Appendix B

Natural Gas Pipeline and System Expansions, 1997-2000

A great deal of new pipeline capability has been proposed for development throughout North America between now and the turn of the century. The most extensive development is focused on expanding the deliverability of Canadian gas to the U.S. Midwest and Northeast and to Canadian markets. Several new pipelines and system expansions are planned that not only would improve access to natural gas supplies in Western Canada but also to production from the developing areas, such as the Sable Island field in Eastern Canada. The second-largest focus is on improving access to the increasing deep-water production in the Gulf of Mexico. Next are those projects whose objectives are to increase the flow of lowercost supplies located in the Central United States to markets located primarily in the Midwest. Currently, the capability to do so is limited in some areas. The latter series of expansions will be competing, to some degree, with the projects slated to increase flows of Western Canadian gas to the Midwest marketplace.

Although there is a question as to whether or not the market can support all these expansions, it must be kept in mind that these projects can proceed only if sufficient commitments are entered into by future customers. ¹²⁰ Most of the proposed projects have, or are, undergoing market-testing through "open-season" offerings whereby potential customers have placed bids for future capacity on the proposed projects. The planned capacity of the proposed projects usually reflects the results of these open seasons and indicates that, at least at the moment, local distribution companies and other major customers believe demand will grow sufficiently to support the incremental supplies destined for these markets.

This appendix examines expansions to the North American natural gas pipeline network during 1997 and the nature and type of proposed pipeline projects announced or approved for construction during the next several years in the United States. It includes those projects in Canada and Mexico that tie in with U.S. markets or projects. Additional details on some of the proposed projects and an analysis of their potential impact on a regional basis or on the overall North American natural gas pipeline network may be found in the main body of the report.

Overview

At least 41 pipeline expansion projects were completed and placed in service in the United States during 1997 (Figure B1) representing more than 6.3 billion cubic feet per day (Bcf/d) of added pipeline capacity. These projects either added capacity directly to the interstate network, improved local intrastate service, or expanded access to producing fields or natural gas market centers. Seven of the projects increased interregional transmission capability by 750 million cubic feet per day (MMcf/d): 513 MMcf/d in the United States and 237 MMcf/d into Mexico (Tables ES1 and B1). These projects, plus others, increased overall daily interstate capability by a little more than 2 percent, or 4.6 Bcf, which is double the interstate capacity added in 1996. 121 Moreover, the total number of completed projects in the United States was substantially more than in 1995 (41 vs. 26).

Almost all the natural gas pipeline projects slated for completion in 1997 were placed in service on schedule. 122 Two were canceled because of changes in market conditions or competitive pressures. A few others were postponed while their original designs were reevaluated in light of conditional regulatory approval or shifts in construction priorities.

As of February 1998, the Energy Information Administration was tracking more than 100 proposed pipeline expansions and new pipeline projects at various stages of development in the United States, Canada, and Mexico, with planned in-service dates between 1998 and the end of 2000 (Figure B2). A number of these projects are slated to be phased in over several years or are jurisdictionally segmented (for instance, U.S. versus Canadian segments). If all U.S. projects were completed, overall daily deliverability on the national network would increase by almost 30 billion cubic feet (3 gathering system projects in the Gulf of Mexico and 11 Canadian projects, some of which are counted in the U.S. projects, are not included). Of all phases/projects, 62 are proposed for completion in 1998, 38 in 1999, and 20 in 2000. Thirty-nine of the projects call for development of new pipeline systems or facilities at new international border points (Table B2).

¹²⁰Without firm customer commitments, neither the necessary regulatory approval nor any needed external financing will be forthcoming. Nevertheless, it is possible that some customers might back out of these commitments after initial regulatory approval, thereby leaving the final implementation of a project in doubt.

Recent Developments and Proposals

The least amount of interstate pipeline development in 1997 occurred in the Western Region with the completion of only one small project (13 MMcf/d) serving the Reno area of Nevada and California. ¹²³ In addition, the Western Region has the least amount of proposed new pipeline capacity development of the regions. This is not surprising since the region currently has an excess of interstate capacity. Between 1990 and the end of 1996, interstate capacity into the region increased by 45 percent, from 7.1 to 10.3 Bcf/d, more than for any other region (see Chapter 4).

