Appendix A.

Description of Survey

SAMPLE DESIGN

The estimates shown in this report are derived from information obtained in the Survey of Use of Permits (SUP) and the Building Permits Survey. The SUP was designed to estimate residential construction activity in the permit-issuing areas. It is a monthly survey in which census field employees visit a sample of building permit offices and select a sample of building permits. The owners or builders are interviewed to find out whether and when each building authorized has been started. If the building has not been started, interviews are made in successive months until the building is reported started, the permit expires, or plans to build have been abandoned. Once a building has been reported started, it remains in the survey until completed or plans for construction are abandoned. Although the SUP sample was designed to provide national and regional estimates, coverage in the Metropolitan Statistical Areas (MSA's), Consolidated Metropolitan Statistical Areas (CMSA's), and Primary Metropolitan Statistical Areas (PMSA's) shown in this report was considered adequate to make reliable estimates.

The Building Permits Survey is a monthly survey in which a sample of permit-issuing jurisdictions in the United States report data on the actual number of housing units authorized by building permits during the month. All permit-issuing jurisdictions located within these selected MSA's, CMSA's, and PMSA's are in the monthly survey.

ESTIMATION PROCEDURES

The following example shows how the estimated number of housing units started each quarter is derived. The same procedure is used to derive estimates of units completed, under construction, and authorized but not started.

Step 1

Using SUP data, two sets of ratios are calculated for each MSA and CMSA. One set is for one-unit houses; the other is for units in multifamily buildings. Each ratio within a set is the estimated proportion of housing units authorized in a month that were started during the current quarter. (Month 1 represents the last month in the current quarter, month 2 is the previous month, and so forth, back to month 60.)

Estimated number of housing units started during current quarter that were authorized in month 1

ratio 1 = $\frac{\text{Estimated number of housing units started during current quarter that were authorized in month 1}}{\text{Estimated total number of housing units authorized in month 1}}$

Estimated number of housing units started during current quarter that were authorized in month 2

ratio 2 = $\frac{\text{Estimated number of housing units started during current quarter that were authorized in month 2}}{\text{Estimated total number of housing units authorized in month 2}}$

Estimated number of housing units started during current quarter that were authorized in month 60

ratio 60 = $\frac{\text{Estimated number of housing units started during current quarter that were authorized in month 60}}{\text{Estimated total number of housing units authorized in month 60}}$

Step 2

The ratios obtained in step 1 are then applied to the number of units authorized from the Building Permits Survey in the corresponding months for the MSA or CMSA. Summing these products over all 60 months yields the estimates of one-family houses and units in multifamily buildings started during the current quarter. The total estimate is the sum of these two estimates.

Step 3

For the PMSA estimates, the ratios obtained in step 1 for a CMSA are applied to the monthly numbers of units authorized from the Building Permits Survey for each of the component PMSA's.

Table A-1 presents an illustration of this procedure. The sum of column (d) is the estimated total number of units started in the current quarter from permits issued in the last 60 months in a MSA or CMSA. The sum of column (f) is the estimated total number of units started for the first component PMSA of an CMSA. There would be additional columns for the other component PMSA's.

LIMITATIONS

Since the statistics in this report cover only housing units authorized by building permits, the coverage of metropolitan areas with places that do not issue permits is incomplete. There are 18 such metropolitan areas in this

report. See Appendix B, Definitions, for a description of which portions of each metropolitan area are covered by building permits and included in this report. These descriptions are based on the 19,000 permit-issuing place universe and apply to 1995 data. Data for 1994 and earlier shown in this report were based upon the 17,000 permit-issuing place universe. See Appendix A, Description of Survey, of the C21/95-Q1 Report for more information regarding the expansion of this universe.

As previously stated, the estimates in this report are derived from the SUP and the Building Permits Survey. The selection of places for the SUP sample was based on the 1983 MSA definitions. To the extent possible, places in the sample have been recoded to the MSA definitions, as revised on June 30, 1993. This means that the sample may not completely represent the new MSA's. Step 2 of the estimator procedures ensures that the level of an estimate is consistent with its associated new MSA definition. The bias resulting from the estimation and definitional change will be small if the rates of starts and completions in the jurisdictions added to the MSA are similar to those in the sample.

RELIABILITY OF DATA

The statistics in this report are estimates based on sample surveys and may differ from statistics which would have been obtained from a complete census using the same schedules and procedures. An estimate based on a sample survey is subject to both sampling error and nonsampling error. The accuracy of a survey result is determined by the joint effects of these errors.

