

—— Volume 13, Number 1 ———

Cases of HIV Infection and AIDS in the United States and Dependent Areas, by Race/Ethnicity, 2002–2006

The *HIV/AIDS Surveillance Supplemental Report* is published by the Division of HIV/AIDS Prevention, National Center for HIV/AIDS, Viral Hepatitis, STD, and TB Prevention, Coordinating Center for Infectious Diseases, Centers for Disease Control and Prevention (CDC), U.S. Department of Health and Human Services, Atlanta, Georgia.

Data are presented for cases of HIV infection and AIDS reported to CDC through June 2007. All data are provisional.

The *HIV/AIDS Surveillance Supplemental Report* is not copyrighted and may be used and copied without permission. Citation of the source is, however, appreciated.

Acknowledgments

Publication of this report would not have been possible without the contributions of the state and territorial health departments and the HIV/AIDS surveillance programs that provided surveillance data to CDC.

This report was prepared by the following staff and contractors of the Division of HIV/AIDS Prevention, National Center for HIV/AIDS, Viral Hepatitis, STD, and TB Prevention, CDC: Lorena Espinoza, Xiaohong Hu, Denise Hughes, Michael Campsmith, Irene Hall, Marie Morgan (editing), Jan Brzuskiewicz (cover), and Michael Friend (desktop publishing).

The HIV/AIDS design element on the cover is used with the permission of the American Red Cross.

Commentary

This report complements the information in the 2006 HIV/AIDS Surveillance Report and updates the information in the supplementary report on race/ ethnicity data from 2000 through 2004 (HIV/AIDS Surveillance Supplemental Report 2006;12[No. 1]). In this report, we present estimated numbers of cases of HIV infection, including cases of HIV infection that progressed to AIDS. These data are stratified by the following races and ethnic groups: white, black or African American, Hispanic or Latino, American Indian or Alaska Native (these classifications have not changed). However, the Asian or Pacific Islander category displayed in previous HIV/AIDS surveillance reports (annual and supplemental) has been split into 2 categories: (1) Asian and (2) Native Hawaiian or other Pacific Islander. Puerto Rico implemented confidential name-based HIV infection case surveillance in January 2003, and this report marks the first time that HIV case reports from Puerto Rico have been included in the tabulation and presentation of HIV/AIDS and AIDS data in a supplemental report.

Surveillance data on HIV infections, compared with data on AIDS, provide a more complete picture of the epidemic and the need for prevention and care services. However, the number of new HIV diagnoses during a given year does not necessarily reflect HIV incidence (i.e., new infections) because some persons were infected recently and others were infected at some time in the past. CDC has developed the serologic testing algorithm for recent HIV seroconversion (STARHS), which can distinguish recent from longstanding HIV infections at a population level. This algorithm has made it possible to develop a surveillance system that provides more accurate and timely estimates of HIV incidence. The monitoring of HIV incidence is critical in evaluating progress toward CDC's goal of reducing the number of new HIV infections in the United States and in allocating resources and evaluating prevention program effectiveness.

In this report, *HIV/AIDS* is used to refer to 3 categories of diagnoses collectively: (1) a diagnosis of HIV infection (not AIDS), (2) a diagnosis of HIV infection with a later diagnosis of AIDS, and (3) concurrent diagnoses of HIV infection and AIDS. For analyses of HIV/AIDS data, we used data from the 38

areas (33 states and 5 U.S. dependent areas) that have had confidential name-based HIV infection reporting long enough (i.e., since at least 2003) for data collection to stabilize and for adjustment of the data in order to monitor trends. This report summarizes the diagnoses and the prevalence of HIV/AIDS by race/ethnicity. For analysis of diagnoses of AIDS, we used data from the 50 states, the District of Columbia, and 5 U.S. dependent areas.

REPORT HIGHLIGHTS

- From 2003 through 2006, the numbers of HIV/ AIDS cases in the 38 areas with confidential namebased HIV infection reporting increased among whites and Asians and fluctuated among American Indians/Alaska Natives. The number of cases among Hispanics/Latinos and blacks/African Americans remained stable; however, blacks/ African Americans accounted for 47% of all new diagnoses of HIV/AIDS in 2006 (Table 1).
- From 2003 through 2006, the numbers of HIV/ AIDS cases in males increased among whites, Hispanics/Latinos, and Asians and remained stable among blacks/African Americans. The numbers of cases in females decreased among blacks/African Americans; remained stable among whites, Hispanics/Latinos, and Asians; and fluctuated among American Indians/Alaska Natives (Table 2).
- In 2005, the proportions of HIV infections in adults and adolescents (≥13 years of age) that progressed to AIDS within 12 months after HIV infection were 42% among Hispanics/Latinos, 38% among blacks/ African Americans, and 35% among whites. The proportions among other races were 49% among Native Hawaiians/other Pacific Islanders, 39% among American Indians/Alaska Natives, and 36% among Asians (Table 3).
- From 2002 through 2006, the numbers of AIDS cases in adults and adolescents (≥13 years of age) decreased among blacks/African Americans and American Indians/Alaska Natives, remained stable among whites and Hispanics/Latinos, and increased among Asians and Native Hawaiians/other Pacific Islanders. The numbers of AIDS cases in children