Other regions of North America saw more extensive pipeline development in 1997 or are slated for significant expansions in the next several years. These expansions can be looked at in two ways. First are those projects that are designed to improve access to developing production areas which have become capacity constrained. On the opposite side of the coin are the pipeline expansions that are designed to improve transportation to expanding market areas and which may or may not be tied in with accessing developing production sources. The following sections look first at projects and trends that are production-area focused and then at those that are geared toward specific markets.

Production Areas

Gulf of Mexico

One of the more significant events of the past several years has been the increased attention to development of gas

¹²³One other project was completed within the Western Region in 1997, the El Paso Havasu Crossover expansion. However, the purpose of this expansion was to increase the capability of the El Paso system to deliver additional supplies to West Texas, not for service within the Western Region itself.

Figure B2. General Location of Major Proposed Natural Gas Pipeline Construction Projects, 1998-2000 (Keyed to Table B2)

Source: Energy Information Administration (EIA), EIAGIS-NG Geographic Information System, Natural Gas Pipeline Construction Database, as of March 1998.

resources in the Gulf of Mexico and, specifically, in the deeper waters (greater than 200 meters) of offshore Louisiana, Alabama, and Mississippi. In 1997, six natural gas pipeline projects were completed in the Gulf, representing a total of 3.2 Bcf/d of new pipeline capacity (Table B1). Three of these projects now bring an additional 2.1 Bcf/d to onshore Louisiana, while the other three (1.1 Bcf/d) operate as gathering systems linking producing platforms in the Gulf with mainlines directed to onshore facilities. The largest of the new systems include the Nautilus and Texaco Discovery pipelines, both with capacities of 0.6 Bcf/d.

At least 10 offshore projects, representing more than 3.7 Bcf/d of capacity, have been proposed for development in 1998/1999. Most of these projects would reach into the deep water area of the Gulf to tap several new production sources

being developed there—most notably in the Ship Shoal, Green Canyon, Destin Corridor, Garden Banks, and Mississippi Canyon areas. ¹²⁴ Companies such as Shell Oil, Transcontinental Pipeline, and Williams Natural Gas Transmission are involved (Table B2). Development of offshore and deep water pipeline-related projects represents 52 percent of the 3.7 Bcf/d of planned additions in the Southwest Region and 44 percent of the 4.0 Bcf/d in the Southeast Region.

The remaining proposed onshore expansion projects in the Southwest Region are designed primarily to increase access to supplies in the east and south Texas and in the San Juan Basin of New Mexico. Several proposed projects in south Texas are designed to support exports to Mexico, if and when the connecting export facilities are finally put in place.

¹²⁴Three projects would direct supply to the Southeast (Alabama and Mississippi) and three to the Southwest (Louisiana). The other projects would be gathering systems.

^bCost and added capacity are the same for this and previous line item.

San Juan Basin (New Mexico) Access

Until recently, the capacity available to move gas from the San Juan Basin area eastward was limited. The rapid development of the area's coalbed methane and other supplies in the area during the late 1980's led to an excess in productive capacity. Originally the new production was expected to be consumed in the California market, and pipeline capacity was developed with that in mind. Today, however, the emphasis is on finding ways to expand deliverability for producers in the basin and move some of this supply eastward to link with market centers in the Texas Panhandle as well as those located in the Waha area of southwestern Texas. From there the gas could be redirected through northern and eastern Texas to Midwest and Northeast markets. The two major interstate pipeline companies in the area, Transwestern Pipeline Company and El Paso Natural Gas Company, have undertaken efforts to expand and enhance facilities on their respective systems, which would allow them to direct more production eastward to the Waha/Permian Basin centers.

In 1997, both pipeline companies completed projects that improved deliverability out of the San Juan Basin and planned several additional projects that would relieve the ongoing capacity constraint issue in the area. For instance, Transwestern Pipeline Company added an additional 25 MMcf/d with the expansion of compression on its system within the basin (Table B1). It also has Federal Energy Regulatory Commission (FERC) approval to expand its local capabilities by 245 MMcf/d in 1998. El Paso Natural Gas Company also plans to expand its local San Juan Basin capabilities by 116 MMf/d in 1998 (pending FERC approval) in response to rising production demands.

In addition, with the completion of the full TransColorado Pipeline system (from northern Colorado to northern New Mexico) in 1998, a portion of its 0.3 Bcf/d capacity could be available to local producers/shippers on an as-available basis.

