

PPL Montana currently operates the project in both base load and peaking modes depending on water availability, electric demands, and existing license constraints. Typically, from mid-May to mid-August, inflows exceed the project's hydraulic capacity and the project is operated as a base load plant, continuously generating at maximum capacity. During this time, flows above the project's hydraulic capacity are captured in Mystic Lake which is gradually raised about 15 to 20 feet per month until it exceeds the project's current minimum recreation elevation of 7,663.5 feet msl. In most years, Mystic Lake is maintained about ten feet higher than the minimum recreation elevation during July and August.

After Labor Day, PPL Montana begins to slowly draft Mystic Lake, reducing its elevation by an average of 8 to 9 feet per month, until the lake is at or near its lowest elevation of 6,512.0 feet msl by the end of March. Drafting the lake permits PPL Montana to release more water into West Rosebud Creek than otherwise would be available from inflows from August through March. During the fall and early winter, PPL Montana employs limited peaking to maximize generation during high use periods, generally from 8 a.m. to 4 p.m. daily. In general, flow changes caused by peaking do not extend further than the project's re-regulation dam which creates West Rosebud Lake located

about one mile downstream of the powerhouse.

Proposed Project

Low Back Exposure Assessment Tool for Mining—NEW—National Institute for Occupational Safety and Health (NIOSH), Centers for Disease Control and Prevention (CDC).

Background and Brief Description

The Federal Mine Safety & Health Act of 1977, Section 501, enables CDC/NIOSH to carry out research relevant to the health and safety of workers in the mining industry. Mining has one of the highest incidence rates for back pain of any industry, and back injuries are
