several coats of paint. They apply enamel or water-based primers to vehicles with metal bodies and flexible primers to newer vehicles with plastic body parts. Controlling the spray gun by hand, they apply successive coats until the finish of the repaired sections of the vehicle matches that of the original, undamaged portions. To speed drying between coats, they may place the freshly painted vehicle under heat lamps or in a special infrared oven. After each coat of primer dries, they sand the surface to remove any irregularities and to improve the adhesion of the next coat. Final sanding of the primers may be done by hand with a fine grade of sandpaper. A sealer then is applied and allowed to dry, followed by the final topcoat.

Working Conditions

Painting and coating workers typically work indoors and may be exposed to dangerous fumes from paint and coating solutions. Although painting usually is done in special ventilated booths, operators typically wear masks or respirators that cover their noses and mouths, even in such booths. In addition, Federal legislation has led to a decrease in workers’ exposure to hazardous chemicals by regulating emissions of volatile organic compounds and other hazardous air pollutants. This legislation also has led to the increasing use of more sophisticated paint booths and fresh-air systems that provide a safer work environment.

Operators have to stand for long periods, and when using a spray gun, they may have to bend, stoop, or crouch in uncomfortable positions to reach different parts of the article. Most operators work a normal 40-hour week, but self-employed automotive painters sometimes work more than 50 hours a week, depending on the number of vehicles customers want repainted.

Training, Other Qualifications, and Advancement

Most painting and coating workers acquire their skills on the job, usually by watching and helping other, more experienced workers.

To minimize exposure to harmful chemicals, painting and coating workers must wear protective masks when performing certain tasks.

For most setters, operators, and tenders, as well as for painting, coating, and decorating workers, training lasts from a few days to several months. Coating, painting, and spraying machine setters, operators, and tenders who modify the operation of computer-controlled equipment while it is running may require additional training in computer operations and minor programming.

Similarly, most transportation equipment painters start as helpers and gain their skills informally on the job. Becoming skilled in all aspects of automotive painting usually requires 1 to 2 years of on-the-job training. Beginning helpers usually remove trim, clean and sand surfaces to be painted, mask surfaces they do not want painted, and polish finished work. As helpers gain experience, they progress to more complicated tasks, such as mixing paint to achieve a good match and using spray guns to apply primer coats or final coats to small areas.

Painters should have keen eyesight and a good sense of color. The completion of high school generally is not required, but is advantageous. Additional instruction is offered at many community colleges and vocational or technical schools. Such programs enhance one’s employment prospects and can speed promotion to the next level.

Some employers sponsor training programs to help their workers become more productive. Training is available from manufacturers of chemicals, paints, or equipment or from other private sources and may include safety and quality tips, as well as impart knowledge of products, equipment, and general business practices. Some

automotive painters are sent to technical schools to learn the intricacies of mixing and applying different types of paint.

Voluntary certification by the National Institute for Automotive Service Excellence (ASE) is recognized as the standard of achievement for automotive painters. For certification, painters must pass a written examination and have at least 2 years of experience in the field. High school, trade or vocational school, or community or junior college training in automotive refinishing that meets ASE standards may substitute for up to 1 year of experience. To retain their certification, painters must retake the examination at least every 5 years.

Experienced painting and coating workers with leadership ability may become team leaders or supervisors. Those who acquire practical experience, college, or other formal training may become sales or technical representatives for chemical or paint companies. Eventually, some automotive painters open their own shops.

Employment

Painting and coating workers held about 186,000 jobs in 2004. Lesser skilled coating, painting, and spraying machine setters, operators, and tenders accounted for about 103,000 jobs, while more skilled transportation equipment painters constituted about 53,000. Another 29,000 jobs were held by painting, coating, and decorating workers.

Approximately 70 percent of salaried jobs were found in manufacturing establishments, where the workers applied coatings to items such as fabricated metal products, motor vehicles and related equipment, industrial machines, household and office furniture, and plastic, wood, and paper products. Outside manufacturing, workers included automotive painters employed by independent automotive repair shops and workers employed by body repair and paint shops operated by retail motor vehicle dealers. About 6 percent of painting and coating workers were self-employed.

Job Outlook

Overall employment of painting and coating workers is expected to grow more slowly than the average for all occupations through the year 2014. Employment growth for highly skilled transportation painters and automotive refinishers is projected to be faster than for painting, coating, and decorating workers. In addition to jobs arising from growth, some jobs will become available each year as employers replace experienced operators who transfer to other occupations or leave the labor force.

Despite increasing demand for manufactured goods, employment of coating, painting, and spraying machine setters, operators, and tenders is expected to decline as part of that demand will be met by products manufactured abroad. Employment will be further decreased by improvements in the automation of paint and coating applications that will raise worker productivity. For example, operators will be able to coat goods more rapidly as they use sophisticated industrial machinery that moves and aims spray guns more efficiently. Legislation has set limits on the emissions of ozone-forming volatile organic compounds and is expected to impede job growth among operators in manufacturing. As manufacturing firms switch to water-based and powder coatings to comply with the law, they will introduce more efficient automation.

Painting, coating, and decorating workers should grow more slowly than the average for all occupations. Increasing demand for hand-painted tiles and related specialty products will lead to growth among these workers. Although competition from imports should temper increases in employment, the specialized skills required by workers in this occupation should keep them from seeing as much of an impact of automation on employment.

Since the detailed work of refinishing automobiles in collision repair shops and motor vehicle dealerships does not lend itself to automation, painters employed in these establishments are projected to experience employment growth about as fast as the average for all occupations. As the demand for refinishing continues to grow, slower productivity growth among these workers will lead to employment increases that are more in line with the growing demand for their services.

The number of job openings for painting and coating workers in manufacturing industries may fluctuate from year to year due to cyclical changes in economic conditions. When demand for manufactured goods lessens, production may be suspended or reduced, and workers may be laid off or face a shortened workweek. Automotive painters, by contrast, can expect relatively steady work because automobiles damaged in accidents require repair and refinishing regardless of the state of the economy.

Earnings

Median hourly earnings of coating, painting, and spraying machine setters, operators, and tenders were \$12.64 in May 2004. The middle 50 percent earned between \$10.16 and \$15.78 an hour. The lowest 10 percent earned less than \$8.54, and the highest 10 percent earned more than \$19.39 an hour.

Median hourly earnings of transportation equipment painters were \$16.89 in May 2004. The middle 50 percent earned between \$12.85 and \$22.74 an hour. The lowest 10 percent earned less than \$10.17, and the highest 10 percent earned more than \$27.52 an hour. Median hourly earnings of transportation equipment painters were \$16.84 in automotive repair and maintenance shops and \$24.13 in motor vehicle manufacturing.

Median hourly earnings of painting, coating, and decorating workers were \$10.95 in May 2004. The middle 50 percent earned between \$8.76 and \$13.94 an hour. The lowest 10 percent earned less than \$7.44, and the highest 10 percent earned more than \$18.23 an hour.

Many automotive painters employed by motor vehicle dealers and independent automotive repair shops receive a commission based on the labor cost charged to the customer. Under this method, earnings depend largely on the amount of work a painter does and how fast it is completed. Employers frequently guarantee commissioned painters a minimum weekly salary. Helpers and trainees usually receive an hourly rate until they become sufficiently skilled to work on commission. Trucking companies, bus lines, and other organizations that repair and refinish their own vehicles usually pay by the hour.

Many painting and coating machine operators belong to unions, including the International Brotherhood of Painters and Allied Trades, the Sheet Metal Workers International Association, and the International Brotherhood of Teamsters. Most union operators work for manufacturers and large motor vehicle dealers.

Related Occupations

Other occupations similar to painting and coating workers include painters and paperhangers, woodworkers, and machine setters, operators, and tenders—metal and plastic.

Sources of Additional Information

For more details about work opportunities, contact local manufacturers, automotive body repair shops, motor vehicle dealers, vocational schools, locals of unions representing painting and coating workers, or the local office of the State employment service. The State employment service also may be a source of information about training programs.

Photographic Process Workers and Processing Machine Operators

(O*NET 51-9131.01, 51-9131.02, 51-9131.03, 51-9131.04, 51-9132.00)

Significant Points

- A decline in employment is expected as digital photography becomes commonplace.
- Most receive on-the-job training from their companies, manufacturers' representatives, and experienced workers.
- Job opportunities will be best for individuals with experience using computers and digital technology.

Nature of the Work

Both amateur and professional photographers rely heavily on photographic process workers and processing machine operators to develop film, make prints or slides, and do related tasks, such as enlarging or retouching photographs. *Photographic processing machine operators* operate various machines, such as mounting presses and motion picture film printing, photographic printing, and film developing machines. *Photographic process workers* perform more delicate tasks, such as retouching photographic negatives, prints and images to emphasize or correct specific features.

Photographic processing machine operators often have specialized jobs. *Film process technicians* operate machines that develop exposed photographic film or sensitized paper in a series of chemical and water baths to produce negative or positive images. First, technicians mix developing and fixing solutions, following a formula. They then load the film in the machine, which immerses the exposed film in a developer solution. This brings out the latent image. The next steps include immersing the negative in a stop-bath to halt the developer action, transferring it to a hyposolution to fix the image, and then immersing it in water to remove the chemicals. The technician then dries the film. In some cases, these steps are performed by hand.

Color printer operators control equipment that produces color prints from negatives. These workers read customer instructions to determine processing requirements. They load film into color printing equipment, examine negatives to determine equipment control settings, set controls, and produce a specified number of prints. Finally, they inspect the finished prints for defects, remove any that are found, and insert the processed negatives and prints into an envelope for return to the customer.

Processing machine operators who work with digital images first load the raw images onto a computer, either directly from the camera or more commonly from a storage device such as a flash card or CD. Most processing of the images is done automatically by software, but they may also be reviewed manually by the operator, who then selects which images the customer wants printed and the quantity. Some digital processors also upload images onto a Web site so that the customer can view them from a home computer and also share them with others through the Internet.

Photographic process workers, sometimes known as *digital imaging technicians*, use computer images of conventional negatives and specialized computer software to vary the contrast of images, remove unwanted background, or combine features from different photographs. Although computers and digital technology are replacing much manual work, some photographic process workers, especially those who work in portrait studios, still perform many specialized tasks by hand directly on the photo or negative. *Airbrush artists* restore damaged and faded photographs, and may color or shade drawings to create photographic likenesses using an airbrush.

Photographic processing workers generate finished photos from film or data files.

Photographic retouchers alter photographic negatives, prints, or images to accentuate the subject. *Colorists* apply oil colors to portrait photographs to create natural, lifelike appearances. *Photographic spotters* remove imperfections on photographic prints and images.

Working Conditions

Photographic process workers and processing machine operators generally spend their work hours in clean, appropriately lighted, well-ventilated, and air-conditioned offices, photofinishing laboratories, or 1-hour minilabs. In recent years, more commercial photographic processing has been done on computers than in darkrooms, and this trend is expected to continue.

Some photographic process workers and processing machine operators are exposed to the chemicals and fumes associated with developing and printing. These workers must wear rubber gloves and aprons and take precautions against these hazards. Those who use computers for extended periods may experience back pain, eyestrain, or fatigue.

Photographic processing machine operators must do repetitive work at a rapid pace without any loss of accuracy. Photographic process workers do detailed tasks, such as airbrushing and spotting, which can contribute to eye fatigue.

Many photo laboratory employees work a 40-hour week, including evenings and weekends, and may work overtime during peak seasons. About one in four work part time.

Training, Other Qualifications, and Advancement

Most photographic process workers and processing machine operators receive on-the-job training from their companies, manufacturers' representatives, and experienced workers. New employees gradually learn to use the machines and chemicals that develop and print film as well as the computer techniques to process and print digital images.

Employers prefer applicants who are high school graduates or those who have some experience in the field. Familiarity with computers is essential for photographic processing machine operators. The ability to perform simple mathematical calculations also is helpful. Photography courses that include instruction in film

processing are valuable preparation. Such courses are available through high schools, vocational-technical institutes, private trade schools, and colleges and universities.

On-the-job training in photographic processing occupations can range from just a few hours for print machine operators to several months for photographic processing workers such as airbrush artists and colorists. Some workers attend periodic training seminars to maintain a high level of skill. Manual dexterity, good hand-eye coordination, and good vision, including normal color perception, are important qualifications for photographic process workers.

Photographic process machine workers can sometimes advance from jobs as machine operators to supervisory positions in laboratories or to management positions within retail stores.

Employment

Photographic process workers held about 32,000 jobs in 2004. About three in ten photographic process workers were employed in photofinishing laboratories and one-hour minilabs. More than one in six worked for portrait studios or commercial laboratories that specialize in processing the work of professional photographers for advertising and other industries. An additional one in nine was employed by general merchandise stores, and one in ten in the printing, publishing, and motion picture industries.

Photographic processing machine operators held about 54,000 jobs in 2004. About half worked in retail establishments, primarily in general merchandise stores and drug stores. About one in three worked in photofinishing laboratories and one-hour minilabs. Small numbers were employed in the printing industry and in portrait studios and commercial laboratories that process the work of professional photographers.

Employment fluctuates somewhat over the course of the year. Typically, employment peaks during school graduation and summer vacation periods, and again during the winter holiday season.

Job Outlook

A decline in employment is expected for photographic process workers and processing machine operators through the year 2014. Some openings will still result from replacement needs, which are higher for machine operators than for photographic process workers.

In recent years, digital cameras, which use electronic memory rather than film to record images, have become standard among professional photographers and are gaining in popularity among amateur photographers as the cost of these cameras continues to fall. This will reduce the demand for traditional photographic processing machine operators. However, while many digital camera owners will choose to print their own pictures with their own equipment, a growing number of casual photographers are choosing not to acquire the needed equipment and skills to print the photos themselves. For them, self-service machines will be able to meet some of the demand, but there will still be some demand for professionals to print digital photos, as well as to develop and print photos from those who continue to use film cameras.

Digital photography also will reduce demand for photographic process workers. Using digital cameras and technology, consumers who have a personal computer and the proper software will be able to download and view pictures on their computer, as well as manipulate, correct, and retouch their own photographs. No matter what improvements occur in camera technology, though, some photographic processing tasks will still require skillful manual treatment. Moreover, not all consumers will want to invest in the software. Job opportunities will be best for individuals with experience using computers and digital technology.

Earnings

Earnings of photographic process workers vary greatly depending on skill level, experience, and geographic location. Median hourly earnings for photographic process workers were \$9.63 in May 2004. The middle 50 percent earned between \$7.79 and \$12.97. The lowest 10 percent earned less than \$6.68, and the highest 10 percent earned more than \$17.99. Median hourly earnings were \$10.20 in photofinishing laboratories, the largest employer of photographic process workers.

Median hourly earning for photographic processing machine operators were \$9.33 in May 2004. The middle 50 percent earned between \$7.78 and \$11.88. The lowest 10 percent earned less than \$6.84, and the highest 10 percent earned more than \$15.21. Median hourly earnings in the two industries employing the largest numbers of photographic processing machine operators were \$10.44 in photofinishing laboratories and \$7.98 in health and personal care stores.

Related Occupations

Photographic process workers and processing machine operators need specialized knowledge of the photo developing process. Other workers who apply specialized technical knowledge include clinical laboratory technologists and technicians, computer operators, jewelers and precious stone and metal workers, prepress technicians and workers, printing machine operators, and science technicians.

Sources of Additional Information

Semiconductor Processors

(O*NET 51-9141.00)

Significant Points

- Employment is expected to decline over the next 10 years because of increasing automation of fabrication plants in this country and the building of many of the new plants abroad.
- An associate degree in a relevant curriculum is increasingly required.

Nature of the Work

Electronic semiconductors—also known as computer chips, microchips, or integrated circuits—are the miniature but powerful brains of high-technology equipment. Semiconductors are composed of a myriad of tiny aluminum or copper lines and electric switches, which manipulate the flow of electrical current. Semiconductor processors are responsible for many of the steps necessary in the manufacture of each semiconductor that goes into personal computers, missile guidance systems, and a host of other electronic equipment.

Semiconductor processors are the production workers who manufacture semiconductors in disks of varying sizes, generally eight to twelve inches wide. These disks, called wafers, are thin slices of silicon on which the circuitry of the microchips is layered. Each wafer is eventually cut into dozens or scores of individual chips.

Semiconductor processors make wafers by means of photolithography, a printing process for creating patterns from photographic images. Operating automated equipment, workers imprint precise

microscopic patterns of the circuitry on the wafers, etch out the patterns with acids, and replace the patterns with metals that conduct electricity. Then, the wafers receive a chemical bath to make them smooth, and the imprint process begins again on a new layer with the next pattern. Wafers usually have from 8 to 20 such layers of microscopic, three-dimensional circuitry.

Semiconductors are produced in semiconductor-fabricating plants, or “fabs.” Within fabs, the manufacturing and cutting of wafers to create semiconductors takes place in “cleanrooms”—production areas that must be kept free of any airborne matter, because even extremely small particles can damage a semiconductor. All semiconductor processors working in cleanrooms—both operators and technicians—must wear special lightweight outer garments known as “bunny suits.” These garments fit over clothing to prevent lint and other particles from contaminating semiconductor-processing worksites.

Operators, who make up the majority of the workers in cleanrooms, start and monitor the sophisticated equipment that performs the various tasks during the many steps of the semiconductor production sequence. They spend a great deal of time at computer terminals, monitoring the operation of the equipment to ensure that each of the tasks in the production of the wafer is performed correctly. Operators also may transfer wafer carriers from one development station to the next; in newer fabs, the lifting of heavy wafer carriers and the constant monitoring for quality control are increasingly being automated.

Semiconductor processing technicians use microscopes to check for flaws in semiconductor wafers.

Once begun, the production of semiconductor wafers is continuous. Operators work to the pace of the machinery that has largely automated the production process. Operators are responsible for keeping the automated machinery within proper operating parameters.

Technicians account for a smaller percentage of the workers in cleanrooms, but they troubleshoot production problems and make equipment adjustments and repairs. They also take the lead in assuring quality control and in maintaining equipment. To keep equipment repairs to a minimum, technicians perform diagnostic analyses and run computations. For example, technicians may determine if a flaw in a chip is due to contamination, and peculiar to that wafer, or if the flaw is inherent in the manufacturing process.

Working Conditions

The work pace in cleanrooms is deliberately slow. Limited movement keeps the air in cleanrooms as free as possible of dust and other particles, which can destroy semiconductors during their production. Because the machinery sets the operators’ rate of work in the largely automated production process, workers maintain an easygoing pace. Although workers spend some time alone monitoring equipment, operators and technicians spend much of their time working in teams.

Technicians are on their feet most of the day, walking through the cleanroom to oversee production activities. Operators spend a great deal of time sitting or standing at workstations, monitoring computer readouts and gauges. Sometimes, they must retrieve wafers from one station and take them to another.

The temperature in the cleanrooms must be kept within a narrow range: usually, it is set at a comfortable 72 degrees Fahrenheit. Although bunny suits cover virtually the entire body, except perhaps the eyes (over which workers wear protective glasses), their lightweight fabric keeps the temperature inside fairly comfortable as well. Entry and exit of workers in bunny suits from the cleanroom are controlled to minimize contamination, and workers must be reclothed in a clean suit and decontaminated each time they return to the cleanroom.

Several highly toxic chemicals are used at various points in the process of manufacturing semiconductors. Workers who are exposed to such chemicals can be seriously harmed. However, semiconductor fabrication plants are designed with safeguards to ensure that these chemicals are handled, used, and disposed of without exposure to workers or the surrounding environment. Toxic chemicals are applied to wafers by computer-controlled machine tools in sealed chambers and there is normally little risk of workers coming into contact with them.

Semiconductor-fabricating plants operate around the clock. For this reason, night and weekend work is common. In some plants, workers maintain standard 8-hour shifts, 5 days a week. In other plants, employees are on duty for 12-hour shifts to minimize the disruption of cleanroom operations brought about by changes in shift. In some plants, managers allow workers to alternate schedules, thereby distributing the overnight shift equitably.

Training, Other Qualifications, and Advancement

People interested in becoming semiconductor processors—either operators or technicians—need a solid background in mathematics and the physical sciences. In addition to applying these disciplines to the complex manufacturing processes performed in fabs, math and science knowledge are essentials for pursuing higher education in semiconductor technology—and knowledge of both subjects is one of the best ways to advance in the semiconductor fabricating field.

Semiconductor processor workers must also be able to think analytically and critically to anticipate problems and avoid costly

mistakes. Communication skills also are vital, as workers must be able to convey their thoughts and ideas both orally and in writing.

For semiconductor processor jobs, employers prefer persons who have completed associate degree programs. However, completion of a 1-year certificate program in semiconductor technology offered by some community colleges, supplemented by experience, may also be sufficient; Some semiconductor technology programs at community colleges include internships at a semiconductor fabricating plants. Others persons also may qualify by completing a degree in high-tech manufacturing, a new degree offered by some community colleges that prepares graduates to work in the semiconductor industry, as well as other industries such as pharmaceuticals, aerospace, or automotive. Degree or certificate program graduates who get hands-on training while attending school should have the best prospects.

To ensure that operators and technicians keep their skills current, many employers provide 40 hours of formal training annually. Some employers also provide financial assistance to employees who want to earn associate and bachelor's degrees to further their career or to work towards becoming a technician.

Summer and part-time employment provide another option for getting started in the field for those who are at least 18 years old and live near a semiconductor processing plant. Students often are hired to work during the summer, and some students are allowed to continue working part time during the school year. Students in summer and part-time semiconductor processor jobs learn what education they need to prosper in the field. They also gain valuable experience that may lead to full-time employment after graduation.

Some semiconductor processing technicians transfer to sales engineer jobs with suppliers of the machines that manufacture the semiconductors or become field support personnel.

Employment

Electronic semiconductor processors held approximately 45,000 jobs in 2004. Nearly all of them were employed in facilities that manufacture semiconductors and other electronic components and accessories, though a small percentage worked in plants that primarily manufacture computers and office equipment.

Job Outlook

Employment of semiconductor processors is projected to decline between 2004 and 2014. The two main reasons for this are increasing automation and the construction of many newer fabs in other countries. Semiconductor manufacturers are shifting production to larger 12" wafers, which produce twice as many chips as fabs making 8" wafers. Plants that make 12" wafers are more automated, allowing them to sharply increase production with the same number of workers. Additionally, a number of domestic companies are building more fabs overseas, where costs are lower. Imports of

semiconductors from non-U.S. companies also are growing and may continue to increase throughout the decade. In spite of the decline in employment, some jobs will open up due to the need to replace workers who leave the occupation.

Despite the expected decline in employment of semiconductor processors, the demand for semiconductor chips remains very high stemming from the many existing and future applications for semiconductors in computers, appliances, machinery, biotechnology, vehicles, cell phones and other telecommunications devices, and other equipment. Moreover, the advent of the new 64-bit microchip and "dual-core" chips is expected to provide the power of computer servers or workstations, onto desktop computers and open up a wealth of new applications, particularly in medical devices.

Industry development of semiconductors made from better materials means that semiconductors will become even smaller, more powerful, and more durable. For example, the industry has begun producing a new generation of microchips made with copper rather than aluminum wires, which will better conduct electricity. Also, technology now exists to make chips for wireless connections to the Internet possible over a range of several miles, while another company will soon be producing chips that will save massive amounts of energy in many kinds of electric products.

Job prospects will be best for people with postsecondary education in electronics or semiconductor technology.

Earnings

Median hourly earnings of electronic semiconductor processors were \$13.85 in May 2004. The middle 50 percent earned between \$11.44 and \$16.90 an hour. The lowest 10 percent earned less than \$9.53, and the top 10 percent earned more than \$20.46 an hour.

Technicians with an associate degree in electronics or semiconductor technology generally start at higher salaries than those with less education. About 15 percent of all electronic semiconductor processors belonged to a union.

Related Occupations

Electronic semiconductor processors do production work that resembles the work of precision assemblers and fabricators of electrical and electronic equipment. Also, many electronic semiconductor processors have academic training in semiconductor technology, which emphasizes scientific and engineering principles. Other occupations that require some college or postsecondary vocational training emphasizing such principles are engineering technicians, electrical and electronics engineers, and science technicians.

Sources of Additional Information

Transportation and Material Moving Occupations

Air Transportation Occupations

Aircraft Pilots and Flight Engineers

(O*NET 53-2011.00, 53-2012.00)

Significant Points

- Regional and low-fare airlines offer the best opportunities; pilots attempting to get jobs at the major airlines will face strong competition.
- Pilots usually start with smaller commuter and regional airlines to acquire the experience needed to qualify for higher paying jobs with national or major airlines.
- Many pilots have learned to fly in the military, but growing numbers have college degrees with flight training from civilian flying schools that are certified by the Federal Aviation Administration (FAA).
- Earnings of airline pilots are among the highest in the Nation.

Nature of the Work

Pilots are highly trained professionals who either fly airplanes or helicopters to carry out a wide variety of tasks. Most are *airline pilots*, *copilots*, and *flight engineers* who transport passengers and cargo, but 1 out of 5 pilots is a commercial pilot involved in tasks such as dusting crops, spreading seed for reforestation, testing aircraft, flying passengers and cargo to areas not served by regular airlines, directing firefighting efforts, tracking criminals, monitoring traffic, and rescuing and evacuating injured persons.

Except on small aircraft, two pilots usually make up the cockpit crew. Generally, the most experienced pilot, the *captain*, is in command and supervises all other crew members. The pilot and the copilot, often called the first officer, share flying and other duties, such as communicating with air traffic controllers and monitoring the instruments. Some large aircraft have a third pilot, the flight engineer, who assists the other pilots by monitoring and operating many of the instruments and systems, making minor in-flight repairs, and watching for other aircraft. The flight engineer also assists the pilots with the company, air traffic control, and cabin crew communications. New technology can perform many flight tasks, however, and virtually all new aircraft now fly with only two pilots, who rely more heavily on computerized controls.

Before departure, pilots plan their flights carefully. They thoroughly check their aircraft to make sure that the engines, controls, instruments, and other systems are functioning properly. They also make sure that baggage or cargo has been loaded correctly. They confer with flight dispatchers and aviation weather forecasters to find out about weather conditions en route and at their destination. Based on this information, they choose a route, altitude, and speed that will provide the safest, most economical, and smoothest flight. When flying under instrument flight rules—procedures governing the operation of the aircraft when there is poor visibility—the pilot

in command, or the company dispatcher, normally files an instrument flight plan with air traffic control so that the flight can be coordinated with other air traffic.

Takeoff and landing are the most difficult parts of the flight, and require close coordination between the pilot and first officer. For example, as the plane accelerates for takeoff, the pilot concentrates on the runway while the first officer scans the instrument panel. To calculate the speed they must attain to become airborne, pilots consider the altitude of the airport, outside temperature, weight of the plane, and speed and direction of the wind. The moment the plane reaches takeoff speed, the first officer informs the pilot, who then pulls back on the controls to raise the nose of the plane. Pilots and first officers usually alternate flying each leg from takeoff to landing.

Unless the weather is bad, the flight itself is relatively routine. Airplane pilots, with the assistance of autopilot and the flight management computer, steer the plane along their planned route and are monitored by the air traffic control stations they pass along the way. They regularly scan the instrument panel to check their fuel supply; the condition of their engines; and the air-conditioning, hydraulic, and other systems. Pilots may request a change in altitude or route if circumstances dictate. For example, if the ride is rougher than expected, pilots may ask air traffic control if pilots flying at other altitudes have reported better conditions; if so, they may request an altitude change. This procedure also may be used to find a stronger tailwind or a weaker headwind to save fuel and increase speed. In contrast, because helicopters are used for short trips at relatively low altitude, helicopter pilots must be constantly on the lookout for trees, bridges, power lines, transmission towers, and other dangerous obstacles. Regardless of the type of aircraft, all pilots must monitor warning devices designed to help detect sudden shifts in wind conditions that can cause crashes.

