

existing questions or content on the ACS, such as out-of-date response categories, or more consequential problems such as questions resulting in estimates that seem systematically lower or higher than expected, based on comparisons to other sources. Additionally, recent or anticipated legislative action may result in identification of new content, not currently included on the ACS, for testing. In this phase, 11 of 25 existing housing questions, 15 of 43 existing socio-economic questions, and three new socio-economic questions were identified for inclusion in the second stage of the content test.

The second stage of the content test, content determination, includes cognitive laboratory pretesting, expert reviews and other pretesting methods for the purpose of developing alternate versions of question content identified as eligible for testing. As with the previous stage, representatives from numerous federal agencies, as well as other data users, have contributed to these early pretesting efforts by providing their subject matter expertise in the development of alternatives.

Content test implementation, the third stage, will include a national sample field test with approximately 50,000 residential addresses. About half of the sample will serve as the test panel for the content, and the other half will serve as the control panel, receiving the current content of the 2005 ACS. The ACS Content Test will reflect almost all of the same data collection methodology as used with the current ACS, starting with mailing a prenotice letter and then an initial mailing package with an ACS questionnaire to residential addresses selected for participation. As with the current ACS, Census Bureau will mail a second questionnaire to the sampled address if no response is received after three weeks. Census Bureau staff will then follow-up households that do not respond by using computer-assisted telephone interviewing (CATI) and computer-assisted personal interviewing (CAPI).

Operations for the 2006 ACS Content Test and the current ACS will differ in that the content test will not provide Telephone Questionnaire Assistance (TQA), nor will it include a Telephone Edit Follow-Up (TEFU) operation for mail respondents. The TQA operation provides direct assistance to respondents while answering the mail form, potentially influencing how they interpret and respond to questions. The TEFU operation follows-up with households that return a mail form to collect more complete data. The 2006 ACS Content Test excludes these two

operations so that we can analyze data that most directly reflects the household's response to the questions.

Additionally, the 2006 ACS Content Test will differ from the current ACS in that the content test will include a CATI Content Follow-up as a method to measure simple response variance and response bias. Both response variance and response bias will serve as critical indicators of the quality of the test questions relative to the current versions of the ACS questions. Both English and Spanish languages will be available in the automated instruments used for this content test.

In the fourth and final stage, final content recommendations, an analysis of the data collected, including content follow-up data, will guide the selection of the versions of the questions that yield the highest quality data. Census Bureau analysts, subject matter experts, and experts from the other participating federal agencies will work together to determine the final question content based on the results of the test. The end product will reflect final content recommendation based on input from all participants. These

recommendations are expected in the early part of January 2007, so that the Census Bureau can implement all the necessary changes to the existing ACS data collection materials (*e.g.*, questionnaires, CATI/CAPI instruments, questionnaire instruction booklet, interviewer training materials, *etc.*) to reflect the final recommended questions/content in time for implementation of the 2008 ACS.

II. Method of Collection

The Census Bureau will mail prenotice letters and then paper questionnaires to households selected for the 2006 ACS Content Test. A reminder card is delivered to all sampled households that have not responded to the survey two weeks after the initial questionnaire was mailed. For households that do not return a questionnaire after three weeks, a second questionnaire is mailed to the non-responding household. After four weeks, Census Bureau staff will attempt to conduct interviews via CATI.

Census Bureau staff will conduct a CAPI for remaining non-response households after eight weeks. All responding households that include a telephone number on their returned questionnaire will be eligible for Content Follow-Up. The Content Follow-up reinterviews will start approximately two weeks after receipt of the first mail returns and continue for approximately two weeks after the closeout of CAPI operations.