- (<13 years of age) decreased among whites, blacks/ African Americans, and Hispanics/Latinos (Table 4).
- In 2006, the rates of AIDS cases in the 50 states and the District of Columbia ranged from a high of 61.5 per 100,000 among black/African American adults and adolescents to a low of 4.1 per 100,000 among Asian adults and adolescents (Table 7).
- In 2006, the rates of HIV/AIDS cases in the 33 states with confidential name-based HIV infection reporting ranged from a high of 87.0 per 100,000 among black/African American adults and adolescents to a low of 7.6 per 100,000 among Asian adults and adolescents (Table 8).
- At the end of 2006, an estimated 509,681 persons were living with HIV/AIDS in the 38 areas with confidential name-based HIV infection reporting since 2003: 46% were black/African American, 32% white, 20% Hispanic/Latino, 1% Asian, and <1% each were American Indian/Alaska Native and Native Hawaiian/other Pacific Islander (Table 9).
- At the end of 2006, an estimated 448,871 persons in the United States and dependent areas were living with AIDS: 43% were black/African American, 34% white, 20% Hispanic/Latino, 1% Asian, and <1% each were American Indian/Alaska Native and Native Hawaiian/other Pacific Islander (Table 10).

Note. Data for Native Hawaiians/other Pacific Islanders must be interpreted with caution because of the small numbers of cases.

Data include persons with a diagnosis of HIV infection (not AIDS), a diagnosis of HIV infection and a later diagnosis of AIDS, or concurrent diagnoses of HIV infection and AIDS.

^a Heterosexual contact with a person known to have, or to be at high risk for, HIV infection.

^b Includes hemophilia, blood transfusion, perinatal exposure, and risk factor not reported or not identified.

^C Includes hemophilia, blood transfusion, and risk factor not reported or not identified.

^d Hispanics or Latinos can be of any race.

^e Includes Asian and Pacific Islander legacy cases (see Technical Notes).

f Includes persons of unknown race or multiple races and persons of unknown sex. Because column totals were calculated independently of the values for the subpopulations, the values in each column may not sum to the column total.

Data include persons with a diagnosis of HIV infection (not AIDS), a diagnosis of HIV infection and a later diagnosis of AIDS, or concurrent diagnoses of HIV infection and AIDS.

^a Hispanics or Latinos can be of any race.

^b Includes Asian and Pacific Islander legacy cases (see Technical Notes).

^C Includes persons of unknown race or multiple races and persons of unknown sex. Because column totals were calculated independently of the values for the subpopulations, the values in each column may not sum to the column total.

See Technical Notes for the list of areas that have had laws or regulations requiring confidential name-based HIV infection reporting since at least 2003.

Data exclude 39 persons whose month of diagnosis of HIV infection is unknown.

^a Includes persons whose diagnoses of HIV infection and AIDS were made at the same time.

^b Includes persons in whom AIDS has not developed.

^C Hispanics or Latinos can be of any race.

 $^{^{\}mbox{\scriptsize d}}$ Includes Asian and Pacific Islander legacy cases (see Technical Notes).

^e Includes persons of unknown race or multiple races and persons of unknown sex. Because column totals were calculated independently of the values for the subpopulations, the values in each column may not sum to the column total.

Total cases ^c	34,770	18.8	33,659	18.1	34,239	18.2	35,314	18.5

Data include persons with a diagnosis of HIV infection (not AIDS), a diagnosis of HIV infection and a later diagnosis of AIDS, or concurrent diagnoses of HIV infection and AIDS.

See Technical Notes for the list of areas that have had laws or regulations requiring confidential name-based HIV infection reporting since at least 2003.

Data exclude cases in persons whose state or area of residence is unknown, as well as cases from U.S dependent areas, for which U.S. census information about race and age categories is lacking.

^a Hispanics or Latinos can be of any race.