Pilots must rely completely on their instruments when visibility is poor. On the basis of altimeter readings, they know how high above ground they are and whether they can fly safely over mountains and other obstacles. Special navigation radios give pilots precise information that, with the help of special maps, tells them their exact position. Other very sophisticated equipment provides directions to a point just above the end of a runway and enables pilots to land completely without an outside visual reference. Once on the ground, pilots must complete records on their flight and the aircraft maintenance status for their company and the FAA.

The number of nonflying duties that pilots have depends on the employment setting. Airline pilots have the services of large support staffs and, consequently, perform few nonflying duties. However, because of the large numbers of passengers, airline pilots may be called upon to coordinate handling of disgruntled or disruptive passengers. Pilots employed by other organizations, such as charter operators or businesses, have many other duties. They may load the aircraft, handle all passenger luggage to ensure a balanced load, and supervise refueling; other nonflying responsibilities include keeping records, scheduling flights, arranging for major maintenance, and performing minor aircraft maintenance and repairs.

Before departure, pilots thoroughly check their aircraft to make sure that the engines, controls, instruments, and other systems are functioning properly.

Some pilots are flight instructors. They teach their students in ground-school classes, in simulators, and in dual-controlled planes and helicopters. A few specially trained pilots are examiners or check pilots. They periodically fly with other pilots or pilot's license applicants to make sure that they are proficient.

Working Conditions

Because of FAA regulations, airline pilots flying large aircraft, cannot fly more than 100 hours a month or more than 1,000 hours a year. Most airline pilots fly an average of 75 hours a month and work an additional 75 hours a month performing nonflying duties. Most pilots have a variable work schedule, working several days on, then several days off. Most spend a considerable amount of time away from home because the majority of flights involve overnight layovers. When pilots are away from home, the airlines provide hotel accommodations, transportation between the hotel and airport, and an allowance for meals and other expenses. Airlines operate flights at all hours of the day and night, so work schedules often are irregular. Flight assignments are based on seniority. An airline seniority number is normally assigned to a pilot on completion of training. The sooner pilots are hired, the lower their seniority number and the stronger their bidding power.

Commercial pilots also may have irregular schedules, flying 30 hours one month and 90 hours the next. Because these pilots frequently have many nonflying responsibilities, they have much less free time than do airline pilots. Except for corporate flight department pilots, most commercial pilots do not remain away from home overnight. But, they may work odd hours. However, if the company owns a fleet of planes, pilots may fly a regular schedule. Flight instructors may have irregular and seasonal work schedules, depending on their students' available time and the weather. Instructors frequently work in the evening or on weekends.

Airline pilots, especially those on international routes, often experience jet lag—fatigue caused by many hours of flying through different time zones. To guard against pilot fatigue, which could result in unsafe flying conditions, the FAA requires airlines to allow pilots at least 8 hours of uninterrupted rest in the 24 hours before finishing their flight duty.

Commercial pilots face other types of job hazards. The work of test pilots, who check the flight performance of new and experimental planes, may be dangerous. Pilots who are crop-dusters may be exposed to toxic chemicals and seldom have the benefit of a regular landing strip. Helicopter pilots involved in rescue and police work may be subject to personal injury.

Although flying does not involve much physical effort, the mental stress of being responsible for a safe flight, regardless of the weather, can be tiring. Pilots must be alert and quick to react if something goes wrong, particularly during takeoff and landing.

Training, Other Qualifications, and Advancement

All pilots who are paid to transport passengers or cargo must have a commercial pilot's license with an instrument rating issued by the FAA. Helicopter pilots must hold a commercial pilot's certificate with a helicopter rating. To qualify for these licenses, applicants must be at least 18 years old and have at least 250 hours of flight experience. The experience required can be reduced through participation in certain flight school curricula approved by the FAA. Applicants also must pass a strict physical examination to make sure that they are in good health and have 20/20 vision with or without glasses, good hearing, and no physical handicaps that could impair their performance. They must pass a written test that includes questions on the principles of safe flight, navigation techniques, and FAA regulations, and must demonstrate their flying ability to FAA or designated examiners.

To fly during periods of low visibility, pilots must be rated by the FAA to fly by instruments. Pilots may qualify for this rating by having the required hours of flight experience, including 40 hours of experience in flying by instruments; they also must pass a written examination on procedures and FAA regulations covering instrument flying and demonstrate to an examiner their ability to fly by instruments. Requirements for the instrument rating vary depending on the certification level of flight school.

Airline pilots must fulfill additional requirements. Pilots must have an airline transport pilot's license. Applicants for this license must be at least 23 years old and have a minimum of 1,500 hours of flying experience, including night and instrument flying, and must pass FAA written and flight examinations. Usually, they also have one or more advanced ratings depending on the requirements of their particular job. Because pilots must be able to make quick decisions and accurate judgments under pressure, many airline companies reject applicants who do not pass required psychological and aptitude tests. All licenses are valid so long as a pilot can pass the periodic physical and eye examinations and tests of flying skills required by the FAA and company regulations.

The U.S. Armed Forces have always been an important source of trained pilots for civilian jobs. Military pilots gain valuable experience on jet aircraft and helicopters, and persons with this experience—because of the extensive flying time military pilots receive—usually are preferred for civilian pilot jobs. Those without Armed Forces training may become pilots by attending flight schools or by taking lessons from FAA-certified flight instructors. The FAA has certified about 600 civilian flying schools, including some colleges and universities that offer degree credit for pilot training. Until 2014, trained pilots leaving the military are not expected to increase very much in number as the need for pilots grows in civilian aviation. As a result, FAA-certified schools will train a larger share of pilots than in the past.

Although some small airlines hire high school graduates, most airlines require at least 2 years of college and prefer to hire college graduates. In fact, most entrants to this occupation have a college degree. Because the number of college-educated applicants continues to increase, many employers are making a college degree an educational requirement.

Depending on the type of aircraft, new airline pilots start as first officers or flight engineers. Although some airlines favor applicants who already have a flight engineer's license, they may provide flight engineer training for those who have only the commercial license. Many pilots begin with smaller regional or commuter airlines, where they obtain experience flying passengers on scheduled flights into busy airports in all weather conditions. These jobs often lead to higher paying jobs with bigger, national or major airlines.

Initial training for airline pilots includes a week of company indoctrination; 3 to 6 weeks of ground school and simulator training; and 25 hours of initial operating experience, including a check-ride with an FAA aviation safety inspector. Once trained, pilots are required to attend recurrent training and simulator checks once or twice a year throughout their career.

Companies other than airlines usually require less flying experience. However, a commercial pilot's license is a minimum requirement, and employers prefer applicants who have experience in the type of craft they will be flying. New employees usually start as first officers, or fly less sophisticated equipment. Test pilots often are required to have an engineering degree.

Advancement for all pilots usually is limited to other flying jobs. Many pilots start as flight instructors, building up their flying hours while they earn money teaching. As they become more experienced, these pilots occasionally fly charter planes or perhaps get jobs with small air transportation firms, such as air-taxi companies. Some advance to flying corporate planes. A small number get flight engineer jobs with the airlines.

In the airlines, advancement usually depends on seniority provisions of union contracts. After 1 to 5 years, flight engineers advance according to seniority to first officer and, after 5 to 15 years, to captain. Seniority also determines which pilots get the more desirable routes. In a nonairline job, a first officer may advance to pilot and, in large companies, to chief pilot or director of aviation in charge of aircraft scheduling, maintenance, and flight procedures.

Employment

Civilian aircraft pilots and flight engineers held about 106,000 jobs in 2004. About 84,000 worked as airline pilots, copilots, and flight engineers. The remainder were commercial pilots who worked as flight instructors at local airports or for large businesses that fly company cargo and executives in their own airplanes or helicopters. Some commercial pilots flew small planes for air-taxi companies, usually to or from lightly traveled airports not served by major airlines. Others worked for a variety of businesses, performing tasks such as dusting crops, inspecting pipelines, or conducting sightseeing trips. Federal, State, and local governments also employed pilots. A few pilots were self-employed.

Pilots are located across the country, but airline pilots usually are based near major metropolitan airports or airports operating as hubs for the major airlines.

Job Outlook

The passenger airline industry is undergoing many changes, with some airlines posting increases in passenger traffic and adding routes while others are cutting back. Overall, the employment of aircraft pilots is projected to increase about as fast as average for all occupations through 2014. In the long run, demand for air travel is expected to grow along with the population and the economy. In the short run, however, employment of pilots is generally sensitive to cyclical swings in the economy. During recessions, when a decline in the demand for air travel forces airlines to curtail the number of flights, airlines may temporarily furlough some pilots.

After September 11, 2001, air travel was severely depressed. A number of the major airlines were forced to reduce schedules, lay

off pilots, and even declare bankruptcy. At the same time, hiring continued at regional and low-fare airlines. Job opportunities are expected to continue to be better with the regional airlines and low-fare carriers, which are growing faster than the more well-known major airlines. Opportunities with air cargo carriers also should arise because of increasing security requirements for shipping freight on passenger airlines and growth in electronic commerce. Business and corporate travel also should provide some new jobs for pilots.

Pilots attempting to get jobs at the major airlines will face strong competition, as those firms tend to attract many more applicants than they have jobs. They also will have to compete with laid-off pilots for any available jobs. Pilots who have logged the greatest number of flying hours using sophisticated equipment typically have the best prospects. For this reason, military pilots often have an advantage over other applicants. However, prior to September 11, 2001, some airlines reported a shortage of qualified pilots to operate the most sophisticated aircraft. Thus, when hiring improves, jobseekers with the most FAA licenses will have a competitive advantage.

Fewer flight engineers will be needed as new planes requiring only two pilots replace older planes that required flight engineers. Pilots also will experience some productivity improvements as airlines switch to larger planes and adopt the low-fare carrier model that emphasizes faster turnaround times for flights, keeping more pilots in the air rather than waiting on the ground.

Earnings

Earnings of aircraft pilots and flight engineers vary greatly depending whether they work as airline or commercial pilots. Earnings of airline pilots are among the highest in the Nation, and depend on factors such as the type, size, and maximum speed of the plane and the number of hours and miles flown. For example, pilots who fly jet aircraft usually earn higher salaries than do pilots who fly turboprops. Airline pilots and flight engineers may earn extra pay for night and international flights. In May 2004, median annual earnings of airline pilots, copilots, and flight engineers were \$129,250.

Median annual earnings of commercial pilots were \$53,870 in May 2004. The middle 50 percent earned between \$37,170 and \$79,390. The lowest 10 percent earned less than \$26,300, and the highest 10 percent earned more than \$110,070.

Airline pilots usually are eligible for life and health insurance plans. They also receive retirement benefits and, if they fail the FAA physical examination at some point in their careers, they get disability payments. In addition, pilots receive an expense allowance, or "per diem," for every hour they are away from home. Some airlines also provide allowances to pilots for purchasing and cleaning their uniforms. As an additional benefit, pilots and their immediate families usually are entitled to free or reduced-fare transportation on their own and other airlines.

More than half of all aircraft pilots are members of unions. Most of the pilots who fly for the major airlines are members of the Airline Pilots Association, International, but those employed by one major airline are members of the Allied Pilots Association. Some flight engineers are members of the Flight Engineers' International Association.

Related Occupations

Although they are not in the cockpit, air traffic controllers and airfield operation specialists also play an important role in making sure flights are safe and on schedule, and participate in many of the decisions that pilots must make.

Sources of Additional Information

Information about job opportunities, salaries for a particular airline, and qualifications required may be obtained by writing to the personnel manager of the airline.

For information about job opportunities in companies other than airlines, consult the classified section of aviation trade magazines and apply to companies that operate aircraft at local airports.

Air Traffic Controllers

(O*NET 53-2021.00)

Significant Points

- Nearly all air traffic controllers are employed by the Federal Aviation Administration (FAA), an agency of the Federal Government.
- Replacement needs will account for most job openings, reflecting the large number of air traffic controllers who will be eligible to retire over the next decade.
- Competition to get into FAA training programs is expected to remain keen; however, graduates of these programs have good job prospects.
- Air traffic controllers earn relatively high pay and have good benefits.

Nature of the Work

The air traffic control system is a vast network of people and equipment that ensures the safe operation of commercial and private aircraft. Air traffic controllers coordinate the movement of air traffic to make certain that planes stay a safe distance apart. Their immediate concern is safety, but controllers also must direct planes efficiently to minimize delays. Some regulate airport traffic through designated airspace; others regulate airport arrivals and departures.

Although *airport tower controllers* or *terminal controllers* watch over all planes traveling through the airport's airspace, their main responsibility is to organize the flow of aircraft into and out of the airport. Relying on radar and visual observation, they closely monitor each plane to ensure a safe distance between all aircraft and to guide pilots between the hangar or ramp and the end of the airport's airspace. In addition, controllers keep pilots informed about changes in weather conditions such as wind shear, a sudden change in the velocity or direction of the wind that can cause the pilot to lose control of the aircraft.

During arrival or departure, several controllers direct each plane. As a plane approaches an airport, the pilot radios ahead to inform the terminal of the plane's presence. The controller in the radar room, just beneath the control tower, has a copy of the plane's flight plan and already has observed the plane on radar. If the path is clear, the controller directs the pilot to a runway; if the airport is busy, the plane is fitted into a traffic pattern with other aircraft waiting to land. As the plane nears the runway, the pilot is asked to contact the tower. There, another controller, who also is watching the plane on radar, monitors the aircraft the last mile or so to the runway, delaying any departures that would interfere with the plane's landing. Once the plane has landed, a ground controller in the tower directs it along the taxiways to its assigned gate. The ground controller usually works entirely by sight, but may use radar if visibility is very poor.

The procedure is reversed for departures. The ground controller directs the plane to the proper runway. The local controller then informs the pilot about conditions at the airport, such as weather, speed and direction of wind, and visibility. The local controller also issues runway clearance for the pilot to take off. Once in the air, the plane is guided out of the airport's airspace by the departure controller.

After each plane departs, airport tower controllers notify *enroute controllers* who will next take charge. There are 20 air route traffic control centers located around the country, each employing 300 to 700 controllers, with more than 150 on duty during peak hours at the busiest facilities. Airplanes usually fly along designated routes; each center is assigned a certain airspace containing many different routes. Enroute controllers work in teams of up to three members, depending on how heavy traffic is; each team is responsible for a section of the center's airspace. A team, for example, might be responsible for all planes that are between 30 and 100 miles north of an airport and flying at an altitude between 6,000 and 18,000 feet.

To prepare for planes about to enter the team's airspace, the radar associate controller organizes flight plans coming off a printer. If two planes are scheduled to enter the team's airspace at nearly the same time, location, and altitude, this controller may arrange with the preceding control unit for one plane to change its flight path. The previous unit may have been another team at the same or an adjacent center, or a departure controller at a neighboring terminal. As a plane approaches a team's airspace, the radar controller accepts responsibility for the plane from the previous controlling unit. The controller also delegates responsibility for the plane to the next controlling unit when the plane leaves the team's airspace.

The radar controller, who is the senior team member, observes the planes in the team's airspace on radar and communicates with the pilots when necessary. Radar controllers warn pilots about nearby planes, bad weather conditions, and other potential hazards. Two planes on a collision course will be directed around each other. If a pilot wants to change altitude in search of better flying conditions, the controller will check to determine that no other planes will be along the proposed path. As the flight progresses, the team responsible for the aircraft notifies the next team in charge of the airspace

Air traffic controllers coordinate the movement of air traffic to make certain that planes stay a safe distance apart.

ahead. Through team coordination, the plane arrives safely at its destination.

Both airport tower and enroute controllers usually control several planes at a time; often, they have to make quick decisions about completely different activities. For example, a controller might direct a plane on its landing approach and at the same time provide pilots entering the airport's airspace with information about conditions at the airport. While instructing these pilots, the controller also might observe other planes in the vicinity, such as those in a holding pattern waiting for permission to land, to ensure that they remain well separated.

In addition to airport towers and enroute centers, air traffic controllers also work in flight service stations operated at more than 100 locations. These *flight service specialists* provide pilots with information on the station's particular area, including terrain, preflight and inflight weather information, suggested routes, and other information important to the safety of a flight. Flight service specialists help pilots in emergency situations and initiate and coordinate searches for missing or overdue aircraft. However, they are not involved in actively managing air traffic.

Some air traffic controllers work at the FAA's Air Traffic Control Systems Command Center in Herndon, VA, where they oversee the entire system. They look for situations that will create bottlenecks or other problems in the system, then respond with a management plan for traffic into and out of the troubled sector. The objective is to keep traffic levels in the trouble spots manageable for the controllers working at enroute centers.

The FAA has implemented an automated air traffic control system, called the National Airspace System (NAS) Architecture. The NAS Architecture is a long-term strategic plan that will allow controllers to more efficiently deal with the demands of increased air traffic. It encompasses the replacement of aging equipment and the introduction of new systems, technologies, and procedures to enhance safety and security and support future aviation growth. The NAS Architecture facilitates continuing discussion of modernization between the FAA and the aviation community.

Working Conditions

Controllers work a basic 40-hour week; however, they may work additional hours, for which they receive overtime, or premium, pay or equal time off. Because most control towers and centers operate 24 hours a day, 7 days a week, controllers rotate night and weekend shifts.

During busy times, controllers must work rapidly and efficiently. Total concentration is required to keep track of several planes at the same time and to make certain that all pilots receive correct instructions. The mental stress of being responsible for the safety of several aircraft and their passengers can be exhausting.

Training, Other Qualifications, and Advancement

To become an air traffic controller, a person must enroll in an FAA-approved education program and pass a pre-employment test that measures his or her ability to learn the controller's duties. Exceptions are air traffic controllers with prior experience and military veterans. The pre-employment test is currently offered only to students in the FAA Air Traffic Collegiate Training Initiative Program or the Minneapolis Community & Technical College, Air Traffic Control Training Program. The test is administered by computer and takes about 8 hours to complete. To take the test, an applicant must apply under an open advertisement for air traffic control positions and be chosen to take the examination. When there are many more applicants than available positions, applicants are selected to take the test through random selection. In addition to the pre-employment test, applicants must have 3 years of full-time work experience, have completed a full 4 years of college, or a combination of both.

In combining education and experience, 1 year of undergraduate study—30 semester or 45 quarter hours—is equivalent to 9 months of work experience. Certain kinds of aviation experience also may be substituted for these requirements.

Upon successful completion of an FAA-approved program, individuals who receive school recommendation, meet the basic qualification requirements (including being less than 31 years of age) in accordance with Federal law, and achieve a qualifying score on the FAA-authorized pre-employment test become eligible for employment as an air traffic controller. Candidates also must pass a medical exam, undergo drug screening, and obtain a security clearance before they can be hired.

Upon selection, employees attend the FAA Academy in Oklahoma City, OK, for 12 weeks of training, during which they learn the fundamentals of the airway system, FAA regulations, controller equipment, and aircraft performance characteristics, as well as more specialized tasks.

After graduation, candidates assigned to an air traffic control facility are classified as "developmental controllers" until they complete all requirements to be certified for all of the air traffic control positions within a defined area of a given facility. Generally, it takes new controllers with only initial controller training between 2 and 4 years, depending on the facility and the availability of facility staff or contractors to provide on-the-job training, to complete all the certification requirements to become certified professional controllers. Individuals who have had prior controller experience normally take less time to become fully certified. Controllers who fail to complete either the academy or the on-the-job portion of the training usually are dismissed. Controllers must pass a physical examination each year and a job performance examination twice each year. Failure to become certified in any position at a facility within a specified time also may result in dismissal. Controllers also are subject to drug screening as a condition of continuing employment.

Air traffic controllers must be articulate to give pilots directions quickly and clearly. Intelligence and a good memory also are important because controllers constantly receive information that they must immediately grasp, interpret, and remember. Decisiveness also is required because controllers often have to make quick decisions. The ability to concentrate is crucial because controllers must make these decisions in the midst of noise and other distractions.

At airports, new controllers begin by supplying pilots with basic flight data and airport information. They then advance to the position of ground controller, then local controller, departure controller, and, finally, arrival controller. At an air route traffic control center, new controllers first deliver printed flight plans to teams, gradually advancing to radar associate controller and then radar controller.

Controllers can transfer to jobs at different locations or advance to supervisory positions, including management or staff jobs, such as air traffic control data systems computer specialist, in air traffic control and top administrative jobs in the FAA. However, there are only limited opportunities for a controller to switch from a position in an enroute center to a tower.

Employment

Air traffic controllers held about 24,000 jobs in 2004. The vast majority were employed by the FAA. Air traffic controllers work at airports—in towers and flight service stations—and in air route traffic control centers. Some professional controllers conduct research at the FAA's national experimental center near Atlantic City, NJ. Others serve as instructors at the FAA Academy in Oklahoma City, OK. A small number of civilian controllers work for the U.S. Department of Defense. In addition to controllers employed by the Federal Government, some work for private air traffic control companies providing service to non-FAA towers.

Job Outlook

Employment of air traffic controllers is expected to grow about as fast as the average for all occupations through the year 2014. Increasing air traffic will require more controllers to handle the additional work. Employment growth, however, is not expected to keep pace with growth in the number of aircraft flying. New computerized systems will assist the controller by automatically making many of the routine decisions. This will allow controllers to handle more traffic, thus increasing their productivity. In addition, Federal budget constraints may limit hiring of air traffic controllers.

More job openings are expected as the result of replacement needs from workers leaving the occupation. The majority of today's air traffic controllers will be eligible to retire over the next decade, although not all are expected to do so. Nevertheless, replacement needs will result in job opportunities each year for those graduating from the FAA training programs. Despite the increasing number of jobs coming open, competition to get into the FAA training programs is expected to remain keen, as there generally are many more applicants to get into the schools than there are openings, but those who graduate have good prospects of getting a job as a controller.

Air traffic controllers who continue to meet the proficiency and medical requirements enjoy more job security than do most workers. The demand for air travel and the workloads of air traffic controllers decline during recessions, but controllers seldom are laid off.

Earnings

Air traffic controllers earn relatively high pay and have good benefits. Median annual earnings of air traffic controllers in May 2004 were \$102,030. The middle 50 percent earned between \$78,170 and \$126,260. The lowest 10 percent earned less than \$57,720, and the highest 10 percent earned more than \$139,210.

The average annual salary, excluding overtime earnings, for air traffic controllers in the Federal Government—which employs 90 percent of the total—in nonsupervisory, supervisory, and managerial positions was \$106,380 in May 2004. The Air Traffic Control pay system classifies each air traffic facility into one of eight levels with corresponding pay bands. Under this pay system, controllers' salaries are determined by the rating of the facility. The higher the rating, the higher the controller's salary and the greater the demand on the controller's judgment, skill, and decision making ability.

Depending on length of service, air traffic controllers receive 13 to 26 days of paid vacation and 13 days of paid sick leave each year, in addition to life insurance and health benefits. Controllers also can retire at an earlier age and with fewer years of service than other Federal employees. Air traffic controllers are eligible to retire at age 50 with 20 years of service as an active air traffic controller or after 25 years of active service at any age. There is a mandatory retirement age of 56 for controllers who manage air traffic. However, Federal law provides for exemptions to the mandatory age of 56, up to age 61, for controllers having exceptional skills and experience.

Related Occupations

Airfield operations specialists also are involved in the direction and control of traffic in air transportation.

Motor Vehicle Operators

Bus Drivers

(O*NET 53-3021.00, 53-3022.00)

Significant Points

- Opportunities should be good, particularly for school bus driver jobs; applicants for higher paying public transit bus driver positions may encounter competition.
- State and Federal governments establish bus driver qualifications and standards, which include a commercial driver's license.
- Work schedules vary considerably among various types of bus drivers.
- Bus drivers must possess strong customer service skills, including communication skills and the ability to manage large groups of people with varying needs.

Nature of the Work

Bus drivers provide transportation for millions of people every year, from commuters to school children to vacationers. There are two major kinds of bus drivers: *Transit and Intercity bus drivers*, who transport people between regions of a State or of the country, along routes run within a metropolitan area or county, or on chartered excursions and tours; and *school bus drivers*, who take children to and from schools and related events.

Bus drivers pick up and drop off passengers at bus stops, stations, or—in the case of students—at regularly scheduled neighborhood locations, all according to strict time schedules. Drivers must operate vehicles safely, especially in heavy traffic. They cannot let light traffic put them ahead of schedule so that they miss passengers. Bus drivers drive a range of vehicles from 15-passenger buses to 60-foot articulated buses that can carry more than 100 passengers.

Local-transit and *intercity bus drivers* report to their assigned terminal or garage, where they stock up on tickets or transfers and prepare trip report forms. In some transportation firms, maintenance departments are responsible for keeping vehicles in good condition; in others, drivers may be expected to check their vehicle's tires, brakes, windshield wipers, lights, oil, fuel, and water supply before beginning their routes. Drivers usually verify that the bus has safety equipment, such as fire extinguishers, first aid kits, and emergency reflectors.

During the course of their shift, local-transit and intercity bus drivers collect fares; answer questions about schedules, routes, and transfer points; and sometimes announce stops. Intercity bus drivers may make only a single one-way trip to a distant city or a round trip each day. They may stop at towns just a few miles apart or only at large cities hundreds of miles apart. Local-transit bus drivers may make several trips each day over the same city and suburban streets, stopping as frequently as every few blocks.

Local-transit bus drivers submit daily trip reports with a record of trips, significant schedule delays, and mechanical problems. Intercity drivers who drive across State or national boundaries

must comply with U.S. Department of Transportation regulations. These include completing vehicle inspection reports and recording distances traveled and the periods they spend driving, performing other duties, and off duty.

Some intercity drivers operate motor coaches which transport passengers on chartered trips and sightseeing tours. Drivers routinely interact with customers and tour guides to make the trip as comfortable and informative as possible. They are directly responsible for keeping to strict schedules, adhering to the guidelines of the tour's itinerary, and ensuring the overall success of the trip. These drivers act as customer service representative, tour guide, program director, and safety guide. Trips frequently last more than a day. The driver may be away for more than a week if assigned to an extended tour. As with all commercial drivers who drive across State or national boundaries, motor coach drivers must comply with U.S. Department of Transportation and State regulations.

School bus drivers usually drive the same routes each day, stopping to pick up pupils in the morning and return them to their homes in the afternoon. Some school bus drivers also transport students and teachers on field trips or to sporting events. In addition to driving, some school bus drivers work part time in the school system as janitors, mechanics, or classroom assistants when not driving buses.

Bus drivers must be alert to prevent accidents, especially in heavy traffic or in bad weather, and to avoid sudden stops or swerves that jar passengers. School bus drivers must exercise particular caution when children are getting on or off the bus. They must maintain order on their bus and enforce school safety standards by allowing only students to board. In addition, they must know and enforce the school system's rules regarding student conduct.

School bus drivers do not always have to report to an assigned terminal or garage. In some cases, they have the choice of taking their bus home or parking it in a more convenient area. School bus drivers do not collect fares. Instead, they prepare weekly reports on the number of students, trips or "runs," work hours, miles, and fuel consumption. Their supervisors set time schedules and routes for the day or week.

School bus drivers hold 7 out of 10 bus driving jobs.

Working Conditions

Driving a bus through heavy traffic while dealing with passengers is more stressful and fatiguing than physically strenuous. Many drivers enjoy the opportunity to work without direct supervision, with full responsibility for their bus and passengers. To improve working conditions and retain drivers, many buslines provide ergonomically designed seats and controls for drivers. Many bus companies use Global Positioning Systems to help dispatchers manage their bus fleets and help drivers navigate.

Intercity bus drivers may work nights, weekends, and holidays and often spend nights away from home, during which they stay in hotels at company expense. Senior drivers with regular routes have regular weekly work schedules, but others do not have regular schedules and must be prepared to report for work on short notice. They report for work only when called for a charter assignment or to drive extra buses on a regular route. Intercity bus travel and charter work tend to be seasonal. From May through August, drivers may work the maximum number of hours per week that regulations allow. During winter, junior drivers may work infrequently, except for busy holiday travel periods, and may be furloughed at times.

School bus drivers work only when school is in session. Many work 20 hours a week or less, driving one or two routes in the morning and afternoon. Drivers taking field or athletic trips, or who also have midday kindergarten routes, may work more hours a week. As more students with a variety of physical and behavioral disabilities assimilate into mainstream schools, school bus drivers must learn how to accommodate their special needs.

