A.5 Letters and E-Mails Received on the Draft SEIS

May 1, 2006

4/23/06
TIR 9383 (7)

To whom it may concern:

For several weeks I have been reading with increasing concern about the recent issues with the aging Palisades nuclear reactor.

Admittedly, with my background obviously NOT being in Nuclear Energy, it has been difficult to effectively understand all the technical information being dispersed.

FF-1 But from what I have read, I want to emphasize that while I agree that the US and the world certainly will need to continue to utilize Nuclear Power to reduce emissions and the reliance on foreign oil, and I am all for SAFE, NEW NUCLEAR PLANTS/TECHNOLOGY, after careful consideration and some research, I feel it is in the best interests of the public for safety issues, to close Palisades down and certainly NOT RENEW THE LICENSE with

FF-2 that aging reactor and all the surrounding safety issues as a result.

FF-3 Please take this into consideration as you decide this issue. How horriffic if we in Michigan had a "Chernobyl" incident contaminating Lake Michigan and the surrounding area. What a disaster that would be.

Thank you for your consideration.

Sincerely,

Diane E. Byrne

Diane Byrne

Kalamazoo, MI 49009

4/28 In light of the recent radioactive exposure to workers at the Palisades plant, I am ever more convinced that this aging dinosaur needs to be shut down.

I. Introduction

A 20-year license extension is proposed for Palisades Nuclear Power Plant

Consumers Energy, owner, and Nuclear Management Company (NMC), LLC, operator, of the Palisades Nuclear Power Plant situated on Lake Michigan in Covert Township, Michigan, has applied to extend its operating license 20 years beyond its original 40-year operation tenure, which began in 1971. The Nuclear Regulatory Commission (NRC), a federal agency responsible for regulating nuclear power plants, is required by the National Environmental Protection Act (NEPA) to seek input from members of the public and interested groups, regarding the environmental impacts of this action, as well as alternatives to the proposed action.

Don't Waste Michigan, the Coalition for a Nuclear Free-Great Lakes, and the Nuclear Information and Resource Service have researched, coordinated and taken a lead in the development of these comments on the proposed action. In addition to providing important background information on the plant and its impact on the region, the groups also present their assessment of the NRC's draft environmental impact statement (EIS), comments on the re-licensing process and stakeholder participation, and recommendations for improving security at the plant, as well as comments aimed at prevention of the continued risky operation of the plant, and the establishment of a permanent site for storage of high-level radioactive waste on the Great Lakes shoreline.

Description of groups submitting comments

Don't Waste Michigan is a federation of environmental organizations with a 25-member board and membership of 1,000 founded in 1987 to oppose the designation of the state of Michigan as a repository for what was misleadingly termed "low-level" radioactive waste from eight states. Don't Waste Michigan's work was ultimately successful and the state of Michigan was eliminated from consideration as a repository for the wastes. Don't Waste Michigan, with the Lake Michigan Federation (now the Alliance for the Great Lakes) and support from numerous local grassroots organizations, along with Michigan Attorney General Frank Kelly, brought suit in federal court in 1993 to prevent the loading of high-level nuclear waste in casks on the shore of Lake Michigan at the Palisades plant. The suit was unsuccessful and the issue was further pursued by Don't Waste Michigan and Lake Michigan Federation in a letter [Docket #: 05000255,07200007] sent to NRC Commissioner Dr. Shirley Jackson. A hard copy of this letter will be provided to the NRC by Don't Waste Michigan to be included as comments for this draft EIS.

The Coalition for a Nuclear-Free Great Lakes, founded 1986 in the wake of Chernobyl, is an association of groups and individuals from eight states and three Canadian provinces advocating for a nuclear-free Great Lakes. The group's inaugural conference drew representation from 35 reactor communities throughout the Great Lakes basin. The Coalition exchanges expertise and information across the basin regarding nuclear power while advocating for safe alternative energy sources and has held a series of ten basin-wide educational and conferences. The Coalition and its member groups

2

succeeded in encouraging the International Joint Commission to acknowledge radio-nuclides as persistent toxic substances, as well as undertaking major studies on the effects of radio-nuclides in the Great Lakes Basin. The coalition is based in Monroe, Michigan.

The Nuclear Information and Resource Service (NIRS), founded in 1978 and based in Washington, DC, is an international information and networking center for citizens and environmental organizations concerned about nuclear power, radioactive waste, radiation, and sustainable energy issues. NIRS and the World Information Service on Energy (WISE) joined forces in 2000, to create a worldwide network of information and resource centers for citizens and environmental organizations concerned about nuclear power, radioactive waste, radiation, and sustainable energy.

History of involvement by submitting groups in the Palisades nuclear power plant

Don't Waste Michigan, the Coalition for a Nuclear-Free Great Lakes, and the Nuclear Information and Resource Service, have a history of monitoring the operations of Palisades, as well as consistently participating in public meetings, providing comments, and instituting legal interventions as needed. The groups have been active participants to date in the meetings, licensing proceedings, and comment processes provided by the NRC as part of the review of the application by Palisades to extend its license.

Both Don't Waste Michigan, and NIRS (representing 50 of its members within 50 miles of Palisades) filed as official interveners against the 20-year license extension, and petitioned the Atomic Safety and Licensing Board (ASLB), the NRC's administrative law licensing board, to hold hearings on the 20-year licensing extension, raising numerous safety and environmental concerns. The ASLB ruled against granting a hearing on March 7, 2006 upon which the groups appealed the decision to the NRC Commissioners. This EIS process is separate and distinct from the ASLB/Commission appeal.

NRC's comment framework unnecessarily restricts public involvement

GG-1

The NRC has established a framework for this application process that unfairly and arbitrarily eliminates a huge array of issues from consideration, discussion and comment by individuals, organizations, and Native American tribes that provides an effective obstacle to meaningful public participation. Because of this, some of these comments will fall "outside" of the scope of this process. Regardless, these comments are provided on issues that we believe are germane, and we vigorously object to the arbitrary and overly strict limitations on the scope of public input.

II. Adverse Consequences of Approval of Palisades' License Extension Request

GG-2

There is much at stake with the prospect of 20 additional years of nuclear power and radioactive waste generation and the associated risks and serious consequences associated with the Palisades plant, which is already unfortunately sited right in the

heart of an exceedingly environmentally valuable and sensitive dune and shoreland on Lake Michigan. Part of the Great Lakes basin, Lake Michigan is an essential facet of a system that is invaluable from a planetary perspective, not only for its contribution to the water supply on the globe - approximately 20% of the world's fresh surface water - but also for its rich and abundant fish and wildlife and the ecosystem services it provides to people, as well as supporting a primary economic engine for the nation. There is no price that can be placed on the value of Lake Michigan, but we do know this with absolute certainty:

Lake Michigan provides essential water resources for 10 million people, supports necessities crucial to the overall health of the region, such as fresh, healthy food from its abundant agricultural base, and provides a significant contribution to the recreation and tourism economies of the four states that border its lakeshore. It is the essential core of the region's natural resource base and provides a value to its human inhabitants that cannot be quantified.

Because pollutants tend to remain in the Great Lakes and cycle through the atmosphere, sediment, water, and biological food chain, contamination of Lake Michigan is a concern for the entire Great Lakes basin, home to one-tenth of the population of the United States and one-quarter of the population of Canada.

Lake Michigan is currently in a critical stage of initial recovery, after suffering decades of impacts from toxic substances, as well as habitat degradation. This initial recovery, unfortunately, has already slowed from the impacts of the more recent intrusion of invasive species. Much has been done and millions of dollars spent to restore and protect the values provided by Lake Michigan, as well as the entire Great Lakes. A recent proposal by a government led coalition has recommended that $20 billion in funds be appropriated to fully restore and protect the Great Lakes.

GG-3 Given what is at stake with consideration of extending an operating license for Palisades, a nuclear power plant and waste storage facility unwisely situated within the heart of Great Lakes, it is imperative to examine the pertinent issues exhaustively as well as encourage the full and meaningful participation of the large constituency of citizens and stakeholders who will be affected by the license decision.

The aforementioned coalition of organizations and individuals listed at the end of these comments oppose the 20-year extension of a license for the Palisades nuclear power plant for the following reasons, elaborated more extensively further in this document:

GG-4 <u>1. There is strong evidence that suggest security measures at Palisades are not adequate.</u> Recent reports, including one in March of 2006 by the Government Accountability Office, call into question the ability and motivation of the NRC and nuclear power industry to take the necessary steps to ensure that the nation's nuclear power plants have instituted the most stringent security measures to protect against terrorist attacks.

GG-5 <u>2. Palisades' license extension will increase the amount of high-level waste on the Lake Michigan shoreline and the number of dangerous barge shipments of high-level</u>

radioactive waste on Lake Michigan. Palisades will generate approximately 290 more tons of high-level radioactive wastes in 20 additional years with no national repository likely to be established to receive the wastes. The U.S. Department of Energy's plan for transporting high-level radioactive wastes generated by the plant's operation, involves barging up to 125 or more giant rail-sized containers of the wastes from Palisades to the Port of Muskegon, up along the Lake Michigan shoreline. The slightest leakage of even a small amount of this waste could not only threaten Lake Michigan as a source of drinking water for ten million people, but also cause a host of other irrevocable impacts on the lake's fish, wildlife, people, and economy.

3. Palisades' high-level radioactive waste storage facility is defective and risky, situated on the Lake Michigan shoreline. There are numerous incidents dating from the installation of the waste storage facility to the present that demonstrate the risks associated with the dry cask storage containers, as well as their problematic placement on a high risk erosion stretch of the shoreline, on pads not adequately designed to be stable during events such as earthquakes. GG-6

4. The Palisades plant harms the environment and the health of its workers and surrounding residents from its discharges of radioactive and toxic substances to Lake Michigan, the air, and land. Routine radioactive discharges by nuclear power plants are incorrectly deemed legal and judged to be "safe" by the NRC and the nuclear power industry, contrary to a recent National Academy of Sciences report that confirms that there is no safe level of exposure to radiation. Further, other toxic chemical discharges to Lake Michigan, such as Betz Clam-Trol, discharged via a National Pollutant Discharge Elimination System (NPDES) permit, require stricter controls and enforcement of violations, as part of any license extension application. GG-7 GG-8

5. Aging and extended operation increase the risk of accidents at Palisades. The longer Palisades operates, the more embrittled its reactor pressure vessel becomes, increasing the risk for Pressurized Thermal Shock, a condition caused by any number of system malfunctions which can result in a severe, sudden overcooling of the reactor pressure vessel. This can lead to a loss-of-coolant accident, meltdown, and catastrophic release of radiation to the entire Great Lakes basin. GG-9

6. The analysis of alternatives to extending the license for Palisades was flawed and biased. Renewable energy sources such as wind power and solar power, as well as alternatives such as energy efficiency and conservation, are not given credible consideration in the EIS. NMC/Consumers and the NRC reveal a bias in favor of fossil fuel and nuclear power by presenting only those two sources favorably and by downplaying the potential for energy efficiency, energy conservation, and renewable sources of electricity. GG-10

7. The draft EIS prepared by the NRC unaccountably discounts the effects of global warming. There is considerable evidence that more extreme winds, as well more frequent and intense tornadoes — all of which global warming could cause — could GG-11

5

make operation of Palisades more and more risky over time.

GG-12

8. Financial benefits to Covert Township, host to Palisades nuclear power plant, are not evident and not expected with a license extension. The township consistently rates substantially below comparable county, state and national economic indicators in median household and per capita incomes and the draft EIS notes no improvements are expected by the license extension.

GG-13

9. A 20-year extension for Palisades will be costly. Ratepayers and (by default) taxpayers are to pay for maintenance of the waste generated by the utilities. The fifty year old Price-Anderson Act requires taxpayers to pay for any major accident or terrorist incident at nuclear power plants over a cap of merely $11 billion paid for by the nuclear utilities and their insurance companies for accidents or terrorist incidents at the plant, a liability that could run into many hundreds of billions of dollars. This liability protection is a unique subsidy provided to the nuclear power industry, at taxpayer expense.

GG-14

10. A license extension at Palisades increases the fragile status of numerous already threatened, endangered, or candidate species, from daily "routine" radiation releases and/or potential large-scale radiation releases. Species exposed to cumulative exposures from the radioactive discharges of a nuclear power plant may over time develop subtle genetic alterations that are not observable in the short term, but that could have large, subtle impacts within a population, not immediately apparent. This has significant implications for the threatened and endangered species of southwest Michigan.

III. Background

Palisades nuclear power plant, a one-unit pressurized water reactor with 798 mega-watt-electric capacity, began operation in 1971. It is owned by Consumers Energy and operated by Nuclear Management Company (NMC). NMC operates six nuclear power plants in Wisconsin, Minnesota, Iowa, and Michigan. Consumers Power is a member/investor in NMC and retains ownership of the Palisades plant.

The operating license for the Palisades nuclear power plant, located 5 miles south of South Haven on Lake Michigan, will expire in March 2011. NMC has applied for an extension to operate the plant for an additional 20 years, until March 2031. Nuclear power plants were originally licensed to operate for 40 years, as allowed by the Atomic Energy Act of 1954. There has been a nationwide movement by government regulators and the nuclear power industry to extend the licenses well beyond that time period, even though the reactors are beginning to show signs of aging, raising considerable concerns about safety. To date, 39 of the nation's 103 nuclear reactors have received 20-year extensions, while 12 others are in the process, including Palisades. The Nuclear Regulatory Commission has approved all applications to date.

The Nuclear Regulatory Commission (headed by a 5-member commission, appointed by the President and confirmed by the Senate) was established in 1974 to license and regulate nuclear power plants with a mission of protecting public health and safety and the environment, as well as protecting the common defense and security. Unfortunately, the NRC's implicit mission has been more one of protecting the nuclear power industry's interests rather than the interests of the public. This may be due in part to its budget: by law, the NRC is required to collect fees from nuclear power plant applicants and holders of licenses for the majority of its budget. $628 million of the NRC's $777 million budget for fiscal year 2007 is provided by the nuclear power industry. GG-15

The drive for re-licensing of the nation's nuclear power plants started as early as 1982, with research on aging of nuclear reactors, and began in earnest in 1991 when the NRC published safety requirements for renewal. Currently, re-licensing plans are moving more rapidly as proponents attempt to take advantage of the nation's current energy crisis. Extended and new nuclear power generation is now being promoted as a "clean" alternative to the use of fossil fuels, which are now universally acknowledged as contributing to global warming. Many utilities that own nuclear power plants, however, including Consumers Energy, also own coal-burning plants. Consumers Power, in particular, generates a sizable share of its electricity from the burning of fossil fuels. GG-16

The NRC and power companies thus advocate for a dangerous source of electricity, nuclear power, calling it "clean" and "green" by appearing to discourage another harmful electricity source, one, however, that they plan to continue utilizing to the fullest extent possible. Nuclear reactors, including Palisades, are not 'clean." They emit harmful radioactivity into the environment on a daily basis and generate long-lasting radioactive wastes. Further, nuclear power is not "carbon free," as it relies heavily on the use of fossil fuels in the mining, milling, processing, transportation, management, and storage of its fuel and waste products. GG-17 GG-18

IV. Inadequate Security at Palisades is an Unacceptable Risk

The NRC has placed this issue outside the scope of the EIS for extending the license for Palisades. We strongly disagree and assert that the decision to allow Palisades to operate an additional 20 years in a much higher risk condition mandates extensive involvement by the public. GG-19

Maintaining the security of the Palisades plant is a high priority concern since the events of September 11, 2001. That threat is real and imminent, as nuclear power plants were considered to be potential targets by the terrorists who carried out 9/11, according to the report of the 9/11 Commission. The Commission report notes that several of the terrorists had given indications that a nuclear power plant near New York City was a considered target for an airplane attack, due to the large population that would be affected by a release of radioactivity. That did not happen, reportedly, because the

7

terrorists appeared to have concluded that it would have been difficult to control the effects of a release of radioactivity. But, the fact that it was considered means that each and every nuclear power plant in the U.S., including Palisades, should be regarded as a potential target for terrorism and security measures must be the most stringent available to address this threat. In fact, reactors such as Palisades are likely more at risk of terrorist attack than certain other reactors, as it is situated on the shoreline of Lake Michigan, the source of drinking water for the region.

Both the NRC and nuclear power companies assert that the events of 9/11 stimulated additional security at plants. However, numerous reports following 9/11 suggest otherwise, including a 2002 report by the Project on Government Oversight (POGO) referencing the plight of overworked and fatigued security guards at the plants during the year following 9/11, and numerous high-profile media accounts of risky gaps in security.

An October 3, 2002 Kalamazoo Gazette article, "Palisades incident leads to reassessment," describes a security response lapse due to Palisades' failure to follow proper procedures, leading to a communications breakdown. When three cars approached Palisades on the eve of the first anniversary of the 9/11/01 attacks, Palisades mistakenly phoned the local police rather than the county 911 system, leading to a 45 minute delay before state police arrived on the scene. By that time, the suspicious cars were long gone.

An October 20, 2002 New York Times article, "Guards at Nuclear Plants Say They Feel Swamped by a Deluge of Overtime," described an emotional breakdown by an armed security guard at Palisades with "unescorted access" to vital areas of the plant after she had been forced to work 72 hour work weeks for months on end. If guards complained about their fatigue, they faced the loss of their job, or forced psychiatric evaluations. Apparently, as reported by POGO, some nuclear utilities chose to nearly double current guards' duty time in order to avoid the added costs of training and providing benefits for newly hired guards.

In March of 2006, an independent nonpartisan investigatory federal agency, the Government Accountability Office (GAO), issued a report that demonstrates that there is much yet to be done to protect the nation from terrorist threats to nuclear power plants. The report, Efforts Made to Upgrade Security, but the Nuclear Regulatory Commission's Design Basis Threat Process Should be Improved (GAO-06-388), assessed the NRC's current efforts and found evidence that suggested the nuclear industry attempted to avoid strengthening security to avoid costs. It also noted slow progress in conducting mock attacks or force-on-force exercises to test safety at plants, as well as egregious examples of security lapses in the small number of mock attacks that NRC has carried out to date.

8

NRC'S process for determining risk to nuclear power plants was flawed and undercut by the nuclear power industry

The recent GAO report was done to review the process that the NRC used to revise the Design Basis Threat (DBT) that was in place for nuclear power plants prior to 9/11. The DBT is a description of the threats that might be anticipated from terrorist activities and is used to recommend appropriate security efforts at plants. The GAO also looked at what nuclear plants were doing to meet the threats, and the results of mock attacks, called "force-on-force" inspections, to test security efforts, carried out by NRC staff.

Trained "threat assessment" staff within the NRC used intelligence information that provided information on the capabilities of terrorists and recommended that the DBT be changed to accommodate a larger suite of threats. After sending out the revised DBT for review by nuclear power plant industry officials and groups, however, the NRC changed their recommendations for revising the DBT to reflect nuclear industry concerns about what was "reasonable and feasible" to defend against.

Judgment calls were made on most likely threats

Much of the threat assessment analysis involved a review of a limited amount of information (not much was available specific to nuclear power plants) as well as personal judgment by NRC staff to predict what might be used in a terrorist attack against nuclear power plants. For example, the staff considered whether to increase the number of potential attackers in the DBT, based on knowing the number of attackers in other incidents. Staff did not, however, recommend increasing the number of attackers in the DBT because they assumed that a large number of attackers would be more likely to be caught before they could carry out an attack – a judgment call. NRC staff concluded that an attack similar to 9/11 would not focus on a single nuclear power plant and that since an attack from the air was not an option used often by terrorists, did not recommend that scenario to be included in the DBT. Staff did assess the possibilities of an attack from water, but concluded that a bomb transported by water would necessarily be of smaller size, because it would need to be carried on a boat. (This assessment would not apply to a facility on Lake Michigan, as boats of quite large size could approach Palisades; in addition, it is plausible that speedboats could have the ability to launch an attack on Palisades before plant security defenses could react.

Undue influence by the nuclear industry changed NRC recommendations

The GAO report, in its review of the revisions to the DBT, noted that because the nuclear industry had the opportunity to review the draft DBT, the changes that were made to the draft appeared to reflect concerns by the nuclear industry over the high cost of some increased security measures, suggesting undue influence by the industry. For example, industry representatives protested the inclusion of certain weapons in the DBT, saying that one would render the ballistic shielding of the plants obsolete and that another would be too costly. The industry argued as well that protecting against the use of certain weapons by terrorists was the responsibility of the U.S. federal government, namely, the Department of Defense.

9

The industry also opposed the inclusion of a threat of an attack from inside the plant, from an "active violent insider," saying there were no cost effective ways of avoiding this scenario. NRC staff made changes to the draft DBT that appeared to be influenced by the industry comments. When the draft DBT was presented to NRC commissioners, even more changes were made based on industry objections, for example, allowing plants to use a "human reliability program" to reduce the potential for an insider situation. The commissioners also removed some weapons from the list recommended by staff that plants would have to defend against that would have added to the cost of increasing security, as well as voting to decrease the maximum amount of weight of equipment, weapons, and explosives an attacker might carry, downgrading the level of security required at plants. The GAO report concluded that some of the changes suggested by commissioners and included as part of the DBT, were made due to judgment, rather than specific criteria.

Few mock attacks carried out to date

The GAO report noted that as of November 2005, the NRC had only conducted mock attacks, or force-on-force demonstrations at 20 of the 65 nuclear plant locations (with 103 reactors) in the U.S. The GAO reviewed documents from inspections and force-on-force demonstrations as well as observing a number of force-on-force demonstrations. Its review of 18 baseline inspection reports and demonstrations noted problems, including an intrusion detection failure at one site:

- Notice of demonstration dates were given 8 to 12 weeks in advance, and daytime and nighttime exercises were generally convened at the same times at each event, leading to a lack of unpredictability in the exercises.
- There were instances where advance information about attack scenarios had inadvertently been provided to plant personnel.
- The quality of feedback from NRC personnel to plants after an inspection varied. For example, not all potential problems were discussed by NRC with plant officials after each demonstration.
- Alarms failed to activate; some did not function properly.
- Gaps in patrols were observed.
- Not all personnel entering protected areas within the plant were searched (for example, a security officer did not examine objects that set off the metal detector).
- Some security officers were inadequately trained for a terrorist attack (lack of physical stress preparedness, training inappropriate to threat).
- Security officers in one location were noted as inattentive at their posts.
- A vehicle barrier system was improperly and ineffectively placed at one plant location.

Accountability to the public on security is non-existent

The need to keep classified certain sensitive information about measures taken at potential targets of terrorism is understandable, but those who live in the vicinity of Palisades, as well as those throughout the region who might be affected by a terrorist

attack directed at Palisades, must be assured in no uncertain terms by the NRC, Palisades, and elected leaders that every measure has been instituted that will provide safety and peace of mind to the public. It is disturbing to note that keeping back information on the plants has even broader implications. In March 2004, for example, the NRC decided not to publicize results of problems related to security at plants, as well as enforcement information relating to actions taken by the NRC against the reactor licensees for violations of safety regulations. This appears to be taking advantage of the heightened attention and concern for security at nuclear power plants to limit information about unsafe operations that should be readily available to members of the public.

If a force on force demonstration has not been conducted at Palisades, it should be conducted as soon as possible. Classified results of the demonstration should then be directly communicated to the region's U.S. Congressional representatives and senators, as well as the Governor and Attorney General of the State of Michigan, for their thorough review and approval and reporting back to the public. To truly secure the Palisades nuclear power plant and dry cask storage, the following security safeguards, if not instituted already, would need to be in place.

- Sufficient cameras and patrols;
- Delay measures, such as fences outside buildings and entrances that would delay potential attackers;
- Bullet resistant structures in the protected areas of the plant site;
- Adequate and specific training for security officers;
- Several levels of intrusion detection systems (Needed especially by Palisades to protect against intrusion from potential attackers that may enter from Van Buren State Park, adjacent to the plant site);
- Vehicle barrier systems to prevent vehicles with bombs from entering the site;
- Anti-aircraft capability, and;
- Shore patrol equipped with stationary weaponry capable of preventing an offshore assault.

While some of these safeguards may appear excessive, they are necessary to secure the facility. Unfortunately, some of these measures have significant civil liberties ramifications for the communities surround Palisades, therefore we request that the NRC address how this will be handled in a 20-year license extension in the draft EIS.

Palisades must also ensure that its irradiated nuclear fuel storage pools are safeguarded from terrorist activities. A study released in April 2005 by the National Academy of Sciences shows that the cooling pools at nuclear reactors, which store 10 to 30 times more radioactive material than that contained in the reactor core, are at risk from attacks by terrorists. According to the study, the cooling ponds could be severely damaged by crashing aircraft, high-powered weapons or explosives, releasing large quantities of radioactive material into the environment.

11

V. Lake Michigan Dunes and Shoreline Unsafe Location for Stored Waste Containers and Concrete Pads

GG-20

Changing conditions of Lake Michigan dunes pose risks to waste storage facilities

Lake Michigan dunes constitute a series of dynamic environmental settings, from bare beach shorelines, to "growing dunes" or lightly vegetated foredunes, fragile interdunal wetlands and ponds, and finally to mature, forested "oldest" dune hills. Vegetation – grasses, bushes, and trees – is an essential key to the stability of the dunes. When dune vegetation is disturbed by footpaths or other activities, high winds and storms can widen a small stretch of bare sand into an increasingly wide swath or "blowout." Blowouts, areas of blowing and unstable sands, in dunes in the vicinity of Palisades' dry cask storage system could threaten the integrity of the dry cask storage waste system, by clogging vents in the casks, and causing the wastes to overheat, which could lead to an explosion. Left unattended, large blowouts in the dunes surrounding the casks could possibly decrease the stability of the pads on which the casks are situated. This issue must be addressed in the EIS. Palisades must, at minimum, be required to monitor the dunes for potential blowouts and ensure that the dunes are consistently vegetated and stable.

GG-21

Threat to the waste storage facility from earthquake impacts ignored

Michigan has had a lengthy history of earthquake activity, dating back to the first several historically recorded quakes, in 1811 and 1812, originating from the New Madrid fault, centered in New Madrid, Missouri. These quakes registered at 8.0 or higher on the Richter scale. Additional quakes were felt in a variety of locations throughout Michigan in the later 1800s. The largest earthquake experienced in Michigan was in 1947. With a magnitude of 4.6, it was felt throughout southern Michigan, affecting an area of 50,000 square miles. A quake originating in south central Illinois in 1968 extended approximately 580,000 square miles and was felt throughout southern Michigan. The last earthquake in Michigan registered 3.5 and was centered in Lansing in 1994.

