

## APPLES

New England utilized **apple** production in 2007 totaled 3.7 million bushels (42-pound units), 19 percent above 2006 utilized output. A fairly mild winter was experienced across most of New England during 2006 – 2007. Cool

conditions in April and early May delayed bloom, and wet weather increased the incidence of apple scab and root rot. Sunshine and warmer temperatures arrived by mid-May in time for peak bloom and provided good pollinating conditions at

most locations. Late June storms brought hail, causing significant damage in some orchards. July and August brought drier weather, leading to a larger number of drops than anticipated earlier. Overall, producers rated the 2007 growing season as one of the best in recent years. A preliminary grower estimate of expected price for the 2007 apple crop placed New England value of utilized production at \$66.1 million, 21 percent above the previous year's value. An updated estimate of value will be available July 8, 2008, after the majority of the 2007 crop has been marketed.

<sup>1</sup> Apple production from commercial orchards with 100 or more trees.

<sup>2</sup> Yield is based on total production, which includes unharvested production and fruit harvested but not sold due to market conditions.

<sup>3</sup> Total production is the quantity actually harvested plus quantities which would have been acceptable for fresh market or processing but were not harvested because of economic or natural reasons.

<sup>4</sup> Utilized production includes fruit sold, amount used on the operation or given away, and fruit placed in storage.

\* Preliminary. Final statistics for 2007 will be available July 8, 2008.
