

1 critical issue that is not getting enough  
2 attention. We propose that the FDA take a more  
3 active control and oversight for post-marketing  
4 surveillance of adverse reactions for AIDS drugs  
5 and make it public, make the public aware of the  
6 results of this surveillance.

7           And I know as consumers for the Committee  
8 of Ten Thousand, we are going to do our part in  
9 helping the FDA try to secure that funding because  
10 we believe it is very important to the community  
11 who is suffering from HIV and AIDS. Thank you for  
12 the opportunity.

13           DR. FRIEDMAN: Thank you.

14           MR. BYRD: Thank you very much.

15           MS. DUCCA: Good afternoon. My name is  
16 Anita Ducca. I'm the director for Regulatory  
17 Relations for the American Red Cross. I'm pleased  
18 to be here today to provide the views of the  
19 Coalition for Regulatory Reform, CFRR or the  
20 Coalition, on the Food and Drug Administration's  
21 meeting to talk with stakeholders about FDA  
22 modernization.

1           CFRR was formed in 1994 at the request of  
2 FDA to bring the blood and plasma industries  
3 together to jointly explore ideas for a more  
4 efficient regulatory system for blood and plasma  
5 products. The coalition consists of the American  
6 Association of Blood Banks which includes the  
7 American Red Cross and the Armed Services Blood  
8 Program Office, America's Blood Centers and the  
9 American Blood Resources Association.

10           CFRR represents virtually the entire  
11 spectrum of blood and plasma collection and  
12 transfusion interests. Today I will highlight the  
13 key points we wish to make based on the collective  
14 view of the whole blood, transfusion and plasma  
15 industries. CFRR supports FDA's desire to utilize  
16 state of the art science in its risk-based  
17 decision-making processes. Product review and  
18 approval times can have a direct impact on the  
19 availability of life saving products.

20           In the blood and blood products industry,  
21 FDA has a host of new tools for modifications or  
22 changes to approved applications that ostensibly

1 are the result of the agency's risk-based decision  
2 making. The annual report, the changes being  
3 affected and the comparability protocol are  
4 intended to reduce the regulatory burden associated  
5 with minor changes to approved applications.  
6 Similarly, full implementation of the biologics  
7 license application would free up scientific  
8 resources.

9           To increase its scientific resources, FDA  
10 could enhance collaboration with domestic and  
11 international health organizations. Collaborative  
12 efforts between CBER and the United Kingdom are one  
13 example. We also recommend expanding interactions  
14 with domestic health organizations such as NIH and  
15 CDC. We also encourage further collaboration with  
16 us, the regulated community.

17           There is much to be learned from each  
18 other. Interaction with the North American  
19 Technical Advisory Group to address the issues  
20 surrounding bar code labeling of blood products and  
21 the NAT inter-agency task force has permitted  
22 active exchange of information with other

1 scientists on the cutting edge.

2           We invite further FDA participation on  
3 such groups. CFRR also urges the agency to  
4 consider the need for exchange of information  
5 within the FDA particularly across centers and with  
6 the Office of Regulatory Affairs. For example, the  
7 Center for Drug Evaluation and Review recently  
8 approved a new drug for the treatment of psoriasis  
9 which included as part of its package labeling the  
10 warning that individuals taking the drug should not  
11 donate blood for three years after the date of last  
12 administration.

13           However, CBER, and consequently the blood  
14 and blood products industry, were not informed  
15 about this package label warning as quickly as they  
16 might have been. We urge ongoing and continued  
17 consultation between the centers and with the  
18 regulated community to review the scientific  
19 information necessary to make such policy  
20 determinations.

21           FDA has also asked about focusing its  
22 resources on areas of greatest risk. Some of this

1 work has already begun. In 1998, FDA announced a  
2 blood action plan aimed at reinventing some  
3 regulatory aspects of the agency's approach to  
4 blood. Recently CBER has also developed a device  
5 action plan and a tissue action plan. These  
6 action plans represent important steps to begin  
7 focusing on areas of greatest risk.

8           However, more could be done. As part of  
9 its risk-based resource assessment, FDA could  
10 reinvent its inspection program towards a systems  
11 based approach. A systems based approach will help  
12 provide greater focus on important safety and  
13 quality steps within the manufacturing sites.

14           Self-certification licensure programs such  
15 as the proposed red blood cell immunization and  
16 whole blood irradiation self-certification programs  
17 could hold promise for appropriate allocation of  
18 agency resources. CFRR is ready to work with FDA  
19 to expand the scope of these self-certification  
20 programs to other areas.

