Latinwo, L. M., Donald, C., Ikediobi, C., and Silver, S. Effects of intracellular glutathione on sensitivity of *Escherichia coli* to mercury and arsenite. *BIOCHEMICAL AND BIOPHYSICAL RESEARCH COMMUNICATIONS*; 242 (1).1998.67-70.AB - BIOSIS COPYRIGHT: BIOL ABS. The effect of intracellular glutathione on sensitivity to mercuric cations and arsenite anions was studied in *Escherichia coli* mutants that lack glutathione (*gshA*) with or without an additional mutation affecting the osmotregulant trehalose. The absence of glutathione increased cellular sensitivity to both Hg^{2+} and AsO_2^- . The double mutant was more sensitive to Hg^{2+} than the single mutant strain. The addition of plasmid resistance determinants of Hg^{2+} and AsO_2^- showed additivity between chromosomal genes and plasmid genes. Mercury resistance was increased in the plasmid-containing cells but not up to the level of wild-type cells. Plasmid arsenite resistance was not expressed in the *gshA* mutant of *E. coli*. 1998.

Toxicity of inorganic compounds in the Spirotox test: A miniaturized version of the Spirostomum ambiguum test. *ARCHIVES OF ENVIRONMENTAL CONTAMINATION AND TOXICOLOGY*; 34 (1).1998.1-5.AB - BIOSIS COPYRIGHT: BIOL ABS.The Spirostomum ambiguum toxicity test has been intensively studied in the Department of Environmental Health Sciences, Warsaw University of Medicine for the last 5 years.The purpose

of the present work was to develop and evaluate a miniaturized microplate version of the test, called the Spirotox test, and to estimate the toxicity of selected inorganic compounds to the *Spirostomum ambiguum*. The test was carried out in conventional 24-well (6plate). Preliminary test was one control and 11 toxicant concentrations with two duplicates. Definitive test was one control and five toxicant concentrations with three duplicates per concentration. Dilution of the sample was made directly in the plate. Toxicity series of heavy metals based on 24-h LC50 may be established as follows: Cu > A- > Hg > Cr > Cd > Zn classes: extremely toxic: below 0.1 ppm (Cu, Ag, Hg); very toxic: 0.1-1.0 ppm (Cr, Cd, Zn . 1998.

Png, F. Y. Shrinkage of motor axons following systemic exposure to inorganic mercury. AU - PAMPHLETT R. *JOURNAL OF NEUROPATHOLOGY & EXPERIMENTAL NEUROLOGY*; 57 (4).1998.360-366.AB - BIOSIS COPYRIGHT: BIOL ABS. Systemically-administered inorganic mercury localizes to motor neurons, but it is not known if mercury injures these neurons. We therefore looked for signs of damage to the motor and sensory neurons of mice that had been exposed to inorganic mercury. Young adult mice were injected intraperitoneally with either 1 or 2 mug/g of mercuric chloride and perfused 1 or 30 weeks later. The cellular distribution of mercury in the spinal cord was examined with silver nitrate autometallography. The numbers and sizes of myelinated axons in the L5 anterior and posterior roots were quantitated using an image analysis program. Mercury was found throughout the cytoplasm of motor neuron cell bodies after 1 week and in paranuclear aggregations after 30 weeks. Thirty weeks after exposure to either 1 or 2 mug/g of mercury, fewer large myelinated axons were seen in mercury-injected groups than in controls, though total numbers of myelinated axons did not differ between groups. A slight incre . 1998.
