## EXTENSION/FSA COMMENTS:

General: The remnants of hurricane Humberto pushed through Alabama Thursday, which brought much needed, widespread rainfall to most of the state. Donald Mann in the Jackson County FSA office stated that 1 to 3 inches of rain was received from this storm. This moisture was expected to help pastures and late maturing soybeans begin to recover from the devastating drought conditions experienced throughout the year. Temperatures for the state cooled off during the past week, and varied from just below to just above normal. Daytime highs ranged from 90 degrees in Sand Mountain to 97 degrees in Pinson. Overnight lows dipped down to 47 degrees in Hamilton and Bridgeport. Headland recorded the warmest overnight temperature at 61
degrees. All reporting weather stations received some rainfall during the past week. Accumulations ranged from 0.02 inches in Anniston to 5.97 inches in Hamilton. Cullman received over 4 inches of rain, while numerous other stations totaled over 3 inches. Farmers in Etowah and Autauga Counties worked on bed preparation for small grain seeding, with a few producers having already sown winter ryegrass.

Corn/Soybeans: Alabama's corn harvest continued to push forward, but remained behind the progress of producers a year ago. The state's soybean crop remained in mostly very poor or poor condition. Dennis Delaney, Soybean Specialist with Auburn University, reported that a lot of the crop had been severely hurt, particularly the early planted and early maturity varieties in northern Alabama. The southwestern part of the state was in better condition due to later plantings and more rainfall. The triple digit heat during bloom hurt pod set, but many fields recovered and were expected to produce a fair crop. Asian soybean rust was found in Baldwin County in late June and several additional counties recently. Producers in the affected areas were spraying fungicide applications. Soybean loopers were also seen in southern Alabama.

Cotton/Peanuts: Cotton harvest moved forward during the past week. Leonard Kuykendall, Autauga County Extension Agent, indicated that some cotton was picked at less than half a bale per acre. Other producers in the county were busy defoliating their fields. William C. Birdsong, Extension Agronomist at the Wiregrass Research and Extension Center, reported that some farmers that purchased cotton strippers last year had already started harvest. Yields produced on these fields averaged approximately 500 pounds of lint per acre. Insect pressure had been light, but there were several reports of leaf-footed stinkbugs in cotton fields this past week. A few whiteflies were also found in the area. Peanut harvest was underway in Districts 50 and 60 during the past week, with most of the crop in fair to excellent condition. Progress was slightly ahead of last year, but 12 percentage points behind the five-year average. James $D$. Jones, Jr., Henry County Extension Agent, mentioned that a few farmers in the county will start digging their fields in the coming week.

Pasture/Hay/Livestock: Pasture conditions showed a little improvement with the past week's rainfall, but still remained in mostly very poor and poor condition. Mr. Birdsong noted that many hay fields had a high infestation of fall armyworms, and most producers were busy spraying insecticide applications. The condition of the state's livestock was quite varied. Some were reported in very poor condition, while others were in good condition.

ALABAMA＇S Weekly Crop Weather for the Period：Monday，September 10， 2007 To Sunday，September 16， 2007
