

FOOD AND DRUG ADMINISTRATION

COMMISSIONER'S VIDEO TELECONFERENCE 11 P253

CHICAGO DISTRICT

Chicago, Illinois

Wednesday,  
April 28, 1999

2:30 p.m.

ON BEHALF OF THE AGENCY:

RAYMOND MLECKO  
District Director  
Chicago District

VIRGINIA CONNELLY  
Executive Officer

JOSEPH LEVITT  
Director  
Center for Food Safety & Applied Nutrition

DAVID ARMSTRONG  
Associate Director for Research  
Moffett Center

P R O C E E D I N G S

1  
2 MS. CONNELLY: I just want to thank everybody for  
3 returning for the continuation of our program today. We're  
4 going to begin the panel discussion portion of today's  
5 event.

6 We have three distinguished FDA panelists: Mr.  
7 Joseph Levitt, the director of the Center for Food Safety  
8 and Applied Nutrition; Mr. Ray Mlecko, the District Director  
9 of Chicago and Detroit District; and Dr. David Armstrong,  
10 the Associate Director for Research at the Moffett Center,  
11 which we heard about this morning from Dr. Henney -- or  
12 earlier this afternoon.

13 Mr. Levitt will be monitoring the remainder of  
14 the discussion after he makes a presentation, but let me  
15 just remind everybody to use the forms that have been  
16 provided for questions and comments, and if you'd like to  
17 make a presentation or ask your question orally, there are  
18 microphones set up in the middle aisle.

19 Joe?

20 MR. LEVITT: Thank you very much. It's a  
21 pleasure for me to be here today, but most importantly, it's  
22 a pleasure for me to see so many of you here today. Let me  
23 begin by thanking the local district staff, who organized  
24 the local end of this conference, and for getting the word

1 to all of you to come.

2 I have seen and talked to a number of people in  
3 the audience, especially our state and local counterparts  
4 and consumer industry representatives in the audience.

5 Also, David Armstrong will have a few words after  
6 me, and I'm just trying to figure out what they had to trade  
7 over at the Moffett Center to get that paid political  
8 announcement from Dr. Henney. But having visited it myself,  
9 I can assure you that it was well -- it has been one of  
10 FDA's best-kept secrets, and I think it's good that we are  
11 unveiling it, because it really is at the heart of a lot of  
12 our food-safety efforts that we're trying to accomplish.

13 I have a fair amount of information that I'm  
14 going to try to run through. A little bit I'm almost going  
15 to rush through as a way -- we can come back during  
16 questions and answers.

17 For those of you who do not know me, I'm the  
18 director of CFSAN, the Center for Food Safety and Applied  
19 Nutrition at the FDA and headquartered in Washington. I  
20 have been at the FDA for 20 years, and I've worked in almost  
21 every part of the FDA. I became director of this center  
22 about a year ago.

23 A lot of what I'm going to try to do, then, is to  
24 give you a little bit of a sense of, number one, who we have

1 put together as our senior team within the center, running  
2 the National Foods Program; number two, having been in the  
3 job a little more than a year, give you a little bit of a  
4 report card.

5 What was I saying last spring that was going to  
6 be done? How are we doing on it a year later? Note some  
7 specific accomplishments, and then talk a little about the  
8 budget. There's a lot of interest; you've heard some of  
9 that. A lot of what you're going to hear reinforces and  
10 gives you a view of the foods version of what Dr. Henney was  
11 saying.

12 Let me begin with the CFSAN management team. We  
13 have put together a group of, in addition to myself, five or  
14 six people that have a variety of backgrounds and  
15 experience:

16 Janice Oliver, who was the food spokesperson in  
17 the FDA studio audience that you saw before, has been at FDA  
18 for 30 years. Most of her background is in the field, and  
19 she's been at the center for the last ten years, and really  
20 was the person at FDA most directly responsible for getting  
21 the food-safety initiative off and going and off the ground.

22 Number two is Bob Lake, who has actually spent  
23 this entire year in the Center for Food Safety and Applied  
24 Nutrition; is known to especially to those that have worked

1 on the Hill; it's involved a lot of legislation activities.

2 We have just recruited -- I was very pleased when  
3 he was brought up to FDA -- Dr. Morrie Potter, who has 25  
4 years' experience in foodborne illness down at CDC. He is  
5 known to many in Washington, because he's been in many ways  
6 the Washington connection, but he really brings a strong  
7 public-health perspective to the issue, which I think is  
8 absolutely critical.

9 Number four, we have Bob Buchanan, who is my  
10 senior science advisor. I'm a lawyer; people don't know  
11 that. We are a science-based agency. I pledged when I was  
12 put into the position that I would surround myself with  
13 strong scientists. Morrie Potter and Bob Buchanan are but  
14 two examples of that.

15 Dr. Buchanan came from the USDA Agricultural  
16 Research Service up in Philadelphia and has a wealth of  
17 background and knowledge in a variety of programs.

18 And finally, our executive officer, Juanita  
19 Wills, who I'll just say, by coincidence, comes from the  
20 EPA.

21 And so just within this group, what I've tried to  
22 put together is people that, number one, are experienced.  
23 I'm the junior member of the team, with 20 years federal  
24 experience. Number two, they have a variety of experience:

1 We have the FDA field, FDA headquarters, other parts of FDA;  
2 CDC, USDA.

3 We have new problems. Dr. Henney talked about  
4 the changes that are happening in the food supply. We have  
5 new problems; we need new solutions, and therefore we need a  
6 variety of perspectives on the subject.

7 And finally, we have a commitment of people who  
8 want to work together, not only with each other, but with  
9 the other counterparts around the other agencies. And so by  
10 having people go back and forth between different  
11 agencies -- people have gone from FDA to USDA, also -- we  
12 actually now have a person stationed at CDC; CDC has a  
13 person stationed at the FDA -- we are recognizing more and  
14 more that it's critical that we think of ourselves as a  
15 single food establishment, because from the consumer's point  
16 of view, the consumer, I'm sure, doesn't look at their plate  
17 and say, Oh, I'm eating an FDA-regulated product; ooh, I'm  
18 eating a USDA-regulated product; I'm consuming something  
19 that the states are responsible for.

20 The consumer doesn't care. The consumer wants  
21 safe food, period, and it's our responsibility as federal  
22 and state food-safety officials to look at our missions more  
23 broadly, to look at blurring the lines but strengthening the  
24 connections, and I'm starting that internally here at the

1 FDA.

2 Now, report card from last spring: I gave a  
3 variety of speeches to a lot of groups last spring, and I  
4 stressed, number one, values that I bring -- I'll talk about  
5 that -- number two, food safety as our top priority; number  
6 three, the need to set priorities in the other areas of the  
7 foods programs, and, four, and probably most importantly,  
8 the need to show clear accomplishments. We need to show  
9 we're here and we're doing something for the benefit of  
10 consumers. So let's see at least how we're doing.

11 Number one, values: One of the first things I  
12 did -- I'm new to a lot of you; when I came to CFSAN, I was  
13 new to a lot of people there, too, and so one of the first  
14 things we did was say what are the values that we bring to  
15 the table; what is the foundation that is underpinning what  
16 we want to do?

17 We put together this rather simple slide that  
18 talks about public health and safety as I talk: priority;  
19 respect for our stakeholders, for ourselves, for the law;  
20 integrity, objectivity; dedication, and dedication to  
21 excellence. You put that down the side and you see the  
22 letters PRIDE; that's not a coincidence, obviously, and we  
23 have signs and posters throughout our center talking about  
24 CFSAN PRIDE and really trying to reinforce that we want a

1 system that has high standards, that is responsive to  
2 stakeholder needs but, above all, has a dedication to  
3 excellence and to safe food.

4 Number two, talked about the food-safety  
5 initiative, and one of my favorite slides was, knowing it's  
6 a presidential initiative, I knew my priorities: food  
7 safety, food safety, and food safety. And that really is  
8 what I at least began and still spend most of my time on.

9 The vision is clear: We have to reduce the  
10 incidence of foodborne illness. The numbers -- and these  
11 numbers are challenged, and we recognize they are soft, but  
12 the numbers that are out there of 9,000 deaths, 6 to 33  
13 million illness, those are too many. It doesn't matter if  
14 it's off by 50 percent one way or another; it is too many.

15 And if there's one thing I could change and will  
16 try to change at the FDA, it's not so much the focus on just  
17 the product but the focus on the impact on the consumer.  
18 We've got to reduce the incidence of illnesses. That is  
19 when we'll really know if we're doing the job properly. We  
20 have systems in place to help measure and gauge that, but we  
21 really want to change vision to foodborne illness and away  
22 from just looking at the product for product's sake.

23 Now, how are we doing in the first year? Number  
24 one, we have what I call laid -- we spent a long time laying

1 a strong foundation for the program. There are six major  
2 building blocks of the food-safety program.

3 Number one is surveillance. Through CDC we have  
4 put in place the new FoodNet system and the new PulseNet  
5 system that are now in place. They need to be expanded and  
6 enhanced, but a major advance is to get those systems in  
7 place.

8 Number two, we have a clear research agenda  
9 within FDA. We have a three-year research plan; we also  
10 have a cross-government research plan for produce and other  
11 activities.

12 Number three, risk assessment: We really have to  
13 take a stronger look at risk assessment, be sure that we are  
14 addressing things that have the highest risk. We have a  
15 consortium of agencies to establish a risk-assessment  
16 consortium, and we are establishing a clearinghouse to  
17 collect information on risk assessment and exchange it  
18 through our collaboration with the University of Maryland.

19 We have, number four, education: the public-  
20 private partnership. I see in the back the back puppet, the  
21 Fight Back campaign; Janice Oliver referenced that also. It  
22 is a critical part of what we're trying to accomplish, as  
23 well as education for retail and food-service  
24 establishments.

1 Fifth part of the building block is outbreak  
2 response. We have something called Force D, which is a  
3 broad coordination unit, but more important than that is at  
4 the operational level we're working very hard and diligently  
5 to get in better systems so outbreak response will really  
6 result in early detection and containment, and we are  
7 getting there, and PulseNet is helping us out with that.

8 And the sixth building block is really the FDA  
9 outcome, which is the inspection. We have -- are  
10 implementing this year our Seafood HACCP program, during  
11 1998, as USDA did with meat and poultry, and we are seeing  
12 improvements across the board. So our year number one, we  
13 have the foundation. And the importance of that is the  
14 money that Congress provided is not designed to be a one-  
15 year fix.

16 It was designed to really change the landscape  
17 and the direction of how we're approaching these issues.  
18 And so I see that first year foundation as an investment in  
19 the future, not just what happened that year. But we do  
20 have things that happened that year, as we did inspect every  
21 seafood plant for HACCP in the calendar year as we promised  
22 that we would.

23 The good news is that a full 1,200-plus firms got  
24 it fully right the first time. For an industry that was

1 largely unregulated in the past, that is an important step  
2 forward. The bad news is we still have a long way to go.  
3 We are providing educational letters with our untitled  
4 letters to industry. We are following up with warning  
5 letters of enforcement where that is needed.