The New Madrid zone has produced the country's largest earthquake and is considered the country's most seismically active region east of the Rocky Mountains. The United States Geological Survey (USGS) has given the New Madrid fault a 25 to 40% probability of having an earthquake of 6.0 or greater in the next 50 years (USGS Fact Sheet FS-131-02). Movement has already been noted and described in a June 2005 *Nature* article describing the results of a University of Memphis study that detected a half-inch shift in the fault from 2000 to 2005.

The potential for earthquake activity to damage Palisades' outdoor dry cask storage pads, upon which the casks have been placed, warrants rigorous consideration, which unfortunately, is not in evidence in the draft EIS. Concerns regarding the impacts of an earthquake that might cause disruptive movement to the waste storage facilities at Palisades surfaced as early as 1994, from within the NRC. Dr. Ross Landsman, Nuclear Safety Engineer and Palisades Dry Cask Storage Inspector, questioned the adequacy of

requirements associated with earthquake activity for Palisades' dry cask storage facility in a letter to the chairman of the NRC. In his letter, Dr. Landsman voiced his concerns, "Actually, it's the consequences that might occur from an earthquake that I'm concerned about. The casks can either fall into Lake Michigan or be buried in the loose sand because of liquefaction [soil taking on liquid characteristics]. This event might be in the public's mind in view of what just happened in Southern California. It is apparent to me that NMSS [NRC's Office of Nuclear Material Safety and Safeguards] doesn't realize the catastrophic consequences of their continued reliance on their current ideology."

In a September 15, 2005 affidavit, Dr. Landsman further describes his concerns regarding the ability of the storage pads to withstand movement due to earthquakes, asserting that both the older pad nearer Lake Michigan and the newer one further inland, are in violation of NRC earthquake regulations, 10 CFR § 72.212(b)(2)(i)(B), which require that: "Cask storage pads and areas have been designed to adequately support the static and dynamic loads of the stored casks, considering potential amplification of earthquakes through soil-structure interaction, and soil liquefaction potential or other soil instability due to vibratory ground motion. . . ." Dr. Landsman noted that Palisades' analysts and engineers apparently failed to acknowledge the differences in elevation between the plant and pad sites in their design of the storage facility. This led to mistakes in the calculations made to determine the potential movement of the pads due to an earthquake. Dr. Landsman noted the violation after inspecting the new storage pad in 2004 and warned that it was not safe, but his concerns were not addressed and casks have nonetheless been allowed by NRC to be placed on the pad right up to the present.

The implications of damage to the casks from an earthquake are significant. Wastes in casks covered in or buried by sand, could overheat, causing severe damage to the irradiated nuclear fuel assemblies and making future storage, handling, transport, and management more dangerous. Overheated radioactive wastes could damage the dry storage casks, leading to leakage of radioactivity into the environment. Emergency responders could be at risk from any damage to the radiation shielding measures on the casks.

The dangers of nuclear waste cask submersion underwater are two fold. First, radioactivity could leak from the cask into the water. Leakage of even a fraction of a cask's contents into Lake Michigan could endanger the source of drinking water for ten million people. Second, enough fissile uranium-235 and plutonium is present in the high-level radioactive waste inside the casks, that water, with its neutron moderating properties, could actually cause a nuclear chain reaction to take place within the cask. This would complicate emergency responses, as potentially fatal radiation doses could be emitted from within the cask.

There is undoubtedly an elevated probability of a strong earthquake originating from the New Madrid fault in the next 50 years, and the potential for it to extend to

southwest Michigan. Because of that, it is imperative that the question of the safety of the concrete pads and the 29 storage casks of high-level wastes be resolved to the satisfaction of citizens of the region.

VI. Native American Tribes Left Out of the EIS

GG-22

NRC staff, in the draft supplement to the Generic Environmental Impact Statement (GEIS), recommended that the Commission determine that the impacts of continued operation of Palisades were not significant enough to make its extended operation unreasonable. The document states further that: "This recommendation is based on (1) the analysis and findings in the GEIS; (2) the Environmental Report submitted by NMC; (3) consultation with Federal, State, and local agencies; (4) the NRC staff's own independent review; and (5) the NRC staff's consideration of public comments received during the scoping process." Astoundingly, it is obvious that Native American tribes were not included in the consultation process for the development of the draft EIS for Palisades.

The role of affected federally recognized, as well as non-federally recognized Native American tribes can best be described as unfairly and severely restricted throughout all aspects of the development of the EIS. Even though the re-licensing application from NMC was submitted to the NRC in March of 2005, it was not until four months later that eleven tribes in Michigan and Oklahoma were invited to participate (via one letter) in the license extension proceedings. A single letter to a federally recognized tribe is not legally sufficient government-to-government consultation. However, other tribes that might be expected to have a substantial interest in proceedings involving Palisades relating to treaty rights and other related issues were left completely out of any part of the process, such as the Bay Mills Indian Community, the Keweenaw Bay Indian Community, the Sault Saint Marie Tribe of Chippewa Indians, all in Michigan's Upper Peninsula, tribes in Wisconsin, the Sauk and Fox Tribes and others in Oklahoma, and the Kickapoo Tribe of Texas (which absorbed the Mascouten Tribe), all with ancestral ties to the Lake Michigan shoreline. In particular, there are concerns for the continued disregarding of sacred burial grounds and other artifacts of tribal groups that may be present on the site and possibly along electric transmission lines extending from the plant, as well as concerns from the tribes in safeguarding such species as the sturgeon that may be negatively impacted by continued operations at Palisades.

Native American tribes are known to have traveled regularly throughout the dunes in West Michigan, hunting in them and using dune plants for food and medicinal purposes. Because of that, it is likely that villages or encampments, as well as burial sites, may well have been located on or in the vicinity of Palisades, especially given the presence of creeks just north and just south of the plant site and the heavily forested, large dunes of the property. This likelihood is confirmed in the draft EIS, on page 2-61 to page 2-62, where the NRC reports "Native American groups that inhabited the area during the historic period were predominantly the Potawatomi, Mascouten, Miami, and Ottawa. During the early historic period, their villages were situated on the edge of

forested land, adjacent to prairies and convenient to streams or the lakeside; temporary winter camps were established in sheltered areas. By the beginning of the nineteenth century, the Potawatomi had established 11 known villages in southern Michigan. Most were near the shorelines of Lake Michigan and Lake Erie, generally along the streams that flow into their waters." Thus, Palisades has a significant potential for such Native American sites to be located on its property.

Nuclear Management Company (NMC), however, gives scant attention to the interests of Native American tribes in its over 500 page Environmental Report, prepared as part of the re-licensing application process. Section 2.10, "Historic and Archaeological Resources," of the report consists of four paragraphs, taking up less than two-thirds of one page (Page 2-46). In fact, the potential for Native American sites on the Palisades property is not explicitly mentioned at all. In its Environmental Report, NMC referenced a number of documents prepared as part of the original license application for Palisades that noted the absence of known archeological or historical resources on the site or in the vicinity to discount the potential for Native American artifacts to be impacted by the license extension application.

The only specific documentation NMC provides in the Environmental Report to support its claim that there are no Native American artifacts, is a letter dated April 7, 1972 from the U.S. Department of the Interior (DOI) to the U.S. Atomic Energy Commission (the predecessor to today's NRC), in terms of nuclear power plant regulation). In that letter, reproduced from Pages C-5 to C-9 of NMC's Environmental Report, DOI states "It does not appear that the existing plant should directly affect any existing or proposed unit of the National Park System, nor any site eligible for registration as a national historic, natural or environmental education landmark; however, the final statement should contain evidence of consultation with the State Historic Preservation Officer concerning the effects of the power station on places on or being considered for nomination to the National Register of Historic Places." However, the DOI statement does not seem to indicate that there was attention placed on locating Native American burial sites, former village sites, etc. located on the power plant site or along the transmission line corridors.

Even though the Michigan State Historic Preservation Office (MSHPO) noted the possibility of unreported artifacts (see Page C-2, Cultural Resources Correspondence of NMC's Environment Report), there has been no survey done by Consumers Power to confirm or dispute this claim and no actions taken by MSHPO officials to resolve the question, demonstrating a distinct lack of significance attached to protecting the interests of Native American tribes. In fact, NRC staff acknowledged in the draft EIS that no adequate surveys have ever been conducted at Palisades. Further, although the draft EIS document determined that the license extension for Palisades might pose a "moderate" impact on the interests of Native American tribes regarding archaeological or historical cultural resources, this initial determination was verbally deemed "a mistake" by NRC staff at the April 5, 2005 draft EIS public comment meeting in South Haven, Michigan. We ask for an explanation as to the reason for this "mistake" and

justification for a significant downgrading of the impact level ascribed to Native American interests in such cultural resources as burial sites from "moderate" in the draft EIS to "small" at the public meeting.

Forty years ago, Native American tribes were seemingly ignored in decisions regarding the original placement and construction of the Palisades nuclear power plant, even though it was an intense and disruptive use on lands at one time occupied by a number of tribes along Lake Michigan, which is revered by all Native Americans of the region. It can only be concluded from this most recent lack of attention in the re-licensing process, that these tribes have once again been accorded neither legally sufficient notification nor appropriate involvement, which is especially negligent in respect to the federally recognized tribes, which are sovereign entities and are legally entitled to have a government-to-government relationship with the United States.

All Native American tribes and bands that could be expected to have an interest in the application by Palisades to operate an additional 20 years deserve both notification of this process, as well as the opportunity to share government-to-government decision making regarding the application, as allowed for under NEPA and other federal laws. A comprehensive site wide survey should be performed on the entire Palisades property - as recommended by Palisades' own cultural resource assessment subcontractor as described in the draft EIS - carried out in close consultation with all affected tribes. If Native sites, such as burials, are found, then appropriate actions should be taken to protect them from damage, again, in close and meaningful consultation with affected tribes in order to ensure that NEPA, treaties, and the terms of other relevant federal laws, such as the Native American Graves Protection and Repatriation Act and the National Historic Preservation Act, are met.

VII. Socio-economic Impact Conclusions in EIS Biased by Substandard Methodology

GG-23

Palisades has been considered a major contributor to Van Buren County's property and municipal tax revenues, but the economic benefit to Covert Township has been ambiguous. In fiscal year 2004, a total of $3.6 million in property taxes went to Covert Township and schools, with an additional $1.6 million to Van Buren County and schools. As host to the Palisades plant and benefactor of its tax revenue, it is reasonable to assume that Covert Township should at minimum be at economic parity with surrounding geographic household and per capita incomes. Despite the financial benefit such payments suggest, however, Covert Township consistently rates substantially below comparable county, state and national economic indicators in median household and per capita incomes. The EIS overlap of Geographic Distribution of Minority Populations (figure 4-1 on p. 4-29 of the NRC draft EIS) and Low-Income Populations (figure 4.2 on p. 4-30) shows a large area of Covert Township (and St. Joseph/Benton Harbor) to be both "high minority and low-income. Poverty persists in the Covert Township, a high minority and low-income community, despite the presence of the Palisades nuclear power plant for nearly four decades.

Consumers Energy is described as the largest employer in Van Buren County, with 484 employees (draft EIS, Table 2-8). The draft EIS states that unemployment in the county "was moderately high at 7.2% in December 2004," but determines no "incremental change" in employment and personal income resulting from a Palisades license renewal –new employment opportunities are not projected to occur.

Palisades' Permanent Employee Residence Information by County and City (Table 2-3) lists employee residence totals as: South Haven (156), Bangor (14), Grand Junction (13), Paw Paw (12), Hartford (8), and Others (30). Unfortunately, residents of Covert Township that might be employed at Palisades are not specified in this information, raising the question as to whether or not Covert Township residents benefit at all from employment at the plant.

A review of household income further shows a lack of positive benefit to Covert Township from Palisades. Per capita incomes in 2000 were $21,587 for the United States, $22,168 for Michigan, $17,878 for Van Buren County and $12,156 for Covert Township (U.S. Census Bureau, 2000 Census, in 1999 dollars). These figures reveal incomes for Covert Township that range from 45% and 33% consistently lower than the state of Michigan and Van Buren County respectively.

Covert Township reported 14.3% of families with incomes less than $10,000, three times the rate of Van Buren County. There are over three times as many families below poverty level in Covert Township as in Van Buren County. Covert bears the burden of 34% of related children under 18 years of age in poverty compared to Van Buren's 11%; related children under 5 years of age in poverty, 38% compared to Van Buren's 17%; Covert families with female householders, no husband present, 48% compared to Van Buren's 25%; related children under 18 years of age for Covert at 57% compared to Van Buren's 30%, and Covert related children under 5 years of age living below poverty level at 80% versus Van Buren's at 48%. Covert reports 32% of individuals in poverty while Van Buren reports 11% of individuals living in poverty. As unfortunate as Van Buren County poverty levels may be, Covert Township's poverty is consistently two and three times worse. None of this data was provided whatsoever in the scope of the EIS socio-economic factors.

Comments by local and county government and Chambers of Commerce officials at public hearings have extolled the benefits of new fire trucks and infrastructure improvements, and the EIS notes that Palisades' property tax revenues are "used to fund local and county emergency management programs, public safety, local public schools, local government operations, local road maintenance, and the local library system," (page 2-58, of the draft EIS). Still, Covert Township experiences chronic poverty.

NRC staff ultimately determined that the socio-economic impacts resulting from Palisades' license renewal would be "small", implying that the impacts "would not produce an incremental change in any of the impact measures used. Unfortunately, the draft EIS's methodology neglected a comprehensive analysis of socio-economic

17

conditions in Covert Township and Van Buren County, leaving out those conditions that did not support a positive benefit from the nuclear power plant.

NMC/Consumers discounts potential impacts to Latin American migrant workers in southwest Michigan from an extension of Palisades' license. NMC/Consumers' Environmental Report (page 2-32) notes (inaccurately) that "Berrien and Van Buren Counties host moderate numbers of migrant workers." According to the U.S. Department of Agriculture, however, in 2004, 3,677 and 6,733 temporary farm laborers (many of them Latino) were employed in Berrien and Van Buren Counties, respectively. These numbers, in addition to family members of the workers, represent populations as large as the county seats and even the biggest towns in these counties. Rather than characterizing the number of migrant workers, many of whom are Latino and of low income, as "moderate," a more accurate characterization relative to the populations of the host counties would be "large," and therefore worthy of significant consideration not only in NMC's Environmental Report, but also in NRC's draft EIS.

The Latin American agricultural workforce of the Palisades area is also at disproportionate risk from both routine radioactive discharges, as well as catastrophic radiation releases, given this workforce's complete reliance on agricultural sector employment. A large-scale radiation release from Palisades could seriously damage the region's agricultural base. Even a "minor" accident at Palisades involving radiation release could significantly harm area agriculture, due to the stigma attached to radioactive contamination. In either scenario, the Latino migrant labor workforce would suffer disproportionate harm. There also has been no evaluation of the potential for the synergistic effects of chronic or catastrophic radiation releases combined with the toxic pesticides to which field workers have been exposed. In addition, there are no Spanish language emergency evacuation instructions and notifications prepared to serve the Spanish speaking Latino population within 50 miles of the Palisades reactor.

VIII. NRC's Re-Licensing Process Arbitrarily Eliminates Major Impacts from Consideration

With no new nuclear plant orders (that were not later canceled) since 1973, a consequence of the partial meltdown in 1979 of the Three Mile Island plant in Pennsylvania, and with the last reactor built in the U.S. completed in 1996, the American public believed that nuclear power was on the way out, too risky and costly to contemplate. That was not the case. Plans for extending the licenses of operating nuclear power plants were already underway, begun in 1991, with draft rules written to establish a process that would ensure approvals for the extension applications. Although there were major concerns about the procedure raised by the U.S. Environmental Protection Agency, the President's Council on Environmental Quality (CEQ), state officials, environmental and safe energy organizations, concerned citizens, and others about the proposed rule, the procedure nonetheless went forward and ended with a final rulemaking published in the Federal Register in 1995 that provides

for a generic environmental impact review process for any and all nuclear power plants in the country intending to extend their licenses.

The rule requires nuclear power plant applicants to submit an environmental report (ER) and the NRC to write an environmental impact statement (EIS). Both documents are to analyze the environmental impacts associated with the proposed license extension, consider alternatives to a 20-year extension, and alternatives for reducing adverse environmental effects.

This process allows renewal applicants to take advantage of a generic analysis of environmental impacts for numerous environmental issues. Out of 92 issues identified that need to be addressed in an environmental impact analysis of re-licensing, the NRC has determined that 69 are already "adequately" addressed in the generic impact statement. Only 23 issues were found to require additional assessment for at least some plants at the time of the license renewal review. In other words, members of the public and those who live around Palisades are not allowed to address the 69 issues in comments to the NRC about re-licensing, only the short list of 23 identified by the NRC. At that time, over a decade ago, NRC made no meaningful or adequate public outreach in the vicinity of Palisades to alert the public and potentially interested stakeholders to the significance of the rulemaking and the opportunity to provide meaningful input into the decision. GG-24

The NRC also made a determination "that, although no standard exists that can be used to reach a conclusion as to the significance of the magnitude of the collective radiological effects attributable to any plant, these impacts are acceptable in that these impacts would not be sufficiently large to require the NEPA conclusion, for any plant, that the option of extended operation under 10 CFR Part 54 should be eliminated." This determination made by the NRC is in direct conflict with a 2005 National Academy of Science report, which concluded that no dose of radiation, no matter how small, can be declared "safe." GG-25

The NRC also concludes that any impacts from high-level waste and irradiated fuel disposal from a license extension (even acknowledging the uncertainties about the proposed Yucca Mountain repository) would not be sufficiently large to require the NEPA conclusion, for any plant, that the option of extended operation under 10 CFR Part 54 should be eliminated. GG-26

Through these determinations, the NRC has effectively stifled debate on two of the most significant impacts of a 20-year license extension – the continued and cumulative effects of radioactive discharges to the environment and humans from the Palisades plant, and the buildup of close to 300 more tons of high-level radioactive waste. This means storage of more wastes on the lakeshore, added to the 29 storage casks already in place, and the remainder of wastes stored in the pool within the plant, which is also a risky method for storing these deadly wastes.

19

IX. Routine Radioactive Discharges Pose Serious Threat to Health

GG-27

The NRC has placed this issue outside the scope of the EIS for extending the license for Palisades. We strongly disagree.

There are routine everyday discharges from nuclear power plants, deemed to be both explicitly "permissible" or "allowable," and implicitly "safe" or "insignificant" by the NRC and the nuclear power industry. Prior to the advent of nuclear power, radioactive fission products, produced in nuclear reactors, were present in only exceedingly rare, trace amounts in isolated locations on earth. Over 300 different radioactive chemicals are currently created by nuclear chain reactions - and it takes hundreds of thousands to many millions of years for these new chemicals to return to a stable state.

Radioactivity is emitted to the air and the water, as part of routine discharges by nuclear power reactors. It settles upon or is washed back up on the soil and beach as well. For example, reactors use large amounts of water for cooling, and that water when it is returned to a lake or river will have radioactive substances in it. Radioactivity from air discharges also can fall out into water bodies and become embedded in bottom sediments, as well as upon soil on land. Contamination of soils and groundwater can occur through routine discharges, as well as through leaks, accidents, and spills, which are not always fully detected or reported. Wind, water, precipitation, and ecological processes (such as bio-accumulation) can move the radioactive contaminants off site where they are dispersed or diluted, but still present in the ecosystem where they can eventually make their way into living organisms.

GG-28

Although radiation monitoring occurs at reactor sites, it only provides information on levels of discharges emitted or released. It does not provide specific information about where the radioactive materials end up, or if they contribute to radiation levels in plants, fish, and wildlife as well as body burdens of local and downwind or downstream residents. The Nuclear Regulatory Commission relies upon self-reporting and computer modeling from reactor operators to track radioactive releases and their projected dispersion. A significant portion of the environmental monitoring data is extrapolated - or virtual, not real.

Radioactive materials are toxic, persistent pollutants, now widely acknowledged to have many adverse affects on people, as well as fish and wildlife. According to the Union of Concerned Scientists (UCS), the adverse affects are numerous, and can include cancer, reproductive difficulties, genetic and birth defects, and death. "Routine" radioactive releases from nuclear power plants, while reported by the utility to be below "permissible" levels, are still potent due to their ability to become concentrated in organisms. For example, a report by UCS found that mallard ducks carried concentrations of cesium-137 in their flesh that was 2,000 to 2,500 times that in their food, while strontium-90 was concentrated by a factor of 65,000 in clam shells. UCS's report also found increased levels of radioactivity in marine life up to 300 miles from the source.

Ionizing radioactivity differs from natural background radioactivity because it produces radioisotopes that mimic natural chemicals and concentrate in the body where these chemicals reside. Strontium-90, which is routinely released during fission, can get into cow's milk and mimic calcium, following the path of that element in the body and end up in teeth and bones. It can concentrate to high levels and cause leukemia, a deadly form of cancer. Iodine-131, another highly toxic by-product of nuclear power, can concentrate in the thyroid where naturally occurring iodine is deposited, and produce serious hormonal dysfunctions or even thyroid cancer in children.

Radioactive byproducts in reactor waste have different half-lives – the amount of time it takes for half of a given amount of radioactive material to decay. Some decay in a few hours. Others, like strontium-90 and cesium-137 last longer, with half-lives of about 30 years. It takes them around 300 years, or ten half-lives, to decay. But some by-products, like iodine-129, have half-lives of a million years or longer. Plutonium-239, one of the most toxic human-made materials, has a half-life of nearly 25,000 years.

While concerns about the consequences of human exposure to ionizing radiation are not new, the 2005 National Academy of Science's seventh Biological Effects of Ionizing Radiation (BEIR VII) report on "Health Risks from Exposure to Low Levels of Ionizing Radiation" has confirmed that there is no safe level of exposure to radiation—that even very low doses can cause cancer and other maladies – and that risks from low dose radiation are likely greater than previously thought. The implications of NAS's recent findings require a thorough analysis by NRC in its EIS of the human health impacts of the radioactive substances released by Palisades. GG-29

NMC/Consumers should be required to provide the communities in the vicinity of the Palisades plant, with a monitoring program to supply independent information regarding radioactive discharges and releases. These communities are currently dependent upon the operators of Palisades to provide notification of radiological releases. Establishment of an independent program would give evidence of NMC/Consumers' interest in and commitment to ensuring the health of its surrounding communities. GG-30

Historically, the NRC has relied on a 1990 National Cancer Institute (NCI) study to address cancer rates near nuclear power plants. However, this study is now outdated, not accounting for latency periods which could have developed into cancers since 1990. And it was essentially methodologically flawed from the start, as the only data considered by the NCI was from the county that each reactor is located in, and not other downwind and downstream populations potentially affected by radioactive releases of the plants. Further, there are a host of other diseases associated with radiation exposure that have not been assessed, such as thyroid disease, infertility, genetic damage and birth defects, heart disease, and immune system suppression, which require monitoring and attention. A baseline assessment, as well as regular monitoring, of cancer and other disease rates is warranted prior to consideration of Palisades' proposal for a 20-year license extension. GG-31

X. More Palisades Waste to Build Up On the Lake Michigan Shoreline

Palisades' high-level radioactive waste storage facility is defective

GG-32 The NRC has placed the issue of waste generation and storage outside the scope of the EIS for extending the license for Palisades. We strongly disagree.

The Palisades nuclear power plant has generated, on average, 14.5 tons [U.S. Dept. of Energy's Feb. 2002 Final EIS for Yucca Mountain. Appendix A. Tables A-7 and A-8] per year of high-level radioactive waste. The Nuclear Waste Policy Act was amended in 1982 to allow the NRC to approve interim storage of high-level radioactive waste in dry cask storage facilities in a "generic licensing" without studies specific to each plant site or Environmental Impact Statements. In 1993, several tons of wastes that were accumulating in the Palisade plant's overfull irradiated fuel pools were moved into massive concrete and steel storage casks on concrete pads on the plant site.

GG-33 Inexplicably, the extremely dangerous radioactive wastes from Palisades, that will remain dangerous for tens to hundreds of thousands of years, were deliberately placed within a high-risk erosion zone, which is highly unstable, dynamic and risky. Currently, around 20 of a total of 29 casks, weighing 132 tons each, are situated approximately 150 yards from Lake Michigan, sitting atop loose sand dozens of feet thick. Thus, the casks, and the concrete pad upon which they sit, are not anchored to bedrock. This stretch of Lake Michigan's southwest shoreline is known to have the ability to recede in an exceptionally short time frame. The high-risk erosion zone requires 30-year construction setbacks that range from 55 ft. to 140 ft. and 60-year setbacks that range from 115 ft. to 260 ft.

GG-34 One of the waste storage cask systems at Palisades, the "VSC-24," (Ventilated storage cask containing 24 pressurized water reactor irradiated nuclear fuel assemblies) utilizes passive ventilation to keep the waste at the appropriate temperature. The vents on this type of cask need regular cleaning so they will not clog from blowing dune sand, debris, or snow. This cask is also not considered transportable, like some casks, and as such, wastes contained within them will need to be unloaded and transferred into shipping containers, when or if transport occurs. But even though Consumers Energy and the NRC testified in federal court that the casks could be safely unloaded, there have been numerous problems. When weld defects were detected in the fourth VSC-24 cask to be loaded in 1994, for example, it was found that there were critical questions about how to handle the procedure. This defective cask has yet to be unloaded, twelve years later.

To further complicate the unloading problems of Palisades' casks, the configuration of the dry casks currently stored on the older pad nearer Lake Michigan is such that those casks furthest back cannot be moved or unloaded until all other casks in front of them have been moved out of the way first. Thus, casks that cannot be unloaded on the shore side of the pads will effectively halt unloading of the casks behind them.

There have been other accidents and incidents with the VSC-24 system. While a VSC-24 cask was being welded shut at the Wisconsin Point Beach nuclear power plant in 1996, a spark from the welding caused a hydrogen gas explosion that tilted the lid of the cask (3 tons of metal) several inches ajar; this incident occurred on the edge of the waste storage pool, threatening to damage the pool and unleash a potentially catastrophic radiological accident. Additional weld defects have been detected in other casks at Palisades and at other plant sites.