Measures of Sampling Errors

Sampling error reflects the fact that only a particular sample was surveyed rather than the entire population. The sample selected for this survey is one of a large

number of similar probability samples that, by chance, might have been selected under the same specifications. Estimates derived from the different samples would differ from one another. The standard error, or sampling error, of a survey estimate is a measure of the variation among the estimates from all possible samples and, thus, is a measure of the precision with which an estimate from a particular sample approximates the average from all possible samples.

Estimates of the standard errors have been computed from the sample data for selected quarterly statistics in this report. They are presented in the tables in the form of average relative standard errors. The relative standard error equals the standard error divided by the estimated value to which it refers. Average relative standard errors for annual estimates are not shown in the tables. To compute the average relative standard error for an annual estimate, divide its corresponding quarterly average relative standard error by 2.

The sample estimate and an estimate of its standard error allow us to construct interval estimates with prescribed confidence that the interval includes the average result of all possible samples with the same size and design. A 90 percent confidence interval is defined to be from 1.6 standard errors below the estimate to 1.6 standard errors above the estimate. If all possible samples were selected and surveyed under essentially the same conditions and all the respective 90-percent confidence intervals were generated, then approximately nine-tenths of the intervals would include the average value of all sample estimates and approximately one-tenth would not include this estimate. For example, suppose table 1 of this report showed that an estimated 8,000 units in one-family houses were started in a particular quarter in the Atlanta, GA, MSA. Further, suppose that the relative standard error of this estimate is 5 percent. Multiplying 8,000 by 0.05, we obtain 400 as the standard error. To obtain a 90-percent confidence interval, multiply 400 by 1.6 and add and subtract

the result from 8,000 yielding limits of 7,360 and 8,640. The average estimate of one-family houses started during the quarter may or may not be contained in this computed interval, but one can say that the average is included in the constructed interval with a specified confidence of 90 percent.

Nonsampling Errors

As calculated for this report, the relative standard error measures certain nonsampling errors, but does not measure any systematic biases in the data. Bias is the difference, averaged over all possible samples with the same size and design, between the estimates and the true value being estimated. Nonsampling errors can be attributed to many sources: inability to obtain information about all cases in the sample; definitional difficulties; differences in interpretation of questions; inability or unwillingness of respondents to provide correct information; and errors made in processing the data. These nonsampling errors

also occur in complete censuses. Although no direct measurements of the biases have been obtained, it is believed that most of the important response and operational errors were detected in the course of reviewing the data for reasonableness and consistency.

The estimates of building permits issued are adjusted (imputed) for nonresponse. In most of the tables the imputation rate is 2 percent or less, but it may be as high as 10 percent. The imputation rates vary from quarter to quarter depending upon nonresponse.

As stated in the estimation procedures section, the ratios obtained for a CMSA are applied to the monthly numbers of units authorized from the Building Permits Survey to obtain the estimates for each of the component PMSA's. This could introduce potential biases into the PMSA estimates, because the ratios for the CMSA would differ from the ratios for the component PMSA's. However, the bias resulting from the estimation method is considered to be small compared to the larger standard error that would be contributed by the ratios from the individual PMSA's.

Appendix B. Definitions

Each estimate in this report is shown as a number of housing units. A housing unit is defined as a single room or group of rooms intended for occupancy as separate living quarters by a family, by a group of unrelated persons living together, or by a person living alone. Separate living quarters are those in which the occupants do not live and eat with any other persons in the structure and which have direct access from the outside of the building or through a common hall which is used or intended to be used by the occupants of another unit or by the general public.

Separate estimates are shown for the following categories:

1. Authorized—A building permit was issued.
2. Authorized, but not started—A building permit has been issued, but construction was not started by the end of the reporting period.
3. Started—Excavation for footings or foundation was begun. All housing units in buildings with two units or more are counted as being started when excavation for the building is begun. Beginning with September 1992, starts estimates include units in residential structures being totally rebuilt on existing foundations.

4. Under construction—Construction has been started, but was not completed by the end of the reporting period.
5. Completed—
 - a. One-family houses are considered completed when all finish flooring is installed, carpeting is installed in place of wood flooring, or the unit is occupied.
 - b. Buildings with two units or more are considered completed when half or more of the units are occupied or available for occupancy.

METROPOLITAN AREAS

Data for years prior to 1993 are based on definitions of metropolitan areas issued by the Office of Management and Budget (OMB) in June 1983 and amended as of June 1985. Data for 1993 and later periods are based on definitions issued by OMB on December 31, 1992 and amended as of June 30, 1993. The portion of the MSA, CMSA, or PMSA covered by the building permits and included in this report is shown below.