6 We also are putting what I call a booster shot of  
7 education. So -- but Seafood HACCP round one is finished;  
8 round two is just as important, if not more. Good  
9 agricultural practices: You have in your package in front  
10 of you a green book. This is a very significant effort in  
11 the first year.

12 If you think back to the earlier telecast,  
13 somebody asked the question, Are you going to get the  
14 industry involved early on? And this is a perfect example  
15 of that, because there was a decree shortly before I took  
16 over first of the fiscal year that we would do these good  
17 agricultural practices.

18 So the FDA quickly ran around, put together a  
19 working draft. The people who did it were very pleased with  
20 it, put it out, and had grass-roots meetings. I have to  
21 tell you, we got creamed.

22 We were harshly criticized for not really being  
23 in touch with agricultural practices. And we then took  
24 that, rounded more people -- got in more people from the

1 agricultural community, more from the states, more from  
2 USDA.

3 By the time we came up with our draft, the  
4 discussion had shifted from whether to do it to, Are we  
5 doing exactly right? We then went on with site visits and  
6 came out with a final guide. Within 12 months, it was  
7 endorsed by United Fresh Fruits and Vegetables. So we feel  
8 that is a good model, both in terms of speed and intensity,  
9 as well as involvement. But it is only a start.

10 So we have a die. That's nice if anybody's using  
11 it. I'll come up to that in Round 2. But at least in the  
12 first year, we did what we said we would. We had a proposal  
13 where we would extend HACCP for unpasteurized juice for  
14 juice products. And we put in place a label warning in time  
15 for the fall apple season that has been in place since last  
16 September.

17 The president of the United States himself  
18 announced that in the Fourth of July radio address, and that  
19 was really clearly one of the highlights of the year. But  
20 it's a highlight, not just because he announced it. It's a  
21 highlight because it's giving consumers the important  
22 information they need to protect themselves. You have a  
23 product that is largely not so much of a problem, but for  
24 vulnerable populations, a big problem. We have those

1 warnings in place. And I think that's important.

2 Egg safety, we've got a start on. We issued a  
3 joint notice with the USDA. We have a long way to go on egg  
4 safety. We also -- kind of a sleeper area is the  
5 antimicrobial resistance. That is really a focus of another  
6 sector. Our Center for Veterinary Medicine has the lead on  
7 that, but we have put in place again as part of the broader  
8 surveillance system, a surveillance system for resistance to  
9 antibiotics used in animals.

10 And we issued a progress report at the end of the  
11 year, which is available on our web. So at least we feel,  
12 in terms of the first year, we made a good start. But it is  
13 only a start. Where are we trying to go this year? Well,  
14 we're looking at, What do we feel the highest risk area is?  
15 Number one is imports.

16 The level of imports has skyrocketed over the  
17 last five years, and the level of FDA coverage FDA has been  
18 able to provide has lowered, and that is a bad combination.  
19 And so with the money we got from Congress last year, we are  
20 strengthening both our emphasis to borders who are also  
21 realizing we've got to have a stronger border presence.  
22 We're increasing our inspections overseas.

23 We're increasing our technical assistance to  
24 foreign governments. We're using a variety of mechanisms in

1 Latin America, in overseas further. We just this week held  
2 a national conference out of Washington on rolling out and  
3 implementing these produce guides overseas. We had over 140  
4 representatives at that meeting. And so there was a lot of  
5 input there.

6 Number two, that leads me into the roll-out of  
7 the good agricultural practices. We work closely with USDA.  
8 We're working jointly so that -- because they have the  
9 extension service here. They have the lead domestically.  
10 We get the lead internationally. We made -- sponsored the  
11 conference in Orlando two weeks ago. Domestically, we did  
12 the international conference in Washington this week. And  
13 so that is well on its way.

14 Seafood HACCP-Round 2: I alluded to this  
15 already. We are going back this year and we will be less  
16 patient. We are going to be providing more education along  
17 the way. We're also -- we're saying we're going to get  
18 serious. Warning letters have already started to go out and  
19 if we need to take enforcement, we will do that, because we  
20 need to get that entire industry up to snuff.

21 Juice HACCP: We have to go forward with a final  
22 rule on that. We have a proposed rule getting ready to come  
23 out starting to address the issue of Salmonella in eggs,  
24 focusing on retail, refrigeration and on consumer safe-

1 handling practices following on a transportation regulation  
2 that USDA issued last year.

3           And we have a broad number of issues under the  
4 umbrella of the President's Council for Food Safety  
5 involving, as the Commissioner said, in moderate term  
6 strategic plan and coordinated budget, a better -- and even  
7 better coordinated research across the government. So I  
8 think in food safety, we have made a good start. We have to  
9 realize this is going to be a multi-year effort and is  
10 really challenging us in very many ways.

11           I think, if you will, the good part of it is  
12 that, number one, we are recognizing -- I think more people  
13 are recognizing more and more this is a real problem. It is  
14 a real problem because of some of the things Dr. Henney  
15 mentioned. We have a change in the food supply. We have  
16 different distribution practices. We are eating at  
17 different places.

18           We're actually -- believe it or not, 50 percent  
19 of the dollars Americans spend are on food prepared outside  
20 the home. And so the retail food service is an important  
21 area. We also have an increasing vulnerable population. If  
22 you take the very young, the elderly, the immune-suppressed,  
23 pregnant women, that's almost 25 percent of the U.S.  
24 population.

1           Think about it. Twenty-five percent are at high  
2 risk. This is not a small amount. It is a very high amount  
3 and makes the issue more compelling. The fact that the  
4 issue is more compelling -- is so compelling is making us  
5 break down a lot of barriers that did exist in the past.  
6 And so people like me at the FDA are now talking about  
7 reducing foodborne illness, not just about: Are we getting  
8 good regulations on the product?

9           We have a recent MOU that we've signed with the  
10 Food Safety and Inspection Service at USDA in plants of  
11 joint jurisdiction. We have closely worked with CDC. Can  
12 we do better? Yes. Can we do more with the states? Yes,  
13 also. But the issue is sufficiently compelling. We're  
14 seeing that. And the good news is that people are rising to  
15 the occasion of what is needed.

16           But we move on. Priority setting: I've already  
17 told you the top three priorities. We also have a  
18 responsibility over a lot of other aspects of the food  
19 supply and the food regulation. And so what I said last  
20 year was, Okay. After we take care -- we at least get  
21 going on food safety. We even looked across the foods  
22 program and asked the simple basic questions.

23           We can't do everything that Dr. Henney said.  
24 Where we do most good to consumers, that's where I'm going

1 to direct that our time be devoted. We have established as  
2 always having an open and participatory priority-setting  
3 process for the year we're in now and to develop a blueprint  
4 for our foods program. Again, it's what I said last spring.

5 We held a stakeholder meeting. This was the  
6 birth of the FDA stakeholder meeting that the Commissioner  
7 mentioned in June. We had -- you see a number of oral  
8 written presentations. It was at that meeting that I first  
9 showed this chart. And I'll dwell -- pause on this for a  
10 moment. So I've worked for FDA for 20 years. I took a job  
11 as director of CFSAN.

12 I consider myself knowledgeable enough that I  
13 knew something what I was getting into. But I was  
14 surprised -- genuinely surprised when I saw this chart. The  
15 Center for Food Safety, if you go back 20 years, which isn't  
16 just the day I started and it isn't just 20 years as a round  
17 number -- it also, in fairness, is the peak of the foods  
18 program.

19 This is the year that the Food Center had the  
20 most people. It was just under 1,000 -- 995. Now, what you  
21 see clearly is ten years of constant reductions. That is  
22 common among a lot of agencies across government. You see  
23 now early '90s start to get better. Almost all of that  
24 getting better was in the seafood area. There was a lot of

1 visibility on seafood.

2 We had some small increases for imports, as well  
3 as some small increase for our nutrition labeling, somewhat  
4 after the fact, and some very recent at FSI that doesn't  
5 really show up here because it was the first year. But you  
6 see even with those increases, we still are 200 people below  
7 where we were 20 years ago.

8 Now, another way to look at it if you worked in  
9 the Center, if you take away those added targeted  
10 resources -- that they were mostly for seafood, but also  
11 some for imports and nutrition labeling and the first little  
12 wave of food safety -- we're down a full 33 percent. And  
13 most of the people -- or at least a lot of people that work  
14 in CFSAN -- number one, they've been there 20 years, because  
15 the last big hiring binge in foods in FDA was the 1970s,  
16 following the Bon Vivant incident -- those with good  
17 memories.

18 Number one, they've been there. They look  
19 around. They know how many were in their branch. But I  
20 went around around from office to office. One person, when  
21 it got to her turn, she filled out a sign -- held up a sign  
22 that said, Small but mighty, proud but poor; my division  
23 could sure use a lot more. And I actually took that. I  
24 framed it.

1           Dr. Henney took it recently across to show the  
2 secretary, because it reflects, unfortunately, a lot of what  
3 is going on across FDA. As Linda Suydam said on the tape  
4 before, there are a number of programs in FDA that are  
5 getting very well funded: the prescription drug user fee  
6 program, the mammography program. Now we're starting to get  
7 there with the food safety program.

8           But when you look at all the other programs,  
9 they're the ones that are really getting squeezed, and this  
10 shows it very graphically. At the same time, of course,  
11 Congress passed all these laws adding new responsibilities.  
12 I'm the new center director; I look at these charts, and I  
13 say, Wow. We have got to set priorities.

14           And so we did. We then tried an internal  
15 process. Each program presented what they thought  
16 priorities should be. We did cross-cutting priorities. We  
17 shipped aside traditional comprehensive plans. The  
18 Commissioner joined us as we were finishing up that. We  
19 took her priorities, which overlapped strongly with foods,  
20 and we wrapped those in, and we came out in January with  
21 this CFSAN priorities document.

22           Internally, we call this the bible, because this  
23 is not just our work plan; this is what we are doing this  
24 year and what we are committed to finishing. What you find

1 from looking at it is, number one, food safety covers about  
2 50 percent of our priorities.

3 It's also now about 50 percent of the Center's  
4 resources are devoted to food safety initiative work, which  
5 is a translation for anything related to microbiological  
6 contamination falls under that general umbrella.

7 And so I will not go through those since you have  
8 it all in front of you, but we have specific objectives that  
9 we will accomplish in imports and HACCP and produce and  
10 additional prevention efforts, in surveillance and outbreak  
11 response research, risk assessment, and education, to  
12 continue a growing emphasis in this area.

13 Number two, you'll find we identify five other  
14 program areas that need emphasis: premarket review of food  
15 ingredients, nutrition, health claims and labeling, dietary  
16 supplements -- and one of the speakers is going to be  
17 addressing that after me, an area of growing interest --  
18 chemical and other contaminants.

19 I'll tell you, if you looked at this same slide  
20 from a previous director a decade ago, you would see it  
21 reversed. You would see chemical contaminants way up there  
22 high and microbiological problems much lower in priority.  
23 We've seen a real reversal in that. That's good for the  
24 microbiological problems. At some point, we're going to

1 have to start readdressing a number of the chemical issues,  
2 as well, and finally cosmetics. We also have cross-cutting  
3 areas and shrinking of the science base; increasing federal,  
4 state, local collaboration; establishing what I'd call an  
5 affirmative international agenda. There are lots of  
6 international meetings codexed in other areas.

