

Summary
**Lead action level exceedances for medium (3,300-50,000) and
large (>50,000) public water systems**
(Updated as of June 1, 2004)

In 2001 and 2002, the District of Columbia Water and Sewer Authority (WASA) began to observe elevated levels of lead from customer tap sampling carried out to comply with the national regulation for lead in drinking water. Public education efforts carried out by the utility failed to convey the magnitude of the problem. Awareness in the community of the problem was heightened after the publication of a series of articles in the Washington Post since January 2004. Several Congressional hearings have also been held to review the actions of WASA, the U.S. Army Corps of Engineers Washington Aqueduct (which sells water to WASA) and the Environmental Protection Agency (EPA). On June 17, 2004, EPA and WASA reached a consent agreement to address several violations, including a failure to report elevated levels to EPA (which has enforcement responsibility for the District of Columbia). Additional information on the consent agreement and other activities related to the problem in the District can be found on the EPA website at <http://www.epa.gov/dclead/>.

The problem in the District raised the question of whether problems related to elevated lead levels exist in other areas throughout the country. The Lead and Copper Rule, published in 1991 and revised in 2000, requires water utilities to carry out actions to monitor for lead at customer taps and take action to control corrosion within their distribution systems. As part of its wider review of implementation of the rule by states and utilities, EPA has been reviewing data reported by states for the rule. The data reviewed to date does not point to a nationwide problem - fewer than 4% of the 7,702 systems that serve more than 3,300 people in the country for which EPA has data have exceeded the action level since 2000.

Background

The Lead and Copper Rule (LCR) requires that systems conduct monitoring of lead from customer taps - generally every six months, annually, or triennially, depending on the levels of lead observed in drinking water (i.e., less frequent monitoring if levels are low). In some cases, small systems can monitor every nine years. If 10% of the homes that are tested have lead levels greater than the action level (AL) of 15 ppb, the system must increase monitoring, undertake additional efforts to control corrosion and inform the public. For each monitoring period, a system (or the state) must calculate the lead level at the 90th percentile of homes monitored. For example, if a system monitors 100 homes, it sorts its results from the lowest to the highest concentration and reports the concentration it observed in the 90th sample.

The Safe Drinking Water Information System/Federal Version (SDWIS/FED) holds information that water systems are required to submit to states. Since 2002, states have been required to report to EPA the 90th percentile lead concentrations reported by water systems serving more than 3,300 regardless of whether the system is over the action level (note: states could report since 2000). As of January 2004, EPA had incomplete data for this reporting requirement, with data in SDWIS/FED for only 23% of the systems serving more than 3,300

people. To respond to questions about the national prevalence of elevated lead levels, EPA requested that states expedite entry of the data. States were asked to submit data for large systems that serve more than 50,000 people by April; for medium systems serving between 3,300 and 50,000 people by May; and for small systems that serve less than 3,300 by the end of June. For small systems, a state is only required to report a 90th percentile if the value is greater than the action level.

On May 5, EPA released a preliminary summary of data for systems serving more than 50,000 people that reflected data retrieved from the SDWIS/FED production database on April 28, 2004. This new summary, which is based on data pulled from the production database on June 1, 2004, updates the earlier summary to reflect additional data received and provides a preliminary summary for systems serving between 3,300 and 50,000 people. Since the May 5 release, states have continued to upload data and made corrections to existing lead concentration and/or inventory data. Due to problems with California data in the SDWIS/FED system, EPA has pulled all California lead monitoring information from the SDWIS/FED production database. California data is being held in a separate spreadsheet pending the resolution of issues to allow for complete entry of data into the SDWIS/FED database, which is the federal database of record for the drinking water program. We have, however, included data from California in this summary.

The review that follows summarizes findings for systems that (1) serve more than 50,000, and (2) serve from 3,300 to 50,000 people. The data continues to show that there does not appear to be a widespread problem with elevated lead levels across the country comparable to that currently being observed in the District of Columbia. EPA will continue to collect and report on data in the months ahead.

