support deck mounted LNG receiving and vaporization equipment and utilities, berthing accommodations for LNG carriers, facilities for delivery of natural gas to a pipeline transportation system, and personnel accommodations.

The Terminal will be able to receive the largest LNG carriers in service or on order in 2002. LNG carrier arrival frequency will be planned to match specified terminal gas delivery rates. All marine systems, communication, navigation aids and equipment necessary to conduct safe LNG carrier operations and receiving of product during specified atmospheric and sea states will be provided at the port.

The regasification process consists of lifting the LNG from storage tanks, pumping the cold liquid to pipeline pressure, vaporization across heat exchanging equipment and delivery through custody transfer metering to the gas pipeline network. No gas conditioning is required for the Terminal since the incoming LNG will be pipeline quality.

A 42-inch diameter offshore Pelican Interconnector Pipeline, 37 nautical miles in length, will be constructed as part of the Pelican Project. The PIPL will transport gas from the Terminal to a point near the Tiger Shoal Platform "A" where it will connect to the Henry-Floodway Gas Gathering System (HFGGS). The HFGGS will deliver the gas to the onshore U.S. gas pipeline network.

The Terminal will be constructed in two phases. Phase I includes the installation of two GBS units with internal storage tanks and facilities for LNG offloading, and vaporization capability to deliver a peal 1.0 billion standard cubic feet per day (SCFD) of natural gas to the pipeline system. Additional vaporization equipment and associated support equipment and facilities will be installed during Phase II to increase the facility vaporization and send out rate to 2.0 billion SCFD peak.