On February 6, 1997, Mary P. Sinclair Ph.D. co-chair of Don't Waste Michigan, wrote to Dr. Shirley Jackson, Chair U.S. Nuclear Regulatory Commission and reviewed this history in great detail with documentation and references for each point made. In her letter to Dr. Jackson, Dr. Sinclair wrote the following:

" . . . Attorney General Frank Kelley petitioned for an injunction in May 1993, against the loading of these casks in the Western Michigan Federal Court at Grand Rapids. (Case No. 4:93 CV 67). Consumers Power Co.'s response to the Court was that the company would unload the casks and place the nuclear waste back in the spent fuel pool if the Court should rule against them and, therefore, an injunction to prevent loading was unnecessary. A supporting position for the utility's action was filed by Charles Haughney of the NRC, in which he assured Judge Robert Holmes Bell that Consumers was able to do this by simply reversing the process of loading, if the Court so ordered. This demonstrates that, not only did Consumers Power Co. mislead the Judge, perhaps out of ignorance, about Consumers' ability to unload these casks, but more importantly, Charles Haughney of the NRC pledged the Agency's credibility in support of this position. His statement is signed, "Pursuant to 28 U.S.C. sec. 1746, I declare under penalty of perjury that the foregoing is true and correct." (Executed and signed on May 5, 1993). Judge Bell, of course, could hardly grant an injunction under those circumstances. This is one of many instances in which the judgment of the staff was flagrantly in error, and helped to compound the problems that have later developed. [pp. 3-4, Requests that Commission review 2.206 petition filed on 950919 & amended on 960930 by Lake Michigan Federation & Don't Waste Michigan, Sinclair MP. Accession Number: 9704090248, Docket Number: 05000255,07200007, Microform Address: 92410:204-92410:211] A hard copy of this letter is being provided by Don't Waste Michigan to be entered in its entirety into the record as part of comments being submitted on this draft EIS. There are additional comments in the letter, which also pertain to this EIS process.

The Wisconsin explosion led to a three year hiatus in the loading of VSC-24 casks nationwide, in order to improve safety procedures. Palisades was the first plant in the country to begin loading VSC-24s again, in June, 1999. However, mistakes were made yet again. A welding crew accidentally ignited flammable hydrogen gas being vented off a loaded VSC-24. But it failed to notify the next welding crew coming on shift to replace them. The new crew also ignited the leaking hydrogen gas, representing a breakdown of safety protocols, risking a repeat of the Wisconsin explosion.

During the June, 1999 dry cask loading campaign, Palisades also loaded irradiated fuel that had not yet thermally cooled and radioactively decayed in the underwater storage

pool for the required minimum of five years. This represented a violation of the technical specifications for the casks, and thus NRC safety regulations. Also in June 1999, a fire at Palisades in an office trailer storing paper records on the dry cask storage installation destroyed records on the most recent, and earlier, accidents.

Palisades also uses Transnuclear NUHOMS-32PT dry storage casks. In October 2005, crane handling errors led to a 107 ton NUHOMS transfer cask fully loaded with high-level radioactive waste dangling for 55 hours above the storage pool. Reports confirmed that the risk of a heavy load drop had been increased due to improper emergency brake manipulation during the incident. NRC reported that, had the load dropped, severe damage to the pool could have resulted.

GG-35

A separate NRC report, "Technical Study of Spent Fuel Pool Accident Risk at Decommissioning Nuclear Power Plants," (NUREG-1738, Feb. 2001) revealed that a heavy load drop can cause the cooling water to drain away. The densely-packed waste in the pool could then overheat, spontaneously combust, and ignite a waste fire causing catastrophic radiation release. NRC concluded that up to tens of thousands of people could die from cancer over time, downwind of such an accident.. Despite similar crane problems years earlier at its Big Rock Point nuclear power plant in northern Michigan, failure to communicate "lessons learned" within the nuclear utility contributed to repeating the same dangerous errors at Palisades.

GG-36

Establishment of a permanent national waste repository remains indefinitely delayed

In 1982, with the passage of the Nuclear Waste Policy Act, the U.S. Department of Energy (DOE) was given the responsibility for finding a permanent site to build and operate a repository for all of the wastes accumulating at the reactors across the country. Original plans were for the repository to begin accepting irradiated nuclear fuel in 1998, but it has been pushed back until 2020, according to the most-recent predictions made by Energy Secretary Samuel Bodman. In 2002, Congress voted to allow DOE to apply for a license from NRC to construct and operate a repository at Yucca Mountain in Nevada. The opening of the repository is uncertain: the State of Nevada has actively opposed the plan, and raised legitimate questions about the suitability of the site; DOE does not have full funding for construction and operations, and recently, a federal appeals court found that the impact of the project must be evaluated for longer than the 10,000 years currently considered. Even if the Yucca site were to open in 2020, DOE has projected in its 2002 Final EIS for Yucca that it would take 24 to 38 years to transport wastes to Yucca from reactors across the U.S., including Palisades. Thus, even if Yucca opened in 2020, it would take until 2044 or even until 2058 for the wastes generated before 2010 at Palisades to be moved to Yucca Mountain, Nevada. Because of this, existing wastes from Palisades are likely to remain on the Lake Michigan shoreline indefinitely.

GG-37

Waste from 20 additional years of operation at Palisades will not go to Yucca Mountain

Yucca Mountain is limited by law to store 70,000 metric tons of nuclear waste. Only 90%, or 63,000 metric tons, of that can come from commercial nuclear reactors. 63,000

metric tons is approximately the amount of nuclear waste that will be stored on-site at reactors around the country by 2010. A 2004 analysis by the Environmental Working Group found that the 26 reactors at nuclear power plants re-licensed between 2000 and 2004 will produce an additional 9,000 metric tons of high-level nuclear waste over the 20-year period of their license extensions. Eighteen more reactors at nine power plants with license extensions pending would add another 6,600 metric tons of waste, for a total of 15,600 additional metric tons. Wastes produced at Palisades for 20 additional years– 290 additional tons of irradiated nuclear fuel –will likely be stored indefinitely in the same manner as the other Palisades wastes that have been produced to date, resulting in a massive assemblage of concrete and steel silos extending along the high risk erosion zone on Lake Michigan, as well as a packed storage pool within the Palisades plant.

If Yucca Mountain opens, waste will be transported by barge and rail

The DOE has estimated that transporting the waste from the plants to Yucca Mountain would require more than 53,000 truck shipments to Yucca over 24 years or about 2,200 per year. If rail is the primary means of transporting the waste – and DOE has stated that it prefers rail – the proposed action would require more than 10,700 cross-country shipments over 24 years, or about 450 per year (Halstead 2002). Re-licensing to date has added about 5,700 more truck shipments, or 1,050 rail shipments to that total. GG-38

The Department of Energy declared in April 2004 that rail shipment to Nevada is the preferred mode of transportation for high-level nuclear waste. Barge shipments are being considered under this option because 17 nuclear power plants, including Palisades, have no rail access, yet could connect to rail lines via barges.

For Palisades, DOE has proposed barging up to 125 giant rail-sized containers of high-level radioactive waste from Palisades to the Port of Muskegon, up the Lake Michigan shoreline. DOE's estimate of 125 shipments may very well be an underestimate, in that DOE assumed Palisades would only get a 10-year license extension, while NRC's practice to date has been to approve every request for a 20-year license extension. Thus, an additional 10 years worth of waste generation would mean that many more barge shipments between Palisades and Muskegon.

The barging of 125 or more shipments of high-level radioactive waste is very risky. Any submersion of the casks in water, could stimulate the fissile uranium-235 and plutonium, both present in the high-level waste, to cause a nuclear chain reaction. The slightest leakage of even a small amount of this waste could not only threaten Lake Michigan as a source of drinking water for ten million people, but also cause a host of other irrevocable impacts on the lake's fish, wildlife, people, and economy.

Storage of "low" level radioactive waste from Palisades not addressed in the draft EIS

The Barnwell, South Carolina "low" level radioactive waste dump, which has accepted shipments from Palisades for decades, will close its doors to wastes from Michigan in 2008. Neither NMC in its Environmental Report, nor NRC in its draft EIS, have GG-39

25

explained how Palisades will deal with the "low" level radioactive wastes when Barnwell closes, such as establishing storage installations for "low" level radioactive wastes on the plant site. What NRC and the nuclear industry term "low" level radioactive wastes contain many of the same radio-nuclides as high-level radioactive waste, only less concentrated. Some "low" level radioactive waste can even deliver a lethal dose of radiation at close enough range in as little as 20 minutes. "Low" level radioactive waste management at Palisades is a significant health, safety, and environmental issue that requires is largely unaddressed by NMC and NRC in the license extension application and requires specific consideration.

XI. Plant Aging Increases Accident Risk

GG-40

A top concern directly related to the re-licensing of Palisades for 20 additional years, is the aging of the plant, in particular *embrittlement*, or the gradual weakening of the reactor pressure vessel (RPV) from decades of bombardment by neutrons emitted by the nuclear chain reaction in the core. It is generally acknowledged that the reactor pressure vessel at Palisades is one of the most embrittled in the nation. The longer Palisades operates, the more embrittled its RPV becomes, increasing the risk for Pressurized Thermal Shock (PTS), a condition caused by any number of system malfunctions which can result in a severe, sudden overcooling of the reactor pressure vessel. This, combined with the intense pressurization in a pressurized water reactor, can stress the RPV such that its walls could crack or rupture, leading to a loss-of-coolant accident, meltdown, and catastrophic release of radiation to the entire Great Lakes basin.

Age-related failure of Palisades' systems could initiate the sequence of events that leads to PTS. Examples of aging systems at Palisades are evident in this short list of recent incidents:

1. Alert Declared Due to Loss of Shutdown Cooling (Event # 39699 March 25, 2003)
2. Failure of the Control Rod Drive Mechanism (see PNO-III-04-010 August 11, 2004)
3. Reactor Manually Tripped Due to Fire in 2B Condensate Pump (Event# 41002 August 31, 2004)
4. Relief Requests for Reactor Vessel Head Penetration problems (NMC Request 10/4/04)
5. Reactor Vessel Head Nozzle Cracking - Through Wall Cracks (Degraded Condition 10/17/2004)
6. Manual Reactor Trip/Main Condenser Vacuum (Event # 41319)

7. Emergency Declared on Primary Coolant System Integrity (Event # 41681)

8. Control Rod Stuck in Reactor Core (Event #42569 May 11, 2006)

The embrittlement at Palisades, the unresolved risks of PTS, and the ever-increasing likelihood of the failure of the RPV as Palisades ages warrant special environmental considerations. This type of accident is considered one that goes beyond the design of the reactor. NRC has not, however, included the issue in the EIS nor incorporated it in "Beyond Maximum Credible Accident" scenarios for Palisades as a potential accident. Further, NMC in its Environmental Report, has declined to undertake major refurbishment for Palisades' license renewal, despite Consumers Energy's earlier pledge to "anneal" (super-heat) the reactor pressure vessel. This super-heating theoretically can bring back ductility or flexibility to the metal, thus reducing potential for PTS. Annealing has never been performed in the U.S., however, and thus raises concerns itself as an experimental procedure.

Please include for the record the Adobe PDF document entitled "Palisades Nuclear Plant Yearly Capacity Factors" & "Palisades Plant - Record of Transients or Operational Cycles" for Occurrence #1 dated 1/11/1972 through Occurrence # 126 dated 1/9/2005. This is a record which has major implications for embrittlement and the Reactor Pressure Vessel at Palisades. A hard copy will be sent. Please enter it into the record.

Age-related deterioration also increases the likelihood of unintentional leaks, as plant systems, structures and components wear out and fail. Palisades' age-related degradation means increasing amounts of radioactivity will be "routinely" released over time. Plans for addressing embrittlement and other aging issues at Palisades are not provided in NMC's Environmental Report or in the EIS. Any discussion of 20 additional years of operation at Palisades necessitates a specific plan for addressing embrittlement and aging issues.

The most recent NRC report on a potential accident at Palisades, done in 1982, (Calculation of Reactor Accident Consequences or CRAC- 2), predicted that a meltdown and large-scale radiation release from the Palisades reactor would cause 1,000 fatalities and 7,000 injuries in just the first year, 10,000 cancer deaths over time, $52.6 billion in property damage (based on 1980 census, expressed in 1980 dollars, thus significantly underestimating current and future impacts due to population growth and inflation; adjusting for inflation, property damage could exceed $100 billion expressed in year 2005 dollars). The above CRAC - 2 report did not take into account a "Beyond Maximum Credible Accident" scenario. We request the EIS provide assessment of the consequences of a "Beyond Maximum Credible Accident" as Palisades' embrittlement status increases the likelihood of such an accident.

27

XIII. Emergency Evacuation Plans Need Updating

GG-41

Emergency responders in the 50-mile zone around the Palisades nuclear reactor are likely to be inadequately trained and inadequately equipped to respond to a major radioactivity release during an accident or attack at the Palisades plant. Covert Township does not have the staffing, equipment, training or preparedness for a major radiological emergency, the risk of which increases with 20 additional years of operation at Palisades., as the plant ages.

Other communities within the 50-mile zone are mostly rural, and maintain only volunteer fire departments, which have even less equipment and training than Covert Township. Radiation monitors and radiation-protective gear are unheard of, or in limited supply. Isolation wards for radioactively contaminated victims – the patients themselves posing a hazard to emergency medical technicians, doctors, and nurses -- are limited as well at hospitals within 50 miles of Palisades

NMC/Consumers are obligated to demonstrate how the communities that surround its facility are equipped for such a risk referenced in NRC's 1982 report, of a catastrophic radiation release, as well as ensuring that the plant's current Radiological Emergency Response Plan projects 20 years forward and incorporates population trends and development, highway construction projects, transitory populations of migrant workers, and provisions for bi-lingual notifications and dissemination of information.

XIV. Dispute Regarding Violations of Palisades' NPDES Permitted Discharges Remains Unresolved

GG-42

There are questions regarding the status of the NPDES permit of Palisades to utilize and eventually discharge a compound, Betz Clam-Trol, to Lake Michigan to control mussel and clam mussel colonization in discharge and intake pipes. Reports posted by the Michigan Department of Environmental Quality (MDEQ) in 2000 and through 2004 indicated "continued non-compliance." Subsequent updating of the reports now appears to indicate that the plant is and was in compliance with its permit. To further confuse the matter, MDEQ has stated that the original reports were erroneous. We ask that a full explanation be provided for this situation and how it will be considered in the re-licensing decision. The impact of 20 additional years of pollution improperly controlled under requirements of the National Pollutant Discharge Elimination System will adversely affect the water quality of nearby sources, including Lake Michigan.

In its "Ninth Biennial Report on Great Lakes Water Quality," the International Joint Commission urged that "[g]overnments monitor toxic chemicals used in large quantities at nuclear power plants, identify radioactive forms of the toxic chemicals and analyze their impact on the Great Lakes ecosystem." The draft EIS must address how the NRC or the U.S. Environmental Protection Agency has met this obligation.

XV. Analysis of Alternatives to License Extension Flawed and Self-Serving

In the draft EIS, Section 7.0, "Alternatives to the Proposed Action," renewable energy sources such as wind power and solar power, as well as alternatives such as energy efficiency and conservation, are not given credible consideration. Polluting electricity sources such as fossil fuels are cited by NMC/Consumers as the only realistic alternatives to approval of a 20-year license extension at Palisades. This is not surprising, as nearly three-quarters of Consumers' electricity generation (in 2002) comes from fossil fuel facilities. But the choice is not just between nuclear power and coal as sources for electricity generation. NMC/Consumers reveal a bias in favor of fossil fuel and nuclear power use by presenting only those two sources favorably in their Environmental Report, and by downplaying the potential for energy efficiency, energy conservation, and renewable sources of electricity. NRC echoes this as well in its draft EIS. GG-43

Renewables, efficiency and conservation are not only available, reliable, safe, clean and affordable options for electricity generation and savings, but also a source for tremendous job growth and cost savings. Using simple energy efficient techniques, Michigan citizens and businesses could easily reduce the state's energy demand by 1%, the energy used by 40,000 homes. In the state of Michigan there is currently 19,250 megawatts of generating capacity. Palisades generates 798 megawatts, or 4% of the power generation in the state of Michigan. Wind power potential in Michigan, according to the DOE, is 16,000 megawatts, or twenty fold the mega-wattage of Palisades, and could be a viable replacement for the energy that Palisades provides. In fact, wind power is the fastest growing new source of electricity in the United States, relative to all other sources. GG-44

NRC staff's assertion in the draft EIS that such wind power expansion would have a large negative impact due to the large surface area of land it would require is incorrect, and ignores the fact that small-scale family farmers could benefit from the placement of wind turbines on their fields. These farmers could either benefit from the lease payments from wind power companies for use of their land's "windshed," or could work towards owning their own wind turbines on their own land, and thus receive the full income from wind powered electricity generation. Wind turbines would not preclude the farmers' continued use of fields for agricultural crop or livestock production. Wind power could serve as a valuable source of income for farming families, complementing their agricultural livelihood, while also providing safe, clean, reliable, and inexpensive electricity for the region. GG-45

There are also many examples of new efforts underway in Michigan to move forward with renewable energy, with the deployment by Mackinaw Power of modern, large capacity wind turbines on the northern tip of Michigan's lower peninsula, plans to deploy more wind turbines on the Lake Michigan shoreline of west Michigan, and advances in solar electricity by United Solar Ovonics in Troy, Michigan (which GG-46

manufactures solar electricity generating roofing shingles). President Bush visited the headquarters of United Solar Ovonics earlier this year to promote promising renewable energy technologies.

It is especially significant that on April 6, 2006, Michigan Governor Jennifer Granholm signed Executive Directive No. 2006 - 2, which charges the Michigan Public Service Commission to prepare an "Energy Plan for the State of Michigan" by December 31, 2006. The directive calls for the development of a renewable portfolio standard that "establishes targets for the share of this state's energy consumption derived from renewable energy sources" and initiates the "appropriate use and application of energy efficiency, alternative energy technology, and renewable energy technologies.... consistent with the goal of assuring reliable, safe, clean and affordable energy." This puts the state of Michigan in a favorable position to promptly substitute clean energy sources for those with adverse impacts, such as nuclear power, as it moves into the forefront of renewable energy technology.

The full cycle of nuclear power illustrates its complete adverse environmental impact

There are many different types of nuclear power reactors. In the U.S. there are two types of light water reactors, Boiling Water Reactors (BWR) and Pressurized Water Reactors (PWR). Palisades is a pressurized water reactor. All, however, rely on a nuclear fission chain reaction to generate heat to boil water, to create steam, which is then used to drive an electrical generator. The radioactive material used in the fission process is uranium.

Mining for uranium involves separating the ore from rock, which leaves "tailings" that contain residues of uranium, and other radioactive materials (such as radium, radon, and thorium) from the radioactive decay of uranium and, although being considered "low-level" radioactive waste, actually contain around 85% of the natural uranium's original radioactivity. Mining of uranium is likely to impact the quality of Michigan's environment with an extension of Palisades' license, as there have been recent proposals to mine uranium in the Upper Peninsula of Michigan. The Great Lakes have already been damaged by such mining activities. Uranium mining at Elliot Lake, Ontario from the 1940s to the 1990s released vast quantities of radiological and toxic chemicals into Lake Huron. Despite the mines shutting down in the late 1990s, harmful effluents still flow into the Great Lakes. Mine tailings were flooded over with water to prevent oxidation, thus creating "dead," artificial lakes which dot the landscape.

After mining, raw ore is milled, ground up, and chemically leached into a powder called "yellowcake." The yellowcake powder is chemically processed or enriched, into either uranium dioxide for use in power plants or uranium metal, used in making nuclear weapons. Wastes from the enrichment process, also miss termed a "low-level" radioactive waste by NRC, are called depleted uranium or DU. The U.S. and some other countries use DU to coat tank armor and armor piercing shells/weapons. There is considerable controversy regarding DU coated weapons and the potential for exposure to depleted uranium to cause kidney and lung damage, and cancer and birth defects.

According to Dr. Arjun Makhijani, Director of the Institute for Energy and Environmental Research, uranium mining and milling inflicts some of the worst human health impacts of the entire uranium fuel chain. This is due to the careless handling of the radioactive materials involved, and dumping of waste materials upon the surface of the land, where they can be dispersed in air and water. Because of this, the Navajo Indian Tribe in the Southwestern United States – the largest Indian tribe in the country – has officially banned the mining, milling, or processing of uranium upon its reservation territory. GG-47

Nuclear power is not carbon-free. Considerable amounts of fossil fuel energy are used to mine, mill, process, and transport, and manage uranium ores and byproducts. As more reactor licenses are extended, fossil fuel use is likely to increase as poorer-quality ores are used due to the depletion of higher quality ore reserves because poorer quality ores require much more conventional energy for extraction and processing. Mining of more distant deposits also contributes greater carbon dioxide inputs to the atmosphere. Uranium enrichment is also energy intensive, and has historically involved the release of very large amounts of ozone layer destroying chlorofluorocarbons. NRC's draft EIS does not address such negative environmental impacts of the nuclear fuel chain. A full cost accounting of the uranium fuel chain's negative impacts on health and the environment is required to properly evaluate Palisades' twenty-year license extension request.

Nuclear power generation is more costly than readily available alternatives

Many costs associated with nuclear power are often hidden or externalized; for example, the very existence of the nuclear industry is only possible due to the government's assumption of the accident liability risk. According to Public Citizen ("Renewable Energy Is Capable of Meeting Our Energy Needs" fact sheet, 2006) direct taxpayer subsidies to the nuclear energy industry totaled $115 billion between 1947 and 1999, with a further $145 billion in indirect subsidies. In contrast, subsidies to wind and solar during the same period amounted to only $5.5 billion.

Decommissioning, or the closing and dismantling of nuclear power plants, ranges from $280-$612 million for each plant, ultimately paid for by utility customers. DOE's latest cost prediction for the Yucca site for high-level radioactive waste generated up to the year 2010 is $58 billion. Energy Secretary Bodman has recently admitted, however, that DOE has no total price tag predictions for the project and the state of Nevada predicts the cost will top $100 billion. Ratepayers who receive electricity from nuclear reactors pay a Nuclear Waste Fee on their electricity bills. Several billion dollars of the Fund have already been spent at Yucca; about $20 billion remains in the Fund, far short of DOE's now underestimate of $58 billion for Yucca. The shortfall will have to be paid, yet again, by US taxpayers, many of whom have already paid as ratepayers. GG-48

Nuclear power is not, as currently promoted, cost effective compared with other energy sources. In a 2006 paper on the "economics and climate-protection potential" of nuclear power, Amory Lovins, energy researcher and director of the Rocky Mountain Institute,

31

describes the advantages of energy efficiency and explains that ".... nuclear power saves as little as half as much carbon per dollar as wind power and traditional cogeneration, half to a ninth as much as innovative cogeneration, and as little as a tenth as much carbon per dollar as end-use efficiency. ..... Empirically, on the criteria of both cost and speed, nuclear power seems about the least effective climate-stabilizing option on offer." [Amory B. Lovins, "Nuclear power: economics and climate-protection potential, Rocky Mountain Institute, 11 September 2005, updated 6 January 2006, p. 15.]

Lovins puts it succinctly in his recent analysis: "No other energy technology spreads do-it-yourself kits and innocent disguises for making weapons of mass destruction, nor creates terrorist targets or potential for mishaps that can devastate a region, nor creates wastes so hazardous, nor is unable to restart for days after an unexpected shutdown."

The full costs of operating the Palisades nuclear plant for 20 additional more years, including the costs of accidents, waste storage, and decommissioning, must be assessed as part of the EIS.

Impacts from extreme weather/global climate change discounted by NRC

GG-49

A majority of scientists throughout the world now believe that increased emissions of carbon dioxide since the Industrial Revolution are enhancing the greenhouse effect of the atmosphere that surrounds the earth, and causing a warming that will cause dangerous effects to the earth's climate and inhabitants - global warming. The NRC confirms it as well, in its analysis of impacts of alternatives that might be more appropriate options than extending the license for Palisades, as it concludes that the impacts of substituting coal plants for Palisades would be a "large" impact, due to their contribution to global warming.

A one-degree Celsius warming of the earth's surface may seem insignificant, but it is not. The temperature of the earth's surface greatly affects our climate in many ways. In particular, a warmer planetary climate means more rain, flooding, and snow in various regions, earlier spring arrivals, hurricanes, heat waves, drought and fires in some places, frigid cold in others.

The effects are already seen in Michigan, where water in the Great Lakes is warming. According to Dr. Natalia Andronova, research scientist at the Department of Atmospheric, Oceanic, and Space Sciences at the University of Michigan in a May 7, 2006 interview with the Ann Arbor News, "Measurements of the near-surface temperature over the northern part of Lake Michigan and southern part of Lake Huron showed that for both lakes the period from 2000 to 2005 was warmer by at least two degrees Celsius than the period from 1981 to 1985." An increase of Lake Michigan water temperatures may eventually affect Palisades' operation, since the condenser within the plant requires cooler water to operate efficiently. During a heat wave in the late 1990s, reactors on the U.S. side of Lake Ontario shut down because the water temperature was too high to efficiently cool the reactor and generate steam for electricity production. During the extreme heat wave in France in recent years, nuclear reactors released so

much superheated water to rivers that fish kills occurred; operators had to hose down the exterior of reactors as an emergency measure to provide additional cooling at the same time.

In the recent interview, Dr. Andronova also noted conditions particular relevant to re-licensing of Palisades. She commented that "it is becoming windier over the Great Lakes. The extreme winds increased from the one period to the next by more than 3 meters per second." More extreme winds, as well more frequent and intense tornadoes — all of which global warming could cause — could make operation of Palisades more and more risky over time. For example, documents received by the Nuclear Information and Information Resource from NRC during a Freedom of Information Act request regarding the October 2005 "near-drop" of a storage cask into the irradiated nuclear fuel pool at Palisades revealed that on extremely windy days, Palisades is prohibited from lifting loaded dry casks from the pool, as the high winds make crane operations too dangerous.

The potential danger presented by tornadoes to reactors was clearly shown in 1998, when a tornado struck the Davis-Besse nuclear plant in Ohio, knocking out the off-site electricity supply; the emergency back up diesel generators also malfunctioned. If not for extreme efforts by staff, the plant could have lost coolant, leading to a meltdown. An increase in severe weather due to global climate destabilization in the region could well increase risks at Palisades. Far from being a solution to global warming, nuclear power could become unacceptably dangerous and unreliable due to global warming.

