4. CLIPER (Neumann, 1972). Stepwise multiple screening regression using the predictors derived from climatology and persistence
5. NHC-72 (Neumann, Hope, Miller, 1972). A modified stepwise multiple screening regression system which combines the NHC-67 concept and the CLIPER system into a single model.
6. NHC-73 (Neumann and Lawrence, 1973). Similar in concept to the NHC-72 except it also uses the "perfect prog" and MOS (model output statistics) methods to introduce NMC (National Meteorological Center) numerical prognostic data into the prediction equations.
7. NMC MFM MODEL (Hovemeyer, 1975). A ten-level baroclinic model which uses a moving fine mesh (MFM) grid nested within the coarser NMC fixed grid primitive equation (PE) model.

In addition, operational forecasts of tropical cyclone intensity changes in knots at 12-hourly intervals out to 72 hours are generated by a program named SHIFOR (Statistical Hurricane Intensity FORcasts). Generation of the forecast equations was done by multiple screening regression techniques using historical tropical cyclone data as input. Results over the past several years have shown that SHIFOR and official intensity forecasts have comparable skill scores.

The National Hurricane Center uses the above models as guidance in the formulation of its forecasts. The hurricane forecaster also makes extensive use of analyses and prognoses produced by NMC and RCTM (Regional Center for Tropical Meteorology) in Miami.

VERIFICATION

Verification statistics for the 1982 season are shown in Table

The initial position error in Table 1 is the difference between the operational initial position and that determined during post analysis (best track position). The forecast displacement error is the vector difference between the forecast displacement and the actual displacement computed from best-track positions. Landfall prediction errors for the official forecasts are given in Tables 2a and 2b. These are defined as the distance from the predicted landfall point made 24 hours prior to actual landfall, to the actual landfall point. In cases where a storm either crossed an island or made landfall when predicted to remain offshore, the error was designated as the distance from the landfall point to the nearest point on the forecast track.

Tropical cyclone warning lead times for United States landfalling storms are given in Table 3a. A summary of warning lead times for the period 1970-1982 for hurricanes only and for both tropical storms and hurricanes is given in Table 3b. The length of time between the issuance of the warnings and the time that the center crossed the coast, as determined from the "best track," was taken as the warning lead time. A more complete discussion of the verification of tropical cyclone warning lead times, as well as verifications for individual storms from 1970-1977, can be found in the 1977 Annual Data and Verification Tabulation (Lawrence, Hebert, and Staff, 1979).

DATA SUMMARIES

A summary of 1982 North Atlantic tropical and subtropical cyclone statistics is given in Table 4. Tracks of 1982 named storms as well as the June subtropical cyclone are shown in Figure

The best track, initial, and forecast positions for 1982 named storms are in Table 5, along with initial position and forecast errors, and storm average errors.

Table 6 lists all center fix positions and intensity evaluations used operationally at the National Hurricane Center during 1982. In chronological order, and include those obtained by aerial reconnaissance penetrations, satellite (Miami SFSS), and land-based radar. This precedes the initial table.

Supplementary Vortex Data Messages which replaced Vortex P in the 1977 Annual Data Tabulation are given in Table 7. A diagram of paths flown in obtaining these Data Messages is given in Figure 2. A symbolic code for interpreting the Data Messages, revised this year, is Appendix A.

Table 8 is an aerial reconnaissance summary for the 1982 season.

Graphs of the lowest central pressure versus time for cyclones and the subtropical cyclone are presented in Figure 3.

Daily GOES-5 satellite photographs of 1982 named tropical cyclones and the subtropical cyclone are shown in Figure 4.

ACKNOWLEDGMENTS

Main contributors were: Frank Revitte and Andrew Stern, who did all center fixes in chronological order and performed other miscellaneous tasks; Mr. Miles Lawrence, who computed the verification statistics; Ms. Mary Watson, who drafted the pressure/time graphs; Mr. Frank Marzilli, who did all reduction work on the graphs and tables; and Mrs. Teresa and Ms. Mary Ellen Dell, who typed the tables and manuscript.

INTRODUCTION

This is the ninth report of an annual series prepared by the National Hurricane Center (NHC) to provide a source of summarized data on Atlantic tropical cyclones. It will not duplicate the narrative overview of the hurricane season and the description of individual storms, which will continue to be published in the Monthly Weather Review.

In addition to data supplied by the National Weather Service, materials have been furnished by the NOAA National Earth Satellite Services (NESS) Miami Office, and the CARCAH (Chief Aerial Reconnaissance Coordination, all Hurricanes).

