PESTICIDE USE REPORTING REQUIREMENTS CONTINUE

The Oregon Legislature, acting through its Emergency Board on October 4, 2002, decided not to provide funding needed to complete development of the Oregon Pesticide Use Reporting System (PURS). However, the statutory requirement for pesticide users to report their use of pesticide products was not changed. The department has paused further development of the various PURS computer components. Replacement of the current web site reporting system with an enhanced version, which would allow reporters to search, view, and edit previously submitted reports, and to copy information from previous reports to create new reports, will not be deployed during November as previously planned. Also paused is development of a system whereby reporters could report through electronic data submission (EDS). Available development funds have been diverted to maintain the existing web site reporting system. Department staff will continue outreach programs on how to comply with pesticide use reporting requirements.

Funding for the household use portion of the Pesticide Use Reporting System was not affected by the October Legislative decision. A household pesticide use survey pilot program is being completed this fall. The pilot survey has been sent to selected households from all around Oregon. Following the results of the pilot survey, a full statewide household use survey program will begin. The full survey is expected to be conducted in three-month intervals.

For more information on the Pesticide Use Reporting System, visit ODA's website at: http://oda.state.or.us/purs

SETTING METAL LEVELS IN FERTILIZERS STIRS CONTROVERSY

On August 3, 2001, Governor John Kitzhaber signed into law House Bill 3815, which amended Oregon statutes regulating fertilizer, agricultural amendment, agricultural mineral and lime products. The amended statutes require the Oregon Department of Agriculture (ODA) to establish numerical limits for certain metals in fertilizer, agricultural amendment, agricultural mineral and lime products. The administrative rule declaring the maximum level of arsenic, cadmium, lead, mercury and nickel allowed in fertilizer type products is to become operative by January 1, 2003. Oregon has never before regulated metals in fertilizer type products. Setting these levels is therefore a step in a larger process to address metals in our environment.

Continued on page 6

TESTING FEES TO BE PAID BY APPLICANTS

Beginning November 1, 2002, ODA stopped paying testing fees to pesticide testing centers on behalf of applicants for pesticide consultant, applicator, and trainee licenses. Mandatory cost-cutting measures required the department to take this step to reduce expenditures. Applicants are now required to pay the testing center directly at the time of testing. Fees may vary from \$10 to \$25 per test, depending on the center selected. For this reason, applicants are encouraged to inquire at the time of registration about fees and forms of payment accepted. In addition, the Pesticides Division is no longer providing testing services for special training sessions sponsored by private organizations and community colleges not affiliated with a pesticide testing center. Sponsors of these sessions should contact the nearest pesticide testing center to arrange for testing services, or direct students to make their own arrangements at a center convenient to them. Information regarding pesticide tests, licensing, and testing centers is available on the Pesticides Division Web Page at http:// oda.state.or.us/pesticide (click "Pesticide Licensing"), or by contacting the Pesticides Division at (503) 986-4635.

NO MORE FORM 4018 INSURANCE REMINDERS!

After January 1, 2003, Oregon pesticide operators will no longer be reminded to provide ODA with a completed 4018 form signed by their insurance companies as proof of insurance for a pesticide operator license. Although this form will continue to be required for initial and renewed licenses, ODA has traditionally sent reminders to operators when their insurance expired. This reminder has been a courtesy of the department that has proven to be costly and redundant. The pesticide operator must continue to provide Form 4018 to ODA upon any change in insurance coverage, renewal dates, etc. The only change is that ODA will not remind you to do so! The operator's requirement to have insurance coverage for property damage

and bodily damage attributed to pesticide application activities has not changed. Remember: An operator license is not valid if the required insurance is not in force. It is also a violation of state law (ORS 634) not to have the appropriate insurance as a licensed pesticide operator.

COMPANIES MUST STOP MARKETING UNREGISTERED ANTHRAX DECONTAMINATION PRODUCTS

The U.S. Environmental Protection Agency issued a stopsale order to both Aerotech Laboratories Inc., Phoenix, AZ., and American Security and Control Inc., Falls Church, VA., to cease advertising and selling their respective products which allegedly protect against anthrax. The companies both marketed their unregistered pesticides over the Internet.

The Agency registers no pesticides for the control of anthrax. Selling or distributing unregistered pesticides is prohibited under the Federal Insecticide, Fungicide and Rodenticide Act and ORS 634.

The stop sale orders became effective immediately. Because of the orders, both companies have removed their unauthorized anthrax advertisements from their respective Internet sites. The Agency will be monitoring compliance with its orders, which included a request that each company withdraw all unregistered products.

Anthrax can present a serious threat to public health and only properly trained emergency health and safety personnel should investigate and handle suspected anthrax contamination. Anyone who suspects anthrax contamination should contact their local police, or health and safety authorities.