Regular local-transit bus drivers usually have a 5-day workweek; Saturdays and Sundays are considered regular workdays. Some drivers work evenings and after midnight. To accommodate commuters, many work "split shifts"—for example, 6 a.m. to 10 a.m. and 3 p.m. to 7 p.m., with time off in between.

Intercity bus drivers operating tour and charter buses may work any day and all hours of the day, including weekends and holidays. Their hours are dictated by the destinations, schedules, and itineraries of chartered tours. Like all commercial drivers, their weekly hours must be consistent with the Department of Transportation's rules and regulations concerning hours of service. For example, drivers may drive for 10 hours and work for up to 15 hours—including driving and nondriving duties—before having 8 hours off duty. Drivers may not drive after having worked for 60 hours in the past 7 days or 70 hours in the past 8 days. Most drivers are required to document their time in a logbook.

Training, Other Qualifications, and Advancement

Many employers prefer high school graduates and require a written test of ability to follow complex bus schedules. Many intercity and public transit bus companies prefer applicants who are at least 24 years of age; some require several years of experience driving a bus or truck. In some States, school bus drivers must pass a background investigation to uncover any criminal record or history of mental problems.

Bus driver qualifications and standards are established by State and Federal regulations. All drivers must comply with Federal regulations and with any State regulations that exceed Federal requirements. Federal regulations require drivers who operate commercial motor vehicles in excess of 26,000 pounds gross vehicle weight rating or designed to carry 16 or more persons, including the driver, to hold a commercial driver's license (CDL) with the appropriate endorsements from the State in which they live.

To qualify for a CDL, applicants must pass a knowledge test on rules and regulations and then demonstrate in a skills test that they can operate a bus safely. A national databank records all driving violations incurred by persons who hold commercial licenses, and a

State may not issue a CDL to a person who has already had a license suspended or revoked in another State. To be issued a CDL, a driver must surrender all other driver's licenses. A driver with a CDL must accompany trainees until the trainees get their own CDL. In addition to having a CDL, all bus drivers must have a "passenger" endorsement for their CDL, which requires passing a knowledge test and demonstrating the necessary skills in a vehicle of the same type as the one they would be driving in their duties. Information on how to apply for a CDL and each type of endorsement can be obtained from State motor vehicle administrations.

While many States allow those who are 18 years of age and older to drive buses within State borders, the Department of Transportation establishes minimum qualifications for bus drivers engaged in interstate commerce. Federal Motor Carrier Safety Regulations require drivers to be at least 21 years old and to pass a physical examination once every 2 years. The main physical requirements include good hearing, at least 20/40 vision with or without glasses or corrective lenses, and a 70-degree field of vision in each eye. Drivers cannot be colorblind. They must be able to hear a forced whisper in one ear at not less than 5 feet, with or without a hearing aide. Drivers must have normal blood pressure as well as normal use of their arms and legs. They may not use any controlled substances, unless prescribed by a licensed physician. Persons with epilepsy or with diabetes controlled by insulin are not permitted to be interstate bus drivers. Federal regulations also require employers to test their drivers for alcohol and drug use as a condition of employment and require periodic random tests of the drivers while they are on duty. In addition, a driver must not have been convicted of a felony involving the use of a motor vehicle, a crime involving drugs, driving under the influence of drugs or alcohol, refusing to submit to an alcohol test required by a State or its implied consent laws or regulations, leaving the scene of a crime, or causing a fatality through negligent operation of a commercial vehicle. All drivers must be able to read and speak English well enough to read road signs, prepare reports, and communicate with law enforcement officers and the public. In addition, drivers must take a written examination on the Motor Carrier Safety Regulations of the U.S. Department of Transportation.

Because bus drivers deal with passengers, they must be courteous. They need an even temperament and emotional stability because driving in heavy, fast-moving, or stop-and-go traffic and dealing with passengers can be stressful. Drivers must have strong customer service skills, including communication skills and the ability to coordinate and manage large groups of people.

Most intercity bus companies and local-transit systems give driver trainees 2 to 8 weeks of classroom and behind-the-wheel instruction. In the classroom, trainees learn Department of Transportation and company work rules, safety regulations, State and municipal driving regulations, and safe driving practices. They also learn to read schedules, determine fares, keep records, and deal courteously with passengers.

School bus drivers also are required to obtain a CDL from the State in which they live. They must additionally have a "school bus" endorsement for their CDL. To receive this endorsement, they must pass a written test and demonstrate necessary skills. The skills portion of the test is taken in a bus of the same type that they would be driving on their route. Both of these tests are specific to school buses and are in addition to the testing required to receive a CDL and the "passenger" endorsement. Many persons who become school bus drivers have never driven any vehicle larger than an automobile. They receive between 1 and 4 weeks of driving instruction and classroom training on State and local laws, regulations, and policies of operating school buses; safe driving practices; driver-pupil relations; first aid; special needs of disabled and emotionally troubled students; and emergency evacuation procedures. School bus drivers

also must be aware of the school system's rules for discipline and conduct for bus drivers and the students they transport.

During training, bus drivers practice driving on set courses. They practice turns and zigzag maneuvers, backing up, and driving in narrow lanes. Then, they drive in light traffic and, eventually, on congested highways and city streets. They also make trial runs without passengers to improve their driving skills and learn the routes. Local-transit trainees memorize and drive each of the runs operating out of their assigned garage. New drivers make regularly scheduled trips with passengers, accompanied by an experienced driver who gives helpful tips, answers questions, and evaluates the new driver's performance. Most bus drivers get brief supplemental training at regular periods to keep abreast of safety issues and regulatory changes.

New intercity and local-transit drivers usually are placed on an "extra" list to drive chartered runs, extra buses on regular runs, and special runs (for example, during morning and evening rush hours and to sports events). They also substitute for regular drivers who are ill or on vacation. New drivers remain on the extra list, and may work only part time, perhaps for several years, until they have enough seniority to be given a regular run.

Senior drivers may bid for the runs that they prefer, such as those with more work hours, lighter traffic, weekends off, or—in the case of intercity bus drivers—higher earnings or fewer workdays per week.

Opportunities for promotion are generally limited. However, experienced drivers may become supervisors or dispatchers—assigning buses to drivers, checking whether drivers are on schedule, rerouting buses to avoid blocked streets or other problems, and dispatching extra vehicles and service crews to scenes of accidents and breakdowns. In transit agencies with rail systems, drivers may become train operators or station attendants. Opportunities exist for bus drivers to become either instructors of new bus drivers or master-instructors, who train new instructors. A few drivers become managers. Promotion in publicly owned bus systems is often determined by competitive civil service examination. Some motor coach drivers purchase their own equipment and open their own business.

Employment

Bus drivers held about 653,000 jobs in 2004. About 35 percent worked part time. Around 71 percent of all bus drivers were school bus drivers working primarily for school systems or for companies providing school bus services under contract. Most of the remainder worked for private and local government transit systems; some also worked for intercity and charter bus lines.

Job Outlook

Persons seeking jobs as bus drivers likely will encounter many opportunities. Individuals who have good driving records and who are willing to work a part-time or irregular schedule probably will have the best job prospects. School bus driving jobs, particularly in rapidly growing suburban areas, should be easiest to acquire because most are part-time positions with high turnover and less training required than for other bus-driving jobs. Those seeking higher paying public transit bus driver positions may encounter competition. Opportunities for intercity driving positions should be good, although employment prospects for motor coach drivers will depend on tourism which fluctuates with the cyclical nature of the economy.

Employment of bus drivers overall is expected to increase about as fast as the average for all occupations through the year 2014, primarily to meet the transportation needs of the growing general population and the school-aged population. Most job openings are expected to occur each year because of the need to

replace workers who take jobs in other occupations or who retire or leave the occupation for other reasons.

The number of school bus drivers is expected to increase as fast as average over the next 10 years, although at a decreasing rate. School enrollments are projected to increase in 30 States and to decrease in 20 States. The net effect will be a slowdown in school enrollment and, therefore, in employment growth of school bus drivers. This, as well as the part-time nature of the occupation, will result in most openings for school bus drivers being to replace those who leave the occupation.

Employment growth for local-transit bus drivers is expected to be faster than the average for all occupations in 2004, and will likely be the result of the increasing popularity of mass transit due to congestion and rising fuel prices, as well as the demand for transit services in expanding portions of metropolitan areas. There may be competition for positions with more regular hours and steady driving routes.

Competition from other modes of transportation—airplane, train, or automobile—will temper job growth among intercity bus drivers. Most growth in intercity bus transportation will occur in group charters to locations not served by other modes of transportation. Like automobiles, buses have a far greater number of possible destinations than airplanes or trains. Since they offer greater cost savings and convenience over automobiles, buses usually are the most economical option for tour groups traveling to out-of-the-way destinations.

Full-time bus drivers rarely are laid off during recessions. If the number of passengers decreases, however, employers might reduce the hours of part-time local-transit and intercity bus drivers since fewer extra buses would be needed. Seasonal layoffs are common. Many intercity bus drivers with little seniority, for example, are furloughed during the winter when regularly scheduled and charter business declines, while school bus drivers seldom work during the summer or school holidays.

Earnings

Median hourly earnings of transit and intercity bus drivers were \$14.30 in May 2004. The middle 50 percent earned between \$10.74 and \$19.31 an hour. The lowest 10 percent earned less than \$8.66, and the highest 10 percent earned more than \$23.53 an hour. Median hourly earnings in the industries employing the largest numbers of transit and intercity bus drivers in May 2004 were as follows:

Local government	\$17.10
Interurban and rural bus transportation.....	15.86
Urban transit systems	13.49
Charter bus industry.....	10.81
Other transit and ground passenger transportation	10.74

Median hourly earnings of school bus drivers were \$11.18 in May 2004. The middle 50 percent earned between \$8.10 and \$13.92 an hour. The lowest 10 percent earned less than \$6.23, and the highest 10 percent earned more than \$16.81 an hour. Median hourly earnings in the industries employing the largest numbers of school bus drivers in May 2004 were as follows:

School and employee bus transportation	\$11.97
Elementary and secondary schools	10.74
Other transit and ground passenger transportation	10.62
Child day care services	9.28
Individual and family services	8.75

The benefits bus drivers receive from their employers vary greatly. Most intercity and local-transit bus drivers receive paid health and life insurance, sick leave, vacation leave, and free bus rides on any of

the regular routes of their line or system. School bus drivers receive sick leave, and many are covered by health and life insurance and pension plans. Because they generally do not work when school is not in session, they do not get vacation leave.

Many intercity and local-transit bus drivers are members of the Amalgamated Transit Union. Local-transit bus drivers in New York and several other large cities belong to the Transport Workers Union of America. Some drivers belong to the United Transportation Union or to the International Brotherhood of Teamsters.

Related Occupations

Other workers who drive vehicles on highways and city streets include taxi drivers and chauffeurs, and truck drivers and driver/sales workers.

Taxi Drivers and Chauffeurs

(O*NET 53-3041.00)

Significant Points

- Taxi drivers and chauffeurs may work any schedule, including full-time, part-time, night, evening, weekend, and seasonal work.
- Many taxi drivers like the independent, unsupervised work of driving their automobile.
- Local governments set license standards for driving experience and training; many taxi and limousine companies set higher standards.
- Job opportunities will be good because of the need to replace the many people who work in this occupation for short periods and then leave.

Nature of the Work

Anyone who has been in a large city knows the importance of taxi and limousine services. *Taxi drivers* and *chauffeurs* help passengers get to and from their homes, workplaces, and recreational pursuits such as dining, entertainment, and shopping, as well as to and from business-related events. These professional drivers also help out-of-town business people and tourists get around in unfamiliar surroundings. Some drivers offer sight-seeing services around their city.

At the beginning of their driving shift, taxi drivers usually report to a taxicab service or garage where they are assigned a vehicle, most frequently a large, conventional automobile modified for commercial passenger transport. They record their name, the date, and the cab's identification number on a trip sheet. Drivers check the cab's fuel and oil levels and make sure that the lights, brakes, and windshield wipers are in good working order. Drivers adjust rear and side mirrors and

their seat for comfort. Any equipment or part not in good working order is reported to the dispatcher or company mechanic.

Taxi drivers pick up passengers by “cruising” for fares, prearranging pickups, and picking up passengers from taxistands in high-traffic areas. In urban areas, the majority of passengers flag down drivers cruising the streets. Customers also may prearrange a pickup by calling a cab company and giving a location, approximate pickup time, and destination. The cab company dispatcher then relays the information to a driver by two-way radio, cellular telephone, or onboard computer. Outside of urban areas, the majority of trips are dispatched in this manner. Drivers also pick up passengers waiting at cabstands or in taxi lines at airports, train stations, hotels, restaurants, and other places where people frequently seek taxis.

Some drivers transport individuals with special needs, such as those with disabilities and the elderly. These drivers, known as *paratransit drivers*, operate specially equipped vehicles designed to accommodate a variety of needs in nonemergency situations. Although special certification is not necessary, some additional training on the equipment and passenger needs may be required.

Drivers should be familiar with streets in the areas they serve so that they can use the most efficient route to destinations. They should know the locations of frequently requested destinations, such as airports, bus and railroad terminals, convention centers, hotels, and other points of interest. In case of emergency, the driver should know the location of fire and police stations as well as hospitals.

Upon reaching the destination, drivers determine the fare and announce it to their riders. Fares often consist of many parts. In many cabs, a taximeter measures the fare based on the distance covered and the amount of time the trip took. Drivers turn on the taximeter when passengers enter the cab and turn it off when they reach the final destination. The fare also may include surcharges to help cover fuel costs as well as fees for additional passengers, a fee for handling luggage, and a drop charge—an additional flat fee added for use of the cab. In some cases, fares are determined by a system of zones through which the taxi passes during a trip. Each jurisdiction determines the rate and structure of the fare system covering licensed taxis. Passengers generally add a tip or gratuity to the fare. The amount of the gratuity depends on the passengers’ satisfaction with the quality and efficiency of the ride and the courtesy of the driver. Drivers issue receipts upon request by the passenger. They enter onto the trip sheet all information regarding the trip, including the place and time of pickup and dropoff and the total fee; these logs help taxi company management check drivers’ activity and efficiency. Drivers also must fill out accident reports when necessary.

Chauffeurs operate limousines, vans, and private cars for limousine companies, private businesses, government agencies, and wealthy individuals. Chauffeur service differs from taxi service in that all trips are prearranged. Many chauffeurs transport customers in large vans between hotels and airports as well as bus or train terminals. Others drive luxury automobiles, such as limousines, to business events, entertainment venues, and social events. Still others provide full-time personal transportation for wealthy families and private companies.

At the beginning of the workday, chauffeurs prepare their automobiles or vans for use. They inspect the vehicle for cleanliness and, when needed, vacuum the interior and wash the exterior body, windows, and mirrors. They check fuel and oil levels and make sure the lights, tires, brakes, and windshield wipers work. Chauffeurs may perform routine maintenance and make minor repairs, such as changing tires or adding oil and other fluids when needed. If a vehicle requires a more complicated repair, they take it to a professional mechanic.

Chauffeurs cater to passengers by providing attentive customer service and paying attention to detail. They help riders into the car

by holding open doors, holding umbrellas when it is raining, and loading packages and luggage into the trunk of the car. Chauffeurs may perform errands for their employers such as delivering packages or picking up clients arriving at airports. To ensure a pleasurable ride in their limousines, many chauffeurs offer conveniences and luxuries such as newspapers, magazines, music, drinks, televisions, and telephones. Increasingly, chauffeurs work as full-service *executive assistants*, simultaneously acting as driver, secretary, and itinerary planner.

Working Conditions

Taxi drivers and chauffeurs occasionally have to load and unload heavy luggage and packages. Driving for long periods can be tiring and uncomfortable, especially in densely populated urban areas. Drivers must be alert to conditions on the road, especially in heavy and congested traffic or in bad weather. They must take precautions to prevent accidents and avoid sudden stops, turns, and other driving maneuvers that would jar passengers. Taxi drivers risk robbery because they work alone and often carry large amounts of cash.

Work hours of taxi drivers and chauffeurs vary greatly. Some jobs offer full-time or part-time employment with work hours that can change from day to day or remain the same every day. It is often necessary for drivers to report to work on short notice. Chauffeurs who work for a single employer may be on call much of the time. Evening and weekend work is common for drivers and chauffeurs employed by limousine and taxicab services.

Taxi drivers and chauffeurs may work any schedule, including full-time, part-time, night, evening, weekend, and seasonal work.

Whereas the needs of the client or employer dictate the work schedule for chauffeurs, the work of taxi drivers is much less structured. Working free of supervision, they may break for a meal or a rest whenever their vehicle is unoccupied. Many taxi drivers like the independent, unsupervised work of driving.

This occupation is attractive to individuals seeking flexible work schedules, such as college and postgraduate students, and to anyone seeking a second source of income. For example, other service workers, such as ambulance drivers and police officers, sometimes moonlight as taxi drivers or chauffeurs.

Full-time taxi drivers usually work one shift a day, which may last from 8 to 12 hours. Part-time drivers may work half a shift each day, or work a full shift once or twice a week. Drivers may work shifts at all times of the day and night because most taxi companies offer services 24 hours a day. Early morning and late night shifts are not uncommon. Drivers work long hours during holidays, weekends, and other special times when demand for their services may be heavier. Independent drivers, however, often set their own hours and schedules.

Design improvements in newer cars have reduced the stress and increased the comfort and efficiency of drivers. Many regulatory bodies overseeing taxi and chauffeur services require standard amenities such as air-conditioning and general upkeep of the vehicles. Some modern taxicabs also are equipped with sophisticated tracking devices, fare meters, and dispatching equipment. Satellites and tracking systems link many of these state-of-the-art vehicles with company headquarters. In a matter of seconds, dispatchers can deliver directions, traffic advisories, weather reports, and other important communications to drivers anywhere in the area. The satellite link also allows dispatchers to track vehicle location, fuel consumption, and engine performance. Automated dispatch systems help dispatchers locate the closest driver to a customer in order to minimize individual wait time and increase the quality of service. Drivers easily can communicate with dispatchers to discuss delivery schedules and courses of action if there are mechanical problems. When threatened with crime or violence, drivers may have special “trouble lights” to alert authorities of emergencies and guarantee that help arrives quickly.

Many municipalities and taxicab and chauffeur companies require drivers to have a neat appearance. Many chauffeurs wear formal attire, such as a tuxedo, a coat and tie, a dress, or a uniform and cap.

Training, Other Qualifications, and Advancement

Local governments set licensing standards and requirements for taxi drivers and chauffeurs which may include minimum amounts of driving experience and training. Many taxi and limousine companies set higher standards than those required by law. It is common for companies to review applicants’ medical, credit, criminal, and driving records. In addition, many companies require applicants to be 21, higher than the age typically required by law. Most companies also prefer that an applicant be a high school graduate.

Persons interested in driving a taxicab or a limousine first must have a regular automobile driver’s license. Usually, applicants then must acquire a taxi driver or chauffeur’s license, commonly called a “hack” license. Some States require only a passenger endorsement on a driver’s license; some require only that drivers be certified by their employer; while others require a Commercial Driver’s License with a passenger endorsement. While States set licensing requirements, local regulatory bodies usually set other terms and conditions. These often include requirements for training, which can vary greatly. Some localities require new drivers to enroll in training programs consisting of up to 80 hours of classroom instruction before they are allowed to work. To qualify through either an exam or a training program, applicants must know local geography, motor vehicle laws, safe

driving practices, and relevant regulations and display some aptitude for customer service. Some localities require an English proficiency test, usually in the form of listening comprehension; applicants who do not pass the English exam must take an English course in addition to any formal driving programs. Some classroom instruction includes route management, mapreading, and service for passengers with disabilities. Many taxicab or limousine companies sponsor applicants, giving them a temporary permit that allows them to drive before they have finished the training program and passed the test. Some jurisdictions, such as New York City, have discontinued this practice and now require driver applicants to complete the licensing process before operating a taxi or limousine.

Some taxi and limousine companies give new drivers on-the-job training. This training is typically informal and often lasts only about a week. Companies show drivers how to operate the taximeter and communications equipment and how to complete paperwork. Other topics covered may include driver safety and the best routes to popular sightseeing and entertainment destinations. Many companies have contracts with social service agencies and transportation services to transport elderly and disabled citizens in nonemergency situations. To support these services, new drivers may get special training in how to handle wheelchair lifts and other mechanical devices.

Taxi drivers and chauffeurs should be able to get along with many different types of people. They must be patient when waiting for passengers and when dealing with rude customers. It also is helpful for drivers to be tolerant and level-headed when driving in heavy and congested traffic. Drivers should be dependable since passengers expect to be picked up at a prearranged time and taken to the correct destination. To be successful, drivers must be responsible and self-motivated because they work with little supervision. Increasingly, companies encourage drivers to develop their own loyal customer base, so as to improve their business.

Many taxi drivers and chauffeurs are *lease drivers*. These drivers pay a daily, weekly, or monthly fee to the company allowing them to lease their vehicles. In the case of limousines, leasing also permits the driver access to the company’s dispatch system. The fee also may include charges for vehicle maintenance, insurance, and a deposit on the vehicle. Lease drivers may take their cars home with them when they are not on duty.

Opportunities for advancement are limited for taxi drivers and chauffeurs. Experienced drivers may obtain preferred routes or shifts. Some advance to become lead drivers, who help to train new drivers, or to take dispatching and managerial positions. Many managers start their careers as drivers. Some people start their own limousine companies.

In small and medium-size communities, drivers sometimes are able to buy their own taxi, limousine, or other type of automobile and go into business for themselves. These independent owner-drivers require an additional permit allowing them to operate their vehicle as a company. Some big cities limit the number of operating permits. In these cities, drivers become owner-drivers by buying permits from owner-drivers who leave the business, or by purchasing or leasing them from the city. Although many owner-drivers are successful, some fail to cover expenses and eventually lose their permits and automobiles. For both taxi and limousine service owners, good business sense and courses in accounting, business, and business arithmetic can help an owner-driver to be successful. Knowledge of mechanics enables owner-drivers to perform their own routine maintenance and minor repairs to cut expenses.

Employment

Taxi drivers and chauffeurs held about 188,000 jobs in 2004. About 27 percent of taxi drivers and chauffeurs were self-employed.

Job Outlook

Persons seeking jobs as taxi drivers and chauffeurs should encounter good opportunities because of the need to replace the many people who work in this occupation for short periods and then transfer to other occupations or leave the labor force. Opportunities for drivers vary greatly in terms of earnings, work hours, and working conditions, depending on economic and regulatory conditions. Opportunities should be best for persons with good driving records, good customer service instincts, and the ability to work flexible schedules.

Employment of taxi drivers and chauffeurs is expected to grow faster than the average for all occupations through the year 2014, as local and suburban travel increases. Employment growth also will stem from Federal legislation requiring increased services for persons with disabilities. Rapidly growing metropolitan areas should offer the best job opportunities.

The number of job openings can fluctuate with the overall movements of the economy because the demand for taxi and limousine transportation depends on travel and tourism. During economic slowdowns, drivers seldom are laid off, but they may have to increase their work hours, and earnings may decline. When the economy is strong, job openings are numerous as many drivers transfer to other occupations. Extra drivers may be hired during holiday seasons as well as during peak travel and tourist times.

Earnings

Earnings of taxi drivers and chauffeurs vary greatly, depending on factors such as the number of hours worked, regulatory conditions, customers' tips, and geographic location. Median hourly earnings of salaried taxi drivers and chauffeurs, including tips, were \$9.41 in May 2004. The middle 50 percent earned between \$7.61 and \$11.94 an hour. The lowest 10 percent earned less than \$6.43, and the highest 10 percent earned more than \$15.62 an hour. Median hourly earnings in the industries employing the largest numbers of taxi drivers and chauffeurs in May 2004 were:

Taxi and limousine service.....	\$10.68
Other transit and ground passenger transportation	9.23
Traveler accommodation.....	8.48
Automobile dealers	8.45
Automotive equipment rental and leasing	8.25

Related Occupations

Other workers who have similar jobs include bus drivers and truck drivers and driver/sales workers.

Sources of Additional Information

Information on necessary permits and the registration of taxi drivers and chauffeurs is available from local government agencies that regulate taxicabs. Questions regarding licensing should be directed to your State motor vehicle administration. For information about work opportunities as a taxi driver or chauffeur, contact local taxi or limousine companies or State employment service offices.

For general information about the work of taxi drivers, chauffeurs, and paratransit drivers, contact:

► Taxicab, Limousine & Paratransit Association, 3849 Farragut Ave., Kensington, MD 20895.

For general information about the work of limousine drivers, contact:

Truck Drivers and Driver/Sales Workers

(O*NET 53-3031.00, 53-3032.01, 53-3032.02, 53-3033.00)

Significant Points

- Job opportunities should be favorable.
- Competition is expected for jobs offering the highest earnings or most favorable work schedules.
- A commercial driver's license is required to operate most larger trucks.

Nature of the Work

Truck drivers are a constant presence on the Nation's highways and interstates. They deliver everything from automobiles to canned food. Firms of all kinds rely on trucks to pick up and deliver goods because no other form of transportation can deliver goods door-to-door. Even if some goods travel most of the way by ship, train, or airplane, almost everything is carried by trucks at some point in its journey.

Before leaving the terminal or warehouse, truck drivers check the fuel level and oil in their trucks. They also inspect the trucks to make sure that the brakes, windshield wipers, and lights are working and that a fire extinguisher, flares, and other safety equipment are aboard and in working order. Drivers make sure their cargo is secure and adjust the mirrors so that both sides of the truck are visible from the driver's seat. Drivers report equipment that is inoperable, missing, or loaded improperly to the dispatcher.

Once under way, drivers must be alert in order to prevent accidents. Drivers can see farther down the road because large trucks seat them higher off the ground than other vehicles. This allows them to see the road ahead and select lanes that are moving more smoothly as well as giving them warning of any dangerous road conditions ahead of them.

The duration of runs vary according to the types of cargo and the destinations. Local drivers may provide daily service for a specific route or region, while other drivers make longer, intercity and interstate deliveries. Interstate and intercity cargo tends to vary from job to job more than local cargo. A driver's responsibilities and assignments change according to the type of loads transported and their vehicle's size.

New technologies are changing the way truck drivers work, especially long-distance truck drivers. Satellites and the Global Positioning System link many trucks with their company's headquarters. Troubleshooting information, directions, weather reports, and other important communications can be instantly relayed to the truck. Drivers can easily communicate with the dispatcher to discuss delivery schedules and courses of action in the event of mechanical problems. The satellite link also allows the dispatcher to track the truck's location, fuel consumption, and engine performance. Some drivers also work with computerized inventory tracking equipment. It is important for the producer, warehouse, and customer to know their product's location at all times so they can maintain a high quality of service.

Heavy truck and tractor-trailer drivers operate trucks or vans with a capacity of at least 26,000 pounds Gross Vehicle Weight (GVW). They transport goods including cars, livestock, and other materials in liquid, loose, or packaged form. Many routes are from city to city and cover long distances. Some companies use two

drivers on very long runs—one drives while the other sleeps in a berth behind the cab. These “sleeper” runs can last for days, or even weeks. Trucks on sleeper runs typically stop only for fuel, food, loading, and unloading.

Some heavy truck and tractor-trailer drivers who have regular runs transport freight to the same city on a regular basis. Other drivers perform ad hoc runs because shippers request varying service to different cities every day.

The U.S. Department of Transportation requires that drivers keep a log of their activities, the condition of the truck, and the circumstances of any accidents.

Long-distance heavy truck and tractor-trailer drivers spend most of their working time behind the wheel, but also may have to load or unload their cargo. This is especially common when drivers haul specialty cargo, because they may be the only ones at the destination familiar with procedures or certified to handle the materials. Auto-transport drivers, for example, position cars on the trailers at the manufacturing plant and remove them at the dealerships. When picking up or delivering furniture, drivers of long-distance moving vans hire local workers to help them load or unload.