21           We suggest that FDA perform a  
22 comprehensive cross-cutting review of

1 responsibilities of the centers along with the  
2 Office of Regulatory Affairs to help identify areas  
3 where the FDA resources could be emphasized and  
4 where they could be deemphasized. Currently, the  
5 manufacturer of a new piece of equipment used in  
6 the processing of a blood product must undergo a  
7 510(k) review by the Center for Devices and  
8 Radiological Health. CBER then reviews the blood  
9 facility's license application for that device  
10 often including quality assurance data before the  
11 equipment can be used at the facility.

12           Sometimes there is a prelicensure  
13 inspection prior to license supplement approval and  
14 during a facilities annual inspection, FDA local  
15 district investigators will often review the same  
16 information pertaining to the device and its  
17 validation. CFRR urges FDA to reconcile these  
18 processes with an eye towards eliminating the  
19 existing overlap.

20           FDA should be acknowledged for its efforts  
21 to communicate with stakeholders. The internet  
22 home page is a superior resource for all interested

1 stakeholders. In addition, stakeholder meetings  
2 and solicitations of public comment offer an  
3 opportunity to provide feedback to FDA on FDAMA's  
4 implementation. CFRR urges FDA to continue its  
5 current trend of announcing proposed policies via  
6 the internet and Federal Register notices and to  
7 hold public and stakeholder meetings.

8           However, it is essential that such  
9 meetings be announced sufficiently in advance to  
10 permit adequate time to prepare. It is also  
11 essential for FDA to make publicly available all  
12 non-proprietary information provided to its  
13 advisory committees. We understand the need to be  
14 consistent with applicable regulations and to apply  
15 appropriate controls for confidential commercial  
16 information. However, this information, such as  
17 scientific data and algorithms discussed at the  
18 Blood Products Advisory Committee meetings will  
19 considerably aid our ability to participate.

20           In conclusion, the coalition applauds the  
21 actions FDA has taken towards implementation of  
22 FDAMA and we look forward to future interactions.

1 Thank you.

2 MR. BYRD: Thank you.

3 DR. CHODOSH: I'm Sanford Chodosh. I am  
4 the president and one of the founders of a group  
5 called Public Responsibility in Medicine and  
6 Research, commonly called PRIMR. This is our 25th  
7 anniversary year and I'm very pleased that we were  
8 invited to address this as a stakeholder. I have  
9 to also mention that I'm a government employee. I  
10 work for the Veterans Administration and what I say  
11 does not in any way represent what the Veterans  
12 Administration believes.

13 I've also been a clinical researcher for  
14 well over 30 years, mostly in the area of  
15 pharmacology, and I have been an institutional  
16 review board or IRBD chairperson in the past for,  
17 oh, ten, 15 years. So that I come with a lot of  
18 credentials about what I want to speak about and  
19 that has to do mostly with number one and number  
20 two questions about the state of the art of science  
21 in what the FDA does and how to exchange and  
22 integrate scientific information. I really welcome

1 this opportunity to present my ideas concerning how  
2 the FDA could influence the scientific aspects of  
3 the research carried out for regulatory purposes.

4 I believe that a significant change should  
5 be made to serve the goals of the drug and device  
6 approval process while still gathering useful  
7 scientific knowledge. What is the current state of  
8 affairs, and this is mostly in bullets because I  
9 wanted to be sure I covered it in five minutes.  
10 Right now, by and large, industry plans and carries  
11 out studies sometimes by the scientific groups in  
12 the industry and sometimes by the marketing groups  
13 in industry. They do require often approval of the  
14 FDA. However, the onus is on industry to develop  
15 these plans.

16 The protocols by and large reflect FDA's  
17 minimum standards to obtain approval and as far as  
18 the company is concerned for market acceptance  
19 purposes also. Legally--I didn't realize this  
20 until recently--industry only has to submit study  
21 results to the FDA. They do not have to under law  
22 legally supply this information to investigators,

1 the institution or the human subjects.

2           Indeed, industry rarely provides reports  
3 to investigators and often needs to be even coaxed  
4 to break a double-blind code after the study has  
5 been completed. Yes, it is true. Don't shake your  
6 head.

7           Five, feedback of results to participating  
8 subjects is almost nil. In many areas of drug and  
9 device development, the required to demonstrate  
10 equivalence to a comparative drug or device is the  
11 general rule. Comparator agents are often selected  
12 to satisfy marketing concerns, not selected because  
13 they are the gold standard for the group of drugs  
14 being tested.