Systems serving more than 50,000 people

As of June 1, 2004, EPA had data in SDWIS/FED for 97% of the active systems in this size class, excluding systems from the State of California (Table 1). EPA has data for 80 of California's 150 systems in a separate spreadsheet. EPA has also verified that 19 of the 20 systems for which there are no data are part of a consecutive system and are not responsible for lead monitoring pursuant to agreements with their partner systems. Excepting California, EPA lacks data for only one system in Nevada.

Twelve of 316 systems that had a monitoring period which ended in 2003 or later exceeded the action level of 15 ppb (Table 2). The percentage of population served with elevated lead levels in 2003 is driven by exceedances in 3 utilities serving major metropolitan areas: the Massachusetts Water Resources Authority (MWRA), which serves 2 million people in 28 communities in the greater Boston area; the Metropolitan system, which serves 1.5 million people in the San Juan, Puerto Rico area; and, the District of Columbia Water and Sewer Authority, which serves close to 600,000 people in Washington, D.C. Additional findings follow below.

Table 2 - Summary of 90th Percentile Lead Data for Systems Serving more than 50,000 People

SUMMARY	For Monitoring Periods Ending in 2003 and later	For Monitoring Periods Ending in 2000 and later
Total Number of Systems	--	834
Population Served	--	153,760,018
Total Number of Systems with Data	316	744
Population Served	63,020,639	132,228,947
Total Number of Systems > AL	12	27
Population Served	5,235,961	7,153,801
% Systems > AL	3.8%	3.6%
% Population Served	8.3%	5.4%

- As noted, 12 systems exceeded the level in 2003, 4 of which are in Puerto Rico. Since 2000, 27 systems, or 3.6% of 744, have exceeded the action level (Figure 1, Table 3). Four exceeded the level in 2000 and have been below since that time. Most of the systems (61%) reported that the maximum value observed during any one monitoring period since 2000 was less than 5 ppb.
- EPA has results from 1,424 monitoring periods for which systems conducted sampling for monitoring periods ending in 2000 and later¹. The data shows that only 45, or 3.2%, of the 90th percentile samples reported to and by states exceeded the action level (Figure 2). Again, most of the results (66%) were less than 5 ppb.
- The total population served by systems that exceeded the action level for one or more monitoring periods ending since 2000 is 7.1 million, or 5.4% of the 132 million people served by systems for which EPA has data. For 2003 data, 5.2 million, or 8.3%, of the people served by systems for which EPA has data exceeded the action level. As noted above, this higher percentage was largely driven by the inclusion of the MWRA and Metropolitano systems.
 - It is important to note that the population actually exposed to elevated lead levels in the community is likely less than the values shown in the table, which reflects the population of the entire service area. This is due to the nature of lead occurrence, which is largely due to leaching of lead from lead service lines and plumbing fittings and fixtures, and thus site-specific to homes that have those fixtures. Also, with respect to MWRA, additional information from the utility indicates that the action level was exceeded in 10 of the 28 communities served by the system, not the entire 2 million person service area.
- The systems that exceeded the action level since 2000 were limited to 10 states and Puerto Rico (Table 1). Massachusetts (6) and Puerto Rico (5) had the greatest number of systems over the action level which represents 32% and 29%

¹This does not include other data obtained by the region, state, or utility that has not been entered into SDWIS/FED, which includes 6 samples from MWRA, 4 of which were between 16-25 ppb.

- of the systems in that size class for each jurisdiction, respectively. As a percentage of systems, both D.C. and Maine are at 100% because they only have one system in each jurisdiction that serves more than 50,000 people.
- EPA removed two additional systems (Cary and Asheville, NC) from the list of systems exceeding the action level after verifying that the data in SDWIS/FED was in error. Also, as described earlier, EPA did not include 3 systems from Oregon (Portland, Rockwood and Tulatin Valley) in the list for 2003 because the systems had shown levels lower than the action level for monitoring periods conducted during 2003.
- The summary only included systems that are currently active. This eliminated 12 systems from the pool, one of which had tested above the action level in 2000.
- As noted, 19 systems for which there was no data were consecutive systems. Under the Lead and Copper Rule, systems that are wholesalers or purchasers must enter into agreements to determine which party is responsible for sampling and/or compliance. For example, under the MWRA agreement with its customers, the MWRA is responsible for monitoring and reporting results of 90th percentile levels. The 90th percentile data is not reported under records for its individual customer systems.