Light or delivery services truck drivers operate vans and trucks weighing less than 26,000 pounds GVW. They pick up or deliver merchandise and packages within a specific area. This may include short “turnarounds” to deliver a shipment to a nearby city, pick up another loaded truck or van, and drive it back to their home base the same day. These services may require use of electronic delivery tracking systems to track the whereabouts of the merchandise or packages. Light or delivery services truck drivers usually load or unload the merchandise at the customer’s place of business. They may have helpers if there are many deliveries to make during the day, or if the load requires heavy moving. Typically, before the driver arrives for work, material handlers load the trucks and arrange items for ease of delivery. Customers must sign receipts for goods and pay drivers the balance due on the merchandise if there is a cash-on-delivery arrangement. At the end of the day drivers turn in receipts, payments, records of deliveries made, and any reports on mechanical problems with their trucks.

Some local truck drivers have sales and customer service responsibilities. The primary responsibility of *driver/sales workers*, or *route drivers*, is to deliver and sell their firm’s products over established routes or within an established territory. They sell goods such as food products, including restaurant takeout items, or pick up and deliver items such as laundry. Their response to customer complaints and requests can make the difference between a large order and a lost customer. Route drivers may also take orders and collect payments.

The duties of driver/sales workers vary according to their industry, the policies of their employer, and the emphasis placed on their sales responsibility. Most have wholesale routes that deliver to businesses and stores, rather than to homes. For example, wholesale bakery driver/sales workers deliver and arrange bread, cakes, rolls, and other baked goods on display racks in grocery stores. They estimate how many of each item to stock by paying close attention to what is selling. They may recommend changes in a store’s order or encourage the manager to stock new bakery products. Laundries that rent linens, towels, work clothes, and other items employ driver/sales workers to visit businesses regularly to replace soiled laundry. Their duties also may include soliciting new customers along their sales route.

After completing their route, driver/sales workers place orders for their next deliveries based on product sales and customer requests.

Truck driving is an occupation well suited for those who are self-motivated and able to work with little supervision.

Working Conditions

Truck driving has become less physically demanding because most trucks now have more comfortable seats, better ventilation, and improved, ergonomically designed cabs. Although these changes make the work environment less taxing, driving for many hours at a stretch, loading and unloading cargo, and making many deliveries can be tiring. Local truck drivers, unlike long-distance drivers, usually return home in the evening. Some self-employed long-distance truck drivers who own and operate their trucks spend most of the year away from home.

Design improvements in newer trucks have reduced stress and increased the efficiency of long-distance drivers. Many newer trucks are equipped with refrigerators, televisions, and bunks.

The U.S. Department of Transportation governs work hours and other working conditions of truck drivers engaged in interstate commerce. A long-distance driver may drive for 11 hours and work for up to 14 hours—including driving and non-driving duties—after having 10 hours off-duty. A driver may not drive after having worked for 60 hours in the past 7 days or 70 hours in the past 8 days unless they have taken at least 34 consecutive hours off-duty. Most drivers are required to document their time in a logbook. Many drivers, particularly on long runs, work close to the maximum time permitted because they typically are compensated according to the number of miles or hours they drive. Drivers on long runs face boredom, loneliness, and fatigue. Drivers often travel nights, holidays, and weekends to avoid traffic delays.

Local truck drivers frequently work 50 or more hours a week. Drivers who handle food for chain grocery stores, produce markets, or bakeries typically work long hours—starting late at night or early in the morning. Although most drivers have regular routes, some have different routes each day. Many local truck drivers, particularly driver/sales workers, load and unload their own trucks. This requires considerable lifting, carrying, and walking each day.

Training, Other Qualifications, and Advancement

State and Federal regulations govern the qualifications and standards for truck drivers. All drivers must comply with Federal regulations and any State regulations that are in excess of those Federal requirements. Truck drivers must have a driver's license issued by the State in which they live, and most employers require a clean driving record. Drivers of trucks designed to carry 26,000 pounds or more—including most tractor-trailers, as well as bigger straight trucks—must obtain a commercial driver's license (CDL) from the State in which they live. All truck drivers who operate trucks transporting hazardous materials must obtain a CDL, regardless of truck size. In order to receive the hazardous materials endorsement a driver must be fingerprinted and submit to a criminal background check by the Transportation Security Administration. Federal regulations governing CDL administration allow for States to exempt farmers, emergency medical technicians, firefighters, some military drivers, and snow and ice removers from the need for a CDL at the State's discretion. In many States a regular driver's license is sufficient for driving light trucks and vans.

To qualify for a CDL an applicant must have a clean driving record, pass a written test on rules and regulations, and then demonstrate that they can operate a commercial truck safely. A national database permanently records all driving violations committed by those with a CDL. A State will check these records and deny a CDL to those who already have a license suspended or revoked in another State. Licensed drivers must accompany trainees until they get their own CDL. A person may not hold more than one license at a time and must surrender any other licenses when a CDL is issued. Information on how to apply for a CDL may be obtained from State motor vehicle administrations.

Many States allow those who are as young as 18 years old to drive trucks within their borders. To drive a commercial vehicle between States one must be 21 years of age, according to the U.S. Department of Transportation (U.S. DOT), which establishes minimum qualifications for truck drivers engaging in interstate commerce. Federal Motor Carrier Safety Regulations—published by U.S. DOT—require drivers to be at least 21 years old and to pass a physical examination once every 2 years. The main physical requirements include good hearing, at least 20/40 vision with glasses or corrective lenses, and a 70-degree field of vision in each eye. Drivers may not be colorblind. Drivers must be able to hear a forced whisper in one ear at not less than 5 feet, with a hearing aid if needed. Drivers must have normal use of arms and legs and normal blood pressure. Drivers may not use any controlled substances, unless prescribed by a licensed physician. Persons with epilepsy or diabetes controlled by insulin are not permitted to be interstate truck drivers. Federal regulations also require employers to test their drivers for alcohol and drug use as a condition of employment, and require periodic random tests of the drivers while they are on duty. A driver must not have been convicted of a felony involving the use of a motor vehicle; a crime involving drugs; driving under the influence of drugs or alcohol; refusing to submit to an alcohol test required by a State or its implied consent laws or regulations; leaving the scene of a crime; or causing a fatality through negligent operation of a motor vehicle. All drivers must be able to read and speak English well enough to read road signs, prepare reports, and communicate with law enforcement officers and the public.

Many trucking operations have higher standards than those described here. Many firms require that drivers be at least 22 years old, be able to lift heavy objects, and have driven trucks for 3 to 5 years. Many prefer to hire high school graduates and

require annual physical examinations. Companies have an economic incentive to hire less risky drivers, as good drivers use less fuel and cost less to insure.

Taking driver-training courses is a desirable method of preparing for truck driving jobs and for obtaining a CDL. High school courses in driver training and automotive mechanics also may be helpful. Many private and public vocational-technical schools offer tractor-trailer driver training programs. Students learn to maneuver large vehicles on crowded streets and in highway traffic. They also learn to inspect trucks and freight for compliance with regulations. Some programs provide only a limited amount of actual driving experience. Completion of a program does not guarantee a job. Those interested in attending a driving school should check with local trucking companies to make sure the school's training is acceptable. Some States require prospective drivers to complete a training course in basic truck driving before being issued their CDL. The Professional Truck Driver Institute (PTDI), a nonprofit organization established by the trucking industry, manufacturers, and others, certifies driver training courses at truck driver training schools that meet industry standards and Federal Highway Administration guidelines for training tractor-trailer drivers.

Drivers must get along well with people because they often deal directly with customers. Employers seek driver/sales workers who speak well and have self-confidence, initiative, tact, and a neat appearance. Employers also look for responsible, self-motivated individuals who are able to work well with little supervision.

Training given to new drivers by employers is usually informal, and may consist of only a few hours of instruction from an experienced driver, sometimes on the new employee's own time. New drivers may also ride with and observe experienced drivers before getting their own assignments. Drivers receive additional training to drive special types of trucks or handle hazardous materials. Some companies give 1 to 2 days of classroom instruction covering general duties, the operation and loading of a truck, company policies, and the preparation of delivery forms and company records. Driver/sales workers also receive training on the various types of products their company carries so that they can effectively answer questions about the products and more easily market them to their customers.

Although most new truck drivers are assigned to regular driving jobs immediately, some start as extra drivers—substituting for regular drivers who are ill or on vacation. Extra drivers receive a regular assignment when an opening occurs.

New drivers sometimes start on panel trucks or other small straight trucks. As they gain experience and show competent driving skills they may advance to larger, heavier trucks and finally to tractor-trailers.

The advancement of truck drivers generally is limited to driving runs that provide increased earnings, preferred schedules, or working conditions. Local truck drivers may advance to driving heavy or specialized trucks, or transfer to long-distance truck driving. Working for companies that also employ long-distance drivers is the best way to advance to these positions. Few truck drivers become dispatchers or managers.

Some long-distance truck drivers purchase trucks and go into business for themselves. Although some of these owner-operators are successful, others fail to cover expenses and go out of business. Owner-operators should have good business sense as well as truck driving experience. Courses in accounting, business, and business mathematics are helpful. Knowledge of truck mechanics can enable owner-operators to perform their own routine maintenance and minor repairs.

Employment

Truck drivers and driver/sales workers held about 3.2 million jobs in 2004. Of these workers, 451,000 were driver/sales workers and 2.8 million were truck drivers. Most truck drivers find employment in large metropolitan areas or along major interstate roadways where trucking, retail, and wholesale companies tend to have their distribution outlets. Some drivers work in rural areas, providing specialized services such as delivering newspapers to customers.

The truck transportation industry employed 25 percent of all truck drivers and driver/sales workers in the United States. Another 25 percent worked for companies engaged in wholesale or retail trade. The remaining truck drivers and driver/sales workers were distributed across many industries, including construction and manufacturing.

Around 9 percent of all truck drivers and driver/sales workers were self-employed. Of these, a significant number were owner-operators who either served a variety of businesses independently or leased their services and trucks to a trucking company.

Job Outlook

Job opportunities should be favorable for truck drivers. In addition to growth in demand for truck drivers, numerous job openings will occur as experienced drivers leave this large occupation to transfer to other fields of work, retire, or leave the labor force for other reasons. Jobs vary greatly in terms of earnings, weekly work hours, the number of nights spent on the road, and quality of equipment. There may be competition for the jobs with the highest earnings and most favorable work schedules.

Overall employment of truck drivers and driver/sales workers is expected to increase about as fast as the average for all occupations through the year 2014, due to growth in the economy and in the amount of freight carried by truck. Competing forms of freight transportation—rail, air, and ship transportation—still require trucks to move the goods between ports, depots, airports, warehouses, retailers, and final consumers who are not connected to these other modes of transportation. Demand for long-distance drivers will remain strong because they can transport perishable and time-sensitive goods more effectively than alternate modes of transportation. Job opportunities for truck drivers with local carriers will be more competitive than those with long-distance carriers because of the more desirable working conditions of local carriers.

Job opportunities may vary from year to year, since the output of the economy dictates the amount of freight to be moved. Companies tend to hire more drivers when the economy is strong and their services are in high demand. When the economy slows, employers hire fewer drivers or may lay off some drivers. Independent owner-operators are particularly vulnerable to slowdowns. Industries least likely to be affected by economic fluctuation, such as grocery stores, tend to be the most stable employers of truck drivers and driver/sales workers.

Earnings

Median hourly earnings of heavy truck and tractor-trailer drivers were \$16.11 in May 2004. The middle 50 percent earned between \$12.67 and \$20.09 an hour. The lowest 10 percent earned less than \$10.18, and the highest 10 percent earned more than \$24.07 an hour. Median hourly earnings in the industries employing the largest numbers of heavy truck and tractor-trailer drivers in May 2004 were:

General freight trucking	\$17.56
Grocery and related product wholesalers.....	17.32
Specialized freight trucking	15.61
Employment services	14.82
Cement and concrete product manufacturing	14.47

Median hourly earnings of light or delivery services truck drivers were \$11.80 in May 2004. The middle 50 percent earned between \$8.96 and \$16.00 an hour. The lowest 10 percent earned less than \$7.20, and the highest 10 percent earned more than \$20.83 an hour. Median hourly earnings in the industries employing the largest numbers of light or delivery services truck drivers in May 2004 were:

Couriers.....	\$17.94
General freight trucking	14.79
Grocery and related product wholesalers.....	12.44
Building material and supplies dealers	10.85
Automotive parts, accessories, and tire stores	8.07

Median hourly earnings of driver/sales workers, including commissions, were \$9.66 in May 2004. The middle 50 percent earned between \$6.94 and \$14.59 an hour. The lowest 10 percent earned less than \$5.96, and the highest 10 percent earned more than \$19.81 an hour. Median hourly earnings in the industries employing the largest numbers of driver/sales workers in May 2004 were:

Drycleaning and laundry services.....	\$14.67
Direct selling establishments	13.55
Grocery and related product wholesalers.....	12.36
Limited-service eating places	6.77
Full-service restaurants	6.59

Local truck drivers tend to be paid by the hour, with extra pay for working overtime. Employers pay long-distance drivers primarily by the mile. The per-mile rate can vary greatly from employer to employer and may even depend on the type of cargo they are hauling. Some long-distance drivers are paid a percent of each load's revenue. Typically, earnings increase with mileage driven, seniority, and the size and type of truck driven. Most driver/sales workers receive commissions based on their sales in addition to their hourly wages.

Most self-employed truck drivers are primarily engaged in long-distance hauling. Many truck drivers are members of the International Brotherhood of Teamsters. Some truck drivers employed by companies outside the trucking industry are members of unions representing the plant workers of the companies for which they work.

Related Occupations

Other driving occupations include ambulance drivers and attendants, except emergency medical technicians; bus drivers; and taxi drivers and chauffeurs. Another occupation involving sales duties is sales representatives, wholesale and manufacturing.

Sources of Additional Information

Information on truck driver employment opportunities is available from local trucking companies and local offices of the State employment service.

Information on career opportunities in truck driving may be obtained from:

- American Trucking Associations, Inc., 2200 Mill Rd., Alexandria, VA 22314. Internet: <http://www.trucking.org>

A list of certified tractor-trailer driver training courses may be obtained from:

- Professional Truck Driver Institute, 2200 Mill Rd., Alexandria, VA 22314. Internet: <http://www.ptdi.org>

Information on union truck driving can be obtained from:

- The International Brotherhood of Teamsters, 25 Louisiana Ave., NW., Washington, DC 20001.

Rail Transportation Occupations

(O*NET 53-4011.00, 53-4012.00, 53-4013.00, 53-4021.01, 53-4013.02, 53-4031.00, 53-4041.00, 53-4099.99)

Significant Points

- Opportunities are expected to be good for qualified applicants, mainly because of the large number of workers expected to retire or leave these occupations in the next decade.
- Employment is expected to decline due to productivity increases.
- Most workers begin as yard laborers and later may have the opportunity to train for engineer or conductor jobs.
- Eight out of 10 workers are members of unions, and earnings are relatively high.

Nature of the Work

More than a century ago, freight and passenger railroads were the ties binding the Nation together and the engine driving the economy. Today, rail transportation remains a vital link in our Nation's transportation network and economy. Railroads deliver billions of tons of freight and millions of travelers per year to destinations throughout the country, while subways and light-rail systems transport millions of passengers around metropolitan areas.

Locomotive engineers are among the most experienced and skilled workers on the railroad. They operate large trains carrying cargo and passengers between stations. Most engineers run diesel-electric locomotives, although a few operate locomotives powered electrically.

Before and after each run, engineers check the mechanical condition of their locomotives, making any minor adjustments necessary. Engineers receive starting instructions from conductors. They move controls such as throttles and airbrakes to drive the locomotive. They monitor instruments that measure speed, amperage, battery charge, and air pressure, both in the brake lines and in the main reservoir.

On the open rail and in the yard, engineers confer with conductors and traffic control center personnel via two-way radio or mobile telephone to issue or receive information concerning stops, delays, and the locations of trains. They interpret and comply with orders, signals, speed limits, and railroad rules and regulations. They must have a thorough knowledge of the signaling systems, yards, and terminals on the routes over which they travel. Engineers must be constantly aware of the condition and makeup of their train, because trains react differently to acceleration, braking, and curves, depending on the grade and condition of the rail, the number of cars, the ratio of empty cars to loaded cars, and the amount of slack in the train.

Rail yard engineers operate engines within the rail yard. *Dinkey operators* drive smaller engines, mainly within industrial plants, mines and quarries, or construction projects. *Hostlers* operate engines—without attached cars—within the yard, as well as driving them to maintenance shops.

Railroad conductors coordinate the activities of freight and passenger train crews. Railroad conductors assigned to freight trains review schedules, switching orders, waybills, and shipping records to obtain loading and unloading information

regarding their cargo. In switching operations, conductors may move engines using radio control devices. Conductors assigned to passenger trains also ensure passenger safety and comfort as they go about collecting tickets and fares, making announcements for the benefit of passengers, and coordinating activities of the crew to provide passenger services.

Before a train leaves the terminal, the conductor and the engineer discuss instructions received from the dispatcher concerning the train's route, timetable, and cargo. During the run, conductors use two-way radios and mobile telephones to communicate with dispatchers, engineers, and conductors of other trains. Conductors use dispatch or electronic monitoring devices that relay information about equipment problems on the train or the rails. They may arrange for the removal of defective cars from the train for repairs at the nearest station or stop. In addition, conductors may discuss alternative routes if there is a defect in, or obstruction on, the rails.

Yardmasters coordinate the activities of workers engaged in railroad traffic operations. These activities include making up or breaking up trains and switching inbound or outbound traffic to a specific section of the line. Some cars are sent to unload their cargo on special tracks, while others are moved to different tracks to await assembly into new trains, based on their destinations. Yardmasters tell engineers where to move the cars to fit the planned train configuration. Switches—many of them operated remotely by computer—divert the locomotive or cars to the proper track for coupling and uncoupling.

Railroad brake operators act as assistants to engineers, handling the coupling and uncoupling of cars as well as operating some switches. *Signal operators* install, maintain, and repair the signals on tracks and in yards. *Switch operators* control the track switches within a rail yard.

Traditionally, freight train crews included either one or two brake operators—one in the locomotive with the engineer and another who rode with the conductor in the rear car. Brake operators worked under the direction of conductors and did the physical work involved in adding and removing cars at railroad stations and assembling and disassembling trains in railroad yards. In an effort to reduce costs, most railroads have phased out brake operators. Many modern freight trains use only an engineer and a conductor. New visual instrumentation and monitoring devices have eliminated the need for crewmembers located at the rear of the train, so the conductor is now stationed with the engineer.

In contrast to other rail transportation workers, subway and streetcar operators generally work for public transit authorities instead of railroads. *Subway operators* control trains that transport passengers through cities and their suburbs. The trains run in underground tunnels, on the surface, or on elevated tracks. Operators must stay alert to observe signals along the track that indicate when they must start, slow, or stop their train. They also make announcements to riders, may open and close the doors of the train, and ensure that passengers get on and off the subway safely.

To meet predetermined schedules, operators must control the train's speed and the amount of time spent at each station. Increasingly, however, these functions are controlled by computers and not by the operator. During breakdowns or emergencies, operators contact their dispatcher or supervisor and may have to evacuate cars.

Most workers begin as yard laborers and later may have the opportunity to train for engineer or conductor jobs.

Streetcar operators drive electric-powered streetcars, trolleys, or light-rail vehicles that transport passengers around metropolitan areas. Some tracks may be recessed in city streets or have grade crossings, so operators must observe traffic signals and cope with car and truck traffic. Operators start, slow, and stop their cars so that passengers may get on and off with ease. Operators may collect fares and issue change and transfers. They also answer questions from passengers concerning fares, schedules, and routes.

Working Conditions

Many rail transportation employees work nights, weekends, and holidays, because trains operate 24 hours a day, 7 days a week. Many work more than a 40-hour workweek. Seniority usually dictates who receives the more desirable shifts.

Many freight trains are dispatched according to the needs of customers; as a result many train crews have irregular schedules. Many workers place their names on a list and wait for their turn to work. Jobs usually are assigned on short notice and often at odd hours; working weekends is common. Those who work on trains operating between points hundreds of miles apart may spend several nights at a time away from home.

Workers on passenger trains ordinarily have regular and reliable shifts. Also, the appearance, temperature, and accommodations of passenger trains are more comfortable than those of freight trains.

Rail yard workers spend most of their time outdoors and work regardless of weather conditions. The work of conductors

and engineers on local runs, on which trains frequently stop at stations to pick up and deliver cars, is physically demanding. Climbing up and down and getting off moving cars is strenuous and can be dangerous.

Training, Other Qualifications, and Advancement

Most railroad transportation workers begin as yard laborers; later they may have the opportunity to train for engineer or conductor jobs. Railroads require that applicants have a minimum of a high school diploma or its equivalent. Applicants must have good hearing, eyesight, and color vision, as well as good hand-eye coordination, manual dexterity, and mechanical aptitude. Physical stamina is required for entry-level jobs. Employers require railroad transportation job applicants to pass a physical examination, drug and alcohol screening, and a criminal background check. Federal regulation requires that the driving record of anybody applying for a job operating an engine be checked for evidence of drug or alcohol problems. Similarly, under Federal regulation, all persons licensed to operate engines are subject to random drug and alcohol testing while on duty.

Applicants for locomotive engineer jobs must be at least 21 years old. Employers almost always fill engineer positions with workers who have experience in other railroad-operating occupations. Federal regulations require beginning engineers to complete a formal engineer training program, including classroom, simulator, and hands-on instruction in locomotive operation. The instruction usually is administered by the rail company in programs approved by the Federal Railroad Administration. At the end of the training period, engineers must pass a hearing and visual acuity test, a safety conduct background check, a railroad operation knowledge test, and a skills performance test. The company issues the engineer a license after the applicant passes the examinations. Other conditions and rules may apply to entry-level engineers and usually vary with the employer.

To maintain certification, railroad companies must monitor their engineers. In addition, engineers must periodically pass an operational rules efficiency test. The test is an unannounced event requiring engineers to take active or responsive action in certain situations, such as maintaining a particular speed through a curve or yard.

Engineers undergo periodic physical examinations and drug and alcohol testing to determine their fitness to operate locomotives. In some cases, engineers who fail to meet these physical and conduct standards are restricted to yard service; in other instances, they may be disciplined, trained to perform other work, or discharged.

Conductor jobs generally are filled from the ranks of experienced rail transportation workers who have passed tests covering signals, timetables, operating rules, and related subjects. Seniority usually is the main factor in determining promotion to conductor. Entry-level conductors generally must be at least 21 years of age and are either trained by their employers or required to complete a formal conductor training program through a community college.

Newly trained engineers and conductors are placed on the "extra board" until permanent positions become available. Workers on the extras-board receive assignments only when the railroad needs substitutes for regular workers who are absent because of vacation, illness, or other reasons. Seniority rules may allow workers with greater seniority to select their type of assignment. For example, an engineer may move from an initial, regular assignment in yard service to road service.

For brake and signal operator jobs, railroad firms will train applicants either in a company program or—especially with smaller railroads—at an outside training facility. Typical training programs combine classroom and on-site training and last between 4 and 6 weeks for signal operators and between 10 and 18 weeks for brake operators.

For subway and streetcar operator jobs, subway transit systems prefer applicants with a high school education. Most transit systems that operate subways and streetcars also operate buses. In these systems, subway or streetcar operators usually start as bus drivers. Applicants must be in good health, have good communication skills, and be able to make quick, responsible judgments. New operators generally complete training programs that last from a few weeks to 6 months. At the end of the period of classroom and on-the-job training, operators usually must pass qualifying examinations covering the operating system, troubleshooting, and evacuation and emergency procedures. Some operators with sufficient seniority can advance to station manager or another supervisory position.

For yard occupations, a commercial driver's license may be required because these workers often operate trucks and other heavy vehicles. For more information on commercial driver's licenses, contact your State motor vehicle administration and see the *Handbook* statements on truck drivers and driver/sales workers or bus drivers.

Employment

Rail transportation workers held 112,000 jobs in 2004, distributed among the detailed occupations as follows:

Locomotive engineers and operators	40,000
Railroad conductors and yardmasters	38,000
Railroad brake, signal, and switch operators	17,000
Subway and streetcar operators	9,200
Rail transportation workers, all other.....	8,100

Most rail transportation workers are employed in either the rail transportation industry or support activities for the industry. The rest work primarily for local governments as subway and streetcar operators and for mining and manufacturing establishments that operate their own locomotives and dinkey engines to move railcars containing ore, coal, and other bulk materials.

Job Outlook

Even though employment in most railroad transportation occupations is expected to decline through the year 2014, opportunities are expected to be good for qualified applicants, due mainly to the large number of workers expected to retire or leave these occupations in the next decade. Employment is expected to decline, despite expected increases in the amount of freight carried, due to productivity increases.

Opportunities for long-distance train crews are expected to be better than those for yard jobs, because yard occupations generally require little education beyond high school and do not require as much travel. Employment of subway and streetcar operators will grow about as fast as the average for all occupations, due to increased demand for light-rail transportation systems around the country.

Demand for railroad freight service will grow as the economy and the intermodal transportation of goods expand. Intermodal systems use trucks to move shippers' sealed trailers or containers to and from terminals and employ trains—which are more fuel-efficient than trucks—to transport them over the long distances

between terminals. Railroads are improving delivery times and ontime service, while reducing shipping rates, in order to compete with other modes of transportation, such as trucks, ships, and aircraft.

Growth in the number of railroad transportation workers will be adversely affected by innovations such as larger, faster, more fuel-efficient trains and computerized classification yards that make it possible to move freight more efficiently. Computers help to keep track of freight cars, match empty cars with the closest loads, and dispatch and control trains. Computer-assisted devices alert engineers to malfunctions, and work rules now allow trains to operate with two-person crews instead of the traditional three- to five-person crews.

Earnings

Median hourly earnings of rail transportation occupations in May of 2004 were relatively high, as indicated in the following tabulation:

Locomotive engineers.....	\$24.30
Subway and streetcar operators	23.70
Railroad conductors and yardmasters	22.28
Railroad brake, signal, and switch operators	21.46

Most railroad workers are paid according to miles traveled or hours worked, whichever leads to higher earnings. Full-time employees have steadier work, more regular hours, increased opportunities for overtime work, and higher earnings than do those assigned to the extra board.

Eight out of 10 railroad transportation workers are members of unions. Many different railroad unions represent various crafts on the railroads. Most railroad engineers are members of the Brotherhood of Locomotive Engineers and Trainmen, while most other railroad transportation workers are members of the United Transportation Union. Many subway operators are members of the Amalgamated Transit Union, while others belong to the Transport Workers Union of North America.

Related Occupations

Other related transportation workers include bus drivers, truck drivers and driver/sales workers, and those working in water transportation occupations.

Water Transportation Occupations

(O*NET 53-5011.01, 53-5011.02, 53-5021.01, 53-5021.02, 53-5021.03, 53-5022.00, 53-5031.00)

Significant Points

- Merchant mariners spend extended periods at sea.
- Entry, training, and educational requirements for most water transportation occupations are established and regulated by the U.S. Coast Guard, an agency of the U.S. Department of Homeland Security.
- Increasing global trade and tourism will generate growth in water transportation occupations.

Nature of the Work

The movement of huge amounts of cargo, as well as passengers, between nations and within our Nation depends on workers in water transportation occupations, also known on commercial ships as merchant mariners. They operate and maintain deep-sea merchant ships, tugboats, towboats, ferries, dredges, excursion vessels, and other waterborne craft on the oceans, the Great Lakes, rivers, canals, and other waterways, as well as in harbors. (Workers who operate watercraft used in commercial fishing are described in the section on fishers and fishing vessel operators elsewhere in the *Handbook*.)

Captains, mates, and pilots of water vessels command or supervise the operations of ships and water vessels, both within domestic waterways and on the deep sea. *Captains or masters* are in overall command of the operation of a vessel, and they supervise the work of all other officers and crew. They determine the course and speed of the vessel, maneuver to avoid hazards, and continuously monitor the vessel's position with charts and navigational aides. Captains either direct or oversee crew members who steer the vessel, determine its location, operate engines, communicate with other vessels, perform maintenance, handle lines, or operate equipment on the vessel. Captains and their department heads ensure that proper procedures and safety practices are followed, check to make sure that machinery and equipment are in good working order, and oversee the loading and discharging of cargo or passengers. They also maintain logs and other records tracking the ships' movements, efforts at controlling pollution, and cargo and passengers carried.

