

# COORDINATED SPRING SURVEY OF MID-CONTINENT SANDHILL CRANES

2004

2004

## COORDINATED SPRING SURVEY OF MID-CONTINENT SANDHILL CRANES

2004 TOTAL: 447,600

2004 AERIAL TRANSECT: 426,500

THREE-YEAR AVERAGE (2002-04): 363,200

SURVEY DATES: 22 - 25 March 2004

### SURVEY PERSONNEL:

#### Aerial Survey

Observer/pilot: John Solberg, USFWS, DMBM, Bismarck, ND

Observer: Jeff Drahota, USFWS, Rainwater Basin WMD, Kearney, NE

Photographer: Rich Walters, NGPC, Kearney, NE

#### Ground Surveys (State Coordinators)

North Dakota: Stan Kohn, NDGFD, Bismarck, ND

South Dakota: Spencer Vaa, SDGFP, Brookings, SD

Nebraska: John Dinan, NGPC, Lincoln, NE

Kansas: Helen Hands, KDWP, Great Bend, KS

Texas: Jay Roberson, TPWD, Austin, TX

**ABSTRACT:** The aerial portion of the coordinated spring survey of mid-continent sandhill cranes was conducted on 23 March in Nebraska's Platte and North Platte River valleys. The 2004 photo corrected aerial estimate was 426,500 birds. Ground observations were conducted 22 - 25 March. Outside aerial coverage boundaries, observers in the Official Survey Area (OSA) of Nebraska, Kansas, and Texas reported an additional 21,100 cranes. The total 2004 estimate (447,600) increased 18% since 2003 and is the eighth highest in twenty-three years of comparable figures. The current three-year average (2002 - 2004), based on photo corrected aerial counts, is 363,200.

**METHODS:** The annual target date for the coordinated survey is the 4<sup>th</sup> Tuesday of March. Survey methods utilized in 2004 were unchanged since 2003 and incorporate coverage changes adopted by the Central Management Unit Technical Committee (CMU) in 1985. The aerial portion of the survey utilizes an ocular transect design with a sampling rate of approximately twenty-five percent. Sub-sampling crane flocks, using 35 mm oblique photography, allows determination of observer specific estimation correction factors which are applied to aerial counts. Ground efforts, directed by state coordinators, are conducted outside the region of aerial coverage in areas of traditional crane use/occurrence. Observations by ground personnel are not photo corrected. Specific details regarding personnel, photography, habitat, and weather conditions are on file in the Bismarck office of the USFWS.

**RESULTS:** The aerial transect component of the 2004 survey was conducted as scheduled, on 23 March. Concurrently, USGS field researchers reported 82% of their radio marked cranes present in the Platte River Valley (Dave Brandt, USGS, pers. comm.). The 2004 estimate of mid-continent sandhill cranes is 447,600 (Table 1), which includes 426,500 birds from aerial transects (Tables 2 and 3), and 21,100 cranes from other regions in the OSA. Correction factors, applied to aerial estimates, were calculated from photographs of 95 unique flocks (Drahota 45, Solberg 50). Observer effort in the 2004 survey is presented in Table 4. The 2004 index increased 18% from the 2003 figure and is the eighth highest of comparable record (23 years). The current three-year average (2002-2004), based on the photo-corrected Nebraska aerial portion, is 363,200 (Figure 1) and is within the management range (343,000 - 465,000) established by the CMU (Management Guidelines for Mid-Continent Sandhill Cranes, revised March 1993).

Appreciation is expressed to all coordinators, observers, and participants who assisted in the 2004 survey. Two long time contributors, Dr. Douglas Johnson (Northern Prairie Wildlife Research Center) for his statistical analysis and Mr. John Steiner (Jamestown, ND) for his photo processing and interpretation, continued their able assistance and support in completing the final report.

John W. Solberg