^b Includes Asian and Pacific Islander legacy cases (see Technical Notes).

^C Includes persons of unknown race or multiple races and persons of unknown sex. Because column totals were calculated independently of the values for the subpopulations, the values in each column may not sum to the column total.

Data include persons with a diagnosis of HIV infection (not AIDS), a diagnosis of HIV infection and a later diagnosis of AIDS, or concurrent diagnoses of HIV infection and AIDS.

See Technical Notes for the list of areas that have had laws or regulations requiring confidential name-based HIV infection reporting since at least 2003.

Dash indicates that the rate is not reported because no cases or fewer than 5 cases of HIV/AIDS were reported.

Ellipses indicate racial/ethnic groups for which no cases or fewer than 5 cases of HIV/AIDS were reported.

NC indicates that the rate could not be calculated because U.S. census information about race and age categories was lacking.

^a Hispanics or Latinos can be of any race.

b Includes Asian and Pacific Islander legacy cases (see Technical Notes).

^C Rates include persons of unknown race or multiple races.

^d Dependent areas with fewer than 100,000 population are not reported.

^e Includes cases from American Samoa, the Northern Mariana Islands, and the U.S. Virgin Islands.

f Includes rates from American Samoa, the Northern Mariana Islands, and the U.S. Virgin Islands.

⁹ Because column totals were calculated independently of the values for the subpopulations, the values in each column may not sum to the column total.

Technical Notes

SURVEILLANCE OF HIV INFECTION

This report includes data from case reports from 38 areas that had laws or regulations requiring confidential name-based HIV infection reporting for adults, adolescents and children, in addition to the reporting of AIDS. Data in this report are from cases reported according to the 2000 revised HIV surveillance case definition [1].

SURVEILLANCE OF AIDS

AIDS cases are reported to CDC by all 50 states, the District of Columbia, and U.S. dependent areas, by use of a uniform surveillance case definition and case report form. Data in this report are from cases reported according to the 2000 revised HIV surveillance case definition [1]. Persons in whom HIV infection progresses to AIDS are reported as having AIDS.

TABULATION OF DATA

The supplemental report is organized in 2 sections: (1) cases of HIV/AIDS and AIDS and (2) persons living with HIV/AIDS or AIDS. Data estimating the number of persons with diagnoses of HIV/AIDS or AIDS and the number of persons living with HIV/AIDS or AIDS have been statistically adjusted to correct for delays in the reporting of cases. Unreported risk factors have been statistically redistributed to better present the trends in the epidemic and the distribution of risk factors among affected populations. For the assessment of trends in diagnoses or prevalence, it is preferable to use adjusted data, presented by year of diagnosis instead of vear of report, to eliminate artifacts of reporting in the surveillance system. The racial/ethnic distribution of cases of HIV/AIDS reflects the racial/ethnic distribution of the 38 areas and should not be considered representative of all persons with HIV/AIDS in the United States.

The data in this report are provisional. This report includes information received by CDC through June 30, 2007.

Inclusion of Areas with Mature HIV Reporting Systems for Analysis of Cases of HIV Infection

The inclusion of areas with mature confidential name-based HIV reporting for the tabulation of HIV/ AIDS data was based on the date that HIV infection reporting was implemented in the area and the ability to calculate 4 years of reporting delays in order to display trends reliably. This report includes the 38 areas with laws or regulations requiring confidential namebased HIV infection reporting since 2003. The 38 areas comprise 33 states (Alabama, Alaska, Arizona, Arkansas, Colorado, Florida, Idaho, Indiana, Iowa, Kansas, Louisiana, Michigan, Minnesota, Mississippi, Missouri, Nebraska, Nevada, New Jersey, New Mexico, New York, North Carolina, North Dakota, Ohio, Oklahoma, South Carolina, South Dakota, Tennessee, Texas, Utah, Virginia, West Virginia, Wisconsin, and Wyoming) and 5 U.S. dependent areas (American Samoa, Guam, the Northern Mariana Islands, Puerto Rico, and the U.S. Virgin Islands).

Race and Ethnicity

In the *Federal Register* for October 30, 1997 [2], the Office of Management and Budget announced the Revisions to the Standards for the Classification of Federal Data on Race and Ethnicity. Implementation by January 1, 2003, was mandated. At a minimum, data on the following racial categories should be collected: American Indian or Alaska Native; Asian; black or African American; Native Hawaiian or other Pacific Islander; and white. Additionally, systems must be able to retain information when multiple racial categories are reported. In addition to data on race, data on 2 categories of ethnicity should be collected: Hispanic or Latino and not Hispanic or Latino.