7 I want to be sure that not only are we  
8 prioritizing where and how we go, but we go with a mission  
9 to accomplish something positive for American consumers. I  
10 think Linda Suydam said, We see harmonization as an  
11 opportunity to be world leaders. And we want to be there.

12 But to do that, we have to think about it. We  
13 can't just get an agenda to a meeting, go there and come up  
14 with a position, you know, immediately prior to that. And  
15 we have to spend more attention internally to the resources.  
16 You have all the specifics on here. Again, I ask you to  
17 take it and look at it. You will find simple one-line  
18 listings of each item to just very clearly say, This is what  
19 we're going to try to do.

20 We also have what I call the A list and the B  
21 list. The A list means we will do it. It doesn't mean  
22 we're going to try to do it. We're going to do it. And  
23 there are 79 of those. I am well known for telling my story  
24 about the pebbles and the boulder. And what it basically

1 means is I've always thought that FDA makes the mistake of  
2 spreading ourselves too thin.

3           And I think it likes taking 100 pebbles, pushing  
4 them up a mountainside one mile an hour. After 50 years,  
5 what have you got? A mountainside of rubble. And I would  
6 rather identify a fewer number of boulders, get them up and  
7 over the hill; show the consumer we are something -- you  
8 know, the taxpayer has gotten something. There was  
9 something to show for ourselves and some real  
10 accomplishments.

11           Even though we've whittled this list down and  
12 down and down and down and down, we still came up with 79  
13 boulders. And people are challenging me on whether my  
14 pebble/boulder theory works. And I said, Well, we started  
15 with a thousand, so I think we're in the right direction.  
16 It is a management challenge, but it's something I'm gladly  
17 taking on, because I believe if we focus on specific things,  
18 we can do them and we will.

19           The B list means not the opposite, but a  
20 separate -- these are things we know they're important. We  
21 want to make progress on them. I would love to see them all  
22 on the A list. But with them all, they will neutralize each  
23 other and not get done. So these are the ones we will make  
24 progress on as we can.

1           We are monitoring very clearly all the boulders,  
2           and I promise to have four-month reviews and modifications  
3           as new things happen during the year. And the first one is  
4           coming up at the end of this month.

5           Accomplishments: I noted earlier I don't believe  
6           that in jobs such as ours it's enough to have nice plans.  
7           It's important to have nice plans, but they really don't  
8           mean a lot unless you have real accomplishments that we're  
9           doing. I am going to run through these ever so quickly.  
10          The copies of these slides are on our website, so you can  
11          access them and go back and look at them.

12          But just to note: In addition to food safety  
13          that I mentioned, in food additives, we approved last year  
14          two new artificial sweeteners, did a postmark review of  
15          Olestra, approved a new food additive, chlorine dioxide.  
16          And because of that that was one of the stimulants to focus  
17          on creating expedited review for food-safety related  
18          petitions.

19          And so we have a new program now that says if you  
20          in the industry have a new chemical, have a new process  
21          that's going to make the food safer, that's going to kill  
22          pathogens, we are not going to put that on the routine  
23          track; we're going to move that to the front of the line.  
24          We want to create an incentive for companies to invest in

1 these products. We don't want FDA to be the logjam for  
2 that. And that has been put in place now.

3 In the area of health claims and food labeling,  
4 you can read them up there. We are having a public meeting  
5 in May 11 to look at the issue of authoritative statements.  
6 It is a somewhat controversial area. You'll see amongst up  
7 here psyllium we said yes to; soy protein, we said yes to.  
8 The first nine notifications, we said no to.

9 And our pledge is to work on the basis of science  
10 and openness. But we also want to be sure we have a process  
11 that people understand and is consistent with the law. And  
12 so we're having a meeting to try and address that.

13 Dietary supplements: We issued a structure  
14 function proposed rule last year -- very controversial -- a  
15 lot of comments and questions about that.

16 We issued a proposed rule extending to dietary  
17 supplements, the same provisions of FDAMA that apply to  
18 conventional foods on authoritative statements. And we have  
19 coming in place -- and this was referenced earlier very  
20 quickly. Just like the food nutrition panel, we have now  
21 the same kind of panel focus on supplements that became  
22 effective this past month for dietary supplements.

23 It's called supplement facts. It gives very  
24 clear information on what's in there: vitamins, minerals,

1 amino acids, herbs. Within herbs, it tells you if it's from  
2 the root, if it's from the leaf, if it's from the stem. If  
3 there's a daily reference value, it gives you the percent.  
4 It's in the same format you're used to seeing on the food  
5 label. It's just that it's focus is what I call the bottom  
6 half of the label instead of the top half of the label.

7 In foods, I think most people look at fat,  
8 saturated fat, sodium, cholesterol, fiber and so forth.  
9 This is focusing in dietary supplements more on the vitamin,  
10 mineral, amino acid, botanical section. But that is coming  
11 out. That is effective now. And consumers will start to  
12 see that on shelves.

13 Federal-state collaboration, an increasingly  
14 important area: The scope of the Food Safety Initiative, as  
15 such, as I meant before, that nobody can do it ourselves  
16 individually. And we're devoting major efforts in this  
17 area. Number one, we have come out with the latest --  
18 really first real and widely endorsed provision of the Food  
19 Code.

20 As I mentioned before, if 50 percent of our  
21 dollars are spent on food prepared outside the home, and a  
22 lot of those foods prepared outside the home are  
23 institutions that deal with individuals at high risk of  
24 foodborne illness -- nursing homes, hospitals, day care

1 centers -- then the Food Code really becomes a very  
2 important vehicle.

3 Secretary Shalala, Secretary Glickman have  
4 written to all 50 governors. We are seeing -- and I'd be  
5 interested in feedback from our state colleagues here --  
6 increased receptivity in the states. But that will clearly  
7 be a major effort. We have sponsored a series of what we  
8 call national integration meetings.

9 We have representatives from all states -- state  
10 health departments, Ag departments, FDA, USDA, CDC, state  
11 epidemiologists -- Janice Oliver referenced that -- focusing  
12 first on outbreak response, laboratory capabilities and  
13 findings and techniques, and finally on inspections. We  
14 work very closely with the ISSC on the specific issue in  
15 shellfish safety in the state of Florida. And if people  
16 want to know more about that, we can address that in the  
17 question and answer period.

18 Budget: Let me focus a little bit on the budget.  
19 Let me give the usual caveats, which is that federal  
20 officials, including myself, are not permitted to either  
21 lobby individuals or ask people to lobby on their behalf.  
22 And I clearly am not trying to desiring to do that.

23 What I have found, however, is people just surely  
24 do not understand our budget. I'll tell you most people in

1 FDA don't understand our budget. And we have found it  
2 valuable, both inside and outside, to just lay out -- What  
3 is it? What is the budget? What has it been? What is our  
4 budget request? What does it mean? What do we get this  
5 year?

6 And I will try to do that quickly for you.  
7 Number one: FY '99 budget increases for all of FDA. There  
8 is a wide perception that the food sector of FDA does not  
9 get sufficient interest when it comes to funding.

10 There may be some historical basis for that, but  
11 that is being turned around under the auspices of the Food  
12 Safety Initiative. You see here just from last year  
13 virtually all of the money given to FDA as an addition in FY  
14 '99 was for the foods program.

15 Number two, with the Food Safety Initiative \$25  
16 million, we devoted about 14 to the field, nine million to  
17 the Center, a small piece, 1.3 million, to veterinary  
18 medicine for antimicrobial resistance and a half million to  
19 NCTR, our Arkansas research facility, for research. The  
20 allocation was done this way because the purpose of the  
21 money was to really devote on imports and on produce, and a  
22 lot of that is done in the field with headquarter's help and  
23 direction.

24 We also got a number of very small but targeted

1 increases for cosmetics, for food contact substances and for  
2 seafood, which was to be devoted to equivalency assessments  
3 with border countries. Now, let's see. I'll go back. This  
4 is part 2 to the same chart you saw before. Let's see what  
5 impact -- certainly, the last chart looked good.

6 We see the good news is for the first time in a  
7 number of years the FTE Base within my Center has increased,  
8 and that's very good. And we are devoting it to those  
9 programs that are essential to the food safety effort. And  
10 so we're starting to get that. Even so, we're still, of  
11 course, a long ways away from 1978 laws.

12 But remember the second chart I showed. If  
13 you're a part of the base program, non-Food Safety  
14 Initiative part of the Center, you took an additional cut.  
15 Because what happened within FDA each year now is that --  
16 and this has been so for about the last five years -- we  
17 need to absorb inflationary increases.

18 And so if the base program gets the same amount  
19 of money as the year before, we can't sustain the same  
20 program the year before, because costs have increased. The  
21 payroll cost increase; other costs increase. And so we need  
22 to not replace people, because we need what would have gone  
23 to their salaries to make up for that shortfall. And this  
24 has been happening for about five years in a row at the FDA.

1           And so you see, even with those increases, the  
2 base program is going down. And were it not for that  
3 cosmetics restoration, which I put it here because that was  
4 part of the base program, it would have gone down even  
5 further. And so this is very important to understand as we  
6 are allocating resources. The good news is that the new  
7 money is going to where the biggest problems are in the area  
8 of food safety.

9           The not-so-good news is that the base program, as  
10 Linda Suydam says, is being eroded. And this is the best  
11 chart I know to try and illustrate what the facts are there.

12           2000 budget, looking ahead: Because of that -- I  
13 just want to come back for one second there. This chart is  
14 not unique to foods. I know we're here; I'm supposed to  
15 talk about foods. But I'll take advantage of the fact that  
16 I've worked in all parts of FDA.

17           And it is certainly true in the field. You ask  
18 anybody here in the Chicago district or Detroit district.  
19 People realize that the base programs across have been  
20 eroded. And we all got together last spring and all the  
21 center directors realized we have issues, say, more common  
22 than you think.

23           There's nothing like a common problem that can  
24 band people together, whether you're in food or drugs or

1 devices. And we realized that we need to seriously address  
2 that. And so this year for the 2000 budget, which is what  
3 is before the Congress -- we had our Senate hearing  
4 yesterday -- FDA -- the president has proposed a \$216  
5 million increase for FDA above last year's appropriation.  
6 That's an 18 percent increase.

7           If enacted, it would be the largest one-year  
8 increase, at least any of us can remember. The Secretary  
9 Shalala is getting directly involved. She wrote the Health  
10 Appropriations Committee in February, "The president's  
11 budget request for FDA for FY 2000 begins a fundamental  
12 rebuilding of this agency and its science base."

13           I would focus on a number of things, starting  
14 with "fundamental," but also focusing on "begins." I think  
15 Linda Suydam used the phrase "downpayment" in terms of  
16 strengthening the Agency and its science base.

17           Now, let's see where those monies are put. There  
18 was a question on the telecast about injury reporting and  
19 adverse event reporting. There's 15 million there.

20           I'll show you later where the food pieces are in  
21 all of this. Product safety assurance: Most of that is for  
22 drug and device inspections; there's also money for an L.A.  
23 lab within there; premarket approval across a number of  
24 areas; Food Safety Initiative is a separate line item;

1 tobacco and bioterrorism.