The El Paso Natural Gas Company's completed its Havasu Crossover expansion project in mid-1997. This project uses expanded capacity on the westward-bound portion of the system to move supplies that are redirected eastward (either physically or by displacement) just east of the California border. The expansion upgraded the Havasu Crossover, which links the north and south parts of the El Paso system. These system enhancements increased El Paso deliverability in the Waha area of West Texas by an additional 180 MMcf/d.

Potential East and South Texas Expansions

Although no pipeline projects have been proposed for the area, the Cotton Valley Trend of East Texas is expected to

become a major new source of gas production over the next several years. The same is true of the area around Southeast Texas. In 1997, Delhi Pipeline Company and several other intrastate pipelines expanded parts of their gathering and mainline systems to accommodate current and future new production. The question remains, however, whether current interstate capacity levels, which are not fully utilized at the present, can handle the new production without expansion. The proposed ANR Katy project, which was, in part, targeted at shippers who potentially might want to access this new production, did not generate as much interest as the company expected when an "open-season" was offered in mid-1997. The future of the project is currently under review by the company.

Rocky Mountain Area Access

In the past, Rocky Mountain supplies (Colorado, Wyoming and Utah) generally moved to a strong southern California gas market, but the current emphasis of area producers is to increase their presence in local energy markets and to extend their customer base further in U.S. Midwestern and Eastern markets. Customers in the Midwest and East are also very interested in having greater access to these relatively lower priced supplies.

In 1997, several natural gas pipeline projects were completed that furthered that goal. For instance, KN Interstate Pipeline Company placed its "Pony Express" line (0.26 Bcf/d) in service in August and the Trailblazer/Overthrust/Wyoming Interstate system (0.1 to 0.2 Bcf/d) expansion was completed in the last quarter of the year. The latter expansion increased the system's deliverability to its interconnection with the Natural Gas Pipeline Company of America's Amarillo line, which transports supplies to the Midwest Region.

The proposed pipeline expansion projects in the area, for the most part, target expanding regional service as an outlet for expanding area production. Two major project proposals, the KN Interstate Pipeline Company's Front Runner projects (Table B2), both intend to transport Wyoming supplies to a growing Denver, Colorado, marketplace. The Questar Pipeline Company proposes to expand its capabilities in the Salt Lake City area.

In addition to the expanding production in areas of the Rocky Mountains located in Wyoming, Utah, and northern Colorado, the Powder River area of southern Montana and northern Wyoming is expected to develop into a major producing area over the next decade. Already several of the pipeline projects discussed earlier have anticipated access to this area's production in their design.

Improved Access to Canadian Supply

During 1997, the TransCanada Pipeline system increased its domestic deliverability by 119 MMcf/d and expanded several of its export points to the United States. However, only one of the interconnecting U.S. pipelines (Viking Gas Transmission Company) expanded its capacity accordingly. The TransCanada export upgrades were primarily to alleviate some of its own limitations. Most of the U.S. pipelines were already capable of accepting the increased flows.

The completion of these projects in 1997 only partially relieved the existing capacity constraint problem on the TransCanada system. Flow restrictions on the system have limited western Alberta (Canada) natural gas producers' access to markets to the east during the past several years. However, within Canada, a number of projects are planned that will improve operational flows significantly and add to export capability. Although it is doubtful that all will be built, 11 projects within Canada, representing more than 8.6 Bcf/d of new capacity, 125 have been proposed for development by the end of 2000. Several, like the NOVA system expansion and the new ANG Kootenay Pacific Pipeline, would increase production area exit capacity. However, the bulk of the new capacity that is being proposed would be longhaul system capacity targeted for eastern Canadian natural gas markets (which are growing rapidly) and to expand export capabilities (Figure B3).

Reflecting the growing Canadian production and desire to flow more of that gas to U.S. markets, 14 projects have been proposed that could add as much as 5.9 Bcf/d to U.S. import capacity from Canada during the next 3 years, an increase of 52 percent from the 1997 level. 126 The volume increase is 17 percent more than the total Canadian import capacity added from 1991 through 1997, 5.0 Bcf/d (see Chapter 3). This anticipated growth also reflects the continuing U.S. demand for Canadian natural gas, especially in the Midwest and Northeast regions.

