(a) Licensees and other entities who implement an FFD program under this subpart shall ensure that audits are performed to assure the continuing effectiveness of the FFD program, including FFD program elements that are provided by C/Vs, and the FFD programs of C/Vs that are accepted by the licensee or other entity.

(b) Each licensee and other entity shall ensure that these programs are audited at a frequency that assures their continuing effectiveness and that corrective actions are taken to resolve any problems identified. Licensees and entities may conduct joint audits, or accept audits of C/Vs conducted by others, so long as the audit addresses the relevant C/Vs' services.

(c) Licensees and other entities need not audit HHS-certified laboratories or the specimen collection and alcohol testing services that meet the requirements of 49 CFR part 40, “Procedures for Department of Transportation Workplace Drug and Alcohol Testing Programs” (65 FR 41944; August 9, 2001), on which licensees and other entities may rely to meet the drug and alcohol testing requirements of this subpart.

§ 26.417 Recordkeeping and reporting.

(a) Licensees and other entities who implement FFD programs under this subpart shall ensure that records pertaining to the administration of the program, which may be stored and archived electronically, are maintained so that they are available for NRC inspection purposes

and for any legal proceedings resulting from the administration of the program.

(b) Licensees and other entities shall make the following reports:

(1) Reports to the NRC Operations Center by telephone within 24 hours after the licensee or other entity discovers any intentional act that casts doubt on the integrity of the FFD program and any programmatic failure, degradation, or discovered vulnerability of the FFD program that may permit undetected drug or alcohol use or abuse by individuals who are subject to this subpart. These events must be reported under this subpart, rather than under the provisions of 10 CFR 73.71; and

(2) Annual program performance reports for the FFD program.

§ 26.419 Suitability and fitness evaluations.

Licensees and other entities who implement FFD programs under this subpart shall develop, implement, and maintain procedures for evaluating whether to assign individuals to construct safety- and security-related SSCs. These procedures must provide reasonable assurance that the individuals are fit to safely and competently perform their duties, and are trustworthy and reliable, as demonstrated by the avoidance of substance abuse.

Subpart L—[Reserved]

SubpartM—[Reserved]

Subpart N—Recordkeeping and Reporting Requirements

§ 26.709 Applicability.

The requirements of this subpart apply to the FFD programs of licensees and other entities specified in § 26.3, except for FFD programs that are implemented under subpart K of

this part.

§ 26.711 General provisions.

(a) Each licensee and other entity shall maintain records and submit certain reports to the NRC. Records that are required by the regulations in this part must be retained for the period specified by the appropriate regulation. If a retention period is not otherwise specified, these records must be retained until the Commission terminates the facility's license, certificate, or other regulatory approval.

(b) All records may be stored and archived electronically, provided that the method used to create the electronic records meets the following criteria:

(1) Provides an accurate representation of the original records;

(2) Prevents the alteration of any archived information and/or data once it has been committed to storage; and

(3) Permits easy retrieval and re-creation of the original records.

(c) The licensees and other entities specified in § 26.4(a) and (d), as applicable, shall inform each individual of his or her right to review information about the individual that is collected and maintained under this part to assure its accuracy. Licensees and other entities shall provide the individual with an opportunity to correct any inaccurate or incomplete information that is documented by licensees and other entities about the individual.

(d) Licensees and other entities shall ensure that only correct and complete information about individuals is retained and shared with other licensees and entities. If, for any reason, the shared information used for determining an individual's eligibility for authorization under this part changes or new information is developed about the individual, licensees and other entities shall correct or augment the shared information contained in the records. If the changed or developed information has implications for adversely affecting an individual's eligibility for authorization, a licensee and other entity specified in § 26.4(a) and (d), as

applicable, who has discovered the incorrect information, or develops new information, shall inform the reviewing official of any FFD program under which the individual is maintaining authorization of the updated information on the day of discovery. The reviewing official shall evaluate the information and take appropriate actions, which may include denial or unfavorable termination of the individual's authorization.

§ 26.713 Recordkeeping requirements for licensees and other entities.

(a) Each licensee and other entity who is subject to this subpart shall retain the following records for at least 5 years after the licensee or other entity terminates or denies an individual's authorization or until the completion of all related legal proceedings, whichever is later:

(1) Records of self-disclosures, employment histories, and suitable inquiries that are required under §§ 26.55, 26.57, 26.59, and 26.69 that result in the granting of authorization;

(2) Records pertaining to the determination of a violation of the FFD policy and related management actions;

(3) Documentation of the granting and termination of authorization; and

(4) Records of any determinations of fitness conducted under § 26.189, including any recommendations for treatment and followup testing plans.

(b) Each licensee and other entity who is subject to this subpart shall retain the following records for at least 3 years or until the completion of all related legal proceedings, whichever is later:

(1) Records of FFD training and examinations conducted under § 26.29; and

(2) Records of audits, audit findings, and corrective actions taken under § 26.41.

(c) Licensees and other entities shall ensure the retention and availability of records pertaining to any 5-year denial of authorization under § 26.75(c), (d), or (e)(2) and any permanent denial of authorization under § 26.75(b) and (g) for at least 40 years or until, on application, the NRC determines that the records are no longer needed.

(d) Licensees and other entities shall retain any superseded versions of the written FFD policy and procedures required under §§ 26.27, 26.39, and 26.203(b) for at least 5 years or until completion of all legal proceedings related to an FFD violation that may have occurred under the policy and procedures, whichever is later.

(e) Licensees and other entities shall retain written agreements for the provision of services under this part for the life of the agreement or until completion of all legal proceedings related to an FFD policy violation that involved those services, whichever is later.

(f) Licensees and other entities shall retain records of the background investigations, credit and criminal history checks, and psychological assessments of FFD program personnel, conducted under § 26.31(b)(1)(i), for the length of the individual's employment by or contractual relationship with the licensee or other entity, or until the completion of all related legal proceedings, whichever is later.

(g) If a licensee's or other entity's FFD program includes tests for drugs in addition to those specified in this part, as permitted under § 26.31(d)(1), or uses more stringent cutoff levels than those specified in this part, as permitted under § 26.31(d)(3), the licensee or other entity shall retain documentation certifying the scientific and technical suitability of the assays and cutoff levels used, as required under § 26.31(d)(1)(i) and (d)(3)(iii)(C), respectively, for the time the FFD program follows these practices or until the completion of all related legal proceedings, whichever is later.

§ 26.715 Recordkeeping requirements for collection sites, licensee testing facilities, and laboratories certified by the Department of Health and Human Services.

(a) Collection sites providing services to licensees and other entities who are subject to this subpart, licensee testing facilities, and HHS-certified laboratories shall maintain and make available documentation of all aspects of the testing process for at least 2 years or until the completion of all legal proceedings related to a determination of an FFD violation, whichever is

later. This 2-year period may be extended on written notification by the NRC or by any licensee or other entity for whom services are being provided.

(b) Documentation that must be retained includes, but is not limited to, the following:

(1) Personnel files, including training records, for all individuals who have been authorized to have access to specimens, but are no longer under contract to or employed by the collection site, licensee testing facility, or HHS-certified laboratory;

(2) Chain-of-custody documents (other than forms recording specimens with negative test results and no FFD violations or anomalies, which may be destroyed after appropriate summary information has been recorded for program administration purposes);

(3) Quality assurance and quality control records;

(4) Superseded procedures;

(5) All test data (including calibration curves and any calculations used in determining test results);

(6) Test reports;

(7) Records pertaining to performance testing;

(8) Records pertaining to the investigation of testing errors or unsatisfactory performance discovered in quality control or blind performance testing, in the testing of actual specimens, or through the processing of appeals and MRO reviews, as well as any other errors or matters that could adversely reflect on the integrity of the testing process, investigation findings, and corrective actions taken, where applicable;

(9) Performance records on certification inspections;

(10) Records of preventative maintenance on licensee testing facility instruments;

(11) Records that summarize any test results that the MRO determined to be scientifically insufficient for further action;

(12) Either printed or electronic copies of computer-generated data;

(13) Records that document the dates, times of entry and exit, escorts, and purposes of

entry of authorized visitors, maintenance personnel, and service personnel who have accessed secured areas of licensee testing facilities and HHS-certified laboratories; and

(14) Records of the inspection, maintenance, and calibration of EBTs.

§ 26.717 Fitness-for-duty program performance data.

(a) Licensees and other entities shall collect and compile FFD program performance data for each FFD program that is subject to this subpart.

(b) The FFD program performance data must include the following information:

(1) The random testing rate;

(2) Drugs for which testing is conducted and cutoff levels, including results of tests using lower cutoff levels, tests for drugs not included in the HHS panel, and any special analyses of dilute specimens permitted under § 26.163(a)(2);

(3) Populations tested (i.e., individuals in applicant status, permanent licensee employees, C/Vs);

(4) Number of tests administered and results of those tests sorted by population tested (i.e., individuals in applicant status, permanent licensee employees, C/Vs);

(5) Conditions under which the tests were performed, as defined in § 26.31(c);

(6) Substances identified;

(7) Number of subversion attempts by type; and

(8) Summary of management actions.

(c) Licensees and other entities who have a licensee-approved FFD program shall analyze the data at least annually and take appropriate actions to correct any identified program weaknesses. Records of the data, analyses, and corrective actions taken must be retained for at least 3 years or until the completion of any related legal proceedings, whichever is later.

(d) Any licensee or other entity who terminates an individual's authorization or takes administrative action on the basis of the results of a positive initial drug test for marijuana or

cocaine shall also report these test results in the annual summary by processing stage (i.e., initial testing at the licensee testing facility, testing at the HHS-certified laboratory, and MRO determinations). The report must also include the number of terminations and administrative actions taken against individuals for the reporting period.

(e) Licensees and other entities shall submit the FFD program performance data (for January through December) to the NRC annually, before March 1 of the following year.

(f) Licensees and other entities may submit the FFD program performance data in a consolidated report, as long as the report presents the data separately for each site.

(g) Each C/V who maintains a licensee-approved drug and alcohol testing program is subject to the reporting requirements of this section and shall submit the required information either directly to the NRC or through the licensee(s) or other entities to whom the C/V provided services during the year. Licensees, other entities, and C/Vs shall share information to ensure that the information is reported completely and is not duplicated in reports submitted to the NRC.

§ 26.719 Reporting requirements.

(a) *Required reports*. Each licensee and entity who is subject to this subpart shall inform the NRC of significant violations of the FFD policy, significant FFD program failures, and errors in drug and alcohol testing. These events must be reported under this section, rather than under the provisions of 10 CFR 73.71.

(b) *Significant FFD policy violations or programmatic failures*. The following significant FFD policy violations and programmatic failures must be reported to the NRC Operations Center by telephone within 24 hours after the licensee or other entity discovers the violation:

(1) The use, sale, distribution, possession, or presence of illegal drugs, or the consumption or presence of alcohol within a protected area;

(2) Any acts by any person licensed under 10 CFR parts 52 and/or 55 to operate a

power reactor, as well as any acts by SSNM transporters, FFD program personnel, or any supervisory personnel who are authorized under this part, if such acts—

(i) Involve the use, sale, or possession of a controlled substance;

(ii) Result in a determination that the individual has violated the licensee's or other entity's FFD policy (including subversion as defined in § 26.5); or

(iii) Involve the consumption of alcohol within a protected area or while performing the duties that require the individual to be subject to the FFD program;

(3) Any intentional act that casts doubt on the integrity of the FFD program; and

(4) Any programmatic failure, degradation, or discovered vulnerability of the FFD program that may permit undetected drug or alcohol use or abuse by individuals within a protected area, or by individuals who are assigned to perform duties that require them to be subject to the FFD program.

(c) *Drug and alcohol testing errors*. (1) Within 30 days of completing an investigation of any testing errors or unsatisfactory performance discovered in performance testing at either a licensee testing facility or an HHS-certified laboratory, in the testing of quality control or actual specimens, or through the processing of reviews under § 26.39 and MRO reviews under § 26.185, as well as any other errors or matters that could adversely reflect on the integrity of the random selection or testing process, the licensee or other entity shall submit to the NRC a report of the incident and corrective actions taken or planned. If the error involves an HHS-certified laboratory, the NRC shall ensure that HHS is notified of the finding.

(2) If a false positive error occurs on a blind performance test sample submitted to an HHS-certified laboratory, the licensee or other entity shall notify the NRC within 24 hours after discovery of the error.

(3) If a false negative error occurs on a quality assurance check of validity screening tests, as required in § 26.137(b), the licensee or other entity shall notify the NRC within 24 hours after discovery of the error.

(d) *Indicators of programmatic weaknesses*. Licensees and other entities shall document, trend, and correct non-reportable indicators of FFD programmatic weaknesses under the licensee's or other entity's corrective action program, but may not track or trend drug and alcohol test results in a manner that would permit the identification of any individuals.

Subpart O—Inspections, Violations, and Penalties

§ 26.821 Inspections.

(a) Each licensee and other entity who is subject to this part shall permit duly authorized NRC representatives to inspect, copy, or take away copies of its records and to inspect its premises, activities, and personnel as may be necessary to accomplish the purposes of this part.

(b) Written agreements between licensees or other entities and their C/Vs must clearly show that—

(1) The licensee or other entity is responsible to the NRC for maintaining an effective FFD program under this part; and

(2) Duly authorized NRC representatives may inspect, copy, or take away copies of any licensee's, other entity's, or C/V's documents, records, and reports related to implementation of the licensee's or other entity's FFD program under the scope of the contracted activities.

§ 26.823 Violations.

(a) An injunction or other court order may be obtained to prohibit a violation of any provision of —

(1) The Atomic Energy Act of 1954, as amended;

(2) Title II of the Energy Reorganization Act of 1974; or

(3) Any regulation or order issued under these Acts.

(b) A court order may be obtained for the payment of a civil penalty imposed under

section 234 of the Atomic Energy Act of 1954, for violations of —

(1) Section 53, 57, 62, 63, 81, 82, 101, 103, 104, 107, or 109 of the Act;

(2) Section 206 of the Energy Reorganization Act of 1974;

(3) Any rule, regulation, or order issued under these sections;

(4) Any term, condition, or limitation of any license issued under these sections; or

(5) Any provisions for which a license may be revoked under section 186 of the Atomic Energy Act of 1954.

§ 26.825 Criminal penalties.

(a) Section 223 of the Atomic Energy Act of 1954, as amended, provides for criminal sanctions for willful violation of, attempted violation of, or conspiracy to violate, any regulation issued under sections 161b, 161i, or 161o of the Act. For the purposes of section 223, all of the regulations in part 26 are issued under one or more of sections 161b, 161i, or 161o, except for the sections listed in paragraph (b) of this section.

(b) The regulations in part 26 that are not issued under sections 161b, 161i, or 161o for the purposes of section 223 are as follows: §§ 26.1, 26.3, 26.5, 26.7, 26.8, 26.9, 26.11, 26.51, 26.81, 26.121, 26.151, 26.181, 26.201, 26.823, and 26.825.

Appendix A Subpart D 4.1	26.153 (d)

Regulatory Analysis of the Final Rulemaking to Amend the Fitness-for-Duty Rule (10 CFR Part 26)

U.S. Nuclear Regulatory Commission
Office of Nuclear Reactor Regulation
Office of Nuclear Security and Incident Response

ABSTRACT

The purpose of this document is to present the U.S. Nuclear Regulatory Commission's regulatory analysis of the final revisions to the Fitness-for-Duty (FFD) rule as set forth in Title 10, Part 26, of the Code of Federal Regulations (10 CFR Part 26). It analyzes the final rule's benefits and costs, and it presents a backfit analysis as required by 10 CFR 50.109, 10 CFR 70.76, and 10 CFR 76.76. The analysis is conducted in accordance with the Regulatory Analysis Guidelines of the U.S. Nuclear Regulatory Commission, NUREG/BR-0058, Revision 4.

EXECUTIVE SUMMARY

The U.S. Nuclear Regulatory Commission (NRC) is amending the former Fitness-for-Duty (FFD) regulations contained in Title 10, Part 26, of the *Code of Federal Regulations* (10 CFR Part 26). The NRC is amending these regulations to update them and to improve their effectiveness, efficiency, and clarity. With respect to licensee drug and alcohol testing programs, the amendments enhance consistency with the Department of Health and Human Services (HHS) Mandatory Guidelines for Federal Workplace Drug Testing Programs (HHS Guidelines) and other Federal drug and alcohol testing programs (e.g., Department of Transportation [DOT] programs) that impose similar requirements. Another goal of the amendments is to further consistency with the NRC's access authorization requirements for nuclear power plants. A third area the rule addresses is fatigue management. While licensees already maintain a variety of work hour controls, the final rule standardizes and strengthens licensee programs in this area. The final rule's drug and alcohol testing and authorization provisions apply to licensees authorized to operate a nuclear power reactor; licensees authorized to possess, use, or transport formula quantities of strategic special nuclear material (SSNM); corporations that obtain certificates of compliance or approved compliance plans involving formula quantities of SSNM; combined operating license holders; mixed oxide fuel fabrication facilities; and construction permit holders with a plant under active construction. The fatigue management provisions apply to nuclear power reactors. The final rule also applies to contractor/vendors (C/Vs) who implement FFD programs or program elements, to the extent that licensees and other entities rely upon those C/V FFD programs or program elements to meet the requirements of Part 26.

The main analysis presented in this document examines the benefits and costs of the final FFD requirements relative to the baseline of the former FFD requirements, including regulations (including enforcement discretion), and relevant orders. The key findings of the analysis are as follows:

- Total Cost to Industry: The final rule results in a one-time cost to the nuclear industry of approximately $13.7 million, followed by annual costs on the order of $31.7 million. The total present value of these costs is estimated at $444.0 million (using a 7-percent discount rate) and $694.3 million (using a 3-percent discount rate) over the next 49 years.

- Average Cost per Program. The average FFD program, which may include multiple plants and units, incurs a one-time cost of approximately $482,000, followed by annual costs of approximately $1,174,500. The total present value of these costs is estimated at $13,768,000 (using a 7-percent discount rate) and $22,034,000 (using a 3-percent discount rate).

- Relative Costs of Fatigue Management Provisions. The substantial costs of the fatigue management provisions in Subpart I dominate the cost results of the final rule as a whole. For the industry these fatigue management costs are estimated at between $572.9 million (present value using a 7-percent discount rate) and $898.1 million (assuming a 3-percent discount rate). When the other (non-fatigue) provisions are evaluated independently, the results show a savings to industry estimated at

approximately $128.8 million (present value using a 7-percent discount rate) or $203.8 million (assuming a 3-percent discount rate).

- Value of Benefits Not Reflected Above. With the exception of most of the direct monetary savings to industry, the cost figures shown above *do not* reflect the value of the benefits of the final rule. These benefits are evaluated qualitatively in Section 4.1.2 (for drug and alcohol testing and authorization provisions) and in Section 4.1.3 (for fatigue management provisions).[1] This regulatory analysis concluded the costs of the rule are fully justified in view of the qualitative benefits.

- Costs to NRC. The rule results in a one-time cost to NRC of approximately $28,000, followed by annual costs of approximately $47,000. The total present value of these costs is estimated at $665,000 (using a 7-percent discount rate) and $1,025,000 (using a 3-percent discount rate).

- Decision Rationale. Although the NRC did not quantify the benefits of this rule, except as noted above, the staff did qualitatively examine benefits and concluded that the rule provides safety and security-related benefits. The rule accomplishes this by improving the management of worker fatigue at nuclear reactor facilities and by increasing the effectiveness of drug and alcohol testing. It updates and enhances the consistency of 10 CFR Part 26 with advances in other relevant federal rules and guidelines, including the U.S. Department of Health and Human Services Mandatory Guidelines for Federal Workplace Drug Testing Programs (HHS Guidelines) and other Federal drug and alcohol testing programs (e.g., those required by the U.S. Department of Transportation [DOT]) that impose similar requirements on the private sector. The rule also enhances regulatory efficiency and effectiveness by improving clarity and, thereby, reducing the need for enforcement discretion, interpretations of rule language and/or exemption requests, and by enhancing consistency between the Part 26 rule and access authorization programs. The NRC also believes that the final rule provides additional assurance to members of the public that their health and safety is protected due to the FFD of personnel at nuclear facilities.

Pre-Order Baseline Sensitivity Analysis. The regulatory analysis contains a sensitivity analysis that is not required by NRC's Regulatory Analysis Guidelines and has not been used for decision-making purposes. It reflects the fact, which has been voiced by stakeholders, that many requirements in the area of fitness-for-duty and access authorization have been imposed or modified as a result of the NRC's "Issuance of Order for Compensatory Measures Related to Access Authorization" (also known as the Access Authorization Order, or AAO), dated January 7, 2003, and "Issuance of Order for Compensatory Measures Related to Fitness-for-Duty Enhancements Applicable to Nuclear Facility Security Force Personnel" (also known as Order EA-03-038), dated April 29, 2003. Therefore, this sensitivity analysis examines the rule relative to a "Pre-Order Baseline."[2] Under this pre-order baseline, the final rule results in a one-time cost to industry of approximately $19.8 million, followed by annual costs on the order of $4.9 million. The total present value of these costs is estimated at $85.1 million (using a 7-

---

[1] See Section 3.2 of this document for a discussion of the issues that would be involved in quantifying the benefits of the final rule.

[2] This sensitivity analysis considers only the FFD portions of the requirements in the Access Authorization Order (AAO). Industry savings resulting from these portions of the AAO do not represent the financial impact on the industry of the AAO as a whole.

percent discount rate) and $124.8 million (using a 3-percent discount rate) over the next 49 years. For the average licensee's FFD program, which may include multiple plants and units, this equates to a one-time cost of approximately $618,500, followed by annual costs of approximately $154,600. The total present value of these costs is estimated at $2,581,000 (using a 7-percent discount rate) and $3,582,000 (using a 3-percent discount rate).

1. INTRODUCTION

This document presents a regulatory analysis of the revisions to the Fitness-for-Duty (FFD) rule as set forth by the U.S. Nuclear Regulatory Commission (NRC) in Title 10, Part 26, of the Code of Federal Regulations (10 CFR Part 26). This introduction is divided into three sections. Section 1.1 states the problem and the reasons for the rulemaking, Section 1.2 provides background information on the Part 26 rulemaking, and Section 1.3 discusses backfit considerations related to adoption of the revisions to the Part 26 rule.

1.1 Statement of the Problem and Reasons for the Rulemaking

This rulemaking ensures that 10 CFR Part 26 continues to effectively address the related concerns of reliability and trustworthiness of workers at nuclear facilities as demonstrated by the avoidance of substance abuse. Evidence has shown that the use of alcohol or drugs can impair a worker's motor skills and judgment sufficiently that it increases the likelihood of accidents arising from neglect or human error (see Section 4.1.2.1). Licensee or contractor/vendor (C/V) employees who knowingly use illegal drugs, or abuse legal drugs or alcohol, willingly violate the standards set by the licensee as well as society's laws and norms. The Part 26 FFD program requirements are designed to provide reasonable assurance that individuals are trustworthy and reliable in carrying out their duties as demonstrated by the avoidance of substance abuse.

When the NRC published the Part 26 rule in June 1989, the Commission directed the NRC staff to continue to analyze licensee programs, assess the effectiveness of the rule, and recommend appropriate improvements or changes (SRM dated March 22, 1989). The NRC reviewed information from several sources, including inspections, periodic reports by licensees on FFD program performance, reports of significant FFD events, industry-sponsored meetings and current literature, and initiatives by the Nuclear Management and Resources Council [NUMARC, now the Nuclear Energy Institute (NEI)] and the Substance Abuse and Mental Health Services Administration [SAMHSA, formerly the National Institute on Drug Abuse (NIDA)] and its Drug Testing Advisory Board.

On the basis of that extensive review, the NRC has concluded that the regulatory approach in 10 CFR Part 26 is fundamentally sound and provides a means for both detecting and deterring substance abuse at licensee facilities. However, lessons learned during implementation of the existing rule indicate that NRC should address a number of issues. These issues include:

- *Subversion*. Testing neither detects nor deters substance abuse if testing is easily subverted through the exploitation of vulnerabilities in the testing process.

- *Inefficiencies.* Some Part 26 requirements contribute little to the effectiveness of licensee's FFD programs relative to the resources (time and money) required to meet these requirements.

- *Regulatory efficiency.* NRC licensees are subject to regulation by State and Federal agencies other than the NRC. Additions or changes to the regulatory requirements for drug testing by other agencies, such as Health and Human Services (HHS) and the Department of Transportation (DOT), as well as new legislation since 1989 (e.g., the Americans with Disabilities Act) have created incompatibilities and redundancies with NRC's requirements.

- *Confusion regarding the original intent of the NRC.* Ambiguities in the language of the rule have created some confusion regarding the Commission's original intent in Part 26. Resolving these ambiguities saves NRC staff time, increase consistency in the interpretation of the regulation industry-wide, and thus reduce licensee time in interpreting the regulation.

- *Technical developments.* Recent improvements in drug and alcohol testing practices can increase the effectiveness of licensee's and C/V's FFD programs.

The NRC is issuing this final rule to address these issues through a comprehensive revision of 10 CFR Part 26.

The NRC's continuing analysis of appropriate improvements or changes to the Part 26 rule also has led the NRC to conclude that strengthened fatigue management provisions should be added to 10 CFR Part 26. Research and experience have shown that fatigue can substantially degrade an individual's ability to safely and competently perform a wide range of work-related duties. The degradation in an individual's cognitive functioning resulting from inadequate rest includes, but is not limited to, a reduced ability to sustain attention; maintain situational awareness and make timely and conservative decisions; and communicate and work effectively as a team member. Such degradations in performance, if exhibited by individuals performing risk-significant functions, can adversely affect the safety and security of a nuclear power plant, and can cause levels of worker impairment comparable to those prohibited by Part 26 for alcohol. Although the NRC has established guidelines limiting work hours for personnel performing safety-related functions at nuclear power reactors, conditions that contribute to worker fatigue continue to exist. These conditions include:

- *Extended work shifts*, including the use of 12-hour shifts during normal operations and/or the use of 6 or more consecutive 12-hour shifts during plant outages, have become increasingly common at U.S. nuclear power plants. During outages, some licensees have scheduled personnel for three or more weeks of consecutive 12-hour shifts without intervening days off.

- *Extensive use of overtime.* Extensive use of overtime creates a combined effect of long work hours with reduced break periods.

- *Work schedules affecting normal biological cycles*. Because the nuclear power industry is a round-the-clock operation requiring individuals to be awake and working at times when they would normally be asleep, workers are cyclically affected by a daily biological clock, which runs on about a 24-hour (circadian) cycle. A substantial amount of scientific literature on circadian variations in alertness has demonstrated the significant roles worker fatigue, sleep loss and circadian rhythms play in contributing to errors and accidents.

In addition, the NRC has determined that ambiguities in the existing regulatory framework for matters pertaining to working hours and fatigue should be removed and that the effectiveness of FFD programs should be strengthened by establishing clear and enforceable requirements concerning the management of fatigue of nuclear power plant personnel.

Goals

Specifically, the goals of the rulemaking are as follows:

1. Update and enhance the consistency of 10 CFR Part 26 with advances in other relevant federal rules and guidelines, including the U.S. Department of Health and Human Services Mandatory Guidelines for Federal Workplace Drug Testing Programs (HHS Guidelines) and other Federal drug and alcohol testing programs (e.g., those required by the U.S. Department of Transportation [DOT]) that impose similar requirements on the private sector.

2. Strengthen the effectiveness of FFD programs at nuclear power plants in ensuring against worker fatigue adversely affecting public health and safety and the common defense and security by establishing clear and enforceable requirements for the management worker fatigue.

3. Improve the effectiveness and efficiency of FFD programs.

4. Improve consistency between FFD requirements and access authorization requirements established in 10 CFR 73.56, as supplemented by orders to nuclear power plant licensees dated January 7, 2003.

5. Improve 10 CFR Part 26 by eliminating or modifying unnecessary requirements.

6. Improve clarity in the organization and language of the rule.

7. Protect the privacy rights and other rights (including due process) of individuals who are subject to 10 CFR Part 26.

1.2 Background

1.2.1 Drug and Alcohol Testing Provisions, and General Fitness-for-Duty Provisions

In a June 7, 1989, Federal Register (54 FR 24468), the Commission announced the adoption of a new rule, 10 CFR Part 26, Fitness for Duty Programs, that required each licensee authorized to operate or construct a nuclear power reactor to implement a FFD program for all personnel having unescorted access to the protected area of its plant. A subsequent final rule published in the Federal Register on June 3, 1993 (58 FR 31467), expanded the scope of Part 26 to include licensees authorized to handle formula quantities of Strategic Special Nuclear Materials (SSNM).

When the Part 26 rule was published in 1989, the Commission directed the NRC staff to continue to analyze licensee programs, assess the effectiveness of the rule, and recommend appropriate improvements or changes. The NRC staff reviewed information from several sources including inspections, periodic reports by licensees on FFD program performance, reports of significant FFD events, industry sponsored meetings and current literature, as well as initiatives by industry, the Substance Abuse and Mental Health Services Administration (SAMHSA, formerly the National Institute on Drug Abuse [NIDA]) and SAMHSA's Drug Testing Advisory Board, and recommended improvements and changes.

As a result, the NRC published proposed amendments to the Part 26 rule in the Federal Register on May 9, 1996 (61 FR 21105). The 90-day public comment period for the proposed rulemaking closed on August 7, 1996. The NRC staff reviewed and considered public comments on the proposed rule, and submitted a final rule to the Commission in a Commission paper (SECY-00-0159), dated July 26, 2000. The Commission affirmed the rule in a staff requirements memorandum (SRM) dated December 4, 2000. Subsequently, the affirmed rule was sent to the Office of Management and Budget (OMB) to obtain a clearance under the Paperwork Reduction Act. The request for comments on the clearance was published in the Federal Register on February 2, 2001 (66 FR 8812). OMB and NRC received public comments that objected to some aspects of the rule (responses to those comments are included in the Federal Register notice for the proposed rule). Consequently, in SECY-01-0134, dated July 23, 2001, the NRC staff recommended withdrawing the request for clearance and preparing a new proposed rule. By SRM, dated October 3, 2001, the Commission approved the staff's recommendation to prepare this new proposed rule, rather than incorporating the 1996 proposed amendments into a final rule.

1.2.2 Worker Fatigue Rulemaking

The NRC's "Policy on Factors Causing Fatigue of Operating Personnel at Nuclear Reactors" (NRC's Policy on Worker Fatigue) was first published in the Federal Register on February 18, 1982, (47 FR 7352), and later issued through Generic Letter (GL) 82-12, "Nuclear Power Plant Staff Working Hours," on June 15, 1982. In GL 82-12, the NRC requested that licensees revise the administrative section of their technical specifications to ensure that plant administrative procedures were consistent with the working hours guidelines. Those guidelines are:

(1) An individual should not be permitted to work more than 16 hours straight (excluding shift turnover time);

(2) An individual should not be permitted to work more than 16 hours in any 24-hour period, nor more than 24 hours in any 48-hour period, nor more than 72 hours in any seven day period (all excluding shift turnover time);

(3) A break of at least 8 hours should be allowed between work periods (including shift turnover time); and

(4) Except during extended shutdown periods, the use of overtime should be considered on an individual basis and not for the entire staff on a shift.

Further, the guidelines permit deviations from these limits in very unusual circumstances if authorized by the plant manager, his or her deputy, or higher levels of management. The NRC's Policy on Worker Fatigue was incorporated, directly or by reference, and with variations in wording and detail, into the technical specifications of all but three nuclear power plant sites. Those three sites implemented the concept using other administrative controls.

When 10 CFR Part 26 was issued on June 7, 1989 (54 FR 24468), it focused on establishing requirements for preventing and detecting personnel impairment from drugs and alcohol. However, several requirements addressed other causes of impairment, including fatigue. Those requirements included general performance objectives (§§26.10(a) and (b)) that required licensees to provide "...reasonable assurance that nuclear power plant personnel...are not

under the influence of any substance, legal or illegal, or mentally or physically impaired from any cause..." and "...early detection of persons who are not fit to perform activities within the scope of this part..." A requirement was also included in §26.20(a) for licensee policies to "...address other factors that could affect fitness for duty such as mental stress, fatigue and illness."

In a letter dated February 25, 1999, Congressmen Dingell, Klink, and Markey expressed concerns to former NRC Chairman Shirley Ann Jackson that low staffing levels and excessive overtime may present a serious safety hazard at some commercial nuclear power plants. The Union of Concerned Scientists (UCS) expressed similar concerns on March 18, 1999, in a letter from David Lochbaum to Chairman Jackson, and in the UCS report "Overtime and Staffing Problems in the Commercial Nuclear Power Industry," dated March 1999. In a letter dated May 18, 1999, to the Congressmen, the Chairman stated that the NRC staff would assess the need to revise the policy.

Soon thereafter, the Commission received a petition for rulemaking (PRM-26-2), dated September 28, 1999, from Barry Quigley. The petition requested that the NRC amend 10 CFR Parts 26 and 55 to establish clear and enforceable work hour limits to mitigate the effects of fatigue for nuclear power plant personnel performing safety-related work. (A discussion of the petition, which is addressed by the proposed rulemaking, is included in the Federal Register notice for the proposed rule.)

The Union of Concerned Scientists petitioned the NRC on April 24, 2001, pursuant to 10 CFR 2.206, to issue a Demand for Information (DFI) to specified licensees. The petition asserted that Wackenhut Corporation has the contractual right to fire security guards who refuse to report for mandatory overtime, and that this contractual right conflicts with 10 CFR Part 26.10(a) and (b). The NRC denied the DFI (ADAMS Accession No. ML013230169), but, as described below, addressed the concern highlighted by the petition through the NRC's generic communication process.

On January 10, 2002, in SRM-SECY-01-0113, the Commission approved a rulemaking plan, "Fatigue of Workers at Nuclear Power Plants," dated June 22, 2001. The Commission decided to initiate a rulemaking to incorporate fatigue management into 10 CFR Part 26 in order to strengthen the effectiveness of FFD programs by establishing clear and enforceable requirements concerning the management of fatigue of nuclear power plant personnel that would reduce the potential for worker fatigue to adversely affect public health and safety and the common defense and security.

On May 10, 2002, the NRC issued NRC Regulatory Issue Summary (RIS) 2002-07: "Clarification of NRC Requirements Applicable to Worker Fatigue and Self-Declarations of Fitness-for-Duty." The RIS addressed the applicability of 10 CFR Part 26 to worker fatigue, the potential that a work environment conducive to reporting FFD concerns might be adversely affected if sanctions were to be imposed on workers raising FFD concerns, and the protections afforded workers who make self-declarations by 10 CFR 50.7, "Employee Protection."

During the development of proposed requirements, the NRC observed an increase in concerns (e.g, media and public stakeholder reports, allegations from security personnel) regarding the workload and fatigue of security personnel following the terrorist attacks of September 11, 2001. Following an NRC review of the control of work hours for security force personnel, the NRC issued Order EA-03-038 on April 29, 2003, requiring compensatory measures to reduce fatigue among security personnel at nuclear power plants, including work hour limits.

The compensatory measures imposed by Order EA-03-038 were similar to the guidelines of the NRC's Policy on Worker Fatigue. The compensatory measures differed from the policy guidelines in a few areas in which the NRC believed it was necessary to address previously identified deficiencies in the guidelines, including the need to address cumulative fatigue from prolonged use of extended work hours, matters unique to security personnel, and matters identified through stakeholder input obtained through public meetings concerning the proposed worker fatigue rulemaking and the order. The requirements in the order were imposed to provide the NRC with reasonable assurance that the public health and safety and common defense and security continue to be adequately protected. The NRC plans to withdraw Order EA-03-038 once the fatigue management provisions in Subpart I for security force personnel take effect. Differences between the requirements in Subpart I and the requirements imposed by order, and the rationale for those differences, are discussed in Section VI of the Federal Register notice for this final rule.

1.2.3 Proposed FFD Rulemaking Including Fatigue Requirements

On March 29, 2004, in COMSECY-04-0014, the NRC staff informed the Commission of the status of both rulemakings. The NRC staff also noted that because both rulemakings were being completed in parallel, the proposed fatigue rule draft language was based on the draft language in the overall revision of Part 26, rather than on the current language in Part 26. As a result, meaningful public comment could be confounded by the simultaneous promulgation of two draft rules which are somewhat interdependent and staff action to address a comment on one proposed rule could easily impact the other proposed rule, creating a high potential for the need to repropose one or both rules. In SRM-COMSECY-04-0014, dated May 25, 2004, the Commission directed the staff to combine the rulemaking related to nuclear power plant worker fatigue with the ongoing Part 26 rulemaking activity.

Following the publication of the August 25, 2005, proposed rule (70 Federal Register, 50442), the NRC accepted public comments for a 4-month period. The NRC also held several public meetings after the proposed rule was published to increase stakeholder involvement in the rulemaking. These meetings were held on September 21, 2005 (ADAMS Accession No. ML052420363), November 7 and 9, 2005 (ADAMS Accession No. ML052990048), December 15, 2005 (ADAMS Accession No. ML053400002), and March 29-30, 2006 (ADAMS Accession No. ML060650535). The fatigue provisions of the rule engendered the most comments. As a result, the fatigue provisions in the final rule contain the most revisions relative to the proposed rule.

In addition, the NRC reorganized the overall structure of the proposed rule and renumbered many of the subparts. The regulatory analysis discussion reflects the renumbered sections and new structure of the final rule.

1.3 Backfit Rule Considerations

Section 4.4 of this regulatory analysis presents the NRC's evaluation of changes in the final rule in accordance with the backfit provisions of 10 CFR §50.109, 10 CFR §70.76, and 10 CFR §76.76. Section 4.4.1 examines the aggregation of the final rule requirements that constitute backfits, and explains why many provisions have been appropriately excluded from the backfit analysis. Section 4.4.2 describes a screening analysis conducted in accordance with NRC's Regulatory Analysis Guidelines to ensure that the aggregate analysis does not mask the

inclusion of individual rule provisions that are (1) not cost-beneficial when considered individually and (2) not necessary to meet the goals of the rulemaking.

2. IDENTIFICATION AND PRELIMINARY ANALYSIS OF ALTERNATIVE APPROACHES

This section presents preliminary analysis of the alternatives that the staff considered to meet the regulatory goals identified in the previous section. (Section 4 presents a more detailed analysis of the final rule option.) The staff considered three alternatives for revising Part 26's substance abuse and authorization provisions, and five alternatives addressing fatigue management,[3] as discussed below.

2.1 Alternatives Considered for Part 26 Substance Abuse and Authorization Provisions

The staff considered the following three alternatives relative to the substance abuse and authorization provisons in Part 26:

(1) Take no action.

(2) Revise 10 CFR Part 26 (either in part or in whole).

(3) Address problems through means other than revising 10 CFR Part 26 (e.g., regulatory guides, generic communications, stakeholder meetings).

2.1.1 Option 1: Take No Action

One alternative to rule changes would be to take no action. The no-action alternative would allow current practices to continue, or require the NRC staff to continue to address certain outstanding FFD issues on a case-by-case basis. Taking no action would allow licensees continued flexibility in determining the course of action when they are not constrained by other agencies, legal requirements, or labor negotiations. This would also avoid certain cost increases that the final rule would impose. However, taking no action would disregard the staff and industry recommendations regarding areas for improvement (as described in Section 1.1) and would continue to impose avoidable costs on licensees. Moreover, taking no action at this time would not yield any positive impact on the effectiveness of the rule.

Advantages:

- Licensees would not have to bear the implementation costs of certain rule changes and the NRC would save on rulemaking costs.

- Licensees would have continued flexibility to determine courses of action, thereby avoiding more restrictive regulatory approaches.

[3] Until mid-year 2004, NRC had addressed the possibility of a fatigue management rulemaking separately from the previously-initiated rulemaking to revise the Part 26 substance abuse and authorization regulations.

Disadvantages:

- The identified concerns and lessons learned regarding the current Part 26 rule (described in Section 1.1) would not be resolved.
- Licensee and C/V FFD programs would not realize the potential savings from particular rule changes, including elimination or modification of unnecessary requirements.
- This alternative would not yield permanent solutions to a variety of problems.
- Licensees would have a less comprehensive set of requirements.
- NRC staff and licensees would still be compelled to interpret ambiguous rule language and these interpretations would vary by program. Also, the NRC staff would continue to face difficulties in maintaining consistency among licensees' inspection and enforcement programs.
- This alternative disregards licensees' preference, expressed at meetings with stakeholders, that program implementation details be included in the rule language.
- Depending on whether issues such as the protection of individual rights are addressed as rule requirements or as guidance, this alternative may provide less protection of individual rights.

By definition, the no-action alternative has no incremental benefits or costs, as it does not change the status quo. This option is inconsistent with NRC's goals for the rulemaking.

2.1.2 Option 2: Revise 10 CFR Part 26

This option provides the opportunity to resolve the identified issues and concerns regarding Part 26 (described in Section 1.1). This option includes two alternatives:

(1) Revise the regulation comprehensively to address the identified issues.

(2) Revise portions of the regulation to address only those issues that cannot be resolved through other means (e.g., a regulatory guide, stakeholder meetings).

2.1.2.1 Comprehensive Rule Revision

A comprehensive rulemaking would provide a means of addressing the identified issues and concerns with respect to Part 26. Through a comprehensive revision, the NRC staff could (1) ensure that all licensees would consistently implement measures to prevent subversion; (2) eliminate or modify unnecessary requirements; (3) address adjustments and changes to regulatory positions and requirements of other government agencies; (4) clarify the language of the rule; and (5) incorporate changes to take advantage of technical developments in drug and alcohol testing practices.

Advantages:

- The revised rule would address all requirements for licensee and C/V FFD programs.
- Regulatory change would enhance consistency across programs and provide opportunities for savings (e.g., allowing generic training to be accepted across licensees) that would not be available with more informal approaches.
- The revised rule would provide clear inspection guidance and, therefore, would result in a more efficient inspection process.

Disadvantages:

- Some rule revisions would impose costs on licensees.
- The revised rule would give licensees less flexibility in the implementation of their FFD programs (as a result of the rule's increased clarity).

The NRC has pursued this alternative and estimated the benefits and costs of this option as described in Section 4 of this regulatory analysis.

2.1.2.2 Partial Rule Revision with Other Agency and Licensee Actions

Some problems, such as varying interpretations of the regulation, could be addressed through other means, such as a regulatory guide, generic communications, or stakeholder meetings.

Advantages:

- This alternative would address some problems in some manner.
- This alternative would reduce changes to the regulation (compared to the more comprehensive revision discussed in Section 2.1.2.1) and may have a lower implementation cost to licensees.
- This alternative would allow more informal and potentially more flexible resolutions to some problems, which may be less costly.

Disadvantages:

- This alternative would not yield permanent solutions to a variety of problems.
- This alternative may involve preparation of more documents than comprehensive revision would and could be more time-consuming and costly to the NRC, and less efficient for licensees.
- Licensees would have a less comprehensive set of requirements.
- NRC staff and licensees would still be compelled to interpret ambiguous rule language and these interpretations would vary by program. Also, the NRC staff would continue to

face difficulties in maintaining consistency among licensees' inspection and enforcement programs.

- Because various rule changes are interrelated, it may be inappropriate to have some required in rule text and some suggested in guidance.

- This alternative disregards licensees' preference, expressed at meetings with stakeholders, that program implementation details be included in the rule language.

- Depending on whether issues such as the protection of individual rights are addressed as rule requirements or as guidance, this alternative may provide less protection of individual rights.

The NRC considered this alternative, but determined that the disadvantages are too significant relative to the comprehensive rule revision described in Section 2.1.2.1. Therefore, this regulatory analysis does not evaluate the quantitative benefits and costs of this alternative.

2.1.3 Option 3: Address Issues through Means Other than Revising Part 26

Under this alternative, the NRC staff would not revise 10 CFR Part 26 at all. This alternative differs from the no-action alternative discussed in Section 2.1.1 because this alternative would address FFD concerns through other means, such as new or revised regulatory guides, generic communications, stakeholder meetings, and other agency initiatives.

Advantages:

- This alternative would allow greater flexibility both for NRC staff and licensees.

Disadvantages:

- This alternative would not be able to address all of the identified issues (see Section 1.1), because many issues require direct regulatory changes.

- This alternative would not yield permanent solutions to a variety of issues.

- Preparing multiple documents to address issues could be more time-consuming and costly to the NRC, and less efficient for licensees.

- Inconsistency in program implementation, inspection, and enforcement would be more likely to persist. Some licensees currently have aggressive programs, while other licensee programs address only the licensees' interpretation of the requirements of the rule. Such discrepancies would be likely to continue in areas where changes are not included in the regulation.

- Licensees would not have a single comprehensive source of guidance.

- The process of developing guidance can be as burdensome as rulemaking for both NRC staff and licensees.

- This alternative disregards licensees' preference, expressed at meetings with stakeholders, that the rule language should include program implementation details.

- Depending on whether issues such as the protection of individual rights are addressed as rule requirements or as guidance, there may be less protection of individual rights.

The NRC considered this alternative, but determined that the disadvantages are too significant relative to the alternative described in Section 2.1.2.1. Therefore, this regulatory analysis does not evaluate the quantitative benefits and costs of this alternative.

2.2 Alternatives Considered for Fatigue Management

In PRM-26-2 (December 1, 1999; 64 FR 67202), a petitioner requested that the NRC establish clear and enforceable work hour limits to mitigate the effects of fatigue for nuclear power plant personnel performing safety-related work and presented a detailed proposal for managing fatigue through regulation.[4] The staff evaluated the merits of PRM-26-2 and the comments received in response to the PRM and assessed the policy statement. The staff concluded that the petitioner proposed a comprehensive set of requirements that could reasonably be expected to effectively address fatigue from individual and programmatic causes. However, the staff also began considering whether it would be possible to achieve the petitioner's objectives through alternative requirements that are more flexible, more directly focused on risk, and more aligned and integrated with current regulatory requirements.

The staff developed four potential alternatives, plus the no-action alternative, which were presented in the rulemaking plan attached to SECY-01-0113 (June 22, 2001).[5] These four alternatives are as follows:

(1) Implement the proposals in PRM-26-2.

(2) Amend Part 26 to establish thresholds for work hour controls. Provide flexibility and ensure focus on safety through a risk-informed deviation process. Amend Part 26 and RG 1.134, "Medical Evaluation of Licensed Personnel at Nuclear Power Plants," to ensure that fatigue from any cause is addressed through existing licensee programs.

(3) Amend Part 26 to establish thresholds for work hour controls and a defined process for controlling exceptions.

---

[4] More specifically, the petition requested that the NRC (1) add enforceable working hour limits to 10 CFR Part 26; (2) add a criterion to 10 CFR 55.33(a)(1) to require evaluation of known sleeping disorders; (3) revise the NRC Enforcement Policy to include examples of working hour violations that warrant various NRC sanctions; and (4) revise NRC Form 396 to include self-disclosure of sleeping disorders by licensed operators.

[5] NRC prepares a rulemaking plan to establish the goals of a rulemaking, help define potential regulatory alternatives (including whether regulatory action is necessary to resolve the problem), begin specifying the research efforts that should be undertaken, consider schedules and milestones, and undertake preliminary assessments of whether a rule will be cost-effective and feasible to implement.

(4) Amend Part 26 to establish requirements for assessing and managing the risks associated with schedules and conditions that cause fatigue and impaired alertness. Amend Part 26 and RG 1.134 to ensure that fatigue from any cause is addressed through licensee programs.

With respect to the proposal contained in PRM-26-2, the staff determined that implementing the proposals in the petition would (1) ensure that personnel are not impaired and are responsive to plant risk and the likelihood of personnel impairment; (2) establish clear expectations; and (3) increase public confidence.

The rulemaking plan also evaluated each of the other alternatives. The evaluation found that Option 2, in particular, would be equally effective as the petition proposals, while also affording the added benefits of increased scheduling flexibility, stronger focus on risk, and improved alignment and integration with existing programs, including the use of licensee corrective action programs to support a performance based approach. Based on this preliminary analysis, the rulemaking plan recommended Option 2 rather than the other alternatives, including the approach proposed in the petition.

In a Staff Requirements Memorandum (January 10, 2002), the Commission accepted the recommendation presented in SECY-01-0113 and directed the staff to develop a rule using Option 2 as described in the rulemaking plan.

3. EVALUATION OF BENEFITS AND COSTS

This section describes the analysis conducted to identify and evaluate the benefits (values) and costs (impacts) of the final rule. Section 3.1 identifies the attributes that the final rulemaking is expected to affect. Section 3.2 describes the methodology used to analyze the benefits and costs associated with changes to the affected attributes. The results of the analysis are presented in Section 4.

3.1 Identification of Affected Attributes

This section identifies the factors within the public and private sectors that the final rulemaking is expected to affect. These factors are classified as "attributes" using the list of potential attributes provided in Chapter 5 of the NRC's "Regulatory Analysis Technical Evaluation Handbook."[6] Affected attributes from the handbook include the following:

- *Industry Implementation.* The rulemaking requires licensees to modify written policies, procedures, and training materials. In addition, some licensees may be required to modify equipment used to conduct drug and alcohol testing. Some licensees also may be required to modify personnel practices to address fatigue management requirements.

- *Industry Operation.* The rulemaking requires licensees to change their existing practices with respect to authorization (e.g., self-disclosures, suitable inquiries, recordkeeping), behavioral observation and training, drug and alcohol collection and testing practices (e.g., cutoff levels for marijuana and opiates, validity testing, quality assurance procedures, testing of offsite FFD program personnel, reporting), and FFD determinations. Licensees also are required to change their existing practices with respect to work hours and related controls (e.g., days off between work periods, waivers from work hour limitations, and fatigue assessments).

- *Safeguards and Security Considerations.* The final rule clarifies and modifies certain authorization procedures, which should result in improved safeguards and security. The final rule also revises certain drug and alcohol testing provisions to increase assurance that individuals are trustworthy and reliable by enhancing provisions to detect attempts to subvert the testing process. The final rule, which includes security force personnel within the scope of workers covered by fatigue provisions, should result in improved safeguards and security.

- *Public Health (Accident).* The final rule reduces the risk that public health will be affected by accidents that are attributable to the undetected use of drugs or alcohol or to fatigue.

- *Occupational Health (Accident).* The final rule reduces the risk that occupational health will be affected by accidents that are attributable to the undetected use of drugs or alcohol or to fatigue.

---

[6] NUREG/BR-0184, "Regulatory Analysis Technical Evaluation Handbook: Final Report," U.S. Nuclear Regulatory Commission, Office of Nuclear Regulatory Research, January 1997.

- *Occupational Health (Routine).* The final rule reduces the risk that workers will be subject to unnecessary exposures either as the direct result of cognitive impairments attributable to the influence of drugs or alcohol or to fatigue, or as the result of conducting mitigative and/or cleanup activities following an event caused by cognitive impairment attributable to the influence of drugs or alcohol or to fatigue.

- *Off-Site Property*. The final rule reduces the risk that off-site property will be affected by accidents that are attributable to the undetected use of drugs or alcohol or to fatigue.

- *On-Site Property.* The final rule reduces the risk that on-site property will be affected by accidents that are attributable to the undetected use of drugs or alcohol or to fatigue.

- *Environmental Considerations.* The final rule reduces the risk that the environment will be affected by accidents that are attributable to the undetected use of drugs or alcohol or to fatigue.

- *Regulatory Efficiency.* The final rule reduces uncertainties in the former rule, Orders, and guidance, including guidance on fatigue management, improve consistency of practices among licensee and C/V FFD programs, and improve consistency between the NRC's FFD requirements and guidance and those of other Federal agencies (e.g., HHS, DOT).

- *NRC Implementation.* The rulemaking likely causes NRC to incur one-time costs to train NRC staff reviewers and inspectors on the rule revisions.[7]

- *NRC Operation.* Modified program reporting requirements related to program performance data and reportable FFD events have an impact on NRC staff operations, as does the need to train NRC staff and inspectors on the final rule changes.

- *Other Considerations.* The final rule may improve *public perceptions* regarding the safe operation of nuclear facilities, and may increase *workplace productivity and efficiency* of affected workforces.

The rulemaking is *not* expected to affect the following attributes:

- Public Health (Routine);
- Other Government;
- General Public;
- Improvements in Knowledge; and
- Antitrust Considerations.

3.2 Analytical Methodology

This section describes the methodology used to analyze the benefits and costs associated with the final rule. The benefits of the rule include any desirable changes in affected attributes (e.g.,

[7] Consistent with direction in Section 5.7.9 of the NRC's "Regulatory Analysis Technical Evaluation Handbook", this analysis does not include the predecisional costs of analyzing and promulgating the revised requirements.

improved safety, monetary savings) while the costs include any undesirable changes in affected attributes (e.g., monetary costs).

The analysis evaluates several attributes on a quantitative basis. (These include industry implementation, industry operation, NRC implementation, and NRC operation.) Quantitative analysis requires a baseline characterization of factors such as the number and size of individual FFD programs, the remaining operating life of licensee facilities, hours worked by staff during normal operations and during outages, the use of onsite versus offsite collection and testing facilities, the number of authorization actions conducted annually, the number of drug and alcohol tests conducted annually by type, the number of positive tests, cost information, and a range of other current licensee practices relating to specific program elements. Sections 3.2.1–3.2.4 describe the most significant analytical data, variables, and assumptions used in the quantitative analysis of these attributes.

This analysis relies on a primarily qualitative (rather than quantitative) evaluation of several other affected attributes (safeguards and security considerations, public health, occupational health, offsite property, onsite property, environment considerations, public perception, and workplace productivity/efficiency) due to the difficulty in quantifying the impact of the current rulemaking.[8] These attributes are affected by the regulatory option through the associated reduction in the risks of accidents within the protected area due to worker fatigue or the undetected use of drugs or alcohol, or due to potential inconsistencies between the FFD and the authorization functions. These risks range in severity from workplace safety incidents up to damage to the reactor core. Quantification of any of these attributes would require estimation of factors such as the types, frequencies, and results of damage that now occur (i.e., pre-rule) and would occur post-rule.

Additional details regarding the calculations used in the analysis are presented in two appendices. Appendix 1 provides the specific cost equations used to quantify costs and savings, along with any necessary assumptions not presented elsewhere. Appendix 1 contains 15 sections, one for each of the 15 subparts, A-O, of the revision to 10 CFR Part 26. Appendices 2-3 present data and input calculations referenced in Appendix 1, including data on unit costs, hourly wage rates, FFD programs, costs of eliminating work hour deviations, and other information.

3.2.1 Baselines for Analysis

This regulatory analysis measures the incremental impacts of the final rule relative to a baseline, which reflects anticipated behavior in the event that the final regulation is not imposed. The baseline used in this analysis assumes full licensee compliance with existing NRC requirements, including current regulations and relevant orders.[9] (The current regulations, as

[8] The regulatory efficiency attribute also is evaluated qualitatively, by definition, in accordance with NRC guidelines. See Section 5.5.14 of the NRC's "Regulatory Analysis Technical Evaluation Handbook."

[9] The Commission issued orders to nuclear power plant licensees for Compensatory Measures Related to Access Authorization on January 7, 2003. The Commission issued Order EA-03-038 requiring compensatory measures to reduce fatigue among security personnel at nuclear power plants, including work hour limits, on April 29, 2003.

included in the baseline, take into account the enforcement discretion issued in October 2002.[10]) This is consistent with NUREG/BR-0058, "Regulatory Analysis Guidelines of the U.S. Nuclear Regulatory Commission," Rev. 4, which states that, "...in evaluating a new requirement for existing plants, the staff should assume that all existing NRC and Agreement State requirements have been implemented." Section 4.1 presents the estimated incremental costs and savings associated with the final rule relative to this baseline. Unless otherwise noted, the estimated costs and savings presented in this document reflect this baseline and are referred to as the "main analysis."

The NRC staff also has prepared two sensitivity analyses as part of this regulatory analysis, in accordance with the agency's regulatory analysis guidelines. The primary sensitivity analysis, like the main analysis, estimates all incremental savings and costs of the final rule, but it assumes an alternative baseline consisting of only the regulations that were in effect before the NRC issued the Access Authorization Order (AAO) on January 7, 2003, and before it issued Order EA-03-038 on April 29, 2003. This analysis is referred to as the "pre-order baseline analysis," and its results appear in Section 4.2.

The purpose of the second sensitivity analysis is to account for the situation that some licensees have interpreted certain provisions of the existing Part 26 rule differently than has NRC. For these provisions, some licensees' practices have only recently changed to comply with the former rule. Therefore, this sensitivity analysis considers a third baseline that reflects industry practices in the recent past, that is, prior to both the AAO and the recent enforcement discretion, and in accordance with licensees' interpretations of existing regulations. For this "industry practices baseline," therefore, the cost of complying with the final rule will exceed the cost estimated using the pre-order baseline. Section 4.3 presents the results of this sensitivity analysis.

3.2.2 FFD Programs and Program Characteristics

This analysis considers 33 individual FFD programs, as follows:

- The analysis models 28 FFD programs that govern 65 facilities with a total of 103 operating power reactors. Each program administered by a nuclear power reactor operator licensee is known to govern a specific number of reactors, which may be located at one or more "facilities." Each facility may include several reactor units that are adjacent to one another. Information on the specific number of reactors and facilities operated by individual licensee FFD programs is taken from NUREG-1350, *NRC Information Digest, 2006-2007 Edition.* The analysis assumes that licensees will seek and obtain a 20-year operating license renewal for each operating reactor and to operate each reactor until the expiration of its renewed license. Thus, for each FFD program, the analysis estimates program-specific costs as a function of (1) the number of facilities operated by the program, (2) the number of reactors operated by the program, (3) the actual remaining operating lives of each reactor, and (4) whether the program uses

[10] The NRC published a revision to NUREG-1600, "General Statement of Policy and Procedure for NRC Enforcement Actions" in the *Federal Register* (67 FR 66311) on October 31, 2002 to include an interim enforcement policy regarding enforcement discretion for certain FFD issues.

onsite or offsite collection and onsite or offsite testing, as discussed below. However, the analysis assumes that all operating power reactors have the same average annual number of personnel covered by the various provisions of Part 26, regardless of operator, facility design or age, or other factors (e.g., periodic need to refuel).

- The analysis models two fuel-cycle facilities, including Nuclear Fuel Services (in Erwin, Tennessee) and BWX Technologies (in Lynchburg, Virginia). Information on these two programs was obtained from NRC documents.

- The analysis models two contractors/vendors (C/Vs) that operate their own FFD programs. The two C/Vs provided information on their own programs.

- The analysis models one additional program to account for a mixed-oxide fuel fabrication facility that would be built under a new license application submitted to the NRC by Duke, Cogema, Stone & Webster. Although this facility does not yet exist, it would be subject to the requirements of Part 26 once it becomes operational.[11] The model for this facility draws upon information available to the NRC.

In addition, the analysis considered the likelihood that the NRC will be receiving applications for new reactors. Programs associated with these facilities would be relevant to Subpart K of the final rule. These facilities are considered only with regard to Subpart K. For further detail, see Appendix 1.

For many provisions of the rule, this analysis estimates that licensee costs will vary, depending on whether a particular licensee operates its collection facilities onsite (using licensee personnel or a contractor), or whether the licensee sends personnel to offsite collection facilities at the time of testing. Where known, the model reflects actual practices (i.e., onsite or offsite collection) for each licensee. For most licensees, however, this information is not readily available, so the analysis calculates costs assuming that these licensees operate "hybrid" collection facilities which reflect a weighted average of 95 percent onsite collection and 5 percent offsite collection.

Similarly, costs may vary depending on whether a particular licensee operates its own drug testing laboratory ("onsite testing") in order to conduct initial tests, or whether the licensee sends all specimens for drug testing to an HHS-certified laboratory ("offsite testing"). Information regarding the specific licensees that operate onsite testing laboratories and those that use only offsite testing facilities was obtained from the nuclear industry and is believed to be current as of May 2003.

3.2.3 Incremental Requirements in the Final Rule

The NRC evaluated every provision contained in the final rule relative to the applicable baselines described in Section 3.2.1. Based on this analysis, the NRC developed equations to estimate costs and savings using available data, augmented by assumptions when necessary. Appendix 1 documents this analysis, including the rationale for why specific provisions do or do not result in incremental impacts and the specific equations used to quantify costs and savings.

[11] The analysis assumes the facility will begin operational testing in 2009. However, operations are expected to start in 2015.

3.2.4 Other Data and Assumptions

The analysis estimates benefits and costs of the final rule for 33 individual licensee and C/V FFD programs based on several program-specific variables, as discussed in Section 3.2.2. The analysis conservatively assumes that the rule will take effect in 2007. The timeframe for which costs are estimated differs by program based on the remaining operating lives of the relevant facilities. For the analysis as a whole, however, costs and savings are estimated over 49 years, with each year's costs or savings discounted back at a 7-percent and 3-percent discount rate, in accordance with NUREG/BR-0184, "Regulatory Analysis Technical Evaluation Handbook." (See Section 4.1 for these results.)

The analysis assumes that licensees and C/Vs incur all costs associated with FFD programs. To the extent that testing laboratories or collection facilities conduct any of the incremental activities required by the rule, the analysis assumes that the costs of those activities are passed on to the licensee. Therefore, the analysis assumes that neither testing laboratories nor collection facilities will incur incremental costs or savings as a result of the final rule.

Qualitative information concerning attributes affected by the rule (e.g., the nature and magnitude of environmental impacts) has been obtained from, or developed primarily in consultation with, staff from the NRC's Office of Nuclear Reactor Regulation (NRR), Office of Nuclear Security and Incident Response (NSIR), and Office of Nuclear Material Safety and Safeguards (NMSS). Other data for the analysis have been derived from information sources including the NRC, licensees (including FFD program managers), experts in drug testing analytical methods and practices, other Federal agencies (including HHS and DOT contacts and information sources), and NEI. For the analysis of the final rule's fatigue management provisions, the NRC used data submitted voluntarily by six nuclear power plants in 2004, as well as survey results for 47 plants submitted by NEI in August, 2000.

Finally, the analysis assumes the only impairments to be prevented or mitigated by the final rule are those relating to substance abuse and worker fatigue. Although other types of impairments may be prevented or mitigated as well (e.g., emotional distress), these other impairments are assumed to be infrequent and they cannot be quantified easily due to a lack of data.

4. RESULTS

This section presents the analytical results, which are organized into six separate sections:

- Section 4.1 presents findings on the overall benefits and costs of the final rule under the main analysis.
- Section 4.2 summarizes the results relative to the pre-order baseline.
- Section 4.3 discusses a sensitivity analysis addressing recent industry practices.
- Section 4.4 considers the findings relative to NRC's backfit rule.
- Section 4.5 addresses the applicability of a safety goal evaluation to the current rulemaking.
- Section 4.6 describes the information required for review by the Committee to Review Generic Requirements (CRGR).

4.1 Benefits and Costs — Main Analysis

This section summarizes the benefits (values) and costs (impacts) estimated for the final rule. Most of the final rule's implementation and operational costs and savings, both to industry and to the NRC, is analyzed quantitatively with the *net* impacts calculated and presented below. However, some benefits could be evaluated only on a qualitative basis (as noted in Section 3.2). Section 4.1.1 provides the detailed results of the quantitative analysis of industry implementation and operation costs and savings for each of the specific provisions in the final rule. Section 4.1.2 presents additional detail on the benefits analyzed qualitatively for the drug and alcohol testing and authorization portions of Part 26. Section 4.1.3, similarly, presents additional detail on the benefits of the fatigue management provisions. Finally, Section 4.1.4 considers the final rule provisions on a disaggregated basis.

Exhibit 4-1 summarizes the results of the benefit-cost analysis. Relative to the no-action alternative, the final rule results in an estimated net quantitative cost to the industry and the NRC of approximately $445 million (total present value), assuming a 7-percent discount rate, or approximately $695 million assuming a 3-percent discount rate. Exhibits 4-2 and 4-3 show how the total net cost to the industry breaks out under the 7-percent and 3-percent discount rate assumptions, respectively, for each subpart (A–O) of 10 CFR Part 26:

- Subpart A: Administrative Provisions
- Subpart B: Program Elements
- Subpart C: Granting and Maintaining Authorization
- Subpart D: Management Actions and Sanctions To Be Imposed
- Subpart E: Collecting Specimens for Testing
- Subpart F: Licensee Testing Facilities
- Subpart G: Laboratories Certified by the DHHS
- Subpart H: Determining FFD Policy Violations and Determining Fitness
- Subpart I: Managing Fatigue
- Subpart J: [Reserved]

- Subpart K: FFD Programs for Construction
- Subpart L: [Reserved]
- Subpart M: [Reserved]
- Subpart N: Recordkeeping and Reporting Requirements
- Subpart O: Inspections, Violations, Penalties

Exhibit 4-1
Summary of Benefits and Costs

Net Monetary Savings (+) or Costs (-) (Total Present Value)	Non-Monetary Benefits/Costs
Industry: ($444.0 million) using a 7% discount rate ($694.3 million) using a 3% discount rate **NRC:** ($665,000) using a 7% discount rate ($1.0 million) using a 3% discount rate	***Qualitative Benefits:*** *Safeguards and Security Considerations.* Improved FFD enhances safety and reduces security risks. *Public Health (Accident); Occupational Health (Accident); Occupational Health (Routine); Offsite Property; Onsite Property; Environmental Considerations.* Improved FFD reduces the risk that these attributes will be affected by accidents that are attributable to the undetected use of drugs or alcohol, to fatigue, to potential inconsistencies between the FFD and access authorization functions, or to ambiguities in the existing fatigue management guidelines and programs. *Regulatory Efficiency.* An improved Part 26 rule results in better, less costly compliance because it reduces misinterpretation. It also improves consistency across licensee programs and between the NRC's FFD and access authorization rules. In addition, it enhances the consistency of regulations and policies across Federal agencies (e.g., HHS, DOT). *Public Perception.* The final rule may improve the public's perception of NRC's protection of public health and safety and the common defense and security. *Workplace Productivity and Efficiency.* Improved FFD reduces absenteeism, improves productivity, lowers medical and insurance costs, and reduces plant downtime attributable to human-related errors caused by FFD problems. ***Qualitative Costs:*** *None.*

NRC incurs a net cost under the rule, due to various new reporting provisions and the need to develop implementation materials for NRC staff and inspectors. Most significantly, §26.719(b) will lead to increased processing and review costs associated with an expected increase in the number of reports filed by FFD programs regarding significant policy violations related to validity

testing. This cost is estimated at $49,500 annually. In addition, the one-time development of procedures and training for NRC staff reviewers and inspectors on the rule revisions will result in an initial cost of $28,200. The net effect of all annual costs and savings is an annual cost to the NRC of $47,000, and this contributes to a net present value cost of approximately $664,900, assuming a 7-percent discount rate or $1,025,000, assuming a 3-percent discount rate.

Exhibit 4-2
Industry Savings and Costs by Subpart (7% discount rate)

Sub-part	Average Per FFD Program			Total - All FFD Programs		
	One-Time Saving (Cost)	Annual Saving (Cost)	Net Present Value	One-Time Saving (Cost)	Annual Saving (Cost)	Net Present Value
A	-	$7,600	$103,400	-	$243,000	$3,320,000
B	($44,500)	$285,100	$3,803,500	($1,424,000)	$9,123,000	$122,454,000
C	-	($1,900)	($26,400)	-	($62,000)	($848,000)
D	-	-	-	-	-	-
E	($9,500)	$17,600	$230,400	($304,000)	$564,000	$7,401,000
F	($5,900)	($19,200)	($265,800)	($190,000)	($613,000)	($8,577,000)
G	-	($2,300)	($32,900)	-	($73,000)	($1,037,000)
H	-	$13,300	$181,200	-	$426,000	$5,821,000
I	($421,700)	($1,475,300)	($17,770,000)	($11,808,000)	($41,309,000)	($572,863,000)
J	-	-	-	-	-	-
K	-	-	-	-	-	-
L	-	-	-	-	-	-
M	-	-	-	-	-	-
N	-	$600	$8,700	-	$19,000	$273,000
O	-	-	-	-	-	-
Total	**($481,600)**	**($1,174,500)**	**($13,767,900)**	**($13,726,000)**	**($31,680,000)**	**($444,056,000)**

* Net present value is calculated using a discount rate of 7 percent.
** A licensee's FFD program may include more than one facility. The average annual savings (costs) presented are for the initial years of the analysis and change over time as programs decrease in size with the closure of specific plants. Consequently, the total net present values cannot be derived using only the one-time and annual values shown above.

Exhibit 4-2 is based on an assumed 7-percent discount rate, consistent with NUREG/BR-0184 as well as current OMB "best practices" for regulatory analyses.[12] These NRC and OMB guidelines also indicate that results should be presented using a 3-percent discount rate. Therefore, Exhibit 4-3 below presents the savings (costs) of the rule to the nuclear industry using a discount rate of 3 percent. As shown, industry costs under the 3-percent discount rate increase to approximately $694 million.

[12] Circular A-4, Office of Management and Budget, September 17, 2003.

4.1.1 Costs and Savings Attributable to Industry Implementation and Industry Operation

This analysis quantitatively evaluates the final rule's costs and savings associated with the industry implementation and industry operation attributes. The presentation is organized by subpart of the rule (A–O).

Exhibit 4-3
Industry Savings and Costs by Subpart (3% discount rate)

Subpart	Average Per FFD Program			Total - All FFD Programs		
	One-Time Saving (Cost)	Annual Saving (Cost)	Net Present Value	One-Time Saving (Cost)	Annual Saving (Cost)	Net Present Value
A	-	$7,600	$169,100	-	$243,000	$5,241,000
B	($44,500)	$285,100	$6,202,400	($1,424,000)	$9,123,000	$193,643,000

N	-	$600	$15,200	-	$19,000	$445,000
O	-	-	-	-	-	-
Total	**($481,600)**	**($1,174,500)**	**($22,034,100)**	**($13,726,000)**	**($31,680,000)**	**($694,324,000)**

* Net present value is calculated using a discount rate of 3 percent.
** A licensee's FFD program may include more than one facility. The average annual savings (costs) presented are for the initial years of the analysis and change over time as programs decrease in size with the closure of specific plants. Consequently, the total net present values cannot be derived using only the one-time and annual values shown above.

4.1.1.1 Savings and Costs of Subpart A Provisions

Subpart A sets forth requirements and standards for establishing and maintaining FFD programs, describes to whom (licensees and other entities) the regulation applies, identifies the individuals subject to the FFD program, defines terms used throughout Part 26, and addresses administrative matters. The only provision that results in an incremental change is §26.4(j), which addresses individuals subject to another acceptable FFD program. As shown in Exhibit 4-4A, annual savings are estimated to total $243,000 (an average of $7,600 per program).

Exhibit 4-4A
Industry Savings and Costs from Revisions to Subpart A:
Administrative Provisions

Section/ Activity	Average per Program		Total -All FFD Programs	
	One-Time Saving (Cost)	Annual Saving (Cost)	One-Time Saving (Cost)	Annual Saving (Cost)
26.4(j) Individuals Subject to Another Acceptable Program	-	$7,599	-	$243,179
Total	-	$7,599	-	$243,179

4.1.1.2 Savings and Costs of Subpart B Provisions

Subpart B requires that each licensee subject to Part 26 establish and implement a FFD program, and identifies FFD program performance objectives, training requirements, and drug and alcohol testing requirements. Although industry will incur a one-time cost of $1,424,000 (an average of $44,500 per program) in the first year following implementation of the rule, annual savings are estimated to total $9,123,000 thereafter (an average of $285,000 per program).

The most significant annual savings of this subpart result from provisions under §26.29(c)(2) that allow individuals to take a comprehensive annual examination (i.e., a “challenge exam”) in place of the annual refresher training course required under this paragraph. The shorter length of the challenge examination relative to the refresher course results in significant employee labor burden reductions, estimated at an annual industry-wide savings of $9,347,000 (or an average of $292,100 per program).

Exhibit 4-4B
Industry Savings and Costs from Revisions to Subpart B:
Program Elements

Section/ Activity	Average Per FFD Program		Total - All FFD Programs	
	One-Time Saving (Cost)	Annual Saving (Cost)	One-Time Saving (Cost)	Annual Saving (Cost)
26.27(a) Policy and Procedure Revisions - Overall Program	($30,451)	-	($974,444)	-
26.29(a) Revise and Implement Training, Including Behavioral Observation	($1,251)	-	($40,039)	-

Section/ Activity	Average Per FFD Program		Total - All FFD Programs	
	One-Time Saving (Cost)	Annual Saving (Cost)	One-Time Saving (Cost)	Annual Saving (Cost)
26.29(b) Comprehensive Examination	($12,793)	($3,127)	($409,362)	($100,049)
26.31(d)(3) Forensic Toxicologist Review of More Stringent Cutoff Levels	($10)	-	($314)	-
26.29(c)(2) Comprehensive Examination in Lieu of Refresher Training	-	$292,105	-	$9,347,351
26.31(b)(1)(i) Background Checks, Psychological Evaluations, Credit History, Criminal History	-	$653	-	$20,880
26.31(b)(2) DOT-Approved Specimen Collection Facilities	-	$140	-	$4,487
26.31(d)(2) Reasonable Effort to Track Randomly Selected Individuals for Testing	-	($3,494)	-	($111,817)
26.33 Behavioral Observation	-	($1,846)	-	($59,066)
26.37(d) Disclosure requirements positive test results	-	($429)	-	($13,725)
26.41(b) Audit Frequency	-	$493	-	$15,779
26.41(c)(2) Elimination of Audit Duplication of HHS-Certified Laboratories	-	$611	-	$19,566
Total	($44,505)	$285,106	($1,424,159)	$9,123,406

Some of these savings will be offset by the annual costs of other provisions including §26.31(d)(2), which specifies requirements for tracking individuals who are randomly selected for testing but are off-site when selected.

Although this subpart yields substantial savings on an annual basis, industry will incur a substantial cost in the first year following the rule's promulgation. The largest of these one-time costs will be incurred to undertake policy and procedure revisions under §26.27(a). The cost of this provision is estimated at $974,000 industry-wide (or an average of $30,500 per program).

4.1.1.3 Savings and Costs of Subpart C Provisions

Subpart C contains FFD requirements for granting and maintaining authorization for unescorted access to protected areas in nuclear facilities and for assignment to perform authorization activities. Industry-wide annual costs are estimated at $62,000 (or an average of $1,900 per program). To a substantial degree, this subpart adopts requirements, contained in NRC's Access Authorization Order (AAO), which have been implemented in advance of this final rule. (See Section 4.2 for estimates of the costs and savings using the alternative pre-AAO baseline.)

Costs under this subpart result from provisions in §§26.55(a)(4), 26.57(a)(4), 26.59(a)(4), and 26.59(c)(3), which require licensees to conduct random drug and alcohol tests on individuals who are seeking authorization for unescorted access. (Currently, only individuals who already have authorization are subject to random testing.)

Exhibit 4-4C
Industry Savings and Costs from Revisions to Subpart C:
Granting and Maintaining Authorization

Section/ Activity	Average Per FFD Program		Total - All FFD Programs	
	One-Time Saving (Cost)	Annual Saving (Cost)	One-Time Saving (Cost)	Annual Saving (Cost)
26.55(a)(4) Random Testing Pool for Initial Applicants	-	($527)	-	($16,856)
26.57(a)(4) Random Testing Pool for Update Applicants	-	($78)	-	($2,490)
26.59(a)(4) Random Testing Pool for Reinstatement Applicants with 31-365 Day Interruption	-	($568)	-	($18,176)
26.59(c)(3) Random Testing Pool for Reinstatement Applicants with Less than 31 Day Interruption	-	($768)	-	($24,590)
Total	-	($1,941)	-	($62,113)

4.1.1.4 Savings and Costs of Subpart D Provisions

Subpart D ("Management Actions and Sanctions to be Imposed") specifies sanctions to be imposed when an individual has violated the FFD policy. These requirements do not prohibit the licensee or C/V from taking more stringent action, except for certain limitations on terminating an individual's authorization based solely on a positive, adulterated, substituted, dilute or invalid initial test result. No incremental costs or savings have been estimated for this subpart.

4.1.1.5 Savings and Costs of Subpart E Provisions

Subpart E specifies the requirements for collecting specimens for drug and alcohol testing. This subpart defines the specimens to be collected, collector qualifications and responsibilities, collection sites, acceptable devices for conducting alcohol tests, and procedures for collecting drug and alcohol specimens. Following a one-time industry cost of approximately $304,000, or $9,500 for the average program, the industry is expected to realize an annual industry saving of $564,000 or $17,600 per average program.

Exhibit 4-4E
Industry Savings and Costs from Revisions to Subpart E:
Collecting Specimens for Testing

Section/ Activity	Average Per FFD Program		Total - All FFD Programs	
	One-Time Saving (Cost)	Annual Saving (Cost)	One-Time Saving (Cost)	Annual Saving (Cost)
26.83(a) Blood Collection for Confirmatory Alcohol Testing	-	$261	-	$8,365
26.85(a),(b) Urine and Alcohol Collector Training	($3,961)	-	($126,764)	-
26.89(b)(2) Urine Collection: Donors Without Adequate ID	-	$1,987	-	$63,596
26.89(b)(3) Urine Collection: Eliminate Listing Medications on the CCF Form and add description of testing process	-	$7,489	-	$239,654
26.91(b) Purchase of EBT and Calibration Equipment and Related Training	($5,526)	($82)	($176,846)	($2,625)
26.91(c) Required Use of an EBT on the NHTSA CPL for Confirmatory Testing	-	$9	-	$286
26.95(c) One Breath Specimen Collection for Initial Alcohol Test	-	$12,789	-	$409,253
26.99(b) Lowering Initial BAC Requiring Confirmatory Test to BAC 0.02	-	($116)	-	($3,725)
26.103 FFD Manager Determines Confirmed Positive Test for Alcohol (BAC 0.02 < 0.04)	-	($11)	-	($355)
26.105(b) Urine Collection: Inspecting Contents of Donor's Pockets	-	($12,357)	-	($395,429)
26.109(a) Urine Specimen Quantity: Minimum Quantity of 30 mL	-	$9,408	-	$301,065
26.109(b)(2) Urine Specimen: At Least 30 mL, but Less than Predetermined Quantity	-	($240)	-	($7,680)
26.119 Shy Bladder Medical Evaluation	-	($1,500)	-	($47,995)
Total	($9,488)	$17,638	($303,610)	$564,410

The one-time costs result from two provisions. §26.85(a),(b) requires urine and alcohol collector training ($127,000 industry, $4,000 per average program) and §26.91(b) requires the use of an evidential breath testing device meeting the specifications in §26.91(c) ($177,000 industry, $5,500 per average program).

Most of the annual savings from Subpart E provisions will result from §26.95(c), which reduces the number of breath specimens collected during initial alcohol tests from two to one ($409,000

industry, $12,800 per average program); §26.109(a), which reduces the minimum quantity of urine for a specimen collection from 60 mL to 30 mL, thereby decreasing the need for second collections due to fewer “shy bladder” instances ($301,000 industry, $9,400 per program); and §26.89(b)(3), which reduces specimen collection time by eliminating the requirement that donors must list all prescription medications on the custody-and-control form ($240,000 industry, $7,500 per average program). Some of the annual savings will be offset by other annual costs, most notably those from §26.105(b), which requires an inspection of the contents of each donor's pockets before each urine collection ($395,000 industry, $12,400 per program).

4.1.1.6 Savings and Costs of Subpart F Provisions

Subpart F specifies the requirements for licensee testing facilities. This subpart defines the testing facility capabilities, personnel, laboratory procedures, and drug (initial) and validity (screening and initial) testing. The annual industry cost is $613,000 (or approximately $19,200 for the average program). One-time costs, primarily from revisions to licensee testing facility policies and procedures, will result in industry costs of $190,000 (or approximately $5,900 per average program).

The majority of annual costs result from two rule provisions, §26.131(b) and §26.137(e)(6). §26.131(b) requires that licensee testing facilities conduct validity testing on urine specimens. The analysis assumes that all licensee testing facilities will only conduct validity screening tests on urine specimens and send any specimens with an adulterated, substituted, dilute, or invalid initial validity test result to HHS-certified laboratories for further testing. The annual industry cost is estimated at $489,000 or approximately $15,300 per average program. §26.137(e)(6) amends the current quality control provisions to include quality control specimens in each analytical run to licensee testing facilities. The annual industry cost is estimated at approximately $127,800 or $4,000 per average program.

Exhibit 4-4F
Industry Savings and Costs from Revisions to Subpart F:
Licensee Testing Facilities

Section/ Activity	Average Per FFD Program		Total - All FFD Programs	
	One-Time Saving (Cost)	Annual Saving (Cost)	One-Time Saving (Cost)	Annual Saving (Cost)
26.127 Licensee Testing Facility Policy and Procedure Revisions	($5,303)	-	($169,696)	-
26.131(b) Initial Validity Tests - Onsite Testing Facilities	($638)	($15,267)	($20,419)	($488,530)
26.133 Change Cutoff Levels for Marijuana and Opiates - Onsite Testing Facilities	-	($368)	-	($11,763)
26.137(e)(6) Quality Control Specimens in Each Analytical Run - Onsite Testing Facilities	-	($3,992)	-	($127,758)

	One-Time Saving (Cost)	Annual Saving (Cost)	One-Time Saving (Cost)	Annual Saving (Cost)
26.139(d) Licensee Testing Facility Reporting of Testing Data to FFD program (Monthly to Annually)	-	$459	-	$14,700
Total	($5,941)	($19,167)	($190,115)	($613,351)

4.1.1.7 Savings and Costs of Subpart G Provisions

Subpart G specifies the requirements for HHS-certified laboratories used by licensees and C/Vs to conduct drug and validity testing on urine specimens. This subpart defines HHS-certified laboratory capabilities, personnel, laboratory procedures, and drug (initial and confirmatory) and validity (screening, initial, and confirmatory) testing. The annual industry cost is $73,000, or approximately $2,300 for the average program.

The majority of the annual costs result from the requirement in §26.161(b)(1) for licensees and C/Vs to conduct validity testing on urine specimens ($407,000 industry or $12,700 per average program). Much of the annual costs are offset by annual savings that include §26.168(a)(2), which reduces the number of blind specimens required to be submitted for testing after the first quarter of a new contract with an HHS-certified laboratory ($338,000 industry, $10,600 per average program).

Exhibit 4-4G

26.169(k) HHS-Certified Laboratory Reporting of Testing Data to FFD program (Monthly to Annually)	-	$403	-	$12,906
Total	-	($2,274)	-	($72,753)

4.1.1.8 Savings and Costs of Subpart H Provisions

Subpart H contains requirements for determining whether a FFD policy violation has occurred and for making a determination of fitness. It establishes requirements for MROs, procedures for verification of FFD policy violations, and requirements for substance abuse experts (SAEs) and determinations of fitness. Industry-wide annual savings are estimated at $426,000 (or an average of $13,300 per program). No incremental one-time costs or savings are expected as a result of this subpart.

Requirements contained in §26.189(b)(3), in conjunction with §26.69(a)(2), is expected to result in annual savings estimated at $571,000 (or an average of $17,900 per program). These savings occur because licensees and C/Vs will not need to conduct determinations of fitness on individuals with potentially disqualifying FFD information, if the information has previously been evaluated by another licensee.

Offsetting some of these savings, §26.189(c) requires determinations of fitness that are conducted for-cause to be conducted through face-to-face interaction between management and the individual under review. The annual industry-wide costs of conducting these face-to-face determinations of fitness are estimated at $145,000 (or an average of $4,500 per program).

Exhibit 4-4H
Industry Savings and Costs from Revisions to Subpart H:
Determining FFD Policy Violations and Determining Fitness

Section/ Activity	Average Per FFD Program		Total - All FFD Programs	
	One-Time Saving (Cost)	Annual Saving (Cost)	One-Time Saving (Cost)	Annual Saving (Cost)
26.189(b)(3) Definition of "Potentially Disqualifying Information"	-	$17,858	-	$571,464
26.189(c) Face-to-Face Determinations of Fitness	-	($4,535)	-	($145,117)
Total	-	$13,323	-	$426,348

4.1.1.9 Savings and Costs of Subpart I Provisions

Subpart I contains the rule's provisions governing fatigue management. It applies only to Part 50 licensees, combined license holders under §52.103, and contractor/vendors to nuclear power plant licensees who rely upon contractor/vendor FFD programs or program elements. It does not apply to material licensees.

The annual industry cost is $41,309,000, or approximately $1,475,300 for the average program. One-time industry costs of Subpart I are estimated at $11,808,000, or $421,700 for the average program. The majority of the cost results from two requirements.

Subparagraphs 26.205(d)(4)-(6) establish several mandatory days off for individual workers. Licensees will likely incur some impact during refueling outages and other extended outages given the common industry practice of using "super-crews," which typically work six or seven 12-hour shifts per week during the outage. As implemented in the final rule, the days off in effect require licensees to bring on additional staff to provide the required time off to existing staff. This new staff likely will be temporary workers who must be hired, processed, and paid, thereby generating costs. With respect to the additional need for operators during these periods, the analysis assumes that licensees will maintain a pool of formerly-licensed, semi-retired operators who will be available to provide operations expertise during the outage for duties that do not require a license. The annual cost of this provision is estimated at $605,600 for the average program.

Paragraph 26.207, which places restrictions on the use of waivers as a means of bypassing worker hour limits when necessary, will cost the industry an estimated $588,100 per program annually. This is an average and there is expected to be a large variation between licensees in the cost of implementing this provision between licensees because some licensees currently authorize a much larger number of waivers than others. The analysis of this provision is described in Appendix 1 and Appendix 3.

Licensees also will incur costs related to revising and implementing their fatigue policies and procedures, developing systems to track work hours in the manner specified in the rule, paying a scheduler to plan work schedules, and training staff on the fatigue provisions.

Exhibit 4-4l
Industry Savings and Costs from Revisions to Subpart I:
Managing Fatigue

Section/ Activity	Average Per FFD Program		Total - All FFD Programs

4.1.1.10 Savings and Costs of Subpart J Provisions

In the final rule, Subpart J is reserved and therefore contains no regulatory language. As a result, this subpart does not result in any incremental costs or savings.

4.1.1.11 Savings and Costs of Subpart K Provisions

Subpart K ("FFD Programs for Construction") specifies the minimum FFD program elements applicable to: (1) combined license holders (under 10 CFR Part 52) before the Commission has made the finding under Section 52.103(g); (2) combined license applicants who have received the authorization to construct under Section 50.10(e)(3); (3) construction permit holders (under 10 CFR Part 50); and (4) construction permit applicants who have received the authorization to construct under Section 50.10(e)(3). This subpart should generate savings on balance. See Appendix 1 for more detail.

4.1.1.12 Savings and Costs of Subpart L Provisions

In the final rule, Subpart L is reserved and therefore contains no regulatory language. As a result, this subpart does not result in any incremental costs or savings.

4.1.1.13 Savings and Costs of Subpart M Provisions

In the final rule, Subpart M is reserved and therefore contains no regulatory language. As a result, this subpart does not result in any incremental costs or savings.

4.1.1.14 Savings and Costs of Subpart N Provisions

Subpart N describes recordkeeping and reporting requirements for licensees and C/Vs with approved FFD programs. Industry-wide annual savings are estimated at $19,400 (or an average of approximately $600 per average program). No significant one-time costs or savings are expected as a result of this subpart. Savings result from a decrease in the required reporting frequency for licensee performance data reporting and the elimination of duplicative reporting of C/V performance data. (Note that these savings do not reflect new costs resulting from the need to report fatigue management data within the performance data reports. These costs are calculated under Subpart I.) These savings are partly offset by higher costs associated with the increased number of "reportable events" that will result from the rule's new validity testing requirements and modified thresholds for positive test results.

Exhibit 4-4N
Industry Savings and Costs from Revisions to Subpart N:
Recordkeeping and Reporting Requirements

Section/ Activity	Average Per FFD Program		Total - All FFD Programs	
	One-Time Saving (Cost)	Annual Saving (Cost)	One-Time Saving (Cost)	Annual Saving (Cost)
26.713(g) Filing of Forensic Toxicologist's Evaluation	($0)	-	($4)	-
26.717(e), (f) FFD Programs: Performance Data Reporting and Review	-	$1,556	-	$49,802
26.717(g) Contractor/Vendor Submission of Performance Data to NRC	-	$28	-	$910
26.719(b) Reporting and Review of Reportable Events Due to New Validity Testing Requirements	-	($980)	-	($31,362)
Total	($0)	$605	($4)	$19,350

4.1.1.15 Savings and Costs of Subpart O Provisions

Subpart O ("Inspections, Violations, Penalties") contains provisions covering the inspection of licensee and C/V programs by NRC representatives, written agreements between licensees and C/Vs, violations, and criminal penalties resulting from violations. No incremental activities are included in this subpart and, therefore, no costs or savings are estimated.

4.1.2 Additional Benefits and Qualitative Cost Savings of Final Part 26 Revisions - Drug and Alcohol Testing and Authorization Provisions

The analysis evaluates nine affected attributes on a qualitative basis, as described in the following three sections. Section 4.1.2.1 collectively examines seven of these attributes (safeguards and security considerations; public health [accident]; occupational health [accident]; occupational health [routine]; offsite property; onsite property; environmental considerations). Section 4.1.2.2 considers regulatory efficiency. Finally, Sections 4.1.2.3 and 4.1.2.4 address the "other considerations" attribute, which in this case involves (1) public perception, and (2) workplace productivity and efficiency.

The regulatory options affect these nine attributes by reducing the risks of accidents and/or security events within the protected area due to the undetected use of drugs or alcohol, or due to potential inconsistencies between the FFD and the access authorization functions. These risks could lead to a variety of workplace safety incidents, including damage to the reactor core. Quantification of any of these attributes would require estimation of such factors as the types, frequencies, and results of damages that now occur (i.e., pre-rule) and would occur (i.e., post-rule) as a result of factors related to the former and final rule.

4.1.2.1 Safeguards and Security Considerations; Public Health (Accident); Occupational Health (Accident); Occupational Health (Routine); Offsite Property; Onsite Property; Environmental Considerations

The NRC estimates that this final rule results in benefits (i.e., safeguards and security considerations, public health, occupational health, occupational health, offsite property, onsite property, environmental considerations) by providing assurance that individuals who are subject to the rule are not under the influence of any legal or illegal substance or mentally or physically impaired from any cause that in any way adversely affects their ability to safely and competently perform their duties. Qualitative benefits primarily accrue from increased safety, which the rule achieves by ensuring that workers are fit for duty,[13] and from the increased effectiveness of the Part 26 rule in addressing performance objectives.

Drug and alcohol use and abuse can impair job performance. This impairment significantly threatens the safety of workers themselves, and may also endanger the health and safety of the public. Drug use or alcohol consumption on the job can adversely affect behavior and diminish both physical and cognitive abilities. The effects of withdrawal, hangover, and long-term chronic abuse resulting from off-duty drug and alcohol use also can affect job performance. Drug and alcohol abuse can have a significant impact on safety-related jobs. Drug use remains prevalent

[13] For discussions of safety-related FFD concerns, see NUREG/CR-5227 (Barnes et al., 1988), NUREG/CR-5227 Supplement 1 (Moore et al., 1989), NUREG/CR-5784 (Durbin et al., 1991), and NUREG/CR 6470 (Durbin & Grant, 1996).

in American society and is an ongoing occupational and safety concern in American industry.[14] More importantly, drug or alcohol abuse by nuclear industry personnel indicates a lack of reliability and trustworthiness and remains a legitimate safety concern for the NRC.[15]

The NRC's backfit analysis, prepared in 1989 in conjunction with promulgation of the Part 26 rule, concluded that drug abuse significantly increases the risk of accidents that are attributable to neglect or human error.[16] Although the NRC did not quantify the reduction in risk associated with the implementation of FFD programs, the 1989 backfit analysis stated that drug and alcohol testing (as part of a comprehensive FFD program) can significantly increase the assurance that employees will be fit for duty. The NRC concluded that FFD program implementation costs would be justified by increasing the assurance of public health and safety.

During 1990, the first calendar year of FFD program implementation, 0.87 percent of tests administered under 10 CFR Part 26 requirements were confirmed as positive for the presence of illegal drugs or the abuse of alcohol. In 1995, the confirmed positive test rate was 0.98 percent. In 2000, the confirmed positive test rate was 1.11 percent. In 2003, 0.86 percent of such tests were confirmed as positive for the presence of illegal drugs or the abuse of alcohol. In 2005, the confirmed positive test rate was 0.72 percent. Exhibit 4-5 shows the breakdown by test

Exhibit 4-5
FFD Test Results for CY 1990, 1995, 2000, 2003, and 2005

Test Category	Positive Test Rate by Year				
	1990 (274,599 tests)	1995 (150,121 tests)	2000 (125,713 tests)	2003 (127,785 tests)	2005 (135,702 tests)
Pre-employment/ Pre-access	1.26%	1.41%	1.41%	1.04%	0.82%
Random	0.37%	0.27%	0.39%	0.27%	0.29%
For-Cause/ Post Accident	29.23%	18.22%	15.63%	11.98%	9.13%
Follow-Up	2.47%	1.07%	1.71%	1.34%	0.76%
Other*	-	-	2.44%	3.08%	3.94%

[15] 54 FR 24470, "Fitness-For-Duty Programs; Final Rule and Statement of Policy," June 7, 1989.

[16] SECY-00-0159, July 26, 2000. Attachment F, Analysis of the Application of the Backfit Rule to the Revisions to the Fitness-for-Duty Rule.

Further, the total number of tests administered decreased between 1990 and 1995 because of changes to testing requirements (58 FR 31467), effective January 1994, which reduced the random testing rate from 100 percent to an annual rate equal to 50 percent of all persons covered by the FFD regulation.

The NRC believes that ensuring that workers are not impaired by drugs or alcohol will decrease the probability of human error and reduce the risk to plant personnel of radiological exposures and exposures to hazardous chemicals produced from licensed material. This reasoning is applicable to the current rulemaking in that changes to improve the effectiveness of the rule should further decrease the risk of accidental exposure attributable to human error caused by an FFD problem. Moreover, the addition of validity testing will increase the likelihood of detection. Although there may be a low probability of a significant accidental radiological release, or a release of hazardous chemicals produced from licensed material, due to drug abuse, such a release could have great consequences. Furthermore, any accident attributed to drug or alcohol use could undermine public perceptions of nuclear industry safety. The relatively low positive test rates reported in the exhibit suggest that drug abuse among nuclear facility personnel may not be as prevalent as in the national work force. Although the positive test rates may not reveal all drug and alcohol abuse and, therefore, may understate drug and alcohol abuse within the industry, the data do indicate a continuous detection of previously undetected drug use through the FFD program. The positive test results presented in this section indicate that there continues to be an occasional nuclear industry worker with a drug or alcohol abuse problem. Therefore, NRC believes efforts to improve the effectiveness of the former Part 26 requirements are warranted.

4.1.2.2 Regulatory Efficiency

An important benefit of this rulemaking is an increase in regulatory efficiency and effectiveness. Increased clarity in the intent of many requirements reduces NRC and licensee costs associated with interpreting this rule. When the specifics of a regulatory requirement are not clear, a licensee could enact programs that are more burdensome than the agency intended or could spend unproductive time trying to understand the requirements. Similarly, lack of clarity could result in licensees inadvertently not complying with the true intent of the regulatory action, which could lead to intervention by the NRC or even enforcement action and litigation. Thus, increasing the clarity of this rule may significantly reduce the costs associated with different interpretations of regulatory requirements. In addition, this rule increases regulatory efficiency and effectiveness by increasing consistency between this rule and access authorization requirements. Furthermore, it also enhances the consistency of regulations and policies across Federal agencies (e.g., HHS, DOT). The NRC believes that these agency and licensee savings could potentially be significant, although they are not easily quantified. The NRC has attempted to analyze many of the savings attributable to this rule, but these estimates do not include all of the savings that the agency anticipates as a result of this increase in regulatory efficiency. In addition, increasing the clarity of this rule (i.e., clarifying intent) may enhance its effectiveness and safety-related benefits.

4.1.2.3 Public Perception

By increasing the effectiveness and clarity of the requirements for FFD programs, this final rule enhances the public's confidence in the NRC's protection of public health and safety and the common defense and security. The changes give the public additional assurance that the NRC is addressing safety concerns raised by the use of drugs and alcohol, and by any other causes of

impairment or questionable reliability or trustworthiness, such as an increase in the probability of safety-significant accidents or other safeguards and security risks.

4.1.2.4 Workplace Productivity and Efficiency

Affected licensees may accrue benefits from the improved effectiveness of the rule, including enhanced workforce productivity, reduced absenteeism, lower medical and insurance costs, and less plant downtime. The effects of human-related errors caused by FFD problems can have direct and indirect effects on overall plant operating costs. For example, a 24-hour outage caused by an FFD-related error may result in a direct revenue loss of several hundred thousand to more than a million dollars. Furthermore, the long-term effects of FFD problems arising from increased absenteeism, lower productivity on the job, and increased use of medical benefits can also result in higher costs to the licensee.[17] These secondary benefits result in additional savings for FFD programs beyond those quantified for industry implementation and operations.

4.1.3 Additional Benefits and Qualitative Cost Savings of Final Part 26 Revisions - Fatigue Management Provisions

This analysis evaluates nine affected attributes, as described in the following five sections. Section 4.1.3.1 collectively examines six of these attributes: public health (accident); occupational health (accident); occupational health (routine); offsite property; onsite property; environmental considerations. Section 4.1.3.2 considers safeguards and security. Section 4.1.3.3 addresses regulatory efficiency. Finally, Sections 4.1.3.4 and 4.1.3.5 address the "other considerations" attribute, which in this case involves (1) public perception, and (2) workplace productivity and efficiency.

The regulatory options affect these attributes by reducing the risks of accidents, fires, property damage, and/or security events due to the effects of worker fatigue. By clarifying the provisions of the regulatory framework relating to fatigue management, the regulatory options indirectly affect these attributes by increasing the likelihood of identifying and addressing worker fatigue.

4.1.3.1 Public Health (Accident); Occupational Health (Accident); Occupational Health (Routine); Offsite Property; Onsite Property; Environmental Considerations

The NRC estimates that the fatigue management provisions of the final rule result in benefits (i.e., the attributes of public health, occupational health, offsite property, onsite property, environmental considerations) by providing assurance that individuals who are subject to the rule are not impaired from acute or cumulative fatigue that will adversely affect their ability to safely and competently perform their duties. The Federal Register notice accompanying the final rule presents a detailed discussion of NRC's considerations related to including fatigue management within the Part 26 rulemaking.

---

[17] See, for instance, Crouch, et al. (1989), "A Critical Evaluation of the Utah Power and Light Company's Substance Abuse Management Program: Absenteeism, Accidents and Costs," in: Gust & Walsh (Eds.), Drugs in the Workplace: Research and Evaluation Data, NIDA Research Monograph 91, U.S. Government Printing Office, Washington, DC, pp. 169-193.

In evaluating the anticipated benefits from the fatigue management provisions in Subpart I, the NRC reviewed and assessed the research available on the degradation of worker abilities that are important to safe plant operation. Many studies have shown that fatigue impairs human alertness and performance. Recent studies have shown that fatigue can cause performance degradations that are comparable to the levels observed from blood alcohol concentrations (BACs) in excess of those that would result in a positive breath alcohol test under the former provisions of 10 CFR Part 26. In those studies, individuals who were awake for 17 to 19 hours had cognitive psychomotor performance comparable to individuals with a BAC of 0.05 percent, which is greater than the former breath alcohol cutoff level of 0.04 percent established by 10 CFR Part 26.[18] The NRC considers the insight that fatigue can impair a worker at levels comparable to those prohibited for alcohol to be particularly significant.

The lack of adequate days off and extended workdays (overtime) can result in a cumulative sleep debt (i.e., the difference between the amount of sleep an individual needs and the amount of sleep that individual actually obtains) and degraded performance. Studies concerning extended work hours suggest that fatigue-induced personnel impairment can increase human error probabilities by a factor of more than 2 to 3 times. Studies of the nuclear power industry indicate that normal daily variations in alertness associated with human circadian rhythms (i.e., physiological processes that vary on an approximate 24-hour cycle) may be responsible for daily variations in the incidence of personnel errors at nuclear power plants. The findings of these studies are consistent with the results of a survey of more than 100 nuclear power plant shift supervisors — over 90 percent stated that they notice times of day or days in the schedule when control room operators are less alert, less vigilant, or make more mistakes.

Many of the cognitive tasks performed by nuclear power plant personnel that are important to the protection of public health and safety and the common defense and security rely on individual workers' abilities to sustain attention, analyze problems, make clear decisions and work as a team. Vigilance and attention to detail are fundamental for plant safety, whether an individual is operating or maintaining equipment important to plant safety, conducting surveillance in the plant, monitoring system status in the control room, or monitoring plant security systems or barriers. Tasks requiring sustained attention (e.g., vigilance tasks) are among the most susceptible to fatigue-induced degradation. Conservative decision-making also is a cornerstone of safe nuclear power plant operations. Fatigue has been associated with an increased frequency of low effort and more risky decisions and strategies. Fatigue has been found to contribute to poor problem-solving performance, characterized by an individual or group of individuals maintaining a faulty diagnosis or mitigation plan despite contrary information. Sleep-deprived workers fail to appropriately allocate attention, set task priorities, and sample for sources of potentially faulty information. Mental fatigue also contributes to decreased originality and flexibility in problem solving and sub-optimal planning. Fatigue affects skills important to written and oral communication and teamwork. Fatigue degrades speech articulation, verbal fluency, grammatical reasoning and memory. Fatigued individuals also tend to be less communicative and have greater difficulty performing multiple tasks concurrently. As a result, fatigue can not only degrade the fitness of an individual, but also the overall performance of a crew.

---

[18] Dawson, D. and Reid, K. (1997). "Fatigue, alcohol and performance impairment." Nature, 388:235; Williamson, A.M. and Feyer, A. (2000). "Moderate sleep deprivation produces impairments in cognitive and motor performance equivalent to legally prescribed levels of alcohol intoxication." Occupational and Environmental Medicine, 57, 649-655.

Conditions that contribute to worker fatigue, resulting from an individual remaining awake continuously for an excessive period of time, or from the individual obtaining an inadequate amount or quality of sleep, or both, are present in the U.S. nuclear power industry. These conditions include the following:

- Extended work shifts with five or more consecutive work days. The use of 12-hour shifts during normal operations has become increasingly common at U.S. nuclear power plants. Furthermore, the use of 6 or more consecutive 12-hour shifts is now standard practice during plant outages. During outages, some licensees have scheduled personnel for three or more weeks of consecutive 12-hour shifts without intervening days off.

- Extensive use of overtime. Recent studies indicated that at approximately one-fourth of the nuclear power plant sites studied, more than 20 percent of the personnel covered by current working hour limits work more than 600 hours of overtime annually. The NRC has found that some licensees authorized hundreds to several thousand deviations from the current limits of 16 hours of work in any 24-hour period, 24 hours of work in any 48-hour period, 72-hours of work in a 7 day period, and from the minimum break requirement of 8 hours between work periods. The NRC also noted the continued excessive use of such deviations in research used for this rulemaking (see Appendix 3). Extensive use of overtime creates a combined effect of long work hours with reduced break periods.

- Night work. Because the nuclear power industry is a round-the-clock operation requiring individuals to be awake and working, at times when they would normally be asleep, workers are cyclically affected by the daily biological clock, which runs on about a 24-hour (circadian) cycle. A substantial amount of scientific literature on circadian variations in alertness demonstrates the significant roles that worker fatigue, sleep loss, and circadian rhythms play in contributing to errors and accidents. Instances of operators falling asleep in the control rooms at the Pilgrim nuclear power station (2004) and the test and research reactor at the Massachusetts Institute of Technology (2003), and a nuclear power plant security guard falling asleep while driving a patrol vehicle (2004), despite these individuals recognizing the potential safety and disciplinary consequences, underscore the powerful drive for sleep associated with circadian factors and the fact that shiftwork is a daily influence on the alertness of all shiftworkers at nuclear power plants.

- Site-specific factors. Extended commutes, which are common for some nuclear power plants, contribute to the potential for fatigue associated with early start times.

- Workforce characteristics. In the general U.S. population, sleep disorders, such as sleep apnea, are not uncommon. The incidence of sleep apnea may in fact be higher for shiftworkers at power plants, as this condition is more common in middle-age adult males, who constitute a significant proportion of the power plant workforce, than in the general population.

Considering the above factors, the NRC believes that fatigue can have a significant adverse effect on worker abilities, and that the impairment can result in safety significant deteriorations in worker performance. Further, the likelihood of a nuclear power plant worker being impaired from fatigue is likely far greater than the likelihood of impairment from drugs and alcohol, which the NRC currently requires licensees to address through their FFD programs.

Many provisions of Subpart I are expected to lead to benefits that, while difficult or impossible to analyze quantitatively, are quite substantial in magnitude. Three such provisions, in particular, are the requirement that all workers be trained to recognize the factors contributing to worker fatigue and to identify symptoms of worker fatigue, the provision for worker self-declarations of fatigue, and the provision for for-cause fatigue assessments when workers exhibit symptoms of fatigue to managers or co-workers. These provisions will help ensure that individual variations in susceptibility to fatigue, arising from physiology, personal obligations, or life style, will be addressed in ways beyond the individual work hour limits in the final rule. The training, self-declaration, and fatigue assessment provisions will help avoid potential adverse consequences caused by workers who, for whatever reason, are affected by fatigue irrespective of the other provisions of Subpart I. These provisions thus are primary contributors to safety.

The NRC expects that the following provisions will provide substantial benefits:

- The restrictions on waivers of the individual work hour limits;
- The requirement for a 10-hour break between successive work periods;
- The requirement for a 34-hour break in any 9-day period for individual members of the specified job duty groups; and
- The requirements for mandatory days-off.

By limiting the work hours during normal conditions, individuals will be better rested and less susceptible to cumulative fatigue from the long work hours that are common during plant and security system outages. This may increase the potential for shorter outages. Other potential benefits include improved productivity, lower radiological exposures, less re-work, which can increase the availability of important safety systems, and improved environmental protection through the avoidance of inadvertent oil spills or other non-nuclear environmental events or inadvertent radiological releases. The fatigue management provisions provide reasonable assurance that individuals will be better rested prior to an emergency or increased threat condition.

4.1.3.2 Safeguards and Security

Following the terrorist attacks of September 11, 2001, the NRC received numerous allegations from nuclear security officers that certain licensees required them to work excessive amounts of overtime over long periods due to the post-September 11, 2001, threat environment. These individuals questioned their readiness and ability to perform their required job duties due to the adverse effects of cumulative fatigue. In order to ensure that these individuals are able to meet their responsibilities for maintaining the common defense and security, it is necessary to ensure that they are not subject to fatigue, which could reduce their alertness and ability to perform the critical job duties of identifying and promptly responding to plant security threats. The NRC reviewed the actual hours worked by security personnel and determined that, in the vast majority of cases, individual work hours did not exceed the guidelines specified in the NRC's Policy on Worker Fatigue. However, the review confirmed that some individuals had been working up to 60 hours per week for extended periods. Individual concerns regarding their fitness-for-duty, in light of work schedules that did not exceed the specific guidelines of the policy, as well as relevant technical research supporting the basis for cumulative fatigue, caused the NRC to conclude that the work hour guidelines of the policy were inadequate for addressing cumulative fatigue of security personnel. The NRC therefore issued Order EA-03-038 on April 29, 2003. The compensatory measures imposed by Order EA-03-038 differed from the policy guidelines in a few areas in which the NRC believed it was necessary to address previously identified

deficiencies in the guidelines, including cumulative fatigue from prolonged use of extended work hours and matters unique to security personnel. The requirements in Order EA-03-038 were imposed to provide the NRC with reasonable assurance that the public health and safety and common defense and security continue to be adequately protected.

The NRC plans to withdraw Order EA-03-038 once the fatigue management provisions in Subpart I for security force personnel take effect. The security force personnel who are subject to work hour controls in the Order are the same individuals who are subject to the work hour controls. Subpart I largely incorporates provisions in the Order, including provisions designed to minimize the use of deviations from the individual work hour limits, and limits that minimize the potential for cumulative fatigue. The requirements established by the Order and incorporated into Subpart I ensure adequate protection of public health and safety and the common defense and security.

Subpart I adds a new requirement not contained in Order EA-03-038 for security personnel to obtain a break of 34 hours every 9 days and receive mandatory days-off. That requirement is also expected to result in improved nuclear power plant security. It will support the individual work hour controls by both preventing and mitigating cumulative sleep debt. The break and days-off requirements ensure opportunities for days off, limits forced overtime, and also may support improved morale and safety culture. The training, self-declaration, and for-cause provisions of Subpart I also are expected to have the same qualitative benefits for security personnel as they do for other categories of nuclear plant personnel.

4.1.3.3 Regulatory Efficiency

Currently, even if licensees have incorporated the NRC's Policy on Worker Fatigue into a license condition, technical specification, or administrative procedure, consistent implementation and/or enforcement of the guidance in the policy is complicated by several factors:

- The language in plant technical specifications is largely advisory (e.g., an individual *should* not be permitted to work more than 16 hours straight).
- The technical specifications have inconsistent levels of detail from one nuclear power plant licensee to another.
- Licensees have inconsistently interpreted the scope of personnel who must be subject to the technical specification work hour limits.
- The technical specifications contain varying scopes for other requirements.
- The basic measure–work hours–used to determine whether an individual's situation is within or above the technical specification limits is not implemented consistently from one nuclear power plant to another.

The former Part 26 does not include prescriptive requirements regarding fatigue. Rather, §26.20 uses general, non-mandatory language to state that FFD policy "should" address other factors that can affect a worker's ability to safely and competently perform his or her duties, "such as mental stress, fatigue, and illness." As a result, it is difficult for the NRC to justify a violation of the regulation based on a licensee's failure to limit work hours. In addition, without a numerical limit on work hours, or a provision limiting work hours, a range of work hour practices could be viewed as "reasonable," and therefore in compliance with the regulation. When the specifics of a regulatory requirement are not clear, a licensee could enact programs that are less effective than the agency intended or could spend unproductive time trying to understand the requirements. Similarly, lack of clarity could lead licensees to inadvertently not comply with the true intent of the

regulatory action, which could lead to intervention by the NRC or even enforcement action and litigation. Increasing the clarity of the fatigue management provisions will enhance their effectiveness and safety-related benefits.

4.1.3.4 Public Perception

Many public comments on PRM-26-2 expressed concern that NRC appeared to "look the other way" in matters concerning worker fatigue. More recently, concerns regarding security personnel fatigue and instance of nuclear plant operators and guards falling asleep on the job have been the subject of newspaper articles. By increasing the effectiveness and clarity of the requirements for fatigue management programs, this final rule enhances the public's confidence in the NRC's protection of public health and safety and the common defense and security. The changes give the public additional assurance that the NRC is addressing the safety concern that worker fatigue may increase the probability of safety-significant accidents or may pose safeguards and security risks at power reactors.

4.1.3.5 Workplace Productivity and Efficiency

Affected licensees may accrue cost savings from the improved effectiveness of the rule, including enhanced workforce productivity, reduced absenteeism, lower medical and insurance costs, and less plant downtime. The effects of human-related errors caused by fatigue can have direct and indirect effects on overall plant operating costs. For example, a 24-hour outage caused by a fatigue-related error may result in a direct revenue loss of several hundred thousand to more than a million dollars. Furthermore, the long-term effects of problems arising from increases in illnesses and sick time, increased use of medical benefits, increased industrial accident rates, increased absenteeism, and lower productivity on the job, all of which have been associated with extended work hours and cumulative fatigue, can result in higher costs to the licensee. These secondary benefits result in additional savings for fatigue management programs beyond those discussed above.

4.1.4 Disaggregation

This section addresses the final rule provisions on a disaggregated basis. Section 4.1.4.1 considers the need to examine each requirement on an individual (i.e., fully-disaggregated) basis. Section 4.1.4.2 disaggregates the collection of provisions related to fatigue management from the remainder of the final rule.

4.1.4.1 Screening Review for Disaggregation

In order to comply with the guidance provided in Section 4.3.2 ("Criteria for the Treatment of Individual Requirements") of the Regulatory Analysis Guidelines of the U.S. Nuclear Regulatory Commission, NUREG/BR-0058, Revision 4, the NRC conducted a screening review to ensure that the aggregate analysis does not mask the inclusion of individual rule provisions that are not cost-beneficial when considered individually and not necessary to meet the goals of the rulemaking. The NRC identified all individual Part 26 rule changes where the total present value cost to industry is expected to reach or exceed approximately $50,000 per program (assuming a 7-percent discount rate), and/or where total initial industry costs are estimated to reach or exceed approximately $1,000,000. Because the NRC determined that all individual changes that

meet the above thresholds are also backfits, the complete discussion of the screening review is included in the Backfit Analysis portion of this document (see Section 4.4.2).

4.1.4.2 Disaggregating Fatigue Management from Other Part 26 Revisions

This section summarizes the division of costs and savings of the final rule between fatigue-related provisions (i.e., the provisions in Subpart I) and all other provisions.[19] The NRC is not required to present this information but is doing so as a courtesy to stakeholders.

As can be seen in Exhibit 4-6, the substantial costs of Subpart I (Fatigue Management) dominate the cost results of the final rule as a whole. When the other (non-fatigue) provisions are evaluated separately, the results show a considerable savings to industry.

For a discussion of the benefits of the fatigue management provisions, refer to Section 4.1.3 of this regulatory analysis. The NRC believes the qualitative benefits of the fatigue management provisions are fully justified relative to the costs.

Exhibit 4-6
Industry Savings and Costs of Fatigue Relative to Other Revisions

	Average Per FFD Program			Total for All FFD Programs		
	One-Time Saving (Cost)	Annual Saving (Cost)	Net Present Value	One-Time Saving (Cost)	Annual Saving (Cost)	Net Present Value
Fatigue (Subpart I)	($421,700)	($1,475,300)	($17,770,000)	($11,808,000)	($41,309,000)	($572,863,000)
Rest of Final Rule	(59,900)	$300,800	$4,002,100	($1,918,000)	$9,628,000	$128,807,000
Total	**($481,600)**	**($1,174,500)**	**($13,767,900)**	**($13,726,000)**	**($31,680,000)**	**($444,056,000)**

* Net present value assumes a discount rate of 7 percent. Using a discount rate of 3 percent, the net present values are estimated as follows: Fatigue provisions result in a cost estimated at $28,571,100 per program, or a cost of $898,127,000 to industry as a whole. The rest of the final rule results in a savings estimated at $6,537,000 per program, or savings of $203,804,000 to industry as a whole. Total net present value for the entire rulemaking is estimated at a cost of $22,034,100 per program, or a cost of $694,324,000 to industry as a whole.
** A licensee's FFD program may include more than one facility.

4.2 Benefits and Costs — Pre-Order Baseline

The NRC has performed a sensitivity analysis using an alternative baseline (called the "pre-order baseline") that considers the incremental impacts of the Part 26 rule relative to only those regulations that were in effect before the NRC issued the AAO on January 7, 2003, and Order EA-03-038 on April 29, 2003. The purpose of this sensitivity analysis is to account for

[19] The "other provisions" consists of all other Part 26 revisions including, in particular, provisions related to drug and alcohol testing and authorization, as well as other FFD matters covered by the rule.

relevant impacts of the orders in addition to those that are incremental to the final rule.[20] These impacts already have been incurred, but they have not previously been quantified.

The results of the sensitivity analysis show lower costs for licensees when compared to the main analysis, both under a 7-percent discount rate and a 3-percent discount rate, as shown in Exhibits 4-7 and 4-8 respectively. Under the pre-order baseline, NRC estimates the present value cost of the final rule at $85,106,000 (or $2,581,200 for the average FFD program) using a 7-percent discount rate and $124,837,000 (or $3,582,400 for the average FFD program) using a 3-percent discount rate. Industry will incur a one-time cost totaling $19,792,000 (or $671,200 for the average program) to implement the rule and will incur subsequent annual costs estimated at $4,946,000 (or $339,100 for the average program).

Exhibit 4-7
Industry Savings and Costs by Subpart under the Pre-Order Baseline (7% discount rate)

Subpart	Average Per FFD Program			Total - All FFD Programs		
	One-Time Saving (Cost)	Annual Saving (Cost)	Net Present Value	One-Time Saving (Cost)	Annual Saving (Cost)	Net Present Value
A	-	$7,600	$103,400	-	$243,000	$3,320,000

Consequently, the total net present values cannot be derived using only the one-time and annual values shown above.

Exhibit 4-9 presents only the *additional* costs and savings that accrue under the pre-order baseline relative to the main analysis. As shown, the rule yields additional one-time costs of $6,066,000 ($189,600 for the average program) and additional annual savings of $26,734,000 ($835,000 for the average program), all of which relates to requirements in Subparts B and C.

Exhibit 4-9

* A licensee's FFD program may include more than one facility. The average annual savings (costs) presented are for the initial years of the analysis and change over time as programs decrease in size with the closure of specific plants.

Exhibit 4-10 shows the specific provisions within Subparts B and C that contribute added costs and savings under the pre-order baseline. A total of over $27 million in annual savings (over $800,000 per program) results from various revisions to requirements in §§26.55-59 governing the granting of authorization under Subpart C. Some of these provisions eliminate the need to administer pre-access drug and alcohol tests to initial applicants, update applicants, and reinstatement applicants if the applicants have previously had authorization and have been covered by a licensee-approved behavioral observation program and random drug and alcohol testing program throughout the period of interruption. Other provisions allow licensees to forego obtaining self-disclosures from, or undertaking suitable inquiries about, applicants that have previously had authorization and have been covered by a licensee-approved behavioral observation program throughout the period of interruption.

A large one-time cost results from requiring all employees to be trained in behavioral observation and other aspects of the rule under §26.29(a). As a result, licensees will be required to update the training of all existing employees that were previously trained at the non-supervisory-level, resulting in one-time industry-wide costs of $6,066,000 (or an average of $189,600 per program). §26.29(a) also generates lesser annual costs, which are attributable to the need to continue such training in future years.

4.3 Sensitivity Analysis — Industry Practices

This sensitivity analysis considers a baseline that reflects industry practices prior to the AAO and recent enforcement discretion and is in accordance with licensees' interpretation of existing regulations. For a few rule provisions, until recently, some licensees interpreted the existing Part 26 rule inconsistently with the NRC interpretation. For these provisions, some licensees' practices have recently changed (subsequent to enforcement discretion and issuance of the

AAO) to comply with the former rule. Measured relative to the previous practices, therefore, the cost of complying with the relevant provisions in the final rule will exceed that estimated in the pre-order baseline.

Exhibits 4-11 and 4-12 summarize the results of this "Industry Practices" sensitivity analysis, using a 7-percent discount rate and a 3-percent discount rate, respectively. Under this baseline, the present value of net costs to industry is estimated to be $195,604,000, or $6,024,000 for the average program, assuming a 7-percent discount rate. Assuming a 3-percent discount rate, the costs are estimated to be $299,076,000, or $9,222,000 for the average program.

* Net present value is calculated using a discount rate of 3 percent.
** A licensee's FFD program may include more than one facility. The average annual savings (costs) presented are for the initial years of the analysis and change over time as programs decrease in size with the closure of specific plants. Consequently, the total net present values cannot be derived using only the one-time and annual values shown above.

Exhibit 4-13 details the specific provisions for which costs are higher under the industry practices baseline than under the pre-order baseline.[21] As shown, the NRC estimates that industry would have incurred a total annual cost of about $8,092,000 (or about $252,900 for the average program), as well as a total one-time cost of $15,000 (approximately $500 for the average

[21] Exhibit 4-13 measures the cost of industry coming into compliance with the pre-AAO requirements. Note, however, that the AAO relaxed or eliminated some of the Part 26 requirements with which some licensees had not been complying. Therefore, industry's subsequent compliance actually was achieved partly as a result of a change in its practices and partly as a result of the NRC changing the requirements. For this reason, industry did not "incur" all of the costs shown in Exhibit 4-13. Use of this analytical approach avoids double-counting the results presented in these Exhibits 4-11 and 4-12.

program), to modify recent practices. Most of these costs are associated with licensees' practices for reinstating the authorization of applicants with interruptions of 30 days or less. Appendix 1, which documents the calculation of savings and costs for individual rule requirements (including those cited in Exhibit 4-13), describes the industry practices at issue in this sensitivity analysis.

4.4 Backfit Analysis

This section presents the NRC's evaluation of changes in the final rule in accordance with the Backfit Rule, 10 CFR §50.109, 10 CFR §70.76, and 10 CFR §76.76. The backfit provision of 10 CFR §70.76 is applicable to currently licensed Category I fuel fabrication facilities. These facilities have been considered in the aggregate backfit analysis. Although gas centrifuge facilities are licensed under Part 70, these facilities have not been considered in the analysis because NRC has not granted authorization to possess formula quantities of SSNM at these facilities. The planned mixed-oxide fuel fabrication facility also would be licensed under Part 70, but has not yet submitted a Part 26 program description. Therefore, the consideration of the costs to the mixed-oxide fuel fabrication facility in the regulatory analysis (see Section 3.2.2) is sufficient for consideration of the impacts to that facility. Although the backfit provision of 10 CFR §76.76 is applicable, there are no backfit impacts because the gaseous diffusion plants

certified by the NRC are not currently authorized to possess formula quantities of strategic special nuclear material.

Section 4.4.1 examines the aggregation of the individual Part 26 rule requirements that constitute backfits, which excludes (1) matters that are not subject to the Backfit Rule, and (2) matters that do not fall within the definition of "backfitting" as defined in the Backfit Rule and discussed below. Section 4.4.2 describes a screening analysis conducted in accordance with NRC's Regulatory Analysis Guidelines to ensure that the aggregate analysis does not mask the inclusion of individual rule provisions that are (1) not cost-beneficial when considered individually and (2) not necessary to meet the goals of the rulemaking. Both analyses examine the impacts of the rule relative to the baseline used in the main analysis, which consists of existing requirements including the recently issued orders and enforcement discretion.

4.4.1 Aggregated Backfit Analysis

The backfit analysis examines the aggregation of the subset of the final Part 26 regulatory requirements that constitute backfits as defined in 10 CFR §50.109(a)(1), 10 CFR §70.76(a)(1), and 10 CFR §76.76(a)(1). These provisions are identified in two exhibits. Exhibit 4-14 presents the requirements that both constitute backfits and result in incremental savings or costs. Exhibit 4-15 specifies requirements that constitute backfits that either do not result in incremental costs or savings or that result in incremental costs or savings only in conjunction with other requirements. The analysis excludes individual requirements that are not subject to the Backfit Rule or that are not backfits by definition, which include requirements that fall into one or more of the following categories.

- *Administrative matters*. Revisions that make minor administrative changes, such as correction of typographic errors, correction of inconsistencies, relocating requirements from one section to another, and combining existing requirements into a single section.

- *Information collection and reporting requirements*. Revisions that either amend existing information collection and reporting requirements or impose new information and collection and reporting requirements, which are not considered to be backfits, as set forth in the Committee to Review Generic Requirements (CRGR) charter.

- *Clarifications*. Revisions that clarify current requirements to assure consistent understanding and implementation of the NRC's original intent for these requirements. Without changing the underlying requirements stated in these sections, these revisions remove the ambiguities that produced regulatory uncertainty.

- *Permissive relaxations/Voluntary alternatives*. Revisions that permit, but not require, relaxations or alternatives to current requirements (i.e., licensees are free to either comply with current requirements or adopt the relaxed requirements/voluntary alternative as a binding requirement).

- *Provisions required under the NRC's AAO or Order EA-03-038.* Provisions that have been addressed in a recent FFD AAO and/or Order EA-03-038 and/or

enforcement discretion are excluded from the backfit analysis under the exclusion in 10 CFR §50.109(a)(4), 10 CFR §70.76(a)(4), and 10 CFR §76.76(a)(4).

The analysis also excludes the requirements in Subpart K because the provisions in Subpart K do not apply to existing licensees and other entities.

(Exhibit 4-16 presents the rationale for excluding particular requirements from the backfit analysis. This exhibit does not address numerous requirements that were excluded because they merely restate, clarify, or move requirements in the former rule.)

The NRC then evaluated the aggregated set of requirements constituting backfits in accordance with 10 CFR §50.109, 10 CFR §70.76, and 10 CFR §76.76 to determine if the costs of implementing the rule would be justified by a substantial increase in public health and safety or common defense and security. In performing this analysis, the NRC considered the quantitative and qualitative costs and benefits of the rule, as discussed below.

26.161(b)(1) All Validity Testing Conducted at HHS-Certified Laboratories	-	($12,711)	-	($406,760)
26.161(g) Unidentified Interfering Substance/Adulterant - Contact MRO and Specimen Retesting	-	($395)	-	($12,643)
26.163(a)(1) Change Cutoff Levels for Marijuana and Opiates - HHS-Certified Laboratories	-	($582)	-	($18,614)
26.165(b) Retesting of Single Collection Specimens with Confirmed Positive Drug and/or Validity Test Results	-	($8)	-	($240)
26.168(a)(1) Blind Sample Testing - 1st Quarter of Contract with a HHS-Certified Laboratory	-	$670	-	$21,446
26.168(a)(2) Blind Sample Testing - Contracts with HHS-Certified Laboratories Older Than 90 Days	-	$10,554	-	$337,731
26.189(c) Face-to-Face Determinations of Fitness	-	($4,535)	-	($145,117)
26.203(c) Training	-	($118,152)	-	($3,308,268)
26.203(f) Fatigue Management Audits	-	($3,982)	-	($111,484)
26.205(b) Calculating Work Hours	-	($34,534)	-	($966,942)
26.205(c) Scheduling Work Hours	-	($84,599)	-	($2,368,773)
26.205(d)(4)-(6) Day-off Requirements	-	($605,550)	-	($16,955,400)
26.205(e) Work Hour Control Reviews	-	($2,312)	-	($64,742)
26.207 Waivers from Individual Work Hour Limits	-	($588,111)	-	($16,467,100)
26.209 Self-Declarations of Fatigue	-	($1,617)	-	($45,276)
26.211(a)-(d) Fatigue Assessments	-	($8,943)	-	($250,398)
26.211(e) Post-Fatigue Assessment Controls and Conditions	-	($20,213)	-	($565,956)
Total	($481,657)	($1,486,129)	($13,726,119)	($41,684,076)

The exhibit presents the requirements that both constitute backfits and result in incremental savings or costs. Backfits that do not result in incremental savings or costs, or that result in incremental savings or costs only in conjunction with other requirements, are identified in Exhibit 4-15. Other requirements do not qualify as backfits for reasons explained in Exhibit 4-16, except that Exhibit 4-16 does not address requirements that do not constitute backfits because they represent administrative changes, restatements, or clarifications of requirements in the former rule.

The exhibit presents the requirements that constitute backfits but either do not result in incremental savings or costs or result in incremental savings or costs only in conjunction with other requirements. For requirements that both constitute backfits and result in incremental savings or costs, refer to Exhibit 4-14. Other requirements do not qualify as backfits for reasons explained in Exhibit 4-16, except that Exhibit 4-16 does not address requirements that do not constitute backfits because they represent administrative changes, restatements, or clarifications of requirements in the former rule.

Exhibit 4-16
Rationale for Excluding Particular Requirements from the Backfit Analysis

Requirement	Reason
Subpart A	
§26.4(i)	This revision does not constitute a backfit because licensees are free to continue to comply with the existing requirement or to adopt the final provision.
§26.4(j)	This revision does not constitute a backfit because licensees are free to continue to comply with the existing requirement or to adopt the final provision.
§26.11	This revision does not constitute a backfit because it is an information collection and reporting requirement.
Subpart B	
§26.29(c)(2)	This revision does not constitute a backfit because licensees are free to continue to comply with the existing requirement or to adopt the final provision.
§26.29(c)(3)	This revision does not constitute a backfit because licensees are free to continue to comply with the existing requirement or to adopt the final provision.
§26.29(d)	This revision does not constitute a backfit because licensees are free to continue to comply with the existing requirement or to adopt the final provision.
§26.31(b)(1)(i)	This revision does not constitute a backfit because licensees are free to continue to comply with the existing requirement or to adopt the final provision.
§26.31(b)(2)	This revision does not constitute a backfit because licensees are free to continue to comply with the existing requirement or to adopt the final provision.
§26.31(c)(1)	This revision does not constitute a backfit because the actions addressed in this provision are already required under the NRC's AAO.

Requirement	Reason
§26.31(d)(5)	This revision does not constitute a backfit because licensees are free to continue to comply with the existing requirement or to adopt the final provision.
§26.37(c)	This revision does not constitute a backfit because it is an information collection and reporting requirement.
§26.37(d)	This revision does not constitute a backfit because it is an information collection and reporting requirement.
§26.41(c)(2)	This revision does not constitute a backfit because licensees are free to continue to comply with the existing requirement or to adopt the final provision.
Subpart C	
§26.53(a)	This revision does not constitute a backfit because the actions addressed in this provision are already required under the NRC's AAO.
§26.53(d)	This revision does not constitute a backfit because licensees are free to continue to comply with the existing requirement or to adopt the final provision.
§26.55(a)	This revision does not constitute a backfit because the actions addressed in this provision are already required under the NRC's AAO.
§26.57(a)	This revision does not constitute a backfit because the actions addressed in this provision are already required under the NRC's AAO.
§26.57(a)(1)	This revision does not constitute a backfit because it restates existing requirements and because the actions addressed in this provision are already required under the NRC's AAO.
§26.57(a)(2)	This revision does not constitute a backfit because it restates existing requirements and because the actions addressed in this provision are already required under the NRC's AAO.
§26.57(a)(3)	This revision does not constitute a backfit because it restates existing requirements and because the actions addressed in this provision are already required under the NRC's AAO.
§26.59(a)	This revision does not constitute a backfit because the actions addressed in this provision are already required under the NRC's AAO.
§26.59(a)(1)	This revision does not constitute a backfit because it restates existing requirements and because the actions addressed in this provision are already required under the NRC's AAO.
§26.59(a)(2)	This revision does not constitute a backfit because the actions addressed in this provision are already required under the NRC's AAO.
§26.59(a)(3)	This revision does not constitute a backfit because the actions addressed in this provision are already required under the NRC's AAO.

Requirement	Reason
§26.59(b)	This revision does not constitute a backfit because the actions addressed in this provision are already required under the NRC's AAO.
§26.59(c)	This revision does not constitute a backfit because the actions addressed in this provision are already required under the NRC's AAO.
§26.59(c)(1)	This revision does not constitute a backfit because it restates existing requirements and because the actions addressed in this provision are already required under the NRC's AAO.
§26.59(c)(2)	This revision does not constitute a backfit because it restates existing requirements and because the actions addressed in this provision are already required under the NRC's AAO.
§26.61(a)	These provisions are not independent requirements, and their applicability depends upon the provisions in §§26.55 through 26.59. Therefore, any backfitting implications are addressed in the backfit discussion of those sections.
§§26.61(a)(1)–(2)	These provisions are not independent requirements, and their applicability depends upon the provisions in §§26.55 through 26.59. Therefore, any backfitting implications are addressed in the backfit discussion of those sections.
§§26.61(b)(1)–(3)	These provisions are not independent requirements, and their applicability depends upon the provisions in §§26.55 through 26.59. Therefore, any backfitting implications are addressed in the backfit discussion of those sections.
§26.61(c)	These provisions are not independent requirements, and their applicability depends upon the provisions in §§26.55 through 26.59. Therefore, any backfitting implications are addressed in the backfit discussion of those sections.
§26.63(a)	These provisions are not independent requirements, and their applicability depends upon the provisions in §§26.55 through 26.59. Therefore, any backfitting implications are addressed in the backfit discussion of those sections.
§26.63(b)	These provisions are not independent requirements, and their applicability depends upon the provisions in §§26.55 through 26.59. Therefore, any backfitting implications are addressed in the backfit discussion of those sections.
§26.63(c)	These provisions are not independent requirements, and their applicability depends upon the provisions in §§26.55 through 26.59. Therefore, any backfitting implications are addressed in the backfit discussion of those sections.
§26.63(d)	These provisions are not independent requirements, and their applicability depends upon the provisions in §§26.55 through 26.59. Therefore, any backfitting implications are addressed in the backfit discussion of those sections.
§26.63(f)(1)	These provisions are not independent requirements, and their applicability depends upon the provisions in §§26.55 through 26.59. Therefore, any backfitting implications are addressed in the backfit discussion of those sections.
§26.63(f)(2)	These provisions are not independent requirements, and their applicability depends upon the provisions in §§26.55 through 26.59. Therefore, any backfitting implications are addressed in the backfit discussion of those sections.

Requirement	Reason
§26.63(f)(3)	These provisions are not independent requirements, and their applicability depends upon the provisions in §§26.55 through 26.59. Therefore, any backfitting implications are addressed in the backfit discussion of those sections.
§26.65(b)	These provisions are not independent requirements, and their applicability depends upon the provisions in §§26.55 through 26.59. Therefore, any backfitting implications are addressed in the backfit discussion of those sections.
§26.65(c)	These provisions are not independent requirements, and their applicability depends upon the provisions in §§26.55 through 26.59. Therefore, any backfitting implications are addressed in the backfit discussion of those sections.
§26.65(d)(1)	These provisions are not independent requirements, and their applicability depends upon the provisions in §§26.55 through 26.59. Therefore, any backfitting implications are addressed in the backfit discussion of those sections.
§26.65(d)(2)	These provisions are not independent requirements, and their applicability depends upon the provisions in §§26.55 through 26.59. Therefore, any backfitting implications are addressed in the backfit discussion of those sections.
§26.65(e)(1)	These provisions are not independent requirements, and their applicability depends upon the provisions in §§26.55 through 26.59. Therefore, any backfitting implications are addressed in the backfit discussion of those sections.
§§26.65(e)(2)(i) and (iii)	These provisions are not independent requirements, and their applicability depends upon the provisions in §§26.55 through 26.59. Therefore, any backfitting implications are addressed in the backfit discussion of those sections.
§26.65(e)(2)(ii)	These provisions are not independent requirements, and their applicability depends upon the provisions in §§26.55 through 26.59. Therefore, any backfitting implications are addressed in the backfit discussion of those sections.
§26.65(e)(3)	These provisions are not independent requirements, and their applicability depends upon the provisions in §§26.55 through 26.59. Therefore, any backfitting implications are addressed in the backfit discussion of those sections.
§26.65(f)	These provisions are not independent requirements, and their applicability depends upon the provisions in §§26.55 through 26.59. Therefore, any backfitting implications are addressed in the backfit discussion of those sections.
§26.65(g)	These provisions are not independent requirements, and their applicability depends upon the provisions in §§26.55 through 26.59. Therefore, any backfitting implications are addressed in the backfit discussion of those sections.
§26.67(a)	These provisions are not independent requirements, and their applicability depends upon the provisions in §§26.55 through 26.59. Therefore, any backfitting implications are addressed in the backfit discussion of those sections.
§26.67(a)(2)	These provisions are not independent requirements, and their applicability depends upon the provisions in §§26.55 through 26.59. Therefore, any backfitting implications are addressed in the backfit discussion of those sections.
§26.67(b)	These provisions are not independent requirements, and their applicability depends upon the provisions in §§26.55 through 26.59. Therefore, any backfitting implications are addressed in the backfit discussion of those sections.

Requirement	Reason
§26.67(c)	These provisions are not independent requirements, and their applicability depends upon the provisions in §§26.55 through 26.59. Therefore, any backfitting implications are addressed in the backfit discussion of those sections.
Subpart D	
None.	
Subpart E	
§§26.97(a)-(e)	This revision does not constitute a backfit because licensees are free to continue to comply with the existing requirement or to adopt the final provision.
§26.101(d)	This revision does not constitute a backfit because licensees are free to continue to comply with the existing requirement or to adopt the final provision.
§26.111(c)	This revision does not constitute a backfit because it is an information collection and reporting requirement.
§26.115(d)	This revision does not constitute a backfit because it is an information collection and reporting requirement.
Subpart F	
§26.135(b)	This revision does not constitute a backfit because licensees are free to continue to comply with the existing requirement or to adopt the final provision.
§26.137(e)(3)	This revision does not constitute a backfit because licensees are free to continue to comply with the existing requirement or to adopt the final provision.
§26.137(h)	This revision does not constitute a backfit because licensees are free to continue to comply with the existing requirement or to adopt the final provision.
§26.139(b)	This revision does not constitute a backfit because licensees are free to continue to comply with the existing requirement or to adopt the final provision.
§26.139(d)	This revision does not constitute a backfit because it is an information collection and reporting requirement.
§26.139(e)	This revision does not constitute a backfit because it is an information collection and reporting requirement.
Subpart G	
§26.153(e)	This revision does not constitute a backfit because licensees are free to continue to comply with the existing requirement or to adopt the final provision.
§26.153(g)	This revision does not constitute a backfit because it is an information collection and reporting requirement.
§26.155(d)	This revision does not constitute a backfit because it is an information collection and reporting requirement.
§26.155(f)	This revision does not constitute a backfit because licensees are free to continue to comply with the existing requirement or to adopt the final provision.
§26.157(c)	This revision does not constitute a backfit because licensees are free to continue to comply with the existing requirement or to adopt the final provision.
§26.159(a)	This revision does not constitute a backfit because licensees are free to continue to comply with the existing requirement or to adopt the final provision.

Requirement	Reason
§26.169(b)	This revision does not constitute a backfit because it is an information collection and reporting requirement.
§26.169(c)	This revision does not constitute a backfit because it is an information collection and reporting requirement.
§26.169(f)	This revision does not constitute a backfit because licensees are free to continue to comply with the existing requirement or to adopt the final provision.
§26.169(h)	This revision does not constitute a backfit because it is an information collection and reporting requirement.
Subpart H	
§26.185(c)	This revision does not constitute a backfit because licensees are free to continue to comply with the existing requirement or to adopt the final provision.
§26.185(g)(4)	This revision does not constitute a backfit because licensees are free to continue to comply with the existing requirement or to adopt the final provision.
§26.189(b)(3)	This revision does not constitute a backfit because licensees are free to continue to comply with the existing requirement or to adopt the final provision.
Subpart I	
§26.203(d)	This revision does not constitute a backfit because it is an information collection and reporting requirement.
§26.203(e)	This revision does not constitute a backfit because it is an information collection and reporting requirement.
§26.203(e)(1)	This revision does not constitute a backfit because it is an information collection and reporting requirement.
§26.203(e)(2)	This revision does not constitute a backfit because it is an information collection and reporting requirement.
§26.205(d)(1)	This provision does not constitute a backfit, except for three reactors, because licensees are free to comply with the existing Technical Specification requirement or to adopt the permissive relaxation. The three reactors that do not have this requirement within their Technical Specifications have implemented it as part of their administrative procedures. For these three reactors, this provision constitutes a backfit. The cost of this backfit would be very small, however, and is not significant to the analysis. (The cost would include some administrative costs related to authorizing work hour deviations under certain high workload situations. Any other costs related to the new requirement are addressed under appropriate provisions.)
§26.211(f)	This revision does not constitute a backfit because it is an information collection and reporting requirement.
Subpart J	
None.	

Requirement	Reason
Subpart K	
None.	
Subpart L	
None.	
Subpart M	
None.	
Subpart N	
§26.711(b)	This revision does not constitute a backfit because it is an information collection and reporting requirement.
§§26.713(a)	This revision does not constitute a backfit because it is an information collection and reporting requirement.
§§26.713(b)	This revision does not constitute a backfit because it is an information collection and reporting requirement.
§§26.713(c)	This revision does not constitute a backfit because it is an information collection and reporting requirement.
§§26.713(d)	This revision does not constitute a backfit because it is an information collection and reporting requirement.
§§26.713(e)	This revision does not constitute a backfit because it is an information collection and reporting requirement.
§§26.713(f)	This revision does not constitute a backfit because it is an information collection and reporting requirement.
§§26.713(g)	This revision does not constitute a backfit because it is an information collection and reporting requirement.
§§26.715(a) and 26.715(b)	This revision does not constitute a backfit because it is an information collection and reporting requirement.
§26.717(b)	This revision does not constitute a backfit because it is an information collection and reporting requirement.
§26.717(c)	This revision does not constitute a backfit because it is an information collection and reporting requirement.
§§26.717(e) and 26.717(f)	This revision does not constitute a backfit because licensees are free to continue to comply with the existing requirement or to adopt the final provision.
§26.717(g)	This revision does not constitute a backfit because it is an information collection and reporting requirement.
§26.719(b)	This revision does not constitute a backfit because it is an information collection and reporting requirement.

Requirement	Reason
§26.719(c)(3)	This revision does not constitute a backfit because it is an information collection and reporting requirement.
Subpart O	
None.	

The exhibit presents the requirements that do not constitute backfits, along with the reasons the requirements do not constitute backfits, but excludes requirements that do not constitute backfits because they represent administrative changes, restatements, or clarifications of requirements in the former rule. For requirements that both constitute backfits and result in incremental savings or costs, refer to Exhibit 4-14. Exhibit 4-15 identifies requirements that constitute backfits that either do not result in incremental savings or costs or that result in incremental savings or costs only in conjunction with other requirements.

Collectively, the individual requirements in the final rule that qualify as backfits result in an estimated net cost of approximately $580 million to industry over the next 49 years (present value), assuming a 7-percent discount rate, or approximately $908.4 million assuming a 3-percent discount rate.[22] The present value of these costs to the average program is calculated to be approximately $21,161,400 assuming a 7-percent discount rate, and approximately $34,607,300 using a 3-percent discount rate.

For the average licensee FFD program, these backfits mean an initial one-time cost of approximately $481,700, followed by annual costs of about $1,486,100 per year. For industry as a whole, NRC estimates that the backfits result in approximately $13.7 million in one-time costs, and about $41.7 million in annual costs.

With regard to safety benefits afforded by the Part 26 rule's provisions, as documented in both this regulatory analysis and the statement of considerations of the final Part 26 rule, the NRC considered them in qualitative terms. (See Section 3.2 of this document for a discussion of the issues that would be involved in quantifying the benefits of the final rule.) NRC also qualitatively determined whether the costs of the rule are justified in light of the safety benefits. By contrast, the NRC evaluated costs and cost reductions in quantitative terms, as documented in the regulatory analysis and in the statement of considerations of the final rule.

In performing this analysis, the NRC considered the nine factors in 10 CFR §50.109, 10 CFR §70.76, and 10 CFR §76.76, as follows:

(i) *Statement of the specific objectives that the backfit is designed to achieve.*

The rulemaking constitutes an integrated regulatory initiative directed at the singular regulatory matter of FFD requirements at nuclear facilities. The goals of the final rule are as follows:

1. Update and enhance the consistency of 10 CFR Part 26 with advances in other relevant Federal rules and guidelines, including the U.S. Department of Health and Human Services Mandatory Guidelines for Federal

[22] For more information regarding the derivation of these cost estimates and assumptions employed, see Section 3.2 and Appendix 1.

Workplace Drug Testing Programs (HHS Guidelines) and other Federal drug and alcohol testing programs (e.g., those required by the U.S. Department of Transportation [DOT]) that impose similar requirements on the private sector.

2. Strengthen the effectiveness of FFD programs at nuclear power plants in ensuring against worker fatigue adversely affecting public health and safety and the common defense and security by establishing clear and enforceable requirements for the management of worker fatigue.

3. Improve the effectiveness and efficiency of FFD programs.

4. Improve consistency between Part 26 requirements and access authorization requirements established in 10 CFR 73.56, as supplemented by orders to nuclear power plant licensees dated January 7, 2003.

5. Improve 10 CFR Part 26 by eliminating or modifying unnecessary requirements.

6. Improve clarity in the organization and language of the rule.

7. Protect the privacy and due process rights of individuals who are subject to 10 CFR Part 26.

(ii) *General description of the activity that is required by the licensee or applicant in order to complete the backfit.*

In general terms, the Part 26 rule: requires licensees to modify their procedures for training, scheduling and monitoring work hours, granting authorization, and conducting onsite testing; requires offsite laboratories used by licensees and C/Vs to comply with HHS guidelines, perform additional testing in specific circumstances, and comply with certain procedures intended to protect the rights of tested individuals; and ensures that persons who are impaired and/or are using illegal drugs do not perform safety or security functions at a nuclear facility. Detailed discussions of what activities and procedural changes are required by the Part 26 rule are set forth in this analysis and the statement of considerations of the final Part 26 rule.

(iii) *Potential change in the risk to the public from the accidental offsite release of radioactive material or hazardous chemicals produced from licensed material.*

The rulemaking is intended to provide added assurance that the risk of offsite releases, of either radioactive material or hazardous chemicals produced from licensed materials, as a result of cognitive impairment from fatigue or the use of legal and illegal drugs is acceptably low and consistent with the NRC's Safety Goals. However, the reduction in risk to the public from offsite releases of radioactive materials and hazardous chemicals has not been fully quantified because there is insufficient information and modeling to support such quantification (see Section 3.2).

(iv) *Potential impact on facility employees from radiological exposure or exposure to hazardous chemicals produced from licensed material.*

The rulemaking provides added assurance that nuclear industry workers are not subjected to unnecessary radiological or hazardous chemical exposures either directly as the result of cognitive impairment (*e.g*., where a worker receives an exposure which is greater than expected because of impairment while performing a work function), or because cognitive impairment causes an accident leading to a release of radiation or hazardous chemicals produced from licensed material, which workers then are exposed to as the result of mitigative and/or clean-up activities.

(v) *Installation and continuing costs associated with the backfit, including the cost of facility downtime or the cost of construction delay*.

Part 26 is primarily programmatic in nature and does not involve changes to the licensed facility itself; hence there are no installation or direct downtime costs associated with implementing this rule. The regulatory analysis for the Part 26 rule sets forth the NRC's estimate of the initial costs for implementing the major elements of the final Part 26 rule, and the ongoing costs and savings to the licensees. The estimated one-time industry net cost of this rule is approximately $13.7 million (or $0.5 million for the average program), and the annually recurring cost is slightly more than $31.7 million (or $1.2 million for the average program). Combining these initial and annual costs, this analysis estimates that the final Part 26 rule will cost industry approximately $444 million (present value, assuming a 7-percent discount rate) to $694 million (present value, assuming a 3-percent discount rate).

(vi) *The potential safety impact of changes in plant or operational complexity, including the relationship to final and former regulatory requirements.*

The final Part 26 rule makes no change with respect to the design of a nuclear power plant or other facility. Therefore, this rule is not expected to have any effect on facility complexity.

The final rule also does not affect the direct procedures for operating the plant. For example, the duties of operators are not affected by the rule, although the number of hours that any given operator works each week may be affected. Rather, the changes to Part 26 in the final rule are directed at ancillary procedures and supporting administrative organization associated with operating the plant. The final rule requires modified work schedules, additional testing (*e.g.*, employees who are offsite when selected for testing), and changes to Part 26 program procedures to ensure greater integrity of tests and to reduce tampering of specimens and subversion of tests. These "costs" in terms of increased complexity in FFD procedures are discussed in this Part 26 regulatory analysis, which indicates that the added FFD program complexity is not significant and will not substantially impact licensees' operational practices or result in substantial indirect costs.

(vii) *The estimated resource burden on the NRC associated with the backfit and the availability of such resources.*

The rulemaking does not result in a substantial increase in expenditures of agency resources, as the NRC is already inspecting licensees' implementation of FFD programs required by Part 26, and the final Part 26 rule does not substantially expand the FFD activities formerly required under Part 26 for which NRC oversight is needed. The regulatory analysis estimates an annual cost to NRC of $47,000.

(viii) *The potential impact of differences in facility type, design or age on the relevancy and practicality of the backfit.*

The final requirements for FFD in Part 26 do not relate to, and are independent of, the facility type, design or age. Therefore, the benefits and costs attributable to the final Part 26 rule do not vary based upon the facility type, design or age.

(ix) *Whether the backfit is interim or final and, if interim, the justification for imposing the backfit on an interim basis.*

The backfit, when implemented at the final rule stage, is final.

The NRC finds that the backfits contained in the Part 26 rule, when considered in the aggregate, constitute a substantial increase in protection to public health and safety and security, by addressing the following seven key areas that have been identified by the Staff as posing recurring and, in some cases, significant problems with respect to the effectiveness, integrity, and efficiency of FFD programs at nuclear facilities.

(i) High potential for worker fatigue

Although all power reactor licensees have implemented work hour controls, these controls vary considerably across licensees due in part to differing interpretations of NRC guidance. NRC has found that some licensees authorized hundreds to several thousand deviations from current work hour limits, resulting in substantial overtime hours for workers. The use of 12-hour shifts, including 6 or more consecutive 12-hour shifts per week during outages, is very common. (The average refueling outage lasts 39 days.) These and other factors, discussed in Section 4.1.3 of the regulatory analysis, contribute to a high potential for worker fatigue and degradation of worker fitness for duty at power reactors. For example, there have been instances of operators falling asleep in the control rooms at a nuclear power station and at a test and research reactor, as well as a security officer falling asleep at a nuclear power plant while driving a patrol vehicle, despite these individuals recognizing the potential safety and disciplinary consequences. Since September 11, 2001, the NRC has received reports of nuclear security officers found asleep while on duty. In addition, the NRC received numerous allegations from nuclear security officers that certain licensees have required them to work excessive amounts of overtime over long periods due to the post-September 11 threat environment. The NRC believes that the final rule's work hour controls will reduce the potential for worker fatigue, and that other provisions will increase the likelihood that workers experiencing fatigue (from any

cause) are removed from duty. Considering the importance of reliable human performance to the safe operation of nuclear power plants, the NRC concludes that these protections constitute a substantial increase in protection to public health and safety, and contribute to Goal 2 for the rulemaking. (Subpart I does not apply to the materials licensees who are otherwise subject to Part 26 because there is no evidence of excessive overtime use by these materials licensees.)

(ii) Subversion of the detection/testing process

The NRC's intent when it first adopted Part 26 was that FFD programs have a high degree of effectiveness such that nuclear facilities would be essentially "drug-free" (54 FR 24468; June 7, 1989). To that end, the former Part 26 rule contains several provisions aimed at preventing subversion. However, subversion techniques have evolved and grown more sophisticated since the adoption of the anti-subversion provisions of the 1989 rule. The NRC believes that the adoption of the anti-subversion provisions in the final Part 26 rule serve to keep pace with the evolution of subversion techniques, thereby maintaining the level of effectiveness that the Commission originally intended when it adopted the 1989 Part 26 rule. Accordingly, the NRC concludes that provisions in the final Part 26 rule aimed at preventing subversion constitute a substantial increase in protection to public health and safety, and contribute to Goals 1 and 3 for the rulemaking.

(iii) Regulatory efficiency

The 1989 Part 26 rule requirements were based upon, and keyed to, the drug testing provisions in the HHS Guidelines. HHS, as the lead Federal agency for the development of FFD programs and drug testing requirements, has periodically revised its guidelines based upon its review and experience with both Federal and private-sector FFD and drug testing programs. The NRC believes that there is substantial benefit to conforming its regulations to the most recent HHS Guidelines, taking into account the unique characteristics of the nuclear industry which may warrant departures from specific aspects of the HHS Guidelines. As the Commission stated in its June 30, 1993, SRM, conformance with national standards may be a basis for finding substantial increase in protection. In view of the nature of the HHS Guidelines, the NRC believes that the FFD changes to conform Part 26 to the HHS Guidelines do represent such an instance, and contribute to Goal 1 for the rulemaking.

(iv) Ineffective/unnecessary Part 26 requirements

A significant number of the final Part 26 rule's changes remove requirements from Part 26 which implementation experience shows are either unnecessary or ineffective in achieving the intended objective of the requirement. Removing such requirements simplifies the FFD program and permits licensees to focus their attention on Part 26 requirements that have a more direct impact on FFD program effectiveness. Accordingly, the NRC regards these provisions as providing a substantial increase in protection to public health and safety, and contributing to Goals 3 and 5 for the rulemaking.

(v) Ambiguous or imprecise regulatory language in Part 26

A substantial number of provisions in the final Part 26 rule are intended to clarify former Part 26 requirements and other NRC guidance that use ambiguous or imprecise language. These changes are based upon the NRC Staff's experience with the implementation of Part 26 and fatigue management, which has included situations where the licensee's interpretation resulted in increased work hour deviations, increased opportunities for subversion, decreased assurance of FFD test integrity, and ineffective corrective action in response to confirmed positive results. Utilizing more precise regulatory language should result in a higher level of performance by licensees or other entities and provide a clear regulatory basis for enforcement action against licensees or other entities who fail to meet the clarified regulatory requirements. Accordingly, the NRC concludes that these provisions, which are intended to correct the deficiencies attributable to ambiguous or imprecise regulatory language, provide a substantial increase in protection, and contribute to Goal 6 for the rulemaking.

(vi) Technical developments resulting in higher levels of effectiveness

A number of the final Part 26 rule provisions are intended to reflect the technological improvements in testing methodologies, which improve the capability to identify specific drug metabolites and isomers indicative of illegal drugs and which have increased sensitivity permitting detection at lower levels. Such improvements can reduce false positives, thereby reducing the adverse effects to individuals, and they can reduce licensee resources currently expended on validating false positives. The improvements also have the capability to reduce false negatives, thus providing greater assurance that persons who have reduced cognitive functions due to illegal drug use are detected and prevented from performing safety-related work. There also is greater assurance that those who are less trustworthy and reliable, on average (as evidenced by drug and alcohol abuse) do not have access to the protected area and, therefore, do not pose a safeguards or security risk. The NRC concludes that these provisions constitute a substantial increase in protection to public health and safety, and contribute to Goals 1, 3, and 4 for the rulemaking.

(vii) Part 26 program integrity and protection of individual rights

Several of the final Part 26 rule provisions are intended to ensure that the FFD program requirements are implemented fairly by the licensee, and that individuals with significant responsibilities are not inappropriately influenced when performing their duties. Other provisions are intended to protect the rights of tested workers by providing a fair opportunity to address any findings of illegal drug use. The NRC concludes that these changes, when considered collectively, provide a substantial increase in protection to public health and safety, and contribute to Goal 7 for the rulemaking. A successful FFD program, and more generally a positive regulatory environment, depends in part upon the perception of workers at nuclear facilities that the NRC's regulatory requirements and their implementation by licensees are fair and appropriate. Workers who do not believe that NRC requirements are fair may be less likely to regard other NRC

requirements, or licensee procedures which implement NRC requirements, as justified and may be more likely to disregard them.

These key areas, and the manner in which specific Part 26 rule provisions address these areas and issues, are discussed in detail in the Statement of Considerations of the final Part 26 rule.

In light of the findings above, the NRC submits that the qualitative safety benefits of the final Part 26 rule provisions that qualify as backfits, considered in the aggregate, constitute a substantial increase in protection to public health and safety and the common defense and security, and that the costs of this rule are justified in view of the increase in protection to safety and security provided by the backfits embodied in the final rule.

4.4.2 Screening Review for Disaggregation

This section presents a screening analysis conducted to ensure that the aggregate analysis does not mask the inclusion of individual rule provisions that are not cost-beneficial when considered individually and not necessary to meet the goals of the rulemaking. This analysis has been conducted in accordance with direction provided in the Regulatory Analysis Guidelines of the U.S. Nuclear Regulatory Commission, NUREG/BR-0058, Revision 4.

The NRC conducted a two-step screening review to determine whether any final rule provisions should be evaluated on a disaggregated basis before including it in the overall rule.

In the first step of the screening review, the NRC identified all individual Part 26 rule changes that qualify as backfits where the total present value cost to industry is expected to reach or exceed approximately $50,000 per program (assuming a 7-percent discount rate), and/or where total initial industry costs are estimated to reach or exceed approximately $1,000,000. This step is necessary due to the large number of changes contained in this particular rulemaking. The threshold levels have been selected to be relatively inclusive (i.e., conservatively low) in recognition of the differing opinions expressed on various provisions during extensive stakeholder involvement. The $50,000 threshold also corresponds roughly to the cost of paying one worker for one year. The Staff believes the $1,000,000 threshold is a reasonable figure to consider significant for one-time costs to industry as a whole. Exhibit 4-17 presents the rule provisions identified in this initial step.

Exhibit 4-17
Identification of Requirements to Analyze Individually

Individual Requirement	Per Program Total Cost > $50,000 (Present Value)	Initial Cost to Industry > $1,000,000
26.27(a) Policy and Procedure Revisions - Overall Program	No	$974,444
26.29(b) Comprehensive Examination	$55,325	No
26.105(b) Inspecting Contents of Donor's Pockets	$168,105	No
26.131(b) Onsite Lab Initial Validity Tests	$207,706	No

Individual Requirement	Per Program Total Cost > $50,000 (Present Value)	Initial Cost to Industry > $1,000,000
26.137(e)(6) Quality Control Specimens in Each Analytical Run - Onsite Testing Facilities	$54,052	No
26.161(b)(1) HHS Lab Validity Testing	$173,356	No
26.189(c) Face-to-Face Determinations of Fitness	$61,692	No
26.203(a)-(b) Fatigue Policy and Procedures	No	$910,664
26.203(c) Training and Examinations for Fatigue	$1,886,662	$7,248,837
26.203(f) Fatigue Management Audits	$55,455	No
26.205(b) Calculating Work Hours	$597,050	$3,250,000
26.205(c) Work Hour Scheduling	$1,192,520	No
26.205(d)(4)-(6) Day-off Requirements	$8,437,945	No
26.207 Waivers from Individual Work Hour Limits	$8,191,100	No
26.211(a)-(d) Fatigue Assessments	$124,554	No
26.211(e) Post- Assessment Controls and Conditions	$281,519	No

In the second step of the screening review, the NRC determined whether each of the provisions identified in Exhibit 4-17 is necessary to meet one or more of the stated goals of the rule, as listed below (and discussed in additional detail in the Federal Register notice accompanying the final rule):

1. Update and enhance the consistency of 10 CFR Part 26 with advances in other relevant federal rules and guidelines, including the U.S. Department of Health and Human Services Mandatory Guidelines for Federal Workplace Drug Testing Programs (HHS Guidelines) and other Federal drug and alcohol testing programs (e.g., those required by the U.S. Department of Transportation [DOT]) that impose similar requirements on the private sector.

2. Strengthen the effectiveness of FFD programs at nuclear power plants in ensuring against worker fatigue adversely affecting public health and safety and the common defense and security by establishing clear and enforceable requirements for the management worker fatigue.

3. Improve the effectiveness and efficiency of FFD programs.

4. Improve consistency between FFD requirements and access authorization requirements established in 10 CFR 73.56, as supplemented by orders to nuclear power plant licensees dated January 7, 2003.

5. Improve 10 CFR Part 26 by eliminating or modifying unnecessary requirements.

6. Improve clarity in the organization and language of the rule.

7. Protect the privacy rights and other rights (including due process) of individuals who are subject to 10 CFR Part 26.

The results of the second step of the screening review, which are discussed in the remainder of this section and summarized in Exhibit 4-18, show that all of the individual requirements identified in the first step of the review are necessary to meet one or more goals of the rulemaking. Consequently, it is not necessary to evaluate any of the requirements independently to determine whether they are cost-justified on a stand-alone basis.

[The NRC is aware of some stakeholder comments arguing that provisions related to the second goal of the rulemaking, which relates to fatigue management, should be as a separate rulemaking. Inclusion of fatigue management within the current rulemaking, however, is consistent with the NRC's former rule, which in §26.20(a) explicitly identifies fatigue as a factor that could affect fitness for duty and that should be addressed by FFD programs. It also is consistent with the NRC's long-held policy, stated in 1982 in Generic Letter 82-12, that seeks to "prevent situations where fatigue could reduce the ability of operating personnel to keep the reactor in a safe condition." Nevertheless, in response to these stakeholder comments, the NRC has evaluated the costs and savings of the final rule's fatigue management provisions considered as a discrete set of requirements. This evaluation is presented in Section 4.1.4 of this regulatory analysis.]

Exhibit 4-18
Relationship of Individual "Step 1" Requirements to the Goals of the Rulemaking

Individual Requirement	Necessary to Rulemaking?
26.27(a) Policy and Procedure Revisions - Overall Program	Yes, necessary for goal 3
26.29(b) Comprehensive Examination	Yes, necessary for goals 3 and 5
26.105(b) Inspecting Contents of Donor's Pockets	Yes, necessary for goals 1 and 3
26.131(b) Onsite Lab Initial Validity Tests	Yes, necessary for goals 1 and 3
26.137(e)(6) Quality Control Specimens in Each Analytical Run - Onsite Testing Facilities	Yes, necessary for goal 3
26.161(b)(1) HHS Lab Validity Testing	Yes, necessary for goals 1 and 3
26.189(c) Face-to-Face Determinations of Fitness	Yes, necessary for goal 3
26.203(a)-(b) Fatigue Policy and Procedures	Yes, necessary for goals 2 and 3
26.203(c) Training and Examinations for Fatigue	Yes, necessary for goals 2 and 3
26.203(f) Fatigue Management Audits	Yes, necessary for goal 2
26.205(b) Calculating Work Hours	Yes, necessary for goals 2 and 3
26.205(c) Work Hour Scheduling	Yes, necessary for goal 2
26.205(d)(4)-(6) Day-off Requirements	Yes, necessary for goal 2

Individual Requirement	Necessary to Rulemaking?
26.207 Waivers from Individual Work Hour Limits	Yes, necessary for goal 2
26.211(a)-(d) Fatigue Assessments	Yes, necessary for goal 2
26.211(e) Post- Assessment Controls and Conditions	Yes, necessary for goal 2 and 7

§26.27(a), Policy and Procedure Revisions - Overall Program, is necessary for improving the effectiveness and efficiency of FFD programs (Goal 3). Clearly written FFD policy and procedures will make the programs more effective by ensuring that individuals subject to the rule know what is expected of them and what consequences may result from a lack of adherence to the policy and procedures. Development of the policy and procedures by management, and implementation of procedural controls within the facilities, are necessary to ensure that licensees' FFD management programs are properly and consistently implemented, and to avoid potential impacts on public health and safety and security if individuals are not fit to perform work safely. In addition, written policies and procedures will help to make adherence to the policy and procedures easier and more efficient for individuals who move from program to program.

§26.29(b), Comprehensive Examination, is necessary for ensuring the effectiveness and efficiency of FFD programs (Goal 3). By establishing a method to ensure that individuals understand the requirements with which they must comply (including remedial training for individuals that fail the comprehensive examination), the rule will make the programs more effective by ensuring that the FFD training has been effective. §26.29(b) also permits the use of various media for administering the comprehensive examination, in order to achieve the efficiencies associated with computer-based training and testing, for example, and other new training delivery technologies that may become available. Permitting the use of various media to administer the examination meets the portion of Goal 3 of this rulemaking that relates to improving the efficiency of FFD programs. The permission also meets Goal 5 to improve Part 26 by eliminating or modifying unnecessary requirements, by providing flexibility in the methods that licensees and other entities may use to administer the required examination.

§26.105(b), Inspecting Contents of Donor's Pockets, is necessary for updating and enhancing the consistency of 10 CFR Part 26 with advances in other relevant federal rules and guidelines, including the U.S. Department of Health and Human Services Mandatory Guidelines for Federal Workplace Drug Testing Programs (HHS Guidelines) and other Federal drug and alcohol testing programs (e.g., those required by the U.S. Department of Transportation [DOT]) that impose similar requirements on the private sector (Goal 1). Similar to this section of the final rule, DOT drug testing regulations require that a donor is asked to empty his or her pockets and display the items in them so the collector can identify items that the donor could use to adulterate or substitute his or her urine. This section is necessary to enhance the consistency of urine collection procedures in 10 CFR Part 26 with other relevant federal rules.

§26.105(b) also is necessary for improving the effectiveness and efficiency of FFD programs (Goal 3). Because collectors are required to ask the donor to empty his or her pockets, this section is necessary to provide assurance that the donor is not able to subvert the drug testing process. As a result, this section is necessary to improve the effectiveness and efficiency of FFD programs.

§26.131(b), Onsite Lab Initial Validity Tests, is necessary for updating and enhancing the consistency of 10 CFR Part 26 with advances in other relevant federal rules and guidelines, including HHS Guidelines and other Federal drug and alcohol testing programs (e.g., those required by DOT) that impose similar requirements on the private sector (Goal 1). Current HHS Guidelines contain requirements regarding initial validity tests and criteria for determining whether a specimen must be forwarded to the HHS-certified laboratory for further validity testing. This section adds similar requirements relative to testing each urine specimen for its creatinine concentration, pH, and the presence of one or more oxidizing adulterants, such as nitrite or bleach. This section is necessary because it harmonizes a licensee's initial validity testing procedures with HHS Guidelines. As a result, this section is necessary to enhance the consistency of 10 CFR Part 26 with other relevant federal rules.

§26.131(b) also is necessary for improving the effectiveness and efficiency of FFD programs (Goal 3). Because FFD programs are not permitted to establish more stringent cutoff levels for validity screening and initial validity testing, this section is necessary to decrease the risk of obtaining false positive test results and ensures that donors are not subject to sanctions on the basis of inaccurate test results. As a result, this section is necessary to improve the effectiveness and efficiency of FFD programs.

§26.137(e)(6) Quality Control Specimens in Each Analytical Run - Onsite Testing Facilities, is necessary for improving the effectiveness of FFD programs (Goal 3). The final rule applies requirements for quality controls to licensee testing facilities to provide greater assurance that the results of initial drug tests performed by these facilities are accurate. The increased performance testing is necessary because the final rule permits licensees and other entities to rely on test results from other Part 26 programs to a greater extent that the former rule. Therefore, it is necessary to ensure that any tests performed at licensee testing facilities meet minimum standards.

§26.161(b)(1), HHS Lab Validity Testing, is necessary for updating and enhancing the consistency of 10 CFR Part 26 with advances in other relevant federal rules and guidelines, including HHS Guidelines and other Federal drug and alcohol testing programs (e.g., those required by DOT) that impose similar requirements on the private sector (Goal 1). Current HHS Guidelines contain requirements regarding methods for conducting specimen validity testing at HHS-certified laboratories. This section adds similar requirements relative to HHS-certified laboratory testing requirements for validity tests. As a result, this section is necessary to enhance the consistency of 10 CFR Part 26 with other relevant federal rules.

§26.161(b)(1) also is necessary for improving the effectiveness and efficiency of FFD programs (Goal 3). Because HHS-certified laboratories are required to conduct initial validity tests, this section is necessary to decrease the risk of obtaining false positive test results and ensures that donors are not subject to sanctions on the basis of inaccurate test results. As a result, this section is necessary to improve the effectiveness and efficiency of FFD programs.

§26.189(c), Face-to-Face Determinations of Fitness, is necessary for improving the effectiveness and efficiency of FFD programs (Goal 3). Establishing requirements for face-to-face determinations of fitness will ensure that the professional who is performing the determination has available all of the sensory information that may be required for the assessment, such as the smell of alcohol or the individual's physical appearance. As a result, the effectiveness and efficiency of these determinations of fitness will be enhanced.

§§26.203(a)-(b), Fatigue Policy and Procedures, are necessary for strengthening the effectiveness of FFD programs by establishing clear and enforceable requirements concerning the management of fatigue (Goal 2). Requiring each licensee to develop a written policy statement that describes management's expectations and methods for managing fatigue, and requiring licensees to incorporate their fatigue management policy statement into written FFD policies and procedures will help to ensure that fatigue does not adversely affect individuals' abilities to safely and competently perform their duties. The NRC's past experience with worker fatigue, such as that documented in NRC Regulatory Issue Summary (RIS) 2002-007, Clarification of NRC Requirements Applicable to Worker Fatigue and Self-declarations of Fitness-For-Duty, dated May 10, 2002, indicates that there is a need for individuals to clearly understand their fatigue management responsibilities and those of the licensee. These requirements will ensure that there is a written record of how each FFD program subject to Subpart I meets the objectives and requirements of Part 26, Subpart I, and also a record of any allowable variations in the program. Clearly written fatigue policy and procedures will make the programs more effective by ensuring that individuals subject to the rule know what is expected of them and what consequences may result from a lack of adherence to the policy and procedures. In addition, because some licensees may choose to impose sanctions on individuals for failing to comply with the fatigue management policy or procedures, communication of the policy and its sanctions is necessary in order to protect individuals' rights to due process under the rule. Development of the policy and procedures by management and implementation of procedural controls within the plant are both necessary to ensure that licensees' fatigue management programs are properly and consistently implemented to avoid potential impacts on public health and safety and national security if individuals are too fatigued to perform work safely.

§§26.203(a)-(b) also are necessary for improving the effectiveness and efficiency of FFD programs generally (Goal 3). Written policies and procedures will help to make adherence to the policy and procedures easier and more efficient for individuals who move from program to program.

§26.203(c), Training and Examinations for Fatigue, is necessary for strengthening the effectiveness of FFD programs by establishing clear and enforceable requirements concerning the management of fatigue (Goal 2). Training will provide nuclear plant workers with knowledge of specific, fatigue-related topics that will facilitate personal decisions and actions that are consistent with the objective of preventing, detecting, and mitigating the adverse effects of fatigue on worker job performance. Individual workers typically do not possess these KAs (knowledge and abilities) without training. Training and examinations are the most effective and efficient means of ensuring that all individuals assigned to duties within the scope of Part 26, Subpart I, have the KAs necessary to detect conditions that arise from fatigue, know the personal and public health and safety hazards associated with fatigue, know the proper actions to be initiated to respond to those hazards, and understand their roles and responsibilities in the implementation of the FFD program as it addresses fatigue. Training will ensure that individuals are able to: (1) self-manage fatigue that is due to causes other than work hours; (2) take actions to maintain their alertness at work; and (3) recognize and seek treatment for sleep disorders that might be creating or exacerbating their own fatigue. This knowledge will also allow workers to make use of the provision for worker self-declarations of fatigue and the provision for for-cause fatigue assessments when workers exhibit symptoms of fatigue to managers or co-workers. The training, self-declaration, and fatigue assessment provisions will help ensure that individual variations in susceptibility to fatigue, arising from physiology, personal obligations, or life style, will be addressed outside and in addition to the individual work hour limits in the final rule. The

training provision will help avoid potential adverse consequences being caused by workers who, for whatever reason, are affected by fatigue irrespective of the other provisions of Subpart I.

§26.203(c) also is necessary for improving the effectiveness and efficiency of FFD programs generally (Goal 3). Training in specified KAs will help to make FFD programs more consistent from licensee to licensee, thereby making adherence to the policy and procedures easier and more efficient for individuals who move from program to program.

§26.203(f) Fatigue Management Audits, is necessary to strengthen the effectiveness of FFD programs by establishing clear and enforceable requirements for the management worker fatigue (Goal 2). Including the requirement for fatigue management audits is necessary to establish a method to ensure that a licensee or other entity's overall fatigue management program complies with the requirements in Part 26. The fatigue management audits will evaluate the effectiveness of a licensee or other entity's fatigue management program. The audits will identify program deficiencies that licensees and other entities must strengthen. Without such audits, FFD programs may not be as effective as possible due to weak fatigue management program elements. Therefore, §26.203(f) is necessary to strengthen the effectiveness of FFD programs through enforceable worker fatigue requirements.

§26.205(b), Calculating Work Hours, is necessary for strengthening the effectiveness of FFD programs by establishing clear and enforceable requirements concerning the management of fatigue (Goal 2). A consistent method of calculating work hours is a key component of any fatigue-management program, necessary to ensure that other program components are implemented effectively. Because under the NRC's Policy on Worker Fatigue, the concept of "work hours" was not defined and criteria for calculating work hours were not established, licensees have been inconsistent in defining and calculating work hours when implementing the Policy through their technical specifications and administrative procedures. Proper implementation of individual hour requirements established in §26.205(b), (c), and (d), is not possible in the absence of accurate calculation of work hours. This provision therefore is necessary to ensure that the safety benefits and other benefits of the work hours requirements are achieved. The final rule defines work hours and requirements for calculating them to ensure consistent and accurate implementation of the work hour controls.

§26.205(b) also is necessary for improving the effectiveness and efficiency of FFD programs generally (Goal 3). The provision will help to make FFD programs more consistent from licensee to licensee, thereby enabling the NRC to focus its inspection resources more efficiently.

§26.205(c), Work Hour Scheduling, is necessary for strengthening the effectiveness of FFD programs by establishing clear and enforceable requirements concerning the management of fatigue (Goal 2). This provision complements other fatigue-management provisions, including limits on individual waivers of work hour controls and requirements for breaks and days off at specified frequencies. Because human alertness and the propensity to sleep vary markedly through the course of a 24-hour period, as a consequence of circadian physiological rhythms that are outside the control of the individual, work scheduling (i.e., the sequencing of day, evening, and night shifts and the use of break periods between these shifts) can either optimize the ability of personnel to obtain adequate sleep and effectively transition from one shift to another, or challenge the individual's ability to get adequate rest. The duration of shifts, the number of consecutive shifts, the duration of breaks between blocks of shifts, and the direction of shift rotation, particularly for personnel who work rotating shifts, are critical elements of fatigue management. This section requires licensees to schedule the work hours of individuals in a

manner that is consistent with the objective of preventing impairment from fatigue and consequent safety-related risks due to the duration, frequency, or sequencing of successive shifts. This requirement provides a benefit separate from the maximum work hour and minimum break and days-off requirements that are specified in§26.205(d), which are intended for infrequent, temporary circumstances, and not as guidelines or limits for routine work scheduling. In addition, §26.205(d) does not address several elements of routine schedules that can significantly affect worker fatigue, such as shift length. Although §26.205(c) requires licensees to schedule personnel consistent with preventing impairment from fatigue from these scheduling factors, the NRC recognizes that the complexity of effectively addressing and integrating each of these factors in work scheduling decisions precludes a prescriptive requirement. Therefore, §26.205(c) establishes a non-prescriptive, performance-based requirement.

§26.205(d)(4)-(6), Individual Days-Off, is necessary for strengthening the effectiveness of FFD programs by establishing clear and enforceable requirements concerning the management of fatigue (Goal 2). The day-off provisions for outage periods are key components of fatigue management, because they require licensees to provide adequate days off for individuals who are performing the duties listed in §26.205(a). The day-off requirements help both to prevent and mitigate cumulative sleep debt, by providing opportunities for mitigative sleep and also provide time that individuals need to meet the many daily living obligations that they cannot otherwise readily meet (although due to individual variations in susceptibility to cumulative fatigue, arising from physiology, personal obligations, or life style, the other individual work hour controls and work scheduling provisions contained in Subpart I also are necessary). Without such opportunities, individuals must either forego activities that can be important to general mental and physical fitness (e.g., family interactions, exercise, recreation, doctor appointments) or sacrifice sleep and increase their sleep debt, which will result in impairment on the job. These provisions therefore are necessary components of the FFD fatigue management program.

§26.207, Waiver of Individual Work Hour Controls, is necessary for strengthening the effectiveness of FFD programs by establishing clear and enforceable requirements concerning the management of fatigue (Goal 2). The section provides for limited use of waivers allowing individuals to exceed the individual work hour limits. The waiver must be justified by circumstances in which compliance with the work hour controls could have immediate adverse consequences for the protection of public health and safety or the common defense and security. The provision specifies that an operations shift manager must determine that the waiver is necessary to mitigate or prevent a condition adverse to safety, or a security shift manager must determine that the waiver is necessary to maintain the security of the facility, or a site senior-level manager with requisite signature authority must make either determination. This provision will ensure that waivers of individual work hour controls are not used inappropriately. NRC's reviews of industry work scheduling practices during outages and of records of deviations from technical specification work hour controls indicated that previously the most common deviation was to permit individuals to work more than 72 hours in 7 days, frequently by working more than six consecutive 12-hour days, and that this practice was used extensively at a number of sites.[23] Some licensees were scheduling outages with several weeks of 12-hour shifts with no scheduled days off. The NRC's Policy on Worker Fatigue recognized that "very unusual circumstances may arise requiring deviation from the [work hour] guidelines." However, in SECY-01-0113, the NRC noted that the frequency of guideline deviations at a substantial proportion of sites appeared to

[23] As part of the NRC's rulemaking development efforts, the NRC reviewed information submitted voluntarily by six nuclear power plants in 2004.

be inconsistent with the intent of the policy. The criteria for granting waivers from the individual work hour controls in §26.205(d) are expected to significantly reduce the granting of waivers for work schedules that exceed the individual work hour limits. Such waivers are justified only for limited circumstances in which compliance with the work hour controls could have immediate adverse consequences for the protection of public health and safety or the common defense and security. The provision is intended to ensure that licensees grant waivers only to address circumstances that the licensee could not have reasonably controlled. This provision therefore is consistent with the objective of preventing impairment from fatigue and consequent safety-related risks due to the duration, frequency, or sequencing of work. This requirement supports the maximum work hour and minimum break and day-off requirements that are specified in §26.205(d) by limiting the circumstances in which the work hour provisions may be waived to conditions in which granting a waiver is consistent with maintaining safety.

§§26.211, Fatigue Assessments, is necessary for strengthening the effectiveness of FFD programs by establishing clear and enforceable requirements concerning the management of fatigue (Goal 2). By providing that fatigue assessments should be performed for cause, after a self-declaration, after an event that requires post-event drug and alcohol testing, as a followup to returning an individual to work after a self-declaration, and as a followup to a plant event that requires drug or alcohol testing, the provision will help to ensure that individuals who are observed to be in a condition creating a reasonable suspicion of impaired individual alertness or have indicated that they are not fit for duty because of fatigue are evaluated to determine whether they can, in fact, safely and competently perform their duties Fatigue assessments provide a necessary complement to work hour controls. Appropriately assessing fatigue is important because workers who are experiencing either acute or cumulative fatigue may not be able to perform their duties safely and competently. Worker fatigue, and its effects on worker alertness and performance, can result from many causes in addition to work hours (e.g., stress, sleep disorders, daily living obligations). In addition, there are substantial individual differences in the ability of individuals to work for extended periods without performance degradation from fatigue. Therefore, the work hours controls of §26.205 provide only partial assurance that individuals are not fatigued. The objective of the fatigue assessments is for licensees to appropriately identify and address instances of worker fatigue, including those that are not prevented by the work hour controls, regardless of the number of hours the individual has worked or rested. §26.211(b) and (c) specify who may perform the assessment, and the factors that must be addressed. Ensuring that the assessments are conducted by appropriate persons and cover appropriate topics is essential because, following a finding of fatigue, licensees are required by §26.211(e) to determine and implement the controls and conditions that are necessary if the individual who was the subject of the assessment is to resume performing duties for the licensee. Fatigue assessments are important for effective fatigue management because they provide the basis for fatigue management actions that may be necessary to address individual or programmatic issues contributing to recurring instances of fatigue.

§26.211(e), Post-Assessment Controls and Conditions, is necessary for strengthening the effectiveness of FFD programs by establishing clear and enforceable requirements concerning the management of fatigue (Goal 2). The fatigue assessments provide the basis for licensees to appropriately address instances of worker fatigue, including those that are not prevented by the work hour controls, regardless of the number of hours that the subject individual has worked or rested. Licensee actions for fatigue management could include either short-term corrective actions necessary to ensure that individuals are able to safely and competently perform their duties or long-term corrective actions that may be necessary to address issues contributing to recurring instances of fatigue.

§26.211(e) also is necessary for the protection of the privacy rights and other rights (including due process) of individuals who are subject to 10 CFR Part 26 (Goal 7). Because the corrective actions following a fatigue assessment could include relieving an individual of duties, this section is necessary to provide assurance that fatigue assessments include sufficient and appropriate information to support a valid assessment of the individual relative to fatigue and therefore an appropriate basis for management decisions and actions and protection of the privacy rights and other rights (including due process) of individuals who are subject to 10 CFR Part 26.

4.5 Safety Goal Evaluation

Safety goal evaluations are applicable only to regulatory initiatives considered to be generic safety enhancement backfits subject to the substantial additional protection standard at 10 CFR 50.109(a)(3).[24] The current rulemaking provides added assurance that individuals working at nuclear facilities are fit for duty and, consequently, the rule reduces safety and security risks ranging from workplace safety incidents up to radiological damage to the reactor core. The requirements may qualify, therefore, as generic safety enhancements because they may affect the likelihood of core damage, which generally is the focus of a quantitative safety goal evaluation. However, the magnitude of this change is not readily quantifiable due to uncertainties discussed in Section 3.2 of this analysis. A more dominant effect of the rule is to reduce the probability of other types of accidents and damages associated with a wide array of acts related to drug and alcohol abuse and fatigue, although this effect is equally difficult to quantify. Because the change in safety associated with the rulemaking cannot be quantified, the regulatory changes cannot be compared to the NRC's safety goals.

Certain aspects of the current rulemaking qualify as relaxations of requirements because they result in incrementally fewer activities needed to achieve the same goals. However, relaxations of requirements affecting nuclear power plants are not subject to safety goal evaluation. Therefore, no safety goal evaluation is needed for these requirements.

4.6 CRGR Results

This section addresses regulatory analysis information requirements for rulemaking actions or staff positions subject to review by the Committee to Review Generic Requirements (CRGR). All information called for by the CRGR is presented in this regulatory analysis, or in the Federal Register Notice for the final Part 26 rule. As a reference aid, Exhibit 4-19 provides a cross-reference between the relevant information and its location in this document or the Federal Register Notice.

[24] A safety goal evaluation is not needed, therefore, for new requirements falling within the backfit exceptions of 10 CFR 50.109(a)(4)(i)-(iii).

Exhibit 4-19
Specific CRGR Regulatory Analysis Information Requirements

CRGR Charter Citation	Information Item to be Included in a Regulatory Analysis Prepared for CRGR Review	Where Item is Discussed
IV.B(1)	Proposed generic requirement or staff position as it is proposed to be sent out to licensees. When the objective or intended result of a proposed generic requirement or staff position can be achieved by setting a readily quantifiable standard that has an unambiguous relationship to a readily measurable quantity and is enforceable, the proposed requirements should specify the objective or result to be attained rather than prescribing how the objective or result is to be attained.	Final rule text in Section XVII of the Federal Register Notice.
IV.B(iii)	The sponsoring office's position on whether the proposed action would increase requirements or staff positions, implement existing requirements or staff positions, or relax or reduce existing requirements or staff positions.	Regulatory Analysis, Section 4.1.
IV.B(iv)	The proposed method of implementation.	Regulatory Analysis, Section 6.
IV.B(vi)	Identification of the category of power reactors or nuclear materials facilities/activities to which the generic requirement or staff position will apply.	Regulatory Analysis, Section 3.2.2.
IV.B(vii) IV.B(viii)	If the proposed action involves a power reactor backfit and the exceptions at 10 CFR 50.109(a)(4) are not applicable, the items required at 10 CFR 50.109(c) and the required rationale at 10 CFR 50.109(a)(3) are to be included.	Regulatory Analysis, Section 4.4.
IV.B(x)	For proposed relaxations or decreases in current requirements or staff positions, a rationale is to be included for the determination that (a) the public health and safety and the common defense and security would be adequately protected if the proposed reduction in requirements or positions were implemented, and (b) the cost savings attributed to the action would be substantial enough to justify taking the action.	Section VI, "Section-by-Section Analysis of Substantive Changes," in the Federal Register Notice for the final rule.
IV.B(xii)	Preparation of an assessment of how the proposed action relates to the Commission's Safety Goal Policy Statement.	Regulatory Analysis, Section 4.5.

Exhibit has been adapted from NUREG/BR-0184, Table 2.3.

5. DECISION RATIONALE

5.1 Regulatory Analysis

Relative to the “no-action” alternative, the final rule results in a net cost estimated as approximately $444.7 million (total present value over a 49-year period), assuming a 7-percent discount rate, or approximately $695.3 million assuming a 3-percent discount rate. All of this cost accrues to industry, except for approximately $665,000 (7 percent) or $1,025,000 (3 percent) that accrues to the NRC. The rule results in one-time industry costs of approximately $13.7 million ($481,600 for the average program), and then generates annual costs of about $31.7 million ($1.2 million per program).

Offsetting this net cost, the NRC believes that the rule results in substantial non-quantified benefits related to safety and security, as well as enhanced regulatory efficiency and effectiveness, public perceptions, and improved workplace productivity and efficiency. These benefits are discussed in Sections 4.1.2 and 4.1.3 of this document. Based on the NRC's assessment of the costs and benefits of the final rule on licensee facilities, the agency has concluded that the final rule provisions is justified.

5.2 Backfit Analysis

The NRC conducted a backfit analysis of the final Part 26 rule relative to the backfit requirements in 10 CFR §50.109, 10 CFR §70.76, and 10 CFR §76.76. The analysis evaluates the aggregation of provisions that constitute backfits under the backfit rules. This analysis estimates that these provisions result in a net cost to industry of $580 million (present value) assuming a 7-percent discount rate, or $908.4 million assuming a 3-percent discount rate. The provisions cost industry about $13.7 million in initial costs and generate about $41.7 million in annual costs. For the average program, this equates to about $481,700 in one-time costs, and about $1.5 million in annual costs. Nevertheless, the NRC concludes that these impacts are justified by the substantial increase in the protection of public health and safety provided by this rule.

The NRC also conducted a screening analysis in accordance with NRC’s Regulatory Analysis Guidelines to ensure that the aggregate analysis does not mask the inclusion of individual rule provisions that are (1) not cost-beneficial when considered individually and (2) not necessary to meet the goals of the rulemaking. As discussed in Section 4.4.2, this review concludes that each of the individual backfit requirements are necessary to meet the goals of the rulemaking.

6. IMPLEMENTATION

This section identifies how and when the final action will be implemented, the required NRC actions to ensure implementation, and the impact on NRC resources.

6.1 Schedule

The action will be enacted through a final rule, with promulgation of the final rule within 30 days from the date of publication. However, licensees and other applicable entities may defer implementation of this rule, except for Subparts I and K, by one year from the date of publication. Subpart I must be implemented by licensees and other applicable entities no later than 18 months from the date of publication. Further, licensees and other applicable entities shall comply with the requirements of Subpart K within 30 days from the date of publication. The staff has not identified any impediments to implementing the recommended alternatives.

6.2 Impact on Other Requirements

As discussed in Section 4.1, affected licensee and C/V FFD programs will experience the principal impact of the revisions to 10 CFR Part 26. The NRC further expects that the revisions will have relatively small impacts on NRC resources, as also discussed in Section 4.1. Since 1982, the NRC has used existing personnel for regulatory activities concerning FFD programs, and the NRC does not anticipate the need to add staff or administrative personnel because current personnel will absorb the administration of the revised rule. Moreover, it is expected that the rule will reduce NRC's annual expenditures associated with implementation of the FFD program.

7. OTHER PROCEDURAL REQUIREMENTS

This final rule affects only licensees who are authorized to operate nuclear power reactors or to possess, use, or transport formula quantities of strategic special nuclear material (SSNM); corporations that obtain certificates of compliance or approved compliance plans involving formula quantities of SSNM; combined operating license holders; mixed oxide fuel fabrication facilities; and construction permit holders who have a plant under active construction. The companies that own these facilities do not fall within the definition of “small entities” set forth in the Regulatory Flexibility Act or the size standards adopted by the NRC on April 11, 1995 (60 FR 1834; 10 CFR 2.810). Therefore, this rule will not have a significant economic impact on a substantial number of small entities, as applicable under the Regulatory Flexibility Act of 1980 [(5 U.S.C. 605(b))].

APPENDIX 1: INCREMENTAL ACTIVITIES AND COST EQUATIONS FOR INDIVIDUAL PROVISIONS OF THE FINAL RULE

This appendix presents a detailed analysis of the incremental activities (including activities that qualify as backfits) required by each individual provision in the final rule. It also specifies the equations that the NRC staff used to estimate any costs or savings resulting from the individual rule provisions.

The appendix contains 15 "subparts" that directly correspond to the 15 subparts of the final Part 26 rulemaking:

Subpart A: Administrative Provisions

Subpart B: Program Elements

Subpart C: Granting and Maintaining Authorization

Subpart D: Management Actions and Sanctions to be Imposed

Subpart E: Collecting Specimens for Testing

Subpart F: Licensee Testing Facilities

Subpart G: Laboratories Certified by the DHHS

Subpart H: Determining FFD Policy Violations and Determining Fitness

Subpart I: Managing Fatigue

Subpart J: [Reserved]

Subpart K: FFD Programs for Construction

Subpart L: [Reserved]

Subpart M: [Reserved]

Subpart N: Recordkeeping and Reporting Requirements

Subpart O: Inspections, Violations, and Penalties

Subpart A: Administrative Provisions

26.1 Purpose

This section of the final rule imposes no cost and affords no saving because it merely simplifies and amends §26.1 of the former rule by removing certain references and provisions that are addressed elsewhere in the rule.

26.3 Scope

Paragraph 26.3 reorganizes and amends §26.2 of the former rule, as discussed below.

Paragraphs 26.3(a) - (c)

These paragraphs of the final rule impose no incremental cost and afford no saving because they merely clarify those licensees who are subject to the rule as already stated in paragraph 26.2(a) of the former rule.

Paragraph 26.3(d)

This paragraph of the final rule imposes no cost and affords no saving because it states that the regulations in this part also apply to contractor vendors (C/Vs) who implement FFD programs or program elements to the extent that the licensees and other entities specified in paragraphs 26.3(a) - (c) rely on those C/V FFD programs or program elements to meet the requirements of this part. C/Vs are already subject to the requirements of the former rule as stated in §26.23 of the former rule.

Paragraph 26.3(e)

This paragraph of the final rule imposes no incremental cost and affords no saving because it restates requirements contained in paragraph 26.2(b) of the former rule that stipulated that the regulations of this part do not apply to those licensees who possess, use, or transport formula quantities of irradiated SSNM.

26.4 FFD Program Applicability to Categories of Individuals

Paragraph 26.4(a)

This paragraph specifies those individuals who are subject to an FFD program that meets all of the requirements of 10 CFR Part 26, except Subpart K. This paragraph of the final rule imposes no incremental cost and affords no saving because it merely restates part of paragraph 26.2(a) of the former rule.

Paragraphs 26.4(b) - (c)

This paragraph specifies those individuals who are subject to an FFD program that meets all of the requirements of 10 CFR Part 26, except § 26.205 and Subpart K. This paragraph of the final rule imposes no incremental cost and affords no saving because it merely restates part of paragraph 26.2(a) of the former rule.

Paragraph 26.4(d)

This paragraph specifies those individuals who are subject to an FFD program that meets all of the requirements of 10 CFR Part 26, except Subparts I and K. This paragraph of the final rule imposes no incremental cost and affords no saving because it merely restates part of paragraph 26.2(a) of the former rule.

Paragraph 26.4(e)

Paragraph 26.4(e) of the final rule clarifies the FFD requirements for any individual whose duties for the licensees and other entities in § 26.3(c) require him or her to perform the following activities when construction activities begin at the location where the nuclear power plant will be constructed and operated: (1) serve as a security officer under NRC requirements; (2) perform quality assurance activities, as specified in Appendix B to part 50; (3) monitor the fitness of individuals specified in paragraph 26.4(f), as designated under section 26.406; or (4) determine that inspections, tests, and analyses, or parts thereof, required under part 52 have been successfully completed. Specifically, these individuals must be subject to an FFD program that meets all of the requirements of 10 CFR Part 26, except Subparts I and K. This paragraph imposes additional requirements relative to paragraph 26.2(c) of the former rule. This analysis, however, assumes that new reactor construction will be co-located with existing reactor sites. The licensees operating the reactors will be the same as those undertaking the construction activities at the co-located site. The analysis assumes that licensees and other entities will include the individuals identified above as part of the FFD program at the co-located operating reactor site. The NRC believes that any additional cost to include these individuals within the scope of the FFD program already being conducted is insignificant relative to the overall costs of the FFD program. Therefore, this analysis does not calculate incremental costs for this requirement of the final rule.

Paragraph 26.4(f)

Paragraph 26.4(f) of the final rule clarifies the FFD requirements for any individual who is constructing safety- or security-related structures, systems, and components (SSCs). Specifically, these individuals must be subject to an FFD program that meets the requirements of Subpart K, unless the licensee or other entity subjects these individuals to an FFD program that meets all of the requirements of this part, except Subparts I and K. This final paragraph imposes no incremental cost and affords no saving because it clarifies paragraph 26.2(c) of the former rule.

Paragraph 26.4(g)

Paragraph 26.4(g) clarifies that FFD program personnel shall be subject to the provisions and policies of the FFD program. Although the language of the former rule did not explicitly state that FFD program personnel were subject to the former rule, this was the Commission's intent. Further, FFD program personnel were required to meet the highest standards for honesty and integrity to ensure that the program yields valid results that are not being subverted (as addressed by Appendix A Section 2.3 of the former rule). Consequently, the revised subparagraph imposes no incremental cost and affords no saving.

Sensitivity Analysis - Industry Practices

Most licensees already subject FFD program personnel to drug and alcohol testing, as well as behavioral observation programs in order to meet the requirements of the former rule. Until recently, however, some licensee practices were inconsistent with the NRC staff's interpretation of the requirements and did not subject their medical review officers (MROs) to the provisions and policies of the FFD program. These licensees will incur additional one-time and annual costs to cover their MROs under their FFD programs in compliance with final regulation. The *one-time cost per program* results from the sum of the following costs:[1]

- One-time costs per program to subject their MROs to pre-access drug and alcohol testing to comply with the final regulation are calculated as follows:

  $NUM_{MROs} \times COST_{Test} \times PER_{Compliance}$

- One-time costs per program to pay for MRO travel to a licensee collection facility to comply with the final regulation are calculated as follows:

  $NUM_{MROs} \times HOURS_{Travel} \times WAGE_{MRO} \times PER_{Compliance}$

[1] The analysis assumes that licensees already test and appropriately train in-house FFD program personnel as required under Appendix A Section 2.3 of the former rule. The analysis also assumes that 25 percent of licensees will each need to address two contracted MROs under their testing and training programs in order to comply with this paragraph.

- One-time costs per program to conduct FFD training and to administer the comprehensive examination on their MROs to comply with final regulation are calculated as follows:

  $NUM_{MROs} \times HOURS_{Training} \times WAGE_{MRO} \times PER_{Compliance}$

Parameter	Description
$COST_{Test}$	Drug and alcohol testing cost per test (as described in Appendix 2, Exhibit A2-13)
$HOURS_{Training}$	Length of FFD program training for MROs (as described in assumptions below)
$HOURS_{Travel}$	Hours of MRO travel, waiting, and specimen collection time (as described in assumptions below)
NUM_{MROs}	Number of MROs per program (as described in assumptions below)
$PER_{Compliance}$	Percentage multiplier to spread compliance costs across all programs (as described in assumptions below)
$WAGE_{MRO}$	MRO wage rate (as described in Appendix 2, Exhibit A2-11)

Assumptions:

- Number of MROs per program: 2.

- Length of FFD program training for MROs: 2 hours.

- Hours of MRO travel, waiting, and specimen collection time, on average, under the former rule: 6 hours.

- Given their small number, the MROs will be added to existing training sessions and will not require incremental costs of providing additional training sessions.

- The per-unit cost of a pre-access drug and alcohol test for an MRO working for a licensee with *onsite testing facilities* includes the following factors:
  (1) collection of drug and alcohol specimens (labor of the collector only and collection materials)
  (2) onsite licensee testing costs per urine specimen for drugs and validity
  (3) labor of FFD manager to process paperwork for negative test results.

- The per-unit cost of a pre-access drug and alcohol test for an MRO working for a licensee with *offsite testing facilities* includes the following factors:
  (1) collection of drug and alcohol specimens (labor of the collector only and collection materials);
  (2) HHS-certified laboratory costs per urine specimen for drugs and validity
  (3) labor of FFD manager to process paperwork for negative test results.

- No positive drug or alcohol test results are anticipated for the MRO.

- Licensees have estimated that 25 percent of licensees may not interpret the former regulation to require inclusion of the MRO under the FFD program. Because the analysis cannot identify which facilities were interpreting the former rule correctly and which were not, the analysis assumes that each program will incur the incremental cost of 25 percent of the activity ($PER_{Compliance}$).

Annual costs will arise from adding MROs to the random drug and alcohol testing program. The *annual costs per program* result from the sum of the following costs:

- Annual cost per program to administer a random drug and alcohol testing program for FFD program personnel to comply with the final regulation are calculated as follows:

  $$NUM_{MROs} \times PER_{Random} \times COST_{Test} \times PER_{Compliance}$$

- Annual cost per program to pay for MROs selected for random drug and alcohol testing to travel to the specimen collection facility and provide a specimen to comply with the final regulation are calculated as follows:

  $$NUM_{MROs} \times PER_{Random} \times HOURS_{Travel} \times WAGE_{MRO} \times PER_{Compliance}$$

Parameter	**Description**
$COST_{Test}$	Drug and alcohol testing cost per test (as described in Appendix 2, Exhibit A2-13)
$HOURS_{Travel}$	Hours of MRO travel, waiting, and specimen collection time (as described in assumptions below)
NUM_{MROs}	Number of MROs per program (as described in assumptions below)
$PER_{Compliance}$	Percentage multiplier to spread compliance costs across all programs (as described in assumptions below)
PER_{Random}	Percentage tested by a random drug and alcohol testing program per year (as described in assumptions below)
$WAGE_{MRO}$	MRO wage rate (as described in Appendix 2, Exhibit A2-11)

Assumptions:

- Number of MROs per program: 2.

- Percentage tested by a random drug and alcohol testing program: 50%.

- Hours of MRO travel, waiting, and specimen collection time, on average, under the former rule: 6 hours.

- The per-unit cost of a random drug and alcohol test for an MRO working for a licensee with onsite testing facilities includes the following factors:
  (1) collection of drug and alcohol specimens (labor of the collector only and collection materials)
  (2) onsite licensee testing costs per urine specimen for drugs and validity
  (3) labor of FFD manager to process paperwork for negative test results.

- The per-unit cost of a random drug and alcohol test for an MRO working for a licensee with offsite testing facilities includes the following factors:
  (1) collection of drug and alcohol specimens (labor of the collector only and collection materials)
  (2) HHS-certified laboratory costs per urine specimen for drugs and validity
  (3) labor of FFD manager to process paperwork for negative test results.

- No positive drug or alcohol test results are anticipated for the MRO.

- Licensees have estimated that 25 percent of licensees did not interpret the former regulation to require inclusion of the MRO under the FFD program. Because the analysis cannot identify which facilities were interpreting the former rule correctly and which were not, the analysis assumes that each program will incur the incremental cost of 25 percent of the activity.

Paragraph 26.4(h)

This paragraph of the final rule adds a provision specifying that individuals who have applied for authorization to have the types of access or perform the activities described in paragraphs 26.4(a)-(g) must be subject to the applicable requirements of this part and provided with the applicable protections of this part. The incremental costs and savings from this final paragraph are calculated in their respective sections.

Paragraph 26.4(i)

This paragraph [including subparagraphs (i)(1)-(i)(4)] specifies the individuals who are not subject to an FFD program.

Subparagraph 26.4(i)(1)

This subparagraph of the final rule imposes no incremental cost and affords no saving because it merely states that persons who are not employed by, nor routinely provide services for, a licensee or other entity, but who may be called on to provide an FFD program service are not covered under the final rule. Some licensees have indicated that their auditors have insisted that local hospitals, treatment facilities, or other facilities providing infrequent FFD program services must be audited annually. Nevertheless, this analysis calculates no savings because the prevalence of such auditing practices is unknown.

Subparagraph 26.4(i)(2)

This subparagraph of the final rule imposes no incremental cost and affords no saving because it merely restates requirements contained in paragraph 26.2(b) of the former rule, which stated that NRC employees, law enforcement personnel, and offsite emergency fire and medical response personnel responding onsite are not subject to the final rule.

Subparagraph 26.4(i)(3)

This subparagraph of the final rule imposes no incremental cost and affords no saving because it merely restates requirements contained in paragraph 26.2(b) of the former rule. The final subparagraph states that strategic special nuclear material (SSNM) transporter personnel who are subject to U.S. Department of Transportation drug and alcohol fitness programs that require random testing for drugs and alcohol are not subject to the FFD program.

Subparagraph 26.4(i)(4)

This subparagraph of the final rule imposes no incremental cost and affords no saving because it merely states that FFD program personnel of a program that is regulated by another Federal agency or State on which a licensee or other entity relies to meet the requirements of this part are not subject to the FFD program, if the FFD program personnel are not employed by the licensee or other entity and their normal workplace is not at the licensee's or other entity's facility. This analysis calculates no saving because the prevalence of such personnel is unknown.

Paragraph 26.4(j)

This paragraph is a new requirement that allows licensee's FFD programs to exclude individuals who are covered by another program that is regulated by a Federal or State agency, provided that the program meets the general performance objectives of the FFD rule, as well as the requirements under subparagraphs 26.4(j)(1)–(5). Licensees need only subject these individuals to those elements of the FFD program that are not included in the other program. This revision reduces the burden on some individuals who are currently subject to Federal and State programs with requirements that duplicate those of Part 26. This revision will yield annual savings by eliminating the duplication of pre-access testing, training (non-supervisory level training under

the former rule), and comprehensive examinations (including retesting and remedial training for those who fail the comprehensive examinations) for applicants for initial authorization. Savings from being able to forego the suitable inquiry are not calculated because licensees would still be required to verify that the other program provides adequate coverage and complies with the requirements in this part. The provision also will yield an annual savings by eliminating duplicate random drug and alcohol testing coverage for existing employees. Under the final rule, cutoff levels for drugs and drug metabolites are harmonized with other Federal drug testing programs (per §§26.131 and 26.163), which also increases the likelihood that other programs will be acceptable.

The annual savings per program result from the sum of the following savings:

- The *annual savings per program* from bypassing pre-access drug and alcohol testing for the percentage of applicants covered by an acceptable program are calculated as follows:[2]

  - Pre-access drug and alcohol tests need not be performed at *facilities with onsite testing laboratories* for the percentage of applicants who are covered by an acceptable program. The associated savings are estimated as follows:

    $$NUM_{Applicants} \times PER_{Covered} \times COST_{Onsite} \times NUM_{Units}$$

  - Pre-access drug and alcohol tests need not be performed at *facilities with offsite testing laboratories* for the percentage of applicants who are covered by an acceptable program. The associated savings are estimated as follows:

    $$NUM_{Applicants} \times PER_{Covered} \times COST_{Offsite} \times NUM_{Units}$$

- The *annual savings per program* from bypassing the training and examination requirements for the percentage of applicants covered by an acceptable program are calculated as follows:

  $$NUM_{Applicants} \times PER_{Covered} \times (HOURS_{Non\text{-}Supervisory} + HOURS_{Exam}) \times WAGE_{Worker} \times NUM_{Units}$$

- The *annual savings per program* from requiring fewer contracted trainer hours to conduct trainings and examinations on the percentage of applicants who are covered by acceptable program are calculated as follows:

[2] These incremental savings will vary for programs depending on whether the program has onsite testing capabilities or utilizes an offsite HHS-certified testing laboratory.

$NUM_{Sessions} \times (HOURS_{Non\text{-}Supervisory} + HOURS_{Exam} + HOURS_{Preparation}) \times WAGE_{Trainer} \times NUM_{Units}$

- The *annual savings per program* from not conducting remedial training and reexamining the percentage of applicants who are covered by an acceptable program and fail the comprehensive examination are calculated as follows:

  $PER_{Failing} \times [(NUM_{Applicants} \times PER_{Covered}) \times (HOURS_{Remedial\ Training} + HOURS_{Exam}) \times WAGE_{Worker}] \times NUM_{Units}$

- The *annual savings per program* from requiring fewer contracted trainer hours to conduct remedial training and reexamining those applicants covered by an acceptable program that fail the comprehensive examination are calculated as follows:

  $[NUM_{Sessions} \times (HOURS_{Remedial} + HOURS_{Exam}) \times WAGE_{Trainer}] \times PER_{Failing} \times NUM_{Units}$

- The *annual savings per program* from not subjecting existing employees who are covered by another acceptable program to a duplicative random drug and alcohol testing program are calculated as follows.

  $(NUM_{Employees} \times PER_{Covered}) \times (COST_{Test} \times PER_{Random}) \times NUM_{Units}$

Parameter	**Description**
$COST_{Offsite}$	Drug and alcohol testing cost at facilities with offsite testing laboratories per test (as described in assumptions below and in Appendix 2, Exhibit A2-13)
$COST_{Onsite}$	Drug and alcohol testing cost at facilities with onsite testing laboratories per test (as described in assumptions below and in Appendix 2, Exhibit A2-13)
$HOURS_{Exam}$	Length of comprehensive examination (as described in assumptions below)
$HOURS_{Non\text{-}Supervisory}$	Length of non-supervisory-level training (as described in assumptions below)
$HOURS_{Preparation}$	Hours of preparation and examination grading per session (as described in assumptions below)
$HOURS_{Remedial}$	Length of remedial non-supervisory-level training (as described in Appendix 2, Exhibit A2-3)
$NUM_{Applicants}$	Annual number of applicants for initial authorization per unit who are covered by any other Federal or State program (as described in assumptions below)
$NUM_{Employees}$	Number of existing employees covered by any other Federal or State program (described in assumption below)
NUM_{Units}	Number of units per program (as described in Appendix 2, Exhibit A2-14)

Parameter	Description
$NUM_{Sessions}$	Annual number of training and examination sessions (as described in assumptions below)
$PER_{Covered}$	Percentage of Federal or State programs qualifying under subparagraph 26.25(c)(1) per year (as described in assumptions below)
$PER_{Failing}$	Percentage failing comprehensive examination (as described in assumptions below)
PER_{Random}	Percentage tested by a random drug and alcohol testing program per year (as described in assumptions below)
$WAGE_{Trainer}$	Trainer wage rate (as described in Appendix 2, Exhibit A2-11)
$WAGE_{Worker}$	Facility worker wage rate (as described in Appendix 2, Exhibit A2-11)

Assumptions:

- Annual number of applicants for initial authorization per unit covered by any other Federal or State Program: 10.
- Percentage of Federal or State Programs qualifying under subparagraph 26.4(j)(1): 50%.
- Length of non-supervisory-level training: 2 hours.
- Length of comprehensive examination: 0.5 hours.
- Percentage failing comprehensive examination: 10%.
- Percentage tested by random drug and alcohol testing program per year: 50%.
- Number of training sessions assumes 20 workers per session.
- Hours of preparation and examination grading: 2 hours.
- Number of existing employees covered by any other Federal or State program: 40.
- All affected personnel take non-supervisory-level training under the former rule.[3]

[3] This assumption has been made to simplify the above calculation for MROs. Elsewhere the analysis assumes that 85 percent of personnel are being trained at the non-supervisory-level under the former rule, and that the remaining 15 percent are being trained at the supervisory-level.

- The per-unit cost of an onsite pre-access and random drug and alcohol test includes the following factors:
  (1) travel time of the worker
  (2) collection of drug and alcohol specimens (labor of the collector and the worker, as well as collection materials)
  (3) onsite licensee testing costs per urine specimen for drugs
  (4) labor of FFD manager to process paperwork for negative test results

- The per-unit cost of an offsite pre-access and random drug and alcohol test includes the following factors:
  (1) travel time of the worker
  (2) collection of drug and alcohol specimens (labor of the collector and the worker, as well as collection materials)
  (3) HHS-certified laboratory costs per urine specimen for drugs
  (4) labor of FFD manager to process paperwork for negative test results.

- Individuals whose pre-access drug and alcohol tests yield positive results will be eliminated from the hiring process.

26.5 Definitions

This section of the final rule re-states, clarifies, and adds definitions that are used throughout the entire final FFD rule. A number of these added and revised definitions will require licensees and C/Vs to modify or update their interpretation of current FFD policy, thereby resulting in incremental costs or savings. These costs and savings, however, are discussed in relevant sections of this analysis. The section adds a number of definitions, including those listed below, which are addressed later in this analysis within the context of the requirements that reference them.

- acute fatigue
- alertness
- best effort
- circadian variation in alertness and performance
- cumulative fatigue
- directing
- fatigue
- formula quantity
- increase in threat condition
- other entity
- validity screening test

26.7 Interpretations

This section of the final rule imposes no incremental cost and affords no saving because it merely restates §26.4 of the former rule and provides that interpretation of the meaning of the regulations requires a written interpretation by the General Counsel in order to be recognized as binding upon the Commission.

26.8 Information Collection Requirements: OMB Approval

This section of the final rule [including paragraphs 26.8(a) and (b)] imposes no incremental cost and affords no saving because it merely renumbers and amends §26.8 of the former rule to reference the revised recordkeeping requirements of the final rule. The information collection requirements and their associated costs are discussed in subsequent sections.

26.9 Specific Exemptions

This section of the final rule imposes no incremental cost and affords no saving because it merely restates §26.6 of the former rule and provides that the NRC may (in instances authorized by law and deemed not to endanger life, property, or the public interest) grant exemptions from the requirements of Part 26.

26.11 Communications

This section provides consistency with other 10 CFR parts and states that all communications, applications, and reports concerning the regulations in this part must be sent to a specified NRC address. The section will, however, add a requirement that copies of all communications to the NRC be sent to the appropriate regional office and resident inspector. No incremental costs arise from this requirement, however, as the additional cost to send the additional copies electronically is negligible.

Subpart B: Program Elements

26.21 Fitness-for-Duty Program

This section of the final rule imposes no incremental cost and affords no saving because it merely states that licensees and other entities specified in paragraph 26.3(a) through (c) must implement FFD programs that comply with this part, as required by paragraph 26.3(b) of the former rule.

26.23 Performance Objectives

Paragraphs 26.23(a)–(d)

Paragraphs 26.23(a)-(c) of the final rule merely clarify the program performance objectives contained in paragraphs 26.10(a)-(b) of the former rule. Paragraph 26.23(d) of the final rule amends and clarifies former paragraph 26.10(c) regarding the objective that FFD programs provide reasonable assurance that workplaces specified in § 26.3(a), (b), and, if applicable, (c) are free from the presence and effects of illegal drugs and alcohol. The analysis assumes that any incremental costs and savings related to this objective are imposed by subsequent provisions that implement this objective.