For information about ongoing activities in the EPA Office of Pesticide Programs, visit their homepage at: http://www.epa.gov/pesticides

ACTIVE SECTION 18 EMERGENCY EXEMPTIONS FOR 2002-2003

Crop	Pest	Product	EPA Reg#	OR Sec 18 #	Valid until

THE PARTNERSHIP AND ASSUMED RESPONSIBILITY

The department recently finalized adjudication of an incident resulting in Notices of Violation being issued to a commercial pesticide operator, applicator and the farm owner for faulty, careless or negligent application of a pesticide, a violation of ORS 634.372(4).

Although this newsletter usually does not report specific incidents of pesticide violations, this one presents some valuable lessons to be learned.

In this particular matter, a farm operator employed or contracted with a commercial pesticide operator to apply a pesticide through an irrigation circle. The farmer owned or leased the irrigation circle and the associated equipment.

The pesticide application commenced with the commercial operator and applicator setting up and activating the process to inject the pesticide into the circle irrigation system. Approximately a month after the pesticide was applied, a neighbor adjacent to the chemigated field contacted the Oregon Department of Agriculture alleging the pesticide application caused damage to his property. Investigation by the department determined that vegetation on the neighbor's property had been damaged by the pesticide applied to the circle. It was quite obvious that the "end guns" on the circle irrigation system had sprayed the pesticide beyond the limits of the circle and into the neighbors fields. None of the parties involved seemed to question what had happened.

There was little question that the commercial pesticide operator and applicator had not taken adequate steps to reduce the output of the end guns of the circle system. As with most instances where a commercial operator was contracted for a custom application, they were determined to be responsible for allowing the pesticide to move onto the neighbor's fields.

However, this incident was unique, as are most chemigations, in that the equipment used belonged to, or was under the control of the farmer. In most custom applications the equipment is owned, or controlled by the commercial pesticide operator, whether it be a tractor pulled sprayer, a swamp buggy, an airplane, etc. Most custom or contract pesticide applications make a definite distinction between operator/applicator (contractor) and the crop owner. With the farmer providing the application equipment, he has entered into a partnership, however informal, with the custom pesticide operator. The farmer has assumed an

implied responsibility that he will provide equipment adequate to do the job.

In the case at hand, the department determined that the farmer knew, or should have known, that the circle irrigation system would have performed just as it did, with the end guns applying the pesticide onto the neighbor's field. It is inherent in the design of a circle irrigation system to apply large quantities on the outside perimeter and often beyond the boundaries of the field. The investigation determined the farmer took no action to correct that situation or advise the contractor to shut off the end guns prior to the application. A duty of care existed and was not exercised. The department determined this was faulty, carelessness or negligence on part of the farmer.

Had the circle irrigation system been under the ownership or control of the commercial pesticide operator, the farmer probably would not have been found in violation of the pesticide control law. The department made no determination that one party or the other was more responsible, or contributory, for what happened. That would be for the partnership to sort out. In this case it was determined the farmer contributed enough to be responsible and thus in violation.

The lesson to be learned from this incident is that the department will take enforcement actions against someone who hires a commercial operator and does not exercise a reasonable duty of care when that responsibility is obvious, apparent or implied. Whether it be equipment or some other aspect of the operation. You might take a look at your own operation to see how this lesson may apply.

AG-PLASTICS RECYCLING BIG BONUS FOR OREGON

Agri-Plas Inc. specializes in recycling of agricultural plastic waste products. They process a wide variety of agricultural plastics including baling twine, ground cover, flower pots, fertilizer bags, and triple rinsed pesticide container and 55 gallon drums. This facility will service your ag business **at your facility** and find uses for your waste plastic products. According to Agri-Plas, there are approximately 20 million pounds of ag plastics left in fields every year. Do your part and RECYCLE your ag plastics responsibly. Agri-Plas Inc. may be reached at (503) 390-2381 or (503) 390-5454 fax.

Continued from page 1

The amended statutes also require products registered with ODA to declare if they are comprised in whole or in part from hazardous waste, solid waste or industrial waste as defined by Oregon Department of Environmental Quality (DEQ) statutes and rules. Regulating the recycling of hazardous wastes into fertilizer products is within the authority of the Resource Conservation and Recovery Act (RCRA), a federal act administered in Oregon by DEQ. Any hazardous waste to be recycled for use in or as, a fertilizer, agricultural amendment, agricultural mineral or lime product, must be in compliance with DEQ and RCRA requirements. ODA does not have the authority to specifically restrict the use of hazardous waste materials in products when that use meets DEQ and RCRA requirements. Where the authority exists to allow, or not allow, the use of waste materials in fertilizer type products has been one of several points of misunderstanding that has embroiled this rule making effort in controversy.