These efforts include several very large projects. For example, a new natural gas pipeline (the Alliance project) would bring gas from British Columbia to the Chicago, Illinois, area along the right-of-way of an existing oil pipeline. Several other projects are competing with the Alliance project, including

the Viking Voyageur Pipeline, which is a 1.4 Bcf/d line between the Noyes, Minnesota, import point and the Chicago, Illinois, area, and the Northern Border Project 2000, which is a 400 MMcf/d expansion¹²⁷ that includes a proposal to extend the system to Indiana and possibly to the Michigan-Canada border to serve the Ontario marketplace. (Note: In late April 1998 the sponsors of the Viking Voyageur Project announced that it was unlikely that they would be able to secure enough future shipper commitments and available production in Canada to make the project viable at its proposed level. As a result, the project may terminate or downsize. Since its 1999/2000 expansion plans are predicated in part upon the Viking Project, TransCanada Pipeline's expansion plans may have to cut back as well.) In addition, Great Lakes Gas Transmission in the Midwest Region and Iroquois Transmission in the Northeast plan to expand their existing systems by 441 and 160 MMcf/d, respectively, during the next several years.

Because of the growing demand for Western Canadian supplies in Eastern Canada and the United States, TransCanada Pipeline Ltd. applied to the Canadian National Energy Board in early 1998 to extend its expansion plans to accommodate an interconnection with the Viking Voyageur project and larger potential demand in the Canadian domestic market. The new capacity would be phased in over 2 years beginning in 1999. Currently, TransCanada is in the process of revising its expansion plans for 1999 to reflect its commitments to the Voyageur expansion.

In August 1996, the Federal Energy Regulatory Commission approved construction of the Northern Border Pipeline Company expansion project, which would add 0.7 Bcf/d to import capacity at the Montana border. Correspondingly, Foothills Pipe Line Ltd. of Canada, which interconnects with Northern Border Pipeline at Monchy, Montana, would expand its eastern leg by the same amount.

On the Canadian east coast, several new pipelines have been proposed to move gas supplies being developed off the Canadian Atlantic coast near Sable Island to markets in Canada and the United States (Table B2). The Maritimes & Northeast pipeline project would move Sable Island supplies to the Northeastern United States. The Maritimes & Northeast pipeline project's route will take it directly into the State of Maine and through New Hampshire to interconnections with the Tennessee Gas Pipeline system in Massachusetts. Another project, the MarineLine Subsea pipeline has been proposed. 128 It would not only provide an alternative transportation route

¹²⁵Final capacity levels for TransCanada Pipeline Company's 1999 expansion effort were not available as of March 1998.

¹²⁶Does not include two projects, representing 1.1 Bcf/d capacity, whose chances of success are marginal. It also does not include the Columbia Millennium project into the Northeast Region whose capacity is tied in with the import capacity into the Midwest and the 1.6 Bcf/d Alliance Pipeline import station, which for the most part is accounted for in that project.

¹²⁷Original plans were for a 1.3 Bcf/d expansion, but the project's size has been cut because of less-than-expected market interest.

¹²⁸In March 1998, this project was placed in an inactive status, pending completion of additional geological and geophysical surveys.

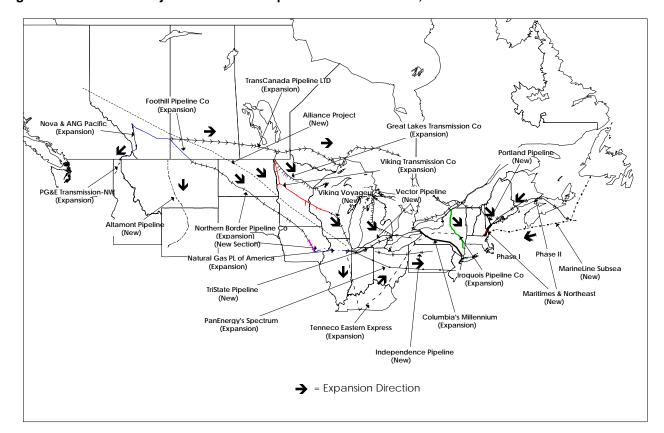

Figure B3. Planned Projects Related to Imports of Canadian Gas, 1998-2000

Source: Energy Information Administration (EIA), EIAGIS-NG Geographic Information System, Natural Gas Pipeline Construction Database, as of March 1998.

from Sable Island but also would handle receipts (supplies) from as far north as Newfoundland, through a sea route passing through the Sable Island fields and southward to landfall in New Hampshire.