Paragraph 26.23(e)

This paragraph of the final rule amends the performance objectives for FFD programs to include reasonable assurance that the effects of fatigue and degraded alertness are managed commensurate with maintaining public health and safety. Incremental costs associated with this performance objective are analyzed under the relevant sections that implement the objective, particularly the provisions in Subpart I.

26.25 Reserved

26.27 Written Policy and Procedures

Paragraph 26.27(a)

This paragraph amends requirements, in §26.20 of the former rule, regarding the establishment, implementation, and maintenance of written policies and procedures designed to meet the general performance objectives and requirements of this part. Licensees and other entities must revise their existing policies, procedures, and contracts with labs or other C/Vs according to paragraphs 26.27(b) and (c), resulting in incremental costs. The costs of the revisions will include policy and procedure development and revision, legal support, and clerical support. Costs associated with revisions to the FFD training program are calculated separately in connection with paragraph 26.29(a).

The *one-time cost per program* results from the sum of the following costs:

- One-time costs per program to account for FFD manager and clerical personnel time and to contract a legal consultant are calculated as follows:

  $(HOURS_{Manager} \times WAGE_{Manager}) + (HOURS_{Legal} \times WAGE_{Legal}) + (HOURS_{Clerical} \times WAGE_{Clerical})$

- One-time costs per program to account for facility supervisor time to implement the corporate policies at the facility level are calculated as follows:

  $HOURS_{Facility\ Supervisor} \times WAGE_{Facility\ Supervisor} \times NUM_{Facilities}$

Parameter	**Description**
$HOURS_{Clerical}$	Hours of clerical personnel to support revision of policies, procedures, and contracts per program (as described in assumptions below)
$HOURS_{Facility\ Supervisor}$	Hours of facility supervisor time to implement revised corporate policies and procedures per facility (as described in assumptions below)
$HOURS_{Legal}$	Hours of legal assistance to review and revise policies, procedures, and contracts per program (as described in assumptions below)
$HOURS_{Manager}$	Hours of FFD program manager labor to develop and revise policies, procedures, and contracts per program (as described in assumptions below)
$NUM_{Facilities}$	Number of facilities (as described in Appendix 2, Exhibit A2-14)
$WAGE_{Clerical}$	Clerical personnel wage rate (as described in Appendix 2, Exhibit A2-11)
$WAGE_{Facility\ Supervisor}$	Facility supervisor wage rate (as described in Appendix 2, Exhibit A2-11)
$WAGE_{Legal}$	Legal consultant wage rate (as described in Appendix 2, Exhibit A2-11)
$WAGE_{Manager}$	FFD program manager wage rate (as described in Appendix 2, Exhibit A2-11)

Assumptions:

- Hours of FFD program manager labor to develop and revise policies, procedures, and contracts per program: 370 hours.

- Hours of legal assistance to review and revise policies, procedures, and contracts per program: 95 hours.

- Hours of clerical personnel to support revision of policies, procedures, and contracts per program: 95 hours.

- Hours of facility supervisor time to implement revised corporate policies and procedures: 40 hours.

- Policy and procedure revisions are developed once per operating firm, regardless of the number of sites or facilities the firm operates.

Paragraph 26.27(b)

This paragraph of the final rule establishes regulatory requirements regarding the content of policy statements. The final paragraph requires that written policies and procedures be clear, concise and readily available to all individuals subject to the policy such that they may understand what is expected of them and what consequences may result from lack of adherence to the policy. These requirements amend the requirements contained in §26.20 of the former rule. The analysis calculates the cost of this revision as part of the related revisions required under paragraph 26.27(a) except as discussed below.

Subparagraphs 26.27(b)(1)–26.27(b)(10)

These subparagraphs of the final rule establish regulatory requirements regarding the content of policy statements. These subparagraphs of the final rule highlight the minimum content of the written policies and procedures available to individuals subject to the policy. These subparagraphs provide more detail on what to include in the written policies and procedures than is contained in paragraph 26.20(a) of the former rule. The analysis calculates the cost of this revision as part of the related revisions required under paragraph 26.27(a).

Subparagraph 26.27(b)(11)

This paragraph requires licensees' written policies and procedures to describe the responsibility of individuals subject to the FFD program (i.e., other than the supervisors, managers, and escorts who are addressed in 26.27(b)(10)) to report FFD concerns (e.g., concerns identified as a result of behavioral observation). The cost of revising the policies and procedures to include this description is included in the calculation under 26.27(a). The new policy will be communicated to employees through the training program required under 26.29 (the costs of which are calculated under 26.29). As a result of the new policy, there will be an increase in the number of for-cause referrals, the number of drug and alcohol tests performed, and the number of positive test results that must undergo confirmatory testing. The analysis calculates the cost of these activities under paragraph 26.33.

Paragraph 26.27(c)

Subparagraph 26.27(c)(1)

This subparagraph of the final rule imposes no incremental cost and affords no saving because it only describes the written procedures that must be prepared, implemented, and maintained by

licensees and other entities related to testing for drugs and alcohol. The requirement to address these procedures is already contained in paragraph 26.20(c) of the former rule.

Subparagraph 26.27(c)(2)(i) and (ii)

These subparagraphs of the final rule impose no incremental cost and afford no saving because they merely state that licensee and other entity written policies and procedures must describe the immediate and follow-up actions to be taken and procedures to be followed when an individual has been involved in the use, sale, or possession of illegal drugs and when an individual has consumed any alcohol during the abstinence period, while on duty, or to excess before reporting to duty. These requirements are already contained in paragraph 26.20(d) of the former rule.

Subparagraph 26.27(c)(2)(iii)–(v)

These subparagraphs of the final rule impose no incremental cost and afford no saving because they merely state that licensee and other entity written policies and procedures must describe the follow-up actions to be taken and procedures to be followed when an individual has attempted to subvert the testing process, refused to provide a specimen for analysis, and had legal action taken on a drug or alcohol related charge. The costs associated with revising licensee and other entity written policy and procedures to address these violations of FFD policy are addressed in paragraph 26.27(a).

Subparagraph 26.27(c)(3)

This subparagraph of the final rule imposes no incremental cost and affords no saving because it only requires that licensee and other entity written policies and procedures must describe (1) the process to ensure that persons called in to perform an unscheduled working tour are fit for duty, and (2) the requirements for licensee and other entity personnel who are scheduled by licensee emergency plans and procedures to physically report to a licensee's Technical Support Center or Emergency Operations Facility. The former rule already required these descriptions to be contained in licensee written policies and procedures under former subparagraph 26.20(e).

Subparagraph 26.27(c)(4)

This subparagraph of the final rule requires that licensee and other entity written policies and procedures must describe the process to be followed if an individual's behavior indicates a potential FFD concern. Although licensees have indicated that the written procedure for managers, supervisors, and escorts to report FFD concerns is well established, the final rule, in conjunction with 26.27(b)(11), adds provisions that all employees are required to report FFD concerns. As a result, the procedures may need to be revised. The incremental cost of these revisions are included in the complete written policy revision calculated under 26.27(a) of this analysis, and the cost of implementing the policy and process is calculated under 26.33.

Paragraph 26.27(d)

This subparagraph of the final rule imposes no incremental cost and affords no saving because it merely retains requirements contained in paragraph 26.20(f) of the former rule stating that the NRC may review licensee or other entity written policies and procedures at any time to assure that the performance objectives of this part are met.

26.29 Training

Paragraph 26.29(a)

This paragraph requires licensees to revise their training programs and training materials to account for the new FFD provisions in the final rule and to include behavioral observation training for all individuals subject to this Subpart. (Currently, behavioral observation is included only in supervisory-level training.) Licensees will incur costs to revise their training programs and materials to reflect the new regulatory provisions. However, the provision to include behavioral observation training for all individuals subject to the rule is already in effect due to the AAO. Therefore, there will be no incremental costs associated with the behavioral observation training provision, except under the alternative Pre-Order Baseline.

The *one-time cost per program* associated with revising the training program and training materials to account for new FFD provisions in the final rule are calculated as follows:

$$(HOURS_{Trainer} \times WAGE_{Trainer}) + (HOURS_{Training\_Manager} \times WAGE_{Training\_Manager}) + (HOURS_{Manager} \times WAGE_{Manager}) + (HOURS_{Clerical} \times WAGE_{Clerical})$$

Parameter	Description
$HOURS_{Manager}$	One-time hours of FFD program manager time per program to review the revised training program and revised training materials to account for new FFD provisions in the final rule (described in assumptions below)
$HOURS_{Trainer}$	One-time hours of trainer time per program to revise the training program and training materials to account for new FFD provisions in the final rule (described in assumptions below)
$HOURS_{Training\_Manager}$	One-time hours of training manager time per program to review the revised training program and revised training materials to account for new FFD provisions in the final rule (described in assumptions below)
$HOURS_{Clerical}$	One-time hours of clerical personnel per program to support the revision of the training program and training materials to account for new FFD provisions in the final rule (described in assumptions below)
$WAGE_{Trainer}$	Trainer wage rate (described in Appendix 2, Exhibit A2-11)
$WAGE_{Training\_Manager}$	Training manager wage rate (described in Appendix 2, Exhibit A2-11)
$WAGE_{Manager}$	FFD program manager wage rate (described in Appendix 2, Exhibit A2-11)

Parameter	Description
$WAGE_{Clerical}$	Clerical personnel wage rate (described in Appendix 2, Exhibit A2-11)

Assumptions:

- Hours of trainer time per program to revise the training program and training materials to address new FFD provisions in the final rule: 20 hours.

- Hours of training manager time per program to review the revised training program and revised training materials to address new FFD provisions in the final rule: 2 hours.

- Hours of FFD program manager time per program to review the revised training program and revised training materials to address new FFD provisions in the final rule: 2 hours.

- Hours of clerical personnel to support the revision of the training program and training materials addressing new FFD provisions in the final rule: 4 hours.

Sensitivity Analysis Note - Pre-Order Baseline

Relative to the regulations in effect prior to NRC's issuance of the Access Authorization Order, this final paragraph results in additional incremental costs. The additional costs arise from the requirement to include behavioral observation training for all individuals subject to the rule. (Currently, behavioral observation is included only in supervisory-level training.)

The revisions to the training program and processes related to behavioral observation training will cause licensees to incur incremental costs for the following activities:

- Training course revisions
- Upgrade to supervisory-level training addressing behavioral observation
  - One-time
  - Annual
- Refresher training

Training Course Revisions. The incremental changes presented in subparagraph 26.29(a)(9) (as well as the AAO) will require licensees to revise their training programs to incorporate behavioral observation training for all individuals subject to the rule. *The one-time cost per program* associated with revising the training program result from the following:

$$(HOURS_{Trainer} \times WAGE_{Trainer}) + (HOURS_{Training\_Manager} \times WAGE_{Training\_Manager}) + (HOURS_{Manager} \times WAGE_{Manager}) + (HOURS_{Clerical} \times WAGE_{Clerical})$$

Parameter	Description
$HOURS_{Trainer}$	Hours of trainer time per program to make revisions to the training program (as described in assumptions below)
$HOURS_{Training\_Manager}$	Hours of training manager time per program to review the revised training program (as described in assumptions below)
$HOURS_{Clerical}$	Hours of clerical personnel per program to support the training program revisions process (as described in assumptions below)
$HOURS_{Manager}$	Hours of FFD program manager time per program to review the revised training program (as described in assumptions below)
$WAGE_{Trainer}$	Trainer wage rate (as described in Appendix 2, Exhibit A2-11)
$WAGE_{Training\_Manager}$	Training manager wage rate (as described in Appendix 2, Exhibit A2-11)
$WAGE_{Clerical}$	Clerical personnel wage rate (as described in Appendix 2, Exhibit A2-11)
$WAGE_{Manager}$	FFD program manager wage rate (as described in Appendix 2, Exhibit A2-11)

Assumptions:

- Hours of trainer time per program to make revisions to the training program addressing behavioral observation for all individuals subject to the rule: 12 hours.

- Hours of training manager time per program to review revisions to the training program addressing behavioral observation for all individuals subject to the rule: 2 hours.

- Hours of FFD program manager time per program to review revisions to the training program addressing behavioral observation for all individuals subject to the rule: 2 hours.

- Hours of clerical personnel per program to support the training program revisions process: 4 hours.

Initial Behavioral Observation Training for All Individuals Who Are Subject to the Rule. Paragraph 26.29(a) also requires training in behavioral observation for all individuals who are subject to the rule, rather than only for supervisors and escorts as required in §26.22 of the former rule. In other words, all individuals must receive what currently is supervisory-level training. As a result of this new training requirement, licensees will incur a one-time cost to retrain all existing employees who have not previously received training in behavioral observation, an annual cost to train newly hired employees in behavioral observation and an annual cost to provide behavioral observation refresher training as required under subparagraph 26.29(c)(2).

Licensees will incur a *one-time incremental cost* in order to provide updated training to all individuals who are already covered by the FFD program, but who have not already had full supervisory-level training. The *one-time cost per program* results from the sum of the following costs:[1]

- One-time costs per program for employees not previously trained at the supervisory level to take updated behavioral observation training and a comprehensive examination are calculated as follows:

  $$[NUM_{Employees} \times PER_{Non\text{-}Supervisory} \times (HOURS_{Training} + HOURS_{Examination}) \times WAGE_{Worker} \times NUM_{Units}] \times PER_{Cost}$$

- One-time costs per program for trainers to administer behavioral observation training to those employees not previously trained at the supervisory level are calculated as follows:[2]

  $$[NUM_{Sessions} \times (HOURS_{Training} + HOURS_{Examination} + HOURS_{Preparation}) \times WAGE_{Trainer} \times NUM_{Units}] \times PER_{Cost}$$

Parameter	**Description**
$HOURS_{Examination}$	Length of comprehensive examination (as described in assumptions below)
$HOURS_{Preparation}$	Hours of preparation and examination grading per session (as described in assumptions below)
$HOURS_{Training}$	Length of updated supervisory-level training (as described in assumptions below)
$NUM_{Employees}$	Number of employees per unit (as described in Appendix 2, Exhibit A2-14)
NUM_{Units}	Number of units per program (as described in Appendix 2, Exhibit A2-14)
$NUM_{Sessions}$	Number of training sessions per unit (as described in assumptions below)
PER_{Cost}	Percentage of cost applied to a given unit (as described in assumptions below)
$PER_{Non\text{-}Supervisory}$	Percentage of employees trained at the non-supervisory level under the former rule (as described in assumptions below)
$WAGE_{Trainer}$	Trainer wage rate (as described in Appendix 2, Exhibit A2-11)
$WAGE_{Worker}$	Facility worker wage rate (as described in Appendix 2, Exhibit A2-11)

[1] This calculation includes costs associated with administering a comprehensive examination because the entire activity of requiring existing employees to update their training and pass an examination represents an incremental requirement.

[2] Although many licensees may be conducting computer-based trainings, the analysis utilizes a class-based format, which may result in an overestimate of the cost of incremental training activities.

Assumptions:

- Percentage of employees trained at the non-supervisory level under the former rule: 85%.
- Length of updated training, including behavioral observation: 4 hours.
- Length of comprehensive examination: 0.5 hours.
- Number of training sessions assumes 50 workers per session.
- Hours of preparation and examination grading per session: 2 hours.
- Licensees have indicated that 75 percent of facilities already train all employees at this higher supervisory level and, therefore, would not incur any incremental cost under this requirement. Because the analysis cannot identify which facilities are already training at the higher level and which are not, the analysis assumes that each unit will incur the incremental cost of 25 percent of the activity.

Annual Initial Training. An incremental cost for annual training for individuals, such as new workers not yet covered under FFD programs or workers updating their authorization, will also lead to increased costs. This is attributable to the longer length of supervisory-level training in relation to training previously conducted under the former rule. The *annual cost per program* results from the sum of the following costs:[3]

- Annual costs per program for incoming employees to take the longer training course addressing behavioral observation are calculated as follows:

  $$[NUM_{Applicants} \times PER_{Non\text{-}Supervisory} \times (HOURS_{Supervisory} - HOURS_{Non\text{-}Supervisory}) \times WAGE_{Worker} \times NUM_{Units}] \times PER_{Cost}$$

- Annual costs per program for trainers to administer the longer behavioral observation training to incoming employees are calculated as follows:[4]

  $$[NUM_{Sessions} \times (HOURS_{Supervisory} - HOURS_{Non\text{-}Supervisory}) \times WAGE_{Trainer} \times NUM_{Units}] \times PER_{Cost}$$

[3] This calculation does not include the costs associated with administering the comprehensive examination required under paragraph 26.29(b) because new hires are already required to take a comprehensive examination. Therefore, the examination does not represent an incremental requirement.

[4] Although many licensees may be conducting computer-based trainings, the analysis utilizes a class-based format, which may result in an overestimate of the cost of incremental training activities.

Parameter	Description
$HOURS_{Non\text{-}Supervisory}$	Length of non-supervisory-level training course per applicant (as described in assumptions below)
$HOURS_{Supervisory}$	Length of supervisory-level training course per applicant (as described in assumptions below)
$NUM_{Applicants}$	Annual number of applicants for initial and update authorization per unit (as described in Appendix 2, Exhibit A2-12)
NUM_{Units}	Number of units per program (as described in Appendix 2, Exhibit A2-14)
$NUM_{Sessions}$	Annual number of supervisory-level training sessions per unit (as described in assumptions below)
PER_{Cost}	Percentage of cost applied to a given facility (as described in assumptions below)
$PER_{Non\text{-}Supervisory}$	Percentage of applicants for initial and update authorization trained at the non-supervisory-level under the former rule (as described in assumptions below)
$WAGE_{Trainer}$	Trainer wage rate (as described in Appendix 2, Exhibit A2-11)
$WAGE_{Worker}$	Facility worker wage rate (as described in Appendix 2, Exhibit A2-11)

Assumptions:

- Percentage of applicants for initial and update authorization trained at the non-supervisory level under the former rule: 85%.
- Length of supervisory-level training course per applicant: 4 hours.
- Length of non-supervisory-level training course per applicant: 2 hours.
- Annual number of supervisory-level training sessions per unit assumes 20 workers per session.
- Licensees have indicated that 75 percent of facilities already train all employees at this higher supervisory level and, therefore, would not incur any incremental cost under this requirement. Because the analysis cannot identify which facilities are already training at the higher level and which are not, the analysis assumes that each unit will incur the incremental cost of 25 percent of the activity.

Annual Refresher Training. Licensees will have to conduct refresher training. As a result, licensees will incur an incremental cost for some employees (i.e., those who are currently taking non-supervisory-level refresher training) because of the increased time required to conduct behavioral observation refresher training instead of non-supervisory-level training as required by the former rule. Although providing only one level of training (as opposed to two) may represent a potential savings, the savings are difficult to quantify and may be negligible when considering

administrative costs associated with providing an optional comprehensive examination in lieu of refresher training under subparagraph 26.29(c)(2). Despite the provision of this optional comprehensive "challenge" examination, the savings of which are presented separately, some workers will continue to take refresher training. The *annual costs per program* result from the sum of the following costs:

- Annual costs per program for employees to take the longer behavioral observation refresher training are calculated as follows:

  $$[NUM_{Employees} \times PER_{Non\text{-}Supervisory} \times PER_{Refresher} \times (HOURS_{Supervisory} - HOURS_{Non\text{-}Supervisory}) \times WAGE_{Worker} \times NUM_{Units}] \times PER_{Cost}$$

- Annual costs per program for trainers to administer the longer behavioral observation refresher training are calculated as follows:[5]

  $$[NUM_{Sessions} \times (HOURS_{Supervisory} - HOURS_{Non\text{-}Supervisory}) \times WAGE_{Trainer} \times NUM_{Units}] \times PER_{Cost}$$

Parameter	**Description**
$HOURS_{Non\text{-}Supervisory}$	Length of non-supervisory-level refresher training course (described in assumptions below)
$HOURS_{Supervisory}$	Length of new refresher training course including behavioral observation (described in assumptions below)
$NUM_{Employees}$	Annual number of employees per unit covered by FFD program (as described in Appendix 2, Exhibit A2-14)
NUM_{Units}	Number of units per program (as described in Appendix 2, Exhibit A2-14)
$NUM_{Sessions}$	Annual number of refresher training sessions per unit (as described in assumptions below)
PER_{Cost}	Percentage of cost applied to a given facility (as described in assumptions below)
$PER_{Non\text{-}Supervisory}$	Percentage of employees trained at the non-supervisory level under the former rule (as described in assumptions below)
$PER_{Refresher}$	Percentage of employees taking refresher training instead of the comprehensive "challenge" examination (described in assumptions below)
$WAGE_{Trainer}$	Trainer wage rate (as described in Appendix 2, Exhibit A2-11)
$WAGE_{Worker}$	Facility worker wage rate (as described in Appendix 2, Exhibit A2-11)

[5] Although many licensees may be conducting computer-based trainings, the analysis utilizes a class-based format, which may result in an overestimate of the cost of incremental training activities.

Assumptions:

- Percentage of employees trained at the non-supervisory level under the former rule: 85%.
- Percentage of employees taking refresher instead of the comprehensive "challenge" examination: 20%.
- Length of new training course including behavioral observation: 4 hours.
- Length of non-supervisory-level training course per applicant: 2 hours.
- Annual number of supervisory-level refresher training sessions assumes 20 workers per session.
- Licensees have indicated that 75 percent of facilities already train all employees at this higher supervisory level and, therefore, would not incur any incremental cost under this requirement. Because the analysis cannot identify which facilities are already training at the higher level and which are not, the analysis assumes that each unit will incur the incremental cost of 25 percent of the activity.

Paragraph 26.29(b)

This final paragraph adds an explicit requirement to administer a comprehensive examination following FFD training. Although the former rule did not explicitly require comprehensive examinations, it did require licensees to ensure that training is achieving the desired results, and licensees normally accomplished this goal through examinations. Licensees have indicated that they already administer comprehensive examinations in order to ensure employee understanding. Thus, the clarified requirement to administer a comprehensive examination imposes no incremental cost and affords no saving. Note that even though there is no incremental cost to administer examinations, the content of the examination must now reflect new material, as discussed above in connection with paragraph 26.29(a). The cost of updating the training course itself also is addressed in connection with paragraph 26.29(a).

This final paragraph also requires that individuals who fail the comprehensive examination must take remedial training and retake the examination. The remedial training requires workers to review specific areas of the examination in which they performed poorly. Although licensees have indicated that they already retest non-supervisory individuals who fail the comprehensive examination, they may not be retraining them. Therefore, this analysis assumes that the new rule will result in incremental costs to retrain existing non-supervisory employees who fail the comprehensive examination following the updated training as well as those applicants for initial and update authorization who fail the examination after initial training.

Licensees will incur a *one-time cost* to require licensees to retrain individuals who fail the comprehensive examination after first taking the updated training addressing behavioral observation. The costs associated with the initial training update are calculated separately above. The *one-time cost per program* results from the following costs:

- One-time costs per program for employees to take remedial training after failing the initial comprehensive examination when updating their training are calculated as follows:

  $$[NUM_{Employees} \times PER_{Non\text{-}Supervisory} \times PER_{Failing} \times HOURS_{Remedial} \times WAGE_{Worker}] \times NUM_{Units}$$

- One-time costs per program for trainers to administer remedial training on those employees who fail the initial comprehensive examination when updating training are calculated as follows:[6]

  $$NUM_{Sessions} \times HOURS_{Remedial} \times WAGE_{Trainer} \times NUM_{Units}$$

Parameter	**Description**
$HOURS_{Remedial}$	Length of remedial supervisory-level training (as described in assumptions below)
$NUM_{Employees}$	Number of employees per unit (as described in Appendix 2, Exhibit A2-14)
NUM_{Units}	Number of units per program (as described in Appendix 2, Exhibit A2-14)
$NUM_{Sessions}$	Number of supervisory-level update training sessions per facility (as described in assumptions below)
$PER_{Failing}$	Percentage of employees failing the comprehensive examination (as described in assumptions below)
$PER_{Non\text{-}Supervisory}$	Percentage of employees trained at the non-supervisory level under the former rule (as described in assumptions below)
$WAGE_{Trainer}$	Trainer wage rate (as described in Appendix 2, Exhibit A2-11)
$WAGE_{Worker}$	Facility worker wage rate (as described in Appendix 2, Exhibit A2-11)

[6] Although many licensees may be conducting computer-based trainings, the analysis utilizes a class-based format, which may result in an overestimate of the cost of incremental training activities.

Assumptions:

- Length of remedial supervisory-level training: 0.75 hours.
- Percentage of employees trained at the non-supervisory level under the former rule: 85%.
- Percentage of employees failing comprehensive examination: 10%.
- Number of supervisory-level update retraining sessions per facility assumes 20 workers per session.

In addition to the one-time costs, licensees will incur an annual cost as a result of the new requirement to retrain all subsequent applicants who fail the comprehensive examination for initial and updated authorization. The *annual costs per program* result from the sum of the following costs:

- Annual costs per program for applicants to take remedial training after failing the initial comprehensive examination are calculated as follows:

  $NUM_{Applicants} \times PER_{Failing} \times HOURS_{Remedial} \times WAGE_{Worker} \times NUM_{Units}$

- Annual costs per program for trainers to administer remedial training on applicants who fail the initial comprehensive examination are calculated as follows:[7]

  $NUM_{Sessions} \times HOURS_{Remedial} \times WAGE_{Trainer} \times NUM_{Units}$

Parameter	**Description**
$HOURS_{Remedial}$	Length of remedial supervisory-level training (as described in assumptions below)
$NUM_{Applicants}$	Annual number of applicants per unit who take the examination for initial and updated authorization (as described in Appendix 2, Exhibit A2-12)
NUM_{Units}	Number of units per program (as described in Appendix 2, Exhibit A2-14)
$NUM_{Sessions}$	Annual number of supervisory-level training sessions per unit (as described in assumptions below)
$PER_{Failing}$	Percentage of applicants failing the comprehensive examination per year (as described in assumptions below)
$WAGE_{Trainer}$	Trainer wage rate (as described in Appendix 2, Exhibit A2-11)

[7] Although many licensees may be conducting computer-based trainings, the analysis utilizes a class-based format, which may result in an overestimate of the cost of incremental training activities.

Parameter	Description
$WAGE_{Worker}$	Facility worker wage rate (as described in Appendix 2, Exhibit A2-11)

Assumptions:

- Length of remedial supervisory-level training: 0.75 hours.
- Percentage of applicants failing the comprehensive examination per year: 10%.
- Number of supervisory-level training sessions per facility assumes 20 workers per session.

Paragraph 26.29(c)

Subparagraph 26.29(c)(1)

This subparagraph of the final rule imposes no incremental cost and affords no saving because it merely requires licensee employees to complete their training before being assigned activities under Part 26, as required under paragraph 26.21(b) of the former rule. Additionally, this final subparagraph eliminated a former provision to allow 3 months to upgrade training for newly assigned supervisors. The elimination of this provision will impose no additional cost because all employees will be required to train at the same supervisory level under paragraph 26.29(a).

Subparagraph 26.29(c)(2)

This subparagraph requires refresher training on a 12-month frequency, as required under paragraphs 26.21(b) and 26.22(c) of the former rule. Thus, no incremental cost or saving will result specifically from this requirement. However, the final subparagraph also adds a provision to allow workers to take a comprehensive annual examination in lieu of refresher training (i.e., a "challenge" exam). This provision represents potential incremental savings, as the examination requires less time to complete than the refresher training. The amount of the savings per employee depends on whether the employee who chooses to take the comprehensive examination is currently taking supervisory-level or non-supervisory-level refresher training. Although incremental savings are associated with workers taking less training, the savings will be partially offset because the cost of examination grading must be considered and subtracted. Licensees will also incur a one-time cost to develop procedures for administering the challenge examination, the cost of which is included in the calculations described in 26.29(a).

The *annual savings per program* result from the sum of the following savings:

- Annual savings per program for those employees choosing to take the shorter comprehensive examination in lieu of (the current non-supervisory-level) refresher training are calculated as follows:

  $NUM_{Employees} \times PER_{Non\text{-}Supervisory} \times PER_{Examination} \times (HOURS_{Non\text{-}Supervisory} - HOURS_{Exam}) \times WAGE_{Worker} \times NUM_{Units}$

- Annual savings per program for those employees choosing to take the shorter comprehensive examination in lieu of (the current supervisory-level) refresher training are calculated as follows.

  $NUM_{Employees} \times PER_{Supervisory} \times PER_{Examination} \times (HOURS_{Refresher} - HOURS_{Exam}) \times WAGE_{Worker} \times NUM_{Units}$

- Annual savings per program from reduced training costs due to employees choosing to take the shorter comprehensive examination in lieu of (the current non-supervisory-level) refresher training are calculated as follows:[8]

  $[NUM_{Sessions\ Non\text{-}Supervisory} \times (HOURS_{Non\text{-}Supervisory} + HOURS_{Preparation} - HOURS_{Exam} - HOURS_{Grading}) \times WAGE_{Trainer}] \times NUM_{Units}$

- Annual savings per program from reduced training costs due to employees choosing to take the shorter comprehensive examination in lieu of (the current supervisory-level) refresher training are calculated as follows:

  $[NUM_{Sessions\ Supervisory} \times (HOURS_{Refresher} + HOURS_{Preparation} - HOURS_{Exam} - HOURS_{Grading}) \times WAGE_{Trainer}] \times NUM_{Units}$

Parameter	**Description**
$HOURS_{Exam}$	Length of comprehensive examination per exam (as described in assumptions below)
$HOURS_{Grading}$	Hours of examination grading per session (as described in assumptions below)
$HOURS_{Non\text{-}Supervisory}$	Length of non-supervisory-level refresher training course per session (as described in assumptions below)
$HOURS_{Preparation}$	Hours of trainer time to prepare for training course per session (as described in assumptions below)

[8] Although many licensees may be conducting computer-based trainings, the analysis utilizes a class-based format, which may result in an overestimate of the cost of incremental training activities.

Parameter	Description
$HOURS_{Refresher}$	Length of new refresher course per session (as described in assumptions below)
$NUM_{Employees}$	Number of employees per unit (as described in Appendix 2, Exhibit A2-14)
NUM_{Units}	Number of units per program (as described in Appendix 2, Exhibit A2-14)
$NUM_{Sessions\ Supervisory}$	Annual number of comprehensive examination sessions per unit replacing supervisory-level refresher training (as described in assumptions below)
$NUM_{Sessions\ Non\text{-}Supervisory}$	Annual number of comprehensive examination sessions per unit replacing non-supervisory-level refresher training (as described in Appendix 2, Exhibit A2-3)
$PER_{Examination}$	Percentage of employees choosing to take comprehensive examination in lieu of refresher training (as described in assumptions below)
$PER_{Non\text{-}Supervisory}$	Percentage of employees trained at the non-supervisory level under the former rule (as described in assumptions below)
$PER_{Supervisory}$	Percentage of employees trained at the supervisory level under the former rule (as described in assumptions below)
$WAGE_{Trainer}$	Trainer wage rate (as described in Appendix 2, Exhibit A2-11)
$WAGE_{Worker}$	Facility worker wage rate (as described in Appendix 2, Exhibit A2-11)

Assumptions:

- Percentage of employees trained at the non-supervisory level under the former rule: 85%.
- Percentage of employees choosing to take the comprehensive examination in lieu of refresher training: 80%.
- Percentage of employees trained at the supervisory level under the former rule: 15%.
- Length of non-supervisory-level refresher training course per session: 2 hours.
- Length of comprehensive examination per exam: 0.5 hours.
- Length of new refresher course per session: 4 hours.
- Number of comprehensive examination sessions replacing refresher course assumes 20 workers per training session.

- Hours of trainer time to prepare for training course per session: 1 hour.
- Hours of examination grading per session: 0.5 hours.

Subparagraph 26.29(c)(3)

This subparagraph of the final rule imposes no incremental cost and affords no saving because the added provision only authorizes licensees to conduct training via a variety of mediums. Alternative training mediums might allow licensees to take advantage of more effective and more efficient techniques. The final subparagraph clarifies the requirements in paragraph 26.21 of the former rule. Any savings that result from this provision are considered to be insignificant.

Subparagraph 26.29(d)

This subparagraph of the final rule imposes no incremental cost and affords no saving because it merely allows licensees to forego training and testing of individuals who have taken Part 26 training within the prior 12 months. The NRC and licensees have indicated that this provision is already practiced under the former rule, in accordance with guidance in NUREG-1385.

26.31 Drug and Alcohol Testing

Paragraph 26.31(a)

This paragraph of the final rule imposes no incremental cost or saving because it merely retains the requirements in paragraph 26.24(a) of the former rule which related to the implementation of drug and alcohol testing programs for persons who are subject to this Subpart of the final rule.

Paragraph 26.31(b)

Subparagraph 26.31(b)(1)

This subparagraph amends Appendix A, Section 2.3 of the former rule to include FFD program personnel in the drug and alcohol testing program requirements. Incremental costs associated with adding FFD program personnel to the testing program are calculated in the discussion of subparagraph 26.4(g).

Subparagraph 26.31(b)(1)(i)

This final subparagraph revises the requirements in Appendix A, Section 2.3(2), of the former rule. The final rule clarifies that the background investigations, credit and criminal history checks, and psychological evaluations that are required for persons who are granted unescorted access to protected areas in nuclear power plants and other affected facilities are acceptable means for meeting this requirement addressing the honesty and integrity of FFD program personnel. The analysis assumes that a criminal history and credit check are included in the

background check already required in order to grant unescorted access authorization under a licensee's access authorization program and, therefore, assumes no incremental cost. The final rule also relaxes a former provision that required licensees to update the background investigation every three years, thereby realizing an incremental saving. Although licensees must continue to update the psychological assessment and criminal history and credit checks, the final rule reduces the frequency of such updates from every 3 years to every 5 years, resulting in additional incremental savings.

The *annual savings per program* result from the *sum* of the following factors:

- The *base annual savings per program* (i.e., regardless of whether the program uses onsite or offsite collection facilities and testing laboratories) from eliminating the requirement to update background checks every 3 years are estimated as follows:

  $NUM_{Personnel\text{-}Base} \times COST_{Background\ Investigation\ Update} \times PER_{Annualized\text{-}1} \times NUM_{Units}$

- Additional savings per program from eliminating the requirement to update background checks every 3 years *per program with onsite testing* are estimated as follows:

  $NUM_{Personnel\text{-}Onsite\ Testing} \times COST_{Background\ Investigation\ Update} \times PER_{Annualized\text{-}1} \times NUM_{Facilities}$

- Additional savings per program from eliminating the requirement to update background checks every 3 years *per program with onsite collection* are estimated as follows:

  $NUM_{Personnel\text{-}Onsite\ Collection} \times COST_{Background\ Investigation\ Update} \times NUM_{Facilities} \times PER_{Collection} \times PER_{Annualized\text{-}1}$

- *Base annual savings per program* (i.e., regardless of whether the program uses onsite or offsite collection and testing facilities) from reducing the frequency with which licensees must update the psychological evaluations and the criminal history and credit checks are estimated as follows:

  $NUM_{Personnel\text{-}Base} \times [COST_{Criminal/Credit\ Update} + COST_{Psychological\ Evaluation\ Update}] \times NUM_{Units} \times PER_{Annualized\text{-}2}$

- Additional savings per program from reducing the frequency with which licensees must update the psychological evaluations and the criminal history and credit check *per program with onsite testing laboratories* are estimated as follows:

  $NUM_{Personnel\text{-}Onsite\text{-}Testing} \times [COST_{Criminal/Credit\ Update} + COST_{Psychological\ Evaluation\ Update}] \times PER_{Annualized\text{-}2} \times NUM_{Facilities}$

- Additional savings per program from reducing the frequency with which licensees must update psychological evaluations and the criminal history and credit check update *per program with onsite collection facilities* are estimated as follows:

  $NUM_{Personnel\text{-}Onsite\text{-}Collection} \times [COST_{Criminal/Credit\ Update} + COST_{Psychological\ Evaluations}] \times PER_{Collection} \times PER_{Annualized\text{-}2} \times NUM_{Facilities}$

Parameter	**Description**
$COST_{Background\ Investigation\ Update}$	Cost of updating an individual's background investigations, excluding the credit check and criminal history check (as described in assumptions below)
$COST_{Criminal/Credit\ Update}$	Cost of updating an individual's criminal and credit history (as described in assumptions below)
$COST_{Psychological\ Evaluation\ Update}$	Cost of updating an individual's psychological evaluation (as described in assumptions below)
$NUM_{Facilities}$	Number of facilities per program (as described in Appendix 2, Exhibit A2-14)
$NUM_{Personnel\text{-}Base}$	Base number of FFD program personnel per unit for each program (as described in the assumptions below)
$NUM_{Personnel\text{-}Onsite\text{-}Testing}$	Additional number of FFD program personnel per facility for programs with onsite testing laboratories (as described in assumptions below)
$NUM_{Personnel\text{-}Onsite\text{-}Collection}$	Additional number of FFD program personnel per facility for programs with onsite collection facilities (described in assumption below)
NUM_{Units}	Number of units per program (as described in Appendix 2, Exhibit A2-14)
$PER_{Annualized\text{-}1}$	Factor to adjust the periodic savings (every 3 years) to an annual savings (as described in assumptions below)
$PER_{Annualized\text{-}2}$	Factor to adjust to the periodic savings (two updates eliminated every 15 years) to an annual savings (as described in assumptions below)
$PER_{Collection}$	Percentage of facilities with onsite collection per program (as described in Appendix 2, Exhibit A2-1)

Assumptions:

- Base number of FFD program personnel (i.e., regardless of whether the program uses onsite or offsite collection facilities or testing laboratories) per unit: 1.5.

- Additional number of FFD program personnel per facility with onsite testing laboratories: 1.

- Additional number of FFD program personnel per facility for programs with onsite collection facilities: 0.5.

- Each facility in a program with onsite testing will have a separate testing laboratory with its own testing staff.

- Each facility in a program with onsite collection will have a separate collection site with its own collection staff.

- Cost of updating an individual's background investigations (excluding the credit and criminal history check): $150.

- Cost of updating an individual's psychological evaluation: $300.

- Cost of updating an individual's criminal and credit history: $50.

- Factor to annualize the 3-year periodic saving equals 1/3, or 33.3 percent (i.e., the final rule eliminates one background check update and one psychological evaluation, the savings of which are spread over 3 years).

- Factor to annualize the periodic saving from reducing a 3-year review frequency to a 5-year review frequency equals 2/15, or 13.3 percent (i.e., the final rule eliminates two criminal and credit history updates are eliminated, the savings of which are spread over 15 years).

Subparagraph 26.31(b)(1)(ii)– (iv)

These subparagraphs of the final rule impose no incremental cost and afford no saving because they merely amend the requirements in Appendix A, Section 2.3(1) of the former rule to prohibit assessment or evaluation by a person having a personal relationship with the donor or by an FFD program supervisor or co-workers within the same work group of the individual being tested. The final subparagraphs add a requirement prohibiting determinations of fitness (discussed with respect to §26.189) by FFD program personnel if the FFD program staff member has a personal relationship with the individual being tested. Specimen collection that does not require direct observation can be conducted by an individual who has a personal relationship with the donor so

long as the collection process is monitored by a second individual who is trained to monitor specimen collections and the preparation of specimens for transfer or shipping and who does not have a personal relationship with the donor. When directly observed specimen collection is required, however, the collector may have no personal relationship with the donor.

Subparagraph 26.31(b)(1)(v)

This subparagraph of the final rule imposes no incremental cost and affords no saving because it merely restates the requirements in Appendix A, Section 2.3(3) of the former rule, which require licensees to subject all persons "responsible for administering the testing program" (including the MRO when on site) to a behavioral observation program.

Subparagraph 26.31(b)(2)

This subparagraph relaxes former requirements by authorizing FFD program personnel who are undergoing drug and alcohol testing to use collection services at a local hospital or other organization, provided that the facility conforms to DOT drug and alcohol testing requirements. This provision results in incremental cost and saving by allowing offsite FFD personnel (i.e., MROs) to utilize local collection services rather than traveling to the licensee's facility. Specifically, licensees may incur higher testing costs at local collection facilities, as opposed to licensee testing facilities. This analysis assumes that the costs associated with periodic collections at non-licensee collection facilities will be greater than the collection cost at licensee facilities. Offsetting some of these costs, MROs and other offsite contracted personnel will experience reduced travel, waiting, and specimen collection time, on average.

The *annual costs per program* from allowing MROs and other offsite contracted personnel to utilize other facilities conforming to DOT requirements are calculated as follows:

$$[(NUM_{MROs} \times PER_{Random} \times PER_{Distance} \times (COST_{Local\ facility} - COST_{Licensee\ facility})] \times NUM_{Facilities}$$

Parameter	**Description**
$COST_{Local\ facility}$	Cost to conduct specimen collection at a local DOT-approved facility (as described in Appendix 2, Exhibit A2-13)
$COST_{Licensee\ facility}$	Cost to conduct specimen collection at the licensee facility (as described in Appendix 2, Exhibit A2-13)
$NUM_{Facilities}$	Number of facilities per program (as described in Appendix 2, Exhibit A2-14)
NUM_{MROs}	Number of offsite contracted MROs per facility (as described in assumptions below)

Parameter	Description
$PER_{Distance}$	Percentage of contracted FFD personnel who live closer to a DOT-approved collection facility than to a licensee's standard collection facility (as described in assumptions below)
PER_{Random}	Percentage tested by a random drug and alcohol testing program per year (as described in assumptions below)

Assumptions:

- Number of offsite contracted MROs per facility: 2.
- Percentage tested by a random drug and alcohol testing program per year: 50%.
- Percentage of contracted FFD personnel who live closer to a DOT-approved collection facility than to a licensee's standard collection facility: 33.3%.

The *annual savings per program* from allowing MROs and other offsite contracted personnel to utilize other facilities conforming to DOT requirements are calculated as follows:

$$[(NUM_{MROs} \times PER_{Random} \times PER_{Distance} \times (HOURS_{Travel} \times WAGE_{MRO}))] \times NUM_{Facilities}$$

Parameter	Description
$HOURS_{Travel}$	Hours of travel, waiting, and specimen collection time (on average) saved by utilizing DOT-approved facility (as described in assumptions below)
$NUM_{Facilities}$	Number of facilities per program (as described in Appendix 2, Exhibit A2-14)
NUM_{MROs}	Number of offsite contracted MROs per facility (as described in assumptions below)
$PER_{Distance}$	Percentage of contracted FFD personnel who live closer to a DOT-approved collection facility than to a licensee's standard collection facility (as described in assumptions below)
PER_{Random}	Percentage tested by a random drug and alcohol testing program per year (as described in assumptions below)
$WAGE_{MRO}$	MRO wage rate (as described in Appendix 2, Exhibit A2-11)

Assumptions:

- Number of offsite contracted MROs per facility: 2.
- Percentage tested by a random drug and alcohol testing program per year: 50%.
- Percentage of contracted FFD personnel who live closer to a DOT-approved collection facility than to a licensee's standard collection facility: 33.3%.
- Hours of MRO travel time saved by utilizing DOT-approved facility in lieu of the licensee's collection site: 2 hours.

Paragraph 26.31(c)

Subparagraph 26.31(c)(1)

This subparagraph of the final rule imposes no incremental cost and affords no saving because it merely clarifies that licensees and other entities with licensee-approved FFD programs must administer pre-access drug and alcohol testing in order to grant initial, updated, and reinstated authorization as specified in §26.65. Although pre-access testing is already required under 26.24(a)(1) of the former rule, the final rule adopts provisions from the AAO that create different requirements for individuals with different lengths of interruptions between periods of authorization. As a result, this subparagraph of the final rule imposes no incremental costs and affords no savings because it is based on non-safeguards information requirements imposed by the NRC's AAO dated January 7, 2003, and published in the Federal Register on January 13, 2003 (68 FR 1643).

Sensitivity Analysis-Pre-Order Baseline

Relative to the regulations that were in effect before the NRC issued the AAO, the final subparagraph does not directly result in incremental costs or savings. The specific pre-access drug and alcohol testing requirements for the three authorization types are contained in §26.65, and the incremental costs and savings of these requirements are calculated there.

Subparagraph 26.31(c)(2)

This subparagraph of the final rule imposes no incremental cost and affords no saving because it merely describes the situations that warrant for-cause drug and alcohol testing, retaining provisions that are already included in subparagraph 26.24(a)(3) of the former rule.

Subparagraph 26.31(c)(3)

This subparagraph of the final rule imposes no incremental cost and affords no saving because it merely describes situations that warrant post-event drug and alcohol testing, renumbering and

clarifying provisions that are already included in subparagraph 26.24(a)(3) of the former rule. The final subparagraph does provide a new requirement establishing a threshold for the types of workplace personal injuries and illnesses for which post-event testing is required. Further, the final subparagraph changes a former requirement such that post-event testing is required regardless of whether there was "reasonable suspicion" that the individual was abusing drugs or alcohol for the consequences listed in the final paragraph.

Subparagraph 26.31(c)(4)

This subparagraph of the final rule imposes no incremental cost and affords no saving because it merely prescribes that licensees must conduct followup drug and alcohol testing on individuals who have violated FFD policy in the past to ensure continued abstinence, as required under subparagraph 26.24(a)(4) of the former rule.

Subparagraph 26.31(c)(5)

This subparagraph of the final rule imposes no incremental cost and affords no saving because it merely rephrases requirements in subparagraph 26.24(a)(2) of the former rule and requires licensees to conduct random drug and alcohol testing on a statistically random and unannounced basis.

Paragraph 26.31(d)

Subparagraph 26.31(d)(1)

This subparagraph of the final rule imposes no incremental cost and affords no saving because it merely reorganizes paragraph 26.24(c) and Appendix A, Section 2.1(a)–(c), of the former rule. This revised subparagraph clarifies the six types of drugs for which each urine specimen must be analyzed and permits licensees and other entities to conduct testing for drugs or other substances that are not explicitly specified by the rule. The final subparagraph adds a requirement such that licensees and other entities must test for adulterants when conducting drug and alcohol testing.

Subparagraph 26.31(d)(1)(i)

This subparagraph of the final rule imposes no incremental cost and affords no saving because it merely retains the permission provided in paragraph 26.24(c) of the former rule for licensees to consult with local law enforcement or other sources to identify additional drugs that are likely to be used in the particular geographic locale of the FFD program. This final subparagraph also extends this permission to other entities with licensee-approved FFD programs and provides procedures for testing additional substances that are identified. The final subparagraph adds requirements that an independent and qualified forensic toxicologist must certify that testing results for other substances not explicitly identified by subparagraph 26.31(d)(1) are scientifically sound and legally defensible. The qualifications of the forensic toxicologist are also defined in this final paragraph. Although these additional testing requirements may result in

additional costs, the identification of additional substances to test for is rare and the costs are, therefore, assumed to be negligible.

Subparagraph 26.31(d)(1)(ii)

This subparagraph of the final rule imposes no incremental cost and affords no saving because it merely clarifies that licensees and other entities are allowed to test for any suspected drugs, drug metabolites, or any other substances and adulterants that the licensee or other entity suspects that an individual may have abused when conducting post-event, followup, and for-cause testing. These requirements are already contained in Appendix A, Sections 2.1(b) and (e) of the former rule. The new provision, however, adds a requirement that testing at the confirmatory assay's LOD may only be performed if the initial test result suggests the presence of a drug or metabolite within 35% of the established cutoff concentration for drugs that the licensee or other entity suspects an individual may have abused. In addition, the final subparagraph specifies that test results that fall below the established cutoff levels may not be considered when determining appropriate management actions and sanctions (per Subpart D), except if the specimen is dilute and the licensee or other entity has requested the HHS-certified laboratory to evaluate the specimen under final §§ 26.163(a)(2) or 26.185(g)(3).
This limitation has been added to assure the privacy rights of individuals whose urine specimens may be tested under this provision. As licensees and other entities are already abiding by these protections, no incremental cost is anticipated.

Subparagraph 26.31(d)(1)(iii)

This subparagraph of the final rule requires licensee and other entities to document the additional drug(s) for which testing will be performed in written policies and procedures in which the substances for which testing will be performed are described. The incremental cost associated with this requirement is calculated within paragraph 26.27(a) of the final rule.

Subparagraph 26.31(d)(2)

This paragraph revises subparagraph 26.24(a)(2) of the former rule to clarify that licensees are required to ensure that all persons in the population subject to testing have an equal probability of being randomly selected and tested. Under the final subparagraph, in the event that a selected individual cannot be tested immediately, (i.e., on leave, out sick, etc.), the licensee must make reasonable efforts to test the individual at the earliest reasonable and practical opportunity when both the donor and collectors are available. Thus, licensees will incur an incremental cost to satisfy the "reasonable effort" requirement by tracking the randomly selected individuals who are unavailable during the selected testing date and testing them at the next (earliest) reasonable and practical opportunity. This final subparagraph also further clarifies that licensees must conduct testing on an unpredictable schedule, including weekends, backshifts, and holidays." This provision imposes no additional costs because former subparagraph 26.24(a)(2) included these time periods, as described in Section 4.6 of NUREG-1385.

The *annual costs per program* from requiring greater effort to track individuals selected for random drug and alcohol testing result from the following:[9]

$$NUM_{Employees} \times PER_{Random} \times PER_{Unavailable} \times HOURS_{Manager} \times WAGE_{Manager} \times NUM_{Units}$$

Parameter	Description
$HOURS_{Manager}$	Hours of FFD manager tracking time per randomly selected employee who is unavailable for the scheduled test (as described in assumptions below)
$NUM_{Employees}$	Number of employees per unit (as described in Appendix 2, Exhibit A2-14)
NUM_{Units}	Number of units per program (as described in Appendix 2, Exhibit A2-14)
PER_{Random}	Percentage of employees per year who are randomly selected for drug and alcohol testing (as described in assumptions below)
$PER_{Unavailable}$	Percentage of randomly selected employees per year who are unavailable for the scheduled test (as described in assumptions below)
$WAGE_{Manager}$	FFD manager wage rate (as described in Appendix 2, Exhibit A2-11)

Assumptions:

- Percentage of employees per year who are randomly selected for drug and alcohol testing: 50%.
- Percentage of randomly selected employees per year who are unavailable for the scheduled test: 25%.
- Hours of FFD manager tracking time per randomly selected employee who is unavailable for the scheduled test: 0.25 hours.

Subparagraph 26.31(d)(3)

This subparagraph specifies general requirements for drug testing and combines paragraph 26.24(f) and Appendix A Sections 1.1(3), 2.8(e)(1), 4.1(a) and (b) of the former rule. An amendment adds validity testing, the costs of which are described under §26.131 in Subpart F and subparagraph 26.161(b)(1) in Subpart G. This final subparagraph also establishes requirements for FFD programs that use more stringent cutoff levels for initial drug testing. (Each licensee and other entity must apply consistent cutoffs to all tests performed.) This final

[9] This analysis assumes that all licensees will be affected by the added provision. However, because some licensees may already be tracking and testing individuals unavailable at the time of random selection, the results may overestimate the true incremental cost.

paragraph also requires documentation of the more stringent cutoff levels in the FFD program policy and procedures. The final subparagraph adds a new requirement such that, before implementing the more stringent cutoffs, an independent forensic toxicologist must evaluate and certify them as technically sound and legally defensible, with two exceptions. An evaluation by an independent forensic toxicologist is not required if the U.S. Department of Health and Human Services revises the cutoff levels in the HHS Guidelines and the FFD program adopts the lower HHS cutoffs. Certification by a forensic toxicologist also is not required if the licensee received written approval from NRC to test for lower cutoff levels before the implementation date of the final rule, in accordance with Appendix A, Section 1.1(2) of the former rule.

The one-time costs per FFD program to employ more stringent cutoff level(s) for drugs result from the following:

$$[(HOURS_{tox.review} + HOURS_{tox.report}) \times WAGE_{toxicologist}] \times PER_{more\ stingent\ cutoffs} \times PER_{non\text{-}report} + (HOURS_{Manager} \times WAGE_{Manager} \times PER_{more\ stingent\ cutoffs} \times PER_{non\text{-}report})$$

Parameter	**Description**
$HOURS_{Manager}$	Hours of FFD program manager labor to review the results of the forensic toxicologist's evaluation of the FFD program's more stringent cutoff levels per program (as described in assumptions below)
$HOURS_{tox.report}$	Hours of time spent by a forensic toxicologist to write an evaluation of the cutoff levels per FFD program (as described in assumptions below)
$HOURS_{tox.review}$	Hours of review by a forensic toxicologist per FFD program using more stringent cutoff level(s) for drug testing (as described in assumptions below)
$PER_{more\ stringent}$	Percentage likelihood that the FFD program uses more stringent cutoff levels for drug testing (as described in assumptions below)
$PER_{non\text{-}report}$	Percentage likelihood that the FFD program, if it uses more stringent cutoff levels for drug testing, has not received NRC written approval (as described in assumptions below)
$WAGE_{Manager}$	FFD program manager wage rate (as described in Appendix 2, Exhibit A2-11)
$WAGE_{toxicologist}$	Toxicologist wage rate (as described in Appendix 2, Exhibit A2-11)

Assumptions:

- Hours of review by a forensic toxicologist per FFD program using more stringent cutoff level(s) for drug testing: 3.5 hours.

- Hours of time spent by a forensic toxicologist to write an evaluation of the cutoff levels per FFD program: 0.5 hours.

- Hours of time spent by FFD program manager to review the results of the forensic toxicologist's evaluation per FFD program: 0.5 hours.

- Percentage likelihood that the FFD program will use more stringent cutoff levels for drug testing after the final rule is enacted: 10 percent.

- Percentage likelihood that the FFD program, if it will use more stringent cutoff levels for drug testing after the final rule is enacted, did not previously use these more stringent cutoff levels (and, therefore, has not received Commission approval): 25 percent.

Subparagraph 26.31(d)(4)

This subparagraph revises requirements in 26.24(g) of the former rule, which pertained to alcohol testing. Specifically, this revised subparagraph modifies the applicable threshold requirement by reducing the threshold level of breath alcohol concentration from 0.04 to 0.02 for an initial breath test requiring confirmatory testing. Incremental costs associated with this revision are calculated and discussed in connection with §26.97. Another revision permits the use of oral fluids for initial breath testing and is discussed in §26.95 of this analysis.

Subparagraph 26.31(d)(5)

This subparagraph permits the MRO to authorize alternative specimen collection and evaluation procedures in instances in which an individual has a medical condition that makes it difficult or hazardous to collect breath, oral fluids, or urine specimens. Although this clarification offers licensees more flexibility in collecting specimens, the analysis assumes that these situations are extremely rare, making any potential savings speculative and negligible.

Subparagraph 26.31(d)(6)

This subparagraph of the final rule imposes no incremental cost and affords no saving because it restates that specimens collected can only be used for Part 26 testing, and clarifies that specimens may only be collected and tested within a licensee or licensee-approved other entity FFD program that meets the requirements of this part, as required by Section 2.1(d) of Appendix A of the former rule.

26.33 Behavioral Observation

This section of the final rule represents a new requirement, which requires that individuals with authorization (i.e., other than supervisors, managers, and escorts as required under subparagraph 26.27(b)(10)) are required to report fitness concerns to persons designated by the licensee. Costs associated with behavioral observation training are calculated in connection with §26.29. In addition, the new behavioral observation requirements and the additional requirement for individuals with authorization to report FFD concerns about other individuals who are present at

the licensee's or other entity's site or facility may result in additional for-cause referrals. As a result, there will be an increase in both the number of drug and alcohol tests performed, and the number of positive test results that must undergo confirmatory testing. The analysis calculates the cost of these activities below. The observation and reporting provisions of this final paragraph impose no incremental cost and afford no saving.

The *annual costs per program* result from the sum of the following costs:

- Annual costs per program to review additional for-cause referrals are calculated as follows:

  $NUM_{For\text{-}Cause} \times PERI_{For\text{-}Cause} \times [(HOURS_{Worker} \times WAGE_{Worker}) + (HOURS_{Manager} \times WAGE_{Manager})] \times NUM_{Units}$

- Annual cost per program to conduct additional drug and alcohol tests due to increased for-cause referrals are calculated as follows:[10]

  - Annual costs per program to conduct additional drug and alcohol tests due to increased for-cause referrals at programs with onsite testing laboratories (yielding negative results) result from the following:

    $NUM_{For\text{-}Cause} \times PERI_{For\text{-}Cause} \times PER_{Negative} \times COST_{Onsite\text{-}Negative} \times NUM_{Units}$

  - Annual costs per program to conduct additional drug and alcohol tests due to increased for-cause referrals at programs with offsite testing laboratories (yielding negative results) result from the following:

    $NUM_{For\text{-}Cause} \times PERI_{For\text{-}Cause} \times PER_{Negative} \times COST_{Offsite\text{-}Negative} \times NUM_{Units}$

  - Annual costs per program to conduct additional drug and alcohol tests due to increased for-cause referrals at programs with onsite testing laboratories (yielding non-negative results) result from the following:

    $NUM_{For\text{-}Cause} \times PERI_{For\text{-}Cause} \times (1\text{-}PER_{Negative}) \times COST_{Onsite\text{-}Non\text{-}Negative} \times NUM_{Units}$

  - Annual costs per program to conduct additional drug and alcohol tests due to increased for-cause referrals at programs with offsite testing laboratories (yielding negative results) result from the following:

    $NUM_{For\text{-}Cause} \times PERI_{For\text{-}Cause} \times (1\text{-}PER_{Negative}) \times COST_{Offsite\text{-}Non\text{-}Negative} \times NUM_{Units}$

[10] The increased costs will vary for programs depending on whether the program has onsite testing capabilities or utilizes an offsite HHS-certified testing laboratory.

- Annual costs per program to retest confirmed positive drug test results at a second HHS-certified laboratory at the request of the donor are calculated as follows:

  $NUM_{For\text{-}Cause} \times PERI_{For\text{-}Cause} \times (1\text{-}PER_{Negatives}) \times PER_{Retest} \times COST_{Retest} \times NUM_{Units}$

- Annual costs per program for the percentage of workers with confirmed positive test results who initiate an appeals process are calculated as follows:

  $NUM_{For\text{-}Cause} \times PERI_{For\text{-}Cause} \times (1\text{-}PER_{Negatives}) \times PER_{Appeals} \times COST_{Appeals} \times NUM_{Units}$

Parameter	**Description**
$COST_{Appeals}$	Cost of appeals process per appeal (as described in Appendix 2, Exhibit A2-11, Exhibit A2-13)
$COST_{Offsite\text{-}Negative}$	For-cause testing cost for a negative result per test at programs with offsite testing laboratories (as described in assumptions below and in Appendix 2, Exhibit A2-13)
$COST_{Offsite\text{-}Non\text{-}Negative}$	For-cause testing cost for a non-negative result per test at programs with offsite testing laboratories (as described in assumptions below and in Appendix 2, Exhibit A2-13)
$COST_{Onsite\text{-}Negative}$	For-cause testing cost for a negative result per test at programs with onsite testing laboratories (as described in assumptions below and in Appendix 2, Exhibit A2-13)
$COST_{Onsite\text{-}Non\text{-}Negative}$	For-cause testing cost for a non-negative result per test at programs with onsite testing laboratories (as described in assumptions below and in Appendix 2, Exhibit A2-13)
$COST_{Retest}$	Cost of drug retest per test (as described in assumptions below and in Appendix 2, Exhibit A2-13)
$HOURS_{Manager}$	Hours of FFD program manager review per for-cause referral (as described in assumptions below)
$HOURS_{Worker}$	Hours of facility worker hours under review per for-cause referral (as described in assumptions below)
$NUM_{For\text{-}Cause}$	Pre-rule annual number of for-cause tests/referrals per unit (as described in Appendix 2, Exhibit A2-12)
NUM_{Units}	Number of units per program (as described in Appendix 2, Exhibit A2-14)
$PER_{Appeals}$	Percentage of workers who have positive test results and initiate an appeals process (as described in assumptions below and in Appendix 2, Exhibit A2-6)
$PERI_{For\text{-}Cause}$	Percentage increase in for-cause tests/referrals as a result of the final rule (as described in assumptions below)
$PER_{Negative}$	Percentage of for-cause tests that yield negative test results (as described in Appendix 2, Exhibit A2-12)

Parameter	Description
PER_{Retest}	Percentage of workers who have positive test results and request retesting (as described in assumptions below)
$WAGE_{Manager}$	FFD program manager wage rate (as described in Appendix 2, Exhibit A2-11)
$WAGE_{Worker}$	Facility worker wage rate (as described in Appendix 2, Exhibit A2-11)

Assumptions:

- Percentage increase in for-cause tests/referrals beginning with new rule: 10%.
- Hours of facility worker hours under review per for-cause referral: 4 hours per review.
- Hours of FFD program manager review per for-cause referral: 4 hours per review.
- Percentage of workers who have positive test results and request retesting: 5%.
- Percentage of workers who have positive test results and initiate an appeals process: 1%.
- The per-unit cost of an *onsite for-cause drug and alcohol test yielding negative results* includes the following factors:
  (1) travel time of the worker
  (2) collection of drug and alcohol specimens (labor of the collector and the worker, as well as collection materials)
  (3) onsite licensee testing costs per urine specimen for drugs and validity
  (4) labor of FFD manager to process paperwork for negative test results.
- The per-unit cost of an *offsite for-cause drug and alcohol test yielding negative results* includes including the following factors:
  (1) travel time of the worker
  (2) collection of drug and alcohol specimens (labor of the collector and the worker, as well as collection materials)
  (3) HHS-certified laboratory costs per urine specimen for drugs and validity;
  (4) labor of FFD manager to process paperwork for negative test results
- The per-unit cost of *an onsite for-cause drug and alcohol test yielding positive results* includes the following factors:
  (1) travel time of the worker
  (2) collection of drug and alcohol specimens (labor of the collector and the worker, as well as collection materials)

(3) onsite licensee testing costs per urine specimen for drugs
(4) HHS-certified laboratory cost per specimen for drugs and validity
(5) cost of subsequent actions resulting from a confirmatory positive drug/validity test result

- The per-unit cost of *an offsite for-cause drug and alcohol test yielding positive results* includes the following factors:
  (1) travel time of the worker
  (2) collection of drug and alcohol specimens (labor of the collector and the worker, as well as collection materials)
  (3) HHS-certified laboratory costs per urine specimen for drugs and validity
  (4) cost of subsequent actions resulting from a confirmatory positive drug/validity test result

26.35 Employee Assistance Programs

Paragraph 26.35(a)

This paragraph of the final rule imposes no incremental cost and affords no saving because it merely restates and clarifies the language in §26.25 of the former rule, which requires licensees and other entities to have employee assistance programs (EAPs).

Paragraph 26.35(b)

This paragraph of the final rule imposes no incremental cost and affords no saving because it merely clarifies language in §26.25 of the former rule, which requires that licensees and other entities are not required to provide EAP services to C/V employees nor to individuals who have applied for, but have not yet been granted, authorization.

Paragraph 26.35(c)

This paragraph of the final rule [including subparagraphs 26.35(c)(1)–(3)] imposes no incremental cost and affords no saving because it merely restates and clarifies the language in §26.25 of the former rule regarding the role of EAP staff in protecting the identity and privacy of any individual's seeking assistance. The new paragraph does allow the EAP to bypass the privacy requirement in the event that the individual waives the right to privacy in writing or if a determination of fitness deems an individual's condition or actions pose or have posed an immediate hazard to himself or herself or others. In such cases, EAP personnel shall inform FFD management. The final paragraph also adds specificity to the former rule, providing examples of individual conditions or actions that require EAP personnel to report the individual to management. This final paragraph parallels elements covered in §26.25 of the former rule.

26.37 Protection of Information

Paragraph 26.37(a)

This paragraph of the final rule imposes no incremental cost and affords no saving because it merely combines and clarifies wording from paragraph 26.29(a) and Appendix A, Section 3.1, of the former rule.

Paragraph 26.37(b)

This paragraph of the final rule [including subparagraphs 26.37(b)(1)–(8)] imposes no incremental cost and affords no saving because it restates and separates elements of paragraph 26.29(b) of the former rule.

Paragraph 26.37(c)

This paragraph of the final rule requires licensees and other entities to disclose personal information collected under this part to other licensees or other entities, including C/Vs, legitimately seeking the information for authorization decisions. As indicated by NRC guidance in NUREG-1600, "Revision to the NRC Enforcement Policy" (per 67 FR 66311, October 31, 2002) licensees are already sharing this information. The analysis also assumes that C/Vs are already sharing such information with other C/Vs. Whether licensees are sharing information with C/Vs is unknown, but such instances are assumed to be rare. Therefore, the final paragraph imposes no incremental cost and affords no saving.

Paragraph 26.37(d)

This paragraph combines elements of paragraph 26.29(b) of the former rule to clarify information disclosure requirements for individuals. Although the former rule required similar disclosure processes, some licensees interpreted the former provisions in a manner that complicates the process through which employees can have access to their records. In an effort to clarify the NRC's original intent, the revised paragraph requires the FFD program (including, but not limited to, the collection site, HHS-certified laboratory, substance abuse expert, or MRO) to give requesting individuals copies of all of their own FFD records, including but not limited to records pertaining to a violation of FFD policy. The copying, packaging, and shipping of these records will result in an incremental cost to licensees.

The *annual costs per program* to provide individuals with easier access to personal documents result from the following:[11]

$$NUM_{Positives} \times PER_{Requesting} \times [(HOURS_{Clerical} \times WAGE_{Clerical}) + COST_{Mailing}] \times NUM_{Units}$$

Parameter	Description
$COST_{Mailing}$	Cost of mailing (express mail) per information disclosure request (as described in Appendix 2, Exhibit A2-6)
$HOURS_{Clerical}$	Additional clerical personnel hours to copy, package, and ship records per disclosure request (as described in assumptions below)
$NUM_{Positives}$	Annual number of drug tests yielding positive results per unit (as described in Appendix 2, Exhibit A2-12)
NUM_{Unit}	Number of units per program (as described in Appendix 2, Exhibit A2-14)
$PER_{Requesting}$	Percentage of employees who have positive test results and request records (as described in assumptions below)
$WAGE_{Clerical}$	Clerical personnel wage rate (as described in Appendix 2, Exhibit A2-11)

Assumptions:

- For the purposes of this analysis, it is assumed that individuals request their own FFD records only when they are found in violation of FFD policy.
- Percentage of employees who have positive test results and request records: 50%.
- Additional clerical personnel hours to copy, package, and mail records per disclosure request: 1 hour.

Paragraph 26.37(e)

This paragraph of the final rule imposes no incremental cost and affords no saving because it retains a portion of Section 3.1 of Appendix A to the former rule.

Paragraph 26.37(f)

This paragraph of the final rule imposes no incremental cost and affords no saving because it retains a portion of paragraph 26.29(b) of the former rule.

[11] The analysis assumes that all licensees will incur costs as a result of this provision. However, because some licensees may already be providing adequate access to records, the results may overestimate the true incremental cost.

26.39 Review Process for Fitness-for-Duty Policy Violations

Paragraph 26.39(a)

This paragraph of the final rule, which states that an objective and impartial review process for FFD policy violations must be established, imposes no incremental cost and affords no saving because any incremental costs associated with revising or rewriting procedures are calculated in connection with §26.27. The final paragraph, however, adds requirements to the language in paragraph 26.28 of the former rule by requiring an objective and impartial review of the facts.

Paragraph 26.39(b)

This paragraph of the final rule imposes no incremental cost and affords no saving because it requires that an individual under review must be allowed to offer additional relevant information, as provided under §26.28 of the former rule.

Paragraph 26.39(c)

This paragraph requires that a review of potential FFD policy violations be conducted by an individual who is not associated with FFD program administration. Under the subparagraph 26.27(b)(3) of the former rule, licensees were required to establish satisfactory management and medical assurance of an individual's fitness for duty before granting unescorted access following a previous violation of policy. According to NRC guidance contained in NUREG-1385, "Fitness for Duty in the Nuclear Power Industry: Responses to Implementation Questions," licensees were free to interpret how best to meet the "satisfactory assurance" requirement, which at a minimum involves a review by a single individual. This paragraph of the final rule imposes no incremental cost and affords no saving because it retains the intent of subparagraph 26.27(b)(3) of the former rule.

Paragraph 26.39(d)

This paragraph of the final rule imposes no incremental cost and affords no saving because it merely requires licensees to update their records in the event that review finds in favor of the individual. Further, the final paragraph clarifies paragraph 26.28 of the former rule, which implicitly required corrections of records after a successful appeal.

Paragraph 26.39(e)

This paragraph of the final rule imposes no incremental cost and affords no saving because it merely clarifies provisions in paragraph 26.28 of the former rule. Specifically, this final paragraph states that when a C/V is administering an FFD program on which licensees and other entities rely, and the C/V determines that its employee, subcontractor, or applicant has violated its FFD policy, the C/V must ensure that the review procedure required in this section is provided to the individual. In addition, this final paragraph states that licensees who rely on a

C/Vs FFD program are *not* required to give C/V employees a review procedure for violations identified through a C/V's drug and alcohol testing program.

26.41 Audits and Corrective Action

Paragraph 26.41(a)

This paragraph of the final rule imposes no incremental cost and affords no saving because it merely clarifies the licensee's responsibility for ensuring the continued effectiveness of all elements of the FFD program, including programs and program elements implemented by C/Vs, as well as programs implemented by HHS-certified laboratories. These requirements are addressed in connection with paragraph 26.80 of the former rule.

Paragraph 26.41(b)

This paragraph reduces the audit frequency for licensees and other entities (with onsite collection services) from every 12 months under paragraph 26.80(a) of the former rule to "as needed, but no less frequently than every 24 months," resulting in a potential incremental savings. Total annual savings will depend on whether a given licensee has onsite or offsite collection and testing facilities (i.e., because the final rule [in paragraph 26.41(c)(1)] does not reduce the frequency of licensee audits of HHS-certified laboratories or offsite collection facilities that do not maintain their own FFD program). The reduced audit frequency will also yield savings from reduced auditor travel costs, which are calculated separately below.

The *annual savings per program*, excluding travel savings (which are calculated separately later in the discussion), are calculated as the *sum* of the following factors:

- The *annual base saving per program* (regardless of whether the program uses onsite or offsite testing and collection facilities) from the reduced audit frequency are estimated as follows:

  $$[(HOURS_{Auditor\text{-}Base} \times WAGE_{Auditor}) + (HOURS_{Manager\text{-}Base} \times WAGE_{Manager}) + (HOURS_{Clerical\text{-}Base} \times WAGE_{Clerical})] \times PER_{Annualized} \times NUM_{Facilities}$$

- The additional *annual savings per program* from the audit frequency reduction that accrue to programs with *onsite testing* are estimated as follows:

  $$[(HOURS_{Auditor\text{-}Onsite\ Testing} \times WAGE_{Auditor}) + (HOURS_{Manager\text{-}Onsite\ Testing} \times WAGE_{Manager}) + (HOURS_{Clerical\text{-}Onsite\ Testing} \times WAGE_{Clerical}) + (HOURS_{Lab\ Manager} \times WAGE_{Lab\ Manager}) + (HOURS_{Lab\ Staff} \times WAGE_{Lab\ Staff})] \times PER_{Annualized} \times NUM_{Facilities}$$

- The additional *annual savings per program* from the audit frequency reduction that accrue *to programs with onsite collection* are estimated as follows:

$$[(HOURS_{Auditor\text{-}Onsite\ Collection} \times WAGE_{Auditor}) + (HOURS_{Manager\text{-}Onsite\ Collection} \times WAGE_{Manager}) + (HOURS_{Clerical\text{-}Onsite\ Collection} \times WAGE_{Clerical}) + [NUM_{Facilities} \times ((HOURS_{Collection\ Manager} \times WAGE_{Collection\ Manager}) + (HOURS_{Collection\ Staff} \times WAGE_{Collection\ Staff}))]] \times PER_{Collection} \times PER_{Anualized} \times NUM_{Facilities}$$

Parameter	**Description**
$HOURS_{Auditor\text{-}Base}$	Base hours of contracted auditor time that each facility saves per full program audit (as described in assumptions below)
$HOURS_{Auditor\text{-}Onsite\ Collection}$	Additional hours (i.e., above the base described previously) of contracted auditor time saved per full program audit of a facility with onsite collection facilities (as described in assumptions below)
$HOURS_{Auditor\text{-}Onsite\ Testing}$	Additional hours (i.e., above the base described previously) of contracted auditor time saved per full program audit of a facility with onsite testing laboratories (as described in assumptions below)
$HOURS_{Clerical\text{-}Base}$	Base hours of clerical personnel time that each facility saves per full program audit (as described in assumptions below)
$HOURS_{Clerical\text{-}Onsite\ Collection}$	Additional hours (i.e., above the base described previously) of clerical personnel time saved per full program audit of a facility with onsite collection facilities (as described in assumptions below)
$HOURS_{Clerical\text{-}Onsite\ Testing}$	Additional hours (i.e., above the base described previously) of clerical personnel time saved per full program audit of a facility with onsite testing laboratories (as described in assumptions below)
$HOURS_{Collection\ Staff}$	Hours of collection site staff time saved per full program audit of a facility with onsite collection facilities (as described in assumptions below)
$HOURS_{Collection\ Manager}$	Hours of collection site manager time saved per year per facility with onsite collection facilities (as described in assumptions below)
$HOURS_{Lab\ Manager}$	Hours of testing laboratory manager time saved per full program audit of a facility with onsite testing laboratories (as described in assumptions below)
$HOURS_{Lab\ Staff}$	Hours of testing laboratory staff time saved per full program audit of a facility with onsite testing laboratories (as described in assumptions below)
$HOURS_{Manager\text{-}Base}$	Base hours of FFD program manager time that each facility saves per full program audit (as described in assumptions below)
$HOURS_{Manager\text{-}Onsite\ Testing}$	Additional hours (i.e., above the base described previously) of FFD program manager time saved per full program audit of a facility with onsite testing laboratories (as described in assumptions below)

Parameter	Description
$HOURS_{Manager\text{-}Onsite\ Collection}$	Additional hours (i.e., above the base described previously) of FFD program manager time saved per full program audit of a facility with onsite collection facilities (as described in assumptions below)
$NUM_{Facilties}$	Number of facilities per program (as described in Appendix 2, Exhibit A2-14)
$PER_{Annualized}$	Percentage multiplier to yield annualized savings (as described in assumptions below)
$PER_{Collection}$	Percentage of facilities with onsite collection per program (as described in Appendix 2, Exhibit A2-4)
$WAGE_{Auditor}$	Contract auditor wage rate (as described in Appendix 2, Exhibit A2-11)
$WAGE_{Clerical}$	Clerical personnel wage rate (as described in Appendix 2, Exhibit A2-11)
$WAGE_{Collection\ Manager}$	Collection site manager wage rate (as described in Appendix 2, Exhibit A2-11)
$WAGE_{Collection\ Staff}$	Collection site staff wage rate (as described in Appendix 2, Exhibit A2-11)
$WAGE_{Lab\ Staff}$	Laboratory staff wage rate (as described in Appendix 2, Exhibit A2-11)
$WAGE_{Lab\ Manager}$	Laboratory manager wage rate (as described in Appendix 2, Exhibit A2-11)
$WAGE_{Manager}$	FFD program manager wage rate (as described in Appendix 2, Exhibit A2-11)

Assumptions:

- Percentage multiplier to yield annualized savings is 50% because the frequency reduction allows facilities to eliminate 1 audit over a 2-year period.
- Base hours of contracted auditor time that each facility saves per full program audit: 25 hours.
- Base hours of FFD program manager time that each facility saves per full program audit: 13 hours.
- Base hours of clerical personnel time that each facility saves per full program audit: 5 hours.
- Additional hours (i.e., above the base described above) of contracted auditor time saved per full program audit of a facility with onsite testing laboratories: 12 hours.

- Additional hours (i.e., above the base described above) of FFD program manager time saved per full program audit of a facility with onsite testing laboratories: 7 hours.

- Additional hours (i.e., above the base described above) of clerical personnel time saved per full program audit of a facility with onsite testing laboratories: 0 hours.

- Each program with onsite testing maintains a separate onsite testing laboratory.

- Additional hours (i.e., above the base described above) of contracted auditor time saved per full program audit of a facility with onsite collection facilities: 5 hours.

- Additional hours (i.e., above the base described above) of FFD program manager time saved per full program audit of a facility with onsite collection facilities: 0 hours.

- Additional hours (i.e., above the base described above) of clerical personnel time saved per full program audit of a facility with onsite collection facilities: 0 hours.

- Hours of testing laboratory manager time saved per full program audit of a facility with onsite testing laboratories: 2 hours.

- Hours of testing laboratory staff time saved per full program audit of a facility with onsite testing laboratories: 1 hours.

- Hours of collection site manager time saved per full program audit of a facility with onsite collection facilities: 2 hours.

- Hours of collection site staff time saved per full program audit of a facility with onsite collection facilities: 1 hour.

- Each facility in a program with onsite collection maintains a separate onsite collection site.

The audit frequency reduction will also result in reduced travel costs. The *annual savings per program* result from the sum of the following savings:

- The reduced audit frequency will result in reduced travel costs for auditors. The associated *annual base savings per program* from the reduced travel at each facility (i.e., regardless of whether a program uses onsite or offsite collection facilities and testing laboratories) are calculated as follows:

  $[NUM_{Auditors\text{-}Base} \times (COST_{Travel} + (COST_{Lodging} \times NUM_{Nights–Base}) + (HOURS_{Travel} \times WAGE_{Auditor}))] \times PER_{Annualized}$

- Additional annual savings per program that accrue due to reduced auditor travel to facilities with *onsite testing laboratories* are estimated as follows:

  $NUM_{Auditors\text{-}Onsite\ Testing} \times COST_{Lodging} \times NUM_{Nights\text{-}Onsite\ Testing} \times PER_{Annualized}$

- Additional annual savings per program that accrue due to reduced auditor travel to facilities with *onsite collection facilities* are estimated as follows:

  $NUM_{Auditors\text{-}Onsite\ Collection} \times COST_{Lodging} \times NUM_{Nights\text{-}Onsite\ Collection} \times PER_{Collection} \times PER_{Annualized}$

Parameter	**Description**
$COST_{Lodging}$	Cost of lodging and per diem per night (as described in assumptions below)
$COST_{Travel}$	Cost of round trip travel per auditor per audit (as described in assumptions below)
$HOURS_{Travel}$	Hours of round trip travel auditor per audit (as described in assumptions below)
$NUM_{Auditors\text{-}Base}$	Base number of auditors per program audit (as described in assumptions below)
$NUM_{Auditors\text{-}Onsite\ Testing}$	Additional number of auditors per program with onsite testing laboratories (as described in assumptions below)
$NUM_{Auditors\text{-}Onsite\ Collection}$	Additional number of auditors per program with onsite collection facilities (as described in assumptions below)
$NUM_{Nights\text{-}Base}$	Base number of nights of lodging that each program saves per full program audit (as described in assumptions below)
$NUM_{Nights\text{-}Onsite\ Testing}$	Additional number of nights of lodging each program saves per full program audit of a program with onsite collection and offsite testing (as described in assumptions below)
$NUM_{Nights\text{-}Onsite\ Collection}$	Additional number of nights of lodging each program saves per full program audit of a program with offsite collection and offsite testing (as described in assumptions below)

Parameter	Description
$PER_{Annualized}$	Percentage multiplier to yield annual savings (as described in assumptions below)
$PER_{Collection}$	Percentage of facilities with onsite collection per program (as described in Appendix 2, Exhibit A2-4)
$WAGE_{Auditor}$	Auditor wage rate (as described in Appendix 2, Exhibit A2-11)

Assumptions:

- Base number of auditors per program audit (regardless of whether the program uses onsite or offsite collection sites and testing laboratories): 1.
- Additional number of auditors per program with onsite testing laboratories: 1.
- Additional number of auditors per program with onsite collection facilities: 0.[12]
- Cost of round trip travel per auditor per audit: $300.
- Cost of lodging and per diem per night: $150.
- Hours of round trip travel per auditor per audit: 4 hours.
- Base number of nights of lodging each program saves per full program audit: 3 nights.
- Additional number of nights of lodging each program saves per full program audit of a program with onsite testing laboratories: 1 night.
- Additional number of nights of lodging each program saves per full program audit of a program with onsite collection facilities: 0 nights.
- Percentage multiplier to yield annualized savings is 50% because the frequency reduction allows facilities to eliminate 1 audit over a 2-year period.
- Each facility in a program with onsite collection maintains a separate onsite collection site.

[12] Programs with onsite testing laboratories are also believed to operate onsite collection facilities. In this case, the additional auditor calculated for the onsite collection facility is also assumed to audit the onsite testing facility.

Although licensees and other entities with approved FFD programs are allowed to audit less frequently, they are expected to conduct additional auditing activities when performance indicators suggest a potential area of weakness in the FFD program. The cost of these additional, focused audits, which targets specific FFD program activities and requires a shorter amount of time to complete than a full program audit, partially offsets the savings resulting from the reduced frequency of full program audits. The *annual costs per program* to conduct focused audits addressing problem areas of the FFD program result from the following:

$$[(HOURS_{Focused\ Auditor} \times WAGE_{Auditor}) + (HOURS_{Focused\ Manager} \times WAGE_{Manager}) + (HOURS_{Focused\ Clerical} \times WAGE_{Clerical})] \times NUM_{Facilities} + [NUM_{Auditors} \times (COST_{Travel} + (COST_{Lodging} \times NUM_{Nights\text{-}Focused}) + (HOURS_{Travel} \times WAGE_{Auditor}))]$$

Parameter	**Description**
$COST_{Lodging}$	Cost of lodging and per diem per night (as described in assumptions below)
$COST_{Travel}$	Cost of round trip travel per focused audit (as described in assumptions below)
$HOURS_{Focused\ Clerical}$	Hours of clerical personnel time per focused audit per facility (as described in assumptions below)
$HOURS_{Focused\ Manager}$	Hours of FFD program manager time per focused audit per facility (as described in assumptions below)
$HOURS_{Focused\ Auditor}$	Hours of contracted auditor time per focused audit per facility (as described in assumptions below)
$HOURS_{Travel}$	Hours of round trip auditor travel per focused audit (as described in assumptions below)
$NUM_{Auditors}$	Number of auditors per focused audit (as described in assumptions below)
$NUM_{Facilities}$	Number of Facilities per program (as described in Appendix 2, Exhibit A2-14)
$NUM_{Nights\text{-}Focused}$	Number of nights of lodging required by the auditor to complete a focused audit (as described in assumptions below)
$WAGE_{Auditor}$	Contract auditor wage rate (as described in Appendix 2, Exhibit A2-11)
$WAGE_{Clerical}$	Clerical personnel wage rate (as described in Appendix 2, Exhibit A2-11)
$WAGE_{Manager}$	FFD program manager wage rate (as described in Appendix 2, Exhibit A2-11)

Assumptions:

- Hours of contracted auditor time conducting a focused audit per facility: 4 hours.
- Hours of FFD program manager time per a focused audit per facility: 3 hours.
- Hours of clerical personnel time conducting a focused audit per facility: 1 hours.
- Number of auditors per focused audit: 2.
- Cost of round trip travel per focused audit: $300.
- Cost of lodging and per diem per night: $150.
- Hours of round trip auditor travel per focused audit: 4 hours.
- Number of nights of lodging required by the auditor to complete a focused audit: 1 night.

Paragraph 26.41(c)

Subparagraph 26.41(c)(1)

This subparagraph of the final rule imposes no incremental cost and affords no saving because it merely clarifies that C/Vs located offsite or not under the direct supervision or observation of licensee personnel must be audited at a 12-month frequency, as specified in paragraph 26.80(a) of the former rule. The C/V services subject to this requirement include contracted MRO services, EAP or specimen collection services, and the services provided by HHS-certified laboratories. As described and calculated in 26.41(b), those C/V services that are provided onsite under the direct daily supervision of licensee personnel will be audited at a frequency of at least once every 24 months.

Subparagraph 26.41(c)(2)

This subparagraph adds a provision that allows licensees and other entities to rely upon the HHS certification reports and audits of HHS-certified laboratories, thereby eliminating audit duplication. Services provided to the licensee or other entity not addressed in the certification review must continue to be audited. Further duplication is eliminated by exempting organizations that do not routinely provide FFD services to a licensee or other entity, such as local hospitals or substance abuse treatment facilities. The elimination of audit duplication under this final subparagraph will result in incremental savings.

The *annual savings per program* from eliminating audit duplication result from the following:

$(HOURS_{Auditor} \times WAGE_{Auditor}) + (HOURS_{Manager} \times WAGE_{Manager}) + (HOURS_{Clerical} \times WAGE_{Clerical})$

Parameter	Description
$HOURS_{Auditor}$	Hours of contracted auditor time saved annually per program in elimination of audit duplication (as described in assumptions below)
$HOURS_{Clerical}$	Hours of clerical personnel time saved annually per program in elimination of audit duplication (as described in assumptions below)
$HOURS_{Manager}$	Hours of FFD program manager time saved annually per program in elimination of audit duplication (as described in assumptions below)
$WAGE_{Auditor}$	Contracted auditor wage rate (as described in Appendix 2, Exhibit A2-11)
$WAGE_{Clerical}$	Clerical personnel wage rate (as described in Appendix 2, Exhibit A2-11)
$WAGE_{Manager}$	FFD program manager wage rate (as described in Appendix 2, Exhibit A2-11)

Assumptions:

- Hours of contracted auditor time saved annually per program in elimination of audit duplication: 7 hours.
- Hours of FFD program manager time saved annually per program in elimination of audit duplication: 4 hours.
- Hours of clerical personnel time saved annually per program in elimination of audit duplication: 1 hour.

Paragraph 26.41(d)

Subparagraph 26.41(d)(1)

This subparagraph of the final rule imposes no incremental cost and affords no saving because it merely restates the provision in Appendix A, Section 2.7(m) of the former rule regarding the reservation of the right to audit C/Vs, the C/V's subcontractors providing FFD services, and the HHS-certified laboratories at any time.

Subparagraph 26.41(d)(2)

This subparagraph of the final rule adds a new requirement stating that licensees' and other entities' contracts with C/Vs or HHS-certified laboratories must permit the licensee or other entity to obtain copies of any documents to assure that the C/V or the laboratory are performing their functions properly and that staff and procedures meet applicable requirements. The C/V or HHS-certified laboratory, however, does have the ability to reasonably limit the use and dissemination of any documents to ensure the protection of proprietary information and donors' privacy. Although not explicitly required in the former rule, the analysis assumes that current industry practices provide for the sharing of such information. As a result, no incremental costs or savings result from this final subparagraph.

Subparagraph 26.41(d)(3)

This subparagraph of the final rule imposes no incremental cost and affords no saving because it merely restates requirements in Appendix A, Section 2.7(m) of the former rule. The final subparagraph requires licensees to conduct pre-award inspections and audits of the procedural aspects of HHS laboratory operations, except as provided in 26.41(g)(5), discussed below.

Paragraph 26.41(e)

This paragraph of the final rule imposes no incremental cost and affords no saving because it merely states that audits must focus on the effectiveness of FFD programs and auditors must remain independent of FFD program management and other personnel responsible for implementing the FFD program, as required by paragraph 26.80(b) of the former rule.

Paragraph 26.41(f)

This paragraph of the final rule imposes no incremental cost and affords no saving because it merely states licensees must document audit results and report them to senior corporate and site management, who must take and document appropriate corrective actions, including possible re-auditing of deficient areas (as discussed in paragraph 26.41(b)). These provisions are contained in paragraph 26.80(c) of the former rule.

Paragraph 26.41(g)

This paragraph of the final rule [including subparagraphs 26.41(g)(1)–(5)] imposes no incremental cost and affords no saving because it clarifies and/or explicitly sets forth implementation requirements under paragraph 26.80(a) of the former rule, and permitted practices regarding the sharing of audits. Subparagraph 26.41(g)(5) allows licensees and other entities to immediately use another HHS-certified laboratory in the event that their contracted HHS-laboratory loses its certification (the effect of which is discussed in paragraph 26.153(e) of this analysis).

Subpart C: Granting and Maintaining Authorization

26.51 Applicability

This section of the final rule imposes no incremental cost and affords no saving because it merely states that Subpart C applies to: (1) the licensees and other entities identified in § 26.3(a) and (b) for the categories of individuals in § 26.4(a) through (d), and at the licensee's or other entity's discretion, the individuals in § 26.4(g) and, if necessary, § 26.4(j); (2) the licensees and other entities specified in § 26.3(c) for the categories of individuals in § 26.4(e) and, at the licensee's or entity's discretion, the categories of individuals identified in § 26.4(f), and; (3) the entities in § 26.4(d) to the extent that a licensee or other entity relies on the C/V to meet the requirements of this Subpart. This section also states that certain requirements in Subpart C apply to the individuals in § 26.4(h).

26.53 General Provisions

Paragraph 26.53(a)

This paragraph establishes categories of individuals applying for authorization and states that licensees must ensure that the requirements applicable for the individual's category have been met before granting authorization to initial authorizations, authorization updates, authorization reinstatements, and authorization with potentially disqualifying FFD information. This paragraph of the final rule is based on non-safeguards information requirements imposed by the NRC's Access Authorization Order (AAO) dated January 7, 2003, and published in the Federal Register on January 13, 2003. As a result, the final paragraph imposes no incremental costs and affords no savings.

Sensitivity Analysis - Pre-Order Baseline

Relative to regulations that were in effect before the NRC issued the AAO, the paragraph indirectly results in incremental costs and savings for the different categories of applicants (as described in §§26.55, 26.57, 26.59, and 26.69 of the final rule). The incremental costs and savings that result from these differences are calculated in subsequent relevant sections of this analysis.

Paragraph 26.53(b)

This paragraph of the final rule defines new requirements for the beginning and ending dates of an individual's period of interruption of authorized status. The period of interruption begins on the day after authorization was previously terminated and ends with the day the licensee or other entity actually grants or denies authorization. Costs and savings associated with each category of authorization are presented below in the analysis of §§26.55, 26.57, and 26.59.

Paragraph 26.53(c)

This paragraph of the final rule imposes no incremental cost and affords no saving because it merely states that FFD training requirements must be met by an applicant for authorization before licensees can grant authorization, which parallels the requirements in paragraph 26.21(b) of the former rule.

Paragraph 26.53(d)

This paragraph of the final rule imposes no incremental cost and affords no saving because it merely clarifies that licensees and other entities seeking to grant authorization to an individual who is maintaining authorization under another FFD program may rely on that other program to satisfy the applicable requirements of this part. The receiving FFD program must ensure that the program elements to which the individual is subject under the transferring FFD program remain current. This practice is already allowed under §26.23 and subparagraph 26.24(a)(1) of the former rule, as well as guidance contained in NUREG-1385, "Fitness for Duty in the Nuclear Power Industry: Responses to Implementation Questions."

Paragraph 26.53(e)

This paragraph of the final rule allows licensees and other entities to rely on a C/V's FFD program or program elements when granting or maintaining the authorization of an individual who is or has been subject to the C/V's FFD program, if the C/V's program or program elements meet the applicable requirements of this part. This provision is a permissive relaxation of the former rule requirements providing licensees and other entities with flexibility to rely on a C/V's FFD program.

Subparagraph 26.53(e)(1)

This subparagraph of the final rule is a new requirement that allows a C/V's FFD program to grant and maintain an individual's authorization under the C/V's FFD program. The final subparagraph also states that only a licensee or other entity in § 26.3(a) through (c) may grant or maintain an individual's authorization to have the types of access or perform the duties specified in § 26.4(a) through (e) and (g), and, at the licensee's or other entity's discretion, § 26.4(f). Costs and savings associated with each category of authorization are presented below in the analysis of §§26.55, 26.57, and 26.59.

Subparagraph 26.53(e)(2)

This subparagraph of the final rule requires C/Vs to inform affected licensees and other entities of the denial or unfavorable termination of an individual's authorization if the individual is performing any duties for the licensee or other entity. This final subparagraph also requires the licensee and other entity to either deny or unfavorably terminate the individual's authorization to perform those duties on the day that the licensee or other entity receives the information from the

C/V, or implement the applicable process set forth in § 26.69 in order to maintain the individual's authorization to perform those duties. This final paragraph imposes no incremental cost and affords no saving because this analysis assumes that C/Vs already share information regarding access authorization denials and unfavorable terminations with licensees and other entities.

Subparagraph 26.53(e)(3)

This subparagraph of the final rule is a new requirement that allows a licensee or other entity to grant authorization to an individual or maintain an individual's authorization if the individual is maintaining authorization under a C/V's FFD program. The individual must continue to be subject to either the receiving FFD program or a combination of elements from the receiving FFD program and the C/V's program that collectively satisfy the applicable requirements of this part. The receiving licensee's or other entity's FFD program must ensure that the program elements to which the individual is subject under the C/V's FFD program remain current. This provision is a permissive relaxation of the former rule requirements providing licensees and other entities with flexibility to rely on a C/V's FFD program.

Paragraph 26.53(f)

This paragraph of the final rule establishes that licensees and other entities who are seeking to grant authorization to an individual who has been subject to an FFD program under Subpart K may not rely on that program or its program elements to meet the access authorization requirements of Subpart C, except if the program or program elements of the FFD program for construction satisfy the applicable requirements of Part 26. Costs and savings associated with each category of authorization are presented below in the analysis of §§26.55, 26.57, and 26.59.

Paragraph 26.53(g)

This paragraph of the final rule requires licensees and C/Vs to identify an individual's violations of FFD requirements to licensees who have relied on or intend to rely on the FFD program elements of which the individual is in violation. This paragraph of the final rule is based on non-safeguards information requirements imposed by the NRC's Access Authorization Order (AAO) dated January 7, 2003, and published in the Federal Register on January 13, 2003. As a result, the final paragraph imposes no incremental costs and affords no savings.

Sensitivity Analysis - Pre-Order Baseline

Relative to the regulations that were in effect before the NRC issued the AAO, the paragraph does not result in any incremental costs. Although the final paragraph adopts provisions from the AAO that require licensees and C/Vs to identify an individual's violations of FFD requirements to licensees who have relied on or intend to rely on the FFD program elements of which the individual is in violation, this analysis assumes that licensees and C/Vs already share

information regarding FFD violations. Therefore, the analysis anticipates that this new requirement will not result in any additional costs.

Paragraph 26.53(h)

This paragraph of the final rule prohibits licensees and other entities from initiating any actions under Subpart C, such as beginning to gather information about the individual's authorization history from other licensees or entities, without the knowledge and consent of the individual who is applying for authorization. This paragraph of the final rule is based on non-safeguards information requirements imposed by the NRC's Access Authorization Order (AAO) dated January 7, 2003, and published in the Federal Register on January 13, 2003. As a result, the final paragraph imposes no incremental costs and affords no savings.

Sensitivity Analysis - Pre-Order Baseline

Relative to the regulations that were in effect before the NRC issued the AAO, the paragraph does not result in any incremental costs. Although the final paragraph adopts provisions from the AAO that require licensees and other entities to gain an individual's consent before gathering information about the individual's authorization history, this analysis assumes that this is a standard business practice for licensees and other entities. Therefore, the analysis anticipates that this new requirement will not result in any additional costs.

Paragraph 26.53(i)

This paragraph of the final rule requires licensees to inform, in writing, individuals who are applying for authorization that the following actions are sufficient cause for denial or unfavorable termination of authorization: (1) refusal to provide written consent for the suitable inquiry; (2) refusal to provide or the falsification of any personal information; (3) refusal to provide written consent for the sharing of personal information with other licensees or C/Vs; (4) failure to report any legal actions. This paragraph of the final rule contains access authorization requirements established in 10 CFR 73.56, as supplemented by orders to nuclear power plant licensees dated January 7, 2003. Therefore, this paragraph of the final rule does not impose any incremental costs on licensees.

Sensitivity Analysis - Pre-Order Baseline

Relative to the regulations that were in effect before the NRC issued the AAO, the paragraph results in incremental costs. The final paragraph adopts provisions from the AAO that require licensees and other entities to inform, in writing, individuals applying for authorization of actions that are sufficient cause for denial or unfavorable termination of authorization. This analysis calculates the one-time cost associated with developing a written notification document as part of the one-time costs calculated in §26.27(a), Written Policy and Procedures.

26.55 Initial Authorization

Paragraph 26.55(a)

This paragraph of the final rule establishes that an initial applicant is any individual who either has never held authorization or whose authorization was terminated favorably and has been interrupted for a period of 3 or more years. No incremental costs or savings result from this provision because it is based on non-safeguards information requirements imposed by the NRC's Access Authorization Order (AAO) dated January 7, 2003, and published in the Federal Register on January 13, 2003.

Sensitivity Analysis - Pre-Order Baseline

Relative to the regulations in effect before the NRC issued the AAO, the paragraph indirectly results in incremental costs and savings because it imposes different requirements for the different categories of applicants than does the former rule. The incremental costs and savings associated with these changes are presented and calculated in the subparagraphs below.

Subparagraph 26.55(a)(1)

This subparagraph of the final rule requires licensees to ensure that self-disclosures have been obtained and reviewed, as described by §26.61, from applicants for initial authorization before granting authorization. This final paragraph imposes no incremental cost and affords no saving because, under provisions of the AAO, applicants for unescorted access are subject to similar self-disclosure requirements.

Sensitivity Analysis - Pre-Order Baseline

Relative to the regulations that were in effect before the NRC issued the AAO, the subparagraph, in conjunction with subparagraph 26.61(a)(1), does result in incremental savings. The savings result from provisions that state that applicants for initial authorization whose last authorization was terminated favorably and who have been covered by a behavioral observation and arrest-reporting program throughout the period of interruption do not need to submit self-disclosures to licensees and other entities. The *annual savings per program* result from the *sum* of the following savings:

- The annual savings per program from reduced facility worker labor burden for those initial applicants who qualify for the self-disclosure relaxation are estimated as follows:

  $$NUM_{Applicants} \times PER_{Qualify} \times HOURS_{Worker} \times WAGE_{Worker} \times NUM_{Units}$$

- The annual savings per program resulting from a reduced clerical personnel labor burden (because fewer self-disclosures submitted by initial applicants will need to be processed) are calculated as follows:

$$NUM_{Applicants} \times PER_{Qualify} \times HOURS_{Clerical} \times WAGE_{Clerical} \times NUM_{Units}$$

Parameter	Description
$HOURS_{Clerical}$	Clerical personnel hours saved in a self-disclosure (as described in assumptions below)
$HOURS_{Worker}$	Facility worker hours saved in a self-disclosure (as described in assumptions below)
$NUM_{Applicants}$	Annual number of applicants for initial authorization per unit (as described in Appendix 2, Exhibit A2-12)
NUM_{Units}	Number of units per program (as described in Appendix 2, Exhibit A2-14)
$PER_{Qualify}$	Percentage of $NUM_{Applicants}$ who qualify for the relaxation (as described in assumptions below)
$WAGE_{Clerical}$	Clerical personnel wage rate (as described in Appendix 2, Exhibit A2-11)
$WAGE_{Worker}$	Facility worker wage rate (as described in Appendix 2, Exhibit A2-11)

Assumptions:

- Percentage $NUM_{Applicants}$ who qualify for the relaxation: 50%.
- Facility worker hours saved in a self-disclosure: 0.25 hours per update.
- Clerical personnel hours saved in a self-disclosure: 0.25 hours per update.

Subparagraph 26.55(a)(2)

This subparagraph of the final rule requires licensees to ensure that a suitable inquiry has been completed, as described by §26.63, on applicants for initial authorization before granting authorization. This final subparagraph imposes no incremental cost and affords no saving because, under provisions in the AAO, applicants for unescorted access are subject to similar suitable inquiry requirements.

Sensitivity Analysis - Pre-Order Baseline

Relative to the regulations that were in effect before the NRC issued the AAO, the subparagraph, in conjunction with subparagraph 26.63(a), does result in incremental savings. The savings result from provisions that state that licensees and other entities do not need to conduct suitable inquiries on applicants for initial authorization whose last authorization was terminated

favorably and who have been covered by a behavioral observation and arrest-reporting program throughout the period of interruption. The *annual savings per program* from not conducting the suitable inquiry on initial applicants qualifying for the relaxation result from the following:

$$NUM_{Applicants} \times PER_{Qualify} \times HOURS_{HR} \times WAGE_{HR} \times NUM_{Units}$$

Parameter	Description
$HOURS_{HR}$	HR personnel hours saved per applicant due to the relaxation of a suitable inquiry under former rule, but prior to the AAO (as described in assumptions below)
$NUM_{Applicants}$	Annual number of applicants for initial authorization per unit (as described in Appendix 2, Exhibit A2-12)
NUM_{Units}	Number of units per program (as described in Appendix 2, Exhibit A2-14)
$PER_{Qualify}$	Percentage of $NUM_{Applicants}$ who qualify for the behavioral observation relaxation (as described in assumptions below)
$WAGE_{HR}$	HR personnel wage rate (as described in Appendix 2, Exhibit A2-11)

Assumptions:

- Percentage of $NUM_{Applicants}$ who qualify for the behavioral observation relaxation: 50%.

- HR personnel hours saved in the relaxation of a suitable inquiry under the former rule, but prior to the AAO: 1 hour per inquiry.

In addition, the final subparagraph, in conjunction with subparagraph 26.63(f)(1), results in additional incremental savings relative to the regulations in effect before the NRC issued the AAO. The savings result from provisions that reduce the licensees' labor burden to conduct suitable inquiries on applicants that have not identified any potentially disqualifying FFD information on their self-disclosures. This labor burden is reduced in three ways by (1) reducing the time period that the suitable inquiry must cover from 5 years under the former rule to 3 years, if no potentially disqualifying information is identified, (2) requiring licensees to contact only those employers whom the applicant identified as having worked for the longest in a given calender month during the first and second years of the 3 year period,[1] and (3) by allowing licensees to take credit for a portion of the suitable inquiry that has been conducted by other licensees. The *annual savings per program* due to the reduced suitable inquiry coverage period and scope for those initial applicants qualifying for the relaxation result from the following:

$$NUM_{Applicants} \times PER_{Not\ Qualifying} \times PER_{Non\text{-}PDFFDI} \times HOURS_{HR} \times WAGE_{HR} \times NUM_{Units}$$

[1] Licensees must contact all employers for the year immediately preceding the request for authorization, as required by subparagraph 26.63(f)(1).

Parameter	Description
$HOURS_{HR}$	HR personnel hours saved per applicant as a result of the reduced suitable inquiry coverage period and the reduced number of employers who must be contacted (as described in assumptions below)
$NUM_{Applicants}$	Annual number of applicants for initial authorization per unit (as described in Appendix 2, Exhibit A2-12)
NUM_{Units}	Number of units per program (as described in Appendix 2, Exhibit A2-14)
$PER_{Not\ Qualifying}$	Percentage of applicants for initial authorization per year who do not qualify for the behavioral observation relaxation under subparagraph 23.63(a) (as described in assumptions below)
$PER_{Non\text{-}PDFFDI}$	Percentage of $NUM_{Applicants}$ who have no potentially disqualifying FFD information to disclose on their self-disclosures (as described in assumptions below)
$WAGE_{HR}$	HR personnel wage rate (as described in Appendix 2, Exhibit A2-11)

Assumptions:

- Percentage of applicants for initial authorization per year who do not qualify for the behavioral observation relaxation: 50%

- Percentage of $NUM_{Applicants}$ who have no potentially disqualifying FFD information to disclose on their self-disclosures: 95%

- Hours of HR personnel time saved per applicant as a result of the reduced suitable inquiry coverage period and the reduced number of employers who must be contacted: 0.5 hours.

Sensitivity Analysis - Industry Practices

The former rule stipulated that a suitable inquiry must address all employers for whom the applicant worked over the past 5 years. Nonetheless, until recently, industry practices were inconsistent with NRC's interpretation of the requirements such that licensees conducting suitable inquiries did not call those employers for whom an applicant worked for less than 30 days. As a result, licensees will incur an incremental cost to comply with requirements in the former rule regarding applicants for initial authorization. The *annual costs per program* to conduct a more thorough suitable inquiry on applicants for initial authorization to comply with the former regulation result from the following:

$$NUM_{Applicants} \times HOURS_{HR} \times WAGE_{HR} \times NUM_{Units}$$

Parameter	Description
$HOURS_{HR}$	Additional HR personnel hours required to conduct a suitable inquiry consistent with former regulations (as described in assumptions below)
$NUM_{Applicants}$	Annual number of applicants for initial authorization per unit (as described in Appendix 2, Exhibit A2-12)
NUM_{Units}	Number of units at a given program (as described in Appendix 2, Exhibit A2-14)
$WAGE_{HR}$	HR personnel wage rate (as described in Appendix 2, Exhibit A2-11)

Assumptions:

- Additional HR personnel hours required to conduct a suitable inquiry consistent with former regulations: 10 minutes (a 20-percent increase over the current estimate of 50 minutes per applicant).

Subparagraph 26.55(a)(3)

This subparagraph of the final rule requires licensees to administer a pre-access drug and alcohol test, as described in §26.65, on applicants for initial authorization before granting authorization. This final subparagraph imposes no incremental cost and affords no saving because, under provisions of the AAO, applicants for unescorted access are subject to similar drug and alcohol testing requirements.

Sensitivity Analysis - Pre-Order Baseline

Relative to the regulations that were in effect before the NRC issued the AAO, the paragraph, in conjunction with paragraph 26.65(c), does result in incremental savings. The savings result from provisions that allow licensees and other entities to grant authorization without administering a pre-access drug and alcohol test to applicants whose previous authorization was terminated favorably and who have been covered by both a licensee-approved random drug and alcohol testing program and a behavioral observation and arrest reporting program throughout the period of interruption.[2] The *annual savings per program* result from the sum of the following savings:

- The annual savings per program from not administering a pre-access drug and alcohol test on initial applicants covered by both a random drug and alcohol

[2] In conjunction with §26.65, licensees and other entities are also allowed to grant authorization without administering a pre-access drug and alcohol test to applicants relying upon negative results from drug and alcohol tests conducted before the individual applied for authorization if the individual has been subject to a behavioral observation and arrest reporting program and a random drug and alcohol testing program since the testing was conducted. This provision, however, will not generate any savings that are not already captured by the calculation of savings for §26.65(b).

testing program and a behavioral observation and arrest-reporting program throughout the period of interruption are calculated as follows:[3]

- Pre-access drug and alcohol tests need not be performed at facilities with onsite testing laboratories for the percentage of applicants who are covered by both a random drug and alcohol testing program and a licensee-approved behavioral observation and arrest-reporting program throughout the period of interruption. The associated savings are estimated as follows:

  $$NUM_{Applicants} \times PER_{Qualify} \times COST_{Onsite} \times NUM_{Units}$$

- Pre-access drug and alcohol tests need not be performed at facilities with offsite testing laboratories for the percentage of applicants who are covered by both a random drug and alcohol testing program and a licensee-approved behavioral observation and arrest-reporting program throughout the period of interruption. The associated savings are calculated as follows:

  $$NUM_{Applicants} \times PER_{Qualify} \times COST_{Offsite} \times NUM_{Units}$$

- The annual savings per program from bypassing required worker labor in the administration of a pre-access drug and alcohol tests for initial applicants covered by both a random drug and alcohol testing program and a behavioral observation and arrest-reporting are calculated as follows:

  - The final paragraph reduces the number of hours of lost worker productivity awaiting negative test result verification from *onsite testing laboratories*. The associated savings are calculated as follows:

    $$NUM_{Applicants} \times PER_{Qualify} \times HOURS_{Onsite\ Worker} \times WAGE_{Worker} \times NUM_{Units}$$

  - The final paragraph reduces the number of hours of lost worker productivity awaiting negative test result verification from *offsite testing laboratories*. The associated savings are calculated as follows:

    $$NUM_{Applicants} \times PER_{Qualify} \times HOURS_{Offsite\ Worker} \times WAGE_{Worker} \times NUM_{Units}$$

[3] The incremental savings from this provision will vary per individual program depending on whether the program has onsite testing capabilities or utilizes an offsite HHS-certified testing laboratory.

Parameter	Description
$COST_{Offsite}$	Pre-access drug and alcohol testing cost at a facility with offsite testing laboratories (described in the assumption below and in Appendix 2, Exhibit A2-13)
$COST_{Onsite}$	Pre-access drug and alcohol testing cost at a facility with onsite testing laboratories (described in the assumptions below and in Appendix 2, Exhibit A2-13)
$HOURS_{Offsite\ Worker}$	Hours of facility worker time at a unit with offsite testing laboratories awaiting a negative test verification and not working under the former rule (as described in assumptions below)
$HOURS_{Onsite\ Worker}$	Hours of facility worker time at a unit with onsite testing laboratories awaiting a negative test verification and not working under the former rule (as described in assumptions below)
$NUM_{Applicants}$	Annual number of applicants for initial authorization per unit (as described in Appendix 2, Exhibit A2-12)
NUM_{Units}	Number of units per program (as described in Appendix 2, Exhibit A2-14)
$PER_{Qualify}$	Percentage of $NUM_{Applicants}$ who qualify for the pre-access drug and alcohol test relaxation per year (as described in assumptions below)

Assumptions:

- Percentage of $NUM_{Applicants}$ who qualify for the pre-access drug and alcohol test relaxation per year: 25%.

- Hours of facility worker time at a unit with onsite testing laboratories awaiting negative test verification and not working under the former rule: 4 hours per reinstatement.[4]

- Hours of facility worker time at a unit with offsite testing laboratories awaiting negative test verification and not working under the former rule: 8 hours per reinstatement.

- The per-unit cost of an *onsite pre-access drug and alcohol test* includes the following factors:
  (1) travel time of the worker
  (2) collection of drug and alcohol specimens (labor of the collector and the worker, as well as collection materials)
  (3) onsite licensee testing costs per urine specimen for drugs
  (4) labor of FFD manager to process paperwork for negative test results

[4] Verification usually requires 1 to 3 business days, depending on whether the given licensee engages in onsite or offsite testing. Although some of the time awaiting verification may be used by applicants for other work-related activities, the analysis assumes that applicants are paid, but unproductive, for a portion of this waiting period.

- The per-unit cost of an *offsite pre-access drug and alcohol test* includes the following factors:
  (1) travel time of the worker
  (2) collection of drug and alcohol specimens (labor of the collector and the worker, as well as collection materials)
  (3) HHS-certified laboratories costs per urine specimen for drugs
  (4) labor of FFD manager to process paperwork for negative test results

- Applicants who qualify for the relaxation are not expected to yield positive drug and alcohol test results under the former regulations.

Subparagraph 26.55(a)(4)

This subparagraph of the final rule adds provisions that require licensees and other entities to include applicants for initial authorization in a random drug and alcohol testing pool, in accordance with §26.67. Licensees and other entities are expected to use the same random testing pool for this purpose as specified under subparagraph 26.31(d)(2). Licensees and other entities must administer a drug and alcohol test on those applicants randomly selected, although authorization can be granted before results have been verified provided that all other applicable requirements for authorization have been met. The former rule did not contain these provisions.

The *annual costs per program* from the implementation of a random drug and alcohol testing program on initial applicants in applicant status are calculated as follows:[5]

- The final paragraph increases the number of random drug and alcohol tests performed at facilities with *onsite testing laboratories*. The associated costs are estimated as follows:

  $$NUM_{Applicants} \times PER_{Random} \times COST_{Onsite} \times NUM_{Units}$$

- The final paragraph increases the number of random drug and alcohol tests performed at facilities with *offsite testing laboratories*. The associated costs are calculated as follows:

  $$NUM_{Applicants} \times PER_{Random} \times COST_{Offsite} \times NUM_{Units}$$

[5] The costs from this provision will vary by individual program depending on whether the program has onsite testing capabilities or utilizes an offsite HHS-certified testing laboratory.

Parameter	Description
$COST_{Offsite}$	Offsite random drug and alcohol testing cost (as described in assumptions below and in Appendix 2, Exhibit A2-13)
$COST_{Onsite}$	Onsite random drug and alcohol testing cost (as described in assumptions below and in Appendix 2, Exhibit A2-13)
$NUM_{Applicants}$	Annual number of applicants for initial authorization per unit (as described in Appendix 2, Exhibit A2-12)
NUM_{Units}	Number of units per program (as described in Appendix 2, Exhibit A2-14)
PER_{Random}	Percentage of $NUM_{Applicants}$ selected for random drug and alcohol testing (as described in assumptions below)

Assumptions:

- Percentage of $NUM_{Applicants}$ selected for random drug and alcohol testing: 1.0%.[6]

- The per-unit cost of an *onsite random drug and alcohol test* includes the following factors:
  (1) travel time of the worker
  (2) collection of drug and alcohol specimens (labor of the collector and the worker, as well as collection materials)
  (3) onsite licensee testing costs per urine specimen for drugs
  (4) labor of FFD manager to process paperwork for negative test results

- The per-unit cost of an *offsite random drug and alcohol test* includes the following factors:
  (1) travel time of the worker
  (2) collection of drug and alcohol specimens (labor of the collector and the worker, as well as collection materials)
  (3) HHS-certified laboratory costs per urine specimen for drugs
  (4) labor of FFD manager to process paperwork for negative test results

Paragraph 26.55(b)

This paragraph of the final rule requires licensees and other entities to take the management action specified in §26.69 when potentially disqualifying FFD information is disclosed or discovered for an applicant for initial authorization. This final paragraph imposes no incremental cost and affords no saving because, under §26.27 of the former rule, applicants for

[6] This figure is calculated by assuming that on any given day an individual in applicant status has a chance of being selected equivalent to the following: (1 day / 365 days) x required annual testing rate of 50% x number of days in applicant status. Initial applicants are assumed to be in applicant status for an average period of 7 days.

unescorted access were subject to similar requirements. These management actions are further discussed in relevant sections of the analysis.

26.57 Authorization Update

Paragraph 26.57(a)

This paragraph of the final rule establishes that an update applicant is any individual whose authorization has been interrupted for more than 365 days but less than 3 years and whose last period of authorization was terminated favorably. No incremental costs or savings result from this provision, however, because it is based on non-safeguards information requirements imposed by the NRC's Access Authorization Order (AAO) dated January 7, 2003, and published in the Federal Register on January 13, 2003.

Sensitivity Analysis - Pre-Order Baseline

Relative to the regulations in effect before the NRC issued the AAO, the paragraph indirectly results in incremental costs and savings because it imposes different requirements for the different categories of applicants than does the former rule. The incremental costs and savings associated with these changes are presented and calculated in the subparagraphs below.

Subparagraph 26.57(a)(1)

This subparagraph of the final rule requires licensees to ensure that self-disclosures have been obtained and reviewed, as described by §26.61, from applicants updating authorization before granting authorization. This final paragraph imposes no incremental cost and affords no saving because, under §26.27(a)(1) of the former rule and provisions of the AAO, applicants for unescorted access were subject to similar self-disclosure requirements.

Sensitivity Analysis - Pre-Order Baseline

Relative to the regulations that were in effect before the NRC issued the AAO, the subparagraph, in conjunction with subparagraph 26.61(a)(1), does result in incremental savings. The savings result from provisions that state that update authorization applicants whose last authorization was terminated favorably and who have been covered by a behavioral observation and arrest-reporting program throughout the period of interruption do not need to submit self-disclosures to licensees and other entities. The *annual savings per program* result from the *sum* of the following savings:

- The annual savings per program from reduced facility worker labor burden for those applicants for updated authorization who qualify for the self-disclosure relaxation are calculated as follows:

  $$NUM_{Applicants} \times PER_{Qualify} \times HOURS_{Worker} \times WAGE_{Worker} \times NUM_{Units}$$

- The annual savings per program resulting from reduced clerical personnel labor burden (because fewer self-disclosures submitted by applicants for updated authorization will need to be processed) are calculated as follows:

$$NUM_{Applicants} \times PER_{Qualify} \times HOURS_{Clerical} \times WAGE_{Clerical} \times NUM_{Units}$$

Parameter	Description
$HOURS_{Clerical}$	Clerical personnel hours saved in a self-disclosure (as described in assumptions below)
$HOURS_{Worker}$	Facility worker hours saved in a self-disclosure (as described in assumptions below)
$NUM_{Applicants}$	Annual number of applicants for authorization updates per unit (as described in Appendix 2, Exhibit A2-12)
NUM_{Units}	Number of units per program (as described in Appendix 2, Exhibit A2-14)
$PER_{Qualify}$	Percentage of applicants for authorization updates who qualify for the relaxation (as described in assumptions below)
$WAGE_{Clerical}$	Clerical personnel wage rate (as described in Appendix 2, Exhibit A2-11)
$WAGE_{Worker}$	Facility worker wage rate (as described in Appendix 2, Exhibit A2-11)

Assumptions:

- Percentage of applicants for authorization updates who qualify for the relaxation: 50%.

- Facility worker hours saved in a self-disclosure: 0.25 hours per update.

- Clerical personnel hours saved in a self-disclosure: 0.25 hours per update.

Subparagraph 26.57(a)(2)

This subparagraph of the final rule requires licensees to ensure that a suitable inquiry has been completed, as described by §26.63, on applicants updating authorization. This final subparagraph imposes no incremental cost and affords no saving because, under §26.27 of the former rule and provisions in the AAO, applicants for unescorted access were subject to similar suitable inquiry requirements.

Sensitivity Analysis - Pre-Order Baseline

Relative to the regulations that were in effect before the NRC issued the AAO, the subparagraph, in conjunction with subparagraph 26.63(a), does result in incremental savings. The savings result from provisions that state that licensees and other entities do not need to conduct suitable

inquiries on update applicants whose last authorization was terminated favorably and who have been covered by a behavioral observation and arrest-reporting program throughout the period of interruption. The *annual savings per program* from not conducting the suitable inquiry on applicants for updated authorization qualifying for the relaxation result from the following:

$$NUM_{Applicants} \times PER_{Qualify} \times HOURS_{HR} \times WAGE_{HR} \times NUM_{Units}$$

Parameter	Description
$HOURS_{HR}$	HR personnel hours saved per applicant due to the relaxation of a suitable inquiry under former rule, but prior to the AAO (as described in assumptions below)
$NUM_{Applicants}$	Annual number of applicants for authorization updates per unit (as described in Appendix 2, Exhibit A2-12)
NUM_{Units}	Number of units per program (as described in Appendix 2, Exhibit A2-14)
$PER_{Qualify}$	Percentage of applicants for authorization updates who qualify for the behavioral observation relaxation (as described in assumptions below)
$WAGE_{HR}$	HR personnel wage rate (as described in Appendix 2, Exhibit A2-11)

Assumptions:

- Percentage of applicants for authorizations updates who qualify for the behavioral observation relaxation: 50%.

- HR personnel hours saved in the relaxation of a suitable inquiry under the former rule, but prior to the AAO: 1 hour per inquiry.

In addition to the relaxation discussed above, additional incremental savings result from this final subparagraph, in conjunction with paragraph 26.63(b) and subparagraph 26.63(f)(2) relative to the regulations that were in effect before the NRC issued the AAO. These savings result from provisions that reduce the licensee labor burden to conduct a suitable inquiry on individuals who have no potentially disqualifying FFD information to disclose and who do not qualify for the relaxation discussed above. The scope of the suitable inquiry is reduced in three ways: (1) by reducing the time period required to be covered by the suitable inquiry from 5 years under the former rule to the period since authorization was last terminated favorably, (2) by requiring licensees to contact only those employers whom the applicant identified as having worked for the longest in a given calendar month after the first year of interruption (for which licensees must contact all employers, regardless of the duration of employment) until authorization was terminated, and (3) by allowing licensees to take credit for a portion of the suitable inquiry that has been conducted by other licensees. The *annual savings per program* due to the reduced suitable inquiry coverage period and scope for applicants for updated authorization qualifying for the relaxation result from the following:

$$NUM_{Applicants} \times PER_{Not\ Qualifying} \times PER_{Non\text{-}PDFFDI} \times HOURS_{HR} \times WAGE_{HR} \times NUM_{Units}$$

Parameter	Description
$HOURS_{HR}$	Hours of HR personnel time saved per suitable inquiry as a result of the reduced coverage period and number of employees who must be contacted (as described in assumptions below)
$NUM_{Applicants}$	Annual number of applicants for updated authorization per unit (as described in Appendix 2, Exhibit A2-12)
NUM_{Unit}	Number of units per program (as described in Appendix 2, Exhibit A2-14)
$PER_{Non\text{-}PDFFDI}$	Percentage of $NUM_{Applicants}$ who have no potentially disqualifying FFD information to disclose on their self-disclosures (as described in assumptions below)
$PER_{Not\ Qualifying}$	Percentage of applicants for updated authorization per year who do not qualify for the relaxation under subparagraph 26.63(a) (as described in assumptions below)
$WAGE_{HR}$	HR personnel wage rate (as described in Appendix 2, Exhibit A2-11)

Assumptions:

- Percentage of $NUM_{Applicants}$ who have no potentially disqualifying FFD information to disclose on their self-disclosures: 98%.
- Percentage of applicants for updated authorization per year who do not qualify for the relaxation under subparagraphs 26.63(a): 50%.
- Hours of HR personnel time saved per suitable inquiry as a result of the reduced scope of coverage: 0.5 hours.

Sensitivity Analysis - Industry Practices

The former regulation stipulated that a suitable inquiry must address all employers for whom applicants for authorization updates worked over the past 5 years. Nonetheless, until recently, industry practices were inconsistent with the NRC's interpretation of the requirements such that licensees conducting suitable inquiries did not call those employers for whom an applicant worked for less than 30 days. As a result, licensees will incur an incremental cost to comply with former requirements for suitable inquiries. The *annual costs per program* to conduct a more thorough suitable inquiry on applicants for updated authorization to comply with the former regulation result from the following:

$$NUM_{Applicants} \times HOURS_{HR} \times WAGE_{HR} \times NUM_{Units}$$

Parameter	Description
$HOURS_{HR}$	Additional HR personnel hours required to conduct suitable inquiries consistent with former regulations (as described in assumptions below)

Parameter	Description
$NUM_{Applicants}$	Annual number of applicants for authorization updates per unit (as described in Appendix 2, Exhibit A2-12)
NUM_{Units}	Number of units per program (as described in Appendix 2, Exhibit A2-14)
$WAGE_{HR}$	HR personnel wage rate (as described in Appendix 2, Exhibit A2-11)

Assumptions:

- Additional HR personnel hours required to conduct suitable inquiries consistent with former regulations: 10 minutes (i.e., a 20-percent increase over the current estimate of 50 minutes per applicant).

Subparagraph 26.57(a)(3)

This subparagraph of the final rule requires licensees to administer a pre-access drug and alcohol test, as described in §26.65, on applicants updating authorization before granting authorization. This final subparagraph imposes no incremental cost and affords no saving because, under §26.24(a) of the former rule and provisions of the AAO, applicants for unescorted access were subject to similar drug and alcohol testing requirements.

Sensitivity Analysis - Pre-Order Baseline

Relative to the regulations that were in effect before the NRC issued the AAO, the paragraph, in conjunction with paragraph 26.65(c), does result in incremental savings. The savings result from provisions that allow licensees and other entities to grant authorization without administering a pre-access drug and alcohol test to applicants whose previous authorization was terminated favorably and who have been covered by both a licensee-approved random drug and alcohol testing program and a behavioral observation and arrest reporting program throughout the period of interruption.[7] The *annual savings per program* result from the sum of the following savings:

- The annual savings per program from not administering a pre-access drug and alcohol test on update applicants covered by both a random drug and alcohol

[7] In conjunction with §26.65, licensees and other entities are also allowed to grant authorization without administering a pre-access drug and alcohol test to applicants relying upon negative results from drug and alcohol tests conducted before the individual applied for authorization if the individual has been subject to a behavioral observation and arrest reporting program and a random drug and alcohol testing program since the testing was conducted. This provision, however, will not generate any savings that are not already captured by the calculation of savings for §26.65(b).

testing program and a behavioral observation and arrest-reporting program throughout the period of interruption are calculated as follows:[8]

- Pre-access drug and alcohol tests need not be performed at facilities with onsite testing laboratories for the percentage of applicants who are covered by both a random drug and alcohol testing program and a licensee-approved behavioral observation and arrest-reporting program throughout the period of interruption. The associated savings are estimated as follows:

  $$NUM_{Applicants} \times PER_{Qualify} \times COST_{Onsite} \times NUM_{Units}$$

- Pre-access drug and alcohol tests need not be performed at facilities with offsite testing laboratories for the percentage of applicants who are covered by both a random drug and alcohol testing program and a licensee-approved behavioral observation and arrest-reporting program throughout the period of interruption. The associated savings are calculated as follows:

  $$NUM_{Applicants} \times PER_{Qualify} \times COST_{Offsite} \times NUM_{Units}$$

- The annual savings per program from bypassing required worker labor in the administration of a pre-access drug and alcohol tests for update applicants covered by both a random drug and alcohol testing program and a behavioral observation and arrest-reporting are calculated as follows:

  - The final paragraph reduces the number of hours of lost worker productivity awaiting negative test result verification from *onsite testing laboratories*. The associated savings are calculated as follows:

    $$NUM_{Applicants} \times PER_{Qualify} \times HOURS_{Onsite\ Worker} \times WAGE_{Worker} \times NUM_{Units}$$

  - The final paragraph reduces the number of hours of lost worker productivity awaiting negative test result verification from *offsite testing laboratories*. The associated savings are calculated as follows:

    $$NUM_{Applicants} \times PER_{Qualify} \times HOURS_{Offsite\ Worker} \times WAGE_{Worker} \times NUM_{Units}$$

[8] The incremental savings from this provision will vary per individual program depending on whether the program has onsite testing capabilities or utilizes an offsite HHS-certified testing laboratory.

Parameter	Description
$COST_{Offsite}$	Pre-access drug and alcohol testing cost at a facility with offsite testing laboratories (described in the assumption below and in Appendix 2, Exhibit A2-13)
$COST_{Onsite}$	Pre-access drug and alcohol testing cost at a facility with onsite testing laboratories (described in the assumptions below and in Appendix 2, Exhibit A2-13)
$HOURS_{Offsite\ Worker}$	Hours of facility worker time at a unit with offsite testing laboratories awaiting a negative test verification and not working under the former rule (as described in assumptions below)
$HOURS_{Onsite\ Worker}$	Hours of facility worker time at a unit with onsite testing laboratories awaiting a negative test verification and not working under the former rule (as described in assumptions below)
$NUM_{Applicants}$	Annual number of applicants for authorization updates per unit (as described in Appendix 2, Exhibit A2-12)
NUM_{Units}	Number of units per program (as described in Appendix 2, Exhibit A2-14)
$PER_{Qualify}$	Percentage of $NUM_{Applicants}$ who qualify for the pre-access drug and alcohol test relaxation per year (as described in assumptions below)

Assumptions:

- Percentage of $NUM_{Applicants}$ who qualify for the pre-access drug and alcohol test relaxation per year: 25%.

- Hours of facility worker time at a unit with onsite testing laboratories awaiting negative test verification and not working under the former rule: 4 hours per reinstatement.[9]

- Hours of facility worker time at a unit with offsite testing laboratories awaiting negative test verification and not working under the former rule: 8 hours per reinstatement.

- The per-unit cost of an *onsite pre-access drug and alcohol test* includes the following factors:
  (1) travel time of the worker
  (2) collection of drug and alcohol specimens (labor of the collector and the worker, as well as collection materials)
  (3) onsite licensee testing costs per urine specimen for drugs
  (4) labor of FFD manager to process paperwork for negative test results

[9] Verification usually requires 1 to 3 business days, depending on whether the given licensee engages in onsite or offsite testing. Although some of the time awaiting verification may be used by applicants for other work-related activities, the analysis assumes that applicants are paid, but unproductive, for a portion of this waiting period.

- The per-unit cost of an *offsite pre-access drug and alcohol test* includes the following factors:
  (1) travel time of the worker
  (2) collection of drug and alcohol specimens (labor of the collector and the worker, as well as collection materials)
  (3) HHS-certified laboratories costs per urine specimen for drugs
  (4) labor of FFD manager to process paperwork for negative test results

- Applicants who qualify for the relaxation are not expected to yield positive drug and alcohol test results under the former regulations.

Subparagraph 26.57(a)(4)

This subparagraph of the final rule adds provisions that require licensees and other entities to include applicants for updated authorization in a random drug and alcohol testing pool, under §26.67. Licensees and other entities are expected to use the same random testing pool for this purpose as is specified under subparagraph 26.31(d)(2) of the final rule. Licensees and other entities must administer a drug and alcohol test on those applicants randomly selected, although applicants can be granted authorization before results have been verified, provided that all other applicable requirements for authorization have been met.

The *annual costs per program* due to the increase in the number of random drug and alcohol tests performed on applicants for updated authorization are calculated as follows:[10]

- The final paragraph increases the number of random drug and alcohol tests performed at facilities with *onsite testing laboratories*. The associated costs are estimated as follows:

  $$NUM_{Applicants} \times PER_{Random} \times COST_{Onsite} \times NUM_{Units}$$

- The final paragraph increases the number of random drug and alcohol tests performed at facilities with *offsite testing laboratories*. The associated costs are calculated as follows:

  $$NUM_{Applicants} \times PER_{Random} \times COST_{Offsite} \times NUM_{Units}$$

Parameter	**Description**
$COST_{Offsite}$	Offsite random drug and alcohol testing cost (as described in assumptions below and in Appendix 2, Exhibit A2-13)

[10] The costs from this provision will vary by individual program depending on whether the program has onsite testing capabilities or utilizes an offsite HHS-certified testing laboratory.

Parameter	Description
$COST_{Onsite}$	Onsite random drug and alcohol testing cost (as described in assumptions below and in Appendix 2, Exhibit A2-13)
$NUM_{Applicants}$	Annual number of applicants for updated authorization per unit (as described in Appendix 2, Exhibit A2-12)
NUM_{Units}	Number of units per program (as described in Appendix 2, Exhibit A2-14)
PER_{Random}	Percentage of $NUM_{Applicants}$ selected for random drug and alcohol testing (as described in assumptions below)

Assumptions:

- Percentage of $NUM_{Applicants}$ selected for random drug and alcohol testing: 1.0%.[11]

- The per-unit cost of an *onsite random drug and alcohol test* includes the following factors:
  (1) travel time of the worker
  (2) collection of drug and alcohol specimens (labor of the collector and the worker, as well as collection materials)
  (3) onsite licensee testing costs per urine specimen for drugs
  (4) labor of FFD manager to process paperwork for negative test results

- The per-unit cost of an *offsite random drug and alcohol test* includes the following factors:
  (1) travel time of the worker
  (2) collection of drug and alcohol specimens (labor of the collector and the worker, as well as collection materials)
  (3) HHS-certified laboratory costs per urine specimen for drugs
  (4) labor of FFD manager to process paperwork for negative test results

Paragraph 26.57(b)

This paragraph of the final rule requires licensees and other entities to take the management action specified in §26.69 when potentially disqualifying FFD information is disclosed or discovered for an applicant for updated authorization. This final paragraph imposes no incremental cost and affords no saving because, under §26.27 of the former rule, applicants for unescorted access were subject to similar requirements. These management actions are further discussed in relevant sections of the analysis.

[11] This figure is calculated by assuming that on any given day, an individual in applicant status has a chance of being selected equivalent to the following: (1 day / 365 days) x required annual testing rate of 50% x number of days in applicant status. Initial applicants are assumed to be in applicant status for an average period of 7 days.

26.59 Authorization Reinstatement

Paragraph 26.59(a)

This paragraph of the final rule [including subparagraphs 26.59(a)(1) – (3)] addresses reinstatement applicants with an interruption of more than 30 days but not more than 365 days and whose last period of authorization was terminated favorably. No incremental costs or savings result from this provision, however, because it is based on non-safeguards information requirements imposed by the NRC's Access Authorization Order (AAO) dated January 7, 2003, and published in the Federal Register on January 13, 2003.

Sensitivity Analysis - Pre-Order Baseline

Relative to the regulations in effect before the NRC issued the AAO, the paragraph indirectly results in incremental costs and savings because it imposes different requirements for the different categories of applicants relative to the requirements of the former rule. These incremental costs and savings are presented and calculated in the subparagraphs below.

Subparagraph 26.59(a)(1)

This subparagraph of the final rule requires licensees to ensure that self-disclosures have been obtained and reviewed, as described by §26.61, from applicants for reinstatement authorization with an interruption of more than 30 days but not more than 365 days, before granting authorization. This final subparagraph imposes no incremental cost and affords no saving because, under §26.27 of the former rule and provisions of the AAO, applicants for unescorted access were subject to similar self-disclosure requirements.

Sensitivity Analysis - Pre-Order Baseline

Relative to the regulations that were in effect before the NRC issued the AAO, the subparagraph, in conjunction with subparagraph 26.61(a)(1), does result in incremental savings. The savings result from provisions that state that previously authorized applicants whose last authorizations were terminated favorably and who have been covered by a behavioral observation and arrest-reporting program throughout the period of interruption do not need to submit self-disclosures to licensees and other entities. The *annual savings per program* result from the *sum* of the following savings:

- The annual savings per program from reduced facility worker labor burden for those applicants for authorization reinstatement who qualify for the self-disclosure relaxation are calculated as follows:

  $$NUM_{Applicants} \times PER_{Qualify} \times HOURS_{Worker} \times WAGE_{Worker} \times NUM_{Units}$$

- The annual savings per program from reduced clerical personnel labor burden (because fewer self-disclosures submitted by applicants for authorization reinstatement will need to be processed) are calculated as follows:

$$NUM_{Applicants} \times PER_{Qualify} \times HOURS_{Clerical} \times WAGE_{Clerical} \times NUM_{Units}$$

Parameter	Description
$HOURS_{Clerical}$	Clerical personnel hours saved in a self-disclosure (as described in assumptions below)
$HOURS_{Worker}$	Facility worker hours saved in a self-disclosure (as described in assumptions below)
$NUM_{Applicants}$	Annual number of applicants for authorization reinstatement with an interruption of more than 30 days but not more than 365 days per unit (as described in Appendix 2, Exhibit A2-12)
NUM_{Units}	Number of units per program (as described in Appendix 2, Exhibit A2-14)
$PER_{Qualify}$	Percentage of applicants for authorization reinstatement who qualify for the relaxation (as described in assumptions below)
$WAGE_{Clerical}$	Clerical personnel wage rate (as described in Appendix 2, Exhibit A2-11)
$WAGE_{Worker}$	Facility worker wage rate (as described in Appendix 2, Exhibit A2-11)

Assumptions:

- Percentage of applicants for authorization reinstatements who qualify for the relaxation: 50%.

- Facility worker hours saved in a self-disclosure: 0.25 hours per update.

- Clerical personnel hours saved in a self-disclosure: 0.25 hours per update.

Subparagraph 26.59(a)(2)

This subparagraph of the final rule requires licensees to ensure that a suitable inquiry has been completed, as described by §26.63, on applicants for reinstatement authorization with an interruption of more than 30 days but not more than 365 days, before granting authorization. This final subparagraph imposes no incremental cost and affords no saving because, under §26.27 of the former rule, applicants for unescorted access were subject to similar suitable inquiry requirements. The final subparagraph also adopts provisions from the NRC's AAO that (1) eliminate the suitable inquiry requirement for the subset of applicants whose previous authorization was terminated favorably and who have been covered by a licensee-approved behavioral observation and arrest-reporting program throughout the period of interruption [in conjunction with 26.63(a)], (2) reduce the labor burden associated with conducting a suitable inquiry, and (3) allow licensees to grant authorization prior to the completion of a suitable

inquiry, provided that it is completed within 10 business days. There is no incremental savings from these provisions, except under the alternative Pre-Order Baseline as discussed below, because they are based on non-safeguards information requirements imposed by the NRC's AAO dated January 7, 2003, and published in the Federal Register on January 13, 2003 (68 FR 1643).

Sensitivity Analysis - Pre-Order Baseline

Relative to the regulations in effect before the NRC issued the AAO, the subparagraph does result in incremental savings by not requiring suitable inquiries for reinstatement applicants with interruptions of 31–365 days if their last authorization was terminated favorably and they were covered by a licensee-approved behavioral observation and arrest-reporting program throughout the period of interruption. The *annual savings per program* from not conducting the suitable inquiry on applicants for authorization reinstatement qualifying for the relaxation result from the following:

$$NUM_{Applicants} \times PER_{Qualify} \times HOURS_{HR} \times WAGE_{HR} \times NUM_{Units}$$

Parameter	Description
$HOURS_{HR}$	HR personnel hours saved per applicant by not conducting a suitable inquiry due to the relaxation (as described in assumptions below)
$NUM_{Applicants}$	Annual number of applicants per unit for authorization reinstatement with interruption of more than 30 days but not more than 365 days per unit (as described in Appendix 2, Exhibit A2-12)
NUM_{Units}	Number of units per program (as described in Appendix 2, Exhibit A2-14)
$PER_{Qualify}$	Percentage of $NUM_{Applicants}$ covered by a licensee-approved behavioral observation and arrest-reporting program throughout the period of interruption (as described in assumptions below)
$WAGE_{HR}$	HR personnel wage rate (as described in Appendix 2, Exhibit A2-11)

Assumptions:

- Percentage of authorization reinstatement applicants who qualify for the behavioral observation relaxation: 50%.

- HR personnel hours saved per applicant by not conducting a suitable inquiry due to the relaxation: 1 hour per suitable inquiry.

In addition to the relaxation discussed above, this subparagraph of the final rule, in conjunction with paragraph 26.63(b) and 26.63(f)(3), adopts provisions from the NRC's AAO that result in incremental savings by reducing the scope (and associated labor burden) of the suitable inquiry for reinstatement applicants with interruptions of 31–365 days who have no potentially

disqualifying FFD information to disclose and who do not qualify for the relaxations discussed above. The scope is reduced in three ways: (1) by reducing the time period required to be covered by the suitable inquiry from 5 years under the former rule to the period since authorization was last terminated favorably, (2) by requiring licensees to contact only those employers whom the applicant identified as having worked for the longest in a given calender month (as opposed to all employers under the former rule), and (3) by allowing licensees to take credit for a portion of the suitable inquiry that has been conducted by other licensees. The *annual savings per program* due to the reduced suitable inquiry coverage period and scope for applicants for authorization reinstatement qualifying for the relaxation result from the following:

$$NUM_{Applicants} \times PER_{Not\ Qualifying} \times PER_{Non\text{-}PDFFDI} \times HOURS_{HR} \times WAGE_{HR} \times NUM_{Units}$$

Parameter	Description
$HOURS_{HR}$	Hours of HR personnel time saved per suitable inquiry due to reduced suitable inquiry coverage period and a reduction in the number of employees that must be contacted (as described in assumptions below)
$NUM_{Applicants}$	Annual number of applicants per unit for authorization reinstatement with interruption of more than 30 days but not more than 365 days per unit (as described in Appendix 2, Exhibit A2-12)
NUM_{Units}	Number of units per program (as described in Appendix 2, Exhibit A2-14)
$PER_{Non\text{-}PDFFDI}$	Percentage of $NUM_{Applicants}$ who have no potentially disqualifying FFD information to disclose on their self-disclosures (as described in assumptions below)
$PER_{Not\ Qualifying}$	Percentage of $NUM_{Applicants}$ not covered by a licensee-approved behavioral observation and arrest-reporting program throughout the period of interruption (as described in assumptions below)
$WAGE_{HR}$	HR personnel wage rate (as described in Appendix 2, Exhibit A2-11)

Assumptions:

- Percentage of $NUM_{Applicants}$ not covered by a licensee-approved behavioral observation and arrest-reporting program throughout the period of interruption: 50%.

- Percentage of $NUM_{Applicants}$ who have no potentially disqualifying FFD information to disclose on their self-disclosures: 99%.

- Hours of HR personnel time saved per suitable inquiry as a result of the reduced scope of coverage: 0.5 hours.

In addition to the relaxation discussed above, this final subparagraph adopts provisions from the AAO that allow for applicants for authorization reinstatement with an interruption of 31–365

days to be granted authorization *prior to* the completion of a suitable inquiry, provided that the inquiry is completed within 10 business days of granting reinstated authorization. If after 10 business days the suitable inquiry has not been completed, authorization must be administratively withdrawn until it is completed. This provision does not change the activities that must be conducted. It could lead to savings, however, by reducing the amount of lost worker productivity while awaiting completion of the inquiry. The analysis assumes, however, that workers are engaged in other work-related activities (such as training, testing, and other non-FFD-related activities) that do not require authorization while the suitable inquiry is being conducted.

Sensitivity Analysis - Industry Practices

The former regulation stipulated that a suitable inquiry must address all employers for whom applicants for authorization worked over the past 5 years. Nonetheless, until recently, industry practices were inconsistent with NRC's interpretation of the requirements such that industry practice has been that licensees conducting suitable inquiries did not call employers for whom an applicant worked for 30 days or less. As a result, licensees should have incurred an incremental cost to comply with former requirements for suitable inquiries on applicants with an interruption of 31–365 days. The *annual cost per program* to conduct a more thorough suitable inquiry on applicants for authorization reinstatement to comply with the former regulation result from the following:

$$NUM_{Applicants} \times HOURS_{HR} \times WAGE_{HR} \times NUM_{Units}$$

Parameter	Description
$HOURS_{HR}$	Additional HR personnel hours required to conduct a suitable inquiry consistent with the former regulations (as described in assumptions below)
$NUM_{Applicants}$	Annual number of applicants for authorization reinstatement with an interruption of more than 30 days but not more than 365 days (as described in Appendix 2, Exhibit A2-12)
NUM_{Units}	Number of units per program (as described in Appendix 2, Exhibit A2-14)
$WAGE_{HR}$	HR personnel wage rate (as described in Appendix 2, Exhibit A2-11)

Assumptions:

- Additional HR personnel hours required to conduct suitable inquiries consistent with the former regulations: 10 minutes (i.e., a 20-percent increase over the current estimate of 50 minutes per applicant).

Subparagraph 26.59(a)(3)

This subparagraph of the final rule requires licensees to administer a pre-access drug and alcohol test, as described in §26.65, on applicants for reinstatement authorization with an interruption of more than 30 days but not more than 365 days, before granting authorization. The final subparagraph imposes no incremental cost and affords no saving because, under the former rule, applicants for unescorted access were subject to similar drug and alcohol testing requirements under 26.24(a). The final subparagraph does, however, adopt provisions from the NRC's AAO that eliminate the pre-access drug and alcohol testing requirement for those applicants whose previous authorization was terminated favorably and who have been covered both by behavioral observation and arrest program and by a licensee-approved random drug and alcohol testing program throughout the period of interruption. Other provisions adapted from the AAO allow licensees to grant authorization reinstatement to applicants prior to receiving verification of negative drug test results as long as verification occurs within 5 business days. If verification does not occur during this time frame, authorization must be administratively withdrawn until completed. There is no incremental savings from these provisions, except under the alternative *Pre-Order Baseline* as discussed below, because they are based on non-safeguards information requirements imposed by the NRC's AAO dated January 7, 2003, and published in the Federal Register on January 13, 2003 (68 FR 1643).

Sensitivity Analysis - Pre-Order Baseline

Relative to the regulations in effect before the NRC issued the AAO, the subparagraph, in conjunction with §26.65(d), does result in incremental saving. According to §26.24 of the former rule as well as guidance provided by the NRC in NUREG-1385, "Fitness for Duty in the Nuclear Power Industry: Responses to Implementation Questions," licensees could not grant authorization without administering a drug and alcohol test and verifying negative test results. Provisions in this final rule, however, allow applicants for authorization reinstatement with an interruption of 31–365 days to forego pre-access drug and alcohol testing if covered by a licensee-approved random drug and alcohol testing program and a behavioral observation and arrest reporting program throughout the period of interruption.[12] As a result, savings arise from the reduction in the number of pre-access tests administered and the reduction in the loss of worker productivity awaiting negative test results.

The *annual savings per program* result from the *sum* of the following savings:

[12] In conjunction with §26.65, licensees and other entities are also allowed to grant authorization without administering a pre-access drug and alcohol test to applicants relying upon negative results from drug and alcohol tests conducted before the individual applied for authorization if the individual has been subject to a behavioral observation and arrest reporting program and a random drug and alcohol testing program since the testing was conducted. This provision, however, will not generate any savings that are not already captured by the calculation of savings for §26.65(b).

- Annual savings per program from allowing reinstatement applicants covered by a random drug and alcohol testing program and a behavioral observation and arrest reporting program throughout the period of interruption to forego pre-access drug and alcohol testing are calculated as follows:[13]

  - The final paragraph reduces the number of pre-access drug and alcohol tests performed at facilities with *onsite testing laboratories*. The associated savings are calculated as follows:

    $NUM_{Applicants} \times PER_{Qualify} \times COST_{Onsite} \times NUM_{Units}$

  - The final paragraph reduces the number of pre-access drug and alcohol tests performed at facilities with *offsite testing laboratories*. The associated savings are calculated as follows:

    $NUM_{Applicants} \times PER_{Qualify} \times COST_{Offsite} \times NUM_{Units}$

- Annual savings per program from reducing the number of hours of lost worker productivity for reinstatement applicants covered by both a random drug and alcohol testing program and a behavioral observation and arrest reporting program are calculated as follows:[14]

  - The final paragraph reduces the number of hours of lost worker productivity awaiting negative test result verification from *onsite testing laboratories*. The associated savings are calculated as follows:

    $NUM_{Applicants} \times PER_{Qualify} \times HOURS_{Onsite\ Worker} \times WAGE_{Worker} \times NUM_{Units}$

  - The final paragraph reduces the number of hours of lost worker productivity awaiting negative test result verification from *offsite testing laboratories*. The associated savings are calculated as follows:

    $NUM_{Applicants} \times PER_{Qualify} \times HOURS_{Offsite\ Worker} \times WAGE_{Worker} \times NUM_{Units}$

[13] The incremental savings from this provision will vary by individual program depending on whether the program has onsite testing capabilities or utilizes an offsite HHS-certified testing laboratory.

[14] The incremental savings from this provision will vary by individual program depending on whether the program has onsite testing capabilities or utilizes an offsite HHS-certified testing laboratory.

Parameter	Description
$COST_{Offsite}$	Offsite pre-access drug and alcohol testing cost (as described in assumptions below and in Appendix 2, Exhibit A2-13)
$COST_{Onsite}$	Onsite pre-access drug and alcohol testing cost (as described in assumptions below and in Appendix 2, Exhibit A2-13)
$HOURS_{Offsite\ Worker}$	Hours of facility worker time at a unit with offsite testing laboratories awaiting a negative test verification and not working under the former rule (as described in assumptions below)
$HOURS_{Onsite\ Worker}$	Hours of facility worker time at a unit with onsite testing laboratories awaiting a negative test verification and not working under the former rule (as described in assumptions below)
$NUM_{Applicants}$	Annual number of applicants for authorization with an interruption of more than 30 days but not more than 365 days per unit (as described in Appendix 2, Exhibit A2-12)
NUM_{Units}	Number of units per program (as described in Appendix 2, Exhibit A2-14)
$PER_{Qualify}$	Percentage of $NUM_{Applicants}$ covered by a licensee approved random drug and alcohol testing program and a behavioral observation and arrest reporting program (as described in assumptions below)
$WAGE_{Worker}$	Facility worker wage rate (as described in Appendix 2, Exhibit A2-11)

Assumptions:

- Percentage of $NUM_{Applicants}$ covered by a licensee approved random drug and alcohol testing program and behavioral observation and arrest reporting program: 25%.

- Hours of facility worker time at a unit with onsite testing laboratories awaiting negative test verification and not working under the former rule: 4 hours per reinstatement.[15]

- Hours of facility worker time at a unit with offsite testing laboratories awaiting negative test verification and not working under the former rule: 8 hours per reinstatement.

[15] Verification usually requires 1 to 3 business days, depending on whether the given licensee engages in onsite or offsite testing. Although some of the time awaiting verification may be used by applicants for other work-related activities, the analysis assumes that applicants are paid, but unproductive, for a portion of this waiting period.

- The per-unit cost of an *onsite pre-access drug and alcohol test* includes the following factors:
  (1) travel time of the worker
  (2) collection of drug and alcohol specimens (labor of the collector and the worker, as well as collection materials)
  (3) onsite licensee testing costs per urine specimen for drugs
  (4) labor of FFD manager to process paperwork for negative test results

- The per-unit cost of an *offsite pre-access drug and alcohol test* includes the following factors:
  (1) travel time of the worker
  (2) collection of drug and alcohol specimens (labor of the collector and the worker, as well as collection materials)
  (3) HHS-certified laboratory costs per urine specimen for drugs
  (4) labor of FFD manager to process paperwork for negative test results

In addition, this final subparagraph adopts provisions from the AAO that allow licensees to grant authorization reinstatement to applicants with interruptions of 31–365 days prior to receiving verification of negative drug test results as long as verification occurs within 5 business days of specimen collection. (This applies only to those applicants that must take a pre-access test, thereby excluding those covered by the preceding relaxation). Verification usually requires 1 to 3 business days, depending on whether the given licensee engages in onsite or offsite testing. Although some of the time awaiting verification may be used by applicants for other work-related activities, the analysis assumes that applicants are paid, but unproductive, for a portion of this waiting period. *The annual savings per program* resulting from this group of applicants not having to await verification of negative results before granting authorization are calculated as follows:[16]

- The final paragraph decreases the number of hours of lost worker productivity awaiting negative test result verification from *onsite testing laboratories*. The associated savings are calculated as follows:

  $$NUM_{Applicants} \times PER_{Not\ Qualifying} \times HOURS_{Onsite\ Worker} \times WAGE_{Worker} \times NUM_{Units}$$

- The final paragraph decreases the number of hours of lost worker productivity awaiting negative test result verification from *offsite testing laboratories*. The associated savings are calculated as follows:

  $$NUM_{Applicants} \times PER_{Not\ Qualifying} \times HOURS_{Offsite\ Worker} \times WAGE_{Worker} \times NUM_{Units}$$

[16] The incremental savings from this provision will vary by individual program depending on whether the program has onsite testing capabilities or utilizes an offsite HHS-certified testing laboratory.

Parameter	Description
$HOURS_{Offsite\ Worker}$	Hours of facility worker time at a unit with offsite testing laboratories awaiting a negative test verification and not working under the former rule (as described in assumptions below)
$HOURS_{Onsite\ Worker}$	Hours of facility worker time at a unit with onsite testing laboratories awaiting a negative test verification and not working under the former rule (as described in assumptions below)
$NUM_{Applicants}$	Annual number of applicants for authorization reinstatement with an interruption of more than 30 days but not more than 365 days per unit (as described in Appendix 2, Exhibit A2-12)
NUM_{Units}	Number of units per program (as described in Appendix 2, Exhibit A2-14)
$PER_{Not\ Qualifying}$	Percentage of $NUM_{Applicants}$ not covered by a licensee-approved random drug and alcohol testing program and a behavioral observation and arrest reporting program throughout the period of interruption (as described in assumptions below)
$WAGE_{Worker}$	Facility worker wage rate (as described in Appendix 2, Exhibit A2-11)

Assumptions:

- Percentage of $NUM_{Applicants}$ not covered by a licensee-approved random drug and alcohol testing program and a behavioral observation and arrest reporting program throughout the period of interruption: 75%.

- Hours of facility worker time at a unit with onsite testing laboratories awaiting negative test verification and not working under the former rule: 4 hours per reinstatement.[17]

- Hours of facility worker time at a unit with offsite testing laboratories awaiting negative test verification and not working under the former rule: 8 hours per reinstatement.

Subparagraph 26.59(a)(4)

This subparagraph of the final rule adds provisions that require licensees and other entities to include applicants for reinstatement authorization with an interruption of more than 30 days but not more than 365 days in a random drug and alcohol testing pool, under §26.67. Licensees and other entities are expected to use the same random testing pool for this purpose as specified under subparagraph 26.31(d)(2) of the final rule. Licensees and other entities must administer a drug and alcohol test on those applicants randomly selected. Authorization may be granted

[17] Verification usually requires 1 to 3 business days, depending on whether the given licensee engages in onsite or offsite testing. Although some of the time awaiting verification may be used by applicants for other work-related activities, the analysis assumes that applicants are paid, but unproductive, for a portion of this waiting period.

before results have been verified provided that all other applicable requirements for authorization have been met.

The *annual costs per program* to conduct random drug and alcohol tests on applicants randomly selected while awaiting the granting of authorization are calculated as follows:[18]

- The final paragraph increases the number of drug and alcohol tests performed at facilities with *onsite testing laboratories*. The associated costs are calculated as follows:

  $NUM_{Applicants} \times PER_{Random} \times COST_{Onsite} \times NUM_{Units}$

- The final paragraph increases the number of pre-access drug and alcohol tests performed at facilities with *offsite testing laboratories*. The associated costs are calculated as follows:

  $NUM_{Applicants} \times PER_{Random} \times COST_{Offsite} \times NUM_{Units}$

Parameter	**Description**
$COST_{Offsite}$	Offsite random drug and alcohol testing cost (as described in assumptions below and in Appendix 2, Exhibit A2-13)
$COST_{Onsite}$	Onsite random drug and alcohol testing cost (as described in assumptions below and in Appendix 2, Exhibit A2-13)
$NUM_{Applicants}$	Annual number of applicants for authorization reinstatement with an interruption of more than 30 days but not more than 365 days per unit (as described in Appendix 2, Exhibit A2-12)
NUM_{Units}	Number of units per program (as described in Appendix 2, Exhibit A2-14)
PER_{Random}	Percentage of $NUM_{Applicants}$ selected for random drug and alcohol testing (as described in assumptions below)

[18] The incremental savings from this provision will vary by individual program depending on whether the program has onsite testing capabilities or utilizes an offsite HHS-certified testing laboratory.

Assumptions:

- Percentage of $NUM_{Applicants}$ selected for random drug and alcohol testing: 1.0%.[19]

- The per-unit cost of an *onsite random drug and alcohol test* includes the following factors:
  (1) travel time of the worker
  (2) collection of drug and alcohol specimens (labor of the collector and the worker, as well as collection materials)
  (3) onsite licensee testing costs per urine specimen for drugs
  (4) labor of FFD manager to process paperwork for negative test results

- The per-unit cost of an *offsite random drug and alcohol test* includes the following factors:
  (1) travel time of the worker
  (2) collection of drug and alcohol specimens (labor of the collector and the worker, as well as collection materials)
  (3) HHS-certified laboratory costs per urine specimen for drugs
  (4) labor of FFD manager to process paperwork for negative test results

Paragraph 26.59(b)

This subparagraph of the final rule imposes no incremental cost and affords no saving because it is added to ensure that the administrative withdrawal of an individual's authorization is not recorded as an unfavorable termination. No incremental costs or savings result from this provision, however, because it is based on non-safeguards information requirements imposed by the NRC's Access Authorization Order (AAO) dated January 7, 2003, and published in the Federal Register on January 13, 2003.

Paragraph 26.59(c)

This paragraph of the final rule [including subparagraphs 26.59(c)(1) – (3)] addresses reinstatement applicants with an interruption of no more than 30 days and whose last period of authorization was terminated favorably. No incremental costs or savings result from this provision, however, because it is based on non-safeguards information requirements imposed by the NRC's Access Authorization Order (AAO) dated January 7, 2003, and published in the Federal Register on January 13, 2003.

[19] This figure is calculated by assuming that on any given day, an individual in applicant status has a chance of being selected equivalent to the following: (1 day / 365 days) x required annual testing rate of 50% x number of days in applicant status. The analysis assumed an average applicant status of 7 days. Applicants for reinstatement authorization, however, are likely to have a much shorter review period. Consequently, the analysis likely overstates these costs.

Sensitivity Analysis - Pre-Order Baseline

Relative to the regulations in effect before the NRC issued the AAO, the paragraph indirectly results in incremental costs and savings because it imposes different requirements for the different categories of applicants relative to the requirements of the former rule. The incremental costs and savings associated with these changes are presented and calculated in the subparagraphs below.

Subparagraph 26.59(c)(1)

This paragraph of the final rule requires licensees to ensure that self-disclosures have been obtained and reviewed, as described by §26.61, from applicants for reinstatement authorization with an interruption of no more than 30 days. This final subparagraph imposes no incremental cost and affords no saving because, under the former rule, applicants for unescorted access were subject to similar self-disclosure requirements under §26.27. In addition, the final paragraph does not require licensees and other entities to conduct suitable inquiries on these applicants, as required by the former rule under §26.27. There are no incremental savings from this provision, except under the alternative *Pre-Order Baseline* as discussed below, because it is based on non-safeguards information requirements imposed by the NRC's AAO dated January 7, 2003, and published in the Federal Register on January 13, 2003 (68 FR 1643).

Sensitivity Analysis - Pre-Order Baseline

Relative to the regulations that were in effect before the NRC issued the AAO, the subparagraph, in conjunction with subparagraph 26.61(a)(1), does result in incremental savings. The savings result from provisions that state that previously authorized applicants whose last authorizations were terminated favorably and who have been covered by a behavioral observation and arrest-reporting program throughout the period of interruption do not need to submit self-disclosures to licensees and other entities. The *annual savings per program* result from the *sum* of the following savings:

- The annual savings per program from reduced facility worker labor burden for those applicants for authorization reinstatement who qualify for the self-disclosure relaxation are calculated as follows:

  $NUM_{Applicants} \times PER_{Qualify} \times HOURS_{Worker} \times WAGE_{Worker} \times NUM_{Units}$

- The annual savings per program from reduced clerical personnel labor burden (because fewer self-disclosures submitted by applicants for authorization reinstatement will need to be processed) are calculated as follows:

  $NUM_{Applicants} \times PER_{Qualify} \times HOURS_{Clerical} \times WAGE_{Clerical} \times NUM_{Units}$

Parameter	Description
$HOURS_{Clerical}$	Clerical personnel hours saved in a self-disclosure (as described in assumptions below)
$HOURS_{Worker}$	Facility worker hours saved in a self-disclosure (as described in assumptions below)
$NUM_{Applicants}$	Annual number of applicants for authorization reinstatement with an interruption of not more than 30 days per unit (as described in Appendix 2, Exhibit A2-12)
NUM_{Units}	Number of units per program (as described in Appendix 2, Exhibit A2-14)
$PER_{Qualify}$	Percentage of applicants for authorization updates who qualify for the relaxation (as described in assumptions below)
$WAGE_{Clerical}$	Clerical personnel wage rate (as described in Appendix 2, Exhibit A2-11)
$WAGE_{Worker}$	Facility worker wage rate (as described in Appendix 2, Exhibit A2-11)

Assumptions:

- Percentage of $NUM_{Applicants}$ who qualify for the relaxation: 50%.
- Facility worker hours saved in a self-disclosure: 0.25 hours per update.
- Clerical personnel hours saved in a self-disclosure: 0.25 hours per update.

In addition to the relaxation discussed above, the final subparagraph, like the AAO, but in contrast to the former rule, allows licensees and other entities to grant authorization reinstatement to applicants with interruptions of not more than 30 days without conducting a suitable inquiry. Under subparagraph 26.27(a)(2) of the former rule, licensees had to conduct a suitable inquiry on all applicants before granting authorization. The *annual savings per program* from not conducting the suitable inquiry on applicants for authorization reinstatement with an interruption of not more than 30 days result from the following:

$$NUM_{Applicants} \times HOURS_{HR} \times WAGE_{HR} \times NUM_{Units}$$

Parameter	Description
$HOURS_{HR}$	HR personnel hours saved in suitable inquiries under former regulations (as described in assumptions below)
$NUM_{Applicants}$	Annual number of applicants for authorization reinstatement with an interruption of not more than 30 days per unit (as described in Appendix 2, Exhibit A2-12)
NUM_{Units}	Number of units per program (as described in Appendix 2, Exhibit A2-14)
$WAGE_{HR}$	HR personnel wage rate (as described in Appendix 2, Exhibit A2-11)

Assumptions:

- HR personnel hours saved in suitable inquiries under former regulations: 1 hour per inquiry.

- Percentage of individuals who have potentially disqualifying FFD information is assumed to be negligible.

Sensitivity Analysis - Industry Practices

As previously noted, former subparagraph 26.27(a)(1) required licensees to obtain self-disclosures from applicants before granting authorization reinstatement. Nonetheless, until recently, industry practices were inconsistent with NRC's interpretation of the requirements such that licensees did not consider it a requirement to obtain self-disclosures from applicants for reinstatement who have experienced an interruption of authorization of not more than 30 days. This fraction of licensees (assumed to be 50 percent) should have incurred additional costs to meet former requirements. The *annual costs per program* result from the sum of the following costs:[20]

- The annual costs per program for applicants for authorization reinstatement with interruptions of not more than 30 days to submit self-disclosures to comply with self-disclosure requirements are estimated as follows:

  $$NUM_{Applicants} \times PER_{Non\text{-}Compliance} \times HOURS_{Worker} \times WAGE_{Worker} \times NUM_{Unit}$$

- The annual costs per program for clerical personnel to process additional self-disclosures for applicants for authorization reinstatement with interruptions of not more than 30 days to comply with self-disclosure requirements are estimated as follows:

  $$NUM_{Applicants} \times PER_{Non\text{-}Compliance} \times HOURS_{Clerical} \times WAGE_{Clerical} \times NUM_{Unit}$$

[20] Based on current industry practices, this cost is expected to accrue to the 50 percent of facilities that have not previously interpreted the former rule as requiring a self-disclosure for applicants with an interruption of authorization of not more than 30 days. NRC believes that the remaining 50 percent of facilities interpreted the former FFD rule correctly, so costs for them should not be calculated. However, as the identity of licensees falling within the two groups is not known, this analysis assumes that 100 percent of facilities will incur costs of 50 percent of the calculated amount.

Parameter	Description
$HOURS_{Clerical}$	Clerical personnel hours required to process a self-disclosure (as described in assumptions below)
$HOURS_{Worker}$	Facility worker hours required to complete a self-disclosure (as described in assumptions below)
$NUM_{Applicants}$	Annual number of applicants for authorization reinstatement with an interruption of not more than 30 days per unit (as described in Appendix 2, Exhibit A2-12)
NUM_{Unit}	Number of units per program (as described in Appendix 2, Exhibit A2-14)
$PER_{Non\text{-}Compliance}$	Percentage of cost applied to a given program (as described in assumptions below)
$WAGE_{Clerical}$	Clerical personnel wage rate (as described in Appendix 2, Exhibit A2-11)
$WAGE_{Worker}$	Facility worker wage rate (as described in Appendix 2, Exhibit A2-11)

Assumptions:

- Facility worker hours required to complete a self-disclosure: 0.25 hours per self-disclosure.

- Clerical personnel hours required to process self-disclosure: 0.25 hours per self-disclosure.

- Licensees have indicated that 50 percent of licensees did not interpret the former regulation as requiring a self-disclosure for applicants with interruptions of not more than 30 days. Because the analysis cannot identify which facilities are or are not appropriately interpreting the requirement, the analysis assumes that each unit will incur the incremental cost of 50 percent of the activity.

In addition to the incremental activities discussed above, some licensees should have conducted additional suitable inquiries. As previously noted, paragraph 26.27(a) of the former rule required licensees to conduct suitable inquiries on all reinstatement applicants before granting authorization. Nonetheless, until recently, many licensees did not consider it a requirement to conduct suitable inquiries on reinstatement applicants with interruptions of not more than 30 days. This fraction of licensees (assumed to be 50 percent) should have incurred additional costs to conduct suitable inquires in a manner that meets former requirements. The *annual cost per*

program to conduct suitable inquiries on applicants for authorization reinstatement with an interruption of not more than 30 days to comply with the former regulations result from the *sum* of the following costs:[21]

$$NUM_{Applicants} \times PER_{Non\text{-}Compliance} \times HOURS_{HR} \times WAGE_{HR} \times NUM_{Units}$$

Parameter	Description
$HOURS_{HR}$	HR personnel hours saved in suitable inquiries under former regulations (as described in assumptions below)
$NUM_{Applicants}$	Annual number of applicants for authorization reinstatement with an interruption of not more than 30 days per unit (as described in Appendix 2, Exhibit A2-12)
NUM_{Units}	Number of units per program (as described in Appendix 2, Exhibit A2-14)
$PER_{Non\text{-}Compliance}$	Percentage cost applied to a given program (as described in assumptions below)
$WAGE_{HR}$	HR personnel wage rate (as described in Appendix 2, Exhibit A2-11)

Assumptions:

- HR personnel hours required to conduct a suitable inquiry under former regulations: 1 hour per inquiry.

- Licensees have indicated that 50 percent of licensees did not interpret the former regulations as requiring a suitable inquiry to be conducted on applicants with interruptions of not more than 30 days. Because the analysis cannot identify which facilities are or are not appropriately interpreting the requirement, the analysis assumes that each facility will incur 50 percent of the incremental cost of the activity.

In addition to the incremental activities discussed above, some licensees also should have conducted more thorough suitable inquiries. As previously noted, the former regulation stipulated that a suitable inquiry must address all employers for whom applicants for authorization reinstatements worked over the past 5 years. Nonetheless, until recently, industry practice was that licensees conducting background investigations did not call those employers for whom an applicant worked for less than 30 days. As a result, the portion of licensees that are interpreting the former rules incorrectly should have incurred an incremental cost to comply with

[21] Based on current industry practices, this cost is expected to accrue to the 50 percent of facilities that have not previously interpreted the former rule as requiring a suitable inquiry to be conducted for reinstatement applicants with an interruption of not more than 30 days. The remaining 50 percent of facilities interpreted the former FFD rule correctly, costs for them should not be calculated. However, because data are not available regarding which specific facilities will incur costs, this analysis assumes that 100 percent of facilities will incur costs of 50 percent of the calculated amount.

former requirements for suitable inquiries. The *annual cost per program* to conduct a more thorough suitable inquiry on applicants for authorization reinstatement with an interruption of 5 days or less to comply with the former regulation result from the following:

$$NUM_{Applicants} \times HOURS_{HR} \times WAGE_{HR} \times NUM_{Units}$$

Parameter	Description
$HOURS_{HR}$	Additional HR personnel hours required to conduct suitable inquiries consistent with the former regulation (as described in assumptions below)
$NUM_{Applicants}$	Annual number of applicants for authorization reinstatement with an interruption of not more than 30 days per unit (as described in Appendix 2, Exhibit A2-12)
NUM_{Units}	Number of units per program (as described in Appendix 2, Exhibit A2-14)
$WAGE_{HR}$	HR personnel wage rate (as described in Appendix 2, Exhibit A2-11)

Assumption:

- Additional HR personnel hours required to conduct suitable inquires consistent with the former regulation: 10 minutes (i.e., a 20-percent increase over the current estimate of 50 minutes per applicant).

Subparagraph 26.59(c)(2)

This subparagraph of the final rule requires licensees and other entities to administer pre-access drug and alcohol testing on all applicants with an interruption of more than 5 days but not more than 30 days under §26.65. This final paragraph imposes no incremental cost and affords no saving because, under the former rule, applicants for unescorted access were subject to similar drug and alcohol testing requirements under paragraph 26.24(a). The final paragraph does, however, allow licensees and other entities to forego the pre-access testing requirement for those applicants with an interruption of 5 days or less. There are no incremental savings from this provision, except under the alternative Pre-Order Baseline as discussed below, because it is based on non-safeguards information requirements imposed by the NRC's AAO dated January 7, 2003, and published in the Federal Register on January 13, 2003 (68 FR 1643).

Sensitivity Analysis - Pre-Order Baseline

Relative to the regulations that were in effect before the NRC issued the AAO, the subparagraph, does result in incremental savings. The final subparagraph, like the AAO, but in contrast to the former rule, allows licensees to grant authorization reinstatement to applicants with interruptions of 5 days or less without administering a pre-access drug and alcohol test. According to §26.24 of the former rule as well as guidance provided by the NRC in NUREG-1385, "Fitness for Duty in the Nuclear Power Industry: Responses to Implementation Questions," licensees could not grant authorization without administering a drug and alcohol test and verifying negative test

results. The *annual savings per program* associated with the administration of fewer pre-access drug and alcohol tests results from the *sum* of the following savings:[22]

- The annual savings per program from not administering a pre-access drug and alcohol test on applicants for authorization reinstatement with an interruption of 5 days or less are calculated as follows:
    - Pre-access drug and alcohol tests need not be performed at facilities with onsite testing laboratories. The associated savings are estimated as follows:

      $NUM_{Applicants} \times COST_{Onsite} \times NUM_{Units}$

    - Pre-access drug and alcohol tests need not be performed at facilities with offsite testing laboratories. The associated savings are calculated as follows:

      $NUM_{Applicants} \times COST_{Offsite} \times NUM_{Units}$

- The annual savings per program from bypassing required worker labor in the administration of a pre-access drug and alcohol tests for applicants for authorization reinstatement with an interruption of 5 days or less are calculated as follows:
    - The final paragraph reduces the number of hours of lost worker productivity awaiting negative test result verification from *onsite testing laboratories*. The associated savings are calculated as follows:

      $NUM_{Applicants} \times HOURS_{Onsite\ Worker} \times WAGE_{Worker} \times NUM_{Units}$

    - The final paragraph reduces the number of hours of lost worker productivity awaiting negative test result verification from *offsite testing laboratories*. The associated savings are calculated as follows:

      $NUM_{Applicants} \times HOURS_{Offsite\ Worker} \times WAGE_{Worker} \times NUM_{Units}$

Parameter	**Description**
$COST_{Offsite}$	Offsite pre-access drug and alcohol testing cost (as described in assumptions below and in Appendix 2, Exhibit A2-13)

[22] The incremental savings from this provision will vary per individual program depending on whether the program has onsite testing capabilities or utilizes an offsite HHS-certified testing laboratory.

Parameter	Description
$COST_{Onsite}$	Onsite pre-access drug and alcohol testing cost (as described in assumptions below and in Appendix 2, Exhibit A2-13)
$HOURS_{Offsite\ Worker}$	Hours of facility worker time at a unit with offsite testing laboratories awaiting a negative test verification and not working under the former rule (as described in assumptions below)
$HOURS_{Onsite\ Worker}$	Hours of facility worker time at a unit with onsite testing laboratories awaiting a negative test verification and not working under the former rule (as described in assumptions below)
$NUM_{Applicants}$	Annual number of applicants for authorization reinstatement with an interruption of 5 days or less per unit (as described in Appendix 2, Exhibit A2-12)
NUM_{Units}	Number of units per program (as described in Appendix 2, Exhibit A2-14)
$WAGE_{Worker}$	Facility worker wage rate (as described in Appendix 2, Exhibit A2-11)

Assumptions:

- Hours of facility worker time at a unit with onsite testing laboratories awaiting negative test verification and not working under the former rule: 4 hours per reinstatement.[23]

- Hours of facility worker time at a unit with offsite testing laboratories awaiting negative test verification and not working under the former rule: 8 hours per reinstatement.

- The per-unit cost of an *onsite pre-access drug and alcohol test* includes the following factors:
  (1) travel time of the worker
  (2) collection of drug and alcohol specimens (labor of the collector and the worker, as well as collection materials)
  (3) onsite licensee testing costs per urine specimen for drugs
  (4) labor of FFD manager to process paperwork for negative test results

- The per-unit cost of an *offsite pre-access drug and alcohol test* includes the following factors:
  (1) travel time of the worker
  (2) collection of drug and alcohol specimens (labor of the collector and the worker, as well as collection materials)
  (3) HHS-certified laboratory costs per urine specimen for drugs

[23] Verification usually requires 1 to 3 business days, depending on whether the given licensee engages in onsite or offsite testing. Although some of the time awaiting verification may be used by applicants for other work-related activities, the analysis assumes that applicants are paid, but unproductive, for a portion of this waiting period.

(4) labor of FFD manager to process paperwork for negative test results

- Applicants who qualify for the relaxation are not expected to yield positive drug and alcohol test results under the former regulations.

In addition to the incremental changes discussed above, the final subparagraph results in additional pre-order baseline incremental savings. According to §26.24 of the former rule as well as guidance provided by the NRC in NUREG-1385, "Fitness for Duty in the Nuclear Power Industry: Responses to Implementation Questions," licensees could not grant authorization to any applicant without administering a drug and alcohol test and verifying negative test results. Provisions in the final subparagraph, however, allow licensees and other entities to forego pre-access drug and alcohol testing on applicants that are either covered by a licensee-approved random drug and alcohol testing program and behavioral observation and arrest-reporting program, or are not randomly selected for a pre-access drug and alcohol test under the requirements of subparagraph 26.59(c)(3) discussed below. As a result, savings accrue from the reduction in the number of pre-access tests administered and the reduction in the loss of worker productivity awaiting negative test results.[24] The *annual savings per program* result from the *sum* of the following savings:[25]

- The annual savings per program from allowing reinstatement applicants who have been covered by a random drug and alcohol testing program and by a behavioral observation and arrest-reporting program throughout the period of interruption to forego the pre-access drug and alcohol test are calculated as follows:

  - The final paragraph reduces the number of pre-access drug and alcohol tests performed at facilities with *onsite testing laboratories*. The associated savings are calculated as follows:

    $$NUM_{Applicants} \times PER_{Covered} \times COST_{Onsite} \times NUM_{Units}$$

  - The final paragraph reduces the number of pre-access drug and alcohol tests performed at facilities with *offsite testing laboratories*. The associated savings are calculated as follows:

    $$NUM_{Applicants} \times PER_{Covered} \times COST_{Offsite} \times NUM_{Units}$$

- Annual savings per program from bypassing required worker labor in the administration of a pre-access drug and alcohol tests for reinstatement applicants

[24] These savings are calculated in replacement of the costs calculated in the main analysis under paragraph 26.59(c)(2).

[25] The incremental savings from this provision will vary by individual program depending on whether the program has onsite testing capabilities or utilizes an offsite HHS-certified testing laboratory.

who have been covered by a random drug and alcohol testing program and by a behavioral observation and arrest-reporting program throughout the period of interruption are calculated as follows:

- The final paragraph reduces the number of hours of lost worker productivity at facilities with *onsite testing laboratories*. The associated savings are calculated as follows:

  $NUM_{Applicants} \times PER_{Covered} \times HOURS_{Onsite\ Worker} \times WAGE_{Worker} \times NUM_{Units}$

- The final paragraph reduces the number of hours of lost worker productivity at facilities with *offsite testing laboratories*. The associated savings are estimated as follows:

  $NUM_{Applicants} \times PER_{Covered} \times HOURS_{Offsite\ Worker} \times WAGE_{Worker} \times NUM_{Units}$

- Annual savings per program from allowing reinstatement applicants who have not been covered by a random drug and alcohol testing program and by a behavioral observation and arrest-reporting program throughout the period of interruption, but who have not been randomly selected for pre-access testing, to forego the pre-access drug and alcohol test are calculated as follows:

  - The final paragraph reduces the number of pre-access drug and alcohol testing at facilities with *onsite testing laboratories*. The associated savings are calculated as follows:

    $NUM_{Applicants} \times (1\text{-}PER_{Covered}) \times PER_{Not\ Selected} \times COST_{Onsite} \times NUM_{Units}$

  - The final paragraph reduces the number of pre-access drug and alcohol tests at facilities with *offsite testing laboratories*. The associated savings are calculated as follows:

    $NUM_{Applicants} \times (1\text{-}PER_{Covered}) \times PER_{Not\ Selected} \times COST_{Offsite} \times NUM_{Units}$

- Annual savings per program from reducing the number of hours of lost worker productivity for reinstatement applicants who are not covered and are not selected for random pre-access drug and alcohol testing are calculated as follows:

  - The final paragraph reduces the number of hours of lost worker productivity at facilities with *onsite testing laboratories*. The associated savings are calculated as follows:

    $NUM_{Applicants} \times (1\text{-}PER_{Covered}) \times PER_{Not\ Selected} \times HOURS_{Onsite\ Worker} \times WAGE_{Worker} \times NUM_{Units}$

- The final paragraph reduces the number of hours of lost worker productivity at facilities with *offsite testing laboratories*. The associated savings are calculated as follows:

  $NUM_{Applicants} \times (1\text{-}PER_{Covered}) \times PER_{Not\ Selected} \times HOURS_{Offsite\ Worker} \times WAGE_{Worker} \times NUM_{Units}$

Parameter	Description
$COST_{Offsite}$	Offsite pre-access drug and alcohol testing cost (as described in assumptions below and in Appendix 2, Exhibit A2-13)
$COST_{Onsite}$	Onsite pre-access drug and alcohol testing cost (as described in assumptions below and in Appendix 2, Exhibit A2-13)
$HOURS_{Offsite\ Worker}$	Hours of facility worker time at a unit with offsite testing laboratories awaiting a negative test verification and not working under the former rule (as described in assumptions below)
$HOURS_{Onsite\ Worker}$	Hours of facility worker time at a unit with onsite testing laboratories awaiting a negative test verification and not working under the former rule (as described in assumptions below)
$NUM_{Applicants}$	Annual number of applicants for reinstatement authorization with an interruption of more than 5 days but not more than 30 days per unit (as described in Appendix 2, Exhibit A2-12)
NUM_{Units}	Number of units per program (as described in Appendix 2, Exhibit A2-14)
$PER_{Covered}$	Percentage of $NUM_{Applicants}$ covered by a licensee-approved random drug and alcohol testing program and a behavioral observation and arrest-reporting program (as described in assumptions below)
$PER_{Not\ Selected}$	Percentage of qualifying applicants not randomly selected for pre-access drug and alcohol testing (as described in assumptions below)
$WAGE_{Worker}$	Facility worker wage rate (as described in Appendix 2, Exhibit A2-11)

Assumptions:

- Percentage of $NUM_{Applicants}$ covered by a licensee-approved random drug and alcohol testing program and a behavioral observation and arrest-reporting program: 50%.

- Percentage of qualifying applicants not randomly selected for pre-access drug and alcohol testing: 97.95%.

- Hours of facility worker time at a unit with onsite testing laboratories awaiting negative test verification and not working under the former rule: 4 hours per reinstatement.[26]

- Hours of facility worker time at a unit with offsite testing laboratories awaiting negative test verification and not working under the former rule: 8 hours per reinstatement.

- The per-unit cost of an *onsite pre-access drug and alcohol test* includes the following factors:
  (1) travel time of the worker
  (2) collection of drug and alcohol specimens (labor of the collector and the worker, as well as collection materials)
  (3) onsite licensee testing costs per urine specimen for drugs
  (4) labor of FFD manager to process paperwork for negative test results

- The per-unit cost of an *offsite pre-access drug and alcohol test* includes the following factors:
  (1) travel time of the worker
  (2) collection of drug and alcohol specimens (labor of the collector and the worker, as well as collection materials)
  (3) HHS-certified laboratory costs per urine specimen for drugs
  (4) labor of FFD manager to process paperwork for negative test results

Sensitivity Analysis - Industry Practices

In addition to incremental activities discussed above, some licensees should have administered additional pre-access tests. As previously noted, §26.24 of the former rule required licensees to administer pre-access drug and alcohol tests on all reinstatement applicants before granting authorization. Nonetheless, until recently, many licensees did not consider it a requirement to administer pre-access drug and alcohol tests on reinstatement applicants with interruptions of 30 days or less. This fraction of licensees (assumed to be 50 percent) should have incurred additional costs to administer pre-access drug and alcohol tests in a manner that meets former requirements. The *annual costs per program* to comply with pre-access drug and

[26] Verification usually requires 1 to 3 business days, depending on whether the given licensee engages in onsite or offsite testing. Although some of the time awaiting verification may be used by applicants for other work-related activities, the analysis assumes that applicants are paid, but unproductive, for a portion of this waiting period.

alcohol testing requirements for applicants with interruptions of not more than 30 days result from the *sum* of the following costs:[27]

- The annual costs per program to administer additional pre-access drug and alcohol tests are calculated as follows:[28]
  - Additional pre-access drug and alcohol tests need to be performed at facilities with onsite testing laboratories. The associated costs are calculated as follows:

    $$NUM_{Applicants} \times PER_{Compliance} \times COST_{Onsite} \times NUM_{Units}$$

  - Additional pre-access drug and alcohol tests need to be performed at facilities with offsite testing laboratories. The associated costs are calculated as follows:

    $$NUM_{Applicants} \times PER_{Compliance} \times COST_{Offsite} \times NUM_{Units}$$

- The annual costs per program from increased lost worker productivity awaiting verification of negative test results are calculated as follows:
  - Additional hours of lost worker productivity awaiting negative test result verification from *onsite testing laboratories* will be expended. The associated savings are calculated as follows:

    $$NUM_{Applicants} \times PER_{Compliance} \times HOURS_{Onsite\ Worker} \times WAGE_{Worker} \times NUM_{Units}$$

  - Additional hours of lost worker productivity awaiting negative test result verification from *offsite testing laboratories* will be expended. The associated savings are calculated as follows:

    $$NUM_{Applicants} \times PER_{Compliance} \times HOURS_{Offsite\ Worker} \times WAGE_{Worker} \times NUM_{Units}$$

---

[27] Based on current industry practices, this cost is expected to accrue to the 50 percent of facilities that have not previously interpreted the former rule as requiring a pre-access drug and alcohol test to be administered for reinstatement applicants with an interruption of not more than 30 days. The remaining 50 percent of facilities interpreted the former FFD rule correctly, so costs for them should not be calculated. However, because data are not available regarding which specific facilities will incur costs, this analysis assumes that 100 percent of facilities will incur costs of 50 percent of the calculated amount.

[28] The incremental savings from this provision will vary per individual program depending on whether the program has onsite testing capabilities or utilizes an offsite HHS-certified testing laboratory.

Parameter	Description
$COST_{Offsite}$	Offsite pre-access drug and alcohol testing cost (as described in assumptions below and in Appendix 2, Exhibit A2-13)
$COST_{Onsite}$	Onsite pre-access drug and alcohol testing cost (as described in assumptions below and in Appendix 2, Exhibit A2-13)
$HOURS_{Offsite\ Worker}$	Hours of facility worker time at a unit with offsite testing laboratories awaiting a negative test verification and not working under the former rule (as described in assumptions below)
$HOURS_{Onsite\ Worker}$	Hours of facility worker time at a unit with onsite testing laboratories awaiting a negative test verification and not working under the former rule (as described in assumptions below)
$NUM_{Applicants}$	Annual number of applicants for authorization reinstatement with an interruption of not more than 30 days per unit (as described in Appendix 2, Exhibit A2-12)
NUM_{Units}	Number of units per program (as described in Appendix 2, Exhibit A2-14)
$PER_{Compliance}$	Percentage cost applied to a given program (as described in assumptions below)
$WAGE_{Worker}$	Facility worker wage rate (as described in Appendix 2, Exhibit A2-11)

Assumptions:

- Hours of facility worker time at a unit with onsite testing laboratories awaiting negative test verification and not working under the former rule: 4 hours per reinstatement.[29]

- Hours of facility worker time at a unit with offsite testing laboratories awaiting negative test verification and not working under the former rule: 8 hours per reinstatement.[30]

[29] Verification usually requires 1 to 3 business days, depending on whether the given licensee engages in onsite or offsite testing. Although some of the time awaiting verification may be used by applicants for other work-related activities, the analysis assumes that applicants are paid, but unproductive, for a portion of this waiting period.

[30] Verification usually requires 1 to 3 business days, depending on whether the given licensee engages in onsite or offsite testing. Although some of the time awaiting verification may be used by applicants for other work-related activities, the analysis assumes that applicants are paid, but unproductive, for a portion of this waiting period.

- The per-unit cost of an *onsite pre-access drug and alcohol test* includes the following factors:
  (1) travel time of the worker
  (2) collection of drug and alcohol specimens (labor of the collector and the worker, as well as collection materials)
  (3) onsite licensee testing costs per urine specimen for drugs
  (4) labor of FFD manager to process paperwork for negative test results

- The per-unit cost of an *offsite pre-access drug and alcohol test* includes the following factors:
  (1) travel time of the worker
  (2) collection of drug and alcohol specimens (labor of the collector and the worker, as well as collection materials)
  (3) HHS-certified laboratory costs per urine specimen for drugs
  (4) labor of FFD manager to process paperwork for negative test results

- Licensees have indicated that 50 percent of licensees did not interpret the former regulations as requiring a pre-access drug and alcohol test to be administered on applicants with interruptions of 30 days or less. Because the analysis cannot identify which facilities are or are not appropriately interpreting the requirement, the analysis assumes that each unit will incur 50 percent of the incremental cost of the activity.

Subparagraph 26.59(c)(3)

This subparagraph of the final rule adds provisions that require licensees and other entities to include applicants for reinstatement authorization with an interruption of not more than 30 days in a random drug and alcohol testing pool, under §26.67. Licensees are expected to use the same random testing pool for this purpose as is specified under subparagraph 26.31(d)(2) of the final rule. Licensees and other entities must administer a drug and alcohol test on those applicants randomly selected although verification of results does not delay the granting of authorization.

The *annual costs per program* to conduct additional random drug and alcohol tests on reinstatement applicants selected for random testing are calculated as follows:[31]

[31] The incremental costs of this provision will vary by individual program depending on whether the program has onsite testing capabilities or utilizes an offsite HHS-certified laboratory.

- The final paragraph increases the number of random drug and alcohol tests performed at facilities with *onsite testing laboratories*. The associated costs are estimated as follows:

  $NUM_{Applicants} \times PER_{Random} \times COST_{Onsite} \times NUM_{Units}$

- The final paragraph increases the number of random drug and alcohol tests performed at facilities with *offsite testing laboratories*. The associated costs are estimated as follows:

  $NUM_{Applicants} \times PER_{Random} \times COST_{Offsite} \times NUM_{Units}$

Parameter	**Description**
$COST_{Offsite}$	Offsite random drug and alcohol testing cost (as described in assumptions below and in Appendix 2, Exhibit A2-13)
$COST_{Onsite}$	Onsite random drug and alcohol testing cost (as described in assumptions below and in Appendix 2, Exhibit A2-13)
$NUM_{Applicants}$	Annual number of applicants for authorization reinstatement with an interruption of not more than 30 days per unit (as described in Appendix 2, Exhibit A2-12)
NUM_{Units}	Number of units per program (as described in Appendix 2, Exhibit A2-14)
PER_{Random}	Percentage of $NUM_{Applicants}$ selected for random drug and alcohol testing (as described in assumptions below)

Assumptions:

- Percentage of $NUM_{Applicants}$ selected for random drug and alcohol testing: 1.0%.[32]

- The per-unit cost of an *onsite random drug and alcohol test* includes the following factors:
  (1) travel time of the worker
  (2) collection of drug and alcohol specimens (labor of the collector and the worker, as well as collection materials)
  (3) onsite licensee testing costs per urine specimen for drugs
  (4) labor of FFD manager to process paperwork for negative test results

[32] This figure is calculated by assuming that on any given day, an individual in applicant status has a chance of being selected equivalent to the following: (1 day / 365 days) x required annual testing rate of 50% x number of days in applicant status. The analysis assumes an average applicant status of 7 days. Applicants for reinstatement authorization, however, are likely to have a much shorter review period. Consequently, the analysis likely overstates these costs.

- The per-unit cost of an *offsite random drug and alcohol test* includes the following factors:
  (1) travel time of the worker
  (2) collection of drug and alcohol specimens (labor of the collector and the worker, as well as collection materials)
  (3) HHS-certified laboratory costs per urine specimen for drugs
  (4) labor of FFD manager to process paperwork for negative test results

Paragraph 26.59(d)

This paragraph of the final rule requires licensees and other entities to take the management action specified in §26.69 when potentially disqualifying FFD information is disclosed or discovered for an applicant for reinstatement authorization. This final paragraph imposes no incremental cost and affords no saving because, under §26.27 of the former rule, applicants for unescorted access were subject to similar requirements. These management actions are further discussed in relevant sections of the analysis.

26.61 Self-Disclosure and Employment History

Paragraph 26.61(a)

This paragraph of the final rule requires that licensees to ensure that a self-disclosure and employment history has been obtained from all applicants for authorization before authorization may be granted. Under the former rule, licensees were required to obtain an equivalent "written statement" from these applicants under subparagraph 26.27(a)(1).

Subparagraphs 26.61(a)(1)–(2)

These paragraphs of the final rule add provisions that allow licensees to forego the self-disclosure requirement for those applicants who have previously held authorization, had their previous termination terminated favorably, and have been covered by a licensee-approved behavioral observation program that includes arrest reporting throughout the period of interruption. Additionally, those applicants who have had their authorizations terminated favorably within the last 30 days, regardless of whether they were covered by a behavioral observation and arrest-reporting program, need not submit an employment history. For applicants for updated or reinstated authorization, there is no incremental cost or saving due to this provision because this paragraph is based on non-safeguards information requirements imposed by the NRC's AAO dated January 7, 2003, and published in the Federal Register on January 13, 2003 (68 FR 1643). For applicants for initial authorization, however, this represents a relaxation over the former rule. Savings associated with this provision are calculated under subparagraph 26.55(a)(1).

Sensitivity Analysis - Pre-Order Baseline

Relative to the regulations that were in effect before the NRC issued the AAO, the paragraph does result in incremental savings relative to the former rule. Savings associated with this provision are calculated and discussed in the *Sensitivity Analysis - Pre-Order Baseline* under §§26.57 and 26.59.

Paragraph 26.61(b)

Subparagraphs 26.61(b)(1)–(3)

These subparagraphs of the final rule describe the types of events and the time period that must be addressed in the self-disclosure. The disclosure of most of this information was required under subparagraphs 26.27(a)(1) and (2) of the former rule. Although the final subparagraphs include additional information disclosure requirements and allow individuals to address only events that have occurred within the past 5 years, rather than all relevant events that have ever occurred, there is no incremental cost or saving due to these added provisions (discussed below) because this revised paragraph is based on non-safeguards information requirements imposed by the NRC's Access Authorization Order dated January 7, 2003, and published in the Federal Register on January 13, 2003 (68 FR 1643).

Sensitivity Analysis Note - Pre-Order Baseline

Relative to the regulations that were in effect before the NRC issued the AAO, these paragraphs do result in incremental changes. The reduction in the time period within which events must be disclosed on the self-disclosure may reduce the amount of applicant time required to complete one. Simultaneously, however, the additional events that must be reported (i.e., any legal or employment action taken for alcohol or drug use) may increase the amount of time required to complete a self-disclosure. The analysis assumes that the two incremental changes offset each other, thereby resulting in no discernable net incremental costs or savings.

Paragraph 26.61(c)

This paragraph of the final rule requires applicants for authorization to submit an employment history report for verification during the suitable inquiry. This final paragraph imposes no incremental cost and affords no saving because, under the former rule and guidance contained in NUMARC 89-01: Industry Guidelines for Nuclear Power Plant Access Authorization Programs, applicants had to submit an employment history. The final paragraph does reduce the scope of the employment history from the past 5-years under former regulations to the shortest of (1) the past 3 years; (2) since the individual's eighteenth birthday; or (3) since authorization was last terminated, if authorization was terminated favorably. This provision, however, is based on non-safeguards information requirements imposed by the NRC's Access Authorization Order dated January 7, 2003, and published in the Federal Register on January 13, 2003 (68 FR 1643).

Sensitivity Analysis Note - Pre-Order Baseline

Relative to the regulations that were in effect before the NRC issued the AAO, the paragraph does not result in incremental costs or savings. These paragraphs adopt provisions that reduce the period of time that an individual must address in an employment history. This reduction, however, is not anticipated to result in any significant reductions in the amount of labor required to fill out an employment history and, therefore, no savings result.

26.63 Suitable Inquiry

Paragraph 26.63(a)

This subparagraph of the final rule [including subparagraphs 26.63(a)(1)–(3)] imposes no incremental cost and affords no saving because it merely requires licensees and other entities to ensure that a suitable inquiry has been conducted on the self-disclosures submitted by applicants for authorization in order to verify the information contained therein and to determine whether any potentially disqualifying FFD information exists. Under the former rule, applicants for unescorted access were subject to similar suitable inquiry requirements under §26.27. The provision also adds a provision that allows licensees and other entities to forego the suitable inquiry requirement on those applicants who have previously held authorization, had that authorization terminated favorably, and who have been covered by a licensee-approved behavioral observation program that includes arrest reporting throughout the period of interruption. This provision, however, is based on non-safeguards information requirements imposed by the NRC's Access Authorization Order dated January 7, 2003, and published in the Federal Register on January 13, 2003 (68 FR 1643).

Sensitivity Analysis Note - Pre-Order Baseline

Relative to the regulations that were in effect before the NRC issued the AAO, the paragraph does result in incremental savings relative to the former rule. Savings associated with this provision are calculated and discussed as appropriate in the *Sensitivity Analysis - Pre-Order Baseline* under §§26.57 and 26.59.

Paragraph 26.63(b)

This paragraph of the final rule allows licensees to rely on information gathered by other licensees and other entities for previous periods of authorization for the purpose of completing suitable inquiries and determinations of fitness. Although this represents a relaxation of the former regulations, there is no incremental savings because this final paragraph is based on non-safeguards information requirements imposed by the NRC's Access Authorization Order dated January 7, 2003, and published in the Federal Register on January 13, 2003 (68 FR 1643).

Sensitivity Analysis - Pre-Order Baseline

Relative to the regulations that were in effect before the NRC issued the AAO, the paragraph does not result in incremental costs or savings because licensees have indicated that they were already sharing information extensively and relying on such information to complete suitable inquiries, as noted in NRC guidance in NUREG-1600, "Revision to the NRC Enforcement Policy" (per 67 FR 66311, October 31, 2002).

Paragraph 26.63(c)

This paragraph of the final rule [including subparagraphs 26.63(c)(1)–(3)] imposes no incremental cost and affords no saving because it merely clarifies the manner in which licensees must ensure that a suitable inquiry has been conducted for periods of claimed employment, military service, and education (in lieu of employment). Provisions under subparagraph 26.27(a)(2) of the former rule required a suitable inquiry, but do not explicitly describe how licensees should conduct the suitable inquiry. The analysis assumes that licensees are already conducting suitable inquiries in a manner similar to that described in the final rule, although the final rule more explicitly describes the required process.

Paragraph 26.63(d)

This paragraph mandates that licensees and other entities must share information regarding a denial of authorization or unfavorable termination with other licensees and other entities who are legitimately seeking the information and have obtained a signed release from the subject individual for the purpose of conducting a suitable inquiry. This final paragraph imposes no incremental cost and affords no saving because licensees have indicated that they already share information, as noted in the NRC guidance in NUREG-1600, "Revision to the NRC Enforcement Policy" (per 67 FR 66311, October 31, 2002).

Paragraph 26.63(e)

This paragraph of the final rule imposes no incremental cost and affords no saving because it merely clarifies the media (i.e., telephone, email, facsimile) that licensees may use to conduct a suitable inquiry. The final paragraph also requires licensees to make a written record of any suitable inquiry conducted over the telephone. Licensees must maintain such records (along with other documents and electronic files) in accordance with the recordkeeping requirements of the final rule. No costs are calculated for this provision because paragraph 26.71(a) of the former rule already required licensees to retain records of suitable inquiries.

Paragraph 26.63(f)

Subparagraph 26.63(f)(1)

This paragraph of the final rule defines the scope of suitable inquiries conducted on applicants for initial authorization about whom no potentially disqualifying FFD information is known (or about whom potentially disqualifying FFD information is known, but it has been resolved by a licensee or other entity who is subject to this Subpart) at the time at which the suitable inquiry is initiated. The suitable inquiry must address the past 3-year period or since the applicants eighteenth birthday, whichever is shorter. The suitable inquiry must address every employer the applicant identified as having worked for during the 1-year period immediately preceding the application for authorization. For the remaining 2-year period, the suitable inquiry must address the employer for whom the applicant identified as having worked for the longest in each calendar month, if applicable. There is no incremental cost or saving due to this provision because this final paragraph is based on non-safeguards information requirements imposed by the NRC's Access Authorization Order dated January 7, 2003, and published in the Federal Register on January 13, 2003 (68 FR 1643).

Sensitivity Analysis - Pre-Order Baseline

Relative to the regulations that were in effect before the NRC issued the AAO, the paragraph does result in incremental savings relative to the former rule. Savings associated with this provision are calculated and discussed in the *Sensitivity Analysis - Pre-Order Baseline* for subparagraph 26.55(a)(2).

Subparagraph 26.63(f)(2)

This paragraph of the final rule defines the scope of suitable inquiries conducted on applicants for updated authorization about whom no potentially disqualifying FFD information is known (or about whom potentially disqualifying FFD information is known, but it has been resolved by a licensee or other entity who is subject to this Subpart) at the time at which the suitable inquiry is initiated. The suitable inquiry must address the period since authorization was last terminated. The suitable inquiry must address every employer the applicant identified as having worked for during the 1-year period immediately preceding the application for authorization. For each remaining calendar month in the period since authorization was terminated, the suitable inquiry must address the employer for whom the applicant identified as having worked for the longest, if applicable. There is no incremental cost or saving due to this provision because this final paragraph is based on non-safeguards information requirements imposed by the NRC's Access Authorization Order dated January 7, 2003, and published in the Federal Register on January 13, 2003 (68 FR 1643).

Sensitivity Analysis - Pre-Order Baseline

Relative to the regulations that were in effect before the NRC issued the AAO, the paragraph does result in incremental savings relative to the former rule. Savings associated with this provision are calculated and discussed in the *Sensitivity Analysis - Pre-Order Baseline* for subparagraph 26.57(a)(2).

Subparagraph 26.63(f)(3)

This paragraph of the final rule defines the scope of suitable inquiries conducted on applicants for authorization reinstatement after an interruption of more than 30 days about whom no potentially disqualifying FFD information is known (or about whom potentially disqualifying FFD information is known, but it has been resolved by a licensee or other entity who is subject to this Subpart) at the time at which the suitable inquiry is initiated. The suitable inquiry must address the period since authorization was last terminated. The suitable inquiry must address the applicant's current employer. In addition, for each calendar month since authorization was terminated, the suitable inquiry must address the employer whom the applicant identified as having worked the longest for, if applicable. There is no incremental cost or saving due to this provision because this final paragraph is based on non-safeguards information requirements imposed by the NRC's Access Authorization Order dated January 7, 2003, and published in the Federal Register on January 13, 2003 (68 FR 1643).

Sensitivity Analysis - Pre-Order Baseline

Relative to the regulations that were in effect before the NRC issued the AAO, the paragraph does result in incremental savings relative to the former rule. Savings associated with this provision are calculated and discussed in the *Sensitivity Analysis - Pre-Order Baseline* for subparagraph 26.59(c)(2).

26.65 Pre-Access Drug and Alcohol Testing

Paragraph 26.65(a)

This paragraph of the final rule imposes no incremental cost and affords no saving because it describes the purpose of this section as containing the pre-access testing requirements for granting authorization. The former rule already required pre-access testing under subparagraph 26.24(a)(1).

Paragraph 26.65(b)

This paragraph of the final rule allows licensees and other entities to forego the pre-access drug and alcohol testing requirement for those applicants who have had negative test results from a drug and alcohol test performed under the requirements of this part within the 30-day period ending the day authorization is granted or denied. Although this provision is based on

subparagraph 26.24(a)(1) of the former rule, the revised subparagraph reduces the period within which a previous drug and alcohol test will be accepted from 60 to 30 days. There is no incremental cost or saving due to this provision because this revised paragraph is based on non-safeguards information requirements imposed by the NRC's AAO dated January 7, 2003, and published in the Federal Register on January 13, 2003 (68 FR 1643).

Sensitivity Analysis - Pre-Order Baseline

Relative to the regulations that were in effect before the NRC issued the AAO, the paragraphs do not result in any incremental costs. Although the final paragraphs adopt provisions from the AAO that reduce the time period within which pre-access drug and alcohol testing must be completed from 60 days under the former rule to 30 days, licensees and other entities are expected to adjust their pre-access testing schedules to accommodate the smaller time frame. The analysis anticipates that this adjustment will not result in any additional costs.

Paragraph 26.65(c)

This paragraph of the final rule [including subparagraphs 26.65(c)(1) and (2)] requires licensees to administer a pre-access drug and alcohol test and verify negative results before granting authorization to any applicant for initial authorization (i.e., an applicant who has never been authorized or who has not been authorized within the past 3 years) or for updated authorization (i.e., an applicant with an interruption of more than 365 days, but not more than 3 years). Under the former rule, applicants for unescorted access were subject to similar drug and alcohol testing requirements under 26.24(a). The final subparagraphs do, however, adopt provisions from NRC's AAO that allow licensees and C/Vs to forego the pre-access drug and alcohol test requirement for certain applicants. Licensees and C/Vs may forego the pre-access drug and alcohol test requirement for individuals whose previous authorization had been terminated favorably and who have been covered by licensee-approved behavioral observation program that includes behavioral observation and a random drug and alcohol testing programs throughout the period of interruption, or who have had a negative result from a licensee-approved drug and alcohol test conducted anytime in the past and are covered by licensee-approved behavioral observation program that includes behavioral observation and a random drug and alcohol testing program beginning on the date of the drug and alcohol test through the date the individual is granted authorization. For applicants for updated authorization, the provision affords no savings except under the alternative Pre-Order Baseline, because it is based on non-safeguards information requirements imposed by the NRC's AAO dated January 7, 2003, and published in the Federal Register on January 13, 2003 (68 FR 1643). For applicants for initial authorization, however, this represents a relaxation relative to the former rule. Savings associated with this provision are calculated under subparagraph 26.55(a)(3).

Sensitivity Analysis - Pre-Order Baseline

Relative to the regulations that were in effect before the NRC issued the AAO, the subparagraph does result in incremental savings relative to the former rule. Savings associated with this

provision are calculated and discussed in the *Sensitivity Analysis - Pre-Order Baseline* for paragraph 26.57(a)(3).

Paragraph 26.65(d)

Subparagraph 26.65(d)(1)

This subparagraph of the final rule requires licensees to verify results of the pre-access alcohol test and collect a specimen for pre-access drug testing before granting authorization to any reinstatement applicant with an interruption of more than 30 days but no more than 365 days. Verification of negative drug test results must be completed within 5 business days of specimen collection. If verification has not occurred within this time frame, authorization must be administratively withdrawn until negative results have been received. Under the former rule, applicants for unescorted access were subject to similar drug and alcohol testing requirements under 26.24(a), except that licensees must verify negative results of both the drug and alcohol tests before authorization may be granted. The provision affords no savings, however, except under the alternative Pre-Order Baseline, because it is based on non-safeguards information requirements imposed by the NRC's AAO dated January 7, 2003, and published in the Federal Register on January 13, 2003 (68 FR 1643).

Sensitivity Analysis - Pre-Order Baseline

Relative to the regulations that were in effect before the NRC issued the AAO, the subparagraph does result in incremental savings relative to the former rule. Savings associated with this provision are calculated and discussed in the *Sensitivity Analysis - Pre-Order Baseline* for paragraph 26.59(c)(2).

Subparagraph 26.65(d)(2)

This subparagraph of the final rule allows licensees to forego the pre-access drug and alcohol testing requirements on certain applicants for authorization reinstatement with interruptions of more than 30 days but not more than 365 days. Licensees and C/Vs may forego the pre-access drug and alcohol test requirement for individuals whose previous authorization had been terminated favorably and who have been covered by licensee-approved behavioral observation program that includes arrest reporting and a random drug and alcohol testing program throughout the period of interruption, or who have had a negative result from a licensee-approved drug and alcohol test conducted anytime in the past and are covered by licensee-approved behavioral observation program that includes behavioral observation and a random drug and alcohol testing program beginning on the date of the drug and alcohol test through the date the individual is granted authorization. For these reinstatement applicants, the provision affords no savings except under the alternative Pre-Order Baseline, because it is based on non-safeguards information requirements imposed by the NRC's AAO dated January 7, 2003, and published in the Federal Register on January 13, 2003 (68 FR 1643).

Sensitivity Analysis - Pre-Order Baseline

Relative to the regulations that were in effect before the NRC issued the AAO, the subparagraph does result in incremental savings relative to the former rule. Savings associated with this provision are calculated and discussed in the *Sensitivity Analysis - Pre-Order Baseline* for paragraph 26.59(a)(3).

Paragraph 26.65(e)

Subparagraph 26.65(e)(1)

This subparagraph of the final rule allows licensees to forego the pre-access drug and alcohol tests for applicants for reinstatement authorization with an interruption of 5 days or less. Under paragraph 26.24(a) of the former rule, all applicants for unescorted access were required to be subjected to a pre-access drug and alcohol test before authorization can be granted. The provision affords no savings, however, except under the alternative Pre-Order Baseline, because it is based on non-safeguards information requirements imposed by the NRC's AAO dated January 7, 2003, and published in the Federal Register on January 13, 2003 (68 FR 1643).

This paragraph of the final rule also adds a provision that allows licensees and other entities to forego the pre-access drug and alcohol testing requirement for those applicants for authorization with an interruption of fewer than 30 days whose previous authorization was terminated favorably and who have been covered by a licensee-approved drug and alcohol testing program that included random testing and a licensee-approved behavioral observation program that includes arrest reporting throughout the period of interruption. Under paragraph 26.24(a) of the former rule, all applicants for unescorted access were required to be subjected to a pre-access drug and alcohol test before authorization can be granted. There is no incremental cost or saving due to this provision, however, because this revised paragraph is based on non-safeguards information requirements imposed by the NRC's AAO dated January 7, 2003, and published in the Federal Register on January 13, 2003 (68 FR 1643).

Sensitivity Analysis - Pre-Order Baseline

Relative to the regulations that were in effect before the NRC issued the AAO, the paragraph does result in incremental savings. Savings associated with these provisions are calculated and discussed in the *Sensitivity Analysis - Pre-Order Baseline* for subparagraph 26.59(c) and (c)(2).

Subparagraph 26.65(e)(2)

Subparagraph 26.65(e)(2)(i) and (iii)

This subparagraph of the final rule adds provisions that require licensees and other entities to subject applicants for authorization reinstatement with an interruption of more than 5 days but not more than 30 days to random selection for a pre-access drug and alcohol test at a one-time

probability that is equal to or greater than the normal random testing rate specified in subparagraph 26.31(d)(2) calculated for a 30-day period. For applicants randomly selected for pre-access drug and alcohol testing, licensees and other entities must verify negative results of the alcohol test and collect a drug test specimen before granting authorization. Drug test results must be verified within 5 business days of the granting of authorization or authorization must be administratively terminated. Costs associated with this provision are calculated and discussed under 26.59(c)(2).

Subparagraph 26.65(e)(2)(ii)

This subparagraph of the final rule adds provisions that allow licensees and other entities to forego the pre-access drug and alcohol testing requirement for those reinstatement applicants with interruptions of more than 5 days but not more than 30 days if not randomly selected. Under paragraph 26.24(a) of the former rule, all applicants for unescorted access were required to be subjected to a pre-access drug and alcohol test before authorization can be granted. The provision affords no savings, however, except under the alternative Pre-Order Baseline, because it is based on non-safeguards information requirements imposed by the NRC's AAO dated January 7, 2003, and published in the Federal Register on January 13, 2003 (68 FR 1643).

Sensitivity Analysis - Pre-Order Baseline

Relative to the regulations that were in effect before the NRC issued the AAO, the paragraphs do result in incremental savings. Savings associated with this provision are calculated and discussed in the *Sensitivity Analysis - Pre-Order Baseline* for subparagraph 26.59(c)(2).

Paragraph 26.65(f)

This subparagraph of the final rule imposes no incremental cost and affords no saving because it is added to ensure that the administrative withdrawal of an individual's authorization is not recorded as an unfavorable termination.

Paragraph 26.65(g)

This paragraph of the final rule [including subparagraphs 26.65(h)(1)–(3)] describes the minimum management actions and sanctions that must be met in the event of a positive, adulterated, or substituted random drug, validity, or alcohol test after selection during the applicant period. Licensees and other entities are required to either deny authorization [as required by paragraphs 26.75(b), (d), (e)(2), or (g)], terminate authorization if it has been granted [under paragraphs 26.75(e)(1) or (f)], or grant authorization under §26.69. No incremental costs are anticipated to result from this final paragraph because the management actions are similar to those already required under the former rule.

26.67 Random Drug and Alcohol Testing of Individuals who have Applied for Authorization

Paragraph 26.67(a)

This paragraph of the final rule [including subparagraphs 26.67(a)(1) and (2)] adds a requirement for licensees and other entities to subject applicants for authorization to random drug and alcohol testing under subparagraph 26.31(d)(2) once the licensee collects specimens from an individual for any pre-access testing that may be required under §§26.65 or 26.69. This added provision will result in incremental costs. These costs, however, are presented separately for each applicant type under §§26.55, 26.57, and 26.59.

Subparagraph 26.67(a)(1)

This subparagraph states that licensees and other entities can forego the random drug and alcohol testing requirement presented in paragraph 26.67(a) if authorization is not granted. This requirement imposes no incremental activity relative to the former rule and, therefore, results in no incremental cost or saving.

Subparagraph 26.67(a)(2)

This subparagraph states that if the licensee or other entity, to meet the applicable requirements for pre-access testing, relies upon drug and alcohol testing conducted before the individual applied for authorization from the licensee, the licensee or other entity shall subject the individual to random testing beginning upon arrival at the facility for in-processing. Because this requirement ultimately will not change the time period within which random testing must be conducted, this requirement imposes no incremental cost or saving.

Paragraph 26.67(b)

This paragraph of the final rule states that if an individual is selected for random drug and alcohol testing after the requirement for pre-access testing has been meet, the licensee or other entity may grant authorization before test results are verified, provided that they are available within the time period specified in §26.65 (10 business days). No incremental costs or savings result because licensees already allow access to be granted following the completion of pre-access drug and alcohol testing.

Paragraph 26.67(c)

This paragraph of the final rule [including subparagraphs 26.67(c)(1)–(3)] describes the minimum management actions and sanctions that must be met in the event of a positive, adulterated, or substituted random drug, validity, or alcohol test after selection during the applicant period. Licensees and other entities are required to either deny authorization [as required by paragraphs 26.75(b), (d), (e)(2), or (g)], terminate authorization if it has been granted

[as required by paragraphs 26.75(e)(1) or (f)], or grant authorization under §26.69. No incremental costs are anticipated to result from this final paragraph because the management actions are similar to those of current industry practice.