Following are some of the allegations heard regarding the proposed heavy metal standards. With each allegation is commentary drafted by Pesticides Division staff intended to clarify apparent misunderstandings.

Allegation: The standards are based on a risk assessment that was conducted for, and funded by, the fertilizer industry.

Comment: The proposed standards are based on several risk assessment models designed, conducted and/or commissioned by the United States Environmental Protection Agency (EPA), the California Department of Food and Agriculture (CDFA) and the Fertilizer Institute (TFI). CDFA retained the consulting firm Foster Wheeler to prepare a fertilizer risk assessment. TFI, an industry group, retained a consulting firm, The Weinberg Group, to prepare a fertilizer risk assessment. For the metals evaluated, these two different risk assessments yielded very similar "upper limit" results. "Lower limit" results were calculated by former Foster Wheeler scientists working for CDFA using EPA identified values for such model variables as Kd and plant uptake. The American Association of Plant Food Control Officials (AAPFCO), in preparing national model rules for maximum heavy metal limits in fertilizers, used mid-points between these "upper" and "lower limits". The proposed Oregon standards are based upon the AAPFCO model rules.

Allegation: The standards are less stringent than California's and Washington's standards making Oregon a potential dumping ground.

Comment: The California levels of arsenic, cadmium and lead in phosphorus and micronutrient containing fertilizer

products are lower than the proposed Oregon standards. However, California does not have standards for the other fertilizer products, including agricultural minerals, agricultural amendments and lime products, to which the proposed Oregon standards would apply. Further, California does not set levels for mercury and for nickel, which the proposed Oregon standards do. Washington also does not have standards for all types of products that would be subject to the proposed Oregon standards. For the standards Washington does have, some are higher and some are lower than the proposed Oregon standards. Other than California, Oregon and Washington, Western states currently lack standards for these heavy metals in fertilizer products. The Oregon registration process requires the filing of analytical reports on the contents of each product. Beginning in January 2003, this information will be available to the public through an internet site maintained by ODA. Oregon would be an unlikely "dumping ground" for products compared to other states.

Allegation: The standards are not designed to protect water, soil quality, wildlife, etc.

Comment: The proposed Oregon standards are based on human health effects, for which risk assessment models have been developed. Similar models for ecological effects have not been developed. Some fifty years of fertilizer product use, during which time the heavy metal content of products was not regulated, has not resulted in data which identifies environmental harm resulting from the heavy metals contained in products used. The need for more ecological data to accurately reflect Oregon conditions is readily acknowledged, and has been identified as the main topic for future research funded through ODA.

Allegation: The proposed levels are several times higher than DEQ soil clean-up levels which may create new clean-up sites in the future. (Compares lead levels in zinc vs. lead clean-up levels)

Comment: Soil clean-up levels are determined based on sampling a solid soil profile to a given depth. Fertilizer products are applied on an occasional basis, with a specific amount of product spread over the surface of a large volume of soil (e.g. two lbs of a zinc micronutrient product applied over one acre one time per year, if needed for crop production). Many factors have been identified which reduce the amount of fertilizer material which remains associated with soil, including plant uptake and utilization. Some fifty years of fertilizer product use, during which time the heavy metal content of products was not regulated, has not resulted in data which identifies heavy metal accumulation throughout the soil profile to levels equivalent to superfund site levels.

Allegation: The levels are so lax that products currently registered are lower than the standards proposed, making the standards irrelevant.

Comment: The proposed standards are based upon risk, not the number of products that would be affected. Analysis of heavy metal contents of existing products does show that the vast majority of products registered in Oregon do not pose a risk if used properly. This analysis is supported by EPA, which has stated that studies of contaminants in fertilizers have indicated that the great majority of fertilizers are safe when used properly. This general finding is consistent with similar studies done by states such as Washington and California.

Allegation: The proposed standards ignore other dangerous chemicals that can occur in fertilizers such as dioxin.

Comment: The enabling statutes require ODA to adopt rules by January 1, 2003, which establish standards for arsenic, cadmium, lead, mercury and nickel in fertilizer products. No other contaminants are specifically named in the statutes. However, the statutes allow ODA to address other materials in fertilizer products which may be of concern. ODA is currently addressing the five metals as required to meet the January 1, 2003 deadline. This action does not preclude ODA from addressing other concerns in the future. Improved research, knowledge, expertise and analytical capabilities to address other possible contaminants in fertilizer products will assist ODA in evaluating these other materials of concern.

The public hearings on the proposed administrative rule setting levels of arsenic, cadmium, lead, mercury and nickel in fertilizer, agricultural amendment, agricultural mineral and lime products took place on September 24, in Pendleton, and September 26, in Salem. The public comment period on these proposed rules closed at 5:00 PM on September 26. The Oregon Department of Agriculture will determine the final rules to become effective January 1, 2003.