The draft EIS prepared by the NRC unaccountably discounts the effects of global warming, noting that its effects cannot be predicted. We assert that there is sufficient information currently available that should be investigated and considered regarding the impacts of changes in weather that may occur in a 20-year extension to Palisades' license. This must also include an analysis of the increased potential for an electrical station loss of power that could lead to loss of cooling in the reactor core and waste storage pool, with the potential for core meltdown and waste pool fires, with consequent catastrophic large-scale radiation releases to the environment. The warming of the cooling water supply from Lake Michigan must also be considered in regards to the efficiency and safety of Palisades continued operation till 2031.

XVI. Endangered Species Harmed by Radioactive Discharges

Plant and wildlife species become endangered for a variety of reasons, including loss of habitat, overexploitation, disease and pollution, and the introduction of invasive species. Official designation of a species by federal or state government as endangered or threatened not only acknowledges the importance of that species, but also its fragile status that requires special protection efforts. These special protection efforts most certainly encompass protection against the routine and cumulative exposure to radioactive substances.

Frameworks for radiological protection have traditionally been focused on the protection of humans. The International Commission on Radiological Protection (ICRP), which provides recommendations on protection against ionizing radiation, has maintained that "if man is adequately protected then other living things are also likely to be sufficiently protected" (ICRP, 1977). There is no scientific evidence, however, to support this viewpoint.

In addition, it is well established that ionizing radiation is one of the causes of genetic mutation. Species exposed to cumulative exposures from the radioactive discharges of a nuclear power plant may over time develop subtle genetic alterations that are not observable in the short term, but that could have subtle, but large impacts within a population. This has significant implications for threatened and endangered species.

GG-50

NMC/Consumers' Environmental Report identifies numerous federal and State of Michigan endangered, threatened, candidate or species of special concern – such as the eastern box turtle, lake sturgeon, lake herring, creek chub sucker, Pitcher's thistle, prairie warbler, prairie vole, eastern massasauga rattlesnake, spotted turtle, Indiana bat, globe-fruited seedbox, scirpus-like rush, bald rush, Carey's smartweed, and sedges that either already live at or near the Palisades reactor or along its transmission lines, or very likely could in the future.

Approving a license extension of 20 more years of reactor operations at Palisades increases the fragile status of these already threatened, endangered, or candidate species, from daily "routine" radiation releases and/or potential large-scale radiation releases. At minimum, NMC/ Consumers must be required to establish a baseline for the status of the endangered species listed above and conduct appropriate monitoring to ensure that Palisades is not further endangering their health and viability.

XVII. Conclusions

GG-51

For the reasons laid out in this document, the coalition of aforementioned environmental, social justice, and public interest organizations oppose the application by Palisades nuclear power plant to operate for an additional 20 years beyond its original 40 year license. The decision to sanction approval of the 20-year license extension appears to have been predetermined and the invitation to members of the public and citizens of this region to participate in this decision making process has been merely perfunctory. This coalition of organizations protests the severe limitations of the process and advocates for a decision-making framework that allows for an unbiased, deliberative, participatory discussion as to whether or not to allow 20 more years of operation by the Palisades nuclear power plant.

With a **fair and just** Environmental Impact Statement – the conclusion reached in the EIS would not have been the continued operation of a potentially catastrophic accident risk and terrorist target on our beloved Lake Michigan shoreline. These risks are

exacerbated by the already regrettable high-level radioactive waste storage -- or de facto high-level nuclear dump -- in the heart of the Great Lakes.

There are too many explicit threats to the region's environment and people that have been ignored in order to promote the use of an energy that is far too costly, exceedingly hazardous, increasingly risky and highly irresponsible, as the question of a solution to the waste problem is passed down as a regrettable legacy to future generations.

For these reasons we urge that the proposed 20-year license extension be denied until all environmental impact concerns raised here and by other stakeholders are addressed in an objective process that is deemed acceptable by the public as prescribed by the 1969 National Environmental Policy Act (NEPA).

Recommendations

Security issues at Palisades must be addressed immediately. If a mock attack or force on force demonstration has not been conducted at Palisades, it should be conducted as soon as possible. Classified results of the demonstration should then be directly communicated to the region's U.S. Congressional representatives and senators, as well as the Governor and Attorney General of the State of Michigan, for their thorough review and approval and reporting back to the public. The following security safeguards, if not instituted already, must be put in place immediately: GG-52

- Sufficient cameras and patrols;
- Delay measures, such as fences outside buildings and entrances that would delay potential attackers;
- Bullet resistant structures in the protected areas of the plant site;
- Adequate and specific training for security officers;
- Several levels of intrusion detection systems (Needed especially by Palisades to protect against intrusion from potential attackers that may enter from Van Buren State Park, adjacent to the plant site.);
- Vehicle barrier systems to prevent vehicles with bombs from entering the site;
- Anti-aircraft capability, and;
- Shore patrol equipped with stationary weaponry capable of preventing an offshore assault.

NRC and Palisades must also ensure that the plants irradiated nuclear fuel storage pools are safeguarded from terrorist activities as well as address civil liberties ramifications of increased security to the host and surrounding communities of Palisades.

Native American interests must be addressed. All Native American tribes and bands that could be expected to have an interest in the application by Palisades to operate an additional 20 years deserve both notification of this process, as well as the opportunity to share government-to-government decision making regarding the application, as allowed for under NEPA and other federal laws. A comprehensive site wide survey GG-53

35

should be performed on the entire Palisades property – as recommended by Palisades' own cultural resource assessment subcontractor as described in the draft EIS - carried out in close consultation with all affected tribes.

GG-54

Effects on the health of populations surrounding Palisades and subject to downstream or downwind discharges must be studied and quantified. The implications of the National Academy of Science's recent findings require a thorough analysis by the NRC in its EIS of the human health impacts of the radioactive substances released by Palisades. NMC/Consumers are obligated to provide the communities in the vicinity of the Palisades plant, with a monitoring program to provide them with independent information regarding radioactive discharges and releases. There is also a need to establish a baseline assessment of cancer and other disease rates, as well as a program of regular monitoring, prior to consideration of the proposal for a 20-year license extension. This should also include an evaluation of the potential for the synergistic effects of chronic or catastrophic radiation releases combined with the toxic pesticides to which migrant field workers in the region have been exposed.

GG-55

NRC must provide a detailed explanation to the public as to the ultimate disposition of the wastes stored currently on the Palisades plant site, as well as the 290 additional tons expected as part of 20 additional years of operation.
The proposed national repository for high-level wastes from nuclear power plants, Yucca Mountain, Nevada, is not expected to open until at least 2020, and is likely to be delayed beyond that date. Further, by law, the repository can only store 70,000 metric tons, which will not include the additional wastes generated at Palisades during a license extension. NRC in its EIS, must also explain how Palisades will deal with its "low" level radioactive wastes when its current repository site in Barnwell, South Carolina closes in 2008.

GG-56

Barging of high-level radioactive wastes in Lake Michigan must be removed as a transportation option. The barging of 125 or more shipments of high-level radioactive waste on Lake Michigan is simply too risky. Any submersion of the casks containing the wastes in water, could stimulate the fissile uranium-235 and plutonium, both present in the high-level waste, to cause a nuclear chain reaction. The slightest leakage of even a small amount of this waste could not only threaten Lake Michigan as a source of drinking water for ten million people, but also cause a host of other irrevocable impacts on the lake's fish, wildlife, people, and economy.

GG-57

NRC must require Palisades to develop and implement a specific plan for addressing embrittlement and aging issues. Plans for addressing embrittlement at Palisades are not provided in by NMC or in the EIS. Any discussion of 20 additional years of operation at Palisades necessitates such a plan to address the aging of plant structures and components. We request the EIS provide assessment of the consequences of a "Beyond Maximum Credible Accident" as Palisades' embrittlement status increases the likelihood of such an accident.

NMC/Consumers must demonstrate how the communities that surround its facility are equipped for a catastrophic radiation release. The plant's current Radiological Emergency Response Plan is inadequate and must be revised to project 20 years forward and incorporate population trends and development, highway construction projects, transitory populations of migrant workers, and provisions for bi-lingual notifications and dissemination of information. This requires Spanish language emergency evacuation instructions and notifications prepared to serve the Spanish speaking Latino population. GG-58

A comprehensive analysis of socio-economic conditions in Covert Township and Van Buren County must be conducted to encompass income disparities. NRC must account for the lack of positive benefit by Covert Township residents as a result of the presence of Palisades' nuclear power plant and potential license extension. NRC must also direct NMC/Consumers to address the potential for disproportionate harm to the Latino migrant labor workforce from harm to the agricultural base from a radiation release. GG-59

The safety of the concrete pads and the storage casks of high-level wastes must be resolved to the satisfaction of citizens of the region. The potential for earthquake activity to damage Palisades' outdoor dry cask storage pads, upon which the casks have been placed, warrants rigorous consideration, which unfortunately, is not in evidence in the EIS. Further, blowouts, areas of blowing and unstable sands, in dunes in the vicinity of Palisades' dry cask storage system could threaten the integrity of the dry cask storage waste system, by clogging vents in the casks, and causing the wastes to overheat, which could lead to an explosion. Palisades must be required to monitor the dunes for potential blowouts and ensure that the dunes are consistently vegetated and stable. GG-60

NRC must revise its analysis of energy alternatives. Full and objective consideration must be afforded the options of renewable energy and efficiency. NRC must also provide a thorough cost accounting of the uranium fuel chain's negative impacts on health and the environment. GG-61

The EIS should be revised to include how the NRC meets its obligations as described in the International Joint Commission's (IJC) "Ninth Biennial Report on Great Lakes Water Quality." In it, the IJC urged that "[g]overnments monitor toxic chemicals used in large quantities at nuclear power plants, identify radioactive forms of the toxic chemicals and analyze their impact on the Great Lakes ecosystem." GG-62

NRC must assess and consider as part of the EIS, the information currently available regarding the impacts of global warming to the region. This must also include an analysis of the increased potential for an electrical station loss of power that could lead to loss of cooling in the reactor core and waste storage pool, with the potential for core meltdown and waste pool fires, with consequent catastrophic large-scale radiation releases to the environment. The warming of the cooling water supply from Lake GG-63

37

Michigan must also be considered in regards to the efficiency and safety of Palisades continued operation till 2031.

GG-64

NMC/Consumers must be required to establish a baseline for the status of the endangered species and conduct appropriate monitoring to ensure that Palisades is not further endangering their health and viability. Approving a license extension of 20 more years of reactor operations at Palisades increases the fragile status of these already threatened, endangered, or candidate species, from daily "routine" radiation releases and/or potential large-scale radiation releases.

I. Introduction

A 20-year license extension is proposed for Palisades Nuclear Power Plant
Consumers Energy, owner, and Nuclear Management Company (NMC), LLC, operator,

5711 Summerset Dr.
Midland, MI 48640
Feb. 6, 1997

Dr. Shirley Jackson, Chair
U. S. Nuclear Regulatory Commission
Washington, D. C. 20555

Dear Dr. Jackson:

I respectfully submit a request that you and your fellow Commissioners personally review the 2.206 petition(10 CFR 2.206) that was filed on Sept. 19, 1995, and amended on Sept. 30, 1996, by Lake Michigan Federation and Don't Waste Michigan. Acting Director Frank Miraglia of the Office of NRR issued a decision on this petition on Jan. 23, 1997. The Federal Register notice of this decision indicates that there are 25 days in which the Commission can institute a review of this decision before it becomes final.

This petition was related to the fact that Consumers Power Co. (CPCo) did not have a workable unloading procedure in place before it loaded the first VSC-24 cask at the Palisades site in May, 1993, as required by the Certificate of Compliance (No. 1007) under 10 CFR 72, Section 1.1.2.

When cask #4 was found to be defective in Aug., '94, CPCo pledged to unload the cask. It claimed that this would be a means of affirming to the public its high standards of safety and of restoring public confidence in the cask loading operations at Palisades. When the task of unloading was actually to be undertaken, the technicians found that there were challenging procedures which had never been considered or anticipated in the initial unloading document. In a public meeting with the NRC in Maryland in late Aug., 1994, the concerns described included: 1) introducing 400 degree F. fuel from the metal basket to 100 degree F. spent fuel pool water which would result in a highly radioactive steam flash and raised concerns about thermal shock to the fuel; 2) cutting through the steel in a window of 50 hours or less, since the cooling process cannot be maintained during cutting; 3) developing a procedure for removing steel shims that were pressure-fit inside the fuel basket below the lid.

Without resolving these grave issues and demonstrating a successful unloading procedure of the defective cask, CPCo proceeded to load 9 more casks 150 yards from the shore of Lake Michigan at Palisades.

A year later, when defective cask #4 was still not unloaded, Don't Waste Michigan and La:e Michigan Federation filed the aforesaid petition 2.206 to demand enforcement proceedings by the NRC, since public confidence not only in CPCo but in the NRC,-- because it allowed continued loading of these casks,--was even further eroded by these actions.

I am enclosing a copy of this 2.206 petition so that you and your fellow Commissioners can readily review it and understand why we strenuously object to NRC's decision in the resolution of these matters and our reasons for doing so.

1) The decisions made by Mr. Miraglia are based on what appears to be a woefully inadequate understanding of all the facts involved. The lack of a factual basis for his decision is due either to ignorance on his part (understandable, perhaps, since he has been in his Acting Director position for only a few months), or is a deliberate evasion of some of the extraordinary issues and events that have transpired in the design, development, certification and implementation of this cask system that are now in the public record. It is possible to review these facts only briefly in this communication, but even this should be enough to convince you and your fellow NRC Commissioners that a hearing is in order to fulfill the requirement of your responsibility in implementing the 2.206 regulation in the Federal Code.

Mr. Miraglia appears to have relied solely on the judgment of the staff and the facts they provided him for his decision. For this reason, the role of the NRC staff must be reevaluated in light of the serious errors in judgment on the part of some staff members that have been made in the past, and the notable lack of comprehension and understanding of some important aspects of this cask system by some leading staff members who are in decision-making positions.

(It should be noted that there are some highly competent staff members who have tried to influence the decisions of the NRC in key areas. For example, Dr. Ross Landsman, an NRC soils expert, visited the Palisades area in Feb., '94, after repeated citizen concerns about placing casks on unstable sand dunes. He pointed out that using the site specific studies that were initially done for the nuclear plant's environmental impact statement as a basis for judging the stability of the cask storage area on site, as is now done under "generic"

licensing, was seriously flawed and could lead to "catastrophic consequences." As an example, he showed how a nuclear plant, itself, as at Palisades, usually has a foundation of 8 ft. of concrete that is grounded in bedrock. By contrast, the casks, as at Palisades, are placed on top of a 3 ft. concrete pad with no foundation to bedrock. His concerns and expert advice have been ignored by staff members in decision-making positions, and "generic" licensing continues to be the policy for siting dry cask storage facilities on our fresh water supplies throughout the country).

The few historical events we are limited to describing here will demonstrate how poor judgment and incompetence on the part of some of the staff who have directed policy have had unfortunate consequences for the public.

2) The NRC staff was establishing their "generic" licensing policy with the development of the VSC-24 cask at Palisades. This meant that there was no full environmental impact statement required for an area of the dunes at that site that was, and is, characterized as a "high risk erosion area" by the Michigan Dept. of Natural Resources, and no public adjudicatory hearing was permitted.

For these reasons and other safety concerns brought to him by the public, Attorney General Frank Kelley of Michigan requested such a hearing on the VSC-24 cask. This cask had never been built before and had never been fully tested before it was to be certified for use for dry cask storage of high level nuclear waste at Palisades. Having been refused such a hearing, Attorney General Kelley petitioned for an injunction in May, 1993, against the loading of these casks in the Western Michigan Federal Court at Grand Rapids. (Case No. 4:93 CV 67). Consumers Power Co.'s response to the Court was that the company would unload the casks and place the nuclear waste back in the spent fuel pool if the Court should rule against them and, therefore, an injunction to prevent loading was unnecessary. A supporting position for the utility's action was filed by Charles Haughney of the NRC, in which he assured Judge Robert Holmes Bell that Consumers was able to do this by simply reversing the process of loading, if the Court so ordered. <u>This demonstrates that, not only did Consumers Power Co. mislead the Judge, perhaps out of ignorance, about Consumers' ability to unload these casks, but more importantly, Charles Haughney of the NRC pledged the Agency's credibility in support of this position.</u> His statement is signed,

"Pursuant to 28 U.S.C. sec.1746, I declare under penalty of perjury that the foregoing is true and correct." (Executed and signed on May 5, 1993). Judge Bell, of course, could hardly grant an injunction under those circumstances. This is one of many instances in which the judgment of the staff was flagrantly in error, and helped to compound the problems that have later developed.

3) On May 28, '96, a "hydrogen ignition" event occurred at the Point Beach n-plant in a loaded VSC-24 cask. This "ignition" was of sufficient explosive force to raise a 3 ton lid several inches and tilt it on its side. This event was a complete surprise to the utilities, the vendor, and most significantly, to the NRC. It was discovered that the chemical reaction between the zinc coating inside the metal basket and the boric acid of the spent fuel water released hydrogen causing the explosion when the lid was being welded shut. This is further evidence that the staff was not competent to evaluate all the parts of this cask before it was certified. Yet, Mr. Mirgalia repeatedly relies only on this staff's flawed judgment for his decision-making on our petition without providing any proof through documented data or the testimony of independent qualified experts to support his decisions.

(Such independent evaluations by qualified experts would have surely been a great assistance to the staff if a public hearing and an environmental impact statement had been required in the process of certifying this cask. It would have prevented much of the chaos, confusion and costs that we are now experiencing as remedies are being sought for controlling the generation of explosive hydrogen within these casks.)

4) The NRC staff responded to the explosion at Point Beach by sending inspection teams to Point Beach and to the facilities of the vendor of this cask, Sierra Nuclear, in California, by issuing Confirmatory Action Letters to the utilities using the VSC-24, and by issuing Bulletin 96-04 to all utilities in the country to stop loading procedures and to analyze the casks they were using for chemical, galvanic, or other reactions in the casks. Their findings had to be approved by the NRC before loading could again proceed.

5) The responses prepared for Bulletin 96-04 by the utilities which were using the VSC-24 cask we found to be disturbingly inadequate and unsupported by documentation. For this reason, we retained a

highly competent corrosion engineer consultant, Dr. Rudolf Hausler, who had been retained in the past by the Electric Power Research Institute to solve a corrosion problem afflicting all nuclear reactors. He was able to do so and developed a corrosion inhibitor which is now used in all reactors.

Dr. Hausler was able to define a number of serious deficiencies in this cask that had not been found before, and he recommended that they be resolved before any more VSC-24 casks were loaded.

Carl Paperiello, Director of NMSS, wrote an analysis of Dr. Hausler's study and claimed his comments were not sufficient to halt further loading of the casks. (Dec.10, '96) Dr. Hausler responded (Dec. 29, 1996) by stating that Mr. Paperiello's evaluation was pure speculation, and pointed out in detail the additional data that would have to be a part of this analysis to come to the conclusions that Paperiello did in his analysis. Hausler also pointed out that in certain areas of the chemistry of metals, the staff was "stunningly ignorant."

6) Further evidence of the inadequacy of staff's regulatory performance in whom the public is asked to place its trust came to light when an announced inspection at the Sierra Nuclear Corp. took place a week after the explosion at the Point Beach plant. (Inspection Rept. No. 72-0007/96-204, July 9, 1996). Following are only a few of the serious deficiencies that were found:

a) Retrieval of documents was difficult. Design records for the VSC-24 were mixed with those of the VSC-17. Most of the analyses were performed for the VSC-17, whose testing data the NRC had never accepted, but were used, nevertheless, by Sierra Nuclear for the VSC-24 design. The design calculation package, dated Feb. 14, 1989, did not contain a signature nor proof of verification by either the Project Manager or Project Engineer. Neither the design plan or the design package included reference to the design verification as required. The Project Plan should provide detailed guidance for the design staff but contained neither.

b)The SNC staff indicated that the design was not reviewed by a corrosion engineer, that SNC did not consult an environmental effects specialist, and that SNC did not consider the problem of environmental interactions of components in the SFP.

c) The SNC design team had no well-founded basis to specify Carbo-Zinc 11 for coating the MSB components.

All of these deficiencies should have been identified by staff inspections in 1989 and 1990, long before the cask was certified. The licensees should have been required to provide oversight and corrective actions among their own vendors since NRC regulations state that licensees are responsible for assuring that fabricators and vendors establish and execute appropriate QA programs. But the staff did not do so. Yet we are now asked to accept the judgments of this staff, who did not find these very obvious deficiencies in the critical design phase of this cask, as being able to give us the assurance and the appropriate resolution for the far more complicated safety-related issues we have described in our petition.

7) After the Point Beach explosion, you, the Chairman of the NRC, requested the Office of the Inspector General to evaluate staff actions and the dry cask storage program. A major conclusion was, "NRC staff told us they do not formally approve or validate licensee loading and unloading procedures because the agency does not have sufficient staff or expertise to review each procedure." Yet, that is exactly what the NRC staff has been doing when they halted all loading and unloading procedures at all utilities after the Point Beach explosion. They required responses to Bulletin 96-04 which they had to approve before these procedures could continue at individual plants.

Given this acknowledgement to the Inspector General' Office of the lack of sufficient staff and expertise, it strains the public's credibility to be asked to have the confidence in the judgment of the staff in all the critical areas that we pointed out in our petition, as Mr. Miraglia would have us do.

8) Since the explosion at Point Beach, there is general recognition that unloading these casks may be even more difficult. The problems that were earlier identified when CPCo first pledged to unload the cask are now compounded by the fact that hydrogen may be generated in that process. Here again we are asked to accept the judgment of the staff,--now already proved to be incompetent in so many ways--that "the deficiencies in the original unloading procedure would not have challenged the integrity of the cask or the fuel...and that the licensee would have ultimately been able to safely unload a cask." This failure to have an adequate unloading procedure,--with all these glaring mistakes and oversights

that are now apparent--is characterized by Miraglia as having "limited safety significance" and therefore, the NRC has refrained from issuing a Notice of Violation or a civil penalty.

The examples of the incompetence of some staff members cited here have become better known to the public since our petition was filed in Sept.19. 1995. But it is that record of poor judgment on the part of the staff that should have given pause to Mr. Miraglia in relying on them for an adequate response to this petition. Instead, his main reliance for his decision is on judgments by staff that he should be able to realize have been inadequate in the past and, therefore, cannot be relied upon now if the public is to have any confidence in the NRC.

Miraglia should have gone beyond these staff judgments to make a decision on our petition. He should have considered the magnitude of what has been done without adequate deliberation and knowledge--1) that millions of curies of radioactivity have been placed in 13 poorly designed casks on the shores of the Great Lakes, 9 of which the utility continued to load even though grave problems with unloading were known to it and were unresolved; 2) that Consumers failed to monitor the casks vendor's design, fabrication and construction practices, giving the public a cask whose design and function it cannot trust; and 3) that some of this high level nuclear waste on the shores of the Great Lakes will remain highly toxic for thousands of years, and yet the casks are licensed for only twenty years. He should especially have considered the fact that no cask has been successfully unloaded, and that there is no assurance of a federal repository.

In view of these considerations, he should at least have required that a VSC-24 cask be successfully unloaded to begin to restore the confidence of the public in the dry cask storage system in general, and at the Palisades site in particular. This should have been required as a condition for continuing to load these casks, and for not issuing a high level violation and meaningful fine. Instead he is asking us to believe his staff's demonstrated flawed judgment that procedural deficiencies of the initial unloading document were of "limited safety significance" as his decision states.

Mr. Miraglia's decision sends the wrong message to the whole nuclear industry on this most dangerous course for the country--i.e. placing high level nuclear wastes on the shores of our fresh water supplies--with no repository in sight. The message is that no matter how careless and sloppy its procedures are, the NRC is a "paper tiger"--it will cost them nothing--and the sham of regulation will go on as usual.

I hope that you and your fellow Commissioners are beginning to understand the sense of outrage on the part of the public over this cavalier dismissal of the grave issues we have placed before you in this 2.206 petition--and its implications for the safety of the fresh water supplies of this country for all future time.

We hope that you and your fellow Commissioners will institute a review of the decision on this 2.206 petition discussed here.

We deeply appreciate your attention to these grave issues.

Yours sincerely,

Mary P. Sinclair, PhD.
Co-chair, Don't Waste Michigan

Event Text

MANUAL REACTOR TRIP DUE TO LOWERING MAIN CONDENSER VACUUM

"The Palisades reactor was manually tripped from approximately 75% power at 1127 hours EST due to lowering main condenser vacuum. Prior to the reactor trip, power was lowered from 100% to 75% in accordance with off-normal procedures in an effort to restore condenser vacuum. The reason for the loss of condenser vacuum is not understood and is being investigated. At 1135 hours an automatic actuation of the auxiliary feedwater system occurred, as designed, to maintain steam generator levels. The atmospheric steam dump valves opened per design on reactor trip, however one dump valve did not fully re-close until instrument air was manually isolated to it. Reactor decay heat is being removed via steaming through the turbine bypass valve to the main condenser. Reportable under 10CFR50.72(b)(2)(iv)(B) and (b)(3)(iv)(A)."

After the reactor trip, Main Condenser vacuum rose to 25 inches - sufficient for using the Turbine Bypass valves for removing decay heat. All rods inserted on the manual reactor trip. The electric grid is stable.

Event Text

MANUAL ACTUATION OF REACTOR PROTECTION SYSTEM DUE TO FAILURE OF CONTROL ROD TO WITHDRAW

"Following a startup from a refueling outage with the plant at approximately 24% power, it was determined that one control rod appeared to be fully inserted in the core as determined by both incore and excore flux tilts. The Off Normal Procedure for a dropped control rod was entered. The decision was made to take the plant offline to troubleshoot and correct the apparent condition. The Off Normal Procedure does not allow operation in Mode 2 with a dropped control rod. At 1514 hours EDT the reactor was manually tripped from 8% power. The reactor trip was uncomplicated.

"This is reportable under 10 CFR 50.72(b)(2)(iv)(B) as a manual Reactor Protection System actuation while critical."

Decay heat is being discharged to the condenser via the turbine bypass valves and cooling is being supplied from AFW. All systems besides the control rod in question functioned as required.