15           The FDA allows and industry capitalizes on  
16 using investigators of variable scientific  
17 capability. What are the results of this state of  
18 affairs? Positive drugs and devices may well get  
19 approved in a faster way. On the other hand, the  
20 data collected to meet minimal standards often does  
21 not conform to good scientific methodology.  
22 Studies designed to demonstrate equivalence usually

1 results in inadequate numbers of subjects to show  
2 anything but equivalence. And the selection of  
3 outcome goals and methods that are used are not as  
4 objective as they could or should be, and I can  
5 give you many examples of that.

6 Lacking good scientific design, most of  
7 the investigation's resulting data which is very  
8 unlikely to pass muster in a good peer review  
9 journal. Unless a publication can be produced to  
10 help the marketing of the drug, the results will  
11 likely only be referred to as data on file and  
12 therefore not subject to any peer review beyond the  
13 FDA, but usable in advertising. The results of the  
14 study do not flow back to the investigators, the  
15 institution or the human subjects.

16 I think this raises some important ethical  
17 issues. The subjects generally are led to believe  
18 that they are taking risks so that scientific  
19 information will be advanced. I think that in  
20 general we've missed that our subjects. Most  
21 investigators are disinterested in the results  
22 because most companies are very upset when I ask

1 for a report of the study, because no one else has.

2           Why then should they be considered ethical  
3 or even legitimate investigators? Institutions do  
4 not insist on seeing the results of such industry  
5 oriented research. Shouldn't IRBs consider that  
6 their part of their responsibility is to see that  
7 the studies they approved were actually carried out  
8 appropriately and expect to see results. What can  
9 be done?

10           Well, I think you need to change the  
11 rules. Drug studies should be reviewed by the  
12 industry, FDA, IRBs and investigators to ensure  
13 that the best science is being used to evaluate a  
14 new drug or device. Quite frankly, that often is  
15 cheaper than the way this goes right now. Because  
16 if you really design a study properly, you probably  
17 do not need as much work on it frankly.

18           You need to have true scientific advisory  
19 boards. That is that are very specific for the  
20 topic for the drug being studied, and IRBs need to  
21 consider these as if they were NIH proposals.  
22 Very often, most IRBs will get industry sponsored

1 studies and say, well, these aren't that important.  
2 You know let's look at this NIH study. That we're  
3 going to pick apart.

4 FDA should change its acceptance of  
5 equivalence testing as the desired outcome. I  
6 think they should be looking to see differences if  
7 they exist. The methodology used should be the  
8 best objective measures of what is expected of the  
9 compound. Surprisingly, that doesn't always occur.

10 It should be required that the results of  
11 these studies be made available to science and  
12 society. This may require some new type of journal  
13 or register. Currently journals should accept more  
14 responsibility for considering publication of  
15 negative results. It's just as important to know  
16 something doesn't work.

17 However, if studies can pass peer review  
18 scrutiny, the results should also not be accessible  
19 for obtaining new drug approval. So it all goes  
20 around and around. If you plan good science and do  
21 good science, you'll probably come up with answers  
22 that are meaningful.

1           Require industry to give results back to  
2 the investigators and the investigators should find  
3 means of relating the information to the subjects  
4 that were in the study and to their institution  
5 review boards. The FDA should require that  
6 industry not use their marketing departments to  
7 dictate publication policies and details of  
8 publication.

9           In summary, the FDA needs to set a higher  
10 standard for the science which I think Dr. Henney  
11 obviously agrees with of the drug and device  
12 approval system. Industry needs to reassess their  
13 responsibility to develop therapies that are  
14 properly tested and reported and are scientifically  
15 sound. Human subjects must be provided the dignity  
16 of knowing what they were involved in by being  
17 given outcome results. All significant studies  
18 should be reported to the scientific community and  
19 to society whether positive or negative. I thank  
20 you very much for this opportunity to present.

21           DR. FRIEDMAN: Thank you.

22           MR. BYRD: Thank you. Are there any

1 comments or questions from members in the audience?

2 MS. RUSSANO: I have a question. First,  
3 I'd like to applaud the gentleman that just--

4 MR. BYRD: Could you identify yourself,  
5 please, for the record?

6 MS. RUSSANO: Jama Russano from Children  
7 Afflicted by Toxic Substances.

8 MR. BYRD: Thank you.

9 MS. RUSSANO: I would like to applaud the  
10 gentleman that just spoke for his truthfulness and  
11 his stand on this situation because I fully agree  
12 with it. I want to ask the woman from the Red  
13 Cross about blood bags and donating blood and if  
14 the Red Cross and the FDA have taken the position  
15 on accepting blood from people with immune  
16 deficiencies or severe allergic reactions like  
17 having a silicone device and then being allergic to  
18 silicone and what they're doing about it?