26.69 Authorization with Potentially Disqualifying Fitness-for-Duty Information

Paragraph 26.69(a)

This paragraph of the final rule states that the purpose of §26.69 is to define the management actions for granting authorization when potentially disqualifying information has been discovered. Such management actions were defined in subparagraph 26.27(a)(3) of the former rule. In addition, the final paragraph allows licensees and other entities to rely on past reviews and determinations of potentially disqualifying FFD information conducted by previous licensees. This provision may result in incremental savings as the number of applicants that require a determination of fitness is likely to decrease. These incremental savings are calculated and presented under subparagraph 26.189(b)(3).

Paragraph 26.69(b)

This paragraph of the final rule describes the procedures for licensees and other entities to follow in granting and maintaining authorization for an individual whose authorization was denied for 5 years under §26.75(c), (d), (e)(2), or (f) or terminated unfavorably for a first confirmed positive drug or alcohol test result by a licensee or other entity. This procedure includes a more thorough suitable inquiry than required under paragraph 26.61,[33] a determination of fitness (as required by 26.27(a)(3) of the former rule), verification of negative results of a pre-access drug and alcohol test with collection under direct observation, and completion of or compliance with any follow-up testing program. Although this final paragraph includes some new provisions that may require additional labor burden, the analysis assumes that licensees and other entities will rarely hire or grant authorization to individuals with confirmed first positive drug and alcohol test results. Consequently, the requirements impose no added cost or savings.

Paragraph 26.69(c)

This paragraph of the final rule describes the procedures for licensees and other entities to follow in granting authorization to an applicant for whom potentially disqualifying FFD information, other than a first confirmed drug or alcohol test result, has been discovered or disclosed. This procedure includes a more thorough suitable inquiry than required under paragraph 26.61, a determination of fitness (as required by 26.27(a)(3) of the former rule) if necessary, verification of negative results of a pre-access drug and alcohol test, and completion of or compliance with any follow-up testing program. Although this final paragraph includes some new provisions that may require an additional labor burden, the analysis assumes that licensees and other entities will

[33] This more thorough suitable inquiry is equivalent to what was called for under the former rule.

rarely hire or grant authorization to individuals who have been denied authorization for a period of 5 years. Consequently, the requirements impose no added cost or savings.

Paragraph 26.69(d)

This paragraph of the final rule describes the procedures for licensees and other entities to follow in order to maintain authorization of an individual when potentially disqualifying FFD information is discovered or disclosed after authorization has been granted. The procedure requires that the licensee's or other entity's designated reviewing official complete a review of the circumstances associated with the information. Upon the direction of the reviewing official, the appropriate professional (e.g., SAE) must conduct a determination of fitness and verify that the individual is fit to safely and competently perform his or her duties. Authorization may be maintained with the approval of the reviewing official and following the implementation of any recommendations for treatment and followup drug and alcohol testing as well as assurance of compliance with any such recommendations and treatments. The provisions impose no incremental cost and afford no saving because paragraph 26.27(b) of the former rule already required licensees and other entities to determine whether an individual who is suspected of potential impairment or questionable fitness is fit to safely and competently perform activities required under this part.

Paragraph 26.69(e)

This paragraph [including subparagraphs 26.69(e)(1) and (2)] addresses the transfer of an individual who is in a treatment and/or follow-up testing plan to a different FFD program. The final paragraph requires the licensee or other entity who imposed the treatment and/or followup testing plan to ensure that information documenting the treatment and/or followup plan is identified to any subsequent licensee or other entity who seeks to grant authorization to the individual. The paragraph also requires that the receiving licensee ensure that the treatment and follow-up testing requirements are met. No incremental costs or savings are expected to result from this requirement because the former rule already required (in subparagraph 26.27(a)(3)) that follow-up testing requirements apply to an individual wherever he or she goes, and as such, this final paragraph represents a clarification of former requirements. The language clarifies that the receiving licensee may take credit for the portion of a follow-up drug and alcohol testing program that was completed under a previous licensee, and that individuals will not need to start over with follow-up testing when transferring to a new licensee. Although these provisions may result in incremental savings for those licensees who have been hiring such individuals and restarting the follow-up testing program, the analysis does not quantify them given the rarity of situations in which a licensee will chose to hire such individuals.

Paragraph 26.69(f)

This paragraph of the rule describes the sanctions that licensees and other entities must implement in the event that an applicant applying for authorization with potentially disqualifying FFD information receives confirmed positive, adulterated, or substituted drug, validity, or

alcohol test results. In such situations, licensees and other entities are required to either deny authorization or terminate an individual's authorization (if they already have been authorized). These procedures were already contained in paragraph 26.27(b)(2) of the former rule. As a result, the final paragraph imposes no incremental costs and affords no savings.

26.71 Maintaining Authorization

Paragraph 26.71(a)

Subparagraph 26.71(a)(1)

This paragraph of the final rule states that individual's must comply with licensee and other entity FFD policies and procedures in order to maintain authorization. This final subparagraph imposes no incremental cost and affords no saving because the former rule already required individuals to conform to this provision based on the actions that would warrant revocation of the individual's authorization in paragraph 26.27(b) of the former rule.

Subparagraph 26.71(a)(2)

This paragraph of the final rule states that individuals must remain subject to an approved drug and alcohol testing program in order to maintain authorization. It imposes no incremental costs and affords no saving because this already is required under §26.24 of the former rule.

Subparagraph 26.71(a)(3)

This paragraph states that individuals must be subject to a behavioral observation program in order to maintain authorization, as required by subparagraph 26.22(a)(4) of the former rule. Incremental costs indirectly related to this provision are addressed in connection with §26.29.

Subparagraph 26.71(a)(4)

This paragraph of the final rule imposes no incremental cost and affords no saving because FFD policy training already is required under §26.21 of the former rule. Costs or savings associated with changes to training requirements are calculated and discussed in connection with §26.29.

Paragraph 26.71(b)

This paragraph of the final rule adds provisions that require the licensee or other entity to terminate authorization of any authorized individual who for a period of 30 days has not been subject to a licensee-approved FFD program that meets the requirements of this part. The analysis assumes that current industry practice already allows a limited period of time during which authorized individuals may be away from the FFD program to account for vacations and other approved short-term leaves of absence. Therefore, the analysis assumes the final paragraph imposes no incremental costs and affords no savings.

Subpart D: Management Actions and Sanctions to be Imposed

26.73 Applicability

This section of the final rule imposes no incremental cost and affords no saving because it merely states that the requirements in Subpart D apply to the: (1) licensees and other entities identified in § 26.3(a) and (b) for the categories of individuals specified in § 26.4(a) through (d); (2) licensees and other entities specified in § 26.3(c) for the categories of individuals in § 26.4(e), and, at the licensee's or entity's discretion, for the categories of individuals identified in § 26.4(f); (3) entities in § 26.3(d) to the extent that a licensee or other entity relies on the C/V to meet the requirements of this Subpart, and; (4) individuals specified in § 26.4(h) and (j), as appropriate.

26.75 Sanctions

Paragraph 26.75(a)

This paragraph of the final rule imposes no incremental cost and affords no saving because it merely introduces the subsequent provisions regarding minimum sanctions required in the event of violations of the drug and alcohol provisions of an FFD policy, which are similar to those required by paragraph 26.27(b) of the former rule.

Paragraph 26.75(b)

Licensees may realize incremental savings as a result of this paragraph, which requires licensees to deny authorization permanently to individuals who refuse to be tested or have engaged, or attempted to engage, in subversion of the testing process. This is a new requirement that was not addressed in the former rule. Requiring permanent denial of authorization may prevent, currently and in the future, disputes which require lengthy discussion or questioning of the grounds for denial in such instances. This analysis does not quantify any associated savings, however, because neither refusals nor subversion attempts are common, and data are not available to support a meaningful estimate.

Paragraph 26.75(c)

This paragraph of the final rule revises paragraph 26.27(b)(3) of the former rule to require licensees and other entities to deny authorization for a period of at least 5-years if an employee is determined to have been involved in the sale, use, or possession of illegal drugs or the consumption of alcohol within a protected area of any nuclear power plant, within a facility that is licensed to possess or use formula quantities of SSNM, within a transporter's facility or vehicle, or while performing activities that require the individual to be subject to this part. Although the addition of the consumption of alcohol to this requirement represents a new requirement, no incremental cost or savings is anticipated to result because it is assumed that licensees already impose similar sanctions under their current policies.

Paragraph 26.75(d)

This paragraph of the final rule revises the requirements located in paragraph 26.27(c) of the former rule to require licensees and other entities to deny authorization for a period of at least 5 years if an employee resigns or withdraws his application for authorization in anticipation of having their authorization terminated unfavorably as a result of a violation of the drug and alcohol provisions of the FFD policy. Although this is a new requirement, no incremental saving is estimated, even though future authorizing licensees or other entities may realize some savings by avoiding initial processing of these individuals.

Paragraph 26.75(e)

This paragraph revises the requirement located in subparagraph 26.27(b)(2) of the former rule by requiring the presumption that alcohol consumption (in addition to drug use) occurred off-site unless evidence suggests otherwise. Although the addition of the consumption of alcohol to this requirement represents a new requirement, no incremental cost or savings is anticipated to result because it is assumed that licensees already impose similar sanctions under their current policies.

Paragraph 26.75(f)

This paragraph of the final rule revises requirements contained in subparagraph 26.27(b)(5) of the former rule. The former rule stated that current licensee sanctions for confirmed misuse of alcohol, valid prescription drugs, and over-the-counter drugs must be sufficient to deter such abuse, and therefore it does not apply certain management actions to such misuse specified in this section. The final rule removes confirmed alcohol use from this category and specifically applies the management actions in 26.75(e) to such abuse. Although this is a new requirement, the final paragraph imposes no incremental cost and affords no saving, however, because it is not a significant change to licensee and other entity policy and because there is no incremental cost or saving associated with 26.75(e).

Paragraph 26.75(g)

This paragraph of the final rule requires licensees and other entities to permanently deny authorization to any individual who violates the drug and alcohol provisions of FFD policy after already having a denial of authorization of at least 5 years under paragraphs 26.75(c)–(f). Under the former rule, only a second positive test result, or sale, use, or possession of drugs while on duty could result in a permanent denial of authorization. Although this new requirement may result in additional permanent denials of authorization that will require additional record-keeping activities in conjunction with paragraph 26.713(c), no incremental costs are expected to result because licensees already store records of such violations under §26.71 of the former rule and the incremental activities associated with recording the violation as a permanent denial is anticipated to be negligible. Additionally, the longer 40-year retention period [specified in §26.713(c)], as compared to the 5-year period under the former rule, is not expected to result in

incremental costs because the most substantial costs associated with retaining the records (filing, removal) do not change as a result of this final paragraph.

Paragraph 26.75(h)

This paragraph of the final rule imposes no incremental cost and affords no saving because it merely renumbers and revises paragraph 26.24(d)(2) of the former rule. The revisions add terminology to be consistent with the rest of the rule, as well as references to validity testing.

Paragraph 26.75(i)

This paragraph of the final rule imposes no incremental cost and affords no saving because it merely renumbers and revises paragraph 26.24(d)(2) of the former rule. The revisions add terminology to be consistent with the rest of the rule, as well as references to validity testing.

26.77 Management Actions Regarding Possible Impairment

Paragraph 26.77(a)

This paragraph of the final rule imposes no incremental cost and affords no saving because it merely states the purpose of the section, which is to describe management actions that licensees and other entities must take when an individual who is subject to this part shows indications of not being fit to safely and competently perform activities within the scope of this part.

Paragraph 26.77(b)

This paragraph of the final rule imposes no incremental costs and affords no savings because it merely requires licensees and other entities to take immediate action with drug and alcohol testing if an employee exhibits an indication of possible impairment while performing activities within the scope of this part, as already required under paragraph 26.27(b)(1) of the former rule. The revised paragraph does, however, add provisions allowing licensees and other entities the option of conducting only an alcohol test (but not a drug test) when the evidence of possible impairment is the smell of alcohol. The analysis has not quantified any incremental savings from this provision. Additionally, the provision requires that observed behaviors or physical conditions suggesting impairment solely from fatigue shall result in a fatigue assessment in accordance with §26.211 rather than a determination of fitness. Additional costs associated with the fatigue assessment are calculated under §26.211 of this analysis.

Paragraph 26.77(c)

This paragraph of the final rule imposes no incremental cost and affords no saving because it merely renumbers paragraph 26.27(d) of the former rule, which stated that licensees must provide escorted access to NRC employees or contractors when there are indications of questionable fitness to perform activities within the scope of this part.

Subpart E: Collecting Specimens for Testing

26.81 Purpose and applicability

This section of the final rule imposes no incremental cost and affords no saving because it merely explains that Subpart E presents the requirements associated with collecting specimens for drug and alcohol testing by or on behalf of the licensees and other entities in §26.3. This section also states that the requirements of this Subpart do not apply to specimen collections and alcohol tests that are conducted under the requirements of 49 CFR Part 40, "Procedures for Department of Transportation Workplace Drug and Alcohol Testing Programs," as permitted under §§ 26.4(j), 26.31(b)(2), and Subpart K.

26.83 Specimens to be collected

Paragraph 26.83(a)

This paragraph of the final rule revises the requirements in former §26.24(g), which specified the types of specimens permitted to be analyzed for alcohol testing. Requirements in former §26.24(g) of the former rule permitted the use of breath specimens for initial and confirmatory alcohol tests and blood specimens for additional confirmatory alcohol testing. The final rule eliminates the use of blood specimens for confirmatory alcohol testing which was permitted in former Section 2.2(d)(4) in Appendix A to Part 26. The final rule adds a new provision permitting the collection of oral fluids (in addition to breath) for initial alcohol tests. The use of oral fluids is a permissive relaxation of the former rule requirements providing licensees with flexibility in using an alternative specimen testing (saliva) method to conduct initial alcohol testing (see the discussion of §26.91(a) of this analysis). Elimination of blood samples for confirmatory alcohol testing will result in minor licensee savings by eliminating the costs associated with collecting blood specimens from donors, analyzing blood specimens, lost worker productivity, and MRO time to review and communicate blood test results to the worker and FFD management.

The *annual savings per FFD program* are estimated as follows:

$$NUM_{blood} \times [(COST_{blood\ draw} + COST_{blood\ testing}) + (HOURS_{worker} \times WAGE_{worker}) + (HOURS_{MRO} \times WAGE_{MRO})]$$

Parameter	Description
NUM_{blood}	Number of blood tests per FFD program per year under the former rule (as discussed in the assumptions below)
$COST_{blood\ draw}$	Cost per blood test for a phlebotomist/RN to arrive at the onsite collection site and conduct a blood draw (as discussed in Appendix 2, Exhibit A2-13).
$COST_{blood\ testing}$	Cost per blood test for a laboratory to analyze a blood specimen for alcohol (as discussed in Appendix 2, Exhibit A2-13)

Parameter	Description
$HOURS_{worker}$	Hours of lost worker productivity resulting from receiving a blood test (as discussed in the assumptions below)
$WAGE_{worker}$	Facility worker wage rate (as discussed in Appendix 2, Exhibit A2-13)
$HOURS_{MRO}$	Hours of MRO time to review blood test results and communicate the results to the worker and FFD management (as discussed in the assumptions below)
$WAGE_{MRO}$	MRO wage rate (as discussed in Appendix 2, Exhibit A2-13)

Assumptions:

- Number of blood tests per FFD program per year under the former rule: 1.

- Hours of lost worker productivity per test resulting from receiving a blood test includes waiting time for phlebotomist/RN to arrive at the onsite collection site, conduct a blood draw, and complete paperwork: 45 minutes.

- Hours of MRO time to review blood test results and communicate the results to worker and FFD management: 45 minutes.

- Blood specimen is collected at the same collection site where the confirmatory evidential breath testing device (EBT) testing is conducted.

Paragraph 26.83(b)

This paragraph of the final rule imposes no incremental cost and affords no saving because it clarifies requirements in former §26.24(f) which specified "urine drug testing" on all specimens at licensee testing facilities and/or HHS-certified laboratories. Since no other type of specimen is described in the former rule language as acceptable alternative for drug testing, this final paragraph simply clarifies the former rule requirements.

26.85 Collector qualifications and responsibilities

Paragraphs 26.85(a) and (b)

Paragraph 26.85(a) addresses urine collector qualifications and training requirements and paragraph 26.85(b) addresses alcohol collector qualifications and training. These final paragraphs revise requirements in former Section 2.2(d) in Appendix A to Part 26, which addressed training of collection site personnel. The former requirements specified collector training in maintaining the integrity of the specimen collection and transfer process, donor privacy issues, and appropriate collector conduct. The final rule adds requirements that collectors must be knowledgeable about Part 26, as well as the FFD policy and procedures of

licensees and other entities, and must keep up to date with urine and alcohol collection procedures. It also requires all collectors to receive qualification training on problem collections and the correction of problems associated with collections.[1] FFD programs will incur incremental costs associated with conducting one-time collector training classes and the labor costs for all collectors to attend a training class.[2]

The *one-time costs per FFD program* are estimated as follows:

$$NUM_{collectors} \times [(HOURS_{collector\ training} \times WAGE_{collector}) + COST_{training\ course})] \times NUM_{facilities}$$

Parameter	**Description**
$NUM_{collectors}$	Number of collectors per licensee facility (as discussed in the assumptions below)
$HOURS_{collector\ training}$	Length of training course (as discussed in the assumptions below)
$WAGE_{collector}$	Collection site personnel wage rate (as discussed in Appendix 2, Exhibit A2-11)
$COST_{training\ course}$	Cost of a commercial vendor to conduct an onsite collector training course per facility (as discussed in the assumptions below)
$NUM_{facilities}$	Number of facilities in a given FFD program (as discussed in Appendix 2, Exhibit A2-14)

Assumptions:

- Each facility uses a unique collection site.
- Each collector is trained to conduct urine and breath collections.
- Number of collectors per licensee facility: 4.
- Length of training course (includes urine and breath collections): 8 hours.
- Cost of collector training course for a commercial vendor to conduct onsite at a collection site: $1,000.

[1] All urine and breath collectors used by a licensee or other entity's collection site will receive re-training to meet the requirements in §26.85(a) and (b) as well as to receive training on all new collection procedures resulting from the rule revision. Some of the urine collectors at a licensee collection site may be medical professionals, technologists, or technicians who are no longer exempted from the former rule requirement in Section 2.2(d)(2) in Appendix A due to the provision in §26.85(c), and thus, may be receiving training for the first time.

[2] The analysis estimates no incremental cost for future training (e.g., due to normal employee turnover) because it is believed that new collectors already receive on-the-job training as part of their normal training activities given that the topics for qualification training are necessary for fulfilling job responsibilities (e.g., completing the custody-and-control form, shy bladder procedures, specimen integrity procedures, donor privacy protections).

Paragraph 26.85(c)

This paragraph of the final rule revises the requirements in former Section 2.2(d)(2) in Appendix A to Part 26, which permitted medical professionals, technologists, and technicians to collect urine specimens without receiving training or demonstrating proficiency in specimen collections, as long as these collectors received the instructions in former Section 2.2(3) in Appendix A to Part 26 and perform collections in accordance with those instructions. The final paragraph adds a requirement that limits the persons excused from the training and demonstration of proficiency requirements for specimen collections to medical professionals, technologists, or technicians who are not employed by the licensee's or other entity's FFD program and whose workplace is not at the licensee's or other entity's facility. This revision will increase the incremental cost per FFD program associated with the training costs for medical professionals, technologists, and technicians who serve as collectors, but who are no longer excused from training. The incremental cost resulting from additional training required under the new provision is discussed in connection with §§26.85(a) and (b).

Paragraph 26.85(d)

This paragraph of the final rule revises the former requirements in Section 2.7(o)(5) in Appendix A to Part 26, which required licensee testing facility and HHS-certified laboratory personnel to be available to testify in an administrative or disciplinary proceeding against an individual when that proceeding is based on positive drug or alcohol test results or adulterated or substituted test results reported by the licensee's testing facility or the HHS-certified laboratory. This final paragraph extends this requirement to qualified collection site personnel. The analysis estimates no incremental cost or saving will result from this final rule provision because the requirement is consistent with existing licensee and collection site actions with respect to personnel appearing for administrative or disciplinary proceedings related to a specimen collection.

Paragraph 26.85(e)

This paragraph of the final rule adds a new requirement that specifies the records that must be retained for collection site personnel. The paragraph requires that collection site personnel files include each individual's resume of training and experience; certification or license, if any; references; job descriptions; records of performance evaluations and advancement; incident reports, if any; results of tests that establish employee competency for the position he or she holds; and appropriate data to support determinations of honesty and integrity conducted in accordance with this part. This final paragraph extends to collection site personnel the records retention requirements in former Sections 2.5(f) and 2.6(c) in Appendix A to Part 26 for laboratory personnel and licensees' testing facility personnel, respectively. The analysis estimates no incremental cost will result from this final rule provision because it is assumed that these files are already kept for collection site personnel.

26.87 Collection sites

Paragraph 26.87(a)

This paragraph of the final rule imposes no incremental cost and affords no saving because it merely clarifies former requirements in Section 2.4(a) in Appendix A to Part 26, which related to designated collection sites.

Paragraph 26.87(b)

This paragraph of the final rule adds a new requirement that each collection site must provide visual privacy while a donor and collector view the results of a breath alcohol test. The former requirements in Sections 2.4(g)(8) and 2.4(f) in Appendix A to Part 26 required only that a donor must be permitted to provide a urine specimen in the privacy of a stall or otherwise partitioned area. The requirement is estimated to result in no incremental cost or saving because collection sites that need to modify collection procedures to meet this new requirement can do so using readily available office supplies. For example, a piece of cardboard may be affixed over the EBT readout to prevent anyone other than the collector and donor from viewing test results.

Paragraph 26.87(c)

This paragraph of the final rule extends the requirement in former Section 2.7(m) in Appendix A to Part 26, which mandated that licensees must include in contracts for collection site services a provision that both NRC and licensees have the authority to conduct unannounced inspections and audits. The final paragraph extends the provisions in former Section 2.7(m) in Appendix A to other entities and their contracts for collection site services. The incremental costs associated with modifying other entity contracts with collection sites is discuss in connection with §26.27(a).

Paragraph 26.87(d)

This paragraph of the final rule clarifies requirements in former Section 2.4(c) in Appendix A to Part 26 regarding collection site security procedures. Final §26.87(d)(2) provides examples of methods that may be used to assure the security of a collection site such as locking doors, using alarms, or visually monitoring the collection site, and clarifies that designated collection sites must be secure at all times. Former Section 2.4(c) instructed that "security procedures shall provide for the designated collection site to be secure" while the former requirement in Section 2.4(c)(1) required that for specimen collections in a public rest rooms, the rest rooms be posted against access during the collection process. This paragraph of the final rule imposes no incremental cost and affords no saving because it clarifies former requirements by providing examples of methods to secure a collection site, but does not prescribe how the facility is to be secured.

Paragraph 26.87(e)

This section of the final rule discusses collection procedures that urine collectors must follow prior to and after a specimen collection to deter and detect instances where a donor attempts to adulterate, dilute, or substitute their urine specimen.

Subparagraph 26.87(e)(1)

This subparagraph amends the former requirement in Section 2.4(g)(1) in Appendix A to Part 26, which mandated the addition of toilet bluing agents to the water in the toilet tank in the enclosure where a urine specimen collection is conducted. By contrast, the final rule provides added flexibility for collection sites to use coloring agents other than blue (excluding yellow). This paragraph of the final rule imposes no incremental cost and affords no saving because many similarly priced coloring agents existing on the market today that can meet the provision.

Subparagraph 26.87(e)(2)

This subparagraph imposes no incremental cost and affords no saving because it restates a former requirement in Section 2.4(g)(1) in Appendix A to Part 26, which required that sources of water present in an enclosure used for a specimen collection must be secured or monitored to detect and prevent specimen dilution.

Subparagraph 26.87(e)(3)

This subparagraph establishes a new provision under which a urine collector, before each collection, must inspect and secure or remove from the privacy enclosure all chemicals and products that could be used by a donor to adulterate their urine specimen. This subparagraph imposes no incremental cost or saving because it is consistent with existing collection site security procedures.

Paragraph 26.87(f)

This paragraph restates and clarifies former requirements in Section 2.4(c)(1)–(2) in Appendix A to Part 26 regarding procedures for collecting urine specimens at locations other than designated collection sites (e.g., public restroom, on-site restroom, hospital examining room). In addition, as described in the subparagraph discussions below, several of the revised subparagraphs include new provisions. However, no incremental costs or savings will result from the provisions in this final paragraph because urine specimen collections at non-designated collection sites are rare events (i.e., they apply to only some post-event tests and some for-cause tests).

Subparagraph 26.87(f)(1)

This subparagraph of the final rule adds a new provision to permit an individual to be assigned to prevent unauthorized access to a public restroom being used during a urine collection. The final

rule also includes a requirement from former Section 2.4(c)(1) in Appendix A to Part 26 that a sign may be posted to prevent unauthorized access. No incremental cost or saving will result from this revised subparagraph because the new provision is a relaxation, permitting an alternative method to prevent unauthorized access to a public restroom.

Subparagraph 26.87(f)(2)

This subparagraph of the final rule revises the requirement in Section 2.4(g)(10) in Appendix A to Part 26 of the former rule that the collector add a toilet bluing agent in the bowl and any accessible toilet tank for a specimen collection conducted at a location other than a dedicated collection site. The revised subparagraph provides added flexibility by permitting collection sites to use coloring agents in addition to blue (excluding yellow) as described in final §26.87(e)(1) and clarifies that the urine collector must add a water coloring agent to any accessible source of standing water within the enclosure where a donor is to provide a specimen. No incremental cost or saving is estimated to result from these provisions which provide flexibility in the use additional types of coloring agents, and clarify existing collection practices to add coloring agents to accessible water sources within the privacy enclosure.

Subparagraph 26.87(f)(3)

This subparagraph of the final rule amends a former requirement in Section 2.4(g)(10) of Appendix A to Part 26 regarding the use of a same gender urine collector to accompany a donor into the area used for a specimen collection, if a multi-stalled bathroom is used. If a collector of the same gender is unavailable, the revised subparagraph provides additional flexibility by adding a provision that permits another person of the same gender who has been instructed in the requirements of Subpart E to assist in the collection. This revised subparagraph also adds a new requirement that the name of the same gender person must be documented on the custody-and-control form in situations where a same-gender collector is not available. No incremental cost or saving will result from this final subparagraph because the new provisions provide an alternative method to existing collection practices at non-dedicated collection sites.

Subparagraph 26.87(f)(4)

This subparagraph of the final rule imposes an additional inspection requirement to former Section 2.4(g) of Appendix to Part 26. The new requirement pertains to specimen collections at non-designated collection sites. Upon receiving a urine specimen from a donor, the collector must inspect the privacy enclosure where the specimen was provided to ensure that there is no evidence of a donor subversion attempt. This subpargraph also adds a requirement that the collector and not the donor flush the toilet at the completion of a specimen donation. A requirement in former Section 2.4(g)(10) permitted the donor to flush the toilet under certain circumstances. No incremental cost or saving is estimated to result from this revised subparagraph due to the rarity of collections at non-dedicated collection sites.

Subparagraph 26.87(f)(5)

This subparagraph of the final rule revises former requirements in Section 2.4(c)(2) in Appendix A to Part 26 which pertain to urine specimen collections conducted at non-dedicated collection facilities and which directed urine collectors to maintain physical control of donor urine specimens. The final provision relaxes the former requirement by permitting the collector to designate another individual to maintain custody of the specimen until it is shipped (i.e., in the case of an opposite gender collector who instructs a same gender individual to assist in a urine collection). This revised subparagraph also requires that, in the case where the collector uses an individual to assist in the collection process, the individual's name must be documented on the custody-and-control form. No incremental cost or saving is estimated to result from this final subparagraph due to the rarity of collections at non-dedicated collection sites.

26.89 Preparing to collect specimens for testing

Paragraph 26.89(a)

This paragraph of the final rule revises former requirements in Section 2.4(g)(3) in Appendix A to Part 26 regarding the actions to take if a donor does not arrive at the collection site for drug and/or alcohol testing. The former requirement instructed the collection site staff to contact "the appropriate authority to obtain guidance on the action to be taken." The final paragraph adds a new requirement that mandates that FFD program management investigate and determine whether the absence or tardiness of a donor is an attempt to subvert the testing process and to take appropriate action when necessary. This revision is believed to be consistent with long-term licensee practice and, therefore, will not result in incremental costs or savings.

Paragraph 26.89(b)

Subparagraphs 26.89(b)(1)–(2)

The subparagraphs revise former requirements in Section 2.4(g)(2) in Appendix A to Part 26, which describe the process for identifying a donor before collecting a specimen. Subparagraph 26.89(b)(1) clarifies former requirements pertaining to acceptable donor identification. Subparagraph 26.89(b)(2) now requires (rather than prohibits) a collection to proceed in cases where the donor does not produce acceptable identification, except for pre-access testing. The collector will now proceed with the specimen collection even without positively identifying the donor and will inform FFD program management that the employee could not be positively identified. FFD program management must then contact the individual's supervisor to verify in person the individual's identity, or if unavailable, take other steps to establish the individual's identity, and investigate the circumstances to determine whether the employee's behavior was an attempt to subvert the testing process. As a result, FFD programs may realize savings related to reduced worker productivity losses because workers will no longer have to leave the collection site, obtain appropriate identification, and return to the collection site for a test. Management

time is not expected to change based on whether the manager's investigation occurs prior to or subsequent to the collection, in accordance with the former and final rules, respectively.

Subparagraph 26.89(b)(2) also adds a provision prohibiting a specimen collection in these cases if the test is a pre-access test. The analysis estimates no incremental cost or saving will result from this provision due to the rarity of these situations.

The *annual savings per FFD program* resulting from §26.89(b)(2) are estimated as follows:

$$NUM_{selected\ individuals} \times PER_{no\text{-}ID} \times (HOURS_{worker} \times WAGE_{worker}) \times NUM_{reactors}$$

Parameter	**Description**
$NUM_{selected\ individuals}$	Number of individuals selected for drug and alcohol testing per reactor per year (as discussed in the assumptions below and in Appendix 2, Exhibit A2-12)
$PER_{no\text{-}ID}$	Percentage of individuals without identification (as discussed in the assumptions below)
$HOURS_{worker}$	Time a donor without identification would spend to leave the collection site, obtain appropriate identification, and return to the collection site for drug and alcohol testing (as discussed in the assumptions below)
$WAGE_{worker}$	Facility worker wage rate (as discussed in Appendix 2, Exhibit A2-11)
$NUM_{reactors}$	Number of reactors per FFD program (as discussed in Appendix 2, Exhibit A2-14)

Assumptions:

- Number of individuals selected for drug and alcohol testing per reactor per year is equivalent to the number of drug tests conducted per reactor per year (a drug and alcohol test is conducted each time an individual is tested). This assumes that each individual selected for testing is actually tested.

- Percentage of individuals without identification: 1 percent.
  The analysis assumes only 1 percent because employees subject to FFD program requirements must have identification with them at all times while at a licensed facility and, therefore, cases where an employee does not have adequate identification are rare.

- Time a donor without identification would spend to leave the collection site, obtain appropriate identification, and return to the collection site for drug and alcohol testing: 45 minutes.

- FFD management will incur no incremental costs or savings related to the final rule revisions. The analysis assumes that, under the former rule, the collection site notified FFD management after an employee arrived for a specimen

collection without adequate identification, and FFD management investigated the situation with the employee. The final rule requires the collection site to contact FFD management after completing a test, but the activities and time required of the FFD management would be similar.

Subparagraph 26.89(b)(3)

This subparagraph restates the former requirements in Sections 2.4(g)(4) and (g)(23)(ii) in Appendix A to Part 26 with the exception of the requirement for the collector to direct the donor to list on the chain-of-custody form the prescription medications and over-the-counter (OTC) preparations taken within 30 days prior to their urine specimen collection. This revised subparagraph now prohibits the donor from listing prescription medications and OTC preparations recently used. This revised subparagraph also adds a new requirement for the collector to explain the testing procedure to each donor. Each FFD program will recognize incremental savings per urine collection resulting from the reduced time of the collection process due to the elimination of the donor listing medications and OTC preparations on the custody-and-control form. Theses savings are offset to a small extent by the increase in time related to the collector describing the testing process to each donor. Overall, a reduction in lost worker productivity and reduced collector wages will be realized by FFD programs.[3]

The *annual savings per FFD program* are estimated as follows:

$$NUM_{collections} \times [(HOURS_{saved} - HOURS_{added}) \times (WAGE_{worker} + WAGE_{collector})] \times NUM_{reactors}$$

Parameter	Description
$NUM_{collections}$	Number of urine collections per reactor per year (as discussed in the assumptions below and in Appendix 2, Exhibit A2-12)
$HOURS_{saved}$	Time saved per average collection because the donor does not list medications on the chain-of-custody form (as discussed in the assumptions below)
$HOURS_{added}$	Time added per average collection for the collector to explain the testing process to the donor (as discussed in the assumption below)
$WAGE_{worker}$	Facility worker wage rate (as discussed in Appendix 2, Exhibit A2-11)
$WAGE_{collector}$	Collection site personnel wage rate (as discussed in Appendix 2, Exhibit A2-11)
$NUM_{reactors}$	Number of reactors per FFD program (as discussed in Appendix 2, Exhibit A2-14)

[3] In order to capture total costs and savings, the analysis assumes that savings incurred by any offsite collection sites are passed back to licensees (i.e., through lower costs per collection). This assumption depends on the degree to which the offsite collection site industry is price competitive. To the extent that it is not price competitive, savings will accrue as estimated, but will benefit the offsite collection site rather than licensees (i.e., offsite collection sites will recognize savings in labor costs because of the reduced collection time, but will not reduce the cost per collection charged to the licensee).

Assumptions:

- Number of urine collections per reactor per year is equal to the number of drug tests per reactor per year.

- Time saved per average collection because the donor does not list medications on the CCF: 2 minutes.

- Time added per average collection for the collector to explain the testing process to the donor: 45 seconds.

Paragraph 26.89(c)

This paragraph of the final rule adds a new requirement directing the collector to inform the donor that, if the donor refuses to cooperate in the specimen collection process (including but not limited to, behaving in a confrontational manner that disrupts the testing process; admitting to the collector that he or she adulterated or diluted the specimen; is found to have a device, such as a prosthetic appliance, the purpose of which is to interfere with providing an actual urine specimen; or leaving the collection site before all of the collection procedures are completed) will be considered as a refusal to test. No incremental cost or saving is estimated to result from this final paragraph because providing the directions to the donor will only take seconds per collection, and the number of instances in which a donor will leave the collection site before testing or will refuse to cooperate with the collection process will be very low due to the severity of the consequences.

Paragraph 26.89(d)

This paragraph restates former requirements in Section 2.4(e) in Appendix A to Part 26 which require that a collector only conduct one urine specimen collection at a time and defines when a collection process is complete, that is, when the donor has left the collection site.

26.91 Acceptable devices for conducting initial and confirmatory tests for alcohol and methods of use

Paragraph 26.91(a)

This paragraph of the final rule expands the acceptable breath alcohol testing devices beyond the former requirements in §26.24(g). The final paragraph permits FFD programs to conduct initial tests for alcohol using NHTSA-certified alcohol screening devices (ASDs), including devices that test specimens of oral fluids or breath, that are on the NHTSA Conforming Products List (CPL). This provision affords licensees added flexibility in conducting initial tests for alcohol. However, because an EBT compliant with §26.91(c) is required for confirmatory tests, the ability to use ASDs does not eliminate the need for an evidential breath testing device (EBT). The analysis assumes that licensees, in order to simplify their testing and training procedures,

will conduct alcohol testing using only EBTs under normal circumstances, and that licensees will use ASDs only when a screening test must be conducted at a non-standard location (e.g., in the case of some post-event tests or possibly some for-cause tests). Because the need to conduct tests at non-standard locations is infrequent, the analysis assumes that any costs associated with the use of ASDs are insignificant to the analysis.

Paragraph 26.91(b)

This paragraph of the final rule adds a new requirement that all EBTs used to conduct confirmatory alcohol testing must meet the specific functionalities (e.g., provide a printed result for each breath test, test an air blank) as stated in §26.91(c). This final paragraph also revises former requirements in §26.24(g) and Section 2.4(g)(18) in Appendix A to Part 26 which mandated the use of two different EBTs for initial versus confirmatory alcohol testing. This final paragraph permits licensees to use a single EBT for both initial and confirmatory breath alcohol testing if the EBT meets the specifications in §26.91(c). This final paragraph will result in an incremental one time cost for some FFD programs to purchase EBTs (along with necessary calibration equipment) meeting the specifications in §26.91(c) for confirmatory breath alcohol testing, along with the one time cost to train breath alcohol collectors in the use of the new EBTs. Incremental annual costs incurred by FFD programs that purchase EBTs to comply with §26.91(c) will consist of the cost to purchase calibration equipment to conduct quality control checks on the new EBTs.

One time costs per FFD program are estimated as the *sum* of the following*:*

- Purchase EBTs meeting the specifications in §26.91(c):

  $COST_{EBT} \times NUM_{new\ EBTs} \times PER_{purchase\ EBT} \times NUM_{facilities}$

- Purchase a regulator used in calibrating new EBT equipment[4]:

  $COST_{regulator} \times PER_{purchase\ EBT} \times NUM_{facilities}$

- Breath alcohol collector training on use of new EBTs:

  $[COST_{training\ course} + (NUM_{collectors} \times (HOURS_{collector\ training} \times WAGE_{collector}))] \times NUM_{facilities} \times PER_{purchase\ EBT}$

Annual costs per FFD program are estimated as follows:

- Purchase calibration device for new EBTs:

[4] A regulator is a piece of equipment used to attach a calibration canister to an EBT in order to conduct quality control checks. One regulator can calibrate multiple EBTs.

$COST_{calibration\ device}\ x\ PER_{purchase\ EBT}\ x\ NUM_{facilities}$

Parameter	Description
$COST_{EBT}$	Cost of an EBT compliant with §26.91(c) (as discussed in Appendix 2, Exhibit A2-8)
$NUM_{new\ EBTs}$	Number of new EBTs compliant with §26.91(c) purchased per facility (as discussed below and in Appendix 2, Exhibit A2-8)
$PER_{purchase\ EBT}$	Percentage of collection sites that will purchase an EBT meeting the specifications in §26.91(c) (as discussed in the assumptions below)
$COST_{regulator}$	Cost of purchasing a regulator which attaches the calibration canister to the EBT (as discussed in the assumptions below and in Appendix 2, Exhibit A2-13)
$COST_{training\ course}$	Cost of EBT manufacturer to conduct an onsite training course per collection site (as discussed in the assumptions below)
$NUM_{collectors}$	Number of breath alcohol collectors per collection site (as discussed in Appendix 2, Exhibit A2-8)
$HOURS_{collector\ training}$	Length of training course (as discussed in the assumptions below)
$WAGE_{collector}$	Collection site personnel wage rate (as discussed in Appendix 2, Exhibit A2-11)
$COST_{calibration\ canister}$	Cost of purchasing a calibration canister for quality control checks on new EBTs compliant with §26.91(c) (as discussed in the assumptions below and in Appendix 2, Exhibit A2-13)
$NUM_{facilities}$	Number of facilities per FFD program (as discussed in Appendix 2, Exhibit A2-14)

Assumptions:

- Each facility uses one collection site.
- Percentage of collection sites that will purchase an EBT meeting the specifications in §26.91(c): 50 percent.[5]
- Each collection site that purchases an EBT meeting the specifications in this §26.91(c) will purchase one EBT.

[5] The 50 percent estimate is based on an NEI industry survey (May 2004) in which 21 FFD programs that represent 32 facilities reported on the number of EBTs that would be purchased to meet the requirements in 26.91(c). Of the 32 facilities, 24 facilities had EBTs compliant with §26.91(c) and would not purchase any new equipment. The remaining 8 facilities in the survey reported that 16 new EBTs would be purchased. As an industry, 16 new EBTs would be purchased for the 32 facilities surveyed, or an average of 0.5 EBTs per facility. Therefore, 50 percent of collection sites will purchase one EBT.

- The EBTs purchased by any given collection site will be of the same manufacturer make and model and therefore, only one breath collector training class and only one regulator will be needed.

- Each calibration canister provides enough product to calibrate one EBT for two year of use. The annual cost of the calibration canister is the price of the canister divided by 2 years.

Paragraph 26.91(c)

This paragraph of the final rule establishes the required functionalities that an EBT must have to be used to conduct confirmatory alcohol testing. The incremental costs associated with some licensees purchasing EBTs meeting the functionalities in this final paragraph are described in §26.91(b). This final paragraph also revises the former requirements in §26.24(g) and Section 2.4(g)(18) in Appendix A to Part 26 which required the use of different EBTs for initial and confirmatory alcohol tests. This provision provides flexibility for licensees using an EBT meeting the criteria specified in this final paragraph by permitting the use of the same EBT for both initial and confirmatory tests. Incremental savings for FFD programs with collection sites that use EBTs meeting the specifications in this final paragraph will consist of a reduction in the time between conducting initial and confirmatory breath alcohol tests.

Annual savings per FFD program are estimated as follows:

$$NUM_{confirmatory\ alcohol\ tests} \times PER_{new\ EBT} \times [HOURS_{saved} \times (WAGE_{worker} + WAGE_{collector})] \times NUM_{reactors}$$

Parameter	Description
$NUM_{confirmatory\ alcohol\ tests}$	Number of confirmatory alcohol tests per reactor per year (as discussed in Appendix 2, Exhibit A2-12)
$PER_{new\ EBT}$	Percentage of collection sites that will use an EBT meeting the specifications in paragraph 26.91(c) for both initial and confirmatory alcohol tests (as discussed in the assumptions below)
$HOURS_{saved}$	Time per test to set-up a second EBT (locate the EBT, turn on the equipment) to conduct confirmatory testing as required under the former requirements in §26.24(g) and §2.4(g)(18) (as discussed in the assumptions below)
$WAGE_{worker}$	Facility worker wage rate (as discussed in Appendix 2, Exhibit A2-11)
$WAGE_{collector}$	Collection site personnel wage rate (as discussed in Appendix 2, Exhibit A2-11)
$NUM_{reactors}$	Number of reactors per FFD program (as discussed in Appendix 2, Exhibit A2-14)

Assumptions:

- Number of confirmatory alcohol tests conducted per reactor per year is equivalent to the number of confirmatory positive alcohol test results per reactor per year.

- Time per test to set-up a second EBT to conduct confirmatory testing: 2 minutes. If a second EBT is needed, the collector must prepare the second EBT to be used for the confirmatory test.

- Percentage of collection sites that will use an EBT meeting the specifications in paragraph 26.91(c) for both initial and confirmatory alcohol test: 50 percent.

Paragraph 26.91(d)

This paragraph establishes the quality assurance and quality control requirements for ASDs. The final paragraph requires that licensees using ASDs must implement the quality assurance plan (QAP) submitted by the manufacturer to NHTSA. No incremental cost or saving is estimated to result from this provision because the use of ASDs provides an alternative to former requirements for conducting initial alcohol testing.

Paragraph 26.91(e)

This paragraph establishes a new requirement that licensees and other entities implement the quality assurance and quality control requirements for EBTs as described in the most recent quality assurance plan (QAP) submitted by each EBT manufacturer to NHTSA. Adherence to the QAP for an EBT is consistent with existing collection site practices given that the specifications in the QAP are necessary for normal equipment operation and for accurate and defensible results. This paragraph adds an optional provision for collection sites to conduct an external calibration check immediately after a positive test result. This provision is optional and will not result in any incremental cost or saving given that the number of positive tests is infrequent.

26.93 Preparing for alcohol testing

Paragraph 26.93(a)

This paragraph of the final rule imposes no incremental cost and affords no saving because it clarifies former requirements in Section 2.4(g)(18) in Appendix A to Part 26 regarding testing procedures for conducting initial breath alcohol tests, including a mandatory 15 minute waiting period if the donor has consumed any potential sources of mouth alcohol (e.g., breath fresheners) or has ingested or expelled any other substances (e.g., via eating, smoking, regurgitation of stomach contents from vomiting or burping). This paragraph of the final rule also adds several requirements as described in the subparagraph discussions below.

Subparagraph 26.93(a)(1)

This subparagraph of the final rule clarifies a former requirement in Section 2.4(g)(18) in Appendix A to Part 26. This final subparagraph also adds a new requirement for a collector to instruct the donors to avoid eating, drinking, belching, or putting anything in their mouth during the collection process. No incremental cost or saving will result from this final subparagraph because this activity will only take seconds to complete.

Subparagraphs 26.93 (a)(2)–(3)

These subparagraphs of the final rule clarify former breath collection requirements in Section 2.4(g)(18) in Appendix A to Part 26 which directed the collector to proceed with a collection if a donor has not consumed any substance prior to the test. Subparagraph 26.93(a)(3) adds a requirement for the breath collector to inform the donor that a mandatory 15-minute waiting period is necessary to prevent an accumulation of mouth alcohol from leading to an artificially high breath alcohol reading if the donor has consumed a substance (e.g., ate, smoked) or belched prior to a test. No significant incremental cost or saving will result from §26.93(a)(2) as it restates former requirements, nor from §26.93(a)(3), which require an activity that will only take seconds to complete.

Subparagraph 26.93(a)(4)

This subparagraph of the final rule adds a new requirement to the former breath collection procedures in Section 2.4(g)(18) in Appendix A to Part 26. This final subparagraph requires that breath alcohol collectors explain to each donor, when needed, that during the mandatory 15-minute waiting period it is to the donor's benefit to avoid the activities described by the collector in §26.93(a)(1). No significant incremental cost or saving will result from this final subparagraph because this activity is conducted during the mandatory waiting period.

Subparagraph 26.93(a)(5)

This subparagraph of the final rule adds a new requirement to the former breath collection procedures in Section 2.4(g)(18) in Appendix A to Part 26. The new provision adds a requirement for breath alcohol collectors to inform each donor who indicated that they have demonstrated behaviors described in §26.93(a)(1) within 15-minutes before an initial alcohol test, that an initial test (and confirmatory test, when necessary) will be performed at the end of the 15-minute waiting period, even if the donor did not follow the instructions given by the collector during the waiting period. No significant incremental cost or saving will result from this final subparagraph because this activity is conducted during the mandatory waiting period.

Subparagraph 26.93(a)(6)

This subparagraph of the final rule adds a new requirement to the former breath collection procedures in Section 2.4(g)(18) in Appendix A to Part 26. The new provision requires that breath collectors document that directions regarding the breath alcohol collection process were communicated to each donor. This activity will result in no significant incremental cost or saving because the activity will take only seconds to complete (i.e., the collector notes on the testing form the phrase "instructions given to donor").

Paragraph 26.93(b)

This paragraph adds a new requirement to the former drug and alcohol testing procedures in §26.24(a)(3). The new provision directs licensees to minimize delays in administering for-cause drug and alcohol tests. This final paragraph also adds a requirement that specifies the sequence of specimen testing in for-cause testing situations (i.e., requires alcohol testing be conducted before drug testing). The former rule did not specify the order that drug and alcohol testing was to be conducted in for-cause testing situations. No incremental cost or saving will result from the final paragraph because for-cause drug and/or alcohol testing is already required by the former requirement in §26.24(a)(3). The final paragraph only specifies that delays in testing should be minimized and specifies the sequence for conducting for-cause alcohol and drug testing.

26.95 Conducting an initial test for alcohol using a breath specimen

This section, including paragraphs (a)–(c), revises former requirements in Section 2.4(g)(18) in Appendix A to Part 26, which mandated the collection of two breath specimens for each screening alcohol test using an EBT. The tests must be conducted no less than 2 minutes and no more than 10 minutes apart. Paragraph 26.95(c) reduces the number of breath specimens collected from two to one unless problems arise. FFD programs will realize a reduction in alcohol testing costs due to a decrease in the duration of the testing process, reducing equipment costs (using fewer exhalent tubes), decreasing worker productivity losses, and reducing collector labor costs.[6]

The *annual savings per FFD program* resulting from §26.95(c) are estimated as follows:

$$NUM_{alcohol\ tests} \times [HOURS_{saved} \times (WAGE_{worker} + WAGE_{collector}) + COST_{exhalent\ tube}] \times NUM_{reactors}$$

[6] In order to capture the total costs and savings, the analysis assumes that savings incurred by offsite collection sites are passed back to licensees (i.e., lower costs per collection). This assumption depends on the degree to which the offsite collection site industry is price-competitive. To the extent that it is not price competitive, savings will accrue as estimated, but will benefit the offsite collection site rather than licensees (i.e., offsite collection sites will realize savings in labor costs because of the reduced collection time, but will not reduce the cost per collection charged to licensees).

Parameter	Description
$NUM_{alcohol\ tests}$	Number of alcohol tests per reactor per year (as discussed in Appendix 2, Exhibit A2-12)
$HOURS_{saved}$	Reduction in collection time from one fewer breath collection per initial screening test (as discussed in the assumptions below)
$WAGE_{worker}$	Facility worker wage rate (as discussed in Appendix 2, Exhibit A2-11)
$WAGE_{collector}$	Collection site personnel wage rate (as discussed in Appendix 2, Exhibit A2-11)
$COST_{exhalent\ tube}$	Cost per exhalent tube (as discussed in Appendix 2, Exhibit A2-13)
$NUM_{reactors}$	Number of reactors per FFD program (as discussed in Appendix 2, Exhibit A2-14)

Assumptions:

- Reduction in collection time resulting from one fewer breath collection per initial screening test: 2 minutes/60 minutes = 0.033 hours.

- Each breath specimen collection requires a new exhalent tube (i.e., for a screening test under the former regulations, two exhalent tubes would be used).

26.97 Conducting an initial test for alcohol using a specimen of oral fluids

This section, including paragraphs (a)–(e), establishes collection procedures for conducting initial alcohol tests using ASDs. The former requirements in §26.24(g) only permit the collection of breath specimens (for initial and confirmatory alcohol tests) and blood specimens (for confirmatory alcohol testing). The use of ASDs provides licensees with flexibility in conducting alcohol testing by permitting the testing of an alternative specimen type (i.e., saliva) to breath for initial alcohol testing as discussed in §26.91(a).

26.99 Determining the need for a confirmatory test for alcohol

Paragraph 26.99(a)

This paragraph of the final rule establishes that a breath alcohol concentration (BAC) of less than 0.02 percent constitutes a negative alcohol test result. This revision modifies former requirements in §26.24(g) and Section 2.7(e)(1) in Appendix A to Part 26 which specified that a breath alcohol testing result of less than 0.04 is a negative test result. Incremental costs associated with the final paragraph are described in the discussion of §26.99(b).

Paragraph 26.99(b)

This paragraph of the final rule revises former requirements in §26.24(g) and Section 2.7(e)(1) in Appendix A to Part 26 by reducing the BAC of an initial alcohol test that requires a confirmatory

test from 0.04 percent to 0.02 percent. FFD programs will incur incremental costs because of an increase in the number of initial alcohol tests requiring confirmatory testing and the costs of FFD administrative actions resulting from additional confirmed positive alcohol test results. This final paragraph also adds a new provision that directs the collector to document the time of the initial breath alcohol test result (if 0.02 percent or greater) and inform the donor that a confirmatory test is required. The requirements to document the time of the test result and notify the employee that a confirmatory test must be performed are consistent with existing collection practices and will result in no incremental cost or saving.

The *annual costs per FFD program* are estimated as follows:

$$(NUM_{IPAT} \times PERI_{IPAT}) \times [(HOURS_{CAT} \times (WAGE_{worker} + WAGE_{collector}) + COST_{exhalent\ tube} + (HOURS_{FFD\ manager} \times WAGE_{FFD\ manager})] \times NUM_{reactors}$$

Parameter	**Description**
NUM_{IPAT}	Number of initial positive breath alcohol test (IPAT) results per reactor per year under the former requirements (as discussed in the assumptions below and in Appendix 2, Exhibit A2-12)
$PERI_{IPAT}$	Percentage increase in the number of initial positive alcohol test (IPAT) results under the lower screening level BAC that remain positive after confirmatory testing (as discussed in the assumptions below)
$HOURS_{CAT}$	Time to conduct a confirmatory alcohol test under the final rule (as discussed in the assumptions below)
$WAGE_{worker}$	Facility worker wage rate (as discussed in Appendix 2, Exhibit A2-11)
$WAGE_{collector}$	Collection site personnel wage rate (as discussed in Appendix 2, Exhibit A2-11)
$COST_{exhalent\ tube}$	Cost of an exhalent tube for a confirmatory alcohol test (as discussed in Appendix 2, Exhibit A2-13)
$HOURS_{FFD\ manager}$	Hours of FFD manager time associated with personnel activities and administrative actions resulting from a confirmed positive alcohol test result (as discussed in the assumptions below)
$WAGE_{FFD\ manager}$	FFD management wage rate (as discussed in Appendix 2, Exhibit A2-11)
$NUM_{reactors}$	Number of reactors per FFD program (as discussed in Appendix 2, Exhibit A2-14)

Assumptions:

- Number of initial positive breath alcohol test (IPAT) results per reactor per year under the former requirements in Part 26 is assumed to be equal to the number of confirmed positive alcohol tests under the former rule per reactor per year.

- Percentage increase in the number of initial positive breath alcohol test results under the lower screening level BAC that will remain positive after confirmatory testing: 20 percent.

- Time to conduct a confirmatory alcohol test under the final rule: 3 minutes.

- Hours of FFD manager time associated with personnel activities and administrative actions resulting from a confirmed positive alcohol test result (i.e., worker notification interview, paperwork, and administrative proceedings: 2.5 hours.

- All initial positive alcohol test results are confirmed positive.

26.101 Conducting a confirmatory test for alcohol

Paragraph 26.101(a)

This paragraph of the final rule revises former requirements in Section 2.4(g)(18) in Appendix A to Part 26, which relate to confirmatory alcohol testing. The final rule requires that a confirmatory alcohol test be conducted as soon as possible following an initial alcohol test result of 0.02 BAC or greater and no later than 30-minutes after the initial test result. This paragraph of the final rule is estimated to impose no incremental cost and afford no saving because (even though the former rule did not specify a 30-minute time frame for testing), licensees will still incur testing costs, and the instances when a confirmatory test could not be conducted as soon as possible after an initial breath test are very low (delays in testing would most likely only result from equipment malfunctions which are rare).

Paragraph 26.101(b)

This paragraph establishes collection procedures for conducting a confirmatory alcohol test using an EBT as required in final rule provisions in §§26.91(b) and (c). This provision will result in one time training costs of breath alcohol collectors which is discussed in this analysis in connection with §§26.85(a) and (b).

Paragraph 26.101(c)

This paragraph revises former requirements in Section 2.4(g)(18) in Appendix A to Part 26, which required when necessary, two additional breath specimens be collected from an individual for confirmatory testing. This final paragraph reduces the number of breath specimens collected from two to one unless problems encountered while administering the confirmatory breath test require an additional collection. This final paragraph also prohibits an activity permitted under the former requirements in Section 2.4(g)(18) in Appendix A to Part 26. Specifically, the final paragraph prohibits licensees from calculating an average or otherwise combine results from two or more breath specimens to determine the confirmatory breath alcohol test result. FFD

programs will realize minor savings in confirmatory alcohol testing costs resulting from decreasing the duration of the testing process, reducing equipment costs (using fewer exhalent tubes), decreasing worker productivity losses, and reducing collector labor costs.[7] However, the analysis does not calculate any savings because of the infrequency of confirmatory alcohol testing events (less than 2 per reactor per year),[8] and the minor savings (2 minutes and the cost of one exhalent tube per confirmatory - see assumptions in §26.95).

Paragraph 26.101(d)

This paragraph of the final rule establishes that if an EBT that meets the requirements of §§26.91(b) and (c) was used for the initial alcohol test, the same EBT may be used for confirmatory testing. The former requirements in §26.24(g) required that initial and confirmatory alcohol testing be conducted using different EBTs. Incremental savings associated with this provision are accounted for in the discussion on §26.91(c).

26.103 Determining a confirmed positive test result for alcohol

This section, including paragraphs (a)–(b), revises former requirements in §26.24(g) and Section 2.7(f)(2) in Appendix A to Part 26 pertaining to the screening alcohol test result that constitutes a positive test result for a confirmatory alcohol test. The final rule establishes BACs that are more stringent than the former rule's BAC level of 0.04, depending on the length of time an employee has been in work status. Thus, a confirmatory test may yield a positive result with a BAC that is equal to or greater than 0.02 BAC. Each FFD program will incur incremental costs for FFD manager labor to determine the work status for an individual with a confirmatory BAC test result that is equal to or greater than 0.02 and less than 0.04.[9]

The *annual costs per FFD program* are estimated as follows:

$$(NUM_{CPAT} \times PERI_{CPAT}) \times (HOURS_{FFD\ manager} \times WAGE_{FFD\ manager}) \times NUM_{reactors}$$

[7] In order to capture the total costs and savings, the analysis assumes that all savings incurred by offsite collection sites are passed back to licensees (i.e., through lower costs per collection). This assumption depends on the degree to which the offsite collection site industry is price-competitive. To the extent that it is not price competitive, savings will accrue as estimated, but will benefit the offsite collection site rather than licensees (i.e., offsite collection sites will realize savings in labor costs because of the reduced collection time, but will not reduce the cost per collection charged to licensees).

[8] The NRC Information Notice 2003-04 "Summary of Fitness-for-Duty Program Performance Reports for Calendar Year 2000" reported 211 confirmed positive alcohol test results for all licensees.

[9] The incremental costs of other activities resulting from additional confirmed positive alcohol test results attributable to the BAC thresholds are estimated and discussed in connection with paragraph 26.99(b).

Parameter	Description
NUM_{CPAT}	Number of confirmed positive breath alcohol test (CPAT) results per reactor per year under former requirements (as discussed in Appendix 2, Exhibit A2-12)
$PERI_{CPAT}$	Percentage increase in the number of confirmed positive alcohol test (CPAT) results under the BACs (as discussed in the assumptions below)
$HOURS_{FFD\ manager}$	Time (per test) for the FFD manager to determine the length of time the employee has been in work status for BACs equal to or greater than 0.02 and less than 0.04 (as discussed in the assumptions below)
$WAGE_{FFD\ manager}$	FFD manager wage rate (as discussed in Appendix 2, Exhibit A2-11)
$NUM_{reactors}$	Number of reactors per FFD program (as discussed in Appendix 2, Exhibit A2-14)

Assumptions:

- Percentage increase in the number of confirmed positive breath alcohol test (CPAT) results under the BACs: 20 percent.

- Time (per test) for the FFD manager to determine the length of time the employee has been in work status for BACs equal to or greater than 0.02 and less than 0.04: 15 minutes.

26.105 Preparing for urine collection

This section restates former requirements in Section 2.4(g)(5)–(7) in Appendix A to Part 26, which required the collector to instruct donors to remove any unnecessary outer garments, wash their hands, and remain in the presence of the collector until proceeding to the privacy enclosure to provide a urine specimen. This section also adds a new requirement in §26.105(b) for the collector to evaluate the contents of each donor's pockets of each donor before a specimen donation can commence.

Paragraph 26.105(a)

This paragraph of the final rule imposes no incremental cost and affords no saving because it restates former requirements in Section 2.4(g)(5) in Appendix A to Part 26.

Paragraph 26.105(b)

This paragraph of the final rule adds a new requirement for donors to empty their pockets and display the items to the collector. If the donor refuses to show the collector the contents of their pockets, this action is considered a refusal to test. If the collector identifies an item in a donor's pockets that appears to be a potential adulterant or substitute specimen, the collector must contact the FFD program manager or the MRO for direction as to whether a directly observed collection is warranted. If an item is identified in a donor's pocket which the collector

determines to be inadvertently brought to the collection site, the collector is to secure the item and continue with a normal collection process. The number of instances in which a donor may attempt to conceal a potential adulterant or substitute specimen in their pocket is deemed low (due to the donor's knowledge of the inspection process) as is the likelihood of a donor refusing to display the contents of his/her pockets (given the consequences of their action). Incremental costs will result from additional time per collection to empty and inspect the contents of a donor's pockets. Each FFD program will incur a per specimen collection cost of additional lost worker productivity and additional collector labor.

The *annual costs per FFD program* are estimated as follows:

$$NUM_{collections} \times HOURS_{inspection} \times (WAGE_{worker} + WAGE_{collector}) \times NUM_{reactors}$$

Parameter	Description
$NUM_{collections}$	Number of urine collections per reactor per year (as discussed in the assumptions below and in Appendix 2, Exhibit A2-12)
$HOURS_{inspection}$	Time per collection to empty and inspect contents of a donor's pockets (as discussed in the assumptions below)
$WAGE_{worker}$	Facility worker wage rate (as discussed in Appendix 2, Exhibit A2-11)
$WAGE_{collector}$	Collection site personnel wage rate (as discussed in Appendix 2, Exhibit A2-11)
$NUM_{reactors}$	Number of reactors per FFD program (as discussed in Appendix 2, Exhibit A2-14)

Assumptions:

- Number of urine collections per reactor per year is assumed to be equal to the number of drug tests per reactor per year.

- Time per specimen collection for a donor to empty and the collector to evaluate the contents of a donor's pockets: 2 minutes.

Paragraphs 26.105(c) - (d)

These paragraphs of the final rule impose no incremental cost and afford no saving because they restate former requirements in Section 2.4(g)(6) - (7) in Appendix A to Part 26.

Paragraph 26.105(e)

This paragraph of the final rule establishes collection site procedures for the collector/donor to select and unwrap collection kit materials. This final paragraph imposes no incremental cost and affords no saving because this collection procedure will not increase the time of a specimen collection. The same activity of selecting and unwrapping the collection materials will still occur, but the donor rather than the collector may conduct the activity.

26.107 Collecting a urine specimen

This section restates and clarifies former requirements in Section 2.4 in Appendix A to Part 26, which addressed collector responsibilities during the urine collection process. This section also adds several new requirements, as indicated in the paragraph discussions below.

Paragraph 26.107(a)

This paragraph of the final rule restates a former requirement in Section 2.4(g)(8) in Appendix A to Part 26. This final paragraph also adds a provision which provides the urine collector with discretion as to setting "a reasonable time limit for voiding" by the donor. No significant incremental cost or saving will result from the revision because on average, it is uncommon for donors to take long periods of time to provide specimens.

Paragraph 26.107(b)

This paragraph of the final rule clarifies the former requirements in Sections 2.4(g)(9) and (g)(25) in Appendix A to Part 26 which required the collector to consult with a "higher level supervisor in the drug testing program to review and concur that a collection under direct observation should proceed." This final paragraph clarifies that the collector must contact "FFD program management" to receive direction as to whether an observed collection is warranted in cases where a donor attempts to subvert the collection process (e.g., bringing in a substituted urine specimen or adulterant). No incremental cost or saving will result from this provision as it only clarifies who the collector is to contact regarding a direct observation. In addition, this final paragraph directs the collector to document on the custody and control form a description of the donor's actions that the collector believed demonstrated an attempt by the donor to subvert the testing process. This collector requirement to document the reason for believing a donor has attempted to subvert the testing process offers an employee protection from unwarranted observed collections as the collector must justify the reason that an observed collection is needed. Because the collector's action of documenting a description of the donor's actions on the custody and control form will be very rare, no significant cost or saving will be incurred.

Paragraph 26.107(c)

This paragraph of the final rule restates a former requirement in Section 2.4(g)(12) in Appendix A to Part 26. This final paragraph also adds a new requirement for the collector to inspect the toilet bowl and privacy area used by a donor for a specimen collection for evidence of a subversion attempt. No significant incremental cost or saving will result from the provision because this action is both consistent with current collection site practices, and because inspecting a privacy enclosure takes only a matter of seconds per collection.

26.109 Urine specimen quantity

Paragraph 26.109(a)

This paragraph of the final rule revises the former requirement in Section 2.4(g)(11) in Appendix A to Part 26, under which the minimum quantity of urine to be collected for a drug test was 60 mL. The final rule introduces the term, "predetermined quantity" of urine to describe that a donor must provide a specific quantity of urine based on the licensee's or other entity's testing program. The new provision reduces the minimum quantity of urine to be collected from a donor from 60 mL to 30 mL. That is, at a minimum, the donor must provide 30 mL of urine to permit an HHS-certified laboratory to conduct initial (and confirmatory, when necessary) validity and drug tests as required by 10 CFR Part 26. An additional 15 mL of urine is permitted to be collected for split specimen collections. The final rule also permits licensee and other entity testing programs to collect additional quantities of urine as part of the predetermined quantity based on their own additional specific testing and collection procedures. No incremental change is estimated for the added flexibility in permitting licensees to conduct additional testing beyond the rule requirements in 10 CFR Part 26, as that is allowed as an accommodation to licensees. The reduction in the minimum quantity of urine required (from 60 mL to 30 mL) will reduce the number of instances in which a donor cannot provide the minimum specimen quantity on a first attempt. Therefore, FFD programs will recognize incremental savings attributable to a reduction in lost worker productivity and reduced collector labor resulting from fewer shy bladder instances.[10]

The *annual savings per FFD program* are estimated as follows:

$$(NUM_{collections} \times PER_{low\ quantity} \times PERD_{low\ quantity}) \times (HOURS_{saved} \times (WAGE_{worker} + WAGE_{collector})) \times NUM_{reactors}$$

Parameter	Description
$NUM_{collections}$	Number of urine collections per reactor per year (as discussed in Appendix 2, Exhibit A2-12)
$PER_{low\ quantity}$	Percentage of collections that are of inadequate quantity after the initial attempt to provide a specimen under the former requirements (as discussed in the assumptions below)
$PERD_{low\ quantity}$	Percentage decrease in the number of shy bladder tests per year that produce inadequate specimens resulting from the reduction in the minimum specimen quantity (from 60 mL to 30 mL) (as discussed in the assumptions below)

[10] In order to capture the total costs and savings, this analysis assumes that savings incurred by offsite collection sites are passed back to licensees (i.e., lower costs per specimen collection). The validity of this assumption depends on the degree to which the offsite collection site industry is price-competitive. To the extent that it is not price-competitive, savings will accrue as estimated, but will benefit the offsite collection site rather than licensees (i.e., offsite collection sites will realize savings in labor costs because of the reduced collection time, but will not reduce the cost per collection charged to licensees).

Parameter	Description
$HOURS_{saved}$	Average time per test saved because a donor can provide a sufficient specimen under the final rule (as discussed in the assumptions below)
$WAGE_{worker}$	Facility worker wage rate (as discussed in Appendix 2, Exhibit A2-11)
$WAGE_{collector}$	Collection site personnel wage rate (as discussed in Appendix 2, Exhibit A2-11)
$NUM_{reactors}$	Number of reactors per FFD program (as discussed in Appendix 2, Exhibit A2-14)

Assumptions:

- Number of urine collections per reactor per year is assumed to be equal to the number of drug tests per reactor per year.

- Percentage of collections (per year) that are of inadequate quantity after the initial attempt to provide a specimen under the former requirements : 6.7 percent.[11]

- Percentage decrease in the number of shy bladder tests per year that produce inadequate specimens: 25 percent.

- Average time per test saved because a donor can provide a sufficient specimen under the final rule: 1.5 hours.

Paragraph 26.109(b)

This paragraph of the final rule [including subparagraphs (b)(1)–(4)] revises former requirements in Section 2.4(g)(11) in Appendix A to Part 26, which described the collection procedures in the event that a donor provides less than the minimum quantity of urine needed to complete a specimen collection during his or her initial attempt. The incremental costs and savings for this final paragraph are discussed in connection with subparagraphs (b)(1)–(4).

Subparagraph 26.109(b)(1)

This subparagraph revises a former requirement in Section 2.4(g)(11) in Appendix A to Part 26, which permitted a donor to be provided with "a reasonable amount of liquid to drink for this purpose (e.g., a glass of water)" if they cannot provide a urine specimen that meets the minimum quantity requirement during their initial attempt. The revision directs the collector to encourage the donor to drink up to a specific amount of fluid (i.e., 40 ounces) over a three-hour time period. The former rule contained no such maximum restriction on fluid consumption. This analysis

[11] Landers, Peter. April 22, 2003. "Looking for Relief, Shy bladder syndrome is widespread. But in many cases it can be treated successfully." Special Report: Personal Health Quarterly 2003-2, The Wall Street Journal. The article cites a 1994 study indicating that 6.7 percent of Americans suffer from shy-bladder syndrome, or what is called paruresis.

assumes that no incremental cost or saving will result from this revised subparagraph because the activity (of providing fluids to the donor) is common to both the former and final rules.

Subparagraph 26.109(b)(2)

This subparagraph adds three new requirements. First, this subparagraph prohibits a licensee or other entity from requiring a donor to provide additional urine specimens to try to meet the licensee's or other entity's predetermined quantity if the donor's initial specimen is at least 30 mL, but less than the predetermined quantity (greater than 30 mL). That is, a donor cannot be compelled to make additional attempts to provide a specimen that meets the licensees's or other entity's predetermined quantity, after the donor has successfully provided an initial specimen of at least 30 mL. Second, this subparagraph prohibits any sanctions from being imposed on a donor who provides a specimen of at least 30 mL but less than the predetermined quantity. Third, this subparagraph requires that a specimen of 30 mL but less than the predetermined quantity be forwarded directly to the an HHS-certified laboratory for testing. The three new requirements in this subparagraph will not result in any incremental costs or savings for FFD programs that send all urine specimens to HHS-certified laboratories. However, the provisions will result in incremental costs for FFD programs with onsite licensee testing facilities because specimens meeting the minimum 30 mL quantity (but less than the predetermined quantity) cannot be tested at the licensee testing facility and must be forwarded directly to an HHS-certified laboratory for testing.

The *annual incremental costs per FFD program with onsite testing facilities* are estimated as follows:

$$(NUM_{drug\ tests} \times PER_{not\ predetermined\ quantity}) \times (COST_{test\ at\ HHS\ lab} - COST_{test\ at\ licensee\ lab}) \times NUM_{reactors}$$

Parameter	**Description**
$NUM_{drug\ tests}$	Number of drug tests per reactor per year (as discussed in Appendix 2, Exhibit A2-12)
$PER_{not\ predetermined\ quantity}$	Percentage of urine specimens at least 30 mL in volume, but less than the licensee's or other entity's predetermined quantity of urine (as discussed in the assumptions below)
$COST_{test\ at\ HHS\ lab}$	Cost to conduct initial drug testing and initial validity testing on a urine specimen at an HHS-certified laboratory for FFD programs that primarily use onsite testing facilities (as discussed in Appendix 2, Exhibit A2-13)
$COST_{test\ at\ licensee\ lab}$	Cost to conduct initial drug testing and initial validity testing on a urine specimen at an onsite licensee testing facility (as discussed in the assumptions below and in Appendix 2, Exhibit A2-13)
$NUM_{reactors}$	Number of reactors per FFD program (as discussed in Appendix 2, Exhibit A2-14)

Assumptions:

- FFD programs that conduct initial drug testing at onsite testing facilities send fewer specimens to HHS-certified laboratories than do FFD programs that do not operate onsite testing facilities, and so must pay a higher per specimen cost for drug and validity testing (both initial and confirmatory, when necessary).

- Percentage of urine specimens of at least 30 mL in volume, but less than the licensee or other entity's predetermined quantity: 1 percent.

Subparagraph 26.109(b)(3)

The paragraph revises former requirements in Section 2.4(g)(11) in Appendix A to Part 26. In situations where a donor has not provided a urine specimen of adequate volume (at least 30 mL) within 3 hours of the initial unsuccessful attempt, this revised subparagraph instructs the collector to terminate the testing process and notify the FFD manager or MRO to initiate the shy bladder procedures in §26.119. The former rule only required that the collector contact the appropriate authority to obtain guidance on the action to be taken. The final paragraph provides a specific requirement for the collector to notify the FFD manager or MRO to initial shy bladder procedures. This final subparagraph will not result in any incremental costs or savings because the collector must still contact an individual to initiate additional actions related to the shy bladder situation.

Subparagraph 26.109(b)(4)

This subparagraph revises the former requirement in Section 2.4(g)(11) in Appendix A to Part 26, to prohibit, rather than require, the pooling of successive urine specimens. Donors must now provide a minimum of 30 mL of urine in a single specimen collection attempt. The final rule also requires that urine collectors must discard specimens of less than 30 mL. If the collector has a reason to believe that a donor has diluted, adulterated, substituted, or tampered with their specimen of 15 mL or more but less than 30 mL, the specimen must be sent to an HHS-certified laboratory for testing. Although FFD programs may realize an additional cost to send specimens to an HHS-certified laboratory that are 15 mL or more but less than 30 mL and collected from a donor who is suspected of diluting, adulterating, substituting, or tampering with their specimen, the analysis assumes that no incremental costs or savings will result because of the infrequency of these situations.

26.111 Checking the acceptability of the urine specimen

Paragraph 26.111(a)

This paragraph of the final rule revises former requirements in Section 2.4(g)(13) in Appendix A to Part 26, which required collectors to measure the temperature of a urine specimen within 4 minutes of receiving the specimen from the donor. This paragraph of the final rule revises the

former rule's urine specimen temperature requirements in Section 2.4(g)(14) in Appendix A to Part 26. Specifically, the final rule expands the acceptable urine specimen temperature range from (90.5°F – 99.8°F) to (90°F – 100°F). Any specimen outside the (90°F – 100°F) temperature range indicates that a donor may have attempted to subvert the testing process. The analysis does not estimate any saving from this revision because the change in the temperature range is minor.

Paragraph 26.111(b)

This paragraph of the final rule revises former requirements in Section 2.4(g)(15) in Appendix A to Part 26, which specified that "immediately after a urine specimen is collected, the collection site person shall also inspect the specimen to determine its color and look for any signs of contaminants. Any unusual findings shall be noted in the permanent record book." This final paragraph requires that immediately after a urine specimen is collected, "the collector shall also inspect the specimen to determine its color and clarity and look for any signs of contaminants or adulteration. Any unusual findings must be noted on the custody-and-control form." This final paragraph changes the required location that the information is to be recorded from a permanent recordbook to the custody-and-control form. This final paragraph imposes no incremental cost and affords no saving because the collector must still inspect each specimen and document any unusual findings (even if in a different place).

Paragraph 26.111(c)

This paragraph of the final rule revises former requirements in Sections 2.4(g)(17) and 2.4(g)(25) in Appendix A to Part 26, which instructed the urine collector, after receiving approval from a "higher level supervisor in the drug testing program," to perform a second collection as soon as possible under direct observation "whenever there is a reason to believe that a particular individual may alter or substitute the urine specimen." The final paragraph specifies that the collector should contact the designated FFD program manager if there is reason to believe the individual may have diluted, substituted, or adulterated the specimen based upon temperature or other observations. It also permits the FFD manager to consult with the MRO to determine whether a subversion attempt has occurred. There are no incremental costs or savings attributable to these clarifications because this analysis assumes that these requirements are consistent with existing practices.

Paragraph 26.111(d)

This paragraph of the final rule revises former Section 2.4(g)(16) in Appendix A to Part 26, which required all urine specimens suspected of being adulterated or diluted to be "forwarded to the laboratory for testing." This revised paragraph specifies that a specimen of sufficient quantity (at least 15 mL) that is suspected of having been diluted, substituted, or adulterated and any specimen of 15 mL or more that has been collected under direct observation in accordance with paragraph (c) of this section, must be "sent directly to the HHS-certified laboratory for testing." The only minor incremental costs or savings that may result from the requirement pertain to FFD programs with onsite licensee testing facilities, because FFD programs that send

all specimens offsite for testing at an HHS-certified laboratory already comply with this requirement. The analysis assumes, however, that even FFD programs with onsite testing facilities already send any suspect urine specimens directly to an HHS-certified laboratory because HHS-certified laboratories have more sophisticated equipment to identify potential specimen validity concerns.

Paragraph 26.111(e)

This paragraph of the final rule revises former Section 2.4(g)(16) in Appendix A to Part 26, which required all urine specimens suspected of being adulterated or diluted to be forwarded to an HHS-certified laboratory. This final paragraph specifies that the collector must also preserve a suspect urine specimen for possible testing. This paragraph of the final rule imposes no incremental cost and affords no saving because it is consistent with existing collection site practices.

Paragraph 26.111(f)

This paragraph of the final rule defines the specific criteria to be used by a collector to determine whether a urine specimen is acceptable (i.e., is free of apparent contaminants, meets the required quantity of at least 30 mL, and is within acceptable temperature range). This analysis assumes no incremental costs or savings are attributable to this final paragraph because collectors currently use these criteria to determine whether a urine specimen is acceptable, although the minimum quantity of urine has been reduced from 60 mL to 30 mL, as discussed in connection with §26.109.

26.113 Splitting the urine specimen

This section of the final rule [including paragraphs (a)–(c)] imposes no incremental costs and affords no savings because it clarifies the former requirements in Sections 2.4(g)(20) and 2.7(j) in Appendix A to Part 26, which detailed the procedures for collecting split specimens. Paragraph 26.113(b) revises the former requirement in Section 2.7(j) which instructed the urine collector to pour one half of the urine specimen into each specimen bottle. Paragraph 26.113(b) instructs the collector, to pour 30 mL of urine into Bottle A and a minimum of 15 mL into Bottle B. The final paragraph also requires that if there is less than 15 mL of urine available for Bottle B, then the collector must pour the remaining urine into Bottle B and forward the specimens in Bottles A and B to the HHS-certified laboratory for drug and validity testing. The quantities apportioned to each split specimen bottle have been revised, but no cost or saving will result from this modified procedure.

26.115 Collecting a urine specimen under direct observation

Paragraph 26.115(a)

This paragraph of the final rule restates without substantive change former requirements in Section 2.4(f)(1)-(3) in Appendix A to Part 26 which specified the criteria indicating exclusive grounds that a donor has attempted to alter or substitute their urine specimen.

Paragraph 26.115(b)

This paragraph establishes a new requirement that in instances where an observed collection is deemed warranted by the collector, the collector must obtain agreement of the FFD manager or MRO to obtain a specimen under direct observation. No incremental cost or savings will result from this final paragraph because situations where an observed collection is warranted are rare.

Paragraphs 26.115(c)

The paragraph of the final rule adds a requirement that the collector inform the donor of the reason(s) for the directly observed collection so that the donor is aware of the nature of the concern that has initiated a directly observed collection. No costs or savings will result from this final paragraph because situations where an observed collection is warranted are rare.

Paragraph 26.115(d)

The paragraph of the final rule establishes new recordkeeping requirements related to the directly observed collection. The final paragraph requires the collector to record on the specimen's custody-and-control form that the specimen was collected under direct observation and the reason for the directly observed collection. The requirement is necessary to ensure that the HHS-certified laboratory and the MRO have this information available when the specimen is tested and the MRO conducts his or her review of the test results, as is required under §26.185. No costs or savings will result from this final paragraph because situations where an observed collection is warranted are rare.

Paragraph 26.115(e)

This paragraph of the final rule retains and combines the former requirements in Sections 1.2, 2.4(b), 2.4(g)(14), (g)(17), and (g)(25) in Appendix A to Part 26, which required that the individual who observes the specimen collection must be of the same gender as the donor. Consistent with the former requirements, the final rule permits another individual of the same gender to serve as the observer if a qualified urine collector of the same gender is not available, as long as the observer receives the instructions specified in §26.115(f).

Paragraph 26.115(f)

This paragraph of the final rule adds new requirements for conducting directly observed collections. These more detailed procedures are necessary because devices and techniques to subvert the testing process have been developed since Part 26 was first published that can be used under direct observation without detection. Therefore, the changes have been made to increase the likelihood of detecting such attempts to subvert the testing process and, thereby, increase the effectiveness of directly observed collections in assuring that a valid specimen is obtained from the donor. No costs or savings will result from this final paragraph because situations where an observed collection is warranted are rare.

Paragraph 26.115(g)

This paragraph of the final rule has been added to clarify that a donor's refusal to participate in the directly observed collection constitutes an act to subvert the testing process, under §26.75(b). Former Section 2.4(j) in Appendix A to Part 26 required the collector to inform the MRO, and the MRO to inform licensee management, if a donor fails to cooperate with the specimen collection process, including, but not limited, to a refusal to provide a complete specimen, complete paperwork, or initial the specimen bottles. The former requirement did not specifically mention that a refusal to participate in a directly observed collection is also an instance of a failure to cooperate. In addition, the former rule did not require the licensee or other entity to impose sanctions on a donor for refusing to be tested. No costs or savings will result from this final paragraph because situations where an observed collection is warranted are rare.

Paragraph 26.115(h)

This paragraph of the final rule adds new collection requirements for collectors to follow if a directly observed collection was required, but was not performed. The collector would inform the FFD program manager or designee of the omission, who would ensure that a directly observed collection is immediately performed. No costs or savings will result from this final paragraph because situations where an observed collection is warranted are rare.

26.117 Preparing urine specimens for storage and shipping

Paragraph 26.117(a)

This paragraph of the final rule restates without substantive change former requirements in Section 2.4(g)(20) in Appendix A to Part 26, which pertained to the collector keeping the urine specimen in view of the donor at all times before sealing and labeling the specimen. This paragraph of the final rule imposes no incremental cost and affords no saving because it is consistent with existing licensee collection practices.

Paragraph 26.117(b)

This paragraph of the final rule imposes no incremental cost and affords no saving because it restates former requirements in Section 2.4(g)(21) in Appendix A to Part 26.

Paragraph 26.117(c)

This paragraph of the final rule imposes no incremental cost and affords no saving because it restates former requirements in Section 2.4(g)(22) in Appendix A to Part 26.

Paragraph 26.117(d)

This paragraph of the final rule imposes no incremental cost and affords no saving because it restates former requirements in Section 2.4(g)(23) in Appendix A to Part 26.

Paragraph 26.117(e)

This paragraph of the final rule imposes no incremental cost and affords no saving because it restates without substantive changes the former requirements in Section 2.4(g)(26) in Appendix A to Part 26.

Paragraph 26.117(f)

This paragraph of the final rule imposes no incremental cost and affords no saving because it restates former requirements in Section 2.4(g)(27) in Appendix A to Part 26.

Paragraph 26.117(g)

This paragraph of the final rule imposes no incremental cost and affords no saving because it restates former requirements in Section 2.4(g)(28) in Appendix A to Part 26.

Paragraph 26.117(h)

This paragraph of the final rule imposes no incremental cost and affords no saving because it restates former requirements in Section 2.4(c)(2) in Appendix A to Part 26.

Paragraph 26.117(i)

This paragraph of the final rule imposes no incremental cost and affords no saving because it restates without substantive changes former requirements in Section 2.4(i) in Appendix A to Part 26 which pertain to specimen packaging procedures.

Paragraph 26.117(j)

This paragraph of the final rule clarifies and revises former requirements (primarily in Section 2.7(c) in Appendix A to Part 26) regarding refrigerating specimens to protect them from degradation. This final paragraph restates portions of the former rule and adds a performance standard regarding "appropriate and prudent actions" to minimize specimen degradation. Licensees would likely achieve the performance standard by implementing the more specific criteria from the former rule, which are also restated in the final rule. The final paragraph also relaxes refrigeration criteria for most specimens, but tightens them for specimens that are suspected of having been substituted, adulterated, or tampered with. Finally, the final paragraph adds a requirement that the collection site must send specimens to a licensee testing facility or HHS-certified laboratory as soon as reasonably practical, with a time limit of 2 business days from the shipping of a specimen to the receipt of the specimen at the appropriate laboratory, except under unusual circumstances. It is believed that the new provisions in this final paragraph are consistent with current industry practices. To the extent (if any) that the new refrigeration standards (some relaxed, some tightened) might require licensees to change their operating practices, the net effect is likely to be small. As a result of these uncertainties (including a lack of data) and the likelihood that any impact would be small, this analysis does not quantify costs or savings resulting from the final paragraph.

Paragraph 26.117(k)

This paragraph of the final rule clarifies former requirements in Section 2.4(h) in Appendix A to Part 26, stating that the date and purpose be documented on the chain-of-custody form for a specimen each time the specimen is handled or transferred, and every individual in the chain of custody shall be identified. This final paragraph clarifies that because couriers, express carriers, and postal service personnel do not have access to the custody-and-control forms, these individuals are not required to document chain of custody during transit of a urine specimen. However, this final paragraph adds a new requirement that the custody accountability of the shipping containers during shipment must be maintained by a tracking system provided by the courier, express carrier, or postal service. This paragraph of the final rule imposes no incremental cost and affords no saving because it describes existing courier, express carrier, and postal service shipment tracking practices.

26.119 Determining "shy" bladder

This section of the final rule replaces former requirements in Section 2.4(g)(11) in Appendix A to Part 26, which required that the collection site must contact the appropriate authority to obtain guidance on the action to be taken when a donor cannot provide an adequate volume of urine. This final paragraph adopts "shy bladder procedures" consistent with U.S. DOT regulations (49 CFR 40.193). All costs are considered incremental because this is a new requirement. Specific incremental costs include labor (or productivity losses) associated with the donor, the FFD manager, the MRO, and a licensed physician, and are described in the paragraph discussions below.

The equation presented at the end of this section calculates the incremental costs combined for all seven paragraphs within §26.119, as follows:

- Paragraph 26.119(a) establishes a new requirement for the FFD program personnel to direct the donor to obtain a medical evaluation from a licensed physician within 5 business days of a donor's inability to provide an adequate urine specimen of at least 30 mL. The MRO must approve the physician to conduct the evaluation (an MRO can perform the evaluation if he or she possesses appropriate expertise). Incremental costs per FFD program consist of lost worker productivity while obtaining the medical evaluation, MRO labor to evaluate and agree with the selection of physician, and the cost of the medical evaluation.

- Paragraphs 26.119(b), (c), and (d) establish new requirements necessitating that the MRO provide the physician selected to perform a medical evaluation with the physical and psychological conditions that constitute a medical condition that could preclude a donor from providing an adequate quantity of urine. The MRO must also instruct the physician to provide a written statement of the conclusions of the evaluation to the MRO. The incremental costs include MRO labor to communicate the specific evaluation requirements to the examining physician.

- Paragraphs 26.119(e) and (f) require the physician evaluating the donor to provide a written statement to the MRO regarding the findings and conclusions from his or her evaluation. The report must state whether a medical condition exists that precludes the donor from providing sufficient specimens in future collections. The incremental cost consists of the cost of obtaining the physician's written statement.

- Paragraph 26.119(g) describes the required MRO findings, which are to be based on results of the physician's evaluation of the donor. Incremental costs consist of MRO labor to review the physician evaluation, make a determination on the donor's condition, and communicate the results.

The annual costs per FFD program associated with section 26.119 are estimated as follows:

$$NUM_{shy\ bladder} \times [COST_{medical\ evaluation} + ((HOURS_{medical\ evaluation} \times WAGE_{worker}) + (HOURS_{FFD\ manager} \times WAGE_{FFD\ manager}) + (HOURS_{MRO} \times WAGE_{MRO}))] \times NUM_{facilities}$$

Parameter	**Description**
$NUM_{shy\ bladder}$	Number of urine collections unable to be completed because of inadequate specimen volume after 3 hours, per facility per year (as discussed in the assumptions below)
$COST_{medical\ evalutaion}$	Cost of a medical evaluation and written report from a licensed physician per incident where an employee is unable to provide the minimum quantity of urine after 3 hours (as discussed in the assumptions below)

Parameter	Description
$HOURS_{medical\ evaluation}$	Time per medical evaluation (including travel to and from the physician's office) (as discussed in the assumptions below)
$WAGE_{worker}$	Facility worker wage rate (as discussed in Appendix 2, Exhibit A2-11)
$HOURS_{FFD\ manager}$	Time for an FFD manager per incident where an employee is unable to provide the minimum quantity of urine after 3 hours (as discussed in the assumptions below)
$WAGE_{FFD\ manager}$	FFD manager wage rate (as discussed in Appendix 2, Exhibit A2-11)
$HOURS_{MRO}$	MRO time per incident where a donor is unable to provide the minimum quantity of urine after 3 hours to select a physician, instruct the physician on the medical evaluation that must be conducted, and review and communicate the medical evaluation results to the FFD manager and worker (as discussed in the assumptions below)
$WAGE_{MRO}$	MRO wage rate (as discussed in Appendix 2, Exhibit A2-11)
$NUM_{facilities}$	Number of facilities per FFD program (as discussed in Appendix 2, Exhibit A2-14)

Assumptions:

- Number of urine collections unable to be completed because of inadequate specimen volume after 3 hours, per facility per year: 1.

- Cost of a medical evaluation and written report from a physician per incident where a donor is unable to provide the minimum quantity of urine after 3 hours: $300.00.

- Time per medical evaluation (including travel to and from the physician's office): 1.5 hours.

- Time for an FFD program manager per incident where an employee is unable to provide the minimum quantity of urine after 3 hours to direct an employee to proceed to a physician for a medical evaluation, to consult with the MRO regarding an appropriate physician to conduct a shy bladder examination, and to perform administrative activities associated with the MRO's results: 2 hours.

- MRO time per incident where an employee is unable to provide the minimum quantity of urine after 3 hours to select a physician, instruct the physician on the medical evaluation that must be conducted, and communicate the medical evaluation results to the FFD manager and worker: 2 hours.

Subpart F: Licensee Testing Facilities

26.121 Purpose

This section of the final rule imposes no incremental cost and affords no saving because it merely states that Subpart F contains requirements for laboratories operated by licensees to perform initial drug testing and validity testing on urine specimens.

26.123 Testing facility capabilities

This section of the final rule revises former requirements in Section 2.7(l)(2) in Appendix A to Part 26, which required that licensee testing facilities must have the capability to perform initial drug tests on urine specimens for each of the five drugs and drug metabolites as required in §2.7(e)(1). The final rule adds a requirement that each licensee testing facility must have the capability to perform validity screening or initial validity tests on urine specimens. This analysis captures any incremental costs associated with this section in §26.131 of the final rule.

26.125 Licensee testing facility personnel

This section of the final rule [including paragraphs (a)–(c)] imposes no incremental cost and affords no saving because it restates and clarifies former requirements in Section 2.6(a)–(c) in Appendix A to Part 26, which pertained to the requirements for licensee testing facility personnel responsible for the day-to-day management of operations and supervision of testing technicians, other technicians, non-technical staff, and licensee testing facility personnel files. Paragraph 26.125(b) of the final rule revises former requirement in Section 2.6(c), which described collector proficiency requirements, by adding a new requirement that technicians who perform urine specimen testing have documented proficiency in operating the testing instruments and devices used at the testing facility. This new provision will result in no incremental cost or saving because it is consistent with existing licensee testing facility training practices and documentation procedures.

26.127 Procedures

This section of the final rule clarifies former requirements in Sections 2.2 and 2.7 in Appendix A to Part 26 as discussed in paragraphs (a)–(f) below. No incremental costs or savings will result directly from the clarifications in this final section. However, FFD programs with onsite licensee testing facilities will incur incremental costs to comply with the requirements in this section and therefore must revise current laboratory policies and procedures to incorporate necessary changes related to other sections of Subpart F (e.g., validity testing, modified cutoff levels for marijuana and opiates, blind performance specimen testing, quality assurance procedures). The analysis evaluates the incremental costs of all licensee testing facility policy revisions required because of the final rule revisions in this section of the analysis.

The one-time cost per FFD program with onsite licensee testing facilities is estimated as follows:

$(HOURS_{FFD\ manager} \times WAGE_{FFD\ manager}) + (HOURS_{Lab\ supervisor} \times WAGE_{Lab\ supervisor}) + (HOURS_{Clerical} \times WAGE_{Clerical}) + (HOURS_{Legal} \times WAGE_{Legal})$

Parameter	Description
$HOURS_{FFD\ manager}$	Hours of FFD manager's time to revise the laboratory procedures manual (as discussed in the assumptions below)
$WAGE_{FFD\ manager}$	FFD manager wage rate (as discussed in Appendix 2, Exhibit A2-11)
$HOURS_{Lab\ supervisor}$	Hours of laboratory supervisor's time to revise the laboratory procedures manual (as discussed in the assumptions below)
$WAGE_{Lab\ supervisor}$	Laboratory supervisor wage rate (as discussed in Appendix 2, Exhibit A2-11)
$HOURS_{Clerical}$	Hours of clerical personnel time to revise the laboratory procedures manual (as discussed in the assumptions below)
$WAGE_{Clerical}$	Clerical personnel wage rate (as discussed in Appendix 2, Exhibit A2-11)
$HOURS_{Legal}$	Hours of legal time to review the laboratory procedures manual (as discussed in the assumptions below)
$WAGE_{Legal}$	Legal wage rate (as discussed in Appendix 2, Exhibit A2-11)

Assumptions:

- Hours for procedure revisions per FFD program with onsite licensee testing facilities by labor category (total of 360 hours):
  - FFD manager: 120 hours.
  - Laboratory supervisor: 160 hours.
  - Clerical: 40 hours.
  - Legal: 40 hours.

- Each FFD program with onsite licensee testing facilities uses a single procedures manual for all testing facilities.

Paragraph 26.127(a)

The paragraph of the final rule imposes no incremental cost and affords no saving because it restates without substantive change former requirements within Section 2.2 in Appendix A to Part 26, which related to the maintenance and documentation of procedures for the collection, shipment, and accession of urine specimens.

Paragraph 26.127(b)

The paragraph of the final rule imposes no incremental cost and affords no saving because it restates without substantive change the former requirements in Section 2.7(a)(2) in Appendix A

to Part 26, which pertained to the content and implementation of specimen chain-of-custody procedures for licensee testing facilities.

Paragraph 26.127(c)

The paragraph of the final rule revises without substantive change former requirements within Section 2.7(o)(1) in Appendix A to Part 26 which specified that licensee testing facilities must maintain a procedures manual detailing the numerous components of the drug testing process. The final paragraph extends the former requirement to include a provision requiring documentation of standard operating procedures for each specimen validity testing assay performed. In addition, this final paragraph requires that the licensee testing facility maintain written procedures, but no longer specifies that these procedures must be maintained in a "procedure manual." Incremental costs associated with revisions to the licensee testing facility policy and procedures are discussed in connect with §26.127.

Paragraph 26.127(d)

The paragraph of the final rule imposes no incremental cost and affords no saving because it restates a former requirement in Section 2.7(o)(3)(iii) in Appendix A to Part 26.

Paragraph 26.127(e)

The paragraph of the final rule imposes no incremental cost and affords no saving because it restates and clarifies former requirements in Section 2.7(o)(4) in Appendix A to Part 26, which maintained that a licensee testing facility must develop, implement, and maintain procedures for remedial actions if systems are out of acceptable limits or errors are detected. This paragraph adds a new requirement for licensee testing facilities that use validity screening testing tests to maintain procedures for instrumented and non-instrumented testing. As discussed in §26.131(a) of the analysis, the analysis assumes that no licensee testing facilities will conduct validity screening tests. Therefore, this revised provision will result in no incremental cost or saving because license testing facilities will not have to maintain procedures for instrumented and non-instrumented validity screening tests.

26.129 Assuring specimen security, chain of custody, and preservation

Paragraph 26.129(a)

There are no incremental costs or savings from this paragraph because it clarifies former requirements in Section 2.7(a)(1) in Appendix A to Part 26.

Paragraph 26.129(b)

This paragraph of the final rule revises former requirements in Section 2.7(b)(1) in Appendix A to Part 26, which required that licensee testing facility personnel must inspect each package

containing urine specimens to identify any evidence of possible tampering and must notify licensee officials of any tampering as soon as possible, but within 8 hours of identifying a potential tampering incident. By contrast, the provisions in this paragraph will require each licensee testing facility to conduct an investigation into possible tampering and take corrective actions when necessary. This paragraph of the final rule adds a provision to require the licensee testing facility to obtain a memorandum for the record from the specimen collector to document correction of the discrepancy, which must accompany the specimen(s) and custody-and-control forms to the HHS-certified laboratory, if the specimen(s) must be transferred. This paragraph also adds specific instances that would require testing of a specimen to be cancelled. If the licensee testing facility personnel identify any reason to believe that the integrity and/or identity of a specimen is in question, the specimen is not to be tested and the licensee or other entity must ensure that another collection occurs as soon as reasonably practicable. This analysis estimates that no incremental costs or savings will result from this final paragraph because the requirements are believed to be consistent with existing licensee practices used to address issues associated with discrepancies of information, specimen bottles, and/or the specimen custody-and-control form. The new requirement that a memorandum for the record be obtained from the specimen collector only ensures that the error correction is made to the custody-and-control form, but the level of effort to resolve the error is unchanged.

Paragraph 26.129(c)

This paragraph of the final rule clarifies and revises former requirements in Section 2.7(b)(2) in Appendix A to Part 26, which pertained to the handling of urine specimens at licensee testing facilities and the use of chain-of-custody forms. Specifically, this paragraph clarifies that licensee testing facilities must use laboratory chain-of-custody forms or other appropriate methods of tracking aliquot custody and control while conducting validity testing (screening and/or initial) and initial drug testing on urine specimens. This final paragraph also establishes that both the original specimen and the original specimen custody-and-control form must remain in secure storage. Finally, this paragraph clarifies that licensee testing facilities may discard specimens as soon as practical after receiving negative results for validity screening and/or initial validity and initial drug tests. No incremental costs or savings will result from this final paragraph because it is considered to be consistent with existing licensee testing facility practices for urine specimen handling, storage, and disposal. The analysis does not quantify the costs for any licensee testing facilities to use alternative custody and control tracking methods to accommodate validity testing, as these costs, if any, are deemed to be insignificant.

Paragraph 26.129(d)

This final paragraph imposes no incremental cost and affords no saving because it restates without substantive change former requirements in Section 2.7(a)(2) in Appendix A to Part 26, which pertained to chain-of-custody procedures and information required to be included on custody-and-control forms used to track urine specimens at licensee testing.

Paragraph 26.129(e)

This paragraph of the final rule clarifies and revises former requirements in Section 2.7(d) in Appendix A to Part 26, which pertained to the shipment of "presumptive positive" urine specimens to an HHS-certified laboratory for confirmatory testing. The former requirements did not designate a time by which the licensee testing facility must send a specimen identified as positive or of questionable validity to an HHS-certified laboratory. The final paragraph replaces the term "presumptive positive" with "positive or of questionable validity" to account for drug positive specimens and specimens with validity test results that require additional testing and directs licensee testing facilities to send these specimens to an HHS-certified laboratory as soon as reasonably practical. No incremental costs or savings are estimated because the revised provision is consistent with current specimen shipping practices used by licensee testing facilities.

Paragraph 26.129(f)

This paragraph of the final rule clarifies and revises former requirements (which primarily appear in Section 2.7(c) in Appendix A to Part 26), as they relate to refrigerating specimens to protect them from degradation. This final paragraph restates portions of the former rule and adds a performance standard regarding "appropriate and prudent actions" to minimize specimen degradation. (Licensees would likely meet the performance standard by implementing the more specific criteria from the former rule, which are also restated in the final rule.) The revised paragraph also relaxes the refrigeration criteria for most specimens, but tightens them for specimens identified as positive or of questionable validity that will undergo validity screening, initial validity, or initial drug testing. The analysis assumes that the provisions are consistent with current industry practice. To the extent (if any) that the refrigeration standards (some relaxed, some tightened) might require licensees to change their operating practices, the net effect is likely to be negligible. As a result of these uncertainties (including a lack of data) and the likelihood that any impact would be negligible, this analysis does not quantify costs or savings resulting from this final paragraph.

Paragraph 26.129(g)

This paragraph of the final rule clarifies former requirements in Section 2.4(i) in Appendix A to Part 26, which specified packaging and shipping requirements for urine specimens that are sent from a licensee testing facility to an HHS-certified laboratory. No incremental costs or savings will result from this final paragraph because it is consistent with former requirements.

Paragraph 26.129(h)

This paragraph of the final rule clarifies that because couriers, express carriers, and postal service personnel do not have access to the custody-and-control forms or the specimen bottles, they are not required to document chain-of-custody of a urine specimen in transit. However, this paragraph adds a new requirement that the custody accountability of the shipping containers

during shipment must be maintained by a tracking system provided by the courier, express carrier, or postal service. No incremental costs or savings will result from the final paragraph because it describes former courier, express carrier, and postal service shipment tracking practices.

26.131 Cutoff levels for validity screening and initial validity tests

Paragraph 26.131(a)

This paragraph of the final rule establishes that licensee testing facilities must conduct validity screening and/or initial validity testing on all urine specimens collected under the requirements in 10 CFR Part 26. Specimens with a validity screening and/or initial validity test result of questionable validity must be sent to an HHS-certified laboratory for further validity testing. The analysis assumes that all licensee testing facilities will choose to conduct initial validity testing (rather than validity screening testing) on all urine specimens. As discussed in the Statement of Considerations, NRC is allowing the use of validity screening tests for the potential future benefit of licensees and other entities even though no such devices currently meet the quality assurance and quality control requirements in §26.137(b) of the final rule. All validity testing costs are considered incremental because this is a new regulatory requirement.[1] The analysis estimates all specimen validity testing costs in the discussion of §26.131(b) of the final rule.

Paragraph 26.131(b)

This paragraph of the final rule establishes specimen validity testing requirements for licensee testing facilities and requires that each urine specimen be analyzed for creatinine, pH, and one or more oxidizing adulterants and specifies the cutoff levels for each validity test (screening and initial validity). The provisions in this paragraph prohibit licensees and other entities from using more stringent cutoff levels for validity tests than those specified in 10 CFR Part 26.

The regulatory analysis calculates under this paragraph not only the costs related to conducting initial validity testing at licensee testing facilities, but also the subsequent costs for some specimens to receive initial and confirmatory validity and drug testing at an HHS-certified laboratory, and the associated costs resulting from confirmed adulterated or substituted validity and/or positive drug test results (including positive drug test results following confirmatory testing to the LOD for dilute specimens and positive test results following the second collection for a donor that produced an invalid specimen). Even though many of these costs are directly related to other provisions in the final rule, as referenced below, this approach consolidates the

[1] By assuming that no licensees currently conduct validity testing, the analysis overstates the incremental costs to be incurred by FFD programs as a result of the validity testing provisions. This assumption is necessary, however, because of the lack of available data regarding the types of validity testing being conducted throughout the industry.

series of actions that are initiated under §26.131, allowing for a unified (hence clearer) presentation of related actions and a simpler analysis.

One-time costs captured below consist of training laboratory technicians at licensee testing facilities in the methods and procedures to conduct initial validity testing, and the annual costs associated with conducting initial validity testing at licensee testing facilities on all urine specimens (including calibrating validity testing equipment), conducting initial and confirmatory validity testing at an HHS-certified laboratory for specimens with test results of questionable validity[2] from the licensee testing facility, the labor costs of MRO and FFD personnel for administrative activities for confirmed positive drug test results and/or confirmed adulterated or substituted validity test results, the costs of retesting some specimens with confirmed drug positive, adulterated, substituted, or invalid test results at the donor's request (MRO's request for invalid specimens), and the costs of the appeals process for some drug positive, adulterated, or substituted test results that donors choose to contest. In addition, because HHS certified laboratory testing procedures and required licensee actions vary based on the type of confirmatory validity test result (e.g., dilute, invalid), the analysis discusses the costs for each validity test result type separately (designated below as "Results A, B, and C").

- "Result A": adulterated and substituted specimens
- "Result B": dilute specimens
- "Result C": invalid specimens

Annual costs per FFD program with an onsite licensee testing facility are estimated as the *sum* of the following:

- Cost to conduct initial validity testing at onsite licensee testing facilities for all urine specimens

  $NUM_{validity} \times [(COST_{validity\ test\ reagents} + (HOURS_{lab\ tech} \times WAGE_{lab\ tech})] \times NUM_{reactors}$

- Cost to conduct daily calibration of validity testing equipment

  $NUM_{days} \times [COST_{calibration\ reagents} + (HOURS_{lab\ tech\text{-}calibrate} \times WAGE_{lab\ tech})] \times NUM_{facilities}$

[2] The final rule in § 26.5 created a definition for licensee testing facility validity test results. Any specimen that indicates the specimen may be adulterated, substituted, dilute, or invalid is referred to as having a validity test result of "questionable validity." The use of the term "questionable validity" is necessary because licensee testing facilities cannot conduct specific gravity testing to determine if a specimen is dilute or adulterated and therefore, NRC has decided to improve the clarity of the final rule by creating a single term to cover all specimens with a validity test result requiring further testing at an HHS-certified laboratory.

- Annualized cost of purchasing validity testing equipment (i.e., pH meter)[3]

  $NUM_{pH\ meter} \times COST_{pH\ meter} \times NUM_{facilities}$

- Cost of sending and testing all urine specimens with initial validity test result of questionable validity to an HHS-certified laboratory for initial and confirmatory validity testing (and drug testing under specific instances), as described by the following validity test result cases (Results A, B, and C).

  - Result A: HHS-certified laboratory validity testing costs for specimens with test results of adulterated or substituted consist of the following:

    $NUM_{validity} \times (PER_{adulterated} + PER_{substituted}) \times COST_{HHS\ validity\ testing} \times NUM_{reactors}$

  - Result B: HHS-certified laboratory validity testing costs for specimens with test results of dilute. Additional costs include confirmatory drug testing to the limit of detection (LOD) for some specimens.[4] The costs include the following:

    $NUM_{validity} \times PER_{dilute} \times (COST_{HHS\ validity\ testing} + COST_{HHS\ LOD\ testing}) \times NUM_{reactors}$

  - Result C: HHS-certified laboratory validity testing costs for specimens with a test results of invalid. Additional costs include collecting a second urine specimen under direct observation, as specified in §26.185(f)(3) of the final rule, and then validity and drug testing the second specimen at an HHS-certified laboratory. The costs include the following:

    $NUM_{validity} \times PER_{invalid} \times [COST_{HHS\ validity\ testing} + (COST_{2nd\ collection} + COST_{HHS\ validity\ \&\ drug\ testing})] \times NUM_{reactors}$

- Cost of subsequent actions for all adulterated, substituted, dilute, or invalid validity test results and positive drug test results identified because of the validity testing requirements in §26.131(b) and §26.185(f)(3) (sum of adulterated, substituted, dilute, and invalid validity test results and positive drug tests from Results A, B, and C). FFD programs with onsite licensee testing facilities may also incur costs associated with some donors requesting the retesting of an aliquot of a single specimen or the testing of their

---

[3] The analysis assumes that each licensee testing facility will only need to purchase one pH meter to comply with the validity testing requirements because all licensee testing facilities already either lease or have purchased desktop sized drug testing instrument using enzyme immunoassay (EIA) technology to comply with the former requirements in 10 CFR Part 26. Reagents are commercially available for testing of creatinine and some adulterants using EIA based testing equipment. Creatinine and adulterant testing is performed on urine specimens using the same basic testing procedures as employed in conducting testing for each of the five drugs.

[4] Paragraph 26.163(a)(2) of the final rule permits FFD programs to require confirmatory LOD drug testing for any drug with an initial drug test result equal to or greater than 50 percent of the cutoff calibrator.

split specimen and/or some donors appealing confirmed adulterated or substituted validity and/or positive drug test results (including positive drug test results following confirmatory testing to the LOD for dilute specimens and positive test results following the second collection for a donor that produced an invalid specimen)

- Cost for actions subsequent to confirmed adulterated or substituted validity, and/or positive drug (including positive drug test results following confirmatory testing to the LOD for dilute specimens and positive test results following the second collection for a donor that produced an invalid specimen) test results

  $NUM_{validity} \times [(PER_{adulterated} + PER_{substituted} + (PER_{dilute} \times PER_{positive\text{-}dilute}) + (PER_{invalid} \times PER_{drug\ positive\ 2nd\ collection}))] \times COST_{subsequent\ actions} \times NUM_{reactors}$

- When requested by some donors, the cost of retesting specimens with confirmed adulterated or substituted validity, and/or positive drug (including positive drug test results following confirmatory testing to the LOD for dilute specimens and positive test results following the second collection for a donor that produced an invalid specimen) test results at a second HHS-certified laboratory

  $NUM_{validity} \times [(PER_{adulterated} + PER_{substituted} + (PER_{dilute} \times PER_{positive\ at\ LOD}) + (PER_{invalid} \times PER_{drug\ positive\ 2nd\ collection}))] \times PER_{retest} \times COST_{retest} \times NUM_{reactors}$

- When requested by some donors, the cost of the appeals process for confirmed adulterated or substituted validity and/or positive drug test results (including positive drug test results following confirmatory testing to the LOD for dilute specimens and positive test results following the second collection for a donor that produced an invalid specimen)

  $NUM_{validity} \times [(PER_{adulterated} + PER_{substituted} + (PER_{dilute} \times PER_{positive\ at\ LOD}) + (PER_{invalid} \times PER_{drug\ positive\ 2nd\ collection}))] \times PER_{appeal} \times [(HOURS_{FFD\ manager} \times WAGE_{FFD\ manger}) + (HOURS_{Worker} \times WAGE_{Worker})] \times NUM_{reactors}$

One time costs per FFD program with onsite licensee testing facilities are estimated as the following:

- One time costs to train laboratory technicians in the procedures and methods to conduct initial validity tests.[5]

  $[(NUM_{technicians} \times HOURS_{tech\ training} \times NUM_{training\ courses}) + COST_{training\ course}] \times NUM_{facilities}$

[5] Additional laboratory technician training will be necessary because of normal employee turnover at onsite licensee testing facilities. However, this analysis estimates no incremental cost because it is assumed that laboratory technicians will receive on-the-job training as part of their normal training activities.

Parameter	Description
$NUM_{validity}$	Number of validity tests per reactor per year (as discussed in the assumptions below and in Appendix 2, Exhibit A2-12)
$COST_{validity\ test\ reagents}$	Cost of reagents used to perform initial validity testing (pH, creatinine, and one adulterant) per urine specimen at an onsite licensee testing facility (as discussed in Appendix 2, Exhibit A2-13)
$HOURS_{lab\ tech}$	Hours of time for a laboratory technician to conduct initial validity testing (pH, creatinine, and one adulterant) per urine specimen at an onsite licensee testing facility (as discussed in Appendix 2, Exhibit A2-13)
$WAGE_{lab\ tech}$	Laboratory technician wage rate (as discussed in Appendix 2, Exhibit A2-11)
NUM_{days}	Number of days that a licensee testing facility conducts drug and validity testing per year (as discussed in assumptions below)
$COST_{calibration\ reagents}$	Cost of reagents used to perform daily calibration of validity testing equipment at a licensee testing facility (as discussed in Appendix 2, Exhibit A2-13)
$HOURS_{lab\ tech\ calibrate}$	Hours of time per day for a laboratory technician at a licensee testing facility to conduct daily calibration of validity testing equipment (as discussed in Appendix 2, Exhibit A2-13)
$NUM_{pH\ meter}$	Number of pH meters purchased per licensee testing facility per year. (as discussed in the assumptions below)
$COST_{pH\ meter}$	Annualized cost per pH meter, which includes the cost of replacement probes (as discussed in the assumptions below and in Appendix 2, Exhibit A2-13)
$PER_{adulterated}$	Percentage of urine specimens with validity test results of adulterated (as discussed in Appendix 2, Exhibit A2-12)
$PER_{substituted}$	Percentage of urine specimens with validity test results of substituted (less than 2 mg/dL of creatinine) (as discussed in Appendix 2, Exhibit A2-12)
$COST_{HHS\ validity\ testing}$	Cost of conducting initial and confirmatory validity testing at an HHS-certified laboratory per urine specimen with an initial validity test result of questionable validity determined at an onsite licensee testing facility. Costs included preparation of urine specimen and shipping costs to the HHS-certified laboratory (as discussed in the assumptions below)
PER_{dilute}	Percentage of urine specimens with validity test results of dilute (as discussed in Appendix 2, Exhibit A2-12)
$COST_{HHS\ LOD\ testing}$	Cost per specimen to conduct initial drug testing and confirmatory drug testing to the level of detection (LOD) for drug(s) identified during initial testing, as permitted by § 26.163(a)(2) of the final rule (as discussed in Appendix 2, Exhibit A2-13)
$PER_{invalid}$	Percentage of urine specimens with validity test results of invalid (as discussed in Appendix 2, Exhibit A2-12)

Parameter	Description
$COST_{2nd\ collection}$	Cost of collecting a second urine specimen under direct observation from a donor with a confirmatory validity test result of invalid for the initial urine specimen collected. The cost of the second collection includes the labor for the donor's travel time to and from the collection site, donor's time spent at the collection site, as well as the labor of the collector (as discussed in Appendix 2, Exhibit A2-13)
$COST_{HHS\ validity\ \&\ drug\ testing}$	Cost of validity and drug testing a urine specimen that is sent by an onsite licensee testing facility to an HHS-certified laboratory for testing. Costs include confirmatory drug and/or validity testing when necessary (as discussed in Appendix 2, Exhibit A2-13)
$PER_{positive\ at\ LOD}$	Percentage of dilute specimens that test positive for drug(s) during initial testing (equal to or greater than 50 percent of the cutoff calibrator) and at confirmatory LOD testing (as discussed in the assumptions below)
$PER_{drug\ positive\ 2nd\ collection}$	Percentage of specimens collected under direct observation as a result of an initial specimen with an invalid test result that is positive for drugs (as discussed in the assumptions below)
$COST_{subsequent\ actions}$	Labor costs associated with MRO and FFD program personnel activities and administrative actions resulting from a confirmed positive drug test result (including positive drug test results following confirmatory testing to the LOD for dilute specimens and positive test results following the second collection for a donor that produced an invalid specimen), and/or adulterated or substituted validity test result (as discussed in Appendix 2, Exhibit A2-13)
PER_{retest}	Percentage of urine specimens with confirmed positive drug, and/or adulterated, or substituted validity test results retested at the request of the donor at a second HHS-certified laboratory (as discussed in the assumptions below)
$COST_{retest}$	Cost of specimen retesting at a second HHS-certified laboratory including specimen preparation and shipping costs (as discussed in Appendix 2, Exhibit A2-13)
PER_{appeal}	Percentage of confirmed positive drug test results (including positive drug test results following confirmatory testing to the LOD for dilute specimens and positive test results following the second collection for a donor that produced an invalid specimen) and/or adulterated or substituted validity test results appealed by some donors (as discussed in the assumptions below)
$HOURS_{FFD\ manager}$	Average amount of FFD manager time per appeal for a confirmed positive drug test result (including positive drug test results following confirmatory testing to the LOD for dilute specimens and positive test results following the second collection for a donor that produced an invalid specimen), and/or adulterated or substituted validity test result appealed by some donors (as discussed in the assumptions below)
$WAGE_{FFD\ manger}$	FFD manager wage rate (as discussed in Appendix 2, Exhibit A2-11)

Parameter	Description
$HOURS_{Worker}$	Average amount of worker time per appeal process for a confirmed positive drug test result (including positive drug test results following confirmatory testing to the LOD for dilute specimens and positive test results following the second collection for a donor that produced an invalid specimen), and/or adulterated or substituted validity test result (as discussed in the assumptions below)
$WAGE_{Worker}$	Facility worker wage rate (as discussed in Appendix 2, Exhibit A2-11)
$NUM_{technicians}$	Number of laboratory technicians per licensee testing facility (as discussed in the assumptions below)
$HOURS_{tech\ training}$	Length of laboratory technician training course (as discussed in assumptions below)
$NUM_{training\ courses}$	Number of laboratory technician training courses per licensee testing facility (as discussed in the assumptions below)
$COST_{training\ course}$	Cost per laboratory technician training course conducted by a commercial vendor at the licensee testing facility (as discussed in the assumptions below)
$NUM_{facilities}$	Number of licensee testing facilities per FFD program (as discussed in Appendix 2, Exhibit A2-14)
$NUM_{reactors}$	Number of reactors per FFD program (as discussed in Appendix 2, Exhibit A2-14)

Assumptions:

- Number of validity tests per reactor per year is equivalent to the number of drug tests conducted per year per reactor.

- Each licensee facility that conducts onsite testing has one testing facility.

- Each licensee testing facility purchases one pH meter, which is replaced every six years. Each pH meter requires a replacement probe every two years.

- Number of days a licensee testing facility operates per year: 365 days.

- Cost per specimen to conduct initial and confirmatory validity testing at an HHS-certified laboratory for a urine specimen with an adulterated, substituted, dilute, or invalid initial validity test result at an onsite licensee testing facility: $1.50 + (cost of drug test at HHS-certified laboratory, as discussed in Appendix 2, Exhibit A2-13). FFD programs contract with HHS-certified laboratories at a fixed price per urine specimen analysis which includes drug testing (initial and confirmatory when necessary) and will also include specimen validity testing (initial and confirmatory when necessary) under the final rule. The analysis assumes that the testing cost per urine specimen will increase by $1.50 to account for validity testing in addition to drug testing costs. This testing event did not occur under the

former rule because no validity testing was required (i.e., no specimen would be sent to an HHS laboratory for further testing based on validity problems).

- All urine specimens with initial validity test result of questionable validity at an onsite licensee testing facility will receive test results of adulterated, substituted, dilute, or invalid after initial and confirmatory validity testing at an HHS-certified laboratory.

- All FFD programs choose to test dilute specimens according to the optional provisions in § 26.163(a)(2). That is, any specimen with an initial drug test result equal to or greater than 50 percent of the cutoff calibrator will receive confirmatory LOD drug testing.

- Percentage of dilute specimens that test positive for drug(s) during initial testing and at confirmatory LOD testing: 33 percent.

- For all urine specimens with validity test results of invalid, the analysis assumes that a second specimen is collected under direct observation.

- Percentage of specimens collected under direct observation as a result of an initial specimen with an invalid test result that test positive for drugs (as discussed in the assumptions below):[6] 33 percent.

- Percentage of urine specimens with confirmed positive drug, and/or adulterated or substituted validity test result retested at the request of the donor at a second HHS-certified laboratory: 5 percent.

- Average amount of FFD manager time per appeal process for a confirmed positive drug test result (including positive drug test results following confirmatory testing to the LOD for dilute specimens and positive test results following the second collection for a donor that produced an invalid specimen), and/or adulterated or substituted validity test result: 12.5 hours.

- Average amount of worker time per appeal process for a confirmed positive drug test result (including positive drug test results following confirmatory testing to the LOD for dilute specimens and positive test results following the second collection for a donor that produced an invalid specimen), and/or adulterated or substituted validity test result appealed by some donors: 2.0 hours.

[6] A second specimen is collected under direct observation for donors that have an initial specimen with an invalid test result to reduce the probability that their second specimen will be altered (e.g., use of adulterants) and therefore, the drug use that was attempted to be masked during the initial specimen donation will more likely be detected in the second specimen collected.

- Percentage of confirmed positive drug test results (including positive drug test results following confirmatory testing to the LOD for dilute specimens and positive test results following the second collection for a donor that produced an invalid specimen), and/or adulterated or substituted validity test results appealed by some donors: 1 percent.

- Number of laboratory technicians per licensee testing facility: 4.

- Length of laboratory technician training course: 4 hours.

- Number of laboratory technician training courses per licensee testing facility: 1.

- Cost per laboratory technician training course conducted by a commercial vendor at a licensee testing facility: $500.00.

26.133 Cutoff levels for drugs and drug metabolites

This section revises former requirements in Section 2.7(e)(1) in Appendix A to Part 26, which pertained to the initial cutoff levels for drugs (marijuana, cocaine, opiate, phencyclidine, amphetamines). The final rule will lower the initial cutoff level for marijuana metabolites from 100 ng/mL to 50 ng/mL. FFD programs using onsite testing facilities will incur annual incremental costs as a result of the more stringent testing cutoff level, which will increase the number of positive drug tests for marijuana.[7] The additional costs will consist of the costs of initial and confirmatory drug testing at an HHS-certified laboratory, labor costs for the MRO and FFD personnel activities resulting from confirmed positive drug test results, the costs of retesting specimens at a second HHS-certified laboratory at the request of some donors, and the costs of the appeals process for some positive test results that donors choose to contest. The final rule will also raise the initial cutoff level for opiate metabolites from 300 ng/mL to 2,000 ng/mL. FFD programs using onsite licensee testing facilities will realize annual incremental savings as a result of the less stringent testing cutoff level, which will substantially reduce the number of positive opiate drug tests that MROs ultimately verify as negative. Savings are associated with eliminating specimen testing costs at an HHS-certified laboratory, labor costs of the MRO and FFD personnel activities resulting from positive drug tests results, the costs of retesting specimens at a second HHS-certified laboratory at the request of some donors, and the cost of the appeals process for some positive test results that donors choose to contest.

Annual costs per FFD program with an onsite licensee testing facility for additional confirmed positive marijuana drug tests are estimated as the sum of the following:

- Cost for initial and confirmatory drug tests at HHS-certified laboratories

[7] The analysis over-estimates the costs of additional confirmed positive marijuana test results due to the lower initial cut-off level (50 ng/mL) because some licensees may already be testing to the cut-off level.

$(NUM_{marijuana} \times PERI_{marijuana} \times COST_{HHS\ validity\ \&\ drug\ testing}) \times NUM_{reactors}$

- Cost for actions subsequent to positive confirmatory marijuana drug test results from the HHS-certified laboratory

  $(NUM_{marijuana} \times PERI_{marijuana} \times COST_{subsequent\ actions}) \times NUM_{reactors}$

- Cost for retesting specimens with confirmed positive marijuana drug test results at a second HHS-certified laboratory at the request of some donors

  $(NUM_{marijuana} \times PERI_{marijuana} \times PER_{retest} \times COST_{retest}) \times NUM_{reactors}$

- Cost of appeals process for confirmed positive marijuana test results that some donors choose to contest

  $(NUM_{marijuana} \times PERI_{marijuana} \times PER_{appeal}) \times [(HOURS_{FFD\ manager} \times WAGE_{FFD\ manger}) + HOURS_{Worker} \times WAGE_{Worker})] \times NUM_{reactors}$

Annual savings per FFD program with an onsite licensee testing facility for fewer confirmed positive opiate drug test results are estimated as the sum of the following:

- Saving from fewer specimens with positive opiate drug tests requiring testing at HHS-certified laboratories

  $(NUM_{opiate} \times PERD_{opiate} \times COST_{HHS\ validity\ \&\ drug\ testing}) \times NUM_{reactors}$

- Saving from fewer specimens with confirmed positive opiate drug test results associated subsequent actions

  $(NUM_{opiate} \times PERD_{opiate} \times COST_{subsequent\ actions}) \times NUM_{reactors}$

- Saving from fewer confirmed positive opiate drug test specimens retested at another HHS-certified laboratory at the request of donors

  $(NUM_{opiate} \times PERD_{opiate} \times PER_{retest} \times COST_{retest}) \times NUM_{reactors}$

- Saving from fewer appeals for some confirmed positive opiate drug test results

  $(NUM_{opiate} \times PERD_{opiate} \times PER_{appeal}) \times [(HOURS_{FFD\ manager} \times WAGE_{FFD\ manger}) + HOURS_{Worker} \times WAGE_{Worker})] \times NUM_{reactors}$

Parameter	Description
$NUM_{marijuana}$	Number of confirmed positive marijuana drug test results per reactor per year under the former rule (as discussed in Appendix 2, Exhibit A2-12)
$PERI_{marijuana}$	Percentage increase in positive marijuana drug tests results due to the more stringent cutoff level in the final rule (as discussed in the assumptions below)
$COST_{HHS\ validity\ \&\ drug\ testing}$	Cost of preparing and shipping a urine specimen with an initial positive drug test result to an HHS-certified laboratory and the cost of validity and drug testing at the HHS-certified laboratory (as discussed in Appendix 2, Exhibit A2-13)
$COST_{subsequent\ actions}$	Labor costs associated with MRO and FFD program personnel activities and administrative actions resulting from a confirmed positive drug test result (as discussed in Appendix 2, Exhibit A2-13)
PER_{retest}	Percentage of urine specimens with confirmed positive drug test results retested at the request of the donor at a second HHS-certified laboratory (as discussed in the assumptions below)
$COST_{retest}$	Cost of specimen retesting at second HHS-certified laboratory including specimen preparation and shipping costs (as discussed in Appendix 2, Exhibit A2-13)
NUM_{opiate}	Number of confirmed positive opiate drug test results per reactor per year under former rule (as discussed in Appendix 2, Exhibit A2-12)
$PERD_{opiate}$	Percentage decrease in confirmed positive opiate drug test results due to the higher cutoff level in the final rule (as discussed in the assumptions below)
PER_{appeal}	Percentage of confirmed positive drug test results appealed by some donors (as discussed in the assumptions below)
$HOURS_{FFD\ manager}$	Average amount of FFD manager time per appeal process for a confirmed positive drug test result (as discussed in the assumptions below)
$WAGE_{FFD\ manager}$	FFD manager wage rate (as discussed in Appendix 2, Exhibit A2-11)
$HOURS_{Worker}$	Average amount of worker time per appeal process for a confirmed positive drug test result (as discussed in the assumptions below)
$WAGE_{Worker}$	Facility worker wage rate (as discussed in Appendix 2, Exhibit A2-11)
$NUM_{reactors}$	Number of reactors per FFD program (as discussed in Appendix 2, Exhibit A2-14)

Assumptions:

- Changing the cutoff thresholds for marijuana and opiates will not result in a change in assay costs, nor will the changes require the upgrading of testing facility equipment. Testing facilities will have to purchase new standards and controls specific for the changes in the cutoff thresholds; however, the purchasing of standards and controls is a normal operations cost and will not result in an incremental change.

- FFD programs pay HHS-certified laboratories a per specimen cost, which includes both initial and confirmatory drug testing.

- Percentage increase in positive marijuana drug tests results due to the more stringent cutoff level in the final rule: 40 percent.[8]

- Percentage decrease in confirmed positive opiate drug test results due to the higher cutoff level in the final rule: 75 percent.[9]

- Percentage of urine specimens with confirmed positive drug test results retested at the request of the donor at a second HHS-certified laboratory: 5 percent.

- Average amount of FFD manger time per appeal process for a confirmed positive drug test result: 12.5 hours.

- Average amount of worker time per appeal process for a confirmed positive drug test result: 2.0 hours.

- Percentage of confirmed positive drug test results appealed by some donors: 1 percent.

26.135 Split specimens

Paragraph 26.135(a)

No incremental costs or savings will result from this final paragraph, which restates without substantive change the former requirements in Section 2.7(j) in Appendix A to Part 26, which pertained to split-specimen handling, testing, and storage procedures. The revisions conform the former requirements with the terminology used in other parts of the final rule, but they do not change the meaning of the former requirements.

[8] The experience of HHS-certified laboratories when U.S. DOT changed the marijuana metabolite cutoff level from 100 ng/mL to 50 ng/mL increased the number of positive marijuana test results from 25-40 percent. Several licensees currently test for marijuana metabolites at the 50 ng/mL cutoff level. One licensee reported 49 additional positive test results over a two and one-half year period, (an increase of 57 percent over the 100 ng/ml cutoff level).

[9] Raising the initial cutoff level for opiate metabolites will almost eliminate poppy seed false positive results, and unless an individual consumes large prescribed doses of codeine based cough syrup or other cold prescriptions, the threshold will significantly reduce positive screening results for opiates due to legitimate use of prescribed cold and cough prescriptions.

Paragraph 26.135(b)

This paragraph of the final rule restates and revises former requirements in Section 2.7(j) in Appendix A to Part 26, which specified the specimen shipping procedures for licensee testing facilities when notified that a donor has requested that a split specimen be tested by a second HHS-certified laboratory. The former requirement maintained that the licensee testing facility could forward the split specimen to a second HHS-certified laboratory on the same day that the laboratory receives notice that a donor has requested testing of their split specimen. The final paragraph relaxes the former requirement by providing one business day following the day of the donor's request for the specimen to be forwarded to a second HHS-certified laboratory (per §26.165(b) of the final rule). No incremental costs or savings will result from this final paragraph as it provides licensees with additional time to respond to a donor's request for specimen retesting, but does not change the required activity.

Paragraph 26.135(c)

There is no incremental cost or saving from this final paragraph as it clarifies former requirements in Section 2.7(h) in Appendix A to Part 26, which pertained to long-term frozen storage of positive, adulterated, substituted, and invalid urine specimens.

26.137 Quality assurance and quality control

Paragraph 26.137(a)

This paragraph of the final rule restates without substantive change the former requirements in Section 2.8(a) in Appendix A to Part 26, which describe the elements of a licensee testing facility quality assurance program.

Paragraph 26.137(b)

This paragraph of the final rule establishes performance testing and quality control requirements for validity screening tests conducted at licensee testing facilities. As discussed in §26.131(a) of the analysis, the analysis assumes that no licensee testing facilities will conduct validity screening tests. However, given that the final rule in §26.131(a) now requires validity testing of each urine specimen (either validity screening and/or initial validity testing) by licensee testing facility, compliance with this final paragraph or that of §§26.137(c) or (d) is a new requirement. No incremental costs or savings will result from this final paragraph because the analysis assumes that licensees will conduct initial validity tests. The costs for all licensee testing facility validity tests costs are included in §26.137(d).

Paragraph 26.137(c)

This paragraph establishes that if a licensee testing facility conducts validity screening tests on urine specimens, for specimens with results of questionable validity, the licensee testing facility

must either then perform initial validity testing or must send the specimens to an HHS-certified laboratory for additional validity testing. As discussed in §26.131(a), the analysis assumes that no licensee testing facilities will conduct validity screening tests. Therefore, no incremental costs or savings will result from this final paragraph. However, given that the final rule in §26.131(a) now requires validity testing of each urine specimen (either validity screening and/or initial validity testing) by each licensee testing facility, compliance with this final paragraph or that of §§26.137(b) or (d) is a new requirement.

Paragraph 26.137(d)

This paragraph of the final rule establishes the quality control requirements that analytical equipment must meet in order to be used to perform initial validity tests and specifies the quality control samples that must be included in each analytical run. The incremental costs of initial validity testing (including quality control measures) are included in the per test cost to conduct initial validity testing, as discussed in connection with §26.131.

Paragraph 26.137(e)

This paragraph of the final rule revises quality control requirements for initial drug tests that are performed at licensee testing facilities, as discussed in §§26.137(e)(1)–(8).

Subparagraph 26.137(e)(1)

There are no incremental costs or savings from this final subparagraph as it clarifies former requirements in Section 2.7(e)(1) in Appendix A to Part 26, which required licensee testing facilities to conduct initial drug tests using an immunoassay meeting the requirements of the Food and Drug Administration (FDA) for commercial distribution. This subparagraph also adds a new provision that prohibits non-instrumented immunoassay testing devices that are pending HHS/Substance Abuse and Mental Health Services Administration (SAMHSA) review and approval from being used for initial drug testing under this part. The subparagraph also adds a provision that licensees and other entities may not take management action against an individual based on any drug test results obtained from non-instrumented devices that may be used for validity screening tests. The new requirements in this subparagraph will result in no incremental costs or savings for licensee testing facilities because the provisions simply prohibit the use of specific analytical equipment and prevent management action based on non-instrumented devices.

Subparagraph 26.137(e)(2)

This subparagraph of the final rule establishes that negative urine specimens must be discarded or pooled for use in the licensee testing facility's internal quality control program, as long as the specimens are certified as drug-negative and valid by an HHS-certified laboratory. The analysis assumes that licensee testing facilities will choose the most cost-effective method of obtaining negative urine specimens to be used as their quality control testing specimens, and that licensee

testing facilities already (1) purchase negative urine specimens directly from a vendor selling HHS-certified drug negative urine or from an HHS-certified laboratory, (2) pool the negative urine specimens analyzed at their testing facility and submit them to an HHS-certified laboratory for testing to certify that they are drug-negative. The final rule will not change these practices, so no incremental costs or savings will result.

Subparagraph 26.137(e)(3)

No incremental cost or saving will result from this final subparagraph as it affords licensee testing facilities the flexibility to conduct multiple initial drug tests for the same drug or drug class, provided that all tests meet the cutoffs and quality control requirements in this part.

Subparagraph 26.137(e)(4)

No incremental cost or saving will result from this final subparagraph, which restates former requirements in Section 2.8(b) in Appendix A to Part 26.

Subparagraph 26.137(e)(5)

This subparagraph of the final rule revises a former requirement in Section 2.8(b) in Appendix A to Part 26, which mandated that each licensee testing facility submit a "sampling" of urine specimens screening negative for drugs from each test run to an HHS-certified laboratory for additional drug testing to ensure that the drug testing process of the licensee testing facility is accurate, with no false negative tests results. This subparagraph revises the former requirement by clarifying that the term "sampling" means a minimum of 5 percent (or at least 1) of the drug test specimens screening negative for drugs from every analytical run. Some FFD programs using onsite licensee testing facilities may realize annual incremental savings resulting from this final rule revision. Licensee testing facilities that submit a sample of negative drug test specimens from each analytical run below the 5 percent maximum level will not be affected by this final subparagraph because current practice already meets the final rule requirement. Even though some onsite licensee testing facilities may be submitting more than 5 percent of negative drug test specimens per analytical run to an HHS-certified laboratory, an accurate estimate on savings is not possible due to a lack of data on current onsite licensee testing facility practices.

Subparagraph 26.137(e)(6)

This subparagraph of the final rule extends to licensee testing facilities the former requirements in Section 2.8(c) in Appendix A to Part 26, which mandated that HHS-certified laboratories must include a minimum of 10 percent of the total number of urine specimens in each analytical run as quality control samples. This subparagraph of the final rule also extends to licensee testing facilities the former requirements in Section 2.8(c) in Appendix A to Part 26, which pertained to the quality control samples that must be included in each analytical run of initial drug tests performed by HHS-certified laboratories. The quality control samples must consist of: (1) specimen(s) certified to contain no drug (i.e., negative urine samples), (2) at least one positive

control with drug(s) or drug metabolite(s) targeted at 25 percent above the cutoff, (3) at least one positive control with drug(s) or drug metabolite(s) targeted at 25 percent below the cutoff, (4) a sufficient number of calibrators to ensure and document the linearity of the assay method over time in the concentration area of the cutoff, and (5) sample(s) that appear to be a donor specimen to the laboratory analysts. With regard to the quality control samples that must be included in each analytical run, this subparagraph imposes no incremental cost because licensee testing facilities are assumed to use appropriate control specimens in each analytical run, as specified by the manufacturer's operating manuals for drug testing equipment. However, the change in the composition of the blind performance testing samples results in an incremental cost per urine specimen analyzed to comply with this final paragraph.

The *annual cost per FFD program with onsite licensee testing facilities* are estimated as follows:

$$(NUM_{specimens} \times COST_{specimen} \times PERI_{cost}) \times NUM_{reactors}$$

Parameter	Description
$NUM_{specimens}$	Number of urine specimens analyzed per reactor per year for FFD programs with onsite licensee testing facilities (as discussed in the assumptions below and in Appendix 2, Exhibit A2-12)
$COST_{specimen}$	Cost per urine specimen to conduct drug testing as specified in the former requirements (as discussed in Appendix 2, Exhibit A2-11)
$PERI_{cost}$	Percentage increase in the average urine specimen analysis cost based on the change in costs to comply with the quality control specimen testing requirements (as discussed in the assumptions below)
$NUM_{reactors}$	Number of reactors per FFD program (as discussed in Appendix 2, Exhibit A2-14)

Assumptions:

- Number of urine specimens analyzed per reactor per year for FFD programs with onsite licensee testing facilities is equivalent to the number of drug tests performed per reactor per year for FFD programs with onsite licensee testing facilities.

- Percentage increase in the average urine specimen analysis cost based on the change in costs to comply with the quality control specimen testing requirements [this includes the increase in costs per blind performance test specimen to comply with the inclusion of adulterated, substituted, dilute and invalid specimens as a part of the percentage of specimens as discussed in §26.167(f) of Subpart G]: 10 percent.

Subparagraph 26.137(e)(7)

This subparagraph of the final rule extends to licensee testing facilities the former requirements in Section 2.8(c) in Appendix A to Part 26, which mandated that (HHS-certified) laboratories must implement procedures to ensure that carryover does not contaminate the testing of a donor's specimen. This subparagraph imposes no incremental cost and affords no savings because it is consistent with existing specimen handling procedures used by licensee testing facilities.

Paragraph 26.137(f)

This paragraph of the final rule clarifies that it is the licensees' responsibility to investigate errors in the testing of quality control samples, the testing of actual specimens, or the processing of management reviews and/or MRO reviews, as well as any other errors or matters that could reflect adversely on the licensees' testing process. The licensees' mandated responsibility also includes taking action to correct errors that are within the licensees' control. This analysis assumes that no incremental costs or savings will result from the final paragraph because licensees were formerly responsible [under a performance standard in Section 2.8(a) in Appendix A to Part 26] for having "a quality assurance program which encompasses all aspects of the testing process."

Paragraph 26.137(g)

There is no incremental cost or saving from this final paragraph as it restates a former rule requirement in Section 2.7(o)(3)(i) in Appendix A to Part 26.

Paragraph 26.137(h)

This paragraph of the final rule clarifies and revises former requirements in Section 2.7(o)(2) in Appendix A to Part 26, which required licensee testing facilities to use "HHS-certified laboratory standards." The final rule relaxes the former requirements by permitting licensee testing facilities to use "stock standard solutions obtained from other laboratories, or standard solutions obtained from commercial manufacturers." This analysis assumes that any incremental saving from this final paragraph will be insignificant.

26.139 Reporting initial validity and drug test results

Paragraph 26.139(a)

No incremental cost or saving is estimated for this final paragraph, which restates without substantive change requirements in §2.7(g)(2) in Appendix A to Part 26, as they relate to drug testing. Paragraph 26.131(a) of the final rule requires validity screening and/or initial validity test results. The new provisions in this paragraph add reporting requirements for negative and questionable validity test results for validity screening and initial validity tests. Except as

permitted under paragraph 26.75(h), licensee testing facilities are prohibited from reporting positive test results from initial drug tests and results from validity screening or initial validity testing to licensee or other entity management. The new provisions in this final paragraph will result in no incremental costs or savings because the provisions prohibit communication of specific types of test results rather than require any specific activity. In addition, because licensee testing facilities already have established communication methods to transmit drug test results to licensee and FFD management, the inclusion of validity test results will result in an no incremental cost or saving.

Paragraph 26.139(b)

This paragraph of the final rule restates without substantive change a former requirement in §26.24(d)(1), which limited access to initial drug test results to licensee testing staff, the MRO, the FFD manager, and EAP personnel (when appropriate). The final rule also permits the SAE to access initial drug test results. No incremental cost or savings will result from the final paragraph because it clarifies who is permitted access to test results.

Paragraph 26.139(c)

No incremental costs or savings will result from this final paragraph which restates the former requirements in Section 2.7(o)(5) in Appendix A to Part 26, which mandated that a licensee testing facility must have qualified personnel available to testify at proceedings against an individual based on urinalysis results.

Paragraph 26.139(d)

This paragraph of the final rule revises the former requirements in Section 2.7(g)(6) in Appendix A to Part 26, which specified that licensee testing facilities must provide a monthly statistical summary of urinalysis data to a licensee official responsible for coordinating the FFD program. The final paragraph only requires that licensee testing facilities must prepare the information required for the annual report that each FFD program must provide to NRC on an annual basis, as discussed in §26.717 of the final rule. Therefore, licensee testing facilities will now prepare the statistical summary of urinalysis data only on an annual basis. Incremental savings will be realized by each FFD program due to the reduction in labor costs associated with the elimination of monthly statistical summary reports. Some of the savings will be offset by the labor costs associated with annual report preparation.

- *Annual savings per FFD program with onsite testing facilities* are estimated as follows:

$$(HOURS_{monthly\ report} \times WAGE_{laboratory\ supervisor} \times NUM_{monthly\ reports} \times NUM_{facilities}) - (HOURS_{annual\ report} \times WAGE_{laboratory\ supervisor} \times NUM_{facilities})$$

Parameter	Description
$HOURS_{monthly\ report}$	Time for a laboratory supervisor per licensee testing facility to prepare a monthly statistical summary report of urinalysis testing data (as discussed in the assumptions below)
$WAGE_{laboratory\ supervisor}$	FFD manager wage rate (as discussed in Appendix 2)
$NUM_{monthly\ reports}$	Number of monthly reports per FFD program per year
$HOURS_{annual\ report}$	Time for a laboratory supervisor per licensee testing facility to prepare an annual statistical summary report of urinalysis testing data (as discussed in the assumptions below)
$NUM_{facilities}$	Number of licensee testing facilities per FFD program (as discussed in Appendix 2)

Assumptions:

- Time for a laboratory supervisor per licensee testing facility to prepare a monthly statistical summary report of urinalysis testing data: 1.5 hours.

- Time per report for a laboratory supervisor to prepare an annual statistical summary report of drug testing data: 4 hours.

Paragraph 26.139(e)

This paragraph of the final rule revises the former requirements in Section 2.7(g)(7) in Appendix A to Part 26, which pertained to the reporting of drug testing results to NRC. Under the former rule, if a licensee conducted drug testing using more stringent cutoff levels than required in 10 CFR Part 26, the licensee had to report the drug test results for the cutoff levels mandated by Part 26, as well as more stringent levels. The final rule relaxes the reporting requirements and only requires licensees to report in the annual report to NRC the drug testing information for either the cutoff levels specified in §26.31(d)(1) or for any more stringent cutoff levels used by the FFD program. In addition, if the licensee tests for additional drugs beyond those specified in §26.31(d)(1), this final paragraph adds a requirement that the annual report also include the number of positive test results and the cutoff levels used for those additional drugs and drug metabolites. No incremental costs or savings are estimated for the final paragraph because licensee testing facilities conducting drug testing using more stringent cutoff levels and/or testing for additional drugs beyond Part 26 requirements already tabulate the necessary testing data under the former rule.

Paragraph 26.139(f)

This paragraph of the final rule adds a new requirement that the designated FFD program official use the available information from the licensee testing facility's validity and drug test results, the results of quality control testing performed at the licensee testing facility, and the results from testing the quality control samples that the licensee testing facility submits to the HHS-certified laboratory to evaluate continued testing program effectiveness and detect any local trends in drugs of abuse that may require management action or FFD program adjustments. No incremental costs or savings are estimated because this requirement is consistent with current oversight practices of existing FFD programs.

Subpart G: Laboratories Certified by the Department of Health and Human Services

26.151 Purpose

This section of the final rule imposes no incremental cost and affords no saving because it merely states that the purpose of this Subpart is to present requirements pertaining to HHS-certified laboratories used by licensees and C/Vs for specimen validity and drug testing.

26.153 Using certified laboratories for testing urine specimens

Paragraph 26.153(a)

This paragraph of the final rule revises former requirements in § 26.24(f) and Sections 1.1(3), 2.7(l)(1), and 4.1(a) in Appendix A to Part 26, which authorized licensees to use only HHS-certified laboratories to perform urine drug testing, except for initial drug tests conducted at a licensee's testing facility as permitted by § 26.24(d)(2). This final paragraph only authorizes the use of HHS-certified laboratories that have the capability at the same location to perform drug testing and specimen validity testing except for initial drug and validity testing that may be performed at a licensee's testing facilities, as allowed by § 26.31(d)(3)(ii). These requirements impose no incremental cost and afford no saving because HHS-certified laboratories are already qualified to conduct validity testing (the incremental costs associated with validity testing are discussed in § 26.161(b)(1)-(5)).

Paragraph 26.153(b)

This paragraph of the final rule revises former requirements in Section 2.7(l)(2) in Appendix A to Part 26, which directed licensees to use only HHS-certified laboratories that had the capability at the same location to conduct both initial and confirmatory testing for the drugs required in Part 26. The final paragraph requires that HHS-certified laboratories must also have the capability to perform initial and confirmatory tests for specimen validity. These requirements impose no incremental cost and afford no saving because HHS-certified laboratories already have this capability and have been conducting validity testing for U.S. DOT-regulated entities.

Paragraph 26.153(c)

This paragraph of the final rule imposes no incremental cost and affords no saving because it restates without substantive change former requirements in Section 2.7(k) in Appendix A to Part 26, which prohibited HHS-certified laboratories from subcontracting work unless authorized by the licensee. This paragraph clarifies that this restriction also applies to HHS-certified laboratories used by other entities who have licensee approved FFD programs.

Paragraph 26.153(d)

This paragraph of the final rule imposes no incremental cost and affords no saving because it restates without substantive change former requirements in Section 4.1(b) in Appendix A to Part 26, which pertained to the use of HHS-certified laboratories when conducting drug testing beyond Part 26 requirements.

Paragraph 26.153(e)

This paragraph of the final rule clarifies and amends former requirements in Section 2.7(m) in Appendix A to Part 26, which required licensees to conduct a pre-award inspection and evaluation of the procedural aspects of a laboratory's drug testing operation before awarding a contract to the laboratory. The final paragraph clarifies that pre-award inspections and evaluations must be conducted by qualified personnel. Also, the final paragraph adds a provision allowing licensees to immediately begin using the services of a second HHS-certified laboratory without first conducting a pre-award inspection if the licensee's first laboratory loses its certification and the second laboratory is already conducting drug and validity testing for another licensee or other entity subject to 10 CFR Part 26. Incremental savings will result from the elimination of pre-award inspection and evaluation costs for FFD programs that need to replace a decertified laboratory with a new HHS-certified laboratory that is already in use by another FFD program.

The *annual savings per FFD program* are estimated as follows:

$$HOURS_{inspection} \times WAGE_{FFD\ manager} \times PER_{decertification} \times PER_{known\ HHS\ lab}$$

Parameter	Description
$HOURS_{inspection}$	Hours per pre-award inspection of an HHS-certified laboratory conducted by licensee personnel or a designee (as discussed in the assumptions below)
$WAGE_{FFD\ manager}$	FFD manager wage rate (as discussed in Appendix 2, Exhibit A2-11)
$PER_{decertification}$	Percentage of FFD programs that must change to a new HHS-certified laboratory per year because their current HHS-certified laboratory loses its certification (as discussed in the assumptions below)
$PER_{known\ HHS\ lab}$	Percentage of instances in which a replacement HHS-certified laboratory is being used by another FFD program (also identified in this analysis as a "known" HHS lab) (as discussed in the assumptions below)

Assumptions:

- Hours per pre-award inspection: 100 hours, assumed to be the FFD manager.
- Each FFD program only contracts with one HHS-certified laboratory for testing services.

- Percentage of FFD programs that must change to a new HHS-certified laboratory per year because their current HHS-certified laboratory loses its HHS-certification or withdraws from the certification program: 10 percent.

- Percentage of instances in which a replacement HHS-certified laboratory is already in use by another FFD program (also identified in this analysis as "known" HHS-certified laboratory): 50 percent.

Paragraph 26.153(f)

This paragraph of the final rule restates former requirements in Section 2.7(m) in Appendix A to Part 26, which mandated that licensees require their HHS-certified laboratories to implement and comply with all applicable requirements in Part 26.[1] The final subparagraphs specify the minimum contractual terms between a licensee or C/V and their HHS-certified laboratory as discussed below:

- Subparagraph 26.153(f)(1) restates former requirements in Section 2.7(l)(1) in Appendix A to Part 26.

- Subparagraph 26.153(f)(2) clarifies former requirements in Section 2.7(o)(5) in Appendix A to Part 26.

- Subparagraph 26.153(f)(3) clarifies former requirements in Section 3.1 in Appendix A to Part 26.

- Subparagraph 26.153(f)(4) clarifies former requirements in Section 3.2 in Appendix A to Part 26.

- Subparagraph 26.153(f)(6) clarifies former requirements in Section 2.7(m) in Appendix A to Part 26.

Paragraph 26.153(f) of the final rule also adds one new contract term as discussed below:

- Subparagraph 26.153(f)(5) prohibits HHS-certified laboratories from entering into any relationships with a licensee's or other entity's MRO when such relationships may be construed as potential conflicts of interest. Although this is a new requirement, it is consistent with ethical business practices and Section 2.4(g)(6) in the HHS Guidelines (April 13, 2004). Consequently, although programs may incur an incremental cost to

[1] HHS-certified laboratories will pass on the costs associated with specific rule revisions to licensees through increased specimen testing costs. The analysis accounts for these incremental costs associated with implementation of validity testing requirements in § 26.131(a) and § 26.161(b), the most significant testing change in the final rule.

revise certain contracts to incorporate the new provision, such costs would fall only on programs with contracts that (a) do not already contain such a provision, and (b) will not update themselves automatically by incorporating the NRC provisions "by reference." The analysis assumes that any costs resulting from this provision are reflected within the legal and managerial costs calculated for § 26.27(a).

Paragraph 26.153(g)

This paragraph of the final rule adds a requirement that licensees and other entities must provide their HHS-certified laboratory with an explanatory memorandum for the record in situations where a non-Federal custody-and-control form is used for a specimen collection. The memorandum must describe why the form is being used and must state that the form contains all information required in the Federal custody-and-control form. Incremental costs per FFD program result from the labor costs of collection site personnel to write each memorandum.

The *annual costs per FFD program* are estimated as follows:

$$[NUM_{memoranda} \times (HOURS_{collector} \times WAGE_{collector})] \times NUM_{facilities}$$

Parameter	Description
$NUM_{memoranda}$	Number of memoranda per year a collection site used by a facility will write because it uses a non-Federal custody-and-control form for a specimen collection (as discussed in the assumptions below)
$HOURS_{collector}$	Time for collection staff to draft a memorandum(as discussed in the assumptions below)
$WAGE_{collector}$	Wage of collection site personnel (as discussed in Appendix 2, Exhibit A2-11)
$NUM_{facilities}$	Number of facilities per FFD program (as discussed in Appendix 2, Exhibit A2-14)

Assumptions:

- Number of memoranda per year a collection site used by a facility will write because it uses a non-Federal custody-and-control form for a specimen collection: 2.

- Time for collection staff to draft a memorandum: 15 minutes.

26.155 Laboratory personnel

Paragraph 26.155(a)

The final paragraph restates without substantive change a former requirement in Section 2.5(a)(1) in Appendix A to Part 26. The final rule replaces the term "qualified individual" used in the former rule with the term "responsible person." Subparagraphs (a)(1)–(6)

in the final rule restate the former requirements in Sections 2.5(a)(2)–(7) in Appendix A to Part 26 that defined the qualifications and responsibilities of the individual responsible for the HHS-certified laboratory's testing facility. Therefore, this final paragraph imposes no incremental costs and affords no savings.

Paragraph 26.155(b)

This paragraph of the final rule revises a former requirement in Section 2.5(b) in Appendix A to Part 26, which described the "qualified individual who reviews all pertinent data and quality control results in order to attest to the validity of the laboratory's test reports." The final paragraph introduces the term "certifying scientist" to clarify the term "qualified individual" used in the former rule. The final rule also establishes the qualifications for a certifying scientist. No incremental costs or savings are expected to result from this final paragraph because the qualifications for a certifying scientist are consistent with existing HHS-laboratory personnel qualification requirements.

Paragraph 26.155(c)

This paragraph of the final rule imposes no incremental cost and affords no saving because it restates without substantive change former requirements in Section 2.5(c) in Appendix A to Part 26.

Paragraph 26.155(d)

This paragraph of the final rule imposes no incremental cost and affords no saving because it restates without substantive change former requirements in Section 2.5(d) in Appendix A to Part 26.

Paragraph 26.155(e)

This paragraph of the final rule imposes no incremental cost and affords no saving because it restates without substantive change former requirements in Section 2.5(e) in Appendix A to 10 CFR Part 26.

Paragraph 26.155(f)

This paragraph of the final rule simplifies former requirements in Section 2.5(f) in Appendix A to Part 26, which mandated that laboratory personnel files must include: "resume of training and experience; certification or license, if any; references; job descriptions; records of performance evaluation and advancement; incident reports; and results of tests which establish employee competency for the position he or she holds . . ." Under the final paragraph, personnel files will no longer need to include: references, referrals, and incident reports, but must still include "a resume, any professional certification(s) or license(s), a job description, and documentation to show that the individual has been properly trained to perform his or her job." Even though the

final paragraph represents a relaxation of the former recordkeeping requirements applicable to HHS-certified laboratories, the analysis assumes that laboratories will not alter their file maintenance practices (and will not incur savings) because businesses commonly maintain the aforementioned documents that are no longer required.

26.157 Procedures

Paragraph 26.157(a)

This paragraph of the final rule revises former requirements in Section 2.2 in Appendix A to Part 26, which pertained to the maintenance and documentation of procedures for collecting, shipping, and accessing urine specimens. The final rule clarifies that the HHS-certified laboratory must also maintain procedures for receiving and testing specimens. The final paragraph imposes no incremental cost and affords no saving because it is consistent with the procedures and practices of existing HHS-laboratories.

Paragraph 26.157(b)

This paragraph of the final rule revises former requirements in Section 2.7(a)(2) in Appendix A to Part 26, which pertained to the content and implementation of specimen chain-of-custody procedures for HHS-certified laboratories. The final rule adds a provision that the HHS-certified laboratory must have written chain-of-custody procedures for shipping specimens to another HHS-certified laboratory. The final paragraph imposes no incremental cost and affords no saving because the new requirement is consistent with the existing specimen chain-of custody procedures used by HHS-certified laboratories.

Paragraph 26.157(c)

The final paragraph revises former requirements in Section 2.7(o)(1) in Appendix A to Part 26, which required that each HHS-certified laboratory maintain a "procedure manual." The final paragraph clarifies that HHS-certified laboratories must develop, implement, and maintain a "written standard operating procedures manual." The revision imposes no incremental costs or savings because it restates without substantive change former requirements.

Paragraph 26.157(d)

This paragraph of the final rule imposes no incremental cost and affords no saving because it restates without substantive change a former requirement in Section 2.7(o)(3)(iii) in Appendix A to Part 26.

Paragraph 26.157(e)

This paragraph of the final rule imposes no incremental cost and affords no saving because it restates without substantive change former requirements in Section 2.7(o)(4) in Appendix A to Part 26, which mandated that licensee testing facilities develop, implement, and maintain procedures for remedial actions if systems do not meet acceptable limits or errors are detected.

26.159 Assuring specimen security, chain of custody, and preservation

Paragraph 26.159(a)

This paragraph of the final rule imposes no incremental cost and affords no saving because it restates without substantive change former requirements in §2.7(a)(1) in Appendix A to Part 26, which pertained to laboratory security. This final paragraph provides added flexibility to security requirements by enumerating individuals who are permitted to be unescorted in an HHS-certified laboratory (e.g., personnel conducting inspections and audits on behalf of licensees, other entities, the NRC, the Secretary of the DHHS, and emergency personnel).

Paragraph 26.159(b)

This paragraph of the final rule imposes no incremental cost and affords no saving because it restates former requirements in Section 2.7(b)(1) in Appendix A to Part 26. The final rule also requires each licensee to investigate possible specimen tampering and take corrective actions when necessary. If there is a reason to believe that the integrity or identity of a specimen is in question, the specimen is not to be tested and the licensee or C/V must ensure that another collection occurs as soon as reasonably practicable. The final rule adds a provision that another collection is not required if either bottle from a split specimen collection remains intact and contains at least 15 mL of urine. In this case, the split specimen must be sent to the HHS-certified laboratory for testing. The final rule also specifies exclusive grounds requiring the MRO to cancel the testing of a donor's urine specimen. The analysis estimates that these final provisions will impose no incremental costs and afford no savings because the requirements are consistent with existing licensee practices, and because of the infrequent occurrence of specimen tampering events.

Paragraph 26.159(c)

This paragraph of the final rule revises former requirements in Section 2.7(b)(2) in Appendix A to Part 26, which pertained to the handling of urine specimens at HHS-certified laboratories and the use of internal custody and control forms. The final rule clarifies that laboratory chain-of-custody forms must be used while conducting initial and confirmatory testing of aliquots of an original urine specimen. The final rule also establishes that the original specimen and original specimen custody-and-control form must remain in secure storage. This final paragraph will impose no incremental cost and affords no saving because it is consistent with the existing urine specimen handling and storage practices of HHS-certified laboratories.

Paragraph 26.159(d)

This paragraph of the final rule revises former requirements in Section 2.7(a)(2) in Appendix A to Part 26, which pertained to the use of internal custody and control forms by HHS-certified laboratories. The final rule expands the required information contained on the laboratory custody-and-control form to now include the identity of the donor. Adding this information to the custody-and-control form will not result in any incremental costs.

Paragraph 26.159(e)

This paragraph of the final rule restates without substantive change former requirements in Section 2.7(a)(2) in Appendix A to Part 26, which pertained to completing the custody-and-control form each time a specimen is handled or transferred within the laboratory. The final paragraph imposes no incremental cost and affords no saving because the requirements are believed to be consistent with existing specimen chain-of-custody procedures used by HHS-certified laboratories.

Paragraph 26.159(f)

The final paragraph revises former requirements in Section 2.4(d) in Appendix A to Part 26, which pertained to specimen chain of custody procedures. This final paragraph also extends to HHS-certified laboratories the specimen packaging and shipping requirements in former Section 2.4(i) in Appendix A to Part 26, which only applied to collection sites. The final paragraph imposes no incremental cost and affords no saving because it is consistent with current HHS-certified laboratory practices.

Paragraph 26.159(g)

This paragraph of the final rule clarifies that couriers, express carriers, and postal service personnel do not have access to the custody-and-control forms or to the specimen bottles and, therefore, are not required to document chain-of-custody on the custody and control form of a urine specimen in transit. However, this paragraph adds a new requirement that the custody accountability of the shipping containers during shipment must be maintained by a tracking system provided by the courier, express carrier, or postal service. The final paragraph imposes no incremental cost and affords no saving because it describes existing courier, express carrier, and postal service specimen shipping practices.

Paragraph 26.159(h)

The final paragraph imposes no incremental cost and affords no saving because it restates without substantive change former requirements in Section 2.7(c) in Appendix A to Part 26, which pertained to short-term refrigeration storage procedures of urine specimens.

Paragraph 26.159(i)

This paragraph of the final rule revises former requirements in Section 2.7(h) in Appendix A to Part 26, which specified long-term storage requirements for positive urine specimens so that they can be made available for any necessary retesting. The final paragraph adds specimens with adulterated, substituted, and invalid test results to those that already must be stored for possible further testing. The analysis assumes that the storage costs for any additional urine specimens that must be retained by the HHS-laboratory as a result of validity test results will be accounted for in the per test cost that an HHS-certified laboratory charges each licensee. Therefore, any incremental cost resulting from the final paragraph are captured in the new validity test costs estimated in connection with §§ 26.131 and 26.161(b)(1)-(5) of the final rule.

Paragraph 26.159(j)

This paragraph of the final rule establishes a new requirement that specimens testing negative on initial or confirmatory drug testing be discarded or may be pooled for use in the HHS-certified laboratory's internal quality control program, unless validity testing indicates that the specimen is invalid. The paragraph also adds a new provision that the laboratory may not retain any information linking donors to specimens pooled for use in the internal quality control program. The final paragraph imposes no incremental cost and affords no saving because it is consistent with current practices of HHS-certified laboratories.

26.161 Cutoff levels for validity testing

Paragraph 26.161(a)

This paragraph of the final rule establishes that each initial validity test must be performed on one aliquot of a donor's urine specimen. Licensees and other entities must ensure that the HHS-certified laboratory is capable of conducting, and conducts, confirmatory testing for at least one oxidizing adulterant and any other adulterants specified by the licensee's or other entity's testing program. To report an adulterated, substituted, dilute, or invalid test result, a confirmatory validity test must be performed on a second aliquot of the donor's urine specimen. All costs associated with validity testing are considered to be incremental[2] because validity testing is a new regulatory provision. Incremental costs associated with validity testing are discussed in connection with § 26.161(b)(1)-(5).

[2] By assuming that no licensees currently conduct validity testing, the analysis overstates the incremental costs to be incurred by FFD programs as a result of the validity testing provisions. This assumption is necessary, however, because of the lack of available data regarding the types of validity testing being conducted throughout the industry.

Paragraph 26.161(b)

Subparagraphs 26.161(b)(1)-(5)

These subparagraphs of the final rule establish initial validity testing requirements, including the types of initial tests to be performed (creatinine, pH, adulterants) and the specific criteria to determine whether a specimen may be adulterated, substituted, dilute, or invalid, and thus, require confirmatory validity testing. The analysis accounts for validity testing costs under this requirement based on a per specimen testing cost at HHS-certified laboratories (i.e., initial validity testing or initial and confirmatory validity testing have the same cost).

The regulatory analysis calculates under these subparagraphs not only the costs related to conducting initial and confirmatory validity testing, but also the subsequent costs for some specimens to receive initial and confirmatory drug testing, and the associated costs resulting from confirmed adulterated or substituted validity and/or positive drug test results (including positive drug test results following confirmatory testing to the LOD for dilute specimens and positive test results following the second collection for a donor that produced an invalid specimen). Even though many of these costs are directly related to other provisions, as referenced below, this approach consolidates the series of actions that are initiated under § 26.161(b)(1)-(5), allowing for a unified (hence clearer) presentation of related actions and a simpler analysis.

FFD programs using HHS-certified laboratories for all drug testing will incur a per specimen incremental cost to conduct validity testing, as well as the labor costs of MRO and FFD personnel for administrative activities for confirmed positive drug test results and/or confirmed adulterated or substituted validity test results, the costs of retesting some specimens with confirmed drug positive, adulterated, substituted, or invalid test results at the donor's request (MRO's request for invalid specimens), and the costs of the appeals process for some drug positive, adulterated, or substituted test results that donors choose to contest. In addition, because HHS certified laboratory testing procedures and required licensee actions vary based on the type of confirmatory validity test result (e.g., dilute, invalid), the analysis discusses the costs for each validity test result type separately (designated below as "Results A, B, and C")

- "Result A": adulterated and substituted specimens
- "Result B": dilute specimens
- "Result C": invalid specimens

Annual costs per FFD program that conducts all drug testing (and validity testing) at an HHS-certified laboratory are estimated as follows:[3]

- Cost to conduct validity testing (initial and confirmatory when necessary) at an HHS-certified laboratory:

  $NUM_{validity} \times COST_{HHS\ validity\ testing} \times NUM_{reactors}$

- Additional testing may be required based on specific confirmatory validity test results, as described by the following result cases (Results A, B, and C).

  - Result A: Specimens with HHS-certified laboratory confirmatory validity test results of adulterated or substituted (creatinine concentration less than 2 mg/dL). No additional testing procedures.

  - Result B: Specimens with HHS-certified laboratory confirmatory validity test results of dilute. Additional costs include confirmatory drug testing to the limit of detection (LOD) for some specimens.[4] The costs include the following:

    $NUM_{validity} \times PER_{dilute} \times COST_{HHS\ LOD\ testing} \times NUM_{reactors}$

  - Result C: Specimens with HHS-certified laboratory confirmatory validity test results of invalid. Additional costs include collecting a second urine specimen under direct observation, as specified in § 26.185(f)(3) of the final rule, and then validity and drug testing the second specimen at an HHS-certified laboratory. The costs include the following:

    $NUM_{validity} \times PER_{invalid} \times [(COST_{2nd\ collection} + COST_{HHS\ validity\ \&\ drug\ testing})] \times NUM_{reactors}$

- Cost of subsequent actions for all adulterated, substituted, dilute, or invalid validity test results and positive drug test results identified because of the validity testing requirements in §26.161(b) and §26.185(f)(3) (sum of adulterated, substituted, dilute, and invalid validity test results and positive drug tests from Results A, B, and C). FFD programs may also incur costs associated with some donors requesting testing of their split specimen and/or some donors appealing their positive, adulterated, or substituted validity and/or drug test results.

---

[3] Incremental costs associated with validity testing for FFD programs using onsite licensee testing facilities are discussed in connection with § 26.131.

[4] Paragraph 26.163(a)(2) of the final rule permits FFD programs to require confirmatory LOD drug testing for any drug with an initial drug test result equal to or greater than 50 percent of the cutoff calibrator.

- Cost for actions subsequent to confirmed adulterated or substituted validity, and/or positive drug (including positive drug test results following confirmatory testing to the LOD for dilute specimens and positive test results following the second collection for a donor that produced an invalid specimen) test results

  $(NUM_{validity} \times [(PER_{adulterated} + PER_{substituted}) + (PER_{dilute} \times PER_{positive\ at\ LOD}) + (PER_{invalid} \times PER_{drug\ positive\ 2^{nd}\ collection})] \times COST_{subsequent\ actions}) \times NUM_{reactors}$

- When requested by some donors, the cost of retesting specimens with confirmed adulterated or substituted validity, and/or positive drug (including positive drug test results following confirmatory testing to the LOD for dilute specimens and positive test results following the second collection for a donor that produced an invalid specimen) test results at a second HHS-certified laboratory

  $(NUM_{validity} \times [(PER_{adulterated} + PER_{substituted}) + (PER_{dilute} \times PER_{positive\ at\ LOD}) + (PER_{invalid} \times PER_{drug\ positive\ 2^{nd}\ collection})] \times PER_{retest} \times COST_{retest}) \times NUM_{reactors}$

- When requested by some donors, the cost of the appeals process for confirmed adulterated or substituted validity and/or positive drug test results (including positive drug test results following confirmatory testing to the LOD for dilute specimens and positive test results following the second collection for a donor that produced an invalid specimen)

  $NUM_{validity} \times [(PER_{adulterated} + PER_{substituted}) + (PER_{dilute} \times PER_{positive\ at\ LOD}) + (PER_{invalid} \times PER_{drug\ positive\ 2^{nd}\ collection})] \times PER_{appeal} \times [(HOURS_{FFD\ manager} \times WAGE_{FFD\ manager}) + HOURS_{Worker} \times WAGE_{Worker})] \times NUM_{reactors}$

Parameter	**Description**
$NUM_{validity}$	Number of validity tests per reactor per year (as discussed in the assumptions below and in Appendix 2, Exhibit A2-12)
$COST_{HHS\ validity\ testing}$	Incremental cost per urine specimen to conduct validity testing (initial validity test and confirmatory validity test when necessary) at an HHS-certified laboratory (as discussed in the assumptions below)
PER_{dilute}	Percentage of urine specimens with validity test results of dilute (as discussed in Appendix 2, Exhibit A2-12)
$COST_{HHS\ LOD\ testing}$	Cost per specimen to conduct initial drug testing and confirmatory drug testing to the level of detection (LOD) for drug(s) identified during initial testing, as permitted by § 26.163(a)(2) of the final rule (as discussed in Appendix 2, Exhibit A2-13)
$PER_{invalid}$	Percentage of urine specimens with validity test results of invalid (as discussed in Appendix 2, Exhibit A2-12)

Parameter	Description
$COST_{2nd\ collection}$	Cost of collecting a second urine specimen under direct observation from a donor with a confirmatory validity test result of invalid for the initial urine specimen collected. The cost of the second collection includes the labor for the donor's travel time to and from the collection site, donor's time spent at the collection site, as well as the labor of the collector (as discussed in Appendix 2, Exhibit A2-13)
$COST_{HHS\ validity\ \&\ drug\ testing}$	Cost per specimen to conduct initial drug and initial validity testing at an HHS-certified laboratory, as well as confirmatory drug and/or validity testing when necessary (as discussed in Appendix 2, Exhibit A2-13)
$PER_{adulterated}$	Percentage of urine specimens with validity test results of adulterated (as discussed in Appendix 2, Exhibit A2-12)
$PER_{substituted}$	Percentage of urine specimens with validity test results of substituted (less than 2 mg/dL creatinine) (as discussed in Appendix 2, Exhibit A2-12)
$PER_{positive\ LOD}$	Percentage of dilute specimens that test positive for drug(s) at LOD testing (as discussed in the assumptions below)
$PER_{drug\ positive\ 2nd\ collection}$	Percentage of specimens collected under direct observation as a result of an initial specimen with a confirmatory validity test result of invalid that test positive for drugs (as discussed in the assumptions below)
$COST_{subsequent\ actions}$	Labor costs associated with MRO and FFD program personnel activities and administrative actions resulting from a confirmed positive drug test result (including positive drug test results following confirmatory testing to the LOD for dilute specimens and positive test results following the second collection for a donor that produced an invalid specimen), and/or adulterated or substituted validity test result (as discussed in Appendix 2, Exhibit A2-13)
PER_{retest}	Percentage of urine specimens with confirmed positive, adulterated, substituted, dilute, or invalid validity and/or drug test results retested at the request of the donor at a second HHS-certified laboratory (as discussed in the assumptions below)
$COST_{retest}$	Cost of specimen retesting at a second HHS-certified laboratory, including specimen preparation and shipping costs (as discussed in Appendix 2, Exhibit A2-13)
PER_{appeal}	Percentage of confirmed adulterated and substituted validity test results and positive drug test results appealed by some donors (as discussed in the assumptions below)
$HOURS_{FFD\ manager}$	Average amount of FFD manager time per appeal for a confirmed positive drug test result (including positive drug test results following confirmatory testing to the LOD for dilute specimens and positive test results following the second collection for a donor that produced an invalid specimen), and/or adulterated or substituted validity test result appealed by some donors (as discussed in the assumptions below)
$WAGE_{FFD\ manger}$	FFD manager wage rate (as discussed in Appendix 2, Exhibit A2-11)

Parameter	Description
$HOURS_{Worker}$	Average amount of worker time per appeal of a confirmed adulterated or substituted validity test result and/or positive drug test result (as discussed in the assumptions below)
$WAGE_{Worker}$	Facility worker wage rate (as discussed in Appendix 2, Exhibit A2-11)
$NUM_{reactors}$	Number of reactors per FFD program (as discussed in Appendix 2, Exhibit A2-14)

Assumptions:

- Number of validity tests per reactor per year is equivalent to the number of drug tests conducted by each reactor per year.

- Each FFD program contracting with an HHS-certified laboratory to conduct all drug and validity testing of urine specimens will pay a fixed cost per specimen, which will account for initial drug and validity testing and confirmatory drug and validity testing when necessary.[5]

- All FFD programs choose to test dilute specimens according to the optional provisions in § 26.163(a)(2). That is, any specimen with an initial drug test result equal to or greater than 50 percent of the cutoff calibrator will receive confirmatory LOD drug testing.

- Percentage of dilute specimens that test positive for drug(s) at LOD testing: 33 percent.

- All urine specimens that test as adulterated, substituted (< 2 mg/dL creatinine), or invalid on initial validity testing, remain adulterated, substituted, and invalid after confirmatory validity testing.

- For all urine specimens with validity test results of invalid, the analysis assumes that a second specimen is collected under direct observation.

[5] Some HHS-certified laboratories may not charge licensees to conduct initial and confirmatory validity testing, given the other tests that are being performed. However, to be conservative, the analysis assumes that a validity test at an HHS-certified laboratory will cost $1.50.

- Percentage of specimens collected under direct observation as a result of an initial specimen with a confirmatory validity test result of invalid that test positive for drugs: 33 percent.[6]

- Percentage of urine specimens with confirmed positive drug, and/or adulterated or substituted validity test result retested at the request of the donor at a second HHS-certified laboratory: 5 percent.

- Percentage of confirmed positive, adulterated, and substituted validity and drug test results appealed by some donors: 1 percent.

- Average amount of FFD manager time per appeal process for a confirmed positive drug test result (including positive drug test results following confirmatory testing to the LOD for dilute specimens and positive test results following the second collection for a donor that produced an invalid specimen), and/or adulterated or substituted validity test result: 12.5 hours.

- Average amount of worker time per appeal process for a confirmed positive drug test result (including positive drug test results following confirmatory testing to the LOD for dilute specimens and positive test results following the second collection for a donor that produced an invalid specimen), and/or adulterated or substituted validity test result appealed by some donors: 2.0 hours.

Paragraphs 26.161(c), (d), (e), and (f)

The final paragraphs establish the analytical test result thresholds, which indicate that a urine specimen is adulterated, substituted, dilute, or invalid. The incremental costs associated with validity testing are discussed in connection with §§ 26.131 and 26.161(b)(1)-(5).

Paragraph 26.161(g)

This paragraph of the final rule adds a new requirement that if a urine specimen is suspected of containing an unidentified interfering substance or adulterant that could make a validity test invalid, the HHS-certified laboratory must consult with the licensee's or other entity's MRO to obtain instruction as to whether to send the specimen to a second HHS-certified laboratory that has the capability to identify the suspected substance or adulterant.

---

[6] A second specimen is collected under direct observation for donors that have an initial specimen with an invalid test result to reduce the probability that their second specimen will be altered (e.g., use of adulterants) and therefore, the drug use that was attempted to be masked during the initial specimen donation will more likely be detected in the second specimen collected. (Note: the analysis assumes that if the MRO chooses to retest the initial invalid specimen at a second HHS-certified laboratory, the second laboratory will be unable to identify what is causing the specimen result to be invalid and a second specimen collection under direct observation would commence.)

The *annual costs per FFD program* are estimated as follows:

$$NUM_{new\ adulterant} \times [COST_{retest} + (HOURS_{MRO} \times WAGE_{MRO})] \times NUM_{facilities}$$

Parameter	Description
$NUM_{new\ adulterant}$	Number of urine specimens per facility per year that are suspected of having a new adulterant or interfering agent that could make a test result invalid and the MRO decides to send to a second HHS-certified laboratory for additional validity testing (as discussed in the assumptions below)
$COST_{retest}$	Cost per specimen to conduct validity retesting at a second HHS-certified laboratory, including specimen preparation and shipping costs (as discussed in Appendix 2, Exhibit A2-13)
$HOURS_{MRO}$	Time per specimen for an MRO to speak with the HHS-certified laboratory and determine whether a specimen is to be retested at a second HHS-certified laboratory, and the time to review the results of validity testing at the second HHS-certified laboratory (as discussed in the assumptions below)
$WAGE_{MRO}$	MRO wage rate (as discussed in Appendix 2, Exhibit A2-11)
$NUM_{facilities}$	Number of facilities per FFD program (as discussed in Appendix 2, Exhibit A2-14)

Assumptions:

- Number of urine specimens per facility per year that are suspected of having a new adulterant or interfering agent that could make a test result invalid and the MRO decides to send to a second HHS-certified laboratory for additional validity testing: 1.

- Time per specimen for an MRO to speak with the HHS-certified laboratory and determine whether a specimen is to be retested at a second HHS-certified laboratory, and the time to review the results of validity testing at the second HHS-certified laboratory: 30 minutes.

- MRO chooses to retest all specimens that are suspected of containing adulterants or interfering agents that could make a test result invalid.

Paragraph 26.161(h)

The final paragraph imposes no incremental cost and affords no saving because it prohibits licensees and C/Vs from using validity testing cutoff levels that are more stringent than those specified in Part 26. The costs associated with validity testing are discussed in connection with §§ 26.131 and 26.161(b)(1)-(5) of the final rule.

26.163 Cutoff levels for drugs and drug metabolites

Subparagraph 26.163(a)(1)

This subparagraph revises former requirements in Section 2.7(e)(1) in Appendix A to Part 26, which pertained to the initial cutoff levels for drugs and drug metabolites (marijuana, cocaine, opiates, phencyclidine, amphetamines). The final rule will lower the initial cutoff level for marijuana metabolites from 100 ng/mL to 50 ng/mL. FFD programs conducting initial drug testing at HHS-certified laboratories will incur annual incremental costs attributable to the more stringent cutoff testing level, which will increase the number of positive drug tests for marijuana. The additional costs will consist of labor costs for the MRO and FFD personnel activities resulting from confirmed positive drug test results, the costs of retesting specimens at a second HHS-certified laboratory at the request of some donors, and the costs of the appeals process for some positive test results that donors choose to contest. The final rule will also raise the initial cutoff level for opiate metabolites from 300 ng/mL to 2,000 ng/mL. FFD programs conducting initial drug testing at HHS-certified laboratories will realize annual incremental savings resulting from the less stringent cutoff level, which will significantly reduce the number of positive opiate drug tests that MROs will ultimately verify as negative. Incremental savings will result from eliminating labor costs associated with the MRO and FFD personnel activities as a result of fewer confirmed positive drug test results, savings associated with fewer donors requesting retesting of their specimen at a second HHS-certified laboratory, and the savings from fewer appeals for some positive drug test results that donors choose to contest.

Annual costs per FFD program using HHS-certified laboratories for initial drug testing for additional confirmed positive marijuana drug test results are estimated as the sum of the following:

- Cost for actions subsequent to additional positive confirmatory marijuana drug test results:

  $(NUM_{marijuana} \times PERI_{marijuana} \times COST_{subsequent\ actions}) \times NUM_{reactors}$

- Cost for retesting specimens with confirmed positive marijuana drug test specimens at a second HHS-certified laboratory at the request of some donors:

  $(NUM_{marijuana} \times PERI_{marijuana} \times PER_{retest} \times COST_{retest}) \times NUM_{reactors}$

- Cost of appeals process for confirmed positive marijuana test results that some donors choose to contest:

  $(NUM_{marijuana} \times PERI_{marijuana} \times PER_{appeal}) \times [(HOURS_{FFD\ manager} \times WAGE_{FFD\ manager}) + HOURS_{worker} \times WAGE_{worker})] \times NUM_{reactors}$

Annual savings per FFD program using HHS-certified laboratories for initial drug testing for fewer confirmed positive opiate drug tests are estimated as the sum of the following:

- Saving from fewer specimens with positive confirmatory opiate drug test results:

  $(NUM_{opiate} \times PERD_{opiate} \times COST_{subsequent\ actions}) \times NUM_{reactors}$

- Saving from fewer positive opiate drug test specimens retested at another HHS-certified laboratory at the request of some donors:

  $(NUM_{opiate} \times PERD_{opiate} \times PER_{retest} \times COST_{retest}) \times NUM_{reactors}$

- Saving from fewer appeals for confirmed positive opiate drug test results that some donors choose to contest:

  $(NUM_{opiate} \times PERD_{opiate} \times PER_{appeal}) \times [(HOURS_{FFD\ manager} \times WAGE_{FFD\ manager}) + HOURS_{worker} \times WAGE_{worker})] \times NUM_{reactors}$

Parameter	**Description**
$NUM_{marijuana}$	Number of confirmed marijuana positive drug test results under the former rule per reactor per year (as discussed in Appendix 2, Exhibit A2-12)
$PERI_{marijuana}$	Percentage increase in positive marijuana drug test results due to the more stringent cutoff level in the final rule (as discussed in the assumptions below)
$COST_{subsequent\ actions}$	Labor costs associated with MRO and FFD program personnel activities and administrative actions resulting from a confirmatory positive drug test result (as discussed in Appendix 2, Exhibit A2-13)
$NUM_{reactors}$	Number of reactors per FFD program (as discussed in Appendix 2, Exhibit A2-14)
PER_{retest}	Percentage of urine specimens with confirmed positive drug test results which the donors request specimen retesting at a second HHS-certified laboratory (as discussed in the assumptions below)
$COST_{retest}$	Cost of specimen retesting at a second HHS-certified laboratory, including specimen preparation and shipping costs, per specimen (as discussed in Appendix 2, Exhibit A2-13)
PER_{appeal}	Percentage of confirmed positive drug test results appealed by some donors (as discussed in the assumptions below)
$HOURS_{FFD\ manager}$	Average amount of FFD manager time per appeal of a confirmed positive validity test result (as discussed in the assumptions below)
$WAGE_{FFD\ manager}$	FFD manager wage rate (as discussed in Appendix 2, Exhibit A2-11)
$HOURS_{worker}$	Average amount of worker time per appeal of a confirmed positive drug test result (as discussed in the assumptions below)

Parameter	Description
$WAGE_{worker}$	Facility worker wage rate (as discussed in Appendix 2, Exhibit A2-11)
NUM_{opiate}	Number of confirmed positive opiate drug test results under the former rule per reactor per year (as discussed in Appendix 2, Exhibit A2-12)
$PERD_{opiate}$	Percentage decrease in positive opiate drug test results due to the higher cutoff level in the final rule (as discussed in the assumptions below)

Assumptions:

- Percentage increase in positive marijuana drug test results due to the more stringent cutoff level in the final rule: 40 percent.[7]

- Percentage of urine specimens with confirmed positive drug test results which the donors request specimen retesting at a second HHS-certified laboratory (as discussed in the assumptions below): 5 percent.

- Percentage decrease in positive opiate drug test results due to the higher cutoff level in the final rule: 75 percent.[8]

- Changing the cutoff thresholds for marijuana and opiates will not result in a change in assay costs and will not require upgrading testing facility equipment because HHS-certified laboratories currently conduct testing to the cut-off levels for DOT regulated entities covered by 49 CFR Part 40.

- Percentage of confirmed positive drug test results appealed by some donors: 1 percent.

- Average amount of FFD manager time per appeal of a confirmed positive drug test result: 12.5 hours.

- Average amount of worker time per appeal of a confirmed positive drug test result: 2.0 hours.

[7] When U.S. DOT changed the marijuana metabolite cutoff level from 100 ng/mL to 50 ng/mL, HHS-certified laboratories experienced an increase in the number of positive marijuana test results from 25 to 40 percent. Several licensees currently test for marijuana metabolites at the 50 ng/mL cutoff level, as required in the final rule. One licensee reported 49 additional positive test results over a 2½-year period (an increase of 57 percent over the 100 ng/ml cutoff level).

[8] Relaxing the initial cutoff level for opiate metabolites will almost entirely eliminate the false positive issue associated with consuming poppy seeds and, unless an individual consumes large prescribed doses of codeine-based cough syrup or other cold prescriptions, the threshold will significantly reduce the number of tests that screen positive for opiates as a result of legitimate use of prescribed cold and cough prescriptions.

Subparagraph 26.163(a)(2)

This subparagraph establishes that a licensee or other entity may require the HHS-certified laboratory to conduct special analyses on dilute specimens. The subparagraph states that if the initial validity test result of a urine specimen is dilute, the licensee or other entity has the option to require the laboratory to compare the quantitative test results for each drug tested to the cutoff calibrator in each drug class. If the initial test result for any drug is equal to or greater than 50 percent of the cutoff, the laboratory must conduct confirmatory testing to the LOD for the drug(s) and/or drug metabolites. These incremental costs are estimated and discussed in connection with §§ 26.131 and 26.161(b)(1)-(5).

Paragraph 26.163(b)

This paragraph revises former requirements in Section 2.7(f)(2) in Appendix A to Part 26, which pertained to the cutoff levels for confirmatory drug testing. The final rule will increase the cutoff levels used in confirmatory tests for morphine and codeine from 300 ng/mL to 2,000 ng/mL. The final paragraph will also establish a cutoff level of 10 ng/mL for 6-acetylmorphine, which is to be evaluated for specimens in which morphine is detected at or above the 2,000 ng/mL cutoff level. The incremental costs of the final rule changes are estimated and discussed in connection with §§ 26.133 and 26.163(a)(1) and include additional confirmed positive marijuana drug test results and fewer positive opiate drug test results.

26.165 Testing split specimens and retesting single specimens

Paragraph 26.165(a)

This paragraph of the final rule imposes no incremental cost and affords no saving because it merely restates without substantive change former requirements in Section 2.7(j) in Appendix A to Part 26, which pertain to the split specimen testing procedures for Bottles A and B of a urine specimen, based on whether the licensee testing facility or HHS-certified laboratory analyzed the specimen in Bottle A.

Paragraph 26.165(b)

This paragraph of the final rule establishes a new provisions that permits a donor from an FFD program that does not follow split specimen collection procedures to request (through the MRO) a retest of an aliquot of a single specimen with a confirmed positive, adulterated, or substituted test result (provided the specimen quantity is 30 mL or more and the specimen is not invalid). This paragraph also restates former requirements in Section 2.7(j) in Appendix A to Part 26, which permitted testing of a split specimen with a confirmed positive drug test result for the initial specimen tested. The final rule adds a provision to permit split specimen testing for confirmed adulterated and substituted validity test results. The incremental costs associated with

retesting split specimens with confirmed positive, adulterated, or substituted test results are estimated in connection with §§ 26.131 and 26.161(b)(1)-(5).

Incremental costs associated with a retest of an aliquot of a single specimen with a confirmed positive, adulterated, or substituted test result includes an increased number of retests for FFD programs that currently use single specimen collections, given that donors do not currently have the option to request a retest. The incremental costs estimated in this section account only for the retesting of an aliquot of a single specimen that returns a confirmed positive drug test result. The incremental costs calculated here do not include those associated with retesting an aliquot of a single specimen with confirmed adulterated or substituted validity test result, which are estimated separately in connection with §§ 26.131 and § 26.161(b)(1)-(5). Similarly, changes in cutoff levels for marijuana and opiates are estimated in connection with §§ 26.133, and 26.163(a)(1).

The *annual incremental costs per FFD program* are estimated as follows:

$$(NUM_{confirmed} \times PER_{retest} \times PERI_{retest} \times COST_{retest}) \times NUM_{reactors}$$

Parameter	Description
$NUM_{confirmed}$	Number of positive drug test results per reactor per year (as discussed in Appendix 2, Exhibit A2-12)
PER_{retest}	Percentage of urine specimens with positive drug test results retested at the request of the donor at a second HHS-certified laboratory (as discussed in the assumptions below)
$PERI_{retest}$	Percentage increase in retesting of positive urine specimens based on the final rule provision to allow retesting of single specimens (as discussed in the assumptions below)
$COST_{retest}$	Cost of specimen retesting at a second HHS-certified laboratory including, specimen preparation and shipping costs (as discussed in Appendix 2, Exhibit A2-13)
$NUM_{reactors}$	Number of reactors per FFD program (as discussed in Appendix 2, Exhibit A2-14)

Assumptions:

- Percentage of urine specimens with positive drug test results retested at the request of the donor at a second HHS-certified laboratory (as discussed in the assumptions below): 5 percent.

- Percent increase in retesting of positive drug test specimens based on the final rule provision to allow retesting of single specimens: 10 percent.

Paragraph 26.165(c)

This paragraph of the final rule revises former requirements in Section 2.7(i) and (j) in Appendix A to Part 26, which pertained to the procedures for testing split specimens for drugs at a second

HHS-certified laboratory. The final rule adds procedures for retesting single specimens. The retesting of a urine specimen must be confirmatory testing for drugs and drug metabolites only for the drugs(s) that the specimen tested positive at the first HHS-certified laboratory. If the second HHS-certified laboratory fails to reconfirm the presence of the drug(s) detected at the initial HHS-certified laboratory, the second HHS-certified laboratory shall conduct specimen validity testing. The incremental costs for retesting single specimens is calculated and discussed in connection with § 26.165(b).

Paragraph 26.165(d)

This paragraph of the final rule establishes procedures for retesting urine specimens with confirmatory validity test results of adulterated at a second HHS-certified laboratory. Retesting of adulterated urine specimens is limited to conducting confirmatory testing only for the adulterant(s) identified by the first HHS-certified laboratory. The incremental costs associated with retesting urine specimens for adulterants are estimated and discussed in connection with §§ 26.131 and 26.161(b)(1)-(5).

Paragraph 26.165(e)

This paragraph of the final rule establishes procedures for retesting urine specimens with confirmatory validity test results of substituted at a second HHS-certified laboratory. Retesting of substituted urine specimens is limited to conducting confirmatory testing only for creatinine and specific gravity. The incremental costs associated with retesting urine specimens for substitution are estimated and discussed in connection with §§ 26.131 and 26.161(b)(1)-(5).

Paragraph 26.165(f)

This paragraph of the final rule establishes FFD management actions and sanctions pertaining to situations where a donor has a confirmed positive, adulterated, or substituted drug and/or validity test result and requests the retesting of their specimen at a second HHS-certified laboratory. If the results of the retest do not confirm the initial result, that is, the second test indicates a negative drug and/or validity test result, this paragraph specifies procedures that the licensee and other entities must follow. The procedures and actions include not imposing any sanctions on the individual; eliminating any records from the individual's personnel files pertaining to the temporary administrative actions; prohibiting the disclosure of temporary administrative action in response to a suitable inquiry, a background investigation, or any other inquiry or investigation; and providing a written statement to the individual that the temporary administrative action that was taken will not be disclosed and need not be disclosed by the individual in response to requests for self-disclosure of potentially disqualifying FFD information. The analysis does not estimate the costs of the administrative actions (FFD program management labor to discard records and draft a written statement) associated with this final paragraph due to the infrequency of instances where the retesting of a positive, adulterated, or substituted validity and/or drug test specimen at a second HHS-certified laboratory fails to confirm the initial HHS-certified laboratory positive, adulterated, or substituted test result.

26.167 Quality assurance and quality control

Paragraph 26.167(a)

This paragraph of the final rule clarifies former requirements in Section 2.8(a) and (d) in Appendix A to Part 26, which specified that HHS-certified laboratories must implement a quality assurance program that encompasses all aspects of the testing process. The final rule adds a new requirement for the quality assurance program to encompass the certification of calibrators and controls to ensure that calibrators and controls are accurate. This paragraph in the final rule imposes no incremental costs and afford no savings because the requirements are consistent with the existing quality assurance programs implemented by HHS-certified laboratories.

Paragraph 26.167(b)

This paragraph of the final rule revises former requirements in Sections 2.8(c) and (d) in Appendix A to Part 26, which required HHS-certified laboratories to include appropriate calibrators and controls in each analytical run of initial and confirmatory drug test specimens. The final paragraph adds the requirement that appropriate calibrators and controls must be included in each analytical run for initial and confirmatory validity test specimens. The incremental costs resulting from validity testing are discussed in connection with § 26.161. This paragraph in the final rule imposes no incremental costs and afford no savings for drug testing because the requirements are consistent with the existing quality assurance programs implemented by HHS-certified laboratories

Paragraph 26.167(c)

This paragraph establishes quality control requirements for conducting initial and confirmatory validity tests at HHS-certified laboratories. This final paragraph will impose incremental costs per FFD program on a per specimen test basis. That is, the per test cost to conduct validity testing includes the costs to comply with the quality control requirements in this paragraph. The incremental cost for FFD programs to conduct validity testing is calculated in §§ 26.131 and 26.161(b)(1)-(5).

Paragraph 26.167(d)

This paragraph of the final rule revises former requirements in Section 2.7(e)(1) in Appendix A to Part 26, which mandated that initial drug tests must be performed using an immunoassay that meets the FDA requirements for commercial distribution. The final rule prohibits the use of non-instrumented immunoassay testing devices pending HHS/SAMHSA review and approval from being used for initial drug testing under this part. The final rule also revises former requirements in Section 2.8(c) in Appendix A to Part 26, which pertained to the quality control requirements for performing initial drug tests at HHS-certified laboratories. This final paragraph imposes no incremental costs and affords no savings because the provisions are consistent with the existing practices of HHS-certified laboratories.

Paragraph 26.167(e)

This paragraph of the final rule revises former requirements in Sections 2.7(f)(2) and 2.8(d) in Appendix A to Part 26, which pertained to quality control requirements for performing confirmatory drug tests at HHS-certified laboratories. This final paragraph imposes no incremental costs and affords no savings because the provisions are consistent with existing practices of HHS-certified laboratories.

Paragraph 26.167(f)

This paragraph of the final rule clarifies former requirements in Sections 2.8(e)(4)–(6) in Appendix A to Part 26, which pertained to errors in HHS-certified laboratory testing of blind performance test specimens and actual specimens, as well as errors identified through processing reviews and any matters that may adversely affect the testing process. The final paragraph requires licensees and C/Vs to ensure that the HHS-certified laboratory conducts investigations into any testing errors and takes corrective action when necessary. The final paragraph will impose no incremental costs and affords no savings because the requirement is consistent with current quality assurance procedures used by HHS-certified laboratories.

Paragraph 26.167(g)

This paragraph of the final rule imposes no cost and affords no savings because it restates former requirements in Section 2.7(o)(3)(i) in Appendix A to Part 26.

Paragraph 26.167(h)

This paragraph of the final rule revises without substantive change the former requirements in Section 2.7(o)(2) in Appendix A to Part 26 which described the preparation and handling procedures for standards and controls. This paragraph clarifies that HHS-certified laboratories may prepare calibrators and controls from stock solutions obtained from other laboratories or commercial manufacturers. This final paragraph also adds a provision that prohibits HHS-certified laboratories from using calibrators and controls prepared from the same stock solution. No incremental cost or saving will result from the provisions in this paragraph because they are consistent with existing laboratory practices pertaining to calibrator and control preparation.

26.168 Blind Performance Testing

Paragraph 26.168(a)

This paragraph of the final rule revises former requirements in Section 2.8(e)(2)–(3) in Appendix A to Part 26, which pertained to blind performance test samples. This revision will result in incremental savings for each FFD program, as discussed in connection with § 26.168(a)(1)–(2).

Subparagraph 26.168(a)(1)

This subparagraph in the final rule revises former requirements in Section 2.8(e)(2) in Appendix A to Part 26, which pertained to the number of blind performance test samples that licensees and other entities were required to submit to an HHS-certified laboratory during the initial 90 days of any contract (not including rewritten or renewed contracts). Under the former requirements, during the initial 90 days of a contract, 50 percent of the total number of specimens submitted were required to be blind performance test samples (up to a maximum of 500 samples). The final rule reduces the number of blind performance test samples that must be submitted by a licensee or other entity in the initial 90 days of a contract to 20 percent (up to a maximum of 100 blind samples) or 30 blind samples, whichever is greater. The final rule will result in incremental savings for some FFD programs and costs for other FFD programs, as follows:

- FFD programs that conduct all testing at HHS-certified laboratories ("offsite laboratories") will recognize savings related to the reduced number of blind performance test samples purchased from commercial vendors and analyzed at HHS-certified laboratories.

- In contrast, FFD programs that conduct initial validity and drug testing of specimens at onsite licensee testing facilities send HHS-certified laboratories many fewer urine specimens for testing under the former rule requirements.[9] Unlike the former rule, the final rule requires an FFD program to submit a minimum number of blind performance test samples to their HHS-certified laboratory. Therefore, this provision increases the number of blind samples that FFD programs with onsite licensee testing facilities must submit to HHS-certified laboratories. For this reason, FFD programs using onsite licensee testing facilities will incur incremental costs for an increased number of blind samples purchased from commercial vendors and analyzed at HHS-certified laboratories.

Annual savings per FFD program that uses an HHS-certified laboratory for all validity and drug testing of urine specimens are calculated as the difference between the costs under the former rule and costs under the final rule, as follows:

$$[(NUM_{\text{drug tests per quarter}} \times PER_{\text{blind samples, initial 90 days, former rule}} \times COST_{\text{blind sample and testing, former rule}} \times NUM_{\text{reactors}}) - (NUM_{\text{drug tests per quarter}} \times PER_{\text{blind samples, initial 90 days, final rule}} \times COST_{\text{blind sample and testing, final rule}} \times NUM_{\text{reactors}})] \times PER_{\text{change HHS lab}}$$

[9] Specifically, FFD programs with onsite licensee testing facilities submit to HHS-certified laboratories only positive initial drug test specimens, and a "sampling" of negative urine specimens (assumed to be 1 percent) analyzed at the licensee testing facility.

Annual costs per FFD program that conducts initial validity and drug testing of specimens at an onsite licensee testing facility are calculated as the difference between the costs under the former rule and costs under the final rule, as follows:

$$[(NUM_{\text{specimens to HHS lab per quarter from LTF}} \times PER_{\text{blind samples, initial 90 days, former rule}} \times COST_{\text{blind sample and testing, former rule}} \times NUM_{\text{reactors}}) - (NUM_{\text{specimens to HHS per quarter from LTF}} \times PER_{\text{blind samples, initial 90 days, final rule}} \times COST_{\text{blind sample and testing, final rule}} \times NUM_{\text{reactors}})] \times PER_{\text{change HHS lab}}$$

Parameter	Description
$NUM_{\text{drug tests per quarter}}$	Number of drug tests per reactor per quarter (as discussed in the assumptions below and in Appendix 2, Exhibit A2-14)
$PER_{\text{blind samples, initial 90 days, former rule}}$	Percentage of drug test specimens under the former rule that must be blind performance test samples submitted in the first 90 days of a contract with an HHS-certified laboratory (as discussed in the assumptions below)
$COST_{\text{blind sample and testing, former rule}}$	Cost per blind specimen under the former rule for an FFD program to purchase a blind performance test sample from a commercial vendor, prepare the sample (fill out custody-and-control form, submit the sample for testing to an HHS-certified laboratory, drug test the specimen, and labor to verify that the test results are accurate (as discussed in Appendix 2, Exhibit A2-13)
$PER_{\text{blind samples, initial 90 days, final rule}}$	Percentage of drug test specimens under the final rule that must be blind performance test samples submitted in the first 90 days of a contract with an HHS-certified laboratory (as discussed in the assumptions below)
$COST_{\text{blind sample and testing, final rule}}$	Cost under the final rule provisions for an FFD program to purchase a blind performance test sample from a commercial vendor, prepare the sample (fill out custody-and-control form), submit the sample for testing to an HHS-certified laboratory, drug and validity test the specimen, and labor to verify that the test results are accurate (as discussed in Appendix 2, Exhibit A2-13)
$PER_{\text{change HHS lab}}$	Percentage of years that an FFD program enters a contract with a different HHS-certified laboratory (as discussed in the assumptions below)
$NUM_{\text{specimens to HHS lab per quarter from LTF}}$	Number of urine specimens per reactor per quarter submitted to an HHS-certified laboratory by FFD programs that conduct initial specimen testing at an onsite licensee testing facility (LTF) (as discussed in the assumptions below and in Appendix 2, Exhibit A2-12)
NUM_{reactors}	Number of reactors per FFD program (as discussed in Appendix 2, Exhibit A2-14)

Assumptions:

- The number of drug tests conducted per reactor per quarter is equivalent to the number of drug tests per conducted per reactor per year (see Appendix 2, Exhibit A2-14) divided by 4 quarters in the year.

- Percentage of years that a FFD program enters a contract with a different HHS-certified laboratory: 10 percent. That is, on average, a FFD program will choose to use a different HHS-certified laboratory every 10 years.

- Percentage price increase per blind performance test sample purchased from a commercial vendor under the final rule due to the inclusion of adulterated, substituted, and dilute validity test specimens as well as samples submitted as a false negative challenge §§ 26.168(a)(3)–(a)(6): 75 percent.

- The number of urine specimens per reactor per quarter submitted to an HHS-certified laboratory by FFD programs that conduct initial specimen testing at an onsite licensee testing facility (LTF) is equal to the total per quarter of the following:

    - positive initial drug test specimens, and

    - a "sampling" of negative urine specimens [assumed to be 1 one percent] as a check on false negative rate

Subparagraph 26.168(a)(2)

This subparagraph of the final rule revises former requirements in Section 2.8(e)(2) in Appendix A to Part 26, which pertained to the number of blind performance test specimens that licensees and C/Vs must submit to their HHS-certified laboratory during each quarter after the initial 90 days of the contract with the laboratory. Under the former regulations, 10 percent of the total number of samples submitted per quarter (up to a maximum of 250 samples) had to be blind performance test specimens. Th final rule reduces that number to a minimum of 1 percent of the total number of samples submitted per quarter (up to a maximum of 100 samples) or 10 blind specimens, whichever is greater. This subparagraph in the final rule will result in incremental savings for some FFD programs and costs for other FFD programs, as follows:

- FFD programs that send all urine specimens to HHS-certified laboratories ("offsite laboratories") will recognize incremental savings related to the reduced number of blind performance test specimens purchased from commercial vendors and validity and drug tested at HHS-certified laboratories.

- In contrast, FFD programs that conduct testing at onsite licensee testing facilities send HHS-certified laboratories many fewer specimens for testing under the former rule.[10] Unlike the former rule, the final rule requires licensees testing facilities to submit a minimum number of blind performance test samples to their HHS-certified laboratories.

[10] Specifically, FFD programs with onsite licensee testing facilities submitted to HHS-certified laboratories only positive initial drug test specimens, and a "sampling" of negative urine specimens [assumed one percent].

Therefore, the final rule increases the number of blind specimens that onsite licensee testing facilities must submit to HHS-certified laboratories. For this reason, FFD programs that conduct testing of urine specimens at onsite licensee testing facilities will incur incremental costs for an increased number of blind performance test samples purchased from commercial vendors and submitted to HHS-certified laboratories for drug and validity testing.

Annual savings per FFD program that uses an HHS-certified laboratory to conduct all urine specimen testing. The savings per FFD program with a contract with an HHS-certified laboratory that has been in place for more than 90 days are calculated as the difference between the costs under the former rule and the costs after implementation of the final rule, as follows:

$$(NUM_{\text{drug tests per quarter}} \times PER_{\text{blind specimens, former rule}} \times COST_{\text{blind specimen testing, former rule}} \times NUM_{\text{reactors}} \times NUM_{\text{quarters in year}}) - (NUM_{\text{drug tests per quarter}} \times PER_{\text{blind specimens, final rule}} \times COST_{\text{blind specimen testing, final rule}} \times NUM_{\text{reactors}} \times NUM_{\text{quarters in year}})$$

Annual costs per FFD program that conducts testing of urine specimens at a licensee testing facility (LTF) are calculated as the difference between the costs under the former rule and costs after implementation of the final rule, as follows:

$$(NUM_{\text{drug tests to HHS lab per quarter, LTF}} \times PER_{\text{blind specimens, former rule}} \times COST_{\text{blind specimen testing, former rule}} \times NUM_{\text{reactors}} \times NUM_{\text{quarters in year}}) - (NUM_{\text{drug tests to HHS lab per quarter, LTF}} \times PER_{\text{blind specimens, final rule}} \times COST_{\text{blind specimen testing, final rule}} \times NUM_{\text{reactors}} \times NUM_{\text{quarters in year}})$$

Parameter	**Description**
$NUM_{\text{drug tests per quarter}}$	Number of drug tests per reactor per quarter (as discussed in the assumptions below)
$PER_{\text{blind specimens, former rule}}$	Percentage of drug tests under the former rule that must be blind performance test specimens submitted during each quarter for a contract with an HHS-certified laboratory that has been in place for more than 90 days (as discussed in the assumptions below)
$COST_{\text{blind specimen testing, former rule}}$	Cost per blind specimen under the former rule for an FFD program to purchase a blind performance test specimen from a commercial vendor, prepare the specimen for testing (fill out custody-and-control form), submit the specimen for testing at the HHS-certified laboratory, and verify that the test results are accurate (as discussed in Appendix 2, Exhibit A2-13)
$PER_{\text{blind specimens, final rule}}$	Percentage of drug tests under the final rule that must be blind performance test specimens submitted during each quarter for a contract with an HHS-certified laboratory that has been in place for more than 90 days (as discussed in the assumptions below)

Parameter	Description
$COST_{\text{blind specimen testing, final rule}}$	Cost per blind specimen under the former rule for an FFD program to purchase a blind performance test specimen from a commercial vendor, prepare the specimen for testing (fill out custody-and-control form), submit the specimen for testing at the HHS-certified laboratory, and verify that the test results are accurate (as discussed in Appendix 2, Exhibit A2-13)
$NUM_{\text{drug tests to HHS lab per quarter, LTF}}$	Number of drug tests submitted to an HHS-certified laboratory per reactor per quarter for licensees that conduct testing of urine specimens at onsite licensee testing facilities (LTF) (as discussed in the assumptions below)
$NUM_{\text{quarters in year}}$	Number of quarters in a year (as discussed in the assumptions below)
NUM_{reactors}	Number of reactors per FFD program (as discussed in Appendix 2, Exhibit A2-14)

Assumptions:

- The number of drug tests per reactor per quarter is equivalent to the number of drug tests per reactor per year (see Appendix 2, Exhibit A2-14) divided by the number of quarters in a year.

- The number of quarters in a year:[11] 4.

- The number of specimens per reactor per quarter submitted to an HHS-certified laboratory from FFD programs with onsite licensee testing facilities (LTF) is equal to the total per quarter of:

    - positive initial drug test specimens, and

    - a "sampling" of negative urine specimens [assumed to be 1 one percent] as a check on the false negative rate

- Percentage price increase per blind performance test sample purchased from a commercial vendors under the final rule due to the inclusion of adulterated,

[11] The § 26.168(a)(2) equations for FFD programs that have onsite licensee testing facilities and those that send all specimens to an HHS-certified laboratory for testing both account for four quarters of blind specimen testing costs. For the ten percent of FFD programs accounted for in § 26.168(a)(1) that switch to new HHS-certified laboratories, this means that there is one quarter of over counting of costs/savings under § 26.168(a)(2). Consequently, the equations in § 26.168(a)(2) somewhat overstate the savings/costs for those FFD programs accounted for in § 26.168(a)(1). The net overstatement is small, however, and does not merit the complication that would be needed to provide a more precise estimate.

substituted, dilute samples, as well as "false negative challenge" samples as required by §§ 26.168(d) and (e): 75 percent.

Paragraph 26.168(b)

This paragraph in the final rule revises the former requirements in Section 2.8(e)(3) in Appendix A to Part 26, which specified the percentage of positive blind specimens that licensees and other entities had to submit to their HHS-certified laboratories. Under the former regulations, 20 percent of the total number of blind performance test specimens submitted per quarter had to be positive for one or more drugs. The final rule increases the percentage of blind performance test samples positive for one or more drugs or drug metabolites that must be submitted to HHS-certified laboratories to 60 percent. The provision changes the "mix" or composition of blind performance test samples that FFD programs must submit for testing and will result in an incremental cost per program associated with the composition change in the blind performance test samples is accounted for in connection with §§ 26.168(a)(1)–(a)(2).

Paragraph 26.168(c)

This paragraph in the final rule establishes a requirement that licensee and other entities may only submit blind performance test samples positive for only the drugs that the FFD program tests the presence for in each specimen. No incremental cost or saving will result from the final provision because the requirement simple ensures that the licensee and other entity is measuring the ability of the HHS-certified laboratory to detect drugs that the FFD program is testing for in each specimen.

Paragraph 26.168(d)

This paragraph of the final rule establishes a new requirement that licensees and other entities submit approximately 10 percent of all blind performance test samples as false negative challenge samples to the HHS-certified laboratory according to the requirements established in § 26.168(g)(3). This provision will result in incremental costs associated with purchasing false negative challenge samples and submitting the samples for testing. These incremental costs are accounted for in connection with § 26.168(a)(1) and (2).

Paragraph 26.168(e)

This paragraph of the final rule establishes a new requirement that licensees and other entities must submit approximately 20 percent of all blind samples as adulterated, diluted, or substituted specimens. This paragraph will result in incremental costs associated with purchasing adulterated, substituted, and dilute samples meeting the requirements in § 26.168(g)(4) - (g)(6) and submitting the samples for testing. These incremental costs are accounted for in connection with § 26.168(a)(1) and (2).

Paragraph 26.168(f)

This paragraph in the final rule revises the former requirements in Section 2.8(e)(3) in Appendix A to Part 26, which specified the percentage of negative blind specimens that licensees and other entities had to submit to their HHS-certified laboratories. Under the former regulations, 80 percent of the total number of blind specimens submitted per quarter had to be "blank." Licensees will realize an incremental increase in costs associated with the increased number of more costly adulterated, diluted, substituted and false negative challenge blind performance test samples required in § 26.168(d) and (e) of the final rule. These incremental costs are accounted for in connection with §§ 26.168(a)(1)–(2).

Paragraph 26.168(g)

This paragraph specifies the criteria that each type of blind performance test specimens must meet. This paragraph specifies that blind performance test samples must be certified by the supplier to be negative (i.e., certified by immunoassay and confirmatory testing as containing no drug), drug positive (i.e., certified by immunoassay and confirmatory testing as containing one or more drug(s)/and/or metabolite(s)), adulterated (i.e., certified using one or more appropriate analytical procedure(s)) as being adulterated with a specific adulterant), substituted (i.e., certified as having a creatinine concentration and a specific gravity that satisfy the criteria for a substituted specimen) or a false negative challenge. The provisions in this paragraph will result in incremental costs for FFD programs to purchase blind performance test samples that meet the specifications of the final rule, as discussed in connection with § 26.168(a)(1) and (a)(2).

Paragraph 26.168(h)

Paragraph 26.168(h) establishes requirements for blind performance test samples that licensees and other entities must submit to the HHS-certified laboratories to ensure to the consistency and effectiveness of the blind performance testing process. The paragraph requires the supplier of the blind samples to: (1) certify that all blind specimen lots are confirmed by an HHS-certified laboratory prior to being put into service, (2) provide an expiration date for each sample, and (3) to monitor each open lot on a bi-monthly (i.e., every two month) basis to ensure that samples remaining in the lot do not fall below the criteria in this section. Although these provisions may be normal industry practice for some manufacturers, the analysis accounts for an incremental cost that may result for some manufacturers that would pass the additional cost to the licensee or other entity in terms of higher blind sample costs. The costs associated with these provisions are accounted for in the increased cost to purchase a blind performance test sample under the final provisions in § 26.168(a)(1) and (2).

Paragraph 26.168(i)

This paragraph of the final rule establishes the procedures that a licensees and other entities must follow to ensure that each blind performance test sample that is sent to an HHS-certified laboratory for testing is indistinguishable from a donor specimen sent to a laboratory. The

paragraph requires that the blind performance test samples be sent from the same channels that donor specimens are sent to the laboratory (e.g., from the collection site, licensee testing facility). The paragraph also requires that if split specimen collection is performed, the tamper-evident bottle seals must be initialed and the collector must inform the MRO on the MRO copy of the custody and control form that the sample is a blind performance test sample. Finally, the paragraph requires that if a licensee or other entity uses split specimen collections for donors, the blind performance test sample must also be a split specimen sample. No incremental cost or saving will result from the provisions in this paragraph because they are consistent with existing blind performance test sample preparation.

26.169 Reporting results

Paragraph 26.169(a)

This paragraph of the final rule revises former requirements in Section 2.7(g)(1) in Appendix A to Part 26, which pertained to HHS-certified laboratories reporting drug test results to MROs. The final rule will add a requirement that the laboratory's reports must include validity testing results and any indications of tampering, adulteration, or substitution. The final paragraph will impose no incremental costs and affords no savings because HHS-certified laboratories already conduct validity testing for some U.S. DOT-regulated entities and, therefore, have the capability to report validity testing results, using existing automated systems.

Paragraph 26.169(b)

This paragraph of the final rule revises former requirements in Section 2.7(g)(7) in Appendix A to Part 26, which pertained to HHS-certified laboratories reporting test results for licensees who use cutoff levels that are more stringent than those required in Part 26. Currently, HHS-certified laboratories must report drug test results for both the Part 26 cutoff levels, and the licensee's more stringent cutoff levels. By contrast, under the final rule HHS-certified laboratories are only required to report the results for the more stringent cutoff levels. Given that HHS-certified laboratories use automated systems to tabulate testing data, printing fewer data items for the test results is unlikely to result in any incremental costs or savings to either FFD programs or HHS-certified laboratories.