Deck officers or mates direct the routine operation of the vessel for the captain during the shifts when they are on watch. All mates stand watch for specified periods, usually 4 hours on and 8 hours off. However, on smaller vessels, there may be only one mate (called a *pilot* on some inland towing vessels), who alternates watches with the captain. The mate would assume command of the ship if the captain became incapacitated. When more than one mate is necessary aboard a ship, they typically are designated chief mate or first mate, second mate, third mate, etc. Mates also supervise and coordinate activities of the crew aboard the ship. They inspect the cargo holds during loading to ensure that the load is stowed according to specifications and regulations. Mates supervise crew members engaged in maintenance and the primary upkeep of the vessel.

Pilots guide ships in and out of harbors, through straits, and on rivers and other confined waterways where a familiarity with local water depths, winds, tides, currents, and hazards such as reefs and shoals are of prime importance. Pilots on river and canal vessels

usually are regular crew members, like mates. Harbor pilots are generally independent contractors who accompany vessels while they enter or leave port. Harbor pilots may pilot many ships in a single day. *Motorboat operators* operate small, motor-driven boats that carry six or fewer passengers on fishing charters. They also take depth soundings in turning basins and serve as liaisons between ships, between ship and shore, between harbors and beaches, or on area patrol.

Ship engineers operate, maintain, and repair propulsion engines, boilers, generators, pumps, and other machinery. Merchant marine vessels usually have four engineering officers: A chief engineer and a first, second, and third assistant engineer. Assistant engineers stand periodic watches, overseeing the safe operation of engines and machinery.

Marine oilers and more experienced *qualified members of the engine department*, or QMEDs, maintain the vessel in proper running order in the engine spaces below decks, under the direction of the ship's engineering officers. These workers lubricate gears, shafts, bearings, and other moving parts of engines and motors; read pressure and temperature gauges; record data; and sometimes assist with repairs and adjust machinery.

Sailors operate the vessel and its deck equipment under the direction of the ship's officers and keep the nonengineering areas in good condition. They stand watch, looking out for other vessels and obstructions in the ship's path, as well as for navigational aids such as buoys and lighthouses. They also steer the ship, measure water depth in shallow water, and maintain and operate deck equipment such as lifeboats, anchors, and cargo-handling gear. On vessels handling liquid cargo, mariners designated as *pumpmen* hook up hoses, operate pumps, and clean tanks; on tugboats or tow vessels, they tie barges together into tow units, inspect them periodically, and disconnect them when the destination is reached. When docking or departing, they handle lines. They also perform routine maintenance chores, such as repairing lines, chipping rust, and painting and cleaning decks or other areas. Experienced sailors are designated *able seamen* on oceangoing vessels, but may be called simply *deckhands* on inland waters; larger vessels usually have a *boatswain*, or head seaman.

Studying at a maritime academy is usually the best route to becoming an officer.

A typical deep-sea merchant ship has a captain, three deck officers or mates, a chief engineer and three assistant engineers, a radio operator, plus six or more unlicensed seamen, such as able seamen, oilers, QMEDs, and cooks or food handlers. The size and service of the ship determine the number of crewmembers for a particular voyage. Small vessels operating in harbors, on rivers, or along the coast may have a crew comprising only a captain and one deckhand. The cooking responsibilities usually fall under the deckhands' duties.

On larger coastal ships, the crew may include a captain, a mate or pilot, an engineer, and seven or eight seamen. Some ships may have special unlicensed positions for entry level apprentice trainees. Unlicensed positions on a large ship may include a full-time cook, an electrician, and machinery mechanics. On cruise ships, *bedroom stewards* keep passengers' quarters clean and comfortable.

Working Conditions

Merchant mariners spend extended periods at sea. Most deep-sea mariners are hired for one or more voyages that last for several months; there is no job security after that. The length of time between voyages varies depending on job availability and personal preference.

The rate of unionization for these workers is about 36 percent, much higher than the average for all occupations. Consequently, merchant marine officers and seamen, both veterans and beginners, are hired for voyages through union hiring halls or directly by shipping companies. Hiring halls rank the candidates by the length of time the person has been out of work and fill open slots accordingly. Hiring halls typically are found in major seaports.

At sea, these workers usually stand watch for 4 hours and are off for 8 hours, 7 days a week. Those employed on Great Lakes ships work 60 days and have 30 days off, but do not work in the winter when the lakes are frozen. Workers on rivers, on canals, and in harbors are more likely to have year-round work. Some work 8-hour or 12-hour shifts and go home every day. Others work steadily for a week or a month and then have an extended period off. When working, they usually are on duty for 6 or 12 hours and off for 6 or 12 hours. Those on smaller vessels are normally assigned to one vessel and have steady employment.

People in water transportation occupations work in all weather conditions. Although merchant mariners try to avoid severe storms while at sea, working in damp and cold conditions often is inevitable. While it is uncommon nowadays for vessels to suffer disasters such as fire, explosion, or a sinking, workers face the possibility that they may have to abandon their craft on short notice if it collides with other vessels or runs aground. They also risk injury or death from falling overboard and hazards associated with working with machinery, heavy loads, and dangerous cargo. However, modern safety management procedures, advanced emergency communications, and effective international rescue systems place modern mariners in a much safer position.

Most newer vessels are air conditioned, soundproofed from noisy machinery, and equipped with comfortable living quarters. For some mariners, these amenities have helped ease the sometimes difficult circumstances of long periods away from home. Also, modern communications, especially email, link modern mariners to their families. Nevertheless, some mariners dislike

the long periods away from home and the confinement aboard ship and consequently leave the occupation.

Training and Other Qualifications

Entry, training, and educational requirements for most water transportation occupations are established and regulated by the U.S. Coast Guard, an agency of the U.S. Department of Homeland Security. All officers and operators of commercially operated vessels must be licensed by the Coast Guard, which offers various kinds of licenses, depending on the position and type of vessel.

There are two ways to qualify for a deck or engineering officer's license: applicants either must accumulate sea time and meet regulatory requirements, or must graduate from the U.S. Merchant Marine Academy or one of the six State maritime academies. In both cases, applicants must pass a written examination. Federal regulations also require that an applicant pass a physical examination, a drug screening, and a National Driver Register Check before being considered. Persons without formal training can be licensed if they pass the written exam and possess sea service appropriate to the license for which they are applying. However, it is difficult to pass the examination without substantial formal schooling or independent study. Also, because seamen may work 6 or fewer months a year, it can take 5 to 8 years to accumulate the necessary experience. The academies offer a 4-year academic program leading to a bachelor-of-science degree, a license (issued only by the Coast Guard) as a third mate (deck officer) or third assistant engineer (engineering officer), and, if the person is qualified, a commission as ensign in the U.S. Naval Reserve, Merchant Marine Reserve, or Coast Guard Reserve. With experience and additional training, third officers may qualify for higher rank.

Sailors and unlicensed engineers working on U.S. flagged deep-sea and Great Lakes vessels must hold a Coast Guard-issued document. In addition, they must hold certification when working aboard liquid-carrying vessels. Able seamen also must hold government-issued certification. For employment in the merchant marine as an unlicensed seaman, a merchant mariner's document issued by the Coast Guard is needed. Most of the jobs must be filled by U.S. citizens; however, a small percentage of applicants for merchant mariner documents do not need to be U.S. citizens, but must at least be aliens legally admitted into the United States and holding a green card. A medical certificate of excellent health attesting to vision, color perception, and general physical condition is required for higher level deckhands and unlicensed engineers. While no experience or formal schooling is required, training at a union-operated school is the best source. Beginners are classified as ordinary seamen and may be assigned to any of the three unlicensed departments: Deck, engine, or steward. With experience at sea and perhaps union-sponsored training, an ordinary seaman can pass the able-seaman exam and move up with 3 years of service.

No special training or experience is needed to become a seaman or deckhand on vessels operating in harbors or on rivers or other waterways. Newly hired workers generally are given a short introductory course and then learn skills on the job. After sufficient experience, they are eligible to take a Coast Guard exam to qualify as a mate, pilot, or captain. Substantial knowledge gained through experience, courses taught at approved schools, and independent study is needed to pass the exam.

Harbor pilot training usually consists of an extended apprenticeship with a towing company or a pilots' association. Entrants may be able seamen or licensed officers.

Employment

Water transportation workers held more than 72,000 jobs in 2004. The total number who worked at some point in the year was perhaps twice as large because many merchant marine officers and seamen worked only part of the year. The following tabulation shows employment in the occupations that make up this group:

Captains, mates, and pilots of water vessels.....	29,000
Sailors and marine oilers.....	28,000
Ship engineers.....	12,000
Motorboat operators.....	3,400

About 33 percent of all workers were employed in water transportation services. About 17 percent worked in inland water transportation—primarily the Mississippi River system—while the other 16 percent were employed in water transportation on the deep seas, along the coasts, and on the Great Lakes. Another 25 percent worked in establishments related to port and harbor operations, marine cargo handling, or navigational services to shipping. The Federal government employed approximately 5 percent of all water transportation workers, most of whom worked on supply ships and are Civilian Mariners of the Department Navy's Military Sealift Command.

Job Outlook

Employment in water transportation occupations is projected to grow more slowly than the average for all occupations through the year 2014. Job growth will stem from increasing tourism and increases in shipping traffic due to rising imports that will provide greater employment in and around major port cities.

Employment in deep-sea shipping for American mariners is expected to stabilize after several years of decline. International regulations have raised shipping standards with respect to safety, training, and working conditions. Consequently, competition from ships that sail under foreign flags of convenience has lessened as the standards of operation become more uniform. This has made the costs of operating a U.S. ship more comparable to foreign-flagged ships and has modestly increased the amount of international cargo carried by U.S. ships. A fleet of deep-sea U.S.-flagged ships is also considered to be vital to the Nation's defense, so some receive Federal support through a maritime security subsidy and other provisions in laws that limit certain Federal cargoes to ships that fly the U.S. flag.

Employment growth also is expected in passenger cruise ships within U.S. waters. Vessels that operate between U.S. ports are required by law to be U.S.-flagged vessels. The building and staffing of several new cruise ships that will travel around the Hawaiian Islands will create new opportunities for employment at sea in the cruise line industry, which is composed mostly of foreign-flagged ships. In addition efforts are underway at the Federal level that could lead to greater use of ferries to handle commuter traffic around major metropolitan areas, which may cause more workers to be hired.

Moderating the growth in water transportation occupations is a projected decline in vessels operating in the Great Lakes and inland waterways. Vessels on rivers and canals and on the Great Lakes carry mostly bulk products, such as coal, iron ore, petroleum, sand and gravel, grain, and chemicals. Although ship-

ments of most of these products are expected to grow through the year 2014, imports of steel are dampening employment on the Lakes.

Job openings will also result from the need to replace those leaving the occupation. Some experienced merchant mariners may continue to go without work for varying periods. However, this situation appears to be changing, with demand for licensed and unlicensed personnel rising. Maritime academy graduates who have not found licensed shipboard jobs in the U.S. merchant marine find jobs in related industries. Because they are commissioned as ensigns in the Naval or Coast Guard Reserve, some are selected for active duty in those branches of the Service. Some find jobs as seamen on U.S.-flagged or foreign-flagged vessels, tugboats, and other watercraft or enter civilian jobs with the U.S. Navy or Coast Guard. Some take land-based jobs with shipping companies, marine insurance companies, manufacturers of boilers or related machinery, or other related jobs.

Earnings

Earnings vary widely with the particular water transportation position and the worker's experience, ranging from the minimum wage for some beginning seamen or mate positions to more than \$42.02 an hour for some experienced ship engineers. Median hourly earnings of water transportation occupations in May 2004 were:

Ship engineers.....	\$26.42
Captains, mates, and pilots of water vessels.....	24.20
Motorboat operators.....	15.39
Sailors and marine oilers.....	14.00

Annual pay for captains of larger vessels, such as container ships, oil tankers, or passenger ships, may exceed \$100,000, but only after many years of experience. Similarly, captains of tugboats often earn more than the median reported here, with earnings dependent on the port and the nature of the cargo.

Related Occupations

Workers in other occupations who make their living on the seas and coastal waters include fishers and fishing vessel operators and some members of the Armed Forces.

Sources of Additional Information

Information on a program called "Careers Afloat", which includes a substantial listing of training and employment descriptive information and contacts in the U.S., may be obtained through:

Material Moving Occupations

(O*NET 53-1021.00, 53-7011.00, 53-7021.00, 53-7031.00, 53-7032.01, 53-7032.02, 53-7033.00, 53-7041.00, 53-7051.00, 53-7061.00, 53-7062.01, 53-7062.02, 53-7062.03, 53-7063.00, 53-7064.00, 53-7071.01, 53-7071.02, 53-7072.00, 53-7073.00, 53-7081.00, 53-7111.00, 53-7121.00, 53-7199.99)

Significant Points

- Job openings should be numerous because the occupation is very large and turnover is relatively high.
- Most jobs require little work experience or training.
- Pay is low, and the seasonal nature of the work may reduce earnings.

Nature of the Work

Material moving workers are categorized into two groups—operators and laborers. Operators use machinery to move construction materials, earth, petroleum products, and other heavy materials. Generally, they move materials over short distances—around construction sites, factories, or warehouses. Some move materials onto or off of trucks and ships. Operators control equipment by moving levers, wheels, and/or foot pedals; operating switches; or turning dials. They also may set up and inspect equipment, make adjustments, and perform minor maintenance or repairs. Laborers and hand material movers manually handle freight, stock, or other materials; clean vehicles, machinery, and other equipment; feed materials into or remove materials from machines or equipment; and pack or package products and materials.

Material moving occupations are classified by the type of equipment they operate or the goods they handle. Each piece of equipment requires different skills, as do different types of loads. (For information on *operating engineers; paving, surfacing, and tamping equipment operators; and pile-driver operators*, see the statement on construction equipment operators elsewhere in the *Handbook*.)

Industrial truck and tractor operators drive and control industrial trucks or tractors equipped to move materials around warehouses, storage yards, factories, or construction sites. A typical industrial truck, often called a forklift or lift truck, has a hydraulic lifting mechanism and forks for moving heavy and large objects. Industrial truck and tractor operators also may operate tractors that pull trailers loaded with materials, goods, or equipment within factories and warehouses or around outdoor storage areas.

Excavating and loading machine and dragline operators tend or operate machinery equipped with scoops, shovels, or buckets to dig and load sand, gravel, earth, or similar materials into trucks or onto conveyors. Construction and mining industries employ the majority of excavation and loading machine and dragline operators. *Dredge operators* excavate waterways, removing sand, gravel, rock, or other materials from harbors, lakes, rivers, and streams. Dredges are used primarily to maintain navigable channels but also are used to restore wetlands and other aquatic habitats; reclaim land; and create and maintain beaches. *Underground mining loading machine operators* use underground loading machines to load coal, ore, or rock into shuttles and mine cars or onto conveyors. Loading equipment may include power shovels, hoisting engines equipped with cable-drawn scrapers or scoops, and machines equipped with gathering arms and conveyors.

Crane and tower operators work mechanical boom and cable or tower and cable equipment to lift and move materials, machinery, and other heavy objects. Operators extend and retract horizontally mounted booms and lower and raise hooks attached to load lines. Most operators are guided by other workers using hand signals or a radio. Operators position loads from an onboard console or from a remote console at the site. While crane and tower operators are noticeable at office building and other construction sites, the biggest group works in primary metal, metal fabrication, and transportation equipment manufacturing industries that use heavy, bulky materials. *Hoist and winch operators* control movement of cables, cages, and platforms to move workers and materials for manufacturing, logging, and other industrial operations. They work in positions such as derrick operators and hydraulic boom operators. Many hoist and winch operators are found in manufacturing or construction industries.

Pump operators tend, control, and operate power-driven pumps and manifold systems that transfer gases, oil, or other materials to vessels or equipment. They maintain the equipment to regulate the flow of materials according to a schedule set up by petroleum engineers and production supervisors. *Gas compressor and gas pumping station operators* operate steam, gas, electric motor, or internal combustion engine-driven compressors. They transmit, compress, or recover gases, such as butane, nitrogen, hydrogen, and natural gas. *Wellhead pumpers* operate power pumps and auxiliary equipment to produce flows of oil or gas from extraction sites.

Tank car, truck, and ship loaders operate ship-loading and -unloading equipment, conveyors, hoists, and other specialized material-handling equipment such as railroad tank car-unloading equipment. They may gauge or sample shipping tanks and test them for leaks. *Conveyor operators and tenders* control and tend conveyor systems that move materials to or from stockpiles, processing stations, departments, or vehicles. *Shuttle car operators* run diesel or electric-powered shuttle cars in underground mines, transporting materials from the working face to mine cars or conveyors.

Laborers and hand freight, stock, and material movers manually move materials and perform other unskilled general labor. These workers move freight, stock, and other materials to and from storage and production areas, loading docks, delivery vehicles, ships, and containers. Their specific duties vary by industry and work setting. In factories, they may move raw materials or finished goods between loading docks, storage areas, and work areas, as well as sort materials and supplies and prepare them according to their work orders. Specialized workers within this group include baggage and cargo handlers, who work in transportation industries, and truck loaders and unloaders.

Hand packers and packagers manually pack, package, or wrap a variety of materials. They may inspect items for defects, label cartons, stamp information on products, keep records of items packed, and stack packages on loading docks. This group also includes order fillers, who pack materials for shipment, as well as grocery store courtesy clerks. In grocery stores, they may bag groceries, carry packages to customers' cars, and return shopping carts to designated areas.

Machine feeders and offbearers feed materials into or remove materials from automatic equipment or machines tended by other workers.

Fork lifts have hydraulic lifting mechanisms for moving heavy or large objects.

Cleaners of vehicles and equipment clean machinery, vehicles, storage tanks, pipelines, and similar equipment using water and other cleaning agents, vacuums, hoses, brushes, cloths, and other cleaning equipment.

Refuse and recyclable material collectors gather refuse and recyclables from homes and businesses into their truck for transport to a dump, landfill, or recycling center. They lift and empty garbage cans or recycling bins by hand or operate a hydraulic lift truck that picks up and empties dumpsters. They work along scheduled routes.

Working Conditions

Material moving work tends to be repetitive and physically demanding. Workers may lift and carry heavy objects and stoop, kneel, crouch, or crawl in awkward positions. Some work at great heights and some work outdoors, regardless of weather and climate. Some jobs expose workers to fumes, odors, loud noises, harmful materials and chemicals, or dangerous machinery. To protect their eyes, respiratory systems, and hearing, these workers wear safety clothing, such as gloves, hardhats, and other safety devices. These jobs have become much less dangerous as safety equipment—such as overhead guards on lift trucks—has become common. Accidents usually can be avoided by observing proper operating procedures and safety practices.

Material movers generally work 8-hour shifts, though longer shifts also are not uncommon. In industries that work around the clock, material movers may work overnight shifts. Some do this because the establishment does not want to disturb customers during normal business hours. Refuse and recyclable material collectors often work shifts starting at 5 or 6 a.m. Some material movers work only during certain seasons, such as when the weather permits construction activity.

Training, Other Qualifications, and Advancement

Little work experience or training is required for most material moving occupations. Some employers prefer applicants with a high school diploma, but most simply require workers to be at least 18 years old and physically able to perform the work. For those jobs requiring physical exertion, employers may require that applicants pass a physical exam. Some employers also require drug testing or background checks before employment. Material movers often are younger than workers in other occupations, reflecting the limited training but significant physical requirements of many of these jobs.

Material movers generally learn skills informally, on the job, from more experienced workers or their supervisors. Workers who handle toxic chemicals or use industrial trucks or other dangerous equipment must receive specialized training in safety awareness and procedures. Many of the training requirements are standardized through the U.S. Occupational Safety and Health Administration. This training is usually provided by the employer. Employers also must certify that each operator has received the training and evaluate each operator at least once every 3 years. For other operators, such as crane operators and those working with specialized loads, there are some training and apprenticeship programs, such as that offered by the International Union of Operating Engineers, as well as certifying institutions, such as the National Commission for the Certification of Crane Operators. Some employers may require crane operators to be certified. Twelve States have laws requiring crane operators to be licensed. Licensing requirements typically include a written as well as a skills test to demonstrate that the licensee can operate a crane safely.

Material moving equipment operators need a good sense of balance, the ability to judge distances, and eye-hand-foot coordination. For jobs that involve dealing with the public, such as grocery store courtesy clerks, workers should be pleasant and courteous. Most jobs require basic arithmetic skills and the ability to read procedural manuals, to understand orders, and other billing documents. Mechanical aptitude and training in automobile or diesel mechanics can be helpful because some operators may perform basic maintenance on their equipment. Experience operating mobile equipment—such as tractors on farms or heavy equipment in the Armed Forces—is an asset. As material moving equipment becomes more advanced, workers will need to be increasingly comfortable with technology.

In many of these occupations, experience may allow workers to qualify or become trainees for jobs such as construction trades workers; assemblers or other production workers; motor vehicle operators; or vehicle and mobile equipment mechanics, installers, and repairers. In many workplaces new employees gain experience in a material moving position before being promoted to a better paying and more highly skilled job. Some may eventually advance to become supervisors.

Employment

Material movers held 5.1 million jobs in 2004. They were distributed among the detailed occupations as follows:

Laborers and freight, stock, and material movers, hand.....	2,430,000
Packers and packagers, hand.....	877,000
Industrial truck and tractor operators.....	635,000
Cleaners of vehicles and equipment.....	347,000
First-line supervisors/managers of helpers, laborers, and material movers, hand.....	173,000
Refuse and recyclable material collectors.....	149,000
Machine feeders and offbearers.....	148,000
Excavating and loading machine and dragline operators.....	86,000
Conveyor operators and tenders.....	53,000
Crane and tower operators.....	44,000
Tank car, truck, and ship loaders.....	17,000
Wellhead pumpers.....	11,000
Pump operators, except wellhead pumpers.....	11,000
Hoist and winch operators.....	5,600
Gas compressor and gas pumping station operators.....	5,100
Loading machine operators, underground mining.....	4,300
Shuttle car operators.....	3,100
Dredge operators.....	2,500
All other material moving workers.....	58,000

About 29 percent of all material movers worked in the wholesale trade or retail trade industries. Another 22 percent worked in manufacturing; 14 percent in transportation and warehousing; 4 percent in construction and mining; and 15 percent in the employment services industry, on a temporary or contract basis. For example, companies that need workers for only a few days, to move materials or to clean up a site, may contract with temporary help agencies specializing in providing suitable workers on a short-term basis. A small proportion of material movers were self-employed.

Material movers work in every part of the country. Some work in remote locations on large construction projects such as highways and dams, while others work in factories, warehouses, or mining operations.

Job Outlook

Job openings should be numerous because the occupation is very large and turnover is relatively high—characteristic of occupations requiring little prior or formal training. Many openings will arise from the need to replace workers who transfer to other occupations or those who retire or leave the labor force for other reasons.

Employment in material moving occupations is projected to increase more slowly than the average for all occupations through 2014. Improvements in equipment, such as automated storage and retrieval systems and conveyors, will continue to raise productivity and moderate the demand for material movers.

Employment growth will stem from an expanding economy, especially in industries involved with the production, distribution, and sales of goods. Employment also will grow in the warehousing and storage industry as more firms contract out their warehousing functions to this industry. For example, a frozen food manufacturer may reduce its costs by outsourcing these functions to a refrigerated warehousing firm, which can more efficiently deal with the specialized storage needs of frozen food. Job growth for material movers depends on the growth or decline of employing industries and the type of equipment the workers operate or the materials they handle. For example, jobs in mining are expected to decline due to continued productivity increases within that industry. Job growth generally will be slower in large establishments, as they increasingly turn to automation for their material moving needs.

Both construction and manufacturing are very sensitive to changes in economic conditions, so the number of job openings in these industries will fluctuate. Although increasing automation will eliminate some routine tasks, new jobs will be created by the need to operate and maintain new equipment.

Earnings

Median hourly earnings of material moving workers in May 2004 were relatively low, as indicated by the following tabulation:

First-line supervisors/managers of helpers, laborers, and material movers, hand	\$18.40
Crane and tower operators	17.99
Pump operators, except wellhead pumpers.....	17.04
Wellhead pumpers.....	16.31
Hoist and winch operators	16.19
Tank car, truck, and ship loaders.....	15.59
Excavating and loading machine and dragline operators	15.37
Material moving workers, all other.....	13.87
Industrial truck and tractor operators.....	12.78
Refuse and recyclable material collectors.....	12.38
Conveyor operators and tenders.....	12.23
Machine feeders and offbearers	10.68
Laborers and freight, stock, and material movers, hand	9.67
Cleaners of vehicles and equipment	8.41
Packers and packagers, hand.....	8.25

Wages vary according to experience and job responsibilities. Wages usually are higher in metropolitan areas. Seasonal peaks and lulls in workload can affect the number of hours scheduled and, therefore, earnings. Certified crane operators tend to have a slightly higher hourly rate than those who are not certified.

Related Occupations

Other workers who operate mechanical equipment include construction equipment operators; machine setters, operators, and tenders—metal and plastic; rail transportation workers; and truck drivers and driver/sales workers. Other entry-level workers who perform mostly physical work are agricultural workers; building cleaning workers; construction laborers; forest, conservation, and logging workers; and grounds maintenance workers.

Sources of Additional Information

For information about job opportunities and training programs, contact local State employment service offices, building or construction contractors, manufacturers, and wholesale and retail establishments.

Job Opportunities in the Armed Forces

(O*NET 55-1011.00, 55-1012.00, 55-1013.00, 55-1014.00, 55-1015.00, 55-1016.00, 55-1017.00, 55-1019.99, 55-2011.00, 55-2012.00, 55-2013.00, 55-3011.00, 55-3012.00, 55-3013.00, 55-3014.00, 55-3015.00, 55-3016.00, 55-3017.00, 55-3018.00, 55-3019.99)

Significant Points

- Some training and duty assignments are hazardous, even in peacetime; hours and working conditions can be arduous and vary substantially.
- Enlisted personnel need at least a high school diploma or its equivalent, while officers need a bachelor's or an advanced degree.
- Opportunities should be good in all branches of the Armed Forces for applicants who meet designated standards.

Nature of the Work

Maintaining a strong national defense encompasses such diverse activities as running a hospital, commanding a tank, programming computers, operating a nuclear reactor, or repairing and maintaining a helicopter. The military provides training and work experience in these and many other fields for more than 2.6 million people. More than 1.4 million people serve in the active Army, Navy, Marine Corps, and Air Force, and more than 1.2 million serve in their Reserve components, and the Air and Army National Guard. The Coast Guard, which is also discussed in this *Handbook* statement, is now part of the U.S. Department of Homeland Security.

The military distinguishes between enlisted and officer careers. Enlisted personnel, who make up about 85 percent of the Armed Forces, carry out the fundamental operations of the military in areas such as combat, administration, construction, engineering, health care, and human services. Officers, who make up the remaining 15 percent of the Armed Forces, are the leaders of the military, supervising and managing activities in every occupational specialty of the Armed Forces.

The sections that follow discuss the major occupational groups for enlisted personnel and officers.

Enlisted occupational groups

Administrative careers include a wide variety of positions. The military must keep accurate information for planning and managing its operations. Both paper and electronic records are kept on personnel and on equipment, funds, supplies, and all other aspects of the military. Administrative personnel record information, type reports, maintain files, and review information to assist military officers. Personnel may work in a specialized area such as finance, accounting, legal affairs, maintenance, supply, or transportation.

Combat specialty occupations refer to enlisted specialties, such as infantry, artillery, and special forces, whose members operate weapons or execute special missions during combat. Persons in these occupations normally specialize by the type of weapon system or combat operation. These personnel maneuver against enemy forces and position and fire artillery, guns, and missiles to destroy enemy positions. They also may operate tanks and amphibious assault vehicles in combat or scouting missions. When the military has difficult and dangerous missions to perform, they call upon special forces teams. These elite combat forces maintain a

constant state of readiness to strike anywhere in the world on a moment's notice. Team members from the special forces conduct offensive raids, demolitions, intelligence, search-and-rescue missions, and other operations from aboard aircraft, helicopters, ships, or submarines.