19 MS. DUCCA: We have an extensive donor  
20 screening process that occurs before any donor can  
21 donate. It tends to focus in on questions as  
22 lifestyle and transmissible diseases. For the

1 specific types of toxic transmissions that you're  
2 speaking about, I'd have to go back and speak with  
3 our medical department and find out if that very  
4 specific level is in there currently, and if you'll  
5 give me your name and your phone number after our  
6 discussion I'll be sure to get that information  
7 back to you. But right now it is focused primarily  
8 on the transmitted types of diseases.

9 MS. RUSSANO: Also, do you work with  
10 consumer groups like myself and other groups, maybe  
11 MS, or diabetes, to understand that you have  
12 searched all the questions that do need to be  
13 answered?

14 MS. DUCCA: That's a very good suggestion.  
15 We do work with such--well, we participate in the  
16 meetings that are held by FDA, primarily the Blood  
17 Products Advisory Committee, and I know, for  
18 example, there's a member of the Committee for Ten  
19 Thousand that is on that committee and we  
20 participate through that particular forum as  
21 consumer groups also participate. Again, though,  
22 for your specific kind of question about your

1 particular groups, I don't remember them  
2 specifically participating in these BPAC meetings.

3 For example, I certainly see no reason why  
4 they would be particularly excluded, but again that  
5 would be something that we can certainly explore  
6 with you and I welcome the question.

7 MS. RUSSANO: Thank you.

8 DR. FRIEDMAN: Thank you for your  
9 question.

10 MR. BYRD: Thank you. Any more? I'd like  
11 to thank this panel, too. Thank you very much.

12 DR. FRIEDMAN: Thank you, all.

13 MR. BYRD: Again, your comments and  
14 responses will be recorded. Thank you. Let me  
15 introduce the participants in our third panel.  
16 Michael Doneo from the People's Medical Society;  
17 Susan Cohen, a consumer representative; and Brian  
18 Meyer, who is from the American Society of Health  
19 Systems Pharmacists. Mr. Doneo.

20 MR. DONEO: Thank you, Mr. Byrd, and thank  
21 you, members of the FDA for inviting my  
22 organization to be at this session today. It has

1 certainly been enlightening and very informative  
2 and I'd like to say that I really appreciate the  
3 comments that the other consumer members have made.  
4 Ann and Jama and I think Dr. Chodosh were really  
5 right on target.

6 My organization is a national health care  
7 consumer information and education advocacy group.  
8 And we're generally supportive of the FDA  
9 modernization act. Insomuch as it does get things  
10 that are needed to certain populations. However,  
11 we do have some reservations about the expediency  
12 of perhaps bringing some items on the market,  
13 primarily because when there are adverse incidents,  
14 there are reactions. We are the ones who pay the  
15 price in more ways than one.

16 So I don't think we want to see any more  
17 repeats of the Dalkon Shield, the Shively heart  
18 valve, the silicone breast implant--thank you,  
19 Pamela Lee Anderson--and things such as defective  
20 pace makers. The other thing that I think was  
21 raised here today and we are also concerned about  
22 it is the fact that at the present time the

1 scientific stream seems to be things that the  
2 manufacturer funds and the types of studies and the  
3 reports and we don't know if these things are  
4 published in things that the manufacturer owns and  
5 then they're presented to the FDA as being fact.

6 I had raised an issue earlier about  
7 tracking side effects. We've heard Commissioner  
8 Henney mention that while we know in these studies  
9 there are certain side effects from medications,  
10 but I think it's also important to know what  
11 happens when you put that medication or that device  
12 into the general population. Are there certain  
13 population groups that are more vulnerable, who  
14 might have other reactions? And we need a  
15 mechanism for getting that information back to the  
16 FDA because if there is something that needs to be  
17 done, they could pull it back.

18 I'm not going to address items one and two  
19 because I don't think--we are not a scientific  
20 group. We are strictly a consumer group, but I do  
21 want to address question three. And I think that  
22 something that's very important is that we need to

1 particularly uninformed about the risks associated  
2 with medication use. Drug products after they  
3 enter the marketplace leave the artificial  
4 situation of controlled clinical trials and they're  
5 placed in the hands of ordinary human beings--  
6 health professionals who strive to maintain a  
7 thorough understanding of the product and patients  
8 who may not be well informed about their role in  
9 ensuring the best use of the product.