Paragraph 26.169(c)

This paragraph of the final rule clarifies and amends former requirements in Section 2.7(g)(2) in Appendix A to Part 26, which pertained to HHS-certified laboratories reporting negative and positive, adulterated, substituted, dilute, and invalid test results. The final rule also establishes that HHS certified laboratories must report negative, positive, adulterated, substituted, dilute, and invalid test results. The final paragraph will impose no incremental costs and affords no

savings because HHS-certified laboratories already conduct validity testing for U.S. DOT-regulated entities and, therefore, have the capability to report validity testing results, using existing automated systems.

Paragraph 26.169(e)

This paragraph of the final rule imposes no incremental cost and affords no saving because it restates former requirements within Section 2.7(g)(4) in Appendix A to Part 26 pertaining to the acceptable transmission methods to send test results from the HHS-certified laboratory to the MRO. This final paragraph also revises a former requirement in Section 2.7(g)(4) in Appendix A to Part 26 which required the HHS-certified laboratory to ensure that security of data transmission, data access, storage, and retrieval systems. This final paragraph clarifies that the licensee or other entity, directly or through the HHS-certified laboratory, must ensure the security of data transmission, data storage, and data retrieval systems. Under the former rule the licensee or other entity is still ultimately responsible for the compliance of the HHS-certified laboratory (given licensee and other entity oversight requirements) even though the text in Section 2.7(g)(4) did not clearly specify this responsibility. This revision will result in no increment cost or savings because it is consistent with existing licensee and other entity data security evaluation procedures.

Paragraph 26.169(f)

This paragraph of the final rule revises former requirements in Section 2.7(g)(5) in Appendix A to Part 26, which pertained to acceptable methods for HHS-certified laboratories to use in transmitting the custody-and-control form to the MRO. Currently, HHS-certified laboratories are required to transmit a certified copy of the original custody-and-control form with a copy of the test report. The final paragraph expands the acceptable methods of transmitting the custody-and-control form to include fax, courier, mail, and electronic transmission. Although this final paragraph provides flexibility in the transmission mechanism, it will result in insignificant incremental costs or savings.

Paragraph 26.169(g)

This paragraph of the final rule clarifies that the HHS-certified laboratory must retain the original custody-and-control form for any specimen with a positive, adulterated, substituted, dilute, or invalid result and transmit to the MRO a copy of the original custody-and-control form signed by the certifying scientist. No incremental costs or savings will result from the final paragraph as it is consistent with existing HHS-certified laboratory recordkeeping practices.

Paragraph 26.169(h)

This paragraph of the final rule revises and amends former requirements in Sections 2.7(g)(6) and (g)(7) in Appendix A to Part 26, which required HHS-certified laboratories to prepare statistical summary reports of each licensee's drug test results, and submit those reports to the

licensee official on a monthly basis. By contrast, the final paragraph will reduce the reporting frequency from monthly to annually thereby providing more flexibility in the reporting of this data. However, the final rule includes a new reporting requirement in the summary reports to include validity testing results (i.e., information on specimens with adulterated, substituted, diluted, or invalid test results). No incremental costs are expected to result from the requirement to include validity test summary data, because HHS-certified laboratories already have the data management systems to provide summary test result information. However, this final paragraph will yield incremental savings by reducing the required frequency of statistical summary reports (i.e., reduced labor and postage costs).

The *annual savings per FFD program* are estimated as follows:[12]

$$[(HOURS_{lab\ tech} \times WAGE_{lab\ tech}) + COST_{postage}] \times NUM_{reports} \times NUM_{facility}$$

Parameter	Description
$HOURS_{lab\ tech}$	Time for the laboratory technician to generate and send an annual or monthly statistical summary report per facility (as discussed in the assumptions below)
$WAGE_{lab\ tech}$	Laboratory technician wage rate (as discussed in Appendix 2, Exhibit A2-11)
$COST_{postage}$	Cost to send an annual or monthly statistical summary report via the U.S. Postal Service (as discussed in the assumptions below)
$NUM_{reports}$	Number of reports that will no longer be sent to a facility per year (as discussed in the assumptions below)
$NUM_{facilities}$	Number of facilities per FFD program (as discussed in Appendix 2, Exhibit A2-14)

Assumptions:

- Time for the laboratory technician to generate an send annual or monthly statistical summary report per facility: 30 minutes.
- Cost to send an annual or monthly statistical summary report via the U.S. Postal Service: $2.00.
- Number of reports that will no longer be sent to a facility per year: 11.
- An annual summary report requires the same amount of labor and postage as a monthly summary report.

[12] In order to capture total costs and savings, the analysis assumes that savings recognized by HHS-certified laboratories will be passed back to licensees (i.e., lower specimen testing costs).

Subpart H: Determining Fitness-for-Duty Policy Violations and Determining Fitness

26.181 Purpose

This section of the final rule imposes no incremental cost and affords no saving because it merely describes the purpose of Subpart H.

26.183 Medical Review Officer

Paragraph 26.183(a)

This paragraph of the final rule imposes no incremental cost and affords no saving because it merely clarifies the qualifications of the medical review officer (MRO), as currently defined under §26.3 and Appendix A, paragraph 2.9(b), of the former rule. In addition, subparagraph 26.25(a)(4) added MROs to the list of FFD program personnel subject to this part. The final paragraph also adds a requirement that within 2 years of the implementation of this rule, all MROs must pass an examination administered by a nationally recognized MRO certification board. However, licensees have indicated that most MROs currently meet the clarified MRO qualifications and that the 2-year phase-in period, in conjunction with revised hiring practices, will ensure that costs will be insignificant.

Paragraph 26.183(b)

This paragraph of the final rule establishes requirements regarding the relationships between the MRO and HHS-certified laboratories. The requirements add more explicit conflict-of-interest requirements to prohibit MROs from having a relationship or vested financial interest in a laboratory or contracted operator of a licensee testing facility for which the MRO reviews drug testing results for the licensee or other entity. Although this is a newly required provision, it is consistent with standard ethical business practices. Consequently, this analysis assumes that the only incremental costs that might result from this provision involves the revision of employee labor contracts to incorporate these prohibited relationships. However, the analysis also assumes that existing contracts incorporate "by reference" the applicable provisions of 10 CFR Part 26. Consequently, the provision is believed to take effect automatically when the rule is promulgated and, therefore, it will not result in any incremental cost or saving.

Paragraph 26.183(c)

This paragraph of the final rule [including subparagraphs 26.183(c)(1)–(2)] imposes no incremental cost and affords no saving because it renumbers and retains the requirements contained in paragraph 2.9(b) of Appendix A to the former rule, as they relate to overall MRO responsibilities. The final paragraph does add a provision that requires the MRO to advise and assist licensee and other entity management in planning and overseeing the overall FFD program. The analysis anticipates no incremental cost from this added provision, however, because the MRO already meets these obligations given current industry practice.

Paragraph 26.183(d)

This paragraph of the final rule [including subparagraphs 26.183(d)(1)–(2)] imposes no incremental cost and affords no saving because it merely clarifies and explicitly states the MRO staff responsibilities that are already effective under the former rule. The final paragraph also adds requirements to ensure that MRO staff are properly supervised by the MRO and are independent from the licensee or other entity management while performing MRO staff functions. This provision does not result in an incremental cost because it incorporates existing practices into written regulation and makes the procedures consistent with HHS-recommended practices.

26.185 Determining a Fitness-for-Duty Policy Violation

Paragraph 26.185(a)

This paragraph amends former requirements in Appendix A, paragraph 2.9(a), that describe the MRO's responsibility to review drug and alcohol test results. The final paragraph amends language to include validity testing in the reviewing process. The final paragraph also references other entities as subject to this requirement. In addition, the final paragraph eliminates the blood testing option for the alcohol test, resulting in savings that are calculated under paragraph 26.83(b) of the analysis.

Paragraph 26.185(b)

This paragraph of the final rule imposes no incremental cost and affords no saving because it merely retains requirements in the last sentence of Appendix A, paragraph 2.9(a) of the former rule. The final paragraph also adds a new provision that prohibits the MRO and MRO staff from communicating positive, adulterated, substituted, or invalid initial test results to management, except as specified under paragraph 26.75(h), but that provision does not result in any incremental costs.

Paragraph 26.185(c)

This paragraph of the final rule renumbers and amends former requirements in Appendix A, paragraph 2.9(c), of the former rule. Specifically, the final paragraph retains requirements for the MRO to discuss a positive, adulterated, substituted, or invalid drug test result or other occurrence with the donor before determining whether a violation of FFD policy has occurred. The MRO is required to discuss positive, adulterated, substituted, or invalid validity test results with the donor as part of the verification process. Contacting the EAP is no longer required and is at the discretion of the MRO. Potential savings are assumed to be insignificant because the MRO must still contact management.

Paragraph 26.185(d)

This paragraph of the final rule [including subparagraphs 26.185(d)(1)–(3)] specifies three circumstances in which the MRO may determine that a positive, adulterated, substituted, or invalid test result or other occurrence is an FFD policy violation without having discussed the result or occurrence directly with the donor: (1) the donor expressly declining the opportunity to discuss the test result or other occurrence with the MRO; (2) the donor failing to contact the MRO after a representative of the licensee has successfully made contact and instructed them to contact the MRO directly or (3) a failure on the part of the MRO to contact the donor after making reasonable efforts to contact the donor over a 24-hour period. For all circumstances, the MRO or the licensee's representative must clearly document the attempted contacts, the successful contact, and any declination of opportunities to discuss the possible violation with the MRO. Although the requirement to document such interactions represents a new provision, the analysis assumes that MROs already document such attempts in a manner that meets the requirements of this final paragraph.

Paragraph 26.185(e)

This paragraph of the final rule imposes no cost and affords no saving because it merely provides more detailed guidance than contained in Appendix A, paragraph 2.9, of the former rule. The provision allows donors, in circumstances in which the MRO has not discussed a positive, adulterated, substituted, or invalid test result or other occurrence directly with the donor, to present information documenting the circumstances that prevented the donor from contacting or being contacted by the MRO in a timely manner. Although this provision may require additional MRO time when these events occur, NRC believes this will happen very infrequently. Therefore, the analysis estimates no incremental costs for this provision.

Paragraph 26.185(f)

This paragraph of the final rule describes the actions that an MRO must take when a urine specimen has an invalid test result.

Subparagraph 26.185(f)(1)

This subparagraph of the final rule establishes a provision directing the MRO, in instances where an HHS-certified laboratory reports an invalid result, to consult with the laboratory to determine whether additional testing could help in determining whether the specimen is positive or adulterated. This final subparagraph also permits the MRO to send a specimen to a second HHS-certified laboratory for additional testing when appropriate. The incremental costs per FFD program associated with this final subparagraph are discussed in connection with §26.161(g).

Subparagraph 26.185(f)(2)

This subparagraph of the final rule establishes a new requirement that requires the MRO, in instances where a urine specimen has an invalid test result with no technical explanation for the result, to contact the donor to determine if an acceptable medical explanation can explain the invalid test result. If an acceptable medical explanation exists, the MRO must report to the licensee or other entity that a negative test result was not obtained. If the medical reason for the invalid result is a temporary condition, the licensee or other entity must collect a second urine specimen (unobserved collection) from the donor and rely upon the MRO's review of the test results from the second specimen. If the medical reason for the invalid result would similarly affect the testing of another urine specimen, the MRO may authorize an alternative method for drug testing. The analysis estimates that the incremental cost per FFD program associated with the requirements in this final subparagraph are insignificant due to the infrequency of such invalid test results.

Subparagraph 26.185(f)(3)

This subparagraph of the final rule establishes a new requirement that requires the licensee, in instances where a urine specimen has an invalid test result with no technical or medical explanation, to obtain a second collection under direct observation. The analysis estimates that the incremental cost associated with the requirements in this final subparagraph are insignificant due to the infrequency of such invalid test results.

Paragraph 26.185(g)

This paragraph of the final rule describes the actions that an MRO must take when a urine specimen has a dilute test result.

Subparagraph 26.185(g)(1)

This subparagraph of the final rule adds a requirement to §2.7(f)(2) of Appendix A to 10 CFR Part 26 of the former rule, which specifies the confirmatory cut-off levels for drug metabolites, indicating a laboratory positive drug test result. This subparagraph of the final rule provides that the MRO must declare a violation of FFD policy if the HHS-certified laboratory reports a specimen as dilute with drug(s) or drug metabolites at or above the cutoff levels, there is no legitimate medical explanation for the result, and a clinical examination, if required under paragraph (g)(4) of this section, has been conducted. This analysis assumes that no incremental cost or saving will result from this new provision.

Subparagraph 26.185(g)(2)

This subparagraph of the final rule establishes procedures for the MRO to follow in the event that an attempt at subversion through dilution of the collected specimen is suspected. If evidence of potential subversion [of the sort defined in subparagraphs 26.185(g)(2)(i)–(iii)] is

present, the MRO may require the laboratory to conduct the special analysis of dilute specimens permitted in § 26.163(a)(2). NRC believes that this provision will apply in very few instances and, therefore, the analysis estimates no incremental cost for this provision.

Subparagraph 26.185(g)(3)

This subparagraph of the final rule allows the MRO to conduct confirmatory testing of a dilute specimen at the levels of detection if it was collected under direct observation. No incremental cost or saving will result from this final subparagraph as discussed in connection with final §26.69.

Subparagraph 26.185(g)(4)

This subparagraph of the final rule revises former requirements in §2.9(d) of Appendix A to 10 CFR Part 26 under which the MRO must evaluate donors with opiate positives through clinical examination and a review of prescription medication use before determining that the donor has violated the FFD policy. The subparagraph permits the MRO to select a designee (who must be a licensed physician) to conduct a clinical evaluation in situations where drugs detected in a dilute specimen are opium, opiate, or opium derivative or over-the-counter medications. No incremental costs or savings will result from the requirements in this final subparagraph.

Subparagraph 26.185(g)(5)

This subparagraph of the final rule revises former requirements in §2.7(f)(2) of Appendix A to 10 CFR Part 26 of the former rule. The provision states that an MRO review is not required for specimens that the HHS-certified laboratory reports as negative and dilute. Under these circumstances, the licensee or other entity may not take any administrative actions or impose any sanctions on a donor who submits negative and dilute specimens. NRC believes that this provision will apply in very few instances and, therefore, the analysis calculates no incremental saving for this provision.

Paragraph 26.185(h)

This paragraph of the final rule describes the actions that an MRO must take when a urine specimen has a substituted test result.

Subparagraph 26.185(h)(1)

This subparagraph of the final rule adds new provisions that require the MRO to allow the donor to provide an acceptable medical explanation for the substituted result when the creatinine concentration is less than 2 mg/dL and the specific gravity is less than or equal to 1.0010 or equal to or greater than 1.0200. The donor must then present creditable evidence within 5

business days of the specimen collection. This analysis estimates the costs associated with urine specimens having creatinine concentrations below 2 mg/dL in connection with §§26.131 and 26.161(b)(1).

Subparagraph 26.185(h)(2)–(3)

These subparagraphs of the final rule establish procedures for the MRO to follow when a medical explanation is provided by the donor of a urine specimen with a substituted test result. If an acceptable medical explanation is not identified, the MRO must declare the specimen to be substituted and a violation of FFD policy. If an acceptable medical explanation is provided by the donor, the MRO is required to report to the licensee or other entity that no FFD violation has occurred. The incremental cost associated with the requirements in this final subparagraph are discussed in connection with final §§26.131 and 26.161(b)(1).

Paragraph 26.185(i)

This paragraph describes the procedure to be followed in the event that the laboratory reports a specimen as adulterated. The final paragraph requires the MRO to allow the donor an opportunity to provide a medical explanation for the adulterated specimen. Depending on the donor's evidence, the MRO will determine whether an FFD policy violation has occurred. This procedure differs from that established in the former rule under Appendix A, paragraph 2.4. The incremental cost of the revised procedures are described in connection with §§26.131(f) and 26.161(b).

Paragraph 26.185(j)

Subparagraph 26.185(j)(1)

This subparagraph of the final rule revises and expands upon the former requirements in 2.9(d) in Appendix A to 10 CFR Part 26 pertaining to determining whether a legitimate medical explanation for positive confirmatory test results for opiates and prescription medication use. The former rule requires the MRO to confirm a positive drug test result for unauthorized use of opium, opiate, or opium derivative (e.g., morphine/codeine) through clinical evidence. This final subparagraph permits a designee of the MRO, who must be a licensed physician, to conduct the clinical examination. In addition, this final subparagraph includes a provision that limits the circumstances where an MRO may find a medically acceptable reason for opiate consumption. Food products may not be considered as a legitimate medical explanation for morphine or codeine concentrations at or above 15,000 ng/mL. No significant incremental costs or savings will result from the revisions given the low number of opiate positive drug test results under the former cut-off levels, as well as the increase in the initial cut-off level for opiate metabolites as discussed in §§26.133 and 26.163(a)(1).

Subparagraph 26.185(j)(2)

This subparagraph of the final rule imposes no incremental cost and affords no saving because it restates requirements contained under Appendix A, paragraph 2.9(d), of the former rule. The provision requires that if the MRO determines that no legitimate medical explanation for positive confirmatory test results exists, the MRO must determine whether there is clinical evidence of unauthorized use of certain prescription drugs or over-the-counter preparations.

Subparagraph 26.185(j)(3)

This subparagraph imposes no incremental cost and affords no saving because it merely clarifies procedures [contained in Appendix A, paragraph 2.9(d) of the former rule] for the MRO to follow when a positive, adulterated, substituted, or invalid test result is due to unauthorized use of another individual's prescription medication. In such situations, the MRO must determine whether there exists clinical evidence of abuse. If no clinical evidence of abuse is detected, the MRO would report to the appropriate licensee or other entity management that the donor has misused a prescription medication. If clinical evidence of abuse is detected, the MRO must report to the licensee that the donor has violated the FFD policy.

Subparagraph 26.185(j)(4)

This subparagraph has been added to provide guidance to help define the procedure for determining whether the use of a prescription medication from a foreign country qualifies as a legitimate medical explanation for a positive confirmatory test result. Although this provision is not explicitly contained in the former rule, it likely is the case that when an individual with a positive, adulterated, substituted, or invalid drug test result acknowledges use of a valid prescription obtained in a foreign country, the MRO takes the information into consideration when making the decision to verify positive, adulterated, substituted, or invalid test results as positive.

Subparagraph 26.185(j)(5)

This subparagraph of the final rule imposes no incremental cost and affords no saving because it merely states that the consumption of food products, supplements, or other preparations that contain substances which may trigger a positive confirmatory drug test result may not be considered a legitimate medical explanation when the presence of drugs or drug metabolites in the urine specimen exceeds the cutoff levels specified in section 26.163. This final subparagraph explicitly limits the discretion of the MRO, as provided under Appendix A, paragraph 2.9(f) of the former rule.

Subparagraph 26.185(j)(6)

This subparagraph of the final rule revises former requirements in paragraph 1.2 in Appendix A to 10 CFR Part 26, which defines illegal drugs as "Those drugs included in Schedules I through

V of the Controlled Substances Act (CSA), but not when used pursuant to a valid prescription or when used as otherwise authorized by law." The subparagraph establishes that the MRO cannot consider the use of any drug contained in Schedule I of section 202 of the Controlled Substances Act [21 U.S.C. 012] as a legitimate medical explanation for a positive confirmatory drug test result, even if the drug may be legally prescribed and used under State law. No incremental cost or saving will result from this revision because licensees must currently have written policies governing the prescription drug use of covered employees, as specified in §26.20(a). This analysis assumes that FFD programs effectively train and inform covered employees regarding the use of prescription drugs and, therefore, that no situations arise where an individual has a laboratory positive test result due to the consumption of a prescription drug.

Paragraph 26.185(k)

This paragraph of the final rule imposes no incremental cost and affords no saving because it merely clarifies Appendix A, paragraph 2.9(f), of the former rule requiring the MRO to assess the likely public health and safety risk of an individual's legitimate drug use. If the MRO determines a potential risk, a determination of fitness would be required.

Paragraph 26.185(l)

This paragraph of the final rule restates without change former requirements in §2.9(e) of Appendix A to 10 CFR Part 26, which permit the MRO to request a retest of a donor's specimen at a second HHS-certified laboratory at the request of the donor. No incremental cost or saving will result from the clarification.

Paragraph 26.185(m)

This paragraph of the final rule imposes no incremental cost and affords no saving because it merely renumbers former requirements contained in Appendix A, paragraph 2.9(g), of the former rule.

Paragraph 26.185(n)

This paragraph of the final rule imposes no incremental cost and affords no saving because it provides the procedure and policy to be followed for MRO verification decisions based on retests by a second laboratory. Although the final paragraph contains new requirements, the analysis assumes that licensees already follow these procedures to comply with elements of the former rule, including Appendix A, paragraph 2.9(e).

Paragraph 26.185(o)

This paragraph of the final rule imposes no incremental cost and affords no saving because it provides the procedure and policy to be followed by the MRO when evaluating drug test results from individuals seeking re-authorization following a first violation of the FFD policy based on a confirmed positive drug test result. Although the final paragraph contains new requirements, the analysis assumes that this circumstance is infrequent. Therefore, no incremental cost or saving will result from the revisions.

Paragraph 26.185(p)

This paragraph of the final rule imposes no incremental cost and affords no saving because it merely limits to 10 business days the time within which the MRO must review test results and notify licensee and other entity management. These provisions were formerly required under paragraph 26.24(e) of the former rule.

26.187 Substance Abuse Expert

This section of the final rule creates a new position of a substance abuse expert (SAE), with paragraphs 26.187(a)–(g) describing requirements for credentials, basic knowledge, qualifications training, continuing education, responsibilities and prohibitions, and documentation to demonstrate that the SAE meets the required qualifications under this section. In conjunction with subparagraph 26.189(a)(1), the final paragraph requires that when substance abuse is involved an SAE must conduct all determinations of fitness instead of the MRO as required by the former rule. Licensees whose MROs do not qualify as SAEs need to contract additional labor to have an SAE perform the necessary determinations of fitness. (The analysis estimates that the SAE wage rate is approximately equivalent to that of the MRO.) This provision, however, imposes no incremental costs and affords no savings because most MROs will also qualify as an SAE.

26.189 Determination of Fitness

Paragraph 26.189(a)

Subparagraph 26.189(a)(1)

This subparagraph of the final rule establishes requirements that allow determinations of fitness associated with suspected or confirmed substance abuse to be conducted by an individual qualifying as an SAE, as defined in §26.187. The SAE is required to make determinations of fitness following an unfavorable termination or denial of authorization under this part. The incremental impacts of this requirement area discussed in more depth under §26.187.

Subparagraphs 26.189(a)(2)–(5)

These subparagraphs of the final rule establish requirements that allow determinations of fitness associated with use of psychoactive medications, illness, injury, fatigue, or use of legal medications to be conducted by relevant professionals, such as clinical psychologists, psychiatrists, or physicians, provided that a substance abuse problem is not involved. Although in some instance, using such individuals may result in incremental savings due to a lower wage rate, the analysis assumes that there will be no savings on average, as quantified under §26.187.

Paragraph 26.189(b)

Subparagraphs 26.189(b)(1) and 26.189(b)(2)

These subparagraphs of the final rule impose no incremental cost and afford no saving because they merely renumber and clarify elements that are already covered in Appendix A, paragraph 2.9(f) and §26.27(b)(1) and §26.27(b)(4) the former rule.

Subparagraph 26.189(b)(3)

This subparagraph, in conjunction with §§26.69 and 26.65, requires licensees to conduct determinations of fitness in cases where potentially disqualifying FFD information is identified, as is already required under the former rule. The subparagraph adds a provision [in conjunction with §26.69(a)(2)], however, that eliminates the requirement to conduct the determination of fitness in cases where the potentially disqualifying FFD information has previously been evaluated by another licensee. As a result, fewer determinations of fitness will be conducted under the final rule. NRC anticipates that this decrease will more than offset the slight increase in the number of determinations of fitness that otherwise result from this provision due to the effects of revisions to the definition of "potentially disqualifying FFD information" (discussed in §26.5) and the additional information that will have to be reported by individuals on their self-disclosures [as required by §26.61(b)]. Therefore, the net result of these changes will be a savings for licensees and other entities, as quantified below.

The *annual savings per program* result from the sum of the following savings:

- Annual savings per program from the reduction in the number of determinations of fitness requiring SAE review are calculated as follows:

  $[(NUM_{Applicants} \times PER_{PDFFDI\text{-}Former}) - (NUM_{Applicants} \times PER_{PDFFDI\text{-}Final})] \times HOURS_{SAE} \times WAGE_{SAE} \times NUM_{Units}$

- Annual savings per program from the reduction in the number of determinations of fitness requiring FFD program manager review are calculated as follows:

$[(NUM_{Applicants} \times PER_{PDFFDI\text{-}Former}) - (NUM_{Applicants} \times PER_{PDFFDI\text{-}Final})] \times HOURS_{Manager} \times WAGE_{Manager} \times NUM_{Units}$

- Annual savings per program from the reduction in the number of determinations of fitness requiring clerical personnel support are calculated as follows:

  $[(NUM_{Applicants} \times PER_{PDFFDI\text{-}Former}) - (NUM_{Applicants} \times PER_{PDFFDI\text{-}Final})] \times HOURS_{Clerical} \times WAGE_{Clerical} \times NUM_{Units}$

Parameter	**Description**
$HOURS_{Clerical}$	Clerical personnel hours of support per determination of fitness (as described in assumptions below)
$HOURS_{Manager}$	FFD program manager hours of review per determination of fitness (as described in assumptions below)
$HOURS_{SAE}$	SAE hours of review per determination of fitness (as described in assumptions below)
$NUM_{Applicants}$	Annual number of applicants for authorization per unit (as described in Appendix 2, Exhibit A2-12)
NUM_{Units}	Number of units per program (as described in Appendix 2, Exhibit A2-14)
$PER_{PDFFDI\text{-}Former}$	Percentage of applicants for authorization requiring a determination of fitness based on potentially disqualifying FFD information under the former rule (as described in assumptions below)
$PER_{PDFFDI\text{-}Final}$	Percentage of applicants for authorization requiring a determination of fitness based on potentially disqualifying FFD information under the final rule (as described in assumptions below)
$WAGE_{Clerical}$	Clerical personnel wage rate (as described in Appendix 2, Exhibit A2-11)
$WAGE_{Manager}$	FFD program manager wage rate (as described in Appendix 2, Exhibit A2-11)
$WAGE_{SAE}$	SAE wage rate (as described in Appendix 2, Exhibit A2-11)

Assumptions:

- Percentage of applicants for authorization requiring a determination of fitness under the former rule: 10%.

- Percentage of applicants for authorization requiring a determination of fitness under the final rule: 5%.

- SAE hours of review per determination of fitness: 2 hours.

- FFD program manager hours of review per determination of fitness: 2 hours.

- Clerical personnel hours of support per determination of fitness: 2 hours.

Subparagraph 26.189(b)(4)

This subparagraph imposes no incremental cost and affords no saving because it simply clarifies elements covered in §26.69 of the final rule. The provision requires determinations of fitness when potentially disqualifying FFD information is identified and the licensee's or other entity's reviewing official determines that a determination of fitness is warranted under §26.69.

Paragraph 26.189(c)

This paragraph adds a new requirement that all determinations of fitness that are conducted for-cause be conducted through face-to-face interaction with the individual under review to ensure that the professional who is performing the determination has available all of the sensory information that may be required for the assessment. Determinations of fitness for other purposes, however, can continue to be conducted in the absence of the individual under review or over the phone. This added requirement will result in lost labor productivity for the individual under review.

The *annual costs per program* from requiring that a for-cause determination of fitness be conducted face-to-face with the individual under review results from lost worker productivity for the individuals under review, calculated as follows:

$$NUM_{For\text{-}Cause} \times HOURS_{Worker} \times WAGE_{Worker} \times NUM_{Units}$$

Parameter	Description
$HOURS_{Worker}$	Hours of worker time required per face-to-face determination of fitness (as described in assumptions below)
$NUM_{For\text{-}Cause}$	Number of for-cause referrals per unit per year (as described in Appendix 2, Exhibit A2-12)
NUM_{Units}	Number of units per program (as described in Appendix 2, Exhibit A2-14)
$WAGE_{Worker}$	Facility worker wage rate (as described in Appendix 2, Exhibit A2-11)

Assumptions:

- Hours of worker time required per face-to-face determination of fitness: 2 hours.

Subparagraph 26.189(c)(1)

This subparagraph imposes no incremental cost and affords no saving because it merely requires that when a for-cause determination of fitness is conducted, as required by paragraph 26.189(b), individuals shall be determined to be fit for duty when no conclusive evidence and no significant basis for concern exists. The subparagraph does, however, provide a more specific procedure that must be followed when making a determination of fitness.

Subparagraph 26.189(c)(2)

This subparagraph imposes no incremental cost and affords no saving because it merely requires that individuals being reviewed in a for-cause determination of fitness must be determined to be unfit for duty when there is a significant basis for concern, even when there is no conclusive evidence of an FFD policy violation. This provision does, however, provide a more specific procedure that must be followed when making a determination of fitness.

Paragraph 26.189(d)

This subparagraph imposes no incremental cost and affords no saving because it merely requires that the professional who performed the initial determination of fitness be responsible for any changes or modifications made to the determination, and prohibits individuals, licensees, and other entities from seeking a second determination of fitness if one has already been performed.

Subpart I: Managing Fatigue

Note: For analytical purposes, the regulatory analysis calculates an average cost per program for each provision in Subpart I. The NRC notes, however, that actual programs vary considerably in terms of (1) the number of sites and units per program, and (2) the staffing levels per site. Consequently, some programs will have much lower costs or savings than estimated, and others will have much higher costs or savings than estimated.

26.201 Applicability

This section of the final rule indicates that Subpart I applies to Part 50 licensees, combined license holders under 52.103, and contractor/vendors to nuclear power plant licensees who rely upon contractor/vendor FFD programs or program elements. Subpart I does not apply to material licensees. This section also states that the requirements in §§ 26.203 and 26.207 through 26.211 apply to the individuals identified in § 26.4(a) through (c). The final language also specifies that the requirements in § 26.205 apply to the individuals identified in § 26.4(a). Incremental costs associated with the new provisions of this Subpart are addressed in the relevant paragraphs.

26.203 General Provisions

Paragraph 26.203(a)-(b)

These paragraphs of the final rule require licensees to establish a policy and develop, implement, and maintain procedures for the management of fatigue in accordance with the final rule. Procedures must address self-declarations, work hour controls, fatigue assessments, and sanctions. Licensees and C/Vs will incur incremental costs to revise their existing policies and procedures to include the fatigue provisions.

The *one-time cost per program* to address fatigue policies and procedures, including self-declarations, work hour controls, fatigue assessments, and sanctions, includes the sum of the following factors:

- One-time costs per program to account for FFD staff, manager, and clerical labor and to contract a legal consultant to incorporate fatigue provisions into the written policies and procedures are calculated as follows:

  $$(HOURS_{FFD\_Staff} \times WAGE_{FFD\_Staff}) + (HOURS_{Manager} \times WAGE_{Manager}) + (HOURS_{Legal} \times WAGE_{Legal}) + (HOURS_{Clerical} \times WAGE_{Clerical})$$

- One-time costs per program for facility supervisors to implement the corporate policies on the management of fatigue at the facility level (e.g., for development of any site-specific implementing procedures, delineation and delegation of roles and responsibilities under revised policies and procedures, and for other miscellaneous administrative implementation costs not accounted for under other provisions) are calculated as follows:

  $HOURS_{Supervisor} \times WAGE_{Supervisor} \times NUM_{Facilities}$

Parameter	Description
$HOURS_{Clerical}$	One-time hours of clerical personnel to support revision of policies and procedures per program (described in assumptions below)
$HOURS_{Manager}$	One-time hours of labor of various managers to review and approve policies and procedures for fatigue per program (described in assumptions below)
$HOURS_{FFD\_Staff}$	One-time hours of FFD program staff labor to develop and revise policies and procedures for fatigue provisions per program (described in assumptions below)
$HOURS_{Legal}$	One-time hours of legal assistance to review and revise policies and procedures for provisions per program (described in assumptions below)
$HOURS_{Supervisor}$	One-time hours of facility supervisor time to implement revised corporate policies and procedures for fatigue per facility (e.g., for development of any site-specific implementing procedures, delineation and delegation of roles and responsibilities under revised policies and procedures, and for other miscellaneous administrative implementation costs not accounted for under other provisions) (described in assumptions below)
$NUM_{Facilities}$	Number of facilities (described in Appendix 2, Exhibit A2-14)
$WAGE_{Manager}$	FFD program manager wage rate (described in Appendix 2, Exhibit A2-11)
$WAGE_{FFD\_Staff}$	FFD staff wage rate (described in Appendix 2, Exhibit A2-11)
$WAGE_{Legal}$	Legal consultant wage rate (described in Appendix 2, Exhibit A2-11)
$WAGE_{Clerical}$	Clerical personnel wage rate (described in Appendix 2, Exhibit A2-11)
$WAGE_{Supervisor}$	Facility supervisor wage rate (described in Appendix 2, Exhibit A2-11)

Assumptions:

- Hours of FFD program staff labor to develop and revise policies and procedures for fatigue provisions per program: 80 hours.

- Hours of labor of various managers to review and approve policies and procedures for fatigue provisions per program: 40 hours.

- Hours of legal assistance to review and revise policies and procedures for fatigue provisions per program: 20 hours.

- Hours of clerical personnel to support revision of policies and procedures for fatigue provisions per program: 40 hours.

- Hours of facility supervisor time to implement revised corporate fatigue policies and procedures (e.g., for development of any site-specific implementing procedures, delineation and delegation of roles and responsibilities under revised policies and procedures, and for other miscellaneous administrative implementation costs not accounted for under other provisions): 160 hours.

- Policy and procedure revisions are developed once per operating firm, regardless of the number of sites or facilities the firm operates.

Paragraph 26.203(c)

This paragraph of the final rule requires licensees and C/Vs to incorporate the fatigue-related knowledge and abilities (KAs) into the training that is required in final paragraph 26.29(a) and the comprehensive examination required in final paragraph 26.29(b). Licensees and C/Vs will incur incremental costs for the following activities:

- Training course revisions
- Employee training addressing new fatigue KAs
  - one-time initial training of covered employees
  - annual initial training of new employees
- Annual refresher training for all covered employees

Training Course Revisions. The final provision will require licensees to revise their training programs to address the fatigue-related KAs presented in final subparagraphs 26.197(c)(1) and (2).

The *one-time cost per program* associated with revising the training program to include fatigue KAs results from the following:

$$(HOURS_{Consultant} \times WAGE_{Consultant}) + (HOURS_{Trainer} \times WAGE_{Trainer}) + (HOURS_{Training\_Manager} \times WAGE_{Training\_Manager}) + (HOURS_{Manager} \times WAGE_{Manager}) + (HOURS_{Clerical} \times WAGE_{Clerical})$$

Parameter	Description
$HOURS_{Consultant}$	Hours of industry consultant time per program to develop generic training materials for use by the entire industry (described in assumptions below)
$HOURS_{Manager}$	One-time hours of FFD program manager time per program to revise the training materials to address fatigue KAs (described in assumptions below)
$HOURS_{Clerical}$	One-time hours of clerical personnel to support the revision of the training materials to include fatigue KAs (described in assumptions below)
$HOURS_{Trainer}$	One-time hours of trainer time per program to revise the training materials to address fatigue KAs (described in assumptions below)
$HOURS_{Training\_Manager}$	One-time hours of training manager time per program to revise the training materials to address fatigue KAs (described in assumptions below)
$WAGE_{Manager}$	FFD program manager wage rate (described in Appendix 2, Exhibit A2-11)
$WAGE_{Clerical}$	Clerical personnel wage rate (described in Appendix 2, Exhibit A2-11)
$WAGE_{Consultant}$	Consultant wage rate (described in Appendix 2, Exhibit A2-15)
$WAGE_{Trainer}$	Trainer wage rate (described in Appendix 2, Exhibit A2-11)
$WAGE_{Training\_Manager}$	Training manager wage rate (described in Appendix 2, Exhibit A2-11)

Assumptions:

- Hours of industry consultant time per program to develop generic training materials for use by the entire industry: 2.6 hours (i.e., 80 hours divided by 31 programs).

- Hours of trainer time per program to revise the training materials to address fatigue KAs: 8 hours.

- Hours of training manager time per program to review the training materials addressing fatigue KAs: 2 hours.

- Hours of FFD program manager time per program to review the training materials addressing fatigue KAs: 2 hours.

- Hours of clerical personnel to support the revision of the training materials addressing fatigue KAs: 4 hours.

Initial Fatigue KA Training for All Individuals Subject to the Rule. Licensees and C/Vs will be required to incur a one-time cost to retrain affected employees to be familiar with the fatigue-related KAs, an annual cost to train newly hired employees in the additional KAs, and an annual cost to provide refresher training that includes the fatigue KAs.

Licensees and C/Vs will incur a one-time incremental cost to train affected individuals who are already covered by the FFD program, but who must now be retrained in the additional fatigue-related KAs. The costs calculated below assume that the fatigue training will be presented as an incremental unit of the training already conducted under §26.29. The *one-time cost per program* results from the sum of the following costs:

- One-time costs per program to retrain existing employees on the fatigue-related KAs are calculated as follows:

  $NUM_{Employees} \times (HOURS_{Training\text{-}Fatigue} + HOURS_{Examination\text{-}Fatigue}) \times WAGE_{Worker} \times NUM_{Units}$

- One-time costs per program for trainers to administer the training on the fatigue-related KAs are calculated as follows:[1]

  $NUM_{Sessions} \times (HOURS_{Training\text{-}Fatigue} + HOURS_{Examination\text{-}Fatigue} + HOURS_{Preparation\text{-}Fatigue}) \times WAGE_{Trainer} \times NUM_{Units}$

Parameter	**Description**
$HOURS_{Training\text{-}Fatigue}$	Length of training increment addressing the fatigue-related KAs (described in assumptions below)
$HOURS_{Examination\text{-}Fatigue}$	Length of comprehensive examination increment addressing the fatigue-related KAs (described in assumptions below)
$HOURS_{Preparation\text{-}Fatigue}$	Hours of incremental preparation and examination grading per session addressing the fatigue-related KAs (described in assumptions below)
$NUM_{Employees}$	Number of employees per unit covered by FFD program requirements (described in Appendix 2, Exhibit A2-14)
NUM_{Units}	Number of units per program (described in Appendix 2, Exhibit A2-14)
$NUM_{Sessions}$	Number of training sessions per facility (described in assumptions below)
$WAGE_{Worker}$	Utility worker wage rate (described in Appendix 2, Exhibit A2-11)
$WAGE_{Trainer}$	Trainer wage rate (described in Appendix 2, Exhibit A2-11)

Assumptions:

- Length of training addressing the fatigue-related KAs per session: 1 hour.

[1] Although many licensees may be conducting computer-based trainings, the analysis assumes a class-based format and may overestimate the cost of incremental training activities.

- Length of comprehensive examination increment addressing the fatigue-related KAs per session: 10 minutes.

- Number of training sessions assumes 50 workers per session.

- Hours of preparation and examination grading per session addressing the fatigue-related KAs: 0.5 hours.

Annual Initial Training for other affected individuals, such as new workers not yet covered under FFD programs will also lead to increased costs due to the additional fatigue-related KAs. The costs calculated below assume that the fatigue training will be presented as an incremental unit of the training already conducted under §26.29. The *annual cost per program* results from the sum of the following factors:

- Incoming employees must take the training course increment for fatigue-related KAs:

  $NUM_{Applicants} \times HOURS_{Training\text{-}Fatigue} \times WAGE_{Worker} \times NUM_{Units}$

- Annual costs per program for trainers to administer the training course increment for fatigue-related KAs are calculated as follows:[2]

  $NUM_{Sessions} \times HOURS_{Training\text{-}Fatigue} \times WAGE_{Trainer} \times NUM_{Units}$

Parameter	**Description**
$HOURS_{Training\text{-}Fatigue}$	Length of fatigue-related KA training increment (described in assumptions below)
$NUM_{Applicants}$	Number of applicants (e.g., new hires including outage workers) covered by FFD program requirements per year (described in Appendix 2, Exhibit A2-14 and in assumptions below)
$NUM_{Sessions}$	Number of training sessions per unit (described in assumptions below)
NUM_{Units}	Number of units per program (described in Appendix 2, Exhibit A2-14)
$WAGE_{Worker}$	Utility worker wage rate (described in Appendix 2, Exhibit A2-11)
$WAGE_{Trainer}$	Trainer wage rate (described in Appendix 2, Exhibit A2-11)

Assumptions:

- Length of training increment addressing the fatigue-related KAs: 1 hour.

[2] Although many licensees may be conducting computer-based trainings, the analysis assumes a class-based format and may overestimate the cost of incremental training activities.

- Hours of incremental preparation and examination grading per session addressing the fatigue-related KAs: 0.5 hours.

- Number of training sessions assumes 20 workers per session.

- Number of applicants (e.g., new hires including outage workers) covered by FFD program requirements per facility per year represents new employees due to staff turnover. The analysis assumes a turnover rate of 25%.

Annual Refresher Training. Licensees and C/Vs also will be required to reflect the fatigue-related KAs in the required annual refresher training. As a result, licensees and C/Vs will incur an incremental cost. The costs calculated below assume that the fatigue training will be presented as an incremental unit of the training already conducted under §26.29. The *annual costs per program* result from the sum of the following costs:

- Annual costs per program for employees to take the refresher training increment addressing fatigue-related KAs are calculated as follows:

  $NUM_{Employees} \times PER_{Refresher} \times HOURS_{Fatigue\ Training} \times WAGE_{Worker} \times NUM_{Units}$

- Annual costs per program for trainers to administer the refresher training increment addressing fatigue-related KAs are calculated as follows:[3]

  $NUM_{Sessions} \times (HOURS_{Fatigue\ Training} + HOURS_{Preparation\text{-}Fatigue}) \times WAGE_{Trainer} \times NUM_{Units}$

Parameter	**Description**
$HOURS_{Preparation\text{-}Fatigue}$	Hours of training preparation and examination grading for fatigue-related training (described in assumptions below)
$HOURS_{Fatigue\ Training}$	Length of fatigue-related refresher training course (described in assumptions below)
$NUM_{Employees}$	Number of employees per program covered by FFD program requirements (described in Appendix 2, Exhibit A2-14)
$NUM_{Sessions}$	Annual number of additional refresher training sessions per facility (described in assumptions below)
NUM_{Units}	Number of units per program (described in Appendix 2, Exhibit A2-14)

[3] Although many licensees may be conducting computer-based trainings, the analysis assumes a classroom-based format and may overestimate the cost of incremental training activities.

Parameter	Description
$PER_{Refresher}$	Percentage of employees taking refresher training (described in assumptions below)
$WAGE_{Worker}$	Utility worker wage rate (described in Appendix 2, Exhibit A2-11)
$WAGE_{Trainer}$	Trainer wage rate (described in Appendix 2, Exhibit A2-11)

Assumptions:

- Percentage of employees taking refresher training rather than the comprehensive "challenge" exam described under §26.29(c)(2): 20%.
- Hours of training preparation and examination grading addressing the fatigue-related KAs: 0.5 hours.
- Length of fatigue-related refresher training increment: 1 hour.
- Annual number of refresher training sessions assumes 20 workers per session.

Paragraph 26.203(d)

This paragraph of the final rule [including subparagraphs 26.203(d)(1)–(5)] requires each licensee to retain records associated with certain fatigue requirements for a period of at least three years or until completion of all related legal proceedings, whichever is later. These records include (1) records of work hours for individuals subject to the work hour controls as specified in final paragraph 26.205, (2) documentation of shift schedules and shift cycles of individuals who are subject to the work hour controls in final paragraph 26.205, (3) documentation of waivers required under final subparagraph 26.205(a)(4), (4) documentation of work hour reviews conducted in accordance with final subparagraphs 26.205(e)(3) and (e)(4), and (5) documentation of any fatigue assessments conducted in accordance with final paragraph 26.211(f). The burden of preparing the documents covered by this recordkeeping requirement (e.g., preparing records of fatigue assessments) is calculated under the respective sections of the rule (e.g., 26.211(f) for fatigue assessments). However, licensees will incur annual costs for recordkeeping under subparagraphs (1) - (5) of this paragraph, as discussed below.

Licensees will incur incremental annual costs to physically place the documentation required under 26.203(d)(1), (2),(4), and (5) into storage.

The *annual cost per program* is estimated as follows:

$$[(HOURS_{Work\_Hours} + HOURS_{Reviews} + HOURS_{Assessments}) \times WAGE_{Clerical}] \times NUM_{Facilities}$$

Parameter	Description
$HOURS_{Work\_Hours}$	Annual number of hours per facility to store individuals' work hours under final rule (described in assumptions below)
$HOURS_{Reviews}$	Annual number of hours per facility to store work hour reviews under final rule (described in assumptions below)
$HOURS_{Assessments}$	Annual number of hours per facility to store fatigue assessment documentation under final rule (described in assumptions below)
$WAGE_{Clerical}$	Utility clerical wage rate (described in Appendix 2, Exhibit A2-11)
$NUM_{Facilities}$	Number of facilities per program (described in Appendix 2, Exhibit A2-14)

Assumptions:

- Annual number of hours per facility to store individuals' work hours under final rule: 40 hours.

- Annual number of hours per facility to store work hour reviews under final rule: 4 hours.

- Annual number of hours per facility to store fatigue assessment documentation under final rule: 10 hours.

Subparagraph 26.203(d)(3) of the final rule requires licensees to document waivers as required in final subparagraph 26.203(d)(5)(v). This subparagraph modifies recordkeeping activities that licensees currently undertake under their plant technical specifications. These currently require licensees to keep on file each authorized deviation from the extended work hour limits contained in their specifications. The provision will result in annual savings because fewer waivers will be issued after the final rule takes effect.

The *annual savings per program* are estimated as the difference between the new costs and the current costs as follows:

$$(HOURS_{WaiverNew} - HOURS_{WaiverTS}) \times WAGE_{Clerical} \times NUM_{Facilities}$$

Parameter	Description
$HOURS_{WaiverTS}$	Annual number of hours per facility to file deviation authorizations under existing licensee technical specifications (described in assumptions below)
$HOURS_{WaiverNew}$	Annual number of hours per facility to file waivers under final rule (described in assumptions below)
$NUM_{Facilities}$	Number of facilities per program (described in Appendix 2, Exhibit A2-14)
$WAGE_{Clerical}$	Utility clerical wage rate (described in Appendix 2, Exhibit A2-11)

Assumptions:

- Annual number of hours per facility to file deviation authorizations under existing licensee technical specifications: 12 hours.

- Annual number of hours per facility to file waivers under final rule: 1 hour.

Paragraph 26.203(e)

This paragraph of the final rule specifies the fatigue-related information that licensees must include in the annual FFD program performance report required under Section 26.717. Incremental costs and savings to licensees are addressed below under the relevant subparagraph.

In addition, NRC will experience annual costs under this provision in conjunction with the requirements of §26.717. Under the former rule, FFD program performance reports do not address fatigue requirements. NRC, therefore, will incur incremental costs related to the increased effort needed to review the annual FFD program performance reports. On an annual basis, a member of the NRC staff reads, reviews, and summarizes the performance reports in an annual agency report. The *annual cost to the NRC* from reviewing and summarizing the additional information on fatigue is calculated as follows:

$$(HOURS_{Clerical} \times WAGE_{Clerical}) + (HOURS_{NRC\_Staff} \times WAGE_{NRC\_Staff})$$

Parameter	Description
$HOURS_{NRC\_Staff}$	NRC staff hours per year to review and summarize the additional information addressing fatigue (described in assumptions below)
$WAGE_{NRC\_Staff}$	NRC staff wage rate (described in Appendix 2, Exhibit A2-11)
$HOURS_{Clerical}$	NRC clerical hours per year to assist in reviewing and summarizing the additional information addressing fatigue (described in assumptions below)
$WAGE_{Clerical}$	NRC clerical wage rate (described in Appendix 2, Exhibit A2-11)

Assumptions:

- NRC staff hours per year to review and summarize the additional information addressing fatigue: 24 hours.

- NRC clerical hours per year to assist in reviewing and summarizing the additional information addressing fatigue: 24 hours.

Subparagraph 26.203(e)(1)

This subparagraph of the final rule requires licensees to include, within the annual FFD program performance report required under §26.717, a summary for each nuclear power plant site of all instances during the previous calendar year when the licensee waived the work hour controls specified in §26.205(d)(1) through (d)(5)(i). Licensees must report the number of instances each work hour control was waived during operating and outage periods. In addition, the licensee must report a summary that shows the distribution of waiver use among the individuals in each category identified in paragraph 26.4(a).

This analysis assumes that licensees will incur an annual cost to review their waiver documentation, categorize the instances of waivers as required, and report the data and frequency distribution in the FFD program performance report.

The *annual cost per program* is calculated as follows:

$$[(HOURS_{Clerical} \times WAGE_{Clerical}) + (HOURS_{Manager} \times WAGE_{Manager})] \times NUM_{Facilities}$$

Parameter	**Description**
$HOURS_{Clerical}$	Annual hours of clerical worker labor per facility to tally the annual number of waivers of each type, separate operating waivers from outage waivers, produce a summary of the distribution, and report these data in the FFD program report (described in assumptions below)
$HOURS_{Manager}$	Annual hours of managerial labor per facility to review the waivers data included in the FFD program report (described in assumptions below)
$WAGE_{Manager}$	Utility managerial wage rate (described in Appendix 2, Exhibit A2-11)
$WAGE_{Clerical}$	Utility clerical wage rate (described in Appendix 2, Exhibit A2-11)
$NUM_{Facilities}$	Number of facilities per program (described in Appendix 2, Exhibit A2-14)

Assumptions:

- Hours of clerical worker labor per facility to tally the annual number of waivers of each type, separate operating waivers from outage waivers, produce a summary of the distribution, and report these data in the FFD program report: 10 hours.

- Hours of managerial labor to review the waivers data included in the FFD program report: 10 hour.

Subparagraph 26.203(e)(2)

This subparagraph of the final rule requires licensees to report a summary for each nuclear power plant site of the instances of fatigue assessments conducted during the previous calendar year, including: the conditions under which each fatigue assessment was conducted (i.e., self-declaration, for cause, post-event, follow-up); a statement of whether the individual was working on outage activities at the time of the fatigue assessment; the category of duties the individual was performing if the individual was performing one of the duties described in the 26.4(a)(1) through (a)(5) of the final rule; and the management actions, if any, resulting from each fatigue assessment. This information should be readily available based on documentation prepared under 26.211(f). This analysis assumes that licensees will incur an annual cost to review and summarize the relevant fatigue assessment documentation.

The *annual cost per program* is calculated as follows:

$$[(HOURS_{Clerical} \times WAGE_{Clerical}) + (HOURS_{Manager} \times WAGE_{Manager})] \times NUM_{Facilities}$$

Parameter	**Description**
$HOURS_{Clerical}$	Annual hours of clerical labor per facility to summarize instances of fatigue assessments conducted during the previous calendar year to be included in the FFD program report (described in assumptions below)
$HOURS_{Manager}$	Annual hours of manager labor per facility to review the summary information to be sent to NRC (described in assumptions below)
$NUM_{Facilities}$	Number of facilities per program (described in Appendix 2, Exhibit A2-14)
$WAGE_{Clerical}$	Utility clerical wage rate (described in Appendix 2, Exhibit A2-11)
$WAGE_{Manager}$	Utility manager wage rate (described in Appendix 2, Exhibit A2-11)

Assumptions:

- Hours of clerical labor per facility to summarize instances of fatigue assessments conducted during the previous calendar year to be included in the FFD program report: 20 hours.

- Hours for manager per facility to review the summary information to be sent to NRC : 10 hours.

Paragraph 26.203(f)

This paragraph of the final rule requires licensees to audit the management of worker fatigue. The audits must be conducted as part of the overall FFD program audit required by paragraph 26.41 of the final rule. Under the former rule, FFD program audits do not address the fatigue requirements. Licensees, therefore, will incur an ongoing implementation cost to audit worker fatigue management.

The *annual cost per program* is calculated as follows:

$$[(HOURS_{Auditor} \times WAGE_{Auditor}) + (HOURS_{Manager} \times WAGE_{Manager}) + (HOURS_{Clerical} \times WAGE_{Clerical})] \times NUM_{Facilities} \times PER_{Annualized}$$

Parameter	Description
$HOURS_{Auditor}$	Annual hours of auditor labor per facility to audit the management of worker fatigue (described in assumptions below)
$HOURS_{Clerical}$	Annual hours of clerical labor per facility to assist with the audit of fatigue management program (described in assumptions below)
$HOURS_{Manager}$	Annual hours of manager labor per facility to assist with the audit of fatigue management program (described in assumptions below)
$NUM_{Facilities}$	Number of facilities per program (described in Appendix 2, Exhibit A2-14)
$PER_{Annualized}$	Percentage multiplier to yield annualized savings (as described in assumptions below)
$WAGE_{Auditor}$	Contract auditor wage rate (as described in Appendix 2, Exhibit A2-11)
$WAGE_{Clerical}$	Utility clerical wage rate (described in Appendix 2, Exhibit A2-11)
$WAGE_{Manager}$	Utility manager wage rate (described in Appendix 2, Exhibit A2-11)

Assumptions:

- Hours of auditor labor per facility to audit the management of worker fatigue: 40 hours.
- Hours of clerical labor per facility to assist with the audit of fatigue management program: 16 hours.
- Hours for manager per facility to review the summary information to be sent to NRC : 16 hours.
- Percentage multiplier to yield annualized savings is 50% because the audits occur every 2 years.

26.205 Work Hours

Paragraph 26.205(a)

This paragraph of the final rule describes the individuals subject to the work hour controls of §26.205. NRC's Generic Letter 82-12 and existing plant work hour technical specifications require that licensees establish administrative procedures to limit the working hours of "plant staff who perform safety-related functions (e.g., licensed SROs, licensed ROs, health physicists, auxiliary operators, and key maintenance personnel)." The final paragraph requires that individuals be subject to the work hour controls if they perform duties within one of the following five job duty groups: (1) operating or on-site directing of the operation of systems and components that a risk-informed evaluation process has shown to be significant to public health and safety; (2) performing maintenance or on-site directing of the maintenance of structures, systems, and components that a risk-informed evaluation process has shown to be significant to public health and safety; (3) performing Health Physics or Chemistry duties required as a member of the on-site emergency response organization minimum shift complement; (4) performing the duties of a Fire Brigade member who is responsible for understanding the effects of fire and fire suppressants on safe shutdown capability; or (5) performing security duties as an armed security force officer, alarm station operator, response team leader, or watchperson, hereinafter referred to as security personnel. Incremental costs related to this provision are addressed in the analysis of paragraphs 26.205(b)-(e) of the final rule. In addition, substantial savings are expected to accrue to numerous licensees that will likely apply fatigue management rules to fewer workers than they do currently.[4] NRC believes these savings might be as high as one-third of all fatigue management costs incurred under the former requirements. These savings have not been quantified, however, because of a lack of data.

[4] Relative to Generic Letter 82-12 and existing plant work hour technical specifications, the final rule more precisely identifies workers subject to fatigue management provisions. This could lead licensees not to cover workers that had been covered unnecessarily due to ambiguity in the rules or for administrative ease.

Paragraph 26.205(b)

This final paragraph, including subparagraphs (1) - (5), specifies the work hours to be included when calculating individual work hours. The analysis assumes that licensees will incur costs to modify their existing timekeeping systems and to monitor, manage, and document the actual hours worked by individuals covered under 26.205.[5]

Licensees will incur a one-time cost to modify their existing timekeeping systems in order to record, track, and document the actual hours worked and rest breaks and days off received by individuals covered under the individual work hour controls of paragraph 26.205(d) of the final rule. The *one-time costs per program* result from the following:

$$COST_{System} \times NUM_{Facilities}$$

Licensees will incur an annual cost associated with monitoring and managing the hours actually worked by individuals, including filing or backing up work hour records. The *annual costs per program* result from the following:

$$[(HOURS_{Supervisor} \times WAGE_{Supervisor}) + (HOURS_{Clerical} \times WAGE_{Clerical})] \times NUM_{Facilities}$$

Parameter	Description
$COST_{System}$	One-time cost per facility to modify a facility's existing timekeeping systems, or develop new systems, to record and track work hour data (described in Appendix 2, Exhibit A2-16)
$HOURS_{Supervisor}$	Annual hours of supervisory labor to monitor and manage the hours actually worked by individuals at one facility, including filing or backing up work hour records (described in assumptions below)
$HOURS_{Clerical}$	Annual hours for clerical labor to monitor and manage the hours actually worked by individuals at one facility, including filing or backing up work hour records (described in assumptions below)
$NUM_{Facilities}$	Number of facilities per program (described in Appendix 2, Exhibit A2-14)
$WAGE_{Supervisor}$	Utility managerial wage rate (described in Appendix 2, Exhibit A2-11)
$WAGE_{Clerical}$	Utility clerical wage rate (described in Appendix 2, Exhibit A2-11)

[5] Based on available information, NRC believes that licensees will use timekeeping systems (e.g., electronic timesheets) or access control systems (e.g., electronic card-key badge readers) to record employee work hour data.

Assumptions:

- One-time cost to modify a facility's existing systems, or develop a new system, to record, track, and document workers' actual hours worked is inclusive of all labor, management, contractor, and software.

- Annual hours of supervisory labor to monitor and manage the hours actually worked by individuals, including filing or backing up copies of work hour records: 200 hours.

- Annual hours for clerical labor to monitor and manage the hours actually worked by individuals, including filing or backing up copies of work hour records: 50 hours.

Sensitivity Analysis - Pre-Order Baseline

The preceding analysis addresses the cost of modifying timekeeping systems and tracking hours of all workers covered by §26.205, including security personnel, operators, maintenance, health physics/chemistry emergency response, and fire brigade. For one subset of these workers – security personnel – licensees already have undertaken activities similar to those described above due to the requirements of Order EA-03-038. In particular, licensees already have developed modified timekeeping systems to track hours of security personnel as necessary to implement certain individual work hour limits. These timekeeping systems are inadequate, however, with respect to conducting the tracking necessary to implement the rest break and day-off provisions required under §26.205(d)(2)-(3). This analysis assumes, therefore, that licensees will replace the systems developed in response to Order EA-03-038 in favor of new systems, as costed above.

Paragraph 26.205(c)

This final paragraph requires licensees to schedule the work hours of individuals who are subject to §26.205 consistent with the objective of preventing impairment from fatigue due to the duration, frequency, or sequencing of successive shifts.

Licensees may incur one-time costs to renegotiate collective bargaining agreements, or discuss changes with employee committees (for non-union facilities), in order to address issues related to the assignment of overtime. *One-time costs per program* are calculated as follows:

$$[(HOURS_{Management} \times WAGE_{Management}) + (HOURS_{Legal} \times WAGE_{Legal})] \times PER_{Negotiation} \times NUM_{Facilities}$$

Licensees will incur annual costs to prepare modified work schedules on an ongoing basis for all employees covered by the rule as required by this paragraph, as well as by other provisions of the final rule. *Annual costs per program* are calculated as follows:

$$HOURS_{Scheduler} \times WAGE_{Scheduler} \times NUM_{Facilities}$$

Parameter	Description
$HOURS_{Scheduler}$	Annual hours needed for workers to support supervisors in reviewing, analyzing, and modifying schedules (described in the assumptions below)
$HOURS_{Management}$	One-time hours needed for licensee management to work with union representatives in collective bargaining (described in the assumptions below)
$HOURS_{Legal}$	One-time hours needed for licensee legal staff to work with union representatives in collective bargaining (described in the assumptions below)
$NUM_{Facilities}$	Number of facilities per program (described in Appendix 2, Exhibit A2-14)
$PER_{Negotiation}$	Percentage of licensees whose schedule modifications lead to revisions to collective bargaining agreements or to discussions with employee committees (for non-union facilities) (described in the assumptions below)
$WAGE_{Scheduler}$	Utility worker wage rate (described in Appendix 2, Exhibit A2-11)
$WAGE_{Management}$	Licensee management wage rate (described in Appendix 2, Exhibit A2-11)
$WAGE_{Legal}$	Licensee legal wage rate (described in Appendix 2, Exhibit A2-11)

Assumptions:

- Hours needed for licensee management to prepare for and bargain with union representatives or discuss changes with employee committees: 60 hours.

- Hours needed for licensee legal staff to prepare for and bargain with union representatives or discuss changes with employee committees: 40 hours.

- Percentage of facilities whose schedule modifications lead to revisions to collective bargaining agreements or to discussions with employee committees (for non-union facilities): 100 percent.

- An additional level of effort averaging ½ FTE per site will be needed to prepare and maintain all worker schedules in a manner that complies with

new fatigue requirements, including the break and day-off requirements in the final rule. This level of effort includes any necessary work associated with special scheduling during a unit outage, security system outage, or increased threat condition. This analysis assumes that the additional work is not occurring on a routine basis, and instead covers instances, for example, where individuals are call in for work on weekends.

Sensitivity Analysis - Pre-Order Baseline

The preceding analysis addresses the cost of preparing modified work schedules on an ongoing basis for all employees covered by the final rule (including security personnel, operators, maintenance, health physics/chemistry emergency response, and fire brigade) consistent with the objective of preventing impairment from fatigue due to the duration, frequency, or sequencing of successive shifts. For one subset of these workers – security personnel – licensees already have undertaken activities similar to those described above due to the requirements of Order EA-03-038. In particular, licensees already have developed modified work schedules for security personnel as necessary to implement certain individual work hour limits. These schedules may not be adequate, however, with respect to implementing the break and day-off provisions required under §26.205(d)(2)-(3). This analysis assumes, therefore, that licensees will replace the schedules developed in response to Order EA-03-038 in favor of new scheduling practices, as costed above.

Paragraph 26.205(d)

Subparagraph 26.205(d)(1)

This subparagraph of the final rule establishes work hour limits for individuals subject to §26.205. Except as allowed by the waiver provisions of paragraph 26.207 of the final rule, licensees must ensure that employee work hours do not exceed the following individual work hour limits:

- 16 work hours in any 24-hour period;
- 26 work hours in any 48-hour period; and
- 72 work hours in any 7-day period.

This paragraph imposes no incremental cost and affords no savings because licensees' existing technical specifications, based on Generic Letter 82-12, contain almost identical requirements. The only change is that under the final rule employee work hours must not exceed 26 hours (instead of 24 hours) in any 48-hour period. This slight relaxation in the work hour limit relieves licensees from the requirement of granting a waiver in those cases where it would have permitted the employee to work up to two additional hours. The associated savings are accounted for in the analysis of subparagraph 26.207 of the final rule. Order EA-03-038 imposed the requirements in §26.205(d)(1) of the final rule on security personnel. Therefore, the provision results in no incremental costs for security personnel.

Although licensees' existing plant technical specifications contain almost identical requirements, some licensees are applying them more broadly to encompass some plant workers who would not be subject to individual work hour controls under §26.205(d)(1) of the final rule. For those workers, the final rule results in savings because licensees are no longer required to complete paperwork when necessary to waive the individual work hour limits. These savings also are accounted for under §26.207.

Sensitivity Analysis - Pre-Order Baseline

Relative to the requirements that were in effect before the NRC issued Order EA-03-038, which established certain fatigue management provisions for security personnel, the final subparagraph represents an entirely new requirement as applied to security personnel. NRC, however, believes that even prior to Order EA-03-038, security personnel rarely exceeded the individual work hour limits in the final rule. A 72-hour work week consisting of six 12-hour days, for example, would meet the limits in the final rule, and NRC believes that security personnel worked substantially fewer hours. Therefore, the analysis assumes that any incremental costs resulting from this subparagraph are insignificant to the analysis.

Subparagraph 26.205(d)(2)

This subparagraph of the final rule revises and amends requirements related to mandatory rest breaks. Licensee work hour technical specifications based on Generic Letter 82-12 currently require that individuals performing safety-related functions must receive a minimum break of at least 8 hours, including shift turnover time, between work periods. There currently is no other required break. The final rule extends the minimum break between shifts to 10 hours (or a minimum 8-hour break when a break of less than 10 hours is necessary to accommodate a crew's scheduled transition between work schedules or shifts). The final rule also introduces a 34-hour break in any 9-day period.

NRC expects that licensees will be able to meet the break provisions in the final rule at no incremental cost other than the scheduling cost described under paragraph 26.205(c) of the final rule, except under unusual circumstances, as addressed under paragraph 26.207 of the final rule. This includes any costs during power operation to ensure staff coverage over weekends as well as the availability of personnel during and after unscheduled call-ins. NRC came to this conclusion based on analysis of sample shift schedules provided by industry and on related industry comments.

Sensitivity Analysis Note - Pre-Order Baseline

Relative to the requirements that were in effect before the NRC issued Order EA-03-038, the final subparagraph also establishes mandatory breaks for security personnel. NRC expects that licensees will be able to meet the break provisions of the final rule at no incremental cost other than the scheduling cost described under paragraph 26.205(c) of the final rule and the calculation

and monitoring cost described under paragraph 26.205(b) of the final rule, except under unusual circumstances, as addressed under paragraph 26.207 of the final rule.

Subparagraph 26.205(d)(3)

Under the final subparagraph, licensees must ensure that individuals have, at a minimum, the number of days off specified in this subparagraph. The final language defines a day off as a day during which an individual does not start a work shift. The final language introduces the following mandatory days off for affected workers:

- For individuals working 8-hour shift schedules, at least 1 day off per week, averaged over a shift cycle
- For individuals working 10-hour shift schedules, at least 2 days off per week, averaged over a shift cycle
- For non-security personnel working 12-hour shift schedules, at least 2 ½ days off per week, averaged over a shift cycle
- For security personnel working 12-hour shift schedules, at least 3 days off per week, averaged over a shift cycle

The final rule also specifies that a shift cycle may not exceed six weeks.

NRC expects that licensees will be able to meet the day-off provisions at no incremental cost other than the scheduling cost described under paragraph 26.205(c) of the final rule, except under unusual circumstances, as addressed under paragraph 26.207 of the final rule. This includes any costs during power operation to ensure staff coverage over weekends as well as the availability of personnel during and after unscheduled call-ins. NRC came to this conclusion based on analysis of sample shift schedules provided by industry and on related industry comments.

Subparagraphs 26.205(d)(4)-(6)

Subparagraphs 26.205(d)(4)-(6) provide exceptions to the day-off requirements in paragraph 26.205(d)(3) of the final rule.

For non-security personnel, licensees do not need to meet the day-off requirements in §26.205(d)(3) during the first 60 days of a unit outage. In addition, for security personnel, licensees do not need to meet the day-off requirements in §26.205(d)(3) during the first 60 days of a unit outage, security system outage, or increased threat condition. Instead, during these periods, licensees must ensure that:

- Non-security personnel receive at least three days off in each successive (i.e., non-rolling) 15-day period during the first 60 days of a plant outage; and

- Security personnel receive at least four days off in each successive (i.e., non-rolling) 15-day period during the first 60 days of a unit outage or planned security system outage.
- Security personnel need not meet the requirements of paragraphs 26.205(d)(3) and 26.205(d)(5)(i) during unplanned security system outages or increased threat conditions.

Subparagraph 26.205(d)(6) of the final rule allows licensees to extend these day-off provisions beyond the first 60 days of a unit or security system outage or increased threat condition. Licensees may extend these provisions for an individual for seven days for each independent seven-day period in which the individual has worked less than 48 hours during the plant or security system outage or increased threat condition.

NRC expects that licensees will incur incremental costs to be able to meet the day-off provisions of the final rule during unit outages. NRC came to this conclusion based on analysis of sample shift schedules provided by industry and on related industry comments. These incremental costs are described below, as well as under paragraph 26.205(c) of the final rule, and as addressed under paragraph 26.207 of the final rule.

NRC expects that licensees using "Super Crew" 12-hour shifts during outages will incur incremental costs associated with drawing upon additional workers in order to continue obtaining the same level of effort during outage periods. These staff may be permanent part-time staff or temporary contract staff hired to work during the outage, depending on the relevant job duty group, as follows:

- Operators - the analysis assumes that licensees will meet the additional need for operators by (1) maintaining a pool of semi-retired, formerly-licensed, operators that work only during outages and (2) obtaining some additional contract operator staff (i.e., fuel handlers). (Licensees are assumed to obtain contracted operator staff, such as refueling floor operators, only to the extent that current contract operator staffing levels cease to be adequate.) The analysis assumes there is no "slack" in available operator staff, and may, therefore, overstate costs. This may be particularly true if operators work fewer than 72 hours during some portions of an outage. Licensees will incur annual costs to coordinate, maintain, and pay a small pool of semi-retired, formerly-licensed operators to work during outages. These costs, however, are more than offset by savings associated with reduced overtime wages paid to current operators. These savings have not been calculated because they will vary depending on (1) whether the semi-retired operators are any less efficient than the current operators, and (2) the size of the pool of semi-retired operators (e.g., if the pool is large enough, then none of the semi-retired operators will be paid for overtime, thereby maximizing savings to licensees).

- Maintenance - the analysis assumes that licensees will obtain additional contract maintenance staff during the period of the outage.

- Health Physics/Chemistry Emergency Response - the analysis assumes that additional health physics/chemistry emergency response staff are not needed during outage periods.[6]

- Fire Brigade - the analysis assumes that additional fire brigade staff also are operators and are costed only as part of that group in order to avoid double counting.

- Security Personnel - the analysis assumes that additional security personnel will not be needed to comply with the requirement for four days off in any successive 15-day period during an plant outage, security system outage, or increased threat condition. Under Order EA-03-038, these staff already must average no more than 60 hours per week during planned outages and are not limited during unplanned outages. Licensees do not need to modify a typical 60-hour schedule of five 12-hour days, and other possible schedules (e.g., six 10-hour days) could be adjusted (e.g., to five 12-hour days) without changing staffing levels.

Based on a sample Super Crew 12-hour shift schedule provided by industry (see Table A below), seven crews are scheduled to work six straight days of 12-hour shifts. Assuming the schedule is used for operators and maintenance staff, two crews (D7 and N7) receive 3 days off during successive 15-day periods, but the remaining 5 crews receive only two days off during successive 15-day periods.

Table A. Super Crew Outage Scheduling

Days	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15
	M	T	W	T	F	S	S	M	T	W	T	F	S	S	M

D6	D	X	D	D	D	D	D	D	X	D	D	D	D	D	D
D7	X	D	D	D	D	D	D	X	D	D	D	D	D	D	X

[6] Although HP/Chemistry staff typically work large number of hours during an outage, the only HP/Chemistry staff covered by the final rule are the small number actually assigned emergency response duties (a number that does not change depending on whether or not the plant is in outage). Therefore, even if any licensees respond to the final rule by shifting hours from the HP/Chemistry emergency response team to other HP/Chemistry personnel, this will not result in incremental costs beyond the scheduling costs calculated under paragraph 26.205(c).

Days	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15
	M	T	W	T	F	S	S	M	T	W	T	F	S	S	M

N7	X	N	N	N	N	N	N	X	N	N	N	N	N	N	X

D: 12-hour day shift
N: 12-hour night shift
X: Day off

To comply with the requirements of the final rule, this analysis assumes that licensees will provide operators and maintenance staff with an additional day off by adding another crew to the rotation. As a result, licensees may continue to work six crews during each shift. Table B shows the new scheduling for the eight crews.

D: 12-hour day shift
N: 12-hour night shift
X: Day off

The *annual costs per program* result from the following:

- As a result of the additional hires, licensees will incur annual costs to pay for in-processing two additional contract operator crews at the time of an outage:

  $(COST_{Process\_Contract\_Ops} \times NUM_{Crews} \times FACTOR_{Outage} \times NUM_{Facilities}) \times PER_{SuperCrew}$

- Licensees will incur annual costs to pay for additional contract operator staff during an outage:

  $(WEEKS_{Outage} \times WCOST_{Contract\_Ops} \times NUM_{Crews} \times FACTOR_{Outage} \times NUM_{Facilities}) \times PER_{SuperCrew}$

- Licensees will incur annual costs to pay for in-processing of additional contract maintenance staff at the time of an outage:

  $(COST_{Process\_Maint} \times NUM_{Crews} \times FACTOR_{Outage} \times NUM_{Facilities}) \times PER_{SuperCrew}$

- Licensees will incur annual costs to pay for additional contract maintenance staff during an outage:

  $(WEEKS_{Outage} \times WCOST_{Contract\_Maint} \times NUM_{Crews} \times FACTOR_{Outage} \times NUM_{Facilities}) \times PER_{SuperCrew}$

Parameter	**Description**
$COST_{Process\_Contract\_Ops}$	The average cost to conduct in-processing of an additional contract operator crew (described in Appendix 2, Exhibit A2-15)

Parameter	Description
$COST_{Process\_Maint}$	The average cost to conduct in-processing of an additional contract maintenance crew (described in Appendix 2, Exhibit A2-16)
$FACTOR_{Outage}$	Adjustment factor to annualize modeled outages that do not occur annually (described in the assumptions below)
NUM_{Crews}	Number of crews added (described in Appendix 2, Exhibit A2-16)
$NUM_{Facilities}$	Number of facilities per program (described in Appendix 2, Exhibit A2-14)
$PER_{SuperCrew}$	Percent of facilities that use Super Crew scheduling for operators and maintenance workers during outages (described in the assumptions below)
$WCOST_{Contract\_Ops}$	The weekly cost of an additional contract operator crew (described in Appendix 2, Exhibit A2-16)
$WCOST_{Contract\_Maint}$	The weekly cost of an additional contract maintenance crew (described in Appendix 2, Exhibit A2-16)
$WEEKS_{Outage}$	Number of weeks in modeled refueling outage (described in Appendix 2, Exhibit A2-15)

Assumptions:

- Percent of facilities that use Super Crew scheduling for operators and maintenance workers during outages: 100 percent.

- Significant outages (refueling outages) are assumed to occur only once every 18 months at some reactors and once every 24 months at other reactors. The analysis assumes that each facility (which, on average, has 1.6 units) experiences one significant outage per year. Therefore, the equation applies an "outage factor" ($FACTOR_{Outage}$) of 1 as a means of annualizing the above cost.

Sensitivity Analysis Note - Pre-Order Baseline

Relative to the requirements that were in effect before the NRC issued Order EA-03-038, the proposed subparagraph also establishes mandatory days-off for security personnel. NRC expects that licensees will be able to meet the day-off provisions in the final rule at no incremental cost other than the scheduling cost described under Paragraph 26.205(c) and the calculation and monitoring cost described under Paragraph 26.205(b), except under unusual circumstances, as addressed under Paragraph 26.207.

Subparagraph 26.205(d)(7)

This final subparagraph specifies that if two or more plant outages occur at a licensee's site and the interval(s) between the successive outages is (are) less than 2 weeks, then the day-off requirements of 26.205(d)(4)-(6) must be applied based upon the beginning of the first plant outage. In effect, this provision requires licensees to treat certain instances of two or more outages as a single outage for purposes of controlling work hours. The analysis addresses outage-related costs under the final rule provisions that give rise to the costs [e.g., under §26.207]. NRC believes, however, that instances of successive outages at a site are uncommon and that, in the vast majority of instances, the latter outage(s) and the "combined" outage period is not long enough to materially affect the costs calculated under the other final rule provisions.

Paragraph 26.205(e)

This paragraph of the final rule requires licensees to review at least twice per year the control of work hours for individuals who are subject to this section. The reviews do not need to cover periods of equal duration, but must collectively cover the entire calendar year. If any outages or increased threat conditions occurred since the licensee completed the most recent review, the licensee must include in the review an assessment of the control of work hours during the outages or increased threat conditions.

The *annual costs per program* to conduct work hour control reviews include the following:

$$[(NUM_{Reviews} \times HOURS_{Review} \times NUM_{Managers}) \times WAGE_{Manager}) - (HOURS_{Current\_Review} \times WAGE_{Manager})] \times NUM_{Facilities}$$

Parameter	Description
$HOURS_{Review}$	Time per participating supervisor to review overtime hours under final rule, per review (described in the assumptions below)
$HOURS_{Current\_Review}$	Annual time for manager to review overtime hours under existing technical specifications (described in assumptions below)
$NUM_{Facilities}$	Number of affected facilities (described in Appendix 2, Exhibit A2-14)
$NUM_{Manager}$	Number of manager participating in the review (described in assumptions below)
$NUM_{Reviews}$	Annual number of times a facility will review the control of work hours for individuals who are subject to this Subpart (described in the assumptions below)
$WAGE_{Manager}$	Utility manager wage rate (described in Appendix 2, Exhibit A2-11)

Assumptions:

- Annual number of times a facility will review the control of work hours for individuals who are subject to this Subpart: 2.
- Annual hours for participating managers to review work hours under final rule: 4 hours.
- Number of managers participating in the review: 4 supervisors.
- Annual time for managers to review overtime hours under existing technical specifications: 4 hours.

26.207 Waivers and Exceptions

Paragraph 26.207(a)

Under NRC's Generic Letter No. 82-12 and licensees' existing technical specifications, a deviation from extended work hour limits may be authorized in advance by the plant manager or his deputy or higher levels of management but must be documented and available for NRC review.

Under the final subparagraph, licensees may grant a waiver of the individual work hour controls contained in paragraphs (d)(1)-(5)(i) only if an operations shift manager determines that the waiver is necessary to mitigate or prevent conditions adverse to safety, or a security shift manager determines that the waiver is necessary to maintain site security, or a site senior-level manager with requisite signature authority makes either determination. In addition, a qualified supervisor must assess the individual and determine that there is reasonable assurance that the individual will be able to safely and competently perform his or her duties during the additional work period for which the waiver will be granted. To the extent practicable, licensees must only rely upon the granting of waivers to address circumstances that could not have been reasonably controlled. Licensees also must document the basis for individual waivers.

As a result of the final subparagraph, licensees will be unable to issue waivers to address most of the situations that they currently handle using deviations. Incremental costs result from licensees addressing the situation through means other than a waiver. This may entail using replacement staff who are fully qualified, but less efficient or less familiar with the job. This analysis assumes that this is the case for all instances and estimates the related costs on a weekly basis, both for outage and non-outage periods. Appendix 3 describes the derivation of these weekly costs. In addition, for those waivers that can be granted under the final rule, incremental costs arise from the need to conduct and document a fatigue assessment. This cost is calculated under §26.205 and §26.211.

The *annual cost per program* is calculated as follows:

$$[(WEEKS_{Outage} \times WEEKLYCOSTS_{Outage}) + (WEEKS_{Power} \times WEEKLYCOSTS_{Power})] \times NUM_{Facilities}$$

Parameter	Description
$NUM_{Facilities}$	Number of facilities per program (described in Appendix 2, Exhibit 2-14)
$WEEKS_{Outage}$	Number of weeks per year during which facilities experience outage conditions (described in assumptions below)
$WEEKS_{Power}$	Number of weeks per year during which facilities experience full power conditions (described in assumptions below)
$WEEKLYCOSTS_{Outage}$	The costs per week under outage conditions incurred by facilities as a result of their restricted ability to grant waivers (described in Appendix 3)
$WEEKLYCOSTS_{Power}$	The costs per week under at-power conditions incurred by facilities as a result of their restricted ability to grant waivers (described in Appendix 3)

Assumptions:

- Number of weeks per year during which an average facility experiences outage conditions: 8 weeks.

- Number of weeks per year during which facilities experience full power conditions: 44 weeks.

Paragraph 26.207(b)

Under this final paragraph, when calculating an individual's number of days off, licensees may exclude shifts worked by security personnel during the actual conduct of NRC-evaluated force-on-force tactical exercises. This provision will result in savings to licensees. This analysis does not quantify these savings, however, because the amount would be a relatively small value compared to others in this analysis.

Paragraph 26.207(c)

This paragraph states that when informed in writing by the NRC that the requirements of section 26.205 are waived for security personnel to ensure the common defense and security, licensees need not meet the specified requirements of section 26.205 for the duration of the period defined by the NRC. This provision could result in savings to licensees under unusual security

conditions. These savings will occur very infrequently, however, and are not calculated in the analysis.

Paragraph 26.207(d)

This paragraph states that licensees need not meet the requirements of paragraphs 26.205(c) and (d) during declared emergencies, as defined in the licensee's emergency plan. This provision could result in savings to licensees under unusual conditions. These savings will occur very infrequently, however, and are not calculated in the analysis.

26.209 Self-Declarations

This final paragraph requires licensees to stop any individual from performing any duties listed in paragraph 26.4(a) if the individual is performing, or being assessed for, work under a waiver of the requirements contained in 26.205(d)(1)-(5)(i) and declares that he or she is unable to safely and competently perform his or her duties due to fatigue. If the individual is required to continue performing those duties by certain other requirements, then the licensee must immediately take action to relieve the individual. The licensee must permit or require the individual to take a rest break of at least 10 hours or, alternatively, the licensee may reassign the individual to other duties if a fatigue assessment indicates that the individual is fit to safely and competently perform those other duties.

The analysis calculates costs for this provision by assuming that, in the event of a self-declaration, licensees (1) send the fatigued worker home to take a rest break of at least 10 hours, and (2) call in a replacement worker. Note that the assumed licensee actions may overstate the costs of the final provision, which also allows licensees to perform a fatigue assessment and then reassign fatigued individuals to other duties. To the extent that licensees are able to reassign fatigued staff, there is an offset to the costs calculated below.

Licensees will incur management and labor costs related to replacing fatigued workers. The *annual cost per program* is calculated as follows:

- Licensees will incur incremental management costs to call in replacement workers to substitute for any workers who are sent home to rest following a self-declaration:

  $$NUM_{Waivers} \times PER_{Self\text{-}Declare} \times (HOURS_{Supervisor} \times WAGE_{Supervisor}) \times NUM_{Facilities}$$

- Licensees also will incur incremental labor costs due to the extra time for the worker to "turn over" his/her duties to the replacement worker and other lost labor productivity:

  $$NUM_{Waivers} \times PER_{Self\text{-}Declare} \times (HOURS_{Turnover} \times WAGE_{Worker}) \times NUM_{Facilities}$$

- Licensees also will incur incremental labor costs associated with the replacement worker:[7]

$$NUM_{Waivers} \times PER_{Self\text{-}Declare} \times (HOURS_{Substitute} \times WAGE_{Worker}) \times NUM_{Facilities}$$

Parameter	Description
$HOURS_{Supervisor}$	Supervisor hour expended to identify and call in a replacement worker (described in the assumptions below)
$HOURS_{Turnover}$	Labor hours resulting from an additional turnover due to the replacement of a fatigued worker with a substitute worker (described in the assumptions below)
$HOURS_{Substituted}$	Average number of hours worked by the replacement worker per incident (described in the assumptions below)
$NUM_{Facilities}$	Number of facilities per program (described in Appendix 2, Exhibit A2-14)
$NUM_{Waivers}$	Total annual number of persons, per site, granted waivers from the requirements contained in 26.205(d)(1) and (2) (described in Appendix 3)
$PER_{Self\text{-}Declare}$	Percentage of $NUM_{Waivers}$ that self-declare to a condition of fatigue (described in the assumptions below)
$WAGE_{Worker}$	Utility worker wage rate (described in Appendix 2, Exhibit A2-11)

Assumptions:

- Total annual number of persons, per site, granted waivers from the requirements contained in 26.205(d)(1) - (5)(i) of the final rule: 15.

- Percentage of $NUM_{Waivers}$ that self-declare to a condition of fatigue: 10 percent.

- Supervisor hours expended to identify and call in a replacement worker: 1/2 hour.

- Labor hours resulting from an additional turnover due to the replacement of a fatigued worker with a substitute worker: 1 hour (i.e., 30 minutes for each of two workers).

[7] The analysis assumes that replacement workers are drawn from staff who are present at the site but have flexibility to change assignments for the remainder of the day. Therefore, this cost represents an opportunity cost. The analysis assumes that wages paid to the replacement worker are offset by wages not paid to the fatigued worker.

- Average number of hours worked by the replacement worker per incident: 6 hours.

26.211 Fatigue Assessments

Paragraph 26.211(a)–(d)

These paragraphs introduce a requirement that fatigue assessments must be conducted under four conditions: (1) for-cause; (2) self-declarations; (3) post-event; and (4) follow-up. Only supervisors and FFD program personnel, trained in accordance with the requirements of §§26.29 and 26.203(c), may conduct the fatigue assessment. The fatigue assessment must be face to face with the individual whose alertness may be impaired. The fatigue assessment must address acute fatigue, cumulative fatigue, and circadian variations in alertness and performance, and must provide the information necessary for management decisions and actions in response to the circumstance that initiated the assessment. Individuals subject to the fatigue assessment must provide complete and accurate information needed by the licensee to conduct the assessment. If an individual disagrees with the results of a fatigue assessment, the licensee must follow the procedures developed under §26.203(b)(1)(iii). Incremental costs associated with these fatigue assessments are addressed below.

The *annual costs per program* result from the following factors:

- Licensees must conduct a fatigue assessment for cause, for self-declarations, post-event, and follow-up.[8]

  $$[NUM_{Assessments} \times HOURS_{Assessment} \times (WAGE_{Worker} + WAGE_{Supervisor})] \times NUM_{Facilities}$$

- Licensees will incur costs to resolve challenges that may be brought by workers who, after self-declaring to a state of fatigue, object to negative results from their fatigue assessment:

  $$(NUM_{Self\text{-}Declarations} \times PER_{Not\_Fatigued} \times PER_{Object}) \times [(HOURS_{Worker} \times WAGE_{Worker}) + (HOURS_{ECM} \times WAGE_{ECM}) + (HOURS_{Supervisor} \times WAGE_{Supervisor})] \times NUM_{Facilities}$$

[8] If a fatigue assessment is conducted for-cause or in response to a self-declaration, and the licensee returns the individual to duty following a rest break of less than 10 hours in duration, the licensee must reassess the individual for fatigue as well as the need to implement controls and conditions before permitting the individual to resume performing any job duties. Incremental costs associated with these paragraphs are reflected in the analysis of paragraph 26.201(e) of the final rule.

Parameter	Description
$HOURS_{Worker}$	Amount of worker time to raise and resolve one incident (described in assumptions below)
$HOURS_{ECM}$	Number of hours of Employee Concerns Manager time to raise and resolve one incident (described in assumptions below)
$HOURS_{Supervisor}$	Number of hours of supervisor time to raise and resolve one incident (described in assumptions below)
$HOURS_{Assessment}$	Hours needed to complete one fatigue assessment (described in the assumptions below)
$NUM_{Facilities}$	Number of facilities per program (described in Appendix 2, Exhibit A2-14)
$NUM_{Assessments}$	Total annual number of fatigue assessments per unit, including those conducted for-cause, self-declared, post-event, and follow-up (described in assumptions below)
$NUM_{Self\text{-}Declarations}$	Annual number of self-declarations of fatigue per facility (described in assumptions below)
$PER_{Not\_Fatigued}$	Percent of $NUM_{Self\_Declarations}$ where the results of the fatigue assessment are negative (described in assumptions below)
PER_{Object}	Percent of negative fatigue assessment results that are challenged by workers (described in assumptions below)
$WAGE_{Worker}$	Average hourly wage of worker (described in Appendix 2, Exhibit A2-11)
$WAGE_{ECM}$	Average hourly wage of Employee Concerns Manager (described in Appendix 2, Exhibit A2-11)
$WAGE_{Supervisor}$	Average hourly wage of supervisor (described in Appendix 2, Exhibit A2-11)
$WAGE_{Worker}$	Utility worker wage rate (described in Appendix A2-11)
$WAGE_{Supervisor}$	Utility supervisory wage rate (described in Appendix A2-11)

Assumptions:

- Annual number of self-declarations of fatigue per facility: 20.

- Total annual number of fatigue assessments per facility, including those conducted for-cause, self declarations, post-event, and follow-up: 50 [including approximately 5 for cause, 20 for self declarations, 5 post-event, 5 follow-up, and 15 related to the waiver provisions of §26.207.]

- Time needed to conduct a fatigue assessment (including supervisor transit to the worker): 0.5 hours.

- Percent of $NUM_{Self\_Declarations}$ where the results of the fatigue assessment are negative: 50%.

- Percent of negative fatigue assessment results that are challenged by workers: 30%.

- Amount of worker time to raise and resolve one incident: ½ hour (i.e., two 15-minute meetings).

- Number of hours of Employee Concerns Manager time to address and resolve one incident: 2.5 hours.

- Number of hours of supervisor time to address and resolve one incident: 1 hour.

Paragraph 26.211(e)

This paragraph requires licensees, following a fatigue assessment [the cost of which is calculated under subparagraph 26.211(a) - (d)], to determine and implement the controls and conditions, if any, that are necessary to allow the individual to resume performing duties for the licensee, including the need for a rest break.

The analysis calculates costs for this provision by assuming that licensees take the following actions depending on the result of the fatigue assessment.

Results of Fatigue Assessment	*Modeled Licensee Actions*
Finding of no fatigue	Licensee allows the worker to return to duty with no further controls and no further cost to the licensee (except if the assessment was performed under §26.207, which is costed under that provision).
Finding of acute fatigue, either from work-related or non-work-related causes, or circadian variations in alertness and performance	Licensee sends the worker home for a 24 hour rest break and calls in a replacement worker
Finding of cumulative fatigue, either from work-related or non-work-related causes	Licensee sends the worker home for a 48-hour rest break and calls in a replacement worker

Note that the modeled licensee actions may be more than anticipated by the final rule, which allows licensees to return workers to duty under suitable controls and conditions following a fatigue assessment, and allows licensees not to conduct fatigue assessments in most cases if the licensee permits or requires the individual to take a rest break of at least 10 hours before returning to duty. Consequently, by calculating the cost of the actions shown above, the analysis likely overstates the cost of the provision. However, it follows that if licensees take the assumed actions (i.e., send workers home for rest breaks in the event of any finding of fatigue), then licensees will not incur the lesser costs of developing and implementing controls or conditions related to sending fatigued workers back to duty. In addition, the analysis overstates costs further because it does not give licensees any credit for the actions they currently take with respect to workers who they find to be fatigued.

Licensees will incur management and labor costs related to replacing fatigued workers. The *annual cost per program* results from the sum of the following factors:

- Licensees will incur incremental management costs to call in replacement workers to substitute for any workers who are sent home to rest following a fatigue assessment:

  $$NUM_{Assessments} \times PER_{Fatigue} \times (HOURS_{Supervisor} \times WAGE_{Supervisor}) \times NUM_{Facilities}$$

- Licensees also will incur incremental labor costs due to the extra "turnover" of duties to the replacement worker and other lost labor productivity:

  $$NUM_{Assessments} \times PER_{Fatigue} \times (HOURS_{Turnover} \times WAGE_{Worker}) \times NUM_{Facilities}$$

- Licensees also will incur incremental labor costs associated with the replacement worker:[9]

$$NUM_{Assessments} \times PER_{Fatigue} \times (HOURS_{Substituted} \times WAGE_{Worker}) \times NUM_{Facilities}$$

Parameter	Description
$HOURS_{Supervisor}$	Supervisory hour expended to identify and call in a replacement worker (described in assumptions below)
$HOURS_{Turnover}$	Labor hours resulting from an additional turnover due to the replacement of a fatigued worker with a substitute worker (described in assumptions below)
$HOURS_{Substituted}$	Average number of hours worked by the replacement worker per incident (described in assumptions below)
$NUM_{Assessments}$	Total annual number of fatigue assessments per unit, including those conducted for-cause, self-declared, post-event, and follow-up (described in assumptions below)
$NUM_{Facilities}$	Number of facilities per program (described in Appendix 2, Exhibit A2-14)
$PER_{Fatigue}$	Percentage of fatigue assessments that result in a finding of fatigue (described in assumptions below)
$WAGE_{Worker}$	Utility worker wage rate (described in Appendix A2-11)
$WAGE_{Supervisor}$	Utility supervisory wage rate (described in Appendix A2-11)

Assumptions:

- The analysis assumes that worker breaks are accounted for as annual leave or are otherwise uncompensated.

- Total annual number of fatigue assessments per facility, including those conducted for-cause, self declarations, post-event, and follow-up: 50 [including approximately 5 for cause, 20 for self declarations, 5 post-event, 5 follow-up, and 15 related to the waiver provisions of §26.207.]

[9] The analysis assumes that replacement workers are drawn from staff who are present at the site but have flexibility to change assignments for the remainder of the day. Therefore, this cost represents an opportunity cost. The analysis assumes that wages paid to the replacement worker are offset by wages not paid to the fatigued worker. The analysis assumes that worker breaks are accounted for as annual leave or are otherwise uncompensated.

- Percentage of fatigue assessments that result in a finding of fatigue: 37.5%[10].
- Manager hours expended to identify and call in a replacement worker: 0.5 hours.
- Labor hours resulting from an additional "turnover" due to the replacement of a fatigued worker with a substitute worker: 1 hour (i.e., 0.5 hours for each of two workers).
- Average number of hours worked by the replacement worker per incident: 6 hours.

Paragraph 26.211(f)

This paragraph requires licensees to document the results of any fatigue assessments conducted, the circumstances that necessitated the fatigue assessment, and any controls and conditions that were implemented.

Annual costs per program result from the following:

$$NUM_{Assessments} \times HOURS_{Document} \times WAGE_{Supervisor} \times NUM_{Facilities}$$

Parameter	Description
$HOURS_{Document}$	Time needed to document a fatigue assessment (described in the assumptions below)
$NUM_{Assessments}$	Total annual number of fatigue assessments per unit (described in assumptions)
$NUM_{Facilities}$	Number of facilities per program (described in Appendix 2, Exhibit A2-14)
$WAGE_{Supervisor}$	Utility supervisory wage rate (described in Appendix A2-11)

Assumption:

- Time needed to document a fatigue assessment: 20 minutes.
- Total annual number of fatigue assessments per facility, including those conducted for-cause, self declarations, post-event, and follow-up: 50 [including approximately 5 for cause, 20 for self declarations, 5 post-event, 5 follow-up, and 15 related to the waiver provisions of §26.207.]

[10] This represents a weighted average based on the following results depending on the reason for the assessment: for cause - 90%; self-declarations - 50%; post-event - 5%; follow-up - 50%; waivers under §26.207 - 25%.

Subpart J: [Reserved]

In the final rule, Subpart J is reserved and therefore contains no regulatory language. As a result, this subpart does not result in any incremental costs or savings.

Subpart K: FFD Program for Construction

26.401 General

Paragraph 26.401(a)

This paragraph of the final rule states that a combined license holder (under 10 CFR Part 52) before the Commission has made the finding under Section 52.103(g), combined license applicant who has received the authorization to construct under Section 50.10(e)(3), construction permit holder (under 10 CFR Part 50), and construction permit applicant who has received the authorization to construct under Section 50.10(e)(3) may establish, implement and maintain an FFD program that meets the requirements of Subpart K to apply to any individual constructing safety- or security-related SSCs at the location where the nuclear power plant will be constructed and operated.

This paragraph also states that if the licensees and other entities identified above do not elect to implement an FFD program that meets the requirements of Subpart K, then they must subject the individuals referenced above to an FFD program that meets the requirements of Subparts A through H, N and O. This section of the final rule imposes no incremental cost and affords no saving because it provides licensees with the flexibility to implement a more comprehensive FFD program. This enhanced flexibility is a voluntary provision. Although an FFD program that includes the requirements of Subparts A through H, N and O is generally considered more burdensome relative to the requirements of Subpart K, this may not be true for all licensees and other entities. For example, it is possible that the more comprehensive program could be less burdensome for some licensees where construction is co-located with an operating reactor. This analysis assumes that new reactor construction will be co-located with existing reactor sites and that the licensees operating the reactors will be the same as those undertaking the construction activities at the co-located site.

Paragraph 26.401(b)

This paragraph of the final rule requires licensees and other entities who intend to implement an FFD program under Subpart K to submit an FFD program plan to NRC for review and approval. This is a new requirement that imposes incremental costs on licensees and other entities. The NRC anticipates that the FFD program plan will be very closely related to the written policy and procedures that the licensee and other entity must develop (as required by the former and final rule). This analysis does not quantify the incremental costs because they are assumed to be insignificant.

Paragraph 26.401(c)

This paragraph of the final rule states that a combined license holder (under 10 CFR Part 52) before the Commission has made the finding under Section 52.103(g), combined license applicant who has received the authorization to construct under Section 50.10(e)(3), construction

permit holder (under 10 CFR Part 50), and construction permit applicant who has received the authorization to construct under Section 50.10(e)(3) may subject individuals that perform construction activities at the location where the nuclear power plant will be constructed and operated to an FFD program that meets all of the requirements of Part 26, or to FFD program elements that meet all of the applicable requirements of Part 26.

This section of the final rule imposes no incremental cost and affords no saving because it provides licensees with the flexibility to implement a more comprehensive FFD program. This enhanced flexibility is a voluntary provision. Although an FFD program that includes all of the requirements of Part 26 is generally considered more burdensome relative to the requirements of Subpart K, this may not be true for all licensees and other entities. For example, it is possible that the more comprehensive program could be less burdensome for some licensees where construction is co-located with an operating reactor. This analysis assumes that any anticipated new reactor construction will be co-located with existing reactor sites and that the licensees operating the reactors will be the same as those undertaking the construction activities at the co-located site.

26.403 Written Policy and Procedures

This section of the final rule requires licensees and other entities who implement an FFD program under Subpart K to develop, implement, and maintain written procedures that address FFD program elements. The section also requires licensees and other entities to provide a clear, concise, written FFD policy statement to individuals who are subject to the program. These requirements are required under § 26.20 of the former rule, with a few minor exceptions. Specifically, licensees and other entities must include additional information in their written procedures, such as the immediate and followup actions that will be taken in cases where individuals attempt to subvert the testing process by adulterating or diluting specimens, substituting specimens, or by any other means; refuse to provide a specimen for analysis; and have legal action taken relating to drug or alcohol use. In addition, the written procedures must include the process to be followed if an individual's behavior raises a concern regarding (1) the possible use, sale, or possession of illegal drugs on or off site, (2) the possible use or possession of alcohol while constructing safety- or security-related SSCs, or (3) impairment from any cause which in any way could adversely affect the individual's ability to safely and competently perform his or her duties. This analysis does not calculate this cost because the NRC believes that the incremental burden of including these provisions within the set of procedures that already must be developed under the former rule is not significant.

26.405 Drug and Alcohol Testing

This section of the final rule establishes the drug and alcohol testing procedures that licensees and other entities who implement an FFD program under Subpart K must follow. Paragraph 26.2(c) of the former rule required licensees and other entities to "implement a chemical testing program, including random tests." The final rule differs from the former rule in two ways. First, the final rule provides licensees and other entities with the option to implement a fitness

monitoring program (as described under paragraph 26.406 of the final rule) in place of a random testing program for individuals who perform construction activities. This analysis assumes that any anticipated new reactor construction will be co-located with existing reactor sites and that the licensees operating the reactors will be the same as those undertaking the construction activities at the co-located site. Therefore, if these licensees and other entities implement an FFD program under Subpart K and choose to randomly test individuals for drugs and alcohol under this paragraph, then it is likely the testing will be conducted in close conjunction with the random testing already being conducted for the FFD program at the co-located operating reactor site. For this reason, the NRC believes that any additional cost to test the individuals at the construction site simultaneously with the testing already being conducted is insignificant relative to the overall costs of the current random testing program. Consequently, the analysis does not calculate incremental costs for this requirement of the final rule.

Second, the final rule also includes more detail regarding the types of testing, other than random testing, that licensees and other entities must conduct, the types of drugs that FFD programs must test for, testing procedures to protect donor's privacy, urine testing that must be conducted by HHS-certified laboratories, and required MRO reviews. The NRC believes that the added detail merely clarifies the testing requirements in the former rule because licensees would have implemented these details even in the absence of the rule revisions. Therefore, this section of the final rule does not impose any incremental costs on licensees or other entities.

26.406 Fitness Monitoring

This section of the final rule allows licensees and other entities, at their option, to subject individuals specified in paragraph 26.4(f) to a fitness monitoring program, rather than a random testing program for drugs and alcohol (as required under paragraph 26.405 of the final rule). This section requires licensees and other entities choosing to use this option to establish procedures for fitness monitors to follow, train the monitors to implement the program, and ensure that the fitness of individuals is monitored effectively while the individuals are constructing safety- and security-related SSCs. To achieve this objective, licensees and other entities must consider the number and placement of monitors required, the necessary ratio of monitors to individuals, and the frequency with which the individuals must be monitored while constructing each safety- or security-related SSC. The final rule also requires licensees and other entities to establish procedures that monitors must follow in response to the indications of possible use, sale, or possession of illegal drugs, use or possession of alcohol on site or while on duty, impairment from any cause that if left unattended may result in a risk to public health and safety or the common defense and security, and any actions or other indications that call into question an individual's trustworthiness and reliability.

The requirements in this section provide flexibility to licensees and other entities relative to the requirements in section 26.2(c) of the former rule, which required licensees and other entities to "implement a chemical testing program, including random tests." This analysis assumes that licensees and other entities will implement a fitness monitoring program only if it is less

expensive to do so than to implement a random testing program. Therefore, the analysis does not calculate incremental costs for this requirement.

26.407 Behavioral Observation

This paragraph of the final rule requires licensees and other entities to ensure that individuals specified in §26.4(f) are subject to behavioral observation if they are not subject to fitness monitoring. Licensees and other entities must subject these individuals to behavioral observation while these individuals are constructing safety- or security-related SSCs. Under the former rule, licensees were required during construction to comply with Section 26.10(b) to "provide reasonable measures for the early detection of persons who are not fit to perform" their duties. The NRC believes that licensees would have complied with this former rule requirement by implementing a behavioral observation program that is very similar to the one now required under Section 26.407. Therefore, this requirement does not impose any incremental cost on licensees or other entities.

26.409 Sanctions

This section of the final rule requires licensees and other entities who implement an FFD program under Subpart K to establish sanctions for FFD policy violations. In Section 26.2(c) of the former rule, FFD programs were required to include the "imposition of sanctions." The final rule includes additional detail regarding minimum sanctions; individuals who violate FFD policy at least must be prohibited from being assigned to construct safety- or security-related SSCs unless or until the licensee or other entity determines that the individual's condition or behavior does not pose a potential risk to public health and safety or the common defense and security. The NRC believes that the added detail merely clarifies the sanction requirements in the former rule because licensees would have implemented these details even in the absence of the rule revisions. Therefore, this section of the final rule does not impose any incremental costs on licensees or other entities.

26.411 Protection of Information

This section of the final rule requires licensees and other entities who implement an FFD program under Subpart K to establish and maintain files and procedures to protect personal information. The section also requires licensees and other entities to obtain a signed consent that authorizes the disclosure of the personal information before licensees or other entities disclose the information. Section 26.2(c) of the former rule required FFD programs to make provisions for "the protection of information." The NRC believes that the added detail merely clarifies protection of information requirements in the former rule because licensees would have implemented these details even in the absence of the rule revisions. Therefore, this section of the final rule does not impose any incremental costs on licensees or other entities.

26.413 Review Process

This section of the final rule requires licensees and other entities who implement an FFD program under Subpart K to establish and implement review procedures (including an objective and impartial review of the facts) in cases where individuals have violated FFD policy. Section 26.2(c) of the former rule required FFD programs to make provisions for "appeals procedures." The NRC believes that the added detail merely clarifies the review process requirements in the former rule because licensees would have implemented these details even in the absence of the rule revisions. Therefore, this section of the final rule does not impose any incremental costs on licensees or other entities.

26.415 Audits

This section of the final rule requires licensees and other entities who implement an FFD program under Subpart K to conduct audits to ensure the continuing effectiveness of their FFD programs, including FFD program elements provided by C/Vs and the FFD programs of C/Vs that are accepted by the licensee and other entity. The final rule specifies that the audits occur at a frequency that assures the continuing effectiveness of the program and that corrective actions are taken to resolve any problems identified. The final rule language allows joint audits, and licensees and other entities may accept audits of C/Vs that are conducted by others. Under the final rule, licensees and other entities do not need to audit HHS-certified laboratories.

This analysis assumes that new reactor construction will be co-located with existing reactor sites. The licensees operating the reactors will be the same as those undertaking the construction activities at the co-located site. The analysis assumes that the audits for construction sites will be conducted as part of the audits already being conducted for the FFD program at the co-located operating reactor site. The NRC believes that any additional cost to include the construction site's FFD program within the scope of the audits already being conducted is insignificant relative to the overall costs of the program audit. Therefore, this analysis does not calculate incremental costs for this section of the final rule.

26.417 Recordkeeping and Reporting

Paragraph 26.417(a)

This paragraph of the final rule requires licensees and other entities who implement an FFD program under Subpart K to ensure that records pertaining to the administration of the program (which may be stored and archived electronically) are maintained so that they are available for NRC inspection purposes and for any legal proceedings. Section 26.2(c) of the former rule required that licensees and other entities make provisions for "recordkeeping." The NRC believes that the added detail in the final rule merely clarifies the recordkeeping requirements in the former rule because licensees would have implemented these details even in the absence of the rule revisions. Therefore, this section of the final rule does not impose any incremental costs on licensees or other entities.

Paragraph 26.417(b)

This paragraph of the final rule identifies specific reporting requirements.

Subparagraph 26.417(b)(1)

This subparagraph of the final rule requires licensees and other entities who implement an FFD program under Subpart K to report to the NRC Operations Center within 24 hours any discoveries of intentional acts that cast doubt on the integrity of the FFD program and any programmatic failure, degradation, or discovered vulnerability of the FFD program. Section 26.73(a) of the former rule required licensees and other entities to "inform the Commission of significant fitness-for-duty events," including the following:

- The sale, use, or possession of illegal drugs within the protected area; and,
- Any instances where a person licensed under 10 CFR part 55 to operate a power reactor or a supervisor –
  - (1) sells, uses, or possesses a controlled substance,
  - (2) receives a confirmed positive test result,
  - (3) uses alcohol within the protected area, or
  - (4) receives a determination of unfitness for scheduled work due to the consumption of alcohol.

The NRC believes that the detail in the final rule restates the reporting requirements in the former rule. Therefore, this section of the final rule does not impose any incremental costs on licensees or other entities.

Subparagraph 26.417(b)(2)

This subparagraph of the final rule requires licensees and other entities who implement an FFD program under Subpart K to submit annual program performance reports to the NRC. This analysis assumes that new reactor construction will be co-located with existing reactor sites. The licensees operating the reactors will be the same as those undertaking the construction activities at the co-located site. The analysis assumes that the annual program performance reports for construction sites will be compiled as part of the annual program performance report already being compiled for the FFD program at the co-located operating reactor site. The NRC believes that any additional cost to include the construction site's FFD program within the scope of the annual program performance report already being compiled is insignificant relative to the overall costs of the annual program performance report. Therefore, this analysis does not calculate incremental costs for this subparagraph of the final rule.

26.419 Suitability and Fitness Evaluations

This section of the final rule requires licensees and other entities who implement an FFD program under Subpart K to develop, implement, and maintain procedures for evaluating whether to assign individuals to construct safety- and security-related SSCs. The procedures must provide reasonable assurance that the individuals "are fit to safely and competently perform their duties, and are trustworthy and reliable as demonstrated by the avoidance of substance abuse." This final rule language restates and clarifies the former rule language. Specifically, former Section 26.2(c) required licensees to conform with former paragraph 26.10(a), which stated that the FFD program "provide reasonable assurance that [personnel] will perform their tasks in a reliable and trustworthy manner and are not under the influence of any substance, legal or illegal, or mentally or physically impaired from any cause, which in any way adversely affects their ability to safely and competently perform their duties." Therefore, this section of the final rule imposes no incremental cost on licensees or other entities.

Subpart L: [Reserved]

In the final rule, Subpart L is reserved and therefore contains no regulatory language. As a result, this subpart does not result in any incremental costs or savings.

Subpart M: [Reserved]

In the final rule, Subpart M is reserved and therefore contains no regulatory language. As a result, this subpart does not result in any incremental costs or savings.

Subpart N: Recordkeeping and Reporting Requirements

26.709 Applicability

This section of the final rule imposes no incremental cost and affords no saving because it merely states that the requirements of Subpart N apply to the FFD programs of licensees and other entities specified in final § 26.3, except for FFD programs that are implemented under Subpart K.

26.711 General Provisions

Paragraph 26.711(a)

This paragraph of the final rule restates former requirements, presented in §§26.71 and 26.73 of the former rule, which stated that licensees and other entities that have approved FFD programs must maintain records and submit reports to the NRC. The final paragraph adds a provision specifying that required records must be retained until license termination if the rule does not specify another retention period. Although this may extend the period of retention of certain records (depending on current licensee practices), the most substantial costs associated with retaining the records (filing, removal, etc.) do not change as a result of this final paragraph. The incremental burden of maintaining the necessary storage space for those particular records until the time of license termination is insignificant to this analysis.

Paragraph 26.711(b)

This paragraph of the final rule adds provisions to allow licensees to use electronic recordkeeping. Although this provision may result in savings for some licensees, such savings are likely to be small and are not calculated for purposes of this analysis.

Paragraph 26.711(c)

This paragraph of the final rule requires licensees and other entities to inform individuals of the right to review and correct the records maintained about the individual under this part and imposes a requirement on licensees and other entities to ensure that the information they maintain and share with other licensees and entities is correct and complete. This paragraph of the final rule is based on non-safeguards information requirements imposed by the NRC's Access Authorization Order (AAO) dated January 7, 2003, and published in the Federal Register on January 13, 2003. As a result, the final paragraph imposes no incremental costs and affords no savings.

Sensitivity Analysis - Pre-Order Baseline

Relative to the regulations that were in effect before the NRC issued the AAO, the paragraph does not result in any incremental costs. Although the final paragraph adopts provisions from the AAO that require licensees and other entities to inform individuals of their right to review FFD information about the individual, this analysis assumes that this is a standard business practice for licensees and other entities. Therefore, the analysis anticipates that this new requirement will not result in any additional costs.

Paragraph 26.711(d)

This paragraph of the final rule requires licensees and other entities to ensure that only correct and complete information about individuals is retained and shared with other licensees and other entities. In addition, this paragraph requires that licensees and other entities must correct or augment the shared information used to determine an individual's eligibility for authorization if the information changes or new information is developed. This paragraph of the final rule is based on non-safeguards information requirements imposed by the NRC's Access Authorization Order (AAO) dated January 7, 2003, and published in the Federal Register on January 13, 2003. As a result, the final paragraph imposes no incremental costs and affords no savings.

Sensitivity Analysis - Pre-Order Baseline

Relative to the regulations that were in effect before the NRC issued the AAO, the paragraph does not result in any incremental costs. Although the final paragraph adopts provisions from the AAO that require licensees and other entities to ensure that only correct and complete information about individuals is retained and shared with other licensees and other entities, this analysis assumes that this is a standard business practice for licensees and other entities. Therefore, the analysis anticipates that this new requirement will not result in any additional costs.

26.713 Recordkeeping Requirements for Licensees and Other Entities

Paragraphs 26.713(a)

This paragraph of the final rule [including subparagraphs (1)–(4)] requires that records of self-disclosures, employment histories, and suitable inquiries that are required under §§26.55, 26.57, 26.59, and 26.69 as well as those pertaining to denials and granting of authorization, be retained for a period of at least 5 years or until completion of any related legal proceeding, whichever is later. Although extending the period of retention beyond 5 years represents a new requirement, the most substantial costs associated with retaining the records (filing, removal, etc.) do not change as a result of this final paragraph. The incremental burden of maintaining the necessary storage space for those particular records for which legal proceedings continue beyond the 5 year period is insignificant to this analysis. In addition, the ability to store these records

electronically under subparagraph 26.711(b) will likely reduce or offset the potential costs associated with the longer retention period.

Paragraphs 26.713(b)

This paragraph of the final rule [including subparagraphs (1) and (2)] requires that records of trainings conducted under §26.29 as well as audits, audit findings, and corrective actions taken under §26.41, be retained for a period of at least 3 years or until completion of any related legal proceeding, whichever is later. Although extending the period of retention beyond 3 years in the case of legal proceedings represents a new requirement, the most substantial costs associated with retaining the records (filing, removal, etc.) do not change as a result of this final paragraph. The additional burden of maintaining the necessary storage space for those particular records beyond the 3 year period is insignificant to this analysis. In addition, the ability to store these records electronically under subparagraph 26.711(b) will likely reduce or offset the potential costs associated with the longer retention period.

Paragraphs 26.713(c)

This paragraph of the final rule extends to 40 years (or until the NRC deems adequate) the period for which licensees must retain records pertaining to any 5-year denial of authorization under paragraph 26.75(c), (d), or (e)(2) and any a permanent denial of authorization under paragraphs 26.75(b) and 26.75(g). Paragraph 26.71(c) of the former rule imposed similar requirements, but specified a minimum 3-year period for retaining records. Despite this difference, however, removal of records still requires a management determination that the records are no longer needed. The most substantial costs associated with retaining the records (filing, removing, etc.) do not change as a result of the final rule. Although licensees will incur some additional burden to maintain the necessary storage space for 40 years instead of 3 years, these costs are insignificant to this analysis. In addition, the ability to store these records electronically under subparagraph 26.711(b) will likely reduce or offset the potential costs associated with the longer retention period.

Paragraphs 26.713(d)

This paragraph of the final rule imposes no incremental cost and affords no saving because it merely revises requirements in §26.20 of the former rule, which pertained to retaining for at least three years records of written, superceded FFD policies and procedures. By contrast, the final rule extends the retention period to 5 years or until completion of all legal proceedings related to the FFD policy violation. The most substantial cost associated with retaining the records (filing, removing, etc.) do not change as a result of the new rule. Although licensees will incur some additional burden to maintain the necessary storage space for 5 years instead of 3 years, these costs are insignificant to this analysis. In addition, the ability to store these records electronically under subparagraph 26.711(b) will likely reduce or offset the potential costs associated with the longer retention period.

Paragraphs 26.713(e)

This paragraph of the final rule imposes no incremental cost and affords no saving because it merely retains the requirement that written agreements between licensees and other entities must be stored for the life of the agreement. The final paragraph also adds that licensees must retain such agreements until the completion of all legal proceedings related to FFD violations that involve those services, if that is later than the life of the agreement. This revision is consistent with long-term licensee practices relating to documents governing FFD-related contracts. Consequently, no incremental cost or saving results.

Paragraphs 26.713(f)

This paragraph of the final rule requires that records of background investigations, credit and criminal history checks, and psychological assessments of FFD program personnel, conducted under §26.31(b)(1)(i) be retained for the length of the individual's employment by or contractual relationship with the licensee or other entity, or until the completion of all related legal proceedings, whichever is later. Although this represents a new requirement, the incremental burden associated with retaining the necessary records is insignificant to this analysis. In addition, the ability to store these records electronically under subparagraph 26.711(b) will likely reduce or offset the potential costs associated with the paragraph.

Paragraphs 26.713(g)

This paragraph of the final rule requires that licensees or other entities whose FFD program includes tests for drugs in addition to those specified in the final rule, or uses more stringent cutoff levels than those specified in the final rule, retain documentation certifying the scientific and technical suitability of the assays and cutoff levels used, as required under §§26.31(d)(1)(i) and 26.31(d)(3)(iii)(C). This paragraph of the final rule represents a new requirement, and imposes incremental costs associated with filing and retaining the specified documentation for the length of time the FFD program follows these practices or until the completion of all related legal proceedings, whichever is later. The cost of retaining documentation of these procedures, once filed, is negligible.

The *one-time cost per program* results from clerical support to file and store the forensic toxicologist's evaluation of the FFD program's more stringent cutoff levels.

$$HOURS_{Clerical} \times WAGE_{Clerical} \times PER_{more\ stringent\ cutoffs} \times PER_{non\text{-}report}$$

Parameter	Description
$HOURS_{Clerical}$	Hours of clerical personnel to file and store the forensic toxicologist's evaluation of the FFD program's more stringent cutoff levels per program (as described in assumptions below)

Parameter	Description
$PER_{more\ stringent\ cutoffs}$	Percentage likelihood that the FFD program uses more stringent cutoff levels for drug testing (as described in assumptions below)
$PER_{non\text{-}report}$	Percentage likelihood that the FFD program, if it uses more stringent cutoff levels for drug testing, has not reported to the Commission (as described in assumptions below)
$WAGE_{Clerical}$	Clerical personnel wage rate (as described in Appendix 2, Exhibit A2-11)

Assumptions:

- Hours of clerical personnel to file and store the forensic toxicologist's evaluation per program: 15 minutes.

- Percentage likelihood that the FFD program will use more stringent cutoff levels for drug testing after the final rule is enacted: 10 percent.

- Percentage likelihood that the FFD program, if it will use more stringent cutoff levels for drug testing after the final rule is enacted, did not previously use these more stringent cutoff levels (and, therefore, has not reported to the Commission): 25 percent.

26.715 Recordkeeping Requirements for Collection Sites, Licensee Testing Facilities, and Laboratories Certified by the Department of Health and Human Services

Paragraphs 26.715(a) and 26.715(b)

These paragraphs of the final rule impose no incremental cost and afford no saving because they merely restate requirements in §26.71 and Appendix A Sections 2.5(f), 2.6(c), and 2.7(n) of the former rule. Specifically, these paragraphs of the former rule required collection sites, licensee testing facilities, and HHS-certified laboratories to maintain documentation concerning all aspects of the testing process (including personnel files for individuals who have been authorized to have access to specimens but are no longer under contract to or employed by the entity) for at least 2 years. The final paragraph adds that collection sites, licensee testing facilities, and HHS-certified laboratories must also retain such records until the completion of any legal proceedings related to an FFD violation, if that is later than the 2-year period. Nonetheless, the most substantial costs associated with retaining the records (filing, removing, etc.) do not change as a result of the new rule. Although licensees will incur some additional burden to store these records for a longer period in certain instances, these costs are insignificant to this analysis.

26.717 Fitness-for-Duty Program Performance Data

Paragraph 26.717(a)

This paragraph of the final rule imposes no incremental cost and affords no saving because it merely restates requirements in paragraph 26.71(d) of the former rule, which pertained to the collection and compilation of FFD program performance data.

Paragraph 26.717(b)

This paragraph of the final rule imposes no incremental cost and affords no saving because it merely renumbers requirements in paragraph 26.71(d) of the former rule, which specified the performance data that licensees and C/Vs must compile and collect under paragraph 26.717(a). Although this revised paragraph does add a provision requiring FFD programs to report the number of subversion attempts by type, the rarity of such events makes the incremental cost insignificant.

Paragraph 26.717(c)

This paragraph of the final rule requires licensees and other entities to analyze performance data annually. Incremental costs and savings attributable to this provision are analyzed under related paragraphs 26.717(e) and (f). Licensees and other entities also must retain records of the data, analyses, and corrective actions taken for at least 3 years or until the completion of any related legal proceedings, whichever is later. Although the provision to record corrective actions taken is not contained in the former rule, no incremental costs are expected to result because the burden of recording such events is incidental to that of the corrective actions themselves.

Paragraph 26.717(d)

This paragraph of the final rule imposes no incremental cost and affords no saving because it merely restates requirements in paragraph 26.71(d) of the former rule, which addressed how licensees must report information on terminations of authorization or other administrative actions resulting from positive drug tests to the NRC.

Paragraph 26.717(e) and 26.717(f)

These paragraphs of the final rule require FFD programs to report performance data to the NRC every 12 months, rather than every 6 months as specified under the former regulation. The new requirement represents an incremental savings in that it requires licensees to prepare and submit to the NRC only one performance data report (instead of two) each year. Paragraph 26.717(f) allows licensees to submit the FFD program performance data as a consolidated report, provided

that the data are reported separately for each facility. There is no incremental cost or saving associated with this latter report consolidation provision.[1]

The *annual savings per program* associated with eliminating one performance data report per year are calculated as follows:

$$HOURS_{Manager} \times WAGE_{Manager} \times NUM_{Facilities}$$

Parameter	Description
$HOURS_{Manager}$	FFD program manager hours saved in reducing the reporting frequency per facility (as described in assumptions below)
$NUM_{Facilities}$	Number of units at the given facility (as described in Appendix 2, Exhibit A2-14)
$WAGE_{Manager}$	FFD program manager wage rate (as described in Appendix 2, Exhibit A2-11)

Assumption:

- FFD program manager hours saved in reducing the reporting frequency per facility: 20 hours.

The NRC also will experience savings under this final paragraph. Under the former rule, performance reports were submitted twice each year. As the NRC received the performance reports, clerical personnel process and file them in a manner that facilitates annual review by an NRC manager. On an annual basis, the NRC manager reads, reviews, and summarizes the performance reports in an annual industry report. The reduction in the frequency of performance reports will result in savings for the NRC. The *annual savings to the NRC* from processing fewer licensee reports are calculated as follows:

$$(HOURS_{Clerical} \times WAGE_{Clerical}) + (HOURS_{Manager} \times WAGE_{Manager})$$

Parameter	Description
$HOURS_{Clerical}$	NRC clerical hours saved in reducing the reporting frequency per year (as described in assumptions below)
$HOURS_{Manager}$	NRC manager hours saved in reducing the reporting frequency per year (as described in assumptions below)

[1] The analysis assumes that licensees will not opt to change their reporting practices if doing so increases costs. Savings are assumed not to accrue given that licensees must still report data separately for each facility addressed in the consolidated report.

Parameter	Description
$WAGE_{Clerical}$	NRC clerical wage rate (as described in Appendix 2, Exhibit A2-11)
$WAGE_{Manager}$	NRC manager wage rate (as described in Appendix 2, Exhibit A2-11)

Assumptions:

- NRC manager hours saved in reducing the reporting frequency per year: 20 hours.

- NRC clerical hours saved in reducing the reporting frequency per year: 24 hours.

Paragraph 26.717(g)

This paragraph of the final rule adds a requirement that includes C/Vs in the reporting of performance data, but precludes duplicate information from being submitted to the NRC. Currently, C/Vs who maintain their own FFD programs are reporting performance data to multiple licensees for whom they work. Incremental savings will result from the paragraph because it will reduce the number of report summaries that C/Vs must distribute each year.

The *annual savings per C/V* program result from the sum of the following savings:

- The final paragraph will reduce the C/V manager labor burden because managers will be able to submit to the NRC a single report that consolidates all performance data that the C/V previously prepared for each licensee. The associated costs are estimated as follows:

  $HOURS_{Manager} \times WAGE_{Manager} \times PER_{Consolidation}$

- The final paragraph will reduce mailing costs because C/Vs will only need to submit a single performance data report to the NRC. The associated savings are estimated as follows:

  $(NUM_{Licenees} - 1) \times COST_{Mailing}$

Parameter	Description
$COST_{Mailing}$	Cost of mailing (express mail) one performance data report to each licensee (as described in Appendix 2, Exhibit A2-10)
$HOURS_{Manager}$	Hours of C/V manager time to compile all licensee performance data reports (as described in assumptions below)
$NUM_{Licensees}$	Number of licensees to whom each C/V submits performance data under the former rule (as described in assumptions below)
$PER_{Consolidation}$	Percentage savings achieved by consolidating performance data into a single report submitted to the NRC (as described in assumptions below)
$WAGE_{Manager}$	C/V manager wage rate (as described in Appendix 2, Exhibit A2-11)

Assumptions:

- Number of licensees to whom each C/V submits performance data to under the former rule: 9.
- Hours of C/V manager time to compile all licensee performance data reports: 30 hours.
- Percentage savings achieved by consolidating performance data into a single report submitted to the NRC: 25%.
- Under the former rule, C/Vs submitted performance data reports to each licensee for whom they work, but not to the NRC. Under the final rule, C/Vs will opt to report only to the NRC.

26.719 Reporting Requirements

Paragraphs 26.719(a)

This paragraph of the final rule imposes no incremental cost and affords no saving because it merely clarifies that licensees must report to the NRC all significant violations of the FFD policy (as required in §26.73 of the former rule), significant FFD program failures, and errors in drug and alcohol testing (as required in Appendix A, Sections 2.8(e)(4)–(6) of the former rule). The revised paragraph also clarifies that other entities (C/Vs) who have licensee-approved FFD programs must also report significant violations, failures, or errors to the NRC.

Paragraph 26.719(b)

This paragraph of the final rule [including subparagraphs (1)–(4)] lists the significant FFD policy violations and program failures that must be reported to the NRC Operations Center.

Under the clarifications in §26.719(b)(2)(ii), additional reportable FFD policy violations may result in incremental costs per FFD program because of:

- the reduction in the non-negative breath alcohol concentration (BAC) level for initial alcohol testing from 0.04 to 0.02 BAC as discussed in §26.97(b),

- the reduction in the initial cutoff level for marijuana metabolites from 100 ng/mL to 50 ng/mL (somewhat offset by raising of the initial cutoff level for opiate metabolites from 300 ng/mL to 2,000 ng/mL) as discussed in §§26.133 and 26.163(a)(1), and

- the addition of validity testing on all urine specimens as discussed in §§26.131 and 26.161(b).

Incremental costs will result from the added time that the FFD program manager must spend to collect, analyze, and report information concerning the additional events.

The *annual costs per program* associated with the increase in reported FFD events are calculated as follows:

$$NUM_{Events} \times PER_{Staff} \times (HOURS_{Manager} \times WAGE_{Manager}) \times NUM_{Units}$$

Parameter	**Description**
$HOURS_{Manager}$	FFD program manager hours required to investigate, analyze, and report a FFD event (as described in assumptions below)
NUM_{Events}	Annual number of additional non-negative specimen test results for validity and drugs testing per unit under the final rule (as described in Appendix 2)
NUM_{Units}	Number of units at the given facility (described in Appendix 2)
PER_{Staff}	Percentage of tested staff subject to reporting provisions of §26.719(b)(2) (as described in assumptions below)
$WAGE_{Manager}$	FFD program manager wage rate (described in Appendix 2)

Assumptions:

- Percentage of tested staff subject to reporting provisions of §26.719(b)(2): 15%.

- FFD program manager hours required to investigate, analyze, and report an event: 4 hours.

The NRC also will incur incremental costs as a result of the additional reportable events. The increase in the number of reported FFD events will result in additional reports being sent to the NRC, as required by paragraph 26.719(a), thereby increasing the labor burden associated with

processing and reviewing the licensee reports. The NRC's *annual costs* are calculated as follows:

- The NRC manager labor burden will increase as a result of the increased number of reported FFD events. The associated costs are estimated as follows:

$NUM_{Events} \times PER_{Staff} \times (HOURS_{Manager} \times WAGE_{Manager}) \times NUM_{Units}$

Parameter	Description
$HOURS_{Manager}$	NRC manager hours required to review a reported FFD event (as described in assumptions below)
NUM_{Events}	Annual number of additional non-negative specimen test results for validity and drugs testing per unit under the final rule (as described in Appendix 2)
NUM_{Units}	Number of units per program (as described in Appendix 2, Exhibit A2-14)
PER_{Staff}	Percentage of tested staff subject to reporting provisions of 26.719(b)(2) (as described in assumptions below)
$WAGE_{Manager}$	NRC program manager wage (as described in Appendix 2, Exhibit A2-11)

Assumptions:

- Percentage of tested staff subject to reporting provisions of §26.719(b)(2): 15%.
- NRC manager hours required to review a reported FFD event: 3 hours.

Paragraph 26.719(c)

Subparagraph 26.719(c)(1)

This subparagraph of the final rule imposes no incremental cost and affords no saving because it merely retains and renumbers requirements in Appendix A, Sections 2.8(e)(4)–2.8(e)(6) of the former rule, which stated that licensees must report to the NRC within 30 days of completing an investigation of testing errors or unsatisfactory performance in blind performance testing.

Subparagraph 26.719(c)(2)

This subparagraph of the final rule imposes no incremental cost and affords no saving because it merely clarifies that the requirement in former paragraph 26.73(a) involving the reporting of significant FFD events includes reporting false positive errors on a blind performance test specimen submitted to an HHS-certified laboratory.

Subparagraph 26.719(c)(3)

This subparagraph of the final rule requires licensees to report to NRC within 24 hours in the event of a false negative during quality assurance checks of validity screening tests. Although this represents a new requirement, it imposes no incremental cost and affords no saving for the foreseeable future because there currently are no approved validity screening devices that can be used by licensees (as discussed in more detail under §26.131).

Paragraph 26.719(d)

This paragraph of the final rule requires licensees to document, trend, and correct other non-reportable FFD issues that identify programmatic weaknesses under the licensee's corrective action program in a manner that will not permit the identification of individuals. Although not explicitly required under the former rule, the analysis assumes that licensees and other entities are already tracking and trending FFD program weaknesses in their corrective action programs. As a result, the final paragraph imposes no incremental cost and affords no saving.

Subpart O: Inspections, Violations, and Penalties

26.821 Inspections

This section of the final rule [including paragraphs 26.821(a) and (b)] imposes no incremental cost and affords no saving because it merely retains requirements contained in §26.70 of the former rule, which pertained to inspection of records and written agreements between licensees and C/Vs.

26.823 Violations

Paragraphs 26.823(a) and 26.823(b)

These paragraphs of the final rule impose no incremental cost and afford no saving because they merely renumber and retain the requirements in §26.90 of the former rule as they relate to violations of policy.

26.825 Criminal Penalties

Paragraphs 26.825(a) and 26.825(b)

These paragraphs of the final rule impose no incremental cost and afford no saving because they merely renumber and retain requirements in §26.91 of the former rule, as they relate to criminal penalties.

APPENDIX 2: DATA USED IN THE ANALYSIS

Exhibit A2 - 1
Individuals Subject to the FFD Program

Activity	Equation	Parameter Description	Parameter	Value	Source	Section
FFD Program Personnel Subject to the Rule					**Subpart A**	**26.4(g)**
	These parameters are used in the equations below:					
		Number of MROs per program	NUM mros	2	Assumption	
		% multiplier to spread compliance costs across all programs	PER compliance	25%	Assumption	
	Industry Practices: One-time cost per program to subject MROs to pre-access drug and alcohol testing to comply with the former rule					
			No additional parameters			
	Industry Practices: One-time cost per program to pay for MRO travel to a licensee collection facility to comply with the former rule					
		Hours of MRO travel, waiting, and specimen collection time	HOURS travel	6.0 hr	Assumption	
	Industry Practices: One-time cost per program to conduct FFD training and to administer the comprehensive examination on their MROs to comply with the former rule					
		Length of FFD program training for MROs	HOURS training	2.0 hr	Assumption	
	Industry Practices: Annual cost per program to administer a random drug and alcohol testing program for FFD program personnel to comply with the former rule					
		% tested by a random drug program per year	PER random	50%	Rule requirement	
	Industry Practices: Annual cost per program to pay for MROs selected for random drug and alcohol testing to travel to the specimen collection facility and provide a specimen to comply with the former rule					
		% tested by a random drug program per year	PER random	50%	Rule requirement	
		Hours of MRO travel, waiting, and specimen collection time	HOURS travel	6.0 hr	Assumption	
Individuals Subject to Another Acceptable Program					**Subpart A**	**26.4(j)**
	These parameters are used in the equations below:					
		Annual number of applicants for initial authorization covered by other federal or state program per unit	NUM applicants	10	Assumption	
		% of fed or state programs that qualify	PER covered	50%	Assumption	
	Annual savings per program from bypassing pre-access drug and alcohol testing for the percentage of applicants covered by an acceptable program					
			No additional parameters			
	Annual savings per program from bypassing the training and examination requirement for the percentage of applicants covered by an acceptable program					
		Length of non-supervisory level training	HOURS non-supervisory	2.00 hr	Assumption	
		Length of comprehensive examination	HOURS examination	0.5 hr	Assumption	
	Annual savings per program from requiring fewer contracted trainer hours to conduct trainings and examinations on the percentage of applicants who are covered by an acceptable program					
		Length of non-supervisory level training	HOURS non-supervisory	2.00 hr	Assumption	
		Length of comprehensive examination	HOURS examination	0.5 hr	Assumption	
		Hours of training preparation and examination grading	HOURS preparation	2.0 hr	Assumption	
	Annual savings per program from not conducting remedial training and reexamining the percentage of applicants who are covered by an acceptable program and fail the comprehensive examination					
		Length of remedial supervisory-level training	HOURS remedial	0.75 hr	Assumption	
		Length of comprehensive examination	HOURS examination	0.5 hr	Assumption	
		% failing comprehensive exam	PER failing	10%	Assumption	
	Annual savings per program from requiring fewer contracted trainer hours to conduct remedial training and reexamining those applicants covered by an acceptable program that fail the comprehensive examination					
		Length of remedial supervisory-level training	HOURS remedial	0.75 hr	Assumption	
		Length of comprehensive examination	HOURS examination	0.5 hr	Assumption	
		% failing comprehensive exam	PER failing	10%	Assumption	
	Annual savings per program from not subjecting existing employees who are covered by an acceptable program to a duplicative random drug and alcohol testing program					
		Annual number of existing employees covered by another federal or state program	NUM employees	40	Assumption	
		% tested by a random drug program per year	PER random	50%	Rule requirement	

Activity	Equation	Parameter Description	Parameter	Value	Source	Section
Background Checks, Psychological Evaluations, Credit History, Criminal History					**Subpart B**	**26.31(b)(1)(i)**
	Base annual savings per program from eliminating the requirement to update background checks every three years					
		Base number of FFD program personnel per unit for each program	NUM personnel-base	1.5	Assumption	
		Cost of updating background investigation	COST background investigation update	$150	Assumption	
		Factor to adjust the periodic cost (every three years) to an annual cost	PER annualized-1	33.3%	Calculated	
	Additional savings per program from performing fewer background check updates for programs with onsite testing					
		Additional number of FFD program personnel per facility with onsite testing	NUM personnel-onsite testing	1	Assumption	
		Cost of updating background investigation	COST background investigation update	$150	Assumption	
		Factor to adjust the periodic cost (every three years) to an annual cost	PER annualized-1	33.3%	Calculated	
	Additional savings per program from performing fewer background check updates for programs with onsite collection					
		Additional number of FFD program personnel per facility for programs with onsite collection	NUM personnel-onsite collection	0.5	Assumption	
		Cost of updating background investigation	COST background investigation update	$150	Assumption	
		Percentage of facilities with onsite collection per program	PER collection	95.0%	Assumption	
		Factor to adjust the periodic cost (every three years) to an annual cost	PER annualized-1	33.3%	Calculated	
	Base annual savings per program from reducing the frequency of the psychological evaluation and criminal history and credit check update					
		Base number of FFD program personnel per unit for each program	NUM personnel-base	1.5	Assumption	
		Cost of updating psychological evaluation	COST psychological evaluation update	$300	Assumption	
		Cost of updating individual's credit and criminal history	COST criminal/credit update	$50	Assumption	
		Factor to adjust the periodic savings to an annual savings	PER annualized-2	13.3%	Calculated	
	Additional per program savings from reducing the frequency of the psychological evaluation and criminal history and credit check update for programs with onsite testing					
		Additional number of FFD program personnel per facility with onsite testing	NUM personnel-onsite testing	1	Assumption	
		Cost of updating psychological evaluation	COST psychological evaluation update	$300	Assumption	
		Cost of updating individual's credit and criminal history	COST criminal/credit update	$50	Assumption	
		Factor to adjust the periodic savings to an annual savings	PER annualized-2	13.3%	Calculated	
	Additional savings per program from reducing the frequency of the psychological evaluation and criminal history and credit check update for programs with onsite collection					
		Additional number of FFD program personnel per facility for programs with onsite collection	NUM personnel-onsite collection	0.5	Assumption	
		Cost of updating psychological evaluation	COST psychological evaluation update	$300	Assumption	
		Cost of updating individual's credit and criminal history	COST criminal/credit update	$50	Assumption	
		Percentage of facilities with onsite collection per program	PER collection	95.0%	Assumption	
		Factor to adjust the periodic savings to an annual savings	PER annualized-2	13.3%	Calculated	
DOT-Approved Specimen Collection Facilities					**Subpart B**	**26.31(b)(2)**
	Annual savings per program from allowing MROS and other offsite contracted personnel to utilize facilities conforming to DOT requirements					
		Number of MROs per program	NUM mros	2	Assumption	
		% tested by a random drug program per year	PER random	50.0%	Rule requirement	
		% of contracted FFD personnel that live closer to a DOT-approved collection facility than to a licensee's standard collection facility	PER distance	33.3%	Assumption	
		MRO hours of saved travel, waiting and specimen collection	HOURS travel	2.0 hr	Assumption	

Exhibit A2 - 2
Written Policies and Procedures

Activity	Equation	Parameter Description	Parameter	Value	Source	Section
Policy and Procedure Revisions - Overall Program					**Subpart B**	**26.27(a)**
	One-time cost per program to account for FFD manager and clerical personnel time and to contract a legal consultant to revise FFD policies and procedures					
		Hours of FFD program manager labor to develop and revise policies and procedures	HOURS manager	370.0 hr	Assumption	
		Hours of clerical personnel support of revision of policies and procedures	HOURS clerical	95.0 hr	Assumption	
		Hours of legal assistance to review and revise policies and procedures	HOURS legal	95.0 hr	Assumption	
	One-time cost per program to account for facility supervisor time to implement the corporate policies at the facility level					
		Hours of facility supervisor time to implement revised corporate policies and procedures	HOURS facility supervisor	40.0 hr	Assumption	
Licensee Testing Facility Policy and Procedure Revisions					**Subpart E**	**26.127**
	One time costs per FFD program with onsite testing					
		Hours FFD manager	HOURS FFD manager	120.0 hr	Assumption	
		Hours Lab supervisor	HOURS lab supervisor	160.0 hr	Assumption	
		Hours Clerical	HOURS clerical	40.0 hr	Assumption	
		Hours Legal	HOURS legal	40.0 hr	Assumption	
NRC Implementation - One-time Revision of Inspection Procedures						
	One-time cost for NRC to revise inspection procedures					
		Time for FFD manager to revise the drug and alcohol testing / access authorization inspection procedures	HOURS FFDmanager	20.0 hr	Assumption	
		Time for FFD manager to write fatigue inspection procedures	HOURS FFDmanager	20.0 hr	Assumption

		Clerical personnel hours saved at facility with onsite collection	HOURS clerical-onsite testing	0.0 hr	NRC staff estimate	
		Collection manager hours saved at facility with onsite collection	HOURS collection manager	2.0 hr	NRC staff estimate	
		Collection staff hours saved at facility with onsite collection	HOURS collection staff	1.0 hr	NRC staff estimate	
		Percentage of facilities with onsite collection per program		95.0%	Assumption	
	Base annual savings per program from reduced audit frequency					
		Base number of auditors per program audit	NUM auditors-base	1	Assumption	
		Number of auditor overnights saved at facility with offsite collection and offsite testing	NUM nights-base	3	NRC staff estimate	
		Contracted auditor hours traveling	HOURS travel	4.0 hr	Assumption	
	Additional annual savings per program that accrue due to reduced auditor travel to facilities with onsite testing laboratories					
		Additional number of auditors per program with onsite testing laboratories	NUM auditors-onsite testing	1	Assumption	
		Additional number of overnights per program with onsite testing	NUM nights-onsite testing	1	NRC staff estimate	
	Additional annual savings per program that accrue due to reduced auditor travel to facilities with onsite collection facilities					
		Additional number of auditors per program with onsite collection facilities	NUM auditors-onsite collection	0	Assumption	
		Additional number of overnights per program with onsite collection	NUM nights-onsite collection	0	NRC staff estimate	
	Annual cost per program to conduct focused audits addressing problem areas of the FFD program					
		Hours of contracted auditor time conducting a focused audit	HOURS auditor	4.0 hr	NRC staff estimate	
		Hours of FFD program manager time during a focused audit	HOURS manager	3.0 hr	NRC staff estimate	
		Hours of clerical personnel time during a focused audit	HOURS clerical	1.0 hr	NRC staff estimate	
		Number of auditors per program audit	NUM auditors	2	Assumption	
		Cost of lodging and per diem per night	COST lodging	$ 150.00	Assumption	
		Cost of roundtrip travel	COST travel	$ 300.00	Assumption	
		Number of nights of lodging for auditor to complete focused audit	NUM nights-focused	1	NRC staff estimate	
		Hours of roundtrip auditor travel per audit	auditor travel time	4.0 hr	Assumption	

Activity	Equation	Parameter Description	Parameter	Value	Source	Section
Elimination of Audit Duplication of HHS-Certified Laboratories					**Subpart B**	**26.41(c)(2)**
	Annual savings per program from eliminating audit duplication					
		Hours of contracted auditor time saved annually per program in elimination of audit duplication	HOURS auditor	7.0 hr	Assumption	
		Hours of FFD program manager time saved annually in elimination of audit duplication	HOURS manager	4.0 hr	Assumption	
		Hours of clerical personnel time saved annually in elimination of audit duplication	HOURS clerical	1.0 hr	Assumption	
Forensic Toxicologist Review of More Stringent Cutoff Levels					**Subpart B**	**26.31(d)(3)**
	One time cost per program to employ more stringent cutoff level(s) for drugs					
		Hours of review by forensic toxicologist of more stringent cut-off levels for drug testing	HOURS toxicologist	3.5 hr	Assumption	
		Hours of time for the forensic toxicologist to produce a certification statement regarding the more stringent cut-off levels	HOURS certification	0.5 hr	Assumption	
		Percentage of FFD programs that use more stringent cut-off levels for drug testing	PERmore stringent cutoffs	10%	Assumption	
		Percentage of FFD programs who use more stringent cut-off levels for drug testing, but have not reported to the Commission	PER non-report	25%	Assumption	
		Hours of time spent by FFD program manager to review the results of the forensic toxicologist's evaluation per FFD program	HOURS manager	0.5 hr	Assumption	
Pre-Award Inspections of HHS-Certified Laboratories					**Subpart G**	**26.153(e)**
	Annual costs per FFD program					
		Hours per pre-award inspection for an HHS-certified lab conducted by licensee personnel or a designate	HOURS inspection	100 hr	Discussion with NEI staff, May 23, 2003	
		Percentage of FFD programs that must change to a new HHS lab because their current HHS-lab loses HHS certification	PER decertification	10%	Assumption	
		Percentage of instances in which a replacement HHS-certified lab is being used by another FFD program (a "known" HHS lab)	PER known	50%	Assumption	

Exhibit A2 - 5
Authorizations

Activity	Equation	Parameter Description	Parameter	Value	Source	Section
Initial Authorization						
Self-Disclosure for Initial Applicants					**Subpart C**	**26.55(a)(1)**
		Pre-Order Baseline: Annual savings per program from reduced facility worker labor burden for those initial applicants who qualify for the self-disclosure relaxation				
		% of applicants for initial authorization qualifying for relaxation	PER qualifying	50%	Assumption	
		Facility worker hours saved in foregone self-disclosure	HOURS worker	0.25 hr	NRC staff estimate	
		Pre-Order Baseline: Annual savings per program from reduced clerical personnel labor burden because fewer self-disclosures submitted by initial applicants need to be processed				
		% of applicants for initial authorization qualifying for relaxation	PER qualifying	50%	Assumption	
		Clerical personnel hours saved in foregone self-disclosure	HOURS clerical	0.25 hr	NRC staff estimate	
Suitable Inquiry for Initial Applicants					**Subpart C**	**26.55(a)(2)**
		Pre-Order Baseline: Annual savings per program from not conducting the suitable inquiry on initial applicants qualifying for relaxation				
		% of applicants for initial authorization qualifying for relaxation	PER qualifying	50%	Assumption	
		HR personnel hours saved in exempted suitable inquiry under the former rule, but prior to the AAO	HOURS hr	1.0 hr	NRC staff estimate	
		Pre-Order Baseline: Annual savings per program due to reduced suitable inquiry coverage period and scope for those applicants qualifying for the relaxation				
		HR personnel hours saved due to reduced suitable inquiry coverage period and a reduction in the number of employers that must be contacted	HOURS hr	0.5 hr	NRC staff estimate	
		% of applicants for initial authorization per year who do not qualify for the relaxation under subparagraph 23.63(a) in the final rule	PER not qualifying	50%	Assumption	
		% of initial applicants who have no potentially disqualifying FFD information to disclose	PER non-PDFFDI	95%	Assumption	
		Industry Practices: Annual cost per program to conduct a more thorough suitable inquiry on applicants for initial authorization to comply with the former rule				
		Additional HR personnel hours required to conduct a suitable inquiry compliant with former rule	HOURS hr	0.2 hr	Assumption	
Pre-Access Testing for Initial Applicants					**Subpart C**	**26.55(a)(3)**
		Pre-Order Baseline: Annual savings per program from not administering a pre-access drug and alcohol test on initial applicants covered by a behavioral observation and arrest-reporting program throughout the period of interruption				
		% applicants of applicants for initial authorization qualifying for pre-access drug test relaxation	PER qualifying	25%	Assumption	
		Pre-Order Baseline: Annual savings per program from bypassing required worker labor in the administration of a pre-access drug and alcohol tests for initial applicants covered by a behavioral observation and arrest-reporting				
		Facility worker hours saved at facility with onsite testing laboratory	HOURS onsite	4.0 hr	Assumption	
		Facility worker hours saved at facility with offsite testing laboratory	HOURS offsite	8.0 hr	Assumption	
		% of initial applicants qualifying for pre-access drug test relaxation	PER qualifying	25%	Assumption	
Random Testing Pool for Initial Applicants					**Subpart C**	**26.55(a)(4)**
		Annual costs per program from the implementation of a random drug and alcohol testing program on initial applicants in applicant status				
		% of initial applicants selected for random drug and alcohol testing	PER random	1%	Assumption	
Authorization Updates						
Self Disclosure for Update Applicants					**Subpart C**	**26.57(a)(1)**
		Pre-Order Baseline: Annual savings per program from reduced facility worker labor burden for those applicants for updated authorization who qualify for the self-disclosure relaxation				
		% of applicants for authorization updates qualifying for relaxation	PER qualifying	50%	Assumption	
		Facility worker hours saved in foregone self-disclosure	HOURS worker	0.25 hr	NRC staff estimate	
		Pre-Order Baseline: Annual savings per program from reduced clerical personnel labor burden because fewer self-disclosures submitted by applicants for updated authorization will need to be processed				
		% of applicants for authorization updates qualifying for relaxation	PER qualifying	50%	Assumption	
		Clerical personnel hours saved in foregone self-disclosure	HOURS clerical	0.25 hr	NRC staff estimate	

Activity	Equation	Parameter Description	Parameter	Value	Source	Section
Suitable Inquiry for Update Authorization					**Subpart C**	**26.57(a)(2)**
		Pre-Order Baseline: Annual savings per program from not conducting the suitable inquiry on applicants for updated authorization qualifying for the relaxation				
		% of applicants for authorization updates qualifying for relaxation	PER qualifying	50%	Assumption	
		HR personnel hours saved in exempted suitable inquiry under the former rule, but prior to the AAO	HOURS hr	1.0 hr	NRC staff estimate	
		Pre-Order Baseline: Annual savings per program due to reduced suitable inquiry coverage period and scope for applicants for updated authorization qualifying for the relaxation				
		% of applicants for updated authorization not qualifying for relaxation	PER non qualifying	50%	Assumption	
		% of applicants for updated authorization who have no potentially disqualifying FFD information to disclose	PER non-PDFFDI	98%	Assumption	
		HR personnel hours saved due to reduced suitable inquiry coverage period and a reduction in the number of employers that must be contacted	HOURS hr	0.5 hr	NRC staff estimate	
		Industry Practices: Annual cost per program to conduct a more thorough suitable inquiry on applicants for updated authorization to comply with the former rule				
		Additional HR personnel hours required to conduct a suitable inquiry compliant with former rule	HOURS hr	0.2 hr	Assumption	
Pre-Access Testing for Update Applicants					**Subpart C**	**26.57(a)(3)**
		Pre-Order Baseline: Annual savings per program from not administering a pre-access drug and alcohol test on update applicants covered by a behavioral observation and arrest-reporting program throughout the period of interruption				
		% applicants for authorization updates qualifying for pre-access drug test relaxation	PER qualifying	25%	Assumption	
		Pre-Order Baseline: Annual savings per program from bypassing required worker labor in the administration of a pre-access drug and alcohol tests for update applicants covered by a behavioral observation and arrest-reporting				
		Facility worker hours saved at facility with onsite testing laboratory	HOURS onsite	4.0 hr	Assumption	
		Facility worker hours saved at facility with offsite testing laboratory	HOURS offsite	8.0 hr	Assumption	
		% applicants for authorization updates qualifying for pre-access drug test relaxation	PER qualifying	25%	Assumption	
Random Testing Pool for Update Applicants					**Subpart C**	**26.57(a)(4)**
		Annual costs per program from the implementation of a random drug and alcohol testing program on update applicants in applicant status				
		% of initial applicants selected for random drug and alcohol testing	PER random	1%	Assumption	
Authorization Reinstatements with Interruptions						
Self-Disclosure for Reinstatement Applicants with 31-365 Day Interruption					**Subpart C**	**26.59(a)(1)**
		Pre-Order Baseline: Annual savings per program from reduced facility worker labor burden for those applicants for authorization reinstatement who qualify for the self-disclosure relaxation				
		Facility worker hours saved in foregone self-disclosure	HOURS worker	0.25 hr	NRC staff estimate	
		% of applicants for authorization reinstatement qualifying for self-disclosure relaxation	PER qualifying	50%	Assumption	
		Pre-Order Baseline: Annual savings per program from reduced clerical personnel labor burden because fewer self-disclosures submitted by applicants for authorization reinstatement will need to be processed				
		Clerical personnel hours saved in foregone self-disclosure	HOURS clerical	0.25 hr	NRC staff estimate	
		% of applicants for authorization reinstatement qualifying for self-disclosure relaxation	PER qualifying	50%	Assumption	
Suitable Inquiry for Reinstatement Applicants with 31-365 Day Interruption					**Subpart C**	**26.59(a)(2)**
		Pre-Order Baseline: Annual savings per program from not conducting the suitable inquiry on applicants for authorization reinstatement qualifying for the relaxation				
		HR personnel hours saved in exempted suitable inquiry under the former rule, but prior to the AAO	HOURS hr	1.0 hr	NRC staff estimate	
		% of applicants qualifying for the suitable inquiry relaxation	PER qualifying	50%	Assumption	
		Pre-Order Baseline: Annual savings per program due to reduced suitable inquiry coverage period and scope for applicants for authorization reinstatement qualifying for the relaxation				
		HR personnel hours saved due to reduced suitable inquiry coverage period and a reduction in the number of employers that must be contacted	HOURS hr	0.5 hr	NRC staff estimate	
		% of applicants not qualifying for the suitable inquiry relaxation	PER covered	50%	Assumption	
		% of update applicants who have no potentially disqualifying FFD information to disclose on their self-disclosures	PER non-pdffdi	99%	Assumption	
		Industry Practices: Annual cost per program to conduct a more thorough suitable inquiry on applicants for authorization reinstatement to comply with the former rule				
		Additional HR personnel hours required to conduct a suitable inquiry compliant with former rule	HOURS hr	0.2 hr	Assumption	

Activity	Equation	Parameter Description	Parameter	Value	Source	Section
Pre-Access Testing for Reinstatement Applicants with 31-365 Day Interruption					**Subpart C**	**26.59(a)(3)**
		Pre-Order Baseline: Annual savings per program from allowing reinstatement applicants covered by a random drug and alcohol testing program throughout the period of interruption to forego pre-access drug and alcohol testing				
		% of applicants for authorization reinstatement covered by a random drug and alcohol testing program	PER qualifying	25%	Assumption	
		Pre-Order Baseline: Annual savings per program from reducing the number of hours of lost worker productivity for reinstatement applicants covered by both a random drug and alcohol testing program and a behavioral observation and arrest reporting program				
		Facility worker hours saved at facility with onsite testing laboratory	HOURS onsite	4.0 hr	Assumption	
		Facility worker hours saved at facility with offsite testing laboratory	HOURS offsite	8.0 hr	Assumption	
		% of applicants for authorization reinstatement covered by a random drug and alcohol testing program	PER qualifying	25%	Assumption	
		Pre-Order Baseline: Annual savings per program resulting from this group of applicants not having to await verification of negative results before granting authorization				
		Facility worker hours saved at facility with onsite testing laboratory	HOURS onsite	4.0 hr	Assumption	
		Facility worker hours saved at facility with offsite testing laboratory	HOURS offsite	8.0 hr	Assumption	
		% of applicants for authorization reinstatement not covered by a random drug and alcohol testing program	PER not qualifying	75%	Assumption	
Random Testing Pool for Reinstatement Applicants with 31-365 Day Interruption					**Subpart C**	**26.59(a)(4)**
		Annual costs per program to conduct random drug and alcohol tests on applicants randomly selected while awaiting the granting of authorization				
		% of initial applicants selected for random drug and alcohol testing	PER random	1%	Assumption	
Self-Disclosure (and Suitable Inquiry) for Reinstatement Applicants with Less than 31 Day Interruption					**Subpart C**	**26.59(c)(1)**
		Pre-Order Baseline: Annual savings per program from reduced facility worker labor burden for those applicants for authorization reinstatement who qualify for the self-disclosure relaxation				
		% of reinstatement applicants qualifying for relaxation	PER qualifying	50%	Assumption	
		Facility worker hours saved in foregone self-disclosure	HOURS worker	0.25 hr	NRC staff estimate	
		Pre-Order Baseline: Annual savings per program from reduced clerical personnel labor burden because fewer self-disclosures submitted by applicants for authorization reinstatement will need to be processed				
		% of reinstatement applicants qualifying for relaxation	PER qualifying	50%	Assumption	
		Clerical personnel hours saved in foregone self-disclosure	HOURS clerical	0.25 hr	NRC staff estimate	
		Pre-Order Baseline: Annual savings per program from not conducting suitable inquiries on applicants for authorization reinstatement with an interruption of not more than 30 days				
		HR personnel hours saved in exempted suitable inquiry under the former rule, but prior to the AAO	HOURS hr	1.0 hr	NRC staff estimate	
		Industry Practices: Annual cost per program for applicants for authorization reinstatement with interruptions of not more than 30 days to submit self-disclosures to comply with self-disclosure requirements				
		Facility worker hours required to complete and submit self-disclosure	HOURS worker	0.25 hr	NRC staff estimate	
		% cost applied to each program	PER cost	50%	Assumption	
		Industry Practices: Annual cost per program for clerical personnel to process additional self-disclosures for applicants for authorization reinstatement with interruptions of not more than 30 days to comply with self-disclosure requirements				
		Clerical personnel hours required to process received self-disclosures	HOURS clerical	0.25 hr	NRC staff estimate	
		% cost applied to each program	PER cost	50%	Assumption	
		Industry Practices: Annual cost per program to conduct suitable inquiries on applicants for authorization reinstatement with an interruption of not more than 30 days to comply with the former rules				
		Additional HR personnel hours required to conduct a suitable inquiry as required by former	HOURS hr	1.0 hr	NRC staff estimate	
		% cost applied to each program	PER cost	50%	Assumption	
		Industry Practices: Annual cost per program to conduct a more thorough suitable inquiry on applicants for authorization reinstatement with an interruption of not more than 30 days to comply with the former rule				
		Additional HR personnel hours required to conduct a suitable inquiry compliant with former rule	HOURS hr	0.2 hr	Assumption	

Pre-Access Testing for Reinstatement Applicants with Less than 31 Day Interruption			Subpart C	26.59(c)(2)
Pre-Order Baseline: Annual savings per program from not administering a pre-access drug and alcohol test on applicants for authorization reinstatement with an interruption of 5 days or less				
No additional Parameters	No Parameters			
Pre-Order Baseline: Annual savings per program from bypassing worker labor in the administration of a pre-access drug and alcohol test for authorization reinstatements with an interruption of 5 days or less				
Facility worker hours saved at facility with onsite testing laboratory	HOURS onsite	4.0 hr	Assumption	
Facility worker hours saved at facility with offsite testing laboratory	HOURS offsite	8.0 hr	Assumption	
Pre-Order Baseline: Annual savings per program from allowing reinstatement applicants who have been covered by a behavioral observation and arrest-reporting program throughout the period of interruption to forego the pre-access drug and alcohol test				
% of applicants qualifying for the relaxation	PER covered	50%	Assumption	
Pre-Order Baseline: Annual savings per program from bypassing required worker labor in the administration of a pre-access drug and alcohol tests for reinstatement applicants who have been covered by a behavioral observation and				
% of applicants qualifying for the relaxation	PER covered	50%	Assumption	
Facility worker hours saved at facility with onsite testing laboratory	HOURS onsite	4.0 hr	Assumption	
Facility worker hours saved at facility with offsite testing laboratory	HOURS offsite	8.0 hr	Assumption	
Pre-Order Baseline: Annual savings per program from allowing reinstatement applicants who have not been covered by a behavioral observation and arrest-reporting program throughout the period of interruption but who have not beer randomly selected for pre-access testing to forego the pre-access drug and alcohol test				
% of applicants not qualifying for the relaxation	PER not covered	50%	Assumption	
% of applicants subject to random testing but not selected	PER not selected	98%	Assumption	
Pre-Order Baseline: Annual savings per program from reducing the number of hours of lost worker productivity for reinstatement applicants who are not covered and are not selected for random pre-access drug and alcohol testing				
% of applicants not qualifying for the relaxation	PER not covered	50%	Assumption	
% of applicants subject to random testing but not selected	PER not selected	98%	Assumption	
Facility worker hours saved at facility with onsite testing laboratory	HOURS onsite	4.0 hr	Assumption	
Facility worker hours saved at facility with offsite testing laboratory	HOURS offsite	8.0 hr	Assumption	
Industry Practices: Annual cost per program to comply with existing pre-access drug and alcohol testing provisions				
Facility worker hours saved at facility with onsite testing laboratory	HOURS onsite	4.0 hr	Assumption	
Facility worker hours saved at facility with offsite testing laboratory	HOURS offsite	8.0 hr	Assumption	
% of cost applied to a given program due to non-compliance	PER compliance	50%	Assumption	
Industry Practices: Annual cost per program of increased lost worker productivity awaiting negative test result verification to comply with existing pre-access drug and alcohol testing provisions				
Facility worker hours saved at facility with onsite testing laboratory	HOURS onsite	4.0 hr	Assumption	
Facility worker hours saved at facility with offsite testing laboratory	HOURS offsite	8.0 hr	Assumption	
% of cost applied to a given program due to non-compliance	PER compliance	50%	Assumption	

Random Testing Pool for Reinstatement Applicants with Less than 31 Day Interruption			Subpart C	26.59(c)(3)
Annual costs per program to subject applicants for authorization reinstatement to one-time random selection for a pre-access drug and alcohol test				
% rate of random test selection	PER randomly selected	2%	Assumption	
% rate of random test selection	PER randomly selected	1%	Assumption	
Annual costs per program from reduced labor productivity to subject applicants for authorization reinstatement to one-time random selection for a pre-access drug and alcohol test				
% rate of random test selection	PER random	2%	Assumption	
Facility worker hours saved at facility with onsite testing laboratory	HOURS onsite	4.0 hr	Assumption	
Facility worker hours saved at facility with offsite testing laboratory	HOURS offsite	8.0 hr	Assumption	

Exhibit A2 - 6

Activities Related to Potential Policy Violations

Activity	Equation	Parameter Description	Parameter	Value	Source	Section
Reasonable Effort to Track Randomly Selected Individuals for Testing					**Subpart B**	**26.31(d)(2)**
	Annual costs per program from requiring greater effort to track individuals selected for random drug and alcohol testing					
		% tested by a random drug program per year	PER random	50.0%	Rule requirement	
		% of randomly selected employees per year that are unavailable for the scheduled test	PER unavailable	25%	Assumption	
		Hours of FFD program manager tracking time per randomly selected employee unavailable for the scheduled test	HOURS manager	0.25 hr	Assumption	
Behavioral Observation					**Subpart B**	**26.33**
	This parameter is used in the equations below:					
		% increase in for-cause tests/referrals per year	PERI for-cause	10%	Assumption	
	Annual cost per program to review additional for-cause referrals					
		Hours of FFD program manager review per for-cause referral	HOURS manager	4.0 hr	Assumption	
		Hours of facility worker hours under review per for-cause referral	HOURS worker	4.0 hr	Assumption	
	Annual cost per program to conduct additional drug and alcohol tests due to increased for-cause referrals					
			No additional parameters			
	Annual cost per program to conduct additional pre-access drug and alcohol tests yielding positive results due to increased for-cause referrals					
			No additional parameters			
	Annual cost per program to retest confirmed positive drug test results at a second HHS-certified laboratory at the request of the donor					
		Percentage of urine specimens with confirmed positive, adulterated, substituted, dilute, or invalid validity and/or drug test results retested at the request of the donor at a second HHS-certified laboratory	PER retest	5%	Assumption	
	Annual costs per program for the percentage of workers with confirmed positive test results who initiate an appeals process					
		Percentage of workers with confirmed positive test results that initiate appeals process	PER appeals	1%	Assumption	
Disclosure requirements positive test results					**Subpart B**	**26.37(d)**
	Annual costs per program to provide individuals with easier access to personal documents					
		% of employees with positive test results who request records	PER requesting	50%	Assumption	
		Additional clerical personnel hours copying, packaging, and shipping records per disclosure request	HOURS clerical	1.0 hr	Assumption	
		Cost of mailing (express mail) one performance data report to each licensee	COSTMailing	$ 10.00	Assumption	
Definition of "Potentially Disqualifying Information"					**Subpart H**	**26.189(b)(3)**
	These parameters are used in the equations below:					
		% of applicants for authorization requiring a determination of fitness based on potentially disqualifying FFD information under the former rule	PER PDFFDI-former	10%	Assumption	
		% of applicants for authorization requiring a determination of fitness based on potentially disqualifying FFD information under the final rule	PER PDFFDI-final	5%	Assumption	
	Annual savings per program from the reduction in the number of determinations of fitness requiring SAE review					
		SAE hours of review per determination of fitness	HOURS sae	2.0 hr	Assumption	
	Annual savings per program from the reduction in the number of determinations of fitness requiring FFD program manager review					
		FFD program manager hours of review per determination of fitness	HOURS manager	2.0 hr	Assumption	
	Annual savings per program from the reduction in the number of determinations of fitness requiring clerical personnel support					
		Clerical personnel hours to support determination of fitness	HOURS clerical	2.0 hr	Assumption	
Face-to-Face Determinations of Fitness					**Subpart H**	**26.189(c)**
	Annual costs per program from requiring that a determination of fitness that is conducted for-cause be conducted face-to-face with the individual under review					
		Hours of worker time required per face-to-face determination of fitness	HOURS worker	2.0 hr	Assumption	

Exhibit A2 - 7
Urine Specimen Collections

Activity	Equation	Parameter Description	Parameter	Value	Source	Section
Urine Collection: Donors Without Adequate ID					**Subpart E**	**26.89(b)(2)**
	Annual savings per FFD program per year					
		Percentage of individuals without identification	PER no-ID	1.0%	Assumption	
		Time a donor without ID would spend to leave the collection site, obtain appropriate ID, and return to the collection site to be drug and alcohol tested	HOURS worker	0.75 hr	Assumption	
Urine Collection: Eliminate Listing Medications on the CCF Form and add description of testing process					**Subpart E**	**26.89(b)(3)**
	Annual savings per FFD program per year					
		Time per collection to list medications on CCF	HOURS saved	0.033 hr	Assumption	
		Time per collection for collector to explain testing process to donor	HOURS added	0.013 hr		
Urine Collection: Inspecting Contents of Donor's Pockets					**Subpart E**	**26.105(b)**
	Annual costs per FFD program per year					
		Time to inspect contents of a donors pockets per test	HOURS inspection	0.033 hr	Assumption	
Urine Specimen Quantity: Minimum Quantity of 30 mL					**Subpart E**	**26.109(a)**
	Annual savings per FFD program					
		Percentage of collections considered to be of inadequate quantity under the former requirements	PER low quantity	6.7%	4.22.03 Wall Street Journal article, see RA	
		Percentage decrease in the number of inadequate specimens resulting from reduction in the minimum specimen quantity from 60 mL to 30 mL	PERD low quantity	25.0%	Assumption	
		Time per test saved because donor can provide a sufficient specimen under the new rule	HOURS saved	1.50 hr	Assumption	
Urine Specimen: At Least 30 mL, but Less than Predetermined Quantity					**Subpart E**	**26.109(b)(2)**
	Annual costs per FFD program with onsite testing facility					
		Percentage of urine specimens at least 30 mL in volume, but less than the licensee or C/Vs predetermined quantity of urine	PER not predetermined quantity	1.0%	Assumption	
Shy Bladder Medical Evaluation					**Subpart E**	**26.119**
	Annual costs per FFD program					
		Number of urine collections unable to be completed because of inadequate specimen volume per facility per year	NUM shy bladder	1	Assumption	
		Cost of a medical evaluation and written report from a licensed physician (per shy bladder event)	COST medical evaluation	$ 300.00	Assumption	
		Time per medical evaluation (including travel to and from the physician's office)	HOURS medical evaluation	1.50 hr	Assumption	
		Time for a FFD manager per incident where an employee is unable to provide the minimum quantity of urine after 3 hours	HOURS FFD manager	2.0 hr	Assumption	
		MRO time to select a physician, instruct the physician on the medical evaluation that must be conducted, and review and communicate the medical evaluation results	HOURS MRO	2.0 hr	Assumption	

Exhibit A2 - 8
Alcohol Testing

Activity	Equation	Parameter Description	Parameter	Value	Source	Section
Blood Collection for Confirmatory Alcohol Testing					**Subpart E**	**26.83(a)**
	Annual savings per FFD program per year					
		Number of blood tests per FFD program per year	NUM blood	1	NEI data	
		Hours MRO to review test result & communicate with employee and donor	HOURS mro	0.75 hour	Assumption	
		Hours lost worker productivity resulting from receiving a blood test	HOURS worker	0.75 hour	Assumption	
Purchase of EBT and Calibration Equipment and Related Training					**Subpart E**	**26.91(b)**
	This parameter is used in the equations below:					
		Percentage of collection sites that will purchase an EBT meeting the specifications in paragraph 26.91(c).	PER purchased	50%	Assumption	
	One time equipment purchases per facility					
		Number of compliant EBTs purchased per collection site	NUM EBTs	2	Assumption	
	One time training cost per facility					
		Cost of alcohol collector training course on purchased EBT	COST training course	$ 250	Assumption	
		Number of alcohol collectors per collection site	NUM collectors	4		
		Length of alcohol collector training course	HOURS collector training	2 hours	Assumption	
Required Use of an EBT on the NHTSA CPL for Confirmatory Testing					**Subpart E**	**26.91(c)**
	Annual savings per FFD program per year					
		Time per test to set-up a second EBTs (locate the EBT, turn on the equipment) to conduct confirmatory testing	HOURS saved	0.033 hour	Assumption	
		Percentage of collections sites that will use a compliant EBT for all collections	PER compliant, final rule	50%	Assumption	
One Breath Specimen Collection for Initial Alcohol Test					**Subpart E**	**26.95(c)**
	Annual savings per FFD program per year					
		Savings in collection time from one fewer breath collection per breath test	HOURS breath collection	0.033 hour	Assumption	
Lowering Initial BAC Requiring Confirmatory Test to BAC 0.02					**Subpart E**	**26.99(b)**
	Annual costs per FFD program per year					
		Percentage increase in number of initial positive alcohol tests under the lower screening level BAC	PERI IPAT	20%	Assumption	
		Time to conduct a confirmatory alcohol test under the final rule	HOURS CAT	0.05 hour	Assumption	
		Hours of FFD manager time associated with personnel activities and administrative actions resulting from a confirmed positive alcohol test result	HOURS FFD manager	2.5 hour	Assumption	
FFD Manager Determines Confirmed Positive Test for Alcohol (BAC 0.02 < 0.04)					**Subpart E**	**26.103**
	Annual costs per FFD program per year					
		% increase in the number of confirmed positive breath alcohol tests per FFD program under the BACs in the final rule	PERI CPAT	20%	Assumption. Note: this is the same rate as in 26.97(b) PERI IPAT	
		Time per test result for FFD manager to determine the length of time an employee has been in work for BACs equal to or greater than 0.02 and less than 0.4	HOURS FFD management	0.25 hour	Assumption	

Exhibit A2 - 9

Drug and validity testing (licensee testing facilities and HHS-certified laboratories)

Activity	Equation	Parameter Description	Parameter	Value	Source	Section
Validity Testing (On-site Licensee Testing Facilities and HHS-Certified Laboratories)					**Subpart F**	**26.131(b)**
					Subpart G	**26.161(b)(1)**
	Cost to Conduct Daily Calibration Validity Testing Equipment at Onsite Licensee Testing Facility					
		Number of days per year a licensee testing facility operates	NUMdays	365 days	Assumption	
	Costs for confirmed positive drug tests and confirmed adulterated, substituted, or invalid validity test results					
		Percentage of initial validity tests with dilute, adulterated, substitued, or invalid test results	PER dilute, adulterated, substituted, or invalid - initial valdiity testing	2.69%	Equals the sum of the percentage of dilute, adulterated, and invalid specimens - see Exhibit A2-12)	
		Percentage of Dilute Specimens drug positive at LOD testing	PER positive LOD	33%	Assumption	
		Percentage of initial Adulterated, Substituted (0-<2 mg/dL creatinine), and Invalid test results that remain adulterated, substitued, or invalid on confirmation	PER adulterated, substituted, Invalid confirmed	100%	Assumption	
		Percentage of specimens collected under direct observation as a result of an initial specimen with a confirmatory validity test result of invalid that test positive for drugs	PERdrug positive 2nd collection	33%	Assumption	
Initial Validity Testing - Onsite Licensee Testing Facilities					**Subpart F**	**26.131(b)**
	This parameter is used in multiple equations in 26.131(b) calculations:					
		Percentage of urine specimens with confirmed positive, adulterated, substituted, dilute, or invalid validity and/or drug test results retested at the request of the donor at a second HHS-certified laboratory	PER retest	5.0%	Assumption	
		Percentage of workers with confirmed positive test results that initiate appeals process	PER appeals	1.0%	Assumption	
Change Cutoff Levels for Marijuana and Opiates - Onsite Testing Facilities					**Subpart F**	**26.133**
Change Cutoff Levels for Marijuana and Opiates - HHS-Certified Laboratories					**Subpart G**	**26.163(a)(1)**
		Percentage increase in marijuana positive drug tests resulting from reduced cutoff level in new rule	PERI marijuana	40%	Assumption	
		Percentage decrease in opiate positive drug tests resulting from the increased cutoff level in the new rule	PERD opiate	75%	Assumption	
Quality Control Specimens in Each Analytical Run - Onsite Testing Facilities					**Subpart F**	**26.137(e)(6)**
	Annual costs per unit with onsite testing facilities					
		Percentage cost increase per average urine specimen	PERI cost	10%	Assumption	
Unidentified Interfering Substance/Adulterant - Contact MRO and Specimen Retesting					**Subpart G**	**26.161(g)**
	Annual costs per FFD program					
		Number of urine specimens per facility per year suspected of having a new adulterant or interfering agent that could make a test result invalid that are sent to a second HHS-certified laboratory	NUM new adulterant	1	Assumption	
		Time per specimen for an MRO to speak with the HHS-certified laboratory and determine whether a specimen is to be retested at a second HHS-certified laboratory, and the time to review the results of validity testing at the second HHS-certified laboratory	HOURS MRO	0.50 hr	Assumption	
Retesting of Single Collection Specimens with Confirmed Positive Drug and/or Validity Test Results					**Subpart G**	**26.165(b)**
		Percentage of urine specimens with confirmed positive, adulterated, substituted, dilute, or invalid validity and/or drug test results retested at the request of the donor at a second HHS-certified laboratory	PER retest	5%	Assumption	
		Percentage increase in retesting of confirmed positive urine specimens based on the new rule provision to afford retesting of single specimens	PERI retest	10%	Assumption	

Activity	Equation	Parameter Description	Parameter	Value	Source	Section
Blind Sample Testing - 1st Quarter of Contract with a HHS-Certified Laboratory					**Subpart G**	**26.168(a)(1)**
	Annual savings per FFD program which conduct all drug tests at an HHS-certified lab					
		Percentage of urine specimens that must be blind test specimens submitted in initial 90 days of a contract with an HHS-certified lab, former rule	PER blind specimens, initial 90 days, former rule	50%	Former rule requirement, 2.8(e)(2) of Appendix A	
		Maximum number of blind specimens to be submitted in the first 90 days of a contract with an HHS-certified lab, former rule	NUM blinds, max, initial 90 days, former rule	500	Former rule requirement, 2.8(e)(2) of Appendix A	
		Percentage of urine specimens that must be blind test specimens submitted in the first 90 days of a contract with an HHS-certified lab - new rule	PER blind specimens, initial 90 days, new rule	20%	Final rule requirement	
		Maximum number of blind specimens to be submitted in the first 90 days of a contract with an HHS-certified lab, new rule	NUM blinds, max, initial 90 days, new rule	100	Final rule requirement	
		Minimum number of blind specimens to be submitted in the first 90 days of a contract with an HHS-certified lab, new rule	NUM blinds, min, initial 90 days, new rule	30	Final rule requirement	
		Percentage of years that a FFD program enters contracts with a different HHS-certified lab	PER FFD programs change HHS lab	10%	Assumption	
		Number of quarters in a year	NUM quarters	4		
	Annual costs per FFD program which conducts initial drug testing at an on-site licensee testing facility					
		Percentage of specimens analyzed by a licensee testing facility that must be QA specimen	PER QA specimens	10.0%	Licensee testing facilities include 10 percent of total specimens analyzed as controls, complying with former rule 2.7(d) of Appendix A	
		Percentage of QA specimens that must be a blind specimen	PER QA specimens, blinds	10.0%	Assumption	
		Percentage of blind specimens that must be positive under former requirements	PER Blind specimens, positive	20.0%	Former rule requirement, 2.8(e)(3) of Appendix A	
		Percentage of negative initial drug test result specimens submitted to a HHS-certified laboratory for initial drug testing	PER neg. urine specimens to HHS	1.0%	Assumption	
Blind Sample Testing - Contracts with HHS-Certified Laboratories Older Than 90 Days					**Subpart G**	**26.168(a)(2)**
	Annual savings per FFD program which conduct all drug tests at an HHS-certified lab					
		Percentage of urine specimens that must be blind test specimens submitted per quarter for an existing contract with an HHS-certified laboratory - former rule	PER blind specimens, per quarter, former rule	10%	Former rule requirement, 2.8(e)(2) of Appendix A	
		Maximum number of blind specimens to be submitted in the first 90 days of a contract with an HHS-certified lab, former rule	NUM blinds, max, per quarter, former rule	250	Former rule requirement, 2.8(e)(2) of Appendix A	
		Percentage of urine specimens that must be blind performance test specimens submitted per quarter for an existing contract with an HHS-certified laboratory - new rule	PER blind specimens, per quarter, new rule	1%	Final rule requirement	
		Maximum number of blind specimens to be submitted per quarter for an existing contract with an HHS-certified lab, new rule	NUM blinds, max, per quarter, new rule	100	Final rule requirement	
		Minimum number of blind specimens to be submitted per quarter for an existing contract with an HHS-certified lab, new rule	NUM blinds, min, per quarter, new rule	10	Final rule requirement	
		Maximum percentage of urine specimens that must be blind specimens submitted per quarter for an existing contract with an HHS-certified laboratory (if total number of specimens submitted is less than 10 specimens), new rule	PER cap on min. num. blinds per quarter	25%	Final rule requirement. The number of blind specimens per quarter is Final at a minimum of 3 percent (up to a maximum of 25 percent) or 10 blinds specimens, whichever is greater.	
		Increase in the cost per blind performance test specimen due to the change in the mix of the positive to negative ratio of blind specimens in the final rule	PERIcost blind specimen	75%	Assumption, cost increase by 75% because of change in mix of blind performance test samples (former rule required 80% of samples to be negative, final rule requires 60% of samples to be positive, 10% false negative challenge, 10% adulterated, substitued, or dilute)	

Activity	Equation	Parameter Description	Parameter	Value	Source	Section
Annual costs per FFD program which conducts initial drug testing at on-site licensee testing facility						
		Percentage of specimens analyzed by a licensee testing facility that must be QA specimens (controls)	PER QA specimens	10.0%	Licensee testing facilities include 10 percent of total specimens analyzed as controls, complying with former rule 2.7(d) of Appendix A	
		Percentage of QA specimens that must be a blind specimen	PER QA specimens, blinds	10.0%	Assumption	
		Percentage of blind specimens that must be positive under former rule	PER Blind specimens, positive, former rule	20.0%	Former rule requirement, 2.8(e)(3) of Appendix A	
		Percentage of negative initial drug test result specimens submitted to a HHS-certified laboratory for initial drug testing	PER neg. urine specimens to HHS	1.0%	Value under Section 26.167(h)(1), cell E727	

Exhibit A2 - 10
Reporting Requirements

Activity	Equation	Parameter Description	Parameter	Value	Source	Section
FFD Programs: Performance Data Reporting and Review					**Subpart N**	**26.717(e), (f)**
	Annual savings per program by reducing reporting requirements					
		FFD program manager hours saved in frequency reduction	HOURS manager	20.0 hr	NRC staff estimate	
	Savings from NRC reviewing fewer licensee reports					
		NRC clerical personnel hours saved in reduction in reporting frequency	HOURS clerical	24.0 hr	NRC staff estimate	
		NRC manager hours saved in reduction in reporting frequency	HOURS manager	20.0 hr	NRC staff estimate	
					Subpart N	**26.717(g)**
		Number of licensee to whom each C/V submits performance data to under the former rule	NUM licensees	9	Assumption	
		Cost of mailing (express mail) per information disclosure request	COSTMailing	$ 10.00	Assumption	
	C/V manager labor burden reduced by only having to produce consolidated report for submission to NRC					
		Hours of C/V manager time to compile one licensee performance data report	HOURS manager	30.0 hr	Assumption	
		% savings achieved by consolidating performance data into a single report submitted to NRC	PER consolidation	25%	Assumption	
	Reduced Mailing costs					
		No Additional Parameters	**No additional parameters**			
Reporting and Review of Reportable Events Due to New Validity Testing Requirements					**Subpart N**	**26.719(b)**
	This parameter is used in the equations below:					
		Percentage of tested staff covered by 26.203(b)(2)	PER staff	15%	Assumption	
	Annual cost per unit due to new validity testing requirements					
		FFD program manager hours required to investigate, analyze, and report an event	HOURS manager	4.0 hr	Assumption	
					Subpart N	**26.719(b)**
	Increase in NRC manager labor to review increased number of reportable events					
		NRC manager hours required to review a reported event	HOURS manager	3.0 hr	NRC staff	
	Increase in NRC clerical labor due to increased number of reportable events					
		NRC clerical hours required to process a reported event	HOURS clerical	1.0 hr	NRC staff	
Filing of Forensic Toxicologist's Evaluation					**Subpart N**	**26.713(g)**
	One-time cost per program from clerical support to file and store the forensic toxicologist's evaluation of the FFD program's more stringent cutoff levels.					
		Hours of clerical personnel to file and store the forensic toxicologist's evaluation of the FFD program's more stringent cutoff levels per program	HOURSClerical	0.25 hr		
		Percentage of FFD programs that use more stringent cut-off levels for drug testing	PERmore stringent cutoffs	10%	Assumption	
		Percentage of FFD programs who use more stringent cut-off levels for drug testing, but have not reported to the Commission	PER non-report	25%	Assumption	
Memorandum to HHS-Certified Laboratory for Incorrect CCF Form					**Subpart G**	**26.153(g)**
	Annual costs per FFD program					
		Number of memoranda per year a collection site used by a facility will write because it uses an expired Federal custody-and-control form or a non-Federal custody-and-control form was used for a specimen collection	NUM memoranda	2	Assumption	
		Time for collection staff to draft a memorandum	HOURS collector	0.25 hr	Assumption	
Licensee Testing Facility Reporting of Testing Data to FFD program (Monthly to Annually)					**Subpart F**	**26.139(d)**
	Annual savings per FFD program with Licensee Testing Facility					
		Time for a laboratory supervisor per licensee testing facility to prepare a monthly statistical summary report of urinalysis testing data	HOURS monthly report	1.50 hr	Assumption	
		Time for a laboratory supervisor per licensee testing facility to prepare an annual statistical summary report of urinalysis testing data	HOURS annual report	4.00 hr	Assumption	
		Number of monthly reports per licensee testing facility per year	NUM monthly reports	12	Number of months in a year.	

Activity	Equation	Parameter Description	Parameter	Value	Source	Section
HHS-Certified Laboratory Reporting of Testing Data to FFD program (Monthly to Annually)					**Subpart G**	**26.169(k)**
		Time to generate and send an annual or monthly statistical summary report per facility	HOURS lab tech	0.50 hour	Assumption	
		Number of reports per month per facility	NUM reports per month	1	former requirement	
		Number of reports that will no longer be sent to a facility	NUM reports	11	Final requirement to move from montly to annual reporting	
		Cost to send an annual or monthly statistical summary report via the U.S. Postal Service	COSTpostage	$ 2.00	Assumption	
NRC Review of Fatigue Information in Annual FFD Performance Reports					**Subpart I**	**26.203(e)**
	Annual cost to NRC to review and summarize annual reports on fatigue					
		NRC clerical hours per year to assist in reviewing and summarizing the additional information addressing fatigue	HOURS Clerical	24.0 hr	Assumption	
		NRC manager hours per year to review and summarize the additional information addressing fatigue	HOURS Manager	24.0 hr	Assumption	

Exhibit A2 - 11:
Hourly Wage Rates

Worker Type	Hourly Wage Rate (2002 $)	Hourly Wage Rate (Adjusted 2006 $)	Source/Comments
C/V manager		$ 50.00 /hour	Assumption
Clerical	$ 15.75 /hour	$ 17.52 /hour	Model Facility Data from NEI Jan to May 2002
Collection Site Supervisor		$ 50.00 /hour	Assumption
Collector or Collection Site Personnel	$ 22.78 /hour	$ 25.34 /hour	Model Facility Data from NEI Jan to May 2002
EAP	$ 28.85 /hour	$ 32.09 /hour	Model Facility Data from NEI Jan to May 2002
Facility Supervisor		$ 70.00 /hour	Assumption
FFD Program Manager	$ 31.98 /hour	$ 35.57 /hour	Model Facility Data from NEI Jan to May 2002
FFD Staff		$ 30.00 /hour	Assumption
Forensic Toxicologist		$ 93.75 /hour	Derived from quote from a drug testing expert
HR personnel		$ 50.00 /hour	Assumption
Contractor/Vendor Worker	$ 58.00 /hour	$ 64.52 /hour	Model Facility Data from NEI Jan to May 2002
Lab supervisor		$ 50.00 /hour	Assumption
Lab Technician	$ 26.54 /hour	$ 29.52 /hour	Model Facility Data from NEI Jan to May 2002
Legal		$ 100.00 /hour	Assumption
MRO	$ 100.00 /hour	$ 111.24 /hour	Model Facility Data from NEI Jan to May 2002
NRC Clerical		$ 40.00 /hour	NRC staff , 2004
NRC Staff		$ 87.00 /hour	NRC staff , 2004
SAE	$ 28.85 /hour	$ 32.09 /hour	Same as SAP wage rate
Trainer		$ 50.00 /hour	Assumption
Training Manager		$ 55.00 /hour	Assumption
Facility Worker (weighted average facility workers & C/Vs)	$ 55.14 /hour	$ 61.34 /hour	Model Facility Data from NEI Jan to May 2002
Facility Worker (not weighted)	$ 36.21 /hour	$ 40.28 /hour	Model Facility Data from NEI Jan to May 2002

2002 dollars have been adjusted to 2006 using implicit price deflators for GDP in the Survey of Current Business, as reported by the U.S. Department of Commerce, Bureau of Economic Analysis. Obtained at http://bea.gov/bea/pubs.htm.

Exhibit A2 - 12:
Testing and Applicant Information

Parameter Description	Value	Source
Drug & Alcohol Testing Information		
Total Number of Drug Tests per year for all FFD Programs	135,702	2005 Information Notice, NRC Table 1. Test results for each test category
Total Number of Drug Tests per Reactor per year	1,280 tests/reactor	Calculated
Total Number of Alcohol Tests per year for all FFD Programs	135,702	2005 Information Notice, NRC Table 1. Test results for each test category (one alcohol test and one drug test conducted for each testing event)
Total Number of Alcohol Tests per year per Reactor	1,280 tests/reactor	Calculated
Total Number of Random Drug and Alcohol Tests per year for all programs	50,286	2005 Information Notice, NRC Table 1. Test results for each test category
Total Number of Random Drug and Alcohol Tests per year per reactor	474 tests/reactor	Calculated
Negative Random Drug and Alcohol Test Rate in 2005	99.71%	Calculated
Positive Random Drug and Alcohol Test Rate in 2005	0.29%	Calculated
Number of confirmed positive alcohol tests per year for all FFD programs	196	2005 Information Notice, NRC Table 5. Number of confirmed positives by substance
Number of confirmed positive alcohol tests per reactor per year	1.85 tests/reactor	Calculated
Number of positive drug test results per year for all FFD programs	755	2005 Information Notice, NRC Table 5. Number of confirmed positives by substance
Number of positive drug test results per reactor	7.12 tests/reactor	Calculated
Positive drug test result rate in 2000	0.56%	Calculated
Number of marijuana positive drug test results per year for all FFD programs	432	2005 Information Notice, NRC Table 5. Number of confirmed positives by substance
Number of marijuana positive drug test results per reactor	4.08 tests/reactor	Calculated
Positive marijuana drug test result rate in 2000	0.32%	Calculated
Number of opiate positive drug test results per year for all FFD programs	16	2005 Information Notice, NRC Table 5. Number of confirmed positives by substance
Number of opiate positive drug test results per reactor	0.15 tests/reactor	Calculated
Positive opiate drug test result rate in 2000	0.01%	Calculated

Exhibit A2 - 12:
Testing and Applicant Information

Parameter Description	Value	Source
Drug & Alcohol Testing Information (continued)		
Annual number of drug and alcohol tests yielding positive results for all programs	979	2005 Information Notice, NRC Table 3. 2005 Test results by test category
Annual number of drug and alcohol tests yielding positive results per reactor	9.24 tests/reactor	Calculated
Annual number of positive pre-access drug and alcohol test results for all programs	648	2005 Information Notice, NRC Table 3. 2005 Test results by test category
Annual number of positive pre-access drug and alcohol test results per reactor	6.11 tests/reactor	Calculated
Annual number of positive random drug and alcohol test results for all programs	147	2005 Information Notice, NRC Table 3. 2005 Test results by test category
Annual number of positive random drug and alcohol test results per reactor	1.39 tests/reactor	Calculated
Annual number of positive post-event drug and alcohol test results for all programs	1	2005 Information Notice, NRC Table 3. 2005 Test results by test category
Annual number of positive post-event drug and alcohol test results per reactor	0.01 tests/reactor	Calculated
Annual number of follow-up drug and alcohol test results for all programs	31	2005 Information Notice, NRC Table 3. 2005 Test results by test category
Annual number of follow-up drug and alcohol test results per reactor	0.29 tests/reactor	Calculated
Annual number of positive other drug and alcohol test results for all programs	47	2005 Information Notice, NRC Table 3. 2005 Test results by test category
Annual number of positive other drug and alcohol test results per reactor	0.44 tests/reactor	Calculated
Annual number of for-cause referrals for all programs	1,161	2005 Information Notice, NRC Table 2 - Test Results for Each Test Category and Work Category
Annual number of for-cause referrals per reactor	10.95 tests/reactor	Calculated
Annual number of for-cause tests yielding positive test results	106	2005 Information Notice, NRC Table 2 - Test Results for Each Test Category and Work Category
Positive for-cause testing rate in 2005	**9.13%**	Calculated

Exhibit A2 - 12:
Testing and Applicant Information

Parameter Description	Value	Source
Validity Test Data		
Percentage of adulterated, substitued, dilute, and invalid validity test results (total)	2.691%	Consists of the sum of dilute (2-5, 5-20 mg/dL), substituted, adulterated, and invalid
Percentage of specimens - Dilute (>5 and <20 mg/dL creatinine)	2.60%	Quest Diagnostics, n=435,309, likely a quarter's data for all Quest Labs (presented 2/2003)
Percentage of specimens - Dilute (2 - 5 mg/dL creatinine)	0.015%	DHHS National Laboratory Certification Program, data from 7/01-6/02 based on n=5,266,000
Percentage of specimens - Substituted (<2 mg/dL creatinine)	0.016%	DHHS National Laboratory Certification Program, data from 7/01-6/02 based on n=5,266,000
Percentage of specimens - Adulterated	0.025%	DHHS National Laboratory Certification Program, data from 7/01-6/02 based on n=5,266,001
Percentage of specimens - Invalid	0.035%	DHHS National Laboratory Certification Program, data from 7/01-6/02 based on n=5,266,002
Applicant information		
Annual number of applicants for authorization for all programs	65,845	NEI Estimate
Annual number of applicants for authorization per reactor	621	Calculated
Annual number of reportable events for all programs	135,702	2005 FFD Performance Reports
Annual number of reportable events per reactor	1,280	Calculated
Annual number of applicants for initial and updated authorization for all programs	20,509	NEI Estimate
Annual number of applicants for initial and updated authorization per reactor	193.48	Calculated
Annual number of applicants for initial authorization for all programs	17,869	NEI Estimate
Annual number of applicants for initial authorization per reactor	168.58	Calculated

Exhibit A2 - 12:
Testing and Applicant Information

Parameter Description	Value	Source
Applicant information (continued)		
Annual number of applicants for updated authorization for all programs	2,640	NEI Estimate
Annual number of applicants for updated authorization per reactor	24.91	Calculated
Annual number of applicants for authorization reinstatement with an interruption of 30 days or less for all programs	26,068	NEI Estimate
Annual number of applicants for authorization reinstatement with an interruption of 30 days or less per reactor	245.92	Calculated
Annual number of applicants for authorization reinstatement with an interruption of 5 days or less	40.99	Calculated
Annual number of applicants for authorization reinstatement with an interruption of 6-30 days	204.94	Calculated
Annual number of applicants for authorization reinstatement with an interruption of between 31 and 365 days for all programs	19,268	NEI Estimate
Annual number of applicants for authorization reinstatement with an interruption of between 31 and 365 days per reactor	181.77	Calculated
Number of applicants per training session	20	Assumption

Exhibit A2 - 13:

Drug and Alcohol Testing Data (in 2006 $)

Drug and Alcohol Specimen Collection - LABOR COSTS (Source: Model Facility Data from NEI Jan to May 2002)

Time per activity for a drug and alcohol collection	Time	Activity	Activity definitions
Worker travel time (to test and back to work)	0.60 hr	w	w= worker
ID Worker	0.03 hr	w, c	c= collector
Complete Initial Paperwork	0.09 hr	w, c	
Perform Alcohol Test	0.09 hr	w, c	
Perform Drug Screen	0.18 hr	w, c	

Labor costs for a drug and alcohol collection	Time for collection (drug & alcohol)	Wage rate	Cost per test
Labor collector - per testing process (one urine collection - initial breath collection)	0.39 hr	$ 25.34	$ 9.84
Labor worker - per testing process (one urine collection - initial breath collection)	0.99 hr	$ 55.14	$ 54.70
Labor costs of drug and alcohol specimen collection (collector & worker)			**$ 64.54**

Time per activity for a drug specimen collection	Time	Activity	Activity definitions
Worker travel time (to test and back to work)	0.60 hr	w	w= worker
ID Worker	0.03 hr	w, c	c= collector
Complete Initial Paperwork	0.09 hr	w, c	
Perform Drug Screen	0.18 hr	w, c	

Labor costs for a drug specimen collection	Time for collection (drug & alcohol)	Wage rate	Cost per test
Labor collector - per testing process (one urine collection)	0.30 hr	$ 25.34	$ 7.59
Labor worker - per testing process (one urine collection)	0.90 hr	$ 55.14	$ 49.81
Labor costs of drug specimen collection (collector & worker)			**$ 57.40**

NEGATIVE TEST RESULTS - SUMMARY OF COSTS (labor, equipment and specimen testing costs)

Negative Result - Alcohol test and Drug test (onsite testing) former rule		Description
Labor costs of drug and alcohol collection (collector & worker)	$ 64.54	Costs include: (1) travel time of worker; (2) collection of drug and alcohol specimens (the labor of collector and worker, collection materials), (3) onsite licensee testing costs per urine specimen for drugs; (4) labor of FFD manager to process negative test results paperwork
Equipment cost for alcohol testing (initial test - 2 breath collections)	$ 0.20	
Initial drug test - onsite licensee testing facility	$ 26.98	
FFD manager labor per negative test result	$ 3.56	
Total per test	**$ 95.28 /test**	

Negative Result - Alcohol test and Drug test (all testing at HHS certified lab), former rule		Description
Labor costs of drug and alcohol collection (collector & worker)	$ 64.54	Costs include: (1) travel time of worker; (2) collection of drug and alcohol specimens (the labor of collector and worker, collection materials), (3) HHS-certified lab costs per urine specimen for drugs; (4) labor of FFD manager to process negative test results paperwork
Equipment cost for alcohol testing (initial test - 2 breath collections)	$ 0.20	
Drug testing (initial & confirmatory when necessary) - HHS certified laboratory (all licensee testing conducted at HHS lab)	$ 22.88	
FFD manager labor per negative test result	$ 3.56	
Total per test	**$ 91.18 /test**	

Negative Result - Alcohol test and Drug & Validity test (onsite testing facility), final rule			Description
Labor costs of drug and alcohol collection (collector & worker)	$	64.54	Costs include: (1) travel time of worker; (2) collection of drug and alcohol specimens (the labor of collector and worker, collection materials), (3) onsite licensee testing costs per urine specimen for drugs & validity; (4) labor of FFD manager to process negative test results paperwork
Equipment cost for alcohol testing (initial test - 1 breath collection)	$	0.10	
Validity Testing (onsite) - Total Labor and Reagents cost per specimen	$	4.22	
Initial drug test - onsite licensee testing facility	$	26.98	
FFD manager labor per negative test result	$	3.56	
Total per test	**$**	**99.40 /test**	

Negative Result - Alcohol test and Drug & Validity test (all testing at HHS lab) - final rule			Description
Labor costs of drug and alcohol collection (collector & worker)	$	64.54	Costs include: (1) travel time of worker; (2) collection of drug and alcohol specimens (the labor of collector and worker, collection materials), (3) HHS-certified lab costs per urine specimen for drugs & validity; (4) labor of FFD manager to process negative test results paperwork
Equipment cost for alcohol testing (initial test - 1 breath collection)	$	0.10	
Validity testing incremental (at HHS-certified lab - initial and confirmatory testing)	$	1.50	
Drug testing (initial & confirmatory when necessary) - HHS certified laboratory (all licensee testing conducted at HHS lab)	$	22.88	
FFD manager labor per negative test result	$	3.56	
Total per test	**$**	**92.58 /test**	

MRO Testing - Negative Result - Alcohol test and Drug & Validity test (at onsite testing facility) - final rule			Description
Labor costs of drug and alcohol collection (collector)	$	9.84	Same cost as: Negative Result - Alcohol test and Drug & Validity test (onsite testing facility), final rule, no MRO labor for travel or the collection process, the labor is accounted for separately
Equipment cost for alcohol testing (initial test - 1 breath collection)	$	0.10	
Validity Testing (onsite) - Total Labor and Reagents cost per specimen	$	4.22	
Initial drug test - onsite licensee testing facility	$	24.25	
FFD manager labor per negative test result	$	3.56	
Total per test	**$**	**41.97 /test**	

MRO Testing - Negative Result - Alcohol test and Drug & Validity test (all testing at HHS lab) - final rule			Description
Labor costs of drug and alcohol collection (collector only)	$	9.84	Same cost as: Negative Result - Alcohol test and Drug & Validity test (all testing at HHS lab) - final rule, no MRO labor for travel or the collection process, the labor is accounted for separately
Equipment cost for alcohol testing (initial test - 1 breath collection)	$	0.10	
Validity testing incremental (at HHS-certified lab - initial and confirmatory testing)	$	1.50	
Drug testing (initial & confirmatory when necessary) - HHS certified laboratory (all licensee testing conducted at HHS lab)	$	22.88	
FFD manager labor per negative test result	$	3.56	
Total per test	**$**	**37.88 /test**	

MRO Testing - Incremental Cost for Alcohol and Drug Specimen Collection at a Non-Licensee Collection Facility			Description
Additional drug and alcohol specimen collection and shipping costs from non-licensee collection facilities	**$**	**30.00**	Twice the labor cost of drug and alcohol collection (collector only) plus shipping cost

Positive (DRUG/VALIDITY/ALCOHOL) TEST RESULT - LABOR COSTS

Subsequent actions - positive drug/validity/alcohol test result	Time	Wage rate	Source
Labor MRO	0.42 hr	$ 111.24	Model Facility Data from NEI Jan to May 2002
FFD manager	2.58 hr	$ 35.57	
Worker	0.47 hr	$ 55.14	
Total cost subsequent actions per confirmed positive drug/validity/alcohol test result		**164.14**	

Appeal of positive drug/validity/alcohol (no change former rule or final rule)	Wage rate	Units	Source
FFD manager (average labor per result)	$ 35.57	12.50 hr	Discussion with NEI staff, May 23, 2003
Worker	$ 55.14	2.00 hr	
Total cost per appeal (positive drug/validity/alcohol test result)		**$555 /appeal**	

Positive (DRUG/VALIDITY/ALCOHOL) TEST RESULT - SUMMARY OF COSTS (labor, equipment and specimen testing costs)

Positive Result - Alcohol/Drug/Validity test - (onsite testing facility), final rule		Description
Labor costs of drug and alcohol collection (collector & worker)	$ 64.54	Costs include: (1) travel time of worker; (2) collection of drug and alcohol specimens (the labor of collector and worker, collection materials), (3) onsite licensee testing costs per urine specimen for drugs; (4) HHS-certified lab cost per specimen for drugs and validity; (5) cost of subsequent actions resulting from a confirmatory positive drug/validity test result.
Equipment cost for alcohol testing (initial test - 1 breath collection)	$ 0.10	
Validity Testing (onsite) - Total Labor and Reagents cost per specimen	$ 4.22	
Initial drug test - onsite licensee testing facility	$ 26.98	
Drug testing (intial & confirmatory when necessary) at HHS-certified lab (after initial positive drug/questionable validity test result at licensee testing facility)	$ 35.25	
Validity testing incremental (at HHS-certified lab - initial and confirmatory testing)	$ 1.50	
Subsequent actions - positive drug/validity/alcohol test result	$ 164.14	
Total per test	**$ 296.73 /test**	

Positive Result - Alcohol/Drug/Validity test - (all testing at HHS certified lab) - final rule		Description
Labor costs of drug and alcohol collection (collector & worker)	$ 64.54	Costs include: (1) travel time of worker; (2) collection of drug and alcohol specimens (the labor of collector and worker, collection materials), (3) HHS-certified lab costs per urine specimen for drugs and validity; (4) cost of subsequent actions resulting from a confirmatory positive drug/validity test result.
Equipment cost for alcohol testing (initial test - 1 breath collection)	$ 0.10	
Validity Testing (onsite) - Total Labor and Reagents cost per specimen	$ 4.22	
Initial and confirmatory (when necessary) drug test	$ 22.88	
Subsequent actions - positive drug/validity/alcohol test result	$ 164.14	
Total per test	**$ 255.89 /test**	

VALIDITY TESTING (labor & equipment) - Onsite Licensee Testing Facility - Final Rule

Validity testing - Lab Techinican Labor costs per urine specimen	time/test	wage rate
Time per urine specimen for validity testing		
pH test	0.02 hr	$ 29.52
creatinine	0.02 hr	$ 29.52
one adulterant assay	0.03 hr	$ 29.52
Validity testing (onsite) - Total Assay Labor cost per specimen		**$ 1.97 /specimen**

Validity testing - Reagants Cost - per urine specimen	Cost per test
Reagent costs of validity testing per urine specimen	
pH test	$ 0.25
creatinine	$ 1.00
one adulterant assay	$ 1.00
Validity Testing (onsite) - Total Reagents cost per specimen	**$ 2.25 /specimen**
Validity Testing (onsite) - Total Labor and Reagents cost per specimen	**$ 4.22 /specimen**

Validity testing - Lab Techinican Labor Costs - Daily Calibration of Equipment	time/calibration	wage rate
Daily calibration of validity testing equipment		
pH test	0.08 hr	$ 29.52
creatinine	0.17 hr	$ 29.52
one adulterant assay	0.17 hr	$ 29.52
Validity Testing (onsite) - Total Labor cost per day to calibrate equipment		**$ 12.30 /day**

Validity testing - Reagants Cost - Daily Calibration of Equipment	Cost per test
Reagent costs of validity testing per urine specimen	
pH test	$ 0.50 / day
creatinine	$ 1.00 / day
one adulterant assay	$ 1.00 / day
Validity Testing (onsite) - Total Reagent Costs per Daily Calibration	**$ 2.50 / day**

Validity Testing - pH meter & accessories per Licensee Testing Facility	Cost	Equipment life	Annualized cost
ph meter	$ 600.00	6.0 years	**$ 100.00**
ph meter probe	$ 150.00	2.0 years	**$ 75.00**

VALIDITY TESTING - HHS-certified laboratory - Final Rule

		Source
Validity testing incremental (at HHS-certified lab - initial and confirmatory testing)	$ 1.50 /test	Assumption, range of testing costs from $0.00 to $3.00.