Market Areas

Midwest

In 1997, only three interstate pipeline projects were completed in the Midwest Region (Table B1), adding 441 MMcf/d of new capacity. These projects represented an increase to intraregional capacity of only about one-half of 1 percent. However, one project (ANR Michigan Leg expansion) resolves a capacity bottleneck in the region, while the other two expanded deliverability to growing markets in Wisconsin and vicinity.

Based upon current proposals, natural gas pipeline deliverability to the Midwest Region will grow substantially

by the end of 2000, with 8.2 Bcf/d of new interstate capacity planned overall, the second highest of the six regions. But what really distinguishes the growth in the Midwest is that the vast majority of new capacity would be on newly built trunklines or extensions to existing pipelines bringing supplies from Canada. Ten of these projects would increase interregional deliverability by a total of 5.3 Bcf/d. The Midwest will be the terminus for the Alliance project, which alone would increase area service by 1.3 Bcf/d. Excluding the extension of Canadian supplies via the Northern Border Pipeline to Manhattan, Illinois (near Chicago), and Natural Gas Pipeline Company of America's (NGPL) Amarillo expansion (110 MMcf/d) destined for the same area, the Midwest Region's access to Canadian supplies could increase by as much as 117 percent (3.6 Bcf/d) from the 1997 level (3.0 Bcf/d).

Two new pipelines, TriState (0.5 Bcf/d) and Vector (1.0 Bcf/d), have been proposed to tranship supplies arriving via Voyageur, Alliance, and Northern Border pipelines in the Chicago area to markets in eastern Michigan and southern

Ontario, Canada. The Vector pipeline would provide an integral link in support of Columbia Gas Transmission Company's Millennium project, which has been proposed to begin gas deliveries in the fall of 1999 to customers in the Northeast (see next section). Vector would tranship supplies through Canada via the Union Gas System (Ontario) from the St. Clair export point and Dawn (Ontario) storage to the Millennium pipeline at Niagara, New York.

Northeast

More pipeline expansion projects were completed in the Northeast Region in 1997 than in any other part of North America. Twelve projects, accounting for about 770 MMcf/d of additional deliverability, or 2 percent of intraregional pipeline capabilities, were placed in service. However, only one of these projects (24 MMcf/d) increased interregional deliverability (Table B1). The capacity increase within the region was exceeded only in the Southwest Region. Almost all of the projects were to improve deliverability within local markets or to address bottlenecks that were limiting service in areas of growing demand. Texas Eastern Transmission's several expansion projects were implemented primarily to resolve the latter problem.

The Northeast has the most natural gas pipeline projects (28) slated for development and they represent the largest amount of proposed new pipeline capacity within any region of the United States, 8.3 Bcf/d. Several of the projects are continuations of ones that began in 1996 or 1997 and are being phased in over several years. While many of the proposed projects are smaller regional expansions serving local market areas, more than 59 percent of the added capacity would be on pipeline systems delivering from outside the Northeast Region. Of the 5.0 Bcf/d of proposed new interregional capacity, more than 53 percent would carry supplies originating in Canada.

Many of these projects have been planned because of expectations that an excess deliverability situation could occur in the Chicago area if all the projects slated to bring Canadian supplies into the Midwest are completed. This possibility has spurred several companies to plan large-scale projects that would extend some of this new capacity further eastward to Northeast markets. For example, ANR Pipeline Company and Transcontinental Gas Pipeline Company have proposed the jointly owned Independence project, which could carry 1.0 Bcf/d from ANR's line in northwestern Ohio to a major interconnection with Transcontinental's line in Leidy, Pennsylvania, a major hub serving the Northeastern marketplace. The new line would also be attractive to Canadian-gas shippers seeking an alternative route to Northeast markets. It could also provide an alternative route and opportunity for shippers now moving gas from the Southwest to the Midwest to reach customers in the Northeast.

Other projects that would move some of the new Midwestern pipeline supplies eastward include Tennessee Gas Pipeline Company's proposed Eastern Express project and Duke Energy Corporation's Spectrum project. These two projects alone represent a total of 1.2 Bcf/d of new capacity into the Northeast. Including the Independence and Millennium projects, as well as other import projects slated for development during the next several years, new capacity into the region could reach 5.2 Bcf/d, adding significantly to the 12.4 Bcf/d existing at the close of 1997.