10           Without fully comprehending the benefits  
11 and the risks associated with taking prescription  
12 medications, consumers may have unrealistic  
13 expectations of their medication therapy. There is  
14 a real need for public education in this regard and  
15 ASHP would like to assist the agency in developing  
16 a program to educate the public about what safe  
17 medication use is all about.

18           I say assist because we recognize that  
19 both, both health professionals and the agency have  
20 a shared responsibility to educate the public. And  
21 as front-line practitioners, pharmacists along with  
22 doctors and nurses are safety managers, learned

1 professionals who help patients safely manage the  
2 risks of their medication therapy.

3 ASHP has been an advocate and a leader in  
4 the safe use of drug products. In the first  
5 precept of our leadership agenda declares the top  
6 professional objectives is to foster fail safe  
7 medication use in health systems. And among the  
8 key assumptions that we have made is the belief  
9 that patient risk associated with medication use  
10 will increase as drugs become, drug therapy and  
11 drugs become more complex. And the recognition  
12 that safe medication use is a growing public  
13 concern, as reflected by news reports and the  
14 scientific and professional literature.

15 ASHP has a number of practice guidelines  
16 that our members use. I'm just going to highlight  
17 a few. One is a minimum standard for pharmacies in  
18 hospitals and it states that patient education  
19 coordinated with medical nursing and other clinical  
20 staff should ensure that all patients are given  
21 adequate information about the medications that  
22 they receive.

1           We also have a guideline on adverse drug  
2 reaction monitoring and reporting. And it suggests  
3 that health systems develop a comprehensive adverse  
4 drug reaction and monitoring and reporting program  
5 that includes patient involvement. And finally, we  
6 have a guideline on pharmacist conducted patient  
7 education and counseling, and it states that the  
8 pharmacies profession has the responsibility to  
9 provide patients with information to improve  
10 patience adherence and reduce medication related  
11 problems.

12           And that has a goal to partner with  
13 patients in managing their own care, which is the  
14 very essence of patient practitioner collaboration  
15 and safety management. And that is to ensure the  
16 therapeutic effectiveness of their medication use.

17           And a final guideline that we have deals  
18 with the medication errors and preventing them in  
19 hospitals. And it contains a section entitled  
20 "Recommendations for Patients and Personal Care  
21 Givers," and states that health care providers  
22 should encourage patients to take an active role in

1 their drug use by questioning and learning about  
2 their treatment regimens.

3           Earlier this year in January, our  
4 organization and our research and education  
5 foundation brought together a group of  
6 interdisciplinary experts to discuss medication  
7 misadventures with the goal of developing a set of  
8 ideas for generating concrete action plans to  
9 foster this fail safe medication use in health  
10 systems. Among the major ideas identified by this  
11 group was one that would use patients and consumers  
12 as allies. Patients have the greatest interest in  
13 understanding drug safety.

14           They also have a high level of trust in  
15 pharmacists. Consumer representation should be  
16 designed into projects formulating public  
17 communications such as public service announcements  
18 about the benefits and risks of medication therapy.  
19 Our members also have an ongoing commitment to  
20 safety management in their day to day practice.  
21 Every interaction with a patient is an opportunity  
22 for the pharmacist to educate the public about drug

1 safety. We encourage FDA to take advantage of the  
2 pharmacist role in reducing medication roles but  
3 also recognize that FDA has some responsibility to  
4 educate the public.

5 ASHP stands ready to assist FDA and other  
6 organizations and research projects designed about  
7 safe medication use. One area that needs research  
8 is the incidence and causes of medication errors in  
9 the outpatient and ambulatory setting, and home  
10 care setting. The error free prevention value of  
11 collaborative drug therapy management, arrangements  
12 in which pharmacists, prescribers, nurses,  
13 patients, and others work closely to ensure the  
14 best therapy and safety also needs further study.

15 And ASHP is eager to begin a partnership  
16 between FDA, pharmacy, nursing, medicine and  
17 patients to conduct such research. In March of  
18 this year, at a policy forum on drug safety  
19 sponsored by the American Enterprise Institute,  
20 CDER Director, Dr. Janet Woodcock, stated that risk  
21 management of drugs once they're approved is not  
22 under FDA authority. But that the agency has a

1 role in preventing medication errors through its  
2 regulatory requirements for product packaging,  
3 labeling, and distribution. ASHP believes that  
4 under packaging and labeling the FDA has an  
5 obligation to quickly review and revise its  
6 procedures to eliminate medication errors that  
7 occur due to sound alike names, similarities in  
8 packaging, and other labeling and packaging  
9 problems.

