

# WATERFOWL BREEDING POPULATION SURVEY

## SOUTHERN AND CENTRAL ALBERTA

### MAY 2004

**TITLE** Waterfowl Breeding Population and Habitat Survey for Southern and Central Alberta

**STRATA SURVEYED** 26, 27, 28, 29, 75, 76

**DATES** May 6-23, 2004

**DATA SUPPLIED BY** United States Fish and Wildlife Service (USFWS)  
Canadian Wildlife Service (CWS)  
Alberta Environmental Protection/Wildlife Management Division (AEP)  
Ducks Unlimited, Canada (DUC)

**Aerial Crew**

Pilot/Observer-Elizabeth Buelna Huggins, USFWS, Flyway Biologist  
Observer-Charles Pyle, USFWS, Wildlife Biologist

**Ground Crew**

Crew Leaders-

Paul Pryor, CWS, Population Mgmt. Technician  
Ken Froggatt, Alberta Natural Resources Service, Wildlife Technician  
Sam Berry, CWS, Biometrician  
Ed Hoffman, Alberta Natural Resources Service, Wildlife Biologist  
Chris Procter, CWS, Student Technician

Assistants-

Jason Spenst, DUC, Biological Technician  
Reg Russell, Alberta Natural Resources Service, Wildlife Biologist  
Brian Peers, DUC, Wildlife Biologist  
Trevor Mathews, DUC, Biological Technician  
Nathan Clements, CWS, Student Technician  
Jaymes Going, CWS, Student Technician  
Karl Zimmer, CWS, Student Technician  
Gary Kindrat, DUC, Biological Technician  
Mike Barr, DUC, Wildlife Biologist  
Robin Hunka, DUC, Biological Technician  
Nathan Fontaine, DUC, Habitat Specialist

**ABSTRACT**

The 2004 breeding population estimate for strata 26-29 (Southern Alberta) is 2,503,800 total ducks (Table 1), a decrease of -7.2% from 2003, a decrease of -22.2% from the recent ten-year

mean (1994-2003) and a decrease of -42.6% from the long-term mean (1955-2003). In Southern Alberta, total dabbling ducks (Table 1) decreased -6.6% from 2003, decreased -21.5% from the 1994-2003 ten-year mean and remained -44.7% below the 1955-2003 long-term mean. Mallards (Table 1) decreased -4.3% from 2003, Blue-winged Teal increased +11.6% from 2003 and Pintails decreased -36% from 2003. Total diving ducks (Table 1) decreased -10% from 2003, decreased -24.9% from the 1994-2003 ten-year mean and decreased -30.9% from the 1955-2003 long-term mean. Total pond counts (Table 2) decreased -42.5% in Southern Alberta from last year, decreased -27.4% from the ten-year and -29.7% from the long term means.

The 2004 breeding population estimate for strata 75-76 (Central Alberta) is 1,753,000 total ducks (Table 4) an increase of +38% from last year and an increase of +19.4% from the long-term(15 year) mean. Total dabbling ducks increased +84.0 % from last year and increased +14.7% from the 15-year mean. Mallards increased +37.5% from 2003, and decreased -10.8% from the 15-year mean. Blue-winged Teal increased +290.7% from last year and increased +114% from the 15-year mean. Pintails increased +20.1% from 2003 and increased +17.9% from the 15-year mean. Total diving ducks decreased -3.5% from last year and increased +26.75 from the 15-year mean. Total ponds (Table 5) in Stratum 75 and 76 decreased - 2.9% from last year and increased +3.7% from the 15-year mean.

Over a decade of drought is continuing in Southern and Central Alberta this year. Precipitation since November 2003 was well below normal (64% to 79% of normal) in the prairies and (52% to 84% of normal)in the southern Aspen Parklands of southern Alberta, with habitat in the poor category for most of the area. The high mountain snow pack provided below normal run-off this spring and early summer. Conditions also declined in the west and central Peace Parklands of Stratum 76 and northern Aspen Parklands of Stratum 75 with habitat in the poor to mostly fair category. Precipitation since November 2003 was below normal (64% to 92% of normal).

## **METHODS**

The procedures followed in conducting the survey are contained in the Standard Operating Procedures for Aerial Waterfowl Breeding Ground Population and Habitat Surveys, Section III, revised April 1987. The analytical and procedural changes, described in the 1991 and 1992 reports, continued this year. As a result, measures of precision are now available with the population estimates. This years and the last nine years reports reflects a major change made to the historical (1955-1995) database of breeding waterfowl and habitat estimates. Nonparametric regression methods were used to predict population values for years in which no survey was conducted in a stratum. An internal report (Office of Migratory Bird Management, Laurel, MD) describes how and for which cases prediction was done.

Air-ground segment data in Central Alberta's strata 75 and 76(12- air/ground segments = 13% of the survey area) are not sufficient to compute accurate visibility correction factors (VCF's) for all duck species. Stratum 26 more closely resembles the habitat of 75 and 76 than the other Southern Alberta strata (27-29). It was decided to combine air-ground data from strata 26, 75

and 76, when calculating VCF's for strata 75 and 76. Acceptable standard errors and variances were obtained when this was done. Southern Alberta VCF's are still calculated with data from strata 26-29 only (37- air/ground segments = 25% of the survey area).

