- Other relevant considerations, such as ACC's petition to delist MIBK under EPCRA section 313.
- List of all support documents in the petition.

The petition lists three companies (Eastman Chemical, Shell Chemical, and Union Carbide) that produced 220 million pounds domestically in 1995. The petition describes MIBK as being both a solvent and chemical intermediate. When used as a solvent, it is highly efficient for dissolving a wide variety of resins. Therefore, it is widely used in surface coatings, adhesives, inks, and traffic marking paints. The MIBK is also used as a solvent in cleaning fluids and dewaxing agents, and in the extraction of fats, oils, waxes, and resins. It is used in the formulation of high-solids coatings which are being used to reduce emissions of volatile organic compounds (VOC) from many types of coatings. The MIBK is reported to occur naturally in plants and animals, and has been identified as a natural component of several foods.

According to the petition, based on the chemical and physical properties of MIBK, inhalation is the only significant route of human exposure to MIBK emissions. Using the most recent TRI data and some site-specific data as input in a tiered air dispersion modeling approach, the petition develops estimates of the maximum annual and 24-hour concentrations anticipated to occur at the boundaries of facilities known to emit MIBK. The petition compares modeling output to available health data to conclude that, given the low concentrations anticipated to occur at facility boundaries, MIBK cannot reasonably be anticipated to cause either acute or chronic adverse health effects to people living near these facilities.

The petition discusses the results of fugacity modeling that was performed to evaluate the fate of MIBK in air, water, soil and sediment. The results of the modeling indicate that the concentrations of MIBK in water, soil, and sediment are well below levels expected to pose hazards to human health or the environment.