10 As noted earlier, patients should be  
11 considered the allies of health care professionals  
12 in eliminating medication errors and should be  
13 involved in providing input into the safety design  
14 of drug product labeling. ASHP would also add  
15 advertising to Dr. Woodcock's list of aspects of  
16 FDA's role in drug safety. Specifically, we think  
17 FDA should be reviewing the concept of direct to  
18 consumer advertising much more critically.

19 Direct to consumer advertising may induce  
20 patient demand for a product that is not in the  
21 patient's best interest. We suggest that FDA  
22 thoroughly research the risks and benefits of

1 direct to consumer advertising and its contribution  
2 to increased reports of adverse drug events. We  
3 appreciate FDA's hesitancy in getting involved in  
4 the safety management of drug products on the  
5 patient level. Health system pharmacists, however,  
6 expect the problem of medication misadventures to  
7 get worse as products and more potent products  
8 enter the marketplace, and as these products are  
9 prescribed for more patients.

10 But this hesitancy must not lead to a  
11 renunciation of responsibility. We believe that  
12 the issue of safe medication use provides us all,  
13 health care professionals and the agency, with an  
14 opportunity to work together to provide better  
15 patient care. Thank you.

16 DR. FRIEDMAN: Thank you.

17 MR. BYRD: Thank you. Are there any  
18 comments or questions? Please.

19 MS. HAIRE: My name is Doris Haire, and  
20 I'm president of the American Foundation for  
21 Maternal and Child Health. I have been chair of  
22 the National Women's Health Network and several

1 other organizations of national prominence. First  
2 of all, I'm very pleased that this meeting has been  
3 held and I must say I agree with all of the  
4 statements that the consumers have made at this  
5 meeting. One of the things I think is so terribly  
6 important for people to know, and it is such a  
7 simple statement, that most people do not know that  
8 only--let's see--I'll have to do this again--that  
9 only those doses approved for specific conditions  
10 mentioned in the indication section of a drug's  
11 package insert are FDA approved uses of the drug.

12 I learned that from Dick Krout many years  
13 ago. I have never heard it repeated in any FDA  
14 publication and it is such a simple thing for  
15 people to understand. So I would like to see the  
16 FDA make that a prominent message in the future.

17 I'm also concerned that when Dr. Henney  
18 was speaking today and talking about what needed to  
19 be done at the FDA there was not a single mention of  
20 the fact that the FDA has no written guidelines to  
21 evaluate the safety of drugs given to pregnant  
22 women. All drugs given to pregnant women cross the

1 placental and enter the baby's brain, and the FDA  
2 is still using a 25 year--it's over 25 years old  
3 guidelines. It's not really a guideline. It was  
4 passe when it was produced and it's even more so  
5 today.

6           So I would like to see that the FDA take  
7 upon itself to immediately initiate a program to  
8 evaluate the safety of drugs given to pregnant  
9 women. We've seen drugs can alter dendritic  
10 arborization and cause life long problems for the  
11 child. Thank you.

12           MR. BYRD: Thank you very much. Are there  
13 other comments or questions?

14           MS. FLYNN: I'm Rosemary Flynn from the  
15 Gray Panthers and I have some comments. By the  
16 way, I appreciate the comments of the panel and  
17 some of the other panelists, believe me. But I  
18 want to comment on the fact, and I don't think I'm  
19 mistaken, that no physicians group has been  
20 represented on the panels and I think--I don't  
21 think it's an omission in that FDA wouldn't want  
22 them so I don't really know why they're not. But I

1 think it's very important to consider the  
2 interaction of the pharmaceutical salesman and the  
3 physicians after the use of medications, after the  
4 introduction of those medications, and just how  
5 much information the pharmaceutical company, the  
6 salesman gives to that physician, and it couldn't  
7 be dealt with because there is no one here to speak  
8 to it that I know of. That's all.

9 MR. BYRD: Thank you. Please.

10 MS. COHEN: Can I make a comment and ask a  
11 question? I was in a physician's office and a  
12 detail person came in from a pharmaceutical company  
13 and I kind of grabbed here and I said do you have  
14 any concerns about the job you do? She said to  
15 tell the truth, my concerns are that when there's a  
16 new medication, we really don't know how  
17 efficacious it is or what the side effects are or  
18 the risks are, and I get a little concerned when  
19 I'm so to speak bringing these free samples in and  
20 we have say a year's time and we really don't know  
21 what's going to happen.