2 Now, coming to food and back about Secretary  
3 Shalala, food safety is a compelling public health issue and  
4 is a critical responsibility of my Department. The  
5 requested new funds will reduce a persistent hazard. And so  
6 we are clearly very much in view of what is needed. Now,  
7 how is this translating to FDA to the food program? Again,  
8 the full 30 would go to the foods program.

9 Within food and color additives, that was  
10 approved on the review section. There was 11.4 million,  
11 most of which would be in review fees. I'm going to come  
12 back to that. Injury reporting is a two-and-a-half million  
13 dollar piece. Most of that would go to dietary supplements,  
14 food ingredients and cosmetics. We are moving to a new  
15 modernized facility in College Park in two years. That is  
16 very good.

17 We need to start getting the basic funding.  
18 Construction has been funded, but there are moving costs.  
19 And we're starting to request both funds this year. This  
20 money, by the way, will just wire the new building. It is  
21 important to have the building wired, obviously, and that's  
22 what that money is for. But is all that money would cover.

23 We also have a proposed transfer of a seafood  
24 inspection program from Department of Commerce to the FDA.

1 That is also a fee for service program, and that would be a  
2 transfer. But total affirmative increase of FDA in the  
3 foods areas are off \$64.2 million. Now, breaking that down  
4 a little bit, what would we do with the money?

5 You've heard me stress I believe in results. In  
6 terms of inspection capability, we want to be able to  
7 inspect once a year all of the facilities that have food  
8 that we believe is at high risk of microbiological  
9 contamination. There are about 6,200 such firms nationwide.  
10 That includes seafood. We will more than double our foreign  
11 inspections.

12 And we also have to devote money to the necessary  
13 research and so forth to give our inspectors the right tools  
14 to do the job. We need better rapid tests. We need other  
15 methods that inspectors can use to really detect food safety  
16 issues.

17 Outbreak response: The good news on  
18 surveillance; we have a better system. The bad news is it's  
19 going to detect more things. And we have to be available  
20 and ready. Probably one of, I think, the few mistakes I've  
21 seen in the food safety funding is outbreak response was  
22 never budgeted in the first two years. And I can tell  
23 you -- and I'm sure Ray Mlecko would tell you from the  
24 field -- if it happens, we will do it. And if we do it, it

1 comes off the top, but it works -- it cuts into the time  
2 that otherwise could have been spent on inspections.

3           So we have to realize we have a better  
4 surveillance system. It's going to reveal more outbreaks.  
5 We have to have the resources to have the kind of rapid  
6 response teams to develop them. We have to have the life  
7 support. We have to increase the hook-ups to the PulseNet  
8 system.

9           We also have to focus more on retail and food  
10 service -- training in the Food Code -- you've heard me talk  
11 about that -- antimicrobial resistance contained in the  
12 surveillance there. Injury reporting: As I said, 2.5  
13 million in these areas. Food additives: I'll pause it here  
14 a moment. There's 1.4 million in appropriated funds. There  
15 are two related feed-based requests. One is for food  
16 contact substances.

17           This is actually a provision in FDAMA. These are  
18 the so-called indirect additives, something used in the  
19 packaging that might leach into the food. There is a \$6  
20 million request there. There is also -- and that would  
21 essentially fully fund that program. There also is a \$4  
22 million request for direct food and color additives. That  
23 would be a beginning to the funding of that program.

24           Both of those will be based on a successful model

1 of having fees that are dedicated to the task, clear  
2 performance goals, and accountability all around. So here's  
3 a slide I used last year. The challenge is still there.  
4 Number one, we have to be identifying real public health  
5 issues and be sure they are being addressed properly.  
6 That's why food safety, food safety and food safety is our  
7 top priority.

8           Number two, we have to establish clear priorities  
9 and stick to them. We've established priorities. We have  
10 to stick to them. I will tell you I meet with people  
11 frequently now that want me to do this, that, or the other  
12 thing. And I have this book out and I say, Show me  
13 something on here that is more important than.

14           We have to realize, as Dr. Henney said, that we  
15 cannot do everything. I'd rather do something well than  
16 everything poorly. We have to be able to stick to them. I  
17 hope you folks will support me in trying to stick to them.  
18 To me, that is our best way of matching expectations with  
19 resource availability and finally enhancing a two-way  
20 communication with stakeholders.

21           In that connection, we have established a website  
22 within the Center that is very popular. We are establishing  
23 a new information center. We have special mailings,  
24 stakeholder meetings. On here, just a listing of the food

1 stakeholder meetings Mark Barnett set. Today is not an  
2 isolated event.

3 In addition to the one that I talked about last  
4 summer, we had one on cosmetics to deal with the  
5 restoration, one on an international scheduling issue, one  
6 on food contact substances, today's; I referenced the one on  
7 health claims, and finally, we are scheduling one on dietary  
8 supplements. So that's very important.

9 In conclusion, last spring I just took the job.  
10 I saw the excitement, the challenge. I said to everybody,  
11 It really is -- I mean it -- a great time to be in the foods  
12 business. A year later, I say not only is it still a great  
13 time to be in the foods business, but it's getting better  
14 all the time. And it's getting better because, I think,  
15 there is a real recognition of the problems.

16 People are coming together to solve those  
17 problems and we're doing something valuable and critical for  
18 the American consumer. I'm delighted to be a part of that,  
19 but we know, again, our job is just beginning. Thank you  
20 very much for your attention to a talk that was probably a  
21 little too long. I thank you very much. We will have time  
22 later for questions.

23 What we're going to do now is Dr. David  
24 Armstrong, who is the research director at the Moffett

1 Center down the street, has a presentation which he promises  
2 you is shorter. And then we have a number of public  
3 presentations, people who came here prepared, wanting to  
4 give a presentation, also.

5 Please welcome Dr. Armstrong.

6 (Applause.)

7 DR. ARMSTRONG: I might say while we're waiting  
8 that I had no idea the Commissioner was going to mention the  
9 Moffett Center, in spite of what Mr. Levitt thinks. She did  
10 visit our Center a few months ago. She also visited the  
11 Chicago district. And I guess she was quite impressed with  
12 our operation.

13 I don't know if that's in focus. This is a  
14 picture of the facility. And it's located three miles west  
15 of Midway Airport in Bedford Park. And I'm sure those of  
16 you who are Chicagoans may have gone by this facility and  
17 thought it was part of the Corn Products Company, but it  
18 really isn't. The FDA part of this Center is located on the  
19 fourth floor here.

20 What is the National Center for Food Safety and  
21 Technology? It began about ten years ago as the Cooperative  
22 Research Consortium. And it was really, in my view, one of  
23 the first attempts -- first modern attempts of FDAMA by FDA  
24 in that we instigated to enhance FDA's food science

1 expertise, expand the FDA's food science research program,  
2 cope with emerging food production, processing and packaging  
3 technology and enhance FDA's scientific communication with  
4 industry.

5 Our goals were that we were the open lines of  
6 communications with our stakeholders. We wanted to foster  
7 and scientific and technical exchange among diverse segments  
8 of the food science community. We recognized we better  
9 needed to understand the science and engineering behind food  
10 safety. And we needed to conduct much more research  
11 promoting the safety and quality of the U.S. food supply.

12 And this is where we get into the concept of  
13 being a proactive Center within FDA in that once a food  
14 safety problem appears, we take the initiative. And now I'm  
15 going to show my diversity as far as multimedia and flip  
16 over to the transparency.

17 (Pause.)

18 DR. ARMSTRONG: I'm going to kill all my time  
19 with audio visuals. At the National Center is the  
20 Prevention and Intervention Program research program for  
21 FDA. And I -- as I said, it's really a proactive approach  
22 to FDA's mission to ensure food safety. Actually, we've had  
23 a long history in this program of responding to acknowledged  
24 food safety issues.

1           And we've done many collaborative projects and  
2 task forces in the past. Currently, we are responding to  
3 the president's Food Safety Initiative. As an example of  
4 the stakeholders we have involved at the National Center, we  
5 have, of course, CFSAN in Washington, who we are a part of.  
6 We have the National Center for Food Safety and Technology,  
7 which consists also of Illinois Institute of Technology,  
8 University of Illinois and also industry.

9           We have CFSAN-Dauphin Island. And then we have  
10 our various collaborations with USDA, particularly ARS. We  
11 have several universities that we do contract research with.  
12 We collaborate with the U.S. Army/Navy laboratories. And  
13 now we're beginning to collaborate with JIFSAN, our sister  
14 organization back in Washington. As well, we have  
15 extramural grants that CFSAN has given in this program.

16           Actually, we do three parts in this Prevention  
17 and Intervention Program. We do what's called a hazard  
18 reduction assessment. And some of you have heard about the  
19 five-log reduction that FDA is proposing for the juice  
20 regulation. Here we look at technologies to see if they're  
21 capable of actually doing a five-log reduction.

22           Besides that, we need to look at the critical  
23 control points in the process to assure us that we can  
24 measure that this reduction is being achieved. The next

1 part of the program is technology validation. What is it  
2 that we measure in the process that assures us that this  
3 reduction is achieved and can -- more importantly, can we  
4 deliver every time?

5 So do we have a valid technology that we can  
6 trust? And finally there, the par-market approval  
7 considerations for the technology -- during the process of  
8 doing this new technology, are there substances generated  
9 that might be fruit safety problems in themselves? I just  
10 wanted to give you here today some examples of the research  
11 that we're doing out at the National Center for Food Safety  
12 and Technology.

13 Number one, we're working on particularly alfalfa  
14 sprouts. Number two, we're working in the safety and  
15 assurance of unpasteurized juices. Three, we're working on  
16 the control of pathogenic organisms in seafood and four, on  
17 the survival of pathogens during the 60-day aging period for  
18 hard cheeses.

19 I might mention that this has recently been  
20 challenged because of some outbreaks that have occurred with  
21 hard cheeses from unpasteurized milk. And I should  
22 emphasize this -- unpasteurized milk and not pasteurized  
23 milk. Currently at the Moffett Center, we have a what we  
24 call pathogen pilot plant.

1           It's biocontainment pilot plant where we can  
2 actually inoculate E-Coli 015787, which is an organism some  
3 of you have heard about, directly into cheese and follow its  
4 growth in cheese. This is one of the few pathogen pilot  
5 plants in the United States. And we're just initiating that  
6 work at the Center.

7           I wanted to talk a little bit about another  
8 subject I'm sure some of you have read about, and that is  
9 the risk from sprouts. Recently, they've been linked to  
10 numerous outbreaks, Washington and California. We have  
11 found that the sprouting conditions really allow for  
12 pathogen growth. And probably the most interesting part or  
13 the most exacerbating part is that sprouts are consumed raw.  
14 There's no kill step involved.

15           What we have done at the National Center is to  
16 develop what we call a sprout task force. And we got  
17 together all the industry, the academia, USDA, other  
18 governmental agencies, if they were involved, and sit down  
19 with them and try to determine what we could do in terms of  
20 research to address this food safety problem.

21           And the research approach that we came up with  
22 was first, we're going to try to assess thermal, chemical,  
23 irradiation and other treatments that we might do for  
24 pathogen inactivation in seeds. Next, we're going to try to

1     conduct some commercial scale process evaluation in our  
2     biocontainment pilot plant.