The Spectrum project (0.5 Bcf/d) would extend from the Chicago, Illinois, area to New York and New England, mostly using expanded facilities along Duke Energy's affiliated pipelines: Panhandle Eastern, Texas Eastern, and Algonquin Gas Transmission systems (west to east). In addition, an interconnection with another affiliate, Trunkline Gas Company, could be utilized to move gas supplies from the Southwest Region if appropriate (as could the Panhandle Eastern Pipeline system). The Eastern Express project (0.7 Bcf/d) would utilize Midwestern Gas Transmission Company (an affiliate of Tennessee Gas Pipeline Company) to ship supplies southward (or though displacement) to Tennessee Gas's interconnection in northern Tennessee and then, through expanded facilities on its existing system, transport supplies from the Midwest to the east coast. In addition, the Eastern Express project would include expansion (0.2 Bcf/d) of Tennessee Gas's pipeline between its Niagara, New York, import point and its interconnections near Leidy, Pennsylvania, and its northern line extending directly to New England.

Canadian import expansions slated for development in 1998 and 1999 will result in increased capacity at several import points into the Northeastern United States and development of at least one new import point (for Columbia Gas Transmission's Millennium project). For example, in response to TransCanada's multiyear expansion plans, Iroquois Pipeline Company has proposed to expand its system by about 195 MMcf/d, phased in during 1998 and 2000. Also supported by the TransCanada expansion will be the new Portland Natural Gas Pipeline (178 MMcf/d), which would replace and expand Granite State Pipeline Company's leased line (31 MMcf/d) that currently brings Canadian gas to Maine via Vermont and New Hampshire. Combined with the Millennium import level of 0.7 Bcf/d and several import expansions related to other projects, direct Canadian export capacity to the U.S. Northeast could increase by about 2.6 Bcf/d by the end of 2000, a 91-percent increase over the 1997 level.

Planned expansions in the Northeast Region are also somewhat unique in that several projects represent cooperative efforts among regional pipeline systems. For example, the Texas Eastern expansion of service to some of its Virginia and eastern Pennsylvania service areas depends partly upon the completion of the CNG Transmission PL-1 line and Seasonal Service expansion projects, including improvements to storage deliverability. Columbia Gas Transmission, with its "Market Expansion" project, is also planning improvements (especially to storage services) on its system that would increase deliverability to several major interconnections with these same pipelines. National Fuel Gas Supply Company, another major regional system, has proposed upgrades to its system based upon the eventual completion of projects by Columbia, CNG, and Texas Eastern. In particular, National Fuel's project will complement CNG's planned improvement to its system for flowing gas between Leidy, Pennsylvania, a major storage area and hub interconnection point, and Steuben County, New York, and then northward where CNG and National Fuel have major interconnections. The first phases of several of these projects were completed in 1997.

Of the 28 singular projects planned within the region representing 8.3 Bcf/d of new capacity, a number are either directly or indirectly linked by mutual service needs or partnerships. ¹²⁹ These projects constitute about 18 percent, or 1.1 Bcf/d, of the new capacity additions in the region.

Southeast

Natural gas pipeline expansions completed in the Southeast Region in 1997 (436 MMcf/d) were intended mainly to improve Deliverability within the region, primarily in North and South Carolina, Georgia, and Alabama. These expansions represent less than 1 percent of the total 1996 regional pipeline capacity levels (Table ES1). One system, Transcontinental Gas Pipeline Company, was involved in three of the five projects completed in 1997. In addition to increasing service from its North Carolina mainline, completion of its Sunbelt project supported the expansion of the South Carolina Pipeline system, which was also completed in 1997.

Fifteen expansion projects, representing a potential 3.2 Bcf/d of new capacity development, are proposed for the Southeast Region. About 54 percent of this capacity is geared toward improving regional access to deep water production in the Gulf of Mexico. Offshore projects represent about 1.7 Bcf/d

of proposed capacity additions, all of which are scheduled to be in service sometime in 1998.

Five of these projects (1.2 Bcf/d of expansion capacity) represent an increased commitment by Transcontinental Gas Pipeline Company to customers within the region. Four other projects also represent greater service to regional markets, especially in the Atlanta, Georgia, area and the service territory of Atlanta Gas Light Company. Growth in the regional industrial market is helping to spur demand for additional natural gas supplies.