22 I just had a quick question. Is there any

1 they want to have that flexibility there.

2 MS. COHEN: Thank you very much.

3 MR. BYRD: Thank you.

4 MS. RUSSANO: I'm Jama Russano from CATS,  
5 Children Afflicted by Toxic Substances, and I'm  
6 very happy to hear that the pharmaceutical--or, not  
7 the pharmaceutical, that pharmacists would like to  
8 take a more active role, and I'd certainly like to  
9 be a part of that, but one of the areas that we  
10 really seem to focus today was the drug aspect of  
11 all of this, where we really haven't focused much  
12 on health and beauty aids, cosmetics, which are a  
13 part of the pharmacist's role and people do inquire  
14 about that and I think that it's important coming  
15 from a cosmetic background that maybe your group  
16 might be willing to participate with the FDA with  
17 the cosmetic companies along with health and beauty  
18 aid companies.

19 Because many people do have adverse  
20 reactions to cosmetics, shampoos and various things  
21 on the market. That's just one suggestion. The  
22 other thing is again in pertaining to children and

1 what is happening, I think that the FDA needs to  
2 really focus on the amount of chemicals that these  
3 young children are absorbing in their bodies from  
4 this processed food.

5           You know there was an article in the  
6 Houston Chronicle this Monday about the amount of  
7 chemicals that our children are exposed to and how  
8 it changes their immune system and changes their  
9 mental chemistry, making them more violent, making  
10 them more aggressive, and that issue after we've  
11 seen what has happened cannot be ignored.

12           And I went to my inlaws 60th anniversary  
13 this weekend and a 100th birthday last week, and  
14 they never been to MacDonal'd's once or a fast food  
15 restaurant. I think that has a lot to say about  
16 something. But it is important and even though  
17 drugs and devices are top of the list here, I  
18 agree. We still need to look at that and there  
19 needs to be more consumer groups working with the  
20 FDA on these issues.

21           MR. BYRD: Thank you.

22           MR. DONEO: One other point I'd like to

1 make very quickly and I think it was the fact that  
2 consumers need more information and my group  
3 recognized this. About 12 years ago, we put  
4 together a publication entitled "How to Choose a  
5 Pharmacist" because we recognized early on that  
6 when you look at the health care delivery team,  
7 it's not just the physician health practitioner,  
8 but it's also the patient and the pharmacist very  
9 often because you're getting a prescription, and we  
10 have given a lot of suggestions on questions to ask  
11 about the different medications that are being  
12 prescribed, not just the medication itself, but  
13 also any side effects, any interactions with other  
14 medications you may be taking, whether they are  
15 prescription, OTCs, vitamins and minerals, because  
16 this is all information that you can convey to your  
17 practitioner as well as the pharmacist to help give  
18 you some guidance.

19 Another thing, I was glad to hear you  
20 mention is the fact of tracking and reducing  
21 hospital errors. We did a seminal publication  
22 several years back entitled "Medicine on Trial"

1 where we examined what was written in professional  
2 publications about medication errors, about  
3 surgical procedures gone awry and what have you.  
4 We work with a pharmacist in our area who heads up  
5 an institute known as the Institute for Safe  
6 Medication Practices and he and his partner are  
7 both hospital pharmacists that have done great  
8 strides in trying to reduce. You probably know  
9 Michael Cohen who was excellent.

10 He will work with hospital pharmacies to  
11 try to reduce areas where accidents and mistakes  
12 can occur and he also works with manufacturers in  
13 trying to change the labeling and packaging so that  
14 when something is prescribed it's pulled from the  
15 shelf, that you're not going to get a drug that is  
16 only injectable or should be mixed accidentally  
17 given to someone. But they came up with a formula  
18 that in an average size hospital, you could have up  
19 to 300 medication errors per day, which is what we  
20 told consumers early on. When that pill comes in,  
21 ask who ordered it, what are the hours, what's the  
22 shape, what's the size, the color, whatever you

1 need to do, make sure you know you're getting the  
2 right medication. So we have to work together on  
3 this. I don't think it's just any one. It's a  
4 team effort.

5 MR. BYRD: Thank you very much.

6 MR. MEYER: I guess maybe slightly to  
7 respond if I may and maybe to conclude and it is  
8 striking a balance between both the patients and  
9 the health care practitioners and regulatory  
10 agencies to get a good understanding of risk and  
11 benefit to achieve the best outcome here.