Construction occupations in the military include personnel who build or repair buildings, airfields, bridges, foundations, dams, bunkers, and the electrical and plumbing components of these structures. Personnel in construction occupations operate bulldozers, cranes, graders, and other heavy equipment. Construction specialists also may work with engineers and other building specialists as part of military construction teams. Some personnel specialize in areas such as plumbing or electrical wiring. Plumbers and pipefitters install and repair the plumbing and pipe systems needed in buildings and on aircraft and ships. Building electricians install and repair electrical-wiring systems in offices, airplane hangars, and other buildings on military bases.

Electronic and electrical equipment repair personnel repair and maintain electronic and electrical equipment used in the military. Repairers normally specialize by type of equipment, such as avionics, computer, optical, communications, or weapons systems. For example, electronic instrument repairers install, test, maintain, and repair a wide variety of electronic systems, including navigational controls and biomedical instruments. Weapons maintenance technicians maintain and repair weapons used by combat forces; most of these weapons have electronic components and systems that assist in locating targets and in aiming and firing the weapon.

Engineering, science, and technical personnel in the military require specific knowledge to operate technical equipment, solve complex problems, or provide and interpret information. Personnel normally specialize in one area, such as space operations, information technology, environmental health and safety, or intelligence. Space operations specialists use and repair ground-control command equipment having to do with spacecraft, including electronic systems that track the location and operation of a craft. Information technology specialists develop software programs and operate computer systems. Environmental health and safety specialists inspect military facilities and food supplies for the presence of disease, germs, or other conditions hazardous to health and the environment. Intelligence specialists gather and study information by means of aerial photographs and various types of radar and surveillance systems.

Health care personnel assist medical professionals in treating and providing services for men and women in the military. They may work as part of a patient-service team in close contact with doctors, dentists, nurses, and physical therapists to provide the necessary support functions within a hospital or clinic. Health care specialists normally specialize in a particular area—emergency medical treatment, the operation of diagnostic tools such as x-ray and ultrasound equipment, laboratory testing of tissue and blood samples, or maintaining pharmacy supplies or patients' records, among others. Dental and optical laboratory technicians construct and repair dental equipment and eyeglasses for military personnel.

Human resources development specialists recruit and place qualified personnel and provide the training programs necessary to help people perform their jobs effectively. Personnel in this career area normally specialize by activity. For example, recruiting specialists provide information about military careers to young people, parents, schools, and local communities and explain the Armed Service's employment and training opportunities, pay and benefits, and service

life. Personnel specialists collect and store information about the people in the military, including information on their previous and current training, job assignments, promotions, and health. Training specialists and instructors teach classes and give demonstrations to provide military personnel with the knowledge they need to perform their jobs.

Machine operator and production personnel operate industrial equipment, machinery, and tools to fabricate and repair parts for a variety of items and structures. They may operate engines, turbines, nuclear reactors, and water pumps. Often, they specialize by type of work performed. Welders and metalworkers, for instance, work with various types of metals to repair or form the structural parts of ships, submarines, buildings, or other equipment. Survival equipment specialists inspect, maintain, and repair survival equipment such as parachutes and aircraft life support equipment.

Media and public affairs personnel deal with the public presentation and interpretation of military information and events. They take and develop photographs; film, record, and edit audio and video programs; present news and music programs; and produce graphic artwork, drawings, and other visual displays. Other public affairs specialists act as interpreters and translators to convert written or spoken foreign languages into English or other languages.

Protective service personnel include those who enforce military laws and regulations and provide emergency response to natural and human-made disasters. These personnel normally specialize by function. For example, military police control traffic, prevent crime, and respond to emergencies. Other law enforcement and security specialists investigate crimes committed on military property and guard inmates in military correctional facilities. Firefighters put out, control, and help prevent fires in buildings, on aircraft, and aboard ships.

Support service personnel provide subsistence services and support the morale and well-being of military personnel and their families. Food service specialists prepare all types of food in dining halls, hospitals, and ships. Counselors help military personnel and their families deal with personal issues. They work as part of a team that may include social workers, psychologists, medical officers, chaplains, personnel specialists, and commanders. Religious program specialists assist chaplains with religious services, religious education programs, and related administrative duties.

Transportation and material handling specialists ensure the safe transport of people and cargo. Most personnel within this occupational group are classified according to mode of transportation, such as aircraft, motor vehicle, or ship. Aircrew members operate equipment on board aircraft during operations. Vehicle drivers operate all types of heavy military vehicles, including fuel or water tank trucks, semi-trailers, heavy troop transports, and passenger buses. Quartermasters and boat operators navigate and pilot many types of small watercraft, including tugboats, gunboats, and barges. Cargo specialists load and unload military supplies, using equipment such as forklifts and cranes.

Vehicle and machinery mechanics conduct preventive and corrective maintenance on aircraft, automotive and heavy equipment, heating and cooling systems, marine engines, and powerhouse station equipment. These workers typically specialize by the type of equipment that they maintain. For example, aircraft mechanics inspect, service, and repair helicopters and airplanes. Automotive and heavy equipment mechanics maintain and repair vehicles such as humvees, trucks, tanks, self-propelled missile launchers, and other combat vehicles. They also repair bulldozers, power shovels, and other construction equipment. Heating and cooling mechanics install and repair air-conditioning, refrigeration, and heating equipment. Marine engine mechanics repair and maintain gasoline and diesel engines on ships, boats, and other watercraft. They also

The Marine Corps has many duties, including guarding U.S. embassies.

repair shipboard mechanical and electrical equipment. Powerhouse mechanics install, maintain, and repair electrical and mechanical equipment in power-generating stations.

Officer occupational groups

Combat specialty officers plan and direct military operations, oversee combat activities, and serve as combat leaders. This category includes officers in charge of tanks and other armored assault vehicles, artillery systems, special forces, and infantry. Combat specialty officers normally specialize by the type of unit that they lead. Within the unit, they may specialize by the type of weapon system. Artillery and missile system officers, for example, direct personnel as they target, launch, test, and maintain various types of missiles and artillery. Special-operations officers lead their units in offensive raids, demolitions, intelligence gathering, and search-and-rescue missions.

Engineering, science, and technical officers have a wide range of responsibilities based on their area of expertise. They lead or perform activities in areas such as space operations, environmental health and safety, and engineering. These officers may direct the operations of communications centers or the development of complex computer systems. Environmental health and safety officers study the air, ground, and water to identify and analyze sources of pollution and its effects. They also direct programs to control safety and health hazards in the workplace. Other personnel work as aerospace engineers to design and direct the development of military aircraft, missiles, and spacecraft.

Executive, administrative, and managerial officers oversee and direct military activities in key functional areas such as finance, accounting, health administration, international relations, and supply. Health services administrators, for instance, are responsible for the overall quality of care provided at the hospitals and clinics they operate. They must ensure that each department works together to provide the highest quality of care. As another example, purchasing and contracting managers negotiate and monitor contracts for the purchase of the billions of dollars worth of equipment, supplies, and services that the military buys from private industry each year.

Health care officers provide health services at military facilities, on the basis of their area of specialization. Officers who examine, diagnose, and treat patients with illness, injury, or disease include physicians, registered nurses, and dentists. Other health care officers provide therapy, rehabilitative treatment, and additional services for patients. Physical and occupational therapists plan and administer therapy to help patients adjust to disabilities, regain independence,

and return to work. Speech therapists evaluate and treat patients with hearing and speech problems. Dietitians manage food service facilities and plan meals for hospital patients and for outpatients who need special diets. Pharmacists manage the purchase, storage, and dispensation of drugs and medicines. Physicians and surgeons in this occupational group provide the majority of medical services to the military and their families. Dentists treat diseases and disorders of the mouth. Optometrists treat vision problems by prescribing eyeglasses or contact lenses. Psychologists provide mental health care and also conduct research on behavior and emotions.

Human resource development officers manage recruitment, placement, and training strategies and programs in the military. They normally specialize by activity. Recruiting managers direct recruiting efforts and provide information about military careers to young people, parents, schools, and local communities. Personnel managers direct military personnel functions such as job assignment, staff promotion, and career counseling. Training and education directors identify training needs and develop and manage educational programs designed to keep military personnel current in the skills they need to perform their jobs.

Media and public affairs officers oversee the development, production, and presentation of information or events for the public. These officers may produce and direct motion pictures, videotapes, and television and radio broadcasts that are used for training, news, and entertainment. Some plan, develop, and direct the activities of military bands. Public information officers respond to inquiries about military activities and prepare news releases and reports to keep the public informed.

Protective service officers are responsible for the safety and protection of individuals and property on military bases and vessels. Emergency management officers plan and prepare for all types of natural and human-made disasters. They develop warning, control, and evacuation plans to be used in the event of a disaster. Law enforcement and security officers enforce all applicable laws on military bases and investigate crimes when the law has been broken.

Support services officers manage food service activities and perform services in support of the morale and well-being of military personnel and their families. Food services managers oversee the preparation and delivery of food services within dining facilities located on military installations and vessels. Social workers focus on improving conditions that cause social problems such as drug and alcohol abuse, racism, and sexism. Chaplains conduct worship services for military personnel and perform other spiritual duties covering the beliefs and practices of all religious faiths.

Transportation officers manage and perform activities related to the safe transport of military personnel and material by air and water. These officers normally specialize by mode of transportation or area of expertise because, in many cases, they must meet licensing and certification requirements. Pilots in the military fly various types of specialized airplanes and helicopters to carry troops and equipment and to execute combat missions. Navigators use radar, radio, and other navigation equipment to determine their position and plan their route of travel. Officers on ships and submarines work as a team to manage the various departments aboard their vessels. Ship engineers direct engineering departments aboard ships and submarines, including engine operations, maintenance, repair, heating, and power generation.

Qualifications, Training, and Advancement

Enlisted personnel. In order to join the services, enlisted personnel must sign a legal agreement called an enlistment contract, which usually involves a commitment to 8 years of service. Depending on the terms of the contract, 2 to 6 years are spent on active duty, and the balance is spent in the National Guard or Reserves. The enlistment contract obligates the service to provide the agreed-upon job, rating, pay, cash bonuses for enlistment in certain occupations, medical and other benefits, occupational training, and continuing education. In return, enlisted personnel must serve satisfactorily for the period specified.

Requirements for each service vary, but certain qualifications for enlistment are common to all branches. In order to enlist, one must be between 17 and 35 years old for active service, be a U.S. citizen or an alien holding permanent resident status, not have a felony record, and possess a birth certificate. Applicants who are aged 17 must have the consent of a parent or legal guardian before entering the service. Coast Guard enlisted personnel must enter active duty before their 28th birthday, whereas Marine Corps enlisted personnel must not be over the age of 29. Applicants must both pass a written examination—the Armed Services Vocational Aptitude Battery—and meet certain minimum physical standards, such as height, weight, vision, and overall health. All branches of the Armed Forces require high school graduation or its equivalent. In 2004, more than 9 out of 10 recruits were high school graduates.

People thinking about enlisting in the military should learn as much as they can about military life before making a decision. Doing so is especially important if you are thinking about making the military a career. Speaking to friends and relatives with military experience is a good idea. Find out what the military can offer you and what it will expect in return. Then, talk to a recruiter, who can determine whether you qualify for enlistment, explain the various enlistment options, and tell you which military occupational specialties currently have openings. Bear in mind that the recruiter's job is to recruit promising applicants into his or her branch of military service, so the information that the recruiter gives you is likely to stress the positive aspects of military life in the branch in which he or she serves.

Ask the recruiter for the branch you have chosen to assess your chances of being accepted for training in the occupation of your choice, or, better still, take the aptitude exam to see how well you score. The military uses this exam as a placement exam, and test scores largely determine an individual's chances of being accepted into a particular training program. Selection for a particular type of training depends on the needs of the service, your general and technical aptitudes, and your personal preference. Because all prospective recruits are required to take the exam, those who do so before committing themselves to enlist have the advantage of knowing in advance whether they stand a good chance of being accepted for training in a particular specialty. The recruiter can

A sailor updates the status of one of the aircraft used by the Navy.

schedule you for the Armed Services Vocational Aptitude Battery without any obligation. Many high schools offer the exam as an easy way for students to explore the possibility of a military career, and the test also affords an insight into career areas in which the student has demonstrated aptitudes and interests.

If you decide to join the military, the next step is to pass the physical examination and sign an enlistment contract. Negotiating the contract involves choosing, qualifying for, and agreeing on a number of enlistment options, such as the length of active-duty time, which may vary according to the option. Most active-duty programs have first-term enlistments of 4 years, although there are some 2-, 3-, and 6-year programs. The contract also will state the date of enlistment and other options—for example, bonuses and the types of training to be received. If the service is unable to fulfill any of its obligations under the contract, such as providing a certain kind of training, the contract may become null and void.

All branches of the Armed Services offer a delayed entry program (DEP) by which an individual can delay entry into active duty for up to 1 year after enlisting. High school students can enlist during their senior year and enter a service after graduation. Others choose this program because the job training they desire is not currently available, but will be within the coming year, or because they need time to arrange their personal affairs.

Women are eligible to enter most military specialties; for example, they may become mechanics, missile maintenance technicians, heavy-equipment operators, and fighter pilots, or they may enter into medical care, administrative support, and intelligence specialties. Generally, only occupations involving direct exposure to combat are excluded.

People planning to apply the skills gained through military training to a civilian career should first determine how good the prospects are for civilian employment in jobs related to the military specialty that interests them. Second, they should know the prerequisites for the related civilian job. Because many civilian occupations require a license, certification, or minimum level of education, it is important to determine whether military training is sufficient for a person to enter the civilian equivalent or, if not, what additional training will be required. Other *Handbook* statements discuss the job outlook, training requirements, and other aspects of civilian occupations for which military training and experience are helpful. Additional information often can be obtained from school counselors.

Following enlistment, new members of the Armed Forces undergo initial-entry training, better known as “basic training” or

“boot camp.” Through courses in military skills and protocol recruit training provides a 6-week to 13-week introduction to military life. Days and nights are carefully structured and include rigorous physical exercise designed to improve strength and endurance and build each unit’s cohesion.

Following basic training, most recruits take additional training at technical schools that prepare them for a particular military occupational specialty. The formal training period generally lasts from 10 to 20 weeks, although training for certain occupations—nuclear power plant operator, for example—may take as long as a year. Recruits not assigned to classroom instruction receive on-the-job training at their first duty assignment.

Many service people get college credit for the technical training they receive on duty, which, combined with off-duty courses, can lead to an associate degree through programs in community colleges such as the Community College of the Air Force. In addition to on-duty training, military personnel may choose from a variety of educational programs. Most military installations have tuition assistance programs for people wishing to take courses during off-duty hours. The courses may be correspondence courses or courses in degree programs offered by local colleges or universities. Tuition assistance pays up to 100 percent of college costs up to a credit-hour and annual limit. Each branch of the service provides opportunities for full-time study to a limited number of exceptional applicants. Military personnel accepted into these highly competitive programs—in law or medicine, for example—receive full pay, allowances, tuition, and related fees. In return, they must agree to serve an additional amount of time in the service. Other highly selective programs enable enlisted personnel to qualify as commissioned officers through additional military training.

Warrant officers. Warrant officers are technical and tactical leaders who specialize in a specific technical area; for example, Army aviators make up one group of warrant officers. The Army Warrant Officer Corps constitutes less than 5 percent of the total Army. Although the Corps is small in size, its level of responsibility is high. Its members receive extended career opportunities, worldwide leadership assignments, and increased pay and retirement benefits. Selection to attend the Warrant Officer Candidate School is highly competitive and restricted to those who meet rank and length-of-service requirements. The only exception is the Army aviator warrant officer, which has no prior military service requirements (table 3).

Officers. Officer training in the Armed Forces is provided through the Federal service academies (Military, Naval, Air Force, and Coast Guard); the Reserve Officers Training Corps (ROTC) program offered at many colleges and universities; Officer Candidate School (OCS) or Officer Training School (OTS); the National Guard (State Officer Candidate School programs); the Uniformed Services University of Health Sciences; and other programs. All are highly selective and are good options for those wishing to make the military a career. Persons interested in obtaining training through the Federal service academies must be single to enter and graduate, while those seeking training through OCS, OTS, or ROTC need not be single. Single parents with one or more minor dependents are not eligible to become commissioned officers.

Federal service academies provide a 4-year college program leading to a bachelor-of-science degree. Midshipmen or cadets are provided free room and board, tuition, medical and dental care, and a monthly allowance. Graduates receive regular or reserve commissions and have a 5-year active-duty obligation, or more if they are entering flight training.

To become a candidate for appointment as a cadet or midshipman in one of the service academies, applicants are required to obtain a nomination from an authorized source, usually a member of Congress. Candidates do not need to know a member of Congress personally to request a nomination. Nominees must have an academic record of the requisite quality, college aptitude test scores above an established minimum, and recommendations from teachers or school officials; they also must pass a medical examination. Appointments are made from the list of eligible nominees. Appointments to the Coast Guard Academy, however, are based strictly on merit and do not require a nomination.

ROTC programs train students in about 575 Army, 130 Navy and Marine Corps, and 300 Air Force units at participating colleges and universities. Trainees take 3 to 5 hours of military instruction a week, in addition to regular college courses. After graduation, they may serve as officers on active duty for a stipulated period. Some may serve their obligation in the Reserves or National Guard. In the last 2 years of a ROTC program, students typically receive a monthly allowance while attending school, as well as additional pay for summer training. ROTC scholarships for 2, 3, and 4 years are available on a competitive basis. All scholarships pay for tuition and have allowances for textbooks, supplies, and other costs.

College graduates can earn a commission in the Armed Forces through OCS or OTS programs in the Army, Navy, Air Force, Marine Corps, Coast Guard, and National Guard. These officers

generally must serve their obligation on active duty. Those with training in certain health professions may qualify for direct appointment as officers. In the case of persons studying for the health professions, financial assistance and internship opportunities are available from the military in return for specified periods of military service. Prospective medical students can apply to the Uniformed Services University of Health Sciences, which offers a salary and free tuition in a program leading to a doctor-of-medicine (M.D.) degree. In return, graduates must serve for 7 years in either the military or the U.S. Public Health Service. Direct appointments also are available for those qualified to serve in other specialty areas, such as the judge advocate general (legal) or chaplain corps. Flight training is available to commissioned officers in each branch of the Armed Forces. In addition, the Army has a direct enlistment option to become a warrant officer aviator.

Each service has different criteria for promoting personnel. Generally, the first few promotions for both enlisted and officer personnel come easily; subsequent promotions are much more competitive. Criteria for promotion may include time in service and in grade, job performance, a fitness report (supervisor's recommendation), and passing scores on written examinations. Table 3 shows the officer, warrant officer, and enlisted ranks by service.

Employment

In 2005, more than 2.6 million people served in the Armed Forces. More than 1.4 million were on active duty in the Armed Forces—about 487,000 in the Army, 350,000 in the Navy, 356,000 in the Air Force, and 185,000 in the Marine Corps. In addition, more than 1.2 million people served in their Reserve components, and the Air and Army National Guard. In addition, 33,000 individuals served in the Coast Guard, which is now part of the U.S. Department of Homeland Security. Table 1 shows the occupational composition of the 1.2 million active-duty enlisted personnel in February 2005; table 2 presents similar information for the 216,000 active-duty officers.

Military personnel are stationed throughout the United States and in many countries around the world. About half of all military jobs in the U.S. are located in California, Texas, North Carolina, Virginia, Florida, and Georgia. Approximately 169,000 service members were deployed to Operation Iraqi Freedom either in or around Iraq in June 2005. An additional 278,000 individuals were stationed outside the United States, including 21,000 assigned to ships at sea. About 106,000 were stationed in Europe, mainly in Germany, and another 81,000 were assigned to East Asia and the Pacific area, mostly in Japan and the Republic of Korea.

Table 3. Military rank and employment for active duty personnel, January 2005

Grade	Rank and title Army	Navy	Air Force	Marine Corps	Total Employment
<i>Commissioned officers:</i>					
O-10	General	Admiral	General	General	34
O-9	Lieutenant General	Vice Admiral	Lieutenant General	Lieutenant General	125
O-8	Major General	Rear Admiral (U)	Major General	Major General	276
O-7	Brigadier General	Rear Admiral (L)	Brigadier General	Brigadier General	439
O-6	Colonel	Captain	Colonel	Colonel	11,483
O-5	Lieutenant Colonel	Commander	Lieutenant Colonel	Lieutenant Colonel	28,378

Job Outlook

Opportunities should be good for qualified individuals in all branches of the Armed Forces through 2014. Many military personnel retire with a pension after 20 years of service, while they still are young enough to start a new career. About 170,000 personnel must be recruited each year to replace those who complete their commitment or retire. Since the end of the draft in 1973, the military has met its personnel requirements with volunteers. When the economy is good and civilian employment opportunities generally are more favorable, it is more difficult for all the services to meet their recruitment quotas. It is also more difficult to meet these goals during times of war, when recruitment goals typically rise.

America's strategic position is stronger than it has been in decades. Despite reductions in personnel due to the elimination of the threats of the Cold War, the number of active-duty personnel is expected to remain roughly constant through 2014. However, recent conflicts and the resulting strain on the Armed Forces may lead to an increasing number of active-duty personnel. The Armed Forces' current goal is to maintain a sufficient force to fight and win two major regional conflicts at the same time. Political events, however, could lead to a significant restructuring with or without an increase in size.

Educational requirements will continue to rise as military jobs become more technical and complex. High school graduates and applicants with a college background will be sought to fill the ranks of enlisted personnel, while virtually all officers will need at least a bachelor's degree and, in some cases, an advanced degree as well.

The Army has many health care specialists, including optometrists.

Earnings

The earnings structure for military personnel is shown in table 4. Most enlisted personnel started as recruits at Grade E-1 in 2004; however, those with special skills or above-average education started as high as Grade E-4. Most warrant officers had started at Grade W-1 or W-2, depending upon their occupational and academic qualifications and the branch of service of which they were a member, but warrant officer typically is not an entry-level

Air Force mechanics maintain and repair a broad range of aircraft.

occupation and, consequently, most of these individuals had previous military service. Most commissioned officers started at Grade O-1; some with advanced education started at Grade O-2, and some highly trained officers—for example, physicians and dentists—started as high as Grade O-3. Pay varies by total years of service as well as rank. Because it usually takes many years to reach the higher ranks, most personnel in higher ranks receive the higher pay rates awarded to those with many years of service.

In addition to receiving their basic pay, military personnel are provided with free room and board (or a tax-free housing and subsistence allowance), free medical and dental care, a military clothing

allowance, military supermarket and department store shopping privileges, 30 days of paid vacation a year (referred to as leave), and travel opportunities. In many duty stations, military personnel may receive a housing allowance that can be used for off-base housing. This allowance can be substantial, but varies greatly by rank and duty station. For example, in fiscal year 2005, the average housing allowance for an E-4 with dependents was \$958 per month; for a comparable individual without dependents, it was \$752. The allowance for an O-4 with dependents was \$1,645 per month; for a comparable individual without dependents, it was \$1,428. Other allowances are paid for foreign duty, hazardous duty, submarine and flight duty, and employment as a medical officer. Athletic and other facilities—such as gymnasiums, tennis courts, golf courses, bowling centers, libraries, and movie theaters—are available on many military installations. Military personnel are eligible for retirement benefits after 20 years of service.

The Veterans Administration (VA) provides numerous benefits to those who have served at least 24 months of continuous active duty in the Armed Forces. Veterans are eligible for free care in VA hospitals for all service-related disabilities, regardless of time served; those with other medical problems are eligible for free VA care if they are unable to pay the cost of hospitalization elsewhere. Admission to a VA medical center depends on the availability of beds, however. Veterans also are eligible for certain loans, including loans to purchase a home. Veterans, regardless of health, can convert a military life insurance policy to an individual policy with any participating company upon separation from the military. In addition, job counseling, testing, and placement services are available.

Veterans who participate in the Montgomery GI Bill Program receive education benefits. Under this program, Armed Forces personnel may elect to deduct up to \$100 a month from their pay

Table 4. Military basic monthly pay by grade for active duty personnel, January 2005

Grade	Years of service					
	Less than 2	Over 4	Over 8	Over 12	Over 16	Over 20

during the first 12 months of active duty, putting the money toward their future education. In fiscal year 2005, veterans who served on active duty for 3 or more years or who spent 2 years in active duty plus 4 years in the Selected Reserve received \$1,004 a month in basic

benefits for 36 months of full-time institutional training. Those who enlisted and serve less than 3 years received \$816 a month for 36 months for the same. In addition, each service provides its own contributions to the enlistee's future education. The sum of the amounts from all these sources becomes the service member's educational fund. Upon separation from active duty, the fund can be used to finance educational costs at any VA-approved institution. Among those institutions which are approved by the VA are many vocational, correspondence, certification, business, technical, and flight-training schools; community and junior colleges; and colleges and universities.

Sources of Additional Information

Each of the military services publishes handbooks, fact sheets, and pamphlets describing entrance requirements, training and advancement opportunities, and other aspects of military careers. These publications are widely available at all recruiting stations, at most State employment service offices, and in high schools, colleges, and public libraries. Information on educational and other veterans' benefits is available from VA offices located throughout the country.

In addition, the Defense Manpower Data Center, an agency of the U.S. Department of Defense, publishes *Military Career Guide Online*, a compendium of military occupational, training, and career information designed for use by students and jobseekers. This information is available on the Internet: <http://www.todaysmilitary.com>

Data for Occupations Not Studied in Detail

Employment in the hundreds of occupations covered in detail in the main body of the *Handbook* accounts for more than 131 million or 90 percent of all jobs in the economy. Although occupations covering the full spectrum of work are included, those requiring lengthy education or training generally are given the most attention.

This chapter presents summary data on 129 additional occupations, for which employment projections are prepared, but for which detailed occupational information is not developed. These occupations account for about 7 percent of all jobs. For each occupation, the Occupational Information Network (O*NET) code, a brief description of the nature of the work, the number of jobs in 2004, a phrase describing the projected employment change from 2004 to 2014, and the most significant source of postsecondary education or training are presented. For a complete list of O*NET codes cited in the *Handbook*, refer to a later chapter, *Occupational Information Network (O*NET) Coverage*. For guidelines on interpreting the description of projected employment change, refer to a chapter in the front of the *Handbook*, *Occupational Information Included in the Handbook*.

The approximately 3 percent of all jobs not covered either in the detailed occupational descriptions in the main body of the *Handbook* or in the summary data presented in this chapter are mainly residual categories, such as “all other managers,” for which little meaningful information could be developed.

Management, business, and financial occupations

Agents and business managers of artists, performers, and athletes

(O*NET 13-1011.00)

Represent and promote artists, performers, and athletes to prospective employers. May handle contract negotiations and other business matters for clients.

2004 employment: 21,000

Projected 2004-14 employment change: About as fast as average
Most significant source of postsecondary education or training: Bachelor's or higher degree, plus work experience

Compliance officers, except agriculture, construction, health and safety, and transportation

(O*NET 13-1041.01, 13-1041.02, 13-1041.03, 13-1041.04, 13-1041.05, 13-1041.06)

Examine, evaluate, and investigate eligibility for or conformity with laws and regulations governing contract compliance of licenses and permits, and other compliance and enforcement inspection activities not classified elsewhere. Exclude tax examiners, collectors, and revenue agents and financial examiners.

2004 employment: 177,000

Projected 2004-14 employment change: About as fast as average
Most significant source of postsecondary education or training: Long-term on-the-job training

Credit analysts

(O*NET 13-2041.00)

Analyze current credit data and financial statements of individuals or firms to determine the degree of risk involved in extending credit or lending money. Prepare reports with this credit information for use in decisionmaking.