3             And finally, we're going to try to develop a  
4     rapid test method to detect pathogens in the sprout  
5     irrigation water. I don't know if many of you are familiar  
6     with the sprout-growing process, but these sprouts are grown  
7     in huge rotating drums. And generally, they grow -- you  
8     start with about 40 pounds of seeds which turns into about  
9     800 pounds of sprouts.

10            But in the process, that takes from four to seven  
11     days. These -- this time period is an ideal incubation  
12     period for both microorganisms and pathogens. So we're  
13     looking at methods where we could, at the end of two or  
14     three days, test this irrigation water that's constantly  
15     being sprayed on these sprouts to determine if pathogens  
16     would exist in that water.

17            Therefore, the sprouters could make a  
18     determination at that time whether the sprouts were safe to  
19     distribute. Finally, I want to talk about who benefits from  
20     this approach. First off, the sprout growers benefit  
21     because in general, these are small -- very small companies,  
22     if you want to call them companies. They're usually  
23     individuals that have garage operations where they're  
24     growing sprouts.

1           And they do not have a lot of money to do the  
2 needed research in this area. So if we're going to have a  
3 sprout industry, much research needs to be done for  
4 prevention. For CFSAN, we can look at the guidance for  
5 HACCP and GMP implementation that we need to provide and we  
6 also need, perhaps, to incorporate into our regulatory  
7 programs.

8           Finally, when this all distills out, we need to  
9 provide guidance to the FDA field operations. And let me  
10 finish by saying that research is fine. And that if it's  
11 published -- and all of our research is published and we  
12 have great scientists, both in Washington and at the Center.  
13 But the most important part, I think, is the technology  
14 transfer part of it.

15           We need to get this technology out to the people  
16 who use it and out to the people who inspect it. And so  
17 that's my song and dance for today. Thank you very much.

18           MR. LEVITT: We now have three speakers that have  
19 asked to address us today. Before I announce them, I'm  
20 wondering if it would be well for everybody to stand up for  
21 just one minute in our places and take a stretch. You may  
22 not have realized you were coming to a double-header here.

23           If I could have everybody's attention, please.  
24 We have, as I mentioned, three people who have asked to make

1 a short presentation. Actually, two of them are here, and  
2 so we're not sure if the third one will be available. If  
3 not, we'll be happy to take their presentation and add it to  
4 the record of the proceedings.

5 But let me begin by introducing Joseph Doss, who  
6 is the senior vice president and director of public affairs  
7 at the Consumer Health Care Product Association. And we're  
8 going ask for each speaker to try to limit yourself to about  
9 ten minutes.

10 MR. DOSS: Thank you very much. I will be brief.  
11 I want to first thank Joe Levitt for the opportunity to be  
12 here. The Consumer Health Care Products Association thinks  
13 that this is a very important forum to encourage a dialog  
14 and sharing of information. It's helpful to FDA. It's  
15 helpful to the industry. And I think ultimately, it will be  
16 helpful to the consumer.

17 We have had participants at not only this  
18 location, but as you saw, we had someone in the Washington  
19 meeting, as well as the Philadelphia meeting. So we think  
20 these are very important, and we try to participate whenever  
21 possible. For those of you who may not know, the Consumer  
22 Health Care Products Association represents manufacturers of  
23 non-prescription medicines, as well as dietary supplements.

24 It's a relatively new name. We've been around

1 since 1881 -- over 118 years. But with our new name, we've  
2 only been around for about a month and a half. It's a new  
3 name. And we were formerly known as the Non-Prescription  
4 Drug Manufacturers Association. And we basically now  
5 represent over 200 companies involved in the manufacture and  
6 distribution of consumer health care products, primarily  
7 OTCs and dietary supplements.

8 My comments today will be just directed to  
9 dietary supplements. And I first want to say that we agree  
10 with the Agency's and CFSAN's objective of developing an  
11 overall strategy for dietary supplements, which is listed in  
12 that bible that Joe mentioned earlier, I think on page 10.  
13 And we'd like to offer a few thoughts on how the Agency  
14 might want to go about for developing this overall strategy.

15 We were first very interested in the Agency and  
16 CFSAN statement that they are seeking to set boundaries  
17 between a dietary supplement and a conventional food,  
18 between a dietary supplement and a drug and between a  
19 dietary supplement and a cosmetic.

20 And I just wanted to bring up the issue of -- as  
21 we've looked at that sort of terminology, boundaries, I  
22 wanted to talk a little bit about that, because we think  
23 that in some cases, some people might have a sense that  
24 that's a pejorative term, in the sense that it seems rather

1 limiting and doesn't seem to acknowledge that some of these  
2 could be more than -- fall into more than one category.

3 It may not have been the intent, but it was just  
4 sort of a reaction that some of our members had as they  
5 heard the word, boundaries. So we think terminology is  
6 important and would hope that as we move forward and discuss  
7 this that we start thinking about what dietary supplements  
8 are, rather than what they are not.

9 And if strict boundaries were to be set for  
10 particular classes of products, we think that it might have  
11 a tendency to box out other product classes. And, you know,  
12 it's obvious that there are certain examples of where  
13 products fall under more than one classes. Calcium  
14 products, for instance, are both -- they have health claims  
15 for osteoporosis, as well as making drug claims.

16 There are also psyllium products which are both  
17 dietary supplements and OTC drugs. As we're getting away  
18 from dietary supplements, you have the traditional  
19 antiperspirant deodorants which are categorized as cosmetics  
20 as well as OTC drugs. And there are certain OTC drugs which  
21 are also containing pesticides regulated by EPA.

22 So it's sort of -- there can be an overlap of  
23 product category, and we just wanted to begin thinking about  
24 that and to make sure that there was no unintentional sort

1 of activity that might exceed the current boundaries of DSHA  
2 [phonetic], and just wanted to have the opportunity as the  
3 Agency moved forward to talk to them about that and engage  
4 in a dialog on that.

5 Also mentioned in CFSAN's priority A list are  
6 dietary supplement good manufacturing practices and adverse  
7 even reporting. As for the GMPs, the Consumer Health Care  
8 Products Association, as well as the rest of the dietary  
9 supplement industry, have supported establishing GMPs for  
10 dietary supplements.

11 We have submitted comments to FDA. We're  
12 continuing to look at it and hope to further discuss it with  
13 the Agency as they move forward with the issue. On AERs,  
14 adverse event reporting, we heard a little bit of discussion  
15 about that today. As we go forward and we look at this  
16 issue for dietary supplements with regard to AERs, we wanted  
17 the Agency, and CFSAN particularly, to be aware of a couple  
18 of our thoughts.

19 And first of all, one is that there are currently  
20 several sources of information that are available to obtain  
21 dietary supplement adverse event reporting information.  
22 You've got Med Watch, Dawn [phonetic], spontaneous reports  
23 from consumers, the toxic exposure surveillance at the  
24 Poison Control Center, the published literature and other

1 sources, as well. So it's important to take a look at that.

2 Also, let's talk about the website and putting up  
3 of adverse event reports on the website. Clearly, the web  
4 is an important tool to get information out to consumers.  
5 However, we have some reservations about, I guess, the way  
6 it's currently being done in terms of putting things up  
7 there that might not have had the proper filter to make sure  
8 that they're accurate reports about a specific scientific  
9 concern.

10 And in keeping with the thought of today in  
11 trying to get input from groups like ours, we think that  
12 it's important to think about the kind of approach that  
13 would allow the education of the public about the concept of  
14 balancing the risks and the benefits, but without  
15 unnecessarily alarming them, because it might not have been  
16 an accurate report or you just don't know what the source  
17 was.

18 So we, again, welcome the opportunity to be a  
19 part of that discussion. As to the -- how the Agency can  
20 enhance its outreach efforts, these are great meetings --  
21 stakeholder meetings. Dr. Soller, who was at the Washington  
22 meeting, mentioned that perhaps that the Agency should take  
23 a look -- or CFSAN should take a look at having a meetings  
24 manual policies and procedures.

1 I don't think you have one. As Bill mentioned,  
2 that's something that you might consider. We worked with  
3 CEDER [phonetic] to develop that. And it set forth  
4 procedures for scheduling meetings and conducting the  
5 meetings with outside groups. It describes, among other  
6 things, the maximum time after request for a meeting to be  
7 scheduled, the need for prompt preparation and sharing of  
8 minutes from the meeting and for a summary of the major  
9 points that take place during the meetings.

10 And we found them very successful and would  
11 encourage such procedural documents be prepared within  
12 CFSAN. So in sum, I just want to thank Joe and Ray for the  
13 opportunity to be here to share our thoughts, and look  
14 forward to working with the Department, with the Center as  
15 they move forward.

16 Also, just one procedural matter: We'd hope that  
17 maybe the record could be kept open for a week or so. I  
18 know that you're going to be accepting more questions, but  
19 we may have some follow-up process as a result of some of  
20 the things that were said today. Okay. Thank you very  
21 much.

22 MR. LEVITT: Thank you.

23 Our next speaker is Ms. Karen Truskowski,  
24 multiple chemical sensitivity health and environment.

1 She's here.

2 MS. TRUSKOWSKI: I'm going to discuss the  
3 problems with fragrances. A person easily uses a dozen or  
4 more fragranced products in a day. Many of these products  
5 are applied directly to the skin. The users of these  
6 products assume the safety of the materials used in them and  
7 the final product has been established. It has never  
8 occurred to most people that this is not the case.

9 Fragranced products such perfumes, colognes and  
10 personal care products come under the jurisdiction of the  
11 FDA. However, due to the trade secret status of  
12 fragrances -- or fragrance formulas, the fragrance industry  
13 is basically self-regulated. The ingredients used in  
14 fragrance formulas do not have to be disclosed to anyone,  
15 even the FDA.

16 Increasingly, fragranced products are cited as  
17 triggering or causing health problems. Though the industry  
18 has in place procedures for establishing the safety of  
19 fragrance materials, these measures are not adequate. The  
20 industry has been slow to address the issues involved. The  
21 answers provided by the industry need closer examination.

22 The industry says fragrance materials have a long  
23 history of relatively safe use. It is true that fragrances  
24 have been used for centuries. However, until late the late

1 1860s, virtually all fragrance materials were obtained from  
2 plant and animal sources. And the concentrations were  
3 pretty close to found in nature.

4 No one chemical was found in isolation.  
5 Companion chemicals found together often had synergistic and  
6 modifying effects. The majority of modern fragrances  
7 materials are synthesized from petroleum products. Many are  
8 not found in nature. There is no long history of use. The  
9 material that are obtained from plant materials are often  
10 extracted as isolates.

11 This means individual chemicals, rather than the  
12 complex mixtures found in nature, are used. History of use  
13 of -- history of use no longer applies, as the action of  
14 individual chemicals may be far different than in mixtures.  
15 Okay. Industry also says compounds are used at such low  
16 levels that they are not a health risk.

17 The current trend in fragrance formulation is  
18 toward using powerful long-lasting synthetics at higher  
19 levels. One material may make up as much as 25 percent of  
20 the formula. It is not unusual for four or five materials  
21 to make up 80 percent of the formula.

