

project to allow recirculation of leachate using an alternative landfill liner design will apply only to the Buncombe County Landfill in Asheville, North Carolina and the specific landfill cells at that landfill. Modifications to the terms and conditions pertaining to this XL pilot project are contained in the Final Project Agreement (FPA), on which EPA is requesting comment today. The FPA sets forth the intentions of EPA, Buncombe County, and the State of North Carolina with regard to the implementation of the project and the expected benefits. After review of the comments received during the public comment period and revision of the FPA, as appropriate, the FPA modification will be signed by representatives from the EPA, the State of North Carolina, and Buncombe County.

The legal implementing mechanism for this project is a site-specific rule. The proposed rule was made available for public comment on April 16, 2001 (66 FR 19403). The final rule was promulgated on August 22, 2001 (66 FR 44061). Through the final rule, the design of the bioreactor landfill is enforceable in the same way that current RCRA standards for landfills are enforceable to ensure that management of nonhazardous solid waste is performed in a manner that is protective of human health and the environment. The Final Project Agreement and the site-specific rule do not in any way affect the provisions or applicability of any other existing or future regulations.

Since the last publication of the list on September 27, 2002 (67 FR 61109), new information has been reviewed and added. Norwalk and Norwalk-like viruses, previously listed in Part I, are now identified as Noroviruses so as to conform with current scientific nomenclature.

I. Pathogens Often Transmitted by Food Contaminated by Infected Persons Who Handle Food, and Modes of Transmission of Such Pathogens

The contamination of raw ingredients from infected food-producing animals and cross-contamination during processing are more prevalent causes of foodborne disease than is contamination of foods by persons with infectious or contagious diseases. However, some pathogens are frequently transmitted by food contaminated by infected persons. The presence of any one of the following signs or symptoms in persons who handle food may indicate infection by a pathogen that could be transmitted to others through handling the food supply: Diarrhea, vomiting, open skin sores, boils, fever, dark urine, or jaundice. The failure of food-handlers to wash hands (in situations such as after using the toilet, handling raw meat, cleaning spills, or carrying garbage, for example), wear clean gloves, or use clean utensils is responsible for the foodborne transmission of these pathogens. Non-foodborne routes of transmission, such as from one person to another, are also major contributors