12 MR. BYRD: Thank you. I'd like to thank  
13 this panel. I really appreciate your very  
14 thoughtful comments. I'd like to thank all of the  
15 panelists again. We appreciate all the comments.  
16 They were all recorded. A lot of the comments  
17 suggested the need for the agency to do a number of  
18 new things and to do a number of things better.  
19 And it also recognized the agency's need for  
20 additional resources. We particularly appreciate  
21 those who recognize that need. We hope that people  
22 in the audience and others who are part of our

1 panel will continue to support the agency and  
2 particularly the agency's budget request.

3 I would be remiss if I didn't make that  
4 comment. We also, before we conclude, Ms. Sharon  
5 Holston, who is the Deputy Commissioner for  
6 International and Constituent Relations, will  
7 provide closing comments and a wrap-up for today's  
8 stakeholders meeting.

9 MS. SMITH HOLSTON: I should say I was  
10 going to provide closing comments until Mr. Byrd  
11 just provided closing comments and a wrap up. So  
12 this isn't going to take me long at all. I think,  
13 first of all, I also would like to express the  
14 appreciation of the agency for those who have come  
15 to be with us this afternoon and who have been  
16 supporters of FDA for a long time and many of you  
17 are individuals with whom I've had the pleasure of  
18 working many times in the past, and I appreciate  
19 the fact that you continue to come out and support  
20 us and to give us the benefit of your opinion.

21 One of the things we heard today is that I  
22 think our stakeholders really do want FDA to make

1 decisions based upon the best available science,  
2 but they also want us when we have information  
3 available to us, to find better ways of  
4 communicating that information to those  
5 individuals, organizations that are affected by it.  
6 I heard that from consumers. I heard that from the  
7 industry. Everyone wants to have as much  
8 information at their disposal as possible and  
9 they're looking to FDA to figure out mechanisms for  
10 sharing that information.

11 I think there are concerns. I heard  
12 concerns expressed about the fact that we are  
13 approving drugs at a fairly rapid pace, and  
14 although I think most people out there who need the  
15 drugs, want them available to them as soon as  
16 possible, there's still concerns about the agency's  
17 ability to do adequate post-market surveillance of  
18 drugs, particularly with the limitations that we  
19 have on our resources.

20 There is concern that we do more education  
21 about the benefits and risks of drugs. That  
22 consumers need to understand that there are

1 tradeoffs and that some of the decision making  
2 about whether to use a drug or not to use a drug,  
3 for instance, is dependent upon a consumer making  
4 informed choices about their own benefit-risk  
5 equation and we need to help by providing them with  
6 sufficient information to make that decision.

7 I think everyone is interested and  
8 supportive of two-way communication process,  
9 between FDA and a particular stakeholder group as  
10 well as between FDA and among stakeholders.  
11 There's an interest in having stakeholders work  
12 together with FDA, and finally just to repeat again  
13 what Mr. Byrd has said, there is some recognition  
14 of the fact that FDA has limited resources and that  
15 there are many organizations and individuals who  
16 want to help us become adequately resourced to do  
17 the tremendous job that we have to do.

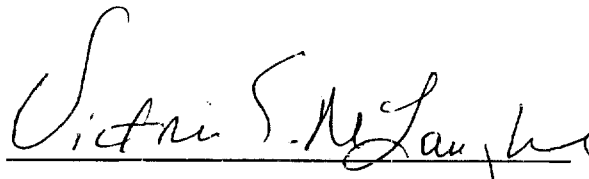

18 Again, we want to thank you for spending  
19 the time with us this afternoon. We will be having  
20 stakeholder meetings again in the future, not only  
21 because of FDAMA, which mandates that we do this  
22 kind of activity, but because for those of you who

1 know the agency, you know for many, many years, it  
2 has been a part of the way we do business that we  
3 do reach out to consumers and to other groups to  
4 try to get their input into the agency. So we look  
5 forward to our next opportunity to hear from you  
6 and thank you again for being with us.

7 [Whereupon, at 5:04 p.m., the meeting was  
8 adjourned.]

**C E R T I F I C A T E**

I, **VICTORIA S. McLAUGHLIN**, the Official Court Reporter for Miller Reporting Company, Inc., hereby certify that I recorded the foregoing proceedings; that the proceedings have been reduced to typewriting by me, or under my direction and that the foregoing transcript is a correct and accurate record of the proceedings to the best of my knowledge, ability and belief.
