

the MY 2000 R models, with one injury allegation and one crash allegation.

To address consumer complaints about this condition, Suzuki redesigned the second driven gear for the R model. In November 2000, a newly-developed second driven gear was introduced as a running change to the MY 2001 R model and released as the recommended service part for all subject motorcycles. A technical training video was released to Suzuki dealers to help their mechanics diagnose the symptoms before disassembling the transmission. A copy of this tape was supplied with Suzuki's reply to ODI's information request.

Suzuki's Quality Assurance group examined several warranty return parts for mechanical integrity, noting that several displayed signs of abuse consistent with "incomplete or abusive shifting practices." Suzuki alleged that these practices will produce high impact shock loads between the gears' engagement surfaces, leading to localized deformation. Eventually, the deformation helps to create a force between the two gears, in this case second and sixth, pushing them apart. If the magnitude of the separating force between the gears exceeds the force generated by the shifting mechanism to hold them together, the two momentarily disconnect, and then are forced back together by the shifting mechanism. This momentary disconnect-reconnect as the motorcycle is accelerated gives the operator a slipping or popping sensation as the transmission delivers torque to the rear wheel. Under rapid acceleration, the operator can experience a quick, hesitation-like feeling when second gear momentarily disengages, accompanied by a change in the pitch of the sound generated by the engine. Left unattended, the slippage can increase in frequency and duration.

To reproduce and demonstrate the failure consequences to ODI, Suzuki prepared one subject motorcycle with parts intended to represent worst-case conditions on the engagement surfaces of the second gear. Additional instrumentation was installed on the shifting mechanism to record the resultant forces and the momentary disconnect of the second gear. Normal operation of the motorcycle, accelerating through a series of turns and straight roadways, was digitally taped (video) to allow analysis of the condition and its consequences, both from an observer's perspective and that of the operator. Review of the video clips did not identify an increased risk to safety or a loss of vehicle control.

Based on this analysis, it is unlikely that NHTSA would issue an order for the notification and remedy of a safety-related defect in the subject vehicles at the conclusion of the investigation requested in the petition. Therefore, in view of the need to allocate and prioritize NHTSA's limited resources to best accomplish the agency's safety mission, your petition is denied.