OBJECTIVE FORECAST TECHNIQUES

The following tropical cyclone prediction models were used at the National Hurricane Center for forecasting motion on an operational basis:

1. NHC-67 (Miller, Hill, Chase, 1968). A stepwise screening regression model using predictors derived from the current and 24-hour old 1000, 700, and 500 mb data, and includes persistence during the early forecast periods.
2. SANBAR (Sanders and Burpee, 1968). A filtered barotropic model using input data derived from the 1000 to 100 mb pressure weighted winds. The model requires use of "bogus" data in data-void areas. The system was modified by Pike (1972) so that the initial wind field near the storm would conform to the current storm motion.
3. HURRAN (Hope and Neumann, 1970). An analog system using as a data base the tracks of all Atlantic tropical storms and hurricanes dating back to 1886.

Table 2a. Landfall prediction errors for 1982 tropical storms and hurricanes.

Following is a list of landfall prediction errors for tropical storms and hurricanes during 1982. Each error represents the distance (in nautical miles) from the predicted landfall point determined from the "Official" forecast issued 24 hours prior to landfall to the actual landfall point determined from the Best Track. Only tropical storms and hurricanes are included. In some cases the storm crossed an island when predicted to pass offshore. In such cases, the perpendicular distance from the landfall point to the forecast track is taken as the landfall prediction error.

Storm name	Category at Landfall	Date/Time (Z) of Landfall	Landfall Forecast Error (N.MI.)	Location and Remarks
Alberto	(No landfall)			
Bery	(No landfall)			
Chris	Trop. Storm	9/11/12Z	*	Southwest Louisiana
Debby	(No landfall)			
Ernesto	(No landfall)			

* Storm developed within 24 hours of making landfall, therefore no forecast was made 24 hours prior to landfall.

Table 2b. Thirteen-year summary of errors in the prediction of the points of landfall of Atlantic tropical storms and hurricanes during the period 1970-1982.

	<u>United States Landfalls All Landfalls</u>	
1982 Mean 24-Hour Landfall Prediction Error (number of cases)	0	0
12 year average 1970-1982	39 n.mi. (21)	50 n.mi. (55)

Storm Name	Category at Landfall	Date/Time (Z) of Landfall	Location of Landfall	Type and Time (Z) of warnings issued for point of landfall	Warning lead time (hours)
Alberto	(No U.S. landfall)				
Beryl	(No U.S. landfall)				
Chris	Trop. Storm	9/1 /12Z	Southwest Louisiana	Gale Warnings issued 9/9/01Z	59 hours*
Debby	(No U.S. landfall)				
Ernesto	(No U.S. landfall)				

* Gale Warnings were issued 35 hours prior to the development of Tropical Storm Chris.

Table 3b. Average warning lead times for all tropical storms and hurricanes and for hurricanes alone, which made landfall on the mainland of the United States during 1982 and during the 12-year period of 1970-1981).

	All Tropical Storms and Hurricanes		All Hurricanes	
	1982	1970-1981	1982	1970-1981
Average Lead Time (hours)	59*	18		21
(number of cases)	(1)	(28)	(0)	(12)

* Gale Warnings were issued 35 hours prior to the development of Tropical Storm Chris.

Table 4. Summary Atlantic tropical Subtropical cyclone Statistics, 1982.

NO.	NAME	CLASS ¹	DATES	MAXIMUM SUSTAINED WINDS (KT)	LOWEST PRESSURE (MB)	U.S. DAMAGE (\$ MILLION)	EATHS
	ALBERTO	H	2-6 JUN	75	985	MINOR	23 (CUBA)

LEGEND FOR TABLE 6

Key to Observational (obs.) Unit and Resolution

OBSERVATIONAL UNIT

Reconnaissance

AF = Air Force

NOAA = National Oceanographic and Atmospheric Administration

Satellite

GOES-5 = Geostationary Operational Environmental Satellite

Radar

EYW-R = Key West, Florida National Weather Service Radar

DAB-R = Daytona Beach, Florida National Weather Service Radar

CHS-R = Charleston, South Carolina National Weather Service Radar

GLS-R = Galveston, Texas National Weather Service Radar

LCH-R = Lake Charles, Louisiana National Weather Service Radar

RESOLUTION

Reconnaissance

Navigational Accuracy/Meteorological Accuracy. (Example - 5/5).

Satellite

Classification confidence*, location and confidence**, visible or infrared resolution (km).

*1 = completely certain as to current intensity number used.

2 = tempted to vary up or down by 1/2 T or S number.

3 = might vary up or down by 1 T or S number, or more.

**1 = well defined eye with certain picture registration.

2 = well defined eye with uncertain picture registration.

3 = well defined circulation center with certain picture registration.

4 = well defined circulation center with uncertain picture registration.

5 = poorly defined circulation center with certain picture registration.

6 = poorly defined circulation center with uncertain picture registration.

(Example - ,1, VSBL 1 = classification confidence, location confidence 1, visible picture with 1 kilometer resolution.)

(Example - 2,5, IR 8 = classification confidence 2, location confidence 5, infrared picture with 8 kilometer resolution.)
