Available for licensing and rapid implementation is a computerized neural network for predicting drug dosage and clinical outcome based on the use of data from drug dosage, drug effect and patient clinical characteristics. This network is especially suited to predict dosage and outcome for Abciximab. By establishing associated mapping, the neural network can predict a drug effect for a given patient characteristic and conversely predict drug dosing for a given drug effect and patient characteristic. The associative mapping is established and can be modulated by setting and adjusting weights of the connections between nodes in the neural network. The invention uses a feed-forward back-propagation neural network to model pharmacodynamic behavior and to predict drug dosage.