2004 employment: 68,000

Projected 2004-14 employment change: More slowly than average
Most significant source of postsecondary education or training: Bachelor's degree

Emergency management specialists

(O*NET 13-1061.00)

Coordinate disaster response or crisis management activities, provide disaster preparedness training, and prepare emergency plans and procedures for natural (e.g. hurricanes, floods, earthquakes), wartime, or technological (e.g., nuclear power plant emergencies, hazardous materials spills) disasters or hostage situations.

2004 employment: 10,000

Projected 2004-14 employment change: Faster than average
Most significant source of postsecondary education or training: Work experience in a related occupation

Financial examiners

(O*NET 13-2061.00)

Enforce or ensure compliance with laws and regulations governing financial and securities institutions and financial and real estate transactions. May examine, verify correctness of, or establish authenticity of records.

2004 employment: 24,000

Projected 2004-14 employment change: About as fast as average
Most significant source of postsecondary education or training: Bachelor's degree

Gaming managers

(O*NET 11-9071.00)

Plan, organize, direct, control, or coordinate gaming operations in a casino. Formulate gaming policies for their area of responsibility.

2004 employment: 3,700

Projected 2004-14 employment change: Faster than average
Most significant source of postsecondary education or training: Work experience in a related occupation

Legislators

(O*NET 11-1031.00)

Develop laws and statutes at the Federal, State, or local level. Includes only elected officials.

2004 employment: 66,000

Projected 2004-14 employment change: More slowly than average
Most significant source of postsecondary education or training: Bachelor's or higher degree, plus work experience

Loan counselors

(O*NET 13-2071.00)

Provide guidance to prospective loan applicants who have problems qualifying for traditional loans. Guidance may include determining the best type of loan and explaining loan requirements or restrictions.

2004 employment: 34,000

Projected 2004-14 employment change: Faster than average

Most significant source of postsecondary education or training:
Bachelor's degree

Logisticians

(O*NET 13-1081.00)

Analyze and coordinate the logistical functions of a firm or organization. Responsible for the entire life cycle of a product, including acquisition, distribution, internal allocation, delivery, and final disposal of resources.

2004 employment: 53,000

Projected 2004-14 employment change: About as fast as average

Most significant source of postsecondary education or training:
Bachelor's degree

Postmasters and mail superintendents

(O*NET 11-9131.00)

Direct and coordinate operational, administrative, management, and supportive services of a U.S. post office; or coordinate activities of workers engaged in postal and related work in assigned post office.

2004 employment: 26,000

Projected 2004-14 employment change: Decline

Most significant source of postsecondary education or training:
Work experience in a related occupation

Social and community service managers

(O*NET 11-9151.00)

Plan, organize, or coordinate the activities of a social service program or community outreach organization. Oversee the program or organization's budget and policies regarding participant involvement, program requirement, and benefits. Work may involve directing social workers, counselors, or probation officers.

2004 employment: 134,000

Projected 2004-14 employment change: Faster than average

Most significant source of postsecondary education or training:
Bachelor's degree

Tax preparers

(O*NET 13-2082.00)

Prepare tax returns for individuals or small businesses but do not have the background or responsibilities of an accredited or certified public accountant.

2004 employment: 86,000

Projected 2004-14 employment change: About as fast as average

Most significant source of postsecondary education or training:
Moderate-term on-the-job training

Transportation, storage, and distribution managers

(O*NET 11-3071.01, 11-3071.02)

Plan, direct, or coordinate transportation, storage, or distribution activities in accordance with governmental policies and regulations. Includes logistics managers.

2004 employment: 92,000

Projected 2004-14 employment change: About as fast as average

Most significant source of postsecondary education or training:
Work experience in a related occupation

Professional and related occupations**Audio-visual collections specialists**

(O*NET 25-9011.00)

Prepare, plan, and operate audio-visual teaching aids for use in education. May record, catalogue, and file audio-visual materials.

2004 employment: 9,300

Projected 2004-14 employment change: Faster than average

Most significant source of postsecondary education or training:
Moderate-term on-the-job training

Clergy

(O*NET 21-2011.00)

Conduct religious worship and perform other spiritual functions associated with beliefs and practices of religious faith or denomination. Provide spiritual and moral guidance and assistance to members.

2004 employment: 422,000

Projected 2004-14 employment change: About as fast as average

Most significant source of postsecondary education or training:
Master's degree

Dietetic technicians

(O*NET 29-2051.00)

Assist dietitians in the provision of food service and nutritional programs. Under the supervision of dietitians, may plan and produce meals based on established guidelines, teach principles of food and nutrition, or counsel individuals.

2004 employment: 25,000

Projected 2004-14 employment change: Faster than average

Most significant source of postsecondary education or training:
Moderate-term on-the-job training

Directors, religious activities and education

(O*NET 21-2021.00)

Direct and coordinate activities of a denominational group to meet religious needs of students. Plan, direct, or coordinate church school programs designed to promote religious education among church membership. May provide counseling and guidance relative to marital, health, financial, or religious problems.

2004 employment: 90,000

Projected 2004-14 employment change: Faster than average

Most significant source of postsecondary education or training:
Bachelor's degree

Farm and home management advisors

(O*NET 25-9021.00)

Advise, instruct, and assist individuals and families engaged in agriculture, agricultural-related processes, or home economics activities. Demonstrate procedures and apply research findings to solve problems; instruct and train in product development, sales, and the utilization of machinery and equipment to promote general welfare. Include county agricultural agents, feed and farm management advisors, home economists, and extension service advisors.

2004 employment: 16,000

Projected 2004-14 employment change: More slowly than average

Most significant source of postsecondary education or training: Bachelor's degree

Health educators

(O*NET 21-1091.00)

Promote, maintain, and improve individual and community health by assisting individuals and communities to adopt healthy behaviors. Collect and analyze data to identify community needs prior to planning, implementing, monitoring, and evaluating programs designed to encourage healthy lifestyles, policies and environments. May also serve as a resource to assist individuals, other professionals, or the community, and may administer fiscal resources for health education programs.

2004 employment: 49,000

Projected 2004-14 employment change: Faster than average

Most significant source of postsecondary education or training: Master's degree

Law clerks

(O*NET 23-2092.00)

Assist lawyers or judges by researching or preparing legal documents. May meet with clients or assist lawyers and judges in court. Excludes lawyers, and paralegal and legal assistants.

2004 employment: 51,000

Projected 2004-14 employment change: More slowly than average

Most significant source of postsecondary education or training: Bachelor's degree

Mathematical technicians

(O*NET 15-2091.00)

Apply standardized mathematical formulas, principles, and methodology to technological problems in engineering and physical sciences in relation to specific industrial and research objectives, processes, equipment, and products.

2004 employment: 1,800

Projected 2004-14 employment change: More slowly than average

Most significant source of postsecondary education or training: Master's degree

Merchandise displayers and window trimmers

(O*NET 27-1026.00)

Plan and erect commercial displays, such as those in windows and interiors of retail stores and at trade exhibitions.

2004 employment: 86,000

Projected 2004-14 employment change: About as fast as average

Most significant source of postsecondary education or training: Moderate-term on-the-job training

Orthotists and prosthetists

(O*NET 29-2091.00)

Assist patients with disabling conditions of limbs and spine or with partial or total absence of limb by fitting and preparing orthopedic braces and prostheses.

2004 employment: 6,000

Projected 2004-14 employment change: Faster than average

Most significant source of postsecondary education or training: Bachelor's degree

Psychiatric technicians

(O*NET 29-2053.00)

Care for mentally impaired or emotionally disturbed individuals, following physician instructions and hospital procedures. Monitor patients' physical and emotional well-being and report to medical staff. May participate in rehabilitation and treatment programs, help with personal hygiene, and administer oral medications and hypodermic injections.

2004 employment: 61,000

Projected 2004-14 employment change: More slowly than average

Most significant source of postsecondary education or training: Moderate-term on-the-job training

Set and exhibit designers

(O*NET 27-1027.01, 27-1027.02)

Design special exhibits and movie, television, and theater sets. May study scripts, confer with directors, and conduct research to determine appropriate architectural styles.

2004 employment: 13,000

Projected 2004-14 employment change: About as fast as average

Most significant source of postsecondary education or training: Bachelor's degree

Social science research assistants

(O*NET 19-4061.00)

Assist social scientists in laboratory, survey, and other social research. May perform publication activities, laboratory analysis, quality control, or data management. Normally these individuals work under the direct supervision of a social scientist and assist in those activities which are more routine. Excludes graduate teaching assistants, who both teach and do research.

2004 employment: 18,000

Projected 2004-14 employment change: About as fast as average

Most significant source of postsecondary education or training: Associate degree

Title examiners, abstractors, and searchers

(O*NET 23-2093.01, 23-2093.02)

Search real estate records, examine titles, or summarize pertinent legal or insurance details for a variety of purposes. May compile lists of mortgages, contracts, and other instruments pertaining to titles by searching public and private records for law firms, real estate agencies, or title insurance companies.

2004 employment: 61,000

Projected 2004-14 employment change: More slowly than average

Most significant source of postsecondary education or training:

Moderate-term on-the-job training

Service occupations

Amusement and recreation attendants

(O*NET 39-3091.00)

Perform a variety of attending duties at amusement or recreation facilities. May schedule use of recreations facilities, maintain and provide equipment to participants of sporting events or recreational pursuits, or operate amusement concessions and rides.

2004 employment: 252,000

Projected 2004-14 employment change: Much faster than average

Most significant source of postsecondary education or training:

Short-term on-the-job training

Animal control workers

(O*NET 33-9011.00)

Handle animals for the purpose of investigations of mistreatment, or control of abandoned, dangerous, or unattended animals.

2004 employment: 15,000

Projected 2004-14 employment change: About as fast as average

Most significant source of postsecondary education or training:

Moderate-term on-the-job training

Baggage porters and bellhops

(O*NET 39-6011.00)

Handle baggage for travelers at transportation terminals or for guests at hotels or similar establishments.

2004 employment: 57,000

Projected 2004-14 employment change: About as fast as average

Most significant source of postsecondary education or training:

Short-term on-the-job training

Concierges

(O*NET 39-6012.00)

Assist patrons at hotel, apartment or office building with personal services. May take messages, arrange or give advice on transportation, business services or entertainment, or monitor guest requests for housekeeping and maintenance.

2004 employment: 18,000

Projected 2004-14 employment change: About as fast as average

Most significant source of postsecondary education or training:

Moderate-term on-the-job training

Costume attendants

(O*NET 39-3092.00)

Select, fit and take care of costumes for cast members, and aid entertainers.

2004 employment: 3,500

Projected 2004-14 employment change: Faster than average

Most significant source of postsecondary education or training:

Short-term on-the-job training

Crossing guards

(O*NET 33-9091.00)

Guide or control vehicular or pedestrian traffic at such places as streets, schools, railroad crossings, or construction sites.

2004 employment: 71,000

Projected 2004-14 employment change: Faster than average

Most significant source of postsecondary education or training:

Short-term on-the-job training

Embalmers

(O*NET 39-4011.00)

Prepare bodies for interment in conformity with legal requirements.

2004 employment: 8,700

Projected 2004-14 employment change: About as fast as average

Most significant source of postsecondary education or training:

Postsecondary vocational award

First-line supervisors/managers of food preparation and serving workers

(O*NET 35-1012.00)

Supervise workers engaged in preparing and serving food.

2004 employment: 773,000

Projected 2004-14 employment change: About as fast as average

Most significant source of postsecondary education or training:

Work experience in a related occupation

First-line supervisors/managers of personal service workers

(O*NET 39-1021.00)

Supervise and coordinate activities of personal service workers, such as supervisors of flight attendants, hairdressers, or caddies.

2004 employment: 206,000

Projected 2004-14 employment change: Faster than average

Most significant source of postsecondary education or training:

Work experience in a related occupation

Funeral attendants

(O*NET 39-4021.00)

Perform a variety of tasks during a funeral, such as placing casket in parlor or chapel prior to service; arranging floral offerings or lights around casket; directing or escorting mourners; closing casket; and issuing and storing funeral equipment.

2004 employment: 30,000

Projected 2004-14 employment change: Faster than average

Most significant source of postsecondary education or training:

Short-term on-the-job training

Lifeguards, ski patrol, and other recreational protective services

(O*NET 33-9092.00)

Monitor recreational areas, such as pools, beaches, or ski slopes to provide assistance and protection to participants.

2004 employment: 113,000

Projected 2004-14 employment change: Faster than average

Most significant source of postsecondary education or training:

Short-term on-the-job-training

Locker room, coatroom and dressing room attendants

(O*NET 39-3093.00)

Provide personal items to patrons or customers in locker rooms, dressing rooms, or coatrooms.

2004 employment: 25,000

Projected 2004-14 employment change: About as fast average

Most significant source of postsecondary education or training:

Short-term on-the-job training

Medical equipment preparers

(O*NET 31-9093.00)

Prepare, sterilize, install, or clean laboratory or healthcare equipment. May perform routine laboratory tasks and operate or inspect equipment.

2004 employment: 43,000

Projected 2004-14 employment change: Faster than average

Most significant source of postsecondary education or training:

Short-term on-the-job training

Motion picture projectionists

(O*NET 39-3021.00)

Set up and operate motion picture projection and related sound reproduction equipment.

2004 employment: 12,000

Projected 2004-14 employment change: Decline

Most significant source of postsecondary education or training:

Short-term on-the-job training

Parking enforcement workers

(O*NET 33-3041.00)

Patrol assigned area, such as public parking lot or section of city to issue tickets to overtime parking violators and illegally parked vehicles.

2004 employment: 11,000

Projected 2004-14 employment change: About as fast as average

Most significant source of postsecondary education or training:

Short-term on-the-job training

Residential advisors

(O*NET 39-9041.00)

Coordinate activities for residents of boarding schools, college fraternities or sororities, college dormitories, or similar establishments. Order supplies and determine need to maintenance, repairs, and furnishings. May maintain household records and assign rooms. May refer residents to counseling resources if needed.

2004 employment: 56,000

Projected 2004-14 employment change: Much faster than average

Most significant source of postsecondary education or training:

Moderate-term on-the-job training

Tour guides and escorts

(O*NET 39-6021.00)

Escort individuals or groups on sightseeing tours or through places of interest, such as industrial establishments, public buildings, and art galleries.

2004 employment: 38,000

Projected 2004-14 employment change: About as fast as average

Most significant source of postsecondary education or training:

Moderate-term on-the-job training

Transportation attendants, except flight attendants and baggage porters

(O*NET 39-6032.00)

Provide services to ensure the safety and comfort of passengers aboard ships, buses, trains, or within the station or terminal. Perform duties, such as greeting passengers, explaining the use of safety equipment, serving meals or beverages, or answering questions related to travel.

2004 employment: 28,000

Projected 2004-14 employment change: About as fast as average

Most significant source of postsecondary education or training:

Short-term on-the-job training

Travel guides

(O*NET 39-6022.00)

Plan, organize, and conduct long distance cruises, tours, and expeditions for individuals or groups.

2004 employment: 5,700

Projected 2004-14 employment change: About as fast as average

Most significant source of postsecondary education or training:

Moderate-term on-the-job training

Ushers, lobby attendants, and ticket takers

(O*NET 39-3031.00)

Assist patrons at entertainment events by performing duties, such as collecting admission tickets and passes from patrons, assisting in finding seats, searching for lost articles, and locating such facilities as rest rooms and telephones.

2004 employment: 112,000

Projected 2004-14 employment change: About as fast as average

Most significant source of postsecondary education or training:

Short-term on-the-job training

Veterinary assistants and laboratory animal caretakers

(O*NET 31-9096.00)

Feed, water, and examine pets and other nonfarm animals for signs of illness, disease, or injury in laboratories and animal hospitals and clinics. Clean and disinfect cages and work areas, and sterilize laboratory and surgical equipment. May provide routine postoperative care, administer medication orally or topically, or prepare samples for laboratory examination under the supervision of veterinary or laboratory animal technologists or technicians, veterinarians, or scientists. Excludes nonfarm animal caretakers.

2004 employment: 74,000

Projected 2004-14 employment change: Faster than average

Most significant source of postsecondary education or training:

Short-term on-the-job training

Sales and related occupations**Door-to-door sales workers, news and street vendors, and related workers**

(O*NET 41-9091.00)

Sell goods or services door-to-door or on the street.

2004 employment: 239,000
 Projected 2004-14 employment change: Decline
 Most significant source of postsecondary education or training:
 Short-term on-the-job training

Parts salespersons

(O*NET 41-2022.00)

Sell spare and replacement parts and equipment in repair shop or parts store.

2004 employment: 239,000
 Projected 2004-14 employment change: Decline
 Most significant source of postsecondary education or training:
 Moderate-term on-the-job training

Telemarketers

(O*NET 41-9041.00)

Solicit orders for goods and services over the telephone.

2004 employment: 415,000
 Projected 2004-14 employment change: Decline
 Most significant source of postsecondary education or training:
 Short-term on-the-job training

Office and administrative support occupations

Correspondence clerks

(O*NET 43-4021.00)

Compose letters in reply to request for merchandise, damage claims, credit and other information, delinquent accounts, incorrect billings, or unsatisfactory services. Duties may include gathering data to formulate reply and typing correspondence.

2004 employment: 23,000
 Projected 2004-14 employment change: Decline
 Most significant source of postsecondary education or training:
 Short-term-on-the-job training

Court, municipal, and license clerks

(O*NET 43-4031.01, 43-4031.02, 43-4031.03)

Perform clerical duties in courts of law, municipalities, and governmental licensing agencies and bureaus. May prepare docket of cases to be called; secure information for judges and court; prepare draft agendas or bylaws for town or city council; answer official correspondence; keep fiscal records and accounts; issue licenses or permits; record data, administer tests, or collect fees.

2004 employment: 110,000
 Projected 2004-14 employment change: Faster than average
 Most significant source of postsecondary education or training:
 Short-term-on-the-job training

Insurance claims and policy processing clerks

(O*NET 43-9041.01, 43-9041.02)

Process new insurance policies, modifications to existing policies, and claims forms. Obtain information from policyholders to verify the accuracy and completeness of information on claims forms, applications and related documents, and company records. Update existing policies and company records to reflect changes requested by policyholders

and insurance company representatives. Excludes claims adjusters, examiners, and investigators.

2004 employment: 251,000
 Projected 2004-14 employment change: More slowly than average
 Most significant source of postsecondary education or training:
 Moderate-term on-the-job training

Mail clerks and mail machine operators, except Postal Service

(O*NET 43-9051.01, 43-9051.02)

Prepare incoming and outgoing mail for distribution. Use hand or mail handling machines to time, stamp, open, read, sort, and route incoming mail; and address, seal, stamp, fold, stuff, and affix postage to outgoing mail or packages. Duties may also include keeping necessary records and completed forms.

2004 employment: 160,000
 Projected 2004-14 employment change: Decline
 Most significant source of postsecondary education or training:
 Short-term on-the-job training

New account clerks

(O*NET 43-4141.00)

Interview persons desiring to open bank accounts. Explain banking services available to prospective customers and assist them in preparing application form.

2004 employment: 98,000
 Projected 2004-14 employment change: More slowly than average
 Most significant source of postsecondary education or training:
 Work experience in a related occupation

Office machine operators, except computer

(O*NET 43-9071.01)

Operate one or more of a variety of office machines, such as photocopying, photographic, and duplicating machines, or other office machines. Excludes computer operators; mail clerks and mail machine operators; and billing and posting clerks and machine operators.

2004 employment: 100,000
 Projected 2004-14 employment change: Decline
 Most significant source of postsecondary education or training:
 Short-term on-the-job training

Proofreaders and copy markers

(O*NET 43-9081.00)

Read transcript or proof type setup to detect and mark for correction any grammatical, typographical, or compositional errors. Excludes workers whose primary duty is editing copy. Includes proofreaders of Braille.

2004 employment: 23,000
 Projected 2004-14 employment change: More slowly than average
 Most significant source of postsecondary education or training:
 Short-term on-the-job training

Statistical assistants

(O*NET 43-9111.00)

Compile and compute data according to statistical formulas for use in statistical studies. May perform actuarial computations

and compile charts and graphs for use by actuaries. Includes actuarial clerks.

2004 employment: 19,000

Projected 2004-14 employment change: More slowly than average

Most significant source of postsecondary education or training: Moderate-term on-the-job training

Farming, fishing, and forestry occupations

Hunters and trappers

(O*NET 45-3021.00)

Hunt and trap wild animals for human consumption, fur, feed, bait, or other purposes.

2004 employment: 1,100

Projected 2004-14 employment change: More slowly than average

Most significant source of postsecondary education or training: Moderate-term on-the-job training

Supervisors, farming, fishing, and forestry workers

(O*NET 45-1011.01, 45-1011.02, 45-1011.03, 45-1011.04, 45-1011.05, 45-1011.06, 45-1012.00)

This broad occupation includes two detailed occupations—first-line supervisors/managers of farming, fishing, and forestry workers; and farm labor contractors. First-line supervisors/managers of farming, fishing, and forestry workers directly supervise and coordinate the activities of agricultural, forestry, aquacultural, and related workers. Farm labor contractors recruit, hire, furnish, and supervise seasonal or temporary agricultural laborers for a fee. May transport, house, and provide meals for workers. Excludes first-line supervisors/managers of landscaping, lawn service, and groundskeeping workers.

2004 employment: 61,000

Projected 2004-14 employment change: More slowly than average

Most significant source of postsecondary education or training: Work experience in a related occupation

Construction and extraction occupations

Continuous mining machine operators

(O*NET 47-5041.00)

Operate self-propelled mining machines that rip coal, metal and nonmetal ores, rock, stone, or sand from the face and load it onto conveyors or into shuttle cars in a continuous operation.

2004 employment: 8,300

Projected 2004-14 employment change: Decline

Most significant source of postsecondary education or training: Moderate-term on-the-job training

Derrick operators, oil and gas

(O*NET 47-5011.00)

Rig derrick equipment and operate pumps to circulate mud through drill hole.

2004 employment: 15,000

Projected 2004-14 employment change: Decline

Most significant source of postsecondary education or training: Moderate-term on-the-job training

Earth drillers, except oil and gas

(O*NET 47-5021.01, 47-5021.02)

Operate a variety of drills—such as rotary, churn, and pneumatic—to tap subsurface water and salt deposits, to remove core samples during mineral exploration or soil testing, and to facilitate the use of explosives in mining or construction. May use explosives. Includes horizontal and earth boring machine operators.

2004 employment: 22,000

Projected 2004-14 employment change: More slowly than average

Most significant source of postsecondary education or training: Moderate-term on-the-job training

Explosives workers, ordnance handling experts, and blasters

(O*NET 47-5031.00)

Place and detonate explosives to demolish structures or to loosen, remove, or displace earth, rock, or other materials. May perform specialized handling, storage, and accounting procedures. Includes seismograph shooters. Excludes earth drillers, except oil and gas who may also work with explosives.

2004 employment: 5,500

Projected 2004-14 employment change: More slowly than average

Most significant source of postsecondary education or training: Moderate-term on-the-job training

Fence erectors

(O*NET 47-4031.00)

Erect and repair metal and wooden fences and fence gates around highways, industrial establishments, residences, or farms, using hand and power tools.

2004 employment: 38,000

Projected 2004-14 employment change: About as fast as average

Most significant source of postsecondary education or training: Moderate-term on-the-job training

First-line supervisors/managers of construction trades and extraction workers

(O*NET 47-1011.01, 47-1011.02)

Directly supervise and coordinate activities of construction or extraction workers.

2004 employment: 750,000

Projected 2004-14 employment change: About as fast as average

Most significant source of postsecondary education or training: Work experience in a related occupation

Helpers—brickmasons, blockmasons, stonemasons, and tile and marble setters

(O*NET 47-3011.00)

Help brickmasons, blockmasons, stonemasons, or tile and marble setters by performing duties of lesser skill. Duties include using, supplying, or holding materials or tools, and cleaning work area

and equipment. Excludes apprentice workers and report them with the appropriate skilled construction trade occupation. Excludes construction laborers who do not primarily assist brickmasons, blockmasons, and stonemasons or tile and marble setters.

2004 employment: 62,000

Projected 2004-14 employment change: About as fast as average
Most significant source of postsecondary education or training:
Short-term on-the-job training

Helpers—carpenters

(O*NET 47-3012.00)

Help carpenters by performing duties of lesser skill. Duties include using, supplying, or holding materials or tools, and cleaning work area and equipment. Excludes apprentice workers and report them with the appropriate skilled construction trade occupation. Excludes construction laborers who do not primarily assist carpenters.

2004 employment: 109,000

Projected 2004-14 employment change: About as fast as average
Most significant source of postsecondary education or training:
Short-term on-the-job training

Helpers—electricians

(O*NET 47-3013.00)

Help electricians by performing duties of lesser skill. Duties include using, supplying, or holding materials or tools, and cleaning work area and equipment. Excludes apprentice workers and report them with them with the appropriate skilled construction trade occupation. Excludes construction laborers who do not primarily assist electricians.

2004 employment: 95,000

Projected 2004-14 employment change: More slowly than average
Most significant source of postsecondary education or training:
Short-term on-the-job training

Helpers—extraction workers

(O*NET 47-5081.00)

Help extraction craft workers, such as earth drillers, blasters and explosives workers, derrick operators, and mining machine operators, by performing duties of lesser skill. Duties include supplying equipment or cleaning work area. Excludes apprentice workers.

2004 employment: 27,000

Projected 2004-14 employment change: Decline
Most significant source of postsecondary education or training:
Short-term on-the-job training

Helpers—painters, paperhangers, plasterers, and stucco masons

(O*NET 47-3014.00)

Help painters, paperhangers, plasterers, or stucco masons by performing duties of lesser skill. Duties including using, supplying, or holding materials or tools, and cleaning work area and equipment. Excludes apprentice workers and report them with the appropriate skilled construction trade occupation. Excludes construction laborers who do not primarily assist painters, paperhangers, plasterers, or stucco masons.

2004 employment: 27,000

Projected 2004-14 employment change: About as fast as average
Most significant source of postsecondary education or training:
Short-term on-the-job training

Helpers—pipelayers, plumbers, pipefitters, and steamfitters

(O*NET 47-3015.00)

Help pipelayers, plumbers, pipefitters, or steamfitters by performing duties of lesser skill. Duties including using, supplying, or holding materials or tools, and cleaning work area and equipment. Excludes apprentice workers and report them with the appropriate skilled construction trade occupation. Excludes construction laborers who do not primarily assist pipelayers, plumbers, pipefitters or steamfitters.

2004 employment: 76,000

Projected 2004-14 employment change: About as fast as average
Most significant source of postsecondary education or training:
Short-term on-the-job training

Helpers—roofers

(O*NET 47-3016.00)

Help roofers by performing duties of lesser skill. Duties include using, supplying, or holding materials or tools, and cleaning work area and equipment. Excludes apprentice workers and report them with the appropriate skilled construction trade occupation. Excludes construction laborers who do not primarily assist roofers.

2004 employment: 22,000

Projected 2004-14 employment change: About as fast as average
Most significant source of postsecondary education or training:
Short-term on-the-job training

Highway maintenance workers

(O*NET 47-4051.00)

Maintain highways, municipal and rural roads, airport runways, and rights-of-way. Duties include patching broken or eroded pavement, repairing guard rails, highway markers, and snow fences. May also mow or clear brush from along road or plow snow from roadway. Excludes tree trimmers and pruners.

2004 employment: 143,000

Projected 2004-14 employment change: Faster than average
Most significant source of postsecondary education or training:
Moderate-term on-the-job training

Mine cutting and channeling machine operators

(O*NET 47-5042.00)

Operate machinery—such as longwall shears, plows, and cutting machines—to cut or channel along the face or seams of coal mines, stone quarries, or other mining surfaces to facilitate blasting, separating, or removing minerals or materials from mines or from the earth's surface. Includes shale planers.

2004 employment: 4,000

Projected 2004-14 employment change: Decline
Most significant source of postsecondary education or training:
Moderate-term on-the-job training

Rail-track laying and maintenance equipment operators

(O*NET 47-4061.00)

Lay, repair, and maintain track for standard or narrow-gauge railroad equipment used in regular railroad service or in plant yards, quarries, sand and gravel pits, and mines. Includes ballast cleaning machine operators and railroad bed tamping machine operators.