22 Industry also says fragrance materials are safety  
23 tested. The Research Institute for Fragrance Materials  
24 safety tests fragrance materials. Only about 1,300 of the

1 more than 5,000 materials used in fragrances have been  
2 tested for safety. The testing that is done is generally  
3 limited to acute oral and dermal toxicity, irritation and  
4 dermal sensitization and phototoxicity.

5 Testing is limited to individual materials.  
6 There is little effort to address synergistic and modifying  
7 effects of materials in combination through the -- though  
8 the IF -- RIFM is aware they do occur. Early on in testing,  
9 it was found that when similar materials were tested  
10 together, more positive sensitization reactions occurred  
11 than when the materials were tested individually.

12 Testing procedures were changed so only unrelated  
13 materials were used in a testing sequence. Most chemical  
14 data sheets and the MSDS information on fragrance materials  
15 plainly states, "The chemical, physical and toxicological  
16 properties have not been thoroughly investigated.

17 And they say -- industry also says present  
18 testing is adequate. Musk ambrette was found to have  
19 neurotoxic properties. This was first discovered in 1967  
20 when mice were fed varying levels of musk ambrette. Since  
21 dietary consumption of musk ambrette is generally very low,  
22 the impact was discounted and no assessment was made of  
23 exposures from fragranced products.

24 In 1985, after studies were published on the

1 neurotoxic effect and it was determined that the musk  
2 ambrette was readily absorbed through the skin, the IFRA  
3 recommended that musk ambrette not be used in direct skin  
4 contact products. Musk ambrette had been used in fragranced  
5 products before the 1920s.

6 Versalide had been used in the fragrance industry  
7 since the 1950s. In the mid-'70s, it was discovered that --  
8 by accident that this material was severely neurotoxic and  
9 caused the internal organs of mice to turn blue. Perfumes  
10 and fragrances were recognized as triggers for asthma by the  
11 American Lung Association and other organizations concerned  
12 about respiratory health.

13 In spite of legitimate concerns, the industry  
14 does not include testing for neurological and respiratory  
15 effects of fragrance materials. The industry also says the  
16 industry can adequately regulate itself to ensure safety of  
17 fragranced products. The International Fragrance  
18 Association takes the information obtained from the RIFM  
19 materials and establishes guidelines for use -- safe use of  
20 fragrance materials.

21 These guidelines are not binding and there is no  
22 enforcement by the industry. In 1985, the IFRA recommended  
23 that musk ambrette not be used in direct skin contact  
24 products. In 1991, the FDA still found musk ambrette in

1 skin contact products. Musk xylol is found in waterways and  
2 aquatic life. It is being found in human adipose tissue and  
3 breast milk.

4 In spite of this, the IFRA has made no  
5 restrictions or recommendations concerning its use. The  
6 industry also says only a small segment of the population  
7 has adverse effects from fragrances. One to 2 percent of  
8 the population has skin allergies to fragrances. Fragrance  
9 is one of the most common causes of adverse reactions to  
10 cosmetics.

11 Asthma rates have doubled in the past 20 years.  
12 In 1994, there were 14 million asthmatics. Perfumes and  
13 colognes trigger 72 percent of asthmatics. Each year, over  
14 35 million people suffer from sinusitis. Fragrances are  
15 general irritants that contribute to the incidence of sinus  
16 problems. For some, they are the primary triggers for upper  
17 and lower respiratory illnesses.

18 Migraines affect as many as 25 million people.  
19 Fragrances are known triggers for migraine headaches. Many  
20 of these health conditions are adversely affected by  
21 fragrances. Those with chronic lung diseases find exposure  
22 to fragrances exacerbate their condition. Those receiving  
23 chemotherapy for treatment of cancer often find exposures  
24 nauseating.

1           Okay. Okay. The attempt to regulate fragrances  
2 is not an isolated incident. In Massachusetts, there was an  
3 effort to regulate fragrance inserts in magazines. One  
4 possible solution may be to require odorless sealed packets  
5 for fragrance samples. Resolving this issue may well  
6 involved the U.S. Postal Service, because it regulates the  
7 use of such inserts.

8           Okay. In light of the fragrance industry's  
9 unwillingness to adequately address this issue of fragrance  
10 safety, it is time for the FDA to intervene. Though FDA  
11 resources are limited, there are cost-effective means of  
12 acting and ensuring the safety of public's health. Programs  
13 and resources already in place can be utilized to more  
14 effectively monitor the safety of fragranced products.

15           Make available fact sheets that acknowledge  
16 exposure to fragrances can exacerbate or trigger asthma,  
17 sinus or upper respiratory problems, migraines and other  
18 disorders. It is important that consumers are aware that  
19 the FDA does not require pre-market testing of products.  
20 Many patients with asthmatic children are not aware that the  
21 products they use may be contributing to the their child's  
22 illness.

23           Such education would also increase the awareness  
24 that second-hand fragrance can cause problems for others.

1 Many parents are unaware of the general consensus among  
2 pediatricians that fragranced products should not be used in  
3 infants.

4 Expand the Cosmetic Adverse Reaction Monitoring  
5 so that complaints can be registered via the FDA website.  
6 This would make it easier to file complaints. Data could be  
7 used to pinpoint specific products that are problematic.  
8 The National Center for Toxicological Research can be  
9 utilized to analyze fragrances that are problematic.

10 The results can be examined to determine if there  
11 are substances or formulations that common in the -- that  
12 are common in the products that complaints have been filed.  
13 Further, the results of analysis can be examined to make  
14 sure that materials banned, voluntarily or by law, are not  
15 present. Also, any lack of compliance with the IFRA  
16 recommendations for restricted materials should be noted.

17 The product should also be examined for proper  
18 labeling, et cetera. The vast numbers of materials used in  
19 fragrances makes the task of ensuring safety of each and  
20 every substance beyond the scope of the FDA's resources.  
21 However, by closer examination, several reasonable points to  
22 start can be determined. The fragrance mix patch test is  
23 diagnostics for the majority of skin allergies to  
24 fragrances.

1           These materials would be a good place to start in  
2 determining if fragrance materials can be -- also act as  
3 respiratory sensitizers. More complaints are registered  
4 concerning fragrance formulated since the mid-'80s.

5 Examination of these products may prove clues to why these  
6 formulations are frequently cited as causing problems.

7 Material -- some materials may have been used on a limited  
8 basis previously, but newer information increased their use.

9           For example, in the late '70s, it was found that  
10 amylcinnamaldehyde and hexylcinnamaldehyde have the ability  
11 to hold the scent, even after washing and rinsing. Though  
12 both of these materials have been used for some time, usage  
13 in products with a wet application increased.

14           Materials introduced in the past several decades  
15 need to be closely monitored, as they have no history of  
16 use. This is especially true of the newer products that are  
17 used at relatively high levels in modern fragrance formulas.  
18 Fragrance materials are not the only things that need  
19 examining. Newer technologies, such as the use of  
20 cyclodextrins, also need to be examined to determine if the  
21 use of such materials add to the health risks.

22           Though health risks from an individual fragrance  
23 may seem insignificant, the sheer numbers of fragranced  
24 products used make them a concern. Further bioaccumulation

1 of fragrance materials increases the concern. Presence of  
2 fragrance chemicals in fat tissue and breast milk raise the  
3 issue of effects on the fetus and nursing infants. These  
4 are health concerns that should not be ignored.

5 Increases in asthma and other respiratory  
6 problems triggered by fragrance exposure raises concerns  
7 over effects on the airways and the lungs. These and other  
8 concerns need to be addressed by the FDA and fragrance  
9 industry. Thank you.

10 MR. LEVITT: I believe that the third speaker who  
11 requested to speak was not able to be here. So what we will  
12 do instead is we will go to the last segment of the  
13 program -- baseball terms, the ninth inning. And we'll  
14 invite up to this table Mr. Mlecko, Dr. Johnson [sic] and  
15 myself. And we won't make you fax your questions up.

16 We will invite you to just walk up to that nice  
17 little microphone over there and raise what you would like  
18 to within the context of either the Dr. Henney-Linda Suydam  
19 teleconference from the first segment of the program, or  
20 issues that were raised by any of our presentations or by  
21 the programs that we administer.

22 I think that our original goal was to try and  
23 finish around 4:00. But I think we will stay longer if  
24 there is interest and questions, because you come out to a

1 meeting and we want to be responsive to that. I'm going to  
2 now walk over there.

3 The other thing I've learned is some of these  
4 microphones are so you can hear me and some of these  
5 microphones are so this lady who's recording can hear me.  
6 This is the one that you can hear me with. Good. I think I  
7 got it. If you could please introduce yourself before you  
8 ask your questions.

9 Yes. Nancy Donley.

10 MS. DONLEY: I'm Nancy Donley, and I'm president  
11 S.T.O.P. -- Safe Tables are Our Priority. We're a foodborne  
12 illness victims' organization. We are a national  
13 organization comprised of families who have lost loved ones  
14 to foodborne illness, who have been victims themselves and  
15 who are just consumed -- concerned consumers everywhere  
16 nationwide.

17 We are very active in policy advocacy, public  
18 education and as well as victim assistance and support.  
19 That said, I have -- and I -- this is to the third question  
20 that has been brought up with the purpose of this meeting  
21 today. And it has to do with communicating with consumers  
22 and as an educational type of component. It's the -- what  
23 actions do you propose for educating the public about the  
24 concept of balancing risk against benefits in public health

1 decision-making?

2 I want to start off by saying, first of all, I'm  
3 going to make a couple comments, and I am going to ask a  
4 question, as well: One being that I think that enough  
5 cannot be said for the usefulness and the necessary  
6 component of just being truthful in disclosing all of the  
7 facts available. That means no sugar-coating of messages.

8 Too often, consumers are hearing conflicting  
9 information. When, on the one hand, we have the safest food  
10 supply in the world, but on the other hand, we're also being  
11 told is, You better treat it -- treat all your food as toxic  
12 waste, because it's up to you to make sure that if it's  
13 unsafe, it's your fault. We're getting conflicting  
14 information.

15 And that's why I want to really bring up a couple  
16 things, because it was brought up by Janice Oliver earlier  
17 today, and that is the fight back campaign. And I just  
18 picked up this book and kind of leafed through it that was  
19 left on the back table. And here is just another instance.  
20 And I would also say we offer S.T.O.P.'s assistance in  
21 producing any consumer information, if you'd like, because  
22 we're starting out right here with a "keep your food safe"  
23 message.

24 And that's in the fight back campaign. If you

1 really stop and think about, we're not keeping food safe;  
2 we're keeping people safe from unsafe food. So we have an  
3 implicit -- an implied message here that if something goes  
4 wrong and you get sick, Mr. or Ms. Consumer, it's your  
5 fault. No.

6 We're dealing -- what we have to be aware of is  
7 we're dealing with our safety and how to work with it and  
8 decontaminate it, if you will, or practice safe food  
9 handling practices or not to take -- cross-contaminate safe  
10 food with unsafe food. This year's fight back educational  
11 message is a -- is going to be a really, really tough one  
12 for FDA and the consortium that is dealing with it.

