Background Information

Prior to 1870, western juniper was limited generally to rocky ridgetops or shallow soil areas with sparse vegetation. Changes in the historic trends are readily apparent within the CMPA. Historically, virtually all plant communities in the Burns District were subjected to wildland fire occurring on a variety of frequencies. The resulting mosaic of plant communities enhanced the success and diversity of animal species and contributed to the ecological integrity of the entire region. In fire-dependent ecosystems, occasional fire is essential to the health and function of the natural system. The loss of natural disturbance events or at least the modification of those events in this area has greatly modified specific habitats affecting the sensitive species living within them.