Systems serving between 3,300 to 50,000 people

While most of the population in the country is served water by large systems, most of the systems in the country are smaller systems. A total of 94 million people in the country receive drinking water from 7,833 systems that serve populations ranging from 3,300 to 50,000 people. As of June 1, 2004, EPA had data in SDWIS/FED for 91%, or 6,678 of the systems in this size class, excluding systems from the State of California (Table 4). EPA has data for 280 of California's 498 systems in a separate spreadsheet. Excluding California, EPA is still missing data for 657 systems, and several states have provided data for fewer than 50% of their systems (RI, VT, DE, LA and AZ). Unlike large systems, EPA has not made an attempt to determine which of the missing systems lack data because they are part of a consecutive water system. The Agency is asking that states continue to update data and provide information for systems for which there is no data.

Because there are more systems in this size category, one expects that there would be a greater number of systems that exceeded the action level. In 2003, 76 of 2442 systems that concluded a monitoring period in that year exceeded the action level (Table 5). However, the percentage of systems that exceeded the action level in 2003 and since 2000 were slightly lower than those observed for systems that serve more than 50,000. A summary of the findings follows below.

Table 5 - Summary of 90th Percentile Lead Data for Systems Serving 3,300 - 50,000 People

	For Monitoring Periods Ending in 2003 and later	For Monitoring Periods Ending in 2000 and later
Total Number of Systems	--	7,833
Population Served	--	94,355,800
Total Number of Systems with Data	2442	6,958
Population Served	29,614,003	84,452,284
Total Number of Systems > AL	76	237
Population Served	1,004,212	3,222,311
% Systems > AL	3.1%	3.4%
% Population Served	3.4%	3.8%

- As noted, 76 of the systems exceeded the level for a monitoring period ending after January 2003 (Table 6). Since 2000, 237 systems, or 3.4%, have exceeded the action level (Figure 3, Table 7). Most of the systems (71%) reported that the maximum value observed during any one monitoring period since 2000 was less than 5 ppb.
- EPA has results from 10,688 monitoring periods for which systems conducted sampling for monitoring periods ending in 2000 and later. The data shows that only 349, or 3.3%, of the 90th percentile samples reported to and by states exceeded the action level (Figure 4). Again, most of the results (73%) were less than 5 ppb.
- The total population served by systems that exceeded the action level for one or more monitoring periods since 2000 is 3.2 million, or 3.8% of the 84 million people served by systems for which EPA has data. For 2003, 1 million, or 3.4%, of the people served by systems for which EPA has data exceeded the action level.
 - As with the systems that serve more than 50,000, it is important to note that the population actually exposed to elevated lead levels in the community is likely less than the values shown in the table.
- Thirty-nine states had systems that exceeded the action level since 2000 (Table 4). Massachusetts (25), New Jersey (17) and North Carolina (16) had the greatest number of systems over the action level which represents 13%, 9% and 7% of the systems in the size class for each jurisdiction, respectively. At 20%, New Hampshire had the greatest percentage of systems over the action level. An additional 5 states had 10% or more of systems in the size class exceed the action level (Alaska, Massachusetts, Maine, Oregon and Puerto Rico).
- Six of the 237 systems are non-community water systems (3 in 2003). Non-community water systems are systems that do not serve the same people year round. Examples include schools, factories, and campgrounds. Most customers get their drinking water from community water systems which provide water to the same people year round.

- The summary only included systems that are currently active. This eliminated 55 systems from the pool, two of which had tested above the action level in 2000.
- Due to the number of systems, EPA has not made an effort to verify whether any of the systems listed as exceeding the action level are in error. EPA expects that it may receive corrected data from states and/or systems following distribution of this summary. EPA will make corrections prior to its next release of summary data.