13 And I think you're really going to be challenged  
14 here. This year's education focus is on the cook it  
15 component of the fight back four areas of -- that they  
16 position. We have -- and the cook it -- and these are kind  
17 of outdated in here, is another thing you might want to  
18 know. We have a real problem here in this particular  
19 quadrant of the fight back campaign where we're going to --  
20 we have mixed messages and conflicting information that is  
21 going out to the public.

22 On the one hand -- let me give you two examples.  
23 On the one hand, both industry and government has  
24 acknowledged that the only safe hamburger to eat is one that

1 is cooked to 160 degrees internal temperature verified by  
2 the thermometer -- that color is not a reliable indicator  
3 and that you must -- the only way to ensure that it's safe  
4 is to use a thermometer.

5 Yet you can walk into just about a restaurant  
6 anywhere across the United States and order your burger any  
7 way you want to. Now, the National Restaurant Association  
8 is part of the Food Safety Consortium, as well as public  
9 health departments. And this is a real problem. Another  
10 example is eggs. You -- the only way -- safe way to eat  
11 eggs is -- as acknowledged, is to make sure that they are  
12 cooked thoroughly and that all whites and yolk is firm.

13 But you still get -- ask routinely anywhere you  
14 walk into the -- into restaurants, How do you want your eggs  
15 prepared? That's conflicting information. We can't be a  
16 "do as a say, not as I do" society and expect any changes in  
17 consumer behavior. And that's the key here. It's not  
18 consumer education; it's behavior modification we should be  
19 after.

20 And we cannot achieve that if we are sending out  
21 conflicting information to the public. That said, I think  
22 what this points out is kind of an overall larger problem  
23 that I hope FDA is going to -- and CFSAN, in particular, is  
24 going to recognize the need for further federal regulations

1 throughout the food industry, and that we cannot have -- and  
2 the Food Code is a great example of this.

3 In the Food Code, it's because municipalities can  
4 adopt any portion that they want to of it. They can take --  
5 they look at the Food Code as a menu and say, I'll take this  
6 part and this part and this part, but I don't want this part  
7 or I -- and I'll modify this part. We cannot have a  
8 patchwork safety system for food throughout the United  
9 States.

10 Public shouldn't be more protected in one area or  
11 one state or one county or one city -- more protected there  
12 than they are anywhere else. And where we -- this is where  
13 we, the public, are looking to the federal government to  
14 establish food safety standards that must be utilized evenly  
15 throughout the United States. And I can't emphasize that  
16 enough.

17 It's once you get strong federal regulations that  
18 you build a good base to develop these partnerships that you  
19 are talking about on the state and local level. And once  
20 you have national regulations, national performance  
21 standards, then you can branch out and develop your  
22 partnerships. And I think then you will probably have a  
23 very even system across the country.

24 You then stand a chance of really developing

1 something good and something wonderful. But it has to be  
2 based on a national framework and a level playing field  
3 throughout. So I guess that said -- I'm sorry I'm taking so  
4 much time up here -- I do -- I really feel we have this  
5 coming up in September -- this education -- I'm going to end  
6 with the education component here of this fight back  
7 campaign.

8           And I'm -- I am very, very concerned as a  
9 president of an organization who -- we are routinely giving  
10 out information to people who ask it -- of what we should  
11 do. And then these same people are hearing other things  
12 back or just viewing other things -- getting wrong, wrong,  
13 unsafe information coming back to them from industry. Thank  
14 you.

15           MR. LEVITT: Thank you very much. I'm not going  
16 to try and respond to every point made, but I will highlight  
17 a couple of items. One, I want to begin by commending you  
18 and your whole organization for the important advocacy  
19 you're arguing in the area of food safety.

20           As Ms. Donley mentioned, she and -- I don't  
21 know -- all -- most -- many members of your organization  
22 have really seen the dangers of food safety as -- firsthand  
23 and had members of their families become very sick or even  
24 die as a result of foodborne illness. And to me, there is

1 nobody who comes with more credibility than that.

2 In fact, when I first saw -- I've never said  
3 this, but when I first saw the name of your group, Safe  
4 Tables are Our Priority, I thought it stood for -- as  
5 S.T.O.P., Stamp Out Pathogens. Maybe that's a -- and so let  
6 me begin with that. The issue of cooking: You're right.  
7 We will be challenged.

8 We -- I mentioned that we're -- are coming  
9 forward, in addition to the fight back campaign, with a  
10 proposed regulation on egg safety, one component of which is  
11 safe handling practices for consumers, which will include  
12 both refrigeration and cooking thoroughly. But you're  
13 right. The hard thing to explain to people is, Wait a  
14 minute. I grew up on this. I've had this all my life.

15 You know, how do we convey how the world has  
16 really changed? And, you know, any help as we go through  
17 developing the materials, you know, we welcome. We can put  
18 on labels that say, Cook thoroughly. Or as you say, in  
19 meat, even if that's regulated by USDA, you know, cook to a  
20 certain degree level.

21 It's different from making it happen. I will  
22 give you just a couple of anecdotes that I've just  
23 experienced. And they're only anecdotes. You know, they do  
24 have now the little disposable -- I'll put in a plug for

1 USDA products. There is now a little disposable thermometer  
2 that you just put in your hamburger, hold it for six  
3 seconds, pull it out.

4 And if it's white, it's -- you have to cook it  
5 more. And if it's black, it's heated to the proper  
6 temperature. And I can tell you I put it in and it's still  
7 white, so I have to close the oven again. But, I mean, they  
8 do work and they are reasonably priced. And people need to  
9 understand that's something we need to do.

10 But you're right -- behavior modification. I  
11 think you're exactly right. I also -- good news -- I was up  
12 at a New England state over vacation, and it was on a  
13 border. So I'm honestly not sure if it was in Massachusetts  
14 or if it was in Connecticut, because it was right on that  
15 border. But the people at the next table ordered a rare --  
16 a hamburger medium rare. And the waitress said, I'm sorry.  
17 We can't serve it to you that way.

18 So there is -- the message is starting to get  
19 out. But clearly, more needs to be done. The last point I  
20 wanted to address is the issue of federal standards. And we  
21 are, I think, coming to understand that in a real way. We  
22 have had, as I mentioned, a number of meetings with state  
23 and local officials about how to expand food safety coverage  
24 in an appropriate way.

1           And one of the first themes that we had -- we had  
2 a list of criteria. One of the first themes was uniform  
3 minimum standards. And what we found was, number one, that  
4 was very much misinterpreted. I found that common uniform  
5 minimum standards became common minimal standards -- became  
6 exactly what you suggest as allowing or even encouraging a  
7 patchwork.

8           And at least within our internal discussions --  
9 and you'll see in the response that the administration gave  
10 to the Academy, you know, that the first criteria is strong  
11 national standards so that we do have a level playing field  
12 across the country, you know, where we can do that. I  
13 think, you know, the HACCP regulations from either Agency  
14 are a major step in that direction.

15           The last thing is the Food Code. I would just  
16 invite any of our state and local health officials here, if  
17 you would like to comment at all on the Food Code, on  
18 implementation efforts, on how that is seen from the  
19 receiving end, because we do see it as a critical component  
20 to the whole food safety effort.

21           MS. BOHM: My name is Shirley Bohm, and I'm the  
22 food program manager with the Division of Food, Drugs and  
23 Dairies, Illinois Department of Public Health. We are, in  
24 Illinois, very strong proponents of the FDA Food Code. In

1 1996, in January, we adopted critical portions of the Food  
2 Code into Illinois rules. And the majority of the local  
3 health departments in Illinois have those as their -- part  
4 of their legal base.

5 We felt at the time that our director, and  
6 basically the entire department -- all of the food  
7 program -- felt that it was a very large document and it  
8 would be very difficult to make that changeover with the --  
9 with so much material. So we started with step one by  
10 incorporated critical sections -- all the time temperature  
11 control and consumer advisory and hand contact with ready-  
12 to-eat food and a number other -- of other issues.

13 We're at the stage now of finishing up a  
14 review -- continued review of the Food Code, and we expect  
15 to share a draft with our stakeholders here in the state  
16 later this summer and then propose it for -- the entire Food  
17 Code for adoption. I would like to make one recommendation  
18 to FDA. I think this might help you, and certainly would  
19 help us.

20 The two-year cycle that you have where you come  
21 out with a new Food Code every two years is very difficult  
22 for the recipients. Rulemaking is a long and sometimes  
23 difficult project. And we can't keep up with you. And  
24 CFSAN can't -- I don't think -- I don't see how you have

1 enough time to continue doing that two-year cycle.

2 I think now we've resolved a lot of the issues  
3 with the conference for food protection and a lot of input  
4 from the industry and regulatory agencies, as well. So  
5 perhaps it won't be so difficult now for you to maybe go on  
6 a four-year or six-year cycle that would correspond with the  
7 conference for food protection, because I know you take a  
8 lot of input from the conference.

9 So that was a recommendation, I think, from a lot  
10 of people I've talked to, and certainly would make my life a  
11 lot easier. Thank you.

12 MR. LEVITT: Wait. Before you -- could you help  
13 us? If you look ahead four years from now -- let's assume  
14 FDA hasn't revised it in the next four years. We'll try and  
15 think about it in that way. Do you see -- knowing how it's  
16 viewed in your state, knowing how your state counterparts  
17 are, do you foresee the result being broad in uniform  
18 adoption, or do you perceive the result being a patchwork  
19 approach as was suggested with a degree of worry a few  
20 moments ago?

21 MS. BOHM: With the present system where it's a  
22 recommended document -- a model document that's made  
23 available for everyone to adopt as they will, certainly  
24 every jurisdiction, whether it's a state or a local level,

1 will have the opportunity, then, to tweak it as they will or  
2 as they want in response to local situations, to local  
3 lobbyists, to whoever makes comment.

4 Without changing a system so that there's a --  
5 oh, I don't want to use that M word for mandatory -- but  
6 without changing the system that you will end up with some  
7 local differences at the -- at whatever level -- whatever  
8 jurisdictional level. And without something to sweeten the  
9 pot, let's say, to encourage state and local agencies to  
10 adopt as is -- for example, a model code as is -- perhaps  
11 funding or whatever -- I can't see -- I can't foresee that  
12 situation changing, really.

13 MR. LEVITT: Okay. But you just gave me one  
14 idea.

15 MS. BOHM: Good.

16 MR. LEVITT: And I'll take that -- your idea. My  
17 impression on the Food Code -- I'm not a long-term expert.  
18 My impression is that this year was viewed as a breakthrough  
19 year and that there had been a lot of opposition to some key  
20 points.

21 And with basically an agreement reached at the  
22 conference of food protection last -- about a year ago by  
23 now -- as basically ratified in the Food Code that came out  
24 in January or February -- January, I guess -- that this

1 really should become the code we are trying to get  
2 implemented.

3 And it is probably not useful as people in the  
4 process of implementing for us to keep moving the target a  
5 little bit. So I certainly will take that -- to make that  
6 suggestion back and the other idea back, too.