In 1996, Canada goose breeding population estimates were corrected for visibility bias based on data collected by air and ground survey crews in this reporting region. For validity of comparisons to means for previous years, historical Canada goose population indices were also adjusted for visibility bias using data collected by all air and ground survey crews throughout the Canadian and U.S. prairie regions in 1996. Therefore, estimates and means reported here cannot be directly compared with those in reports written before 1996 for this region.

Air data were compiled using a notebook computer. All areas in the current survey design (Tables 3 and 6) were flown. The survey was conducted using the same aerial crew and aircraft, a Cessna 206, for strata 26-29, 75 and 76. This was the 16th year of flying aerial waterfowl surveys for the pilot/observer and the 1st year for the aerial observer. All air and ground crew members participated in pre-survey training.

The Alberta ground crew did reconnaissance of the survey area and concluded that most species observed appeared paired by May 1. Most deciduous tree species were leafed out and the season timing appeared normal in southern areas . The survey was initiated on May 6 for Southern Alberta and completed on May 18. The Central Alberta survey commenced on May 18 and concluded on May 23. A total of 59 flight hours was required to complete the survey.

## **WEATHER AND HABITAT CONDITIONS**

Environment Canada, Climate Research Branch reports that the entire province recorded below normal winter precipitation except Peace River and Cold Lake (Bonnyville area). In the Fall, 2003, generally, precipitation recorded in both northwestern and central Alberta varied from near normal to much below normal . In southern Alberta, fall precipitation was recorded as near normal to above normal. Winter was generally colder than normal (averages were -2'C colder than normal).

Spring saw near normal precipitation in the Peace Parklands of north Central Alberta by Grande Prairie. Southern Alberta had generally much below normal precipitation except Red Deer(Aspen Parklands). We found that area to be in fair condition. Spring was warmer than normal (averages were +2'C to +4'C above normal).

The Prairie and Aspen Parklands of Stratum 26 to 29 and 75 were generally in poor condition with a few areas of fair along the Milk River Ridge in Stratum 29. There were actually ponds to count around the Suffield area of Stratum 28(first time in 5 years I have seen this). There is usually an area of good habitat in a 50 mile ring around Edmonton. This year it was barely rated as fair. Pond counts are half that of last year. Stratum 75 is generally in poor condition. St 76 is generally in fair to mostly poor condition. Pond counts are similar to last year.

## **BREEDING POPULATION INDICES**

A listing of all birds and the respective comparisons can be found in Tables 1 and 4, the Trend Graphs and Appendices 1 and 2.

### **SOUTHERN ALBERTA**

The 2004 breeding population estimate for strata 26-29 (Southern Alberta) is 2,503,800 total ducks (Table 1), a decrease of -7.2% from 2003, a decrease of -22.2% from the recent ten-year mean (1994-2003) and a decrease of -42.6% from the long-term mean (1955-2003). In Southern Alberta, total dabbling ducks (Table 1) decreased -6.6% from 2003, decreased -21.5% from the 1994-2003 ten-year mean and remained -44.7% below the 1955-2003 long-term mean. Mallards (Table 1) decreased -4.3% from 2003, Blue-winged Teal increased +11.6% from 2003 and Pintails decreased -36% from 2003. Total diving ducks (Table 1) decreased -10% from 2003, decreased -24.9% from the 1994-2003 ten-year mean and decreased -30.9% from the 1955-2003 long-term mean. Total pond counts (Table 2) decreased -42.5% in Southern Alberta from last year, decreased -27.4% from the ten-year and -29.7% from the long term means. Canada geese numbers changed +11%, +21% and +209.6 %, and Coots changed +8.1%, +17.4% and +3.9 % from the above respective means.

### **CENTRAL ALBERTA**

The 2004 breeding population estimate for strata 75-76 (Central Alberta) is 1,753,000 total ducks (Table 4) an increase of +38% from last year and an increase of +19.4% from the long-term(15 year) mean. Total dabbling ducks increased +84.0 % from last year and increased +14.7% from the 15-year mean. Mallards increased +37.5% from 2003, and decreased -10.8% from the 15-year mean. Blue-winged Teal increased +290.7% from last year and increased +114% from the 15-year mean. Pintails increased +20.1% from 2003 and increased +17.9% from the 15-year mean. Total diving ducks decreased -3.5% from last year and increased +26.75 from the 15-year mean. Total ponds (Table 5) in Stratum 75 and 76 decreased -2.9% from last year and increased +3.7% from the 15-year mean. Canada geese numbers changed +33.3%,and +87.3% , and Coots changed +298.3%, and +52.5 % from the above respective means.

## **CONCLUSIONS**

- 1) Residual nesting cover from last years brief relief from the drought was evident in southern portions of Stratum 29. Total pond counts are 42% below last years numbers. Ducks appeared to be crowded in the remaining wetlands. Total duck numbers are down 7.2% from last year. Production this year should be poor in the Prairies and Aspen Parklands.
- 2) The late spring snow and rain did not seem to discourage early nesting attempts.
- 3) Habitat conditions declined while duck numbers increased in Central Alberta.

Sincere appreciation is extended to all who participated in this survey. Thank you to the Winnipeg Climate Center and Alberta Agriculture for precipitation data and soil moisture maps.

Submitted by: Elizabeth Buelna Huggins-Flyway Biologist      Date: July 1, 2004