DRUG TESTING - LICENSEE TESTING FACILITY

			Source
Drug test (initial) - at onsite licensee testing facility	$	26.98 /test	Model Facility Data from NEI Jan to May 2002

DRUG TESTING - HHS- CERTIFIED LABORATORY

Test Type		Cost/test	Source
Drug testing (intial & confirmatory when necessary) at HHS-certified lab (after initial positive drug/questionable validity test result at licensee testing facility)	$	35.25 /test	Model Facility Data from NEI Jan to May 2002
Drug testing (initial & confirmatory when necessary) - HHS certified laboratory (all licensee testing conducted at HHS lab)	$	22.88 /test	Model Facility Data from NEI Jan to May 2002
Dilute Specimen (>=2-20 mg/dL Creatinine) Testing - GC/MS Level of Detection Testing (LOD)	$	75.00 /test	Assumption
Cost of retesting - a confirmed positive drug/adulterated or substitued validity test specimen at second HHS-certified lab (includes specimen preparation and shipping costs)	$	62.50 /test	Assumption, range of testing costs from $50.00 to $75.00
Retesting a specimen at a second HHS lab when the initial HHS lab could not identify a suspected interfering substance/adulterant (includes specimen preparation, packaging, and shipping)	$	125.00 /test	Costs for to analyze for adulterants at a second HHS-certified lab (cost ranges from $50.00 to $200.00 depending on the contract with the lab)

ALCOHOL TESTING EQUIPMENT

Evidential Breath Testing Device (EBT) - purchase			Source	
EBT - compliant with § 26.91(c) in the final rule - included printer and carrying case	$	2,250	Equipment manufacturer of NHTSA certified EBT (fuel cell)	
EBT Calibration Equipment			**Source**	
Regulator (to attach calibration canister to EBT)	$	100.00	Equipment manufacturer of NHTSA certified EBT (fuel cell)	
Calibration canister	$	75.00	Equipment manufacturer of NHTSA certified EBT (fuel cell)	
EBT Exhalent tubes (source: discussion with NEI staff, May 2003)		**Unit cost**	**# of tubes**	**Cost per test**
Exhalent tubes (per test = 2 breath specimens) - former rule	$	0.10 /tube	2	**$ 0.20**
Exhalent tubes (per test = 1 breath specimen) - final rule	$	0.10 /tube	1	**$ 0.10**
Blood Alcohol testing - Existing Rule				
Blood alcohol testing - cost per blood specimen to conduct laboratory analysis	$	31.98	Model Facility Data from NEI Jan to May 2002	
Cost per blood test for a phlebotomist/RN to arrive at the onsite collection site and conduct the blood draw	$	100.00	Assumption	

BLIND PERFORMANCE SAMPLE & TESTING COSTS			Subpart G	26.168(a)(1) 26.168(a)(2)
Cost per blind perfomrance sample & testing - former rule (all testing at HHS-lab)			**Source**	
Cost per blind specimen, former rule: purchased from a vendor, prepared, and shipped to the HHS-certified laboratory for testing, and FFD manager follow-up to check results (former rule)	$	29.34 /test	Model Facility Data from NEI Jan to May 2002	
Drug testing (initial & confirmatory when necessary) - HHS certified laboratory (all licensee testing conducted at HHS lab) (former rule)	$	22.88 /test	Model Facility Data from NEI Jan to May 2002	
Total per test	**$**	**52.22**		
Cost per blind performance sample & testing - final rule (all testing at HHS-lab)			**Source**	
Cost per blind specimen, former rule: purchased from a vendor, prepared, and shipped to the HHS-certified laboratory for testing, and FFD manager follow-up to check results (former rule)	$	29.34 /test	Model Facility Data from NEI Jan to May 2002	
Increase in the cost per blind performance test specimen due to the change in the mix of the positive to negative ratio of blind specimens in the final rule	$	22.00 /test	Assumption, 75 percent increase in cost of blind performance test sample	
Drug testing (initial & confirmatory when necessary) - HHS certified laboratory (all licensee testing conducted at HHS lab)	$	22.88 /test	Model Facility Data from NEI Jan to May 2002	
Validity testing incremental (at HHS-certified lab - initial and confirmatory testing)	$	1.50 /test	Assumption	
Total per test	**$**	**75.72**		
Cost per blind performance sample & testing - former rule (for FFD programs with onsite licensee testing facilities)			**Source**	
Cost per blind specimen, former rule: purchased from a vendor, prepared, and shipped to the HHS-certified laboratory for testing, and FFD manager follow-up to check results (former rule)	$	29.34 /test	Model Facility Data from NEI Jan to May 2002	
Drug testing (intial & confirmatory when necessary) at HHS-certified lab (after initial positive drug/questionable validity test result at licensee testing facility) (former rule)	$	35.25 /test	Model Facility Data from NEI Jan to May 2002	
Total per test	**$**	**64.59**		
Cost per blind performance sample & testing - final rule (or FFD programs with onsite licensee testing facilities)			**Source**	
Cost per blind specimen, former rule: purchased from a vendor, prepared, and shipped to the HHS-certified laboratory for testing, and FFD manager follow-up to check results (former rule)	$	29.34 /test	Model Facility Data from NEI Jan to May 2002	
Increase in the cost per blind performance test specimen due to the change in the mix of the positive to negative ratio of blind specimens in the final rule	$	22.00 /test	Assumption, 75 percent increase in cost of blind performance test sample	
Drug testing (intial & confirmatory when necessary) at HHS-certified lab (after initial positive drug/questionable validity test result at licensee testing facility)	$	35.25 /test	Model Facility Data from NEI Jan to May 2002	
Validity testing incremental (at HHS-certified lab - initial and confirmatory testing)	$	1.50 /test	Assumption	
Total per test	**$**	**88.09**		

PAPER WORK REQUIREMENTS - Drug and Alcohol Testing		
Information Collection Burden Activities - Negative and Positive Test Results		**Source**
File paper work per negative drug and/or alcohol test result	0.05 hr	Assumption
File paperwork per positive drug and/or alcohol test result	0.25 hr	Assumption
File paperwork per appealed positive drug and/or alcohol test result	0.50 hr	Assumption

Exhibit A2 - 14:
FFD Programs

FFD Program/Licensee	Number of Facilities per Program	Number of Units per Program	On-Site or Off-Site Testing	Number of Employees per Unit	Total Number of Employees per Program
Ameren UE	1	1	On-site	949	949
AmerGen Energy Company	3	3	On-site	949	2,846

Exhibit A2-15
Fatigue Inputs

Activity	Equation	Parameter Description	Parameter	Value	Source	Section
Policy and Procedures					**Subpart I**	**26.203(a)-(b)**
	One-time costs per program to account for FFD manager and clerical personnel time and to contract a legal consultant to implement fatigue provisions into the written policies and procedures					
		Hours of FFD program staff to develop and revise policies and procedures for fatigue provisions per program	HOURS ffd_staff	80.0 hr	Assumption	
		Hours of labor of various managers to review and approve policies and procedures for fatigue provisions per program	HOURS manager-fatigue	40.0 hr	Assumption	
		Hours of legal assistance to review and revise policies and procedures for fatigue provisions	HOURS legal-fatigue	20.0 hr	Assumption	
		Hours of clerical personnel to support revision of policies and procedures for fatigue provisions	HOURS clerical-fatigue	40.0 hr	Assumption	
	One-time costs per program to provide additional facility supervisor time to implement the corporate policies on the management of fatigue at the facility level					
		Hours of facility supervisor time to implement revised corporate policies and procedures for fatigue	HOURS facility supervisor-fatigue	160.0 hr	Assumption	
Training					**Subpart I**	**26.203(c)**
	The following variables are used in several of the equations in this section					
		Length of training addressing the fatigue-related KAs per session	HOURS Training-Fatigue	1.0 hr	Assumption	
		Length of comprehensive examination increment addressing the fatigue-related KAs	HOURS Examination-Fatigue	0.2 hr	Assumption	
		Hours of incremental preparation and examination grading per session addressing the fatigue-related KAs	HOURS Preparation-Fatigue	0.5 hr	Assumption	
	One-time cost per program associated with revising the training program to include fatigue KAs					
		Hours of industry consultant time per program to develop generic training materials for use by the entire industry	HOURS Consultant	2.6 hr	Assumption	
		Hourly wage for industry consultant to develop generic training materials for use by the entire industry	WAGE Training_Consultant_Loaded	$ 90.00 /hour		
		Hours of training time per program to revise the training materials to address fatigue KAs	HOURS Trainer	8.0 hr	Assumption	
		Hours of training manager time per program to revise the training materials to address fatigue KAs	HOURS Training Manager	2.0 hr	Assumption	
		Hours of FFD proram manager time per program to revise the training program to address fatigue KAs	HOURS Manager	2.0 hr	Assumption	
		Hours of clerical personnel time to support the revision of the training program to address fatigue KAs	HOURS Clerical	4.0 hr	Assumption	
	One-time costs per program to retrain existing employees on the fatigue related KAs					
			No additional parameters			
	One-time costs per program for trainers to administer the training on the fatigue-related KAs					
		Number of workers per training session per facility	NUM Sessions	50	Assumption	
	Annual cost per program for incoming employees to take the training course increment for fatigue-related KAs					
		Turnover Rate (e.g., new hires including outage workers) covered by fatigue provision per facility per year	PER Applicants	25%	Assumption	
	Annual cost per program for trainers to administer training course for fatigue-related KAs					
		Number of workers per training session per facility	NUM Sessions	20	Assumption	
	Annual costs per program for employees to take the refresher training increment addressing fatigue-related KAs					
		Percentage of employees taking refresher training	PER Refresher	20%	Assumption	
		Length of fatigue-related portion of refresher training course	HOURS Fatigue Training	1.00 hr	Assumption	

Activity	Equation	Parameter Description	Parameter	Value	Source	Section
	Annual costs per program for trainers to administer the refresher training increment addressing fatigue-related KAs					
		Number of workers per training session per facility	NUM Sessions	20	Assumption	
		Length of fatigue-related refresher training course	HOURS Fatigue Training	1.00 hr	see Appendix 2, Exhibit A2-3	
Retaining Fatigue Records					**Subpart I**	**26.203(d)**
	Annual cost per program to physically place the documentation required under 26.197(d)(1), (2), (4), and (5) into the appropriate filing cabinets or storage facilities					
		Annual number of hours per facility to store individuals' work hours under final rule	HOURS Work Hours	40.0 hr	Assumption	
		Annual number of hours per facility to store work hour reviews under final rule	HOURS Reviews	4.0 hr	Assumption	
		Annual number of hours per facility to store fatigue assessment documentation under final rule	HOURS Assessments	10.0 hr	Assumption	
	Annual savings per program as a result of fewer waivers being issued					
		Annual number of hours per facility to file deviation authorizations under existing licensee technical specifications	HOURS WaiverTS	12.0 hr	Assumption	
		Annual number of hours per facility to file waivers under final rule	HOURS WaiverNew	1.0 hr	Assumption	
Summarize Waiver Data					**Subpart I**	**26.203(e)(1)**
	Annual cost per program to review documentation for the waived individual work hour controls in 26.199(d)(1)-(4) from the previous calendar year, categorize the instances of waivers as required, and report the data and frequency distribution in the FFD program performance report					
		Annual hours of clerical worker labor to tally the annual number of waivers of each type, separate operating waivers from outage waivers, produce a frequency distribution, and report these data in the FFD program report	HOURS Clerical	10.0 hr	Assumption	
		Annual hours of managerial labor to review the waivers data included in the FFD program report	HOURS Manager	10.0 hr	Assumption	
Summarize Fatigue Assessment Data					**Subpart I**	**26.203(e)(2)**
	Annual cost per program to report the number of fatigue assessments conducted during the previous calendar year, the conditions under which each fatigue assessment was conducted, and the management actions, if any, resulting from each fatigue assessment					
		Annual number of clerical labor hours to review and tally the number of fatigue assessments conducted during the previous calendar year, identify the conditions under which each fatigue assessment was conducted, and report the management actions, if any, resulting from each fatigue assessment included in the FFD program report	HOURS Clerical	20.0 hr	Assumption	
		Annual number of manager labor hours to review the summary information to be sent to NRC	HOURS Manager	10.0 hr	Assumption	
Fatigue Management Audits					**Subpart I**	**26.203(f)**
	Annual cost per program to audit fatigue management as part of the overall FFD program audit required under 26.41					
		Annual number of auditor labor hours to audit the management of worker fatigue	HOURS Auditor	40.0 hr	Assumption	
		Annual number of clerical labor hours to assist with the audit of fatigue management	HOURS Clerical	16.0 hr	Assumption	
		Annual number of manager labor hours to assist with the audit of fatigue management program	HOURS Manager	16.0 hr	Assumption	
		Multiplier to yield annualized costs	PER Annualized	50%	Calculated	

Activity	Equation	Parameter Description	Parameter	Value	Source	Section
Calculating Work Hours					**Subpart I**	**26.205(b)**
	One-time cost per program to modify existing timekeeping systems in order to record, track, and document the actual hours worked by individuals covered under the individual work hour controls of paragraph 26.199(d)					
		One-time cost per facility to modify existing timekeeping systems, or develop new systems, to record and track work hour data	COST System	$50,000	Exhibit A2-16	
	Annual costs per program associated with monitoring and managing the hours actually worked by individuals, including filing or backing up work hour records					
		Annual hours of supervisor labor to monitor and manage the hours actually worked by individuals at one facility, including filing or backing up work hour records	HOURS Supervisor_Annual	200.0 hr	Assumption	
		Annual hours for clerical labor to monitor and manage the hours actually worked by individuals at one facility, including filing or backing up work hour records	HOURS Clerical_Annual	50.0 hr	Assumption	
Scheduling Work Hours					**Subpart I**	**26.205(c)**
	One-time cost per program to renegotiate collective bargaining agreements in order to address issues related to the assignment of overtime					
		One-time hours needed for licensee management to work with union representatives in collective bargaining	HOURS Management	60.0 hr	Assumption	
		One-time hours needed for licensee legal staff to work with union representatives in collective bargaining	HOURS Legal	40.0 hr	Assumption	
		Percentage of licensees whose schedule modifications lead to revisions to collective bargaining agreements or to discussions with employee committees	PER Negotiation	100%	Assumption	
	Annual costs per program to prepare modified work schedules on an ongoing basis for all employees covered by the rule					
		Annual hours needed for workers to support supervisors in reviewing, analyzing, and modifying schedules	HOURS Scheduler	2,080 hr	Assumption	
Day-off Requirements					**Subpart I**	**26.205(d)(4)-(6)**
	The following variables are used in several of the equations in this section					
		Number of weeks in modeled refueling outage	WEEKS Outage	6	Exhibit A2-16	
		Adjustment factor to annualize modeled outages that do not occur annually	FACTOR Outage	1	Assumption	
		Number of crews	NUM Crews	2	1 additional day crew plus 1 additional night crew	
	Annual cost per program to pay for in-processing of additional contract operator staff at the time of an outage					
		The average cost to conduct in-processing of one contract operator crew	COST Process_Contract_Ops	$4,500	Assumption	
	Annual cost to pay for additional contract operator staff during an outage					
		The weekly cost of one contract operator crew	WCOST Contract_Ops	$10,260	Is equal to the regular wage * 40 + the overtime wage * 32	
	Annual cost to pay for additional contract maintenance staff during an outage					
		The weekly cost of one contract maintenance crew	WCOST Contract_Maint	$29,640	Is equal to the regular wage * 40 + the overtime wage * 32	
	Annual cost per program to pay for in-processing of additional contract maintenance staff during an outage					
		The average cost to conduct in-processing of one contract maintenance crew	COST Process_Maint	$13,000	Assumption	

Activity	Equation	Parameter Description	Parameter	Value	Source	Section
Waivers from Individual Work Hour Limits					**Subpart I**	**26.207**
	Annual cost per program to conduct and document a fatigue assessment					
		Number of weeks per year during which facilities experience outage conditions (refueling and unplanned outages)	WEEKS Outage	8	Exhibit A2-16	
		The costs per week under outage conditions incurred by facilities as a result of their restricted ability to grant waivers	WEEKLYCOSTS Outage	$25,689	Appendix 3	
		Number of weeks per year during which facilities experience full power conditions	WEEKS Power	44	Exhibit A2-16	
		The costs per week under at-power conditions incurred by facilities as a result of their restricted ability to grant waivers	WEEKLYCOSTS Power	$1,087	Appendix 3	
Self-Declarations of Fatigue					**Subpart I**	**26.209**
	The following variables are used in several of the equations in this section					
		Total annual number of persons, per site, granted waivers from the requirements contained in 26.199(d)(1) - (4)	NUM Waivers	15	Assumption	
		Percentage of NUM Waivers that self-declare to a condition of fatigue	PER Self-Declare	10%	Assumption	
	Annual management cost per program to call in replacement workers to substitute for any workers who are sent home to rest following a fatigue assessment					
		Supervisor hours expended to identify and call in a replacement worker	HOURS Supervisor	0.5 hr	Assumption	
	Annual cost per program due to the extra turnover associated with the replacement worker and other lost productivity					
		Labor hours resulting from an additional turnover due to the replacement of a fatigued worker with a substitute worker	HOURS Turnover	1.0 hr	Assumption	
	Annual incremental labor costs associated with the replacement worker					
		Average number of hours worked by the replacement worker per incident	HOURS Substitute	6.0 hr	Assumption	
Work Hour Control Reviews					**Subpart I**	**26.205(e)**
	Annual cost per program to conduct work hour control reviews					
		Annual number of times a facility will review the control of work hours for individuals who are subject to this subpart	NUM Reviews	2	Assumptions	
		Time per participating supervisor to review overtime hours under final rule, per review	HOURS Review	4.0 hr	Assumption	
		Number of supervisors participating in the review	NUM Manager	4	Assumption	
		Annual time for manager to review overtime hours under existing technical specifications	HOURS former_Review	4.0 hr	Assumption	

Activity	Equation	Parameter Description	Parameter	Value	Source	Section
Fatigue Assessments					**Subpart I**	**26.211(a)-(d)**
	The following variables are used in several of the equations in this section					
		Total annual number of fatigue assessments per reactor, including those conducted for-cause, self-declared, post-event, and follow-up	NUM Assessments	50	Assumption	
		Percentage of fatigue assessments that result in a finding of fatigue	PER Fatigue	37.5%	Assumption	
	Annual cost per program to conduct a fatigue assessment for cause, for self-declaration, post-event, and follow-up					
		Hours needed to complete one fatigue assessment	HOURS Assessment	0.5 hr	Assumption	
	Annual cost per program to resolve challenges that may be brought by workers who, after self-declaring to a state of fatigue, object to negative results from their fatigue assessment					
		Annual number of self-declarations of fatigue per facility	NUM Self-Declarations	20	Assumption	
		Percent of annual number of self-declarations of fatigue per facility where the results of the fatigue assessment are negative	PER Not_Fatigued	50%	Assumption	
		Percent of negative fatigue assessment results that are challenged by workers	PER Object	30%	Assumption	
		Amount of worker time to raise and resolve one incident	HOURS Worker	0.5 hr	Assumption	
		Number of hours of Employee Concerns Manager time to raise and resolve one incident	HOURS ECM	2.5 hr	Assumption	
		Number of hours of supervisor time to raise and resolve one incident	HOURS Supervisor	1.0 hr	Assumption	
Post-Fatigue Assessment Controls and Conditions					**Subpart I**	**26.211(e)**
	The following variables are used in several of the equations in this section					
		Total annual number of fatigue assessments per reactor, including those conducted for-cause, self-declared, post-event, and follow-up	NUM Assessments	50	Assumption	
		Percentage of fatigue assessments that result in a finding of fatigue	PER Fatigue	37.5%	Assumption	
	Annual cost per program to call in replacement workers to substitute for any workers who are sent home to rest following a fatigue assessment					
		Supervisory hours expended to identify and call in a replacement worker	HOURS Supervisor	0.5 hr	Assumption	
	Annual cost per program resulting from extra "turnover" of duties to the replacement worker and other lost labor productivity					
		Labor hours resulting from an additional turnover due to the replacement of a fatigued worker with a substitute worker	HOURS Turnover	1.0 hr	Assumption	
	Annual costs per program associated with the replacement worker					
		Average number of hours worked by the replacement worker per incident	HOURS Substituted	6.0 hr	Assumption	
Documenting Fatigue Assessments					**Subpart I**	**26.211(f)**
	Annual costs per program to document the results of any fatigue assessments conducted, the circumstances that necessitated the fatigue assessment, and any controls and conditions that were implemented					
		Total annual number of fatigue assessments per reactor, including those conducted for-cause, self-declared, post-event, and follow-up	NUM Assessments	50	Assumption	
		Time needed to document a fatigue assessment	HOURS Document	0.33 hr	Assumption	

Exhibit A2 - 16:
Fatigue Input Data

FATIGUE - MAINTENANCE COMPENSATION AND HIRING COSTS

Data Element	Estimate	Source
COST/Process_Maint - The average cost to conduct in-processing of one contract maintenance crew	$13,000	Assumption

FATIGUE PROVISIONS - IMPLEMENTATION COST VARIABLES

Cost/System - One-time cost per facility to modify existing timekeeping systems, or develop new systems, to record and track work hour data

PLANT	Estimate	Source Data	Comments
A		$500	Source data were provided by six facilities.
B		$250,000	
C		minimal	
D		TBD	
E		no estimate	
F		$50,000	
Cost/System	**$50,000**		

WEEKS/Outage - Number of weeks in modeled outage (refueling outages only)

Data Element	Estimate	Source Data	Comments
Average U.S. Nuclear Refueling Outage: NEI - Plant Performance data, in weeks		5.71	Accessed 1/5/2005
Rounded Estimate	**6**		

WEEKS/Outage - Number of weeks per year during which facilities experience outage conditions (refueling and unplanned outages)

Data Element	Estimate	Source Data	Comments
Assuming capacity factor of 85%		7.80	Multiply 15% by 52 weeks
Rounded Estimate	**8**		

WEEKS/Power - Number of weeks per year during which facilities experience full power conditions

Data Element	Estimate	Source Data	Comments
Assuming capacity factor of 85%		44.20	Multiply 85% by 52 weeks
Rounded Estimate	**44**		

Crosswalk Index of Subpart Sections and Exhibits

Subpart	Section	Section Description	Exhibits
NA	NA	NRC Implementation - One-time Training	Exhibit A2 - 2: Written Policies and Procedures
NA	NA	NRC Implementation - One-time Revision of Inspection Procedures	Exhibit A2 - 3: Training and Examinations

Appendix 3: Analysis of Section 26.207

Overview

Section 26.207 of the final worker fatigue provisions establishes new waiver requirements. Among other provisions, the section restricts the granting of waivers from work hour requirement guidelines to cases where the waiver is needed to mitigate or prevent a condition adverse to safety or to maintain security. The rule also clarifies that work hour limits apply only to workers who perform safety-related functions, which will eliminate the need to grant waivers to other staff. This appendix describes a methodology for estimating the incremental costs and savings associated with eliminating waivers that would no longer be permitted under the final rule.

NRC used this methodology to estimate the net cost per week of the new waiver requirements. The resulting estimate of $1,087 per week while at-power and $25,689 per week during plant shutdowns are used as inputs to the cost analysis of §26.207, which is presented in Appendix A2-15. Table 3-1 provides a summary of the waiver data used in this appendix. Table 3-2 provides a breakdown of these data by work-hour provision.

The methodology is based on a review of selected 2003 - 2004 waiver data from six facilities. The analysis categorizes each waiver into one of eight groups and calculates the cost or saving associated with that waiver based on how the situation would be addressed under the final rule. Results for the six facilities are summed and averaged to calculate the net weekly cost of the provision for the average facility (1) while at power, and (2) during an outage.

The remainder of this appendix describes how the analysis estimates the cost or saving of each type of waiver. The discussion is organized into nine sections:

- A3.1 Waivers No Longer Required Under the Final Rule;
- A3.2 Waivers Unaffected by the Final Rule;
- A3.3 Outage Shift Changes that Will Not Meet the New Final Waiver Requirements;
- A3.4 Outage Activities Without Direct Impact on Critical Path;
- A3.5 Outage Activities With Critical Path Impact;
- A3.6 At-Power Costs Associated With Individuals Who Will Not Meet the Final Waiver Requirements;
- A3.7 At-Power Costs Associated With Individuals Involved in Tests or Integrated Evolution Who Will Not Meet the Final Waiver Requirements;
- A3.8 At-Power Costs Associated With Individuals Involved in Return to Full Power Who Will Not Meet the Final Waiver Requirements; and
- A3.9 Generic Costing Assumptions

Table 3-1
Waiver Data Summary

	Description	Total	Plants					
			A	B	C	D	E	F
	Outage Days	295	76	64	30	62	34	29
	At-Power Days	452	30	301	31	30	30	30
A3.1	Waivers No Longer Required*	506	114	81	6	48	25	232
A3.2	Waivers Unaffected*	20	15	1	2	1	0	1
A3.3	Outage Shift Change*	158	133	0	5	18	1	1
A3.4	Outage Activities without Direct Impact on Critical Path*	827	150	6	56	330	112	173
A3.5	Outage Activities with Critical Path Impact*	300	40	4	14	186	36	20
A3.6	At-Power Activities*	28	6	1	5	16	0	0
A3.7	At-Power Activities associated with Test and Integrated Activities*	16	7	7	1	1	0	0
A3.8	At-Power Activities Impacting Return to Full Power*	10	0	1	6	3	0	0
	TOTAL*	1,865	465	101	95	603	174	427

* The numbers in these rows represent the number of personnel with authorized work-hour rule waivers. Consecutively issued waivers for personnel working 12-hour days without an off-day were counted as one occurrence per person for each 7-day period when allowed by the available data.

Table 3-2
Work-hour Provision Breakdown

Provision	Personnel Waived	Percent of Waivers where only a Single Provision is Waived	Percent of Total*
8-hour break	18	6% (1 of 18)	1%
16-hours in 24-hour period	175	28% (49 of 175)	9%
24-hours in a 48-hour period	434	44% (192 of 434)	23%
72-hours in a 7-day period	1536	71% (1333 of 1536)	82%
Total Waived	1865	84% (1575 of 1865)	100%

* Note that since 16% of the waivers address multiple provisions, the sum of provision percentages exceeds 100%.

A3.1 Waivers No Longer Required Under the Final Rule

Numerous work hour waivers that were granted prior to the final rule will no longer be needed (i.e., waivers for engineering staff, waivers that would be eliminated due to the 26-hour in 48-hour rule change and for work not adverse to safety). Licensees will be free to use staff as they did under these waivers, but they will realize incremental savings because they will not have to undertake the administrative exercise of granting the waiver.

The *facility savings per waiver* result from the saved management costs as follows:

$$HOURS_{Manager} \times WAGE_{Management}$$

Parameter	**Description**
$HOURS_{Manager}$	Manager labor saved for each waiver that no longer needs to be processed (described in assumptions below)
$WAGE_{Management}$	Hourly management labor rate (described in Section A3.9)

Assumption:

- Manager labor saved as a result of reduced planning, coordination and administration for each waiver processed: 1 hour.

A3.2 Waivers Unaffected by the Final Rule

Some of the work hour waivers examined will not be affected by the final rule. These are waivers that satisfy the two required elements of the final rule: (a) the activity is necessary to mitigate or prevent a condition adverse to safety or security and (b) there is reasonable assurance that the individual will be able to safely and competently perform his or her duties during the additional work period. There are no incremental costs or savings associated with this category.

A3.3 Outage Shift Changes that Will Not Meet the Final Waiver Requirements

Another group of work hour waivers includes those granted to accommodate a shift schedule change that will not meet the new waiver requirements. This group includes waivers associated with:

- Shifting between day and night schedules or other outage schedule changes; and
- Shifting personnel due to down-staffing.

All but two of the 158 waivers in this category (99%) authorize a variance from the 72-hour work hour control requirement. Due to the limited information provided on many waiver authorization forms, it is often unclear whether the 72-hour limit is exceeded by only a few hours or an entire shift. In addition to the 72-hour limit, about 23% of these waivers also allow individuals to exceed the 16-hours in 24-hour limit.

Contractor - Local Craft

This category estimates the cost associated with eliminating work hour waivers addressing an outage shift change that will not meet the final waiver requirements. The category applies to local contractors supporting an outage that do not require travel or per diem. Activities addressed by this category are not associated with a test or integrated evolution.

The management cost of this section is the additional management burden for planning and coordination. The additional management burden for waivers that address a single person is assumed to be 1 hour. For waivers that address more than one person, this analysis assumes that the additional management burden will be 2 hours.

The *facility cost per waiver* results from the sum of the following factors:

- The labor cost of this waiver is the difference between the cost of labor for the extended period under the final rule and the cost of labor pre-rule. The labor cost is calculated as follows:

  $(NUM_{Local\ Craft} \times HOURS_{Local\ Craft} \times WAGE_{Local\ Craft} \times CONTINGENCY_{Shift\_Schedule\_Change})$
  $- (NUM_{Local\ Craft} \times HOURS_{Local\ Craft} \times WAGE_{Local\ Craft})$

- The management cost of this waiver is the additional management burden for planning and coordination. The management cost is calculated as follows:

  If waiver addresses one person, then $(1\ hour \times WAGE_{Manager})$
  If waiver addresses multiple people, then $(2\ hours \times WAGE_{Manager})$

Parameter	**Description**
$NUM_{Local\ Craft}$	The number of local craft workers impacted by shift schedule changes that will no longer be allowed
$HOURS_{Local\ Craft}$	Hours worked per local craft worker that exceeded the work hour requirements under one waiver
$CONTINGENCY_{Shift\_Schedule\_Change}$	Contingency factor measuring the significance of expected resource loading associated with shift schedule changes (described in assumptions below)
$WAGE_{Local\ Craft}$	The estimated hourly rate of local craft labor (described in Section A3.9)
$WAGE_{Manager}$	Average manager wage rate (described in Section A3.9)

Assumption:

- A scaling factor is used to adjust baseline costs to reflect higher costs under the final waiver provisions. For this equation, the contingency factor value equals 1. Effective management planning should avoid the need for waivers associated with changes in shift schedules.

Contractor - Specialty Vender

This category estimates the cost associated with eliminating work hour waivers addressing an outage shift change. The category is applicable to contractors supporting an outage that are expected to incur transportation and per diem costs.

The labor cost of this waiver is the difference between the cost of labor for the extended period under the final rule and the cost of labor pre-rule. Although transportation and per diem costs are likely for this labor category, these costs are excluded from the cost estimate because it is assumed that effective management planning should avoid such a burden.

The management cost of this section is the additional management burden for planning and coordination. The additional management burden for waivers that address a single person is assumed to be 1 hour. For waivers that address more than one person, this analysis assumes that the additional management burden will be 2 hours.

The *facility cost per waiver* results from the sum of the following factors:

- The labor cost of this waiver is the difference between the cost of labor for the extended period under the final rule and the cost of labor pre-rule. The labor cost is calculated as follows:

  $(NUM_{Specialty\ Vender} \times HOURS_{Specialty\ Vender} \times WAGE_{Specialty\ Vender} \times CONTINGENCY_{Shift\_Schedule\_Change}) - (NUM_{Specialty\ Vender} \times HOURS_{Specialty\ Vender} \times WAGE_{Specialty\ Vender})$

- The management cost of this waiver is the additional management burden for planning and coordination. The management cost is calculated as follows:

  If waiver addresses one person, then $(1\ hour \times WAGE_{Manager})$
  If waiver addresses multiple people, then $(2\ hours \times WAGE_{Manager})$

Parameter	**Description**
$NUM_{Specialty\ Vender}$	The number of specialty venders impacted by shift schedule changes that will no longer be allowed
$HOURS_{Specialty\ Vender}$	Hours worked per specialty vender that exceeded the work hour requirements under one waiver
$CONTINGENCY_{Shift\_Schedule\_Change}$	Contingency factor measuring the significance of expected resource loading associated with shift schedule changes (described in assumptions below)
$WAGE_{Specialty\ Vender}$	The estimated hourly rate of specialty vender labor (described in Section A3.9)
$WAGE_{Manager}$	Average manager wage rate (described in Section A3.9)

Assumption:

- A scaling factor is used to increase baseline costs to reflect higher costs under the final provision. For this equation, the contingency factor value equals 1. Effective management planning should avoid the need for waivers associated with changes in shift schedules.

Utility

This category estimates the cost associated with eliminating work hour waivers addressing an outage shift change. The category is applicable to utility workers supporting an outage. Activities addressed by this category are not associated with a test or integrated evolution that requires a formal job brief.

The management cost represented by this section is the additional management burden for planning and coordination. The additional management burden for waivers that address a single person is assumed to be 1 hour. For waivers that address more than one person, this analysis assumes that the additional management burden will be 2 hours.

The *facility cost per waiver* results from the sum of the following factors:

- The labor cost of this waiver is the difference between the cost of labor for the extended period under the final rule and the cost of labor pre-rule. The labor cost is calculated as follows:

  $$(NUM_{Utility\ Worker} \times HOURS_{Utility\ Worker} \times WAGE_{Utility\ Worker} \times CONTINGENCY_{Shift\_Schedule\_Change}) - (NUM_{Utility\ Worker} \times HOURS_{Utility\ Worker} \times WAGE_{Utility\ Worker})$$

- The management cost represented by this section is the additional management burden for planning and coordination. The management cost is calculated as follows:

  If waiver addresses one person, then $(1\ hour \times WAGE_{Manager})$
  If waiver addresses multiple people, then $(2\ hours \times WAGE_{Manager})$

Parameter	**Description**
$NUM_{Utility\ Worker}$	The number of utility workers impacted by shift schedule changes that will no longer be allowed
$HOURS_{Utility\ Worker}$	Hours worked per utility worker that exceeded the work hour requirements
$CONTINGENCY_{Shift\_Schedule\_Change}$	Contingency factor measuring the significance of expected resource loading associated with shift schedule changes (described in assumptions below
$WAGE_{Utility\ Worker}$	The estimated hourly rate of utility labor (described in Section A3.9)
$WAGE_{Manager}$	Average manager wage rate (described in Section A3.9)

Assumption:

- A scaling factor is used to increase baseline costs to reflect higher costs under the final provision. For this equation, the contingency factor value equals 1. Effective management planning should avoid the need for waivers associated with changes in shift schedules.

A3.4 Outage Activities Without Direct Impact on Critical Path

Contractor - Local Craft

This category estimates the cost associated with eliminating work hour waivers addressing an outage activity that extends beyond a shift. The category is applicable to local contractors supporting an outage that do not require travel or per diem. Activities addressed by this category are not associated with a test or integrated evolution and do not have a direct critical path impact. This group includes waivers associated with:

- Continuation of on-going work activities (not identified or assessed as critical path);
- Equipment de-contamination and temporary shielding activities; and
- Worker contingency actions (personnel on standby).

The management cost of this section is the additional management burden for planning and coordination. The additional management burden for waivers that address a single person is assumed to be 2 hours. For waivers that address more than one person, this analysis assumes that the additional management burden will be 4 hours.

The *facility cost per waiver* results from the sum of the following factors:

- The labor cost of this waiver is the difference between the cost of labor for the extended period under the final rule and the cost of labor pre-rule. The labor cost is calculated as follows:

  $(NUM_{Local\ Craft} \times HOURS_{Local\ Craft} \times WAGE_{Local\ Craft} \times CONTINGENCY_{Non\text{-}Critical\ Path})$
  $- (NUM_{Local\ Craft} \times HOURS_{Local\ Craft} \times WAGE_{Local\ Craft})$

- The management cost of this waiver is the additional management burden for planning and coordination. The management cost is calculated as follows:

  If waiver addresses one person, then $(2\ hours \times WAGE_{Manager})$
  If waiver addresses multiple people, then $(4\ hours \times WAGE_{Manager})$

Parameter	Description
$NUM_{Local\ Craft}$	The number of local craft workers impacted by shift schedule changes that will no longer be allowed
$HOURS_{Local\ Craft}$	Hours worked per local craft worker that exceeded the work hour requirements under one waiver
$CONTINGENCY_{Non\text{-}Critical\ Path}$	Contingency factor measuring the significance of expected resource loading associated with non-critical path resources changes (described in assumptions below)
$WAGE_{Local\ Craft}$	The estimated hourly rate of local craft labor (described in Section A3.9)
$WAGE_{Manager}$	Average manager wage rate (described in Section A3.9)

Assumption:

- A scaling factor is used to increase baseline costs to reflect higher costs under the final provision. The contingency factor value in this equation is assumed to be equal to 2. The contingency factor value is based on an evaluation of special conditions, including individuals' level of specialization, potential difficulty in establishing alternative arrangements, the likelihood of cost premiums like travel per diem and the potential impact to outage duration. In this section of the appendix, the contingency value ranges from 1 to 5. For this category, the contingency factor equals 2 due to the low level of specialization, local availability of labor and limited impact on the outage critical path.

Contractor - Specialty Vender

This category estimates the cost associated with eliminating work hour waivers addressing an outage activity that extends beyond a shift. The category is applicable to contractors supporting an outage that are expected to incur transportation and per diem cost. Activities addressed by this category are not associated with a test or integrated evolution and do not have a direct critical path impact. This group includes waivers associated with:

- Continuation of on-going work activities (not identified or assessed as critical path);
- Motor-operated valve and air-operated valve testing; and
- Worker contingency actions (personnel on standby).

The labor cost of this waiver is the difference between the cost of labor for the extended period under the final rule and the cost of labor pre-rule. The contingency cost includes the expected additional per diem cost. The analysis also assumes that a travel cost of $1,000 per person per waiver will be incurred.

The management cost of this section is the additional management burden for planning and coordination. The additional management burden for waivers that address a single person is

assumed to be 2 hours. For waivers that address more than one person, this analysis assumes that the additional management burden will be 4 hours.

The *facility cost per waiver* results from the sum of the following factors:

- The labor cost of this waiver is the difference between the cost of labor for the extended period under the final rule and the cost of labor pre-rule. The labor cost is calculated as follows:

  $(NUM_{Specialty\ Vender} \times HOURS_{Specialty\ Vender} \times WAGE_{Specialty\ Vender} \times CONTINGENCY_{Non\text{-}critical\ Path}) + (NUM_{Specialty\ Vender} \times COST_{Travel}) - (NUM_{Specialty\ Vender} \times HOURS_{Specialty\ Vender} \times WAGE_{Specialty\ Vender})$

- The management cost of this waiver is the additional management burden for planning and coordination. The management cost is calculated as follows:

  If waiver addresses one person, then $(2\ hour \times WAGE_{Manager})$
  If waiver addresses multiple people, then $(4\ hours \times WAGE_{Manager})$

Parameter	**Description**
$NUM_{Specialty\ Vender}$	The number of specialty venders impacted by shift schedule changes that will no longer be allowed
$HOURS_{Specialty\ Vender}$	Hours worked per specialty vender that exceeded the work hour requirements under one waiver
$CONTINGENCY_{Non\text{-}Critical\ Path}$	Contingency factor measuring the significance of expected resource loading associated with shift schedule changes (described in assumptions below)
$WAGE_{Specialty\ Vender}$	The estimated hourly rate of specialty vender labor (described in Section A3.9)
$COST_{Travel}$	The estimated round trip travel fee used for specialty venders (described in Section A3.9)
$WAGE_{Manager}$	Average manager wage rate (described in Section A3.9)

Assumption:

- A scaling factor is used to increase baseline costs to reflect higher costs under the final provision. The contingency factor value in this equation is assumed to be equal to 4. The contingency factor value is based on an evaluation of special conditions, including individuals' level of specialization, potential difficulty in establishing alternative arrangements, the likelihood of cost premiums like travel per diem and the potential impact to outage duration. In this section of the appendix, the contingency value ranges from 1 to 5. For this category, the contingency factor equals 4 due to the high level of

specialization, potential difficulty in making alternative arrangements, likely need to pay a premium, and the limited impact on the outage critical path.

Utility

This category estimates the cost associated with eliminating work hour waivers addressing an outage activity that extends beyond a shift. The category is applicable to utility workers supporting an outage. Activities addressed by this category are not associated with a test or integrated evolution and do not have a direct critical path impact. This group includes waivers associated with:

- Continuation of on-going work activities (not identified or assessed as critical path);
- Operations outage support (valve manipulations, clearing danger tags, surveillance support, etc.);
- Health Physics survey and job coverage support; and
- Training and qualification support (welders).

The management cost represented by this section is the additional management burden for planning and coordination. The additional management burden for waivers that address a single person is assumed to be 2 hours. For waivers that address more than one person, this analysis assumes that the additional management burden will be 4 hours.

The *facility cost per waiver* results from the sum of the following factors:

- The labor cost of this waiver is the difference between the cost of labor for the extended period under the final rule and the cost of labor pre-rule. The labor cost is calculated as follows:

  $(NUM_{Utility\ Worker} \times HOURS_{Utility\ Worker} \times WAGE_{Utility\ Worker} \times CONTINGENCY_{Non\text{-}critical\ Path}) - (NUM_{Utility\ Worker} \times HOURS_{Utility\ Worker} \times WAGE_{Utility\ Worker})$

- The management cost represented by this section is the additional management burden for planning and coordination. The management cost is calculated as follows:

  If waiver addresses one person, then $(2\ hours \times WAGE_{Manager})$
  If waiver addresses multiple people, then $(4\ hours \times WAGE_{Manager})$

Parameter	Description
$NUM_{Utility\ Worker}$	The number of utility workers impacted by shift schedule changes that will no longer be allowed
$HOURS_{Utility\ Worker}$	Hours worked per utility worker that exceeded the work hour requirements

Parameter	Description
$CONTINGENCY_{Non\text{-}critical\ Path}$	Contingency factor measuring the significance of expected resource loading associated with shift schedule changes (described in assumptions below
$WAGE_{Utility\ Worker}$	The estimated hourly rate of utility labor (described in Section A3.9)
$WAGE_{Manager}$	Average manager wage rate (described in Section A3.9)

Assumption:

- A scaling factor is used to increase baseline costs to reflect higher costs under the final provision. The contingency factor value in this equation is assumed to be equal to 2. The contingency factor value is based on an evaluation of special conditions, including individuals' level of specialization, potential difficulty in establishing alternative arrangements, the likelihood of cost premiums like travel per diem and the potential impact to outage duration. In this section of the appendix, the contingency value ranges from 1 to 5. For this category, the contingency factor equals 2 due to the assignment flexibility of in-house staff and limited impact on the outage critical path.

A3.5 Outage Activities With Critical Path Impact

Contractor - Local Craft

This section estimates the local contractor cost associated with activities that have a critical path impact. The category is applicable to local contractors supporting an outage that do not require travel or per diem. This group includes waivers associated with:

- Support of critical path activities (only 4 waivers were identified as being applicable to the Local Craft portion of this category).

The management cost of this section is the additional management burden for planning and coordination. The additional management burden for waivers that address a single person is assumed to be 2 hours. For waivers that address more than one person, this analysis assumes that the additional management burden will be 4 hours.

The outage portion of this section is used to represent the cost associated with extending the outage as a result of allocating resources without the availability of a waiver. This waiver cost section addresses the potential impact of the job brief on the critical path.

The *facility cost per waiver* results from the sum of the following factors:

- The labor cost of this waiver is the difference between the cost of labor for the extended period under the final rule and the cost of labor pre-rule. The labor cost is calculated as follows:

  $$(NUM_{Local\ Craft} \times HOURS_{Local\ Craft} \times WAGE_{Local\ Craft} \times CONTINGENCY_{Critical\ Path}) - (NUM_{Local\ Craft} \times HOURS_{Local\ Craft} \times WAGE_{Local\ Craft})$$

- The management cost represented by this section is the additional management burden for planning and coordination. The management cost is calculated as follows:

  If waiver addresses one person, then $(2\ hours \times WAGE_{Manager})$
  waiver addresses multiple people, then $(4\ hours \times WAGE_{Manager})$

- The outage portion of this section represents the cost associated with extending the outage as a result of allocating resources without the availability of a waiver. The outage cost is calculated as follows:

  $$HOURS_{Turnover} \times HCOST_{Outage}$$

  If the waiver is associated with the 72-hour provision, then this analysis assumes that there is no cost for critical path turnover. The analysis makes this assumption because the 72-hour provision is typically exceeded for a seventh 12-hour day in 7 days. As a result, a brief would be required regardless of whether this provision is waived or not.

Parameter	**Description**
$NUM_{Local\ Craft}$	The number of local craft workers impacted by shift schedule changes that will no longer be allowed
$HOURS_{Local\ Craft}$	Hours worked per local craft worker that exceeded the work hour requirements
$HOURS_{Turnover}$	The estimated amount of time (in hours) associated with a turnover job briefing (described in assumptions below)
$CONTINGENCY_{Critical\ Path}$	Contingency factor measuring the significance of expected resource loading associated with critical path activities (described in assumptions below)
$WAGE_{Local\ Craft}$	The estimated hourly rate of local craft labor (described in Section A3.9)
$WAGE_{Manager}$	Average manager wage rate (described in Section A3.9)
$HCOST_{Outage}$	The hourly cost of delaying the completion of an outage (described in Section A3.9)

Assumptions:

- A scaling factor is used to increase baseline costs to reflect higher costs under the final provision. The contingency factor value in this equation is assumed to be equal to 3. The contingency factor value is based on an evaluation of special conditions, including individuals' level of specialization, potential difficulty in establishing alternative arrangements, the likelihood of cost premiums like travel per diem and the potential impact to outage duration. In this section of the appendix, the contingency value ranges from 1 to 5. For this category, the contingency factor equals 3 due to the low level of specialization, local availability of labor but a potential impact on the outage critical path.

- The estimated amount of time (in hours) associated with a turnover job briefing: 0.5 hours.

Contractor - Specialty Vender

This section estimates the specialty cost associated with activities that have a critical path impact that will not meet the new waiver requirements. This group includes waivers associated with:

- Refueling path (fuel off-load, on-load, equipment repair, etc.);
- Steam generator eddy current testing;
- Reactor mid-loop operations; and
- Critical path repair/maintenance activities.

The labor cost of this waiver is the difference between the cost of labor for the extended period under the final rule and the cost of labor pre-rule. The cost estimate includes a travel cost of $1,000 per person per waiver.

The management cost of this section is the additional management burden for planning and coordination. The additional management burden for waivers that address a single person is assumed to be 2 hours. For waivers that address more than one person, this analysis assumes that the additional management burden will be 4 hours.

The outage portion of this section is used to represent the cost associated with extending the outage as a result of allocating resources without the availability of a waiver. This waiver cost section addresses the potential impact of the job brief on the critical path.

The *facility cost per waiver* results from the sum of the following factors:

- The labor cost of this waiver is the difference between the cost of labor for the extended period under the final rule and the cost of labor pre-rule. The labor cost is calculated as follows:

$$(NUM_{Specialty\ Vender} \times (HOURS_{Specialty\ Vender} + HOURS_{Turnover} \times 2) \times WAGE_{Specialty\ Vender} \times CONTINGENCY_{Critical\ Path}) + (NUM_{Specialty\ Vender} \times COST_{Travel}) - (NUM_{Specialty\ Vender} \times HOURS_{Specialty\ Vender} \times WAGE_{Specialty\ Vender})$$

- The management cost represented by this section is the additional management burden for planning and coordination. The management cost is calculated as follows:

$$\textit{If waiver addresses one person, then } (2\ hours \times WAGE_{Manager})$$
$$\textit{If waiver addresses multiple people, then } (4\ hours \times WAGE_{Manager})$$

- The outage portion of this section represents the cost associated with extending the outage as a result of allocating resources without the availability of a waiver. The outage cost is calculated as follows:

$$HOURS_{Turnovers} \times HCOST_{Outage}$$

If the waiver is associated with the 72-hour provision, then this analysis assumes that there is no cost for critical path turnover. The analysis makes this assumption because the 72-hour provision is typically exceeded for a seventh 12-hour day in 7 days. As a result, a brief would be required regardless of whether this provision is waived or not.

Parameter	**Description**
$NUM_{Specialty\ Vender}$	The number of specialty vender impacted by shift schedule changes that will no longer be allowed
$HOURS_{Specialty\ Vender}$	Hours worked per specialty vender that exceeded the work hour requirements
$HOURS_{Turnover}$	The estimated amount of time (in hours) associated with a turnover job briefing (described in assumptions below)
$CONTINGENCY_{Critical\ Path}$	Contingency factor measuring the significance of expected resource loading associated with shift schedule changes (described in assumptions below)
$WAGE_{Specialty\ Vender}$	The estimated hourly rate of specialty vender labor (described in Section A3.9)
$COST_{Travel}$	The estimated round trip travel fee used for contractor workers (described in Section A3.9)
$WAGE_{Manager}$	Average manager wage rate (described in Section A3.9)
$HCOST_{Outage}$	The hourly cost of delaying the completion of an outage (described in Section A3.9)

Assumptions:

- A scaling factor is used to increase baseline costs to reflect higher costs under the final provision. The contingency factor value in this equation is assumed to be equal to 5. The contingency factor value is based on an evaluation of special conditions, including individuals' level of specialization, potential difficulty in establishing alternative arrangements, the likelihood of cost premiums like travel per diem and the potential impact to outage duration. In this section of the appendix, the contingency value ranges from 1 to 5. For this category, the contingency factor equals the maximum value of 5 due to the high level of specialization, potential difficulty in making alternative arrangements, likely need to pay a premium, and the potential impact on the outage critical path.

- The estimated amount of time (in hours) associated with a turnover job briefing: 0.5 hours

Utility

This category addresses utility workers and estimates the cost associated with an outage test or integrated evolution that will not meet the new waiver requirements. This group includes waivers associated with:

- Refueling path (fuel off-load, on-load, equipment repair, etc.);
- Steam generator eddy current testing;
- Reactor mid-loop operations;
- Reactor startup activities; and
- Critical path repair/maintenance activities.

The management cost represented by this section is the additional management burden for planning and coordination. The additional management burden for waivers that address a single person is assumed to be 2 hours. For waivers that address more than one person, this analysis assumes that the additional management burden will be 4 hours.

The outage portion of this equation is used to represent the cost associated with extending the outage as a result of allocating resources without the availability of a waiver. This waiver cost section includes the potential impact of the job brief on the critical path. The full weight of this additional activity is included in this cost estimate.

The *facility cost per waiver* results from the sum of the following factors:

- The labor cost of this waiver is the difference between the cost of labor for the extended period under the final rule and the cost of labor pre-rule. The labor cost is calculated as follows:

  $$(NUM_{Utility\ Worker} \times (HOURS_{Utility\ Worker} + HOURS_{Turnover} \times 2) \times WAGE_{Utility\ Worker} \times CONTINGENCY_{Critical\ Path}) - (NUM_{Utility\ Worker} \times HOURS_{Utility\ Worker} \times WAGE_{Utility\ Worker})$$

- The management cost represented by this section is the additional management burden for planning and coordination. The management cost is calculated as follows:

  If waiver addresses one person, then $(2\ hours \times WAGE_{Manager})$
  If waiver addresses multiple people, then $(4\ hours \times WAGE_{Manager})$

- The outage portion of this section represents the cost associated with extending the outage as a result of allocating resources without the availability of a waiver. The outage cost is calculated as follows:

  $$HOURS_{Turnover} \times HCOST_{Outage}$$

  If the waiver is associated with the 72-hour provision, then this analysis assumes that there is no cost for critical path turnover. The analysis makes this assumption because the 72-hour provision is typically exceeded for a seventh 12-hour day in 7 days. As a result, a brief would be required regardless of whether this provision is waived or not.

Parameter	**Description**
$NUM_{Utility\ Worker}$	The number of utility workers impacted by shift schedule changes that will no longer be allowed
$HOURS_{Utility\ Worker}$	Hours worked per utility worker that exceeded the work hour requirements
$HOURS_{Turnover}$	The estimated amount of time (in hours) associated with a turnover job briefing (described in assumptions below)
$CONTINGENCY_{Critical\ Path}$	Contingency factor measuring the significance of expected resource loading associated with shift schedule changes (described in assumptions below)
$WAGE_{Utility\ Worker}$	The estimated hourly rate of utility worker labor (described in Section A3.9)
$HCOST_{Outage}$	The hourly cost of delaying the completion of an outage (described in Section A3.9)
$WAGE_{Manager}$	Average manager wage rate (described in Section A3.9)

Assumptions:

- A scaling factor is used to increase baseline costs to reflect higher costs under the final provision. The contingency factor value in this equation is assumed to be equal to 3. The contingency factor value is based on an evaluation of special conditions, including individuals' level of specialization, potential difficulty in establishing alternative arrangements, the likelihood of cost premiums like travel per diem and the potential impact to outage duration. In this section of the appendix, the contingency value ranges from 1 to 5. For this category, the contingency factor equals 3 due to the assignment flexibility of in-house staff and the potential impact on the outage critical path.

- The estimated amount of time (in hours) associated with a turnover job briefing: 0.5 hours.

A3.6 At-Power Costs Associated with Individuals Who Will Not Meet the Final Waiver Requirements

This category addresses a general estimate of the at-power cost associated with individuals who will not meet the new waiver requirements. This group includes waivers associated with training, meetings and other miscellaneous activities.

The *facility cost per waiver* results from the sum of the following factors:

- The labor cost associated with a shift schedule change that will not meet the new waiver requirements is the difference between the cost of labor for the final rule and the cost of labor pre-rule. The labor cost is calculated as follows:

  $(NUM_{Utility\ Worker} \times HOURS_{Utility\ Worker} \times WAGE_{Utility\ Worker} \times CONTINGENCY_{Power}) - (NUM_{Utility\ Worker} \times HOURS_{Utility\ Worker} \times WAGE_{Utility\ Worker})$

- The management cost associated with a shift schedule change that will not meet the new waiver requirements is the cost of the additional management burden for planning and coordination. The management cost is calculated as follows:

  $(1\ hour \times WAGE_{Manager})$

Parameter	Description
$NUM_{Utility\ Worker}$	The number of utility workers impacted by shift schedule changes that will no longer be allowed
$HOURS_{Utility\ Worker}$	Hours worked per utility worker that exceeded the work hour requirements

Parameter	Description
$CONTINGENCY_{Power}$	Contingency factor measuring the significance of expected resource loading associated with at-power activities (described in assumptions below
$WAGE_{Utility\ Worker}$	The estimated hourly rate of utility worker labor (described in Section A3.9)
$WAGE_{Manager}$	Average manager wage rate (described in Section A3.9)

Assumptions:

- A scaling factor is used to increase baseline costs to reflect higher costs under the final provision. The contingency factor value in this equation is assumed to be equal to 2. The contingency factor value is based on an evaluation of special conditions, including individuals' level of specialization, potential difficulty in establishing alternative arrangements, the likelihood of cost premiums like travel per diem and the potential impact on at-power operation. In this section of the appendix, the contingency value ranges from 1 to 5. For this category, the contingency factor equals 2 due to the assignment flexibility of in-house staff and the lack of impact on at-power operation.

- The estimated level of effort to process an at-power waiver is 1 hour.

A3.7 At-Power Costs Associated With Individuals Involved in Tests or Integrated Evolution Who Will Not Meet the Final Waiver Requirements

This category addresses an estimate of the at-power cost associated with individuals involved in test or integrated evolution who will not meet the new waiver requirements. This group includes waivers associated with testing and other operational activities.

The *facility cost per waiver* results from the sum of the following factors:

- The labor cost associated with a shift schedule change that will not meet the new waiver requirements is the difference between the cost of labor for the final rule and the cost of labor pre-rule. The labor cost is calculated as follows:

  $$(NUM_{Utility\ Worker} \times (HOURS_{Utility\ Worker} + HOURS_{Turnover} \times 2) \times WAGE_{Utility\ Worker} \times CONTINGENCY_{Power\_Test}) - (NUM_{Utility\ Worker} \times HOURS_{Utility\ Worker} \times WAGE_{Utility\ Worker})$$

- The management cost associated with a shift schedule change that will not meet the new waiver requirements is the cost of the additional management burden for planning and coordination. The management cost is calculated as follows:

  $$(1\ hour \times WAGE_{Manager})$$

Parameter	Description
$NUM_{Utility\ Worker}$	The number of utility workers impacted by shift schedule changes that will no longer be allowed
$HOURS_{Utility\ Worker}$	Hours worked per utility worker that exceeded the work hour requirements
$CONTINGENCY_{Power\_Test}$	Contingency factor measuring the significance of expected resource loading associated with at-power test activities (described in assumptions below
$WAGE_{Utility\ Worker}$	The estimated hourly rate of utility worker labor (described in Section A3.9)
$HOURS_{Turnover}$	The estimated amount of time (in hours) associated with a turnover job briefing (described in assumptions below)
$WAGE_{Manager}$	Average manager wage rate (described in Section A3.9)

Assumptions:

- A scaling factor is used to increase baseline costs to reflect higher costs under the final provision. The contingency factor value in this equation is assumed to be equal to 3. The contingency factor value is based on an evaluation of special conditions, including individuals' level of specialization, potential difficulty in establishing alternative arrangements, the likelihood of cost premiums like travel per diem and the potential impact on at-power operation. In this section of the appendix, the contingency value ranges from 1 to 5. For this category, the contingency factor equals 3 due to the assignment flexibility of in-house staff and the increased importance of on-going operational activities.

- The estimated level of effort to process an at-power waiver is 1 hour.

- The estimated amount of time (in hours) associated with a turnover job briefing: 0.5 hours.

A3.8 At-Power Costs Associated With Individuals Involved in Return to Full Power Who Will Not Meet the Final Waiver Requirements

This category addresses an estimate of the at-power cost associated with individuals involved in activities that are associated with the return to full power who will not meet the new waiver requirements. This group includes waivers for individuals involved in repair activities that are not associated with technical specification equipment and that likely result in a power reduction. This analysis assumes that a facility will operate at 75% of its capacity.

The *facility cost per waiver* results from the sum of the following factors:

- The labor cost associated with a shift schedule change that will not meet the new waiver requirements is the difference between the cost of labor for the final rule and the cost of labor pre-rule. The labor cost is calculated as follows:

  $(NUM_{Utility\ Worker} \times (HOURS_{Utility\ Worker} + HOURS_{Turnover} \times 2) \times WAGE_{Utility\ Worker} \times CONTINGENCY_{Return\ to\ Rull\ Power}) - (NUM_{Utility\ Worker} \times HOURS_{Utility\ Worker} \times WAGE_{Utility\ Worker})$

- The management cost associated with a shift schedule change that will not meet the new waiver requirements is the cost of the additional management burden for planning and coordination. The management cost is calculated as follows:

  $(1\ hour \times WAGE_{Manager})$

- The return to power cost associated with operating at a reduced power level is the cost of allocating resources without the availability of a waiver. The return to power cost is calculated as follows:

  $HOURS_{Turnovers} \times REDUCED\_POWER \times HCOST_{Outage}$

Parameter	**Description**
$NUM_{Utility\ Worker}$	The number of utility workers impacted by shift schedule changes that will no longer be allowed
$HOURS_{Utility\ Worker}$	Hours worked per utility worker that exceeded the work hour requirements
$CONTINGENCY_{Return\ to\ Full\ Power}$	Contingency factor measuring the significance of expected resource loading associated with return to full power activities (described in assumptions below)
$WAGE_{Utility\ Worker}$	The estimated hourly rate of utility worker labor (described in Section A3.9)
$HOURS_{Turnover}$	The estimated amount of time (in hours) associated with a turnover job briefing (described in assumptions below)
REDUCED_POWER	Percent of total power lost per hour from operating at a reduced power level (described in assumptions below)
$HCOST_{Outage}$	The hourly cost of delaying the completion of an outage (described in Section A3.9)
$WAGE_{Manager}$	Average manager wage rate (described in Section A3.9)

Assumptions:

- A scaling factor is used to increase baseline costs to reflect higher costs under the final provision. The contingency factor value in this equation is assumed to be equal to 5.

The contingency factor value is based on an evaluation of special conditions, including individuals' level of specialization, potential difficulty in establishing alternative arrangements, the likelihood of cost premiums like travel per diem and the potential impact on at-power operation. In this section of the appendix, the contingency value ranges from 1 to 5. For this category, the contingency factor equals 5 due to the direct impact waivers have on production output.

- The estimated amount of time (in hours) associated with a turnover job briefing: 0.5 hours.
- The estimated level of effort to process an at-power waiver is 1 hour.
- Percent of total power lost per hour from operating at a reduced power level: 25%.

A3.9 Generic Costing Assumptions

- Management labor rate: $100/hour.
- The estimated hourly rate of utility craft labor: $40/hour.
- The estimated hourly rate of specialty contractors: $80/hour.
- The estimated hourly rate of local labor: $25/hour.
- The effectiveness of additional resources relative to those that are being augmented: 100%.
- The hourly cost of delaying the completion of an outage: $10,000.
- The estimated round trip travel fee used for contractor workers: $1,000.
- The estimated level of effort to process a waiver is 1 hour.

Summary and Analysis of Public Comments Received on Proposed Revisions to 10 CFR Part 26 – Fitness for Duty Programs

Comments Received Between August 26, 2005 and June 23, 2006

VEP	Virginia Electric and Power

Introduction

This document summarizes and responds to the comments received on the NRC's proposed revisions to 10 CFR Part 26 – Fitness for Duty Programs. The NRC accepted 81 written public comments on the proposed rule from August 25, 2005 to June 23, 2006. The NRC also considered six comments submitted on a previous working draft of the proposed rule that NRC posted on its website on May 19, 2005, but which were received too late to consider at that time.

The NRC considered comments contained in the transcript of a public meeting held on September 21, 2005 (ADAMS Accession No. ML052420363), in which 18 individuals, excluding NRC staff, spoke. The NRC also considered comments, although not written, from several other public meetings: November 7 and 9, 2005 (ADAMS Accession No. ML052990048) that provided clarification on the proposed rule; and December 15, 2005 (ADAMS Accession No. ML053400002) regarding NEI's proposed alternative approach to the work-hour portion of the proposed rule.

Exhibit 1 identifies the individuals who provided written comments that the NRC received and the organization the individual is affiliated with, if applicable. Exhibit 2 shows the individuals who spoke during the September 21, 2005, public meeting and the organization the individual is affiliated with, if applicable.

1. General Issues

1.1 Support

Comments: Several commenters expressed general support for the rulemaking. One commenter stated that NRC, the licensees, and all the stakeholders have a common goal in mind, and the only issue is how to implement the provisions while providing the necessary operational flexibility [Joe Bauer, Exelon].

NRC Response: The comments do not require a response.

1.2 Oppose

No comments generally opposed the rulemaking.

1.3 Legal Basis

Comments: A number of commenters from industry addressed the legal basis of a statement made in the proposed rule *Federal Register* notice. The commenters claimed that the proposed rule package repeatedly stated that licensees have violated NRC requirements in the Policy of Worker Fatigue. Concurrently, the proposed rule package noted that the Policy or guidance documents do not prescribe requirements and are enforceable only when included in licensees' Technical Specifications. Because the NRC Policy on Worker Fatigue is not enforceable by the NRC, the commenters argued that the claimed violation of policy is not an appropriate basis for the reporting requirements contained in proposed Subpart I [Michael Coyle, NEI #49; Richard Sweigart, DCS; Keith Jury, Exelon; Mark Wetterhahn, Winston Strawn; Edward Weinkam, NMC; Don Grissette, SNC; Keith D. Young, Ameren; Glenn Morris, TVA; Ronald Gaston, Detroit Edison; Gregory Halnon, FENOC; Jeffrey Archie, SCE&G; Brian McCabe, Progress Energy; A. Edward Scherer, SCE; D.R. Woodlan, STARS; J. A. Stall, FPL; B.T. McKinney, PPL; F.G. Burford, Entergy; Daniel Stenger, NRSG].

NRC Response: The NRC disagrees with the commenter that the proposed rule package discussed licensees “violating” the NRC’s Policy on Worker Fatigue. Instead, the rule package addressed a wide variability in how licensees interpreted and implemented the Policy. The NRC found that, in some cases, the use of waivers, in particular, was inconsistent with the Policy, as was discussed in Section IV.D of the proposed rule *Federal Register* notice. The NRC continues to believe that the reporting requirements are justified for the reasons discussed in Sections V and VI of the final rule *Federal Register* notice and Section 11.2.5 of this document.

1.4 Technical and Scientific Basis

<u>Support for Worker-designed Shifts</u>

Comments: One commenter asserted that Subpart I effectively removes rotating 8-hour schedules for most plants, and it presented a scientific paper supporting worker-designed shift

schedules [Todd Newkirk, IBEW].

NRC Response: The NRC understands the commenter's concern to be related to requirement for a 24 hour break in 7 days. In response to this comment, and related comments, the NRC has revised the rest break provisions to provide substantial additional flexibility in the final rule. For further information, see discussion of comments regarding § 26.199(d)(2) in Section 11.3.4 ("Impact on 8-hour Shifts") of this document.

Correlation between Cited Research and Actual Industry Data

Comments: One commenter, supported by many other commenters, raised several issues with the technical basis discussed in the proposed rule package. The commenter disagreed with the "sweeping generalizations" made in Section IV.D (1) and (2) of the proposed rule *Federal Register* notice regarding alertness problems that may occur as a result of fatigue. The commenter stated that the research alluded to in this discussion is not drawn from the nuclear industry, and there is a lack of correlation between the studies and actual nuclear industry data. As a result, the commenter explained that this raises concerns regarding the validity of the NRC's conclusions. The commenter stated that other factors reduce the potential for fatigue (i.e. industry's safety culture, training, work procedures, and attention to details) and these factors make it difficult to apply conclusions from studies conducted outside the nuclear industry [Michael Coyle, NEI #49; Richard Sweigart, DCS; Keith Jury, Exelon; Mark Wetterhahn, Winston Strawn; Edward Weinkam, NMC; Don Grissette, SNC; Keith D. Young, Ameren; Glenn Morris, TVA; Ronald Gaston, Detroit Edison; Gregory Halnon, FENOC; Jeffrey Archie, SCE&G; Brian McCabe, Progress Energy; A. Edward Scherer, SCE; D.R. Woodlan, STARS; J.A. Stall, FPL; B.T. McKinney, PPL; F.G. Burford, Entergy; Daniel Stenger, NRSG]. Similarly, another commenter expressed concerns about the reasearch included as the basis for the fatigue portion of the proposed rule, as they did not concern workers in the nuclear power industry [Daniel Hansen, Individual].

NRC Response: The NRC agrees with the commenters that Section IV.D (1) of the *Federal Register* notice for the proposed rule provided a general discussion regarding alertness problems that may occur as a result of fatigue as that was the intent of the section. Section IV.D (1) describes the types of impairments that can result from fatigue, specifically impairments of (1) attention, (2) decision-making, (3) problem solving, and (4) communication and teamwork. The discussion includes citations as examples of studies that demonstrate these types of impairments, and the NRC believes that these effects have been well substantiated and broadly accepted by the scientific community. The NRC provided a factual discussion of these effects and related studies and disagrees with the characterization of this discussion as including sweeping generalizations.

Section IV.D (2) of the *Federal Register* notice for the proposed rule provided a discussion of the prevalence of conditions in the nuclear industry that can contribute to worker fatigue. Specifically, the *Federal Register* notice discusses extended work shifts (i.e., 12 or more hours) with five or more consecutive work days, extensive overtime, shiftwork, early start times and extended commutes, and sleep disorders. With regard to the use of more than five consecutive work shifts and extensive use of overtime, the NRC notes that industry and union commenters (further presented and discussed in Section 11.3.4 ("Limited Access to Supplemental Workers" of this document) have asserted that schedules of 6 or more consecutive 12-hour shifts are

necessary to attract supplemental workers and have proposed that the NRC revise the proposed rule requirements to allow such practices. These comments corroborate NRC's assertion of these practices in the U.S. nuclear power industry. Similarly, the NRC considers the proposed rule's *Federal Register* notice discussion of industry use of shiftwork, shift start times beginning at 7 a.m. or earlier, the potential for extended commutes due to the nature of nuclear power plant sites in relationship to major population centers, and the incidence of sleep disorders to be a factual discussion of these conditions and does not overstate their potential to contribute to worker fatigue at nuclear power plants.

Regarding the comment that the NRC cited studies that were based on observations of worker performance outside the nuclear industry, the NRC agrees that it reviewed research from a broad spectrum of industries, in addition to studies of work performance in the nuclear industry. As a result, the NRC believes that it relied upon findings that were demonstrated in multiple settings and that substantiated general principals regarding the relationship between work hours, circadian variations in alertness, and worker performance. In addition, the NRC focused on findings from industries or settings with similar work environments and job demands. Furthermore, in establishing the specific requirements of the final rule, the NRC gave significant consideration to those factors (e.g., level of monitoring and vigilance activities, use of detailed procedures, automated safety systems) and work practices (e.g., use of three-way communications and task verification) that are unique to the nuclear power plant setting.

Accuracy of Data Provided by Industry

Comments: Many commenters from industry argued that the NRC misinterpreted data from an industry survey covering 1997-1999 and that, as a result, the NRC's conclusions regarding the abuse of overtime are not justified. These commenters argued that the NRC overstated overtime hours because the survey was based on pay records, which do not accurately reflect the actual hours worked [Michael Coyle, NEI #49; Richard Sweigart, DCS; Keith Jury, Exelon; Mark Wetterhahn, Winston Strawn; Edward Weinkam, NMC; Don Grissette, SNC; Keith D. Young, Ameren; Glenn Morris, TVA; Ronald Gaston, Detroit Edison; Gregory Halnon, FENOC; Jeffrey Archie, SCE&G; Brian McCabe, Progress Energy; A. Edward Scherer, SCE; D.R. Woodlan, STARS; J. A. Stall, FPL; B.T. McKinney, PPL; F.G. Burford, Entergy; Daniel Stenger, NRSG].

NRC Response: The NRC disagrees with the commenters that the NRC's conclusions on industry use of overtime are not justified. The basis for the NRC's conclusions is, in part, a survey developed and distributed by NEI to nuclear power plant licensees. The survey provided clear instructions to include only those hours worked and not to include extra hour compensations for working nights, weekends, or holidays. Specifically, the survey stated: "For the purposes of this survey, *Overtime* is defined as those hours worked in excess of a *nominal* 40-hour work-week. Overtime does not include special compensation for working nights, weekends, or holidays unless they are above and beyond the *nominal* 40-hour week-week." The survey also included an example which demonstrated the nominal 40-hour work-week concept for purposes of calculating overtime in response to the survey. If the instructions were followed by the participants of the survey then overtime hours were not based solely on pay records as suggested by the commenters. At the time the NEI submitted a summary of the data by letter, the NEI made no assertion that participants did not follow the survey instructions.

The NRC also notes that the large number of waivers reported from the survey data could only have occurred with excessive amounts of overtime. If overtime is not being worked, waivers are not necessary. Therefore, if actual overtime was much less than pay reports, the number of waivers would have been overreported.

Furthermore, the NRC notes that industry commenters [Michael Coyle, NEI #49; Daniel Hansen, Individual; Donald Lenski, Individual; Richard Sweigart, DCS; Keith Jury, Exelon; Mark Wetterhahn, Winston Strawn; Edward Weinkam, NMC; Don Grissette, SNC; Keith D. Young, Ameren; Glenn Morris, TVA; Ronald Gaston, Detroit Edison; Gregory Halnon, FENOC; Jeffrey Archie, SCE&G; Brian McCabe, Progress Energy; A. Edward Scherer, SCE; D.R. Woodlan, STARS; J. A. Stall, FPL; B.T. McKinney, PPL; F.G. Burford, Entergy; Daniel Stenger, NRSG] have asserted that it is necessary to offer large amounts of overtime to prevent the loss of supplemental workers to other industries that can offer overtime without restriction (see Section 11.3.4, "Limited Access to Supplemental Workers"). The premise of this comment is that industry has historically allowed individuals to work large amounts of overtime during outages. The NRC also notes that extensive use of overtime and deviations from Technical Specification work-hour limits has also been documented in NRC inspection reports and in Information Notice 91-36, Nuclear Plant Staff Working Hours. The NRC believes its conclusions regarding industry use of overtime are well founded and consistent with those of many other stakeholders [Kenneth Kolaczyk #33; Michael Jolley, #4; Anonymous, #27, Anonymous #26], including the International Brotherhood of Electrical Workers which observed, "Some of our facilities have done an outstanding job of ensuring a well rested workforce, while other facilities have simply ignored the recommended work hour limitations or relied on other mechanisms to exceed 72 hours per work week" [Edwin Hill, IBEW].

<u>September 11, 2001 Not Valid Justification for Fatigue Provisions</u>

Comments: One commenter, supported by many commenters, stated concern with the following proposed rule package statement: "The inadequacy of the current regulatory framework for addressing cumulative fatigue became particularly apparent in the months following the terrorist attacks of September 11, 2001." The commenters asserted: "Any condition that unexpectedly requires security posture at the highest level of alert is beyond the normal bounds." The commenters claimed that the stress on security officers following the events of September 11, 2001 is not a valid justification for many of the fatigue rule provisions [Michael Coyle, NEI #49; Richard Sweigart, DCS; Keith Jury, Exelon; Mark Wetterhahn, Winston Strawn; Edward Weinkam, NMC; Don Grissette, SNC; Keith D. Young, Ameren; Glenn Morris, TVA; Ronald Gaston, Detroit Edison; Gregory Halnon, FENOC; Jeffrey Archie, SCE&G; Brian McCabe, Progress Energy; A. Edward Scherer, SCE; D.R. Woodlan, STARS; J. A. Stall, FPL; B.T. McKinney, PPL; F.G. Burford, Entergy; Daniel Stenger, NRSG].

NRC Response: The NRC agrees with the commenters that the conditions following the events of September 11, 2001, were beyond normal bounds and resulted from conditions that were largely beyond the control of licensees. However, the NRC maintains that the fatigue of security personnel during this period demonstrated that individuals at nuclear power plants will experience cumulative fatigue, even when those individuals are working hours that are within the NRC's policy guidelines of working not more than 16 hours in any 24-hour period and not more than 72 hours in any 7-day period. Furthermore, such work hours and cumulative fatigue may result from conditions that are within a licensee's control, as in the case of the extended

outage for the Davis Besse reactor head vessel replacement. As a consequence, these examples indicate an inadequacy of the former regulatory framework for addressing cumulative fatigue because plant technical specifications for the control of work hours generally do not place any clear limit on the period of time individuals can work substantially in excess of a 40-hour workweek (e.g., 60 to 72 hours per week).

Adequacy of Former Rule

Comments: A number of industry commenters questioned a contradiction in the proposed rule *Federal Register* notice language. Specifically, the *Federal Register* notice states that former regulatory requirements, orders and the policy statement are adequate. However, in other parts of the rule package, the NRC claims that new provisions will result in significant improvements in public health and safety. These commenters argued that this contradiction shows that the added layers of requirements are not warranted [Michael Coyle, NEI #49; Richard Sweigart, DCS; Keith Jury, Exelon; Mark Wetterhahn, Winston Strawn; Edward Weinkam, NMC; Don Grissette, SNC; Keith D. Young, Ameren; Glenn Morris, TVA; Ronald Gaston, Detroit Edison; Gregory Halnon, FENOC; Jeffrey Archie, SCE&G; Brian McCabe, Progress Energy; A. Edward Scherer, SCE; D.R. Woodlan, STARS; J. A. Stall, FPL; B.T. McKinney, PPL; F.G. Burford, Entergy; Daniel Stenger, NRSG].

NRC Response: The NRC disagrees with the commenters that the *Federal Register* notice statements described by the commenter are contradictory. Adequate protection of public health and safety and the common defense and security are ensured through the NRC's Policy on Worker Fatigue, licensee technical specification requirements related to this policy statement, and former regulations. However, opportunities exist to improve the former framework regarding to the enforceability and consistency of the former requirements to ensure that all licensees provide reasonable assurance that workers are able to safely and competently perform their duties.

The NRC's Policy on Worker Fatigue does not prescribe requirements and is therefore enforceable only to the extent that licensees incorporate the guidelines into a license condition or technical specification requirements. Further, for the licensees who have incorporated the NRC's Policy on Worker Fatigue into a license condition or technical specifications, it is difficult for the NRC to enforce the worker fatigue requirements and work hour limits in an effective, efficient and uniform way due to the following factors: the predominantly advisory language in the specifications, the lack of key term definitions, inconsistent levels of detail in the technical specifications from one licensee to another, varying scopes of requirements, inconsistent interpretation of the covered personnel, and inconsistent implementation of the basic measures used to determine whether an individual's work hours are within or above the technical specification limits. The NRC believes that by addressing these and other limitations of the former regulatory framework with respect to managing the effects of fatigue on worker FFD, the rule will provide a substantial enhancement to the protection of public health and safety and common defense and security.

24/7 and 48/14 Rest Break Provisions Not Justified

Comments: Several commenters from industry argued that the NRC's justification for a 24-hour break every 7 days and a 48-hour break every 14 days in the proposed rule *Federal*

Register notice is flawed because the proposed rule package discussed the effects of cumulative fatigue without first establishing that cumulative fatigue would exist when every other provision in the proposed rule were observed. The commenters also stated that the lack of industry-specific evidence did not provide adequate justification for these break provisions [Michael Coyle, NEI #49; Richard Sweigart, DCS; Keith Jury, Exelon; Mark Wetterhahn, Winston Strawn; Edward Weinkam, NMC; Don Grissette, SNC; Keith D. Young, Ameren; Glenn Morris, TVA; Ronald Gaston, Detroit Edison; Gregory Halnon, FENOC; Jeffrey Archie, SCE&G; Brian McCabe, Progress Energy; A. Edward Scherer, SCE; D.R. Woodlan, STARS; J. A. Stall, FPL; B.T. McKinney, PPL; F.G. Burford, Entergy; Daniel Stenger, NRSG].

NRC Response: The NRC disagrees with the commenters that the *Federal Register* notice for the proposed rule discussed the effects of cumulative fatigue without first establishing that cumulative fatigue would exist when every other provision in the proposed rule were observed. As discussed with respect to the comment "September 11, 2001 Not Valid Justification for Fatigue Provisions," the NRC cited operational experience that indicated cumulative fatigue of nuclear power plant personnel at levels of work hours that are lower than those that would be allowed by the other work hour controls. Specifically, the *Federal Register* notice noted that following the terrorists attacks of September 11, 2001, the NRC began to receive a large number of concerns from nuclear power plant security personnel regarding the number of hours they were being required to work and their ability to remain alert and fit for duty. The NRC subsequently reviewed the work hours of security personnel at nuclear power plants and found that the work hours typically did not exceed an average of 60 hours per week. Similarly, the NRC reviewed work hours of personnel at the Davis Besse plant during an extended outage for a reactor vessel head replacement. Although workers had expressed concerns regarding excessive work hours and fatigue, the NRC found that the individual work hours typically did not exceed the guidelines of the NRC's Policy on Factors Causing Fatigue of Operating Personnel at Nuclear Reactors. However, for both the security personnel and the Davis Besse plant staff, the NRC noted that the individuals had worked substantially more than a 40-hour work week for many weeks.

As a result of reviewing this industry experience and related studies concerning cumulative fatigue, the NRC concluded that it was necessary to include controls in the final rule to provide reasonable assurance that the FFD of individuals is not impaired by cumulative fatigue. However, the NRC revised the requirements to address cumulative fatigue in response to comments concerning the impact of these requirements on scheduling flexibility and ability to meet exigent operational demands. For further information on changes to the final rule, see Section 11.3.4, "Opposition to 24/7 and 48/14 Breaks - § 26.199(d)(2)(ii) and (iii)," of this document.

Federal Motor Carrier Safety Administration Precedent

Comments: Several commenters from industry argued that the NRC's proposed rule package did not indicate the same rigor in review and application of studies conducted outside the power reactor industry as that of the Federal Motor Carrier Safety Administration (FMCSA). According to the commenters, the NRC often extrapolated narrow research findings into overly broad assertions. The commenters recommended that the NRC consider the FMCSA precedent, which is based on sound science and takes an integrated approach to managing both acute and cumulative fatigue. The FMCSA analysis was guarded in its extrapolation of narrow

research findings into broad regulatory findings. For example, in many of the studies, a psychomotor vigilance test is used to monitor for fatigue. However, as pointed by FMCSA, this does not necessarily equate to actual performance of assigned tasks. The commenters also explained that the FMCSA rules do not include long-term quarterly, annual or group work hour limits and research data support this regulatory approach [Michael Coyle, NEI #49; Richard Sweigart, DCS; Keith Jury, Exelon; Mark Wetterhahn, Winston Strawn; Edward Weinkam, NMC; Don Grissette, SNC; Keith D. Young, Ameren; Glenn Morris, TVA; Ronald Gaston, Detroit Edison; Gregory Halnon, FENOC; Jeffrey Archie, SCE&G; Brian McCabe, Progress Energy; A. Edward Scherer, SCE; D.R. Woodlan, STARS; J. A. Stall, FPL; B.T. McKinney, PPL; F.G. Burford, Entergy; Daniel Stenger, NRSG].

NRC Response: The NRC disagrees with the commenters that it extrapolated narrow research findings into overly broad assertions. Although many scientific studies of fatigue cited by the NRC may have considered a limited range of operational conditions, the NRC did not rely on the results of single studies to draw its conclusions. Rather, the NRC relied upon findings that were demonstrated in multiple settings that substantiated general, widely accepted principles regarding the relationship between work hours, circadian variations in alertness, and worker performance. In addition, the NRC focused on findings from industries or settings with similar work environments and job demands. Furthermore, in establishing the specific requirements of the final rule, the NRC gave significant consideration to those factors that are unique to the nuclear power plant setting (e.g., use of detailed procedures, automated safety systems) and work practices (e.g., self-checking, peer verification of tasks), which in some cases justified less stringent work hour controls than would have otherwise been indicated for work environments with greater sensitivity to fatigue induced errors and lapses in attention.

The NRC also acknowledges that the FMCSA rules for commercial vehicle operators do not include long-term quarterly, annual, or group limits and agrees that there is a stronger technical basis for requirements that focus on individual work hours over shorter periods of time. Accordingly, the NRC revised the requirements of the proposed rule to have all work hour limits applicable to individual work hours. In addition, the NRC revised the rule to require an average number of days off per week, for periods when the plant is operating, or a minimum number of days off in a 15-day period, when the plant is shutdown. These requirements focus the control of work hours on shorter time periods than the group work hour controls which established controls for periods up to 13-weeks.

2. Specific Questions for Public Comment

In the *Federal Register* notice for the proposed rule (70 FR 50616), the NRC sought public comment on several specific issues. These issues are addressed below.

2.1 Proposed Drug and Alcohol Provisions

2.1.1 Proposed Sanction for Attempted Subversion of Testing Process (Issue 1 in *Federal Register* Notice)

Issue: "Proposed § 26.75 in Subpart D would increase the sanctions for certain testing-related actions by requiring that: 'Any act or attempted act to subvert the testing process, including refusing to provide a specimen and providing or attempting to provide a substituted or

adulterated specimen, for any test required under this part must result in permanent denial of authorization,' and 'for individuals whose authorization was denied for 5 years ... any subsequent violation of the drug and alcohol provisions of an FFD policy must immediately result in permanent denial of authorization.' The NRC requests comments regarding these proposed changes specifically when compared to the 5-year ban available through the agency's enforcement policy for other acts of deliberate misconduct."

Comments: Several commenters agreed with the proposed requirement and stated that many licensees implemented policies of permanent denial of authorization as a sanction to deter subversion of the testing process. One commenter, supported by other comments, noted that attempted subversion must also be considered by the reviewing official during the trustworthiness and reliability decision required in 10 CFR § 73.56(b). [Randy Cleveland, NMC; Jim Davis, NEI #48; Richard Sweigart, DCS; Keith Jury, Exelon; Mark Wetterhahn, Winston Strawn; Edward Weinkam, NMC; Don Grissette, SNC; Keith D. Young, Ameren; Glenn Morris, TVA; Ronald Gaston, Detroit Edison; Gregory Halnon, FENOC; Jeffrey Archie, SCE&G; Brian McCabe, Progress Energy; C.L. Funderburk, Dominion; F.G. Burford, Entergy].

NRC Response: The NRC has adopted the proposed requirement in the final rule. Section 26.75(b) of the final rule states that any act or attempted act to subvert the testing process, including, but not limited to, refusing to provide a specimen and providing or attempting to provide a substituted or adulterated specimen, for any test required under § 26.31(c) must result in the immediate unfavorable termination of the individual's authorization and permanent denial of authorization thereafter. Also, § 26.75(g) of the final rule states that for individuals whose authorization was denied for 5 years, any subsequent violation of the drug and alcohol provisions of an FFD policy must immediately result in permanent denial of authorization.

2.1.2 Need for "Shy-Lung"' Procedure (Issue 2 in *Federal Register* notice)

Issue: "Proposed § 26.119 [Determining "shy" bladder] would establish a process for determining whether there is a medical reason that a donor is unable to provide a urine specimen of at least 30 mL. The NRC added this proposed section in response to stakeholder requests and adapted the process from the DOT's Procedures for Transportation Workplace Drug and Alcohol Testing Programs (49 CFR 40.197). The DOT Procedures also include processes for determining whether there is a medical reason that a donor is unable to provide a specimen of oral fluids (49 CFR 40.263) or a breath specimen (49 CFR 40.265) of sufficient quantity to support alcohol testing. The NRC invites comments on whether the NRC should consider incorporating these processes for insufficient oral fluids and breath specimens in Part 26."

Comments: Several commenters responded to the request for public comments on whether the NRC should consider incorporating these procedures in Part 26. The commenters stated that, based on many years of experience with the former rule requirements, industry sees no need for this provision because there are few, if any, instances where it would apply [Susan Techau, Exelon; Jim Davis, NEI #48; Richard Sweigart, DCS; Keith Jury, Exelon; Mark Wetterhahn, Winston Strawn; Edward Weinkam, NMC; Don Grissette, SNC; Keith D. Young, Ameren; Glenn Morris, TVA; Ronald Gaston, Detroit Edison; Gregory Halnon, FENOC; Jeffrey Archie, SCE&G; Brian McCabe, Progress Energy; C.L. Funderburk, Dominion; F.G. Burford, Entergy].

One commenter suggested that the alcohol collector qualifications in § 26.85(b) are sufficient to address any "shy lung" issues [Susan Techau, Exelon].

NRC Response: Because there is no evidence of a problem requiring a solution in this matter, the NRC has not included these procedures in the final rule.

2.1.3 Forensic Toxicologist (Issue 3 in *Federal Register* notice)

Issue: "Proposed § 26.31(d)(3)(iii)(C) would permit licensees and other entities to specify more stringent cutoff levels for the panel of drugs for which testing is required under this part without informing the NRC within 60 days and without obtaining the written approval of the NRC. Proposed § 26.31(d)(1)(i)(D) and (d)(1)(ii) would also permit licensees and other entities to test for drugs and drug metabolites in addition to those specified in proposed § 26.31(d)(1) without informing or obtaining the written approval of the NRC. However, the proposed paragraphs would require that the scientific and technical suitability of the more stringent cutoff levels and of the assays and cutoff levels used to test for additional drugs or drug metabolites must be evaluated and certified, in writing, by a qualified, independent forensic toxicologist. Certification by a forensic toxicologist would not be required in three circumstances: (1) if the HHS issues more stringent cutoff levels in the HHS Guidelines and the licensee or other entity adopts the revised HHS cutoffs; (2) if the HHS Guidelines are revised to authorize use of the assay in testing for the additional drug or drug metabolites and the licensee or other entity uses the cutoff levels established in the HHS Guidelines for the drug or drug metabolites; and (3) if the licensee or other entity received written approval from the NRC for the lower cutoff levels and/or for testing for the additional drugs or drug metabolites, under former Section 1.1(2) in Appendix A to Part 26. The proposed paragraphs differ from the former requirement in Section 1.1(2) of Appendix A to Part 26. The NRC requests comments regarding these proposed changes."

No comments addressed this issue. However, one commenter referenced proposed 26.31, and that comment is discussed in Section 4.6.4 of this document.

2.1.4 Changes to Opiate Testing (Issue 4 in *Federal Register* notice)

Issue: "Proposed §§ 26.133 and 26.163 would raise the cutoff levels for initial and confirmatory tests for opiates from 300 nanograms (ng) per milliliter (mL) to 2,000 ng/mL. The proposed rule would also require testing for 6-acetylmorphine (6-AM), a metabolite that comes only from heroin, using a 10 ng/mL confirmatory cutoff level for specimens that tested positive on the initial test. The proposed cutoff levels and new test would be consistent with those used by HHS and DOT, and would reduce the number of specimens in Part 26 programs that test positive for opiates at an HHS-certified laboratory but are subsequently determined to be negative by the MRO after consultation with the donor. The NRC invites comment on these proposed changes."

Comments: Several commenters addressed the proposed provision to raise the cut-off levels for initial and confirmatory tests for opiates from 300 nanograms (ng) per mililiter (mL) to 2,000 ng/mL. They stated that industry strongly supports the proposed requirement, as it would increase the efficiency of FFD programs [Pete Defilippi, Westinghouse Electric Company; Jim Davis, NEI #48; Richard Sweigart, DCS; Keith Jury, Exelon; Mark Wetterhahn, Winston Strawn; Edward Weinkam, NMC; Don Grissette, SNC; Keith D. Young, Ameren; Glenn Morris, TVA;

Ronald Gaston, Detroit Edison; Gregory Halnon, FENOC; Jeffrey Archie, SCE&G; Brian McCabe, Progress Energy; C.L. Funderburk, Dominion; F.G. Burford, Entergy].

NRC Response: The NRC has retained the proposed rule cut-off levels and new test (as discussed above) in the final rule.

2.1.5 Specimen Validity Testing (Issue 5 in *Federal Register* notice)

Issue: "In proposed §§ 26.131, 26.137, 26.161, and 26.167, the NRC would add new requirements for validity testing of urine specimens to detect specimens that may have been adulterated, substituted, or diluted. The new requirements are adapted from practices the HHS published in the *Federal Register* on April 13, 2004 (69 FR 19643) as a final rule. The NRC invites public comment on the following issues related to the proposed validity testing requirements."

Comments: One commenter, supported by many commenters, addressed the proposal to add new requirements for validity testing of urine specimens to detect specimens that may have been adulterated, substituted, or dilute. The commenter stated that validity testing requirements should be consistent with established HHS criteria and should not be more stringent [Jim Davis, NEI #48; Richard Sweigart, DCS; Keith Jury, Exelon; Mark Wetterhahn, Winston Strawn; Edward Weinkam, NMC; Don Grissette, SNC; Keith D. Young, Ameren; Glenn Morris, TVA; Ronald Gaston, Detroit Edison; Gregory Halnon, FENOC; Jeffrey Archie, SCE&G; Brian McCabe, Progress Energy; C.L. Funderburk, Dominion; F.G. Burford, Entergy].

NRC Response: Comments received on validity testing are addressed in Sections 8 and 9 of this document regarding Subparts F and G, respectively.

No comments were received on Issues 5a and 5b in *Federal Register* Notice.

2.1.6 MRO Training (Issue 6 in *Federal Register* notice)

Issue: "Proposed § 26.183(a) requires that 'The MRO shall be knowledgeable of this part and of the FFD policies of the licensees and other entities for whom the MRO provides services.' The NRC invites comments on whether Part 26 should establish specific training requirements for the MRO related to this part and the licensee's or other entity's programs for which the MRO provides services."

Comments: Several commenters addressed the issue of whether Part 26 should establish specific training requirements for the MRO related to this part and the licensee's or other entity's programs for which the MRO provides services. The commenters stated that the NRC should not regulate MRO training because MROs are licensed by the states and will be certified as required under the proposed rule. Therefore, additional regulation is not required to ensure that MROs understand licensee policies and procedures [Randy Cleveland, NMC; Jim Davis, NEI #48; Richard Sweigart, DCS; Keith Jury, Exelon; Mark Wetterhahn, Winston Strawn; Edward Weinkam, NMC; Don Grissette, SNC; Keith D. Young, Ameren; Glenn Morris, TVA; Ronald Gaston, Detroit Edison; Gregory Halnon, FENOC; Jeffrey Archie, SCE&G; Brian McCabe, Progress Energy; C.L. Funderburk, Dominion; F.G. Burford, Entergy].

NRC Response: The NRC received no public comments supporting the need for specific training requirements for the MRO related to this part and the licensee's or other entity's programs for which the MRO provides services. Therefore, the NRC has retained § 26.183(a) as proposed.

2.1.7 Single or Split Specimen (Bottle B) Retesting (Issue 14 in *Federal Register* notice)

Issue: "Proposed §§ 26.135(b) and 26.165(a)(4) and (b)(1) would prohibit licensees and other entities, the MRO, and the NRC from initiating testing of the specimen in Bottle B or retesting an aliquot from a single specimen without the donor's written permission. The NRC is considering an alternative approach that would permit a licensee or other entity to initiate testing of the specimen in Bottle B or retesting an aliquot from a single specimen without the donor's written permission only if all of the following conditions are met: (1) the first results from testing the specimen were confirmed as non-negative by the MRO; (2) the donor has requested a review under proposed § 26.39 or initiated legal proceedings; and (3) the testing is conducted in accordance with proposed § 26.165(c)–(e), as applicable. Under either the proposed provisions or the alternative approach, the proposed rule would require the licensee or other entity to administratively withdraw the donor's authorization until the results from Bottle B or the retest results are available and to rely only on those results in determining whether the licensee or other entity would be required to take management actions or impose sanctions on the donor. The NRC is seeking an appropriate balance between protecting donors' rights to privacy and due process under the rule and the protection of public health and safety and the common defense and security, and invites public comment on the proposed and alternative approaches."

Comments: One commenter, supported by many commenters, addressed administrative withdrawal of the donor's authorization until the results from Bottle B or the retest results are available. The commenter recommended that the NRC consider the protection of public health and safety and the common defense and security as the primary goal. The commenter further argued that no provisions in the proposed rule negatively impacted the donor's rights, and it appears that only the donor, the MRO, and one employee of the licensee or other entity know the rationale for the administrative withdrawal of the donor's authorization. Thus, it is difficult for industry to envision a smaller number of people with this knowledge, and the donor's right to privacy is protected as much as possible. Therefore, the commenter supported this aspect of the proposed rule [Jim Davis, NEI #48; Richard Sweigart, DCS; Keith Jury, Exelon; Mark Wetterhahn, Winston Strawn; Edward Weinkam, NMC; Don Grissette, SNC; Keith D. Young, Ameren; Glenn Morris, TVA; Ronald Gaston, Detroit Edison; Gregory Halnon, FENOC; Jeffrey Archie, SCE&G; Brian McCabe, Progress Energy; C.L. Funderburk, Dominion; F.G. Burford, Entergy].

NRC Response: The NRC addressed comments received on initiating testing of the specimen in Bottle B or retesting an aliquot from a single specimen without the donor's written permission in Section 8.8 of this document with respect to comments regarding § 26.135(b) and in Section 9.8.1 of this document with respect to comments regarding § 26.165(a)(4).

2.2 Rulemaking Issues

2.2.1 Validity Screening Tests (Issue 7 in *Federal Register* notice)

Issue: "The NRC is considering incorporating future changes to the draft HHS Guidelines that were published as a proposed rule for public comment in the *Federal Register* on April 13, 2004 (69 FR 19672) relating to the permission in this proposed Part 26 rule for licensees and other entities to use non-instrumented validity tests to determine whether a urine specimen appears to be adulterated, diluted, or substituted and requires further testing at an HHS-certified laboratory. Proposed Part 26 would permit licensees and other entities to use these devices for validity screening tests, in lieu of the instrumented validity testing required in the April 13, 2004, final version of the HHS Guidelines. Should any changes be made to those draft HHS Guidelines between issuing this proposed rule and issuing the final 10 CFR Part 26 rule, those changes would be considered for incorporation. Any comments related to the potential incorporation of those changes are of interest."

Comments: Several commenters from industry addressed the incorporation of future changes to the draft HHS validity testing guidelines relating to the permission in the proposed rule for licensees and other entities to use non-instrumented validity tests to determine whether a urine specimen appears to be adulterated, dilute, or substituted and requires further testing at an HHS laboratory. The commenters argued that the NRC has offered no justification for bypassing its own processes in the brief discussion of this issue. Thus, they stated that changes to HHS guidelines should not be incorporated into the NRC regulations without going through a complete rulemaking process [Randy Cleveland, NMC; Jim Davis, NEI #48; Richard Sweigart, DCS; Keith Jury, Exelon; Mark Wetterhahn, Winston Strawn; Edward Weinkam, NMC; Don Grissette, SNC; Keith D. Young, Ameren; Glenn Morris, TVA; Ronald Gaston, Detroit Edison; Gregory Halnon, FENOC; Jeffrey Archie, SCE&G; Brian McCabe, Progress Energy; C.L. Funderburk, Dominion; F.G. Burford, Entergy].

NRC Response: In the proposed rule, the NRC stated that it would consider any changes to the draft HHS Guidelines for incorporation in the final FFD rule. HHS has not issued a final rule, and no changes to the draft HHS Guidelines have occurred. Therefore, the NRC is not adopting any changes to the draft HHS Guidelines in the final FFD rule.

2.2.2 Adopting Future Changes to the HHS Guidelines without Backfit (Issue 13 in *Federal Register* notice)

Issue: "The NRC is considering amending 10 CFR 50.109, 70.76, and 76.76 to exclude certain future changes to Part 26 from current backfit requirements. The scope of the exclusions would be limited to only those changes to Part 26 that would be necessary to incorporate relevant revisions to the HHS Guidelines when they are published by HHS as final rules. Examples of changes to the HHS Guidelines that may be incorporated into Part 26 in future rulemakings may include, but would not be limited to (1) adopting changes to the cutoff levels established in the Guidelines; (2) the addition or deletion of drugs and adulterants for which testing would be required; and (3) changes in the specimens, instruments, or assays used in drug and validity testing. The NRC requests comment on excluding such future changes to Part 26 from backfit analysis requirements."

Comments: Several commenters addressed the proposal to amend 10 CFR 50.109, 70.76 and 76.76 to exclude future changes to Part 26 from former backfit requirements. The commenters did not support this proposal and advocated making no changes to § 50.109, § 70.76, and § 76.76 regarding the former backfit requirements. One commenter, supported by many commenters, stated that examples of the changes the NRC would like to make without backfit analyses, given in the comment solicitation, do not appear to provide "… a substantial increase in the overall protection of the public health and safety or the common defense and security …" described in §§ 50.109, 70.76 and 76.76. Therefore, lacking the "substantial increase," industry argued that the NRC should not change these subsections to allow revision of regulations without determining whether the direct and indirect cost of the suggested changes are actually cost beneficial. Further, the commenter argued that the proposed § 26.31(d)(1)(i) allowed licensees and other entities to add other drugs to the panel of substances for testing, such as those popular in their local geographical areas, and to establish appropriate cutoff levels for any additional substances for which testing will be conducted. Thus, industry stated that there is no need to revise §§ 50.109, 70.76 and 76.76, given the proposed rule requirements. Finally, the commenter argued that the NRC has offered no justification for bypassing its own processes in the brief discussion of this issue, and the examples given are not inclusive so the scope of possible changes is boundless [Jim Davis, NEI #48; Richard Sweigart, DCS; Keith Jury, Exelon; Mark Wetterhahn, Winston Strawn; Edward Weinkam, NMC; Don Grissette, SNC; Keith D. Young, Ameren; Glenn Morris, TVA; Ronald Gaston, Detroit Edison; Gregory Halnon, FENOC; Jeffrey Archie, SCE&G; Brian McCabe, Progress Energy; C.L. Funderburk, Dominion; Nick DePietro, First Energy; F.G. Burford, Entergy].

NRC Response: Based on the commenters' objections and the lack of support to amend 10 CFR 50.109, 70.76 and 76.76 to exclude future changes to Part 26 from former backfit requirements, the NRC has decided not to pursue modification of the applicability of current backfit requirements relative to Part 26 in the final rule.

2.2.3 Reporting Burden (Issue 15 in *Federal Register* notice)

Issue: "The NRC is seeking comment regarding the administrative reporting burden that the proposed rule provisions would create. Provide any comments as described in Section XIII, Paperwork Reduction Act Statement, of this notice."

Comments: One commenter stated that the reporting requirements associated with the drug and alcohol part of the rule are unnecessary for the NRC to regulate the industry or to protect human health and safety. However, the commenter supported the annual reporting requirements for the purpose of assessing the popularity of specific drug sets. Ultimately, however, the commenter supported the reporting requirements [Jim Davis, NEI].

NRC Response: The NRC considered the comment, but concluded that the reporting requirements associated with the drug and alcohol testing components of the rule are necessary to provide information from which the NRC can monitor the effectiveness of the drug and alcohol testing activities.

2.3 Proposed Fatigue Provisions

2.3.1 Rest Break Provisions (Issue 8a in *Federal Register* notice)

Issue: "Proposed Subpart I, Managing Fatigue, includes many requirements related to worker fatigue at nuclear power plants. The NRC is especially interested in comments on the following provision: Proposed § 26.199(d)(2)(ii) and (d)(2)(iii) would require licensees to provide individuals who are subject to the proposed work hour limits with at least one 24-hour rest break in any 7-day period and at least one 48-hour rest break in any 14-day period, except during the first 14 days of any outage, as well as certain other circumstances for security force personnel."

Impact on 8-hour Shifts

Comments: Several commenters expressed concern about the potential disruption in operations, such as the provision's potential impact on 8-hour shifts and consecutive working days, due to the rest breaks in § 26.199(d)(2)(ii) and (iii). They argued that these rest break provisions do not provide the necessary flexibility and that it would be impossible to build a proper 8-hour rotation without violating the regulations as written. Commenters argued that in response to the inflexible break requirements, licensees with 8-hour shift rotations will adopt 12-hour shift rotations [John Fee, SCE ; Anthony Rizzo Jr., Salem-Hope Creek; Michael Coyle, NEI #49; Todd Newkirk, IBEW; Richard Sweigart, DCS; Keith Jury, Exelon; Mark Wetterhahn, Winston Strawn; Edward Weinkam, NMC; Don Grissette, SNC; Keith D. Young, Ameren; Glenn Morris, TVA; Ronald Gaston, Detroit Edison; Gregory Halnon, FENOC; Jeffrey Archie, SCE&G; Brian McCabe, Progress Energy; A. Edward Scherer, SCE; D.R. Woodlan, STARS; J. A. Stall, FPL; B.T. McKinney, PPL; F.G. Burford, Entergy; Daniel Stenger, NRSG].

NRC Response: In response to this and related comments, the NRC has conducted further analysis of the proposed rule provisions and agrees that the proposed rest break provisions could have significantly disrupted current shift scheduling practices for 8-hour shifts. The NRC has modified the rest break provisions in the final rule to provide substantial additional flexibility. The requirements of the final rule allow licensees greater flexibility in the number of days between days off and whether the days off are provided consecutively or distributed. This flexibility enables licensees to more readily design schedules that meet operation demands while insuring an amount of time off comparable to that which would have been required by the proposed rule. Accordingly the final rule provides comparable assurance that cumulative fatigue from inadequate rest does not impair the ability of workers to safely and competently perform their duties. The revised break and day off provisions are in § 26.205(d)(2)-(5) of the final rule.

2.3.2 Waivers of Work Hour Controls (Issue 8b in *Federal Register* notice)

Issue: "Proposed Subpart I, Managing Fatigue, includes many requirements related to worker fatigue at nuclear power plants. The NRC is especially interested in comments on the following provision: Proposed § 26.199(d)(3) would permit licensees to waive individual work hour limits and rest break requirements only in circumstances in which it is necessary to mitigate or prevent a condition adverse to safety, or to maintain the security of the facility. Proposed § 26.197(e)(1) would require licensees to report the number of waivers granted in a year."

Waivers do not Effect Prior Hours Worked

Comments: One commenter at the September 21, 2005, public meeting disagreed with the provision, stating that waivers have no value when received after the extra hours have been worked, and they do not prevent the utilities from forcing workers to work above the limits [Anthony Rizzo Jr., Salem Hope Creek].

NRC Response: The NRC disagrees with the commenter's assertion that waivers have no value. It is not the NRC's intention that waivers be granted after the fact to account for any excess hours that have already been worked above the work hour limits. As stated in § 26.207(a)(1)(ii) of the final rule, a waiver can only be granted subsequent to a supervisor performing a fatigue assessment. A waiver may be granted only if it is necessary to mitigate or prevent a condition adverse to safety or to maintain the security of the facility and only to address circumstances that the licensee could not have reasonably controlled. In such cases, a fatigue assessment must be performed before the additional hours are worked in order to verify that there is reasonable assurance the individual will be able to safely and competently perform his or her duties during the additional work period for which the waiver may be granted. Therefore, the NRC retains the provisions for waiving work hour controls in § 26.207 of the final rule.

Flexibility of Waivers

Comments: Several commenters from industry argued that situations will arise where a waiver is appropriate for the situation even though safety is not challenged. According to the commenters, management should have the ability to grant waivers in these situations. [Michael Coyle, NEI #49; Richard Sweigart, DCS; Keith Jury, Exelon; Mark Wetterhahn, Winston Strawn; Edward Weinkam, NMC; Don Grissette, SNC; Keith D. Young, Ameren; Glenn Morris, TVA; Ronald Gaston, Detroit Edison; Gregory Halnon, FENOC; Jeffrey Archie, SCE&G; Brian McCabe, Progress Energy; A. Edward Scherer, SCE; D.R. Woodlan, STARS; J. A. Stall, FPL; B.T. McKinney, PPL; F.G. Burford, Entergy; Daniel Stenger, NRSG].

NRC Response: The NRC disagrees with the commenters' concern that granting a waiver is appropriate in situations where safety is not challenged. The potential for worker fatigue in conditions that would require a waiver is substantial. Therefore, the NRC cannot conclude that licensees can reasonably justify the performance of activities on systems, structures, or components (SSC's) that a risk-informed evaluation process has shown to be significant to public health and safety or the performance of functions that are essential for effective response to a fire, plant emergency, or implementation of the site security plan by individuals who have worked hours in excess of the work hour limits on the basis that granting the waiver would not have an adverse impact on safety or security. If the rule were changed for situations such as the example provided above it would be inconsistent with the NRC's goal of providing reasonable assurance that an individual will be able to safely and competently perform his or her duties, and would reduce the likelihood of fatigue-related errors, which could adversely affect public health and safety or the common defense and security. Therefore, the NRC has retained this provision as § 26.207(a)(1)(i) in the final rule.

Agreement with Waiver Provision

Comment: However, another commenter agreed with the NRC's expectations that waivers would only be granted "to address circumstances that the licensee could not have reasonably controlled." The commenter stated that the two circumstances where a waiver can be allowed as proposed in § 26.199(d)(3)(i)(A) – to mitigate or prevent a condition adverse to safety or to maintain the security of the facility – appear to be reasonable and appropriate. The commenter agreed that all use of waivers should be reported to and tracked by the NRC for analysis of unsafe or inappropriate patterns and should be made available to the public where deemed appropriate [Darrel Drobnich, NSF].

NRC Response: The final rule retains the criteria for authorizing a waiver that was specified in § 26.199(d)(3)(i)(A) of the proposed rule. These criteria are in § 26.207(a)(1) and (a)(2) of the final rule. The final rule also retains the requirement for an annual report summarizing the licensee's use of waivers from the work hour limits. The reporting requirement is in § 26.203(e) of the final rule.

2.3.3 48-hour/week Collective Work Hour Limits (Issue 8c in *Federal Register* notice)

Issue: "Proposed Subpart I, Managing Fatigue, includes many requirements related to worker fatigue at nuclear power plants. The NRC is especially interested in comments on the following provision: Proposed § 26.199(f) would prohibit job duty groups that are subject to work hour controls from working more than a maximum collective average of 48 hours per person per week, except during the first 8 weeks of any outage, as well as certain other circumstances for security force personnel."

Removal of Group Work Hour Limits

Comments: One commenter, supported by many commenters, suggested removing the group work hour limits completely for individuals other than security personnel because cumulative fatigue is adequately addressed through many other provisions (layers) built into the rule, such as: inherent alertness abilities that individuals must exhibit, supervisory overviews, individual work hour limits, and rest break provisions. [Michael Coyle, NEI #49; Richard Sweigart, DCS; Keith Jury, Exelon; Mark Wetterhahn, Winston Strawn; Edward Weinkam, NMC; Don Grissette, SNC; Keith D. Young, Ameren; Glenn Morris, TVA; Ronald Gaston, Detroit Edison; Gregory Halnon, FENOC; Jeffrey Archie, SCE&G; Brian McCabe, Progress Energy; A. Edward Scherer, SCE; D.R. Woodlan, STARS; J. A. Stall, FPL; B.T. McKinney, PPL; F.G. Burford, Entergy; Daniel Stenger, NRSG; Anthony Rizzo Jr., Salem Hope Creek; Joe Bauer, Exelon; Jim Davis, NEI].

NRC Response: The NRC disagrees with the commenters that the proposed rule adequately addressed cumulative fatigue through other provisions or layers built into the rule. However, the NRC simplified the rule by eliminating the 48-hour break requirement in the proposed § 26.199(d)(2)(iii) and the collective work hour limits in proposed § 26.199(f) and replaced them with requirements for minimum days off per week averaged over a shift in § 26.205(d)(3) and minimum days off in 15 day blocks in § 26.205(d)(4) of the final rule. This issue is further discussed in detail in Section 11.3.6 of this document. Therefore, the NRC has revised the rule and maintains provisions to address cumulative fatigue on an individual basis and will therefore

provide more uniform assurance of worker fatigue.

2.3.4 Alternate Work-Scheduling Examples (Issue 9 in *Federal Register* notice)

Issue: "As a means of determining the flexibility of the proposed rule work hour controls in § 26.199, the NRC is seeking public comment on work-scheduling examples that meet the requirements of the proposed rule and whether such schedules afford a reasonable degree of flexibility to licensee management."

Request for Prototype 8-hour Shift Schedule

Comment: One commenter requested that the NRC provide a prototype 8-hour rotation because industry could not resolve an alternative shift to fit all the provisions [Todd Newkirk, IBEW].

NRC Response: In response to this and related comments, the NRC conducted further analysis of the proposed rule provisions and agreed that the proposed rest break provisions could significantly disrupt current shift scheduling practices for 8-hour shifts. The NRC has modified the rest break provisions in the final rule to provide substantial additional flexibility in this regard, while providing comparable assurance that cumulative fatigue from inadequate rest does not impair the ability of workers to safely and competently perform their duties. The revised break and day off provisions are in § 26.205(d)(2)-(d)(5) of the final rule.

Example of Shift Based on 24-hour Basis

Comment: One commenter offered an alternative work-scheduling example in response to NRC's request for examples that meet the requirements of the work hour controls in § 26.199 and afford a reasonable degree of flexibility to licensee management. The commenter believed that all schedules and shift lengths need to be based firmly on a 24-hour basis. The commenter also specified additional limits for shift overlap (or turn-over), for currency training and administration, and for overtime. The commenter suggested requirements for the use of fixed (non-rotating) shifts, rapid rotation (no more than 3 contiguous work days on the same shift) or slow rotation (no fewer than 28 contiguous work and free days on the same shift), and, for 8- and 12-hour shifts [Darrel Drobnich, NSF].

NRC Response: The NRC agrees with the concepts provided by the commenter, however the NRC considers the comments to be examples of a good practices that licensees can implement consistent with the requirements of § 26.205(c) of the final rule. The NRC intends to consider the commenter's recommendations for incorporation in the implementation guidance for the final rule. Therefore, no additional changes to the final rule are warranted in response to this comment.

2.3.5 Outage Work Scheduling (Issue 10 in *Federal Register* notice)

Issue: "The NRC is seeking comment on the exclusions from certain work hour controls that would be allowed by proposed § 26.199(d)(2)(iii), (f)(1) and (f)(2) during maintenance and refueling outages, and how these exclusions could affect human error. The NRC is specifically interested in whether a more precisely defined rule scope with more limited outage exclusions

would better meet the stated objectives of the rule."

Definition of an Outage

Comment: One commenter suggested that the rule explicitly define an outage, and asked if "package walk-downs and package preps" are considered part of the outage. The commenter also argued that because outages are planned in advance and workers have a chance to prepare for them, it is unreasonable that workers should be expected to work extra hours during an outage [Todd Newkirk, IBEW].

NRC Response: The NRC agrees with the commenter suggesting that the term "outage" needs to be defined. For the purposes of Part 26, the final rule defines the term "unit outage" to mean that the reactor unit is disconnected from the electrical grid. In response to the commenter's question of whether "package walk-downs and package preps" are considered part of a unit outage, these activities would be considered part of an outage only if they are performed on a unit that is disconnected from the electrical grid.

Work Hour Exclusions During Outages

Comment: One commenter expressed confusion about the rationale for waiving group work hour controls for the first 8 weeks of outages. The commenter did not agree that employees should be encouraged to work more hours during times when significant maintenance and operational functions such as refueling, testing of systems, repair of failed components and structures, plant modifications and regulatory inspections are undertaken. Therefore, the commenter requested that the NRC reconsider all provisions that allow relaxed work hour controls during outages, especially during planned outages [Darrel Drobnich, NSF].

One commenter stated that intensely focused outage periods are a very effective means of assuring and improving overall safety. The commenter further explained that scientific evidence and plant experience show that "super crews" working six 12-hour shifts have been effective during outage periods up to ten weeks with increased plant safety and no increase in performance errors. The commenter also stated that the proposed rule would have impacted 15 percent of the plant outages in 2004, and it will directly impact outages that support major plant improvements in the future. Therefore, the commenter argued that the proposed rule does not need to be more restrictive than the former rule [David Ziebel, EPRI].

NRC Response: The NRC disagrees with the commenter that the NRC should reconsider all provisions that allow relaxed work hour controls during outages, especially during planned outages. Although it would be advantageous for fatigue management to level load all activities on systems, structures, and components (SSC's) that a risk informed process has shown to be significant to public health and safety or activities that are essential for effective response to a fire, plant emergency, or implementation of the site security plan, the nature of work in the nuclear industry requires that work often must be completed during an outage in order to ensure worker safety and public health and safety. The NRC recognizes that individuals are capable of working with limited rest without degraded performance for short periods of time. In addition, the NRC recognizes that plant outages are unique, relatively short-term, and involve levels of activity that are substantially higher than most non-outage operating periods. Therefore, the NRC considers it appropriate to allow flexibility within the work hour

requirements to accommodate limited periods of more intensive work schedules.

In developing the minimum day off requirements for the final rule, the NRC also considered scheduling practices during outages and determined it could not practically extend the same approach used in § 26.205(d)(3) of the final rule because those requirements are based on shift cycles which provide a defined period for implementing the average day off requirement. The length of outages and increased threat conditions are variable and therefore do not provide a consistent averaging period. The NRC further considered establishing the requirement as a minimum 3 days off in any 14-day period because that requirement would have been similar to the requirements it would have replaced. However, the NRC ultimately determined that 3 days off in 15 day periods provided licensees the flexibility of establishing a schedule comprising a repeating series of 4 work shifts followed by 1 day off. As a consequence, the rule allows licensees the option to establish a schedule that is predictable, a characteristic desired by schedulers and workers, and that both mitigates and prevents cumulative fatigue by including periodic rest breaks without an excessive number of consecutive 12-hour shifts. Working 72 hours per week for extended periods is inconsistent with the research cited with respect to § 26.205(d)(2)(i) and (d)(2)(ii), nor does the NRC believe it is consistent with providing reasonable assurance that individuals are fit to perform their duties. The minimum day off requirement of § 26.205(d)(4) provides an important protection against cumulative fatigue for individuals who work during unit outages, particularly those working extended periods.

The NRC also disagrees with the commenter that the final rule does not need to be more restrictive than the former rule with regards to a “super crew” working six consecutive 12-hour shifts for up to ten weeks. Although individuals are capable of working with limited rest without degraded performance for short periods of time, research has shown that the ability to sustain performance without adequate rest is clearly limited. Extending the outage exclusion period to prolong these conditions would substantively increase the potential for cumulative fatigue and fatigue-related personnel errors.

Therefore, the NRC retains requirements in the final rule which allow for a relaxation from work hour controls for the first 60 days of an outage.

Increase Work Hour Exclusion During Outages to 10 Weeks

Comments: One commenter, supported by many commenters, argued that the outage exclusion should be increased from 8 weeks to 10 weeks. According to the commenter, this change will provide adequate time to complete extended outages involving major equipment replacements. The commenter also claimed that its analysis of human performance data also supports this recommendation because in each outage evaluated, there was a downward trend in human performance errors as the outage progressed [Michael Coyle, NEI #49; Richard Sweigart, DCS; Keith Jury, Exelon; Mark Wetterhahn, Winston Strawn; Edward Weinkam, NMC; Don Grissette, SNC; Keith D. Young, Ameren; Glenn Morris, TVA; Ronald Gaston, Detroit Edison; Gregory Halnon, FENOC; Jeffrey Archie, SCE&G; Brian McCabe, Progress Energy; A. Edward Scherer, SCE; D.R. Woodlan, STARS; J. A. Stall, FPL; B.T. McKinney, PPL; F.G. Burford, Entergy; Daniel Stenger, NRSG].

NRC Response: The NRC disagrees with the commenter suggesting an increase from 8 weeks to 10 weeks for the plant outage exclusion from work hour controls in § 26.199(f). In

reviewing the frequency of outages, by duration, the NRC found that it would be necessary to increase the exclusion period substantially to address a marginal number of additional outages of longer lengths. This increase in the exclusion period would substantially increase the period of time that individuals would be working extended work hours with reduced recovery time. During the exclusion period, individuals are permitted to work up to 72 hours in a 7-day period and are assured of just 3 days off in each 15-day period. Individuals who work 12-hour shifts, which is common during outages, will average up to 67.2 hours per week, a rate of 160 percent of their normally scheduled hours with less than half of their normally scheduled days off for recovery, for a period of up to 2 months. Extending the outage exclusion period to prolong these conditions would substantively increase the potential for cumulative fatigue and fatigue-related personnel errors.

The NRC also disagrees with the conclusion that the commenters' analysis of human performance data supports the recommendation to increase the outage exclusion to 10 weeks because in each outage evaluated there was a downward trend in human performance errors as the outage progressed. The conclusions from that study were subjective and based on visual inspections of graphs of condition reports (CRs) compiled during the outage. The number of CRs were in at least one case actually higher in week 13 compared to week 1. Therefore, the conclusions of the report do not withstand a rigorous analysis and are not evidence that the proposed rule should revised.

However, the NRC has included a provision in the final rule (§ 26.205(d)(6)) that permits licensees to extend the outage exception period by 7 days for each 7-day period during the outage an individual works not more than 48 hours. This provision accommodates longer outages when it is justified by the work history of the individual containing adequate recovery periods. Therefore, the NRC has responded to the commenters' concern in a manner that should not increase cumulative fatigue.

2.3.6 Alternatives for Addressing Cumulative Fatigue (Issue 11 in *Federal Register* notice)

Issue: "The NRC is seeking public comment on alternatives to the group work hour controls that could also address cumulative fatigue, such as individual work hour limits based on a longer term (e.g., monthly or quarterly)."

Comments: Several commenters from industry expressed opposition to long-term individual work hour limits to address cumulative fatigue as an alternative to the group work hour controls. They stated that these limits represent an unnecessary and indefensible layer of regulatory requirements [Michael Coyle, NEI #49; Richard Sweigart, DCS; Keith Jury, Exelon; Mark Wetterhahn, Winston Strawn; Edward Weinkam, NMC; Don Grissette, SNC; Keith D. Young, Ameren; Glenn Morris, TVA; Ronald Gaston, Detroit Edison; Gregory Halnon, FENOC; Jeffrey Archie, SCE&G; Brian McCabe, Progress Energy; A. Edward Scherer, SCE; D.R. Woodlan, STARS; J. A. Stall, FPL; B.T. McKinney, PPL; F.G. Burford, Entergy; Daniel Stenger, NRSG].

NRC Response: The NRC disagrees with the commenters that requirements to address cumulative fatigue are unnecessary or indefensible, as discussed in the NRC's response to comments on "Collective Work Hour Limits" in Section 11.3.6 of this document. However, the NRC agrees with these commenters' opposition to the use of long-term individual work controls to address cumulative fatigue as an alternative to the group work hour controls (i.e., collective

work hour limits) of the proposed rule. Accordingly, the NRC did not replace the collective work hour limits with long term individual limits. Rather, the NRC eliminated the collective work hour limits and the requirement for a minimum 48-hour break in any 14-day period and addressed cumulative fatigue in the final rule through requirements for a minimum number of days off per week, averaged over a shift cycle, in § 26.205(d)(3), and minimum days off in 15 day blocks, in § 26.205(d)(4) and (d)(5).

2.3.7 Defining Job Duty Groups (Issue 12 in *Federal Register* notice)

Issue: "Proposed § 26.199(a) would require any individual who performs duties within specified job duty groups to be subject to the work hour control provisions in § 26.199. Other individuals, beyond those specified within the scope of § 26.199(a), might substantially impact the outcome of risk-significant work, such as certain engineers (e.g., Shift Technical Advisors). The NRC requests comment on the inclusion of other individuals in the scope of § 26.199(a). The NRC is also seeking comments on an alternative approach for identifying the specific job functions that would be subject to these requirements. Specifically, the NRC is interested in whether, as an alternative, the scope should instead be structured to define attributes of the job functions (e.g., time-critical nature of decisions needed to ensure public health and safety, operational control of risk-important equipment) that would fall within the scope of the proposed work hour control provisions in §26.199. Under such an alternative, the licensee would then be required to identify the specific job functions that fit the defined attributes."

Scope is Appropriate

Comment: One commenter stated that there is not necessarily a need to broaden the scope of individuals subject to work hour controsl; the groups that are already defined are the critical groups [Dana Millar, Entergy].

NRC Response: The NRC agrees with the commenter that the scope is appropriate. The scope includes those job functions that the NRC considers to have the most potential for fatigue to degrade the protection of public health and safety and common defense and security. Although broader application of the work hour limits to other job functions could provide additional safety and security benefits, it is not clear that the additional benefit that could be achieved would justify the substantial cost of broader application of the work hour limits.

Definition of "Directing"

Comments: Several commenters from industry suggested that the NRC clearly define what is meant by the term "directing" in § 26.199(a). The commenters expressed concern that this phrase, along with the definition of "directing" in § 26.5 will subject engineering personnel to work-hour controls, thus increasing the recordkeeping burden on industry [Michael Coyle, NEI #49; Richard Sweigart, DCS; Keith Jury, Exelon; Mark Wetterhahn, Winston Strawn; Edward Weinkam, NMC; Don Grissette, SNC; Keith D. Young, Ameren; Glenn Morris, TVA; Ronald Gaston, Detroit Edison; Gregory Halnon, FENOC; Jeffrey Archie, SCE&G; Brian McCabe, Progress Energy; A. Edward Scherer, SCE; D.R. Woodlan, STARS; J. A. Stall, FPL; B.T. McKinney, PPL; F.G. Burford, Entergy; Daniel Stenger, NRSG].

NRC Response: The NRC agrees with the commenters that NRC should clarify the definition

of the term “directing.” Individuals who are responsible for the correct performance of activities on SSCs that a risk-informed process has shown to be significant to public health and safety or functions that are essential for an effective response to a fire, plant emergency, or implementation of the site security plan should be subject to work hour controls, including engineering and technical support personnel.

The revised definition of “directing” is presented in § 26.5 of the final rule. The revised definition clarifies NRC’s expectations that a limited scope of personnel providing technical input would be subject to the requirements of § 26.205. The definition explicitly states the criteria that the term directing refers to an individual who is directly involved “in the execution of the work activity, or is ultimately responsible for the correct performance of that work activity” as opposed to, for example, the planning, development or scheduling of the activity, and that the technical input does not receive “subsequent technical review.” The revised definition more clearly focuses on activities that have the potential to substantively and immediately effect safety.

The definition of "directing" in § 26.5 also applies to the MRO's oversight of MRO staff. In the case of an MRO's direction of MRO staff, the NRC contends that this oversight is necessary because the MRO's direction has the potential to substantively and immediately affect the integrity of the FFD program.

Limit Group Hours to Security Personnel

Comments: Several commenters from industry agreed that armed security officers, anyone carrying a weapon, armed responders, watch persons, and central alarm station (CAS) and secondary alarm stations (SAS) operators should be included in the critical group subject to these provisions [Michael Coyle, NEI #49; Richard Sweigart, DCS; Keith Jury, Exelon; Mark Wetterhahn, Winston Strawn; Edward Weinkam, NMC; Don Grissette, SNC; Keith D. Young, Ameren; Glenn Morris, TVA; Ronald Gaston, Detroit Edison; Gregory Halnon, FENOC; Jeffrey Archie, SCE&G; Brian McCabe, Progress Energy; A. Edward Scherer, SCE; D.R. Woodlan, STARS; J. A. Stall, FPL; B.T. McKinney, PPL; F.G. Burford, Entergy; Daniel Stenger, NRSG]

NRC Response: In response to the comments stating concerns regarding the burden and potential effectiveness of the group work hour controls (i.e., collective work-hour limits) , discussed in Section 11.3.6 of this document, the NRC has replaced the collective work hour limits with individual work hour controls that are applicable to individuals including those security personnel described by the commenters.

Specify Job Functions Instead of Job Duty Groups

Comments: Commenters also suggested that the NRC develop a clear set of job functions which would warrant the added work hour restrictions. They argued that such performance-based criteria would help industry in deciding which individuals must be subjected to work hour restrictions [Michael Coyle, NEI #49; Richard Sweigart, DCS; Keith Jury, Exelon; Mark Wetterhahn, Winston Strawn; Edward Weinkam, NMC; Don Grissette, SNC; Keith D. Young, Ameren; Glenn Morris, TVA; Ronald Gaston, Detroit Edison; Gregory Halnon, FENOC; Jeffrey Archie, SCE&G; Brian McCabe, Progress Energy; A. Edward Scherer, SCE; D.R. Woodlan, STARS; J. A. Stall, FPL; B.T. McKinney, PPL; F.G. Burford, Entergy; Daniel Stenger,

NRSG].

NRC Response: The NRC agrees with the commenters that performance-based criteria for the scope of individuals subject to the work hour controls is an appropriate objective and has attempted to establish the requirements accordingly. In this regard the NRC notes that the NRC did not define the scope of individuals subject to the work hour limits in terms of job titles but rather in terms of functions important to the protection of public health and safety and the common defense and security. As an example, the work hour controls do not apply to all operators or maintenance personnel, but rather only to those who operate or maintain systems, structures, or components that a risk-informed evaluation process has shown to be significant to public health and safety. Although the NRC acknowledges that the scope could be defined using more elemental criteria, the NRC notes that the commenters further stated "based on the years of discussions involved in the development of the proposed rule, there appears to be little chance of achieving agreement on this type of performance-based criteria" (Mike Coyle, NEI, #49). Defining the scope in terms of more elemental performance-based criteria presents substantive challenges and may not markedly improve the effectiveness of the rule and may in fact contribute to additional challenges to clear and consistent interpretation of the scope of individuals subject to the work hour controls. Accordingly the final rule retains the approach developed with substantive stakeholder interaction for defining the scope of individuals subject to the work hour controls.

Maintenance Personnel

Comment: One commenter at the September 21, 2005, public meeting stated that industry is struggling with identifying and categorizing maintenance personnel. Industry found that some maintenance organizations are a single multi-tasked organization and others are cross-functional organizations that perform both safety and non-safety related tasks. Therefore, industry finds it difficult to identify a maintenance individual as either safety or non-safety personnel and accordingly categorize them into job duty groups [Jim Davis, NEI].

NRC Response: The NRC agrees that categorizing maintenance personnel could be difficult. The NRC has decided that maintenance personnel are subject to work hour requirements if they are maintaining, or providing onsite direction of maintenance of systems, structures, and components that a risk informed evaluation process has shown to be significant to public health and safety regardless of the organizational structure of the maintenance personnel.

Supplemental Workers

Comment: One commenter stated that transient workers should be included under individual work hour controls, but it would be impractical to include such workers in collective work hour controls [Darrel Drobnich, NSF].

NRC Response: The NRC agrees with this commenter and notes that the final rule does not retain requirements for collective work hour limits. All work hour limits of the final rule are applicable on an individual basis, including § 26.205(d)(4) of the final rule. This requirement ensures that individuals, including transient workers, receive a minimum of 3 days off in each consecutive 15-day period of a unit outage. The minimum day-off requirement of § 26.205(d)(4) will support the final rule's objective of reasonable assurance that transient

workers who perform activities on SSCs that a risk-informed process has shown to be significant to public health and safety or functions that are essential for effective response to a fire, plant emergency, or implementation of the site security plan are not impaired from cumulative fatigue.

Information Sharing

Comment: One commenter agreed with the NRC's proposal as outlined in Subpart C to require licensees and other entities to collect and share greater amounts of information than under the former rule, subject to the protections of individuals' privacy specified in proposed § 26.37. The commenter argued that facilities should be required to share information on the work hours of transient workers at any facility to ensure they that do not exceed the individual work hour control limits [Darrel Drobnich, NSF].

NRC Response: The NRC disagrees with the commenter that licensees should be required to share information on the work hours of transient workers. Although sharing of work hour information among licensees would provide licensees more complete information concerning the work hours of transient workers, such information would not include the hours that these individuals may work for other employers outside of the nuclear power industry. As a result, the accuracy of the information with respect to an individual's total work hours would be substantially diminished and the administrative burden and associated costs would be substantial. As a result, the NRC does not the believe that the potential benefit for management of worker fatigue of sharing this information justifies the significant costs that would be incurred by licensees.

3. Subpart A: Administrative Provisions

3.1 Purpose (§ 26.1)

No comments addressed this section.

3.2 Scope (§ 26.3)

Clarification of § 26.3

Comments: Many commenters addressed the scope of the proposed rule. The majority of these comments focused on § 26.3 and the lack of clarity therein. One commenter at the September 21, 2005, public meeting stated that proposed § 26.3 sufficiently defined the scope until § 26.3(e), which addressed requirements for entities performing construction activities, after which the rule describes program elements and requirements. Industry expressed confusion resolving the requirements here (such as in (e)(1)), "comply with § 26.23, 41 and 189") with the performance objectives described elsewhere in the proposed rule. The commenter also mentioned that industry had difficulty navigating to 10 CFR 52.103 and 50.10(e)(3) and several of the other references mentioned in the language of § 26.3(e) [Jim Davis, NEI].

NRC Response: The NRC agrees with the commenters that the rule language in proposed § 26.3 was unclear about the requirements in Part 26 that apply to each licensee and entity who

is subject to the rule. Therefore, the NRC has reorganized and clarified the provisions in § 26.3 of the final rule and added a description of the licensees and other entities to whom particular sections and subparts of the rule apply (e.g., §§ 26.73 and 26.709).

FFD for Construction

Comments: Several commenters from industry argued that proposed § 26.3(e) was not appropriately written for new plant construction sites [Jim Davis, NEI #48; Tom Houten, NEI; Peter Fowler, Duke Energy; Richard Sweigart, DCS; Keith Jury, Exelon; Mark Wetterhahn, Winston Strawn; Edward Weinkam, NMC; Don Grissette, SNC; Keith D. Young, Ameren; Glenn Morris, TVA; Ronald Gaston, Detroit Edison; Gregory Halnon, FENOC; Jeffrey Archie, SCE&G; Brian McCabe, Progress Energy; C.L. Funderburk, Dominion; F.G. Burford, Entergy].

The commenters stated that it was unclear what type of FFD program the NRC expect for new plant construction sites. The commenters argued that, by referring to specific sections of the rule which must be met by complying with other sections of the rule, the NRC seemingly applied the entire rule to new construction sites. The commenters stated that it would be difficult for industry to ensure compliance with the referenced sections of the rule without applying the entire rule.

They argued that new plant construction sites should be treated in the same manner as other major, non-nuclear construction sites, which have industrial drug and alcohol programs. The commenters argued that, until fuel arrives on site, there is no reason for public health and safety requirements additional to those applied to large commercial construction facilities [Jim Davis, NEI #48; Richard Sweigart, DCS; Keith Jury, Exelon; Mark Wetterhahn, Winston Strawn; Edward Weinkam, NMC; Don Grissette, SNC; Keith D. Young, Ameren; Glenn Morris, TVA; Ronald Gaston, Detroit Edison; Gregory Halnon, FENOC; Jeffrey Archie, SCE&G; Brian McCabe, Progress Energy; C.L. Funderburk, Dominion; F.G. Burford, Entergy].

They also argued that referring to proposed § 26.23, which required FFD programs to meet the performance objectives of that section, for construction sites was inappropriate because it conflicted with proposed § 26.25. The commenters explained that proposed § 26.25 applied to individuals who have unescorted access to nuclear power plant protected areas, but during the construction phase there will be not yet be any protected areas as cited in proposed § 26.3(e).

Commenters also stated that the application of proposed § 23.23(e) regarding fatigue and degraded alertness was also inconsistent with proposed § 26.195, which applied requirements for managing fatigue only to licensees and other entities identified in proposed § 26.3(a) and (d) but not to (e), the construction phase. [Tom Houten, NEI; Peter Fowler, Duke Energy; Jim Davis NEI #48; Richard Sweigart, DCS; Keith Jury, Exelon; Mark Wetterhahn, Winston Strawn; Edward Weinkam, NMC; Don Grissette, SNC; Keith D. Young, Ameren; Glenn Morris, TVA; Ronald Gaston, Detroit Edison; Gregory Halnon, FENOC; Jeffrey Archie, SCE&G; Brian McCabe, Progress Energy; C.L. Funderburk, Dominion; F.G. Burford, Entergy].

They also stated that proposed § 26.41 [Audits and corrective action] and § 26.189 [Determination of fitness] required administrative actions beyond those necessary for a commercial construction site at which there are no protected areas and no nuclear fuel [Jim Davis, NEI #48; Richard Sweigart, DCS; Keith Jury, Exelon; Mark Wetterhahn, Winston Strawn;

Edward Weinkam, NMC; Don Grissette, SNC; Keith D. Young, Ameren; Glenn Morris, TVA; Ronald Gaston, Detroit Edison; Gregory Halnon, FENOC; Jeffrey Archie, SCE&G; Brian McCabe, Progress Energy; C.L. Funderburk, Dominion; F.G. Burford, Entergy].

To implement these comments, one industry commenter, supported by many other industry commenters, suggested that reference to proposed §§ 26.23, 26.41 and 26.189 in proposed § 26.3(e)(1) should be eliminated, and instead that § 26.3(e) should state: "1) establish a drug-and-alcohol-free workplace policy, including sanctions to be imposed, 2) implement a pre-employment drug and alcohol testing program and a for-cause testing program, and 3) make provisions for the objective and impartial review of sanctions decisions, protection of information and recordkeeping" [Jim Davis, NEI #48; Richard Sweigart, DCS; Keith Jury, Exelon; Mark Wetterhahn, Winston Strawn; Edward Weinkam, NMC; Don Grissette, SNC; Keith D. Young, Ameren; Glenn Morris, TVA; Ronald Gaston, Detroit Edison; Gregory Halnon, FENOC; Jeffrey Archie, SCE&G; Brian McCabe, Progress Energy; C.L. Funderburk, Dominion; F.G. Burford, Entergy].

NRC Response: In response to these comments and industry efforts to develop guidance on the subject, the NRC has added Subpart K [FFD Programs for Construction] to the final rule to clarify § 26.3(e) of the proposed rule, which contained requirements for combined license holders, combined license applicants, construction permit holders, construction permit applicants, as well as manufacturing license holders under Part 52. Subpart K's FFD program is intended to provide reasonable assurance that individuals involved in the construction of a nuclear power plant who perform specified duties at the site are fit for duty, trustworthy, and reliable, commensurate with the potential risks to public health and safety and the common defense and security that their activities and access to certain information would pose.

Results of NRC benchmarking activities indicated that, as a result of the higher incidence of substance problems among construction workers than other occupational groups, pre-employment, for-cause, and post-accident drug and alcohol testing are increasingly common at large, commercial construction projects and some labor union coalitions have implemented drug and alcohol testing and substance abuse treatment-referral programs for their members. In addition, the staff also identified several private-sector entities in the petrochemical and steel manufacturing industries that require drug and alcohol testing, including random testing, for construction workers on large projects, as well as employment history evaluations and other background checks. Where safety and/or security during construction are critical, large construction projects initiated by some Federal agencies (e.g., the Department of Energy) require drug and alcohol testing, including random testing, extensive background checks, and continuous behavioral observation for the most sensitive construction tasks. The NRC concluded that (1) implementing FFD requirements for new nuclear power plant construction activities is consistent with the practices of other industries, and (2) taking a graded approach to FFD requirements, by imposing requirements that are commensurate with the potential risks to public health and safety and the common defense and security that the results of construction activities may pose when a plant begins operations, is consistent with the approach implemented by other government agencies when constructing facilities that have the potential to affect public health and safety or the common defense and security.

The NRC also determined that some of the requirements in proposed § 26.3(e) would be difficult to implement. For example, much of the nuclear power plant construction workforce will

likely be transient and rapidly changing. As a result, it may be challenging to conduct random drug and alcohol testing in a manner that would meet all of the random testing requirements Part 26 includes for operating plants. In addition, some new reactors will be constructed near an operating plant that has readily accessible FFD program resources, such as a specimen collection and alcohol testing site, a licensee testing facility, an FFD training program, and expert staff (e.g., a substance abuse expert, MRO, or EAP representative). However, other new reactors may be constructed at locations that are distant from the FFD program resources of an operating plant. Therefore, the NRC concluded that applying some of the requirements in the proposed rule would be overly burdensome, such as requiring random testing of all construction workers, the requirement for all nuclear power plant construction workers to have access to an employee assistance program, and the proposed requirement for a determination of fitness process performed by a substance abuse expert under § 26.189 of the final rule.

To streamline administration of the FFD program for construction, add flexibility, and implement an approach that is commensurate with the potential risks resulting from new plant construction, the final rule requires two different levels of FFD requirements for workers in different job roles. Because of their important oversight responsibilities, the first category of workers includes quality assurance/quality control personnel, personnel who certify that inspections, tests, and analyses have met acceptance criteria (ITAACs), individuals who serve as security officers under NRC requirements, and any persons who are designated by the FFD program to perform fitness monitoring. These individuals must be subject to a full FFD program that meets the same requirements as FFD programs for operating plants (including random drug and alcohol testing at the 50 percent annual rate, behavioral observation training, and a suitable inquiry/employment history check) when they are performing duties at the location where the nuclear power plant is being constructed and will operate.

In contrast, the FFD program in Subpart K applies only to persons who will construct, at the location where the nuclear power plant will be constructed and operated, safety- and security-related structures, systems, and components (SSCs) that are required to be described in the COL/CP applicant's or permit holder's site safety analysis report, preliminary or final safety analysis report, or physical security or safeguards contingency plans (under Part 73). These workers' tasks include fabricating, erecting, integrating, and testing safety- and security-related SSCs and installing their foundations, including the placement of concrete. At a minimum, these individuals must be subject to an FFD program that meets the requirements of Subpart K, which emphasizes performance objectives and does not incorporate all of the requirements of Part 26, unless the licensee or other entity chooses to subject them to an FFD program that meets the Part 26 requirements for operating plants, except the fatigue management requirements in Subpart I of the final rule.

If a licensee or other entity specified in § 26.3(c) of the final rule chooses to implement an FFD program for construction under Subpart K, the entity must submit to the NRC for review and approval an FFD program plan, including a written FFD policy that will be given to all individuals covered by the program and FFD procedures. The program must include pre-assignment, for-cause, and post-accident drug and alcohol testing. Subpart K requires an FFD program for construction to include sanctions for FFD policy violations, a system of files and procedures to protect personal information, and procedures for reviewing determinations that an individual has violated the FFD policy. The entity who elects to implement a program under Subpart K must conduct periodic audits, maintain records, provide reports to the NRC, and develop and apply procedures for suitability and fitness evaluations to determine whether to assign individuals to

constructing safety- and security-related SSCs.

To detect and deter substance abuse by individuals who are constructing safety- and security-related SSCs, Subpart K of the final rule permits applicants for and holders of a COL or CP to subject these individuals either to random testing for drugs and alcohol or a fitness monitoring program. Subpart K also permits FFD programs for construction to—

(1) Collect specimens other than urine for drug testing and/or rely on collection sites at local hospitals or clinics that conduct testing under U.S. DOT procedures, rather than those specified in Subpart E, "Collecting Specimens for Testing," of Part 26;
(2) Rely on healthcare professionals other than a substance abuse expert to evaluate an individual's fitness;
(3) Designate the persons who will perform fitness monitoring, if the entity elects this option, and adjust the number of fitness monitors performing monitoring and the frequency of monitoring to accommodate the stage of construction and local conditions; and
(4) Establish the random testing rate and limit the selection of individuals for testing to only those who are present and constructing safety- or security-related SSCs on a given day, if the entity elects this option.

There are four primary reasons for imposing regulatory requirements for FFD programs during construction: (1) the quality of work could be adversely affected by construction workers who are impaired by substance abuse where studies indicate that members of this group have the highest rates of substance abuse problems among occupational groups in the U.S. (e.g., Substance Abuse and Mental Health Services Administration of the U.S. Department of Health and Human Services' National Household Survey on Drug Abuse (NHSDA) covering the years 2000-2001), (2) individuals who have become addicted to illegal drugs are susceptible to coercion and will interact with others involved in the drug trade, (3) past experience has demonstrated that errors during construction can adversely affect subsequent plant operations (NUREG/CR-6819, Vols. 1-4, "Common-Cause Failure Event Insights," (May 2003) and NUREG-1837, "Regulatory Effectiveness Assessment of Generic Issue 43 and Generic Letter 88-14," (October, 2005)), and (4) quality assurance by design uses a sampling process. The NRC believes that, despite having a high degree of confidence in the effectiveness of quality assurance/quality control programs (required under 10 CFR Part 50) and the inspections, tests, analyses, and acceptance criteria (ITAAC) programs (required under 10 CFR Part 52) to detect construction errors, it is prudent to require an FFD program during construction to provide reasonable assurance that impaired construction workers do not introduce faults in safety- or security-related SSCs that may cause the SSCs to fail when the plant is operational. In addition, the NRC is concerned that some construction personnel who have substance abuse problems will have access to sensitive information that could be useful to an adversary, as well as physical access to safety- and security-related SSCs that may provide opportunities for malicious acts.

The NRC acknowledges, in part, that the full defense-in-depth approach of the FFD program for operating plants is not appropriate for all construction workers because many construction activities do not have the potential to impact subsequent plant operations, and, before fuel arrives on site, do not impose immediate radiological risks. Therefore, the rule's requirements for construction require a full FFD program for only a limited number of personnel who have critical oversight responsibilities for verifying that safety- and security-related SSCs are constructed properly. For workers who will construct the safety- and security-related SSCs, the FFD program requirements in Subpart K are less stringent. For example, Subpart K does not

require a suitable inquiry/employment history check for these workers. In addition, the staff acknowledged the many complex logistical challenges associated with implementing FFD requirements during construction. Therefore, the Subpart K requirements provide applicants for and holders of COLs and CPs greater flexibility in implementing FFD programs for construction than the rule permits for FFD programs at operating plants.

The NRC believes that the requirements for FFD programs for construction in Subpart K of the final rule (1) provide reasonable assurance that individuals who are responsible for constructing and assuring the quality of safety- and security-related SSCs are fit for duty, trustworthy, and reliable, commensurate with the potential risk to public health and safety and the common defense and security, (2) permit licensees and other entities the flexibility to implement programs that are appropriate for local circumstances and the challenges created by a large and transient workforce, and (3) ensure that the privacy and other rights (including due process) of individuals who are subject to the requirements will be protected.

FFD Intent for Fuel Fabrication Facilities

Comment: One commenter asserted that under proposed § 26.3 and § 26.195, Subpart I does not apply to fuel fabrication facilities, which is justified due to the lower level of risk at such facilities. The commenter argued that until the NRC authorizes the possession and use of strategic special nuclear material (SSNM) onsite, there is no reason that FFD requirements should be more stringent than those typically applied in non-nuclear large commercial construction facilities [Richard Sweigart, DCS].

NRC Response: The NRC agrees with the commenter that fuel fabrication facilities will not be subject to the requirements in Subpart I. The final rule in § 26.201(a) states that the requirements in Subpart I only apply to licensees and other entities identified in § 26.3(a), and, if applicable, § 26.3(d). These provisions do not identify fuel fabrication facilities.

Correlation with Part 52

Comments: Two commenters at the public meeting noted that there are discrepancies between the proposed rule language and the draft language for Part 52. The commenters suggested that there be coordination between those efforts [Tom Houten, NEI; Peter Fowler, Duke Energy].

NRC Response: The NRC agrees with the commenters and is coordinating the Part 26 and Part 52 rulemakings.

Exception for Long-term Shutdowns

Comment: One commenter stated that the proposed rule contained no provisions for exceptions to the requirements of Subpart I for plants in long-term shutdown status. The commenter stated that there is no reasonable or cost-effective method to comply with the proposed requirements due to the number of personnel being utilized. The commenter suggested that the NRC add subparagraph (g) that states: “Subpart I of this regulation does not apply to plants in long-term shutdown status when fuel has been removed from the reactor vessel and NRC approval is required prior to loading fuel. At the time approval to load fuel is

received, the licensee will be in compliance with all applicable portions of § 26.3 prior to commencement of loading fuel into the reactor vessel." To accompany this change, the commenter suggested that the following phrase be added to § 26.195: "Exceptions are identified in Section 26.3(g)" [Glenn Morris, TVA].

NRC Response: The NRC does not agree with the recommendation to revise the rule text to include a specific exception for plants in long-term shutdown. The NRC notes that § 26.9 of the final rule allows parties to seek exemptions from Part 26 and considers this provision to be a more appropriate means for addressing such infrequent and unique circumstances.

3.3 Definitions (§ 26.5)

"Non-Negative" vs. "Positive"

Comments: Several commenters requested clarification on whether the terms "non-negative" and "positive" had the same meaning in the proposed rule. They suggested use of a consistent term, if usage is interchangeable. One commenter, supported by other commenters, suggested that if these terms were synonymous in the proposed rule, then industry preferred the term "positive." If the NRC did not intend these terms to be synonymous, then the commenter suggested that the NRC give a definition for "positive" as "1) the same as the HHS definition or 2) the result of a confirmatory test that has established the presence of adulterants, drugs, drug metabolites, or alcohol in a specimen at or above cut-off level and that has been deemed positive by the MRO after evaluation." The text of the comment provided many examples of the alleged confusing use of "positive" [Jim Davis, NEI #48; Richard Sweigart, DCS; Keith Jury, Exelon; Mark Wetterhahn, Winston Strawn; Edward Weinkam, NMC; Don Grissette, SNC; Keith D. Young, Ameren; Glenn Morris, TVA; Ronald Gaston, Detroit Edison; Gregory Halnon, FENOC; Jeffrey Archie, SCE&G; Brian McCabe, Progress Energy; C.L. Funderburk, Dominion; F.G. Burford, Entergy].

NRC Response: The NRC agrees with the commenters that the terms "non-negative" and "positive" in the proposed rule needed clarification. Therefore, the NRC has deleted "non-negative" from the final rule and replaced it with the more specific terminology of "positive, adulterated, dilute, substituted, or invalid." The final rule uses the term "positive" to refer to results from drug and alcohol testing indicating the presence of drugs or drug metabolites in a urine specimen or alcohol in a specimen of breath or oral fluids, and the terms "adulterated, dilute, substituted, or invalid" as appropriate to refer to results of validity tests of urine specimens indicating that the specimen may not be normal human urine.

"Validity Screening"

Comments: Several commenters requested that the definition of validity screening allow for the use of instrumented devices, in addition to non-instrumented devices [Jim Davis, NEI #48; Brian McCabe, Progress Energy; Richard Sweigart, DCS; Keith Jury, Exelon; Mark Wetterhahn, Winston Strawn; Edward Weinkam, NMC; Don Grissette, SNC; Keith D. Young, Ameren; Glenn Morris, TVA; Ronald Gaston, Detroit Edison; Gregory Halnon, FENOC; Jeffrey Archie, SCE&G; Brian McCabe, Progress Energy; C.L. Funderburk, Dominion; F.G. Burford, Entergy].

NRC Response: The comments relating to the use of instrumented devices for validity

screening are addressed below in Section 8.9.2 regarding § 26.137(b) of the final rule.

"Directing"

Comments: Several commenters stated that the proposed rule package discussion significantly expanded who would be included in the area of directing, and industry expressed concern with the lack of clarity of "directing" in the operations and maintenance functional groups. The commenters stated that, for operations, this term is understood to mean individuals with direct authority, such as the Senior Reactor Operator directing the activity of the Reactor Operator.

In the maintenance functional group, the commenters said the NRC staff stated that it was the individual who was at the job site providing direct supervision of the job, had the ability to detect errors and was ultimately responsible for the successful completion of the job. Although the commenters agreed that the group should include management personnel routinely assigned to a shift, they claimed the proposed addition of other individuals who provide periodic support, such as a special outage manager, is unwarranted. They stated that the licensed operator is directly responsible for the safe operation of the plant. The commenters stated that, in the maintenance area, the application of the term "directing" to engineering personnel who provide technical advice is of particular concern.

The commenters argued that the criteria for these two groups should be well-defined and that the term "directing" adds a significant degree of uncertainty as to who should be included in each applicable functional group. The commenters stated that without better definition of expectations in this area, there will be additional disagreement regarding implementation requirements.

The commenters also mentioned that a potential unintended consequence is the distancing of engineering staff from the maintenance and operations staff. Specifically, whenever possible, licensees will define an engineer as an advisor, not a director, of the operations or maintenance groups. In some cases an engineer may not go into the field to give technical advice or participate in troubleshooting for fear that someone will decide he or she is part of a functional group and thus subject to work hour controls. [Michael Coyle, NEI #49; Richard Sweigart, DCS; Keith Jury, Exelon; Mark Wetterhahn, Winston Strawn; Edward Weinkam, NMC; Don Grissette, SNC; Keith D. Young, Ameren; Glenn Morris, TVA; Ronald Gaston, Detroit Edison; Gregory Halnon, FENOC; Jeffrey Archie, SCE&G; Brian McCabe, Progress Energy; A. Edward Scherer, SCE; D.R. Woodlan, STARS; J. A. Stall, FPL; B.T. McKinney, PPL; F.G. Burford, Entergy; Daniel Stenger, NRSG].

NRC Response: The NRC agrees that the proposed definition of "directing" was unclear as used in Subpart I and the scope of personnel who must be subject to work hour controls. Therefore, the NRC has modified the definition in the final rule. The revised definition clarifies the NRC's expectations that a limited scope of personnel providing technical input is subject to the requirements of § 26.205 [Work hours]. The definition explicitly states that the term "directing" refers to an individual who is directly involved "in the execution of the work activity, or is ultimately responsible for the correct performance of that work activity" as opposed to, for example, the planning, development or scheduling of the activity, and that the technical input does not receive "subsequent technical review." The NRC believes that the revised definition

more clearly focuses on activities that have the potential to substantively and immediately affect safety.

In response to the comment that a licensee may define an engineer as an advisor, the NRC notes that the work hour controls are applicable to individuals who perform the functions specified in § 26.4(a)(1) through (a)(5), regardless of their position title.

In response to the comment that individuals may not go out into the field to provide technical advice, the NRC notes that work hour limits apply to individuals providing "on-site" direction of the functions specified in § 26.4(a)(1) and (a)(2) of the final rule. As a consequence, an individual would not be exempted from the requirements because the direction was provided from a remote on-site location. The NRC defined the requirement in these terms to address the commenters' concern.

"Authorization"

Comments: Another commenter stated that the term "authorization" was used throughout the proposed rule in a number of different contexts, while historically the term has referenced "access authorization." Therefore, the commenter suggested that the NRC clearly define the different uses of the tem "authorization" or utilize unique terms where appropriate [Keith Jury, Exelon].

NRC Response: The NRC agrees with this commenter and has added a definition of the term "authorization" to the final rule. The final rule uses the term "authorization" to refer to an individual's status as having been determined by a licensee or other entity to be eligible to perform the duties or have the types of access listed in § 26.4(a) through (e), and at the licensee's or other entity's discretion, § 26.4(f) and (g) of the final rule. The agency selected this term to differentiate "authorization" under Part 26 from the terms "unescorted access authorization" and "unescorted access" that are used by nuclear power plant licensees to refer to individuals who are subject to both Part 26 and related access authorization requirements under 10 CFR 73.56 [Personnel access authorization requirements for nuclear power plants]. The NRC created a new term because some categories of individuals who are subject to Part 26 are not required to meet the additional requirements of 10 CFR 73.56 of this chapter. For example, the NRC has not promulgated access authorization requirements for the FFD program personnel or for individuals who perform construction activities. Therefore, the final rule uses the term "authorization" to refer to the determination that these categories of individuals may perform the duties or have the types of access specified in § 26.4 to distinguish the requirements in this part from the additional requirements that a licensee or other entity must meet in order to grant individual "unescorted access authorization" or "unescorted access" to nuclear power plant protected areas.

"Non-Instrumented Testing Devices"

Comments: One commenter addressed § 26.5 and requested that NRC provide a definition for and some examples of non-instrumented testing devices permitted to perform validity screening tests. The commenter also requested that the definition include examples of acceptable devices to use for validity screening tests [Charles LoDico, Individual].

NRC Response: The NRC agrees, in part, with the commenter's request and has revised the definition of "validity screening test" in § 26.5 of the final rule to clarify the proposed meaning of non-instrumented testing device.[1] In addition, the definition of "validity screening test" has been amended to include instrumented tests, based on another comment received on proposed § 26.137(b), that explained that some instrumented tests could also meet the performance testing criteria in § 26.137. The NRC has revised the definition of a validity screening test in § 26.5 of the final rule to mean the use of a non-instrumented test where the endpoint result is obtained by visual evaluation (i.e., read by human eye), or an instrumented test (machine-read end points), to determine the need for initial validity testing of a urine specimen. The NRC disagrees with the commenter's request to include examples of a non-instrumented test as unnecessary specificity.

"Dilute Specimens"

Comments: One commenter addressed the definition of "dilute specimen" in § 26.5 and stated that the definition did not include the specific gravity, which is necessary to determine if a specimen is dilute or substituted [LoDico, Individual].

NRC Response: The NRC disagrees in part with the commenter. The proposed provision in § 26.5 was consistent with the definition for dilute specimens used in the HHS Mandatory Guidelines for Federal Workplace Drug Testing Programs. The proposed rule presented the specific gravity cutoffs that HHS-certified laboratories must use to determine if a specimen is dilute in § 26.161(d). Subpart F [Licensee Testing Facilities] of the final rule does not contain a provision on specimen specific gravity testing because NRC is not requiring licensee testing facilities to conduct specimen specific gravity testing. Therefore, the NRC has not amended the definition of "dilute specimen" in the final rule.

"Non-Negative Test Result"

Comments: One commenter stated that the proposed definition of a "non-negative test result" did not include the analytical reporting cutoff for specific gravity to determine whether a specimen is substituted [Charles LoDico, Individual].

NRC Response: As a result of other comments received on the use of the term "non-negative test result" the NRC has eliminated the term in the final rule. The NRC has amended § 26.5 in the final rule to include a new term, "questionable validity," to account for validity screening and initial validity test results from testing conducted at a licensee testing facility that indicate that a specimen may be adulterated, substituted, dilute, or invalid.

3.4 Interpretations (§ 26.7)

No comments addressed this section.

[1]The final rule eliminates the use of the term "device" because of the specific connotation associated with the use of the term identified by another commenter.

3.5 Information Collection Requirements: OMB Approval (§ 26.8)

No comments addressed this section.

3.6 Specific Exemptions (§ 26.9)

No comments addressed this section.

3.7 Communications (§ 26.11)

No comments addressed this section.

4. Subpart B: Program Elements

4.1 Fitness for Duty (§ 26.21)

No comments addressed this section.

4.2 Performance Objectives (§ 26.23)

Comments: One commenter stated that the proposed section (*referring to the performance objectives section*) contained no language to provide reasonable assurance that the program will maintain a level of integrity to ensure the privacy of individuals who are subject to testing, and that the individuals who are subject to testing will not be unjustly or inaccurately portrayed as having violated the FFD requirements. Thus, the commenter suggested that the NRC should include such language in the rule [Todd Newkirk, IBEW].

NRC Response: The NRC agrees with the commenter that the performance objectives in proposed § 26.23 [Performance objectives] did not explicitly address worker protections. Rather, the proposed rule's performance objectives focused on protecting public health and safety and the common defense and security, consistent with the NRC's mission. The final rule retains these performance objectives without change. However, the NRC is concerned that FFD programs maintain an appropriate balance between the needs of the public and those of the individuals who are subject to the rule. Therefore, the final rule contains a variety of provisions that are intended to ensure worker privacy and protection, such as § 26.27 [Written policy and procedures], § 26.29 [Training], § 26.37 [Protection of information], § 26.39 [Review process for fitness-for-duty policy violations], § 26.75 [Sanctions], and § 28.185 [Determining a fitness-for-duty policy violation]. In addition, in response to this comment, the NRC has added or modified several requirements (including §§ 26.37(d), 26.53(h) and (i), and 26.711(c) and (d)) to strengthen the privacy of individuals who are subject to the rule and ensure that individuals are not unjustly or inaccurately portrayed as having violated FFD requirements.

4.3 Individuals Subject to the Fitness for Duty Program (§ 26.25)

No comments addressed this section. However, the NRC has amended and moved the proposed requirements of this section to § 26.4 [FFD program applicability to categories of individuals] in the final rule.

4.4 Written Policy and Procedures (§ 26.27)

Comments: With reference to both this section and proposed § 26.29, one commenter stated that the licensee should not screen for drugs in addition to those listed in the proposed rule without identifying them in advance. The commenter said that if prevention is the true goal, the best way to prevent is to forewarn [Todd Newkirk, IBEW].

NRC Response: The NRC agrees with the commenters that informing individuals of the substances for which testing will routinely occur and the cutoff levels to be applied may deter abuse of those substances. Information about the drugs for which testing will occur, and their potential effects on job performance, is also an important part of the FFD training that individuals must receive under § 26.29, to assist individuals in meeting their responsibilities under the rule. Therefore, the NRC has added a new provision in § 26.31(d)(1)(iii) of the final rule to specify that licensees and other entities must document the additional drugs for which testing will be performed in the written policies and procedures. However, the NRC does not agree that a licensee should be prohibited from testing for drugs or drug metabolites in addition to those listed in the rule without identifying them to donors in advance. Although deterring substance abuse is an important goal of the rule, detecting substance abuse is equally important. Therefore, both the former and final rules permit licensees to add drugs to the panel of substances for which they routinely test, as well as to conduct followup, post-event and for-cause testing to detect any drugs listed on Schedules I-IV of the Controlled Substance Act that the individual is suspected of abusing.

4.4.1 General (§ 26.27(a))

No comments addressed this section.

4.4.2 Policy (§ 26.27(b))

Comments: One commenter commended the NRC for considering the impact that untreated sleep disorders have on the health and safety of the workforce at nuclear plants under proposed § 26.27(b)(7). The commenter stated that the NRC has clearly and accurately cited existing information regarding the prevalence of sleep disorders in the United States. The commenter agreed with the NRC that, given the demographics of workers in the nuclear industry, sleep disorders (e.g., sleep apnea) are likely to be prevalent in the workforce and should be diagnosed and treated. The commenter argued that no matter how much time for sleep individuals are afforded, those who suffer from sleep disorders do not accrue the full recuperative benefits from sleep, resulting in an inability to sustain normal levels of alertness and performance throughout the subsequent hours of wakefulness [Darrel Drobnich, NSF].

NRC Response: The comments do not require a response.

4.4.3 Procedures (§ 26.27(c))

Use of the Term “Due Process”

Comments: One commenter, supported by many other commenters, argued that the term "due process" used in proposed § 26.27(c)(1) implied that under this rule, licensee activities will

be subject to judicial review relative to the U.S. Constitution. The commenter suggested replacing "due process rights" with "other rights" [Jim Davis, NEI #48; Richard Sweigart, DCS; Keith Jury, Exelon; Mark Wetterhahn, Winston Strawn; Edward Weinkam, NMC; Don Grissette, SNC; Keith D. Young, Ameren; Glenn Morris, TVA; Ronald Gaston, Detroit Edison; Gregory Halnon, FENOC; Jeffrey Archie, SCE&G; Brian McCabe, Progress Energy; C.L. Funderburk, Dominion; F.G. Burford, Entergy].

NRC Response: In a subsequent telephone call, the commenter clarified that the comment was not intended to suggest that due process concerns do not apply to FFD programs and indicated that the proposal to substitute "other rights" for "due process rights" was intended to recognize that an individual's protected rights are not limited to due process. As clarified, the Commission agrees with the commenter that in addition to any due process rights, workers may also have other rights granted by federal and state statutes. Therefore, the NRC has modified the final rule in § 26.27(c)(1) and the preamble to the final rule to refer to "privacy and other rights (including due process) of individuals who are subject to Part 26."

Alcohol Consumption During the Pre-Work Abstinence Period

Comments: Another commenter, supported by many other commenters, stated that the wording in proposed § 26.27(c)(2)(ii) could be interpreted as prohibiting only excess alcohol consumption during the pre-work abstinence period. The commenter suggested that the wording should more clearly express the prohibition against any alcohol consumption during relevant periods, and should be reworded to state: Consumed alcohol to excess before the mandatory pre-work abstinence period, *or consumed any alcohol* during the mandatory pre-work abstinence period or while on duty, as determined by a test that measures BAC [Jim Davis, NEI #48; Richard Sweigart, DCS; Keith Jury, Exelon; Mark Wetterhahn, Winston Strawn; Edward Weinkam, NMC; Don Grissette, SNC; Keith D. Young, Ameren; Glenn Morris, TVA; Ronald Gaston, Detroit Edison; Gregory Halnon, FENOC; Jeffrey Archie, SCE&G; Brian McCabe, Progress Energy; C.L. Funderburk, Dominion; F.G. Burford, Entergy].

NRC Response: The NRC agrees with this clarification because it is consistent with the NRC's intent to prohibit any consumption of alcohol, not only excess consumption, during the pre-work abstinence period or while on duty. Therefore, the NRC has modified the final rule accordingly.

Use of the Term "Emergency"

Comments: Another commenter, supported by many other commenters, stated that the language in proposed § 26.27(c)(3) was confusing. Specifically, the commenter argued that the term "emergency" was too limiting. Thus, the commenter recommended changing the section to replace the term "emergency" with "unscheduled working tour" and stated that this wording is consistent with the wording "unscheduled working tour" in proposed § 26.27(c)(3)(ii)(c). [Jim Davis, NEI #48; Richard Sweigart, DCS; Keith Jury, Exelon; Mark Wetterhahn, Winston Strawn; Edward Weinkam, NMC; Don Grissette, SNC; Keith D. Young, Ameren; Glenn Morris, TVA; Ronald Gaston, Detroit Edison; Gregory Halnon, FENOC; Jeffrey Archie, SCE&G; Brian McCabe, Progress Energy; C.L. Funderburk, Dominion; F.G. Burford, Entergy].

NRC Response: The NRC disagrees with this comment and maintains that the use of the term "emergency" in the second sentence of proposed § 26.27(c)(3) accurately conveyed the NRC's

intent that, if an individual's knowledge and skills are necessary to respond to an emergency, the consumption of alcohol resulting in a BAC that exceeds the cutoff levels in Part 26 does not preclude the licensee from relying on the individual during an emergency. However, the NRC has reorganized the language in the final rule to further clarify the differences between the controls and conditions that apply only to an emergency and those that apply to an unscheduled working tour.

Procedures for Called-In Individuals

Comments: One commenter, supported by many commenters, expressed concern about the wording in proposed § 26.27(c)(3)(i). The commenter stated that the language requiring individuals to report that they meet the fitness-for-duty requirements could have resulted in unintended audit requirements and would require excess documentation. The commenter stated that the intent of this section can be met by having individuals report if they are not fit for duty or have consumed alcohol within the pre-duty abstinence period. Thus, the commenter suggested revising proposed § 26.27(c)(3)(i) to state: "The procedure must require individuals called in to report by exception. The procedure must require individuals called in to declare, as stated in licensee program when they consider themselves unfit for duty or have consumed alcohol within the pre-duty abstinence period stated in the policy" [Randy Cleveland, NMC; Jim Davis, NEI #48; Richard Sweigart, DCS; Keith Jury, Exelon; Mark Wetterhahn, Winston Strawn; Edward Weinkam, NMC; Don Grissette, SNC; Keith D. Young, Ameren; Glenn Morris, TVA; Ronald Gaston, Detroit Edison; Gregory Halnon, FENOC; Jeffrey Archie, SCE&G; Brian McCabe, Progress Energy; C.L. Funderburk, Dominion; F.G. Burford, Entergy].

NRC Response: The NRC disagrees with the commenters. Proposed § 26.27(c)(3)(i), which required each individual who is called to state whether he or she considers himself or herself fit for duty and has consumed alcohol within the pre-duty abstinence period stated in the policy, could create a need for the licensee to document the individual's statement and that such documentation could be the subject of auditing. However, the NRC believes that the alternative suggested by the commenters of having individuals report only if they believe they are not fit for duty or have consumed alcohol within the pre-duty period would be less protective of public health and safety. An affirmative obligation to provide a statement may dissuade individuals who would be tempted to remain silent. It will also provide a clearer record. Therefore, the NRC has not modified the provision in the final rule.

Sanctions for Called-in Individual

Comment: One commenter, supported by many commenters, stated that the language in proposed § 26.27(c)(3)(ii)(C) could be interpreted to mean that an employee who is called in may not be subject to sanctions for any misconduct. The commenter suggested the following word change to the subparagraph: "State that no sanctions may be imposed on an individual who is called in to perform an unscheduled working tour for having consumed alcohol within the pre-duty abstinence period stated in the policy" [Jim Davis, NEI #48; Richard Sweigart, DCS; Keith Jury, Exelon; Mark Wetterhahn, Winston Strawn; Edward Weinkam, NMC; Don Grissette, SNC; Keith D. Young, Ameren; Glenn Morris, TVA; Ronald Gaston, Detroit Edison; Gregory Halnon, FENOC; Jeffrey Archie, SCE&G; Brian McCabe, Progress Energy; C.L. Funderburk, Dominion; F.G. Burford, Entergy].

NRC Response: The NRC agrees with the commenter. The intent of this provision is not to subject an individual to the sanctions that are otherwise required under this part for a confirmed positive alcohol test result when the individual is called in unexpectedly and has a confirmed positive test result for alcohol. The NRC believes that sanctions for the consumption of alcohol in these circumstances would be inappropriate, given that the individual would have been unaware that he or she would be called in to work. Therefore, the NRC has modified the final rule language accordingly.

4.4.4 Review (§ 26.27(d))

No comments addressed this section.

4.5 Training (§ 26.29)

Comments: The comments that concerned training are addressed in section 4.4 "Written Policies and Procedures" of this document.

4.6 Drug and Alcohol Testing (§ 26.31)

Comments: Several commenters supported the majority of provisions of the drug and alcohol portions of the proposed rule. One commenter explicitly supported those provisions that incorporate HHS Mandatory Guidelines for Federal Workplace Drug Testing Programs requirements, reduce unnecessary regulatory burden, and encourage consistency in implementation with the access authorization program [Richard Sweigart, DCS]. One commenter stated that industry supports most of the drug and alcohol testing provisions of the proposed rule because they were developed over a period of many years with due consideration for many improvements recommended by industry groups. The commenter stated that these changes will make FFD programs more efficient and effective [Brian McCabe, Progress Energy].

NRC Response: The comments do not require a response.

4.6.1 General (§ 26.31(a))

No comments addressed this section.

4.6.2 Assuring the Honesty and Integrity of FFD Program Personnel (§ 26.31(b))

Comments: Regarding proposed § 26.31(b)(1)(i), one commenter suggested that the NRC consider consistency of screening frequency between FFD personnel and non-critical group personnel. Because licensees and other entities are not required to update their psychological evaluations of non-critical group personnel, the commenter suggested that the NRC delete the words "...and psychological assessments..." from the last sentence of this section [C. L. Funderburk, Dominion].

NRC Response: The NRC disagrees with the commenter. The NRC believes that FFD program personnel hold unique responsibilities under the rule, given their critical role in maintaining the integrity of the FFD program. The time period for updates of credit and criminal history checks and psychological assessments do not need to align with the update time periods

for individuals who are granted unescorted access authorization under 10 CFR 73.56. Therefore, the NRC has not modified this provision in the final rule.

4.6.3 Conditions for Testing (§ 26.31(c))

Post-Event Testing

Comment: One commenter referenced proposed § 26.31(c)(3) and disagreed with the elimination of the phrase in former § 26.24(a)(3), "if there is reasonable suspicion that the worker's behavior contributed t o the event," from the proposed rule. The commenter stated that in the section-by-section analysis of the proposed paragraph, the NRC claimed that this phrase has long been subject to misinterpretation and that the location of this phrase at the end of the list of conditions under which post-event testing must be performed has led some licensees to conclude that this phrase applies only to events involving actual or potential substantial degradations of the level of safety of the plant. The commenter argued that the NRC presented an incorrect interpretation of the meaning on the former regulation, and that this phrase clearly modified not only the direct antecedent but other types of incidents potentially requiring for-cause testing.

The commenter also argued that the definition of "human error" in proposed § 26.31(c)(3) was too broad, and that there were no limits in defining human error which "may have caused or contributed to the event." The commenter argued that the proposed language would have the unintended consequence of causing individuals not to report medical conditions or to delay seeking treatment to avoid drug and alcohol testing procedures. Therefore, the commenter argued that the agency should not adopt the rule as proposed, and the rule relating to post-event situations should require at least a suspicion that drugs or alcohol affected the individual's actions.

However, the commenter supported language that would include the phrase "within 4 hours after the event" to describe recordable personal injuries and illnesses that would trigger post-event testing [Mark Wetterhahn, Winston and Strawn].

NRC Response: The NRC disagrees with the commenter and believes it is preferable to determine the need for post-event testing using an objective standard based on the severity of the underlying event. The experience of the DOT with post-accident testing, for example, is that it is more effective to separate completely "for cause" concepts (such as "reasonable suspicion" of substance abuse) from post-event testing. Under the proposed rule's approach, if one of the events occurs that the regulations define as requiring post-event testing, then that testing should be carried out irrespective of the presence or absence of any "reasonable suspicion" of substance abuse.

The proposed rule used the term, "human error," rather than the former term, "worker's behavior," to emphasize that post-event testing is required for acts that unintentionally deviated from what was planned or expected in a given task environment (NUREG/CR-6751, "The Human Performance Evaluation Process: A Resource for Reviewing the Identification and Resolution of Human Performance Problems") as well as failures to act (i.e., errors of omission). Therefore, testing is required regardless of whether there was "reasonable suspicion" that the individual was abusing drugs or alcohol for the consequences listed in the section. This

approach ensures that possible impairment because of substance abuse is always investigated following these significant events, and removes subjectivity from the testing decision.

The NRC believes that the detailed listing in § 26.31(c)(3)(i) through (iii) of situations when post-event testing should be carried out following an accident resulting in injury substantially eliminates the risk of unnecessary testing after "trivial" events mentioned by the commenter. In addition, § 26.31(c)(2) continues to allow "for-cause" testing when its preconditions are met. Section 26.31(c)(3)(i) also limits post-event testing to situations in which the licensee or other entity can determine that an injury or illness meets the threshold within 4 hours after the event has occurred. Therefore, the NRC has not modified § 26.31(c)(3) in the final rule.

Use of the Phrase "Medical Treatment Beyond First Aid"

Comment: Regarding proposed § 26.31(c)(3)(i), one commenter stated that industry believes that the inclusion of the criterion regarding "medical treatment beyond first aid" was an inappropriately low threshold for post-event testing and suggested that this clause be deleted. The commenter expressed concern that setting the for-cause testing threshold this low could have the unintended consequence of increasing the reporting burden associated with industrial safety incidents. The commenter also questioned the benefit of using this threshold because the results of such testing have not identified evidence of substance abuse within the commenter's facilities [F.G. Burford, Entergy].

NRC Response: The NRC disagrees with the commenter. The NRC notes that the phrase regarding "medical treatment beyond first aid" is based on the general criteria contained in 29 CFR 1904.7 of the regulations of the Occupational Safety and Health Administration (OSHA) for recording occupational injuries and illnesses. To clarify, the NRC does not intend that the phrase "medical treatment beyond first aid" should increase the burden of accident reporting by requiring post-event testing in all situations where a personal injury has occurred (i.e., a paper cut or twisted ankle). On the contrary, the NRC intends that this phrase, in addition to the phrase "where the human error may have caused or contributed to the event" in § 26.31(c)(3), should rarely result in testing after such trivial events and should instead cause post-event testing to be undertaken for more significant events caused by human error to determine whether the error was caused by impairment from drugs or alcohol. Therefore, the NRC has not modified § 26.31(d)(3)(i) in the final rule.

Typographical Error

Comments: Many commenters identified a typographical error in proposed § 26.31(c)(3)(i). The commenter stated that the citation of OSHA regulations should refer to 29 CFR 1904.7, not 29 CFR 1907.4 [Jim Davis, NEI #48; F.G. Burford, Entergy; Richard Sweigart, DCS; Keith Jury, Exelon; Mark Wetterhahn, Winston Strawn; Edward Weinkam, NMC; Don Grissette, SNC; Keith D. Young, Ameren; Glenn Morris, TVA; Ronald Gaston, Detroit Edison; Gregory Halnon, FENOC; Jeffrey Archie, SCE&G; Brian McCabe, Progress Energy; C.L. Funderburk, Dominion; F.G. Burford, Entergy].

NRC Response: The NRC agrees with the commenters that proposed § 26.31(c)(3)(i) contained a typographical error and has modified the final rule accordingly.

4.6.4 General Requirements for Drug and Alcohol Testing (§ 26.31(d))

Lack of Provision for Specimen Dilution

Comments: One commenter, supported by many commenters, suggested a clarification to proposed § 26.31(d)(1)(ii) to properly account for actions that may be taken under § 26.185(g)(2) or (g)(3), when the MRO has reason to believe a donor has diluted a specimen. The commenter suggested that the NRC add a line to the end of the section, stating: "unless the specimen was considered dilute and the licensee or other entity chooses to have the specimen evaluated under § 26.185(g)(2) and (g)(3)" [Jim Davis, NEI #48; Richard Sweigart, DCS; Keith Jury, Exelon; Mark Wetterhahn, Winston Strawn; Edward Weinkam, NMC; Don Grissette, SNC; Keith D. Young, Ameren; Glenn Morris, TVA; Ronald Gaston, Detroit Edison; Gregory Halnon, FENOC; Jeffrey Archie, SCE&G; Brian McCabe, Progress Energy; C.L. Funderburk, Dominion; F.G. Burford, Entergy].

NRC Response: The NRC agrees with this comment. The NRC notes that proposed § 26.185(g)(2) and (g)(3) specified that if an MRO has reason to believe that the donor may have diluted a specimen in a subversion attempt, the MRO may require the laboratory to conduct confirmatory testing of the specimen at the LOD for any drugs as long as they are evaluated under § 26.31(d)(1)(ii) (typographical error in reference corrected in the final rule). As defined in the rule, the LOD is the lowest concentration of an analyte that an analytical procedure can reliably detect, which could be significantly lower than the established cutoff levels. However, § 26.31(d)(1)(ii) specifies that test results that fall below the established cut-off levels may not be considered when making sanction decisions. Therefore, the NRC agrees to add language to § 26.31(d)(1)(ii) to provide consistency with the provisions in § 26.185(g)(3) of the final rule.

Random Testing Requirements

Comments: Another commenter, supported by many commenters, stated that proposed § 26.31(d)(2)(i)(A) limited the unpredictability of specimen collections because it prescriptively required collections on at least 4 days in a calendar week. The commenter argued that this would enable members of the workforce to predict when specimens must be collected during the later days of the week to be in compliance with the regulation. The commenter suggested deleting this language and renumbering § 26.31(d)(2)(i)(B) as § 26.31(d)(2)(i)(A) [Jim Davis, NEI #48; Richard Sweigart, DCS; Keith Jury, Exelon; Mark Wetterhahn, Winston Strawn; Edward Weinkam, NMC; Don Grissette, SNC; Keith D. Young, Ameren; Glenn Morris, TVA; Ronald Gaston, Detroit Edison; Gregory Halnon, FENOC; Jeffrey Archie, SCE&G; Brian McCabe, Progress Energy; C.L. Funderburk, Dominion; F.G. Burford, Entergy].

NRC Response: The NRC disagrees with the commenters. Section 26.31(d)(2)(i)(A) states that the FFD program, at a minimum, shall "take reasonable steps to either conceal from the workforce that collections will be performed during a scheduled collection period or create the appearance that specimens are being collected during a portion of each day on at least 4 days in each calendar week at each site." Therefore, the rule does not require licensees and other entities to perform collections on at least four days per week, but only to create an appearance that specimens are being collected. Section 26.31(d)(2)(i)(B)(ii) specifies the actual requirement for specimen collection frequency, which is at a minimum of a nominal weekly frequency.

The NRC believes that the provisions in § 26.31(d)(2)(i) and (d)(2)(i)(B), which specify that random testing must be administered "in a manner that provides reasonable assurance that individuals are unable to predict the time periods during which specimens will be collected" and that licensees shall collect specimens on an "unpredictable schedule," are adequate to ensure that licensees will schedule random testing appropriately. The NRC notes that if a licensee is consistently conducting testing on four consecutive days, or on any predictable schedule, the licensee would not be in compliance with these two provisions.

However, the NRC notes that § 26.31(d)(2)(i)(A) has been clarified to specify the NRC's intent that licensees should reasonable steps to create the appearance of when specimens are being collecte. The NRC has modified this section to require that the portions of each day and the days of the week on which it appears that specimens are being collected must vary in a manner that cannot be predicted by donors.

Testing of Individuals Off-Site/Not Reasonably Available

Comments: One commenter, supported by many commenters, stated that proposed § 26.31(d)(2)(iv) could be interpreted as requiring individuals who are on site but not reasonably available for testing to be tested immediately. The commenter gave the example of an individual who is suited up for work in a radiologically controlled area from which he or she could not exit to be tested in a reasonable period of time. The commenter argued that this is inconsistent with NRC-endorsed industry practices and suggested rewording the second sentence of this subparagraph by changing "and" to "or" after "...for testing" to be consistent with NEI 03-01 [Jim Davis, NEI #48;; Richard Sweigart, DCS; Keith Jury, Exelon; Mark Wetterhahn, Winston Strawn; Edward Weinkam, NMC; Don Grissette, SNC; Keith D. Young, Ameren; Glenn Morris, TVA; Ronald Gaston, Detroit Edison; Gregory Halnon, FENOC; Jeffrey Archie, SCE&G; Brian McCabe, Progress Energy; C.L. Funderburk, Dominion; F.G. Burford, Entergy].

NRC Response: The NRC agrees with the commenters. Proposed § 26.31(d)(2)(iii) and (d)(2)(iv) addressed several circumstances related to selection, notification, and reporting for random testing. These provisions recognized that there will be delays between the points in time at which an individual is selected for random testing, is notified that he or she has been selected, and reports to the collection site for testing. For example, an FFD program may implement its process for selecting individuals for random testing at the beginning of a day shift, but some of the individuals who are selected do not report for work until the mid- or night shift. The NRC expects that FFD program personnel would not notify an individual on the mid- or night shift or his or her supervisor that the individual has been selected for testing until the individual reports for duty to avoid forewarning the individual that testing will occur. Similarly, if an individual has been selected for testing, but the FFD program cannot contact the individual because he or she is on vacation or the individual's supervisor indicates that the individual is suited up and performing work in a radiologically controlled area, the NRC expects that neither FFD program personnel nor the individual's supervisor will notify the individual that he or she must report for testing until the individual has returned to the site or has completed his or her work in the radiologically controlled area. However, the NRC also expects that once an individual has been notified that he or she must be tested, the individual will report to the collection site within the time period specified in the FFD program procedures. The NRC intended proposed § 26.31(d)(2)(iii) to convey these expectations However, the NRC agrees with the commenters that further clarification is necessary. Therefore, the final rule has added the phrase "or who are

on site and are not reasonably available for testing" to § 26.31(d)(2)(v).

Licensees Using LOD Cutoffs

Comment: Another commenter referenced proposed § 26.31(d)(3)(iii)(C) and asked whether the NRC would require licensees already using LOD cutoffs and/or additional substances for testing to submit certification by a forensic scientist or whether they would be grandfathered [Anonymous #18].

NRC Response: The proposed provision stated that one of the circumstances in which certification by a qualified toxicologist is not required under this provisions is if the licensee or other entity received written approval of the NRC to test for lower cut-off levels before the implementation of the final rule. If certification or written approval is required, and the licensee has not received written approval or certification, then the licensee will need toxicologist certification.

Delay of Medical Treatment to Conduct Post-Event Testing

Comments: Two commenters referenced proposed § 26.31(d)(5)(ii) and both agreed that required medical treatment should not be delayed to conduct post-event testing [Todd Newkirk, IBEW; Jim Davis, NEI #48]. However, one of them suggested that the language of this paragraph should state: "treatment *must not* be delayed to conduct drug and alcohol testing" [Todd Newkirk, IBEW].

NRC Response: The NRC agrees with the commenters that medical treatment must not be delayed to conduct drug and alcohol testing. The term "may not" in this provision (and anywhere it appears in the rule) indicates a prohibition. Therefore, the NRC has not modified the provision in the final rule.

Inadequacy of Long-term Random Testing

Comment: One commenter expressed concern that the industry does not adequately test each employee over the long term. The commenter noted that he has not been tested for many years and felt that this trend could compromise the safety of plant operations [Daniel Hansen, Individual].

NRC Response: The NRC disagrees in part with the commenter. If a random drug and alcohol testing program is conducted correctly, each individual who is subject to random testing has an equal probability of being tested each time testing selections are made. However, given the 50% annual testing rate specified in the rule, the NRC acknowledges that it may be possible for an individual not to be tested over a long period of time. The NRC believes that the 50% annual random testing rate is adequate to protect public health and safety because of the continuing low rates of positive test results reported to the NRC in the FFD program performance reports.

4.7 Behavioral Observation (§ 26.33)

No comments addressed this section.

4.8 Employee Assistance Programs (§ 26.35)

Comments: One commenter, supported by many commenters, stated that the language in proposed § 26.35(b) was confusing. Specifically, the rule language did not adequately explain who must be provided EAP services. The commenter suggested rewording the paragraph to state: Licensees and other entities need not provide EAP services to C/V employees *who are working at a licensee's or other entity's facility and are subject to this part. Licensees and other entities need not provide EAP services* to individuals who have applied for, but have not yet been granted, authorization [Jim Davis, NEI #48; Richard Sweigart, DCS; Keith Jury, Exelon; Mark Wetterhahn, Winston Strawn; Edward Weinkam, NMC; Don Grissette, SNC; Keith D. Young, Ameren; Glenn Morris, TVA; Ronald Gaston, Detroit Edison; Gregory Halnon, FENOC; Jeffrey Archie, SCE&G; Brian McCabe, Progress Energy; C.L. Funderburk, Dominion; F.G. Burford, Entergy].

NRC Response: The NRC agrees with this clarification because it is not NRC's intent that licensees and other entities provide EAP services to C/V employees, even if they work at the licensee's or other entity's facility. Therefore, the NRC has modified the final rule language.

4.9 Protection of Information (§ 26.37)

Comments: One commenter referenced proposed § 26.37(d) and suggested that the donor or representative, with the permission of the donor, should be allowed to access the donor's FFD records at any time and not just in the case of a non-negative test. The commenter expressed that "this is to ensure that no records exist that should not be there," such as records of tests that tested non-negative initially and that the MRO subsequently declared to be negative [Todd Newkirk, IBEW].

NRC Response: The NRC agrees that individuals shall have the right to review FFD information to ensure its accuracy. Therefore, the NRC has added § 26.711(c) to state that licensees and other entities shall inform the individual of his or her right to review information collected under Part 26 to assure its accuracy and provide the individual with an opportunity to correct any inaccurate or incomplete information that is developed by licensees and other entities about the individual. The final rule also requires licensees and other entities to ensure that the information they share with other licensees and entities is correct and complete. This addition is consistent with requirements established in 10 CFR 73.56, as supplemented by orders to nuclear power plant licensees dated January 7, 2003, and is necessary to protect individual's rights under the rule (including due process).

4.10 Review Process for Fitness-for-Duty Policy Violations (§ 26.39)

Comments: Several commenters referenced proposed § 26.39(c), which stated that the procedure must ensure that more than one individual conduct the review, and that the individuals who conduct the review are not associated with the administration of the FFD program. One commenter, supported by many commenters, suggested that the review process required by this section should be consistent with that required by 10 CFR 73.56(e) (personnel access authorization) because this would simplify licensee procedures and would improve the consistency between FFD requirements and access authorization requirements. The commenter suggested rewording this paragraph to state, "The procedure must ensure that the

review is conducted by *at least one impartial and independent internal management individual* and that the *individual or* individuals who conduct the review are not associated with the administration of the FFD program (see the description of FFD program personnel in § 26.25(a)(4))" [Jim Davis, NEI #48; Richard Sweigart, DCS; Keith Jury, Exelon; Mark Wetterhahn, Winston Strawn; Edward Weinkam, NMC; Don Grissette, SNC; Keith D. Young, Ameren; Glenn Morris, TVA; Ronald Gaston, Detroit Edison; Gregory Halnon, FENOC; Jeffrey Archie, SCE&G; Brian McCabe, Progress Energy; C.L. Funderburk, Dominion; F.G. Burford, Entergy].

NRC Response: The NRC agrees in part with the commenters. The NRC believes that allowing one person who is not associated with the administration of the FFD program to conduct reviews of FFD policy violations will not compromise an individual's right to an independent and impartial review. Therefore, the NRC has modified the provision in the final rule to clarify this intent.

4.11 Audits and Corrective Action (§ 26.41)

No comments addressed this section.

5. Subpart C: Granting and Maintaining Authorization

5.1 Purpose (§ 26.51)

No comments addressed this section.

5.2 General Provisions (§ 26.53)

No comments addressed this section.

5.3 Initial Authorization (§ 26.55)

No comments addressed this section.

5.4 Authorization Update (§ 26.57)

No comments addressed this section.

5.5 Authorization Reinstatement (§ 26.59)

No comments addressed this section.

5.6 Self-Disclosure and Employment History (§ 26.61)

No comments addressed this section.

5.7 Suitable Inquiry (§ 26.63)

Clarification of Present Employer in § 26.63(c)

Comment: One commenter suggested that the NRC revise the language in proposed § 26.63(c) to state that the licensee or other entity shall conduct the suitable inquiry on a best effort basis by questioning "both the individual's present employer *prior to the day the individual completed the self-disclosure*, and former employers." The commenter argued that this revision would provide more specificity in cases when an individual's current employer changes after the self-disclosure is submitted [Susan Techau, Exelon].

NRC Response: The NRC agrees with the commenter. Licensees and other entities must ensure that a suitable inquiry has been conducted only of those employers that are listed in the self disclosure or employment history. Therefore, the NRC has modified the final rule language in this provision, as well as in § 26.61(c).

Comments: Another commenter, supported by many commenters, stated that the present employer may not be able to answer questions about an individual because of lack of a relationship with the individual in some cases. For example, when a C/V hires the individual on the same day or just a few days before a licensee or other entity processes the individual, the C/V may not be able to answer any questions about the individual. Therefore, the commenter suggested that the NRC add a sentence to the end of proposed § 26.63(c) to state: "If the individual is hired within 3 business days from completion of the self-disclosure, the present employer need not be queried" [Jim Davis, NEI #48; Richard Sweigart, DCS; Keith Jury, Exelon; Mark Wetterhahn, Winston Strawn; Edward Weinkam, NMC; Don Grissette, SNC; Keith D. Young, Ameren; Glenn Morris, TVA; Ronald Gaston, Detroit Edison; Gregory Halnon, FENOC; Jeffrey Archie, SCE&G; Brian McCabe, Progress Energy; C.L. Funderburk, Dominion; F.G. Burford, Entergy].

NRC Response: The NRC disagrees with the commenters. The NRC believes that the current employer could have information that is relevant to the suitable inquiry even if the individual's tenure at the current position has been brief. For example, the current employer may have conducted some form of pre-employment drug testing, the results of which would be relevant to the suitable inquiry. Therefore, the NRC has not modified the provision in the final rule

Use of the Term "Presentation" in § 26.63(d)

Comments: Another commenter, supported by many commenters, disagreed with the use of the word "presentation" in proposed § 26.63(d) with regard to an individual's signed release authorizing the disclosure of information. The commenter argued that a licensee should not have to present an individual's signed release authorizing the disclosure of information to another licensee or other entity and should only have to verify that an individual has signed a release authorizing the disclosure of information. Therefore, the commenter suggested changing the first sentence of the paragraph to state: "In response to another licensee's or other entity's inquiry and verification that an individual has signed a release authorizing the disclosure of information" [Jim Davis, NEI #48; Richard Sweigart, DCS; Keith Jury, Exelon; Mark Wetterhahn, Winston Strawn; Edward Weinkam, NMC; Don Grissette, SNC; Keith D. Young, Ameren; Glenn Morris, TVA; Ronald Gaston, Detroit Edison; Gregory Halnon, FENOC; Jeffrey

Archie, SCE&G; Brian McCabe, Progress Energy; C.L. Funderburk, Dominion; F.G. Burford, Entergy]. Another commenter suggested that the first sentence of § 26.63(d) stating "and presentation of an individual's signed release authorizing" should be changed to "and the individual has signed a release authorizing" [Brian McCabe, Progress Energy].

NRC Response: The NRC agrees with the commenters. Current industry practices allow for verification of a signed release without a licensee "presenting" the actual document. Therefore, the NRC has eliminated the term "presentation" in the final rule and modified the provision to clarify the NRC's intent.

5.8. Pre-Access Drug and Alcohol Testing (§ 26.65)

Comments: Several commenters from industry stated that proposed § 26.65 was generally aligned with current industry practice and recommended that the NRC implement this provision [Jim Davis, NEI #48; Richard Sweigart, DCS; Keith Jury, Exelon; Mark Wetterhahn, Winston Strawn; Edward Weinkam, NMC; Don Grissette, SNC; Keith D. Young, Ameren; Glenn Morris, TVA; Ronald Gaston, Detroit Edison; Gregory Halnon, FENOC; Jeffrey Archie, SCE&G; Brian McCabe, Progress Energy; C.L. Funderburk, Dominion; F.G. Burford, Entergy].

NRC Response: The comments do not require a response.

5.8.1. Purpose (§ 26.65(a))

No comments addressed this section.

5.8.2. Accepting Tests Conducted within the Past 30 Days (§ 26.65(b))

No comments addressed this section.

5.8.3. Initial Authorization and Authorization Update (§ 26.65(c))

Requirements for Pre-Access Test

Comment: One commenter objected to the language in proposed § 26.65(c)(2) and 26.65(d)(2)(ii). The commenter stated that negative test results from drug and alcohol tests conducted within the past 30 days should qualify as a pre-access test regardless of whether the individual is subject to a behavioral observation and arrest reporting program or is subject to random testing [Anonymous, #16].

NRC Response: The NRC disagrees with the commenter. The NRC intends that if the licensee relies on negative results from drug and alcohol tests that were conducted under the requirements of Subpart C and before the individual applied for authorization, the applicant must also be subject to a behavioral observation and arrest reporting program that meets the requirements of this part. This program must begin on the date the specimens for drug and alcohol testing were collected through the date the individual is granted authorization and throughout their employment. The purpose of this requirement is to minimize the potential for any substance abuse following the test. Behavioral observation provides the necessary deterrence and opportunities to detect any substance abuse during the period that falls between

administration of the pre-access test and the granting of authorization. If the individual is not subject to behavioral observation after the previous test was conducted, it is necessary to conduct a pre-access test to verify that the individual had continued to avoid substance abuse. Therefore, the NRC has not changed the provision in response to this comment. The NRC has also added a requirement that the individual must remain subject to a drug and alcohol testing program that includes random testing in order to be exempt from pre-access testing under § 26.65(c)(2). This measure minimizes the potential for any substance abuse following the drug and alcohol test.

Comments: Another commenter, supported by many commenters, stated that proposed § 26.65(c)(2) and 26.65(d)(2)(ii) contradict § 26.65(b) and 26.65(f). In particular, the commenter argued that licensees should be able to rely on drug and alcohol tests that were conducted before the individual applied for authorization if the individual is subject to a behavioral observation and arrest reporting program and random drug and alcohol testing. Therefore, to improve efficiency the commenter suggested changing § 26.65(c)(2) and (d)(2)(ii) to state, "The licensee or other entity relies upon negative results from drug and alcohol tests that were conducted before the individual applied for authorization, and the individual remains subject to *both a drug and alcohol testing program that includes random testing* and a behavioral observation and arrest reporting program which meet the requirements of this part from the date upon which the individual's last authorization was terminated through the date upon which the individual is granted authorization" [Jim Davis, NEI #48; Richard Sweigart, DCS; Keith Jury, Exelon; Mark Wetterhahn, Winston Strawn; Edward Weinkam, NMC; Don Grissette, SNC; Keith D. Young, Ameren; Glenn Morris, TVA; Ronald Gaston, Detroit Edison; Gregory Halnon, FENOC; Jeffrey Archie, SCE&G; Brian McCabe, Progress Energy; C.L. Funderburk, Dominion; F.G. Burford, Entergy].

NRC Response: The NRC agrees with the commenters. The language suggested by the commenter removes the reference to § 26.65(b) in § 26.65(c)(2) and 26.65(d)(2)(ii) to allow licensees to rely on drug and alcohol tests that were conducted more than 30 days before the individual applied for authorization, provided that the individual has been subject to a random drug and alcohol testing program and a behavioral observation program that requires arrest reporting that meet the applicable requirements of this part. The NRC agrees that pre-access testing within 30 days before authorization is granted is unnecessary in these circumstances and has revised the final rule accordingly.

5.8.4. Authorization Reinstatement After an Interruption of More than 30 Days (§ 26.65(d))

The preceding section addresses the comments that related to this section.

5.8.5. Authorization Reinstatement After an Interruption of 30 days or Fewer (§ 26.65(e))

No comments addressed this section.

5.8.6. Time Period for Testing (§ 26.65(f))

Comments: One commenter, supported by many other commenters, disagreed with the

language in proposed § 26.65(f). The commenter stated that licensees currently conduct pre-access drug and alcohol testing within the 30-day period preceding the date the licensee grants authorization. Also, § 26.65(f) only required that licensees collect a sample in this timeframe. The commenter argued that the effort to implement this change exceeds the benefit of the change. Thus, the commenter suggested that the NRC add the 30-day period to conduct testing to § 26.65(c), and delete § 26.65(f) [Jim Davis, NEI #48; Richard Sweigart, DCS; Keith Jury, Exelon; Mark Wetterhahn, Winston Strawn; Edward Weinkam, NMC; Don Grissette, SNC; Keith D. Young, Ameren; Glenn Morris, TVA; Ronald Gaston, Detroit Edison; Gregory Halnon, FENOC; Jeffrey Archie, SCE&G; Brian McCabe, Progress Energy; C.L. Funderburk, Dominion; F.G. Burford, Entergy].

NRC Response: The NRC agrees with the commenters. The NRC has deleted§ 26.65(f) from the final rule to eliminate the unnecessary requirements contained therein. However, to accommodate this change, the NRC has clarified § 26.65(c)(1) and (d)(1)(i) to specify that the licensee may only rely on pre-access tests that were conducted within the 30 day period preceding the granting of authorization by the licensee, consistent with the intent of this provision of the rule.

5.8.7. Administrative Withdrawal of Authorization (§ 26.65(g))

No comments addressed this section.

5.8.8. Sanctions for a Confirmed Positive, Adulterated, or Substituted Pre-access Test Result (§ 26.65(h))

No comments addressed this section.

5.9 Random Drug and Alcohol Testing of Individuals Who Have Applied for Authorization (§ 26.67)

No comments addressed this section

5.10. Authorization with Potentially Disqualifying Fitness-for duty Information (§ 26.69)

Comments: Two commenters expressed concern with the requirements in proposed § 26.69. Both commenters stated that reviewing officials are not offered sufficient flexibility under the proposed rule to make rational FFD decisions when there is a single event that is considered potentially disqualifying information (for example, a citation for driving under the influence or an open container violation). These commenters suggested that licensees need more latitude so they may conduct an appropriate level and type of investigation on the individual, depending on the extent of the potentially disqualifying FFD information disclosed [Jim Davis, NEI; Randy Cleveland, NMC].

NRC Response: The NRC disagrees with the commenters and believes that § 26.69(d) in the final rule provides sufficient flexibility to the reviewing official by permitting him or her to decide whether a determination of fitness is required under the circumstances described by the commenters.

5.10.1. Purpose (§ 26.69(a))

No comments addressed this section.

5.10.2. Authorization After a First Confirmed Positive Drug or Alcohol Test Result or a 5-Year Denial of Authorization (§ 26.69(b))

Comments: One commenter stated that industry is already familiar with the role of Substance Abuse Professionals (SAPs) and suggested that the provision in § 26.69(b)(4) allow for use of either an SAE or SAP as it relates to this section. The commenter recommended that the provision be revised to read, "Ensure that SAE *or SAP* conducts a determination of fitness" and that the remaining paragraphs in the section also include the option of using either an SAE or SAP [C.L. Funderburk, Dominion].

NRC Response: The NRC disagrees with the commenter's suggestion. The NRC notes that the SAP training and credentialing process emphasizes knowledge about the SAP role in 10 CFR Part 40 programs. However, although an SAP under Part 40 meets many of the criteria established in the FFD rule, thorough knowledge of Part 26 requirements is also necessary under the final rule. Therefore, the NRC has not modified this provision in the final rule.

5.10.3. Granting Authorization with Other Potentially Disqualifying FFD Information (§ 26.69(c))

Consistency in Self-Disclosure Requirements

Comments: Several commenters at the public meeting on September 21, 2005, addressed these sections of the proposed rule. One commenter addressed § 26.69(c)(1) that required the licensee to verify self-disclosure and employment history. The commenter stated that the proposed language in § 26.69(c)(1) only referenced the self-disclosure time period identified in § 26.61(b)(3). The commenter suggested that the language also reference the employment history time period identified in § 26.61(c) [Susan Techau, Exelon].

NRC Response: The NRC agrees with the commenter that the time periods that must be addressed by the self-disclosure and employment history should be clarified. The NRC has modified the final rule accordingly.

Suitable Inquiry with Potentially Disqualifying FFD Information

Comments: In addition, several commenters expressed confusion about proposed § 26.69(c)(2). One commenter asked if the industry must cover every employer if potentially disqualifying FFD information is discovered or disclosed during the suitable inquiry process. The commenter explained that page 50513 of the *Federal Register* notice contains a discussion of this intent [Randy Cleveland, NMC]. A second commenter stated that it is confusing to move from one section of the regulation (§ 26.69(c)(2)) to another section of the regulation (§ 26.63(f)) when one is conducting an investigation and potentially disqualifying FFD information is discovered or disclosed [Jim Davis, NEI]. These sections of the rule discuss different timeframes for the suitable inquiry, and both commenters asked for an explanation of the NRC's intent.

A commenter at the September 21, 2005, public meeting asked a followup question about the suitable inquiry process for an individual whose period of interruption is 2.5 years. If potentially disqualifying FFD information is discovered or disclosed during this period of time, the commenter asked if the licensee would have to request the individual to provider an additional 2.5 years of employment history to satisfy the 5-year suitable inquiry requirement [Susan Techau, Exelon].

NRC Response: The NRC intends that if potentially disqualifying FFD information is discovered or disclosed during the suitable inquiry, the licensee must contact every employer from the applicable period in § 26.61(b)(3). In the case of an individual whose authorization had been interrupted for 2.5 years, § 26.69(c)(2) requires the licensee or other entity to complete the suitable inquiry with every employer by whom the individual claims to have been employed during that 2.5-year interruption period, and to obtain and review any records pertaining to potentially disqualifying FFD information about the individual from the licensees or other entities who had granted authorization to the individual during the earlier 2.5 years of the 5-year period required. If an individual had not held authorization during the 5-year period and potentially disqualifying FFD information was discovered or disclosed that a previous licensee had not resolved, then the receiving licensee is required to obtain an employment history from the individual that addressed the entire 5-year period and conduct the suitable inquiry with every claimed employer from those 5 years.

5.10.4. Maintaining Authorization with Other Potentially Disqualifying FFD Information (§ 26.69(d))

No comments addressed this section.

5.10.5. Accepting Follow-up Testing and Treatment Plans from Another Part 26 Program (§ 26.69(e))

Comments: Several commenters from industry disagreed with proposed § 26.69(e)(1), which required the FFD program to which an individual was subject to assume responsibility for overseeing the continuation of treatment and follow-up testing for an employee who had a positive test result under another FFD program administered by the same or different licensee or entity. The commenters argued that the burden of completion, compliance, and follow-up should remain with the individual, not the licensee, to monitor and verify. The commenters asserted that the difficulty and ability to administer such a process would make the requirement ineffective and suggested that § 26.69(e)(1) be deleted from the proposed rule [Jim Davis, NEI #48; Richard Sweigart, DCS; Keith Jury, Exelon; Mark Wetterhahn, Winston Strawn; Edward Weinkam, NMC; Don Grissette, SNC; Keith D. Young, Ameren; Glenn Morris, TVA; Ronald Gaston, Detroit Edison; Gregory Halnon, FENOC; Jeffrey Archie, SCE&G; Brian McCabe, Progress Energy; C.L. Funderburk, Dominion; F.G. Burford, Entergy].

NRC Response: The NRC agrees in part with the commenters. The NRC believes that if it is impractical for the individual to comply with a treatment plan that was developed under another FFD program because of circumstances that are outside of the individual's or licensee's or other entity's control (e.g., geographical distance, closure of a treatment facility), then it is appropriate that the granting FFD program develops a comparable treatment plan, with accountability for monitoring the individual's compliance with the plan assumed by the granting licensee or other

entity. Therefore, the NRC has modified the proposed provision accordingly in the final rule.

5.10.6. Sanctions for Confirmed Non-negative Drug and Alcohol Test Results (§ 26.69(f))

No comments addressed this section.

5.11. Maintaining Authorization (§ 26.71)

No comments addressed this section.

6. Subpart D: Management Actions and Sanctions to Be Imposed

6.1. Sanctions (§ 26.75)

Agreement with § 26.75(a)

Comments: Several commenters from industry stated that the industry agrees with proposed § 26.75(a). Each licensee and other entity should view this proposed rule as a continuum from previous versions of the rule and may impose stricter sanctions than the rule requires [Jim Davis, NEI #48; Richard Sweigart, DCS; Keith Jury, Exelon; Mark Wetterhahn, Winston Strawn; Edward Weinkam, NMC; Don Grissette, SNC; Keith D. Young, Ameren; Glenn Morris, TVA; Ronald Gaston, Detroit Edison; Gregory Halnon, FENOC; Jeffrey Archie, SCE&G; Brian McCabe, Progress Energy; C.L. Funderburk, Dominion; F.G. Burford, Entergy].

NRC Response: The comments do not require a response.

Questionable Justification for § 26.75(b)

Comment: One commenter questioned whether there is adequate justification for proposed § 26.75(b), which stated that refusing to provide a specimen for testing should be considered an act of subversion. The commenter argued that this provision is a significant change from former § 26.27(c), which stated that refusal to provide a specimen for testing must be recorded as a removal for cause [Richard Sweigart, DCS].

NRC Response: The NRC disagrees with the commenter. Refusals to test should be considered an act of subversion and warrant permanent denial of authorization because a refusal to provide a specimen for testing thwarts the testing process, as there is no specimen to test. The NRC believes that those who refuse to provide a specimen for testing will also be willing to disregard other rules and regulations, such as safeguards requirements, which ensure the protection of public health and safety and the common defense and security. Therefore, the NRC has not modified this provision in the final rule.

Sanctions for Withdrawal/Reassignment of Application for Authorization – § 26.75(d)

Comment: One commenter disagreed with proposed § 26.75(d), which stated that any individual who resigns or withdraws his or her application for authorization before authorization is terminated or denied for a first violation of FFD policy shall be subject to a harsher penalty than

a person who does not resign or withdraw. The commenter argued that former § 26.27(c) provided that resignation in such circumstances shall be recorded as a removal for cause [Richard Sweigart, DCS].

NRC Response: The NRC disagrees with the commenter and notes that proposed § 26.75(d) amended the portion of former § 26.27(c) that required licensees to record as removal for cause an individual's resignation that occurs before the licensee removes the individual for violating the FFD policy. Because the former provision raised many questions about the appropriate actions to take in this case, the proposed provision clarified the NRC's intent and provides a more appropriate sanction than the former provision. Therefore, the NRC has not modified the provision in the final rule.

Comment: One commenter referenced proposed § 26.75(d) and suggested that the rule discuss the way the new system of sanctions will handle past violations. The commenter believes that the new system should not consider past violations [Todd Newkirk, IBEW].

NRC Response: The NRC disagrees with the commenter and believes that an individual's past behavior should not be ignored under the final rule. Therefore, the NRC has not modified this provision in the final rule.

Sanctions for Non-Negative Test Result

Comment: Another commenter asked if the FFD regulations define a required action for positive tests, such as a 1–3 year ban on unescorted access [Brent Rice, Individual].

NRC Response: The NRC notes that the final rule contains several provisions that address required actions for positive test results, as well as adulterated, substituted, and invalid results from specimen validity testing. For example, § 26.65(g) describes the sanctions for a confirmed positive, adulterated, or substituted pre-access test result; § 26.67(c) describes the sanctions if an individual has confirmed positive, adulterated, or substituted random testing results (not a positive test result); and § 26.75(e) describes the sanctions for a confirmed positive drug or alcohol test as an indication of off-site drug or alcohol use.

Clarification of § 26.75(g)

Comments: Another commenter, supported by many commenters, stated that proposed § 26.75(g) applied to § 26.75(e)(2) and not to § 26.75(e)(1). Therefore, the commenter suggested that the NRC change the reference in § 26.75(g) from "(e)" to "(e)(2)" [Jim Davis, NEI #48; Richard Sweigart, DCS; Keith Jury, Exelon; Mark Wetterhahn, Winston Strawn; Edward Weinkam, NMC; Don Grissette, SNC; Keith D. Young, Ameren; Glenn Morris, TVA; Ronald Gaston, Detroit Edison; Gregory Halnon, FENOC; Jeffrey Archie, SCE&G; Brian McCabe, Progress Energy; C.L. Funderburk, Dominion; F.G. Burford, Entergy].

NRC Response: The NRC agrees with the commenters that proposed 26.75(g) contained a typographical error and has modified the provision in the final rule to correct the error.

6.2. Management Actions Regarding Possible Impairment (§ 26.77)

No comments addressed this section.

7. Subpart E: Collecting Specimens

7.1 Purpose (§ 26.81)

No comments addressed this section.

7.2 Specimens to Be Collected (§ 26.83)

No comments addressed this section.

7.3 Collector Qualifications and Responsibilities (§ 26.85)

No comments addressed this section.

7.3.1 Urine Collector Qualifications (§ 26.85(a))

No comments addressed this section.

7.3.2 Alcohol Collector Qualifications (§ 26.85(b))

Comments: One commenter noted that proposed § 26.85(b) did not require alcohol collectors to be certified, as required for breath alcohol technicians in U.S. DOT's specimen collector requirements in 49 CFR Part 40. The commenter also stated that the proposed provision did not include documentation requirements for training nor continuing competency training [Sue Brown, Individual].

NRC Response: The NRC agrees that § 26.85(b) in the proposed rule did not require certification of alcohol collectors. The NRC has not required this certification in the proposed and final rule because it believes that certification under the U.S. DOT's specimen collector requirements is unnecessary in Part 26. Licensees currently use the systems approach to training (SAT) breath alcohol collectors. The NRC believes that industry training of breath alcohol collectors in accordance with the SAT provides an adequate level of training to ensure the proper completion of specimen collections. Therefore, the NRC has decided not to require alcohol collectors to be certified as breath alcohol technicians, as required by U.S. DOT. The NRC also agrees with the commenter's statement that proposed § 26.85(b) did not include training documentation requirements for collectors. Therefore, the NRC has revised proposed § 26.85 in the final rule by including a new provision, § 26.85(e), to establish documentation requirements for collectors. Maintaining records to document collector proficiency is necessary for NRC inspection purposes as well as to ensure that the records are available for any administrative and/or legal proceedings challenging an alcohol test result.

7.3.3 Alternative Collectors (§ 26.85(c))

Comments: One commenter disagreed with proposed § 26.85(c) that permitted alternative

collectors (i.e., medical professionals, technologists, technicians) to serve as urine and/or breath collectors without meeting the collector qualification requirements in § 26.85 (a) and/or (b) [Sue Brown, Individual].

NRC Response: The NRC agrees that the intent of the provision as proposed was unclear. The NRC intends that alternative collectors be allowed to conduct specimen collections only in those circumstances, such as post-event testing in a hospital setting, when there is a time period within which a specimen must be collected and a collector who is trained under the requirements of this part cannot reasonably be made available by the licensee or other entity to perform the collection. Therefore, the NRC has reorganized and revised proposed § 26.85(c) in the final rule to clarify this intended meaning.

7.3.4 Personnel Available to Testify at Proceedings (§ 26.85(d))

No comments addressed this section.

7.4 Collection Sites (§ 26.87)

Coloring Agents Cannot Interfere with the Drug and Validity Testing Assays

Comments: One commenter objected to the provision in proposed § 26.87(e)(1) that a coloring agent added to any source of standing water in the stall or room in which a donor provides a specimen cannot interfere with drug and validity testing assays. The commenter stated the proposed provision did not make sense and requested that it be eliminated [Charles LoDico, Individual].

NRC Response: The NRC agrees with the commenter's request and has eliminated the proposed provision that the coloring agent added to standing water in a stall or room to deter specimen tampering must not interfere with drug and validity testing assays. The NRC eliminated the provision because the requirement cannot be effectively implemented. For example, some validity tests use an assay that produces a color result. If a specimen were to contain a coloring agent that an individual had added to their specimen in an attempt to subvert the testing process, the assay could not function correctly and would produce an invalid test result. Therefore, the requirement that a coloring agent added to water not interfere with the drug and validity testing assays is not possible for all validity and drug testing assays used by laboratories.

Same Gender Collector for Specimen Collections in Restrooms with Enclosed Stalls

Comments: One commenter objected to proposed § 26.87(f)(3) that required, in the exceptional instance when a designated collection site is unavailable (e.g., post-event test at a hospital) and a restroom with multiple stalls is used for the collection, that a same-gender collector accompany the donor into the restroom, but remain outside the stall used by the donor. The commenter stated that the proposed provision was contrary to the "normal collection process" that, in the commenter's view, did not require a same gender collector to conduct a specimen collection when a donor provides a specimen in a stall, as long as visual privacy is maintained. The commenter asserted that the proposed provision would be burdensome to implement because it would require that a male and a female collector be present at a collection

site at all times. The commenter also noted that the proposed provision would be especially burdensome to implement during outage situations when a large number of individuals must be subject to testing [Jim Bradshaw, AEP].

NRC Response: The NRC disagrees with the commenter and has retained the proposed requirement in the final rule. This requirement applies only in the exceptional event that a designated collection site is not available (e.g., a post-event test in a hospital setting). Because these circumstances are rare, the NRC does not believe that the requirement imposes an undue burden and that it is necessary to protect donors' privacy rights under the rule. The NRC does not intend to require collectors to be of the same gender as the donor under the "normal collection process."

Comments: Another commenter objected to proposed § 26.87(f)(3) that required a same-gender collector to accompany a donor into a non-dedicated collection site (e.g., a public restroom with multiple stalls) but remain outside the stall used by the donor to provide a specimen. The commenter stated that the proposed provision was inconsistent with the proposed observed specimen collection requirements that do not require a same-gender collector [Charles LoDico, Individual].

NRC Response: The NRC disagrees with the commenter. The circumstance addressed in § 26.87(f)(3) is not an observed collection situation. This provision addresses an exceptional circumstance in which a designated site is not available for specimen collection. In addition, § 26.87(f)(3) is consistent with the same requirement in Section 2.4(g)(10) in Appendix A to Part 26 of the former rule. Therefore, the NRC has not modified the proposed provision in the final rule.

7.5 Preparing to Collect Specimens for Testing (§ 26.89)

Notification of Selection for Testing

Comments: One commenter addressed proposed § 26.89(a) and stated that because a licensee or other entity can "arbitrarily determine" that an employee has attempted to subvert the testing process by failing to appear for testing at a collection site in a timely manner, the provision should have required that each employee receive a "positive contact" of their selection for testing. The commenter suggested that an employee's FFD supervisor be required to notify the employee via face-to-face communication because it is impossible to verify the notifier's identity over the telephone. The commenter further suggested that any FFD supervisor who notifies an employee to appear for testing should be subject to the same subversion of testing provisions as those applicable to donors [Todd Newkirk, IBEW].

NRC Response: The NRC disagrees with the commenter's request to require licensees and other entities to notify, in person, an individual selected for required testing. Requiring a face-to-face notification of testing would be unnecessarily burdensome on licensees and other entities and could delay required testing. The NRC further disagrees with the commenter's assertion that a licensee or other entity can arbitrarily determine whether an individual has attempted to subvert the testing process because the individual did not arrive at the collection site within the required time period. In order to determine that an individual has not reported in a timely manner for testing, the licensee or other entity must maintain a record of the time that an

individual was notified to proceed for testing. Therefore, to conclude that an individual has refused to submit to testing, the licensee must implement a defensible method to document the time that the employee was notified for testing. Although one acceptable notification method would be a face-to-face communication between an FFD program supervisor and the individual selected for testing, the licensee or other entity may meet the rule's requirements by employing other secure methods to notify an individual that he or she has been selected for testing. Therefore, the NRC has not modified the proposed provision in the final rule.

The NRC agrees with the commenter that individuals who notify donors that they have been selected for testing must be subject to sanctions for any attempt or act to subvert the testing process, as required under § 26.75(b) of the final rule. To clarify the applicability of this sanction to FFD program personnel, the final rule specifically states that the sanctions in Subpart D [Management Actions and Sanctions To Be Imposed] apply to the individuals listed in § 26.4(g).

Time Limit to Appear for Testing at a Collection Site

Comments: One commenter requested that proposed § 26.89(a) specify the acceptable time period within which a donor must appear at the designated collection site for testing [Charles LoDico, Individual].

NRC Response: The NRC disagrees with the commenter's request. The types and physical circumstances of licensees and other entities subject to Part 26 vary widely. Accordingly, acceptable time limits for donors to appear for testing at collection sites also vary widely among licensees and other entities. A time limit appropriate at one licensee may be entirely unreasonable at another licensee. Therefore, NRC has chosen to continue to allow each licensee's or other entity's FFD program to establish the acceptable time limit within which a donor must appear at the designated collection site for testing.

FFD Supervisor - Method to Identify a Donor Without Photo Identification

Comments: One commenter suggested that proposed § 26.89(b)(2) be revised to allow an additional method to confirm the identity of a donor. The commenter recommended that FFD supervisors be permitted, except for pre-access testing, to positively identify employees that arrive at a collection site without acceptable photo identification. The commenter reasoned that if an FFD supervisor is trusted to observe a donor, the FFD supervisor should be considered sufficiently trustworthy to verify the donor's identity [Todd Newkirk, IBEW].

NRC Response: The NRC agrees with the commenter and has revised proposed § 26.89(b)(2) in the final rule. For tests other than pre-access tests, this section in the final rule directs FFD management, upon being informed by the specimen collector that the donor did not present acceptable identification, to contact the donor's supervisor to verify the donor's identity. If the donor's supervisor is not available, FFD management must take other steps to establish the donor's identity and determine whether the lack of identification was an attempt to subvert the testing process. This revision is consistent with the former requirement in Section 2.4(g)(2) in Appendix A to Part 26 that permitted a collector to positively identify a donor "through the presentation of a photo identification or identification by the employer's representative."

Pre-access Testing Prohibition Without Valid Photo Identification

Comments: One commenter addressed proposed § 26.89(b)(2) and requested clarification on the intent of words "may not" in the sentence, "If the donor is scheduled for pre-access testing and cannot produce acceptable identification, the collector may not proceed with the collection." (This wording now appears in § 26.89(b)(3) of the final rule.) The commenter stated that by using the words "may not" it appeared as though a licensee or other entity has a choice of whether or not to permit testing. The commenter suggested replacing "may not" with "shall not" to emphasize that no collection is permitted [C.L. Funderburk, Virginia Electric and Power].

NRC Response: The NRC disagrees with the commenter's request. The NRC requires that rule text must use the phrase "may not" to describe a prohibited activity. Therefore, the phrase "may not" is used throughout the final rule instead of the phrase "shall not."

Comments: One commenter addressed proposed § 26.89(b)(2) and disagreed with the permission for a specimen collection to proceed even if the donor's identity cannot be confirmed by the collector. The commenter reasoned that the proposed provision is inconsistent with Section 2.2(f)(2) in the HHS Mandatory Guidelines for Federal Workplace Drug Testing which prohibits a collector from proceeding with a specimen collection if a donor's identity cannot be verified [Sue Brown, Individual].

NRC Response: The NRC disagrees with the commenter. The final rule permits a specimen collection for any testing that is required under Part 26 other than pre-access testing to proceed when a donor does not have acceptable identification. Individuals subject to FFD program requirements must have identification with them at all times while at a licensed facility and, therefore, cases in which a donor does not have an acceptable form of identification will be infrequent. However, the NRC has revised proposed § 26.89(b)(2) in the final rule to explicitly require FFD management to take steps to verify the individual's identity or take other necessary actions. In instances where the donor does not present acceptable identification, § 26.89(b)(2) now requires FFD management to contact the donor's supervisor to verify in person the donor's identity. If the supervisor is not available, FFD management must take other steps to investigate the reason the donor was unable to present acceptable identification and to prevent a donor attempt to subvert the testing process by having another individual provide a specimen for him or her. Steps that FFD program management could take to investigate the reason an individual could not present acceptable identification at the collection site could include assigning a security officer to accompany the individual to his or her car or locker to obtain identification that verifies the individual's claim while ensuring that the individual does not have the opportunity to bring an adulterant or substitute urine back to the collection site. FFD program management could also request collection site personnel to photograph any individual who is unable to present acceptable identification for the FFD manager's use in the investigation.