This report is the first in which the new racial categories have been used for HIV/AIDS and AIDS surveillance data. In the most recent annual surveillance report (the 2006 HIV/AIDS Surveillance Report) [3], the numbers displayed for the Asian/Pacific Islander category are not comparable to the numbers displayed for the 2 new racial categories: (1) Asian and (2) Native Hawaiian and other Pacific Islander. The Asian category includes the cases in Asians/Pacific

Islanders (referred to as legacy cases) that were reported before the implementation of the new racial categories in 2003 and a small proportion of cases in Asians/Pacific Islanders that were reported after 2003 but that were reported according to the old racial category (Asian/Pacific Islander).

Age

The designation "adults and adolescents" refers to persons aged 13 years and older; the designation "children" refers to persons less than 13 years of age. For tables concerning persons living with HIV infection or with AIDS, the age designation is based on the person's age as of December 31, 2006.

For all other tables, the age designation (for example, "adults and adolescents") or the specific age group (for example, 20–24 years) is based on the person's age at the time of the first documented positive result of an HIV antibody test (for persons with a diagnosis of HIV infection) or the person's age at the time AIDS was diagnosed.

Geographic Designations

The areas of residence included in the report are defined as follows.

Northeast: Connecticut, Maine, Massachusetts, New Hampshire, New Jersey, New York, Pennsylvania, Rhode Island, and Vermont

Midwest: Illinois, Indiana, Iowa, Kansas, Michigan, Minnesota, Missouri, Nebraska, North Dakota, Ohio, South Dakota, and Wisconsin

South: Alabama, Arkansas, Delaware, District of Columbia, Florida, Georgia, Kentucky, Louisiana, Maryland, Mississippi, North Carolina, Oklahoma, South Carolina, Tennessee, Texas, Virginia, and West Virginia

West: Alaska, Arizona, California, Colorado, Hawaii, Idaho, Montana, Nevada, New Mexico, Oregon, Utah, Washington, and Wyoming

U.S. dependent areas: American Samoa, Guam, the Northern Mariana Islands, Puerto Rico, and the U.S. Virgin Islands

Persons Living with HIV Infection or AIDS

Tabulations of persons living with HIV/AIDS or with AIDS do not reflect actual counts of cases reported to the surveillance system. Rather, the estimates are based on numbers of reported cases, which

have been adjusted for delays in the reporting of cases and deaths.

TRANSMISSION CATEGORIES

For surveillance purposes, cases of HIV/AIDS and AIDS are counted only once in a hierarchy of transmission categories. Persons with more than one reported risk factor for HIV are classified in the transmission category listed first in the hierarchy. The exception is men who report sexual contact with other men and injection drug use; this group makes up a separate transmission category.

Persons whose transmission category is classified as male-to-male sexual contact include men who report sexual contact with other men (i.e., homosexual contact) and men who report sexual contact with both men and women (i.e., bisexual contact). Persons whose transmission category is classified as high-risk heterosexual contact are persons who report specific heterosexual contact with a person known to have, or to be at high risk for, HIV infection (e.g., an injection drug user).

Adults and adolescents born in, or who had sex with someone born in, a country where heterosexual transmission was believed to be the predominant mode of HIV transmission (formerly classified as Pattern II countries by the World Health Organization) are no longer classified as having heterosexually acquired HIV infection unless they meet the criteria for high-risk heterosexual contact stated in the preceding paragraph. Similar to other cases among persons who were reported without information about a behavioral or transfusion risk factor for HIV infection, these cases are now classified (in the absence of other risk factor information that would classify them in another transmission category) as "no risk factor reported or identified" [4].

Cases in persons with no reported exposure to HIV through any of the routes listed in the hierarchy of transmission categories are classified as "no risk factor reported or identified." No identified risk factor (NIR) cases include cases that are being followed up by local health department officials; cases in persons whose exposure history is missing because they died, declined to be interviewed, or were lost to follow-up; and cases in persons who were interviewed or for whom other follow-up information was available and no risk factor was identified.

RATES

Rates per 100,000 population were calculated for the numbers of cases of HIV/AIDS and AIDS in 2006, as well as for persons living with HIV/AIDS at the end of 2006. The population denominators used to compute these rates for the 50 states and the District of Columbia were based on official intercensal estimates for 2006 from the U.S. Census Bureau [5]. These rates differ slightly from those in the 2006 HIV/AIDS Surveillance Report; in that report, the rates were based on bridged-race estimates for 2006 obtained from the National Center for Health Statistics [6].