It appears that the control rod in question may have been inserted since startup. The rod

position indicators were showing a normal rod position. The licensee believes that the rod may not be coupled. This rod has had a previous history of being difficult to couple. The licensee stated that normal rod testing was conducted prior to startup along with low power physics testing which did not indicate anything significantly out of spec.

The licensee notified the NRC Resident Inspector.

RE: PALISADES NUCLEAR FACILITY, SOUTH HAVEN MI 49090

Hey, NRC, Keep 'er humming! I'm writing to comment on the renewal of the license sought for the plant in South Haven.

HH-1 I am in favor of continued use of the facility because:

1. It is a valuable, viable alternate energy source which, with proper use, conserves and protects the environment.
2. Manpower required for its continued use provide an economic boost in the winter months for the City of South Haven and environs. While tourist dollars grow the local economy in summer, many local businesses benefit during the long winter months when Palisades maintenance plant workers come to the area to perform the bulk of plant maintenance during this time.

HH-2 Finally, I am in agreement with the Kalamazoo Gazette article, April 2, that "it would be smart of the NRC
HH-3 to provide prompt reporting of even allegedly minor incidents". Quoting the same article, I agree with Don Williams, retired Hope College chemistry professor that, "not only should Palisades' life be extended, but another reactor ...added", and to paraphrase, NRC needs to plan for decommissioning the current reactor, replacing it with a more advanced, safer, more economical Generation III plant.

Sincerely,

Marguerite Callaghan

Dear Sir:

The U.S. Department of the Interior (Department) has reviewed the Generic Environmental Impact Statement (EIS) for License Renewal of Nuclear Plants, NUREG-1437, Draft Supplement 27 (dated February 2006), regarding the Palisades Nuclear Plant, Van Buren County, Michigan.

The license renewal does not involve any major construction or physical alteration of the project area. The Generic EIS and Draft Supplement 27 adequately address the concerns of the Department regarding fish and wildlife resources, as well as species protected by the Endangered Species Act. We concur with the preliminary conclusions of the U. S. Nuclear Regulatory Commission staff with respect to the impacts of continued operations on these resources and species. We have no comment on the adequacy of other resource discussions presented in the documents. II-1

We appreciate the opportunity to provide these comments.

Sincerely,

Michael T. Chezik

My Comments regarding document
NUREG 1437, Supplement 27, Draft are:

(1)

RECEIVED

"Generic Environmental Impact Statement for License Renewal of Nuclear Plants (Supplement 27) ; Regarding Palisades Nuclear Plant ; Draft Report for Comments U.S. Nuclear Regulatory Commission February 2006.

JJ-1

1 – Security measures and supervision requirements for the on-site storage of the spent fuel.

It is clear that the amount of on-site, dry stored, spent fuel will increase during the renewal term as long as there is no final off-site storage facility provided by the Federal Government.
Therefore there would be additional security measures and supervision requirements to take care of the status of the on-site dry storage of spent fuel for an indeterminate period of time. Security measures would be: locate the dry storage facility at a place, guarded, hidden and less vulnerable to terrorist activity. I.e. The fact that the South Haven Municipal Airport is within 6 mile distance from Palisades, could imply the need to move the location of that Airport. Supervision requirements are related to continuos monitoring and accounting of the spent fuel during offsite storage. This activity could be an important part of the Palisades renewal term. All these impacts should be considered for the OL extension alternative.

JJ-2

2 – Compliance with Homeland Security regulations.

The SEIS (Supplemental Environmental Impact Statement) report should acknowledge that there has been changes in our government strategy since the original issuance of Palisades OL, particularly regarding sabotage and/or terrorism. Therefore additional analysis are required for OL Renewal.
We believe that additional Severe Accident Mitigation Alternatives (SAMAs) regarding this issue should be considered for Palisades Operation License Renewal.

JJ-3

3 – Environmental impact of the on site dry storage of the spent fuel

The spent fuel during the renewal term, while in on-site dry storage, would have discharges of radioactive elements and neutrons that by collision with the surrounding natural molecules could generate additional radioactive elements These discharges should be added to the atmospheric emissions and ground discharges of the Plant to verify overall compliance with the EPA and NRC regulations.

Template = ADM-013

Page 1

E-RIDS = ADM-03
Add = Bo Pham (BMP)

4 – Environmental Impact of severe emergencies in Nuclear Plants.

Environmental Impacts during severe emergencies at the Nuclear Plant (uncontrolled releases of radioactive elements) were not considered for comparison purposes with other non nuclear alternative sources of energy. Even though probabilistic, these impacts should be evaluated and mentioned in the report's final summary conclusions. JJ-4

5 – Loss of Power in the National Electric Grid

Recognizing that the loss of power at the Palisades Substation could result in severe Plant accidents (core damage), we wonder if all feasible mitigation measures were considered in this regard. I.e. adding a second circuit to the 345kV line connecting Covert Plant to the Substation. JJ-5

6 – Plant Refurbishing Work

The fact that in the Application for renewal the Licensee states that no refurbishing will be performed prior to extended term operation is of our outmost concern. We believe that after 40 years of operations, a thorough refurbishing should be mandatory to insure a safe Plant operation during the extended term. JJ-6

7 - General comments regarding alternative sources of electric energy.

a – The considered Environmental Impacts were not weighted as required to perform an overall impact evaluation. In other words, not all environmental impacts have the same effect. JJ-7

b – Renewable (sustainable) energy sources should be given extra points when compared with energy sources of lower availability
Wind and Solar sources are renewable energy sources.
The Standard Nuclear Plant, using Light Water Cooled Reactor, is a source of limited availability. New types of Nuclear Reactors, using advanced fuel cycle or a fast neutron reactor would be of longer availability.

c - Nuclear Power alternatives using advanced fuel cycles would decrease the amount of long term hazards of nuclear waste. Is this point being considered in the comparison of Nuclear Plants ?

d – Is the impact on Proliferation of radioactive materials in the World being considered to evaluate the Nuclear Plants ?
The standard Nuclear Plant using 5% enriched Uranium has technology and materials, that could be used for the manufacture of the plutonium bomb.

Page 2

e - Between the alternatives to be considered to obtain an "equivalent" electric generation we believe that the following should be maintained as technically feasible:

-Hydro-Pump storage (not considered in GEIS)
-Demand side Load Management. (considered but disregarded)
I.e. the introduction of smart electric meters.
-Wind Power (considered in GEIS Page 8-45, but disregarded)
- Solar Power (considered in GEIS Page 8-45, but disregarded)
- Co-generation (not considered in GEIS)

f – Are the CO2 atmospheric emissions for the different energy sources being considered in the evaluation of alternatives ?

To Whom It May Concern:

I am writing regarding the proposed twenty-year license extension at Palisades nuclear plant in southwest Michigan. I oppose the license renewal because Palisades is an aging facility with a history of noncompliance, reactor pressure vessel embrittlement, radiation release, and other problems that have and will continue to affect the surrounding population beyond Covert Township, Michigan. Many of those affected in the surrounding area are of low socioeconomic status, as well as minorities, raising the issue of environmental justice. KK-1

License renewal should not be granted to the Palisades Nuclear Power Plant, because (1) both of the dry cask storage pads at Palisades are in violation of Nuclear Regulatory Commission's earthquake regulations (2) the risk of radiation to minority populations is underestimated using census block grouping; (3) radiation effects are only considered within a 50-mile radius; and (4) there is continued noncompliance of non-radiological persistent toxic chemicals to area water sources. KK-2 KK-3 KK-4 KK-5

Potential amplification of earthquakes through soil-structure interaction, and soil liquefaction potential or other soil instability due to vibratory ground motion are of great concern, especially considering the geological nature of sand increasing the likelihood of sand avalanches (Landsman 2005). The violation of the Nuclear Regulatory Commission's own standards in storage of radioactive material must be followed.[i] KK-6

Covert Township is one with high levels of minority populations and has many people who are of a low socioeconomic status. In the impact statement, these populations were taken into consideration, but large urban centers such as Battle Creek, Muskegon and Grand Rapids - where significant African American and Latin American communities live – were not considered. Because less than fifty percent of these cities were within the 50-mile radius, they were eliminated, and therefore significant risks to the minority populations were not fully documented.[ii] KK-7

The 50-mile radius considered in the impact assessment also fails to account for the movement of radiation with the wind. The radiation may expand and become less concentrated as it moves away from the epicenter (NRC 2006), but recent studies have shown that there is no safe level of ionizing radiation (NAS 2005). The effects beyond the radius cannot be ignored or discounted as negligible without serious ethical repercussions with this knowledge of toxicity of any level of radiation.[iii] KK-8

The impact of 20 additional years of pollution by non-radiological toxic chemicals will directly affect water quality of nearby sources, including Lake Michigan. In 2000, for example, Palisades was found to be in "continuing noncompliance" for its apparent multiple misuses of Betz Clam-Trol in Lake Michigan for the dispersion of mussels and clams affecting the reactor's water intakes (EPA 2004). The public health risks imposed by Betz Clam-Trol (Alkyl Dimethylbenzyl Ammonium Chloride) - immunological, neurological, respiratory, dermal and gastrointestinal – are counter to the Nuclear Regulator Commission's "*primary* mission to protect public health and safety." (ATSDR 2004 and NRC 2004)[iv] KK-9

For these reasons, I oppose the renewal of the Palisades Nuclear Power Plant license for an additional twenty years. The plant is a danger to not only our precious natural resources in Michigan, but to countless people who are affected by its daily operation, and many more who would be affected should a disaster occur. KK-11

Thank you for your consideration,

Morgan Dill

Appendix with Additional Information

[i] 10 CFR Part 72.212(b)(2)(i)(B) is the law that regulates earthquake standards. The more casks loaded on the storage pads at Palisades, the more risk of erosion to the sand supporting the pads, given the large weight of the casks themselves (VSC-24 casks weigh 132 tons each), weather related erosion of the sand dunes, as well as the erosion that will occur due to more severe weather impacts from the global climate crisis and climate de-stabilization. Arresting erosion at both pads is important to safety and radiation containment over the long haul, given the proximity of the waters of Lake Michigan. The State of Michigan and the U.S. Army Corps of Engineers have designated the sand dunes upon which the older pad is located – so close to the waters of Lake Michigan – as a high-risk erosion zone. Though Michigan itself is a region of "low risk" for earthquake occurrence (Bricker 1977), this does not remove the chance that the event may occur, necessitating compliance with the law.

[ii] Census block groups are a combination of census blocks, which are statistical subdivisions of a census tract, which are intended to remove bias (USCB 2000). Though eliminating bias in collection of data, the full impact of the data is not demonstrated in regards to minority populations, in their elimination from the data set considered in the Environmental Impact Statement for Palisades (because <50% lay within the 50-mile radius).

[iii] Wind has played a factor at other nuclear plants, notably at Three Mile Island. The effects of radiation were present at the epicenter, and upwind, throughout Pennsylvania and beyond. Increased incidences of cancer and other health problems pervaded, and the influence of wind cannot be ignored in the transportation of radiation (Momeni 1998).

[iv] Maintaining unclogged water intakes using Betz Clam-Trol falls within the scoping parameter of 10 CFR Part 54 that says: (a) Plant systems, structures, and components . . . [including] (2) All non safety-related systems, structures, and components whose failure could prevent satisfactory accomplishment of any of the functions identified in paragraphs (a)(1) (i), (ii), or (iii) of this section (10 CFR 54.4 Scope). The International Joint Commission - an independent binational organization that serves to help prevent and resolve disputes relating to the use and quality of boundary waters – stated in its "Ninth Biennial Report on Great Lakes Water Quality," that "[g]overnments monitor toxic chemicals used in large quantities at nuclear power plants, identify radioactive forms of the toxic chemicals and analyze their impact on the Great Lakes ecosystem." The impact of Betz-Clam Trol is such that water resource quality is affected in a way that compromises the agreements made through the Boundary Waters Treaty of 1909, and subsequent Great Lakes Charter and Annex, that call for maintaining the integrity of the freshwater ecosystems.

April 10, 2006

Dear Sir or Madame,

As a resident of Bangor (southwestern) Michigan, well writing the area of the Palisades Nuclear Generating Plant, I am writing in support of renewing the license for this plant for another 20 years. LL-1

The plant has been a good neighbor. They routinely test their public warning system and I have never heard of any negative complaints about the operation or safety of this plant. LL-2

I ask that you totally disregard the environmentalist, and other protesters, many of whom do not live in our community. LL-3

Huxley, is his "brave New world, talked about "General Candle". The environmentalist have done great harm to our country and most American citizens by trying to stem the tide of change for the better.

People have lost their jobs to protect to birds or fish. Millions pay exorbitant sums for gasoline, diesel, heating oil and natural Gas, because thanks to the activist, we are held hostage to foreign oil suppliers, because they have blocked drilling, refineries, pipe lines, etc. for years.

Most of these protesters are misguided, liberals, with substantial assets and care very little for the public, but only for their own agenda. "General Candle sounds real good to some of them!"

No source of energy is 100% safe. But Nuclear power generation has been good for our country, providing jobs and inexpensive power, which God knows we surely need more of.

With your oversight, nuclear plants are not perfect, but they have an enviable safety record and the scare mongers and whiners should be ignored.

This is our plant in our community and we do not want to pay higher prices just to please these environmentalists, especially when most of them do not even live here. LL-4

I urge you to grant the Palisade nuclear generating Plant the 20 year license that is requested.

Thank you for your consideration.

Paul French

RULES AND DIRECTIVES BRANCH

Dear Chief, Rules Review and Directives Branch, NRC:

Radioactive Waste

--The NRC says in its "Nuclear Waste Confidence Decision" that a repository, or permanent dump, for commercial irradiated nuclear fuel will open by 2025. But the only site under consideration for such a dump – Yucca Mountain, Nevada – is in remarkable disarray. Due to the site's scientifically unsuitable geology, as well as legal, political, and popular resistance and skyrocketing costs, the dump's opening has been delayed from 1998 to 2010, then 2012. Now the U.S. Dept. of Energy won't even hazard a guess as to when the dump will open, if ever, and at what cost.
In addition, the State of Nevada, adamantly opposed to becoming the country's atomic sacrifice area, has filed federal lawsuits against the proposal at every turn. One of them challenges NRC's "Waste Confidence Decision" directly. NRC is supposed to be the objective judge of whether or not Yucca Mountain should be opened, but if NRC sticks to its arbitrary 2025 deadline, its bias in favor of approving the dump at Yucca Mountain, despite its defects and dangers, is obvious.
Even if Yucca does open someday, it could only accommodate commercial wastes generated before 2011, due to its capacity limit under the Nuclear Waste Policy Act for only 63,000 tons of commercial irradiated fuel. That much will have been generated in the U.S. by the end of 2010. Thus, any waste generated at Palisades during its license extension from 2011 to 2031 could not legally go to Yucca Mountain, even if the ever-more-doubtful dump opens.
How can the NRC approve 20 more years of waste generation and storage on the Lake Michigan shoreline when there is nowhere for those wastes to go? How can NRC declare such an essential issue to environmental and public health and safety to be "out of scope" during this environmental impact proceeding? The ongoing generation of nuclear waste at Palisades must be stopped as soon as possible. MM-1

--Palisades' dry cask storage installations – outdoor "parking lots" for gigantic 150 ton concrete and steel silos filled with high-level radioactive waste – are in violation of NRC's own earthquake safety regulations. Dr. Ross Landsman, now retired NRC dry cask storage inspector for the Midwest region, has warned for well over a decade that the 13 year old concrete cask pad just 150 yards from Lake Michigan could fail during an earthquake, resulting in casks being buried under sand or being dumped into Lake Michigan. Burial could result in the irradiated fuel overheating, damaging the containers, and releasing radioactivity. Underwater submersion could result in a nuclear chain reaction in the fissile materials still present in the waste. Even the two year old pad further inland is in violation of NRC earthquake regulations. Despite claiming these alleged violations are "under review," NRC has allowed Palisades to continue loading casks onto these unsafe pads. How can NRC allow Palisades to generate 20 more years' worth of waste, when even its current storage facilities violate NRC safety regulations? (see http://www.nirs.org/reactorwatch/licensing/palisades.htm at Sept. 15, 2005 and at Feb. 17, 1994 for more information) MM-2

--How can NRC approve a license extension for Palisades when Consumers Energy and Nuclear Management Company nearly dropped a 107 ton nuclear waste container into the storage pool in October 2005? Such a drop could have punched a hole in the pool floor, draining away the cooling water, leading to a waste fire and radioactive inferno. Tens of thousands of people could have died from radiation-induced cancer downwind. The company cannot safely handle its radioactive wastes with its present workforce, a situation that can only get worse as experienced personnel leave the plant or are laid off as plant owner Consumers Energy tries to sell Palisades, and as plant operator Nuclear Management Company has already been told it will not be retained in the future. Instead of protecting the public health and safety and environment against such hazards as the near-drop of such a heavy load into the vulnerable waste pool, NRC helped the company keep the public in the dark about the incident for months! MM-3

SISP Review Complete
Template = ADM-013

E-RIDS = ADM-03
Add = Bo Pham (BMP)
C. Guerrero (CXG3)

Severe Reactor Accidents

MM-4 --Due to deterioration and degradation, old reactors are more likely to experience accidents than younger reactors. At 39 years, Palisades is one of the oldest operating reactors in the U.S., and has been considered a "nuclear lemon" since it began operations in the first place. The risk of a severe accident at this "geriatric" reactor is reason enough to close it down in 2011 at the end of its current license.

MM-5 --Given the potential dire consequences of a major accident and radiation release at Palisades, how can NRC screen out "Severe Accident Mitigation Alternatives" because "the required extensive changes...would involve implementation costs known to exceed any possible benefit"? (EIS, p. 5-5) In 1982, in its CRAC-2 (Calculation of Reactor Accident Consequences) report, NRC calculated that a severe accident and catastrophic radiation release from Palisades would kill 11,000 people, injure 7,000, and do over $50 billion in damages. The population in the surrounding region has only grown since then (EIS, Table 2-7, p. 2-56), so casualty figures would be higher today. And adjusted for inflation, that property damage figure would top $100 billion, only $10 billion of which would be paid back by the nuclear power industry and its insurance companies (under the Price-Anderson Act, renewed in 2005, U.S. taxpayers would have to pay the rest, or else damages wouldn't be compensated for at all). A major radiation release at Palisades would ruin Michigan's tourism and agriculture forever. How can NRC's EIS " cost/benefit" analysis ignore its earlier CRAC-2 report?

MM-6 --By NRC's own reckoning, Palisades has one of the most embrittled reactor pressure vessels in the U.S. Consumers Energy and Nuclear Management Company admitted in November, 2005 that in 2014, Palisades will surpass NRC embrittlement criteria. In fact, Palisades has surpassed NRC's limits on embrittlement a number of times – the earliest in 1981, just ten years into operations – only to see NRC weaken its standards, allowing Palisades to continue operating. Embrittlement makes the risks of " pressurized thermal shock" (PTS) too great to keep operating this reactor. During an emergency, PTS could fracture Palisades' reactor pressure vessel like a hot glass under cold water. Since such a fracture is a "beyond design basis" accident, there is no countermeasure to prevent a melt down. Operating Palisades till 2031 risks a Chernobyl on the Lake Michigan shoreline, a risk that only grows worse with time. (see environmental interveners' contentions and supporting documents at http://www.nirs.org/reactorwatch/licensing/palisades.htm at 1993, 2004, Aug. 8 and Sept. 16, 2005.)

Socio-economic and Environmental Justice Impacts

MM-7 --NRC reports that 15 Native American archaeological sites have been identified by surveys within 1 mile of the Palisades site and its transmission lines, including a prehistoric village site. Another of the prehistoric sites is of "unknown type," just 0.3 miles south of the Palisades site, and a third is just outside Palisades' eastern boundary. (EIS, pgs. 2-62 to 63) This validates the environmental contention, arbitrarily dismissed by the NRC licensing board on March 7, that 20 more years of routine radiation emissions, potential accidental radiation emissions, and plant expansions such as additional waste storage pads could do irreversible harm to as-yet unidentified Native American burial sites, village sites, etc. at Palisades. Why did the licensing board dismiss this contention when NRC admits in this EIS that it is an issue? (see http://www.nirs.org/reactorwatch/licensing/palisades.htm at Aug. 8 and 30, 2005 for these Native American impact contentions).
NRC admits in its draft EIS that "[i]ntact archaeological sites could be present within the remaining undeveloped areas as well as in soils below the depth of ground disturbance in most areas of the [Palisades] site." It admits "no archaeological field surveys have been conducted either at the Palisades site or for original transmission line construction or maintenance...[and] without accurate knowledge of the cultural resources present at the Palisades site, it must be assumed that power plant construction has the potential to adversely impact significant resources that may exist on the plant site." Palisades' own cultural resource assessment 25 years ago recommended that "an intensive survey be undertaken of the undisturbed portions of the site." Despite all this, no extensive surveying was ever conducted. In its draft EIS, NRC simply brushes off the potentially disproportionate impacts upon Native American cultural resources and spiritual values that could occur with 20 additional years of operations at Palisades. The

intensive site survey must be performed, in close and meaningful consultation with affected Native American tribes, before NRC even considers granting Palisades a license extension. NRC granting an extension without requiring such a survey would itself represent an environmental justice violation, not to a mention a potential violation of the American Indian Religious Freedom Act.

--It is baffling NRC concludes that "offsite impacts from Palisades on minority and low-income populations would be SMALL (sic), and no special mitigation actions are warranted." (EIS, p. 4-31) Just three pages earlier, NRC admits that "[c]ensus block groups with a minority population...are located in Covert," Palisades' hometown. Figure 4-2 on p. 4-30 also identifies Covert's predominantly African American population as "low-income." Why Covert's African American community is still low-income after 38 years of substantial profit-making at Palisades is quite troubling. In addition, Covert's community suffers the worst radiation doses from routine operations at Palisades, and would suffer the worst health impacts from accidental radiation releases. NRC even ignores the fact that Palisades' tax contributions to its neighboring community in Covert are dwindling over time – shown in Nuclear Management Company's 2005 Environmental Report -- so residents suffer worsening risks as the reactor deteriorates with age, while also receiving decreasing benefits such as tax income. (see http://www.astrongerkinship.com/ for a recent book about the African American history of Covert). MM-8

--NRC's treatment – or lack thereof – of Palisades' impact on the surrounding Latin American agricultural workforce is remarkably inconsistent and disconcerting. Regarding environmental interveners' contention that this community would suffer disproportionately from routine and accidental radiation releases from the reactor, NRC staff agreed that the company's license extension application does not sufficiently address the "adverse socio-economic impacts of a catastrophic radiation release...as they would be found among the low-income Latin American agricultural workforce of the Palisades area..." and that such a contention would not necessarily be out of scope. Likewise, NRC's licensing board stated that interveners' allegation of disproportionate impacts upon Latin American agricultural workers from an embrittlement/PTS core rupture might be pertinent and admissible in the proceeding to decide whether or not to grant Palisades 20 more years. Yet, the licensing board dismissed the contention, stating "no facts that would tend to show impacts falling disproportionately on this community have even been alleged." (see pgs. 57-60 of the licensing board's March 7, 2006 ruling dismissing this and all other intervener environmental contentions; also see the contention itself, at Aug. 8, 2005 on the "Palisades Watch" website). MM-9

Isn't it obvious that a catastrophic radiation release at Palisades would ruin nearby agriculture for years, decades, centuries, perhaps even forevermore? Who would eat cherries, blueberries, grapes, peaches, apples, or other agricultural products from west Michigan after a large radiation release from Palisades? (see EIS, p. 2-54 and 55; Table 2-6 shows that nearly half of Van Buren County's land base is devoted to agriculture!) Wiping out of agriculture would very likely impact the low-income, minority community of Latin American agricultural laborers more than any other segment of the surrounding population. MM-10

Yet, despite the NRC staff's and licensing board's statements to the contrary, NRC now dismisses any notion of disproportionate impacts upon – or even the existence of – a Latin American agricultural workforce near Palisades, in the space of two sentences. NRC now treats these real people as invisible (EIS, p. 2-57), which represents an environmental justice violation by NRC itself.

--NRC writes (on page Roman numeral xvi of its draft EIS) that "...there are factors, in addition to license renewal, that will ultimately determine whether an existing nuclear power plant continues to operate beyond the period of the current [operating license]." We would agree with that. A catastrophic accident would do that in a hurry. Last October, had the 107 ton fully loaded high-level radioactive waste container dropped onto the waste storage pool floor, Palisades' operations almost certainly would have ended for good – but how much of the Great Lakes and surrounding states would it have taken with it? MM-11

We want to make it clear to Consumers Energy, Nuclear Management Company, any potential purchaser of Palisades (such as Exelon Nuclear, Dominion Nuclear, or other nuclear utilities), and to NRC that a groundswell of popular opposition by the citizens of Michigan and neighboring states will, sooner rather than later, force the closure of this most dangerously deteriorated nuclear power plant.

As evidence that we mean what we say, I would like to list the two dozen organizations comprising a growing coalition, representing hundreds of thousands of Michiganders and residents of surrounding states and provinces, which oppose the 20 year license extension at Palisades...(see list at http://www.nirs.org/reactorwatch/licensing/palisadesbackgrounder.pdf)

MM-12

Of course, there are many other adverse environmental impacts 20 more years of operations at Palisades would cause. But in addition to all the negatives about Palisades, there are positive alternatives: energy efficiency, wind power, solar power, and biomass could be offered as alternatives to 20 more years of nuclear power and radioactive waste generation. But NRC shrugs off such notions in its draft EIS.