Informing a Donor of Refusal to Test Actions

Comments: One commenter addressed proposed § 26.89(c) that required urine collectors to inform each donor, before beginning a specimen collection, that leaving the collection site before the collection is completed or refusing to cooperate with the specimen collection process will be considered a refusal to test. The commenter stated that solely relying on the collector to verbally inform the donor of the actions considered to be a refusal test under the rule is inadequate

because the collector may forget to convey the information. The commenter requested that a description of the refusal to test actions be included on the donor consent-to-test form or be posted in a conspicuous location at the collection site. [Todd Newkirk, IBEW].

NRC Response: The NRC has declined to grant the commenter's request. The beginning of the testing process is not the first or only time when the rule requires licensees and other entities to inform donors of the actions that will be considered a refusal to test and the consequences of a refusal to test. Section 26.27(b) requires licensees and other entities to inform all individuals subject to the provisions of their FFD program of the program policies. This section also requires licensees and other entities to ensure that a written FFD policy statement is readily available to all covered individuals that includes sufficient detail to provide affected individuals with information on what is expected of them and what consequences may result from a lack of adherence to the policy. Among these details are "the consequences of subverting or attempting to subvert the testing process" in proposed and final § 26.27(b)(3). Likewise, § 26.29(a)(1) requires licensees and other entities to provide training that addresses the FFD policy and the consequences of violating the policy. With regard specifically to a donor's refusal to test, the NRC has revised proposed § 26.27(b)(3) in the final rule to explicitly require that the FFD policy statement describe donor actions considered to be a refusal to test, and the consequences of refusals to test. These various requirements, considered together, ensure that individuals subject to FFD program drug and alcohol testing are adequately informed of the licensee's or other entity's policy regarding refusals to test.

7.6 Acceptable Devices for Conducting Initial and Confirmatory Tests for Alcohol and Methods of Use (§ 26.91)

7.6.1 Acceptable Alcohol Screening Devices (§ 26.91(a))

No comments addressed this section.

7.6.2 Acceptable Evidential Breath Testing Devices (§ 26.91(b))

No comments addressed this section.

7.6.3 EBT Capabilities (§ 26.91(c))

Comments: Several commenters addressed the provision in proposed § 26.91(c)(2) that specified the criteria that evidential breath testing (EBT) devices must meet to be acceptable for use in confirmatory alcohol testing. The commenters disagreed that these EBTs should have to display a unique number that can be read before each test. The commenters asserted that some EBTs on the NHTSA Conforming Products List (CPL) do not have this capability. The commenters stated that to implement the proposed provision, some licensees would have to purchase new equipment, even though their current equipment is on the NHTSA CPL. Finally, the commenters suggested that the proposed provision would have a significant economic impact on small entities that manufacture EBTs [Jim Davis, NEI #48; Richard Sweigart, DCS; Keith Jury, Exelon; Mark Wetterhahn, Winston Strawn; Edward Weinkam, NMC; Don Grissette, SNC; Keith D. Young, Ameren; Glenn Morris, TVA; Ronald Gaston, Detroit Edison; Gregory Halnon, FENOC; Jeffrey Archie, SCE&G; Brian McCabe, Progress Energy; C.L. Funderburk, Dominion; F.G. Burford, Entergy].

NRC Response: The NRC disagrees with the commenters' request. Section 26.91(c)(2) in the proposed and final rule specifically applies only to EBTs used to conduct confirmatory alcohol tests (designated on the NHTSA CPL without an asterisk) and not to EBT models identified on the NHTSA CPL that may be used only to conduct initial alcohol tests (designated with an asterisk on the NHTSA CPL). The majority of EBT models appearing on the NHTSA CPL without an asterisk have the capability to display a unique test number before each test and to print the same unique test number with the alcohol test result once the test is completed. Requiring an EBT that is used for confirmatory testing to display and print a unique test number establishes the chain of custody for the test result and ensures that the result is legally defensible. For example, if the same EBT is used to conduct both initial and confirmatory testing, a unique test number for each test provides the documentation necessary to establish that the individual has actually been tested two different times. Therefore, if the EBTs used by the commenters do not meet the functional requirements specified in § 26.91(c)(2), test results from these EBTs may not be legally defensible if challenged. The final rule permits a licensee or other entity to continue to use any approved EBT model on the most current NHTSA CPL to perform initial alcohol tests. However, confirmatory alcohol tests must be conducted using an EBT meeting the specifications in § 26.91(c) of the final rule. In addition, industry affirmed that the cost estimate in the regulatory analysis of the proposed rule provision is consistent with projected new equipment purchases by some FFD programs. The NRC also deems it unlikely that this requirement will have any significant impact on EBT manufacturers. Because other Federal agencies have similar EBT requirements, most notably the U.S. DOT, this NRC requirement should have no appreciable impact on the EBT market.

7.6.4 Quality Assurance and Quality Control of ASDs (§ 26.91(d))

No comments addressed this section.

7.6.5 Quality Assurance and Quality Control of EBTs (§ 26.91(e))

External Calibration Definition

Comments: One commenter addressed proposed § 26.91(e) and noted that the term "external calibration check" was not defined. The commenter suggested eliminating "external" from the term "external calibration check." [Jim Davis, NEI #48; Richard Sweigart, DCS; Keith Jury, Exelon; Mark Wetterhahn, Winston Strawn; Edward Weinkam, NMC; Don Grissette, SNC; Keith D. Young, Ameren; Glenn Morris, TVA; Ronald Gaston, Detroit Edison; Gregory Halnon, FENOC; Jeffrey Archie, SCE&G; Brian McCabe, Progress Energy; C.L. Funderburk, Dominion; F.G. Burford, Entergy].

NRC Response: The NRC disagrees with the commenter's request. The term "external calibration check" has a specific meaning for EBT devices and is a commonly used term for describing the quality assurance measures taken by a collection site to evaluate the performance of an EBT. A collection site must ensure the each EBT used for FFD program alcohol testing is functioning within the acceptable tolerance limits specified in the quality assurance plan of the equipment manufacturer by conducting a specific accuracy check on the equipment, which is called an external calibration check.

Frequency of External Calibration Checks on EBTs

Comments: One commenter addressed proposed § 26.91(e)(1) that required, at a minimum, that an external calibration check must be performed on an EBT according to the time interval specified in the manufacturer's quality assurance plan (QAP). The commenter requested that the NRC revise this section to require an external calibration check to be performed more frequently because a donor could be sanctioned for a positive test result that would be later overturned if the EBT was malfunctioning (i.e., fails the next external calibration check). Specifically, the commenter requested that an external calibration be performed on each EBT used for testing at the start and end of each testing day. [Todd Newkirk, IBEW].

NRC Response: The NRC agrees, in part, with the commenter's request. The QAPs for many EBTs require only monthly external calibration checks and/or external calibration checks more frequently, if a specific number of tests have been performed. The NRC considered requiring more frequent external calibration checks, but could find no reasonable basis for establishing schedules that would be more appropriate for every EBT on the NHTSA list than those recommended by EBT manufacturers. To address this concern, § 26.91(e)(4) in the final rule provides two optional procedures that licensees or other entities must choose from for reacting to an EBT's failure of an external calibration check. The first option directs that, if an EBT fails an external calibration check, the licensee or other entity is to cancel every confirmed positive test result that was obtained using the EBT from any tests that were conducted after the EBT passed its last external calibration test. Alternatively, collection sites are directed to conduct an external calibration check on the EBT in the presence of the donor after every confirmed positive test result using that EBT. If the EBT fails the external calibration check, the rule requires the collector to cancel the donor's test result and immediately conduct a second specimen collection (initial and, if necessary, confirmatory test) using another EBT. Performing the external calibration check while the donor is still present ensures that, if an EBT is malfunctioning, another EBT that meets the requirements in § 26.91(c) can be used to perform additional alcohol testing in a timely manner. Under either of these options, performing external calibration checks at the start and end of each testing day would be unnecessary and both ensure that donors will not be subject to sanctions based on erroneous test results.

<u>EBT Calibrations and Cancellation of Positive Test Results</u>

Comments: One commenter, supported by other commenters, disagreed with the provision in proposed § 26.91(e)(3) pertaining to an EBT that fails an external check of calibration. The commenter objected to the proposed requirement to cancel all positive breath alcohol test results from the point the EBT last passed an external calibration check to the point the EBT failed the external calibration check and was taken out of service. The commenter argued that "since fitness for duty has traditionally been considered an aspect of physical plant security, it causes one to make a comparison to those situations when security equipment fails, and that comparison yields contradictory results. For instance, if access screening equipment fails, all personnel in the protected area are not required to be re-searched because there is not an automatic assumption made that the machine was inoperative and everyone in the plant was improperly screened. In the same manner, personnel within a vital area are not required to leave the area when the access device or door alarm fails because there is not an automatic assumption made that they were able to obtain unauthorized or undetected access. In each of these instances, the assumption is that the equipment failed in the testing officer's presence and compensatory measures are implemented, to include an investigation. . . The same line of thinking should be applied across the spectrum of security, including FFD. Unless evidence can

be provided that can demonstrate failure occurred immediately following the last successful test, the assumption should not be that the equipment was not working, it should be that it worked properly until the failing test was performed." The commenter also asserted that having to "negate all positives since the last successful test will probably cause an increase in the frequency of testing to minimize the impact from this occurring. The implied test frequency exceeds the required frequency, adding burden to FFD staff and increased costs not calculated in the regulatory analysis." [Jim Davis, NEI #48; Richard Sweigart, DCS; Keith Jury, Exelon; Mark Wetterhahn, Winston Strawn; Edward Weinkam, NMC; Don Grissette, SNC; Keith D. Young, Ameren; Glenn Morris, TVA; Ronald Gaston, Detroit Edison; Gregory Halnon, FENOC; Jeffrey Archie, SCE&G; Brian McCabe, Progress Energy; C.L. Funderburk, Dominion; F.G. Burford, Entergy].

NRC Response: The NRC disagrees that a positive confirmed breath alcohol test result should not be overturned when the EBT used during the test fails an external calibration check. Each donor must receive a fair and accurate test result. A donor should not be subject to sanctions based on a test result produced by a malfunctioning EBT. However, the NRC has revised § 26.91(e) in the final rule to provide licensees and other entities with two options to respond to EBT external calibration check failures. This section retains the proposed § 26.91(e)(3) requirement (in § 26.91(e)(4)(i) in the final rule) that any positive confirmatory alcohol test results that were obtained from an EBT that fails an external calibration check must be cancelled and also that the results of any tests that were conducted with that EBT subsequent to its last successful external calibration check must be cancelled. Section 26.91(e)(4)(ii) in the final rule adds a second option. This section permits licensees and other entities to conduct an external calibration check of the EBT after each positive confirmatory alcohol test result. If the EBT fails the check, the collector must cancel the donor's test result and perform another initial and confirmatory alcohol test, if necessary, using a different EBT. The NRC finds no basis for the commenter's conclusion that the proposed provision would cause additional burden and costs. Given that the positive rate for alcohol testing is low, the likelihood that many test results would be required to be overturned by any FFD program is insignificant.

Copy of the External Calibration Records for EBTs

Comments: One commenter addressed the quality assurance and quality control provisions contained in proposed § 26.91(e)(3) and requested that a provision be added to permit a donor or donor representative to receive a copy of the external calibration check record performed on the EBT used to test the donor [Todd Newkirk, IBEW].

NRC Response: The NRC's expansion of donors' right to obtain their FFD-related records in § 26.37(d) of the final rule addresses this comment. This section in the final rule stipulates that individuals subject to Part 26 requirements, or their designated representatives, have the right to request and receive "…all FFD records pertaining to the individual, including, but not limited to,…drug and alcohol test results…." This information includes records of external calibration checks on EBTs from a collection site. The NRC believes that access to this information is necessary to protect donors' rights, including due process, under the rule.

7.7 Preparing for Alcohol Testing (§ 26.93)

No comments addressed this section.

7.8 Conducting an Initial Test for Alcohol Using a Breath Specimen (§ 26.95)

No comments addressed this section.

7.9 Conducting an Initial Test for Alcohol Using a Specimen of Oral Fluids (§ 26.97)

No comments addressed this section.

7.10 Determining the Need for a Confirmatory Test for Alcohol (§ 26.99)

Comments: One commenter requested that proposed § 26.99 be revised to specifically prohibit any further licensee actions or sanctions against a donor with a breath alcohol concentration result of less than 0.02 percent BAC [Todd Newkirk, IBEW].

NRC Response: The NRC disagrees with the commenter's request. Section 26.23(b) in the final rule stipulates that FFD programs must "Provide reasonable assurance that individuals are not under the influence of any substance, legal or illegal, or mentally or physically impaired from any cause, which in any way adversely affects their ability to safely and competently perform their duties…." Moreover, when an individual appears to be impaired or the individual's fitness appears to be questionable, § 26.77(b) in the final rule requires a licensee or other entity to take immediate action to prevent the person from performing activities that would make him or her subject to Part 26 requirements. Although an individual may have an initial alcohol test result of less than 0.02 percent BAC, other indicators may suggest possible impairment. In these cases, the licensee or other entity must take action consistent with the § 26.77(b) to assure the individual's ability to safely and competently perform duties covered by Part 26.

7.11 Conducting a Confirmatory Test for Alcohol (§ 26.101)

No comments addressed this section.

7.12 Determining a Confirmed Positive Test Result for Alcohol (§ 26.103)

Comments: One commenter, supported by many commenters, stated that proposed § 26.103 would improve the effectiveness of FFD programs in detecting alcohol misuse by ensuring that confirmatory alcohol testing identifies employees who have either consumed alcohol while on duty or before duty and may pose a risk to public health and safety. [Jim Davis, NEI #48; Richard Sweigart, DCS; Keith Jury, Exelon; Mark Wetterhahn, Winston Strawn; Edward Weinkam, NMC; Don Grissette, SNC; Keith D. Young, Ameren; Glenn Morris, TVA; Ronald Gaston, Detroit Edison; Gregory Halnon, FENOC; Jeffrey Archie, SCE&G; Brian McCabe, Progress Energy; C.L. Funderburk, Dominion; F.G. Burford, Entergy].

NRC Response: The NRC agrees with the commenters that § 26.103 improves FFD program effectiveness and has retained this provision without change in the final rule.

Scientific Basis for Assigning a Positive Alcohol Test Result for 0.02 and 0.03 BAC Levels

Comments: One commenter addressed proposed § 26.103(a)(2) and (a)(3) by questioning the scientific validity of assigning a positive test result for an individual with a BAC of 0.03 percent and work status of at least 1 hour, or a BAC of 0.02 percent and work status of at least 2 hours. The commenter asked, "Due to differences in metabolism how can a straight line cutoff be established?" The commenter suggested that several breath specimens should be collected to calculate the decay ratio for the individual being tested [Todd Newkirk, IBEW].

NRC Response: The NRC disagrees with the commenter. Individual metabolism rates for alcohol may be influenced by an individual's weight, the number of metabolizing enzymes present in an individual's liver (a healthy liver vs. a diseased liver), and other factors, such as food consumption. However, individual differences in metabolism should not impact the procedures for back-extrapolation in § 26.103(a). The final rule requires individuals to abstain from alcohol use for at least 5 hours before reporting for duty. Back-extrapolation would be conducted for the first, second, or third hour after an individual has reported for duty. These procedures provide an alcohol-free period of 6 to 8 hours before an alcohol test, which is more than an adequate period of time for all alcohol consumed by even a moderately heavy drinker (3 to 4 drinks per episode) to have been metabolized from the body under normal conditions. Further, if a heavy drinker (5 or more drinks per episode) consumed significant amounts of alcohol just before the beginning of the pre-work abstinence period and had tested positive under these procedures, removal from duty would be warranted not only for the alcohol remaining in the individual's body, but also for the likely carry-over effects (e.g., hangovers) that could affect concentration and cognitive skills. The cutoff levels and time periods in § 26.103(a)(2) and (a)(3) are based on the average rate at which normal metabolic processes reduce an individual's BAC over time, which is about 0.01 percent BAC per hour. The NRC is confident that use of this average metabolic rate, in conjunction with back-extrapolation, will result in fair and accurate alcohol test determinations. Thus, if a donor's BAC is measured as 0.03 percent after he or she has been at work for 1 hour, he or she would have had a BAC of approximately 0.04 percent when reporting for work an hour before the test. Through the same metabolic processes, a donor whose BAC is measured as 0.02 percent after he or she has been in a work status for 2 hours would also have had a BAC of approximately 0.04 percent when he or she reported for work 2 hours before the test. These requirements ensure that confirmatory alcohol testing will identify workers who may have posed a risk to public health and safety by being impaired from alcohol use while on duty.

Comments: One commenter stated that the provisions in proposed § 26.103(a) conflict with the FFD policy requirement in proposed § 26.27(c)(3) that pertained to unscheduled working tours. Specifically, § 26.27(c)(3) stated that "no sanctions may be imposed on an individual called in to perform an unscheduled working tour and has consumed alcohol within the pre-duty abstinence period stated in the policy." [Todd Newkirk, IBEW].

NRC Response: The NRC disagrees that there is a conflict between the requirements in §§ 26.103(a) and 26.27(c)(3). Section 26.27(c)(3) requires licensees and other entities to maintain procedures "to ensure that individuals who are called in to perform an unscheduled working tour are fit for duty." In cases where an individual indicates that he or she has consumed alcohol within the pre-duty abstinence period, § 26.27(c)(3)(ii)(A) specifies that this procedure must "Require a determination of fitness by breath alcohol analysis or other

means…." The NRC has revised proposed §26.27(c)(3) by adding specific directives in the final rule regarding whether or not the individual may be assigned to Part 26-related duties, including emergency response duties, depending on whether the determination of fitness indicates that the individual is fit to safely and competently perform his or her duties. Section 26.27(c)(3)(ii)(E) in the final rule further stipulates that "…no sanctions may be imposed on an individual who is called in to perform any unscheduled working tour for having consumed alcohol within the pre-duty abstinence period stated in the policy."

Section 26.103(a) in the final rule, on the other hand, establishes the cutoff levels for confirmatory alcohol test results that licensees and other entities must declare as positive test results. These requirements are to be used in the "…determination of fitness by breath alcohol analysis or other means…" required in § 26.27(c)(3)(ii)(A) as in any other Part 26 testing for alcohol. Section 26.103(a) does not, however, contain any requirements related to sanctions. Thus, there is no conflict between the § 26.103(a) test result requirements and the § 26.27(c)(3)(ii)(E) stipulation that no sanctions may be imposed on an individual who is called in to perform any unscheduled working tour for having consumed alcohol within the pre-duty abstinence period. Therefore, the NRC has not modified these provisions in the final rule.

7.13 Preparing for Urine Collection (§ 26.105)

Comments: One commenter addressed proposed § 26.105(b) that required each urine specimen donor to empty the contents of his or her pockets so that the collector can inspect the items to ensure that the donor does not possess items that could be used to tamper with, adulterate, or substitute a urine specimen. The commenter requested that the proposed provision be revised to require collection sites to post a list of items that a collector could consider to be used to attempt to subvert the testing process. The commenter expressed concern that the proposed provision was ambiguous in that the collector may determine if an "item appears to have been inadvertently brought to the collection site" or may determine if an item was brought by the donor to the collection site "with the intent to adulterate the specimen." The commenter also expressed concern that an employee might bring a harmless substance such as a bottle of eye drops to the collection site and the collector might wrongly accuse the donor of attempting to subvert the testing process. The commenter suggested that an alternative to a posted list would be to require each donor to place all items on his or her person in a locker outside the collection area. The donor would be provided with the key to the locker which he or she would keep during the collection process [Todd Newkirk, IBEW].

NRC Response: The NRC disagrees with the commenter. The commenter's suggestion regarding a list of items that potentially could be used to subvert alcohol testing is untenable because collection site personnel would have no effective way to identify all possible items. Further, § 26.105 in the final rule provides for urine collection preparation procedures that protect against unjust determinations of subversion attempts. In particular, § 26.105(b) requires that if a collector identifies an item that the collector determines the donor brought to the collection site with the intent of adulterating or substituting a urine specimen, the collector must contact the MRO or FFD program manager to determine if further action must be taken. This review will ensure that a collector makes an accurate determination of whether or not the donor had intended to subvert the testing process. Also, the final rule requires urine collectors to receive training on collection procedures to ensure that correct decisions regarding the contents of a donor's pockets can be made. Finally, if a collector determines that a donor has

inadvertently brought something to the collection site (e.g., eye drops), the collector is required, by proposed and final § 26.105(b), to secure the item(s) outside the stall or enclosure used by the donor to provide a specimen before beginning a specimen collection. The NRC believes that these provisions provide adequate protections for each donor and ensure the integrity of the testing process. Therefore, the NRC has not modified this provision in the final rule.

Refusal to Test Action - Donor Refusal to Display the Contents of their Pockets

Comments: One commenter addressed proposed § 26.105(b) that stated a donor's refusal to show the collector the items in his or her pockets is an action considered to be a refusal to test. The commenter stated that solely relying on a collector to verbally inform the donor of the actions considered a refusal test is inadequate because the collector may forget to convey the information. The commenter requested that a description of the refusal to test actions be included on the donor consent-to-test form or be posted in a conspicuous location at the collection site. [Todd Newkirk, IBEW].

NRC Response: The NRC agrees, in part, with the commenter's request. Section 26.89(c) in the final rule requires that a collector must inform a donor that having an item that could be used to interfere with providing an actual urine specimen is a refusal to test. Individuals subject to Part 26 drug and alcohol testing are also informed of refusal to test actions in other ways. All individuals subject to the provisions of a licensee's or other entity's FFD program must be informed of the program policies under § 26.27(b) and must receive training on the FFD policy and consequences of violating the policy under § 26.29(a)(1). Section 26.27(b) requires that a written FFD policy statement be readily available to all covered individuals and include "sufficient detail to provide affected individuals with information on what is expected of them and what consequences may result from a lack of adherence to the policy." One of the minimum FFD policy statement elements in § 26.27(b) is to "describe the actions that constitute a refusal to test, the consequences of refusals to provide a specimen for testing, as well as the consequences of subverting or attempting to subvert the testing process." The NRC believes that individuals subject to Part 26 urine testing will receive adequate notice of the actions that are considered a refusal test through this combination of access to FFD policy statements, training, and being informed at the urine collection site that having an item that could be used to interfere with providing an actual urine specimen is a refusal to test.

7.14 Collecting a Urine Specimen (§ 26.107)

Comments: Two commenters addressed proposed § 26.107(a)(3). One commenter, supported by many others, agreed with the proposed provision that permitted a collector to use professional judgement to determine an acceptable time limit for a donor to void. The commenter stated that the provision provided flexibility for a collector to accommodate a donor who needs additional time, when appropriate, but also ensured that the collector can prevent a donor from disrupting the testing process by attempting to delay the testing process [Jim Davis].

Another commenter requested that the proposed provision be revised to specify the time limit that is considered a "reasonable time limit for voiding." The commenter requested that a time limit be specified to remove possible subjectivity as to what a collector may deem as a reasonable time limit for voiding [Todd Newkirk, IBEW].

NRC Response: The first comment does not require a response. The NRC disagrees with the second commenter's request to establish a specific time limit that is acceptable for a donor to void. Collectors need flexibility to allow some donors additional time to provide a specimen (e.g., an individual with a disability). In addition, during public meetings some stakeholders reported incidents in which some donors delayed the testing process and challenged the collector's authority to set a time limit on a specimen provision. The intent of § 26.107(a)(3) in the final rule is to provide collectors with the necessary authority to set a reasonable time limit for voiding and to prevent a donor from disrupting the testing process. The collector should rely on his or her professional judgment in setting this time limit. Section 26.85(a) specifies new training and qualification requirements for collectors to ensure that they are able to exercise this professional judgment appropriately. Section 26.107(a)(3) is also consistent with other Federal agency requirements (e.g., U.S. DOT). Therefore, the NRC has not modified the proposed provision in the final rule.

7.15 Urine Specimen Quantity (§ 26.109)

Comments: One commenter addressed proposed § 26.109(b)(1) that permitted a donor to consume up to 24 ounces of fluid in situations where the donor fails on an initial attempt to provide the minimum quantity of urine. The commenter stated that the proposed provision was consistent with the HHS Guidelines, but not the U.S. DOT's provision to permit a donor up to 40 ounces of fluid [Sue Brown, Individual].

NRC Response: The NRC agrees with the commenter and has revised § 26.109(b)(1) to permit donors to consume up to 40 ounces of liquid over a 3-hour period if they fail on their initial attempt to provide the minimum quantity of urine. This is consistent with the quantity of fluid that other Federal testing programs (i.e., U.S. DOT) permit a donor in a shy-bladder situation to consume. The NRC believes that this amount will give donors a better chance than under the proposed rule's 24-ounce limit to provide a urine specimen of the required quantity while at the same time ensuring that individuals who may be subject to water intoxication will not be placed at risk.

<u>Specify That a Collector Must Discard a Specimen that is Less Than 30 mL in Quantity</u>

Comments: One commenter stated that proposed § 26.109(b) did not clearly state that if the quantity of urine collected from a donor is less than 30 mL the collector must discard the specimen and collect another. The commenter suggested that the NRC revise proposed § 26.109(b)(1) to state: "The collector shall discard the specimen and a second specimen shall be collected" and delete the second sentence under proposed § 26.109(b)(1) [Sue Brown, Individual].

NRC Response: NRC disagrees with the commenter's request. Section 26.109(b)(4) in the final rule addresses the commenter's concern because it states that "The collector shall discard specimens of less than 30 mL, except if there is reason to believe that the donor has diluted, adulterated, substituted or otherwise tampered with the specimen . . ." Therefore, the NRC has not modified the proposed provision in the final rule.

7.16 Checking the Validity of the Urine Specimen (§ 26.111)

Acceptable Temperature Range of a Urine Specimen

Comments: One commenter, supported by other commenters, agreed with the proposed provision to expand the acceptable temperature range of a urine specimen in § 26.111. [Jim Davis, NEI #48; Richard Sweigart, DCS; Keith Jury, Exelon; Mark Wetterhahn, Winston Strawn; Edward Weinkam, NMC; Don Grissette, SNC; Keith D. Young, Ameren; Glenn Morris, TVA; Ronald Gaston, Detroit Edison; Gregory Halnon, FENOC; Jeffrey Archie, SCE&G; Brian McCabe, Progress Energy; C.L. Funderburk, Dominion; F.G. Burford, Entergy].

NRC Response: The comment does not require a response.

Comments: One commenter requested the NRC to clarify proposed § 26.111 by specifying whether validity screening (including specific gravity testing) is to be performed at the point of collection or at the point of testing [Anonymous].

NRC Response: Comments received on point of collection testing and specific gravity testing are addressed in Subpart F.

Timing of Measuring a Donor's Temperature

Comments: One commenter addressed proposed § 26.111(a) that required a collector to measure the temperature of a specimen sooner than the 4-minute limit from the point the specimen is provided to the collector, if the ambient temperature was low or the specimen quantity was small. The commenter stated that the proposed provision would be difficult to monitor and would be subject to legal challenge. The commenter recommended that the provision be eliminated from the final rule [Charles LoDico, Individual].

NRC Response: The NRC agrees with the commenter and has eliminated the wording in § 26.111(a) of the proposed rule to which the commenter objected. The normal collection process is that the collector immediately measures the temperature of the specimen once the donor presents the specimen to the collector. The intent of the proposed provision was to serve as guidance to collectors, directing them to take special care to quickly measure the temperature of a specimen under specific circumstances. However, the NRC recognizes that obtaining an accurate temperature reading on specimens smaller than 15 mL can be difficult. Thus, § 26.109(b)(4) in the final rule requires collectors to discard these small specimens. This section also directs collectors to discard specimens of 15 mL or more, but less than 30 mL, unless they have a reason to believe that these specimens have been diluted, adulterated, substituted, or otherwise altered. In these cases, § 26.109(b)(4) directs collectors to transfer the suspect specimens to an HHS-certified laboratory and contact FFD program management to determine whether a directly observed collection is required. It should also be noted, however, that when a small specimen's temperature falls outside the temperature range specified in § 26.111(b), MROs and FFD program managers have the authority, under the § 26.111 provisions, to decide that the low temperature is not a reason to believe that attempted subversion has occurred and they are not required to order a directly observed collection in every instance.

Comments: One commenter, supported by many others, addressed proposed § 26.111(a) regarding measuring the temperature of a specimen within 4 minutes of the specimen collection. The commenter stated that the temperature difference between a donor's specimen and a donor's body temperature as specified in § 26.115(a)(2)(ii) lacked a scientific basis without a time consideration. The commenter stated that a donor's specimen will begin to cool immediately and will continue to cool until it reaches temperature equilibrium with the surrounding air. Because the cooling rate of a specimen is largely a function of the temperature difference between the specimen and the surrounding air and the temperature difference is typically significant (approximately 25 degrees F), the commenter suggested that a donor's body temperature be taken as soon as possible after the specimen is determined to be outside the acceptable temperature range. [Jim Davis, NEI #48; Richard Sweigart, DCS; Keith Jury, Exelon; Mark Wetterhahn, Winston Strawn; Edward Weinkam, NMC; Don Grissette, SNC; Keith D. Young, Ameren; Glenn Morris, TVA; Ronald Gaston, Detroit Edison; Gregory Halnon, FENOC; Jeffrey Archie, SCE&G; Brian McCabe, Progress Energy; C.L. Funderburk, Dominion; F.G. Burford, Entergy].

NRC Response: The NRC agrees in part with this commenter's requests. The NRC has eliminated the provision in proposed § 26.115(a)(2)(ii) that would have authorized comparing the donor's body temperature and specimen temperature as part of a reason for requiring a subsequent collection of a urine specimen under direct observation. Public comments at stakeholder meetings indicated that the U.S. DOT's experience shows that there are often discrepancies when comparing the temperature provided by a specimen container temperature slip and the temperature provided by a device that measures body temperature. Somewhat contrary to the commenter's second suggestion, however, the NRC has decided to eliminate the option for the donor to volunteer to provide a measurement of body temperature that appeared in proposed § 26.111(b). As compared to the former rule, § 26.111 in the final rule creates a wider range of acceptable specimen temperatures. With this increase in acceptable temperature range, measurement of body temperature is less useful to counter a reason to believe that the donor has altered the specimen. This change is consistent with the testing regulations for other Federal agencies (U.S. DOT, and HHS Mandatory Guidelines for Federal Workplace Drug Testing Programs). It should also be noted that § 26.111(c) in the final rule allows the donor to volunteer to submit a second specimen under direct observation. This provides the donor with an opportunity to counter any reason to believe that he or she may have altered or substituted the first specimen.

Comment: One commenter addressed proposed § 26.111(b) that allowed a donor to volunteer to have his or her body temperature measured by the collector in the circumstance when the specimen that a donor provides is outside the acceptable temperature range. The commenter suggested that NRC reconsider permitting the measurement of a donor's body temperature given that a temperature measuring device is a better indicator of body temperature than the temperature strips used on specimen collection containers [Charles LoDico, Individual].

NRC Response: The NRC agrees with the commenter's request. The NRC has eliminated the proposed provision in § 26.111(b) that, in cases when the specimen is out of the acceptable temperature range, would have allowed the donor to volunteer to have his or her body temperature taken to provide evidence to counter a reason to believe that the donor may have altered or substituted the specimen. As compared to the former rule, § 26.111 in the final rule creates a wider range of acceptable specimen temperatures. With this increase in acceptable

temperature range, measurement of body temperature is less useful to counter a reason to believe that the donor has altered the specimen. The elimination of the option to measure a donor's body temperature is also consistent with the testing regulations for other Federal agencies (U.S. DOT, and HHS Mandatory Guidelines for Federal Workplace Drug Testing Programs).

Comments: One commenter addressed proposed § 26.111(b) and stated that if the temperature of a specimen is outside the acceptable range, a form should be used by the collector so that the actual temperature of the donor can be recorded or the donor can sign the form refusing to permit his or her body temperature to be measured [Todd Newkirk, IBEW.]

NRC Response: The NRC has addressed this commenter's concern by eliminating this provision in the final rule, as discussed with respect to the preceding comment.

Use of the Word "Validity" in the Title for § 26.111

Comments: One commenter, supported by other commenters, requested that the word "validity" in the heading for proposed § 26.111, "Checking the validity of the urine specimen," be changed to "acceptability." The commenter recommended the word change to reduce possible confusion that may arise given that three definitions in § 26.5 (initial validity testing, screening validity testing, confirmatory validity testing) already include the word "validity." The commenter suggested using the word "acceptability" given its use in proposed § 26.111(g), which stated that an acceptable specimen is within the acceptable temperature range, is at least 30 mL in quantity, and is free of any apparent contaminants [Jim Davis, NEI #48; Richard Sweigart, DCS; Keith Jury, Exelon; Mark Wetterhahn, Winston Strawn; Edward Weinkam, NMC; Don Grissette, SNC; Keith D. Young, Ameren; Glenn Morris, TVA; Ronald Gaston, Detroit Edison; Gregory Halnon, FENOC; Jeffrey Archie, SCE&G; Brian McCabe, Progress Energy; C.L. Funderburk, Dominion; F.G. Burford, Entergy].

NRC Response: The NRC agrees with this request and has revised the heading of § 26.111 in the final rule to improve the clarity of the heading used to describe the provisions in this section.

7.17 Splitting the Urine Specimen (§ 26.113)

Comments: One commenter disagreed with proposed § 26.113(b)(1) that required a donor to urinate into either a specimen bottle or a specimen container. The commenter asserted that the proposed process might produce conflicting results for Bottle A and Bottle B, especially if a donor successfully adulterates one bottle and the laboratory identifies the adulterant. The donor could challenge the laboratory result by requesting Bottle B specimen testing which would produce a different test result (if no adulterant were added to the Bottle B specimen) that would result in the cancellation of the test result. The commenter recommended that for all specimen collections, a urine specimen be collected in a collection cup and that the collector transfers the urine specimen into the A and B bottles [Charles LoDico, Individual].

NRC Response: The NRC agrees with the commenter's reasoning and has eliminated the proposed provision that a donor may urinate into a specimen bottle. The final rule requires the collector to direct the donor to urinate into a specimen container. Once the donor provides a specimen that is within the acceptable temperature range, is at least 30 mL in quantity, and is

free of any apparent contaminants, the collector will split the specimen into Bottle A and Bottle B under § 26.113(b)(2) and (3) of the final rule.

Comments: One commenter addressed proposed § 26.113(b)(2) and suggested that the phrase "a minimum of" be added to the requirement that "Bottle B must contain 15 mL." [Sue Brown, Individual].

NRC Response: The NRC agrees with the commenter's request and has revised § 26.113(b)(2) in the final rule. This provision now requires the collector to pour a minimum of 15 mL of urine into Bottle B or all urine that remains after pouring 30 mL into Bottle A. As revised, this section of the final rule more clearly specifies that the specimen in Bottle A must be used for drug and validity testing even if there is less than 15 mL of urine available for Bottle B. The agency made this clarification because, in the experience of other Federal agencies, some collection sites have discarded any specimen of less than 45 mL and conducted another collection to obtain a sufficient amount of urine to fill both Bottles A and B. The NRC intends that licensees and other entities subject to Part 26 do not adopt this burdensome practice.

Comments: One commenter addressed proposed § 26.113(b)(2) and suggested that the provision appeared to suggest that a collector would not send Bottle B to either the HHS-certified laboratory or to a licensee testing facility if the quantity of the specimen in Bottle B is less than 15 mL. The commenter suggested that the provision be revised to read: "If there is less than 15 mL of urine available for Bottle B, all remaining urine must be poured into Bottle B. Bottle A and Bottle B must be sent to the HHS-certified laboratory." [Sue Brown, Individual]

NRC Response: NRC agrees with the commenter's request to clarify the proposed requirement and has revised § 26.113(b)(2) in the final rule to require the collector to send both Bottles A and B to the HHS-certified laboratory in circumstances where there is less than 15 mL of urine available for Bottle B. In this circumstance, forwarding the Bottle B specimen to a licensee testing facility is unnecessary, because there is insufficient urine for conducting any testing at the licensee testing facility. This requirement is also consistent with other provisions of the final rule that require collectors to forward specimens with other unusual characteristics to the HHS-certified laboratory.

7.18 Collecting a Urine Specimen under Direct Observation (§ 26.115)

Comments: One commenter requested that NRC define the terms "EC" and "EF" in proposed § 26.115(a)(2)(ii) that stated: "The donor's measured body temperature varies by more than 1EC/1.8EF from the temperature of the specimen." [Charles LoDico, Individual]. Another commenter recommended that NRC replace the letter "E" in the terms "EC" and "EF" with the word "degrees" [Jim Davis, NEI #48; Richard Sweigart, DCS; Keith Jury, Exelon; Mark Wetterhahn, Winston Strawn; Edward Weinkam, NMC; Don Grissette, SNC; Keith D. Young, Ameren; Glenn Morris, TVA; Ronald Gaston, Detroit Edison; Gregory Halnon, FENOC; Jeffrey Archie, SCE&G; Brian McCabe, Progress Energy; C.L. Funderburk, Dominion; F.G. Burford, Entergy].

NRC Response: The NRC has eliminated the requirement in proposed § 26.115(a)(2)(ii) because U.S. DOT's experience shows that there are often discrepancies when comparing the temperature provided by a specimen container temperature slip and the temperature provided by

a device that measures body temperature. Also, § 26.111(b) of the final rule no longer permits a body temperature measurement in instances where a donor provides a specimen that is outside of the acceptable temperature range. Therefore, it is unnecessary for the NRC to make the commenters' suggested change.

7.19 Preparing Urine Specimens for Storage and Shipping (§ 26.117)

Specimen Chain of Custody

Comments: One commenter addressed proposed § 26.117(g) and requested that the provision be revised to more precisely describe what a break in the chain of custody is and what specific actions must be taken [Todd Newkirk, IBEW].

NRC Response: The NRC agrees with the commenter's request. The NRC has added provisions to § 26.129(b) in Subpart F and § 26.159(b) in Subpart G of the final rule to identify the circumstances that require the MRO to cancel the testing of a specimen as a result of conditions that demonstrate the specimen's chain of custody is unverifiable (e.g., the identification numbers on the specimen bottle seal(s) do not match the identification numbers on the custody-and-control form). The requirements included in the final rule are consistent with the related drug testing provisions of the U.S. DOT and are necessary to protect the integrity of the testing process.

Specimen Storage Requirements - Cooling to Not More than 6 Degrees Celsius:

Comments: One commenter addressed proposed § 26.117(j) that required a specimen to be stored at not more than 6 degrees Celsius if the specimen is not shipped to an HHS-certified laboratory or licensee testing facility within 24 hours of the specimen collection or if a specimen is suspected of being tampered with, adulterated, or substituted. The commenter stated that the HHS Guidelines do not contain the specimen storage requirements in the proposed provision [Sue Brown, Individual].

NRC Response: The NRC disagrees with the commenter. The NRC has chosen to maintain the former rule's refrigerated specimen storage requirement. This requirement improves FFD programs' ability to reduce the likelihood of specimen degradation that can lead to erroneous test results and improves the ability of the FFD program to detect and deter prohibited drug use. Therefore, the NRC has not modified the proposed provision in the final rule.

7.20 Determining "Shy" Bladder (§ 26.119)

Comments: One commenter addressed proposed § 26.119(a) and stated that the proposed 5-business day time limit for a donor to receive a medical evaluation after failing to provide the minimum quantity of urine within the 3-hour time limit for a specimen collection is inadequate. The commenter asserted that obtaining an appointment with a medical doctor, especially if the doctor is a specialist, is highly unlikely within the proposed 5-day time limit [Todd Newkirk, IBEW].

NRC Response: The NRC disagrees with the commenters request. The provision was consistent with other federal testing programs (U.S. DOT). It also accounted for the likelihood

that most doctors' offices do not offer appointments during weekends or holidays. The NRC established the time limit of 5 business days as a trade-off between the need to provide the donor with sufficient time to locate a qualified physician and obtain an appointment, and for the physician to complete the evaluation (i.e., the donor's right to due process), and the public's interest in a rapid determination of whether the donor had attempted to subvert the testing process by refusing to provide a sufficient specimen. The U.S. DOT's experience indicates that 5 days is sufficient to complete the evaluation. Therefore, the NRC has not modified the proposed provision in the final rule.

Comments: One commenter addressed § 26.119(a) and inquired as to why a medical doctor who conducts the "shy-bladder" evaluation on a donor must be acceptable to the MRO [Todd Newkirk, IBEW].

NRC Response: The NRC has retained the requirement in § 26.119(a) that a licensed physician who evaluates the donor must be acceptable to the MRO. This is necessary to ensure that the physician is qualified because not all physicians may have the requisite expertise specific to this particular medical condition. MROs will be qualified to assess the expertise of other physicians as a result of the training required to obtain certification under § 26.183(a).

Comments: One commenter addressed proposed § 26.119 and stated that the NRC should consider the use of alternate specimen testing in situations where a donor fails to provide the minimum quantity of urine necessary for specimen testing within the permitted 3-hour time limit. The commenter suggested that alternate specimen testing be considered an option for shy-bladder situations, given that proposed § 26.31(d)(5) allowed for alternate specimen testing if an MRO determines that a donor has a medical condition that precludes urine drug testing [Todd Newkirk, IBEW].

NRC Response: The NRC agrees, in part, with the commenter's request. Testing alternate specimens may be necessary in shy-bladder situations. However, it is imperative that a valid medical condition is confirmed and that only the MRO has the authority to order alternate testing. The NRC disagrees that using an alternate specimen for testing in these situations should be a standard procedure to be routinely implemented by specimen collectors. The MRO must be involved in making or reviewing the medical diagnosis, determining the specimens that are to be collected and tested based on the most recent information available about the accuracy and sensitivity of testing methods for alternate specimens, and directing how the collection and testing procedures must be performed. The MRO's involvement in this process is necessary to ensure that testing of alternate specimens will provide valid and legally defensible results. Section 26.31(d)(5) addresses circumstances when it may be impossible or inadvisable to perform urine drug testing on an individual and permits alternative specimen collection and evaluation procedures for rare instances when it would be difficult or hazardous to the donor to collect breath, oral fluids, or urine specimens. This subsection makes clear that only the MRO is permitted to authorize an alternative evaluation procedure, which may include, but is not limited to blood testing for alcohol. Therefore, the NRC has not modified the proposed provision in the final rule.

8. Subpart F: Licensee Testing Facilities

8.1 Purpose (§26.121)

No comments addressed this section.

8.2 Testing Facility Capabilities (§ 26.123)

Comments: One commenter suggested that each licensee testing facility be required to meet the Initial Instrumented Testing Facility (IITF) specifications described in the proposed revisions to the HHS Mandatory Guidelines for Federal Workplace Drug Testing Programs (69 FR 19672) [Sue Brown, Individual].

NRC Response: The NRC disagrees with the commenter's suggestion. The proposed revisions to the HHS Mandatory Guidelines for Federal Workplace Drug Testing have yet to be finalized to allow for consideration during the completion of this rulemaking effort and may be revised. The NRC will review the provisions regarding Initial Instrumented Testing Facility specifications once the finalized HHS Guidelines have been published and determine if additional revisions to Part 26 may be warranted at that time.

8.3 Licensee Testing Facility Personnel (§ 26.125)

Comments: Two commenters objected to the proposed elimination of the requirement that licensee testing facilities retain records on color blindness testing of their laboratory personnel. The commenters stated that because some non-instrumented validity tests require testing personnel to evaluate the color of the assay to determine the result, color blindness testing is necessary to ensure laboratory technician competency [Sue Brown, Individual; Todd Newkirk, IBEW].

NRC Response: The NRC agrees with the commenters and has revised § 26.125(c) in the final rule to require that licensee testing facilities retain color blindness test results for laboratory testing personnel conducting specimen validity testing. The ability of laboratory personnel to identify the color of test results is a necessary job requirement.

8.4 Procedures (§ 26.127)

Comments: One commenter, supported by many others, affirmed that the proposed provision in § 26.127(b) would ensure that licensees and other entities take appropriate corrective actions if an issue is identified with the chain-of-custody for any specimen [Jim Davis, NEI #48; Richard Sweigart, DCS; Keith Jury, Exelon; Mark Wetterhahn, Winston Strawn; Edward Weinkam, NMC; Don Grissette, SNC; Keith D. Young, Ameren; Glenn Morris, TVA; Ronald Gaston, Detroit Edison; Gregory Halnon, FENOC; Jeffrey Archie, SCE&G; Brian McCabe, Progress Energy; C.L. Funderburk, Dominion; F.G. Burford, Entergy].

NRC Response: The comment does not require a response.

Comments: One commenter requested that proposed § 26.127(b) be revised to specify the required actions that must be taken if the chain of custody for a specimen is "broken" [Todd Newkirk, IBEW]

NRC Response: The NRC has revised proposed § 26.129(b) in the final rule to include a description of the required actions to be taken by a licensee testing facility if the testing laboratory believes the integrity or identity of a specimen is in question (as a result of tampering or discrepancies between the information on the specimen bottle and on the accompanying custody-and-control forms that cannot be resolved). The provisions also describe procedures to address instances where either the Bottle A or Bottle B specimen leaks in transport from the collection site to the testing facility. Further, the revisions to § 26.129(b) include specific instances that would require the cancellation of the testing of a donor's urine specimen. These revisions are consistent with U.S. DOT's requirements.

8.5 Assuring Specimen Security, Chain of Custody, and Preservation (§ 26.129)

Licensee testing facility security

Comments: One commenter, supported by many others, affirmed the adequacy of the proposed security requirements for licensee testing facilities [Jim Davis, NEI #48; Richard Sweigart, DCS; Keith Jury, Exelon; Mark Wetterhahn, Winston Strawn; Edward Weinkam, NMC; Don Grissette, SNC; Keith D. Young, Ameren; Glenn Morris, TVA; Ronald Gaston, Detroit Edison; Gregory Halnon, FENOC; Jeffrey Archie, SCE&G; Brian McCabe, Progress Energy; C.L. Funderburk, Dominion; F.G. Burford, Entergy].

NRC Response: The comment does not require a response.

Comments: One commenter requested that proposed § 26.129(a) be revised to specify the personnel who must maintain the security of licensee testing facilities and what actions must be taken if facility security is determined to be compromised [Todd Newkirk, IBEW].

NRC Response: The NRC disagrees with the commenter. The NRC believes that the requirements in this provision are adequate to protect the security of a licensee testing facility. Adding greater specificity with respect to personnel and actions would unnecessarily limit licensees' and other entities' flexibility. Testing facility staffing and physical and operational characteristics vary substantially among licensees and other entities. This variability makes it impractical for the NRC to devise specific language that would be appropriate at all testing facilities. Therefore, the NRC is leaving it to each individual licensee and other entity to determine the personnel who must maintain the security of licensee testing facilities and the actions to be taken if facility security is determined to be compromised.

Specimen Integrity

Comments: One commenter, supported by many others, supported the requirements in proposed § 26.129(b) [Jim Davis, NEI #48; Richard Sweigart, DCS; Keith Jury, Exelon; Mark Wetterhahn, Winston Strawn; Edward Weinkam, NMC; Don Grissette, SNC; Keith D. Young, Ameren; Glenn Morris, TVA; Ronald Gaston, Detroit Edison; Gregory Halnon, FENOC; Jeffrey Archie, SCE&G; Brian McCabe, Progress Energy; C.L. Funderburk, Dominion; F.G. Burford, Entergy].

NRC Response: The comment does not require a response.

Comments: One commenter suggested that proposed § 26.129(b) be revised to state that a specimen "must not be tested if the integrity or identity" is in question, instead of the proposed language that a specimen "may not be tested if the integrity or identity" of a specimen is in question [Todd Newkirk, IBEW].

NRC Response: The NRC disagrees with the commenter's request. The NRC requires that rule text use the phrase "may not" to describe a prohibited activity.

Correcting Custody and Control Form Errors

Comments: One commenter suggested that proposed § 26.129(b) be revised to stipulate that when attempting to resolve any discrepancies with information entered on the specimen custody-and-control form, licensee testing facility personnel should attempt to obtain a "memorandum for the record" from the specimen collector instead of making any corrections to the original custody-and-control form. The commenter stated that obtaining a memorandum for the record is a forensically acceptable means to correct discrepancies found on a custody-and-control form while permitting a collector to modify the original custody-and-control form is not [Sue Brown, Individual].

NRC Response: The NRC agrees with the commenter. Corrections to the original custody-and-control form should be made only by the collector during the specimen collection process and in the presence of the donor. Once the donor leaves the collection site, any errors identified on the custody-and-control form must be corrected using a memorandum for the record and not on the original custody-and-control form. Therefore, the NRC has revised § 26.129(b) in the final rule to include a description of the process for obtaining a memorandum for the record from the collector to correct any custody-and-control form errors identified after the specimen collection process has been completed and the donor has departed from the collection site.

Other Appropriate Methods to Track Aliquot Custody and Control

Comments: One commenter objected to the provision in proposed § 26.129(c) permitting licensee testing facilities to use "other appropriate methods of tracking aliquot custody and control." The commenter stated that HHS has always required written documentation on a chain-of-custody form to track specimens and aliquots in certified laboratories. The commenter noted that while bar coding is an effective tracking method used in HHS-certified laboratories, a bar code list generated by a tracking device or instrument is always associated with a custody-and-control form that documents the personnel handling each specimen or aliquot. The commenter stated that written documentation ensures the security of each specimen and aliquot during the testing process [Sue Brown, Individual].

NRC Response: The NRC disagrees with the commenter. The NRC is not aware of any instances where the custody and control of a specimen has been jeopardized or called into question as a result of the specimen tracking methods used by a licensee testing facility. Therefore, the NRC has not modified the proposed provision in the final rule.

Bottle B Retention Location

Comments: One commenter addressed proposed § 26.129(f) and recommended that for split specimen collections, both Bottles A and B should be maintained together at all times and that both bottles should be sent to the HHS-certified laboratory if Bottle A has any non-negative test result. The commenter suggested that keeping both bottles together would reduce the chance that a specimen could be lost and would improve the timeliness in testing Bottle B [Charles LoDico, Individual]. Another commenter noted that the proposed provision would create a cumbersome requirement because the licensee testing facility must maintain proper custody and control for Bottle A and Bottle B separately. In addition, the licensee testing facility must ensure that Bottle B is moved from refrigeration to frozen storage, or discarded. The commenter suggested that the probability than an error could occur with the custody-and-control documentation would increase given the number of times Bottle B could be moved at the licensee testing facility [Sue Brown, Individual].

NRC Response: The NRC disagrees with the commenters. The NRC is not aware of any instances where the custody and control of a Bottle B specimen has come into question or a Bottle B specimen has been lost in an attempt to maintain the specimen at a licensee testing facility. Licensee testing facilities have successfully maintained Bottle B specimens and industry experience fails to provide evidence that current practices have been unsuccessful in securing and storing specimens. Therefore, the NRC has not modified § 26.129(f) of the final rule.

Emergency Backup Power

Comments: One commenter addressed proposed § 26.129(f) and disagreed with the NRC's decision not to require each licensee testing facility to have emergency power equipment available in case of a prolonged power failure. The commenter stated that emergency power equipment is necessary to maintain specimens in long-term frozen storage if a licensee testing facility is permitted to retain specimens rather than transferring them to an HHS-certified laboratory [Sue Brown, Individual].

NRC Response: The NRC agrees with the commenter and has revised § 26.135(c) in the final rule to require that licensee testing facilities electing to retain Bottle B specimens at the testing facility rather than forwarding the specimens to an HHS-certified laboratory with Bottle A, must ensure that proper storage conditions be maintained (i.e., specimens stored at a temperature of -20^{o} Celcius or less) in the event of a prolonged power failure.

Location of Original Custody-and-Control Form

Comments: One commenter stated that the proposed § 26.129(g) requirement that a licensee testing facility must send the original custody-and-control form with the Bottle A specimen to the HHS-certified laboratory leaves the specimen in Bottle B maintained at the licensee testing facility without the original custody-and-control form. The commenter noted that the proposed procedure was not in agreement with the HHS Mandatory Guidelines for Federal Workplace Drug Testing which require the original custody-and-control form to be maintained with the specimen Bottle A, and if the specimen in Bottle B is to be sent to a second HHS-certified laboratory, a copy of the original custody-and-control form is to be sent. The commenter

recommended both Bottle A and Bottle B be sent to the HHS-certified laboratory instead of maintaining Bottle B at the licensee testing facility [Sue Brown, Individual].

NRC Response: The NRC disagrees with the commenter. The NRC is not aware of any instances where the custody and control of a specimen has been jeopardized or called into question as a result of the specimen tracking procedures currently used by licensee testing facilities. Therefore, the NRC has not modified the proposed provision in the final rule.

8.6 Cutoff Levels for Validity Screening and Initial Validity Tests (§ 26.131)

Validity Testing at Licensee Testing Facility if Sending All Specimens to HHS-certified Laboratory?

Comments: One commenter asked if proposed § 26.131 required validity testing to be conducted at a licensee testing facility even if the licensee does not conduct immunoassay drug screening onsite at a licensee testing facility (i.e., the FFD program sends all specimens to an HHS-certified laboratory for testing) [Anonymous, #15].

NRC Response: A licensee or other entity may choose to send all urine specimens to an HHS-certified laboratory for all required testing (i.e., validity and drug testing) under this part.

Conducting Initial Validity and Validity Screening Testing

Comments: One commenter addressed proposed § 26.131(a) and requested the NRC to clarify whether initial validity testing must be conducted if a licensee testing facility conducts validity screening tests [Susan Techau, Exelon].

NRC Response: The NRC does not intend to require licensee testing facilities to perform initial validity testing if they the use validity screening tests. Section 26.131(a) of the final rule requires that all validity test results from licensee testing facilities must be based on performing either a validity screening test or an initial validity test, or both, on one or more aliquots of a urine specimen. In other words, a licensee testing facility may conduct either a validity screening test or an initial validity test on each specimen. The NRC is also permitting licensee testing facilities to perform validity screening testing first and then initial validity testing on specimens that yield questionable validity test results from validity screening tests, at their discretion. Either validity screening or initial validity testing will accomplish the NRC's objective of identifying specimens of questionable validity that must be transferred to an HHS-certified laboratory for additional testing. Therefore, the agency is permitting licensees and other entities to choose which of these validity testing procedures, or a combination of procedures, they will implement at a licensee testing facility.

Conduct Validity Testing at Collection Site as Soon a Specimen is Received

Comments: One commenter addressed proposed § 26.131(b) and suggested that specimen validity testing be performed at the collection site as soon as the donor presents a urine specimen to the collector and before the donor leaves the collection site. The commenter stated that immediate validity testing of a specimen would protect the donor from being accused of

attempting to subvert the testing process and would also allow for an immediate observed second collection if the initial specimen did not pass the validity test. [Todd Newkirk, IBEW]

NRC Response: The NRC disagrees with the commenter's suggestion. The NRC believes that licensees or other entities must conduct all specimen testing at a licensee testing facility and/or at an HHS-certified laboratory. Specimen collectors do not have the appropriate level of training to use validity screening tests. In addition, the commenter's suggested revision would permit the individual who tests the specimen to be aware of the identity of the donor. Since Part 26 was first promulgated, the NRC has maintained that the individuals who perform urine testing must not be aware of a donor's identity to protect against any potential biases that knowledge could introduce into the testing process. This policy is consistent with a similar HHS policy which has always prohibited testing facility employees from collecting specimens if they could link the donor's identity to test results. Therefore, the NRC has not modified the proposed provision in the final rule.

Use of the Term "Cutoff Levels"

Comments: One commenter suggested revising proposed § 26.131 by replacing the term "cutoff levels" with "decision points" for validity screening and initial validity testing. The commenter suggested the change because validity testing is based on decision points and not cutoff levels [Sue Brown, Individual].

NRC Response: The NRC disagrees with the commenter's request. The term "cutoff levels" is consistent with testing terminology familiar to licensees and other entities subject to Part 26. To maintain consistency with terminology used by industry, the NRC has decided not to modify the proposed provision in the final rule. However, the NRC has revised the definition of "cutoff level" in § 26.5 in the final rule to address the commenter's concern. The definition of "cutoff level" has been revised to mean "the concentration or decision criteria established for designating and reporting a test result as positive, of questionable validity (referring to validity screening or initial validity test results from a licensee testing facility), or adulterated, substituted, dilute, or invalid (referring to initial or confirmatory test results from an HHS-certified laboratory)."

Use of the Term "Non-negative"

Comments: One commenter stated that use of the term "non-negative" in proposed § 26.131(a) to describe some validity screening and initial validity test results was inaccurate. Instead of "non-negative," the commenter recommended using "presumptive adulterated, substituted, or invalid" for validity screening and initial validity test result reporting [Sue Brown, Individual].

NRC Response: The NRC agrees, in part, with the commenter's request. Throughout the final rule, the NRC has replaced the term "non-negative test result" with a new term to address validity screening and initial validity test results from a licensee testing facility that indicate that a specimen may be adulterated, substituted, dilute, or invalid. The new term used for these validity testing results is "questionable validity." (The NRC has chosen this term, rather than a term that would directly reference possible adulteration, substitution, dilution, or an invalid specimen, because licensee testing facilities will not be conducting the specific gravity testing that is required to establish these specimen characteristics.) The NRC has added a definition of "questionable validity" in § 26.5 of the final rule. Adding the term "questionable validity"

addresses the commenter's concern and improves the clarity of the language used in the final rule.

Validity Screening Testing

Comments: One commenter addressed proposed § 26.131(a) and stated that licensee testing facilities are only capable of performing validity screening testing. The commenter asserted that validity screening tests usually do not have the same sensitivity as initial validity tests and therefore could not meet the cutoff levels listed in proposed § 26.131(b). The same commenter also stated that validity screening tests, at a minimum, should meet the cutoff criteria for an "invalid" specimen in the HHS Guidelines. [Sue Brown, Individual]

NRC Response: The NRC disagrees that licensee testing facilities should be authorized to perform only validity screening tests and is continuing to permit initial validity testing at licensee testing facilities. However, the NRC agrees with the commenter that validity screening tests must be able to meet the invalid specimen criteria in the HHS Guidelines. The NRC has revised the specimen criteria for pH and nitrite concentration in the final rule to identify potentially invalid specimens, consistent with the HHS Guidelines, as specimens with a pH less than 4.5 or a nitrite concentration equal to or greater than 200 mcg/mL. The provisions accounting for invalid specimens have been included in § 26.131(b)(2) and (b)(3) of the final rule.

Required Tests for Validity Screening Testing

Comments: One commenter addressed proposed § 26.131(b) and asked if a licensee testing facility could meet the validity screening testing requirements by only conducting instrumented specimen testing for pH and creatinine [Anonymous, #15].

NRC Response: A licensee testing facility will not meet the validity screening testing requirements if each urine specimen is tested only for pH and creatinine. Section 26.131(b) of the final rule requires licensee testing facilities to test each urine specimen for creatinine, pH, and one or more oxidizing adulterants.

Specific Gravity Testing at Licensee Testing Facilities

Comments: One commenter noted that proposed § 26.131(b) did not include requirements for specific gravity testing at a licensee testing facility. The commenter stated that the HHS Mandatory Guidelines for Federal Workplace Drug Testing Programs require specific gravity testing for any specimen with a creatinine concentration less that 20 mg/dL. The commenter further added that because specific gravity testing is not currently permitted at licensee testing facilities, the NRC has not properly defined specimen dilution and substitution criteria, which both require specific gravity test results [Charles LoDico, Individual].

NRC Response: In contrast to the HHS Guidelines requirements for initial validity testing, the final rule does not require licensee testing facilities to test specimens' specific gravity. Instead, § 26.131(b) of the final rule requires licensee testing facilities to forward specimens having a creatinine concentration of less than 20 mg/dL to the HHS-certified laboratory which will measure these specimens' specific gravity. The NRC has chosen this course because of the high costs of refractometers, the instruments that the HHS Guidelines require for measuring

specimens' specific gravity. Although some licensee testing facilities are currently measuring specific gravity, the new HHS Guidelines specific gravity cutoff levels require more sensitive measurement than those licensee testing facilities are currently capable of doing. They would have to purchase new equipment to meet these new cutoff levels. Rather than require licensees to incur the resulting expense, the final rule does not require licensee testing facilities to test specimens' specific gravity nor does it include cutoff levels for specific gravity or quality control requirements for measuring specific gravity.

Licensee Testing Facilities Reporting Negative and Dilute Specimen Result

Comments: One commenter addressed proposed § 26.131(b)(1) and asked if a licensee testing facility would be permitted to report a specimen as negative and dilute. The commenter noted that if a licensee testing facility were permitted to report a specimen as negative and dilute, the facility would have to perform an initial creatinine test with a calibrator at 2.0 mg/dL, and perform a specific gravity test, using a 3-place refractometer. The licensee testing facility would then forward any specimen with a creatinine less than 5.0 mg/dL to an HHS-certified laboratory for additional testing. The commenter also noted that for a licensee testing facility that performs only validity screening testing for creatinine, all specimens with a creatinine concentration less than 20 mg/dL must be forwarded to an HHS-certified laboratory for further testing [Sue Brown, Individual].

NRC Response: Section 26.131(b) in the final rule does not require licensee testing facilities to conduct specific gravity testing. Therefore, licensee testing facilities are not permitted to report a specimen as negative and dilute. The NRC agrees that any specimen this is determined by a licensee testing facility to have a creatinine concentration less than 20 mg/dL as a result of either validity screening testing and/or initial validity testing must be forwarded to an HHS-certified laboratory for further testing under the final rule.

Specimen pH Testing Levels

Comments: One commenter addressed proposed § 26.131(b)(2)(i) and stated that the proposed specimen pH criteria did not account for specimens meeting the "invalid" criteria specified in the HHS Mandatory Guidelines for Federal Workplace Drug Testing programs. The commenter recommended revising the provision in the final rule to account for invalid specimen criteria from "pH less than 3" to "pH less than 4.5." This change would provide decision points for both presumptive invalid and adulterated specimens that would require additional specimen testing at an HHS-certified laboratory [Sue Brown, Individual].

NRC Response: The NRC agrees with the commenter and has revised § 26.131(b)(2) in the final rule to read "pH less than 4.5" to be consistent with Section 2.4(h)(7)(ii) in the HHS Guidelines.

Specimen Validity Testing - pH Range

Comments: One commenter suggested that proposed § 26.131(b)(2) be revised from "Using either a colorimetric pH test or pH meter" to read "Using either a colorimetric pH test with a dynamic range of 2 to 12 or pH meter." The commenter asserted that the change to include the dynamic pH range is necessary to identify invalid specimens (as defined in the HHS Mandatory

Guidelines for Federal Workplace Drug Testing Programs as a specimen with pH greater than or equal to 3 and less than 4.5, or greater than or equal to 9 and less than 11). The commenter stated that the recommended change would be necessary only if NRC did not revise § 26.131(b)(2)(i) to read “pH less than 4.5” [Sue Brown, Individual].

NRC Response: Because the NRC has revised § 26.131(b)(2) in the final rule to read “pH less than 4.5," the comment does not require a response.

Specimen Validity Testing - Nitrite Concentration

Comments: One commenter stated that the proposed nitrite concentration of “equal to or greater than 500 mcg/mL” in proposed § 26.131(b)(3) would not identify invalid specimens. Specifically, the commenter referenced the criteria in the HHS Guidelines that identify a specimen as possibly invalid when the specimen has a nitrite concentration “greater than or equal to 200 mcg/mL but less than 500 mcg/mL.” The commenter suggested revising the proposed nitrite concentration to be equal to or greater than 200 mcg/mL so that invalid specimens would be detected [Sue Brown, Individual].

NRC Response: The NRC agrees with the commenter and has revised the nitrite concentration in § 26.131(b)(3) in the final rule to read “nitrite or other oxidant concentration equal to or greater than 200 mcg/mL.” This change incorporates the invalid specimen criteria in Section 2.4(h)(7)(iii) of the HHS Guidelines to ensure that potentially invalid specimens are detected through validity screening tests and/or initial validity testing at a licensee testing facility.

Specimen Validity Testing - Nitrite Concentration General Oxidant Colorimetric Test

Comments: One commenter addressed proposed § 26.131(b)(3) and suggested that the reference to the “general oxidant colorimetric test” include an additional reference that the test must have a “cutoff equal to or greater than 200 mcg/mL nitrite-equivalents.” The commenter suggested that the additional information would emphasize that the general oxidant test must be calibrated with a 200 mcg/mL nitrite solution in order to ensure that the test could identify invalid specimens [Sue Brown, Individual].

NRC Response: The NRC agrees with the commenter and has revised § 26.131(b)(3) in the final rule to state that the general oxidant colorimetric test must have a cutoff equal to or greater than 200 mcg/mL nitrite-equivalents. The revision improves consistency with the HHS Guidelines to ensure that potentially invalid specimens are detected through validity screening tests and/or initial validity at a licensee testing facility.

Specimen Validity Testing - Presence of Chromium (VI)

Comments: One commenter addressed proposed § 26.131(b)(4) and suggested that “Presence of chromium (VI) is indicated” should be revised to read “The possible presence of chromium (VI) is determined using . . .” The commenter recommended the change because neither the general oxidant colorimetric test nor the chromium (VI) colorimetric test is the confirmatory test for the presence of chromium (VI). The commenter noted that the recommended change is consistent with the HHS Guidelines [Sue Brown, Individual].

NRC Response: The NRC agrees with the commenter and has revised § 26.131(b)(4) in the final rule to improve the accuracy of the language used in the final rule and its consistency with the HHS Guidelines.

Specimen Validity Testing - Halogen Adulterants

Comments: One commenter addressed proposed § 26.131(b)(5) and suggested that "Presence of halogen . . . is indicated" should be revised to read "The possible presence of halogen (e.g., bleach, iodide, fluoride) is determined using . . ." The commenter recommended the change because neither the general oxidant colorimetric test nor the halogen colorimetric test is the confirmatory test for the presence of halogen. The commenter noted that the suggested change is consistent with the HHS Guidelines [Sue Brown, Individual].

NRC Response: The NRC agrees with the commenter and has revised § 26.131(b)(5) in the final rule to improve the accuracy of the language used in the final rule and its consistency with the HHS Guidelines.

Specimen Validity Testing - Halogen Adulterants, Additional Test

Comments: One commenter suggested that NRC consider adding the odor of the specimen as an additional criterion to evaluate a specimen for the possible presence of halogen. The commenter noted that the suggested revision is consistent with criteria used in the HHS Guidelines to detect the possible presence of halogen [Sue Brown, Individual].

NRC Response: The NRC agrees with the commenter and revised § 26.131(b)(5) in the final rule to add the suggested method to evaluate the possible presence of halogen. Section 26.131(b)(5) now includes a statement that the possible presence of halogen can be determined using the "odor of the specimen as the initial test." Including specimen odor as a method to detect the possible presence of halogen is consistent with Section 2.4(h)(7)(v) of the HHS Guidelines.

Validity Testing Criteria for Adulterants, Glutaraldehyde

Comments: One commenter addressed proposed § 26.131(b)(6) and suggested replacing "Presence of glutaraldehyde is indicated" with the phrase "The possible presence of glutaraldehyde is determined using. . ." The commenter noted that neither the aldehyde test nor the characteristic immunoassay response is the confirmatory test for the presence of glutaraldehyde. The commented noted that the suggested change is consistent with wording in the HHS Guidelines [Sue Brown, Individual].

NRC Response: The NRC agrees with the commenter and has revised § 26.131(b)(6) in the final rule to improve the accuracy of the language used in the final rule and its consistency with the HHS Guidelines.

Validity Testing Criteria for Adulterants, Oxidants

Comments: One commenter suggested revising proposed § 26.131(b)(7) to be consistent with the related provision in the HHS Guidelines. Specifically, the commenter stated that the general oxidant colorimetric test and the chromium (VI) colorimetric test can detect only the possible presence of an oxidizing adulterant and cannot specifically identify pyridine as suggested by the proposed requirement [Sue Brown, Individual].

NRC Response: The NRC agrees, in part, with the commenter's request. The NRC has consolidated proposed § 26.131(b)(4) and (b)(7) in § 26.131(b)(4) of the final rule, given that both provisions in the proposed rule use the same general oxidant colorimetric test and chromium (VI) colorimetric test to detect the possible presence of an oxidizing adulterant.

Validity Testing Criteria for Adulterants, Surfactants

Comments: One commenter stated that proposed § 26.131(b)(8) incorrectly identified the surfactant colorimetric test as the confirmatory test for surfactant. The commenter also asserted that by using the wording "presence of surfactant is indicated" in the proposed rule text implied that the colorimetric test can identify surfactant, which it cannot. The commenter requested that the proposed rule be revised to state the "possible presence of surfactant is determined. . .." In addition, the commenter requested that the final rule be revised to include a "foam/shake test" as an additional method to identify the possible presence of surfactant and noted that the HHS Guidelines permit a "foam/shake test" to identify possible invalid specimens that result from surfactant [Sue Brown, Individual].

NRC Response: The NRC agrees with the commenter's requests. Section 26.131(b)(7) in the final rule now states,"The possible presence of surfactant is determined by using. . ." It also includes the "foam/shake test" as an additional method to identify the possible presence of surfactant. Including this additional test is consistent with Section 2.5(h)(7)(viii) of the HHS Guidelines.

Validity Testing Criteria, Specimen Shows Signs of Adulterants

Comments: One commenter suggested that the phrase "on separate aliquots" in proposed § 26.131(b)(9)(iii) should be revised to read "on two separate aliquots." The commenter noted that the suggested change is consistent with the HHS Guidelines which require testing of two separate aliquots to demonstrate the inability to obtain a valid immunoassay drug test result and for a specimen to be considered possibly an invalid specimen [Sue Brown, Individual].

NRC Response: The NRC agrees with the commenter and has revised proposed § 26.131(b)(9)(iii) (§ 26.131(b)(9) in the final rule) to clarify the intent of the provision and improve the consistency of the final rule with the HHS Guidelines.

8.7 Cutoff Levels for Drugs and Drug Metabolites (§ 26.133)

No comments addressed this section.

8.8 Split Specimens (§ 26.135)

Specimen Retention at the Licensee Testing Facility

Comments: One commenter addressed proposed § 26.135(a) and suggested that the licensee testing facility should be required to forward both Bottle A and Bottle B from split specimen collections to an HHS-certified laboratory for any specimen yields a non-negative test result from testing at a licensee testing facility. The commenter stated that the proposed system appeared cumbersome and open to possible errors at the licensee testing facility that might affect the security and integrity of a specimen in Bottle B. The commenter suggested that HHS-certified laboratories currently have processes in place to ensure the security and integrity of specimens in Bottles A and B [Sue Brown, Individual].

NRC Response: The NRC disagrees with the commenter. The NRC is unaware of instances that demonstrate that the security and integrity of a specimen has been affected by licensee testing facilities maintaining Bottle B onsite, while Bottle A is sent to an HHS-certified laboratory for further testing. Therefore, the NRC has not modified the proposed provision in the final rule.

Support for the Proposed Provision

Comments: One commenter, supported by many other commenters, stated that the industry supports the requirement in proposed § 26.135(b) [Jim Davis, NEI #48; Richard Sweigart, DCS; Keith Jury, Exelon; Mark Wetterhahn, Winston Strawn; Edward Weinkam, NMC; Don Grissette, SNC; Keith D. Young, Ameren; Glenn Morris, TVA; Ronald Gaston, Detroit Edison; Gregory Halnon, FENOC; Jeffrey Archie, SCE&G; Brian McCabe, Progress Energy; C.L. Funderburk, Dominion; F.G. Burford, Entergy].

NRC Response: The comment does not require a response.

Written Request for Bottle B Specimen

Comments: One commenter stated that the requirement in proposed § 26.135(b) that a donor must submit a written request to the MRO to direct Bottle B specimen testing at a second HHS-certified laboratory was not consistent with the HHS Mandatory Guidelines for Federal Workplace Drug Testing Programs. Specifically, the commenter noted that the HHS Guidelines do not prescribe any specific method of notification for the donor to direct the MRO to contact the HHS-certified laboratory to request that the donor's Bottle B specimen be sent for testing at another HHS-certified laboratory [Sue Brown, Individual].

NRC Response: The NRC agrees with the commenter and has eliminated the proposed requirement that a donor must provide a written request to the MRO to direct the retesting of an aliquot of a single specimen or the testing of the Bottle B specimen at a second HHS-certified laboratory. Section 26.165(b) in the final rule provides a donor with more flexibility in communicating with the MRO. The NRC modeled the revised provisions on the regulations of the U.S. DOT in 49 CFR 40.171(a) and related provisions in the HHS Guidelines to increase the consistency of Part 26 with other Federally mandated workplace drug testing programs.

MRO Instructions to Donor for Bottle B Specimen Testing

Comments: One commenter suggested that proposed § 26.135(b) should be revised to require the MRO to provide each donor with an instruction form to use to request Bottle B specimen testing. The same commenter also requested that the rule specify whether the 3 business day limit could be met with a postmark date or if the written request must be received by the MRO within 3 business days [Todd Newkirk, IBEW].

NRC Response: The NRC agrees, in part, with the commenter's requests and has added a provision in § 26.165(b)(2) of the final rule to require the MRO to provide the donor with specific instructions for making a request for a retest of an aliquot of a single specimen or the testing of the Bottle B specimen. It also stipulates that the request, whether written or oral, must be received by the MRO within the 3 business days. The revised provision is based on the U.S. DOT's drug testing regulations in 49 CFR 40.171 and therefore enhances the consistency of Part 26 with advances in other relevant Federal rules and guidelines. However, the NRC has not revised § 26.165(b)(2) in the final rule to address postmarking or receipt of a written request by the MRO because the final rule no longer requires a written request, as discussed with respect to the previous comment on this section.

Other Parties Requesting Bottle B Specimen Testing

Comment: One commenter addressed proposed § 26.135(b) and stated that the requirement to prohibit any entity (e.g., licensee, MRO, NRC) from ordering the testing of a Bottle B specimen without a donor's written permission conflicts with Section 2.6(e)(4) of the HHS Mandatory Guidelines for Federal Workplace Drug Testing Programs. The HHS Guidelines permit a Federal agency to have a single or split (Bottle B) specimen retested "as part of a legal or administrative proceeding to defend an original positive, adulterated, or substituted result." The commenter recommended that NRC should include the HHS Guideline provision [Sue Brown, Individual].

NRC Response: The NRC disagrees with the commenter's recommendation. The NRC intentionally diverged from the HHS Guidelines when former Part 26 was first published by permitting split specimen procedures, which the HHS Guidelines did not permit at the time. The NRC's intent when permitting, but not requiring, split specimen procedures was to enhance donors' confidence in the drug testing process imposed by the rule and provide one means for donors to defend against possible administrative and/or methodological errors in testing the specimen in Bottle A, if a licensee or other entity chose to implement split specimen procedures. The NRC's experience has been that its objectives of detecting and deterring substance abuse can be met with testing a single specimen, but it has permitted split specimen procedures solely for the potential benefits to donors, who are private citizens under Part 26 by contrast to the Federal employees who are subject to testing under the HHS Guidelines and may have a reduced expectation of privacy. The NRC is concerned that permitting testing of the specimen in Bottle B of a split specimen or retesting of a single specimen without the donor's permission in order to defend against a donor's legal or administrative challenge to a drug test result would decrease donors' confidence in the FFD program. In addition, this testing or retesting would also conflict with the principle embodied in § 26.31(d)(6) of the final rule that the donor must retain control over his or her biological specimens for privacy reasons. Section 26.185(l) of the final rule continues to permit an MRO to order retesting an aliquot of a single specimen or

testing of the specimen in Bottle B if he or she questions the accuracy and scientific validity of a test result and believes that this additional testing will aid him or her in determining whether the donor has violated the FFD policy. The NRC believes that permitting the MRO to order this testing or retesting is necessary to meet the rule's objective to improve the effectiveness and efficiency of FFD programs. However, permitting testing of the specimen in Bottle B or retesting of a single specimen for other purposes without the donor's permission would conflict with the NRC's intent for permitting split specimen procedures. Therefore, the NRC has not revised the final rule.

Three Business Day Requirement to Request Testing of Bottle B

Comments: One commenter addressed proposed § 26.135(b) and stated that industry experience suggests that the 3 business day time limit for a donor to request Bottle B testing is adequate, given that donors typically request Bottle B specimen testing on the same day as the MRO notification of a positive test result [Jim Davis, NEI #48; Richard Sweigart, DCS; Keith Jury, Exelon; Mark Wetterhahn, Winston Strawn; Edward Weinkam, NMC; Don Grissette, SNC; Keith D. Young, Ameren; Glenn Morris, TVA; Ronald Gaston, Detroit Edison; Gregory Halnon, FENOC; Jeffrey Archie, SCE&G; Brian McCabe, Progress Energy; C.L. Funderburk, Dominion; F.G. Burford, Entergy]. However, another commenter disagreed with the 3 business day time limit and suggested 10 business days instead. The commenter stated that some shift workers may have difficulty meeting the 3 business day time limit [Todd Newkirk, IBEW].

NRC Response: The NRC believes that the 3 business day time limit in proposed § 26.135(b) provides a donor with sufficient time to direct the MRO to request the retesting of single specimen or the testing of the Bottle B specimen. In addition, this 3 business day time limit provides more flexibility than permitted in Section 2.6(e)(2) of the HHS Guidelines which provide a donor with only 72 hours (i.e., 3 calendar days) after being notified by the MRO of a positive, adulterated, or substituted test result to request Bottle B testing. Therefore, the NRC has not modified the proposed provision in the final rule.

Emergency Backup Power for Long-term, Frozen Storage of Specimens

Comments: One commenter addressed proposed § 26.135(c) and stated that licensee testing facilities should be required to maintain emergency backup power to ensure that specimens in long-term, frozen storage remain at the required temperature during power outages [Sue Brown, Individual].

NRC Response: The NRC agrees with the commenter and added this requirement to § 26.135(c) in the final rule. Licensee testing facilities must provide emergency backup power to ensure that Bottle B specimens that have been retained by the licensee testing facility and placed in long-term frozen storage remain at the required temperature during power outages. This provision is consistent with former Section 2.7(c) in Appendix A to 10 CFR Part 26 which required a licensee testing facility to have emergency power equipment available in case of a prolonged power failure.

8.9 Quality Assurance and Quality Control (§ 26.137)

Comments: One commenter addressed proposed § 26.137 and noted that the provisions did not require a licensee testing facility to conduct quality assurance testing on performance testing samples [Sue Brown, Individual].

NRC Response: The NRC is not aware of any problems that have arisen in the past related to the quality control and performance testing samples used by licensee testing facilities and does not, at this time, believe that there is a need to require quality assurance testing of performance testing samples by licensee testing facilities. The NRC believes the quality control provisions included in § 26.137 of the final rule will effectively identify any testing issues related to performance testing samples.

8.9.1 Quality Assurance Program (§ 26.137(a))

No comments addressed this section.

8.9.2 Performance Testing and Quality Control Requirements for Validity (§ 26.137(b))

FDA Cleared Point-of-Collection Testing Device

Comments: One commenter addressed proposed § 26.137(b)(1)(i) and stated that a drug point-of-collection tests (POCT) is a "device" in FDA terminology and approved by FDA while a specimen validity POCT is not required to be cleared by FDA and should not be referred to as a "device." The commenter suggested that NRC delete this proposed requirement [Sue Brown, Individual].

NRC Response: The NRC agrees with the commenter and has eliminated the requirement for FDA approval of a specimen validity POCT from § 26.137(b)(1)(i) in the final rule. The NRC also agrees with the commenter's request to eliminate the use of the term "device" with respect to validity screening tests given the specific connotation of the use of the term with FDA approval of tests.

Drug and Validity Point of Collection Testing Requirements

Comments: One commenter addressed proposed § 26.137(b) and stated that HHS proposed amendments to the HHS Guidelines (April 13, 2004, FR19673-19732) included a new category of specimen drug and validity tests called point-of-collection tests (POCT) that differed from those proposed for validity testing by the NRC. Unlike the proposed provisions in § 26.137(b), the proposed amendments to the HHS Guidelines did not separate the drug and specimen validity testing requirements. The proposed HHS Guidelines included quality assurance, device validation, annual validation, training and re-training of testers, provision for performance testing, provision for failures of the device, and reporting of results. The commenter stated that it would be difficult to permit only the use of validity POCTs, as proposed by the NRC.

NRC Response: The NRC was aware of the differences between the proposed Part 26 provisions and those published by the HHS. However, the NRC is also aware that specimen validity tests now commercially available can meet the stringent quality assurance and

performance testing requirements established in the final rule. Furthermore, the NRC is satisfied that licensees' and other entities' processes for ensuring that testing facility personnel are properly trained to conduct drug testing will be adequate when applied to training personnel to conduct validity screening tests. In response to this comment, the NRC has reviewed the provisions that addressed quality assurance, device validation, re-validation, training, performance testing, provisions for testing failures, and reporting results in the proposed amendments to the HHS Guidelines. On the basis of this review, the NRC has made several changes in the final rule to further strengthen the requirements related to validity screening tests in Part 26. The specific changes and their bases are discussed in Section VI of the Federal Register Notice publishing the final rule.

Non-instrumented Devices for Validity Screening Tests

Comments: One commenter addressed proposed § 26.137(b) and suggested that permitting licensee testing facilities to use only non-instrumented testing devices to perform validity screening tests is unduly restrictive. The commenter stated that some instrumented tests can successfully meet the performance testing requirements for validity screening tests as described in § 26.137(b). The commenter provided two examples of instrumented tests. The proposed requirement in § 26.137(b)(5) for colorimetric pH tests that have a narrow dynamic range and do not support the 2-12 pH cutoffs can be met using an instrumented test (as most HHS-certified laboratories use for pH screening). The commenter also stated that the proposed requirement in § 26.137(b)(6) for a general oxidizing adulterant test or one or more specific oxidizing adulterant tests for validity screening can be performed using an instrumented test (as HHS-certified laboratories use for initial validity testing) [Sue Brown, Individual].

NRC Response: The NRC agrees with the commenter that some instrumented tests can meet the performance testing requirements for validity screening tests. Therefore, the NRC has revised the definition of "validity screening test" in § 26.5 of the final rule to include "a test that is instrumented to the extent that results are machine-read." The NRC has also eliminated the term "non-instrumented" from the discussion in § 26.137(b) of the final rule and instead simply references validity screening tests.

Eliminate Provision to Permit Licensee Testing Facilities to Use Specimen Validity POCTs

Comments: One commenter addressed proposed § 26.137(b) and suggested that the NRC reconsider permitting licensee testing facilities to use POCTs to conduct validity screening tests. Instead, the commenter suggested that the NRC permit screening validity tests currently permitted in the HHS Guidelines. The commenter stated that licensee testing facilities would most likely follow the current HHS-certified laboratory practice for specimen validity testing (e.g., use of pH paper, dipstick tests for pH, dipstick tests for oxidants, dipstick tests for nitrite, and instrumented colorimetric pH tests with a narrow dynamic range) [Sue Brown, Individual].

NRC Response: The NRC disagrees with the commenter's request. The NRC is permitting licensee testing facilities to use POCTs to conduct validity screening and/or initial validity testing. This provides licensee testing facilities with flexibility in conducting validity testing. However, the NRC has revised proposed § 26.137(b)(1)(i) and (b)(1)(ii) to require that licensee testing facilities use only validity screening tests that either have been placed on the SAMHSA list of POCT

devices that are certified for use in the Federal Workplace Drug Testing Program as published in the Federal Register, or that meet § 26.137(b)(1)(ii) performance testing criteria.

Test Results for POCT Devices That Include Both Drug and Specimen Validity Tests on the Same Device

Comments: One commenter addressed proposed § 26.137(b) and identified a possible concern related to permitting licensee testing facilities to use POCT devices to perform validity screening testing. Because many of the current POCT devices available include both drug and specimen validity tests, the commenter asked what the licensee testing facility would do with drug tests results [Sue Brown, Individual].

NRC Response: Section 26.137(e) in the final rule prohibits licensees and other entities from taking management actions on the basis of any drug test results obtained from non-instrumented devices that may be used for validity screening tests. The NRC is aware that several non-instrumented devices are currently available that combine tests for the presence of drugs and drug metabolites in a urine specimen with tests for other attributes of a urine specimen, such as creatinine concentration. The final rule permits the use of such combination tests for validity screening. However, the drug testing capabilities of these tests are not yet sufficiently accurate and sensitive for Part 26 drug testing purposes. In the future the NRC may consider accepting the use of initial drug test results from non-instrumented tests if and when the HHS publishes a final revision to the Mandatory Guidelines that establishes requirements for their use in Federal workplace drug testing programs. At this time, however, the final rule retains the former prohibition on licensee testing facilities using these tests for drug testing.

Validity Screening Testing - Specific Gravity

Comments: One commenter addressed proposed § 26.137(b) and suggested that NRC consider adding specific gravity testing using a three-place refractometer so that licensee testing facilities could report dilute specimens [Sue Brown, Individual].

NRC Response: The NRC disagrees with the commenter. The NRC is not requiring licensee testing facilities to conduct specific gravity testing on urine specimens as discussed in Section 8.6 of this document in response to a comment received on proposed § 26.131(b). Therefore, the NRC has not revised the proposed provision in the final rule.

Personnel Conducting Performance Testing of Specimen Validity Devices

Comments: One commenter suggested that proposed § 26.137(b)(1)(ii)(A) be revised to require that licensee testing facility personnel who use specimen validity devices be the ones to conduct performance testing of those devices. The commenter stated that HHS-certified laboratory personnel will not be using these types of devices and would therefore not be trained in the performance testing procedures [Sue Brown, Individual]. Another commenter stated that HHS-certified laboratories do not perform performance testing on non-instrumented validity testing devices [Charles LoDico, Individual].

NRC Response: The NRC agrees, in part, with the commenters. The NRC has added § 26.137(b)(1)(ii)(E) in the final rule to require that if a validity screening test is not approved by SAMHSA as a point-of-collection test, the licensee testing facility must submit three consecutive sets of performance testing samples to the manufacturer, using performance testing samples that have been formulated to challenge the validity screening test around the applicable cutoffs specified in § 26.137. The NRC believes that the manufacturer of each validity screening test is the most appropriate entity to conduct initial performance testing before a licensee uses the test in a Part 26 testing program. These revised performance testing requirements will reduce the burden on licensees and other entities while ensuring that validity screening tests provide accurate and consistent test results.

SAMHSA Certified List for Validity Screening Devices

Comments: Two commenters addressed proposed § 26.137(b)(1)(i) and stated that SAMHSA does not currently have a list of certified POCTs acceptable for validity screening testing for use in the Federal Workplace Drug Testing Program [Sue Brown, Individual; Charles LoDico, Individual]. One of the two commenters noted that although HHS has proposed guidelines (April 13, 2004, FR19673-19732) for the use of POCTs, the rule has yet to be finalized [Sue Brown, Individual].

NRC Response: The NRC is aware that SAMHSA has yet to publish a list of approved POCTs and that the proposed HHS Guidelines are not yet finalized. The final rule's § 26.137(b)(i) references a SAMHSA list of certified POCTs so that licensee testing facilities may rely on that list when it becomes available. To enable licensee testing facilities to begin using validity screening tests before the SAMHSA publishes its list, the NRC has added § 26.137(b)(1)(ii) to the final rule which creates stringent validity screening test performance testing requirements. These requirements will both protect donors' interests in having accurate test results and provide licensee testing facilities with flexibility in conducing validity testing.

Clarify the Meaning of pH Tests That Have a Narrow Dynamic Range

Comments: One commenter requested that the NRC clarify the phrase in proposed § 26.137(b)(5) that stated "pH tests that have a narrow dynamic range and do not support the 2-12 pH cutoffs" [Charles LoDico, Individual].

NRC Response: The NRC agrees with this comment and has eliminated the proposed provision from the final rule. Instead, the final rule in § 26.137(b)(1)(ii)(B) clarifies that a pH specimen validity screening test must be able to determine if pH is less than 4.5 and if pH is equal to or greater than 9.

Initial Performance Testing of a Device to Be Used for Specimen Validity Testing

Comments: One commenter addressed § 26.137(b)(1)(ii) and stated that the proposed requirement for a licensee or other entity to ensure, before using a validity screening device for specimen testing, that the device effectively determines the validity of the specimen would be overly burdensome [Sue Brown, Individual].

NRC Response: The NRC agrees with the commenters and has revised the performance testing provisions in § 26.137(b)(1)(ii) of the final rule to reduce the burden that the proposed rule would have imposed on licensees and other entities. This section as revised requires validity screening test manufacturers to demonstrate the performance characteristics of their tests. The NRC believes that the manufacturer is best qualified to demonstrate the effectiveness of each test because the manufacturer, rather than a person with limited training at an HHS-certified laboratory, has the greatest knowledge of correct testing procedures. The final rule continues to require licensee testing facilities to challenge the validity screening tests they intend to use. It requires licensee testing facilities to submit three consecutive sets of performance test samples (6 samples in each round) to the manufacturer for performance testing rather than submitting to an HHS-certified laboratory at least one out of every 10 specimens that test negative using the non-instrumented validity screening device, as proposed § 26.137(b)(1) required. The revised requirement reduces the number of performance test samples that an FFD program must submit to meet the minimum performance testing requirements for creatinine, pH, and one oxidizing adulterant, while at the same time ensuring that the accuracy and sensitivity of the each validity screening test have been successfully evaluated. The revised requirements in the final rule will continue ensure that validity screening tests used in Part 26 programs meet the NRC's objective of detecting specimens of questionable validity that require further testing at an HHS-certified laboratory.

Performance Testing of Validity Screening Tests - Nitrite

Comments: One commenter addressed proposed § 26.137(b)(1)(ii)(B) and asserted that a validity POCT for nitrite should be able to identify invalid specimens that have a nitrite concentration equal to or greater than 200 mcg/dL. In the commenter's view, the proposed requirement to validate a device with samples with nitrite concentrations in the range of 650 to 800 mcg/mL or 250 mcg/mL to 400 mcg/mL would not evaluate a device at the 200 mcg/mL cutoff [Sue Brown, Individual].

NRC Response: The NRC agrees with the commenter that the nitrite concentrations specified in the proposed rule would not evaluate a validity screening device at the nitrite concentration that meets the HHS Guidelines criteria for an invalid specimen. Therefore, the proposed nitrite concentrations are contrary to the NRC's intent. Because the NRC has reorganized the performance testing and quality control requirements for validity screening tests in the final rule, § 26.137(b)(1)(ii)(E) now establishes requirements for nitrite performance testing samples and incorporates the commenter's suggestion. This provision of the final rule states that "The performance testing samples for oxidizing adulterants must contain nitrite and other oxidizing adulterant concentrations in a range of less than or equal to a 200 mcg/mL nitrite-equivalent cutoff to a 500 mcg/mL nitrite-equivalent cutoff . . . ."

Performance Testing of Validity Screening Tests - Creatinine

Comments: One commenter addressed proposed § 26.137(b)(1)(ii)(B) and stated that validity screening POCTs will not be able to distinguish creatinine concentrations in the proposed ranges of 5-20 and 1-5 mg/dL. The commenter noted that a validity screening POCT, at best, would have a creatinine concentration cutoff of 20 mg/dL and should be able to distinguish between a sample with a creatinine concentration of 15 mg/dL from a sample with a creatinine concentration of 25 mg/dL [Sue Brown, Individual].

NRC Response: The NRC agrees with the commenter that validity screening tests need only measure the concentration of creatinine in a specimen to a cutoff of 20 mg/dL. In addition, because the final rule requires licensee testing facilities to send any specimen with a creatinine concentration less than 20 mg/dL to an HHS-certified laboratory for further testing, creatinine testing specificity beyond the 20 mg/dL cutoff is unnecessary. Therefore, the NRC has revised the proposed provision to require that a validity screening device must be able to distinguish the creatinine concentration of a specimen at a 20 mg/dL cutoff. Because the NRC has reorganized the proposed performance testing and quality control requirements for validity screening tests, this requirement appears in § 26.137(b)(1)(ii)(A) of the final rule,

Reconsider the Use of Non-instrumented Validity Testing Devices

Comments: One commenter referenced proposed § 26.137(b)(1)(iii) and requested that the NRC reconsider permitting the use of non-instrumented validity testing devices given that the current SAMHSA Federal Workplace Drug Testing Program does not have any rules or regulations permitting the use of non-instrumented validity screening tests [Charles LoDico, Individual].

NRC Response: The NRC is aware that SAMHSA has not yet published a list of certified POCTs. However, when it publishes such a list, SAMHSA will require that a POCT to meet the same or very similar performance testing requirements as those contained in § 26.137(b)(1)(ii) of the final rule. Incorporating these performance testing requirements in the rule now permits licensee testing facilities to conduct the required performance testing and begin using any devices that meet the criteria before SAMHSA publishes its list. Therefore, the NRC disagrees with the commenter's request to eliminate the option of using non-instrumented validity screening tests. However, in response to other comments received on the performance testing provisions for validity screening tests, the NRC has revised proposed § 26.137(b) in the final rule, as discussed with respect to previous comments on this topic.

Licensee Testing Facility Personnel to Perform Quality Control Sample Testing

Comments: One commenter addressed proposed § 26.137(b)(2) and suggested that licensee testing facility personnel performing validity screening tests should also be responsible for testing quality control samples. The commenter reasoned that because non-instrumented tests have visually read endpoints, the test result must be interpreted by the tester. Therefore, each tester must be able to interpret the quality control samples correctly before conducting tests on donor specimens [Sue Brown, Individual].

NRC Response: The NRC agrees with the commenter's reasoning and has amended § 26.137(b)(2)(i) in the final rule to require that licensee testing facility personnel who conduct validity screening tests must also conduct the required quality control testing. This testing, which is essential to ensuring accurate and reliable test results, is intended to verify that the validity screening tests to be used are functioning properly and that licensee testing facility personnel are able to conduct the tests appropriately.

Validity Screening Tests, Creatinine Concentration Measure to 1 Decimal Place

Comments: One commenter addressed proposed § 26.137(b)(4) and stated that validity screening tests must measure specimen creatinine concentration to 1 decimal place [Charles LoDico, Individual]. Another commenter stated that no validity screening tests can measure to 1 decimal place and that, at best, a dipstick method to measure creatinine has a cutoff of 20 mg/dL. This commenter suggested deleting the requirement to measure creatinine to 1 decimal point [Sue Brown, Individual].

NRC Response: The NRC disagrees with the comment that validity screening tests must measure specimen creatinine concentration to 1 decimal place and agrees with the comment suggesting that validity screening devices can only measure creatinine concentration at the 20 mg/dL cutoff required in the final rule. The final rule does not require licensee testing facilities to conduct validity screening testing for creatinine concentration to 1 decimal place or the specific gravity testing that is necessary for HHS-certified laboratories to report substituted, dilute, or invalid validity test results. Rather, licensee testing facilities are only required to identify specimens of questionable validity in Part 26. Therefore, measuring specificity beyond the 20 mg/dL creatinine cutoff is unnecessary. The NRC has revised the proposed provision accordingly at § 26.137(b)(1)(ii)(A) in the final rule. This change reflects the current capabilities of validity screening tests and supports the NRC's intent that licensee testing facilities need only be able to identify whether a specimen has a creatinine concentration of less than 20 mg/dL.

General Oxidizing Test - Nitrite Cutoff Level

Comments: One commenter addressed proposed § 26.137(b)(6) and stated that the proposed nitrite cutoff level of 500 mcg/mL was for adulterated specimens and did not provide the ability to identify possible "invalid" specimens. The commenter suggested revising the cutoff level to 200 mcg/mL of nitrite [Sue Brown, Individual].

NRC Response: The NRC agrees with the comment. The final rule requires using a nitrite cutoff level of 200 mcg/mL to account for invalid specimens in § 26.137(b)(1)(ii)(C) of the final rule. The 200 mcg/mL nitrite cutoff is consistent with the nitrite decision point for a general oxidizing test in Section 2.4(h)(7)(iii) of the HHS Guidelines.

8.9.3 Non-Negative Validity Screening (§ 26.137(c))

Comments: One commenter noted that the words "may be adulterated, substituted, dilute, or invalid" in proposed § 26.137(c) appeared to be inconsistent with use of the term "non-negative" in other sections of the proposed rule [Sue Brown, Individual].

NRC Response: Based on this and other comments received, the NRC has eliminated the use of the term "non-negative" in the final rule. Instead, the NRC has replaced the term "non-negative" with a new term "questionable validity" to describe the results of validity screening or initial validity testing at a licensee testing facility. A definition for "questionable validity" has been added in § 26.5 of the final rule and states that "questionable validity means the results of validity screening or initial validity tests at a licensee testing facility indicating that a urine specimen may be adulterated, substituted, dilute, or invalid." The NRC has chosen this term, rather than a term that would directly reference adulterated, substituted, dilute or invalid

specimens, because licensee testing facilities will not be conducting specific gravity testing that would determine these specimen characteristics. Using the term "questionable validity" addresses the concern expressed in the comment and improves the clarity of the final rule.

Comments: One commenter recommended that proposed § 26.137(c) refer only to validity screening test results that indicate a specimen may be adulterated (because of pH or an oxidizing adulterant) or substituted (because of creatinine concentration less than 20 mg/dL). The commenter suggested eliminating references to dilute and invalid specimens given that the requirements in proposed § 26.131(b) did not provide for the ability to determine if a specimen is dilute or invalid [Sue Brown, Individual].

NRC Response: The NRC agrees, in part, with the commenter's request. Instead of using the specific test results that a licensee testing facility may report for an individual specimen, the NRC has created a new term, "questionable validity," to apply to specimens that have a creatinine concentration of less than 20 mg/dL or the specimen exhibits characteristics of adulteration, such as an abnormal pH or the possible presence of an oxidant. In addition, the NRC has revised other sections in the final rule to address the commenter's statement that the proposed rule did not provide licensee testing facilities with the capability to identify a specimen that may be invalid. Specifically, § 26.131(b)(2)(i) and (b)(3) in the final rule provide licensee testing facilities with the ability to identify specimens that may be invalid based on pH less that 4.5 or greater than or equal to 9 or a nitrite concentration equal to or greater than 200 mcg/dL.

8.9.4 Quality Control Requirements for Performing Initial Validity Tests (§ 26.137(d))

Quality Control Requirements for Initial Validity Tests at Licensee Testing Facilities - Creatinine

Comments: One commenter recommended that proposed § 26.137(d)(1) be revised in the final rule to be consistent with the HHS Guidelines by adding a creatinine calibrator at 2 mg/dL and a control in the range of 1.0 mg/dL to 1.5 mg/dL [Sue Brown, Individual].

NRC Response: The NRC disagrees with the commenter's request. The calibrators specified in proposed § 26.137(d)(1) pertain to initial validity testing for creatinine and need to ensure only that the test can determine if a specimen's creatinine concentration is less than 20 mg/dL. Because the final rule does not require licensee testing facilities to conduct specific gravity testing or report substituted specimen test results, calibrators at lower creatinine concentrations are unnecessary. Therefore, the NRC has not modified the proposed provision in the final rule.

Incorrect Reference in Section-by-Section Analysis in Proposed Rule

Comments: One commenter addressed the section-by-section analysis of substantive rule changes in the proposed rule (page 50550 of the Federal Register notice). The commenter stated that although the discussion referred to a proposed § 26.137(d)(7), that section did not exist in the proposed rule [Sue Brown, Individual].

NRC Response: The NRC agrees with the comment and has revised the section-by-section analysis of substantive rule changes in the Federal Register notice publishing the final rule to reference the section on blind performance test samples, § 26.137(e)(6)(v).

8.9.5 Quality Control Requirements for Initial Drug Tests (§ 26.137(e))

POCTs for Validity Testing

Comments: One commenter recommended that the second and third sentences of proposed § 26.137(e)(1) should be deleted, because the NRC should not permit licensee testing facilities to use POCTs for validity testing [Sue Brown, Individual].

NRC Response: The NRC disagrees with the commenter's suggestion. The NRC is permitting licensee testing facilities to use validity screening tests that meet the specifications in § 26.137(b) of the final rule. Therefore, the NRC not modified the proposed provision in the final rule.

Donor Information for Negative Urine Specimens Pooled for Internal QC Program

Comments: One commenter recommended that proposed § 26.137(e)(2) be revised to clarify that donor-specific information should be disassociated from samples pooled to be used in the laboratory internal quality control program [Todd Newkirk, IBEW].

NRC Response: The NRC agrees with this comment and revised § 26.137(e)(2) in the final rule to prohibit licensee testing facilities from retaining any information linking donors to specimens pooled for use in the internal quality control program. No reason exists for a laboratory to retain donor-specific information for negative urine specimens used in the internal quality control program. This change further protects the privacy of individuals who are subject to Part 26. A similar provision has been added to § 26.159(j) that applies to HHS-certified laboratories.

Performing Multiple Initial Drug Tests on a Specimen

Comments: One commenter asked the NRC to clarify the intent of proposed § 26.137(e)(3) that permitted licensee testing facilities to perform multiple initial drug tests on a specimen for the same drug or drug class provided that all tests meet the cutoffs and quality control requirements in Part 26. The commenter asked if the provision permitted multiple analyses of a donor specimen for the same drug class. The commenter also asserted that NRC was promoting individual licensee testing instead of a standard applying to all licensee testing facilities [Charles LoDico, Individual].

NRC Response: The NRC agrees with this comment and has revised proposed § 26.137(e)(3) in the final rule to include a more precise description of when multiple initial drug tests on a specimen (also know as rescreening) are permitted. A similar revision was made to proposed § 26.167(d)(2) in the final rule to apply to HHS-certified laboratories. These revisions are consistent with the related provision in the HHS Guidelines and limit the potential variability in testing of concern to the commenter.

Quality Control Requirements for Initial Drug Tests, Quality Control Samples

Comments: One commenter stated that the requirements in proposed § 26.137(e)(6) for quality control samples were consistent with the HHS Guidelines except for one excluded provision in Section 2.5(b)(4) of the Guidelines. The commenter recommended revising the proposed rule

by adding the requirement, “A sufficient number of calibrators to ensure and document the linearity of the assay method over time in the concentration area of the cutoff. After acceptable values are obtained for the known calibrators, those values will be used to calculate sample data.” [Sue Brown, Individual]

NRC Response: The NRC agrees with the comment and has added the recommended provision in § 26.137(e)(6)(iv) of the final rule. This change enhances quality control procedures at licensee testing facilities and increases the consistency of Part 26 with related provisions in the HHS Guidelines.

Comments: One commenter suggested deleting “a” in the phrase “. . . at least one control fortified with a drug or drug metabolite targeted at 25 percent . . .” in proposed § 26.137(e)(6)(ii) because “a” implies that the control may have only one drug or drug metabolite. The commenter stated that a positive control must be positive for all drugs and drug metabolites and that a positive control must be analyzed with each analytical run [Sue Brown, Individual].

NRC Response: The NRC agrees with the comment and has revised § 26.137(e)(6)(ii) in the final rule to more clearly state the intent of the provision.

Comments: One commenter suggested deleting “a” in the phrase “. . . at least one control fortified with a drug or drug metabolite targeted at 75 percent . . .” in proposed § 26.137(e)(6)(iii) because “a” implies that the control may have only one drug or drug metabolite. The commenter stated that a control below the cutoff for each drug and drug metabolite must be analyzed with each analytical run [Sue Brown, Individual].

NRC Response: The NRC agrees with the comment and has revised § 26.137(e)(6)(iii) in the final rule to more clearly state the intent of the provision.

Comments: One commenter suggested reorganizing one of the provisions in proposed § 26.137(e)(7). The commenter noted that because the second sentence in proposed § 26.137(e)(7) discussed a quality control sample requirement, the provision should be moved to § 26.137(e)(6) which described the quality control sample requirements for each analytical run [Sue Brown, Individual].

NRC Response: The NRC agrees with this request. The NRC has renumbered the provisions in proposed § 26.137(e)(7) as § 26.137(e)(6) and (e)(6)(v) in the final rule to improve the rule’s clarity.

Blind Performance Testing Samples

Comments: One commenter asked how the proposed § 26.137(e)(7) requirement to include blind performance tests samples in each run could be met for non-instrumented testing devices when a donor must be present. The commenter also questioned how a blind performance test sample could be introduced into the batch during this testing process [Charles LoDico, Individual].

NRC Response: Section 26.137(e)(7) proposed requirements for quality control samples for initial specimen drug testing at a licensee testing facility. The NRC is not permitting drug or

validity testing to be performed at the collection site using POCTs. Rather, the NRC is restricting the use of non-instrumented validity screening tests to licensee testing facilities. Because all specimen validity testing would be conducted at a licensee testing facility and/or at an HHS-certified laboratory, a donor would never be present during specimen validity testing and the issue raised by this comment does not apply. Therefore, the NRC has not modified the proposed provision in the final rule.

Blind Performance Testing Samples - Example

Comments: One commenter addressed the section-by-section analysis of substantive changes in proposed § 26.137(e)(7). The commenter suggested that the example incorrectly presented the number of quality control samples that must be included in an analytical run. The section-by-section analysis stated, "For example, if an analytical run tested 50 donor specimens, the licensee testing facility would include 5 quality control samples in the run. At least one of the 5 would be required to be a blind test sample, and it could be either a blank or a sample fortified with a drug or metabolite at either 25 percent above the FFD program's cutoff level or at 75 percent of the cutoff level. The remaining 4 samples could include any combination of blanks and fortified samples." The commenter also suggested clarifying the following section-by-section discussion: "The blind test sample may be either a blank (certified negative urine), or a sample with drug or drug metabolite, usually targeted at 50% or greater above the cutoff." Specifically, the commenter stated that this discussion appeared to imply that the "fortified" quality control samples may have varied concentrations of drugs or drug metabolites, conflicting with the requirements in proposed § 26.137(e)(6)(ii) and (iii). The commenter recommended that the example explaining the quality control samples be revised in the final rule as follows: "For example, if an analytical run tested 45 donor specimens, the licensee testing facility would include 5 additional samples, all of which are quality control samples. The total number of samples in the analytical run would then be 50. At least one of the 5 quality control samples must be a control that appears as a donor sample to the initial testing technician. This blind test sample could be either a certified drug negative sample or a sample with drug or drug metabolite above the cutoff. The other 4 quality control samples must meet the requirements of § 26.137(e)(6)(i)-(iii)" [Sue Brown, Individual].

NRC Response: The NRC agrees with the commenter's request and has revised the example used to explain quality control sample requirements in the section-by-section analysis of substantive rule changes for § 26.137(e)(6), where these requirements appear in the final rule. The example more precisely explains the requirement that 10 percent of all specimens tested in each analytical run must be quality control samples. Although the section-by-section analysis was technically accurate for an analytical run of 50 donor specimens, the discussion should have more clearly stated that 10 percent of the number of donor specimens or 5 additional specimens, must be quality control samples. The total specimens in the example analytical run would be 55 specimens.

8.9.6 Errors in Testing (§ 26.137(f))

No comments addressed this section.

8.9.7 Accuracy (§ 26.137(g))

No comments addressed this section.

9.1 Purpose (§ 26.151)

No comments addressed this section.

9.2 Using Certified Laboratories for Testing Urine Specimens (§ 26.153)

More Stringent Cutoff Levels and/or Testing for Other Substances - Oversight

Comments: One commenter addressed proposed § 26.153(d) and requested that, in situations where a licensee or other entity chooses to use more stringent cutoff levels than those specified in Part 26 and/or chooses to test for substance not mandated by Part 26, that the NRC and not the licensee or other entity should ensure that the HHS-certified laboratory takes measures consistent with Part 26 to ensure that test results are valid and defensible [Todd Newkirk, IBEW].

NRC Response: The NRC disagrees with this comment. The NRC believes that the evaluations of assays and cutoff levels by an independent forensic toxicologist, as required in § 26.31(d)(1)(i)(D) and (d)(1)(ii), and the auditing activities required under § 26.41 provide adequate assurance that any testing conducted under this subpart will provide results that are valid and defensible. Therefore, the NRC has not modified the proposed provision in the final rule.

Laboratory Personnel Appearing for Administrative/Disciplinary Hearings

Comments: One commenter suggested revising proposed § 26.153(f)(2) by implementing "more stringent provisions" to compel laboratory personnel to appear to testify at an administrative and disciplinary proceeding against an individual when the proceeding is based on urinalysis results reported by an HHS-certified laboratory. The commenter stated that if laboratory personnel fail to appear at an administrative or disciplinary proceeding, the case against the donor should be dropped [Todd Newkirk, IBEW].

NRC Response: The NRC disagrees with the comment. The licensee or other entity is responsible, through its contract with the HHS-certified laboratory, for ensuring that the

appropriate personnel from the HHS-certified laboratory are available to testify in an administrative or disciplinary proceeding when that proceeding is based on urinalysis results reported by the HHS-certified laboratory. If the licensee does not ensure that the appropriate individuals are available, or the HHS-certified laboratory does not make the individuals available, both the licensee and HHS-certified laboratory could be subject to NRC enforcement action. However, the rule does not require laboratory personnel to appear in person. Therefore, the NRC believes these provisions adequately protect donors' rights to a fair and objective review and are sufficiently stringent. The NRC also does not agree that dropping the case against an individual is acceptable if laboratory personnel are not made available. The NRC requires reviewing officials to make a positive determination that individuals are fit for duty and trustworthy and reliable, as demonstrated by the avoidance of substance abuse, in order for licensees or other entities to grant or maintain an individual's authorization. If test results are received that call into question an individual's fitness for duty and trustworthiness and reliability, the individual's authorization must be terminated to protect public health and safety and the common defense and security until the question can be resolved. The licensee or other entity is responsible for ensuring that sufficient information is available for the reviewing official to make either a positive or negative determination. Therefore, the NRC has not modified the proposed provision in the final rule.

Conflict of Interest Between HHS-Certified Laboratory and MRO

Comments: One commenter, supported by other commenters, addressed proposed § 26.153(f)(5) and requested the NRC to provide specific examples of relationships between HHS-certified laboratories and MROs that the NRC considers to be conflicts of interest. The commenter suggested including the conflict of interest examples specified in the U.S. DOT's drug and alcohol testing regulations in 49 CFR 40.101(b). The commenter also requested that the NRC specifically exempt a potential conflict of interest situation in which a medical doctor uses an HHS-certified laboratory for services in his or her private practice and who also serves as the MRO to a licensee that uses the same HHS-certified laboratory [Jim Davis, NEI #48; Richard Sweigart, DCS; Keith Jury, Exelon; Mark Wetterhahn, Winston Strawn; Edward Weinkam, NMC; Don Grissette, SNC; Keith D. Young, Ameren; Glenn Morris, TVA; Ronald Gaston, Detroit Edison; Gregory Halnon, FENOC; Jeffrey Archie, SCE&G; Brian McCabe, Progress Energy; C.L. Funderburk, Dominion; F.G. Burford, Entergy].

NRC Response: The NRC agrees, in part, with the commenter's request and has revised proposed § 26.183(b) in the final rule to include specific examples of conflict of interest relationships between MROs and HHS-certified laboratories. As requested, the basis for the examples is 49 CFR 40.101(b) of the U.S. DOT's Procedures for Transportation Workplace Drug and Alcohol Testing Programs.

The NRC disagrees with the commenter's request to specifically exempt as a potential conflict of interest the situation where a medical doctor uses an HHS-certified laboratory for services in his or private practice and also serves as the MRO to a licensee or other entity that uses the same HHS-certified laboratory. Under certain circumstances, this relationship could be construed as a potential conflict of interest. For example, an MRO could negotiate lower pricing for specimen testing with the same laboratory a licensee uses by suggesting that he/she could persuade the licensee to take its business elsewhere. This could be considered a possible conflict of interest situation because the MRO could potentially influence a licensee's decision on changing to a

different HHS-certified laboratory and thereby gain leverage in reducing pricing for the MRO's private practice. Therefore, the NRC has not modified the proposed provision in the final rule to include the requested exemption.

Access to Donor Testing Records and Laboratory Records

Comments: Several commenters supported proposed § 26.153(f)(4) and stated that the industry agreed that access to laboratory records, beyond that required for licensee or other entity FFD program functions, should be restricted to individual donors viewing their own records [Jim Davis, NEI #48; Richard Sweigart, DCS; Keith Jury, Exelon; Mark Wetterhahn, Winston Strawn; Edward Weinkam, NMC; Don Grissette, SNC; Keith D. Young, Ameren; Glenn Morris, TVA; Ronald Gaston, Detroit Edison; Gregory Halnon, FENOC; Jeffrey Archie, SCE&G; Brian McCabe, Progress Energy; C.L. Funderburk, Dominion; F.G. Burford, Entergy].

NRC Response: The commenters' reading of proposed § 26.153(f)(4) was contrary to the NRC's intended meaning of that section. The NRC intends that an employee of a licensee or other entity who is subject to a drug test shall have the right to designate a representative to review the HHS-certified laboratory's records related to the employee's validity and drug test as well as any records related to the results of any certification, review, or revocation-of-certification proceedings relevant to the employee. This right to designate a representative is consistent with § 26.37(d) of the proposed and final rules which permits an individual, as well as a designated representative, consistent with the former rule requirements in § 26.29(b), to request and receive copies of all records pertaining to a determination that the individual has violated the FFD policy. The NRC has revised proposed § 26.153(f)(4) in the final rule to clarify the ambiguity in the proposed rule.

Comments: One commenter suggested that the NRC revise proposed § 26.153(f)(4) to permit authorized employee representatives to have access to an HHS-certified laboratory's records pertaining to an employee's validity and drug test results, as well as laboratory records of relevant certification, review, and revocation-of certification proceedings [Todd Newkirk, IBEW].

NRC Response: The NRC intended that proposed § 26.153(f)(4) would authorize employee representatives to have access to the records mentioned by the commenter. The NRC has revised proposed § 26.153(f)(4) in the final rule to clarify the ambiguity in the proposed rule. This revision makes § 26.153(f)(4) consistent with § 26.37(d) in the final rule which permits the employee, and his or her designated representative, to request copies of all records pertaining to the determination of a violation of the FFD policy, including test results, from an HHS-certified laboratory.

9.3 Laboratory Personnel (§25.155)

No comments addressed this section.

9.3.1 Day-to-Day Management of the HHS-Certified Lab (§ 26.155(a))

Comments: One commenter disagreed with the NRC's decision in proposed § 26.155(a)(4) to eliminate the requirement for an HHS-certified laboratory to maintain laboratory operating procedures in a "procedure manual" as specified in Sections 2.5(a)(5) and 2.7(o)(1) in Appendix

A to Part 26. The commenter stated that no longer requiring laboratories to maintain a procedure manual would be inconsistent with the requirements in Section 2.4(q)(1) of the HHS Guidelines. For consistency with the HHS Guidelines, the commenter suggested including the requirement for laboratory operating procedures to be maintained in a manual [Sue Brown].

NRC Response: The NRC agrees with the comment. The NRC has revised proposed § 26.155(a)(4) in the final rule to require an HHS-certified laboratory to maintain laboratory operating procedures in a procedure manual, consistent with the former rule and the related requirement in the HHS Guidelines.

9.3.2 Certifying Scientist (§ 26.155(b))

Comments: One commenter addressed the section-by-section analysis of substantive changes in proposed § 26.155(b). The section-by-section analysis stated that "the proposed rule would provide more detailed requirements with respect to the individual who validates test results at the HHS-certified laboratory." The commenter recommended that the word "validates" should be replaced by the word "certifies" because test results at HHS-certified laboratories are certified and not validated [Sue Brown, Individual].

NRC Response: The NRC agrees with the recommendation and has revised proposed § 26.155(b)(1) in the final rule to state that "HHS-certified laboratories shall have one or more certifying scientists who review all pertinent data and quality control results to certify the laboratory's test results."

9.3.3 Day-to-Day Operations and Supervision of Analysts (§ 26.155(c))

No comments address this section.

9.3.4 Other Personnel (§ 26.155(d))

No comments addressed this section.

9.3.5 Training (§ 26.155(e))

No comments addressed this section.

9.3.6 Files (§ 26.155(f))

No comments addressed this section.

9.4 Procedures (§ 26.157)

No comments addressed this section.

9.5 Assuring Specimen Security, Chain of Custody, and Preservation (§ 26.159)

Comments: One commenter addressed proposed § 26.159(f) that directed an HHS-certified testing laboratory to include the original custody-and-control form with a specimen that is

transferred to a second HHS-certified laboratory for additional testing. The commenter recommended that the proposed requirement be revised to conform to the chain-of-custody procedures used at HHS-certified laboratories. Specifically, HHS-certified laboratories provide a copy, rather than the original custody-and-control form, with a specimen that is transferred to a second HHS-certified laboratory for additional testing [Sue Brown, Individual].

NRC Response: The NRC agrees with the recommendation. The NRC has revised § 26.159(f) in the final rule to require that a copy of the custody-and-control form is packaged with an aliquot of a single specimen or a Bottle B specimen that is transferred to a second HHS-certified laboratory for testing. This revision makes the final rule consistent with the procedures used by HHS-certified laboratories.

Pooling of Urine Specimens Used for Laboratory QC Program

Comments: One commenter stated that proposed § 26.159(j) should be revised to require donor-specific information to be disassociated from valid samples that test negative on initial or confirmatory drug tests and that the laboratory chooses to pool for use in the internal quality control program at the laboratory [Todd Newkirk, IBEW].

NRC Response: The NRC agrees with the comment and has revised § 26.159(j) in the final rule to prohibit HHS-certified laboratories from retaining any information linking donors to specimens pooled for use in the internal quality control program. No reason exists for a laboratory to retain donor-specific information for negative urine specimens used in the internal quality control program. This change further enhances the privacy of individuals who are subject to Part 26. A similar provision has been added to § 26.137(e)(2) that applies to licensee testing facilities.

9.6 Cutoff Levels for Validity Testing (§ 26.161)

No comments addressed this section.

9.6.1 Validity Test Results (§ 26.161(a))

No comments addressed this section.

9.6.2 Initial Validity Testing (§ 26.161(b))

Specific Gravity Testing Instrumentation

Comments: One commenter addressed proposed § 26.161(b) and asked that the final rule specify the type of instrument to be used to perform specific gravity testing. The commenter stated that the HHS Mandatory Guidelines require specific gravity testing to be performed using a four-place refractometer [Charles LoDico, Individual].

NRC Response: The type of equipment that an HHS-certified laboratory must use to perform specific gravity testing of urine specimens is described in § 26.167(c)(2)(i) in the proposed and final rule. Therefore, the NRC has not modified § 26.161(b) in the final rule in response to this comment.

Redundancy with Subpart F Discussion in 26.131(c)

Comments: One commenter addressed proposed § 26.161(b)(2) and noted the redundancy between the initial validity testing requirements in proposed § 26.131(c) through (f) of Subpart F for licensee testing facilities and the requirements in proposed § 26.161(b)(2) for HHS-certified laboratories. The commenter suggested deleting the requirements in proposed § 26.161(b)(2). [Sue Brown, Individual]

NRC Response: The NRC agrees with the suggestion and deleted the proposed requirements in § 26.161(b)(2) because they are captured in § 26.161(c) through (f) of the final rule.

Include Invalid Specimens

Comments: One commenter suggested amending proposed § 26.161(b)(2) to include invalid specimens in the statement "there is a reason to believe the donor may have diluted, substituted, or adulterated the specimen" [Sue Brown, Individual].

NRC Response: The NRC has eliminated proposed § 26.161(b)(2) from the final rule in response to an earlier comment.

9.6.3 Results Indicating an Adulterated Specimen (§ 26.161(c))

Quality Controls for Unidentified Adulterants

Comments: One commenter addressed proposed § 26.161(c)(8) and inquired about what, if any, quality controls exist when testing specimens where "any other adulterant" is reported as the test result. The commenter inquired as to how an HHS-certified laboratory is to identify and quantify the substance [Todd Newkirk, IBEW].

NRC Response: If a specimen is identified as containing "any other adulterant," the adulterant identified by the HHS-certified laboratory is a substance other than those described in § 26.161(c)(1) through (c)(7) of the final rule. An instance that might warrant a laboratory testing for an adulterant not specified in §26.161(c)(1) through(c)(7) may arise when a specimen has an invalid test result (e.g., interference occurs on the immunoassay drug tests on two separate aliquots and a valid immunoassay drug test result cannot be obtained). If an HHS-certified laboratory conducts testing for "any other adulterant," the laboratory must perform two types of testing techniques (as specified in § 26.161(c)(8)). Also, in order to validate the accuracy of the adulterant tests used, the laboratory must use standard controls containing known concentrations of the substance (i.e., "the adulterant that the test identifies"). Further, proposed and final § 26.169(d) requires the laboratory to report the numerical value of a test result to the MRO for a specimen with an adulterated test result. Therefore, the NRC has not modified the proposed provision in the final rule.

Addition of Hyphens for Chromium (VI), Nitrite, and Sulfonate Equivalents

Comments: One commenter addressed proposed § 26.161(c)(3) through (c)(7) and requested that hyphens be inserted before the word "equivalents' in "chromium (VI) equivalents," "nitrite equivalents," and "sulfonate equivalents." The commenter stated that the suggested changes

would be consistent with HHS Guidelines [Sue Brown, Individual].

NRC Response: The NRC agrees with the commenter and has revised proposed § 26.161(c)(3) through (c)(7) in the final rule by adding hyphens before the word “equivalents” to clarify the accuracy of the language in Part 26 and improve consistency with the HHS Guidelines.

Support for Proposed Provision

Comments: Several commenters stated that industry supports the requirements in proposed § 26.161(c)(8) [Jim Davis, NEI #48; Richard Sweigart, DCS; Keith Jury, Exelon; Mark Wetterhahn, Winston Strawn; Edward Weinkam, NMC; Don Grissette, SNC; Keith D. Young, Ameren; Glenn Morris, TVA; Ronald Gaston, Detroit Edison; Gregory Halnon, FENOC; Jeffrey Archie, SCE&G; Brian McCabe, Progress Energy; C.L. Funderburk, Dominion; F.G. Burford, Entergy].

NRC Response: The comment does not require a response.

9.6.4 Results Indicating a Substituted Specimen (§ 26.161(d))

Comments: One commenter addressed a statement in the section-by-section analysis of substantive changes in proposed § 26.161(d). The commenter said that the discussion incorrectly stated that a refractometer must measure to 3 decimal places (e.g., specimen specific gravity levels of 1.001 and 1.020). The commenter asserted that a refractometer must measure to 4 decimal places (e.g., specific gravity levels of 1.0010 and 1.0200) in order to report a specimen as substituted [Sue Brown, Individual].

NRC Response: The NRC agrees with the comment and has revised the section-by-section analysis of § 26.161(d) in the final rule to correct the specific gravity range for a substituted specimen by referencing specimen specific gravity levels of 1.0010 and 1.0200.

9.6.5 Results Indicating a Dilute Specimen (§ 26.161(e))

Comments: One commenter addressed a statement in the section-by-section analysis of substantive changes in proposed § 26.161(e). The commenter stated that the discussion incorrectly specified the specific gravity range for a dilute specimen as “less than or equal to 1.001 or equal to or greater than 1.020.” The commenter stated that the correct specific gravity range is “greater than 1.0010 but less than 1.0030." [Sue Brown, Individual]

NRC Response: The NRC agrees with the comment and has revised the section-by-section analysis of § 26.161(d) in the final rule to correct the specific gravity range for a dilute specimen to “greater than 1.0010 but less than 1.0030.”

9.6.6 Results Indicating an Invalid Specimen (§ 26.161(f))

Specimen Testing Criteria for Invalid Test Result

Comments: One commenter inquired about testing criteria used to determine that a specimen

is invalid. The commenter asked why a substance could not be identified and suggested that the possibility that a laboratory testing problem might also provide an invalid test result [Todd Newkirk, IBEW].

NRC Response: The NRC disagrees with the commenter. Proposed and final § 26.161(f) specify the initial validity testing criteria that HHS-certified laboratories must use to determine whether a specimen is invalid. To ensure that each validity test performed on a specimen functions correctly, § 26.167(b) and (c) require HHS-certified laboratories to evaluate the accuracy of the assays performed using calibrators and controls in each analytical run of specimen testing performed. Each analytical run of specimens must also include blind performance testing samples under § 26.168 of the final rule. Given that sufficient controls exist in the final rule to ensure that initial validity tests function correctly, the NRC not revised proposed § 26.161(f) in the final rule.

General Oxidant Colorimetric Testing

Comments: One commenter suggested that the requirement "equal to or greater than 200 mcg/mL nitrite equivalents using a general oxidant colorimetric test" in proposed § 26.161(f)(3) was inconsistent with the intended meaning in the HHS Guidelines and should be revised to state "equal to or greater than the equivalent of 200 mcg/mL nitrite using a general oxidant colorimetric test." The commenter stated that the intended meaning of the HHS Guideline requirement is that the general oxidant test must be positive with an equivalent of 200 mcg/mL of nitrite. The commenter noted that the general oxidant test can be calibrated with a 200 mcg/mL nitrite calibrator or with a 50 mcg/mL chromium (VI) calibrator. If calibrated with the 50 mcg/mL chromium (VI) calibrator, the general oxidant test would produce a positive result for specimens with nitrite concentrations much less than 200 mcg/mL; not the intended cutoff for nitrite in the proposed provision. [Sue Brown, Individual].

NRC Response: The NRC agrees with the commenter and has revised proposed § 26.161(f)(3) in the final rule to clarify the intent of the provision. That section now reads "equal to or greater than the equivalent of 200 mcg/mL nitrite using a general oxidant colorimetric test."

Addition of Hyphens for Chromium (VI), Nitrite, and Sulfonate Equivalents

Comments: One commenter requested that proposed § 26.161(f)(7) and (f)(8) be revised by adding hyphens before the word "equivalents" in the terms "nitrite equivalents," "chromium (VI) equivalents," and "sulfonate equivalent." The commenter noted the suggested revisions are consistent with HHS Guidelines [Sue Brown, Individual].

NRC Response: The NRC agrees with the commenter and has revised proposed § 26.161(f)(7) and (f)(8) in the final rule by adding hyphens before the word "equivalents" to improve consistency between the HHS Guidelines and these Part 26 provisions.

9.6.7 Additional Testing by a Second Lab (§ 26.161(g))

Support for Proposed Provision

Comments: Several commenters stated that the industry supported proposed § 26.161(g) [Jim

Davis, NEI #48; Richard Sweigart, DCS; Keith Jury, Exelon; Mark Wetterhahn, Winston Strawn; Edward Weinkam, NMC; Don Grissette, SNC; Keith D. Young, Ameren; Glenn Morris, TVA; Ronald Gaston, Detroit Edison; Gregory Halnon, FENOC; Jeffrey Archie, SCE&G; Brian McCabe, Progress Energy; C.L. Funderburk, Dominion; F.G. Burford, Entergy].

NRC Response: The comment does not require a response.

HHS-Certified Laboratory Contacting MRO, Specimens with Possible Interfering Substances/ Adulterants

Comments: One commenter addressed the requirement in proposed § 26.161(g) that HHS-certified laboratories must consult with a licensee's or other entity's MRO to receive approval to send a specimen to a second HHS-certified laboratory for additional testing if the laboratory suspects the presence of an interfering substance/adulterant that could make a specimen test result invalid. The commenter stated that the specimen should be automatically sent to a second HHS-certified laboratory for additional testing. The commenter reasoned that no employee should suffer or be accused of attempting to subvert the testing process because of an unidentified substance [Todd Newkirk, IBEW].

NRC Response: The NRC disagrees with the request to eliminate the required consultation between the HHS-certified laboratory and the licensee's or other entity's MRO to determine if additional testing should be conducted at a second HHS-certified laboratory to try to identify whether an interfering substance/adulterant is present in a donor's specimen. This consultation is important because not all HHS-certified laboratories have the same testing capabilities to identify additional types of interfering substances and "new" adulterants. Therefore, sending a specimen to any second HHS-certified laboratory without first requiring the MRO and laboratory to confer on the test results from the first laboratory and determine whether an appropriate laboratory exists that has the capabilities to conduct additional types of test may not automatically improve the likelihood that the substance will be identified. Specifically, the HHS-certified laboratory must confer with the MRO to determine if additional testing of the specimen might identify the unidentified substance in a donor's urine specimen that is preventing a valid test result. The commenter need not be concerned that a donor would suffer or be accused of attempting to subvert the testing process. These procedures do not result in an employee being accused of subverting the testing process. No sanctions are imposed on anyone for an invalid test result. As required by § 26.185(f), the MRO must contact the donor to determine if an acceptable medical explanation exists that may cause an invalid specimen test result. Depending on the results of this enquiry, the MRO will require the donor to give another specimen, either under direct observation or not. Therefore, the NRC has not modified the proposed provision in the final rule.

Comments: One commenter stated that the provision in proposed § 26.161(g) that required the HHS-certified laboratory to contact a licensee's or other entity's MRO conflicted with Section 2.4(h)(12) in the HHS Guidelines. Specifically, the HHS Guidelines permit HHS-certified laboratories to report an "invalid" specimen test result using the same initial test on two separate aliquots. The commenter stated that most HHS-certified laboratories have eliminated their confirmatory tests for adulterants, and have been reporting more invalid results. The commenter argued that the proposed provision would impose a burden on HHS-certified laboratories to

contact the MRO for every invalid test result and suggested that the proposed provision be eliminated [Sue Brown, Individual].

NRC Response: The NRC disagrees with the commenter's request to eliminate the proposed provision in the final rule. Section 26.161(g) in the proposed and final rule is consistent with Section 2.4(h)(12) in the HHS Guidelines. For invalid specimen test results, a discussion between the HHS-certified laboratory and the MRO is critical because of differences between laboratories in their capabilities to identify interfering substances or "new" adulterants. The intent of this requirement is to deter individuals from attempting to subvert the testing process by introducing interfering substances or adulterants to mask the presence of prohibited drugs and to increase the likelihood of detection if they do. Reporting a specimen as invalid, rather than conducting confirmatory testing for a suspected adulterant when a laboratory is available that is capable of confirming the presence of an adulterant, does not achieve the NRC's objectives in requiring specimen validity testing for adulterants. Therefore, the NRC has not modified the proposed provision in the final rule.

9.6.8 More Stringent Validity Test Cutoff Levels are Prohibited (§ 26.161(h))

No comments addressed this section.

9.7 Cutoff Levels for Drugs and Drug Metabolites (§ 26.163)

No comments addressed this section.

9.7.1 Initial Drug Testing (§ 26.163(a))

Dilute Specimen Testing, Limit of Detection (LOD) Testing

Comments: One commenter addressed proposed § 26.163(a)(2) and suggested revising the provision that permitted an MRO to direct an HHS-certified laboratory to test a specimen for drugs and/or drug metabolites "down to the confirmatory assay's limit of detection (LOD)." The commenter stated that HHS Guidelines do not use the term "limit of detection" and suggested replacing the provision with the phrase "using the laboratory's confirmatory assay" [Sue Brown, Individual].

NRC Response: The NRC disagrees with the commenter's request because it is contrary to the intent of the proposed provision. The NRC is well aware that there are many legitimate reasons for specimens being dilute. However, dilution is also a method some donors use to subvert the testing process. Dilution may decrease the concentration of a drug or drug metabolites sufficiently that applying Part 26 cutoff levels, or a licensee's or other entity's more stringent cutoff levels, would produce false negative drug test results. The special processing of dilute specimens required by §26.163(a)(2) increases the likelihood that any drugs and drug metabolites in the specimen will be detected. Therefore, the final rule continues to permit licensees and other entities to conduct confirmatory testing to the assay's limit of detection for dilute specimens.

Conducting Initial Drug Testing for Dilute Specimens to LOD

Comments: One commenter addressed proposed § 26.163(a)(2) and stated that the requirement "to conduct initial drug testing of dilute specimens using FDA-approved analytical kits that have the lowest concentration levels available for the initial testing technologies" would be overly burdensome to HHS-certified laboratories. The commenter said the requirement would be burdensome because, in her experience, a large category five HHS-certified laboratory may have as many as 10 percent of specimens tested with dilute results. The commenter stated that many health-conscious individuals may have dilute specimen test results simply because they consume large quantities of water, not because they are attempting to conceal drug use. The commenter also stated that the proposed provision would be burdensome because an HHS-certified laboratory would need to have more than one FDA-approved analytical kit for a drug or metabolite to fulfill the proposed requirement. For example, the initial drug test cutoff level for marijuana metabolite is 50 ng/mL. The initial drug test kit manufacturers market a kit for use at the 50 ng/mL cutoff and at the 20 ng/mL cutoff. To meet the proposed requirement, a laboratory would need to re-screen the dilute specimen with the 20 ng/mL cutoff kit, using different controls. The commenter noted that some kit manufacturers also offer lower cutoffs for opiate metabolites and amphetamines. By using the lower cutoff levels, the NRC would effectively be lowering the initial test cutoff levels for these drugs and, by doing so, treating donors with dilute specimens differently.

If the NRC were to decide not to eliminate this proposed § 26.163(a)(2) requirement, the commenter recommended that the laboratory not be required to re-screen the identified dilute specimen and, instead, be permitted to compare the initial drug test immunoassay response for the specimen to the initial drug test immunoassay response for the cutoff calibrator with the initial drug test kit used for testing. If the specimen's response is within 50 percent of the response of the cutoff calibrator, the laboratory would report this to the licensee's or other entity's MRO on the final report. The commenter noted that an additional burden would be imposed on the laboratory to capture the initial test immunoassay response number and report it on the report form. The commenter suggested that the HHS-certified laboratory could accomplish this reporting using the laboratory's information system [Sue Brown, Individual].

NRC Response: The NRC agrees, in part, with the commenter's request and has eliminated from the final rule proposed § 26.163(a)(2) that required HHS-certified laboratories to use an FDA -approved analytical kit with the lowest concentration levels marketed for the technology(ies) being used to conduct initial drug testing of specimens with dilute initial validity test results. The NRC has accepted the commenter's recommended approach to conduct initial drug testing of each dilute specimen and evaluate the immunoassay response for each drug test such that if the quantitative test result is equal to or greater than 50 percent of the cutoff calibrator for the drug tested, the laboratory would consider the result as an initial positive drug test result. The NRC disagrees with the commenter's assertion that further testing is unnecessary. Given the consequences for donors of a positive drug test result, the NRC believes that confirmatory drug testing to the limit of detection is necessary to confirm the initial drug test result.

Dilute Specimen Testing, Eliminate the Word Confirmatory

Comments: One commenter suggested eliminating the word "confirmatory" in the sentence "If confirmatory validity testing indicates that a specimen is dilute . . ." in proposed § 26.163(a)(2). The commenter reasoned that a dilute specimen test result may be reported by testing a single aliquot of a specimen [Sue Brown, Individual].

NRC Response: The NRC agrees with the commenter's reasoning and has eliminated the word "confirmatory" in § 26.163(a)(2)(i) of the final rule. This change also increases the consistency of Part 26 with the related provision in the HHS Guidelines.

9.7.2 Confirmatory Drug Testing (§ 26.163(b))

No comments addressed this section.

9.8 Testing Split Specimens and Retesting Single Specimens (§ 26.165)

No comments addressed this section.

9.8.1 Split Specimens (§ 26.165(a))

No Discussion on Disposal of Negative Bottle A Specimens

Comments: One commenter noted that, while proposed § 26.165(a)(3) permitted the HHS-certified laboratory to discard the Bottle B specimen if the Bottle A specimen is determined to be a valid specimen free of any drugs or drug metabolites, it did not also specify that the Bottle A specimen may be discarded [Sue Brown, Individual].

NRC Response: The NRC agrees with the comment and has revised proposed § 26.165(a)(3) in the final rule to specify that an HHS-certified laboratory may also discard the specimen in Bottle A once the specimen is determined to be valid and free of any drugs or drug metabolites.

Written Request to Test Bottle B Specimen or Retest Aliquot of Single Specimen

Comments: Two commenters stated the prohibition in proposed § 26.165(a)(4) on any entity (e.g., licensee, MRO, NRC) ordering the testing of a Bottle B specimen without a donor's written permission conflicted with Section 2.6(e)(4) of the HHS Guidelines. The HHS Guidelines permit a Federal agency to have a single or split (Bottle B) specimen retested "as part of a legal or administrative proceeding to defend an original positive, adulterated, or substituted result." The commenters recommended that the NRC should include the HHS Guideline provision [Sue Brown, Individual; Charles LoDico, Individual].

NRC Response: The NRC disagrees with the commenters' recommendation. The requirements for testing split specimens in the former, proposed, and now final rule ensure that each donor receives fair and accurate testing under Part 26. The NRC's intent in the original rule, when permitting split specimen testing, was to enhance donors' confidence in the drug testing process imposed by the rule and provide one means for donors to defend against possible administrative and/or methodological errors in testing the specimen in Bottle A.

Because the NRC's intent in permitting split specimen testing has been to protect donors, and because the NRC believes that testing an individual's biological specimen without his or her permission infringes on an individual's privacy, the NRC declines to adopt the commenter's proposed revision.

Clarity of Requirement for Requesting Bottle B (Split Specimen) Testing

Comments: One commenter suggested that the NRC revise the proposed § 26.165(a)(4) that provided a donor with the opportunity to request the testing of a Bottle B specimen. The commenter stated that the proposed provision is lengthy, confusing, and does not specify that MROs must first verify that an HHS-certified laboratory test result is drug positive, adulterated, or substituted before informing donors that they have the right to request testing of the Bottle B specimen. The commenter recommended that § 26.164(a)(4) be revised to be consistent with proposed § 26.165(b)(1), which allows a donor to request a retest of a single specimen at a second HHS-certified laboratory. The commenter suggested using Section 2.6(e) in the HHS Guidelines as an example when considering the suggested revisions. The same commenter also suggested that the first sentence in proposed § 26.165(a)(4) be relocated to the results reporting section of the rule, given that the sentence instructs the laboratory to report test results to the MRO [Sue Brown, Individual].

NRC Response: The NRC agrees with the comments. The NRC has revised the proposed provision in § 26.165(a)(4) and moved it to § 26.165(b) in the final rule to improve the rule's clarity and intent. In addition, the NRC has consolidated the proposed provisions on retesting of an aliquot of a single specimen and the testing of Bottle B specimens into a single section (§ 26.165(b)(1) through (b)(6)) to improve the organization and clarity of the final rule.

Sending Bottle B Specimen to Second HHS-Certified Laboratory

Comments: One commenter stated that proposed § 26.165(a)(5) did not allow for the possibility that a licensee testing facility, rather than the HHS-certified laboratory, may retain Bottle B specimens as allowed under proposed § 26.135(a) and would have to forward Bottle B specimen to a second HHS-certified laboratory. The commenter also noted that in situations where a Bottle B specimen is located at a licensee testing facility, the one business day requirement to send the specimen to a second HHS-certified laboratory may not be sufficient time [Sue Brown, Individual].

NRC Response: Section 26.135(b) in the final rule addresses the issue raised by the commenter. If a licensee testing facility maintains a Bottle B specimen, the licensee or other entity must ensure that the donor's specimen is forwarded to a second HHS-certified laboratory if directed to do so by the MRO, at the specific request of the donor. The NRC believes that the one business day time limit for a licensee testing facility to send a Bottle B specimen to a second HHS-certified laboratory is reasonable. It should be noted that the NRC has relaxed this requirement from the "same-day" requirement for these situations in the former rule. The NRC made this revision because logistical difficulties sometimes created obstacles to FFD program compliance with the former rule's same-day requirement. For example, commenters at public meetings with stakeholders cited communication delays among donors, MROs, and FFD program personnel, particularly on weekends and holidays, as one such difficulty. They also noted that the time required to identify a second laboratory with the appropriate capability to test

the split specimen sometimes made compliance difficult. The NRC is confident that allowing one business day will be sufficient to overcome these logistical obstacles. In response to other comments received on proposed § 26.165(a) and (b), the NRC has revised and consolidated the provisions pertaining to donor requests for the retesting of an aliquot of a single specimen and Bottle B split specimen testing.

Personnel Responsible for Directing a Laboratory to Send a Bottle B Specimen for Testing

Comments: One commenter addressed proposed § 26.165(a)(5) and stated that the phrase "If the donor requests that the specimen in Bottle B be tested . . ." did not accurately reflect the notification process for split specimen testing. The commenter noted that the MRO, at the request of a donor, directs the HHS-certified laboratory to send the Bottle B specimen to a second HHS-certified laboratory for testing [Sue Brown, Individual].

NRC Response: The NRC agrees with the commenter and has revised § 26.165(b) in the final rule to clarify that, at the request of the donor, it is the MRO who directs the HHS-certified laboratory to send the Bottle B specimen for testing at another HHS-certified laboratory. In response to other comments received on proposed § 26.165(a) and (b), the NRC has revised and consolidated the provisions pertaining to donor requests for the retesting of an aliquot of a single specimen and testing of a Bottle B specimen into § 26.165(b) in the final rule to improve the clarity and organization of rule.

Providing Quantitative Values of Specimen Retest Results

Comments: One commenter addressed proposed § 26.165(a)(6) and asked why the NRC was proposing to allow the MRO to provide a donor with the quantitative values of a specimen retest result. The commenter noted that the proposed requirement was inconsistent with Section 2.6(h) in the HHS Guidelines [Sue Brown, individual].

NRC Response: The proposed provision requiring the MRO to provide a donor with the quantitative values of positive test results was consistent with Section 2.7(j) in Appendix A of the former rule. The NRC has retained this provision in the proposed and final rule to maintain donors' rights to this information and has intended to differ from the HHS Guidelines on this issue since Part 26 was first published. Therefore, the NRC has not modified the proposed provision in the final rule.

9.8.2 Donor Request to the MRO for Retest of Single Specimen (§ 26.165(b))

Comments: One commenter recommended that proposed § 26.165(b) be combined with proposed § 26.165(a)(4) and the heading of the combined section to be titled "Donor request to MRO for a retest." The commenter further suggested that the combined paragraph be modeled after the discussion in Section 2.6(e) of the HHS Guidelines [Sue Brown, Individual].

NRC Response: The NRC agrees with the commenter and has consolidated the proposed provisions on retesting of an aliquot of a single specimen and the testing of Bottle B specimens into a single section (§ 26.165(b)(1) through (b)(6) in the final rule) to clarify the NRC's intent in the final rule.

Comments: One commenter noted that the first sentence in proposed § 26.165(b)(2) prohibited a donor from requesting a retest for an invalid specimen test result and that this was consistent with the HHS Guidelines. However, the commenter thought that the second sentence in the proposed provision was confusing and appeared to allow a donor to request a retest of a specimen with an invalid test result [Sue Brown, Individual].

NRC Response: The NRC agrees with the commenter and has revised and consolidated the provisions in proposed § 26.165(a) and (b) to improve the clarity of the final rule. Section 26.165(b)(1) in the final rule now clearly states that a donor is not permitted to request the retesting of an aliquot of a single specimen or a split specimen (Bottle B) that the laboratory's testing had determined to be invalid. The NRC is imposing this prohibition because some invalid specimens create a risk of damaging laboratory equipment and because retesting invalid specimens would not provide useful information.

9.8.3 Retesting a Specimen for Drugs (§ 26.165(c))

Use of the Phrase "Standard Confirmatory Drug Test"

Comments: One commenter addressed proposed § 26.165(c)(1) and stated that the phrase "The second laboratory shall use its standard confirmatory drug test when retesting . . ." is not an accurate description of the test. The commenter requested that the word "standard" be deleted from the proposed provision since no "standard confirmatory drug test" is used by an HHS-certified laboratory [Sue Brown, Individual].

NRC Response: The NRC agrees with the commenter that HHS-certified laboratories do not use a standard confirmatory drug test and has eliminated the word "standard" from proposed § 26.165(c)(1) in the final rule.

Limit of Detection (LOD) Testing

Comments: One commenter suggested that the NRC eliminate the requirement in proposed § 26.165(c)(2) that confirmatory drug testing be performed down to the an assay's LOD for the retesting of an aliquot of a single specimen or for Bottle B split specimen testing. The commenter noted that the HHS Guidelines do not contain a similar provision [Sue Brown, Individual].

NRC Response: The NRC disagrees with this request. Section 26.163(a)(2) in the final rule allows licensees and other entities, at their discretion, to require the HHS-certified laboratory to conduct special analyses of dilute specimens, including confirmatory testing down to the LOD, for those drugs and/or drug metabolites for which the response was equal to or greater than 50 percent of the cutoff. The NRC is aware that this provision differs from the HHS Guidelines. However, testing at the LOD may be necessary to confirm the presence of drugs or metabolites in a dilute specimen. Therefore, requiring the second HHS-certified laboratory to use LOD testing is appropriate.

9.8.4 Retesting a Specimen for Adulterants (§ 26.165(d)

Comments: One commenter addressed proposed § 26.165(d) and suggested changing the word "appropriate" in the phrase "A second laboratory shall use the appropriate confirmatory validity test and criteria . . ." to "required." The suggested change would improve the consistency of the proposed provision with the HHS Guidelines [Sue Brown, Individual].

NRC Response: The NRC agrees with the commenter that the word "required" more accurately characterizes the confirmatory validity test and criteria and has revised § 26.165(d) in the final rule accordingly.

9.8.5 Retesting a Specimen for Substitution (§ 26.165(e))

Comments: One commenter recommended deleting the second sentence of proposed § 26.165(e), suggesting that the sentence was confusing and redundant. Specifically, the commenter noted that if the second HHS-certified laboratory does not find creatinine and specific gravity values that meet the substituted specimen criteria, the laboratory would report the result to the MRO as "failed to reconfirm" and not as stated in the proposed provision as "non-confirmed." The commenter also suggested deleting the phrase "exceed the original test cutoff parameters" because it was redundant with the first sentence of the proposed requirement [Sue Brown, Individual].

NRC Response: The NRC agrees with the commenter's recommendations and has eliminated the second sentence of proposed § 26.165(e) in the final rule to improve the clarity of the requirement to meet Goal 6 of the rulemaking, which is to improve the clarity of the rule's language.

9.8.6 Management Actions and Sanctions (§ 26.165(f))

Donor Compensation While Awaiting Results of Split Specimen Testing

Comments: One commenter stated that the NRC should prohibit a licensee or other entity from withholding an employee's compensation and benefits during the time period when an employee is awaiting the test results of split specimen (Bottle B) testing [Todd Newkirk, IBEW].

NRC Response: The NRC disagrees with the comment. Section 26.75(i)(2) in the final rule prohibits a licensee or other entity from withholding an individual's compensation and benefits during the time period his or her authorization has been administratively withdrawn following a positive initial drug test result for marijuana and/or cocaine metabolites at a licensee testing facility pending an HHS-certified laboratory specimen test result verified by the MRO. However, the NRC does not agree that this prohibition should be applied when a donor is waiting for the results of split specimen testing at a second HHS-certified laboratory. The difference is that, for § 26.75(i)(2), the donor's specimen has not been subject to initial or, if necessary, confirmatory testing at an HHS-certified laboratory and the result has not been confirmed by the MRO. Section 26.75(i)(2) prohibits action stronger than administrative withdrawal of authorization because the initial and confirmatory testing that could show culpability and justify stronger action have not been conducted. In the situation described by the commenter, the donor's specimen has already been subject to an HHS-certified laboratory's sophisticated testing procedures and

the MRO has confirmed the result as positive, adulterated, or substituted. Unlike the first situation, there is ample test result evidence that would indicate an FFD violation that should lead to sanctions, such as withholding of compensation and benefits. Split specimen testing or retesting of an aliquot of a single specimen is a right that a donor may choose to exercise to verify the accuracy of the first HHS-certified laboratory test result. If the second laboratory's testing fails to reconfirm the initial laboratory test result, the MRO, as required by § 26.186(n)(3) and (n)(4) of the final rule, would report that no FFD policy violation had occurred. Because of the significant difference in indicators of culpability in these two situations, the NRC has chosen not to revise proposed § 26.165(f) of the final rule.

Cancel Test Result If Donor Request Retest and Specimen Is Insufficient for Testing

Comments: One commenter stated that proposed§ 26.165(f)(2) conflicted with the HHS Guidelines. The proposed provision required that an MRO cancel an initial confirmed test result if the donor requests a retest and testing by the second laboratory cannot be performed because of circumstances outside of the donor's control (e.g., insufficient quantity of single specimen to permit retesting, or a courier, the HHS-certified laboratory, or a licensee testing facility loses Bottle B). In this instance, the HHS Guidelines also require the MRO to direct that the donor must submit a second specimen under direct observation [Charles LoDico, Individual].

NRC Response: The NRC agrees with the commenter and has revised proposed § 26.165(f)(2) in the final rule. That section now requires the MRO to inform the licensee or other entity that a second specimen collection under direct observation must occur if a donor requests the retesting of an aliquot of a single specimen or the testing of the Bottle B specimen after a confirmed positive, adulterated, or substituted test result, but the second HHS-certified laboratory is unable to test the specimen because of circumstances outside of the donor's control. Without this revision, it would have been be possible for a donor to test positive for a drug but, because the single specimen or the specimen in Bottle B of a split specimen could not be retested, the first confirmed positive test result would be cancelled and the licensee or other entity would not be required to take any further action. However, if the same donor did not request a retest of his or her specimen, the first confirmed positive test result would have stood and the licensee or other entity would impose the appropriate sanctions on the individual. By requiring a second collection under direct observation, this section as revised ensures that the individual is not using prohibited drugs whether or not he or she requests the first specimen be retested. Including this provision in the final rule also increases the consistency of Part 26 with the drug testing requirements of other Federal agencies.

Additional Reason Why a Bottle B Specimen Could Not Be Tested

Comments: One commenter addressed proposed § 26.165(f)(2) and noted that an additional reason that a Bottle B specimen could not be tested for split specimen testing is because of insufficient volume to permit testing or no volume at all.

NRC Response: The NRC agrees with the commenter and has revised proposed § 26.165(f)(2) in the final rule to include insufficient volume in Bottle B as an additional reason why a split specimen (Bottle B) could not be tested.

Reporting of Test Results from an HHS-Certified Laboratory

Comments: One commenter addressed the section-by-section analysis of substantive changes in proposed § 26.165(f)(1). The commenter stated that the phrase "If the test results from the second laboratory confirm any non-negative test results from the first HHS-certified laboratory, the proposed paragraph would require the licensee . . ." was inconsistent with the HHS Guidelines. The commenter suggested that the word "confirms" should be revised to "reconfirms" [Sue Brown].

NRC Response: The NRC agrees with the commenter's request and has revised proposed §26.165(f)(1) in the final rule accordingly. In addition, in response to other comments received on the use of the term "non-negative test result," the NRC has replaced that term in this provision with "positive, adulterated, substituted, or invalid test result," as applicable.

9.9 Quality Assurance and Quality Control (§ 26.167)

Quality Control Testing

Comments: One commenter addressed proposed § 26.167 and recommended that quality control tests be conducted at the start of the testing period. If a specimen tests positive during the analytical run, the commenter recommended that a quality control test should be performed immediately after the positive test result was obtained to ensure that the testing equipment was functioning properly (i.e., the equipment is not reporting false positive results). A copy of the tests results for quality control testing performed at the start of the testing period along with the test results from the quality control test performed immediately after the positive specimen test should be provided to the MRO for each specimen that has a positive result. The commenter also recommended that, if back-to-back positive test results occur during a batch run, the second of the two samples should be tested again to ensure that carryover did not occur [Todd Newkirk, IBEW].

NRC Response: The NRC disagrees with the commenter's request. The NRC believes that the quality assurance and quality control provisions in the final rule provide enhanced measures to evaluate the performance of HHS-certified laboratory testing processes when compared to the commenter's suggestion because the rule requires that a variety of quality control samples must be included in every analytical run of specimens. Including quality control samples in each analytical run ensures that they are subject to the same testing conditions as any donor specimens that yield positive results. If quality control samples are tested only before and after each analytical run, it would be more difficult to conclude that any errors in testing identified also affected donor specimens because the conditions under which testing occurred differed. The purpose of including these quality control samples is to verify the accuracy of the testing process while it is occurring. Therefore, the NRC has not modified the proposed provisions in the final rule.

Replace Hyphens in Control Ranges with "to"

Comments: One commenter addressed proposed § 26.167 and suggested that the NRC should replace the hyphens used when identifying control ranges (e.g., 1-1.5 mg/dL creatinine)

with “to.” The suggested change would make the text consistent with the HHS Guidelines [Sue Brown, Individual].

NRC Response: The NRC agrees with the commenter and has replaced the hyphens used in the control ranges specified in proposed § 26.167 with the word “to” in the final rule. The NRC also made this change in proposed § 26.137, where applicable.

9.9.1 Quality Assurance Program (§ 26.167(a))

No comments addressed this section.

9.9.2 Calibrators and Controls Required (§ 26.167(b))

No comments addressed this section.

9.9.3 Quality Control Requirements for Performing Initial and Confirmatory Validity Testing (§ 26.167(c))

Comments: One commenter addressed proposed § 26.167(c)(1)(iv) and stated that the creatinine concentration for the lower control should be revised from 1 to 1.0. The commenter indicated that the decimal place is important at the low end of the linear range [Charles LoDico, Individual].

NRC Response: The NRC agrees with the commenter and has revised the creatinine concentration from 1 to 1.0 in § 26.167(c)(1)(iv) of the final rule to improve accuracy in the language of the rule.

Reorganization of Requirements for pH Tests to Match HHS Guidelines

Comments: One commenter recommended that proposed § 26.167(c)(3)(i) through (c)(3)(v) addressing pH testing should be reorganized to be more consistent with the HHS Guidelines. Specifically, the commenter requested that proposed § 26.167(c)(3)(ii) be moved to the end of § 26.167(c)(3) and renumbered as (c)(3)(vi) and that the last sentence in proposed § 26.167(c)(3)(i) be moved to a new provision as § 26.167(c)(3)(ii) [Sue Brown, individual].

NRC Response: The NRC agrees with the commenter and has reorganized § 26.167(c)(3) accordingly. These changes enhance the organizational of the final rule and increase its consistency with related provisions in the HHS Guidelines.

Comments: One commenter recommended that the sentence structure of proposed § 26.167(c)(3)(iii) through (c)(3)(v) should be revised to be more consistent with the sentence structure used in the HHS Guidelines for the related provisions. The commenter suggested that the NRC should reverse the order of the clauses in the proposed provisions to present the requirements in these provisions before presenting the conditions under which each requirement applies [Sue Brown, Individual]

NRC Response: The NRC disagrees with the commenter’s recommendation. The NRC believes that presenting the antecedent conditions for a requirement before presenting the

requirement in a sentence is clearer than presenting the consequents first. Therefore, the NRC has not modified these provisions.

§ 26.167(c)(4) - Add References to Cutoff Concentration Sections

Comments: One commenter suggested revising proposed § 26.167(c)(4)(i) that stated, "Initial tests for oxidizing adulterants must include a calibrator at the appropriate cutoff concentration for the compound of interest . . ." to also include a reference to the sections in proposed § 26.161(c) that specified the cutoff concentrations. The commenter suggested that the recommended change would improve consistency with the HHS Guidelines [Sue Brown, Individual].

NRC Response: The NRC agrees with the commenter and has revised § 26.167(c)(4)(i) in the final rule to include references to § 26.161(c) and (f). These provisions specify the cutoff concentrations for initial tests for oxidizing adulterants. The NRC made similar revisions to proposed § 26.167(c)(4)(ii) in the final rule. These changes improve the clarity in the language of the proposed rule.

Comments: One commenter recommended that the phrase in proposed § 26.167(c)(4)(ii) that states, "Each confirmatory analytical run. . " should be replaced with the phrase, "Each confirmatory test batch" to be consistent with Section 2.5(h)(2) of the HHS Guidelines [Sue Brown, Individual].

NRC Response: The NRC disagrees with the commenter's request and believes that the clarity of the proposed language adequately conveyed the testing requirement. Therefore, the NRC has not modified the proposed provision in the final rule.

9.9.4 Quality Control Requirements for Performing Initial Drug Tests (§ 26.167(d))

Comments: One commenter addressed § 26.167(d)(2) and (d)(3) and suggested that the wording in the proposed provisions should be reorganized to be consistent with proposed § 26.137(e)(6) [Sue Brown, Individual].

NRC Response: The NRC agrees, in part, with the commenter's suggestion. The NRC has revised § 26.167(d)(3) in the final rule to be consistent with the organization of § 26.137(e)(6). The NRC disagrees with the commenter's request to reorganize § 26.167(d)(2) because the proposed provision clearly stated the intent of the requirement.

9.9.5 Quality Control Requirements for Performing Confirmatory Drug Test (§ 26.167(e))

Comments: One commenter addressed proposed § 26.167(e)(1) and recommended that because the provision did not describe quality control samples, it should be deleted [Sue Brown, Individual].

NRC Response: The NRC disagrees with the commenter. Section 26.167(e)(1) presents quality control requirements for performing confirmatory drug testing, not only requirements for quality control samples to be included in each analytical run of specimens subject to confirmatory testing, as indicated by the commenter. Therefore, the NRC has not modified the proposed provision in the final rule.

9.9.6 Blind Performance Testing (§ 26.167(f))

Criteria for Positive Samples May Not Result in a Positive Test Result

Comments: One commenter addressed proposed § 26.167(f)(3) and stated that the drug or drug metabolite level for blind performance testing samples at "60-80 percent of the initial cutoff values for the panel of drugs" would not produce a positive result. The commenter also noted that proposed drug or drug metabolite levels were inconsistent with those proposed for blind performance testing samples for licensee testing facilities in § 26.137(f)(6) [Sue Brown, Individual].

NRC Response: The NRC agrees with the commenter and has revised proposed § 26.167(f)(9)(ii) to require that a drug positive blind performance testing sample must contain a measurable amount of the target drug or analyte between 150 and 200 percent of the initial cutoff value. This requirement appears in § 26.168(g)(2) of the final rule. In addition, the NRC has revised proposed § 26.167(f) to include specific criteria that each blind performance test sample type (i.e., negative, drug positive, adulterated, dilute, substituted, and false negative challenge) must meet. The final rule's § 26.168(g) contains these criteria. These criteria ensure that each licensee and other entity sufficiently challenges the testing assays of HHS-certified laboratories to ensure accurate and reliable test results, thus improving the effectiveness and efficiency of FFD programs. The blind performance testing provisions in proposed § 26.167(f) were reorganized into a new section in the final rule, § 26.168(g), to improve the clarify of the final rule.

Blind Performance Testing Sample - Dilute

Comments: One commenter addressed proposed § 26.167(f)(3) that required a licensee or other entity to submit blind performance testing samples to an HHS-certified laboratory meeting the criteria for a dilute specimen. The commenter stated that the HHS Guidelines contain no such requirement [Sue Brown, Individual].

NRC Response: The NRC has chosen to challenge HHS-certified laboratories with blind performance testing sample types beyond those required by the HHS Guidelines. Because the NRC is permitting licensees and other entities to subject dilute specimens to testing at the LOD under § 26.163(a)(2) in the final rule, the NRC believes that challenging the laboratory's ability to detect dilute specimens is necessary. Therefore, the NRC has not modified the proposed provision in the final rule.

Comments: One commenter noted that proposed § 26.167(f)(5) did not include reference to dilute specimens, as required by proposed § 26.167(f)(3).

NRC Response: The NRC agrees with the commenter and has revised § 26.168(e) in the final rule to require FFD programs to submit dilute blind performance testing samples to the HHS-certified laboratory for testing each quarter. Because the NRC is permitting licensees and other entities to subject dilute specimens to testing at the LOD under § 26.163(a)(2) in the final rule, the NRC believes that challenging the laboratory's ability to detect dilute specimens is necessary. The blind performance testing provisions in proposed § 26.167(f) were reorganized into a new section in the final rule, § 26.168(g), to improve the clarify of the final rule.

Eliminate Specific Concentrations for Drug and Validity Performance Testing Samples

Comments: One commenter addressed proposed § 26.167(f)(5)(i)and (f)(5)(ii) and argued that listing the specific concentrations for drug and validity performance testing samples may be confusing and restrictive. The commenter also noted that because proposed § 26.167(f)(5) listed the criteria for performance testing samples, the requirements in proposed § 26.167(f)(5)(i) and (f)(5)(ii) should be deleted [Sue Brown, Individual].

NRC Response: NRC agrees with the commenter's recommendations and has revised proposed § 26.167(f)(5)(i) and (f)(5)(ii) in the final rule. Specifically, the NRC replaced the proposed provisions with revised provisions in § 26.168(g) of the final rule that specify the criteria that each type of blind performance test sample must meet. The specimen criteria in the final rule are less restrictive to ensure that FFD programs have the maximal flexibility to challenge the testing capabilities of HHS-certified laboratories. The blind performance testing provisions in proposed § 26.167(f) were reorganized into a new section in the final rule, § 26.168(g), to improve the clarify of the final rule.

Blind Performance Testing Samples

Comments: One commenter addressed the drug performance testing sample provisions in proposed § 26.167(f)(5)(i)(A) and stated that samples at the proposed "20 percent above the designated cutoff for the initial drug test" may produce a negative result. The commenter stated that to ensure a drug positive on the initial drug test, the drug or drug metabolite concentration should be between 1.5 and 2 times the initial drug test cutoff concentration [Sue Brown, Individual].

NRC Response: The NRC agrees with the commenter. The NRC moved proposed § 26.167(f)(5)(i)(A) to § 26.168(g)(2) of the final rule and revised it to require that drug positive blind performance testing samples must contain a measurable amount of the target analyte between 150 and 200 percent of the initial cutoff value for each drug tested. This revision will ensure that the accuracy of drug testing at HHS-certified laboratories is effectively evaluated. The blind performance testing provisions in proposed § 26.167(f) were reorganized into a new section in the final rule, § 26.168(g), to improve the clarify of the final rule.

Comments: One commenter addressed proposed § 26.167(f)(5)(i)(C) and asked why a drug performance testing "routine sample" would need to be below the cutoff for "special purposes." The commenter stated that the initial drug tests performed on a routine sample submitted to an HHS-certified laboratory would produce a negative test result because the drug concentration was below the initial cutoff level. The commenter recommended clarifying the statement or deleting the requirement from the final rule [Sue Brown, Individual].

NRC Response: The NRC agrees with the commenter's request and has eliminated § 26.167(f)(5)(i)(C) from the final rule.

Comments: One commenter identified an inconsistency between proposed § 26.167(f)(5)(i)(D) and the related provision in the HHS Guidelines. Specifically, the HHS Guidelines require a negative sample to contain no drug, while the proposed provision stated, "A negative sample

may not contain the target drug analyte at a concentration greater than 10 percent of the confirmatory cutoff" [Sue Brown, Individual].

NRC Response: The NRC agrees with the comment. The blind performance test sample criteria have been revised in § 26.168(g)(1) of the final rule. That section requires that a negative blind performance test sample may not contain a measurable amount of a target analyte and must be certified by immunoassay and confirmatory testing. The blind performance testing provisions in proposed § 26.167(f) were reorganized into a new section in the final rule, § 26.168(g), to improve the clarify of the final rule.

Comments: One commenter addressed proposed § 26.167(f)(5)(i)(E) and recommended that the phrase "fortified with" be replaced with the word "contain." [Sue Brown, Individual].

NRC Response: The NRC agrees with the commenter's request. The NRC has eliminated proposed § 26.167(f)(5)(i)(E) in the final rule in response to another comment. Therefore, no action is necessary to respond to this comment. However, the word "fortified" has been eliminated in the final rule in §26.137(d) and § 26.167(d) and (e) to improve the clarity of the final rule provisions.

Comments: One commenter suggested that the NRC combine proposed § 26.167(f)(5)(ii)(D) and (f)(5)(ii)(E) to ensure that blind performance testing samples meet the requirements for substituted or dilute specimens required in proposed § 26.167(f)(3) [Sue Brown, Individual].

NRC Response: The NRC agrees with the commenter. To improve the clarity and intent of the proposed provisions in § 26.167(f)(5)(ii)(D) and (ii)(E), the NRC has revised the blind performance test sample criteria for dilute samples in § 26.168(g)(5) of the final rule and for substituted samples in § 26.168(g)(6) in the final rule.

9.9.7 Errors in Testing (§ 26.167(g))

Comments: One commenter stated that the proposed provision in § 26.167(g)(3) incorrectly identified the title of the individual at an HHS-certified laboratory who is responsible for overseeing any corrective action required as a result of a false positive error. The commenter stated that position title should be the "responsible person" and not the "certifying scientist" was specified in the proposed provision [Sue Brown, Individual].

NRC Response: The NRC agrees with the commenter and has revised § 26.167(f)(3) in the final rule to refer to the individual at an HHS-certified laboratory who oversees any corrective action required as a result of a false positive error as the "responsible person." This change clarifies the intent of the rule.

9.9.8 Accuracy (§ 26.167(h))

No comments addressed this section.

9.10 Reporting Results (§ 26.169)

Comments: One commenter stated that the provision in proposed § 26.169(a) that HHS-certified laboratories must report for each specimen tested "any indications of tampering, adulteration, or substitution that may be present" was redundant given that laboratories will report validity test results as adulterated, substituted, invalid, or dilute. In addition, the commenter noted that any notation made on the custody-and-control form by the specimen collector also will be reported by the HHS-certified laboratory in the test result documentation. The commenter suggested that NRC delete the proposed provision [Sue Brown, Individual].

NRC Response: The NRC disagrees with the commenter. Tampering may occur after a specimen has been collected and before it arrives at the HHS-certified laboratory that cannot be detected only through testing. For example, physical evidence may exist to suggest that a shipping container containing donor specimens had been opened in transit. If the proposed provision were eliminated from the final rule, the laboratory may not inform the licensee or other entity of the physical evidence and the possibility that tampering had occurred would not then be investigated, as required under § 26.159(b) of the final rule. Therefore, the NRC has not modified the proposed provision in the final rule.

Invalid Specimens Not Included as a Non-Negative Test Result

Comments: One commenter addressed the proposed provision in § 26.169(b) that specified the non-negative test results that an HHS-certified laboratory must report to the MRO. The commenter noted that the provision did not include invalid specimen test results [Sue Brown, Individual].

NRC Response: The NRC agrees with the commenter and has amended proposed § 26.169(c)(1) in the final rule to include an invalid specimen test result as a result that must be reported by HHS-certified laboratories to MROs. This change clarifies the NRC's intent that HHS-certified laboratories must report test results for invalid specimens to the MRO.

Reporting Numerical Values of Specimen Test Results

Comments: One commenter addressed proposed § 26.169(d) and stated that by including the phrase "when applicable" in the provision for reporting of numerical values for dilute, adulterated, and substituted test results, it appeared that HHS-certified laboratories may have the option of providing this information for specimens with substituted and adulterated test results. The commenter stated that the HHS Guidelines require laboratories to report to the MRO the numerical values for specimens with substituted and adulterated test results [Sue Brown, Individual].

NRC Response: The NRC agrees with the commenter and has revised proposed § 26.169(c)(3) in the final rule to clarify the intent of the provision. This change clarifies the NRC's intent that HHS-certified laboratories must report to the MRO the numerical values for specimens with substituted and adulterated test results.

Reporting of Numerical Values for Dilute Specimens

Comments: One commenter addressed proposed § 26.169(d) and stated that the provision requiring HHS-certified laboratories to report numerical values for substituted, adulterated, and dilute specimen test results "when applicable" made it appear that the laboratory would have to provide numerical values for dilute specimens. Because the HHS Guidelines do not require laboratories to report the numerical values for dilute specimens, the commenter suggested that NRC revise the proposed provision to be consistent with the HHS Guidelines [Sue Brown, Individual].

NRC Response: The NRC agrees with the commenter and has revised the reporting requirements for substituted and adulterated specimen test results in § 26.169(c)(3) of the final rule to clarify the intent of the proposed provision. The NRC is requiring HHS-certified laboratories to report the numerical values to the MRO for only adulterated and substituted test results.

Reporting of Creatinine Result, Substituted Specimens

Comments: One commenter stated that the requirement in proposed § 26.169(d), "If numerical values for creatinine are below the LOD, the laboratory shall report to the MRO 'creatinine none detected' (i.e., substituted) along with the numerical values," was inconsistent with the HHS Guidelines. Specifically, the commenter stated that if the creatinine concentration for a specimen is below the LOD, the HHS-certified laboratory will report a result of "creatinine: none detected" along with the numerical value of the specific gravity test [Sue Brown, Individual]

NRC Response: The NRC agrees with the commenter. The NRC has revised § 26.169(c)(3) in the final rule to specify that for a specimen with a creatinine test result below the LOD, the HHS-certified laboratory will report the result as "creatinine: none detected" along with the specific gravity test result for the specimen. The revision improves consistency between the HHS Guidelines and the related Part 26 provisions.

Reporting of Numerical Values for Drug Positive, Adulterated, and Substituted Test Results

Comments: One commenter suggested that proposed § 26.169(f) requiring the HHS-certified laboratories to "provide numerical values for non-negative confirmatory test results when the MRO requests such information" was redundant, given the reporting requirement in proposed § 26.169(d). The commenter suggested that perhaps the intent of the provision was to require the laboratory to provide numerical values for drug positive test results to the MRO [Sue Brown, Individual].

NRC Response: The NRC agrees with the commenter. The NRC has revised § 26.169(c)(2) in the final rule to require an HHS-certified laboratory to provide the quantitative test results for positive test result from confirmatory testing when requested by the MRO. This change clarifies the NRC's intent in the proposed provision.

Reporting of Test Results, Number of Rejected Specimens

Comments: One commenter recommended adding two data elements to the reporting requirements in proposed § 26.169(k). To be consistent with the HHS Guidelines, the commenter suggested that HHS-certified laboratories also report the number of specimens reported as rejected for testing because of a fatal flaw and the number of specimens rejected for testing because of an uncorrected flaw [Sue Brown, Individual].

NRC Response: The NRC agrees with the commenter's recommendation and has added a requirement to § 26.169(h) of the final rule for HHS-certified laboratories to report the number of specimens "rejected for testing and the reason for the rejection." The NRC added this reporting requirement to account for specimens where testing has been canceled by the MRO because of circumstances specified in § 26.159(b)(2) of the final rule.

Reporting of Test Results, Number of Specimens Received or Reported

Comments: One commenter stated that the requirement in proposed § 26.169(k)(1) for an HHS-certified laboratory to report the "total number of specimens received" at the laboratory was inconsistent with HHS Guidelines which require the reporting of only the number of "specimen results reported" [Sue Brown, Individual].

NRC Response: The NRC disagrees with the commenter's request. The NRC considers having HHS-certified laboratories report the total number of specimens received to be a necessary component of NRC oversight of licensee testing programs because it permits the NRC to determine how many specimens licensees and other entities send to HHS-certified laboratories for testing. Therefore, the NRC has not modified the proposed provision in the final rule.

10. Subpart H: Determining FFD Policy Violations and Determining Fitness

10.1. Purpose (§ 26.181)

No comments addressed this section.

10.2. Medical Review Officer (§ 26.183)

No comments addressed this section.

10.2.1. Qualifications (§ 26.183(a))

No comments addressed this section.

10.2.2. Relationships (§ 26.183(b))

Comments: One commenter, supported by many comments, stated that additional guidance is needed in proposed § 26.183(b) to clarify conflict-of-interest relationships between MROs and HHS-certified labs. The commenter suggested that the NRC add language from DOT's 49 CFR 40.101(b) which provides examples of MRO conflicts of interest. The commenter noted that this

suggestion is consistent with Goal 1 of the rulemaking [Jim Davis, NEI #48; Richard Sweigart, DCS; Keith Jury, Exelon; Mark Wetterhahn, Winston Strawn; Edward Weinkam, NMC; Don Grissette, SNC; Keith D. Young, Ameren; Glenn Morris, TVA; Ronald Gaston, Detroit Edison; Gregory Halnon, FENOC; Jeffrey Archie, SCE&G; Brian McCabe, Progress Energy; C.L. Funderburk, Dominion; F.G. Burford, Entergy].

NRC Response: The NRC agrees with the commenter's request to add specific examples of conflict-of-interest relationships between MROs and HHS-certified laboratories. Therefore, the NRC has clarified the final rule to include specific examples of conflict-of-interest relationships between MROs and HHS-certified laboratories. The basis for the examples is 49 CFR 40.101(b) of the U.S. DOT's Procedures for Transportation Workplace Drug and Alcohol Testing Programs.

10.2.3. Responsibilities (§ 26.183(c))

No comments addressed this section.

10.2.4. MRO Staff (§ 26.183(d))

MRO Staff Performing Other Duties

Comments: One commenter, supported by many commenters, requested that the NRC revisit the requirements of proposed § 26.183(d)(1)(i) because they limit the flexibility of MRO staff who are licensee employees. The commenter requested that the licensee staff who perform MRO functions on a part-time basis be allowed to perform other duties for, and take direction from, the licensee while not working to support the MRO. This change would allow licensees to avoid needless increases to staff size. The commenter recommended that licensees and other entities be allowed to continue assigning individuals to the MRO staff on a part-time basis in accordance with current practices. The commenter suggested that the NRC add the following language to the end of the proposed section: "Employees of licensees and other entities may function as MRO staff. When functioning as MRO staff they shall take direction from the MRO only" [Jim Davis, NEI #48; Richard Sweigart, DCS; Keith Jury, Exelon; Mark Wetterhahn, Winston Strawn; Edward Weinkam, NMC; Don Grissette, SNC; Keith D. Young, Ameren; Glenn Morris, TVA; Ronald Gaston, Detroit Edison; Gregory Halnon, FENOC; Jeffrey Archie, SCE&G; Brian McCabe, Progress Energy; C.L. Funderburk, Dominion; F.G. Burford, Entergy].

Two commenters in the public meeting requested clarification on how the new rule applies in certain situations. For example, under the former rule, if a site has MRO staff that are licensee employees and an MRO that is a contractor, the licensee maintains authority over performance evaluations, hiring, and firing. The commenters were confused as to how to implement the new rule in such situations. In this case, the commenters stated that the proposed rule would force the licensee to either have an employee that is an MRO, have the MRO staff as employees, or make them all contractors. The commenters argued that in all cases, there will be a cost burden on industry [Nick Depietro, First Energy; Susan Techau, Exelon].

NRC Response: The NRC agrees with the first comment. It is not the NRC's intent to require MRO staff to be employees of an MRO. Rather, the intent of these provisions was to permit licensee staff who perform MRO functions on a part-time basis be allowed to perform other

duties for the licensee while not working to support the MRO. Therefore, the NRC has added a sentence to § 26.183(d) in the final rule to specifically state this intent.

The NRC agrees with the second set of comments that the rule requires MRO staff to be employees of the licensee or other entity, employees of the MRO, or employees of a C/V. The rule also requires an MRO to be directly responsible for the administrative, technical, and professional activities of individuals who perform MRO staff duties subject to the MRO's authority, and that the MRO's direction of staff must be meaningful. Meaningful direction involves, among other things, providing input to an individual's performance evaluation.

MRO Staff Function

Comments: Several commenters from industry addressed proposed § 26.183(d)(2)(iii) and requested that MRO staff, not exclusively the MRO, be allowed to validate prescription medication information as an administrative function. The commenters believed that this change would better allow MRO staff to assist the MRO in obtaining the information necessary to make decisions about specimens [Jim Davis, NEI #48; Brian Mc Cabe, Progress Energy; Richard Sweigart, DCS; Keith Jury, Exelon; Mark Wetterhahn, Winston Strawn; Edward Weinkam, NMC; Don Grissette, SNC; Keith D. Young, Ameren; Glenn Morris, TVA; Ronald Gaston, Detroit Edison; Gregory Halnon, FENOC; Jeffrey Archie, SCE&G; Brian McCabe, Progress Energy; C.L. Funderburk, Dominion; F.G. Burford, Entergy].

NRC Response: The NRC disagrees with this comment. The medications that a donor has taken or is taking is personal information that only a professional who meets the requirements to serve as an MRO is qualified to discuss with the donor and evaluate. Therefore, the NRC has retained the prohibition on permitting MRO staff to request information about prescription medications from donors to protect individuals' privacy under the rule.

Restrictions on MRO Staff

Comments: One commenter, supported by many commenters, disagreed with the language in proposed § 26.183(d)(2)(iv) that prohibited MRO staff from discussing test results with licensees and other entities. The commenter stated that clarification is needed to permit the MRO staff to relate confirmed results and to discuss those results with licensee and other entity personnel. The commenter stated that it is ineffective and inefficient to have only the MRO discuss results with the licensee or other entity personnel. The commenter recommended the following revised language for this subparagraph: "Staff may not report nor discuss any non-negative test results received from the HHS-certified laboratory with any individual other than the MRO and *individuals designated by licensees and other entities*" [Jim Davis, NEI #48; Richard Sweigart, DCS; Keith Jury, Exelon; Mark Wetterhahn, Winston Strawn; Edward Weinkam, NMC; Don Grissette, SNC; Keith D. Young, Ameren; Glenn Morris, TVA; Ronald Gaston, Detroit Edison; Gregory Halnon, FENOC; Jeffrey Archie, SCE&G; Brian McCabe, Progress Energy; C.L. Funderburk, Dominion; F.G. Burford, Entergy].

NRC Response: The NRC disagrees with the commenters that MRO staff should be permitted to discuss test results with licensee or other entity personnel because it is inefficient to prohibit the staff from doing so. The intent of this provision is to ensure that test results are not revealed to licensee or other entity personnel until the MRO has reviewed and confirmed them. This

prohibition is necessary to ensure that donors' privacy is protected if there is a legitimate medical explanation for a positive, adulterated, substituted, or invalid initial or confirmatory test result from the HHS-certified laboratory. It is also necessary to avoid any questions that could arise about the donor's fitness or trustworthiness and reliability based on test results that have not been confirmed by the MRO. The former, proposed, and final rules have consistently reflected the NRC's intent in this matter. The NRC intends that MRO staff may not communicate or discuss any positive, adulterated, substituted, invalid, or dilute test results received from the HHS-certified laboratory that have not been reviewed and confirmed by the MRO (i.e., unconfirmed test results) with any person other than other MRO staff or the MRO. Furthermore, the NRC does not believe that MRO staff are qualified to answer questions about an individual's medical condition, the bases for an MRO decision either to confirm an adverse confirmatory test result from an HHS-certified laboratory or to declare the test result as negative, or the meaning of any quantitative confirmatory test results reported by the HHS-certified laboratory. Those discussions must be conducted only by the MRO.

Proposed § 26.183(d)(2)(iv) referred to test results "received from the HHS-certified laboratory," which the NRC intended to be interpreted as meaning test results that have not been confirmed through MRO review. The NRC has modified this provision to more fully explain its intent in the final rule.

10.3. Determining a FFD Policy Violation (§ 26.185)

"Referral Physician"

Comments: One commenter also asked for clarification of "referral" physician in proposed § 26.185(h)(1) and (i)(1). The commenter argued that if it means the donor must be referred to him by the MRO, the commenter asked: "Why can't the donor pick his own specialist, especially if he already has the proof from the specialist in his possession?" [Todd Newkirk, IBEW].

NRC Response: The NRC agrees with the commenter that the term "referral" is ambiguous and has deleted it from § 26.185(h)(1) and (i)(1) in the final rule. The NRC intends the MRO to have sole responsibility to determine whether or not the donor has provided legitimate medical evidence and whether the specialist selected and/or the documentation provided meets the criterion of legitimate medical evidence. However, the rule does not prohibit a donor from selecting his or her own specialist or providing any documentation that the donor possesses.

Providing Legitimate Medical Evidence within Five Days

Comments: With regard to proposed § 26.185(h)(1) and (i)(1), one commenter argued that five days is not enough time to get an appointment to see a specialist. The commenter suggested that it may be better to show proof of appointment with a specialist within five days and have the clearance placed on administrative hold, pending the results from the doctor. Further, the commenter suggested that the MRO should contact the specialist to expedite the appointment. The commenter also stated that if the specialist exonerates the donor, the licensee should be liable for the costs of testing. However, the commenter stated that if the specialist cannot confirm that a medical explanation exists, then the costs should be the responsibility of the donor [Todd Newkirk, IBEW].

Several commenters from industry stated that five business days are sufficient for the donor to have medical records sent to the MRO from the donor's physician who is familiar with the donor's medical issues and recommend that the NRC implement this paragraph as proposed [Jim Davis, NEI #48; Richard Sweigart, DCS; Keith Jury, Exelon; Mark Wetterhahn, Winston Strawn; Edward Weinkam, NMC; Don Grissette, SNC; Keith D. Young, Ameren; Glenn Morris, TVA; Ronald Gaston, Detroit Edison; Gregory Halnon, FENOC; Jeffrey Archie, SCE&G; Brian McCabe, Progress Energy; C.L. Funderburk, Dominion; F.G. Burford, Entergy].

NRC Response: The NRC disagrees with the commenter who does not support the proposed provision. Five business days is not an onerous time limitation. The DOT reports that individuals who have legitimate medical evidence related to the circumstances addressed in these provisions have not had difficulty in providing their medical records to an MRO within the 5-day time period required under DOT's procedures. Therefore, the NRC has not modified this provision in the final rule.

10.3.1. MRO Review Required (§ 26.185(a))

Comments: Several commenters from industry stated that the proposed rule language calling for the MRO to determine whether the donor has violated the FFD policy was onerous for the MRO, whose expertise is medical. The commenters stated that MROs should not be required to interpret whether the FFD policy has been violated. Rather, MROs should only be responsible for reviewing non-negative test results before reporting the result to licensees. Therefore, the commenters suggested the NRC strike the phrase "to determine whether the donor has violated the FFD policy" from this proposed section [Jim Davis, NEI #48; Richard Sweigart, DCS; Keith Jury, Exelon; Mark Wetterhahn, Winston Strawn; Edward Weinkam, NMC; Don Grissette, SNC; Keith D. Young, Ameren; Glenn Morris, TVA; Ronald Gaston, Detroit Edison; Gregory Halnon, FENOC; Jeffrey Archie, SCE&G; Brian McCabe, Progress Energy; C.L. Funderburk, Dominion; F.G. Burford, Entergy].

NRC Response: The NRC does not agree with the commenters. According to § 26.183(a), the MRO must be knowledgeable of the FFD policies of the licensees or other entities for whom the MRO provides services. Also, according to § 26.185(a), the MRO shall have detailed knowledge of alternate medical explanations for a positive, adulterated, substituted, invalid, or dilute test result. Because the MRO has both detailed medical knowledge and knowledge of the licensee's FFD policies, the NRC believes that review by an MRO is a key element in determining FFD policy violations. Therefore, the NRC has not modified the provision in the final rule.

10.3.2. Reporting of Initial Test Results Prohibited (§ 26.185(b))

No comments addressed this section.

10.3.3. Discussion with the Donor (§ 26.185(c))

No comments addressed this section.

10.3.4. Donor Unavailability (§ 26.185(d))

Comments: One commenter addressed donor unavailability (i.e., to talk to the MRO, or MRO staff) and stated that proposed § 26.185(d)(1) through (3) should be re-written to improve the notification requirements. For example, a night shift worker may not have an answering machine or it may be broken. This situation could make notification impossible, unless the contact is made at work. However, if the MRO were to contact the individual at work and the individual was out of the plant, the commenter asked: "what happens if the message gets lost? What happens if the worker is on vacation, in the hospital, or on a long set of weekday ST days, like 12-hour workers get, and what if the MROs can't make contact?"

This commenter suggested that the licensee should be responsible for contacting the individual's supervisor and making arrangements for the worker to contact the licensee, who would then schedule a time for the MRO discussion. Because the supervisor is aware of the employee's schedule and health status, this would avoid the donor being declared as violating the FFD program simply because he was unavailable due to perfectly innocent reasons [Todd Newkirk, IBEW].

NRC Response: The NRC disagrees with the commenter and believes that the three paragraphs in question give adequate opportunity for the donor to be contacted. The first two paragraphs of this section pertain to situations in which contact with the donor has been made and documented, and which are not the subject of this comment. The third subparagraph clarifies that the MRO may confirm a test result as an FFD policy violation if the MRO is unable to make contact with the donor after the MRO makes all "reasonable efforts" to do so. A reasonable effort is described in this paragraph, which also makes clear that the MRO may go beyond the stated efforts to make contact with the donor.

In response to the commenter's specific examples, the MRO is required to attempt to contact the donor at day and evening phone numbers at least three times spaced reasonably over a 24-hour period. The NRC believes that contacting the donor at work is encompassed within "reasonable" efforts. If the donor is on vacation or in the hospital, reasonable efforts by the MRO will likely uncover this information.

The NRC believes that naming the donor's supervisor, instead of the donor, as the point of contact for the MRO, is inefficient and will not address the issues raised by the commenter because the MRO may face the same challenges in contacting the supervisor as in contacting the donor. In addition, MRO contact with the supervisor has the potential to violate the donor's privacy. However, § 26.185(e) provides donors with an opportunity to contact the MRO and request additional discussion of the test result(s) in the event of circumstances such as those described by the commenter.

In the rare event that a donor is unable to either receive or respond to an MRO's call, § 26.185(e) grants the donor an opportunity to re-open the discussion with the MRO by documenting the reason(s) he or she was unable to contact the MRO to discuss the adverse MRO determination. After the donor has been notified that the MRO has determined the donor violated the FFD policy without discussion, the donor has 30 days to present information to the MRO that documents the unavoidable circumstances which prevented the donor from

establishing contact with the MRO or a representative of the licensee or other entity. After evaluating the information provided by the donor, the MRO may modify the initial determination.

The NRC believes that these provisions adequately protect donors' privacy and other rights (including due process) in the circumstances described by the commenter and has not modified the provisions in the final rule.

10.3.5. Additional Opportunity for Discussion (§ 26.185(e))

No comments addressed this section.

10.3.6. Review of Invalid Specimens (§ 26.185(f))

MRO Judgement

Comments: One commenter addressed proposed § 26.185(f)(2), (f)(3), (g)(1), (h)(1) and (i)(1) and asked what constitutes an "acceptable" or "legitimate" explanation for the drug test result. The commenter argued that the provision should specify that if the individual presents testimony or certification from a medical doctor (especially a specialist), the MRO must accept it as a valid reason [Todd Newkirk, IBEW].

Several commenters from industry stated that industry believes MRO judgement is adequate and appropriate when a donor submits medical evidence to the MRO, and thus recommends that the NRC implement § 26.185(f)(2), (f)(3), (g)(1), (h)(1), and (i)(1) as proposed [Jim Davis, NEI #48; Richard Sweigart, DCS; Keith Jury, Exelon; Mark Wetterhahn, Winston Strawn; Edward Weinkam, NMC; Don Grissette, SNC; Keith D. Young, Ameren; Glenn Morris, TVA; Ronald Gaston, Detroit Edison; Gregory Halnon, FENOC; Jeffrey Archie, SCE&G; Brian McCabe, Progress Energy; C.L. Funderburk, Dominion; F.G. Burford, Entergy].

NRC Response: The NRC agrees with the commenters who support the proposed provisions, and believes it is appropriate and adequate to rely on MRO judgement to determine if there is an acceptable medical explanation for drug test results, based upon his or her medical knowledge, the qualifications and training required under § 26.183(a), and any information that the donor provides. Accordingly, the NRC has not modified the proposed provisions in the final rule.

10.3.7. Review of Dilute Specimens (§ 26.185(g))

Grounds Constituting Reason to Suspect Specimen Dilution

Comments: Another commenter, supported by many commenters, objected to the proposed language in § 26.185(g)(2) that included the specific reasons the MRO may use to determine that a donor has attempted to dilute a specimen. The commenter stated that these reasons were too restrictive, did not afford the opportunity for changes in medical knowledge, and may have negatively impacted the effectiveness of the FFD program. The commenter suggested deleting the last sentence in this paragraph as well as the three paragraphs that follow [(g)(2)(i)-(iii)] [Jim Davis, NEI #48; Richard Sweigart, DCS; Keith Jury, Exelon; Mark Wetterhahn, Winston Strawn; Edward Weinkam, NMC; Don Grissette, SNC; Keith D. Young, Ameren; Glenn

Morris, TVA; Ronald Gaston, Detroit Edison; Gregory Halnon, FENOC; Jeffrey Archie, SCE&G; Brian McCabe, Progress Energy; C.L. Funderburk, Dominion; F.G. Burford, Entergy].

NRC Response: The NRC agrees with commenter that the words "exclusive grounds" in the proposed provision were too restrictive. Therefore, the NRC has added language to the final rule clarifying that MROs shall consider the circumstances specified in § 26.185(g)(2)(i) through (g)(2)(iii) as applicable in making the determination required under this paragraph.

Typographical Error

Comments: Several commenters from industry identified a typographical error in proposed § 26.185(g)(2) and (g)(3): instead of citing § 26.31(c)(1)(ii), the NRC should cite § 26.31(d)(1)(ii) [Jim Davis, NEI #48; Richard Sweigart, DCS; Keith Jury, Exelon; Mark Wetterhahn, Winston Strawn; Edward Weinkam, NMC; Don Grissette, SNC; Keith D. Young, Ameren; Glenn Morris, TVA; Ronald Gaston, Detroit Edison; Gregory Halnon, FENOC; Jeffrey Archie, SCE&G; Brian McCabe, Progress Energy; C.L. Funderburk, Dominion; F.G. Burford, Entergy].

NRC Response: The NRC has revised proposed 26.185(g)(2) in the final rule and has eliminated the need for reference to 26.31(d)(1)(ii). However, the NRC agrees with the commenter that proposed § 26.185(g)(3) contained a typographical error and has revised the final rule accordingly.

MRO Judgement

Comments that addressed MRO judgment are documented in Section 10.3.6 of this document.

10.3.8. Review of Substituted Specimens (§ 26.185(h))

MRO Judgement

Comments that referenced this section are addressed in Section 10.3.6 of this document.

10.3.9. Review of Adulterated Specimens (§ 26.185(i))

Typographical Error

Comments: One industry commenter, supported by many commenters, addressed § 26.185(i)(3) and noted that there is a typographical error in the proposed language. To resolve this issue, the commenter suggested the following language: “If the MRO determines that there *is* a legitimate medical explanation for the adulterated test result and no drugs or drug metabolites were detected in the specimen, the MRO shall report to the licensee or other entity the test is negative”[Jim Davis, NEI #48; Richard Sweigart, DCS; Keith Jury, Exelon; Mark Wetterhahn, Winston Strawn; Edward Weinkam, NMC; Don Grissette, SNC; Keith D. Young, Ameren; Glenn Morris, TVA; Ronald Gaston, Detroit Edison; Gregory Halnon, FENOC; Jeffrey Archie, SCE&G; Brian McCabe, Progress Energy; C.L. Funderburk, Dominion; F.G. Burford, Entergy].

NRC Response: The NRC agrees with this comment. The error in the proposed rule resulted in an inconsistent provision. The NRC has revised the final rule accordingly.

MRO Judgement

Comments that addressed MRO judgment are documented in Section 10.3.6 of this document.

10.3.10. Review of Opiates, Prescription and Over-the-Counter Medications (§ 26.185(j))

Donor Responsibility to Determine if Medication is Controlled Substance

Comments: One commenter referenced proposed § 26.185(j)(6) and stated that if a doctor prescribes medication legally as treatment for a medical condition, it should not be the employee's responsibility to determine if this medication is on the list in Schedule I of section 202 of the Controlled Substances Act [21 U.S.C. 812]. The commenter stated that although § 26.21(b)(6) references the "use of prescription and over-the-counter medications that could cause impairment," no mention is made requiring the individual to report the use of prescription and OTC medications to a supervisor. This would be an invasion of the individual's privacy and a supervisor wouldn't be qualified to determine whether use of the medication would cause impairment. The commenter also argued that there is also no requirement for the employee to list his or her prescription and OTC medications when taking an FFD test; this is only required when the employee is called in for the MRO interview after a positive test occurs [Todd Newkirk, IBEW].

Several commenters from industry also referenced § 26.185(j)(6) and stated that industry agrees with the proposed paragraph because the use of drugs contained in Schedule I is a fitness-for-duty policy violation [Jim Davis, NEI #48; Richard Sweigart, DCS; Keith Jury, Exelon; Mark Wetterhahn, Winston Strawn; Edward Weinkam, NMC; Don Grissette, SNC; Keith D. Young, Ameren; Glenn Morris, TVA; Ronald Gaston, Detroit Edison; Gregory Halnon, FENOC; Jeffrey Archie, SCE&G; Brian McCabe, Progress Energy; C.L. Funderburk, Dominion; F.G. Burford, Entergy].

NRC Response: NRC agrees with the commenters who support the proposed provision. The drugs on Schedule I, by definition, do not have legitimate medical uses and, except in very rare circumstances, are not prescribed by licensed physicians. Therefore, donors will not be required to determine whether a medication resides on Schedule I.

Also, the NRC agrees that requiring an individual to report the use of prescription medications would be an invasion of the individual's privacy. Therefore, there is no requirement in the rule for a donor to list his or her prescription and OTC medications when taking an FFD test. To be consistent with the privacy requirements of the Americans with Disabilities Act [Pub. L. 101-336, July 26, 1990], the final rule eliminates the requirement in the former rule to list medications before specimen collection and testing. The final rule requires donors to provide medication information to the MRO only in the event of positive, adulterated, substituted, or invalid confirmatory validity or drug test results in order to enhance their rights to privacy under the rule. This revised requirement is also consistent with the procedures of other Federal agencies.

Review for Over-the-Counter (OTC) Medications

Comments: One commenter made three OTC-related arguments:

1) Anyone taking prescription and OTC medications may be doing so legally, but may be impaired nonetheless. Therefore, there should be a point of contact in the licensees testing program, available at all times that coincide with shift workers' starting hours, who can ensure that the medication being taken does not jeopardize the safety of the individual, coworkers, or the plant.

2) If the workers FFD file contained prescription and OTC medication information, it would eliminate the need for the worker to endure the stress of the MRO review if the medication were the cause of the non-negative test.

3) If the employee forgets about his or her OTC or prescription medications, and an FFD test were to identify them, the employee should be designated, "Not fit for duty due to accepted medical reasons," until the MRO deems that the medication is no longer being taken. [Todd Newkirk, IBEW]

NRC Response: The NRC disagrees with the commenter's first argument that there should be an available point of contact for those individuals taking prescriptions and OTC medications because the final rule contains other provisions that address this topic. Language has already been included in the final rule for such provisions. Specifically, licensees and other entities must establish the FFD program requirements for addressing these issues in their policy (§ 26.27(b)(6)) and in their procedures (§ 26.27(c)(4)).

The NRC also disagrees with the second argument that employees' FFD file should contain information about their OTC prescription medications. Requiring employees to include medication information that is linked to the positive, adulterated, substituted, or invalid test result would be an invasion of the individuals' privacy. Also, MRO's require current medication information, and the information contained in a donor's personnel file may be outdated.

The NRC disagrees with the commenter's final argument. Section 26.185(k) already addresses the commenter's concern that an employee may forget about his or her prescription or OTC medication only to have the medications identified in the FFD test. That provision states that the donor has not violated the FFD policy if an MRO determines that there is legitimate medical explanation for a positive drug test result, that the use of a drug identified through testing was in the manner and at the dosage prescribed, and the results do not reflect a lack of reliability or trustworthiness.

10.3.11. Results Consistent with Legitimate Drug Use (§ 26.185(k))

No comments addressed this section.

10.3.12. Retesting Authorized (§ 26.185(l))

No comments addressed this section.

10.3.13. Result Scientifically Insufficient (§ 26.185(m))

No comments addressed this section.

10.3.14. Evaluating Results from a Second Lab (§ 26.185(n))

No comments addressed this section.

10.3.15. Reauthorization after a First Violation for a Drug-Positive Test Result (§ 26.185(o))

No comments addressed this section.

10.3.16. Time to Complete MRO Review (§ 26.185(p))

Comments: One commenter, supported by many commenters, suggested a clarification for proposed § 26.185(p), and stated that in this paragraph, the NRC did not specify "business days." The commenter argued that the proposed language should be revised to say "business days" to conform to proposed § 26.169(a) [Jim Davis, NEI #48; Richard Sweigart, DCS; Keith Jury, Exelon; Mark Wetterhahn, Winston Strawn; Edward Weinkam, NMC; Don Grissette, SNC; Keith D. Young, Ameren; Glenn Morris, TVA; Ronald Gaston, Detroit Edison; Gregory Halnon, FENOC; Jeffrey Archie, SCE&G; Brian McCabe, Progress Energy; C.L. Funderburk, Dominion; F.G. Burford, Entergy].

NRC Response: The NRC agrees with the commenters that modifying the rule to state "business days" would improve consistency with other provisions. Therefore, the NRC has revised the final rule accordingly.

10.4. Substance Abuse Expert (§ 26.187)

No comments addressed this section.

10.4.1. Implementation (§ 26.187(a))

Comments: One commenter, supported by many commenters, stated that proposed § 26.187(a) needed clarification. Specifically, the commenter said the language should be revised to give the MRO, if qualified, the option to function as the SAE. This would avoid any unnecessary financial burden for licensees that have an MRO that can make SAE determinations. The commenter suggested adding a second sentence to § 26.187(a) that stated the following: "One person who qualifies as both an MRO as required in § 26.183 and an SAE as required by this section may perform the functions of both positions" [Jim Davis, NEI #48; Richard Sweigart, DCS; Keith Jury, Exelon; Mark Wetterhahn, Winston Strawn; Edward Weinkam, NMC; Don Grissette, SNC; Keith D. Young, Ameren; Glenn Morris, TVA; Ronald Gaston, Detroit Edison; Gregory Halnon, FENOC; Jeffrey Archie, SCE&G; Brian McCabe, Progress Energy; C.L. Funderburk, Dominion; F.G. Burford, EntergyÅ].

NRC Response: The NRC agrees with the commenters that the final rule should specify that an MRO who meets the applicable requirements may serve as both an MRO and as an SAE. Therefore, the NRC has revised this provision in the final rule accordingly.

10.4.2. Credentials (§ 26.187(b))

No comments addressed this section.

10.4.3. Basic Knowledge (§ 26.187(c))

No comments addressed this section.

10.4.4. Qualification Training (§ 26.187(d))

No comments addressed this section.

10.4.5. Continuing Education (§ 26.187(e))

No comments addressed this section.

10.4.6. Documentation (§ 26.187(f))

Comments: One commenter addressed documentation and stated that SAE documentation should be provided to the individual or designated representative upon request [Todd Newkirk, IBEW].

NRC Response: The NRC agrees with the commenter. Documentation of the credentials, knowledge, and training of the SAE should be available upon request to individuals as well as to NRC representatives, licensees, or other entities. The NRC has added a cross-reference to this provision of the final rule to specify that these types of documents shall be made available in accordance with the protection of information requirements in § 26.37.

10.4.7. Responsibilities and Prohibitions (§ 26.187(g))

Comments: One commenter addressed proposed § 26.187(g)(2) and stated that, in order to best prevent a conflict of interest, once the SAE has made the recommendation for the best treatment of the individual, the individual should be allowed to select the entity that will provide the treatment if the entity meets the credential requirements for the course of treatment provided. The commenter argued that, because personality conflicts may interfere with treatments, the individual should be allowed to change treatment providers (with SAE concurrence) during the course of treatment [Todd Newkirk, IBEW].

NRC Response: The NRC does not agree with the commenter. The NRC notes that nothing in this paragraph prohibits an SAE from considering a donor's preferences, among the other considerations specified, in identifying a treatment provider. However, "personality conflicts" with a treatment provider may be clinically meaningful and changing providers may not represent the most effective resolution to the issues. The NRC is confident that an SAE will be qualified to address such circumstances, and, therefore, has not modified this provision in the final rule.

10.5. Determination of Fitness (§ 26.189)

Definition of Determination of Fitness

Comments: One commenter, supported by other commenters, stated that proposed § 26.189(a) was confusing. The commenter suggested rewording the first sentence of the paragraph to clarify what a determination of fitness is: "A determination of fitness is the process entered when there are indications that an individual may be in violation of the licensee's or other entity's FFD policy or is otherwise unable to safely and competently perform his or her duties" [Jim Davis, NEI #48; Richard Sweigart, DCS; Keith Jury, Exelon; Mark Wetterhahn, Winston Strawn; Edward Weinkam, NMC; Don Grissette, SNC; Keith D. Young, Ameren; Glenn Morris, TVA; Ronald Gaston, Detroit Edison; Gregory Halnon, FENOC; Jeffrey Archie, SCE&G; Brian McCabe, Progress Energy; C.L. Funderburk, Dominion; F.G. Burford, Entergy].

NRC Response: The NRC agrees with the commenters. A determination of fitness is conducted after indications that the individual may be in violation of the FFD policy are discovered, not to determine whether there are such indications. Therefore, the NRC has modified the provision in the final rule to clarify this intent.

Language Clarification

Comments: Another commenter, supported by many commenters, stated that the proposed language in § 26.189(b)(3) was confusing and suggested the following minor word change: "Before an individual is granted authorization when potentially disqualifying FFD information is identified *that* has not previously been evaluated by another licensee or entity who is subject to this part..." [Jim Davis, NEI #48; Richard Sweigart, DCS; Keith Jury, Exelon; Mark Wetterhahn, Winston Strawn; Edward Weinkam, NMC; Don Grissette, SNC; Keith D. Young, Ameren; Glenn Morris, TVA; Ronald Gaston, Detroit Edison; Gregory Halnon, FENOC; Jeffrey Archie, SCE&G; Brian McCabe, Progress Energy; C.L. Funderburk, Dominion; F.G. Burford, Entergy].

NRC Response: The NRC agrees with the commenters that this edit will clarify the intent of the provision. A determination of fitness is intended to be conducted before an individual is granted authorization when potentially disqualifying fitness-for-duty information (PDFFDI) is identified that has not been previously evaluated by another licensee or entity who is subject to this part. Therefore, the NRC has modified the provision in the final rule to address this comment.

Requirement for Face-to-Face For-Cause Determination of Fitness

Comments: One commenter, supported by many commenters, addressed the proposed language in § 26.189(c) and stated that face-to-face interaction is not always required to make a "for cause" determination of fitness. The commenter stated that the determination of the appropriate approach to this determination should be left to the professional making the determination. The commenter argued that, in other parts of the rule, the qualified professional would be expected to make that determination using techniques that are generally acceptable in the professional community and these may not include face-to-face interaction in all circumstances. For example, if the ultimate issue is whether a certain psychoactive medication will prevent an individual from performing assigned duties, the commenter argued that a clinical

psychologist may be able to provide the needed determination of fitness without a face-to-face interaction. Thus, the commenter suggested deleting this paragraph, renumbering (d) as (c), and moving the subparagraphs in the previous (c) under the new (c) [Randy Cleveland, NMC; Jim Davis, NEI #48; Richard Sweigart, DCS; Keith Jury, Exelon; Mark Wetterhahn, Winston Strawn; Edward Weinkam, NMC; Don Grissette, SNC; Keith D. Young, Ameren; Glenn Morris, TVA; Ronald Gaston, Detroit Edison; Gregory Halnon, FENOC; Jeffrey Archie, SCE&G; Brian McCabe, Progress Energy; C.L. Funderburk, Dominion; F.G. Burford, Entergy].

NRC Response: A for-cause determination of fitness shall be conducted in response to an individual's observed behavior or physical condition indicating that they are in violation of the FFD policy or otherwise unable to safely and competently perform his or her duties. The NRC believes that the assessment should include immediate sensory observation (such as the smell of alcohol or the individual's physical appearance or behavior) that can only be available during a face-to-face interaction. However, the NRC has clarified the final rule to reflect NRC's intent that a for-cause determination of fitness is not required if there is an absence of physical or sensory information (i.e. based solely on receiving information that an individual is engaging in substance abuse).

Second Determination of Fitness

Comment: Regarding proposed § 26.189(d), one commenter stated that this provision appeared to eliminate the use of a second MRO to evaluate additional information supplied by an individual after an initial determination of fitness has been made. The commenter argued that this creates the situation where an individual's fitness cannot subsequently be evaluated if the deciding MRO is unavailable because only that MRO can change his or her initial determination. The commenter also stated that this section appeared to conflict with the review process in § 26.39. Therefore, the commenter suggested that this section be removed from the rule [C.L. Funderburk, Dominion].

NRC Response: The NRC disagrees with the commenter that the provision would lead to situation in which an individual's fitness cannot subsequently be evaluated if the deciding professional is unavailable in the long-term, given that the provision specifically states "Unless the professional who made the initial determination of fitness is no longer employed by or under contract to the licensee or other entity, only that professional is authorized to modify the evaluation and recommendations." In the short-term, if the professional is on vacation or sick leave, the professional may evaluate any new or additional information upon his/her return to duty.

The NRC also disagrees with the statement that the provision conflicts with § 26.39, as §§ 26.189 and 26.39 contain provisions for differing types of reviews. Section 26.189 contains provisions for a determination of fitness, which is a method of determining whether an individual has violated the FFD policy or is fit to safely and competently perform his or her duties. The review process in § 26.39 establishes provisions for the review of a determination that an individual has violated the FFD policy. This section specifically states that the reviewers cannot be associated with the administration of the FFD program (i.e., those who make a determination of fitness in 26.189). Therefore, the NRC has not modified the proposed provision in the final rule.

11. Subpart I: Managing Fatigue

Many commenters referenced the fatigue provisions in Subpart I of the proposed rule. There appeared to be an equal amount of support for and disagreement with the proposed rule.

Support for Subpart I

Comments: Many commenters supported Subpart I. For example, several commenters ardently supported the fatigue provisions for various reasons, including the prevention of worker injuries and forced-overtime, as well as increased opportunity for time workers will have to spend with their families [Anonymous #26; Anonymous #27; Anonymous #28; Anonymous #29; Mark Haywood, First Energy; Greg Gorman, First Energy; Richard Barkley, Individual]. Some commenters argued that the new rules will force the owners/operators of power plants to increase staffing levels and reduce overtime [Mike Jolley, Individual; Anonymous #19; Richard Barkley, Individual]. Another commenter stated that the fatigue provisions are also beneficial from a security standpoint, [Anthony Rizzo Jr, Salem Hope Creek]. Two commenters argued that if fatigue is left unchecked, problems will worsen due to regulation, downsizing, and the aging workforce [Anonymous #29, Anonymous #75]. Another argued that this rule may increase the experience level of current personnel while reducing the operating costs of licensees, as fewer resources will need to be dedicated to the training of replacement personnel [Kenneth Kolaczyk, Individual].

Several commenters supported the fatigue provisions in this Subpart by discrediting industry arguments against it. They disagreed with industry's argument that worker fatigue has not yet led to a significant reactor event, hence, there is no problem to be resolved via the rulemaking [David Lochbaum, UCS; Deborah Katz, CAN; Anonymous #75]. Two commenters explained that this argument is "intellectually bankrupt" for at least two reasons. First, past evaluations of plant events do not parse human performance finely enough to dismiss fatigue as either a primary or contributing factor. The commenters argued that there are indeed events where "failure to follow procedure" is identified as a cause, and this could be a result of fatigue. Second, the commenters argued that "it would be imprudent public policy and unwise business judgement to tolerate an unsafe practice until it caused mayhem." The commenters stated that although NEI data showed that excessive working hours was not rampant in the industry and that most plant owners were responsibly managing working hours, the data also revealed that some plant managers worked employees beyond reason. Thus, the commenters argued that this rulemaking is necessary to control those owners who cannot responsibly manage work hours and to provide adequate protection against impairment from fatigued workers [David Lochbaum, UCS; Deborah Katz, CAN].

Another commenter stated that because the safety of nuclear power plants is predicated upon the proper implementation of programs and procedures by qualified personnel, and studies have shown that fatigued personnel are less likely to conduct activities properly, the proposed work hour restrictions would be a "prudent NRC action" [Kenneth Kolaczyk, Individual].

One commenter supports the inclusion of education and fatigue assessment as compliments to the explicit work-hour policies, as this represents a progressive approach that acknowledges the complexity of managing fatigue in the nuclear generating industry. The commenter stated that although a duty-hour approach to controlling fatigue cannot fully address fatigue factors, it is

essential to provide a reasonable assurance that the risk of fatigue-related events are being managed. However, the commenter stated that while federal duty-hour policies provide a critical and central structure for managing fatigue, there should also be consideration of the need to respond to unforseen circumstances and operational flexibility [Mark Rosekind, Alertness Solutions].

NRC Response: The comments do not require a response.

Individuals' Recognition of Fatigue

Comments: Some commenters stated that workers should be able to recognize when they are fatigued and should be able to correct the issue themselves via the former rule provisions, thus the proposed NRC fatigue regulation is burdensome and unnecessary [Jim Waite, Exelon; Blaine Peters, Exelon; Danny Todhunter, Exelon; Donald Lenski, Individual; Robert Althoff, Individual]. Some commenters suggested that the only change to the FFD program should be the prohibition of forced overtime, and voluntary overtime should be allowed [Jim Waite, Exelon; Donald Lenski, Individual; Guy Galster, Individual].

NRC Response: The NRC agrees in part with the commenters concerning the workers ability to recognize when they are fatigued. However, although individuals are able to make relative judgements regarding their level of fatigue, there have been several studies that noted the tendency for individuals to underestimate their level of impairment from fatigue as discussed in the *Federal Register*, Vol. 70, No. 165, on page 50458. More recently, research has suggested that individuals may not take necessary safety precautions despite a recognition that they are impaired by fatigue (Nabi et al., 2006). The NRC has also received allegations from nuclear power plant workers expressing fear of adverse actions from employers for reporting that they are unfit for duty because of fatigue. As a consequence, the NRC does not believe there is reasonable assurance workers can reliably address excessive fatigue solely through their own actions under the former requirements applicable to worker fatigue or that only a prohibition on forced overtime would be adequate. Therefore, the NRC retains the requirements in the final rule concerning fatigue management.

New Provisions Add Cost and Only Facilitate Regulatory Oversight

Comment: Another commenter stated that, unless the NRC is finding frequent excessive work hours, providing "additional layers of bureaucracy" is adding costs and seems to only facilitate regulatory oversight [David Sancic, Individual].

