HIV-2/SIV Protein Alignments

There are 104 complete or nearly complete genomes (sequences longer than 4,000 bases) in our database that are from the HIV-2 and SIV-Sooty mangabey group. Twenty-eight sequences are HIV-2, but there are duplicates; only 20 are from unique samples. Seventy-six are SIVs (36 SIVsmm, 37 SIVmac, 2 SIVmne, 1 SIVstm). Although all these viruses have Sooty mangabeys as the natural host, there have been cross-species transfers into humans to create the HIV-2 groups A through G as well as into captive macaques (Rhesus macaques = mac, Stump tailed macaques = stm, and Pig tailed macaques = mne) by unintentional interspecies interactions. Intentional cross species transfers of virus remain labeled as being from the original host (e.g., HIV-1 injected into a Chimpanzee is labeled as HIV-1 and not as SIVcpz; SIVsmm injected into a Rhesus macaque is labeled as SIVsmm and not SIVmac). Sixty-four of the 104 complete genomes are presented in the complete genomes alignment in this compendium, the others were not included because they are replicates of the same strain or isolate (i.e., HIV-2 B isolate D205 entries X61240 and X16109). These same 64 sequences are present in most of the HIV-2/SIVsmm protein alignments except in proteins such as Env and Nef, where a large set of sequence entries containing that gene only and not the complete genome were available. For those proteins, we chose a diverse set including the sub-genomic sequences, and when more sequences than would fit on a page were available, highly similar sequences from the complete genome set of 64 were dropped (for example some of the SIVmac sequences). More than one SIVsmm-PBJ sequence was left in the Nef protein alignment, because of the importance of the R17Y mutation which creates an ITAM-like motif (YXXLXXXXXXXXYXXL) allowing the virus to replicate in unstimulated PBMCs [Du et al., *J. Virol* **70**(6):4157–61 (1996)]. A good review of SIV-SMM diversity in the USA primate research centers was published this year: Apetrei et al., Molecular epidemiology of simian immunodeficiency virus SIVsmm in U.S. primate centers unravels the origin of SIVmac and SIVstm. *J Virol*. 2005 Jul;**79**(14):8991–9005. PMID: 15994793