Sincerely,
Art Hanson

Subject: I strongly oppose the proposed 20 Year License Extension at Palisades Nuclear Power Plant

RECEIVED
RULES AND DIRECTIVES BRANCH

(4)

Dear Chief, Rules Review and Directives Branch, NRC:

Radioactive Waste

--The NRC says in its "Nuclear Waste Confidence Decision" that a repository, or permanent dump, for commercial irradiated nuclear fuel will open by 2025. But the only site under consideration for such a dump – Yucca Mountain, Nevada – is in remarkable disarray. Due to the site's scientifically unsuitable geology, as well as legal, political, and popular resistance and skyrocketing costs, the dump's opening has been delayed from 1998 to 2010, then 2012. Now the U.S. Dept. of Energy won't even hazard a guess as to when the dump will open, if ever, and at what cost. NN-1
In addition, the State of Nevada, adamantly opposed to becoming the country's atomic sacrifice area, has filed federal lawsuits against the proposal at every turn. One of them challenges NRC's "Waste Confidence Decision" directly. NRC is supposed to be the objective judge of whether or not Yucca Mountain should be opened, but if NRC sticks to its arbitrary 2025 deadline, its bias in favor of approving the dump at Yucca Mountain, despite its defects and dangers, is obvious.
Even if Yucca does open someday, it could only accommodate commercial wastes generated before 2011, due to its capacity limit under the Nuclear Waste Policy Act for only 63,000 tons of commercial irradiated fuel. That much will have been generated in the U.S. by the end of 2010. Thus, any waste generated at Palisades during its license extension from 2011 to 2031 could not legally go to Yucca Mountain, even if the ever-more-doubtful dump opens.
How can the NRC approve 20 more years of waste generation and storage on the Lake Michigan shoreline when there is nowhere for those wastes to go? How can NRC declare such an essential issue to environmental and public health and safety to be "out of scope" during this environmental impact proceeding? The ongoing generation of nuclear waste at Palisades must be stopped as soon as possible.

--Palisades' dry cask storage installations – outdoor "parking lots" for gigantic 150 ton concrete and steel silos filled with high-level radioactive waste – are in violation of NRC's own earthquake safety regulations. Dr. Ross Landsman, now retired NRC dry cask storage inspector for the Midwest region, has warned for well over a decade that the 13 year old concrete cask pad just 150 yards from Lake Michigan could fail during an earthquake, resulting in casks being buried under sand or being dumped into Lake Michigan. Burial could result in the irradiated fuel overheating, damaging the containers, and releasing radioactivity. Underwater submersion could result in a nuclear chain reaction in the fissile materials still present in the waste. Even the two year old pad further inland is in violation of NRC earthquake regulations. Despite claiming these alleged violations are "under review," NRC has allowed Palisades to continue loading casks onto these unsafe pads. How can NRC allow Palisades to generate 20 more years' worth of waste, when even its current storage facilities violate NRC safety regulations? (see http://www.nirs.org/reactorwatch/licensing/palisades.htm at Sept. 15, 2005 and at Feb. 17, 1994 for more information) NN-2

--How can NRC approve a license extension for Palisades when Consumers Energy and Nuclear Management Company nearly dropped a 107 ton nuclear waste container into the storage pool in October 2005? Such a drop could have punched a hole in the pool floor, draining away the cooling water, leading to a waste fire and radioactive inferno. Tens of thousands of people could have died from radiation-induced cancer downwind. The company cannot safely handle its radioactive wastes with its present workforce, a situation that can only get worse as experienced personnel leave the plant or are laid off as plant owner Consumers Energy tries to sell Palisades, and as plant operator Nuclear Management Company has already been told it will not be retained in the future. Instead of protecting the public health and safety and environment against such hazards as the near-drop of such a heavy load into the vulnerable waste pool, NRC helped the company keep the public in the dark about the incident for months! NN-3

Severe Reactor Accidents

NN-4 --Due to deterioration and degradation, old reactors are more likely to experience accidents than younger reactors. At 39 years, Palisades is one of the oldest operating reactors in the U.S., and has been considered a "nuclear lemon" since it began operations in the first place. The risk of a severe accident at this "geriatric" reactor is reason enough to close it down in 2011 at the end of its current license.

NN-5 --Given the potential dire consequences of a major accident and radiation release at Palisades, how can NRC screen out "Severe Accident Mitigation Alternatives" because "the required extensive changes...would involve implementation costs known to exceed any possible benefit"? (EIS, p. 5-5) In 1982, in its CRAC-2 (Calculation of Reactor Accident Consequences) report, NRC calculated that a severe accident and catastrophic radiation release from Palisades would kill 11,000 people, injure 7,000, and do over $50 billion in damages. The population in the surrounding region has only grown since then (EIS, Table 2-7, p. 2-56), so casualty figures would be higher today. And adjusted for inflation, that property damage figure would top $100 billion, only $10 billion of which would be paid back by the nuclear power industry and its insurance companies (under the Price-Anderson Act, renewed in 2005, U.S. taxpayers would have to pay the rest, or else damages wouldn't be compensated for at all). A major radiation release at Palisades would ruin Michigan's tourism and agriculture forever. How can NRC's EIS " cost/benefit" analysis ignore its earlier CRAC-2 report?

NN-6 --By NRC's own reckoning, Palisades has one of the most embrittled reactor pressure vessels in the U.S. Consumers Energy and Nuclear Management Company admitted in November, 2005 that in 2014, Palisades will surpass NRC embrittlement criteria. In fact, Palisades has surpassed NRC's limits on embrittlement a number of times – the earliest in 1981, just ten years into operations – only to see NRC weaken its standards, allowing Palisades to continue operating. Embrittlement makes the risks of " pressurized thermal shock" (PTS) too great to keep operating this reactor. During an emergency, PTS could fracture Palisades' reactor pressure vessel like a hot glass under cold water. Since such a fracture is a "beyond design basis" accident, there is no countermeasure to prevent a melt down. Operating Palisades till 2031 risks a Chernobyl on the Lake Michigan shoreline, a risk that only grows worse with time. (see environmental interveners' contentions and supporting documents at http://www.nirs.org/reactorwatch/licensing/palisades.htm at 1993, 2004, Aug. 8 and Sept. 16, 2005.)

Socio-economic and Environmental Justice Impacts

NN-7 --NRC reports that 15 Native American archaeological sites have been identified by surveys within 1 mile of the Palisades site and its transmission lines, including a prehistoric village site. Another of the prehistoric sites is of "unknown type," just 0.3 miles south of the Palisades site, and a third is just outside Palisades' eastern boundary. (EIS, pgs. 2-62 to 63) This validates the environmental contention, arbitrarily dismissed by the NRC licensing board on March 7, that 20 more years of routine radiation emissions, potential accidental radiation emissions, and plant expansions such as additional waste storage pads could do irreversible harm to as-yet unidentified Native American burial sites, village sites, etc. at Palisades. Why did the licensing board dismiss this contention when NRC admits in this EIS that it is an issue? (see http://www.nirs.org/reactorwatch/licensing/palisades.htm at Aug. 8 and 30, 2005 for these Native American impact contentions).
NRC admits in its draft EIS that "[i]ntact archaeological sites could be present within the remaining undeveloped areas as well as in soils below the depth of ground disturbance in most areas of the [Palisades] site." It admits "no archaeological field surveys have been conducted either at the Palisades site or for original transmission line construction or maintenance...[and] without accurate knowledge of the cultural resources present at the Palisades site, it must be assumed that power plant construction has the potential to adversely impact significant resources that may exist on the plant site." Palisades' own cultural resource assessment 25 years ago recommended that "an intensive survey be undertaken of the undisturbed portions of the site." Despite all this, no extensive surveying was ever conducted. In its draft EIS, NRC simply brushes off the potentially disproportionate impacts upon Native American cultural resources and spiritual values that could occur with 20 additional years of operations at Palisades. The

intensive site survey must be performed, in close and meaningful consultation with affected Native American tribes, before NRC even considers granting Palisades a license extension. NRC granting an extension without requiring such a survey would itself represent an environmental justice violation, not to a mention a potential violation of the American Indian Religious Freedom Act.

NN-8

--It is baffling NRC concludes that "offsite impacts from Palisades on minority and low-income populations would be SMALL (sic), and no special mitigation actions are warranted." (EIS, p. 4-31) Just three pages earlier, NRC admits that "[c]ensus block groups with a minority population...are located in Covert," Palisades' hometown. Figure 4-2 on p. 4-30 also identifies Covert's predominantly African American population as "low-income." Why Covert's African American community is still low-income after 38 years of substantial profit-making at Palisades is quite troubling. In addition, Covert's community suffers the worst radiation doses from routine operations at Palisades, and would suffer the worst health impacts from accidental radiation releases. NRC even ignores the fact that Palisades' tax contributions to its neighboring community in Covert are dwindling over time – shown in Nuclear Management Company's 2005 Environmental Report -- so residents suffer worsening risks as the reactor deteriorates with age, while also receiving decreasing benefits such as tax income. (see http://www.astrongerkinship.com/ for a recent book about the African American history of Covert).

NN-9

--NRC's treatment – or lack thereof – of Palisades' impact on the surrounding Latin American agricultural workforce is remarkably inconsistent and disconcerting. Regarding environmental interveners' contention that this community would suffer disproportionately from routine and accidental radiation releases from the reactor, NRC staff agreed that the company's license extension application does not sufficiently address the "adverse socio-economic impacts of a catastrophic radiation release...as they would be found among the low-income Latin American agricultural workforce of the Palisades area..." and that such a contention would not necessarily be out of scope. Likewise, NRC's licensing board stated that interveners' allegation of disproportionate impacts upon Latin American agricultural workers from an embrittlement/PTS core rupture might be pertinent and admissible in the proceeding to decide whether or not to grant Palisades 20 more years. Yet, the licensing board dismissed the contention, stating "no facts that would tend to show impacts falling disproportionately on this community have even been alleged." (see pgs. 57-60 of the licensing board's March 7, 2006 ruling dismissing this and all other intervener environmental contentions; also see the contention itself, at Aug. 8, 2005 on the "Palisades Watch" website).

NN-10

Isn't it obvious that a catastrophic radiation release at Palisades would ruin nearby agriculture for years, decades, centuries, perhaps even forevermore? Who would eat cherries, blueberries, grapes, peaches, apples, or other agricultural products from west Michigan after a large radiation release from Palisades? (see EIS, p. 2-54 and 55; Table 2-6 shows that nearly half of Van Buren County's land base is devoted to agriculture!) Wiping out of agriculture would very likely impact the low-income, minority community of Latin American agricultural laborers more than any other segment of the surrounding population.

Yet, despite the NRC staff's and licensing board's statements to the contrary, NRC now dismisses any notion of disproportionate impacts upon – or even the existence of – a Latin American agricultural workforce near Palisades, in the space of two sentences. NRC now treats these real people as invisible (EIS, p. 2-57), which represents an environmental justice violation by NRC itself.

NN-11

--NRC writes (on page Roman numeral xvi of its draft EIS) that "...there are factors, in addition to license renewal, that will ultimately determine whether an existing nuclear power plant continues to operate beyond the period of the current [operating license]." We would agree with that. A catastrophic accident would do that in a hurry. Last October, had the 107 ton fully loaded high-level radioactive waste container dropped onto the waste storage pool floor, Palisades' operations almost certainly would have ended for good – but how much of the Great Lakes and surrounding states would it have taken with it?

We want to make it clear to Consumers Energy, Nuclear Management Company, any potential purchaser of Palisades (such as Exelon Nuclear, Dominion Nuclear, or other nuclear utilities), and to NRC that a groundswell of popular opposition by the citizens of Michigan and neighboring states will, sooner rather than later, force the closure of this most dangerously deteriorated nuclear power plant.

As evidence that we mean what we say, I would like to list the two dozen organizations comprising a growing coalition, representing hundreds of thousands of Michiganders and residents of surrounding states and provinces, which oppose the 20 year license extension at Palisades...(see list at http://www.nirs.org/reactorwatch/licensing/palisadesbackgrounder.pdf)

NN-12

Of course, there are many other adverse environmental impacts 20 more years of operations at Palisades would cause. But in addition to all the negatives about Palisades, there are positive alternatives: energy efficiency, wind power, solar power, and biomass could be offered as alternatives to 20 more years of nuclear power and radioactive waste generation. But NRC shrugs off such notions in its draft EIS.

License No. DPR-20

Comments Regarding Draft Supplement 27 to the Generic Environmental Impact Statement for License Renewal of Nuclear Plants, NUREG 1437, for Palisades Nuclear Plant License Renewal

In Federal Register Notice 71 FR 9383, the NRC announced the availability of Draft Supplement 27 to NUREG 1437, Generic Environmental Impact Statement for License Renewal of Nuclear Power Plants, and established a public comment period. Draft Supplement 27 pertains to the renewal of the operating license of the Palisades Nuclear Plant.

Nuclear Management Company, LLC (NMC) has reviewed the Draft Supplemental Environmental Impact Statement (DSEIS), and has developed several comments for NRC consideration. NMC's comments are provided in Enclosure 1.

Please contact Mr. Robert Vincent, Palisades License Renewal Project Manager, at 269-764-2559, if you require additional information.

Nuclear Management Company Comments on Draft Supplement 27 to NUREG 1437

(4 Pages)

Enclosure 1
Nuclear Management Company Comments
on Draft Supplement 27 to NUREG 1437

Comment number	Page Number	Line Number	Proposed Change	
1	2-4	22	Suggest that text specifically state the Covert Generating Station is owned and operated independently of Palisades.	OO-1
2	2-5	1	Replace "40-ac" with "400-ac" (See ER[1] p 2-1)	OO-2
3	2-12	4-12	The new Radwaste system became operational in December 2005. Change "NMC is planning to modify ..." to "NMC has modified ...." Remove 2 sentences describing old radwaste system. Change "The system NMC plans to install relies ..." to "The system relies ...."	OO-3
4	2-12	14	Change "The equipment NMC plans to install ..." to "The equipment NMC has installed ...."	OO-4
5	2-14	39-40	Change to "Sanitary waste is sent to three onsite septic systems." (See DSEIS Figure 2-3)	OO-5
6	2-19	1-2	Change "plant area" to "protected area".	OO-6
7	2-19	18	Change "OLs" to "OL"	OO-7
8	2-22	25	The NPDES Permit (corrected copy of 11/8/04 submitted to NRC in letter dated 12/8/04) requires outfall observations five times per week. Suggest changing last word from "day" to "week".	OO-8
9	2-23	5	Suggest adding third sentence to the paragraph which states, "Clam-Trol treatments are no longer required to be recorded in Palisades' DMRs, but monitoring during Clam-Trol treatments is performed in accordance with the NPDES permit."	OO-9
10	2-23	8-9	Revise sentence to state, "Temperature data collection at monitoring point 001A is conducted in accordance with the NPDES permit." As written, sentence implies, incorrectly, that monitoring was not conducted prior to 2005.	OO-10
11	2-23	13	Suggest defining "several" by stating the number of spills cited within the last five years.	OO-11
12	2-24	7	Correct name of facility is the "Benton Harbor-St. Joseph Wastewater Plant."	OO-12
13	2-25	27	Wind class differs from wind class given on DSEIS p. 8-45 line 21	OO-13
14	2-26	16	Change "2350" to ""2500". The rated capacity of the diesel generators is 2500kw per FSAR Section 8.4.	OO-14

[1] ER refers to Applicant's Environmental Report submitted with the Application for Renewed Operating License. (ADAMS Accession No. ML050940449)

1

Enclosure 1
Nuclear Management Company Comments
on Draft Supplement 27 to NUREG 1437

OO-15	15	2-49	35	Change "NMC performed an assessment ..." to "NMC performs an annual assessment..."
OO-16	16	2-51	Table 2-3	Suggest adding footnote "Figures may not add due to rounding."
OO-17	17	2-52	34-35	Fire protection services are provided by the Covert Township Fire Department and the South Haven Fire Department
OO-18	18	2-54	19	Change "Table 2.6" to "Table 2-6"
OO-19	19	2-55	23-25	Stated building heights are not correct. Suggest either deleting heights or replacing with the following approximate values: turbine building - 94 ft; containment building 192 ft; auxiliary building - 108 ft; cooling tower pump house - 35 ft; two cooling towers - 65 ft; and feedwater purity building - 58 ft. These are approximate heights above grade as the buildings would be seen from the west
OO-20	20	2-57	23	Value "27,488" appears to be an error. "27,488" does not represent 39% of Van Buren County's 16,977 employed in 2002, as stated.
OO-21	21	2-57	36-38	Appears that "Van Buren County" should be one of the two counties referenced (instead of both sets of figures being attributed to Berrien county).
OO-22	22	2-58	25-27	Taxes are also paid to Lake Michigan College and the Michigan State Education Tax (See ER[1] p. 2-40)
OO-23	23	2-58	34	According to Table 2-9, taxes paid to Covert Township averaged 58 percent of tax revenues. The word "spent" should be deleted from this sentence. (See DSEIS Table 2-9, p 2-60).
OO-24	24	2-58	35	According to Table 2-9, taxes paid to Covert School District averaged 32 percent of total property taxes. (See DSEIS Table 2-9, p 2-60).
OO-25	25	2-61	2	Suggest clarifying that there are no "known" historic & archaeological resources at the Palisades site.
OO-26	26	2-63	10	Approximately 80 acres of the site are developed or maintained (See DSEIS p 2-4 line 29)
OO-27	27	2-63	12-13	Replace existing sentence with, "Most of these facilities are located along the main and north access roads."
OO-28	28	2-63	19	Suggest changing "former" to "pre-operational"
OO-29	29	2-68	13	Change "Straminea" to "Pitcheri"
OO-30	30	4-24	11	No "Table 2-10" exists; should be changed to "Table 2-9" (See DSEIS p. 2-60)
OO-31	31	4-24	13	Taxes paid to Covert Township averaged 58 percent of tax revenues spent in the county (See DSEIS Table 2-9, p 2-60).
OO-32	32	4-24	14	The Covert School District received an average of

2

Enclosure 1
Nuclear Management Company Comments
on Draft Supplement 27 to NUREG 1437

			$2.7 million annually from Consumers over the 3-year period (See DSEIS Table 2-9, p 2-60).	
33	4-24	21	VBCO & VBCISD received 3-5 percent of revenues from Consumers (See DSEIS Table 2-9, p. 2-60).	OO-33
34	4-26	11 & 15	Suggest rewording "The applicant has stated that these procedures are in place ..." and replacing with "These procedures are in place..."	OO-34
35	4-27	8	Change to "(1) no major..."	OO-35
36	4-37	23	Line should read, "... Palisades' NPDES permit ..."	OO-36
37	4-40	14	Suggest clarifying that Section 106 of the NHPA directs Federal agencies, and not the applicant, to contact Tribal Governments to take into account the effects of their undertakings on historic properties.	OO-37
38	4-40	19	Suggest adding new sentence at end stating that NMC and Consumers have procedures in place to require evaluation for archaeological resources if land-disturbing activities are planned in previously undisturbed areas.	OO-38
39	4-41	1	According to cited study, groundwater flow velocity is from the east-southeast to west-northwest at approximately 23 ft/yr. This would indicate a westward flow.	OO-39
40	4-42	23-24	Suggest noting that NMC and Consumers have procedures in place to require evaluation for archaeological resources if land-disturbing activities are planned in previously undisturbed areas.	OO-40
41	5-5	34	Change "its" to "it"	OO-41
42	5-6	10	"CP 1996" is not in ER[1] reference list—remove reference here; "CP 1995" and "CP 1996" are not in DSEIS Chapter 5 reference list	OO-42
43	5-8	11	% Contribution column does not add to 100%. Suggest adding footnote, "Figures may not add due to rounding."	OO-43
44	5-9	32	"NRC 2004" is not in the Chapter 5 reference list. No reference is cited for NUREG/BR-0058. NMC 2005a is not in Chapter 5 reference list	OO-44
45	5-9	29	Reference should be NRC 1997b, and reference should be added to Chapter 5 reference list.	OO-45
46	5-10	1	"NRC 2004" is not in the Chapter 5 reference list. No reference is cited for NUREG/BR-0058.	OO-46
47	5-10	27	NMC 2005a is not in the Chapter 5 reference list	OO-47
48	5-10	36	NMC 2005b, NMC 2005c are not in the Chapter 5 reference list	OO-48
49	8-4	6	There are no threatened or endangered aquatic species known at Palisades; suggest removing "including threatened and endangered species."	OO-49

3

Enclosure 1
Nuclear Management Company Comments
on Draft Supplement 27 to NUREG 1437

			(See DSEIS page 2-32)
OO-50	50	8-4	29	Palisades has three onsite sanitary drain fields (see DSEIS Figure 2-3)
OO-51	51	8-5	28	"Covert County" should be either "Covert Township" or "Van Buren County"
OO-52	52	8-7	17-31	Annual Energy Outlook 2006 is now available. Suggest updating paragraph to reflect latest information from DOE.
OO-53	53	8-34	4-6	Suggest noting that the AP1000 design is now certified also. See NRC website for references
OO-54	54	8-45	21	Wind class differs from wind class given on DSEIS p. 2-25 line 27
OO-55	55	8-53 & 8-54	Heading	Table numbers should be Table 8-8
OO-56	56	9-1	7	"NMC" should be replaced with "the plant owner"
OO-57	57	E-3	8	The South Carolina Radioactive Waste License for Delivery was reissued for 2006. Authorization information is as follows: Number: 0006-21-06 Issue Date: 01/09/2006 Expiration Date: 12/31/2006
OO-58	58	E-3	10	The Tennessee Radioactive Waste License for Delivery was reissued for 2006. Authorization information is as follows: Number: T-MI003-L06 Issue Date: 01/01/2006 Expiration Date: 12/31/2006
OO-59	59	G-2	39	Change "is 1.0×10^{-7} to "is about 1.0×10^{-7}" . Also change "NMC 2005a" to "NMC 2005b"
OO-60	60	G-4	28	Column does not add to 100%. Suggest adding footnote, "Figures may not add due to rounding."

May 18, 2006

When reviewing Nuclear Management Company, LLC's [NMC, the operator of Palisades, which is owned by Consumers Energy Corporation] "Environemental Report" (ER, published in March, 2005) in preparation for U.S. Nuclear Regulatory Commission [NRC] environmental scoping hearings on July 28, 2005, it became clear that the nuclear utility's conclusion that there are no known Native American cultural resources and archaeological sites on the Palisades property was little more than self-serving, circular logic with no documented basis. In fact, the location of the Palisades property would tend to suggest that Native American resources and sites could very likely be located there. PP-1

Section 2.10, "Historic and Archaeological Resources," of NMC's ER is a scant four paragraphs long, taking up less than two-thirds of one page (Page 2-46). In fact, Native American sites on the Palisades property are not explicitly mentioned at all. The closest NMC comes is a euphemistic mention of "archaeological...resources on or near the Palisades site," and then only to dismiss any such notion: "The AEC [Atomic Energy Commission], in the Final Environmental Statement (FES) for Palisades, noted no known archaeological or historical resources on or near the Palisades site."

NMC's choice of words, "no known," seemed suspicious. What if there are "unknown" Native American sites at or near Palisades? Had a comprehensive site-wide archaeological survey ever been conducted at or near Palisades, to prove that no Native American sites are present in this geographical location where their presence would be likely?

NMC went on to report "The FES indicates on the basis of review by the U.S. Department of the Interior and the Michigan State Liaison Officer for Historic Preservation that operation of Palisades would have no effect on significant historic or archaeological sites (AEC 1972, Appendix A)." Such wording by NMC begs the question – do the companies and federal agencies regard Native American burial sites and village sites, for example, as insignificant?

NMC' ER continued "In the Terrestrial Ecological Survey done for Consumers in 1979, it was noted that no significant historical or archaeological resources were known to occur in the study area." Again, what about unknown resources? Was a search ever conducted?

NMC concluded "Communication with the Director of Michigan History Division in October 1979 confirmed the absence of significant historic or archaeological sites in the immediate vicinity of Palisades." Again, did the Director of Michigan History Division simply consider Native sites insignificant?

Thus, a cursory reading of Section 2.10 of NMC's ER would seem to convincingly lay the issue of Native American sites at Palisades to rest. After all, three federal agencies (the National Park Service, National Register of Historic Places, Atomic Energy Commission, and U.S. Department of the Interior), two State of Michigan agencies (Michigan State Liaison Officer for Historic Preservation, and the Director of the Michigan History Division), and a Consumers Power contractor were all cited, seemingly confirming that no Native American sites were present on Palisades property.

However, upon reviewing Attachment C of NMC's Environmental Report, "Cultural Resources Correspondence," such confidence in the absence of Native American sites at Palisades is shown to be false.

Contradictions, omissions, and loopholes big enough to drive a bulldozer through -- in the documents offered as proof that "no significant historical or archaeological resources were known to occur in the study area" -- raised alarm bells.

"Attachment C. Cultural Resources Correspondence" from the ER includes just two letters, the first from Consumers/NMC to the Michigan State Historic Preservation Office, the second from the Department of the Interior to the Atomic Energy Commission.

The letter dated February 11, 2005 from Dan Malone at NMC and Stephen Wawro at Consumers to Ms. Martha MacFarlane-Faes at the Michigan State Historic Preservation Office (MSHPO) begs several questions. The first paragraph reveals that MSHPO has "concern pertaining to possible unreported archaeological properties on, or within the vicinity of, the Palisades site." Yet, NMC and Consumers fail to include any documentation spelling out these concerns from MSHPO in the companies'ER, other than that brief mention that concerns exist. Why such a significant development was not mentioned in the main body of the NMC ER, at Section 2.10, but was instead buried in the attachments at page C-2, is not explained. This obscuring of such a significant development is unacceptable.

In the second paragraph, Malone and Wawro state that 20 more years of nuclear activity and operations at the site will not disturb the land, and "[t]herefore, NMC and Consumers do not believe a survey of the project area is necessary, as Federal and state agencies have confirmed on multiple occasions that no historic properties, archeological or architectural, are known to exist on, or in the immediate vicinity of the Palisades site."

However, as the coalition of dozens of grassroots Michigan environmental groups has contended in its intervention against the license extension, 20 more years of operations at Palisades risks a large-scale radiological accident due to the reactor having the most embrittled pressure vessel in the United States. Even if no accident were to occur, the daily operations of Palisades nuclear power plant release "low" levels (and sometimes, not-so-low levels) of radioactivity into the air, water, and soil (see NIRS pamphlet "Radioactive Releases from Nuclear Power Plants in the Great Lakes Basin: What Are the Dangers?" for more information; note that the photo of liquid discharges shows Palisades itself discharging directly into Lake Michigan.).

It also generates high-level radioactive waste, large quantities of which have already been stored at Palisades for nearly 40 years, and ever-growing quantities of which will continue to be stored on-site for at least several decades to come, even if dumps targeted at Native American lands out West (sacred Western Shoshone Indian treaty land at Yucca Mountain, Nevada; the Skull Valley Goshute Indian Reservation in Utah) are opened. Since the opening of such dumps is ever more doubtful, this means that Palisades' high-level radioactive waste could remain on-site indefinitely into the future.

The "routine" or "accidental" radioactive contamination caused by 20 additional years of operations at Palisades would be a significant adverse impact upon Native American burial or other sites located there.