NRC Response: The NRC disagrees that the NRC is only adding costs to facilitate regulatory oversight. The NRC has documented concerns regarding frequent excessive use of work hours in SECY-01-0113, "Fatigue of Workers at Nuclear Power Plants," and SECY 05-0074, "Proposed Rule to Amend the Fitness-For-Duty Requirements in 10 CFR Part 26." Therefore, establishing clear and enforceable requirements for the management of worker fatigue is necessary to ensure against worker fatigue adversely affecting public health and safety and the common defense and security.

Lack of Correlation between Impacts of Fatigue and Performance at Reactors

Comments: One commenter, supported by other commenters, stated that there has been no correlation between the claimed impacts of fatigue and actual human performance at power reactor sites. As a result, the commenter suggested that there is no need to significantly expand fatigue requirements beyond those contained in Generic Letter 82-12. The commenter also explained that after reviewing facilities' human performance measures, the data showed no adverse trend in a performance for longer outages and beyond the sixth day of work. Therefore, the commenter disagreed with the rule package's contention that increased fatigue after long outages and after the sixth day of work affects human performance [Andrew Antrassian, UWUA; Michael Coyle, NEI #49; Richard Sweigart, DCS; Keith Jury, Exelon; Mark Wetterhahn, Winston Strawn; Edward Weinkam, NMC; Don Grissette, SNC; Keith D. Young, Ameren; Glenn Morris, TVA; Ronald Gaston, Detroit Edison; Gregory Halnon, FENOC; Jeffrey Archie, SCE&G; Brian McCabe, Progress Energy; A. Edward Scherer, SCE; D.R. Woodlan, STARS; J. A. Stall, FPL; B.T. McKinney, PPL; F.G. Burford, Entergy; Daniel Stenger, NRSG].

NRC Response: The NRC disagrees with the conclusions of the report, “Work Hour Rule Data Summary,” submitted by the commenters. The report concludes that human performance does not suffer in longer outages with greater work schedules and that there is not an adverse trend in human performance for work beyond six straight days. The conclusions of the report do not withstand a rigorous analysis and therefore cannot support leaving fatigue requirements as those stated in Generic Letter 81-12.

According to the text of the report the plot of the number of human performance errors and Corrective Action Reports (CRs) which occurred over a 13 week period has a downward trend (in the data) during an outage. However, both human performance errors and CRs, while declining between weeks 4 and 10, are actually increasing for weeks 11 through 13. (There is no data provided after week 13). Moreover, the number of CRs is actually higher after week 13 compared to week 1 (60 versus 40). The later illustrates a problem generally associated with visual inspection of time series data, namely scale values. If only data for weeks 1 and 13 were shown, then the visual inspection of the data would have led to the observation that human performance errors increase over time during an outage, while CRs are roughly constant.

Several plants submitted data for human performance errors by day of work for seven straight days. Again, the report stated that the data demonstrated that there was either a downward or no trend in human performance errors as a function of the day of shift. Again, there was not a rigorous analysis of the data but rather a subjective conclusion drawn out by visual inspection of graphs.

The NRC recognizes that the analysis of the data collected by licensees to evaluate human performance error during periods of normal operating and outages is of anecdotal value. However, the NRC disagrees that the report is evidence that the proposed rule should be revised. In contrast, the overwhelming body of evidence, as discussed in Section IV.D of the preamble to the final rule, supports the need for periodic days off to prevent cumulative fatigue and human error. Therefore, the final rule language retains provisions to address cumulative fatigue. However, in response to comments regarding the proposed rule provisions concerning the minimum break requirements in § 26.199(d)(2) of the proposed rule and the collective work hour limits in § 26.199(f) of the proposed rule, the NRC has revised the provisions to address

cumulative fatigue. These revised provisions are presented in § 26.205 (d)(2) through (a)(6) of the final rule.

Questionable Data

Comment: Another commenter claimed that the justification for the fatigue provisions is based on speculative and politically skewed data, rather than sound scientific data. [Daniel Hansen, Individual].

NRC Response: The NRC disagrees with the commenter and notes that the commenter provided no basis for this assertion. The studies used by the NRC as the basis for the proposed requirements are largely from refereed journals and the findings of those studies were consistent with the broader research literature and widely accepted fatigue management guidelines. Therefore, the NRC retains the Subpart I requirements for the management of fatigue.

Inconsistency with Goals of the Rulemaking

Comments: Some commenters stated that the proposed work hour provisions in Subpart I are inconsistent with some of the stated goals of the rulemaking. They stated that Subpart I introduces new inefficiencies and unnecessary requirements which are contrary to rulemaking Goals 3 and 5, and suggested that broader application of performance-based principles and fewer prescriptive limits would more effectively meet the Commission's intent in Generic Letter 82-12. [Michael Coyle, NEI #49; Gregory Halnon, First Energy; Richard Sweigart, DCS; Keith Jury, Exelon; Mark Wetterhahn, Winston Strawn; Edward Weinkam, NMC; Don Grissette, SNC; Keith D. Young, Ameren; Glenn Morris, TVA; Ronald Gaston, Detroit Edison; Gregory Halnon, FENOC; Jeffrey Archie, SCE&G; Brian McCabe, Progress Energy; A. Edward Scherer, SCE; D.R. Woodlan, STARS; J. A. Stall, FPL; B.T. McKinney, PPL; F.G. Burford, Entergy; Daniel Stenger, NRSG].

NRC Response: The NRC agrees in part with the comments on the proposed work hour provisions. Therefore, the NRC has eliminated the collective work hour controls that would have been required by the proposed rule and has restructured the break and day off requirements in the final rule in a manner that will reduce the burden on licensees and place more emphasis on performance-based requirements. The revised break and day off requirements are presented in § 26.205(d)(2) through (d)(6) of the final rule.

Napping Policies

Comment: One commenter noted studies that show that napping at the workplace is especially effective for workers who need to maintain a high degree of alertness, attention to detail, or make quick decisions. Thus, it encouraged the NRC to include a provision regarding the inclusion of sound napping policies in the fatigue management plans developed by licensees. These napping policies should include the designation of quiet, dark and accessible areas (e.g., rooms in EAP or wellness units) to be used as napping facilities. The use of these facilities should be encouraged especially during outages, the use of heavy overtime, and when waivers are granted [Darrel Drobnich, NSF].

NRC Response: The NRC agrees that napping is a particularly effective fatigue management strategy. The rule does not require licensees to use napping, or address napping in their fatigue management policy, so that licensees have the flexibility to use the methods they consider most appropriate and effective in the specific circumstances they are addressing. However, the NRC notes that § 26.205(b)(2) of the final rule will allow licensees to exclude within-shift break times from work hour calculations if the licensee provides reasonable opportunity and accommodations for sleep. Although this provision does not require licensees to use napping as a fatigue mitigation strategy, allowing licensees to exclude time used for napping from work hour calculations removes a potentially significant disincentive for using this strategy. In addition, § 26.203(c) of the final rule requires licensee FFD training programs to address "the effective use of fatigue countermeasures" and verify worker knowledge and abilities through a comprehensive examination as required by § 26.29(b). As a consequence, the NRC expects that licensees who choose to use napping as a fatigue mitigation strategy will have associated training to ensure effective implementation.

11.1. Applicability (§ 26.195)

No comments addressed this section.

11.2. General Provisions (§ 26.197)

Comments: One commenter supported § 26.197(a), (b), and (c) [Brian McCabe, Progress Energy]. Other commenters expressed support for the provisions in § 26.197(a) through (d). These commenters agreed that establishing clear policies, procedures, training and records will be a significant improvement for the management of work hour requirements [Michael Coyle, NEI #49; Richard Sweigart, DCS; Keith Jury, Exelon; Mark Wetterhahn, Winston Strawn; Edward Weinkam, NMC; Don Grissette, SNC; Keith D. Young, Ameren; Glenn Morris, TVA; Ronald Gaston, Detroit Edison; Gregory Halnon, FENOC; Jeffrey Archie, SCE&G; Brian McCabe, Progress Energy; A. Edward Scherer, SCE; D.R. Woodlan, STARS; J. A. Stall, FPL; B.T. McKinney, PPL; F.G. Burford, Entergy; Daniel Stenger, NRSG].

NRC Response: The comments do not require a response.

11.2.1. Policy (§ 26.197(a))

Comments: Several commenters from industry supported this section of the rule and stated that setting clear expectations for individuals to self-declare and establishing a process for dealing with fatigue are key features of the proposed rule [Michael Coyle, NEI #49; Richard Sweigart, DCS; Keith Jury, Exelon; Mark Wetterhahn, Winston Strawn; Edward Weinkam, NMC; Don Grissette, SNC; Keith D. Young, Ameren; Glenn Morris, TVA; Ronald Gaston, Detroit Edison; Gregory Halnon, FENOC; Jeffrey Archie, SCE&G; Brian McCabe, Progress Energy; A. Edward Scherer, SCE; D.R. Woodlan, STARS; J. A. Stall, FPL; B.T. McKinney, PPL; F.G. Burford, Entergy; Daniel Stenger, NRSG].

NRC Response: The comments do not require a response.

11.2.2. Procedures (§ 26.197(b))

Support for Procedures

Comments: Some commenters supported the procedure requirements of Subpart I, specifically proposed § 26.197(b)(1), which requires that the licensee's FFD program explicitly describe the process for making and handling fatigue self-declarations by all workers. The commenters stated that this language is "absolutely vital to the efficacy and integrity of the program." They also stated the proposed language assures that appropriate checks and balances are in place to limit abuses both in the case of management forcing fatigued workers to stay on the job, as well as workers using fatigue self-declaration to supplement their sick/vacation time [David Lochbaum, UCS; Deborah Katz, CAN].

NRC Response: The comments do not require a response.

Rest Break Procedures

Comment: One commenter suggested that the NRC add to proposed § 26.197(b)(1) subparagraph (iv) and (v) a requirement for a licensee procedure that would describe criteria for workers to activate the 24 or 48 hour optional rest period. The commenter suggested the following language for subparagraph (v): "For individuals working a nominal rotation shift cycle containing a majority of 8 hour shifts for 7 work days not to exceed 8 work days of continuous duty with each work shift providing a break period as described in § 26.199(d)(2)(i); describe the process to be followed when an individual requests to observe a 24 Hour and/or a 48 Hour break period prior to the licensee soliciting or assigning further work to an individual exceeding the last scheduled day containing the 7 or 8 continuous work days as allowed by § 26.199(d)(2)(ii), § 26.199(d)(2)(iii) and § 26.199(d)(4)." The commenter also suggested the following language for subparagraph (v): "Describe the process to be followed when an individual requests to observe a 48 Hour break period for individuals working a nominal rotation shift cycle containing a majority of scheduled hours above 8 hours per shift as allowed by § 26.199(d)(2)(iii)(a) and § 26.199(d)(4) [Edwin Hill, IBEW].

NRC Response: The NRC agrees in part with the commenter, however, it did not conclude that it was appropriate to establish a requirement for optional rest periods. The NRC has revised the final rule text by establishing minimum day off requirements in § 26.205(d)(3) through (d)(6) of the final rule that allow increased flexibility in the specific timing of the breaks. This increased flexibility allows licensees and workers to address personal and work schedule needs while continuing to provide reasonable assurance that individuals do not become impaired from fatigue because of excessive work hours. Therefore, the commenter's concerns have been addressed through alternative requirements.

Self-Declaration Procedures

Comment: One commenter expressed concern that § 26.197(b)(1) would mandate prescriptive requirements for the content of licensee procedures with respect to worker self-declarations of fatigue. The commenter stated that the proposed rule appears to intrude unnecessarily into the employer-employee relationship and may have the effect of establishing new responsibilities and procedural rights beyond existing collective bargaining agreements. The commenter argued that

the rule should not rely on self-declarations as the primary means of identifying fatigue, and the training of shift workers that would be required as part of the fatigue management program under proposed § 26.197(c) should be sufficient. Thus, in view of the adequacy of training, the commenter recommended that the NRC eliminate the requirement for a detailed self declaration process procedure [Daniel Stenger, NRSG].

NRC Response: The NRC disagrees that the proposed rule intrudes unnecessarily into the employer-employee relationship and that the NRC should eliminate the requirement for a self-declaration process. Section 26.197(b)(1) of the final rule requires licensees to develop, implement, and maintain a procedure for self-declaration. It further requires that the procedure describe the individual's and licensee's rights and responsibilities related to self-declaration, the controls and conditions under which an individual may be permitted or required to perform work after that individual declares that he or she is not fit because of fatigue, and the process to be followed if the individual disagrees with the results of a fatigue assessment. The rule does not establish the individual's rights and responsibilities, does not prescribe the controls and conditions that must be established, and does not prescribe the process to be followed if an individual disagrees with the results of a fatigue assessment. As a consequence, the NRC does not believe that the requirement for a procedure intrudes unnecessarily into the employer-employee relationship. However, in light of the allegations that the NRC has received concerning self-declaration of fatigue, it appears that there has been a lack of understanding by licensees and workers regarding the applicability of the requirements of Part 26 and 10 CFR 50.7 to these circumstances, and that a procedure that addresses the self-declaration process is necessary to ensure that self-declaration is an effective means for detecting impairment from fatigue. Therefore, the NRC retains the proposed requirements regarding self-declaration in § 26.203(b)(1) of the final rule.

11.2.3. Training and Examinations (§ 26.197(c))

Comments: One commenter fully endorsed this provision because comprehensive education and training on the promotion of good quality sleep and the mitigation of fatigue is essential to the promotion of safety in the nuclear industry. The commenter also suggested that some education and training on sleep, sleep disorders and the consequences of sleep deprivation, although not necessarily examinations, should be required for all personnel, whether or not they are in safety sensitive positions or covered under work hour controls in proposed § 26.199(a). The commenter stated that education of all personnel, including (and perhaps especially) upper management, is key to fostering a culture that embraces alertness and effective fatigue management [Darrel Drobnich, NSF].

With regard to proposed § 26.197(c)(1), the commenter stated that the NRC should provide specific guidance regarding topics that should be covered in fatigue training and education modules and examinations. The commenter suggested that the NRC take the lead in developing uniform curriculum and examination materials in order to ensure the accuracy and uniformity of information provided. The commenter also argued that all MROs should receive education and training regarding the signs and symptoms of sleep disorders as well as effective treatment options, and that information on the prevention of drowsy driving should be included in any materials that are developed [Darrel Drobnich, NSF].

NRC Response: The NRC agrees with the commenter's general support for this provision. The NRC notes that this training requirement is applicable to all licensee personnel subject to the FFD program, not just workers subject to the work hour controls. Consequently, managers and MROs, who have an important role in fostering an effective fatigue management culture, would be subject to the training requirements. With regard to the commenter's suggestion that the NRC should provide specific guidance regarding the specific topics that should be addressed in fatigue management training, the NRC notes that § 26.203(c)(1) of the final rule requires licensees to include specified knowledge and abilities concerning fatigue management in the content of the FFD training program. Establishing training requirements at the knowledge and abilities level allows licensees the flexibility to update their existing FFD training programs, as necessary and in a manner that efficiently achieves the fundamental objective of the training. Although the NRC agrees that a uniform curriculum may help ensure the accuracy of the information provided, and notes the NRC may participate in the development and review of guidance concerning fatigue management training, it is the responsibility of individual licensees to ensure that training materials are technically correct and support trainee attainment of the required knowledge and abilities. Therefore, the NRC retains the proposed training requirements in § 26.203(c) of the final rule.

11.2.4. Recordkeeping (§ 26.197(d))

Support for Recordkeeping Provisions

Comments: One commenter agreed with the recordkeeping requirements of Subpart I, especially the three year record retention requirement because it is consistent with the inspection cycle of the reactor oversight process (ROP) [David Lochbaum, UCS; Deborah Katz, CAN]

Several commenters from industry said the provision that requires licensees to maintain records, combined with proposed § 26.199(j), provide an additional performance-based provision to the rule and provides assurance that performance expectations are met [Michael Coyle, NEI #49; Richard Sweigart, DCS; Keith Jury, Exelon; Mark Wetterhahn, Winston Strawn; Edward Weinkam, NMC; Don Grissette, SNC; Keith D. Young, Ameren; Glenn Morris, TVA; Ronald Gaston, Detroit Edison; Gregory Halnon, FENOC; Jeffrey Archie, SCE&G; Brian McCabe, Progress Energy; A. Edward Scherer, SCE; D.R. Woodlan, STARS; J. A. Stall, FPL; B.T. McKinney, PPL; F.G. Burford, Entergy; Daniel Stenger, NRSG].

NRC Response: The comments do not require a response.

Records of Rest Breaks

Comment: Another commenter suggested that the NRC add § 26.197(d) subparagraph (6) that states: "Documentation of individual requested rest breaks and final licensee disposition of the requested break in accordance with § 26.199(d)(2)(ii) and § 26.199(d)(2)(iii)" [Edwin Hill, IBEW].

NRC Response: The NRC disagrees with the comment that individual requested rest breaks should be documented. Optional rest breaks alone do not provide reasonable assurance that nuclear power plant workers will obtain an adequate amount of rest. Consequently, the NRC does not believe that recordkeeping of such requests is warranted. However, the NRC has

modified the final rule to include rest break requirements that largely meet the commenter's objective of providing workers increased flexibility in the distribution of their rest breaks. Therefore, the commenters concerns have been addressed. The revised break and day off requirements are presented in § 26.205(d)(2) through (d)(6) of the final rule.

11.2.5. Reporting (§ 26.197(e))

NRC's Justification of Reporting Requirements is Flawed

Comments: Many commenters addressed the reporting requirements for the fatigue provisions. Several commenters from industry argued that the reporting requirements in § 26.197(e) should be deleted from the rule because they will not provide new or unique information to the NRC, are unnecessary to protect public health and safety, are unnecessary to facilitate NRC oversight of the revised rule, and are unduly burdensome for the NRC power reactor licensees [Marvin Fertel, NEI]. A similar comment stated that (e)(1) and (e)(3) should be deleted for these reasons, and § 26.199(e)(2) should be revised to apply only to the job duty group comprised of security personnel as defined in § 26.199(a)(5) [Michael Coyle, NEI #49;, Richard Sweigart, DCS; Keith Jury, Exelon; Mark Wetterhahn, Winston Strawn; Edward Weinkam, NMC; Don Grissette, SNC; Keith D. Young, Ameren; Glenn Morris, TVA; Ronald Gaston, Detroit Edison; Gregory Halnon, FENOC; Jeffrey Archie, SCE&G; Brian McCabe, Progress Energy; A. Edward Scherer, SCE; D.R. Woodlan, STARS; J. A. Stall, FPL; B.T. McKinney, PPL; F.G. Burford, Entergy; Daniel Stenger, NRSG].

One commenter expanded upon the argument that the requested information is not required for the NRC to ensure public health and safety. The commenter argued that the NRC's FFD rule package does not demonstrate that the industry would fail to comply with the requirements of the revised rule without the imposition of these reporting requirements. Additionally, the commenter stated that the NRC has an effective oversight process that does not depend on extensive data collection from licensees. Thus, the commenter argued that the existing regulatory process is adequate to ensure compliance with regulatory requirements with the reporting provisions in question. The commenter also argued that the NRC's claim that reporting requirements are needed to "focus the NRC inspection resources" is flawed. The commenter stated that the NRC staff will be able to gauge the adequacy of reactor licensees' fatigue management programs without this information collection. With the NRC's baseline inspection program and resident inspectors assigned to each site, the commenter argued that there is adequate attention to a broad range of performance indicators that would indicate any degradation in performance well in advance of a public health and safety issue. Also, the commenter stated this claim is inconsistent with the NRC staff's approach in other areas, such as the corrective action program [Marvin Fertel, NEI].

Some commenters argued that the reporting requirement ignores the significant duplication in licensee efforts that the proposed language creates. For example, § 26.197(d) requires that licensees retain adequate records of waivers and assessments, and § 26.197(j) requires periodic reviews by licensees to assess the effectiveness of the work hour controls, including waivers and fatigue assessments. These reviews are documented and trended under the licensee's corrective action program, and the corrective action program is periodically inspected by the NRC. Thus, industry commenters argued that reporting this data to the NRC under fatigue management on an annual basis is an unnecessary duplication of these requirements

with no attendant increase in protection of public health and safety [Marvin Fertel, NEI; F.G. Burford, Entergy].

NRC Response: The NRC does not agree with comments that the requirements for reporting fatigue management information should be deleted from the rule because they will not provide new or unique information to the NRC, are unnecessary to protect public health and safety, are unnecessary to facilitate NRC oversight of the revised rule, and are unduly burdensome for the NRC power reactor licensees. In choosing to retain reporting requirements regarding the use of waivers the NRC considered several aspects of the work hour requirements in § 26.205 of the final rule: (1) The NRC established the work hour limits in the final rule at levels such that the potential for worker fatigue is substantive for individuals working in excess of those limits; (2) The rule permits licensees to authorize waivers of the limits only for circumstances in which the additional work hours are necessary to prevent or mitigate a condition adverse to safety or security; and (3) the rule only requires a waiver if the individual is operating or maintaining a system, structure, or component (SSC) that a risk-informed evaluation process has shown to be significant to the protection of public health and safety, or if the individual is performing specified functions that are essential for effective response to a fire, plant emergency, or implementation of the site security plan. As a result, information concerning licensee use of waivers provides an indication of: (1) the number of hours worked on risk-significant activities by individuals at increased potential for impairment; and (2) how often a licensee must mitigate or prevent a condition adverse to safety while using individuals at increased potential for impairment. The NRC considers this unique information not otherwise reported to the NRC that is relevant to the NRC's mission.

The NRC similarly considered the need to retain reporting requirements regarding fatigue assessment and any management actions in response to the fatigue assessments. The final rule requires fatigue assessments for 4 conditions: (1) for cause, following an observation indicating impaired alertness, (2) post event, following a plant event or worker injury meeting specified significance criteria, (3) following a self-declaration of being unfit for duty, and (4) when a licensee returns an individual to duty with a break of less than 10 hours after the individual was relieved of duties because of a fatigue assessment conducted for-cause or in response to a self-declaration of fatigue. In regard to fatigue assessments following self-declarations, the NRC notes that individuals are only assessed when a licensee denies a worker request for relief from duty (i.e., a rest break). In all other instances the individual will be allowed time off duty in accordance with the licensee's administrative practices and the rule will not require a fatigue assessment. Given these requirements of the final rule, licensee annual reporting of information pertaining to fatigue assessment will provide an indication of how often: (1) individuals are relieved of duty because of observed impairment from fatigue, (2) fatigue is identified as a causal factor in significant plant events and injuries, (3) individuals are required to remain on duty following their declaration they are unfit, and (4) individuals are returned to duty with less than a 10-hour break following a for-cause assessment for fatigue or a self-declaration of fatigue. The NRC considers this unique information not otherwise reported to the NRC that is relevant to the NRC's mission, particularly when considered in conjunction with information concerning the licensee's use of waivers from the work hour limits.

The NRC also disagrees with the comments that the reporting requirement ignores significant duplication in licensee efforts. The NRC agrees that § 26.205(e) of the final rule requires periodic reviews by licensees to assess the effectiveness of the work hour controls, and that

these reviews will be documented and trended under the licensee's corrective action program, which is periodically inspected by the NRC. However, as noted previously, the NRC considers the burden of the annual report to be limited, and that relative to a review that is limited to evaluation of reports in a licensee's corrective action program, the annual reports will enable the NRC to provide more effective and consistent oversight and achieve other objectives described herein for the effective implementation of the requirements in Subpart I.

The comment recommending that the NRC revise the proposed § 26.197(e)(2) to apply only to security personnel is not applicable to the final rule because collective work hour limits have been removed from the rule and the NRC eliminated the requirement for reporting information pertaining to collective work hours as a conforming change. Therefore the NRC retains the reporting requirements in the final rule with the exception of those related to collective work hour limits.

Intent of Reporting Information

Comments: Some commenters stated that the reports the rule would require do not provide a meaningful indicator of the overall quality of how a licensee manages work hours because there are a number of valid conditions that may warrant waivers of work-hour controls. For example, the series of hurricanes that occurred in 2004 could have resulted in a number of waivers for licensees of nuclear power plants located in Florida and along the Gulf Coast. Thus, the commenter argued that as a result of the way that FFD work-hour waivers are counted and maintained under the NRC regulations, the data requested in these reports would not provide an accurate picture of conditions that may have warranted the waiver [Marvin Fertel, NEI]. To address this issue, another commenter argued that the waivers data should be kept onsite for the NRC inspection so that the data may be accompanied by the plant-specific cause for the waivers [John Cowan, NEI].

Two commenters suggested that the rulemaking should also require licensees to report the number of workers covered under § 26.199(a) to provide appropriate context for the annual reporting of waivers [David Lochbaum, UCS; Deborah Katz, CAN].
A commenter at the public meeting, after acknowledging that the reporting is intended to get management's attention, expressed confusion about the philosophy of the waivers. The commenter asked what the NRC will do with the reports and how many waivers will be considered "too many" [Nick DePietro, First Energy].

NRC Response: The NRC disagrees with the comment that the required reports are not a meaningful indicator of the performance of a FFD program. The NRC agrees in part with the comment that information concerning waivers should be considered in context. The requirements in proposed § 26.197(e)(1) and (e)(3) were revised in response to comments that the required information would not provide a meaningful indicator of licensee performance in managing work hours because there are a number of valid conditions that may warrant waivers of work-hour controls. Through reviews of authorized waivers from the work hour limits in plant technical specifications, the NRC has found that waivers are most frequently associated with outage activities. Accordingly, the NRC has revised the requirements for reporting waivers of the work hour requirements in § 26.205 such that the report shall indicate whether or not the waiver was associated with an outage activity. The requirement for reporting information pertaining to fatigue assessments was also similarly revised such that the report will indicate

whether or not the individual was engaged in an outage related activity at the time of the event or condition that resulted in the need for the licensee to conduct a fatigue assessment.

As a result of these changes, the NRC will be better able to interpret changes in waiver use over time at a site and understand why certain annual reports for a given site may indicate a heightened level of waiver use relative to other reports for that site. The NRC recognizes that outages are not the only cause of waivers, however, the NRC expects that most other causes of waiver use will be for substantially shorter periods of time or smaller groups of workers such that these other conditions would not have a substantive effect on overall waiver use. For unique causes that may have more substantive effects (e.g., licensee response to hurricanes), the NRC would expect to be aware of, or be able to identify, such conditions if they were to significantly affect waiver use. Furthermore, it is the NRC's intent to consider waiver use in conjunction with the reported fatigue assessment information. Therefore, the NRC will be able to assess whether waiver use may be associated with the incidence of fatigue assessments conducted for cause, following events, or in response to self-declarations by individuals asserting that they are not able to safely and competently perform their duties because of fatigue. In this regard the NRC notes that the frequency of waiver use (i.e., how often individuals exceed the work hour limits while performing functions important to safety and security) provides an indication of the potential for worker fatigue to affect the performance of these functions, regardless of whether a waiver is the result of an activity associated with an outage or a cause that is beyond the control of the licensee.

In addition to requiring an indication of whether a waiver was associated with an outage activity, the NRC revised the annual report requirement to require a frequency distribution of waivers for each of the five duty groups described in § 26.4(a) of the final rule. As a result, the annual report would include, for example, a table that shows the number of operators that received just one waiver during the year, the number of operators that received two waivers during the year, etc. The NRC incorporated this requirement in the final rule in response to comments that the rulemaking should also require licensees to report the number of workers covered under § 26.199(a) of the proposed rule to provide appropriate context for the annual reporting of waivers. The NRC understood the intent of this comment was to provide a basis for evaluating the number of waivers from the work hour controls relative to the number of individuals subject to those controls. The NRC chose not to require licensees to report the number of individuals covered under § 26.4(a) of the final rule because that number will vary throughout the course of the reporting period, particularly when the reporting period includes a unit outage. In addition, the NRC believes that the required distribution of waivers more effectively provides context to the waiver use by indicating whether the waivers are concentrated among individuals performing a certain duty and whether the waiver use within a duty group is concentrated within a relatively few individuals or distributed among many.

Reporting Requirements Do Not Satisfy the Paperwork Reduction Act

Comments: The commenters also stated that the NRC has not met its obligation under the Paperwork Reduction Act with respect to the information collection requirements proposed in § 26.197(e). They argued that the NRC has failed to adequately justify the need for these provisions to achieve the objectives of the proposed FFD rule, and has also failed to objectively support its estimate of the burden created on affected licensees.

The commenters note that the NRC rule package estimate for reporting in § 26.197(e)(1) is two hours of clerical and one hour of management time for each facility's annual report. The estimate for § 26.197(e)(2) is two hours management time. The estimate for § 26.197(e)(3) is estimated as 12 hours clerical and two hours management time. The commenters argued that this is a significant understatement of the actual time effort required to prepare, check and review an annual report. The industry estimates that preparing the total report will require at least 30 clerical hours and 20 management hours (and these estimates must be multiplied times the more than sixty nuclear plant sites in the U.S). The commenters argued that the management time required to prepare this report could more effectively be devoted to other activities with a closer nexus to public health and safety.

Accordingly, industry believes that OMB should not approve the data collection proposed in this section of the proposed rule and remand proposed § 26.197(e) to the NRC for its further consideration in light of these inadequacies [Marvin Fertel, NEI; Michael Coyle, NEI #49; Richard Sweigart, DCS; Keith Jury, Exelon; Mark Wetterhahn, Winston Strawn; Edward Weinkam, NMC; Don Grissette, SNC; Keith D. Young, Ameren; Glenn Morris, TVA; Ronald Gaston, Detroit Edison; Gregory Halnon, FENOC; Jeffrey Archie, SCE&G; Brian McCabe, Progress Energy; A. Edward Scherer, SCE; D.R. Woodlan, STARS; J. A. Stall, FPL; B.T. McKinney, PPL; F.G. Burford, Entergy; Daniel Stenger, NRSG].

NRC Response: The NRC disagrees with commenters' statement that the NRC has not met its obligation under the Paperwork Reduction Act with respect to the information collection requirements proposed in § 26.197(e). The NRC expects that the information provided by licensees in response to the annual reporting requirements in Subpart I will facilitate NRC oversight of licensee implementation of the requirements through several means:

(1) Consistency, efficiency, and continuity of NRC oversight -- Information provided through the annual FFD program performance reports concerning fatigue management will enable the NRC to achieve a higher level of consistency and efficiency in oversight of the implementation of the requirements in Subpart I and in enforcement of those requirements. Without the reporting requirements, NRC inspection of licensee FFD programs would likely be limited to individual inspectors evaluating licensee fatigue management for a sample of workers at a site for a limited time period. Such assessments would necessarily be conducted without the benefit of broader contextual information of the site and industry normative information that would be available through the annual reports. In contrast, the annual reports will help ensure a common perspective for the individual inspectors conducting the oversight process and maintain consistency in NRC's oversight process. In addition, information in the annual report can enhance the efficiency of NRC inspection by providing a basis for the NRC to focus inspection resources on duty groups (e.g., security or maintenance) or issues (e.g., self-declaration) that the annual report indicates may be areas warranting review. The report will enable NRC to achieve a greater focus during preparation for the inspection, enabling the NRC to reduce the burden of on-site inspection hours and potentially reduce the total number of hours required for the baseline inspection. Furthermore, the annual reporting will help achieve a more complete and continuous assessment of licensee performance given that the NRC intends to conduct the baseline inspection of FFD programs only once every 2 years.

(2) Evaluation of rule implementation for lessons learned – Although the NRC and stakeholders made extensive efforts to ensure clear and enforceable requirements that are effective and practical, by establishing new requirements for the management of worker fatigue the rule introduces the potential for unintended consequences and lessons learned. In addition,

changes in the size and composition of the nuclear industry may have unforeseen implications for site staffing and fatigue management. The NRC expects that the site specific and normative information obtained through the reports can provide important future insights regarding opportunities to amend the rule to improve its effectiveness or reduce unnecessary burden. The NRC notes that such information was the basis for reducing, in this final rule, the random testing rate for drugs and alcohol.

(3) Consistent interpretation of waiver criterion – The final rule provides licensees the discretion to use waivers to exceed the work hour limits and thereby allow levels of work hours that create substantial potential to adversely affect worker fitness for duty. The principal basis for allowing waivers is to reduce the additional staffing burden that licensees would otherwise incur if waivers were not available to address these exigent circumstances. The annual reporting of waiver use, in conjunction with the reporting of information concerning fatigue assessments will enable NRC to ensure that licensees use this discretion consistent with the objectives of the rule, and not as a means to compensate for a lack of adequate staffing. Furthermore, although the use of waivers is limited to conditions in which the work hours are "necessary to prevent or mitigate a condition adverse to safety or security," the NRC recognizes the potential for licensees to develop different interpretations regarding this criterion. Some industry commenters on the proposed rule took exception to the NRC's characterization that the high levels of waiver use at some sites was abuse. These commenters suggested that differences in licensee waiver practices could be attributed to the NRC allowing the policy statement to be subject to a number of interpretations during the many years it has been in effect. Regardless of the cause of the differences in licensee use of work hour control waivers, the NRC considers it prudent to address, through this rulemaking, the lessons learned from past implementation of the policy and provide a level of oversight through the annual reporting requirement that will ensure consistent implementation of the waiver criteria in the future.

In addition to the reasons cited in the preceding paragraphs for why the reporting requirements are necessary for the effective and efficient oversight of the implementation of the rule, the NRC considers the reporting requirements to be justified and beneficial for several additional reasons:

(1) Consistency with Part 26 requirements and performance objectives – The final rule retains the long-standing requirements for the reporting of results of licensee drug and alcohol testing and the performance objective for reasonable assurance that individuals are not impaired from any cause (§§ 26.719 and 26.23(b) of the final rule). In addition, several studies discussed in detail in Section IV.D of the preamble to the final rule have demonstrated that worker fatigue can produce levels of impairment that are comparable to blood alcohol concentrations above levels permitted by this rule. Furthermore, given the frequency of worker concerns regarding fatigue and the work scheduling practices that are common during outages, the incidence of impairment from fatigue is likely greater than the very low incidence of drug and alcohol use that is detected through testing. The NRC therefore considers the reporting of information pertaining to licensee management of worker fatigue consistent with the requirements for reporting information pertaining to drug and alcohol testing, consistent with the performance objective of this rulemaking for licensees to implement a comprehensive FFD program, and consistent with NRC's belief that the management of worker fatigue is no less important to worker fitness for duty than the effective detection and deterrence of drug and alcohol use.

(2) Public confidence -- Public interest stakeholders such as the Union of Concerned Scientists and the Project on Government Oversight have commented at public meetings that much relevant information regarding worker fatigue is withheld to either protect alleger identity or in the case of security personnel, plant security. In addition, several public media articles have been published during the past 2 years reporting instances of guards sleeping and guards

fearing repercussions for refusing forced and excessive overtime. Information submitted by licensees in the annual reports would be publicly available and provide public stakeholders reassurance that the NRC is appropriately cognizant of licensee actions regarding fatigue management and that the NRC's oversight of these activities is transparent to all stakeholders.

(3) The burden is limited and justified – Section 26.203(e) requires the information concerning waiver use and fatigue assessments to be reported as part of the annual FFD program report. As a consequence, the burden associated with this reporting requirement is an incremental change to the reporting requirement for drug and alcohol testing. In addition, the fatigue management information that § 26.203(e) requires licensees to report is largely information that licensees would already have generated in order to comply with other provisions of Subpart I. As a result, the burden associated with the report would largely be associated with compiling the information in a form appropriate for the report and reviewing that compilation. The NRC has reviewed the public comments asserting that the NRC underestimated the number of clerical and management hours associated with this requirement, and have taken these comments into consideration in estimating the burden of the reporting requirements in § 26.203(e) of the final rule. Nevertheless, the NRC considers the burden justified for the reasons described in this and the preceding paragraphs concerning the annual report requirements in § 26.203(e). Therefore, the NRC has retained requirements for an annual report containing information pertaining to fatigue management in § 26.203(e) of the final rule.

11.3. Work Hour Controls (§ 26.199)

Support for Work Hour Controls

Comments: Several commenters generally addressed the work hour control provisions. One commenter stated that the work-hour limits are reasonable, and will ensure that fatigue will be managed at facilities where the heavy use of overtime for extended periods has become routine. It noted that the work-hour limits will only impose a regulatory burden on licensees commensurate with the safety backfit achieved [Richard Barkley, Individual].

NRC Response: The comments do not require a response.

Layers of Requirements are Ineffective and Burdensome

Comments: The commenters argued that short term individual work hour limits address acute and cumulative fatigue, so additional "layers" of prescriptive requirements would be ineffective and burdensome to industry [Michael Coyle, NEI #49; Richard Sweigart, DCS; Keith Jury, Exelon; Mark Wetterhahn, Winston Strawn; Edward Weinkam, NMC; Don Grissette, SNC; Keith D. Young, Ameren; Glenn Morris, TVA; Ronald Gaston, Detroit Edison; Gregory Halnon, FENOC; Jeffrey Archie, SCE&G; Brian McCabe, Progress Energy; A. Edward Scherer, SCE; D.R. Woodlan, STARS; J. A. Stall, FPL; B.T. McKinney, PPL; F.G. Burford, Entergy; Daniel Stenger, NRSG].

NRC Response: The NRC disagrees with the comment that short-term individual work hour limits are adequate to address cumulative fatigue. The short-term individual limits allow up to 72 hours of work per week, excluding turnover time and time worked under waivers, and require only a minimum 10-hour break between successive work periods. The minimum break period of 10 hours does not provide reasonable assurance that individuals will obtain adequate rest when

individuals are working long work days with few days off. Cumulative fatigue will result from the extended work periods combined with reduced sleep periods as individual forego sleep to attend to daily living obligations. Such fatigue effects were reported by security personnel in the months following the terrorists attacks of September 11, 2001. In those instances the NRC found that the security personnel were typically working fewer hours than would be allowed by the short-term individual limits. However, the NRC agrees with the objective of reducing burden and eliminating unnecessary layers of requirements in the rule. In this regard the NRC notes that the NRC eliminated the requirements for a minimum 48-hour break and collective work hour limits that would have been required by § 26.199(d)(2)(iii) and 26.199(f) of the proposed rule and replaced these requirements with the minimum day off requirements of § 26.205(d)(3) of the final rule. The revised provisions will reduce burden and limit the potential for cumulative fatigue by preventing excessive use of the maximum work hours and minimum rest breaks permitted by the individual work hour controls.

11.3.1. Individuals Subject to Work Hour Controls (§ 26.199(a))

Expanding the Scope of Workers Subject to Subpart I

Comments: Some commenters stated that proposed § 26.199(a) limits the scope of the individuals subject to work hour controls to a subset of the work force; thus, those workers outside the scope of this section have no limits on their individual or collective work hours. They suggested that all workers should be subject to work hour controls [David Lochbaum, UCS; Deborah Katz, CAN].

NRC Response: The NRC disagrees, in part, with the comment stating that all workers should be subject to work hour controls. Work hour controls are only a subset of the requirements included in this rule. Individuals who are not covered by the work hour controls in this subpart are still subject to broader fatigue management requirements. Section 26.203 establishes fatigue management requirements for licensees' FFD programs. Section 26.203(a) requires each licensee to have a written policy statement that describes its management's expectations and methods for managing fatigue to ensure that fatigue does not adversely affect any individual's ability to safely and competently perform his or her duties. Section 26.203(b)(1) requires licensees to develop, implement, and maintain procedures that describe the process to be followed any time an individual who is subject to the licensee's FFD program reports to a supervisor that he or she is unfit for duty because of fatigue (i.e., makes a self-declaration). These broad policy and procedure requirements, which apply to all workers, will provide clear expectations for all workers. In addition, § 26.203(c) requires licensees to train all individuals subject to the licensee's FFD program in fatigue management, including shift work strategies for obtaining adequate rest and effective use of fatigue countermeasures.

For the subset of requirements covering work hour controls, subjecting all workers to work hour controls, regardless of job function, would be impractical, burdensome to both individuals and licensees, and would not significantly improve public health and safety or the common defense and security. In determining the scope of personnel who would be subject to the proposed work hour controls, the NRC considered the burdens on individuals and licensees associated with the practical control of work hours in conjunction with the potential for individuals' work activities to affect public health and safety or the common defense and security if their performance is degraded by fatigue. The NRC also considered the nature of these individuals' work activities

and work environments relative to their potential to induce or exacerbate fatigue, the risk significance of the work, and the potential for other controls to prevent or mitigate the consequences of a fatigue-related error. As a result of these deliberations, only the individuals who perform the types of job duties specified in § 26.4(a)(1) through (a)(5) must be subject to the proposed work hour controls.

Therefore, the NRC retains the requirements for the work hour controls for the narrower scope of workers. The NRC also retains in § 26.203 the requirements for management of fatigue, including the policy and procedure and training requirements for all workers. Therefore, no additional changes are warranted in response to this comment.

"On-Site Directing" and the Inclusion of Engineering Personnel

Comments: Another commenter, supported by many commenters, raised concerns regarding the use of "on-site directing" in § 26.199(a)(1) and (a)(2). The commenter stated that the term "directing" has added uncertainty to who should be included in the functional work groups and suggested that the NRC clarify the definition of this term. Also, by using "on-site directing" in these subparagraphs, the commenter argued that this definition could be interpreted to include engineering and technical support personnel, and maintaining records on this group in addition to the job duty groups that are clearly defined could present a burden to utilities. Thus, the commenter recommended changing "on-site" to "job-site" in subparagraphs § 26.199(a)(1) and (a)(2). The commenter argued that this change would make these provisions consistent with the definition of "directing," which clearly focuses on individuals directly involved with the performance of the work activity [Michael Coyle, NEI #49; Richard Sweigart, DCS; Keith Jury, Exelon; Mark Wetterhahn, Winston Strawn; Edward Weinkam, NMC; Don Grissette, SNC; Keith D. Young, Ameren; Glenn Morris, TVA; Ronald Gaston, Detroit Edison; Gregory Halnon, FENOC; Jeffrey Archie, SCE&G; Brian McCabe, Progress Energy; A. Edward Scherer, SCE; D.R. Woodlan, STARS; J. A. Stall, FPL; B.T. McKinney, PPL; F.G. Burford, Entergy; Daniel Stenger, NRSG].

NRC Response: The NRC agrees with the commenter that the definition of the term "directing" should be clarified. Individuals who are responsible for the correct performance of risk-significant work should be subject to work hour controls, including engineering and technical support personnel.

The revised definition of "directing," is presented in § 26.5 of the final rule. The revised definition clarifies NRC's expectations that a limited scope of personnel providing technical input would be subject to the requirements of § 26.205. The definition explicitly states the criteria that the term "directing" refers to an individual who is directly involved "in the execution of the work activity, or is ultimately responsible for the correct performance of that work activity" as opposed to, for example, the planning, development or scheduling of the activity, and that the technical input does not receive "subsequent technical review." The revised definition more clearly focuses on activities that have the potential to substantively and immediately affect safety.

The work hour requirements in § 26.205 also apply to individuals who direct risk-significant operations on site. These individuals include management on shift, such as shift operations management or special outage managers if those individuals provide direction to operators. Individuals to whom the work hour requirements apply also include engineers who provide onsite

technical direction to operations, such as test directors or reactor engineers. These individuals perform tasks that are often highly dependent on cognitive skills (e.g., problem-solving, decision-making, communications) and are susceptible to fatigue-induced errors, as described in Section IV.D of the preamble to the final rule. Incorrect technical direction provided to operators can significantly challenge licensed operators and increase the possibility of errors or events, especially when the direction is provided by an individual who supervises the operators, or an individual who the operator reasonably expects to have specialized technical knowledge of the system or component being operated.

The work hour requirements also apply to those who direct risk-significant maintenance on site. For example, these individuals include maintenance supervisors who provide direction to maintenance technicians, and engineers who provide onsite technical direction to maintenance crews, such as during key outage maintenance activities. These individuals perform tasks that are often highly dependent on cognitive skills (e.g., problem-solving, decision-making, communications) that are susceptible to fatigue, as discussed in Section IV.D of the preamble to the final rule. Incorrect technical direction provided to maintenance technicians can significantly challenge maintenance technicians and increase the possibility of errors or events, especially when that direction is provided by an individual who supervises them, or an individual who the maintenance technician reasonably expects to have specialized technical knowledge of the system or component being maintained.

The NRC disagrees with the comment that the rule language should be revised to change "on-site" to "job-site." Whether the directing is occurring at the job site or in a nearby room by phone is not relevant. Another commenters regarding the definition of "directing" asserted that engineers will not go out into the field to troubleshoot, for fear of being subject to work hour controls, and this is also a reason why work-hour controls should apply to individuals providing "on-site" direction.

In summary, the NRC has revised the definition for "directing" in § 26.5 of the final rule and clarify to whom the requirement should apply.

Expansion of Scope for Work Hour Limits

Comments: Other commenters stated that the proposed work-hour limits should be imposed on all licensee employees and supervisors who perform safety-related work instead of being limited to the work groups listed in the proposed rule. The commenter argued that all workers who perform safety-related work, as well as the individuals who supervise that work, be fit for duty [Barry Quigley, Individual; Anonymous #75]. One commenter stated that if such an expansion of the rule is not possible, then at a minimum, system engineers be included in the scope of this rule, as their job task assignments often require prompt response to the facility and decision-making that can immediately affect the ability to operate safety-related equipment [Richard Barkley, Individual]. Another commenter also addressed this issue and argued that engineering personnel performing or directing safety-related work be included in the scope of the rule [Barry Quigley, Individual].

NRC Response: The NRC disagrees, in part, that the proposed work-hour limits should be imposed on all licensee employees and supervisors who perform safety-related work instead of being limited to the work groups listed in the proposed rule. (See NRC response to comment

"Expanding the Scope of Workers Subject to Subpart I" at the beginning of Section 11.3.1). However, the NRC agrees that engineers directing safety-related work be included in the scope of this rule, as their job task assignments often require prompt response to the facility and decision-making that can immediately affect the ability to operate safety-related equipment.

The NRC revised the definition of "directing," which is presented in § 26.5 of the final rule. The revised definition clarifies NRC's expectations that a limited scope of personnel providing technical input would be subject to the requirements of § 26.205. The definition explicitly states the criteria that the term directing refers to an individual who is directly involved "in the execution of the work activity, or is ultimately responsible for the correct performance of that work activity" as opposed to, for example, the planning, development or scheduling of the activity, and that the technical input does not receive "subsequent technical review."

These individuals include engineers who provide onsite technical direction to operations and maintenance personnel, such as test directors or reactor engineers. These individuals perform tasks that are often highly dependent on cognitive skills (e.g., problem-solving, decision-making, communications) and are susceptible to fatigue-induced errors, as described in Section IV.D of the preamble to the final rule. Incorrect technical direction provided to operators or maintenance personnel can significantly challenge licensed operators and increase the possibility of errors or events, especially when the direction is provided by an individual who the operator reasonably expects to have specialized technical knowledge of the system or component being operated.

Therefore, the NRC retains the requirements for the scope of the working hour controls and the scope of the requirements in § 26.203 for the management of fatigue, including the policy, procedure, and training requirements for all workers. In addition, the NRC has revised the definition for "directing" so that the definition as applied to the direction of operations and maintenance personnel appropriately includes a limited scope of engineering functions that can have an immediate effect on the safe operation of the plant.

Fire Brigade

Comments: Several commenters from industry expressed disagreement with § 26.199(a)(4). Specifically, the commenters stated that the fire brigade member who is responsible for understanding the effects of fire and fire suppressants on safe shutdown capability should not be subject to work hour controls because of the administrative burden. The commenter recommended that § 26.199(a)(4) be deleted from the draft rule [Michael Coyle, NEI #49; Richard Sweigart, DCS; Keith Jury, Exelon; Mark Wetterhahn, Winston Strawn; Edward Weinkam, NMC; Don Grissette, SNC; Keith D. Young, Ameren; Glenn Morris, TVA; Ronald Gaston, Detroit Edison; Gregory Halnon, FENOC; Jeffrey Archie, SCE&G; Brian McCabe, Progress Energy; A. Edward Scherer, SCE; D.R. Woodlan, STARS; J. A. Stall, FPL; B.T. McKinney, PPL; F.G. Burford, Entergy; Daniel Stenger, NRSG].

NRC Response: The NRC disagrees with the comment that fire brigade members should be deleted from the work hour controls because of the administrative burden. In response to other comments, the NRC has eliminated group work hour controls from the final rule. Thus, fire brigade members' work hours are no longer required to be analyzed as a group. The NRC expects this change will eliminate any excess administrative burden. However, fire brigade members remain subject to the individual work hour controls specified in proposed § 26.199(d).

Fire brigade members must retain the cognitive ability to be able to think and determine the best way to suppress a fire to prevent additional damage to safety-related equipment, evaluate equipment affected by a fire to report to control room operators concerning equipment availability, make decisions concerning smoke ventilation to prevent the fire effects from affecting other plant operations, and coordinate all activities with control room operators. Attachment 1 to SECY-99-140, “Recommendation for Reactor Fire Protection Inspections,” dated May 20, 1999, states that "based on IPEEE results, fire events are important contributors to the reported core damage frequency (CDF) for a majority of plants. The reported CDF contribution from fire events can, in some cases, approach (or even exceed) that from internal events."

Fatigue can substantially degrade a worker’s decision-making and communication abilities, cause a worker to take more risks, and cause a worker to maintain faulty diagnoses throughout an event. These abilities are key to the duties of the fire brigade members who are responsible for understanding the effects of fire and fire suppressants on safe shutdown capability for the reactor. Degradations of these abilities could have significant consequences on the outcome of an event involving a fire. For instance, a fatigued worker could incorrectly decide to vent smoke or toxic gas to an area required for alternate shutdown, which could prevent or impair access to equipment needed for safe shutdown of the plant. In addition, a fatigued worker could incorrectly apply the wrong fire suppressant, which could affect additional equipment in the plant. Further, impaired decision-making could lead a worker to improperly control flooding, which could impact other needed equipment, or could incorrectly determine whether an area contains critical equipment and improperly apply a suppressant in that area. Impaired communications could also lead to incomplete disclosure of information to licensed operators in the control room, which could adversely impact the decision-making of those operators. If information known to the impaired worker is not properly communicated, operators may not initiate appropriate actions to mitigate the fire effects, or effects of suppressant activities, on critical equipment.

Ensuring that the ability of fire brigade members to safely and competently assess the effects of a fire and fire suppressants on safe shutdown capability is essential to the overall success of the fire mitigation strategy and the protection of public health and safety. Therefore, because the comment does not present new information or any explanation of unique administrative burden, the NRC will continue to subject fire brigade members to the requirements of Subpart I in the final rule.

11.3.2. Calculating Work Hours (§ 26.199(b))

Support for Exclusion of Turnover Time

Comments: Several commenters from industry supported the exclusion of turnover time as discussed in the rule package [Michael Coyle, NEI #49; Danny Todhunter, Exelon; Richard Sweigart, DCS; Keith Jury, Exelon; Mark Wetterhahn, Winston Strawn; Edward Weinkam, NMC; Don Grissette, SNC; Keith D. Young, Ameren; Glenn Morris, TVA; Ronald Gaston, Detroit Edison; Gregory Halnon, FENOC; Jeffrey Archie, SCE&G; Brian McCabe, Progress Energy; A. Edward Scherer, SCE; D.R. Woodlan, STARS; J. A. Stall, FPL; B.T. McKinney, PPL; F.G. Burford, Entergy; Daniel Stenger, NRSG].

NRC Response: The comments do not require a response.

Definition of Shift Turnover

Comments: A commenter stated that the exclusion of shift turnover time from individual work hours was abused in the past, and defining shift turnover time is a step in the right direction. However, the commenter stated that proposed § 26.199(b)(1)(i) would define shift turnover as only those activities that are "necessary to safely transfer information and responsibilities between two or more individuals between shifts." The commenter argued that activities considered to be "necessary" is open to interpretation, and, as a result, there will be continued abuse of shift turnover. Also, the commenter explained that the language appears to allow both on-coming and off-going time to be subtracted; in essence allowing the licensee to "double dip" on how much turnover time can be subtracted. Thus, the commenter felt that the turnover language was not clear and should be revised [Peter Hammill, PBNP].

Another commenter asked why turnover times are not counted as work hours, and argued that turnover is "work" [Anonymous #29].

NRC Response: The NRC agrees in part with these comments. The NRC recognizes that shift turnovers are important for communicating plant status information between work crews. However, the NRC also recognizes that shift turnovers routinely add time to the length of a shift and workweek, and including shift turnovers in work hour calculations may cause indirect pressure on individuals to abbreviate shift turnovers in order to ensure that they do not violate work hour limits. This pressure may compromise the quality of shift turnovers and have unintended adverse safety consequences. Therefore, although the commenter and other stakeholders believe that turnover is part of the workday and should be included in work hour calculations, the NRC believes the benefit of including turnover for managing worker fatigue would be outweighed by the potential adverse consequences on the quality of shift turnovers, if turnovers were subject to time limits.

Section 26.205(b)(1) of the final rule defines shift turnover as only those activities that are necessary to safely transfer information and responsibilities between two or more individuals between shifts. In addition, § 26.205(b) provides specific examples of activities that licensees may and may not exclude as part of turnover to provide clear exceptions regarding NRC's intent. Although questions or differences in opinion may arise regarding what transfer of information is necessary to support safe operations, the rule will limit the potential for individuals and/or licensees to use the proposed shift turnover exclusion to perform other unnecessary work activities and addresses NRC concerns arising from observations that some licensees have occasionally excluded 2 or more hours from calculated work hours on the basis that the individuals were engaged in "turnover."

In order to ensure that turnover is not hurried, the rule does not establish a time limit for an acceptable turnover period. However, by clearly delineating the activities that licensees may consider to be turnover activities, the rule reduces the potential for individuals and/or licensees to use the shift turnover exclusion to perform other work activities.

Post-Turnover Technical Assistance

Comment: One commenter suggested that the NRC add the following sentence after the third sentence in the subparagraph § 26.199(b)(1)(i): "Relieved individuals observing rest break(s)

contained in § 26.199(d)(2) that are contacted by telephone to discuss job continuity and/or technical assistance by the licensee is considered shift turnover and is excluded for work hours accounting purposes." The commenter argued that the need for offsite technical assistance contact needs to be addressed because turnover does not always capture every detail that may cause a question to arise later after the worker has been relieved [Edwin Hill, IBEW].

NRC Response: The NRC agrees in part with the commenter's concern and has modified the final rule to allow short periods of technical assistance to be considered turnover and may be excluded from the work hour calculations. This provision is in § 26.205(b)(5) of the final rule. Licensees may exclude from the calculation of an individual's work hours unscheduled work performed off-site (e.g., technical assistance provided by telephone from an individual's home), provided the duration of the work does not exceed a nominal 30 minutes. For the purposes of compliance with the final rule minimum break requirements of § 26.205(d)(2) and minimum day off requirements of (d)(3), such duties do not constitute work periods or work shifts. This provision provides flexibility in the work hour controls to obtain expert advice or details on recent operating experience that may not have been included in a turnover without the burden that would be imposed by resetting the clock to account for the disruption in a break period. The nominal 30 minute duration of such reduction in the break period is not expected to have a detrimental impact on the individual's overall fatigue level and would be offset by the potential contribution to safety.

The revised requirements on post-turnover technical assistance are in § 26.205(b)(5) of the final rule.

Beginning/Resuming Job Duties in Calculation Period

Comment: With reference to § 26.199(b)(1)(iii), other commenters stated that the first sentence must be revised to read "Licensees *shall not* calculate the work hours of an individual ... [who] has not performed such duties during the applicable calculation period." The commenters argued that, as presently worded, this requirement would allow a licensee to pad the group work hour limit with workers qualified to perform duties but never actually performing said duties [David Lochbaum, UCS; Deborah Katz, CAN].

Another commenter, supported by many commenters, disagreed with the proposed language in § 26.199(b)(1)(iii). Specifically, the commenter stated that the proposed language is overly burdensome and too restrictive because it requires that a licensee include all hours worked by an individual who joins a functional work group at some point during the monitoring period. The commenter suggested that work hour controls should be applied once the individual starts to perform activities within the functional group. The commenter recommended changes to the rule language, striking the phrase "include in the calculation of the individual's work hours all work hours worked, including hours worked performing duties that are not listed in paragraph (a) of this section, and" from § 26.199(b)(1)(iii). [Michael Coyle, NEI #49; Richard Sweigart, DCS; Keith Jury, Exelon; Mark Wetterhahn, Winston Strawn; Edward Weinkam, NMC; Don Grissette, SNC; Keith D. Young, Ameren; Glenn Morris, TVA; Ronald Gaston, Detroit Edison; Gregory Halnon, FENOC; Jeffrey Archie, SCE&G; Brian McCabe, Progress Energy; A. Edward Scherer, SCE; D.R. Woodlan, STARS; J. A. Stall, FPL; B.T. McKinney, PPL; F.G. Burford, Entergy; Daniel Stenger, NRSG]. One other commenter argued that the individual limits of paragraph (d)

will be sufficient to meet the intent of § 26.199(b)(1)(iii) without the additional qualification [Brian McCabe, Progress Energy].

NRC Response: The NRC has not retained the collective work hour limits in the final rule. As a result the comment concerning the need to revise the wording of proposed § 26.199(b)(1)(iii) to prevent padding of collective work hour limit calculations is not applicable to the final rule. The NRC disagrees with the comment that when an individual resumes performing duties subject to the work hour controls, the calculation of work hours should not include all hours worked for the licensee. Section 26.205 of the final rule permits licensees to assign individuals, who are qualified to perform the duties listed in § 26.4(a), to other duties than those listed in proposed § 26.4(a), without controlling their work hours in accordance with the work hour controls contained in proposed § 26.205(d). However, if these individuals are assigned or returned to performing any duties that are listed in § 26.4(a) during the calculation period, the rule requires the licensee to include all of the hours that the individual worked when calculating the individual's work hours and to subject the individuals to the work hour controls in § 26.205(d).

Section 26.205(b)(3) requires licensees to count the hours that the individual worked performing other duties if an individual begins performing the duties listed in § 26.4(a) during the calculation period because the individual's level of fatigue is largely dependent on the total number of hours he or she has worked, regardless of the relationship of the work to maintaining plant safety or security. Therefore, including the hours worked performing other duties provides assurance that fatigue does not compromise that individual's ability to safely and competently perform the duties that are specified in § 26.4(a).

Therefore the NRC retains the requirements of proposed § 26.199(b)(1)(iii) in § 26.205(b)(3) of the final rule.

Calculating Collective Work Hours

Comment: One commenter, supported by many commenters, recommended revisions to § 26.199(b)(2)(ii) and (iii) to replace "individuals" with "security personnel" and "any job duty group" with "the security job duty group." [Michael Coyle, NEI #49; Richard Sweigart, DCS; Keith Jury, Exelon; Mark Wetterhahn, Winston Strawn; Edward Weinkam, NMC; Don Grissette, SNC; Keith D. Young, Ameren; Glenn Morris, TVA; Ronald Gaston, Detroit Edison; Gregory Halnon, FENOC; Jeffrey Archie, SCE&G; Brian McCabe, Progress Energy; A. Edward Scherer, SCE; D.R. Woodlan, STARS; J. A. Stall, FPL; B.T. McKinney, PPL; F.G. Burford, Entergy; Daniel Stenger, NRSG].

NRC Response: The NRC has eliminated the referenced requirements, therefore the comment is not applicable to the requirements of the final rule.

11.3.3 Work Hours Scheduling (§ 26.199(c))

Support for Work Hours Scheduling Provision

Comments: Several commenters addressed work hour scheduling and stated that the work hour guidance in proposed § 26.199(c) is an important feature of the proposed rule. They explained that this section represents a performance-based requirement that allows licensees to

design effective fatigue management programs. In addition, the commenters stated that the importance of this provision is not adequately expressed in the rule package [Michael Coyle, NEI #49; Richard Sweigart, DCS; Keith Jury, Exelon; Mark Wetterhahn, Winston Strawn; Edward Weinkam, NMC; Don Grissette, SNC; Keith D. Young, Ameren; Glenn Morris, TVA; Ronald Gaston, Detroit Edison; Gregory Halnon, FENOC; Jeffrey Archie, SCE&G; A. Edward Scherer, SCE; D.R. Woodlan, STARS; J. A. Stall, FPL; B.T. McKinney, PPL; F.G. Burford, Entergy; Daniel Stenger, NRSG].

NRC Response: The NRC agrees with the commenters' support for this provision and notes that the requirement is retained in the final rule as § 26.205(c). During the development of the proposed rule the NRC had intended this requirement to be limited to the development of work schedules. However, the NRC acknowledges the benefit of implementing this provision as a performance-based requirement applicable to licensee control of the actual hours worked by individuals performing the duties specified § 26.4(a)(1) through (a)(5) and adopts this interpretation for the final rule. As a consequence this provision of the final rule requires the work hours of individuals subject to the requirements of this section to be controlled in a manner that prevents impairment from fatigue because of elements of routine schedules that can significantly affect worker fatigue, such as shift length, the number of consecutive shifts, the duration of breaks between blocks of shifts, and the direction of shift rotation.

Opposition to Work Hours Scheduling Provision

Comments: A commenter argued that § 26.199(c) should be eliminated because it lacks the clarity necessary for consistent implementation and enforcement, and it is unnecessary given the numerous layers of prescriptive work hour limits which accomplish the same objective of preventing impairment from fatigue because of the duration, frequency, or sequencing of successive shifts [Brian McCabe, Progress Energy].

One commenter stated that the proposed rest break provisions and individual work hour controls, if implemented at the upper limits of what would be allowed, could result in work schedules that are not based on the 24-hour biological clock. The commenter argued that if these upper limits of scheduling were allowed in the final rules, there could be facilities that misinterpret these limits as being the established upper boundaries for safe operational performance, and as a result, impose work schedules on employees that actually produce unsafe levels of fatigue – at the plant or when the employee drives home. Therefore, the commenter suggested that the NRC make an additional effort to provide clear guidance regarding the systematic scheduling of 24/7 operations that are consistent with a 24-hour day. Additionally, the commenter suggested that the NRC take steps to add provisions that would encourage licensees to make shift rotations that are not only in keeping with the basics of sleep and human performance research, but are predictable and stable [Darrel Drobnich, NSF].

Two commenters argued that because of the way the proposed rule was written, it is difficult to comply with both proposed § 26.199(c) and § 26.199(d). The commenters stated that there is no mechanism in place in Subpart I for NRC review and approval of routine shift schedules that meet the intent of § 26.199(c). Thus, licensees will have to default back to the guidance of § 26.199(d) and develop schedules that would meet the requirements of this section even though the NRC stated that they are not intended as guidelines or limits for routine work scheduling [D.M. Jurss and Peter Hammill, PBNP].

NRC Response: The NRC agrees in part that § 26.199(c), retained as § 26.205(c) in the final rule, establishes a high level objective for scheduling without providing prescriptive requirements. The maximum work hour and minimum break and day off requirements that are specified in § 26.205(d) are intended for infrequent, temporary circumstances, and not as guidelines or limits for routine work scheduling. In addition, the work hour controls in proposed § 26.205(d) would not address several elements of routine schedules that can significantly affect worker fatigue, such as shift length, the number of consecutive shifts, the duration of breaks between blocks of shifts, and the direction of shift rotation. Therefore, § 26.205(c) requires licensees to schedule personnel consistent with preventing impairment from fatigue from these scheduling factors.

The rule requires licensees to address scheduling factors because human alertness and the propensity to sleep vary markedly through the course of a 24-hour period. These circadian rhythms are the result of changes in physiology outside the control of the individual. Work may be scheduled, and the consequent timing of periods of sleep and wakefulness, in a manner that either facilitates an individual's adaptation to the work schedule or challenges the individual's ability to get adequate rest. Therefore, the duration, frequency, and sequencing of shifts, particularly for personnel who work rotating shifts, are critical elements of fatigue management. The effect of circadian rhythms on worker fatigue is also discussed in Section IV. D. The importance of these elements for fatigue management is reflected in guidelines for work scheduling, such as, EPRI NP-6748 (Baker, et al., 1990), and in technical reports, such as, NUREG/CR-4248 and the Office of Technology Assessment's report, Biological Rhythms: Implications for the Worker (Liskowsky, 1991). Although research provides clear evidence of the importance of these factors in developing schedules that support effective fatigue management, the NRC also recognizes that the complexity of effectively addressing and integrating each of these factors in work scheduling decisions precludes a prescriptive requirement. Therefore, § 26.205(c) establishes a non-prescriptive, performance-based requirement.

During the development of the proposed rule the NRC had intended this requirement to be limited to the development of work schedules. However, the NRC acknowledges the benefit of implementing this provision as a performance-based requirement applicable to licensee control of the actual hours worked by individuals performing the duties specified in § 26.4(a)(1) through (a)(5) and adopts this interpretation for the final rule. As a consequence this provision of the final rule requires the work hours of individuals subject to the requirements of this section to be controlled in a manner that prevents impairment from fatigue because of elements of routine schedules that can significantly affect worker fatigue, such as shift length, the number of consecutive shifts, the duration of breaks between blocks of shifts, and the direction of shift rotation.

Because there are many ways to construct schedules, the industry and the NRC acknowledge that it would be more appropriate to put details in a guidance document. This guidance would make it clear that meeting maximum work hour limits or minimum break requirements by themselves would not satisfy § 26.205(c). Industry stakeholders have proposed that guidance be developed, which would assist in the interpretation and implementation of § 26.205(c). A letter from J. W. Davis, Nuclear Energy Institute, to D. R. Desaulniers, dated March 8, 2006, suggested the development of such guidance and proposed draft criteria or metrics to use in a guidance document (ADAMS Accession No. ML060680403). Such guidance would also support the implementation of § 26.205(e)(1), which requires licensees to review the work hours

and performance of individuals subject to the work hour requirements for consistency with the requirements of § 26.205(c). The NRC will consider endorsing the proposed guidance.

Site-Specific Schedule Approval

Comment: One commenter at the public meeting asked if the NRC has considered approving schedules on a site-specific basis [Anthony Rizzo, Jr, Salem Hope Creek].

NRC Response: The NRC disagrees with the comment that the NRC should consider approving schedules on a site-specific basis. In developing this rulemaking, the intent was to establish requirements that allow for a variety of approaches at a site-specific level, and still meet the overall requirements of § 26.205(c) and (d). In the draft industry guidance applicable to § 26.205(c), (ADAMS Accession No. ML060680403), some example schedules are included as appendices. The NRC will consider endorsing the proposed guidance, however, because of the complexities associated with establishing schedules, it is unlikely that the NRC will specifically endorse those examples. It will be the responsibility of the licensee to establish a schedule that meets the intent of § 26.205(b) through (d) and adhere to that schedule in accordance with endorsed criteria included in the guidance.

11.3.4. Work Hour Controls for Individuals (§ 26.199(d))

Support for Work Hour Controls

Comments: Several commenters from industry supported the individual work hour limits in proposed § 26.199(d)(1) because they are effective in preventing both acute and cumulative fatigue [Michael Coyle, NEI #49; John Cowan; NEI; Richard Sweigart, DCS; Keith Jury, Exelon; Mark Wetterhahn, Winston Strawn; Edward Weinkam, NMC; Don Grissette, SNC; Keith D. Young, Ameren; Glenn Morris, TVA; Ronald Gaston, Detroit Edison; Gregory Halnon, FENOC; Jeffrey Archie, SCE&G; Brian McCabe, Progress Energy; A. Edward Scherer, SCE; D.R. Woodlan, STARS; J. A. Stall, FPL; B.T. McKinney, PPL; F.G. Burford, Entergy; Daniel Stenger, NRSG].

NRC Response: The NRC agrees with the comments that support these provisions. However, the NRC does not agree with the assertion that the individual work hour controls in § 26.205(d)(1) are adequate to address cumulative fatigue caused by excessive overtime. To address cumulative fatigue, the final rule includes requirements for rest breaks in § 26.205(d)(2) and the minimum number of days off averaged over a shift cycle in § 26.205(d)(3) and the minimum days off per 15-day block in § 26.205(d)(4) and (5). These provisions will prevent excessive use of the maximum work hours and minimum rest breaks that would be permitted under the proposed individual work hour controls and ensure that the potential for cumulative fatigue, which would otherwise adversely affect the abilities of individuals to perform functions that are important to maintaining the safety and security of the plant, is managed.

Switching between Day and Night Shifts

Comment: One commenter referenced the changing of shifts between night and day and asked: “Do the new rules specify switching between nights, days, nights and then back to days all in one week?” The commenter also suggested that the rule should include language about

changing between shifts to prevent fatigue. Specifically, the commenter suggested "only one switch between nights and days ... in a seven day period when a worker is working 12-hour [shifts]" [Ethan Darrow, Individual].

NRC Response: NRC agrees that some shift schedules can exacerbate fatigue. Section 26.205(c) in the final rule addresses the sequencing of work shifts to prevent impairment from fatigue. Consistent with that provision and anticipated guidance, the NRC expects licensees to develop shift schedules that prevent impairment from fatigue associated with switching between day and night shifts. The final rule also includes additional flexibility in the break and day-off requirements such that licensees will be better able to develop shift schedules that minimize the circadian cycle disruption caused by rotating shifts. Specifically, licensees are not required to provide two consecutive days off, which reduces the potential for adversely affecting circadian adjustment to night shifts.

Negative Impact on Nuclear Power Workers

Comment: Several commenters stated that the proposed rule work-hour limits will have a significant negative financial impact on nuclear power workers by limiting the hours they are allowed to work. One commenter also argued that the proposed rule would produce an out-flow of experienced workers from nuclear facilities to other industries where work hours are not limited, and this loss of experienced workforce will result in the reduction of public health and safety and common defense and security. Further, the commenter argued that this rule language will result in increased contract work to outside entities, which constitutes "union busting" at its most basic level and will contribute to the creation of a hostile work environment at nuclear power facilities [Andrew Antrassian, UWUA]. Another commenter stated that he is re-evaluating his retirement plan because it was based on his previous work during outages. The commenter argued that the work hour provisions will limit the amount of time he will be able to work on outages, thus decreasing his income [Daniel Hansen, Individual].

NRC Response: The NRC disagrees with these comments. The NRC has documented concerns regarding frequent excessive use of work hours in SECY-01-0113, Fatigue of Workers at Nuclear Power Plants," and SECY 05-0074, Proposed Rule to Amend the Fitness-For-Duty Requirements in 10 CFR Part 26. Therefore, establishing clear and enforceable requirements for the management of worker fatigue is indeed necessary to ensure against worker fatigue adversely affecting public health and safety and the common defense and security. Further, the requirements provide a significant amount of flexibility when establishing schedules and they do not dictate or endorse any specific schedule. Therefore, the requirements should not unduly restrain collective bargaining agreements. The NRC also notes that the work hour limits allow for substantial amounts of overtime, allowing approximately a 20% overtime rate when a plant is operating and approximately a more than 50% overtime rate when a plant is in an outage. Furthermore, these limits are only applicable to individuals who are performing duties on systems, structures, or components that a risk-informed evaluation process has shown to be significant to public health and safety, or are performing critical emergency or fire response duties, or are members of the site security force performing duties necessary for execution of the site security plan. The rule does not limit the hours of individuals who are not performing these specified functions.

Limited Access to Supplemental Workers

Comments: Other commenters stated that the work hour restrictions would limit industry's access to supplemental workers. The commenters explained that the break requirements would encourage supplemental workers to seek out jobs in other industries that offer more overtime. Therefore, the commenters stated that this unintended consequence of the break requirements would harm licensees' ability to attract qualified workers. Without a consistent supply of experienced workers, the commenters warned that jobs would be delayed and turnovers would increase. In addition, the commenters predicted that more workers would seek second jobs to supplement their hours. As a result, total hours worked would not necessarily decrease [Michael Coyle, NEI #49; Daniel Hansen, Individual; Donald Lenski, Individual; Richard Sweigart, DCS; Keith Jury, Exelon; Mark Wetterhahn, Winston Strawn; Edward Weinkam, NMC; Don Grissette, SNC; Keith D. Young, Ameren; Glenn Morris, TVA; Ronald Gaston, Detroit Edison; Gregory Halnon, FENOC; Jeffrey Archie, SCE&G; Brian McCabe, Progress Energy; A. Edward Scherer, SCE; D.R. Woodlan, STARS; J. A. Stall, FPL; B.T. McKinney, PPL; F.G. Burford, Entergy; Daniel Stenger, NRSG].

NRC Response: The NRC disagrees with the comments and notes that the work hour requirements in Subpart I require the licensee to manage fatigue by limiting work hours, not compensation, as well as ensuring periodic breaks to enhance safety without unduly limiting overtime. The requirements allow for substantial amounts of overtime, up to 32 hours in a week, in excess of 400 hours per year for years without outages, and substantially more hours of overtime in years with outages. Also, in contrast to the commenters' concerns, the NRC believes that limiting work hours may attract and retain workers who perceive former work hours practices as excessive. Furthermore, the limits of the final rule are not substantially different from the limits in Generic Letter 82-12 and most licensees' Technical Specifications. In addition the work hour limits of Subpart I only apply to individuals who are performing duties on systems, structures, or components that a risk-informed evaluation process has shown to be significant to public health and safety, or are performing critical emergency or fire response duties, or are members of the site security force performing duties necessary for execution of the site security plan. The rule does not limit the hours of individuals who are not performing these specified functions.

Generic Letter 82-12

Comments: Commenters also stated that the individual work hour limits of proposed § 26.199(d)(1) are similar to the work-hour limits that are outlined in Generic Letter 82-12, and industry appreciates the minor change that was made to these limits, as it should eliminate inconsistency in the application of these limits [F.G. Burford, Entergy; Brian McCabe, Progress Energy; Jim Davis, NEI].

NRC Response: The comments do not require a response.

Impact on 8-hour Shifts

Comments: Many commenters opposed certain work hour controls because they decrease scheduling flexibility for the 8-hour shifts and will encourage 12-hour shifts [D.M. Jurss, PBNP; Peter Hammil; PBNP; John Cowan, NEI, Kevin Glidden, Individual; Jim Davis, NEI; Todd

Newkirk, IBEW; James Springfield, IBEW; Dennis Specha, Individual; Anonymous #34; Brian McCabe, Progress Energy; Gregory Halnon, First Energy; Anonymous #75; Ray Wacker, Individual]. Other commenters argued that 8-hour shifts allow adequate amounts of sleep between shifts, so the move to 12-hour shifts would be detrimental to nuclear plant workers in terms of preventing fatigue. [D.M. Jurss; PBNP; John Cowan, NEI; Doug Beck, First Energy]. One commenter argued that working 10 or 12 hour shifts would decrease the amount of time workers will be able to spend with their families [Doug Beck, First Energy].

To address this issue, one commenter suggested that the language of § 26.199(d)(2)(iii) be changed to: "A 48-hour break in any 14-day period, except during the first 14 days of any plant outage if the individual is performing the job duties listed in paragraph (a)(1) through (a)(4) of this section." The commenter also recommended adding subparagraph (iv) that states "A 24-hour break in any 8-day period if work hours scheduled under § 26.199(c) is based on an 8-hour shift schedule" [D.M. Jurss, PBNP].

NRC Response: In response to these and related comments, the NRC has conducted further analysis of the proposed rule provisions and agrees that the proposed rest break provisions could significantly disrupt current shift schedules and rotations. The NRC has modified the rest break provisions in the final rule to provide substantial additional flexibility in this regard, while providing comparable assurance that cumulative fatigue from inadequate rest does not impair the ability of workers to safely and competently perform their duties. The revised break and day off provisions are in § 26.205(d)(2)-(5) of the final rule.

Limit Consecutive Hours Worked to Ten

Comments: Another commenter stated that the proposed changes only address the "tail end" of the fatigue cycle, and the commenter suggested that the language limit the number of consecutive hours worked to ten [Jim Pulley, Clinton Power Station].

NRC Response: The NRC disagrees with the comment that the number of consecutive hours worked should be limited to ten hours. Limiting consecutive hours worked to 10 hours would effectively limit schedules providing 24-hour coverage to 8-hour shift lengths. A 10-hour shift length would not be practical and would not be based on a 24-hour clock and therefore would cause significant disruption of worker circadian shift cycles and worker fatigue. Although studies of worker fatigue in other industries have demonstrated deteriorating performance after 9 hours of duty, 12-hour shifts allow more tasks to be completed without a turnover, reduce the number of turnovers between shifts, and frequently allow individuals to turnover to the individuals that they relieved. As a result, 12-hour shifts improve job continuity and reduce the potential for error that can be introduced through the turnover process. The NRC considers these factors to mitigate, to some extent, the degradation in performance that may occur as a result of shift lengths in excess of 8 hours. In addition, many licensees have implemented 12-hour shifts for years and the NRC does not have information to indicate that the performance of individuals at sites with 12-hour shifts is substantively different from the performance of individuals at sites with using 8-hour shifts. As a consequence the NRC concluded that the information available at this time regarding the potential fatigue management benefit of limiting consecutive hours worked to 10 hours does not justify the substantial burden that would result from eliminating 12-hour shifts as a schedule option.

16 Work Hours in any 24 Hour Period – § 26.199(d)(1)

Comment: One commenter expressed concern about the individual work hour control in (d)(1)(i) that would allow 16 hours of work in any 24-hour period. The commenter acknowledged that 12 hour shifts have become increasingly common at U.S. nuclear power plants and that the NRC has proposed provisions (§ 26.199(d)(1)(ii), § 26.199(d)(2)(i)) that would restrict or dissuade the use of 16-hour days. However, the commenter stated that allowing the possibility of 16-hour days for personnel in safety-sensitive positions is counterproductive and potentially hazardous. The commenter stated that the proposed 16-hour value appears to imply that (1) fewer than 8 hours of sleep will be acquired between work shifts, which is insufficient as the NRC itself has noted, or (2) the report time will slip from day to day causing circadian instability, which should not be acceptable. Therefore, the commenter suggested that the maximum number of work hours should be 10 hours per 24 hours for people on 8-hour shifts and 14 hours per 24 hours for people on 12-hour shifts [Darrel Drobnich, NSF]. Another comment stated that workers should not be working more than 8 hours per day [Anonymous #76].

NRC Response: The NRC agrees in part with the commenterers in that the routine use of 16 hour shifts is inappropriate for fatigue management. Attachment 1 to SECY-01-0113 provides the basis for this proposed limit, which is summarized as follows: Studies have shown that task performance declines after 12 hours on a task (Folkard, 1997; Dawson and Reid, 1997; Rosa, 1991). Other studies have shown that the relative risk of having an accident increases dramatically after 9 consecutive hours on the job (Hanecke, et al.,1998; Colquhoun, et al.,1996; U.S. DOT, 49 CFR Parts 350, et al., Proposed Rule, May 2, 2000, 65 FR 25544). Further, a maximum of 12 work hours per day was the limit recommended by nine experts who met in 1984 to develop recommendations for NUREG/CR-4248. Therefore, in originally developing the NRC's Policy on Worker Fatigue, the NRC had planned a 12-hour maximum limit, but revised it to 16 hours in response to practical concerns from industry that the 12-hour limit required personnel who worked 8-hour shifts to split shifts when they work overtime. Those practical concerns remain valid, and the final rule retains a 16-hour limit in § 26.205(d)(1)(i).

Although the rule permits 16-hour shifts, other work hour limits in the rule would effectively limit the number of 16-hour shifts that licensees could assign. Because of this the final rule has requirements that will substantially limit their use. Specifically, the 10-hour break requirement in § 26.205(d)(2)(i) will be applicable to all individuals subject to work hour controls. As a consequence, an individual would not be eligible to return for the beginning of the next normally-scheduled shift without a 10-hour break, and therefore would likely have a day off following a 16-hour shift.

Support for Ten Hour Between-Shift Rest Break – § 26.199(d)(2)(i)

Comments: Many commenters supported the mandatory rest break provision in § 26.199(d)(2)(i) that increases minimum break time from eight hours to ten hours because it will effectively remove the potential for cumulative fatigue by improving operator alertness levels and providing an opportunity to meet an individual's sleep requirement and minimize any acute sleep loss [Kevin Glidden; Individual; Mike Jolley, Individual; Mark Rosekind, Altertness Solutions; Michael Coyle, NEI #49; Ethan Darrow, Individual; D.M. Jurss, PBNP; Richard Sweigart, DCS; Keith Jury, Exelon; Mark Wetterhahn, Winston Strawn; Edward Weinkam, NMC; Don Grissette, SNC; Keith D. Young, Ameren; Glenn Morris, TVA; Ronald Gaston, Detroit Edison; Gregory

Halnon, FENOC; Jeffrey Archie, SCE&G; Brian McCabe, Progress Energy; A. Edward Scherer, SCE; D.R. Woodlan, STARS; J. A. Stall, FPL; B.T. McKinney, PPL; F.G. Burford, Entergy; Daniel Stenger, NRSG]. One commenter suggested that the rule package understates the importance of this provision [Michael Coyle, NEI #49].

NRC Response: The NRC agrees with the commenters' support for this provision, but does not agree that the 10-hour break is adequate for preventing impairment from cumulative fatigue. Inadequate rest breaks between shifts not only contribute to a long work day but also cause increased pressure for individuals to reduce their sleep time in order to meet the demands of both work and daily life, resulting in an increased potential for cumulative fatigue. Therefore, the NRC has included other rest break and day off requirements in the final rule to effectively manage the effects of cumulative fatigue. The provision in proposed § 26.199(d)(2)(i) has been retained as § 26.205(d)(2)(i) of the final rule.

Opposition to Ten Hour Between-Shift Rest Break

Comments: One commenter stated the issue of off-duty time is one of the most important issues considered by the NRC. It said that ten hours off between shifts is the very minimum that should be allowed to provide employees the opportunity to get adequate sleep. The commenter encouraged the NRC to consider raising this provision to at least 12 hours off between shifts [Darrel Drobnich, NSF].

One commenter suggested that the 10-hour break requirement has little value. The commenter explained that the few times when workers are applicable to the minimum 8-hour breaks are during "call-outs" or shift changes, but the new 10-hour requirement makes an exception for shift changes [Anonymous #75].

NRC Response: The NRC agrees that a 10 hour rest break is the minimum that should be allowed between work periods. The NRC disagrees that the minimum break period should be increased to 12-hours. In most cases at nuclear power plants, workers are allowed at least a twelve hour break, exclusive of turnover. Therefore, the NRC acknowledges that this provision is applied infrequently. However, in instances of extended shifts (holdovers) or unscheduled shifts ("call-outs"), the 10-hour between-shift break requirement is very important to protect against the effects of acute fatigue. Also, the NRC notes that the 10-hour break exception for shift changes is intended for entire crews when they change shift schedules or shift durations, and is not to be used on an individual or frequent basis. Such transitions may occur at the beginning or end of an outage or when new shift schedules are adopted. As a result, the NRC expects that these instances will be infrequent.

Although a longer minimum rest break requirement would provide greater assurance that individuals have adequate opportunities for sleep, the 10-hour break requirement provides adequate opportunity for rest when used infrequently, as is expected given other requirements in this rule. For example, § 26.205(d)(1)(ii) in the final rule limits individuals to working 26 hours in any 48-hour period. Although licensees could use routine 10-hour breaks in conjunction with atypical shift durations (e.g., alternating 12- and 14-hour shifts), the practical implications of these schedules, such as varied start times, make their use improbable. As a consequence, the 10-hour break requirement is sufficient to assure adequate rest during infrequent circumstances

in which individuals work extended hours (e.g., more hours than their typical 8-,10-, or 12-hour shift) and that rest opportunities will typically vary between 12 and 16 hours in duration.

The minimum 10-hour break duration also accommodates most scheduling circumstances for the common shift durations that are currently in use in the industry. A notable exception is that the 10-hour break requirement could potentially prevent an individual who has worked 16 hours straight (e.g., two consecutive 8-hour shifts) from returning to duty at the start of his or her next regularly scheduled shift. However, the 10-hour break requirement appropriately prevents the individual from working in this circumstance because the potential for degraded job performance resulting from fatigue would be substantial given the individual's continuous hours of work and limited opportunity to sleep. Accordingly the NRC retains the proposed rule provision for a minimum 10-hour break between work shifts in § 26.205(d)(2)(i) of the final rule.

Opposition to 24/7 and 48/14 Breaks – § 26.199(d)(2)(ii) and (iii)

Comments: Many commenters disagreed with some aspects of the rest break provisions in § 26.199(d)(2)(ii) and (iii). They stated that the 24-hour and the 48-hour rest breaks are unnecessary, duplicative of requirements in § 26.199(c), do not address practical implementation issues, will be disruptive of normal shifts, and would negatively impact industry [Michael Coyle, NEI #49; James Springfiled, IBEW; Keith Young, Ameren UE; D.M. Jurss, PBNP; Mark Rosekind, Alertness Solutions; Richard Sweigart, DCS; Keith Jury, Exelon; Mark Wetterhahn, Winston Strawn; Edward Weinkam, NMC; Don Grissette, SNC; Keith D. Young, Ameren; Glenn Morris, TVA; Ronald Gaston, Detroit Edison; Gregory Halnon, FENOC; Jeffrey Archie, SCE&G; Brian McCabe, Progress Energy; A. Edward Scherer, SCE; D.R. Woodlan, STARS; J. A. Stall, FPL; B.T. McKinney, PPL; F.G. Burford, Entergy; Daniel Stenger, NRSG; Ray Wacker, Individual].

One commenter, supported by many commenters, stated that fixed break requirements and collective work hour restrictions will lead to significant safety implications and could affect a licensee's ability to restore inoperable equipment in a timely manner. For example, the commenters stated that the break requirements would make it difficult to assign teams to provide 24-hour coverage to complete critical maintenance activities, or to restore inoperable safety equipment, which would result in longer outage times. The commenter also explained that the break requirements will make emergency plan and security drills more difficult to schedule and carry-out. If an individual has to participate on a required day off, there would be limitations on who could participate and there would be an increased need for waivers. According to the commenter, this would add another layer of complexity to planning drills [Michael Coyle, NEI #49; Richard Sweigart, DCS; Keith Jury, Exelon; Mark Wetterhahn, Winston Strawn; Edward Weinkam, NMC; Don Grissette, SNC; Keith D. Young, Ameren; Glenn Morris, TVA; Ronald Gaston, Detroit Edison; Gregory Halnon, FENOC; Jeffrey Archie, SCE&G; Brian McCabe, Progress Energy; A. Edward Scherer, SCE; D.R. Woodlan, STARS; J. A. Stall, FPL; B.T. McKinney, PPL; F.G. Burford, Entergy; Daniel Stenger, NRSG].

One commenter stated that while the rest breaks of § 26.199(d)(2) are intended to provide opportunities to recover from any cumulative sleep debt from preceding consecutive work periods, the ten-hour break provision would be adequate to obtain sufficient sleep and eliminate or minimize any potential acute sleep loss. Therefore, artificially requiring a 24 hour break every

7 days or a 48 hour break every 14 days is arbitrary and there is no scientific justification to support these specific numbers. [Mark Rosekind, Alertness Solutions].

Several commenters from industry stated that the "recovery concept" is scientifically supported, but the approach used to prevent cumulative fatigue should take into consideration existing work schedules and scheduling practices. The commenter explains that there is a problem with focusing on days off when facilities use 12-hour and 8-hour rotation schedules. Further, the commenter stated that there is no scientific basis for linking recovery breaks to any number of days less than 14 consecutive days. The commenter finds fault with focusing on days off without considering the number of hours worked in a particular day and the breaks between work periods. The commenter illustrates this point in a series of work-hour rotation schedule examples [Michael Coyle, NEI #49; Richard Sweigart, DCS; Keith Jury, Exelon; Mark Wetterhahn, Winston Strawn; Edward Weinkam, NMC; Don Grissette, SNC; Keith D. Young, Ameren; Glenn Morris, TVA; Ronald Gaston, Detroit Edison; Gregory Halnon, FENOC; Jeffrey Archie, SCE&G; Brian McCabe, Progress Energy; A. Edward Scherer, SCE; D.R. Woodlan, STARS; J. A. Stall, FPL; B.T. McKinney, PPL; F.G. Burford, Entergy; Daniel Stenger, NRSG].

A commenter, supported by many commenters, suggested that § 26.199(d)(2)(ii) should be revised to provide more equitable breaks during periods of normal operations. The commenter argued that a single set of break limits cannot be applied without undermining the viability of eight hour shift rotations, which industry supports. The commenter recommended deleting proposed § 26.199(d)(2)(ii) and replacing it with the following language:

(ii) During periods of normal operations:

(A) For a crew in a predominately 12-hour work schedule, an average of two 24-hour breaks per week over the nominal rotation cycle.

(B) For a crew in a predominately 8-hour or 10-hour work schedule, an average of one 24-hour break per week over the nominal rotation cycle.

(C) The nominal rotation cycle shall be between 4 and 6 weeks.

(D) Individuals are exempt from this requirement for the first 10 weeks of an outage in which the requirements of paragraph (d)(2)(iii) are applied.

[Michael Coyle, NEI #49; Richard Sweigart, DCS; Keith Jury, Exelon; Mark Wetterhahn, Winston Strawn; Edward Weinkam, NMC; Don Grissette, SNC; Keith D. Young, Ameren; Glenn Morris, TVA; Ronald Gaston, Detroit Edison; Gregory Halnon, FENOC; Jeffrey Archie, SCE&G; Brian McCabe, Progress Energy; A. Edward Scherer, SCE; D.R. Woodlan, STARS; J. A. Stall, FPL; B.T. McKinney, PPL; F.G. Burford, Entergy; Daniel Stenger, NRSG].

Many commenters raised the issue of work schedule disruption as a result of the 48-hour break requirement in § 26.199(d)(2)(iii). They argued that, for workers on the night shift, having one day off provides an additional rest period and allows the worker to maintain a consistent pattern of work and sleep habits, which reduces the risk of accidents on the job. Two days off, however, may interfere with his or her sleep cycle, and as a result, the individual would have to readjust to the night shift after the two-day break. According to the commenters, some workers have stated that having two days off is worse than having no days off. They also argued that a 1-day break in any 7-day period is more than adequate when combined with other rule provisions to address cumulative fatigue. Thus, they requested that the 48-hour break requirement during outage periods be deleted. One commenter, supported by many other commenters, suggested that NRC replace this provisions with the following language: "During outage periods, in which the requirements of (d)(2)(ii) above are not applied [see above text for commenter suggestion for (d)(2)(ii) language], a 24-hour break in any 7-day period." [Dennis Specha, Individual; Danny

Todhunter, Exelon; Jim Waite, Exelon; Daniel Hansen, Individual; Jim Davis, NEI #48; Michael Coyle, NEI #49; Andrew Antrassain, UWUA; Richard Sweigart, DCS; Keith Jury, Exelon; Mark Wetterhahn, Winston Strawn; Edward Weinkam, NMC; Don Grissette, SNC; Keith D. Young, Ameren; Glenn Morris, TVA; Ronald Gaston, Detroit Edison; Gregory Halnon, FENOC; Jeffrey Archie, SCE&G; Brian McCabe, Progress Energy; A. Edward Scherer, SCE; D.R. Woodlan, STARS; J. A. Stall, FPL; B.T. McKinney, PPL; F.G. Burford, Entergy; Daniel Stenger, NRSG; C.L. Funderburk, Dominion].

NRC Response: The NRC agrees that alternative requirements can prevent and mitigate cumulative fatigue while providing licensees increased scheduling flexibility. A significant amount of research has shown that adequate rest breaks are necessary to ensure that licensees provide individuals with sufficient time off between work periods to permit the individuals to recuperate from fatigue and provide reasonable assurance that acute and cumulative fatigue do not compromise the abilities of these individuals to safely and competently perform their duties. However, the NRC has conducted further analysis of the proposed provisions and has concluded that alternative break and day off requirements can effectively support fatigue management while providing greater scheduling flexibility. Therefore, the NRC has modified the work hour controls applicable to periods of normal operations in the final rule.

In response to comments on the break requirement in § 26.199(d)(2)(ii) of the proposed rule, the NRC has revised the maximum number of days between the breaks. The revised requirement is in § 26.205(d)(2)(ii) of the final rule and requires a minimum 34-hour break in any 9-day period. In revising the requirement the NRC considered that although the final rule allows more consecutive work shifts for 8-hour and 10-hour shift schedules, the additional flexibility allowed by the final rule allows licensees to more readily optimize 8-hour shift schedules to minimize transitions between day, evening, and night shifts that can lead to worker fatigue. Although this relaxation also allows more consecutive shifts for individuals on 10-hour shifts, individuals on 10-hour shifts typically do not work a rotating schedule and therefore do not experience the disruption of their circadian cycle that exacerbates the cumulative fatigue effects of consecutive work shifts. The scheduling of 12-hour shifts is unaffected by this requirement because § 26.205(d)(1)(iii) effectively limits the scheduling of 12-hour shifts to not more than 6 consecutive days. The final rule requirement also provides flexibility to accommodate other practical considerations such as scheduling training on a Monday thru Friday basis and allows a contingency day for 8-hour shift schedules that include a series of 7 consecutive 8-hour shifts.

The final rule also revises the minimum duration of the break period from 24 hours, as specified in § 26.199(d)(ii) of the proposed rule, to a minimum 34-hour break in § 26.205(d)(2)(ii) of the final rule. The revision more clearly states NRC's intent to require a periodic "day off" in which individuals have the opportunity for 2 consecutive sleep periods without an intervening work period. The 34-hour break duration provides opportunity for 2 consecutive sleep periods without an intervening work period, supports use of forward rotating and fixed shifts, and allows for the possibility that individuals may work 26 hours in a 48-hour period contiguous to the break.

In response to comments on the proposed 48-hour break requirement (§ 26.199(d)(2)(iii)) and the collective work hour limit (§ 26.199(d)(2)(iii)) of the proposed rule, the NRC has not retained these requirements in the final rule. Rather, the NRC has replaced these requirements with alternative provisions in § 26.205(d)(3) for normal operations and § 26.205(d)(4)-(5) for unit outages, planned security system outages or increased threat conditions.

To address cumulative fatigue during periods when a plant is operating, § 26.205(d)(3) requires each individual subject to the work hour requirements to have a minimum average number of days off per week. This rule provision addresses comments on the 48-hour break requirement and collective work hour limits by addressing cumulative fatigue on an individual basis; by tailoring the breaks to the duration of the shift; by establishing a limit that allows the flexibility of distributing the minimum days off over a shift cycle of up to 6 weeks; and by establishing requirements that are practical and should impose less administrative burden on licensees than would have been required by the collective work hour limits.

These final rule provisions also address those comments on the 48-hour break that were applicable to outage periods, as follows:

(1) The minimum day off requirements of § 26.205(d)(4) and (d)(5) do not require licensees to schedule 2 consecutive days off as would have been required by the 48-hour break requirement. As a consequence licensees are better able to establish schedules that minimize the potential for circadian disruption for individuals on fixed night shifts.

(2) The minimum day off requirements of § 26.205(d)(4) and (d)(5) allow licensees substantial flexibility in scheduling the required days off within the 15 day outage period. As a consequence, licensees are able to implement a range of scheduling options to meet known outage schedule demands and have the flexibility to revise schedules as may be necessary to address emergent needs.

(3) The minimum day off requirements of § 26.205(d)(4) allow licensees to use a predictable repeating schedule. The requirement permits a schedule of 4 consecutive 12 hour shifts followed by 1 day off. This 5 day sequence can repeat 3 times in each 15-day period creating a schedule that is predictable and repeating, characteristics desired by workers and schedulers. It also limits the number of consecutive work shifts to prevent cumulative fatigue and includes sufficient periodic days off to mitigate fatigue.

(4) The minimum day off requirements of § 26.205(d)(4), in conjunction with the other requirements in § 26.205, allow a maximum work week of 72 hours and an average work week of 67.2 hours for a period up to 60 days. As a consequence, the requirement allows licensees to offer, within these limits, substantial amounts of overtime to attract supplemental workers for outage activities, while ensuring that schedules remain consistent with the management of worker fatigue. The NRC acknowledges that some individuals may want to work more than 72 hours, or even more than 84 hours, per week. However, the work hour limits of § 26.205 are applicable to only those duties that have the most direct impact on the protection of public health and safety and common defense and security. As a consequence, the requirements do not prevent individuals from working more than 72 hours per week unless those individuals are performing duties on systems, structures, or components that a risk-informed evaluation process has shown to be significant to public health and safety, or are performing critical emergency or fire response duties, or are members of the site security force performing duties necessary for execution of the site security plan. Accordingly the NRC has replaced the requirements in proposed § 26.199(d)(2)(ii) and (d)(2)(iii) with the requirements in § 26.205(d)(3) of the final rule. The NRC also notes that the final rule includes provisions to accommodate licensees performing unannounced emergency preparedness drills and security drills in response to comments that the break requirements would have made it difficult for licensees to schedule these activities. These provisions are in §§ 26.205(b)(4) and 26.207(b) of the rule, respectively.

Suggested Change to Rest Breaks

Comment: The commenter suggests that, rather than mandatory breaks, individuals should have the discretion to decline or exercise their right to a minimum break period. Specifically, the commenter suggested that NRC modify § 26.199(d)(2)(ii) to state: "A 24-hour break in any 7-day period; *or*" and § 26.199(d)(2)(ii)(A) to state: “During licensee normal operations for individuals identified in § 26.199(d)(4), a 24-hour break after completing 7 or 8 consecutive days of scheduled 8-hour shifts in any 14-day period activated as an individual option requiring reasonable notice by individuals to the licensee to observe the break period. Individuals who do not exercise this option do not require the licensee to adhere to individual waiver requirements in § 26.199(c)(3) unless subject to § 26.199(d). During plant outages § 26.199(d)(2)(ii)(A) is not applicable and § 26.199(d)(2)(ii) and § 26.199(d)(2)(iii) is applicable to § 26.199(d)(4) individuals” [Edwin Hill, IBEW].

Similarly, the commenter suggested that NRC modify § 26.199(d)(2)(iii) to state: “A 48-hour break in any 14-day period activated as an individual option requiring reasonable notice by individuals to the licensee to observe the break period. Individuals who do not exercise this option do not require the licensee to adhere to individual waiver requirements in § 26.199(c)(3) unless subject to § 26.199(d), or” and § 26.199(d)(2)(iii)(A) should state: “During licensee normal operations for individuals identified in § 26.199(d)(4), a 48-hour break in any 14-day period during licensee normal operations. During plant outages § 26.199(d)(2)(iii)(A) is not applicable and § 26.199(d)(2)(ii) and § 26.199(d)(2)(iii) is applicable to § 26.199(d)(4) individuals” [Edwin Hill, IBEW].

NRC Response: The NRC agrees in part with these comments. The break and day off provisions of the final rule in § 26.199(d)(2) through (d)(5) largely meet the commenter’s objective of providing workers and licensees increased flexibility in the distribution of breaks and days off, while allowing the licensee to retain scheduling authority.

Clarification of Rest Breaks

Comment: Another commenter stated that in the proposed rule, it is unclear whether the 24 and 48 hours off could be additive in 14-day period. The commenter asked: “would an individual get 24 hours off in a 7-day period and 48 hours off in a 14-day period, for a total of 72 hours off in the 14-day period?” The commenter suggested that the intent be clarified in the explicit language [Mark Rosekind, Alertness Solutions].

NRC Response: It was not NRC’s intent that the rest break provisions be additive in a 14 day period. Clarification of the NRC’s intent regarding these provisions is unnecessary, as the requirements for a minimum 24-hour break and a minimum 48-hour break have been modified in the final rule in § 26.205(d)(2)(ii) and § 26.205(d)(3) for normal operations and § 26.205(d)(4) through (5) for various outage conditions and these provisions provide a clearer set of requirements.

Exception During Outage

Comments: Other commenters expressed concern about the lack of work hour regulation during outage periods [Ethan Darrow, Individual; Anonymous #75]. In contrast, another

commenter argued the need for an exception from § 26.199(d)(2)(ii) to allow individuals to work for 14 consecutive days during the first two weeks of an outage or during other periods of high work activity [Daniel Stenger, NRSG].

NRC Response: The NRC does not agree that the work hour requirements applicable during outage periods should be made any more or less stringent as recommended by the commenters. Outages are unique, relatively short-term, and involve levels of activity that are substantially higher than most non-outage operating periods. Section 26.205(d)(4) and (d)(5) of the final rule establishes minimum day off requirements applicable to outages that accommodate the increased level activity of outages, but generally limits this more intensive scheduling to a period of 60 days to limit cumulative fatigue. Section 26.205(d)(6) allows an extension of the 60 day periods, but only for individuals who have had periods of less intensive scheduling during the outage. Although more restrictive requirements could perhaps provide greater assurance of worker fitness for duty, the NRC believes the burden on licensees would be excessive relative to the additional fatigue mitigation or prevention that would be gained. Regarding the recommendation to allow 14 consecutive days of work during outages or periods of high work activity, such a provision would allow work schedules with substantial potential for impairment of individuals from fatigue. Accordingly the NRC has not adopted the commenter's recommendation for the final rule.

Outage Length

Comment: One commenter stated that the former regulations allowed personnel to work hours over the guidelines with only a waiver and the ample use of turnover time. The commenter also argued that if the NRC is going to attempt to further limit work hours, then the NRC should mandate the length of an outage, and the commenter suggested a mandated 35 day outage. The commenter argued that if the NRC limits the hours of qualified in-house personnel but does not set a standard outage length, then companies will further rely on non-qualified contractor personnel to do critical work [Anonymous #dpr25].

NRC Response: The NRC does not agree with the comment that the NRC should mandate the length of an outage. The fatigue management provisions of § 26.207 establish criteria for the use of waivers that should substantially limit their use to conditions where warranted by safety or security considerations. Use of turnover time is limited by § 26.205(b)(1) so as to prevent abuse of the exclusion of turnover time from the work hour limits. The suggestion that the NRC limit outage length to prevent excessive work hours could effectively prevent licensees from completing maintenance necessary for the continued safe operation of the facility or create undue pressure to complete such activities within the allowed outage period. The NRC does not agree that the proposed limits will cause increased reliance on contractors, since the limits will also apply to contract personnel.

Conditions for Granting Waivers

Comment: One commenter argued that the process of extending work hours should be difficult for the utility, such that it will only occur under very unusual circumstances [Ethan Darrow, Individual].

NRC Response: The NRC agrees that waivers should only be granted in very unusual circumstances as originally stated in the NRC's Policy on Worker Fatigue. The potential for worker fatigue in conditions that require a waiver is substantial (Baker, et al., 1994; Dawson and Reid, 1997; Stephens, 1995; Strohl, 1999). Therefore, the provision in proposed § 26.199(d)(3) and as retained in § 26.207(a)(1)(i) of the final rule, clearly articulate that licensees must limit the granting of waivers to circumstances in which it is necessary to prevent or mitigate a condition adverse to safety or to maintain the security of the plant.

Also, as stated in § 26.207(a)(2) of the final rule, waivers can be granted only when such circumstances could not reasonably have been controlled. This requirement is necessary because conditions for meeting the waiver criteria that are specified in § 26.207(a)(1) could routinely result from inadequate staffing or work planning. Therefore, § 26.207(a)(2) prohibits the use of waivers in lieu of adequate staffing or proper work planning, for example, but would permit the use of waivers for circumstances that the licensee could not have reasonably controlled, which may include, but would not be limited to, equipment failures or a sudden increase in the personnel attrition rate.

Waiver in Lieu of Adequate Staffing

Comment: A commenter stated that § 26.199(d)(3)(ii) would prohibit the use of a waiver in lieu of adequate staffing, but then gives licensees an "out" by citing a sudden increase in personnel attrition rate as an example of a circumstance that the licensee could not have reasonably controlled, providing further justification for a licensee to stay at inadequate staffing levels [Peter Hammill, PBNP].

NRC Response: The NRC agrees that the waiver provisions allow licensees to use waivers to address a sudden decrease in plant staffing, if the conditions meet the waiver requirements. Specifically, the work to be conducted under the waiver must be necessary to prevent or mitigate a condition adverse to plant safety or security (as required by § 26.207(a)(1)(i) of the final rule), the individual to work under the waiver must be assessed face-to-face, and found fit to perform his or her duties during the additional work period (as required by § 26.207(a)(1)(ii) of the final rule), and, in this example, the sudden decrease in staffing could not have been reasonably controlled (as required by § 26.207(a)(2) of the final rule).

A licensee can reasonably assert that filling a position required by minimum staffing requirements is necessary to prevent or mitigate a condition adverse to safety or security. However, it is not the NRC's intent to allow waivers to compensate for deficiencies in staffing levels or other conditions that a licensee can reasonably control. Nevertheless, the NRC believes that it is reasonable to expect waivers to be used on a temporary basis to meet minimum staffing requirements if the loss of personnel could not have been reasonably controlled by the licensee. The rule would not allow the use of waivers for such conditions for an unlimited period of time because the licensee would eventually have time to respond to the condition and the NRC would consider the condition to be within reasonable control of the licensee. Given these considerations the NRC believes that the rule provision provides appropriate flexibility for conditions beyond the reasonable control of the licensee without providing licensees a blanket exception to use waivers to compensate for inadequate staffing. Accordingly the NRC has retained the provision in § 26.199(d)(3)(ii), which is presented in § 26.207(a)(2) of the final rule.

Insufficient Flexibility of Waivers

Comments: Several commenters from industry suggested that the waiver requirements in proposed § 26.199(d)(3) do not provide sufficient flexibility to grant a waiver to specific workers based on operational needs. They explained that there will be cases where a waiver would allow the completion of important work in a timely manner and would not result in any safety or security impact, and urged that management should have the flexibility to approve waivers in these cases. With the inclusion of the fatigue assessment and allowance for the individual to make a fatigue self-declaration, the commenters stated that this limitation is excessive and may represent a financial burden to the facilities. As a result, one commenter, supported by many commenters recommended adding "or a determination that the waiver is necessary for plant operations" to the end of § 26.199(d)(3)(i)(A) [Michael Coyle, NEI #49; Richard Sweigart, DCS; Keith Jury, Exelon; Mark Wetterhahn, Winston Strawn; Edward Weinkam, NMC; Don Grissette, SNC; Keith D. Young, Ameren; Glenn Morris, TVA; Ronald Gaston, Detroit Edison; Gregory Halnon, FENOC; Jeffrey Archie, SCE&G; Brian McCabe, Progress Energy; A. Edward Scherer, SCE; D.R. Woodlan, STARS; J. A. Stall, FPL; B.T. McKinney, PPL; F.G. Burford, Entergy; Daniel Stenger, NRSG].

Another commenter recommended that proposed § 26.199(d)(3)(i)(A) be modified to say: "An operations shift manager determines that the waiver is necessary to mitigate or prevent a condition adverse to safety or to support plant operational needs..." [Daniel Stenger, NRSG].

NRC Response: The NRC disagrees with the commenters' concern that the criterion that must be met in order to grant a waiver in proposed § 26.199(d)(3)(i)(A) may be overly-restrictive because it would prohibit the granting of waivers for conditions that could be cost-beneficial to the licensee without a substantive decrease in safety. The potential for worker fatigue in conditions that would require a waiver is substantial. Therefore, the NRC cannot conclude that licensees can reasonably justify the performance of risk-significant activities by individuals who have worked hours in excess of the work hour limits on the basis that granting the waiver would not have an adverse impact on safety or security. This would be inconsistent with the NRC's goal of providing reasonable assurance that an individual will be able to safely and competently perform his or her duties, and therefore this provision has not been substantially modified and is retained as § 26.207(a)(1)(i) in the final rule.

Approval Authority for Waivers

Comment: One commenter stated that the language in the rule implies that the operations manager is the approval authority. The commenter stated that the operations manager should be evaluating the situation and individual, however, the plant manager should be the authority "signing off" on the waiver because of the impact of work hours on fatigue [Ethan Darrow, Individual].

NRC Response: The NRC disagrees with the commenter. The final rule states in § 26.207(a)(1)(i) that the operations shift manager would make the determination of whether the waiver is necessary to mitigate or prevent a condition adverse to safety and the security shift manager would make the determination if the waiver is necessary to maintain the security of the plant. Operations shift managers and security shift managers have the requisite knowledge and qualifications to make the respective safety or security determinations, and making such

determinations is consistent with the scope of duties currently performed by individuals in these positions.

Before the waiver is granted, a face-to-face assessment by a supervisor who is qualified to direct the work to be performed is also required by the final rule in § 26.207(a)(1)(ii) to determine that there is reasonable assurance that the individual will be able to safely and competently perform his or her duties during the additional work period for which the waiver will be granted. These determinations require knowledge of the specific skills that are necessary to perform the work and the conditions under which the work will be performed in order to assess the potential for fatigue to adversely affect the ability of an individual to safely and competently perform the work. This knowledge is generally limited to individuals who are qualified to direct the work.

In addition, § 26.207(a)(3) of the final rule requires that the waiver assessment be performed no more than four hours before the individual begins performing any work under that waiver, which will ensure that the individual will be fit-for-duty at the time the waiver is needed. Using the plant manager as the approval authority may increase the time that it takes for the waiver to get approved. Thus, using the operations or security shift manager, instead of the plant manager, as the approval authority will ensure that the appropriate personnel make the important waiver approval decisions and that the waiver process will not be abused.

Counting of Waivers

Comment: Another commenter stated that in many cases, waivers include a whole department or crew, so the counting of waivers does not give an accurate indication of how many workers are exceeding the work hour limits [Anonymous #75].

NRC Response: The NRC disagrees with the comment because the proposed rule required that a waiver may be granted to a particular individual under the circumstances outlined in proposed § 26.199(d)(3) only after that individual has undergone a face-to-face assessment to determine whether or not the individual will be able to safely and competently perform his or her duties during the additional period for which the waiver will be granted. As noted in SECY-01-0113, it has never been the NRC's intent in its Policy on Worker Fatigue or in the proposed rule that blanket waivers be granted for a large group of individuals. In addition, proposed § 26.199(d)(3)(iii) establishes a maximum period of four hours before the individual begins working under the waiver as the period within which the supervisory assessment must be performed. Finally, the reporting requirements in proposed § 26.197(e)(1) state that licensees must report waivers of work hour controls for individuals, not groups of individuals. Accordingly the final rule retains these reporting requirements in § 26.203(e)(1), and the waiver requirements in § 26.207(a)(1), (a)(3), and (a)(4).

Qualification of Supervisor Performing Face-to-Face Assessment

Comment: Referencing § 26.199(d)(3)(i)(B), one commenter stated that the phrase "qualified to direct the work to be performed" could inappropriately be linked to the definition of directing included in paragraph § 26.5, Definitions. The commenter further noted: "If, for example, an instrumentation calibration is required during the night and the Shift Manager determines that the adjustment is needed to prevent or mitigate a condition adverse to safety, an I&C supervisor would be notified to request at least one, probably two task qualified individuals to report to the

plant. The individual will report to the control room supervisor, who assumes oversight responsibilities during the performance of the task. The control room supervisor, although trained on the system and system interactions, may not be able to provide technical input for the calibration function that is being performed. As such, if the phrase "qualified to direct the work to be performed" is linked to the definition of directing, the I&C supervisor would also have to report to the site just to perform the fatigue assessment. This would result in an unnecessary prolonged interruption in the sleep cycle of more individuals than seems appropriate." Therefore, the commenter suggested that the wording "A supervisor, who is qualified to direct the work to be performed" be changed to "A supervisor, who is qualified to provide oversight of the work to be performed..." [F.G. Burford, Entergy]

NRC Response: The NRC agrees that requiring a supervisor to report to the site in the middle of the night for the purpose of conducting a fatigue assessment would be a significant burden and would be counterproductive for managing the fatigue of the supervisor. The proposed rule would have required that a supervisor, who is qualified to direct the work to be performed, assess the individual face-to-face to determine that there is reasonable assurance that the individual will be able to safely and competently perform the tasks during the period covered by the waiver. The purpose of the proposed requirement was to ensure that these determinations are made by individuals with knowledge of the specific skills that are necessary to perform the work and the conditions under which the work will be performed in order to effectively assess the potential for fatigue to adversely affect the ability of an individual to safely and competently perform the work. This knowledge is generally limited to individuals who are qualified to direct the work. In response to this comment the NRC revised the requirement to accommodate situations in which there is no supervisor on site who is qualified to direct the work. Accordingly, § 26.207(a)(1)(ii) of the final rule states that the assessment can be performed by a supervisor who is qualified to provide oversight of the work to be performed by the individual. Although this individual may be less familiar with the details of how the work is to be performed, the exception prevents the substantial burden of a licensee requiring a supervisor that is qualified to direct the work to report to the site to perform the assessment as well as preventing the potential fatigue of the supervisor if called in during the night. The NRC also notes that in all instances, the supervisor performing the assessment shall have the training required by §§ 26.29 and 26.203(c), which provide knowledge and abilities that are essential for a supervisor to make valid assessments in this regard. Among other FFD topics, the training addresses the contributors to worker fatigue and decreased alertness in the workplace, the potential adverse effects of fatigue on job performance, and the effective use of fatigue countermeasures.

The final rule retains the requirements in proposed § 26.199(d)(3)(i)(B), with the changes recommended by the commenter, in § 26.207(a)(1)(ii) of the final rule.

Face-to-Face Assessments for Waivers

Comment: One commenter stated that performing face-to-face fatigue assessments as proposed in the rule will be very difficult, no matter how well trained supervisors may become. The commenter noted that even sleep professionals would not rely on observation to determine how fatigued a person may be, and research demonstrates that most people experience cognitive decrements long before they start to exhibit physical manifestations of fatigue that may be observed by a supervisor or co-workers. The commenter argued that without some objective instrument or measure of fatigue, the system as proposed would be vulnerable to error and/or

abuse. The commenter suggested that NRC develop appropriate guidance for the implementation of training programs in relation to performing fatigue assessments [Darrel Drobnich, NSF].

NRC Response: The NRC agrees in part with the comments but notes that current technology for assessing fatigue has not matured to the state where it has been validated for regulatory use and has its own set of limitations in its ability to reliably detect impairment from fatigue. In lieu of such objective measure, the proposed rule would have required that the supervisor who will be conducting the face-to-face assessment to be trained in accordance with the requirements of § 26.29 and § 26.203(c), and must meet other minimum criteria necessary to effectively assess the potential for acute or cumulative fatigue. These requirements have been retained in § 26.29 and § 26.203(c) of the final rule. The required training will provide the knowledge and abilities that are essential for a supervisor to make valid assessments in this regard. Among other FFD topics, the training addresses the contributors to worker fatigue and decreased alertness in the workplace, the potential adverse effects of fatigue on job performance, and the effective use of fatigue countermeasures.

Section 26.207(a)(1)(ii) of the final rule requires that supervisors must perform the assessment face to face with the individual that he or she is assessing for the waiver. This requirement ensures that the supervisor who is performing the assessment has the opportunity to observe the individual's appearance and behavior to note indications of fatigue (e.g., decreased facial tone, rubbing of eyes, slowed speech) and interact with the individual to assess the individual's ability to continue to safely and competently perform his or her duties during the period for which the waiver will be granted.

Section 26.207(a)(1)(ii) of the final rule also requires that the supervisory assessment must address, at a minimum, the potential for acute and cumulative fatigue, considering the individual's work history for at least the past 14 days and the potential for circadian degradations in alertness and performance, considering the time of day for which the waiver will be granted. The potential for acute fatigue can be practically assessed by estimating the total number of continuous hours the individual will have worked by the end of the work period for which the waiver is being considered. The potential for cumulative fatigue can be practically assessed by reviewing the individual's work schedule during the past 14 days to determine (1) whether the individual had adequate opportunity to obtain sufficient rest, considering the length and sequencing of break periods; (2) whether the available sleep periods occurred during the night or at other times when sleep quality may be degraded; and (3) the potential for transitions between shifts (e.g., from days to nights) to have interfered with the individual's ability to obtain adequate rest. The potential for circadian degradations in alertness and performance can be practically assessed by considering the time of day or night during which the work would be performed, as well as the times of day of the individual's recent shift schedules.
Section 26.207(a)(1)(ii) in effect requires supervisors to address the three work schedule factors (i.e., shift timing, shift duration, and speed of rotation) that are generally considered to be the largest determinants of worker fatigue (Akerstedt, 2004; McCallum, et al., 2003; Mallis, et al., 2002; Folkard and Monk, 1980; Rosa, 1995; Rosa, et al., 1996). In determining the scope of the assessment, the NRC also recognizes the need for licensees to be able to focus the assessment on information that is readily available and could be verified.

Section 26.207(a)(1)(ii) further requires that the supervisory assessment for granting a waiver must address the potential for fatigue-related degradations in alertness and performance to affect risk-significant functions, and whether it is necessary to establish controls and conditions under which the individual is permitted to perform work. This requirement is consistent with the NRC's Policy on Worker Fatigue, which states that "the paramount consideration in such authorizations shall be that significant reductions in the effectiveness of operating personnel would be highly unlikely." However, § 26.207(a)(1)(ii) requires the supervisor to identify any risk-significant functions that may be compromised by worker fatigue, thereby focusing the assessment on worker activities that have the greatest impact on the protection of the public, considering the types of skills and abilities that are most sensitive to fatigue-related degradations.

The NRC also notes that the NEI has initiated development of an implementation guide for the rule, including a checklist that addresses the criteria for authorizing a waiver. Therefore it is anticipated that this will be the subject of further development. The NRC notes that these are minimum criteria, and the requirements do not prevent a licensee from developing a tool that may more effectively make this determination.

Comment: Referring to the last sentence in § 26.199(d)(3)(i)(B)(iii), one commenter expressed uncertainty about how this requirement would apply to a case where the face-to-face supervisory assessment allows an individual to cover a work period in excess of four hours. The commenter presented the example of the case where an individual is called in to cover an 8-hour shift because of sickness of another individual. The commenter asked: "Does the face-to-face supervisory assessment conducted immediately prior to the individual assuming the shift cover the entire 8-hour shift or only the first four hours of it?" The commenter argued that a strict reading of the requirement as presently written might preclude that individual from beginning to perform any work under the waiver more than four hours after the face-to-face supervisory assessment [David Lochbaum, UCS; Deborah Katz, CAN].

NRC Response: The NRC disagrees with the commenter's description of the intent of the subparagraph. Proposed § 26.199(d)(3)(iii) requires that a face-to-face supervisory assessment must be conducted sufficiently close in time (four hours) to the period during which the individual "begins performing any work under the waiver" to ensure that the individual's condition will not substantively change before work is performed under the waiver. This provision is not intended to address the length of the extended work period that the waiver would "cover," and only requires that the assessment is conducted within four hours of the start of the extended work period.

<u>Proposal to Amend Break Requirements</u>

Comment: One commenter argued that work groups/crews who want to work rotating 8-hour shifts should be afforded the opportunity to do so without § 26.199(d)(2)(ii) vetoing existing 8-hour shifts at facilities. The commenter suggested that the NRC add § 26.199(d)(4) that states: "During licensee normal operations for individuals working 7 or 8 days of consecutive work periods scheduled for 8 hours each contained in a nominal shift rotation cycle of 14 days or more § 26.199(d)(2)(ii)(A) and § 26.199(d)(2)(iii)(A) is applicable for rest periods with § 26.199(d)(2)(ii) and § 26.199(d)(2)(iii) being inapplicable for normal operations rest periods. For plant outages § 26.199(d)(2)(ii) and § 26.199(d)(2)(iii) are applicable to individuals scheduled

for 8 hour shift rotations for rest periods with § 26.199(d)(2)(ii)(A) and § 26.199(d)(2)(iii)(A) being inapplicable for plant outage rest breaks." In this case, the commenter suggested that § 26.199(d)(1) should state the following: "Except as permitted under paragraph (d)(3) *and/or (d)(4)* of this section, licensees shall ensure that any individual's work hours do not exceed the following limits" because (d)(4) allows consideration of licensees who work 8-hour shift rotations for 7 or 8 days consecutively for a nominal rotation cycle of 14 days or more [Edwin Hill, IBEW].

NRC Response: The NRC agrees in part with this comment and has revised the final rule to eliminate the requirements for a minimum 24-hour break in any 7 days and a 48-hour break in any 14 days. The new requirements in the final rule are for a 34-hour break in any 9 days and a minimum number of days off per week averaged over a shift cycle. These requirements, which accommodate 8-hour shift schedules, are in § 26.205(d)(2)(ii) and § 26.205(d)(3), respectively, of the final rule.

Impact on Rate of Pay

Comment: One commenter suggested that the NRC review the impact on those workers who have negotiated a rate of pay on their second day off as a double-time day instead of a time-and-a-half day. The commenter argued that this provision negatively affects worker morale not only because workers have less control of their weekly schedule, but also because their rate of pay would be reduced when working overtime [James Springfield, IBEW].

NRC Response: The NRC disagrees with this comment since § 26.205(d)(3)-(6) of the final rule provides break and day off requirements that largely meet the commenter's objective of providing increased flexibility in the distribution of breaks and control of weekly schedules. The intent of Subpart I is to limit fatigue not compensation. The increased flexibility of the final rule allows for negotiation between workers and the licensee while providing the necessary controls to reduce the likelihood of fatigue-related errors adversely affecting public health and safety or the common defense and security.

TVA Overtime Agreement

Comment: One commenter referenced the 1991 Overtime Agreement utilized at all nuclear facilities of the Tennessee Valley Authority (TVA). The commenter stated that this agreement addressed the idea that the "16/24, 24/48, and 72/7 had little if any real safety basis when coupled with the volunteering of overtime." The commenter argued that the NRC, TVA and IBEW were satisfied by the results of this agreement, and this agreement has been successfully utilized without challenge for fifteen years. Hence, the commenter questioned the NRC's attempt to override this settlement and formally requested the settlement to be reopened if the NRC disregards it [James Springfield, IBEW].

NRC Response: The NRC disagrees with the comment that individual work hour limits have little safety basis when individuals volunteer for overtime. Although individuals may be able to make relative judgements regarding their level of fatigue, there have been several studies that have noted the tendency for individuals to underestimate their level of impairment from fatigue (Nabi et al, 2006; Wylie, et al., 1996; Dinges, 1995; Rosekind and Schwartz, 1988). The NRC has also received allegations from nuclear power plant workers expressing fear of adverse actions from employers for reporting that they are unfit for duty because of fatigue. As a

consequence, the NRC does not believe there is reasonable assurance workers can reliably address excessive fatigue through their own actions under the former requirements applicable to worker fatigue.

The NRC also notes that limiting hours and fatigue of employees engaged in licensed activities is an exercise of NRC statutory authority to regulate nuclear safety. Such regulation may affect labor agreements between a licensee and a union. If the parties to a labor contract believe that the contract has been made obsolete by subsequent events, e.g., this final rule, the parties to the contract are responsible for renegotiating their contract. The NRC has no authority to compel parties to a labor contract to renegotiate the contract.

11.3.5. Self-Declarations During Extended Work Hours (§ 26.199(e))

Support for Self-Declarations

Comments: Two commenters supported the self-declaration provision in proposed § 26.199(e) [Jim Davis, NEI; Todd Newkirk, IBEW].

NRC Response: The comments do not require a response.

Suggestion for Increased Implementation Guidance

Comment: One commenter commended the NRC for proposing this self declaration provision to provide employees with a process to declare when they might be too fatigued, for whatever reason, to conduct certain tasks. However, while the concept of self declaration is a worthy one in theory, the commenter argued that its use may be impractical since (a) employees may fear reprisal, directly or indirectly; and (b) chronically sleep deprived individuals and individuals with certain sleep disorders are not capable of accurately self-assessing their level of alertness and capacity to perform. The commenter therefore encouraged the NRC to put forward very clear guidance regarding the implementation of this rule to make sure that the potential for abuse for both self-declaration and face-to face assessments is minimized. The commenter also encouraged the NRC and the nuclear industry to support the development and utilization of objective assessment tools and predictive software models currently being tested [Darrel Drobnich, NSF].

NRC Response: The NRC agrees with the comment for implementation guidance. The NRC's past experience with worker fatigue, such as that documented in NRC Regulatory Issue Summary (RIS) 2002-007, Clarification of NRC Requirements Applicable to Worker Fatigue and Self-declarations of Fitness-For-Duty, dated May 10, 2002, indicates that there is a need for individuals to clearly understand their fatigue management responsibilities and those of the licensee.

The Nuclear Energy Institute has agreed to develop implementation guidance for the rule. The NRC will review the guidance and, as appropriate, recommend changes or endorse the guidance in an NRC Regulatory Guide. Through this process implementation guidance will be made available to licensees. Regarding the comment that the NRC and industry should encourage the development of objective assessment tools and predictive software models, the

NRC would support industry development of tools and methods that would facilitate effective implementation of the requirements of this rule.

Oversight of the Self-Declaration Process

Comments: Other commenters argued that the NRC should closely oversee the self-declaration process. They cited examples of self-declaring workers who are afraid to self-declare and forced to work under duress due to the threat of being fired, sent to psychiatrists, and given undesirable schedules. The commenters argued that if there is evidence of retaliation for self-declaration, then the NRC should take enforcement action and levy significant fines against the utilities [Pete Stockton and Danielle Brian, POGO].

NRC Response: The NRC agrees that oversight of the self-declaration process should be part of the NRC's oversight of licensee implementation of the requirements in Subpart I. The NRC will revise the baseline inspection procedure for fitness for duty programs, IP71130.08, as part of the NRC's implementation activities for this rule. The revision will include requirements for the inspection of licensee fatigue management, including the implementation of the self-declaration requirements. In addition, § 26.203(e) of the final rule requires licensees to report information pertaining to fatigue assessments, including self-declarations. This will enable the NRC to monitor licensee use of the self-declaration process. Furthermore, the NRC notes that the NRC's allegation program is available to all licensee employees. Individuals who believe that they are being forced to work when they are unfit for duty because of fatigue may report these concerns through the NRC's allegation process.

Regarding the commenters' recommendation that NRC should take enforcement action against utilities that retaliate against individuals for self-declaration, the NRC notes that 10 CFR 50.7 prohibits retaliation for the reporting of nuclear safety concerns. The NRC has addressed the applicability of this requirement with respect to self-declarations in RIS-2002-007, "Clarification of NRC Requirements Applicable to Worker Fatigue and Self-Declarations of Fitness-For-Duty." In summary, the NRC has several mechanisms for the oversight of the self-declaration process and, therefore, the commenters concerns are adequately addressed through this rulemaking and existing NRC regulations and programs.

11.3.6. Collective Work Hour Limits (§ 26.199(f))

Support for Collective Work Hour Limits

Comment: One commenter stated that cumulative limits are important controls for the long-term mitigation of fatigue, and thus supports their inclusion in the final rule [Barry Quigley, Individual]

NRC Response: The NRC agrees with the commenter's statement supporting provisions that address cumulative fatigue. Although the NRC has eliminated collective work hour limits from the final rule, those limits have been replaced with requirements for minimum number of days off per week averaged over a shift cycle in § 26.205(d)(3) and minimum days off in 15 day blocks in § 26.205(d)(4) that have the same objective of preventing cumulative fatigue. Therefore, the NRC has revised the final rule and maintains provisions to address cumulative fatigue.

Opposition to Collective Work Hour Limits

Comments: Many commenters addressed collective work hour limits, with the majority of them opposing some portion of the provisions. Some commenters stated that the collective work hour limit approach is inconsistent with the rest of the FFD rule and dangerous when coupled with the provision limiting the scope of work hour limits to only those workers with hands-on responsibilities [David Lochbaum, UCS; Deborah Katz, CAN]. Another commenter recommended that the NRC eliminate the specific policies regarding collective work hour limits, because they are not an effective means to address the known physiological fatigue risks contributed by individual operators [Mark Rosekind, Alertness Solutions]. One commenter stated that the group hours should not be adopted for the further reason that the NRC's backfitting analysis does not adequately justify imposing this new requirement (See Section 14.2) [Daniel Stenger, NRSG]. Another one disputed the validity of surveys referenced by the NRC staff to imply that the limits are consistent with worker desires regarding overtime. To the contrary, the commenter believes that the predominant opinion of workers in the nuclear industry is overwhelming opposition to the work-hour limits [Andrew Antrassian, UWUA].

Many commenters from industry stated that the proposed collective work hour limits are unnecessary to mitigate the effects of cumulative fatigue and limit the flexibility to increase work hours in a job-duty group based on operational needs. They expressed that cumulative fatigue is adequately addressed by other rule provisions, such as the work schedule, individual work hour limits, individual break requirements, the fatigue assessment and the self-declaration process. Therefore, the commenters asserted that the inclusion of cumulative work hour controls is unnecessary and should be eliminated for any functional group except security [Michael Coyle, NEI #49; John Cowan, NEI; Jim Davis, NEI, Richard Sweigart, DCS, Keith Jury, Exelon; Keith Young, Ameren UE; Richard Sweigart, DCS; Mark Wetterhahn, Winston Strawn; Edward Weinkam, NMC; Don Grissette, SNC; Glenn Morris, TVA; Ronald Gaston, Detroit Edison; Gregory Halnon, FENOC; Jeffrey Archie, SCE&G; Brian McCabe, Progress Energy; A. Edward Scherer, SCE; D.R. Woodlan, STARS; J. A. Stall, FPL; B.T. McKinney, PPL; F.G. Burford, Entergy; Daniel Stenger, NRSG; Pete Stockton, POGO]. One commenter suggested that the NRC adopt a more performance-based rulemaking approach that better recognizes the complexity of work scheduling practices at nuclear power plants and allows for more flexibility [Daniel Stenger, NRSG].

Some commenters expressed concern that the utility companies will be able to "fudge" how many armed security officers they have on shift by including the unarmed officers, trainers, and in some cases clerical and managerial staff into the group with the armed responders. Therefore, these commenters suggest that the group hour limits are irresponsible and should be deleted from the rule [Danielle Brian, POGO; Anthony Rizzo Jr, Salem Hope Creek]. One commenter also asserted that the only way to ensure that the collective work hour limit will achieve adequate shift coverage without routine heavy use of overtime is to remove leave hours from the averaging process [Peter Hammill, PBNP].

One commenter stated that collective work hours will allow licensees to force workers to work overtime [Dennis Specha, Individual]. To address this, one commenter suggested that the NRC require that a licensee cannot force someone to work over 48 hours, but an individual may volunteer to work up the 72 hours in a week if it relieves another individual from a forced overtime situation [Guy Galster, Individual]. Another commenter stated that the 48-hour

collective work hour limit will not prevent individuals from working up to the limits of § 26.199(d) on a frequent basis. The commenter argued that the time frame between outages is the time frame when § 26.199(f) will apply, and it is also the period of highest vacation usage. The commenter argued that since overtime is used to cover for vacation or illness, it is possible that during these times one could be working up the limits of § 26.199(d) repeatedly to cover for absences [Peter Hammill, PBNP].

A commenter also noted that the maximum limits for group work hour averages may not be consistent with existing collective bargaining agreements (CBA's), and may result in variations among work groups at a site [Daniel Stenger, NRSG].

Several commenters from industry stated that one of the challenges surrounding the collective work hour limits is the recruitment of supplemental workers past the eight-week point in an outage when the work hours are limited. The commenters argued that, for many individuals, the availability of overtime is a key factor in where they decide to work, and attracting the same individuals to work subsequent outages and retaining them for the duration of the outage significantly improves the quality of the work process. Thus, the commenters suggested that the 8 week outage exemption be increased to 10 weeks because licensees will face the unintended consequence of the loss of supplemental workers in the final stages of an outage [Michael Coyle, NEI #49; Richard Sweigart, DCS; Keith Jury, Exelon; Mark Wetterhahn, Winston Strawn; Edward Weinkam, NMC; Don Grissette, SNC; Keith D. Young, Ameren; Glenn Morris, TVA; Ronald Gaston, Detroit Edison; Gregory Halnon, FENOC; Jeffrey Archie, SCE&G; Brian McCabe, Progress Energy; A. Edward Scherer, SCE; D.R. Woodlan, STARS; J. A. Stall, FPL; B.T. McKinney, PPL; F.G. Burford, Entergy; Daniel Stenger, NRSG].

NRC Response: The NRC agrees in part with the statements made by many commenters concerning collective work hour limits. In response to these comments the NRC has replaced proposed rule requirements for collective work hour limits with the minimum day off requirements in § 26.205(d)(3) of the final rule. The NRC expects that the minimum day off requirements in the final rule will be equally effective in addressing cumulative fatigue, while addressing the commenters' concerns. The requirements of the final rule address cumulative fatigue on an individual basis and therefore provide more uniform assurance against worker fatigue while eliminating the burden of defining and tracking individual membership in job duty groups. The final rule requirements also eliminate the potential that the calculation of collective work hours would not be representative of the hours worked by all individuals in a group or are in some other way biased.

Clarification of Individuals Subject to Collective Work Hours

Comment: Another commenter at the public meeting expressed confusion over which workers were considered to be in the "group" [Pete Stockton and Danielle Brian, POGO]. Others stated that the provision must explicitly state that only those individuals who meet one or more of the criteria in § 26.199(a) shall be included in the group hour calculations [David Lochbaum, UCS; Deborah Katz, CAN].

NRC Response: The NRC agrees that the rule requirements should be clear regarding the individuals to whom they are applicable and the NRC's intent for the collective work hour limits was that these limits would be applicable to only those individuals who met at least one of the

criteria specified in § 26.199(a) of the proposed rule. However, the final rule does not retain the requirements for collective work hour limits. The NRC replaced the collective work hour limits with individual work hour limits and the calculation of work hours for purposes of compliance with the final rule requirements does not depend upon group membership.

Collective Work Hours for Security Personnel

Comments: One commenter, supported by many commenters, recommended revisions to § 26.199(f) to replace "individuals" with "security personnel" or "any job duty group" to "the security job duty group." [Michael Coyle, NEI #49; Richard Sweigart, DCS; Keith Jury, Exelon; Mark Wetterhahn, Winston Strawn; Edward Weinkam, NMC; Don Grissette, SNC; Keith D. Young, Ameren; Glenn Morris, TVA; Ronald Gaston, Detroit Edison; Gregory Halnon, FENOC; Jeffrey Archie, SCE&G; Brian McCabe, Progress Energy; A. Edward Scherer, SCE; D.R. Woodlan, STARS; J. A. Stall, FPL; B.T. McKinney, PPL; F.G. Burford, Entergy; Daniel Stenger, NRSG].

One commenter suggested that the language in § 26.199(f)(1) and (f)(3) should reference (a)(1) and (a)(5) instead of only "(a)" because collective group hour management will not be the best fatigue management for groups (a)(2), (a)(3) and (a)(4) due to the burdensome tracking of average collective work hours for these groups that have a high occurrence of mobility within the industry. The commenter argued that the recommended provision language focuses on security and operations. [Edwin Hill, IBEW].

NRC Response: The NRC agrees with the comment that licensees could experience a greater burden implementing the collective work hour limits for groups that have a high occurrence of mobility within the industry. The NRC eliminated the requirements for collective work hour limits from the final rule. As a consequence, all fatigue management provisions are applicable on an individual, rather than group, basis. The final rule therefore eliminates the burden associated with tracking group membership for individuals in jobs that are highly mobile in the nuclear power industry.

Exclusions During Plant Outages

Comments: Regarding § 26.199(f)(1), one commenter, supported by many commenters, also recommended that the 8 week exclusion for outages be increased to 10 weeks throughout the rule package to accommodate anticipated upcoming outages of longer duration. The commenter argued that review of recent outages shows an increase in the number of outages that exceed 8 weeks. The commenter also argued that equipment replacements show a number of outages that exceed 8 weeks that could be managed with a 10 week outage [Michael Coyle, NEI #49; Richard Sweigart, DCS; Keith Jury, Exelon; Mark Wetterhahn, Winston Strawn; Edward Weinkam, NMC; Don Grissette, SNC; Keith D. Young, Ameren; Glenn Morris, TVA; Ronald Gaston, Detroit Edison; Gregory Halnon, FENOC; Jeffrey Archie, SCE&G; Brian McCabe, Progress Energy; A. Edward Scherer, SCE; D.R. Woodlan, STARS; J. A. Stall, FPL; B.T. McKinney, PPL; F.G. Burford, Entergy; Daniel Stenger, NRSG].

Some commenters strongly opposed the relaxation of collective work hour limits during the first eight weeks of a plant outage [David Lochbaum, UCS; Deborah Katz, CAN]. However, another commenter stated that industry is supportive of this exemption [John Cowan, NEI]. Another

commenter argued that this exemption should continue for longer than the first eight weeks of an outage [Todd Newkirk, IBEW].

NRC Response: The NRC does not agree with the commenters' recommendations that the exemption period from the collective work hour limits for unit outages should be either extended or eliminated. Although the NRC has replaced the collective work hour limits of the proposed rule with the minimum day off requirements in § 26.205(d)(3) of the final rule, the requirements of the final rule that are applicable to unit outages are comparable to those of the proposed rule. As a consequence the NRC has retained a comparable exemption period, limiting the exemption from the requirements of § 26.205(d)(3) to the first 60 days of a unit outage or planned security system outage. The relaxation of individual work hours during these specific times accommodates the short-term demand for increased work hours associated with these outages while limiting cumulative fatigue. The NRC considers the burden on licensees of eliminating the exemption period for these conditions to be excessive for the additional assurance that could be gained in worker fitness for duty relative to that achieved by the limited exemption period of the proposed rule.

In setting the maximum duration of the exclusion period, the NRC not only considered the duration of typical and longer term outages, but also considered that, by the end of 60 days of work at the limits permitted by § 26.205(d)(1) and (d)(2), individuals who are performing the duties specified in § 26.4(a)(1)–(a)(4) will have (1) worked 576 hours, including more than 200 hours of overtime, and (2) missed as many as 17 normally scheduled days off. The loss of the 17 normally scheduled days off would be a reduction of 60 percent in the time available to recover and prevent cumulative fatigue. Further, with each passing week of increased work hours and decreased time off, deferring daily living obligations becomes increasingly difficult, causing increased pressure on individuals to reduce their sleep time in order to meet the demands of both work and daily life, resulting in an increased potential for cumulative fatigue. As a result the NRC did not consider it appropriate to extend the exception period without assurance individuals obtained sufficient rest to prevent cumulative fatigue. However, the NRC has included a provision in the final rule (§ 26.205(d)(6)) that permits licensees to extend the outage exception period by 7 days for each 7-day period during the outage an individual works not more than 48 hours. This provision accommodates longer outages when it is justified by the work history of the individual containing adequate recovery periods.

13-Week Averaging Period

Comments: Other commenters stated that the proposed rule is not clear in how the 8-week outage suspension of the collective work hour limits per § 26.199(f)(1) gets reconciled with the 13-week averaging period specified per § 26.199(b)(2) [David Lochbaum, UCS; Deborah Katz, CAN].

NRC Response: The NRC did not retain the proposed collective work hour limits in the final rule. This change to the requirements eliminates the 13-week averaging period. Therefore, the final rule renders moot comments concerning the 13-week averaging period.

Fatigued Individuals

Comments: Commenters stated that the rule must not allow an individual who is already chronically fatigued from entering the collective work hour limit pool, especially when that entry coincides with the 8-week outage "free pass." They suggested that the NRC revise § 26.199(b)(1)(iii) to require a formal, documented check before an individual begins or resumes performing any of the job duties listed in paragraph (a). The commenters stated that the licensee should assess the person's work hour history over at least the prior 13 weeks to verify that the individual is not already likely to be chronically fatigued [David Lochbaum, UCS; Deborah Katz, CAN].

NRC Response: The NRC agrees that chronically fatigued individuals should not be allowed to perform duties covered in proposed § 26.199(a). The NRC does not agree that the rule should be revised to include a formal documented check of a worker's work hour history over at least the prior 13 weeks. The NRC considered methods for licensees to track the work hours of individuals that work for other licensees and other employers and determined that the burden of tracking work hours was substantial and that the ability to verify work hours from other employers was limited. However, the NRC determined that the potential for cumulative fatigue was substantial for individuals who work outages in close succession and that licensees can reasonably track and verify the hours of individuals that may move from outage to outage among their own power plant sites. Accordingly, the NRC revised § 26.199(g) of the proposed rule to provide more effective controls to prevent cumulative fatigue of individuals that work successive outages for the same licensee. The revised requirement is in § 26.205(d)(7) of the final rule. In addition, the NRC notes in the event an individual becomes chronically fatigued, § 26.211(a)(1) of the final rule requires licensees to conduct fatigue assessments for-cause when individuals appear not to be fit for duty because of fatigue and § 26.203(b)(1) requires licensees to establish procedures for the self-declaration of fatigue. The NRC considers that collectively these requirements provide reasonable assurance that individuals will not perform duties that are subject to the work hour controls when they are chronically fatigued or otherwise are not fit to safely and competently perform those duties.

Ensuring Adequate Staffing Levels

Comment: One commenter argued that § 26.199(f)(3)(i) provides an "out" to licensees, in effect telling them that they do not need to maintain adequate staffing when it is not reasonably controllable. Thus, if the intent is to ensure adequate staffing levels, the commenter urges the NRC to define adequate staffing levels [Peter Hammill, PBNP].

NRC Response: The NRC agrees that proposed § 26.199(f)(3)(i) permitted a limited exception from the collective work hour limits for conditions that the licensee could not have reasonably controlled. However, the NRC has not retained the collective work hour requirements for the final rule and has eliminated the provision in proposed § 26.199(f)(3)(i) as part of the elimination of the collective work hour limits.

Collective Work Hour Limits for Security Personnel During Outages

Comments: Regarding § 26.199(f)(2)(i), one commenter expressed concern that security personnel would be allowed to work more hours during outages. The commenter stated that, for

the reasons stated by the NRC in its reasoning in relation to § 26.199(a)(5), work controls should be in place for security personnel, especially during times of increased activity such as planned security system outages or under threat conditions. Thus, the commenter stated that security personnel must be under more stringent work hour controls and should not be included in any provisions that allow waivers during outages or other circumstances other than, possibly, during attack or emergency situations [Darrel Drobnich, NSF].

Other commenters argued that armed security officers should be limited to 48 hours a week, and the only instances in which hours should reach 60 are refueling and heightened security [Pete Stockton and Danielle Brian, POGO].

NRC Response: The NRC agrees, in part, with the commenters. The NRC agrees that the work hour controls for nuclear power plant security personnel should be stringent for the reasons described in the section-by-section analysis of this rule with respect to § 26.205(a) of the final rule. The NRC also agrees that the work hours of armed security guards should not routinely exceed 48 hours per week. However, the NRC does not agree that the rule should not permit limited periods of increased work hours for security personnel during outages or increased threat conditions. The collective work hour requirements in proposed § 26.199(f)(2)(i) have been eliminated from the final rule. However, the alternative requirements in the final rule for individual work hours in § 26.205(d)(5) prescribe less stringent day off requirements than those required by § 26.205(d)(3) during the first 60 days of a plant outage, security system outage, or increased threat condition.

Outages and increased threat conditions are unique, relatively short-term, and involve levels of activity that are substantially higher than most non-outage operating periods. It is not practical to expect licensees to maintain sufficient supplemental security staff to maintain 48-hour weeks under all conditions. A rule that imposed such a requirement would place an exceptionally high burden on licensees and result in a security staff that would not be fully employed under most circumstances. The relaxation of individual work hours for security personnel accommodates the short-term demand for increased work hours associated with these outages and increased security threat conditions. The minimum day off requirements in § 26.205(d)(5) of the final rule, in conjunction with the other provisions in Subpart I, ensure individuals have sufficient days off during these periods of more intensive work schedules to provide reasonable assurance that security personnel are not impaired by fatigue. However, the NRC agrees that such increased periods of work hours create the increased potential for cumulative fatigue. As a result, § 26.205(d)(5) limits the exception period to generally not more than 60 days.

<u>"Hard Cap" on Collective Work Hours</u>

Comments: A couple of commenters noted that § 26.199 (f)(3)(ii) imposes a cap of 54 hours per person per week under certain circumstances and § 26.199 (f)(2)(i) and other sections impose a cap of 60 hours per person per week for security personnel under other circumstances. To rectify this, the commenters suggested that the NRC provide a "hard cap" on collective work hours [David Lochbaum, UCS; Deborah Katz, CAN].

NRC Response: The NRC has revised the rule such that collective work hour limits are eliminated from the final rule, including the provision in § 26.199 (f)(2)(i) of the proposed rule. The comment is therefore not applicable to the requirements of the final rule.

Approval to Exceed Collective Work Hour Limits

Comment: One commenter stated that the requirement in § 26.199(f)(5) for prior NRC approval of a written request by a licensee to exceed any collective work hour limits for any job group is overly restrictive and could have unintended consequences, such as delayed site response and corrective actions to emerging issues [Daniel Stenger, NRSG].

NRC Response: The NRC has revised the rule such that collective work hour limits are eliminated from the final rule, including the requirement in § 26.199(f)(5). As a result of these changes the comment is not applicable to the requirements in the final rule.

11.3.7. Successive Plant Outages (§ 26.199(g))

Multi-Site Licensees

Comments: A couple of commenters stated that the proposed rule is written under the implicit assumption that there are unique licensees for each reactor site, and that assumption is false. They explained that several companies own and operate reactors at multiple sites, and it is not uncommon for these companies to develop specialty work groups and deploy these work groups to all of their sites. The commenters included an example of when the sustained outage provision of § 26.199(g) does not apply, and argued that the rule must not permit this [David Lochbaum, UCS; Deborah Katz, CAN].

NRC Response: The NRC agrees in part with the comment that certain individuals work successive outages and, therefore, the NRC revised § 26.199(g) of the proposed rule to apply to individuals who work successive outages, separated by less than 2 weeks, for a licensee. The proposed rule provision was limited to successive outages at a licensee's site. The commenter noted that several companies own and operate reactors at multiple sites, and it is not uncommon for these companies to develop specialty work groups and deploy these work groups to all of their sites. Section 26.205(d)(7) of the final rule addresses this comment and is applicable to individuals who work in outages in close succession for a licensee, regardless of whether the outages occurred at a single site or more than one site. The final rule provision is applicable to a larger proportion of the individuals that work successive unit outages and thereby provides greater assurance that these individuals are subject to work hour controls that are appropriate for sustained and successive periods of extended work hours associated with outage work schedules. The NRC notes that like the proposed rule provision, § 26.205(d)(7) of the final rule is not applicable to individuals who may work outages in close succession if those outages are for different licensees. The NRC acknowledges that the potential for cumulative fatigue is likely no different for these individuals than for those individuals working successive outages for the same licensee. However, as described with respect to § 26.205(d)(4), the NRC considered the substantial burden of tracking work hours from one licensee to another and determined the burden was not warranted given the expected benefit. The revised requirements applicable to individuals who work in outages in close succession are in § 26.205(d)(7) of the final rule.

Successive Outage Calculations

Comments: Several commenters also stated that § 26.199(g) "tosses out" the collective work hour limits when outages are separated by at least two weeks but less than 13 weeks. They

argued that § 26.199(b)(2) requires collective work hours to be calculated "within an averaging period that may not exceed 13 weeks." Thus, if the licensee specifies 13 weeks as the averaging period and the end of an outage resets the clock for starting an averaging period, then the collective work hour calculation does not become meaningful until 13 weeks after the end of an outage. The commenters argued that, in the interim, the only real limits on working hours are the individual limits in § 26.199(d), and this allows a licensee to use the collective work hour limits “free pass” for an eight week outage as often as possible during a year, as long as the outages are separated by at least two weeks [David Lochbaum, UCS; Deborah Katz, CAN].

NRC Response: The NRC agrees that § 26.199(g) of the proposed rule allows licensees to use the outage exception multiple times in a year if outages are separated by at least 2 weeks. The NRC does not agree that this provision has the effect of “tossing out” the work hour controls generally applicable to routine plant operations. At the conclusion of an outage, individuals are likely to be fatigued from working extended hours and the increased workload associated with the outage and plant restart preparations. Accordingly, § 26.199(g) of the proposed rule ensures that individuals have at least a 2 week period during which their work hours are subject to the requirements applicable to routine plant operations before the individuals are eligible for control of their work hours in accordance with an outage exception. A minimum of 2 weeks under normal workloads provides reasonable assurance that individuals have the opportunity for successive days of rest to reduce the potential for cumulative fatigue. Although consecutive outages separated by more than 2 weeks may create some potential for cumulative fatigue, particularly if individuals are working more than 2 consecutive outages, the NRC considers the 2 week minimum to be adequate to substantively reduce the potential for cumulative fatigue. In addition, the NRC expects that the likelihood of individuals working more than 2 consecutive extended duration outages separated by just 2 weeks is low given that the time period that licensees conduct unit outages is typically limited to periods of low demand for electricity. In this regard the NRC also notes that it also revised this requirement in the final rule to be applicable to individuals who work in outages in close succession for a licensee, regardless of whether the outages occurred at a single site or more than one site. As a result the final rule provision is applicable to a larger proportion of the individuals that work successive unit outages and thereby provides greater assurance that these individuals are subject to work hour controls that are appropriate for sustained and successive periods of extended work hours associated with outage work schedules. Accordingly, § 26.205(d)(7) retains, with limited changes, the requirements in § 26.199(g) of the proposed rule.

Work Schedules During Extended Outages

Comments: One commenter, supported by many commenters, argued that during an extended outage, if a functional work group returned to normal operations for a period in excess of two weeks, the elapsed outage period should be recalculated based on when the functional work group returned to an outage work schedule. Therefore, the commenter said the criteria for successive plant outages could be applied to these situations. It recommended revising proposed § 26.199(g) by adding the following to the end of the proposed paragraph: "If an outage is scheduled such that a functional group returns to a normal operational schedule for at least two weeks, the number of days may be restarted from the date outage manning is resumed" [Michael Coyle, NEI #49; Richard Sweigart, DCS; Keith Jury, Exelon; Mark Wetterhahn, Winston Strawn; Edward Weinkam, NMC; Don Grissette, SNC; Keith D. Young, Ameren; Glenn Morris, TVA; Ronald Gaston, Detroit Edison; Gregory Halnon, FENOC; Jeffrey

Archie, SCE&G; Brian McCabe, Progress Energy; A. Edward Scherer, SCE; D.R. Woodlan, STARS; J. A. Stall, FPL; B.T. McKinney, PPL; F.G. Burford, Entergy; Daniel Stenger, NRSG].

NRC Response: The NRC does not agree with the recommendation to revise the requirement in proposed § 26.199(g). The proposed revision would allow licensees to schedule individuals in accordance with the requirements applicable to outages, which the NRC intends for temporary use, for more than 40 weeks of a year. Although a 2 week period of routine scheduling would substantively reduce cumulative fatigue, a repeated sequence of outage scheduling with only 2 weeks of routine scheduling intervening would not provide reasonable assurance that personnel do not become impaired by cumulative fatigue. However, the NRC has revised the proposed rule to include a provision that allows a 7-day extension of the relaxed outage work hour controls for each independent 7-day period during which the individual has worked not more than 48 hours during the plant or security system outage or increased threat condition. Instead of re-calculating the outage period as the commenters suggested, this provision will essentially give "credit" to an individual for every week that the individual works not more than 48 hours per week, thus allowing the outage to be extended. This provision limits the total duration an individual is scheduled at the relaxed limits applicable to outages but provides licensees flexibility in scheduling the periods of high and low levels of work hours and does not require that the 2 weeks of "normal operational scheduling" be consecutive. The provision allowing 7-day extensions of the outage exception is contained in § 26.205(d)(6) of the final rule. The requirements in § 26.199(g) are retained, with limited changes, as § 26.205(d)(7) of the final rule.

11.3.8. Common Defense and Security (§ 26.199(h))

Comments: One commenter recommended that the wording in proposed § 26.199(h) be changed from "..when informed in writing by the NRC..." to "...when informed verbally and followed up in writing by the NRC..." or some similar wording that would allow the NRC to verbally state that the licensee does not have to meet the requirements of this section and at a later date the NRC could provide written confirmation of that verbal statement. This is similar to the approval of exemptions from code requirements [F.G. Burford, Entergy].

NRC Response: The NRC does not agree that verbal approval is needed to facilitate exemption of requirements in § 26.205 of the final rule. If there is a security emergency in which the licensee must immediately react to assure the common defense and security, the licensee need not meet the requirements of § 26.205 (c) and (d) as stated in § 26.207(d). In all other cases that do not meet the condition of § 26.207(d), the NRC considers timely written consent to be adequate. The final rule retains the requirements of proposed § 26.199(h), without change, in § 26.207(c) of the final rule.

11.3.9. Plant Emergencies (§ 26.199(i))

Comments: One commenter praised the clarity contained in proposed § 26.199(i) [F.G. Burford, Entergy].

NRC Response: The comment does not require a response.

11.3.10. Reviews (§ 26.199(j))

Comments: One commenter argued that the periodic reviews are not consistent with the desired information for the annual report described in § 26.197(e). As previously stated, industry suggested the deletion of § 26.197(e). However, if the data requested in § 26.197(e) is valuable to the NRC, then the commenter suggested that the information be moved to § 26.199(j). The documentation of the periodic review would be available to the NRC resident inspector upon request, and there remains no need to provide an annual submittal to the NRC [F.G. Burford, Entergy].

Analysis: The NRC disagrees with the commenter that the periodic reviews required by proposed § 26.199(j) are inconsistent with the reporting requirements of proposed § 26.197. The requirements of proposed § 26.199(j) are now contained in § 26.205(e) of the final rule and the requirements of proposed § 26.197 are contained in § 26.203 of the final rule. The NRC acknowledges that both the reviews and reports required by the final rule focus on the use of waivers and fatigue assessments. However, the NRC considers the differences in the review and reporting requirements to be consistent with the licensee's responsibility for fatigue management and the NRC's oversight of the licensee's performance in this regard. Therefore the NRC has not revised the final rule to eliminate or move the requirements in proposed § 26.197(e).

11.4. Fatigue Assessments (§ 26.201)

Further Development of Fatigue Assessment Requirements

Comment: One commenter stated that an effective practice of fatigue assessments will add a significant dimension to overall fatigue management activities and further extend efforts beyond just a work hour limits policy. The commenter stated that some aspects are already well defined, such as situations where fatigue assessments would be used and some of the procedures (e.g., done by properly trained personnel, free of bias, and with privacy protections). However, the specific details of what will be assessed, how the information is summarized and analyzed, and the interpretation of findings require further development. The commenter suggested that one approach to explore is how fatigue factors are examined in accident investigations. This provides a structured approach to examining the known physiological factors that underlie fatigue and could be extrapolated and tailored for use in the context of the NRC proposed fatigue assessments [Mark Rosekind, Alertness Solutions].

NRC Response: The NRC agrees that implementation guidance for the fatigue assessments requirements for Subpart I would be beneficial. The Nuclear Energy Institute has agreed to develop implementation guidance for Subpart I. The NRC intends to review the implementation guidance and ensure that the guidance addresses fatigue assessments and supports valid assessments that can be practically implemented by supervisors trained in accordance with § 26.29 and § 26.203(c) of the final rule.

Clarification of "Impaired Alertness"

Comment: One commenter also stated that the rule language should provide a clear definition of "impaired alertness" within the meaning of proposed § 26.201(a)(1) to bound the conditions

that trigger the need for initiating a fatigue assessment. The commenter recommended that the following point should be clarified in the final rule: if a covered employee is found to be in a state of impaired alertness, including unintentionally falling asleep on duty (e.g., nodding off), a fatigue assessment should be performed to identify the root cause before management actions are taken such as disciplinary action [Daniel Stenger, NRSG].

NRC Response: The NRC does not agree that the rule language should be revised to further define “impaired alertness” as used in § 26.201(a) of the final rule. Proposed § 26.201(a)(1) would have required a fatigue assessment to be conducted in response to an observed condition of impaired alertness “creating a reasonable suspicion that an individual is not fit to safely and competently perform his or her duties.” This threshold for action is consistent with the requirements for management action in response to possible impairment as described in § 26.77(b)(1) of the final rule. The NRC also notes that the nature of the duties (for example, whether a job is monotonous), and the sensitivity of the job from impairment from fatigue (e.g., whether lapses in attention or degraded cognitive function affect the individual’s ability to perform safely and competently) will affect the criteria for this determination. As a consequence, the NRC believes that the criteria of “reasonable suspicion that an individual is not fit to safely and competently perform his or her duties” adequately defines the conditions that trigger the need for initiating a fatigue assessment. Furthermore, an example such as “unintentionally falling asleep on the job,” may be interpreted as the threshold for performing assessments. Although the NRC agrees that fatigue assessments should be performed in such cases, the onset of impairment from fatigue begins prior to an individual falling asleep and reasonable suspicion of fatigue can occur through observation of other behavioral and cognitive impairments, before sleep onset. Accordingly, the NRC has retained the requirements in proposed § 26.201(a)(1) as § 26.211(a)(1) of the final rule.

Affects of Fatigue Assessment on Rule Implementation

Comment: After recognizing that the fatigue assessment is a valuable element of the rule package, one commenter stated that the time needed to develop and establish a fatigue assessment program, which includes training, may be the most time consuming aspect of implementing this rule. Therefore, industry requested a one year implementation period from the date of approval of the rule [F.G. Burford, Entergy].

NRC Response: The NRC agrees that training of personnel to conduct fatigue assessments may require a one-year period for all personnel to receive the training in the course of their normal training cycle for the FFD program. Accordingly, the NRC intends to establish a one-year implementation period for this provision.

Personnel Authorized to Conduct Fatigue Assessment

Comment: Referencing proposed § 26.201(b), one commenter recommended that the words "Either a supervisor or a staff member of the FFD program, who is...” should be revised to "Either a supervisor or a FFD program staff member, who is ... " to clarify that the supervisor need not be a member of the FFD program to conduct the fatigue assessment [Brian McCabe, Progress Energy].

NRC Response: The NRC agrees that the recommended wording provision more clearly states the individuals authorized to conduct fatigue assessments and has revised § 26.201(b) accordingly. The revised rule provision is contained in § 26.211(b) of the final rule.

12. Subpart J: Recordkeeping and Reporting Requirements

12.1. General Provisions (§ 26.211)

Comments: One commenter stated that the proposed rule contained various new or amended information collection requirements, most of which industry supports [Marvin Fertel, NEI].

NRC Response: These comments do not require a response.

12.2. Recordkeeping Requirements for Licensees and Other Entities (§ 26.213)

No comments addressed this section.

12.3. Recordkeeping Requirements for Collection Sites, Licensee Testing Facilities, and Laboratories Certified by the Department of Health and Human Services (§ 26.215)

No comments addressed this section.

12.4. Fitness-for-Duty Program Performance Data (§ 26.217)

Comments: One commenter stated that industry supports the need for reporting to the NRC certain drug and alcohol-related information as proposed here [Jim Davis, NEI].

NRC Response: These comments do not require a response.

12.5. Reporting Requirements (§ 26.219)

No comments addressed this section.

13. Subpart K: Inspections, Violations, and Penalties

No comments addressed this subpart.

14. Other Comments

14.1. Regulatory Analysis

Requirements are Too Prescriptive

Comment: One commenter, supported by many commenters, stated that the new requirements are needlessly prescriptive and the regulatory analysis fails to justify the rigid approach. According to the commenters, the NRC's Regulatory Analysis Guidelines (§ 4.2, NUREG/BR-0058, Rev. 4) state that requirements should be performance based unless there is good cause for highly prescriptive rules. Therefore, the commenters suggested that the

regulatory analysis should better justify the prescriptive approach. [Michael Coyle, NEI #49; Richard Sweigart, DCS; Keith Jury, Exelon; Mark Wetterhahn, Winston Strawn; Edward Weinkam, NMC; Don Grissette, SNC; Keith D. Young, Ameren; Glenn Morris, TVA; Ronald Gaston, Detroit Edison; Gregory Halnon, FENOC; Jeffrey Archie, SCE&G; Brian McCabe, Progress Energy; A. Edward Scherer, SCE; D.R. Woodlan, STARS; J. A. Stall, FPL; B.T. McKinney, PPL; F.G. Burford, Entergy; Daniel Stenger, NRSG].

NRC Response: Although the comment was not specific with regard to which particular provisions might be needlessly prescriptive, the NRC did consider this issue during the development of the rule. The NRC agrees that the rule's drug and alcohol testing provisions are prescriptive when compared to some other NRC regulations. This approach was intentional, however, as discussed in the preamble to the proposed rule (e.g., see 70 FR 50451-50452). As discussed there, the prescriptive approach is intended to improve clarity and enhance effectiveness and, in part, is a response to the requests of industry stakeholders. Therefore, the NRC believes there is good cause for the prescriptive approach and that the basis for the approach is adequately justified. The regulatory analysis accounted for the cost of each provision, and also discussed the effects of improved clarity in Section 4.1.2.2.

With respect to the rule's fatigue management provisions, the NRC agrees that it adopted a prescriptive approach for certain work hour limits. This approach addressed stakeholder concerns, as discussed in SECY-01-0113, Fatigue of Workers at Nuclear Power Plants, related to the clarity and enforceability of NRC's regulatory framework concerning worker fatigue. However, the NRC notes that although certain requirements may be prescriptive, the requirements provide licensees substantial flexibility. As discussed in greater detail with respect to other, more specific comments addressing the relevant provisions, the final rule adopts an approach that is more flexible and considerably less prescriptive. The NRC has revised the regulatory analysis to address the more flexible approach.

Regulatory Analysis Does Not Account for Interaction of Requirements

Comment: One commenter, supported by many commenters, stated that the Regulatory Analysis looks at each provision in isolation and does not allow for a comparison of various portions of the draft rule and the interaction of the various requirements. According to the commenters, the Regulatory Analysis was performed on a section-by-section basis, which makes it difficult to compare the incremental impact of each section given the existence of other proposed requirements. Therefore, the commenters stated that the analysis is deficient because it fails to justify that each section included is essential to the rule and multiple layers were not accounted for properly. [Michael Coyle, NEI #49; Richard Sweigart, DCS; Keith Jury, Exelon; Mark Wetterhahn, Winston Strawn; Edward Weinkam, NMC; Don Grissette, SNC; Keith D. Young, Ameren; Glenn Morris, TVA; Ronald Gaston, Detroit Edison; Gregory Halnon, FENOC; Jeffrey Archie, SCE&G; Brian McCabe, Progress Energy; A. Edward Scherer, SCE; D.R. Woodlan, STARS; J. A. Stall, FPL; B.T. McKinney, PPL; F.G. Burford, Entergy; Daniel Stenger, NRSG].

NRC Response: The NRC agrees that the regulatory analysis was conducted on a section-by-section basis but does not agree that the provisions were considered in isolation. In fact, the cost analysis specifically accounted for the effects of interacting provisions as appropriate, both with respect to drug and alcohol provisions and to fatigue management

provisions. Although it is considerably more difficult to analyze the benefits associated with individual provisions that interact with other provisions, the regulatory benefits analysis of the proposed rule's fatigue management provisions (at which the NRC believes this comment was targeted) was informed by a side-analysis (presented as an addendum to the regulatory analysis), which sought to consider the interaction between key provisions. Nevertheless, the NRC has modified the fatigue management provisions that appear in the final rule in response to other public comments. In light of those rule changes, the NRC believes that this comment is not likely to remain a concern to stakeholders.

Justification for Subpart I Costs

Comment: One commenter, supported by many commenters, claimed that the work hour limits and break requirements in the proposed rule had a disproportionately higher cost than the training, self-declaration, and fatigue assessment provisions. Further, the commenters stated that the Regulatory Analysis did not provide a convincing cost justification for these work hour controls. Also, the commenters stated that the Regulatory Analysis included an extensive analysis of the cost of implementing Subpart I, but the justification for the implementation burden was deficient. [Michael Coyle, NEI #49; Richard Sweigart, DCS; Keith Jury, Exelon; Mark Wetterhahn, Winston Strawn; Edward Weinkam, NMC; Don Grissette, SNC; Keith D. Young, Ameren; Glenn Morris, TVA; Ronald Gaston, Detroit Edison; Gregory Halnon, FENOC; Jeffrey Archie, SCE&G; Brian McCabe, Progress Energy; A. Edward Scherer, SCE; D.R. Woodlan, STARS; J. A. Stall, FPL; B.T. McKinney, PPL; F.G. Burford, Entergy; Daniel Stenger, NRSG].

NRC Response: The NRC disagrees with the commenters. The NRC has modified the fatigue management provisions that appear in the final rule in response to other public comments. In addition, based on insights provided in public comments, the NRC believes that if the proposed fatigue management provisions were not being modified by the final rule then it would be necessary to revise the regulatory analysis to reflect a higher implementation burden associated with certain fatigue management provisions. In light of the rule changes, however, the NRC believes that this comment is not likely to remain a significant concern to stakeholders. In addition, the regulatory analysis has been revised in accordance with the final rule. With respect to the findings of the regulatory analysis for the final rule, the NRC believes there is not a disproportionately higher cost for work hour limits and break requirements than for training, self-declaration, and fatigue assessment provisions.

Disagreement with Safety Goal Evaluation

Comment: One commenter, supported by many commenters, also argued with the Safety Goal Evaluation in section 4.5 of the Regulatory Analysis. According to the commenter, the Safety Goal Evaluation did not fully satisfy the standards set forth in the NRC's Regulatory Analysis Guidelines. Specifically, the commenters stated that in situations where it is not possible to develop adequate quantitative supporting information, "qualitative analysis and perspective" should be provided for the proposed new requirement, and these insights should be "related to the safety goal screening criteria." The commenters argued that the Regulatory Analysis did not address any such criteria. In this regard, the commenter stated that the staff's finding that the proposed changes "may qualify ... as generic safety enhancements because they may affect the likelihood of core damage," and its statement that the rule will reduce the probability of accidents and damages, was cursory and unsubstantiated.

The commenters stated that the Safety Goal Evaluation highlighted the overall lack of rigor and precesion in the entire Regulatory Analysis. The commenter felt that the staff's acknowledgement that its evaluation failed to quantify the "magnitude" of the claimed change in liklihood of core damage, or the claimed added assurance provided by the rule, is significant. Further, the commenter claimed that the generality of the staff's findings undermined the NRC's assertions in the rule package the implementation of Subpart I will "result in substantial non-quantified benefits related to safety and security." [Michael Coyle, NEI #49; Richard Sweigart, DCS; Keith Jury, Exelon; Mark Wetterhahn, Winston Strawn; Edward Weinkam, NMC; Don Grissette, SNC; Keith D. Young, Ameren; Glenn Morris, TVA; Ronald Gaston, Detroit Edison; Gregory Halnon, FENOC; Jeffrey Archie, SCE&G; Brian McCabe, Progress Energy; A. Edward Scherer, SCE; D.R. Woodlan, STARS; J. A. Stall, FPL; B.T. McKinney, PPL; F.G. Burford, Entergy; Daniel Stenger, NRSG].

NRC Response: The NRC's evaluation followed agency guidance in the Regulatory Analysis Guidelines and in Appendix D of the CRGR Charter. Therefore, the NRC disagrees with the comments on the Safety Goal Evaluation and believes that the analysis presented in Section 4.5 of the regulatory analysis was appropriate for this rule. As discussed there, the NRC believes the action is a generic safety enhancement which does not lend itself to a Safety Goal Analysis. The rulemaking provides added assurance that individuals working at nuclear facilities are fit for duty and, consequently, the rule reduces safety and security risks ranging from workplace safety incidents up to radiological damage to the reactor core. A safety goal evaluation generally focuses on the change in likelihood of core damage. However, the magnitude of the change for this rule is not readily quantifiable due to uncertainties regarding the types, frequencies, and results of damage that occurred pre-rule and will occur post-rule. A more dominant effect of the rule will be to reduce the probability of other types of accidents and damages associated with a wide array of acts related to drug and alcohol abuse and fatigue, although this effect is equally difficult to quantify. Because the change in safety associated with the rulemaking cannot be quantified, the rule provisions cannot be compared to the NRC's safety goals. The NRC also disagrees that there was a lack of rigor and precision in the entire regulatory analysis. Nevertheless, in response to other public comments, the NRC has replaced several of the proposed fatigue management provisions (at which the NRC believes this comment was targeted) in the final rule. In light of those rule changes, the NRC believes that this comment is not likely to remain a concern to stakeholders.

14.1.1. Addendum

Comments: In the public meeting, one commenter addressed the Addendum 1 to the Regulatory Analysis, which quantified some of the benefits associated with selected fatigue management provisions in the proposed rule. Industry was confused about the purpose of this addendum and whether the quantitative analysis is considered in the backfit justification of the rule. The commenter did not believe that it should be included in the rule package [Jim Davis, NEI].

One commenter, supported by other commenters, also addressed this issue, expressing disagreement with Addendum 1 to the Regulatory Analysis. Specifically, the commenters stated that the analysis failed to show any correlation between its findings and actual performance and conditions in the commercial nuclear power reactor industry. According to the commenters, this made the "seemingly precise calculations meaningless." The commenters also disagreed with

Addendum 1's conclusions regarding reduced rework. The commenters stated that this conclusion was incorrect because it ignored the many measures in place in the industry, such as use of detailed procedures, supervision and quality assurance measures. [Michael Coyle, NEI #49; Richard Sweigart, DCS; Keith Jury, Exelon; Mark Wetterhahn, Winston Strawn; Edward Weinkam, NMC; Don Grissette, SNC; Keith D. Young, Ameren; Glenn Morris, TVA; Ronald Gaston, Detroit Edison; Gregory Halnon, FENOC; Jeffrey Archie, SCE&G; Brian McCabe, Progress Energy; A. Edward Scherer, SCE; D.R. Woodlan, STARS; J. A. Stall, FPL; B.T. McKinney, PPL; F.G. Burford, Entergy; Daniel Stenger, NRSG].

NRC Response: It is not the NRC's intent that the quantitative analysis in the addendum be considered in the backfit analysis determination. The addendum was provided only as information related to the rulemaking, as the NRC determined in the regulatory analysis and the backfit analysis that the rulemaking would result in substantial additional benefits beyond those captured in the addendum. The addendum has not been revised to address the final rule and has not been included in the final rulemaking package.

14.2. Backfit Analysis

Comments: Several commenters from industry stated that the backfit analysis for the proposed rule was deficient. The commenters suggested that the backfit analysis did not include a meaningful discussion of the proposed rule's actual improvements in public health and safety. Specifically, the commenters explained that the qualitative statement that each element examined will provide substantial improvement to public health and safety was not supported by facts, and did not consider the diminished impact when other rule provisions are considered. The commenters argued that, considering the rule as whole, the protection of public health and safety will not be diminished if cumulative work hour limits are only applied to security personnel and a flexible approach is used for break requirements. Therefore, The commenters argued that the backfit analysis did not meet the intent of § 50.109 [Michael Coyle, NEI #49; Richard Sweigart, DCS; Keith Jury, Exelon; Mark Wetterhahn, Winston Strawn; Edward Weinkam, NMC; Don Grissette, SNC; Keith D. Young, Ameren; Glenn Morris, TVA; Ronald Gaston, Detroit Edison; Gregory Halnon, FENOC; Jeffrey Archie, SCE&G; Brian McCabe, Progress Energy; A. Edward Scherer, SCE; D.R. Woodlan, STARS; J. A. Stall, FPL; B.T. McKinney, PPL; F.G. Burford, Entergy; Daniel Stenger, NRSG].

Other commenters supplemented this argument, specifically arguing that the collective work hour limits of the proposed rule should have been subjected to a separate backfitting analysis to assess whether this aspect of the rule would produce a cost-justified substantial increase in safety as required by the NRC's Backfit Rule. The commenters noted that § 50.109(c) requires a backfitting analysis to consider the potential impact of new requirements on plant "operational complexity" and the cost of facility downtime. The commenter argued that because of the "aggregate" backfitting analysis performed for the entire rule, it was not clear that the full impact of the collective work hour limits was considered [Daniel Stenger, NRSG; Brian McCabe, Progress Energy].

NRC Response: The NRC disagrees with the commenters. Although the NRC believes that neither the proposed rule's backfit analysis nor its underlying approach was deficient based on available information, the NRC has gained additional insights from public comments suggesting that the backfit analysis would need to be revised to account for additional operational

complexity if the fatigue management provisions were to be finalized as proposed. However, the NRC has replaced several of the proposed fatigue management provisions at which the NRC believes that comment was targeted in the final rule in response to other public comments. Therefore, the backfit analysis has been revised as appropriate based on the final rule. In light of the rule changes, the NRC believes that it has resolved the concern.

14.3. Paperwork Burden Analysis

Support for Drug and Alcohol Reporting Requirements

Comments: Several commenters from industry found the reporting requirements associated with the drug and alcohol portion of the rule to be appropriate [Michael Coyle, NEI #49; Richard Sweigart, DCS; Keith Jury, Exelon; Mark Wetterhahn, Winston Strawn; Edward Weinkam, NMC; Don Grissette, SNC; Keith D. Young, Ameren; Glenn Morris, TVA; Ronald Gaston, Detroit Edison; Gregory Halnon, FENOC; Jeffrey Archie, SCE&G; Brian McCabe, Progress Energy; A. Edward Scherer, SCE; D.R. Woodlan, STARS; J. A. Stall, FPL; B.T. McKinney, PPL; F.G. Burford, Entergy; Daniel Stenger, NRSG].

NRC Response: These comments do not require a response.

Paperwork Reduction Act Obligation

Comments: Several commenters argued that the NRC has not met its obligation under the Paperwork Reduction Act with respect to the information collection requirements proposed in § 26.197(e). They claimed that the NRC has failed to adequately justify the need for these provisions to provide useful information for making a determination on the adequacy of a facility's fatigue management program and help the NRC assign inspection resources, and has also failed to objectively support its estimate of the burden created on affected licensees. Therefore, the commenters urged OMB to remand proposed § 26.197(e) to the NRC for its further consideration in light of these inadequacies [Marvin Fertel, NEI; Michael Coyle, NEI #49; F.G. Burford; Brian McCabe, Progress Energy; Gregory Halnon, First Energy; Richard Sweigart, DCS; Keith Jury, Exelon; Mark Wetterhahn, Winston Strawn; Edward Weinkam, NMC; Don Grissette, SNC; Keith D. Young, Ameren; Glenn Morris, TVA; Ronald Gaston, Detroit Edison; Gregory Halnon, FENOC; Jeffrey Archie, SCE&G; Brian McCabe, Progress Energy; A. Edward Scherer, SCE; D.R. Woodlan, STARS; J. A. Stall, FPL; B.T. McKinney, PPL; F.G. Burford, Entergy; Daniel Stenger, NRSG].

NRC Response: The NRC has reviewed its Paperwork Burden Analysis in light of the comments, and has revised certain burden estimates based on information provided by the commenters as well as additional analysis conducted by the staff. The NRC remains convinced, however, that the information collection requirements in the proposed rule are necessary to ensure that the NRC has the information necessary to effectively implement and enforce the FFD program, including its fatigue management requirements, increase consistency of rule enforcement, increase public confidence, and facilitate rule improvement. Section 11.2.5 of this document provides a detailed discussion of the NRC's justification for including these reporting requirements. (Note that the reporting requirements of proposed § 26.197(e) are now contained in § 26.203(e) of the final rule.)

Clarification of OMB Process

Comment: One commenter also asked the question of how the OMB process and the NRC rulemaking process come together with respect to the reporting provisions [Brian McCabe, Progress Energy].

NRC Response: As described in Section XIII of the Supplementary Information for the Proposed Rule (70 FR 50618-50619), under the Paperwork Reduction Act of 1995, the Office of Management and Budget (OMB) must review and approve all new or amended information collection requirements included in the proposed rule. No information collection may be conducted without OMB approval. Thus, the OMB paperwork burden approval process is a key component of the rulemaking process.

14.4. Regulatory Flexibility Analysis

No comments addressed this analysis.

14.5. Implementation

Implementation Process

Comments: Two commenters requested information about the process if the NRC concurred with alternative means of meeting the rule and changed a significant portion of the rule [Brian McCabe, Progress Energy; David Lochbaum, UCS].

NRC Response: Throughout the rulemaking process, the NRC has made efforts to inform stakeholders of significant changes to the proposed rule that resulted from the NRC's consideration of public comment. For example, the NRC held public meetings in March 2006 to discuss changes to the proposed fatigue management provisions and FFD provisions relating to the construction of power reactors. These meetings provided opportunities for the NRC and stakeholders to exchange their views on the proposed provisions. The NRC also published revised rule text on its website in August and October 2006 for public review and to apprise stakeholders of the status of the rulemaking process. In general, changes to the proposed rule that appear in the final rule are clarifications or extensions of the relevant provisions in the proposed rule and were made in response to public comments on the proposed rule.

Implementation Period

Comments: Commenters stated that a significant amount of work will be required to train workers on the provisions of this rule, and asked how long industry will have to implement the final rule. Several commenters from industry argued that, given the significant changes involved in this rulemaking, 12 months will be required for implementation of a majority of the new requirements once the final rule is published [Michael Coyle, NEI #49; Richard Sweigart, DCS; Keith Jury, Exelon; Mark Wetterhahn, Winston Strawn; Edward Weinkam, NMC; Don Grissette, SNC; Keith D. Young, Ameren; Glenn Morris, TVA; Ronald Gaston, Detroit Edison; Gregory Halnon, FENOC; Jeffrey Archie, SCE&G; Brian McCabe, Progress Energy; A. Edward Scherer, SCE; D.R. Woodlan, STARS; J. A. Stall, FPL; B.T. McKinney, PPL; F.G. Burford, Entergy; Daniel Stenger, NRSG].

One commenter argued that there is an urgency to push this rulemaking without a thought of the impact on industry. The commenter argued that the implementation of any changes needs to be phased in gradually to give the workforce time to adjust [Daniel Hansen, Individual].

Another commenter asked if the NRC would consider giving the fatigue subpart a different implementation date than the rest of the rule [Dana Millar, Entergy].

NRC Response: The NRC agrees that implementation of the final rule will require time. Therefore, the agency has determined that licensees and other applicable entities may defer implementation of this rule, except for Subparts I and K, until 365 days from the publication of the final rule in the *Federal Register*. Subpart I must be implemented by licensees and other applicable entities no later than 18 months from the publication of the final rule in the *Federal Register*. Additionally, licensees and other applicable entities shall comply with the requirements of Subpart K as of 30 days from the publication of the final rule in the *Federal Register*.

Topics for the Final Rule Package

Comments: One commenter, supported by many commenters, argued that the final rule package must address several issues regarding the implementation process. These issues include:

- Addressing licensees that have work hour limits in their Technical Specifications
- Addressing the process to cancel the security work hour order
- Addressing portions of the Access Authorization Order that may conflict with 10 CFR Part 26

[Michael Coyle, NEI #49; Richard Sweigart, DCS; Keith Jury, Exelon; Mark Wetterhahn, Winston Strawn; Edward Weinkam, NMC; Don Grissette, SNC; Keith D. Young, Ameren; Glenn Morris, TVA; Ronald Gaston, Detroit Edison; Gregory Halnon, FENOC; Jeffrey Archie, SCE&G; Brian McCabe, Progress Energy; A. Edward Scherer, SCE; D.R. Woodlan, STARS; J. A. Stall, FPL; B.T. McKinney, PPL; F.G. Burford, Entergy; Daniel Stenger, NRSG].

NRC Response: With regard to the first bullet, as stated in the *Federal Register* notice for the final rule, the implementation period for the rule is 365 days from the date of publication in the *Federal Register*. The NRC considers this period sufficient to support an orderly transition from control of work hours in accordance with order EA-03-038, which requires compensatory measures for the control of work hours for security personnel, and unit technical specification requirements for the administrative control of work hours for personnel performing safety-related functions. The NRC expects that, during this period, licensees will submit applications to amend unit technical specifications to remove requirements pertaining to the administrative control of work hours for personnel performing safety-related functions.

With regard to the 2nd and 3rd bullets, the NRC intends, on verification that licensees have met requirements set forth in the final rule, to rescind the portions of the orders that are superceded by the final rule.

14.6. Other Miscellaneous Comments

Comment: One commenter recommended that the NRC conduct a formal study of this rulemaking [Jim Davis, NEI].

NRC Response: The NRC does not believe that a formal study of this rulemaking is warranted. However, the staff acknowledges that there were numerous lessons learned that will be beneficial for future NRC rulemaking efforts.

Comment: Another commenter proposed a third-party FFD assessment tool to assist the NRC with this rulemaking [Michael Cantor, WayPoint].

NRC Response: The NRC does not endorse third-party products and will continue to follow formal rulemaking processes.

Comment: One commenter fully supported the NRC's efforts to address the self-disclosure of sleep disorders by operators through other regulatory documents such as the Regulatory Guide 1.134, (Medical Evaluation of Licensed Personnel at Nuclear Power Plants) (see 70 FR 50445). The commenter argued that no employee should be afraid to seek treatment for a sleep disorder that can be effectively diagnosed and treated and the NRC should take appropriate steps to ensure that all MROs receive proper training regarding the signs and symptoms of sleep disorders as well as effective treatments. The commenter stated that the NRC should take appropriate steps to see that uniform education and training materials for MROs are developed to ensure that appropriate topics are covered accurately [Darrel Drobnich, NSF].

NRC Response: The NRC agrees that the assessment of sleep disorders for licensed operators should be addressed through Regulatory Guide 1.134, Medical Evaluation of Licensed Personnel at Nuclear Power Plants, and is revising that guidance through a separate effort. The NRC intends to revise the guidance to communicate its expectations that the evaluation considers sleep disorders among the potential factors that can affect the ability of an operator to remain alert. Regarding the commenters recommendation for uniform education and training materials, the final rule establishes training and examination requirements applicable to all individuals subject to the licensees FFD program, and specifically requires licensees to add "knowledge of . . . indications and risk factors for common sleep disorders, shiftwork strategies for obtaining adequate rest, and the effective use of fatigue countermeasures" to the content of their FFD training and examinations. Although it is common for industry groups such as the Nuclear Energy Institute or the Institute for Nuclear Power Operations to voluntarily develop generic guidance documents for common use by licensees, the final rule does not require uniform training materials. The NRC notes that it the licensee's responsibility to develop and ensure the accuracy of training materials to meet these requirements.

14.7. Comments Outside the Scope of the Rulemaking

No comments addressed this issue.

SUPPORTING STATEMENT
FOR
10 CFR PART 26, FITNESS-FOR-DUTY PROGRAM,
Final Rule
(OMB Clearance No. 3150-0146)

COMPLETE REVISION OF 10 CFR PART 26

DESCRIPTION OF THE INFORMATION COLLECTION

Part 26 of Title 10 of the Code of Federal Regulations contains the Nuclear Regulatory Commission's requirements and standards for the establishment, implementation, and maintenance of fitness-for-duty (FFD) programs. The Part 26 requirements and standards apply to the following: licensees who are authorized to operate a nuclear power reactor; licensees who are authorized to possess, use, or transport formula quantities of strategic special nuclear material (SSNM) under 10 CFR Part 70; corporations, firms, partnerships, limited liability companies, associations, or other organizations that obtain a certificate of compliance or an approved compliance plan under 10 CFR Part 76, but only if the entity elects to engage in activities involving formula quantities of SSNM; and contractor/vendors (C/Vs) who implement FFD programs or FFD program elements, to the extent that licensees and other entities rely upon those C/V FFD programs or program elements to meet the requirements of 10 CFR Part 26. Certain more limited information collection requirements apply to the following: holders of a combined operating license under 10 CFR Part 52, Subpart C, before the Commission has made the finding under §52.103, combined license applicants who have received authorization to construct under §50.10(e)(3), construction permit holders (under 10 CFR Part 50), construction permit applicants who have received authorization to construct under §50.10(e)(3), and holders of manufacturing licenses (under 10 CFR Part 52).

The 103 operating nuclear power reactors in the United States are located at 65 facilities, with each facility consisting of one or more reactor units. Several facilities may be owned and operated by the same licensee. A licensee may administer the FFD activities at one or more facilities through a single FFD program (i.e., the same FFD policy and procedures apply, a single FFD staff administers the drug and alcohol testing program, one medical review officer performs the MRO functions, etc.) This information collection supporting statement estimates the burden associated with reporting and recordkeeping activities for 52 FFD programs, as follows: 28 FFD programs for 65 facilities with a total of 103 nuclear power reactors; 2 fuel-cycle facilities; 2 contractor/vendors; 1 mixed-oxide fuel fabrication facility; and 19 construction FFD programs.

The fatigue management provisions in Subpart I of Part 26 apply to a smaller group of licensees and other entities, and be implemented through 30 programs (28 FFD programs covering nuclear power reactors and 2 programs covering contractor/vendors, who are required to implement fatigue management provisions if their personnel provide services to nuclear power reactors in the appropriate job duty groups).

With respect to nuclear power plant construction, Part 26 requires all individuals who, at the location where the nuclear power plant will be constructed and operated, serve as a security officers, perform quality assurance activities, are designated by a licensee or other entity to perform fitness monitoring under Subpart K, of have responsibility for determining that all or parts of inspections, tests, and analyses have been successfully completed, to be subject to a

FFD program that meets all the requirements of Part 26 except Subparts I and K. Those individuals who perform construction activities, defined as the tasks involved in building the safety-related structures, systems, and components (SSCs) of a nuclear power reactor that are required to be described in the final safety analysis report (FSAR), including receiving, evaluating, assembling, installing, constructing, and testing the safety-related SSCs, must either be subject to an FFD program that meets the requirements of Subpart K or an FFD program that meets all of the requirements of Subparts A through H of Part 26. Licensees and other entities may either subject these individuals to random drug and alcohol testing and behavioral observation, or they may subject them to a fitness monitoring program. This analysis assumes that 12 of the 19 FFD programs at nuclear power plant construction sites will be closely associated with FFD programs at existing nuclear power reactors and will adopt random testing and behavioral observation, and that the remaining 7 FFD programs will adopt fitness monitoring.

The rule described in this clearance package constitutes a complete revision of Part 26.

The recordkeeping and reporting requirements in the rule include provisions requiring licensees and other entities to develop and maintain policies and procedures; retain records of training, qualification and authorization of individuals; retain records related to drug and alcohol collections and tests; retain other records related to the collection, testing and review processes; report FFD program performance and significant violations, program failures and testing errors; and retain records related to employee assistance programs. Records and reports are also required under the fatigue management component of the FFD program. The recordkeeping and reporting requirements are mandatory for licensees and other entities subject to the rule. The NRC uses the reports to assess the effectiveness of FFD programs for those subject to the rule, and whether the provisions are implemented as the NRC intends.

The recordkeeping and reporting requirements of Part 26 are largely centralized into Subpart I - Managing Fatigue (§26.203) and Subpart N - Recordkeeping and Reporting Requirements (§§26.711-26.719), and Subpart K - FFD Programs for Construction (§§ 26-405, 26.411, and 26.417). Cross references to the recordkeeping and reporting requirements in Subpart N appear in other related portions of the Part 26 rule, but these cross references do not constitute additional recordkeeping or reporting requirements.

The burden for the recordkeeping and reporting requirements is captured against the specific requirement rather than in the general sections for recordkeeping and reporting (primarily §§26.713, 26.715, 26.717, and 26.719) to facilitate determining the burden impacts when a specific requirement is modified.

The estimated annual burden for the final rule of 738,129 hours for one-time recordkeeping (annualized), annual recordkeeping, and annual reporting exceeds NRC's estimate for the previous rule of 61,143 hours (as estimated in the final clearance renewal published in the Federal Register on October 3, 2005 (70 FR 57625)) by 676,986 hours. Of this,132,965 hours are for one-time recordkeeping requirements. The increase in burden is explained by several differences between the former rule and the final rule. In particular, the final rule creates more detailed requirements pertaining to the FFD authorization process for individuals to ensure consistency with the NRC's access authorization requirements for nuclear power plants established in 10 CFR 73.56, as supplemented by orders to nuclear power plant licensees dated January 7, 2003. The final rule includes more detailed requirements pertaining to the specimen collection and testing process, to increase consistency with other relevant Federal rules and guidelines, including the U.S. Department of Health and Human Services (DHHS)

Mandatory Guidelines for Federal Workplace Drug Testing Programs (HHS Guidelines). The final rule also includes a new subpart addressing requirements for HHS-certified laboratories, adds requirements for confirmatory drug and alcohol testing and verification testing, and expands and makes more explicit the requirements for licensee testing facilities. The burden estimate for the final rule captures significant third-party collections associated with the reporting and recordkeeping associated with the drug and alcohol testing activities that were not captured in the previous rule. Experience from the implementation of the current FFD rule, information obtained from stakeholders, and information obtained from sources such as the DHHS National Laboratory Certification Program has led the NRC to revise its estimates of the burden of certain activities. The final rule contains new fatigue management provisions that include reporting and recordkeeping burdens that were not part of previous estimates. The final rule also contains new requirements for an FFD program for construction that includes reporting and recordkeeping burdens, some of which were not part of previous estimates, for an estimated 19 new FFD programs involving individuals constructing new nuclear power reactors.

A. JUSTIFICATION

As provided by the Atomic Energy Act (AEA), as amended, and the Energy Reorganization Act of 1974, in order to provide for the protection of public health and safety, including the radiation safety of workers and the general public, and the common defense and security, the NRC licenses and regulates the owners and operators of nuclear power plants, entities that are authorized to construct nuclear power plants, entities that are authorized to possess, use, or transport formula quantities of strategic special nuclear material (SSNM), and holders of combined licenses and manufacturing licenses under 10 CFR Part 52. NRC provides in 10 CFR Part 26 that the owners and operators of nuclear power plants, entities that are authorized to construct nuclear power plants, entities that are authorized to possess, use, or transport formula quantities of strategic special nuclear material (SSNM), and holders of combined licenses and manufacturing licenses under 10 CFR Part 52 must ensure that certain individuals whose job duties require them to have access to the protected areas of nuclear power plants or to perform certain specified duties are subject to fitness-for-duty programs.

The fitness-for-duty programs must provide reasonable assurance that such individuals are trustworthy, reliable, and fit for duty, as demonstrated by the avoidance of substance abuse; are not under the influence of legal or illegal drugs or alcohol, or mentally or physically impaired from any cause that in any way adversely affects their ability to safely and competently perform their duties; and that the effects of fatigue and degraded alertness on individual's abilities to safely and competently perform their duties are managed commensurate with maintaining public health and safety. The fitness-for-duty programs must also provide reasonable measures for the early detection of individuals who are not fit to perform the job duties that require them to be subject to the program and provide reasonable assurance that the workplaces subject to Part 26 are free from the presence and effects of illegal drugs and alcohol.

The reporting and recordkeeping provisions of 10 CFR Part 26 (listed below) support the following important functions of the fitness-for-duty program: (1) they provide a record of the authorization process through which individuals become authorized to have or maintain access to the protected areas of nuclear power plants or to perform certain specified duties; (2) they provide a record of the drug and alcohol testing procedures and the chain of custody of samples to be available in case a determination of fitness is necessary and/or if a determination of fitness is challenged under either the procedures specified by Part 26 or through litigation; and (3) they provide records for both self-assessments by licensees and other entities and

audits and inspections by the NRC of FFD programs. Because fitness-for-duty programs are required for key functions at nuclear power reactors, and because FFD programs can impose significant consequences on individuals who violate the FFD requirements, access to detailed records concerning the individuals covered by the programs is particularly important.

1. Need for and Practical Utility of the Collection of Information

These information collections are necessary to properly manage fitness-for-duty programs. Licensees must perform certain tasks, maintain records, and prepare reports to demonstrate their fulfillment of regulatory requirements. Certain events are of such significance that they must be reported to the NRC. Collection of this information pertaining to significant fitness-for-duty events is necessary to permit timely evaluation of events that might become problems and that may require a timely response by the NRC staff to ensure that the health and safety of the public is not endangered.

Section 26.9, Specific Exemptions, provides that the Commission may, upon application of any interested person or upon its own initiative, grant exemptions from the requirements of 10 CFR Part 26, and specifies that exemption requests must meet the provisions of 10 CFR 50.12 or 10 CFR 70.17.

This reporting requirement is necessary to ensure that licensees seeking exemptions from the requirements of 10 CFR Part 26 provide the information needed to enable the NRC to determine if the criteria for granting an exemption listed in §§50.12 or 70.17 have been met.

Section 26.11, Communications, provides that all communications, applications, and reports may, except where otherwise specified, be sent to the Commission either by mail or, where practicable, by electronic submission.

This section contains no information collections and merely specifies acceptable means for submitting information under Part 26.

Section 26.27, Written Policy and Procedures

> Paragraph 26.27(a) requires each licensee or other entity subject to Part 26 to establish, implement, and maintain written policies and procedures designed to meet the general performance objectives and specific requirements of Part 26.

The written FFD policy and procedures are the primary means by which a licensee or other entity communicates its FFD policy and procedures to individuals who are subject to the policy and procedures. These requirements are also necessary to ensure that the due process rights of individuals are protected by informing them in sufficient detail about licensee FFD rules, what is expected of them, and what consequences may result from a lack of adherence to the FFD policy. Because the consequences of lack of adherence to the FFD policy can be very severe, including inability to perform certain functions in the industry, it is particularly important that all individuals who are potentially subject to them know their details. The one-time burden for the initial development of the policy is shown under this paragraph.

> Paragraph 26.27(b) requires the current FFD policy statement to be readily available to all individuals subject to the policy and specifies the minimum mandatory contents of the written policy statement, which include a description of the consequences of prohibited actions, reporting for testing requirements, alcohol abstinence requirements, the factors

that could affect fitness-for-duty, employee assistance programs, and responsibilities to report FFD violations or concerns.

This requirement ensures that the FFD policy is included and maintained in the licensee's compendium of policies, where it can be reviewed by any individual who is subject to the FFD program. The burden for incorporating and maintaining the policy statement in the policy compendium is shown under this paragraph.

Paragraph 26.27(c) requires each licensee or other entity to prepare, implement, and maintain written procedures that describe the methods to be used in implementing the FFD policy and requirements of Part 26. It specifies the mandatory contents of the procedures, including procedures to be used in testing for drugs and alcohol; procedures for protecting the employee and the integrity of the specimen; procedures to ensure that the test results are valid and attributable to the correct individual; procedures to describe the immediate and follow-up actions that will be taken in those cases when individuals are determined to have been involved in the use, sale, or possession of illegal drugs, consumed alcohol to excess as determined by a test that measures blood alcohol content (BAC), attempted to subvert the testing process, refused to provide a specimen, or had a legal action taken relating to drug or alcohol consumption; procedures to ensure that individuals who are called in to perform an unscheduled working tour are fit to perform the task assigned; and procedures to describe the process to be followed if an individual's behavior raises a FFD concern.

This requirement is necessary to ensure that individuals who manage and implement the FFD program and individuals subject to that FFD program are provided specific detailed information about how testing for the use of drugs and alcohol are conducted, including the cutoff levels used in drug and alcohol testing and the time periods within which an individual who has been selected for random testing must report to the collection site; how and why behavioral observation is conducted; and how authorization is granted, maintained, reinstated, and withdrawn. They also provide a description of programs that are available to personnel desiring assistance in dealing with drug, alcohol, or other problems that could adversely affect their performance. These requirements also partially meet the legal necessity of protecting the due process rights of individuals who are subject to Part 26, and also proving "prior notice" and having it documented for evidence in legal proceedings. The one-time burden for initial preparation of the procedures and the recurring burden for updating and amending the FFD procedures are shown under this paragraph.

Paragraph 26.27(d) specifies that the NRC may at any time review the written policy and procedures to ensure that they meet the performance objectives of Part 26.

This requirement is necessary to ensure that the NRC can carry out timely evaluations of whether the policies or procedures of particular licensees or other entities fail to include necessary FFD program elements or do include elements that are not consistent with the requirements of an effective FFD program. The recurring burden for providing the policy or procedure to the NRC, when it is reviewed as part of the inspection process or when it is otherwise requested, is shown under this paragraph.

Recordkeeping requirements for current policies and procedures under §26.27(b), (c), and (d) are established by that section. Recordkeeping requirements for superseded procedures are established by §26.715(b)(4).

Section 26.29, Training

Paragaraph 26.29(a) requires licensees and other entities to ensure that individuals who are subject to Part 26 have specified knowledge and abilities.

The one-time burden for developing a training course, including the development of an initial question bank, that reflects the requirements of Part 26, including both drug and alcohol testing and fatigue management provisions, is shown under this paragraph.

Paragraph 26.29(b) requires all individuals subject to Part 26 to demonstrate successful completion of training by passing a comprehensive examination about the knowledge and abilities specified in §26.29(a)(1) through (10).

The one-time burden of testing all personnel subject to the FFD program when the Part 26 rule becomes effective is shown under this paragraph, and includes the burden of FFD management personnel to prepare the computerized examination from the question bank, to grade the examinations, to notify individuals of results, and to maintain records of the examination results.

In addition, the recurring burden of testing individuals who become subject to the FFD programs of licensees or other entities at a later time is shown under this paragraph. The recurring burden includes the time required for preparation of the computerized examination, to grade the examinations, to notify individuals of results, and to maintain records of the examination results.

Paragraph 26.29(c)(1) requires training for all personnel to be completed before FFD program authorization may be granted to a licensee or other entity.

The one-time burden of providing training to those staff of licensees and other entities when the Part 26 rules become effective is shown under this paragraph.

Paragraph 26.29(c)(2) requires refresher training to be completed on a nominal 12-month frequency, and allows individuals who pass a comprehensive annual examination to forgo refresher training.

The recurring burden of providing refresher training, which includes training for new staff who are hired after the initial training, and administering a comprehensive annual examination, is shown under this paragraph. The burden of keeping FFD training updated, maintaining a question bank and developing examinations to be given to new staff and to existing staff as an alternative to refresher training, is also shown under this paragraph.

Paragraph 26.29(d) allows a licensee or other entity to accept the training of individuals who have been subject to another training program that meets the requirements of this section and who have, within the previous 12 months, either had initial or refresher training or have successfully passed a comprehensive examination specified in §26.29(b).

The requirements in §26.29 are necessary to ensure that individuals assigned to activities within the scope of Part 26 are provided with appropriate training so that they understand the methods used to implement the FFD policy, the personal and public health and safety hazards associated with abuse of drugs or alcohol, the effects of prescription and over-the-counter drugs and dietary conditions on drug test results, their roles and responsibilities in the

implementation of the fitness-for-duty program, the role of the Medical Review Officer (MRO), and the Employee Assistance Program (EAP) services available; that they are sufficiently skilled to detect conditions that arise from abuse or presence of drugs or alcohol, and that they know the proper action to be initiated. Licensees or other entities are required to prepare appropriate examination questions and maintain a question bank, develop and administer examinations, assess whether individuals pass or fail the examinations, and communicate examination results to the individuals and to the FFD program managers. FFD programs are expected to administer and grade examinations and communicate results by means of their computer networks. These requirements also partially meet the legal necessity of providing "prior notice" and having it documented (by training and examination records) for evidence in legal proceedings.

Recordkeeping requirements for §26.29 are established by §26.713(b)(1).

Section 26.31, Drug and alcohol testing

Paragraph 26.31(a) requires licensees and other entities to implement drug and alcohol testing programs for individuals who are subject to this subpart.

The reporting and recordkeeping requirements associated with the drug and alcohol testing programs are described under subsequent subparts of Part 26, including Subparts E, F, G, H, and N.

Paragraph 26.31(b)(1)(i) requires licensees and other entities to complete background investigations, credit and criminal history checks, and psychological assessments of FFD program personnel before their assignment to tasks directly associated with administration of the FFD program. The background investigations, credit and criminal history checks, and psychological investigations conducted under a nuclear power plant's access authorization program [10 CFR Part 25] are acceptable to meet the requirement. Section 26.31(b)(1)(i) requires the credit and criminal history checks and psychological assessments to be updated nominally every 5 years.

Paragraph 26.31(b)(1)(v) requires FFD program personnel to be subject to a behavioral observation program designed to assure that they continue to meet the highest standards of honesty and integrity. When an MRO and MRO staff are on site at a licensee's or other entity's facility, the MRO and MRO staff are also subject to behavioral observation.

These requirements are necessary to ensure the honesty and integrity of persons who directly administer the FFD program. Assuring their fitness for duty is important because the FFD program determines those persons who are granted unescorted access to protected areas in nuclear power plants or who possess, use, or transport formula quantities of SSNM. The written procedures for the behavioral observation program are part of the FFD program procedures required to be developed by §26.27.

Recordkeeping requirements for §26.31(b)(1)(i) are established by §26.713(f). The current rule, by relaxing the previous requirement in Section 2.3(2) of Appendix A to Part 26 that requires background checks and psychological evaluations of FFD program personnel to be conducted at least once every three years and providing instead that credit and criminal history checks and updated psychological assessments must be conducted nominally every 5 years, reduces the number of such records that are created. However, the retention period for such records is not affected.

Paragraph 26.31(c) requires licensees and other entities to implement drug and alcohol testing programs that administer tests under the following conditions:

(1) Pre-access. In order to grant initial, updated, or reinstated authorization to an individual;

(2) For cause. In response to an individual's observed behavior or physical condition indicating possible substance abuse or after receiving credible evidence that an individual is engaging in substance abuse as defined in §26.5.

(3) Post-event. The licensee takes action as soon as practical after an event involving a human error that was committed by an individual who is subject to Part 26, where the human error may have caused or contributed to the event. The licensee or other entity shall test the individual(s) who committed the error(s), and need not test individuals who were affected by the event but whose actions likely did not cause or contribute to the event. The individual(s) who committed the human error(s) shall be tested if the event resulted in: (i) a significant illness or personal injury to the individual to be tested or another individual, which within 4 hours after the event is recordable under the Department of Labor standards contained in 29 CFR 1904.7, and subsequent amendments thereto, and results in death, days away from work, restricted work, transfer to another job, medical treatment beyond first aid, loss of consciousness, or other significant illness or injury as diagnosed by a physician or other licensed health care professional, even if it does not result in death, days away from work, restricted work or job transfer, medical treatment beyond first aid, or loss of consciousness; (ii) a radiation exposure or release of radioactivity in excess of regulatory limits; or (iii) actual or potential substantial degradations of the level of safety and security of the plant;

(4) Followup. As part of a followup plan to verify continued abstention from the use of substances covered under Part 26.

(5) Random. On a statistically random and unannounced basis such that all individuals in the population subject to testing have an equal probability of being selected and tested.

No records are required by this paragraph. Records of the drug and alcohol testing programs are required in Subparts C, D, E, F, G, and N of Part 26.

Paragraph 26.31(d)(1)(i)(A),(B) and (C) allows licensees and other entities to add other drugs to the panel of substances for testing, but only if the additional drugs are listed in Schedules I-V of section 202 of the Controlled Substances Act; the licensee or other entity establishes appropriate cutoff limits for these substances; and the licensee or other entity establishes rigorous testing procedures for these substances, so that the MRO can evaluate the use of these substances.

This requirement is necessary to ensure that adequate procedures are established for the testing of additional drugs. Those procedures are additions to the FFD procedures required to be developed under §26.27.

Paragraph 26.31(d)(1)(i)(D) allows licensees and other entities to conduct an analysis for a drug or drug metabolite not listed in §26.31, if the assay and cutoff levels to be used are certified in writing as scientifically sound and legally defensible by an independent qualified forensic toxicologist who has no relationships with manufacturers of the assays or instruments to be used or the HHS Certified Laboratory that will conduct the testing for the licensee or other entity, which could be construed as a potential conflict of interest. Certification is not required if the HHS Guidelines are revised to authorize use of the assay in testing for the additional drug or drug metabolites and the licensee or other entity uses the cutoff levels established in the HHS Guidelines.

This section allows licensees and other entities to add to the panel of drugs for which testing is required in §26.31(d)(1). It eliminates the reporting requirement in the previous Section 1.1(2) in Appendix A to Part 26 that required licensees to obtain written approval from the Commission to test for additional drugs. However, the current rule requires that the assay and cutoff levels to be used in testing for the additional drugs be certified in writing as scientifically sound and legally defensible by an independent forensic toxicologist. This requirement is necessary to ensure that the NRC can verify that the assays and cutoff levels are appropriate.

The licensee or other entity is required to maintain a copy of each certification under §26.31(d)(1)(i)(D). Recordkeeping requirements for §26.31(d)(1)(i)(D) are established by §26.713(g).

Paragraph 26.31(d)(1)(ii) allows licensees and other entities that are conducting post-event, follow-up, or for cause testing to test for drugs listed on Schedules I-V of secton 202 of the Controlled Substances Act [21 U.S.C. 812] that an individual is suspected of having abused. If the drug or metabolites tested are not included in the FFD program's drug panel, the assay and cutoff levels to be used must be certified in writing by an independent qualified forensic toxicologist in accordance with paragraph §26.31(d)(1)(i)(D).

Paragraph 26.31(d)(1)(iii) requires licensees or other entities to document and describe the additional drugs for which testing will be performed in written policies and procedures.

This section allows licensees and other entities to add to the panel of drugs for which testing is required in §26.31(d)(1). It ensures that the NRC can verify that the assays and cutoff levels used in testing for the additional drugs are scientifically sound and legally defensible by requiring an independent forensic toxicologist to perform this evaluation and so certify in writing.

The licensee or other entity is required to maintain a copy of each certification under §26.31(d)(1)(ii). Recordkeeping requirements for §26.31(d)(1)(ii) are established by §26.713(g).

Paragraph 26.31(d)(3)(ii) provides that licensees and other entities may conduct validity screening and initial validity and drug tests of urine aliquots to determine which specimens are valid and negative and need no further testing, provided that the licensee's or other entity's staff possesses the necessary training and skills for the tasks assigned, the staff's qualifications are documented, and adequate quality controls for testing are implemented.

This requirement is necessary to ensure that validity screening and initial validity and drug tests of urine aliquots are performed correctly. Documentation of the qualifications of the personnel

of licensee testing facilities and quality controls for testing are addressed under Subpart F, "Licensee Testing Facilities," §§26.125, 26.127, 26.129, and 26.137.

Paragraph 26.31(d)(3)(iii)(A) requires a licensee or other entity that uses more stringent cutoff levels than the cutoff levels specified in §26.163 to document the cutoff levels in any written policies and procedures in which cutoff levels for drug testing are described.

Paragraph 26.31(d)(3)(iii)(C) requires the scientific and technical suitability of more stringent cutoff levels to be evaluated and certified, in writing, by a forensic toxicologist, unless the HHS Guidelines are revised to lower the cutoff levels used for the drug or drug metabolites in Federal workplace testing programs and the licensee or other entity implements the cutoff levels published in the HHS Guidelines, or if the licensee or other entity received written approval of the NRC to test for lower cutoff levels before the implementation of the final rule.

These requirements are necessary to ensure that individuals receive prior notice of the cutoff levels that are used, and that those cutoff levels are certified by an appropriate expert as meeting the criteria of scientific and technical suitability. The cutoff levels used in a licensee or other entity's testing program are available to individuals subject to the FFD program through the written FFD program policies developed pursuant to §26.27. Recordkeeping requirements for FFD policy and procedures are described under §26.27. The licensee or other entity is required to maintain a copy of each certification under §26.31(d)(3)(iii)(C).

Recordkeeping requirements for §§26.31(d)(3)(iii)(A), and 26.31(d)(3)(iii)(C) are established by §26.713(g).

Paragraph 26.31(d)(6) specifies that specimens collected under NRC regulations may only be designated or approved for testing as described in Part 26 and may not be used to conduct another analysis or test without the written permission of the donor.

This requirement is necessary to ensure that specimens are not used for such testing as DNA testing, serological typing, or other forms of genetic or medical tests for diagnostic or specimen identification purposes without the express written permission of the donor.

Recordkeeping requirements for the third-party collection under §26.31(d)(6) are established by this section.

Section 26.33, Behavioral observation, requires all individuals who are subject to Part 26 to report FFD concerns about other individuals subject to this part to the entity designated in the FFD policy.

This section is necessary to increase the likelihood that if impairment or other adverse behaviors are detected they will be brought to the attention of the licensees or other entities who are subject to the rule so that they can be appropriately addressed. The burden for third-party reports of FFD concerns is covered under this section. Actions in response to reports of FFD concerns are taken under §26.31(c)(2), which provides that licensees and other entities shall administer drug and alcohol tests for cause, in response to any observed behavior indicating possible substance abuse or after receiving credible information that an individual is abusing drugs or alcohol, and under §26.211(a)(1), which provides for fatigue assessments in response to an observed condition of impaired alertness creating a reasonable suspicion that an individual is not fit to safely and competently perform his or her duties. Records of reports

received pursuant to §26.33 are maintained as part of the records of for-cause tests under §§26.31 or 26.211.

Recordkeeping requirements, including the third-party burden for the initial behavioral observation reports, for §26.33 are established by §§26.203(d)(5) or 26.713(a)(2).

Section 26.35, Employee assistance programs

> Paragraph 26.35(a) requires each licensee and other entity to maintain an employee assistance program (EAP) to offer confidential assessment, short term counseling, referral services, and treatment monitoring to individuals who have problems that could adversely affect the individuals' abilities to safely and competently perform their duties.

This requirement is necessary to define the scope and activities of the EAP. The written description of the EAP program forms part of the FFD program policy and procedures to be developed pursuant to §26.27. The burden for the EAP program procedures is covered under this section.

> Paragraph 26.35(c) requires the EAP staff to protect the identity and privacy of any individual (including those who have self-referred) seeking assistance from the EAP, except if the individual waives the right to privacy in writing or a determination is made that the individual's condition or actions pose or have posed an immediate hazard to himself or herself or others. Licensees and other entities are prohibited from requiring the EAP to routinely report the names of individuals who self-refer to the EAP or the nature of the assistance the individuals sought. However, if EAP personnel determine that an individual poses or has posed an immediate hazard to himself or herself or others, EAP personnel are required to so inform FFD program management, and need not obtain a written waiver of the right to privacy from the individual. The individual conditions or actions that EAP personnel shall report to FFD program management include, but are not limited to, substantive reasons to believe that the individual (i) is likely to commit self-harm or harm to others; (ii) has been impaired from using drugs or alcohol while in a work status and has a continuing substance abuse disorder that makes it likely he or she will be impaired while in a work status in the future; or (iii) has ever engaged in any acts that are reportable under §26.719(b)(1) through (b)(3).

