

**CSCH****PURPOSE**

Compute the hyperbolic cosecant for a variable or parameter.

**DESCRIPTION**

The hyperbolic cosecant is defined as:

$$\operatorname{csch}(x) = \frac{2}{e^x - e^{-x}} \quad (\text{EQ 7-109})$$

The hyperbolic cosecant is defined for all real numbers except zero. The range is minus infinity to plus infinity.

**SYNTAX**

LET <y2> = CSCH(<y1>) <SUBSET/EXCEPT/FOR qualification>

where <y1> is a number, parameter, or variable;

<y2> is a variable or a parameter (depending on what <y1> is) where the computed hyperbolic cosecant value is stored; and where the <SUBSET/EXCEPT/FOR qualification> is optional.

**EXAMPLES**

LET A = CSCH(A1)

LET X2 = CSCH(PI/2)

**DEFAULT**

None

**SYNOMYMS**

None

**RELATED COMMANDS**

CSC	=	Compute cosecant.
SINH	=	Compute hyperbolic sine.
COSH	=	Compute hyperbolic cosine.
TANH	=	Compute hyperbolic tangent.
COTH	=	Compute hyperbolic cotangent.
SECH	=	Compute hyperbolic secant.
ARCCOSH	=	Compute hyperbolic arccosine.
ARCCOTH	=	Compute hyperbolic arccotangent.
ARCCSCH	=	Compute hyperbolic arccosecant.
ARCSECH	=	Compute hyperbolic arccosecant.
ARCSINH	=	Compute hyperbolic arcsine.
ARCTANH	=	Compute hyperbolic arctangent.

**APPLICATIONS**

Trigonometry

**IMPLEMENTATION DATE**

Pre-1987