It was irresponsible for NMC and Consumers to state so flippantly in the ER that no "survey of the project area is necessary" when they, and federal and state agencies, appear to have done little if any such surveying in the past. In fact, NRC itself later admitted in its draft Environmental Impact Statement (NUREG-1437, Supplement 27, on page 4-26) that "[t]he NRC staff's independent review of records on file at the SHPO [Michigan State Historic Preservation Office] did not locate records related to project-specific archaeological surveys conducted at Palisades for ground-disturbing activities." NRC continued "However, Consumers Energy did locate in its records one such report that documented a cultural resource field visit to the Palisades site by archaeologists in 1982 for three proposed projects." So Palisades has only a single cultural resource "field visit" documented in nearly 40 years of construction and operations?

Such an admission undermines the relevance of the only documentation NMC and Consumers give in their Environmental Report to support their claims: a letter dated April 7, 1972 from the U.S. Department of the Interior (DOI) to the U.S. Atomic Energy Commission (the predecessor to today's NRC, in terms of nuclear power plant regulation). In that letter, reproduced from Pages C-5 to C-9 of NMC's ER, DOI states "It does not appear that the existing plant should directly affect any existing or proposed unit of the National Park System, nor any site eligible for registration as a national historic, natural or environmental education landmark; however, the final statement should contain evidence of consultation with the State Historic Preservation Officer concerning the effects of the power station on places on or being considered for nomination to the National Register of Historic Places."

Given that no documented cultural resource assessment whatsoever was conducted until a decade later, such "evidence" as the 1972 DOE to AEC letter seems to completely ignore the possibility that Native American burial sites, former village sites, etc. could potentially be present on the power plant site or along its transmission line corridors.

It is interesting that consultation with the Michigan State Historic Preservation Officer is mentioned, because when Kevin Kamps of NIRS spoke with Martha MacFarlane-Faes at MSHPO by phone on August 30, 2005, it was clear that very little consultation had taken place between her office and the companies involved, and in fact, she admitted, that the "ball may have been dropped" on these important matters, apparently referring to her own state agency. Needless to say, "dropping the ball" when it comes to the preservation of Native American burial sites, and other ancient Native sites, is not acceptable. Besides the moral and ethical responsibilities, there are also federal laws, such as the Native American Graves Protection and Repatriation Act, and the National Historic Preservation Act, that require legal enforcement. To not protect Native American burial sites and other sites at Palisades is, in fact, a violation of the law.

Ms. MacFarlane-Faes told Kevin Kamps at NIRS that she would review her files on this matter and get back to him. Other than a single voice mail, perhaps, that her files revealed no more information, there was no further follow up from Ms. MacFarlane-Faes to Mr. Kamps. This was quite disconcerting.

It seems clear that the companies, as well as the state and federal agencies, have allowed this license extension proceeding to progress to this very advanced stage without adequately addressing the potential impacts to Native American sites, rights, and values.

In its Feb. 2005 letter to the Michigan State Historic Preservation Office, NMC and Consumers also mention that: "A May 19, 1972 letter from the Michigan State Liaison Officer for Historic Protection to the AEC (Atomic Energy Commission) confirmed the DOI's determination and stated that Palisades would not 'adversely affect known historical or archaeological resources of the State of Michigan.' "

They go on to state that a "Terrestrial Ecological Survey" conducted 26 years ago by a private contractor paid by Consumers "found no significant historical or archaeological resources were known to occur on the Palisades site" and that these findings were confirmed by the Director of the Michigan Department of State's Michigan History Division, which verified that "no significant historical or archaeological sites had been found in the immediate area of Palisades."

How "significant" and "immediate" are defined by these profit-driven private companies, and by these state agencies, is not clear. Are Native American sites such as burials or villages being considered as insignificant? It is especially troubling that NMC's "evidence" that no Native American sites are present at Palisades is 25 to 40 years old – Native American burial sites, especially, were less respected, morally and legally, at that time by the dominant culture than they are today, after many decades of hard work by Native American tribes to protect their ancestors' graves, and to demand legally-binding respect from the dominant culture.

It seems imperative that an updated, comprehensive, independent site survey be conducted, in close consultation with affected tribes, before Palisades is granted a license to perform nuclear and other activities on this site for another 20 years.

But it appears from the lack of supporting documentation that neither the AEC nor the DOI ever did a careful survey of the Palisades site or adjoining transmission lines. In the ER, NMC and Consumers seem unconcerned about the potential presence of unknown Native American burial sites or other cultural resources.

Yet, given the presence of creeks just north and south of the Palisades nuclear power plant site, it seems all the more likely that Native American villages or encampments might have been located there. And given the forested, large dunes surrounding the Palisades nuclear power plant, it seems possible that even burial sites might be located there, especially considering the great beauty of the area, and the remarkable view to the west (the direction the deceased travel on their way to the spirit

world in many Great Lakes Native American cultures) over Lake Michigan. One definition for "palisade," after all, is "a line of bold cliffs." (Webster's New Collegiate Dictionary) Apparently the hundred-year-old Palisades Park summer resort community with 200 cottages immediately south of the Palisades nuclear power plant took its name from the "cliffs," or tall forested sand dunes, on the site. And Palisades nuclear plant took its name from the Palisades Park community, much to the chagrin of the residents, many of whom have opposed the nuclear reactor since before it was built in the late 1960s.

NMC and Consumers go on in their letter to state that adequate protections are in place to safeguard cultural resources on the site. They write "Examples of activities requiring an Environmental Review include disturbance of 1 or more acres of previously undisturbed land, any earth change within 600 feet of water, wetland and waterway activities, and structural interference with landforms, lakes and streams, among others." But, given the decades of apparent lack of concern, perhaps it should not be surprising that such "protections" actually contain huge loopholes. For example, a good deal of Palisades nuclear power plant property – including much of the forested dunes – is more than 600 feet from Lake Michigan, streams and wetlands. In addition, Native American burial sites could occupy an area of land much smaller than even one acre. Thus, even such "protections" could still allow for overlooking or ignoring burial sites during construction or renovation projects, threatening those sites with damage or complete destruction, whether intentional or unintentional.

Malone and Wawro go on to assure the State of Michigan official that no major refurbishment activities are planned for the 20 year license extension period, so no disturbance to even unknown Native sites could occur. However, they fail to mention that as early as the summer of 2007, a major refurbishment activity is planned – the replacement of the reactor pressure vessel head, involving the movement of very heavy loads, and its barge transport up the Lake Michigan shoreline to Muskegon. In addition, administrative and legal challenges launched by the anti-license extension coalition to the dry cask storage pads at Palisades could require their replacement by new pads elsewhere on the site. This would certainly represent a major refurbishment activity. And with the age-related degradation in coming years and decades at the already 40 year old Palisades plant, it is hard to believe that no refurbishment activities will be required, activities that could disturb, damage, or destroy unknown or unreported Native sites on the Palisades property.

The nuclear companies state repeatedly throughout the Environmental Report that "NMC does not plan to undertake any major refurbishment activities," an admission that itself has dire implications, given the deteriorated state of the reactor and its safety systems. But then again Consumers never envisioned in the early 1970s that it would need to install dozens of 20 foot tall, 132 ton concrete and steel silos to store high-level radioactive waste just 150 yards from the waters of Lake Michigan. And yet, 20 years later, that is exactly what they did. So who knows, really, what projects the companies will need or want to perform on the site over the course of the next 20 years? Besides, Consumers Energy has put Palisades up for sale, so how can it be guaranteed that a future owner would abide by the previous owner's decisions and pledges?

In addition to the ever growing stockpile of high-level radioactive waste stored on-site, in 2008 the so-called "low" level radioactive waste dump at Barnwell, South Carolina -- where Palisades has sent large quantities of atomic trash for decades -- will no longer accept such wastes from Palisades. It is very possible that Palisades would thus expand on-site "storage" for "low" level radioactive wastes as well, some of which is actually intensely radioactive, despite the euphemistic "low-level" label.

Lastly, NMC and Consumers state in the last paragraph that their letter, and a copy of the response to it from the Michigan Historic Preservation Office, would be included in the Environmental Report. No such response is included in the ER. This begs the question, who dropped the ball? NMC/Consumers, or MSHPO? Or both? It is encouraging that MSHPO has expressed concerns, apparently, in the past. But it is discouraging that milestones such as the August 8, 2005 deadline for intervening/ requesting licensing hearings and the August 22, 2005 deadline for environmental scoping comments have come and gone, with no action regarding the potential for Native American impacts from this proposal being adequately addressed by the companies nor by the federal or state agencies.

On July 13, 2005 NRC sent letters to the following tribes: Citizen Potawatomi Nation, Oklahoma; Hannahville Indian Community Council; Grand Traverse Band of Ottawa and Chippewa Indians; Nottawaseppi Huron Pottawatomi; Little River Band of Ottawa Indians; Little Traverse Bay Bands of Odawa Indians; Match-E-Be-Nash-She-Wish Band of Pottawatomi Indians; Miami Tribe of Oklahoma; Ottawa Tribe of Oklahoma; Pokagon Band of Potawatomi Indians of Michigan; Saginaw Chippewa Indian Tribe of Michigan. The letters invited the tribes to submit comments regarding the environmental scoping for the proposed 20 year license extension at Palisades. However, a single letter from NRC does NOT constitute sufficient government-to-government consultation on the part of the U.S. federal government concerning such an important matter.

The very late date of NRC's letter gave tribes insufficient time to consider intervening by the August 8, 2005 deadline for filing a petition to intervene and contentions against the 20 year license extension to the NRC's Atomic Safety and Licensing Board (ASLB). It also gave the tribes insufficient time for taking part in NRC's July 28, 2005 environmental scoping public meeting in South Haven, Michigan, as well as for submitting environmental scoping comments to NRC by the August 22, 2005 deadline. Despite the coalition's formal requests to NRC, both orally on July 28 and in writing on August 19, to extend the public comment deadline so that – among others – tribes could be notified and involved in the proceedings, NRC refused to grant any such extension.

In addition, NRC failed to even send a letter to a number of tribes with ties to the Lake Michigan shoreline, and thus a potential interest and stake in the Palisades license extension. Some examples would include: the Forest County Potawatomi in Crandon, Wisconsin, as well as other tribes on the Wisconsin shoreline of Lake Michigan; the

Prairie Band Potawatomi Nation in Mayetta, Kansas, as well as other Potawatomi diaspora tribes and bands currently located outside the Great Lakes Basin; tribes and bands in Michigan's Upper Peninsula, including the Bay Mills Indian Community, the Keewenaw Bay Indian Community, and the Sault Sainte Marie Tribe of Chippewa Indians. Why were tribes and bands in the northern lower peninsula of Michigan written by NRC, but not these tribes in Michigan's Upper Peninsula? And what about other tribes, such as the Sak and Fox Tribe of Oklahoma, which also have ties to the Lake Michigan shoreline? Why was it not notified and consulted?

But, one of the many contentions filed by the coalition of environmental groups (including NIRS) and concerned citizens (including fifty NIRS members) on August 8, 2005 regarding the license extension at Palisades was the negative impacts on Native American sites potentially on the property. The coalition also raised this Native American sites contention/concern orally at the NRC's July 28, 2005 environmental scoping hearing, and again in its August 22, 2005 written comments on NRC's environmental scoping.

Under its August 8, 2005 contention that "Environmental justice [is being] denied by the continuing operations of Palisades," the environmental coalition stated "Palisades' license extension application also has inadequately addressed the adverse impacts that 20 additional years of operations and waste generation would have on the traditional land uses, spiritual, cultural, and religious practices, and treaty rights of various federally-recognized tribes in the vicinity of the plant and beyond, as well as effects upon non-federally recognized tribes governed by international law..."

The coalition's August 22, 2005 written submission to NRC regarding environmental scoping added:

"...Despite the Michigan State Historic Preservation Office's concern pertaining to possible unreported archaeological properties present on, or with the vicinity of, the Palisades site (see Page C-2, Cultural Resources Correspondence of the Environmental Report), NMC and Consumers persist in opposing a survey of the project area as unnecessary. But, if unreported Native American archaeological sites are present at or near the Palisades nuclear power plant (which is very possible, given the very close proximity of a large creek in Van Buren State Park just to the north of the power plant, as well as the very close proximity of Brandywine Creek just to the south of the power plant in Palisades Park – rivers and creeks being common sites for encampments and villages amongst the indigenous peoples of Michigan since time immemorial), then 20 additional years of nuclear operations, radioactive waste generation, and daily radiation emissions would have a significant and severe adverse impact on Native American cultural and religious values at those sites, values which strive to protect sacred areas from such degradation...Given the sovereignty of these tribes and bands, and the treaty rights that exist between them and the United States federal government, the NRC has a government-to-government responsibility to consult with these tribes and bands on such significant federal actions as granting the Palisades reactor an additional 20 years of operations. An archaeological survey must be conducted before NRC grants a 20 year

license extension to assure that Native American archaeological sites are not negatively impacted by future Palisades reactor operations. Such impacts as harm to lake sturgeon – sacred to some Great Lakes tribes – must also be evaluated. It is interesting and telling that NMC's Environmental Report assigns no "importance" to lake sturgeon (in Table 2.3-1, Page 2-47), despite its State of Michigan Threatened Status, and its sacred status in the cultures and traditions of various Great Lakes Native American Tribes, not to mention its importance to the natural history of Lake Michigan as an ancient indigenous species in the ecosystem. This is an indication that NMC/Consumers is not acknowledging or addressing environmental justice impacts of 20 more years of operations at Palisades on Native Americans."

The coalition's full contention on this issue, as well as its full written environmental scoping comments on this issue, can be viewed at http://www.nirs.org/reactorwatch/licensing/080805intervenorssubmissionsnrcnativeamericanimpacts.pdf.

(Note that NIRS and the coalition's claim that NRC wrote only three tribes was mistaken. NIRS could only locate three such letters on NRC's ADAMS document system at that time, in late July/early August, 2005, and thus assumed that only three tribes had been written. But in fact, an additional eight letters had been sent by NRC to other tribes. NIRS and the coalition did not learn of this until ASLB hearings in early November 2005 in South Haven, Michigan when NRC counsel raised this fact orally.)

On August 30 and 31, 2005, NIRS sent letters to the following tribes regarding this issue: Gun Lake Tribe, Grand River Band of Ottawa Indians of Michigan, Grand Traverse Band of Ottawa and Chippewa Indians, Little River Band of Ottawa Indians, Little Traverse Bay Bands of Odawa Indians, Nottawaseppi Huron Potawatomi, Pokagon Band of Potawatomi Indians, and the Saginaw Chippewa Indian Tribe.

The letter to the Gun Lake Tribe can be viewed at http://www.nirs.org/reactorwatch/licensing/083005ltrtogunlaktribemiketennenbaum.pdf. Letters to the other tribes were similar or even identical.

On March 7, 2006 the NRC Atomic Safety and Licensing Board (ASLB) ruled that this Native American contention, and all other contentions NIRS and the coalition had filed, were inadmissible and denied any further hearings on the matter. On March 17, NIRS and the coalition appealed this ruling to the five-member NRC Commission. Although the NRC Commission has yet to rule on the appeal, the NRC Commission has never overruled any of the dozens of licensing board approvals for reactor license extensions.

Ironically, the NRC staff had just published, in February 2006, its Draft Supplemental Environmental Impact Statement (DSEIS) on the Palisades 20 year license extension (NUREG-1437, Supplement 27) a couple weeks prior to the licensing board ruling. In it, the NRC staff largely confirmed what NIRS and the coalition had contended, which NRC's licensing board nonetheless summarily dismissed. Such a contradiction

between NRC's ASLB ruling and its staff's admissions in the DSEIS have never been explained by NRC to NIRS and the coalition. In fact, it is very troubling that NRC staff and NRC counsel argued against NIRS and the coalition contention having to do with Native American sites on the Palisades property, while at the very same time, NRC staff were admitting in the DSEIS that NIRS and coalition contentions and comments were correct on this subject. Even if NRC's argument is that only aging issues can be heard by an ASLB, it must be pointed out that as systems, structures and components at Palisades age, they'll need replacing. Such refurbishment activities could disturb the land on the property, potentially destroying unknown or unreported Native sites.

NRC's DSEIS (NUREG-1437, Supplement 27, published Feb., 2006) contains numerous very significant admissions concerning Native American sites on or near the Palisades property.

On page iii of the Abstract, NRC admits that it "concludes that the significance of the potential environmental impacts of renewal of the OL [operating license] would be SMALL, except for historic and archaeological resources for which the potential impact would likely be SMALL, but could be MODERATE." NRC defines moderate impact on page xvii in the Executive Summary as "Environmental effects are sufficient to alter noticeably, but not to destabilize, important attributes of the resource." Note that out of the scores of environmental impacts examined in NRC's DSEIS, only the potential impact on archaeological resources rises to this level of potentially "MODERATE" impact. It is, however, difficult to understand how any noticeable alteration of Native American burial sites, for example, would not destabilize important attributes of that "resource."

Kevin Kamps from NIRS pointed out, during his public comments at the April 5, 2005 NRC DSEIS meeting in South Haven, Michigan, that NRC staff had contradicted itself regarding historic and archaeological resources. On a large poster on the wall in the back of the meeting room above NRC's informational hand outs table, NRC staff stated that even for historic and archaeological resources, a license extension at Palisades would have a "SMALL" impact. Yet, on page iii of the Abstract at the very beginning of its hardcopy DSEIS, NRC staff reported that there could be "MODERATE" impact upon historic and archaeological resources. NRC official Rani Franovich, one of the main NRC spokespersons at that April 5 public meeting, approached Kevin Kamps later and said to him that the listing of potentially "MODERATE" impact upon historic and archaeological resources was a mistake, and that it would be corrected in the final SEIS. This is suspicious and unsettling. Why, if NRC staff determined that a 20 year license extension could potentially inflict a "MODERATE" impact upon historic and archaeological resources at or near the Palisades site or along its transmission lines, would NRC suddenly backpedal on that determination when the issue was raised publicly?

Significantly, at page 2-62 of the DSEIS, NRC reports that "15 archaeological sites with 1 mi [mile] of the Palisades site and transmission line rights-of-way" have been identified. One is a prehistoric village site, Pell Village. Two are prehistoric sites of

"undetermined function," one just 0.3 mi south of the Palisades site (thus likely in the vicinity of Brandywine Creek in Palisades Park Resort Community), and the other "just outside the Palisades site's eastern boundary." If the prehistoric sites are of "undetermined function," is it possible that they are burial sites, village sites, or encampment sites, or related to such sites? If so, do they not deserve legal protection under federal and state law against the disturbance or destruction that could occur during a 20 year license extension at Palisades?

On page 2-63, NRC admits that "Intact archaeological sites could be present within the remaining undeveloped areas as well as in soils below the depth of ground disturbance in most areas of the site." It goes on to admit that "***no archaeological field surveys have been conducted either at the Palisades site*** or for original transmission line construction or maintenance. The cultural resource assessment, which was undertaken in 1979, concluded that ***without accurate knowledge of the cultural resources present at the Palisades site, it must be assumed that power plant construction has the potential to adversely impact significant resources that may exist on the plant site. The report recommends that an intensive survey be undertaken of the undisturbed portions of the site.***" [emphases added]

NMC had stated in its Environmental Report at page 2-46 that "In the Terrestrial Ecological Survey done for Consumers in 1979, it was noted that no significant historical or archaeological resources were known to occur in the study area." NMC and Consumers Energy seem to have only selectively revealed what its own contractor reported in 1979, thus misleading the public, tribes, and even state and federal agencies on this very significant matter of Native sites on or near the Palisades property. Where NMC reported "no significant historical or archaeological resources known," it failed to report "power plant construction has the potential to adversely impact significant resources that may exist on the plant site."

Wawro and Malone, on behalf of Consumers and NMC, also deceptively wrote MacFarlane-Faes at the State of Michigan State Historic Preservation Office that "NMC and Consumers do not believe a survey of the project area is necessary, as Federal and state agencies have confirmed on multiple occasions that no historic properties, archeological or architectural, are known to exist on, or in the immediate vicinity of the Palisades site." (NMC ER, Page C-2) How could Wawro and Malone make such a misleading statement to the State of Michigan, knowing that Consumers' own cultural resource assessment concluded that land disturbance "has the potential to adversely impact significant resources that may exist on the plant site," and the recommendation that "an intensive survey be undertaken of the undisturbed portions of the site"? Were Wawro and Malone attempting to deceive the State of Michigan into officially approving the 20 year license extension at Palisades, despite the State's "concern pertaining to possible unreported archaeological properties present on, or within the vicinity of, the Palisades site"?

More troubling still, on page 4-26 NRC reports that "During the site audit, the NRC staff expressed concerns about the NMC procedures not requiring a qualified

archaeologist to survey the proposed ground disturbance area for archaeological resources prior to construction. In addition, the NRC staff noted that "the procedure did not specify the training, experience, or credential requirements for the site's Environmental Coordinator to recognize archaeological materials or assess the potential significance of historic or archaeological resources."

Although NRC goes on to assure that Palisades has now revised its procedures, and that no major refurbishment activities are planned between 2011 and 2031, how can the mere words and assurances of NRC or Palisades be trusted? NRC and the nuclear utility must be required, in compliance with the Native American Graves Protection and Repatriation Act and the National Historic Preservation Act, among other federal laws, as well as in compliance with treaties entered into with affected tribes – treaties being the highest law of the land, as recognized by the U.S. Constitution – to protect Native American burial sites, village sites, encampment sites, and other significant sites to the fullest extent of the law.

NRC seems to be concluding, in essence, that Consumers Energy and NMC can be trusted to protect Native American sites that might be stumbled upon during construction or refurbishment activities. But companies that have concealed relevant information relating to such issues, as described above, cannot be trusted to protect currently unknown or unreported Native American sites on the Palisades property. The laws must be enforced by the federal and state agencies.

It should also be pointed out that NRC's statement on page iii of the SDEIS Abstract, that "The NRC staff determined that information provided during the scoping process did not identify any new issue that has a significant environmental impact," is difficult to believe, given what has been described above. In the SDEIS Appendix B, "Contributors to the Supplement," three contributors whose "Function or Expertise" is listed as "Cultural Resources" were listed; these three experts on cultural resources came from three different government agencies, the NRC, Argonne National Lab, and Lawrence Livermore National Lab. Reviewing the environmental impact statements for the five most recently approved license extensions – at Cook (just 30 miles south of Palisades, on the Lake Michigan shore), Point Beach (on the Lake Michigan shore of northern Wisconsin), Millstone (itself near Native reservations in Connecticut), Arkansas Nuclear One, and Farley, only one "Cultural Resources" contributor took part in each of those EISs. It seems that comments provided by NIRS and the coalition of environmental organizations intervening against and commenting upon the 20 year license extension at Palisades raised a new and important issue – potential Native American sites on the property – that had not been addressed in four decades at Palisades. In fact, the licensee, NMC and Consumers, had nearly completely downplayed this issue in its Environmental Report. NRC then turned to three cultural resource specialists to address this important issue.

It is legally and morally incumbent upon the companies and federal and state agencies involved that a comprehensive site survey of the Palisades property be required and performed, and that it be carried out in close consultation and cooperation with

affected tribes on a legally sufficient, government to government basis. If Native American burial sites or other significant sites are discovered during the comprehensive site survey, then appropriate actions must be taken to protect these sites against 20 more years of radiological and physical disruption and damage. All this, before a license extension can legally be granted for Palisades.

It cannot be overly reinforced and re-emphasized that there should be meaningful consultations not only between the impacted tribes and the Palisades nuclear plant owner and operator, but also government to government consultations between tribes and relevant and involved federal government regulators and agents, including NRC. A letter or a phone call does not constitute legally sufficient government to government consultation.

NRC FORM 659 (6-2003) U.S. NUCLEAR REGULATORY COMMISSION

Category 3

NRC PUBLIC MEETING FEEDBACK

Meeting Date: 04/05/2006

Meeting Title: Public Meeting to discuss Draft Environmenatl Impact Statement for Palisades Nuclear Plant

In order to better serve the public, we need to hear from the meeting participants. Please take a few minutes to fill out this feedback form and return it to NRC.

1. How did you hear about this meeting?
   - ☐ NRC Web Page
   - ☐ NRC Mailing List
   - ☒ Newspaper
   - ☐ Radio/TV
   - ☐ Other _____

		Yes	No (Please explain below)	Somewhat (Please explain below)
2.	Were you able to find supporting information prior to the meeting?	☒	☐	☐
3.	Did the meeting achieve its stated purpose?	☐	☐	☒
4.	Has this meeting helped you with your understanding of the topic?	☐	☐	☐
5.	Were the meeting starting time, duration, and location reasonably convenient?	☒	☐	☐
6.	Were you given sufficient opportunity to ask questions or express your views?	☒	☐	☐
7.	Are you satisfied overall with the NRC staff who participated in the meeting?	☐	☒	☐

COMMENTS OR SUGGESTIONS: Thank you for answering these questions.

QQ-1

3.) The NRC presented their fact findings and it seemed evident that the decision to renew the Palisades license has been approved, regardless of the concerns, facts and alternatives presented by individuals attending this meeting. I question the purpose of this meeting -? to sugarcoat the problems with Palisades? and not offer the public any part in the decision making process. -

Please fold on the dotted lines with Business Reply side out, tape the bottom, and mail back to the NRC.

COMMENTS OR SUGGESTIONS: (Continued)

The NRC officials avoided detailed answers to questions regarding the safety of the aging reactor. When questioned about renewing the license for an additional 20 years beyond 2011, (Exceeding the original life span of Palisades of 40 years) The NRC officials once again avoided the issue of safety.

Given the poor tract record of safety at Palisades along with present conditions of the reactor – How can we expect Palisades to be a source of safe and efficient power for the next 25 years? QQ-2

I also concerned about the safe disposal of the spent fuel rods. Over the next 25 years, more rods will be used and where will they be stored? Is there a safe place to store this nuclear waste or will they be stock piled here along our precious resource Lake Michigan? QQ-3

Seek alternative solutions for a Safe and Clean Future. QQ-4

Subject: Public comments on NUREG-1437, Supplement 27

Dear NRC,

RR-1 My wife and I grew up vacationing at Palisades Park. We recently purchased an old cottage and renovated it so our four children, 8 and under, will grow up with the same wonderful experiences at the lake. We understand nuclear power can be a viable option for clean and efficient power, but we strongly oppose the renewal of the Palisades Nuclear Power Plant license.