How EPA pulled the data

This summary uses data retrieved from the SDWIS/FED production database on June 1, 2004. EPA has made SDWIS/FED reporting data on 90th percentiles for lead available in the form of Microsoft Excel PivotTables. The PivotTables can be accessed on the EPA website at <http://www.epa.gov/safewater/lcrmr/implement.html>. The summary includes data for sample records for monitoring periods that concluded during or after January 2000. As noted previously, the monitoring period for lead can generally vary from between 6 months to 3 years. States are required to report the **start** and **end** dates for the monitoring periods for each 90th percentile sample record. If records had been retrieved by pulling records with a start date after January 2000, EPA would have failed to capture those systems that were on a monitoring period that was less frequent than annual monitoring - where a monitoring period began, say, in 1999, but ended after January 2000. Out of the 11,540 records for systems serving more than 3,300 that are included in this summary, 2,550, or 22%, had a monitoring period start date prior to 2000. Thus, EPA has retrieved records by pulling those that had a monitoring period end date after January 1, 2000. Table 8 shows the number of records by monitoring period start and end date.

However, there are some differences in the ways several states record monitoring period start and end dates. Some states will assign a standard monitoring period regardless of whether the system is on semi-annual, annual, or triennial monitoring. For example, the State of Oregon assigns a 3-year monitoring period to all sample records even if the system is on 6-month monitoring. This became an issue when EPA looked to see how many systems exceeded the action level in 2003. EPA retrieved data for the 2003 period using the same method used to retrieve data for all records - by selecting a monitoring period end date that began after January 1, 2003 - the assumption being that systems are sampling at the end of the 3 year monitoring period. However, because Oregon assigns a default 3-year period, this included 3 systems greater than 50,000 and 8 systems between 3,300-50,000 in the pool of systems that were over the action level in 2003 even though monitoring carried out during 2003 showed that they were no longer above the action level. EPA has adjusted the information in this report accordingly to remove those 11 Oregon systems from the summaries for 2003.

As noted, EPA is maintaining data from California in a separate spreadsheet while it works with the state to resolve issues with how the state has recorded data in SDWIS/FED. EPA's principal concern is that, while the state has assigned a date to each record, it has inconsistently entered start and end dates for monitoring periods. In developing this summary, EPA has included California samples dated after 2000 or in 2003. EPA continues to work with California to ensure that all data for each of its systems is correctly entered into SDWIS/FED.

Other Data

EPA continues to analyze data from SDWIS/FED to determine how systems that initially tested above the action level for monitoring conducted after the rule was issued in 1991 have fared over subsequent years. Table 9 shows data for systems serving more than 50,000 that demonstrated 90th percentile levels greater than the action level during initial rounds of monitoring carried out in 1992 and 1993 (Rounds 1 and 2). The data is a combination of information from SDWIS/FED and EPA press releases in October 1992 and May 1993. The table has information for 177 systems that exceeded the action level in Round 1 or 2. We can compare the results of initial monitoring to recent monitoring for 166 of the systems (some have changed ownership or consolidated with other utilities). During their most recent monitoring period in SDWIS/FED, 17 systems exceeded the action level, 9 of which are now part of the MWRA system service area. Nine of the 177 systems had initial 90th percentile levels that exceeded 100 ppb. Five of those systems are now below the action level, two are part of the MWRA system which is currently above the action level, and another is also currently above the action level. The remaining system is no longer active. EPA continues to work to review the actions taken by utilities that were initially over the action level to determine the effectiveness of the rule in reducing risk.

Additional Activities to Review Implementation

As indicated in Congressional testimony by Acting Assistant Administrator for Water Benjamin Grumbles, EPA is undertaking an evaluation of implementation of the lead and copper rule to determine if the rule is being effectively carried out around the nation. While it does not appear that there is a widespread problem with elevated lead levels, EPA wants to make sure that states and utilities are carrying out the requirements of the law, particularly with respect to following monitoring and reporting protocols and public education. The Agency is also holding a series of expert workshops to discuss issues associated with the rule. The first two workshops, on monitoring protocols and simultaneous compliance, were held in St. Louis in May, 2004. Another workshop on public education is being planned for the fall.

EPA's review of compliance and implementation, expert workshops and other efforts underway will help the Agency to determine whether it is appropriate to develop additional training or guidance or make changes as part of our review of existing regulations. Our immediate goal is to ensure that systems and States have the information they need to fully and effectively implement the rule and minimize risks to public health and that the public has confidence in the safety of their drinking water.

Table 1 - Data Reported by States for Community and Non-community Water Systems Serving more than 50,000 people

State	Percentage of Systems for which a State has Reported a Sample since 2000			Percentage of Systems with Sample(s) that are Above the Action Level