2004 employment: 11,000
 Projected 2004-14 employment change: Decline
 Most significant source of postsecondary education or training:
 Moderate-term on-the-job training

Rock splitters, quarry

(O*NET 47-5051.00)

Separate blocks of rough dimension stone from quarry mass using jackhammer and wedges.

2004 employment: 3,400
 Projected 2004-14 employment change: More slowly than average
 Most significant source of postsecondary education or training:
 Moderate-term on-the-job training

Roof bolters, mining

(O*NET 47-5061.00)

Operate machinery to install roof support bolts in underground mine.

2004 employment: 4,400
 Projected 2004-14 employment change: Decline
 Most significant source of postsecondary education or training:
 Moderate-term on-the-job training

Rotary drill operators, oil and gas

(O*NET 47-5012.00)

Set up or operate a variety of drills to remove petroleum products from the earth and to find and remove core samples for testing during oil and gas exploration.

2004 employment: 15,000
 Projected 2004-14 employment change: More slowly than average
 Most significant source of postsecondary education or training:
 Moderate-term on-the-job training

Roustabouts, oil and gas

(O*NET 47-5071.00)

Assemble or repair oil field equipment using hand and power tools. Perform other tasks as needed.

2004 employment: 34,000
 Projected 2004-14 employment change: More slowly than average
 Most significant source of postsecondary education or training:
 Moderate-term on-the-job training

Septic tank servicers and sewer pipe cleaners

(O*NET 47-4071.00)

Clean and repair septic tanks, sewer lines, or drains. May patch walls and partitions of tank, replace damaged drain tile, or repair breaks in underground piping.

2004 employment: 20,000
 Projected 2004-14 employment change: Faster than average
 Most significant source of postsecondary education or training:
 Moderate-term on-the-job training

Service unit operators, oil, gas, and mining

(O*NET 47-5013.00)

Operate equipment to increase oil flow from producing wells or to remove stick pipe, casing, tools, or other obstructions from drilling wells. May also perform similar services in mining exploration operations. Includes fishing-tool technicians.

2004 employment: 17,000
 Projected 2004-14 employment change: Decline
 Most significant source of postsecondary education or training:
 Moderate-term on-the-job training

Installation, maintenance, and repair occupations

Bicycle repairers

(O*NET 49-3091.00)

Repair and service bicycles.

2004 employment: 8,000
 Projected 2004-14 employment change: About as fast as average
 Most significant source of postsecondary education or training:
 Moderate-term on-the-job training

Commercial divers

(O*NET 49-9092.00)

Work below surface of water, using scuba gear to inspect, repair, remove, or install equipment and structures. May use a variety of power and hand tools, such as drills, sledgehammers, torches, and welding equipment. May conduct tests or experiments, rig explosives, or photograph structures or marine life. Excludes fishers and related fishing workers, athletes and sports competitors, and police and sheriff's patrol officers.

2004 employment: 2,900
 Projected 2004-14 employment change: About as fast as average
 Most significant source of postsecondary education or training:
 Moderate-term on-the-job training

Control and valve installers and repairers, except mechanical door

(O*NET 49-9012.01, 49-9012.02, 49-9012.03)

Install, repair, and maintain mechanical regulating and controlling devices, such as electric meters, gas regulators, thermostats, safety and flow valves, and other mechanical governors.

2004 employment: 38,000
 Projected 2004-14 employment change: More slowly than average
 Most significant source of postsecondary education or training:
 Moderate-term on-the-job training

Fabric menders, except garment

(O*NET 49-9093.00)

Repair tears, holes, and other defects in fabrics, such as draperies, linens, parachutes, and tents.

2004 employment: 2,700
 Projected 2004-14 employment change: Decline
 Most significant source of postsecondary education or training:
 Moderate-term on-the-job training

First-line supervisors/managers of mechanics, installers, and repairers

(O*NET 49-1011.00)

Supervise and coordinate the activities of mechanics, installers, and repairers. Excludes team or work leaders.

2004 employment: 469,000

Projected 2004-14 employment change: About as fast as average
Most significant source of postsecondary education or training:
Work experience in a related occupation

Helpers—installation, maintenance, and repair workers

(O*NET 49-9098.00)

Help installation, maintenance, and repair workers in maintenance, parts replacement, and repair of vehicles, industrial machinery, and electrical and electronic equipment. Perform duties, such as furnishing tools, materials, and supplies to other workers; cleaning work area, machines, and tools; and holding materials or tools for other workers.

2004 employment: 163,000

Projected 2004-14 employment change: About as fast as average
Most significant source of postsecondary education or training:
Short-term on-the-job training

Locksmiths and safe repairers

(O*NET 49-9094.00)

Repair and open locks; make keys; change locks and safe combinations; and install and repair safes.

2004 employment: 28,000

Projected 2004-14 employment change: About as fast as average
Most significant source of postsecondary education or training:
Moderate-term on-the-job training

Manufactured building and mobile home installers

(O*NET 49-9095.00)

Move or install mobile homes or prefabricated buildings.

2004 employment: 15,000

Projected 2004-14 employment change: More slowly than average
Most significant source of postsecondary education or training:
Moderate-term on-the-job training

Mechanical door repairers

(O*NET 49-9011.00)

Install, service, or repair opening and closing mechanisms of automatic doors and hydraulic door closers. Includes garage door mechanics.

2004 employment: 11,000

Projected 2004-14 employment change: About as fast as average
Most significant source of postsecondary education or training:
Moderate-term on-the-job training

Recreational vehicle service technicians

(O*NET 49-3092.00)

Diagnose, inspect, adjust, repair, or overhaul recreational vehicles including travel trailers. May specialize in maintaining gas, electrical, hydraulic, plumbing, or chassis/towing systems as well as repairing generators, appliances, and interior components. Includes workers who perform customized van conversions. Excludes automotive service technicians and mechanics, and bus and truck mechanics and diesel engine specialists who also work on recreation vehicles.

2004 employment: 13,000

Projected 2004-14 employment change: Faster than average
Most significant source of postsecondary education or training:
Long-term on-the-job training

Refractory materials repairers, except brickmasons

(O*NET 49-9045.00)

Build or repair furnaces, kilns, cupolas, boilers, converters, ladles, soaking pits, ovens, etc., using refractory materials.

2004 employment: 3,700

Projected 2004-14 employment change: Decline
Most significant source of postsecondary education or training:
Moderate-term on-the-job training

Riggers

(O*NET 49-9096.00)

Set up or repair rigging for construction projects, manufacturing plants, logging yards, ships and shipyards, or for the entertainment industry.

2004 employment: 13,000

Projected 2004-14 employment change: About as fast as average
Most significant source of postsecondary education or training:
Short-term on-the-job training

Security and fire alarm systems installers

(O*NET 49-2098.00)

Install, program, maintain, and repair security and fire alarm wiring and equipment. Ensure that work is in accordance with relevant codes. Excludes electricians who do a broad range of electrical wiring.

2004 employment: 47,000

Projected 2004-14 employment change: Faster than average
Most significant source of postsecondary education or training:
Postsecondary vocational award

Signal and track switch repairers

(O*NET 49-9097.00)

Install, inspect, test, maintain, or repair electric gate crossings, signals, signal equipment, track switches, section lines, or intercommunications systems within a railroad system.

2004 employment: 8,200

Projected 2004-14 employment change: More slowly than average
Most significant source of postsecondary education or training:
Moderate-term on-the-job training

Tire repairers and changers

(O*NET 49-3093.00)

Repair and replace tires.

2004 employment: 91,000

Projected 2004-14 employment change: More slowly than average
Most significant source of postsecondary education or training:
Short-term on-the-job training

Production occupations

Cementing and gluing machine operators and tenders

(O*NET 51-9191.00)

Operate or tend cementing and gluing machines to join items for further processing or to form a completed product. Processes include joining veneer sheets into plywood; gluing paper; joining rubber and rubberized fabric parts, plastic, simulated leather, or other materials. Excludes shoe machine operators and tenders.

2004 employment: 25,000
 Projected 2004-14 employment change: More slowly than average
 Most significant source of postsecondary education or training: Moderate-term on-the-job training

Chemical equipment operators and tenders

(O*NET 51-9011.01, 51-9011.02)

Operate or tend equipment to control chemical changes or reactions in the processing of industrial or consumer products. Equipment used includes devulcanizers, steam-jacketed kettles, and reactor vessels. Excludes chemical plant and system operators.

2004 employment: 49,000
 Projected 2004-14 employment change: Decline
 Most significant source of postsecondary education or training: Moderate-term on-the-job training

Chemical plant and system operators

(O*NET 51-8091.00)

Control or operate an entire chemical process or system of machines.

2004 employment: 60,000
 Projected 2004-14 employment change: Decline
 Most significant source of postsecondary education or training: Long-term on-the-job training

Cleaning, washing, and metal pickling equipment operators and tenders

(O*NET 51-9192.00)

Operate or tend machines to wash or clean products, such as barrels or kegs, glass items, tin plate, food, pulp, coal, plastic, or rubber, to remove impurities.

2004 employment: 18,000
 Projected 2004-14 employment change: More slowly than average
 Most significant source of postsecondary education or training: Moderate-term on-the-job training

Cooling and freezing equipment operators and tenders

(O*NET 51-9193.00)

Operate or tend equipment, such as cooling and freezing units, refrigerators, batch freezers, and freezing tunnels, to cool or freeze products, food, blood plasma, and chemicals.

2004 employment: 8,700
 Projected 2004-14 employment change: More slowly than average
 Most significant source of postsecondary education or training: Moderate-term on-the-job training

Crushing, grinding, and polishing machine setters, operators, and tenders

(O*NET 51-9021.00)

Set up, operate, or tend machines to crush, grind, or polish materials, such as coal, glass, grain, stone, food, or rubber.

2004 employment: 43,000
 Projected 2004-14 employment change: More slowly than average
 Most significant source of postsecondary education or training: Moderate-term on-the-job training

Cutters and trimmers, hand

(O*NET 51-9031.00)

Use hand tools or hand-held power tools to cut and trim a variety of manufactured items, such as carpet, fabric, stone, glass, or rubber.

2004 employment: 29,000
 Projected 2004-14 employment change: More slowly than average
 Most significant source of postsecondary education or training: Short-term on-the-job training

Cutting and slicing machine setters, operators, and tenders

(O*NET 51-9032.01, 51-9032.02, 51-9032.03, 51-9032.04)

Set up, operate, or tend machines that cut or slice materials, such as glass, stone, cork, rubber, tobacco, food, paper, or insulating material. Excludes woodworking machine setters, operators, and tenders; cutting, punching, and press machine setters, operators, and tenders, metal and plastic; and textile cutting machine setters, operators, and tenders.

2004 employment: 75,000
 Projected 2004-14 employment change: Decline
 Most significant source of postsecondary education or training: Moderate-term on-the-job training

Etchers and engravers

(O*NET 51-9194.01, 51-9194.02, 51-9194.03, 51-9194.04, 51-9194.05, 51-9194.06)

Engrave or etch metal, wood, rubber, or other materials for identification or decorative purposes. Includes such workers as etcher-circuit processors, pantograph engravers, and silk screen etchers. Includes photoengravers with prepress technicians and workers.

2004 employment: 12,000
 Projected 2004-14 employment change: More slowly than average
 Most significant source of postsecondary education or training: Long-term on-the-job training

Extruding, forming, pressing, and compacting machine setters, operators, and tenders

(O*NET 51-9041.01, 51-9041.02)

Set up, operate, or tend machines, such as glass forming machines, plodder machines, and tuber machines, to shape and form products, such as glassware, food, rubber, soap, brick, tile, clay, wax, tobacco, or cosmetics. Excludes paper goods machine setters, operators, and tenders; and shoe machine operators and tenders.

2004 employment: 74,000
 Projected 2004-14 employment change: Decline
 Most significant source of postsecondary education or training: Moderate-term on-the-job training

First-line supervisors/managers of production and operating workers

(O*NET 51-1011.00)

Supervise and coordinate the activities of production and operating workers, such as inspectors, precision workers, machine setters, and operators, assemblers, fabricators, and plant and system operators. Excludes team or work leaders.

2004 employment: 731,000
 Projected 2004-14 employment change: More slowly than average
 Most significant source of postsecondary education or training: Work experience in a related occupation

Furnace, kiln, oven, drier, and kettle operators and tenders

(O*NET 51-9051.00)

Operate or tend heating equipment other than basic metal, plastic or food processing equipment. Includes activities, such as annealing glass, drying lumber, curing rubber, removing moisture from materials, or boiling soap.

2004 employment: 30,000

Projected 2004-14 employment change: Decline

Most significant source of postsecondary education or training:
Moderate-term on-the-job training

Gas plant operators

(O*NET 51-8092.01, 51-8092.02)

Distribute or process gas for utility companies and others by controlling compressors to maintain specified pressures on main pipelines.

2004 employment: 11,000

Projected 2004-14 employment change: More slowly than average

Most significant source of postsecondary education or training:
Long-term on-the-job training

Grinding and polishing workers, hand

(O*NET 51-9022.00)

Grind, sand, or polish, using hand tools or hand-held power tools, a variety of metal, wood, stone, clay, plastic, or glass objects. Includes chippers, buffers, and finishers.

2004 employment: 45,000

Projected 2004-14 employment change: Decline

Most significant source of postsecondary education or training:
Moderate-term on-the-job training

Helpers—production workers

(O*NET 51-9198.01, 51-9198.02)

Help production workers by performing duties of lesser skill. Duties include supplying or holding materials or tools, and cleaning work area and equipment. Excludes apprentice workers.

2004 employment: 484,000

Projected 2004-14 employment change: More slowly than average

Most significant source of postsecondary education or training:
Short-term on-the-job training

Mixing and blending machine setters, operators, and tenders

(O*NET 51-9023.00)

Set up, operate, or tend machines to mix or blend materials, such as chemicals, tobacco, liquids, color pigments, or explosive ingredients. Excludes food batchmakers.

2004 employment: 120,000

Projected 2004-14 employment change: More slowly than average

Most significant source of postsecondary education or training:
Moderate-term on-the-job training

Molders, shapers, and casters, except metal and plastic

(O*NET 51-9195.01, 51-9195.02, 51-9195.03, 51-9195.04, 51-9195.05, 51-9195.06, 51-9195.07)

Mold, shape, form, cast, or carve products such as food products, figurines, tile, pipes, and candles consisting of clay, glass, plaster, concrete, stone, or combinations of materials.

2004 employment: 47,000

Projected 2004-14 employment change: Decline

Most significant source of postsecondary education or training:
Moderate-term on-the-job training

Packaging and filling machine operators and tenders

(O*NET 51-9111.00)

Operate or tend machines to prepare industrial or consumer products for storage or shipment. Includes cannery workers who pack food products.

2004 employment: 412,000

Projected 2004-14 employment change: More slowly than average

Most significant source of postsecondary education or training:
Short-term on-the-job training

Paper goods machine setters, operators, and tenders

(O*NET 51-9196.00)

Set up, operate, or tend paper goods machines that perform a variety of functions, such as converting, sawing, corrugating, banding, wrapping, boxing, stitching, forming, or sealing paper or paperboard sheets into products.

2004 employment: 111,000

Projected 2004-14 employment change: More slowly than average

Most significant source of postsecondary education or training:
Moderate-term on-the-job training

Petroleum pump system operators, refinery operators, and gaugers

(O*NET 51-8093.01, 51-8093.02, 51-8093.03)

Control the operation of petroleum refining or processing units. May specialize in controlling manifold and pumping systems, gauging or testing oil in storage tanks, or regulating the flow of oil into pipelines.

2004 employment: 43,000

Projected 2004-14 employment change: Decline

Most significant source of postsecondary education or training:
Long-term on-the-job training

Separating, filtering, clarifying, precipitating, and still machine setters, operators, and tenders

(O*NET 51-9012.00)

Set up, operate, or tend continuous flow or vat-type equipment; filter presses; shaker screens; centrifuges; condenser tubes; precipitating, fermenting, or evaporating tanks; scrubbing towers; or batch stills. These machines extract, sort, or separate liquids, gases, or solids from other materials to recover a refined product. Includes dairy processing equipment operators. Excludes chemical equipment operators and tenders.

2004 employment: 38,000

Projected 2004-14 employment change: More slowly than average

Most significant source of postsecondary education or training:
Moderate-term on-the-job training

Tire builders

(O*NET 51-9197.00)

Operate machines to build tires from rubber components.

2004 employment: 18,000

Projected 2004-14 employment change: Decline

Most significant source of postsecondary education or training:
Moderate-term on-the-job training

Transportation and material moving occupations

Aircraft cargo handling supervisors

(O*NET 53-1011.00)

Direct ground crew in the loading, unloading, securing, and staging of aircraft cargo and baggage. Determine the quantity and orientation of cargo and compute aircraft center of gravity. May accompany aircraft as member of flight crew and monitor and handle cargo in flight, and assist and brief passengers on safety and emergency procedures. Includes loadmasters.

2004 employment: 7,700

Projected 2004-14 employment change: About as fast as average
Most significant source of postsecondary education or training:
Work experience in a related occupation

Airfield operations specialists

(O*NET 53-2022.00)

Ensure the safe takeoff and landing of commercial and military aircraft. Duties include coordination between air-traffic control and maintenance personnel; dispatching; using airfield landing and navigational aids; implementing airfield safety procedures; monitoring and maintaining flight records; and applying knowledge of weather information.

2004 employment: 5,000

Projected 2004-14 employment change: About as fast as average
Most significant source of postsecondary education or training:
Long-term on-the-job training

Ambulance drivers and attendants, except emergency medical technicians

(O*NET 53-3011.00)

Drive ambulance or assist ambulance drivers in transporting sick, injured, or convalescent persons. Assist in lifting patients.

2004 employment: 20,000

Projected 2004-14 employment change: Much faster than average
Most significant source of postsecondary education or training:
Moderate-term on-the-job training

Bridge and lock tenders

(O*NET 53-6011.00)

Operate and tend bridges, canal locks, and lighthouses to permit marine passage on inland waterways, near shores, and at danger points in waterway passages. May supervise such operations. Includes drawbridge operators, lock tenders and operators, and slip bridge operators.

2004 employment: 3,700

Projected 2004-14 employment change: More slowly than average
Most significant source of postsecondary education or training:
Short-term on-the-job training

First-line supervisors/managers of transportation and material moving machine and vehicle operators

(O*NET 53-1031.00)

Directly supervise and coordinate activities of transportation and material-moving machine and vehicle operators and helpers.

2004 employment: 228,000

Projected 2004-14 employment change: About as fast as average
Most significant source of postsecondary education or training:
Work experience in a related occupation

Parking lot attendants

(O*NET 53-6021.00)

Park automobiles or issue tickets for customers in parking lot or garage. May collect fee.

2004 employment: 122,000

Projected 2004-14 employment change: Decline
Most significant source of postsecondary education or training:
Short-term on-the-job training

Service station attendants

(O*NET 53-6031.00)

Service automobiles, buses, trucks, boats, and other automotive or marine vehicles with fuel, lubricants, and accessories. Collect payment for services and supplies. May lubricate vehicle, change motor oil, install antifreeze, or replace lights or other accessories, such as windshield wiper blades or fan belts. May repair or replace tires.

2004 employment: 91,000

Projected 2004-14 employment change: More slowly than average
Most significant source of postsecondary education or training:
Short-term on-the-job training

Traffic technicians

(O*NET 53-6041.00)

Conduct field studies to determine traffic volume, speed, effectiveness of signals, adequacy of lighting, and other factors influencing traffic conditions, under direction of traffic engineer.

2004 employment: 6,500

Projected 2004-14 employment change: About as fast as average
Most significant source of postsecondary education or training:
Short-term on-the-job training

Transportation inspectors

(O*NET 53-6051.01, 53-6051.02, 53-6051.03, 53-6051.04, 53-6051.05, 53-6051.06)

Inspect equipment or goods in connection with the safe transport of cargo or people. Includes rail transport inspectors, such as freight inspectors, car inspectors, rail inspectors, and other nonprecision inspectors of other types of transportation vehicles.

2004 employment: 26,000

Projected 2004-14 employment change: About as fast as average
Most significant source of postsecondary education or training:
Work experience in a related occupation

Assumptions and Methods Used in Preparing Employment Projections

Occupational statements in the *Handbook* use 1 of 5 phrases to describe the projected change in employment between 2004 and 2014. (See page 24.) These phrases are based on numerical projections developed using the Bureau of Labor Statistics (BLS) employment projections model system. Projections of occupational employment are the sixth and final step in the system; the six steps are listed in the discussion of methods below. A full description of projections methods appears in the BLS *Handbook of Methods*. A discussion of projections methods also is accessible on the Internet at: <http://www.bls.gov/emp/empmth01.htm>. The November 2005 *Monthly Labor Review* presents a comprehensive discussion of the 2004-14 projections of the economy, labor force, and industry and occupation employment. The winter 2005-06 *Occupational Outlook Quarterly* presents the projections in a series of charts.

The projections reflect the knowledge and judgment of staff in the BLS Office of Occupational Statistics and Employment Projections and of knowledgeable people from other BLS offices, other government agencies, colleges and universities, industries, unions, professional societies, and trade associations, who furnished data and information, prepared reports, or reviewed the projections. BLS takes full responsibility, however, for the projections.

Assumptions. The information in the *Handbook* is based on an economic projection, which is characterized by a slower growth in labor force (1.0 percent annually from 2004 to 2014 compared with 1.2 percent over the past 10-year period, 1994-2004), an expected unemployment rate of 5.0 percent in 2014, a continued increase in labor productivity (2.7-percent average annual growth), and an improving but still large deficit of foreign trade. The Federal budget deficit is assumed to decline due largely to modest growth in Federal defense and nondefense expenditures. Other assumptions include consumer spending on durable goods that grows faster than consumer spending on services and nondurable goods. Within nondurable goods, a large source of consumer spending is drugs and medicines, and is assumed to grow much faster than spending on most other categories. Within services, consumer spending on medical care is expected to drive growth. Investment spending for production equipment—including communication equipment, computers, and software—will grow rapidly. Expenditures for construction of residential structures will settle down after its 2004 record high, but a still healthy 1.7-percent average annual growth is projected over the 2004-14 projection period. Spending on nonresidential construction will grow faster than the historical pace—1.3 percent annually over the projection period, compared with 0.7-percent annual growth between 1994 and 2004.

Although BLS considers these assumptions reasonable, the economy may follow a different course, resulting in a different pattern of occupational growth. Real growth also could be different because most occupations are sensitive to a much wider variety of factors than those considered in the various projections models. Unforeseen changes in consumer,

business, or government spending patterns and in the ways in which goods and services are produced could greatly alter the growth of individual occupations.

Methods. This section summarizes the steps involved in BLS projections of employment by occupation. BLS uses U.S. Census Bureau projections of the population by age, gender, and race, combined with projections of labor force participation rates—the percent of the specified group of the population working or seeking work—to arrive at estimates of the civilian labor force for the projected year.

BLS projections are developed in a series of six steps, each of which is based on separate projections procedures and models and various related assumptions. These six steps, or system components, deal with:

- Size and demographic composition of the labor force
- Growth of the aggregate economy
- Final demand or gross domestic product (GDP)
- Interindustry relationships (input-output)
- Industry output and employment
- Occupational employment

These components provide the overall analytical framework needed to develop detailed employment projections. Each component is developed in order, with the results of each used as input for successive components and with some results feeding back into earlier steps. Each step is repeated a number of times to ensure internal consistency as assumptions and results are reviewed and revised.

The projections of the labor force and assumptions about other demographic variables, fiscal and monetary policies, foreign economic activity, and energy prices and availability form the input to the macroeconomic model. This model projects GDP (sales to all final consuming sectors in the economy) and the distribution of GDP by its major demand components (consumer expenditures, investment, government consumption and gross investments, and exports and imports). Estimating the intermediate flows of goods and services—for example, the steel incorporated into automobiles—is the next step in the projections process. The resulting estimates of demand for goods and services are used to project industry output of final products as well as total output by industry.

Industry output of goods and services is then converted to industry employment. Studies of trends in productivity and technology are used to estimate future output per worker hour, and regression analysis is used to estimate worker hours. These estimates, along with output projections, are used to develop the final industry employment projections.

An industry-occupation matrix, also known as the national employment matrix, is used to project employment for wage and salary workers. The matrix shows occupational staffing patterns—each occupation as a percent of employment in every industry. The matrix covering the 2004-14 period includes 336 detailed industries and 754 detailed occupations. Data

for current staffing patterns in the matrix come from the BLS Occupational Employment Statistics surveys, which collect data from employers on a 3-year cycle.

The occupational staffing patterns for each industry were projected based on anticipated changes in the ways in which goods and services are produced, and were then applied to projected industry employment. The resulting employment was summed across industries to derive total wage and salary employment by occupation. Using this method, rapid employment growth is projected for health care workers while employment of rail transportation workers is expected to decline, reflecting the projected changes in the health care and railroad transportation industries, respectively.

Employment in an occupation also may grow or decline as a result of many other factors. For example, faster-than-average growth also is expected among computer support specialists as technology advances and organizations place more emphasis on network applications and on maximizing the efficiency of their computer systems. On the other hand,

automation, the expanding use of computers, and developments in computer software will result in declining employment among procurement clerks, order clerks, and word processors and typists. The projected-year matrix incorporates these expected changes.

Data on self-employed workers in each occupation come from the Current Population Survey. Numbers of self-employed workers were projected separately.

Replacement needs. In most occupations, replacement needs provide more job openings than growth. Replacement openings occur as people leave occupations. Some individuals transfer to other occupations as a step up the career ladder or to change careers; some stop working temporarily, perhaps to return to school or care for a family; other workers—retirees for example—leave the labor force permanently. A discussion of replacements and the methodology used to prepare estimates is presented in *Occupational Projections and Training Data, 2006-07 Edition*, BLS Bulletin 2602.

Occupational Information Network Coverage

The *Occupational Information Network* (O*NET), which replaced the *Dictionary of Occupational Titles*, is used by public employment service offices to classify and place jobseekers. The O*NET was developed by job analysts. The information on job duties, knowledge and skills, education and training, and other occupational characteristics comes directly from workers and employers. Information on O*NET is available from O*NET Project, U.S. Department of Labor/ETA, 200 Constitution Ave. NW., Room N-5637, Washington, DC 20210-0001. Telephone (202) 693-3660. Internet: <http://www.doleta.gov/programs/onet>

The O*NET reflects the 2000 *Standard Occupational Classification* (SOC) system. With 822 detailed occupations, the SOC represents the Federal Government's most recent effort to analyze

the occupational structure in the United States and to provide a universal occupational classification system. All Federal agencies that collect occupational data adhere to the SOC. Information on the SOC, including its occupational structure, is available on the Internet: <http://www.bls.gov/soc>

Occupational statements in this 2006-07 edition of the *Handbook* list the O*NET codes that relate to or match the definitions used in the Bureau's Occupational Employment Statistics (OES) survey—the principal source of occupational employment data in the *Handbook*. All numbers listed also appear in the table below. The table is arranged by the O*NET/SOC code, followed by the O*NET/SOC title and the page on which the corresponding *Handbook* statement begins.

SOC Code	O*NET Title	Page	SOC Code	O*NET Title	Page

Related Publications

Occupational Projections and Training Data

2006-07 Edition . BLS Bulletin 2602

This publication provides statistical data to support information presented in the *Occupational Outlook Handbook*. Education and training planners, career counselors, and jobseekers can compare hundreds of occupations on factors such as employment change, self-employed workers, earnings, and the most significant source of postsecondary education or training. Users also will find awards and degree data, by field of study.

Career Guide to Industries

2006-07 Edition . BLS Bulletin 2601

As a companion publication to the *Occupational Outlook Handbook*, the *Career Guide* discusses careers from an industry perspective.

The 45 industries highlighted in this bulletin account for 3 of every 4 wage and salary jobs in the Nation. The *Career Guide* describes some occupations not covered by the *Handbook*, and discusses the nature of the industry, job qualifications and advancement opportunities, industry outlook, and earnings.