Also not to be overlooked in the expansion mix are the several projects that are designed to transport some of the growing Southwest regional production through the Southeast to markets in the Midwest and Northeast. The Tennessee Gas Pipeline Company's Express 500 is one such proposal, with up to 0.2 Bcf/d additional capacity to be added by 2000, increasing the existing capacity of its Line 500 located within the region. Columbia Gulf Transmission Company also will increase its mainline capacity by more than 0.2 Bcf/d. For the past several years, Columbia Gulf system has been operating below its original design capacity because of an aging infrastructure; the problem would be resolved with the completion of this project.

Mexico Market

Several projects have been proposed to add to the export capability of U.S. natural gas companies located near the border with Mexico (Table B2), although only two projects (237 MMcf/d) were completed in 1997. These were the first new export points to Mexico installed in 5 years (Table B1). None of the proposed projects represents enhancements to import capabilities, currently at about 350 MMcf/d, a figure that has not changed since the 1980s. All of the proposed projects are to support mostly industrial and power generation customers located in the border area.

If completed, the currently proposed projects would represent about 1.4 Bcf/d of additional export capacity (Table B2). Currently (1997), export capacity to Mexico stands at 1.1 Bcf/d. Several of the proposed projects are competing within and for the same market. For example, Both the MidCon-Texas Pipeline Company (Figure B2) and Coastal States Gas Transmission Company are seeking to negotiate with Mexican buyers for firm shipping agreements to essentially the same general area. Nevertheless, both companies view their projects as proceeding regardless of the outcome of negotiations. These two companies also have plans to construct pipelines within Mexico that will link with their border crossing project and Texas intrastate pipeline construction projects.

¹²⁹Transcontinental Gas Pipeline Company and Tennessee Gas Pipeline Company also have several projects in the region that will benefit from and support expansions in the region.

Most of the proposed projects have been proceeding slowly for environmental, economic, and regulatory reasons. One obstacle has been overcome with the installation of Mexico's newly formed regulatory authority, the Comision de Energia (CRE). The CRE has issued less restrictive regulations on foreign investment in Mexico, which affects the ownership and operation of pipeline facilities owned by others. In the fall of 1996, the CRE announced its first award of a (privatization) license permitting the development of a local gas distribution system in the Baja area of northern Mexico. ¹³⁰ This action may hasten the approval and final implementation of several similar local service development proposals, which are linked to pending U.S. export proposals that have remained dormant for several years.

In December 1997, construction was completed on the El Paso Energy Company's Samalayucca project, which links Texas supply sources with customers in Mexico's Chihuahua State. The 45-mile, 210 MMcf/d pipeline is the first pipeline located in Mexico owned in part by a U.S. company. A major customer of the project will be a 700 megawatt combined-cycle electric generating plant located in Samalayucca, Mexico, which will begin operations in late 1998.

Summary

The amount of new capacity proposed for development by the end of 2000 is significant and, if fully implemented, would represent a 9-percent increase in intraregional capacity from the 1996 level and a 17-percent increase in interregional

capacity (Table ES1). Although it is unlikely that all proposed expansions will be completed, additional projects continue to be proposed. During 1997 and early 1998, for instance, at least 22 pipeline companies instituted open-season exercises for 26 projects, with the expectation that the market will support additional expansion plans. These proposals, while not all sussessful, included expansions in all regions of the country.

Beyond what has already been proposed, there are areas of the country where additional pipeline expansion plans might develop in response to changing market profiles and the development of new supply sources. For instance, deep-water development in the Gulf of Mexico will continue over the next decade and with it could come additional complementary onshore expansions. In addition, the expanding production in areas of Texas and the Rocky Mountains will place pressure on local pipeline systems to expand their capabilities to reach nearby and distant markets. As a consequence, utilization rates on interconnecting interstate pipelines should increase and, in some cases, necessitate the development of new capacity on some systems.

The upcoming major increase in capacity from Canada to the U.S. Midwest may also spur additional development of new pipelines, or expansions of existing lines, that can provide alternative capacity for transhipment of some of this gas to the U.S. Northeast. Already several of the proposed Midwest-to-Northeast expansion projects are premised on the assumption that excess capacity into the Chicago, Illinois, area could develop over the next several years as new (proposed Canadian source) pipelines are completed during the interim.

¹³⁰The award was made to a consortium consisting of Pacific Enterprises International (PEI), Enova International Corporation, and Proxima. The license will permit the group to transport gas from PEI's local system in lower California into the city of Mexicali in northern Mexico.