The EAP program helps to prevent harm through early intervention. This requirement is necessary to ensure confidentiality for individuals who seek EAP services, thus encouraging use of the EAP; except if the individual waives the right to privacy in writing or if EAP personnel determine that the individual poses or has posed an immediate hazard to himself or others. The requirement that the individual waive the right to privacy in writing is necessary to ensure that there is a clear record of the waiver. The requirement that the EAP staff inform the FFD program management if the EAP personnel determine that the individual poses or has posed an immediate hazard to himself or others is necessary to increase the likelihood that impairment and other adverse behaviors are appropriately addressed by the licensees and other entities who are subject to the rule.

Recordkeeping requirements for §26.35(a) policy and procedures are established by this section and by §26.27(a). Recordkeeping requirements for §26.35(c) third-party collections for the written waiver by the individual and the communications between the EAP and FFD program management are established by this section.

Section 26.37, Protection of information

Paragraph 26.37(a) requires each licensee or other entity subject to Part 26 that collects personal information on an individual for the purpose of complying with Part 26 to establish and maintain a system of files and procedures to protect the personal information.

The one-time burden to confirm that the FFD files and procedures are adequate to protect personal information is covered under this section.

Paragraph 26.37(b) requires each licensee or other entity to obtain a signed consent that authorizes the disclosure of personal information to persons other than the subject or his or her representative, assigned MROs and MRO staff, NRC representatives, appropriate law enforcement officials under court order, licensee or other entity personnel who have a need to have access to the information to performi their assigned duties under the FFD program, the presiding officer in judicial or administrative proceedings initiated by the individual, persons deciding under review in §26.39, and other persons pursuant to court order.

Paragraph 26.37(b)(1) requires an individual to designate in writing his or her representative for specified FFD matters.

This third-party collection is required if an individual desires representation by a union official, attorney, or other person with a need to review personal information about the individual. The one-time burden to confirm that the signed consent and designation of a personal representative have been obtained is covered under this section.

Paragraph 26.37(c) requires disclosure to other licensees or entities who are legitimately seeking the information as required by Part 26 for authorization decisions and who have obtained a signed release from the subject individual.

Paragraph 26.37(d) requires the FFD program, including the collection site, HHS-certified laboratory, substance abuse expert, or MRO, upon receipt of a written request by the subject individual or his or her designated representative, to promptly provide copies of all FFD records pertaining to the individual, including but not limited to records pertaining to a determination that the individual has violated the FFD policy, drug and alcohol test results, MRO reviews, determinations of fitness, and management actions pertaining to the subject individual. This paragraph also requires the licensee or other entity to obtain records related to the results of any relevant laboratory certification, review, or revocation-of-certification proceeding from the HHS-certified laboratory and provide them to the subject individual or his or her designated representative upon request.

These third-party collection requirements are necessary to ensure the protection of personal information collected and maintained about individuals, and to ensure that such information is not disclosed to persons other than assigned MROs, other licensees legitimately seeking the information as required by Part 26 for employment decisions and who have obtained a release from current or prospective employees or C/V personnel, NRC representatives, appropriate law enforcement officials, the individual subject or his or her representative, or those licensee personnel who have a need to have access to the information in performing assigned duties.

Recordkeeping requirements for §§26.37(c) and (d) are established in this section.

Recordkeeping requirements for §26.37(b) are established by §26.713(a)(3).

Section 26.39, Review process for fitness-for-duty policy violations

Paragraph 26.39(a) requires each licensee and other entity subject to this subpart to establish procedures for the review of a determination that an individual has violated FFD policy.

Paragraph 26.39(b) requires that the procedures for the review of a determination that an individual has violated FFD policy provide for giving notice to the individual of the grounds for the determination that the individual has violated the FFD policy and provide for an opportunity for the individual to respond and submit additional information.

These one-time requirements are necessary to ensure that there are written procedures that specify how each FFD program ensures that the criteria for determining that an individual has violated FFD policy have been met and provides individuals with a specified process for reviewing and appealing determinations that the individual has violated FFD policy. The requirements are necessary to ensure that the due process rights of individuals who are subject to the rule are protected by informing them with sufficient detail about licensee review procedures, what is expected of the individual, and what consequences may result from a lack of adherence to the policy. The requirements also partially meet the legal necessity of proving "prior notice" and having it documented for evidence in legal proceedings.

Recordkeeping requirements for §§26.39(a) and (b) are established by §26.715(a).

Paragraph 26.39(d) requires that if a review of a determination that an individual has violated FFD policy finds in favor of the individual, the licensee or other entity must update the relevant records to reflect the outcome of the review and delete or correct all information found to be inaccurate.

This third-party collection requirement is necessary to ensure that the records of licensees and other entities do not contain incorrect information concerning FFD determinations pertaining to particular individuals. An increase in the number of transient personnel who work solely in the nuclear industry but who travel from site to site and work at several different sites has led to increased information sharing among licensees and C/Vs about individuals in the workforce. This requirement helps to ensure that incorrect information does not enter and proliferate throughout this information-sharing network.

Recordkeeping requirements for §26.39(d) are established by §26.713(a)(2).

Paragraph 26.39(e) requires that when a C/V is administering an FFD program on which licensees and other entities rely, and the C/V determines that its employee, subcontractor, or applicant has violated its FFD policy, the C/V shall ensure that the review procedure required by §26.39 is provided to the individual.

The requirements are necessary to ensure that individuals who are subject to the rule are protected by informing them with sufficient detail about licensee review procedures, what is expected of the individual, and what consequences may result from a lack of adherence to the policy. The requirement also partially meets the legal necessity of proving "prior notice" and having it documented for evidence in legal proceedings.

Recordkeeping requirements for §26.39(e) are established by §26.713(a)(2).

Section 26.41, Audits and corrective action

Paragraph 26.41(a) requires licensees and other entities to ensure that the FFD program elements provided by C/Vs, the FFD programs of any C/Vs that are accepted by the licensee or other entity, any FFD program services that are provided to the C/V by a subcontractor, and the programs of the HHS-certified laboratories upon whom the licensee or other entity and its C/Vs rely is audited and corrective actions are taken to resolve any problems identified.

Paragraph 26.41(b) requires licensees and other entities to ensure that the FFD program is audited as needed, and at least nominally every 24 months.

Paragraph 26.41(c)(1) requires licensees and other entities to ensure that FFD services that are provided to a licensee or other entity by C/V personnel who are off site or are not under the direct daily supervision or observation of the licensee's or other entity's personnel, and HHS-certified laboratories, are audited on a nominal 12-month frequency.

The burden for documenting audit records is shown under §26.41(f).

Paragraph 26.41(d) requires contracts by licensees or other entities with C/Vs and HHS-certified laboratories to reserve the right of licensees to review all information and documentation that is reasonably relevant to audits of FFD program elements provided by C/Vs, the program elements of any C/Vs that are accepted by the licensee or other entity, and the programs of HHS-certified laboratories, and to obtain copies of and take away any documents and any other data that may be needed to assure that the C/V, its subcontractors, or the HHS-certified laboratory are performing their functions properly.

Paragraph 26.41(f) requires the results of any audits required by §§26.41(a), (b), and (c) to be documented and reported to senior corporate and site management. C/Vs who have licensee-approved FFD programs must provide the licensees to whom they provide services with copies of the audit report.

Paragraph 26.41(g) allows licensees and other entities to jointly conduct audits or to accept audits conducted by other licensees, but requires them to review audit records and reports to identify any areas that were not covered by the shared or accepted audit and to maintain a copy of the shared audit and inspection records, including findings, recommendations, and corrective actions.

These requirements for audit documentation, maintenance of audit records, and access to audit information are necessary to help ensure identification and resolution of program weaknesses and to help licensees and other entities, including C/Vs and HHS-certified laboratories, determine what corrective actions are necessary and carry out necessary corrective actions. The requirements help to ensure that necessary information is available for NRC inspections.

Third-party collection requirements for obtaining copies of audit records under §26.41(d) and distribution of audit records and reports to management under §26.41(f) and (g) are established in these sections.

Recordkeeping requirements for retention of audit records in §§26.41(f) and (g) are established by §26.713(b)(2).

Section 26.53, General Provisions

> Paragraph 26.53(d) requires the FFD program of a licensee or other entity that is seeking to grant authorization to an individual who is maintaining authorization under another FFD program to ensure that the program elements to which the individual is subject under the transferring FFD program remain current.

This third-party collection requirement requires communications between the two FFD programs to ensure that the necessary information is transferred between them concerning the individual.

> Paragraph 26.53(e)(2) requires a C/V to inform a licensee or other entity if the C/V's FFD program denies or unfavorably terminates an individual's authorization and the individual is performing any duties for the licensee or other entity that are specified in §26.4(a) through (e) and (g), or, at the licensee's or other entity's discretion, §26.4(f). The licensee or other entity is required to deny or unfavorably terminate the individual's authorization to perform those duties on the day that it receives information from the C/V, or to implement the process in §26.69 to maintain the individual's authorization.

This third-party collection requirement requires communications between the C/V and the licensee or other entity to ensure that the necessary information is transferred between them concerning the individual.

> Paragraph 26.53(g) requires the licensees and C/Vs specified in §26.4(a) and, as applicable, (d) to identify any violation of any requirement of Part 26 to any licensee who has relied on or intends to rely on the FFD program element that is determined to be in violation of Part 26.

This third-party collection requirement requires communications between the C/V and the licensee or other entity to ensure that the necessary information is transferred between them concerning the violation.

> Paragraph 26.53(h) requires licensees and other entities to obtain the knowledge and written consent of the subject individual before initiating any actions under Subpart C [Granting and Maintaining Authorization]. The individual may withdraw consent at any time. If consent is withdrawn, the licensee or other entity may not initiate any elements of the authorization process that were not in process at the time the consent was withdrawn but may conplete and document any elements in progress at the time consent is withdrawn. The licensee or other entity is required to record the individual's application for authorization; withdrawal of consent; the reason given for the withdrawal, if any; and any pertinent information gathered from the elements that were completed. The licensee or other entity shall inform the individual that withdrawal of consent will withdraw the individual's current application for authorization; and other licensees and entities will have access to information documenting the withdrawal.

This third-party collection requirement requires the licensee or other entity to obtain and retain a written consent from the individual.

Paragraph 26.53(i) requires licensees and other entities to inform, in writing, any individual who is applying for authorization that the following actions are sufficient cause for denial or unfavorable termination of authorization: refusal to provide written consent for the suitable inquiry; refusal to provide or falisification of any personal information required under Subpart C of Part 26; refusal to provide written consent for the sharing of personal information with other licensees or C/Vs; and failure to report any legal actions, as defined by §26.5.

This third-party collection requirement requires the licensee or other entity to provide a written notice to the individual.

Section 26.55, Initial Authorization

Paragraph 26.55(a)(1) requires the licensee or other entity to obtain and review a self-disclosure and employment history from an individual before granting authorization to the individual.

Paragraph 26.55(a)(2) requires the licensee or other entity to complete a suitable inquiry before granting authorization to the individual.

Requirements for the contents of the self-disclosure and employment history are established by §26.61. These requirements are necessary to help provide reasonable assurance that any individual who has never previously held authorization or whose authorization has been interrupted for a period of three years or more is trustworthy, reliable, and fit for duty, as demonstrated by avoiding substance abuse, as well as aspects of the individual's character and reputation other than substance abuse covered by the self-disclosure and suitable inquiry.

Recordkeeping requirements for §§25.55(a)(1) and (a)(2)
are established by §§26.61 and 26.63 and by §§26.713(a)(1) and (a)(3).

Section 26.57, Authorization Update

Paragraph 26.57(a)(1) requires the licensee or other entity to obtain and review a self-disclosure and employment history from an individual before granting authorization to the individual.

Paragraph 26.57(a)(2) requires the licensee or other entity to complete a suitable inquiry before granting authorization to the individual.

These requirements are necessary to help provide reasonable assurance that any individual whose authorization has been interrupted for more than 365 days but less than 3 years and whose last period of authorization was terminated favorably who is granted reauthorization is trustworthy, reliable, and fit for duty, as demonstrated by avoiding substance abuse, as well as aspects of the individual's character and reputation other than substance abuse covered by the self-disclosure and suitable inquiry.

Recordkeeping requirements for §25.57(a)(1) and (a)(2) are established by §§26.61 and 26.63 and by §§26.713(a)(1) and (a)(3).

Section 26.59, Authorization Reinstatement

Paragraph 26.59(a)(1) requires the licensee or other entity to obtain and review a self-disclosure and employment history from an individual whose authorization has been interrupted for a period of more than 30 days but no more than 365 days and whose last period of authorization was terminated favorably before granting authorization to the individual.

Paragraph 26.59(a)(2) requires the licensee or other entity to complete a suitable inquiry for an individual whose authorization has been interrupted for a period of more than 30 days but no more than 365 days and whose last period of authorization was terminated favorably within 5 business days of reinstating authorization. If the suitable inquiry is not completed within 5 business days due to circumstances that are outside of the licensee's or other entity's control and the licensee or other entity is not aware of any potentially disqualifying information regarding the individual within the past 5 years, the licensee or other entity may maintain the individual's authorization for another 5 business days. If the suitable inquiry is not completed within 10 business days of reinstating authorization, the licensee or other entity shall administratively withdraw the individual's authorization until the suitable inquiry is completed.

These requirements are necessary to help provide reasonable assurance that any individual whose authorization has been interrupted for more than 30 days but no more than 365 days and whose last period of authorization was terminated favorably who is granted authorization reinstatement is trustworthy, reliable, and fit for duty, as demonstrated by avoiding substance abuse, as well as aspects of the individual's character and reputation other than substance abuse covered by the self-disclosure and suitable inquiry.

Paragraph 26.59(b) provides that if a licensee or other entity administratively withdraws an individual's authorization, and until the suitable inquiry is completed, the licensee or other entity may not record the administrative action to withdraw authorization as an unfavorable termination and may not disclose it in response to a suitable inquiry conducted under the provisions of §26.63, a background investigation conducted under Chapter 10 of the Code of Federal Regulations, or any other inquiry or investigation. The individual may not be required to disclose the administrative action in response to requests for self-disclosure of potentially disqualifying FFD information.

This requirement is necessary to ensure that information about an administrative withdrawal of authorization that is subsequently reversed does not become disseminated to licensees or other entities.

Paragraph 26.59(c)(1) requires the licensee or other entity to obtain and review a self-disclosure from an individual whose authorization has been interrupted for a period of no more than 30 days and whose last period of authorization was terminated favorably before granting authorization to the individual.

This requirement is necessary to help provide reasonable assurance that any individual whose authorization has been interrupted for no more than 30 days and whose last period of authorization was terminated favorably who is granted authorization reinstatement is trustworthy, reliable, and fit for duty, as demonstrated by avoiding substance abuse, as well as aspects of the individual's character and reputation other than substance abuse covered by the

self-disclosure. Because the authorization has been interrupted for a period of no more than 30 days, no suitable inquiry is required.

Recordkeeping requirements for §§26.59(a)(1) and (a)(2), including records of administrative withdrawal of authorization and subsequent termination of the withdrawal of authorization or unfavorable termination of authorization under §26.59(b), are captured by §§26.61 and 26.63 and by §§26.713(a)(1) and (a)(3).

Recordkeeping requirements for §26.59(c)(1) are established by §26.61 and by §§26.713(a)(1) and (a)(3).

Section 26.61, Self-disclosure and employment history

Paragraph 26.61(a) requires a licensee or other entity to obtain a written self-disclosure and employment history from an individual who is applying for authorization, except in specified circumstances.

Paragraph 26.61(a)(1) specifies that if the individual previously held authorization under Part 26, the licensee or other entity must verify that the individual's last period of authorization was terminated favorably, and that the individual has been subject to a behavioral observation and arrest-reporting program throughout the period since the individual's last authorization; if so, the licensee or other entity need not obtain the self-disclosure or employment history in order to grant authorization.

Paragraph 26.61(a)(2) specifies that if the individual's last period of authorization was terminated favorably within the past 30 days, the licensee or other entity need not obtain the employment history.

These sections create the requirement for submission of self-disclosures and employment histories by individuals seeking authorization. FFD programs require individuals to sign a statement at the conclusion of the self-disclosure statement and employment history that the information provided by the individual is, as far as they are aware, correct, and the burden for the self-disclosures, employment histories, and signed certification is included here. These sections relax the requirements in §§26.55, 26.57, and 26.59 when the specified conditions above indicate that the self-disclosure and/or employment history are unnecessary and reduce the number of situations in which a licensee or other entity must obtain and review the documents from those otherwise required by §§26.55, 26.57, and 26.59. Verification that the last previous period of authorization was terminated favorably and that the licensee was subject to a behavioral observation and arrest-reporting program is obtained from the nuclear reactor industry's Personnel Access Data System (PADS), to which plants send information concerning individuals.

Recordkeeping requirements for §26.61(a) are established by §26.713(a)(1).

Paragraph 26.61(b) specifies the information to be included in the written self-disclosure, and includes information on FFD policy violations; authorization denials; unfavorable terminations of authorization; use, sale, or possession of illegal drugs; abuse of legal drugs or alcohol; subversion or attempted subversion of a drug or alcohol testing program; refusal to take a drug or alcohol test; substance abuse treatment (except for self-referral); and legal or employment action taken for alcohol or drug use.

Paragraph 26.61(c) requires the individual to provide an employment history listing employers and dates of employment.

These requirements are necessary to ensure that the written self-disclosure and employment history are sufficiently complete and comprehensive to allow licensees and other entities to rely upon them for determinations concerning the trustworthiness, reliability, and fitness for duty of individuals, as demonstrated by avoiding substance abuse. They do not establish any information collection requirements in addition to those included in §26.61(a), but they do specify the types of information that must be included in the self-disclosure and employment history required by §26.61(a).

These sections specify the information to be reported or recorded in support of authorization determinations under §§26.55, 26.57, and 26.59.

Section 26.63, Suitable inquiry

Paragraph 26.63(a) requires the licensees or other entities to ensure a suitable inquiry has been conducted unless the individual was previously authorized, the licensee has verified that the last authorization was terminated favorably, and the individual was subject to a behavioral observation and arrest-reporting program throughout the period of interruption.

Paragraphs 26.63(b), (c), and (f) specifies that to meet the suitable inquiry requirement, licensees and other entities may rely upon the information that other licensees and entities who are subject to this subpart have gathered for previous periods of authorization and specifies the information to be included, e.g., reasons for termination, eligibility for rehire, and other information that could reflect on the individual's fitness to be granted authorization.

Paragraph 26.63(c)(2) specifies that if a claimed period of employment was military service, the licensee or other entity may accept a copy of the DD 214 presented by the individual or provided by the custodian of military records.

These sections specify the information to be reported or recorded in support of authorization determinations under §§26.55, 26.57, and 26.59. In addition, they specify limitations on the scope of the reporting and recordkeeping necessary in support of the authorization determinations under §§26.55, 26.57, and 26.59. Sections 26.63(b), (c), and (f) specify that licensees and other entities may rely on third-party communications, but do not create any additional recordkeeping requirement.

Paragraph 26.63(c)(2) creates an exception to the requirement for an employment history by allowing submission of an already existing record of military service.

Recordkeeping requirements for §26.63(a) and (c)(2) are established by §26.713(a)(1).

Paragraph 26.63(c)(3) specifies that if a company, previous employer, or educational institution to whom the licensee or other entity has directed a request for information refuses to provide information within 3 business days of the request, the licensee or other entity shall document this refusal, inability, or unwillingness in the record of the investigation and obtain a confirmation of employment or educational enrollment and attendance from at least one alternate source. If the licensee or other entity uses an

alternate source but the response is received after 3 business days, the response should be evaluated and documented.

This third-party requirement is necessary to ensure that a record is created explaining gaps and absences in the information otherwise required by §§26.55, 26.57, and 26.59, so that an individual is not charged with responsibility for such gaps and denied authorization on that basis. This requirement also helps to ensure that licensees and other entities can grant authorization, even if the information requested but not received from another company, previous employer, or educational institution, is not available.

Recordkeeping requirements for §26.63(c)(3) are established by §26.713(a)(1).

Paragraph 26.63(d) requires, if a licensee or other entity presents to another licensee or other entity an individual's signed release authorizing the disclosure of information, that other licensee or entity shall disclose whether the individual's authorization was denied or terminated unfavorably as a result of a violation of an FFD policy and the information upon which the denial or unfavorable termination of authorization was based and any other information that is relevant to an authorization decision.

This requirement is necessary to ensure that information about individuals can be transferred from one licensee or other entity to another licensee or other entity for FFD determinations, because individuals who belong to the much more transient workforce that is currently employed in the nuclear industry frequently move from one licensee or other entity to another. The individual signs a release when first applying for authorization, and the release is placed in the licensee's record of the suitable inquiry. The owners and operators of nuclear power reactors have established and maintain a private system of information known as the Personnel Access Data System (PADS) that contains data on personnel. Each participant is contractually obligated to supply updated information to PADS concerning individual authorizations, employment, and FFD violations.

Paragraph 26.63(e) specifies that in conducting a suitable inquiry, the licensee or other entity may obtain information and documents by electronic means, including but not limited to telephone, facsimile, or email. The licensee or other entity shall make a record of the contents of the telephone call and shall retain that record and any documents or electronic files obtained electronically.

This requirement is necessary in light of the use of PADS and other electronic means of information transfer by licensees and other entities to ensure that a record is made and retained of the information secured by electronic means.

Recordkeeping requirements for §26.63(d) and (e) are specified by §§26.711 and 26.713(a), (b), and (c).

Paragraph 26.63(f) specifies the time periods that a suitable inquiry must cover for initial authorization, authorization update, and authorization reinstatement after an interruption of more than 30 days.

While paragraph 26.63(f) does not require information collection, it does affect the burden attributable to §26.63. An average burden has been used for those estimates.

Section 26.65 Pre-access drug and alcohol testing

Paragraphs 26.65(d)(1) and (e)(2) provides that a licensee or other entity may reinstate authorization for an individual whose authorization has been interrupted for more than 30 days but less than 365 days, or for less than 30 days, respectively, if the individual has negative results from alcohol testing and a specimen for drug testing is collected before authorization is reinstated. Paragraphs 26.65(d)(1)(ii) and (e)(2)(iii)(B) further provide that unless the licensee or other entity verifies that the drug test results are negative within 5 business days of specimen collection, it must administratively withdraw authorization until the drug test results are received.

These sections clarify the required testing where an individual's authorization is terminated less than a year, or less than 30 days. The sections assure that an individual with reinstated authorization maintains the FFD requirements.

Recordkeeping responsibilities for §§26.65(d)(1) and 26.65(e)(2) are established by §26.713(a)(3).

Paragraph 26.65(f) specifies that if a licensee or other entity administratively withdraws an individual's authorization under paragraphs (d)(1)(ii) or (e)(2)(iii)(B), and until the drug results are known, the licensee or other entity may not record the administrative action to withdraw authorization as an unfavorable termination. Immediately upon receipt of negative test results, the licensee or other entity shall ensure that any matter that could link the individual to the temporary administrative action is eliminated from the donor's personnel record and other records.

This requirement is necessary to ensure that any administrative action to withdraw authorization is not permanently recorded as an unfavorable termination of the individual, or communicated to another licensee or other entity as an unfavorable termination, unless and until such a record and such communication is correct and appropriate.

Recordkeeping requirements for §26.65(f) are specified by §26.713(a)(2).

Section 26.67, Random drug and alcohol testing of individuals who have appliced for authorization

Paragraph 26.67(a) specifies that when the licensee or other entity collects specimens from an individual for any pre-access testing that may be required under §§26.65 or 26.69, the licensee or other entity shall subject the individual to random testing under §26.31(d)(2), except if the licensee or other entity does not grant authorization to the individual or the licensee or other entity relies on drug and alcohol tests that were conducted before the individual applied for authorization.

Paragraph 26.67(b) provides that if an individual is selected for one or more random tests after a requirement for pre-access testing under §§26.65 or 26.69 has been met, the licensee may grant authorization before the random testing is completed.

Paragraph 26.67(c) provides that if an individual has a confirmed positive, adulterated, or substituted test result from any drug, validity, or alcohol test required under this section, the licensee or other entity may deny authorization, terminate the individual's authorization if it has been granted, or grant authorization to the individual under §26.69.

These third-party collections involve notice to the individual rafarding the status of their authorization (granted or not granted) and placement of information in PADS concerning the individual.

Recordkeeping requirements for §26.67 are specified by §26.713(a)(2).

Section 26.69, Authorization with potentially disqualifying fitness-for-duty information

Paragraph 26.69(b) specifies that for an individual seeking authorization after a first confirmed positive drug or alcohol test result or a 5-year denial of authorization, a licensee or other entity must obtain and review a self-disclosure and employment history and complete a suitable inquiry with every employer by whom the individual claims to have been employed during the period addressed in the self-disclosure and must obtain and review any records that other licensees or entities who are subject to Part 26 may have developed related to the unfavorable termination or denial of authorization.

Paragraph 26.69(c)(1) requires the licensee or other entity to obtain and review a self-disclosure and employment history for the shortest of the following periods: the past five years, since the individual's eighteenth birthday, or since the individual's last period of authorization was terminated.

Paragraph 26.69(c)(2) requires the licensee or other entity to complete a suitable inquiry with every employer by whom the individual claims to have been employed during the period addressed in the employment history. If the individual held authorization within the past 5 years, the licensee or other entity must obtain and review any records that other licensees or entities who are subject to Part 26 may have developed with regard to potentially disqualifying FFD information about the individual within the past 5 years.

Paragraph 26.69(c)(3) requires, where potentially disqualifying FFD information is discovered that is not a first confirmed positive drug or alcohol test nor a 5-year denial of authorization, that the licensee verify that a professional qualified under §26.187(a) has indicated the individual is fit for duty.

Paragraph 26.69(c)(4) requires the licensee to ensure the individual is in compliance with, or has completed, plans for treatment and drug and alcohol testing.

Paragraph 26.69(c)(5) requires the licensee to verify that results of pre-access drug and alcohol testing are negative before granting authorization, and that the individual is then subject to random testing.

Paragraph 26.69(d) provides that if an individual is authorized when other potentially disqualifying FFD information is disclosed or discovered, in order to maintain the individual's authorization the licensee or other entity shall ensure that a reviewing official completes a review of the circumstances associated with the potentially disqualifying FFD information; decide whether a determination of fitness is required; verify that if a determination of fitness is required that a professional with the appropriate qualifications has indicated that the individual is fit to safely and competently perform his or her duties; and implement any recommendations for treatment and followup drug and alcohol testing from the determination of fitness.

Paragraph 26.69(e) allows licensees and other entities to rely on followup testing, treatment plans, and determinations of fitness that meet the requirements of §26.189 and were conducted under the FFD program of another licensee or entity subject to Part 26.

Paragraph 26.69(e)(1) requires licensees or other entities that imposed treatment and/or followup testing for an individual to ensure that information documenting the treatment and/or followup plan is identified to any subsequent licensee or other entity who seeks to grant authorization to the indivdual.

These requirements are necessary to ensure that the information upon which an authorization decision is made about an individual who has had a first confirmed positive drug or alcohol test or a 5-year denial of authorization is fully complete and comprehensive for the period being covered. They require review of appropriate records, including the written treatment plan, records of drug and alcohol testing of the individual, and records of any potentially disqualifying FFD information that is disclosed or discovered. These third-party collections involve notice to the individual rafarding the status of their authorization (granted or not granted) and placement of information in PADS concerning the individual.

Recordkeeping requirements for §§26.69(b), (c)(1), (c)(2) and (c)(3) are specified by §26.713(a)(1).

Recordkeeping requirements for §§26.69(c)(4) and (5) and for §26.69(d) are specified by §26.713(a)(3).

Section 26.75, Sanctions

Paragraphs 26.75(a), (b), (c), (d), (e) and (g) specifies the minimum sanctions that licensees and other entities must impose upon individuals who are determined to have violated the drug and alcohol provisions of an FFD policy. Paragraph 26.75(d) specifies that if an individual resigns or withdraws his or her application for authorization before his or her authorization is terminated or denied for any violation of the FFD policy, the licensee or other entity shall record the resignation or withdrawal, the nature of the violation, and the minimum sanction that would have been required under Part 26 had the individual not resigned or withdrawn his or her application for authorization.

These requirements, which establish a uniform set of sanctions for FFD violations, are implemented through the creation of records of the sanction imposed. This ensures that a record is created and maintained of the sanction that is available for later reference if the individual seeks authorization after the passage of time or at another facility. Records of sanctions are shared among FFD programs through the industry's Personnel Access Database System (PADS), to which the licensees send information concerning employment dates, approvals of access authorization, withdrawals of access authorization, violations of FFD policy, and other subjects.

Recordkeeping requirements for §§26.75(a), (b), (c), (d), (e)(2), and (g) are established by §26.713(c).

Paragraph 26.75(h) specifies that a licensee or other entity may not terminate an individual's authorization and may not subject the individual to other administrative action based solely on a postive test result from any initial drug test, other than positive initial test reslults for marijuana or cocaine metabolites from a specimen that is reported to be valid

on the basis of either validity screening or inidial validity testing performed at a licensee testing facility, unless other evidence indicates the individual is impaired or might otherwise pose a safety hazard.

This requirement does not create any reporting or recordkeeping requirements. However, it triggers the requirements in the following paragraphs.

Paragraph 26.75(i) allows a licensee testing facility to inform licensee or entity management of initial, non-negative marijuana or cocaine test results with a valid specimen. Licensees or other entities may administratively withdraw the donor's authorization or take lesser administrative actions against the donor, provided that certain conditions specified in §§26.75(i)(1) - (4) are met.

Paragraph 26.75(i)(3) requires that the licensee or other entity eliminate any matter from the individual's personnel record and other records that could link the individual to the temporary administrative action immediately upon receipt of a negative report from the HHS-certified laboratory or the Medical Review Officer.

This requirement is necessary to ensure that any administrative action to withdraw authorization is not permanently recorded as an unfavorable termination of the individual, or communicated to another licensee or other entity as an unfavorable termination, unless and until such a record and such communication is correct and appropriate.

The recordkeeping requirements for this section are established by §26.713(a)(2).

Paragraph 26.75(i)(4) requires that licensees and other entities may not disclose the temporary administrative action against an individual whose initial drug test result is not subsequently confirmed by the MRO as a violation of FFD policy in response to a suitable inquiry conducted under §26.63, a background investigation conducted under Part 26, or to any other inquiry or investigation. The licensees or other entities must provide access to the system of files and records to personnel who are conducting reviews, inquiries into allegations, audits under §26.41, and to NRC inspectors, to ensure that no records are retained. The licensees or other entities shall provide the tested individual with a written statement that the records specified in §§26.713 and 26.715 have not been retained, and shall inform the individual in writing that the temporary administrative action that was taken will not be disclosed and need not be disclosed by the individual in response to requests for self-disclosure of potentially disqualifying FFD information.

This requirement is necessary to ensure that any administrative action to withdraw authorization is not permanently recorded as an unfavorable termination of the individual, or communicated to another licensee or other entity as an unfavorable termination, unless and until such a record and such communication is correct and appropriate. This provision, in addition, ensures that an individual, the individual's personal representatives, and the NRC are allowed to review the records to ensure that no inappropriate records are retained, and that a written confirmation that the temporary administrative action will not be disclosed, and that the individual need not disclose the action, is provided to the individual.

The recordkeeping requirements for this section are established by §26.713(a)(2).

Section 26.77, Management actions regarding possible impairment

Paragraph 26.77(c) requires a licensee or other entity that has a reasonable belief that an NRC employee or NRC contractor may be under the influence of any substance, or is otherwise unfit for duty, to immediately notify the appropriate Regional Administrator by telephone, followed by written notification to document the verbal notification, or, if the Regional Administrator cannot be reached, to notify the NRC Operations Center.

This requirement is necessary to ensure that the NRC receives immediate notification by telephone, followed by written notification, that an NRC employee or NRC contractor may be under the influence of a substance or is otherwise unfit for duty, so that the NRC can take action to remove the employee from duty and to take any other appropriate actions.

Reporting requirements for §26.77(c) are established by §26.719(a).

Section 26.85, Collector qualifications and responsibilities

Paragraph 26.85(a) requires qualification training for urine collectors on the requirements of Part 26, the FFD policy and procedures of the licensee or other entity for whom collections are performed, all steps necessary to complete a collection correctly and the proper completion and transmission of the custody-and-control form; methods to address problem collections, how to correct problems in collections, and the collector's responsibility for maintaining the integrity of the specimen collection and transfer process, ensuring the modesty and privacy of the donor, and avoiding conduct or remarks that might be construed as accusatorial or otherwise offensive or inappropriate.

Paragraph 26.85(b) requires qualification training for alcohol collectors on the requirements of Part 26, the FFD policy and procedures of the licensee or other entity for whom collections are performed, and any changes to alcohol collection procedures, the alcohol testing requirements of Part 26, operation of the particular alcohol testing device(s) or evidential breath testing devices (EBTs) to be used, consistent with the most recent version of the manufacturer's instructions, methods to address problem collections, how to correct problems in collections, and the collector's responsibility for maintaining the integrity of the specimen collection and transfer process, ensuring the modesty and privacy of the donor, and avoiding conduct or remarks that might be construed as accusatorial or otherwise offensive or inappropriate.

This requirement is necessary to ensure that individuals assigned to perform collection activities under Part 26 are provided with appropriate training so that they understand the methods that are used to implement the FFD policy. The burden for one-time training for collectors and the ongoing burden for training new collectors are both shown under these sections.

Recordkeeping requirements for §26.85(a) and (b) are established by §§26.715(a) and (b)(1).

Paragraph 26.85(c)(4) requires any medical professional, technologist or technician who serves as an alternative collector without meeting the training criteria otherwise required to be provided with detailed, clearly-illustrated, written instructions for collecting specimens in accordance in Subpart E of Part 26.

This third-party information collection requirement is necessary to ensure that alternative collectors have detailed instructions on how to perform the collections.

Recordkeeping requirements for §26.85(c)(4) are established by §26.715(a).

Paragraph 26.85(e) requires collection site personnel files to include each individual's resume of training and experience; certification or license, if any; references; job descriptions; records of performance evaluations and advancement; incident reports, if any; results of tests that establish employee competency for the position he or she holds; and appropriate data to support determinations of honesty and integrity conducted in accordance with §26.31(b).

These requirements are necessary to ensure that the training, competency of the collection site personnel a licensee testing facility to correctly use the instruments and devices that the licensee testing facility has selected can be verified This is an important support for the review process underlying determinations of fitness. In addition, records of training and competency may be important evidence in any litigation that may occur with respect to test results. Records of training and competency of collection site personnel also will supports reliance by licensees and other entities on test results from testing that was performed by another Part 26 program.

Recordkeeping requirements for §26.85(e) are established by §26.715(a) and (b)(1).

Section 26.87, Collection Sites

Paragraph 26.87(d)(3) specifies that if a collection site cannot be dedicated solely to collecting specimens, the portion of the facility that is used for specimen collection must be secured and, during the time period during which a specimen is being collected, a sign must be posted to indicate that access is allowed only for authorized personnel.

Paragraph 26.87(f)(1) provides that if a public rest room is used as a collection site, a sign must be posted, or an individual assigned, to ensure that no unauthorized personnel are present during the entire collection procedure.

These requirements are necessary in order to ensure that specimen collection sites are clearly identified to prevent unauthorized access to the collection site that could compromise the integrity of the collection process or the specimens, and to protect donor privacy.

The recordkeeping requirements for §26.87(c)(4) are established by §26.715(b)(3).

The paperwork burden for the posting required by §§26.87(d)(3) and (f)(1) is established by those sections.

Paragraph 26.87(f)(3) requires the person who accompanies the donor into the specimen collection area to be instructed on the collection procedures and his or her identity must be documented on the custody-and-control form.

Paragraph 26.87(f)(4) requires the collector to instruct the donor to participate with the collector in completing the chain-of-custody form.

Paragraph 26.87(f)(5) requires the authorized collector to maintain control of the specimen until the specimen is prepared for transfer, storage, or shipping, and to document his or her custody of the specimen on the custody and control form.

The requirements in §§26.87(f)(3), (f)(4), and (f)(5) are necessary to ensure a chain-of-custody form is prepared that identifies the origin of the specimen and associates the specimen with the correct donor.

Recordkeeping requirements for §§26.87(f)(3) and (f)(5) are established by §26.715(b)(2).

Section 26.89, Preparing to collect specimens for testing

Paragraph 26.89(a) requires collectors to inform FFD program managers when an individual fails to appear for drug testing.

Paragraph 26.89(b)(1) and (b)(2) requires that individuals show proper identification before testing, and, if they cannot produce acceptable identification the collector must notify FFD program management. When so informed, FFD program management shall contact the individual's supervisor to verify in-person the individual's identity, or, if the supervisor is not available, take other steps to establish the individual's identity and determine whether the lack of identification was an attempt to subvert the testing process.

Paragraph 26.89(b)(3) provides that if the donor is scheduled for pre-access testing and cannot produce acceptable identification, the collector may not proceed with the collection and shall inform FFD program management that the individual did not present acceptable identification.

Paragraph 26.89(b)(4) requires the collector to explain the testing procedure to the donor, show the donor the form(s) to be used, and ask the donor to sign a consent-to-testing form.

Paragraph 26.89(c) requires that the collector inform the donor that the donor must remain present at the collection site until the collection is complete. In the event the donor leaves the test site prematurely, the collector is required to report this to FFD management.

Paragraphs 26.89(a), (b)(1), (b)(2), and (b)(3) create third-party collection requirements. Notice to FFD program management is necessary to ensure that appropriate actions are undertaken under the FFD procedures to determine of authorization of the person should be denied or other management actions taken. Paragraph 26.89(b)(4) creates a third-party collection requirement. Explanation of the testing procedure and obtaining a signed consent-to-test form are necessary to ensure that the due process rights of the individual are protected and there is a record that the individual understood the testing procedure and consented. Paragraph 26.89(c) creates a third-party collection requirement. Informing the donor that the donor must remain present until the collection is complete protects the due process rights of the donor. Notice to FFD program management if the donor leaves or is uncooperative is necessary to ensure that appropriate actions are undertaken under the FFD procedures to determine of authorization of the person should be denied or other management actions taken.

The recordkeeping requirements for §§26.89(a), (b), and (c) are established by §26.715(b)(6).

Section 26.91, Acceptable devices for conducting initial and confirmatory tests for alcohol and methods of use

Paragraph 26.91(c)(1) - (3) provides that an evidential breath testing device must provide a printed result of each breath test, assign a unique number to each completed test that is

printed on each copy of the test result, and print on each copy of the test result the manufacturer's name for the device, its serial number, and the time of the test.

This requirement is necessary to establish the specifications for evidential breath testing devices that may be used in FFD programs and to ensure that the results provided by evidential breath testing devices can be confirmed by the individual to whom the test is administered and that it is possible to confirm that no test results have been discarded or ignored. It may be necessary in some cases for licensees and other entities to obtain new evidential breath testing devices (EBTs) with the capability of providing printed results, but most FFD programs are expected to already possess such devices. This requirement helps to ensure that information is available for reviews of determination of fitness and legal proceedings, if any, addressing determinations of fitness. This requirement also helps to ensure that information is available with which to track the performance of each EBT. This requirement does not directly create any records, but describes the types of records that must be created through the use of EBTs in FFD programs.

Recordkeeping requirements for the records created using EBTs that meet the specifications of §26.91(c)(1)-(3) are established by §26.715(b)(12).

Paragraph 26.91(e)(4) requires the licensee or other entity to ensure that confirmed positive alcohol test results are derived from an EBT that is calibrated. The licensee or other entity shall implement one of the following procedures: if an EBT fails any external check of calibration, cancel every confirmed positive test result that was obtained using the EBT from any tests that were conducted after the EBT passed the last external calibration check; or after every confirmed positive test result obtained from using an EBT, conduct an external check of calibration of the EBT in the presence of the donor. If the EBT fails the external calibration check, cancel the donor's test result and conduct another initial and confirmatory test on a different EBT as soon as practicable.

Paragraph 26.91(e)(5) requires that the inspection, maintenance, and calibration of the EBT be performed by the manufacturer or a certified representative of the manufacturer.

Paragraph 26.91(e)(5) creates a third-party collection requirement to create an internal record of the inspection, maintenance, and calibration. This requirement is necessary to ensure that past inspection, maintenance, and calibration activities can be reviewed and confirmed.

The recordkeeping requirements for §26.91(e)(4) and §26.91(e)(5) are established by §26.715(b)(14).

Section 26.93, Preparing for alcohol testing

Paragraph 26.93(a)(6) requires that prior to collecting a specimen for alcohol testing the collector must document that certain questions about substance ingested and instructions about the testing process as specified in §26.93(a)(1) - (a)(5) were communicated to the donor.

This third-party collection requirement is necessary to ensure that the donor understands how the test will be conducted and what the donor must and must not do in order to ensure that the test result is valid and that the testing process is not subverted. This requirement also partially meets the legal necessity of protecting the due process rights of individuals who are subject to

Part 26, and also proving "prior notice" and having it documented for evidence in legal proceedings.

Recordkeeping requirements for §26.93(a)(6) are established by §26.715(b)(6).

Section 26.95, Conducting an initial test for alcohol using a breath specimen

Paragraph 26.95(b)(5) requires a collector conducting an initial breath test for alcohol to ensure that the test result can be associated with the donor and is maintained secure.

This requirement is necessary to help ensure that the test result is an accurate and correct record with respect to the individual who is being tested. This requirement also partially meets the legal necessity of protecting the due process rights of individuals who are subject to Part 26, and also proving "prior notice" and having it documented for evidence in legal proceedings.

Recordkeeping requirements for §26.95(b)(5) are established by §26.715(b)(6).

Section 26.97, Conducting an initial test for alcohol using a specimen of oral fluids

Paragraph 26.97(b)(2) requires that, if the steps required to use the device correctly could not be completed successfully, the collector must record the reason for a new test.

Paragraph 26.97(c)(1) requires that, if a second attempt at collection fails following the failure of the initial attempt, the collector must document the reasons the collection could not be completed.

These requirements are necessary to ensure that if tests cannot be completed because the alcohol testing device cannot be used correctly, that fact must be provided as an explanation of the need for a new test. This helps to ensure that the need for a new test is not incorrectly attributed to the actions of the individual donor. These requirements also partially meet the legal necessity of protecting the due process rights of individuals who are subject to Part 26, and also proving "prior notice" and having it documented for evidence in legal proceedings.

Recordkeeping requirements for §26.97(b)(2) and (c)(1) are established by §26.715(b)(6).

Paragraph 26.97(d) requires the collector, when using a testing device, to show the device and its reading to the donor, record the result, and record that an alcohol screening device (ASD) was used.

This requirement is necessary so that the donor can verify that a particular device was used and confirm the result and the fact that the result was recorded correctly. This record is important for a determination of fitness, if any. The record of the use of the ASD and the result of the test also provide important information for tracking the activities of the FFD program, and help to ensure that information is available for audits and NRC inspections. This requirement also partially meets the legal necessity of protecting the due process rights of individuals who are subject to Part 26, and also proving "prior notice" and having it documented for evidence in legal proceedings.

Recordkeeping requirements for §26.97(d) are established by 26.715(b)(6).

Section 26.99, Determining the need for a confirmatory test for alcohol

> Paragraph 26.99(b) requires the collector to ensure that the time when an initial test whose result is 0.02 percent Blood Alcohol Content (BAC) or higher was concluded (i.e., the time at which the test result was known) is recorded.

This requirement is necessary to ensure that the length of time the donor had been in work status when the initial test was conducted can be determined, in order to calculate the actual level while the individual was in work status, which is one factor under §26.103 in determining whether to declare a confirmed positive test result. In addition, by recording the time of the initial test, the FFD program can demonstrate that the 15-minute waiting period required by §26.93(a), if necessary, has occurred before the initial alcohol test was done. This requirement also is necessary to ensure that the confirmatory test is done, as required by §26.101, no more than 30 minutes after the conclusion of the initial test.

Recordkeeping requirements for §26.99(b) are established by §26.715(b)(6).

Section 26.101, Conducting a confirmatory test for alcohol

> Paragraph 26.101(b)(7) requires the collector to show the donor the result displayed upon or printed by the EBT, record the result, and document the time at which the confirmatory test result was known.

This requirement is necessary so that the donor can personally know that a particular device was used for the confirmatory test, the indicated confirmatory test result, and the fact that the confirmatory test result was recorded correctly. The record of the result of the confirmatory test and the time at which the result was known also provide important information for determining whether or not a confirmed positive test result for alcohol must be declared. This requirement also provides important information for tracking the activities of the FFD program, and help to ensure that information is available for audits and NRC inspections. This requirement also partially meets the legal necessity of protecting the due process rights of individuals who are subject to Part 26, and also proving “prior notice” and having it documented for evidence in legal proceedings.

Recordkeeping requirements for §26.101(b)(7) are established by §26.715(b)(6).

Section 26.103, Determining a confirmed positive test result for alcohol

> Paragraph 26.103(b) requires the collector to declare test results as negative where the results show BAC below .02 but at or above .01, if the donor has been at work status for 3 hours or more. The collector informs FFD management and the licensee or other entity prohibits the donor from duties subject to Part 26 until a determination of fitness is made.

This third party collection requirement is necessary to ensure that FFD management is notified so that appropriate actions, including a determination of fitness, can be undertaken under the FFD procedures.

Recordkeeping requirements for §26.103(b) are established by §26.715(b)(6).

Section 26.107, Collecting a urine sample

Paragraph 26.107(b) requires the collector to document on the custody-and-control form any conduct that clearly indicates an attempt to tamper with a specimen.

This requirement is an integral part of the collection procedure and is essential to documenting the chain of custody for the specimens collected. Because it is expected to be an infrequent occurrence, it does not create a significant additional burden. However, it is necessary to ensure that an immediate record of any attempt to tamper with a specimen is prepared and accompanies the specimen, such as an attempt to bring an adulterant or urine substitute into the room or stall used for urination.

Recordkeeping requirements for §26.107(b) are established by §26.715(b)(6).

Section 26.109, Urine specimen quantity

Paragraph 26.109(b)(3) requires that, if the donor has not provided a specimen of at least 30 mL within 3 hours of the first unsuccessful attempt, the collector shall discontinue the collection and notify the FFD program manager or MRO to initiate the “shy bladder” procedures in §26.119.

Paragraph 26.109(b)(4) requires the collector to discard specimens less than 30mL, unless the collector has reason to believe that the donor had diluted, adulterated, substituted, or otherwise tampered with the specimen. In that event, if the sample is greater than 15mL and less than 30mL, the collectoris required to prepare the specimen for shipping to the HHS-certified lab and contact FFD management to determine whether a directly observed collection is required.

These third-party collection requirements are necessary to ensure that the FFD program manager or MRO is informed to collection problems involving a particular donor so that the FFD program manager or MRO can initiate alternative procedures for which their approval is required.

Recordkeeping requirements for §26.109(b)(4) are established by §26.715(b)(6).

Section 26.111, Checking the validity of the urine specimen

Paragraph 26.111(b) requires the collector to inspect the urine specimen and to note any unusual findings on the custody-and-control form.

This requirement is an integral part of the collection procedure and is essential to documenting the chain of custody for the specimens collected. Because it is expected to be an infrequent occurrence, it does not create a significant additional burden. However, the information provided could be useful to a laboratory conducting testing and ensures the scientific supportability of the test results in case of a review in support of a determination of fitness and/or legal proceedings.

Recordkeeping requirements for §26.111(b) are established by §26.715(b)(2).

Paragraph 26.111(c) requires the collector to contact the designated FFD manager if the collector has the reasonable belief, based on observation, that the donor may have

attempted to dilute, substitute or adulterate the specimen. The FFD manager may require the donor to provide a second specimen under supervision.

This third-party collection requirement is necessary to ensure that the FFD program manager is informed of the possibility that a donor may have attempted to dilure, substitute, or adulterate a specimen, so that the FFD program manager can examine the circumstances and determine whether to initiate appropriate management actions, including notification to the NRC if the facts of attempted dilution, substitution, or adulteration of a specimen are confirmed.

Recordkeeping requirements for §26.111(c) are established by §26.715(b)(6).

Section 26.113 Splitting the urine specimen

Paragraph 26.113 (b)(3) requires the collector to prepare custody-and-control forms for both specimens when the urine specimen is split into two specimen bottles.

This requirement is an integral part of the collection procedure and is essential to documenting the chain of custody for the specimens collected. Chain of custody, in turn, is a fundamental procedure for sample analysis, because it ensures that there is a record demonstrating that the specimens analyzed by the laboratory are the same specimens that were obtained from the donor. When the sample is split into two specimen bottles, a chain-of-custody form must be prepared to accompany each bottle to properly identify each testing result.

Recordkeeping requirements for §26.113(b)(3) are established by §26.715(b)(2).

Section 26.115, Collecting a urine specimen under direct observation

Paragraph 26.115(b) requires that, before collecting a urine specimen under direct observation, the collector must obtain the agreement of the FFD program manager or MRO.

This requirement is necessary because of the intrusive nature of collection of a urine specimen under direct observation. Therefore, a person qualified in making the determination that direct collection should be used must make that decision and document it.

Recordkeeping requirements for §26.115(b) are established by §26.715(a).

Paragraph 26.115(d) requires the collector to complete a new custody-and-control form for a specimen obtained from a directly observed collection, and to record on the form that the collection was observed and the reason(s) for the observed collection.

The third-party collection requirement in §26.115(b) is necessary to ensure that the FFD program manager or MRO is informed of the need for a collection under direct observation, so that the FFD program manager or MRO can examine the circumstances and approve or deny the request for a collection under direct observation. The FFD program manager or MRO, not the collector, are qualified and assigned the duty of making the determination. The requirement to complete a new custody-and-control form, and record the basis for the collection, is an integral part of the collection procedure and is essential to documenting circumstances of collection in case of subsequent legal proceedings.

Recordkeeping requirements for §26.115(d) are established by §26.715(b)(2).

Paragraph 26.115(f)(3) requires that, if someone other than the collector observed the collection, the collector must record the observer's name on the custody-and-control form.

This requirement is an integral part of the collection procedure and is essential to documenting the identity of the observer in case of subsequent legal proceedings.

Recordkeeping requirements for §26.115(f)(3) are established by §26.715 (b)(2).

Section 26.117, Preparing urine specimens for storage and shipping

Paragraph 26.117(c) requires the collector to place an identification label containing the date, the donor's specimen number, and any other identifying information provided or required by the FFD program securely on each specimen container.

Paragraph 26.117(d) requires the donor to initial the identification label(s) on the specimen bottle(s) and to read and sign a statement on the custody-and-control form certifying that the specimen(s) identified as having been collected from the donor is, in fact, the specimen(s) that the donor provided.

Paragraph 26.117(e) requires the collector to complete the custody-and-control form (or forms for both Bottle A and Bottle B, if split specimens procedures were followed) and certify proper completion of the collection.

Paragraph 26.117(k) requires that custody accountability of shipping containers during shipment by couriers, express carriers, and the postal service must be maintained by a tracking system provided by the courier, express carrier, or postal service.

The requirements in §§26.117(c), (d), and (e) are an integral part of the collection procedure and are essential to documenting the chain of custody for the specimens collected. The provision in §26.117(k) is not intended to create a third-party recordkeeping requirement. Use of such tracking systems by couriers, express carriers, and the postal service is an ordinary business practice and relied upon for all shipments. The provision is intended to notify licensees and other entities that they may rely upon the tracking system provided by the courier, express carrier, or postal service.

Recordkeeping requirements for §26.117(c), (d), and (e) are established by §26.715(b)(2).

Section 26.119, Determining "shy" bladder

Paragraph 26.119(a) requires a donor who has not provided a specimen of at least 30 mL within the 3 hours permitted for urine collection to obtain, within 5 business days, an evaluation from a licensed physician, or from the MRO if the MRO has the appropriate expertise.

This requirement is necessary to ensure that a qualified MRO or licensed physician prepares an evaluation of whether the medical condition of the donor was or could have with a high probability been the basis for the donor's failure to provide a specimen.

Paragraph 26.119(b) requires the MRO, if the MRO is not performing the evaluation, to provide the physician who is performing the evaluation with information about the donor

and the testing requirements, and instructions about the determination to be made by the physician.

Paragraph 26.119(e) requires a physician who performs an evaluation of the donor's failure to provide a sufficient specimen to prepare a written statement of his or her determination and the basis for it and to provide the statement to the MRO.

Paragraph 26.119(f) requires the physician, if he or she determines that the donor's medical condition is a serious and permanent or long-term disability that is highly likely to prevent the donor from providing a sufficient amount of urine for a very long or indefinite period of time, to set forth this determination and the reasons for it in the written statement to the MRO.

These requirements are necessary to ensure that if a donor does not provide a specimen within the specified time, then a medical evaluation, based on specified information and instructions, is prepared and provided in writing to the MRO. The medical evaluation, in part, provides an opportunity to the donor to demonstrate that the failure to provide the specimen is not an attempt to subvert the testing process but is, instead, the result of a valid medical condition, and helps to ensure that the licensee or other entity does not inappropriately impose sanctions on the individual.

Recordkeeping requirements related to maintaining a record of the donor's testing results for §26.119(a), (b), (e) and (f) are established by §26.715(b)(6).

Third-party recordkeeping requirements related to providing instructions and making a written determination for §§26.119(a), (b) (e), and (f) are established by §26.119 itself.

Section 26.125, Licensee testing facility personnel

Paragraph 26.125(b) requires technicians who perform urine specimen testing to have documented proficiency in operating the testing instruments and devices used at the licensee testing facility.

Paragraph 26.125(c) requires licensee testing facility files to include each individual's resume of training and experience, certification of license, if any; references; job descriptions; records of performance evaluations and advancement; incident reports, if any; results of tests that establish the employee's competency for the position he or she holds, includiing certification that personnel are proficient in conducting testing; and appropriate data to support determinations of honesty and integrity required by Part 26.

These requirements are necessary to ensure that the training, competency of the technicians and staff of a licensee testing facility to correctly use the instruments and devices that the licensee testing facility has selected can be verified This is an important support for the review process underlying determinations of fitness. In addition, records of training and competency may be important evidence in any litigation that may occur with respect to test results. Records of training and competency of licensee testing facility personnel also supports reliance by licensees and other entities on test results from testing that was performed by another Part 26 program.

Recordkeeping requirements for §26.125(b) and (c) are established by §26.715(a) and (b)(1).

Section 26.127, Procedures

Paragraph 26.127(a) requires licensee testing facilities to develop, implement, and maintain clear and well-documented procedures for accession, receipt, shipment, and testing of urine specimens.

Paragraph 26.127(b) requires licensee testing facilities to have written chain-of-custody procedures describing the methods to be used to maintain control and accountability of specimens from receipt through completion of testing and reporting of results, during storage and shipping to the HHS-certified laboratory, and continuing until final disposition of the specimens.

Paragraph 26.127(c) requires licensee testing facilities to develop, implement, and maintain written standard operating procedures for each assay performed for drug and specimen validity testing. If the licensee testing facility performs validity screening tests, the facility is also be required to develop, implement, and maintain written standard operating procedures for each device. The procedures must include detailed descriptions of the principles of each test; preparation of reagents, standards, and controls; calibration procedures; derivation of results; linearity of the methods; cutoff values; mechanisms for reporting results; controls; criteria for unacceptable specimens and results; reagents and expiration dates; and references.

Paragraph 26.127(d) requires licensee testing facilities to develop, implement, and maintain written procedures for instrument and device setup and normal operation that include a schedule for checking critical operating characteristics for all instruments and devices; tolerance limits for acceptable function checks; and instructions for major troubleshooting and repair.

Paragraph 26.127(e) requires licensee testing facilities to develop, implement, and maintain written procedures for remedial actions to be taken when systems and instrumented and non-instrumented testing devices (if used for validity screening tests) are out of acceptable limits or errors are detected. Each facility is required to maintain documentation that these procedures are followed and that all necessary corrective actions are taken. In addition, all facilities are required to have systems in place and to verify all stages of testing and reporting and to document the verification.

These requirements are an integral part of the quality assurance/quality control process for every testing facility and are essential to documenting the procedures to be followed to ensure that all steps in the testing and analysis process, including chain-of-custody for the specimens collected, are carried out in an appropriate manner by all personnel conducting the activities.

Recordkeeping requirements for §26.127(a), (b), (c), (d) and (e) are established by §26.715(a).

Section 26.129, Assuring specimen security, chain of custody, and preservation

Paragraph 26.129(a) requires each licensee testing facility to limit access to secured areas only to specifically authorized individuals whose authorization is documented.

This requirement, which involves the collection of signatures of persons visiting the secured areas of testing facilities and a check of their credentials or other authorization for such entry, is

necessary to ensure that unauthorized persons do not gain access to testing areas, where they might seek to subvert the testing process.

Paragraph 26.129(b) requires licensee testing facility personnel to inspect each package when specimens are received for evidence of possible tampering and to compare the information on the specimen containers within each package to the information on the accompanying custody-and-control forms, and to attempt to resolve any discrepancies. When resolving any discrepancies, licensee testing facility personnel are required to obtain a memorandum for the record from the specimen collector to document correction of the discrepancy. The memorandum must accompany the specimens and custody-and-control forms if the specimens must be transferred.

This requirement is necessary to ensure that a record of the resolution of any discrepancies involving information about specimens is prepared and accompanies the specimens following the resolution of the discrepancy. This will avoid duplicative efforts to resolve discrepancies and will ensure that the information accompanying the specimen is correct.

Paragraph 26.129(b)(1) requires licensee testing facilities to report to licensee senior management any indications of tampering with specimens in transit from the collection site or at a testing facility, or discrepancies in the information on specimen bottles or on the accompanying custody-and-control forms. Such reports are required to be made as soon as practical and no later than 8 hours after the indications are identified.

This requirement is necessary because confirmed reports of tampering must be reported to the NRC as required by §26.719(b).

Paragraph 26.129(d) requires licensee testing facilities's procedures for tracking custody and control of specimens to protect the identity of the donor. The facilities are required to provide documentation of the testing process and each transfer of custody of the specimen, along with the date and purpose and every individual in the chain of custody.

Paragraph 26.129(h) requires that custody accountability of shipping containers during shipment by couriers, express carriers, and the postal service must be maintained by a tracking system provided by the courier, express carrier, or postal service.

These requirements are an integral part of the quality assurance/quality control process for every testing facility and are essential to ensuring the security from tampering of the specimens collected and appropriate and timely actions if possible tampering is suspected. These requirements are necessary to protect donors from inaccurate results, to provide assurance that specimens of questionable validity are detected, and to ensure the integrity of the testing process.

The provision in §26.129(h) is not intended to create a third-party recordkeeping requirement. Use of such tracking systems by couriers, express carriers, and the postal service is an ordinary business practice and relied upon for all shipments. The provision is intended to notify licensees and other entities that they may rely upon the tracking system provided by the courier, express carrier, or postal service.

Third-party recordkeeping requirements for §26.129(a) are established by §26.715(b)(13).

Third-party recordkeeping requirements for §26.129(b) are established by §26.715(b)(2).

Third-party recordkeeping requirements for §26.129(b)(1) are established by §26.715(b)(3).

Third-party recordkeeping requirements for §26.129(d) are established by §26.715(b)(2).

Section 26.135, Split Specimens

Paragraph 26.135(b) allows, upon a non-negative result, the donor to request that a split specimen (if the FFD program follows split specimen procedures as described in §26.113 be tested at another HHS-certified laboratory. The donor provides his or her written permission for the testing of bottle B.

This requirement is necessary in order to ensure that a record exists of the donor's approval of a second test, in case of subsequent legal proceedings.

Third-party recordkeeping requirements for §26.135(b) are established by §26.715(b)(6).

Section 26.137, Quality assurance and quality control

Paragraph 26.137(a) requires each licensee testing facility to develop and implement a quality assurance program and quality assurance procedures encompassing all aspects of the testing process.

These requirements are an integral part of the quality assurance/quality control process for all testing and laboratory facilities. The requirements are necessary to protect donors from inaccurate results and to provide assurance that specimens of questionable validity are detected.

Paragraph 26.137(b)(1)(ii) requires the licensee or other entity before using the test, to ensure that the validity screening test, by lot number, effectively identifies specimens of questionable validity by meeting the performance testing and quality control requirements listed in this section.

Paragraph 26.137(b)(1)(iii) requires a licensing testing facility that has placed a validity screening test in service to either verify that the device remains on the SAMHSA-approved list or if the list is unavailable, ensure the manufacturer's documentation documents the test's validity and that the licensee conducts performance testing at a nominal annual frequency.

These requirements are necessary to ensure that all point-of-collection testing devices used by a licensee testing facility meet certain minimum performance criteria. This will protect donors from inaccurate test results and provide assurance that specimens of questionable validity are detected.

Recordkeeping requirements for §26.137(a) are established by §26.715(b)(3).

Recordkeeping requirements for §26.137(b)(1)(ii) and (iii) are established by §26.715(b)(7).

Paragraph 26.137(b)(3) requires licensee testing facilities to submit at least one specimen out of every 10 that test negative using each validity screening test to an HHS-certified laboratory as part of the licensee testing facility's quality assurance program.

This requirement is an integral part of the quality control/quality assurance process and protects donors from inaccurate test results as well as providing assurance that specimens of questionable validity are detected.

Reporting requirements for §26.137(b)(3) are established by §26.719(c)(3).

Paragraph 26.137(e)(7) requires licensee testing facilities to document the implementation of procedures to ensure that carryover [i.e., materials from a previous test that have not been adequately purged from the apparatus] does not contaminate the testing of a donor's specimen.

Paragraph 26.137(f)(5) requires licensee testing facilities to prepare a record of findings and corrective actions taken, where applicable, for all investigations of any testing errors or unsatisfactory performance discovered in the testing of quality control samples, in the testing of actual specimens, or through the processing of management reviews or MRO reviews. The record must be signed and dated by the individuals who are responsible for the day-to-day management of the licensee testing facility and reported to appropriate levels of management.

Paragraph 26.137(h) requires standards and controls to be labeled with dates of when received, when prepared or opened, when placed in service, and when scheduled for expiration.

These requirements are an integral part of the quality assurance/quality control process for all testing and laboratory facilities. The requirements are necessary to protect donors from inaccurate results and to provide assurance that specimens of questionable validity are detected.

Recordkeeping requirements for §26.137(e)(8) are established by §26.715 (b)(3).

Recordkeeping requirements for §26.137(f) are established by §26.715(b)(8).

Recordkeeping requirements for §26.137(h) are established by §26.715(b)(5).

Section 26.139, Reporting initial validity and drug test results

Paragraph 26.139(d) requires licensee testing facilities to prepare information for annual reports to the NRC, as required in §26.717.

This requirement is necessary to ensure that the NRC can monitor testing program effectiveness. The NRC has concluded that annual reporting creates the appropriate balance between reporting burden and the NRC's need for information. Section 26.717 of the rule specifies the program performance data to be included in the annual report.

Reporting requirements under §26.139(d) are established by §26.717(b) and (e).

Section 26.153, Using certified laboratories for testing urine specimens

Paragraph 26.153(e) requires a licensee or other entity, before awarding a contract to an HHS-certified laboratory, to conduct a pre-award inspection and evaluation of the procedural aspects of the laboratory's drug testing operations.

Paragraph 26.153(f) requires licensees' and other entities' contracts with HHS-certified laboratories to implement all applicable obligations of Part 26 and specifies minimum requirements.

The third-party recordkeeping of the pre-award inspection and evaluation in the form of documentation of the inspection and evalution ensures that FFD program personnel and managers not personally participating in the inspection and evaluation can review and assess the qualifications of the laboratory and make informed decisions about contracting with that laboratory.

Recordkeeping requirements for §26.153(e) are established by §26.715(b)(9).

Recordkeeping requirements for §26.153(f) are established by §26.713(e).

Paragraph 26.153(g) requires licensees or other entities who use a form other than the current Federal custody-and-control form to provide a memorandum to the HHS-certified laboratory explaining why a non-Federal form was used, and to ensure that the form used contains all the required information on the Federal custody-and-control form.

This requirement is consistent with the HHS Mandatory Guidelines for Federal Workplace Drug Testing Programs. Under the HHS Guidelines, laboratories may reject any specimen that is submitted for testing with a non-Federal custody-and-control form unless the licensee or other entity provides a memorandum for the record. The paragraph is necessary to prevent licensee's and other entity's specimens from being rejected.

Recordkeeping requirements for §26.153(g) are established by §26.715(b)(2).

Section 26.155, Laboratory personnel

Paragraph 26.155(a)(1) requires day-to-day management of the HHS-certified laboratory to be performed by an individual with documented scientific qualifications in analytic forensic toxicology.

Paragraph 26.155(a)(3) requires the individual to ensure the continued competency of laboratory personnel by documenting their in-service training, reviewing their work performance, and verifying their skills.

Paragraph 26.155(a)(4) requires the day-to-day manager to review, sign, and date procedures to be followed by laboratory personnel whenever the procedures are first placed into use or changed or when a new individual assumes responsibility for management of the laboratory, and to ensure that copies of all procedures are maintained.

Paragraph 26.155(a)(5) requires the day-to-day manager to maintain a quality assurance program that, among other things, documents the validity, reliability, accuracy, precision, and performance characteristics of each test and test system.

Paragraph 26.155(b) requires that each HHS-certified laboratory have at least one certifying scientist to certify test results. The paragraph specifies the requirements for the certifying scientist.

Paragraph 26.155(c) requires that each HHS-certified laboratory assign at least one individual to be responsible for day-to-day operations and supervision of the technical analysts. The paragraph specifies the requirements for the analysts' supervisor.

Paragraph 26.155(e) requires that HHS-certified laboratories make available continuing education programs for personnel.

Paragraph 26.155(f) requires each laboratory personnel file to include a resume, any professional certifications or licenses, a job description, and documentation to show that the individual has been properly trained to perform his or her job function.

These requirements are consistent with the HHS Mandatory Guidelines for Federal Workplace Drug Testing Programs, Sections 11.2 and 11.3. HHS explains (69 FR 19691, April 13, 2004), that these recordkeeping requirements are necessary for any laboratory to conduct forensic drug testing and to ensure the scientific supportability of the test results. As standard business practices, they are not considered a burden for this analysis.

Recordkeeping requirements for §§26.155(a)(1), (a)(3), (b), and (c) are established by §26.155(f).

Recordkeeping requirements for §26.155(a)(4) are established by §26.157.

Recordkeeping requirements for§26.155(a)(5) are established by §26.715(b)(3).

The recordkeeping burden for §26.155(e) and (f) is captured under HHS OMB control number 0930-0158.

Section 26.157, Procedures

Paragraph 26.157(a) requires HHS-certified laboratories to develop, implement, and maintain clear and well-documented procedures for accession, receipt, shipment, and testing of urine specimens.

Paragraph 26.157(b) requires HHS-certified laboratories to have written chain-of-custody procedures describing the methods to be used to maintain control and accountability of specimens from receipt through completion of testing and reporting of results, during storage and shipping to another HHS-certified laboratory, if required, and continuing until final disposition of the specimens.

Paragraph 26.157(c) requires HHS-certified laboratories to develop, implement, and maintain a written standard operating procedures manual for each assay performed for drug and specimen validity testing. If the licensee testing facility performs validity screening tests with non-instrumented devices, the facility is also required to develop, implement, and maintain written standard operating procedures for each device.

Paragraph 26.157(d) requires HHS-certified laboratories to develop, implement, and maintain written procedures for instrument and device setup and normal operation.

Paragraph 26.157(e) requires HHS-certified laboratories to develop, implement, and maintain written procedures for remedial actions to be taken when systems and non-instrumented testing devices (if used for validity screening tests) are out of acceptable

limits or errors are detected. Each facility is required to maintain documentation that these procedures are followed and that all necessary corrective actions are taken. In addition, all facilities are required to have systems in place and to verify all stages of testing and reporting and to document the verification.

These requirements are consistent with the HHS Mandatory Guidelines for Federal Workplace Drug Testing Programs, Section 11.1. These recordkeeping requirements are necessary for any laboratory to conduct forensic drug testing and to ensure the scientific supportability of the test results. As standard business practices, they are not considered a burden for this analysis.

The recordkeeping burden for §26.157(a), (b), (c), (d) and (e) is captured under HHS OMB control number 0930-0158 .

Section 26.159, Assuring specimen security, chain of custody, and preservation

Paragraph 26.159(a) requires each HHS-certified laboratory to limit access to secured areas only to specifically authorized individuals whose authorization is documented.

Paragraph 26.159(b) requires HHS-certified laboratories to inspect each shipment of specimens for evidence of possible tampering and to compare information on specimen bottles within each package to the information on the accompanying custody-and-control forms. Any direct evidence of tampering or discrepancies in the information on the specimen bottles and the custody-and-control forms attached to the specimen bottles must be reported to the licensee or other entity within 24 hours of the discovery and must be noted on the custody-and-control forms for each specimen contained in the package.

Paragraph 26.159(c) requires laboratory personnel to use aliquots and laboratory internal custody-and-control forms when conducting initial and confirmatory tests, and that these forms remain in secure storage.

Paragraph 26.159(d) requires each HHS-certified laboratory's internal custody-and-control form to allow for identification of the donor, and documentation of the testing process and transfers of custody of the specimen.

Paragraph 26.159(e) requires each HHS-certified laboratory's personnel to document the date and purpose each time a specimen is handled or transferred within the laboratory on the custody-and-control form, and to identify every individual in the chain. Authorized technicians are required to sign and complete custody-and-control forms for each specimen or aliquot as they are received.

Paragraph 26.159(f) requires that, when transferring a specimen to a second HHS-certified laboratory, the original custody-and-control form is packaged with its associated urine specimen bottle.

Paragraph 26.159(i) requires that, unless otherwise authorized in writing, specimens be retained in proper storage for 1 year.

These requirements are consistent with the HHS Mandatory Guidelines for Federal Workplace Drug Testing Programs, Sections 11.7, 11.8., and 16.1. These requirements are necessary for any laboratory to conduct forensic drug testing and to ensure the scientific supportability of the test results. As standard business practices, they are not considered a burden for this analysis.

The recordkeeping burden for §26.159(a) is captured under HHS OMB control number 0930-0158.

Recordkeeping requirements for §26.159(b) are established by §26.715(b)(3).

Recordkeeping requirements for §26.159(c), (d), (e), (f), and (i) are established by §26.715(b)(2).

Reporting requirements for reports of tampering to NRC under §26.159(b) are established by §26.719(b)(3).

Section 26.163, Cutoff levels for drugs and drug metabolites

Paragraph 26.163(a)(2) specifies that if initial validity testing indicates that a specimen is dilute, and any response is equal to or greater than 50 percent of the cutoff, the HHS-certified laboratory shall test the specimen for those drugs and/or drug metabolites down to the confirmatory assay's limit of detection (LOD). The laboratory shall report the numerical values obtained from this special analysis to the MRO.

This requirement is necessary to validate a dilute result to protect donors from inaccurate results, to provide assurance that specimens of questionable validity are detected, and to ensure the integrity of the testing process.

The recordkeeping requirements for §26.163(a)(2) are established by §26.715(b)(6).

Section 26.165, Testing split specimens and retesting single specimens

Paragraph 26.165(b)(1) requires that for a confirmed positive, adulterated, or substituted result reported on a single specimen of 30 mL or more, or a specimen in Bottle A of a split specimen which the donor submitted to the licensee or other entity, a donor may request (through the MRO) that an aliquot from the single specimen or the split (Bottle B) specimen be tested by a second HHS-certified laboratory to verify the result reported by the first laboratory. For an invalid test result, a donor may not request that an aliquot from the single specimen or the split specimen in Bottle B be tested by a second HHS-certified laboratory.

Paragraph 25.165(b)(2) requires the MRO to inform the donor that he or she may, within 3 business days of notification by the MRO of the confirmed positive, adulterated, or substituted test result, request the re-testing of an aliquot of the single specimen or the testing of the Bottle B split specimen. The MRO shall provide the donor with specific instructions for making this request (i.e., providing telephone numbers or other contact information). The MRO is required to have the ability to receive the donor's calls at all times during the 3-day period (e.g., by use of an answering machine with a "time stamp" feature when there is no one in the MRO's office to answer the phone.) The donor's request may be oral or in writing. .

Paragraph 25.165(b)(3) requires the donor to provide his or her permission for re-testing an aliquot of the single specimen or the testing of Bottle B.

Paragraph 25.165(b)(4) provides that if the donor has not requested a retest of an aliquot of a single specimen or a test of the split specimen within 3 business days, the donor may

present to the MRO information documenting that serious injury, illness, lack of actual notice of the confirmed test result, inability to contact the MRO, or other circumstances unavoidably prevented the donor from making a timely request. If the MRO concludes that there was a legitimate reason for the donor's failure to contact the MRO within 3 business days, the MRO shall direct the retesting take place, as if the donor had made a timely request.

Paragraph 26.165(b)(6) requires the HHS-certified laboratory that re-tests an aliquot of a single specimen or tests the specimen in Bottle B to provide the test results to the MRO and the MRO to provide the test results to the donor.

Paragraph 25.165(c)(4) provides that a second laboratory conducting retesting shall report all results to the licensee's or other entity's MRO.

Paragraph 26.165(f)(1) specifies that a licensee or other entity may administratively withdraw an individual's authorization on the basis of a first confirmed positive, adulterated, or substituted test result until the results of testing Bottle B or retesting an aliquot of a single specimen are available and have been reviewed by the MRO. Paragraph 26.165(f)(1) requires that licensees and other entities may not disclose the temporary administrative action against an individual whose initial drug test result is not subsequently confirmed by the MRO as a violation of FFD policy in response to a suitable inquiry conducted under §26.63, a background investigation conducted under Part 26, or to any other inquiry or investigation. The licensees or other entities must provide access to the system of files and records to personnel who are conducting reviews, inquiries into allegations, audits under §26.41, and to NRC inspectors, to ensure that no records are retained. The licensees or other entities shall provide the tested individual with a written statement that the records specified in §§26.713 and 26.715 have not been retained, and shall inform the individual in writing that the temporary administrative action that was taken will not be disclosed and need not be disclosed by the individual in response to requests for self-disclosure of potentially disqualifying FFD information.

Paragraph 26.165(f)(1)(ii) requires that the licensee or other entity eliminate any matter from the individual's FFD record and other records that could link the individual to the temporary administrative action immediately upon receipt of a negative report from the testing of Bottle B or retesting the aliquot of a single specimen.

Paragraph 26.165(f)(1)(iv) requires that the licensee or other entity provide the tested individual with a written statement that the records specified in §§26.713 and 26.715 have not been retained and shall inform the individual in writing that the temporary administrative action that was taken will not be disclosed.

Paragraph 26.165(f)(2) requires that if the donor requests that either Bottle B be tested or an aliquot of a single specimen be retested and either is not available, the MRO shall cancel the test and inform the licensee or other entity that another collection is required under direct observation as soon as reasonably practical. The licensee or other entity shall eliminate from the donor's personnel and other records any matter that could link the donor to the original positive, adulterated, or substituted test result(s) or any temporary administrative action.

These requirements are necessary to provide donors with the opportunity to request that either Bottle B of a split specimen or an aliquot of a single specimen be tested if an initial non-

negative test result is obtained, and to ensure that no records of a temporary administrative action taken as a result of an initial non-negative test result are retained if a negative report is received from the testing of Bottle B or retesting of an aliquot of a single specimen. These requirements are, in part, consistent with the HHS Mandatory Guidelines for Federal Workplace Drug Testing Programs, Section 15.1. The requirements are necessary to protect donors from inaccurate results and to provide assurance that specimens of questionable validity are detected. They also assure to the donor the confidential nature of temporary administrative actions.

Recordkeeping requirements for the test result collections in §26.165(b)(1), (b)(6), and (c)(4) are established by §26.715(b)(6).

Recordkeeping requirements for third-party collections for notifications to the donor, permissions by the donor, and access to records by the NRC inspectors under §26.165(b)(1), (b)(2), (b)(3), (b)(4), (b)(6), (f)(1), (f)(1)(ii), (f)(1)(iv), and (f)(2) are established in this section.

Section 26.167, Quality assurance and quality control

> Paragraph 26.167(a) requires each HHS-certified laboratory to have a quality assurance program encompassing all aspects of the testing process, including, but not limited to, specimen accessioning, chain of custody, security and reporting of results, initial and confirmatory testing, certification of calibrators and controls, and validation of analytical procedures. The performance characteristics (e.g., accuracy, precision, limit of detection (LOD), limit of quantitation (LOQ), specificity) of each test must be validated and documented for each test. Validation procedures must document that carryover does not affect the donor's specimen results. Periodic re-verification of analytical procedures is required. Quality assurance procedures must be designed, implemented, and reviewed to monitor the conduct of each step of the testing process.

This requirement is consistent with the HHS Mandatory Guidelines for Federal Workplace Drug Testing Programs. These recordkeeping requirements are necessary for any laboratory to conduct forensic drug testing, and to ensure the scientific legitimacy of test results. As standard business practices, they are not considered a burden for this analysis.

> Paragraph 26.167(c)(2)(i) requires a refractometer used by an HHS-certified laboratory to report and display the specific gravity to 4 decimal places and to be interfaced with a laboratory information management system or computer and/or to generate a hard copy or digital electronic display to document the numerical result.

This requirement is necessary to establish the specifications for refractometers used in HHS-certified laboratories to perform tests for FFD programs. The section does not create any separate records, but determines the types of records that will be created under other sections of Part 26. The section is consistent with the HHS Mandatory Guidelines for Federal Workplace Drug Testing Programs. This requirement also is necessary to protect donors from inaccurate results, to allow donors to see the result, and to ensure the integrity of the testing process.

Recordkeeping requirements for the records created meeting the specifications of §26.167(c)(2)(i) under other sections of Part 26 are established by §26.715(b)(14).

Paragraph 26.167(f) requires the licensee or other entity to ensure that the HHS-certified laboratory investigates any testing errors or unsatisfactory performance. Paragraph 26.167(f)(1) requires sufficient records to be maintained to furnish evidence of activities affecting quality. The identification of the significant condition, the cause of the condition, and the corrective action taken are required to be documented and reported to appropriate levels of management Paragraph 26.167(f)(3) requires, if a false positive error occurs on a blind performance test sample and the error is determined to be technical or methodological, that the licensee or other entity instruct the laboratory to provide all quality control data from the batch or analytical run of specimens that included the false positive sample. If retesting is required, the retesting must be documented by a statement signed by the laboratory's certifying scientist.

These requirements are consistent with the HHS Mandatory Guidelines for Federal Workplace Drug Testing Programs and with 10 CFR Part 50, Appendix B, Quality Assurance Requirements for Nuclear Power Plants and Fuel Reprocessing Plants, Criterion XVI, Quality Assurance Records. These requirements are necessary to protect donors from inaccurate results, to provide assurance that specimens of questionable validity are detected, and to ensure the integrity of the testing process.

Paragraph 26.167(h) requires laboratory calibrators and controls to be prepared using pure drug reference materials, stock standard solutions obtained from other laboratories, or standard solutions that are obtained from commercial manufacturers and that are properly labeled as to content and concentration. The standards and controls must be labeled with the dates when they are received, when prepared or opened, when placed in service, and when scheduled for expiration.

These requirements are consistent with the HHS Mandatory Guidelines for Federal Workplace Drug Testing Programs and are standard business and laboratory practices necessary for any laboratory to conduct forensic drug testing, and to ensure the scientific legitimacy of test results. As standard business practices, they are not considered a burden for this analysis.

Recordkeeping requirements for §§26.167(a), (c)(2)(i), and (f) are established by §26.715(b)(7).

Recordkeeping requirements for §26.167(h) are established by §26.715(b)(3).

Section 26.168, Blind performance testing

Paragraph 26.168(a) requires each licensee or other entity to submit blind performance test samples to the HHS-certified laboratory. Sixty percent of the blind performance test samples submitted to the laboratory must be positive for one or more drugs.

This third-party collection requirement involves the use of a simple standard form, and is a standard business practice of laboratories that prepare blind performance test samples.

Paragraph 26.168 (h)(2) requires each licensee or other entity to ensure that the supplier of blind performance test samples provides the expiration date for each test sample.

This third-party collection requirement is a standard business practice of laboratories that prepare blind performance test samples.

Paragraph 26.168(i)(2) requires each licensee or other entity to use a custody-and-control form, place fictional initials on the specimen bottles' labels/seals, and indicate for the MRO on the MRO's copy that the speciemn is a blind performance test sample.

This third-party collection requirement is a standard business practice for blind performance test samples.

Section 26.169, Reporting results

Paragraph 26.169(a) requires HHS-certified laboratories to report test results to the licensee's or other entity's MRO within 5 business days after receiving the specimen. Before reporting any test result, the laboratory's certifying scientist must certify the result as correct. The report must identify the substances for which testing was performed; the results of the validity and drug tests; the cutoff levels for each; any indications of tampering, adulteration, or substitution that may be present; the specimen identification number assigned by the licensee or other entity; and the specimen identification number assigned by the laboratory.

Paragraph 26.169(c)(1) requires HHS-certified laboratories to report all positive, adulterated, substituted, dilute, and invalid test results to the MRO.

Paragraph 26.169(c)(2) requires HHS-certified laboratories to report to the MRO numerical values for all positive test results if the MRO requests them. The laboratory shall routinely provide quantitative values for confirmatory opiate test results for morphine or codeine that are greater than or equal to 15,000 ng/mL, even if the MRO has not requested quantitative values for the test result.

Paragraph 26.169(c)(3) requires HHS-certified laboratories to report to the MRO numerical values for all adulterated or substituted test results.

Paragraph 26.169(c)(4) requires the HHS-certified laboratory to contact the MRO and both will decide whether testing by another certified laboratory would be useful in being able to report a positive or adulterated result.

Paragraph 26.169(c)(5) an HHS-certified laboratory may report to the MRO that the quantitative value "exceeds the linear range of the test," that the quantitative value is "equal to or greater than <insert the value for the upper limit of the linear range>," or may report an accurate quantitative value above the upper limit of the linear range that was obtained by diluting an aliquot of the specimen.

Paragraph 26.169(e) requires the HHS-certified laboratory to transmit results by electronic means (e.g., teleprinter, facsimile, or computer) in a manner designed to ensure the confidentiality of the information, and would prohibits transmitting results verbally by telephone.

Paragraph 26.169(f) requires the HHS-certified laboratory to fax, courier, mail, or electronically transmit a computer-generated electronic report and/or a legible image or copy of the completed custody-and-control form to the MRO. However, for positive, adulterated, substituted, dilute, and invalid results, the laboratory shall fax, courier, mail, or electronically transmit a legible image or copy of the completed custody-and-control form to the MRO.

Paragraph 26.169(g) requires the HHS-certified laboratory for a specimen that has a positive, adulterated, substituted, dilute, or invalid result, to retain the original custody-and-control form and transmit to the MRO a copy of the original custody-and-control form signed by a certifying scientist.

Paragraph 26.169(h) requires the HHS-certified laboratory to prepare an annual statistical summary report of urinalysis testing results for that year. To avoid sending data from which it is likely that information about an individual donor's test result can be inferred, the laboratory is not permitted to send a report if the licensee or other entity has fewer than 10 specimen test results in a one-year period. The summary report is required to be sent within 14 calendar days after the end of the one-year period covered by the report. Information that is required to be included in the summary report is listed in §§26.169(k)(1) - (8).

These requirements are necessary to ensure that licensees and other entities receive all necessary reports of test results and testing-related information from HHS-certified laboratories performing services for the licensees or other entities. This information is necessary for implementation of the licensee or other entities' FFD programs and for submission in annual FFD program reports to the NRC. The recordkeeping and reporting requirements under §26.169 are established by contract between licensees and other entities and HHS-certified laboratories. Such records and reports are generally consistent with the requirements for HHS-certified laboratories in the HHS Mandatory Guidelines for Federal Workplace Drug Testing Programs, as well as with usual and customary business practices for such laboratories.

Recordkeeping requirements for §26.169 are established by §26.715(b)(2), (b)(3), (b)(5), (b)(6), and (b)(8).

Section 26.183, Medical Review Officer

Paragraph 26.183(a) establishes the required qualifications of the MRO and requires a record of the degree held by the MRO and the results of the MRO examination administered by a nationally-recognized MRO certification board or subspeciality board.

This requirement is necessary to ensure that if questions are raised about the qualifications of the MRO a record is available that indicates that the MRO meets the requirements specified in Part 26 to serve as an MRO.

Paragraph 26.183(c)(1) requires the MRO to examine alternate causes of a positive, adulterated, substituted, invalid and, at the licensee's or other entity's discretion, dilute result, including reviewing records made available by the donor, and documented medical conditions.

Paragraph 26.183(d)(1)(ii)(D) requires the MRO to maintain the confidentiality of records and other donor personal information, except for those releases permitted under Part 26; to ensure the security of data transmission; and to ensure that drug test results are reported to the licensee's or other entity's designated reviewing official only in accordance with the requirements of Part 26.

These requirements and records are necessary to specify how the MRO performs certain duties.

Paragraph 26.183(d)(2)(i) allows MRO staff, under the direction of the MRO, to receive, review, and report negative test results to the licensee's or other entity's designated representative.

Paragraph 26.183(d)(2)(ii) requires that the staff reviews of positive, adulterated, substituted, invalid, or at the licensee's or other entity's discretion, dilute test results must be limited to reviewing the custody-and-control form to determine whether it contains any errors that may require corrective action and to ensure that it is consistent with the information on the MRO's copy. The staff may resolve errors in custody-and-control that require corrective action(s), but must forward the custody-and-control forms to the MRO for review and approval of the resolution.

These requirements are necessary to ensure the protection of personal information, except as necessary for the ongoing implementation of the FFD program. These requirements define the limits of the duties that the staff of the MRO may perform, and require the staff to make third-party communications with the MRO to inform the MRO about actions proposed by the staff. Review of chain-of-custody errors and review of test results by an independent MRO is a key due process protection for individuals. These requirements therefore partially meet the legal necessity of protecting the due process rights of individuals who are subject to Part 26.

Recordkeeping requirements for §§26.183(a) are established by this section or, for MROs no longer employed by the licensee, by §26.715(b)(1).

Recordkeeping requirements for §§26.183(c)(1), (d)(1)(ii), (d)(2)(i) and (d)(2)(ii) are established by §26.713(a)(2).

Section 26.185, Determining a fitness-for-duty violation

Paragraph 26.185(a) requires the MRO to review all positive, adulterated, substituted, dilute, or invalid test results from the HHS-certified laboratory to determine whether the donor has violated the FFD policy before reporting the results to the licensee's or other entity's designated representative.

Paragraph 26.185(c) prohibits the MRO from determining that a positive, adulterated, substituted, dilute, or invalid result or other occurrence is a FFD policy violation and reporting it to the licensee or other entity without giving the donor an opportunity to discuss the test result or other occurrence with the MRO, if, after discussion, the MRO determines the result or occurrence is FFD violation, the MRO shall notify the licensee.

These requirements are necessary to ensure that before the licensee or other entity is notified of a possible FFD violation the MRO has reviewed the positive, adulterated, substituted, dilute, or invalid result and, before reporting it as a violation, has discussed the result with the donor.

Paragraph 26.185(d) allows the MRO to determine that a positive, adulterated, substituted, dilute, or invalid test result or other occurrence is an FFD policy violation without having discussed the test result or other occurrence directly with the donor in three instances (1) if the MRO had made and documented contact with the donor and the donor expressly declined the opportunity to discuss the test result or other occurrence that might constitute an FFD policy violation; (2) a representative of the licensee or other entity, or a MRO staff member, has successfully made and documented contact with the donor and has instructed him or her to contact the MRO; or (3) the MRO, after making all reasonable

efforts and documenting the dates and time of those efforts, has been unable to contact the donor.

Paragraph 26.185(e) allows a donor, within 30 days of notification, to present to the MRO information documenting circumstances that unavoidably prevented the donor from being contacted by the MRO or a representative of the licensee or other entity, or from contacting the MRO in a timely manner to request that the MRO reopen the procedure for determining whether the donor's test result or other occurrence is an FFD policy violation.

The requirements in §§26.185(c), (d), and (e) partially meet the legal necessity of protecting the due process rights of individuals who are subject to Part 26, and also proving "prior notice" and having it documented for evidence in legal proceedings.

Paragraph 26.185(f)(1) requires the MRO to consult with an HHS-certified laboratory that reports an invalid result, to determine if additional testing by another HHS-certified laboratory would be useful.

This requirement is necessary to protect donors from inaccurate results, to provide assurance that specimens of questionable validity are detected, and to ensure the integrity of the testing process.

Paragraph 26.185(f)(2) requires the MRO, if additional testing is not useful, to contact the donor to determine whether there is an acceptable medical explanation for the invalid result, and, if there is, to report to the licensee that the test result is not an FFD policy violation.

Paragraph 26.185(h)(1) requires the MRO, if the HHS-certified laboratory reports a specimen as substituted, to contact the donor and offer the donor an opportunity to provide an acceptable medical explanation for the substituted result. The donor must provide credible medical evidence within 5 business days that he or she produced the specimen for which the HHS-certified laboratory reported a substituted result. Any medical evidence must be submitted through a referral physician who is experienced and qualified in the medical issues involved.

Paragraph 26.185(h)(2) requires the MRO, if the MRO determines there is no acceptable medical explanation for the substituted test result, to report to the licensee or other entity that the specimen was substituted.

Paragraph 26.185(h)(3) requires the MRO, if the MRO determines there is an acceptable medical explanation for the substituted test result, to report to the licensee or other entity that no FFD policy violation has occurred.

Paragraph 26.185(i)(1) requires the MRO, if the HHS-certified laboratory reports a specimen as adulterated, to contact the donor and offer the donor an opportunity to provide an acceptable medical explanation for the adulterated result. The donor is required to provide creditable medical evidence within 5 business days that he or she produced the adulterated result through normal human physiology.

Paragraph 26.185(i)(2) requires that, if the MRO determines there is no acceptable medical explanation for the adulterated test result, the MRO must report to the licensee or other entity that the specimen is adulterated.

Paragraph 26.185(i)(3) requires that, if the MRO determines there is an acceptable medical explanation for the adulterated test result, the MRO must report to the licensee or other entity that there was no FFD policy violation.

Paragraph 26.185(j)(3) requires that, if the MRO determines that the donor has used another individual's prescription medication and evidence of drug abuse is found, the MRO must report to the licensee that the donor has violated the FFD policy.

Paragraph 26.185(k) requires, if the MRO determines that there is a legitimate medical explanation for a positive confirmatory drug test result, and that the use of a drug identified through testing was in the manner and at the dosage prescribed and the results do not reflect a lack of reliability or trustworthiness, the MRO to report to the licensee or other entity that no FFD policy violation has occurred.

Paragraph 26.185(m) provides that, based on the review of inspection and audit reports, quality control data, multiple specimens, and other pertinent results, the MRO may determine that a positive, adulterated, substituted or invalid test result is scientifically insufficient for further action and may declare that a drug or validity test result is not an FFD policy violation.

Paragraph 26.185(n) provides that, if a second laboratory reconfirms any drug-positive test results or reconfirms any adulterated, substituted, or invalid validity test results, the MRO may report an FFD policy violation to the licensee or other entity; if the second laboratory does not reconfirm any drug-positive test results, the MRO shall report that no FFD policy violation has occurred; or if the second laboratory does not reconfirm any adulterated, substituted, or invalid validity test results, the MRO shall report that no FFD policy violation has occurred.

Paragraph 26.185(o) requires the MRO to review drug test results from an individual whose authorization was terminated or denied following a first violation of FFD policy. In order to determine whether subsequent positive confirmatory drug test results represent new drug use or remaining metabolites from the drug use that initially resulted in the FFD policy violation, the MRO shall request from the HHS-certified laboratory and the laboratory shall provide, quantitation of the test results and other information necessary to make the determination.

Paragraph 26.185(p) requires the MRO to complete the MRO's review of positive, adulterated, substituted, and invalid test results and, in those instances in which the MRO determines that the donor has violated the licensee's or other entity's FFD policy, to notify the licensee or other entity's designated representative in writing within 10 business days of an initial positive, adulterated, or substituted test result.

The requirements in §§26.185(h)(1), (h)(2), (h)(3), (i)(1), (i)(2), (i)(3), (m), (n), (o) and (p) are necessary to partially meet the legal necessity of protecting the due process rights of individuals who are subject to Part 26, and also proving "prior notice" and having it documented for evidence in legal proceedings. The requirements also protect donors from inaccurate results, to provide assurance that specimens of questionable validity are detected, and to ensure the integrity of the testing process.

Recordkeeping requirements for §26.185 are established by §26.713(a)(2).

Section 26.187, Substance Abuse Expert

Paragraph 26.187(d) requires the Substance Abuse Expert (SAE) to receive qualification training on the background, rationale, and scope of Part 26; key drug testing requirements of Part 26, including specimen collection, laboratory testing, MRO review, and problems in drug testing; key alcohol testing requirements of Part 26, including specimen collection, laboratory testing, MRO review, and problems in alcohol tests; SAE qualifications and prohibitions; the role of the SAE in making determinations of fitness and the return-to-duty process, including the initial evaluation, referrals for education and/or treatment, the followup evaluation, continuing treatment recommendations, and the followup testing plan; procedures for SAE consultation and communication with licensees or other entities, MROs, and treatment providers; reporting and recordkeeping requirements of Part 26; and issues that SAEs confront in carrying out their duties under Part 26.

This requirement is necessary to ensure that SAEs are aware of the special requirements associated with their position. Some aspects of the SAE training are covered in the FFD training given to all individuals who are subject to the FFD program. Additional training in topics specific to the SAE will also be prepared and given.

Paragraph 26.187(f) requires the Substance Abuse Expert to maintain documentation showing that he or she currently meets all credentials, knowledge, and training requirements for a Substance Abuse Expert established by §26.187, and to provide this documentation upon request to NRC representatives, licensees, or other entities who are relying upon or contemplating relying upon the substance abuse expert's services and to other individuals and entities, in accordance with the requirements of § 26.37.

This requirement is necessary to ensure that the training and competency of the Substance Abuse Expert can be verified by NRC inspectors, license auditors, or other staff of the licensee or other entity conducting self-assessments or other activities. Records of training and competency may be important evidence in any litigation that may occur with respect to test results and/or FFD program management actions or sanctions. In addition, records of training and competency of Substance Abuse Experts will support reliance by licensees and other entities on FFD program results from other Part 26 programs.

Recordkeeping requirements for §§26.187(d) and (f) are established by this section, or for SAEs no longer employed by the licensee by §715(b)(1).

Reporting requirements for §26.187(f) are established by this section.

Section 26.189, Determination of Fitness

Paragraph 26.189(a) provides that a determination of fitness, the process entered when there are indications that an individual in § 26.4(a) through (e), and, at the licensee's or other entity's discretion, § 26.4(f) and (g) may be in violation of the licensee's or other entity's FFD policy or is otherwise unable to safely and competently perform his or her duties, must be made by a licensed or certified professional who is appropriately qualified and has the necessary clinical expertise, as verified by the licensee or other entity, to evaluate the specific fitness issues presented by the individual. A written record of the determination of fitness must be prepared.

Paragraph 26.189(c) provides that a determination of fitness that is conducted "for cause" must be conducted through face-to-face interaction between the subject individual and the professional making the determination. If there is no conclusive evidence of an FFD policy violation but there is a significant basis for concern that the individual may be impaired while on duty, then the subject individual must be determined to be unfit for duty. This result does not constitute a violation of Part 26 nor of the licensee's or other entity's FFD policy, and no sanctions may be imposed. However, the professional who made the determination of fitness is required to consult with the licensee's or other entity's management personnel to identify the actions required to ensure that any possible limiting condition does not represent a threat to workplace or public health and safety. A written record of the determination of fitness conducted "for cause" must be prepared.

These requirements are necessary to specify the procedures to be followed in making determinations of fitness of individuals under Part 26. Licensees must ensure that certain individuals whose job duties require them to have access to the protected areas of nuclear power plants or to perform certain specified duties are fit-for-duty. The determinations of fitness-for-duty must provide reasonable assurance that such individuals are trustworthy and reliable, as demonstrated by the avoidance of substance abuse, are not under the influence of legal or illegal drugs or alcohol, or mentally or physically impaired from any cause that in any way adversely affects their ability to safely and competently perform their duties, and that the effects of fatigue and degraded alertness on individual's abilities to safely and competently perform their duties are managed commensurately with maintaining public health and safety, common defense, and security. The fitness-for-duty determinations must also provide reasonable measures for the early detection of individuals who are not fit to perform the job duties that require them to be subject to the program and provide reasonable assurance that the workplaces subject to Part 26 are free from the presence and effects of illegal drugs and alcohol. These requirements also partially meet the legal necessity of protecting the due process rights of individuals who are subject to Part 26, and also proving "prior notice" and having it documented for evidence in legal proceedings.

Paragraph 26.189(d) provides that after the initial determination of fitness has been made, the professional making the determination may modify his or her evaluation and recommendations based on new or additional information from other sources.

This requirement is necessary to ensure that if additional information is received that causes the determination of fitness to be modified, the determination is modified and records pertaining to the determination are changed to reflect the new determination.

Recordkeeping requirements for §26.189 are established by §26.713(a)(4).

Section 26.203, General provisions

Paragraph 26.203(a) requires each licensee or other entity subject to Part 26, Subpart I, to establish a policy for the management of fatigue for all individuals who are subject to the licensee's FFD program and to incorporate it into the written policy required in §26.27(b).

Paragraph 26.203(b) requires each licensee or other entity subject to Part 26, Subpart I, to develop, implement, and maintain written procedures that describe the process to be followed when an individual subject to Part 26 makes a self-declaration that he or she is not fit to safely and competently perform his or her duties for any part of a working tour as a result of fatigue; describe the process for implementing the controls required under

§26.205; describe the process for conducting fatigue assessments; and describe the sanctions, if any, that the licensee may impose on an individual following a fatigue assessment and the conditions and consierations for taking those sanctions.

These requirements are necessary to ensure that written policies and procedures are available to individuals that indicate how each FFD program subject to Subtitle I meets the general objectives of Part 26, Subpart I, and that describe any allowable variations in the program. The policy and procedures are necessary to ensure that individuals who are covered by Subpart I are aware of their responsibilities and rights by informing them with sufficient detail about licensee FFD rules, what is expected of them, and what consequences may result from a lack of adherence to the FFD policy. The requirements also partially meet the legal necessity of proving "prior notice" and having it documented for evidence in legal proceedings.

The policy and procedures for fatigue management are included in the overall policy and procedures for FFD. Therefore, the burdens for the written policy and procedures required under §26.203 are included under §§26.27(b) and (c) for the overall policy and procedures.

Paragraph 26.203(c) requires licensees to add specific knowledge and abilities (KAs) to the content of the training that is required in §26.29(a) and the comprehensive examination required in §26.29(b) relating to knowledge of and ability to identify symptoms of work fatigue and contributors to decreased alertness in the workplace.

This requirement is necessary to ensure that individuals assigned to activities within the scope of Part 26 Subpart I are provided with appropriate training with respect to fatigue so that they are sufficiently skilled to detect conditions that arise from fatigue, they know the proper action to be initiated, and that they understand the methods that will be used to implement the FFD policy, the personal and public health and safety hazards associated with fatigue, their roles and responsibilities in the implementation of the fitness-for-duty program as it addresses fatigue, the role of the Medical Review Officer (MRO), and the EAP services available. The requirement also partially meets the legal necessity of providing "prior notice" and having it documented for evidence in legal proceedings.

Paragraph 26.203(d) requires all licensees and other entities to retain the following records for at least 3 years or until the completion of all related legal proceedings, whichever is later:

- Paragraph 26.203(d)(1): Records of work hours for individuals subject to the work hour controls in §26.205;
- Paragraph 26.203(d)(2): Records of shift schedules and shift cycles of individuals who are subject to the work hour controls in §26.205;
- Paragraph 26.203(d)(3): Documentation of waivers that is required in §26.207(a)(4), including the basis for granting the waivers.
- Paragraph 26.203(d)(4): Documentation of work hour reviews that is required in §26.205(e)(3) and (e)(4); and
- Paragraph 26.203(d)(5): Documentation of fatigue assessments that is required in §26.211(f).

These requirements are necessary to ensure that licensees and other entities establish and properly implement fatigue management programs. Licensees and other entities must maintain records to demonstrate the fulfillment of regulatory requirements for self-assessments and to support the preparation of annual reports, and to provide information to the NRC to be used in evaluating the effectiveness of the fatigue management programs required by Part 26.

Paragraph 26.203(e) requires that the following information in a standard format is included in the annual FFD program performance report required under §26.717:

- Paragraph 26.203(e)(1): Summaries for each nuclear power plant site of all instances during the previous calendar year in which the licensee waived the work hour controls specified in §26.205(d)(1) through (d)(5)(i) for individuals described in §26.4(a). The summary must include only those waivers under which work was performed. If it was necessary to waive more than one work hour control during any single extended work period, the summary of instances must include each of the work hour controls that were waived during the period. For each category of individuals specified in §26.4(a) the licensee shall report: the number of instances in which each work hour control specified in § 26.205(d)(1)(i) through (d)(1)(iii), (d)(2)(i) and (d)(2)(ii), and (d)(3)(i) through (d)(3)(iv) was waived for individuals not working on outage activities; the number of instances in which each work hour control specified in § 26.205(d)(1)(i) through (d)(1)(iii), (d)(2)(i) and (d)(2)(ii), (d)(3)(i) through (d)(3)(iv), and (d)(4) and (d)(5)(i) was waived for individuals working on outage activities; and a summary that shows the distribution of waiver use among the individuals within each category of individuals identified in § 26.4(a) (e.g., a table that shows the number of individuals that received only one waiver during the reporting period, the number of individuals that received a total of two waivers during the reporting period, etc.).

- Paragraph 26.203(e)(2) requires licensees to summarize instances of fatigue assessments for each NPP site during the previous calendar year, for any individual indentified in § 26.4(a) through (c). The summary must include: the conditions under which each fatigue assessment was conducted (i.e., self-declaration, for cause, post-event, followup); a statement of whether or not the individual was working on outage activities at the time of the self-declaration or condition resulting in the fatigue assessment; the category of duties the individual was performing, if the individual was performing the duties described in § 26.4(a)(1) through (a)(5) at the time of the self-declaration or condition resulting in the fatigue assessment; and the management actions, if any, resulting from each fatigue assessment.

These requirements are necessary to ensure that licensees and other entities provide information to the NRC to demonstrate their fulfillment of regulatory requirements for fatigue management and to allow the NRC to assess the effectiveness of the fatigue management requirements. Collection of this information pertaining to significant fatigue-management topics, events, and actions is necessary to permit self-assessments and internal reviews and audits by licensees and to permit timely evaluation of events that might become problems and that may require action by the NRC staff to ensure that the health and safety of the public is not endangered.

Recordkeeping requirements for §26.203 are established by this section.

Reporting requirements for §§26.203(e)(1), and (e)(2) are established by this section.

Section 26.205, Work hours

Paragraph 26.205(b) requires licensees to calculate the work hours of individual's subject to this section as the amount of time the individuals perform duties for the licensee. Except as permitted by paragraphs (b)(1) through (b)(5) of this section, the calculated work hours must include all time performing duties for the licensee, including all within-shift break

times and rest periods during which there are no reasonable opportunities or accommodations appropriate for restorative sleep.

Paragraph 26.205(c) requires licensees to schedule the work hours of individuals who are subject to this section consistent with the objective of preventing impairment from fatigue due to the duration, frequency, or sequencing of successive shifts.

Paragraph 26. 205 (d)(1) requires licensees to implement work hour controls for individuals to ensure that, except as permitted by the waiver provisions in §26.207, individual's work hours do not exceed 16 work hours in any 24-hour period, 26 work hours in any 48-hour period, and 72 work hours in any 7-day period.

Paragraph 26. 205 (d)(2) requires licensees to ensure that individuals have adequate rest breaks between successive work periods, during which the individual does not perform any duties for the licensee other than one shift turnover, either at the beginning or the end of a shift, but not both. Except as permitted in § 26.207, at a minimum, licensees are required to ensure that individuals subject to Subpart I have a 10-hour break between successive work periods or an 8-hour break when a break of less than 10 hours is necessary to accomodate a crew's scheduled transition between work schedules or shifts; and a 34 - hour break in any 9 - day period.

Paragraph 26. 205(d)(3) requires licensees to ensure that individuals have, at a minimum, the number of days off specified in this paragraph. For the purposes of this subpart, a day off is defined as a calendar day in which an individual does not start a work shift. For the purposes of calculating the average number of days off required in this paragraph, the duration of the shift cycle may not exceed 6 weeks. Individuals who are working 8-hour shift schedules shall have at least 1 day off per week, averaged over the shift cycle; individuals who are working 10-hour shift schedules shall have at least 2 days off per week, averaged over the shift cycle; individuals who are working 12-hour shift schedules while performing the duties described in § 26.4(a)(1) through (a)(4) shall have at least 2.5 days off per week, averaged over the shift cycle; and individuals who are working 12-hour shift schedules while performing the duties described in § 26.4(a)(5), shall have at least 3 days off per week, averaged over the shift cycle.

Paragraph 26.205(d)(4) exempts licensees from the requirements of paragraph (d)(3) of this section for individuals specified in § 26.4(a)(1) through (a)(4) for the first 60 days of an outage, while the individuals are working on unit outage activities. However, the licensee is required to ensure that these individuals have at least 3 days off in each successive (i.e., non-rolling) 15-day period.

Paragraph 26.205(d)(5) exempts licensees from the requirements of paragraph (d)(3) of this section for individuals specified in § 26.4(a)(5) for the first 60 days of a unit outage, security system outage, or increased threat condition. However, licensees shall ensure that these individuals have at least 4 days off in each successive (i.e., non-rolling) 15-day period; and during the first 60 days of an unplanned security system outage or increased threat condition, licensees need not meet the requirements of either paragraph (d)(3) or (d)(5)(i) of this section.

Paragraph 26.205(d)(6) extends the 60-day periods in paragraphs (d)(4) and (d)(5) of this section for each individual in 7-day increments for each non-overlapping 7-day period in

which the individual has worked not more than 48 hours during the unit or security system outage or increased threat condition, as applicable.

Paragraph 26.205(d)(7) requires the licensee to implement the requirements in paragraphs (d)(4) through (d)(6) of this section based upon the number of days that have elapsed since the first outage in the series began when an individual works for a licensee during two or more unit outages or security system outages (or a combination thereof), and the interval(s) between successive outages is less than 2 weeks.

Paragraph 26. 205(e)(1) and (2) requires licensees to review the effectiveness of their control of work hours for individuals who are subject to Part 26, Subpart I, at a minimum twice per calender year. The two reviews need not cover periods of equal duration but must collectively cover the entire calendar year. The reviews evaluate the effectiveness of the work hour controls and assess staffing adequacy for all jobs subject to the work hour controls.

Paragraph 26. 205(e)(3) requires licensees to document the methods used to conduct the reviews and the results of the reviews.

Paragraph 26. 205(e)(4) requires licensees to record, trend, and correct, under the licensee's corrective action program, any problems identified in maintaining control of work hours consistent with the specific requirements and performance objectives of Part 26.

These requirements are necessary to ensure that licensees and other entities are properly implementing work hour controls, including waivers of those controls, for personnel performing activities on systems, structures, and components that a risk-informed evaluation process has shown to be significant to public health and safety. These records are necessary to enable licensees and other entities to review and correct any problems in maintaining control of work hours, to enable the NRC to inspect the licensee's and other entities' fatigue management programs, and to provide information for periodic audits.

Recordkeeping requirements for §26. 205(c) and (d)(1) are established by §26.203(d)(1).

Recordkeeping requirements for §26.205(d)(2) through (d)(7) are established by §26.203(d)(2).

Recordkeeping requirements for §25.205(e)(1) through (e)(3) are established by §26.203(d)(4).

Recordkeeping requirements for §26.205(e)(4) are established by this section.

Section 26.207, Waivers and exceptions

Paragraph 26.207(a)(4) requires licensees to document the bases for individual waivers. The documented basis for a waiver must include a description of the circumstances that necessitate the waiver, a statement of the scope of work and time period for which the waiver is approved, and the bases for the determinations.

Recordkeeping requirements for §25.207 are established by §26.203(d)(3).

Section 26.211, Fatigue assessments

Paragraph 26.211(f) requires licensees to document the results of any fatigue assessments conducted, the circumstances that necessitated the fatigue assessment, and any controls and conditions that were implemented.

This requirement is necessary to ensure that fatigue assessments of individuals are conducted in appropriate circumstances and in an appropriate manner. This requirement is necessary to ensure that the due process rights of individuals who are subject to the fatigue management requirements are protected. It will support internal licensee self-assessments of fatigue-management programs. This requirement also will enable the NRC to review and audit the licensees' and other entities' fatigue management programs.

Recordkeeping requirements for §26.211(f) are established by §26.203(d)(5).

Section 26.401, General

Paragraph 26.401(b) requires licensees and other entities who elect to implement an FFD program under Subpart K to submit an FFD program plan to the NRC for review and approval as part of the license or permit application.

This requirement is necessary to ensure licensees develop a plan to ensure worker fitness for duty prior for the start of construction of a nuclear reactor.

Section 26.403, Written Policy and Procedures

Paragraph 26.403(a) requires FFD programs under Subpart K to ensure that a clear, concise, written FFD policy statement is provided to individuals who are subject to the program. The policy statement must be written in sufficient detail to provide affected individuals with information on what is expected of them and what consequences may result from a lack of adherence to the policy.

Paragraph 26.403(b) requires FFD programs under this Subpart K to develop, implement, and maintain written procedures that address drug and alcohol testing program methods and techniques and procedures for ensuring valid results attributable to the correct individual, actions taken and procedures used for FFD violations, and the process to be followed for behavior that may raise concerns of possible FFD violations or impairment.

The written FFD policy and procedures required by Subpart K are the primary means by which a licensee or other entity communicates its FFD policy and procedures to individuals who are subject to the policy and procedures. These requirements are also necessary to ensure that individuals are protected by informing them in sufficient detail about licensee FFD rules, what is expected of them, and what consequences may result from a lack of adherence to the FFD policy. Because the consequences of lack of adherence to the FFD policy can be very severe, including inability to perform certain functions in the industry, it is particularly important that all individuals who are potentially subject to them know their details. The one-time burden for the initial development of the policy is shown under this paragraph.

Section 26.405, Drug and alcohol testing

Paragraph 26.405(b) provides that if a licensee or other entity elects to impose random testing for drugs and alcohol, the random testing must meet certain specified criteria.

Paragraph 26.405(c)(1) requires licensees to conduct pre-assignment testing before employees are assigned to perform activities specified in § 26.4(f).

Paragraph 26.405(c)(2) requires licensees to conduct for-cause testing in response to an individual's observed behavior or physical condition indicating possible substance abuse or after receiving credible information that an individual is engaging in substance abuse, as defined in § 26.5.

Paragraph 26.405(c)(3) requires licensees to conduct post-accident testing as soon as practical after an event involving human error committed by individuals specified in § 26.4(f), where the human error may have caused or contributed to the accident. The individual(s) who committed the human error(s) shall be tested if the event resulted in: a significant illness or personal injury to the individual to be tested or another individual, which is recordable under the Department of Labor standards contained in 29 CFR 1904.7, and results in death, days away from work, restricted work, transfer to another job, medical treatment beyond first aid, loss of consciousness, or other significant illness or injury; or, even if it does not result in death, if it results in days away from work, restricted work or job transfer, medical treatment beyond first aid, or loss of consciousness; or significant damage to SSCs that are required to be described in the FSAR.

Paragraph 26.405(c)(4) requires licensees to conduct followup testing as part of a followup plan to verify an individual's continued abstinence from substance abuse.

Paragraph 26.405(d) requires licensees and other entities to test for specified drugs, adulterants, and alcohol, at the cutoff levels specified in Part 26, and requires urine specimens collected for drug testing to be subject to validity testing.

Paragraph 26.405(e) requires the specimen collection and drug and alcohol testing procedures of FFD programs under Subpart K to protect the donor's privacy and the integrity of the specimen, and to implement stringent quality controls to ensure that test results are valid and attributable to the correct individual. At the licensee's or other entity's discretion, specimen collections and alcohol testing may be conducted at a local hospital or other facility under the specimen collection and alcohol testing requriements of 49 CFR Part 40.

Paragraph 26.405(f) requires testing of urine specimens for drugs and validity, except validity screening and initial drug and validity tests that may be performed by licensee testing facilities, must be performed in an HHS-certified laboratory. Any initial drug test performed by a licensee or other entity must use an immunoassay that meets FDA requlirements for commercial distribution. Specimens that yield positive, adulterated, substituted, or invalid initial validity or drug test results must be subject to confirmatory testing by the HHS-certified laboratory, except for invalid specimens that cannot be tested.

Paragraph 26.405(g) requires FFD programs under this subpart to provide for an MRO review of positive, adulterated, substituted, and invalid drug and validity test results from the HHS-certified laboratory to determine whether the donor has violated the FFD policy, before reporting the results to the individual designated by the licensee or other entity to perform the suitability and fitness evaluations required under § 26.419.

These requirements are necessary to ensure testing occurs under all necessary circumstances. In order to ensure proper FFD is maintained testing must occur in pre-assignment, for cause, post accident, followup, and random circumstances.

Section 26.406, Fitness Monitoring Program

Paragraphs 26.406(a), (b), and (d) require licensees and other entities that do not implement random testing under § 26.405(b) to establish a fitness monitoring program to deter substance abuse and detect indications of possible use, sale, or possession of illegal drugs; use or possession of alcohol on site or while on duty; impairment from any cause that if left unattended may result in a risk to public health and safety or the common defense and security, and any actions or other indications that call into question an individual's trustworthiness and reliability under Part 26. To ensure that the fitness of individuals is monitored effectively, licensees and other entities must consider the number and placement of monitors requlried, the necessary ratio of monitors to individuals specified in §24.4(f), and the frequency with which observations must be conducted.

Paragraph 26.406(c) requires licensees and other entities that do not elect to establish a random testing program to establish instead a fitness monitoring program and to establish procedures that fitness monitors shall follow and to train the monitors to implement the program.

These requirements are necessary to ensure that fitness monitors know and understand the procedures established for the fitness monitoring program if the licensee or other entity elects to establish a fitness monitoring program.

Section 26.407, Behavioral Observation

Paragraph 26.407 requires a licensee or other entities who implement an FFD program under this subpart to ensure that the individuals who are specified in §26.4(e) perform behavioral observation of the individuals listed in §26.4(f), unless those persons are subject to a fitness monitoring program under §26.406.

This requirement is necessary to ensure that if licensees and other entities elect to implement a random drug and alcohol testing program under §26.405, they also implement behavioral observation under this section to deter substance abuse and detect indications of possible use, sale, or possession of illegal drugs, use or possession of alcohol on site, and impairment from any cause that if left unattended may result in a risk to public health and safety or the common defense and security.

Section 26.411, Protection of Information

Paragraph 26.411(a) requires FFD programs that collect personal information about an individual for the purpose of complying with this subpart to establish and maintain a system of files and procedures to protect the personal information. FFD programs shall maintain and use such records with the highest regard for individual privacy.

Paragraph 26.411(b) requires licensees and other entities to obtain a signed consent that authorizes the disclosure of the personal information collected and maintained under this subpart before disclosing the personal information.

These information collection requirements are necessary to ensure the protection of personal information collected and maintained about individuals, and to ensure that such information is not disclosed to persons other than assigned MROs, other licensees legitimately seeking the information as required by Part 26 for employment decisions and who have obtained a release from current or prospective employees or C/V personnel, NRC representatives, appropriate law enforcement officials, the individual subject or his or her representative, or those licensee personnel who have a need to have access to the information in performing assigned duties.

Section 26.413, Review Process

Paragraph 26.413 requires FFD programs to establish and implement procedures for the review of a determination that an individual in §26.4(f) has violated the FFD policy. The procedure must provide for an objective and impartial review of the facts related to the determination that the individual has violated the FFD policy.

These one-time requirements are necessary to ensure that there are written procedures that specify how each FFD program ensures that the criteria for determining that an individual has violated FFD policy have been met and will provide individuals with a specified process for reviewing and appealing determinations that the individual has violated FFD policy. The requirements are necessary to ensure that the due process rights of individuals who are subject to the rule are protected by informing them with sufficient detail about licensee review procedures, what is expected of the individual, and what consequences may result from a lack of adherence to the policy. The requirements also partially meet the legal necessity of proving "prior notice" and having it documented for evidence in legal proceedings.

Section 26.415, Audits

Paragraph 26.415(a) requires licensees and other entities to ensure that audits are performed to assure the continuing effectiveness of the FFD program, including FFD program elements that are provided by C/Vs, and the FFD programs of C/Vs that are accepted by the licensee or other entity.

These requirements for audit documentation, maintenance of audit records, and access to audit information are necessary to help ensure identification and resolution of program weaknesses and to help licensees and other entities, including C/Vs and HHS-certified laboratories, determine what corrective actions are necessary and carry out necessary corrective actions. The requirements help to ensure that necessary information is available for NRC inspections.

Section 26.417, Recordkeeping and Reporting

Paragraph 26.417(a) requires FFD programs to ensure that records pertaining to the administration of the program, which may be stored and archived electronically, are maintained so that they are available for NRC inspection purposes and for any legal proceedings resulting from the administration of the program.

Paragraph 26.417(b)(1) requires licensees and other entities who implement FFD programs to make reports to the NRC Operations Center by telephone within 24 hours after the licensee or other entity discovers any intentional act that casts doubt on the integrity of the FFD program and any programmatic failure, degradation, or discovered vulnerability of the FFD program that may permit undetected drug or alcohol use or abuse

by individuals who are subject to this subpart. These events must be reported under this subpart, rather than under the provisions of 10 CFR 73.71.

Paragraph 26.417(b)(2) requires licensees and other entities who implement FFD programs to make annual program performance reports for the FFD program.

These requirements are necessary to ensure that records are maintained by licensees and other entities that maintain collection sites and/or testing facilities, and by laboratories certified by the Department of Health and Human Services that provide services to licensees and other entities, that demonstrate that drug and alcohol testing requirements are implemented properly. Such records are generally consistent with the requirements for HHS-certified laboratories in the HHS Mandatory Guidelines for Federal Workplace Drug Testing Programs, as well as with usual and customary business practices for such laboratories. These records are also necessary to enable licensees and other entities to review and correct any problems in implementing FFD drug and alcohol testing programs, and to enable the NRC to inspect the licensees' and other entities' drug and alcohol testing programs. This section groups recordkeeping requirements that apply to collection sites, testing facilities, and laboratories certified by the Department of Health and Human Services that provide services to licensees or other entities in one section in the rule, in order to improve clarity in the organization of the rule and to respond to requests from stakeholders.

These requirements are also necessary to ensure that licensees and other entities provide information about significant violations of FFD policy, testing errors, and other events affecting the performance of their FFD programs that will enable the NRC to ensure that those programs are adequately protecting public health and safety, common defense, and security. These reports are necessary to enable licensees and other entities to review and correct any problems in implementing FFD programs, and to enable the NRC to inspect the licensee's and other entities' FFD programs and to obtain information necessary to evaluate the effectiveness of the FFD programs. Collection of information pertaining to significant FFD events is necessary to permit evaluations of events that might become problems and that may require timely response by the NRC staff to ensure that the health and safety of the public is not endangered.

Section 26.711, General provisions [Recordkeeping and Reporting Requirements]

Paragraph 26.711(a) provides that each licensee and other entity shall maintain records and submit certain reports to the NRC. Records that are required by the regulations in Part 26 must be retained for the period specified by the appropriate regulation. If a retention period is not otherwise specified, these records must be retained until the Commission terminates the facility license, certificate, or other regulatory approval.

Paragraph 26.711(b) provides that each licensee and entity may store and archive records electronically, provided that the record is an accurate representation of the original, cannot be altered once it has been committed to storage, and can be easily retrieved and recreated.

Although no records or reports are required by this paragraph, this section influences how the records and reports required by Part 26 will be made, stored, and archived. This section provides licensees and other entities with the opportunity to use electronic records and makes the requirements in Part 26 consistent with access authorization requirements established in 10 CFR 73.56, as supplemented by orders to nuclear power plants dated January 7, 2003.

Section 26.713, Recordkeeping requirements for licensees and other entities

Paragraph 26.713(a)(1) requires the retention of records of self-disclosures and suitable inquiries conducted under §§26.55, 26.57, 26.59, and 26.69 that result in the granting of authorization for at least 5 years after the licensee or other entity terminates or denies an individual's authorization or until the completion of all related legal proceedings, whichever is later.

Paragraph 26.713(a)(2) requires the retention of records pertaining to any determination of a violation of the FFD policy and related management actions for at least 5 years after the licensee or other entity terminates or denies an individual's authorization or until the completion of all related legal proceedings, whichever is later.

Paragraph 26.713(a)(3) requires the retention of records of documentation of the granting and termination of authorization for at least 5 years after the licensee or other entity terminates or denies an individual's authorization or until the completion of all related legal proceedings, whichever is later.

Paragraph 26.713(a)(4) requires the retention of records of any determinations of fitness conducted under §26.189 for at least 5 years after the licensee or other entity terminates or denies an individual's authorization or until the completion of all related legal proceedings, whichever is later.

Paragraph 26.713(b)(1) requires that licensees and other entities retain records of FFD training and examinations conducted under §26.29 for at least 3 years or until the completion of all related legal proceedings, whichever is later.

Paragraph 26.713(b)(2) requires that licensees and other entities retain records of FFD audits, audit findings, and corrective actions taken under §26.41 for at least 3 years or until the completion of all related legal proceedings, whichever is later.

Paragraph 26.713(c) requires that licensees and other entities ensure the retention and availability of records pertaining to any 5-year denial of authorization under §26.75(c), (d), or (e)(2) and any permanent denials of authorization under §§26.75(b) and (g) for at least 40 years or until, upon application, the NRC determines that the records are no longer needed.

Paragraph 26.713(d) requires that licensees and other entities retain any superseded versions of the written FFD policy and procedures required under §26.27, 26.39, and 26.203(b) for at least 5 years or until completion of all legal proceedings related to an FFD violation that may have occurred under the policy and procedures, whichever is later.

Paragraph 26.713(e) requires that licensees and other entities retain written agreements for the provision of services under Part 26 for the life of the agreement or until completion of all legal proceedings related to an FFD policy violation that involved those services, whichever is later.

Paragraph 26.713(f) requires that licensees and other entities retain records of the background investigations, credit and criminal history checks, and psychological assessments of FFD program personnel, conducted under §26.31(b)(1), for the length of

the individual's employment by or contractual relationship with the licensee or other entity, or until the completion of all related legal proceedings, whichever is later.

Paragraph 26.713(g) requires that if a licensee's and other entity's FFD program includes tests for drugs in addition to those specified in Part 26, the licensee or other entity shall retain the documentation certifying the scientific and technical suitability of the assays and cutoff levels used, as required under §26.31(d)(1) and (d)(3)(iii)(C) respectively, for the period of time during which the FFD program follows those practices of until the completion of all related legal proceedings, whichever is later.

These requirements are necessary to ensure that licensees and other entities collect and maintain records that demonstrate they are properly implementing FFD regulatory requirements in a manner adequate to protect public health and safety and the common defense and security. These records are also necessary to enable licensees and other entities to review and correct any problems in implementing FFD programs, and to enable the NRC to review and audit the licensee's and other entities' FFD programs. This section groups recordkeeping requirements that apply to licensees and other entities in one section in the rule, in order to improve clarity in the organization of the rule and thereby to reduce the information collection burden associated with this recordkeeping.

Section 26.715, Recordkeeping requirements for collection sites, licensee testing facilities, and laboratories certified by the Department of Health and Human Services

Paragraph 26.715(a) requires collection sites providing services to licensees and other entities who are subject to this subpart, licensee testing facilities, and HHS-certified laboratories to maintain and make available documentation of all aspects of the testing process for at least two years or until the completion of all legal proceedings related to the determination of an FFD violation, whichever is later, and also provides that the 2-year period may be extended upon written notification by the NRC or by any licensee or other entity for whom services are being provided.

Paragraph 26.715(b) specifies that the records that must be retained pursuant to §26.715(a) include the following:

- Paragraph 26.715(b)(1): Personnel files, including training records, for all individuals who have been authorized to have access to specimens, but are no longer under contract to or employed by the collection site, licensee testing facility, or HHS-certified laboratory;
- Paragraph 26.715(b)(2): Chain of custody documents (other than forms recording specimens with negative test results and no FFD violations or anomalies, which may be destroyed after approriate summary information has been recorded for program administration purposes);
- Paragraph 26.715(b)(3): Quality assurance and quality control records;
- Paragraph 26.715(b)(4): Superseded procedures;
- Paragraph 26.715(b)(5): All test data (including calibration curves and any calculations used in determining test results);
- Paragraph 26.715(b)(6): Test reports;
- Paragraph 26.715(b)(7): Records pertaining to performance testing;
- Paragraph 26.715(b)(8): Records pertaining to the investigation of testing errors or unsatisfactory performance discovered in quality control or blind performance testing, in the testing of actual specimens, or through the processing of appeals and MRO

reviews, as well as any other errors or matters that could adversely reflect on the integrity of the testing process, investigation findings, and corrective actions taken, where applicable;
- Paragraph 26.715(b)(9): Performance records on certification inspections;
- Paragraph 26.715(b)(10): Records of preventative maintenance on licensee testing of facility instruments;
- Paragraph 26.715(b)(11): Records that summarize any negative test results based on scientific insufficiency;
- Paragraph 26.715(b)(12): Printed or electronic copies of computer-generated data;
- Paragraph 26.715(b)(13): Records that document the dates, times of entry and exit, escorts, and purposes of entry of authorized visitors, maintenance personnel, and service personnel who have accessed secured areas of licensee testing facilities and HHS-certified laboratories; and
- Paragraph 26.715(b)(14): Records of the inspection, maintenance, and calibration of EBTs.

These requirements are necessary to ensure that records are maintained by licensees and other entities that maintain collection sites and/or testing facilities, and by laboratories certified by the Department of Health and Human Services that provide services to licensees and other entities, that demonstrate that drug and alcohol testing requirements are implemented properly. Such records are generally consistent with the requirements for HHS-certified laboratories in the HHS Mandatory Guidelines for Federal Workplace Drug Testing Programs, as well as with usual and customary business practices for such laboratories. These records are also necessary to enable licensees and other entities to review and correct any problems in implementing FFD drug and alcohol testing programs, and to enable the NRC to inspect the licensees' and other entities' drug and alcohol testing programs. This section groups recordkeeping requirements that apply to collection sites, testing facilities, and laboratories certified by the Department of Health and Human Services that provide services to licensees or other entities in one section in the rule, in order to improve clarity in the organization of the rule and to respond to requests from stakeholders.

Section 26.717, Fitness-for-duty program performance data

Paragraph 26.717(a) requires licensees and other entities to collect and compile FFD program performance data.

Paragraph 26.717(b) specifies that the FFD program performance data must include the following information:

- Paragraph 26.717(b)(1): The random testing rate;
- Paragraph 26.717(b)(2): Drugs tested for and cutoff levels, including results of tests using lower cutoff levels tests for drugs not included in the HHS panel, and tests of dilute specimens tested at the level of detection (LOD);
- Paragraph 26.717(b)(3): Populations tested;
- Paragraph 26.717(b)(4): Number of tests administered and results of those tests sorted by population tested;
- Paragraph 26.717(b)(5): Conditions under which the tests were performed;
- Paragraph 26.717(b)(6): Substances identified;
- Paragraph 26.717(b)(7): Number of subversion attempts by type; and
- Paragraph 26.717(b)(8): Summary of management actions.

Paragraph 26.717(c) requires any licensee or other entity who has a licensee-approved FFD program to analyze the FFD program performance data at least annually and to retain records of the data, analyses, and corrective actions taken for at least 3 years or until the completion of any related legal proceedings, whichever is later.

Paragraph 26.717(d) requires any licensee or other entity who terminates an individual's authorization or takes administrative action on the basis of the results of a positive initial drug test for marijuana or cocaine to report those test results in the annual summary by processing stage and to include the number of terminations and administrative actions taken against individuals in the reporting period.

Paragraph 26.717(e) requires licensees and other entities to submit the FFD program performance data (for January through December) to the Commission annually, before March 1 of the following year.

Paragraph 26.717(f) permits licensees and other entities to submit FFD program performance data in a consolidated report, if the report presents the data separately for each site.

Paragraph 26.717(g) specifies that each C/V who maintains a licensee-approved drug and alcohol testing program is subject to the reporting requirements of §26.717 and shall submit the required information either directly to the NRC or through the licensee(s) or entities to whom the C/V provided services during the year. Licensees, C/Vs, and other entities are required to share information to ensure that the information is reported completely and is not duplicated in reports submitted to the NRC.

These requirements are necessary to ensure that licensees and other entities provide information about the performance of their FFD programs that will enable the NRC to ensure that those programs are adequately protecting public health and safety. These reports also are necessary to enable licensees and other entities to review and correct any problems in implementing FFD programs, and to enable the NRC to inspect the licensees' and other entities' FFD programs and to obtain information necessary to evaluate the effectiveness of the programs. Collection of information pertaining to significant FFD events is necessary to permit evaluations of events that might become problems and that may require actions by the NRC staff to ensure that the health and safety of the public and the common defense and security are not endangered. The rule requires licensees and other entities to submit program performance data to the NRC every 12 months, rather than every 6 months as required by the previous rule, to reduce reporting burden and to make the reporting time consistent with the NRC's need for the information.

Section 26.719, Reporting requirements

Paragraph 26.719(a) requires licensees and entities subject to Part 26 to report significant violations of the FFD policy, significant FFD program failures, and errors in drug and alcohol testing, and to report under §26.719 rather than §73.71.

Paragraph 26.719(b) requires licensees and entities subject to Part 26 to report the following significant violations of the FFD policy and significant FFD program failures to the NRC Operations Center by telephone within 24 hours after the licensee or other entity discovers the violation:

- Paragraph 26.719(b)(1): The use, sale, distribution, possession, or presence of illegal drugs, or the consumption or presence of alcohol within a protected area or by an individual while performing duties within the scope of Part 26.
- Paragraph 26.719(b)(2): Any acts by any person who is licensed under 10 CFR Parts 52 and/or 55 to operate a power reactor, as well as any acts by SSNM transporters, FFD program personnel, or any supervisory personnel who are authorized under Part 26; if such acts (i) involve the use, sale, or possession of a controlled substance; (ii) result in a determination that the individual has violated the licensee's or other entity's FFD policy; or (iii) involve the consumption of alcohol within a protected area or while performing the duties that require the individual to be subject to the FFD program.
- Paragraph 26.719(b)(3): Any intentional act that casts doubt on the integrity of the FFD program; and
- Paragraph 26.719(b)(4): Any programmatic failure, degradation, or discovered vulnerability of the FFD program that may permit undetected drug or alcohol use or abuse by individuals within a protected area, or by individuals assigned to perform duties that require them to be subject to the FFD program.

Paragraph 26.719(c)(1) requires the licensee or other entity to submit to the NRC a report within 30 days following completion of an investigation of any testing errors or unsatisfactory performance discovered in performance testing at either a licensee testing facility or an HHS-certified laboratory, in the testing of quality control or actual specimens, or through the processing of reviews under §26.39 and MRO reviews under §26.185, as well as any other errors or matters that could adversely reflect on the integrity of the random selection or testing process. The report is required to include a report of the incident and corrective action taken or planned.

Paragraph 26.719(c)(2) requires the licensee or other entity to notify the NRC within 24 hours following discovery of a false positive error on a blind performance test sample submitted to an HHS-certified laboratory.

Paragraph 26.719(c)(3) requires the licensee or other entity to notify the NRC within 24 hours following discovery of a false negative error on a quality assurance check of validity screening tests required by §26.137(b).

Paragraph 26.719(d) requires the licensee or other entity to document, trend, and correct non-reportable indicators of FFD programmatic weaknesses under the licensee's or other entity's corrective action program, but prohibits the tracking or trending of drug and alcohol test results in a manner that permits the identification of any individuals.

These requirements are necessary to ensure that licensees and other entities provide information about significant violations of FFD policy, testing errors, and other events affecting the performance of their FFD programs that will enable the NRC to ensure that those programs are adequately protecting public health and safety, common defense, and security. These reports are necessary to enable licensees and other entities to review and correct any problems in implementing FFD programs, and to enable the NRC to inspect the licensee's and other entities' FFD programs and to obtain information necessary to evaluate the effectiveness of the FFD programs. Collection of information pertaining to significant FFD events is necessary to permit evaluations of events that might become problems and that may require timely response by the NRC staff to ensure that the health and safety of the public is not endangered. The rule

groups these reporting requirements into one section in order to improve clarity in the organization of the rule and to respond to requests of stakeholders.

Section 26.821, Inspections

Paragraph 26.821(a) requires licensees and other entities to permit duly authorized NRC representatives to inspect, copy, or take away copies of its records as necessary to accomplish the purposes of Part 26.

This requirement is necessary to enable the NRC to obtain copies of documents for additional review and analysis at the offices of the NRC and for the development of a written record on topics involving Part 26. Such copies of records may be necessary to enable the NRC to evaluate the licensee's and other entities' FFD programs and to obtain information necessary to develop public policy.

Paragraph 26.821(b) requires licensees and other entities to enter into written agreements with their C/Vs that permit duly authorized NRC representatives to inspect, copy, or take away copies of the C/V's documents, records, and reports related to implementation of the licensee's or other entity's FFD program under the scope of the contracted activities.

This requirement is necessary because C/Vs may administer components of the licensee's or other entities' FFD program or may have their own FFD programs pertaining to their employees who work under contract to licensees or other entities in situations in which they are subject to FFD requirements. This requirement is necessary to enable the NRC to obtain copies of documents for additional review and analysis at the offices of the NRC and for the development of a written record on topics involving Part 26. Such copies of records may be necessary to enable the NRC to evaluate the C/Vs' FFD programs and to obtain information necessary to develop public policy.

The recordkeeping requirement for §26.821(b) is established by §26.713(e).

2. Agency Use of Information

The NRC will use the information included in the records and reports required in this part for one or more of the following purposes:

- to monitor compliance with Part 26 and ensure that licensees' and other entities' FFD programs are adequate to protect public health and safety and minimize danger to life and property, common defense, and security;

- to determine if there are problems requiring timely response by the NRC staff (NRC actions might vary depending on the circumstances, but include immediate telephone contact with the licensee or other entity to discuss the event or followup at the site);

- to perform empirical evaluations of drug and alcohol testing and fatigue management in support of any future considerations, including analysis of trends and lessons learned.

3. Reduction of Burden Through Information Technology

There are no legal obstacles to reducing the burden associated with this information collection. The NRC encourages respondents to use information technology when it is beneficial to them. Most licensees collect, store, and format fitness-for-duty data electronically. The NRC issued a regulation on October 10, 2003 (68 FR 58792), consistent with the Government Paperwork Elimination Act, which allows its licensees, vendors, applicants, and members of the public the option to make submissions electronically via CD-ROM, e-mail, special Web-based interface, or other means. It is estimated that none of the potential responses are filed electronically, because the licensees and other entities have concluded that they do not wish to do so.

4. Efforts to Identify Duplication and Use Similar Information

Certain records referenced in Subpart G of Part 26 belonging to HHS-Certified laboratories are required to be kept under the standards for a National Laboratory Certification Program established by the HHS Mandatory Guidelines for Federal Workplace Drug Testing Programs, and also are consistent with usual and customary business practices for forensic laboratories. Licensees for nuclear power reactors maintain a system of records on individuals subject to access authorization requirements called the Personnel Access Database System (PADS), to which the licensees send information concerning employment dates, approvals of access authorization, withdrawals of access authorization, violations of FFD policy, and other subjects. All other records maintained by licensees are not duplicated by other Federal information collection requirements and are not available from any other source. NRC has in place an on-going program to examine all information collections with the goal of eliminating all duplication and/or unnecessary information collections.

5. Effort to Reduce Small Business Burden

The NRC has determined that the affected entities are not small entities or businesses as those terms are used in the Regulatory Flexibility Act.

6. Consequences to Federal Programs or Policy Activities if the Collection is Not Conducted or is Collected Less Frequently

The records required by the rule pertaining to drug and alcohol testing, including data about the performance of specimen collection sites, licensee testing facilities, and HHS-Certified laboratories, the chain of custody of specimens, laboratory test results, quality assurance and quality control procedures, the inspection, maintenance, and calibration of laboratory instruments, training and qualifications of FFD program personnel, and security of specimen collection, storage, and testing facilities, are standard components of all forensic specimen collection and testing programs. If these records are not made in a comprehensive manner at the time that specimen collection and testing occurs, the scientific accuracy of test results cannot be assessed or verified and neither the performance objectives of the FFD program nor the protection of the rights of individuals subject to the program can be attained. Collection of information pertaining to individuals' past employment, past periods of authorization, if any, including authorization denial or unfavorable termination, past arrest record, and other potentially disqualifying FFD information also must be complete and must take place at the time that FFD authorization decisions are made, or inappropriate authorizations may be granted. The annual report on the performance of licensees' and other entities' programs provides data that is necessary for the NRC to assess whether the FFD programs are meeting the program requirements. The rule reduces the frequency of the current FFD performance report from semi-annually to annually. Receiving FFD program performance data at least annually is necessary because any longer period of time could result in substantial program deterioration

that would result in potential threats to public health and safety and danger to common defense and security.

7. Circumstances which Justify Variation from OMB Guidelines

Section 26.77(c) requires a licensee or other entity that has a reasonable belief that an NRC employee or NRC contractor may be under the influence of any substance, or is otherwise unfit for duty, to immediately notify the appropriate Regional Administrator by telephone, followed by written notification (e.g., email or fax) to document the verbal notification. If the Regional Administrator cannot be reached, the licensee or other entity must notify the NRC Operations Center. The immediate notification is necessary to inform the NRC of potential FFD violations by NRC staff, so that the appropriate NRC managers can address the situation immediately.

Section 26.165 (b)(3) requires written permission from the donor before additional testing may occur if the initial sample had positive, adulterated, or substituted results. If a donor wants retesting, he or she must request it in writing within 3 business days. The time requirement is needed to ensure that the specimen(s) are retested quickly and do not deteriorate before retesting. The requirement protects the due process rights of donors.

Section 26.169(a) requires HHS-certified laboratory to report test results to the licensee's or other entity's MRO within 5 business days after receiving the specimen. The requirement for reporting within 5 business days ensures that the FFD program can take prompt action if the test results indicate that the authorization of the individual should be withdrawn or that there is evidence of tampering, adulteration, or substitution that should be investigated that must be investigated promptly to ensure that the results of other tests are not affected in the same way.

Section 26.169(h) requires the HHS-certified laboratory to provide to the licensee's or other entity's official responsible for coordination of the FFD program an annual statistical summary of urinalysis testing within 14 calendar days after the end of the 1-year period covered by the report. This requirement provides information from which the NRC can monitor the effectiveness of drug testing activities.

Section 26.185(p) requires an MRO to complete a review of positive, adulterated, substituted, and invalid test results and notify the licensee or other entity's designated representative within 10 business days of the an initial non-negative test result. Notification within 10 days is necessary so that the licensee or other entity can take prompt action concerning the non-negative result.

Section 26.203(d) requires that specified records pertaining to fatigue management should be kept for at least three years, which is consistent with the OMB Guidelines, "or until the completion of all related legal proceedings, whichever is later:" The latter requirement is necessary to ensure that records pertaining either to an enforcement action against a licensee or other entity for failure to comply with the fatigue management requirements of Subpart I of Part 26 or to an individual are available. The requirement protects the due process rights of licensees and other entities and of individuals.

Section 26.417(b)(1) requires licensees and other entities to report to the NRC Operations Center by telephone within 24 hours after the licensee or other entity discovers any intentional act that casts doubt on the integrity of the Subpart K FFD program and any programmatioc failure, degradation, or discovered vulnerability of the Subpart K FFD program that may permit undetected durg or alcohol use or abuse by individuals subject to Subpart K of Part 26. This

requirement is necessary to ensure that the NRC is informed promptly so that the appropriate NRC managers can address the situation immediately.

Section 26.711(a) requires that if a retention period is not otherwise specified in the appropriate section of Part 26, records must be retained until the Commission terminates the facility license. This requirement is necessary to ensure that records are available should an individual, the NRC, a licensee, or another entity who is subject to the rule require access to them in a legal or regulatory proceeding.

Section 26.713(a) requires that records of self-disclosures, employment histories, and suitable inquiries, records pertaining to the determination of a violation of the FFD policy and related management actions, documentation of the granting and termination of authorization, and records of any determinations of fitness conducted under §26.189 must be retained for at least 5 years after the licensee or other entity terminates or denies an individual's authorization or until the completion of all related legal proceedings, whichever is later. The requirement to retain records for at least five years, which is consistent with the previous rule, is necessary to ensure that licensees and other entities who may be considering granting authorization to an individual can obtain these records for review as part of the authorization decision-making process. The NRC considers that retention of these records for only three years will not be sufficient to ensure that individuals will be identified who seek reauthorization with a licensee or other entity after previously having violated an aspect of the FFD program. The requirement to retain records until the completion of all related legal proceedings was added at the suggestion of stakeholders during public meetings. The stakeholders noted that some legal proceedings involving records of the type specified in the paragraph have continued longer than the 5 years that the previous rule requires these records to be retained and that adding a requirement to retain the records until all legal proceedings are complete protects individuals' right to due process under the rule.

Sections 26.713(b)(1) and (b)(2) requires that licensees and other entities retain records of FFD training and examinations, and of FFD audits, audit findings, and corrective actions for at least three years, which is consistent with OMB guidelines, or until the completion of all related legal proceedings, which is later. The NRC again added the requirement to retain records until the completion of all related legal proceedings at the suggestion of stakeholders during public meetings to address the possibility of protracted legal proceedings.

Section 26.713(c) requires that licensees and other entities ensure the retention and availability of records pertaining to any 5-year denial of authorization and any permanent denial of authorization for at least 40 years or until, upon application, the NRC determines that the records are not longer needed. Because of the extremely serious nature of the actions that cause an individual to receive either a 5-year denial of authorization or a permanent denial of authorization, the 40-year retention requirement is intended to cover the longest expected working life of an individual, so that the record is available over the individual's entire working life. Requiring the record to continue to be available, even if the license is terminated of the licensee or other entity that had denied the individual's authorization, is necessary because the individual whose authorization was denied for 5 years or permanently denied under that licensee's FFD program would not necessarily leave the industry. Requiring retention and availability of the records pertaining to those individuals ensures that the records of the 5-year and permanent denials are available, should the individual seek authorization from another licensee or other entity.

Section 26.713(d) requires that licensees and other entities retain superseded FFD policies and procedures for at least 5 years or until they no longer need to respond to a legal challenge. The period of time that superseded materials are retained has been increased from 3 to 5 years to ensure that the materials are available if subsequent licensees and other entities require the information in validating a determination of fitness made at the time the procedures were in effect. The requirement to retain the policy and procedures related to any matter under legal challenge until the matter is resolved has been added to ensure that the materials remain available, should an individual, the NRC, a licensee, or another entity who is subject to this rule require access to them in a legal or regulatory proceeding.

Section 26.713(e) requires licensees and other entities to retain the written agreement for the life of the agreement (as in the current rule) or until completion of all legal proceedings related to an FFD violation that involved the services, whichever is later. The requirement to retain the written agreements for any matter under legal challenge until the matter is resolved has been added to ensure that the materials remain available, should an individual, the NRC, a licensee, or another entity who is subject to the rule require access to them in a legal or regulatory proceeding.

Section 26.713(f) requires licensees and other entities to retain records related to the background investigations, credit and criminal history checks, and psychological assessments of FFD program personnel, conducted under §26.31(b)(1)(i), for the length of the individual's employment by or contractual relationship with the licensee or other entity, or until the completion of all related legal proceedings, whichever is later. The retention period is based on the NRC's need to have access to the records for inspection purposes and the potential need for the records to remain available should an individual, the NRC, a licensee, or another entity who is subject to this rule require access to them in a legal or regulatory proceeding. However, the rule establishes a limit on the period during which the records must be retained in order to reduce the burden associated with storing such records indefinitely.

Section 26.713(g) requires licensees and other entities to retain records of the certification of the scientific and technical suitability of any assays and cutoff levels used for drug testing that are not addressed in Part 26, provided by a qualified forensic toxicologist, as required under §26.31(d)(1)(i) and (d)(3)(iii)(C). The licensee or other entity is required to retain these records for the period of time during which the FFD program continued to test for drugs for which testing is not required under Part 26, uses more stringent cutoff levels than those specified in Part 26, or until the completion of all related legal proceedings, whichever is later. The retention period is necessary to ensure the NRC's access to the records for inspection purposes and that the records remain available should an individual, the NRC, a licensee, or another entity who is subject to this rule require access to them in a legal or regulatory proceeding.

Section 26.715(a) requires collection sites providing services to licensees and other entities, licensee testing facilities, and HHS-certified laboratories to maintain and make available documentation of all aspects of the testing process for at least two years, which is consistent with OMB guidance, or until the completion of all legal proceedings related to the determination of an FFD violation, whichever is later. The section also provides that the 2-year period may be extended upon written notification by the NRC or by any licensee or other entity for whom services are being provided. This requirement is necessary to ensure access to the records by the NRC or by a licensee or other entity securing services from the collection site or the HHS-certified laboratory for inspection purposes and that the records remain available should an

individual, the NRC, a licensee, or another entity who is subject to this rule require access to them in a legal or regulatory proceeding.

Section 26.717(c) requires a licensee and any other entity that has a licensee-approved FFD program to analyze the FFD program performance data at least annually and to retain records of the data, analyses, and corrective actions taken for at least three years, which is consistent with OMB guidelines, or until the completion of any related legal proceedings, whichever is later. This retention is necessary to ensure that the records remain available should an individual, the NRC, a licensee, or another entity who is subject to this rule require access to them in a legal or regulatory proceeding.

Section 26.719(b) requires licensees or other entities to report significant FFD policy violations or programmatic failures to the NRC Operations Center by telephone within 24 hours after the licensee or other entity discovers the violation. This requirement is necessary to ensure that the NRC is informed promptly so that the appropriate NRC managers can address the situation immediately.

Section 719(c)(2) requires licensees or other entities to report a false positive error that occurs on a blind performance test sample submitted to an HHS-certified laboratory within 24 hours of the discovery of the error. Because positive test results can result in significant actions taken by FFD programs, it is important that a false positive experienced by one FFD program be reported to the NRC immediately so that actions can be taken to provide notice to other FFD programs that a particular laboratory may be experiencing analytic problems.

Section 719(c)(3) requires licensees or other entities to report a false negative error that occurs on a blind performance test sample submitted to an HHS-certified laboratory within 24 hours of the discovery of the error. Because negative test results can result in significant actions taken by FFD programs, it is important that a false negative experienced by one FFD program be reported to the NRC immediately so that actions can be taken to provide notice to other FFD programs that a particular laboratory may be experiencing analytic problems.

8. Consultations Outside the NRC

The requirements of 10 CFR Part 26 are discussed on a continuing basis with the Nuclear Energy Institute (NEI), the Substance Abuse and Mental Health Services Administration (SAMHSA) of the Department of Health and Human Services (HHS), and licensees individually and at industry-wide meetings.

In 2000, the Office of Management and Budget commented on the information collection clearance document submitted by the NRC in support of a proposed revision of the FFD rule. The NRC has prepared responses to those comments, the majority of which dealt with issues aside from reporting and recordkeeping. The NRC's responses are presented in Section V.A. of the Federal Register notice announcing the proposed rule and the availability of this supporting statement for public comment. Between 2001 and 2004, the NRC staff conducted 11 stakeholder meetings on the drug and alcohol testing portions of Part 26 and held 13 stakeholder meetings on a proposed draft rule to incorporate provisions to manage worker fatigue. Subsequent to the Commission's decision in May 2004 to combine the two rulemaking efforts, the staff held one stakeholder meeting on the combined rule in July 2004, and two meetings on the fatigue portions of the combined rule in August and September 2004. During the meetings the staff discussed with the stakeholders the proposed reporting and recordkeeping requirements along with other topics pertaining to the proposed FFD

requirements. At the July 2004 stakeholders meeting, the stakeholders received a detailed description of the estimated reporting and recordkeeping burdens associated with the proposed rule provisions as they existed at that time. Stakeholders provided verbal commentary on a few sections, but in general the stakeholders stated that they preferred to comment on the reporting and recordkeeping burden estimates when the proposed rule was published. The NRC offered to review and, consistent with the rulemaking schedule outlined to stakeholders at the public meetings, consider comments sent in following the meeting and received prior to September 15, 2004. However, no comments were received. Subsequent to the July 2004 stakeholders meeting, the NRC also requested and received data from six nuclear power plants pertaining to certain fatigue management provisions in the proposed Subpart I. Throughout this period of time, the staff made the draft proposed rule language available to the public through the agency's internet-based interactive rulemaking website at http://ruleforum.llnl.gov. All comments received between 2001 and September 15, 2004, were considered in developing this burden estimate.

An opportunity for public comment on the information collection requirements contained in the proposed rule published in the Federal Register on August 26, 2005, (70 FR 50442) elicited comments from several commenters. Stakeholders objected to the proposed annual reporting requirements that would have required licensees to report, as part of their annual FFD program performance report, information concerning implementation of their fatigue management program. Several commenters asserted that the NRC should delete the reporting requirements from the rule because they would not provide new or unique information, are unnecessary to protect public health and safety, are unnecessary to facilitate NRC oversight of implementation of the revised rule, and are unduly burdensome. Commenters also stated that the NRC has not met its obligation under the Paperwork Reduction Act with respect to the information collection requirements in the proposed reporting requirement. They argued that the NRC failed to adequately justify the need for these provisions to achieve the objectives of the proposed FFD rule and to objectively support the agency's estimate of the burden created for affected licensees. The commenters asserted that the annual report would require at least 30 clerical hours to develop and 20 management hours to review.

In response to these public comments, the staff revised the reporting requirements to ensure that annual reports provided meaningful information regarding licensee management of worker fatigue. However, the staff does not agree with comments suggesting that the requirements to include fatigue management information in annual FFD program performance reports should be deleted from the rule. The staff concludes that the industry-estimated 50 hours of licensee staff effort to include fatigue management information in the annual report is justified for the following reasons:

- The report will contain information that is central to effective oversight of licensee fatigue management— Licensee annual reports summarizing waivers from the work-hour limits will indicate how often a licensee relies on individuals who are at increased potential for impairment from fatigue to mitigate or prevent a condition adverse to safety or security when these conditions are associated with risk-significant SSCs or functions that are essential for effective response to a fire, plant emergency, or implementation of the site security plan. Frequent reliance on personnel with a high potential for impairment to resolve these conditions indicates a lack of effective management of worker fatigue and plant risk. The annual reports will also include information pertaining to licensee fatigue assessments that will provide an indication of how often: (1) individuals are relieved of duty because of observed impairment from fatigue, (2) fatigue is identified as a causal factor in significant plant events and injuries, and (3) individuals are required to remain on duty

following their declaration that they are not fit for duty because of fatigue. When this information is considered in conjunction with information concerning the licensee's use of waivers from the work hour limits, it will provide the NRC an indication of the extent to which these conditions may be the result of licensee's work scheduling practices.

- Consistency of NRC oversight— Annual FFD program performance reports concerning fatigue management will enable the NRC to achieve a higher level of consistency in the oversight of the implementation of the requirements in Subpart I and in the enforcement of those requirements. By enabling ready access to the fatigue management information (e.g., waiver use) for all plants, the annual reports provide NRC inspectors a common basis and perspective when inspecting licensee FFD programs and thereby maintain consistency in NRC's oversight of licensee FFD programs.

- Efficiency of NRC oversight— Information in the annual reports will enhance the efficiency of the NRC inspection process by providing the information necessary to allow the agency to better focus inspections of licensee fatigue management on specific categories of workers (e.g., security or maintenance) or issues (e.g., self-declaration). Accordingly, the staff expects that the annual reports will enable the NRC to be better focused in preparing for the inspection, thereby reducing the burden of onsite inspection hours and potentially reducing the total number of hours required for a baseline inspection.

- Evaluation of rule implementation— Changes in the size and composition of the nuclear industry, and staffing demands from possible new plant construction may have significant and unforeseen implications for site staffing and fatigue management at the existing nuclear power plants. As a result, industry trend and normative information obtained through the annual reports will provide important insights regarding potential opportunities to amend the rule to improve its effectiveness.

- Consistent interpretation of the waiver criteria— Based on experience with licensee use of waivers from work hour limits in plant technical specifications[1], the staff considers it prudent to provide a level of oversight through the annual reporting requirement that will ensure consistent implementation of the waiver criteria in the future. The NRC's policy guidance is for waivers to be used for "very unusual circumstances." Consistent with the guidance, the final rule provides licensees the discretion, in limited circumstances, to use waivers to exceed the work hour limits. The annual reporting of waiver use, in conjunction with the reporting of information concerning fatigue assessments, will enable the NRC to ensure that licensees use this discretion in a manner consistent with the objectives of managing worker fatigue, and not as a means to compensate for a lack of adequate staffing.

- Consistency with Part 26 requirements and performance objectives—The final rule retains the requirement of the former rule for reporting results of drug and alcohol testing and the performance objective for reasonable assurance that individuals are not impaired from any cause. In addition, several studies discussed in detail in Section IV of Enclosure 1 have demonstrated that worker fatigue can produce levels of impairment that are comparable to blood alcohol concentrations above levels permitted by Part 26. Accordingly, a requirement for annual reporting of information pertaining to licensee management of worker fatigue is consistent with the requirements for reporting information pertaining to

[1] In SECY-01-0113, the staff reported extensive use of waivers by some licensees.

drug and alcohol testing, consistent with the Part 26 performance objective for licensees to implement a comprehensive FFD program, and consistent with the staff's belief that the management of worker fatigue is no less important to worker FFD than the effective detection and deterrence of drug and alcohol use.

- Public confidence—Public interest groups such as the Union of Concerned Scientists (UCS) and the Project on Government Oversight have commented that the NRC has withheld much relevant information regarding worker fatigue to either protect an alleger's identity, or in the case of security personnel, plant security. In addition, several public media articles have been published during the past 2 years reporting instances of guards sleeping and guards fearing repercussions for refusing forced and excessive overtime. Information submitted by licensees in the annual reports would be publicly available and reassure public stakeholders that the NRC is appropriately cognizant of licensee actions regarding fatigue management. In essence, these reports would make the NRC's oversight of this issue transparent to all stakeholders

9. Payment or Gift to Respondents

Not applicable.

10. Confidentiality of the Information

Sections 26.31, 26.33, 26.35, 26.39, 26.61 through 26.70, 26.75, 26.77, 26.85, 26.115, 26.117, 26.119, 26.165, 26.183, 26.185, 26.189, 26.211, 26.411, 26.713, and 26.719 require each licensee or other entity to collect personal information for the purpose of complying with Part 26. Section 26.37(a) of the rule requires each licensee or other entity who collects personal information about an individual for the purpose of complying with Part 26 to establish and maintain a system of files and procedures to protect the personal information, and to maintain and use such records with the highest regard for individual privacy. Section 26.37(b) permits disclosure of personal information concerning an individual only pursuant to a signed consent from the individual, except for disclosures to the following: the subject individual or his or her representative, when the individual has designated the representative in writing for specified FFD matters; assigned MROs and MRO staff; NRC representatives; appropriate law enforcement officials under court order; a licensee's or other entity's representatives who have a need to have access to the information in performing assigned duties, including determinations of fitness, audits of FFD programs, and human resources functions; the presiding officer in a judicial or administrative proceeding that is initiated by the subject individual; persons deciding matters under review for FFD policy violations under §26.39; and other persons pursuant to court order. Section 26.37(c) provides that personal information that is collected under Part 26 must be disclosed to other licensees or other entities, including C/Vs, or their authorized representatives, who are legitimately seeking the information for authorization decisions as required by Part 26 and who have obtained a signed release from the subject individual. Section 26.37(d) provides that upon receipt of a written request by the subject individual or his or her designated representative, the licensee, other entity, HHS-certified laboratory, or MRO possessing such records shall promptly provide copies of all records pertaining to the determination of a violation of the FFD policy, including test results, MRO reviews, and management actions pertaininig to the subject individual.

Information identified as proprietary or confidential will be handled in accordance with 10 CFR 2.390 of the NRC regulations.

11. Justification for Sensitive Questions

Sections 26.31, 26.33, 26.35, 26.39, 26.61 through 26.70, 26.75, 26.77, 26.85, 26.115, 26.117, 26.119, 26.165, 26.183, 26.185, 26.189, 26.211, 26.411, 26.713, and 26.719 require each licensee or other entity to collect personal information for the purpose of complying with Part 26. It is necessary to obtain sensitive personal information to accomplish the performance objectives of Part 26, which include providing reasonable assurance that individuals who are subject to Part 26 are trustworthy and reliable as demonstrated by the avoidance of substance abuse; providing reasonable assurance that individuals who are subject to Part 26 are not under the influence of any substance, legal or illegal, or mentally or physically impaired from any cause, which in any way adversely affects their ability to safely and competently perform their duties, that the workplaces subject to Part 26 are free from the presence and effects of illegal drugs and alcohol, and that the effects of fatigue and degraded alertness on individuals' abilities to safely and competently perform their duties are managed commensurate with maintaining public health and safety; and to provide reasonable measures for the early detection of individuals who are not fit to perform the job duties that require them to be subject to Part 26.

12. Estimate of Industry Burden and Costs

The burden associated with the information collections are given in Table 1 for one-time burden, Table 2 for annual recordkeeping burden, Table 3 for annual reporting burden, and Table 4 for third-party collections. Because the new rule constitutes a complete revision of Part 26, estimates are included for all sections that affect the information collection requirements and establish a new baseline. These estimates are based, in part, on discussions with nuclear utility employees, staff of the Nuclear Energy Institute, and on estimates made by NRC personnel who are familiar with the records and reports required by 10 CFR Part 26.

13. Estimates of Other Additional Costs

The quantity of records to be maintained is roughly proportional to the recordkeeping burden (excluding third-party communication requirements that are not specifically recordkeeping) and therefore can be used to calculate approximate records storage costs. Based on the number of pages maintained for a typical clearance, the records storage cost has been determined to be equal to .0004 times the recordkeeping burden cost. Therefore, the storage cost for this clearance is estimated to be $5,627 (576,428 recordkeeping hours - 507,795 third-party hours = 68,633 recordkeeping hours x $205 per hour x .0004).

Approximately 50 percent of FFD programs, or 20 programs, are expected to purchase an average of 2 evidentiary breath testing (EBT) devices per program at a cost of approximately $3,000 per device for a total of $120,000 (20 x 2 x $3,000).

14. Estimated Annualized Cost to the Federal Government

Table 5 describes the estimated annual cost to the NRC for administration of the reporting and recordkeeping requirements in Part 26. The cost is fully recovered through fee assessments to NRC licensees pursuant to 10 CFR Parts 170 and/or 171.

15. Reasons for Change in Burden or Cost

The estimated annual burden of 645,861 hours for one-time recordkeeping (annualized), annual recordkeeping, and annual reporting of the rule exceeds NRC's estimate for the current rule of 61,143 hours (as estimated in the final clearance renewal published in the Federal Register on October 3, 2005 (70 FR 57625)) by 584,718 hours. Of this, 128,701 hours are for one-time recordkeeping requirements. Therefore, the burden increase will be reduced by about 20 percent once the one-time requirements are complete. The final rule is a complete revision of Part 26, and as such the burden increase or decrease cannot be associated with changes in the estimate for particular rule sections from the former rule to the final rule.

The factors that account for the increased estimate are the following: the rule creates more detailed requirements pertaining to the FFD authorization process for individuals to ensure consistency with the NRC's access authorization requirements for nuclear power plants established in 10 CFR 73.56, as supplemented by orders to nuclear power plant licensees dated January 7, 2003. The rule includes more detailed requirements pertaining to the specimen collection and testing process, to increase consistency with other relevant Federal rules and guidelines, including the U.S. Department of Health and Human Services Mandatory Guidelines for Federal Workplace Drug Testing Programs (HHS Guidelines). The rule adds requirements for confirmatory drug and alcohol testing and verification testing, and makes more explicit the requirements for licensee testing facilities. The burden estimate for the rule captures significant third-party collections associated with the reporting and recordkeeping associated with the drug and alcohol testing activities that were not captured in the previous rule. Experience from the implementation of the previous FFD rule, information obtained from stakeholders, and information obtained from sources such as the DHHS National Laboratory Certification Program has led the NRC to revise its estimates of the burden of certain activities. Finally, the rule contains new fatigue management provisions that include reporting and recordkeeping burdens that were not part of previous estimates, and it contains new requirements for FFD programs for individuals involved in the construction of new nuclear power reactors. The fatigue management requirements pertain to 30 programs; the FFD requirements for individuals involved in the construction of new reactors are expected to apply to 19 new nuclear power reactor construction activities.

16. Publication for Statistical Use

Not applicable.

17. Reasons for Not Displaying the Expiration Date

The requirement will be contained in a regulation. Amending the Code of Federal Regulations to display information that, in an annual publication, could become obsolete is unduly burdensome and too difficult to keep current.

18. Exceptions to the Certification Statement

None.

B. COLLECTION OF INFORMATION EMPLOYING STATISTICAL METHODS

Statistical Methods are not used in this information collection.

Table 1
One-Time Recordkeeping Requirements
(Annualized)

Section	Number of Programs	Burden Hours per Program (Annualized)	Total Burden Hours (Annualized)
26.27(a): Prepare FFD policy statement	33 programs	321.0	3,531
26.27(a): Prepare FFD procedures	33 programs	213.0	7,029
26.29(a): Prepare FFD training course	33 programs	83.0	2,739
26.29(b): Prepare FFD exam	33 programs	13.3	440
26.29(b): All current staff take FFD exam	33 programs	283.3	9,350[2]
26.29(b): FFD staff mgmt grade FFD exam	33 programs	283.3	9,350[3]
26.29(c)(1): FFD training for current staff	33 programs	2,266.7	74,800[4]
26.31(b)(1)(v): Prepare behavioral observation procedures for FFD program personnel	Burden shown under §§26.27		
26.31(d)(1)(iii): Document additional drugs being tested	33 programs	0.3	11
26.37(a): Confirm files and procedures protect personal information	33 programs	2.7	88
26.37(b): Obtain signed consent for release of information	33 programs	141.7	4,675[5]
26.39(a) and (b): Prepare procedure for review of determination of FFD violation	33 programs	13.3	440
26.85(a): Prepare and deliver qualification training for urine collectors	33 programs	5.3	176

[2]Estimate assumes 1,700 employees per program take the FFD exam. The FFD exam is estimated to take 0.5 hours to complete per employee.

[3]Estimate assumes 1,700 employees per program take the FFD exam. The FFD exam is estimated to take 0.5 hours to grade per employee.

[4]Estimate assumes 1,700 employees per program that require FFD training. The FFD training is estimated to take 4.0 hours per employee.

[5]Estimate assumes 1,700 employees per program that must consent to the release of information. The collection is estimated to take 0.25 hours per employee.

Section	Number of Programs	Burden Hours per Program (Annualized)	Total Burden Hours (Annualized)
26.85(b): Prepare and deliver qualification training for alcohol collectors	33 programs	5.3	176
26.127(a): Prepare procedures for handling specimens at licensee testing facilities	33 programs	13.3	440
26.127(b): Prepare written chain-of-custody procedures for licensee testing facilities	33 programs	13.3	440
26.127(c): Prepare written procedures for assays performed by licensee testing facilities	33 programs	13.3	440
26.127(d): Prepare written procedures for instrument and test setup by licensee testing facilities	33 programs	13.3	440
26.127(e): Prepare written procedures for remedial actions for systems and tests at licensee testing facilities	33 programs	13.3	440
26.137(a): Develop QA/QC program and procedures for licensee testing facilities	33 programs	13.3	440
26.155(a)(1), (3), (4), (5); (b),(c), (e), and (f): Confirm that HHS requirements for laboratory personnel qualifications and procedures already in place pursuant to HHS requirements also meet Part 26 requirements	26 HHS labs	2.7	69
26.157(b), (c), (d), and (e): Confirm that laboratory procedures already in place pursuant to HHS requirements also meet Part 26 requirements	26 HHS labs	2.7	69
26.159(a), (c), (e), (f): Confirm that specimen security, chain of custody, and preservation procedures already in place pursuant to HHS requirements also meet Part 26 requirements	26 HHS labs	2.7	69
26.203(a): Prepare fatigue management policy (In addition to §§26.27 burden)	30 programs	2.7	400
26.203(b): Prepare fatigue management procedures (In addition to §26.27 burden)	30 programs	13.3	400

Section	Number of Programs	Burden Hours per Program (Annualized)	Total Burden Hours (Annualized)
26.203(c): Prepare training on fatigue management.	30 programs	22.7	680
26.205(b): Develop work hour tracking system	30 programs	133.3[6]	4,000
26.205(c): Develop individual work scheduling system	30 programs	33.3	1,000
26.401(b): Prepare FFD program plan	19 programs	60.0	1,140
26.403(a): Prepare construction FFD policy statement	19 programs	107.0	2,033
26.403(a): Distribute FFD policy statement to all individuals	19 programs	5.0	95
26.403(b): Prepare construction FFD policy procedures	19 programs	213.0	4,047
26.406(a), (b), and (d): Establish a fitness monitoring program	7 programs	26.7	187
26.406(c): Establish procedures for fitness monitors	7 programs	40.0	280
26.407: Establish procedures for behavioral observation	12 programs	40.0	480
26.413: Develop procedures for review of determinations of FFD violations	19 programs	120.0	2,280

26.99(b): Record test time of initial test with 0.02% or higher BAC	33 programs	17.1	565
26.101(b)(7): Indicate time on EBT printout of alcohol test result	33 programs	17.1	565
26.103(b): Inform FFD mgmt of result between 0.01 and 0.02 when donor in work status 3 or more hours	33 programs	0.3	11
26.107(b): Document tampering attempt on c & c form	33 programs	1.4	47
26.109(b)(3): Notify FFD mgt. or MRO of “shy bladder” problem	33 programs	0.5	18
26.109(b)(4): Notify FFD mgmt. if observed collection required	33 programs	0.3	11
26.111(b): Note unusual findings on c & c form	33 programs	1.4	47
26.111(c):Report tampering attempts to FFD mgr.	33 programs	0.3	11
26.113(b)(3): Prepare c & c forms for both parts of split sample	33 programs	0.3	11
26.115(b): Obtain approval for collection under direct observation from FFD mgr. or MRO	33 programs	0.5	18
26.115(d): Prepare c & c form for directly observed collection	33 programs	0.3	11
26.115(f)(3): Record name of observer	33 programs	0.3	11
26.117(c), (d), and (e): Prepare ID labels and c & c forms for specimen shipment	33 programs	65.5	2,160
26.119(a), (e), and (f): Obtain evaluation from MRO or physician evaluating “shy bladder” claim	33 programs	6.0	198

Section	Number of Recordkeepers	Burden Hours per Recordkeeper	Total Annual Burden Hours
26.119(b): MRO provides information to physician as background for evaluation of “shy bladder” claim	33 programs	2.2	72
26.125(b) and (c): Proficiency and qualifications records of testing facility personnel	33 programs	16.4	540
26.127(a): Procedures for handling specimens by licensee testing facilities	33 programs	40.0	1,320
26.127(b): Written chain-of-custody procedures for licensee testing facilities	33 programs	40.0	1,320
26.127(c): Written procedures for assays performed by licensee testing facilities	33 programs	40.0	1,320
26.127(d): Written procedures for instrument and device setup by licensee testing facilities	33 programs	40.0	1,320
26.127(e): Written procedures for remedial actions for systems and testing devices at licensee testing facilities	33 programs	40.0	1,320
26.129(a): Limit access to testing site	33 programs	2.5	83
26.129(b): Inspect specimen packages, custody control forms, and obtain memorandum from specimen collector	33 programs	0.5	17
26.129(b)(1): Report to senior mgmt. attempts to tamper with specimens in transit	33 programs	1.0	33
26.129(d): Procedures for tracking c & c of specimens	33 programs	95.0	3,135
26.135(b): Donor’s written permission for retest second part of split sample	33 programs	2.2	72
26.137(a): Maintain QA/QC program and procedures for licensee testing facility	33 programs	4.0	132
26.137(b)(1)(ii): Document performance of testing device not on SAMHSA list	2 programs	40.0	80
26.137(b)(1)(iii): Document results of annual test of device not on SAMHSA list	2 programs	20.0	40
26.137(b)(3): Submit 1 in 10 negative specimens for validity screening	33 programs	40.0	1,320
26.137(e)(7): Document procedures to protect against carryover material	33 programs	2.0	66

Section	Number of Recordkeepers	Burden Hours per Recordkeeper	Total Annual Burden Hours
26.137(f)(5): Record finding of testing errors	33 programs	26.2	864
26.137(h): Label standards and controls	33 programs	65.0	2,145
26.139(d): Prepare information for FFD annual report on activities of licensee testing facility	33 programs	40.0	1,320
26.153(e): Inspect HHS-certified labs	33 programs	40.0	1,320
26.153(f): Include specified requirements in contracts with HHS labs	33 programs	40.0	1,320
26.153(g): Supply memo to HHS labs explaining use of non-federal c & c form	33 programs	0.5	17
26.155(a)(1): Document qualifications for lab mgr of HHS-certified lab.	Burden covered by HHS lab certification requirements OMB Clearance # 0930-0158		
26.155(a)(3): Lab mgr. documents training of lab personnel	Burden covered by HHS lab certification requirements OMB Clearance # 0930-0158		
26.155(a)(4): Lab mgr. reviews and signs lab procedures	Burden covered by HHS lab certification requirements OMB Clearance # 0930-0158		
26.155(a)(5): Lab mgr. maintains QA program	Burden covered by HHS lab certification requirements OMB Clearance # 0930-0158		
26.155(b): Certifying scientist to certify test results from HHS lab	Burden covered by HHS lab certification requirements OMB Clearance # 0930-0158		
26.155(c): Supervise technical analysts at HHS lab	Burden covered by HHS lab certification requirements OMB Clearance # 0930-0158		
26.155(e): Continuing education for staff of HHS lab	Burden covered by HHS lab certification requirements OMB Clearance # 0930-0158		
26.155(f): Lab personnel records	Burden covered by HHS lab certification requirements OMB Clearance # 0930-0158		
26.157(a): Written procedures for accession, receipt, shipment, and testing of urine specimens by HHS lab	Burden covered by HHS lab certification requirements OMB Clearance # 0930-0158		

Section	Number of Recordkeepers	Burden Hours per Recordkeeper	Total Annual Burden Hours
26.157(b): Written chain-of-custody procedures for HHS lab	Burden covered by HHS lab certification requirements OMB Clearance # 0930-0158		
26.157(c): Written procedures manual for each assay performed by HHS lab	Burden covered by HHS lab certification requirements OMB Clearance # 0930-0158		
26.157(d): Written procedures for device set-up and operation	Burden covered by HHS lab certification requirements OMB Clearance # 0930-0158		
26.157(e): Written procedures for remedial actions to address systems and instrument errors	Burden covered by HHS lab certification requirements OMB Clearance # 0930-0158		
26.159(a): Documented restriction to access to HHS lab	Burden covered by HHS lab certification requirements OMB Clearance # 0930-0158		
26.159(b): Report evidence of tampering with specimens in transit to FFD program mgr. of licensee or other entity	33 programs	1.0	33
26.159(c), (d), and (e): Use and storage of c & c forms	Burden covered by HHS lab certification requirements OMB Clearance # 0930-0158		
26.159(f): Use of c & c form when shipping specimen to another HHS lab	Burden covered by HHS lab certification requirements OMB Clearance # 0930-0158		
26.159(i): Obtain written authorization to store specimens other than 1 year	33 programs	0.5	17
26.163(a)(2): Inform licensee of dilute specimen and report confirmatory validity test result to MRO	33 programs	3.3	108
26.165(b)(1): Donor requests aliquot or split specimen to be tested by a second HHS-certified laboratory	33 programs	10.9	361[11]
26.165(b)(2): MRO informs donor of opportunity for re-test of aliquot or test of Bottle B of split sample	33 programs	3.3	108

[11]Estimate is based on 361 donors and one burden hour per donor.

Section	Number of Recordkeepers	Burden Hours per Recordkeeper	Total Annual Burden Hours
26.165(b)(3): Donor gives written permission for re-test of aliquot or test of Bottle B of split sample	33 programs	10.9	361[12]
26.165(b)(4): Donor presents documentation for reason unable to complete timely retest request	33 programs	0.2	6[13]
26.165(b)(6): Provide results of re-test of aliquot or test of Bottle B to MRO and to donor	33 programs	6.5	216
26.165(c)(4): Report retesting results to MRO	26 laboratories	13.9	361[14]
26.165(f): Adjustments to personnel files and written notifications regarding test results, including temporary administrative action	33 programs	6.5	216
26.165(f)(1)(iv) and (f)(2): Written notice that records purged of references to temporary administrative action	33 programs	8.7	288
26.167(a): Document quality assurance program of HHS lab	Burden covered by HHS lab certification requirements OMB Clearance # 0930-0158		
26.167(c)(2)(i): HHS-certified laboratory's refractometer must display specific gravity to 4 decimals and be interfaced with laboratory information management system or computer and/or document result by hard copy or electronic display	Burden covered by HHS lab certification requirements OMB Clearance # 0930-0158		
26.167(f)(3): Certification by HHS lab that retesting requested by licensee or other entity has occurred	26 laboratories	1.0	26
26.167(h): Labeling of standards and controls	Burden covered by HHS lab certification requirements OMB Clearance # 0930-0158		

[12]Estimate is based on 361 donors and one burden hour per donor.

[13]Estimate is based on 6 donors and one burden hour per donor.

[14]Estimate is based on 361 donors and one burden hour per donor.

Section	Number of Recordkeepers	Burden Hours per Recordkeeper	Total Annual Burden Hours
26.168(a): Preparer certifies contents of blind performance test samples submitted to HHS lab	Burden covered by HHS lab certification requirements OMB Clearance # 0930-0158		
26.168(h)(2): Ensure supplier provides expiration date for test sample	Burden covered by HHS lab certification requirements OMB Clearance # 0930-0158		
26.168(i)(2): Use c & c form, place fictional initials on specimen labels, and indicate blind performance test samples	Burden covered by HHS lab certification requirements OMB Clearance # 0930-0158		
26.169(a): Reports of test results by HHS lab	Burden covered under §§26.169 (c)(1) through (c)(5)		
26.169(c)(1): HHS lab reports positive, adulterated, substituted, dilute, and invalid test results to the MRO	26 laboratories	350.0	9,100
26.169(c)(2): HHS lab reports quantitative test results as requested by MRO	5 laboratories	1.0	5
26.169(c)(2): HHS lab reports quantitative test results for opiates to MRO	16 laboratories[15]	1.0	16
26.169(c)(3): HHS lab reports quantitative test results for adulterated or substituted test results	26 laboratories	20.0	520
26.169(c)(4): HHS contact with MRO to discuss whether testing by another HHS lab should be done	26 laboratories	2.0	52
26.169(c)(5): HHS lab may report concentration exceeding linear range	5 laboratories	1.0	5
26.169(f): HHS lab transmits copy of the c & c form for negative results to the MRO	26 laboratories	0.3	7
26.169(g): HHS lab transmits original of c & c form for positive, adulterated, substituted, dilute or invalid results to the MRO	26 laboratories	100.0	2,600
26.169(h): HHS lab prepares and submits annual statistical summary report of urinalysis testing results	26 laboratories	40.0	1,040
26.183(a): Documentation of MRO qualifications	33 programs	3.5	116

[15]Estimate based on 16 total positive opiate drug tests listed in NRC's 2005 FFD program perforance data.

Section	Number of Recordkeepers	Burden Hours per Recordkeeper	Total Annual Burden Hours
26.183(c)(1): MRO review of records for positive, adulterated, substituted, invalid, or, at the licensees or other entity's discretion, dilute test results	33 programs	26.2	864
26.183(d)(1)(ii)(D): MRO report of drug test results to licensee's designated reviewing official	33 programs	24.0	792
26.183(d)(2)(i): MRO staff review and reporting of negative test results	33 programs	12.0	396
26.183(d)(2)(ii): MRO staff review c & c forms and forward changes to MRO	33 programs	13.1	432
26.185(a) MRO review of all positive, adulterated, substituted, dilute, or invalid test results and report to licensee or other entity	33 programs	54.5	1,800
26.185(c): MRO discussion of test results with the donor	33 programs	2.2	72
26.185(c): MRO report to licensee, following discussion with donor, of FFD violation	33 programs	2.2	72
26.185(d)(1): Documentation that donor declined to discuss test results	33 programs	2.2	72
26.185(e): Documentation that donor was unavoidably prevented from discussing test results and request to reopen proceeding	33 programs	0.3	11
26.185(f)(1): MRO consultation with HHS lab to determine whether additional testing needed	33 programs	0.5	17
26.185(f)(2): MRO contact with donor regarding medical explanation for test result	33 programs	0.5	17
26.185(h)(1): MRO contact with donor to offer opportunity to provide medical evidence regarding substituted specimen	33 programs	1.0	33
26.185(h)(1): Donor presents medical explanation for substituted result	33 programs	1.0	33
26.185(h)(2): MRO notification to licensee that no valid medical explanation presented	33 programs	2.0	66
26.185(h)(3): MRO notification to licensee that valid medical explanation presented	33 programs	1.0	33

Section	Number of Recordkeepers	Burden Hours per Recordkeeper	Total Annual Burden Hours
26.185(i)(1): MRO contact with donor to offer opportunity to provide medical evidence regarding adulterated specimen	33 programs	1.0	33
26.185(i)(1): Donor presents medical explanation for adulterated result	33 programs	1.0	33
26.185(i)(2): MRO notification to licensee that no valid medical explanation presented	33 programs	2.0	66
26.185(i)(3): MRO notification to licensee that valid medical explanation presented	33 programs	1.0	33
26.185(j)(3): MRO notification to licensee where evidence of drug abuse	33 programs	1.0	33
26.185(j)(3): MRO report to licensee that donor has violated FFD policy by use of another individual's prescription medication	33 programs	0.5	17
26.185(k): MRO report to licensee that no FFD policy violation has occurred	33 programs	1.0	33
26.185(m): MRO review of inspection and audit reports, quality control data, multiple specimens, and other data to determine if positive, adulterated, substituted, or invalid result is scientifically insufficient for determination of FFD policy violation	33 programs	1.0	33
26.185(n): MRO report to licensee on result of analysis by second laboratory	33 programs	2.0	66
26.185(o): MRO request for quantitation of test results	33 programs	0.5	17
26.185(o): Lab provides quantitation of test results	33 programs	1.0	33
26.185(p): MRO notice to licensee of determination of FFD policy violation	33 programs	8.7	288
26.187(d): SAE training requirements	33 programs	20.0	660
26.187(f): Documentation of SAE credentials and training	33 programs	1.0	33
26.189(a): Written record of determination of fitness	33 programs	74.2	2,448
26.189(c): Written record of "for cause" determination of fitness	33 programs	13.1	432

Section	Number of Recordkeepers	Burden Hours per Recordkeeper	Total Annual Burden Hours
26.189(d): Modification of an initial determination of fitness	33 programs	1.0	33
26.203(d)(1): Records of work hours	Burden shown under §26.205(c), (d)(1), and (e)(4)		
26.203(d)(2): Records of shift schedules and shift cycles	Burden shown under §26.205(c), (d)(1), and (e)(4)		
26.203(d)(3): Documentation of waivers	Burden shown under §26.207(a)(4)		
26.203(d)(4): Documentation of work hour reviews	Burden shown under §26.205(d)(2), (e)(3) and (e)(4)		
26.203(d)(5): Documentation of fatigue assessment	Burden shown under §26.211(f)		
26.205(b): Calculate work hours	30 programs	176.0	5,280
26.205(c): Schedule work hours	30 programs	2,288.0	68,640
26.205(d)(1): Implement work hour controls	30 programs	50.0	1,500
26.205(d)(2): Ensure adequate rest breaks	30 programs	50.0	1,500
26.205(e)(1) and (2): Review of control of work hours twice per calendar year	30 programs	40.0	1,200
26.205(e)(3): Document methods for reviews	30 programs	20.0	600
26.205(e)(4): Record and trend problems in regarding work hours	30 programs	20.0	600
26.207(a)(4): Document bases for waiver	3 programs	6.0	18
26.211(f): Document results of fatigue assessments	30 programs	50.0	1,500
26.405(a) Random drug and alcohol testing	12 programs	875.0	10,500[16]
26.405(c)(1): Document pre-assignment testing	19 programs	1,750.0	33,250[17]
26.405(c)(2) and (c)(3): Document for-cause and post accident testing	19 programs	38.0	722

[16]Value based on estimate of 12 construction programs choosing to conduct random testing (rather than fitness monitoring), 1,750 workers per construction site subject to the FFD program, a 50% test rate, and one hour of burden per test. This one hour burden per random test is larger than the 0.5 hours per random test for operating reactor sites, due to the large size of a construction site and the associated travel time necessary to reach the testing site.

[17]Estimate based on one hour per person to document pre-assignment testing for 1,750 workers at the construction site subject to the FFD program.

Section	Number of Recordkeepers	Burden Hours per Recordkeeper	Total Annual Burden Hours
26.405(c)(4): Document follow up testing	19 programs	190.0	3,610
26.405(d): Test for specified drugs, adulterants, and alcohol, at Part 26 specified cutoff levels	Burden shown under §26.405(a) - (c)(4)		
26.405(e): Ensure privacy and quality control	19 programs	40.0	760
26.405(f): Ensure testing conducted at an HHS-certified laboratory	19 programs	40.0	760
26.405(g): MRO review of positive, adulterated, substituted, and invalid drug and validity test results	19 programs	50.0	950
26.406(c): Maintain fitness monitoring procedures (programs that do not adopt random testing and behavioral observation)	7 programs	80.0	560
26.411(a): Maintain a system of files and procedures to protect personal information	19 programs	4.0	76
26.411(a): Collect personal information	19 programs	1,750.0	33,250[18]
26.411(b): Obtain signed consent form	19 programs	1.5	29
26.413: Document results of review process	19 programs	80.0	1,520
26.415: Document and report audit results	19 programs	40.0	760
26.417(a): Retain program records	19 programs	20.0	380
26.713(a)(1): Retain records of self-disclosure	33 programs	80.0	2,640
26.713(a)(2): Retain records on FFD violations	33 programs	80.0	2,640
26.713(a)(3): Retain records of authorization	33 programs	80.0	2,640
26.713(a)(4): Retain records of FFD determinations	33 programs	80.0	2,640
26.713(b)(1): Retain records of FFD training	33 programs	160.0	5,280
26.713(b)(2): Retain records of audits	33 programs	80.0	2,640
26.713(c): Retain records on 5-year authorization denial and permanent denial	33 programs	40.0	1,320

[18]Estimate based on one hour per person to collect personal information for 1,750 workers at the construction site subject to the FFD program.

Section	Number of Recordkeepers	Burden Hours per Recordkeeper	Total Annual Burden Hours
26.713(d): Retain superseded FFD policy	33 programs	80.0	2,640

Table 3
Annual Reporting Burden

Section	Number of Respondents	Responses per Respondent	Total Responses	Burden per Response (hours)	Total Burden Hours
26.9: Application to NRC for exemption	2 programs	1	2	16.0	32
26.77(c) Report FFD-impaired NRC employee	33 programs	None	None	1.0	None
26.137(b)(2)(iii): Report false negative QC test result	Burden shown under §26.719(c)(3)				
26.137(b)(3): Report false negative QC lab result	Burden shown under §26.719(c)(3)				
26.139(d): Prepare information for annual report	Burden shown under §26.717(c)				
26.187(f): Provide SAE quals documentation to NRC	1 program	1	1	1.0	1
26.203(e)(1): Report work hour controls waivers to NRC	30 programs	1	30	20.0	600
26.203(e)(2): Report number of fatigue assess. to NRC	30 programs	1	30	30.0	900
26.417(b)(1): Report to NRC by telephone with 24 hours programmatic failures	1 program	1	1	4.0	4
26.417(b)(2): Annual construction FFD report	19 programs	1	19	80.0	1,520
26.717(d): Report termination test results in the annual summary by processing stage	33 programs	30	979	1.0	979[19]
26.717(e) and (f): Annual report of FFD program performance	33 programs	1	33	120.0	3,960

[19]Estimate is based on 979 positive test results in NRC's 2005 FFD program perforance data and one burden hour per positive test result.

Section	Number of Respondents	Responses per Respondent	Total Responses	Burden per Response (hours)	Total Burden Hours
26.719(a): Reports of signif. FFD violations, program failurs, and errors in testing	Burden reported under 26.719(b) and (c)				
26.719(b): Report signif. FFD violations by phone w/in 24 hrs	33 programs	1	33	2.3	74
26.719(c)(1): Report results of testing error investigation to NRC w/in 30 days	2 programs	1	2	1.0	2
26.719(c)(2): Notify NRC of false pos. on blind performance sample w/in 24 hrs	33 programs	155	5,112	4.0	20,448
26.719(c)(3): Notify NRC of false neg. on QA check w/in 24 hrs	33 programs	7	216	1.0	216
Table 3 Total			**6,458**		**28,736**

TOTAL PART 26 BURDEN: 738,129 hours (132,965 hours one-time recordkeeping annualized, 576,428 hours recordkeeping + 28,736 hours reporting)
TOTAL RESPONSES: 6,510 (6,458 responses + 52 recordkeepers)
NUMBER OF RESPONDENTS: 52 (28 reactor programs, 2 contractor/vendors, 2 fuel cycle facilities, 1 mixed-oxide fuel fabrication facility, and 19 construction FFD programs)

Table 4
Annual Third - Party Burden

Section	Number of Recordkeepers	Burden Hours per Recordkeeper	Total Annual Burden Hours
26.27(b): Make FFD policy statement available to staff subject to FFD reqs.	33 programs	2.0	66
26.29(b): FFD exams	33 programs	1.0	33
26.29(b): All current staff take FFD exam	33 programs	283.3	9,350
26.29(b): FFD staff mgmt grade FFD exam	33 programs	283.3	9,350
26.29(c)(1): FFD training for current staff	33 programs	2,266.7	74,800
26.29(c)(2): Refresher FFD training or testing	33 programs	250.0	8,250
26.29(d): Accept FFD training from other licensees' programs	33 programs	17.5	576
26.31(b)(1)(i): Background checks for FFD personnel	33 programs	17.5	576
26.31(b)(1)(v): Behavioral observation for FFD program personnel	33 programs	80.0	2,640
26.31(d)(1)(i)(D): Analysis and certification for unlisted drugs	8 programs	4.0	32
26.31(d)(1)(ii): Licensee additions to tested drugs	33 programs	8.0	264
26.31(d)(3)(iii)(A): Document more stringent cutoff levels	8 programs	8.0	64
26.31(d)(3)(iii)(C): Evaluation and certification of more stringent cutoff levels	8 programs	8.0	64
26.31(d)(6): Written permission of donor to conduct another analysis or test with specimen	8 programs	1.0	8
26.33: Records of behavioral observations	33 programs	436.4	14,400
26.35(a): Employee assistance program records	33 programs	16.0	528
26.35(c): Written waiver of right to privacy from individual given to EAP	33 programs	2.0	66
26.35(c): EAP disclosure to FFD mgmt.	16 programs	1.0	16
26.37(b): Obtain signed consent for release of information	33 programs	141.7	4,675

Section	Number of Recordkeepers	Burden Hours per Recordkeeper	Total Annual Burden Hours
26.37(b)(1): Signed designation of personal representative for FFD matters	33 programs	117.8	3,888
26.37(c): Disclosure to other licensees	33 programs	108.0	3,564
26.37(d): Obtain lab results and provide result to individual	33 programs	32.7	1,080
26.39(a) and (b): Maintain procedures for review of determinations of FFD	33 programs	120.0	3,960
26.39(d): Update records to reflect outcome of review of determination of fitness	33 programs	43.6	1,440
26.39(e): Provide review procedure to individual	33 programs	14.8	490[20]
26.41(d): Review C/V audit results	33 programs	38.0	1,254
26.41(f): Document and report audit results	33 programs	38.0	1,254
26.41(g): Share audit results with mgmt and with other FFD programs	32 programs	40.0	1,320
26.53(e)(2): Inform licensee of the termination of an individual's authorization	2 programs	120.0	240
26.53(g): Inform licensee of Part 26 requirement violations	8 programs	8.0	64
26.53(h): Obtain the knowledge and written consent of the subject individual before initiating any actions under Subpart C	33 programs	1,197.0	39,503[21]
26.53(i): Inform, in writing, any individual applying for authorization of the causes for denial or termination of authorization	33 programs	19.6	648[22]
26.55(a)(1) and (a)(2): Obtain and review self-disclosure and empl. history and complete suitable inquiry	Burden shown under §§26.61 and 26.63		

[20]Estimate is based on 979 positive test results from NRC's 2005 FFD program perforance data. 0.5 burden hours is estimated for each positive test result.

[21]Estimate is based on 79,005 pre-access tests from NRC's 2005 FFD program perforance data. 0.5 burden hours is estimated for each test.

[22]Estimate is based on 648 positive pre-access test results from NRC's 2005 FFD program perforance data. 1 burden hour is estimated for each positive test result.

Section	Number of Recordkeepers	Burden Hours per Recordkeeper	Total Annual Burden Hours
26.57(a)(1) and (a)(2): Obtain and review self-disclosure and empl. history and complete suitable inquiry	Burden shown under §§26.61 and 26.63		
26.59(a)(1) and (a)(2): Obtain and review self-disclosure and empl. history and complete suitable inquiry	Burden shown under §§26.61 and 26.63		
26.59(c)(1): Obtain and review self-disclosure	Burden shown under §§26.61		
26.61(a): Written self-disclosure and employment history	33 programs	1,096.4	36,180
26.63(a) and (e): Suitable inquiry	33 programs	1,723.6	56,880
26.63(c): Confirm contents of employment history	33 programs	1,096.4	36,180
26.63(c)(2): Receive and file DD 214	33 programs	7.6	252
26.63(c)(3): Document refusal to supply employment information	33 programs	5.5	180
26.63(d) and (e): Obtain and maintain documentation of reinstated authorization from other FFD programs	33 programs	1.0	33
26.65(d)(1) and (e)(2): Prepare record of reinstatement or administrative withdrawal of authorization	33 programs	193.1	6,372
26.65(f): Adjust personnel records	33 programs	1.0	33
26.67: Random drug and alcohol testing of persons who have applied for authorization	33 programs	0.5 [23]	25,000
26.69(c)(1): Obtain and review written self-disclosure and employment history	Burden shown under §§26.713(a)(1)		
26.69(b) and (c)(3): Obtain and review employee records to confirm potentially disqualifying FFD situation resolved	33 programs	81.8	2,700
26.69(c)(2): Complete a suitable inquiry on previous employers	Burden shown under §§26.63		
26.69(c)(4): Verify drug/alcohol treatment & testing completed	33 programs	3.0	99
26.69(c)(5): Verify pre-access drug/alcohol testing completed	33 programs	1.0	33

[23]NRC's 2005 FFD program perforance data reported approximately 50,000 total random drug tests.

Section	Number of Recordkeepers	Burden Hours per Recordkeeper	Total Annual Burden Hours
26.69(d): Verify reviewing officer's review completed	33 programs	24.0	792
26.69(e): Provide information on testing and treatment plans to other FFD programs	33 programs	8.0	264
26.75(a), (b), (c), (d), (e), and (g): Record of sanctions for FFD violation	33 programs	12.0	396
26.75(h):Record additional evidence indicating impairment	33 programs	18.0	594
26.75(i): Inform licensee of non-negative initial test result	33 programs	80.0	2,640
26.75(i)(3) and (i)(4): Eliminate references to temporary administrative action and provide written statement that records expunged	33 programs	1.0	33
26.85(a), (b), and (c): Training collectors	33 programs	4.0	132
26.85(c)(4): Written instructions for alternate collectors	33 programs	16.0	528
26.85(e): Maintain personnel files	33 programs	4.0	132
26.87(d)(3) and (f)(1): Signage/security at test site	11 programs	0.3	3
26.87(f)(3), (f)(4), and (f)(5): Prepare custody-and-control form	11 programs	0.5	6
26.89(a): Report absence of donor	33 programs	1.0	33
26.89(b)(1) an (b)(2): Obtain ID and consent form	33 programs	1.5	50
26.89(b)(3): Inform FFD program management that individual did not present identification	33 programs	4.0	132
26.89(c): Report premature departure	33 programs	3.3	108
26.91(c)(1), (c)(2), and (c)(3): Record of EBT test results	Burden shown under §26.715(b)(12)		
26.91(e)(4): Cancel results after EBT calibration check failure	8 programs	6.0	48
26.91(e)(5): Prepare record of EBT maintenance	33 programs	6.0	198
26.93(a)(6): Document alcohol pre-test questions asked and answered	33 programs	322.9	10,656

Section	Number of Recordkeepers	Burden Hours per Recordkeeper	Total Annual Burden Hours
26.95(b)(5): Record donor identity for initial alcohol breath test	33 programs	322.9	10,656
26.97(b)(2): Record reason for new oral fluid alcohol test	33 programs	5.5	180
26.97(c)(1): Document reason for failure of 2nd collection attempt	33 programs	2.7	90
26.97(d): Record results and alcohol screening device used	33 programs	67.6	2,232
26.99(b): Record test time of initial test with 0.02% or higher BAC	33 programs	17.1	565
26.101(b)(7): Indicate time on EBT printout of alcohol test result	33 programs	17.1	565
26.103(b): Inform FFD mgmt of result between 0.01 and 0.02 when donor in work status 3 or more hours	33 programs	0.3	11
26.107(b): Document tampering attempt on c & c form	33 programs	1.4	47
26.109(b)(3): Notify FFD mgt. or MRO of “shy bladder” problem	33 programs	0.5	18
26.109(b)(4): Notify FFD mgmt. if observed collection required	33 programs	0.3	11
26.111(b): Note unusual findings on c & c form	33 programs	1.4	47
26.111(c):Report tampering attempts to FFD mgr.	33 programs	0.3	11
26.113(b)(3): Prepare c & c forms for both parts of split sample	33 programs	0.3	11
26.115(b): Obtain approval for collection under direct observation from FFD mgr. or MRO	33 programs	0.5	18
26.115(d): Prepare c & c form for directly observed collection	33 programs	0.3	11
26.115(f)(3): Record name of observer	33 programs	0.3	11
26.117(c), (d), and (e): Prepare ID labels and c & c forms for specimen shipment	33 programs	65.5	2,160
26.119(a), (e), and (f): Obtain evaluation from MRO or physician evaluating “shy bladder” claim	33 programs	6.0	198

Section	Number of Recordkeepers	Burden Hours per Recordkeeper	Total Annual Burden Hours
26.119(b): MRO provides information to physician as background for evaluation of "shy bladder" claim	33 programs	2.2	72
26.125(b) and (c): Proficiency and qualifications records of testing facility personnel	33 programs	16.4	540
26.129(a): Limit access to testing site	33 programs	2.5	83
26.129(b): Inspect specimen packages, custody control forms, and obtain memorandum from specimen collector	33 programs	0.5	17
26.129(b)(1): Report to senior mgmt. attempts to tamper with specimens in transit	33 programs	1.0	33
26.129(d): Procedures for tracking c & c of specimens	33 programs	95.0	3,135
26.135(b): Donor's written permission for retest second part of split sample	33 programs	2.2	72
26.137(a): Maintain QA/QC program and procedures for licensee testing facility	33 programs	4.0	132
26.137(b)(1)(ii): Document performance of testing device not on SAMHSA list	2 programs	40.0	80
26.137(b)(1)(iii): Document results of annual test of device not on SAMHSA list	2 programs	20.0	40
26.137(b)(3): Submit 1 in 10 negative specimens for validity screening	33 programs	40.0	1,320
26.137(e)(7): Document procedures to protect against carryover material	33 programs	2.0	66
26.137(f)(5): Record finding of testing errors	33 programs	26.2	864
26.137(h): Label standards and controls	33 programs	65.0	2,145
26.153(e): Inspect HHS-certified labs	33 programs	40.0	1,320
26.153(f): Include specified requirements in contracts with HHS labs	33 programs	40.0	1,320
26.153(g): Supply memo to HHS labs explaining use of non-federal c & c form	33 programs	0.5	17
26.155(a)(1): Document qualifications for lab mgr of HHS-certified lab.	Burden covered by HHS lab certification requirements OMB Clearance # 0930-0158		

Section	Number of Recordkeepers	Burden Hours per Recordkeeper	Total Annual Burden Hours
26.155(a)(3): Lab mgr. documents training of lab personnel	Burden covered by HHS lab certification requirements OMB Clearance # 0930-0158		
26.155(a)(4): Lab mgr. reviews and signs lab procedures	Burden covered by HHS lab certification requirements OMB Clearance # 0930-0158		
26.155(a)(5): Lab mgr. maintains QA program	Burden covered by HHS lab certification requirements OMB Clearance # 0930-0158		
26.155(b): Certifying scientist to certify test results from HHS lab	Burden covered by HHS lab certification requirements OMB Clearance # 0930-0158		
26.155(c): Supervise technical analysts at HHS lab	Burden covered by HHS lab certification requirements OMB Clearance # 0930-0158		
26.155(e): Continuing education for staff of HHS lab	Burden covered by HHS lab certification requirements OMB Clearance # 0930-0158		
26.155(f): Lab personnel records	Burden covered by HHS lab certification requirements OMB Clearance # 0930-0158		
26.157(a): Written procedures for accession, receipt, shipment, and testing of urine specimens by HHS lab	Burden covered by HHS lab certification requirements OMB Clearance # 0930-0158		
26.157(b): Written chain-of-custody procedures for HHS lab	Burden covered by HHS lab certification requirements OMB Clearance # 0930-0158		
26.157(c): Written procedures manual for each assay performed by HHS lab	Burden covered by HHS lab certification requirements OMB Clearance # 0930-0158		
26.157(d): Written procedures for device set-up and operation	Burden covered by HHS lab certification requirements OMB Clearance # 0930-0158		
26.157(e): Written procedures for remedial actions to address systems and instrument errors	Burden covered by HHS lab certification requirements OMB Clearance # 0930-0158		
26.159(a): Documented restriction to access to HHS lab	Burden covered by HHS lab certification requirements OMB Clearance # 0930-0158		

Section	Number of Recordkeepers	Burden Hours per Recordkeeper	Total Annual Burden Hours
26.159(b): Report evidence of tampering with specimens in transit to FFD program mgr. of licensee or other entity	33 programs	1.0	33
26.159(c), (d), and (e): Use and storage of c & c forms	Burden covered by HHS lab certification requirements OMB Clearance # 0930-0158		
26.159(f): Use of c & c form when shipping specimen to another HHS lab	Burden covered by HHS lab certification requirements OMB Clearance # 0930-0158		
26.159(i): Obtain written authorization to store specimens other than 1 year	33 programs	0.5	17
26.163(a)(2): Inform licensee of dilute specimen and report confirmatory validity test result to MRO	33 programs	3.3	108
26.165(b)(1): Donor requests aliquot or split specimen to be tested by a second HHS-certified laboratory	33 programs	10.9	361[24]
26.165(b)(2): MRO informs donor of opportunity for re-test of aliquot or test of Bottle B of split sample	33 programs	3.3	108
26.165(b)(3): Donor gives written permission for re-test of aliquot or test of Bottle B of split sample	33 programs	10.9	361[25]
26.165(b)(4): Donor presents documentation for reason unable to complete timely retest request	33 programs	0.2	6[26]
26.165(b)(6): Provide results of re-test of aliquot or test of Bottle B to MRO and to donor	33 programs	6.5	216
26.165(c)(4): Report retesting results to MRO	26 laboratories	13.9	361[27]

[24]Estimate is based on 361 donors and one burden hour per donor.

[25]Estimate is based on 361 donors and one burden hour per donor.

[26]Estimate is based on 6 donors and one burden hour per donor.

[27]Estimate is based on 361 donors and one burden hour per donor.

Section	Number of Recordkeepers	Burden Hours per Recordkeeper	Total Annual Burden Hours
26.165(f): Adjustments to personnel files and written notifications regarding test results, including temporary administrative action	33 programs	6.5	216
26.165(f)(1)(iv) and (f)(2): Written notice that records purged of references to temporary administrative action	33 programs	8.7	288
26.167(a): Document quality assurance program of HHS lab	Burden covered by HHS lab certification requirements OMB Clearance # 0930-0158		
26.167(c)(2)(i): HHS-certified laboratory's refractometer must display specific gravity to 4 decimals and be interfaced with laboratory information management system or computer and/or document result by hard copy or electronic display	Burden covered by HHS lab certification requirements OMB Clearance # 0930-0158		
26.167(f)(3): Certification by HHS lab that retesting requested by licensee or other entity has occurred	26 laboratories	1.0	26
26.167(h): Labeling of standards and controls	Burden covered by HHS lab certification requirements OMB Clearance # 0930-0158		
26.168(a): Preparer certifies contents of blind performance test samples submitted to HHS lab	Burden covered by HHS lab certification requirements OMB Clearance # 0930-0158		
26.168(h)(2): Ensure supplier provides expiration date for test sample	Burden covered by HHS lab certification requirements OMB Clearance # 0930-0158		
26.168(i)(2): Use c & c form, place fictional initials on specimen labels, and indicate blind performance test samples	Burden covered by HHS lab certification requirements OMB Clearance # 0930-0158		
26.169(a): Reports of test results by HHS lab	Burden covered under §§26.169 (c)(1) through (c)(5)		
26.169(c)(1): HHS lab reports positive, adulterated, substituted, dilute, and invalid test results to the MRO	26 laboratories	350.0	9,100
26.169(c)(2): HHS lab reports quantitative test results as requested by MRO	5 laboratories	1.0	5

Section	Number of Recordkeepers	Burden Hours per Recordkeeper	Total Annual Burden Hours
26.169(c)(2): HHS lab reports quantitative test results for opiates to MRO	16 laboratories[28]	1.0	16
26.169(c)(3): HHS lab reports quantitative test results for adulterated or substituted test results	26 laboratories	20.0	520
26.169(c)(4): HHS contact with MRO to discuss whether testing by another HHS lab should be done	26 laboratories	2.0	52
26.169(c)(5): HHS lab may report concentration exceeding linear range	5 laboratories	1.0	5
26.169(f): HHS lab transmits copy of the c & c form for negative results to the MRO	26 laboratories	0.3	7
26.169(g): HHS lab transmits original of c & c form for positive, adulterated, substituted, dilute or invalid results to the MRO	26 laboratories	100.0	2,600
26.169(h): HHS lab prepares and submits annual statistical summary report of urinalysis testing results	26 laboratories	40.0	1,040
26.183(a): Documentation of MRO qualifications	33 programs	3.5	116
26.183(c)(1): MRO review of records for positive, adulterated, substituted, invalid, or, at the licensees or other entity's discretion, dilute test results	33 programs	26.2	864
26.183(d)(1)(ii)(D): MRO report of drug test results to licensee's designated reviewing official	33 programs	24.0	792
26.183(d)(2)(i): MRO staff review and reporting of negative test results	33 programs	12.0	396
26.183(d)(2)(ii): MRO staff review c & c forms and forward changes to MRO	33 programs	13.1	432
26.185(a) MRO review of all positive, adulterated, substituted, dilute, or invalid test results and report to licensee or other entity	33 programs	54.5	1,800

[28]Estimate based on 16 total positive opiate drug tests listed in NRC's 2005 FFD program perforance data.

Section	Number of Recordkeepers	Burden Hours per Recordkeeper	Total Annual Burden Hours
26.185(c): MRO discussion of test results with the donor	33 programs	2.2	72
26.185(c): MRO report to licensee, following discussion with donor, of FFD violation	33 programs	2.2	72
26.185(d)(1): Documentation that donor declined to discuss test results	33 programs	2.2	72
26.185(e): Documentation that donor was unavoidably prevented from discussing test results and request to reopen proceeding	33 programs	0.3	11
26.185(f)(1): MRO consultation with HHS lab to determine whether additional testing needed	33 programs	0.5	17
26.185(f)(2): MRO contact with donor regarding medical explanation for test result	33 programs	0.5	17
26.185(h)(1): MRO contact with donor to offer opportunity to provide medical evidence regarding substituted specimen	33 programs	1.0	33
26.185(h)(1): Donor presents medical explanation for substituted result	33 programs	1.0	33
26.185(h)(2): MRO notification to licensee that no valid medical explanation presented	33 programs	2.0	66
26.185(h)(3): MRO notification to licensee that valid medical explanation presented	33 programs	1.0	33
26.185(i)(1): MRO contact with donor to offer opportunity to provide medical evidence regarding adulterated specimen	33 programs	1.0	33
26.185(i)(1): Donor presents medical explanation for adulterated result	33 programs	1.0	33
26.185(i)(2): MRO notification to licensee that no valid medical explanation presented	33 programs	2.0	66
26.185(i)(3): MRO notification to licensee that valid medical explanation presented	33 programs	1.0	33
26.185(j)(3): MRO notification to licensee where evidence of drug abuse	33 programs	1.0	33
26.185(j)(3): MRO report to licensee that donor has violated FFD policy by use of another individual’s prescription medication	33 programs	0.5	17

Section	Number of Recordkeepers	Burden Hours per Recordkeeper	Total Annual Burden Hours
26.185(k): MRO report to licensee that no FFD policy violation has occurred	33 programs	1.0	33
26.185(m): MRO review of inspection and audit reports, quality control data, multiple specimens, and other data to determine if positive, adulterated, substituted, or invalid result is scientifically insufficient for determination of FFD policy violation	33 programs	1.0	33
26.185(n): MRO report to licensee on result of analysis by second laboratory	33 programs	2.0	66
26.185(o): MRO request for quantitation of test results	33 programs	0.5	17
26.185(o): Lab provides quantitation of test results	33 programs	1.0	33
26.185(p): MRO notice to licensee of determination of FFD policy violation	33 programs	8.7	288
26.187(d): SAE training requirements	33 programs	20.0	660
26.187(f): Documentation of SAE credentials and training	33 programs	1.0	33
26.189(a): Written record of determination of fitness	33 programs	74.2	2,448
26.189(c): Written record of “for cause” determination of fitness	33 programs	13.1	432
26.189(d): Modification of an initial determination of fitness	33 programs	1.0	33
26.205(e)(1) and (2): Review of control of work hours twice per calendar year	30 programs	40.0	1,200
26.205(e)(3): Document methods for reviews	30 programs	20.0	600
26.205(e)(4): Record and trend problems in regarding work hours	30 programs	20.0	600
26.207(a)(4): Document bases for waiver	3 programs	6.0	18
26.211(f): Document results of fatigue assessments	30 programs	50.0	1,500

Section	Number of Recordkeepers	Burden Hours per Recordkeeper	Total Annual Burden Hours
26.405(a) Random drug and alcohol testing	12 programs	875.0	10,500[29]
26.405(c)(1): Document pre-assignment testing	19 programs	1,750.0	33,250[30]
26.405(c)(2) and (c)(3): Document for-cause and post accident testing	19 programs	38.0	722
26.405(c)(4): Document follow up testing	19 programs	190.0	3,610
26.405(f): Ensure testing conducted at an HHS-certified laboratory	19 programs	40.0	760
26.405(g): MRO review of positive, adulterated, substituted, and invalid drug and validity test results	19 programs	50.0	950
26.406(c): Maintain fitness monitoring procedures	7 programs	80.0	560
26.411(a): Maintain a system of files and procedures to protect personal information	19 programs	4.0	76
26.411(a): Collect personal information	19 programs	1,750.0	33,250[31]
26.411(b): Obtain signed consent form	19 programs	1.5	29
26.413: Document results of review process	19 programs	80.0	1,520
26.415: Document and report audit results	19 programs	40.0	760
26.821(b): Written agreement between C/Vs and licensees to permit authorized NRC representatives to inspect, copy, or take away copies of C/Vs documents, records, and reports	5 C/Vs	4.0	20
Table 4 Total			**507,795**

[29]Value based on estimate of six construction programs choosing to conduct random testing (rather than fitness monitoring), 1,750 workers per construction site subject to the FFD program, a 50% test rate, and one hour of burden per test. This one hour burden per random test is larger than the 0.5 hours per random test for operating reactor sites, due to the large area of a construction site.

[30]Estimate based on one hour to document pre-assignment testing for 1,750 workers at the construction site subject to the FFD program.

[31]Estimate based on one hour to collect personal information for 1,750 workers at the construction site subject to the FFD program.

Table 5
Annualized NRC Burden

NRC ACTION	No. Actions/Year	Burden Hours/Action	Total Hours
Review exemptions requests under §26.9	1	16 hours per review.	16
Review written FFD policies and procedures under §26.27(d)	12	8 hours. Reviews performed during periodic inspections.	96
Review records under §26.75(h) to ensure no inappropriate records are maintained	1	4 hours/review	4
Review reports under §26.77(c) that NRC employee or contractor is unfit for duty	0	No reports anticipated.	--
Review waiver requests submitted under §26.203(e)(1)	2	8 hours/request	16
Review and approve FFD program plans under §26.401	1	80 hours (one-time) x 19 applicants	506
Review reports under 26.417(b)(1) of significant FFD program failures	1	2 hours/review	2
Review annual reports submitted under 26.417(b)(2)	19	40 hours per report	760
Review annual reports submitted under §26.717(e) and (f)	33	92 hours per report for 28 programs; 44 hours per report for 5 programs that do not include fatigue-related information	2,796
Review reports under §26.719(a) of significant violations of FFD policy, FFD program failures, and errors in testing	24	3 hours per report	72