7 MR. MLECKO: Shirley, you mentioned "sweeten the  
8 pot." How can we sweeten the pot?

9 MS. BOHM: Well, I can use the USDA setup -- USDA  
10 and State Department of Agriculture setup with meat and  
11 poultry inspection. That's one possibility where USDA  
12 requires state agriculture departments to basically adopt,  
13 as is, federal regulations, make their program equivalent or  
14 identical to the federal program and, therefore, they also  
15 get -- I believe it's 50 percent of the program funded by  
16 the feds.

17 That's a possibility. Certainly that's one  
18 setup. I, you know, don't know enough about how it could  
19 work. There may be other alternatives. But that's one  
20 possibility of having some federal funding tied to that  
21 uniform adoption.

22 MR. LEVITT: Thank you very much.

23 Who else has a question? Yes. Please.

24 MS. SOSA: My name is Merle Sosa, and I'm manager

1 of food safety programs for Food Animal Concerns Trust, or  
2 FACT. And my question has to do with the announced notice  
3 of public rulemaking that was done in May of last year for  
4 *Salmonella enteritidis* in shell eggs. And you mentioned a  
5 few things in your presentation about things you've got  
6 coming up for eggs, But none of those related to anything  
7 on-farm.

8 I should mention that our group is involved --  
9 the group that I represent -- what we advocate is more  
10 humane -- using animal husbandry systems to improve the  
11 safety of milk, meat and eggs. So one of the things that  
12 we're concerned with is the fact that there doesn't seem to  
13 be any regulation on the horizon that would relate to  
14 systems on the farm.

15 So what you're doing is implementing programs  
16 that will be -- I think you mentioned refrigeration and  
17 transportation and things like that. But our group feels  
18 that the best chance for trying to prevent SE in eggs is  
19 right on the farm. And we do have model farms. We have 14  
20 in Pennsylvania where we use extensive SE testing programs  
21 to try and prevent SC.

22 So what we don't understand is what happened in  
23 the interim process. There were comments made. We tried to  
24 find out more information on the comments and what the whole

1 process is going to be, but there hasn't been anything  
2 that's come out since comments were made in August. So my  
3 questions are: Number one, is there going to be anything on  
4 the horizon concerning regulations for on-farm pathogen  
5 protection programs with regard to SC.

6 And number two, my question -- my second question  
7 relates to communication. Once comments are submitted,  
8 you're kind of left with: Where are things going? And so  
9 one thing that we've tried to do is we've tried to contact  
10 FDA officials to check on the status. And we have received  
11 no response whatsoever.

12 Whereas, when we contacted the USDA for their  
13 part of this whole joint process, we received very, very  
14 prompt response. So my take on the FDAMA modernization act  
15 was: We want to communicate. We want two-way communication  
16 with the stakeholders and we want to communicate with you.  
17 So those are my two questions.

18 MR. LEVITT: Okay. Thank you. Number one, if  
19 you'll leave me a card or something, I'll be sure that  
20 somebody more specifically knowledgeable than me will call  
21 you back. But in general, let me kind of give you broad  
22 brush. Number one, we recognize that the first steps I  
23 outlined we're doing because they're the clearest and most  
24 direct that can be done -- if you will, the easiest -- and

1 so we ought to get them done.

2           The refrigeration will limit further growth of  
3 *Salmonella enteritidis*, and that's important. And the safe  
4 handling practices -- refrigeration will do the same and the  
5 cooking will kill the bacteria. We do not want a system,  
6 however, where we're relying on the consumer to be the  
7 principal checkpoint. You are right. We've got to go back  
8 to the farm.

9           There have been some successful farm quality  
10 assurance programs in Pennsylvania. We have within the  
11 priorities documents -- you'll see it -- it is on the B  
12 list -- to continue to foster those. I am not an expert in  
13 this area myself, but the discussions I've had on it so far  
14 have at least convinced me that it is a -- it's a hard  
15 problem to try to figure how to solve.

16           That doesn't mean we shouldn't try to solve it.  
17 I said when I was up there, you know, eggs -- *Salmonella*  
18 *enteritidis* is one of the big food safety challenges we  
19 have. I'm not sure that the comments in totality gave us a  
20 clear direction. But, you know, we will try to get done  
21 this year what we've laid out and come back and follow that  
22 more intensely in the future.

23           I don't know if that answer is fully satisfactory  
24 to you, but it's at least truthful and honest.

1 MS. SOSA: Right. We appreciate that.

2 MR. LEVITT: And did I hit both of your  
3 questions, or did I --

4 MS. SOSA: Well, I'd like you to address -- well,  
5 I guess one of things I have about the communication issues  
6 is there -- I guess my question is, is there a directive to  
7 the FDA personnel? I guess what I'm trying to say is some  
8 people feel that regulatory agencies are insular and are  
9 hard to communicate with. And I think that the FDAMA, as a  
10 document, is trying to change that impression.

11 And so I guess what my question would be is, is  
12 there going to be some work within the FDA to try and make  
13 FDA personnel more accessible and have some responsibility  
14 for them to -- if people do reach out to them, that they'll  
15 come back and at least respond either by e-mail or some  
16 other kind of communication?

17 MR. LEVITT: Okay. I think -- let me address  
18 this first in the case of a rulemaking proceeding, which is  
19 different from a lot of other things. One of the issues in  
20 rulemaking is what's called ex parte contacts with the idea  
21 that the process is, I'm afraid, kind of an arms-length  
22 process. That's why I tend to like these public meetings,  
23 because it gives you a chance to get more give and take than  
24 just read the document, summarize the comments and figure

1 where to go from there.

2           And we're doing -- you know, we've done workshops  
3 in a number of areas. But actually, it's not exactly the  
4 case here for people to extrapolate. When we issue a  
5 proposed rule, we really are not supposed to be talking to  
6 people outside of the process, because that creates an  
7 elements of unfairness. I'm talking to you now. I'm  
8 talking to somebody else. Who called? Who didn't call?

9           So it unfortunately does put you at a feeling  
10 like: I'm in the dark. And I don't -- I mean, the best  
11 solution to that is speed. When we did the juice labeling  
12 rule, we went from proposal to final in less than 60 days.  
13 It might have been less than 30 days. It was so fast, we  
14 can't even -- can't count them all.

15           But that was unusual. We had a particular time  
16 element we had to hit for the fall -- apple season. And  
17 I've tried to say to people and staff who literally worked  
18 all day, all night, all weekend for about a month or a  
19 month-and-a-half on that, we will reserve that for when  
20 there is not just importance, but time certain urgency where  
21 we'll bring out our staff so fast that they won't be here to  
22 do the next one.

23           But part of it also is, when you think of my  
24 boulders and pebbles, is how many of these can we

1 systematically address well at once, including follow  
2 through. We're working on following through on seafood.  
3 We're working on follow through on the fresh foods and  
4 produce, both domestically and internationally. And so part  
5 of it is how many of these major areas can we take on at  
6 once?

7           And I wanted to be sure the ones we do take on  
8 are -- we can do right and thoroughly and not have  
9 everything neutralize it out. So I think it's a combination  
10 of how much we know, how clear the comments were, what its  
11 priority is against other things. But yes. We know it's a  
12 real problem. We've got to get to it.

13           MS. SOSA: I guess in a situation like the SC  
14 regs when they've basically gone on for this long -- I mean,  
15 it's been -- what -- eight months since the comments were  
16 received. Then in that situation, I guess, as stakeholders,  
17 what we want is at least perhaps some status report that's  
18 put onto the web that says, you know, We're working on this,  
19 or, you know, We foresee in the horizon X regs.

20           And that way, at least we're -- we feel like  
21 we're part of the loop and we can -- and if there's  
22 something that we want to address, we could at least file  
23 more comments or do something. But we feel like there's --  
24 we're just in this black abyss. And I understand. I, too,

1 am an attorney, also.

2 And so I understand the concept of ex parte  
3 communication and things like that and how that would be a  
4 problem. But once it gets so lengthy, there has to be at  
5 least something that we can have.

6 MR. LEVITT: Okay. That's a valid point. Thank  
7 you.

8 Other questions or comments? Yes?

9 While he's walking up there, I'll welcome Ken  
10 Moore, who's executive director of the Interstate Shellfish  
11 Sanitation Commission. I think maybe he wins the award for  
12 the person who travelled the furthest today.

13 Okay. We'll let you introduce yourself, though,  
14 for the record.

15 MR. MOORE: I'm Ken Moore, and I am with the  
16 Interstate Shellfish Sanitation Com. I really want to  
17 comment, not so much a question. Regarding the Food Code,  
18 our organization, quite frankly, provided the blueprint that  
19 the Conference for Food Protection used when they developed  
20 their organization. And quite frankly, we copied ours from  
21 the milk conference.

22 Ours is -- the Interstate Shellfish Sanitation  
23 Conference is a little different in the fact that we deal  
24 with interstate shipments of shellfish. Therefore, when our

1 organization adopts a requirement, every state is expected  
2 to go home and adopt the requirement in their entirety.  
3 There are no choices regarding whether -- you know, whether  
4 you can adopt a portion or not, because not only is FDA, but  
5 the states, as well, expect reciprocity in programs.

6 I'm going to tell you with the Food Code, if  
7 every state was required to adopt the Food Code in its  
8 entirety, it would look different today. One of the reasons  
9 you have the adoption of the document that you have or the  
10 ratification by the states is they recognize the fact that  
11 they would have options when they return home. You have a  
12 unique talent if you expect every state to adopt the Food  
13 Code as it is presently written.

14 I see difficult issues before our conference --  
15 issues of things like particular situations in shellfish  
16 which affect immuno-compromised individuals. Those issue  
17 are debated over years. The organization has, quite  
18 frankly, found themselves in situations where certain public  
19 health officials felt differently about the right of choice  
20 the consumers had.

21 Those issues become very difficult if you're in a  
22 process in which the results of the discussion will result  
23 in every state having to adopt each requirement in its  
24 entirety. So I only want to suggest that you do have a

1 challenge if your purpose is to develop a Food Code in which  
2 every state is going to adopt it. I mean, I recognize what  
3 Shirley said, as well, when she said that we'll sweeten the  
4 pot.

5 Well, quite frankly, if you look at democracy,  
6 and that's what the country's all about, everyone supposedly  
7 has their own process. And when you're looking at food,  
8 you're looking at situations that aren't necessarily  
9 interstate shipments of food. They're intrastate shipments.  
10 Quite frankly, the states have that choice as to how they  
11 plan to regulate it.

12 You find different opinions in different parts of  
13 the country. You find different cultures in different parts  
14 of the country. Again, you have some unique challenges.  
15 Thank you.

16 MR. LEVITT: Thank you. If I was Mark Barnett,  
17 I'd be at the point that I'd say we have time for one more  
18 question. And seeing none, let me again thank all of you  
19 for coming, thank the presenters, again thank the staff both  
20 in Chicago and from back in Washington.

21 Mr. Mlecko, thank you for your hospitality --

22 MR. MLECKO: You're welcome.

23 MR. LEVITT: -- as host of the meeting, and Dr.  
24 Armstrong from the Moffett Center. And we'll continue to

1 work on this issue. So we wish you all a safe trip back  
2 home. This will conclude the meeting.

3 (Whereupon, at 4:25 p.m., the hearing was  
4 concluded.)

REPORTER'S CERTIFICATE