RR-2 There are far too many identified safety, security, environmental and health issues to overcome specific to the Palisades facility to warrant a license renewal. The age-related degradation, embrittlement of the reactor vessel, radioactive generation and storage issues, as well as the sensitive socio-economic impact

RR-3 of the community are just a few. There are a number of energy efficient alternatives that are more viable for the area. Overlooking the interests of the people and clearly identified health concerns in the interest of plant self-preservation are actions from a bygone era.

RR-4 We implore you to deny the license renewal for Palisades Nuclear Power Plant, listen to the voices of the people, and take a stand for future generations. This is an opportunity to do what is right and set a course for safe, healthy, efficient and renewable energy, rather than holding on to strings of a proven aged, unsafe and volatile facility. Please do the right thing and deny this application, for our kids and the future generations."

U.S. REGULATORY COMMISSION
WASHINGTON, D.C. 20555-001

Nuclear Regulatory Commission,

I'm writing to express my opinion on the use nuclear power plants in the united states. I believe we are putting our head in the sand like an ostrich by not using our nuclear power for electricity for the benefit of our citizens of this country. We burn coal like our 18TH century ancestures, we burn natural gas that is running out that will be needed for home heating, when we have nuclear energy that is clean, cheap and an unending supply.

SS-1

Why do our leaders listen to activist like Kevin Kamps (who most likely got his information from the movie China Syndrome).

SS-2

What I'm saying is every new territory our country has ventured into we have learned by doing not letting navsayers run our experts.

I understand the country of Israel generates most if not all of their electricity with nuclear power. Our technology not used at home. Look at the advancement in our nuclear suberines since they were put into service. We cannot advance in this field if we don't inter into it. I believe all our elect--ricity one day will be by nuclear power. because we must, the problems of spent fuel rods will be figured out by scientest not by activist.

SS-3 What I'm saying is build all the new nuclear power plants the electrict companys need to buid as that will benefit everyone. As for the Palisades Plant, let the experts make the decisens not the nuts on the street. Sincerely

George Richards

Palisades Conversion Group

Concerns and comments, for Environmental Scoping Meeting
April 5th 2006

1. Having worked in two Occupations, within the Nuclear field, *Laborer, J.A. Jones Construction Co. 1971-72* on the *Donald C Cook Nuclear Power Plant*, then at *Palisades Nuclear Power Plant, Decon-Tech* for *Essential Services Co.* during an Refueling Outage, in the early 90s, I have seen construction of, then finished Plants, during tours. The Plants then new and impressive. Then again, many years later, aging, much obsolete, often highly contaminated equipment; mal-functioning devices such as the Reactor Containment, Hatch-door, in-operable for some time, while I was de-coning when *Consumers Energy*, Operated this Plant. Things get old, dilapidated with time, especially when they are neglected. Worn-out. Under the influence of radiation. Out-dated. Or used-up, such as the Palisades Plants Fuel-pool, now double-racked. Steam Generators replaced, highly contaminated previous units, within they're own mortuary on the Plant Site. Along with, approximately 30, V.S.C. 24 and (34) Dry Storage Casks, in use for Above Ground Spent-fuel Assembly storage, also on site. An Cut-rate, move Consumers Energy Co. took when their Fuel-pool was filled to maximum capacity. Well-passed, it's origional design capacity; threatening a Shut-down of the Plant. Breaking another promise, made when the Plant was first built, "That no, Highly contaminated radioactive materials would be on the plant-site, out-side it's high-level Containment structure. For purposes other than re-fueling and eventual removal of spent-fuel assemblies. To a National Depository." TT-1 TT-2
2. After 38 years of Operation, *Palisades Nuclear Power Plant* and it's *Reservation*, is showing it's age. Effects of Embrittelment, it's Pressure Reactor Vessel being protected with old, many cycled fuel assemblies, a case in point. Years now. No vessel replacement, or further shielding in sight. Or 2007 says the NRC, 2011, say others; 2014, says Palisades Lawyers! Should have been replaced ten years ago. As P.R. Spokesperson, Mark Savage told the Local Press back 1993, when the problem surfaced, during an interview with the South Haven Daily Tribune. Once they finally got him to admit, there was a metal condition called "Embitterment," effecting the reactor! TT-3

One of the biggest complaints, from Plant Critics, is the Operators have been less, than forth-coming when problems surface. Make excuses, rosy predictions they know, well never come to pass. Or lie to anyone listening, when the information might, or well be, perceived as contentious. Placing Public trust, in jeopardy. TT-4

Much the same thing, can be said, of the NRC, during these current round of Scoping Meetings, concerning this Relicensing endeavor. Long time followers of this issue, has seen and heard from a very different NRC, under past Presidential Administrations; the difference between now, and say, the early 90s, can not be denied. This is a very, Business Friendly, NRC. Not Public or Environmentally friendly. TT-5

2.Yesterday I received my copy of ***Generic Environmental Impact Statement for License Renewal of Nuclear Plants Supplement 27: Regarding Palisades Nuclear Power Plant*** Feb. 2006 TT-6

Reading through, both the Manual and it's cover-letters, I see, despite the potentional, Radioactive hazards, the *NRC* insists the *Environmental Impacts*, of Palisades Nuclear Power Plant and all the radioactive materials about it's Reservation, is always regarded as "SMALL"! throughout this Report. But, when I turn to the Alternative Energy sources, which should be pursued at the Palisades Plant site, there impacts are often referred to as "**LARGE**"! Which all considering, they would be, taking into account the enormity, of the electrical power the plant puts on the grid, for Alternatives to equal out. In they're current forms, at the site.

TT-7

A rather particular assumption. Bracketing both the Plant's and *NRC* positions well, yet ignoring the simple fact, that if all the resources used to continue operation of this plant, were put into Renewables and others forms or electrical generation throughout the State, it would turn the argument on its head.

TT-8

What my real concern here, is the fact this *GEIS Report* does not, take into it's consideration of the Dry-cask Storage, other highly radioactive, contaminated things such as the former Steam Generators on site. Many would argue the Palisades Reservation is all ready, a defacto High-level, Nuclear-Waste Dump! Which to their, *PCG* (*Palisades Conversion Group*) and my way of viewing this issue, a "**LARGE**" impact, on this fragile, Lake Shore Environment. More to the point, Potentional Impact, should things, not, go as designed or planned. Or Promised! Which over the last 38 years, time and time again, have been broken.

TT-9

With an additional, twenty years, worth of Above-ground, Dry Storage Casks, along with other contaminated equipment, which is sure to be replaced should this plant be pushed so far past is origional, design capacity. Which it all ready has, by years, now. Counter to the *GEIS's* insistence that no changes to the plant, need take place, in the additional twenty years.

TT-10

Isn't the reactor-head, soon to be replaced? In July, perhaps?

The Pressure reactor vessel, long in question, operated in a patch-work method since Embrittlement, was discovered, more than ten years ago. How long, before it is replaced?. Annulated as once promised in Court, or an Neutron-thermal shield installed? Replaced!?

TT-11

And yes, the Dry-storage Casks piling up on Site. I'm sure we'll hear all about Yucca Mountain, or the Goshutes, Skull Valley Indian Reservation, taking all this off our hands, for the umpteenth time, in the last twenty years. Now there are over 20 to 30 Dry-storage Casks on site. Well anyone here, give us the exact number?! Or are you going to just dodge the question again? Insisting it's a Federal issue, none of this Relicensing business concern.

This is, a Local Community concern, for we, well have to live with, and care-take all of this waste for Generations to come! In 93, we were told these experimental, Cut-rate, Dry-storage casks, would be gone in 1998, time and time again by Mark Savage, the Plant Spokesman.

Now, we are told by the *NRC*, they're licensed to store fuel assemblies for twenty years; well last for 150 years; and *Above Ground Storage* is our Nations Nuclear future! Since the Feds haven't found a hole, deep or dry enough, to put all this radioactive waste and materials in! After nearly fifty years of looking, constructing, spending and charging us Rate-Payers, for a place to take it off our shorelines. Nothing, but this. Another promise broken. More public trust, going by the wayside.

(On April 4th, the Skull Valley Reservation well be approved for Above Ground Storage; but, what with Yucca Mountain inability to take the slated casks off the Goshutes hands, there WELL NOT, be room in ether Nuclear-waste Storage-site, for the all waste piling-up at Palisades now; much-less then all the additional waste, produced during the 20 Relicensing period! All, for a little, electricity now, decades, perhaps centuries of Radioactive waste, for the local citizenry to look after. Yet the Operators still insist, this is a cheap form of power-generation!? TT-12

4. Another concern, is the Plants original 7-mile Cooling –Loop, rumored to be back in use again; it's effect of Lake Michigan's Eco-system. Is it, or is it not, back in use? When I questioned the new Palisades P.R. Spokesperson, she wasn't even aware, of this Cooling-Loop!?
Or so she. informed me. She was fairly new to the job, but this loop has been out in the lake since the plants inception. I know Mr. Bradley, one of the Under-Waters Welders who built it, back in the late 60s. I remember the Environmentally driven, Court actions, making Consumers Power Co. construct Cooling Towers, to bypass this system because of the Loops adverse impact on the Lakes wildlife and Endangered-species; therefore the Court's shutting this underwater Cooling loop down. I thought, for good, since Cooling Towers had the be constructed to operate the plant. Again, is this Cooling-loop back in use? What are the new, Eco-system Impacts on the Lake, taken into consideration by the Plant Operators and NRC, if it is?
What is the current status of this Loop, now?
No mention of the Sail Darter, in this new GEIS Manual. Is the Snail Darter now extinct, recovered, or still within the Plants immediate shoreline area? If-so, how is it doing, should this Cooling Loop, be back in use. Or is the Plants huge, lake water, intake and discharge ,effecting it?
(I need to call Dept of Wildlife? The DNR?) (I called up the Dept of Fish and Wildlife, in Lansing, spoke to Todd, who was interested, yet explained that the Snail-darter is an Endangered species, who lives in three South Eastren States. Not, listed as ever having lived within Lake Michigan!? To his knowledge, but this Court-suit goes back to the late 60s. It seems the Snail Darter must have moved on, wiped out of the Great Lakes so long ago, this issue is no longer prevalent to the current Cooling-loop problems.

5. Questions about Palisades, Fuel-pool crane breakdown, the Oct.11th. 55 hour shutdown, with an 110 ton. Dry-storage cask, containing spent fuel-assemblies, hung "partially suspended" in the air, held partly submerged over the fuel-pool. The Fuel-pool racked well beyond, it's origional design capacity with fuel-assemblies going back to the 70-s.. I have gathered from the Tribune article, all the brakes froze, because Plant-personal did not set the emergence brake properly, just before leaving for his vacation! TT-13

How big, a rem-stream, would this situation would be giving off? How many rems, the article certainly didn't say. Did the whole fuel-pool area, must have had to been decontaminated; how much did it receive?

All that spent-fuel at risk, should that Cask had dropped down onto decades worth of spent-fuel assemblies, in would could have caused a fire, making for a accident much worse, than Chernobyl!
The article also pointed out, this incident was considered, of Low, Safety significance, by the NRC, within it's Quarterly Report. Quite a change, from the NRC in the Early 90s, when Dry-Cask Storage, was first initiated at Palisades; giving the Operators 30 violations, for everything from crack pipes to, mishandled, dropped fuel-assembly rods, into its reactor vessel..
Did they ever find that two pounds of missing fuel?

To *Palisades Conversion Group*, this incident further demonstrates the Aged, long-time ineffectiveness of both the equipment and Personal, at the Palisades plant; right along with the Current *NRC*, not handing out *Violations*, for such screw-ups. This must have been, some long term radiation, being released for over two days within the Fuel-pool area? We're procedures fumbled? Could not get their crane to budge, for days!? Because one brake froze, then all it's breaks shutdown. For 55, hours!? What were the Plant Personal doing, scratching their heads?!
A further explanation, of "partially suspended" 110 lb. Metal inner cask, leaves me with cause for concern, as it did others, was not made clear in the article. Just insistences that everything was "Okay". Just what is, the shielding, of the bare metal cask? Lead, Neutron-thermal shielding? Was there Helium within the cask, at the time? The *Public* would like to know?
Just keeping this incident under wraps, while say, the Three Judge Panel Hearing was taking place, demonstrates both the Plant, and the NRC's inability, to be less than forthcoming with the local Public when things go wrong at Palisades.
And please, stop saying, this is a Federal issue, no concern to any of us Locals here. Or this Re licensing process. Anther twenty-five years, of manufactured waste, and waste handling, storage, is what we are going to have to live with, so it's our concern. On questionable storage pads, cut-rate casks, piling up out of a plant long past it origional Decommissioning Date.
By the way. Tell us this. What was, this Plants origional Decommissioning date, when first built and began operations, in 71?

Re: Generic Environmental Impact Statement for License Renewal of Nuclear Plants, Supplement 27: Palisades Nuclear Plant, Van Buren County, Michigan, Draft Report, NUREG-1437, EIS No. 20060052

Dear Sir or Madam:

In accordance with Section 309 of the Clean Air Act and the National Environmental Policy Act (NEPA), the U.S. Environmental Protection Agency (EPA) has reviewed the Generic Environmental Impact Statement for License Renewal of Nuclear Plants, Supplement 27 (SEIS): Palisades Nuclear Plant, which is a draft report. According to the SEIS, the operating license for Palisades Nuclear Plant will expire on March 24, 2011. The proposed Federal action would renew the current operating license for an additional 20 years.

The Nuclear Regulatory Commission (NRC) developed the Generic Environmental Impact Statement (GEIS) to streamline the license renewal process on the premise that environmental impacts of most nuclear power plant license renewals are similar, in most cases. NRC develops facility-specific SEISs for individual plants as the facilities apply for license renewal. EPA provided comments on the GEIS during its development process--for the draft version in 1992, and for the final version in 1996.

Palisades Nuclear Plant is located in Covert Township, Van Buren County, Michigan, on the southeastern shoreline of Lake Michigan. The plant has a single pressurized light-water reactor. The maximum authorized power level of its reactor is 2,565 megawatts thermal. The plant's current net summer capacity is 786 megawatts electric. The plant is refueled on an 18-month cycle. Palisades Nuclear Plant uses a closed-loop cooling system.

Based on our review of the Palisades Nuclear Plant draft SEIS, we have given the project an EC-2 rating. The "EC" means that we have environmental concerns with the proposed action, and the "2" means that additional information needs to be provided in the final SEIS. Our concerns relate to:

1. Adequacy and clarity of the information provided,

E-RIDS = ADM-03
Add = Bo Pham (BMP)
C. Guerrero (CXG3)

SUNSI Review Complete
Template = ADM-013

2. Risk estimates,
3. Entrainment of fish and shellfish in early life stages, and
4. Threatened and endangered species.

We have enclosed our comments and the U.S. EPA rating system summary.

If you have any questions or wish to discuss any aspect of the comments, please contact Newton Ellens (for NEPA-related issues) at (312) 353-5562, or Michael Murphy (for radiation-related issues) at (312) 353-6686.

Sincerely,

Kenneth A. Westlake, Chief
NEPA Implementation Section
Office of Science, Ecosystems, and Communities

Enclosures.

U.S. Environmental Protection Agency Comments on
The U.S. Nuclear Regulatory Commission's Generic Environmental Impact Statement for License Renewal of Nuclear Plants, Supplement 27: Palisades Nuclear Plant, Draft Report, NUREG-1437

General Comments:

The supplement to the Generic Environmental Impact Statement (GEIS) for Renewal of Nuclear Power Plant Licenses should be a Site Specific Environmental Impact Statement instead. This would follow after forty years of operation, with a forty year data collection history, and where site specific conditions could be utilized to provide a specific response to the Environmental Impact requirements instead of a generalized one.

Specific Comments:

1. Section 2.1.4.2, *Gaseous Waste Processing Systems and Effluent Controls*, Page 2-12, second paragraph. Citations of dose values should include the dose value, in addition to the citation, to make the values clearer. UU-1

2. Section 2.2.7, *Radiological Impacts*, pages 2-49, 2-50. The references to the environmental standards need to be more complete citations, including title of the rule or regulation along with the basic standard for comparison provided consistently. All of the environmental standards that could be used for comparison should be used, including 40 CFR 61 Radionuclide National Emission Standards for Hazardous Air Pollutants values. This will reduce the time needed to look up these citations and verify values that are cited in the text. UU-2

3. Section 2.2.7, *Radiological Impacts*, page 2-49. We are concerned about the level of information provided in the draft supplemental environmental impact statement (SEIS) on direct and cumulative radiological impacts. According to the draft SEIS, Nuclear Management Company, LLC (NMC), the applicant for the operating license, has conducted a radiological environmental monitoring program (REMP) around the Palisades site since 1971. Through this program, NMC has monitored and documented radiological impacts to workers, the public, and the environment. The draft SEIS states: UU-3

> The REMP includes monitoring of the waterborne environment (ground water, surface water, and sediments), ingestion pathways (milk, fish and vegetation), direct radiation (gamma dose at thermoluminescent dosimeter [TLD] locations), and atmospheric environment (airborne radioiodine, particulates, gross beta, and gamma). [Page 2-49]

The draft SEIS cites two annual reports which summarizes information from the REMP, but the draft SEIS does not contain this summary information itself. Summarized

quantitative information about radiation and exposure pathways in the environment is relevant in determining radiological impacts from the continued operation of Palisades. We are unable to make such a determination from the draft SEIS as it is written. In addition, the draft SEIS lacks a comprehensive assessment of cumulative radiological impacts, since it does not include quantitative information about the D.C. Cook Nuclear Plant, located about 28 miles south-southwest of Palisades on Lake Michigan's shores. Therefore, we suggest that the final SEIS include (1) current annual summary information from the REMP, and (2) a quantitative cumulative impact assessment of radiological impacts which accounts for impacts from the D.C. Cook Nuclear Plant.

UU-4 4. Section 2.2.7, *Radiological Impacts*, pages 2-49, 2-50. Providing the estimated total effective dose equivalents (TEDE's) for comparisons helps in providing the public with additional assurances that doses are monitored and do meet the As Low As Reasonably Achievable (ALARA) principals of the U.S. Nuclear Regulatory Commission (NRC).

UU-5 5. Section 4.2.2, *Electromagnetic Fields - Chronic Effects*, page 4-17. We commend NRC for providing the reference to the National Institute of Environmental Health Sciences results and recommendations on chronic exposures to electromagnetic fields. This will provide the public with valuable information on these types of exposures.

UU-6 6. Section 4.8.3, *Cumulative Radiological Impacts*, page 4-38, 4-39. Information or procedures used to generate values to support the assertions in this section need to be provided in a clearer manner to reduce the possibility of misunderstandings and the reasoning on procedures to reach these conclusions.

UU-7 7. Section 5.2.2, *Estimate of Risk*, page 5-6. It is stated that "The baseline core damage frequency (CDF) for the purpose of the SAMA [Severe Accident Mitigation Alternatives] evaluation is approximately 4.05×10^{-5} per year. This CDF is based on the risk assessment for internally-initiated events. NMC did not include the contribution to risk from external events within the Palisades risk estimates; however it did account for the potential risk reduction benefits associated with external events by increasing the estimated benefits for internal events by a factor of two."

The estimates for risks from both types of events should be evaluated and presented, along with a rationale for not basing risk decisions on the external events or including them in the considerations as necessary to get an accurate portrayal of the risk of the licensing renewal.

UU-8 8. Section 6.1, *The Uranium Fuel Cycle*, page 6-3. Under the bullet point for Off-site radiological impacts (individual effects from other than disposal of spent fuel and high level waste disposal), no consideration appears to be given to the potential long-term storage of the spent fuel and high-level waste materials on site until such time as a

permanent facility is finally licensed and begins to accept these materials for disposal. A reference to other sections that this evaluation may have been included in should be provided here as well as in other sections, or if this evaluation has not been adequately conducted, the issue needs to be considered and an appropriate evaluation conducted.

9. Section 6.1, *The Uranium Fuel Cycle*, page 6-8, under the bullet point for On-Site Spent Fuel. A more thorough evaluation for the volume of spent fuel expected to be generated during the additional licensed time needs to be provided, along with more specific information as to site specific circumstances that may impair or improve the risk values for potential exposures to this spent fuel storage. UU-9

10. Section 7.1, *Decommissioning*, page 7-2, under bullet point Radiation Doses. As the GEIS is based on a forty-year licensing period, an extension of this period would have an impact that needs to be quantified and reported. This information should have been included specifically in the draft SEIS as part of the risk that would be associated with the license extension. The specific methodology needs to be provided and explained. UU-10

11. Section 8.1, *No-Action Alternative*, page 8-5, under the bullet point Human Health. The actual value representing the cited percent value should be specifically provided in addition to the citation. This will reduce unnecessary additional research by readers, except for value verifications, and potential misunderstandings or confusion as to the actual value(s) being specified. UU-11

12. Section 8.2.1, *Coal-Fired Generation*, page 8-17, under bullet point Human Health. Any dose estimate that would have the potential to fall in the risk range of 10^{-6} to 10^{-4} or greater needs to be specifically evaluated for potential regulatory requirements or risk impacts to the public health. This should be estimated conservatively using the data that is currently available or that can be logically extrapolated from currently available information. UU-12

13. Section 8.2.3, *Nuclear Power Generation*, page 8-34. The changes in power production would provide a difference in potential risk to the public and needs to be specified, rather than merely referenced, to provide a clearer understanding of the risk determination in this section of the document. UU-13

14. Section 8.2.3.1, *Closed -Cycle Cooling System*, page 8-39, under bullet point Waste. Waste impacts need to be specified, rather than merely referenced, to provide a clearer understanding of the risk determination made in this section of the document. UU-14

15. Section 8.2.3.1, *Closed -Cycle Cooling System*, page 8-40, under bullet point Human Health. Human-health impacts need to be specified, rather than merely referenced, to provide a clearer understanding of the risk determination in this section of the document. UU-15

UU-16

16. Section 2.1.4.1, *Liquid Waste Processing Systems and Effluent Controls*, Page 2-12. The draft SEIS does not provide quantitative details about the planned modification of the liquid radioactive waste processing system. The draft SEIS states that NMC is planning to replace the current system, which is based on evaporation, to a system using resins for ion exchange. The draft SEIS does not provide quantitative details about the estimated change in collection efficiency between the two systems. This information should be provided in the final SEIS.

UU-17

17. Section 4.1, *Cooling System*, page 4-9. We are concerned about entrainment of fish and shellfish in early life stages. Under a U.S. EPA rule, codified in 40 C.F.R. § 125 (U.S. EPA Rule), Palisades Nuclear Plant is required to reduce its entrainment of fish and shellfish in early life stages. Under the U.S. EPA Rule, Palisades Nuclear Plant is required to choose one of five compliance alternatives to reduce entrainment, and the compliance alternative must meet a regulatory performance standard. We understand that Palisades will comply with the U.S. EPA rule through conditions in a NPDES permit issued by the Michigan Department of Environmental Quality. However, we believe that the project proponents should have a proposed compliance alternative and regulatory performance standard for Palisades, because the project proponents must assess the feasibility of complying with the rule. Listing this information would provide a comprehensive public disclosure of plans to reduce entrainment. Therefore, we request the project proponents to determine and disclose the proposed compliance alternative and performance standard that would most likely be proposed in the NPDES permit application for Palisades in the final SEIS.

UU-18

18. Section 4.6, *Threatened and Endangered Species*, pages 4-32 to 4-35. We are concerned because the draft SEIS does not evaluate impacts on state-listed threatened and endangered species. The draft SEIS includes an evaluation of federal and state-listed threatened and endangered species in the study area. However, the draft SEIS only evaluates impacts to federal-listed threatened and endangered species. We believe that the final SEIS should include a more comprehensive evaluation of threatened and endangered species, by including an evaluation of impacts to state-listed species.

SUMMARY OF RATING DEFINITIONS AND FOLLOW UP ACTION*

Environmental Impact of the Action

LO-Lack of Objections
The EPA review has not identified any potential environmental impacts requiring substantive changes to the proposal. The review may have disclosed opportunities for application of mitigation measures that could be accomplished with no more than minor changes to the proposal.

EC-Environmental Concerns
The EPA review has identified environmental impacts that should be avoided in order to fully protect the environment. Corrective measures may require changes to the preferred alternative or application of mitigation measures that can reduce the environmental impacts. EPA would like to work with the lead agency to reduce these impacts.

EO-Environmental Objections
The EPA review has identified significant environmental impacts that must be avoided in order to provide adequate protection for the environment. Corrective measures may require substantial changes to the preferred alternative or consideration of some other project alternative (including the no action alternative or a new alternative). EPA intends to work with the lead agency to reduce these impacts.

EU-Environmentally Unsatisfactory
The EPA review has identified adverse environmental impacts that are of sufficient magnitude that they are unsatisfactory from the standpoint of public health or welfare or environmental quality. EPA intends to work with the lead agency to reduce these impacts. If the potential unsatisfactory impacts are not corrected at the final EIS sate, this proposal will be recommended for referral to the CEQ.

Adequacy of the Impact Statement

Category 1-Adequate
The EPA believes the draft EIS adequately sets forth the environmental impact(s) of the preferred alterative and those of the alternatives reasonably available to the project or action. No further analysis or data collecting is necessary, but the reviewer may suggest the addition of clarifying language or information.

Category 2-Insufficient Information
The draft EIS does not contain sufficient information for the EPA to fully assess the environmental impacts that should be avoided in order to fully protect the environment, or the EPA reviewer has identified new reasonably available alternatives that are within the spectrum of alternatives analyzed in the draft EIS, which could reduce the environmental impacts of the action. The identified additional information, data, analyses, or discussion should be included in the final EIS.

Category 3-Inadequate
EPA does not believe that the draft EIS adequately assesses potentially significant environmental impacts of the action, or the EPA reviewer has identified new, reasonably available alternatives that are outside of the spectrum of alternatives analyzed in the draft EIS, which should be analyzed in order to reduce the potentially significant environmental impacts. EPA believes that the identified additional information, data analyses, or discussions are of such a magnitude that they should have full public review at a draft stage. EPA does not believe that the draft EIS is adequate for the purposes of the NEPA and/or Section 309 review, and thus should be formally revised and made available for public comment in a supplemental or revised draft EIS. On the basis of the potential significant impacts involved, this proposal could be a candidate for referral to the CEQ.
