| Berry Production | 2 |
| Final Grape Crush Summary | 3 |
| Citrus Production | 4 |

FEBRUARY CROP COMMENTS

General maintenance activities were underway during February in many grape vineyards as growers replaced stakes and trellis wire, pruned vines, and shredded canes. Several grape growers were busy discing rows and applying herbicides to the surrounding berms for weed control. Insecticides were applied to some vinevards to control the vine mealvbug. Warm temperatures at the beginning of the month caused some early varieties of tree fruit to prematurely begin pushing buds. Freezing temperatures shortly followed, raising concerns about crop damage to these early variety fruit crops. Despite the cool temperatures, some early-variety deciduous fruit trees began leafing out near the end of the month. Early almond trees were also starting to bloom at the beginning of the month. By month's end, most

early variety almond orchards were in full bloom, and later maturing varieties began blooming. A few orchards were treated with fungicides to prevent blossom rot. The freezing temperatures during the month caused some damage to early almond varieties, but the overall impact remains to be determined. Bees were busy working to pollinate the almond trees, but the cool temperatures slowed their production. Replanting of almond, walnut, and pistachio orchards continued. New peach orchards were planted in the San Joaquin Valley. Strawberry plants continued to show good growth in the San Joaquin Valley, and harvesting began along the central coast.

Harvesting of Navel oranges, grapefruit, lemons, mandarins, tangelos, and tangerines continued during February with good yields reported. Growers applied copper, lime, and zinc to citrus groves in order to control fungal disease and to comply with export requirements. Harvest began of early variety Valencia oranges, but some maturity problems were reported. Citrus growers were busy running water and wind machines when temperatures dropped below freezing. Navel demand in the domestic and export markets was moderate. Puff and rind problems continued to be problematic in Navels resulting in lower than normal pack-outs.

FRUIT AND NUT STATISTICS AT A GLANCE

2/

FINAL GRAPE CRUSH REPORT

The 2005 crush totaled 4,328,840 tons, up 20 percent from the 2004 crush of 3,615,278 tons. Red wine varieties accounted for the largest share of all grapes crushed, at 2,234,595 tons, up 36 percent from 2004. The 2005 white wine variety crush totaled 1,520,572 tons, up 34 percent from 2004. Tons crushed of raisin type varieties totaled 467,483, down 36 percent from 2004, while tons crushed of table type varieties totaled 106,190, down 6 percent from 2004.

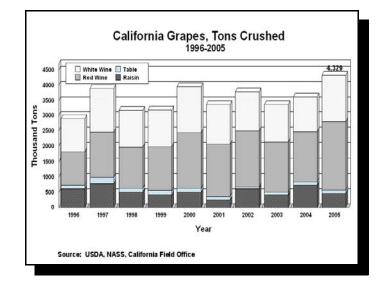

Beginning with the 1999 season, the Grape Crush Report includes the total number of tons crushed for concentrate production. In determining grape tonnage crushed for concentrate production, each processor was required to report the estimated equivalent tons of grapes crushed for grape concentrate. For the 2005 season, this total was 550,296 tons, approximately 13 percent of the 2005 grape crush total. This report provides only the aggregate figure for grapes crushed for concentrate production and does not include information by district, type, or variety.

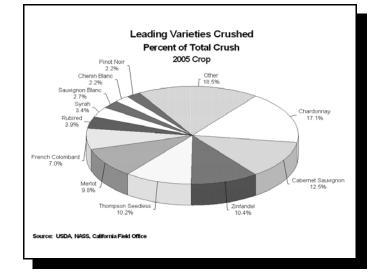

California grape growers received prices in 2005 for raisin and table grapes that were, on average, below the 2004 prices, while the prices received for red and white were, on average, above the 2004 prices. The 2005 average price of all varieties was \$532.78, up 10 percent from 2004. Average prices for the 2005 crop by type were as follows: red wine grapes, \$633.48, up 1 percent from 2004; white wine grapes, \$506.37, up 4 percent from 2004; raisin grapes, \$164.25, down 18 percent; and table grapes, \$121.36, down 39 percent. These price levels have not been adjusted for inflation.

LEADING GRAPE VARIETIES AND DISTRICTS

In 2005, Chardonnay accounted for the largest percentage of crush volume with 17.1 percent. Cabernet Sauvignon accounted for the second leading percentage of crush with 12.5 percent of the total crush. The next eight highest percentages of grapes crushed were all wine varieties, with the exception of Thompson Seedless.

Grapes produced in District 4 (Napa County) received the highest average price of \$2,990.23 per ton, up 2 percent from 2004. District 3 (Sonoma and Marin counties) received the second highest return of \$1,871.23, virtually unchanged from 2004. The 2005 Chardonnay price of \$713.98 was up 3 percent from 2004, while the 2005 Cabernet Sauvignon price of \$938.12 was down 4 percent from 2004. The 2005 average price for Merlot was \$729.53, down 9 percent from 2004, while the Zinfandel average price of \$472.08 was down less than 1 percent from 2004.

CALIFORNIA VALENCIA ORANGE OBJECTIVE MEASUREMENT REPORT, 2005-06

The 2005-06 Valencia orange forecast is 22.0 million (37.5-pound) cartons, 39 percent below last season's estimated total of 36.0 million cartons. Objective measurement survey data indicated an average fruit set of 492 oranges per tree in the State of California. Fruit sizes have decreased this year, with an average diameter of 2.640 inches.

The Valencia Orange Objective Measurement Survey was reinstated in the year 2000. This year, Valencia oranges were sampled from 650 groves or blocks. The sample blocks were distributed in proportion to the bearing acres in each county and the year the trees were planted. Two trees were sampled in each selected block. Sampling was done by measuring branches, randomly selecting a branch at that stage, then moving to the next stage and repeating the steps until a terminal branche was selected. All oranges on intermediate and terminal branches were counted. Two separate random counts were taken in each tree. The two counts were mathematically combined to arrive at an estimated total fruit count per tree.
